(Data in metric tons of contained tin, unless otherwise noted)
Domestic Production and Use: In 1999, there was no domestic tin mine production. Production of tin at the only U.S. tin smelter, at Texas City, TX, stopped in 1989. Twenty-five firms consumed about $97 \%$ of the primary tin. The major uses were as follows: cans and containers, $30 \%$; electrical, $20 \%$; construction, $10 \%$; transportation, 10\%; and other, $30 \%$. Based on the New York composite price, the estimated values of some critical items were as follows: primary metal consumed, $\$ 277$ million; imports for consumption, refined tin, $\$ 326$ million; old scrap, $\$ 65$ million.

Recycling: About 17,800 tons of tin from old and new scrap was recycled in 1999. Of this, about 7,710 tons was recovered from old scrap at 5 detinning plants and 46 secondary nonferrous metal processing plants.

Import Sources (1995-98): Brazil, 21\%; Indonesia, 20\%; Bolivia, 17\%; China, 16\%; and other, 26\%.

Tariff: Most major imports of tin, including unwrought metal, waste and scrap, and unwrought tin alloys, enter duty free.

Depletion Allowance: 23\% (Domestic), 15\% (Foreign).
Government Stockpile: The Defense Logistics Agency (DLA) tin sales program emphasized its long-term activity and had only a modest spot sales effort. DLA allocated 2,000 tons of tin to sell on the spot market at monthly sales. Two long-term sales were again conducted, one in the spring, another in the fall. DLA announced that its Annual Materials Plan for fiscal year 1999 called for sales of up to 12,000 tons of stockpile tin. Stockpile tin is warehoused at six depots, with the largest holdings at Hammond, IN, and Baton Rouge, LA. The Stockton, CA, depot was closed.

## TIN

Events, Trends, and Issues: The Steel Recycling Institute (SRI), Pittsburgh, PA, announced that the domestic steel can recycling rate was $56 \%$ in 1998, compared with a $61 \%$ rate in 1997. SRI continued to emphasize the importance of aerosol can recycling. It noted that 200 million Americans had access to steel can recycling programs.

The world tin industry's major research and development laboratory, based in the United Kingdom, was in its fifth full year under its new structure. It is now privatized, with funding supplied by numerous major tin producing and consuming firms rather than by the Association of Tin Producing Countries. The organization reported progress in several areas of research to develop new tin uses; among these were a tin foil capsule to replace lead foil capsules on wine bottles, and a new noncyanide-based electrolyte called "Stanzec" that yields a coating of tin and zinc, which could replace cadmium as an environmentally acceptable anticorrosion coating on steel.

## World Mine Production, Reserves, and Reserve Base:

|  | Mine production |  | Reserves ${ }^{3}$ | Reserve base ${ }^{3}$ |
| :---: | :---: | :---: | :---: | :---: |
|  | 1998 | $199{ }^{\text {e }}$ |  |  |
| United States |  |  | 20,000 | 40,000 |
| Australia | 10,000 | 9,000 | 210,000 | 600,000 |

| Thailand | 1,000 | 1,000 | 940,000 | 1,000,000 |
| Other countries | 6,000 | 6,000 | 180,000 | 200,000 |
| World total (may be rounded) | 206,000 | 210,000 | 7,700,000 | 12,000,000 |

World Resources: U.S. resources of tin, primarily in Alaska, were insignificant compared with those of the rest of the world. Sufficient world resources, principally in western Africa, southeastern Asia, Australia, Bolivia, Brazil, China, and Russia were available to sustain current production rates well into the next century.

Substitutes: Aluminum, glass, paper, plastic, or tin-free steel substitute for tin in cans and containers. Other materials that substitute for tin are epoxy resins for solder; aluminum alloys, copper-base alloys, and plastics for bronze; plastics for bearing metals that contain tin; and compounds of lead and sodium for some tin chemicals.
