Dear Ms. Henry,

Recently, I have been hearing about a certain chemical injected in cows to produce milk and it proving to be having negative affects on them. I was even more shocked to hear that the FDA along with other investigative and inspection companies were not checking and denying approval of these cows. The chemical BGH has been proven to produce puss riddled milk and when these cows are slaughtered, beef with this chemical still present, causing people to be slightly poisoned.

My reason for writing this letter is to ask that the FDA commence an investigation on the companies that produces BGH and

C828

the farms that it is shipped to. The companies that produce the chemical have been said to bribe head officials in major companies, congressmen, and others. With this investigation, it could stop BSE from being injected into the cows we as humans use for food and sustenance. Thank you for your time in reading this note.
