${ }^{1}$ High rate industries were those having the 20 highest total cases incidence rates for injuries at the most detailed or lowest SIC level at which rates are calculated and published. Generally, manufacturing industries were calculated at the 4 -digit code level and the remaining industries at the 3-digit level based on the Standard Industrial Classification Manual, 1987 Edition.
${ }^{2}$ Standard Industrial Classification Manual, 1987 Edition.
3 Employment is expressed as an annual average and is derived primarily from the BLS-State Covered Employment and Wages program. Employment in private households (SIC 88) is excluded.
4 The incidence rates represent the number of injuries per 100 full-time workers and were calculated as: (N/EH) $\times 200,000$, where

$$
\left.\begin{array}{l}
\begin{array}{l}
\mathrm{N} \\
\mathrm{EH} \quad \begin{array}{l}
\text { = number of injuries } \\
= \\
\text { total hours worked by all employees during }
\end{array} \\
\text { the calendar year }
\end{array} \\
200,000= \\
\\
\\
\\
\text { (wase for } 100 \text { equivalent full-time workers }
\end{array}\right)
$$

${ }^{5}$ A statistical significance test indicates that the difference between the 1998 incidence rate and the 1997 rate is statistically significant at the 95 percent confidence level.
${ }^{6}$ Excludes farms with fewer than 11 employees.
n.e.c. $=$ not elsewhere classified.
