THE MINERAL INDUSTRIES OF

PARAGUAY AND URUGUAY

By Pablo Velasco

PARAGUAY

The Republic of Paraguay, which is northeast of Argentina in central South America, has an area of about 406,750 square kilometers (km²). In 2002, the area supported a population of about 5.9 million people, the gross domestic product (GDP) per capita was \$4,600, and the GDP was \$26.2 billion based on 2001 purchasing power parity. Of the total population, 36% was estimated to exist below the poverty line. Industry accounted for about 26% of the GDP compared with agriculture (29%) and services (45%). A large informal segment of the economy included microenterprises, urban street vendors, and the reexport of consumer goods. The formal economy grew by an average of about 3% per year from 1995 to1997, but according to Paraguay's Banco Central, the GDP declined by 2.2% in 2002 from 2001 (U.S. Central Intelligence Agency, 2002§¹).

The mineral industry of Paraguay accounted for less than 1% of its GDP and was focused on the production of cement and the extraction of industrial minerals, such as clays, gypsum, limestone, marble, ocher, sand, and talc. Other mineral-related activity, which was based on imported raw materials, included the production of pig iron and steel and the refining of petroleum.

Paraguay relied entirely on imports to meet its crude oil demand, which amounted to 29,000 barrels per day (bbl/d) in 2001 (the last year for which data are available). The oil refinery continued importing crude from various producing countries (Yamana Resources Inc., 2001).

The 5,300-kilometer gas pipeline from Bolivia through Argentina and Paraguay to Brazil could allow Paraguay to incorporate natural gas into its national fuel mix, which relied heavily upon hydroelectric generation and imported petroleum in 2002 (U.S. Energy Information Administration, 2002§).

Morrison Mining Co., Ltd. of Canada (MMC) was searching for oil in the Boquerón Block near the Bolivian Chaco. Later, in February 2002, negotiations were reportedly underway for a joint venture between the local operator Primo F. Cano Martinez and MMC (Ellis, 2002).

Hydroelectric powerplants made Paraguay a low-cost provider of electricity in South America. Estimates of electricity availability for export ranged from 51% to more than 70% (U.S. Energy Information Administration, 2000§).

URUGUAY

The Republic of Uruguay, which is in southern South America and borders the South Atlantic Ocean between Argentina and Brazil, has an area of about 176,220 km². In 2002, the population was about 3.4 million. The GDP per capita was \$9,200, and the overall GDP was \$31 billion based on 2001 purchasing power parity. The Uruguayan economy remained dependent on agriculture and a well-educated workforce. The industrial sector, which accounted for 29% of the GDP, was largely based on agricultural products production. The GDP fell by 10.8% in 2002 compared with 1.5% in 2001 and 1.3% in 2000. The unemployment rate was estimated to be about 15.2% in 2001. Uruguay's economy has not grown since 1999, and market reforms have moved ahead slowly. The annual inflation rate decreased to about 3.6% in 2001. The total labor force in 2001 was estimated to be about 1.2 million, distributed as follows: services, 70%; industry, 16%; and agriculture, 14% (U.S. Central Intelligence Agency, 2002§).

Because Uruguay has no fossil fuel resources and only a small amount of hydroelectric power, the country must rely heavily on imports to meet its energy needs. Energy integration has been on the rise throughout the Mercado Común del Cono Sur (Argentina, Brazil, and Paraguay; Chile and Bolivia are associate members). The use of natural gas in particular has been increasing rapidly. Uruguay must import 43,000 bbl/d for its consumption. Administración Nacional de Combustibles, Alcohol y Portland (ANCAP), which is the state cement and oil company, owned Uruguay's only refinery the 37,000-bbl/d La Teja refinery in Montevideo (Administración Nacional de Combustibles, Alcohol y Portland, 2003).

Pacific Enterprises Inc. of the United States has been awarded the economic bid by the Government of Uruguay to build separate natural gas and propane distribution systems to serve most of the country. The contract is expected to cost from \$150 million to \$200 million and calls for Pacific Enterprises and ANCAP to build separate natural gas and liquefied petroleum gas (LPG) distribution networks that will reach 177,000 potential customers. The project was to be completed by 2003. Natural gas supplies will come from Buenos Aires, Argentina. ANCAP will provide LPG supplies. Pacific Enterprises expects to be joined with Madrid, Spain-based Union Fenosa in

developing and operating the network system (Pipe Line & Gas Industry, 2003).

ANCAP was also seeking associations with foreign oil companies to help find new oil reserves. New natural gas reserves were expected to be found during the next few years. Plants that use oil were to be converted to dual use (oil and gas). Natural gas will come from new pipelines that will link gasrich Argentina to Uruguay; this will include the \$160 million Gasoducto Cruz del Sur that was being built to enhance natural gas trade among Argentina, Brazil, and Uruguay (U.S. Energy Information Administration, 2002§).

Although the country is small, Uruguay has a significant industrial minerals sector. The country was an important producer of cement and extractor of construction materials and dimension stone. The industrial materials mined included basalt, dolomite, feldspar, gypsum, limestone, marl, and quartz. Ornamental rocks, such as flagstone, granite, and marble, also were produced as were semiprecious stones for jewelry, such as agate and amethyst. The ongoing extraction projects totaled more than 350 facilities; most were small in scale.

Among these materials, limestone, which was used in the manufacture of portland cement, had significant potential for export growth. In 2002, Uruguayan output of limestone was 1.3 million metric tons (Mt), which was an increase of 3% compared with that of 2000. In 2002, cement production remained at about the same level as that of 2001 (1 Mt). In 2001, Argentinean cement producer Cementos Loma Negra C.I.A.S.A., which borders Uruguay to the south and west, formed a new company Cementos del Plata. Loma Negra sells most of its production to ANCAP in Uruguay and some to Argentina. In addition, Loma Negra provided technical assistance to Compañia Uruguaya de Cemento Portland and to Compañia Nacional de Cementos in Uruguay. These two companies planned to build a new plant as a joint venture. Uruguay had three cement companies with a combined capacity of about 1 Mt. The largest one was ANCAP [510,000 metric tons per year (t/yr)], which had two plants at Minas and Paysandú], followed by Compañia Uruguaya de Cemento Portland (450,000 t/yr), which had two plants at Sayago and Verdún, and Compañia Nacional de Cementos (55,000 t/yr), which had one plant at Maldonado (International Cement Review, 2000).

In the past few years, the Uruguayan mining sector has started to change with the revival of minerals prospecting and exploitation, which had been idle for many years. The country has opened its doors to foreign investment as a result of changes in national legislation that have improved the business environment. Mining output has grown at an annual pace of almost 4% during the past 5 years.

Minera San Gregorio S.A. (a subsidiary of Crystallex International Corp.) accounted for about 70% of Crystallex's total gold production in 2002. Production of 2,079 kilograms (kg) (reported as 66,832 troy ounces) of gold was equivalent to 2001 levels. Total cash cost of production decreased to \$237 per troy ounce in 2002 from \$262 per troy ounce in 2001 in part owing to less waste stripping. The San Gregorio Mine was forecasted to produce 1,617 kg (reported as 52,000 trou ounces) of gold in 2003. Cash operating costs were expected to increase to about \$250 per troy ounce with the continued processing of lower grade ore (Crystallex International Corp., 2002).

Uruguay Mineral Exploration Inc. (UME) entered into a joint venture with Crystallex in 2002 that will allow Crystallex, through its subsidiary Minera San Gregorio, to evaluate UME's Sobre Saliente mineral project near Minera San Gregorio. Under the terms of the agreement, Crystallex will begin a drilling program to establish mine reserves. Once this has been completed, Crystallex will have the option to begin mining operations. The ore will be processed at the San Gregorio mill (Uruguay Mineral Exploration Inc., 2002).

Because Uruguay's rivers were highly dammed, the potential for additional hydroelectric powerplants was limited. With the region's increased economic integration, Uruguay planned to increase the use of natural gas in homes and for electricity generation at existing or new powerplants (U.S. Energy Information Administration, 2002§).

The British Gas Plc Group (BG Group) announced that on November 8, 2002, the first gas had flowed beneath the River Plate from Argentina to Montevideo, Uruguay, through the \$160 million Gasoducto Cruz del Sur S.A. The pipeline will be operated by the BG Group and the Pan American Energy Consortium under a 30-year concession agreement awarded by the Government of Uruguay. The Group was a 40% shareholder; the other partners were the Pan American Energy Consortium (30%), ANCAP (20%), and Wintershall AG of Germany (10%) (BG Group Plc, 2002).
