

NEWS RELEASE

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, WEDNESDAY, APRIL 30, 2008

Virginia H. Mannering: (202) 606-5304
Recorded message: (202) 606-5306

BEA 08-18

GROSS DOMESTIC PRODUCT: FIRST QUARTER 2008 (ADVANCE)

Real gross domestic product -- the output of goods and services produced by labor and property located in the United States -- increased at an annual rate of 0.6 percent in the first quarter of 2008, according to advance estimates released by the Bureau of Economic Analysis. In the fourth quarter, real GDP also increased 0.6 percent.

The Bureau emphasized that the first-quarter "advance" estimates are based on source data that are incomplete or subject to further revision by the source agency (see the box on page 3). The first-quarter "preliminary" estimates, based on more comprehensive data, will be released on May 29, 2008.

The increase in real GDP in the first quarter primarily reflected positive contributions from personal consumption expenditures (PCE) for services, private inventory investment, exports of goods and services, and federal government spending that were partly offset by negative contributions from residential fixed investment and PCE for durable goods. Imports, which are a subtraction in the calculation of GDP, increased.

The increase in real GDP is the same as in the fourth quarter, reflecting an upturn in inventory investment that was offset by an upturn in imports, and downturns in nonresidential structures, in PCE for durable goods, and in PCE for nondurable goods.

Final sales of computers contributed 0.12 percentage point to the first-quarter growth in real GDP after contributing 0.16 percentage point to the fourth-quarter growth. Motor vehicle output subtracted 0.30 percentage point from the first-quarter growth in real GDP after subtracting 0.86 percentage point from the fourth-quarter growth.

NOTE.--Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and are annualized. "Real" estimates are in chained (2000) dollars. Price indexes are chain-type measures.

This news release is available on [BEA's Web site](#) along with the [Technical Note](#) and [Highlights](#) related to this release.

The price index for gross domestic purchases, which measures prices paid by U.S. residents, increased 3.5 percent in the first quarter, compared with an increase of 3.7 percent in the fourth. Excluding food and energy prices, the price index for gross domestic purchases increased 2.2 percent in the first quarter, compared with an increase of 2.3 percent in the fourth. About 0.3 percentage point of the first-quarter increase in the index was accounted for by the pay raise for federal civilian and military personnel, which is treated as an increase in the prices of employee services purchased by the federal government.

Real personal consumption expenditures increased 1.0 percent in the first quarter, compared with an increase of 2.3 percent in the fourth. Durable goods decreased 6.1 percent, in contrast to an increase of 2.0 percent. Nondurable goods decreased 1.3 percent, in contrast to an increase of 1.2 percent. Services increased 3.4 percent, compared with an increase of 2.8 percent.

Real nonresidential fixed investment decreased 2.5 percent in the first quarter, in contrast to an increase of 6.0 percent in the fourth. Nonresidential structures decreased 6.2 percent, in contrast to an increase of 12.4 percent. Equipment and software decreased 0.7 percent, in contrast to an increase of 3.1 percent. Real residential fixed investment decreased 26.7 percent, compared with a decrease of 25.2 percent.

Real exports of goods and services increased 5.5 percent in the first quarter, compared with an increase of 6.5 percent in the fourth. Real imports of goods and services increased 2.5 percent, in contrast to a decrease of 1.4 percent.

Real federal government consumption expenditures and gross investment increased 4.6 percent in the first quarter, compared with an increase of 0.5 percent in the fourth. National defense increased 6.0 percent, in contrast to a decrease of 0.5 percent. Nondefense increased 1.8 percent, compared with an increase of 2.8 percent. Real state and local government consumption expenditures and gross investment increased 0.5 percent, compared with an increase of 2.8 percent.

The real change in private inventories added 0.81 percentage point to the first-quarter change in real GDP after subtracting 1.79 percentage points from the fourth-quarter change. Private businesses increased inventories \$1.8 billion in the first quarter, following a decrease of \$18.3 billion in the fourth and an increase of \$30.6 billion in the third.

Real final sales of domestic product -- GDP less change in private inventories -- decreased 0.2 percent in the first quarter, in contrast to an increase of 2.4 percent in the fourth.

Gross domestic purchases

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- increased 0.4 percent in the first quarter, in contrast to a decrease of 0.4 percent in the fourth.

Disposition of personal income

Current-dollar personal income increased \$129.6 billion (4.4 percent) in the first quarter, compared with an increase of \$121.6 billion (4.2 percent) in the fourth.

Personal current taxes increased \$2.3 billion in the first quarter, compared with an increase of \$18.2 billion in the fourth.

Disposable personal income increased \$127.3 billion (5.0 percent) in the first quarter, compared with an increase of \$103.4 billion (4.1 percent) in the fourth. Real disposable personal income increased 1.4 percent, compared with an increase of 0.1 percent.

Personal outlays increased \$106.8 billion (4.2 percent) in the first quarter, compared with an increase of \$148.0 billion (5.9 percent) in the fourth. Personal saving -- disposable personal income less personal outlays -- was \$20.2 billion in the first quarter, in contrast to a negative \$0.3 billion in the fourth. The personal saving rate -- saving as a percentage of disposable personal income -- was 0.2 percent in the first quarter; in the fourth quarter, the personal saving rate was 0.0 percent. Saving from current income may be near zero or negative when outlays are financed by borrowing (including borrowing financed through credit cards or home equity loans), by selling investments or other assets, or by using savings from previous periods. For more information, see the FAQs on "Personal Saving" on BEA's Web site. For a comparison of personal saving in BEA's national income and product accounts with personal saving in the Federal Reserve Board's flow of funds accounts and data on changes in net worth (which helps finance negative saving), go to <http://www.bea.gov/bea/dn/nipaweb/Nipa-Frb.asp>.

Current-dollar GDP

Current-dollar GDP -- the market value of the nation's output of goods and services -- increased 3.2 percent, or \$111.0 billion, in the first quarter to a level of \$14,185.2 billion. In the fourth quarter, current-dollar GDP increased 3.0 percent, or \$103.7 billion.

Information on the assumptions used for unavailable source data is provided in a technical note that is posted with the news release on BEA's Web site. Within a few days after the release, a detailed "Key Source Data and Assumptions" file is posted on the Web site. In the middle of each month, an analysis of the current quarterly estimates of GDP and related series is made available on the Web site; click on *Survey of Current Business*, "GDP and the Economy."

Next release -- May 29, 2008, at 8:30 A.M. EDT for:
Gross Domestic Product: First Quarter 2008 (Preliminary)
Corporate Profits: First Quarter 2008

Comparisons of Revisions to GDP

Quarterly estimates of GDP are released on the following schedule: "Advance" estimates, based on source data that are incomplete or subject to further revision by the source agency, are released near the end of the first month after the end of the quarter; as more detailed and more comprehensive data become available, "preliminary" and "final" estimates are released near the end of the second and third months, respectively. The "latest" estimates reflect the results of both annual and comprehensive revisions.

Annual revisions, which cover the quarters of the 3 most recent calendar years, are usually carried out each summer and incorporate newly available major annual source data. Comprehensive (or benchmark) revisions are carried out at about 5-year intervals and incorporate major periodic source data, as well as improvements in concepts and methods that update the accounts to portray more accurately the evolving U.S. economy.

The table below shows comparisons of the revisions between quarterly percent changes of current-dollar and real GDP for the different vintages of the estimates. From the advance estimate to the preliminary estimate (one month later), the average revision to real GDP without regard to sign is 0.5 percentage point, while from the advance estimate to the final estimate (two months later), it is 0.6 percentage point. From the advance estimate to the latest estimate, the average revision without regard to sign is 1.2 percentage points. The average revision (with regard to sign) from the advance estimate to the latest estimate is 0.3 percentage point, which is larger than the average revisions from the advance estimate to the preliminary or to the final estimates. The larger average revisions to the latest estimate reflect the fact that comprehensive revisions include major improvements, such as the introduction of chain indexes and the capitalization of software. The quarterly estimates correctly indicate the direction of change of real GDP 98 percent of the time, correctly indicate whether GDP is accelerating or decelerating 74 percent of the time, and correctly indicate whether real GDP growth is above, near, or below trend growth more than three-fifths of the time.

Rewvisions Between Quarterly Percent Changes of GDP: Vintage Comparisons
[Annual rates]

Vintages compared	Average	Average without regard to sign	Standard deviation of revisions without regard to sign
<u>Current-dollar GDP</u>			
Advance to preliminary.....	0.2	0.5	0.4
Advance to final.....	.2	.7	.4
Preliminary to final.....	.0	.3	.2
Advance to latest.....	.4	1.1	.9
<u>Real GDP</u>			
Advance to preliminary.....	0.1	0.5	0.4
Advance to final.....	.1	.6	.4
Preliminary to final.....	.0	.3	.2
Advance to latest.....	.3	1.2	1.0

NOTE.--These comparisons are based on the period from 1983 through 2004.

1. For some components of final sales of computers, includes computer parts.

2. Farm output less intermediate goods and services purchased.

3. Consists of GDP less gross value added of farm, of households and institutions, and of general government.

4. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions.

See "Explanatory Note" at the end of the tables.

Explanatory Note: NIPA Measures of Quantities and Prices

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year -- at present, the year 2000 -- equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2005-06 annual percent change in real GDP uses prices for 2005 and 2006 as weights, and the 2005-06 annual percent change in GDP prices uses quantities for 2005 and 2006 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, 7, 8, and Appendix Table A. Contributions by major components to changes in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2000) dollar estimates." For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 ($= \$100 \times 110 / 100$). Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or other major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
