

Mapping Project Tracking Systems

The National Digital Orthophoto Programs (NDOP) and the National Digital Elevation Program (NDEP) committees have collaborated to create project tracking systems that allow their Federal agency members to coordinate upcoming projects and share information about new data.

The Geospatial One Stop (GOS) portal harvests project information from NDOP/NDEP member agencies and displays the data in the GOS Marketplace. Users may zoom to areas of interest on the Marketplace map to see footprints of planned and requested data acquisitions.

National States Geographic Information Council (NSGIC) is an important member of both the NDOP and NDEP committees. NSGIC created the Ramona GIS Inventory System to allow State and local governments, and their partners, to share on a consistent platform geospatial data and information about their organizations, systems, and policies. Now it is possible to search for information in the Ramona System directly from the NDOP and NDEP tracking systems, or from the GOS portal.

Participation in the NDOP and NDEP committees, as well as use of these project tracking systems, helps FEMA build data partnerships that identify, collect, and use orthoimagery and elevation data in the flood hazard mapping program. This interoperability allows Federal, State, and local partners to enter project information in the system of their choice and display the project information to potential partners via the GOS portal.
