

Figure 1.1. Percent of persons of all ages without health insurance coverage: United States, 1997-2003

NOTES: A person was defined as uninsured if he or she did not have any private health insurance, Medicare, Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, or military plan at the time of the interview. A person was also defined as uninsured if he or she had only Indian Health Service coverage or had only a private plan that paid for one type of service such as accidents or dental care. The analyses excluded persons with unknown health insurance status (about 1% of respondents each year). The data on health insurance status were edited using an automated system based on logic checks and keyword searches. For comparability, the estimates for all years were created using these same procedures. The resulting estimates of persons without health insurance coverage are generally 0.1-0.2 percentage points lower than those based on the editing procedures used for the final data files. CI is confidence interval.

Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See "About This Release" and appendix tables in this release for more details.

DATA SOURCE: Family Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, the percent of uninsured persons was 14.8% (95% CI = 14.2% -15.5%), which was similar to the 2002 estimate of 14.7%. The estimate was 14.4% in the first quarter and 15.3% in the second quarter.
- The annual percent of uninsured persons was 15.4% in 1997, 14.6% in 1998, 14.2% in 1999, 14.9% in 2000, 14.3% in 2001, and 14.7% in 2002.

Table 1.1. Number and percent of persons without health insurance coverage, by age group: United States, 1997–2003

Age group	1997	1998	1999	2000	2001	2002	2003 Jan.-June
Number of uninsured¹ in millions							
All ages	41.0	39.3	38.7	41.3	40.2	41.5	42.3
Under 65 years	40.7	39.0	38.3	40.8	39.8	41.1	41.9
18-64 years	30.8	30.0	29.8	32.0	31.9	33.5	35.1
Under 18 years	9.9	9.1	8.5	8.9	7.9	7.6	6.9
Percent uninsured¹ (95% confidence interval)							
All ages	15.4 (15.0-15.8)	14.6 (14.1-15.1)	14.2 (13.8-14.6)	14.9 (14.5-15.3)	14.3 (13.8-14.8)	14.7 (14.3-15.1)	14.8 (14.2-15.5)
Under 65 years							
Crude	17.4 (16.9-17.9)	16.5 (16.0-17.0)	16.0 (15.5-16.5)	16.8 (16.3-17.2)	16.2 (15.7-16.7)	16.5 (16.0-16.9)	16.7 (15.3-17.2)
Age-adjusted	17.2 (16.8-17.7)	16.4 (15.9-16.9)	16.0 (15.5-16.5)	16.8 (16.3-17.3)	16.2 (15.7-16.7)	16.6 (16.1-17.1)	16.8 (16.1-17.5)
18-64 years	18.9 (18.4-19.4)	18.2 (17.7-18.7)	17.8 (17.3-18.3)	18.7 (18.1-19.2)	18.3 (17.8-18.8)	19.1 (18.6-19.6)	19.7 (18.9-20.5)
Under 18 years	13.9 (13.2-14.6)	12.7 (12.0-13.4)	11.8 (11.2-12.4)	12.3 (11.7-12.9)	11.0 (10.3-11.7)	10.5 (9.9-11.1)	9.4 (8.6-10.3)

¹A person was defined as uninsured if he or she did not have any private health insurance, Medicare, Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, or military plan at the time of the interview. A person was also defined as uninsured if he or she had only Indian Health Service coverage or had only a private plan that paid for one type of service such as accidents or dental care. The analyses excluded persons with unknown health insurance status (about 1% of respondents each year). The data on health insurance status were edited using an automated system based on logic checks and keyword searches. For comparability, the estimates for all years were created using these same procedures. The resulting estimates of persons without health insurance coverage are generally 0.1-0.2 percentage points lower than those based on the editing procedures used for the final data files. The number of uninsured was calculated as the percent of uninsured multiplied by the total weighted population including persons with unknown coverage. The age-specific numbers of uninsured may not add to their respective totals due to rounding error. Age-adjusted estimates for persons under 65 years old for this Healthy People 2010 leading health indicator are adjusted to the year 2000 projected U.S. standard population using three age groups: under 18 years, 18-44 years, and 45-64 years.

NOTES: Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were also recalculated using weights derived from the 2000 census. See About This Release and appendix tables in this release for more details.

DATA SOURCE: Family Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, the percent of uninsured persons was 16.7% (41.9 million) for persons under age 65 years, 19.7% (35.1 million) for persons aged 18-64 years, and 9.4% (6.9 million) for children under age 18 years.
- For children under age 18 years, the percent uninsured continued to decrease from 10.5% in 2002 to 9.4% in the first half of 2003. The decrease between 2002 and the first half of 2003 was statistically significant.
- For adults aged 18-64 years, there was an increasing trend in the percent uninsured from 2001 through June 2003, although the observed increase from 2002 to the first half of 2003 (19.1% to 19.7%) was not statistically significant.

Table 1.2. Percent of persons under age 65 years with public health plan and private health insurance coverage, by age group: United States, 1997–2003

Type of coverage ¹ and age group	1997	1998	1999	2000	2001	2002	2003 Jan.-June
Percent (95% confidence interval)							
Public							
Under 65 years	13.6 (13.1-14.1)	12.7 (12.2-13.2)	12.4 (12.0-12.9)	12.9 (12.4-13.4)	13.6 (13.1-14.1)	15.2 (14.6-15.8)	15.6 (14.8-16.5)
18-64 years	10.2 (9.8-10.6)	9.5 (9.1-9.9)	9.0 (8.6-9.3)	9.1 (8.7-9.4)	9.4 (9.0-9.8)	10.3 (9.9-10.7)	10.4 (9.7-11.0)
Under 18 years	21.5 (20.5-22.4)	20.0 (19.0-20.9)	20.5 (19.5-21.4)	22.0 (21.0-23.0)	23.6 (22.6-24.5)	27.1 (26.0-28.2)	28.3 (26.7-30.0)
Private							
Under 65 years	70.8 (70.1-71.5)	72.0 (71.3-72.7)	73.1 (72.3-73.8)	71.8 (71.1-72.5)	71.6 (70.9-72.3)	69.8 (69.0-70.6)	69.2 (68.2-70.3)
18-64 years	72.8 (72.2-73.4)	73.5 (72.9-74.1)	74.8 (74.1-75.4)	73.8 (73.2-74.4)	73.7 (73.1-74.4)	72.3 (71.6-72.9)	71.5 (70.6-72.5)
Under 18 years	66.2 (65.1-67.3)	68.5 (67.4-69.5)	69.1 (68.0-70.2)	67.1 (66.1-68.2)	66.7 (66.4-68.6)	63.9 (62.7-65.1)	63.6 (61.9-65.2)

¹The category "public health plan coverage" includes Medicare (disability), Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, and military plans. The category "private health insurance" excludes plans that paid for only one type of service such as accidents or dental care. A small number of persons were covered by both public and private plans and were included in both categories. The analyses excluded persons with unknown health insurance status (about 1% of respondents each year). The data on type of coverage were edited using an automated system based on logic checks and keyword searches. For comparability, the estimates for all years were created using these same procedures. The resulting estimates of persons having public or private coverage are within 0.1-0.3 percentage points of those based on the editing procedures used for the final data files.

NOTES: Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were also recalculated using weights derived from the 2000 census. See About This Release and appendix tables in this release for more details.

DATA SOURCE: Family Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, 15.6% of persons under age 65 years were covered by public plans, and 69.2% were covered by private health insurance plans.
- For persons aged 18-64 years, from 1999 through June 2003, there was an increasing trend in the estimates of public coverage and a decreasing trend in the estimates of private coverage. However, the estimates of private or public coverage between 2002 and the first half of 2003 were not significantly different.
- For children under age 18 years, from 1999 through June 2003, there was also an increasing trend in the estimates of public coverage and a decreasing trend in the estimates of private coverage. The estimates of private or public coverage in 2002 and the first half of 2003 were not significantly different.

Figure 1.2. Percent of persons under age 65 years without health insurance coverage, by age group and sex: United States, January-June 2003

NOTES: A person was defined as uninsured if he or she did not have any private health insurance, Medicare, Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, or military plan at the time of the interview. A person was also defined as uninsured if he or she had only Indian Health Service coverage or had only a private plan that paid for one type of service such as accidents or dental care. The analyses excluded 485 persons (1.3%) with unknown health insurance status. The data on health insurance status were edited using an automated system based on logic checks and keyword searches. The resulting estimates of persons not having health insurance coverage are generally 0.1-0.2 percentage points lower than those based on the editing procedures used for the final data files.

DATA SOURCE: Based on data collected from January through June in the Family Core component of the 2003 National Health Interview Survey.

- For both sexes combined, the percent of uninsured persons was highest among persons aged 18-24 years (30.2%) and lowest among persons under age 18 years (9.4%) and at ages 45-64 years (13.5%). Starting at age 18 years, younger adults were more likely than older adults to lack health insurance coverage.

- Among adults in age groups 18-24 years, 25-34 years, and 35-44 years, men were more likely than women to lack health insurance coverage.

Figure 1.3. Age- sex-adjusted percent of persons of all ages without health insurance coverage, by race/ethnicity: United States, January-June 2003

NOTES: A person was defined as uninsured if he or she did not have any private health insurance, Medicare, Medicaid, State Children's Health Insurance Program (SCHIP), State-sponsored or other government-sponsored health plan, or military plan at the time of the interview. A person was also defined as uninsured if he or she had only Indian Health Service coverage or had only a private plan that paid for one type of service such as accidents or dental care. The analyses excluded 509 persons (1.2%) with unknown health insurance status. The data on health insurance status were edited using an automated system based on logic checks and keyword searches. The resulting estimates of persons not having health insurance coverage are generally 0.1-0.2 percentage points lower than those based on the editing procedures used for the final data files. Estimates are age- sex-adjusted to the year 2000 projected U.S. standard population using three age groups: under 18 years, 18-64 years, and 65 years and over.

DATA SOURCE: Based on data collected from January through June in the Family Core component of the 2003 National Health Interview Survey.

- After adjusting for age and sex, the percent of uninsured persons was 31.7% for Hispanic persons, 10.6% for non-Hispanic white persons, and 17.8% for non-Hispanic black persons.
- Hispanic persons were most likely to be uninsured, followed by non-Hispanic black persons and non-Hispanic white persons.

¹Estimates for this Healthy People 2010 leading health indicator are for persons under 65 years and are age-adjusted to the year 2000 projected U.S. standard population using three age groups: under 18 years, 18-44 years, and 45-64 years.

Data table for figure 1.3. Age-sex-adjusted percent of persons of all ages without health insurance coverage, by race/ethnicity: United States, January-June 2003

Race/ethnicity	Percent (95% confidence interval)	
	Age-sex-adjusted ¹	Age-adjusted ²
Hispanic or Latino	31.7 (29.9-33.5)	34.2 (32.3-36.1)
Not Hispanic or Latino		
White, single race	10.6 (10.0-11.2)	12.3 (11.5-13.0)
Black, single race	17.8 (16.4-19.1)	19.7 (18.2-21.2)

¹Estimates are for persons of all ages and are age- sex-adjusted to the year 2000 projected U.S. standard population using three age groups: under 18 years, 18-64 years, and 65 years and over.

²Estimates for this Healthy People 2010 leading health indicator are for persons under 65 years and are age-adjusted to the year 2000 projected U.S. standard population using three age groups: under 18 years, 18-44 years, and 45-64 years.

Figure 2.1. Percent of persons of all ages with a usual place to go for medical care: United States, 1997-2003

NOTES: The usual place to go for medical care does not include a hospital emergency room. The analyses excluded persons with unknown usual place to go for medical care (about 0.6% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See "About This Release" and appendix tables in this release for more details.

DATA SOURCE: Combined Sample Adult and Sample Child Core components of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, the percent of persons who had a usual place to go for medical care was 87.9% (95% CI = 87.2%-88.6%), which was similar to the 2002 estimate of 87.6%.
- The annual percent of persons of all ages who had a usual place to go for medical care was 86.2% in 1997, 87.4% in 1998, 86.3% in 1999, 87.0 in 2000, 88.0% in 2001, and 87.6% in 2002.

Figure 2.2. Percent of persons of all ages with a usual place to go for medical care, by age group and sex: United States, January-June 2003

NOTES: The usual place to go for medical care does not include a hospital emergency room. The analyses excluded 102 persons (0.5%) with unknown usual place to go for medical care.

DATA SOURCE: Based on data collected from January through June in the Sample Adult and Sample Child Core components of the 2003 National Health Interview Surveys.

- Of the five age groups, persons aged 18-24 years were least likely to have a usual place to go for medical care. Children under age 18 years were more likely than adults aged 18-64 years to have a usual place to go for medical care.
- For adults aged 18-64 years, men were less likely than women to have a usual place to go for medical care.
- Among those aged 18 years and over, the percent of persons having a usual place to go for medical care increased with age.

Figure 2.3. Age- sex-adjusted percent of persons of all ages who had a usual place to go for medical care, by race/ethnicity: United States, January-June 2003

NOTES: The usual place to go for medical care does not include a hospital emergency room. The analyses excluded 102 persons (0.5%) with unknown usual place to go for medical care. Estimates are age- sex-adjusted to the year 2000 projected U.S. standard population using five age groups: under 18 years, 18-24 years, 25-44 years, 45-64 years, and 65 years and over.

DATA SOURCE: Based on data collected from January through June in the Sample Adult and Sample Child Core components of the 2003 National Health Interview Surveys.

- After adjusting for age and sex, the percent of persons with a usual place to go for medical care was 78.1% for Hispanic persons, 90.3% for non-Hispanic white persons, and 86.6% for non-Hispanic black persons.
- Of the three race/ethnic groups, Hispanic persons were least likely to have a usual place to go for medical care.

Data tables for figures 2.1-2.3:

Figure 3.1. Percent of persons of all ages who failed to obtain needed medical care at some time during the past 12 months due to financial barriers: United States, 1997-2003

NOTES: The analyses excluded persons with unknown success in obtaining needed medical care (about 0.5% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See "About This Release" and appendix tables in this release for more details.

DATA SOURCE: Family Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, 5.1% (95% CI = 4.8%-5.4%) of the population was unable to obtain needed medical care at some time during the past year due to financial barriers. The estimate is significantly higher than the 2002 estimate of 4.7%.
- From 1998 through 2003, an increasing trend has occurred in the annual percent of persons who experienced this lack of access to medical care (4.2% in 1998, 4.3% in 1999, 4.5% in 2000, 4.7% in 2001, 4.7 in 2002, and 5.1 in the first half of 2003).

Figure 3.2. Percent of persons of all ages who failed to obtain needed medical care at some time during the past 12 months due to financial barriers, by age group and sex: United States, January-June 2003

NOTE: The analyses excluded 188 persons (0.4%) with unknown success in obtaining needed medical care.

DATA SOURCE: Based on data collected from January through June in the Family Core component of the 2003 National Health Interview Survey.

- For both sexes combined, the percent of persons who were unable to obtain needed medical care at some time during the past 12 months was 2.1% for those aged under 18 years, 6.8% for those aged 18-64 years, and 2.6% for those aged 65 years and over.
- For the age group 18-64 years, women were more likely than men to have experienced this lack of access to medical care during the past 12 months.

Figure 3.3. Age- sex-adjusted percent of persons of all ages who failed to obtain needed medical care at some time during the past 12 months due to financial barriers, by race/ethnicity: United States, January-June 2003

NOTES: The analyses excluded 188 persons (0.4%) with unknown success in obtaining needed medical care. Estimates are age- sex-adjusted to the year 2000 projected U.S. standard population using three age groups: under 18 years, 18-64 years, and 65 years and over.

DATA SOURCE: Based on data collected from January through June in the Family Core component of the 2003 National Health Interview Survey.

■ After adjusting for age and sex, 6.2% of Hispanic persons, 4.6% of non-Hispanic white persons, and 6.7% of non-Hispanic black persons were unable to obtain needed medical care at some time during the year preceding the interview due to financial barriers.

■ Hispanic persons and non-Hispanic black persons were more likely than non-Hispanic white persons to experience this lack of access to medical care.

Data tables for figures 3.1-3.3:

Data table for figure 3.1. Percent of persons of all ages who failed to obtain needed medical care at some time during the past 12 months due to financial barriers: United States, 1997-2003

Year	Percent	95% confidence interval
1997	4.5	4.3-4.7
1998	4.2	4.0-4.4
1999	4.3	4.1-4.5
2000	4.5	4.3-4.7
2001	4.7	4.5-4.9
2002	4.7	4.5-4.9
2003 (January-June)	5.1	4.8-5.4

Data table for figure 3.2. Percent of persons of all ages who failed to obtain needed medical care at some time during the past 12 months due to financial barriers, by age group and sex, United States, January-June 2003

Figure 4.1. Percent of adults aged 18 years and over who had received an influenza vaccination during the past 12 months, by age group and quarter: United States, 1997–2002

NOTES: Respondents were asked if they had received a flu shot during the past 12 months. Responses to this question cannot be used to determine when during the preceding 12 months the subject received the flu shot. In addition, estimates are subject to recall error, which will vary depending on when the question is asked because the receipt of an influenza vaccination is seasonal. The analyses excluded those with unknown influenza vaccination status (about 1% of respondents each year). Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See "About This Release" and appendix tables in this release for more details.

DATA SOURCE: Sample Adult Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

■ In the second quarter of 2003, the percent of adults who received influenza vaccination during the past year was 65.4% for persons aged 65 years and over, 36.8% for persons aged 50-64 years, and 17.2% for persons aged 18-49 years.

■ For persons aged 65 years and over, the second quarter estimate increased from 65.4% in 2001 to 67.8% in 2002 (the delays in the availability of influenza vaccine occurred in the fall of 2000, and to a lesser extent, in the fall of 2001) (4,5). Although the second quarter estimate in 2003 was slightly lower than that in 2002 (65.4% vs. 67.8%), the difference was not statistically significant.

Table 4.1. Annual percent of adults aged 50 years and over who had received an influenza vaccination during the past 12 months, by age group and sex: United States, 1997-2002

NOTES: Respondents were asked if they had received a flu shot during the past 12 months. Responses to this question cannot be used to determine when during the preceding 12 months the subject received the flu shot. In addition, estimates are subject to recall error, which will vary depending on when the question is asked because the receipt of an influenza vaccination is seasonal. The analyses excluded those with unknown influenza vaccination status (about 1% of respondents each year). Age-adjusted estimates for persons aged 65 years and over for this Healthy People 2010 leading health indicator are based on the year 2000 projected U.S. standard population using two age groups: 65-74 years and 75 years and over. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were also recalculated using weights derived from the 2000 census. See appendix tables in this release for more details.

DATA SOURCE: Sample Adult Core component of the 1997-2002 National Health Interview Surveys.

- For adults aged 50-64 years, the annual percent of persons who received an influenza vaccination increased from 32.2% in 2001 to 34.0% in 2002. The increase was seen mainly among women.

- For adults aged 65 years and over, the annual percent of persons who received an influenza vaccination increased from 63.1% in 2001 to 65.7% in 2002. The estimate in 2002 was the same as that in 1999 (the delays in the availability of influenza vaccine occurred in the fall of 2000 and to a lesser extent, in the fall of 2001).

Figure 4.2. Percent of adults aged 18 years and over who had received an influenza vaccination during the past 12 months, by age group and sex: United States, January-June 2003

NOTES: Respondents were asked if they had received a flu shot during the past 12 months. Responses to this question cannot be used to determine when during the preceding 12 months the subject received the flu shot. In addition, estimates are subject to recall error, which will vary depending on when the question is asked because the receipt of an influenza vaccination is seasonal. The analyses excluded 237 adults (1.7%) with unknown influenza vaccination status.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

■ For both sexes combined, the percent of adults vaccinated against influenza during the past 12 months was highest among adults aged 65 years and over (66.6%), followed by adults aged 50-64 years (36.8%) and 18-49 years (17.1%).

■ For age groups 18-49 years and 50-64 years, women were more likely than men to have received an influenza vaccination during the past 12 months.

Figure 4.3. Percent of adults aged 65 years and over who had received an influenza vaccination during the past 12 months, by race/ethnicity: United States, January-June 2003

NOTES: Respondents were asked if they had received a flu shot during the past 12 months. Responses to this question cannot be used to determine when during the preceding 12 months the subject received the flu shot. In addition, estimates are subject to recall error, which will vary depending on when the question is asked because the receipt of an influenza vaccination is seasonal. The analyses excluded 49 adults (1.8%) aged 65 years and over with unknown influenza vaccination status.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- For adults aged 65 years and over, the percent of persons receiving an influenza vaccination during the past 12 months was 50.7% for Hispanic persons, 69.6% for non-Hispanic white persons, and 48.5% for non-Hispanic black persons.
- Hispanic persons and non-Hispanic black persons were less likely than non-Hispanic white persons to have received an influenza vaccination during the past 12 months.

Data tables for figures 4.1-4.3:

Figure 5.1. Percent of adults aged 65 years and over who had ever received a pneumococcal vaccination: United States, 1997-2003

NOTES: The analyses excluded those with unknown pneumococcal vaccination status (about 3% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See About This Release and appendix tables in this release for more details.

DATA SOURCE: The Sample Adult Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, the percent of adults aged 65 years and over who have ever received a pneumococcal vaccination was 55.3% (95% CI = 53.1%-57.5%), which was slightly lower than but not statistically different from the 2002 estimate of 56.0%.
- Between 1997 and 2002, the percent of adults aged 65 years and over who have ever received a pneumococcal vaccination increased from 42.4% in 1997 to 46.0% in 1998, 49.7% in 1999, 53.1% in 2000, 54.0% in 2001, and 56.0% in 2002.

Figure 5.2. Percent of adults aged 18 years and over who had ever received a pneumococcal vaccination, by age group and sex: United States, January-June 2003

NOTES: The analyses excluded 465 adults (3.2%) with unknown pneumococcal vaccination status. For persons aged 18-64 years, pneumococcal vaccination is only recommended for those who have selected chronic illnesses or immunosuppression.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

■ The percent of adults who had ever received a pneumococcal vaccination was 55.3% for persons aged 65 years and over and 8.5% for persons aged 18-64 years.

■ There was no significant difference between men and women in pneumococcal vaccination status.

Figure 5.3. Percent of adults aged 65 years and over who had ever received a pneumococcal vaccination, by race/ethnicity: United States, January-June 2003

NOTE: The analyses excluded 109 adults (4.1%) aged 65 years and over with unknown pneumococcal vaccination status.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- The percent of adults aged 65 years and over who received a pneumococcal vaccination was 28.9% for Hispanic persons, 59.7% for non-Hispanic white persons, and 32.7% for non-Hispanic black persons.
- Hispanic persons and non-Hispanic black persons were less likely than non-Hispanic white persons to have ever received a pneumococcal vaccination.

Figure 6.1. Prevalence of obesity among adults aged 20 years and over: United States, 1997-2003

NOTES: Obesity is defined as a Body Mass Index (BMI) of 30 kg/m² or more. The measure is based on self-reported height and weight. The analyses excluded people with unknown height or weight (about 4% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See "About This Release" and appendix tables in this release for more details.

DATA SOURCE: Sample Adult Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, 23.8% (95% CI = 22.9%-24.7%) of U.S. adults aged 20 years and over were obese, which is similar to the 2002 estimate of 23.9%.
- The annual prevalence of obesity among U.S. adults aged 20 years and over has increased over time from 19.4% in 1997 to 20.6% in 1998, 21.5% in 1999, 21.8% in 2000, 23.0% in 2001, and 23.9% in 2002.

Figure 6.2. Prevalence of obesity among adults aged 20 years and over, by age group and sex: United States, January-June 2003

NOTES: Obesity is defined as a body mass index (BMI) of 30 kg/m² or more. The measure is based on self-reported height and weight. The analyses excluded 829 people (5.8%) with unknown height or weight.

DATA SOURCE: Based on data collected from January-June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- For both sexes combined, the prevalence of obesity was highest among adults aged 40-59 years (28.0%) and lowest among adults aged 20-39 years (20.4%). This pattern in obesity by age group was seen in both men and women.
- There was no significant difference in the prevalence of obesity between women and men for all three age groups.

Figure 6.3. Age-adjusted prevalence of obesity among adults aged 20 years and over, by sex and race/ethnicity: United States, January-June 2003

NOTES: Obesity is defined as a body mass index (BMI) of 30 kg/m² or more. The measure is based on self-reported height and weight. The analyses excluded 829 people (5.8%) with unknown height or weight. Estimates are age-adjusted to the year 2000 projected U.S. standard population using three age groups: 20-39 years, 40-59 years, and 60 years and over.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- For both sex groups, non-Hispanic black persons were more likely than Hispanic and non-Hispanic white persons to be obese.
- Among the six sex-specific race/ethnic groups, the age-adjusted prevalence of obesity was highest among non-Hispanic black women (38.7%) and lowest among non-Hispanic white women (21.1%).

Data tables for figures 6.1-6.3:

1999	21.5 (20.9-22.1)	21.5 (20.9-22.1)
2000	21.8 (21.2-22.4)	21.8 (21.2-22.3)
2001	23.0 (22.4-23.6)	22.9 (22.3-23.5)
2002	23.9 (23.3-24.6)	23.8 (23.2-24.5)
2003 (January-June)	23.8 (22.9-24.7)	23.6 (22.7-24.6)

¹Crude estimates are presented in the graph.

²Estimates for this Healthy People 2010 leading health indicator are age-adjusted to the year 2000 projected U.S. standard population using seven age groups: 20-29 years, 30-39 years, 40-49 years, 50-59 years, 60-69 years, 70-79 years, and 80 years and over.

Data table for figure 6.2. Prevalence of obesity among adults aged 20 years and over, by age group and sex: United States, January-June 2003

Age and sex	Percent	95% confidence interval
20-39 years		
Total	20.4	19.0-21.8
Men	21.5	19.5-23.5
Women	19.3	17.6-21.0
40-59 years		
Total	28.0	26.5-29.6
Men	28.2	25.9-30.5
Women	27.9	25.9-29.8
60 years and over		
Total	22.4	20.8-24.1
Men	20.8	18.5-23.0
Women	23.8	21.5-26.0

Data table for figure 6.3. Age-adjusted prevalence of obesity among adults aged 20 years and over, by sex and race/ethnicity: United States, January-June 2003

Sex and race/ethnicity	Percent¹	95% confidence interval
Men		
Hispanic or Latino	22.2	19.3-25.2
Not Hispanic or Latino		
White, single race	23.1	21.6-24.6
Black, single race	28.9	24.7-33.1
Women		
Hispanic or Latino	25.7	22.8-28.7
Not Hispanic or Latino		
White, single race	21.1	19.7-22.5
Black, single race	38.7	34.9-42.5

¹Estimates for this Healthy People 2010 leading health indicator are age-adjusted to the year 2000 projected U.S. standard population using three age groups: 20-39 years, 40-59 years, and 60 years and over.

Figure 7.1. Percent of adults aged 18 years and over who engaged in regular leisure-time physical activity: United States, 1997-2003

NOTES: This measure reflects the definition used for the physical activity leading health indicator (Healthy People 2010). Regular leisure-time physical activity is defined as engaging in light-moderate leisure-time physical activity for greater than or equal to 30 minutes at a frequency greater than or equal to 5 times per week, or engaging in vigorous leisure-time physical activity for greater than or equal to 20 minutes at a frequency greater than or equal to 3 times per week. The analyses excluded persons with unknown physical activity participation (about 3% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See About This Release and appendix tables in this release for more details.

DATA SOURCE: Sample Adult Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, 33.2% (95% CI = 32.1%-34.3%) of U.S. adults aged 18 years and over engaged in regular leisure-time physical activity. The estimate for January-June was 32.7% in 1997, 29.9% in 1998, 29.9% in 1999, 32.4% in 2000, 32.4% in 2001, and 32.5 in 2002.
- The annual percents of adults aged 18 years and over who engaged in regular leisure-time physical activity increased from 29.9% in 1998 to 31.9% in 2000, but remained stable thereafter.

Figure 7.2. Percent of adults aged 18 years and over who engaged in regular leisure-time physical activity, by age group and sex: United States, January-June 2003

NOTES: This measure reflects the definition used for the physical activity leading health indicator (Healthy People 2010). Regular leisure-time physical activity is defined as engaging in light-moderate leisure-time physical activity for greater than or equal to 30 minutes at a frequency greater than or equal to 5 times per week, or engaging in vigorous leisure-time physical activity for greater than or equal to 20 minutes at a frequency greater than or equal to 3 times per week. The analyses excluded 414 persons (2.9%) with unknown physical activity participation.

DATA SOURCE: Based on data collected from January-June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- For both sexes combined, the percent of adults who engaged in regular leisure-time physical activity decreased with age.
- For all age groups, women were less likely than men to engage in regular leisure-time physical activity.

Figure 7.3. Age- sex-adjusted percent of adults aged 18 years and over who engaged in regular leisure-time physical activity, by race/ethnicity: United States, January-June 2003

NOTES: This measure reflects the definition used for the physical activity leading health indicator (Healthy People 2010). Regular leisure-time physical activity is defined as engaging in light-moderate leisure-time physical activity for greater than or equal to 30 minutes at a frequency greater than or equal to 5 times per week, or engaging in vigorous leisure-time physical activity for greater than or equal to 20 minutes at a frequency greater than or equal to 3 times per week. The analyses excluded 414 persons (2.9%) with unknown physical activity participation. Estimates are age-sex-adjusted to the year 2000 projected U.S. standard population using five age groups: 18-24 years, 25-44 years, 45-64 years, 65-74 years, and 75 years and over.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- The age- sex-adjusted percent of adults who engaged in regular leisure-time physical activity was 24.7% for Hispanic adults, 35.9% for non-Hispanic white adults, and 26.5% for non-Hispanic black adults.
- Non-Hispanic white adults were more likely to engage in regular leisure-time physical activity than Hispanic adults and non-Hispanic black adults.

Figure 8.1. Prevalence of current smoking among adults aged 18 years and over: United States, 1997-2003

NOTES: Current smokers were defined as those who smoked more than 100 cigarettes in their lifetime and now smoke every day or some days. The analyses excluded people with unknown smoking status (about 1% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See "About This Release" and appendix tables in this release for more details.

DATA SOURCE: Sample Adult Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, 21.6% (95% CI = 20.8%-22.5%) of adults aged 18 years and over were current smokers, continuing a decline in the prevalence of current smoking among adults in the United States.
- The annual prevalence of current smoking among U.S. adults has declined over time from 24.7% in 1997 to 24.1% in 1998, 23.5% in 1999, 23.2% in 2000, 22.7% in 2001, and 22.4% in 2002.

Figure 8.2. Percent distribution of smoking status among adults aged 18 years and over, by sex: United States, January-June 2003

NOTES: Current smokers were defined as those who smoked more than 100 cigarettes in their lifetime and now smoke every day or some days. The analyses excluded 181 people (1.3%) with unknown smoking status.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- The percent of current smokers was higher for men (24.0%) than for women (19.4%).
- The percent of former smokers was higher for men than for women, and the percent of those who had never smoked was higher for women than for men.

Figure 8.3. Prevalence of current smoking among adults aged 18 years and over, by age group and sex: United States, January-June 2003

NOTES: Current smokers were defined as those who smoked more than 100 cigarettes in their lifetime and now smoke every day or some days. The analyses excluded 181 people (1.3%) with unknown smoking status.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- For both sexes combined, the prevalence of current smoking was lower among adults aged 65 years and over (9.3%) compared with adults aged 18-44 years (25.4%) and 45-64 years (21.8%). This pattern in current smoking by age group was seen in both men and women.
- For persons aged 18-44 years, men were more likely than women to be current smokers. Although this pattern was also seen among persons aged 45-64 years and 65 years and over, the differences were not statistically significant.

Figure 8.4. Age- sex-adjusted prevalence of current smoking among adults aged 18 years and over, by race/ethnicity: United States, January-June 2003

NOTES: Current smokers were defined as those who smoked more than 100 cigarettes in their lifetime and now smoke every day or some days. The analyses excluded 181 people (1.3%) with unknown smoking status. Estimates are age- sex-adjusted to the year 2000 projected U.S. standard population using five age groups: 18-24 years, 25-34 years, 35-44 years, 45-64 years, and 65 years and over.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- The age- sex-adjusted prevalence of current smoking was 16.8% for Hispanic persons, 23.0% for non-Hispanic white persons, and 21.9% for non-Hispanic black persons.
- Non-Hispanic white adults and non-Hispanic black adults were more likely than Hispanic adults to be current smokers.

Figure 9.1. Percent of adults aged 18 years and over who had 5 or more drinks in 1 day at least once in the past year: United States, 1997-2003

NOTES: The analyses excluded adults with unknown alcohol consumption (about 2% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See About This Release and appendix tables in this release for more details.

DATA SOURCE: Sample Adult Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

■ From January through June 2003, the percent of adults who had five or more drinks in 1 day at least once in the past year was 19.8% (95% CI=18.8%-20.8%).

■ From 1997 through 2002, there was no significant trend in the annual estimates of adults who had five or more drinks in 1 day at least once in the past year.

Figure 9.2. Percent of adults aged 18 years and over who had 5 or more drinks in 1 day at least once in the past year, by age group and sex: United States, January-June 2003

NOTE: The analyses excluded 403 adults (2.8%) with unknown alcohol consumption.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- For both men and women, younger adults were more likely than older adults to have had five or more drinks in 1 day at least once in the past year.
- In all four age groups, men were more likely than women to have had five or more drinks in 1 day at least once in the past year.

Figure 9.3. Age- sex-adjusted percent of adults aged 18 years and over who had 5 or more drinks in 1 day at least once in the past year, by race/ethnicity: United States, January-June 2003

NOTES: The analyses excluded 403 adults (2.8%) with unknown alcohol consumption. Estimates are age- sex- adjusted to the year 2000 projected U.S. standard population using four age groups: 18-24 years, 25-44 years, 45-64 years, and 65 years and over.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- The age- sex-adjusted percent of adults who had five or more drinks at least once in the past year was 16.2% for Hispanic persons, 22.8% for non-Hispanic white persons, and 12.1% for non-Hispanic black persons.
- Non-Hispanic white persons were more likely than Hispanic and non-Hispanic black persons to have had five or more drinks in 1 day at least once in the past year.

Figure 10.1. Percent of adults aged 18 years and over who had ever been tested for HIV: United States, 1997-2003

NOTES: The analyses excluded those with unknown human immunodeficiency virus (HIV) test status (about 4% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See About This Release and appendix tables in this release for more details.

DATA SOURCE: Sample Adult Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, the percent of U.S. adults who had ever been tested for HIV was 35.9% (95% CI = 34.8%-36.9%), continuing an increase in the estimate of adults who had ever had an HIV test.
- The annual percent of adults who had ever had an HIV test increased from 30.2% in 1998 to 34.5% in 2002.

Figure 10.2. Percent of adults aged 18 years and over who had ever been tested for HIV, by age group and sex: United States, January-June 2003

NOTES: The analyses excluded 631 adults (4.4%) with unknown HIV test status.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

■ For both sexes combined, the percent of persons who ever had an HIV test was highest among adults aged 25-34 years (55.5%) and lowest among adults aged 65 years and over (10.8%).

■ For age groups 18-24 years, 25-34 years, and 35-44 years, women were more likely than men to have ever had an HIV test, whereas for adults aged 65 years and over, women were less likely than men to have ever had an HIV test.

Figure 10.3. Age- sex-adjusted percent of adults aged 18 years and over who had ever been tested for HIV, by race/ethnicity: United States, January-June 2003

NOTES: The analyses excluded 631 adults (4.4%) with unknown HIV test status. Estimates are age-sex-adjusted to the year 2000 projected U.S. standard population using five age groups: 18-24 years, 25-34 years, 35-44 years, 45-64 years, and 65 years and over.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- The age- sex-adjusted percents of persons who ever had an HIV test were 37.8% for Hispanic persons, 33.6% for non-Hispanic white persons, and 48.4% for non-Hispanic black persons.
- Of the three race/ethnic groups, non-Hispanic black persons were most likely to have ever had an HIV test.

Data table for figure 10.3. Age- sex-adjusted percent of adults aged 18 years and over who had ever been tested for HIV, by race/ethnicity: United States, January-June 2003

Race/ethnicity	Percent¹	95% confidence interval
Hispanic or Latino	37.8	35.5-40.2
Not Hispanic or Latino		
White, single race	33.6	32.4-34.9
Black, single race	48.4	45.8-50.9

¹Estimates are age- sex-adjusted to the year 2000 projected U.S. standard population using five age groups: 18-24 years, 25-34 years, 35-44 years, 45-64 years, and 65 years and over.

Figure 11.1. Percent of persons of all ages whose health was assessed as excellent or very good: United States, 1997-2003

NOTES: Health status data were obtained by asking respondents to assess their own health and that of family members living in the same household as excellent, very good, good, fair, or poor. The analyses excluded persons with unknown health status (about 0.5% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See "About This Release" and appendix tables in this release for more details.

DATA SOURCE: Family Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

■ From January through June 2003, the percent of persons whose health was assessed as excellent or very good was 67.3% (95% CI = 66.5% - 68.2%), which is similar to the 2002 estimate of 67.4%.

■ From 1997 through 2001, the annual percent of persons whose health was assessed as excellent or very good has remained similar: 68.5% in 1997, 69.1% in 1998, 68.7% in 1999, 68.3% in 2000, and 68.4% in 2001. The estimate in 2002 (67.4%) was significantly lower than that in 2001.

Figure 11.2. Percent distribution of respondent-assessed health status, by sex for all ages: United States, January-June 2003

NOTES: Health status data were obtained by asking respondents to assess their own health and that of family members living in the same household as excellent, very good, good, fair, or poor. The analyses excluded 187 persons (0.4%) with unknown health status.

DATA SOURCE: Based on data collected from January through June in the Family Core component of the 2003 National Health Interview Survey.

- For both sexes combined, the health status of most persons was assessed as either excellent (35.9%) or very good (31.4%). The health status of a smaller percent of persons was assessed as good (23.5%), and that of even fewer was assessed as fair (6.8%) or poor (2.4%).
- Compared with men, the health status of women was less likely to be assessed as excellent (37.4% vs. 34.5%) and more likely to be assessed as good (22.7% vs. 24.2%) or fair (6.3% vs. 7.4%).

Figure 11.3. Percent of persons whose health was assessed as excellent or very good, by age group and sex: United States, January-June 2003

NOTES: Health status data were obtained by asking respondents to assess their own health and that of family members living in the same household as excellent, very good, good, fair, or poor. The analyses excluded 187 persons (0.4%) with unknown health status.

DATA SOURCE: Based on data collected from January through June in the Family Core component of the 2003 National Health Interview Survey.

■ For both sexes combined, the percent of persons whose health was assessed as excellent or very good decreased with age: 82.6% for those aged under 18 years, 66.6% for those aged 18-64 years, and 38.6% for those aged 65 years and over.

■ For persons aged 18-64 years, the percent of persons whose health was assessed as excellent or very good was higher for men (67.9%) than for women (65.3%).

Figure 11.4. Age- sex-adjusted percent of persons of all ages whose health was assessed as excellent or very good, by race/ethnicity: United States, January-June 2003

NOTES: Health status data were obtained by asking respondents to assess their own health and that of family members living in the same household as excellent, very good, good, fair, or poor. The analyses excluded 187 persons (0.4%) with unknown health status. Estimates are age- sex-adjusted to the year 2000 projected U.S. standard population using three age groups: under 18 years, 18-64 years, and 65 years and over.

DATA SOURCE: Based on data collected from January through June in the Family Core component of the 2003 National Health Interview Survey.

- After adjusting for age and sex, the percent of persons whose health was assessed as excellent or very good was 57.8% for Hispanic persons, 70.8% for non-Hispanic white persons, and 56.9% for non-Hispanic black persons.
- The health status of Hispanic persons and non-Hispanic black persons were less likely than non-Hispanic white persons to be assessed as excellent or very good.

Data tables for figures 11.1-11.4:

Data table for figure 11.1. Percent of persons of all ages whose health was assessed as excellent or very good: United States, 1997-2003

Year	Percent	95% confidence interval

Figure 12.1. Percent of adults aged 65 years and over who need help with personal care from other persons: United States, 1997-2003

NOTES: Personal care needs or activities of daily living (ADL) include such things as eating, bathing, dressing, or getting around inside the person's home. The analyses excluded persons with unknown information on personal care needs (about 0.1% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See "About This Release" and appendix tables in this release for more details.

DATA SOURCE: Family Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, 6.4% (95% CI = 5.7%-7.2%) of adults aged 65 years and over needed help with personal care from other persons. The estimate was not significantly different from the 2002 estimate of 6.2%.
- There was no significant time trend in the annual percent of adults who needed help with personal care from other persons (6.6% in 1997, 6.3% in 1998, 6.4% in 1999, 6.4% in 2000, 6.5% in 2001, and 6.2% in 2002).

Figure 12.2. Percent of adults aged 65 years and over who need help with personal care from other persons, by age group and sex: United States, January-June 2003

NOTE: Personal care needs or activities of daily living (ADL) include such things as eating, bathing, dressing, or getting around inside the person's home.

DATA SOURCE: Based on data collected from January through June in the Family Core component of the 2003 National Health Interview Survey.

■ For both sexes combined, adults aged 85 years and over were more than seven times as likely as adults aged 65-74 years old to need help with personal care from other persons (22.4 vs. 3.3%).

■ For adults aged 85 years and over, the percent of women who needed help with personal care from other persons was higher than that for men.

Figure 12.3. Age- sex-adjusted percent of adults aged 65 years and over who need help with personal care from other persons, by race/ethnicity: United States, January-June 2003

NOTES: Personal care needs or activities of daily living (ADL) include such things as eating, bathing, dressing, or getting around inside the person's home. Estimates are age- sex-adjusted to the year 2000 projected U.S. standard population using three age groups: 65-74 years, 75-84 years, and 85 years and over.

DATA SOURCE: Based on data collected from January through June in the Family Core component of the 2003 National Health Interview Survey.

- The age- sex-adjusted percent of persons who needed help with personal care from other persons was 7.8% for Hispanic persons, 6.1% for non-Hispanic white persons, and 9.0% for non-Hispanic black persons.
- The percent of non-Hispanic black persons who needed help with personal care from other persons was higher than that for non-Hispanic white persons.

Figure 13.1. Percent of adults aged 18 years and over who experienced serious psychological distress during the past 30 days: United States, 1997–2003

NOTES: Six psychological distress questions are included in the Sample Adult Core component. These questions ask how often a respondent experienced certain symptoms of psychological distress during the past 30 days. The response codes (0-4) of the six items for each person are summed to yield a scale with a 0 to 24 range. A value of 13 or more for this scale is used here to define serious psychological distress (6). Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See About This Release and appendix tables in this release for more details.

DATA SOURCE: Sample Adult Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

■ From January through June 2003, 3.2% (95% CI = 2.8% - 3.5%) of adults aged 18 years and over experienced serious psychological distress during the past 30 days.

■ The annual percent of adults who experienced serious psychological distress during the past 30 days declined significantly from 3.3% in 1997 to 2.4% in 1999, and then increased from 2.4% in 1999 to 3.0% in 2002.

Figure 13.2. Percent of adults aged 18 years and over who experienced serious psychological distress during the past 30 days, by age group and sex: United States, January-June 2003

NOTES: Six psychological distress questions are included in the Sample Adult Core component. These questions ask how often a respondent experienced certain symptoms of psychological distress during the past 30 days. The response codes (0-4) of the six items for each person are summed to yield a scale with a 0 to 24 range. A value of 13 or more for this scale is used here to define serious psychological distress (6).

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- For both sexes combined, persons aged 45-64 years (4.0%) were more likely to have experienced serious psychological distress during the past 30 days compared with persons aged 18-44 years (2.9%) and 65 years and over (2.5%).

- For all age groups, women were more likely than men to have experienced serious psychological distress during the past 30 days.

Figure 13.3. Age- sex-adjusted percent of adults aged 18 years and over who experienced serious psychological distress during the past 30 days, by race/ethnicity: United States, January-June 2003

NOTES: Six psychological distress questions are included in the Sample Adult Core component. These questions ask how often a respondent experienced certain symptoms of psychological distress during the past 30 days. The response codes (0-4) of the six items for each person are summed to yield a scale with a 0 to 24 range. A value of 13 or more for this scale is used here to define serious psychological distress (6). Estimates are age- sex-adjusted to the year 2000 projected U.S. standard population using three age groups: 18-44 years, 45-64 years and 65 years and over.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- The age- sex-adjusted prevalence of serious psychological distress was 4.2% for Hispanic persons, 3.0% for non-Hispanic white persons, and 2.9% for non-Hispanic black persons.

- The prevalence of serious psychological distress was higher among Hispanic persons than among non-Hispanic white persons and non-Hispanic black persons.

Figure 14.1. Prevalence of diagnosed diabetes among adults aged 18 years and over: United States, 1997-2003

NOTES: Prevalence of diagnosed diabetes is based on self-report of physician diagnosis. Persons reporting "borderline" diabetes status and women reporting diabetes only during pregnancy were not coded as having diabetes in the analyses. The analyses excluded people with unknown diabetes status (about 0.1% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See "About This Release" and appendix tables in this release for more details.

DATA SOURCE: Sample Adult Core component of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, 6.2% (95% CI = 5.7% - 6.6%) of U.S. adults aged 18 years and over had ever been diagnosed as having diabetes. The estimate was slightly lower, but not significantly different, from the 2002 estimate of 6.5%.
- From 1997 through 2002, the annual prevalence of diagnosed diabetes among U.S. adults aged 18 years and over increased from 5.1% in 1997 to 5.3% in 1998, 5.4% in 1999, 5.9% in 2000, 6.4% in 2001, and 6.5% in 2002.

Figure 14.2. Prevalence of diagnosed diabetes among adults aged 18 years and over, by age group and sex: United States, January-June 2003

NOTES: Prevalence of diagnosed diabetes is based on self-report of physician diagnosis. Persons reporting "borderline" diabetes status and women reporting diabetes only during pregnancy were not coded as having diabetes in the analyses. The analyses excluded 11 people (0.1%) with unknown diabetes status.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

- For both sexes combined, the prevalence of diagnosed diabetes increased with age, with the highest rate among adults aged 65 years and over (15.9%) and the lowest rate among adults aged 18-44 years (1.5%).
- For persons aged 65 years and over, the prevalence of diagnosed diabetes was higher among men than women.

Figure 14.3. Age- sex-adjusted prevalence of diagnosed diabetes among adults aged 18 years and over, by race/ethnicity: United States, January-June 2003

NOTES: Prevalence of diagnosed diabetes is based on self-report of physician diagnosis. Persons reporting "borderline" diabetes status and women reporting diabetes only during pregnancy were not coded as having diabetes in the analyses. The analyses excluded 11 people (0.1%) with unknown diabetes status.

DATA SOURCE: Based on data collected from January through June in the Sample Adult Core component of the 2003 National Health Interview Survey.

■ The age- sex-adjusted prevalence of diagnosed diabetes was 8.1% for Hispanic persons, 5.4% for non-Hispanic white persons, and 9.7% for non-Hispanic black persons.

■ The prevalence of diagnosed diabetes was higher among non-Hispanic black persons and Hispanic persons than among non-Hispanic white persons.

Figure 15.1. Prevalence of an asthma episode in the past 12 months among persons of all ages: United States, 1997-2003

NOTES: Information on an episode of asthma or asthma attack during the past 12 months is self-reported by adults aged 18 years and over. For children under age 18 years, the information is collected from an adult family member, usually a parent, who is knowledgeable about the child's health. The analyses excluded people with unknown asthma status (about 0.3% of respondents each year). CI is confidence interval. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000-02 were recalculated using weights derived from the 2000 census. See "About This Release" and appendix tables in this release for more details.

DATA SOURCE: Sample Adult and Sample Child Core components of the 1997-2003 National Health Interview Surveys. The estimate for 2003 was based on data collected from January through June.

- From January through June 2003, the prevalence of an asthma episode (per 1,000 population) in the past 12 months for persons of all ages was 40.1 (95% CI = 36.7-43.6), which was lower than but not significantly different from the 2002 estimate of 42.6.
- The annual prevalence (per 1,000 population) of an asthma episode in the past 12 months for persons of all ages decreased from 41.8 in 1997 to 38.6 in 1999, but then increased significantly to 40.0 in 2000 and 43.2 in 2001. The prevalence was 42.6/1,000, slightly lower than but not significantly different from the 2001 estimate.

Figure 15.2. Prevalence of an asthma episode in the past 12 months, by age group and sex: United States, January-June 2003

NOTES: Information on an episode of asthma or asthma attack during the past 12 months is self-reported by adults aged 18 years and over. For children under age 18 years, the information is collected from an adult family member, usually a parent, who is knowledgeable about the child's health. The analyses excluded 37 persons (0.2%) with unknown asthma status.

DATA SOURCE: Based on data collected from January through June in the Sample Adult and Sample Child Core components of the 2003 National Health Interview Survey.

- For both sexes combined, the prevalence of an asthma episode was higher among children under age 15 years than among those aged 15 years and over. For males, asthma was higher among children 0-14 years than among those aged 15 years and over. This age difference was not seen among females.

- For children under age 15 years, the prevalence of an asthma episode was higher among boys than among girls. However, for persons in age groups 15-34 years and 35 years and over, the prevalence was higher among females than among males.

Figure 15.3. Sex-adjusted prevalence of an asthma episode in the past 12 months, by age group and race/ethnicity: United States, January-June 2003

NOTES: Information on an episode of asthma or asthma attack during the past 12 months is self-reported by adults aged 18 years and over. For children under age 18 years, the information is collected from an adult family member, usually a parent, who is knowledgeable about the child's health. The analyses excluded 37 persons (0.2%) with unknown asthma status. CI is confidence interval.

DATA SOURCE: Based on data collected from January through June in the Sample Adult and Sample Child Core components of the 2003 National Health Interview Survey.

- For children under age 15 years, the sex-adjusted prevalence of an asthma episode was higher among non-Hispanic black children than among Hispanic or non-Hispanic white children. This race/ethnic disparity was not seen among persons aged 15 years and over.
- Among the six age-specific race/ethnic groups, the sex-adjusted prevalence of an asthma episode was highest among non-Hispanic black children under age 15 years (89.2/1,000 population).

Data tables for figures 15.1-15.3:

Data for figure 15.1. Prevalence of an asthma episode in the past 12 months among persons of all ages: United States, 1997-2003

Year	Percent ¹ (95% Confidence Interval)	
	Crude ²	Age-adjusted ³
1997	41.8 (39.7-43.8)	41.5 (39.4-43.5)
1998	39.5 (37.4-41.7)	39.3 (37.2-41.5)
1999	38.6 (36.4-40.9)	38.5 (36.2-40.7)
2000	40.0 (37.7-42.2)	39.9 (37.6-42.1)
2001	43.2 (40.8-45.5)	43.1 (40.8-45.4)
2002	42.6 (40.2-44.9)	42.5 (40.2-44.9)
2003 (January-June)	40.1 (36.7-43.6)	40.1 (36.7-43.6)

¹Per 1,000 population.

²Crude estimates are presented in the graph.

³Estimates are age-adjusted to the year 2000 projected standard population using three age groups: 0-14 years, 15-34 years, and 35 years and over.

Data table for figure 15.2. Prevalence of an asthma episode in the past 12 months, by age group and sex: United States, January-June 2003

Age and sex	Percent	95% confidence interval
0-14 years		
Total	55.5	47.2-63.8
Male	65.0	52.7-77.2
Female	45.5	34.7-56.2
15-34 years		
Total	35.9	30.3-41.5
Male	26.3	19.6-32.9
Female	45.5	36.5-54.6
35 years and over		
Total	36.0	31.8-40.3
Male	20.2	15.4-24.9
Female	50.2	43.6-56.8

Data table for figure 15.3. Sex-adjusted prevalence of an asthma episode in the past 12 months, by age group and race/ethnicity: United States, January-June 2003

Sex and race/ethnicity	Percent¹	95% confidence interval
0-14 years		
Hispanic or Latino	49.4	35.1-63.8
Not Hispanic or Latino		
White, single race	45.1	35.7-54.6
Black, single race	89.2	63.7-114.8
15 years and over		
Hispanic or Latino	33.3	24.8-41.8
Not Hispanic or Latino		
White, single race	36.3	32.2-40.4
Black, single race	39.1	29.5-48.6

¹Estimates are sex-adjusted to the year 2000 projected U.S. standard population.

With need for personal care	6.3 (5.9-6.8)	6.4 (5.9-6.9)	6.5 (6.0-7.0)	6.5 (6.0-7.0)	6.2 (5.6-6.7)	6.2 (5.7-6.7)
Serious psychological distress	2.7 (2.5-2.9)	2.7 (2.5-2.9)	3.2 (2.9-3.4)	3.2 (2.9-3.4)	3.0 (2.8-3.3)	3.0 (2.8-3.2)
Diagnosed Diabetes	5.9 (5.6-6.2)	5.9 (5.6-6.2)	6.4 (6.1-6.7)	6.4 (6.1-6.7)	6.5 (6.2-6.8)	6.5 (6.2-6.8)
Asthma episodes in the past year	40.1 (37.9-42.4)	40.0 (37.7-42.2)	43.4 (41.0-45.8)	43.2 (40.8-45.5)	42.8 (40.4-45.2)	42.6 (40.2-44.9)

¹The estimates are calculated based on data with sample weights derived from the 1990 census.

²The estimates are calculated based on data with sample weights derived from the 2000 census.

Appendix Table III. The NHIS Questions used to define selected health measures

Lack of health insurance and type of coverage¹

- FHI.010 {Are you/Is anyone} covered by any kind of health insurance or some other kind of health care plan?
- FHI.070 What kind of health insurance or health care coverage {do/does} {you/subject name} have? INCLUDE those that pay for only one type of service (nursing home care, accidents, or dental care), exclude private plans that only provide extra cash while hospitalized.

Usual place to go for medical care

- AAU.020 Is there a place that you USUALLY go to when you are sick or need advice about your health?
- AAU.030 What kind of place is it - a clinic, doctor's office, emergency room, or some other place?

Obtaining needed medical care

- AAU.111 DURING THE PAST 12 MONTHS, was there any time when {you/someone in the family} needed medical care, but did not get it because {you/the family} couldn't afford it?

Influenza vaccination

- AAU.310 DURING THE PAST 12 MONTHS, have you had a flu shot? A flu shot is usually given in the fall and protects against influenza for the flu season.

Pneumococcal vaccination

- AAU.320 Have you EVER had a pneumonia shot? This shot is usually given only once or twice in a person's lifetime and is different from the flu shot. It is also called the pneumococcal vaccine.

Obesity

- AHB.190 How tall are you without shoes?
- AHB.200 How much do you weigh without shoes?

Leisure-time physical activity

- AHB.110 How often do you do LIGHT OR MODERATE activities for AT LEAST 10 MINUTES that cause ONLY LIGHT sweating or a SLIGHT to MODERATE increase in breathing or heart rate?
- AHB.120 About how long do you do these light or moderate activities each time?
- AHB.090 How often do you do VIGOROUS activities for AT LEAST 10 MINUTES that cause HEAVY sweating or LARGE increases in breathing or heart rate?

AHB.100 About how long do you do these vigorous activities each time?

Current smoking

AHB.010 Have you smoked at least 100 cigarettes in your ENTIRE LIFE?

AHB.030 Do you NOW smoke cigarettes every day, some days or not at all?

Alcohol consumption

AHB.150 In your ENTIRE LIFE, have you had at least 12 drinks of any type of alcoholic beverage?

AHB.180 In the PAST YEAR, on how many DAYS did you have 5 or more drinks of any alcoholic beverage?

HIV testing

ADS.040 Except for tests you may have had as part of blood donations, have you ever been tested for HIV?

General health status

FHS.500 Would you say {subject name's} health in general is excellent, very good, good, fair, or poor?

Personal care needs

FHS.070 Because of a physical, mental, or emotional problem, {do/does} {you/anyone in the family} need the help of other persons with PERSONAL CARE NEEDS, such as eating, bathing, dressing, or getting around inside this home?

Serious psychological distress

ACN.471 During the PAST 30 DAYS, how often did you feel... ..So sad that nothing could cheer you up? ...Nervous? ...Restless or fidgety? ...Hopeless? ...That everything was an effort? ...Worthless?

Diabetes

ACN.160 Other than during pregnancy, have you EVER been told by a doctor or health professional that you have diabetes or sugar diabetes?

Asthma

ACN.090 DURING THE PAST 12 MONTHS, have you had an episode of asthma or an asthma attack?

¹Information from follow-up questions such as plan name(s) was used to reassign insurance status and type of coverage to avoid misclassification.
