## ***The Heart Truth* Professional Education Campaign: LDL Goals and Drug Therapy Cut-Points in Women**

### **General Information:**

- Any person at high risk or moderately high risk who has lifestyle-related risk factors (eg, obesity, physical inactivity, elevated triglycerides, low HDL-C, or metabolic syndrome) is a candidate for therapeutic lifestyle changes to modify these risk factors regardless of LDL-C level.
- Metabolic syndrome: Current American Heart Association/National Heart, Lung, and Blood Institute diagnosis *in women* requires three of the following five criteria:
  - ▶ Central obesity as measured by waist circumference greater than or equal to 35 inches
  - ▶ Fasting blood triglycerides greater than or equal to 150 mg/dL
  - ▶ Blood HDL cholesterol less than 50 mg/dL
  - ▶ Blood pressure greater than or equal to 130/85 mmHg
  - ▶ Fasting glucose greater than or equal to 100 mg/dL

Risk Status	Method of Assessing Risk Status	Goal LDL-C Level*	Consider Drug Therapy
<p><b>High Risk:</b> &gt;20% 10-year risk of CHD event</p> <p><b>NOTE:</b> No additional risk calculation is indicated for patients with CHD or equivalent risk conditions. Attempts to use the CHD risk calculator for these patients may seriously underestimate risk.</p>	<p>Patients with CHD or equivalent risk conditions have a &gt;20% risk of CHD events.</p> <p>High risk patients include those with:</p> <ul style="list-style-type: none"> <li>• Known CHD</li> <li>• Noncoronary forms of atherosclerotic disease <ul style="list-style-type: none"> <li>- Peripheral arterial disease</li> <li>- Abdominal aortic aneurysm</li> <li>- Carotid artery disease (transient ischemic attacks or stroke of carotid origin or &gt;50% obstruction of a carotid artery)</li> </ul> </li> <li>• Diabetes</li> </ul> <p><b>OR</b></p> <ul style="list-style-type: none"> <li>• 2+ risk factors with calculated 10-year risk for CHD &gt;20% (includes patients with end stage renal disease) (see below)</li> </ul>	<ul style="list-style-type: none"> <li>• &lt;100 mg/dL</li> <li>• Optional goal &lt; 70 mg/dL</li> <li>• When LDL-lowering drug therapy is employed, it is advised that intensity of therapy be sufficient to achieve at least a 30% to 40% reduction in LDL-C levels.</li> </ul>	<ul style="list-style-type: none"> <li>• ≥100 mg/dL</li> <li>• If baseline LDL-C is &lt; 100 mg/dL, institution of an LDL-lowering drug is a therapeutic option on the basis of available clinical trial results.</li> </ul>
<p><b>Moderate Risk:</b> 2+ risk factors, 10-20% 10-year risk of CHD event</p>	<p>Use Electronic 10-year risk calculators available at <a href="http://www.nhlbi.nih.gov/guidelines/cholesterol">www.nhlbi.nih.gov/guidelines/cholesterol</a> for patients at moderate risk.</p> <p>Risk factors include :</p> <ul style="list-style-type: none"> <li>• Cigarette smoking</li> <li>• Hypertension (BP ≥140/90 mm Hg or on antihypertensive medication)</li> <li>• Low HDL cholesterol (&lt;40 mg/dL)</li> <li>• Family history of premature CHD (CHD in male first-degree relative &lt;55 years of age; CHD in female first-degree relative &lt;65 years of age)</li> <li>• Age ≥ 55 years</li> </ul>	<ul style="list-style-type: none"> <li>• &lt;130 mg/dL</li> <li>• When LDL-lowering drug therapy is employed, it is advised that intensity of therapy be sufficient to achieve at least a 30% to 40% reduction in LDL-C levels.</li> </ul>	<ul style="list-style-type: none"> <li>• ≥130 mg/dL</li> <li>• For moderately high-risk persons, when LDL-C level is 100-129 mg/dL, at baseline or on lifestyle therapy, initiation of an LDL-lowering drug to achieve an LDL-C level &lt;100 mg/dL is a therapeutic option on the basis of available clinical trial results.</li> </ul>
<p><b>Moderate Risk:</b> 2+ risk factors, &lt;10% 10-year risk of CHD event</p>	<p>Use Electronic 10-year risk calculators available at <a href="http://www.nhlbi.nih.gov/guidelines/cholesterol">www.nhlbi.nih.gov/guidelines/cholesterol</a> for patients at moderate risk.</p> <p>Risk factors include :</p> <ul style="list-style-type: none"> <li>• Cigarette smoking</li> <li>• Hypertension (BP ≥140/90 mm Hg or on antihypertensive medication)</li> <li>• Low HDL cholesterol (&lt;40 mg/dL)</li> <li>• Family history of premature CHD (CHD in male first-degree relative &lt;55 years of age; CHD in female first-degree relative &lt;65 years of age)</li> <li>• Age ≥ 55 years</li> </ul>	<ul style="list-style-type: none"> <li>• &lt;130 mg/dL</li> <li>• When LDL-lowering drug therapy is employed, it is advised that intensity of therapy be sufficient to achieve at least a 30% to 40% reduction in LDL-C levels.</li> </ul>	<ul style="list-style-type: none"> <li>• ≥160 mg/dL</li> </ul>
<p><b>Lower Risk:</b> Zero or one risk factor</p>	<p>Almost all people with zero or one risk factor have a 10-year risk &lt;10%. 10-year risk assessment in people with zero or one risk factor is thus not necessary.</p>	<ul style="list-style-type: none"> <li>• &lt;160 mg/dL</li> <li>• When LDL-lowering drug therapy is employed, it is advised that intensity of therapy be sufficient to achieve at least a 30% to 40% reduction in LDL-C levels.</li> </ul>	<ul style="list-style-type: none"> <li>• ≥190 mg/dL</li> <li>• 160-189 mg/dL; LDL-lowering drug optional</li> </ul>

\* Goal LDL-C levels are targets for drug therapy. An LDL-C level of <100 mg/dL is considered "optimal" for all women, and should be encouraged through lifestyle changes
