It has been subject to the Agency's peer and administrative review, and it has been approved for publication as an EPA document. Mention of trade names of commercial products does not constitute an endorsement or recommendation for use.

This report is a work prepared for the United States Government by Battelle. In no event shall either the United States Government or Battelle have any responsibility or liability for any consequences of any use, misuse, inability to use, or reliance on the information contained herein, nor does either warrant or otherwise represent in any way the accuracy, adequacy, efficacy, or applicability of the contents hereof.

Foreword

The U.S. Environmental Protection Agency (EPA) is charged by Congress with protecting the Nation's land, air, and water resources. Under a mandate of national environmental laws, the Agency strives to formulate and implement actions leading to a compatible balance between human activities and the ability of natural systems to support and nurture life. To meet this mandate, EPA's research program is providing data and technical support for solving environmental problems today and building a science knowledge base necessary to manage our ecological resources wisely, understand how pollutants affect our health, and prevent or reduce environmental risks in the future.

The National Risk Management Research Laboratory (NRMRL) is the Agency's center for investigation of technological and management approaches for preventing and reducing risks from pollution that threaten human health and the environment. The focus of the Laboratory's research program is on methods and their cost-effectiveness for prevention and control of pollution to air, land, water, and subsurface resources; protection of water quality in public water systems; remediation of contaminated sites, sediments and ground water; prevention and control of indoor air pollution; and restoration of ecosystems. NRMRL collaborates with both public and private sector partners to foster technologies that reduce the cost of compliance and to anticipate emerging problems. NRMRL's research provides solutions to environmental problems by: developing and promoting technologies that protect and improve the environment; advancing scientific and engineering information to support regulatory and policy decisions; and providing the technical support and information transfer to ensure implementation of environmental regulations and strategies at the national, state, and community levels.

This publication has been produced as part of the Laboratory's strategic long-term research plan. It is published and made available by EPA's Office of Research and Development to assist the user community and to link researchers with their clients.

Sally Gutierrez, Director
National Risk Management Research Laboratory

Abstract

Capping is a common remediation technology for the containment/stabilization of contaminated sediments. During capping activities, capping material is commonly released from a barge at the water surface and falls through the water column to the sediment surface, thus providing a clean surface sediment layer. Little information exists on the potential release of contaminated sediments during and after the capping operations. This report focuses on the measured release of contaminants during individual capping events at two Confined Aquatic Disposal Cells (CADs) located in the Mystic River, Boston, MA. The two CADs (M8 and M19) were previously filled with dredged material contaminated with total petroleum hydrocarbons (TPH), polycyclic aromatic hydrocarbons (PAHs), and polychlorinated biphenyls (PCBs). U.S. EPA/ORD sampled the water column during each capping event to evaluate whether cap placement resulted in the release of contaminated sediments. Results showed capping from the water surface resulted in contaminant resuspension with the most significant releases occurring during the application of the first layers of capping material. With each subsequent layering of the capping material, levels of contaminant resuspension decrease with each successive application.

1.0 INTRODUCTION

This technical report was prepared in fulfillment of Contract No. 68-C7-0008, Work Assignment (WA) No. 4-26 by Battelle under the sponsorship of the United States Environmental Protection Agency's (U.S. EPA's) National Risk Management Research Laboratory (NRMRL). The work was conducted at Battelle, Columbus, OH, from April 11, 2000 to September 30, 2001.

Mr. George T. Moore is the U.S. EPA Project Officer for this contract and Mr. Terrence Lyons is the U.S. EPA Work Assignment Manager (WAM). Dr. Abraham Chen is the Battelle Program Manager and Battelle Work Assignment Leader (WAL). The members of the Battelle project staff included Ms. Jennifer Ickes, Mr. Wayne Trulli, Dr. Carl Albro, Ms. Carole Peven-McCarthy, Ms. Lydia Cumming, and Dr. Victor Magar.

1.1 Background

The U.S. EPA's NRMRL is interested in evaluating if placement of marine caps would result in the release of contaminants into the surrounding water column. The goal of this study was to achieve a better understanding of the amount of contaminants released into the surrounding water column before, during, and after capping. For this study, a state-of-the-art oceanographic technology was used to acquire real time, high-resolution field data to determine the extent of the release of contaminants into the water column caused by sediment agitation from capping activities for two confined aquatic disposal (CAD) cells at the Mystic River/Boston Harbor, Boston, MA. A parallel study conducted under U.S. EPA Contract No. 68-C7-0008, WA No. 4-30 focused on the resuspension of polycyclic aromatic hydrocarbon (PAH) compounds during capping at the Wyckoff/Eagle Harbor Superfund site in Bainbridge Island, WA (Battelle, 2001).

A common remediation technology for the containment/stabilization of contaminated sediments is capping. Capping is the covering of contaminated sediments with sand, gravel, or fine-grain dredged or excavated materials. During capping activities, tons of capping material are released from barges at the water's surface to fall to the sediment layer below. Caged fish located downstream of the capping site have been used to try to evaluate the extent of exposure from individual capping activities. Little information exists on the amount of contaminants released into the surrounding water column during and after capping.

CAD cells in Boston Harbor were used as disposal sites for silty, fine-grained sediments that were determined to be unsuitable for ocean placement from the Boston Harbor Navigation Improvement Project (BHNIP). Two of the CAD cells, located in the Mystic River portion of Boston Harbor (Figure 1-1), were filled with dredged material in January 2000. The two cells, M8 and M19 (Figure 1-2), were left undisturbed for 8 months to allow the dredged material to consolidate prior to capping. Consolidation was expected to reduce mixing between the sediments in the CAD cells and the cap sediments.

CAD cell M8 was 700 ft by 200 ft, was excavated to 90 ft deep, and had an estimated capacity of 155,000 yd³ of dredged material. CAD cell M19 was the larger of the two cells at 800 ft by 300 ft, was excavated to 80 ft deep, and had an estimated capacity of 179,000 yd³ of dredged material. Average concentrations of total petroleum hydrocarbons (TPH), polychlorinated biphenyls (PCBs), and PAHs measured in CAD cells from the Mystic River were 1,519 mg/kg, 220 µg/kg, and 64,478 µg/kg, respectively (USACE, 1999a). These concentrations were not measured in either CAD cells M19 or M8. However, all CAD cells in the Mystic River were filled with dredged material from the same location, so concentrations of the material placed in cells M8 and M19 should be consistent with these concentrations.

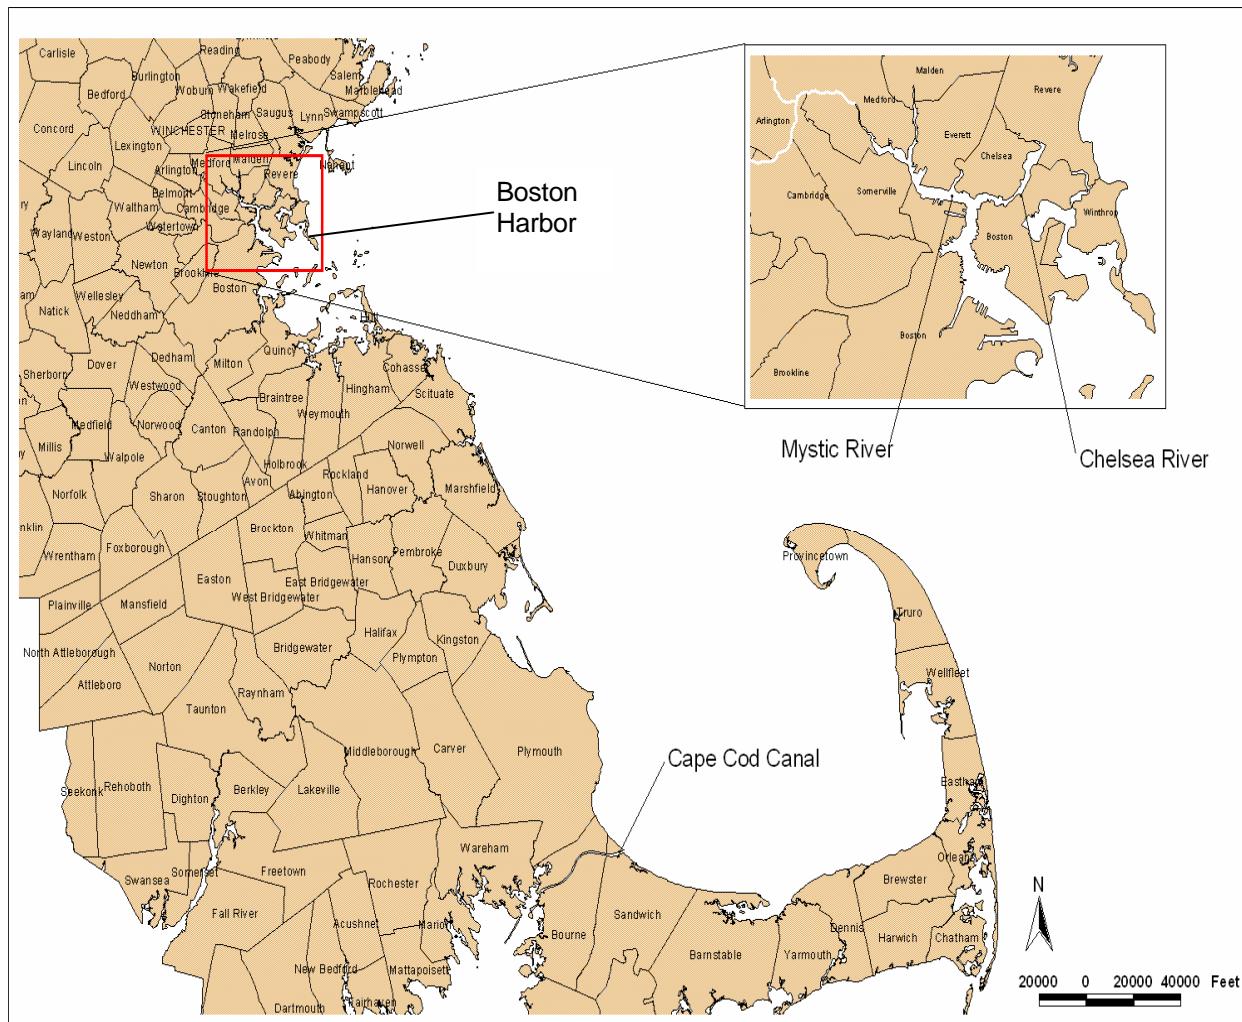

Figure 1-1. Location of Boston Harbor Navigation Improvement Project and Cape Cod Canal
 (Source: Fredette et al., 2000)

Sand dredged from Cape Cod Canal (Figure 1-1) was used to cap CAD cells M8 and M11 (Fredette et al., 2000). The sand cap was “sprinkled” on the cells using a partially opened hopper dredge, which was maneuvered using a tug rather than utilizing the dredge’s engines (Figure 1-3). This method of capping was expected to minimize disturbance of the silt material in the CAD cells.

1.2 Environmental System

During a May 16, 2000 site visit, the U.S. EPA WAM, U.S. EPA Region 1 office, United States Army Corps of Engineers’ (USACE’s) New England District, and Battelle identified Boston Harbor as a suitable candidate site for monitoring sediment agitation and mixing during a capping event. Boston Harbor was selected for this study for the following reasons:

- The site has a well-documented history of contaminated sediments disposal, which made identification of contaminants of concern (COCs) easier and eliminated the need for sample collection and analysis for site characterization.

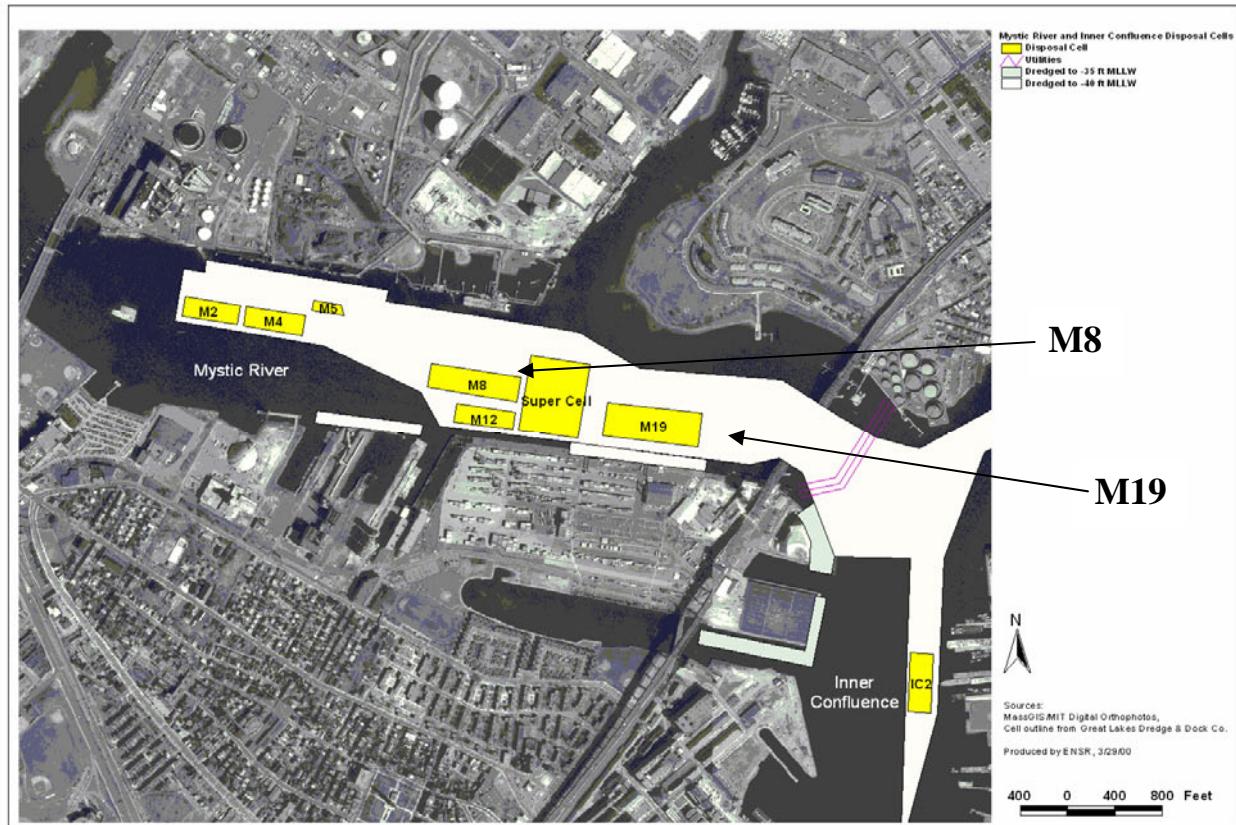

Figure 1-2. Boston Harbor Navigation Improvement Project, Mystic River and Inner Confluence Disposal Cells (Source: Fredette et al., 2000)

Figure 1-3. Tug Boat Pushing Great Lakes Hopper Dredge, *The Manhattan Island*

- COC concentrations in the CAD were high enough to make detection possible during monitoring.
- The U.S. EPA Region 1 Office and the USACE's New England District expressed interest in this study and agreed to provide technical support for the field efforts, including data exchange.
- The site was well characterized, thereby provided a large database of information to select appropriate sample locations.
- The capping of the CADs took place during fiscal year 2000, allowing field activities to be completed during the time allotted for this work assignment.

1.3 Project Objectives

The primary objective of this work assignment was to evaluate if cap placement resulted in the release of contaminants into the surrounding water column. This report focuses on results of water quality analyses during capping events at the two Boston Harbor/Mystic River CAD cells.

2.0 FIELD SAMPLING AND ANALYTICAL METHODS

This section describes field sampling methods used at Boston Harbor, and methods used to analyze samples for TPH, PCBs, and PAHs, and Resource Conservation and Recovery Act (RCRA) 8 metals. Field and analytical methods were conducted in accordance with a U.S. EPA-approved Quality Assurance Project Plan (QAPP) for the study (QAPP I.D. No. 206-Q2-0) (Battelle, 2000). The experimental design is described in Section 2.0 of that QAPP.

Table 2-1 identifies both critical and noncritical measurements that were made during the course of this study.

Table 2-1. Critical and Noncritical Measurements

Measurement	Method/Instrument
<i>Critical Measurements</i>	
TPH (fingerprint) in water	Battelle SOP 5-202
PCBs in water	Battelle SOP 5-128
PAHs in water	Battelle SOP 5-157
RCRA metals in water	U.S. EPA Method 200.8
TSS	Battelle SOP 5-053
Transmissometry/ Turbidity	Seatech 20-cm (660 nm)
GPS Navigation	Battelle SOP
<i>Noncritical Measurements</i>	
Conductivity	OS200 CTD
Temperature	OS200 CTD
Depth	Furuno FCV-52
Current velocity	RD Instruments ADCP WHM600-I-UG6

ADCP = Acoustic Doppler Current Profiler.

CTD = conductivity, temperature, and depth.

GPS = global positioning system.

SOP = Standard Operating Procedure.

TSS = total suspended solids.

2.1 Marine Water Sampling

2.1.1 Sampling and Navigation. Monitoring of the capping event was conducted using the Battelle Ocean Sampling System (BOSS) deployed from a survey vessel. The BOSS in situ sensor package included: conductivity, temperature, depth, and transmissometers, and a Teflon™/titanium pumping system for sample collection (Figure 2-1). A second transmissometer, calibrated to the in situ data, was located at the water sampling manifold so that the appropriate parcel of water could be identified and sampled at the appropriate time. Additionally, an Acoustic Doppler Current Profiler (ADCP) was deployed to obtain vertical profiles of horizontal currents. Table 2-2 provides a summary of the field measurements that were acquired from the survey vessel during each monitoring event. A more detailed description of monitoring activities and sample collection can be found in the Boston Harbor Plume Tracking Survey Report (Appendix A).

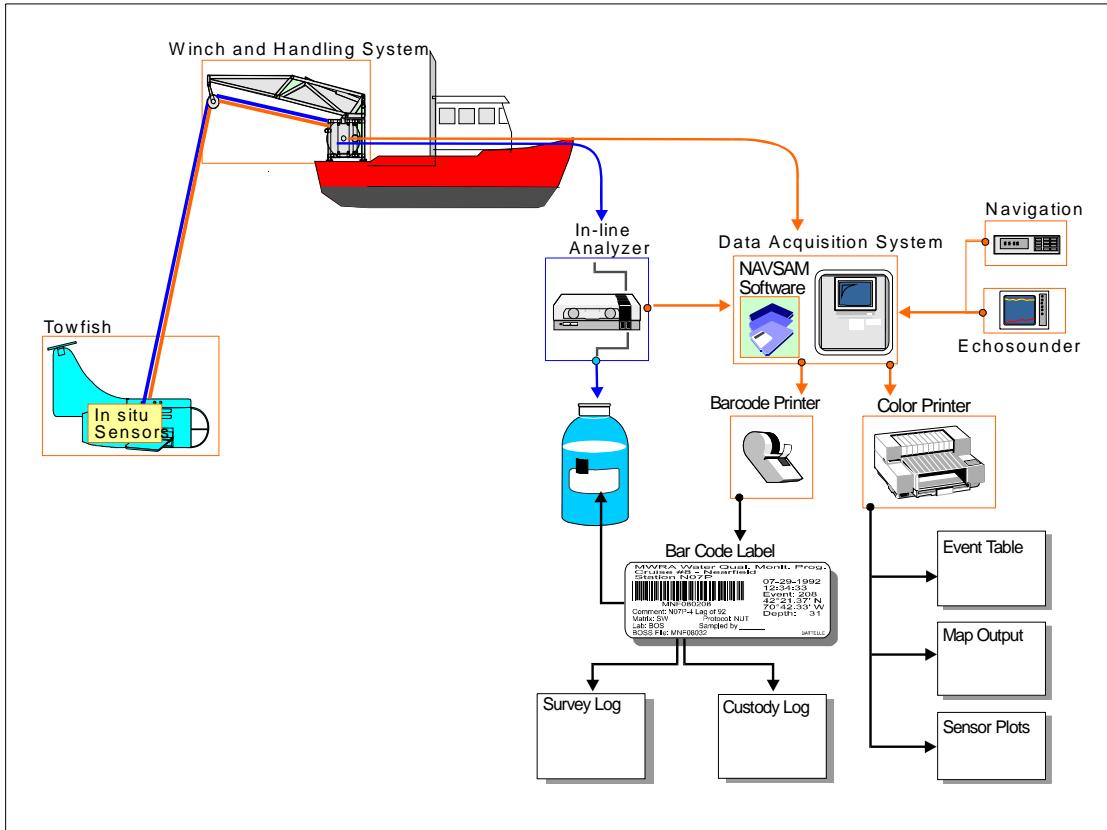

Figure 2-1. BOSS In Situ Measurement and Onboard Components

Table 2-2. Field Measurements and Instruments

Measurements	Units	Instrument
Conductivity	µmhos/cm	OS200 CTD
Temperature	°C	OS200 CTD
Pressure	m	OS200 CTD
Transmissometry/Turbidity	m ⁻¹	Seatech 20-cm (660 nm) (2)
Bottom depth	m	Furuno FCV-52
Navigational position	degrees	Northstar 942X
Ocean current velocity	cm/sec	RD Instruments ADCP WHM600-I-UG6

Several days prior to the field operations, all equipment was installed aboard the survey vessel and tested. Two days prior to the initiation of capping, background sampling events were conducted at CAD cells M8 and M19. Monitoring for both cells was a deviation of the approved QAPP (Battelle, 2000), which stated that either cell M8 or cell M19 would be monitored. Monitoring of both cells was unavoidable because the hopper dredge was unable to cap one CAD cell continuously as the USACE had anticipated. Monitoring activities were conducted in approximately 14-hour intervals. Each 14-hour interval included approximately 1 hour of capping for each barge drop plus 13 hours of barge reloading. The hopper dredge was reloaded at Cape Cod, MA.

2.1.2 Monitoring and Sampling Operations. Field survey operations consisted of 10 separate sampling events conducted over a 22-day period (approximately two events per day plus background samples before and after capping). All 10 events were conducted using the BOSS (Figure 2-2). During the first event, sensor data and water samples were collected prior to initiation of capping activities at CAD cells M8 and M19 for baseline/reference data. During the next eight events, sensor data and water samples were collected while capping activities were conducted at either cells M8 or M19 (Table 2-3). During the last (10th) event, sensor data and water samples were collected four days after completion of all capping activities at cells M8 and M19. Figure 2-3 shows the target BOSS transects and target sampling locations used for background surveys and active monitoring events (i.e., during capping).

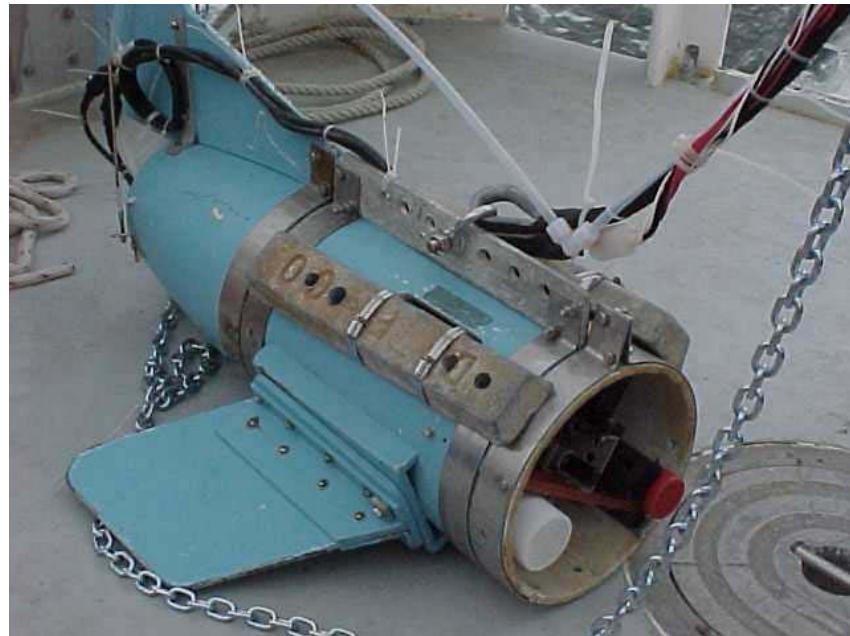

Figure 2-2. BOSS Onboard Battelle's Vessel, Aquamonitor

Table 2-3. Number of Samples Collected During the Survey Events at Boston Harbor

Type of Event	Number of Events per Survey	Number of Samples per Event		
		CAD Cell M19	CAD Cell M8	Total
Pre Survey	1	5	5	10
Pre Runs 1 – 4	4	3	0	12
Runs 1 – 4	4	9	0	36
Post Runs 1 – 4	4	3 ^(a)	0	10
Pre Runs 5 – 8	4	0	3	12
Runs 5 – 8	4	0	9	36
Post Runs 5 – 8	4	0	3	12
Post Survey	1	5	5	10
Total	-	-	-	138

- (a) Sampler struck bottom immediately following sample collection for the first Post Run 3 sample, and system components fouled with mud. As a result the second and third samples for Post Run 3 could not be collected.

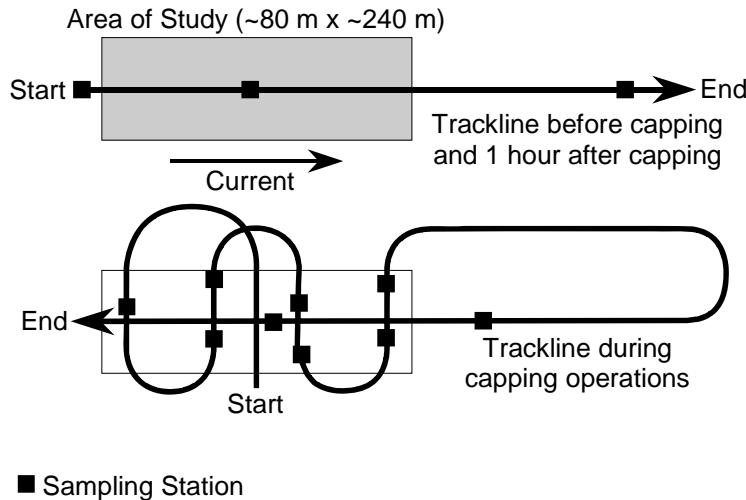

Figure 2-3. Transect Line, Sampling Stations, and Station Types for BOSS Surveys and Monitoring. The top transect represents the daily Pre Run and Post Run background monitoring events. The bottom transect represents a typical monitoring event during capping.

A total of 138 water sample sets were collected during the study. Ten sample sets (for organics, metals, and TSS) were collected during each of the first and last (10th) sampling events along the Standard Transect Line (five at CAD cell M8 and five at CAD cell M19) (see Figure 2-3, Table 2-3, and Appendix A Table 1). Fifteen sample sets (for organics, metals, and TSS) were collected during each of the eight capping events (i.e., sampling events 2 through 9). Three samples were collected before and after each of the two daily capping events (six samples total per event).

During these monitoring activities, real-time BOSS sensor data was collected continuously along several transects within the designated CAD. The BOSS was towed at a distance of 2 m above the river bottom for all transects (unless obstructed) in order to optimize the potential to detect resuspended sediments.

Three samples were collected along the Pre- and Post-Dump Transect Lines (Figure 2-3). Nine samples were collected along the Standard Transect Line (Figure 2-3 and Appendix A Table 1) during actual capping activities for each of the eight sampling events during capping.

Five sediment samples of the sand used as capping material for CAD cells M8 and M19 were collected by the USACE. These five samples were analyzed for organic contaminants.

2.1.3 Field Measurements and Collection of Water Samples. Monitoring equipment and sampling techniques used for the monitoring survey are described in detail in Appendix A and in the approved QAPP I.D. No. 206-Q2-0 (Battelle, 2000). Chain of custody documentation for all samples collected are provided in Appendix B.

2.1.4 Decontamination of Sample Pumping System. Prior to each sampling event, the sample pumping system was decontaminated by pumping the following solvents through the system (Figure 2-4):

- Dichloromethane (DCM)
- Acetone
- 5% hydrochloric acid (HCl)
- Deionized water (3 times the tubing volume).

Figure 2-4. Decontaminating the BOSS Between Sampling Events

All solvents, acids, and aqueous waste residue resulting from the decontamination of field sampling equipment were collected in separate, approved waste containers and returned to Battelle, Duxbury, MA where they were disposed of in an appropriate hazardous waste stream.

2.1.5 Field Observations. A complete description of field observations can be found in the Boston Harbor Plume Tracking Survey Report (Appendix A).

2.2 Analyses of Organic Contaminants

Given holding time constraints, samples were prepared and extracted within 7 days of the respective collection dates. The extracts from each sample matrix were analyzed for TPH, PCBs, and PAHs within 40 days of extraction. General physical observations of the samples (e.g., color, visible sediments, and presence of plant/wood debris) were made and recorded in the laboratory preparation records. Items such as sediments and debris were removed prior to processing by allowing the samples to settle before decanting the supernatant for extraction and analysis.

Water samples obtained during field sampling were prepared for analysis of TPH, PCBs, and PAHs according to Battelle SOP 5-200-02 (*Water Extraction for Trace Level Semi-Volatile Organic Contaminant Analysis*) (Battelle, 2000). The method is summarized as follows:

If suspended sediment was visibly present in the water sample, it was filtered through a quartz glass fiber filter (1.0 μm). Water samples of approximately 1,000 mL were spiked with Surrogate Internal Standard (SIS) and serially extracted three times with 60 mL of DCM using a separatory funnel. The SIS compounds added were *o*-terphenyl, naphthalene-d₈, phenanthrene-d₁₀, chrysene-d₁₂, and the

following PCB congeners¹: Cl2 (PCB 14), Cl3 (PCB 34), Cl5 (PCB 104), and Cl5 (PCB 112). The three extracts were combined and treated with anhydrous sodium sulfate to remove residual water from the extract. The dried extract then was concentrated to approximately 0.5 mL using the Kunderna Danish (K-D) and nitrogen evaporation (N-evap) techniques. The combined extracts were passed through a 2% deactivated alumina column, and the eluate from the column concentrated to 900 L using K-D and/or N-evap concentration techniques. This concentrated extract was fractionated by size-exclusion high-performance liquid chromatography (HPLC) water. The HPLC extract was concentrated under nitrogen, and the concentrated extract was spiked with Recovery Internal Standard (RIS) (containing 5 α -androstane, acenaphthene-d₁₀, fluorene-d₁₀, benzo[a]pyrene-d₁₂), and the following PCB congeners: Cl5 (PCB 96), Cl5 (PCB 103), and Cl6 (PCB 166). The extract then was split for TPH and PAH/PCB analyses.

For selected filtered samples, the filters were placed into a 500-mL glass jar and spiked with SIS and serially extracted three times with 100 mL of DCM using shaker table techniques. Sand capping material collected by the USACE was analyzed in a similar manner as the filters. The SIS compounds added were *o*-terphenyl, naphthalene-d₈, phenanthrene-d₁₀, chrysene-d₁₂, and the following PCB congeners: Cl2 (PCB 14), Cl3 (PCB 34), Cl5 (PCB 104), and Cl5 (PCB 112). The three extracts were combined and treated with anhydrous sodium sulfate to remove residual water from the extract. The dried extract then was concentrated to approximately 0.5 mL using the K-D and N-evap techniques. The combined extracts were passed through a 2% deactivated alumina column, and the eluate from the column concentrated to 900 L using K-D and/or N-evap concentration techniques. This concentrated extract was fractionated by size-exclusion HPLC water. The HPLC extract was concentrated under nitrogen, and the concentrated extract was then spiked with RIS (containing 5 α -androstane, acenaphthene-d₁₀, fluorene-d₁₀, benzo[a]pyrene-d₁₂), and the following PCB congeners: Cl5(PCB 96), Cl5(PCB 103), and Cl6(PCB 166). The extract then was split for TPH and PAH/PCB analysis.

The following quality control samples were processed along with each batch of \leq 20 water samples:

- 1 laboratory control sample (LCS)
- 1 procedural blank (PB)
- 1 duplicate (DUP)
- 1 matrix spike (MS).

A quality control summary for all samples analyzed for organics is provided in Appendix C.

2.2.1 TPH Analysis. The high resolution “fingerprint” of the extractable TPH from each water sample was conducted at Battelle’s Duxbury laboratory using Battelle SOP 5-202-04, *Determination of Low Level Total Petroleum Hydrocarbons and Individual Hydrocarbon Concentrations in Environmental Samples* (Battelle, 2000). This method employed capillary gas chromatography with flame ionization detection (GC/FID). The analytical system was comprised of a Hewlett Packard (HP) 5890 or equivalent GC and FID. Prior to sample analysis, a five-point calibration was performed to demonstrate the linear range of the analysis and to determine the individual compound response factors (RFs) at each calibration solution concentration. The calibration solution was composed of selected C₈ to C₃₆ *n*-alkanes, pristane, and phytane. Analyte concentrations in the standard solutions ranged from approximately 1.0 μ g/mL to 100 μ g/mL. The RF at each calibration concentration was determined and the TPH RF was based on the average response factors of all the target analytes in the calibration solution. A mid-level calibration check and solvent blank was analyzed for every 10 samples. Samples were quantified against the RIS 5 α -androstane. TPH laboratory-reported sample data is provided in Appendix D.

¹ PCB numbers in parentheses refer to the International Union of Pure and Applied Chemistry (IUPAC) nomenclature.

2.2.2 PAH Analysis. Water sample extracts were analyzed for the concentrations of 16 priority PAH analytes (Table 2-3) by Battelle's Duxbury laboratory using high-resolution capillary gas chromatography with mass spectrometry (GC/MS) as described in Battelle SOP 5-157, *Identification and Quantitation of Polynuclear Aromatic Hydrocarbons by Gas Chromatography/Mass Spectrometry* (Battelle, 2000). The analytical system was comprised of a HP 5890 or equivalent GC, equipped with an electronic pressure controlled (EPC) inlet and an HP 5972 or equivalent mass selective detector (MSD) operating in the selected ion monitoring (SIM) mode. A minimum of a five-point RF calibration was run with analyte concentrations in the standard solutions ranging from approximately 0.02 ng/µL to approximately 10 ng/µL. The samples were bracketed by passing standard checks analyzed no less frequently than every 10 samples and at the completion of each sequence.

Quantification of individual compounds was obtained by the method of internal standards using the RIS compound acenaphthene-d₁₀ as the quantification internal standard. Total PAH was determined as the sum of the individual PAH analytes. Laboratory-reported sample data for PAHs is provided in Appendix E.

2.2.3 PCB Analysis. Water extracts were analyzed for the concentration of 18 PCB congeners by Battelle's Duxbury laboratory according to Battelle SOP 5-128, *Identification and Quantitation of Polychlorinated Biphenyls (by Congener and Aroclor) and Chlorinated Pesticides by Gas Chromatography/Electron Capture Detection* (Battelle, 2000). This method employed high-resolution capillary GC with an electron capture detector (ECD). The analytical system was comprised of a HP 5890 or equivalent GC equipped with an EPC inlet and dual ECD detectors. A minimum of a five-point RF calibration was run with analyte concentrations in the standard solutions ranging from 0.005 ng/µL to approximately 1.0 ng/µL. All 18 major PCB congeners (Table 2-3) were included in the calibration standards. The samples were bracketed by passing standard checks analyzed no less frequently than every 10 samples and at the completion of each sequence.

Quantification of individual compounds were obtained by the method of internal standards using the RIS compounds as quantification internal standards using Cl5 (PCB 103) and Cl6 (PCB 166). Total PCBs were determined as the sum of the individual PCB congeners. Laboratory-reported sample data for PCBs is provided in Appendix F.

2.3 TSS Analyses

Water samples obtained during field sampling were prepared for analysis according to Battelle SOP 5-053 (Total Suspended Solids) (Battelle, 2000). The method is summarized as follows:

Sample volumes of at least 500 mL were stored at 4°C±2°C in the dark for no more than 7 days. These samples then were filtered using a polysulfone filter that was 47 mm in diameter and had a pore size of 0.45 µm. All samples were filtered in duplicate. A known amount of sample volume was decanted into the filtering apparatus and filtered using a vacuum pump at 5 psi. Before the filter was removed from the filter holder it was rinsed with Milli-Q water adjusted to pH 8. The filter then was air-dried in a desiccator for at least 48 hours and reweighed.

TSS was calculated as follows:

$$\text{TSS (mg/L)} = \frac{\text{particle mass (mg)}}{\text{volume of water filtered (L)}}$$

where: particle mass (mg) = (filter with sample – filter tare weight)
volume of water filtered = (volume measured directly as initial volume – final volume).

2.4 RCRA 8 Metals Analyses

Water samples obtained during field sampling for metals analysis were prepared according to U.S. EPA Method 200.8 for total recoverable elements. Samples were acidified with (1+1) nitric acid to pH < 2 in the field using reagent-grade acid. Samples were held for at least 16 hours at pH < 2 prior to analysis. All quality control samples specified by U.S. EPA Method 200.8 were prepared with:

- 1 quality control sample (quarterly)
- 1 laboratory reagent blank (1 per ≤ 20 samples)
- 1 laboratory fortified blank (1 per ≤ 20 samples)
- 1 matrix spike sample (1 per 10 samples).

Water samples were analyzed, without additional laboratory processing, using inductively coupled plasma–mass spectrometry (ICP-MS). Table 2-4 lists the target compounds and associated method detection limits (MDLs) for this project. The method detection limits for RCRA 8 metals reported for this project are higher than can generally be determined by ICP-MS because of matrix interferences during analysis of the samples. Quality control summaries for samples analyzed for RCRA 8 metals are provide in Appendix C. Laboratory-reported sample data for RCRA 8 metals is provided in Appendix G.

Table 2-4. Compounds of Interest and Method Detection Limits

PAHs (ng/L)	MDL	PCBs (ng/L) ^(a)	MDL

3.0 RESULTS AND DISCUSSION

This section describes the TPH, PAH, PCB, RCRA 8 metals, and TSS analytical results. Tables 3-1 and 3-2 list the analytical results for the Pre Survey. Tables 3-3 through 3-10 list the TSS, TPH, total PAH, and total PCB analytical results, and Tables 3-11 through 3-18 list the analytical results for the RCRA 8 metals. Table 3-19 lists TPH, total PAH, and total PCB results for the sand capping material. Post Survey results are listed in Table 3-20 and 3-21. All samples are listed in the order in which they were collected by the BOSS. Samples will be described in the following sections using the terms described below:

- Pre Survey: samples taken two days before capping began in Boston Harbor
- Pre Run (1-8): samples taken approximately one hour before each capping event
- Run (1-4): samples taken during capping at CAD cell M19
- Run (5-8): samples taken during capping at CAD cell M8
- Post Run (1-8): samples taken approximately one hour after each capping event for Runs 1-8
- Post Survey: samples taken four days after capping was completed
- Sand Capping Material: sand samples collected by USACE and Great Lakes from the sand used to cap both CAD cells M19 and cell M8.

Nine of the samples collected during capping were filtered before analysis to determine the soluble fraction of TPH, PAHs, and PCBs and the amount of these organics sorbed to particulate matter. Tables 3-3, 3-5, 3-7, 3-8, and 3-9 present the combined concentrations of the filtrate and particulate matter, and Section 3.7 compares the two fractions of the filtered samples.

3.1 Pre Survey Background

Two days prior to capping, water samples were taken in Boston Harbor using the BOSS. Five samples each were collected at both CAD cell M8 and cell M19 (Table 3-1). PCB results from all ten samples showed that PCB levels were less than Analytical Limits of Quantitation (ALQ) prior to capping in Boston Harbor. For several samples, all 18 PCB congeners were non-detected or were below the ALQ (<ALQ) for these samples. These samples are reported as <ALQ in the following tables; analytical data associated with these samples can be found in Appendix F. TSS levels associated with these samples were low (<4.1 mg/L). TPH concentrations ranged from 8.34 µg /L to 99.63 µg/L, except for one sample (CAD01021) collected at CAD cell M8 which was <ALQ. Total PAH concentrations were between 32.17 ng/L and 72.26 ng/L.

Only two of the RCRA 8 metals were detected in the Pre Survey samples (Table 3-2). Arsenic was detected in four samples, with concentrations ranging from 0.024 mg/L to 0.035 mg/L. Chromium was detected in all ten background samples, with concentrations ranging from 0.056 mg/L to 0.064 mg/L. As expected, no observable differences in water quality could be determined between the two CAD cells prior to capping in Boston Harbor.

3.2 Total Suspended Solids

TSS concentrations for the Pre Run samples for Run 1 were consistent with before capping background samples (3.6 to 5.2 mg/L; see Table 3-3). Once capping began at cell M19, TSS levels increased to as high as 122 mg/L and remained elevated throughout Run 1. TSS samples likely included some of the capping sand as it was being released from the hopper dredge. The highest TSS levels at cell M19 were recorded during Run 1. TSS one hour after capping during Run 1 decreased to approximately 9 mg/L, which was slightly higher than the initial TSS values for the Pre Run samples at cell M19.

Note: Bold type indicates detected concentrations

Subsequent runs (Runs 2, 3, and 4; see Tables 3-4, 3-5, and 3-6, respectively) showed similar patterns of elevated TSS levels during each run, followed by decreased levels that approached background levels between runs. However, concentrations of TSS during capping for Run 2 (i.e., approximately 12 to 42 mg/L) were much lower than those seen during Run 1. Runs 3 and 4 had similar results to Run 2, with TSS levels of approximately 8 to 53 mg/L.

Samples collected from cell M8 showed a trend similar to those from cell M19. Run 5, which was the first capping event at cell M8, had concentrations of TSS similar to those of Run 1 at cell M19, with a maximum TSS concentration of 102 mg/L (see Table 3-7). The next three runs at cell M8 (see Tables 3-8, 3-9, and 3-10) showed a decrease in TSS levels of approximately 3 to 52 mg/L. During Run 7 a very high detection of TSS (191.74 mg/L) was observed for the first sample collected during that run. This could either be the result of resuspension of silt material that was not capped during the previous events or it could be the result of collection of clean capping sand by the BOSS.

3.3 Total Petroleum Hydrocarbons

TPH concentrations tended to vary over the 22 days of sampling (Tables 3-3 through 3-10). At cell M19, the highest average TPH level (i.e., 729.23 µg/L) was detected during Post Run 3, with the next highest level occurring during Run 1 (i.e., 218.1 µg/L) (Figure 3-1). Only one sample and one duplicate were collected during Post Run 3 because the BOSS struck bottom immediately following the collection

CAD0143C	9/12/00	23:36	3.84	<156.80	61.82	0.47
CAD0143CDUP	9/12/00	23:36		59.80	50.92	0.90

of these samples, disabling the system for further sampling during this run. As a result, the system had to be taken back to the pier and cleaned. Figure 3-1 shows that Post Run samples often would have greater TPH concentrations than those collected during capping. Figure 3-2 shows that average TPH concentrations during capping at cell M8 remained relatively consistent with Post Survey concentrations. Runs 1-4 were more variable because of a few very high detections during Run 1, Run 3, and Post Run 3; note the difference in scales of the y-axis between Figures 3-1 and 3-2. Only one sample was collected during Post Run 3, so this concentration is not based on an average.

(a) Value includes both water and sediment concentration for samples that were filtered before analysis. Water and sediment concentrations are reported separately in Table 3-11.

The TPH concentrations above cell M19 and cell M8 resulting from the capping activities were likely overshadowed by background TPH due to the level of urbanization and industrialization around Boston Harbor and by the large amount of boat traffic in the harbor. In general, there was no clear trend between samples collected for the Pre and Post Survey samples and samples collected during capping.

3.4 Polycyclic Aromatic Hydrocarbons

Total PAH concentrations followed a more predictable pattern than TPH concentrations, with the highest total PAH concentration measured during Run 1, and with decreasing concentrations measured throughout the remaining events (Figures 3-3 and 3-4).

Note: Bold type indicates detected concentrations

Pre Run 1 samples for cell M19 had concentrations similar to background samples, with an average Pre Run 1 concentration of 59.99 ng/L (Figure 3-3; Table 3-3). Total PAH concentrations collected during capping were much greater than background and Pre Run 1 concentrations. Total PAH concentrations in samples taken during Run 1 averaged $1,372 \text{ ng/L} \pm 1,569 \text{ ng/L}$, with a maximum of 5,242.30 ng/L. Post Run 1 samples collected one hour after capping stopped for Run 1 remained elevated above the Pre Run 1 samples, but decreased significantly from samples collected during Run 1.

Pre Run 2 samples had higher total PAH concentrations compared to the samples collected during Post Run 1 and Run 2. These samples also had elevated TSS, TPH, and PCB concentrations. The cause of the higher concentrations in the Pre Run 2 samples is not known. Shortly before the Pre Run 2 samples were collected, a container ship entered the harbor, passing over cell M19. It is possible the turbulence from this ship's engines caused uncapped contaminants from cell M19 to be resuspended for a short period of time. Further resuspension after Run 2 was not observed at cell M19.

Total PAH concentrations continued to decrease over the remaining capping events at cell M19. By the end of sampling at cell M19, concentrations had returned to background levels measured during the Pre Survey before capping began. For Runs 3 and 4, total PAH concentrations during each run were slightly higher than Pre Run and Post Run concentrations.

Samples from Runs 5-8 at cell M8 followed a similar pattern to cell M19, but the PAH concentrations for cell M8 were on average lower than those from cell M19. The highest PAH concentration for cell M8 were detected during Run 5 (the first run), with an average concentration of 310 ng/L and a maximum concentration of 770.72 ng/L (Figure 3-4; Table 3-7). The Post Run 5 concentrations remained elevated, but PAH levels returned to Pre Survey concentrations by the next morning, as seen by the Pre Run 6 sampling. The remaining three runs had elevated PAH concentrations averaging around 100 ng/L. The cause of the elevated total PAH concentrations during Runs 6, 7, and 8 is not known. The Post Run 8 concentrations dropped back to Pre Survey levels with an average concentration of 63.5 ng/L, and a maximum concentration of 78.47 ng/L.

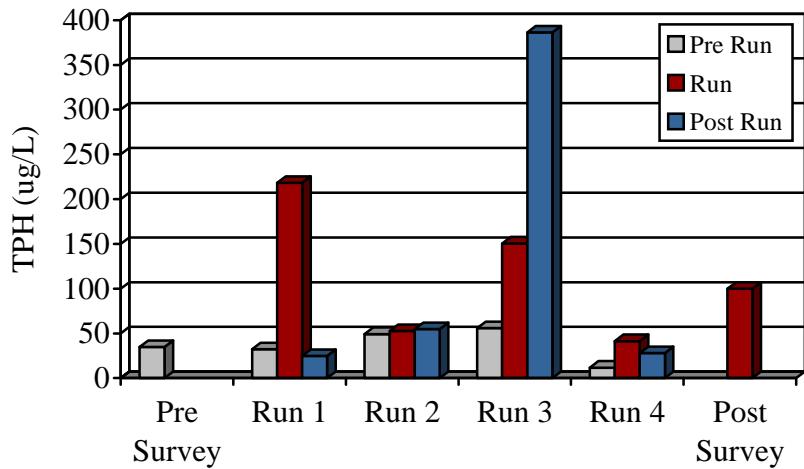

Figure 3-1. Average TPH Concentrations – Cell M19

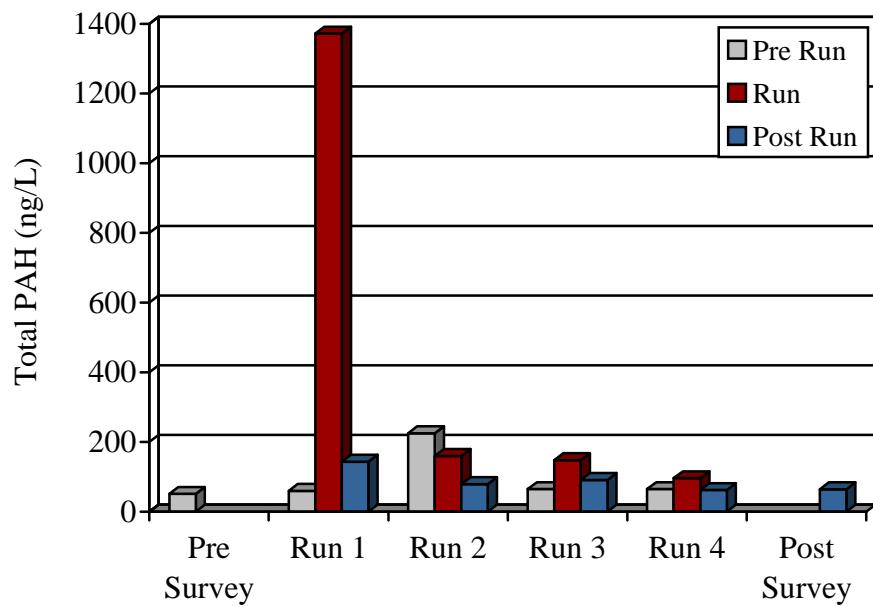

Figure 3-3. Average Total PAH Concentrations – Cell M19

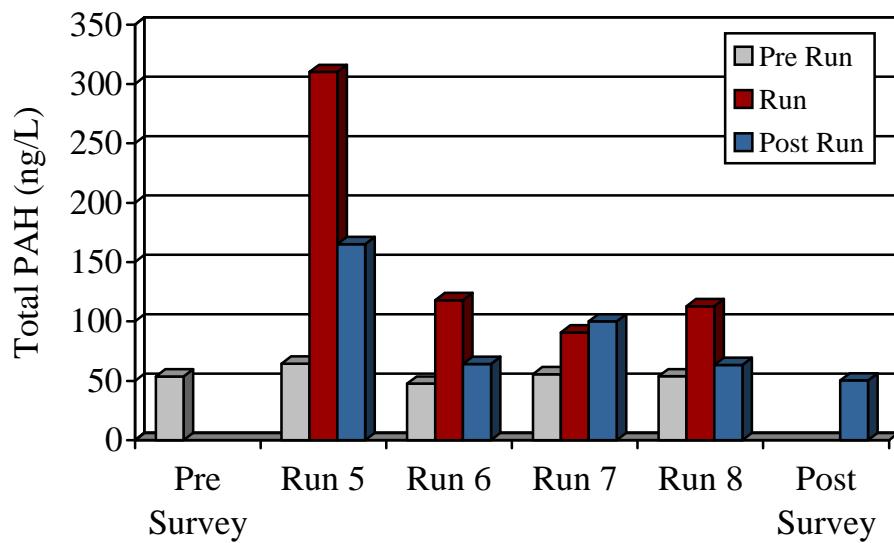

Figure 3-4. Average Total PAH Concentrations – Cell M8

3.5 Polychlorinated Biphenyls

PCB concentrations in background samples and Pre Run 1 samples were all <ALQ for cell M19. The first PCB detection occurred during Run 1, where concentrations average $19.7 \text{ ng/L} \pm 25.6 \text{ ng/L}$, with a maximum value of 84.24 ng/L (Table 3-3). The 84.24 ng/L sample collected during Run 1 was the highest PCB detection for all sampling events, and was the only sample that exceeded the water quality criteria, set for the BHNIP, for PCBs of 30 ng/L (USACE, 1999b). Samples taken 1 hour after Run 1 dropped back to <4.7 ng/L. The first Pre Run 2 sample had a PCB concentration of 18.02 ng/L, but the other two Pre Run 2 samples had concentrations <5 ng/L.

PCB concentrations were lower during Run 2 than Run 1, and averaged $1.8 \text{ ng/L} \pm 1.6 \text{ ng/L}$ with a maximum of 4.25 ng/L (Figure 3-5; Tables 3-3 to 3-6). Average concentrations for Run 3 and Run 4 were higher than Run 2, but much lower than Run 1, and Pre Run 4 samples returned to <ALQ. The average PCB concentrations for Runs 3 and 4 were 3.3 ng/L and 4.6 ng/L, respectively; variation in the Run 4 samples was high with one elevated detection at 23.79 ng/L, and three Run 4 samples measured <ALQ.

The PCB concentrations at CAD Cell M8 were, in general, lower than those for cell M19 (Figure 3-6). The highest detection at cell M8 was in a sample from Pre Run 5 (the first run), measured at a concentration of 28.30 ng/L (Tables 3-7 to 3-10). The cause of the elevated total PCB concentration during Pre Run 5 is not known. PCB levels remained elevated during Run 5 with a high concentration of 14.49 ng/L; the remaining samples at cell M8 did not exceed 12.00 ng/L. No samples collected during sampling at cell M8 exceeded the water quality standard of 30 ng/L.

3.6 RCRA 8 Metals

The following eight metals were analyzed in the Boston Harbor water samples: arsenic, barium, cadmium, chromium, silver, lead, mercury, and selenium. Tables 3-12 through 3-19 show the results of the RCRA 8 metals for Runs 1-8, respectively. Three of these metals, barium, cadmium, and silver, were <ALQ in all samples collected during the survey. Mercury was detected only in one sample during Run 8 at cell M8 at a concentration of 0.0013 mg/L. Selenium was not detected in any of the samples collected before or during capping, but it was detected in the Post Survey samples at a range of 0.023 to 0.17 mg/L (see Section 3.8). Lead was detected in all but one sample collected during Run 4 at cell M19. The lead concentrations in these samples ranged from 0.024 to 0.025 mg/L, which was just slightly higher than the detection limit of 0.02 mg/L. One Post Survey sample for cell M8 also had a lead detection of 0.15 mg/L (see Section 3.8). However, lead was not detected in any other samples during the survey.

Arsenic was detected in the Pre Survey samples for both cell M19 and cell M8, but was not detected again until Run 4 at a concentration range of 0.024 to 0.031 mg/L. Detections of arsenic also were observed in a few samples from Run 5, Run 6, Run 7, and Run 8, with the highest detection of 0.04 mg/L during Run 7.

Chromium was detected in all of the Pre Survey samples at a range of 0.056 to 0.064 mg/L. Chromium also was detected in two samples from Run 1 at 0.041 and 0.047 mg/L. All samples collected from Runs 4 and 5 had detections of chromium ranging from 0.047 to 0.061 mg/L, which is less than the maximum concentration detected in the Pre Survey samples. Chromium also was detected in some of the samples from Run 6 and Run 8, but all of those detections also were below Pre Survey sample concentrations.

3.7 Filtered Samples

Nine of the samples collected at Boston Harbor were filtered before analysis to determine if the organic contaminants of concern were sorbed to the suspended particulates or if organics partitioned into the water column. Particulate sample concentrations are reported as the mass of contaminant on the sediment per liter of water collected, for comparison with filtrate concentrations. Table 3-19 shows both the filtrate and particulate concentrations for these nine samples. For PAHs, generally the highest concentrations were found in the particulate samples. Only one of the nine samples had higher total PAH levels in the filtrate. The remaining eight samples had higher particulate concentrations, with four samples having particulate concentrations of PAH more than double the filtrate concentration. Several samples had TPH

concentrations higher in water, with the largest difference in sample CAD014DB where the filtrate TPH concentration was 338.97 µg/L and the particulate concentration was 51.05 µg/L. All but one sample had a higher PCB concentration in the particulate and four of the nine samples had filtrate total PCB concentrations <ALQ.

This pattern of the highest levels of organics associated with particulate matter was expected. PCBs and PAHs are highly hydrophobic and tend to sorb strongly to organic material, and therefore are not likely to partition into the water column. TPH has greater solubility in water and therefore would partition to a greater extent into the water phase.

3.8 Post Survey Sampling

Four days after capping stopped at CAD cells M8 and cell M19, the Post Survey samples were collected above each CAD cell. Ten samples (five at each cell) were taken from approximately the same locations as the Pre Survey background samples (Table 3-20). PCB levels did not return to the before capping <ALQ, but were still low at a range of <ALQ to 1.49 ng/L. TSS levels returned to approximately the same as before capping at <4.2 mg/L.

TPH concentrations again varied widely, ranging from 36.00 µg/L to 219.05 µg/L. The high TPH concentrations probably were not related to the capping events. The Post Survey PAH range was slightly higher than the Pre Survey concentrations, ranging from 41.01 ng/L to 82.93 ng/L in the Post Survey as compared to 32.17 ng/L to 72.26 ng/L in the Pre Survey.

Only two of the eight RCRA 8 metals were detected during the Post Survey sampling (Table 3-21). Lead was detected in one sample at 0.15 mg/L. Selenium was detected in six of the ten samples at a range of 0.023 mg/L to 0.17 mg/L.

3.9 Sand Capping Material

Sand used for capping in Boston Harbor was analyzed for PCB, PAH, and TPH in order to determine if the levels of organics detected in the water samples taken during the survey could be caused by the material used for capping. The capping sand was collected from the Cape Cod Canal, which has been determined by the USACE to be free from contaminants and contains sand suitable for use in capping. The sand samples were obtained from the USACE and Great Lakes Dredging Company. Samples were taken from five different loads in order to provide a good representation of the sand used throughout the capping process, and were collected during the last three days of capping at Boston Harbor in order to meet the holding times for organics. A TPH analysis was run for Load #24, but no duplicate was run for PCBs. These cap samples were not analyzed for the RCRA 8 metals because of the time and budget constraints on the project. However, the very low concentration of RCRA 8 metals detected during capping indicate that the capping material would not have noticeably contributed to contamination of the water column.

All of the Cape Cod sand samples had low levels of organic contaminants (Table 3-22). PCBs were <ALQ in all five sand samples. TPH was <ALQ in two samples, including Load #20 and Load #21. Load #22 and Load #23 had estimated TPH concentrations of 2.35 mg/kg and 3.10 mg/kg, respectively. The highest detection of TPH was 14.03 mg/kg in Load #24.

Table 3-22. Organics Analytical Results for Sand Capping Material

Sample ID	Date Collected	Time Collected	TPH (mg/kg)	Total PAH (ng/g)	Total PCB (ng/g)
<i>Sand Capping Material</i>					
Load #20	9/22/00	ND	<4.42	3.16	<ALQ
Load #21	9/22/00	ND	<4.76	2.81	<ALQ
Load #22	9/23/00	ND	2.35	6.66	<ALQ
Load #23	9/23/00	ND	3.10	8.24	<ALQ
Load #24	9/24/00	ND	14.03	14.46	<ALQ
Load #24 DUP	9/24/00	ND	4.85	13.52	NA

PAHs were detected at low levels in all five sand samples and the duplicate for Load #24. PAH concentrations ranged from 2.81 ng/g in Load #21 to 14.46 ng/g in Load #24. The detections of TPH and PAH were so low in the sand samples that they were probably related to natural background from the Cape Cod area.

3.10 Data Comparisons

Analytical results of water samples collected before, during, and after capping activities were compared to quantify changes in contaminant concentrations in the water column caused by the capping activities. Contaminant concentrations were plotted against turbidity levels to determine whether areas of high turbidity (caused by capping) corresponded to areas of relatively high contamination. Two dimensional (2-D) turbidity maps were generated to show TSS levels and COCs in the area where the capping took place. A 2-D diagram of PAH and TSS concentrations for Run 1 is shown in Figure 3-7 and 2-D plots for the remaining runs can be found in Appendix H. Figures 3-8 through 3-10 show plots for TPH, PAH, and PCB concentrations plotted against TSS, respectively, for Runs 1 through 4. Figures 3-11 through 3-13 show plots for TPH, PAH, and PCB concentration plotted against TSS, respectively, for Runs 5 through 8. Linear regression values and correlation coefficients for each plot are shown in Table 3-23. All r^2 values were below 0.5 except PAH vs. TSS for Run 3 ($r^2 = 0.957$), PCBs vs. TSS for Run 7 ($r^2 = 0.7696$) and PCBs for Run 3 ($r^2 = 0.6611$). However, PCBs vs. TSS for Run 2 had a negative slope, suggesting that the r^2 value of 0.7696 was an artifact of the data and does not suggest a predictable trend. In general, the low r^2 values indicate that TSS values are not good predictors of suspended contaminant concentrations during capping. This is because the resuspended, contaminated TSS likely are overshadowed by the TSS from the capping material.

Information from the ADCP was used to determine flow velocity and direction for Boston Harbor and the Mystic River during all sampling events. The data gathered using the ADCP and BOSS shows that the current velocity during sampling was very slow and the flow direction was variable. Table 3-24 gives the average velocity and direction for each day of sampling; the standard deviation is also listed. Average current velocities were plotted for each day (Appendix I). The velocities and flow direction in Table 3-24 and the plots in Appendix I are calculated at approximately 2 m above the river bottom, which was the same depth that samples were taken using the BOSS. The ADCP gathers profiles of horizontal currents for the entire water column by depth, but the velocities and flow directions for the entire water column were more variable than for 2 m above the river bottom. The current velocities observed in the Mystic River probably were not great enough to transport sediments resuspended by capping “downstream” from the CAD cells.

Data from Boston Harbor indicate that resuspension was greater when capping was conducted over uncapped sediments, and that resuspended contaminants probably did not travel downstream with the current. Suspended sediments settled rapidly (within an hour) after the capping activities ceased and resuspension decreased as more capping material was placed over the contaminated sediments.

In general, high TSS concentrations did not correlate to high organic concentrations at cell M19, where the average correlation coefficient was 0.3560. At cell M19, four water samples taken during Run 1 had both high TSS concentrations and relatively high organic concentrations; however, several water samples also had high TPH levels and very low TSS concentrations. Cell M19 also had one sample in Run 4 with a high PCB concentration (23.79 ng/L), but low TSS (7.54 mg/L).

Samples taken at cell M8 showed even lower correlation between TSS and organic concentrations, where the average correlation coefficient was 0.2195. TSS levels and organic concentrations at cell M8 were generally lower than at cell M19.

4.0 CONCLUSIONS

Background levels of TPH, PCBs, and PAHs were below detection limits or very low levels were detected. The highest resuspension of contaminant material was seen during the first event at each CAD cell when previously uncapped sediments were being capped. In general, contaminant resuspension was very low for all capping events during this survey. Rapid dissipation of TSS and contaminants was seen for all capping events.

Table 4-1 compares sampling results at Boston Harbor to results from the parallel study at Eagle Harbor. These two sites used very different methods for capping contaminated sediments, but both sites showed similar results from the monitoring during the capping events. The capping material at Eagle Harbor was washed off of a barge with a high-pressure hose, compared to the “sprinkling” method used at Boston Harbor. A complete description of the capping method used at Eagle Harbor can be found in Battelle (2001).

The BOSS proved to be an effective instrument for the collection of water samples before, during, and after capping. Samples and data collected using the BOSS helped to achieve a better understanding of the amount of contaminants released into the surrounding water column as a result of a capping event.

Table 4-1. Comparison of Results from Boston Harbor and Eagle Harbor

Monitoring Event	Boston Harbor		Eagle Harbor	Observations
	PCBs (ng/L)	PAHs (ng/L)	PAHs (ng/L)	
Before Capping	<ALQ	32 – 72	46 – 73	Non-detect to low level background at both sites.
During Capping	<ALQ – 84	32 – 5,242	20 – 3,872	Elevated suspended contaminants during capping; contaminant resuspension decreased with successive capping layers at both sites.
After Capping	0.4 – 1.5	41 – 83	38 – 159	Rapid settling of suspended contaminants at both sites.

1. Introduction

The U.S. Environmental Protection Agency's (U.S. EPA's) National Risk Management Research Laboratory (NRMRL) wanted to determine whether the placement of a marine sediment-cap results in the release of contaminants both into the surrounding water column and onto surrounding sediments. The goal of this study was to achieve a better understanding of the amount of contaminants released into the surrounding water column before, during, and after capping. This study utilized state-of-the-art oceanographic technology to acquire high-resolution field data for determining the extent of the release of any contaminated sediment into the water column attributable to sediment agitation during capping activities of a confined aquatic disposal (CAD) cell in Boston Harbor, MA.

CAD cells in Boston Harbor have been used as disposal sites for silty, fine-grained sediments from the Boston Harbor Navigation Improvement Project (BHNIP) that were determined to be unsuitable for ocean disposal. Two of the CAD cells, located in the Mystic River portion of Boston Harbor, were filled with dredged material in January 2000. The dredged material in these two cells, M8 and M19 (Figure 1), has been allowed to consolidate in order to reduce the amount of mixing between the dredged silt and cap sand during capping of the cell. Sand dredged from the Cape Cod Canal was used to create caps for cells M8 and M19 in Mystic River/Boston Harbor (Fredette *et al.*, 2000). The sand cap was "sprinkled" on the cells using a partially opened hopper dredge, which was maneuvered using a tug down the length of the CAD cell. This "sprinkling" method of cap creation minimizes the disturbance of the silt material in the disposal cells.

CAD cells M19 and M8 (Figure 1) were monitored during capping operations. The objective of the study was to determine whether or not capping affects resuspension of the contaminated sediments and adversely impacts the water column and surrounding environment. To accomplish this objective Battelle conducted a plume tracking survey to monitor the plumes at each of the two targeted Boston Harbor CAD sites.

This plume tracking survey at CAD Sites M19 and M8 was conducted from September 6 through 28, 2000. The survey involved tracking and sampling the plumes of sediment generated by the capping activities. The Battelle-owned research vessel R/V *Aquamonitor* served as the monitoring platform. Mobilization was conducted on September 4 and 5, and final demobilization was conducted on September 28, while the vessel was docked at Hewitts Cove Marina in Hingham, MA. The survey crew is listed in Table 1. The planned numbers of events and samples to be collected are in Table 2.

This survey report describes the daily activities of survey CAD 01, and provides a synopsis of some preliminary observations from the survey. A description of the survey methods is provided in Section 2. A chronological summary of survey activities and observations is provided in Section 3. Preliminary survey results are provided in Section 4. A description of survey problems and corrective actions, and recommendations for future surveys can be found in Section 5.

2. Methods

The following subsections briefly summarize the methods used during this survey. The Quality Assurance Project Plan (QAPP) (Battelle 2000) for the *Evaluation of Sediment Agitation and Mixing into the Surrounding Water Column from Capping Activities* contains additional details on survey sampling methods.

Method Descriptions:

Navigation. Vessel positioning during sampling operations was accomplished with the BOSS navigation system. This system consists of a Northstar Differential Global Positioning System (DGPS) interfaced to the NAVSAM computer and software. The global positioning system (GPS) receiver has six dedicated channels and is capable of locking onto six different satellites at one time. To correct the GPS calculations, the Northstar DGPS received correction data from one of three United States Coast Guard DGPS broadcast sites: Montauk Point, NY, Chatham, MA, or Portsmouth Harbor, NH. This capability ensured strong signal reception, and accurate and reliable positioning with 2-second updates.

A calibration check of the GPS navigation system vs. known benchmarks was conducted twice daily to verify that the system was working properly. The checks were conducted prior to departing in the morning and following arrival at the dock in the evening.

Battelle Ocean Sampling System. Monitoring of the capping event was conducted using the Battelle Ocean Sampling System (BOSS) deployed from the R/V *Aquamonitor*. The BOSS *in situ* sensor package included a conductivity, temperature and, depth (CTD) sensor (OS200 CTD), a turbidity sensor, and a TeflonTM/titanium pumping system for sample collection. A second turbidity sensor, calibrated to the *in situ* data, was located at the water-sampling manifold so that the appropriate parcel of water could be identified and sampled at the appropriate time. Additionally, an Acoustic Doppler Current Profiler (ADCP) was deployed for obtaining vertical profiles of horizontal currents. Table 2 lists the field measurements acquired from the survey vessel during each monitoring event.

The entire pumping system, including suction strainers, pump, and Teflon tubing up to but not including the on-deck transmissometer, was decontaminated with dichloromethane (DCM) and acetone, followed by deionized water rinse. The transmissometer could not be cleaned using this procedure because the solvents would melt the plastic components of the unit. Decontamination was conducted during each dumping event prior to initiating sampling operations.

Field measurements and instruments are listed in Table 3.

Plume Tracking and Sampling. BOSS sensor data were collected continuously along transects within each CAD cell (Figure 2). The configuration of the transect and the sampling locations along each transect varied according to the capping activity (e.g., pre-capping, capping, post-capping activities). During the transects, BOSS was towed at a distance of ~2 m above the bottom along all transects (unless obstructed) to ensure that sensors detected resuspended sediments (if detectable).

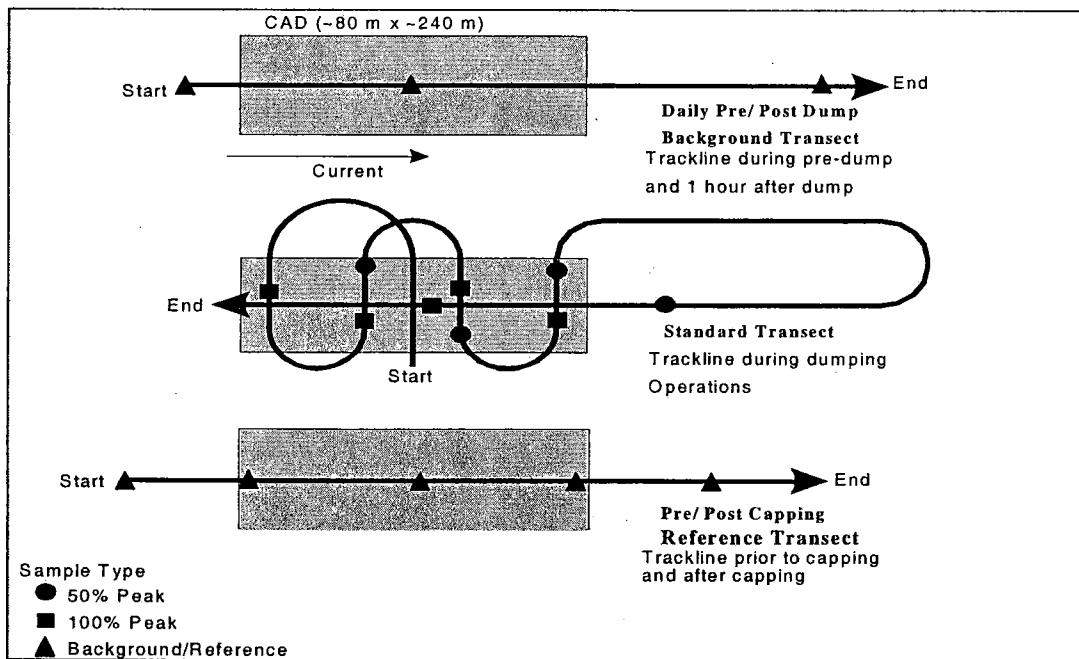

Figure 2. Survey Transects and Sampling Station Types. (Top: daily pre-dump and post-dump background transect line. Middle: standard transect line. Bottom: pre-capping operations and after all post-capping operations).

Three sample sets were collected immediately prior to each capping event, nine sample sets were collected during each capping event, and, with one exception during Event 3 at cell M19), three sets were collected immediately following each capping event. Each sample set consisted of three water samples: one sample for organic-constituents analysis, one sample for trace metals analysis, and one sample for total suspended solids (TSS) analysis. Water sample sets were shipped to the analytical laboratories for analysis immediately following the survey.

The station/sample location number, GPS coordinates, date and time, depth of the water column, and any observations associated with the sampling at each sampling location were made in the field survey logbook. Each sample was assigned a unique ID and label by NAVSAM, which also electronically stores the field and sensor data. Exceptions are noted in Section 5.

BOSS sensor data were collected continuously during transit through the site, pre- and post-capping sampling activities, and along all transects between water-sampling locations within the capping area during capping operations. [The plots are not included in this survey report but will be reported in the final interpretive report.] The BOSS was towed at a distance of approximately 2 m or less above the bottom along all transects (unless obstructed) to ensure that sensors were deep enough to detect (if detectable) the resuspended sediments, and the sampling intake was in the best place to sample for those sediments.

Sample Shipping and Custody. Each day, samples were stored shipboard in coolers containing ice, and returned to the Battelle Duxbury Laboratory following each sampling event. Samples were stored in a walk-in chill room until analysis, or until shipment to the analytical laboratories targeted to analyze TSS and trace metal samples. Before shipping, the ice was replenished in each cooler, and the sample custody forms were completed, placed in a sealed Ziploc bag which was taped to the inside of the cooler lid. A cooler blank was included in the shipment. The laboratory sample custodian was notified of the impending shipment on the day that the samples were shipped so that they were alerted to expect the samples on the following day. Sample custodians were as shown below.

Organics Analysis	TSS Analysis	Metals Analysis
Mr. Patrick Barrett	Ms. Laura Reed	Mr. Kevin Murray
Battelle Duxbury	University of Rhode Island (URI)	Alpha Analytical, Inc.
397 Washington Street	Graduate School of Oceanography	255 Glendale Avenue, Suite 21
Duxbury, MA 02332	Narragansett, RI 02882-1197	Sparks, Nevada 89431-5778
781-934-5400 (main)	(401) 874-6657 (office)	(775) 355-1044 (office)
781-952-5282 (direct)	(401) 874-6651 (lab)	(775) 355-0406 (FAX)

Sample Storage Conditions. Sample storage conditions are presented in Table 4.

2.1. Deviations

Additional Work at CAD Cell M8. Under the original plan, only one of the two uncapped CAD cells, the larger-area M19, was selected for monitoring during capping activities. However, because Battelle was able to monitor only four dumping events at M19, U.S. EPA and Battelle management jointly decided to monitor four consecutive dumping events at cell M8. This activity provided additional valuable information on resuspension of CAD sediments and contaminant concentrations at the site, and also provided verification that sediments at cell M8 behaved similarly to those at cell M19 during capping. Sampling operations at cell M8 were conducted in pattern similar to the pattern shown in Figure 2 and followed during the sampling at cell M19.

Table 4. Analyte, Sampling Method, Volume, Preservation, and Holding Times.

Analyte (Analytical Laboratory) ^(a)	Matrix	Method	Sample Volume	Container Type	Preservation	Holding Time
<i>Laboratory Analyses</i>						
TPH (BDO)	Water	Battelle SOP 5-202-04	1,000 mL	Amber glass with Teflon™-lined cap	Cool, 4°C±2°C	14 days
PCB (BDO)	Water	Battelle SOP 5-128	1,000 mL ^(b)	Amber glass with Teflon™-lined cap	Cool, 4°C±2°C	7 days/ 40 days ^(c)
PAH (BDO)	Water	Battelle SOP 5-157	1,000 mL ^(b)	Amber glass with Teflon™-lined cap	Cool, 4°C±2°C	7 days/ 40 days ^(c)
TSS (URI)	Water	Battelle SOP 5-053	500 mL	Poly ethylene plastic	Cool, 4°C±2°C, Dark	7 days
Metals (AAI)	Water		1000mL	Polyethylene plastic	Cool, 4°C±2°C, Dark	28 days
<i>Field Analyses</i>						
Temperature (BDO)	Water	OS200 CTD	NA	NA	NA	<i>In situ</i>
Depth (BDO)	Water	OS200 CTD	NA	NA	NA	<i>In situ</i>
Transmissometry/ Turbidity (BDO)	Water	Seatech 20-cm (660nm)	NA	NA	NA	<i>In situ</i>
Conductivity (BDO)	Water	OS200 CTD	NA	NA	NA	<i>In situ</i>

(a) BDO: Battelle Duxbury Operations; URI: University of Rhode Island; AAI: Alpha Analytical, Inc.

(b) Sample for TPH also extracted for PAH analysis.

(c) Extractions must be complete within 7 days, and gas chromatography/mass spectrometry (GC/MS) analysis must be complete within 40 days.

GC/MS = gas chromatography/mass spectrometry.

NA = Not applicable.

3. Survey Chronology

Note: All times are recorded as Eastern (Daylight Savings) Time.

Monday, September 4, 2000

0800	Loaded all equipment and supplies aboard the vessel R/V <i>Aquamonitor</i> . Prepared water-column sampling-system for towing.
------	--

Tuesday, September 5, 2000

0800	Continued mobilization activities. Ms. Jennifer Ickes and Ms. Lydia Cumming arrive from Battelle Columbus.
------	--

Wednesday, September 6, 2000

1100	Departed Hewitts Cove Marina (HCM) to CAD cell M8. Conducted training exercises with staff from Sampling Team 2.
1223	Initiated collection of precapping reference samples at CAD cell M8. Collected pre-capping reference sample at Station B1.
1225	Collected pre-capping reference sample at Station B2.
1226	Collected pre-capping reference sample at Station B3.
1227	Collected pre-capping reference sample at Station P1.
1232	Collected pre-capping reference sample at Station P2. Completed Collection of five pre-capping reference samples at CAD cell M8. Returned to HCM to pick up Sampling Team 1 for training.
1300	Switched sampling teams and returned to CAD cell M19 to conduct training exercises and collect reference samples at CAD cell M19.
1413	Initiated collection of pre-capping reference samples at CAD cell M-19. Collected pre-capping reference sample at Station B1.
1415	Collected pre-capping reference sample at Station B21.
1419	Collected pre-capping reference sample at Station B3.
1422	Collected pre-capping reference sample at Station P1.
1424	Collected pre-capping reference sample at Station P2. Completed collection of pre-capping reference samples at CAD cell M19. Returned to HCM.

Saturday, September 9, 2000

1300	Conducted navigation calibration. Meet with Sampling Team 1 to discuss the daily sampling strategy.
------	---

1320	Departed HCM to Collected background samples at M19 before hopper dredge arrived at the site and began initial dump of capping material. In route, sampling team was notified that the dredge arrival on site will be approximately 1615. <i>Aquamonitor</i> proceeded to Pier 1 in East Boston.
1410	Arrive Pier 1 dock; pick up Ms. Ickes and Ms. Cumming of Battelle-Columbus and Mr. Lyons of U.S. EPA.
1512	Transited to cell M19 for sampling of Event 1.
1550	On site. Cleaned pumping system and calibrated pump.
1559	Initiate monitoring/sampling activities along pre-dump transect. Collected Event 1 pre-dump water samples for organics, metals, and TSS at Station B1.
1601	Collected Event 1 pre-dump water samples for organics, metals, and TSS at Station B2.
1603	Collected Event 1 pre-dump water samples for organics, metals, and TSS at Station B3.
1650	Hopper dredge <i>Manhattan Island</i> initiates capping operations (dumping).
1700	Collected Event 1/Sample Set 1F water samples for organics, metals, and TSS along Standard Transect at M19.
1704	Collected Event 1/Sample Set 2H water samples for organics, metals, and TSS along Standard Transect at M19.
1705	Collected Event 1/Sample Set 3F water samples for organics, metals, and TSS along Standard Transect at M19.
1708	Collected Event 1/Sample Set 4F water samples for organics, metals, and TSS along Standard Transect at M19.
1710	Collected Event 1/Sample Set 5H water samples for organics, metals, and TSS along Standard Transect at M19.
1713	Collected Event 1/Sample Set 6H water samples for organics, metals, and TSS along Standard Transect at M19.
1717	Collected Event 1/Sample Set 7F water samples for organics, metals, and TSS along Standard Transect at M19.
1723	Collected Event 1/Sample Set 8H water samples for organics, metals, and TSS along Standard Transect at M19. Pumping system hit bottom, and Chief Scientist noted a reduction in the pumping rate.
1726	Collected Event 1/Sample Set 9F water samples for organics, metals, and TSS along Standard Transect at M19. Dredge departs site.
1834	Collected Event 1 post-dump water samples for organics, metals, and TSS at Station P1.

1837	Collected Event 1 post-dump water samples for organics, metals, and TSS at Station P3.
1843	Collected Event 1 post-dump water samples for organics, metals, and TSS at Station P2.
1840	<i>Aquamonitor</i> departed survey area.
1910	Dropped off Ms. Cumming, Ms. Ickes, and Mr. Lyons at Pier 1 in East Boston.
2010	Arrive HCM.

Sunday, September 10, 2000

0529	Performed navigation calibration.
0534	<i>Aquamonitor</i> departed HCM.
0630	Arrived Pier 1, East Boston, to pick up Battelle and U.S. EPA staff.
0700	Arrive on site at cell M19. Clean pumping system. Check and record flow rate of pumping system. Container ship entering port delayed capping and sampling operations.
0720	Initiated monitoring/sampling activities along pre-dump reference transect. Collected Event 2 pre-dump water samples for organics, metals, and TSS at Station B1.
0723	Collected Event 2 pre-dump water samples for organics, metals, and TSS at Station B3.
0729	Collected Event 2 pre-dump water samples for organics, metals, and TSS at Station B2.
0802	Dredge <i>Manhattan Island</i> on site.
0835	Dredge began dumping at cell M19.
0851	Collected Event 2/Sample Set 1F water samples for organics, metals, and TSS along Standard Transect at M19.
0855	Collected Event 2/Sample Set 2H water samples for organics, metals, and TSS along Standard Transect at M19.
0858	Collected Event 2/Sample Set 3F water samples for organics, metals, and TSS along Standard Transect at M19.
0903	Dredge completed dumping at M19.
0911	Collected Event 2/Sample Set 4F water samples for organics, metals, and TSS along Standard Transect at M19.
0913	Collected Event 2/Sample Set 5H water samples for organics, metals, and TSS along Standard Transect at M19.
0926	Collected Event 2/Sample Set 6H water samples for organics, metals, and TSS

	along Standard Transect at M19.
0928	Collected Event 2/Sample Set 7F water samples for organics, metals, and TSS along Standard Transect at M19.
0934	Collected Event 2/Sample Set 8H water samples for organics, metals, and TSS along Standard Transect at M19.
0941	Collected Event 2/Sample Set 9F water samples for organics, metals, and TSS along Standard Transect at M19. Dredge departs site.
1015	Collected Event 2 post-dump water samples for organics, metals, and TSS at Station P1.
1017	Collected Event 2 post-dump water samples for organics, metals, and TSS at Station P2.
1020	Collected Event 2 post-dump water samples for organics, metals, and TSS at Station P3.
1025	<i>Aquamonitor</i> departs survey area for Pier 1 to drop off L. Cumming, J. Ickes, and T. Lyons
1145	Arrived HCM. Repairs made to the pumping system. Sampling Team 1 departed.
2030	Sampling Team 2 arrived.
2120	<i>Aquamonitor</i> departed HCM and transited to Pier 1 to pick up additional crew.
2230	Arrive on site at M19. Sampling system cleaned and calibrated.
2300	System flow calibration completed.
2316	Collected Event 3 pre-dump water samples for organics, metals and TSS at Station B1.
2319	Collected Event 3 pre-dump water samples for organics, metals and TSS at Station B2.
2322	Collected Event 3 pre-dump water samples for organics, metals and TSS at Station B3.
2324	Pumping system turned off.

Monday, September 11, 2000

0001	<i>Manhattan Island</i> approached survey area. Personnel transferred from the tug <i>Little Joe</i> to the dredge.
0052	Pumping system turned on.
0114	Collected Event 3/Sample Set 1F water samples for organics, metals, and TSS along Standard Transect at M19.
0115	Dredge began dumping in other direction.

0116	Collected Event 3/Sample Set 2H water samples for organics, metals, and TSS along Standard Transect at M19.
0119	Collected Event 3/Sample Set 3F water samples for organics, metals, and TSS along Standard Transect at M19.
0121	Collected Event 3/Sample Set 4F water samples for organics, metals, and TSS along Standard Transect at M19.
0126	Collected Event 3/Sample Set 5H water samples for organics, metals, and TSS along Standard Transect at M19.
0130	Collected Event 3/Sample Set 6H water samples for organics, metals, and TSS along Standard Transect at M19.
0133	Collected Event 3/Sample Set 7F water samples for organics, metals, and TSS along Standard Transect at M19.
0135	Barge completed dumping and departs.
0140	Collected Event 3/Sample Set 8H water samples for organics, metals, and TSS along Standard Transect at M19.
0141	Collected Event 3/Sample Set 9F water samples for organics, metals, and TSS along Standard Transect at M19.
0145	Began "Figure 8" towing.
0225	Collected Event 3 post-dump water samples for organics, metals and TSS at Station P1, approximately 1 hour after dumping stopped. Sampler struck the bottom immediately following P1 sampling, and system components fouled with mud. Extent of repairs/cleaning deemed too time consuming to remain on station. P2 and P3 samplings canceled. Repairs initiated. Transited to Pier 1
0252	L. Cummings departed at Pier 1.
0430	Arrived HCM. Sampling team departs.
1300	Sampling Team arrived at HCM.
1335	<i>Aquamonitor</i> departs HCM. Pumping system flow rate was unacceptable during transit to cell M19. Repairs initiated during transit to and at the sampling site while awaiting the dredge.
1605	<i>Manhattan Island</i> arrived.
1615	Dredge began dumping (Event 4).
1634	Dumping completed and dredge departed site.
1647	Pumping system problems persisted. Event 4 Sampling suspended until the problem is corrected. <i>Aquamonitor</i> returned to HCM.

Tuesday, September 12, 2000

	Event 5 sampling was canceled.
2005	Depart HCM for Event 6 sampling.
2135	Collected Event 6 pre-dump water samples for organics, metals and TSS at Station B1.
2137	Collected Event 6 pre-dump water samples for organics, metals and TSS at Station B2.
2139	Collected Event 6 pre-dump water samples for organics, metals and TSS at Station B3.
2150	<i>Manhattan Island</i> arrives on site.
2205	Dredge began dumping.
2214	Collected Event 6/Sample Set 1F water samples for organics, metals, and TSS along Standard Transect at M19.
2217	Collected Event 6/Sample Set 2H water samples for organics, metals, and TSS along Standard Transect at M19.
2220	Collected Event 6/Sample Set 3F water samples for organics, metals, and TSS along Standard Transect at M19. In sand.
2225	Collected Event 6/Sample Set 4F water samples for organics, metals, and TSS along Standard Transect at M19.
2230	Collected Event 6/Sample Set 5H water samples for organics, metals, and TSS along Standard Transect at M19.
2231	Dumping completed. <i>Manhattan Island</i> departs.
2236	Collected Event 6/Sample Set 6H water samples for organics, metals, and TSS along Standard Transect at M19.
2237	Collected Event 6/Sample Set 7F water samples for organics, metals, and TSS along Standard Transect at M19.
2245	Collected Event 6/Sample Set 8H water samples for organics, metals, and TSS along Standard Transect at M19.
2247	Collected Event 6/Sample Set 9F water samples for organics, metals, and TSS along Standard Transect at M19.
2332	Collected Event 6 post-dump water samples for organics, metals and TSS at Station P1.
2334	Collected Event 6 post-dump water samples for organics, metals and TSS at Station P2.
2336	Collected Event 6 post-dump water samples for organics, metals and TSS at Station P3.

Wednesday, September 13, 2000

1135	<i>Aquamonitor</i> departs HCM. Sampling pump not working properly. Repairs initiated during transit to Pier 1.
1229	Picked up Ms. Ickes at Peir 1 and departed for M19. Pump repairs ongoing during transit to M19 and while awaiting the dredge.
1400	Dumping began (Event 7). Pump repairs continued.
1430	Pump repaired. Dumping completed. Initiated Figure 8-pattern sampling for turbidity measurements. Began Figure 8 at a point 200 m downcurrent and 2m above the bottom. Sampled in Figure 8 in the site at 2, 4, and 6 m above the bottom.
1500	Figure 8 sampling completed. Turbidity mostly >3%. Depart for HCM
1615	Arrive HCM.

Thursday, September 14, 2000

0145	Crew arrived at HCM.
0200	Departed HCM.
0333	Arrived CAD cell M8. Collected Event 8 pre-dump water samples for organics, metals and TSS at Station B1.
0335	Collected Event 8 pre-dump water samples for organics, metals and TSS at Station B2.
0338	Collected Event 8 pre-dump water samples for organics, metals and TSS at Station B3.
0430	<i>Manhattan Island</i> arrived on site.
0448	Begin dumping.
0453	Collected Event 8/Sample Set 1F water samples for organics, metals, and TSS along Standard Transect at M8.
0501	Collected Event 8/Sample Set 2H water samples for organics, metals, and TSS along Standard Transect at M8.
0505	Collected Event 8/Sample Set 3F water samples for organics, metals, and TSS along Standard Transect at M8.
0510	Completed dumping. <i>Manhattan Island</i> remained on site.
0513	Collected Event 8/Sample Set 4F water samples for organics, metals, and TSS along Standard Transect at M8.
0518	Collected Event 8/Sample Set 5H water samples for organics, metals, and TSS along Standard Transect at M8.

0525	Collected Event 8/Sample Set 6H water samples for organics, metals, and TSS along Standard Transect at M8.
0530	<i>Manhattan Island</i> departs.
0532	Collected Event 8/Sample Set 7F water samples for organics, metals, and TSS along Standard Transect at M8. Out of cell and downcurrent.
0534	Collected Event 8/Sample Set 8H water samples for organics, metals, and TSS along Standard Transect at M8.
0540	Collected Event 8/Sample Set 9F water samples for organics, metals, and TSS along Standard Transect at M8.
0611	Collected Event 8 post-dump water samples for organics, metals and TSS at Station P1.
0613	Collected Event 8 post-dump water samples for organics, metals and TSS at Station P2.
0616	Collected Event 8 post-dump water samples for organics, metals and TSS at Station P3.
0735	Arrive HCM.

Friday, September 15, 2000

0630	Crew arrived at HCM.
0655	Departed HCM for M8.
0800	On site.
0815	Cleaned system.
0832	Pre-dump cross calibration with ADCP completed.
0840	Advised by B. Cuzzelli that the dump site is cell M8.
0846	Collected Event 9 pre-dump water samples for organics, metals and TSS at Station B1.
0848	Collected Event 9 pre-dump water samples for organics, metals and TSS at Station B2.
0851	Collected Event 9 pre-dump water samples for organics, metals and TSS at Station B3.
0915	<i>Manhattan Island</i> arrived in the study area. Dredge advised W. Trulli (Battelle Chief Scientist) to cease and desist further communication with the dredge (reasons unknown to <i>Aquamonitor</i> crew. Sampled area west to east.
0941	Dredge began dumping.
0949	Encountered sand approximately 50 m short of the site.

0952	Collected Event 9/Sample Set 1F water samples for organics, metals, and TSS along Standard Transect at M8.
0956	Dumping completed.
0957	Collected Event 9/Sample Set 2H water samples for organics, metals, and TSS along Standard Transect at M8.
1000	Collected Event 9/Sample Set 3F water samples for organics, metals, and TSS along Standard Transect at M8.
1003	Collected Event 9/Sample Set 4F water samples for organics, metals, and TSS along Standard Transect at M8. <i>Manhattan Island</i> departs survey area.
1006	Collected Event 9/Sample Set 5H water samples for organics, metals, and TSS along Standard Transect at M8.
1011	Collected Event 9/Sample Set 6H water samples for organics, metals, and TSS along Standard Transect at M8.
1014	Collected Event 9/Sample Set 7F water samples for organics, metals, and TSS along Standard Transect at M8.
1023	Collected Event 9/Sample Set 8H water samples for organics, metals, and TSS along Standard Transect at M8.
1026	Collected Event 9/Sample Set 9F water samples for organics, metals, and TSS along Standard Transect at M8.
1040	Running Figure 8 tracks for turbidity measurements at 2, 4, and 6 m. Turbidity between 3 and 15%.
1101	Sampler hit bottom. Scoop mud going into Station P1. System re-cleaned.
1136	Collected Event 9 post-dump water samples for organics, metals and TSS at Station P1. Muddy sediments in organics sample. Cleaned with DCM and Milli-Q water, recalibrated.
1149	Collected Event 9 post-dump water samples for organics, metals and TSS at Station P2.
1151	Collected Event 9 post-dump water samples for organics, metals and TSS at Station P3.
1154	Depart site to return to HCM after pulling ADCP. Pumping system checked
1300	Arrive HCM. Continued equipment maintenance.
2015	Depart HCM for M8.
2335	Collected Event 10 pre-dump water samples for organics, metals and TSS at Station B1.
2338	Collected Event 10 pre-dump water samples for organics, metals and TSS at Station B2.

2342	Collected Event 10 pre-dump water samples for organics, metals and TSS at Station B3.
2355	<i>Manhattan Island</i> arrives at M8.

Saturday, September 16, 2000

0001	Dumping began.
0009	Collected Event 10/Sample Set 1F water samples for organics, metals, and TSS along Standard Transect at M8.
0015	Collected Event 10/Sample Set 2H water samples for organics, metals, and TSS along Standard Transect at M8.
0016	Dumping ended. <i>Manhattan Island</i> departed.
0020	Collected Event 10/Sample Set 3F water samples for organics, metals, and TSS along Standard Transect at M8.
0025	Collected Event 10/Sample Set 4F water samples for organics, metals, and TSS along Standard Transect at M8.
0027	Collected Event 10/Sample Set 5H water samples for organics, metals, and TSS along Standard Transect at M8.
0031	Collected Event 10/Sample Set 6H water samples for organics, metals, and TSS along Standard Transect at M8.
0035	Collected Event 10/Sample Set 7F water samples for organics, metals, and TSS along Standard Transect at M8.
0042	Collected Event 10/Sample Set 8H water samples for organics, metals, and TSS along Standard Transect at M8.
0045	Collected Event 10/Sample Set 9F water samples for organics, metals, and TSS along Standard Transect at M8.
0120	Pump not working, tripping breakers. Cleaned and deployed.
0133	Collected Event 10 post-dump water samples for organics, metals and TSS at Station P1.
0136	Collected Event 10 post-dump water samples for organics, metals and TSS at Station P2.
0140	Collected Event 10 post-dump water samples for organics, metals and TSS at Station P3.
0305	Crew departed at HCM.
1323	Departed HCM for cell M8.
1403	Advised by the tugboat <i>Little Joe</i> that the <i>Manhattan Island</i> is not due in the survey area until 1600-1630.

1435	Moored at Pier 1 to await the barge. Pumping system decontaminated.
1522	Departed Pier1 for survey area.
1535	Arrived survey area.
1543	Advised <i>Manhattan Island</i> estimated time of arrival at 1615.
1610	System experienced weak flow. Corrective maintenance and calibration performed.
1616	System deployed.
1641	System flow stopped. System retrieved and fixed.
1650	<i>Manhattan Island</i> set up on M19. Attempted to call dredge about setting up on M8, with no response. Attempted to call Bob Cuzzelli but his cell phone was turned off.
1705	<i>Manhattan Island</i> dumped at M19 instead of M8. <i>Manhattan Island</i> finished dumping at M8 and departs survey area. <i>Manhattan Island</i> did not respond to radio hails.
1712	Departed survey area for HCM.
1720	Followed tugboat <i>Little Joe</i> to discuss with Bob Cuzzelli the just-completed dumping at M8. Mr. Cuzzelli indicated he did not realize that they were dumping at the wrong site.
1824	Arrived HCM.

Wednesday, September 20, 2000

0730	Crew arrived. Equipment checks OK.
0820	Departed HCM for M8.
0921	Enter survey area and begin equipment decontamination.
0943	Collected Event 12 pre-dump water samples for organics, metals and TSS at Station B1.
0950	Collected Event 12 pre-dump water samples for organics, metals and TSS at Station B2.
0954	Collected Event 12 pre-dump water samples for organics, metals and TSS at Station B3.
1010	<i>Manhattan Island</i> arrived at M8 to dump west to east.
1025	<i>Manhattan Island</i> began dumping.
1034	Collected Event 12/Sample Set 1F water samples for organics, metals, and TSS along Standard Transect at M8.
1037	<i>Little Joe</i> moves to other side of <i>Manhattan Island</i> to help drop in reverse direction.

1039	Collected Event 12/Sample Set 2H water samples for organics, metals, and TSS along Standard Transect at M8.
1045	Collected Event 12/Sample Set 3F water samples for organics, metals, and TSS along Standard Transect at M8.
1049	Collected Event 12/Sample Set 4F water samples for organics, metals, and TSS along Standard Transect at M8.
1052	Dumping completed.
1055	Collected Event 12/Sample Set 5H water samples for organics, metals, and TSS along Standard Transect at M8.
1101	Collected Event 12/Sample Set 6H water samples for organics, metals, and TSS along Standard Transect at M8.
1105	Collected Event 12/Sample Set 7F water samples for organics, metals, and TSS along Standard Transect at M8.
1111	Collected Event 12/Sample Set 8H water samples for organics, metals, and TSS along Standard Transect at M8.
1113	Collected Event 12/Sample Set 9F water samples for organics, metals, and TSS along Standard Transect at M8.
1142	Complete Figure 8 runs.
1153	Collected Event 12 post-dump water samples for organics, metals and TSS at Station P1.
1157	Collected Event 12 post-dump water samples for organics, metals and TSS at Station P2.
1201	Collected Event 12 post-dump water samples for organics, metals and TSS at Station P3.
1205	Retrieved equipment and departed for HCM
1305	Arrived HCM. Demobilized.

Thursday, September 28, 2000

0756	Departed HCM.
0900	On station for Event 13 post-dumping activities. System cleaned.
0914	Equipment deployed.
0923	Collected Event 13 post-dumping water samples for organics, metals and TSS at Station 1F.
0927	Collected Event 13 post-dumping water samples for organics, metals and TSS at Station 2H.

0930	Collected Event 13 post-dumping water samples for organics, metals and TSS at Station 3F.
0933	Collected Event 13 post-dumping water samples for organics, metals and TSS at Station 4F.
0936	Collected Event 13 post-dumping water samples for organics, metals and TSS at Station 5H.
0939	Collected Event 13 post-dump water samples for organics, metals and TSS at Station 6H.
0942	Collected Event 13 post-dump water samples for organics, metals and TSS at Station 7F.
0944	Collected Event 13 post-dump water samples for organics, metals and TSS at Station 8H.
0947	Collected Event 13 post-dump water samples for organics, metals and TSS at Station 9F.
0950	Collected Event 13 post-dump water samples for organics, metals and TSS at Station 10H.
1000	Sampling completed.

4. Survey Results

Field sampling operations were successfully completed over a 23-day period during which 10 separate events at CAD cells M8 and M19 were sampled and 138 sample sets were collected (Table 5). One pre-capping event was sampled as a reference event to characterize baseline conditions prior to capping operations. One post-capping event was sampled to characterize post-dumping background conditions. Four capping events each at CAD cells M19 and M8 were sampled to characterize the extent of any resuspension of contaminant sediments caused by the capping operations. Equipment problems, primarily with the BOSS pump, were responsible for missing 3 additional capping events at cell M19. During the fourth cell M8 dumping event, sediments were actually dumped within cell M19.

In situ hydrographic measurements of conductivity, temperature, depth, turbidity, and transmissometry were collected during transit between stations (as much as possible) and to follow the plume after daily capping operations were suspended. In most cases these hydrographic measurements were taken at a depth of 2 m from the sea bottom, and in some cases the measurements were made at one or more additional depths located at 2-m increments above the bottom. During the survey, no apparent distinction in turbidity/transmissometry could be made between the resuspension plume and the ever-present visible capping material plume. Apparently, considerable concentrations of fine particles in the capping sand were resuspended to produce a long-lasting and well-defined plume that spanned the entire depth of the water column.

All field data (date, time, sampling coordinates, bathymetry, and sample depth) generated during this survey are presented in Appendix A.

Maps showing the actual sampling locations and transect lines between stations for each set of events conducted on each sampling day are presented in Appendix B. The transect lines are also color coded to indicate relative amount of turbidity.

Table 5. Actual Numbers and Types Transects Occupied and Samples Collected during the Capping Resuspension Survey in Boston Harbor, MA.

Type of Event	Number of Events	Numbers and Types of Transects per Event	Total Numbers of Samples		
			Organics	Metals	TSS
Pre-capping	2	5 locations within uncapped area	10	10	10
Capping	9	3 pre-dump background transects per event	24	24	24
		9 standard transects per event	72	72	72
		3 post-dump background transects per event	22	22	22
Post-capping	1	10 standard transects	10	10	10
<i>Total</i>	12	--	138	138	138

5. Problems Experienced, Actions Taken, and Recommendations

5.1. Schedule

- Miscommunication between the captain and chief scientist resulted in a third missed disposal event at cell M19. The captain did not receive the departure message and did not report to the *Aquamonitor* at the appointed time.
- Communications between the *Aquamonitor* and *Manhattan Island* (MI) were strained. The MI was reluctant to respond to our questions regarding disposal initiation, pattern of disposal, and time of arrival at the site. This made it very difficult to schedule operations and conduct them efficiently.
- A miscommunication between the U.S. Army Corps of Engineers observer allowed a capping-material dump at M19 that should have occurred at M8. Because Battelle completed monitoring operations at cell M19 and was monitoring at cell M8, the trip was unproductive for the survey team aboard the *Aquamonitor*, and more importantly was a needless expenditure of EPA funds.

5.2. Technical

- All instruments worked well throughout the survey. However, the large coarse-grained sand used as capping material severely wore the Teflon parts in the pump and slip ring assembly of the water sampling system. As a result, two disposal events at cell M19 were missed because repairs to the pumping system were necessary.

Jennifer Ickes
Battelle Memorial Institute
Columbus, OH

Subject: Delivery of QC Deliverable from Battelle Duxbury's WA3-26: Boston Cap Project for PAH/ECD/TPH Analyses

Dear Jennifer:

This letter provides a summary of the data quality for analyses Battelle's Duxbury Operations (BDO) has performed in order to determine the concentrations of TPH, PCB, and PAH analytes from the analytical task: WA3-26: Boston Cap Project.

WA3-26: Boston Cap Project

Samples were safely received at our lab on September 2000. A total of 5 sediment samples, 148 water samples, and 9 filter samples, along with the appropriate quality control (QC) samples, were processed and analyzed in 12 analytical batches for both 8270M (PAH), 8081M (PCB) and 8015M (TPH) analyses (as defined in the Project's QAPP).

Sample extractions and handling went smoothly

All of these data have been thoroughly reviewed and validated by BDO's independent Quality Assurance Unit, as well as by staff of the chemistry department, as per the Project QAPP.

Specific Quality Control Sample Information

The quality control (QC) sample data quality objectives (DQOs) were largely met for this project, thereby supporting the overall reliability and quality of the reported data. The overall data set was excellent. There are isolated exceedences with some of the analyses, however there is no impact on the overall quality of the data. Below is a listing and discussion of the QC for the data set.

All samples:

- Sample Holding Times. All sample holding times were met.

There were 63 QC criteria of 3438 QC data points outside of acceptance criteria.

PCB data:

- Procedural (Method) Blanks. A method or procedural blank (PB) was processed and analyzed with each analytical batch of samples. The PB's data quality objectives (DQOs) were consistently met as defined in the Project QAPP.
- Laboratory Control Sample Recovery. A laboratory control sample (LCS) was processed and analyzed with each analytical batch of samples. The target compound recoveries consistently met the DQOs for both the 8081M analyses as defined in the Project QAPP.
- Matrix Spike Recovery and Precision. One matrix spike (MS) sample was processed with the field samples in each analytical batch of samples. The target compound recoveries consistently met the DQOs for both the 8081M analyses as defined in the Project QAPP.
- Internal Standard Recoveries. Surrogate internal standards (SIS) and recovery internal standard compounds (RIS) were added to each field and QC sample to monitor the sample processing efficiency.

For samples analyzed by 8081M, surrogate recoveries were within criteria in all but 5 samples. Four of the five samples had artificially high surrogate recoveries, which was due to an interfering, unidentified compound(s) that co-eluted with the surrogates. The fifth sample had a low surrogate recovery and was noted in the sample preparation records.

- Sample Duplicates. A sample duplicate (DUP) was processed and analyzed with each analytical batch of samples. The DUP's data quality objectives (DQOs) were consistently met as defined in the Project QAPP.

There were 9 QC criteria of 950 QC data points outside of acceptance criteria.

PAH data:

- Procedural (Method) Blanks. A method or procedural blank (PB) was processed and analyzed with each analytical batch of samples. The PB's data quality objectives (DQOs) were consistently met as defined in the Project QAPP with one exception. The PB in Batch #00-407 was contaminated. There was no sample left for re-extraction, however all other QC data was excellent including the LCS and MS, and the water data was consistent with those found in other batches.
- Laboratory Control Sample Recovery. A laboratory control sample (LCS) was processed and analyzed with each analytical batch of samples. The target compound recoveries consistently met the DQOs for both the 8270M analyses as defined in the Project QAPP with one exception. There was 127% recovery of fluoranthene in Batch #00-408. This appears to be an isolated incident and should have no impact on the data.
- Matrix Spike Recovery and Precision. One matrix spike (MS) sample was processed with the field samples in each analytical batch of samples. The target compound recoveries consistently met the DQOs for both the 8270M analyses as defined in the Project QAPP.
- Internal Standard Recoveries. Surrogate internal standards (SIS) and recovery internal standard

compounds (RIS) were added to each field and QC sample to monitor the sample processing efficiency.

- For samples analyzed by 8270M, surrogate recoveries were within criteria in all but 10 samples. X8602 had a low naphthalene-d8 recovery, which is usually indicative of rapid concentration. The other surrogates were just outside of acceptance criteria. The data are not impacted by these exceedences.
- Sample Duplicates. A sample duplicate (DUP) was processed and analyzed with each analytical batch of samples. The DUP's data quality objectives (DQOs) were consistently met as defined in the Project QAPP with a few isolated exceptions. The data are not impacted by these exceedences.

There were 45 QC criteria of 2261 QC data points outside of acceptance criteria.

TPH data:

- Procedural (Method) Blanks. A method or procedural blank (PB) was processed and analyzed with each analytical batch of samples. The PB's data quality objectives (DQOs) were consistently met as defined in the Project QAPP.
- Laboratory Control Sample Recovery. A laboratory control sample (LCS) was processed and analyzed with each analytical batch of samples. The target compound recoveries consistently met the DQOs for both the 8015M analyses as defined in the Project QAPP with some exceptions. Two of the LCS samples had some analytes outside of criteria. The data are not impacted by these exceedences.
- Matrix Spike Recovery and Precision. One matrix spike (MS) sample was processed with the field samples in each analytical batch of samples. The target compound recoveries consistently met the DQOs for both the 8015M analyses as defined in the Project QAPP with two exceptions. Two of the MS samples had one analyte outside of criteria each.
- Internal Standard Recoveries. Surrogate internal standards (SIS) and recovery internal standard compounds (RIS) were added to each field and QC sample to monitor the sample processing efficiency.

For samples analyzed by 8015M, surrogate recoveries were within criteria in all but 5 samples. Four of the five samples had artificially high surrogate recoveries, which was due to an interfering, unidentified compound(s) that co-eluted with the surrogates. The fifth sample had a low surrogate recovery and was noted in the sample preparation records.

- Sample Duplicates. A sample duplicate (DUP) was processed and analyzed with each analytical batch of samples. The DUP's data quality objectives (DQOs) were consistently met as defined in the Project QAPP.

There were 9 QC criteria of 227 QC data points outside of acceptance criteria.

Please do not hesitate to give us a call if you would like to discuss these data or if I can provide any further assistance.

Sincerely,

Robert Lizotte, Jr.
Research Scientist

Laboratory Analysis Report

Sierra
Environmental
Monitoring, Inc.

Alpha Analytical

255 Glendale Avenue Suite 21
Sparks, NV 89431

Date: 10/16/2000

Laboratory Analysis Report

Sierra
Environmental
Monitoring, Inc.

Alpha Analytical

255 Glendale Avenue Suite 21
Sparks, NV 89431

Date: 10/25/00
Client: ALP-855
Taken by: Client
Report: 37235
PO #:

Approved By:

A handwritten signature of "Brian Seher" over a solid horizontal line.

Sierra Environmental Monitoring, Inc.

Date: 10-25-00

This report is applicable only to the sample received by the laboratory. The liability of the laboratory is limited to the amount paid for this report. This report is for the exclusive use of the client to whom it is addressed and upon the condition that the client assumes all liability for the further distribution of the report or its contents.

NA-Not Applicable.

ND-Not Detected

J- Analyte detected below the MDL

B - Analyte detected at a level greater than 3* MDL in PB

ME - Significant matrix interference estimated value

U Analyte not detected

& - QC value outside the accuracy or data quality objective.

~ - QC value outside the accuracy or precision data quality objective -but meets contingency criteria

Evaluation of Sediment Agitation and Mixing into the Surrounding Water Column from Capping Activities - Boston Harbor

APPENDIX E

PAH LABORATORY-REPORTED SAMPLE DATA WITH QC QUALIFIERS

Project Name: WA3-26 (Boston Cap
Project)

Silver - ICP-MS	EPA 200.8	<0.02	mg/L	0.02	Rivera	10/20/00
Lead - ICP-MS	EPA 200.8	0.15	mg/L	0.02	Rivera	10/20/00
Mercury - AA Cold Vapor	EPA 245.1	<0.0005	mg/L	0.0005	Kobza	10/18/00
Selenium - ICP-MS	EPA 200.8	<0.02	mg/L	0.02	Rivera	10/20/00

Sample ID:	Customer Sample ID	Date Sampled	Time Sampled	Date Received
S200010-0672	BMI00101664-10 - CAD0162CMM1	9/28/00		10/16/00

Parameter	Method	Result	Units Of Measure	Detection Limit	Analyst	Date Analyzed
Total Recoverable Metals - Acid	EPA 200.2	Completed			Kleinworth	10/20/00
Arsenic - ICP-MS	EPA 200.8	<0.02	mg/L	0.02	Rivera	10/20/00
Barium - ICP-MS	EPA 200.8	<0.02	mg/L	0.02	Rivera	10/20/00
Cadmium - ICP-MS	EPA 200.8	<0.02	mg/L	0.02	Rivera	10/20/00
Chromium - ICP-MS	EPA 200.8	<0.02	mg/L	0.02	Rivera	10/20/00
Silver - ICP-MS	EPA 200.8	<0.02	mg/L	0.02	Rivera	10/20/00
Lead - ICP-MS	EPA 200.8	<0.02	mg/L	0.02	Rivera	10/20/00
Mercury - AA Cold Vapor	EPA 245.1	<0.0005	mg/L	0.0005	Kobza	10/18/00
Selenium - ICP-MS	EPA 200.8	<0.02	mg/L	0.02	Rivera	10/20/00

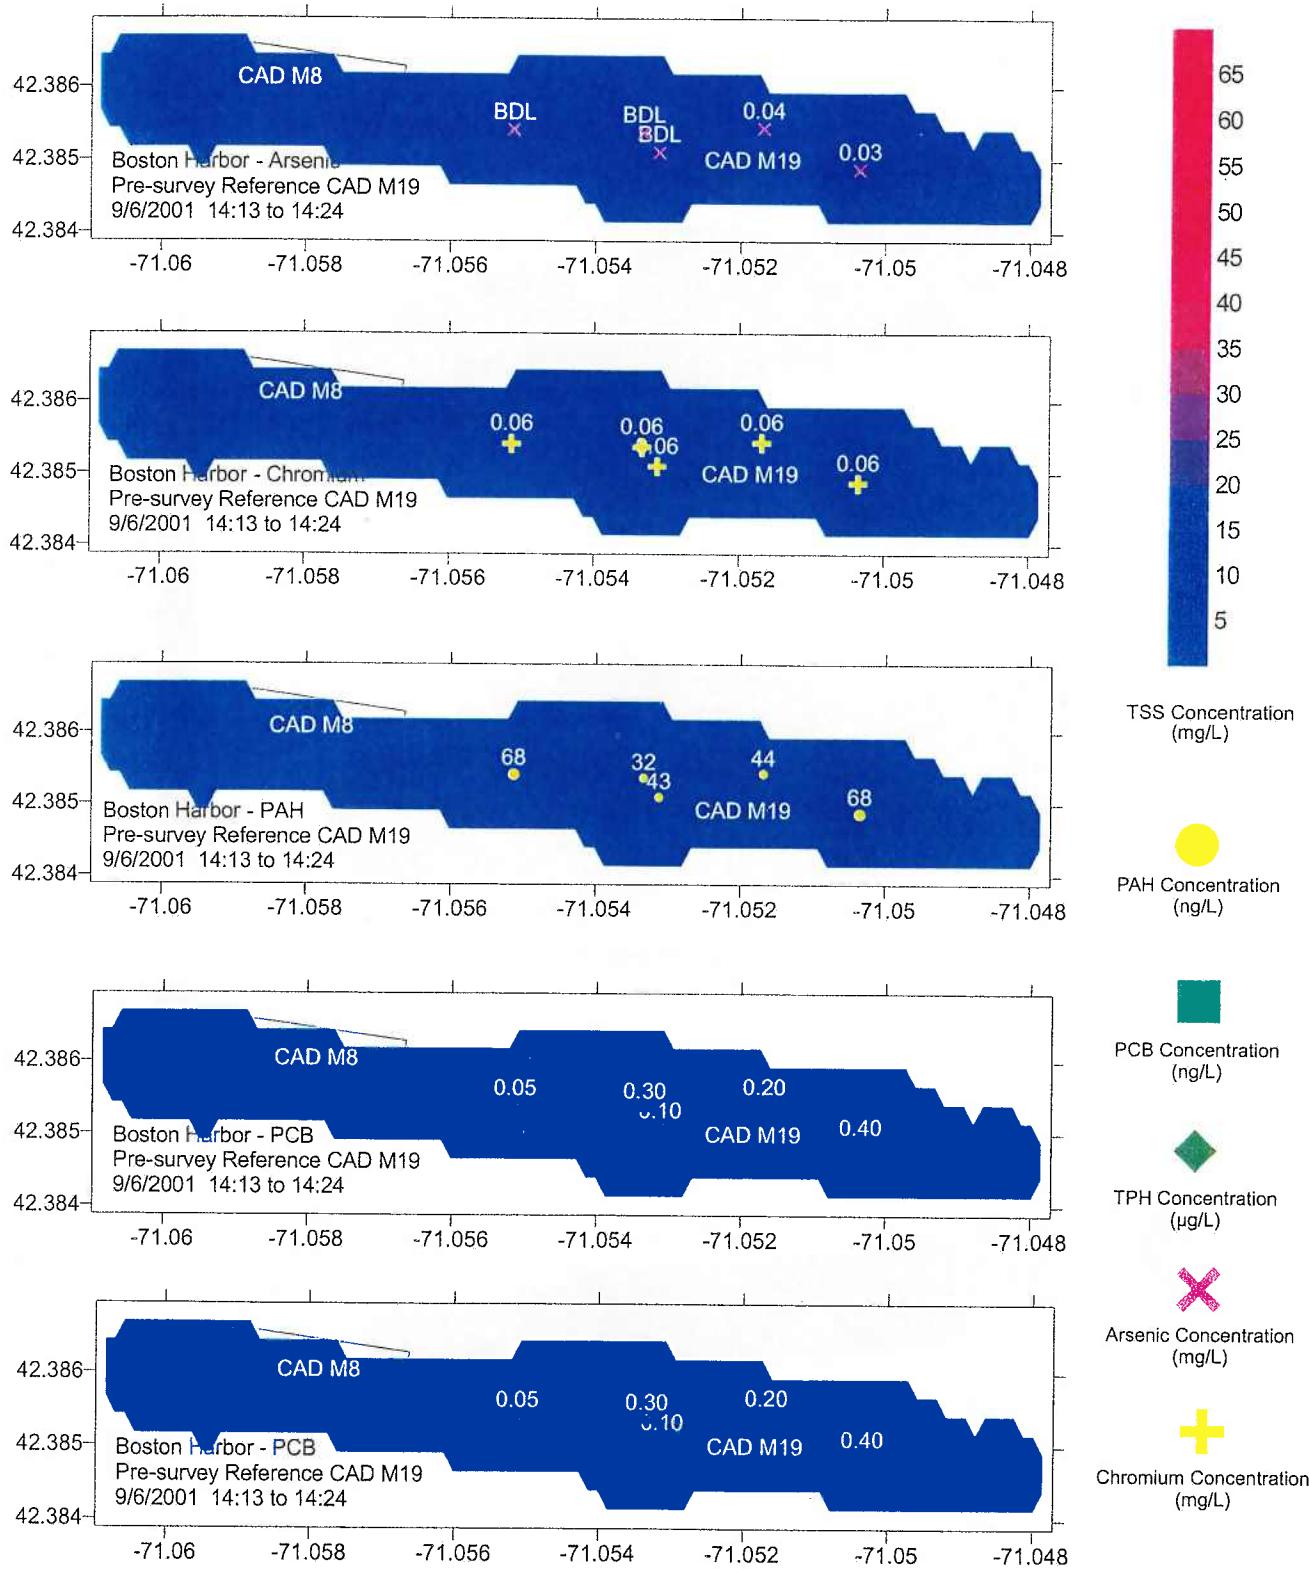

Evaluation of Sediment Agitation and Mixing into the Surrounding Water Column from Capping - Boston Harbor

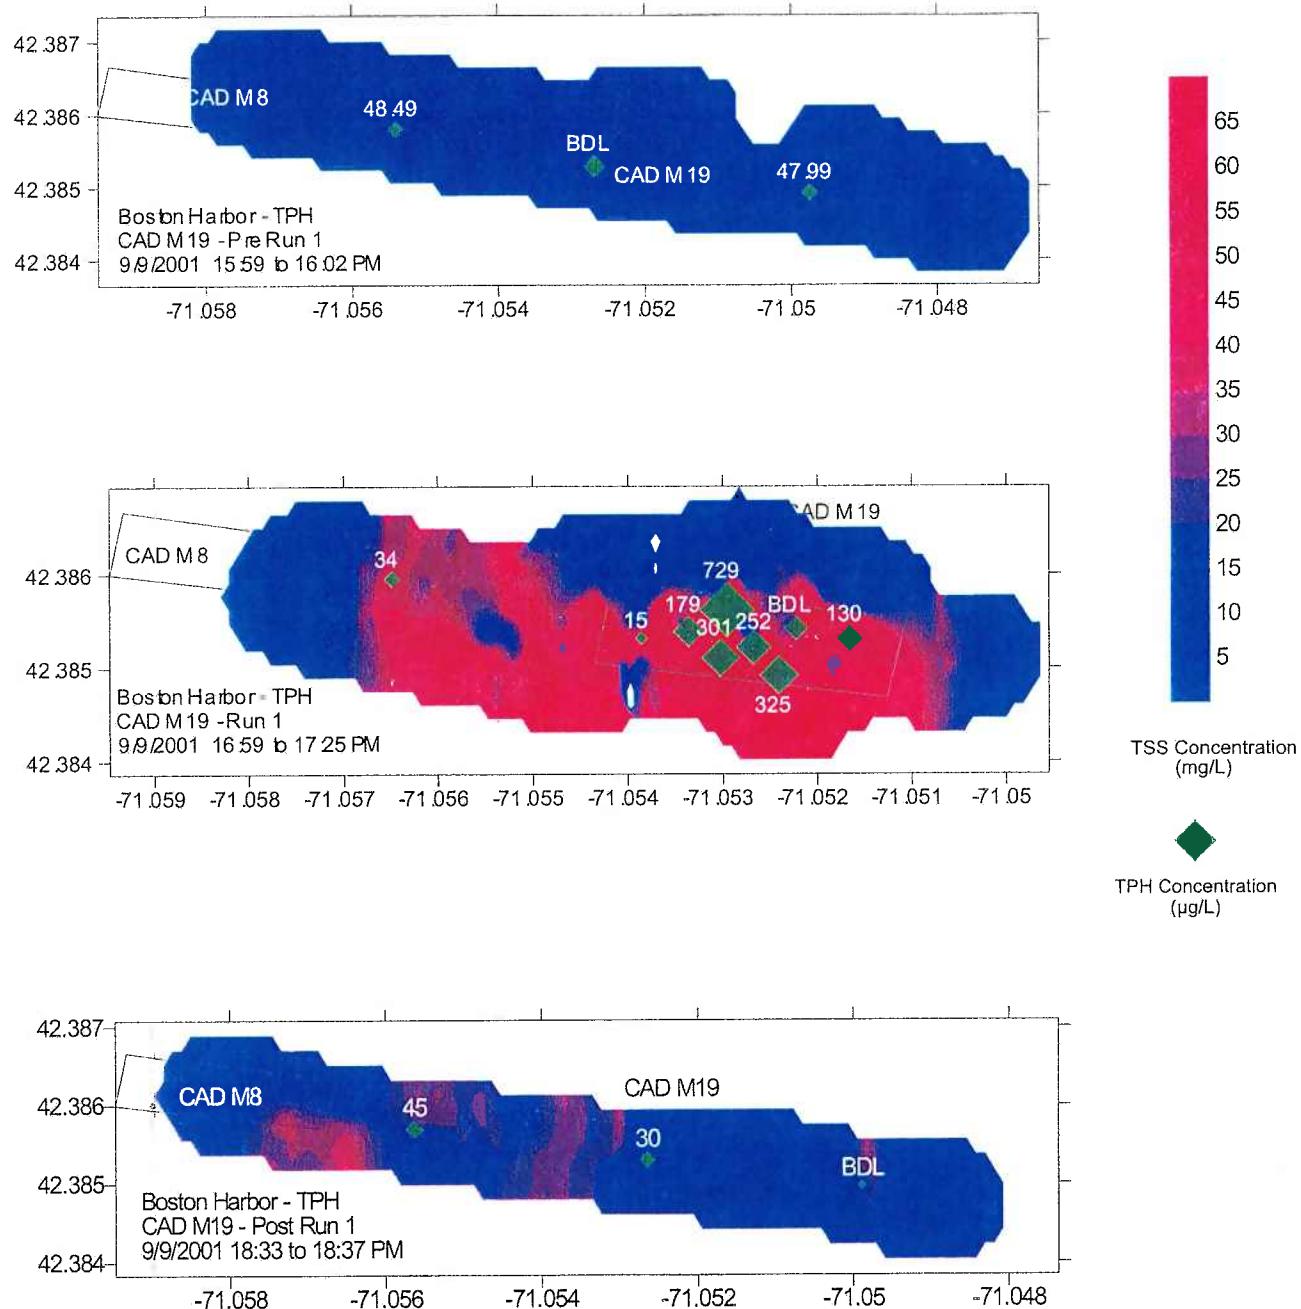

APPENDIX H

TSS AND CONTAMINANT OF CONCERN 2-DIMENSIONAL PLOTS

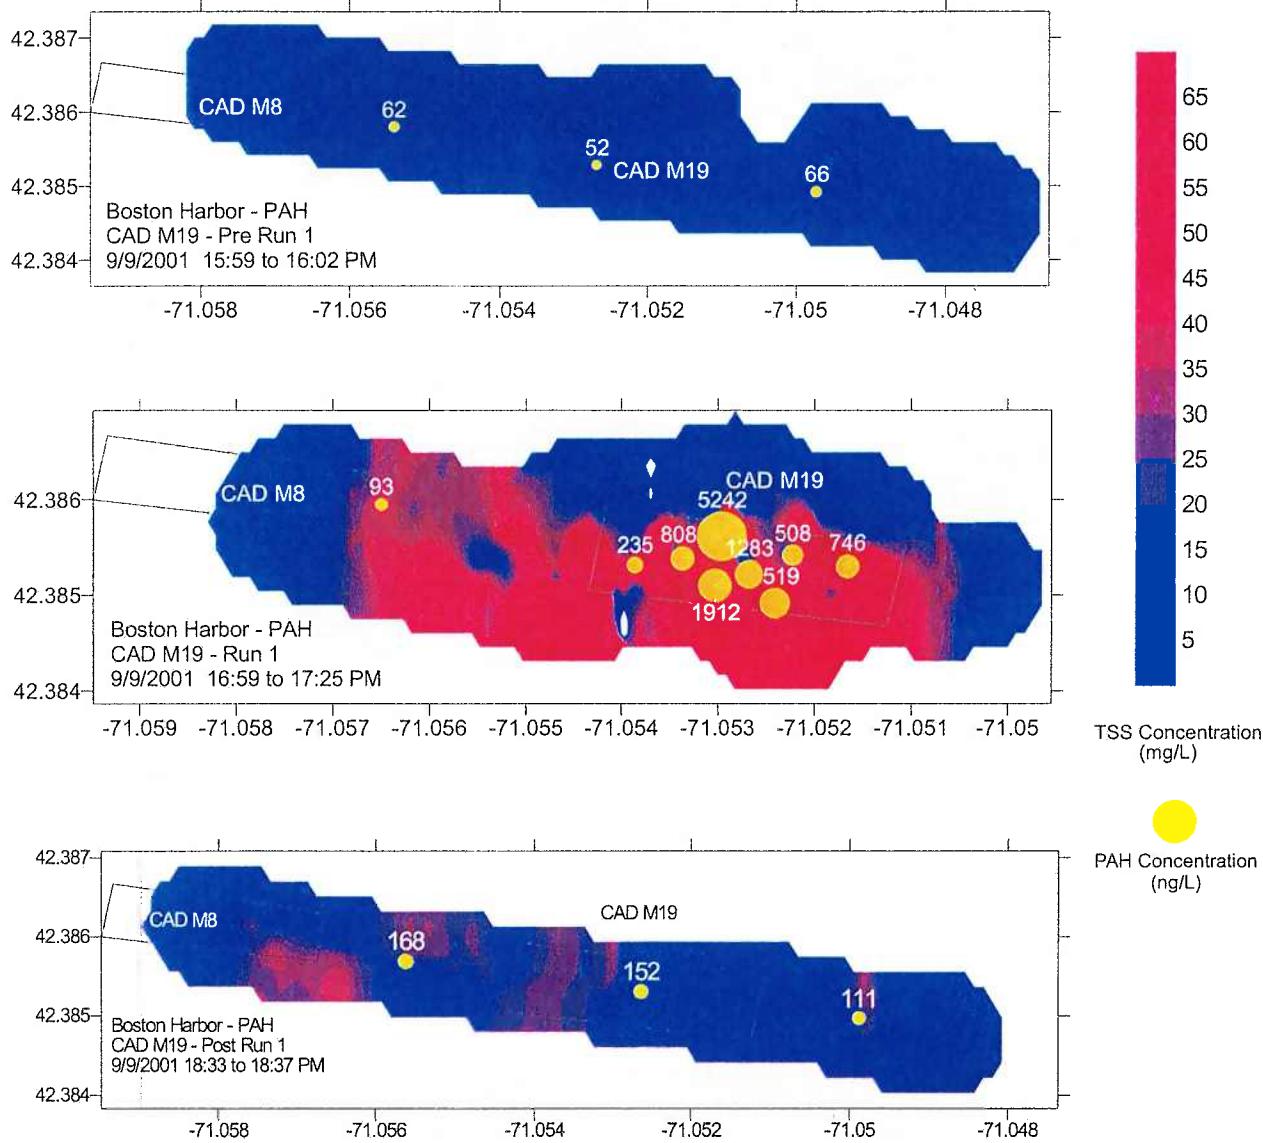

Pre Survey CAD Cell M19 All Contaminants

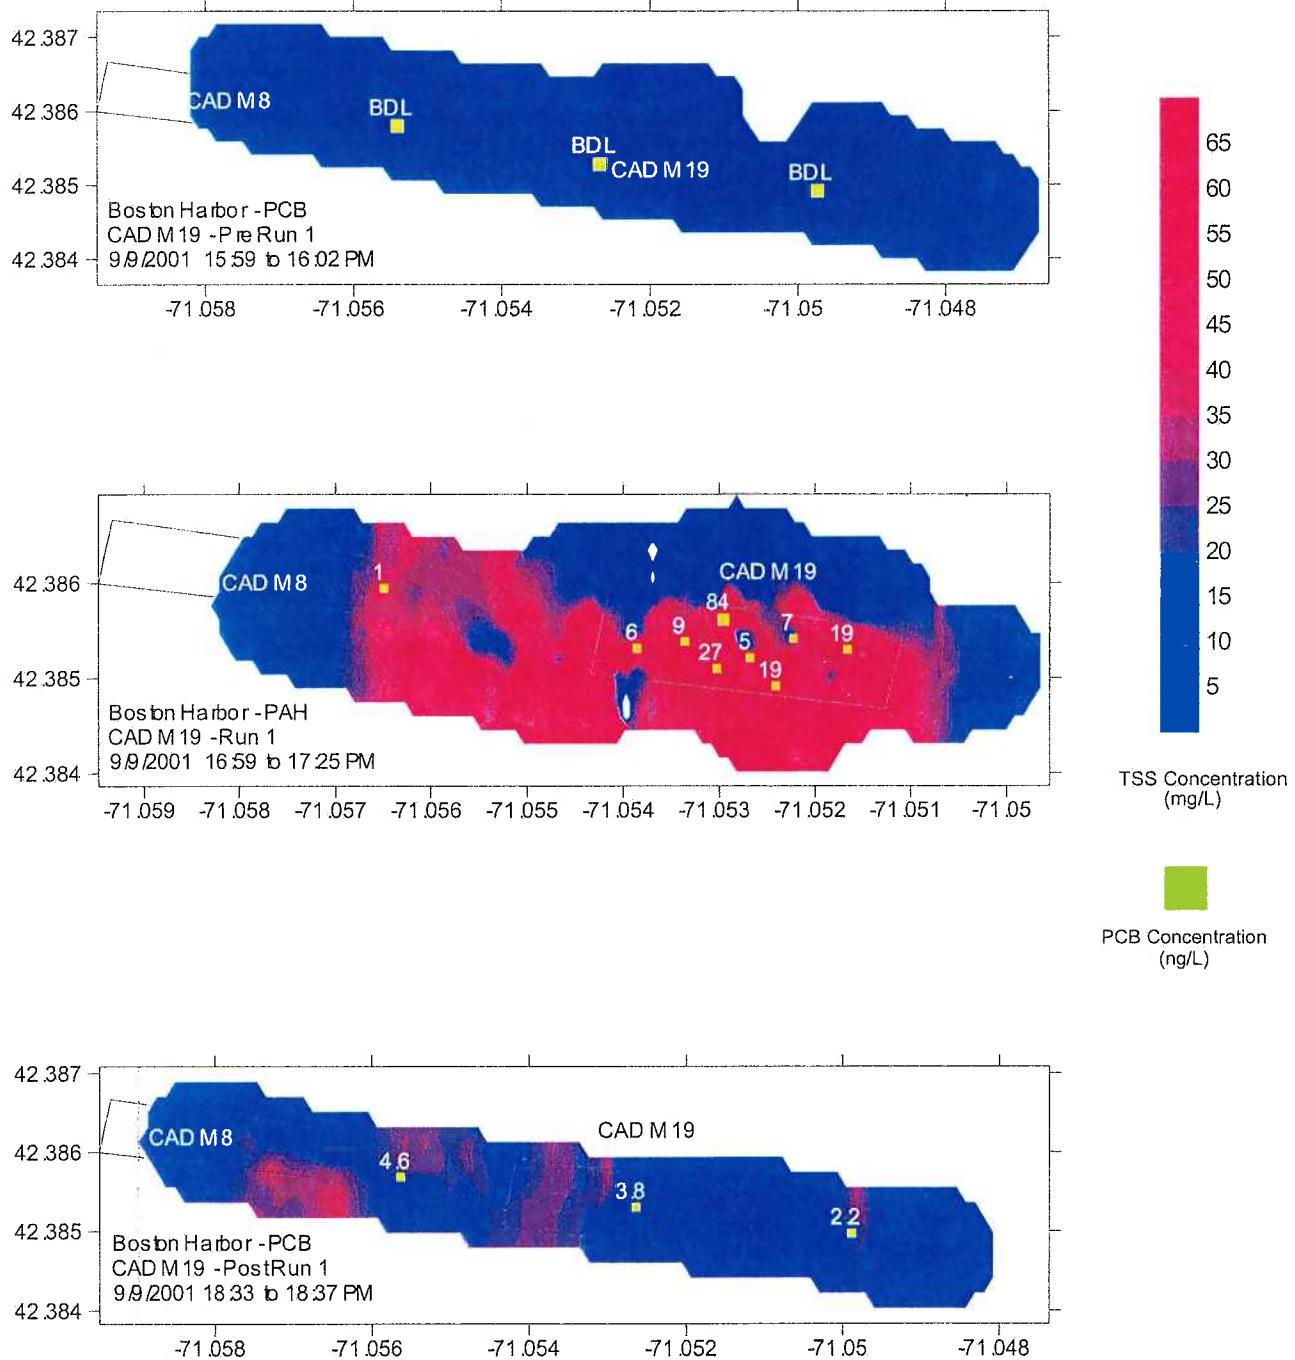

Run 1 CAD Cell M19 - TPH

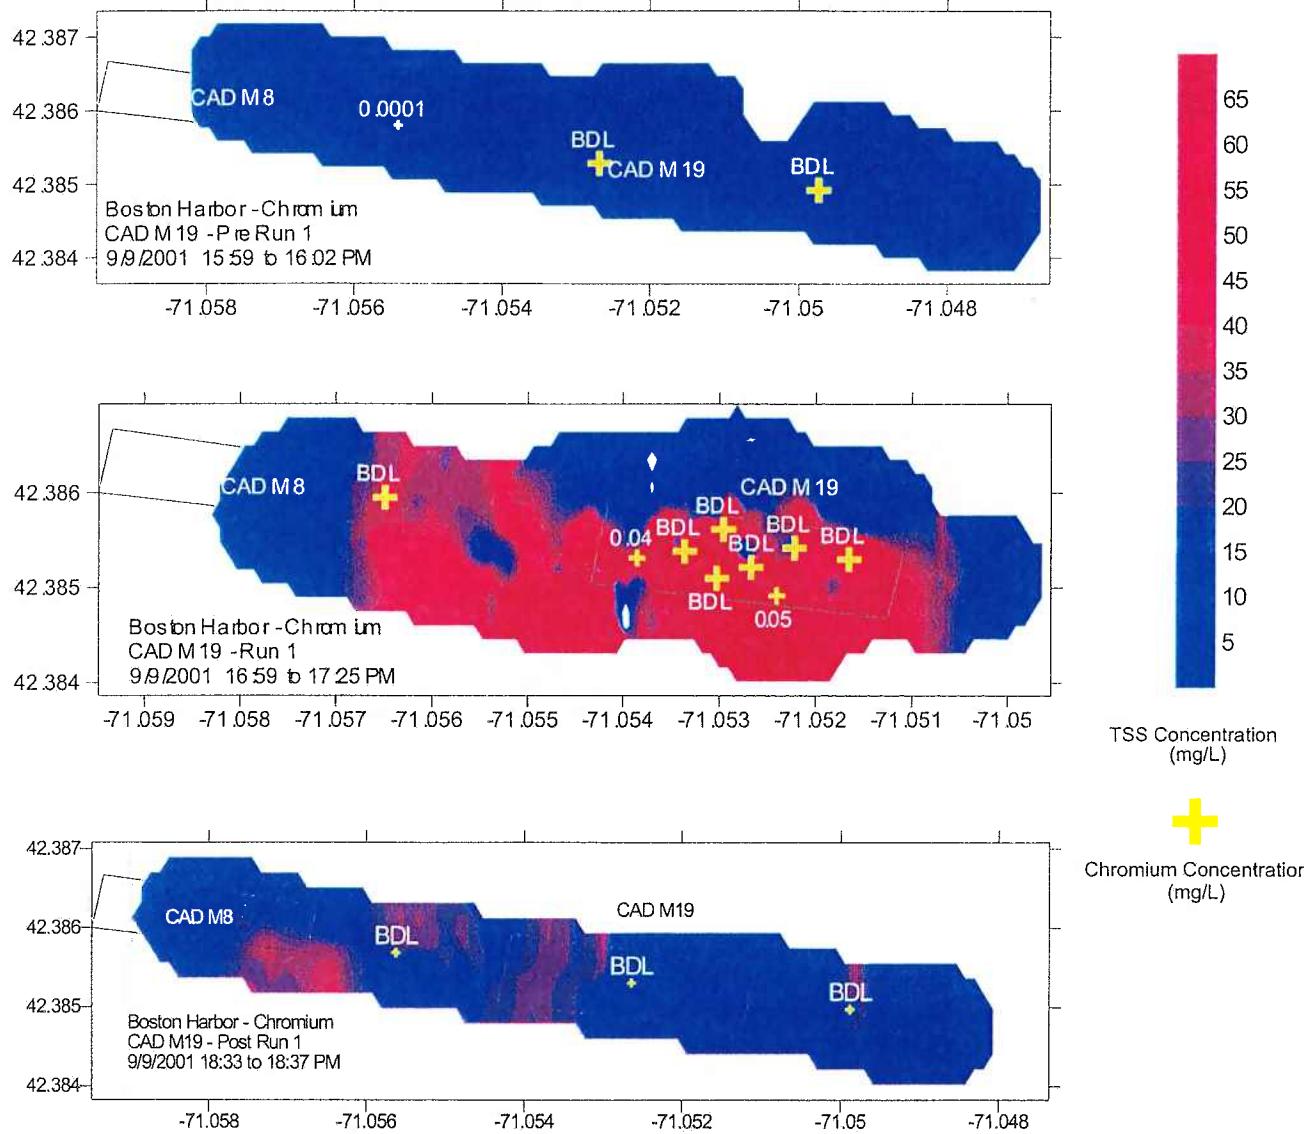

Run 1 CAD Cell M19 - PAH

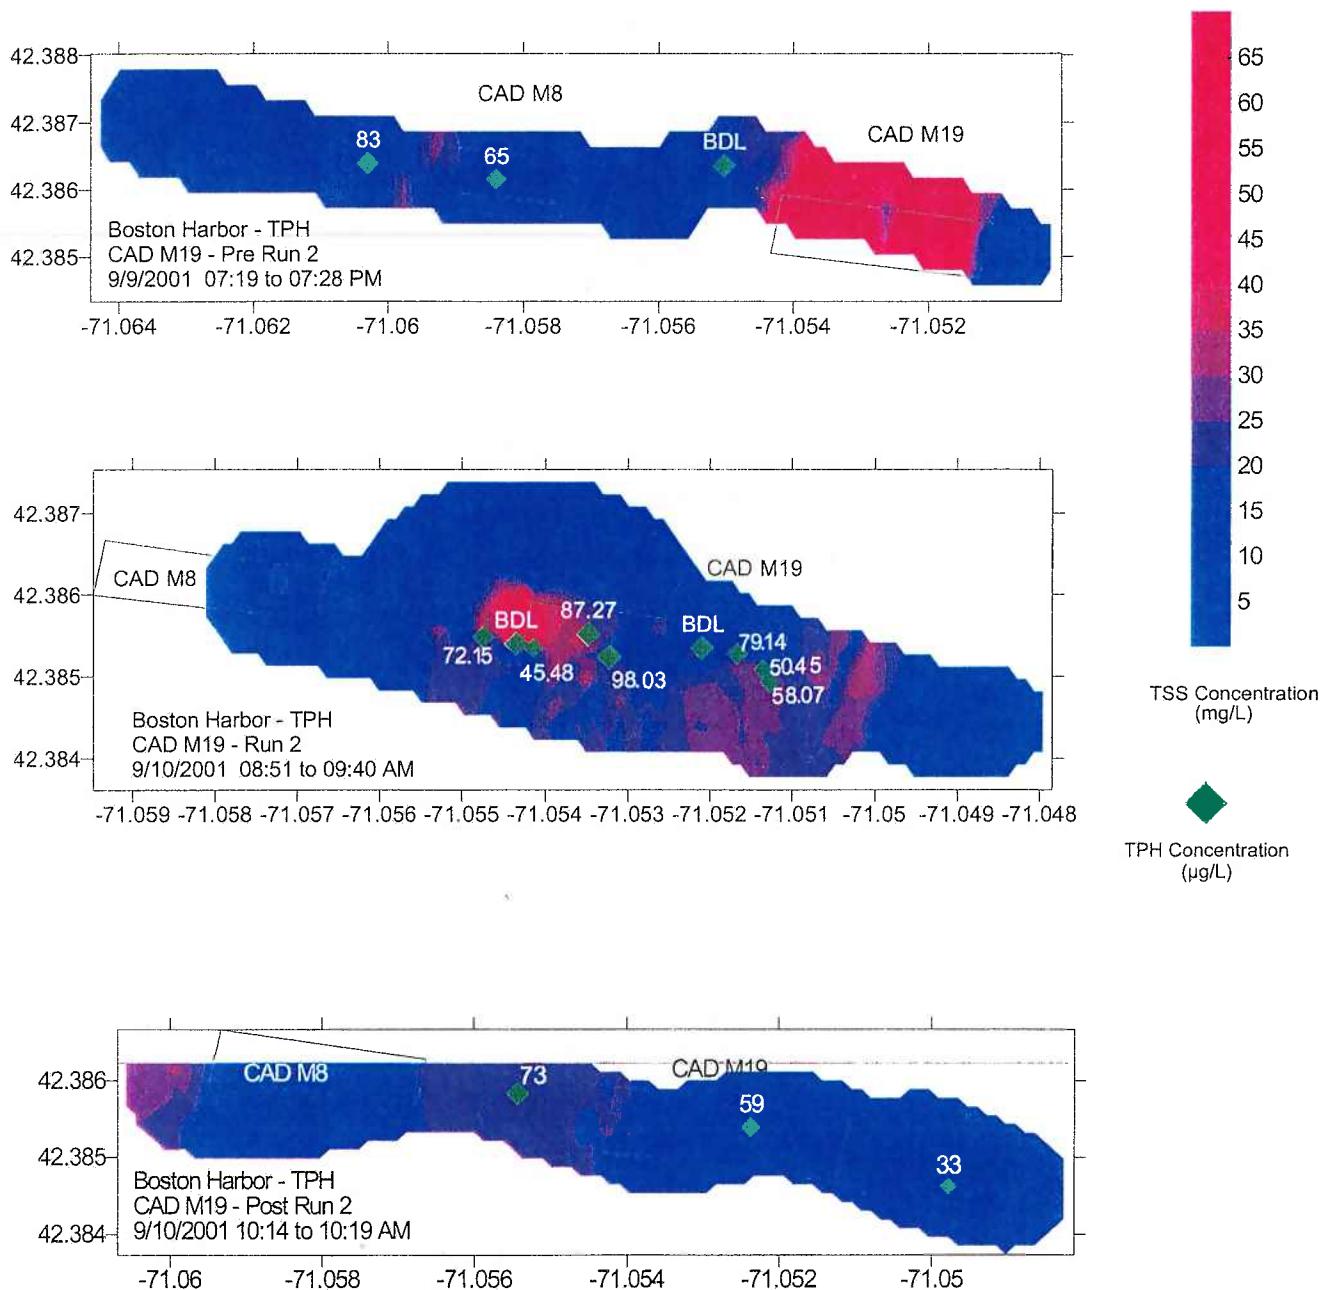

Run 1 CAD Cell M19 - PCB

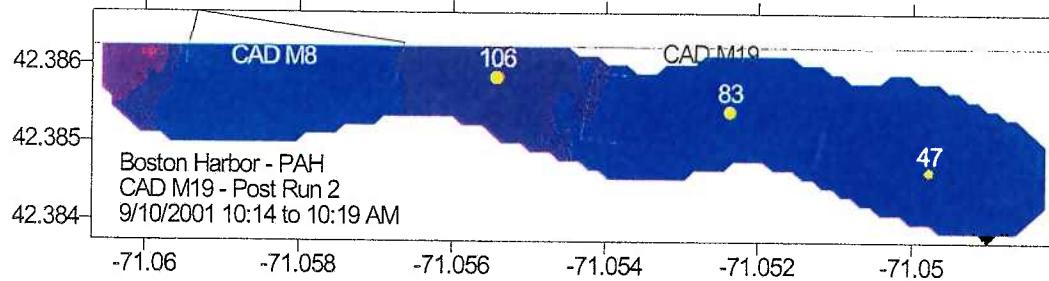

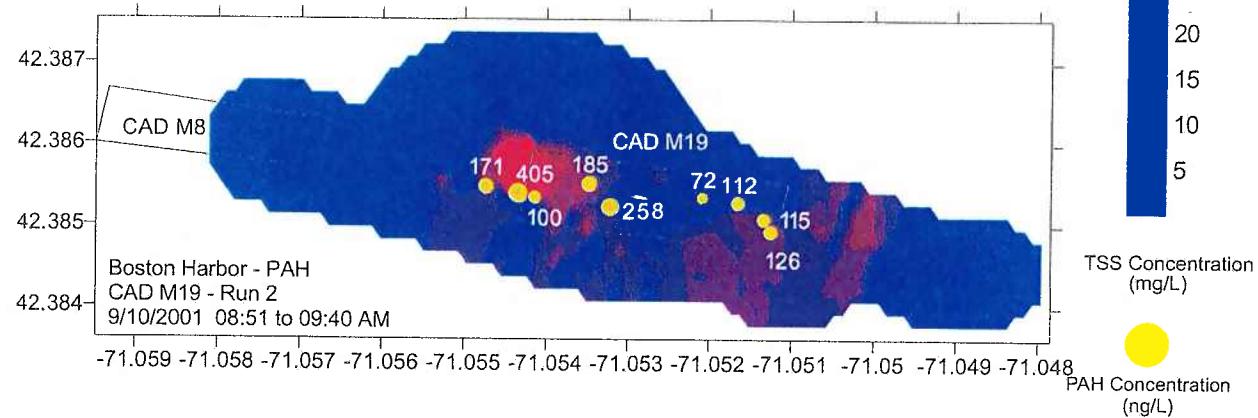

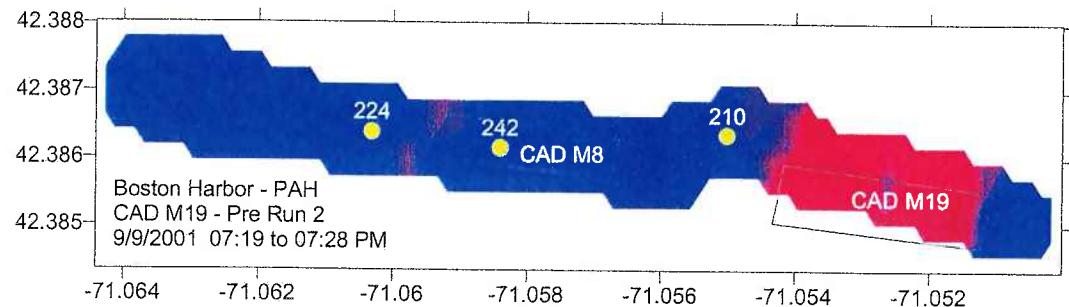

Run 1 CAD Cell M19 - Cr

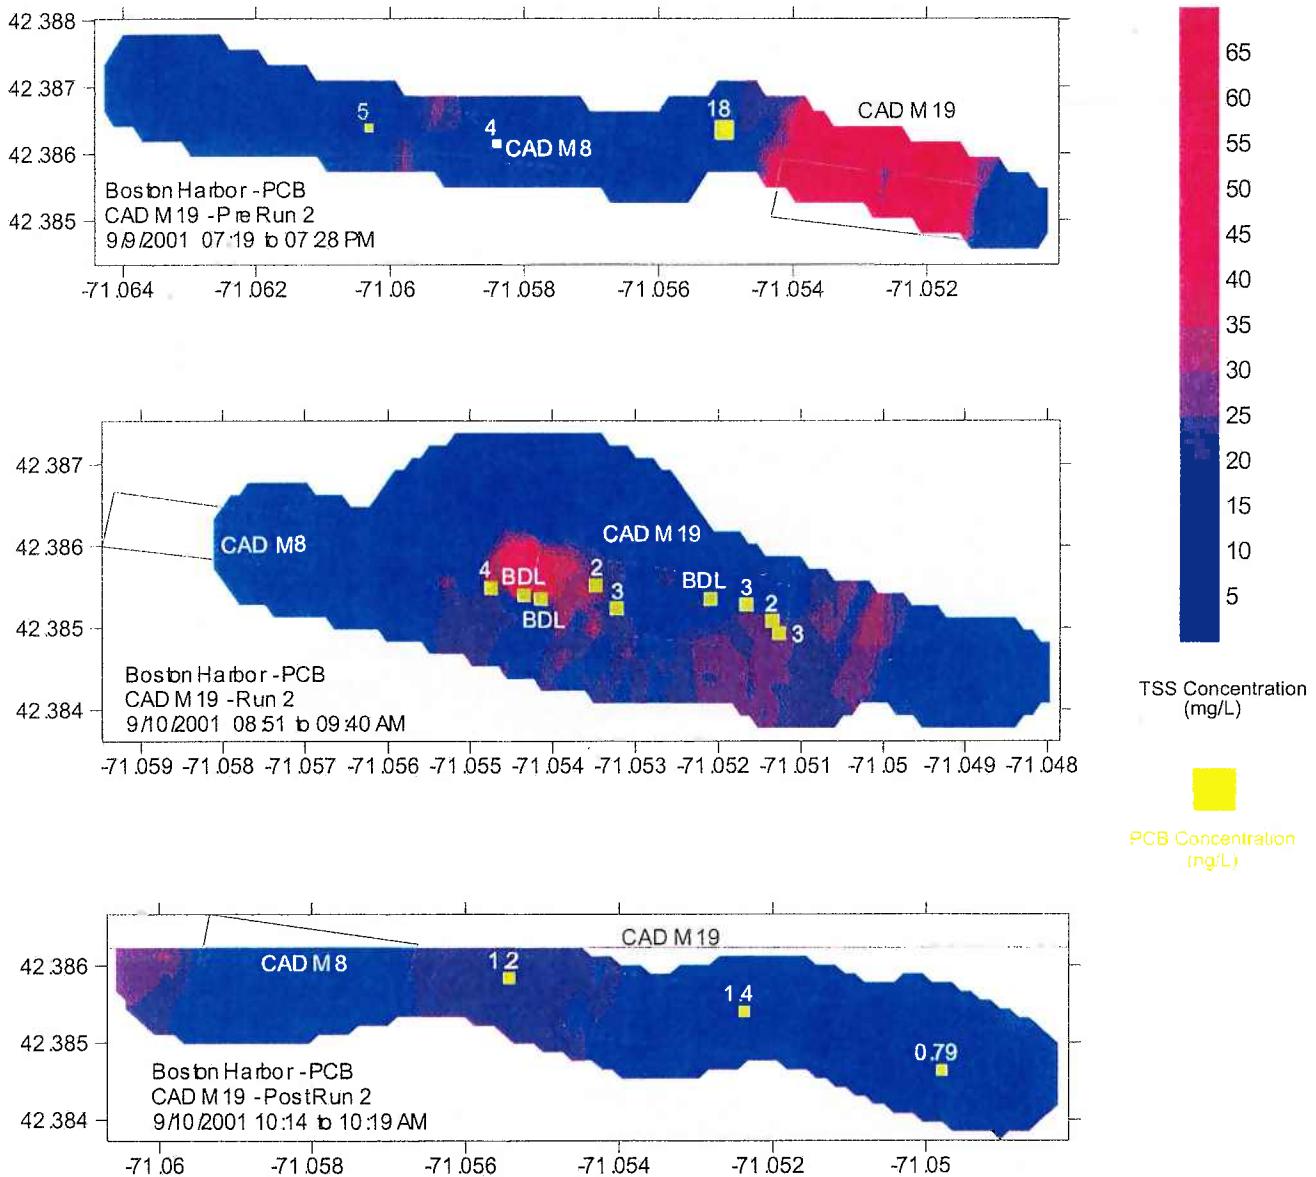

Run 2 CAD Cell M19 - TPH

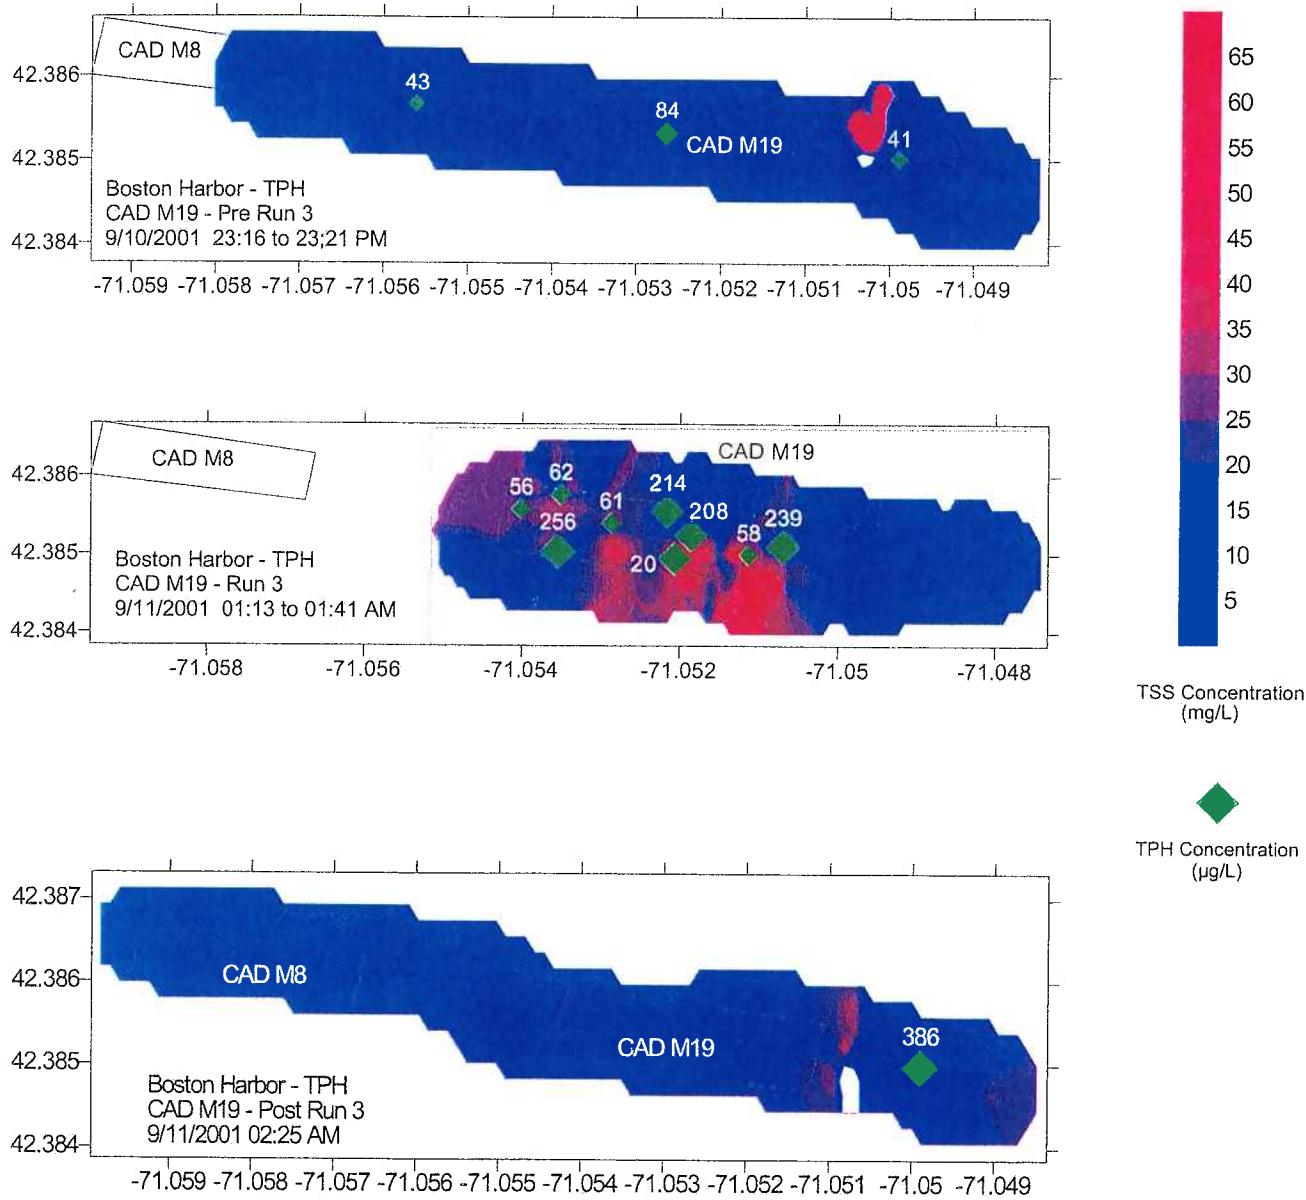

Run 2 CAD Cell M19 - PAH

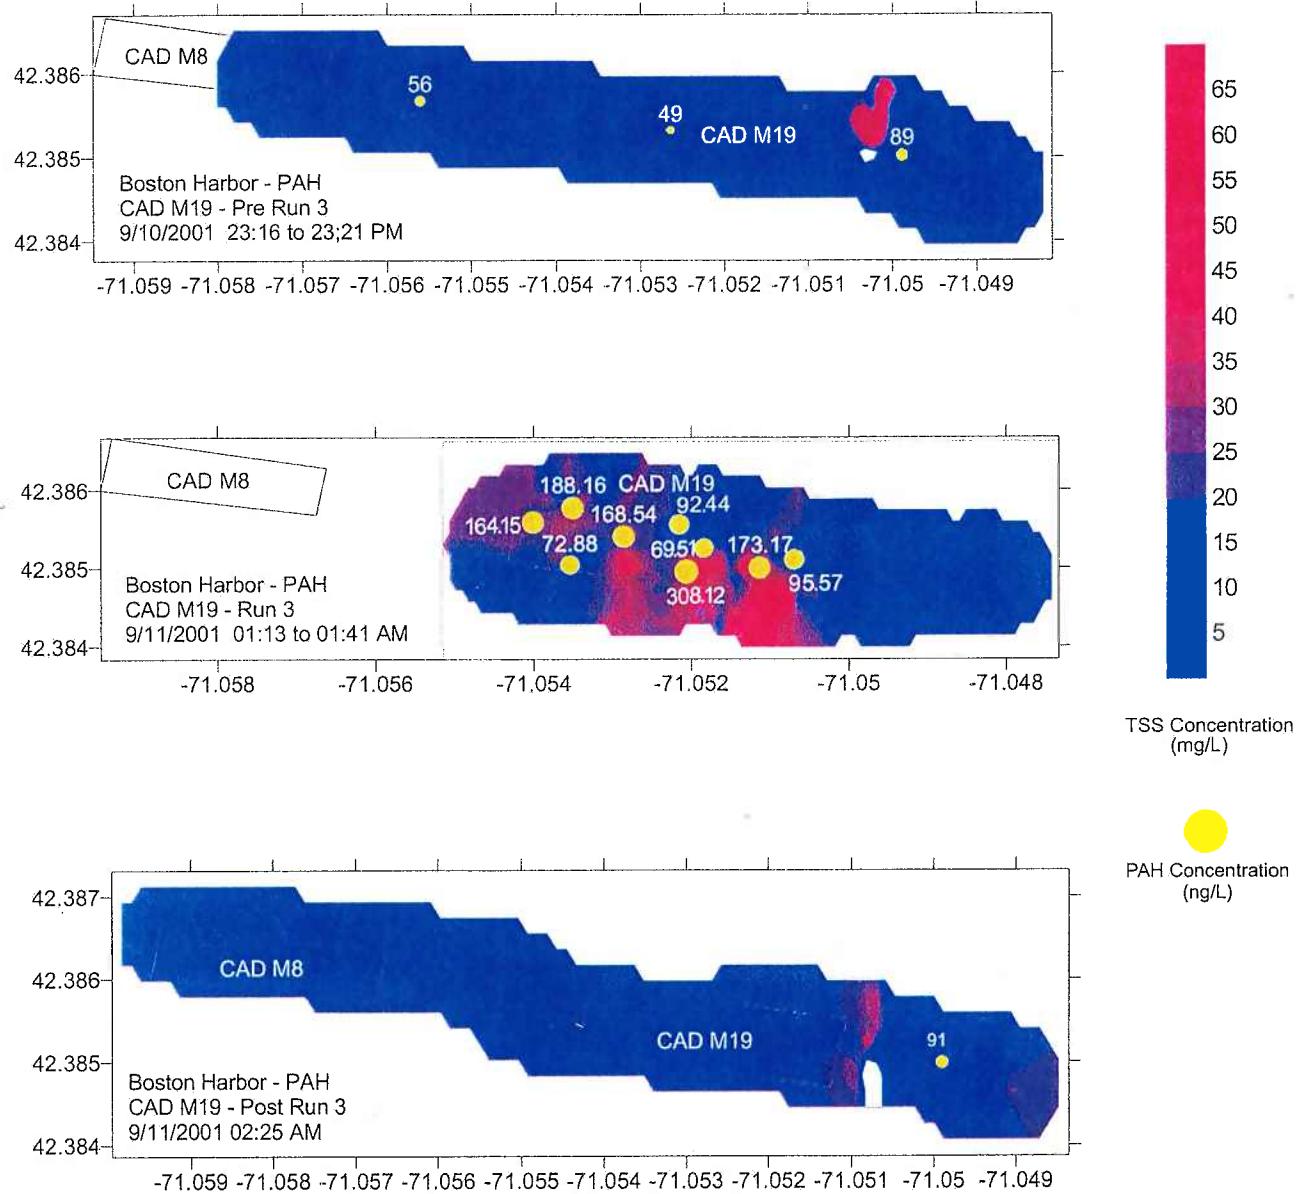

Run 2 CAD Cell M19 - PCB

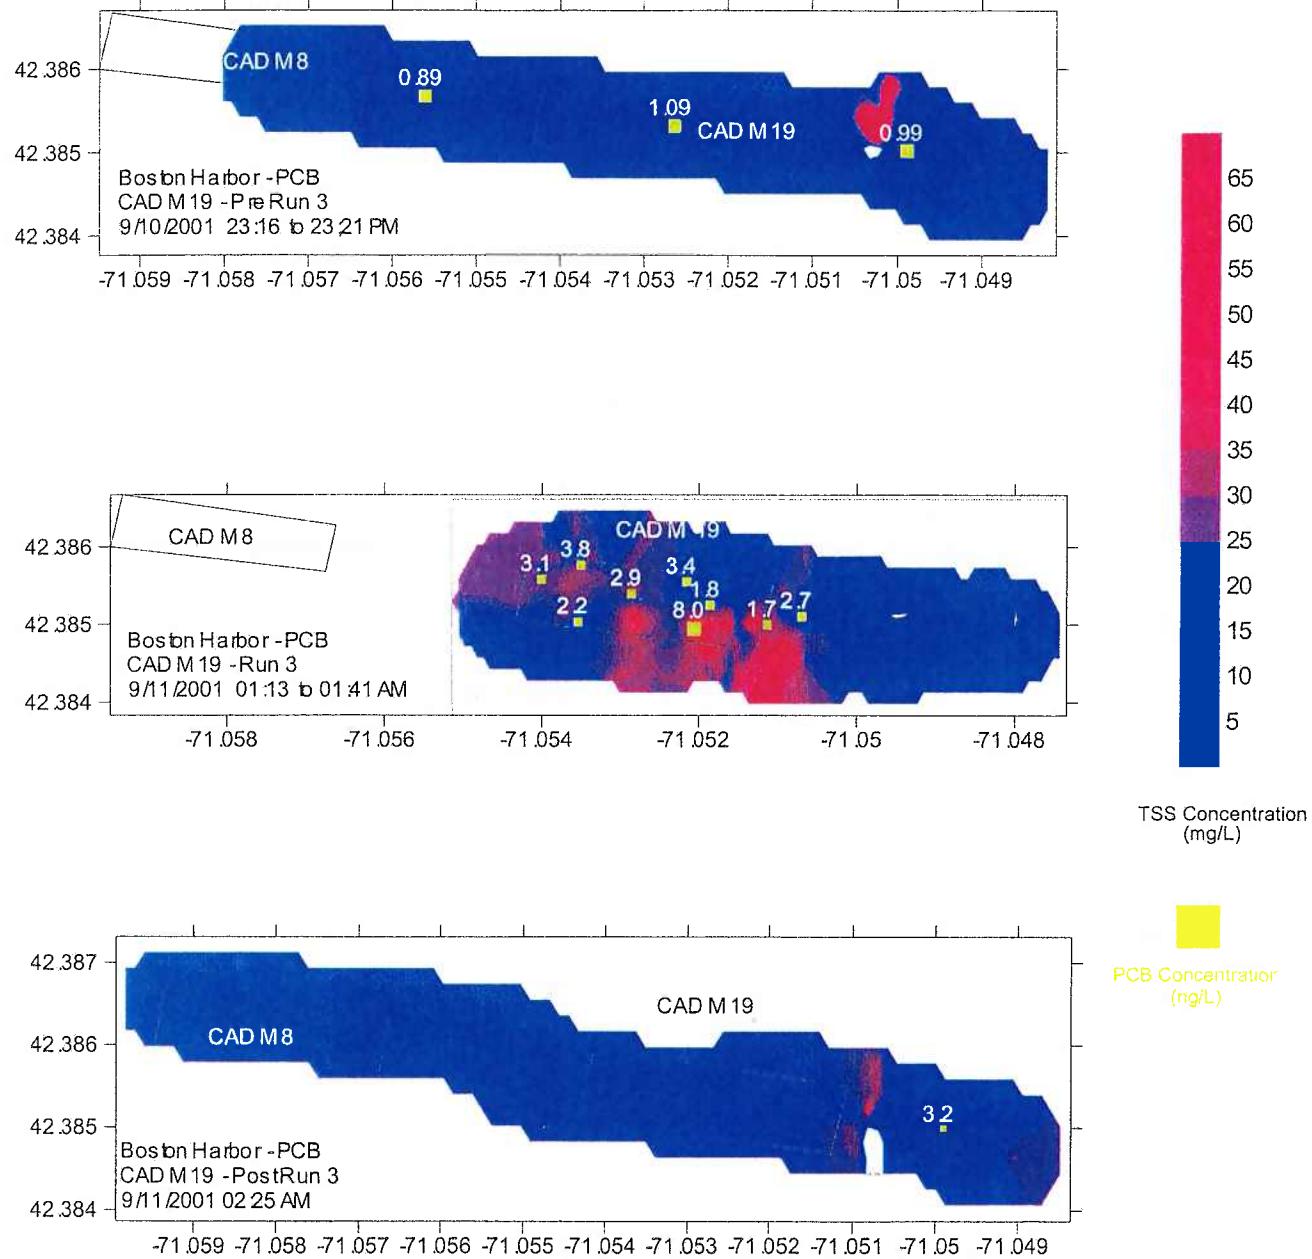

Run 3 CAD Cell M19 - TPH

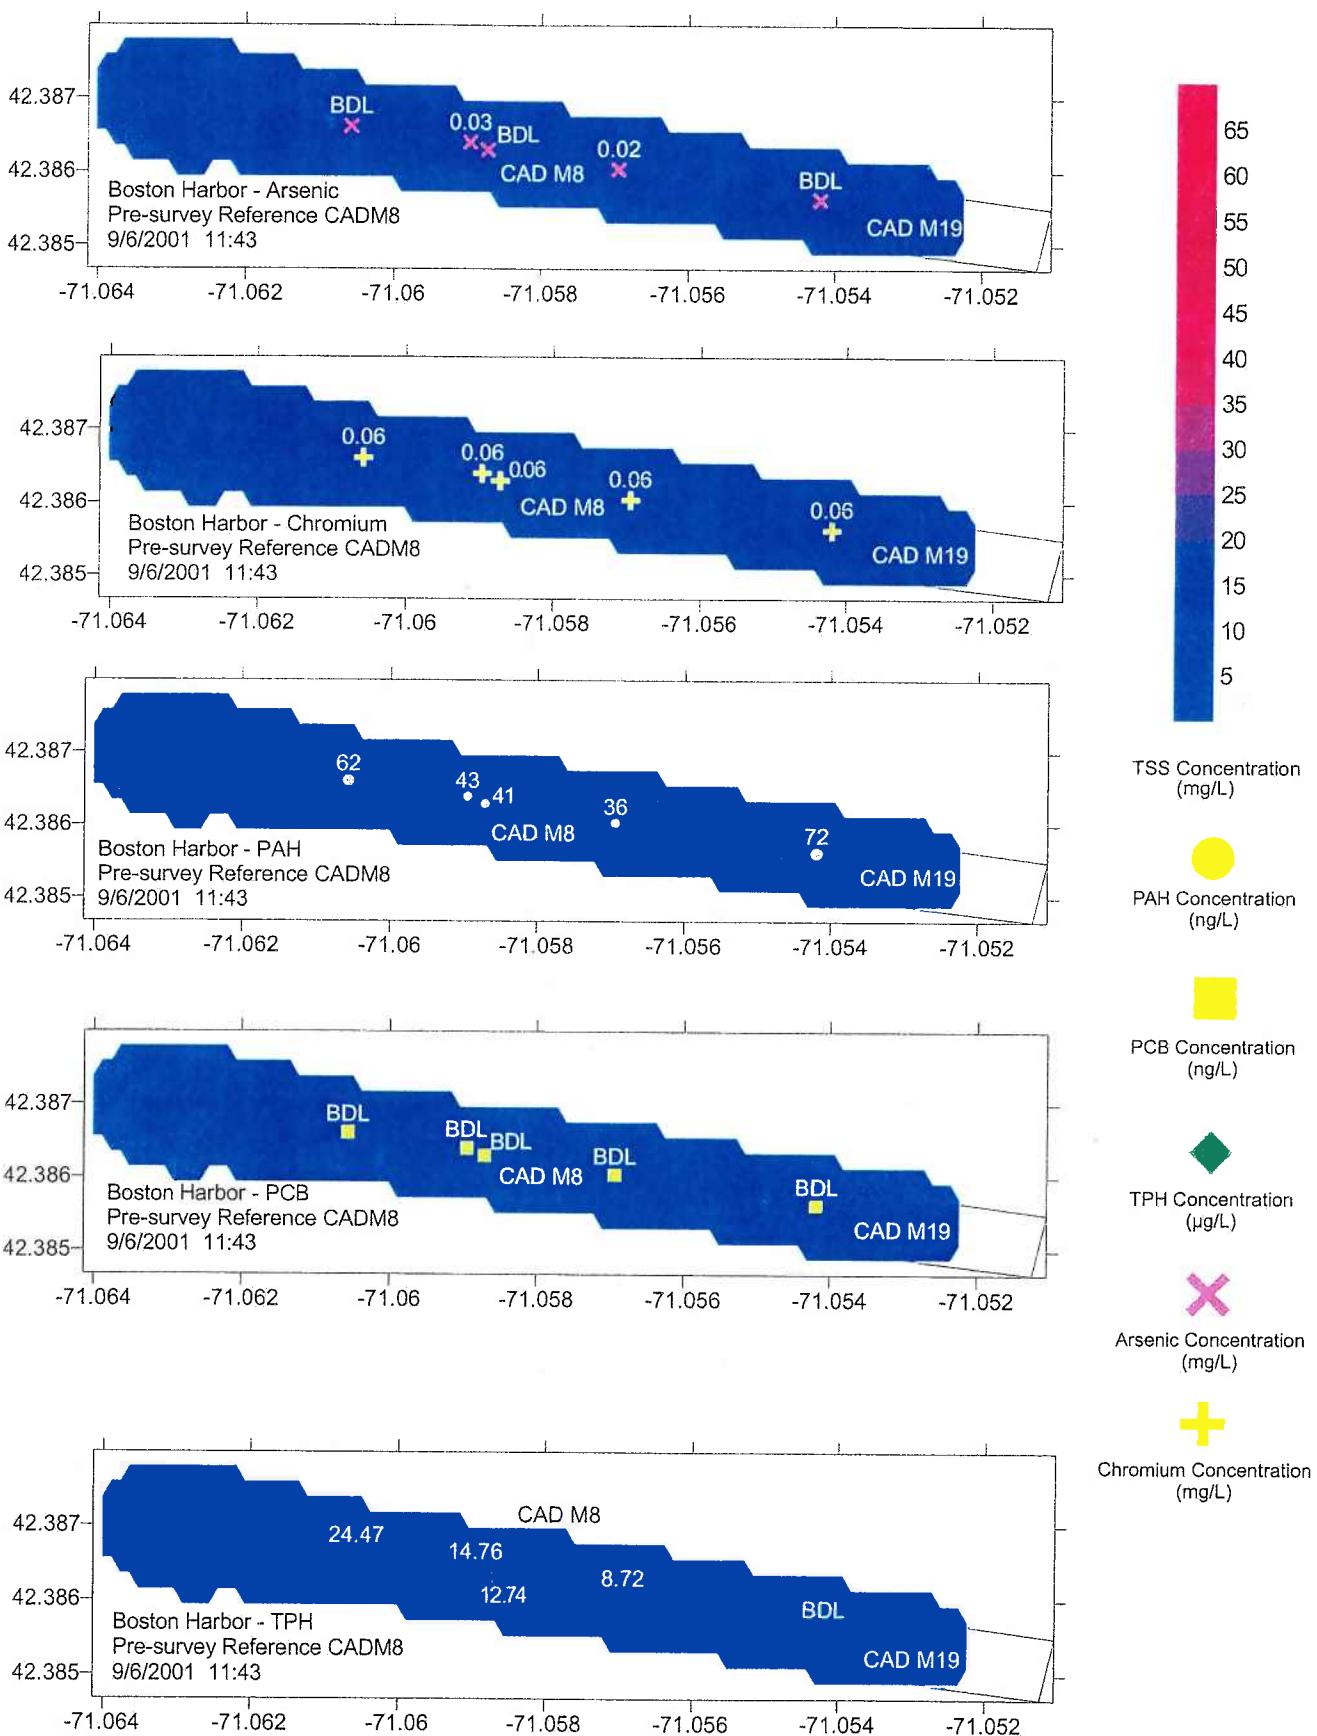

Run 3 CAD Cell M19 - PAH

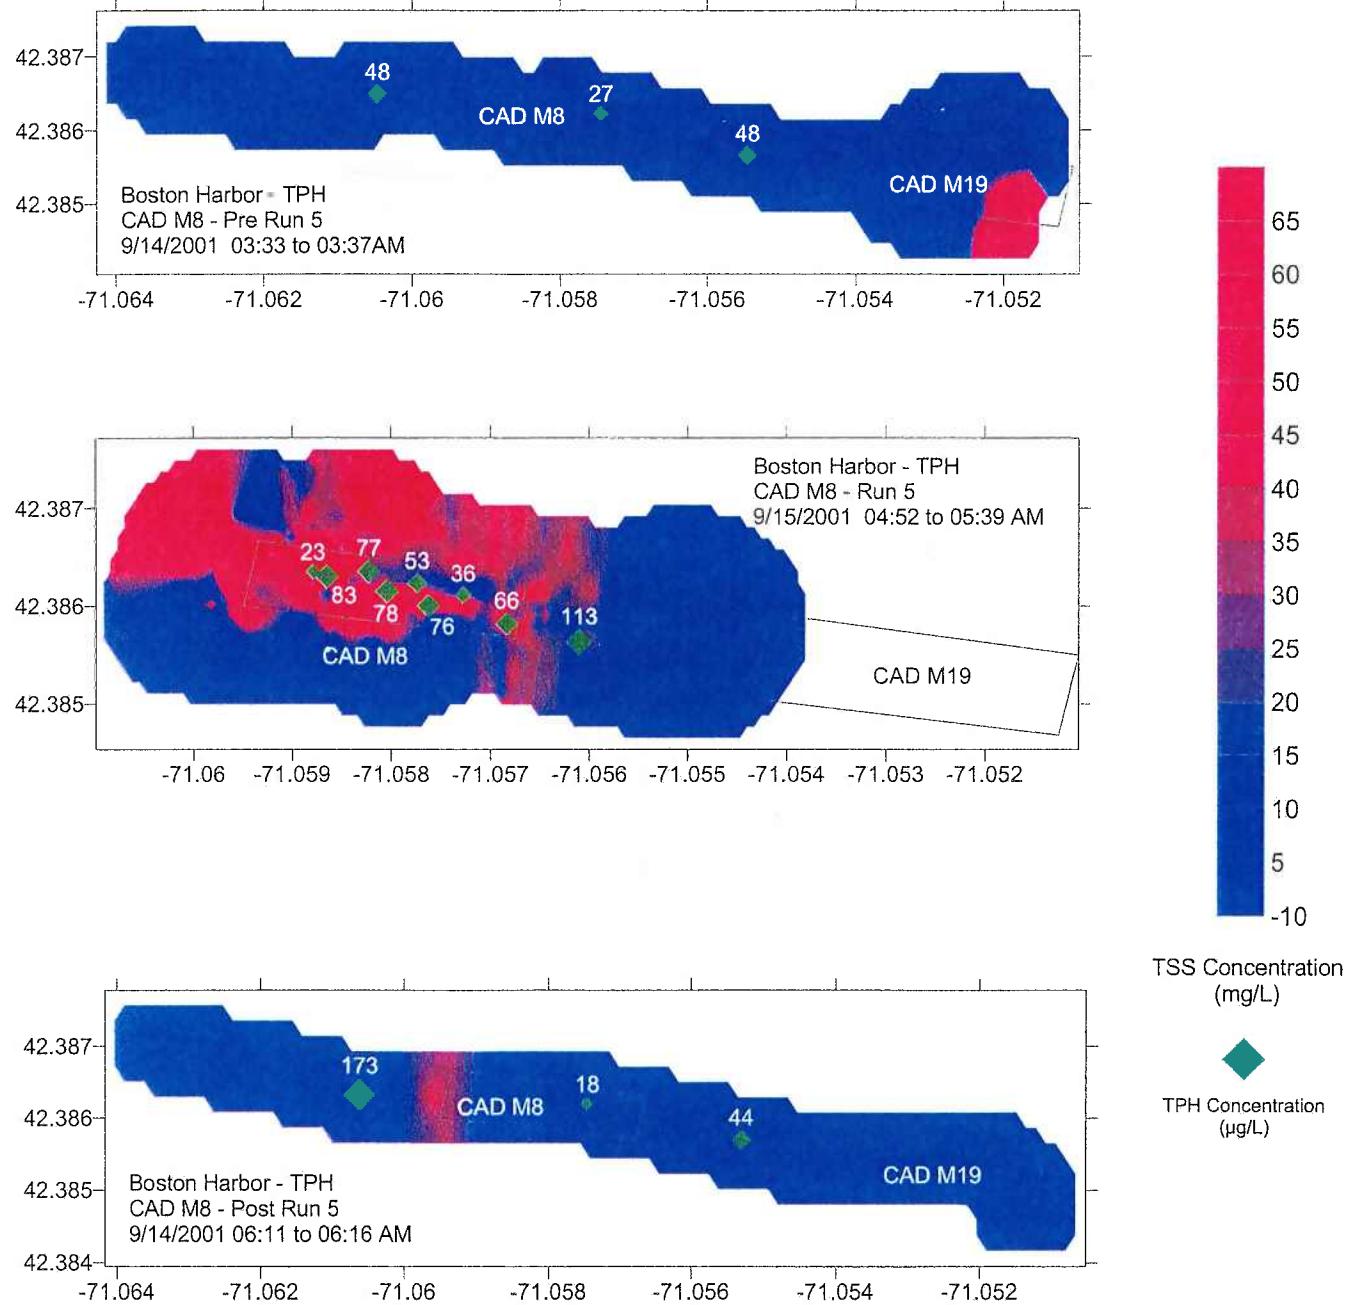

Run 3 CAD Cell M19 - PCB

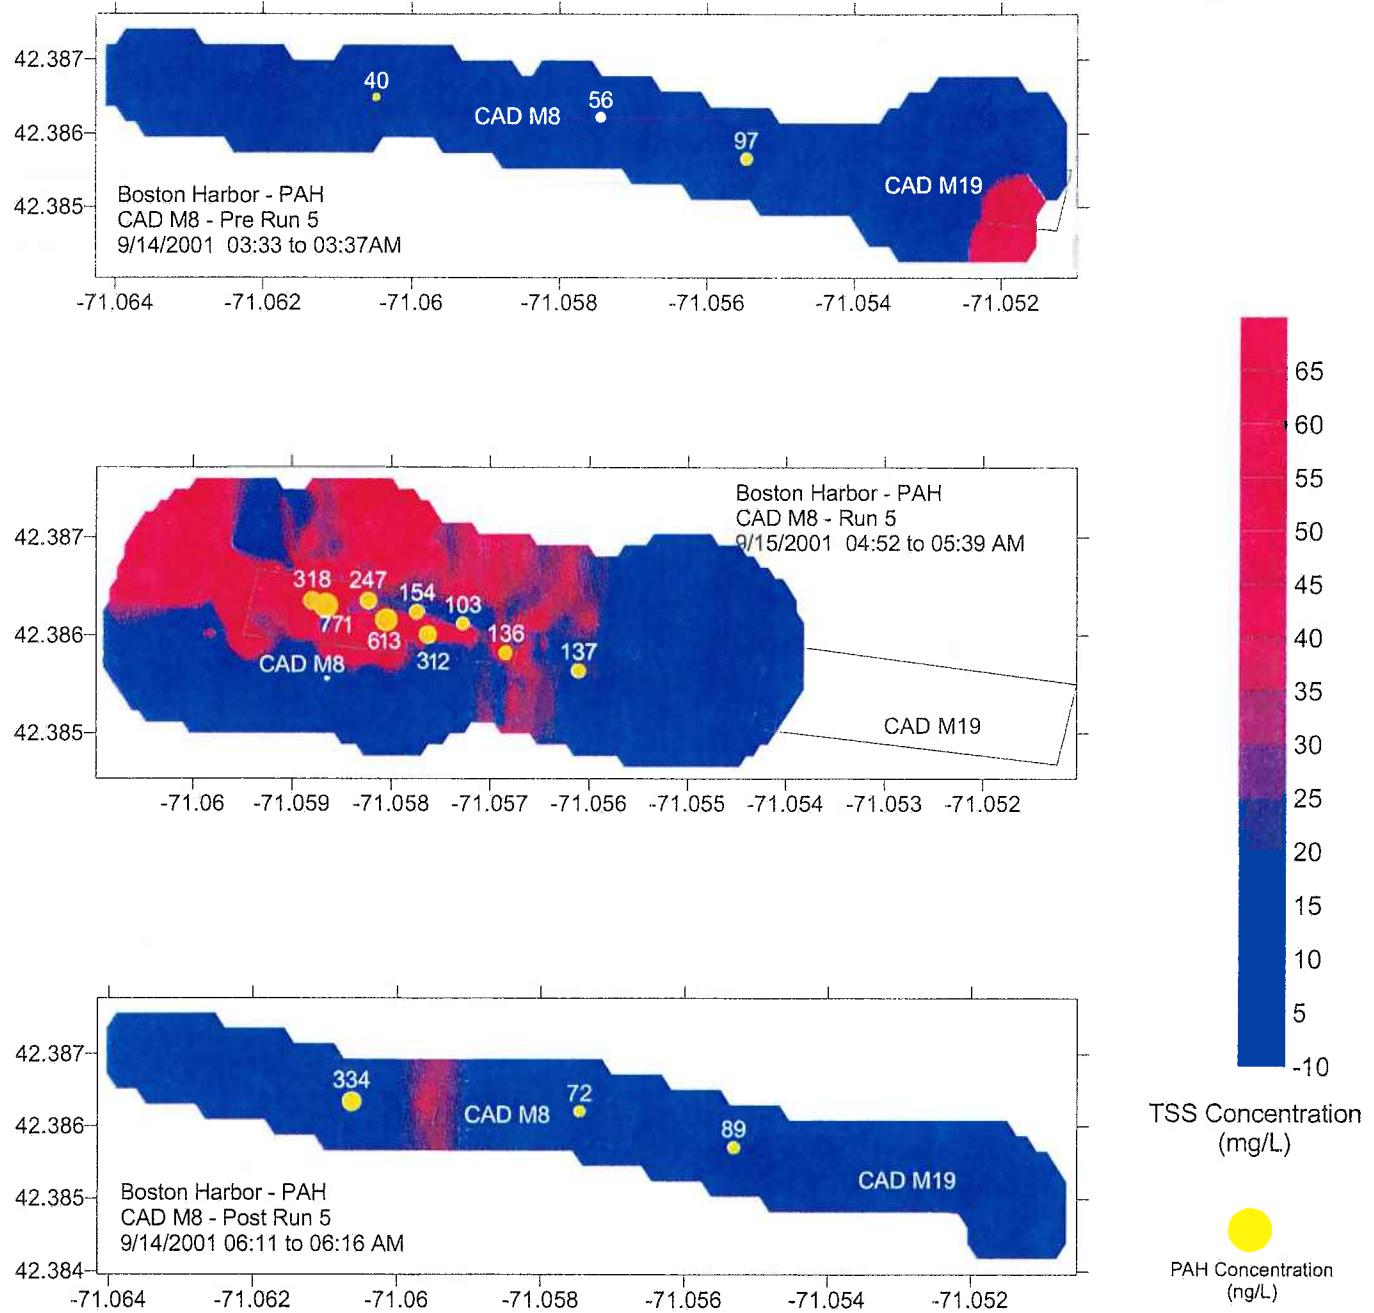

Pre Survey CAD Cell M8 All Contaminants

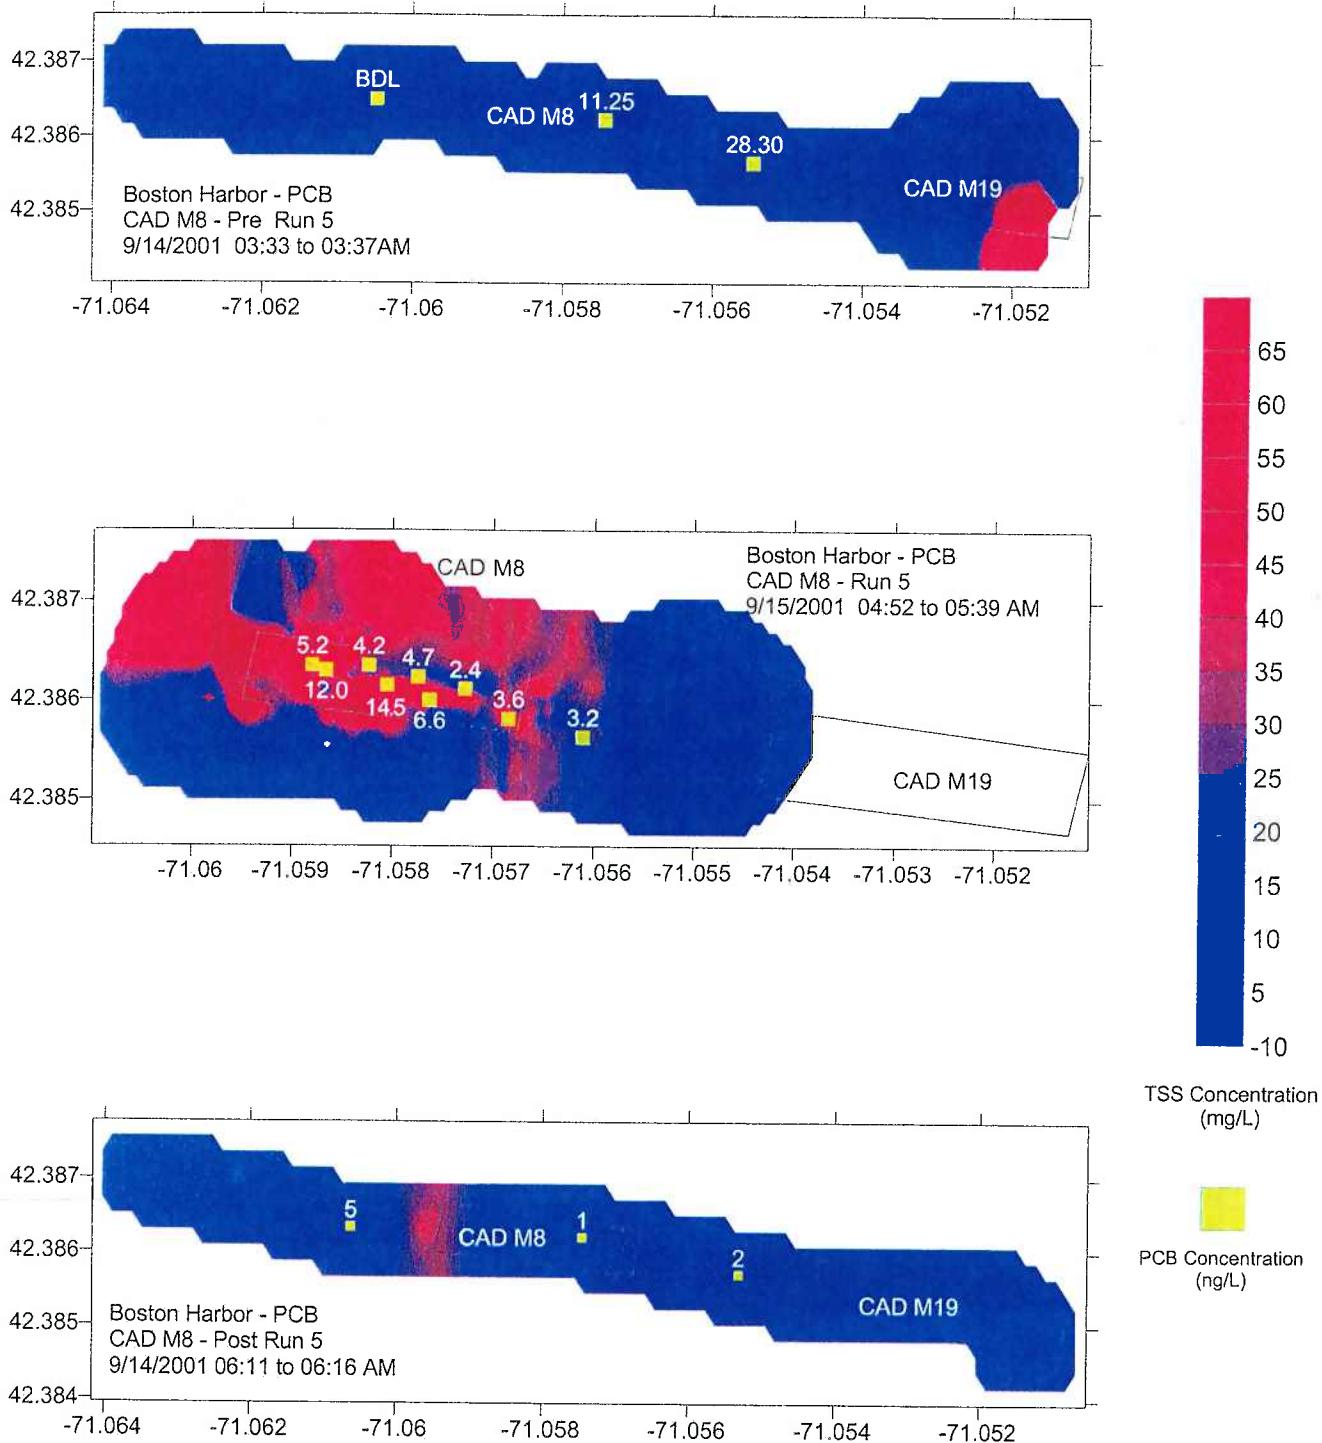

Run 5 CAD Cell M8 - TPH

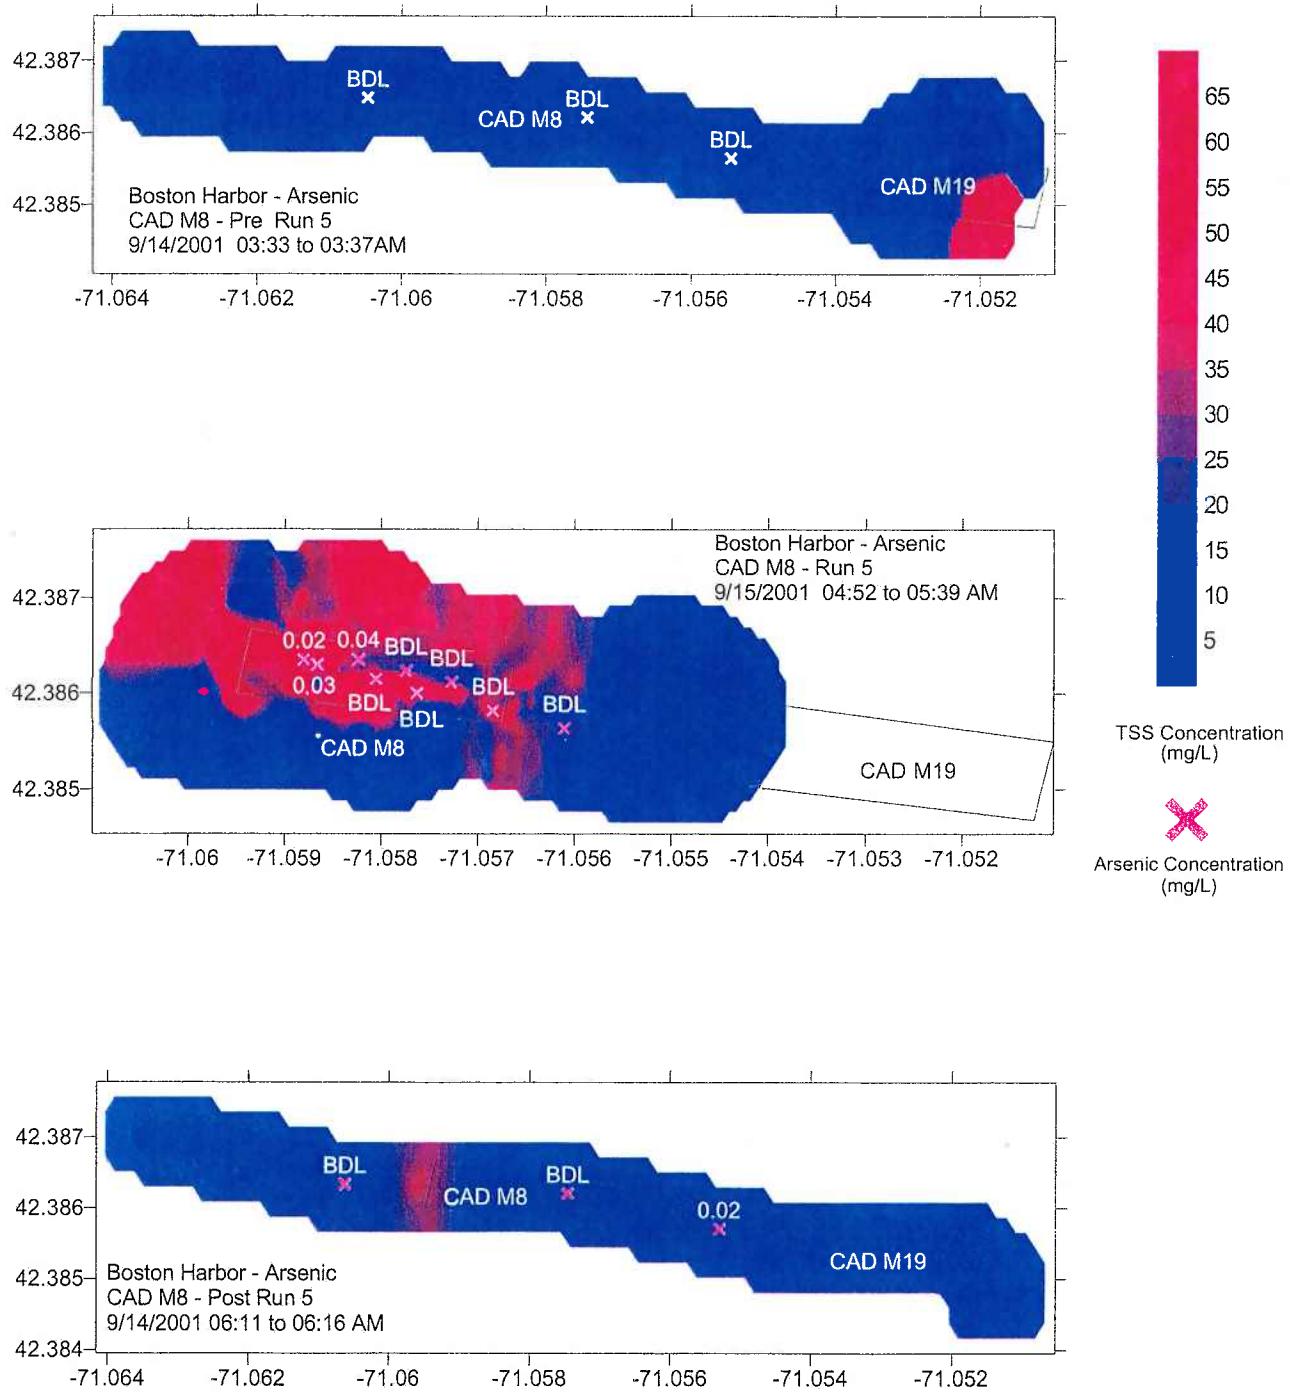

Run 5 CAD Cell M8 - PAH

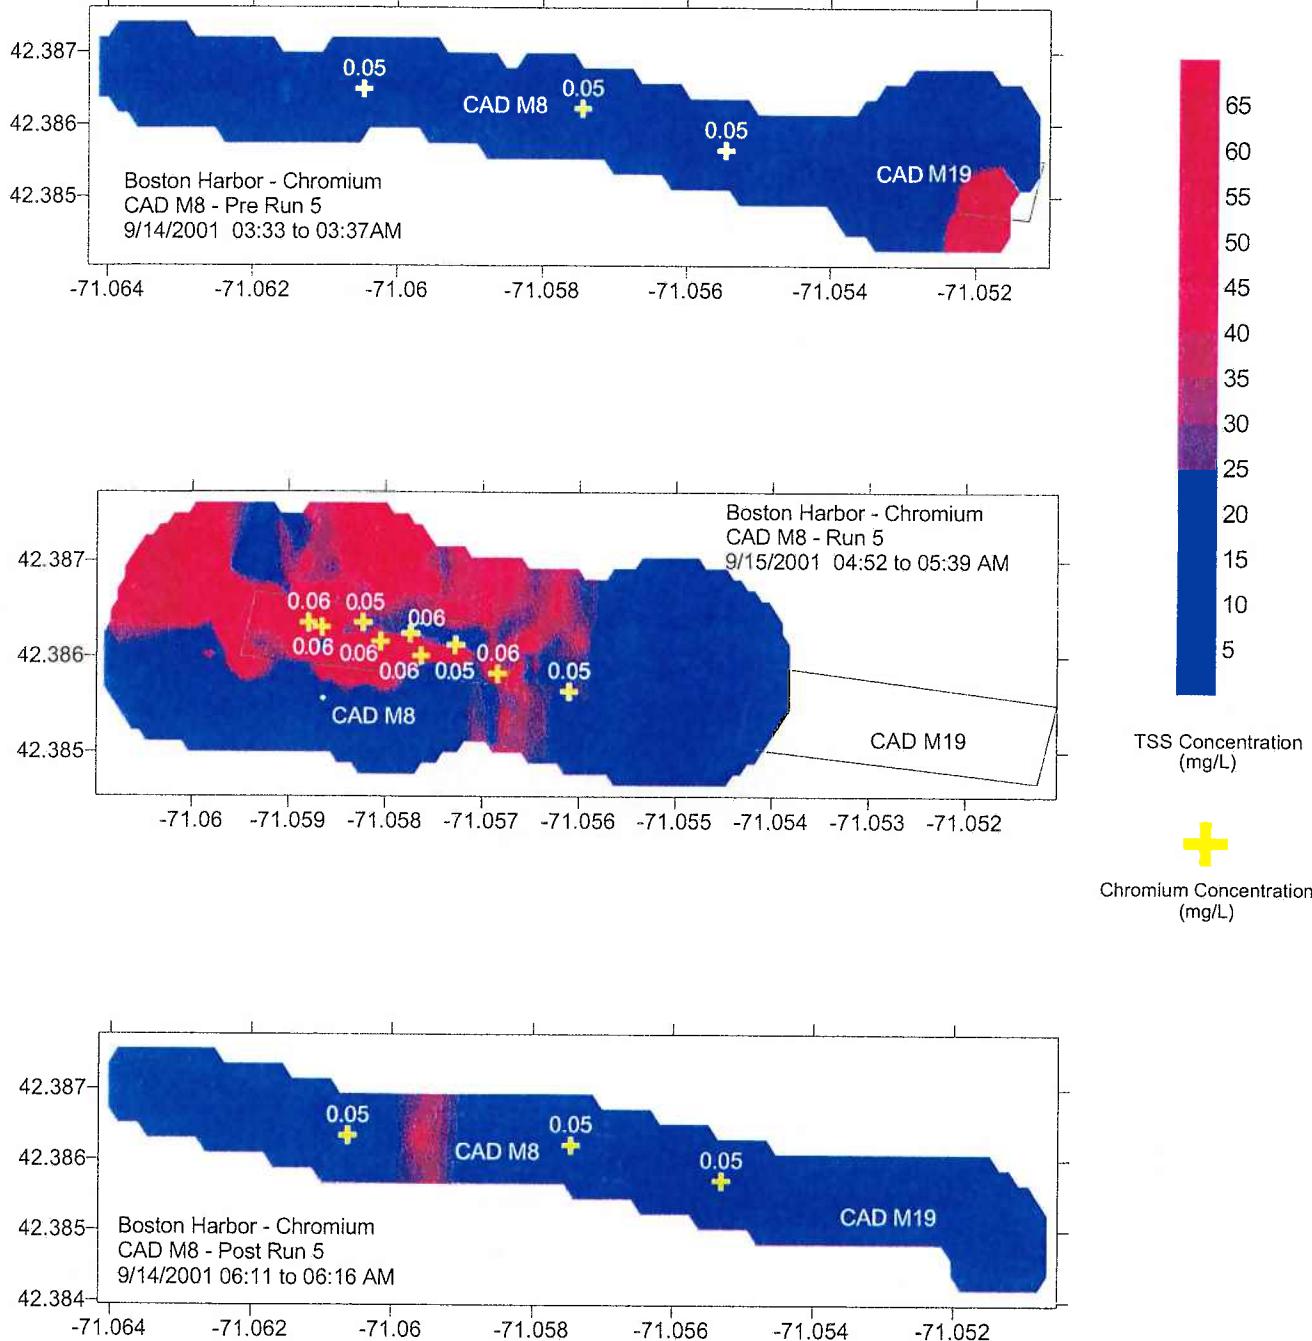

Run 5 CAD Cell M8 - PCB

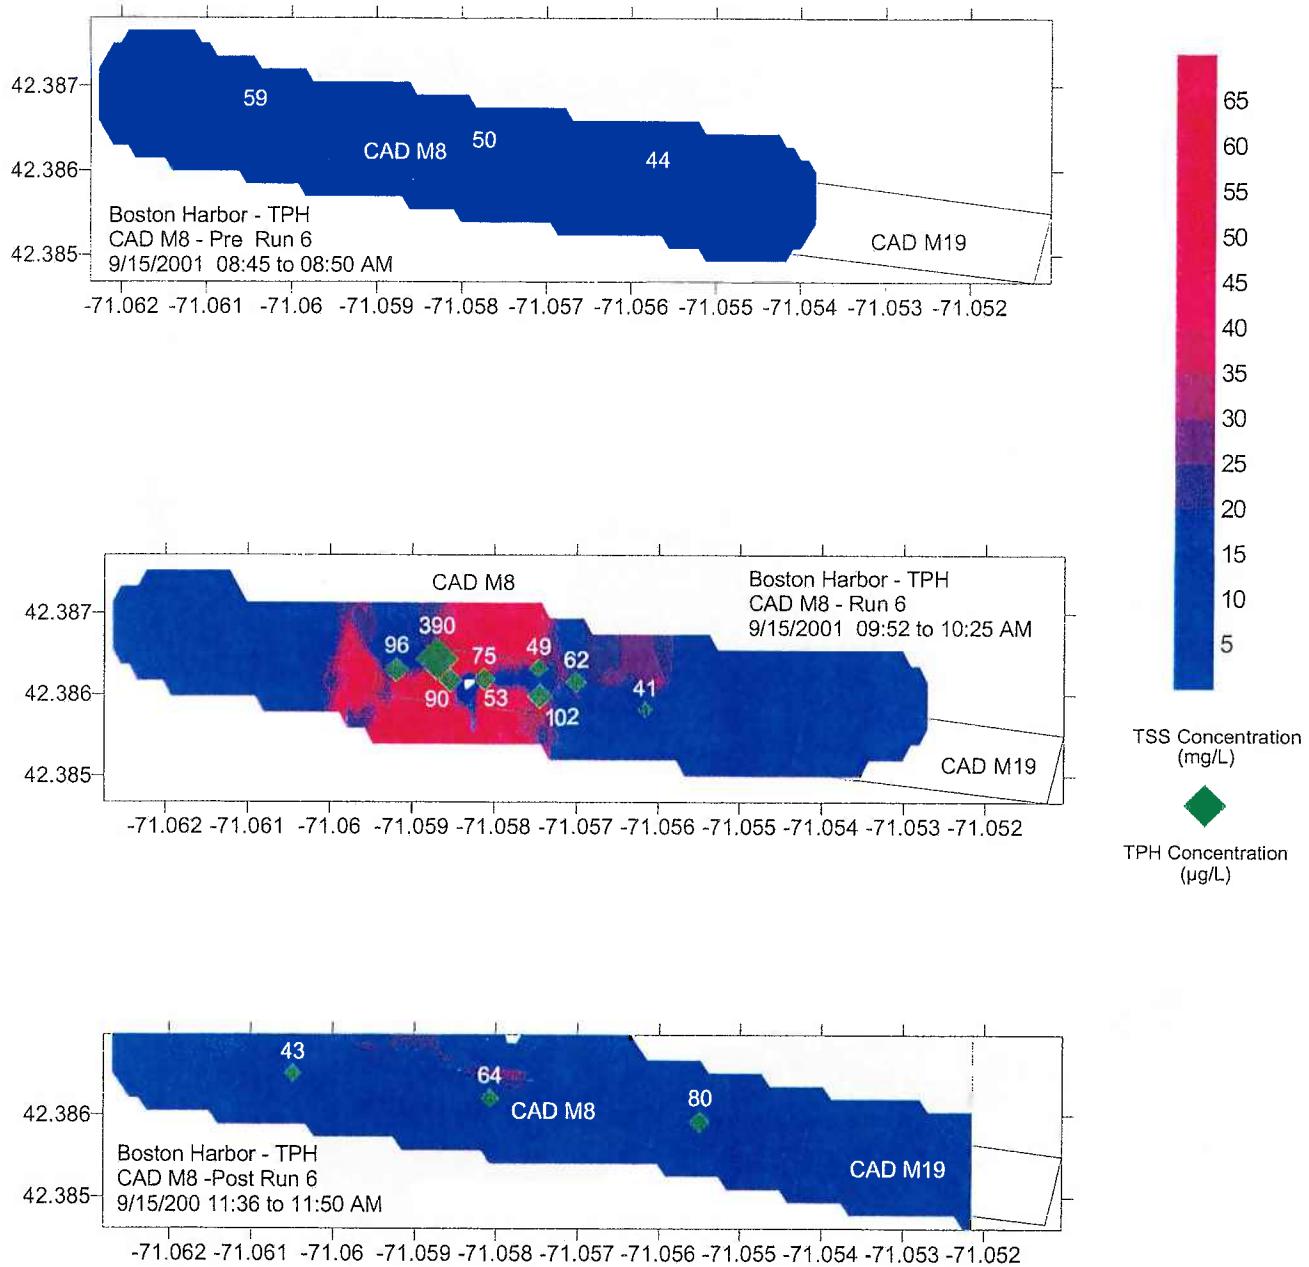

Run 5 CAD Cell M8 - As

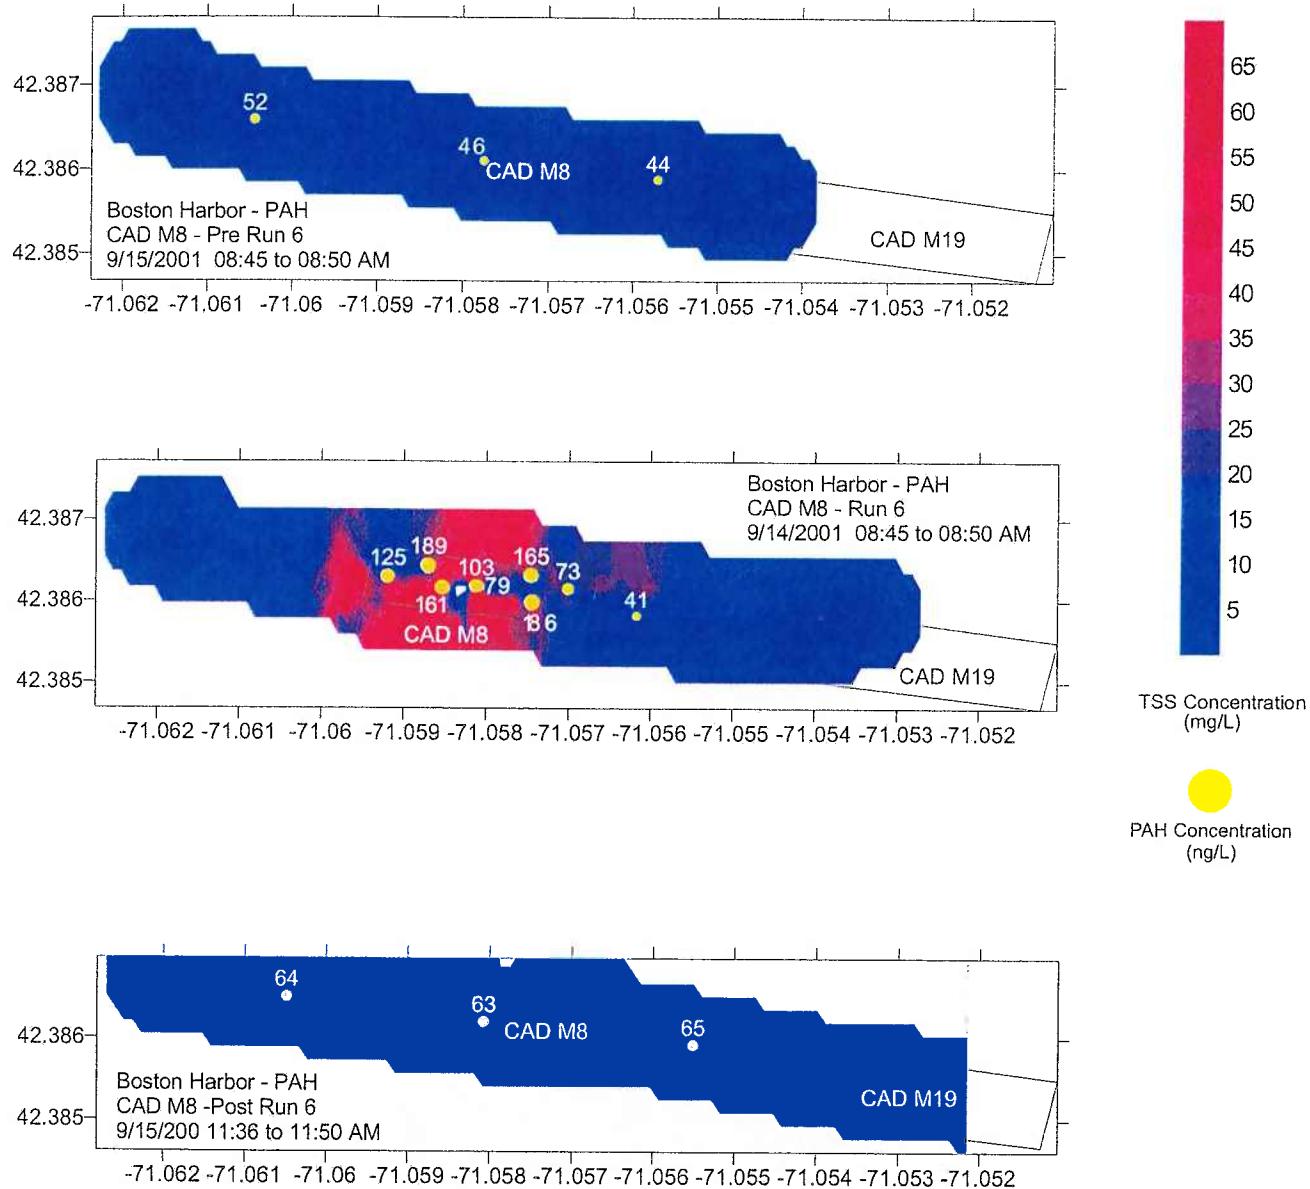

Run 5 CAD Cell M8 - Cr

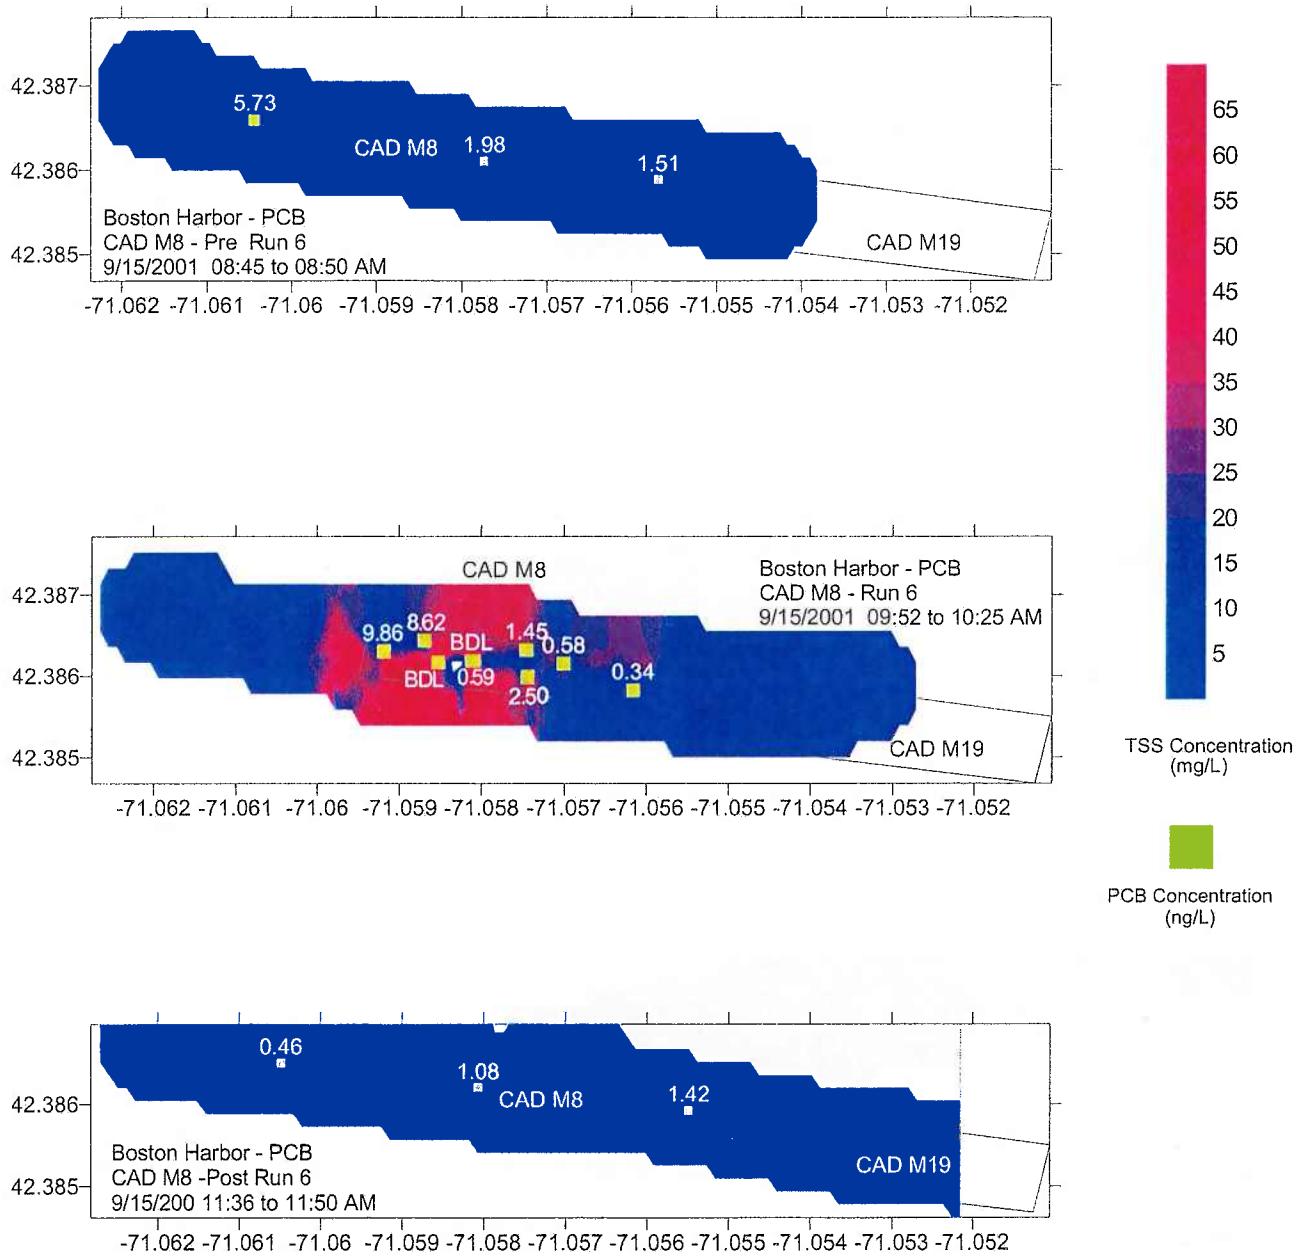

Run 6 CAD Cell M8 - TPH

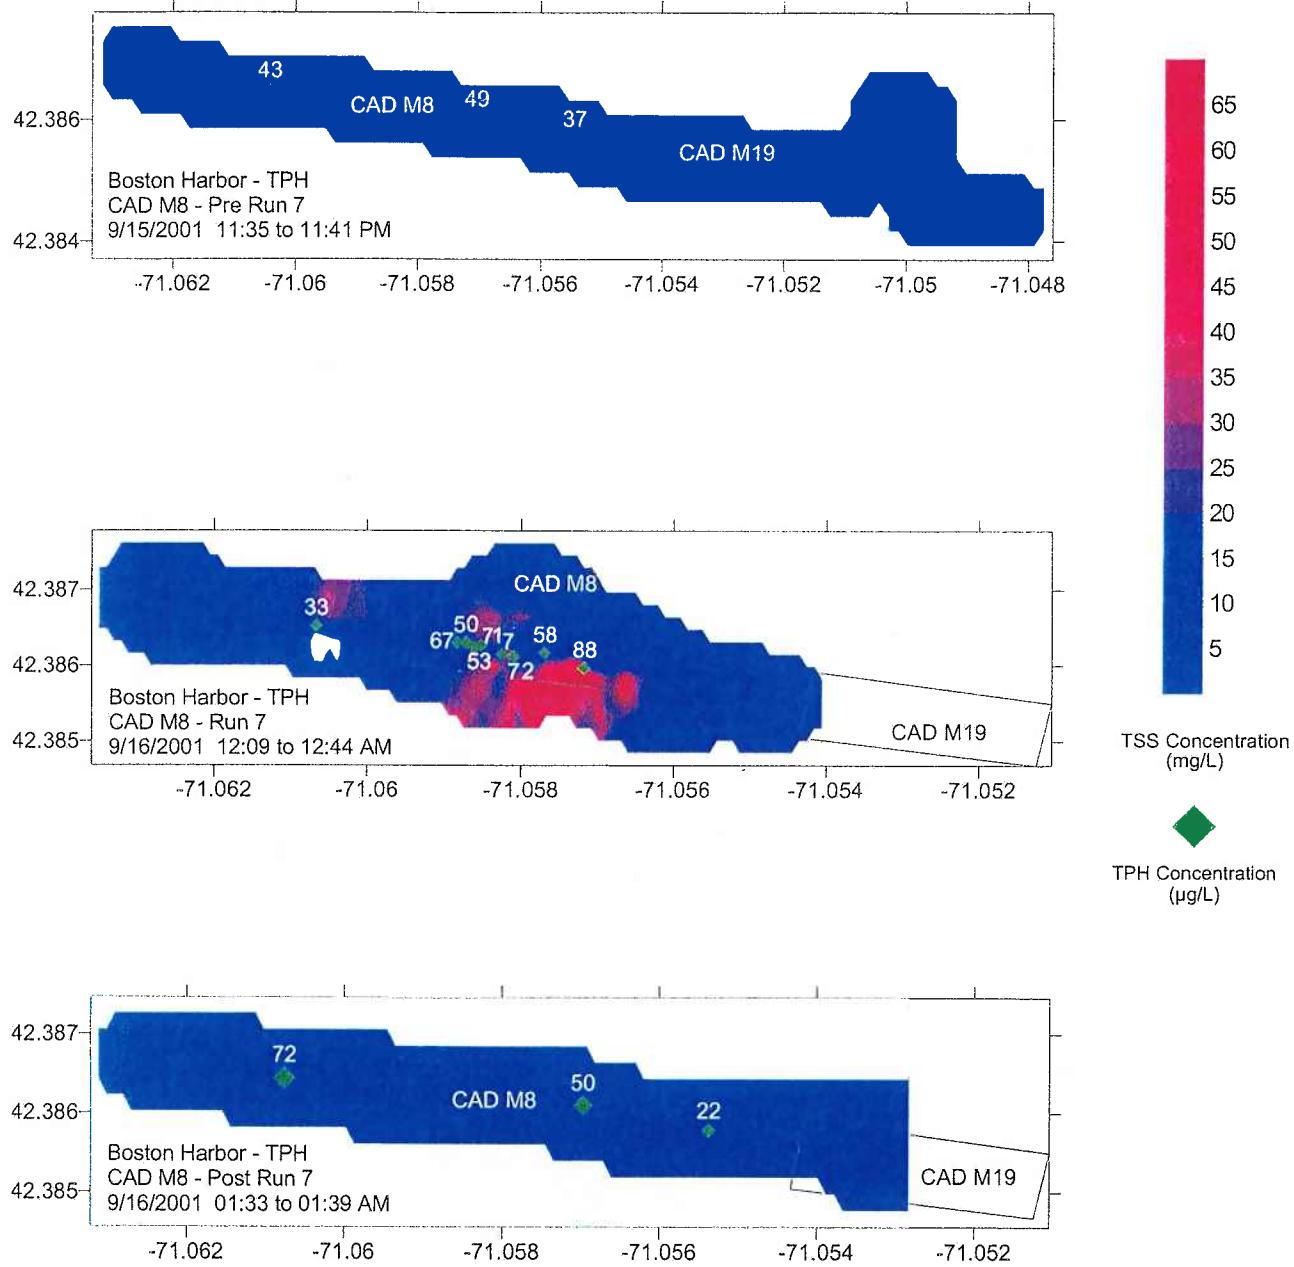

Run 6 CAD Cell M8 - PAH

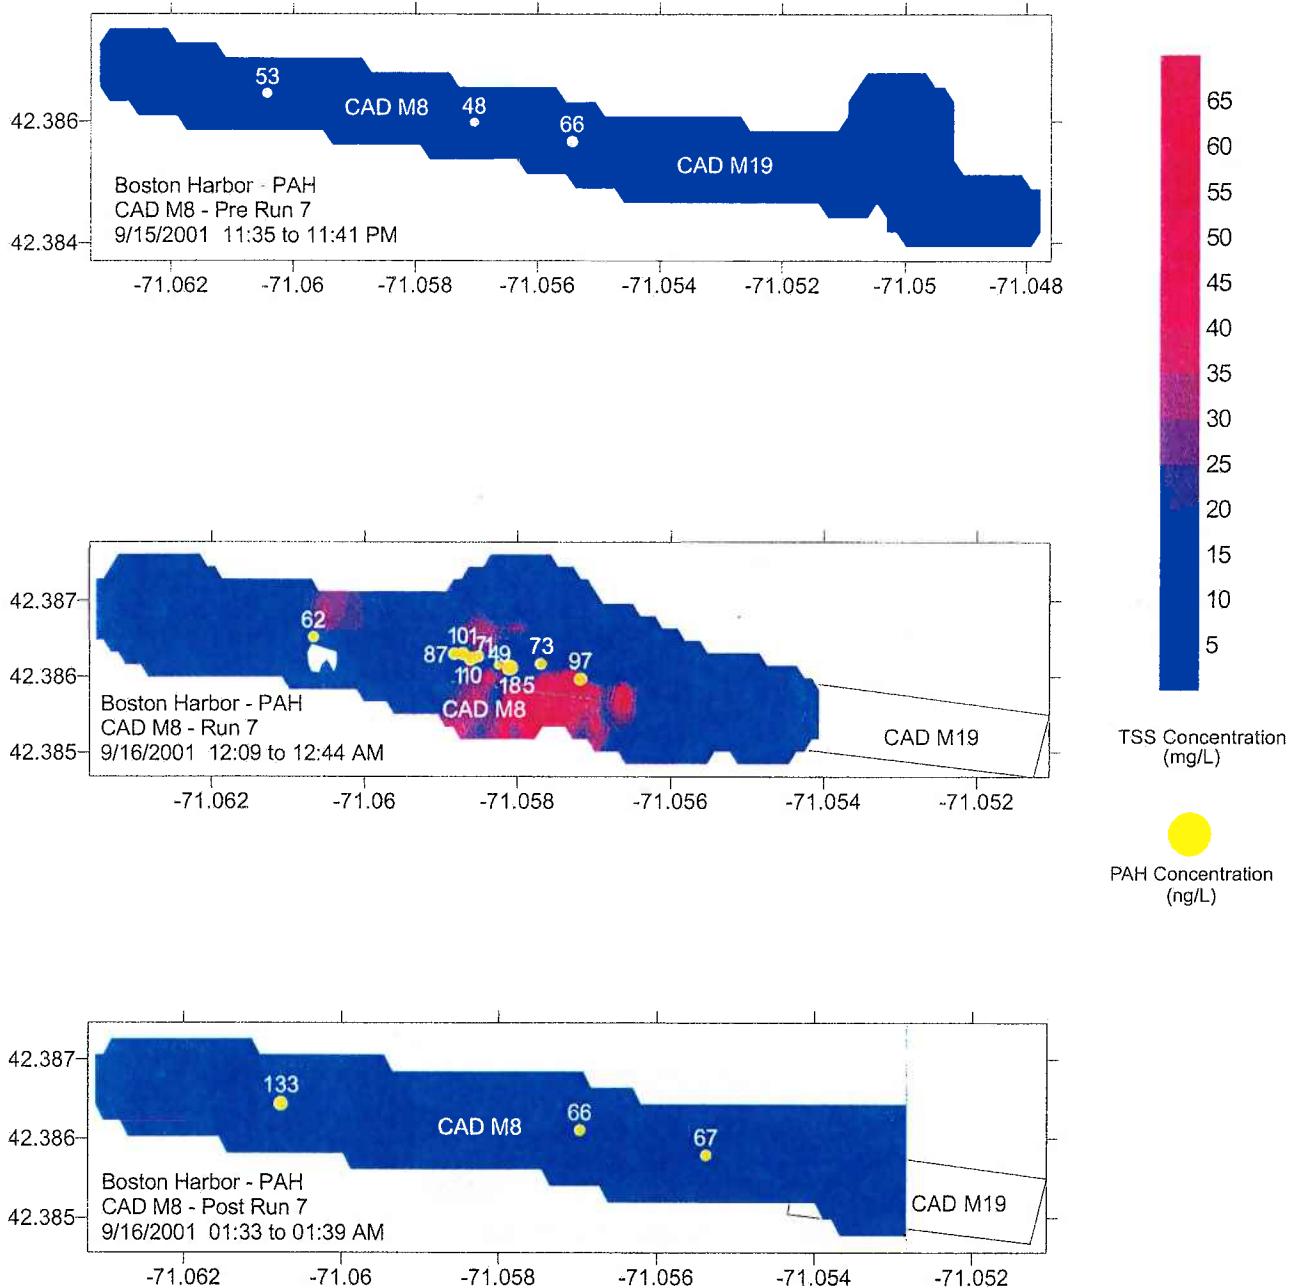

Run 6 CAD Cell M8 - PCB

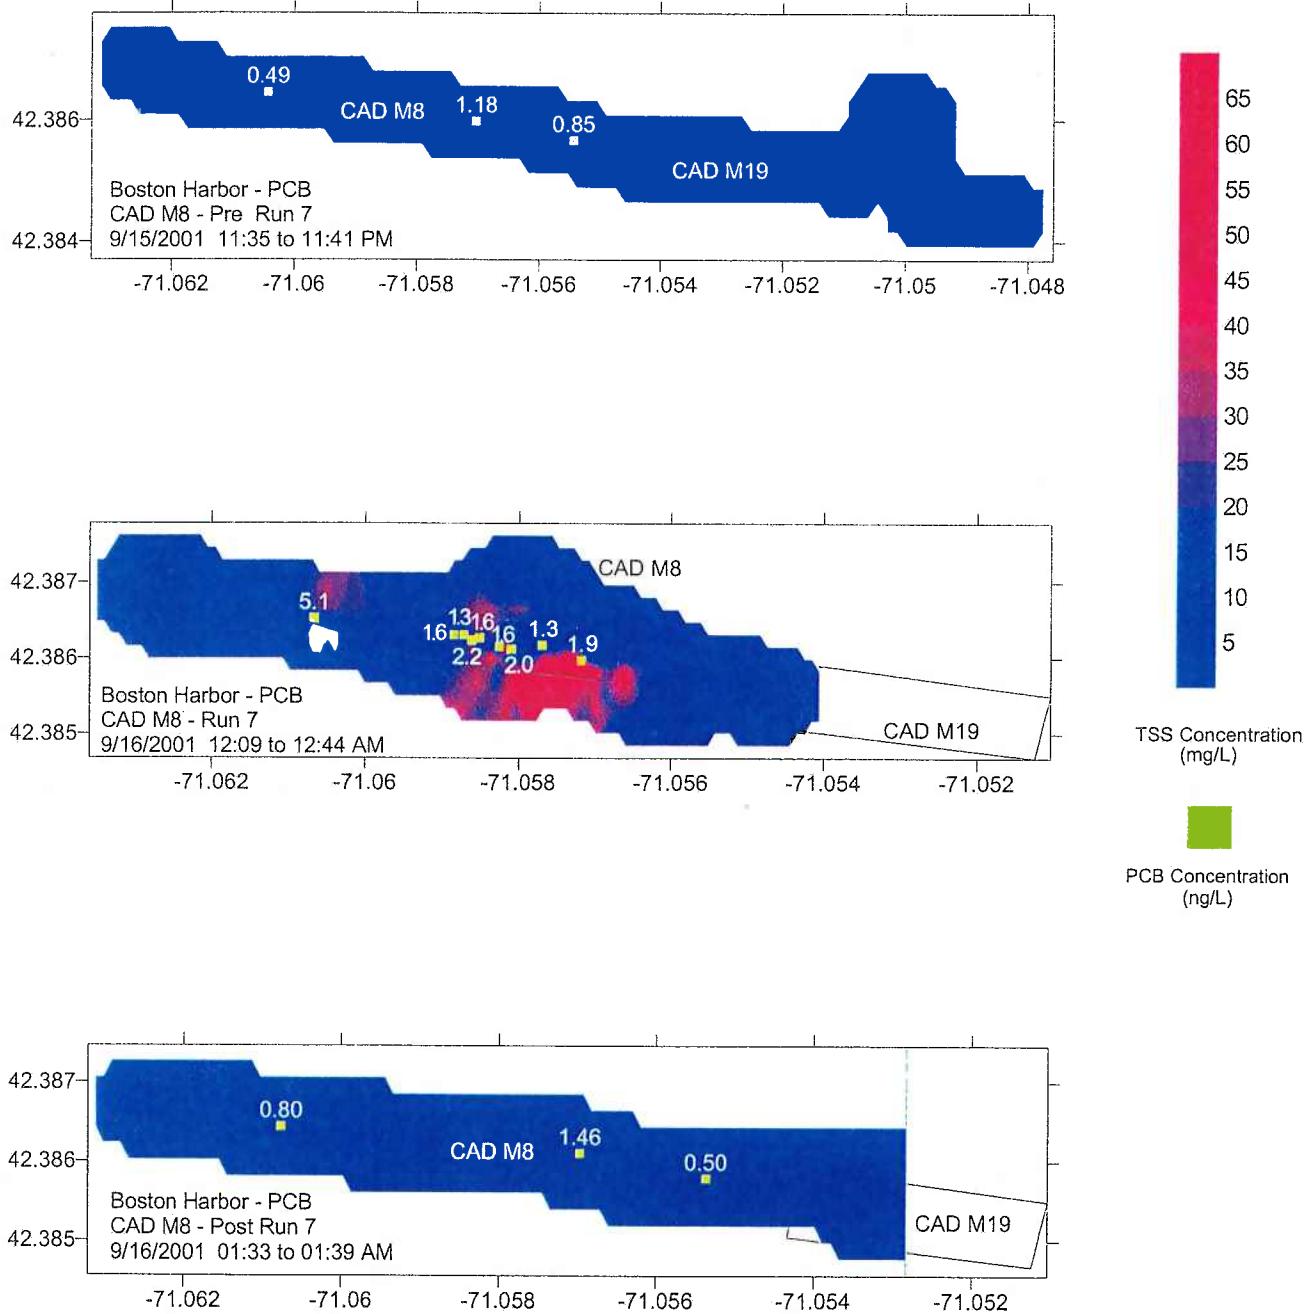

Run 7 CAD Cell M8 - TPH

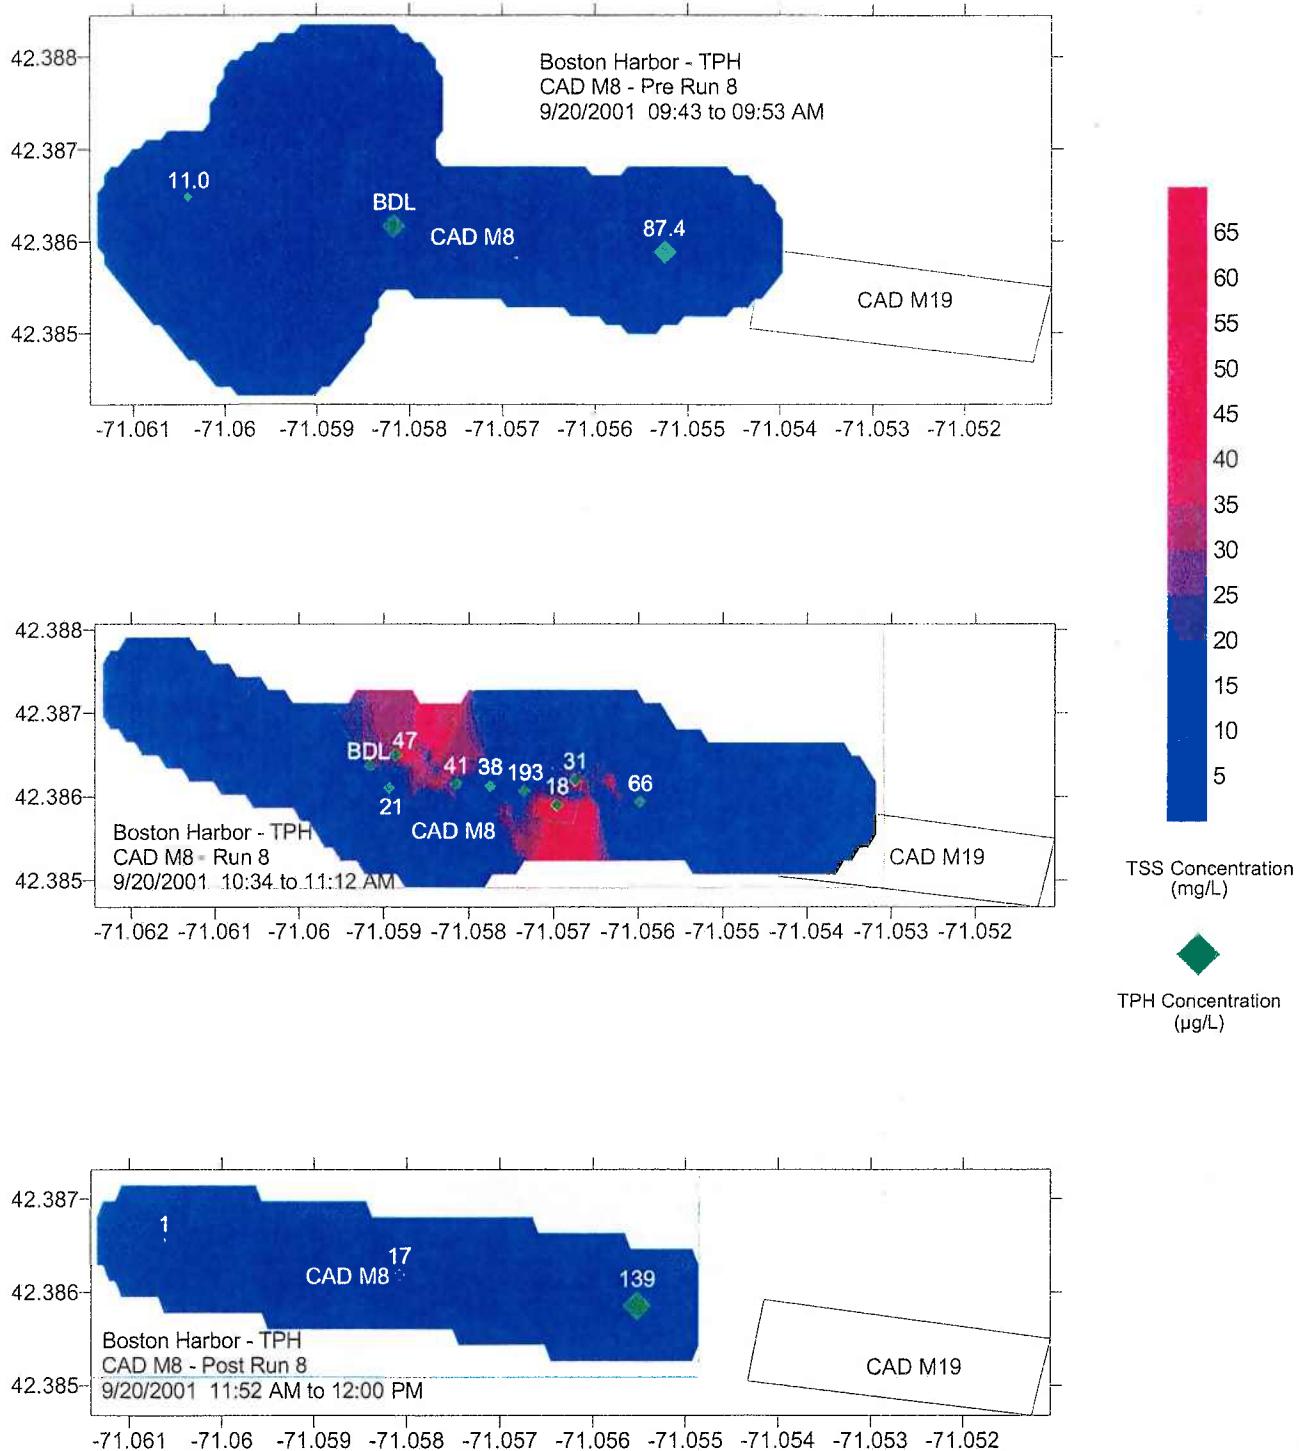

Run 7 CAD Cell M8 - PAH

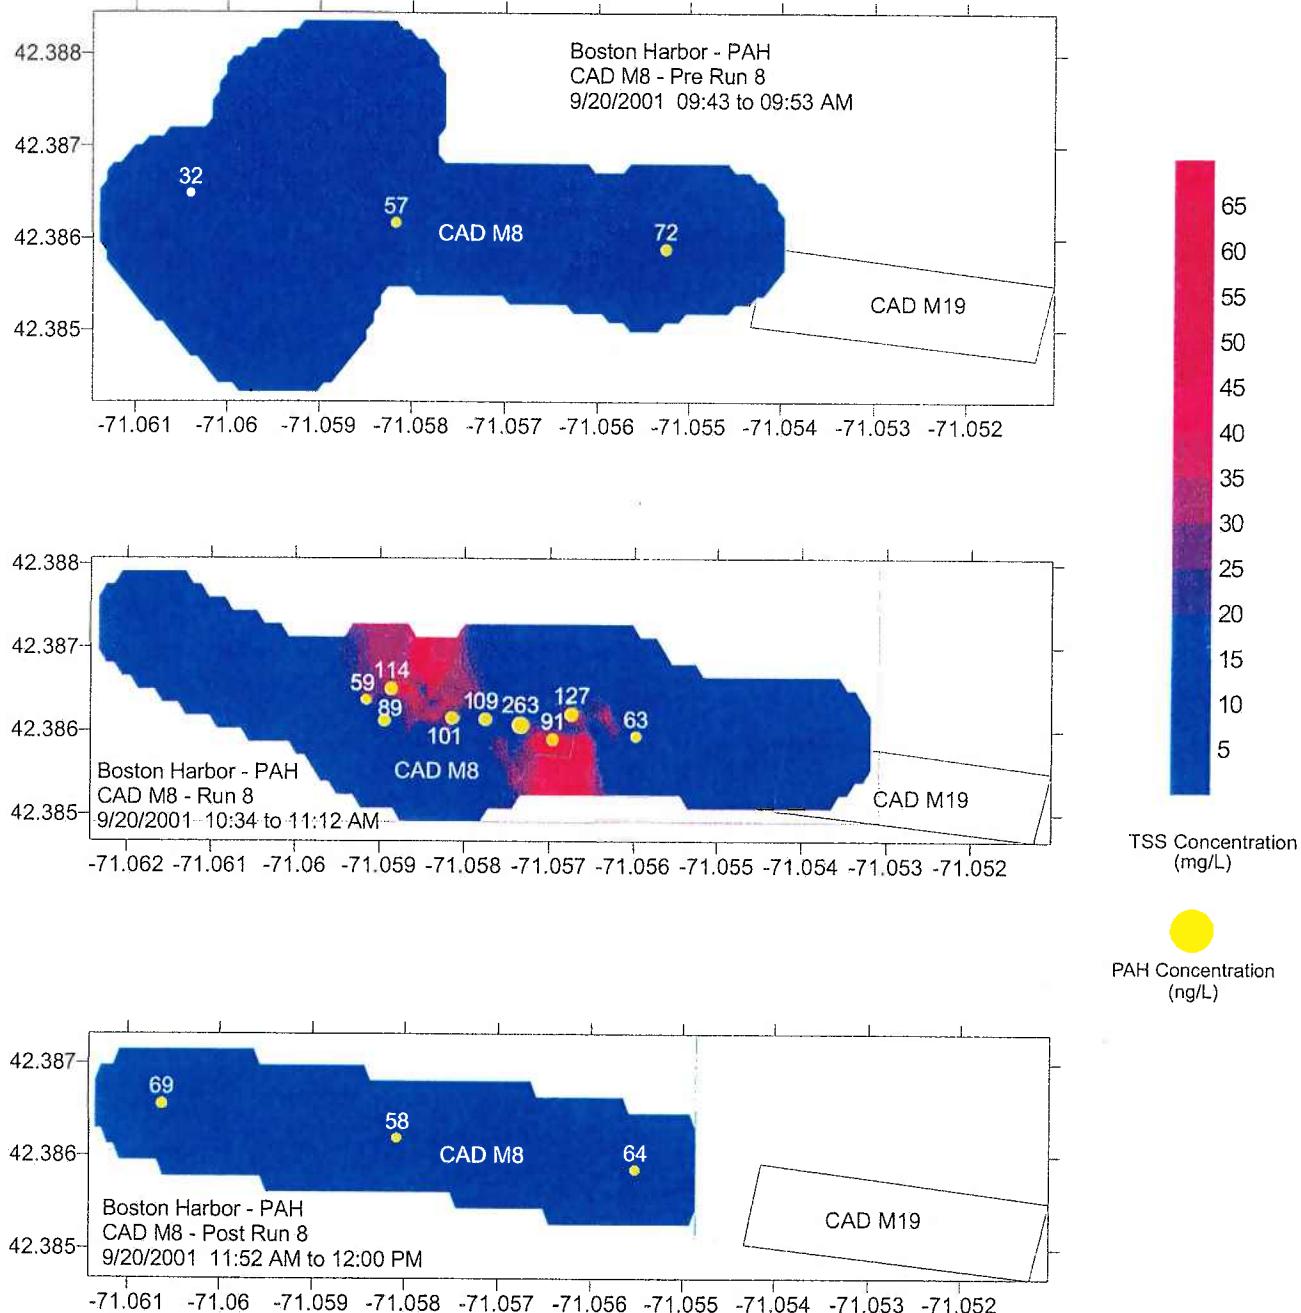

Run 7 CAD Cell M8 - PCB

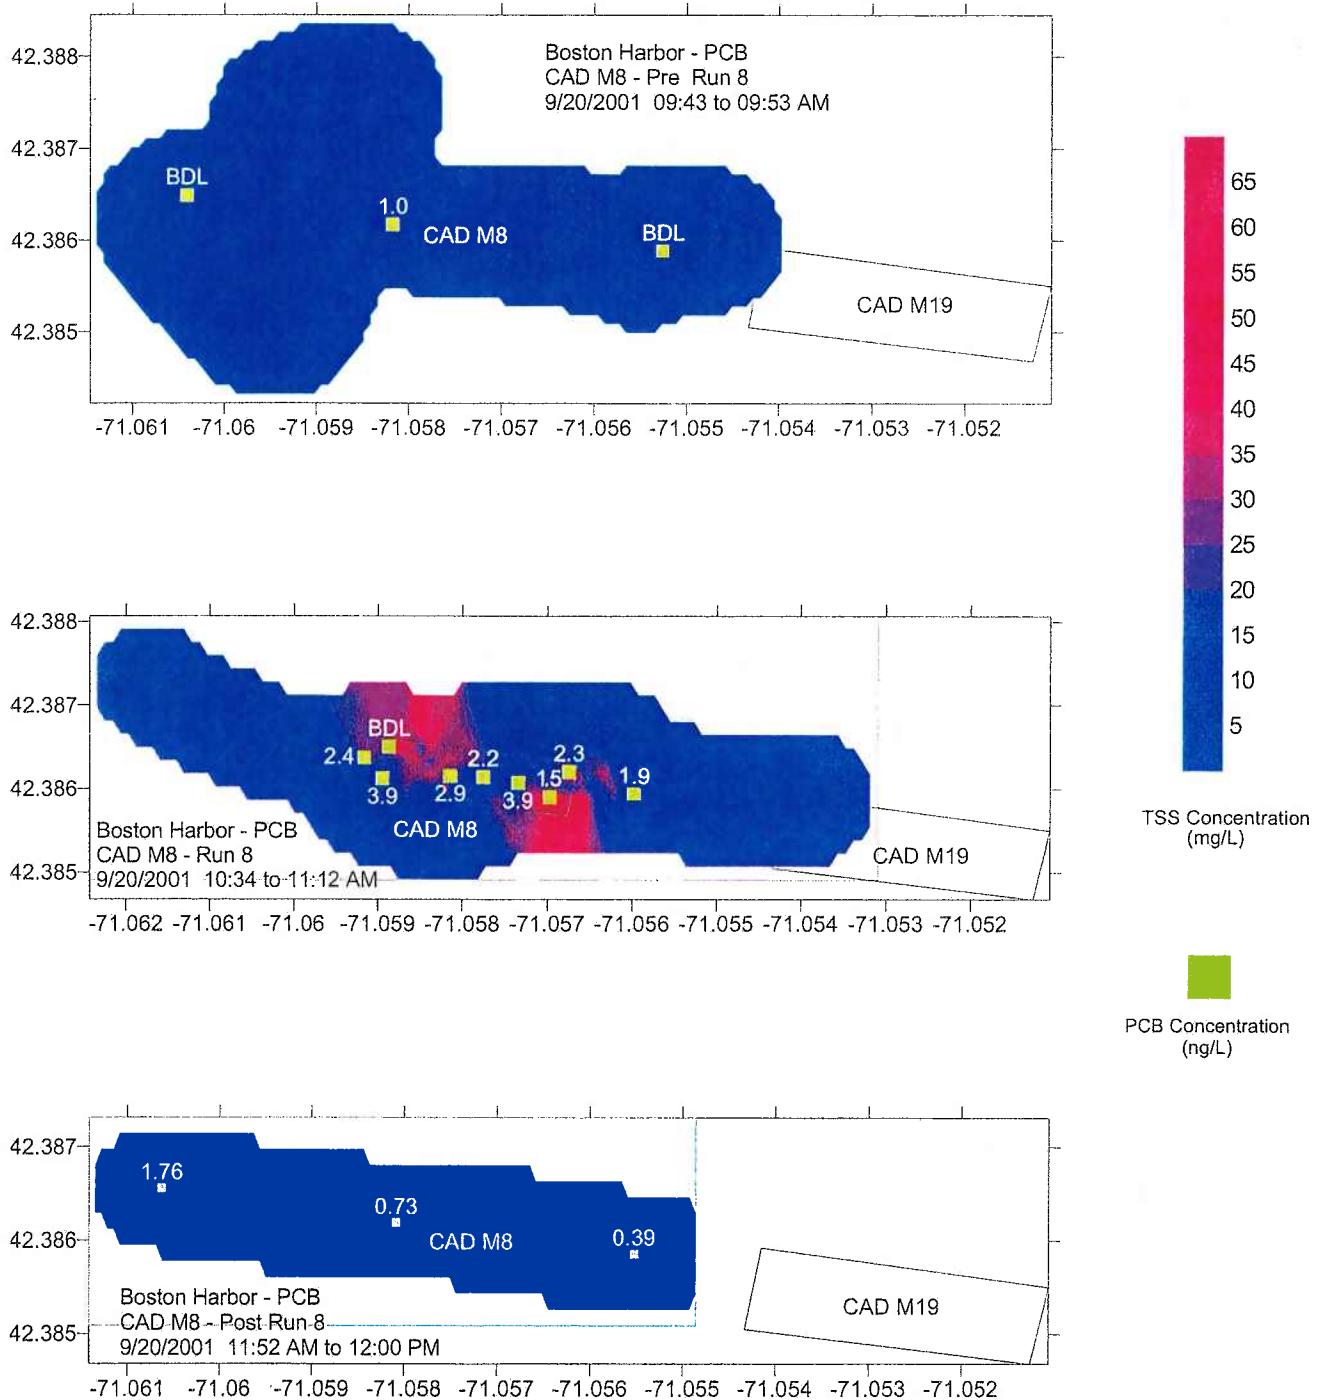

Run 8 CAD Cell M8 - TPH

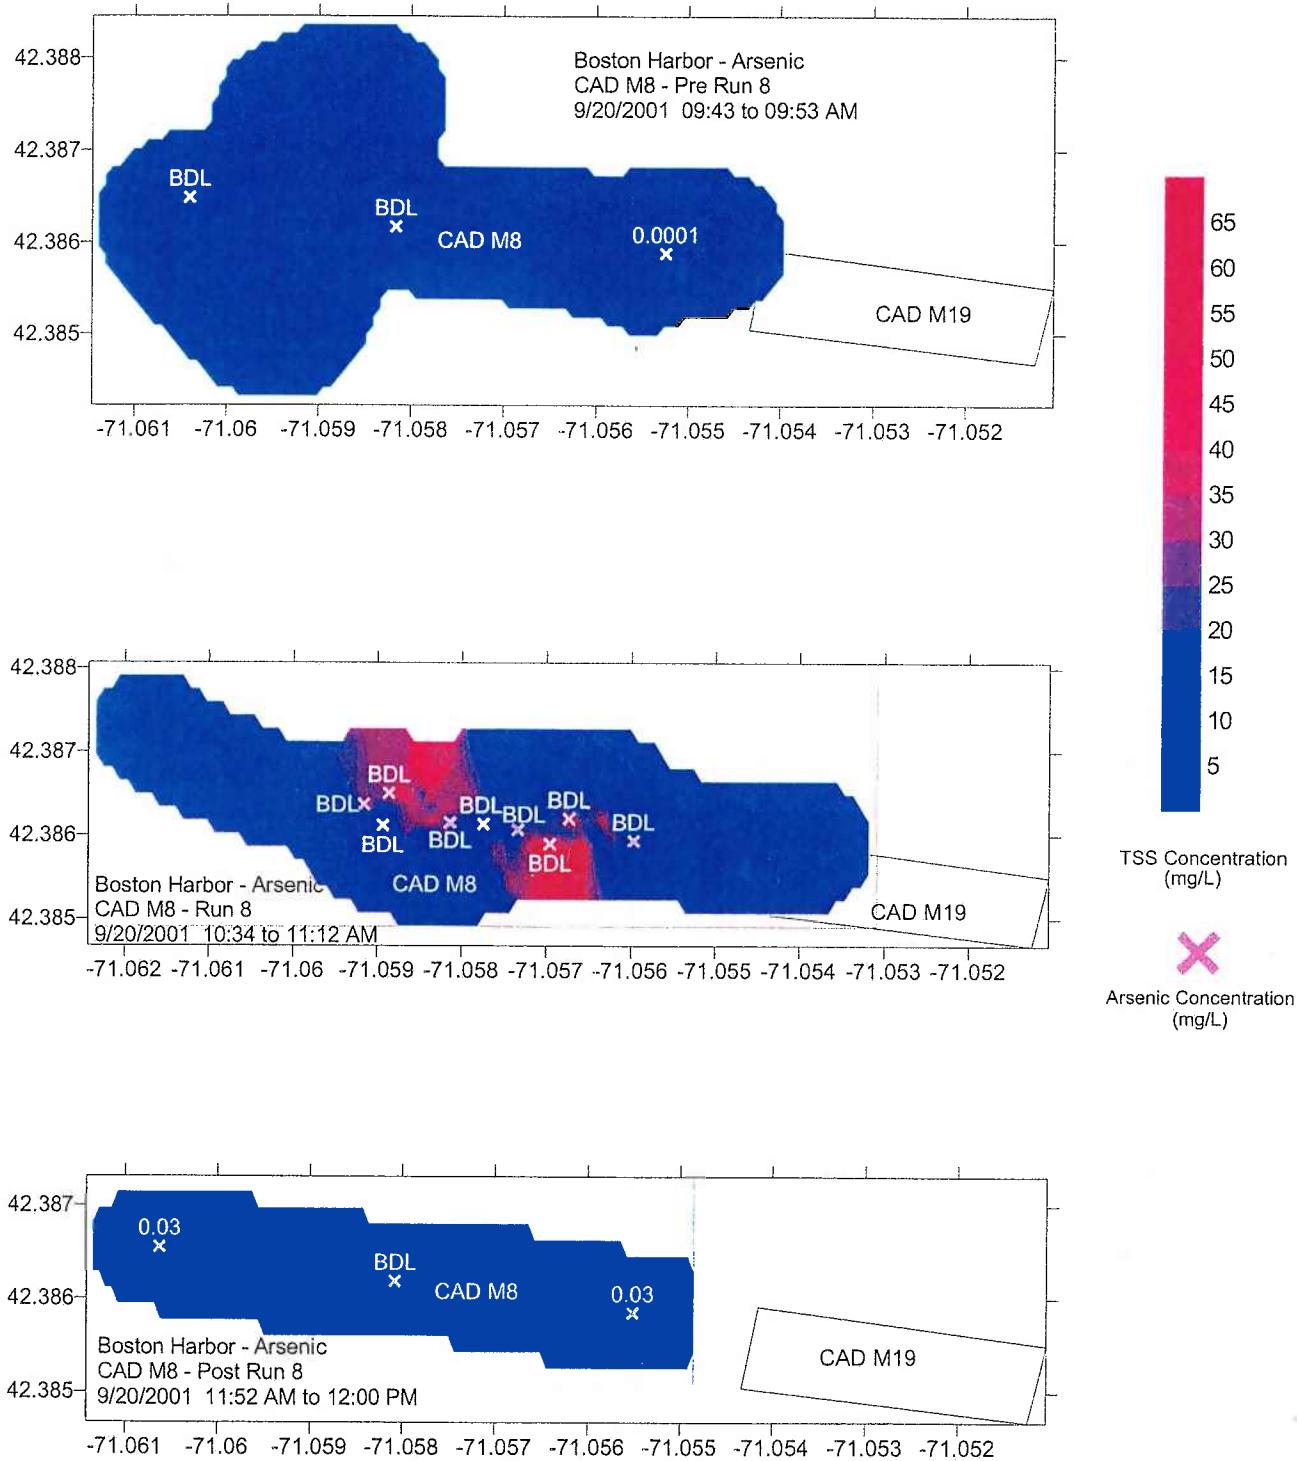

Run 8 CAD Cell M8 - PAH

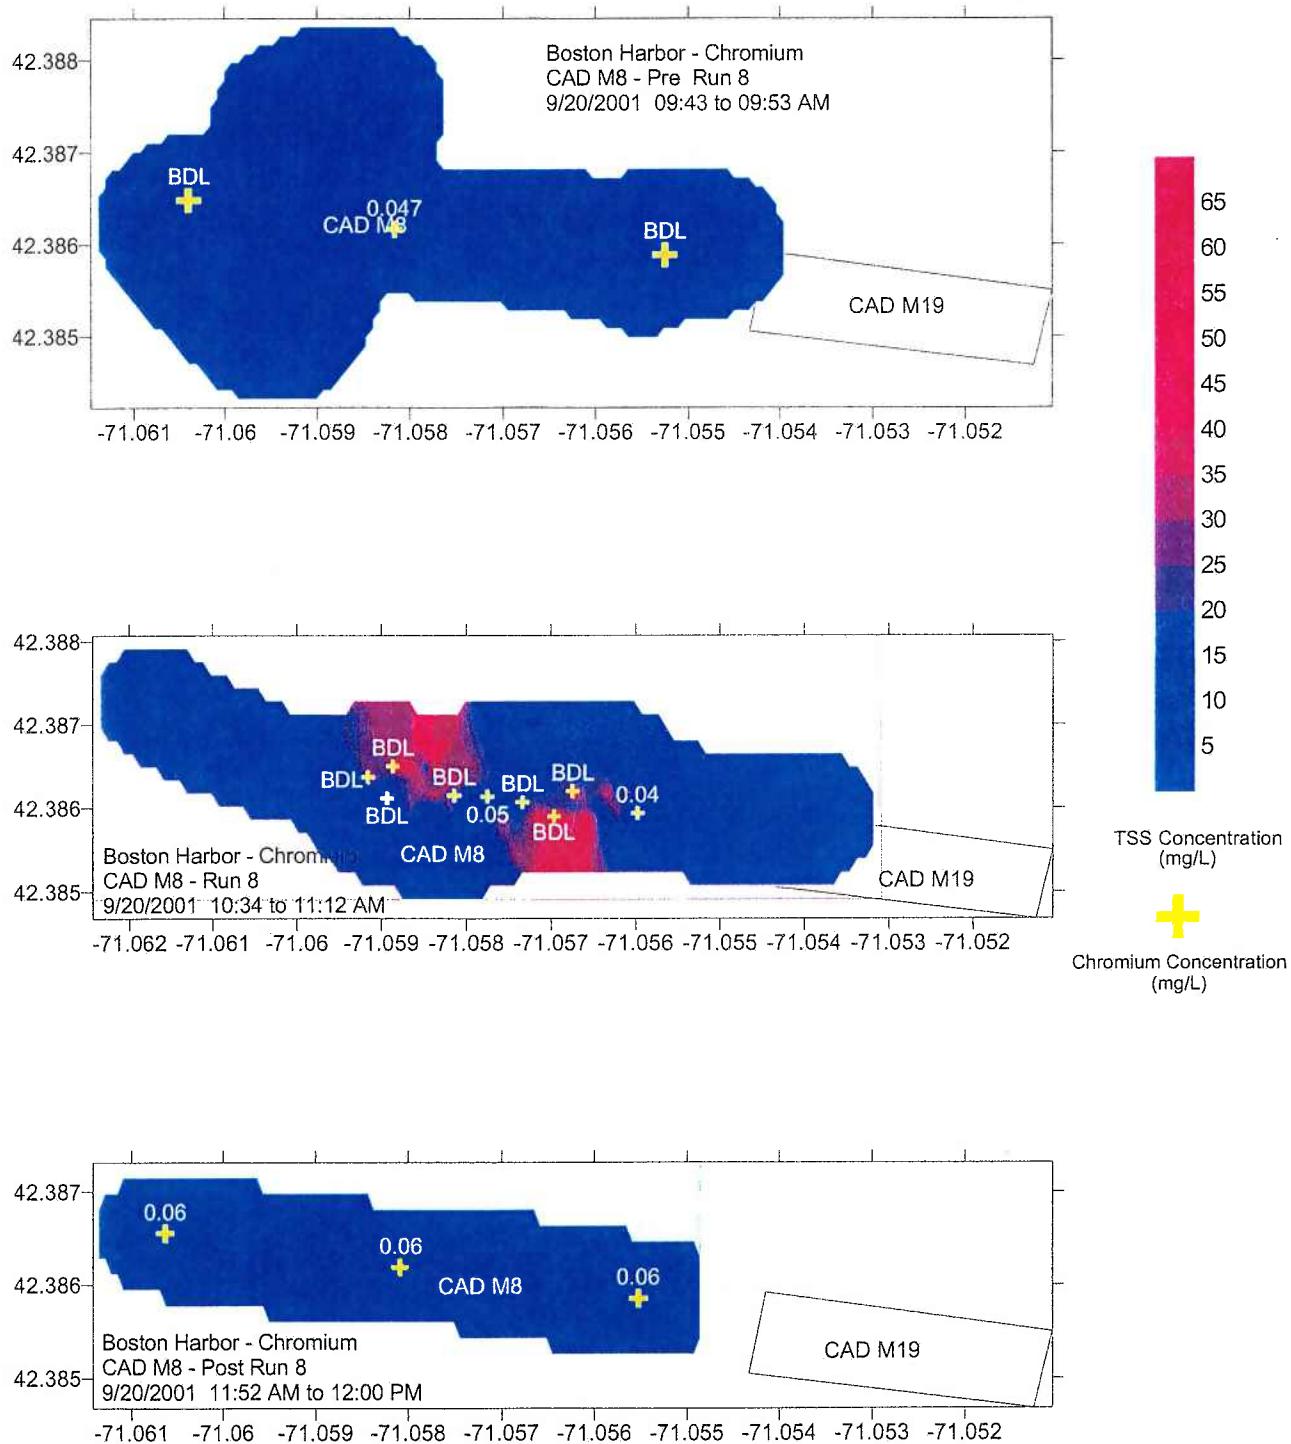

Run 8 CAD Cell M8 - PCB

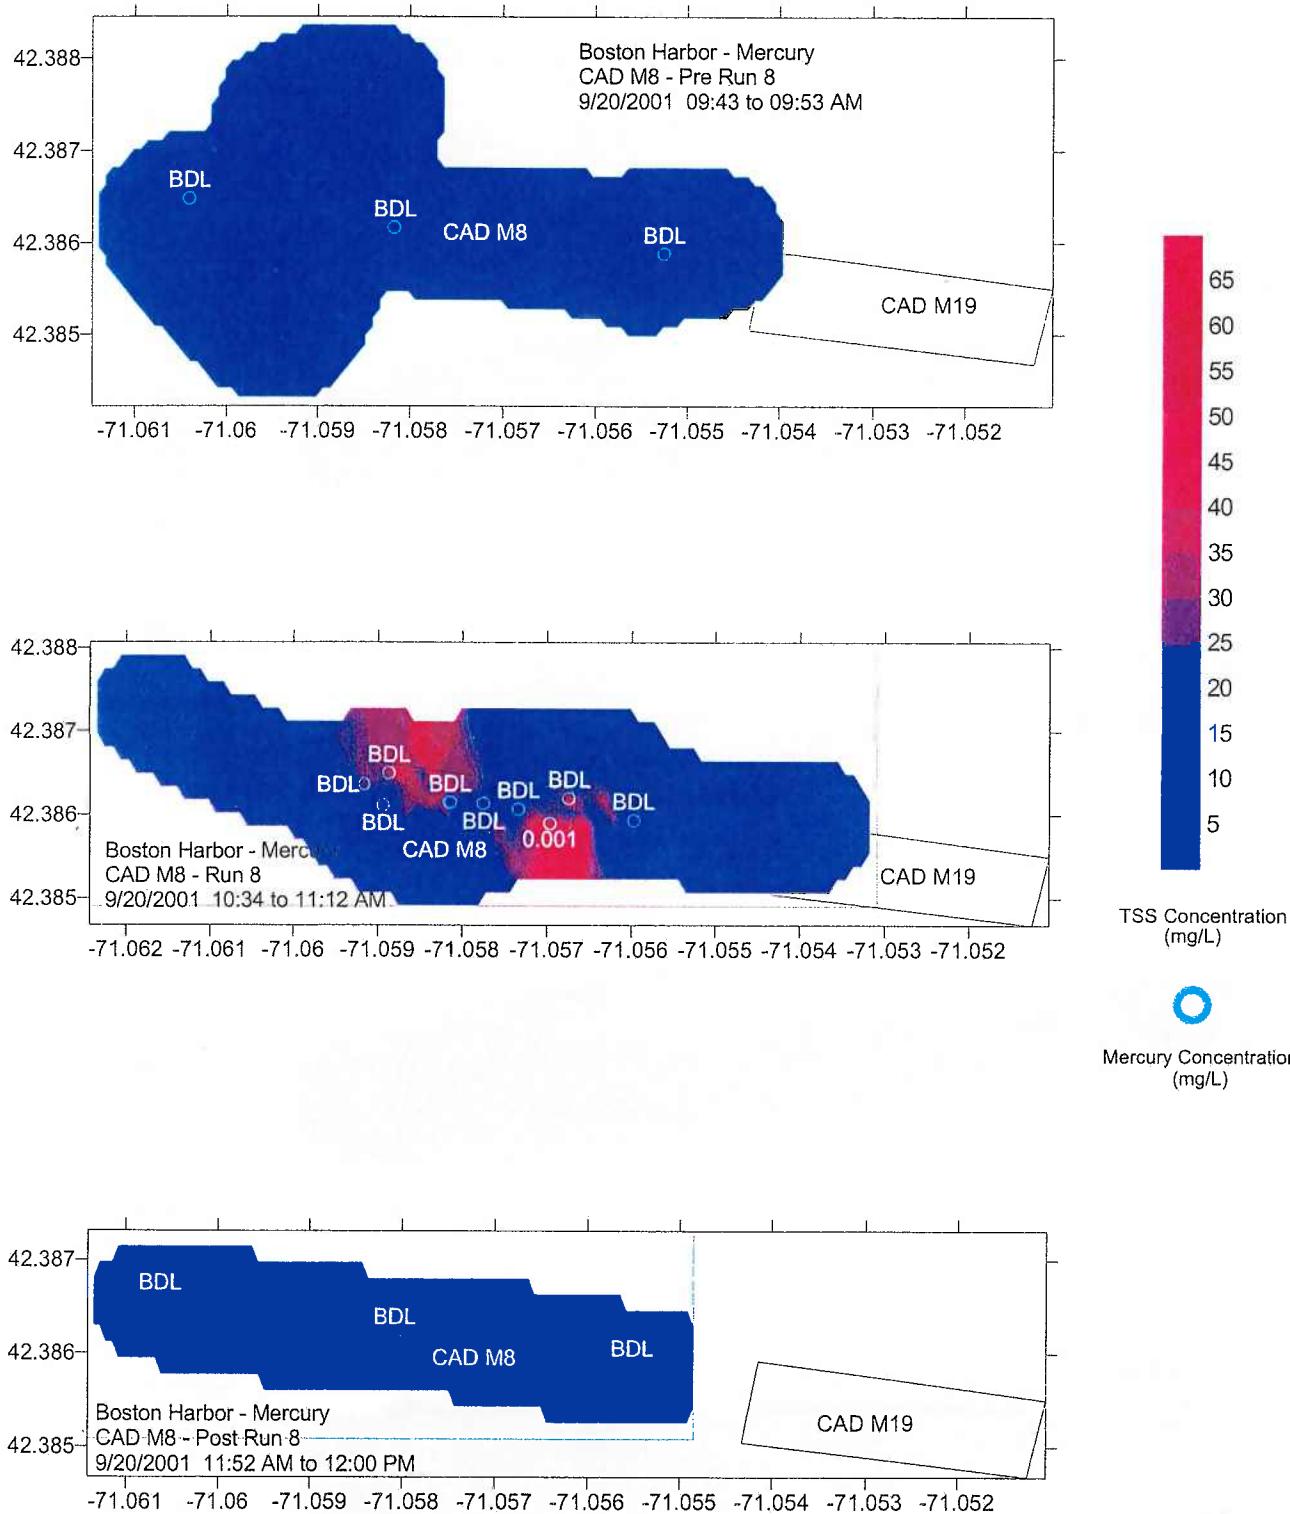

Run 8 CAD Cell M8 - As

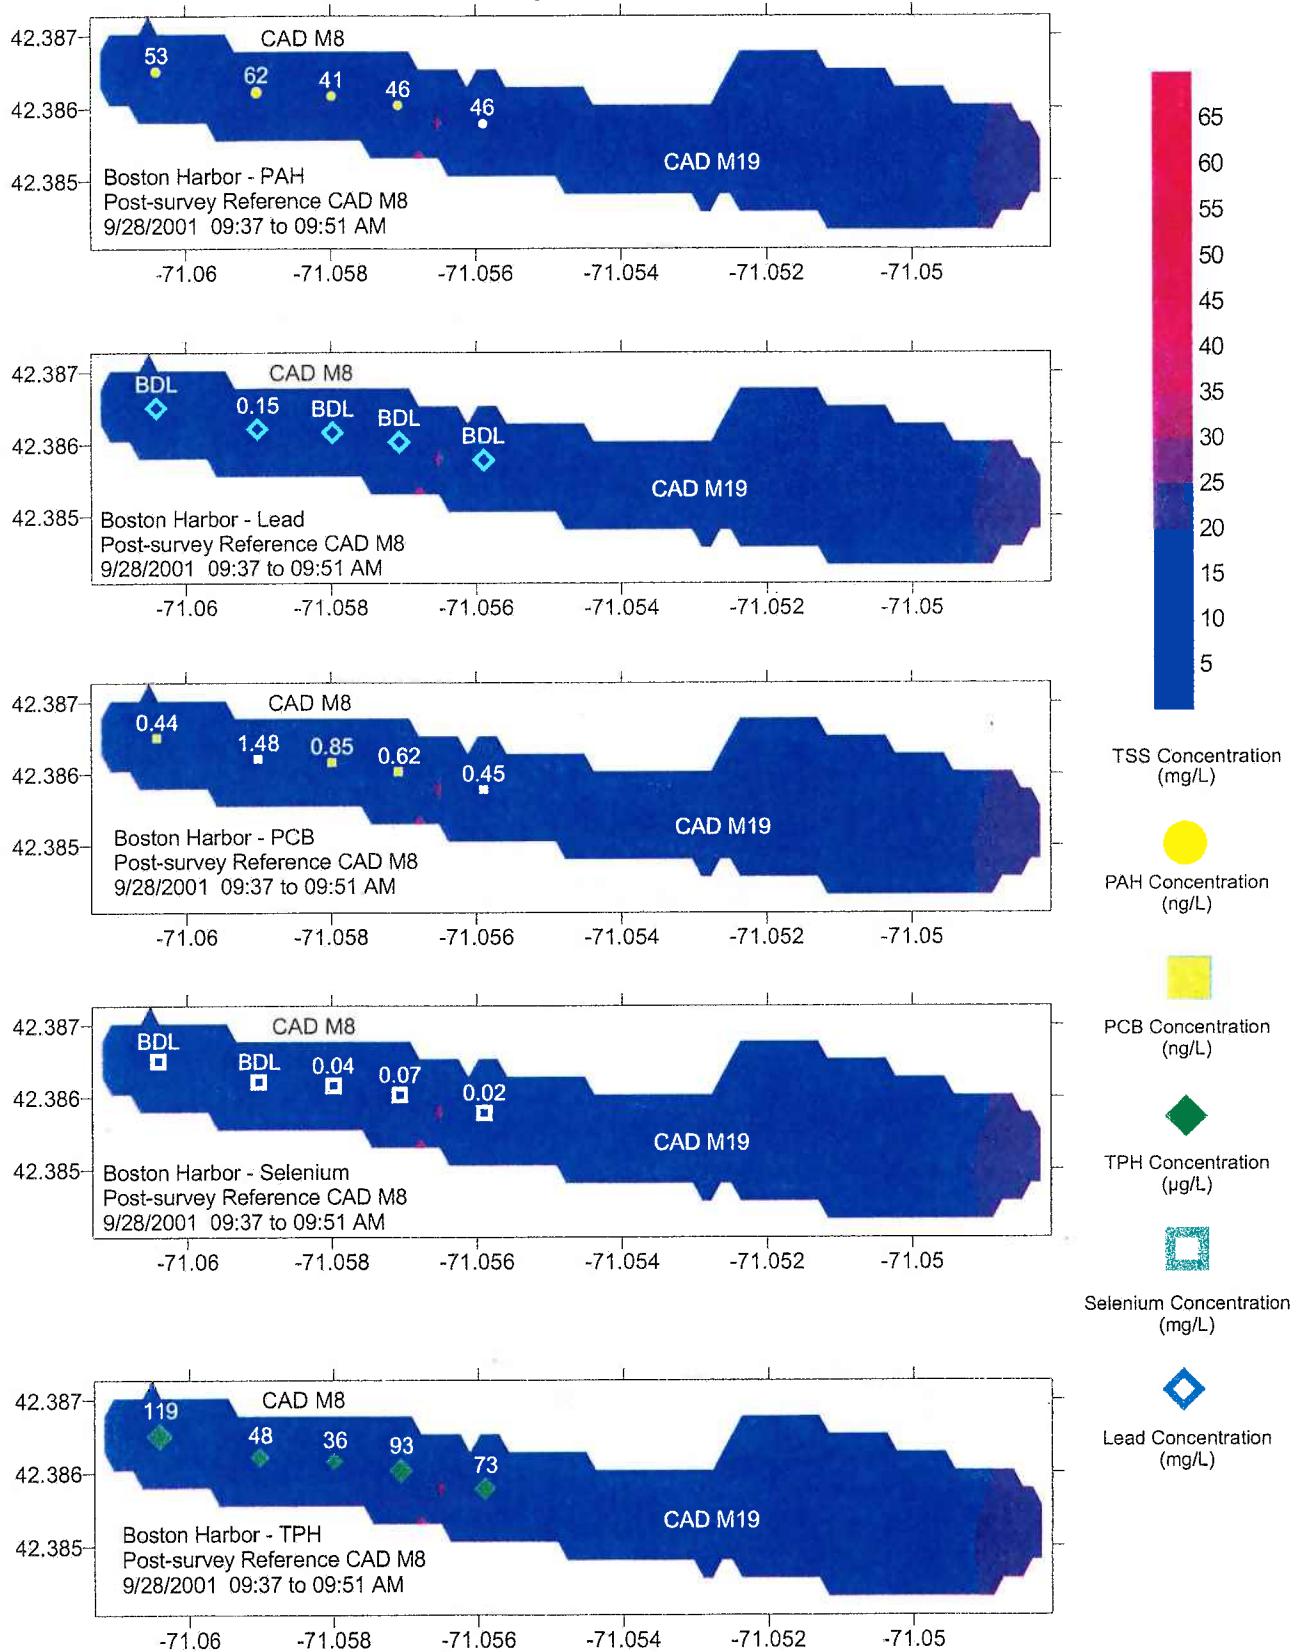

Run 8 CAD Cell M8 - Cr

Run 8 CAD Cell M8 - Hg

Post Survey CAD Cell M8 All Analytes

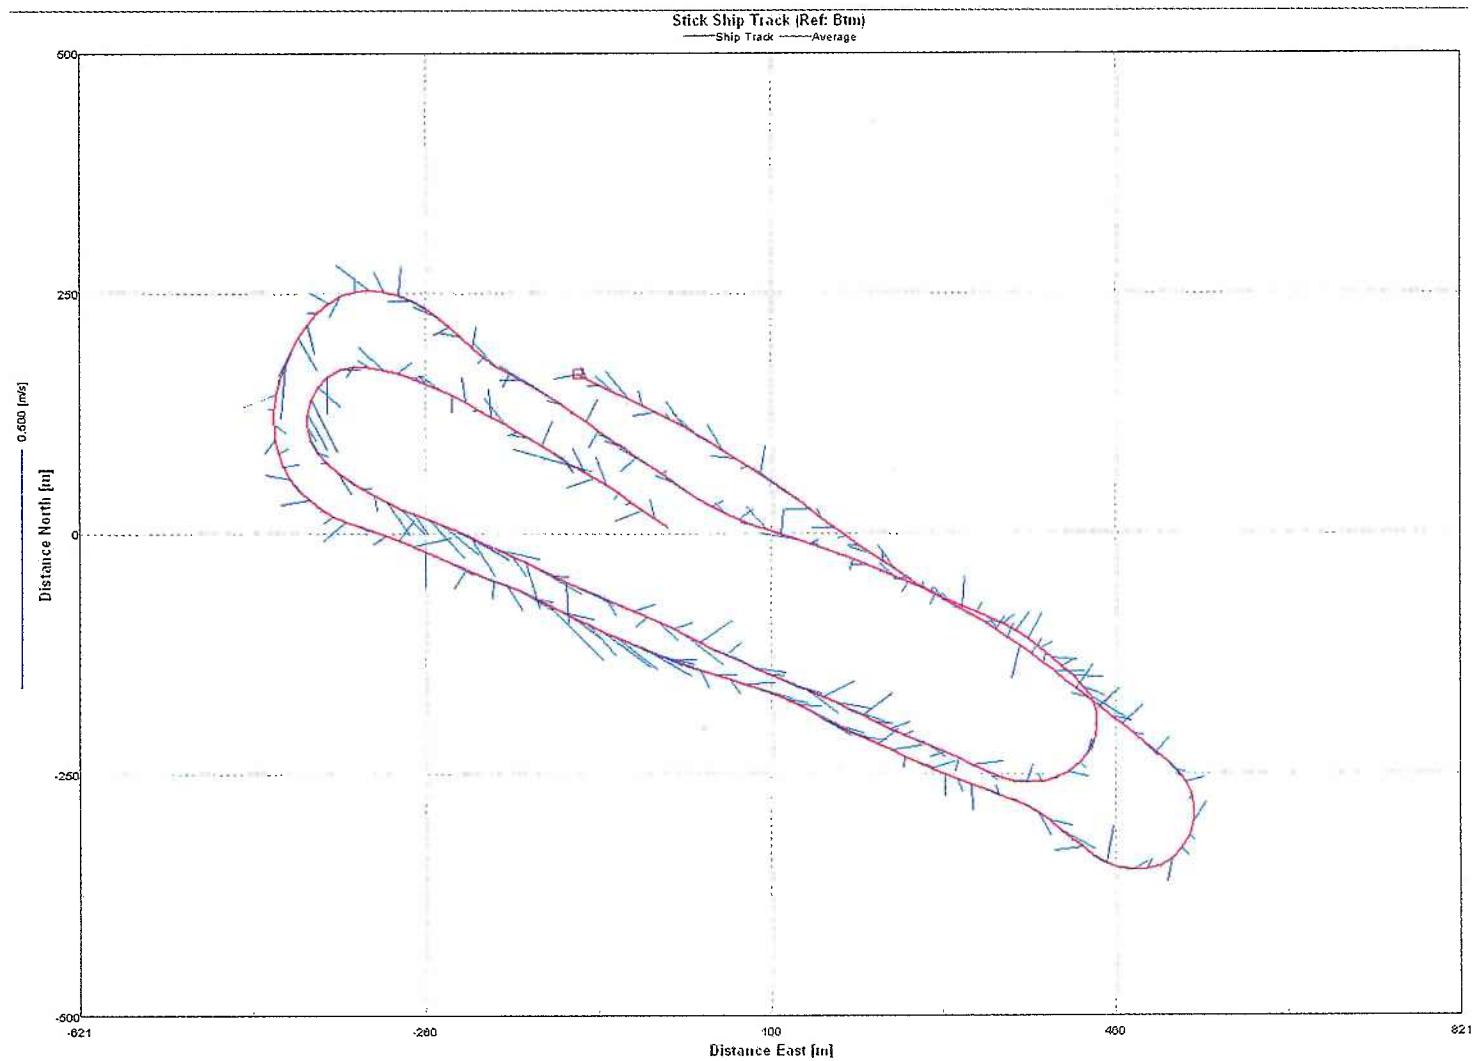

Evaluation of Sediment Agitation and Mixing into the Surrounding Water Column from Capping Activities - Boston Harbor
