Federal Railroad Administration

49 CFR Parts 222 and 229

**Use of Locomotive Horns at Highway-Rail
Grade Crossings; Proposed Rule**

DEPARTMENT OF TRANSPORTATION**Federal Railroad Administration****49 CFR Parts 222 and 229****[Docket No. FRA-1999-6439, Notice No. 1]****RIN 2130-AA71****Use of Locomotive Horns at Highway-Rail Grade Crossings****AGENCY:** Federal Railroad Administration (FRA), Department of Transportation (DOT).**ACTION:** Notice of proposed rulemaking.

SUMMARY: FRA is proposing rules to require that a locomotive horn be sounded while a train is approaching and entering a public highway-rail crossing. The proposed rules also provide for an exception to the above requirement in circumstances in which there is not a significant risk of loss of life or serious personal injury, use of the locomotive horn is impractical, or supplementary safety measures fully compensate for the absence of the warning provided by the horn. This rule is required by law.

DATES: *Written Comments:* Comments must be received by May 26, 2000. Comments received after that date will be considered to the extent possible without incurring additional expense or delay.

Public Hearings: FRA will hold public hearings to receive oral comments from interested parties. The dates and specific location of hearings will be announced in a subsequent **Federal Register** document and on FRA's web site at <http://fra.dot.gov>. Cities in which hearings will be held are listed in **ADDRESSES** section below.

ADDRESSES: *Written Comments:* Anyone wishing to file a comment should identify the FRA docket and notice numbers (Docket No. FRA-1999-6439, Notice No.1). Comments should be sent to the Docket Management System, U.S. Department of Transportation, room PL-401, 400 Seventh Street, S.W., Washington, D.C. 20590-0001. Written comments will be available for public review during regular business hours at the above address and through the Internet at <http://dms.dot.gov>.

Public Hearings: Public hearings will be held in the following cities: Los Angeles, California; Washington, D.C.; Ft. Lauderdale, Florida; Chicago, Illinois; South Bend, Indiana; Berea, Ohio; Pendleton, Oregon; and Boston, Massachusetts. The specific location and date of each hearing will be announced in a subsequent **Federal Register** document and on FRA's web site at <http://fra.dot.gov>.

FOR FURTHER INFORMATION CONTACT: Ron Ries, Office of Safety, FRA, 1120 Vermont Avenue, N.W., Washington, D.C. 20590 (telephone: 202-493-6299); or Mark Tessler, Office of Chief Counsel, FRA, 1120 Vermont Avenue, N.W., Washington, D.C. 20590 (telephone: 202-493-6038).

SUPPLEMENTARY INFORMATION:**Background**

Approximately 4,000 times per year, a train and highway vehicle collide at one of this country's 262,000 public and private highway-rail grade crossings. Of those crossings, more than 158,000 are public at-grade crossings—those crossings in which a public road crosses railroad tracks at grade. During the years 1994 through 1998, there were 21,242 grade crossing collisions in the United States. These collisions one of the greatest cause of death associated with railroading, resulting in more than 400 deaths each year. For example, in the 1994-1998 period, 2,574 people died in these collisions. Another 8,308 people were injured. Approximately 50 percent of collisions at highway-rail intersections occur at those intersections equipped with active warning devices such as bells, flashing lights, or gates (approximately 62,000 crossings).

Compared to a collision between two highway vehicles, a collision with a train is eleven times more likely to result in a fatality, and five and a half times more likely to result in a disabling injury. The average freight locomotive weighs between 140 and 200 tons, compared to the average car weight of one to two tons. Many freight trains weigh in excess of ten thousand tons. Any highway vehicle, even a large truck, would be crushed when struck by a moving train. The laws of physics compound the likelihood that a motor vehicle will be crushed in a collision with a moving train. The train's weight, when combined with the likelihood that the train will not be able to stop to avoid a collision, results in severe injury or death in virtually every collision (it takes a one-hundred car train traveling 30 miles per hour approximately half a mile to stop—at 50 miles an hour that train's stopping distance increases to one and a third miles).

FRA is responsible for ensuring that America's railroads are safe for both railroad employees and the public. FRA shares with the public the responsibility to confront the compelling facts surrounding grade crossing collisions.

In 1990, as part of FRA's crossing safety program, the agency studied the impact of train whistle bans (i.e., state or local laws prohibiting the use of train

horns or whistles at crossings) on safety in Florida. (In this document the terms "whistle" and "horn" are used interchangeably to refer to the air powered locomotive audible warning device required to be installed on locomotives by 49 CFR 229.129, and to steam whistles required to be installed on steam locomotives by 49 CFR 230.121. These terms do not refer to a locomotive bell, which has value as a warning to pedestrians but which is not designed to provide a warning over long distances.) FRA had previously recognized the locomotive horn's contribution to rail safety by requiring that lead locomotives be equipped with an audible warning device, 49 CFR 229.129, and exempting the use of whistles from federal noise emission standards "when operated for the purpose of safety." 49 CFR 210.3(b)(3). The Florida study, which is discussed below (and which has been filed in the docket), documented how failing to use locomotive horns can significantly increase the number of collisions.

A. Who Is at Risk in a Grade Crossing Collision?

Many people have argued that highway drivers who disobey the law and try to beat a train through a crossing should not be protected at the expense of the peace and quiet of communities that parallel railroad tracks. FRA strongly agrees that drivers who unlawfully enter grade crossings should be fined by local police, but death or serious injury is simply not a just penalty.

Overlooked in this emotional debate are the many innocent victims of crossing collisions, including blameless automobile and railroad passengers and railroad crews who, despite performing their duties correctly, are usually unable to avoid the collisions. Nationally, from 1994 to 1998, eight railroad crewmembers died in collisions at highway-rail crossings, and 570 crewmembers were injured. Two hundred railroad passengers were also injured and two died. In Bourbonnais, Illinois, earlier this year, eleven innocent passengers died in their sleeper car following a collision with a truck at a highway-rail crossing. In addition, since approximately one-half of all collisions occur at grade crossings that are not fully equipped with warning devices, some of the drivers involved in these collisions may have been unaware of the approaching train.

Property owners living near railroad rights-of-way can also be at risk. For example, on December 1, 1992, in Hiebert, Alabama, a freight train collided with a lumber truck. Three

locomotives and nine rail cars were derailed, releasing 10,000 gallons of sulfuric acid into a nearby water supply. Residents living near the derailment site had to be evacuated because of the chemical spill. Even where the locomotive consist is not derailed in the initial collision with the highway vehicle, application of the train's emergency brake can result in derailment and harm to persons and property along the right-of-way.

Law-abiding motorists can also be endangered in crossing collisions. On March 17, 1993, an Amtrak train collided with a tanker truck in Fort Lauderdale, Florida. Five people died when 8,500 gallons of burning fuel from the tanker truck engulfed cars waiting behind the crossing gates.

Highway passengers can also be innocent victims. On December 14, 1995, in Ponchatoula, Louisiana, five people were killed when their truck was hit by an Amtrak train. Among the dead were three children who were passengers in the truck.

In making a decision on the use of locomotive horns, all of the competing interests must be reasonably considered. Those whose interests will be affected by this rule include those who may be disturbed by the sounding of locomotive horns and all of those who may suffer in the event of a collision; pedestrians using the crossing; the motor vehicle driver and passengers, those in adjacent vehicles, train crews, and those living or working nearby.

B. FRA's Study of the Florida Train Whistle Ban

Effective July 1, 1984, Florida authorized local governments to ban the nighttime use of whistles by intrastate trains approaching highway-rail grade crossings equipped with flashing lights, bells, crossing gates, and highway signs that warned motorists that train whistles would not be sounded at night. Fla. Stat. § 351.03(4)(a) (1984). After enactment of this Florida law, many local jurisdictions passed whistle ban ordinances.

In August 1990, FRA issued a study of the effect of the Florida train whistle ban up to the end of 1989. The study compared the number of collisions at crossings subject to bans with four control groups. FRA was trying to determine the impact of the whistle bans and to eliminate other possible causes for any increase or decrease in collisions.

Using the first control group, FRA compared collision records for time periods before and during the bans. FRA found there were almost three times more collisions after the whistle bans

were established, a 195 percent increase. If collisions continued to occur at the same rate as before the bans began taking effect, it was estimated that 49 post-ban collisions would have been expected. However, 115 post-ban collisions occurred, leaving 66 crossing collisions statistically unexplained. Nineteen people died and 59 people were injured in the 115 crossing collisions. Proportionally, 11 of the fatalities and 34 of the injuries could be attributed to the 66 unexplained collisions.

In the second control group, FRA found that the daytime collision rates remained virtually unchanged for the same highway-rail crossings where the whistle bans were in effect during nighttime hours.

The third control group showed that nighttime collisions increased only 23 percent along the same rail line at crossings with no whistle ban.

Finally, FRA compared the 1984 through 1989 accident record of the Florida East Coast Railway Company (FEC), which, because it was considered an "intrastate" carrier under Florida law, was required to comply with local whistle bans, with that of the parallel rail line of interstate carrier, CSX Transportation Company (CSX), which was not subject to the whistle ban law. By December 31, 1989, 511 of the FEC's 600 gate-equipped crossings were affected by whistle bans. Collision data from the same period was available for 224 similarly equipped CSX crossings in the six counties in which both railroads operate. As noted above, FRA found that FEC's nighttime collision rate increased 195 percent after whistle bans were imposed. At similarly equipped CSX crossings, the number of collisions increased 67 percent.

On July 26, 1991, FRA issued an emergency order to end whistle bans in Florida. Notice of that emergency order (Emergency Order No. 15) was published in the **Federal Register** at 56 FR 36190. FRA is authorized to issue emergency orders where an unsafe condition or practice creates "an emergency situation involving a hazard of death or injury." 49 U.S.C. 20104. FRA acted after updating its study with 1990 and initial 1991 collision records and finding that another twelve people had died and thirteen were injured in nighttime collisions at whistle ban crossings. During this time, a smaller study, conducted by the Public Utility Commission of Oregon, corroborated FRA's findings and led to the cessation of state efforts to initiate a whistle ban in Oregon.

FRA's emergency order required that trains operated by the FEC sound their

whistles when approaching public highway-rail grade crossings. This order preempted state and local laws that permitted the nighttime ban on the use of locomotive horns.

Twenty communities in Florida petitioned for a review of the emergency order. During this review, FRA studied other potential causes for the collision increase. FRA's closer look at the issue strengthened the conclusion that whistle bans were the likely cause of the increase.

For example, FRA subtracted collisions that whistles probably would not have prevented from the collision totals. Thirty-five collisions where the motor vehicle was stopped or stalled on the crossing were removed from the totals. Eighteen of these collisions occurred before and 17 were recorded during the bans. When these figures were excluded, the number of collisions in the pre-ban period changed from 39 to 21, and the number of collisions in the post-ban period decreased from 115 to 98. Collisions which whistles could have prevented, therefore, totaled 98 collisions as compared to 21 collisions in the pre-ban period; this represents a 367 percent increase, compared to the 195 percent increase initially calculated.

Similarly, if collisions where the motor vehicle hit the side of the train were also excluded (nine in the pre-ban period and 26 in the post-ban period) as being unlikely to have been prevented by train whistles, the pre-ban collision count became 12 versus 72 in the whistle ban period. The increase in collisions caused by the lack of whistles then became 500 percent.

FRA's data, however, showed that, before the ban, highway vehicles on average, struck the sides of trains at the 37th train car behind the locomotive. After the ban took effect, 26 vehicles struck trains, and on average, struck the twelfth train car behind the locomotive. This indicated that motor vehicles are more cautious at crossings if a locomotive horn is sounding nearby. Before the whistle bans, highway vehicles tended to hit the side of the train after the whistling locomotive had long passed through the crossing. After the ban took effect, highway traffic hit the train much closer to the now silent locomotive—at the 12th car. The number of motor vehicles hitting the sides of trains also increased nearly threefold after the ban was established.

FRA also considered collisions involving double tracked grade crossings where two trains might approach at the same time. Since a driver's view of the second train might be blocked, hearing the second train's whistle could be the only warning

available to an impatient driver. FRA's Florida study found the number of second train collisions for the pre-ban period was zero, while four were reported for the period the bans were in effect.

Several Florida communities asked whether train speed increased collisions. FRA research has well established, as discussed below, that train speed is not a factor in determining the likelihood of a traffic collision at highway-rail crossings equipped with active warning devices that include gates and flashing lights. Speed, however, is a factor in determining the severity of a collision.

FRA also considered population growth in Florida, but found it was not a factor. Day time collision rates were not increasing at the very same crossings that had whistle bans at night. If population was a factor, then the day time numbers should have increased dramatically as well. FRA also reviewed the number of fatal highway collisions, and registered drivers and motor vehicles and found no increases that either paralleled or explained the rise in night time crossing collisions.

In the first two years after July 1991, when FRA issued its emergency order prohibiting whistle bans in Florida, collision rates dropped dramatically to pre-ban levels. In the two years before the emergency order, there were 51 nighttime collisions. In the two years after, there were only 16. Daytime collisions dropped slightly from 34 collisions in the two years before the emergency order, to 31 in the following two years.

C. FRA's Nationwide Study of Train Whistle Bans

FRA's Florida study raised the concern that whistle bans could be increasing collisions in other locations. Given the wide difference between grade crossing conditions from one community to another, FRA did not assume that the Florida results would be true at every whistle ban crossing. FRA began a nationwide effort to locate grade crossings subject to whistle bans and study collision information for those crossings. The Association of American Railroads (AAR) joined the FRA in that effort.

The AAR surveyed the rail industry and found 2,122 public grade crossings subject to whistle bans for some period of time between January 1988 and June 30, 1994. This total did not include the 511 public crossings that were subject to whistle bans in Florida that FRA had already studied. The study also did not include crossings on small, short line railroads, which did not report to the AAR. The nationwide survey found whistle bans in 27 states that affected 17 railroads. FRA studied collisions occurring between January 1988, and June 30, 1994.

Two thousand and four of the crossings were subject to 24-hour whistle bans. Another 118 grade crossings were subject to nighttime-only bans. The states with the largest number of whistle ban crossings were Illinois, Wisconsin, Kentucky, New York, and Minnesota. More than half of the crossings were on three railroads: CSX, Consolidated Rail Corporation (Conrail), and Soo Line. A report covering the

nationwide study was issued in April 1995. FRA found that whistle ban crossings averaged 84 percent more collisions than similar crossings with no bans. There were 948 collisions at whistle ban crossings during the period studied. Sixty-two people died in those collisions and 308 were injured. Collisions occurred on every railroad with crossings subject to whistle bans, and in 25 of the 27 states where bans were in effect.

Since the 1995 study, FRA has continued to analyze relevant data. Over the period of 1992–1996, there were 793 collisions at 2,366 crossings subject to whistle bans. These collisions resulted in the fatalities and injuries displayed in Table 1, as well as more than \$2 million in motor vehicle damages.

TABLE 1.—COLLISION INJURIES AND FATALITIES BY TYPE OF PERSON INVOLVED

Type of person involved	Injuries	Fatalities
Motorist	258	56
Pedestrian	17	41
Railroad employee	56	0

The types of collisions which took place at whistle ban crossings are shown in Table 2. It is interesting to note that the mean train speed (train speed is positively correlated with fatalities) varies by type of collision. Please note that the number of fatalities shown for category "hit by second train" are included in the other categories (97 fatalities).

TABLE 2.—TYPE OF COLLISION

Type of collision	Injuries	Fatalities	Mean train speed
Motor vehicle struck train	51	8	15.5
Train struck motor vehicle	224	89	25.4
Hit by second train	11	5	28.5

The driver was killed in the collision in 42 instances (5.3% of collisions), the remaining 55 fatalities were either passengers or pedestrians. The driver passed standing vehicles to go over the crossing in 37 of the collisions (4.7%). The driver was more likely to be killed when moving over the crossing at the time of the collision (35 of the driver fatalities), rather than when the vehicle was stopped or stalled at the crossing, and in most of the collisions (69.9%) at whistle-ban crossings the driver was moving over the crossing. Additionally, in almost every collision (97%), a warning device (either active or passive)

was located on the vehicle's side of the crossing. This supports the theory that the warning given by the train horn could deter the motorist from entering the crossing.

Collisions which took place when the motorist was moving over the crossing were more likely to be fatal (72% of the fatalities). This type of collision was also more likely to result in injury with 209 of the 258 motorist injuries occurring under these circumstances. These are the types of collisions the proposed rule is designed to prevent. Motorists that fail to notice or heed the warning devices in place at a crossing

may be deterred by the sound of a train horn. The motorist is also given information by the horn about the proximity, speed, and direction of the train.

Collisions occurred on every railroad with crossings subject to whistle bans, and in 25 of the 27 states where bans were in effect.

FRA's study indicated that the installation of automatic traffic gates at crossings with whistle bans was more than twice the national average. Forty percent of the whistle ban crossings had gates compared to 17 percent nationally.

FRA found 831 crossings where whistle sounding had at one time been in effect, but where the practice had changed during the January 1988 through June 1994 study period. In 87 percent of the cases, bans were no longer in effect. A "before-and-after" analysis comparing collision rates showed an average of 38 percent fewer collisions when whistles were sounded indicating that whistles had a .38 effectiveness rate in reducing collisions. This finding paralleled the Florida experience.

FRA also rated whistle ban grade crossings according to an "Accident Prediction Formula." The formula predicts the statistical likelihood of having a collision at a given highway-rail grade crossing. The physical characteristics of each crossing were considered in the formula, including the number of tracks and highway lanes, types of warning devices, urban or rural location, and whether the roadway was paved. Also considered were operational aspects, such as, the number of highway vehicles, and the number, type, time of day, and maximum speed of trains using the crossing. The formula was developed using data from thousands of collisions spanning many years. FRA then ranked the 167,000 public crossings in the national

inventory at that time in an identical manner. Both the whistle ban crossings and the national inventory crossings were then placed into one of ten groups ranging from low-risk to high-risk.

FRA compared the number of collisions occurring within each of the ten groups of crossings, over a five year period from 1989 through 1993, and found that for nine out of the ten risk groups, the whistle ban crossings had significantly higher collision rates than the crossings with no whistle bans. On average, the risk of a collision was found to be 84 percent greater at crossings where train horns were silenced. Another way to interpret this difference would be to say that locomotive horns had a .46 effectiveness rate in reducing the rate of collisions.

FRA was concerned about the higher risk disclosed by the nationwide study. From its vantage point, FRA was able to see the elevated risk associated with whistle bans, which might not be apparent to local communities. While crossing collisions are infrequent events at individual crossings, the nationwide study, and the experience in Florida, showed they were much less infrequent when train horns were not sounded.

FRA conducted an outreach program in order to promptly share this information with all communities where

bans were in effect. In addition to issuing press releases and sending informational letters to various parties, FRA met with community officials and participated in town meetings. Along with the study's findings, information about the upcoming rule requiring the sounding of train horns was presented, including provisions for supplementary safety measures that could be implemented by communities to compensate for silenced train horns and allow bans to remain in effect.

From the outreach effort, FRA gained a clearer understanding of local concerns and issues. Many of those concerns were expressed in person and others were submitted in writing to FRA's whistle ban docket. Another result of the outreach effort was the identification of 664 additional crossings that were subject to whistle bans, but not included in the nationwide study. About 95 percent of these were located in the city and suburbs of Chicago, Illinois. Many carry a high volume of commuter rail traffic.

Recently, FRA updated its analysis of the safety at whistle ban crossings, expanding it to include data for all the Chicago area crossings as well as for a few other newly identified locations.

BILLING CODE 4910-06-P

**BILLING CODE 4910-06-C**

FRA also refined its procedure by conducting separate analyses for three different categories of warning devices in place at the crossings (*e.g.*, automatic gates with flashing lights, flashing lights or other active devices without gates, and passive devices, such as "crossbucks" or other signs). In addition, FRA excluded from the analysis certain collisions where the sounding of the train horn would not have been a deterrent to the collisions. These included cases where there was no driver in the vehicle and collisions where the vehicle struck the side of the train beyond the fourth locomotive unit (or railcar). FRA also excluded events where pedestrians were struck. Pedestrians, compared to vehicle operators, have a greater opportunity to see and recognize an approaching train because they can look both ways from the edge of the crossing. They can also stop or reverse their direction more quickly than a motorist if they have second thoughts about crossing safely.

Data for the five-year time period from 1992 through 1996 was used for the updated analysis in place of the older data of the 1995 Nationwide Study. For the updated analysis, the collision rate for whistle ban crossings in each device category was compared to similar

crossings in the national inventory using the ten range risk level method used in the original study.

The analysis showed that an average of 62 percent more collisions occurred at whistle ban crossings equipped with automatic gates and flashing lights than at similarly equipped crossings across the nation without bans. FRA will use this value as the increased risk associated with whistle bans instead of the 84 percent cited in the Nationwide Study of Train Whistle Bans released in April 1995. FRA believes that 62 percent is appropriate because it represents the elevated risk associated with crossings with automatic gates and flashing lights, which are the only category of crossings that will be eligible for "quiet zones" (except for certain crossings where train speeds do not exceed 15 miles per hour).

The updated analysis also indicated that whistle ban crossings without gates, but equipped with flashing light signals and/or other types of active warning devices, on average, experienced 119 percent more collisions than similarly equipped crossings without whistle bans. This finding made it clear that the train horn was highly effective in deterring collisions at non-gated crossings equipped only with flashing lights. The only exception to this

finding was in the Chicago area where collisions were 16 percent less frequent. This is a puzzling anomaly. One possible explanation for this result is that more than 200 crossings (approximately one third of the crossings in Chicago) still included in the DOT/AAR National Inventory have in all likelihood been closed. They would continue to be included in the Inventory until reported closed by state or railroad officials. (At this time submission of grade crossing inventory data to FRA is voluntary on the part of states and railroads.) FRA believes this could contribute to the low collision count for Chicago area crossings without gates. Collisions cannot occur at crossings that have been closed. The retention of closed crossings in the inventory would, therefore, have the effect of incorrectly reducing the calculated collision rate for the Chicago area crossings.

In comparing the collision differences at crossings with gates and those without gates, FRA found that about 55 percent of the collisions at crossings with gates occurred when motorists deliberately drove around lowered gates. These collisions occurred 128 percent more often at crossings with

whistle bans than at other crossings. Another 18 percent of the collisions occurred while motorists were stopped on the crossings, probably waiting for vehicles ahead to move forward. There were smaller percentages of collisions involving stalled and abandoned vehicles. Suicides are not included in the collision counts. At crossings equipped with flashing signal lights and/or other active warning devices, but not gates, collisions occurred 119 percent more often at crossings subject to bans. A distinction should be made between the two circumstances. In the case of lowered gates, it is the motorist's decision to circumvent a physical barrier to take a clearly unsafe and unlawful action that can result in a collision. However, in the case of crossings with flashing light signals and/or other active devices, collisions may be more the result of a motorist's error in judgement rather than a deliberate violation of the state's motor vehicle laws. The ambiguity of flashing lights at crossings, which in other traffic control situations indicate that the motorist may proceed after stopping, when safe to do so, coupled with the difficulty of correctly judging the rate of approach of a large object such as a locomotive, may contribute to this phenomenon. FRA's collision data show that the added warning provided by the train horn is most critical at crossings without gates but which are equipped with other types of active warning devices.

By separating crossings according to the different categories of warning devices installed, FRA has been better able to identify the level at which locomotive horns increase safety at gated crossings and thus the level at which substitutes for the horn must be effective in order to fully compensate for the lack of a horn at those crossings.

For crossings with passive signs as the only type of warning device, the updated study indicated an average of 27 percent more collisions for crossings subject to whistle bans. This is the smallest difference identified between crossings with and without whistle bans. These crossings account for about one fourth of the crossings with whistle bans. Typically, they are the crossings with the lowest aggregate risk of collision because the installation of active warning devices usually follows a sequence where the highest risk crossings are equipped first. Two determinants of crossing risk are the amount of train traffic and highway traffic at a crossing. Often, crossings with only passive warning devices are located on seldom used sidings and industrial tracks and/or on highways

with relatively low traffic levels. FRA believes this may be the reason that the difference in the numbers of collisions at whistle ban and non-ban crossings is so much less than for the other crossing categories. For crossings with passive warnings where trains do not exceed 15 miles per hour and where railroad personnel use flags to warn motorists of the approach of a train, whistle bans would entail a small risk of a collision resulting in an injury. However, at crossings with passive warnings and with higher train speeds, motorists would have no warning of the approach of a train if the train horn were banned. At such crossings, in order to ensure their safety, motorists must search for and recognize an approaching train, and then visually judge whether it is moving, and if so, estimate its arrival time at the crossing, all based only on visual information which may be impaired by hills, structures, vegetation, track curvature, road curvature as well as by sun angle, weather conditions, or darkness. The driver's decision to stop must be made at a point sufficiently in advance of reaching the crossing to accommodate the vehicle's stopping distance. If other vehicles are following, a sudden decision to stop could result in a rear-end collision with the vehicle being pushed into the path of the train. While FRA's data indicates that the smallest increase in collision frequency is associated with whistle bans at passive crossings, logic suggests that the banning of train horns at passive crossings could entail a much more significant safety risk per unit of exposure (vehicle crossings per train movement). Without the audible train horn warning, motorists would have no indication of the imminent arrival of a train beyond what they could determine visually. For motorists unfamiliar with whistle bans who encounter passive crossings where horns are not sounded, there would be an even greater risk.

The conclusions drawn from the 1995 Nationwide Study and its recent update have helped determine the requirements of this rule. FRA appreciates the assistance and cooperation of the many organizations and individuals who contributed to this effort by reporting whistle ban locations, compiling data, researching ordinances, and sharing their concerns, ideas, and opinions.

D. Congressional Action

After reviewing FRA's Florida study, Congress addressed the issue. On November 2, 1994, Congress passed the Swift Rail Development Act, Public Law 103-440 ("Act") which added section 20153 to title 49 of the United States Code. The Act requires the use of

locomotive horns at grade crossings, but gives FRA the authority to make reasonable exceptions. Section 20153 of title 49 of the United States Code states as follows:

"§ 20153. Audible warning at highway-rail grade crossings.

"(a) DEFINITIONS.—As used in this section—

"(1) The term 'highway-rail grade crossing' includes any street or highway crossing over a line of railroad at grade;

"(2) The term 'locomotive horn' refers to a train-borne audible warning device meeting standards specified by the Secretary of Transportation; and

"(3) The term 'supplementary safety measure' refers to a safety system or procedure, provided by the appropriate traffic control authority or law enforcement authority responsible for safety at the highway-rail grade crossing, that is determined by the Secretary to be an effective substitute for the locomotive horn in the prevention of highway-rail casualties. A traffic control arrangement that prevents careless movement over the crossing (e.g., as where adequate median barriers prevent movement around crossing gates extending over the full width of the lanes in the particular direction of travel), and that conforms to standards prescribed by the Secretary under this subsection, shall be deemed to constitute a supplementary safety measure. The following do not, individually or in combination, constitute supplementary safety measures within the meaning of this subsection: standard traffic control devices or arrangements such as reflectorized crossbucks, stop signs, flashing lights, flashing lights with gates that do not completely block travel over the line of railroad, or traffic signals.

"(b) REQUIREMENT.—The Secretary of Transportation shall prescribe regulations requiring that a locomotive horn shall be sounded while each train is approaching and entering upon each public highway-rail grade crossing.

"(c) EXCEPTION.—(1) In issuing such regulations, the Secretary may except from the requirement to sound the locomotive horn any categories of rail operations or categories of highway-rail grade crossings (by train speed or other factors specified by regulation)—

"(A) That the Secretary determines not to present a significant risk with respect to loss of life or serious personal injury;

"(B) For which use of the locomotive horn as a warning measure is impractical; or

"(C) For which, in the judgment of the Secretary, supplementary safety measures fully compensate for the

absence of the warning provided by the locomotive horn.

“(2) In order to provide for safety and the quiet of communities affected by train operations, the Secretary may specify in such regulations that any supplementary safety measures must be applied to all highway-rail grade crossings within a specified distance along the railroad in order to be excepted from the requirement of this section.

“(d) APPLICATION FOR WAIVER OR EXEMPTION.—Notwithstanding any other provision of this subchapter, the Secretary may not entertain an application for waiver or exemption of the regulations issued under this section unless such application shall have been submitted jointly by the railroad carrier owning, or controlling operations over, the crossing and by the appropriate traffic control authority or law enforcement authority. The Secretary shall not grant any such application unless, in the judgment of the Secretary, the application demonstrates that the safety of highway users will not be diminished.

“(e) DEVELOPMENT OF SUPPLEMENTARY SAFETY MEASURES.—(1) In order to promote the quiet of communities affected by rail operations and the development of innovative safety measures at highway-rail grade crossings, the Secretary may, in connection with demonstration of proposed new supplementary safety measures, order railroad carriers operating over one or more crossings to cease temporarily the sounding of locomotive horns at such crossings. Any such measures shall have been subject to testing and evaluation and deemed necessary by the Secretary prior to actual use in lieu of the locomotive horn.

“(2) The Secretary may include in regulations issued under this subsection special procedures for approval of new supplementary safety measures meeting the requirements of subsection (c)(1) of this section following successful demonstration of those measures.

“(f) SPECIFIC RULES.—The Secretary may, by regulation, provide that the following crossings over railroad lines shall be subject, in whole or in part, to the regulations required under this section:

“(1) Private highway-rail grade crossings.

“(2) Pedestrian crossings.

“(3) Crossings utilized primarily by nonmotorized vehicles and other special vehicles.

“(g) ISSUANCE.—The Secretary shall issue regulations required by this section pertaining to categories of

highway-rail grade crossings that in the judgment of the Secretary pose the greatest safety hazard to rail and highway users not later than 24 months following the date of enactment of this section. The Secretary shall issue regulations pertaining to any other categories of crossings not later than 48 months following the date of enactment of this section.

“(h) IMPACT OF REGULATIONS.—The Secretary shall include in regulations prescribed under this section a concise statement of the impact of such regulations with respect to the operation of section 20106 of this title (national uniformity of regulation).

“(i) REGULATIONS.—In issuing regulations under this section, the Secretary—

“(1) Shall take into account the interest of communities that—

(A) Have in effect restrictions on the sounding of a locomotive horn at highway-rail grade crossings; or

(B) Have not been subject to the routine (as defined by the Secretary) sounding of a locomotive horn at highway-rail grade crossings;

“(2) Shall work in partnership with affected communities to provide technical assistance and shall provide a reasonable amount of time for local communities to install supplementary safety measures, taking into account local safety initiatives (such as public awareness initiatives and highway-rail grade crossing traffic law enforcement programs) subject to such terms and conditions as the Secretary deems necessary, to protect public safety; and

“(3) May waive (in whole or in part) any requirement of this section (other than a requirement of this subsection or subsection (j)) that the Secretary determines is not likely to contribute significantly to public safety.

“(j) EFFECTIVE DATE OF REGULATIONS.—Any regulations under this section shall not take effect before the 365th day following the date of publication of the final rule.” The last two subsections of section 20153 were added on October 9, 1996 when section 20153 was amended by Public Law 104–264.

E. Rulemaking

When conducting a rulemaking, FRA must follow the Administrative Procedure Act (5 U.S.C. 553 *et seq.*) (APA). The APA generally requires that FRA allow all interested parties to review and comment on any proposed rule. Thus, by this notice, FRA is providing the public an opportunity to study the proposed rule and comment on it. Based on comments and testimony provided in response to this notice, FRA

will, after the close of the comment period, determine what action to take.

There are two ways for you to share with FRA your opinions, experience or information about locomotive horns. First, the FRA can receive letters and other written remarks or reports. FRA places all of these comments in one place, the rulemaking docket. Please include the docket number on all comments submitted in response to this notice. The docket number for this rulemaking is “Docket Number FRA–1999–6439.” All written comments are placed in the docket, including scientific and technical reports on which FRA substantially relied when preparing the proposed rule. For example, the docket for this rulemaking includes, among many documents, copies of FRA’s Florida and nationwide whistle ban studies. The public is free to inspect the rulemaking docket during regular business hours at the address listed above. Additionally, all documents in the docket are now available online at <http://dms.dot.gov>.

The second way to make a comment on this rulemaking is to attend one of the scheduled public hearings. The hearings will provide interested parties an opportunity for an oral presentation. FRA will have a court reporter record each public hearing and will place a copy of the transcript of each hearing into the docket. FRA will review all written comments and testimony provided in the public hearings.

F. Comments Received by FRA

Because of the great interest in this subject throughout various areas of the country, FRA has been involved in an extensive outreach program to inform those communities which presently have whistle bans of one type or another in effect. FRA staff has attended a large number of meetings with local officials and citizens. FRA has also held a number of public meetings to discuss the issues and to receive information from the public. FRA broke from tradition and established a public docket before formal initiation of rulemaking proceedings in order to enable citizens and local officials to comment on how FRA might implement the Act and to provide insight to FRA. Establishment of the docket also enabled members of the public to learn what other interested parties thought about this subject. The vast majority of commenters were in favor of quiet zones in their communities. A number were in favor of the use of four-quadrant gates at affected crossings, while one person favored the less expensive articulated gates rather than four-quadrant gates. Some commenters indicated how they

think the Act should be amended. Of course, new legislative enactments are beyond the scope of this rulemaking, and FRA must implement the law as it now reads.

Some commenters expressed the belief that state and localities were best suited to make the decisions regarding exemptions from the requirement that trains sound horns at crossings. A representative of the City of Portland, Maine wants the Act amended to empower the appropriate transportation agency for each state to grant local municipalities exemptions, since these officials "are better able to properly assess the merits of any local community request for such a waiver." Examples of such exemptions that would be appropriate, according to this official, would be cases where the crossings are adequately protected, train speeds are no more than 30 miles per hour and vehicle speed is 35 miles per hour or less. This commenter also stated that all crossings which are flagged by the train crews or where the train crew activates the crossing signal should be exempt from locomotive horns. Similarly, the Maine Department of Transportation believes that "the State's regulatory process should be retained under any rules proposed * * *." The state requests that an exception under the Act be granted to those states which, either by an adjudicatory process or by rulemaking, permit train whistling to be discontinued.

The Chairman of the Board of Selectmen of the town of Acton, Massachusetts expressed strong opposition to the return of locomotive horns, and urged that FRA issue regulations "so that each state could make its own determination as to the appropriate level of safety devices needed at each grade crossing." Similarly, a Wisconsin state representative requests that FRA "empower states with the available expertise, such as Wisconsin's Office of the Commissioner of Railroads, to make their own rules. The states, better than the federal government, know the local conditions and have contact with the citizens who are represented directly in the State Legislature." This same legislator closed his comment by stating that "I hope this letter reaches a human being who will read it and I hope it will go to a deliberative body who truly cares about the true needs of our citizens." FRA wishes to assure the writer, and the public generally, that indeed we do care about the needs of our citizens. In addition to the citizens who may be disturbed by locomotive horns, we are concerned about the safety of the driver of a car at a grade crossing, the driver's

innocent passengers, members of train crews, as well as nearby residents who may be injured by collisions at crossings. The intent of this rule is to help provide for safe grade crossings without unduly burdening nearby residents.

A number of commenters felt that costs associated with alternative safety measures should be borne by parties other than the local or state government. A Massachusetts state senator stated that FRA should require the railroad to assume the costs associated with two crossings in his town. An organization of bed and breakfast owners in Vicksburg, Mississippi objected to what they described as "intense noise" from local trains. The group urged that FRA "adopt a liberal policy permitting alternative grade crossing safety devices that would eliminate the need for the train horns." The group added, "Of course, a financial assistance program to accomplish these alternatives is also essential." The Town of Ashland, Massachusetts argues that the railroad's cost of doing business should not be transferred to the town and taxpayers. "Responsibility for this [measures to minimize disruption caused by these crossings] must be put squarely on the operators of the railroad. * * *"

Two commenters have raised the issue as to whether rural and urban areas should be treated in the same manner. One commenter stated that "the Act no doubt should apply in full force to rural sections of America, but such provisions are quite out of line with the logical treatment of those areas of the land where the population is far heavier." Another commenter urged FRA to establish maximum decibel levels for locomotive horns which "should be considerably lower in urban areas than in sparsely populated rural areas."

Various commenters have proposed that specific provisions be contained in FRA's regulations. One commenter proposes that the regulation be waived for any crossing within 300 yards of a residence.

Many commenters expressed the view that many communities with present whistle bans have excellent safety records and therefore sounding of locomotive horns will only disrupt residents' lives with no real impact on safety. The city attorney for Bellevue, Iowa indicated that the railroad tracks run down the center of a main street in the city. He points out that slow train speed, locomotives equipped with ditch lights, stop signs at crossings, and the sounding of the locomotive bell all have contributed to only 5 collisions, one injury, and no fatalities in almost 7

years of train traffic averaging 8 trains a day. He claims that locomotive horns along the 15 crossings in town will have a minimal affect on safety, but will have a maximum effect on the quality of life of most of Bellevue's residents. Similarly, the mayor of Batavia, Illinois indicated that because the city has a good rail safety record, the "whistle blowing standards that have been set forth in this Act are not necessitated and would cause unnecessary discomfort to our constituency." These commenters, along with others, recommend that a community's safety record be a factor in determining whether locomotive horns need to be sounded.

FRA has received many comments from Chicago area municipal groups representing suburban areas in which, for the most part, locomotive horns are not routinely sounded. The Chicago Area Transportation Study conducted by the Council of Mayors states that it represents over 200 cities and villages with over 4 million residents outside of Chicago. The study authors recommended that FRA's regulations include provisions for: (1) Accident reduction programs tailored to the magnitude and type of accident experience at individual crossings; (2) recognition of the effectiveness of enhanced enforcement of existing rail safety laws and public education programs; (3) use of less costly physical barriers such as flexible median delineator tubes and articulated railroad crossing gates; (4) use of strobe lights and more visible paint schemes on locomotives and cab car fronts and reflective delineators on the sides of railroad cars; and (5) exemptions from locomotive horns if a community or subregion's accident experience is under a specified threshold. These proposals were echoed by the West Central Municipal Conference and the West Suburban Mass Transit District, both of suburban Chicago.

Another association of suburban Chicago local governments, the DuPage [County] Mayors and Managers Conference, emphasized the large number of rail lines, large number of daily train movements and high volume of pedestrian and motor vehicle movements over area grade crossings. The Conference pointed out that the citizens have grown to rely on locomotive horns in cases of impending danger, not for warning of the routine approach of a train. The Conference indicates a downward trend in grade crossing collisions over the past ten years, and attributes a significant portion of that decline to stepped-up law enforcement efforts by municipalities and more focused public

awareness programs. Rather than providing for engineering improvements to decrease collisions at crossings, the Conference recommends that a community or subregion be exempt from both locomotive horn soundings and the requirement to install supplementary safety measures if the area's collision experience is under a specified threshold. The Conference states support for aggressive enforcement and education programs as well as less costly physical barriers such as flexible median delineator tube. The Conference is also in favor of a state-level oversight mechanism, rather than federal oversight, "given the already close working relationship that must exist between state highway and rail-related agencies."

FRA particularly appreciates the efforts of Members of Congress who have invited FRA to their districts and have provided citizens and local officials with the opportunity to express their views on this rulemaking process. These exchanges, and others conducted directly through FRA's regional crossing managers, have been very valuable in identifying the need for flexibility in preparing the proposed rule.

In the Chicago region, Rep. Henry Hyde of Illinois chaired a public meeting attended by the FRA Administrator, with participation by other Members of Congress and a number of public witnesses. Rep. William Lipinski also convened a district meeting with the Administrator in attendance that permitted a full airing of community concerns. These Chicago-area forums called attention to the large number of commuter and freight trains that would be required to sound horns along rail lines where many of the engineering concepts embodied in E.O. 15 would be difficult or impossible to implement, without substantial revision. Representatives from DuPage County proposed the concept of aggregating and abating risk by corridor rather than by crossing, a concept embodied in this proposal. Concerns were raised by an association of local governments regarding the identification of crossings currently impacted by informal bans on train horns, and those concerns led to an extensive data collection effort to complete the identification of impacted communities and re-analyze the accident data in light of this new information. Although most witnesses opposed any rulemaking in this area, a DuPage County citizen group formed to promote highway-rail crossing safety supported the use of train horns.

Senior FRA staff members also joined Rep. Tim Roemer and officials from the

State Department of Transportation in meetings with city officials and citizens from South Bend and Mishawaka, Indiana, to consider the implications of the forthcoming rulemaking on those communities, where whistle bans are in place over most crossings. Concern was expressed that residents along the railroad would have to "pay the price" for violation of warning systems by individual motorists. Serious crashes had occurred along the Conrail line that bisects these cities, and options were reviewed for making improvements that might offset the train horn. Cost was identified as a critical issue for the local governments.

The office of Senator Edward Kennedy convened a meeting involving FRA senior staff early in the agency's outreach effort that was attended by several elected officials, who expressed concern over the prospective rulemaking. Senior FRA staff members attended separate district meetings in Massachusetts convened by Rep. Martin Meehan and Rep. John Tierney. These congressional districts are significantly impacted by scheduled commuter service. Residents and officials called attention to the generally good safety record at local crossings and the incompatibility of train horns with the quiet of their communities. Concern was also expressed regarding the public health effects of loud train horns and the cost of supplementary safety measures.

Citizens and officials involved in several of these contacts expressed concern that the proposed rule would impose "unfunded mandates" on local communities. Without exception, the offices of Members of Congress and Senators contacting FRA in this proceeding have expressed that FRA seek flexible solutions and allow ample time for communities with existing whistle bans to adjust to any new requirements.

Additional issues raised in the course of these contacts, briefings for congressional staff, and other communications are set forth elsewhere in this preamble, including the section-by-section analysis.

In-Vehicle Warning Systems

FRA periodically receives suggestions from the public that electronic devices should be installed on motor vehicles to warn of approaching trains, thereby eliminating the need for locomotive horns. Over the long term, systems may be deployed that permit broadcast notifications to motorists warning of the passage of trains over highway-rail crossings. If these systems are sufficiently reliable and use is

widespread, sounding of the train horn may be discontinued. This type of warning may be achieved through integration of Intelligent Transportation Systems (ITS) deployed for highway use, together with elements of Positive Train Control (PTC) systems that will govern train movements and provide accurate data concerning location, direction of movement and velocity (or that may function on the train to notify information systems through location-specific interfaces). Such systems will not be widely deployed for some time, but a clearly delineated "user service" (Number 30) has been established within the architecture of the Intelligent Transportation Systems program as a venue for research and planning. FRA's PTC Working Group (a part of the Railroad Safety Advisory Committee) has also identified this as a possible auxiliary function for PTC.

In the interim, FRA expects progress toward in-vehicle warning for priority vehicles such as school buses, emergency vehicles and the like. Concepts for "proximity warning" have been evaluated with Department of Transportation funding at the Transportation Technology Center, and field operational tests were conducted in 1998. The State of Illinois is demonstrating a priority vehicle system in the Chicago metropolitan area. A commercial vendor is offering a radar system for private motor vehicles that is designed to detect a train's approach, assuming the lead locomotive to be equipped with a radar unit. FRA will continue to work with the Federal Highway Administration and other transportation bodies to identify promising strategies for priority vehicle warning system.

Consideration has also been given to transmitting train proximity warnings through new generations of car radios equipped to receive such transmissions, sound audible warnings, and display text messages. This Emergency Radio Data System (ERDS) is used in several European countries and is proposed for demonstration in the U.S. as part of ITS development. This approach would use consumer electronics as the in-vehicle platform.

Successful in-vehicle systems will need to meet several criteria in order to be candidates for wide-scale application to all passenger motor vehicles: 1. Systems must be fail-safe; or they must be shown to be so highly reliable that their utility as a warning system exceeds the loss of safety associated with inappropriate reliance on the system when in the failure mode. 2. Systems must be affordable for the vehicle owner, as well as the railroad charged

with equipping locomotives. 3. False alarms must be infrequent, or the system will lack credibility and may be subject to being defeated (if false alarms produce annoyance).

Clearly, before train horns could be silenced, essentially all trains and motor vehicles would need to be equipped with the in-vehicle warning system. With respect to private motor vehicles, such a feature is most likely to be implemented as part of a multi-function ITS package. Although Intelligent Transportation Systems offer significant promise for enhancing rail safety and perhaps entirely replacing the function currently served by the train horn, this alternative is not available as a realistic option on a community-by-community basis at the present time.

G. Proposed Rule

FRA has reviewed information obtained through our "outreach" efforts, comments submitted to the public docket and other unsolicited comments sent to the agency by concerned citizens, communities, and legislators. FRA has considered that information and has attempted, within the statutory framework established by Congress, to accommodate many of the legitimate concerns expressed. We anticipate that many constructive comments will result from public analysis of this proposal and that the proposed rule may be changed as a result of the public input. In drafting this proposed rule, FRA has attempted to reconcile Congress' two, somewhat conflicting, directives. The first directive, which is unambiguous, is that "The Secretary of Transportation shall prescribe regulations requiring that a locomotive horn shall be sounded while each train is approaching and entering upon each public highway-rail grade crossing." This directive does not allow any discretion as to issuance of the regulation requiring the sounding of horns. The Secretary, and by delegation, the Federal Railroad Administrator, must require that horns are sounded at every public grade crossing. The second directive, however, is entirely discretionary. The Secretary "may" exempt from the requirement to sound the locomotive horn certain categories of rail operations or categories of crossings. While exceptions may be crafted, they are not required. This proposed rule, which does contain provisions for such exceptions, is essentially a rule which reduces the impact of the Congressional locomotive horn mandate. It provides communities with the ability to reduce the impact of locomotive horns within their jurisdictions.

The basis of this proposed rule is the determination by Congress that locomotive horns provide a measure of safety at highway-rail grade crossings beyond that provided by the conventional stationary grade crossing warning systems of crossing gates and flashing lights. Because of the added safety benefits afforded by locomotive horns, they must be sounded unless an effective substitute is provided. The proposed rule is crafted to detail when and how locomotive horns must be sounded. For the first time, FRA proposes limits to the sound level of locomotive horns to provide some relief to the surrounding population while still ensuring that the sound level is high enough to provide the required warning to the motorist.

The rule requires that horns be sounded at every public highway-rail crossing. FRA has provided an exception to this requirement for crossings within a designated "quiet zone." If all crossings within that zone are equipped with approved supplementary safety measures in addition to conventional gates and flashing lights, locomotive horns will not need to be sounded (subject to the rule requirements). The rule further provides that if a community wishes to establish a quiet zone, but it can not, for some reason, fully comply with the rule's requirements for supplementary safety measures at every crossing within the zone, it may apply to the FRA with its proposed program of safety measures. FRA will evaluate the community proposal to determine if the safety measures will compensate for the lack of a locomotive horn. Finally, the rule provides a very limited exception to the requirement that supplementary or alternative safety measures must be in place if locomotive horns are to be silenced.

As required in section "j" of the Act, any regulations issued pursuant to the Act shall not take effect for one year following the date of publication of the final rule. As a result, the regulation's requirements to sound the locomotive horn (absent establishment of a quiet zone) will not be effective until one year after publication of the final rule. The one year period, in addition to the period between publication of this proposed rule and the final rule, will enable communities to assess options and plan for those actions deemed best for that particular community. FRA anticipates that during the one year between final rule publication and its effective date, communities will wish to initiate the administrative process involved in establishing quiet zones so that, if desired, they can have quiet

zones in place on the anniversary of the rule publication. Therefore, FRA anticipates that for administrative purposes only, the final rule will have an effective date 60 days after publication. The final rule, of course, would not impose any requirement for the sounding of locomotive horns before one year after final rule publication. FRA requests comments on this proposal.

Section-By-Section Analysis

Section 229.129 Audible Warning Device

As noted earlier, FRA has a rule at, 49 CFR 229.129, which requires that each lead locomotive be provided with an audible warning device. That provision currently requires that the warning device produce a minimum sound level of 96 dB(A) at 100 feet forward of the locomotive in its direction of travel. Over the past few years FRA has received many complaints regarding the loudness of various locomotive horns. While the regulation appropriately required a minimum sound level in order to assure the horn's effectiveness, it did not restrict the maximum sound level of a locomotive horn. This section would correct that situation and would establish a maximum sound level that an audible warning device may produce. (Proposed language for this section can be found at the end of this document following proposed regulatory language for new Part 222.) This section would also revise the directionality requirements of the regulation. It would establish a maximum sound level to the side of the locomotive in order to reduce the horn's effect on the surrounding community. FRA is faced with the task of balancing the need for an effective warning to the motorist while minimizing the horn's intrusion into the surrounding community.

There are a number of factors which influence the ability of a motorist to hear a train horn. These include: The sound spectrum level (intensity at each frequency) of the horn, distance from the horn, ambient noise spectrum level in the motor vehicle, the acoustic insertion loss of the vehicle (sound reflected and absorbed by the vehicle which does not enter the vehicle interior), and the characteristics of the grade crossing. The human ear is only sensitive to sounds between 20 and 20,000 hertz (Hz), and is most sensitive in the range between 500 and 5,000 Hz. Hearing sensitivity declines sharply for higher and lower frequencies. As distance from a sound source increases, the effective intensity of the sound

decreases by approximately 7.5 dB for every doubling of the distance. For instance, if the calibrated intensity of the train horn at 100 feet is 100 dB(A), then at 200 feet it is 92.5 dB(A).

Ambient noise in the vehicle can reduce the motorist's ability to hear the train horn through masking. Masking would be strongest when the frequency of the noise is at the same frequency of the train horn. In general, this means that the spectrum level of the horn inside the vehicle must exceed that of ambient noise for the horn to be heard.

Determining the required minimum level and the required maximum level for the train horn requires a balance between effectiveness as a safety warning and mitigation of undesirable community noise impacts. In the past, some mitigation of noise impacts has occurred through exercise of discretion by locomotive engineers who have sought to limit community impacts by "going easy" on the air horn control. A Federal mandate to use this warning device will inevitably change accepted practice. Although engineers have undoubtedly sought to exercise good judgment in this regard, whether this exercise of discretion has been uniformly benign is not known and not determinable using existing data.

Recent installation on some newer locomotives of electronic controls for operation of horns may have resulted in the maximum intended sound levels routinely under all circumstances. Again, whether this automation of the horn function has improved safety cannot be determined from available data. Although highway-rail crossing safety has continued to improve during this period despite increased exposure, many other variables (such as improved education and awareness programs, strengthened law enforcement, equipping of locomotives with alerting lights, installation of warning devices at high-risk crossings, and crossing closures) are likely responsible for most of this improvement.

Even the maximum sound level available from the horn has varied widely among segments of the locomotive and cab car fleets. FRA is aware that a major commuter authority sets the output of the horns on at least a portion of its commuter equipment at the minimum allowed (96 dB(A) at 100 feet, "plus or minus" 4 dB(A) for actual field testing). By contrast, many freight locomotives have horns that deliver as much as 114 dB(A) at 100 feet in front of the locomotive. Locomotive horns that proved highly effective in the warm climate through which the Florida East Coast Railway operates (where many motorists may have driven with open

vehicle windows in mild nighttime hours) have apparently been set at about 104 dB(A), but it may not be reasonable to expect similar effectiveness at this level under other conditions. FRA is particularly concerned that railroads not be required to reduce horn levels across the board to accommodate local community sensitivities, if that will result in reduced horn effectiveness at the majority of crossings that are not located in tightly-developed noise-sensitive areas.

The Volpe National Transportation Systems Center (Volpe Center) has been studying train horn issues for FRA in support of this rulemaking. Based upon field data collection and analysis the Volpe Center has suggested that, for peak safety effectiveness, train horns should be set at approximately 111–114 dB(A). This range takes into consideration the need to provide adequate advance warning to as many motorists as practical.

This would include a high percentage of motorists stopped, or approaching at low speed, crossings with automated warning devices. Behavioral science suggests that these motorists may have an expectation that a train is nearing the crossing. Under these circumstances, the train horn can be very effective because the motorist is listening for an auditory cue. Even if the "insertion loss" associated with closed vehicle windows and sound insulation is in the range of 18 to 45 dB(A), and despite some degree of background noise associated with the vehicle's engine and other interfering noise, the train horn should add significant value in these cases. Preliminary analysis by the Volpe Center appears to indicate that under most circumstances of crossing configuration and train speed, a train horn set in the range of 104–105 dB(A) at 100 feet in front of the locomotive may provide a sufficient auditory cue to alert the motorist who pauses at a crossing with active warning systems that the arrival of the train is imminent.

The greater challenge is presented by passively signed crossings. Although FRA does not propose to allow banning of train horn use at passively signed crossings and crossings with only flashing lights, the train horn will nevertheless remain an important warning system at those crossings. Reducing the allowed sound level by setting a maximum in this proceeding could thus lead to a net reduction in safety. At passively signed crossings, overall risk to the public is generally less because of fewer conflicting movements of trains and vehicles. However, the risk to any given motorist seeking to use the crossing during the

period a train is approaching is much higher. Motorists seeking to act wisely by yielding to the train are entitled to fair warning of the train's approach. Even with all lights (headlight and "ditch" lights) functioning, a train is sometimes difficult to pick out against the visual background. Further, due to such factors as buildings, mature stands of trees, track curvature, and the angle of motorists' approach, sight distances at many crossings do not permit a long preview of the train's approach. A sufficiently loud auditory warning will tell the motorist that a train is approaching and from what direction (within about 10 degrees for a person of good hearing in both ears under optimum circumstances). This will give the motorist more opportunity to sight the oncoming train at the first opportunity, evaluate its rate of approach, and make a safe decision.

The challenge at passively signed crossings is to provide warning sufficiently early to affect motorist behavior. This is more difficult, because the motorist approaching the crossing in most cases (except where an enforced STOP sign is present) will not stop and may not slow down except as required by unevenness of the road surface. The motorist's decision point is thus farther away from the crossing and (in the typical case) from the train horn. According to the Volpe Center, a vehicle traveling at 30 miles per hour may have interior noise level in the range of 21 to 63 dB(A) from its engine and typical road noise. A loud sound system playing music or other programming will add to this background noise. Depending upon the train horn harmonics, the Volpe Center estimates that a horn sound level in the range of 111–114 dB(A) may be sufficient to warn most motorists at passive crossings for all conventional train speeds, despite the fact that the horn sound as inserted into the vehicle must exceed the background noise by a larger margin than at crossings with automated warning devices in order to seize the motorists' attention. However, reducing the train horn level from that range is expected to result in a rather rapid fall-off of effectiveness at passively signed crossings. The result will be that the horn will be effective only at lower combined closing speeds for the vehicle and train approaching the crossing, leaving motorists without effective warning under a larger number of real-life scenarios.

Community impacts are also highly sensitive to train horn levels—but in the opposite direction. Volpe Center calculations suggest, for instance, that just reducing train horn levels from 114

dB(A) to 111 dB(A) would almost double the number of train movements permitted before a common 24-hour measure of acceptable community noise levels ($L_{dn}=65$ dB(A)) is exceeded at any given distance from the railroad right-of-way. This measure of acceptable community noise levels was developed to evaluate noise from frequent transportation movements (aircraft overflights, transit vehicle passes), in connection with public investments in new transportation facilities and equipment. FRA has grave reservations concerning whether such a standard could be appropriately applied to evaluate the acceptability of short-duration warning sounds necessary for safety in an existing transportation system. Train horn noise has been excepted from Environmental Protection Administration limits on railroad noise emissions because of these kinds of differences. Nevertheless, FRA recognizes the importance of imposing no greater noise impacts on local communities than may be necessary for safety. Accordingly, as discussed below FRA will be conducting an environmental assessment in parallel with this rulemaking and utilizing the results of that effort in preparing a final rule.

FRA does not propose to conclude this rulemaking without setting a maximum level for the train horn. Although FRA is skeptical, based on noise readings taken in locomotive cabs, that train horns have been set at levels exceeding approximately 114 dB(A)—a level that does not appear excessive given the safety needs involved—FRA does recognize that the mandate to use the horn implicates a responsibility to set a maximum level. For purposes of this proposed rule, therefore, FRA is proposing two specific options, with a third concept suggested for comment. Under both options the minimum level would remain at 96 dB(A). However, in order to avoid significant loss of warning effectiveness, field tests would not include the current “plus or minus” allowance for error. Tests in the field would be required to demonstrate a sound level of at least 96 dB(A) at 100 feet in front of the locomotive and to comply with a specified maximum level. To avoid non-representative results caused by environmental extremes, testing would be required to be conducted within a range of temperature of 36 and 95 degrees Fahrenheit with relative humidity between 20 and 90 percent. Both temperature and humidity affect the propagation of sound waves.

Options for maximum level. Under the first option, the maximum

permissible train horn sound level would not exceed 104 dB(A), which is believed to be sufficient in most circumstances to provide adequate warning at crossings using automated warning devices (where the motorist makes a decision while at rest near the crossing, expecting the train to arrive). Under the second option, the train horn could be set at up to 111 dB(A), which is in the range where the horn is believed to be effective under many circumstances at passively signed crossings (where the motor vehicle is in motion at the decision point and the motorist have been provided no contemporaneous reason to expect to see a train). As soon as they are completed, FRA will place in the docket Volpe Center studies providing information pertinent to this analysis.

Variable level option. FRA notes that one possible approach to addressing this issue is a variable horn level. Under this approach, train horns would be required to be capable of sounding within a low range (e.g., 96–104 dB(A)) approaching any crossing with active warning devices and within a higher range (e.g., 104–111 dB(A)) at any crossing not equipped with automated warning systems. FRA notes concern that this could place an additional burden on the locomotive engineer and that sounding the horn in this pattern would not be feasible where crossings are closely spaced and are not uniformly treated with automated warning devices. Accordingly, at a minimum simplified procedures requiring the engineer to take the safe course would be required in these circumstances. Commenters are asked to evaluate this approach as a third option.

Directionality. Under current regulations, some locomotive horns have been placed near the center of the locomotive in order to reduce crew noise exposure. Although providing at least 96 dB(A) at 100 feet in front of the locomotive, these arrangements have sometimes led to higher sound levels at right angles to the locomotive than to the front or rear. This has resulted from obstructions such as diesel exhaust stacks and air conditioning units causing the horn noise to disperse. FRA believes that this approach is not necessary for crew safety and is inconsistent with the responsibility of the transportation company to limit community noise impacts. Accordingly, the proposed rule would require that the sound levels at 90 degrees and 100 feet from the center of the locomotive not exceed the value 100 feet in front of the locomotive. FRA also requests comment whether this community exposure should be measured at 90 degrees from

the horn placement location, rather than the center of the locomotive.

Crew safety concerns. FRA does not expect locomotive crew exposure to be a limiting factor in this rulemaking. In a 1996 Report to Congress entitled *Locomotive Crashworthiness and Cab Working Conditions*, FRA described the results of a survey of cab noise levels and the literature dealing with occupational hearing loss. The report found noise exposure for most locomotive assignments to fall within acceptable levels and noted that cabs of new locomotives are exceptionally quiet because they provide an environment that is isolated from the locomotive structure and temperature controlled (permitting windows to remain closed). However, the report identified the need to improve FRA's noise exposure standard for locomotive cabs and to adopt a hearing conservation approach to this area of occupational safety and health. A working group of the Railroad Safety Advisory Committee is currently pursuing these improvements, and comments from within that working group have prompted the suggestion noted above for a variable sound level for the horn. Depending upon the circumstances under which the low sound level might be selected by the locomotive engineer, having this option available could reduce the overall noise dose to which crew members are subjected during any duty tour. In any event, FRA expects that continued improvements in locomotive design, use of personal hearing protection, and other initiatives now under study should permit further reduction in occupational noise exposure over the coming years.

Costs. FRA recognizes that varying the loudness of the locomotive horn by adapting to a new maximum level, providing for a variable level, or relocating a horn to avoid excessive levels to the “field” could result in costs to the railroads. FRA requests comment on the extent of the costs involved and the optimum means of achieving any necessary retrofit of locomotives, including the period that should be allowed to accomplish this work.

Section 222.3 Application

The requirements contained in this part apply to all railroads, both passenger and freight, which operate on the general railroad system of transportation, *i.e.*, the network of standard gage railroads over which the interchange of goods and passengers throughout the nation is possible. This part does not apply to exclusively freight railroads that operate only on track which is not part of the general

system of transportation. This part also does not apply to rapid transit operations within an urban area that are not connected to the general railroad system of transportation.

In other recent rulemakings, FRA has discussed the basis for its exercise of jurisdiction over "scenic" or "tourist" railroads. FRA has declined to exercise jurisdiction over insular scenic or tourist railroads *i.e.*, passenger railroads operating inside an installation so that the operations are limited to a separate enclave in such a way that there is no reasonable expectation that the safety of the public—except a business guest, licensee of the railroad or an affiliated entity, or a trespasser—would be affected by the operation. FRA has determined that the presence of certain characteristics will prevent the railroad from being considered insular and thus will result in FRA's exercise of jurisdiction over that railroad. The presence of one of the following characteristics will trigger the assertion of FRA regulatory jurisdiction: (1) A public highway-rail crossing that is in use; (2) an at-grade rail crossing that is in use; (3) a bridge over a public road or waters used for commercial navigation; or (4) a common corridor with a railroad, *i.e.*, its operations are within 30 feet of those of any railroad. Inasmuch as this proposed rule is directed at locomotive horn use at public highway-rail grade crossings, the rule will thus apply to every tourist or scenic railroad crossing a public highway rail grade crossing, whether or not the railroad is part of the general railroad system of transportation. The language of this proposed section reflects that result.

FRA recognizes that additional public grade crossings may be found on plant railroads and freight railroads which are not part of the general railroad system of transportation. Operations on these railroads are typically low speed with small numbers of rail cars permitting relatively short stopping distances. Additionally, these operations typically also involve roadway crossings with relatively low speed vehicular traffic. These reasons, together with the historical basis for not asserting jurisdiction in these cases, leads FRA to propose not to exercise jurisdiction over public and private crossings at such plant and private railroads. FRA does, of course, retain the statutory right to assert jurisdiction in this area and will do so if circumstances so warrant. As in all aspects of this proposed rule, FRA invites comments on the jurisdictional determinations proposed in this notice.

Section (f) of the Act explicitly gives discretion to the Secretary on the

question of whether to subject private highway-rail crossings, pedestrian crossings, and crossings utilized primarily by nonmotorized vehicles and other special vehicles to this regulation. At this time, FRA is proposing to exercise its jurisdiction in a limited manner regarding these crossings.

Although some private crossings experience heavy rail and motor vehicle use, we do not have sufficient information as to present practices, the number and type of such diverse crossings, and the impacts of locomotive horns at such crossings. Thus, FRA will not at this time require that the locomotive horn be sounded at private highway-rail crossings. Whether horns must be sounded at such crossings will remain subject to state law (if any) and agreements between the railroad and the holder of crossing rights. FRA will, however, permit the establishment of quiet zones on rail line segments which include private crossings. To do otherwise would undermine a major purpose of the Act.

While we believe that, absent compensating warning or protective devices, sounding of locomotive horns provides a safer highway-rail crossing, it may be sufficient that the locomotive bell, rather than horn, be rung prior to entering a pedestrian or other non-highway crossing. At such crossings, pedestrians, horse-drawn vehicles, bicycles, and equestrians enter the crossing at a significantly slower speed than motor vehicles, are not enclosed as in an automobile or truck, and do not face the same distractions as those confronting motorists. FRA therefore proposes to decline to exercise jurisdiction over the use of locomotive horns at such crossings.

Section 222.5 Preemptive Effect

This section provides notice that pursuant to 49 U.S.C. 20106, issuance of these regulations preempts any State law, rule, regulation, or order covering the same subject matter, except a provision necessary to eliminate or reduce an essentially local safety hazard, that is not incompatible with Federal law or regulation and does not unreasonably burden interstate commerce. Accordingly, all existing local ordinances and state statutes relating to whistle bans or to the sounding of locomotive horns at public highway-rail crossings will be preempted by this regulation unless such ordinances or laws fall within the exception contained within 49 U.S.C. § 20106. This rule, however, does not confer authority on localities to establish quiet zones if state law does not otherwise permit such actions.

Section 222.7 Definitions

This proposed rule uses various terms which are not widely understood or which, for purposes of this rulemaking, have very specific definitions. This section defines the following terms:

"Barrier curb" means a highway curb designed to discourage a motor vehicle from leaving the roadway. FRA proposes to define such curb as a curb more than six inches, measured from the surface of the roadway. As with mountable curbs and channelization devices, additional design requirements are left to the standard specifications used by the governmental entity constructing the engineering improvements.

"Channelization device" means one of a continuous series of highly visible obstacles placed between opposing highway lanes designed to alert or guide traffic around an obstacle or to direct traffic in a particular direction. Channelization devices must be at least 2.5 feet high and placed a maximum of seven feet apart.

"Effectiveness rate" means the effectiveness of a supplementary safety measure in reducing the probability of a collision at a highway-rail grade crossing. (Effectiveness is indicated by a number between zero and one which represents the reduction of the probability of a collision as a result of the installation of a supplementary safety measure when compared to the same crossing equipped with conventional automated warning systems of flashing lights, gates and bells. Zero effectiveness means that the supplementary safety measure provides no reduction in the probability of a collision (there is no effectiveness) while an effectiveness rating of one means that the supplementary safety measure is totally effective in reducing collisions. Measurements between zero and one reflect the percentage by which the supplementary safety measure reduces the probability of a collision. Thus, a supplementary safety measure with an effectiveness of .37 reduces the probability of a collision by 37 percent).

"Locomotive horn" means a locomotive air horn, steam whistle, or similar audible warning device mounted on a locomotive or control cab car. The terms "locomotive horn", "train whistle", "locomotive whistle", and "train horn" are used interchangeably in the railroad industry. Specifications concerning audible warning devices on locomotives other than steam locomotives are contained in 49 CFR 229.129.

"Median" means an "island" or the portion of a divided highway separating

the travel ways for traffic in opposite directions. A median is bounded by mountable or barrier curbs.

"Mountable curb" means a highway curb designed to permit a motor vehicle to leave a roadway when required. It is a curb not more than six inches high measured from the roadway surface, with a well rounded top edge. Additional design specifications are determined by the standard traffic design specifications used by the governmental entity constructing the mountable curb.

"Positive train control territory" means, for purposes of this part, a line of railroad on which railroad operations are governed by a train control system which is capable of determining the position of the train in relation to a highway-rail grade crossing and capable of computing the time of arrival of the train at the crossing which results in the automatic operation of the locomotive horn or the automatic prompting of the locomotive engineer such that the horn is sounded at a predetermined time prior to the locomotive's arrival at the crossing.

"Public highway-rail grade crossing" means a location where a public highway, road, or street, including associated sidewalks or pathways, crosses one or more active railroad tracks at grade. Public highway-rail grade crossing, also referred to in this part as "highway-rail crossings", "public grade crossing", and "grade crossing", includes pedestrian walkways or other pathways when associated or part of a larger public highway, road or street crossing.

"Quiet zone" means a segment of a rail line within which is situated one or a number of consecutive highway-rail crossings at which locomotive horns are not routinely sounded.

"Railroad" means any form of nonhighway ground transportation that runs on rails or electromagnetic guideways and any entity providing such transportation, including (i) Commuter or other short-haul railroad passenger service in a metropolitan or suburban area and commuter railroad service that was operated by the Consolidated Rail Corporation on January 1, 1979; and (ii) high speed ground transportation systems that connect metropolitan areas, without regard to whether those systems use new technologies not associated with traditional railroads; but does not include rapid transit operations in an urban area that are not connected to the general railroad system of transportation.

"Supplementary safety measure" means a safety system or procedure

established in accordance with this part which is provided by the appropriate traffic control authority or law enforcement authority and that is determined by the Administrator to be an effective substitute for the locomotive horn in the prevention of highway-rail casualties.

"Whistle board" means a post or sign directed toward oncoming trains and bearing the letter "W" or equivalent symbol, erected at a distance from a grade crossing, which indicates to the locomotive engineer that the locomotive horn should be sounded beginning at that point.

Section 22.9 Penalties.

This provision provides civil penalties for violations of requirements of this regulation. Any person or railroad who violates or causes a violation is subject to a civil penalty of up to \$11,000. Penalties may be assessed against individuals only for willful violations. Penalties of up to \$22,000 can be assessed for violations caused by gross negligence, or where a pattern of violations has created a risk or was the cause of death or injury to any person. Maximum penalties of \$11,000 and \$22,000 are required by the Federal Civil Penalties Inflation Adjustment Act of 1990 (Pub.L. 101-410) (28 U.S.C. 2461 note), as amended by the Debt Collection Improvement Act of 1996 (Pub.L. 104-134, 110 Stat. 1321-373) which requires each agency to regularly adjust certain civil monetary penalties in an effort to maintain their remedial impact and promote compliance with the law.

Section 22.11 Petitions for Waivers

This section explains the process for requesting a waiver from a provision of this regulation. FRA has historically entertained waiver petitions from parties affected by an FRA regulation. In many instances, a regulation, or specific section of a regulation, while appropriate for the general regulated community, may be inappropriate when applied to a specific entity. Circumstances may make application of the regulation to the entity counterproductive; an extension of time to comply with a regulatory provision may be needed; or technological advancements may result in a portion of a regulation being inappropriate in a certain situation. In such instances, FRA may grant a waiver from its regulations. The rules governing FRA's waiver process are found in 49 CFR part 211. In summary, after a petition for a waiver is received by FRA, a notice of the waiver request is published in the **Federal Register**, an opportunity for

public comment is provided, and an opportunity for a hearing is afforded the petitioning or other interested party. FRA, after reviewing information from the petitioning party and others, will grant or deny the petition. In certain circumstances, conditions may be imposed on the grant of a waiver if FRA concludes that the conditions are necessary to assure safety or if they are in the public interest. Because this regulation's affected constituency is broader than most of FRA's rail safety regulations, the waiver process is proposed to be somewhat different. Paragraphs (a) and (b) address the aspects which are different than FRA's customary waiver process. However, as paragraph (c) makes clear, once an application is made pursuant to either paragraph (a) or (b), FRA's normal waiver process, as specified in 49 CFR part 211, applies.

Paragraph (a) of this section addresses jointly submitted waiver petitions as specified by 49 U.S.C. 20153(d). Such a petition must be submitted by both the railroad whose tracks cross the highway and by the appropriate traffic control authority or law enforcement authority which has jurisdiction over the roadway crossing the railroad tracks. Although § 20153(d) requires that a joint application be made before a waiver of a provision of this regulation is granted, FRA, in paragraph (b), addresses the situation that may occur if the two parties can not reach agreement to file a joint petition. Section 20153(l)(3) gives the Secretary (and the Federal Railroad Administrator) the authority to waive in whole or part any requirement of § 20153 (with certain limited exceptions) if it is determined not to contribute significantly to public safety. FRA thus proposes to accept individually filed waiver applications (under certain conditions) as well as jointly filed applications. In an effort to encourage the traffic control authority and the railroad to agree on the substance of the waiver request, FRA proposes to require that the filing party specify the steps it has taken in an attempt to reach agreement with the other party. Additionally, the filing party must also provide the other party with a copy of the petition filed with the FRA.

It is clear that FRA prefers that petitions for waiver reflect the agreement of both entities controlling the two transportation modes at the crossing. If agreement is not possible, however, FRA will entertain a petition for waiver, but only after the two parties have attempted to reach an agreement on the petition.

Paragraph (c) provides that each petition for a waiver must be filed in the manner required by 49 CFR part 211.

Paragraph (d) provides that the Administrator may grant the waiver if the Administrator finds that it is in the public interest and that safety of highway and railroad uses will not be diminished. The Administrator may grant the waiver subject to any necessary conditions required to maintain public safety.

Subpart B—Use of Locomotive Horns

Section 222.21 When To Use Locomotive Horns

Paragraph (a) of this section would require that, except as provided elsewhere in this part, a locomotive horn on the lead locomotive of a train, or the lead locomotive of a consist of locomotives, or on an individual locomotive must be sounded when the locomotive or lead car is approaching and passes through each public highway-rail crossing. The locomotive horn must be sounded with a series of two long, one short, and one long horn blasts to signify the locomotive's approach to a crossing. FRA is adopting the industry standard as the required indicator of the approach of a locomotive to a crossing. This paragraph also requires that the horn be blown at the location required in paragraph (b) and that the horn warning be repeated or prolonged until the locomotive or train occupies the crossing.

The remaining paragraphs of this section address the specific location at which the sounding of the locomotive horn should be initiated. Establishment of this point is important both to provide adequate warning to the motorist and also to not unnecessarily impose the loud locomotive horn noise upon the surrounding community.

In drafting paragraph (b), FRA has attempted to address the fact that various states have long established requirements governing the location at which the horn must be sounded. Although those requirements would be preempted by this rule, rather than require immediate wholesale changes of whistle boards and timetable instructions, FRA is not proposing to immediately change the practical effects of present state requirements, if any. However, if a railroad changes the maximum authorized track speed on a line of railroad approaching a grade crossing, the location where the locomotive engineer is required to sound the horn (as indicated by whistle board or other method) must then be adjusted to reflect the change. The

adjustment at that time would be made irrespective of conflicting state law.

This paragraph further establishes (within the $\frac{1}{4}$ mile limitation contained in paragraph (e)) the location at which the locomotive horn should be sounded. If using whistle boards, the railroad must place them at a distance from the crossing equal to the distance traveled by a train in 20 seconds while operating at the maximum speed allowed for any train operating on the track in that direction of movement. Because a fixed location for sounding of a horn results in differing periods of warning depending on the speed of the train or locomotive, the location of a whistle board must therefore be dependent on the fastest train operating over that track. If a railroad decreases the maximum authorized speed of trains operating over a crossing, the whistle board must be moved closer to the crossing in order to provide 20 seconds of warning. Conversely, if the maximum authorized speed is increased, then the whistle board must be placed farther from the crossing to maintain the 20 second warning time.

Paragraph (b) further provides that if the railroad uses methods or systems other than whistle boards to indicate when the horn should be sounded (such as positive train control systems), that system should ensure that the horn is sounded not less than 20, nor more than 24 seconds before the locomotive enters the grade crossing.

Paragraph (c) addresses the situation in which a state does not have on the effective date of this rule, a specific requirement for placement of whistle boards or specific distance requirements for the sounding of a horn. In that case, a railroad must take the same actions as are required when it adjusts maximum authorized speed in paragraph (b) above; if using whistle boards, the railroad must (within the $\frac{1}{4}$ mile limitation contained in paragraph (e)) place them at a distance from the crossing equal to the distance traveled by a train in 20 seconds while operating at the maximum speed allowed for any train operating on the track in that direction of movement. If the railroad uses methods or systems other than whistle boards to indicate when the horn should be sounded (such as positive train control systems), that system should ensure that the horn is sounded not less than 20 seconds, nor more than 24 seconds before the locomotive enters the grade crossing. These provisions, together with the definition of "positive train control" are based on the long held assumption that sounding the locomotive horn for 20 seconds before entering the grade

crossing provides the optimum length of warning. Recent research, however, tends to indicate that 15 seconds of advance warning may be sufficient, especially where active warning systems are in place at the crossing. FRA requests comments on the proper length of time and under what circumstances locomotive horns should be sounded.

Paragraph (d) provides that each railroad, irrespective of state law to the contrary, must promptly adjust the location of each whistle board to reflect changes in maximum authorized track speeds, except where all trains operating over that crossing are equipped to be responsive to a positive train control system. This paragraph mandates that if a railroad decreases the maximum authorized speed of trains operating over a crossing, the whistle board must be moved closer to the crossing. Conversely, if the maximum authorized speed is increased, then the whistle board must be placed farther from the crossing. Railroads must ensure that whistle boards are placed at a distance from each crossing equal to the distance traveled by a train in 20 seconds while operating at the maximum speed allowed for any train operating in that direction of movement.

Paragraph (e) establishes a maximum distance of $\frac{1}{4}$ mile before a crossing, over which a train horn may be sounded, regardless of train speed. Sound diminishes at a rate of approximately 7.5dB(A) for each doubling of distance. Thus, a locomotive horn registering 100dB(A) at 100 feet in front of the locomotive will have diminished to roughly 75 dB(A) at $\frac{1}{4}$ mile (1,320 feet) in front of the locomotive. That distance is likely near the outer margin of utility in terms of alerting the motorist to oncoming trains at that particular crossing.

Section 222.23 Emergency and Other Uses of Locomotive Horns

Paragraph (a) of this section is meant to make clear that even at grade crossings subject to quiet zone conditions, locomotive engineers may sound the locomotive horn in emergency situations. Nothing in this part is intended to prevent an engineer from sounding the locomotive horn to provide a warning to vehicle operators, pedestrians, trespassers or crews on other trains in an emergency situation if, in the engineer's sole judgment, such action is appropriate in order to prevent imminent injury, death or property damage. Establishment of a quiet zone does not prevent an engineer from sounding the horn in such situations, nor does it impose a legal duty to do so. Additionally, paragraph (b) provides

that nothing in this part restricts the use of the horn to announce the approach of the train to roadway workers in accordance with a program adopted under 49 CFR part 214. This regulation is not meant to restrict the use of the locomotive horn when active crossing warning devices have malfunctioned and use of the horn is required by either 49 CFR 234.105 (activation failure), 234.106 (partial activation), or 234.107 (false activation).

Subpart C—Exceptions To Use of the Locomotive Horn

Section 222.31 Train Operations Which Do Not Require Sounding of Horns at Individual Crossings

This section addresses the situation in which locomotive horns need not be sounded even though the crossing is not part of a quiet zone. Locomotive horns need not be sounded at individual highway-rail grade crossings at which the maximum authorized operating speed (as established by the railroad) for that segment of track is 15 miles per hour or less and properly equipped flaggers (as defined by 49 CFR 234.5) provide warning to motorists. These limited types of rail operations do not present a significant risk of loss of life or serious personal injury and thus, under the Act, may be exempted from the requirement to sound the locomotive horn. Locomotive horns will still be required to be sounded if automatic warning systems have malfunctioned and the crossing is being flagged pursuant to 49 CFR 234.105, 234.106, or 234.107. Horns will still be required in these limited circumstances in order to offset the temporary loss of the active warning which motorists have presumably come to rely on.

This section is an exception to the requirement that silencing of locomotive horns must include all crossings within a designated quiet zone. This section permits a railroad, on its own initiative, to silence its horns at individual crossings under certain circumstances in which the safety risk is low. The primary purpose of this section is not the same as that of § 222.35 ("Establishment of quiet zones"). Rather than silencing horns for the benefit of the surrounding community, this section will be used primarily at crossings located in industrial areas where substantial switching occurs, and would avoid unnecessary noise impacts on those railroad personnel working on the ground in very close proximity to the locomotive horn. This section recognizes that under the noted conditions, public and railroad safety do not require the sounding of locomotive

horns—a railroad is thus free to eliminate them. Since the primary beneficiary of this section is not nearby residences, the reasoning for the establishment of quiet zones rather than individual quiet crossings would not be applicable here. There is no additional burden placed on an engineer in this situation since the flagger will generally be a member of the train crew itself, and the engineer will not be placed in the position of having to determine when horns must be silenced or sounded as would be the case if horns could be silenced on an individual crossing basis. Additionally, prevention of noise spill-over from a crossing would not be a consideration in these situations.

FRA has considered whether railroad operations involving less frequent service and slow speeds, such as railroad operations typically associated with short lines and secondary lines, should also be categorically excluded from the requirement to sound locomotive horns based on the premise that they do not present a significant risk of loss of life or serious personal injury. Another factor which could be considered in addition to the above factors is the level of highway traffic over the crossing. While FRA is not proposing at this time to categorically exclude crossings based on these factors, FRA solicits comments, and specific suggestions as to the desirability of categorically excluding certain crossings based on a combination of the above factors or other characteristics of crossings that significantly affect risk. Inclusion of supporting data and analysis is encouraged.

Section 222.33 Establishment of Quiet Zones

Methods of Establishing a Quiet Zone

This section addresses the manner in which quiet zones are established. A quiet zone is defined as a segment of rail line within which is situated one or a number of consecutive highway-rail crossings at which locomotive horns are not routinely sounded. The concept of quiet zones is crucial to understanding the intent and thrust of this proposed rule. While it would be possible to approve a ban on locomotive whistles on a case-by-case, or a crossing-by-crossing basis, the desired result of less disruption to the surrounding community by locomotive horn noise would be minimal. Because a locomotive horn must be sounded well in advance of a grade crossing, the noise spill-over from a crossing not subject to a ban could still disrupt the community near a crossing where horns are banned.

As a result, the concept of a quiet zone was developed, which would essentially fulfill the following purposes: ensure that a whistle ban would have the greatest impact in terms of noise reduction; ease the added burden on locomotive crews of the necessity of determining on a crossing-by-crossing basis whether or not to sound the horn; and enable grade crossing safety initiatives to be focused on specific areas within the quiet zone.

FRA proposes two different methods of establishing quiet zones, depending on local circumstances. In one method (provided for in § 222.33(a)), every public grade crossing within the proposed quiet zone would have a supplementary safety measure applied to the crossing. These measures, which are listed in Appendix A, have been determined by FRA to be an effective substitute for the locomotive horn in the prevention of highway-rail grade crossing casualties. In other words, these measures each have an effectiveness rate which is at least equivalent to that of a locomotive horn. Because each highway-rail grade crossing would be upgraded from the standard flashing lights and automatic gates to a crossing with a supplementary safety measure, FRA's role would be minimal. The governmental entity establishing the quiet zone would only need to designate the extent of the quiet zone, install the supplementary safety measures, and comply with various notice and information requirements of § 222.35(a).

Another method (provided for in § 222.33(b)) of establishing a quiet zone permits a governmental entity greater flexibility in using supplementary safety measures or other types of safety measures (alternative safety measures) to deal with problem crossings. While Appendix A lists those measures which FRA believes fully compensate for the lack of a locomotive horn, Appendix B includes all Appendix A measures and adds other safety measures whose success in compensating for the locomotive horn is dependent on the level of time and effort expended by the community. Such measures include public safety education and increased law enforcement programs. Using a combination of supplemental safety measures from Appendix A, alternative safety measures listed in Appendix B, and tailoring supplemental safety measures to unique circumstances at specific crossings, the governmental entity is provided with a greater level of flexibility than is available using only supplementary safety measures from Appendix A. Another major difference in this approach from the earlier method

is the manner in which risk is viewed. In this more flexible approach, risk will be viewed in terms of the quiet zone as a whole, rather than at each individual grade crossing. Thus, FRA would consider a quiet zone under this approach that does not have a supplemental safety measure at every crossing as long as implementation of the proposed supplementary and alternative safety measures on the quiet zone as a whole will cause a reduction in risk to compensate for the lack of a locomotive horn. If the aggregate reduction in predicted collision risk for the quiet zone as a whole is sufficient to compensate for the lack of a horn, a quiet zone may be established.

Because of the greater flexibility and the greater variation in possible risk reduction, FRA would take a much more active role in reviewing the approach of the governmental entity. Paragraph (b) of this section provides that a state or local government may apply to the FRA Associate Administrator for Safety for acceptance of a quiet zone, within which one or more safety measures identified in Appendix B (alone or together with supplementary measures identified in Appendix A), will be implemented. The application for acceptance must contain a commitment to implement the proposed safety measures within the proposed quiet zone. The applying entity must demonstrate through data and analysis that implementation of the proposed measures will effect a reduction in risk at public highway-rail crossings within the quiet zone sufficient to equal the reduction in risk that would have been achieved through the use of the locomotive horn.

It is important to note that, as required in paragraph (d) of this section, all public highway-rail crossings in a quiet zone, except for those exceptions contained in § 222.31 and Appendix C, must be equipped with automatic gates and lights that conform to the standards contained in the Manual on Uniform Traffic Control Devices.

Under paragraph (b)(2), the FRA Associate Administrator for Safety may take one of three actions in response to a state or local government application: (1) The quiet zone may be accepted as proposed; (2) the Associate Administrator may accept the proposed quiet zone under additional conditions designed to ensure that the safety measures fully compensate for the absence of the warning provided by the locomotive horn; or (3) the proposed quiet zone may be rejected if, in the Associate Administrator's judgment, the proposed safety measures do not fully compensate for the absence of the

warning provided by the locomotive horn.

Paragraph (c) addresses the categories of crossings which the Administrator has determined do not present a significant risk with respect to loss of life or serious personal injury if the locomotive horn is not sounded. In the very limited situations listed, neither supplementary safety measures, nor lights, gates and bell are required at the crossing. Appendix C contains a list of those criteria which must be met for a quiet zone to be established under this provision. The criteria include: Maximum authorized train speed as established by the railroad does not exceed 15 miles per hour; the train travels between traffic lanes of a public street or on an essentially parallel course within 30 feet of the street; unless the railroad is actually situated on the surface of the public street, traffic on all crossing streets is controlled by STOP signs or traffic lights which are interconnected with automatic crossing warning devices; and the locomotive bell is rung when approaching and traveling through the crossing.

FRA'S Approach and Request for Comments. FRA has specified in Appendix B the manner in which the community must show the reduction in risk resulting from its proposed alternative safety measures. In proposing the very specific procedures cited in Appendix B (and in its introduction), FRA has been guided by the need to establish a predictable environment within which affected communities can plan and take action. FRA believes that such objective measures will help communities in their decision-making process, as well as assist FRA in determining which proposals will in fact provide for the safety of the motoring and rail public. One alternative to FRA's proposal would allow communities to perform their own effectiveness analyses based on methodology of their own choosing with subsequent reporting of the methodology and data results to FRA. That alternative would result in FRA review of both the methodology and the data involved in each submission from each locality wishing to establish a quiet zone. That approach might provide greater flexibility to communities to design countermeasures meeting their needs and circumstances. However, FRA is concerned that this approach might overwhelm FRA's resources and delay approvals beyond reasonable limits. This could backlog review of proposed new quiet zone proposals emanating from communities impacted by industry restructuring (such as the proposed acquisition of Conrail by

Norfolk Southern and CSX Transportation). Further, ascertaining appropriate decisional criteria for evaluating community submissions might present a major challenge. The proposed alternative measures laid out in this notice already comprehend the broad range of safety measures within the traditional crossing safety categories of "engineering, education, and enforcement." Commenters are asked to note specific examples of opportunities that might be presented by less definite enumeration of alternative measures.

FRA encourages comments on the proposed regulatory approach, as well as alternative suggestions as to the best way to assure that alternative safety measures will in fact compensate for the lack of a locomotive horn.

Who May Establish a Quiet Zone

Under this proposed rule, a local political jurisdiction, in addition to a state, can establish a quiet zone. FRA does not intend that the proposed rule confer authority on localities to establish quiet zones if state law does not otherwise permit such actions. Local political jurisdictions are creations of their respective states and their powers are thus limited by their individual state law or constitution.

Under the Act and the proposed regulations, establishment of quiet zones requires specific action by a state or local governmental body. Therefore, if the appropriate political entity determines that sounding of locomotive horns at grade crossings is the proper course of action for their community, no specific action needs to be taken to ensure that locomotive horns are sounded at every public highway-rail grade crossing. This is, of course, a legitimate public policy result. However, if quiet zones are desired, there are a number of approaches that could be considered in terms of application and implementation.

First, one approach could be that all designations and applications under this section must come from a state agency. Under this approach, FRA would deal with only one entity from each state. How the state determines which quiet zones are designated and which should be the subject of an application for acceptance would be up to each individual state. The processes may be as varied as: the state agency acting only as a conduit for designations and applications; the agency acting as a filter to weed out "inappropriate" applications; or, the state agency acting solely on its own to determine the extent of designations and applications.

A second approach would limit authority for designations and

applications to the political subdivision with direct responsibility over traffic safety at a crossing. This approach would present problems inasmuch as a line of railroad typically crosses state highways, and city, county, and village roads.

A third approach would require the political subdivision in which the proposed quiet zone is located to be the applicant.

FRA at this time contemplates that both states and local jurisdictions (if they have the legal authority to do so) will establish quiet zones under both paragraphs (a) and (b) of this section. FRA encourages comments on this regulatory approach.

Length of Quiet Zone

Paragraph (d) addresses the minimum length of a quiet zone. FRA believes that if locomotive horns are to be prohibited along a segment of track, the underlying purpose of the prohibition will not be served unless the prohibition is effective on a corridor-like basis. Without a quiet zone requirement, the sounding of horns may be prohibited at one crossing, required at the next crossing two blocks away, and then prohibited at the next crossing one-quarter mile along the line. Because horns must be sounded in advance of a public highway-rail crossing, the horn being sounded at the one crossing in the example will effectively negate a large measure of the benefit of the prohibition elsewhere along the corridor.

In addition to ensuring the benefits of the prohibition within the zone, imposition of a horn prohibition on a zone basis will eliminate excessive, and unnecessary workload demands on the engineer, permitting greater attention to other locomotive operating requirements. Without a zone prohibition, the engineer will be faced with the need to constantly be aware of which crossings are subject to a prohibition and which are not. Such a situation provides a greater chance of human error than if the engineer need only concentrate on groups of crossings. Paragraph (d) establishes the minimum length of a quiet zone as 2,640 feet (one-half mile). The community which establishes a quiet zone has the discretion to determine the length (subject to the one-half mile minimum); however, certain factors should be taken into consideration in establishing such a quiet zone. While locomotive horns can not be routinely sounded at all crossings within the quiet zone, it is entirely possible that sound from a locomotive horn for a crossing just outside the quiet zone will begin in the quiet zone or will intrude into the area of the quiet zone. It is up to the community to devise the placement of a quiet zone to minimize that effect.

The following is an example of two different acceptable quiet zones in terms of placement: *Example No. 1:* A single grade crossing at milepost 4.5 is subject to a quiet zone. In this situation, the quiet zone would extend at least one-quarter-mile in each

direction along the right-of-way. If there are public highway-rail grade crossings at milepost 4.2 or 4.8, (both of which are outside of the quiet zone), locomotive horns would need to be sounded for those crossings, despite beginning within the quiet zone or despite intruding into the quiet zone. In this example, a community could extend the quiet zone to include either, or both additional crossings. Those crossings must then either comply with the requirements contained in Appendix A, or the quiet zone as a whole must compensate for the lack of a horn through a combination of measures from Appendix A and Appendix B.

Example No. 2: Four public highway-rail grade crossings at every block for a distance of .4 mile. (Crossings at mileposts 4.5, 4.6, 4.7, 4.8 are subject to a quiet zone.) Additional crossings at mileposts 4.3 and 4.4 do not have to be included in a quiet zone if the quiet zone is extended in the other direction along the track—to milepost 5.0. That would be acceptable even if there were no crossings from milepost 4.8 to 5.0. The crossings within the quiet zone in this example, like the crossings in Example No. 1, must then either comply with the requirements contained in Appendix A, or the quiet zone as a whole must compensate for the lack of a horn through a combination of measures from Appendix A and Appendix B. It is clear that under this approach, locomotive horn noise for crossings at mileposts 4.3 and 4.4 will intrude or begin within the quiet zone. However, the approach set out here provides a community with the greatest flexibility in determining how to, and where to establish quiet zones.

BILLING CODE 4910-06-P

Example 1**Example 2****BILLING CODE 4910-06-C****Requirement for Active Warning Devices**

Paragraph (e) provides that, except for slow speed train movements over public highway-rail grade crossings as addressed in § 222.31, and quiet zones established in accordance with paragraph (c) of this section, each crossing in a quiet zone must be equipped with automatic gates and flashing lights that conform to the standards contained in the Manual on Uniform Traffic Control Devices. This section makes it clear that installation or upgrading of these devices is not regarded as implementation of supplementary safety measures under this part, nor will the risk reduction resulting from the installation or upgrading be credited toward the compensating reduction in risk referenced in paragraph (b). If the new warning system exceeds the standards of the MUTCD and conforms to the requirements for supplementary safety measures contained in Appendix A, that

risk reduction attributable to the supplementary safety measure in accordance with Appendix A may be credited toward the risk reduction referenced in paragraph (b).

Requirement for Advance Warning Signs

Paragraph (f) ensures that motorists are notified wherever horns are not required to be sounded. The paragraph requires that each highway approach to each public highway-rail crossing at which locomotive horns are not routinely sounded pursuant to this part shall be equipped with an advance warning sign advising the motorist that train horns are not sounded at the crossing. FRA will leave to individual states the decision as to specific size and design of the required signs, however, they must be in conformance with the MUTCD. FRA is not at this time proposing that approaches to each private highway-rail crossing be equipped with such advance warning signs. FRA solicits comments as to whether such signs should be required,

and if so, who should be responsible for installation and maintenance. A factor to consider is that by definition, the approaches to these crossings are on private, rather than public property.

Section 222.35 Notifications, Affirmations, and Required Information

Paragraph (a) requires a state or local government designating a quiet zone under § 222.33(a) to provide written notice of the designation to all railroads operating over public highway-rail grade crossings within the quiet zone, the highway or traffic control authority and law enforcement authority having control over vehicular traffic at the crossings within the quiet zone, the state agency responsible for highway and road safety, and the FRA Associate Administrator for Safety. In order to ensure that all parties have notice and sufficient time to prepare for the change at the crossings, all notices required under this section must be provided by certified mail, return receipt requested.

Paragraph (b) contains the notice requirements which apply to the

situation in which a state or local government has proposed a quiet zone for acceptance by FRA under § 222.33(b). Upon acceptance of a quiet zone by FRA, the state or local government must provide written notice by certified mail, return receipt requested, of the acceptance to all railroads operating over the public highway-rail grade crossings within the quiet zone, the highway or traffic control authority or law enforcement authority having control over vehicular traffic at the crossings within the quiet zone, and the state agency responsible for highway and road safety.

Paragraph (c) ensures that certain needed information is provided to FRA. This section requires that certain information be provided to the FRA Associate Administrator for Safety.

Paragraph (1) requires an accurate and complete U.S. DOT-AAR National Highway-Rail Grade Crossing Inventory Form (Inventory Form) for each crossing dated within six months prior to the designation of FRA acceptance of the quiet zone. The information from this form will establish a base-line from which FRA can determine the measures taken by the state or locality to compensate for the lack of a locomotive horn.

Paragraph (2) requires submission of a current Inventory Form which reflects the supplementary and alternative safety measures which have been put in place upon establishment of the quiet zone.

Paragraph (3) requires the name and title of the state or local official responsible for monitoring compliance with this regulation and the manner in which the person can be contacted.

Section 222.37 Quiet Zone Implementation

Paragraph (a) provides that a quiet zone can not be implemented until all requirements of § 222.35 are complied with and at least 14 days have elapsed since the required parties have received the notifications required by that section. The notification provision and two-week delay will ensure that the various interested parties have time to inform employees and others regarding the changes at the crossings. Paragraph (b) provides that all railroads operating over public highway-rail grade crossings within a quiet zone established in accordance with this regulation shall cease routine use of the locomotive horn as of the date established by the state or local government, which of course can be later than the 14 day minimum period. This paragraph prohibits the routine use of the locomotive horn within the quiet zone. However, the rule

is not meant to prohibit the occasional use of the horn for railroad operating purposes such as for crew and flagger communications when radios fail. The rule does not prohibit use of the horn in emergency situations or as a method of warning railroad workers of the approach of the train. (See § 222.23.)

Section 222.39 Quiet Zone Duration

Paragraph (a) governs the duration of quiet zones designated by state or local governments under § 222.33(a) i.e., zones in which supplementary safety measures are in place at each crossing. A quiet zone may remain in effect indefinitely if all the requirements of this rule are complied with, and if, within six months before the expiration of five years from the original designation made to FRA, the designating entity (the state or local government) affirms in writing, by certified mail, return receipt requested, to the same parties receiving the original notification of implementation of the quiet zones under § 222.35(a), that the supplementary safety measures implemented within the quiet zone continue to conform to the requirements of Appendix A of the regulation. The designating entity must thereafter affirm within six months before the fifth anniversary of the prior affirmation that the supplementary safety measures implemented within the quiet zone continue to conform to the requirements of Appendix A of the regulation.

This paragraph, as well as paragraph (b), also requires that along with its affirmation, the governmental entity must send to the FRA Associate Administrator for Safety an accurate and complete U.S. DOT-AAR National Highway-Rail Grade Crossing form (FRA F6180.71) (available through the FRA Office of Safety Analysis, 202-493-6299) for each public highway-rail grade crossing. This requirement will ensure that the National Inventory is kept current regarding all crossings within quiet zones.

Paragraph (b) governs the duration of quiet zones accepted by FRA under § 222.33(b), i.e., zones that, as a whole, comply with Appendix B. This provision is similar to paragraph (a), with the exception that the period between affirmations is 3, rather than 5 years and that the state or local government must affirm that the supplementary and alternative safety measures in place continue to be effective and continue to fully compensate for the absence of the warning provided by the locomotive horn. FRA is proposing a shorter period between affirmations because of the greater possibility that changed

circumstances will affect the effectiveness of the safety measures put in place in the quiet zone. Because every public highway-rail crossing subject to the five year affirmation period has in place a supplementary safety measure providing sufficient compensation for lack of a locomotive horn, as long as such measures remain in place, FRA can be assured that safety is being maintained along the entire quiet zone. However, because the safety measures instituted at crossings subject to the three year affirmation period are dependent on local circumstances and local effort, review on a more frequent basis is appropriate. FRA solicits comment on this proposal.

Paragraph (d) provides that the FRA Associate Administrator for Safety may, at any time, review the status of any quiet zone and determine whether the safety measures in place fully compensate for the absence of the warning provided by the locomotive horn under the conditions then present at the public highway-rail grade crossings within the quiet zone. This oversight will enable FRA to take action in the event that conditions at the crossings have changed sufficiently so that safety measures originally installed and implemented are insufficient to compensate for the lack of a horn. Under this provision, if the Associate Administrator makes a preliminary determination that the safety measures in place do not fully compensate for the absence of the locomotive horn, notice of the determination will be published in the **Federal Register** and an opportunity for comment and informal hearing will be provided. The Associate Administrator may thereafter require that additional safety measures be taken to ensure that there is full compensation for the absence of the locomotive horn. This paragraph also provides for termination of the quiet zone if conditions so warrant.

Section 222.41 Supplementary and Alternative Safety Measures

Paragraph (a) states that a list of approved supplementary safety measures are listed in Appendix A to this regulation. These measures, based on the best available data, have been determined by FRA to be an effective substitute for the locomotive horn in the prevention of highway-rail casualties.

Paragraph (b) states that additional, alternative safety measures that may be included in a request for FRA acceptance of a quiet zone under § 222.33(b) are listed in Appendix B.

Paragraph (c) states that Appendix C contains a list of those situations which the Administrator has determined do

not present a significant risk with respect to loss of life or serious personal injury from establishment of a quiet zone. In the very limited situations listed, supplementary safety measures are not required because the requisite level of safety has already been achieved.

Paragraph (d) provides that the Administrator will add new listings to Appendices A or B when the Administrator determines that such measures or standards are effective substitutes for the locomotive horn in the prevention of highway-rail grade crossing casualties. The Administrator will add new listings to Appendix C when it is determined that no negative safety consequences result from the establishment of a quiet zone under the listed conditions.

Paragraph (e) is based on language contained in the Act, and makes clear that the following traditional highway-rail grade crossing safety measures do not individually, or in combination, constitute supplementary safety measures: standard traffic control devices or arrangements such as reflectorized crossbucks, stop signs, flashing lights, or flashing lights with gates that do not completely block travel over the line of railroad, or traffic signals.

Section 222.43 Development and Approval of New Supplementary Safety Measures

This section discusses the manner in which new supplementary safety measures may be demonstrated and approved for use. Paragraph (a) provides that interested parties may demonstrate proposed new supplementary safety measures to determine if they are an effective substitute for the locomotive horn in the prevention of highway-rail grade crossing casualties. Paragraph (b) provides that the Administrator may order railroad carriers operating over a crossing or crossings to temporarily cease the sounding of locomotive horns at such crossings to demonstrate proposed new supplementary safety measures. This paragraph reflects statutory language and requires that such proposed new supplementary safety measures have been subject to prior testing and evaluation before such an order is issued. The Administrator's order to the railroads to temporarily cease sounding of horns may contain any conditions or limitations deemed necessary in order to provide the highest level of safety. These provisions provide an opportunity for the testing and introduction of new grade crossing safety technology which would provide a sufficient level of safety to enable

locomotive horns to be silenced. FRA has, in one case to date, ordered a railroad to cease sounding horns for the purposes of testing. In Spokane, Washington, the Burlington Northern Santa Fe Railway (BNSF), Spokane County, Washington State Public Utilities Commission and the FRA worked together to test the effectiveness of median barriers as a substitute for the locomotive horn. See 62 FR 54681, August 21, 1997. To accomplish this test, BNSF was ordered to cease sounding of the horn after installation of engineering improvements at the two subject crossings. This test is continuing.

Paragraph (c) provides that upon the successful completion of a demonstration of proposed supplementary safety measures, interested parties may apply for their approval. This section requires certain information to be included in every application for approval.

Paragraphs (d) and (e) provide that if the FRA Associate Administrator for Safety is satisfied that the proposed supplementary safety measure fully compensates for the absence of the locomotive horn, its use as a supplementary safety measure (with any conditions or limitations deemed necessary) will be approved and it will be added to Appendix A.

Paragraph (f) provides an opportunity to appeal a decision of the FRA Associate Administrator for Safety. The party applying for approval of a supplementary safety measure may appeal to the Administrator a decision by the FRA Associate Administrator for Safety rejecting a proposed supplementary safety measure or the conditions or limitations imposed on use.

Section 222.45 Communities With Pre-existing Restrictions on Use of Locomotive Horns

Section (i)(1) of section 20153 requires that in issuing these regulations, FRA take into account the interests of communities that "have in effect restrictions on the sounding of a locomotive horn at highway-rail grade crossings, or have not been subject to the routine * * * sounding of a locomotive horn at highway-rail grade crossings. This section is meant to address that statutory requirement. FRA requests public comment regarding the provisions of this section. Paragraph (a) provides that communities which as of the date of issuance of this NPRM have enacted ordinances restricting the sounding of locomotive horns, or communities which as of the same date have not been subject to the sounding of

locomotive horns at public highway-rail crossings due to formal or informal agreements with the railroad may continue those restrictions for a period of up to three years from the date the final rule is issued. This period will enable the community to plan for, and implement additional safety measures at the affected crossings without the sounding of horns in the intervening period. This three-year period is dependent on compliance with paragraph (b).

Paragraph (b) states that if a community with pre-existing restrictions on locomotive horns has not designated a quiet zone (under § 233.33(a)) or had a quiet zone accepted by FRA (under § 233.33(b)) within two years after the date of issuance of the final rule, the community must, within two-years of issuance of the final rule, initiate or increase highway-rail grade crossing safety public awareness initiatives and grade crossing traffic law enforcement programs in an effort to offset the lack of supplementary safety measures at the affected crossings. If, however, the community does not take actions to initiate or increase public awareness initiatives and traffic law enforcement programs, locomotive horns must be sounded in accordance with § 222.21. Thus, the effect of paragraphs (a) and (b) provides communities with pre-existing whistle bans a three-year grace period to comply with §§ 233.33(a) or (b). If those communities do not initiate or increase public awareness initiatives and traffic law enforcement programs by the end of the second year after issuance of the final rule, then the three year grace period is reduced to two years.

A number of communities wishing to implement quiet zones have worked with FRA in developing programs of supplementary safety measures. These programs reflect the early commitment of local officials to both improve railroad safety and to minimize the disruption caused by train horns. These communities were concerned that if they invested funds in engineering improvements prior to issuance of this rule, those improvements might not be among those approved in the final rule, and thus they would be forced to spend more tax dollars installing other safety improvements after the final rule was issued. Given the absence of a regulation in force, the communities were free to ban sounding of the locomotive horn without implementing any grade crossing safety improvements at all. Neither these communities, nor FRA, wanted a whistle ban without supplementary safety measures in place. Therefore, FRA partnered with these

communities to develop workable, sound safety plans. As a result of these efforts, communities were able to reduce noise intrusion while FRA reaped the benefits of "real world" experience in the implementation of supplementary safety measures.

The quiet zones established, or planned to be established, by the following communities have been evaluated by FRA as being in compliance with the requirements of proposed § 222.33(b): crossings in Burlington, Vermont suburbs on the Vermont Railway; crossings in Louisville, Kentucky on CSX Transportation Company; single crossing at McNabb Road on Southeast Florida Rail Corridor; single crossing in Richardson, Texas; five crossing in Yakima, Washington, on the BNSF Railway; single crossing in Spokane, Washington on BNSF Railway; eleven crossings in Covina, California on MetroLink; and a single crossing in Westfield, New Jersey on the Lehigh Valley Railroad.

Accordingly, FRA proposes to exempt those communities from the initial acceptance requirements of that paragraph. Provisions of § 222.39(b) (Quiet Zone Duration) which contains periodic reaffirmation and notification requirements would apply to those quiet zones. FRA solicits comments regarding this, or any other suggested regulatory approach to those communities which have pre-existing restrictions on the use of locomotive horns.

Appendices A and B

Appendix A lists those supplementary safety measures which FRA has determined effectively compensate for the lack of a locomotive horn. Because each supplementary safety measure in this appendix fully compensates for the lack of a locomotive horn, a quiet zone may be established without specific FRA approval.

Appendix B lists those alternative safety measures which may compensate for the lack of a locomotive horn depending on the extent of implementation of the safety measure. Because of the many possible variations, FRA acceptance of the proposed implementation plan is required.

Community Guide

The introduction to Appendix A discusses the issues and actions that state and local governments should be aware of in determining how to proceed in implementing quiet zones. The guide is meant to assist in the community's decision-making process in determining whether to designate a quiet zone under § 222.33(a) or to apply for acceptance of

a quiet zone under § 222.33(b). The guide also contains details regarding the methods to be used in performing analyses which must accompany applications for acceptance of a quiet zone under § 222.33(b). If a crossing within a proposed quiet zone can not be addressed with a supplementary safety measure from Appendix A, the applicant community (or state) will need to show that once a quiet zone is implemented under the alternative safety measures listed in Appendix B, the number of accidents that can be expected on that quiet zone corridor will not increase. As a basis for that series of calculations, which are described in detail in the Introduction, FRA proposes to require that communities use the DOT Highway-Rail Crossing Accident Prediction Formula. The Accident Prediction Formula provides a means of calculating the expected annual number of accidents and casualties at a crossing on the basis of the crossing's characteristics and the crossing's historical accident experience. FRA's Regional Managers for Highway-Rail Crossing Safety who are located throughout the United States will be available to assist the communities in performing that analysis. Thus, all calculations involving a specific corridor proposed for a quiet zone will be based on the accident history at those crossings together with the characteristics of the crossing.

Appendix A

This Appendix lists those supplementary safety measures which FRA has determined effectively compensate for the lack of a locomotive horn. Included in the discussion of each supplementary safety measure is an "effectiveness" figure for that measure. That figure indicates the effectiveness of the supplementary safety measure in reducing the probability of a collision at a highway-rail grade crossing.

The effectiveness (see definition of effectiveness rate in § 222.7) figures discussed for each supplementary safety measure are based on available empirical data and experience with similar approaches. The effectiveness figures used in Appendix A are subject to adjustment as research and demonstration projects are completed and data is gathered and refined. FRA proposes to use these estimates as benchmark values to determine the effectiveness of an individual supplementary safety measure and the combined effectiveness of all supplementary safety measures along a proposed quiet zone. FRA seeks comments, including any data or

analysis, concerning the appropriateness of the individual estimates. FRA also encourages public comments on the appropriateness of this approach in general.

FRA's national study of train horn effectiveness indicated that collision probabilities increase an average of 62 percent when horns are silenced. As such, the supplementary safety measure should have an effectiveness of at least .38 (reducing the probability of a collision by at least 38 percent) in order to compensate for this 62 percent increase. For example, if a select group of 1,000 crossings are expected to have 100 collisions per year with train horns being sounded, this same group of crossings would be expected to have 162 collisions per year once the train horn is banned if no other safety measures are implemented and other factors remain unchanged. Conversely, if these same crossings were experiencing 162 collisions per year while the horn was banned, it would be expected that this number would reduce to 100 once use of the horn is reinstituted. This would equate to an effectiveness of 62/162, or .38.

FRA is aware this figure is an average, but it has the benefit of reflecting the broadest range of exposure available to the agency. FRA is willing to consider well founded arguments that train horn effectiveness is heightened or reduced under specific circumstances. However, any such argument would need to be grounded in sound data and analysis. This could potentially create significant difficulty in administration of the final rule, since historic collision patterns over a small number of crossings are not, by themselves, meaningful predictors of future exposure. FRA requests comment as to whether it is practical to use any value other than a national average with respect to train horn effectiveness.

There is one case for which FRA has sufficient data to estimate train horn effectiveness on a particular corridor. That is the Florida East Coast Railroad and the territory subject to Emergency Order 15. In that case, FRA can point to exposure for over 500 crossings over a period of eight years with experience both before and after the whistle ban period indicating consistent results. For that territory, FRA proposes to apply an effectiveness rate of 68% (.68) for the train horn. It should be noted that the extraordinary impacts shown in Florida have been segregated from the "national" data, and the national average of effectiveness of .38 (38 percent reduction) for train horns does not include the Florida experience. FRA requests comment as to what extent the

Florida experience may be relevant to other areas.

Much of the data available today to evaluate the effectiveness of supplementary safety measures reflects the reduction in violation rates, not collision rates. (Collisions are rare, and determination of a collision rate reduction for any one supplementary safety measure requires long term data collection.) Only one study (in Los Angeles) has contrasted collision rates with violation rates, and out of necessity (until additional data is available), this finding is used in these analyses. In the Los Angeles demonstration it was noted that a carefully administered and well publicized program of photo enforcement reduced violation rates by 92 percent, while collisions were reduced by only 72 percent. This ratio, 72:92 or .78, is proposed to be used to adjust violation rate reductions in order to estimate resultant reductions in collision rates for law enforcement and education/awareness options described in Appendix B. Violations that result in collisions constitute a small subset of all violations. It is reasonable to infer that education and legal sanctions may lack effectiveness for several segments of the population, including those who do not become aware of the countermeasures (e.g., because they are not residents of the area, do not follow public affairs in the media, or are difficult to reach because they are not fluent in English or other principal languages in which information is disseminated) and those who are particularly inclined to violation of traffic laws. As such, for law enforcement and education/awareness options the rate of violations must be reduced at least 49 percent (measure must have an effectiveness value of at least .49) in order to realize the required 38 percent reduction in the risk of collision.

In contrast, engineering improvements such as those described in Appendix A appear to work in synergy with existing warning systems to condition and modify motorist behavior, reducing both the number of violations and the number of very close calls (violations within a few seconds of the train's arrival). Four-quadrant gates installed to date, for instance, appear to have been completely successful in preventing collisions. Although we would not expect this extraordinarily high level of success to be sustained over a broader range of exposure, excellent results would be expected. Accordingly, for engineering improvements contained in Appendix A this notice adopts estimates of success drawn from carefully monitored studies of individual crossings.

FRA is aware that the number and duration of observations in site-specific studies is small. However, FRA is working with a variety of parties to gather additional information that may be helpful in achieving further refinement of effectiveness rates and greater confidence that they predict future outcomes in circumstances not identical to those specifically studied. FRA has sought partnerships with communities to implement or preserve quiet zones through use of supplementary safety measures. Unfortunately, many communities have taken the view that they will wait to see how the rulemaking might proceed before acting. Accordingly, FRA will proceed with the information available and will continue to gather effectiveness data as this rulemaking proceeds.

1. Temporary Closure of a Public Highway-Rail Grade Crossing

This supplementary safety measure has the advantage of obvious safety and thus will more than compensate for the lack of a locomotive horn during the periods of crossing closure. The required conditions for closure are intended to ensure that vehicles are not able to enter the crossing. In order to avoid driver confusion and uncertainty, the crossing must be closed during the same hours every day and may only be closed during one period each 24 hours. FRA believes that such consistency will avoid unnecessary automobile to automobile collisions in addition to avoiding collisions with trains. Activation and deactivation of the system is the responsibility of the local traffic control authority or the entity responsible for maintenance of the street or highway crossing the railroad. Responsibility for activation and deactivation of the system may be contracted to another party, however the appropriate governmental entity shall remain fully responsible for compliance with the requirements of this section. In addition, the system must be tamper and vandal resistant to the same extent as other traffic control devices.

Effectiveness: Because an effective closure system prevents vehicle entrance onto the crossing, the probability of a collision with a train at the crossing is zero during the period the crossing is closed. Effectiveness would equal 1. However, traffic would need to be redistributed among adjacent crossings or grade separations for the purpose of estimating risk following imposition of a whistle ban, unless the particular "closure" was accomplished by a grade separation.

2. Four-Quadrant Gate System

A four-quadrant gate system involves the installation of gates at a public highway-rail grade crossing to fully block highway traffic from entering the crossing when the gates are lowered. This system includes at least one gate for each direction of traffic on each approach. A four quadrant gate system is meant to prevent a motorist from entering the oncoming lane of traffic to avoid a fully lowered gate in the motorist's lane of traffic. Because an additional gate would also be fully lowered in the other lane of the road, the motorist would be fully blocked from entering the crossing.

In defining "supplementary safety measures" Congress approved use of four quadrant gates as supplementary safety measures. The definition states in part: "A traffic control arrangement that prevents careless movement over the crossing (e.g., as where adequate median barriers prevent movement around crossing gates extending over the full width of the lanes in the particular direction of travel), and that conforms to the standards prescribed by the Secretary * * * shall be deemed to constitute a supplementary safety measure." The Association of American Railroads (AAR) has shared with FRA its views on four-quadrant gates. The AAR states, "Since the operation of 4-quadrant gates has not yet been fully tried and proven, a false perception has been conveyed to [municipalities and state transportation agencies]. Continual advocacy of 4-quadrant gates * * * has put undue burdens on the railroads and its supply industry. The railroads are committed to grade crossing safety but are not exactly sure how 4-quadrant gates shall operate or if they will provide any additional benefits. * * *" The AAR requested that FRA "abstain from advocating the application of 4-quadrant gates until the operational and liability issues have been resolved." The AAR also submitted for FRA consideration a study entitled "Design of Gate Delay and Gate Interval Time for Four-Quadrant Gate System at Railroad-Highway Grade Crossings" by Dr. Fred Coleman of the University of Illinois. Dr. Coleman studied safe operating time parameters of four quadrant gates.

FRA has participated with the AAR, the Federal Highway Administration, the Brotherhood of Railroad Signalmen and railroad suppliers in discussions regarding four-quadrant gate systems. Those discussions resulted in some broad areas of agreement which have been incorporated into this proposed rule. Among areas of agreement are: (1) The need to do a location-specific

engineering study of the exit gate delay time; (2) that failure of the system would place the exit gates in the up position; and (3) highway presence detectors would be installed and maintained at the election of, and by, the local highway authorities. If detectors are provided, exit gates would remain up during the period the crossing is determined to be occupied by highway traffic.

Four-quadrant gate systems have been in existence for many years, and FRA believes that they have been fully tried and proven. There have been installations in several states: Wyoming; Tennessee; New Jersey; North Carolina; and Ohio, as well as in Canada, which involve various railroads, including the Burlington Northern Santa Fe, Norfolk Southern, New Jersey Transit Rail Operations, and Calgary Transit. Further, FRA understands that the Metropolitan Transportation Authority of Los Angeles is implementing four-quadrant gates on one of its transit lines. FRA welcomes a discussion of the efficacy of four-quadrant gates, timing and other safety considerations and any proposed alternatives to these gates.

FRA proposes that the following be required for all four-quadrant gate systems: When a train is approaching the crossing, all highway approach and exit lanes on both sides of the grade crossing must be spanned by gates to deny to the highway user the option of circumventing the conventional approach lane gates by switching into the opposing (oncoming) traffic lane in order to enter the crossing and cross the tracks. When the gates are fully lowered the gap between the ends of the gates must be less than two feet if no median between lanes is present. If there is a median or if channelization devices are installed, the gap between the gate end and the median or channelization device must be within one foot. If "break-away" channelization devices are used they must be frequently monitored and broken elements replaced. FRA also proposes to require that constant warning time devices activate the gates. This requirement will ensure that the gates are activated at the same amount of time prior to the arrival of a train irrespective of its speed. This will avoid long unnecessary waits at crossings being approached by very slow moving trains. FRA would also require that signs be posted alerting motorists that the train horn does not sound.

FRA also strongly recommends that the following conditions be applied when new four-quadrant gates are installed: Gate timing should be established by qualified traffic

engineers. Because each crossing presents unique topographic and traffic conditions, such timing should be established based on site specific determinations. Consideration should be given to the need for a delay in the descent of the exit gates following the descent of the entrance gates (equivalent to conventional gates) to prevent a motorist from being "locked in" between the gates. Factors that should be considered include available storage space between the gates that is outside the fouling limits of the tracks (beyond the width of trains) and the possibility that traffic flows may be interrupted as a result of nearby intersections. Fail-safe mode of the gate system should include exit gates failing in the raised, or up position. Further, a determination should be made as to whether to provide vehicle presence detectors (VPDs) to open or keep open the exit gates until all vehicles are clear of the crossing. Among the factors to consider are the presence of the intersecting roadways near the crossing, the priority that the traffic crossing the railroad is given at such intersections, the types of traffic control devices at those intersections, and the presence and timing of traffic signal preemption.

FRA further recommends that highway approaches on one or both sides of the highway-rail crossing be provided with medians or channelization devices between the opposing lanes.

Effectiveness: FRA is confident that four-quadrant gates will provide a safe alternative to the locomotive horn. No highway-rail crossing collisions have been documented at any of the five four-quadrant gate installations in the United States nor at a demonstration site in Knoxville, Tennessee during 1985–1986. The oldest of the permanent installations dates from 1952.

Recognizing the limited number of installations, however, FRA proposes very conservative estimates for effectiveness of this countermeasure.

FRA estimates effectiveness as follows: Four-quadrant gates only, no presence detection: .82.

Four-quadrant gates only, with presence detection: .77.

Four-quadrant gates with medians of at least 60 feet (with or without presence detection): .92.

The estimate of .82 for free-standing four-quadrant gates (no medians and no presence detection) is a highly conservative figure involving a discount from documented experience. As noted above, four-quadrant gates installed in the United States thus far have been highly successful; and, in fact, these

installations have been of this basic configuration. More formal investigation attempted thus far includes a recent four-quadrant gate installation in North Carolina, without medians, which reduced violations 86 percent compared to previous experience at the same crossing, which was previously equipped with standard gates. This North Carolina test ran for a period of 5 months, including base and test periods. However, it should be noted that the North Carolina observations involved simultaneous use of the train horn (both during the base period and the evaluation period). It is not known whether there is a significant synergistic effect between the train horn and the engineering improvements, but the short duration of the study and possibility of such effects suggest the need for the modest discount to the effectiveness rate.

Four-quadrant gate installations undertaken thus far in the United States have generally not employed vehicle presence detection (VPD). However, some future installations will incorporate this feature to ensure coordination with other traffic signals and for other purposes. For instance, tight geometry may not allow for any storage space within the gates should queuing of traffic at a STOP sign on one side of the crossing prevent prompt clearance by a motor vehicle. In such cases, leaving the exit gates in the raised position may be elected. Installing VPD will cause exit gates to remain up indefinitely as one or more vehicles pass over the crossing. Although providing VPD avoids the scenario of "entrapment" (long feared by some in the railroad community as a liability risk), it also allows the possibility that some motorists will follow violators through the crossing in a steady stream, defeating the intended warning. Accordingly, where medians are not provided to prevent this pattern, we assume a lower effectiveness rate. FRA estimates that four-quadrant gates with presence detection, but without median barriers, would have an effectiveness rate of approximately .77.

By contrast, where four-quadrant gates are supplemented by lengthy median barriers to discourage the violation minded driver, the use of presence detection should make little or no difference in the safety effectiveness of the arrangement. The North Carolina demonstration showed that, when the four-quadrant gate installation was supplemented by medians (channelization devices) of at least 50 feet on each highway approach, the crossing experienced a 97 percent drop in violations. Again applying a discount

to this illustration, FRA estimates an effectiveness rate of .92 for four-quadrant gates with median barriers of reasonable length.

It is important to re-emphasize that use of data regarding violations to estimate collision risk itself involves some hazard that effectiveness will be over- or under-estimated. FRA believes that the likelihood is that these estimates for four-quadrant gates are conservative, not only because of the excellent effectiveness of in-service four-quadrant installations, but also because of the North Carolina findings. In the North Carolina observations, as the number of violations decreased, the average number of seconds prior to arrival of the train also significantly increased (predicting that collisions might fall off at a faster rate than violations). The effectiveness of four-quadrant gates may thus be higher than the range stated above, both with and without medians and with presence detection.

It is also true that a variety of applications for these systems may result in a variety of effectiveness rates. FRA solicits comments, including any available data and analysis, regarding the effectiveness estimates on four-quadrant gates, as well as other supplementary safety measures described in this notice.

3. Gates With Medians or Channelization Devices

Keeping highway traffic on both highway approaches to a public highway-rail grade crossing in the proper lane denies the highway user the option of circumventing gates in the approach lanes by switching into the opposing (oncoming) traffic lane in order to drive around a lowered gate to cross the tracks.

FRA therefore proposes to require that gates with medians or channelization devices be considered supplementary safety measures if the following conditions are met. Opposing traffic lanes on both highway approaches to the crossing must be separated by either: (1) Medians bounded by barrier curbs, or (2) medians bounded by mountable curbs if equipped with channelization devices. Such medians must extend at least 100 feet from the gate, unless there is an intersection within that distance. If so, the median or channelization device must extend at least 60 feet from the gate. Intersections within 60 feet of the gate must be closed or moved. The crossing warning system must be equipped with constant warning time system. Additionally, the horizontal gap between the lowered gate and the median or channelization device must be one foot or less. As in other

installations, "break-away" channelization devices must be monitored frequently, and broken elements replaced. Also, as at all crossings within a quiet zone, signs must be posted alerting motorists to the fact that the train horns are not sounded.

FRA estimates that mountable curbs with channelization devices have an effectiveness of .75 and barrier curbs with or without channelization devices have an effectiveness of .80. FRA has found that a gate installation in North Carolina with channelization devices 60 feet long and longer reduced violations by 77 percent. The period of data collection was 22 months. FRA requests that commenters address whether the estimate of .75 should be further reduced to reflect the novelty effect of the improvements at this crossing?

A gate installation in the State of Washington equipped with barrier curbs (with channelization devices), 99 feet long on one approach and 30 feet long on the other, experienced reductions in violations of 97.5 and 95.6 percent respectively during a 4-month test period while train horns continued to sound. Given the short period of observation, the novelty effect of the installation would be expected to result in somewhat superior performance to that which would be expected over the long term, particularly on the approach with the 30-foot median. Further, the particular application involved allowed for a clearly channelized two-lane, tangent roadway on level ground with median separation between two main tracks. In this setting, expectations concerning motorist behavior were exceptionally clear. As noted, the train horn continued to blow, reinforcing the engineering improvements. Accordingly, these data are not taken as indicative of the average or typical installation in a whistle ban environment.

It may be possible to describe combined effectiveness rates for barrier medians and mountable medians of varying lengths. Comments are requested on how this can best be accomplished.

4. One Way Street With Gates

This installation consists of one way streets with gates installed so that all approaching highway lanes are completely blocked. FRA would require that the gate arms on the approach side of the highway-rail grade crossing extend across the road to within one foot of the far edge of the pavement. If two gates are used, with one on each side of the road, the gap between the ends of the gates when they are in the down position should be no more than

two feet if no median is present. If the highway approach is equipped with a median, the lowered gates should reach to within one foot of the median. In this and other similar measurements, the measurement should be horizontal across the road from the end of the lowered gate to the median or to a point over the median edge. The gate and the median top do not have to be at the same elevation. In situations in which only one gate is used, the edge of the road opposite the gate mechanism must have a barrier curb extending to and around the nearest intersection for at least 100 feet, so that the motorist cannot veer onto the shoulder of the road and drive around the gate tip.

FRA also proposes that the warning system be equipped with constant warning time systems as well as equipped with signs alerting motorists that the train horn does not sound.

Effectiveness: Lacking real world data from one way streets with gates, we are applying the effectiveness rate of .82 to this type supplementary safety measure which is the effectiveness rate for four-quadrant gates without medians. However, a case can be made that this arrangement should be as secure as four-quadrant gates with medians. Comment is requested on this issue. To what extent does current collision experience at existing gated one-way streets (with or without train horns sounding) impact the appropriate effectiveness rate?

5. Photo Enforcement

An automated means of gathering valid photographic or video evidence of violations of traffic laws relating to highway-rail grade crossings can be an effective supplementary safety measure if there is sufficient support and follow through by the law enforcement and judicial community. FRA would require that state law authorize use of photographic evidence both to bring charges against the vehicle owner and sustain the burden of proof that a traffic law violation has occurred. This would need to be accompanied by the commitment of the law enforcement and judicial communities to vigorously enforce the traffic laws in this area. Evidence of sufficient commitment would be traffic law violation penalties (and collection) sufficiently large to deter violations. Although we do not intend to mandate any specific penalty, we suggest that a fine of at least \$100 be assessed against the violator. We note that some states have substantially higher penalties, such as Illinois and Florida with \$500 fines. Other possible measures of sufficient deterrence could

include one or more points posted against a violator's driving license. We specifically invite comment as to whether FRA should require specific minimum penalties before acceptance as a supplementary safety measure, and if so, what the minimum level of penalty should be.

The proposed rule would also require that the photo enforcement system have a means to reliably detect violations (such as loop detectors and video imaging technology) and photo or video equipment deployed to capture images sufficient to convict violators under state law. FRA does not propose to require that every public highway-rail grade crossing be equipped with cameras for continual monitoring. FRA believes the goal of deterrence may be accomplished by moving the surveillance equipment among several crossing locations, as long as the motorist perceives the strong possibility that a violation of the law will lead to sanctions. Therefore, each location should appear identical to the motorist, whether or not the camera or video equipment is actually within the housing or equivalent equipment. We invite comment as to whether FRA should specify a minimum ratio of operating equipment to empty housings (such as 25 percent), or a minimum number of monitoring hours per housing, and if so, what the minimum levels should be.

FRA also proposes to require appropriate integration, testing and maintenance of the system to provide evidence supporting enforcement. Periodic data analysis would be performed to verify that violation rates remain below a baseline level (level with train horns sounding). Also required would be signs alerting motorists that train horns are not sounded and that the crossings are monitored for compliance with the law. Public awareness efforts are critical to the success of this program. The public must be informed that the horns are not being sounded and that violation of crossing laws will result in fines and penalties.

Effectiveness: FRA's estimate of the effectiveness of photo enforcement programs is discussed below.

As discussed earlier, the Los Angeles photo enforcement demonstration project showed that a carefully administered and well publicized program of photo enforcement reduced violation rates by 92 percent, while collisions were reduced only 72 percent. This ratio, 72:92 or .78, is proposed to be used to adjust reduced violation rates to estimate projected reductions in

collision rates (effectiveness) for law enforcement and education/awareness options described in Appendix B. As discussed above, it is reasonable to infer that education and legal sanctions may lack effectiveness for several segments of the population. These persons, while a small portion of the overall population, may be over represented in the population of those involved in violations and thus in collisions. As such, for law enforcement and education/awareness options violations must be reduced at least 49 percent (the measure must reduce violations by at least 49 percent) in order to realize a 38 percent reduction in the risk of collision.

Where train horns routinely sound prior to the evaluation. Effectiveness would be determined by comparison of a violation/train count ratio based on the number of violations divided by the number of train movements in any calendar quarter to the violation/train count ratio during a baseline monitoring period (minimum of four weeks if conducted without public notice or media coverage, 16 weeks if conducted with public notice or media coverage). The reduction in violations should be at least 49 percent prior to implementation of the quiet zone. Effectiveness would be considered unacceptable if, following establishment of the quiet zone, violations are greater than the original baseline level. The discussion below addresses actions when effectiveness becomes unacceptable.

Where a whistle ban is to be continued within a quiet zone. Effectiveness would be determined by comparison of a violation/train count ratio based on the number of violations divided by the number of train movements in any calendar quarter to the violation/train count ratio during a baseline monitoring period (minimum of four weeks if conducted without public notice or media coverage, 16 weeks if conducted with public notice or media coverage). The violation rate should be at least 49 percent lower than the baseline rate. Effectiveness would be considered unacceptable if, at any time following establishment of the quiet zone, the rate of violations is greater than a value less than 49 percent below the baseline level. The following discussion addresses actions when effectiveness becomes unacceptable.

Unacceptable effectiveness after establishment of quiet zone. Initial effectiveness of the photo enforcement program would be determined by calculating violation rates for at least two consecutive calendar quarters following establishment of the quiet zone. The railroad would be notified to

resume sounding of the train horn if results are not acceptable. FRA and all parties required to be informed in § 222.35(b) would be informed of such notification. If, in a subsequent calendar quarter the violation rate rises above the acceptable level, the quiet zone may be continued temporarily provided the state or municipality takes reasonable steps to increase the effectiveness of the supplementary safety measure. If, in the second calendar quarter following the quarter for which results were not acceptable, the rate is still unacceptable, the quiet zone would be terminated until requalified.

Appendix B—Alternative Safety Measures

A state or local government seeking acceptance of a quiet zone under § 222.33(b) of this part may include in its proposal alternative safety measures listed in Appendix B. Credit may be proposed for closing of public highway-rail grade crossings provided the baseline risk at other crossings is appropriately adjusted by increasing traffic counts at neighboring crossings as input data to the prediction formula (except to the extent nearby grade separations are expected to carry that traffic). FRA Regional Managers for Grade Crossing Safety can assist in performing the required analysis.

As stated above, the introduction to Appendices A and B contains details regarding the decision-making process in determining whether to designate a quiet zone under § 222.33(a) or to apply for an acceptance of a quiet zone under § 222.33(b). The introduction also contains details regarding the methods to be used in performing required analyses. FRA requests comments on both the proposed process and the calculations required in that process.

The first five alternative safety measures listed are the same as those listed in Appendix A. A community may of course include one or more of these supplementary measures in its proposed program. However, if there are unique circumstances pertaining to a specific crossing or number of crossings, the specific requirements associated with a particular safety measure may be adjusted or revised in the community's proposal. As provided for in section 222.33(b), using Appendix B alternative safety measures will enable a locality to tailor the use and application of various supplementary safety measures to a specific set of circumstances. Thus, a locality may institute alternative or supplementary measures on a number of crossings within a quiet zone, but due to specific circumstances a crossing or a number of crossings may be omitted

from the list of crossings to receive those safety measures. FRA will review the proposed plan, and will approve the proposal if the community has established that the predicted accident rate applied to the quiet zone as a whole (rather than on a crossing-by-crossing basis), is reduced to a level which would be at least equivalent to that occurring with the sounding of the locomotive horn.

The following alternative safety measures may be included in a proposal for acceptance by FRA for creation of a quiet zone. Approved supplementary safety measures which are listed in Appendix A may be used for purposes of alternative safety measures. If one or more of the requirements associated with that supplementary safety measure as listed in Appendix A is revised or deleted, data or analysis supporting the revision or deletion must be provided to FRA for review.

A discussion of the following alternative safety measures may be found above in the discussion of Appendix A:

1. Temporary closure of the highway-rail crossing;
2. Four quadrant gate system;
3. Gates with medians or channelization devices;
4. One way street with gates; and
5. Photo enforcement.

6. Programmed Enforcement

An additional alternative safety measure which may be proposed for use within a specific quiet zone proposal is programmed enforcement. This safety measure involves community and law enforcement officials committed to a systematic and measurable crossing monitoring and traffic law enforcement program at the subject public highway-rail grade crossings. This may be accomplished alone, or in conjunction with the public education and awareness program. Programmed enforcement entails a sustainable law enforcement effort combined with continued crossing monitoring.

Effectiveness: In order to determine the program effectiveness, a valid baseline violation rate must first be determined through automated or systematic manual monitoring or sampling at the subject crossing or crossings. FRA believes that the effectiveness rates would be similar to those of the photo enforcement measures discussed in Appendix A, above. Procedures similar to those outlined in Appendix A for photo enforcement should be applied to assess the effectiveness of programmed law enforcement efforts.

FRA would impose conditions upon acceptance of a programmed

enforcement safety measure. Included in those conditions would be monitoring and sampling to determine that the enforcement effort results in continuation of the reduction in violation rate. FRA would reserve the right to terminate the quiet zone if, after a reasonable period of time as established at the commencement of the program, improvement is not shown.

7. Public Education and Awareness

This alternative safety measure, alone, or in conjunction with Programmed Law Enforcement is a program of public education and awareness directed at motor vehicle drivers, pedestrians and residents near the railroad to emphasize the risks associated with highway-rail crossings and applicable requirements of state and local traffic laws at those crossings. This program would require establishment of a valid baseline violation rate which has been determined through automated or systematic manual monitoring or sampling at the subject crossing.

Effectiveness: Procedures similar to those outlined in Appendix A for photo enforcement should be applied to assess effectiveness of public education and awareness programs. Like Programmed Law Enforcement, a public education and awareness program must be defined, established and continued along with continued monitoring. FRA would impose conditions upon acceptance of a public education and awareness safety measure. Included in those conditions would be monitoring and sampling to determine that the education effort results in continuation of the reduction in violation rate. FRA would reserve the right to terminate the quiet zone if, after a reasonable period of time as established at the commencement of the program, improvement is not shown.

FRA recognizes the importance of public education and awareness efforts to safety at highway-rail crossings. FRA and other modal administrations and offices within the U.S. Department of Transportation have promoted the "Always EXpect a Train" campaign, Operation Lifesaver, Inc., and other public outreach efforts. However, FRA is concerned that the desire of communities to implement quiet zones could lead to redirection of scarce safety resources from safe community initiatives and could seriously tax the capacity of crossing safety programs provided by railroads and supported by the Federal government, leading to a net reduction in crossing safety. Accordingly, it is critical that programs proposed under this appendix represent

valid new increments of effort generated from the local level where quiet zone benefits will accrue.

FRA is prepared to provide technical assistance to communities seeking to implement quiet zones, including information regarding public education and awareness resources. However FRA does not wish, nor is it able, to step into the shoes of local authorities responsible for public safety.

A second concern related to the public education and awareness option is sustaining the required level of effort. Public safety campaigns generally have temporary value when conducted over a short period or during widely separated periods of emphasis. Campaigns such as those promoting seat belt use or child safety seat use have long-term and sustained impact only to the extent the message is delivered repeatedly and with varied or innovative techniques. FRA is concerned that government entities wishing to utilize the public education and awareness option will need to find effective means of targeting the relevant audience (concentrating the impact where it will have utility) and ensuring that the message is reinforced over time. FRA seeks comments regarding communities that have had notable success in addressing particularly serious highway-rail crossing problems in their areas. To what extent did those successes derive from methods that might be transferred elsewhere? To what extent were prior very well publicized collisions the immediate impetus for those campaigns? To what extent is the public receptive to well-structured messages prior to the occurrence of one or more serious and well-publicized events?

Other Alternatives for Consideration

Wayside horns. During FRA's outreach process several commenters asked whether placement of a horn at the crossing and directed at oncoming motorists might be entertained as a supplementary safety measure. Such a device would typically be activated by the same track circuits used to detect the train's approach for purposes of other automated warning devices at the crossing. At FRA's direction, the Volpe Center has conducted an initial evaluation of two wayside horn installations at Gering, Nebraska. (The report of that evaluation will be placed in the docket of this proceeding when finalized.) This evaluation noted that use of the wayside horn in lieu of the train horn reduced net community noise impacts. However, the report also contains analysis that suggests questions (related to the loudness of the subject wayside "horn") regarding the

effectiveness of that particular installation in alerting motorists. Further, this evaluation did not contain adequate data or analysis to permit a determination of whether a wayside horn could fully substitute for a train-borne audible warnings. At least three questions must be answered in this regard:

1. Does the particular system provide the same quality of warning, determined by loudness at appropriate frequencies, within the motor vehicle while it is approaching the motorist's decision point.

2. As currently conceived, a single stationary horn cannot give the motorist a cue as to the direction of approach of the train or trains. To what extent does this lack of directionality detract from the effectiveness of the warning? Can wayside installation design be altered to compensate?

3. To what extent will the stationary horn suffer from the lack of credibility sometimes associated with automated warning devices, due to the fact that it is activated by the same means? Over what period of time may this problem arise, if at all?

FRA will continue to identify opportunities for developing data and analysis that may be responsive to these questions. However, for the present it is not possible to have confidence that the wayside horn can fully compensate for the absence of the train horn at any individual crossing.

Articulated gates. Concepts have been presented for articulated gates that would descend from a single apparatus to block the approach to the crossing in the normal direction of travel and continue down to block the exit lanes from the crossing (on one or both sides). The State of North Carolina, as part of an FRA-funded "sealed corridor initiative," will be evaluating articulated gates as a low-cost safety measure in the context of the Next-Generation High Speed Ground Transportation Program. Articulated gates appear to be particularly attractive for two-lane roads where the highway-rail crossing is at a sufficient distance from other intersections or obstructions that could cause traffic to back up on the crossing. In principle, such gates should have the same effectiveness as other four-quadrant gate arrangements.

FRA reserves the right to expressly approve use of articulated gates as four-quadrant gate arrangements in the final rule. FRA seeks comment on the extent to which articulated gates present special issues (such as maintainability, performance in high winds, etc.) that should be addressed specifically in the final rule.

Different treatment during daylight and night-time hours. It has been suggested that variable level horns could be used at higher range during daylight hours with lower range used at night when vehicle traffic is lower and train traffic is often higher. Also, it has been argued, lower level horns are more appropriate at night when the ambient noise level is lower than during daylight hours.

It has also been suggested that perhaps in some circumstances it might be appropriate to allow locomotive horns to be sounded during the day while banning them only at night when people are typically sleeping. This, it is argued, has the benefit of attacking the problem when it is most serious (locomotive horns disturbing the sleep of nearby residents) and when the risk is ostensibly lower (during periods in which train traffic may be higher, and motor vehicle traffic is generally less). While the NPRM addresses temporary closure of the roadway as a means of accomplishing a night-time only ban, it has been suggested that non-engineering safety measures such as increased law enforcement during the ban hours and increased public education addressing the night-time motorist population may also be appropriate. FRA is concerned that locomotive horns being sounded during daylight hours and remaining silent at other times could very well lead to fatal confusion on the part of the motorist. We note that the Florida whistle ban was a night-time only ban which resulted in substantially higher collision and injury rates than if a ban had not been in effect.

FRA requests comments on the issues surrounding different treatment during different periods of the day and night.

Regulatory Impact

Executive Order 12866 and DOT Regulatory Policies and Procedures

This proposed rule has been evaluated in accordance with existing policies and procedures and is considered "significant" under Executive Order 12866. It is also considered to be significant under DOT policies and procedures. See 44 FR 11034.

FRA has prepared a Regulatory Evaluation addressing the economic impact of the proposed rule. This regulatory evaluation has been placed in the public docket and is available for public inspection and copying. Copies may also be obtained by submitting a written request to the FRA Docket Clerk at Mail Stop 10, 1120 Vermont Avenue, N.W., Washington, D.C. 20950.

The problems considered by this rule are collisions and their associated casualties and property damage involving vehicles on public highways and the front ends of trains at whistle-ban grade crossings. Although accident severity and the probability of a fatal accident is most strongly related to train speed, every grade crossing where locomotive horns are not sounded is a potential accident site. In 1996 there were 79 collisions at whistle-ban crossings which resulted in 2 fatalities, 39 injuries to non-railroad employees, and 2 injuries to railroad employees.

The estimated safety benefits of this proposed rule are derived from the prevention of collisions and the resulting fatalities and injuries. Benefits also exist for railroads in terms of reduced train delay, debris removal and repairs. The costs of this rulemaking will be incurred predominantly by communities, however there are also costs to railroads and to the federal government. The benefits in terms of lives saved and injuries prevented will exceed the costs imposed on society for this proposed rule. Even under the best case scenario (falling accident rates over time) the safety benefits alone, excluding any benefit to railroads, exceed the most costly realistic scenario for community safety enhancements. FRA has a preliminary assessment of the effects to homeowners or businesses adjacent to railroads tracks, where an existing whistle-ban exists, should the community elect not to pursue a qualifying quiet zone. The results of this study are summarized in Section VII of this report, and conclude that there is not a significant long-run impact on residential housing markets. For purposes of this analysis FRA assumes that such communities will choose to take actions that have the least cost (i.e. a cost that will not exceed the costs of supplementary or alternative safety measures).

The estimated benefits of this proposed rule exceed the estimated costs over a 20 year period at a 7% discount rate. Various benefit and cost scenarios are established in the following sections. The costs are summarized in Table 1, the benefits resulting from casualties prevented are shown in Table 2. These findings are somewhat preliminary as FRA does not have detailed data for the effectiveness or costs for some of the Supplementary Safety Measures. FRA does not have adequate information on what choices a given community will make regarding either blowing the train whistle or installing or implementing alternatives

to the train whistle. FRA seeks comment and additional information from communities regarding choices they will make so that a more complete estimate of the costs and benefits of this rule may be made prior to the issuance of the final rule.

TABLE 1.—ESTIMATED COSTS ¹

Whistle Boards	\$20,250
Directionality Provision	10,982,000
Installation of Gates & Lights (878 crossings) ²	67,109,706
Increased Maintenance Gates/Lights (878)	11,201,974
Signs	375,500
Community Planning	134,000
Government Costs	134,000
Medians (mountable at 878 crossings)	11,060,183
Medians (mountable at all crossings)	26,453,740
Police Enforcement	24,805,600

TABLE 1.—ESTIMATED COSTS ¹—Continued

Photo Enforcement	124,955,453
-------------------------	-------------

¹ This table cannot be summed for a total cost of the rule, much of the cost depends on community choice. Numbers for Police and Photo Enforcement are shown, however they are also contained in the benefits section.

² The number of passive crossings in the data set that are assumed to require upgrades.

The estimated safety benefits of this proposed rule are derived from the prevention of accidents and the resulting fatalities and injuries. Benefits also exist for railroads in terms of reduced train delay, debris removal and repairs. Two benefit scenarios were estimated, one where the accident rate remains constant over time and one where the accident rate declines by about 4% per year.

TABLE 2.—ESTIMATED BENEFITS

Category	Effectiveness = .38 ¹	Effectiveness = .75 ²
Collision Rate Constant	\$258,641,800	\$510,477,200
Collision Rate Decline	188,273,400	371,592,200

¹ Equivalent to effectiveness of train whistle at crossings with gates and lights.

² Equivalent to effectiveness of median barrier with frangible delineators at crossings with gates and lights.

A scenario where median barriers are installed at each crossing, signs are installed at each crossing and crossing upgrades to a minimum of gates and lights for all passive crossings would be justified on the basis of casualties prevented alone (At 2,100 crossings, total costs for all required improvements, including changes in direction of horn sound, and maintenance equal \$116,395,343).

The following table identifies costs and benefits of alternative implementation scenarios:

TABLE 3.—COSTS AND BENEFITS OF ALTERNATIVE IMPLEMENTATION SCENARIOS FOR PROPOSED RULE, NET PRESENT VALUE 1999–2019 ¹

Implementation scenario	Costs monetized/ non-monetized	Benefits		Net monetized benefits
		Injury/fatality reduction	Monetized injury/ fatality	
Train whistles at crossing with gates and lights, collision rate constant ² .	\$89,313,931	(68 Fatalities) (342 Injuries)	\$258,641,800	\$169,327,869
Train whistles at crossing with gates and lights, collision rate decline ³ .	\$89,313,931	(47 Fatalities) (235 Injuries)	188,273,400	98,959,469
Median barrier with frangible delineators at crossings with lights and gates, collision rate constant ⁴ .	\$116,395,343	(135 Fatalities) (75 Injuries)	510,477,200	394,081,857
Median barrier with frangible delineators at crossings with lights and gates, collision rate decline ⁵ .	\$116,395,343	(97 Fatalities) (463 Injuries)	371,592,200	255,196,857

¹ All figures assume 7% discount rate. The baseline to which these scenarios are compared is the continuation of the whistle-bans in the communities that now have them. See table below for categories of costs and benefits included in these monetized estimates.

² Assumes a 38% reduction in fatalities and injuries and an accident rate that is constant over time. Reduction in fatalities and injuries is the same 38%, the equivalent effectiveness of a train horn whether the horn is sounded or not. Costs include installation and maintenance of gates and lights at 878 passive crossings.

³ Assumes a 38% reduction in fatalities and injuries and an accident rate that declines by about 4% per year. Reduction in fatalities and injuries is the same 38%, the equivalent effectiveness of a train horn whether the horn is sounded or not. Costs include installation and maintenance of gates and lights at 878 passive crossings.

⁴ Assumes a 75% reduction (effectiveness rate of median barrier) in fatalities and injuries and an accident rate that is constant over time.

⁵ Assumes a 75% reduction (effectiveness rate of median barrier) in fatalities and injuries and an accident rate that declines by about 4% per year.

TABLE 4.—CATEGORIES OF MONETIZED AND NON-MONETIZED COSTS AND BENEFITS INCLUDED IN ABOVE ANALYSIS

Category		Monetized	Non-monetized
Costs	Train whistles at crossings with gates and lights.	—Whistle boards (see § 222.21) —Directionality provision (see § 229.129) —Upgrades to gates and lights at passive crossings	—Indeterminate level of noise costs.

TABLE 4.—CATEGORIES OF MONETIZED AND NON-MONETIZED COSTS AND BENEFITS INCLUDED IN ABOVE ANALYSIS—Continued

Category		Monetized	Non-monetized
Benefits	Supplementary safety measures	—Upgrades to gates and lights at passive crossings. —Community costs —Government costs —Whistle boards —Directionality —Supplementary Safety Measures and Alternative Safety Measures (see § 222.33)	None.
	Train whistles at crossings with gates and lights.	—Reduction in injuries and fatalities	—Community noise reduction through whistle boards and the directionality provision.
	Supplementary safety measures	—Reduction in injuries and fatalities (greater reduction than train horn is likely as all SSM's have higher effectiveness rate than train horn).	—Reduced train delay, debris removal and repairs. —Collisions/incidents involving pedestrians and bicyclists. —Incidents where car struck train at behind the first five cars. —Community noise reduction through quiet zones in communities where state law currently requires the use of the train horn.

FRA recognizes that it is possible to imagine a situation under which the disbenefits of the proposed rule might exceed the benefits as applied to an individual community. FRA does not believe that this condition would occur through excessive expenditures on supplementary of alternative safety measures, since those measures can be scaled to the safety need within the quiet zone (taken as a whole) and since most such measures will yield benefits well in excess of the value of the train horn if applied to all crossings.

However, should a community elect NOT to implement the proffered alternatives, and should the negative societal impact of train horns be valued in excess of the safety benefits of the horn, a net disbenefit would, by definition, occur. This situation might arise where the persons adversely affected by the train noise constituted a minority in the community, and the community as a whole did not wish to invest in the alternatives. Thus far, vocal minorities in affected communities have succeeded in having the train horn silenced despite negative safety impacts for motor vehicle users in the community at large. Thus, it does not seem likely that they will be wholly without influence in the future. However, given the competing demands on local elected decision-makers, underinvestment in alternatives could occur. FRA requests comment on any options that may exist, consistent with the statutory mandate we are implementing, to address this concern. In this regard, FRA notes the availability

of the Federal funding, through the Surface Transportation Program, which State departments of transportation might elect to commit on behalf of the affected minority should county or municipal institutions not be responsive.

Regulatory Flexibility Act

The Regulatory Flexibility Act of 1980 (5 U.S.C. 601 *et seq.*) requires a review of final rules to assess their impact on small entities unless the Secretary certifies that a final rule will not have a significant economic impact on a substantial number of small entities. FRA is not able to certify that this proposed rule would not have a significant economic impact on a substantial number of small entities. FRA has performed an Initial Regulatory Flexibility Assessment (IRFA) on small entities that potentially can be affected by this proposed rule. The IRFA is summarized in this preamble as required by the Regulatory Flexibility Act. Copies of the full IRFA are available as an appendix to the Regulatory Impact Analysis, and is available in the public docket of this proceeding. Written public comments that will clarify what the impacts will be for the affected small entities are requested. Comments must be identified as responses to the IRFA, and must be filed by the deadlines for comments on the NPRM provided above.

This is a proposed rule which essentially is a safety rule that implements as well as minimizes the potential negative impacts of a

Congressional mandate to blow train whistles and horns. It provides provisions for exceptions, and it provides communities with the ability to reduce the impact of the locomotive horns within their jurisdictions. However, this proposed rule will be responsible for an amount of impact on small entities, no matter how the outcome for each whistle ban is determined. This basically means that if a community elects to simply follow the mandate, and become subject to whistle blowing at crossings where a whistle ban had been prior, then there will be a noise impact to any potential small business that exists along that route. If a community elects to implement supplementary safety measures that are necessary to establish a “quiet zone,” then the governmental jurisdiction will be impacted by the cost of such program or system.

Some communities believe that the sounding of train whistles at every crossing is excessive and an infringement on community quality of life, and therefore have enacted “whistle bans” that prevent the trains from sounding their whistles entirely, or during particular times (usually at night). FRA is concerned that with the increased risk at grade crossings where train whistles are not sounded, or another means of warning utilized, collisions and casualties may increase significantly. In 1996 at least 52 percent of the 79 grade crossing collisions that occurred at crossings with whistle bans in place, occurred in a small community

where the governmental jurisdiction is considered to be a small entity.

FRA is concerned that there are potential small entities that might be affected by this proposal. Hence, FRA encourages small businesses, small railroads, and governmental jurisdictions that are considered to be small entities to participate in the comment process if they feel they will be adversely impacted by this proposed rule. The Agency encourages such small entities to submit written comment to the docket and/or participate in one of the public hearings.

FRA's Regulatory Impact Analysis notes that the costs of this proposed rulemaking will predominately be on the governmental jurisdictions of communities. Thus, FRA is concerned about potential adverse economic impact on small entities which are "small governmental jurisdictions." As defined by the Small Business Administration (SBA) this term means governments of cities, counties, towns, townships, villages, school districts, or special districts with a population of less than fifty thousand. Currently, FRA has knowledge of Whistle Bans in 265 communities.

FRA has recently published an interim policy which establishes "small entity" as being railroads which meet the line haulage revenue requirements of a Class III railroad. As defined by 49 CFR 1201.1-1, Class III railroads are those railroads who have annual operating revenues of \$20 million per year or less. Hazardous material shippers or contractors that meet this income level will also be considered as small entities. FRA is proposing to use this definition of small entity for this rulemaking. Since this is still considered to be an alternative definition, FRA is using this definition in consultation with the Office of Advocacy, SBA, and therefore requests public comments to the docket for its use.

The IRFA concludes that only a few small railroads might be minimally impacted by this proposed rule. In addition, some small businesses that operate along or nearby rail lines that currently have whistle bans in place that potentially may not after the implementation of this proposed rule, could be moderately impacted. The most significant impacts from this proposed rule will be on 265 governmental jurisdictions whose communities currently have either formal or informal whistle bans in place. FRA estimates that approximately 70 percent (*i.e.* 186 communities) of these governmental jurisdictions are considered to be small entities. Alternative options for complying with this proposed rule include allowing the train whistle to be blown. This alternative has no direct costs associated with it for the governmental jurisdiction. Other alternatives include "gates with median barriers" which are estimated to cost \$11,070 for the median barrier. Four-quadrant gate system is estimated to cost \$244,000, and have an annual maintenance of \$2,500-\$5,000. "Photo enforcement is estimated to cost \$55,000-\$75,000, and have an annual costs of \$20,000-\$30,000. A "law enforcement" program is estimated to cost \$3,000 annually, and it has an expected annual benefit \$10,600. An alternative that does not impact the governmental jurisdiction with any costs is running trains at speeds of 15 miles per hour or less with flagging being performed at the crossing. Finally, FRA has not limited compliance to the lists provided in Appendix A or Appendix B of the proposed rule. The NPRM provides for supplementary safety measures that might be unique or different. For such an alternative an analysis would have to accompany the option that would demonstrate that the number of motorists that violate the crossing is equivalent of less than that of blowing the whistle. FRA intends to

rely on the creativity of communities to formulate solutions which will work for that community. FRA is aware that there are a few Class III railroads that are subject to local whistle bans. This number is estimated to be less than ten.

FRA does not know how many small businesses are located within a distance of the affected highway-rail crossings where the noise from the whistle blowing could be considered to be nuisance and bad for business. Concerns have been advanced by owners and operators of hotels, motels and some other establishments as a result of numerous town meetings and other outreach sessions in which FRA has participated during development of this proposed rule. If supplementary safety measures are implemented to create a quiet zone then such small entities should not be impacted. Hence FRA requests comments to the docket from small businesses that feel they will be adversely impacted by this proposed rule.

In the IRFA FRA discusses the ways in which each type of small entity could be affected. However, since FRA does not know the manner which each affected community will elect to proceed, it is not possible to quantify or estimate the total or average cost for each type of small entity. Comments and input from potentially affected small entities will assist us in being able to determine the real impact of this proposed rule.

Paperwork Reduction Act

The information collection requirements in this proposed rule have been submitted for approval to the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995, 44 U.S.C. 3501 *et seq.* The sections that contain the new information collection requirements and the estimated time to fulfill each requirement are as follows:

CFR section	Respondent universe	Total annual responses	Average time per response	Total annual burden hours	Total annual burden cost
222.11—Petitions for Waivers	270 communities ..	92 petitions	1 hour	92 hours	\$2,208
222.33—Establishment of quiet zones	(see § 222.35)	(see § 222.35)	(see § 222.35)	(see § 222.35)	(see § 222.35)
—Community Designation	270 communities ..	97 applications	40 hours	3,880 hours	116,400
—FRA acceptance	270 communities ..	1,600 signs	1 hour	1,600 hours	38,400
—Requirement for advance warning signs					
222.35—Notice and information requirements:					
—Notifications	280 communities ..	383 notifications ..	20 minutes	128 hours	3,840
—U.S. DOT—AAR National Highway-Rail Grade Crossing Inventory Form (FRA F 6180.71).	280 communities ..	800 forms	1 hour	821 hours	24,630
222.39—Quiet zone duration:		85 letters	15 minutes		
—222.39(a)—Notification					
—222.39(b)—Notification					

N/A (requirement will not take effect until 5 years after the rule's publication).
N/A (requirement will not take effect until 6 years after the rule's publication).

CFR section	Respondent universe	Total annual responses	Average time per response	Total annual burden hours	Total annual burden cost
—222.39(c)—Notification	N/A (requirement will not take effect until 6 years after the rule's publication).				
222.43—Development and approval of new supplementary safety measures:					
—Applications	270 communities ..	54 applications	40 hours	2,160 hours	64,800
—Appeal letter	54 communities	1 letter	1 hour	1 hour	30
222.45—Communities with pre-existing restrictions on use of locomotive horns.	270 communities ..	73 documents	8 hours	584 hours	17,520
Appendix A:					
—Temporary closure of a public highway-rail grade crossing.	270 communities ..	60 signs	1 hour	60 hours	1,440
—Photo Enforcement	270 communities ..	20 signs daily 10 reports	40 hours	400 hours	12,000
Appendix B:					
—Alternative Safety Measures	270 communities ..	5 reports	40 hours	200 hours	6,000

All estimates include the time for reviewing instructions; searching existing data sources; gathering or maintaining the needed data; and reviewing the information. Pursuant to 44 U.S.C. 3506(c)(2)(B), FRA solicits comments concerning: whether these information collection requirements are necessary for the proper performance of the function of FRA, including whether the information has practical utility; the accuracy of FRA's estimates of the burden of the information collection requirements; the quality, utility, and clarity of the information to be collected; and whether the burden of collection of information on those who are to respond, including through the use of automated collection techniques or other forms of information technology, may be minimized.

FRA believes that soliciting public comment will promote its efforts to reduce the administrative and paperwork burdens associated with the collection of information mandated by Federal regulations. In summary, FRA reasons that comments received will advance three objectives: (i) reduce reporting burdens; (ii) ensure that it organizes information collection requirements in a "user friendly" format to improve the use of such information; and (iii) accurately assess the resources expended to retrieve and produce information requested. See 44 U.S.C. 3501.

Comments must be received no later than March 13, 2000. Organizations and individuals desiring to submit comments on the collection of information requirements should direct them to the Office of Management and Budget, Attention: Desk Officer for the Federal Railroad Administration, Office of Information and Regulatory Affairs, Washington, DC 20503, and should also send a copy of their comments to Robert Brogan, Federal Railroad Administration, RRS-211, Mail Stop 25,

400 7th Street, SW, Washington, DC 20590.

OMB is required to make a decision concerning the collection of information requirements contained in this proposed rule between 30 and 60 days after publication of this document in the **Federal Register**. Therefore, a comment to OMB is best assured of having its full effect if OMB receives it within 30 days of publication. The final rule will respond to any OMB or public comments on the information collection requirements contained in this proposal.

FRA cannot impose a penalty on persons for violating information collection requirements which do not display a current OMB control number, if required. FRA intends to obtain current OMB control numbers for any new information collection requirements resulting from this rulemaking action prior to the effective date of a final rule. The OMB control number, when assigned, will be announced by separate notice in the **Federal Register**.

For information or a copy of the paperwork package submitted to OMB please contact Robert Brogan at 202-632-3318.

Environmental Impact

FRA is evaluating these proposals in accordance with its procedures for ensuring full consideration of the environmental impact of FRA actions, as required by the National Environmental Policy Act (42 U.S.C. 4321 *et seq.*), other environmental statutes, Executive Orders, and DOT Order 5610.1c.

The principal environmental effect and potentially significant impact of these proposals is additional horn noise where there whistle bans currently exist. FRA has studied the potential costs of noise from locomotive horns by examining residential property values. Other studies have also been conducted

on the value of noise impacts captured in residential prices, including studies by the FAA. FAA conducted studies that concluded that residential property values were diminished from exposure to substantial quantities of aircraft noise. FAA studied significant changes in aircraft generated noise levels in consideration of actions that would change the total noise emitted by each aircraft. The DEIS discusses the substantial estimated costs associated with given increments of noise over a 24-hour period in the FAA studies. FRA may be faced with a significantly different question, because this regulation has the potential to add incremental noise at certain locations to the considerable noise, vibration and other impacts generated by train locomotives and train movements. In studying residential property values where the horn noise was added as an increment to noise from train operations, FRA found that it did not produce a significant lasting effect on residential prices. The DEIS seeks to elicit comment as to the potential relevance of the FAA studies to the current issue and the relative weight they should be accorded given the findings of the train horn property value research.

These proposals also contain various provisions that have the potential to reduce existing train horn noise exposure over time. The provision limiting the distance over which horn sounding would occur could reduce the total amount of horn noise generated. Because this provision is proposed to be implemented slowly, the potential benefits are indeterminate. The provision for a maximum horn sound level to the front and to the side of locomotives has the potential to greatly reduce horn noise generated depending upon the limits selected. Unlike the sounding distance provision, this is proposed to occur a three-year period

and the value of any potential benefit is indeterminate, however it is expected to be significant (2 to 4 million people). Finally, these proposals contain provisions that would make it possible for many communities, currently exposed to train horn noise, to establish quiet zones and thus relieve themselves of noise exposure. Any potential benefit from these new quiet zones is indeterminate, as it is impossible to estimate how many would be implemented and when; however, FRA has noted the interest of many communities impacted by recent mergers in abating the train horn impacts of recent changes in traffic flows.

FRA has prepared a draft environmental impact statement (DEIS) analyzing the environmental impacts associated with these proposals. The DEIS is being issued concurrently with this NPRM. Copies of the DEIS are being distributed to organizations and individuals who participated in the environmental scoping process and those who filed comments in the pre-rulemaking stage of this proceeding. The DEIS is also available on FRA's Internet Site www.fra.dot.gov, or from the FRA at the following address: David Valenstein, Office of Railroad Development, FRA, 400 Seventh Street, SW. (Mail Stop 20), Washington, DC 20590. The public comment period on the DEIS and this NPRM will run concurrently. Interested parties may comment on the DEIS, the NPRM, or both documents. Because FRA is soliciting comments on both the DEIS and this NPRM, separate public dockets have been established for each. Interested parties wishing to comment on the DEIS should include the docket number for the environmental docket, "Docket Number FRA-1999-6440" on the first page of their comments. Those persons wishing to comment on this NPRM should include the docket number for this rulemaking proceeding, "Docket Number FRA-1999-6439" on the first page of their comments.

Federalism Implications

Executive Order 13132, entitled, "Federalism," issued on August 4, 1999, requires that each agency "in a separately identified portion of the preamble to the regulation as it is to be issued in the **Federal Register**, provides to the Director of the Office of Management and Budget a federalism summary impact statement, which consists of a description of the extent of the agency's prior consultation with State and local officials, a summary of the nature of their concerns and the agency's position supporting the need to issue the regulation, and a statement of

the extent to which the concerns of State and local officials have been met; * * *."

FRA will adhere to Executive Order 13132 when issuing a final rule in this proceeding. FRA has already taken the opportunity to consult extensively with state and local officials prior to issuance of this NPRM, and we will, of course, take very seriously the concerns and views expressed by State and local officials as the public comment stage of this rulemaking proceeds. FRA staff will be providing briefings to many State and local officials and organizations during the comment period to encourage full public participation in this rulemaking. As discussed earlier in this preamble, because of the great interest in this subject throughout various areas of the country, FRA has been involved in an extensive outreach program to inform communities which presently have whistle bans of the effect of the Act and the regulatory process. Since the passage of the Act, FRA headquarters and regional staff has met with a large number of local officials. FRA has also held a number of public meetings to discuss the issues and to receive information from the public. In addition to local citizens, both local and state officials attended and participated in the public meetings. Additionally, FRA took the unusual step of establishing a public docket before formal initiation of rulemaking proceedings in order to enable citizens and local officials to comment on how FRA might implement the Act and to provide insight to FRA. FRA received comments from representatives of Portland, Maine; Maine Department of Transportation; Acton, Massachusetts; Wisconsin's Office of the Commissioner of Railroads; a Wisconsin state representative; a Massachusetts state senator; the Town of Ashland, Massachusetts; Bellevue, Iowa; and the mayor of Batavia, Illinois.

Since passage of the Act in 1994, FRA has consulted and briefed representatives of the American Association of State Highway and Transportation Officials (AASHTO), the National League of Cities, National Association of Regulatory Utility Commissioners, National Conference of State Legislatures, and others. Additionally we have provided extensive written information to all United States Senators and a large number of Representatives with the expectation that the information would be shared with interested local officials and constituents.

FRA has been in close contact with, and has received many comments from Chicago area municipal groups representing suburban areas in which,

for the most part, locomotive horns are not routinely sounded. The Chicago area Council of Mayors, which represents over 200 cities and villages with over 4 million residents outside of Chicago, provided valuable information to FRA as did the West Central Municipal Conference and the West Suburban Mass Transit District, both of suburban Chicago.

Another association of suburban Chicago local governments, the DuPage [County] Mayors and Managers Conference, provided comments and information. Additionally, FRA officials have met with Members of Congress, including Senator Kennedy, and Representatives Rick Boucher, Henry Hyde, William Lipinsky, Martin Meehan, Tim Roemer and John Tierney, who have invited FRA to their districts and have provided citizens and local officials with the opportunity to express their views on this rulemaking process. These exchanges, and others conducted directly through FRA's regional crossing managers, have been very valuable in identifying the need for flexibility in preparing the proposed rule. For further discussion regarding the nature of state and local concerns please see paragraph F. "Comments received by FRA." above.

Under 49 U.S.C. 20106, issuance of this regulation preempts any State law, rule, regulation, order, or standard covering the same subject matter, except a provision necessary to eliminate or reduce an essentially local safety hazard, that is not incompatible with Federal law or regulation and does not unreasonably burden interstate commerce.

Compliance With the Unfunded Mandates Reform Act of 1995

Pursuant to the Unfunded Mandates Reform Act of 1995 (Public Law 104-4) each federal agency "shall, unless otherwise prohibited by law, assess the effects of Federal Regulatory actions on State, local, and tribal governments, and the private sector (other than to the extent that such regulations incorporate requirements specifically set forth in law)." Section 201. Section 202 of the Act further requires that "before promulgating any general notice of proposed rulemaking that is likely to result in promulgation of any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$ 100,000,000 or more (adjusted annually for inflation) in any 1 year, and before promulgating any final rule for which a general notice of proposed rulemaking was published, the agency shall prepare a written statement * * *" detailing the effect on

State, local and tribal governments and the private sector. The proposed rules issued today will not result in the expenditure, in the aggregate, of \$100,000,000 or more in any one year, and thus preparation of a statement is not required.

List of Subjects

49 CFR Part 222

Administrative practice and procedure, Penalties, Railroad safety, Reporting and recordkeeping requirements.

49 CFR Part 229

Locomotives, Penalties, Railroad safety.

The Proposed Rule

In consideration of the foregoing, FRA proposes to amend chapter II of title 49, Code of Federal Regulations as follows:

1. Part 222 is added to read as follows:

PART 222—USE OF LOCOMOTIVE HORNS AT PUBLIC HIGHWAY-RAIL GRADE CROSSINGS

Subpart A—General

Sec.

- 222.1 Purpose and scope.
- 222.3 Application.
- 222.5 Preemptive effect.
- 222.7 Definitions.
- 222.9 Penalties.
- 222.11 Petitions for waivers.
- 222.13 Responsibility for compliance.

Subpart B—Use of Locomotive Horns

- 222.21 When to use locomotive horns.
- 222.23 Emergency and other uses of locomotive horns.

Subpart C—Exceptions to Use of the Locomotive Horn

- 222.31 Train operations which do not require sounding of locomotive horns at individual public highway-rail grade crossings.
- 222.33 Establishment of quiet zones.
- 222.35 Notice and information requirements.
- 222.37 Quiet zone implementation.
- 222.39 Quiet zone duration.
- 222.41 Supplementary and alternative safety measures.
- 222.43 Development and approval of new supplementary safety measures.
- 222.45 Communities with pre-existing restriction on use of locomotive horns.

Appendix A to Part 222—Approved Supplemental Safety Measures

Appendix B to Part 222—Alternative Safety Measures

Appendix C to Part 222—Conditions Not Requiring Additional Safety Measures

Authority: 49 U.S.C. 20103, 20107 and 20153; 28 U.S.C. 2461 note; and 49 CFR 1.49.

Subpart A—General

§ 222.1 Purpose and scope.

(a) The purpose of this part is to increase safety at public highway-rail grade crossings by ensuring that locomotive horns are sounded when trains approach and pass through public highway-rail grade crossings.

(b) This part prescribes standards for sounding locomotive horns when locomotives approach and pass through public highway-rail grade crossings. This part further provides standards for exempting from the requirement to sound the locomotive horn certain categories of rail operations and categories of public highway-rail grade crossings.

§ 222.3 Application.

This part applies to every railroad with public highway-rail grade crossings on its line of railroad, except:

- (a) A railroad that exclusively operates freight trains exclusively on track which is not part of the general railroad system of transportation; and
- (b) Rapid transit operations within an urban area that are not connected to the general railroad system of transportation.

§ 222.5 Preemptive effect.

Under 49 U.S.C. 20106, issuance of this part preempts any State law, rule, regulation, or order covering the same subject matter, except an additional or more stringent law, regulation, or order that is necessary to eliminate or reduce an essentially local safety hazard; is not incompatible with a law, regulation, or order of the United States Government; and does not unreasonably burden interstate commerce.

§ 222.7 Definitions.

As used in this part—

Administrator means the Administrator of the Federal Railroad Administration or the Administrator's delegate.

Barrier curb means a highway curb designed to discourage a motor vehicle from leaving the roadway. Such curb is more than six inches but not more than nine inches high with a rounded top edge and is used where highway speeds do not exceed 40 miles per hour. The barrier curb is highly visible and provided with sloped end treatments. Additional design specifications are determined by the standard traffic design specifications used by the governmental entity constructing the barrier curb.

Channelization device means one of a continuous series of highly visible obstacles placed between opposing

highway lanes designed to alert or guide traffic around an obstacle or to direct traffic in a particular direction.

Channelization devices must be at least 2.5 feet high and placed at least every seven feet. End treatments, in the case of rigid channelization devices, should be determined by reference to the governmental entity's own standard traffic design specifications.

Effectiveness rate means the effectiveness of a supplementary safety measure in reducing the probability of a collision at a public highway-rail grade crossing. (Effectiveness is indicated by a number between zero and one which represents the reduction of the probability of a collision as a result of the installation of a supplementary safety measure when compared to the same crossing equipped with conventional automated warning systems of flashing lights, gates and bells. Zero effectiveness means that the supplementary safety measure provides no reduction in the probability of a collision (there is no effectiveness) while an effectiveness rating of one means that the supplementary safety measure is totally effective in reducing collisions. Measurements between zero and one reflect the percentage by which the supplementary safety measure reduces the probability of a collision. Thus, a supplementary safety measure with an effectiveness of .38 reduces the probability of a collision by 38 percent.) FRA has determined that collision probabilities increase an average of 62 percent when locomotive horns are silenced. Thus, generally, a supplementary safety measure should have an effectiveness of at least .38 (reducing the probability of a collision by at least 38 percent) in order to compensate for this 62 percent increase. FRA means the Federal Railroad Administration.

Locomotive horn means a locomotive air horn, steam whistle, or similar audible warning device mounted on a locomotive or control cab car. The terms "locomotive horn", "train whistle", "locomotive whistle", and "train horn" are used interchangeably in the railroad industry.

Median means the portion of a divided highway separating the travel ways for traffic in opposite directions. A median is bounded by mountable or barrier curbs.

Mountable curb means a highway curb designed to permit a motor vehicle to leave a roadway when required. It is a curb not more than six inches high, with a well rounded top edge. Additional design specifications are determined by the standard traffic design specifications used by the

governmental entity constructing the mountable curb.

Positive train control territory means a line of railroad on which railroad operations are governed by a train control system capable of determining the position of the train in relation to a public highway-rail grade crossing and capable of computing the time of arrival of the train at the crossing, resulting in the automatic operation of the locomotive horn (or automatic prompting of the locomotive engineer) such that the horn is sounded at a predetermined time prior to the locomotive's arrival at the crossing.

Public highway-rail grade crossing means a location where a public highway, road, or street, including associated sidewalks or pathways crosses one or more active railroad tracks at grade.

Quiet zone means a segment of a rail line within which is situated one, or a number of consecutive public highway-rail crossings at which locomotive horns may not be routinely sounded.

Railroad means any form of nonhighway ground transportation that runs on rails or electromagnetic guideways and any entity providing such transportation, including:

(1) Commuter or other short-haul railroad passenger service in a metropolitan or suburban area and commuter railroad service that was operated by the Consolidated Rail Corporation on January 1, 1979; and

(2) High speed ground transportation systems that connect metropolitan areas, without regard to whether those systems use new technologies not associated with traditional railroads; but does not include rapid transit operations in an urban area that are not connected to the general railroad system of transportation.

Supplementary safety measure means a safety system or procedure established in accordance with this part which is provided by the appropriate traffic control authority or law enforcement authority and that is determined by the Administrator to be an effective substitute for the locomotive horn in the prevention of highway-rail casualties. Appendix A to this part lists such measures.

Whistle board means a post or sign directed toward oncoming trains and bearing the letter "W" or equivalent symbol, erected at a distance from the next public highway-rail grade crossing which indicates to the locomotive engineer that the locomotive horn should be sounded beginning at that point.

§ 222.9 Penalties.

Any person who violates any requirement of this part or causes the violation of any such requirement is subject to a civil penalty of least \$500 and not more than \$11,000 per violation, except that: Penalties may be assessed against individuals only for willful violations, and, where a grossly negligent violation or a pattern of repeated violations has created an imminent hazard of death or injury to persons, or has caused death or injury, a penalty not to exceed \$22,000 per violation may be assessed. Each day a violation continues shall constitute a separate offense. Any person who knowingly and willfully falsifies a record or report required by this part may be subject to criminal penalties under 49 U.S.C. 21311 (formerly codified in 45 U.S.C. 438(e)).

§ 222.11 Petitions for waivers.

(a) Except for petitions filed pursuant to paragraph (b) of this section, all petitions for a waiver of any provision of this part must be submitted jointly by the railroad owning, or controlling operations of the railroad tracks crossing the public highway-rail grade crossing and by the appropriate traffic control authority or law enforcement authority (public authority) having jurisdiction over the public highway, street, road, pedestrian sidewalk or pathway crossing the railroad tracks.

(b) If the railroad and the appropriate public authority can not reach agreement to file a joint petition, either party may file a petition for a waiver, however the filing party shall, in its petition, specify the steps it has taken in an attempt to reach agreement with the other party and shall provide the other party with a copy of the petition filed with the FRA.

(c) Each petition for a waiver of this part must be filed in the manner required by 49 CFR Part 211.

(d) If the Administrator finds that a waiver of compliance with a provision of this part is in the public interest and that safety of highway and railroad users will not be diminished if the petition is granted, the Administrator may grant the waiver subject to any conditions the Administrator deems necessary.

§ 222.13 Responsibility for compliance.

Although duties imposed by this part are generally stated in terms of the duty of a railroad, any person, including a contractor for a railroad, or a local or state governmental entity that performs any function covered by this part, must perform that function in accordance with this part.

Subpart B—Use of Locomotive Horns

§ 222.21 When to use locomotive horns.

(a) Except as provided in this part, the locomotive horn on the lead locomotive of a train, lite locomotive consist, individual locomotive or lead cab car shall be sounded when such locomotive or lead car is approaching and passes through each public highway-rail grade crossing. Sounding of the locomotive horn with two long, one short, and one long blast shall be initiated at the location required in paragraph (b) of this section and shall be repeated or prolonged until the locomotive or train occupies the crossing.

(b) Although preempted by this part, state requirements in effect on [the effective date of the final rule] which govern the location where, or time in which, locomotive horns must be sounded in advance of a public highway-rail grade crossing, shall be used as guidelines under this rule until such time as the railroad changes the maximum authorized speed for that portion of track at the grade crossing. At that time the railroad shall, subject to the one-quarter mile limitation contained in paragraph (e) of this section, either:

(1) Place whistle boards at a distance from the next crossing equal to the distance traveled by a train in 20 seconds while operating at the maximum speed allowed for any train operating on the track in that direction of movement; or

(2) Ensure by other methods that the locomotive horn is sounded no less than 20, nor more than 24 seconds before the locomotive enters the crossing.

(c) If, as of [the effective date of the final rule], there are no state requirements that locomotive horns be sounded at a specific distance in advance of the public highway-rail grade crossing, railroads shall, subject to the ¼ mile limitation contained in paragraph (e) of this section, either:

(1) Place whistle boards at a distance from the next crossing equal to the distance traveled by a train in 20 seconds while operating at the maximum speed allowed for any train operating on the track in that direction of movement; or

(2) Ensure by other methods that the locomotive horn is sounded no less than 20, nor more than 24 seconds before the locomotive enters the crossing.

(d) Each railroad shall, in the manner provided in paragraph (c) of this section, promptly adjust the location of each whistle board to reflect changes in maximum authorized track speeds, except where all trains operating over that public highway-rail grade crossing

are equipped to be responsive to a positive train control system.

(e) In no event shall a locomotive horn sounded in accordance with paragraph (a) of this section be sounded more than one-quarter mile (1,320 feet or 403 meters) in advance of a public highway-rail grade crossing.

§ 222.23 Emergency and other uses of locomotive horns.

(a)(1) Nothing in this part is intended to prevent an engineer from sounding the locomotive horn to provide a warning to vehicle operators, pedestrians, trespassers or crews on other trains in an emergency situation if, in the engineer's sole judgment, such action is appropriate in order to prevent imminent injury, death or property damage.

(2) Establishment of a quiet zone does not preclude the sounding of locomotive horns in emergency situations, nor does it impose a legal duty to sound the locomotive horn in such situations.

(b) Nothing in this part restricts the use of the locomotive horn to announce the approach of the train to roadway workers in accordance with a program adopted under part 214 of this Chapter, or where active warning devices have malfunctioned and use of the horn is required by one of the following sections of this Chapter: §§ 234.105; 234.106; or 234.107.

Subpart C—Exceptions to Use of the Locomotive Horn

§ 222.31 Train operations which do not require sounding of horns at individual public highway-rail grade crossings.

(a) Locomotive horns need not be sounded at individual public highway-rail grade crossings if the maximum authorized operating speed (as established by the railroad) for that segment of track is 15 miles per hour or less and properly equipped flaggers (as defined in 49 CFR 234.5) provide warning of approaching trains to motorists.

(b) This paragraph does not apply where active warning devices have malfunctioned and use of the horn is required by 49 CFR 234.105, 234.106, or 234.107.

§ 222.33 Establishment of quiet zones.

(a) *Community designation.* A state or local government may designate a quiet zone by implementing one or more supplementary safety measures identified in Appendix A of this part at each public highway-rail grade crossing within the quiet zone and by providing the information and notifications described under § 222.35.

(b) *FRA acceptance.* (1) A state or local government may apply to FRA's Associate Administrator for Safety for acceptance of a quiet zone, within which one or more safety measures identified in Appendix A or Appendix B of this part will be implemented. The state or local government's application to FRA's Associate Administrator for Safety must contain sufficient detail concerning the present engineering improvements at the public highway-rail grade crossings proposed to be included in the quiet zone, together with detailed information pertaining to the proposed supplementary and alternative safety measures to be implemented at each crossing. The application must conform with the requirements contained in Appendix B of this part, and must be based on the calculations discussed in the Introduction to Appendices A and B of this part. The application must also contain a commitment to implement the proposed safety measures within the proposed quiet zone. The state or local government must demonstrate through data and analysis that implementation of these measures will effect a reduction in risk at public highway-rail grade crossings within the quiet zone (viewing risk in the aggregate rather than on a crossing-by-crossing basis) sufficient to fully compensate for the absence of the warning provided by the locomotive horn. For purposes of this paragraph, risk will be viewed in terms of the quiet zone as a whole, rather than at each individual grade crossing. The aggregate reduction in predicted collision risk for the quiet zone as a whole must be shown to compensate for the lack of a locomotive horn.

(2) The FRA Associate Administrator for Safety may accept the proposed quiet zone, may accept the proposed quiet zone under additional conditions designed to ensure that the safety measures fully compensate for the absence of the warning provided by the locomotive horn, or may reject the proposed quiet zone if, in the Associate Administrator's judgment, the proposed safety measures do not fully compensate for the absence of the warning provided by the locomotive horn.

(c) *Quiet zone in which supplementary or alternative safety measures are not necessary.* A state or local government may create a quiet zone under this paragraph if the crossings within the quiet zone conform to the requirements contained in Appendix C of this part. Appendix C of this part describes those categories of crossings which the Administrator has determined do not present a significant risk with respect to loss of life or serious

personal injury if the locomotive horn is not sounded.

(d) *Minimum length.* The minimum length of a quiet zone established under this part shall be one-half mile (2,640 feet or 805 meters) along the length of railroad right-of-way.

(e) *Requirement for active grade crossing warning devices.* Except as provided in § 222.31, and paragraph (c) of this section, each public highway-rail grade crossing in a quiet zone established or accepted under this section must be equipped with active grade crossing warning devices comprising both flashing lights and gates which control traffic over the crossing and that conform to the standards contained in the Manual on Uniform Traffic Control Devices issued by the Federal Highway Administration. Installation or upgrading of such devices is not regarded as implementation of supplementary safety measures under this part and is not credited toward the compensating reduction in risk referenced in paragraph (b) of this section, except to the extent the new warning systems exceed the standards of the MUTCD and conform to requirements for supplementary safety measures contained in Appendix A of this part.

(f) *Requirement for advance warning signs.* Each highway approach to each public highway-rail grade crossing at which locomotive horns are not routinely sounded pursuant to this part shall be equipped with an advance warning sign advising the motorist that train horns are not sounded at the crossing.

§ 222.35 Notice and information requirements.

(a) A state or local government designating a quiet zone under § 222.33(a) shall provide written notice, by certified mail, return receipt requested, of such designation to: all railroads operating over the public highway-rail grade crossings within the quiet zone; the highway or traffic control authority or law enforcement authority having control over vehicular traffic at the crossings within the quiet zone; the state agency responsible for highway and road safety; and the FRA Associate Administrator for Safety.

(b) Upon acceptance by the FRA Associate Administrator for Safety of a quiet zone proposed by a state or local government under § 222.33(b), such state or local government shall provide written notice, by certified mail, return receipt requested, of such acceptance to: all railroads operating over the public highway-rail grade crossings within the quiet zone; the highway or traffic

control authority or law enforcement authority having control over vehicular traffic at the crossings within the quiet zone; and the state agency responsible for highway and road safety.

(c) A state or local government creating a quiet zone under § 222.33(c), shall provide written notice, by certified mail, return receipt requested, of such designation to: all railroads operating over the public highway-rail grade crossings within the quiet zone; the highway or traffic control authority or law enforcement authority having control over vehicular traffic at the crossings within the quiet zone; the state agency responsible for highway and road safety; and the FRA Associate Administrator for Safety.

(d) The following information pertaining to every quiet zone must be submitted to the FRA Associate Administrator for Safety:

(1) An accurate and complete U.S. DOT-AAR National Highway-Rail Grade Crossing Inventory Form, FRA F6180.71, (Inventory Form) (available through the FRA Office of Safety Analysis, Mail Stop 17, 1120 Vermont Avenue, NW., Washington, DC 20590) for each public highway-rail grade crossing within the quiet zone dated within six months prior to designation or FRA acceptance of the quiet zone;

(2) An accurate, complete and current Inventory Form reflecting supplementary and alternative safety measures in place upon establishment of the quiet zone; and

(3) The name and title of the state or local officer responsible for monitoring compliance with the requirements of this part and the manner in which that person can be contacted.

§ 222.37 Quiet zone implementation.

(a) A quiet zone established under this part shall not be implemented until:

(1) All requirements of § 222.35 are complied with; and

(2) At least 14 days have elapsed since receipt of all of the notifications required by § 222.35.

(b) All railroads operating over public highway-rail grade crossings within a quiet zone established in accordance with this part shall cease routine use of the locomotive horn at public highway-rail crossings upon the date set by the state or local government which has established such quiet zone.

§ 222.39 Quiet zone duration.

(a) Subject to paragraph (d) of this section, a quiet zone designated by a state or local government under § 222.33(a) may remain in effect indefinitely, provided that all requirements of this part continue to be

met and that within six months before the expiration of five years from the original designation made to FRA, or within six months of the expiration of five years from the last affirmation, the designating entity affirms in writing to the FRA Associate Administrator for Safety that the supplementary safety measures implemented within the quiet zone continue to conform with the requirements of Appendix A of this part. Copies of such notification must be provided to the parties identified in § 222.35(a) by certified mail, return receipt requested. In addition to its affirmation, the designating entity must send to the FRA Associate Administrator for Safety an accurate and complete U.S. DOT-AAR National Highway-Rail Grade Crossing Inventory Form, FRA F6180.71, for each public highway-rail grade crossing within the quiet zone.

(b) Subject to paragraph (d) of this section, a quiet zone accepted by FRA under § 221.33(b) shall remain in effect indefinitely, provided that all requirements of this part continue to be met and that within six months before the expiration of three years from the original designation made to FRA, or within six months of the expiration of three years from the last affirmation, the state or local government affirms in writing (with notification by certified mail, return receipt requested, of such affirmation provided to the parties identified in § 222.35(b)) that the supplementary safety measures installed and implemented in the quiet zone continue to be effective and continue to fully compensate for the absence of the warning provided by the locomotive horn. In addition to its affirmation, the governmental entity must send to the FRA Associate Administrator for Safety an accurate and complete U.S. DOT-AAR National Highway-Rail Grade Crossing Inventory Form, FRA F6180.71, for each public highway-rail grade crossing within the quiet zone.

(c) Subject to paragraph (d) of this section, a quiet zone created by a state or local government under § 222.33(c) may remain in effect indefinitely, provided that all requirements of this part continue to be met and that within six months before the expiration of five years from the original designation made to FRA, or within six months of the expiration of five years from the last affirmation, the state or local government affirms in writing to the FRA Associate Administrator for Safety that the conditions contained in Appendix C of this part continue to be met. Copies of such notification must be provided to the parties identified in § 222.35(a) by certified mail, return

receipt requested. In addition to its affirmation, the designating entity must send to the FRA Associate Administrator for Safety an accurate and complete U.S. DOT-AAR National Highway-Rail Grade Crossing Inventory Form, FRA F6180.71, for each public highway-rail grade crossing within the quiet zone.

(d) The FRA Associate Administrator for Safety may, at any time, review the status of any quiet zone and determine whether, under the conditions then present, supplementary and alternative safety measures in place fully compensate for the absence of the warning provided by the locomotive horn, or in the case of quiet zones created under § 222.33(c), whether there is a significant risk with respect to loss of life or serious personal injury. If the FRA Associate Administrator for Safety makes a preliminary determination that such safety measures do not fully compensate for the absence of the locomotive horn, or that there is a significant risk with respect to loss of life or serious personal injury, he or she will publish notice of the determination in the **Federal Register** and provide an opportunity for comment and informal hearing. The FRA Associate Administrator for Safety may require that additional safety measures be taken or that the quiet zone be terminated.

§ 222.41 Supplementary and alternative safety measures.

(a) Approved supplementary safety measures determined to be at least as effective as the locomotive horn when each public highway-rail grade crossing is equipped, and standards for their implementation, are listed in Appendix A of this part.

(b) Additional, alternative safety measures that may be included in a request for FRA acceptance of a quiet zone under § 222.33(b) are listed in Appendix B of this part.

(c) Appendix C of this part describes those situations in which the Administrator has determined do not present a significant risk with respect to loss of life or serious personal injury from establishment of a quiet zone. In the situations listed, supplementary safety measures are not required.

(d) The Administrator will add new supplementary safety measures and standards to Appendix A or B of this part when the Administrator determines that such measures or standards are an effective substitute for the locomotive horn in the prevention of collisions and casualties at public highway-rail grade crossings. The Administrator will add new listings to Appendix C of this part when the Administrator determines that

no negative safety consequences result from establishment of a quiet zone under the listed conditions.

(e) The following do not, individually or in combination, constitute supplementary or alternative safety measures: standard traffic control devices arrangements such as reflectorized crossbucks, STOP signs, flashing lights, or flashing lights with gates that do not completely block travel over the line of railroad, or traffic signals.

§ 222.43 Development and approval of new supplementary safety measures.

(a) Interested parties may demonstrate proposed new supplementary safety systems or procedures to determine if they are an effective substitute for the locomotive horn in the prevention of collisions and casualties at public highway-rail grade crossings.

(b) The Administrator may order railroad carriers operating over a public highway-rail grade crossing or crossings to temporarily cease the sounding of locomotive horns at such crossings to demonstrate proposed new supplementary safety measures, provided that such proposed new supplementary safety systems or procedures have been subject to prior testing and evaluation. In issuing such order, the Administrator may impose any conditions or limitations on such use of the proposed new supplementary safety measures which he or she deems necessary in order provide the highest level of safety.

(c) Upon successful completion of a demonstration of proposed new supplementary safety measures, interested parties may apply to the FRA Associate Administrator for Safety for approval of the new supplementary safety measures. Applications for approval shall be in writing and shall include the following:

- (1) The name and address of the applicant;
- (2) A description and design of the proposed new supplementary safety measure;
- (3) A description and results of the demonstration project in which the proposed supplementary safety measures were tested;
- (4) Estimated costs of the proposed new supplementary safety measure; and
- (5) Any other information deemed necessary.

(d) If the FRA Associate Administrator for Safety is satisfied that the proposed supplementary safety measure fully compensates for the absence of the warning provided by the locomotive horn, he or she will approve its use as a supplementary safety

measure to be used in the same manner as the measures listed in Appendix A of this part. The Associate Administrator may impose any conditions or limitations on use of the supplementary safety measures which he or she deems necessary in order to provide the highest level of safety.

(e) If the FRA Associate Administrator for Safety approves a new supplementary safety measure he or she will notify the applicant and shall add the measure to the list of approved supplementary safety measures contained in Appendix A of this part.

(f) The party applying for approval of a supplementary safety measure may appeal to the Administrator from a decision by the FRA Associate Administrator for Safety rejecting a proposed supplementary safety measure or the conditions or limitations imposed on use.

§ 222.45 Communities with pre-existing restrictions on use of locomotive horns.

(a) Subject to paragraph (b) of this section, communities which, as of October 9, 1996, have enacted ordinances restricting the sounding of a locomotive horn, or communities which, as of October 9, 1996, have not been subject to sounding of locomotive horns at highway-rail crossings due to formal or informal agreements between the community and the railroad or railroads may continue those restrictions for a period of up to three years from [the date of publication of the final rule] in order to provide time for the community to plan for, and implement supplementary safety measures at the affected crossings.

(b) If a quiet zone has not been created pursuant to § 222.33 by [two years after date of publication of the final rule], a community with a pre-existing restriction on locomotive horns as of October 9, 1996, must initiate or increase both grade crossing safety public awareness initiatives and public highway-rail grade crossing traffic law enforcement programs in an effort to offset the lack of supplementary safety measures at affected crossings. The community must document in writing the steps taken to comply with this provision. The FRA Associate Administrator for Safety reserves the right to determine whether the steps taken are sufficient to temporarily offset the lack of supplementary safety measures. If such public awareness initiatives and traffic law enforcement programs are not initiated or increased, or if the FRA Associate Administrator for Safety determines that the steps taken are not sufficient to temporarily offset the lack of supplementary safety

measures, locomotive horns must be sounded in accordance with § 222.21.

(c) Quiet zones which have been established by communities prior to issuance of this NPRM and which have been determined by the FRA Associate Administrator for Safety to be substantially in accord with this part shall be deemed to comply with the requirements of Appendix B of this part.

Appendix A to Part 222—Approved Supplementary Safety Measures Community Guide

The following discussion is intended to help guide state and local governments through the decision making process in determining whether to designate a quiet zone under § 222.33(a) or to apply for acceptance of a quiet zone under § 222.33(b). The suggested steps and “checklist” items are not meant to supersede or amend the regulatory requirements. They are included to provide a general guide. However, use of FRA’s DOT Highway-Rail Crossing Accident Prediction Formula to determine the “mitigation goal” together with the figures to be used in performing local calculations is required. The suggested steps are as follows:

a. Define the subject corridor and the involved crossings. Obtain the U.S. DOT/AAR Crossing Inventory Number of each crossing within the proposed quiet zone. The corridor must be at least one-half mile in length (805 meters) measured along the rail right-of-way, and all highway-rail crossings within the entire length of the quiet zone corridor must be included.

b. Ensure that current data, especially public or private status, highway and rail traffic counts and at least five years of collision history, is available. Current highway and rail traffic counts must be submitted to the Federal Railroad Administration (FRA) for inclusion in the U.S. DOT/AAR National Highway-Rail Crossing Inventory. A record of collisions can be obtained from the FRA (Office of Safety Analysis (RRS-22) Mail Stop 17, 1120 Vermont Avenue, NW., Washington, DC 20590 or on the internet at <http://safetydata.fra.dot.gov/officeofsafety>.

c. Determine the presence of minimum requirements. The minimum traffic control requirement for each public highway-rail grade crossing within a quiet zone is flashing lights, automatic gates, and bell and a special advance warning sign (in accordance with standards contained in the Manual on Uniform Traffic Control Devices) on each highway approach which advises approaching highway users that the train horn will not be sounded.

d. Account for private and pedestrian crossings. Private highway-rail crossings do not need to be addressed by supplementary or alternative safety measures to be included within a quiet zone. Calculations of violation rates and collision rates should not include such crossings. The minimum traffic control requirement for each private highway-rail grade crossing and pedestrian at-grade crossing within a quiet zone is a special warning sign on each approach which

advises users of the crossing that the train horn will not be sounded.

e. In order to establish a quiet zone that includes private crossings, the jurisdiction establishing the quiet zone must notify all land owners using the crossing that train horns will not be routinely sounded at crossings within the quiet zone.

f. Determine which crossings can be addressed by the engineering-based supplementary safety measures of this Appendix A. If all crossings can be so addressed without changing any requirements of the supplementary safety measures, the road authorities and the railroad(s) should proceed to implement the appropriate measures and make the applicable notifications.

g. If any of the crossings will be addressed with a non-engineering-based supplementary safety measure from this Appendix A (currently, only Photo Enforcement is included), a baseline violation rate for each crossing to be so addressed must be determined for subsequent assessment purposes:

1. In the case where train horns are routinely being sounded within the proposed quiet zone: once baseline violation rates have been determined, and before the quiet zone has been implemented, Photo Enforcement should be initiated. In the calendar quarter following initiation, a new violation rate should be determined and compared to the baseline violation rate. If and when the new violation rates at all crossings in the quiet zone at which Photo Enforcement is to be used are at least 49 percent below the baseline violation rates, and all the other crossings in the quiet zone have been addressed with Appendix A options, the community and the railroad may proceed with notifications and implementation of the quiet zone. Violation rates must be monitored for the next two calendar quarters and every other quarter thereafter. If the violation rate is ever greater than the baseline violation rate, the procedures for dealing with unacceptable effectiveness after establishment of a quiet zone should be followed.

2. In the case where the routine use of train horns within the proposed quiet zone is already prohibited: Once baseline violation rates have been determined and all the other crossings in the quiet zone have been addressed with other Appendix A options, the community and the railroad may proceed with initiation of Photo Enforcement and notification and implementation of the quiet zone. Violation rates must be monitored for the next two calendar quarters and every other quarter thereafter. If the violation rate is ever greater than a value less than 49 percent below the baseline violation rate, the procedures for dealing with unacceptable effectiveness after establishment of a quiet zone should be followed.

h. Where one or more crossings in the proposed quiet zone corridor can not be addressed with a supplementary safety measure from this Appendix A, the applicant must use the DOT Highway-Rail Crossing Accident Prediction Formula to determine the total of predicted accidents at all of the public crossings within the quiet zone

assuming that each crossing is equipped with lights, automatic gates, and a bell. If a ban is not in effect, this total becomes the "mitigation goal" for the corridor, i.e., the predicted accident total which the community's proposal must show will not be exceeded once the quiet zone is implemented. The mitigation goal must be multiplied by 1.62 (communities subject to FRA's Emergency Order No. #15 (EO15) should multiply by 3.125) to establish the 'expected accident total without horns,' i.e., the expected accident total once horns are banned if no supplementary safety measures are applied. If a ban is in effect, this total is the expected accident total without horns. The mitigation goal is realized by multiplying this total by .62 (communities subject to EO15 should multiply by .32).

i. The accident prediction for any crossing(s) to be closed prior to implementation of the quiet zone should be subtracted from the "expected accident total without horns." The highway traffic counts for crossings to be closed must be added to the traffic counts of the crossings which will be used by the displaced vehicles and the accident prediction for these impacted crossings must be recalculated and multiplied by 1.62 (3.125 for communities subject to EO15) to establish a new "expected accident total without horns."

j. For each crossing to be addressed, the effectiveness of the supplementary safety measure to be applied, as set forth above, should be multiplied times that crossing's accident prediction and the product should be subtracted from the "expected accident total without horns." For the non-engineering-based measures, an effectiveness of .38 may be assumed until analysis of the specific crossing and applied mitigation measure has been assessed.

k. Once it can be shown that the "expected accident total without horns" will be reduced to or below the mitigation goal, the quiet zone proposal may be submitted for approval to FRA's Associate Administrator for Safety.

Approved Supplementary Safety Measures

1. Temporary Closure of a Public Highway-Rail Grade Crossing

Close the crossing to highway and pedestrian traffic during whistle-ban periods.

Required

a. The closure system must completely block highway and pedestrian traffic from entering the crossing.

b. The crossing must be closed during the same hours every day.

c. The crossing may only be closed during one period each 24-hours.

d. Daily activation and deactivation of the system is the responsibility of the traffic control authority or governmental authority responsible for maintenance of the street or highway crossing the railroad. The entity may provide for third party activation and deactivation; however, the governmental entity shall remain fully responsible for compliance with the requirements of this part.

e. The system must be tamper and vandal resistant to the same extent as other traffic control devices.

Recommended

Manual on Uniform Traffic Control Devices (MUTCD) standards should be met for any barricades and signs used in the closure of the facility. Signs for alternate highway traffic routes should be erected in accordance with MUTCD and state and local standards and should inform pedestrians and motorists that the streets are closed, the period for which they are closed, and that alternate routes must be used.

2. Four-Quadrant Gate System

Install gates at a crossing sufficient to fully block highway traffic from entering the crossing when the gates are lowered, including at least one gate for each direction of traffic on each approach.

Required

a. When a train is approaching, all highway approach and exit lanes on both sides of the highway-rail crossing must be spanned by gates, thus denying to the highway user the option of circumventing the conventional approach lane gates by switching into the opposing (oncoming) traffic lane in order to enter the crossing and cross the tracks.

b. Gates must be activated by use of constant warning time devices.

c. The gap between the ends of the entrance and exit gates (on the same side of the railroad tracks) when both are in the fully lowered, or down, position must be less than two feet if no median is present. If the highway approach is equipped with a median or a channelization device between the approach and exit lanes, the lowered gates must reach to within one foot of the median or channelization device, measured horizontally across the road from the end of the lowered gate to the median or channelization device or to a point over the edge of the median or channelization device. The gate and the median top or channelization device do not have to be at the same elevation.

d. "Break-away" channelization devices must be frequently monitored to replace broken elements.

e. Signs must be posted alerting motorists to the fact that the train horn does not sound.

Recommendations for new installations only

f. Gate timing should be established by a qualified traffic engineer based on site specific determinations. Such determination should consider the need for and timing of a delay in the descent of the exit gates (following descent of the conventional entrance gates). Factors to be considered may include available storage space between the gates that is outside the fouling limits of the track(s) and the possibility that traffic flows may be interrupted as a result of nearby intersections.

g. When operating in the failure (fail-safe) mode, exit gates should remain in the raised, or up, position.

h. A determination should be made as to whether it is necessary to provide vehicle presence detectors (VPDs) to open or keep open the exit gates until all vehicles are clear of the crossing. VPD should be installed on one or both sides of the crossing and/or in the surface between the rails closest to the

field. Among the factors that should be considered are the presence of intersecting roadways near the crossing, the priority that the traffic crossing the railroad is given at such intersections, the types of traffic control devices at those intersections, and the presence and timing of traffic signal preemption.

i. Highway approaches on one or both sides of the highway-rail crossing may be provided with medians or channelization devices between the opposing lanes. Medians should be defined by a barrier curb or mountable curb, or by reflectorized channelization devices, or by both.

j. Remote monitoring of the status of these crossing systems is preferable. This is especially important in those areas in which qualified railroad signal department personnel are not readily available.

3. Gates With Medians or Channelization Devices

Install medians or channelization devices on both highway approaches to a public highway-rail grade crossing denying to the highway user the option of circumventing the approach lane gates by switching into the opposing (oncoming) traffic lane in order to drive around lowered gates to cross the tracks.

Required

a. Opposing traffic lanes on both highway approaches to the crossing must be separated by either: (1) Medians bounded by barrier curbs, or (2) medians bounded by mountable curbs if equipped with channelization devices.

b. Medians must extend at least 100 feet, or if there is an intersection within 100 feet of the gate, the median must extend at least 60 feet from the gate.

c. Intersections within 60 feet of the crossing must be closed or moved.

d. Crossing warning system must be equipped with constant warning time devices.

e. The gap between the lowered gate and the barrier curb or channelization device must be one foot or less, measured horizontally across the road from the end of the lowered gate to the barrier curb or channelization device or to a point over the curb edge or channelization device. The gate and the curb top or channelization device do not have to be at the same elevation.

f. "Break-away" channelization devices must be frequently monitored to replace broken elements.

g. Signs must be posted alerting motorists to the fact that the train horn does not sound.

4. One Way Street With Gate(s)

Gate(s) must be installed such that all approaching highway lanes to the public highway-rail grade crossing are completely blocked.

Required

a. Gate arms on the approach side of the crossing should extend across the road to within one foot of the far edge of the pavement. If a gate is used on each side of the road, the gap between the ends of the gates when both are in the lowered, or down, position should be no more than two feet.

b. If only one gate is used, the edge of the road opposite the gate mechanism must be configured with a barrier curb extending at least 100 feet.

c. Crossing warning system must be equipped with constant warning time devices.

d. Signs must be posted alerting motorists to the fact that the train horn does not sound.

5. Photo Enforcement

The alternative entails automated means of gathering valid photographic or video evidence of traffic law violations together with follow-through by law enforcement and the judiciary.

Required

a. State law authorizing use of photographic or video evidence both to bring charges and sustain the burden of proof that a violation of traffic laws concerning public highway-rail grade crossings has occurred, accompanied by commitment of administrative, law enforcement and judicial officers to enforce the law.

b. Sanction includes sufficient minimum fine (e.g., \$100 for a first offense) to deter violations.

c. Means to reliably detect violations (e.g., loop detectors, video imaging technology).

d. Photographic or video equipment deployed to capture images sufficient to document the violation (including the face of the driver, if required to charge or convict under state law).

Note to 5.d.: This does not require that each crossing be continually monitored. The objective of this option is deterrence, which may be accomplished by moving photo/video equipment among several crossing locations, as long as the motorist perceives the strong possibility that a violation will lead to sanctions. Each location must appear identical to the motorist, whether or not surveillance equipment is actually placed there at the particular time. Surveillance equipment should be in place and operating at each crossing at least 25 percent of each calendar quarter.

e. Appropriate integration, testing and maintenance of the system to provide evidence supporting enforcement.

f. Semi-annual analysis verifying that the last quarter's violation rates remain at or below the acceptable levels established prior to initiation of photo enforcement.

g. Signs must be posted alerting motorists to the fact that the train horn does not sound.

h. Public awareness efforts designed to reinforce photo enforcement and alert motorists to the absence of train horns.

Appendix B to Part 222—Alternative Safety Measures

a. Please refer to the section entitled "Community guide" at the beginning of Appendix A of this part for a discussion intended to help guide state and local governments through the decision making process in determining whether to designate a quiet zone under § 222.33(a) (implementing supplementary safety measures) or to apply for acceptance of a quiet zone under § 222.33(b) (implementing alternative safety measures or a combination of alternative and supplementary safety measures).

b. A state or local government seeking acceptance of a quiet zone under § 222.33(b) may include in its proposal alternative safety measures listed in this appendix. Credit may be proposed for closing of public highway-rail grade crossings provided the baseline risk at other crossings is appropriately adjusted by increasing traffic counts at neighboring crossings as input data to the prediction formula (except to the extent that nearby grade separations are expected to carry that traffic).

c. The following alternative safety measures may be proposed to be employed in the same manner as stated in Appendix A of this part. Unlike application of the supplementary safety measures in Appendix A of this part, if there are unique circumstances pertaining to a specific crossing or number of crossings, the specific requirements associated with a particular supplementary safety measure may be adjusted or revised. In addition, as provided for in § 222.33(b), using the alternative safety measures contained in this Appendix B will enable a locality to tailor the use and application of various supplementary safety measures to a specific set of circumstances. Thus, a locality may institute alternative or supplementary measures on a number of crossings within a quiet zone but due to specific circumstances a crossing or a number of crossings may be omitted from the list of crossings to receive those safety measures. FRA will review the proposed plan, and will approve the proposal if it finds that the predicted collision rate applied to the quiet zone as a whole, is reduced to the required level.

d. The following alternative safety measures may be included in a proposal for acceptance by FRA for creation of a quiet zone. Approved supplementary safety measures which are listed in Appendix A of this part may be used for purposes of alternative supplementary safety measures. The requirements for the first five measures listed below are found in Appendix A of this part. If one or more of the requirements associated with that supplementary safety measure as listed in Appendix A of this part is revised or deleted, data or analysis supporting the revision or deletion must be provided to FRA for review.

1. Temporary Closure of a Public Highway-Rail Grade Crossing

Close the crossing to highway and pedestrian traffic during whistle-ban periods.

2. Four-Quadrant Gate System

Install sufficient gates at a public highway-rail grade crossing to fully block highway traffic from entering the crossing when the gates are lowered, including at least one gate per each direction of traffic on each approach.

3. Gates With Medians or Channelization Devices

Install medians or channelization devices on both highway approaches to a public highway-rail grade crossing which prevent highway traffic from driving around lowered gates.

4. One-Way Street With Gate(s)

Gate(s) are installed such that all approaching highway lanes to a public highway-rail grade crossing are completely blocked.

5. Photo Enforcement

Automated means of gathering valid photographic evidence of traffic law violations at a public highway-rail grade crossing together with follow-through by law enforcement and judicial personnel.

The following alternatives may be proposed for inclusion in a proposed program of alternative safety measures within specific quiet zone proposals:

16. Programmed Enforcement

Community and law enforcement officials commit to a systematic and measurable crossing monitoring and traffic law enforcement program at the public highway-rail grade crossing, alone or in combination with the Public Education and Awareness option.

Required

a. Subject to audit, a statistically valid baseline violation rate must be established through automated or systematic manual monitoring or sampling at the subject crossing(s). See Appendix A of this part (Photo Enforcement) for treatment of effectiveness with or without prior whistle ban.

b. A law enforcement effort must be defined, established and continued along with continual or regular monitoring.

c. Following implementation of the quiet zone, results of monitoring for not less than two full calendar quarters must show that the violation rate has been reduced sufficiently to compensate for the lack of train horns, (i.e., a reduction of at least 49 percent), and the railroad shall be notified (to resume sounding of the train horn if results are not acceptable).

d. Subsequent semi-annual sampling must indicate that this reduction is being sustained. If the reduction is not sustained, the state or municipality may continue the quiet zone for a maximum of one calendar quarter and shall increase the frequency of sampling to verify improved effectiveness. If, in the second calendar quarter following the quarter for which results were not acceptable, the rate is not acceptable, the quiet zone shall be terminated until requalified and accepted by FRA.

e. Signs alerting motorists to the fact that the train horn does not sound.

7. Public Education and Awareness

Conduct, alone or in combination with programmed law enforcement, a program of

public education and awareness directed at motor vehicle drivers, pedestrians and residents near the railroad to emphasize the risks associated with public highway-rail grade crossings and applicable requirements of state and local traffic laws at those crossings.

Requirements

a. Subject to audit, a statistically valid baseline violation rate must be established through automated or systematic manual monitoring or sampling at the subject crossing(s). See Appendix A of this part (Photo Enforcement) for treatment of effectiveness with or without prior whistle ban.

b. A sustainable public education and awareness program must be defined, established and continued concurrent with continued monitoring. This program shall be provided and supported primarily through local resources.

c. Following implementation of the quiet zone, results of monitoring for not less than two full calendar quarters must show that the violation rate has been reduced sufficiently to compensate for the lack of train horns (i.e., a reduction of at least 49 percent with statistical confidence of .95). The railroad (with a copy of such notification sent to FRA's Associate Administrator for Safety) shall be notified to resume sounding of the train horn if results are not acceptable.

d. Subsequent semi-annual sampling must indicate that this reduction is being sustained. If the reduction is not sustained, the state or municipality may continue the quiet zone for a maximum of one calendar quarter and shall increase the frequency of sampling to verify improved effectiveness. If, in the second calendar quarter following the quarter for which results were not acceptable, the rate is not acceptable, the quiet zone shall be terminated until requalified and accepted by FRA.

e. Signs alerting motorists to the fact that the train horn does not sound.

Appendix C to Part 222—Conditions Not Requiring Additional Safety Measures

No negative safety consequences result from establishment of a quiet zone under the following conditions:

1. Train speed does not exceed 15 miles per hour;

2. Train travels between traffic lanes of a public street or on an essentially parallel course within 30 feet of the street;

3. Signs are posted at every grade crossing indicating that locomotive horns do not sound;

4. Unless the railroad is actually situated on the surface of the public street, traffic on

all crossing streets is controlled by STOP signs or traffic lights which are interconnected with automatic crossing warning devices; and

5. The locomotive bell will ring when approaching and traveling through the crossing.

PART 229—[AMENDED]

2. The authority citation for part 229 continues to read as follows:

Authority: 49 U.S.C. 20103, 20107, 20701–20703, and 49 CFR 1.49.

3. Section 229.129 is revised to read as follows:

§ 229.129 Audible warning device.

(a) Each lead locomotive shall be provided with an audible warning device that produces a minimum sound level of 96dB(A) and a maximum sound level of [Option 1—104 dB(A); Option 2—111 dB(A)] at 100 feet forward of the locomotive in its direction of travel. The sound level of the device as measured 100 feet from the locomotive to the right and left of the center of the locomotive shall not exceed the permissible value measured at 100 feet forward of the locomotive. The device shall be arranged so that it can be conveniently operated from the engineer's normal position in the cab.

(b) Measurement of the sound level shall be made using a sound level meter conforming, at a minimum, to the requirements of ANSI S1.4–1971, Type 2, and set to an A-weighted slow response. While the locomotive is on level tangent track, the microphone shall be positioned 4 feet above the ground at the center line of the track, and shall be oriented with respect to the sound source in accordance with the manufacturer's recommendations. Measurements verifying compliance shall be taken only while the ambient temperature is in the range between 36 and 95 degrees Fahrenheit and the relative humidity is in the range between 20 and 90 percent. The test site shall be free of reflective structures (including buildings, natural barriers, and other rolling stock) within a 200 foot radius of the horn system.

Issued in Washington, D.C. on December 16, 1999.

Jolene M. Molitoris,

Federal Railroad Administrator.
