Media contact: 691-5902 Friday, July 2, 2004.

## THE EMPLOYMENT SITUATION: JUNE 2004

Nonfarm payroll employment continued to rise in June, and the unemployment rate remained at 5.6 percent, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Payroll employment increased by 112,000 in June, following larger gains in the prior 3 months.

## <u>Unemployment</u> (Household Survey Data)

The number of unemployed persons, 8.2 million, was essentially unchanged in June, and the unemployment rate held steady at 5.6 percent. The unemployment rate has been 5.6 percent in all but one month this year. The unemployment rates for the major worker groups—adult men (5.0 percent), adult women (5.0 percent), teenagers (16.8 percent), whites (5.0 percent), blacks (10.1 percent), and Hispanics or Latinos (6.7 percent)—showed little or no change over the month. In June, the unemployment rate for Asians was 5.0 percent, not seasonally adjusted. (See tables A-1, A-2, and A-3.)

## Total Employment and the Labor Force (Household Survey Data)

Total employment was 139.0 million in June, and the employment-population ratio—the proportion of the population age 16 and over with jobs—was about unchanged at 62.3 percent. The civilian labor force participation rate also was little changed at 66.0 percent. (See table A-1.)

## Persons Not in the Labor Force (Household Survey Data)

The number of persons who were marginally attached to the labor force was 1.5 million in June, about the same as a year earlier. (Data are not seasonally adjusted.) These individuals wanted and were available to work and had looked for a job sometime in the prior 12 months. They were not counted as unemployed, however, because they did not actively search for work in the 4 weeks preceding the survey. There were 478,000 discouraged workers in June, the same as a year earlier. Discouraged workers, a subset of the marginally attached, were not currently looking for work specifically because they believed no jobs were available for them. The other 1.0 million marginally attached had not searched for work for reasons such as school or family responsibilities. (See table A-13.)

## Industry Payroll Employment (Establishment Survey Data)

Total nonfarm payroll employment increased by 112,000 in June to 131.3 million, seasonally adjusted, following larger gains in the prior 3 months. Since August 2003, payroll employment has risen by 1.5 million. In June, there were job gains in health care and social assistance, professional and technical services, and transportation and warehousing. Manufacturing employment edged lower following several months of small increases, and construction employment was flat. (See table B-1.)

Within the service-providing sector, health care and social assistance continued to grow, adding 30,000 jobs over the month. Employment in this industry has increased by 279,000 over the year. In June, employment rose in hospitals and in ambulatory health care services, which includes doctors' offices and home health care services. Child day care services added 11,000 jobs.

Employment in professional and technical services increased by 23,000, with small gains in several component industries, including management and consulting services, architectural and engineering services, and computer systems design and related services. Employment in temporary help services continued to trend up in June; the industry has added 306,000 jobs since its recent low in April 2003.

Transportation and warehousing added 19,000 jobs in June. Since August 2003, employment in the industry has grown by 83,000. In June, employment in truck transportation edged up, and the courier and messenger industry added 6,000 jobs.

Retail trade employment was little changed in June. Within retail, employment in clothing stores continued to rise. There were small job losses in building material and garden supply stores and in motor vehicle and parts dealers. Employment had been growing in both industries. There was little change in employment elsewhere among private service-providing industries and in government.

In the goods-producing sector, manufacturing employment edged down in June (-11,000) after increasing by 75,000 over the prior 4 months. In June, durable goods employment was little changed, while the number of jobs in nondurable goods continued to trend down.

Following 3 months of increases totaling 120,000, employment in construction was unchanged in June. Construction employment expanded by 250,000 from its recent low point in March 2003 through May 2004.

## Weekly Hours (Establishment Survey Data)

The average workweek for production or nonsupervisory workers on private nonfarm payrolls decreased by 0.2 hour in June to 33.6 hours, seasonally adjusted. The workweek in manufacturing fell by 0.3 hour to 40.8 hours, nearly offsetting the gain in May. Manufacturing overtime was unchanged at 4.6 hours. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls declined by 0.6 percent in June to 99.6 (2002=100). The manufacturing index fell by 0.8 percent over the month to 94.6. (See table B-5.)

## Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls increased by 2 cents in June to \$15.65, seasonally adjusted. Average weekly earnings declined by 0.5 percent over the month to \$525.84. Over the year, average hourly earnings grew by 2.0 percent, and average weekly earnings increased by 1.7 percent. (See table B-3.)

The Employment Situation for July 2004 is scheduled to be released on Friday, August 6, at 8:30 A.M. (EDT).

# **Explanatory Note**

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with State agencies. The sample includes about 160,000 businesses and government agencies covering approximately 400,000 individual worksites. The active sample includes about one-third of all nonfarm payroll workers. The sample is drawn from a sampling frame of unemployment insurance tax accounts.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12th, which may or may not correspond directly to the calendar week.

# Coverage, definitions, and differences between surveys

**Household survey**. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as *employed* if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as *unemployed* if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4-week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unemployed persons. Those not classified as employed or unemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labor force participation rate is the labor force as a percent of the population, and the employment-population ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as Federal, State, and local government entities. *Employees on nonfarm payrolls* are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. *Hours and earnings* data are for private businesses and relate only to production workers in the goods-producing sector and nonsupervisory workers in the service-providing sector. Industries are classified on the basis of their principal activity in accordance with the 2002 version of the North American Industry Classification System.

**Differences in employment estimates**. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:

- The household survey includes agricultural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
- The household survey includes people on unpaid leave among the employed. The establishment survey does not.
- The household survey is limited to workers 16 years of age and older. The establishment survey is not limited by age.
- The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

#### **Seasonal adjustment**

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Most seasonally adjusted series are independently adjusted in both the household and establishment surveys. However, the adjusted series for many major estimates, such as total payroll employment, employment in most supersectors, total employment, and unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is derived by summing the adjusted series for four major age-sex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

For both the household and establishment surveys, a concurrent seasonal adjustment methodology is used in which new seasonal factors are calculated each month, using all relevant data, up to and including the data for the current month. In the household survey, new seasonal factors are used to adjust only the current month's data. In the establishment survey, however, new seasonal factors are used each month to adjust the three most recent monthly estimates. In both surveys, revisions to historical data are made once a year.

## Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or *sampling error*, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90-percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 350,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90-percent confidence interval on the monthly change would range from -250,000 to 450,000  $(100,000 \pm 350,000)$ . These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a 90-percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90-percent confidence interval would be greater than zero. In this case, it is likely (at least a 90-percent chance) that an employment rise had, in fact, occurred. At an unemployment rate of around 5.5 percent, the 90-percent confidence interval for the monthly change in unemployment is about +/- 320,000, and for the monthly change in the unemployment rate it is about +/- .22 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by *nonsampling error*. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on substantially incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth, an estimation procedure with two components is used to account for business births. The first component uses business deaths to impute employment for business births. This is incorporated into the sample-based link relative estimate procedure by simply not reflecting sample units going out of business, but imputing to them the same trend as the other firms in the sample. The second component is an ARIMA time series model designed to estimate the residual net birth/death employment not accounted for by the imputation. The historical time series used to create and test the ARIMA model was derived from the unemployment insurance universe micro-level database, and reflects the actual residual net of births and deaths over the past five years.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.3 percent, ranging from zero to 0.7 percent.

### Additional statistics and other information

More comprehensive statistics are contained in *Employment and Earnings*, published each month by BLS. It is available for \$27.00 per issue or \$53.00 per year from the U.S. Government Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household and establishment survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-D of its "Explanatory Notes." For the establishment survey data, the sampling error measures and the actual size of revisions due to benchmark adjustments appear in tables 2-B through 2-F of Employment and Earnings.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-691-5200; TDD message referral phone: 1-800-877-8339.

**HOUSEHOLD DATA HOUSEHOLD DATA** 

Table A-12. Alternative measures of labor underutilization

(Percent)

Measure	Not sea	sonally a	djusted	Seasonally adjusted								
		May 2004	June 2004	June 2003	Feb. 2004	Mar. 2004	Apr. 2004	May 2004	June 2004			
U-1 Persons unemployed 15 weeks or longer, as a percent of the civilian labor force	2.3	2.1	2.0	2.4	2.2	2.3	2.0	2.1	2.1			
U-2 Job losers and persons who completed temporary jobs, as a percent of the civilian labor force	3.2	2.6	2.6	3.4	3.0	3.1	3.0	2.9	2.8			
U-3 Total unemployed, as a percent of the civilian labor force (official unemployment rate)	6.5	5.3	5.8	6.3	5.6	5.7	5.6	5.6	5.6			
U-4 Total unemployed plus discouraged workers, as a percent of the civilian labor force plus discouraged workers	6.8	5.6	6.1	6.6	5.9	6.0	5.9	5.9	5.9			
U-5 Total unemployed, plus discouraged workers, plus all other marginally attached workers, as a percent of the civilian labor force plus all marginally attached workers	7.4	6.3	6.7	7.2	6.7	6.7	6.5	6.6	6.5			
U-6 Total unemployed, plus all marginally attached workers, plus total employed part time for economic reasons, as a percent of the civilian labor force plus all marginally attached workers	10.6	9.3	9.8	10.3	9.6	9.9	9.6	9.7	9.6			

NOTE: Marginally attached workers are persons who currently are neither working nor looking for work but indicate that they want and are available for a job and have looked for work sometime in the recent past. Discouraged workers, a subset of the marginally attached, have given a job-market related reason for not currently looking for a job. Persons employed part time for economic reasons are those who want and are available for full-time work but have had to settle for a part-time schedule. For further information, see "BLS introduces new range of alternative unemployment measures," in the October 1995 issue of the *Monthly Labor Review*. Beginning in January 2004, data reflect revised population controls used in the household survey.

Table A-13. Persons not in the labor force and multiple jobholders by sex, not seasonally adjusted

(Numbers in thousands)

Category	To	otal	Ме	en	Women		
	June	June	June	June	June	June	
	2003	2004	2003	2004	2003	2004	
NOT IN THE LABOR FORCE							
Total not in the labor force  Persons who currently want a job  Searched for work and available to work now <sup>1</sup> Reason not currently looking:  Discouragement over job prospects <sup>2</sup> Reasons other than discouragement <sup>3</sup>	72,897	74,718	27,199	27,863	45,698	46,855

	5.3	5.3	5.1	4.9	5.5	5.6	
Primary job full time, secondary job part time Primary and secondary jobs both part time Primary and secondary jobs both full time Hours vary on primary or secondary job	3,809	3,719	2,154	2,099	1,655	1,619	
	1,563	1,614	500	433	1,063	1,181	
	341	332	237	201	104	131	
	1,547	1,657	860	962	687	695	

 $<sup>^{\</sup>rm 1}$  Data refer to persons who have searched for work during the prior 12 months and

vere available to take a job during the reference week.

Includes thinks no work available, could not find work, lacks schooling or training, employer thinks too young or old, and other types of discrimination.

Includes those who did not actively look for work in the prior 4 weeks for such reasons as school or family responsibilities, ill health, and transportation problems, as well

as a small number for which reason for nonparticipation was not determined.  $^4\,$  Includes persons who work part time on their primary job and full time on their secondary job(s), not shown separately.

NOTE: Beginning in January 2004, data reflect revised population controls used in the

household survey.

<sup>&</sup>lt;sup>1</sup> Data relate to production workers in natural resources and mining and manufacturing, construction workers in construction, and nonsupervisory workers in the service-providing industries. These groups account for

approximately four-fifths of the total employment on private nonfarm payrolls.  $^{\rm p}\!=\!{\rm preliminary}.$
