

CBO STAFF MEMORANDUM

BUDGET PROJECTIONS THROUGH 2001

October 1991

**CONGRESSIONAL BUDGET OFFICE
SECOND AND D STREETS, S.W.
WASHINGTON, D.C. 20515**

Twice a year the Congressional Budget Office (CBO) prepares estimates of federal spending and revenues for the current fiscal year, as well as a baseline projection of spending and revenues for the following five years. CBO's most recent projections were released in August 1991, and cover fiscal years 1992 through 1996. The attached tables extend those projections for an additional five years, through 2001.

ECONOMIC ASSUMPTIONS

Table 1 summarizes the economic assumptions underlying the budget projections. CBO projects that growth in real gross national product (GNP) will average 2.7 percent a year through 2001, reflecting an average rate of growth of 2.8 percent over the 1991-1996 period and 2.5 percent in the 1997-2001 period. The more rapid growth in the initial years reflects recovery from the recent recession. CBO assumes that after 1996, real GNP will grow at the same rate as potential GNP. Because projected and potential growth are equal, implying little upward or downward pressure on the inflation rate, inflation is projected to remain steady at the 1996 rate over the long term. For the same reason, interest rates are also unchanged after 1996. CBO anticipates that corporate profits will grow more slowly than GNP, continuing a long trend.

CBO's projection of potential GNP depends on projected growth in labor, capital, and total factor productivity.¹ The projections for these components of growth in potential GNP for the 1997-2001 period continue the assumptions used for 1991 through 1996. Growth in the labor force follows the mid-range projection made by the Bureau of Labor Statistics; it averages 1.3 percent per year in the 1991-1996 period and 1.2 percent in the 1997-2001 period. Growth in total factor productivity continues at the trend rate of the 1980s, or about 0.7 percent. CBO projects that the capital stock will grow slightly faster in the 1997-2001 period than during the earlier years of the projection because of a slightly higher rate of national saving.

BUDGET PROJECTIONS

Table 2 summarizes the baseline budget projections. They assume that the amount of discretionary spending remains within the limits established in the Budget Enforcement Act through 1995 and keeps pace with inflation in later years. For tax revenues and mandatory spending, the baseline generally assumes that laws now on the statute books will continue. Excise taxes dedicated to trust funds are assumed to be extended beyond statutory expiration dates. Other taxes are assumed to expire on schedule.

1. Total factor productivity is the amount by which the growth of output exceeds the growth of capital and labor inputs. It largely measures the improvement in technology.

Excluding deposit insurance, the federal deficit is projected to rise from \$200 billion (or 2.6 percent of GNP) in 1996 to \$313 billion (3.1 percent of GNP) in 2001. The large year-to-year swings in deposit insurance spending and receipts are generally excluded from measures of fiscal policy, because these changes do not represent changes in the federal government's effect on the economy and have little effect on interest rates.

Revenues are projected to decline from 19.2 percent of GNP in 1996 to 18.9 percent of GNP in 2001 (see Table 3). (Extension of tax provisions that are scheduled to expire would increase revenues in the later years by only about 0.1 percent of GNP.) Outlays excluding deposit insurance rise only slightly--from 21.9 percent of GNP in 1996 to 22.0 percent of GNP in 2001. Within a relatively constant total, however, discretionary spending continues its long decline, shrinking to 6.8 percent of GNP by 2001, while mandatory spending rises. Table 4 provides details about the components of mandatory spending in the baseline projections.

Table 5 shows an alternative budget projection in which discretionary spending is not limited by the caps in the Budget Enforcement Act but grows at the rate of inflation after 1992. In this path, discretionary spending is higher by an estimated \$16 billion in 1993, \$38 billion in 1994, \$52 billion in 1995, and greater amounts in later years. (The precise amount of these differences will depend on the final level and distribution of appropriations for 1992.) As a result of the higher level of discretionary spending, interest costs on the federal debt are also greater. By 2001 the deficit excluding deposit insurance in this alternative will reach \$418 billion, or 4.1 percent of GNP.

While budget projections are always uncertain, the degree of uncertainty increases as the time horizon expands. The long-run projections depend critically on assumptions about the performance of the economy, the costs and utilization of medical care, losses from deposit insurance, and a myriad of other factors, none of which can be foreseen precisely. Therefore, the figures for the 1997-2001 period must be used with particular care.

TABLE 1. ECONOMIC ASSUMPTIONS (By fiscal year)

a. A single cap applies to the three categories of discretionary spending--defense, international, and domestic--in 1994 and 1995. The assumed caps for fiscal years 1996 through 2001 are CBO extrapolations.
