> Dear Surgeon General,
> My friends and I have been reading terrible information on BGH (Bovine Growth Hormones) that we think you have information on this subject.
> Why are you and our government allowing the Monsanto Company to sell and provide this growth hormone to our farmers in our country to inject their cows with this product just for the cows to make more milk. No other country will allow this hormone to be used. Our country has been brought up believing that milk and milk products are the choice for nourishment. This is not true. These hormones promote various cancers in humans and is called Posilac and works by increasing the insulin-like Growth
> factor (IGF-1) This is a cancer promoter known to cause cell proliferation and tumor growth. Milk is not nature's perfect food at all.
> Please review your information on this subject and stop this product from use. Reporters have been instructed not to include this kind of information to the public because of this frightening claim.
> There loads of these articles on the internet. I myself have printed at least an inch thick of all this information. We now drink and eat goat milk and goat cheese.
