DATE OF MEETING: 03/13/98

SLIDES

XENICAL® (orlistat)

Hoffmann-La Roche Inc.

Novel Site of Action and Mode of Activity

Site of Action

- Localized to the gastrointestinal tract

Mode of activity

- Reduces absorption of some ingested fat

Expert Panel's Assessment - May 1997

- Mutagenicity, genotoxicity and carcinogenicity studies in animals with systemic exposures many times that in man showed no evidence of any carcinogenic potential.
- Times to diagnoses of a number of the breast cancer cases were too soon after randomization for the case to be due treatment.
- The direct causative effect of orlistat is unlikely due to negligible systemic absorption.
- No mechanism resulting from a secondary effect of orlistat that could be identified linking orlistat to breast cancer.
- Chance or detection bias were possible explanations for the observed imbalance.

Analysis of Breast Cancer Cases

Data Collected

- Medical Records
- Pre- and post-study mammograms
- Histopathology slides
- Follow-up survey all female patients ≥ 45 years of age

Efficacy and Tolerability

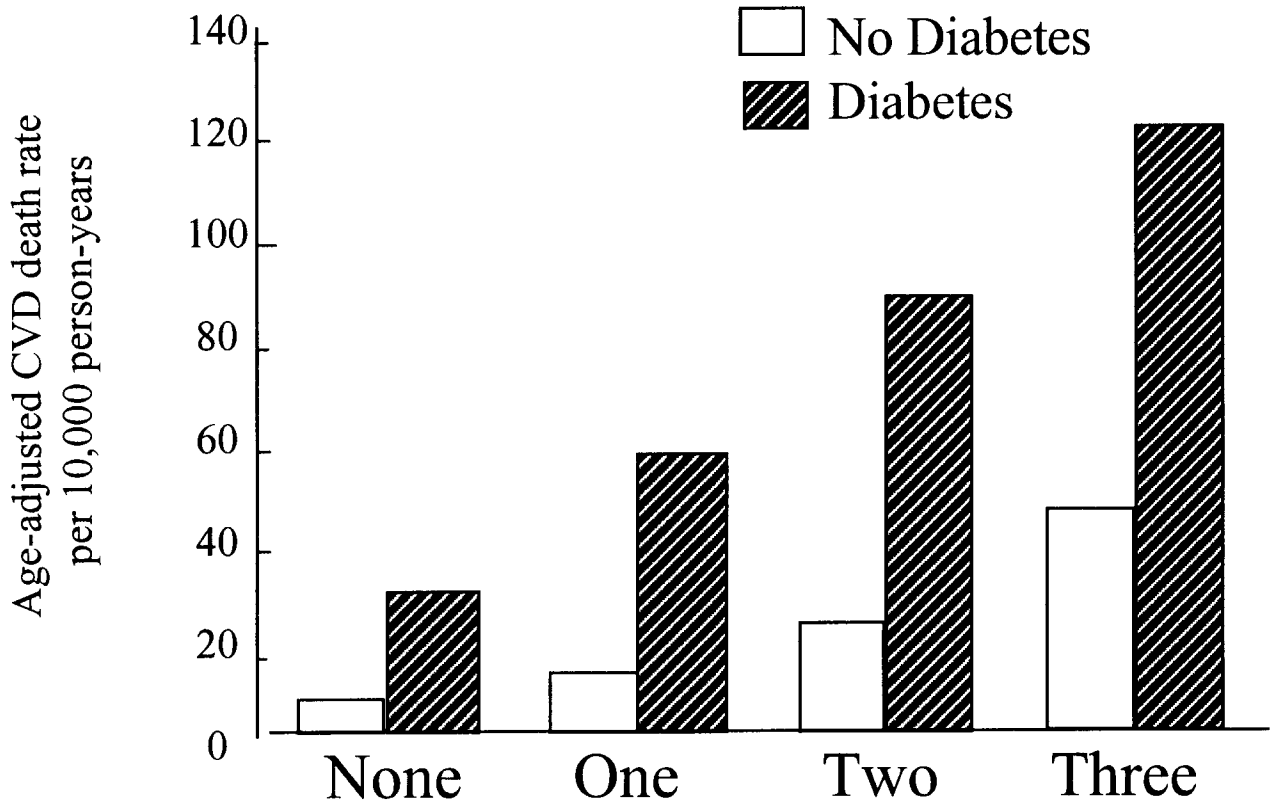
FDA Advisory Presentation

Age-Adjusted CVD Death Rates by Number of CVD Risk Factors for Diabetic and Nondiabetic Men



Subjects are screenees for the MRFIT study; risk factors are hypercholesterolemia, hypertension, and smoking

Diabetes in America

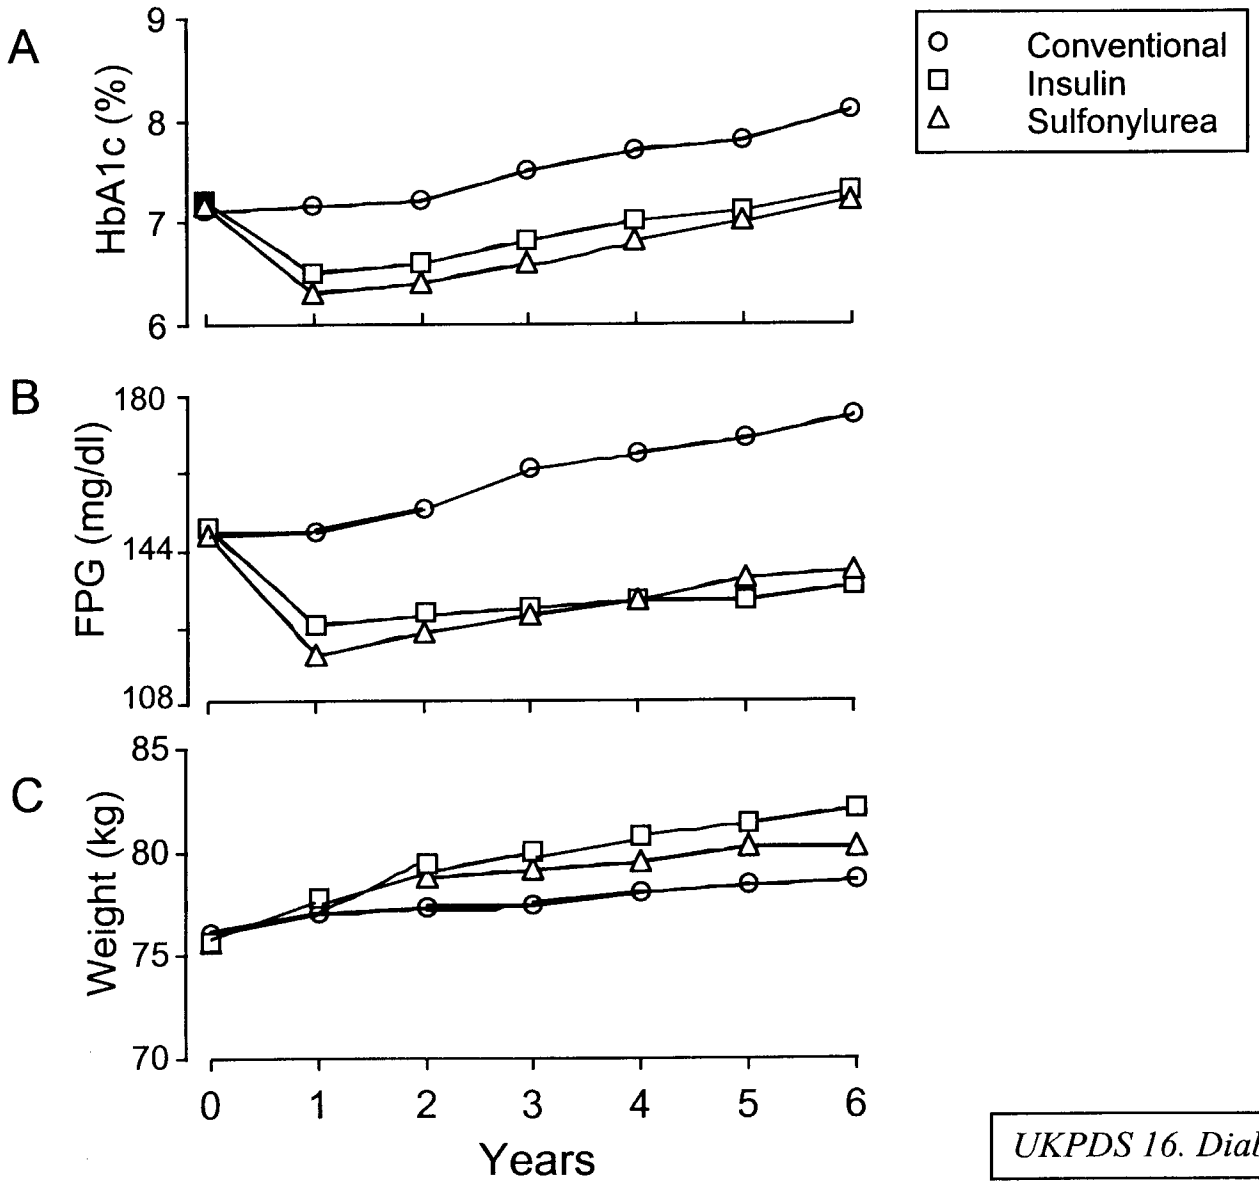
Type 2 Diabetes:
A Problem in Overall Risk Management

- Glycemic control
- Cardiovascular Disease
  - Hypertension
  - Dyslipidemia

Treatment of Type 2 Diabetes

- Diet and exercise
- Pharmacotherapy
  - Sulfonylurea medications
  - Biguanides (Metformin)
  - Alpha-glucosidase inhibitor (Acarbose)
  - Insulin
  - Troglitazone

HbA1c (A), fasting plasma glucose (B), and body weight (C) over 6 y in newly diagnosed Type 2 diabetic patients



UKPDS 16. Diabetes 44:1249, 1995

UKPDS:

Natural History of Progression of Type 2 Diabetes

- Worsening glycemia
- Progressive weight gain
- Exacerbated cardiovascular disease risk

Treatment of Type 2 Diabetes

- Diet and exercise
- Pharmacotherapy
  - Sulfonylurea medications
  - Biguanides (Metformin)
  - alpha-Glucosidase inhibitors (Acarbose)
  - Insulin
  - Insulin-sensitizer (Troglitazone)
- Weight management

Treatment of Type 2 Diabetes:

Desired characteristics of weight management component

- Potentiate initial weight loss
- Prevent weight regain
- Beneficial effect on glycemic control
- Improve comorbidities
- Hypoglycemic agent-sparing

American Diabetes Association: Clinical Practice Recommendations 1998

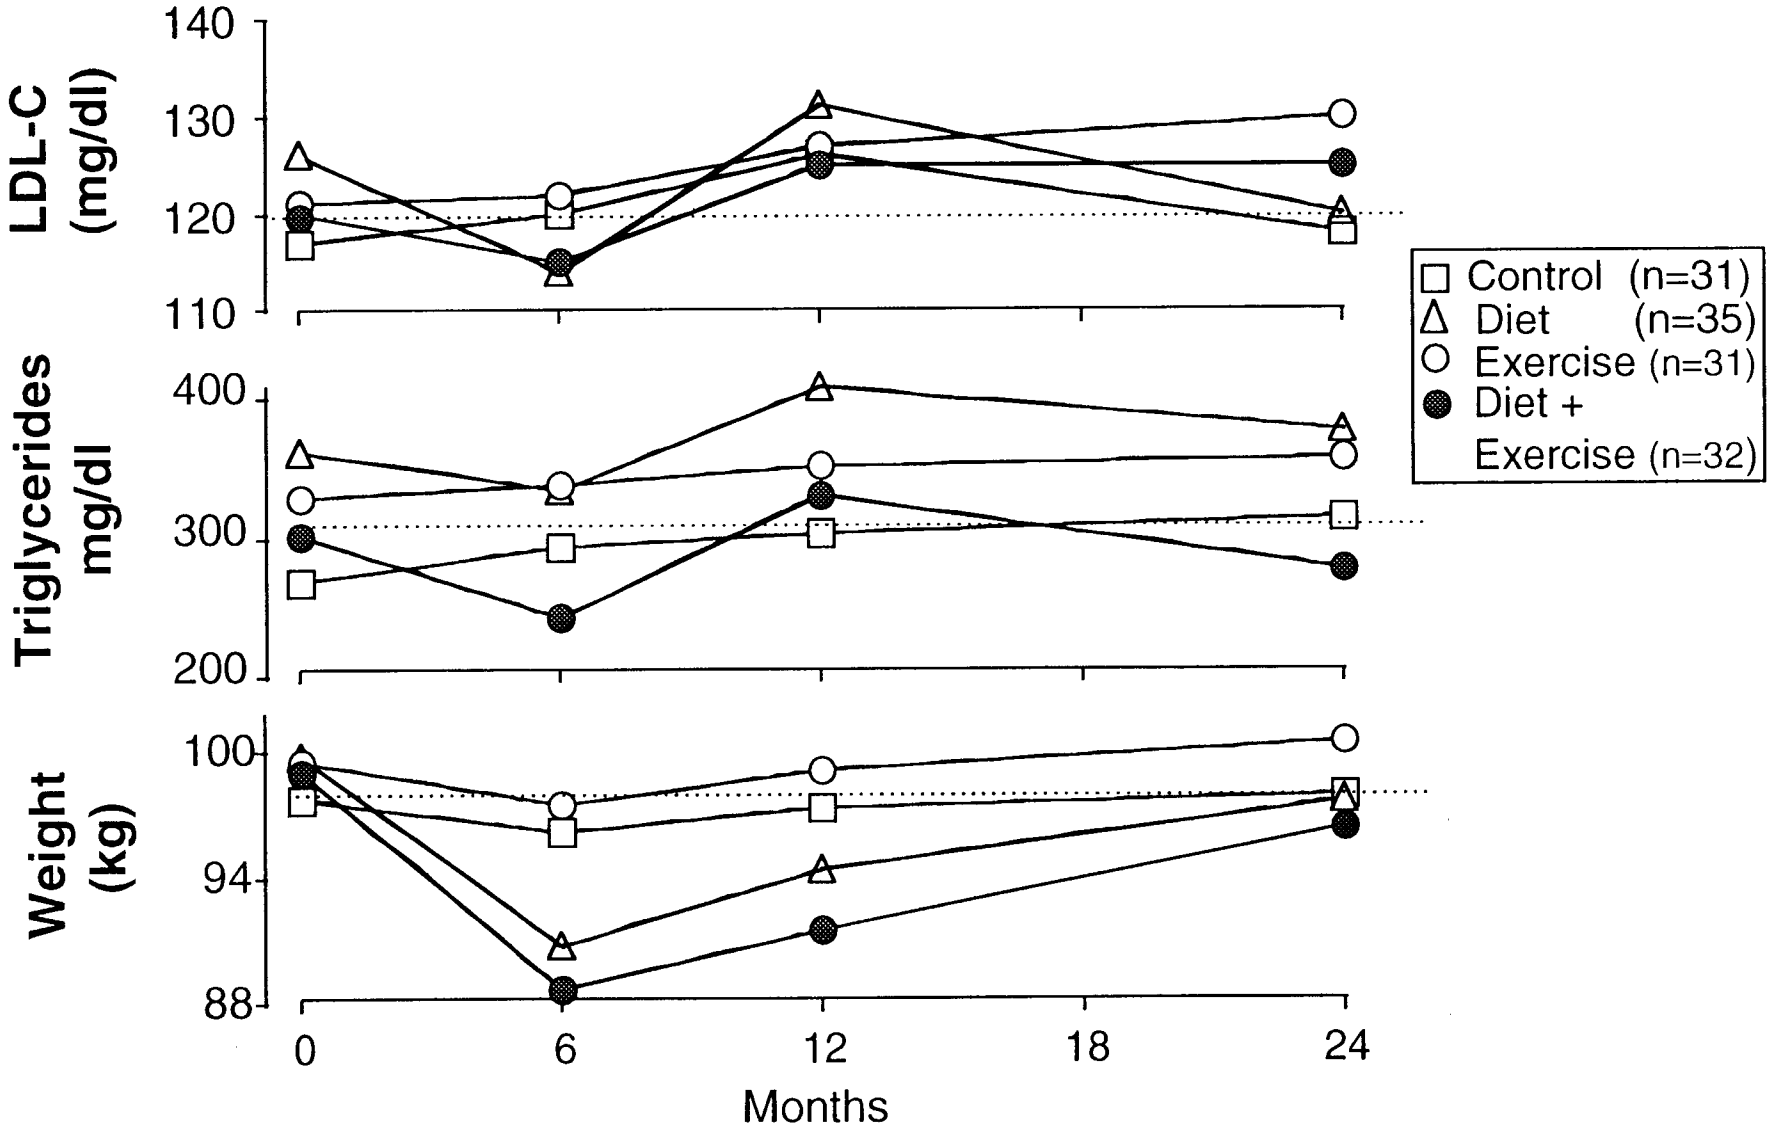
POSITION STATEMENT

Management of Dyslipidemia in Adults With Diabetes

- Weight loss and increased physical activity will lead to decreased triglyceride and increased HDL cholesterol levels and also to modest lowering of LDL levels.
- Treatment of LDL cholesterol is considered as the first priority for pharmacological therapy of dyslipidemia.

Diabetes Care; Suppl 1: S36, 1998

Body weight and Lipid Levels over 2 y of Lifestyle Intervention in Obese Subjects with Parental Diabetes

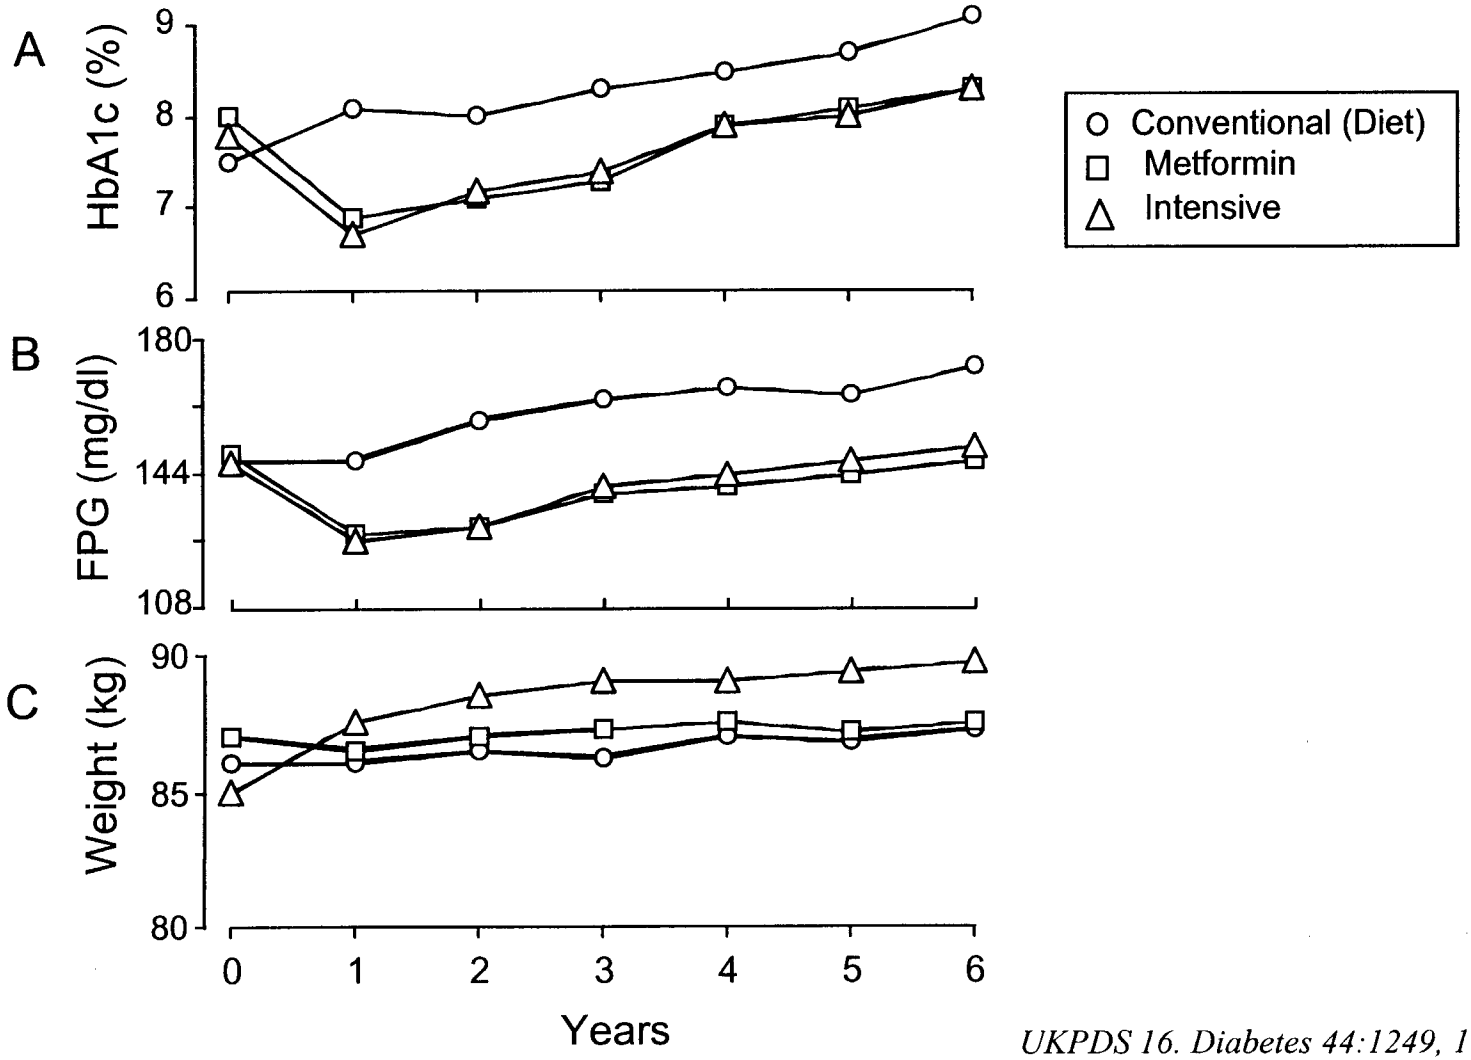


Wing et al. Diabetes 21:350, 1998

Desired Characteristics of Pharmacotherapy

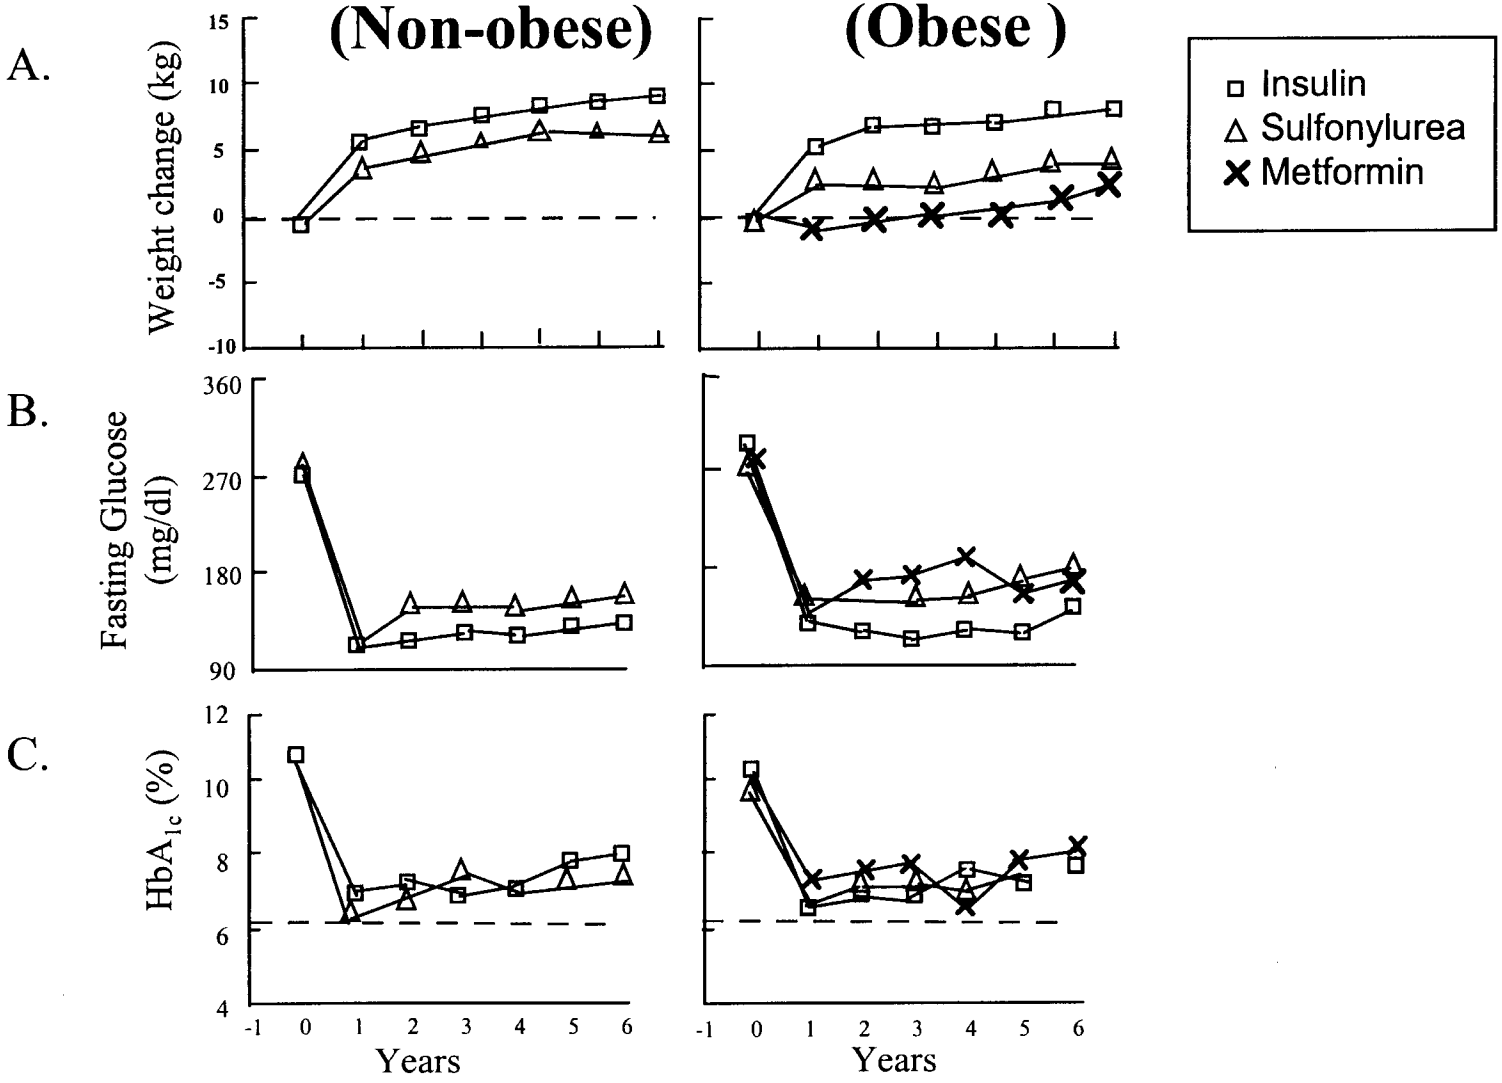
- Potentiates weight loss
- Minimizes or prevents weight regain
- Achieves and sustains weight loss sufficient to achieve and sustain health benefits
- An adjunctive weight management tool to prevent diabetes in obese persons at high risk

HbA1c (A), fasting plasma glucose (B), and body weight (C) over 6 y in obese patients assigned to conventional (diet), metformin, or intensive (insulin or sulfonylurea) therapy



UKPDS 16. Diabetes 44:1249, 1995

Changes in body weight (A), fasting glucose (B), and HbA_{1c} (C) over 6 years in patients in the primary diet failure group allocated to insulin, sulfonylurea, or metformin. The horizontal dashed lines indicate HbA_{1c} of 6.2 % (the upper 97.5th percentile of normal).



Ann Intern Med. 1998. 128:165-175.

XENICAL® (orlistat) in the Treatment of Obesity

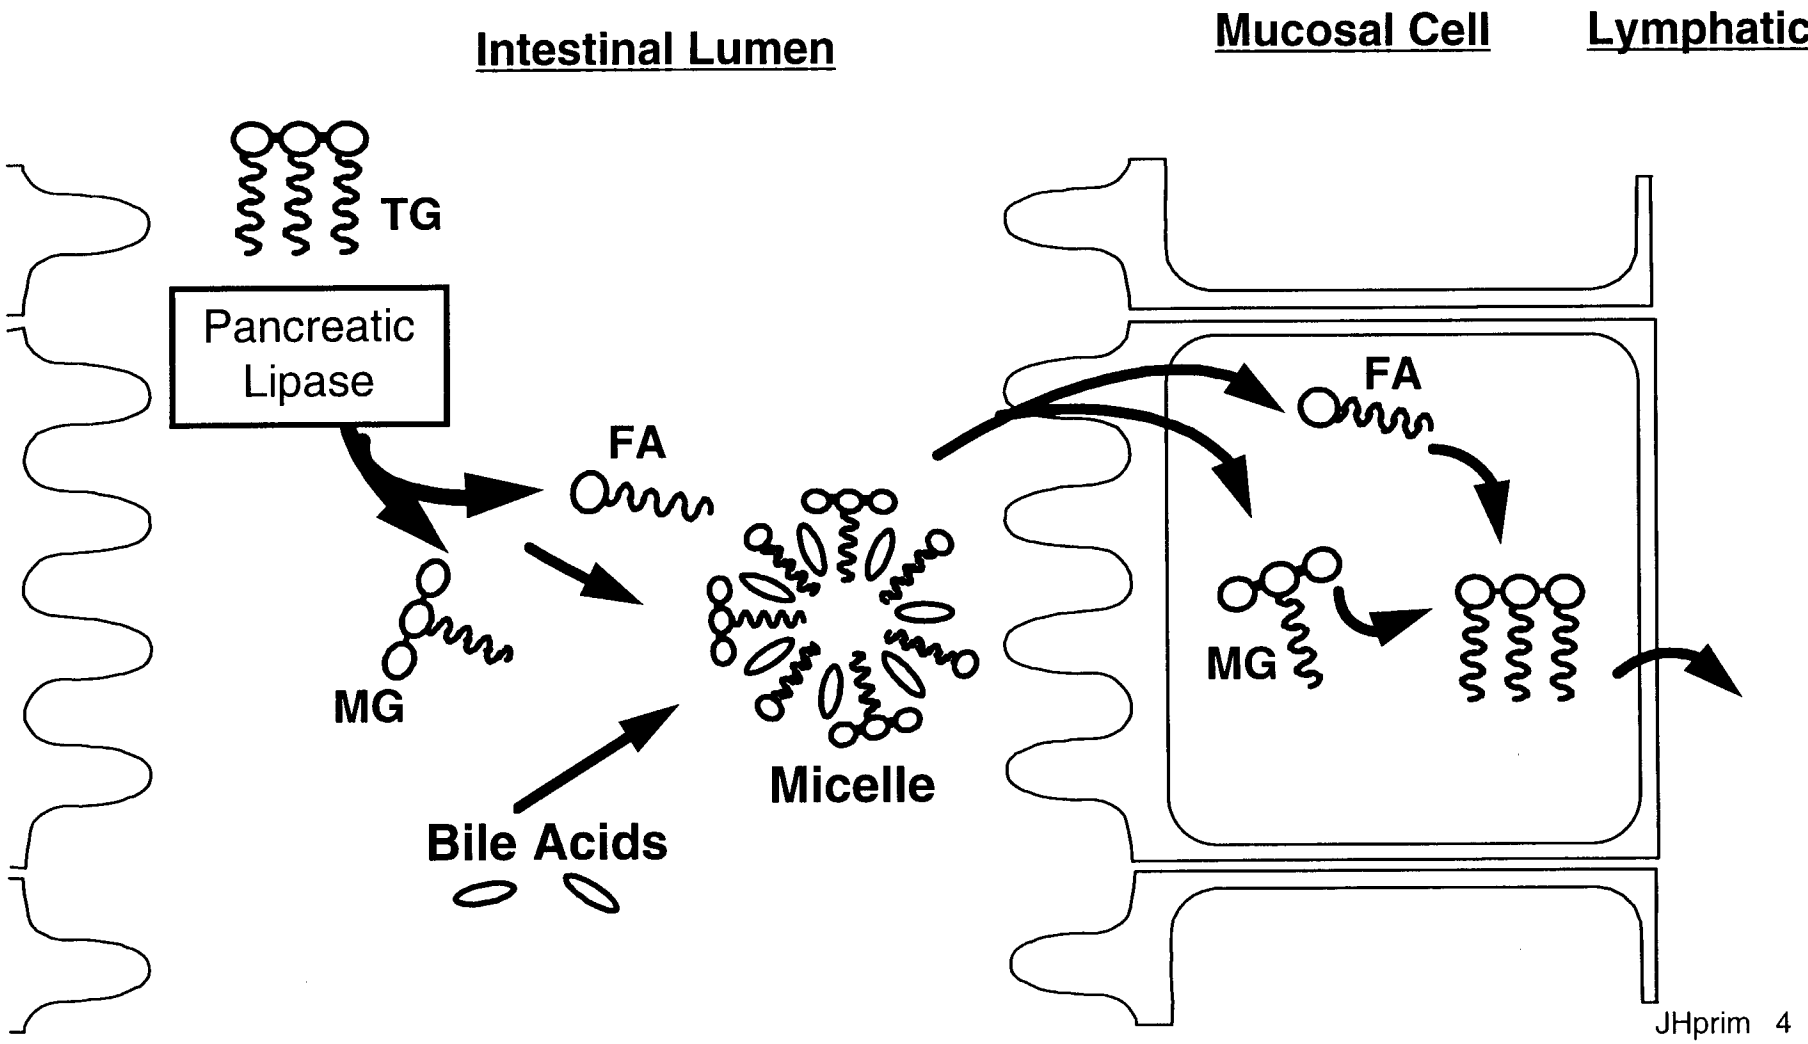
Jonathan Hauptman, MD
Hoffmann-La Roche
Nutley, New Jersey

Medically Significant Obesity

- BMI $\geq$ 30
- BMI $\geq$ 27 with risk factors
  - Type 2 Diabetes
  - Impaired Glucose Tolerance
  - Hyperlipidemia
  - Hypertension

Orlistat Selectively Inhibits Fat Absorption to Produce a Caloric Deficit

Physiology of Fat Absorption



Phase III Clinical Program

7 Double-Blind, Randomized, Placebo-Controlled Trials (N = 4188)

- 5 studies evaluated weight loss and maintenance for one year
  - 4 studies had a second year of treatment
- 1 study evaluated patients with Type 2 Diabetes on oral hypoglycemic agents
- 1 study evaluated prevention of weight regain after weight loss with diet alone

As Part of an Overall Weight Management Program, Orlistat

- Helps to produce and maintain a clinically meaningful weight loss
- Demonstrates favorable effects on obesity-related risk factors

Overall Weight Management Program

Year One Goal: Weight Loss and Maintenance

- Balanced hypocaloric diet
- Dietary counseling
- Behavior modification
- Frequent clinic visits

Overall Weight Management Program

Year Two Goal: Help Prevent Weight Regain

- Balanced eucaloric diet
- Counseling to diminish weight regain
- Longer intervals between clinic visits

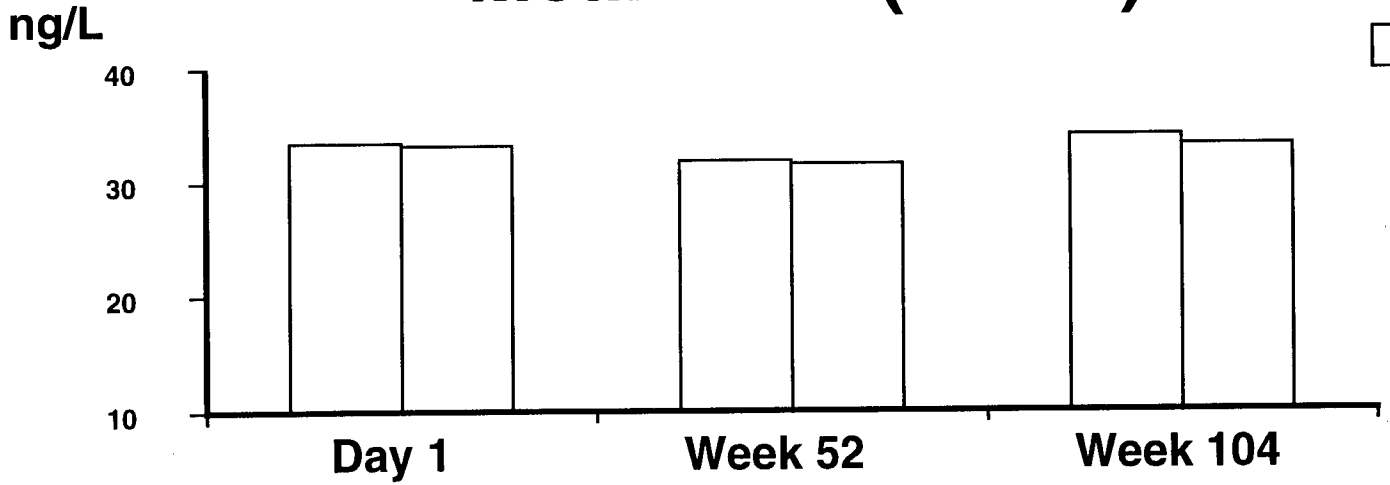
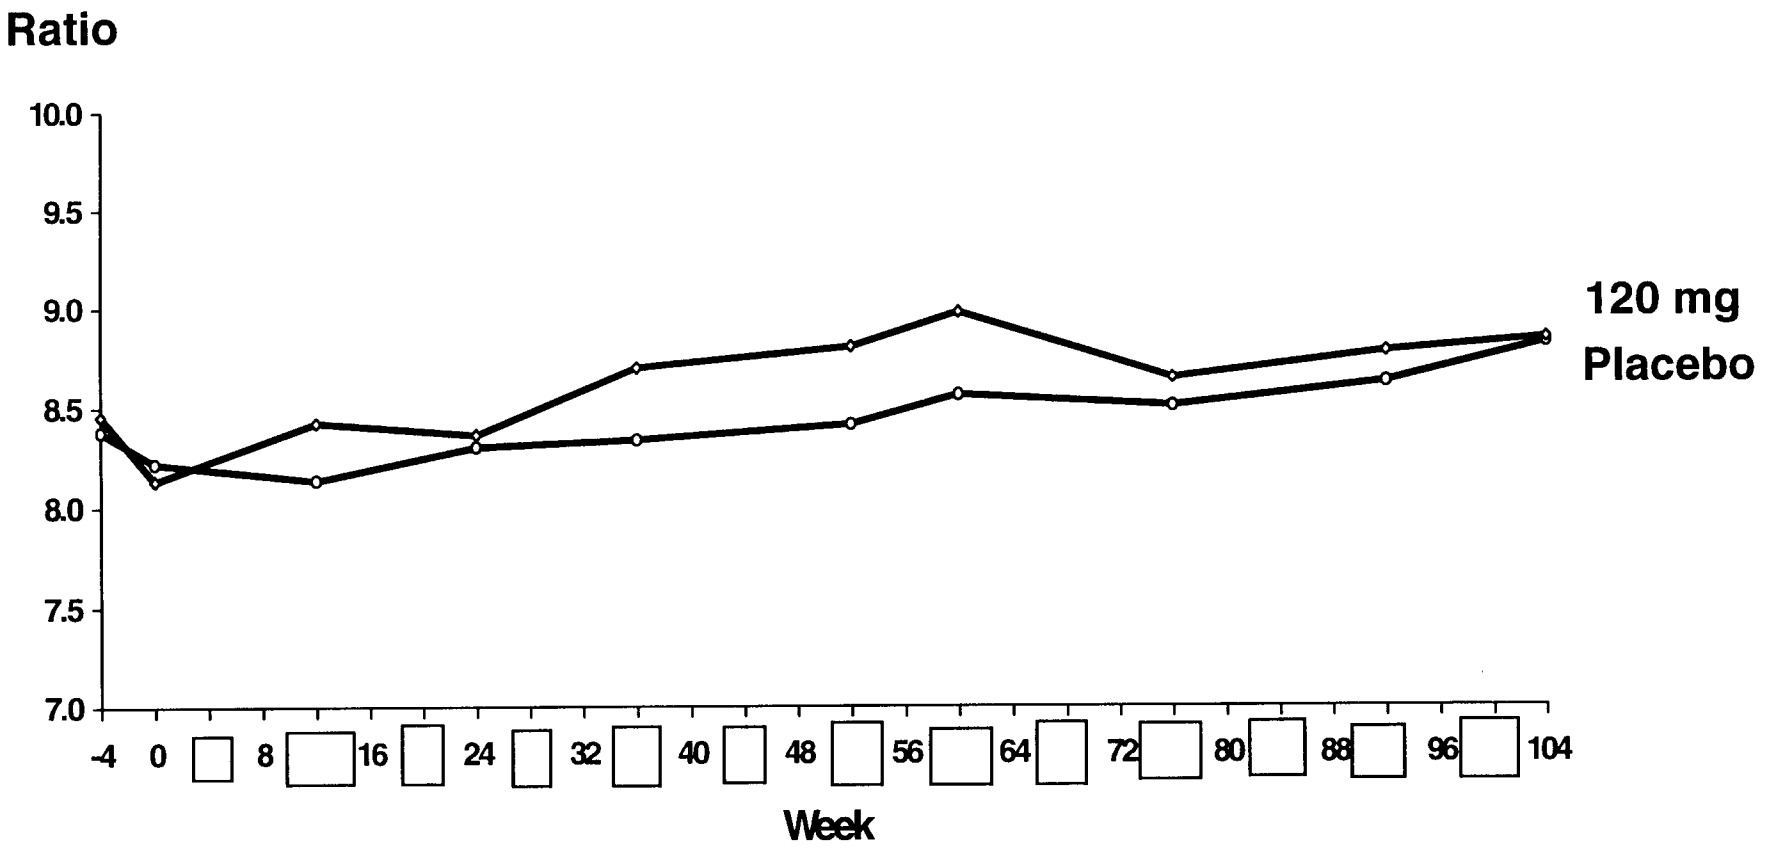
Mean PTH (Intact)



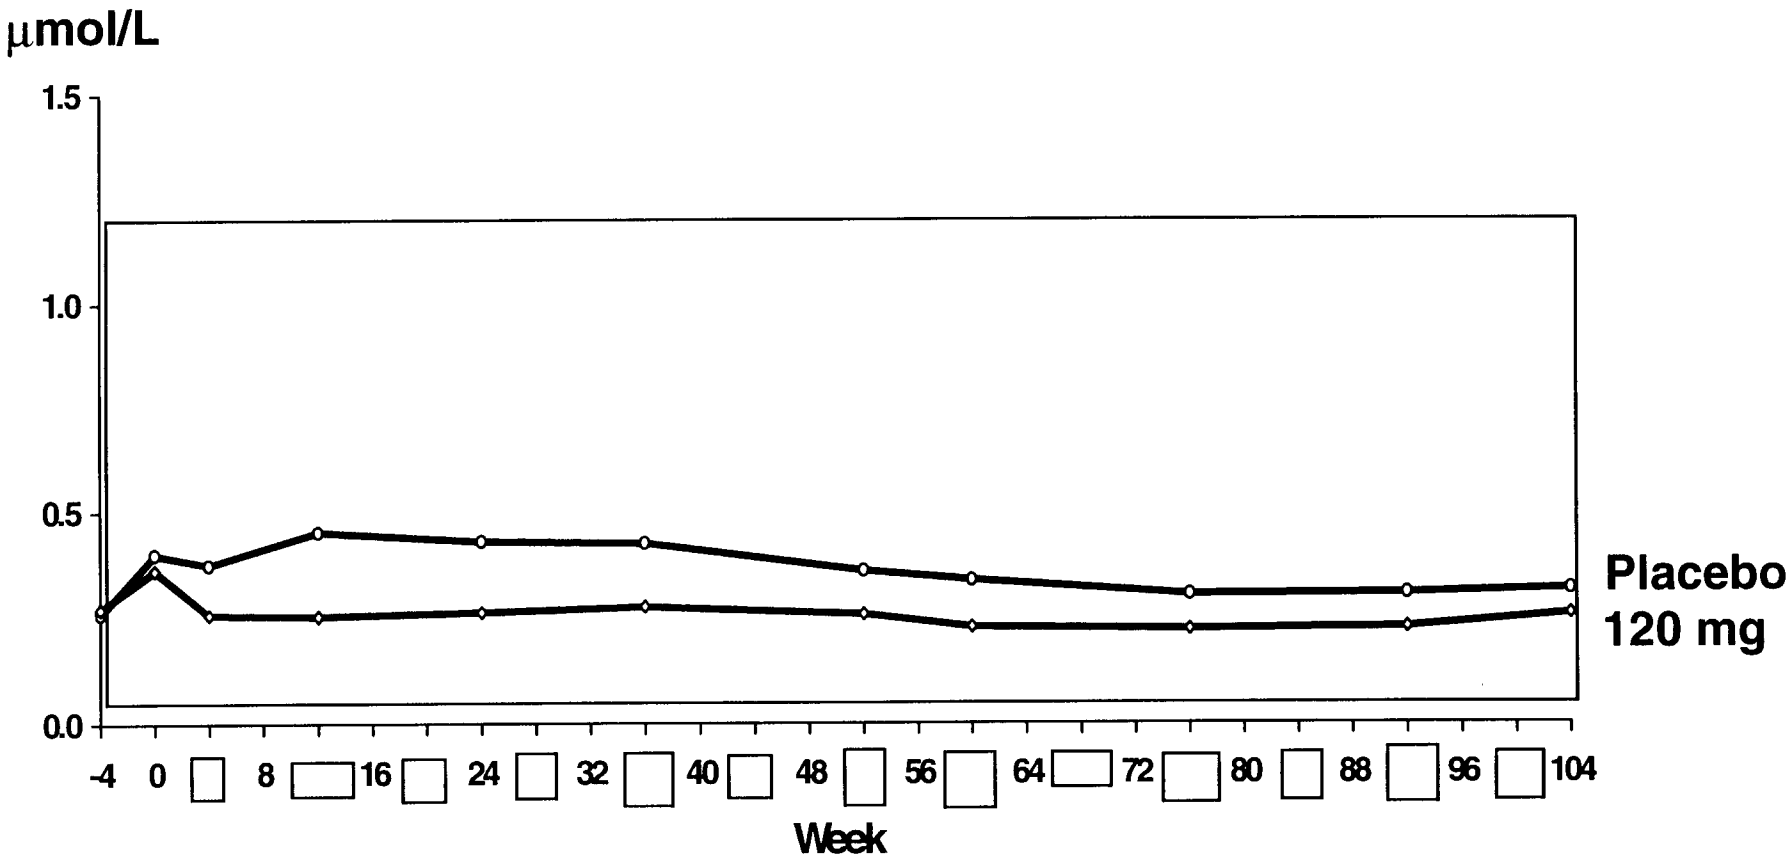
☐ Placebo (n=209)

☐ Orlistat (n=211)

Mean Vitamin E/LDL Cholesterol Ratio



Mean Beta-Carotene Level



Effect of Orlistat on Fat-Soluble Vitamin Levels

- All mean vitamin levels remain within reference range
- Modest decrease in vitamin D and Beta-Carotene levels
- Multivitamin reverses decreased values
- Vitamin supplementation should be given

Safety and Tolerability of Orlistat

- Few clinically significant adverse events
- Well characterized pharmacological effects
  - Limited to gastrointestinal tract
  - Mild to moderate
  - Occurs early
  - Few withdrawals

Orlistat Efficacy on Weight Management

- Produces sustained weight loss
- Diminishes weight regain
- Is effective long-term

Orlistat Efficacy – Risk Factor Improvements

- Improved lipid profiles
- Decreased elevated blood pressure
- Decreased insulin,glucose and c-peptide levels
- Normalized OGTT status
- Improved glycemic control

Martin Huber, M.D.

Clinical Oncology
Hoffmann-La Roche

Observations in Phase III Programs

- No imbalance in cancers overall
- Imbalance in breast cancer cases
- No breast cancer in women <45

Imbalance in Breast Cancer was Unexpected

- Obesity and breast cancer
- Preclinical Data
- No reports in Phase II
  - 917 women in Phase II
  - 652 on orlistat

Possible Explanations for the Imbalance

- Causality (Initiator)
- Stimulation of pre-existing tumors
- Detection effect
- Chance

Procedures for Assessing Breast Cancer Reports

- Surveys of women ≥45 years of age
- Detailed epidemiologic analyses
- Complete review of preclinical data
- Review of source materials by breast cancer experts

Survey of Women ≥45 in Phase III Trials

- Survey #1 - Assessed the incidence of breast cancer after study
- Survey #2 - Gathered risk factor information

Incidence of Breast Cancer Reported in Orlistat Studies and Follow-Up Period

Treatment Group	Number of reported cases			Number of Women	
	During Trial	During FU Survey	Total	All	≥ 45

Conclusion

On the evidence available, chance is the most plausible explanation for the breast cancer findings

Breast Cancer
Areas of Investigation

Epidemiology	**James Schlesselman, PhD**
Preclinical	**Tim Anderson, DVM, PhD**
Clinical	**Martin Huber, MD**
Histopathology	**James McGee, MD, PhD**

No Evidence in Preclinical Studies that Orlistat has any Carcinogenic Potential

- Genotoxicity studies
- Animal carcinogenicity studies
  - 2 year study in rats
  - 2 year study in mice

No Genotoxicity Seen in Orlistat Studies

Orlistat was tested in the following assays:

- Ames test +/- metabolic activation
- V79/HPRT assay in Chinese hamster ovary cells ± metabolic activation
- Unscheduled DNA Synthesis in Rat Hepatocytes
- Human Chromosome Aberrations ± metabolic activation (in vitro assay)
- Mouse Micronucleus Test (in vivo assay)

Animal Studies Are Suitable to Assess Risk - Multiples of Human Exposure*

	Species		
Parameter	Mouse	Rat	Dog
Dose (mg/kg/day)	1500	1000	1000
Duration	2-yrs	2-yrs	1-yr
Orlistat (C_{max}, ng/ml)	12X	730X	130X
M1 Metabolite (C_{max}, ng/ml)	18X	49X	4X
M3 Metabolite (C_{max}, ng/ml)	24X	5X	1X

*120 mg tid to a 70 kg adult
Orlistat = 4ng/ml, M1 = 25 ng/ml, M3 = 92 ng/ml

Carcinogenicity Study in Rats
Incidence of Mammary Neoplasms

Dose (mg/kg/day)	Adenoma	Carcinoma	Fibroadenoma
0	0/50	2/50	14/50
0	1/49	1/49	15/49
150	0/50	2/50	9/50
500	1/47	0/47	9/47
1000	1/49	2/49	3/49*

*$P \leq 0.01$

Carcinogenicity Study in Mice
Incidence of Mammary Neoplasms

Dose (mg/kg/day)	Adenocarcinoma
0	3/49
0	2/50
25	0/49
375	1/49
750	0/49
1500	0/49

Preclinical Evaluation

Orlistat did *not* initiate or promote tumors

No evidence for stimulation of mammary gland or mammary tumors by orlistat.

- Rodent carcinogenicity studies
- Hormonal effects
  - chronic toxicity studies
  - reproductive toxicity studies

No Growth Stimulation or Change in Time to Detection of First Palpable Mammary Masses

Rat Carcinogenicity study

Dose (mg/kg/d)	No. Examined	No. with Palpable Mass	% Incidence	Mean Masses /Rat	Week of First Observation
0	50	17	34	0.44	31
0	50	20	40	0.56	66
150	50	10	20	0.30	55
500	50	8	16	0.18	59
1000	50	5	10	0.12	69

No Histologic Effects of Orlistat on Hormone-Responsive Tissues

No changes observed in mammary tissue, testes, ovaries, vagina, or uterus in:

- **Mice - 2-Years - 1500 mg/kg**
- **Rats - 2-Years - 1000 mg/kg**
- **Dogs - 1-Year - 1000 mg/kg**

No Evidence of Hormonal Activity in Reproductive Studies

- Segment I - Fertility Study in Rats - 400 mg/kg
- Segment II - Teratogenicity in Rats - 800 mg/kg
- Segment II - Teratogenicity in Rabbits - 800 mg/kg
- Segment III - Peri-natal Effects in Rats - 400 mg/kg

"I conclude that the nonclinical studies with Orlistat provide no findings to suggest any human cancer hazard, and in particular, any potential for enhancing or accelerating breast cancer development".

Dr. Gary Williams, MD
Director, Naylor Dana Institute
American Health Foundation

Orlistat Shows No Evidence of Carcinogenic Potential in Animal Studies

- Systemic exposure to orlistat and its metabolites is much higher than in humans
- Not genotoxic
- No increased incidence of mammary adenomas or carcinomas in rats or mice
- Decreased incidence of mammary fibroadenomas
- Not carcinogenic at any other site in rats or mice

Orlistat Did Not Stimulate Mammary Gland or Tumor Growth in Animal Studies

- No hormonal activity in toxicity or reproductive toxicity studies
- No growth stimulation in normal mammary tissue
- No growth enhancement of spontaneous rodent mammary tumors

Radiology Review

- Independent review of available mammograms
  - Post-randomization on 14 of 15 patients
  - Pre-randomization on 9 of 15 patients
- 6 of the 9 patients had evidence of a lesion prior to treatment
  - 1 of 3 patients on placebo
  - 5 of 6 patients on orlistat

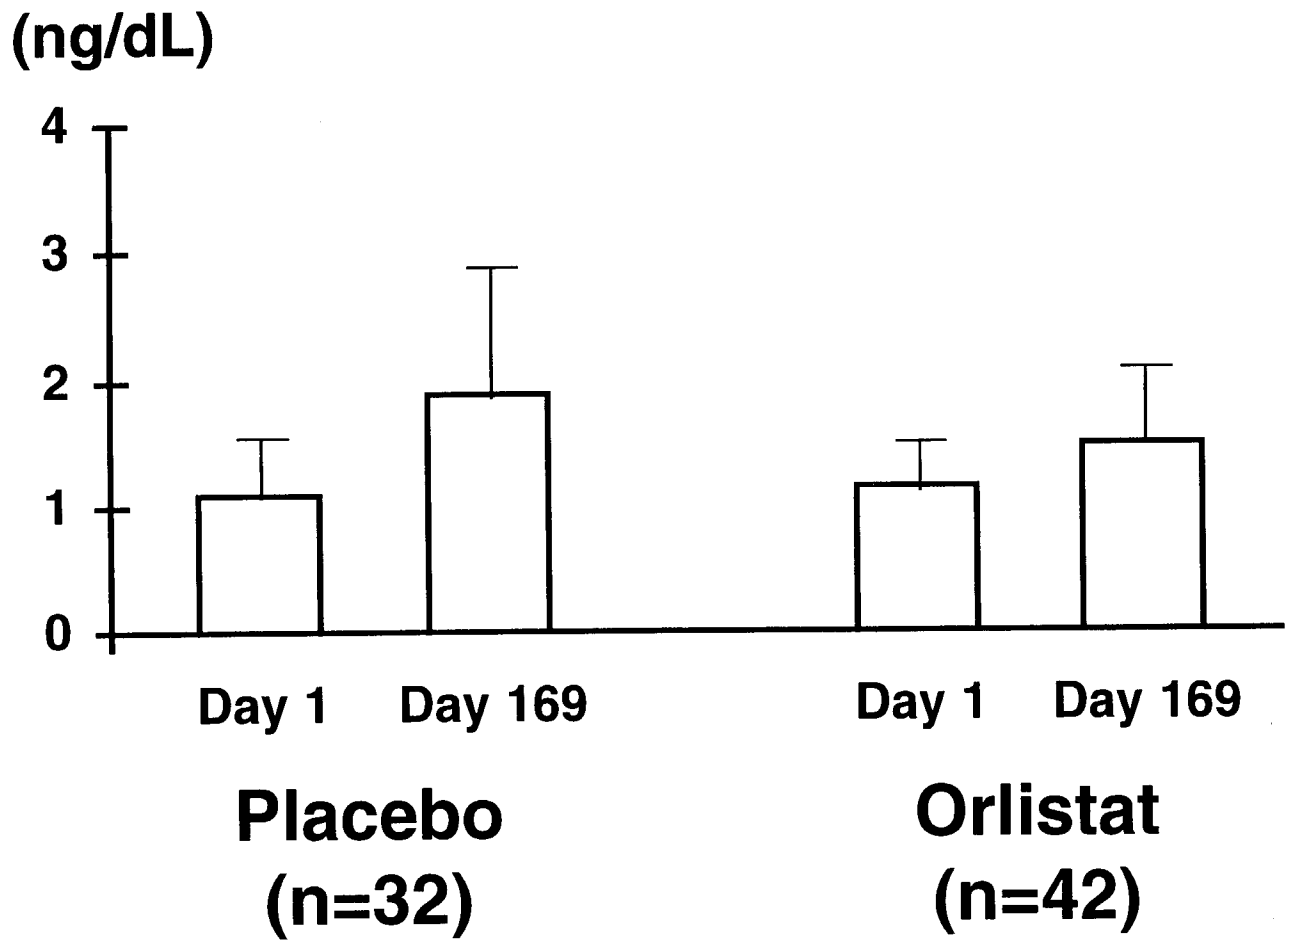
Vitamin Levels in Breast Cancer Patients

- Vitamin E: Almost all measurements within reference range
- Vitamin A: All within reference range
- Vitamin D: Almost all measurements within reference range
- Beta carotene: All within reference range

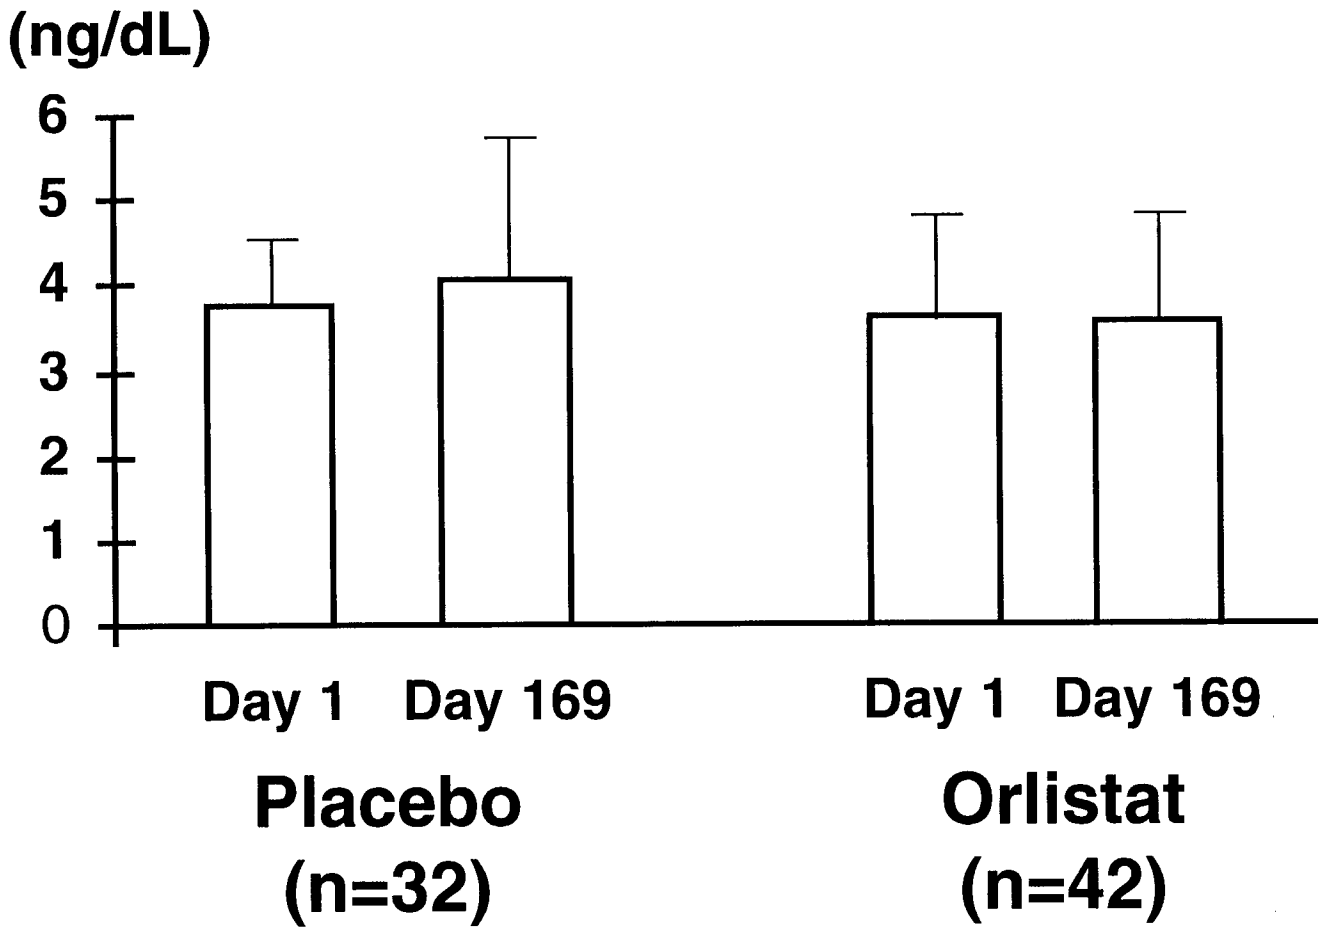
Demographics - Women ≥45 years and FSH >30 IU/ml

	Placebo (32)	120 mg (45)
Age		
median	55	58
range	47-76	45-78
BMI (kg/m^2)		
mean	35.7	35.5
range	29-43	28-43
Weight change (kg)		
mean	-2.0	-6.2
SD	3.5	5.6

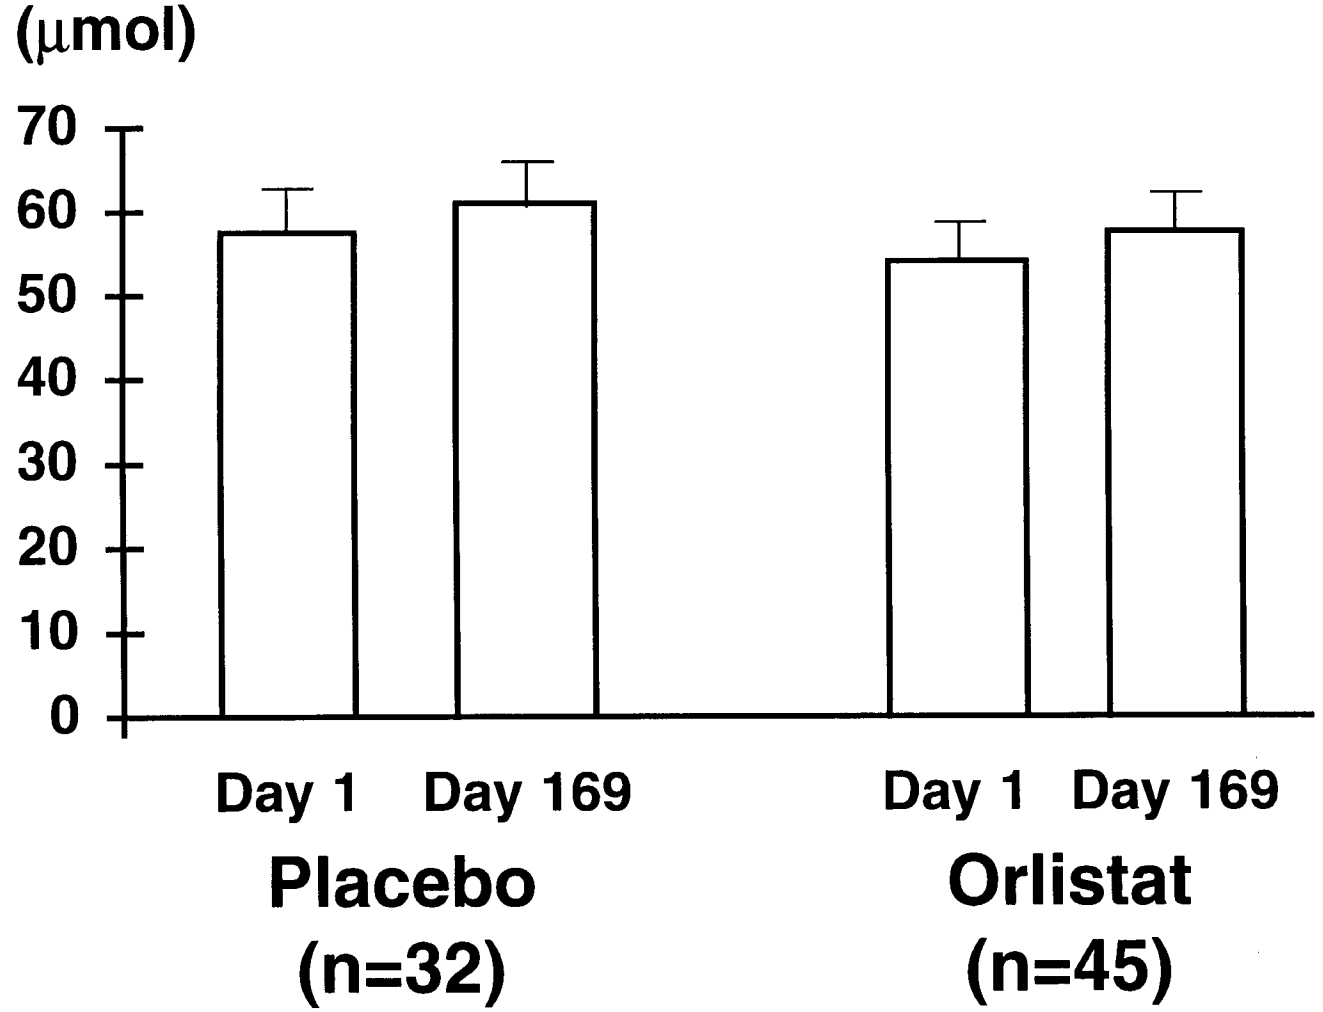
Plasma Estradiol



Plasma Estrone



Serum Sex Hormone Binding Globulin (SHBG)



Clinical Conclusions

- Majority of tumors present at time of randomization
- Vitamin levels normal
- Estrogen levels not increased

Breast Cancer Issues in Orlistat Trials

- Issue One
  - Does orlistat cause breast cancer?
- Issue Two
  - Does orlistat enhance the growth of breast cancer?

Breast Cancers Detected in the Orlistat and Follow-Up Trials: The Issues

NUMBER OF REPORTED CASES

Treatment	During Trial	During FU* Survey	Total	Women (> 44 yrs)
Placebo	1	2	3	579
Orlistat 30/60 mg	1	0	1	316
Orlistat 120 mg	9	2	11	747
Total	11	4	15	1642

* FU = Follow-Up

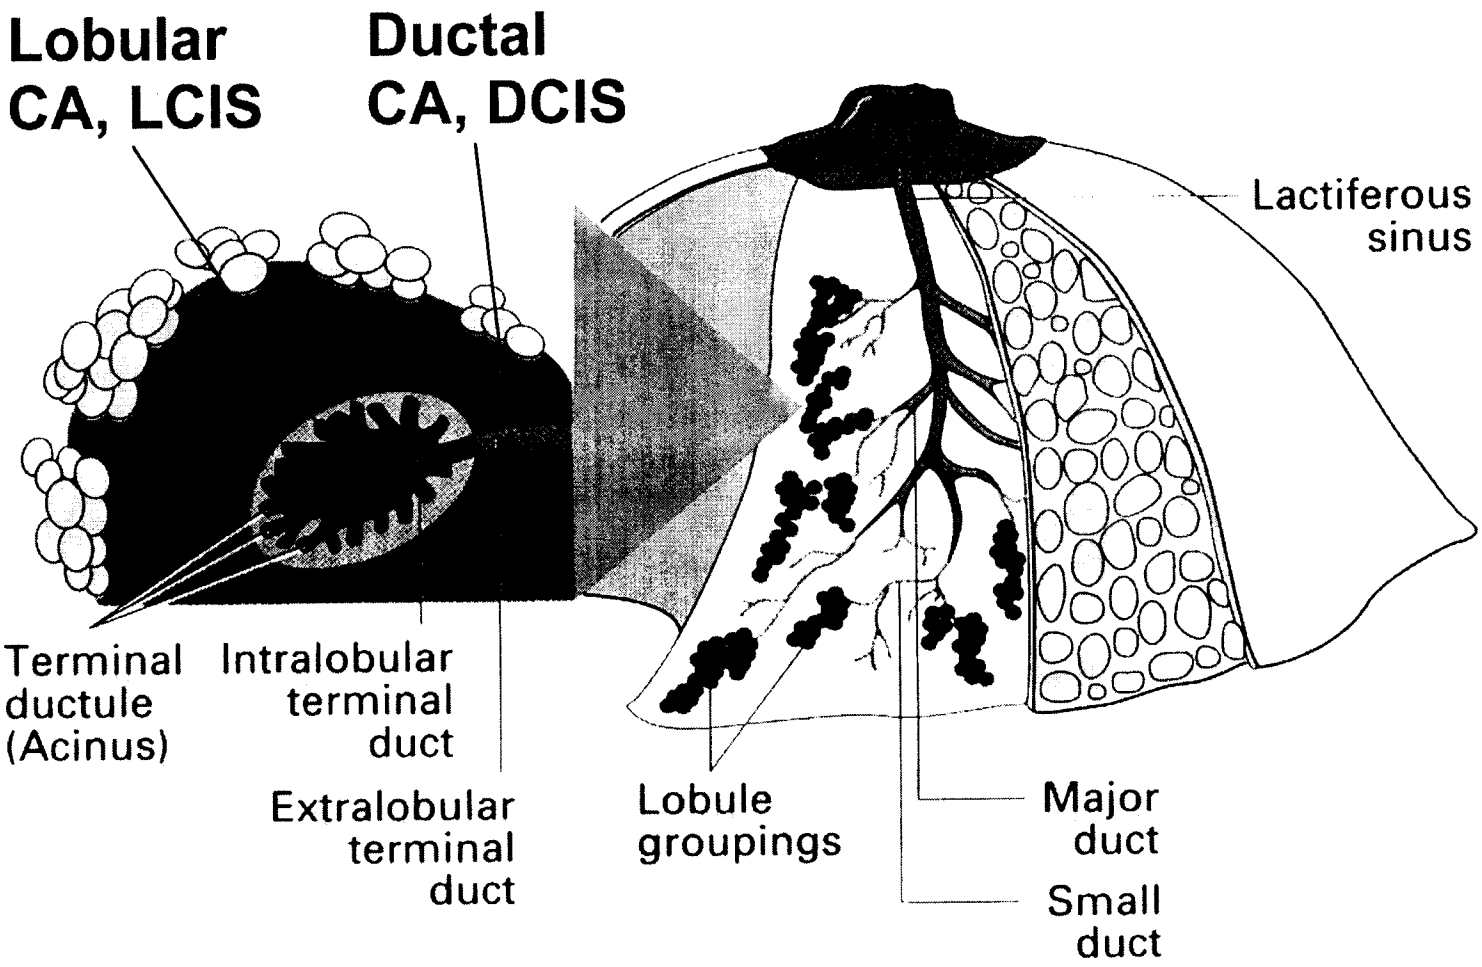
Issue One

Evidence will now be presented indicating that orlistat is not causally related to breast cancer initiation of promotion.

Breast Cancer Causality in Orlistat Trials: Study Design

- "Blinded". To *all* data.
- Analysis of all histologic slides (USA, Finland, Holland, Germany, Sweden, Austria).
- Remarkably all microscopic slides, from all patients, were available for analysis.
- "Unblinded". The report integrates my views and information from other reports.

Histopathologic Terminology



Criteria Used to Determine Causality and Relationship to Treatment

1. Carcinoma in situ (LCIS and DCIS)
   - Increases the risk of breast cancer 10X
   - Over a period of 20-30 years in 25% of women
2. Tumor classification
   - Type
   - Grade
   - Lymph node mets
   - Tumor size

Tumor Size

- Breast cancer requires 9-17 years to grow from a single cell to a clinically detectable mass (~10mm)
- 30 volume doublings required for a 10mm tumor mass (2 x diameter = 8 x volume of a "sphere")

Tumor Size (cont'd)

- Tumor size at time of randomization was calculated
  - Peers et al, 1993; Dutch Breast Screening Clinical Data
  - Tumor volume doubling time occurs on average every 157 days (121-204 days)

Breast Cancer Causality: Summary of Evidence

- Presence of CIS
- Tumor type heterogeneity
- Tumor grade heterogeneity
- Lymph node metastases
- Tumor size

Conclusion on Causality

In my view there are no data indicating that orlistat is causally related to breast cancer initiation or promotion

Independent Assessment

- Pathologists: Drs, Tavassoli, Wagner and Wright
- Radiologist: Dr. Feig

THERE WAS COMPLETE INDEPENDANT CONCORDANCE ON CAUSALITY ISSUE

Issue Two

Evidence will be presented that there are no cell biologic or pathologic data to support this idea.

Issue Two:
Did orlistat enhance pre-existing breast tumor growth?

- No preclinical evidence for enhancement of growth (Dr. Anderson)
- Human Pathology Evaluation

Growth Enhancement Issue: Predictions

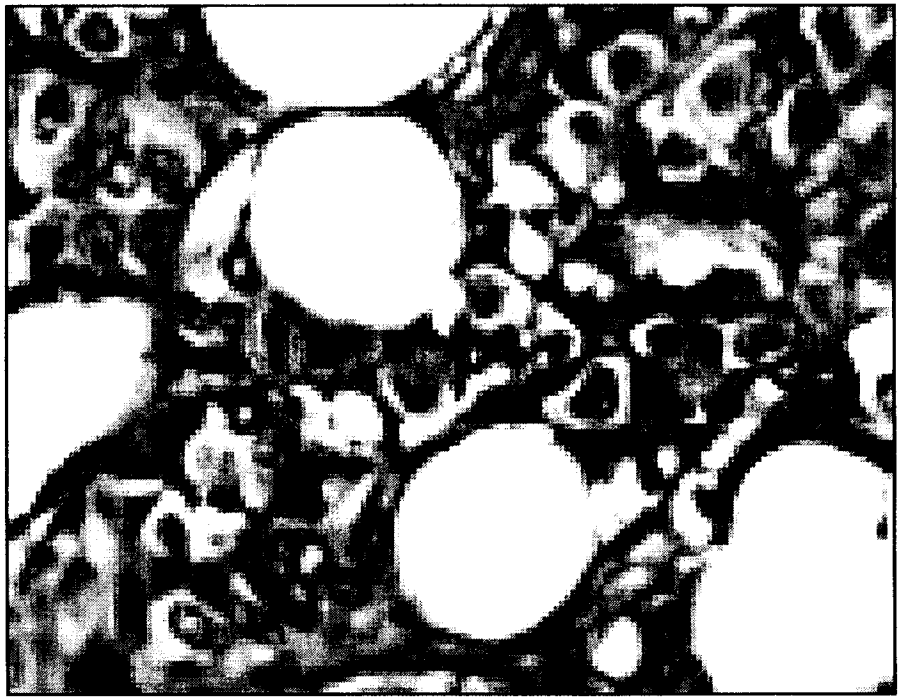
1. INCREASED CELL PROLIFERATION

- Invasive cancers would be high grade (mitoses, etc.)
- CIS lesions would be high nuclear grade (mitoses, etc.)
- Non-tumorous breast tissue may also show evidence of epithelial proliferation

2. DECREASED CELL DEATH

Invasive Cancer Grade

Grade 1



Grade 3

Quantification of Grading

1) Tubule formation

- >75% = 1
- 10-75% = 2
- <10% = 3

2) Nuclear morphology

- Regular = 1
- Large/irregular = 2
- Marked variation = 3

3) Cell mitoses

- 0-9 10/hpf = 1
- 10-19 10/hpf = 2
- >20 10/hpf = 3

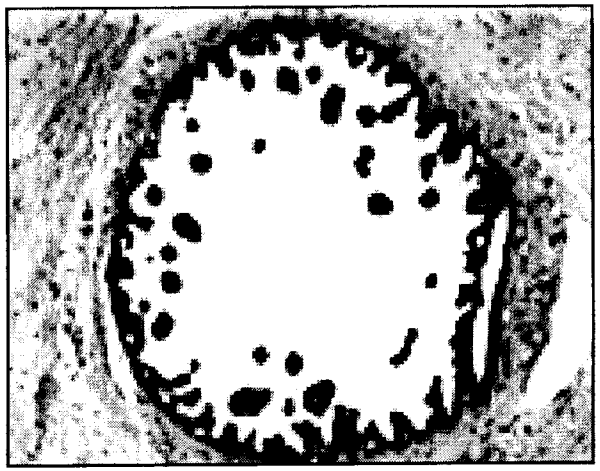
4) TOTAL SCORE

3-5 = grade 1

6-7 = grade 2

8-9 = grade 3

Carcinoma in Situ Grades



Low Nuclear Grade

High Nuclear Grade

PLACEHOLDER
Slide to come via Jim

Summary of Evidence on Growth Enhancement in Human Breast Tumors

1. PROLIFERATION
   - Tumors were of heterogeneous grade: 1 = 1; 7 = 2; 2 = 3
   - CIS lesions were also of heterogeneous (low to high) grade: 9 of 11; 2 of 3
   - No evidence of stimulation seen in non-tumorous breast epithelium
2. CELL DEATH
   - No evidence of decreased cell death

Conclusion:
Possible enhancement of tumor growth by orlistat?

From my review there is no cell biological or pathologic evidence indicating that orlistat enhances tumor growth

XENICAL® (orlistat) in the Treatment of Obesity

Jonathan Hauptman, MD

Hoffmann-La Roche

Nutley, New Jersey

3 Key Points to Reconsider

- General safety & tolerability
- Issues related to breast cancer
- Overall efficacy

Safety and Tolerability of Orlistat

- Few clinically significant adverse events
- Well characterized pharmacological effects

Effect of Orlistat on Fat-Soluble Vitamin Levels

- Modest decrease in vitamin D and Beta-Carotene levels
- Multivitamin reverses decreased values
- Vitamin supplementation should be given

Summary of Additional Specialized Safety Evaluation

- **No plausible evidence of a biological association between orlistat & breast cancer**
- **Most plausible explanation is chance**

Taking into consideration the overall benefits and risks of orlistat including the increased incidence of breast cancer in the controlled clinical studies, do you recommend that the drug be approved for the treatment of obesity?

Orlistat Efficacy

- Produces clinically meaningful sustained weight loss
- Diminishes weight regain
- Is effective long-term

Cardiovascular Risk Improvement

- LDL-Cholesterol
- LDL/HDL Ratio
- Blood pressure

Carbohydrate Metabolism Improvement

- Fasting insulin
- Oral Glucose Tolerance Test
- Diabetic control

Benefits of Orlistat

Patients with medically significant obesity will:

- **Lose more weight**
- **Keep weight off long-term**
- **Have lower obesity-related risks**

Conclusion

Administered as part of an overall weight control program, orlistat:

- **is well tolerated**
- **has a good safety profile**
- **is effective in producing and maintaining a clinically meaningful weight loss**
- **improves obesity-related risk factors**
