APPENDIX A
COMMENTS RECEIVED ON THE
DRAFT ENVIRONMENTAL IMPACT STATEMENT

On December 19, 1997, the Section of Environmental Analysis (SEA) of the Surface Transportation Board (the Board) issued a Draft Environmental Impact Statement (Draft EIS) that evaluated the environmental impacts that could result from the proposed Conrail Acquisition. SEA prepared the Draft EIS in accordance with the requirements of the National Environmental Policy Act (NEPA), as amended (42 U.S.C. 4321); the Board's environmental rules (49 CFR Part 1105); and other applicable environmental statutes and rules.

This Final Environmental Impact Statement (Final EIS) addresses the comments on the Draft EIS, as well as other environmental comments that SEA received during its ongoing environmental review, and it reflects SEA's further environmental analysis, including site visits and consultations. In addition, the Final EIS contains SEA's final environmental recommendations to the Board. The Board will consider SEA's recommendations and the environmental record before making a decision in this proceeding.

This appendix contains the 257 written comments on the Draft EIS that SEA received during the formal comment period that ended on February 2, 1998. SEA also fully considered comments received after February 2 during its environmental review process. Although they are not reproduced here, these comments are part of the Board's administrative record and the Board will consider them in making its decision.

Table A-1 lists the comments on the Draft EIS in order of comment date and organizes them as follows:

- Federal agencies.
- Applicants.¹
- National and regional groups.²

¹ "The Applicants" refers to CSX Corporation and CSX Transportation, Inc. (CSX); Norfolk Southern Corporation and Norfolk Southern Railway Company (NS); and Conrail, Inc., and Consolidated Rail Corporation (Conrail).

² This group also includes comments submitted anonymously or without addresses.

- States, regional, and local agencies, elected officials, organizations, and individuals, grouped by state.

The reproduced comment letters follow the order presented in Table A-1. For ease of reference, each page of each document contains the document identifier number, as listed in Table A-1.

SEA also provided an additional full 45-day comment period (ending April 15, 1998) specifically for refined hazardous materials transport, noise, and environmental justice analyses. SEA refined these analyses to be able to include information that was unavailable during its preparation of the Draft EIS and then opened this second comment period to allow the public to review all of its analysis. Table A-2 lists the letters SEA received during this comment period. The addendum to this Final EIS presents copies of these letters, along with SEA's responses.

Table A-3 is a list of comment letters that SEA received between publication of the final scope and service of the Draft EIS. Table A-4 is a list of comment letters that SEA received after Final EIS analysis and writing.

CENTRAL ADMINISTRATIVE UNIT
REC'D: 12/30/97
DOCUMENT # 12/31/97 10:12:57 AM

DEC 1 1997

Ms. Elaine K. Kaiser
Chief-Section of Environmental Analysis
Surface Transportation Board
Washington, D.C. 20423

Dear Ms. Kaiser:

Thank you for your letter of November 26, 1997, updating the Bureau of Indian Affairs (BIA) about the status of the CSX Corporation (CSX) and Norfolk Southern Corporation (NS) joint application to acquire Conrail Inc.

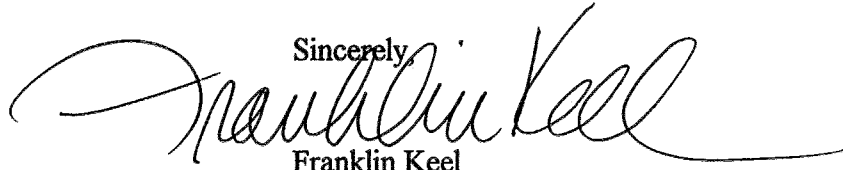

We appreciate the notification of intent to prepare an Environmental Impact Statement (EIS) for the proposed CSX-NS acquisition of Conrail Inc. and commend the Surface Transportation Board for notifying the two (2) federally-recognized Indian tribes (Seneca Nation of Indians & Poarch Band of Creek Indians) of its intent to evaluate the potential environmental impacts of this proposed action including any and/or all impacts on the Indian reservation trust lands and related trust resources of these tribes.

This type of open communication between non-BIA federal agencies and Indian tribes is an outstanding example of how other federal government agencies are recognizing Indian tribal governments and consulting with Indian tribes in assessing the impact of federal and non-federal actions on tribal trust lands and related trust resources.

We look forward to receiving copies of the various environmental documents related to this proposed action and will coordinate with the two tribes in preparing comments and input for your consideration in preparing the Environmental Impact Statement for the CSX-NS acquisition of Conrail Inc.

If we can be of further assistance to your agency concerning this matter, please do not hesitate to contact the Eastern Area Office of the Bureau of Indian Affairs.

Sincerely,

A handwritten signature in black ink, appearing to read "Franklin Keel". The signature is written in a cursive style with a large initial "F" and a long horizontal flourish extending to the right.

Franklin Keel

Dear Ms. Kaiser:

This is in response to the request for comments concerning the proposal listed below. The U.S. Department of Housing and Urban Development has determined that the proposal does not present any special interests or concerns to HUD.

**Conrail Acquisition by CSX
and Norfolk Southern**

Thank you for the opportunity to comment. If you should require any further input from HUD, I may be reached at (614) 469-5737, x8252.

Sincerely,

Ross S. Carlson
Environmental Officer

 Washington, D.C. 20423-0001

Dear Ms. Kaiser:

Thank you for mailing to us a copy of the Draft Environmental Impact Statement (DEIS) for the proposed acquisition of Conrail, Inc., by Norfolk Southern Railroad and CSX Railroad.

We note that the description of the analysis methods used in the preparation of the DEIS, at paragraph 3.15.3, specifically included consideration of U.S. Army Corps of Engineers permitting requirements under Section 10 of the Rivers and Harbors Act and Section 404 of the Clean Water Act. This office, the Regulatory Division of the Jacksonville District of the U.S. Army Corps of Engineers, administers the permitting program for activities occurring in Florida.

The Executive Summary, at page ES-24, and the specific discussion for Florida, at page FL-2, reports no construction activity in Florida. Therefore, an application for a permit is not required to be submitted to this office. However, if there are any changes that result in work in Florida, please advise this office at the address above. We will assist in determining whether the construction is in the location and of the nature that requires a permit.

Feel free to contact Bob Barron at the letterhead address or by telephone at (904) 232-2203.

Sincerely,

Hanley K. Smith
 Acting Chief, Regulatory Division

Washington, D.C. 20423-0001

Dear Ms. Kaiser:

This is in reference to the Draft Environmental Impact Statement (DEIS) received by this office on January 2, 1998 entitled "Proposed Conrail Acquisition." The transmittal requested comments prior to February 2, 1998.

I have reviewed the DEIS with regard to potential impacts to waters of the United States within the Buffalo District. Eight projects were identified for which Department of the Army authorization would potentially be required. These projects include the following:

New York:

- Gardenville Junction Construction (Erie County, NY)
- Blasdell Connection (Erie County, NY)

Ohio

- Collinwood New Intermodal Facility (Cuyahoga County, OH)
- Oak Harbor Connection (Ottawa County, OH)
- Willard Fueling Facility (Huron County, OH)
- Vermilion Connection (Erie County, OH)
- Abandonment: Toledo to Maumee
- Abandonment: Toledo Pivot Bridge

In each of these projects, the proposal would either directly impact a water of the United States or potentially impact a water of the United States. The DEIS correctly

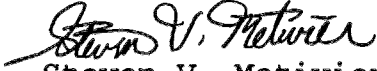

Regulatory Branch

SUBJECT: Department of the Army Processing No. 98-493-0001(1); STB Finance Docket No. 33388; Draft Environmental Impact Statement, "Proposed Conrail Acquisition"

indicates that Department of the Army authorization would be required for the placement of fill material into a water of the United States. The Buffalo District strongly encourages further coordination with this office prior to construction of any of the cited projects.

Questions pertaining to this matter should be directed to me at (716) 879-4314, by writing to the following address: U.S. Army Corps of Engineers, 1776 Niagara Street, Buffalo, New York 14207-3199, or by e-mail at: Steven.V.Metivier@usace.army.mil

CENTRAL ADMINISTRATIVE UNIT
REC'D: 2/3/98
DOCUMENT # 2/3/98 11:35:58 AM

Dear Ms. Kaiser:

This is in response to your October 1, 1997 letter requesting comments on the Draft Environmental Impact Statement (DEIS) for the proposed acquisition of Conrail's assets by Norfolk Southern Railroad and CSX Railroad.

We have reviewed the DEIS and noted that the map of Little Ferry, Bergen County, New Jersey in Figure 5-NJ-5, Volume 3B of the DEIS depicts wetland areas regulated by New Jersey Department of Environmental Protection. Work in these and/or nearby areas may also be regulated by the U.S Army Corps of Engineers. Our jurisdiction would include the discharge of dredged or fill material into any wetlands, freshwater or tidal, on the site or into the waterway waterward of the spring high tide line. If such work is proposed within waters of the United States at Little Ferry, a Department of the Army permit from the New York District will be necessary. In order for us to accurately determine the extent of our jurisdiction on the site, a wetland delineation would need to be submitted for our review and approval. Once we receive a wetland delineation for the site, we will then be able to schedule a site inspection.

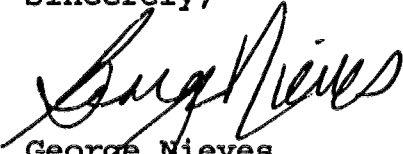

If the proposed work would not involve work within our jurisdiction, a permit will not be required and no further contact with this office will be necessary. If work is proposed within our jurisdiction, the appropriate application documents should be submitted at an appropriate juncture.

For impacts to waters of the United States at the Gardenville Junction at the City of Buffalo, Erie County, New York you will need to contact the US Army Corps of Engineers Buffalo District at 1776 Niagara Street, Buffalo, New York 14207-3199, ATTN: NCBCO-S.

 Washington, D.C. 20423-0001

ATTN: Elaine K. Kaiser
 Environmental Project Director
 Environmental Filing

Dear Ms. Kaiser:

This is in response to the Draft Environmental Impact Statement (DEIS) for the "Proposed Conrail Acquisition" dated December 12, 1997 and received in this office December 24, 1997, wherein comments have been requested by February 2, 1998.

The Detroit District Corps of Engineers has the responsibility of regulating activities in the waters and wetlands of Michigan and the northern third of Indiana. The Corps' jurisdiction in Michigan is unique in the fact that we have joint regulating responsibilities with the Michigan Department of Environmental Quality (MDEQ) along all the navigable waters and their adjacent wetlands. Work along these areas, therefore, requires prior authorization from both governmental agencies. The remaining inland waters and/or wetlands will require prior authorization from the MDEQ only.

Within the DEIS it specifically stated that there would be new construction/connections and abandonments within the Detroit Districts jurisdiction limits and those actions would be permitted before the fact by the actual railway company. However, this office has yet to receive any such request. For your convenience, informational brochures and applications for both Indiana and Michigan have been enclosed. Please complete and return these applications to the attention of Mary C. Miller, Project Manager. Plan view and cross-sectional view drawings, in 8 1/2" format, should accompany the applications, along with a clear description of all quantities, dimensions, and nature of

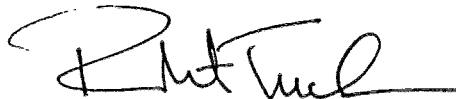

material placement or soil movement. Be advised that a wetland delineation, in accordance with the Corps of Engineers 1987 delineation Manual, must also be completed for each proposed work site to determine if any wetlands are present.

The authority of the Corps of Engineers to regulate construction or other work in navigable waters of the United States is contained in Section 10 of the Rivers and Harbors Act, Section 404 of the Clean Water Act and regulations promulgated pursuant to these Acts. Please be advised that filling and grading work, mechanized landclearing, ditching or other excavation activity, and piling installation constitute or otherwise involve discharges of dredged and/or fill material under the Corps' regulatory authority.

It was noted that the DEIS Volume 5B, Appendix L, section of environmental analysis sample consultation letter and recipients, did not identify the MDEQ as being on the contact list. Therefore, we recommend that you contact Ms. Peg Bostwick, Lake and Stream Protection Unit, Land and Water Management Division, MDEQ, P.O. Box 30458, Lansing, Michigan, 48909, (517)373-1950, for their comments and a determination of State permit requirements.

Should you have any questions, please contact Mary C. Miller at the above address or telephone (313) 226-2220. All correspondence should reference File Number: 97-200-014-0E.

Sincerely,

Robert Tucker

Comments of the
United States Department of Transportation
on the
Draft Environmental Impact Statement

I. Introduction

The Surface Transportation Board ("STB" or "Board") in this proceeding is considering the proposed acquisition of Consolidated Rail Corporation and Conrail, Inc. ("Conrail") by Norfolk Southern Corporation and Norfolk Southern Railway Company ("NS") and CSX Corporation and CSX Transportation, Inc. ("CSX").¹ By Decision No. 6 (served May 30, 1997), the Board directed its Section of Environmental Analysis ("SEA") to prepare an Environmental Impact Statement ("EIS") in order to assess the transaction's potential impacts on, *inter alia*, the environment and safety. On December 12, 1997, the SEA issued a Draft Environmental Impact Statement ("DEIS") and sought comment thereon. The United States Department of Transportation ("DOT" or "Department") hereby offers these comments on the safety and environmental aspects of the DEIS.²

¹/ Collectively, these entities are referred to herein as "Applicants."

²/ These comments, of course, do not in any way reflect a view as to whether the pending transaction should be approved. DOT will address this fundamental issue in its brief on February 23, 1998.

The Department commends the Board for ordering the preparation of an EIS for this complicated and important matter. DOT's comments address the impacts of the pending transaction on the following major subject areas covered in the DEIS: (1) railroad safety, (2) rail passenger transportation, and (3) severely affected communities. We also wish to inform the SEA of our view that a purely technical application of environmental thresholds can result in real-world impacts being overlooked.

As discussed more fully below, the Department believes that (1) the safety integration plans ("SIPs") submitted by the Applicants appropriately address the safety issues raised by their operating plans for purposes of the EIS, (2) the DEIS recommendations concerning a 15 minute separation of passenger trains from other trains and implementation of industry guidelines for carriage of hazardous materials should not be adopted, (3) the consequences of the transaction for rail passenger transportation require oversight, (4) prospective impacts on communities are best resolved by STB action that will facilitate prompt resolution of mitigation problems by direct agreements between the Applicants and affected communities, and (5) the DEIS analysis isolates some of the "individual" impacts of the transaction in such a way that it fails to identify certain broader consequences and indeed whole communities. DOT recommends that the final EIS should focus more broadly in order to measure the transaction's true impacts more accurately, and for this reason we urge the Board to retain oversight.

II. Rail Safety Impacts

A. Safety Integration Plans

Following the Department's expression of concern about the effect that the proposed transaction might have on rail safety (DOT-3, filed October 21, 1997), the STB directed each of the Applicants to prepare a SIP. Decision No. 52, (served November 3, 1997). These plans were intended to explain in detail the steps to be taken by the Applicants to ensure that the division and integration of Conrail into the NS and CSX systems, and the formation and operation of the Shared Asset Areas ("SAA"s), occurred in a safe manner. DOT again extends its appreciation for the STB's prompt action.

As we explained earlier in this proceeding (DOT-4, filed December 3,

1997), the Applicants worked closely with the Federal Railroad Administration ("FRA") to produce the SIPs filed on December 3, 1997.³ Specifically, immediately following the issuance of Decision No. 52, FRA and the Applicants began a close dialogue regarding the contents of the SIPs. At that time FRA also developed merger-related Safety Integration Plan Guidelines ("SIPG"), which were crafted specifically for the Applicants, to address all of the safety concerns identified by FRA in the original application filed by Applicants and through its consideration of earlier rail mergers.⁴

Concurrently with the preparation of the SIPG, FRA and the Applicants established a ten member SIP review team made up of various FRA subject experts and Conrail/CSX/NS representatives. The team's initial purpose was to prepare SIPs that were as comprehensive as possible given the short time allotted for submission to the STB. Subsequently, the SIP review team continued to refine the SIPs and prepare for their implementation by the Applicants under the supervision of FRA, in the event that the STB approves the proposed transaction. DOT wishes to emphasize that each of the Applicants has cooperated fully with FRA and continues to do so, and we highly commend their efforts.

The primary criteria used by FRA in reviewing the SIPs were (1) that each safety item identified in the SIPG be thoroughly considered, (2) that provisions for the reasonable integration of the disparate procedures and cultures prevalent in the operations of the Applicants be developed for each safety item, and (3) that the integration process reflect a logical sequence of events, including the identification of workforce and resource allocations, and the delegation of authority necessary to carry out the stated action items.

The following are FRA's major findings with respect to the SIPs:

1. The SIPs demonstrate that each Applicant has systematically considered, and established procedures for integrating, all potentially significant sources of increased safety risk. These sources include the following:

³/ FRA is the agency within DOT that exercises plenary authority over the safety of the railroad industry. *See generally* 49 U.S.C. §§ 20101-53 and 49 C.F.R. § 1.49.

⁴/ The final version of the SIPG is attached hereto as Exhibit 1.

- a) Differences in employee cultures. These differences have required (i) the establishment of adequate lines of communication between management, labor, and field personnel, (ii) prevention of harassment and intimidation, and (iii) the provision of adequate training to employees;
- b) Differences in railroad management and operating procedures. These differences have necessitated taking advantage of the "best practices" and unique strengths of each carrier;
- c) Loss of institutional knowledge. This prospect has required integration of railroad field, mid-level, and senior management with knowledge of operating and safety practices; and
- d) The very large increase in the size of two major railroad systems, including train volumes, and potential additional workloads for management and labor of both NS and CSX.

2. The CSX, NS, and the Shared Assets Area SIPs adequately address all of the safety items listed in FRA's SIPG in a reasonable manner. Each identifies the significant safety issues and provides a detailed approach to integration through the implementation of a logical sequence of events involving detailed workforce and resource allocations that employ sound industry/engineering safety practices.

FRA has held extensive discussions with the Applicants in order to match specific timing and resource allocations, in terms of both manpower and expenses, to each safety action item identified in the SIPs. A common understanding of the issues and the Applicants' undertakings will be critical to assure a safe implementation of the SIPs under FRA direction, assuming the acquisition is approved. FRA is satisfied with the commitments made to date and will continue to work with the Applicants to address implementation issues as they arise.

Accordingly, the Department is satisfied that the SIPs address and satisfactorily mitigate every safety concern raised in the environmental review portion of this proceeding. The Applicants' commitments to cooperate with FRA, the accountability embodied in agreed-upon resource allocations, and the SIPs themselves have put FRA in a position to ensure that the SIPs are implemented by the Applicants in a timely manner, consistent with existing railroad safety laws. No other mitigation on this subject is necessary or appropriate.

Although DOT believes no further changes should be made to the SIPs, we request the SEA and/or the Board to consult with FRA to the extent they may consider comments of other parties that are inconsistent with our findings.

B. Passenger/Freight Train 15 Minute Separation

The Department takes issue with the DEIS recommendation that passenger and freight trains operating on the same track be "cleared" by not less than 15 minutes temporal separation between them. DEIS, Executive Summary, at ES-17. This suggestion is not only impractical, but would unduly burden passenger and freight railroad operations.

Historically, railroads have not segregated passenger and freight trains for safety reasons. Rather, passenger trains received a preference over freight trains, which meant that slower-moving freight trains were kept out of the way of faster-moving passenger trains, because of the premium placed on passenger service. This practice endures, and both types of trains continue to operate safely in a "commingled" status.

The DEIS recommendation is predicated on "minimizing the potential conflicts" between passenger and freight trains, thereby reducing the risk of collisions. *Id.* There are three types of collisions at risk here: (1) head-on, (2) rear-end, and (3) "raking," that is, when a shifted load on one train strikes a train on an adjacent track. As discussed below, the proposed 15 minute temporal separation is not a good way of reducing the risk of head-on or rear-end collisions, and it is irrelevant to the prevention of raking collisions. The risk of collisions overall is best addressed uniformly under FRA's plenary rulemaking authority over railroad safety.

FRA and the railroad industry are now seeking to minimize the risk of head-on and rear-end collisions through operating rules and practices, track structure, and signal systems (including Advanced Train Control and Positive Train Separation), communications systems, and braking systems. Positive Train Separation holds the promise of virtually eliminating head-on and rear-end collisions. Indeed, FRA's Railroad Safety Advisory Committee is now working with FRA to develop standards for these systems, and the Applicants are all jointly developing such systems for their respective operations under a grant from FRA. A 15 minute temporal separation would thus hinder the installation of Positive Train Separation, which would be a step backward.

Neither would a 15 minute separation reduce the risk of "raking." On single line

track, one of two trains would have to be placed in a siding to permit the other to pass.⁵ On multiple line track, both trains would continue and pass each other. A temporal buffer would not change these operating realities.

This proposal also poses substantial operating problems. In many single track situations, there is insufficient trackage to accommodate freight trains "clearing up" for passenger trains by 15 minutes in each and every case. For example, passing sidings may not be long enough, or they may not be spaced at convenient intervals. This could result in freight trains being held at terminal points for extended periods.⁶

Not only would this be very disruptive of freight operations, it could create a cumulative crew fatigue issue. With expanded crew runs, some crew districts now extend over 300 miles. The federal hours of service laws, of course, still apply in these instances.⁷ Application of the 15 minute separation recommendation, however, could create any number of instances in which freight trains could not pass through such districts within the statutory limit of 12 hours. The necessary result would be re-staffing of the crews (together with the logistical and dispatching problems this creates) and inordinate delays for rail traffic.

In sum, the proposed 15 minute temporal separation is both inappropriate and unworkable, and it should be withdrawn.

C. Hazardous Materials Recommendation

The DEIS contains two recommendations to address increased or rerouted shipments of hazardous materials brought about by the merger. The Applicants would be required to: (1) implement guidelines of the Association of American Railroads ("AAR") concerning the carriage of hazardous materials (*i.e.*, circular OT-55-B) and develop emergency response plans on major or new routes on which hazardous

^{5/} Ordinarily this would be the freight train, although it could also be the passenger train for logistical reasons.

^{6/} It is also the unfortunate reality that prolonged waiting periods in sidings or terminal points increase the risk of vandalism to freight trains (particularly in more populated areas), which produces its own threat to safety. For example, safety appliances aboard trains may be tampered with or hazardous materials released.

^{7/} *Previously codified* at 49 U.S.C. §§ 21101-21108, now contained in various provisions in Title 49.

materials are transported, and (2) prepare emergency response plans and establish training programs for local communities in which new hazardous materials facilities are constructed. DEIS, Vol. 3B, Table 5-2.

The Department has consistently promoted emergency response planning and community awareness programs with respect to shipment of hazardous materials. We therefore agree that the applicants should be involved in such planning with the input of local communities. We cannot, however, endorse the imposition of AAR circular OT-55-B as though it were a federal regulatory standard.

DOT regulations establish minimum requirements for packaging, handling, and transporting hazardous materials. 49 C.F.R. Parts 171-180. These rules provide mandatory, uniform safety standards applicable to all movements of dangerous commodities, including those that move by more than one mode. Circular OT-55-B, by contrast, is more narrowly focused on large volume movements of a selected group of chemicals, and is written and intended as a "good practices" guide rather than a binding regulatory standard. It calls, for instance, for restrictions on the meetings and passings of trains carrying hazardous materials "when practicable," and requests "maximum reasonable efforts" to reduce coupling speeds of loaded, placarded tank cars to no more than "4 MPH." As salutary as the industry efforts represented in this document are, to accord them the status of a mandatory federal standard would be a mistake because it could confuse the regulated community in general, and the Applicants in particular, about their duty to comply with the Code of Federal Regulations.

DOT is also concerned, for example, that the adoption of the circular's "key train" concept (a train with more than a minimum number of cars or intermodal containers loaded with certain classes of hazardous materials) could lead to lower standards of care for other trains carrying hazardous materials. The Department's hazardous materials regulations impose higher standards for packaging, handling, and documentation of more dangerous commodities and less stringent standards for less dangerous items, in order to secure the same low level of risk for the transportation of *all* regulated commodities. The "key train" concept, made mandatory, would tend to frustrate this interest.

We do not question that the industry may adopt higher standards for itself, so long as they are in addition to and not inconsistent with existing federal standards. DOT would, however, consider it unwise for the STB to attempt to create alternative binding standards in this area. DOT urges the SEA merely to commend these "good practices" to the Applicants for appropriate use consistent with federal hazardous

materials regulations. Finally, it is important to underscore that in the SIPs the Applicants have already developed plans to comply with all federal hazardous materials regulations. DEIS, Vol. 2, at 168-77 (CSX) and at 147-66 (NS).

III. Rail Passenger Transportation Impacts

The purchase and division of Conrail has the potential to affect rail passengers significantly, both commuter and intercity, particularly in the northeastern United States. Rail passenger transportation is an important national resource. Federal, state, and local governments have invested billions of dollars on capital equipment, operating subsidies, track acquisition, maintenance, and similar purposes for Amtrak and several commuter rail operators. This funding reflects a deep commitment to fundamental values such as reducing pollution and highway congestion, enhancing energy efficiency, and improving the quality of life, particularly in major metropolitan areas. *See, generally*, 49 U.S.C. §§ 5301 *et seq.* Much of this investment has been concentrated in the region affected by this transaction.

In this region, too, most passenger and freight railroads operate on each others' lines to some extent. DEIS, Vol. 1, chap. 4, at 4-22. They must therefore coordinate extensively, rely upon each other for dispatching in many instances, and otherwise accommodate sometimes inconsistent interests. DOT believes that Conrail, the various commuter rail agencies, and Amtrak have managed this interdependence in relatively harmonious fashion overall. Effectively eliminating Conrail and replacing it with NS and CSX introduces at least the potential for concern that this may not continue to be the case.

Although Amtrak operates nationwide and therefore has ongoing dealings with CSX and NS, its operations elsewhere are relatively infrequent, low in volume, and spread out over the day by comparison with those taking place in the most relevant area for present purposes, the Northeast Corridor. Moreover, neither CSX or NS has any real experience with the kind of high-volume commuter services they would encounter in former Conrail territory. As discussed below, these dissimilar backgrounds with respect to commuter rail transportation and other factors counsel caution and careful observation of the true impacts of the pending transaction.

Accurate assessment of the possible consequences of the pending application on passenger rail operations is crucial in this regard. The DEIS, however, contains

significant flaws and so in some cases does not accurately portray those consequences. In other cases it recommends inappropriate mitigation measures. In our view, the actual conditions that may emerge militate in favor of an oversight condition through which the Board can retain the ability to respond to demonstrations of adverse impact.

The DEIS appears to make several dubious assumptions. The first concerns the capacity of affected rail lines, a factor that undermines the DEIS's assessment of the acquisition's real impact on passenger railroads. The DEIS seems to assume that freight trains are evenly distributed over a 24-hour day. See DEIS, Vol. 5A, Appendix C, at C-1 through C-23. To the extent such trains operate disproportionately in periods when passenger trains also operate, this will understate the transaction's impact on rail passenger service.

A primary example is on the line segment from Washington, D.C. to Richmond, Virginia. Passenger operations on this line are conducted by both Virginia Railway Express ("VRE") and Amtrak. Currently there is an average of 44 daily passenger trains on the segment between Washington and Alexandria, Virginia, 30 between Alexandria and Fredericksburg, and 18 between Fredericksburg and Richmond. DEIS, Vol. 1 Chap. 4, at 4-39. Post-transaction, CSX intends to raise the number of average daily freight trains between Washington and Alexandria from 17.9 to 28.6 and from Alexandria to points south from 16.3 to 23.4. *Id.*

The DEIS concluded that the increased freight traffic levels were well within the capacity of these segments. DEIS, Vol. 3B, Chap. 5, at VA-15. That may or may not actually be the case. Most of this line has two main tracks with centralized traffic control, and so theoretically can absorb projected traffic levels. However, there are a number of physical and operating factors that can reduce the segment's capacity in reality. These include the location and spacing of crossovers, the single-track Quantico Bridge, the restrictions of VRE boarding platforms to the east track at most stations, and the bunching of freight and passenger trains at certain times of day.⁸

⁸/ For example, there is a significant number of freight trains passing through Alexandria between 4:40 AM and 9:50 AM., a period that coincides with VRE's morning "rush hour" and also includes Amtrak trains. CSX/NS-177, Rebuttal Verified Statement of John W. Orrison, Figure JWO-18 at HC 607-610. During this time a similarly large number of passenger trains also pass through Alexandria. *Id.* Delays to any one train during such busy periods often result in collateral delays to other trains, particularly since the dispatcher's options are limited by physical factors. Planned capital improvements (such as crossovers in Woodbridge and Aquia, Virginia, and design work on a new Quantico Bridge)

There is also an implicit assumption in the use of a statistic like "average daily traffic," that all freight trains will have the same impact on passenger service. DEIS, Vol. 5A, Appendix C, at C-1 through C-23. However, intermodal trains, coal trains, and grain trains travel at different speeds with different priorities and can have different effects on a freight railroad's capacity and, possibly, inclination to accommodate passenger operations.⁹ In certain instances, passenger train speeds also play a larger role. The Chicago - Detroit corridor is such an example. This is a highly competitive passenger market, in which Amtrak vies for business with airlines and the private automobile; consequently, there is little tolerance for delays. Maximum authorized passenger train speed is currently 79 miles per hour, but improvements will soon permit speeds of 100 miles per hour or higher on the Kalamazoo, Michigan to Porter, Indiana (97 mile) segment, thereby increasing the likelihood that freight trains will be overtaken here.¹⁰ The DEIS concludes that the existence of passing sidings and Amtrak's control of dispatching on this line will prevent the projected addition of 10 more freight trains daily from causing a problem. DEIS, Vol. 1, Chap. 4, at 4-28, -29. The existence of sidings and the performance of dispatchers are likewise relied upon to avoid capacity problems on the (147 mile) segment between Kalamazoo and Detroit, although Amtrak does not own or dispatch that portion. DEIS, Vol. 3, Chap. 5, at MI-14. The spacing of sidings, however, can allow for poorly planned meetings of passenger and freight trains, with the prospect of rippling delays in a market particularly sensitive to them. The entry of a third freight railroad, the Canadian Pacific, is also in prospect.¹¹ Close cooperation among the affected carriers will be necessary to match theoretical capacity to operating realities.

do not wholly alleviate DOT's concerns, particularly if they are not completed prior to increased freight operations. The Department believes that CSX, Amtrak, and VRE should work together to develop operating plans and performance standards to avoid disruptions.

^{9/} A generic treatment of freight trains also ignores such realities as the necessity for "helper" locomotives on certain track segments in certain circumstances. This additional traffic would consume capacity and potentially affect passenger trains.

^{10/} The State of Michigan and FRA are assisting Amtrak to install Positive Train Control on this segment.

^{11/} NS is reportedly discussing haulage rights for Canadian Pacific trains on this segment. DEIS, Vol. 1, Chap. 4, at 4-28.

One of the Department's most basic concerns in this aspect of the proceeding stems from the fact that the DEIS does not properly consider the transaction's impacts on passenger train reliability due to increased freight traffic.

SEA determined that impacts of freight operations on passenger rail service would be significant if the anticipated post-Acquisition increases in freight operations resulted in the need to reduce passenger service by one or more trains per day. However, the current operating agreements between the passenger service operators and the freight railroads preclude reduction in passenger service. Thus, any significant impact that would result from increased post-Acquisition freight operations could occur only after expiration of a current agreement.

DEIS, Vol. 1, at 3-16.

DOT finds this approach unacceptable for two reasons. First, it effectively defines away impacts -- an impact occurs only if one or more passenger trains must be canceled, but this cannot occur because operating agreements forbid it. This approach overlooks what could be the more significant impact of a substantial increase in freight traffic -- a decline in reliability of passenger service, a development that has potentially profound environmental consequences. Track capacity is a fluid concept. It is certainly possible to demonstrate that additional freight trains may be operated without interfering with commuter and inter-city passenger schedules. However, additional trains clearly create a greater potential for conflict with passenger trains. Freight trains do not always operate on firm schedules. Train numbers vary with the demand for service, and freight trains are subject to mechanical and other problems that interfere with the operation of passenger trains.

In addition to outright cancellations, erratic delays in passenger trains, particularly commuter operations, can have a serious impact on riders and can reduce ridership and thwart the goal of publicly supported passenger operations. The DEIS offers assurance that there is adequate capacity in all of the commuter rail corridors for the proposed additional freight operations. However, it should also discuss the potential effect on passenger train reliability. DOT notes that Amtrak and most of the commuter rail agencies may be close to agreement with the Applicants. We support this process, but urge the SEA to consider carefully the impact on passenger operation reliability of the proposed transaction, particularly in the absence of such agreements between the parties.

The second difficulty with the DEIS's treatment of this issue is that it is too narrowly confined to the period covered by existing agreements between Conrail and passenger rail agencies. *Id.* Regardless of whether such agreements terminate in as little as six months, their ordering of the current operational and financial relationships between freight and passenger railroads, in the view of the DEIS, again means that the purchase and division of Conrail has no effects cognizable by the SEA.

The Department considers this too restrictive a scope to measure the application's true potential effects. Quantitatively, these agreements will only govern the parties (and their successors) for a relatively short period. Most of the agreements will expire within either the usual three year term projected by rail merger applicants under the STB's rules, or the five year period set for oversight of the effects of the most recent rail merger. Finance Docket No. 32760, Union Pacific Corp., Union Pacific Railroad Co., and Missouri Pacific Railroad Co. -- Control and Merger -- Southern Pacific Transportation Co., St. Louis Southwestern Railway Co., SPCSC Corp., and the Denver & Rio Grande Western Railroad Co., Decision No. 44 (served August 12, 1996) ("UP/SP") at 146-47. Qualitatively, approval of the application will eliminate Conrail, a freight railroad with substantially more experience on the Northeast Corridor and in dealing with intercity and commuter rail operators than either CSX or NS. In Conrail's stead will be two freight railroads with much less exposure to the different problems presented by passenger rail agencies, whose operations tend to be concentrated in certain hours of the day, and for whom reliability and on-time performance are especially critical. Moreover, those two freight railroads have different histories and radically different track systems reaching different markets, and carrying different commodities, than Conrail. It is consequently at least plausible that NS and CSX will bring to the bargaining table very different goals and incentives in the near future, when existing contracts with passenger operators must be renegotiated.

The fact that the Applicants have entered into negotiations with such operators and have reached settlement agreements with several bodes well for future relations, and DOT commends these efforts. But this does not change the prospect, at least for the other operators, that their negotiations and relationships with CSX or NS may produce different results in the near future than would have been the case had Conrail continued in existence. The extent to which this proves so is a true measure of the impact of this transaction on these operators. Finally, of course, the continuing national interest in fostering passenger rail transportation extends beyond the terms of the current operating agreements.

DOT does not advocate that existing contract terms should remain forever unchanged, that passenger rail agencies should obtain whatever they please from NS and CSX, or any other particular outcome. On the basis of concerns broadly expressed by Amtrak and these commuter agencies, however, we strongly recommend that the STB retain jurisdiction for a five year period to monitor relevant developments regarding on-time performance and capacity, and to remain in a position to address passenger service issues that may arise.¹²

IV. Community Impacts

The DEIS also addresses the various potential consequences this transaction may have on affected communities, including noise, vibration, pollution, and vehicular traffic delays. As here relevant, the DEIS recommends that the communities most affected by projected rail traffic increases and reroutings should pursue negotiations with the Applicants in order to reach mutually satisfactory solutions. DEIS, Vol. 3B, at OH-140, -150; Vol. 3A. at IN-85. The specific communities are in Ohio (Cleveland, Lakewood, Rocky River, Bay

^{12/} The ICC refused to impose on-time conditions for the benefit of Amtrak in the railroad merger immediately preceding UP/SP, but that case presented very different facts from this one. Finance Docket No. 32549, Burlington Northern, Inc. & Burlington Northern R.R. - Control & Merger - Santa Fe Pacific Corp. & Atchison, Topeka & Santa Fe Railway, Decision served August 23, 1995 ("BN/SF"), at 97. The bases for the Commission's decision there were (1) the adequacy of existing contractual and statutory remedies, and (2) the absence of merger-related harm arising from increased freight traffic. Id. The very much larger number and complexity of rail passenger operations (intercity and commuter) here and the clear transaction-related increases in freight trains on affected lines projected in the Applicants' operating plans provide a rational basis to expect that the pending transaction is more likely to have an impact. The total absence of statutory protection for commuter agencies, the relatively short duration of existing agreements, and the replacement of Conrail (the freight carrier with the most experience with passenger operations) with two different freight carriers (with possibly the least exposure) suggests that in the near future there may be more problems in renewing operating agreements than has been the case in the past. The national, state, and local interest in passenger rail services offers a reason to be concerned by this prospect. Finally, the condition DOT tenders does not require proactive intervention by the Board, but simply a period of observation to monitor developments and not foreclose all possibility of further relief.

Village, and Olmsted Falls) and Indiana (East Chicago, Hammond, Gary, and Whiting). *Id.* The Department supports the general SEA approach in these cases of urging the parties to negotiate settlement agreements. However, we are concerned that this approach, without more precise guidance, may lead to interminable delays in a situation where the adverse consequences of such delay are likely to be substantial. We therefore urge the SEA in the final EIS to recommend that the Board take direct steps to facilitate a more timely mitigation of outstanding issues.

In the most recent rail merger case, the STB encouraged Reno and Wichita to negotiate agreements with the UP to resolve environmental issues identified in those communities, rather than mandating specific mitigation measures at the outset. UP/SP at 278-80. This basic approach is generally preferable to a binding regulatory condition because it is far more flexible and allows the parties to negotiate agreements that best suit their situations. Such agreements could include mitigation that encompasses issues of specific interest to a party that are beyond those that directly concern the STB, or that otherwise address concerns beyond traditional criteria for imposing merger conditions. For example, under existing precedent the Board would not itself impose a condition that addresses existing (pre-merger) problems, although private agreements that encompass such matters have traditionally been incorporated into conditions of regulatory approval at the request of the parties.¹³

It now appears that such a process is finally working in Wichita, where the STB has suspended issuance of the Final Mitigation Plan at the request of the UP and the community while they make progress toward an agreement. Finance Docket No. 32760, Decision No. 76 (served December 12, 1997). However, in Reno the same cannot be said. The STB approved the UP/SP merger with the proviso that UP could only operate two additional trains a day through these communities until the earlier of the completion of the final mitigation plan (which was to take eighteen months) or a settlement agreement was reached. UP/SP at 279-80. Since agreement has not yet been reached, that limitation continues to this day.

^{13/} See BN/SF at 83, in which the ICC accepted provisions in voluntary settlement agreements among parties that extended "far beyond" any the Commission would have imposed.

The Department is concerned that, without incentives to spur negotiations, following this approach again may lead to inordinate delays in reaching agreements mitigating the more complex and extensive problems posed by the Conrail acquisition. Since, unlike the Reno and Wichita situations, the affected areas already should have been examined comprehensively by the time the Board votes on the pending transaction, there is no basis to allow much time to pass while the matter is considered.¹⁴ Moreover, DOT submits that the facts of the instant transaction do not afford the luxury of extended negotiations.

As noted, the DEIS has again proposed that the affected communities and the railroads negotiate an agreement. If this can be accomplished in a timely manner, it is certainly the preferred approach. The Department strongly endorses a fair and equitable treatment of those areas that require mitigation, and believes that the affected parties themselves are in the best position, at least as an initial matter, to decide upon mutually acceptable mitigation measures.

It bears emphasis, however, that the situation in Cleveland and neighboring communities in northeastern Ohio, to take the most pressing example, is much more complicated than the situation faced in Reno or Wichita. Agreement must be reached between at least two railroads and several different communities. Some of the mitigation proposals solve one community's problem at the expense of another; some proposals solve one railroad's problem at the expense of the other. Noise impacts on residences, blockage of grade crossings, safety hazards at grade crossings, the avoidance of disproportionate effects on poor and minority residents, improved service to local industries, efficient transit of through trains, and cost, among other factors, must all be weighed and balanced fairly and sensitively. We understand, for instance, that the Mayor of Cleveland has identified potential impacts of the acquisition on the City, and has proposed mitigation measures. These mitigation measures, however, could have consequences for other communities. Reaching an agreement that meets the requirements of all of the interested parties in northeastern Ohio thus promises

^{14/} We discuss below, however, our conviction that the analytical approach followed in the DEIS has resulted in an incomplete identification of affected communities and areas. Adoption of the five year oversight period we propose should alleviate concerns on this score.

to be much more difficult than the problems faced after the UP/SP merger.¹⁵

The financial problems likely to face the Applicants in the event of a delay in their plans to stimulate and reroute traffic would seem to give them sufficient encouragement to reach timely agreements and to give the cities a certain leverage. However, without incentives to prompt the communities to avoid delay on their part, there is less prospect for reasonably prompt resolution. Moreover, since reaching an overall solution in an affected region like northeastern Ohio or northwestern Indiana requires cooperation from a number of stakeholders, it is by no means clear that comprehensive negotiated settlements can be reached in a timely fashion without assistance.

The Department proposes that the SEA facilitate this critical negotiation process by providing in the final EIS a clearer exposition of what needs to be mitigated and the measures the Board might order absent an agreement within a reasonable time. These measures should be carefully crafted to balance the environmental burdens placed on communities against the anticipated economic benefits to shippers so that, under the circumstances facing the communities and the Applicants, all parties have an incentive to negotiate on an accelerated basis.¹⁶ This would also help to foreclose at the outset any unrealistic expectations held by the participants as to the scope and cost of the mitigation measures that might be imposed in the absence of settlement, and thus make good faith negotiations more likely to follow.

The DEIS also proposes that the Applicants upgrade warning devices at 118 highway-rail crossings throughout the Conrail territory where train traffic will increase as a result of the pending transaction. DEIS, Executive Summary at ES-18. In reaching this recommendation, the SEA appears to have examined the projected volume of rail and vehicular traffic at individual crossings and other

^{15/} Moreover, if the agreed-upon mitigation program includes any substantial construction (e.g. rail or highway overpasses, significant sound barriers, etc.) additional environmental assessments may be required. Even if they are not, planning and construction could take one or two years.

^{16/} For example, a stringent limit on new train routings or operations would be likely to leave communities satisfied and less interested in hard bargaining. On the other hand, permission for NS and CSX to implement their operating plans without meaningful restrictions would leave the Applicants content with the status quo.

crossing-specific factors but no other considerations. DEIS, Vol. 1, Chap. 3, at 3-10.

The Department certainly supports mitigation to remedy transaction-related safety risks, and although the DEIS approach is appropriate for determining the risk presented at a single crossing, we believe that highway-rail crossing safety in the context of a comprehensive reordering of rail systems would be better served by adoption of a "corridor-based" analysis. The crossing-by-crossing approach used in the DEIS isolates each crossing from its overall setting, and so in this case may present a distorted or otherwise unrealistic view of the impacts under study.¹⁷ By contrast, a corridor analysis focuses on train and vehicular traffic within a larger environment in an effort to reflect the way in which rail operations actually affect public safety and the way people and commerce move on surrounding roadways in a cohesive community. All crossings within such a community are examined, regardless of traffic volume at an individual location. Similarly, mitigation measures appropriate to this broader perspective are considered. These include crossing consolidation and low-cost improvements (e.g., clearing underbrush, pavement markings, etc.) in addition to installation or upgrading of automatic warning devices, grade separations, or other mitigation measures.¹⁸ A number of states, including Ohio, follow this approach in their administration of federal highway funds. Once a more accurate picture of the transaction's true effects is obtained, the Applicants should be required to mitigate those effects as a condition of approval. DOT offers its full assistance in identifying the transaction-related grade crossing problems.

In sum, the Department submits that the final EIS should include specific recommendations for interim measures and/or mitigation conditions that the

^{17/} The next section in these Comments underscores the cumulative consequence of such a narrowly-focused analysis: failure to identify whole communities at risk from the transaction.

^{18/} DOT has described this approach in a publication, Rail Highway Crossing Safety - Action Plan Support Proposal (June 13, 1994). A copy is attached hereto as Exhibit 2. FRA and the Federal Highway Administration have developed and distributed a checklist of items to be considered and analyzed when following this approach to community safety. Exhibit 3.

STB would impose absent an agreement for the identified communities. To hasten serious bargaining, DOT recommends that the issue of required mitigation be resolved as soon as possible, but in any event, no later than the Board's final decision on the application. Finally, we propose that examination and mitigation of transaction-related grade crossing problems use a corridor approach in order to identify and remedy such impacts in a more realistic fashion. The Applicants should be responsible for mitigation of those problems.

IV. Impacts Not Meeting SEA's Thresholds

The Department appreciates the need to establish thresholds, such as the increase in the number of trains or the average daily traffic ("ADT"), for identifying locations that warrant further analysis of possible environmental impacts. However, it should be understood that thresholds only prompt further consideration, and their satisfaction, *vel non*, does not by itself conclusively demonstrate the need (or lack thereof) for mitigation. As suggested above, a purely technical application of threshold criteria may result in a lack of attention to some communities that would otherwise suffer serious consequences without remediation. We urge the SEA and the Board to consider several real-world examples of such problems.

DOT suggests that Greenwich and New London, Ohio, qualify. Between them there is only one vehicular crossing with traffic sufficient to meet the 5,000 ADT threshold (Main Street in Greenwich), and both communities face significant increases in rail traffic if the transaction is consummated. CSX/NS-20, Vol. 3A at 435, 446; CSX/NS-54, Vol. 6B Errata - page 20. The DEIS does not consider these communities for any mitigation, but the analysis undertaken overlooks the fact that another rail line (of the Wheeling and Lake Erie Railroad, or "WLE") crosses the Conrail line in New London and the CSX line in Greenwich, and also parallels the line between the two towns. *Id.* Moreover, in Greenwich, a Conrail and a CSX line cross. Yet WLE traffic waiting to cross the rail lines in both cities already blocks crossings, and with increases in traffic after the acquisition, this will become more frequent. A separated grade crossing may be miles away and this group of crossings may be blocked for extensive periods of time -- as they will be in New London with adverse effects on public safety and community cohesion.

In Greenwich, a road with fairly light traffic (Kniffin Road) has three grade

crossings within two hundred yards.¹⁹ These three crossings will have nearly one hundred trains a day after the acquisition. CSX/NS-20, Vol. 3A at 435, 446. By considering the effects of this increase on each crossing separately, none may appear particularly intolerable. But trains on the lines that cross the town may block several crossings at the same time. Therefore, even if no one crossing meets the 5,000 ADT threshold, the Board should aggregate the traffic of several streets in close proximity to each other, and in such circumstances mitigation should be considered.

It must be emphasized that in the case of these two communities, CSX and the local authorities appear to have reached an agreement, and DOT has no desire to disturb such arrangements. We offer these situations only as support for the necessity for the final EIS, and the Board, to apply regulatory criteria not rigidly, but with an eye to the practical reality that will exist following any approval.

Lakewood, Ohio, is another example. Considered individually, only one of its vehicular crossings has sufficiently high ADT to meet the traffic threshold; yet train traffic following the integration of Conrail will clearly cut the town in half by blocking virtually all of its 27 crossings. BRL-2 at 7; CSX/NS-23, Vol 6B at 18-91. A more reasonable standard in such circumstances, in the Department's view, would be to adopt a corridor approach to consider impacts at all grade crossings and propose solutions that address the broader problems of emergency access, trespassers on railroad property, and noise. These could include requiring closing of some crossings and grade separation at others, based on the delays at all crossings that otherwise would be blocked without access to a grade separation.

Fostoria, Ohio, is another community as to which no mitigation measures are proposed in the DEIS, but which nonetheless faces very real transaction-related problems. The State of Ohio has described the impacts on Fostoria from significant transaction-generated increases in train traffic. OAG-4 at 33-34, and Exhibit 10. This community already experiences high levels of freight rail operations (more than 80 per day), which take place in a "U-shaped" configuration. *Id.* The three different rail lines pass through Fostoria at grade. When trains are stopped, waiting for trains on other lines before proceeding, they sometimes block all roadway access to two sections of the town. *Id.*, Exhibit 11. The addition of more trains poses a realistic risk of blocking off in particular those portions of Fostoria located in the middle of the "U" from access by

¹⁹/ Fin. Dkt. No. 33388 (Sub-No. 3), Decision No. 28331 (served October 10, 1997).

emergency vehicles in the not uncommon event that freight trains have to stop at particular locations. *Id.*, Exhibit 11, Verified Statement of Charles Dodge. Given that three busy rail lines cross at grade in the town, such stoppages are likely to occur more frequently in the future, with attendant risks for delayed emergency response times.

The inability to satisfy the ADT threshold and the lack of a national standard for emergency response times, however, are no bases to ignore the problem. To disregard the effects of closing all grade crossings leading to a neighborhood for a significant but undetermined length of time beyond that occurring under current circumstances is to accept a fundamental risk simply because there may be some difficulty in measuring it. The community and the railroad should be directed to negotiate over potential mitigation measures that address this and other issues, such as noise.

Berea, Ohio, is the Department's final example of a community on which there are likely to be substantial environmental impacts, but which has not been identified in the DEIS. A four lane highway in Berea (Front Street) crosses both of what the Applicants propose to make their main lines, and does so within very close proximity. This circumstance is not mentioned in the DEIS. Vehicles in Berea today face an average of 65.8 trains daily on these lines. CSX/NS-20, Col. 3A at 446-47; Vol. 3B at 462. The Applicants project an increase to about 75.7 trains per day. *Id.* Even this relatively small addition could exacerbate emergency response difficulties and the usual crossing risks. Moreover, if NS's proposal to relocate trains from the Cleveland-to-Vermilion route is adopted, total rail traffic on these lines in Berea would reach 100 trains per day. DEIS, Appendix S at 2.

The Department poses these examples not to impugn the validity of the DEIS overall, but in order to emphasize that the SEA and the Board must be flexible in their assessment of the impacts of this transaction. In cases where rail lines cross roads in close proximity to each other, or multiple rail lines cross the same roads, the impacts should be aggregated to obtain a realistic view of post-transaction consequences. Those communities already saturated with railroad traffic may face serious impacts from the addition of more trains per day, depending upon schedules and operating plans of the new carrier(s) serving the route. Impacts from trains that block vehicular crossings while waiting permission to proceed should be considered in communities where there will be a significant increase in trains that will cross at grade. Impacts on emergency vehicle access should receive special concern as a general matter because of the obvious risks involved.

DOT urges that the final EIS consider appropriate mitigation measures for

each of the communities named above that are similar to those recommended for the communities identified in the DEIS. That is, these communities and the Applicants should be encouraged by appropriate incentives to reach reasonably prompt resolution of the problems posed by this transaction. Because the discovery of the above communities raises a concern that there may be more such communities that have not been identified in the DEIS, we recommend that the SEA and the Board broaden their focus, consider a more flexible application of threshold criteria, and encourage communities with potential problems to communicate them to the STB. For this reason, therefore, the Department strongly recommends that a five year oversight period be established, during which the Board would remain receptive to demonstrations of transaction-related problems from previously unidentified communities.

V. Conclusion

The Department appreciates the Board's recognition that the consummation of this transaction could have a major impact on safety. The preparation of the SIPs ordered by the STB and their ongoing detailed cooperation with FRA reflect a genuine commitment by the Applicants to maintain safety. FRA will continue to work with the Applicants to assure the proper implementation of the SIPs, consistent with its regulatory authority over rail safety matters, should the Board approve the proposed transaction. However, other safety recommendations contained in the DEIS, specifically those concerning hazardous materials carriage and temporal separation between passenger and freight trains, would not improve safety and should not be adopted.

The introduction of NS and CSX to the high-volume intercity and commuter passenger operations of the northeastern United States may portend significant changes, notwithstanding the fact that operating agreements will order relationships for the very near future. For this reason, and because dubious assumptions prevent the DEIS from conveying a truly accurate picture of the consequences of the pending transaction for Amtrak and commuter rail operators, DOT strongly recommends that a five year oversight period be established to allow the Board to monitor performance and capacity developments in this important aspect of the case.

traffic generated or rerouted by the pending transaction will also have major impact on various communities, some of which the DEIS did not identify. The Department recommends that the Board impose conditions that promote reasonably prompt, effective, and flexible settlement agreements between the Applicants and the affected communities. We also encourage a more realistic application of the criteria by which communities facing such problems are identified. For this reason as well, DOT strongly supports a five year oversight period, during which the Board should remain receptive to demonstrations that transaction-related problems affect still more communities.

Respectfully submitted,

NANCY E. MCFADDEN
General Counsel

SAFETY IMPLEMENTATION PLAN GUIDELINES

**November 7, 1997
Washington, D.C**

SAFETY IMPLEMENTATION PLAN GUIDELINES

Introduction

The Federal Railroad Administration (FRA) has determined from the mergers of the Union Pacific Railroad Company and the Southern Pacific Transportation Company and the Burlington Northern Railroad Company and the Atchison, Topeka and Santa Fe Railway Company that integrating operations of two Class 1 railroads into one railroad presents significant challenges to rail safety. Investigations of recent collisions, derailments, and other serious incidents reveal a correlation between inadequately planned operational integration of independent railroad entities and compromises of rail safety. Railroads merging with or acquiring other railroads must prepare thorough and complete, formal, written safety integration plans to ensure safe operations.

For these reasons, FRA submits the following guidelines that CSX Transportation, Incorporated (CSXT), and Norfolk Southern Corporation (NS) should address in their respective safety integration plans (SIP). The SIPs should focus on the formulation, development, issuance, and implementation of measures that address specific operational elements, as detailed below, necessary to ensure compliance with the Federal railroad safety laws and otherwise provide safe railroad operations. As one example of how a SIP should extend beyond the reach of present Federal railroad safety regulations, an acquiring carrier should assure that personnel in safety-critical positions are not so burdened with tasks unrelated to safety that they cannot adequately perform their safety-critical functions. Principally, CSXT's and NS's SIPs must: show how their practices differ from Conrail's; identify as the end state to be achieved once their respective acquisitions are consummated practices that will minimize or eliminate incidents and injuries, and promote a culture emphasizing rail safety; and demonstrate step-by-step how they will effect the transition from current circumstances to their desired end states while maintaining safety. FRA underscores the need for the acquiring railroads to define the steps or procedures proposed to integrate Consolidated Rail Corporation's (Conrail) operational plans with their own during the transition process (i.e., until the acquisition is complete). FRA concludes that a SIP addressing the subject areas below will strengthen CSXT's and NS's integral operational interests and ensure safe rail transportation.

Safety Integration Plan

1. **Content of Plan:** Provide the following information for each subject matter listed in number 2:
 - a. Itemized list or index of measures addressing (i) how Conrail differs from the acquiring railroad and best practices identified from either; (ii) description of how the railroad will operate once the acquisition is completed; (iii) step-by-step description of how elements of acquired property, including Conrail Shared Assets Operating Areas, will be integrated with operations of acquiring railroad; and (iv) efforts to comply with Federal regulations;

- b. Allocation of resources (e.g., work effort expressed as person-days per year, capital, facilities, and technology) directed to that subject;
- c. Schedule for implementing plans addressing that subject.

2. Subject Matters To Be Addressed In Plan

- a. Corporate Safety Culture
 - i. Management attitudes, directives, priorities, practices, and philosophies, within each operating administration or division, that is directed to employee training, staffing, health, morale and safety practices
 - ii. How organizational priorities will be balanced between (1) enhancing productivity (e.g., employment reduction and elimination of resource duplication) to achieve economic efficiency and (2) minimizing safety risks with no compromise of safety (e.g., narrowed communication forums between labor and management, excess hours, and loss of institutional knowledge)
- b. Training
 - i. Train and engine service personnel
 - ii. Roadway worker and bridge worker personnel
 - iii. Motive Power and Equipment personnel
 - iv. Dispatching and operating personnel
 - v. Signal and Train Control personnel
 - vi. Hazardous materials personnel
- c. Operating Practices
 - i. Operating rules, practices, and instruction
 - (1) Training and qualifying train crews
 - (2) Rulebook(s) to govern
 - (3) Standardizing operational testing programs
 - ii. Accidents/Incidents
 - (1) Reporting procedures for accidents/incidents
 - (2) Procedures available to employees perceiving intimidation and harassment under Railroad Accidents/Incidents regulations
 - iii. Alcohol and Drug
 - (1) Integration of Conrail program with acquiring railroads' programs
 - (2) Implementation of Post Accident Toxicological Testing and Random Drug and Alcohol Testing programs on acquired territories
 - iv. Locomotive Engineer Qualification and Certification
 - (1) Qualifying and certifying engineers on acquired territories.
 - v. Hours of Services laws
 - (1) Implementing measures for electronic recordkeeping
 - (2) Centralizing crew management functions
 - vi. Yard/terminal operations
 - (1) Training and instructing employees to ensure familiarity with rules

ENHANCE ENFORCEMENT OF TRAFFIC LAWS AT CROSSINGS

By improving the understanding and observation of existing traffic laws, collisions at highway-rail crossings will be reduced. Law enforcement initiatives and innovations reduce traffic law violations and therefore reduce collisions.

Objective: To establish an expanded and proactive outreach program to our Nation's traffic law enforcement community ranging from patrol officers to judges.

Objective: To reduce the number of traffic law and warning device violations at highway-rail crossings by increasing enforcement and judicial support.

To meet these objectives we will:

1. Encourage State officials to use Section 402 funds (Highway Safety Program) to support education programs for the law enforcement and judicial communities.
2. Develop police officer and judicial outreach program materials for Federal, State and local advocates.
3. Develop an information package to assist States in revising their rules of evidence to allow for the use of photographic and video evidence for traffic citations and enforcement.
4. Consider a rulemaking to define violations of automatic warning devices at highway-rail crossings (e.g., going around lowered gates) as a serious offense, for holders of Commercial Driver's Licenses (CDL).
5. Update and republish the 1983 compilation of state laws and regulations regarding highway-rail crossings.

ENHANCE RAIL CORRIDOR CROSSING REVIEWS AND IMPROVEMENTS

Traditionally, highway-rail crossings are selected for safety improvements one at a time based on the crossing's accident experience and highway and rail traffic counts. This fosters a bias toward urban areas and main roads where traffic densities are high, and excludes most low density crossings and those already equipped with automatic devices. In many cases, these crossings are not reviewed but would benefit from low cost improvements or could be eliminated.

Objective: To promote comprehensive and systematic corridor reviews of highway-rail crossings, especially those over our nation's Principal Railroad Lines (PRLs).

Objective: To eliminate little used and redundant crossings within corridors where alternatives exist, especially those on the National Highway System (NHS).

Objective: To upgrade signs and signals at all crossings, taking full advantage of available state-of-the-art technologies.

To meet these objectives we will:

1. Nominate PRL corridors for review and organize and promote State, local, MPO and industry safety corridor review programs.
2. Propose the elimination of crossings where NHS roads cross PRLs and

upgrading or elimination of all other NHS crossings, as part of the Safety Management System.

3. Promote the upgrading of existing signal circuitry and signage. In addition, States should consider the installation of STOP signs where warranted.
4. Review the allocation of responsibilities for the selection and installation of warning devices and the potential for uniform nationwide standards.
5. Make legislative proposals to provide Federal funds for bonuses, matched by the railroad(s), to local highway authorities for closing crossings.
6. Convene railroads, State DOTs and MPOs in regional meetings to facilitate integrated intermodal planning.
7. Update and republish the 1986 Handbook on highway-rail crossings, including a checklist of items to be considered in a corridor safety analysis.
8. Make a legislative proposal for incentive funding to promote the accomplishment of corridor safety programs.
9. Study the potential for a more equitable allocation of Section 130 funds to individual States, reflecting crossing needs and accident rates.

EXPAND PUBLIC EDUCATION AND OPERATION LIFESAVER ACTIVITIES

Over \$2.8 billion in Federal-aid funds have been invested by States for safety improvements at highway-rail crossings since 1973. Over half of these funds were for automated warning devices. However, half of all collisions occur at crossings equipped with these devices. To realize full benefit from the public investment in these devices, motorists must be educated in their responsibilities at all types of crossings.

Operation Lifesaver (OL) is an active, continuous public information and education program to help prevent and reduce crashes, injuries and fatalities and improve driver performance at our Nation's 280,000 public and private highway-rail crossings.

Objective: To increase public awareness of
1) hazards at crossings and,
2) motorist responsibilities at crossings.

To meet this objective we will:

1. Work with OL to plan, coordinate, initiate and sustain a nationwide mass-media and youth education campaign.
2. Develop new and updated driver-training materials related to crossing safety. Distribute materials to state officials.
3. Promote outreach to our Nation's truck and bus industry stressing the hazards of highway-rail crossings.
4. Discuss crossing safety with truck and bus operators during on-site compliance reviews by State and Federal inspectors.
5. Increase Federal funding to OL, Inc. on the condition that the increase be matched from non-public sources.

INCREASE SAFETY AT PRIVATE CROSSINGS

Private crossings are categorized as either farm, residential, recreational or industrial. Nearly two-thirds are farm crossings. However, most accidents occur at industrial crossings.

In the U.S., there are 110,000 private highway-rail crossings. More than 400 accidents and 40 deaths occur at these crossings each year. In most years, the number of deaths which occur at private crossings exceeds the number of on-duty deaths among railroad employees in all rail operations.

Objective: To develop and provide national, minimum safety standards for private crossings.

Objective: To eliminate the impediment to high speed rail operations posed by private crossings.

To meet these objectives we will:

1. Develop operational definitions and monitor accident rates for each private crossing category.
2. Conduct an informal safety inquiry to consider the definition of responsibilities, minimum safety requirements and warning device standards for each category.
3. Promote research to determine the feasibility of using railroad-dispatcher controlled cipher locks to secure highway barriers at private crossings.

IMPROVE DATA AND RESEARCH EFFORTS

Access to valid data is key to good decision making. Additionally, for progress to occur, research and innovation are necessary. However, for highway-rail crossing issues, institutional concerns regarding costs (research and potential implementation), liability and current convention often impede progress. With the Department's involvement and leadership these obstacles can be overcome.

Objective: To enhance the effectiveness of our resources through research and data analysis.

Objective: To promote research and champion plausible innovation.

Objective: To insure that timely and accurate information needed by decision makers is available.

To meet these objectives we will:

1. Host Research Roundtables/Workshops with highway safety, law enforcement, rail and transit industry officials, governors' highway safety representatives, academia, consultants and defense industry representatives to examine research needs.

2. Develop demographic information regarding accident fatalities.
3. Investigate causes of increasing accident severity and the potential for severity mitigation measures.
4. Examine the potential of providing additional information to the motorist through innovative signs, signals, lights and markings.
5. Review available automated presence and intrusion detection hardware and the potential effectiveness of existing and proposed technology for conveying emergency messages.
6. Develop a hardware/software package for automatically receiving and forwarding reports of malfunctions and emergency situations at highway-rail crossings.
7. Expand transit safety data to include specific data on shared rights-of-way accidents involving light rail vehicles.
8. Review and confirm DOT's currently available highway-rail crossing resource allocation procedures and accident prediction formulas.
9. Promote more systematic updating of the U.S. DOT/AAR National Highway-Rail Crossing Inventory.

PREVENT RAIL TRESPASS TRAGEDIES

Trespassing, with over a thousand deaths and injuries each year, presents the rail industry with a serious dilemma. Trespassers are not a single, cohesive group. Their one common attribute is the illegality of their act (trespassing). Because of this diversity, it is not likely that trespassers will respond to a single national initiative. Regional programs have more promise. The Department of Transportation will target this problem. Our goal is to prevent trespassing, not to make the railroad right-of-way safe for trespassers.

Objective: To raise public and police awareness of the unlawfulness of, and dangers inherent in, trespassing on railroad right-of-way.

Objective: To develop and make available sufficiently detailed information to prepare and focus trespass prevention campaigns.

To meet these objectives we will:

1. Conduct a demographic survey of past casualties to determine the types of individuals and activities involved.
2. Refine future railroad "Injury and Illness" reporting requirements to provide more detailed and useful information regarding trespasser casualties.
3. Conduct a second Workshop on Trespass Prevention in cooperation with Operation Lifesaver, railroad police and the industry.
4. Plan and promote regional anti-trespass campaigns in cooperation with Operation Lifesaver, railroad police and the industry.
5. Develop model code for possible adoption by State legislatures dealing with trespassers and vandals in cooperation with the rail industry.

Memorandum

Subject INFORMATION: Highway-Rail Crossing Safety,
Corridor Analysis Guide

Date May 17, 1995

From Associate Administrator for Safety
and System Applications, FHWA
Associate Administrator for Safety, FRA

Reply to HHS-20
Attn of RRS-23

To: FHWA Regional Administrators
FHWA Division Administrators
FRA Regional Directors

Low cost grade crossing safety improvements can best be identified when all crossings along a railroad corridor or in a given geographic area (urban area, county, highway district, etc.) are analyzed at the same time. This method of reviewing crossings is especially important for developing crossing consolidation programs.

A number of our respective field offices have requested guidance for conducting corridor reviews. In response to these requests, the FHWA and FRA jointly developed the attached "Corridor Analysis Guide" and a list of references for use in analyzing grade crossings for improvement. While the Guide includes an extensive list of items that should be investigated/considered when making reviews, State and local officials and the railroads may find it desirable to consider additional topics unique to a specific corridor or area.

We encourage you to share the Guide with State and local highway agencies, those agencies responsible for statewide and metropolitan planning processes, railroad regulatory agencies in the states, and the railroads. As more experience is gained with corridor reviews, it is likely that the Guide will need to be expanded or modified. Your feedback toward this end will be appreciated.

condition its approval of the proposed acquisition and division which limit the operation of the railroads, then the STB would have a continuing program responsibility for the approval and the resulting emissions. It appears that in some nonattainment and/or maintenance areas there will be a net increase in emissions above the de minimis levels; thus, a conformity determination may be necessary. EPA expects the STB to address our comments regarding General Conformity and recommends that this discussion be included in the final EIS. Please see our enclosed technical comments for our detailed concerns.

EPA also is concerned with the lack of justification for a number of critical assumptions used in the noise analysis. The noise mitigation results are directly related to the validity of these assumptions. The final EIS should offer a more substantive description of the STB's assumptions and their results or correct them.

Finally, although many minority or low income communities were identified by the STB, it appears that the STB has thus far made little effort to mitigate potential impacts. EPA believes that additional coordination may be appropriate in the communities identified and that mitigation should be discussed in the final EIS. Because the STB does not have extensive regional or field staff, the STB staff may want to contact the Environmental Justice Coordinators located in other federal regional or field offices to see if they can provide information on these potentially affected communities. Additionally, the Council on Environmental Quality issued its "Environmental Justice Guidance Under the National Environmental Policy Act" in December 1997. This guidance should be referred to during the preparation of the final EIS.

Thank you for the opportunity to review this document. If you have any questions regarding our review, the staff contact is Patricia Haman. She can be reached at 202-564-7152.

Sincerely,

Richard E. Sanderson
Director
Office of Federal Activities

Enclosures

Technical Comments

Air Quality:

Lake and Porter Counties in Indiana have been granted a nitrogen oxides (NO_x) waiver; however, Vanderburg, Marion, St. Joseph and Elkhart Counties all have maintenance plans and a NO_x budget. The NO_x emissions in these counties from the project (if above 100 tons per year) should be compared with the projected NO_x emissions in the maintenance plan to determine if the projected growth can be accommodated. If the NO_x emissions are found to be greater than the growth allowed by the maintenance plan, then mitigation measures could be implemented so the project can be found to conform.

Six Michigan counties were evaluated for potential impacts from the proposed Conrail Acquisition: Calhoun; Jackson; Kalamazoo; Monroe; Wayne; and Washtenaw. Monroe, Wayne, and Washtenaw are part of the Detroit-Ann Arbor, Michigan, metropolitan area which is an ozone maintenance area, and Wayne County is part of a nonclassifiable nonattainment area for carbon monoxide (CO). The Detroit-Ann Arbor, Michigan, area was redesignated to maintenance in 1995, but the areas subsequently violated the ozone standard in the same year. This violation prompted U.S. EPA to remove a NO_x waiver which was granted as part of the redesignation request. Please address this change in status in the final EIS.

EPA is also concerned that passenger or commuter trains which currently utilize freight train tracks affected by this acquisition may not be able to continue to provide valuable transportation services to the public. Specifically, because much of the area affected by this acquisition is in the Northeast corridor and is in non-attainment or maintenance status for ground level ozone, EPA is concerned that if these trains are unable to offer their services or must reduce service, their passengers may resort to additional single occupancy vehicle trips, potentially impeding an area's ability to attain the National Ambient Air Quality Standard for ozone. EPA thinks this potential resultant impact to air quality needs to be addressed in the final EIS.

The draft EIS assumes that relocation of intermodal facilities and increased truck activities at these facilities will have little impact on local roadway systems. However, the current conditions or Level of Service of these local roadways were not identified or the effects of the additional truck traffic evaluated. In the review of transportation projects, the effect of truck traffic and the percentage of truck traffic on local roadways contributes to operational and safety problems. The draft EIS also does not discuss the interaction of the proposed rail modifications with proposed transportation projects in the potentially affected states. There are a number of major highway projects that being undertaken near rail lines involved with this project. For example, the Erie East Side Access in downtown Erie, Pennsylvania (PA), will cross the relocated Norfolk Southern tracks in Erie; SR 322 in Dauphin County, PA, could be affected by changes in operation of the adjacent rail lines. Corridor H in West Virginia also could be affected. Coordination with the State Departments of Transportation should be undertaken for all activities within each state.

Hazardous Materials:

The impact of the proposal on hazardous materials transport is not discussed fully in the draft EIS. It is unclear why the draft EIS only recommends mitigation for hazardous materials transport for rail segments which, post-acquisition, exceed 10,000 car loads of hazardous materials per year. The transportation of hazardous materials is increasing substantially on some rail routes (e.g., N-477 by 133%) albeit still to a level lower than 10,000 car loads. The risk calculations used in the draft EIS do not imply or support a significant increase of risk of release at the 10,000 car load level nor does the draft EIS provide enough discussion to explain what those risks may mean to a community.

We also are concerned about the adequacy of the proposed mitigation for hazardous materials transport to effectively address an anticipated increase in release of hazardous materials. The proposed mitigation which would be required for an increase in hazardous materials transport appears limited to complying with Association of American Railroads "Key Route" guidelines (AAR Circular No. OT-55-B). These guidelines appear only to address specific measures designed to decrease the probability of train accidents or car failures as the cause of accidental releases of hazardous materials and not what happens should an accident occur. The Key Routes or Major Key Routes do not appear to take into account the population or proximity of communities adjacent to these routes. We also note that the analysis of incidents involving hazardous materials contained in Chapter 4 of the draft EIS shows that vehicle-train accident/derailment accounts for less than 5% of the causes of these incidents. We suggest that an appropriate mitigation plan would include provisions to address all causes of incidents involving release of hazardous materials. Although the STB's Section of Environmental Analysis (SEA), "... believes that CSX and NS should establish a formal Failure Mode and Effects Analysis (FMEA) for reducing risk of spills both for storage and transport of hazardous materials... [page 4-21 of the draft EIS]," EPA could find no specific requirements that this be addressed with specific mitigation measures, or that if conducted, the results would be implemented.

Noise:

In general EPA finds the noise analysis confusing and the methodological assumptions used not well documented. Specifically, we are concerned with the lack of justification for the mitigation criterion for wayside noise: "SEA considered noise impact of wheel/rail and locomotive engine noise (wayside noise) to warrant potential mitigation if any sensitive receptors are exposed to noise levels above 70 dBA-Ldn and have a 5 dB Ldn increase." Work done with airport-related noise [see Federal Agency Review of Selected Airport Noise Analysis Issues (Federal Interagency Committee on Noise), August 1992] indicates that threshold criteria for changes in noise levels should decrease with increasing absolute values. The SEA screening criterion goes the opposite direction, from 3 dBA change at 65 dBA to 5 dBA change at 70 dBA. The reason that this is a problem is that at the higher absolute levels, a greater percentage of people are "highly annoyed" for each dBA increase. Our concern is that this SEA mitigation threshold greatly underestimates the need for mitigation.

A number of other assumptions in the analysis which should be justified in the final EIS are:

- Why construction noise impacts were not analyzed nor discussed in the mitigation sections.
- The validity of the (implicit) assumption that post-acquisition traffic has the same day/night ratio as the pre-acquisition traffic.
- Why background noise was not included in the analysis and how its omission effects the noise mitigation outcome.
- Why the option of remote horn installations at crossings was not explored as a mitigation option.
- The need for mitigation for engine noise at switching or other engine "accelerating" areas.
- The feasibility of slower train speed through noise critical areas as a mitigation.

Finally, as a matter of clarification, while the draft EIS statement that "...noise effects in areas where the Ldn is less than 65 dBA are generally not considered adverse..." is true, the FICON group specifically concluded "...that it is prudent to provide for systematically analyzing noise levels below 65 dB in NEPA documents using the Screening Procedures indicated below. If done properly, this added level of analysis could provide useful information to both the public and decision-maker." (See Section 3.4, FICON.)

Water Quality:

Most of the rail segments show an increase in the number of train operations. Also, there is an increase in activity at rail yards and intermodal facilities. However, there is no discussion of the potential water quality impacts of this increased activity. Since little information is given on the environment surrounding the rail line segments it is impossible to ascertain if there are any water resources that could be sensitive to additional pollutant runoff. There is no discussion of storm water management treatment for any of the facilities or operational changes. Please address these impacts in the final EIS.

Safety:

The discussion on rail safety was confusing. Although the Federal Railroad Administration reports 2600 accidents nationally for 1996, the draft EIS shows that there will be no accidents for hundreds of years. We believe that both the Board and the public need to understand the potential for increases in rail accidents from the associated increases in rail operations.

The impact of additional freight trains on passenger rail operations is not fully addressed. For example, on page MI-9 the draft EIS states, "Based on information the railroads provided and SEA's independent analysis, SEA determined that the increased risk for passenger train accidents for three of the four rail line segments exceeded SEA's criteria for significance. The draft EIS notes that one of the rail line segments, Kalamazoo to Porter, Indiana is owned and dispatched by Amtrak, a passenger rail service. SEA encourages Amtrak to implement any necessary modifications through its management of this rail line segment's operations. For the remaining two rail line segments, SEA anticipates that potential conflicts can be minimized by reinforcing passenger trains' priority over freight trains." We are concerned about the possibility that these conflicts may not be worked out and that increased freight rail operations may impinge on safe passenger rail service. We recommend that the final EIS address this concern in more detail.

Site-specific Analyses:

EPA is concerned with both the extent of the actions analyzed as well as the level of detail for those actions considered to "meet or exceed the Board's Environmental Thresholds". In particular, it appears that many of the activities resulting from the acquisition were not analyzed. We are unable to evaluate the direct and cumulative impacts of the changes to railroad operation or facilities as a result of the acquisition. For the segments or facilities evaluated in each of the states, regardless of the potential impact associated with the activity, the Board concludes a lack of significant impact with minimal data to support those assumptions.

In addition to these overriding concerns, EPA Region 5 expressed concern for specific sites in their review of the draft EIS. EPA believes additional analysis of potential impacts to watersheds, wetlands, and threatened or endangered species for construction/abandonment activities is needed for the following sites in:

<u>State</u>	<u>Activity</u>
Illinois	Exermont Connection
Illinois	Paris-Danville Abandonment
Illinois	Lincoln Avenue Chicago Connection
Illinois	59th Street Intermodal Facility
Indiana	Butler Connection
Indiana	South Bend to Dillion Junction Abandonment
Ohio	Oak Harbor, Ottawa County
Ohio	Willard Fueling, Huron/Seneca Counties
Ohio	Vermilion Connection, Erie County
Ohio	Toledo to Maumee Abandonment, Lucas County
Ohio	Columbus Connection, Franklin County
Ohio	Toledo Pivot Bridge Abandonment, Lucas County
Ohio	Collinwood New Intermodal Facility, Cleveland/Cuyahoga Counties

Best Management Practices:

It is in the public interest that the details of construction are accomplished with the most environmentally sound methods practicable. To avoid the necessity of detailed specifications for each construction detail, it is our opinion that Best Management Practices (BMP), as amended below, be followed. In addition, a disinterested third party should be contracted to supervise and audit the ongoing construction and abandonment activities from an environmental standpoint.

Best Management Practices (BMPs) listed in Volume 1, page 3-43, are well stated, but incomplete. They are expanded upon in Volume 4, Chapter 7.2.5; however, they are referred to as "General Mitigation for Proposed Constructions and Abandonments" and again in Volume 5A, Appendix I, where they are again referred to as "mitigation." It is our position that these are construction and abandonment management practices and not mitigation. To facilitate the review of such an extensive document, they should be compiled into one "Best Management Practices" section and referred back to when applicable, not repeated. Attached is a list provided by one of EPA's regions which we recommend be used to augment the BMP list in the draft EIS.

Recommended Best Management Practices

- a. We recommend the use of recycled materials and environmentally-sound products during construction. Abandonment activities should be coordinated with construction activities to take maximum advantage of reuse and recycled materials.
- b. Impacts or losses to wetlands should be avoided wherever possible. If wetland impacts are unavoidable, it must be demonstrated that there are no practicable alternatives available that would avoid or further minimize impacts to wetlands. Unavoidable wetland losses must be compensated for at a minimum of 1.5 acres of compensatory wetlands per each acre of naturally occurring wetlands impacted by the project at issue.
- c. Compensatory wetlands should be designed to replicate as closely as possible the specific mix of types, functions and values provided by the project-impacted wetlands. The compensatory wetlands should be established via the process of restoration to the extent feasible, and they should be located in an area as close as practicable to the project-impacted wetlands.
- d. If, in the course of the project, it is discovered that impacts will occur in a fen, bog, or a bottomland hardwood assemblage, the responsible parties will cease activities and contact the U.S. Army Corps of Engineers and the U.S. EPA immediately. These wetland resources are extremely scarce and cannot be adequately compensated for with existing mitigation and restoration technology.
- e. If trees will need to be cleared to accommodate the proposed project activities, compensation should be provided for the removed trees. Trees should be replaced with native saplings, if practicable, at a minimum ratio of 1:1, and replacement should occur as close as possible to the impacted areas. Replacement of removed trees would provide erosion control, increase the drainage capacity of the area, help mitigate the loss of habitat, and would improve aesthetics.
- f. Measures should be taken to protect vegetation from impacts that may be incurred by the use of heavy equipment. All activities should be restricted to the footprint of the project. The contractor should be required to install fences around the project area so that vegetation outside the immediate footprint is protected.
- g. To control erosion and spills, a staging area should be established for the construction equipment in an environmentally non-sensitive area, and all disturbed areas should be revegetated upon completion of the construction activities, preferably with native flora. The long root systems characteristic of native flora help hold the soil firmly in place. Also, natural vegetation works as an efficient filter, it provides habitat for wildlife, and improves aesthetics. "Natural landscaping" techniques maximize the use of native species thus reducing the need for fertilization and motorized maintenance.
- h. Construction activities will temporarily increase levels of noise, dust and carbon monoxide. Measures should be taken to minimize any adverse impacts. We suggest that the contractor be

required to control noise and fumes emitted by construction equipment by installing control devices and employing prescribed control methods.

i. The project plan should consider in every way possible the pollution prevention impacts of materials that are decommissioned from the rail line. When recycling or reuse is not a viable option, the project plan should specify how disposal of materials such as rail ties and potentially contaminated surrounding soils and ballast materials will be accomplished to ensure compliance with applicable solid and hazardous waste regulations.

j. In counties where threatened and endangered species are documented to exist but site visits to the project area did not find supportable habitat, the responsible parties will cease activities and contact the U.S. Fish and Wildlife Service and the appropriate state Department of Natural Resources immediately if construction or abandonment activities discover such habitat and/or species.

DATA COLLECTION AND ANALYSIS

Crossing Location/Description

- A. U.S.DOT/AAR number
- B. Highway/street name or number
- C. Railroad(s) name and milepost(s)
- D. Urban/rural
- E. Development

Attention: Elaine K. Kaiser
Chief, Section of Environmental Analysis
Environmental Filing

Dear Ms. Kaiser:

In accordance with the National Environmental Policy Act (NEPA) and Section 309 of the Clean Air Act (CAA), the Environmental Protection Agency (EPA) is providing comments to you on the "Draft Environmental Impact Statement (EIS) for the Proposed Conrail Acquisition." Our comments are meant to build upon our previous scoping comments and technical assistance offered to you in 1997.

As outlined in this letter and technical enclosure, EPA has many specific concerns with the proposed acquisition; however, we think the impacts from the proposal can be successfully avoided, offset or mitigated. Therefore, EPA has rated the potential impacts from the acquisition as described in the draft EIS "EC" (environmental concerns). EPA rates the documentation of the draft EIS "2" (insufficient information) because, while EPA recognizes the difficulty in trying to analyze and document an undertaking which affects 24 states and the District of Columbia, we also think the draft EIS could have described more fully the potential impacts to and risk from air quality, noise, increased hazardous material transport, and the direct and cumulative impacts to water quality from increased rail operations and activity in rail yards and intermodal facilities. Our major issues are summarized below and our detailed technical comments are attached. The combined rating for the draft EIS is EC-2; a copy of our rating system is also enclosed.

EPA is concerned about the potential impacts to air quality that the proposed acquisition may impose. In our August 1997 scoping letter we indicated that the Surface Transportation Board (STB) needed to address the applicability of the General Conformity regulations of the CAA (40CFR 93.150-160). We further recommended that this information be included in the draft EIS. The draft EIS does not address our recommendation. If the STB has the ability to

SUMMARY OF RATING DEFINITIONS AND FOLLOW UP ACTION*

Environmental Impact of the Action

LO--Lack of Objections

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC--Environmental Concerns

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

EO--Environmental Objections

The EPA review has identified significant environmental impacts that must be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU--Environmentally Unsatisfactory

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the CEQ.

Adequacy of the Impact Statement

Category 1--Adequate

The EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2--Insufficient Information

The draft EIS does not contain sufficient information for the EPA to fully assess the environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

Category 3--Inadequate

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

ATTN: Ms. Elaine K. Kaiser, Chief
Section of Environmental Analysis (SEA)

Dear Sir/Madam:

The U.S. Department of the Interior has reviewed the Draft Environmental Impact Statement, Finance Docket No. 33388, "Proposed Conrail Acquisition," CSX Corporation and CSX Transportation, Inc., Norfolk Southern Corporation and Norfolk Southern Railway Company. We have the following comments.

The Draft EIS showed one rail segment that occurs in Mississippi with a proposed increased environmental risk and exceedance of SEA's criteria for significance. Rail segment Site ID C-387 runs between Mobile, Alabama and New Orleans, Louisiana, and would have an increase in hazardous material transport. This segment passes through Jackson, Harrison, and Hancock Counties, Mississippi. It also crosses the Pascagoula, Biloxi, Wolf, and Pearl Rivers. These large river basins, and other lands along the rail route, have significant fish and wildlife resources including the following federally listed species:

brown pelican (*Pelecanus occidentalis*)
piping plover (*Charadrius melodus*)
bald eagle (*Haliaeetus leucocephalus*)
Gulf sturgeon (*Acipenser oxyrinchus desotoi*)
inflated heelsplitter (*Potamilus inflatus*)
Mississippi sandhill crane (CH) (*Grus canadensis pulla*)
ringed sawback turtle (*Graptemys oculifera*)

The increase in transport of hazardous material would have a significant impact to trust resources if a spill were to occur. The standard Hazardous Materials Emergency Response Plan may not be adequate to address immediate and long term fish and wildlife resource impacts.

Specific Comments

5-MS.5.2

We believe preventing a spill is much preferable to cleaning one up. Therefore, we recommend the following:

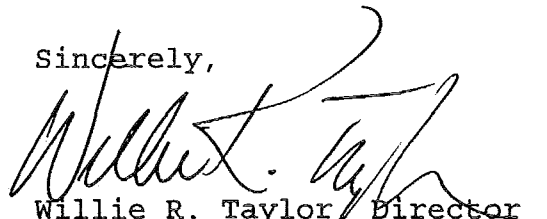

1. Lower speeds should be adopted across bridges within the listed basins.
2. Inspections of cars carrying hazardous materials along this route should be increased.
3. Inspection of rail lines along this corridor should be increased.
4. Emergency management plans should include guidelines for immediate consultation with Service personnel regarding potential adverse impacts to the listed species.

Summary

The proposed project could have significant adverse impacts on present and future natural resources in this area if a spill were to occur. The Surface Transportation Board should adopt the above measures to prevent such an event from occurring.

Thank you for the opportunity to provide these comments.

Sincerely,

Willie R. Taylor, Director
Office of Environmental
Policy and Compliance

Dear Ms. Kaiser:

This is in reply to your letter, dated December 19, 1997, regarding Draft Environmental Impact Statement (DEIS) for the Proposed Acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad.

We have reviewed the DEIS on potential environmental impacts within the regulatory boundaries of the Pittsburgh District. There does not appear to be impacts related to Section 404 of the Clean Water Act (33 CFR 320-330; 33 CFR 330, updated Nov. 22, 1991; 33 CFR 1344 or the Rivers and Harbors Act of 1899 (33 CFR 401, 403, 407)).

If further information is required, please contact me at (412) 395-7155.

Sincerely,

Albert H. Rogalla

Subject: Proposed Conrail Acquisition by CSX Corporation.

Dear Ms. Kaiser,

This is in response to your request for comments on the proposed Draft, Environmental Impact Statement for the Conrail acquisition by the CSX Corporation.

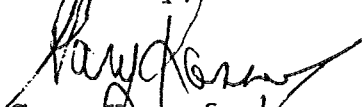

Our review has not identified any additional issues than those previously sent to you by our letter dated August 6, 1997. I have enclosed a copy for your file.

I would like to take this opportunity to briefly reiterate our comments regarding the Lehigh Valley Bridge across Newark Bay in New Jersey. Federal Regulations governing the operation of drawbridges specifically require that this bridge over Newark Bay listed under § 117.735 be operated so as to not delay openings of the draw for more than periods of five minutes. It has been a practice to back up trains across this bridge during the process under which trains are "made up" for periods of several hours. The Coast Guard has assessed civil penalties for past violations and will continue to enforce the regulations with regard to these delays.

We strongly recommend, once the acquisition is finalized, that steps be taken to prevent these delays by considering alternatives necessary to expand or reconfigure the train yard to correct this problem. In this regard, we would be happy to meet with the new management team to discuss this matter.

If you have any questions please do not hesitate to contact me at
(212) 668-7165.

Sincerely,

Gary Kassof
Bridge Administrator

Ms Elaine K. Kaiser
Chief, Section of Environmental Analysis
Surface Transportation Board
Washington, D.C. 20423

Dear Ms Kaiser:

This is in response to your request for comments on the proposed EIS scope for the consolidation of Conrail assets with those of the CSX and Norfolk Southern railroad companies. I am providing comments on behalf of Admiral Richard M. Larrabee, First Coast Guard District Commander.

The First Coast Guard District's Bridge Administration program closely interfaces and coordinates with Conrail's operations in the northeast. The following issues/impacts should be included in the environmental impact statement process:

o marine safety implications and intermodal conflicts anticipated by increased rail service particularly across drawbridges; discuss increase in number and frequency of trains crossing bridges. ~~NOTE: Although the scope of the EIS is limited to marine safety, the impacts of increased rail service on bridge congestion and intermodal conflicts should be addressed.~~

o expansion of rail facilities (yards, stations) particularly where freight trains are "made up" and the impacts on drawbridge operations eg. Lehigh-Valley Bridge across Newark Bay, NJ.

o plans to construct, replace or rehabilitate bridge structures over waterways; CG bridge permits and construction approvals may be required. The Draft Scope of the EIS (p. 13) omits compliance with the federal bridge statutes (33 U.S.C. 401, 491, 525 et seq.)

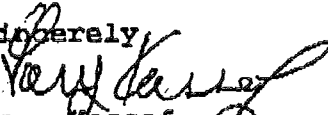

o discussion of maintenance program for bridges to include operational machinery (for drawbridges), protective fenders, navigational lighting.

o training program for drawbridge operators and dispatchers to include knowledge of bridge owner's/operator's responsibilities in accordance with 33 CFR 117.

o plans to remove all abandoned bridge structures across navigable waters of the United States.

Please provide a copy of the railroads' Environmental Report, if available as I haven't received one. Once the DEIS is published we will provide more in depth comments. In the meantime we are available to answer any questions you may have. Please contact the Bridge Administration Branch at 212 668-7165.

Sincerely,

Gary Kassof
Bridge Administrator
First Coast Guard District

------------	---	------

1.0 INTRODUCTION AND SUMMARY

Norfolk Southern Corporation and Norfolk Southern Railway Company (collectively, "NS" or "Norfolk Southern") hereby submit their comments on the December 12, 1997 Draft Environmental Impact Statement ("DEIS") prepared by the Surface Transportation Board's ("STB" or the "Board") Section of Environmental Analysis ("SEA") in Docket No. 33388. SEA has served the DEIS on over 2,000 persons and has provided a 45-day period for the submission of comments from all interested persons.

The six-volume DEIS documents the results of an exhaustive environmental analysis by SEA of the potential environmental impacts of the proposed Conrail Transaction ("Transaction"), involving the operation of rail service across 44,000 miles of the eastern United States. The DEIS addresses in comprehensive fashion every environmental issue which the Board is required to analyze independently in satisfaction of its obligations under the National Environmental Policy Act, 42 U.S.C. 4321, and the Board's own implementing regulations, 49 CFR 1105. The Board determined at the outset of this Transaction that it would prepare an Environmental Impact Statement ("EIS") to evaluate the potential impacts of the Transaction to ensure that the full range of environmental issues would be taken into consideration as the Board evaluated the application filed jointly by NS, CSX Corporation and CSX Transportation, Inc. (collectively, "CSX") and Conrail, Inc. and Consolidated Rail Corporation (collectively, "Conrail"). The Board tasked SEA, and the third-party environmental consultants retained by SEA, with preparing an EIS for the Board's consideration in conjunction with the Board's analysis of the various transportation and competitive issues presented by the Transaction.

The overall conclusion of the DEIS is that the proposed Transaction will produce substantial system-wide environmental benefits in several respects, and will not create any system-wide significant adverse environmental impacts. For example, as noted in the DEIS, on a system-wide basis the Transaction:

- "[W]ould reduce emissions for most air pollutants" (DEIS at ES-23);
- "[W]ould result in net annual reduction in fuel consumption of approximately 80 million gallons of diesel fuel" (DEIS at ES-22);
- "[I]s expected to benefit the national and regional highway systems by reducing truck traffic on major state, regional and U.S. highways" (DEIS at ES-21); and
- "[S]hould result in a slight safety improvement for rail transportation of hazardous materials" (DEIS at ES-19).

NS not only concurs with these important conclusions by SEA, it believes that the true benefits of the proposed Transaction--which must be balanced against its adverse impacts--are much greater than indicated in the DEIS. A discussion by NS of the significant environmental, safety, and other benefits of the Transaction follows at Section 3 of these comments.

Notwithstanding its acknowledgment of the correctness of the DEIS's overall conclusion of net system-wide environmental benefits, NS is concerned that the approach to implementation of the Board's obligations under NEPA, as demonstrated by some portions of the DEIS, indicates a potential misapplication of the principles of NEPA and may go beyond the limitations on the Board's legal authority in deciding railroad control applications. NS provides its analysis of these issues at Section 2 of these comments. In addition, NS believes that SEA's analysis of potential environmental impacts has, in certain instances, applied unduly conservative or flawed approaches or assumptions and thereby overestimated the predicted impacts. In those instances where NS takes issue with the approach, the analysis or other aspects of the DEIS's assessment of a particular environmental impact, NS sets out the basis for its conclusions at Section 4 of these comments. Through the DEIS, SEA has directed NS to "consult" with cities with unique circumstances and other specific local communities to seek to negotiate mutually-acceptable agreements to address potential environmental impacts. NS' response to this direction is provided in Sections 5 and 6. In addition, NS has identified a number of minor corrections to the DEIS which are primarily editorial in nature. These comments are provided in Section 7 and are for the purposes of clarification.

As discussed in detail in these comments, the following are the principal areas of NS concern with the analysis and recommendations of the DEIS:

The DEIS Unnecessarily Seeks to Mitigate All Environmental Impacts: Since an EIS, rather than an EA, is being prepared in this case, there is no requirement that all identified adverse environmental impacts be mitigated. The DEIS blurs this important distinction, however, with a variety of mitigation proposals that appear designed to deal with virtually every potential localized adverse impact, and without adequate balancing of the potential adverse impacts against the positive benefits of the Transaction, including its environmental benefits.

Proposed Passenger Rail Safety Mitigation: The DEIS identifies certain line segments over which both freight and passenger operations are conducted as warranting special safety mitigation consisting of establishing passenger trains as "superior" and requiring freight trains to clear the line 15 minutes before and, in some instances, 15 minutes after a passenger train passes. This proposal is unprecedented and would involve outdated, cumbersome procedures that would

seriously impact rail line efficiency. As demonstrated in these comments, no passenger safety mitigation is in fact warranted. The statistical analysis presented in the DEIS overstates the Transaction-related impacts of freight traffic increases and utilizes data not directly applicable to the safety concern for which the proposed mitigation is purportedly designed. Moreover, the question of passenger rail safety is most properly left to the jurisdiction of the Federal Railroad Administration (FRA). Assuming that any mitigation is appropriate, it should be in the form of railroad consultations with the FRA and the affected passenger rail agencies.

Proposed Interim Two-Train Per Day Limitation on Traffic Increases at Erie, PA: The DEIS proposes that traffic increases over NS' main line through Erie, PA be limited to two trains per day until completion of NS' proposed track relocation project (which project will move all NS operations through Erie to new trackage on the grade-separated Conrail right-of-way). In view of the substantial benefits (including environmental benefits) associated with the Transaction, this type of localized service limitation is not warranted in Erie (nor would such limitations be warranted in other localities), and it would have serious adverse ramifications for NS' proposed operating plan, particularly in the crucial Midwest to New York/New Jersey market. Moreover, there appears to be no analytical basis for the DEIS' selection of two trains per day as the number for such a limitation on traffic increases. This proposed limitation is particularly unjustified in view of the temporary nature of anticipated traffic increases through downtown Erie and the significant long-term environmental benefits that Erie will experience once the track relocation project is completed.

Proposed Mitigation for Highway/Rail At-Grade Crossings: The DEIS proposes that NS upgrade protection devices at 44 highway/rail at-grade crossings in order to mitigate perceived grade crossing safety issues, and the DEIS further proposes mitigation for certain crossings based on purported vehicle delay impacts. In both the safety and delay areas as respects grade crossings, the DEIS' proposed approach would displace the well-established authority of state transportation departments to conduct final analysis of and to prioritize grade crossing projects. Additionally, the methodology by which the DEIS identifies crossings requiring such mitigation is flawed. In the grade crossing safety context, the DEIS improperly utilizes a formula designed for ranking grade crossings according to a perceived need for crossing protection upgrade as the sole basis for determining the need for, and type of, crossing protection upgrades. In the grade crossing delay context, the DEIS improperly uses a method developed for assessing delay at signalized vehicular highway intersections for determining highway/rail at-grade crossings actually requiring mitigation. Finally, the DEIS recommendations threaten to disrupt well-established policies and practices regarding cost allocation for grade crossing improvements and grade separations.

Environmental Justice Analysis and Recommendations: The DEIS includes an unprecedented effort to apply an environmental justice analysis to consolidations of long-established transportation systems of broad geographical reach. In an attempt to work within the framework of an Executive Order that was principally designed for and is most logically applied to the localized siting of a new facility (as opposed to changed utilization of an existing infrastructure over a broad geographic area), SEA is sailing in uncharted waters. The substantial difficulties in attempting to apply to a transaction of this kind the Executive Order and the guidance and methodologies developed thereunder to date by other agencies, should counsel caution. Nevertheless, in the DEIS, SEA has utilized new processes and untested analytic methodologies for environmental justice, and has recommended consideration of untried mitigation strategies. The resulting environmental justice discussion in the DEIS fails to reflect any assessment of whether adverse impacts would be predominantly borne by minority or low-income populations or whether potential adverse impacts on minority or low-income communities would be more severe or greater in magnitude than among other affected populations. NS' analysis confirms that, in fact, the potential environmental impacts of the Transaction are not borne disproportionately by minority or low-income communities. There are other serious flaws in the environmental justice analysis of the DEIS. Moreover, for reasons described in Section 4.16 of these comments, application of environmental justice principles to this Transaction may, at most, lead to enhanced outreach and consultations with certain local communities, not to the imposition of mitigation measures beyond those that might otherwise be recommended to mitigate significant adverse impacts upon full consideration of the substantial environmental, safety and other benefits of the Transaction.

Noise Analysis and Potential Mitigation: While much of the treatment of noise in the DEIS is correct, the analysis significantly overstates potential noise levels on NS lines. This results from a combination of overly conservative methodology, application of noise models developed for CSX trains to the quieter NS trains, and failure to recommend or conduct site-specific measurements and analysis. There is, moreover, no analytic or other support in the DEIS for the suggestion that noise barriers be deemed the "preferred" method of mitigating noise.

In sum, NS believes that SEA has conducted a comprehensive assessment of the environmental aspects of the proposed Transaction that satisfies and exceeds the mandate of NEPA and the Board's implementing regulations. SEA has clearly taken a "hard look" at all the attendant issues and its DEIS provides a good foundation for a comprehensive Final Environmental Impact Statement ("FEIS") in full compliance with the Board's obligations under NEPA. For publication of the FEIS in May, SEA should now in light of these comments consider what recommendations for mitigation are factually warranted, within the lawful purview

of the Board and consistent with the appropriate balance of public benefits and interests related to this Transaction.

2.0 APPLICABLE LEGAL PRINCIPLES

2.1 Scope of Environmental Impact Analysis and Standards Governing Proposed Mitigation Conditions

As the Board knows, this is the first railroad consolidation proceeding in which it has undertaken to prepare an Environmental Impact Statement (“EIS”) pursuant to the requirements of NEPA. In all previous cases, the Board and the ICC only performed Environmental Assessments (“EA”), because in each case the EA was able to conclude that the consolidations would have no significant environmental impacts if the parties complied with various mitigation conditions prescribed in the agency’s final decisions. As a result of the decision to prepare an EIS in this case, the Board’s SEA staff and the Applicants have been required to engage in a far more intensive and comprehensive analysis of the potential environmental impacts of the Transaction than in any previous case.

The DEIS represents SEA’s preliminary conclusions based on its comprehensive and exhaustive environmental review of the proposed Transaction. Its six volumes contain a detailed and wide-ranging analysis of the potential environmental effects of the Transaction. The DEIS also contains a lengthy list of proposed conditions recommended to be imposed on Applicants; these are proposed for the purpose of mitigating virtually every adverse environmental effect of the Transaction identified in the DEIS.

The FEIS issued by the Board in this case must conform to the requirements both of NEPA and the Board’s governing statute, the ICC Termination Act of 1995, 49 U.S.C. §§ 10101 et seq. (“ICCTA”). As discussed below, NS respectfully submits that a number of the mitigation conditions proposed in the DEIS, some of which are unprecedented and address far more than the impacts asserted, are not consistent with the Board’s basic function and responsibilities under NEPA and the ICCTA in several critical respects.

2.2 NEPA Only Requires the Board to Consider Environmental Effects. Imposition of Conditions Must Be Based on a Balancing of All Relevant Factors, Which the DEIS Does Not Do.

The proposed conditions appear to be based on the assumption that NEPA and/or the ICCTA require all adverse environmental effects to be mitigated before the Transaction can be approved. That assumption is not correct.

The fundamental command of NEPA is that federal agencies must consider -- or take a "hard look" at -- potential environmental impacts associated with the exercise of federal regulatory functions. Robertson v. Methow Valley Citizens Council, 490 U.S. 332, 349 (1989). The obligations that it imposes on federal agencies are procedural in nature. Vermont Yankee Nuclear Power Corp. v. NRDC, 435 U.S. 519, 588 (1978) ("NEPA does set forth significant substantive goals for the Nation, but its mandate to the agencies is essentially procedural"). When, as the Board has determined to be the case here, a federal agency concludes that a proposed federal action may have significant impacts on the quality of the environment or the conservation of energy resources, the agency must prepare an Environmental Impact Statement assessing those impacts, and must consider the identified impacts in deciding upon its course of action. 42 U.S.C. § 4332 (2)(C). However, neither NEPA nor an EIS prepared in accordance with NEPA *requires* the agency to do more than consider the potential environmental impacts of its actions. They do not require the agency to take any measures to eliminate or mitigate *any* -- let alone *all* -- of those impacts. What mitigation measures to impose, if any, is a matter of the agency's discretion as defined and limited by its responsibilities and authority under its governing statute, as the Board's environmental regulations expressly recognize. 49 CFR 1105.10 (f). See also Strycker's Bay Neighborhood Council, Inc. v. Karlen, 444 U.S. 223, 227-28 (1980).

Under the ICCTA, the Board has broad, but not unlimited, authority to impose conditions on a transaction to ensure that it is consistent with the public interest. 49 U.S.C. § 11324(c). In deciding whether to impose any conditions, including environmental mitigation conditions, the Board must weigh and balance *all* considerations relevant to the ultimate public interest determination. These include not only specific adverse environmental effects, but also the positive environmental effects and the positive economic and other public benefits of the transaction. The Supreme Court has clearly ruled that there is a fundamental distinction between the process of considering the environmental impacts of a particular federal action under NEPA and a requirement that those impacts be mitigated. NEPA mandates only that environmental impacts be considered, *not* mitigated. Robertson, 490 U.S. at 352-53. In choosing a course of action, the agency properly must weigh positive environmental effects against adverse environmental effects and, even more importantly, must balance environmental factors against other relevant legal or policy considerations bearing on the propriety of the proposed action. Id. at 350. Indeed, the basic purpose of NEPA is to require a federal agency to "balance a project's economic benefits against its adverse environmental impacts," Hughes River Watershed Conservancy v. Glickman, 81 F.3d 437, 446 (4th Cir. 1996); the intent of NEPA is not to "elevate environmental concerns over other appropriate considerations" before the agency. Baltimore Gas and Electric Co. v. Natural Resources Defense Council, 462 U.S. 87, 97 (1983).

governing yard/terminal operations

- d. Motive Power and Equipment
 - i. Qualifying employees on inspections and tests of rolling equipment
 - ii. Implementing mechanical department maintenance and equipment service plans
 - iii. Implementing measures to ensure safe freight operations and compliance with the law when "blocking" and "block swapping" trains
 - iv. Ensuring a sufficient fleet service and inventory to carry out field operations
- e. Signal and Train Control
 - i. Operating budgets addressing
 - (1) Training
 - (2) Maintenance
 - (3) Capital improvements
 - (4) Research and development projects and programs
 - ii. Ensuring safety maintenance with integration of, or migration to, properties acquired, specifically, Automatic Cab Signal/Automatic Train Control systems and wayside and cab signal aspects and indications
- f. Track and Structures
 - i. Maintenance, management and rehabilitation of track and bridges
 - ii. Inspection program for track and bridges
 - iii. Sufficient employee (including supervisors) coverage for track and bridge safety
- g. Hazardous Materials
 - i. Programs addressing field operations and internal safety audits
 - ii. Need for comprehensive inspection program addressing:
 - (1) Field inspections
 - (2) Hazardous materials communication standards (e.g., shipping paper, marking, labeling, and placarding requirements)
 - (3) Employment staffing to implement program
 - (4) Emergency response practices and procedures
 - iii. Computer software systems to ensure immediate availability of hazardous materials shipping paper information
 - iv. Customer service centers
 - (1) Sufficient employment staff levels
 - (2) Timely generation and transmission of hazmat information on trains and shipments to customers and Federal officials
- h. Dispatching Operations
 - i. Measures to eliminate or minimize excess service performed and reduce maximum dispatching workloads, including criteria used for determining maximum safe workloads
 - ii. Integrating acquired dispatching system with acquiring railroads' systems

- i. Highway-rail Grade Crossings
Safety prevention and emergency response program addressing:
 - (1) Increase traffic volume, speeds, and track at crossings
 - (2) Improved warning devices
 - (3) Rail safety education of public
 - (4) Improved crossings with emphasis on closing existing crossings
- j. Allocation and deployment of personnel in following sectors:
 - i. Management of safety programs
 - ii. Roadway maintenance
 - iii. Motive Power and Equipment maintenance
 - iv. Dispatching operations
 - v. Train and Engine service
 - vi. Yard and terminal service
 - vii. Signal and Train Control maintenance
 - viii. Customer service centers
- k. Employee "Quality of Life" issues
 - i. Rest
 - ii. Travel/time away from home
 - iii. Perceptions of harassment or intimidation
 - iv. Health and wellness programs
 - v. Morale
 - vi. Availability and distribution of personal safety equipment (e.g., safety shoes, eye protection, and ear plugs)
- l. Relationship between freight and passenger service. Each plan to address the integration of freight and passenger operations on the following lines:
 - i. MARC
 - ii. SEPTA
 - iii. VRE
 - iv. METRA
 - v. NJTR
 - vi. MNCW
 - vii. MBTA
 - viii. Amtrak
- m. Information Systems Compatibility. Each plan to address information systems to be implemented that will provide for the uninhibited interchange of information between the acquiring railroads in the following areas:
 - i. Train consists
 - ii. Train performance
 - iii. Waybill/car movements
 - iv. Dispatching
 - v. Hazmat

- vi Crew management
- vii Accident/incident reporting and record keeping
- viii Equipment management (locomotives and freight cars)
- ix Emergency shutdowns

Rail-Highway Crossing Safety Action Plan Summary

**Federal Highway Administration
Federal Railroad Administration
Federal Transit Administration
National Highway Traffic Safety Administration**

June 13, 1994

A-28-c

INTRODUCTION

Each day, we are reminded of the importance of our efforts to improve highway-rail grade crossing safety and trespass prevention. Highway-rail collisions and trespassing on rail properties are the number one and two leading causes of death in the entire railroad industry, far surpassing employee or passenger fatalities.

In 1993, grade-crossing deaths rose by 8.1% over 1992 and trespassing deaths remained high. Specifically, nearly 4,900 collisions occurred between highway users and on-track railroad equipment. More than 600 individuals were killed and over 1,800 were seriously injured in these collisions. These crashes occurred nearly equally at crossings equipped with automatic warning devices (flashing lights and sometimes gates) and at those not equipped. Also in 1993, more than 500 people died while trespassing on railroad rights-of-way.

On the United States' approximately 160,000 miles of rail rights-of-way, there are over 280,000 highway-rail intersections. Approximately 60,000 (21%) of these are equipped with automatic warning devices.

The very existence of crossings is a major challenge to growing rail traffic and higher speeds for both passenger and freight rail operations. Our efforts to develop a "seamless" national intermodal transportation network must resolve these challenges.

This *Action Plan* details six major goals and 55 actions, addressing some aspect of crossing safety or trespass prevention. To be successful, the proposed actions will require strong partnerships between local, State and Federal highway and rail officials, law enforcement, the rail and transit industries, Operation Lifesaver and the United States Congress. With this plan as our blueprint, we will work together to increase public awareness to help prevent these needless tragedies.

MAJOR INITIATIVES

- Enhance Enforcement of Traffic Laws at Crossings;
- Enhance Rail Corridor Crossing Reviews and Improvements;
- Expand Public Education and Operation Lifesaver Activities;
- Increase Safety at Private Crossings;
- Improve Data and Research Efforts;
- Prevent Rail Trespass Tragedies.

In this sense, the purpose of an EIS is fundamentally different from an EA, the form of environmental analysis that has been employed by the Board and the ICC in prior rail consolidation proceedings. The purpose of an EA is simply to assess whether the proposed federal action would have significant environmental effects warranting the preparation of an EIS. For this reason, any significant adverse environmental impacts identified in an EA *must* be fully mitigated as a condition to the proposed federal action, or else the agency would be required to perform a complete EIS *before* undertaking the proposed action. E.g., 46 Fed. Reg. 18026, 18037 (1981) (Agencies can include enforceable mitigation measures to conclude that an action does not require preparation of an EIS); Cabinet Mountains Wilderness/Scotchman's Peak Grizzly Bears v. Peterson, 685 F.2d 678 (D.C. Cir. 1982) (upholding Forest Service's use of mitigation measure to conclude no EIS was necessary). When, as here, a full EIS is prepared, there is *no* corresponding requirement that all identified adverse impacts be mitigated, but only the essentially *procedural* requirement that all environmental impacts be taken into consideration by the agency in deciding upon a course of action. Robertson, 490 U.S. at 352-53. In this case, the DEIS blurs this important distinction, as it proposes a plethora of mitigation measures that appear designed to alleviate or eliminate virtually every potential adverse impact of the Transaction, without regard to the impact of those measures upon other aspects of the Transaction or the costs to the transportation industry and shipping public. The Board is obligated by NEPA and the ICCTA to balance adverse environmental effects against offsetting positive environmental effects and, importantly, non-environmental public benefits of the Transaction.

In deciding this case, the Board must consider the very substantial benefits this Transaction will provide, benefits not only to the U.S. transportation system and the economies of the regions that NS and CSX will serve but also to the environment. Because NS believes that it is critical that the Board consider all of those benefits as part of its environmental review as well as in its decision on the merits, those benefits are summarized in Section 3 of these comments.

2.3 Several Proposed Mitigation Conditions Exceed Basic Limitations on the Board's Conditioning Power Long Recognized By the Board and the ICC.

The measures proposed in the DEIS to mitigate identified potential adverse environmental effects of the Transaction are also governed by the limitations on the Board's authority to impose conditions to its approval of a proposed rail consolidation. *See generally* CSX/NS-176 at 36-43. Any condition imposed by the Board must be directly related to the transaction at issue. As such, the proposed condition may appropriately address and ameliorate *only* those identified impacts that are directly attributable to the proposed transaction, and may not be designed to remedy pre-

existing conditions or effects unrelated to the transaction at issue. Indeed, SEA has acknowledged the clear-cut limitations on the Board's ability to impose mitigation to remedy environmental conditions that arise prior to the transaction or that would address circumstances that are not directly related to the Board's action. DEIS at 1-10. Accordingly, proposed conditions are justified *only* if they are narrowly tailored to remedy specific transaction-related harms. Proposed conditions are not warranted if other alternative remedies are available or if the proposed condition would improve the pre-transaction condition of third parties, would be operationally infeasible, or would disproportionately undermine the other public benefits of the proposed transaction. *See, e.g., BN/Santa Fe* at 55-56; *UP/SP* at 144.

Although the DEIS at several places makes reference to these established limitations on the Board's authority to impose environmental conditions (*e.g.,* DEIS at 7-31), it fails to apply these standards in critical respects. The DEIS identifies various adverse environmental effects that are claimed to be traceable to the Transaction but, in proposing measures to mitigate these identified harms, fails to assess whether the proposed mitigation is narrowly tailored to remedying *only* the Transaction-related harm, whether alternative remedies are available, and whether the proposed mitigation would be operationally feasible and preserve the other public benefits of the Transaction.

For example, the DEIS proposes that Applicants be required to (1) comply with various laws, regulations and private agreements that would be independently binding on them (measures that, by definition, are not necessary and for which alternative remedies exist), (2) install, with or without otherwise required state and federal funding, costly upgrades in highway/rail at-grade crossings that would more than rectify the claimed Transaction-related adverse impacts on accident rates and traffic delays (measures that, by definition, would improve pre-Transaction conditions), and (3) commit enormous funds to the installation of new rail facilities, limit the number of trains moving over certain line segments and implement new operating procedures and other measures that would disproportionately undermine the public benefits of the Transaction. In all of these respects, such proposed mitigation measures should be rejected.

In addition, the NEPA process and the Board's conditioning power should not be used to re-write industry-wide regulations and operating practices related to railway safety and operations. Just as the Board has recognized that its conditioning power may not be used to effectuate broad restructuring of the rail industry and the competitive balance among carriers (*see, e.g., BN/Santa Fe* at 55-56), so too it would be an inappropriate exercise of the Board's responsibility to consider environmental impacts of the Transaction to impose conditions that

fashion broad new safety and operating rules to which other major railroads are not subject and that fall within the regulatory responsibility of other federal and/or state agencies.¹

Such "de facto" rulemaking -- resulting in the selective imposition of new standards upon only a portion of the railroad industry -- is neither legally sound nor a prudent exercise in implementing federal transportation policy. SEA recognized this limitation in the DEIS in its proposal not to impose noise-impact abatement measures falling within the FRA's regulatory jurisdiction over train horn signals (DEIS at 3-36), but it strayed from this standard in several respects, including its proposals to require Applicants to (1) comply with a *proposed* industry-wide FRA regulation governing rail inspections, (2) alter the existing regulatory scheme governing selection and funding of grade crossing improvements, (3) maintain 15 and 30-minute separations between passenger and freight trains on certain line segments, without regard to FRA's passenger train safety role, prevailing industry standards and operating practices on similar rail lines, and (4) comply with various newly fashioned operating requirements and procedures governing transportation of hazardous materials, again without regard to the established FRA role in regulating the safe transport of hazardous materials, prevailing industry guidelines and operating practices in the handling of such traffic.

2.4 The DEIS's Recommended Mitigation to Impose Grade Crossing Protection Device Upgrades Conflicts with the Traditional Role of State DOTs.

SEA has recommended in the DEIS that 118 NS and CSX at-grade crossings be upgraded based on SEA's analysis of the predicted impact of the proposed Transaction upon safety conditions at those locations. NS will address the specific results of SEA's safety analysis at Section 4.3 below. A more fundamental issue, however, is raised by SEA's proposal to impose upon NS and CSX a requirement that they upgrade the 118 at-grade crossings in accordance with SEA's judgment, without state involvement, as to the need for additional protection devices, the priority of need, the design of such devices for individual locations and the funding of the cost of installing and maintaining such devices.

¹ The ICC recognized the wisdom and propriety of leaving to state and industry expertise decisions concerning industry practices that have traditionally been addressed through cooperative state/industry relationships. See, e.g., Yellow Freight System, Inc. of Indiana, Petition For Declaratory Order -- Weighing Shipments MCC Dkt. No. 40853 (served January 20, 1995). (ICC declined to regulate motor common carrier weighing practices where traditional mechanisms are in place for state/industry cooperative effort.)

It is important to understand that this issue is not tied only to a determination as to how the cost of SEA's recommendations for upgrading the 118 grade-crossings will be borne. Of greater concern is the undermining of a role assigned by federal statute and duly promulgated administrative regulations to state DOTs and other relevant state transportation agencies. The DEIS proposal to impose as mitigation requirements that NS and CSX install the specified protection devices at each location as indicated at Table 7-4 ("Preliminary Recommended Highway/Rail At-Grade Crossings That May Warrant Safety Improvements") would contravene the statutory authority granted to the state DOTs and other state bodies. It would also ignore and override the states' expertise necessary to assess the appropriate levels of crossing protection within their jurisdictions. Federal law assigns the determination of the need for, and priority to be assigned, the upgrading of a particular grade crossing to the state transportation agency charged with ensuring the road safety of its citizens. Federal law assigns to that state agency the right to determine the type of warning device that is most appropriate for the location in question. Traditionally, the state agency has worked with the railroads in a cooperative effort to allocate the costs of installing and maintaining the protection devices.

Many considerations are taken into account by the state agency in making its grade crossing determinations, and there is no one set of factors that is required to be considered universally to derive a common answer. Rather, a determination as to the need for, priority of, design, and funding for a grade crossing upgrade project is typically based on specific factors assigned degrees of importance by the state agency. These decisions are based on criteria as appropriate in each state. These decisions are not made in a vacuum, but instead take into appropriate account the different priorities that may be expressed within the state or a local community.

SEA's approach removes this very site-specific prioritization duty from the appropriate state regulatory body. It also attempts to apply a set formula for determining what design of protection device is to be installed at each of the 118 locations, without regard to site-specific conditions and variables. This approach is inconsistent with established practices and is simply unworkable. For example, in the DEIS SEA would require NS to install four-quadrant gates or median barriers at seven crossings in Indiana, Ohio, Pennsylvania and Virginia, based solely on SEA's significance criteria without required consideration of site-specific factors, and despite the fact that such devices are still experimental. These devices have not received FRA approval to date. Indeed, they are currently being installed and tested at limited, controlled locations with case-by-case state and local approval. In addition, these warning devices are not appropriate for any and all sites. States typically rely upon the Manual for Uniform Traffic Control Devices ("MUTCD") for guidance on warning devices; notably, the MUTCD has not approved the

installation and use of four-quadrant gates or median barriers. Obviously, NS cannot lawfully implement SEA's recommended mitigation without the express approval by the state, for the very same reason that one cannot unilaterally install a stoplight at a chosen location on a state roadway without first obtaining authorization from the state to do so.

As the above comments indicate, the only feasible way to determine how and when individual grade crossings in a state should be upgraded is through consultation by NS with the responsible state transportation agency. NS would provide the relevant state agencies with the necessary information it has developed to predict changes in NS train traffic as a result of the Transaction. Armed with that information, the state entities can assess the need for particular upgrades at individual locations. They can then determine, in consultation with NS, the desired timing and funding of the upgrade projects consistent with their other priorities.

2.5 Localized Service Limitations Should Not Be Imposed as Environmental Mitigation in This Case.

The significant economic and environmental benefits that can be expected to result from this Transaction can only be fully realized if the Applicants are permitted to implement the operating plans upon which such benefits are predicated. Among other things, the operating plans were designed to maximize the efficiency of each Applicant's expanded system, to improve service times, to satisfy the service needs of all existing shippers, to make rail transportation more attractive as compared to other modes of transportation to current and potential shippers, and to ensure that each Applicant can fully and effectively compete with the other. If artificial limitations are imposed upon NS' train operations in any particular locality, the above-mentioned goals of the operating plan will be impaired. Among the preliminary mitigation possibilities recommended by the DEIS (in Erie, Vol. 3B at PA-56), and which may be suggested for certain other locations by other parties, are restrictions on the number of trains which may be operated over a particular section of track or other routing or operating restrictions. Such restrictions are

not appropriate in this case.² They would: (1) create operational bottlenecks or clogs which will inhibit service and infect the network with congestion and delay, (2) preclude realization of transportation benefits of the Transaction, (3) reduce the environmental benefits of the Transaction, and (4) impose long-term rigidity on railroad operating decisions which would otherwise be entirely discretionary.

2.5.1 Operating Restrictions Would Create Bottlenecks and Clogs.

The parties and, indeed, many commentators in this proceeding have recognized the enormous challenge of allocating the assets of a single, integrated rail network between two operators, NS and CSX. The division is fundamental to the competitive benefits of the Transaction, but it is a mammoth and at the same time a delicate operation. The parties worked diligently to allocate routes so as to provide both competitive balance and operational integrity. Getting the physical plant right assures that the transition from single railroad to dual railroad service will occur safely and smoothly, with the fewest possible disruptions for shippers.

Among the most difficult allocations were those in urban areas, and urban geography consumed a large share of the effort for both NS and CSX. Making the transition from lines on a map to a determination of actual rail capacity presented an array of complex operational challenges. The roadbed, track structure, signaling, connections, and access to yards and sidings all go into the equation governing what traffic a line can actually handle.

The resulting plan for achieving division, transition, and balanced competitive capability is too fine to admit artificial adjustments. It has been reported, for example, that many operating problems experienced in the West by UP/SP rippled out from the closure of a single yard in Houston. A railroad is like a hydraulic line; a kink in one place can drastically affect the whole system.

² NS urges SEA to undertake a thorough examination of any mitigation options it might consider that have the potential to interfere with Applicants' Operating Plans. All potential adverse effects related to such mitigation proposals should be carefully analyzed before selection for recommendation. Even should SEA determine that a specific measure that could have other ripple effects on the railroad system is potentially available to address a significant local impact, SEA should, at a minimum, provide the Board with several alternatives to that measure so the Board can properly weigh all of the environmental, commercial and other benefits that would be disturbed and other adverse impacts that would flow from any tinkering by the Board with an Applicant's Operating Plan.

Arbitrary train limits or other operating restrictions (such as a directive to use one route in preference to another) are a particularly dangerous form of mitigation. For example, the two-train-increase ceiling proposed for Erie could mean the traffic will not be handled (see Transportation Benefits at Section 2.5.2 below), or trains will be held, combined, or otherwise handled in a less than optimal manner. As the experience of the West shows so well, sub-optimization of personnel and equipment use quickly balloons into train crew and motive power shortages with impacts on the adjoining parts of the network.

Similarly, train limits or routing directives in Cleveland or northern Ohio would risk upsetting a carefully planned equilibrium. Northern Ohio is where the "X" of the Conrail system crosses, and where the major lines of the New York Central and Pennsylvania intersected before the merger of those railroads. (Friedmann VS, Rebuttal Vol. 2A, pp. 165-66). Moreover, Conrail's announced strategy over the past decade was to concentrate rail traffic through Cleveland. *Id.* The disaggregation of these properties was particularly challenging, yet central to the competitive thrust of the undertaking. Applicants' solution puts CSX traffic through Cleveland on the so-called "Short Line," a wide, grade-separated route with excellent safety characteristics.

Adjustment and restrictions that have been proposed, and which are not acceptable, would make less use of the Short Line and more use of the Lakefront line. One suggestion would require construction of a two-mile long flyover, dividing and shadowing the city of Berea (southwest of Cleveland). The same proposal complicates access to Norfolk Southern's Rockport Yard, hurting service to shippers such as Ford Motor Company (Friedmann VS, Rebuttal Vol. 2A, p. 168), eliminates NS' access to its major ore dock at Whiskey Island, and entails increased train traffic and the construction of an embankment by a waterfall which Cleveland had desired to protect. The crimping of the operation again poses the strong probability of congestion.

The purpose of these general comments is not to provide an engineering assessment of each proposal. Rather, it is to point out that the introduction of arbitrary restrictions into a carefully engineered system will necessarily constrain the capacity of the system, and that congestion, delay, and attendant power and crew shortages and service failures are the predictable consequence.

2.5.2 Operating Restrictions Would Impair Transportation Benefits.

The EIS process involves balancing Transaction benefits (including environmental benefits) against environmental costs. Consequently, proposed mitigation must be evaluated in light of the price it exacts in lost Transaction benefits. Train limits and operating restrictions threaten the fundamental transportation benefits of the Transaction.

For example, a major commercial objective of NS in this Transaction is to use the Southern Tier route for its only access to New England and for an important second mainline to the Port of New York/New Jersey through New York State (Application, Vol. 1, pp. 528-30; Vol. 2B, p. 249; Vol. 3B, pp. 14-15, 38). The Southern Tier route, not the favored route today, needs every possible flexibility to compete with CSX's Water Level Route and to provide service comparable to that on NS' Pennsylvania Route, the routes which today have most of the East-West traffic.

Long-haul traffic which NS is projecting for the Southern Tier will move over Buffalo and Erie. The two-train-increase limit in Erie would prevent NS from handling traffic that is projected for Day 1 in competitive train service. Particularly since Erie will ultimately receive major environmental benefits from the Transaction through the construction of a bypass, an interim punitive restriction on NS' ability to use the Southern Tier effectively and to compete with CSX in the critical startup period is wholly unwarranted.

In northern Ohio, traffic from the former PRR lines to be operated by NS crosses to the former NYC line for movement to and from Chicago (Application, Vol. 1, p. 522). Train limits or operating restrictions here at the epicenter have the potential for major disruption to the fluidity of the system. The routes have been put together with attention to signals, curvature, grade, capacity and service. Even so, NS is not simply standing on its plans. For example, in order to avoid increased traffic at Lakewood, NS has volunteered, subject to funding, to work with local governments to build a connection to move some of the traffic through a more industrial corridor. However, any imposition of unilateral solutions would come at a cost to the Transaction which is always greater than appears on the surface. Ultimately, a wrench in the works at Cleveland would cripple the ability of one or both parties to provide efficient, competitive service along the critical East-West routes to Chicago. It would be highly unfortunate if the Applicants, who are making the greatest investment in new capacity the East has seen in decades, would find themselves hobbled by arbitrary limits on train operations.

2.5.3 Operating Restrictions Would Reduce Environmental Benefits.

The traffic which causes train increases in Erie, in and around Cleveland, and elsewhere on the network is either being removed from other routes or diverted from trucks or other modes of transportation. The environmental benefits of the Transaction are not independent of these traffic changes. On the contrary, traffic changes resulting in train increases in a real sense are the consequence and measure of the undisputed environmental benefits of the Transaction.

The substantial highway safety, energy efficiency, and pollution reduction improvements of the Transaction account for the preponderance of the net environmental benefits identified by the DEIS (see Section 3 below). These benefits come from diverting truck traffic, and to a lesser extent from handling rail traffic more efficiently, with fewer switches and interchanges.

Over half the train increases in the northern Ohio region are accounted for by the capture of business now moving by highway. Because northern Ohio is an interstate highway as well as a rail hub, with Interstate Highways 80, 90 and 77 criss-crossing the region, it will be among the major beneficiaries of the diversion of truck traffic. Train limits or other restrictions will keep much of the additional traffic from moving by rail, with adverse emissions, safety, fuel efficiency and highway congestion and maintenance consequences. Such limits and restrictions could also result in rerouting of rail traffic and resulting increases in adverse environmental impacts for different localities. The DEIS does not attempt to weigh these adverse consequences against the benefit of restrictions. The required balancing would be difficult, and reemphasizes the impropriety of using arbitrary train limits to try to reform the predicted but changeable downstream impacts of the Transaction.

2.5.4 Operating Restrictions Would Unduly Limit Operating Discretion.

Under normal circumstances, decisions about numbers of trains and routing of trains rest with railroad management. For example, in recent years, through voluntary coordination agreements with Conrail, NS has rerouted substantial volumes of north-south interchange from Potomac Yard (Washington) to Hagerstown, Maryland to take advantage of the more efficient interior route via Harrisburg (Application, Vol. 1, p. 510). Without this route, no carrier would be able to offer Northeast/Southeast doublestack service. Similarly, NS has agreed with Conrail to concentrate the interchange of auto traffic moving to and from the East at Cleveland, rather than leaving it dispersed among several other points.

Commercial initiatives, laudable in the context of coordinations, should not be stymied when they happen to surface in a control case. These operating and marketing adjustments go on continually in the railroad industry and do not require federal approval. In the context of a control proceeding, the Board should be very cautious about imposing restrictions that would disable an applicant railroad's ability to achieve efficient and commercially attractive operations.

In northern Ohio, traffic has varied among the involved routes as the economics of the industry, the demands of customers and the operating imperatives of the time have required. For example, the Cleveland Short Line corridor from Collinwood through East Cleveland handled well over 50 trains per day from the time of its completion in 1912 through the late 1950's, then still over 40 trains per day through the early 1960's. Thus, for about 50 years this corridor had train volumes greater than or equal to the volume that CSX now expects to operate over it. Now some interested parties would freeze the discretion which has permitted these adjustments.

The Transaction that is proposed facilitates routing and traffic changes, but as the history of train movements through Cleveland shows, such changes would go on in any event. Authorization of control does not cause trains to move on different routes in the same sense that construction of an interstate causes trees to be destroyed or farmland consumed. Because of the contingent and downstream connection between the financial transaction proposed and the train movements which give concern, the Board should be especially reluctant to impose operating restrictions on the Applicants.³

As explained above in Section 2.1, the Board is not required in this Transaction, as it was in the UP/SP merger, to mitigate every (or indeed, any) environmental impact it anticipates. In UP/SP, the Board was faced with no option other than to proceed, upon completion of its EA, with a full EIS *unless* it determined that no significant adverse environmental impacts would remain following Board-imposed mitigation. Hence, SEA had no viable option other than to recommend that the Board impose a restriction on the increase in train traffic at Reno and

³ Indeed, a recent search by NS of the Federal Register found *no* other merger, in *any* industry, regulated or unregulated, in 1997 for which an EIS was required. This is probably due to the fact that mergers per se are financial transactions which do not have automatic environmental consequences. The Federal Energy Regulatory Commission, for example, has "categorically excluded" merger approvals from the actions requiring either an EA or an EIS except where scenic rivers, wilderness areas or other unique resources are affected. 18 C.F.R. § 380.4. See also 61 Fed. Reg. 68595, 68605 (Dec. 30, 1996) (reaffirming categorical exclusion rule). No other sector of the American economy undergoes this kind of merger scrutiny, a fact which argues for extreme restraint in imposing burdensome conditions with unpredictable consequences.

Wichita pending selection and completion of mitigation to eliminate the adverse environmental impacts of the merger. Here, the Board faces no similar NEPA restriction or other legal impediments to the fulfillment of its task of balancing any localized environmental impacts with the system-wide environmental and other public benefits to be derived from the Conrail Transaction. Thus, the rationale applied by the Board for imposing traffic restrictions in UP/SP is neither relevant nor appropriate in this proceeding.

In view of the fact that the DEIS recognizes a number of system-wide environmental benefits associated with the proposed Transaction and does not identify any system-wide significant adverse environmental impacts, and the fact that restricting traffic on one line segment can have adverse effects on operating capacity, efficiency and the net benefits of the Transaction, localized environmental impacts should not be allowed to disrupt the overall operating plans developed by the railroads.

2.6 Opposition to STB Imposition of Negotiated Agreements as Conditions to STB Approval

SEA has indicated in the DEIS that it intends to impose as a condition of its approval of the Transaction any negotiated settlement agreements or other mutually-acceptable binding agreements pertaining to the Transaction that NS and CSX enter into with non-Applicants. SEA apparently intends to take all such agreements completed prior to the publication of the FEIS and recommend to the Board that it impose the terms of the agreements as environmental conditions to any decision approving the Transaction. DEIS at 7-4. SEA and the Board should, however, give serious consideration to whether this proposed action to impose conditions is in fact within the Board's authority and whether it is a prudent and necessary step.

While it is true that the Board and the ICC have in several instances involving railroad mergers and other consolidations conditioned agency approval upon the parties' compliance with various environmental mitigation measures, there is no basis in NEPA for requiring in all instances that negotiated agreements pertaining to mitigation be made formal conditions of Board approval. As explained at Section 2.1 above, NEPA mandates a process, not a result. Moreover, the present application by CSX, NS and Conrail is the first instance in which the Board has prepared an EIS to evaluate fully the range of potential environmental impacts associated with a proposed consolidation. Because of the fundamental differences between the process and end result of the preparation of an EIS versus the completion of an EA, as explained at Section 2.1 above, it is not necessary in this instance that the Board resolve each and every potential environmental impact that can be identified. Yet this is precisely what SEA suggests it would do

by requiring that all solutions to potential environmental impacts that the Applicants negotiate be imposed as formal conditions. Not only is this standard for imposing conditions unnecessarily stringent in the context of an EIS, which requires that the Board balance the identified adverse environmental impacts with the identified system-wide environmental, commercial, and other public benefits of the proposed Transaction, it fails to heed clear limits on the Board's authority to impose conditions.

Because of the amorphous nature of some of the perceived environmental impacts that may become the subject of negotiations between NS and affected entities, it can be expected that some of the negotiated solutions to the impacts will fall outside the limited authority of the Board to impose as mitigation measures. Moreover, any insistence by SEA that the terms of a negotiated agreement be converted into a Board-imposed condition would have an obvious dampening effect on the ability of NS to consider and agree to innovative, creative solutions to community concerns. The Applicants would likely be less willing to negotiate such agreements with the prospect hanging over their heads of the Board turning a voluntary, uniquely-tailored solution in a specific instance into a formal condition that could later be argued to have precedential effect because of the Board's imposition of the agreement as a condition of approval.

NS is actively seeking bilateral agreements with third parties where feasible and appropriate to address environmental concerns. The recognition in the FEIS of voluntary stipulated agreements between an Applicant and a third party is an appropriate alternative mechanism for addressing identified environmental issues related to the proposed Transaction. Such voluntary third-party agreements should be recognized as stipulations, not conditions of Board approval. The Board's ability to carry out its responsibilities does not require that such voluntary agreements become formal conditions of approval -- the Board will have continuing oversight following any decision to approve the Application. This oversight function will fully enable the Board to determine whether the Applicants are satisfying the terms of their voluntary agreements and to take appropriate steps in the event that intervention is required.

Moreover, SEA and the Board should not presume that the lack of a voluntary agreement between an Applicant and a third-party at the time of issuance of the FEIS and/or at the time of the Board's voting conference necessitates the imposition of a formal condition. As the DEIS itself recognizes, the consultative process is a far superior means for developing and implementing creative, mutually-beneficial solutions to local environmental impacts than is the formal conditioning process. The consultation process allows the parties to share responsibilities and costs in a manner that the Board could not impose unilaterally. However, the consultative process cannot be expected to produce across-the-board agreements over the course of a mere

few months. Creative solutions with public entities require many levels of review and approval before the public entity can commit itself to a binding agreement. Given these realities, SEA and the Board should allow the consultative process to continue beyond issuance of the FEIS, the voting conference or the implementation of the Transaction, in order to allow the process a full opportunity to produce optimal results. Applicants propose that they report the outcome of the consultations to the Board as consultations are concluded or as otherwise appropriate.

3.0 BENEFITS OF THE CONRAIL TRANSACTION

The proposed Conrail Transaction will provide substantial environmental, safety and socioeconomic benefits. NEPA requires that the Board, in choosing a course of action, properly weigh positive effects against adverse effects, and balance environmental factors against other relevant legal or policy considerations bearing on the merits of the proposed Transaction. The following sections summarize the environmental, safety and socioeconomic benefits of the proposed Transaction. These benefits should be properly recognized within the FEIS, and taken into account by the Board in reaching a decision and determining what, if any, mitigation is required.

3.1 Environmental Benefits

The Transaction's benefits start from the basic fact that railroads are the least polluting, most energy efficient, and safest freight transportation mode on land in the United States. Railroads' environmental advantages are especially pronounced when railroads are compared with trucks:

- **Railroads are more fuel efficient than trucks** — using the same amount of fuel, trains can move the same amount of freight three times farther than trucks.
- **Railroads pollute less than trucks** - because of their superior fuel efficiency, trains emit less air pollution than trucks hauling the same freight the same distance.
- **Transportation of hazardous materials (hazmat) is safer by rail than by highway** — Railroads have less than one-tenth the hazmat incidents of trucks when compared on an equal ton-mileage basis.
- **Railroads provide lower accident risk than trucks** — Significantly more truck collisions than train accidents occur on a per ton-mile basis.

The Transaction's environmental benefits derive mainly from diverting freight from trucks to railroads. These truck-to-rail diversions will be substantial over the entire Transaction; for NS' portion alone, there will be a reduction of an estimated 589,000 truck trips annually. This will result in system-wide energy savings, fewer air emissions, reduced wear and tear on highways, and less highway congestion, as well as safety and socioeconomic benefits.

3.1.1 Air Emissions Benefits

Air pollutant emissions will decrease notably as a direct result of the Transaction. In particular, hydrocarbons, carbon monoxide, nitrogen oxides, particulates and lead emissions will substantially decrease. The DEIS correctly recognizes that the Transaction will result in "...an overall improvement in air quality." DEIS at 4-70.

Railroads are more fuel efficient than trucks, and this efficiency translates into fewer pollution emissions from trains than from trucks hauling the same freight the same distance. The system-wide decreases in air pollutant emissions will result primarily from the substantial truck-to-rail diversions that will occur due to the Transaction, but will also result from more efficient rail routings that will be available through the expanded CSX and NS systems.

The DEIS also notes another air quality benefit, "...a reduction in the potential for accidental release of ozone-depleting materials..." DEIS at 4-62. This benefit is due to the reduction in car-miles and freight-handling in rail yards for these shipments as a result of the Transaction.

3.1.2 Energy Benefits

The combination of truck-to-rail diversions and more efficient rail routings will result in very significant reductions in fuel consumption. Various models and estimates by the Applicants and the Board project a range of savings in net annual reduction in diesel fuel consumption. Estimates range from a high of 133.6 million gallons of diesel fuel, to the most conservative estimate used in the DEIS (at 3-1) of approximately 80 million gallons of diesel fuel saved annually. Thus, the DEIS concludes that "there would be no significant environmental impacts on energy consumption...as a result of the proposed Conrail Acquisition" (DEIS at 4-49), although this actually represents a significant benefit.

3.1.3 Safer Hazardous Materials Transportation

Transportation of hazardous materials is safer by rail than by road. Railroads in the United States carry almost 2 million freight cars of hazardous materials annually; this is equivalent to almost 6 million trucks on U.S. roads. Yet, railroads have less than one-tenth the number of hazardous material incidents of trucks, despite equal ton-mileage. (Whenever a hazardous material leaks or spills from its container, it is considered an "incident" no matter how small the amount or minor the effect.) NS, in particular, has an excellent safety record. Of the 225,000

shipments of hazardous materials transported in 1996, less than one-tenth of one percent involved incidents, most of which were minor in nature and were shipper or tankcar owner-related.

The DEIS concludes, correctly, that "[o]verall, the proposed Acquisition should result in a slight safety improvement for rail transportation of hazardous materials and no significant system-wide adverse impacts related to hazardous materials transport." DEIS at ES-19. This improvement results from a decrease in rail car-miles of hazardous materials associated with more efficient routings and from a reduction in hazardous materials freight-handling in rail yards due to expansion of single-line service and reduction of interchanges. The expansion of single-line service and reduction of interchange (switching) is particularly important in improving hazardous materials transportation safety. Single-line service decreases the amount of rail car switching between tracks and carriers — and it is during switching that accidents are most likely to occur.

3.1.4 Enhancement of Long-Term Productivity

As required by NEPA, the DEIS considers the extent to which the Transaction would result in long-term productivity gains at the expense of short-term use of the environment and environmental impacts. The DEIS concludes that the short-term impacts would be more than offset by long-term gains in productivity, including increased productivity and efficiency of rail operations in the eastern United States. DEIS at 4-76. The long-term positive effects also include improved service and system-wide reductions in energy consumption, highway traffic congestion, highway accidents, and air pollutant emissions. NS concurs with this conclusion - the Transaction will have a net positive benefit for the environment and the economy.

3.1.5 Commitment of Resources

The DEIS evaluates the irreversible and irretrievable commitment of resources, including natural, physical, human, and fiscal resources; it concludes that the benefits of the proposed Transaction would outweigh the commitment of resources. DEIS at 4-77. NS agrees with this important conclusion in the DEIS.

3.1.6 Norfolk Southern's Environmental Policy

Another benefit of the Transaction will be the expansion of the best practices of NS' environmental commitment as selected Conrail operations and activities become part of the

expanded NS rail system. NS' environmental policy requires every employee to understand and comply with environmental requirements on the job. Government agencies are informed of any spill or hazardous materials incident regardless of the potential to cause environmental harm. Wastes are minimized through recycling, reduced consumption, and use of environmentally preferred materials and nonpolluting technologies. Cooperation is given to all governmental/environmental authorities. All laws and regulations related to protecting the environment and transporting environmentally sensitive materials are complied with in full. NS is committed to implement the best environmental practices of Conrail and NS after the Transaction.

Long-standing conservation practices at NS include collecting and recycling crossties, tires, paper, metal, aluminum, and rail car parts. Used rail is rewelded and reused. Lubricating oil and cleaning solvents are rejuvenated and reused. Tens of thousands of aging rail cars have been rebodied. NS works hard to be a sound environmental caretaker, and will utilize its proven environmental protection practices and programs to improve environmental management throughout its expanded system.

3.2 Safety Benefits

In addition to environmental benefits, the Transaction will bring about significant safety benefits which the Board should take into account as part of the NEPA balancing process. The most significant of these will result from the integration of Norfolk Southern's safety culture with that of Conrail. As SEA has noted (DEIS at B8-1), both NS and CSX had the lowest accident rates of all Class I railroads for the 1994 through 1996 period. Their rates have been lower than the Class I railroads as a whole. While Conrail's accident rate is higher than both NS and CSX, Conrail has been below or at the Class I accident rate average for the same period. DEIS at B8-1. The railroads' commitment to safety is reflected by these records and by their submission of detailed Safety Integration Plans to the Board in close coordination with the FRA.

3.2.1 Fewer Accidents

The greatest safety benefit from the Transaction will come from diverting freight from trucks to railroads. With an estimated reduction of 589,000 truck trips annually on the NS portion, there will be approximately 800 fewer truck crashes. This includes approximately 15 fewer fatal truck crashes involving one or more fatalities. DEIS, Volume 5A at B-14.

3.2.2 Reduced Switching

The expansion of single-line service (e.g., service via one railroad) that will result from the Transaction will also improve rail safety. Single-line service decreases the amount of rail car switching, where there is the greatest potential for collisions, derailments and employee injuries. The post-Transaction NS system will provide single-line service to an additional 245,000 freight units annually. Integration of some existing NS and Conrail terminals should reduce switching and improve safety as well.

3.2.3 Norfolk Southern Safety Program

One of the most important factors contributing to the environmental and safety benefits of the Transaction is NS' proven performance and commitment to safety. Within the railroad industry, NS is a safety leader, having recently earned the prestigious E.H. Harriman Memorial Gold Award for employee safety for the eighth straight year. NS strongly believes that safety is good business; its low number of injuries is proof its commitment is working. In 1996, NS employee injuries were one-fifth of what they were just eight years before. Since 1988, Norfolk Southern's train accident rate has dropped 31 percent, and is currently less than half that of the rail industry as a whole. Applying either NS or CSX's accident rate to the new lines will eliminate, even after accounting for new traffic, a net of approximately 50 rail accidents per year (Application, Vol. 6A, at 75).

Safely integrating NS' operations and activities with those of Conrail will be a key factor in maintaining and improving the safety of railroad operations. NS will accomplish this safe integration through, among other things, implementation of a comprehensive Safety Integration Plan (SIP) and by retaining key Conrail employees.

Safety Integration Planning. NS has been planning since the spring of 1997 how to integrate its part of Conrail in the safest and smoothest manner possible. In December 1997, NS submitted a comprehensive Safety Integration Plan to the Board, which documents all anticipated safety elements of the Transaction. NS has been and continues to consult with the FRA regarding the SIP and related planning for safe integration of operations.

Retaining Sufficient Employees. NS is committed to retaining sufficient numbers of Conrail employees (as well as Norfolk Southern's own valued workforce), particularly train crews and dispatchers. NS knows that a well-trained, skilled workforce is critical to safety. To underscore its commitment to retaining Conrail's institutional knowledge, NS has recently hired

several high-ranking Conrail employees knowledgeable about that carrier's operations and safety practices. For example, NS has already appointed Conrail's Director of Safety, William L. Barringer, to Director of Safety for NS, to capitalize on Conrail's own safety expertise and to meld smoothly the railroads' respective safety efforts. NS also plans to keep the same regional dispatching system in place to minimize the potential for disruption or disorientation, thereby ensuring that dispatchers are familiar with their territories.

3.3 Socioeconomic Benefits

The Transaction, and the resultant increased productivity and efficiency of rail operations in the eastern United States, will stimulate economic growth and deliver nearly \$1 billion in public benefits to the nation as well as significant unquantified benefits. CSX/NS-18, Volume 1 at 16. The Board should give proper weight to these benefits, as well as environmental and safety benefits, as part of the NEPA balancing process.

3.3.1 Economic Benefits to the Public

CSX and NS have documented in submissions to the Board that the Transaction will generate nearly \$1 billion in quantifiable public benefits. These benefits will result from the following:

- The proposed construction projects would increase transportation operation efficiency and improve service capabilities (shorter, more direct transportation routes), resulting in reduced transportation cost to shippers and consumers.
- These enhanced efficiencies would also facilitate the diversion of traffic from highways to rail. Over one million truck-to-rail diversions are predicted by NS and CSX, and NS alone anticipates approximately 589,000 diverted truckloads (Environmental Report at 2-2).
- In addition, truck-to-rail diversions would reduce fuel consumption by an estimated 133.6 million gallons of diesel fuel annually. DEIS at 4-47.
- Truck-to-rail diversions would also extend the life of the national highway system, and significantly reduce highway maintenance costs borne by federal, state and local agencies. The net savings from the Transaction to highway maintenance costs is approximately \$93 million per year (Environmental Report at 2-6).

- In addition to the normal capital expenditures the railroads' would spend to operate Conrail, NS and CSX plan to spend a combined \$1.3 billion for major capital improvements and equipment purchases. *[This \$1.3 billion is the largest expenditure for new capacity on a railroad in at least four decades.]* NS alone anticipates spending \$729 million in the first three years for projects such as rail corridor upgrades (\$130 million), improvements to existing Conrail routes (\$70 million) and new automobile facilities (\$30 million).
- Other important public economic benefits will include reduced highway congestion and new opportunities for industrial development.

3.3.2 Benefits to Shippers from Increased Competition and Access

The Transaction will bring about a dramatic increase in competition between railroads, and will strengthen rail as a competitor with trucks for freight movements. The shift of traffic from the highways to NS will save shippers \$92 million in annual logistics costs.

Conrail is presently the only Class I U.S. rail carrier operating throughout the Northeast section of the country. Shippers who are located in the Northeast thus lack the competitive and service benefits that come from having two strong rail networks serve them. The Transaction will introduce competitive Class I rail service for the first time since before the creation of Conrail for a substantial portion of the Northeast. The establishment of Shared Assets Areas for North Jersey, South Jersey/Philadelphia and Detroit and the restoration of rail competition for shippers served by the former Monongahela Railway will bring shippers in those areas the benefits of head-to-head competition between CSX and NS.

The expansion of CSX and NS's rail networks will also markedly improve rail service by creating new single-line service. Through the operation and use of Conrail's lines, CSX and NS will operate a number of new single-line routes, particularly between the Northeast and the Midwest and the Northeast and the Southeast. Shippers will benefit from the advantages of single-line service as compared to joint-line service in terms of timeliness, reliability and cost-effectiveness. There will be fewer interchanges, and more traffic will be able to bypass terminals, reducing delays and inefficiencies.

3.3.3 Industrial Development

Over the past seven years, NS' industrial development efforts have led the industry in creating economic growth and jobs in the Southeast and Midwest regions of the country. Just as NS' efforts have fueled growth in the areas it currently serves, so will the application of NS' proven industrial development strategy create substantial benefits for communities now served by Conrail. In 1997, 62 new industries located along NS' tracks, and 43 industries expanded existing facilities. Investments by these industries amounted to \$2.6 billion, and 7,300 new jobs were created in the communities NS serves. Eight of the last 12 automobile plants built in the U.S. were built along NS lines.

SECTION 4

4.0 PRINCIPAL COMMENTS ON ENVIRONMENTAL ISSUES

The following presents Norfolk Southern's comments on the scope, approach, methodology, technical analyses, conclusions, and recommended mitigation measures within the DEIS. These principal comments affect the DEIS conclusions and recommended mitigation measures. Overall, the DEIS provides a comprehensive assessment of the system-wide environmental effects of the proposed Transaction, and correctly concludes that the Transaction will have a net positive benefit on the environment and the economy. The DEIS analyses and conclusions regarding local impacts are equally comprehensive. However, there are several areas where NS has identified inappropriate analytical methods, technical inaccuracies, or other substantive errors in the DEIS which have led to erroneous conclusions and inappropriate recommendations for mitigation. Comments offered below support the DEIS where the analyses and conclusions are appropriate and accurate, and identify areas where the analysis or conclusions are inaccurate and mitigation inappropriate. In several areas where it appears improvements could be made to the DEIS, NS has offered a discussion of improvements or corrections and the results of their application, including the necessary technical justification for SEA's consideration.

4.1 Safety: Freight Rail Operations

For the freight rail operations safety analysis, the DEIS undertook both a system-wide and localized (rail line segment specific) safety analysis. The analyses estimated the probability of occurrence of freight train accidents that would result from the proposed Transaction.

4.1.1 Safety: Freight Rail Operations, System-Wide Analysis

The DEIS examined the system-wide freight operations accident risk for both pre- and post-Transaction configurations on all 1,022 rail line segments and 375 rail yards associated with the Transaction. To assess potential system-wide safety effects, the DEIS calculated the system-wide probability of an accident occurring based on the projected train activity data provided by NS and CSX in their Operating Plans. The DEIS concludes that the combined changes in freight traffic on rail line segments and freight activity in rail yards would result in a small overall decrease in the likelihood of freight rail accidents and derailments. DEIS at 4-10. Based on this analysis, the DEIS' findings are that the Transaction would not result in significantly adverse system-wide safety effects for freight rail operations and therefore, no system-wide mitigation measures are proposed.

NS believes the DEIS presents a well-founded, comprehensive analysis of the potential system-wide safety impacts from freight rail operations on the expanded NS and CSX systems. NS completely concurs with the DEIS conclusion of no significantly **adverse** system-wide safety effects from freight rail operations. Additionally, the Transaction will result in notably significant system-wide positive impacts on safety when the reduction in truck crashes resulting from truck-to-rail diversions is considered. The DEIS at 4-10 notes that the estimated reduction in truck-miles due to the Transaction could result in 1,600 fewer annual highway accidents. In addition, it should be noted that the latest statistics project a reduction of 31 fatal truck crashes, each involving one or more fatalities. DEIS at B-14. Significant environmental benefits such as this must be acknowledged and properly weighed against any adverse environmental effects when considering mitigation, as discussed in Section 2.2 above.

4.1.2 Safety: Freight Rail Operations, Segment-Specific Analysis

The DEIS performed segment-specific analyses of accidents on rail line segments where estimated increases in freight train traffic would exceed the Board's environmental thresholds for air quality and noise analysis. The DEIS estimates the average annual accident rate for freight operations on each specific segment and adjusts these estimates based on the track condition and on whether or not the segment has a train control signal system (which reduces the potential for accidents). The DEIS then applies inappropriate significance criteria to the line segment predicted accident frequencies to recommend unwarranted mitigation.

NS does not believe the Transaction will have adverse impacts on freight rail operations, and opposes any mitigation for freight rail operations safety for numerous reasons. First, the Transaction is expected to result in substantially significant system-wide safety benefits primarily as a result of truck-to-rail diversions. Additionally, NS currently has numerous programs, the details of which can be found in the ER (Part 1, Section 3.3 and 7.2) and the SIP (DEIS, Volume 2), to effectively manage freight rail operations safety as evidenced by its consistently low accident rate. These safety benefits of the Transaction should be taken into consideration when evaluating the need to mitigate segment-specific safety concerns. Finally, the significance criteria of a predicted accident frequency greater than one every 100 years actually addresses pre-existing conditions rather than Transaction-related changes as well as being based on erroneous data.

The DEIS identifies four NS line segments which SEA has calculated will exceed the significance criteria defined in the DEIS. The significance criteria as described in the DEIS at B-13 to evaluate the significance for safety effects of freight rail operations are as follows.

“First, SEA compared the Acquisition-related change in accident rate for a rail segment to the normal fluctuation in the state-wide accident rate. Second, SEA determined if the rail segment is predicted to experience an accident more frequently than once every 100 years per route mile. If a rail line segment is predicted to have an increase in accident rate greater than the normal variations in state-wide accident rates and to have an accident more frequently than once every 100 years per route mile, SEA considered mitigation for safety impacts.”

The criterion of more than one accident predicted every 100 years is not an appropriate threshold to determine significance of safety effects from Transaction-related changes in freight rail operations. Any condition imposed by the Board must be directly related to the Transaction’s impacts and may not be designed to remedy pre-existing conditions. The criterion of a predicted post-Transaction accident rate greater than one accident in 100 years would actually address existing conditions rather than just the Transaction-related change in traffic on the line segment.

This is verified by the calculations provided in Attachment B-1 of Appendix B of the DEIS. For example, the NS line segment Miami to Airline (N-086) exceeds the DEIS so-called significance criterion with a predicted post-Transaction accident rate of one accident every 78 years. However, this is not a Transaction-related impact, because the pre-Transaction predicted accident rate for the same segment is one every 88 years which is already greater than the DEIS significance threshold. This significance criteria encompasses pre-existing conditions and neither restricts its focus to changes related to the Transaction nor results in recommendations narrowly tailored to mitigate the potential changes in such impacts.

Additionally, this significance criterion appears to have been based on incorrect data. The DEIS at B-13 states that a criterion of one accident every 100 years was based on the national frequency of railroad accidents calculated from the 1996 FRA Accident/Incident Bulletins. The DEIS uses the values 1,078 total freight and passenger accidents and 126,682 miles of main line railroad tracks operated in the U.S. to calculate that a freight train accident can be expected to occur once every 117 years per route mile.

However, there is no reference to 1,078 total freight and passenger accidents in the 1996 FRA Accident/Incident Bulletins. In fact, on page 14 of the Accident/Incident Bulletin, No. 165 for the Calendar Year 1996, a total of 2,584 train accidents were reported. These statistics suggest that a freight rail accident can be expected to occur once every 49 years, not once every 117 years. There are **no** NS line segments with pre- or post-Transaction predicted accident rates

exceeding one every 49 years. *For this reason and the reason described above, no mitigation related to freight rail operation safety is justified or warranted.*

There is, moreover, no analytical basis for the mitigation the DEIS proposes for the four NS line segments that are purportedly above the DEIS significance criteria for freight rail operations safety. Recommended mitigation in the DEIS includes annual training of mechanical and track inspectors and compliance with a proposed FRA rule requiring certain frequencies of rail inspection. *NS opposes imposition of any mitigation that would constrain its ability to adopt equally or even more effective alternative inspection and training programs.*

The DEIS proposes for line segments identified as having a significant impact for freight rail operations safety that NS comply with a proposed FRA rule which could require certain frequencies of rail inspection based on ton-miles of traffic on a line. The current proposal would require such inspections at least once every 40 million gross ton-miles, or annually, whichever is more frequent. NS' already conducts such inspections on an equal or more frequent basis and stipulates it would continue to do so. NS believes, however, that it would be inappropriate for the FEIS to recommend such a requirement as it would encroach upon the jurisdiction of FRA regarding freight rail safety operating rules, and have the effect of prematurely adopting a proposed rule which is currently subject to the proper FRA rulemaking process.

Additional mitigation the DEIS recommends for the four NS line segments above the significance criteria includes annual training of mechanical and track inspectors for these locations. No justification is provided for this mitigation. The existing NS safety program is proven effective - the NS overall safety record is second to none. All NS inspectors receive extensive training and are fully qualified to provide inspections per NS standards. NS has systems in place to continually monitor and review the performance of its inspectors and to provide additional training when traffic or other condition changes warrant such training. The DEIS fails to provide a reasonable basis for implementing this specific annual training requirement. *For these reasons, NS believes there is no justification for any proposal to require annual training for these inspectors in the FEIS.*

4.2 Safety: Passenger Rail Operations

The DEIS correctly reports that the Transaction will not result in any system-wide degradation in the safety of passenger rail operations that are conducted on the expanded NS and CSX systems following the proposed Transaction. NS and CSX are both experienced in safely handling passenger operations on their systems and in working cooperatively with Amtrak and

other passenger rail agencies to enhance safety. NS and CSX have achieved outstanding safety records in this area.

Nonetheless, on the basis of a statistical analysis of passenger and freight operations on the 197 rail line segments over which both freight and passenger operations are conducted, the DEIS (Chapter 7 at 7.2.2) concludes that a total of ten NS and CSX segments may warrant special safety mitigation measures. The DEIS therefore proposes that NS establish passenger trains as “superior,” and maintain 30-minute windows around passenger trains, on four NS line segments and possibly one additional route over which there are both freight and passenger operations.⁴ Identical mitigation is proposed for five CSX line segments. The NS segments are:

- Kalamazoo, MI to Porter, IN (N-497)
- Campbell Hall, NY to Port Jervis, NY (N-063)
- Jackson, MI to Kalamazoo, MI (N-120)
- West Detroit, MI to Jackson, MI (N-121)
- Porter, IN to Chicago, IL route (if the Canadian Pacific (CP) is granted or given haulage or trackage rights over any segment on this route.) This route consists of the following four segments: Porter, IN to Control Pt. 501, IN (N-308); Control Pt.

⁴ The DEIS is not internally consistent in its description of the proposed mitigation. Chapter 3, which identifies potential mitigation measures, does not even mention a separation rule among the options for consideration. See DEIS Sections 3.2.3 and 3.3.3. Further, Chapters 5 and 7 are not consistent in their description of the proposed mitigation. The proposed “superior” passenger train/freight train separation mitigation described in Chapter 7 of the DEIS contemplates that freight trains moving in the same or opposite direction on the same track on any of these line segments would need to be clear of the track at least 15 minutes before and 15 minutes after the expected arrival of a passenger train at any point. This proposed measure would thereby establish a 30-minute separation window around passenger trains moving on that track. See DEIS Section 7.2.2 at 7-12.

By contrast, the discussion of mitigation of the individual line segments found in the state-by-state sections of Chapter 5 of the DEIS does not use the term “superior trains.” Rather, Chapter 5 contemplates a proposed separation window under which freight trains, both opposing and moving in the same direction, would need to be clear of a point on the same track at least 15 minutes prior to the estimated arrival of a passenger train; no 15 minute window after a passenger train is proposed in Chapter 5. See DEIS at IL11-13, IN11-13, MI-7 through MI-9 and NY-8 through NY-10. Further, whereas the mitigation proposed in Chapter 7 contemplates that the separation requirements would not apply when the freight train is moving in the opposite direction away from the passenger train, there is no similar qualification in the Chapter 5 description of the proposed mitigation.

501, IN to Indiana Harbor, IN (N-042); Indiana Harbor, IN to South Chicago, IL (N-047); and South Chicago to Ashland Avenue, Chicago, IL (N-309).

Amtrak operates on segments N-497, N-120, N-121 and the Porter to Chicago route. On segment N-063, New Jersey Transit operates commuter train service for Metro North. Segment N-497 is owned by Amtrak, and Conrail currently operates a local train about twice a week on this segment. CP has haulage rights only over the Porter, IN to Control Pt. 501, IN (N-308) segment, a portion of the Porter to Chicago route. The CP traffic on this segment is now being hauled by CSX under CSX's trackage rights with Conrail over this segment.⁵ While NS anticipates that CP traffic will stay on the line post-Transaction and be hauled by NS, the net result is that there will be no increase in CP traffic - just a shift as to which railroad will carry that traffic. No final agreement has been reached by NS with CP regarding possible CP haulage rights over segments N-497, N-120 and N-121, as is more fully discussed in Section 4.22.1.

Norfolk Southern does not believe there are any adverse safety impacts to passenger rail operations as a result of this Transaction for the following reasons:

First, no passenger safety mitigation is warranted because, by any standard, operations on these line segments -- which are already subject to FRA safety oversight -- are demonstrably safe and will remain equally as safe following the Transaction. The statistical analysis conducted by SEA to ascertain whether mitigation is warranted relied on data and assumptions that overstated the Transaction-related impacts of modestly increased freight traffic. For example, in conducting its statistical review of passenger/freight train collisions, the DEIS utilized a collision rate that was based on collisions of a type that are unrelated to increased freight operations and that would not be addressed by the proposed mitigation, i.e., collisions resulting from freight trains and passenger trains operating on different tracks or from passenger trains hitting parked freight cars. The actual rate of passenger trains being hit from behind by freight trains operating on the same track, or vice-versa, is closer to zero, a fact that underscores the mitigation proposal addresses an unlikely safety risk.

Second, even assuming that some mitigation might be warranted on certain line segments, modern signaling systems and other safety controls offer the highest levels of safety without the cumbersome procedures and efficiency sacrifices inherent in the proposed mitigation

⁵ Presently CSX has trackage rights on this Conrail line from Porter to Pine Jct., Indiana, east of Gary. All CSX trains on their way to Michigan use this line, including the CP haulage traffic.

procedures. Train superiority and temporal separation practices of the type proposed in the DEIS, which are not even listed among the potential safety mitigation measures identified in Chapter 3 of the DEIS, have been outdated for decades, and their re-introduction on NS now could well detract from safety.

Third, the proposed 15/30 minute separations would disrupt freight service on all five identified line segments, particularly the Porter to Chicago route. This would impose a substantial burden on commerce and attract more freight to trucks, reversing the significant environmental and other public benefits of the Transaction. The DEIS gives no consideration to possible adverse impacts and the overall balance of effects that would result from its proposed mitigations.

Fourth, to the extent that any mitigation might be appropriate, such mitigation should be in the form of a requirement that NS consult with the FRA and the passenger rail agencies concerning safety enhancements that might be considered for these line segments. A consultation requirement would fully comport with the Board's obligation under NEPA to identify matters that other federal and state agencies might more appropriately address.

4.2.1 The Board Should Not Adopt Mitigation Measures That Interfere with the FRA's Exclusive Authority to Regulate the Safety of Passenger Operations.

The Board should tread cautiously before imposing any special safety condition applicable to train operations, particularly passenger train operations. While NS does not question the Board's right to address legitimate Transaction-related safety concerns through the NEPA process, the propriety of any proposed condition in the passenger safety area must be measured against the FRA's "plenary authority over the safety of the railroad industry."⁶ Section 202 of the Federal Railroad Safety Act of 1970, 49 U.S.C. §20101, grants the FRA the power to regulate "every area of railroad safety." The FRA has exercised that authority extensively, and as discussed further below is currently reviewing a variety of passenger train safety issues.

Congress has made clear that the FRA's role in regulating passenger train safety is exclusive. In explaining the 1973 deletion of language from section 801 of the Rail Passenger Service Act of 1970 that allowed the ICC to prescribe regulations "necessary to provide safe...service," the Conference Report on the Amtrak Improvement Act of 1973 stated as follows:

⁶ DEIS, Volume 5 at B-2.

The Conference substitute rewrites Sections 801 of existing law to clarify the jurisdiction of the Department of Transportation and the Interstate Commerce Commission over safety related and service related issues. First, this provision resolves a possible legislative inconsistency which results from the fact that Section 801 of existing law, as presently worded, authorizes the ICC to “prescribe such regulations as it considers necessary to provide safe and adequate service, equipment, and facilities for intercity rail passenger service.” The Federal Railroad Safety Act of 1970, enacted only two weeks prior to the rail passenger Service Act, defined the Secretary of Transportation’s jurisdiction to include “all areas of railroad safety.” It is the intent of the committee of conference to make clear that the Secretary’s jurisdiction over railroad safety is exclusive. The ICC, in prescribing its own regulations with respect to the adequacy of service, should take account of safety regulations prescribed by the Secretary of Transportation.

H.R. Conf. Rep. No. 93-587, at 12 (1973), reprinted in 1973 U.S.C.C.A.N. 2331, 2342 (emphasis added).

Congress’s message was unambiguous - the FRA has the sole authority to regulate rail safety. Moreover, nothing in the ICC Termination Act changes that fact. To the contrary, that statute curtailed the Board’s limited authority with respect to commuter operations. See 49 U.S.C. §10501(c) (2) (providing that the Board does not have jurisdiction over commuter agencies other than with respect to access to facilities).⁷ In view of the Board’s absence of authority to regulate with respect to passenger carrier safety matters, and FRA’s exclusive jurisdiction and ongoing activity in the area of passenger carrier safety, the Board should defer to its sister agency before adopting any passenger safety conditions, particularly a condition as far reaching as that proposed in DEIS Mitigation Measure 2(A) and (B).⁸

The FRA in fact has several pending rulemaking proceedings and other projects underway in connection with passenger safety. These include Passenger Equipment Safety Standards (FRA Docket No. PCSS-1), 62 Fed. Reg. 49730 (Sept. 23, 1997) and Passenger Train Emergency Preparedness (FRA Docket No. PTEP-1), 62 Fed. Reg. 8330 (Feb. 24, 1997). It is noteworthy that FRA has acknowledged the breadth of its interest in this area in its rulemaking notice at 62 Fed. Reg. 49732 (September 23, 1997) in the Passenger Equipment proceeding,

⁷ See H. Rep. 104-422, 104th Cong. 1st Sess. 167 (statement of Board jurisdiction modified to “reflect curtailment of regulatory jurisdiction in areas such as passenger transportation.”)

⁸ In fact, were the STB to impose the type of superiority/temporal separation proposed in the DEIS, such a condition could conflict with NS’ statutory right under section 402(e) to petition for relief from the preference rule for Amtrak operations.

...rail passenger safety does involve the safety of the railroad system as a whole, including the track structure, signal and train control systems, operating procedures, and station -- and platform-to-train interface design -- in addition to passenger equipment safety. To that end, FRA has active rulemaking and research projects in a variety of contexts that address non-equipment aspects of passenger railroad safety, including signal and train control systems.

The proposed separation measure could well intrude upon, or conflict with, FRA pending future proposals or plans to address passenger safety issues. Suffice it to say that any potential for conflict arising from the activities of more than one safety regulator should be scrupulously avoided.

The Board should also take note of the fact that neither the FRA nor any participant in the rail safety community known to NS has proposed a temporal separation rule as a means of enhancing passenger train safety. Neither Amtrak, New Jersey Transit or Metro North (nor any other commuter agency) have requested the proposed mitigation -- or any safety mitigation on any line segments -- in their filings with the Board. NS works closely with these agencies on safety issues, and at no point in its safety-related dealings with any of these agencies have the notions of passenger train superiority or mandated temporal separations of trains as a means of ensuring safety been raised by any of these parties.⁹

Notably, neither Amtrak nor any commuter agency has claimed that the Transaction will have any detrimental impact on the safety of their operations on any NS lines. Nor have any

⁹ Chapter 5 of the DEIS states that the potential for freight/passenger train conflicts could be reduced "by reinforcing passenger trains' priority over freight trains." This language is, at best, confusing, because there is no existing passenger train priority of the type contemplated in the proposed mitigation, and thus there is no rule to reinforce. It is possible that the DEIS is referring to the "preference" for Amtrak trains provided under section 402(e) of the Rail Passenger Service Act of 1970, 49 U.S.C. 24308(c). The proposed freight passenger train separation condition is entirely unlike the preference for Amtrak trains that is contemplated by that statute. Section 402(e) provides that except in an emergency, "Amtrak has preference over freight transportation in using a rail line, junction or crossing unless the Secretary of Transportation orders otherwise under this subsection." This statute does not require any temporal separation between Amtrak and freight trains, and does not apply to commuter operations at all. The purpose of the statutory preference for Amtrak, in fact, has nothing to do with safety, but rather was designed to address on-time performance issues that arose in the 1970's. See Hearings before the Senate Committee on Commerce on S. 1763, 93rd Cong., 1st Session at 46, 105 (1973).

passenger groups claimed that the Transaction will impair in any way the safe operations of passenger trains on any NS lines, including the five lines identified by SEA for mitigation. The proposed mitigation thus not only addresses a problem that does not (and will not following the Transaction) exist, but it lacks any safety constituency.

As a matter of sound public policy and respect for its sister agency, the Board should not intrude into a passenger safety area reserved for another agency that is already active in these matters. Nothing in NEPA requires that it do so. Rather, in addressing passenger safety mitigation, the Board would appropriately fulfill its NEPA role by identifying potential safety issues for FRA, leaving it to the agency to address those issues as it best sees fit. See Robertson v. Methow Valley Citizens Council, *supra*, 490 U.S. at 352-353 (1989) (NEPA “imposes no substantive requirement that mitigation measures actually be taken”; agency preparing NEPA document fulfills its duty by identifying and evaluating environmental consequences that can be addressed only by another agency).

4.2.2 The DEIS Fails to Justify the Conclusion That Any Mitigation is Warranted on the Identified NS Line Segments.

In determining the significance of impacts on passenger train safety, SEA first identified an annual rate at which passenger/freight train accidents occur. SEA then identified the line segments shared by passenger and freight trains on which there would be an increase of at least one freight train/day as a result of the Transaction. Using the accident rate data, SEA then determined for each of the identified line segments: (a) whether the proposed Transaction-related change in the projected accident rate on each line segment was greater than an annual increase of 25%, and (b) whether the accident frequency was less than one accident in 150 years. NS has several comments to offer on the SEA methodology and the significance factors used by SEA, as follows.

Appendix B of the DEIS explains that one element of the calculation of accident potential on the line segments that were reviewed in connection with the DEIS was a factor that assumed a passenger/freight train collision rate of 1.25 annually for Amtrak trains and 0.25 annually for commuter trains. See DEIS Appendix B at B-16. These accident rates were determined based on a review of freight/passenger train collisions over a four-year period, 1993 through 1996, inclusive. The collisions on which the DEIS accident rate was based are discussed below.

The list of collisions on which the DEIS relies is informative in several respects. First, it shows that there have been very few passenger/freight “collisions” in recent years (and in fact

fewer than identified by SEA as discussed below). Second, an analysis of the collisions identified by SEA also shows that the proposed mitigation addresses a "problem" of passenger/freight train separation distances that does not in fact exist.

Passenger/freight train collisions are very rare. Six passenger/freight collisions were used to calculate the accident rates used in the DEIS analysis. (Collisions involving passenger trains are identified on the list with the number "1" in either the Amtrak collision column or the commuter collision column.) There have in fact been only five such collisions during that four-year period, all but two of which occurred on the lines of Western railroads.

The list includes five Amtrak/freight train collisions and one commuter/freight train collision during the four year period studied, thus explaining the 1.25 and 0.25 annual accident rates. However, the one collision involving a commuter train was improperly included because it was not a commuter/freight train collision. Rather, that one accident was an Amtrak/MARC collision in Silver Spring in February 1996. Since this was a collision between two passenger trains, with no freight train involved, it should not have been counted in determining the rate of freight/passenger collisions. Accordingly, the actual annual rate of commuter/freight collisions during the four-year study period was **zero**, not 0.25 as applied in the DEIS.

Further, a closer analysis of the Amtrak accidents shows that the proposed separation rules are designed to address a situation that experience shows is highly improbable. At least four of the five Amtrak collisions on the list occurred in circumstances that would not be addressed by the proposed mitigation measure, *i.e.*, circumstances other than passenger and freight trains sharing the same track and traveling under power too closely to one another. The September 1993 collision occurred when an Amtrak train hit parked freight cars in a siding that was not long enough to accommodate the freight and passenger cars. The May 16, 1994 accident involving a CSX and Amtrak train occurred when the Amtrak train was struck by a trailer that had become unfastened from its mooring on a CSX train on an adjacent track and protruded over the track on which the Amtrak train was moving.¹⁰ Similarly, the February 1995 accident involving an Amtrak and a UP train occurred when the Amtrak train struck a load of steel that was projecting from a UP train located on an adjacent siding. A fourth collision on the list, which occurred on BN's lines in March 1995, was caused when the brakes on several parked BN

¹⁰ The CSX train was located on a passing track on a single-track route, and because it was on a different track would not have been subject to a separation rule. Improved securement of intermodal trailers will help avoid the recurrence of this type of accident.

cars failed, causing those cars to hit an Amtrak train. The freight cars were not connected to a locomotive at the time of the accident.

This review shows that at least four of the five collisions from which the 1.25 annual accident rate involving Amtrak trains was calculated occurred in circumstances that the proposed train separation mitigation rule would not have addressed, i.e., circumstances that are unrelated to the level of freight train traffic on the same track as the passenger train traffic. These accidents did not involve freight and passenger trains moving under power and operating on the same track, and thus a separation rule designed to address freight and passenger trains sharing the same track would not have prevented the accidents.¹¹

In fact, the proposed mitigation also would not address the causes of any of the major collisions involving passenger trains colliding with other trains over the last several years. A summary of these collisions is set forth in an FRA rulemaking notice on Passenger Equipment Safety Standards, 62 Fed. Reg. at 49730 (Sept. 23, 1997). Not one of the major collisions involved a passenger train colliding with a freight train operating on the same track. The one collision involving a freight and passenger train that ended up on the same track was the 1987 collision in Chase, MD between a Conrail and an Amtrak train. However, that collision resulted when the Conrail engineer, who was operating a freight train on another track, ignored signals and entered the track being used by the passenger train without permission. A separation rule of the sort proposed here would not have prevented a collision resulting from such actions by an engineer, who may have been impaired by drug use.¹²

The rate of passenger/freight collisions involving freight trains hitting passenger trains from behind or vice-versa on the same track is thus near or at zero, even on line segments where the level of passenger and freight train activity (pre and post-Transaction) is much higher than that on the segments identified in the DEIS for mitigation. (The projected level of increased freight train activity on the NS line segments identified for mitigation ranges between 4.1 trains and 9.2 trains on rail line segments N-497, N-063, N-120 and N-121 and 16.2 on rail line

¹¹ The remaining collision on the list was a March 1995 accident involving an Amtrak train operating on the BN system. NS is unable to find any reports concerning this accident, which suggests that the accident did not involve any loss of life, injuries or major property damage.

¹² The DOT/FRA drug testing rules were not in effect at the time. Neither were the rules regarding engineer certification, which impose penalties for abuse of prohibited substances.

segment N-042, which is part of the Porter to Chicago route. This route is double and triple track. Each of the line segments at issue can easily and safely accommodate these train increases). The facts thus show that the passenger train safety mitigation designed to address an increase in the level of freight train operations is simply not warranted.

In addition, SEA has applied an overly conservative threshold of 25% annual fluctuation in passenger train accident rate and a second tier criterion of an accident prediction value that would exceed one accident every 150 years. These factors appear to have been arbitrarily chosen, and their use would overstate any potential impact.

NS believes that the DEIS methodology for passenger rail line safety is too conservative and does not reflect NS' excellent safety history. NS has not had any accidents involving passenger/freight train collisions in over 30 years -- which is as far back as records and memory permit. By applying the national average passenger train accident rates instead of individual railroad accident statistics, the DEIS significantly overestimates the potential for any adverse post-Transaction safety impacts. This is demonstrated by considering the FRA train accident database, a much larger database with greater statistical confidence. Conrail has an accident rate that is close to the national average while the accident rate of NS is considerably lower. NS' average accident rate over the past three years is approximately 40% below the national average. Applying such a factor to the passenger rail safety analysis would more accurately predict accident probabilities on NS. Such a correction would show that rail line segments N-120, N-121, N-497, and N-063 will have a predicted post-Transaction interval between passenger collisions of over 150 years.

NS has reviewed the NS rail line segments where DEIS recommended "superior" trains. Dispatching for the segment Campbell Hall, NY to Port Jervis, NY (N-063) will be the responsibility of New Jersey Transit, and thus imposing mitigation under the EIS would be inappropriate. The segment Kalamazoo, MI to Porter, IN (N-497) is owned and dispatched by Amtrak and is neither the responsibility of NS, nor a suitable candidate for the imposition of mitigation under the FEIS.

NS also believes that the Porter, IN to Chicago, IL mitigation is unsubstantiated. The route consists of four segments: N-308, N-309, N-042 and N-047. Two of these segments (N-308 and N-309) are not even found in the DEIS analysis in Attachment B-2 (Appendix B, Volume 5-A) since they either have a predicted decrease in traffic or a negligible increase of 0.1 trains. For the segments N-042 and N-047, the DEIS itself indicates accident intervals of 3,970 years and 604 years, respectively. These rates are substantially less frequent than the 150-year interval

established by the DEIS for being significant, and thus these two segments should not have been included for mitigation. SEA should also refrain from imposing DEIS Mitigation No. 2(B) on this route because, as indicated earlier, there will be **no increase** in CP traffic on line segment (N-308) but only retention of the **same CP traffic** on the line if CP is given haulage rights by NS. This route is double and triple track with bi-directional CTC. Therefore, the entire route from Porter, IN to Chicago, IL should be deleted in the FEIS as requiring mitigation.¹³

4.2.3 The Proposed Mitigation Relies on Archaic Notions of Train Operation That Overlook the Existence of Modern Signaling.

Even assuming that some passenger safety mitigation were warranted, the proposed assignment of “superior” status to one type of train over another, and the proposed temporal separation of trains (e.g., the 15/30 minute separation rule proposed in the DEIS) would re-introduce into railroading outmoded and outdated operating procedures. The proposed mitigation is outdated in concept, would distract from safety, and would cause huge disruptions to NS’ operations (especially on the Porter to Chicago route), impairing NS’ ability to achieve significant Transaction-related safety and efficiency benefits.

While train superiority and temporal separation rules played a role in ordering train operations in the era prior to the introduction of modern train signals and communications, these procedures were rendered obsolete beginning in the early 20th century, with the advent of modern signals. Today, neither FRA rules nor rail operational rulebooks utilize the concepts of train superiority or temporal separation. Even when such rules were in effect -- decades ago and prior to the advent of modern signals -- rail rulebooks provided for a train to clear five minutes ahead of a passenger train schedule. On non-signaled main tracks, trains followed with a ten-minute interval. Trains were never required to remain clear of the track after passage of a train, merely to follow according to signal rules or the “dark territory” (no signals) separation prescribed. A 30-minute “balloon” around each passenger train was unheard of, even in the 1940's. Further, in the era when separation rules were in effect, such “superiority” rules were not

¹³ Also, the Board generally does not regulate haulage, which is a private contractual arrangement among carriers. The DEIS seems to equate haulage with trackage rights, but trackage rights are a Board-recorded legal right to use a rail line that may not be begun or terminated without Board approval. NS has no intention of granting CP trackage rights between Porter and Chicago. Finally, if any such mitigation is imposed on this particular route, at a minimum it should be tied to “commencement of haulage rights,” not the granting of such rights.

designed as a safety measure at all, but as a means of enhancing the opportunity for trains to maintain on-time schedules.

Each of the five NS line segments identified for mitigation is fully signaled with modern signals. Each line has Automatic Block Signals that provide the engineer with information about other trains or broken rails within the block covered by the signal. Each line is also equipped with Train Control System signals ("TCS"). This is a remote dispatcher-controlled centralized train control system that provides the train engineer with additional information about authority for movement including route and speed at control points, in addition to the "train or broken rail in block" information provided by Automatic Block Signals.

These signals and train control systems will allow NS trains and passenger trains to operate over the same track with safe headways of approximately four to five minutes between the trains. Such signals and systems provide tolerances that allow all trains, both freight and passenger, to safely share the same tracks. These systems are designed to prevent train collisions, while enhancing track capacity and service efficiency. The systems are recognized as safe by the FRA and are in use throughout the rail industry. The analysis of the collisions discussed above underscores the fact that signals are in fact working to prevent trains from being struck from the rear.

Modern signals and centralized train control provide a uniform and proven method of achieving the safe separation of trains that the DEIS seeks. By contrast, the temporal separation that is envisioned in the DEIS would not enhance safety beyond the levels achieved through these modern signal and train control systems, but could well detract from the safety of rail operations. The proposed mitigation measures would effectively undermine the utility and consistency of these safety systems on the five line segments, in favor of an unconventional, non-technological approach for those segments of the type that pre-dates modern railroad operations. The introduction of this type of unusual operating rule on the five line segments would undermine the safety that is achieved through the use of the uniform rules now in effect, introducing a "wild card" into NS train operations. From a safety perspective, the introduction of such non-uniform rules enhances the possibility of confusion and human error -- thereby resulting in the potential for a net reduction in safety.

4.2.4 The Proposed Mitigation is Inconsistent with the DEIS Description of Appropriate Passenger Train Safety Mitigation Set Forth in Sections 3.2.3 and 3.3.3 of the DEIS.

As noted above, the proposed mitigation is also not consistent with the DEIS description of appropriate passenger train safety mitigation. Beginning at DEIS, 3-7, Section 3.2.3 lists a series of potential passenger/freight train safety mitigation measures that the DEIS deemed appropriate to consider in connection with its analysis of Transaction-related safety impacts, but does not include passenger train superiority or temporal separations on the list.

The measures that are identified in the DEIS at Section 3.2.3 (and incorporated for passenger trains by Section 3.3.3) offer a more appropriate series of potential approaches to the enhancement of operating safety on lines over which both freight and passenger operations are conducted. As described in Appendix NS-1, NS already adheres to each of the pertinent safety mitigation measures that are identified in Chapter 3 of the DEIS and will do so with the line segments NS will operate. These measures provide a formidable, uniform and consistent measure of safety for the identified line segments, consistent with modern procedures and technologies. *The Transaction will not undermine, or change in any way, the utility of any of these safety measures, and thus no mitigation is required.*

4.2.5 The Proposed Mitigation Would Effectively Confiscate NS Lines, Lead to More Truck Traffic and Eliminate Important Transaction-Related Benefits.

Were the proposed mitigation rule adopted, it would cause huge disruptions to NS' east-west operations, effectively confiscating NS' ability to use the Porter, IN to Chicago, IL route and achieve significant Transaction-related safety and transportation benefits. In these circumstances, the absence of any demonstrable safety benefit offered by the proposal, and the absence of any evidence that the increased level of freight operations poses a risk to passenger safety, strongly argues against adoption of the proposed mitigation. Nothing in NEPA requires a different result.

A 15/30 minute separation rule on the NS system would, on at least some of the line segments identified for such mitigation, make it impossible for freight trains and passenger trains to share the same tracks during periods of significant passenger use of the tracks. The problem would be particularly acute on the Porter to Chicago route, over which significant Amtrak operations are conducted.

The 30-minute separation balloon would have the effect of terminating virtually all freight service on the Porter to Chicago route and thus on NS' Chicago to New York area main line during daytime hours. The effective confiscation of NS' major east-west line for the benefit of passenger service would not only terminate efficient rail operations, but would disable NS' efforts to divert time-sensitive intermodal freight from less safe, and less environmentally friendly, highway carriage to the national rail system.

Further, the availability of passenger transportation could also suffer. If 30 or 15 minute separation windows were adopted, NS would be unable to entertain any proposals from Amtrak to expand its services on this route, with additional frequencies without major investments, on Amtrak's part, in additional capacity. *The proposed mitigation would effectively destroy the operational basis on which NS is able to accommodate extensive Amtrak service on its lines, and hinder NS' ability to work cooperatively with Amtrak with respect to future passenger service enhancements.*

4.2.6 Any Additional Safety Measures Should Be Carefully Considered in Coordination with FRA and the Passenger Agencies.

For all of the reasons stated above, NS does not believe that any special mitigation measures are called for in connection with the line segments identified for mitigation in the DEIS. However, if any mitigation were to be imposed, the Board could appropriately consider a provision for consultations by NS with FRA and other relevant parties over possible further passenger train safety enhancements that may be appropriate for these line segments. Such a mitigation approach would be consistent with the settled proposition that where other governmental agencies have jurisdiction over matters that might warrant mitigation, the Board, lacking such jurisdiction, satisfies its NEPA obligations by identifying the issues that those agencies might address. See Robertson, 490 U.S. at 352-353; CEQ Release, 46 Fed. Reg. 18031-32 (an EIS can appropriately identify matters outside the lead agency's jurisdiction so as to alert appropriate officials of other agencies).

NS already retains an open dialogue on safety issues with the FRA and Amtrak. It is prepared to engage in careful and considered deliberation and study of safety issues on these line segments. Such considered rail industry and FRA safety consultations offer the appropriate response to any legitimate safety concerns involving passenger operations.

4.3 Safety: Highway/Rail At-Grade Crossings

The DEIS treatment of grade crossing safety provides some useful information for consideration by state Departments of Transportation (DOTs) but is otherwise seriously flawed. Most importantly, the DEIS is in direct conflict with federal statutes and duly promulgated regulations assigning the state DOTs the primary responsibility for highway railroad crossing warning systems. In doing so, the DEIS would displace States' authority and well-established methods and processes for mitigating any potential grade crossing safety impacts. *Rather than requiring mitigation based on flawed analysis, the more appropriate and readily available alternative is to require NS to provide information on expected train traffic levels and to consult with the state DOTs.* This would assure any significant impacts are properly mitigated based on the substantial expertise and established practices of those with the necessary expertise and the duly assigned responsibility for grade crossing safety.

The DEIS treatment would preempt states' discretion to select the best method for ranking crossings in their state for further analysis. The DEIS then prematurely leaps directly from what is designed and intended to serve only as a preliminary ranking method to a mitigation requirement, ignoring the critically important analysis by state DOTs of state, local and site-specific considerations. Such state analysis is critical to determine whether any upgrade to warning devices is in order and, if so, the best type and design of the upgrade. The DEIS has specified installation of some devices which have not been sanctioned by the Manual of Uniform Traffic Control Devices and which are being used only on an experimental or limited basis in carefully selected locations. These DEIS recommendations were apparently made without any site evaluation to assure the upgrade would be a safe alternative or is even feasible at the specified crossings. The DEIS also recommends upgrades at numerous grade crossings where the specified upgrades have already been made, and at others where the specified upgrades have already been funded and scheduled. This reinforces the need for these issues to be addressed by the state DOTs' experts in consultation with the railroads.

The DEIS applied the U.S. DOT Accident and Severity Prediction Formula to identify crossings which it believes should be upgraded. NS believes that SEA has misused the formula for an unintended purpose. The primary role of the formula is to help state DOTs rank crossings and to identify crossings that potentially need safety improvements. In short, the formula simply identifies crossings for further evaluation. The formula is not intended to be used, as the DEIS has done, as the sole basis for determining the need to upgrade the warning device at a crossing. Application of the formula is just part of the processes used by state DOTs, which take into account many other factors (including completion of field investigations) that may influence

accident rates. Only after the full process is completed can an informed judgment be made on whether the warning device at a crossing should be upgraded. The DEIS does not indicate that field investigations were completed, that FRA data were verified, or that the appropriateness of proposed upgrade measures was evaluated. Because these steps were not conducted as part of the analysis, the conclusions and recommendations for mitigation are largely unsubstantiated.

After careful review and analysis, NS believes that 34 of the 44 crossings recommended by SEA for permanent upgrade should be dropped from consideration for such upgrades based on one or more of the following reasons:

- They do not meet the DEIS Category A or Category B significance criteria using 1991-1995 accident histories.
- They do not meet the DEIS Category A or Category B significance criteria using 1992-1996 accident histories.
- The upgrade device has already been installed or is already scheduled and funded for construction.

4.3.1 Display of a Toll-Free Number

The DEIS recommends that NS install emergency information signs that prominently display a toll-free telephone number and a unique crossing number at all grade crossings with active warning devices. In addition, SEA recommends that NS provide 24-hour, seven-day-a-week staffing to respond to calls to the toll-free telephone number. NS has already, independently of the proposed Transaction, equipped all of its public crossings and certain private crossings with such signs. All crossings, public or private, with active warning devices are equipped with signs asking the public to report signal malfunctions to a toll free number. These signs are located on the signal mast, and, where applicable, on the gate. Passive crossings (including marked private crossings) have a sign, mounted on each crossbuck pole, urging motorists to report a stalled vehicle blocking a crossing or other emergency to the same toll-free telephone number. All calls are received by personnel at NS' Police Communications Center, which is staffed 24-hours a day, seven-days-a-week.

NS concurs that this is a prudent action. Upon approval of the proposed Transaction, NS will install signs that display a toll-free number and a unique crossing number on all Conrail public at-grade crossings allocated to NS within two years following the control date. Further,

NS and CSX will coordinate with the Conrail Shared Assets Operator to ensure that a similar program is implemented within the Shared Assets Areas, within the same time frame.

4.3.2 Discussion of Analysis Method

For individual grade crossings, SEA has proposed mitigation for upgraded warning devices at highway/rail crossings based solely on the outcome of an analytical method used to model potential risk of safety impacts. The analytical method is part of a procedure developed by the U.S. Department of Transportation and published in a document titled "Rail-Highway Crossing Resource Allocation Procedure - User's Guide, Third Edition, August 1987." The part of the procedure used by SEA is called the DOT Accident and Severity Prediction Formula. The formula predicts the number of accidents and casualties at a crossing based on data on the characteristics of and the reported collision history for the crossing which is obtained from FRA's crossing grade inventory and collision files. The data is prepared on an annual basis after all information from the previous year has been incorporated in the files.

The DEIS has used the DOT Accident and Severity Prediction formula for a non-intended purpose. The Rail-Highway Crossing Resource Allocation Procedure clearly states that the primary role of the formula is to rank crossings by number of predicted accidents in order to identify crossings that potentially qualify for safety improvements appropriate to state-wide needs. The procedure is not intended to single out crossings on a national basis without considering the many other factors, including criteria appropriate to the individual state, which may influence accident rates.

Further, the federal regulations do not dictate a particular hazard ranking formula, but instead leave it to each state to select a formula best suited to its needs. Thus, decisions as to grade crossing improvements are made by each state applying its own criteria, which may differ from criteria used in other states. This is consistent with the federal scheme calling for state highway authorities to utilize their expertise to improve crossing safety within their borders.

The Federal Grade Crossing Program is based on the premise that a state's traffic engineers, who have been making similar judgments on signalization of intersections throughout the state for many years, have a much higher degree of expertise in traffic control than does the railroad. Only in this manner can it be ensured that the crossings which the state deems most hazardous are upgraded before crossings which are deemed less hazardous, and that the state's determination of relative hazard is based on a hazard ranking formula chosen by the state.

The formula used in the DEIS is part of a DOT procedure referenced in the "Rail-Highway Crossing Resource Allocation Procedure Users's Guide, Third Edition" which states:

"Results of the DOT Procedure, findings of the diagnostic team, inclusion of any state warrants, and the judgment of state and local officials **should all be considered** before final improvement decisions are made" (emphasis added).

There is no indication in the DEIS that a diagnostic team evaluated the crossing sites and the proposed mitigation or that the appropriate state agencies were involved in the decision-making process.

A diagnostic team, consisting of experts with knowledge of local and state-wide needs, must conduct a field investigation to ensure the accuracy of the input data. (The FRA acknowledges that its grade crossing inventory database contains errors due to keypunch and submission errors.) The diagnostic team also needs to examine other critical factors that are not taken into consideration with the DOT Accident Prediction and Severity Formula, and which can only be examined by a field investigation. Examples of these factors include sight-distance, roadway geometrics, highway congestion, local topography, frequency of high-occupancy vehicles, and frequency of hazardous materials transport vehicles. Diagnostic teams can determine revised cost-effective improvement decisions for particular crossings where data from FRA files is found to be incorrect. The revised results obtained by the diagnostic team can then form a useful basis upon which state and local officials can finalize crossing improvement programs.

4.3.3 Four-Quadrant Gates and Median Barriers

The DEIS has proposed mitigation including the installation of four-quadrant gates and median barriers for certain NS crossings in Indiana, Pennsylvania, Virginia and Ohio. SEA's mitigation proposal appears to be based solely on the outcome of the DOT Accident and Severity Prediction Formula, without involvement of state and local officials or diagnostic review by such officials.

Four-quadrant gates and median barriers are not presently approved by the FRA or the Manual of Uniform Traffic Control Devices (MUTCD). The MUTCD places the responsibility for the design, placement, operation and maintenance of traffic control devices with the governmental body or official having jurisdiction. In virtually all states, traffic control devices are required by statute to substantially conform to the MUTCD. Experimental devices such as

four-quadrant gates and median barriers require a request for permission of experiment from the governmental agency or private toll facility responsible for the operation of the road or street on which the experiment is to take place.

Furthermore, in those instances in which four-quadrant gates and median barriers have been installed on an experimental basis, preliminary studies have been conducted first. Each such preliminary study involved an evaluation of the geometric features, road width, and other local conditions on a case-by-case basis. The study first identified if a need existed, and if so, what device was best suited to fulfill the need at each particular location. For instance, four-quadrant gates were found best suited for roadway facilities over 45-feet wide and median barriers were only deemed appropriate where there was no road or driveway connections within 70 to 100-feet of the crossing.

4.3.4 Funding of Grade Crossing Warning Upgrades

The DEIS is silent on funding for grade crossing upgrades and leaves unclear the mechanism for assuring the requisite and customary funding participation by state stakeholders. The proposed mitigation may thus be inconsistent with the message and the spirit of the national grade crossing safety program and with FHWA's requirements.

The assignment of the responsibility for grade crossing safety to governmental agencies has carefully evolved over many years. In the early 1960s, the Interstate Commerce Commission concluded:

Highway users are the principal recipients of the benefits following from rail-highway grade separations and from special protections at rail-highway grade crossings. For this reason the cost of installing and maintaining such separations and protective devices is a public responsibility and should be financed with public funds the same as highway traffic devices.

These general approaches were adopted by the U.S. Congress in 1973 when it enacted 23 U.S.C. § 130(d). The congressional mandate was implemented by FHWA's requirements in 23 C.F.R. § 924.9 and in 23 C.F.R. § 646.210 (1), which reads as follows:

- (1) Projects for grade crossing improvements are deemed to be of no ascertainable net benefit to the railroads and there shall be no required railroad share of the costs.

The DEIS has failed to acknowledge the process which state authorities might follow to evaluate a hierarchy of options on a cost effective basis. The foremost option is to close the crossing if it is deemed redundant and/or unsafe. A closed crossing eliminates the possibility of collision; however, closing a crossing is not always possible because of high traffic volumes or a lack of alternative routes. The second option is the installation of additional passive devices such as stop or yield signs. The third option is the addition of flashing lights or flashing lights and gates. The fourth option, and by far the most costly, is to grade separate the crossing.

4.3.5 Suggested Revisions and Corrections to Table 7-4

The following inconsistencies illustrate the weakness of the DEIS' use of the FRA formula to require specific mitigations.

NS reviewed the proposed mitigation in DEIS Table 7-4 at 7-26 to 7-33, and has identified thirteen crossings apparently inadvertently included as requiring mitigation. These 13 crossings as reported in Attachment B-7 of the DEIS do not have accident prediction values that meet the DEIS' proposed significance criteria of an increase of one accident every 100 years for a Category A crossing or an increase of one accident every 20 years for a Category B crossing (see Tables 4.3.1, 4.3.2 and 4.3.3). These crossings are as follows:

IN 484248X	NY 471825F	OH 473726P	MD 534887F
IN 484209G	PA 471940M	OH 473668W	
IN 484246J	PA 592290T	OH 473673T	
IN 478240E	PA 592320H	OH 473680D	

There are also several NS crossings included in DEIS Table 7-4 that already have upgrades completed. The installed devices meet or exceed the mitigation recommended by the DEIS. Also, the appropriate public agency with jurisdictional authority has scheduled improvements at several other locations that have been included in Table 7-4. These crossings are already funded and are due to be constructed within the next ten months, under the respective agency's grade crossing program. These crossings should be removed from Table 7-4.

NS locations where upgrades are already installed:

<u>AAR/DOT #</u>	<u>Type Device Installed</u>	<u>In-Service Date</u>
IL 479848P	Installed Flashing Lights With Gates	7/1/93
IN 478314U	Installed Flashing Lights With Gates	6/4/97
MD 469321F	Installed Flashing Lights With Gates	1/3/96
OH 472012W	Installed Flashing Lights With Gates	5/13/97
OH 481584W	Installed Flashing Lights With Gates	8/13/97
OH 481490V	Installed Flashing Lights With Gates	7/2/97

NS locations currently scheduled and funded:

IN 478216D	Project #05.0241	Add Gates
IN 478270W	Project #05.1062	Add Gates
OH 481546M	Project #10.0317	Add Flashing Lights with Gates
VA 468634S	Project #13.0458	Add Flashing Lights with Gates
IN 484282E	Project #05.0243	Add Gates

When SEA performed its highway/rail at-grade crossing analysis, the most recent five-years of accident history available was the 1991 through 1995 period. Accident history data for the period 1992 through 1996 subsequently became available. Applying the DOT Accident Prediction and Severity Formula to this most recent data, several crossings in Table 7-4 do not exceed the DEIS Category A or DEIS Category B significance criteria (see Tables 4.3.1, 4.3.2 and 4.3.3). *Based on analysis using the most recent accident history, the requirement to provide upgraded warning devices at the following crossings to mitigate safety impacts should be deleted.*

IN 474598M	OH 481547U	PA 535146X	PA 592295C
IN 484216S	OH 503133H	VA 468599F	OH 481660M
IN 484229T	OH 472284J	IN 484269R	

It is possible that utilizing the most recent accident history data for this analysis will result in additional crossings exceeding the significance criteria. In that event, such additional crossings would be added to those being brought to the attention of the state DOTs.

In sum, a review of the 44 NS highway/rail at-grade crossings where the DEIS proposed permanent warning device upgrades shows that 34 of them should not be included in Table 7-4 because of one or more of the following reasons:

- They do not exceed DEIS Category A or Category B significance criteria using the 1991 through 1995 accident histories;
- They do not exceed DEIS Category A or Category B significance criteria using 1992 through 1996 accident histories;
- The upgraded device has already been installed; or
- The upgraded device is already scheduled for construction.

4.3.6 Responsibilities and Jurisdiction for Upgrading Grade Crossing Safety Devices

The DEIS specifically states in Section 7.2.3.8 at 7-15 and Table 7-4 at 7-26 to 7-33, “CSX and NS shall upgrade warning devices at 118 highway/rail at-grade crossings in the States of Illinois, Indiana, Kentucky, Maryland, Michigan, New York, Ohio, Pennsylvania, and Virginia as listed and specified in Table 7-4.” This statement implies that NS has the authority to determine need and selection of traffic control devices. The *Manual of Uniform Traffic Control Devices* (MUTCD) Section 1A-3 and Section 8A-1 places this responsibility on the public agency with jurisdictional authority. While NS should report crossings that have the potential of increased accident probabilities due to a change in operational or physical characteristics, and NS may recommend a particular warning device, it is ultimately the responsibility of the public agency to confirm the need and select the type of device. Under most circumstances, the public agency will fund the project and maintain the devices. The railroad’s role is normally to coordinate the design and construction of the project. Therefore, the DEIS statement in Volume 4, Chapter 7, Section 7.2.3.8 at 7-15 should be revised to say:

“SEA has identified grade crossings in the States of Illinois, Indiana, Kentucky, Maryland, Michigan, New York, Ohio, Pennsylvania, and Virginia as listed in Table 7-4, that have been ranked using the DOT Accident and Severity Prediction Formula. CSX and NS should notify the appropriate State agency with jurisdictional authority of the potential of increased accident probabilities for these crossings due to a change in operational characteristics so these crossings can be evaluated to determine if closing of the crossing or upgrade of the warning device is needed.”

4.4 Safety: Rail Transport of Hazardous Materials

The DEIS concludes that "[o]verall, the proposed Transaction should result in a slight safety improvement for rail transportation of hazardous materials and no significant system-wide adverse impacts related to hazardous materials transport." DEIS at ES-19. NS concurs and expects the improvements to be greater than described in the DEIS as the best of NS' and Conrail's practices are implemented system-wide. The DEIS recommends mitigations on 29 NS and 4 Shared Assets Areas rail line segments based on expected increases in hazardous materials traffic.

NS concurs with the large majority of these recommendations as prudent, but has concluded that certain aspects of the analysis and certain recommendations are unreasonable or impractical and should be amended. Recommendations that could postpone implementation of the Operating Plan, such as requiring implementation of OT-55B guidelines prior to increasing hazardous materials traffic on a rail line segment, are neither justified nor reasonable. The Board is obligated, as discussed in Section 2, to balance adverse environmental effects against offsetting positive environmental effects and, importantly, non-environmental public benefits to the Transaction. The recommendation that would establish a permanent new "rule" requiring drills or desk-top simulations on some line segments should have a sunset provision to allow those lines to be treated consistently with other similarly situated rail line segments after the first three years. The recommended adoption of a Failure Mode and Effects Analysis (FMEA) is aimed at pre-existing conditions and contradicted by the DEIS conclusion that yard activity is expected to decrease as a result of the Transaction. Each of these topics is discussed in more detail below.

Safety, including safe transport of hazardous materials, is Norfolk Southern's highest priority. This unflagging commitment, which goes far beyond simply complying with existing regulations and accepted industry practices, has resulted in NS' industry-leading safety performance. NS is dedicated to being a responsible member of the communities it serves and is also motivated by the tenet that safety is good business. Simply put, accidents are both damaging and expensive, and NS is devoted to preventing them. NS participates in many voluntary programs such as the guidelines of AAR Circular No. OT-55B - "Recommended Railroad Operating Practices for Transportation of Hazardous Materials," Responsible Care®, and the North American Non-Accident Release (NAR) Program. The intention of such programs is to voluntarily reduce risks, improve railroad performance, and thus to alleviate the need for even more government regulation. These programs have been very effective at reducing risks through innovative approaches. It is important that these efforts be encouraged and that Applicants retain

the flexibility to continue to seek improvements. Recommendations in the DEIS should be considered in this context.

NS is committed to improvements it expects to be effective and concurs with a number of the recommendations presented in the DEIS. Many of these recommendations relate to practices which have already been voluntarily implemented by NS, and therefore are not required as a mitigation condition. In some cases, there are established, cooperative mechanisms in place for developing new rules or standards. These mechanisms involve the participation of NS and other railroads and effective use of their tremendous reservoir of experience and talent. NS only objects to DEIS recommended requirements that may create burdens without commensurate safety benefits and recommended requirements where existing industry practices already address the issue.

4.4.1 Key Route Requirements

The DEIS applies the definition of a "key route" from OT-55B as a significance criterion: when hazardous materials traffic has increased from below to above 10,000 hazardous materials car loads per year, a line segment becomes a key route. NS concurs that this is an appropriate threshold and has itself adopted a stricter threshold of 9,000 car loads. NS supports the intent of the DEIS recommendation that NS should meet "key route" requirements on new key routes and that these existing standards and practices mitigate potential risks. However, as these industry standards are revised and improved, NS should retain the flexibility to adopt updated practices.

In addition to the OT-55B standards, which NS is committed to fulfill regardless of the Transaction, the DEIS recommends four additional requirements for "new key routes". The first is that, if NS has more stringent requirements than the provisions of the AAR "Key Route" and "Key Train" guidelines, NS shall comply with its own requirements. NS does have more stringent requirements and will comply with these. However, NS objects to its proactive responsibility being established as a condition by the STB. The actions required would not apply to other railroads and thus would create an inappropriate double-standard. Further, it could inhibit changes to NS practices aimed at further improving safety performance. *The recommendation to require Applicants, as a condition, to comply with their own more stringent key route requirements is neither necessary nor appropriate. NS recommends it not be included in the FEIS other than to acknowledge that NS has more stringent requirements with which it will voluntarily apply.*

The second additional DEIS recommendation is that NS implement the OT-55B requirements prior to increasing hazardous materials traffic on these lines. NS does not believe that such a condition is warranted because it adheres as a matter of practice to the industry-standard key route safety procedures set forth in the AAR circular. Thus, to the extent that any line segments meet the key route volume thresholds, NS would as a matter of long-standing practice apply the key route safety measures. In the event that such a condition were imposed, however, NS recommends that the condition be worded so that NS may retain the flexibility to adhere to any new industry standard that replaces, modifies or supplements the existing requirements in OT-55B. Those standards were developed in 1993, and could well be revised in future years. NS should be able to adhere to any future revised version of these standards without the need to seek Board approval.

As to the timing of implementation of any condition that may be adopted, NS notes that a determination of whether a route is a key route or not is made based on an assessment of the level of hazardous materials traffic on the route during the previous twelve months. Further, there will be no immediate overall change in traffic levels on these routes on Day One. Rather, the projected traffic increases are based on a growth of traffic over a three year period.

While NS is nonetheless prepared to comply with existing key route requirements in OT-55B for the identified line segments as of Day One, NS submits that any condition that might be imposed should allow for a one-year period following Day One before such a requirement would become effective. Also, any such condition should expire at the end of three years following Day One, after which time the determination of whether a line segment should be treated as a key route should be made in the same manner that it is made throughout the rest of the NS system (and the national rail system generally), i.e., on the basis of the actual level of hazardous materials carried. If the key route criteria are met, the key route obligations would attach.

A three-year time frame for any mitigation measure concerning these line segments is appropriate because the traffic projections on which the mitigation has been proposed are three year projections. If the projections prove accurate with respect to these line segments, then the key route test will have been met and NS would apply the key route measures identified in the AAR Circular. On the other hand, NS should not be bound to adhere to the key route obligations on line segments as to which projections for increased hazardous material traffic in excess of the key route criteria are not met.

The third additional DEIS recommendation is that NS "prepare a Hazardous Materials Emergency Response Plan for each local emergency response organization along these [new key

route' and 'major key route'] rail line segments." This recommendation would appear to apply for each such organization in 63 counties in 10 states. Such an interpretation is too burdensome and unwieldy to implement. NS is prepared to provide plans for each county for distribution to Local Emergency Planning Committees (LEPCs) within that county. The plans would provide information about NS' hazardous materials emergency response practices and plans and instructions on railroad and other emergency contacts for the county. The NS-provided information will supplement each LEPC's own emergency response plans. NS concurs this is a prudent recommendation to help ensure emergency response organizations are prepared should an incident occur involving NS operations and activities.

It is obviously impractical and inappropriate for a railroad to prepare a detailed and customized plan to manage how a particular local emergency response organization would respond to an incident. NS is confident SEA did not intend its recommendation to be interpreted in this way, since it is to be expected that communities already have emergency response plans prepared by LEPCs as required by Section 303 of the Emergency Planning and Community Right-to-Know Act 41986 (SARA Title III). Notably, when Congress enacted SARA Title III, it did not require transporters to participate in the emergency planning process through the designation of facility emergency coordinators.¹⁴ Nonetheless, NS routinely cooperates with LEPCs in the planning process. The DEIS should not be interpreted to shift a responsibility already assigned by federal law. NS recommends this issue be clarified in the FEIS - *that the railroads will provide planning information to designated counties for distribution to the LEPCs about the railroads' plans and practices, and information on railroad and railroad-related emergency contacts that apply within the county.*

The fourth additional DEIS recommendation for new key routes is that NS shall provide a 24-hour toll-free telephone number to all emergency response organizations for each community located along "new key route" and "major key route" line segments. *NS concurs this is a prudent recommendation and will provide to each county, for distribution to LEPCs, a toll-free number for the NS Police Communications Center in Roanoke which can immediately access all NS dispatch centers.* Local emergency response personnel could quickly obtain information regarding the transport of hazardous materials on a given train and appropriate emergency response procedures in the event of a train accident or train-related hazardous materials release.

¹⁴ Section 327 of SARA Title III exempts transporters from all provisions of the statute, including the requirement to coordinate with the LEPCs, except for the emergency notification requirement for spills set forth in Section 304.

4.4.2 Key Train Requirements

The DEIS recommends that, before increasing the number of rail cars carrying hazardous materials on any train, NS shall comply with the AAR "Key Train" guidelines ("Recommended Railroad Operating Practices for Transportation of Hazardous Materials," AAR Circular No. OT-55B). *NS already complies with key train guidelines as a standard practice but urges that the FEIS not include such compliance as a condition for the reasons discussed in Section 4.4.1.*

4.4.3 Rail Line Segments on Which Hazardous Materials Traffic Doubles and Exceeds 20,000 Cars Per Year

The DEIS recommends certain requirements for rail line segments on which hazardous materials rail car traffic would double and exceed an annual volume of 20,000 cars per year as a result of the Transaction. NS concurs with the DEIS that this represents a significant change in hazardous materials traffic and that additional efforts are reasonable to increase the preparedness of local emergency response organizations. *NS concurs with the recommendation to provide emergency response planning information to affected counties as described above in Section 4.4.1 for new key routes.*

The DEIS also recommends that for line segments which exceed this higher threshold, NS shall implement a real time or desktop simulation emergency response drill with voluntary participation of local emergency response teams at least once every two years. NS concurs that it is reasonable to conduct one such drill within two years of Day One for rail line segments which exceed the threshold in order to orient and improve the preparedness of emergency response organizations. However, the recommendation in the DEIS would appear to be a permanent condition not having any "sunset" provision. It would also create a double-standard because the requirement would not apply to other rail line segments on NS or on other railroads which currently have as much or even more hazardous materials traffic. It would thus have the effect of rulemaking without the benefit of the cooperative and established rulemaking or standards setting process. The fact is, NS conducts drills already and should continue to be allowed to prioritize and schedule such drills as it does now in cooperation with state and local emergency response organizations. This recommendation should be modified for NS to *conduct one such drill for each line segment exceeding the threshold within two years of Day One.* This will appropriately "bring up to speed" local emergency response teams on these line segments, after which time these routes would be subject to the same NS management practices as other routes with similar hazardous materials traffic levels.

NS also recommends that the FEIS not utilize the term "Major Key Route." The term "key route" was established and defined by the Inter-Industry Task Force in OT-55B. While NS agrees that the DEIS threshold of a doubling of hazardous materials traffic plus an annual volume of 20,000 cars is reasonable, NS believes that the term "Major Key Route" would be confusing. The "key route" terminology should be reserved for the voluntary, proactive and effective industry efforts to provide safe transport of shippers' hazardous materials. *NS concurs with the threshold for routes that would double in hazardous materials traffic and exceed 20,000 hazardous materials car loads per year to trigger certain efforts (as modified above) but recommends the elimination of any and all use of the term "Major Key Route" in the FEIS.*

4.4.4 Failure Mode and Effects Analysis (FMEA) Program

The DEIS directs NS to establish a formal Failure Mode and Effects Analysis (FMEA) program for NS and Shared Assets Areas rail yards and intermodal facilities as mitigation to address the sources and consequences of spills of both stored hazardous materials and hazardous materials in transportation. This mitigation is without justification. The DEIS at 4-21 states that on a system-wide basis, the proposed Transaction "...should result in a modest, but virtually unmeasurable, decrease in hazardous material releases from derailments." The DEIS also states that, system-wide, the Transaction would result in fewer car miles per day of cars carrying hazardous material and a decrease in freight car handling in rail yards. *The DEIS also concludes, significantly, that the Applicants have the proper general measures in place to handle any potential increase in hazardous materials accidents.* DEIS at 4-21.

As an example of cooperative and proactive efforts by NS to improve safety of hazardous materials transport, NS is a member of Responsible Care® (a voluntary program) which includes management practices that address risk assessment issues. As noted at 2-152 in the DEIS in NS' Safety Integration Plan, NS intends to adopt the Conrail framework (including the Transportation Incident Severity Index process used by Conrail) for systematic categorization of shipper-caused releases. NS also participates in industry programs such as the North American Non-Accident Release (NAR) Program, as outlined in the NS SIP. This is another existing voluntary initiative for the purpose of reducing hazardous material incidents. The program is based on a four-phase effort: (1) data collection; (2) data analysis; (3) communication of results; and (4) follow-up with shippers.

These and other programs, such as the Railroad Tank Car Safety Research and Test Project and OT-55B, were established for the industry to manage risks responsibly and effectively (to be self-regulating) and thus avoid the need for government regulation.

Government regulation of existing voluntary industry programs is redundant and unnecessary and eliminates the incentive for companies to participate in voluntary industry programs. The DEIS recommendation for FMEA clearly targets existing conditions, which are already properly managed. This recommendation also circumvents the established rule-making process. *For the foregoing reasons, the FMEA requirement should not be included in the FEIS.*

4.4.5 NS Rail Line Segment Alexandria, VA to Manassas, VA (N-315)

The DEIS at VA-14 erroneously displays 16,000 for the number of post-Transaction hazardous materials cars per year on NS rail line segment Alexandria, VA to Manassas, VA (N-315). Consequently, the DEIS recommends new key route mitigation for this line segment. The correct projected post-Transaction hazardous materials shipments on this line is 6,000 cars per year and, therefore, this rail line segment is **not** expected to be a new key route. *NS recommends the FEIS correct the 16,000 post-Transaction value to 6,000 car loads of hazardous materials and remove this line segment from all recommended hazardous materials transportation safety mitigation discussions.*

4.5 Transportation: Passenger Rail Service Capability

The DEIS presents a comprehensive analysis of the expected effects of the Transaction on passenger train service. NS' review indicates that the analysis was thorough and reasonable, albeit conservative. NS concurs with the DEIS findings that no adverse impacts on passenger train service capability will occur and there is no need for mitigation.

4.6 Transportation: Highway/Rail At-Grade Crossing Delay

The DEIS evaluates the potential impact of the Transaction on grade crossing delays, both on a system-wide and local (e.g., crossing-specific) basis. NS concurs with the DEIS that, on a system-wide basis, it is impossible to predict actual delays that would occur as a result of Transaction-related changes in train traffic. However, NS believes the DEIS analysis of local effects should be amended. Specifically:

- The DEIS uses the wrong equation to determine traffic delays.
- The DEIS consideration of level of service exceeds SEA's regulatory scope.
- The DEIS displaces the authority of state and local agencies responsible for grade separation issues.

- The DEIS determination of where grade separations would be necessary is without critical site-specific considerations.
- The DEIS suggests the possibility of mandated negotiated agreements, which NS believes would be an improper requirement (See Section 2.6 of these comments).

NS believes that there are few, if any, crossings with significant delays as a result of the Transaction. However, if the FEIS concludes any crossings exceed a justifiable significance criteria for delays, NS recommends that Applicants be directed to consult with the appropriate state and local authorities. This established alternative is readily available and would allow prioritization and handling of such crossings in a manner consistent with other crossings in a particular state which may merit consideration of grade separation, including crossings not affected by the Transaction which could be of higher priority.

NS' observations on the DEIS treatment of grade crossing delays are discussed in more detail below. Additional technical details are presented in Appendix NS-2 of these comments.

The DEIS conducted emergency vehicle response delay analysis to determine the effect on response time of emergency vehicles from a crossing blocked by a passing train. The DEIS evaluated potential delay in two ways: delay per stopped vehicle; and total daily crossing blockage time. However, on a system-wide basis, the DEIS acknowledges that it is impossible to predict actual delays that would occur as a result of Transaction-related changes in train traffic. There are no national standards for measuring emergency response vehicle delay or the significance of any delay impacts. The preliminary conclusion of the DEIS is that no system-wide mitigation is recommended. NS concurs with this conclusion.

In Mitigation Measure No. 11 at 7-16, the DEIS recommends delay-related mitigation on NS crossings IN 474600L and IN 474601T due to an increase in average delay per stopped vehicle greater than 30 seconds. The DEIS has also made specific recommended mitigation on ten Lafayette, Indiana crossings and five Erie, Pennsylvania crossings¹⁵ in Mitigation Measures No. 22 and 23 due to changes in the level of service from Pre-Transaction to Post-Transaction which meet the DEIS proposed significance criteria. NS officials are instructed by the DEIS to

¹⁵ In SEA's January 21, 1998 Supplemental Errata, the DEIS was corrected to indicate that two of the five at-grade crossings at Erie would no longer meet SEA's threshold for mitigation due to a discovered error in SEA's calculations. Nonetheless, SEA states the correction should be ignored and the two crossings be included for mitigation because of their "close proximity." There is no justification for adoption of this new and arbitrary position.

consult with local officials and appropriate state DOTs to negotiate traditional separated grade crossing agreements or identify other mutually-acceptable approaches to address Transaction-related traffic delay impacts. In addition, SEA in its January 12, 1998 Errata to the DEIS directed NS to consult with the City of Cleveland to reach an agreement on measures to minimize or mitigate the effects of increased emergency vehicle delay. Possible mitigation measures suggested by SEA include increasing train speeds, upgrading communication between NS and the emergency dispatch center, or constructing grade separation. *NS does not believe that mandated negotiated-agreements are a proper mitigation approach.* (See Section 2.6 of these comments.)

The DEIS analysis of grade crossing delay finds no crossings in Cleveland are significantly impacted. No Transaction-related impact is mentioned that would suggest justification for the proposed mitigation. In like manner, there is no justification for SEA's recommended limitation of a two train increase in traffic through Erie, Pennsylvania for the reasons discussed at length in Section 5.6.

The DEIS has misused procedures contained within the Transportation Research Board's "Highway Capacity Manual" for a non-intended purpose. The DEIS defines level of service (LOS) as "... a measure of the operational efficiency of the highway/rail at-grade crossing using procedures contained in the Highway Capacity Manual (HCM)." In fact, the HCM does not address the operational efficiency of highway/rail at-grade crossings, and procedures do not exist to measure grade crossing efficiency in terms of LOS. A more detailed discussion of this issue is in Appendix NS-2. Moreover, the HCM does not contain the table shown at C-14 of the DEIS, which is purported to draw a correlation between LOS and delay at highway/rail at-grade crossings.

The DEIS does not explain the relationship between LOS and delay, but appears to have mischaracterized at-grade crossings as signalized intersections. The table presented in the DEIS purporting to correlate LOS and average delay per vehicle resembles, but in critical respects is not identical to, a table in the "Highway Capacity Manual" on page 9-6, titled "Table 9-1. Level-of-Service Criteria For Signalized Intersections." That table draws a correlation between LOS and stopped delay per vehicle, not LOS and average delay per vehicle as presented in the DEIS. It appears the DEIS has improperly modified this table to imply the same relationship between LOS and average delay per vehicles at a grade crossing.

In modifying the HCM, the DEIS has failed to acknowledge the fundamental differences in operational characteristics between signalized road intersections and highway/rail at-grade

crossings. The HCM defines level of service criteria for signalized intersections in terms of the average stopped delay per vehicle for a 15-minute analysis period. Delay at signalized intersections can be measured in the field or estimated using procedures contained in the HCM. These HCM procedures are complex empirical equations that are dependent upon a number of variables such as the quality of progression, the cycle length, the "green ratio", and the volume to capacity ratio that are unique characteristics to signalized road intersections, and have little or no relevance to highway/rail at-grade crossings. These procedures are inappropriate to estimate delay impacts of grade crossings.

Traffic signals and highway/rail at-grade crossings differ because traffic signals continuously operate in uniform cycles (red-green phase changes) throughout the majority of the day as opposed to intermittent crossing events at highway/rail at-grade crossings. Also, drivers do not have the same expectations from different types of warning devices. For instance, the HCM recognizes different LOS thresholds between signalized road intersections and road intersections only protected by stop signs. Drivers would reasonably expect longer intermittent delays at highway/rail at-grade crossings than for signalized intersections. Therefore, LOS as defined in the HCM for signalized road intersections cannot be directly applied to highway/rail at-grade crossings.

The equation used in the DEIS to decide LOS at highway/rail at-grade crossings is found in DEIS, Appendix-C at C-13 as Average Delay for All Vehicles. The equation over-simplifies a very complex traffic operation by making several general assumptions. For instance, the equation assumes that the period of critical delay at a crossing occurs during the peak hour of vehicular delay (i.e., during rush hour), the arrival rate of trains is spread evenly throughout the day, and vehicles arrive uniformly throughout the train blockage period. The equation also assumes that all trains are the same length and travel at the same speed through the crossing.

The flawed equation used by the DEIS to calculate at-grade crossing delays has resulted in overestimation of projected increases in average delay per vehicle at crossings. At two crossings (474600L and 474601T in Alexandria, IN) for which the DEIS recommends that NS consult with the community because the delay exceeds the significance criteria of 30 seconds, NS has used a more appropriate equation to recalculate the delay increase. The DEIS reports the delay increases to be 2.16 minutes and 1.68 minutes, respectively. NS' alternative equation shows a much lower delay increase of 0.73 minutes for each crossing. While NS acknowledges this would still exceed the 30 second criterion proposed in the DEIS, this demonstrates *the DEIS calculations overestimated these potential delays by over 100 percent. NS recommends use of the correct equation in the FEIS. Use of the incorrect equation has overstated potential delays.*

SEA relied on these overestimates of delays when proposing that delays be mitigated in Lafayette, Indiana; Erie, Pennsylvania; and Alexandria, Indiana.

System-wide, the assumptions made within the correct equation may be acceptable and the results may provide some useful screening of potential delay impacts. However, before recommending a final mitigation, a site-specific analysis should be done. Such an analysis would use more accurate data and would take into consideration actual site-specific characteristics and train/vehicular traffic patterns.

Generic modeled calculations may be revealed to be too conservative if a site-specific analysis determines, for example, that during the most congested period of vehicular traffic, no trains block the crossing. Conversely, actual conditions may show that during the peak train interval, very few vehicles use the roadway. At the site-specific level, various combinations of train length, train speed, vehicle arrival frequencies, and train frequencies should be considered based on actual conditions to decide the critical delay period.

Therefore, SEA should only use the results of this equation to "rank" the crossings in terms of delay severity, similar to the way the DOT Accident Prediction Formula is used to rank crossings for further evaluation of the need for warning device upgrades. After the crossings are ranked, state authorities should be notified that a change in the operational characteristics has taken place that may influence delay. The state authorities can then make their own determination regarding the need and method for mitigation. The state authorities are in a better position to consider all the other factors that influence a grade separation project, such as evaluating whether adequate alternative routes exist or determining the impact of purchasing additional right-of-way on adjacent land uses. NS recommends that the FEIS direct Applicants to consult with state DOTs about any potential grade crossing delay impacts rather than directing NS to participate in implementation of specific mitigation measures.

4.7 Transportation: Roadway Effects from Rail Facility Modifications

The DEIS considered the impact on local transportation systems of changes in truck activity at intermodal facilities, construction projects and abandonments. *NS concurs that the methods, analysis and results are reasonable and appropriate. In the following discussion, NS is providing updated information for SEA to use in the final analysis for the FEIS.*

The DEIS reports a new at-grade crossing would be constructed in Vermilion, Ohio. The DEIS recommends that NS fully fund the cost of raising Coen Road in order to create a level

highway/rail crossing. (See Volume 4, Chapter 7, Section 7.2.6, page 7-23; Volume 3A and 3B, Table 5-2, page 5-39; and Volume 3B, Chapter 5, Section 5-OH.10, page OH-40 and OH-41). NS has revised the proposed Vermilion, Ohio project since SEA evaluated the site. The new rail alignment will reuse the existing crossing in lieu of constructing a new at-grade crossing at Coen Road, as presented in the DEIS. *Therefore, no adjustment to the profile of Coen Road is needed.*

The DEIS reports a new at-grade crossing would be constructed in Oak Harbor, Ohio. The DEIS recommends that NS fully fund the cost of raising Toussaint-Portage Road in order to create a level highway/rail crossing. (See Volume 4, Chapter 7, Section 7.2.6, page 7-23 and 7-24; Volume 3A & 3B, Table 5-2, page 5-39; and Volume 3B, Chapter 5, Section 5-OH.10, page OH-39 and OH-40). The Oak Harbor, Ohio project involves the installation of connection track to be constructed between Conrail and Norfolk Southern lines. The proposed track is approximately 4,835 feet in length and will intersect Toussaint-Portage Road (Township Road #92) by means of an at-grade crossing. The proposed connection track will cross Toussaint-Portage Road at approximately 1,200-feet north of the existing Conrail crossing and approximately 950-feet south of the existing NS crossing. If approved by the state agency with jurisdictional authority, the proposed crossing will be equipped with mast-mounted flashing light signals with gates, activated by constant warning time circuitry.

The new connection track profile will descend to the proposed crossing at a rate of -0.30% from the existing NS track. The proposed track will remain level throughout the crossing before ascending at a rate of 0.24% to tie into the Conrail track. The proposed vertical alignment for the connection track will require that Toussaint-Portage Road be raised approximately 12-inches higher than the existing surface at the crossing. A smooth transition in the roadway profile will be made by constructing approximately 100-feet of run-off approaches on each side of the new at-grade crossings. *Therefore, the resulting crossing will not contribute to a "roller coaster"-type safety hazard for vehicles on Toussaint-Portage Road, and raising the road is not necessary.*

4.8 Transportation: Navigation

The DEIS evaluated a total of 13 movable bridges on NS and CSX line segments system-wide where Transaction-related increases in rail traffic are projected to meet or exceed the Board's thresholds for evaluation. SEA determined that the U.S. Coast Guard has jurisdiction over these movable bridges, and that, in accordance with U.S. Coast Guard regulations, navigation use (e.g., ships) has priority over trains. Therefore, the DEIS concludes that there are no system-wide or site-specific adverse impacts on navigation, including service to coastal and

inland ports. Norfolk Southern concurs with this conclusion. Conrail, CSX, and Norfolk Southern together serve a combined total of 17 ports on the Atlantic and Gulf coasts, and 27 ports on the Great Lakes and inland waterways. Service to these ports will be maintained and enhanced by the Conrail Transaction.

4.9 Energy

The DEIS concludes that there will be a large annual reduction in diesel fuel consumption and no significant adverse environmental impacts on transportation of energy resources or recyclable commodities as a result of the Transaction. DEIS at 4-49. NS concurs with this observation but, as with other benefits of the Transaction, the substantial environmental benefits from the savings in energy consumption are undervalued in the DEIS. *The net reduction in fuel consumption is a notably significant positive impact compared to other significance criteria in the DEIS. The fact that it is a positive impact does not diminish its significance; rather, the value of this benefit should be given appropriate emphasis in the Board's decision.*

The overriding impact of the Transaction on energy consumption is the decrease in annual diesel fuel consumption resulting from truck-to-rail diversions - *a net annual decrease for NS and CSX combined of approximately 133.6 million gallons*, according to the DEIS. Both the methodology employed in the DEIS for evaluating fuel savings and the application of that methodology are reasonable and appropriate. Fuel consumption is the most dependable indicator of the net positive impact expected from the Transaction on energy resources.

The DEIS further projects a total Transaction-related net annual reduction in fuel consumption of 80.1 million gallons. This is clearly a significant environmental benefit and should be stated as such in the DEIS. Nevertheless, that figure grossly understates the actual amount of benefit which NS believes is more accurately reflected by the truck-to-rail diversion impacts discussed above. The DEIS arrives at the 80.1 million gallon decrease after a confusing and misleading discussion which concludes by erroneously subtracting 53.5 million gallons from the 133.6 million gallon net decrease associated with truck-to-rail diversions. DEIS at 4-47. The DEIS incorrectly calculates that an annual increase of 53.5 million gallons is the net change in fuel consumption from factors other than truck-to-rail diversions. The DEIS bases this calculation on the rail traffic data provided by NS and CSX that projects increases in rail traffic greater than those associated with truck-to-rail diversions. The error occurs when the DEIS makes a faulty assumption that projected rail traffic increases not associated with truck-to-rail diversions have no off-setting decreases on other railroads or other modes of transport.

The fact is that essentially all Transaction-related increases in rail traffic on NS and CSX lines segments beyond those associated with truck-to-rail diversions would, but for the Transaction, be shipped on other railroads or by other transport modes. The resulting decreases on other railroads or other modes of transport have not proven feasible to model. However, it is obvious they will result at worst in no net change in fuel consumption since railroads are the most fuel efficient land-based method of transporting freight in the United States. Therefore, a conservative estimate would be to assume that Transaction-related net fuel changes associated with NS and CSX rail traffic increases other than truck-to-rail diversions would be zero.

NS recommends the FEIS adopt this reasoning and acknowledge that the Transaction-related net impact on fuel consumption is a net annual decrease of approximately 133.6 million gallons - a much larger benefit than the 80.1 million gallons stated in the DEIS.

The DEIS also analyzes proposed changes in operations at rail yards and intermodal facilities that could affect energy resources. Additionally, the DEIS considered the proposed Transaction's effect on the transportation of energy resources and recyclable commodities, and also considered the consumption of energy resulting from vehicular traffic delays at highway/rail at-grade crossings. The DEIS concluded that there would be no significant adverse environmental impacts on energy consumption, transportation of energy resources, or recyclable commodities as a result of the proposed Transaction.

NS concurs that no significant adverse impacts are expected on transportation of energy resources or recyclable commodities from the Transaction, but urges SEA to recognize the projected greater decrease in fuel consumption as a notably significant positive impact.

4.10 Air Quality

The analysis of air quality impacts in the DEIS is thorough and comprehensive. NS agrees that some of the details where the DEIS methods depart from Applicants' analysis in the ER represent improvements in methodology. NS concurs with the DEIS adoption and application of recent EPA Ozone Transport Assessment Group (OTAG) conclusions. These recent conclusions confirm that air impact issues are system-wide or regional; analysis and significance criteria related to local emissions are now moot. NS concurs with the results of the DEIS analysis that there are no significant local impacts, and that system-wide reductions in air emissions is a net positive impact resulting from the Transaction. *On the other hand, NS believes the DEIS, with its focus on local increases in emissions, both understates and undervalues the*

positive overall impact of the Transaction on air quality. The positive impact of the Transaction on air quality should be considered significant.

4.10.1 Methodology

The DEIS evaluated both system and county-wide emission increases and decreases from each rail line segment, rail yard, and intermodal facility, as well as emission changes due to truck-to-rail diversions, rail-to-rail diversions, and emissions from idling vehicles at grade crossings. SEA's independent analysis deviated from Applicants' method in selection of certain emission factors. *NS' review indicates the factors and methods used in the DEIS are sound. This is consistent with the October 24, 1997 letter from SEA to EPA which discusses SEA's methodology and EPA's view that the methodology used is reasonable and conservative.*

The DEIS analysis does, however, suffer from the same bias discussed above in Section 4.9. That is, except for the truck-to-rail diversions, the air quality analysis includes all the expected NS and CSX rail traffic increases but does not include offsetting traffic decreases for other railroads and transportation modes that currently carry that freight. This exclusion is not through oversight, but because it has not proven feasible to model these reductions in detail. Common sense concludes, however, that the offsetting air emissions benefits from decreased traffic on other railroads or modes can be expected to be of approximately the same magnitude as the air emissions increases from the shift of traffic to NS and CSX. As with energy impacts, analysis of the truck-to-rail diversions most accurately reflects the net impact on air quality that can be expected from the Transaction.

4.10.2 System and Regional Impacts vs. Local Impacts

The DEIS points out that the Ozone Transport Assessment Group (OTAG) found that because ozone problems are a regional concern, local control of NO_x is less productive than control of NO_x emissions on a regional level. Mitigation on a local level for the Northeast Ozone Transport Region (OTR) was therefore considered unnecessary by SEA since NO_x emissions in this region are expected to decrease. Therefore, it is obvious the projected net system-wide decrease in emissions expected to result from the Transaction is more relevant than local increases and decreases. NS concurs that ozone is largely a regional concern rather than a local concern and suggests that this observation be emphasized in the FEIS by stating that *no local mitigation options for NO_x are indicated because NO_x emissions will decrease at the system-wide level over the Northeast Ozone Transport Region (OTR) and will decrease further in the future due to the newly promulgated EPA locomotive standards.*

4.10.3 Significance Criteria

The DEIS looked at overall air emission increases in terms of system-wide emission changes and county-by-county emission changes. System-wide, the Transaction would result in a net decrease in emissions. Local impacts of projected increases in activity were compared to the stationary source thresholds as a screening method, then compared to one percent of the existing county emissions. If the emission change from the Transaction was less than one percent of the existing county emissions, the change was considered insignificant. If the increase in emissions exceeded one percent of the existing county emissions, the emissions were then analyzed in terms of regional or multi-county emission changes. In some cases the emissions in a particular county exceed the one percent threshold. However, in no cases did SEA find that a particular county would be significantly affected by the Transaction.

NS concurs with this conclusion, noting however that establishment of local significance criteria, a practice reasonably employed by SEA for prior transactions, is inconsistent with OTAG's cited conclusions. *NS recommends further consideration of the implications of the recent OTAG conclusions and suggests that local air analysis and significance criteria is no longer relevant since it is a system and regional issue.*

4.10.4 Conclusions

The DEIS concludes there will not be a significant adverse impact on air quality resulting from the proposed Transaction either locally or system-wide. In fact, the DEIS finds there will be net system-wide reductions each year for five of the six pollutants analyzed, including reductions of over 4,500 tons of nitrogen oxides, over 6,000 tons of carbon monoxide and over 1,000 tons of volatile organic compounds and an "insignificant" net increase of 521 tons per year of sulfur dioxide (DEIS at 4-56). For nitrogen oxides, these reductions are equivalent to elimination of 180 major stationary sources (sources with nitrogen oxides emissions of 25 tons per year for severe ozone nonattainment areas), or to removing 300,000 passenger cars from the road. *The overall reductions in air emissions, particularly the reductions in ozone-related pollutants, represent the major impact of the Transaction on air quality and are a significant benefit.*

As mentioned above in the discussion of methodology, the DEIS presents a conservative analysis which does not account for all of the expected reductions in air emissions. *A more representative analysis of net system-wide air emissions impacts would be based on the truck-to-rail diversions which are expected to dominate the air and fuel impacts of the Transaction.*

Based on the same reasoning discussed above in Section 4.9 on fuel consumption, *such an analysis would result in estimated reductions in emissions over 60% higher than the DEIS has projected.*

New locomotive emissions standards were promulgated by EPA on December 17, 1997 and are discussed in the DEIS. The new standards will provide further substantial emissions reductions in the future. According to a U.S. EPA fact sheet on the new standards, the new emission standards will reduce nitrogen oxides emissions from locomotives by nearly two-thirds and hydrocarbons and particulates by half. This would result in an additional 304,000 tons per year reduction of nitrogen oxides emissions expected in 2005, and would be the equivalent of removing nearly 20 million passenger cars from the road.

4.10.5 Mitigation

The DEIS recommends that the railroads should use “best management practices” to minimize fugitive dust emissions that result from construction projects and associated activities. *NS already employs standard best management practices during construction activities to minimize fugitive dust, and is committed to using such practices to minimize dust during Transaction-related construction and associated activities.*

4.11 Noise

The DEIS provides a comprehensive, albeit highly conservative, analysis of potential noise impacts, and concludes that only a few rail line segments are likely to have significant adverse noise impacts. NS concurs with the noise impact significance criteria applied in the DEIS and the safety considerations recognized for horn noise by the DEIS. The general approach for modeling noise is appropriate for use as a screening tool. However, the DEIS applies a CSX noise model based on CSX noise measurements of CSX and Conrail trains and ignores equivalent data on noise measurements of NS trains. This information on measured NS train noise levels was supplied to SEA in Applicants’ ER. The data demonstrates that NS trains, which are typically shorter and operate at slower average speeds, are quieter than the DEIS suggests. SEA’s exclusive use of the CSX model and measurements significantly overstates noise levels on NS lines, as has been demonstrated by recent field measurements. Further, since all of the noise assessment models were intentionally developed to be conservative, the models should only be used as a screening tool to identify areas of potential concern for site-specific analysis. The DEIS also inappropriately and unnecessarily defines a “preferred” recommended mitigation approach. Appropriate mitigation, if warranted, should only be determined following

site-specific analyses of noise impacts, location and type of receptors, and other local conditions. These issues are discussed below and in Appendix NS-3.

The DEIS presents a noise analysis of local adverse impacts where railroad operations are expected to increase on rail line segments, intermodal facilities and rail yards. The DEIS only considers potential adverse local noise impacts. Noticeably absent is any discussion of the positive benefits in reduced noise level that will be experienced by communities and sensitive receptors along those lines and roads where train and truck traffic would decrease, and those lines proposed for abandonment. In order to provide some semblance of balance, *NS recommends the FEIS at least acknowledge that noise benefits will accrue wherever train or truck traffic will decrease as a consequence of shifts in traffic expected to result from the Transaction.*

The DEIS appropriately concludes that safety considerations necessitate the sounding of locomotive horns for crossings and take precedence over noise effects. This is consistent with FRA regulations which specify horn loudness and laws which require horns to be sounded at grade crossings to provide for public safety. Therefore, for areas near grade crossings, the DEIS does not consider noise mitigation to be feasible. *NS concurs with the conclusion that safety considerations necessitate the sounding of horns and with the precedence of public safety considerations and the existing FRA regulation.*

NS concurs that the significance criteria of 70 dBA and an increase of 5 dBA, applied in the DEIS for wayside and facility noise, is reasonable and appropriate.

4.11.1 The DEIS Fails to Apply NS Train Noise Data to NS Traffic.

The DEIS analysis of noise levels and contours related to NS rail operations purports to be based on noise levels which were based on measurements of NS trains. In fact, the DEIS impact analysis is consistent with use of a CSX noise model based on measurements of CSX and Conrail trains. As demonstrated by field measurements, this results in a significant overstatement of noise impacts on NS lines.

NS recognizes the validity of the general approach applied within the DEIS - applying noise models to project potential increases in noise levels as a screening tool to determine where there might be a significant noise impact. *NS also agrees that it is appropriate to be conservative in applying such a tool to screen for potential impacted areas.* This is the reason NS applied a conservative model in the Applicants' Environmental Report (ER) - to avoid underestimating potential noise impacts. As discussed in Appendix NS-3 of these comments, NS

used a model developed by Thornton Acoustics based on actual field measurements of NS trains. These measurements determined that the wayside SEL (the average Sound Exposure Level 100 feet from the track while the train passes) was 98.4 dBA for the representative NS train.

The train noise model used in the DEIS is apparently the CSX model from the ER. This CSX model is based on CSX field measurements of CSX and Conrail trains. As documented in the ER, Volume 6A, Appendix B, field measurements found CSX trains to be louder than either NS or Conrail trains.

Although the DEIS states that SELs of 98.4 dBA wayside noise and 108.5 dBA crossing noise were used to determine contours for NS trains (DEIS, Appendix F, page F-5), in fact the contours presented in the DEIS are consistent with SELs of 100 dBA (wayside noise) and 109.1 dBA (grade crossing noise). *Although this difference appears small, the CSX model represents approximately 50 percent higher noise energy from wayside noise than the Thornton Acoustics model due to the logarithmic nature of dBA.* The wayside noise level of 100 dBA in the DEIS was apparently derived by applying a model based on CSX measurements of CSX and Conrail trains to NS trains, which operate at slower speed and shorter train lengths than CSX trains. The noise at grade crossings (109.1 dBA) in the DEIS was apparently determined by adding the train noise (100 dBA) to the horn noise only (108.5 dBA).

Application of the incorrect SEL for NS trains in the DEIS results in significantly overstated L_{dn} 65 contour distances from the rail line over the already conservative model results based on noise measurements of NS trains. The measurements of NS trains and the Thornton Acoustics model were presented in detail in the noise methodology in Appendix B of Applicants' ER. The CSX model was presented in the same Appendix. The data on NS trains was apparently neither applied by the DEIS nor incorporated into a unified model for use in the DEIS. The DEIS does not indicate any attempt to validate the assumption that the CSX model is a better predictor of NS wayside noise than are the NS measurements and model.

4.11.2 The NS Model is Conservative.

NS and its consultant Thornton Acoustics recognized the need for a conservative model to avoid any possibility of understating potential noise impacts. The model was based on real-world measurements of NS trains, but conservative assumptions were made concerning shielding and background noise, effects which reduce the actual impact of a noise source. *Subsequent field measurements have confirmed that the Thornton Acoustics model is conservative and*

appropriate as a screening tool for NS trains since it consistently overstates actual noise impacts from passing trains.

The Thornton Acoustics noise model was based on noise measurements made in an open, flat field area in North Carolina adjacent to NS track over a four-day period. There were no structures present to shield (absorb or deflect) noise. There were essentially no noticeable sources of background or non-railroad noise. The model included a factor for background noise inputs, but for all modeling runs it was assumed that the background noise levels would be very low (50 dBA during daytime hours and 40 dBA during nighttime hours). Although standard shielding equations predict shielding of up to 10 dBA from structures between the noise source and the receptor, the Thornton Acoustics model restricted the maximum shielding attenuation in the model to 5 dBA and only if structures parallel to the track occupied at least 65 percent of the total frontage along the track. This very restrictive shielding assumption ensures the model provides a conservative, i.e., louder, estimate of noise levels. In addition, the quiet flat field noise measurements made in North Carolina accentuate the effects of train noise when compared to urban or town areas where the model is applied to determine impacts on receptors. The Thornton Acoustics model was intentionally made to be conservative.

4.11.3 Validation of the NS Model as a Conservative Screening Method

Some models are better than others, but a model is only a model and only predicts potential noise levels. By using a conservative model, NS recognized that any areas identified through modeling as having potential significant impacts could then be measured to determine the site specific sound levels from trains. *Additional field measurements recently conducted by Wyle Laboratories, a consultant to NS, confirm that the Thornton Acoustics model is both conservative and more accurate for NS trains than the model applied by the DEIS. The Thornton Acoustics model consistently overestimated noise levels when compared to actual measured noise levels, confirming that, as is the general case with models, this model is only appropriate as a screening tool.* The results are presented in more detail in Appendix NS-3 and summarized below.

In December 1997 and January 1998, noise measurements were performed by Wyle Laboratories on Norfolk Southern rail segments in Cleveland, Bellevue, and Clyde, Ohio and Fort Wayne and Lafayette, Indiana. The measurements were made in order to: (1) determine if the existing Norfolk Southern noise model was conservative or if it underestimated noise impacts, and (2) perform site-specific modeling in areas on NS line segments where the DEIS identified a noise concern. Several of the measurements include horn and/or bell noise, which

SEA has acknowledged should not be considered for purposes of determining significance of impact or mitigation. Results are shown below and in Table 4.11.1.

TABLE 4.11.1					
COMPARISON BETWEEN MEASURED AND MODELED NOISE VALUES					
Location	Distance (ft.)	Grade Crossing	Highest Measured SEL ^a	Thornton Predicted SEL	Percentage Over-Predictions ^b
Bellevue					
Site 1	100	Yes	106.2	108.5	69%
Site 2	230	Yes	98.4	102.7	170%
Site 3	650	Yes	88.9	95.5	356%
Clyde					
Site 1	100	Yes	106.0	108.5	78%
Site 2	330	Yes	95.0	100.2	231%
Site 3	545	Yes	93.4	96.7	115%
Ft. Wayne					
Site 1	130	No	88.4	96.6	561%
Site 2	200	No	89.6	93.6	151%
Lafayette					
Site 1	100	No	93.8	98.4	188%
Site 2	250	No	86.8	92.0	231%
Cleveland					
Site 1	300	Yes	63.2 ^c	67.7 ^c	182%
Site 2	200	No	56.8 ^c	62.7 ^c	289%
Site 3 ^d	235	No	60.8 ^c	63.0 ^c	65%
^a The measured SEL includes horn and/or bell noise for Bellevue, Clyde and Lafayette. ^b The percentage the Thornton model over-predicted the sound energy level over and above the actual measured level. ^c All Cleveland measurements and model estimates are L _{dn} values. ^d At this site, Conrail train noise was measured, and the predicted SEL is also based on Conrail train noise as predicted by the Thornton model.					

- Cleveland, Ohio - Noise measurements were made for 24 hour periods in each of three areas in Cleveland. In each case, a comparison was made between the measured L_{dn} noise value and the calculated L_{dn} noise value using the Thornton

Acoustics train noise model. In each case, the noise levels measured were lower than the NS model predicted. The Thornton Acoustics model overstated noise levels at the three locations between 2.2 dBA (66 % too high) to 6.1 dBA (307% too high); the DEIS values would overstate the actual values by approximately 3.6 dBA (129% too high) to 7.7 dBA (489% too high).

- Bellevue, Ohio - In Bellevue, Ohio, Wyle Laboratories performed noise measurements at three locations on an existing NS rail line segment. The Bellevue noise measurements were taken over a three-hour period. Three train pass-by noise measurements were made and subsequently compared to the Thornton Acoustics noise model predictions. For each site and train pass-by, the measured noise levels were lower, i.e., quieter, than the levels predicted by the Thornton Acoustics model.
- Clyde, Ohio - Wyle Laboratories performed SEL noise measurements at three locations in Clyde, Ohio along NS' Oak Harbor to Bellevue line segment. Two train pass-by noise measurements were made. The measured noise values were lower than the Thornton Acoustics model predicted for each site and train pass-by.
- Fort Wayne, Indiana - Wyle Laboratories performed SEL noise measurements at two locations in Fort Wayne, Indiana along an existing Norfolk Southern line segment. Three train pass-by noise measurements were made. The measured noise values were lower than the Thornton Acoustics model predicted for each site and train pass-by.
- Lafayette, Indiana - Wyle Laboratories performed SEL noise measurements at two locations in Lafayette, Indiana along an existing NS line segment. One train pass-by noise measurement was made at each location. The measured noise values were lower than the Thornton Acoustics model predicted for each site and train pass-by.

The comparison between Wyle Laboratories noise measurements and the predictions of the Thornton Acoustics noise model show that, in all cases, the Thornton Acoustics noise model overestimates the L_{dn} 65 dBA contour both at grade crossings and for wayside noise. *This conclusively confirms that the FEIS analysis should apply no higher noise levels than those predicted by the Thornton Acoustics model for NS trains and that modeled levels should be used only as a screening tool to determine where additional site-specific measurements are indicated.*

Only with this level of noise analysis can an accurate determination be made as to whether noise impacts are potentially significant.

4.11.4 Acoustic Shielding and Background Noise

The Thornton Acoustics and DEIS (CSX) models were all intentionally designed with conservative assumptions concerning acoustic shielding and background (non-railroad) noise. The modeling only applied a fraction of the shielding recommended by a Federal Highway Administration (FHWA) noise model. The recent measurements by Wyle Laboratories suggest *the full range of shielding from the FHWA model would provide a more accurate prediction of actual noise levels.* Also, urban areas and areas with other noise sources have higher background noise levels that reduce the impact of train noise. Therefore, potential noise impacts are overstated throughout the DEIS. Details are discussed in Appendix NS-3.

4.11.5 Exclusive Use of CSX Train Noise Levels for Shared Assets Areas

For the Shared Assets Areas, the DEIS apparently based noise projections solely on CSX model calculations for CSX's average train length and speed (102 dBA for wayside noise and 112.8 dBA for grade crossings [see DEIS Appendix F, Attachment F-1.]). This not only ignores the NS model for NS trains, it also ignores that the typical NS train operates at lower speeds and shorter length. *NS recommends the FEIS apply a weighted average SEL between CSX and NS trains for Shared Assets Area line segments since the Shared Assets Areas will have both NS and CSX trains.*

4.11.6 Arbitrary Inclusion of Noise as a Potential Environmental Justice Impact

The DEIS applies a dual-standard for consideration of noise impacts in the discussion of Environmental Justice on three levels:

1. An arbitrarily restrictive noise contour is established and used to define the affected area wherein the DEIS will address potential population characteristics for inclusion within the Environmental Justice category.
2. The DEIS identifies three line segments with DEIS-designated environmental justice communities as potentially warranting noise mitigation; *however, the three segments fail to meet the DEIS established noise criteria for significance.*

3. Although the DEIS analysis of noise finds no environmental justice communities with significant noise impacts warranting mitigation, the DEIS suggests continued evaluation is necessary to ensure there are no cumulative impacts which include noise - however, the same suggested analysis for potential cumulative impacts involving noise is not provided for other communities throughout the system.

The DEIS defines the “area of potential effect” for Environmental Justice analysis as the maximum area potentially exposed to the Board’s noise threshold of 65 dBA. The justification offered within the DEIS is that the 65 dBA threshold offers a practical, uniform approach to identifying an outer boundary where communities could be reasonably expected to experience localized environmental impacts. Norfolk Southern agrees this is a reasonable approach, given the available guidelines. However, as has been conclusively demonstrated, the use of either the DEIS (CSX) noise model, or the Thornton Acoustics (NS) noise model, overstates the actual measured level of noise associated with NS trains, and would therefore provide an exaggerated area for analysis. The DEIS approach to noise for environmental justice further overstates the extent of actual noise impacts by applying two arbitrary assumptions *solely* to environmental justice analysis: (1) assuming an increase of three to seven trains per day generates as much noise as an increase of eight trains per day - effectively lowering the analysis threshold for environmental justice communities from an increase of eight trains per day to three; and (2) assuming that horn noise occurs along the entire line segment, not just at crossings. No justification is provided for this unfounded double-standard.

On page 3-51, Environmental Justice Analysis, the DEIS states, “SEA used the criteria for “significance” described in the preceding sections of this chapter.” Preceding DEIS Section 3.12.2, at 3-35, provides the mitigation criteria for noise and states, “SEA considered noise impacts . . .to warrant potential mitigation if any sensitive receptors are exposed to noise levels above 70 dBA L_{dn} and have a 5 dBA L_{dn} increase.” However, the NS line segments listed as having potential noise impacts at DEIS 7-48, Table 7-9 “Preliminary Communities that May Warrant Environmental Justice Mitigation,” do not meet the criteria SEA has defined as warranting noise mitigation. These line segments are: Cleveland to Ashtabula (N-075), White to Cleveland (N-081), and Youngstown to Ashtabula (N-082). In DEIS, Appendix F, Attachment F-1, the change in dBA for these three line segments is 4.5, 3.4, and 4.2, respectively. All three of the changes are well below the significant impact criterion.

The DEIS indicates that the Board is still considering the possibility that “cumulative” impacts on environmental justice communities could result from noise and from other unspecified factors, and that further study is required. However, the DEIS does not identify

significant potential noise effects in any of the environmental justice communities, and based on NS analyses presented here and in Section 4.16 below, NS does not believe that these communities will see significant adverse impacts of any kind. A finding of cumulative impact is based on the idea that synergies between multiple insignificant effects can create a significant effect. However, the DEIS contains no discussion of a link between insignificant noise effects and other insignificant effects, and provides no evidence that such a link exists. Similarly, the DEIS provides no justification for why further noise studies are warranted if it is already established that these communities do not have significant noise impacts, nor what these additional noise studies might consist of. The continued review of noise, and the consideration of insignificant noise as a potential cumulative effect for environmental justice communities where there is no significant noise impact, represents an unsupportable double-standard. *Environmental justice communities should be subject to the same noise thresholds and criteria contained in the DEIS and applied to other communities.*

NS recommends that a double-standard not be employed in the FEIS. The significance criteria established for the noise analysis elsewhere is reasonable, appropriate and sufficient, without creation of a second more stringent standard for particular communities based on demographic composition.

4.11.7 Practical Problems with DEIS Preferred Noise Mitigation

The DEIS recommends that, if and where noise mitigation is warranted, "noise barriers would be the preferred type of noise mitigation for substantially impacted areas." NS believes this is an arbitrary statement, and fails to consider site-specific variables and local considerations. *If noise mitigation is considered for any line segment, the consideration of potential alternatives should be based on a site-specific analysis of the noise impact, receptors, site conditions, and desires of the affected community, not with an arbitrary "one size fits all" mitigation measure.*

4.12 Cultural Resources

The DEIS, in accordance with Section 106 of the National Historic Preservation Act of 1966, as amended, evaluated each proposed abandonment and construction action associated with the Transaction to determine whether cultural resources (e.g., historic properties) were adversely affected, and if so, what mitigation would be warranted. The DEIS applied the "Criteria of Effect and Adverse Effect" (36 CFR 800.9) developed by the Advisory Council on Historic Preservation as the criteria for determining whether there would be an adverse impact on cultural resources. In addition to SEA's own analysis of potential impacts to cultural resources,

each proposed abandonment and construction action was coordinated with the State Historic Preservation Officer (SHPO) for additional review. The DEIS (as amended by the January 12, 1998 Errata and the January 21, 1998 Supplemental Errata) concluded there are no adverse impacts to cultural resources along NS rail line segments from the Transaction.

NS concurs with the cultural resources evaluation approach and conclusions as presented in the DEIS (as amended by the two Errata). During the implementation of the proposed abandonment and construction activities, NS will continue to coordinate as required with the appropriate SHPOs to ensure that significant cultural resources are not adversely impacted by the Transaction-related activities.

During recent engineering studies on Conrail's Buffalo-Binghamton rail line (which will be operated by NS post-Transaction), a Conrail Bridge (No. 361.66) over the Genesee River near Portageville, New York, was found to be near the end of its useful life. The bridge is an 819-foot long steel viaduct carrying a single railroad track, and is currently rated for 263k (load rating) traffic at 10 mph due to its condition. The viaduct rests on six steel towers that were constructed in 1875. The design and age of the current structure preclude repair or renovation without replacing the entire bridge. NS is conducting further studies and working with federal state and local authorities, including consultation with the State Historic Preservation Officer, to evaluate alternatives to replace the existing bridge. The anticipated bridge replacement is in response to an existing condition, and is not related to the Transaction. NS will replace the bridge in full compliance with all applicable federal, state and local laws and regulations.

4.13 Hazardous Materials and Waste Sites

The DEIS evaluated the potential for the Transaction to affect existing hazardous waste sites within 500 feet of the Transaction-related rail line construction or abandonment activities. Investigation and cleanup of hazardous waste sites during construction or abandonment activities is controlled by several federal and state statutes and regulations. The DEIS therefore concluded that no further evaluation was necessary, and that additional mitigation measures were not warranted. *NS concurs with this conclusion. NS routinely coordinates with federal and state agencies as appropriate to ensure all hazardous waste sites where NS has responsibility are addressed in compliance with applicable laws and regulations, and in a manner protective of human health and safety and the environment. It will continue to do so.* NS does point out that, as a general rule, some sites only require the involvement of the appropriate state agency(ies) while others may require the involvement of U. S. EPA alone or, at times, joint State and EPA involvement - depending on the constituent or amount of contamination discovered. Applicants

should be given the flexibility they currently have to involve the most appropriate authority(ies) in cleanup matters consistent with legal requirements.

4.14 Natural Resources

The DEIS addresses natural resources (water and biological) for site-specific Transaction-related activities at rail line segment constructions and abandonments. SEA evaluated the site for the construction of the proposed NS connection at Vermilion, Ohio for its potential to impact natural resources. The DEIS at OH-105 indicated that a site visit determined the woodland area located south of the proposed Vermilion construction site may contain habitat for the endangered Indiana bat. However, a subsequent Errata to the DEIS (dated January 9, 1998, at page 13) indicated the Indiana bat is not historically documented in Erie County. The DEIS indicated the Vermilion construction site visit did not identify any potential habitat for other threatened or endangered species. No other potentially significant natural resource impacts were identified, although the bald eagle was identified in the DEIS as a threatened species known to occur in Erie County.

Although the wooded area south of the Vermilion construction site will not be directly affected by the construction, the DEIS recommends that NS consult with the U.S. Fish and Wildlife Service (USFWS) and the Ohio Department of Natural Resources to determine the potential effects to any federally-listed threatened or endangered species. Prior to initiating construction at the site, the DEIS at OH-105 directs NS to conduct a survey to determine the potential presence of the Indiana bat and the bald eagle.

NS does not concur with the DEIS proposed mitigation. NS believes that since the wooded area will not be directly affected by the construction, a survey for the Indiana bat is not necessary. According to NS' preliminary correspondence with the USFWS, dated January 12, 1998, a survey for the Indiana bat may not be needed even if the wooded area were to be affected by the construction. Also, based on the same preliminary correspondence, the USFWS believes a survey for the bald eagle would not be necessary because the Ohio Department of Natural Resources maintains good records of the nesting locations obviating the need for a survey. *Therefore, the proposed mitigation should be revised as follows: "NS should coordinate with the U. S. Fish and Wildlife Service and Ohio Department of Natural Resources prior to construction."*

NS concurs with the DEIS's three-step process for evaluating water resources (map review and analysis, field reviews, and evaluation of impacts) and for evaluating biological

resources (data collection, field review, and evaluation of impacts). The methodologies are applied appropriately and the findings in the DEIS are well-founded except for the unclear methodology for the distances used to identify biological resources described in Section 7.7 and the survey recommendation at Vermilion discussed above.

NS concurs that the proposed Transaction will not result in significant impacts to natural resources.

4.15 Land Use/Socioeconomics

The DEIS addresses land use and socioeconomic issues directly related to changes in the physical environment from the proposed Transaction-related rail line segment constructions and abandonments. The DEIS concludes there are no significant adverse effects on land use or socioeconomics resulting from the proposed Transaction. NS supports this conclusion. The DEIS conducted a thorough review of the proposed rail line segment constructions and abandonments for:

- consistency with local land use plans;
- effects on Prime Farmlands;
- consistency with State Coastal Zone Management Plans;
- need for relocation/demolition of any business or residence;
- consistency with local land use plans and other requirements if within Native American reservations; and
- effects on jobs as a direct result of or related to changes in the physical environment.

Proposed abandonments were also evaluated for suitability for alternative public uses and/or trail uses, and identification of alternative transportation modes for goods and services affected by the abandonment.

A few comments below offer clarification to the DEIS methodology and state-specific conclusions related to the Tolono, Illinois rail line segment construction and the Seneca Indian Nation/Cattaraugus Reservation in New York.

Tolono, Illinois The proposed Tolono Connection involves the construction and operation of a new rail line connection between the existing Illinois Central (IC) and NS lines. The City of Tolono, Illinois identified a potential concern that the proposed NS construction

activity would disturb Daggy Street and adjacent residential properties. This concern, expressed in comments by the City on the scope of the DEIS, was based on information within the Environmental Report which was misconstrued. *In a public meeting held to address the City's concerns, NS clarified that the construction of the Tolono Connection would occur entirely within the existing IC and NS rights-of-way and no additional land would be acquired for this construction.*

The DEIS concludes:

- “Because the proposed construction would not require the acquisition of land outside the existing railroad right-of-way, this activity would be consistent with the local land use plan.”
- “...the land use within the existing right-of-way is railroad. Therefore, there would be no effect on prime farmlands in the area.”
- “Based on the findings described above, SEA has determined that there would be no significant impacts to land use associated with the proposed action at Tolono so long as construction remains within existing railroad right-of-way. Because there are no significant impacts, SEA does not recommend mitigation.”

However, in the next paragraph, the DEIS goes on to contradict itself and recommend mitigation. Specifically, the DEIS provides a preliminary recommendation which states “...that the Board state, as a condition for approval of the Transaction, that Norfolk Southern does not disturb Daggy Street or residential properties at this location.” DEIS at IL-68 through 69.

NS does not believe this recommendation is necessary nor in keeping with the conclusions of the DEIS. In effect, the recommendation seeks to mitigate a potential effect that is not projected to happen and which SEA has determined is not an issue of concern. NS' proposed construction activity at Tolono would occur entirely within the existing IC and NS railroad rights-of-way and no additional land would be acquired for this construction. Further, NS has met with local officials to clear up the misunderstanding. *Therefore, there is no impact to Daggy Street, and there is no need for a mitigation requirement.*

Seneca Indian Nation, Cattaraugus Reservation, New York The DEIS departs from its stated methodology for land use and socioeconomic analyses in addressing Native American issues on the NS Ashtabula - Buffalo (N-070) rail line segment. The DEIS concludes that the N-070 rail line segment is projected to increase the transportation of hazardous materials from 7,000 carloads to 26,000 carloads per year. The DEIS recommends the following mitigation:

- Adhere to the provisions of the AAR for transport of hazardous materials, including: (1) restricting train speeds to 50 mph; (2) upgrading the track to Class 2 or better; (3) installation of wayside defect detectors; and (4) establishing a Hazardous Materials Response Plan, including accident simulations with local emergency response providers.
- Coordinate the preparation of the Plan with the Reservation, and assist the Reservation with emergency response preparedness as requested.

The DEIS also notes that SEA will conduct additional public outreach among the Seneca Indian Nation and the Cattaraugus Reservation. DEIS at NY-38.

NS has several concerns regarding the DEIS approach on this issue:

- *This rail line segment is neither a construction nor an abandonment, and thus does not meet the DEIS criteria for evaluation for land use and socioeconomic issues. Therefore, this line segment should not be addressed within this section of the DEIS.*
- The potential issue identified, hazardous materials transportation, is already addressed for this rail line segment in the appropriate sections of the DEIS (e.g., DEIS Table 5-2). *Since recommended mitigation for increased hazardous materials transportation would eliminate the potential for a significant impact, there is no need to repeat the issue under land use and socioeconomic issues, and it should not be addressed in this section of the FEIS.*
- NS has raised several issues in Section 4.4 addressing the DEIS evaluation of hazardous materials transportation, including offering well-established mitigation measures (e.g., approaches to transportation of hazardous materials reflecting NS' excellent safety record) to address significant increases in hazardous materials rail traffic. These mitigation measures should be applied to the Cattaraugus Reservation in the same manner as they will be applied to other communities along rail lines projected to experience similar increases in hazardous materials transportation.
- The mitigation recommendation that NS "...assist the Reservation with emergency response preparedness as may be requested" is ambiguous and unsupported. This

requirement for additional, open-ended assistance is not specified for other non-Native American communities. *There is no justification for treating the Cattaraugus Reservation differently than any other community on the issue of increased hazardous materials transportation. This recommendation should not be included in the FEIS.*

- The DEIS does not state why the Seneca Indian Nation requires additional outreach. However, NS supports community outreach efforts with the Seneca Indian Nation (and all communities) to ensure information on the Transaction is available to the affected public and the community is informed so that it may participate in the EIS process.

4.16 Environmental Justice

NS strongly supports the objectives of inclusiveness and non-discrimination. However, the DEIS analysis of potential environmental justice effects of the Transaction is flawed and reflects a misapplication of sound environmental justice concepts. The analysis does not support additional mitigation and mitigation requirements predicated on it would exceed the legal authority of the Board. Specifically, NS believes:

- *There are substantial difficulties in attempting to apply the Executive Order on environmental justice and the guidance and methodologies developed thereunder by other agencies, to a transaction of this kind, which counsels caution.*
- *The Transaction will not have disproportionate effects on minority and low-income populations.*
 - *Potential impacts would not be borne predominantly by minority or low-income populations.*
 - *Effects on minority and low-income populations would not be more serious or greater in magnitude than on other populations.*
- *The Transaction will not have high and adverse effects on the “Environmental Justice communities” identified in the DEIS, disproportionately or otherwise.*

- *Communities identified as “Environmental Justice” communities in the DEIS are not predominantly minority or low-income.*
- *The environmental justice mitigation measures proposed in the DEIS are unjustified and impractical.*

4.16.1 Attempting to Apply to This Kind of Transaction the Executive Order on Environmental Justice and the Guidance and Methodologies Developed Thereunder by Other Agencies Presents Difficulties and Risks of Unforeseen Consequences, Which Counsels Caution.

The Executive Order on environmental justice defines its substantive standard as follows:

“Each federal agency shall conduct its programs, policies and activities that substantially affect human health or the environment, in a manner that ensures that such programs, policies and activities do not have the effect of excluding persons (including populations) from participation in, deny persons (including populations) the benefits of, or subjecting persons (including populations) to discrimination under, such programs, policies and activities because of their race, color, or national origin.”¹⁶

To achieve its objectives, the Executive Order urges Federal Agencies to conduct elaborate population demographic analysis for, “identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects” on minority and low-income populations.¹⁷ While the Executive Order requests that independent agencies such as the Surface Transportation Board comply with the terms of the Order,¹⁸ the DEIS recognizes (at 3-46, note 4) that the Board is not bound to conduct environmental justice analyses, or to require mitigation on the basis of such analyses.

NS believes that the Board has always met the substantive standard of the Executive Order and can continue to do so through existing processes.¹⁹ However, the guidance and

¹⁶ Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*, February 11, 1994, paragraph 2-2.

¹⁷ *Id.*, Sec. 1-101.

¹⁸ *Id.*, paragraph 6-604.

¹⁹ NS notes that the Board elected not to specifically address the terms of the Executive Order in the Burlington Northern / Santa Fe and Union Pacific / Southern Pacific railroad control proceedings, both of which post-dated the Executive Order.

methodologies developed to date by other agencies, applying the Executive Order to very different types of proposed actions, were not designed for, and are not well suited to, a rail consolidation of this kind. Attempting to apply such guidance and methodologies in this context, moreover, risks far-reaching and unforeseen consequences contrary to those intended.

First, the proposed action at issue – the Board’s decision whether to approve this Transaction – does not present the potential for discrimination that the Executive Order was designed to protect against. This is not a situation in which certain communities might be excluded from participating in the environmental review process or otherwise receive less environmental protection. Notice of the proceedings and relevant information have been widely circulated every place where there could be potential environmental impacts from the proposed Transaction. SEA has undertaken a comprehensive analysis of potential environmental impacts system-wide and at each point in the 44,000-mile system controlled by the Applicants. Minority and low-income communities have not been overlooked. Potential impacts in these communities have not been dismissed or treated less seriously than potential impacts in other communities, because the DEIS evaluations of potential impacts and the criteria for analysis and for recommended mitigation have been applied evenly and neutrally system-wide. Population demographics have not been a factor in determining potential impacts or mitigation measures. Rather, the driving factors have been increases in rail traffic projected across the entire 44,000-mile system based on operational capacity and market demand. *Where neutral criteria are plainly applied across the system, as in this case, additional demographic analysis is not necessary to ensure nondiscrimination.*

Application of the Executive Order to this proceeding is not necessary to protect against discrimination by NS or CSX. The DEIS does not suggest that NS and CSX, in deciding how to route their trains, had any intent to disfavor minority or low-income populations. Nor could such a claim plausibly be made. The numerous complex factors which were taken into account in deciding how to route trains are discussed in the Operating Plans.²⁰ The demographics of communities along the rail lines is not among them.

Moreover, orders or conditions based on incomplete or technically flawed environmental justice analysis could inadvertently create preferential treatment on the basis of minority status or income level. Nothing in the Executive Order requires or suggests preferential or unique

²⁰ The primary factors are the origin and destination points for the expected freight shipments, geographic factors such as route distance and terrain, and the capacity of the tracks, yards and intermodal facilities.

mitigation for impacts in a minority or low-income community compared to a non-minority or non-low-income community similarly situated with respect to the impacts. *The recommendation in the DEIS for NS to enter into binding agreements for additional mitigation with certain communities but not with non-minority or non-low-income communities similarly situated with respect to impacts is an example of preferential treatment not warranted under the Executive Order and is a violation of its directive and spirit.*

In its attempt to work within the framework of an Executive Order aimed at different kinds of transactions, the DEIS unavoidably dealt with new processes, untested analytic methodologies and untried mitigation strategies. The Board has never issued guidance or proposed rules that address the application of environmental justice concepts to the types of issues typically reviewed by the Board. Virtually all of the academic literature and guidance from other federal agencies with respect to environmental justice describes analysis of localized facility siting or construction decisions (e.g., where to locate an industrial facility, or whether to expand an airport). NS can find no precedent for environmental justice assessment of a financial transaction like the Transaction here, the principal environmental effect of which is to cause interrelated system-wide shifts in train and truck traffic throughout the eastern United States. The railroad rights-of-way at issue in the proposed action were established beginning in the mid-nineteenth century and were largely determined by the early twentieth century. Nearby land was developed with the full knowledge that freight trains moved along the tracks, in most cases with much greater frequency than they do today (e.g., in Cleveland, see Section 2.5.4) or would following the consummation of the proposed Transaction. Neither the Executive Order, nor any other guidance promulgated to implement the Order, directly addresses the type of action proposed here. NS believes that the DEIS environmental justice analysis is technically flawed, due in large part to the conceptual incompatibility of a facility siting model with the very different nature of this Transaction. Given that the Board is not required to conduct such analysis and that such analysis is not necessary to ensure inclusiveness and non-discrimination, a better approach is to review environmental analytic procedures to ensure non-discrimination, or to limit additional demographic analysis to new construction, as was proposed in the draft scoping notice for the EIS.

However, if the Board believes that environmental justice considerations in the future should become a distinct part of its processes, NS urges the Board to follow the lead of DOT and other agencies. The Board (like DOT and other agencies) should issue proposed rules or guidance on environmental justice analysis and seek input from community organizations, state and local governmental agencies, and other stakeholders before issuing final rules. The EIS

process is not the appropriate place for the Board to establish for the first time its policy and approach to environmental justice.

4.16.2 The Proposed Action Will Not Have Disproportionate Effects on Minority and Low-Income Populations.

The President's Executive Order on Environmental Justice directs Federal Agencies to identify and address "*disproportionately* high and adverse human health or environmental effects" on minority and low-income populations (emphasis added).²¹ The Applicants' Operating Plans have been devised to route freight traffic so as to provide the quickest, safest and most cost-effective rail transportation possible, to the benefit of persons of every racial and income group. Some lines will experience increased traffic and some will experience decreased traffic. Analysis of the minority and income status of populations adjacent to the rail lines, shown in Tables 4.16.1 and 4.16.2, discussed below, clearly shows that the increases and decreases in traffic over the 44,000 miles of rail lines at issue will not be borne by minority and low-income persons disproportionate to their presence along the rail lines. Since train routing decisions are not based on the status of the populations adjacent to the lines, this finding should come as no surprise.

The U.S. Department of Transportation's Order on Environmental Justice (as well as the literature in the field of environmental justice impact assessment) defines two tests to determine whether impacts are disproportionate: "Disproportionately high and adverse effect on minority and low-income populations means an adverse effect that:

- is predominantly borne by a minority population and/or a low-income population, or
- will be suffered by the minority population and/or low-income population and is appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the non-minority population and/or non-low income population."²²

Neither test is met in this Transaction.

²¹ Executive Order 12898, Sec. 1-101.

²² U.S. Department of Transportation, *Order to Address Environmental Justice in Minority Populations and Low-Income Populations*, February 3, 1997, page 25.

Potential impacts are not borne disproportionately by minority or low-income communities. Table 4.16.1 compares the minority and low income concentrations of populations that would experience increases in train traffic post-Transaction with the minority and low-income concentrations of populations residing adjacent to all of the rail lines to be controlled by the Applicants.²³ Table 4.16.1 clearly shows that the demographic makeup of communities that would see increases in train traffic is virtually identical to that of the system as a whole. It shows, additionally, that about 75 percent of the population adjacent to the rail lines involved in this Transaction that will experience train traffic increases is non-minority, and about 85 percent of the population so impacted is non-low-income. Potential impacts would therefore not be “predominantly borne” by minority or low-income communities on a system-wide basis.

Table 4.16.1: Comparison of Communities Where Train Traffic will Increase and Decrease Across the Expanded NS, CSX and Shared Assets Areas Systems

	Entire systems (NS, CSX and Shared Assets Areas)	Communities where:		
		Train traffic would increase above SEA threshold for analysis (8 trains per day)	Train traffic would increase by any amount	Train traffic would be unchanged or would decrease
Share of population with minority status	25%	22%	26%	24%
Share of population in poverty	15%	15%	15%	15%

On a system-wide basis, potential effects on minority and low-income populations would not “appreciably exceed,” or be “more severe” or “greater in magnitude” than among other adversely populations effected. Table 4.16.1 shows that communities that would see increased train traffic at or above the Board’s analytic threshold of eight trains per day are virtually identical in low-income concentration and, if anything, slightly lower in minority concentration

²³ Demographic data were gathered for populations adjacent to each rail line in the expanded NS, CSX and Shared Assets Areas systems using procedures similar to those described in the DEIS (Appendix K). Because NS’ analysis is system-wide, and, by contrast, the DEIS includes demographic data for only a small number of segments, there are two important differences in methodology. First, data were collected for this analysis at the postal zip code level instead of the census block group level used in the DEIS. Second, NS’ analysis does not isolate the portion of each zip code potentially affected by the Transaction. The DEIS provides no methodology for defining area of potential effect where the Transaction would result in benefits or in insignificant impact. This analysis is based solely on expected increases in traffic, as a surrogate for environmental impacts, and does not consider the mitigating effects of actions recommended by the DEIS.

than the system as a whole. Table 4.16.2 below focuses in on those segments where train traffic would increase. The table compares increases on segments with adjacent populations in the highest 20 percent in terms of minority and low-income concentration, with increases on other segments.²⁴ Table 4.16.2 clearly shows that, among communities adjacent to segments where train traffic would increase, those communities with the highest minority and low-income concentrations would not see bigger increases than the rest of the communities adjacent to such segments.

Table 4.16.2 Comparison of Rail Segments Where Train Traffic Would Increase (High Minority and Low-Income Concentration Segments Versus Other Rail Segments)

	Minority Concentration		Low-Income Concentration	
	Highest 20%	Other	Highest 20%	Other
Increase in train traffic (trains per day)	4.38	4.9	4.66	4.76

In the prevailing literature, statistical tests called “difference of means” tests are used to determine whether comparisons such as those made in Table 4.16.1 or Table 4.16.2 are “statistically significant,” i.e., whether differences in the demographic data are real or random ‘noise’ in the data. These tests - conducted on all the comparisons made in Tables 4.16.1 and 4.16.2 - confirm that differences in the average demographics of communities that will see various effects are not statistically significant.²⁵

²⁴ To construct the ‘highest 20%’ and ‘other segment’ groups, segments were ranked by minority or low-income concentration of adjacent populations from highest to lowest. Segments were then divided into five groups (quintiles). The sum of the populations in any quintile equals 20% of the total population adjacent to the entire system. The exercise was done separately for analysis of minority and low-income effects. The ‘highest 20%’ is the quintile with the highest minority or low-income concentration. The ‘other segments’ group includes the other four quintiles.

²⁵ As the literature suggests, difference of means tests are used to determine whether observed differences in minority and low-income concentrations are “statistically significant” at a 95% confidence level. See Vicki Been and Francis Gupta, “Coming to the Nuisance or Going to the Barrios? A Longitudinal Analysis of Environmental Justice Claims,” *Ecology Law Quarterly* v24 (1997) n1:1-56; Paul Mohai and Bunyan Bryant, “Environmental Injustice: Weighing Race and Class as Factors in the Distribution of Environmental Hazards,” *University of Colorado Law Review* v63 (1992) n4:921-932; and Andrew Szasz, Michael Meuser, Hal Aronson, and Hiroshi Fukurai, “The Demographics of Proximity to Toxic Releases: The Case of Los Angeles County,” Paper presented at the Annual Meetings of the American Sociological Association, Miami, FL, 1993.

Nowhere in the DEIS is there an assessment of whether impacts would be disproportionate, predominantly borne by minority or low-income populations, or whether potential impacts in low income communities would be more severe or greater in magnitude than among other affected populations. The only explanation of the DEIS methodology for determining whether effects on minority or low-income communities are disproportionate is as follows:

“SEA used a qualitative analysis approach which included review of several different factual circumstances, including cumulative effects of exposure to health and environmental impacts from many sources, to determine the significance levels on a local case-by-case basis. A determination of a significant environmental justice impact specifically included SEA’s consultation with affected communities.”²⁶

Such analysis can provide useful information, but it is not determinative of the question of whether impacts are predominantly borne by, or are more severe among, minority and low-income populations than among other populations on a system-wide basis. Members of communities consulted in such analysis would have limited knowledge of how other communities are being affected by the proposed action. Consultation might help to identify hypothetical cumulative effects (e.g., situations where individuals are more susceptible to effects because of site-specific circumstances) but the DEIS puts forward no reason why such consultation is needed only in minority or low-income communities, or why a community’s demographics could affect the potential for cumulative effects.

4.16.3 The Proposed Action Will Not Have High and Adverse Effects on the “Environmental Justice Communities” Identified in the DEIS.

The DEIS identifies seven rail segments along the expanded NS system that “may warrant environmental justice mitigation”²⁷ (see Table 4.16.3). The list is composed of rail segments that (1) exceed DEIS significance criteria for one or more environmental effects and (2) also exceed a DEIS threshold for minority or low-income concentration in the surrounding population.²⁸ The potential adverse effects identified on these segments include at-grade crossing safety (2 segments), freight rail safety (2 segments), and increased hazardous materials transport (5

²⁶ DEIS, Appendix K at 10-11.

²⁷ DEIS, Table 7-9, at 7-47 to 7-48.

²⁸ DEIS at 3-48 to 3-49.

segments). The DEIS also suggests that otherwise insignificant noise effects, in combination with other factors, could pose a “cumulative impact” on five of the seven segments.

**TABLE 4.16.3
NS RAIL SEGMENTS IDENTIFIED IN DEIS FOR ENVIRONMENTAL JUSTICE MITIGATION**

Segment	At-Grade Crossings	Freight Rail Safety	Hazmat Transport	Noise*
N-041	X		X	X
N-045	X		X	X
N-075			X	X
N-081			X	X
N-082			X	X
N-086		X		
N-090		X		

*Potential cumulative impact concern.

These rail segments, like all areas that could potentially experience effects, were appropriately subject to SEA assessment. NS is prioritizing outreach activities in minority and low-income communities near these segments as the DEIS directs. However, a closer look reveals that these communities will not experience significant impacts from the Transaction, much less impacts that are “disproportionately high and adverse.”

The initial step in the environmental justice methodology described in the DEIS is identification of health and environmental effects of the proposed Transaction.²⁹ The DEIS proposes system-wide and site-specific mitigation measures that SEA generally believes will “ensure” that no significant effects occur. Given these measures, NS sees no grounds for further environmental justice analysis. *There can be no disproportionately high and adverse effect on minority or low-income populations if there is no significant adverse effect at all, or if mitigation is in place to ameliorate the potential adverse condition.*

The failure to consider the benefits of proposed measures to promote at-grade crossing safety, freight rail safety, and safe hazardous materials transport is a major flaw in the DEIS environmental justice analysis. In this respect, the DEIS deviates from federal guidance and

²⁹ DEIS at 3-48.

accepted practice.³⁰ SEA proposes that its criteria-based at-grade crossing safety, freight rail safety, and safe hazardous materials transport measures be implemented in the identified environmental justice communities.³¹ The DEIS states that these measures would “address environmental impacts for these [environmental justice] communities.”³² The DEIS states that proposed mitigation measures are of the type that the Surface Transportation Board typically considers and imposes to “ensure freight safety”³³ and to “ensure safety at specific grade crossings.”³⁴ With respect to hazardous materials transport, the DEIS proposes system-wide measures to “prevent and quickly, efficiently and effectively respond to hazardous materials releases.”³⁵ The DEIS also proposes measures on these specific segments that “reduce potentially significant Acquisition related impacts resulting from the increased transportation of hazardous materials.”³⁶ Yet, the ameliorative effects of these mitigation measures are not taken into account by the DEIS’ environmental justice analysis.

Even in its consideration of potential impacts (i.e., those that could potentially occur absent measures to address them), the DEIS fails to demonstrate any reasonable connection to minority or low-income populations. The U.S. Environmental Protection Agency’s *Guidance on Incorporating Environmental Justice into EPA’s NEPA Compliance Analyses* notes that “the effects of proposed actions will often vary depending on the distance of the affected community from the action and the type of effect created by the action. Effects on the community should be

³⁰ The U.S. Department of Transportation’s Order on Environmental Justice states that, “in making determinations regarding disproportionately high and adverse effects on minority and low-income populations, mitigation and enhancements measures that will be taken and all offsetting benefits to the affected minority and low-income populations may be taken into account, as well as the design, comparative impacts, and the relevant number of similar existing system elements in non-minority and non-low-income areas.” U.S. DOT, *Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*, paragraph 8.b.

³¹ DEIS recommended Mitigation Number 1 for at-grade crossing safety, at 7-11 to 7-12; DEIS recommended Mitigation Numbers 3(A), 3(B), 3(C), 4(A), 4(B), 5 and 6 for hazardous materials transport, at 7-12 to 7-14; DEIS recommended Mitigation Numbers 7(A) and 7(B) for freight rail safety, at 7-14 to 7-15. Table 7-4, at 7-26 to 7-33 for at-grade crossing safety; Table 7-5 and 7-6, at 7-34 to 7-42 for hazardous materials transport; Table 7-2, at 7-25 for freight rail safety.

³² DEIS at 7-18.

³³ DEIS at 3-7.

³⁴ DEIS at 3-11.

³⁵ DEIS at 3-14.

³⁶ DEIS at 3-14.

discussed in terms of *reasonable* increments from the site”³⁷ (emphasis in original). In fact, the DEIS identifies minority and low-income populations based on areas that would hypothetically be affected by an exaggerated 65 dBA noise contour.³⁸ But the DEIS identifies no significant adverse noise impact in any of the seven environmental justice communities.

Two of the segments identified in the DEIS, N-086 (Toledo, Ohio) and N-090 (Harrisburg, Pennsylvania), are singled out for environmental justice analysis solely because of potential freight rail safety effects. The DEIS analysis of freight rail safety focuses on freight train collisions, derailments, and collisions with train service vehicles.³⁹ Freight rail safety effects are considered significant in the DEIS if, absent mitigation, they were projected to produce at least one accident in 100 years.⁴⁰ Freight rail incidents are almost always confined to the tracks themselves and, as the DEIS points out, are infrequent in any case.⁴¹ Freight rail incidents are rarely noticeable to the neighboring community. NS submits that the very low risk of a freight rail incident, the effects of which are usually confined to the tracks themselves, does not create a “high and adverse effect” on surrounding populations.⁴² In addition, measures taken to improve freight rail safety are determined by regulatory requirements, industry practice, available technology, and the railroad operating plan. Freight rail safety measures must be implemented system-wide, not on a community-by-community basis.

Two of the segments identified in the DEIS, N-045 (Ft. Wayne, Indiana) and N-041 (Danville, Illinois), are singled out for environmental justice analysis in part because of potential at-grade crossing safety effects. The potential effects are related to incidents involving highway vehicles, not residences. The DEIS provides no evidence linking the highway traffic at these crossings to the relevant populations, i.e., there is no evidence that a potential at-grade crossing safety issue has a significant adverse effect on an environmental justice community located elsewhere along the line segment.

³⁷ U.S. EPA, *Interim Final Guidance on Incorporating Environmental Justice into EPA's NEPA Compliance Analyses*, September 30, 1997, page 5. (Emphasis added)

³⁸ DEIS at 3-48 to 3-50.

³⁹ In the DEIS, freight rail safety issues are analyzed separately from hazardous materials transportation and at-grade crossing safety. The DEIS identifies no significant hazardous materials transport effect or at-grade crossing safety effect on either of these two segments.

⁴⁰ DEIS at 3-8.

⁴¹ DEIS at 3-4.

⁴² See Section 4.1 above for further discussion of freight rail safety.

These two segments, along with three others, N-081 (Ashtabula and Cleveland, Ohio), N-082 (Ashtabula and Youngstown, Ohio), and N-075 (Ashtabula and Cleveland, Ohio), are also singled out because of projected increases in hazardous materials transport. Rail transport of hazardous materials does not create a “high and adverse” effect in these communities. In 1996, 99.96 percent of all hazmat shipments through the NS system arrived without incident.⁴³ That figure has steadily improved from 99.90 percent a decade ago.⁴⁴ Like freight rail safety, measures taken to ensure safe transport of hazardous materials must be applied system-wide, not community by community. In similar fashion, the DOT has issued comprehensive hazardous materials regulations at 49 CFR Parts 171-174, which are intended to make the possibility of a hazardous materials incident unlikely. Compliance with the DOT rules on a system-wide basis, coupled with NS’ voluntary proactive risk management efforts (see Sections 4.4 and 4.4.4 of these comments), means the possibility of an incident occurring is remote, further supporting NS’ position that the projected increased hazmat traffic on those two line segments will have no high or adverse effect on the communities along those lines.

The additional safety benefits of the proposed Transaction should also be recognized in the environmental justice analysis. Between 1994 and 1996, the NS system experienced 2.15 incidents per million train miles, 41 percent better than Conrail’s record of 3.63 incidents per million train miles. According to the DEIS, hazardous materials incidents on the NS system caused no injuries between 1992 and 1996, while incidents on the Conrail system caused nine injuries.⁴⁵ The DEIS recognizes that the proposed action will create fewer incidents and “an overall safety improvement for rail transportation of hazardous materials.”⁴⁶ These findings should be reflected in any environmental justice analysis.

Finally, the DEIS indicates that the Board is still considering the possibility that “cumulative” impacts on environmental justice communities could result from noise and from other unspecified factors. However, the DEIS does not find “cumulative” impacts in other non-minority, non-low-income communities. The DEIS does not identify significant potential noise effects in any of the environmental justice communities. And, based on the analysis presented here, NS believes that these communities will not see significant adverse impacts of any kind. A finding of cumulative exposure is based on the idea that the whole is sometimes bigger than the

⁴³ As explained previously, an “incident” involving hazardous materials transportation refers to any leak or spill of material from its original container, without regard to the amount released or its effect. The loss of one drop of material is labeled an “incident.”

⁴⁴ This represents a 60% improvement in the rate of hazmat incidents.

⁴⁵ DEIS at B8-1 – B8-4.

⁴⁶ DEIS at ES-19.

sum of its parts, e.g., that synergies between multiple insignificant effects create a significant effect. Neither the DEIS, nor the scoping documents that preceded it, discuss a link between insignificant noise effects and other effects. The DEIS provides no evidence that such a link exists. The DEIS contains no discussion of how the hypothetical cumulative effects are borne disproportionately in minority and low-income populations. A finding of cumulative effects must be based on sound science that is clearly explained.

NS supports the Board's efforts to reach out to these communities and all the communities affected by the Transaction. These efforts complement NS's own ongoing activities in community outreach. NS reiterates its intent, wherever mitigation measures are appropriate, to address significant human health and environmental impacts to implement such measures regardless of the race, color, national origin or socioeconomic status of the affected communities. *However, NS does not believe that conditions in these seven locations (or any other community along NS' expanded system) warrant additional environmental justice mitigation beyond what may otherwise be appropriate to ensure adequate opportunity to participate in the EIS process.*

4.16.4 "Environmental Justice" Communities in the DEIS Are Not Predominantly Low-Income or Minority.

According to the DEIS, in none of the seven communities is a majority of the potentially affected population classified as low-income. And in only one community, along NS line segment N-041, does the share of minority persons in the potentially affected population top 50 percent.⁴⁷

Six of the seven communities were identified as "environmental justice" communities within the DEIS because they exceeded by ten percentage points the minority or low-income concentration in the surrounding counties. NS could find no applicable precedent for the use of this standard. Presumably, the DEIS meant to identify those communities that might be disempowered relative to wealthier or otherwise demographically different neighbors. The standard may be appropriate for examining the siting of a waste station, an industrial facility or a power plant. In such cases, plausible alternatives might shift the distribution of impacts among two neighboring communities. But the DEIS threshold of 10 percent greater minority or low-income population than the surrounding county makes no sense in the context of the proposed

⁴⁷ Segment N-041, in which 63.7% of the population are minority persons. Demographic information for each community is contained in Appendix K of the DEIS.

Transaction. The DEIS identifies no locality in which a decision on the proposed Transaction will redistribute burdens among neighboring communities not located adjacent to the railroad.

The potential effects identified in the DEIS for these seven communities result from interdependent changes in rail traffic patterns across a 44,000-mile system that crosses county, state and even national borders, changes that are central to the benefits of the proposed Transaction. Therefore, NS urges that this standard for defining a community as minority or low-income be dropped from the FEIS.

4.16.5 The Environmental Justice Mitigation Measures Proposed in the DEIS Are Unjustified and Impractical.

Notwithstanding the acknowledgment that other proposed mitigation measures address all of the relevant environmental impacts in the seven environmental justice communities, the DEIS directs the applicants to “meet with these communities *to identify and agree on any further appropriate measures* to address the specific environmental impacts that may disproportionately impact these communities.”⁴⁸ The DEIS states further that, absent such agreement prior to issuance of the FEIS, “SEA may recommend that the Board, as a condition of the approval of the Application, direct CSX and NS to implement appropriate mitigation measures.”⁴⁹

It should be reiterated that the proposed Transaction will not have a disproportionate impact on minority and low-income communities in general, that the proposed Transaction will not have a high and adverse impact on the seven environmental justice communities identified in the DEIS, and that only one of these communities is predominantly made up of low-income or minority persons. For all these reasons, negotiation of further mitigation solely on the basis of population demographics would be inappropriate.

The Board is limited by its own regulations to condition approval of a proposed action on environmental mitigation only when that mitigation is directly related to the environmental impact of the proposed action.⁵⁰ Imposing mitigation based on the environmental justice analysis reflected in the DEIS, would, contrary to these regulations, be based not on evidence of additional human health or environmental impact on these communities, but rather solely on the

⁴⁸ DEIS at 7-18. (emphasis added)

⁴⁹ Id.

⁵⁰ 49 CFR 1180.1(d). The point is also made in the DEIS at 3-3.

minority or socioeconomic status of these communities. The additional mitigation proposed is not connected to any significant environmental impact of the proposed Transaction.

For example, consider the N-090 segment (Harrisburg, Pennsylvania) and the N-086 segment (Toledo, Ohio) that could see potential freight rail safety effects according to the DEIS. Based on the demographics of the surrounding populations, the DEIS characterizes these as environmental justice “communities” and recommends that NS consult and reach agreements with these “communities” for additional mitigation. There are two other segments in the NS system (N-047 (Indiana Harbor, Indiana) and N-077 (Oak Harbor, Ohio) that could see the same potential freight rail safety effects, according to the DEIS. The populations surrounding these segments do not exceed the DEIS environmental justice thresholds for minority or low-income concentration, so the DEIS does not call for additional mitigation. The DEIS does not claim that Harrisburg and Toledo would experience greater freight rail safety effects than would Indiana Harbor or Oak Harbor. In fact, freight traffic will increase by less than 10 percent in the Harrisburg and Toledo segments as contrasted with increases of 20 percent and 22 percent in the Oak Harbor and Indiana Harbor segments respectively.⁵¹ The DEIS does not identify a technical basis for the additional mitigation, and mitigation is not justified based on population demographics alone. *An order made on this basis would clearly be contrary to the Board’s regulations and the intent of the Executive Order.*

Furthermore, the method proposed in the DEIS for developing additional mitigation for DEIS-designated environmental justice communities -- negotiation of binding agreements with minority and low-income populations -- is impractical and inconsistent with existing guidance. Who has the authority to speak for “affected populations”? How are parties to be excluded from or included in the negotiation? Must there be unanimous agreement among all interested parties? If not, who must agree? Are the terms of the negotiation limited by the Board’s authority to impose mitigation, or are all issues on the table? Given that these negotiations are to be based on or are the basis for an order of the Board, are they governed by the Federal Advisory Committee Act? How would the terms of an agreement be enforceable against any party other than the Applicants?

Similar concerns were raised when the U.S. Department of Transportation proposed the notion of developing environmental justice mitigation through binding agreements with affected

⁵¹ DEIS at ES-8.

populations in its draft Order on Environmental Justice.⁵² The State of Colorado called the proposal “far too expensive and time consuming.” The National Association for the Advancement of Colored People (NAACP) argued that the option sent the “wrong message and should be removed” because it would create “powerful incentives for project sponsors and unrepresentative factions within a community to reach ‘agreements’ that are not truly representative of community sentiment.”⁵³ The NAACP pointed out that parties to such an agreement might unknowingly compromise their rights to settle environmental justice complaints through other means.⁵⁴ The State of California asked how it would determine, “when there really is community ‘buy in’?”⁵⁵ California pointed to the West Cypress Expressway reconstruction in Oakland, where successful negotiations with one community group prompted a lawsuit from another. “A significant amount of resources had to be expended in defending the suit.”⁵⁶ The New York City Bar Association, commenting generally in favor of environmental justice measures, called the proposal for negotiations with affected populations, “fraught with risk and unworkable. In particular, the identification of the appropriately representative group to enter into an agreement... which, in effect, waives the whole community’s environmental justice protections does not appear to be a task that a government agency is suited to undertake.”⁵⁷ Finally, the State of Illinois commented that mitigation measures likely to be of interest to affected populations would be “impractical” because funding of those measures would be beyond the authority of state or federal public works and transportation agencies.⁵⁸

In its Final Order, U.S. DOT noted that comments expressed “concern and uncertainty as to the implementation” of the negotiated agreement approach: “DOT agreed with the comments

⁵² DOT proposed three options (A – C) for developing mitigation for environmental justice impacts (paragraph 6 of the draft order). Option B included a requirement that “an agreement is reached with the potentially affected populations to proceed with the program, policy or activity.” U.S. DOT, *Proposed Order to Address Environmental Justice in Minority Populations and Low-Income Populations*, June 29, 1995, Option ‘B’, paragraph 6.b(1).

and, accordingly, that paragraph has been deleted from the final order.”⁵⁹ NS recognizes that the Board is not bound by the DOT Order, but urges the Board to come to the same conclusion as DOT and public commentors on this matter.

NS is not opposed to additional consultation with individual communities. Our own outreach efforts to date are described in Sections 5 and 6 of these comments. Additional consultation may be useful, for example, in determining whether a particular at-grade crossing safety, freight rail safety or hazardous materials transportation mitigation strategy recommended by the DEIS can be tailored to address local concerns. Consultation may open the EIS process to input from a wider spectrum of interests. NS supports efforts to achieve these objectives. *But NS is opposed to binding negotiations of the type proposed in the DEIS, and to practices that might create preferential treatment on the basis of minority status or income.*

4.17 Cumulative Impacts

The DEIS evaluated system-wide cumulative effects of the Conrail Transaction, considering the scale and dimensions of the overall Transaction, including the effects on energy, air quality and transportation. Based on this evaluation, the DEIS concludes that the Transaction will result in a net positive cumulative effect. Norfolk Southern concurs with this conclusion - as stated in Section 3 herein, NS strongly believes that this Transaction will have a net positive benefit for the environment and the economy.

The DEIS also discusses evaluating cumulative impacts on identified environmental justice communities, but not, however, on other communities with similar potential impacts. The DEIS provides no supporting justification, analytical approach, or evidence supporting potential adverse cumulative effects at the local level. The DEIS includes no methodology for weighting and then combining the various potential adverse effects of rail traffic (grade crossing safety, traffic delays, noise, etc.). And of course, there is no quantification of the benefits of the Transaction on a localized basis. Further, there is apparently no consideration of the mitigation effects of measures SEA plans to require. NS believes this approach is flawed as discussed in detail in Section 4.16 above.

⁵⁹ U.S. Department of Transportation, *Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*, preamble, page 7.

4.18 Relationship Between Short-Term Uses of the Environment and Enhancement of Long-Term Productivity

The DEIS considers the extent to which the Transaction would result in long-term productivity gains at the expense of short-term use of the environment and environmental impacts. Potential short-term impacts result from construction activities for new rail line connections. The short-term impacts identified by the DEIS are typically very limited in geographic scope, and readily mitigated by the railroad's existing Best Management Practices employed at construction sites. The DEIS concludes that the short-term impacts would be offset by long-term gains in productivity, including increased productivity and efficiency of rail operations in the eastern U. S. Long-term positive effects include system-wide reductions in energy consumption, highway traffic congestion, highway safety and air pollutant emissions. *Norfolk Southern concurs with this conclusion - the Conrail Transaction will have a net positive benefit for the environment and the economy.*

4.19 Irreversible and Irrecoverable Commitment of Resources

The DEIS evaluates the irreversible and irretrievable commitment of resources, including natural, physical, human and fiscal resources. The evaluation addresses resources committed to both operational changes and construction of new and/or modified intermodal facilities, rail yards and line segments. Operational changes on existing rail lines redistribute resources, but do not increase the use of irreversible and irretrievable resources. New construction activities typically involve use of land and construction materials, labor, and minor amounts of fossil fuels. Land use is an irretrievable commitment only for the period of use by the railroad; the land can later be converted to another use. The use of construction materials, labor, and fossil fuels represents a minor irretrievable use of resources; use of these materials will not have an adverse effect upon continued availability of these resources. Therefore, the DEIS concludes that the benefits of the proposed Transaction would outweigh the commitment of the described resources. The long-term positive effects include system-wide reductions in energy consumption, highway traffic congestion, and air pollutant emissions. *Norfolk Southern concurs with this conclusion - the Conrail Transaction will have a net positive benefit for the environment and the economy.*

4.20 Abandonments

SEA evaluated the potential for abandonment-related impacts on land use and socioeconomics, natural resources (water and biological), air quality, noise, cultural resources (historic and archeological), hazardous waste sites, transportation, and energy. The DEIS found that no significant impacts would result from the proposed abandonments. The findings in the DEIS are well-founded and the methodologies are appropriate for evaluating the potential for abandonment impacts.

In general, abandonments are expected to have a positive impact; therefore, mitigation measures were recommended on a system-wide basis. SEA recommended using "best management practices" to minimize soil erosion and sedimentation, restoring any adjacent properties that are disturbed during right-of-way salvage activities, controlling temporary noise caused by salvage equipment, restoring roads disturbed during removal activities, and contacting and coordinating activities with the State SHPO if any previously unknown archaeological remains are found. SEA also recommended that NS comply with all applicable federal, state, and local regulations regarding the control of fugitive dust and the handling and disposal of any waste materials. NS is committed to fulfill these requirements.

4.21 Construction

SEA evaluated proposed NS construction projects for 11 new connections and 1 bridge rehabilitation. The DEIS sets forth SEA's criteria for determining which constructions require environmental review (DEIS at 1-14). Normally, SEA does not evaluate the impacts of constructions and other activities that take place wholly within existing right-of-way. However, to ensure a thorough environmental review of the proposed merger, certain activities, even if they would occur solely within the existing railroad right-of-way, were reviewed in the DEIS. Specifically, SEA reviewed such projects if (1) they were major undertakings; (2) they would not be undertaken but for the proposed Conrail Transaction; and (3) they had the potential for environmental impacts outside the existing right-of-way (DEIS at 1-15).

NS concurs with the findings in the DEIS. The findings are well-founded and the methodologies are appropriate for evaluating the potential construction-related impacts.

During engineering studies on Conrail's Buffalo-Binghamton rail line, a Conrail Bridge (No. 361.66) over the Genesee River near Portageville, New York, was found to be near the end of its useful life. The bridge is an 819-foot long steel viaduct carrying a single railroad track, and is currently rated for 263k (load rating) traffic at 10 mph due to its design, age and condition. The viaduct rests on six steel towers that were constructed in 1875. The design and age of the current structure preclude repair or renovation of its load-handling capability without essentially replacing the entire bridge. NS is conducting further studies to evaluate alternatives to replace the existing bridge. The anticipated bridge replacement is in response to an existing condition, and is not related to the Transaction. NS will replace the bridge in full compliance with all applicable federal, state and local laws and regulations.

4.22 Other Miscellaneous Issues

4.22.1 Train Traffic Correction for CP Trains on the Michigan Line Segments

The presence in the DEIS of the W. Detroit to Jackson, Michigan (N-121) and Jackson to Kalamazoo, Michigan (N-120) line segments fails to consider important information provided by NS to SEA in October 30, 1997 correspondence. In that correspondence, NS clarified that the Canadian Pacific (CP) traffic that was included in the Operating Plan for these segments was not correct. As the October 30 letter specified, a final agreement with CP has not been reached. For the agreement to become final, CP would have to commit capital on the NS line and on the Amtrak line from Kalamazoo, Michigan to Porter, Indiana, including specialized locomotive equipment for the Amtrak line. No CP trains would be hauled on the NS or Amtrak lines until a final agreement has been reached. Further, by agreement with CSX, CP is required to send a minimum number of trains on the CSX line (from Detroit, MI to Grand Rapids, MI to Porter, IN). The specified minimum number of trains is confidential but would decrease the number of trains it would send on the NS line if a final agreement should be reached and if CP should choose to use its haulage rights with NS. With this understanding, the letter stated that the CP traffic should not have been added to these line segments. *The CP traffic should be deleted; as a result, the two line segments would not meet STB thresholds and, therefore, no longer need to be analyzed for environmental impacts.* Additionally, the CP trains should not have been added to the Amtrak line from Kalamazoo to Porter. The correct train data is included in Section 7.11 of these comments and should be used for these line segments for the FEIS.

4.22.2 Train Traffic Correction for Kankakee Connection

The Errata issued by SEA (January 12, 1998 Errata at 10, row 3, Subject - Construction) proposes to correct the DEIS at Chapter 5, page IL-22 by making the following correction: "according to the Application, approximately six trains per day will run over the new connection." This statement is only technically correct and is misleading. The ER did indicate this level of traffic, but in error. To correct this, October 2, 1997 correspondence from NS to SEA stated:

Traffic on the new connection would be zero trains per day after the Transaction but could increase later if the market for transportation services grows.

and;

The proposed project would allow NS to provide more consistent service for customers on these routes in anticipation of the growing future markets for transportation services in these areas.

Even though growth in the market for transportation services is anticipated, future traffic levels cannot be known at this time, and consideration of future market growth does not meet the Board's criteria for relation to the Transaction.

The DEIS was correct at Chapter 5, page IL-22. The DEIS was incorrect, however, in its discussion of the Kankakee connection at IL-74. The latter discussion and recommendations were based on outdated and incorrect information. (The initial error in the DEIS was compounded in SEA's January 12, 1998 Errata which proposed to eliminate the correct information and let the incorrect information stand.)

In summary, the correct information was properly reflected in the initial DEIS at IL-22. The January 12, 1998 Errata was incorrect. The discussion and references at Volume 3A, page IL-74 are incorrect. *Applying the correct information of zero trains per day, there is no potential impact in Kankakee. The FEIS should consistently reflect the correct information in its analysis.*

4.22.3 Miscellaneous Comments Addressed by CSX

NS concurs with CSX's comments on the DEIS regarding the Stark Development Board, Cross-Harbor Car Float Service, New Jersey Department of Transportation and New Jersey Transit Corporation and the Southeastern Pennsylvania Transportation Authority.

5.0 NORFOLK SOUTHERN RESPONSE TO DEIS DISCUSSION REGARDING COMMUNITIES WITH UNIQUE CIRCUMSTANCES

The DEIS identifies several communities with “unique circumstances” as areas of special concern. SEA conducted additional analyses and site visits to assess potential environmental impacts and public concerns in these communities. The DEIS identifies the following as communities with unique circumstances potentially affected by NS’ operations and activities following the Transaction:

- Lafayette, Indiana
- Muncie, Indiana
- Four Cities Consortium (Gary, East Chicago, Hammond, and Whiting, Indiana)
- Cleveland, Ohio
- Western Cleveland Suburbs, Ohio
- Erie, Pennsylvania

The DEIS directs NS to resolve potential environmental impacts in these communities through negotiation of binding agreements between and among the locally affected community, NS and the appropriate government agencies. SEA is also planning and implementing an expanded public outreach program in these (and other) communities to ensure adequate public access to information about the Transaction and the EIS process.

NS believes SEA’s approach of requesting binding agreements with the intent of imposing the agreements as conditions, as described within the DEIS, to be inappropriate. NS strongly opposes the imposition of negotiated agreements as a condition of approval of the Transaction (see Section 2.6). Agreements reached between the railroad and local communities should be recognized as stipulations by the Board, not made a condition of the Transaction approval.

Although NS does not believe negotiated settlements should be mandated as a mitigation measure, it does recognize the importance of ensuring the public’s access to information on the Transaction, and in working with affected communities to address specific issues wherever possible. Accordingly, NS has initiated a community coordination and outreach program with the communities identified above. The purpose of NS’ community outreach is to identify

community concerns relating to the Transaction, and provide information to the communities regarding NS operations and activities, including environmental and safety management programs. Where potential environmental impacts are identified and require mitigation, NS will coordinate potential mitigation strategies in an attempt to resolve the community concerns and potentially enter into memoranda of understanding (MOU's) with the affected parties.

NS' coordination efforts with the above communities are designed to be flexible and responsive to the needs of each community. Community-specific coordination and outreach efforts are summarized in the following sections. NS is willing to work with these communities to the extent practicable to mitigate the effects of increased train traffic. However, because these communities are located in or near long-standing major rail line routes and hubs, it is commercially and operationally infeasible to reroute large amounts of traffic away from these areas. Nonetheless, NS remains open to all constructive dialogues related to the Transaction and the potential impacts it may have on selected communities.

5.1 Lafayette, Indiana

The DEIS identifies potential environmental impacts for noise, transportation safety (eight at-grade crossings) and traffic delay (ten at-grade crossings) at Lafayette, which has a long-standing concern about the local impacts of railroad operations. The ongoing Lafayette Railroad Relocation Project, involving the relocation of the NS line and the removal of the existing NS tracks through Lafayette, was initiated to address existing conditions. The project will also offer mitigation for the transportation, noise, and air quality impacts of the Transaction, according to the DEIS. The Lafayette Railroad Relocation Project has been ongoing since the 1970's; completion is anticipated by 2001, pending final funding. The DEIS also includes additional mitigation requirements for Lafayette, including: directing NS to upgrade the at-grade crossing warning devices to mitigate the potential safety issues; and directing NS to meet with the City of Lafayette, Indiana DOT, and other appropriate parties to negotiate an interim mitigation plan to address potential vehicle delay at the ten crossings until the relocation project is completed.

There are several inconsistencies within the DEIS approach for Lafayette which overstate the need for special treatment:

- The DEIS concludes that Tippecanoe County is designated as attainment for all pollutants (DEIS at IN-46), and the Transaction-related air emissions would not

adversely affect air quality (DEIS at W-49). No need for air quality impact mitigation has been identified for Lafayette in the DEIS. However, in the Preliminary Recommended Mitigation section (DEIS at IN-89) for Lafayette, the completion of the Lafayette Railroad Relocation Project would reportedly mitigate air quality impacts. This is an inconsistent application in the DEIS of the basis for mitigation.

- The DEIS calculated the 65 dBA L_{dn} noise contours for pre- and post-Transaction conditions at the NS line segments Peru - Lafayette Junction and Lafayette - Tilton. These line segments exceed this DEIS threshold for evaluation, but do not exceed the 70 dBA L_{dn} and 5 dBA increase threshold as a significant impact. "SEA considered rail line segments eligible for noise mitigation for noise sensitive receptors exposed to at least 70 dBA L_{dn} and an increase of at least 5 dBA L_{dn} due to increased rail activity." DEIS at 3-35. Since noise levels at these rail line segments do not qualify as significant impacts, no mitigation is necessary for noise.

- The DEIS directs NS to upgrade safety warning devices at several crossings. However, as stated in Sections 2.4 and 4.3, of these comments, NS believes this requirement conflicts with state DOT authority to determine crossing upgrade priorities, and fails to consider site-specific variables.

- Traffic delay impacts identified at the ten NS at-grade crossings at Lafayette no longer meet the DEIS threshold for a significant impact resulting from the Transaction, as calculated within the January 21, 1998 Supplemental Errata. Nonetheless, the Supplemental Errata concludes that mitigation is required for the 10 crossings "...due to the unique conditions in this community with close proximity of these crossings to each other within an urban setting and the resultant effect on traffic delay along these roadways." Supplemental Errata, Table 1, at 3 of 4. Thus, the DEIS applies a more restrictive and arbitrary threshold for significance of traffic delays to Lafayette than to other communities. There is no supporting rationale for this more restrictive threshold, nor any supporting studies projecting "...the resultant effect on traffic delay along these roadways." In addition, the Lafayette Railroad Relocation Project will eliminate all highway/rail at-grade crossings, thus eliminating the projected vehicle delays.

The City of Lafayette is not significantly adversely impacted by the Transaction, as defined by the DEIS thresholds for significance. *The existence of multiple at-grade crossings is a pre-existing condition, with a plan to address the existing condition (the Lafayette Railroad Relocation Project) in place for the past several years, and now undergoing the final phase of construction. The additional temporary traffic delay related to the Transaction does not meet the DEIS requirements for significance, and therefore does not warrant special mitigation.*

Regardless of these inconsistencies, NS recognizes the importance of ensuring the public's access to information on the Transaction, and in working with affected communities to address specific issues and public concern wherever possible. Accordingly, NS has initiated a coordination and outreach program with the City of Lafayette and the Indiana DOT.

5.2 Muncie, Indiana

The DEIS notes that residents of Muncie have expressed concerns regarding traffic delays, including potential delays of emergency vehicles, that may result from increased train traffic on NS' line between Alexandria and Muncie. The DEIS directs NS to negotiate with the City of Muncie, Indiana DOT, and other appropriate parties to develop a binding agreement for the implementation and funding of measures to address safety and traffic concerns at seven highway/rail at-grade crossings in Muncie on the Alexandria to Muncie line.

There are several inconsistencies with this approach. In addition to NS' previously stated objection to mandated negotiations concerning grade crossings and Board imposition of stipulated agreements as conditions of approval (see Sections 2.4 and 2.6), the requirement for mitigation at Muncie is not based on any determination of potentially significant environmental impacts within the DEIS. The crossings at Muncie do not exceed the DEIS impact thresholds for significance for delay or safety, and therefore do not require mitigation. The sole reason for identifying Muncie as a community with unique circumstances appears to be the existence of public comments unsupported by technical analyses of impact.

Nonetheless, NS recognizes the importance of ensuring the public's access to information on the Transaction, and in working with affected communities to address specific issues and public concern wherever possible. Accordingly, NS has initiated a coordination and outreach program with the City of Muncie and the Indiana DOT. NS has also proposed to work with the Indiana DOT and other relevant governmental agencies to seek support and public funding for

upgrading seven existing grade crossings from Council Street to Morrison to include both automatic flashing lights and gates. NS submitted this proposal to SEA on November 25, 1997. A copy of the letter proposal is included in Volume 5B of the DEIS.

5.3 Four Cities Consortium, Indiana

The Four Cities Consortium is an association of East Chicago, Gary, Hammond, and Whiting, Indiana, formed to assess regional effects of the proposed Transaction. Its concerns focus on localized issues of safety and traffic delays at crossings. The DEIS identified potential significant safety impacts at four CSX at-grade crossings, but none for at-grade crossings on NS rail line segments. Traffic delay impacts were evaluated for 15 crossings (both CSX and NS), and the DEIS determined that levels of service remained unchanged and therefore no mitigation was warranted. However, recognizing the Four Cities Consortium's expressed concerns regarding potential delays for emergency vehicles, the DEIS recommends that NS and CSX negotiate with the Four Cities Consortium and the Indiana DOT to address potential traffic delay and safety concerns at nine at-grade crossings. Potential noise impacts were also addressed by the DEIS, but no significant noise impacts requiring mitigation were identified. The DEIS does not identify any disproportionate or specific impacts affecting low income or minority populations within the Four Cities Consortium area. Nonetheless, additional public outreach efforts are being conducted by SEA.

There are several inconsistencies with this approach to mitigation. In addition to NS' previously stated objection to mandated negotiations (see Section 2.6), the requirement for negotiated mitigation at the Four Cities is not based on any determination of potentially significant environmental impacts within the DEIS. The crossings within the Four Cities do not exceed the DEIS impact thresholds for significance for delay, and therefore do not require mitigation. The sole reason for identifying the Four Cities as a community with unique circumstances appears to be the existence of public comments unsupported by the DEIS technical analyses.

The Four Cities Consortium proposed two alternative plans, aimed principally at rerouting CSX train traffic. Implementation of the Consortium's Alternative 2 would compel NS to grant CSX trackage rights over the NS Fort Wayne - Chicago main line between Hobart and Van Loon, and construct new connections at Van Loon between NS and the Elgin, Joliet and Eastern Line at Pine Junction between the post-Transaction NS lines and CSX. *The proposed*

operations over NS' lines are not feasible, and, moreover, would significantly undermine NS' service from Chicago to the Southeast.

The Hobart-Van Loon trackage rights would burden an important NS main line that represents NS' only route between Chicago and Cincinnati, Atlanta, Jacksonville, New Orleans, the Virginias, and the Carolinas. This additional burden would be placed on the NS line at the same time that NS would be losing the use of a second main line route in this corridor (the former Conrail Fort Wayne - Hobart line, which NS only recently acquired and which will be assigned to CSX as part of the Transaction). Following the Transaction, NS would be left without a viable alternative routing for time-sensitive and other high priority trains between Chicago and the Southeast. The unanticipated addition of CSX trains to NS' line between Hobart - Van Loon would aggravate congestion problems on the line and would threaten NS' ability to maintain schedules for time-sensitive traffic, including passenger trains. Currently, there are 16 Amtrak passenger trains per day using the line east of Pine Junction.

With respect to the two new connections that would have to be constructed under the Four Cities Consortium Plan, the Pine Junction connection would be especially problematic for NS. Due to the track arrangement east of Pine Junction, this "connection" would actually involve the crossing (via two intermediate crossovers) of a line that will be allocated to NS - the extremely busy Conrail Chicago - Toledo mainline. A crossing at that location would cause severe disruption, at substantial costs, to NS' planned operations.

Although NS' analyses clearly show the Four Cities Consortium's proposed alternatives to be unworkable, and the DEIS determined there are little if any adverse environmental effects on the area from the Transaction, NS is committed to working with the Four Cities Consortium to address its concerns. NS and CSX have established a series of working groups with representatives of the Four Cities. These groups are scheduled to meet January 30 and February 11, 1998 to continue discussions of alternative routings and train traffic flows.

5.4 Cleveland, Ohio

After careful review of the DEIS, NS believes that, notwithstanding SEA's designation of the City of Cleveland as a community with "Unique Circumstances" warranting mitigation, the public concern that has been expressed with regard to post-Transaction train traffic increases in Cleveland, and the reality of fairly substantial traffic increases on some lines, **there are few**

significant adverse impacts expected. Indeed, the overall objective analysis of the environmental impacts presented in the DEIS for the Cleveland area shows that, on the whole, there are relatively few significant impacts expected, and that these are addressed by mitigation measures applied on a larger scale. The only potentially significant environmental effects identified in the Cleveland area are as follows:

- Noise impacts on portions of three CSX line segments (CSX has proposed a noise abatement plan).
- Four CSX and one NS line segments have been classified as Key Routes for Hazardous Materials (mitigation measures proposed for key routes ameliorate the potential significant impact from hazmat transport).
- Grade crossing delays at two crossings on CSX line segment (C-070).
- “Environmental justice” communities as defined by SEA have been identified along two CSX and two NS lines. (NS’ analyses, presented in Section 4.16, show there are no disproportionate high and adverse impacts on low-income and minority communities.)

Although there were no NS grade crossings that exceeded the DEIS threshold for significance for traffic delay, nonetheless, the January 12, 1998 Errata recommends that NS consult with the City of Cleveland to reach agreement on measures to minimize or mitigate the effects of “increased” emergency response vehicle delay. (London Road and Dillie Road crossings on the Cleveland to Ashtabula line segment [N-075]. DEIS at OH-146).

For the City of Cleveland as a whole, the DEIS directs CSX and NS to jointly and/or separately continue to consult with the City of Cleveland, the City of East Cleveland, the Ohio Department of Transportation, elected officials and others to address concerns about train traffic increases on the following line segments:

CSX - Quaker to Mayfield line segment

CSX - Mayfield to Marcy line segment

NS - Cleveland to White line segment

NS - Cleveland to Ashtabula line segment

The DEIS directs CSX and NS to negotiate a mutually-acceptable binding agreement on train routing through Cleveland and mitigation measures for those routes that could experience potentially significant environmental impacts. As stated previously, NS does not believe that negotiated settlements should be mandated as a mitigation measure, and Cleveland is no exception. Nonetheless, the Applicants have been meeting with City representatives and others in an attempt to fully address local concerns regarding the Transaction.

In December 1997, the City proposed that the Applicants "flip" ownership of selected lines traversing the City. Both railroads conducted an exhaustive operational, engineering, and environmental analysis of the proposal and reported back to Cleveland in mid-January 1998 that the flip proposal would not be feasible.

The alternative routings now proposed by the City (released publicly by the City of Cleveland on January 27, 1998), would result in NS traffic moving over the portion of the Short Line between Berea and Harvard/University Circle toward connections with its own Buffalo and acquired Pittsburgh lines. It would further result in all present and future CSX traffic moving between Berea and Collinwood over the Lakefront Line in order to connect with the newly acquired CSX route via Buffalo and upstate New York to the Northeast. This is essentially the same flip proposal examined by the railroad in December 1997. In the recent news release, dated January 27, 1998, from the office of Mayor White, the cost of the City's alternative was estimated by City consultants to be in the range of \$148 to \$171 million, with the need for a massive "fly-over" and other improvements in Berea at significant cost. The costs of the mitigation alternative proposed by the City are substantially disproportionate to the adverse environmental impacts identified within the DEIS.

Applicants' analysis confirmed that the routing alternative proposed by Cleveland would not be practical for several reasons. First, the alternate routing would adversely affect the primary mainlines of NS and CSX and would have these competing rail traffic flows intersecting at the town of Berea. This would create a massive bottleneck or "traffic jam," with resultant inefficiencies and delays in train traffic throughout this part of the system for both NS and CSX. Eliminating the "bottleneck" at the crossing would require construction of a massive "fly-over" at Berea to enable the unrestricted crossover of CSX and NS trains to and from their primary main lines. An unrestricted fly-over with the necessary 0.5 percent gradient and clearances for future improvements would be over two miles long, and would essentially cut the town of Berea in two. Construction would require almost two years, and could only begin after an exhaustive study and design period, including an assessment of environmental impacts, which would require

an additional one to two years (this assumes that the necessary federal, state, and local approvals were obtained in a timely manner). Construction would necessitate the disturbance and perhaps condemnation of existing residential and commercial structures, and would dramatically alter the existing character of the affected area. Of particular concern, but requiring further analysis, is the prospective impact of the construction on Berea's existing infrastructure, including highways, sewer lines, water lines, and utility and communication lines.

Applicants' analysis also indicated additional impracticalities in the proposed alternate route. A second track would be required at the Harvard Connection in order for NS to operate. The construction of this track would necessitate the building of a bulkhead in the adjacent creek basin and can be expected to adversely affect the environmentally sensitive waterfall located in Mill Creek which Cleveland had desired to protect. Also, in order for NS to maintain its critical operating base at Rockport Yard, substantial additional track construction would be required to be able to access Rockport Yard and the Ford Motor Company. The proposed alternate route would also adversely impact NS' efficient access to its major ore dock at Whiskey Island. **For these and other reasons, NS continues to oppose the flip of ownership of rail lines in Cleveland.**

Other responsive applications were filed by several parties for Cleveland expressing concern about the impact of increased train operations in the community. These included the City (Mayor White) and Congressmen Louis Stokes and Dennis Kucinich. A theme of all of these responsive applications has been to ask CSX and NS to reroute all rail traffic -- existing and future changes in trains -- away from Cleveland and consider reallocating rail lines within Cleveland.

Applicants stated in their rebuttal to these responsive applications that, while NS and CSX acknowledge that they are willing to work with Cleveland to the extent possible to mitigate impacts of increased traffic, the fact remains that the City of Cleveland has long served as a rail hub, and Conrail has concentrated its traffic flows through the city. In fact, historical train count data going back to the early 1900's show train traffic levels exceeding those anticipated by this Transaction.

NS and CSX presented to the City and other officials a set of detailed reasons why rerouting traffic flows away from Cleveland is neither commercially nor operationally feasible. Moreover, the potential alternatives for reallocating routes and rerouting rail traffic within

Cleveland entail disproportionate expense and/or pose operating problems that would create fundamental disruptions in the CSX and NS rail systems. It should be further emphasized that NS and CSX, in developing their Operating Plans, made efforts to mitigate the impact of increased rail traffic, for example CSX's routing traffic over the Short Line Subdivision. Without any additional mitigation, CSX is reportedly planning to invest over \$60 million in the Cleveland area for system improvements and upgrades, while NS is anticipating spending over \$48 million on new and expanded facilities in Ohio in addition to necessary system improvements and upgrades. Because of Cleveland's key position as an important rail hub, both carriers (NS and CSX) will offer assistance to Cleveland from Applicants' industrial development staffs to assist the greater Cleveland area in attracting new industry and expanding existing developments with rail access.

NS urges the Board to review the information presented by Applicants regarding the City of Cleveland in the rebuttal. NS also urges the Board to give proper weight to the substantial benefits of the Transaction as compared to the relatively minor impacts predicted by the DEIS when evaluating the need for and extent of any mitigation and/or "binding agreements" in Cleveland. A recent editorial in the Cleveland "Plain Dealer," a local newspaper, offers support for this rational position (see Figure 5.1). Key information provided to the Board by Applicants regarding the City of Cleveland's concerns include:

- Applicants' Rebuttal, Volume 1: Section X (pages X-1 thru X-4)
- Applicants' Rebuttal, Volume 2A: Verified Statement of John Orrison (pages 546-556)
- Applicants' Rebuttal, Volume 2A: Verified Statement of John Friedman (pages 164-171)

NS remains open to addressing identified significant impacts and in dealing with issues raised by the community in a constructive fashion. However, localized solutions that appear to potentially substantially impact the overriding public and environmental benefits of the Transaction may make certain negotiations challenging.

White drives the train

Cleveland's effort to reconfigure major rail deal
could damage others' interests – and its own

To his roles as airport master planner and stadium construction boss, Cleveland Mayor Michael R. White this week added an even more ambitious one: architect of a major railroad make-over.

AGENDA '98

THE REGION

To the consternation of professional railroad

planners, White proposed to resolve concerns arising from the sale of Conrail by requiring CSX and Norfolk Southern to swap routes they would operate when the Conrail deal gets regulatory approval.

Such a move would spare Cleveland neighborhoods the adverse affects of increased train traffic but could also transfer them to Berea, where Norfolk Southern and CSX tracks would come together.

To lighten the burden on that suburb, already a busy freight rail center, the White plan would call for construction of a 2-mile-long, double-deck flyover to carry tracks above the streets. The price tag is estimated at up to \$171 million, presumably to be paid by the railroads.

White, like Rep. Dennis J. Kucinich ahead of him, has embraced an issue that is loaded with populist appeal. The proposed Conrail carve-up sprung a few surprises on Greater Cleveland, beginning with Norfolk Southern's announcement that it would triple the number of trains it operates through the west shore suburbs and into Cleveland.

Then, CSX said it would run 44 trains a day on a loop from Collinwood through the East Side, Cuyahoga Heights and Brooklyn Heights to W. 150th St. and beyond. Interestingly, CSX intends to shift many freight trains from the Lakefront route, which area transportation planners covet for commuter services.

On Tuesday, the mayor said city officials had concluded that CSX-Norfolk Southern proposals would harm Cleveland and that if a resolution could not be negotiated, the city would take legal action to stop Conrail's dismemberment.

White seems to believe the damaging effects would outweigh economic benefits to the city, which promise to be substantial. New routings would provide direct connections between Cleveland and major markets in all directions. CSX alone has promised to expand the Collinwood yards as an intermodal hub, substantially increasing the work force at what once was a major facility on the city's railway network.

Nobody is faulting White, Kucinich or other political leaders for acting on constituents' genuine concerns. In Lakewood, for instance, Norfolk Southern should have anticipated that residents might worry, rightly, that most cross-city connections would be cut many more times a day, hindering emergency vehicles. Residents of the less affluent inner-city likewise have valid questions about the new setup.

But the rails were not laid yesterday. The fortunes of Greater Cleveland in many ways were shaped by its proximity to the tracks. The re-emergence of freight trains as a vital component of the nation's transportation system carries economic and environmental benefits that should be acknowledged.

It seems reasonable to demand that the railroads take measures against increased noise, as CSX has told Cleveland it would do. Issues like that and the prospect of traffic tie-ups in the suburbs could be resolved through negotiation. White, however, appears to have raised the stakes in a way that could throw the matter into court, where the city's long-term best interests might not be served.

Figure 5.1: Editorial from the *Plain Dealer*, a local newspaper in Cleveland, Ohio
January 30, 1998

5.5 Western Cleveland Suburbs

For the Western Suburbs of Cleveland, the DEIS directs NS to continue to consult with appropriate parties to address concerns about train traffic increases on the NS Cleveland to Vermilion rail line segment. NS has proposed a preliminary alternative routing plan (as set forth in Appendix S of the DEIS) to balance NS rail post-Transaction traffic on the Cleveland to Vermilion line segment and the Lakeshore Line through Berea. NS has stated from the beginning, however that implementation of this plan (estimated to cost nearly \$50 million) would require public funding. NS' view on this has not changed. The DEIS directs NS to negotiate a mutually-acceptable binding agreement on the construction and funding allocation for this plan prior to issuing the FEIS. NS is continuing consultations with parties from the Western Suburbs of Cleveland, as well as the State and other stakeholders, and those negotiations are on-going. Since October, 1997, NS has met with representatives of the Western Suburbs, as well as the Ohio Rail Development Commission and Public Utility Commission to discuss related issues. NS continues to meet and consult with representatives from these communities and agencies. Progress has been slowed due to the following factors: (1) uncertainty of public funding initiatives; (2) potential impacts of changes that the City of Cleveland seeks to make that could affect the Western Suburbs; and (3) environmental impacts that could result from the rerouting proposal for the Western Suburbs of Cleveland. No agreement has been reached to date.

5.6 Erie, Pennsylvania

The DEIS identifies potential significant environmental impacts involving pedestrian safety, emergency response, transportation safety (four at-grade crossings) and traffic delay (five at-grade crossings) as a result of NS' proposal to increase by 12 trains per day the number of freight trains on the NS main line that has run through the 19th Street corridor in Erie since 1882. The DEIS states that "the presence of the tracks results in the disruption delay and the potential for accidents involving roadway traffic along 19th Street." DEIS at PA-55.

NS and CSX included in their joint Application an agreement that would enable NS to reroute rail traffic from 19th Street to a new portion of NS track running parallel to the existing Conrail line north of downtown Erie that is to be operated by CSX post-Transaction. The new NS track would be constructed nearly exclusively on existing Conrail right-of-way. A description of the proposal by NS to reroute traffic to new track along the Conrail right-of-way

was submitted by NS in a letter to SEA, and is referenced in the DEIS at PA-55, and provided in Appendix S.

An important benefit of the rerouting proposal would be the elimination of long-present freight rail traffic, as well as post-Transaction increases in rail traffic that is now required to be routed along 19th Street. The Transaction would provide an opportunity to utilize the pedestrian and emergency vehicle crossing and road congestion advantages of the largely grade-separated Conrail corridor, following construction of the portion of the NS main line that would be rerouted off of 19th Street. However, because of the substantial infrastructure work required to accomplish the NS rerouting proposal, as well as the legal impediments to commencing construction on Conrail property prior to CSX control of the right-of-way and Board approval of the construction project, on Day One and for some time to come, NS will need to be able to continue operating freight trains on the existing route. NS estimates that the rerouting construction would require about 1.5 to 2 years to complete.

The DEIS originally indicated that a total of five existing at-grade crossings along the NS 19th Street corridor would exceed SEA thresholds for recommended mitigation due to potential traffic delay impacts. However, SEA subsequently discovered that an error had been made in its crossing delay calculations which resulted in the incorrect doubling of estimated traffic impacts. In SEA's January 21, 1998 Supplemental Errata, the DEIS was corrected to indicate, *inter alia*, that two of the five NS Erie at-grade crossings (Peach Street and Raspberry Street) along the 19th Street corridor included in Table 7-7 of the DEIS ("Preliminary Highway/Rail At-Grade Crossings That May Warrant Traffic Delay Mitigation") would no longer meet SEA's threshold criteria for mitigation. Despite having acknowledged that the DEIS erroneously identified those two crossings as meeting mitigation threshold criteria, SEA recommended in the Supplemental Errata that the error simply be ignored in favor of leaving the two Erie crossings on the DEIS' list of crossings recommended for mitigation. The rationale provided in the Errata suggests that SEA devised a new, heretofore unheard of, category for "measuring" impact -- a notion of "close proximity" to grade crossings that do meet SEA's threshold criteria. *There is no analytical support for such a deviation in the application of mitigation criteria and NS urges SEA to remove the two Erie crossings from its list of crossings recommended for mitigation.*

As to the appropriateness of the DEIS recommendation for mitigation of the other three at-grade crossings listed in Table 7-7 of the DEIS, NS has raised several substantive objections to

the DEIS approach and conclusions regarding safety of at-grade crossings (see Section 4.3).⁶⁰ In addition, as set out above at Section 2.3, it is not appropriate for the Board to displace the well-established role of state DOTs in determining the selection, priority and funding of grade crossing upgrades in communities within their jurisdiction. NS recommends that this important safety task be properly left to the state transportation agencies and the well-founded practices and procedures already in place for railroad/state cooperative resolution of grade crossing safety issues.

Moreover, the DEIS recommendation of a limit of two additional trains per day on the existing NS main line through the 19th Street corridor in Erie is without sound basis -- localized service limitations should not be imposed as environmental mitigation in this case (see Section 2.4). Having determined that certain of the NS grade crossings along 19th Street would meet the threshold criteria for mitigation consideration, the DEIS did not take into account several crucial facts.

First, the limit of a two-train per day increase in rail traffic pending completion of the proposed NS rerouting appears to have been taken from SEA's preliminary mitigation recommendations at Reno and Wichita in UP/SP. In that instance, SEA recommended that UP/SP be limited to running an additional two trains per day through Reno, Nevada and Wichita, Kansas pending completion of a post-EA mitigation study. The two-train limit was selected due to a desire to avoid SEA's threshold for air impact analysis in a non-attainment area, 49 CFR 1105.7(e)(5)(ii). This was necessitated by the fact that the environmental analysis of the UP/SP merger was being pursued by SEA through means of an EA, rather than an EIS, and therefore all significant impacts required mitigation. As described at Section 2.1 above, by choosing to prepare an EIS for the Transaction, the Board has eliminated the need to eliminate or mitigate all potentially significant environmental impacts--a fundamental distinction from the UP/SP scenario. Also, the DEIS acknowledges that, unlike the issue presented for further consideration in UP/SP, the Transaction would not have any significant air impact at Erie and that no mitigation is needed. DEIS at PA-43. Thus the reason for applying the train increase limit recommended in UP/SP at Reno and Wichita is simply not transferable to the circumstances of the Board's consideration of potential environmental impacts at Erie.

⁶⁰ It should be noted that the construction of the Erie rerouting proposal will completely negate any need for grade separation along the 19th street corridor.

Second, the increase in NS traffic along the 19th Street corridor will be only temporary, until completion of the physical improvements to reroute traffic to the Conrail right-of-way. Once completed, rail safety in Erie will benefit far more than just the removal of the post-Transaction increase in train traffic along 19th Street. Because NS plans to remove all freight traffic to the new route, existing as well as increased traffic will be taken out of downtown Erie. Extraneous grade crossings along 19th Street will be able to be closed. *This is a substantial benefit to Erie that NS believes far exceeds the temporary increase in traffic until the rerouting construction work is completed.*

Third, the DEIS fails to recognize that, as of Day One, there will be freight traffic waiting to be carried by NS along its Cleveland to Buffalo main line. This represents carloads of freight traffic that will, up until Day One, have been carried over the Conrail system. In order to be competitive, and in order to provide vital, timely service to shippers, NS must be able on Day One to assume its share of the Conrail traffic. The only feasible way for NS to do so is to move trains over its existing main line route through Erie pending completion of the relocation. *This is a critical aspect of the commercial benefits and viability of the Transaction.*

An arbitrary and artificial limit of two additional trains per day in Erie, because of the much broader ripple effects, would have catastrophic consequences to the ability of NS and CSX to create a smooth transition for eastern United States rail service on Day One and thereafter. NS urges SEA to eliminate from further consideration any recommendation to the Board of "temporary" limits to the proposed increase in NS train traffic at Erie on Day One.

6.0 NORFOLK SOUTHERN COMMUNITY OUTREACH PROGRAM

The DEIS identifies several areas and communities where consultation and coordination with a local community or agency is recommended in order to resolve various potential environmental impacts or potential public concerns. The DEIS further recommends that NS negotiate binding agreements with affected communities to resolve potential environmental impacts. NS opposes the imposition of negotiated agreements as conditions to Board approval (see Section 2). Any negotiated agreements between NS and affected communities or agencies should be viewed as stipulations, not conditions, within the context of the Transaction. NS supports public outreach and coordination with neighboring communities. This section presents NS' response to the DEIS-directed community outreach for specific communities, other community outreach issues, and the need for consultation with state Departments of Transportation (state DOTs).

NS regularly meets with and hears the concerns of local citizens and government officials, in an effort to tailor its approach to doing business to community-specific needs wherever practicable. Examples of NS' current outreach efforts independent of the Transaction include:

- Operation Lifesaver, a program designed to reduce grade-crossing accidents and save lives by educating local communities and children.
- Working with state and local transportation agencies to improve grade crossing safety, including closing unnecessary grade crossings.
- Conducting Grade Crossing Collision Investigation courses for state and local agencies to assure proper investigative techniques, identify causes of collisions and improve safety.
- Meeting with interested communities to discuss railroad operations.

6.1 DEIS-Required Community Outreach

The DEIS recognizes that the recommended mitigation measures within the DEIS ameliorate the potential significant impacts. Nonetheless, the DEIS directs NS to resolve potential environmental impacts in several communities identified by the DEIS as “Environmental Justice Communities,” as well as other communities, through negotiation of binding agreements between the locally affected community, NS, and the appropriate government agencies. At page 7-18, the DEIS says:

“SEA’s Recommended Mitigation Nos. 1-18, and 28-41 would address potential significant environmental impacts for these communities, which may experience disproportionately high adverse effects as a result of the proposed Conrail Acquisition. Nevertheless, CSX and NS shall meet with these communities to identify and agree on any further appropriate measures to address the specific environmental impacts that may disproportionately impact these communities, or to develop other mitigation measures that might offset these disproportionate impacts. If the parties have not reach mutually-acceptable binding agreement on the implementation of appropriate mitigation measures to address environmental impacts resulting from the proposed Acquisition prior to issuing the Final EIS, SEA may recommend that the Board, as a condition of the approval of the Application, direct CSX and NS to implement appropriate mitigation measures.”

The DEIS directs NS to consult with the following communities:

- Fort Wayne, Indiana
- Alexandria, Indiana
- Tilton, Illinois
- Danville, Illinois
- Youngstown and Ashtabula, Ohio
- Toledo, Ohio
- Harrisburg, Pennsylvania
- Oak Harbor - Bellevue, Ohio.

SEA is also planning an expanded public outreach program in these (and other) communities to ensure adequate public access to information about the Conrail Transaction and the EIS process.

NS believes the requirement to negotiate binding agreements with these communities, and subsequent inclusion of such agreements as conditions of the Transaction, as described within the DEIS, to be flawed and inappropriate for the following reasons:

1. The potential environmental impacts to be resolved through negotiation are not identified within the DEIS. The Oak Harbor - Bellevue, Ohio NS line segment is the only exception, where a potential for a noise impact has been identified.
2. The DEIS also fails to identify the specific portion of the community (e.g., the actual people, neighborhood, or group) significantly affected by the Transaction. In most cases, the affected "community" described within the DEIS is based on the DEIS environmental justice analysis, and is not representative of actual social or political boundaries or local communities. This makes it difficult to properly focus outreach, and, if appropriate, mitigation.
3. The DEIS does not provide any rationale for treating these communities differently than any other communities throughout the system (see Section 4.16, Environmental Justice). Those communities labeled as "environmental justice" within the DEIS do not suffer any disproportionate or high and adverse impacts as a result of the Transaction.
4. NS strongly opposes the imposition of a requirement to negotiate agreements as a condition of approval of the Transaction (see Section 2.6). CEQ and DOT guidance on considering environmental justice issues during the EIS process suggest outreach, but do not suggest negotiations with the community.

Although NS does not believe negotiated settlements should be mandated as a mitigation measure, it does recognize the importance of ensuring the public's access to information on the Transaction. Accordingly, NS has initiated a community outreach program within the communities identified above. The purpose of NS' community outreach is to identify community concerns relating to the Transaction, and provide information to the communities

regarding NS operations and activities, including environmental and safety management programs. Resolution of concerns, by agreement or otherwise, is the ultimate goal of these efforts.

NS' community outreach program is designed to be flexible and responsive to the needs of each community. NS' community outreach program includes some combination of the following, tailored to the needs of the individual community and the identified issues (if any):

- Contact with local government officials and agencies
- Contact with local community leaders
- Contact with local newspapers and/or other media
- Meetings with local organizations and groups.

To date, NS has completed the initial planning phases of its community outreach program in response to the DEIS mandate. A kick-off meeting was held on January 15, 1998, to brief NS resident vice presidents, strategic planning, public affairs, and legal departments on the purpose and scope of the NS outreach efforts. Community-specific updates are provided below.

6.1.1 Fort Wayne, Indiana

Background - The DEIS has identified the NS Butler - Fort Wayne line segment (N-041) as having potential environmental justice impacts in Fort Wayne, Indiana, requiring outreach and a negotiated settlement. However, the DEIS fails to provide any rationale for this. In addition to the previous issues noted in Sections 2.6 and 4.16, and above, NS' concerns with this requirement at this community include:

- An at-grade crossing safety potential impact is identified at Estella Road and Anthony Boulevard in Fort Wayne near Sunnymede Woods. At-grade crossing safety issues are addressed and resolved at the direction of the Indiana DOT, not derived from negotiation with the local community (see Section 4.3 for additional NS comments on traffic safety). Therefore, there is no need to negotiate with the community outside the normal cooperative process addressing grade crossing safety.

- The segment is identified as a “major key route” for hazardous materials transportation. However, mitigation of increased hazardous materials transportation does not warrant providing special treatment to any single community (see Section 4.4 for additional NS comments on transportation of hazardous materials).
- The DEIS also identifies noise as a potential cumulative environmental impact, presumably due solely to the demographics of the population affected, as the projected noise levels on the rail segment do not meet the DEIS criteria for a significant impact (see Section 4.11 for additional NS comments on evaluation of noise, and Section 4.16 for additional NS comments on environmental justice). Further, the DEIS states that SEA is conducting additional studies to determine if the environmental justice population is impacted by noise. However, noise impacts are not determined by the minority status or income level of a community. Also, beyond the simple fact that these issues all spring from an increase in train traffic, there is no methodology specified in the DEIS for weighting and combining the various potential adverse effects of rail traffic (grade crossing safety, traffic delay, noise, etc.) into a determination of cumulative impact. Similarly, there is no methodology specified in the DEIS for defining and evaluating the benefits of the Transaction on a local basis.

The DEIS does not identify any specific environmental impacts which require mitigation through negotiation with the local community.

Status of Community Outreach - NS has initiated community outreach efforts with Fort Wayne, Indiana. Discussions with local officials and other outreach efforts are ongoing.

6.1.2 Alexandria, Indiana

Background - Alexandria is the hub of the NS Alexandria - Muncie line segment (N-040). Alexandria (Madison County) includes one at-grade crossing identified by the DEIS as requiring mitigation for safety (CR 100 E). The DEIS recommends upgrading the crossing safety warning devices from passive to flashing lights. The DEIS also identifies two crossings in Madison County which are projected to exceed the significance thresholds for traffic delay. The increased delays at these crossings are due to slower moving trains through the new Alexandria connection.

The DEIS recommends that NS coordinate with the City of Alexandria, the Indiana DOT, and other appropriate agencies to agree on mitigation measures to address the potential traffic delay impact.

Status of Community Outreach - NS has been engaged in discussions with City officials since early 1997 concerning plans for addressing traffic delays. NS has scheduled additional community outreach efforts in February 1998.

6.1.3 Tilton, Illinois

Background - The DEIS has identified NS' Lafayette, Indiana - Tilton, Illinois line (N-045) as having potential environmental justice impacts in Tilton, requiring outreach and a negotiated settlement. However, the DEIS fails to provide any rationale for this. In addition to the previous issues noted in Sections 2.6 and 4.16, and above, NS's concerns with this requirement at this community include:

- The segment is identified as a "major key route" for hazardous materials transportation. However, mitigation of increased hazardous materials transportation does not warrant providing special treatment to any single community (see Section 4.4 for additional NS comments on transportation of hazardous materials). Therefore, there is no need to negotiate with the community on this issue.
- The DEIS also identifies noise as a potential cumulative environmental impact, presumably due solely to the demographics of the population affected, as the projected noise levels on the rail segment do not meet the DEIS criteria for a significant impact (see Section 4.11 for additional NS comments on evaluation of noise, and Section 4.16 for additional NS comments on environmental justice). Further, the DEIS states that SEA is conducting additional studies to determine if the environmental justice population is impacted by noise. However, noise impacts are not determined by the minority status, or income level of a community. Also, beyond the simple fact that these issues all spring from an increase in train traffic, there is no methodology specified in the DEIS for weighting and combining the various potential adverse effects of rail traffic (grade crossing safety, traffic delay, noise, etc.) into a determination of cumulative

impact. Similarly, there is no methodology specified in the DEIS for defining and evaluating the benefits of the Transaction on a local basis.

The DEIS does not identify any specific environmental impacts which require mitigation through negotiation with the local community.

Status of Community Outreach - NS has initiated contacts with local officials in an effort to provide information on the proposed Transaction. NS will conduct additional outreach and hold informational meetings if they are requested.

6.1.4 Danville, Illinois

Background - The DEIS has identified the NS Lafayette, Indiana - Tilton, Illinois line segment (N-045) as having potential environmental justice impacts in Danville, Illinois, requiring outreach and a negotiated settlement. However, the DEIS fails to provide any rationale for this. In addition to the previous issues noted in Sections 2.6 and 4.16, and above, NS' concerns with this requirement at this community include:

- At-grade crossing safety potential impacts are identified at Campbell Crossing, City of Danville (described in the DEIS as "proximal to minority and low-income communities"). The DEIS reviewed demographics and traffic grade-crossing potential impacts along this rail line segment, and found that traffic grade-crossing delay and traffic accident potential impacts would not be disproportionate for minority or low-income populations along this segment. The DEIS specifically concludes for this rail segment that "...no environmental justice impacts exist for grade crossing." The DEIS further recommends that NS mitigate the potential traffic safety impact for this segment by upgrading the existing warning devices (see Section 4.3 for NS comments on traffic safety). At-grade crossing safety issues are addressed and resolved at the direction of the Illinois Department of Transportation, not derived from negotiation with the local community (see Section 4.3 for additional NS comments on traffic safety). Therefore, there is no need to negotiate with the community outside the normal cooperative process addressing grade crossing safety.

- The segment is identified as a “major key route” for hazardous materials transportation. However, mitigation of increased hazardous materials transportation does not warrant providing special treatment to any single community (see Section 4.4 for additional NS comments on transportation of hazardous materials).
- The DEIS also identifies noise as a potential cumulative environmental impact, presumably due solely to the demographics of the population affected, as the projected noise levels on the rail segment do not meet the DEIS criteria for a significant impact (see Section 4.11 for additional NS comments on evaluation of noise, and Section 4.16 for additional NS comments on environmental justice). Further, the DEIS states that SEA is conducting additional studies to determine if the environmental justice population is impacted by noise. However, noise impacts are not determined by the minority status or income level of a community. Also, beyond the simple fact that these issues all spring from an increase in train traffic, there is no methodology specified in the DEIS for weighting and combining the various potential adverse effects of rail traffic (grade crossing safety, traffic delay, noise, etc.) into a determination of cumulative impact. Similarly, there is no methodology specified in the DEIS for defining and evaluating the benefits of the Transaction on a local basis.

The DEIS does not identify any specific environmental impacts which require mitigation through negotiation with the local community.

Status of Community Outreach - NS has initiated contacts with local officials in an effort to provide information on the proposed Transaction. NS will conduct additional outreach and hold information meetings if they are requested.

6.1.5 Youngstown and Ashtabula, Ohio

Background - The DEIS has identified NS Youngstown - Ashtabula line segment (N-082) as having potential environmental justice impacts in both Youngstown and Ashtabula, requiring outreach and a negotiated settlement. However, the DEIS fails to provide any rationale for this. In addition to the previous issues noted in Sections 2.6 and 4.16, and above, NS' concerns with this requirement at this community include:

- At-grade crossing potential safety impacts are identified by the DEIS at Bradley-Brownlee Road and Warren Sharon Road, several miles north of Youngstown and away from environmental justice populations. At-grade crossing safety issues are addressed and resolved at the direction of the Ohio Department of Transportation, not derived from negotiation with the local community (see Section 4.3 for additional NS comments on traffic safety). Therefore, there is no need to negotiate with the community outside the normal cooperative process addressing grade crossing safety. Moreover, due to the distance of several miles between the grade crossings in issue and the environmental justice populations in Youngstown designated by the DEIS, there is no evidence of high and disproportionate impacts on environmental justice populations.
- The segment is identified as a “key route” for hazardous materials transportation. However, mitigation of increased hazardous materials transportation does not warrant providing special treatment to any single community (see Section 4.4 for additional NS comments on transportation of hazardous materials).
- The DEIS also identifies noise as a potential cumulative environmental impact, presumably due solely to the demographics of the population affected, as the projected noise levels on the rail segment do not meet the DEIS criteria for a significant impact (see Section 4.11 for additional NS comments on evaluation of noise, and Section 4.16 for additional NS comments on environmental justice). Further, the DEIS states that SEA is conducting additional studies to determine if the environmental justice population is impacted by noise. However, noise impacts are not determined by the minority status or income level of a community. Also, beyond the simple fact that these issues all spring from an increase in train traffic, there is no methodology specified in the DEIS for weighting and combining the various potential adverse effects of rail traffic (grade crossing safety, traffic delay, noise, etc.) into a determination of cumulative impact. Similarly, there is no methodology specified in the DEIS for defining and evaluating the benefits of the Transaction on a local basis.

The DEIS does not identify any specific environmental impacts which require mitigation through negotiation with the local community.

Status of Community Outreach - NS has initiated contacts with local officials in an effort to provide information on the proposed Transaction. NS will conduct additional outreach and hold informational meetings if they are requested.

6.1.6 Toledo, Ohio

Background - The DEIS has identified the NS Miami - Airline line segment (N-086) as having potential environmental justice impacts in Toledo, Ohio, requiring outreach and a negotiated settlement. The rationale for this is not clear. The only potential environmental impact identified in the DEIS is freight safety, calculated by the DEIS for this segment as an 88-year interval between train accidents per mile. (The DEIS threshold for freight safety is a 100-year interval). However, freight safety is not an issue directly affecting the community, nor is it an issue which is readily mitigated through negotiation with the local community. See Section 4.1 for additional NS comments on freight rail safety and Section 4.16 for additional comments on environmental justice issues.

Status of Community Outreach - NS has scheduled community outreach efforts to begin in February 1998.

6.1.7 Harrisburg, Pennsylvania

Background - The DEIS has identified the NS Harrisburg - Rutherford line segment (N-090) as having potential environmental justice impacts in Harrisburg, Pennsylvania, requiring outreach and a negotiated settlement. The rationale for this is not at all clear. The only potential environmental impact identified in the DEIS is freight safety, calculated by the DEIS for this segment as an 88-year interval between train accidents per mile. (The DEIS threshold for freight safety is a 100-year interval). However, freight safety is not an issue directly affecting the community, nor is it an issue which is readily mitigated through negotiation with the local community. See Section 4.1 for additional NS comments on freight rail safety and Section 4.16 for additional comments on environmental justice issues.

Status of Community Outreach - NS has scheduled a series of meetings with the Mayor of Harrisburg and other local officials. In these meetings, NS will ensure that information on the Transaction is available to the public.

6.1.8 Oak Harbor - Bellevue, Ohio

Background - The DEIS identifies the NS line segment Oak Harbor - Bellevue, Ohio (N-079) as having potential significant adverse noise impacts requiring mitigation. The DEIS directs NS to meet with communities along the rail line segment to negotiate an agreement to implement measures to reduce the wayside noise for sensitive receptors experiencing noise levels above 70 dBA L_{dn} and with an increase of 5 dBA or more. The DEIS does not, however, provide specifics on which receptors are potentially significantly impacted by increased noise levels related to the Transaction.

Status of Community Outreach - NS will conduct additional community outreach efforts along the Oak Harbor - Bellevue line segment to ensure information on the Transaction is available to the public. NS will also conduct further technical reviews, including noise level measurements, on the potential for significant noise impacts along this line segment, to identify specific receptors where there may be a significant adverse effect from increased noise, and to assess the feasibility and effectiveness of mitigation alternatives.

6.2 Additional Community Outreach

The DEIS describes a program of expanded public outreach by SEA in specific communities, including several low income and minority communities, to ensure full opportunity to participate in the review of the proposed Transaction. These communities are:

- Seneca Indian Nation, Cattaraugus Reservation, New York
- Bellevue - Sandusky, Ohio
- Kankakee, Illinois
- Chicago, Illinois
- Delaware County, Indiana
- Detroit, Michigan
- Ontario & Seneca Counties, New York
- Cloggsville Junction, Ohio.

The DEIS does not direct NS to conduct any community outreach within these communities, nor to negotiate any agreements to mitigate potential environmental justice or other impacts. However, NS recognizes the importance of community outreach and public participation in the EIS process. Therefore, NS will also conduct additional outreach efforts in these communities to ensure the public has access to information regarding the Transaction, if directed by SEA.

6.2.1 Seneca Indian Nation, Cattaraugus Reservation, New York

The DEIS identifies the NS line segment Ashtabula, Ohio - Buffalo, New York (N-070) as meeting the threshold for a "major key" route for hazardous materials transportation. According to the DEIS, the rail line segment traverses the federally-designated Seneca Indian Nation, Cattaraugus Reservation. The DEIS proposes to mitigate the potential impact of increased hazardous materials transportation through the Reservation through implementation (by NS) of the AAR guidelines on hazardous materials transportation, emergency response planning and assistance (to be coordinated between NS and the Seneca Indian Nation), and additional outreach by SEA to the Seneca Indian Nation within the Cattaraugus Reservation.

The mitigation recommendation that NS "...assist the Reservation with emergency response preparedness as may be requested" is ambiguous and unsupported. This requirement for additional, open-ended assistance is not specified for other non-Native American communities. There is no justification for treating the Cattaraugus Reservation differently than any other community on the issue of increased hazardous materials transportation. This recommendation should be deleted.

NS has also raised several issues in Section 4.4 addressing the DEIS evaluation of hazardous materials transportation, including offering well-established mitigation measures (e.g., safe approaches to transportation of hazardous materials reflecting NS' excellent safety record) to address significant increases in rail traffic. These mitigation measures should be applied to the Cattaraugus Reservation in the same manner as they will be applied to other communities along rail lines projected to experience similar increases in hazardous materials transportation.

6.2.2 Bellevue - Sandusky Docks, Ohio

The Bellevue - Sandusky Docks NS line segment (N-085) is identified in the DEIS as having potential environmental justice effects from increased noise, presumably due solely to the demographics of the population along the line segment. The DEIS noise impact evaluation does not identify this line segment as having significant noise impacts. Nonetheless, the DEIS has identified a need to conduct further reviews to determine if environmental justice populations are impacted by noise. These further reviews will include community outreach by SEA. Given the DEIS conclusion that there are no significant adverse noise impacts along the entire line segment, there is no basis for conducting further investigation of noise impacts on environmental justice populations. Noise impacts are not determined by the minority status or income level of a community. The January 12, 1998 Errata to the DEIS also identifies this line segment as having a potential traffic safety issue. NS comments on at-grade crossing safety are provided in Section 4.3.

6.2.3 Kankakee, Illinois

The planned new NS connection at Kankakee (line segment NC -01), is identified in the DEIS as having potential environmental justice effects from increased noise. This is based both on incorrect train traffic information and on unsupported reasoning. The correct information, supplied to SEA in October 2, 1997 correspondence from NS, is that traffic on this new connection would be zero trains per day after the Transaction. (The reason for the connection is anticipation of a growing need for transportation services, traffic which cannot be predicted and does not meet the Board's criteria for being related to the Transaction.) The initial DEIS provided the correct information at Chapter 5, page IL-22, although the information and discussion on page IL-74 was based on outdated and incorrect information. (As described in Section 4.22.2, herein, this error was compounded in SEA's January 12, 1998 Errata which proposed to eliminate the correct information and let the incorrect information stand.) Applying the correct information, there is no potential noise impact on environmental justice communities (or other populations) in Kankakee. *The FEIS should reflect the correct information for analysis of this connection.*

The DEIS discussion of potential impacts from increased noise on this connection is presumably due solely to the demographics of the population within Kankakee County. The DEIS noise impact evaluation does not identify this proposed new line segment as having significant noise impacts. Nonetheless, the DEIS has identified a need to conduct further reviews to

determine if environmental justice populations are impacted by noise. These further reviews will include community outreach by SEA. Given the DEIS conclusion that there are no significant adverse noise impacts along the entire line segment, there is no basis for conducting further investigation of noise impacts on environmental justice populations. Noise impacts are not determined by the minority status or income level of a community.

6.2.4 Delaware County, Indiana

The Alexandria - Muncie NS line segment (N-040) is identified in the DEIS as having potential environmental justice effects from increased noise, presumably due solely to the demographics of the population within Delaware County. The DEIS noise impact evaluation does not identify this proposed line segment as having significant noise impacts. Nonetheless, the DEIS has identified a need to conduct further reviews to determine if environmental justice populations are impacted by noise. These further reviews will include community outreach by SEA. Given the DEIS conclusion that there are no significant adverse noise impacts along the entire line segment, there is no basis for conducting further investigation of noise impacts on environmental justice populations. Noise impacts are not determined by the minority status or income level of a community.

6.2.5 Detroit, Michigan

The Detroit - N. Yard Shared Assets Areas line segment (S-021) is identified in the DEIS as having potential environmental justice effects from increased noise, presumably due solely to the demographics of the population within the affected section of Detroit. The DEIS noise impact evaluation does not identify this line segment as having significant noise impacts. Nonetheless, the DEIS has identified a need to conduct further reviews to determine if environmental justice populations are impacted by noise. These further reviews will include community outreach by SEA. Given the DEIS conclusion that there are no significant adverse noise impacts along the entire line segment, there is no basis for conducting further investigation of noise impacts on environmental justice populations. Noise impacts are not determined by the minority status or income level of a community.

6.2.6 Ontario and Seneca Counties, New York

The Corning - Geneva NS line segment (N-060) is identified in the DEIS as having potential environmental justice effects from increased noise, presumably due solely to the demographics of the population within Ontario and Seneca Counties. The DEIS noise impact evaluation does not identify this line segment as having significant noise impacts. Nonetheless, the DEIS has identified a need to conduct further studies to determine if environmental justice populations are impacted by noise. These further studies will include community outreach by SEA. Given the DEIS conclusion that there are no significant adverse noise impacts along the entire line segment, there is no basis for conducting further investigation of noise impact on environmental justice populations. Noise impacts are not determined by the minority status or income level of a community.

6.2.7 Cloggsville Junction (Cleveland), Ohio

The Cleveland - Shortline Junction NS line segment (N-074) is identified in the DEIS as having potential environmental justice effects from increased noise, presumably due solely to the demographics of the population adjacent to the line in Cleveland. The DEIS noise impact evaluation does not identify this line segment as having significant noise impacts. Nonetheless, the DEIS has identified a need to conduct further studies to determine if environmental justice populations (21 sensitive receptors) are impacted by noise. These further studies will include community outreach by SEA. Given the DEIS conclusion that there are no significant adverse noise impacts along the entire line segment, there is no basis for conducting further investigation of noise impacts on environmental justice populations. Noise impacts are not determined by the minority status or income level of a community.

6.3 Consultation with State Departments of Transportation

The DEIS directs NS to consult with state DOTs (and appropriate local agencies) to address potential safety and traffic delay issues related to the Transaction, and to negotiate "traditional" separated crossing agreements or identify other mutually-acceptable approaches to mitigate potential impacts. The DEIS, as corrected by the January 12, 1998 Errata and the January 21, 1998 Supplemental Errata, identifies for NS 44 at-grade crossings as requiring mitigation for safety and 18 NS at-grade crossings requiring mitigation for traffic delays. Further, the DEIS specifies mitigation measures and types of crossing upgrades for each crossing.

NS concurs with the DEIS recommendation for consultation with state DOTs and other appropriate agencies to address potential safety and traffic delay issues. NS recognizes the importance of ensuring that issues affecting highway traffic safety and delay are dealt with under the direction of state DOTs and other appropriate agencies. Accordingly, NS has initiated a program of consultation with state DOTs and other appropriate agencies, following NS' standard practice in coordinating highway/rail crossing issues with state DOTs and other appropriate agencies. The purpose of NS's consultation with the state DOTs and other appropriate agencies is to ensure that the Transaction-related changes in traffic safety and delay at highway/rail at-grade crossings are understood by the state DOTs, and become part of the state DOTs planning process for crossing upgrades and/or closures according to state priorities.

NS is conducting a consultation with the state DOTs listed below, in accordance with the potential impacts identified by the DEIS. This consultation includes describing the Transaction, describing the projected effects on highway/rail at-grade crossings as determined within the DEIS (plus Errata) and by NS's calculations, and requesting the state DOT enter the crossing in question into the state crossing safety planning process as appropriate. NS will then work with the state DOT as appropriate to identify and implement those mitigation measures considered warranted by the state crossing safety planning process.

<u>State DOTs*</u>	<u>Crossings With Potential Safety Issue</u>	<u>Crossings With Potential Delay Issue</u>
IL	1	
IN	27	13
MD	3	
MI	1	
NY	1	
OH	13	
PA	9	5
VA	2	

*State Departments of Transportation or similar agencies.

NS will also discuss with the state DOTs all crossings affected by significant increases in traffic volume or train speed and those subject to physical change resulting from Transaction-related construction. The state DOTs will then be able to evaluate fully and prioritize all crossings affected by the Transaction, based on each state's unique criteria.

7.0 ADDITIONAL COMMENTS ON ENVIRONMENTAL ISSUES

Norfolk Southern's principal, substantive comments on the DEIS analysis of environmental and safety topic areas are contained in Section 4.0 of this document. Additional comments provided in this section are for the purpose of clarification or improving accuracy, and mainly note minor typographical or factual errors and inconsistencies and discrepancies. The comments and clarifications offered by NS in this section are not expected to substantively affect the conclusions or recommendations of the EIS.

7.1 Safety: Freight Rail Operations

Comment No. 1

NS has noted several inconsistencies in accident rates (accidents per million train miles) used in several locations in the DEIS as follows.

Accidents Per Million Train Miles

	Page 3-7 Second Paragraph, Fourth Sentence	Page 4-9, Figure 4-2	Page B8-1, Table B8-1, Appendix B
Year 1978	15.0	14.5	--
Year 1995	4.0	3.71	3.71
Year 1996	--	3.69	3.69

In order to remain consistent with the second sentence in the second paragraph on page 3-7, the accident rate value for 1996 should be used instead of the 1995 value that was used, and the period 1978-1996 should be analyzed in the fourth sentence of that paragraph using the values of 14.5 for 1978 and 3.7 for 1996. With this change, the fourth sentence should be revised to say, "In the last 20 years, the accident rate has decreased from 14.5 accidents per million train miles (in 1978) to 3.7 accidents per million train miles (in 1996), an overall decrease of 75 percent in the accident rate." This revision results in the overall decrease changing from 73 percent to 75 percent.

Comment No. 2

The third sentence of the third paragraph on page 4-8 (Chapter 4, Volume 1, Section 4.4.2) says, "From 1970 until 1996, the national average accident rate has decreased from 15.0 to 3.7 accidents per million train-miles." In order to remain consistent with Section 3.2.2 on page 3-7 (Chapter 3), SEA should report the value over the last 20 years: 1978 to 1996. The accident rate in 1978 was 14.5 accidents per million train-miles as reported in Figure 4-2. SEA should revise the third sentence to say, "From 1978 until 1996, the national average accident rate has decreased from 14.5 to 3.7 accidents per million train-miles." However, if SEA's intent was to report the 1970 statistic, the correct value is 10.5 in lieu of 15.0 accidents per million train-miles.

Comment No. 3

The DEIS at 3-6 states the system-wide analysis examined accident risk for "all 119 rail line segments." It appears to NS that this sentence should read "all 1,022 rail line segments."

7.2 Safety: Highway/Rail At-Grade Crossings

Comment No. 1

NS has noted the following inconsistency on page B-5, (Volume 5A, Appendix B, Section B.3.2). The DEIS states, "SEA used the latest version of the FRA database to compile accident data for all crossings with at least one accident in the last five years." According to the grade-crossing tables located in Volume 3A & 3B, the analysis also includes grade crossings with zero accidents in the last five years. This should be corrected.

Comment No. 2

NS suggests a change to the title of Table B-7 on pages B-19 through B-21 (Volume 5A, Appendix B, Section B.4.3). The table is currently titled "Highway/Rail At-Grade Crossing Accident Index Roadway ADT More Than 15,000." Since Table B-7 also includes two other ranges of ADT's, the title should only read "Highway/ Rail At-Grade Crossing Accident Index."

Comment No. 3

NS suggests revisions to the definition of two factors in a formula presented in Section B.4.3, page B-22 (Volume 5A, Appendix B). The formula is presented under the heading "Segment-Specific Safety Effects Analysis:"

$$a = K \times EI \times DT \times MS \times MT \times HP \times HL$$

The definition for "a" should be revised to read, "a is the *unnormalized* initial predicted number of accidents per year," and the definition for "EI" should be revised to read "EI is the exposure index factor based on the product of the number of *average daily* roadway vehicles and *average* trains per day."

Comment No. 4

On page B-23 (Volume 5A, Appendix B, Section B.4.3), the second sentence of the second paragraph states, "FRA recommends that actual accident experience be limited to the 1991 through 1995 period, as..." NS suggests that this sentence be revised, replacing the portion of the sentence "1991 through 1995" with "*data for the most recent 5 years of history.*" NS notes that the period 1991 through 1995 was the most recent interval available at the time the DEIS analysis was conducted. However, more recent data (1992 through 1996) has since been released.

7.3 Safety: Rail Transport of Hazardous Materials

Comment No. 1

NS has noted that the definition of a "Key Train" as presented in the following sections of the DEIS is incorrect (Executive Summary, Glossary; Volume 1, Glossary; Volume 1, Chapter 4, Page 4-15; Volume 3A, Glossary; Volume 3B, Glossary; and Volume 5A, Glossary). The definition described in those DEIS sections is as follows: "The Association of American Railroads (AAR) defines a key train as any train handling five or more carloads of poison inhalation hazard (PIH) materials or a combination of 20 or more carloads containing hazardous materials."

This definition is incorrect because PIH Zone A or B materials are not specified, and because the definition implies that any train that contains 20 or more hazardous material

loads regardless of hazard classification are defined as “Key Trains.” The correct definition should be: “ ‘Key Trains’ are any trains with five or more tank car loads of chemicals classified as Poison Inhalation Hazard (PIH) **Zone A or B**; or any train with a combination of 20 or more car loads or intermodal tank loads of PIH (Hazard A or B), Division 2.1 Flammable Gas; Division 1.1 or 1.2 Explosives, and Environmentally Sensitive Chemicals (ESCs) as defined in Appendix A to the Circular.” (Bold added).

Comment No. 2

NS notes that one of the requirements for key routes as stated on page ES-19 under the Hazardous Materials Transportation section is incorrect. The DEIS states “These AAR [key route] guidelines include **visual** rail defect inspections at least twice per week...” The correct definition, which includes neither visual inspections nor twice weekly inspections, is referenced at DEIS, Volume 5A, Appendix B-10, page 2 of AAR Circular No. OT-55B: *“2. Main Track on “Key Routes” must be inspected by rail defect detection and track geometry inspection cars or any equivalent level of inspection no less than two times each year; and sidings must be similarly inspected no less than one time per year.”* As a further note, FRA regulations specify weekly track inspections.

Comment No. 3

NS notes the following typographical error on page 4-61, Table 4-18 of the DEIS. The total number of rail cars should be 2,430 not 24,30.

Comment No. 4

NS notes the following misspelling on DEIS, Page 5-32, Table 5-2, Summary of Impacts Warranting Mitigation by State, for rail segment N-360: Berke County should be spelled Burke County.

Comment No. 5

NS suggests modifying Table 9-1 in Volume 5A, Appendix B, Page B9-4 and B9-5. For Conrail, the table includes “Key Routes” columns for 5,000-8,000 and 8,000-10,000 cars. These reflect tabulations of feeder routes to Conrail’s “key routes”. Neither OT-55B nor the criteria in the DEIS would consider routes with less than 10,000 carloads of hazmat to be “key routes”. NS recommends the tables be modified to eliminate these columns to avoid confusion.

Comment No. 6

Table B9-2 on page B9-5 of the DEIS is persuasive in demonstrating that most reported hazardous materials incidents are of very small quantities very unlikely to have any noticeable impact for communities. However, the phrase “[t]he primary reason for most of the releases in the HMIRS database being non-reportable is their small size” is misleading, because all incidents regardless of their size must be reported, and is inconsistent with the fact that all releases have been reported in the HMIRS database.

7.4 Energy

Comment No. 1

As part of the system-wide analysis of energy consumption, the DEIS estimated changes in fuel consumption from increased delays at highway/rail at-grade crossings. (DEIS at 4-49.) This analysis considered this effect at crossings with average daily traffic (ADT) greater than 5,000 vehicles on rail line segments that met the Board’s thresholds for environmental analysis. (See Energy Consumption Changes from Highway/Rail At-Grade Crossing Delays, DEIS, Appendix D, Page D-7.) These were the same at-grade crossings analyzed for air quality impacts.

This analysis arbitrarily excludes at-grade crossings with ADT greater than 5,000 projected to experience decreases in train traffic. This analysis thereby overestimates fuel consumption and fails to assess the benefits (e.g., decrease in fuel consumption) associated with the Transaction.

7.5 Air Quality

Comment No. 1

NS notes that there appears to be some inconsistency in the impacts reported in DEIS Appendix E, Attachments E-2 and E-4. If the differences are intentional, perhaps an explanation of why the impacts are different should be supplied in the FEIS. For example, if the difference in the two sets of data is a result of Attachment E-2 presenting emissions increases while Attachment E-4 presents net emission changes, this could be stated clearly in Appendix E. Otherwise, if the differences were in error, they should be corrected in the FEIS.

Comment No. 2

NS suggests a correction to the title of Figure 4-6 on page 4-52 of the DEIS. Figure 4-6 does not indicate the specific pollutant(s) for which each of the shaded areas is designated nonattainment. It is logical therefore to infer that the shaded areas are non-attainment for SO₂, CO, Pb, and particulate matter. This is not correct. At a minimum the title could be modified to say "*Areas of Non-Attainment for SO₂, CO, Lead(Pb) and/or Particulate Matter.*" Also, it would be appropriate to add a reference to Attachment E-1 in Appendix E where the pollutant(s) for which a county is nonattainment are specified.

Comment No. 3

NS suggests the following correction to the first sentence of the first full paragraph on page 4-54 of the DEIS which currently reads: "... EPA's proposed new NO_x emission control requirements for 25 eastern states ...". The sentence should be modified to read, "*... EPA's proposed new NO_x emission control requirements for 22 eastern states and the District of Columbia ...*".

Comment No. 4

NS suggests that the third sentence of the third paragraph on page 4-63, which currently reads, "... EPA has determined that NO_x is not ...". be modified to read, "*... EPA has determined that NO_x emissions locally are not ...*".

Comment No. 5

NS suggests the following modification to the fourth sentence of the last paragraph on page E-7. The sentence currently reads, "These lengths were multiplied by the corresponding annual gross tons, and then by a fuel efficiency (gross ton miles/gallon, or GTM/gal.), and by an emission factor (lb/gallon) to obtain emissions estimates for each segment (see Section E.7.1)." The sentence should be reworded to read "*These lengths were multiplied by the corresponding annual gross tons, **divided** by a fuel efficiency (gross ton miles/gallon, or GTM/gal), and **multiplied** by an emission factor (lb/gal) to obtain emissions estimates for each segment (see Section E.7.1).*"

Comment No. 6

The emission factor for NO_x, is listed as 566.4 lb/Kgal on Table E-3, page E-9. The correct factor is **564.2 lb/Kgal**.

Comment No. 7

NS notes corrections to two emission factors used in Table E-4 on page E-10 of the DEIS. The emission factor for NO_x, is listed as 830.7 lb/Kgal, but should be **827.5 lb/Kgal**. The emission factor for VOC is listed as 46.2 lb/Kgal, but should be **46.0 lb/Kgal**.

7.6 Noise

Comment No. 1

In Appendix F, Attachment F-1, the DEIS indicates receptors along the Riverton Jct. to Roanoke line segment will experience a 5.0 dBA increase in noise level from the pre-Transaction to post-Transaction conditions. In the Applicants' Environmental Report (ER), noise receptors were expected to experience a 4.7 dBA increase along this line segment. Even applying the DEIS model, which we recommend be adjusted to accurately reflect NS train noise, it appears projected traffic changes would result in a 4.9 dBA increase. The equations used for this calculation follow:

- $10 * \log (\# \text{ of Pre-Transaction trains} / \# \text{ of Post-Transaction trains}) = \text{Change in dBA}$

where: # of Pre-Transaction trains = 3.9 and # of Post-Transaction trains = 12.1.

Comments No. 2

With reference to DEIS Appendix F, Attachment F-2, the following table identifies inconsistencies between the DEIS and information on operations submitted to SEA by NS in the ER and thereafter. The table below lists discrepancies in number of trucks, change in decibels (dBA) and distance to the 65 dBA Ldn contours at the intermodal facilities. NS requests that SEA verify the numbers presented in the DEIS for Luther. Also, the EIS should use the information for a proposed intermodal facility in Sandusky, OH and delete information for a proposed intermodal facility in Bellevue, OH since NS is no longer planning to construct a facility there.

Discrepancies in Number of Trucks, Change in Decibels and Distance to the 65 dBA Ldn Contours at Intermodal Facilities								
Location	ER Change in Trucks	DEIS Change in Trucks	ER Post-Act. Trucks/ Day	DEIS Post-Act. Trucks/ Day	ER Change in dBA	DEIS Change in dBA	ER Distance to 65 Ldn	DEIS Distance to 65 Ldn
Luther	63	194	251	382	<2	3	N/A	223
Sandusky*	71		71				73	
Bellevue*		65		65				69

*In a letter dated October 31, 1997 from NS to SEA, NS explained that the proposed new facility would be built at Sandusky rather than at Bellevue as had been indicated in the ER. In the same letter, a change in the projected number of trucks per day post-Transaction was provided.

Comment No. 3

The following table also lists discrepancies in the change in dBA and distances to the 65 Ldn contours at the intermodal facilities from DEIS, Appendix F, Attachment F-2. NS requests that SEA verify that the latest information provided by NS has been used in the DEIS. SEA may also wish to consider verifying the calculations for the intermodal facilities.

Discrepancies in Change in dBA and Distance to the 65 dBA Ldn Contour at Intermodal Facilities				
Location	ER Change in dBA	DEIS Change in dBA	ER Distance to 65 Ldn	DEIS Distance to 65 Ldn
Baltimore	2.7	3.0	83	145
E-Rail, Portside	6.9	7.0	not different	
Allentown	5.5	6.0	57	113
Rutherford	7.7	N/A	229	250
Pitcairn	not different		100	250

NS' consultant Burns & McDonnell, calculated the change in dBA using the formula below:

$$10 * \log (\# \text{ of pre-Transaction trucks} / \# \text{ of post Transaction trucks}) = \text{Change in dBA}$$

For example, at the Baltimore facility, the pre-Transaction number of trucks is 108; the post-Transaction number of trucks is 200. Using the equation above, the change in dBA was calculated to be 2.7 dBA. However, the DEIS lists 3.0 dBA.

The distance to the Ldn 65 contour was calculated using the equation from the ER (page B-39). The equation is shown below:

$$L_{dn} = 28.2 - 15 \log(D/450) + 10 \log [(H_d + 10 H_n)N_{total}/(H_d + H_n)]$$

where:

H_d = number of hours of operation during the daytime (7 am to 10 pm)

H_n = number of hours of operation during the night (10 pm to 7 am)

N_{total} = average number of daily operations

D = distance in feet to Ldn 65 contour

For example, at the Baltimore facility the number of daytime hours is 9, the number of nighttime hours is 1 and the average number of operations is 200. Using the above mentioned equation, the distance to the Ldn 65 contour is 83 feet. The DEIS lists 145 feet.

7.7 Natural Resources

Comment No. 1

The methodology for natural resources (DEIS at 3-41 and I-7) states, "The biological resources assessment included identifying and analyzing potential impacts to Federally listed threatened and endangered species, protected wildlife habitats and migration corridors, wildlife refuges and sanctuaries, national, state and/or local parks or forests, and protected unique or critical habitats." This methodology does not provide a specific distance from the construction or abandonment that was used for identifying biological resources, such as a parks or refuges, for inclusion in the analysis of potential impacts. However, varying distances to specific biological resources are provided in the following instances:

- The DEIS at IN-62 states, “SEA determined that there are no Federal or state parks, forests, preserves, refuges, or sanctuaries located **within or adjacent** to the proposed construction site at Tolleston.”
- The DEIS at IN-62 also states, “. . . there are no Federal or state parks, forests, preserves, refuges and sanctuaries that exist within **one mile** of the Tolleston site...”
- The discussion of the South Bend to Dillon Junction abandonment (DEIS at IN-68) states, “Kingsbury State Fish and Wildlife area is located approximately **one mile** southwest of Dillon Junction; and the Potato Creek Recreation Area is located less than **one mile** north of the proposed abandonment area. There are no sanctuaries, refuges, national, state, or local forest/parks within **500 feet** of the existing rail line for the proposed NS abandonment from South Bend to Dillon Junction.”

The FEIS should clarify the natural resources methodology regarding distances to wildlife refuges and sanctuaries; national, state and/or local parks or forests. Also, if none are within the specified distance, this should be clearly stated under the Existing Conditions section.

Comment No. 2

Under the column, Preliminary Recommended Mitigation for the Alexandria, IN Construction (DEIS at Volume 3A, Page 5-24, Table 5-2 and Volume 3B, Page 5-24, Table 5-2), the following text appears “NS shall use only EPA-approved herbicides during right-of-way maintenance.” The apparent error is that this statement is referenced under Environmental Justice in the technical area column, rather than the technical area for Natural Resources.

Comment No. 3

Under the Preliminary Recommended Mitigation heading for Tolono, Illinois Construction (DEIS at IL-62), there is an incorrect reference to CSX in the following sentence, “...SEA would require CSX to conform to its standard specifications during construction.” *The FEIS should contain the corrected reference to NS not CSX.*

7.8 Land Use/Socioeconomics

Comments No. 1

The reference to Native American Issues (DEIS at NY-38) appears to be associated with the Gardenville Junction construction because the text follows directly under the discussion of prime farmland at this construction. Separating the discussion of Native American Issues with a bolded heading similar to those used for constructions or abandonments could reduce the potential for confusion.

7.9 Abandonments

Comment No. 1

The Summary of Potential Effects and Preliminary Recommended Mitigation section (DEIS at IN-30) states, "Tables 5-IN-10 and 5-IN-11, presented at the end of this state discussion how..." There is no Table 5-IN-10 at the end of the Indiana State discussion. The reference actually appears to refer to Tables 5-IN-11 and 5-IN-12. If this is the case the sentence in question should be revised to say, "*Tables 5-IN-11 and 5-IN-12*, presented at the end of this state discussion, *show...*"

Comment No. 2

In both Figure 5-IN-4a (Volume 3A, Chapter 5) and Figure 2a (Volume 6) of the DEIS, the east end point for the South Bend to Dillon Junction Abandonment is in South Bend. The east abandonment end point on the figures should be moved to a point on the rail line approximately 200 feet northeast of U.S. Highway 20/31, southwest of South Bend. The correct end point is approximately 2 miles closer to Dillon Junction.

Comment No. 3

The Hazardous Waste Sites section (DEIS at Volume 6 Page 30) states, "...the EDR database report identified 13 sites including one NPL/CERCLIS site, four Indiana SPILLS sites, six LUST sites, and two RCRIS-TSD sites located within 500 feet of the proposed abandonment corridor." As discussed in Comment No. 2 above, the South Bend to Dillon Junction abandonment end point is located approximately 2 miles closer to Dillon Junction. Therefore, the hazardous spills sites located in South Bend are not within 500 feet of the proposed abandonment corridor. Therefore, this statement should be revised to

say, "...the EDR database report identified 2 sites (one LUST site and one RCRIS-TSD site) located within 500 feet of the proposed abandonment corridor."

Comment No. 4

The last sentence of the first paragraph (DEIS at Volume 6 page 25) Proposed Action section states, "Dillon is a rail crossing..." The sentence should be revised to say, "Dillon Junction is a rail crossing..."

Comment No. 5

The DEIS at Volume 6, page 67 states, "NS would also dispose of all materials that **could** be reused in accordance with state and local solid waste management regulations." NS believes the DEIS intended to say and therefore should be modified to, "NS would also dispose of all materials that **cannot** be reused in accordance with state and local solid waste management regulations."

7.10 Construction

Comment No. 1

The DEIS at IL-67 states, "The construction of the new connection at Kankakee, would convert approximately 2.3 acres to rail line right-of-way." *The correct acreage is 1.0 acre* as provided in a letter from NS to SEA dated October 16, 1997. The correct acreage should be used in the FEIS.

Comment No. 2

The DEIS at IN-69 states, "The proposed construction would require that NS acquire and convert approximately 3.9 acres of currently undeveloped land to rail line right-of-way." *The correct acreage is 0.4 acre* as provided in a letter from NS to SEA dated October 16, 1997. The correct acreage should be used in the FEIS.

Comment No. 3

The DEIS at IN-29 states, "The connection . . . would be approximately 1,750 feet long." *The correct length is 1,700 feet* as provided in a letter from NS to SEA dated October 16, 1997. The correct length should be used in the FEIS.

Comment No. 4

The Summary of Sites Mapped by EDR, Table H-1 (DEIS at H-10) contains a reference to a LUST site 317 feet east of the proposed site for the Butler, Indiana construction. However, under the Indiana Hazardous Materials and Waste Sites, Existing Environment at the Butler construction (DEIS at IN-54 and IN-55), the text states, "The Environmental Data Resources, Inc. (EDR, 1997) report identified no hazardous waste sites or related environmental concerns within 500 feet of the proposed connection." The inconsistency should be corrected in the FEIS.

7.11 Data Differences Between the DEIS and Information Provided SEA by NS

7.11.1 Train Traffic Data

Comment No. 1

Some of the traffic data included in the DEIS differs from what was provided by NS to SEA in the ER, the Operating Plan or in supplemental submissions. The following table presents discrepancies noted by NS of plus or minus 2 trains or greater, or discrepancies of plus or minus ten percentage points or greater. Explanations which follow the table address apparent errors which should be corrected in the FEIS. The reason for other discrepancies is unclear, and the discrepancies are pointed out here for SEA's consideration and appropriate use.

Segment Name	SEA #	Type of Data	DEIS*	Correct	Source
Indiana Hbr to S. Chicago	N-047	Percent change in MGT	22	40	Revised Table 1-4, submitted on 10/17/97
W. Detroit to Jackson	N-121	Post freight	12.1	3.7	See explanation below
		Change in trains	9.2	0.8	See explanation below
		Percent change in MGT	313	-25	See explanation below
Jackson to Kalamazoo	N-120	Post freight	12	3.4	See explanation below
		Change in trains	6.6	-2.0	See explanation below
		Percent change in MGT	162	-49	See explanation below
Burstall to Meridian	N-343	Post freight trains	16.2	18.2	See explanation below

Segment Name	SEA #	Type of Data	DEIS*	Correct	Source
Calumet to Landers	N-499	Percent change in MGT	-99	40.3	Operating Plan Errata, page 18
Ridgewood to Suffern	N-064	Percent change in MGT/GTM	123	32	Revised Table 1-4, submitted on 10/17/97

* As listed in DEIS Attachments B-1 through B-3

The differences in tonnage on the **Indiana Harbor to South Chicago** segment are likely a result of the exclusion of 14.6 million gross tons per year of CSX post-Transaction trackage rights trains. Neither these trains nor their tonnage were included in the Operating Plan and it appears their tonnage was not included in the DEIS either. The tonnage should have been included in the DEIS and should be reflected in the percent change in tonnage.

As discussed in Section 4.22 in these comments, the expected change in traffic on the **W. Detroit to Jackson** and **Jackson to Kalamazoo** line segments was modified by NS based on new information on the status of the potential for haulage of CP trains across these line segments (addressed in a correspondence to SEA on 10/30/97). The FEIS should be edited to reflect these modifications.

In the Operating Plan, the post-Transaction train numbers for the **Burstall, Alabama to Meridian, Mississippi** line segment were listed as 2 passenger trains per day, 18.2 freight trains per day and 18.2 total trains per day. The total trains per day column was incorrect; it should have read 20.2 trains per day. Thus, 18.2 freight trains per day post-Transaction is correct.

The reason for the other data discrepancies is unclear. This information is supplied for SEA's consideration.

7.11.2 Other Data

The DEIS at GA-21 in Table 5-GA-16 incorrectly states NS is currently constructing a new intermodal facility in Fulton County, Georgia which is related to the proposed Transaction. This is not the case. NS is currently in the process of seeking permits for a

new intermodal facility in Austell, Georgia which is located in Cobb County. However, this action is completely unrelated to the Transaction and therefore, all references to it should be removed from the FEIS.

APPENDIX NS-1

**DESCRIPTION OF NS COMPLIANCE WITH
POTENTIAL PASSENGER TRAIN SAFETY MITIGATION MEASURES
DESCRIBED IN CHAPTER 3 OF THE DEIS**

APPENDIX NS-1

DESCRIPTION OF NS COMPLIANCE WITH POTENTIAL PASSENGER TRAIN SAFETY MITIGATION MEASURES DESCRIBED IN CHAPTER 3 OF THE DEIS

Chapter 3 of the DEIS, Sections 3.2.3 and 3.3.3, describe a variety of potential mitigation measures for passenger rail safety as follows:

- Enhanced rail-safety programs, such as closer spacing of rail car defect detectors along rail lines.
- Increased frequency of track inspections, tank car inspections, and highway/rail at-grade crossing signal inspections.
- Toll-free numbers for use by emergency response forces in communities to contact railroad authorities.
- Training programs for community and emergency response personnel to enhance their abilities to respond to rail-related emergency incidents.
- Head-hardened rail-on-track curves in mountainous territory to reduce the risk of track breakage and serious derailments.
- Centralized train traffic control systems for safer rail operations.
- Replacement of old rails to reduce the risk of derailment.
- New track installation to increase the capacity of the rail line segment, which reduces the potential for train collisions.
- Improved rail signal system to make more efficient and safer use of track.

In this appendix, NS will describe its existing compliance programs with each of the nine measures described above. These measures will be employed by NS on each of the line segments operated by NS.¹

1. **Rail Safety Programs/Defect Detectors** - NS will maintain rail safety programs appropriate to the classification of the track on each of the four NS (now Conrail) involved line segments. With respect to defect detectors, Conrail's standard spacing for hot bearing detectors is 20 miles. Conrail presently has an approved

¹ N-063; N-120; N-121 and the Porter, IN to Chicago, IL route which consists of N-308, N-042, N-047, and N-309. Line segment N-497 is owned by Amtrak.

capital AFE to install 41 detectors to achieve nominal 20-mile spacing on lines where spacing presently exceeds this standard. Upon completion of this AFE, 20-mile nominal spacing will be achieved on these four line segments.

- 2(a). **Inspection of Track** - NS already has in place an inspection program which features twice weekly inspections (twice as frequent as the FRA requirements). In addition to these regular inspections, NS will perform more frequent inspections when: (a) ambient temperature conditions and/or temperature changes along the involved line segments create stresses in the track structure which produce the potential for track problems (such as kinks and pull aparts); and (b) weather conditions produce potential risks associated with the possibility of derailments caused by uncontrolled water flows or other weather phenomena as addressed in FRA Safety Advisory 97.

In addition, current NS standards require all main line rail to be tested at least once per year. Frequency of testing can be up to four times per year. NS testing frequency is based on density, traffic type, defect history, rail type and age. The NS track testing policy is more stringent in most cases than STB's proposed "at least once every 40 million gross ton-miles of rail traffic, or to inspect annually, whichever is more frequent."

- 2(b). **Inspection of Tank Cars** - Tank cars are inspected before acceptance at originating point, when received in interchange, and at any point where a train is required to be inspected (i.e., in yards where the car is put into a train). The cars may continue in transit only when the inspection indicates that the cars are in safe condition for transportation as required by 49 CFR 174.8 and NS Hazardous Materials Timetable Rule F.1 and F.2. The inspection is made from the ground and verifies that the car has no visible leaks and that all valves and openings are properly secured. Additional inspections in passenger corridors by railroads is not practical or necessary to ensure safety.
- 2(c). **Inspections of Highway/Rail At-Grade Crossing Warning Devices** - NS conducts monthly, quarterly and bi-annual tests and inspections of grade crossing warning devices in accordance with FRA and company standards and instructions. Such tests and inspections will continue to be done on the four lines.
3. **Toll Free Telephone Number** - The NS Police Communications Center has two toll free numbers (one is used for general emergencies and the other is displayed on railroad crossing devices). The general number is published in the phone books in all locations which NS operates. It has also been broadcast on the law enforcement network. Additionally, it is distributed at all Grade Crossing Collision Classes conducted by the NS police Department (approximately 30 classes per year).
4. **Emergency Response Training** - The NS Police Department conducts approximately 30 Grade Crossing Collision Courses each year. As part of that instruction, unique problems associated with passenger train collisions are

discussed. Passenger train locomotive and car schematics are included in the Operation Respond software NS donates to local communities. For more information on the Operation Respond program refer to the SIP at DEIS 2-159. Schematics for Amtrak, VRE, MARC and NJT will be included in version 3.2 of the OREIS software which will be available by January 1998.

5. **Head-hardened Rail** - None of the segments are located in mountainous territory. Application of head-hardened rail on these segments will be initiated in cases where this type of rail is justified by overall traffic levels and track curvature.
6. **Centralized Train Control** - Each of the four line segments mentioned is already equipped with centralized traffic control (CTC) signaling. When signal indications are complied with, these systems enhance safety by providing protection for opposing and following train movements on the same track, and allow for positive protection of roadway workers. In addition, these systems enable more efficient and fluid train operation.

In addition, Amtrak, Michigan DOT and CR (later NS) have a FRA grant for \$9 million to install and test a positive train separation system called Incremental Train Control System (ITCS) on the Kalamazoo to Porter line. The grant will equip 40 locomotives, and 10 wayside servers along 70 miles of track. Imposition of the 15/30 minute rule would nullify the value of this system.

On the Campbell Hall to Port Jervis line New Jersey Transit (NJT) is installing a similar system. The objective of the NJT project is to implement technology to make the railroad safer. It consists of two systems for enforcing civil speed restrictions, signal indications, and positive stops at "Stop" or "Stop and Proceed" signals. The complementary system, using wayside transponders at interlockings and automatic signals interfaced to signal aspects, is called PTS or Positive Train Separation. It will be integrated into the remaining existing wayside signal systems and operate in conjunction with and enhance the capabilities of the existing and future Continuous Cab Signal Systems and Automatic Train Control.

7. **Rail Replacement** - NS will replace rail on the involved segments based on wear and defects detected in accordance with applicable FRA requirements.
8. **Enhancement of Track Capacity** - NS believes that existing track capacity on the five involved line segments is sufficient to safely accommodate existing and foreseeable future traffic levels. Should future traffic levels develop where additional track capacity is needed to safely and efficiently accommodate train operations, NS is prepared to initiate necessary track construction projects. There appears to be sufficient space in the rights-of-way on the Kalamazoo - Jackson; Jackson - West Detroit; and Campbell Hall - Port Jervis segments to add track if necessary.

In addition, the lines at issue are projected to experience only modest freight train

frequency increase of 4.1 for the Campbell Hall to Port Jervis line; between 6.7 and 9.2 on the two segments between West Detroit and Kalamazoo and 6 on the Amtrak line between Kalamazoo and Porter, IN. The line between Porter, IN and Ashland Avenue, Chicago is divided into four segments with an increase of 0.1 train per day between Porter and CP 501; an increase of 16.9 trains between CP 501 and Indiana Harbor; and an increase of 4.1 trains between Indiana Harbor and South Chicago and a decrease of 16.2 trains between South Chicago and Ashland Avenue. This 38-mile line is double and triple track with bi-directional CTC and is not going to be taxed with the train frequency shifts listed above.

9. **Rail Signal Systems**- Improvements have been approved for the Campbell Hall - Port Jervis segment. Conrail presently has an approved capital AFE to eliminate the signal pole line on the Campbell Hall to Port Jervis line segment. This project will enhance signal system reliability and consequently improve passenger train safety. On the other three mentioned lines to be allocated to NS, pole lines have been eliminated, and the signal systems in use are both safe and reliable.

Also, see response to 6 above. In addition, NJT is adding wayside 4-aspect coded 100 hz Continuous Cab Signal Systems (CCSC) to an additional 214 track miles in 131 route miles of existing signaled territory, increasing ATC to about 76 percent of its system. The ATC portion of the project is expected to be completed by the end of 1998. Subsequent to installation of ATC all locomotives operating over such signal territory will be required to have ATC equipment. Imposition of the 15/30 rule would make the investment in these high-tech systems a waste of time and money as the railroad would be running as if the territory was dark, i.e., no signals at all.

APPENDIX NS-2

HIGHWAY/RAIL AT-GRADE CROSSING DELAYS

APPENDIX NS-2

HIGHWAY/RAIL AT-GRADE CROSSING DELAYS

In Volume 5A, Appendix C, Section C.4.3, pages C-11, C-12 of the DEIS, SEA has calculated the crossing delay per stopped vehicle by use of the following equation which the DEIS describes as "from" the Institute of Transportation Engineers, "Transportation and Traffic Engineering Handbook," Second Edition, 1982:

$$D_A = \frac{D_C \times (S_c/S_c - S_q)}{2}$$

This equation does not appear in the "Transportation and Traffic Engineering Handbook" in this form to represent a relationship of delay per stopped vehicle. Also, the equation is not semantically correct (i.e. S_c/S_c is equal to one). The equation SEA used to calculate crossing delay per stopped vehicle resembles the equation in the "Transportation and Traffic Engineering Handbook," for calculating the duration of the queue. The correct equation found in the publication that calculates the average minutes of vehicle delay is presented on the same page as the above equation in the ITE "Transportation and Traffic Engineering Handbook." The equation is expressed as follows,

$$d = r/2 (1 - s_r/q)$$

where,

d = average minutes of vehicle delay
 r = duration of blockade, minutes
 s_r = flow rate (vehicles per minute) at bottlenecks during blockade
 q = average arrival rate of traffic (vehicle per minute) upstream of bottleneck

The value of s_r is zero when the roadway is completely blocked as in the case of an at-grade railroad crossing. Therefore, the equation reduces to,

$$d = r/2$$

When an additional 0.30 minutes is added to allow for the waiting line of vehicles to dissipate, the equation resembles the average delay time equation presented in the Applicants' ER, Volume 6A, Appendix D, page 246. This equation was developed by the Stanford Research Institute "Guidebook for Planning to Alleviate Urban Railroad Problems," prepared for the Federal Railroad Administration and Federal Highway Administration, August 1974, RP-31, Volume 3, Appendix C and has been used previously in the Environmental Assessment prepared by SEA for the UP/SP merger. (STB, SEA. 1996. EA, Finance Docket No. 32760, Union Pacific Corporation, et. al. Control and Merger Southern Pacific Rail Corporation et. al.)

Therefore, the final form of the equation to calculate average delay per vehicle using the DEIS notation should be expressed as,

$$D_A = D_C/2 + 0.3$$

This equation will more accurately reflect the crossing delay per stopped vehicle definition as described in the DEIS Volume 1, Chapter 3, Section 3.7.1, page 3-17, that says SEA assumed that vehicles arrive at a crossing at a uniform rate and that the average delay for any particular roadway is half the time the crossing is activated ($D_C/2$), plus the time required for vehicles to disperse (0.3) after the train has passed.

In Volume 5A, Appendix C, Section C.4.3, the last paragraph on page C-16 describes Table C-5 as the variation of average delay per stopped vehicle with changes in train length and train speed for various roadway ADT volumes and number of roadway travel lanes. However, Table C-5 is titled "Blocked Crossing Times (in minutes)" which SEA defines differently than average delay per stopped vehicles. Furthermore, the ITE "Traffic Engineering Handbook" does not directly associate blocked crossing time and delay per stopped vehicle as functions of the number of lanes and ADT during a blocked crossing event. If it is SEA's intent to generate a table of average delay per stopped vehicle as defined in the ITE handbook, the table should contain the values generated by using the equation,

$$D_A = D_C/2 + 0.3$$

and the proposed table would be as follows:

Table C-5					
Average Delay per Stopped Vehicle (minutes)					
Train Speed	Train Length (in feet)				
	4,869	5,000	5,600	6,000	6,200
10	3.32	3.39	3.73	3.96	4.07
20	1.93	1.97	2.14	2.25	2.31
30	1.47	1.50	1.61	1.69	1.72
40	1.24	1.26	1.35	1.40	1.43
50	1.10	1.12	1.19	1.23	1.25

In Volume 5A, Appendix C, page C-14, the third paragraph says, "For crossing delay per vehicle, SEA determined that a significant impact would occur if vehicle delay at highway/rail at-grade crossings increased by 30 seconds. This figure represents a driver tolerance threshold above which the driver perceives added delay for an intermittent blocked crossing event."

The DEIS does not explain how the 30-second significance criteria was established. If this value is based on past research, it would be appropriate to cite the source. If SEA has performed their own study to derive at this value, details of that study should be included in the methodology. Furthermore, the 30-second criteria appears to be inconsistent with the statement in the DEIS Volume 1, Chapter 4, Section 4.9, page 4-44 that says, "There are no national standards for measuring emergency response vehicle delay or the significance of any delay impacts."

APPENDIX NS-3

ADDITIONAL NOISE MEASUREMENTS

APPENDIX NS-3

ADDITIONAL NOISE MEASUREMENTS

Noise measurements were performed on Norfolk Southern rail segments by Wyle Laboratories in Cleveland, Bellevue and Clyde, Ohio and Fort Wayne and Lafayette, Indiana. The measurements were performed in December, 1997 and January, 1998. The measurements were performed in order to: (1) determine if the existing Norfolk Southern noise model was conservative or underestimated noise impacts, and (2) perform site-specific modeling in areas where the STB identified a noise concern.

The noise model used in the Environmental Report (ER) was developed by Thornton Acoustics. The noise model was based on noise measurements made in a flat open field area in North Carolina over a four-day period. Wayside noise measurements were made at four locations perpendicular to the track at distances of 50, 100, 150 and 200 feet from track centerline. The train speed was measured by a radar gun and number of locomotives and rail cars were counted for each train pass-by. Thirty-six trains were measured for noise. The measurements were made without any horn soundings. Based on these noise measurements, SEL's were determined for trains traveling at 20 mph, 35 mph and 50 mph. For each train speed, train length was determined. For the model, trains were divided into three size categories (15 to 50 rail cars, 51 to 99 rail cars and 100 and greater rail cars). From evaluation of its system-wide operations, Norfolk Southern determined that the typical NS train travels at 35 mph and contains approximately 75 rail cars. For the representative NS train, the wayside noise SEL at a distance 100 feet from the track centerline was determined to be 98.4 dBA. The average attenuation rate of the noise was determined to be 4.8 dBA per doubling distance. A separate set of measurements were made of the locomotive with the horns soundings. The SEL noise level at 100 feet from a grade crossing was determined to be 108.5 dBA. The noise model was developed based on the measured data. Also included in the model was the option for background noise inputs. For all modeling runs it was assumed that the background noise levels would be relatively low. The background levels were set to 50 dBA during daytime hours (7 am to 10 pm) and 40 dBA during nighttime hours (10 pm to 7 am). The noise model allows for input runs used a shielding attenuation of 5 dB only if the structures parallel to the track occupied at least 65 percent of the total area parallel to the track. Further details of Norfolk Southern's noise model is contained in the Environmental Report, Volume 6A, Appendix B.

Wyle Laboratories performed noise measurements in Cleveland, Bellevue, and Clyde, Ohio and Fort Wayne and Lafayette, Indiana. The noise measurements in Cleveland were made in three areas for a 24 hour period. Two sites (Site 1 and 2) were on the NS Cloggsville to Ashtabula line segment and one site (Site #3) was on Conrail's Cloggsville to Short Line line segment. A comparison was made between the measured L_{dn} noise value and the calculated L_{dn} noise value using Thornton Acoustics' noise model. Thornton Acoustics' noise model predicted noise values 2.2 to 6.1 dBA higher than the measured noise values. The train noise levels were subtracted out of the 24 hour L_{dn} noise measurement to obtain the background noise levels. Background noise values from non-railroad sources ranged from 58 to 61.5 dBA.

In Bellevue, Wyle Laboratories performed noise measurements for three sites on an existing Norfolk Southern rail segment. The Bellevue noise measurements were taken over a three hour period. Three train pass-by noise measurements were made. A comparison was made between the measured noise value and the calculated noise values using the Thornton Acoustics' noise model. It is evident from the train pass-by noise measurements that horn noise affects the noise SEL values. Thornton Acoustics measured a noise SEL for a standard train at grade crossings to be 108.5 dBA at 100 feet from the track centerline. The highest measured SEL value at 100 feet from the track centerline was 106.2 dB. The lowest measured SEL value was 90 dBA. Thornton Acoustics determined a 4.8 dB spreading rate. At location 2,230 feet from the track, the highest measured SEL was 98.4 dBA. Thornton Acoustics' model predicts a 102.9 dBA SEL. At the third location, 650 feet from the track, the highest measured SEL was 88.9 dBA SEL while the modeled SEL value was 95.5 dBA. Thornton Acoustics' noise model over-predicts the noise values for each site and train pass-by.

Noise measurements were performed in Clyde, Ohio, along Norfolk Southern's Oak Harbor to Bellevue line segment. Wyle Laboratories performed SEL noise measurements at three locations. Two train pass-by noise measurements were made. A comparison was made between the measured noise value and the calculated noise value using Thornton Acoustics' noise model. It is evident from the train pass-by noise measurements that horn noise affects the noise SEL values. Thornton Acoustics' measured a noise SEL for a standard train at 108.5 dBA at 100 feet from the track centerline. The highest measured SEL value at 100 feet from the track centerline was 106.0 dB. The lowest measured SEL value was 97.4 dBA. Thornton Acoustic determined a 4.8 dB spreading rate. At location 2,330 feet from the track, the highest measured SEL was 95.0 dBA. Thornton Acoustics' model predicts a 100.2 dBA SEL. At the third location, 545 feet from the track, the highest measured SEL was 93.4 dBA SEL while the modeled SEL value was 96.7 dBA. Thornton Acoustics' noise model over-predicts the noise values for each site and train pass-by.

Noise measurements were performed in Fort Wayne along an existing Norfolk Southern line segment. Wyle Laboratories performed SEL noise measurements for two locations. Two train pass-by noise measurements were made. A comparison was made between the measured noise value and the calculated noise value using Thornton Acoustics' noise model. All crossings within the measurement area are separated. Thornton Acoustics measured a noise SEL for a standard train at 98.4 dBA at 100 feet from the track centerline. Thornton Acoustics determined a 4.8 dB spreading rate. For a location 200 feet from the track centerline, Thornton Acoustics' model predicts a 93.6 dBA SEL. The highest measured SEL value at 200 feet from the track centerline was 89.6 dB. The lowest measured SEL value was 75.8 dBA. At location 2,130 feet from the track, the highest measured SEL was 88.4 dBA. Thornton Acoustics' model predicts a 96.6 dBA SEL. Thornton Acoustics' noise model over-predicts the noise values for each site and train pass-by.

Noise measurements were performed in Lafayette along an existing Norfolk Southern line segment. Wyle Laboratories performed SEL noise measurements for two locations. One train pass-by noise measurement was made. A comparison was made between the measured noise value and the calculated noise value using Thornton Acoustics' noise model. All crossings within the measurement area are at grade. However, horn noise was not heard during the train

pass-by. It was noted that bell noise was heard during the pass-by. Thornton Acoustics measured a noise SEL for a standard train at 98.4 dBA at 100 feet from the track centerline. The highest measured SEL value at 100 feet from the track centerline was 93.8 dBA. Thornton Acoustics determined a 4.8 dB spreading rate. At location 2,250 feet from the track, the highest measured SEL was 86.8 dBA. Thornton Acoustics' model predicts a 92.0 dBA SEL. Thornton Acoustics' noise model over predicts the noise values for each site and train pass-by.

The comparisons between Wyle Laboratories noise measurements and Thornton Acoustics' noise model predictions show that in all cases, the Thornton Acoustics' noise model overestimates the L_{dn} 65 dBA contour at grade crossings and for wayside noise. It is evident in areas with a significant amount of structures, that shielding is an important consideration to determine actual noise impacts. The data consistently shows that the difference between Wyle Laboratories noise measurements and Thornton Acoustics' noise model is greatest where the building structure are most densely populated. Also, in areas with high background noise, the change in the total noise level is not necessarily equal to the change in the rail traffic only due to the logarithmic nature of the dB. For example, at Cleveland site #1, the background noise level is 61.5 dB. The measured L_{dn} from the rail traffic is 63.2 dB. The total measured L_{dn} was 65.4 dB. Assuming a 181 percent increase in rail traffic along this line as a result of the acquisition, the rail L_{dn} will increase by 4.5 dB. The post-acquisition rail L_{dn} will then be 67.7 dB and the total L_{dn} will be 68.6 dB. The total L_{dn} will increase by 3.2 dB due to the acquisition, not the 4.5 dB increase predicted by the noise model.

The Thornton Acoustics' noise model used in the ER is conservative compared to all noise measurements made by Wyle Laboratories. The model used to predict noise contours and levels in the DEIS further overestimates noise impacts and should be amended to adopt the Thornton Acoustics' predicted SELs for NS trains. The model would also be improved by application of additional acoustic shielding where justified by the presence of structures. Finally, it is apparent that noise models should be used only as a screening tool and that further local analysis needs to be performed in areas where the STB is considering mitigation.

INTRODUCTION

CSX Corporation and CSX Transportation, Inc. hereby submit the following comments on the Draft Environmental Impact Statement ("DEIS") prepared by the Board's Section of Environmental Analysis ("SEA"), served December 12, 1997.

The present case represents the first occasion on which the Board (or its predecessor) has determined to prepare an EIS in a rail combination case. One of the basic purposes of an EIS is to identify all of the significant environmental impacts that may arise from a proposed federal agency action. The basic philosophy of the National Environmental Policy Act, 42 U.S.C. §§ 4321 et seq. ("NEPA"), is that federal agency actions that have significant environmental impacts should not be effected in ignorance of those environmental impacts. The potential impacts must be called clearly and plainly to the attention of the decision-maker(s) of the agency before the final decision is made, so that the agency may, in reviewing the action in question, balance the public interest and the performance of its statutory mandate against the environmental impacts that will arise from it.

The DEIS is clearly successful in this regard, as it fully identifies the potential environmental impacts of the proposed Transaction. The SEA and its consultants prepared a detailed, six-volume DEIS that carefully analyzes every potential significant environmental impact that could result from Board approval of the proposed Transaction. In addition, the DEIS offers preliminary recommendations for Board-imposed mitigation of adverse impacts. The comprehensiveness of the DEIS leaves little doubt that the Final EIS ("FEIS") will fully satisfy the requirements of NEPA.

Pursuant to the mandate of NEPA, the Board has exposed the DEIS to public comment. The public comments will doubtless call to the attention of the Board and its staff other possible methods of addressing the environmental impacts of the Transaction. The public comment period, and, indeed, the period throughout the preparation and exposure of the FEIS, should permit the Applicants and other interested parties to suggest the appropriate weighing of the benefits that flow from the Transaction as proposed -- both on environmental issues and on the basic public interest factors considered by the Board under its statutory authority -- against any adverse environmental impacts. It also should permit the Board to weigh and consider the extent to which any of the mitigation alternatives proposed in the DEIS might, on balance, cut too deeply into or even eliminate the benefits -- environmental and non-environmental -- of the Transaction. Such balancing will require the Board's consideration of whether other, more targeted mitigation approaches might be taken, or perhaps a realization reached that in some areas no mitigation is appropriate given the countervailing considerations, such as the broader impacts on the region or significant impacts that the mitigation would have on the transportation system.

Comments will no doubt be filed by numerous persons with concerns about various local impacts. Some local communities, understandably concerned only with their local interests, might request that the Board impose solutions that would effectively require redesigning CSX and NS's operating plans or postponing their implementation (effectively nullifying the Transaction). An example of this is the greater Cleveland area where the City of Cleveland has offered a plan requiring a redesign of the CSX/NS systems that would disrupt East-West traffic flows, as well as have significant adverse impacts on other local communities. If indulged, such requests would have catastrophic consequences for the CSX and NS rail networks, and indeed the national

transportation system, and would thwart the public and private benefits flowing from the Transaction.

It is important to note now that the DEIS concludes that the proposed Transaction will create important system-wide environmental benefits. Those positive impacts are in a number of areas, including enhanced safety, improved air quality and reduced energy consumption. For example, the DEIS predicts a decline in the likelihood of rail accidents and the release of hazardous materials, a decline in truck accidents and emissions due to the projected diversion of approximately one million intermodal units to the CSX and NS rail systems, a significant decline in energy use resulting from those diversions and a general improvement in the efficiency of rail operations. Further, no systemwide significant adverse environmental impacts are noted in the DEIS.

Because of the fact that the local and particular requires more explication and description than the general and the systemic, the DEIS inevitably devotes considerable attention to a discussion of particular local impacts and less attention to a discussion of the overall, systemwide benefits and other effects of the Transaction. This is entirely appropriate -- indeed necessary under NEPA -- as any discussion of numerous, unique local impacts will inevitably require more lengthy discussion. But it is important that the Board not lose sight of a crucial conclusion of the DEIS, namely, that the substantial systemwide beneficial environmental effects of the Transaction overshadow the far more limited local impacts discussed in such considerable detail. The FEIS should clearly reflect this.

While the DEIS does not discuss in any detail non-environmental benefits of the Transaction, since these are analyzed by other elements of the Board's staff and are to be, with

the environmental impacts, the material of the ultimate resolution and decision by the Board itself, the FEIS should nonetheless recognize them. It is also worthwhile to note them at this stage.

The Transaction brings, to a large segment of the Northeastern United States, rail-to-rail competition between Class I rail carriers for the first time in a generation. The Transaction enhances Class I rail-to-rail competition in a number of major markets in the Northeastern United States. The Transaction also extends the systems of two strong Class I railroads considerably and brings single-line rail service between many markets in the Southeastern United States and the Northeastern United States. These effects not only strengthen rail movements as a competitor against truck movements, thus producing more efficient railroads and many of the systemwide environmental benefits already mentioned, but also bring economic benefits to businesses, consumers and communities throughout the entire Eastern United States and indeed throughout the country at large. Strong railroads offer opportunities for growth and jobs in communities, including in lower-income communities where they are most needed.

The DEIS has well fulfilled its mission of identifying all of the significant environmental impacts that could flow from the proposed Transaction. However, there are two items of unfinished business which must be undertaken in preparing an FEIS.

First, the SEA, in taking its work and the vast work of its consultants from the DEIS stage to the FEIS stage, must permit the Board to fulfill its statutory charge of balancing the economic and other nonenvironmental benefits and the systemwide environmental benefits, against localized environmental impacts that may attend the Transaction, and of balancing possible remediation of those local impacts against the achievement of the great benefits of the Transaction. The DEIS, perhaps understandably, does not do this nor does it suggest how or when that balancing process

is going to be conducted. As we develop below, it is this balancing process which distinguishes the EIS process from the Environmental Assessment (“EA”) process, which has previously been employed in rail combinations by the Board and its predecessor. Just as the Board is not to single-mindedly devote itself to its transportation mission in ignorance of the environmental consequences -- which the process employed by the SEA clearly guarantees it will not -- the Board is not to devote itself single-mindedly to avoiding localized environmental impacts at the price of sacrificing its basic statutory mission. Thus, where the effect of a recommended remediation might be to reduce materially the overall public benefits of the Transaction, the FEIS should provide the Board with a broader menu of remediation alternatives. It should, as far as the SEA’s expertise permits, provide some suggestions as to the relative weight of the local environmental concerns and the systemwide environmental benefits, and the weight of the transportation policy benefits which the Transaction involves.

Second, while identifying localized environmental impacts and their optimum “freestanding” mitigation, (that is, mitigation not balanced against other factors), the DEIS in a number of cases overlooks the basic constraints under which the Board operates, in the environmental as well as other areas. Respectfully, CSX suggests that the DEIS has recommended environmental mitigation in situations where the Board’s established policies and precedents (even where an EA has been prepared) do not require -- or permit -- the imposition of conditions. Moreover, in some areas, the mitigation proposed by the DEIS would inappropriately extend the Board’s reach into areas reserved exclusively or primarily to other federal and state agencies.

Accordingly, CSX believes that in a number of areas the recommended mitigation measures which are set forth in the DEIS should be withdrawn, should be modified, or should be supplemented with alternative recommendations, in each case for ultimate resolution by the Board. Among the areas discussed in detail below where CSX believes the proposed mitigation measures set forth in the DEIS go beyond an appropriate use of the Board's conditioning authority are the following:

- the proposed 30-minute separation window around passenger trains in relation to freight trains;
- the proposed upgrading of certain grade crossings or construction of grade separations at CSX's expense;
- the proposed conduct of emergency response drills every two years on certain line segments that may experience more hazardous materials traffic;
- the proposed Failure Mode and Effects Analysis for hazardous materials incidents at yards;
- the proposed environmental justice mitigation; and
- the proposed mitigation for "unique" communities with pre-existing conditions (Newark and the Four Cities).

As to each of these measures, and others, it appears to CSX that one or more of the following conditions is present:

- (1) the recommended mitigation will unreasonably, and sometimes drastically, interfere with CSX's ability to run a viable and efficient freight railroad;

- (2) the recommended mitigation will unreasonably reduce the public benefits that the proposed Transaction was designed to create;
- (3) the recommended mitigation is unnecessary as alternative remedies are available;
- (4) the recommended mitigation attempts to cure environmental impacts that are unrelated to the Transaction;
- (5) the recommended mitigation is overbroad and reaches beyond any potential harm caused by the Transaction;
- (6) the recommended mitigation is not a feasible strategy for curing the identified environmental impact; and
- (7) the recommended mitigation would infringe on the jurisdiction of other bodies.

The DEIS is, by definition, a preliminary document. The comment process provides interested parties with the opportunity to assist the SEA in shaping the FEIS. CSX submits that, by addressing its concerns in the manner discussed in the subsequent sections of these comments, the SEA can provide the Board with a tool of environmental analysis that is best suited for enabling the Board to weigh the environmental costs of the proposed Transaction against the Transaction's environmental and other public benefits and to decide if, how, and to what extent, it will exercise its conditioning authority.

I. General Comments

A. The Purpose of an EIS Is Not To Resolve Every Identified Environmental Impact. An EIS Is Simply A Tool to Bring Environmental Considerations to the Decision-Maker's Attention

The DEIS represents an impressive undertaking by the SEA to identify and analyze every potential significant environmental impact that could result from Board approval of the proposed Transaction. The enormous effort and millions of dollars committed to the preparation of the DEIS are unparalleled in the history of the Board or Interstate Commerce Commission ("ICC") and reflect the seriousness with which the SEA approaches its environmental review process. While CSX respectfully disagrees with certain limited portions of this analysis, CSX, on the whole, agrees with and applauds the analytical process. However, upon completion of this analytical process, the FEIS should address the unfinished task that the authors of NEPA intended: to provide a finished document permitting the balancing process to be effected by the Board, without resolving every environmental impact identified by SEA's analytical process. Although well-intentioned, DEIS's attempt to devise a Board-controlled mediation for every identified environmental impact not only goes beyond that which is legally required by NEPA but also (1) does not facilitate the balancing test that the Board will ultimately apply and (2) runs the very real danger of intruding into the regulatory jurisdiction of other federal and state agencies and unnecessarily provoking conflicts with those agencies.

Federal law is quite clear as to what Congress intended, and what it did not intend, when, in 1969, it required all federal agencies to prepare an EIS before undertaking "a major Federal action" that would "significantly affect [] the quality of the human environment." 42 U.S.C. § 4332(2)(c). Congress intended to create a mandatory process that would ensure that federal

agencies would take a “hard look” at all significant environmental impacts of a proposed action and that the results of this “hard look” would be made available to the public. Robertson v. Methow Valley Citizens Council, 490 U.S. 332, 349-50 (1989); Baltimore Gas and Electric Co. v. Natural Resources Defense Council, Inc., 462 U.S. 87, 97 (1983) (citing Vermont Yankee Nuclear Power Corp. v. Natural Resources Defense Council, 435 U.S. 519, 553 (1978)).

Congress, however, did not intend the EIS process to “require agencies to elevate environmental concerns over other appropriate considerations.” Baltimore Gas and Electric Co., 462 U.S. at 97 (citing Stryckers’ Bay Neighborhood Council, Inc. v. Karlen, 444 U.S. 223, 227 (1980)). Rather, the EIS process mandates that federal agencies, prior to undertaking major federal actions, “balance a project’s economic benefits against its adverse environmental effects.” Hughes River Watershed Conservancy v. Glickman, 81 F.3d 437, 446 (4th Cir. 1996); see Idaho v. Interstate Commerce Comm’n, 35 F.3d 585, 595 (D.C. Cir. 1994); Calvert Cliffs Coordinating Comm., Inc. v. United States Atomic Energy Comm’n, 449 F.2d 1109, 1113 (D.C. Cir. 1971). Once a federal agency identifies and evaluates the adverse environmental effects of a proposed transaction, NEPA’s goals are satisfied. See Simmons v. United States Army Corps of Engineers, 120 F.3d 664, 666 (7th Cir. 1997) (“[I]f a federal agency has heard all the objections to a plan and considered all the sensible options before it, the agency has fulfilled its duty.”) The agency is then free to conclude that the benefits of the proposed action outweigh the environmental costs and that the proposed action should go forward. Robertson, 490 U.S. at 350-51.

As part of the process of weighing the benefits and costs of a proposed action, a federal agency must include in its EIS a discussion of possible measures that can be taken to mitigate the identified adverse environmental impacts. See Robertson, 490 U.S. at 351-52. However, because NEPA mandates a process and not a result, the Supreme Court has made clear that NEPA does not require an agency to mitigate all (or indeed any) of the identified adverse environmental impacts. See id. at 352 & n.16. If an agency determines that, given the benefits of the proposed action, the identified impact need not be mitigated, the agency may approve the action without mitigation, even if the imposition of mitigation would fully remedy the identified harm. The weighing of the costs and benefits that go into this decision is left to the discretion of the agency.

The DEIS's attempt to remedy every identified potentially significant impact goes far beyond what is required in the EIS process and is more consistent with the abbreviated Environmental Assessment ("EA") process followed by the Board and the ICC in prior rail consolidation proceedings. However, the purpose of preparing an EA is to determine whether the action contemplated will have a significant adverse environmental effect requiring the preparation of an EIS. If an EA reveals that the proposed action will have a significant adverse environmental effect, the agency must either completely mitigate all significant impacts or prepare a full EIS. See Idaho, 35 F.3d at 595 (citing Cabinet Mountains Wilderness v. Peterson, 685 F.2d 678, 682 (D.C. Cir. 1982)); Roanoke River Basin Ass'n v. North Carolina, 940 F.2d 58, 62 (4th Cir. 1991). In stark contrast to the shorter EA process, where as here, the STB prepares an EIS, it has no corresponding obligation to mitigate every (or any) environmental impact, because the preparation and consideration of a legally sufficient EIS satisfies NEPA's procedural mandate. As the Supreme Court has explained, "[i]f the adverse environmental effects of the proposed action

are adequately identified and evaluated, the agency is not constrained by NEPA from deciding other values outweigh the environmental costs.” Robertson, 490 U.S. at 350.

While reciting the differences between the two processes, the DEIS also recommends some form of mitigation for every significant local environmental impact. This approach should now be complemented with a further balancing of the environmental impacts of the proposed Transaction against the Transaction's public benefits. By performing this balancing process, the Board will determine what weight the local environmental impacts will carry in its ultimate decision as to whether to approve the pending application. The Board may decide that (1) the public benefits of the proposed Transaction so outweigh the local environmental impacts that the Transaction should be approved without any environmental conditions; or (2) the public benefits of the proposed Transaction outweigh the local environmental impacts but that certain mitigation of environmental impacts, which will not reduce the public benefits, should be imposed.

Where the DEIS presently recommends a mitigation measure that would require Applicants to modify their respective Operating Plans, either permanently or pending implementation of the mitigation measure, or would otherwise significantly reduce the overall public benefits of the Transaction, CSX urges that the FEIS provide the Board with one or more alternative mitigation measures which would not significantly reduce the overall public benefits of the Transaction. The Board will thus be able to balance the local environmental impact and the costs of mitigating it in various ways against both the local and overall public benefits of the Transaction in deciding if, and how, it will exercise its conditioning authority.

The DEIS's preference for “in-house” mitigation -- through remedies created and administered by the Board alone -- for every identified environmental impact also runs the risk of

intruding into the exclusive or primary jurisdiction of other federal and state agencies. NEPA was not enacted to expand an agency's substantive jurisdiction. The DEIS puts the Board into the role of regulator of passenger train safety (a role which Congress has given exclusively to the Federal Railroad Administration ("FRA")), at-grade crossing safety (a role which Congress has given jointly to the FRA, the Federal Highway Administration ("FHWA"), and the states), and hazardous material safety (a role which Congress again has given exclusively to other federal agencies, including the Department of Transportation's Research and Special Programs Administration).¹

Any such intrusion into the regulatory jurisdiction of other federal agencies could result in the creation of unique and potentially conflicting new safety requirements outside the prescribed federal rulemaking process. Likewise, the intrusion into the regulatory jurisdiction of state agencies could result in an interference with state law and ignore established state-government procedures and priorities. Moreover, such intrusion is entirely unnecessary under NEPA. A lead agency, where it has identified environmental impacts for which it does not possess the necessary jurisdiction to impose mandatory mitigation measures, can satisfy its NEPA obligations by discussing the identified impacts and possible mitigation measures and leaving the decision as to whether to impose any mandatory mitigation to the agency with the proper jurisdiction. The Council on Environmental Quality addressed this precise issue in its "Forty Most Asked Questions Concerning CEQ's National Environmental Policy Act Regulations":

Q. How should an EIS treat the subject of available mitigation measures that are (1) outside the jurisdiction of the lead or

¹ The processes of these authorities in administering their responsibilities are described in Sections II.2.A.1 and II.8.B.2.

cooperating agencies, or (2) unlikely to be adopted or enforced by the responsible agency.

A. All relevant, reasonable mitigation measures that could improve the project are to be identified, even if they are outside the jurisdiction of the lead agency or the cooperating agencies, and thus would not be committed as part of the RODs of these agencies. Sections 1502.16(h), 1505.2(c). This will serve to alert agencies or officials who can implement these extra measures, and will encourage them to do so. Because the EIS is the most comprehensive environmental document, it is an ideal vehicle in which to lay out not only the full range of environmental impacts but also the full spectrum of appropriate mitigation.

46 Fed. Reg. 18026, 18031-32 (Mar. 23, 1983) (“CEQ Notice”). So long as the lead agency presents its mitigation recommendations for consideration by the agency possessing the appropriate substantive jurisdiction,² the lead agency may approve the proposed action and need not wait for the agency with jurisdiction to decide whether to implement the recommended mitigation. Robertson, 490 U.S. at 352-53.³

B. The DEIS Contains Many Mitigation Recommendations That Are Beyond the Scope of the Board’s Policies as to the Use of Its Conditioning Power

² It is important to understand that CSX is not suggesting that the Board abdicate its environmental review responsibilities to another agency. This would clearly be improper. See Idaho, 35 F.3d at 595. What CSX is suggesting is that the Board can and should satisfy its environmental review responsibilities by analyzing all significant environmental impacts and, where appropriate, leaving the imposition of mitigation to those agencies with the requisite authority to do so.

³ In other contexts, the ICC deferred to other federal and state agencies that have jurisdiction to regulate a matter relating to transportation. See, e.g., No. 40853, Yellow Freight System, Inc. of Indiana -- Petition for Declaratory Order -- Weighing Shipments (served Jan. 20, 1995) (deferring to jurisdiction of National Institute of Standards and Technology and states over truck weighing practices).

Even if the SEA concludes that the DEIS's attempt to mitigate every identified environmental impact is proper, the DEIS nonetheless recommends numerous mitigation measures that transcend, if not the Board's powers, its traditional approach to exercising those powers. The exercise of the Board's power to require mitigation is constrained by well-established limitations. The Board will not invoke its conditioning power where (1) no causal connection links the transaction and the alleged environmental harm, e.g., the alleged environmental harm is a pre-existing condition; (2) the mitigation is not narrowly tailored to remedy the alleged harm; (3) alternative remedies are available; (4) the mitigation would put the affected community in a better position than before the transaction; or (5) the mitigation, although potentially remedying a specific environmental harm, would reduce the overall public benefits of the transaction.⁴ See Union Pacific Corp., Union Pacific R.R. Co. & Missouri Pacific R.R. Co. -- Control and Merger -- Southern Pacific Transportation Co., St. Louis Southwestern Ry. Co., SPCSC Corp., & the Denver & Rio Grande Western R.R. Co., Decision No. 44, Finance Docket No. 32760 at 144 (1996) (hereinafter "UP/SP"); Burlington Northern, Inc., & Burlington Northern R.R. -- Control & Merger -- Santa Fe Pacific Corp. & Atchison, Topeka and Santa Fe Ry., Decision No. 38, Finance Docket 32549 (1995) (hereinafter "BN/SF"); DEIS, Vol. 1 at 1-10.

While the DEIS acknowledges these established limitations on the Board's imposition of environmental conditions, it fails to apply these standards in a number of critical respects. For example, the DEIS proposes that Applicants are required to (1) comply with various laws,

⁴ The Board has applied these factors even in cases where it relies solely on an EA to meet its NEPA obligations.

regulations and private agreements that would be independently binding on them (measures that, by definition, are not necessary and for which alternative remedies exist), (2) install, with or without otherwise required state and federal funding, costly upgrades at highway/rail at-grade crossings that would more than rectify the claimed transaction-related adverse impacts on accident rates and highway traffic movements, and (3) commit enormous funds to the installation of new rail facilities, limit the number of trains moving over certain line segments and implement new operating procedures and other measures that would disproportionately and drastically undermine the public benefits of the Transaction, and actually reduce the level of transportation services to the public. In all of these respects, the proposed mitigation measures should be narrowed and/or eliminated, or alternative approaches laid before the Board, in the issuance of the FEIS.⁵

In addition, the NEPA process and the Board's conditioning power is not properly used to re-write industry-wide regulations and operating practices related to railway safety and operations. Just as the Board has recognized that its conditioning power may not be used to effectuate broad restructuring of the rail industry and the competitive balance among carriers, see, e.g., BN/SF at 55-56, so too it would be an inappropriate exercise of the Board's responsibility to consider environmental impacts of the Transaction as a predicate to impose conditions that fashion broad new safety and operating rules to which other major railroads are not subject and that fall within the regulatory responsibility of other federal and/or state agencies. The DEIS itself recognizes this limitation in its proposal not to impose noise-impact abatement measures falling within the FRA's regulatory jurisdiction over the sounding of train horns, see Vol. 1 at 3-36, but

⁵ For specific applications, see Sections II.2, II.8, II.10 and II.11.

it has not conformed to this standard in several other respects, including its proposals to require Applicants to (1) comply with a proposed industry-wide FRA regulation governing rail inspections, (2) construct at-grade crossing protection devices at certain locations notwithstanding the existing regulatory regime governing selection and funding of grade crossing improvements, (3) maintain 15-minute separations between passenger and freight trains on certain line segments without regard to the prevailing industry standards and operating practices on similar rail lines, and (4) comply with various newly fashioned operating requirements and procedures governing the transportation of hazardous materials, again without regard to prevailing industry standards and operating practices in the handling of that traffic.

C. The Board Should Not Impose the Terms of Voluntary Agreements as Formal Conditions of Approval of the Transaction

The DEIS has suggested that the SEA intends to recommend that the Board impose as a condition of its approval of the proposed Transaction any negotiated settlement agreements or other mutually acceptable binding agreements pertaining to the Transaction that CSX and NS enter into with non-Applicants. Some parties have even suggested that all such agreements completed prior to the publication of the FEIS be imposed as environmental conditions to any decision approving the Transaction. Vol. 4 at 7-4. The SEA and the Board should, however, give serious consideration to whether the imposition of voluntary agreements as formal conditions is a prudent and necessary step.

First and foremost, the existence of a bilateral agreement between an applicant and an affected third party is an alternative mechanism for remediating an identified harm that obviates the need for the imposition of a formal condition. As the Board noted in UP/SP, the Board

expects Applicants to honor all representations and agreements. UP/SP at 12 n.14. Furthermore, the Board will have continuing oversight following any decision to approve the Application. This oversight function will fully enable the Board to determine whether the Applicants are satisfying the terms of their voluntary agreements and to take appropriate steps in the event that intervention is required. Accordingly, no reason exists to impose the terms of voluntary agreements as formal conditions to approval of the Transaction.

While it is true that the Board has in several instances involving railroad mergers and other consolidations conditioned its approval of the transaction in question upon the parties' compliance with various environmental mitigation measures, there is no basis in NEPA for requiring in all instances that negotiated agreements pertaining to mitigation of environmental impacts be made formal conditions of Board approval. As bilaterally-negotiated settlements, those agreements contain undertakings that go beyond the Board's standards for imposing conditions. Again, NEPA mandates a process, not a result. Moreover, where, as here, the Board has prepared an EIS rather than an EA, it is not necessary that the Board itself resolve each and every potential environmental impact that can be identified. A "process" resolution leaving the issue to private resolution or referring the issue to other regulatory agencies, federal or state, with experience in the matter and established procedures and practices, may be the most desirable result. Not only is the DEIS's proposal for imposing conditions unnecessary in the context of an EIS (which requires that the Board balance the identified significant adverse environmental impacts with the identified systemwide environmental and commercial benefits of the proposed Transaction), it fails to heed clear limits in the practices applied by the Board as to the imposition of conditions.

Because of the amorphous nature of some of the perceived environmental impacts that may become the subject of negotiations between CSX and affected entities, it can be expected that some of the negotiated solutions to the impacts will fall outside the practices of the Board in imposing mitigation measures. Moreover, any insistence that the terms of a negotiated agreement be converted into a Board-imposed condition would have an obvious dampening effect on the ability of CSX to consider and agree to innovative, creative solutions to community concerns. The Applicants would likely be less willing to negotiate such agreements with the prospect hanging over their heads of the Board turning a voluntary, uniquely-tailored solution in a specific instance into a formal condition that could later be argued to have precedential effect because of the Board's imposition of the agreement as a condition of approval. The need to so limit its conditioning authority have long been recognized by the Board and the ICC which often favorably commented on settlement agreements but declined to impose them as conditions.

D. The Inability of Applicants and Third Parties to Enter Voluntary Agreements by the Date of the Board's Decision Does Not Necessarily Require the Imposition of Formal Conditions

Just as the Board should not impose the terms of voluntary agreements as formal conditions, the SEA and the Board should not presume that the lack of a voluntary agreement at the time of the issuance of the FEIS and/or at the time of the voting conference necessitates the imposition of a formal condition. As the DEIS itself recognizes, the consultation process is a far superior means for developing and implementing creative, mutually-beneficial solutions to local environmental impacts than is the formal conditioning process. The consultation process allows the parties to share responsibilities and costs in a manner that the Board could not impose

unilaterally. However, the consultative process cannot be expected to produce across-the-board agreements over the course of a mere few months. Creative solutions with public entities require many levels of review and approval before the public entity can commit itself to a binding agreement. Given these realities, the SEA and the Board should allow the consultative process to continue beyond either issuance of the FEIS, the voting conference or the implementation of the Transaction. Applicants propose that they report the status of the consultations to the Board as consultations are concluded or as otherwise appropriate. What the SEA and the Board should not do, and need not do to satisfy NEPA, is to cut short the consultation process and impose rigid conditions before the consultation process has had a full opportunity to produce optimal results.

E. The SEA Should Not Recommend the Imposition of Any Environmental Conditions that Require Applicants to Modify or Refrain from Implementing Their Respective Operating Plans Pending Implementation of Mitigation

Well-established Board and ICC precedent teaches that the Board will only impose a condition where the condition “will produce public benefits (through reduction or elimination of the possible harm) outweighing any reduction to the public benefits produced by the merger.” BN/SF at 56; see UP/SP at 144. The approach of NEPA and the teachings of the courts as to the function of an EIS confirm the applicability of this balancing approach. The proposed Transaction is designed to produce a more efficient and competitive rail network. Key to the realization of these benefits is implementation on Day One (the day that the CSX and NS Operating Plans become effective) of those Operating Plans.

The projections of train traffic in Applicants' Operating Plans were not arrived at randomly. Quite to the contrary, the Operating Plans reflect the considered judgment of the respective applicants as to their best use of the two competing networks that will emerge from Board approval of the proposed Transaction. If the Board imposes a condition modifying Applicants' Operating Plans pending implementation of mitigation, neither Applicants nor shippers nor the American public will realize the competitive and other benefits of the Transaction on Day One. Instead, one or both of the Applicants will be required to operate their respective networks in a less than optimally efficient and competitive manner. The effects of such an impediment on competition may be long-lasting. The costs of not realizing the benefits of the proposed Transaction on Day One far outweigh the benefits of reducing a modest, temporary, and local environmental impact pending the implementation of mitigation. While Applicants have been and remain willing to work with affected communities to develop mutually beneficial mitigation measures, that mitigation should not come at the expense of the prompt, effective and enduring enjoyment of the overall public benefits that will result from Board approval of the proposed Transaction.

The situation here is readily distinguishable from UP/SP, where the Board imposed a condition modifying the UP Operating Plan until mitigation was implemented. In UP/SP, the SEA, after preparing an EA, found that the proposed transaction would have significant adverse effects in Reno, Nevada and Wichita, Kansas. Furthermore, the SEA concluded that additional studies were needed to identify adequate mitigation measures for these communities. Rather than delaying implementation of the entire transaction to prepare an EIS to take a "hard look" at the environmental impacts identified in the EA, the SEA chose to comply with NEPA by

recommending the complete and immediate prevention of any adverse environmental impacts. As the SEA had not yet recommended specific mitigation measures for Reno and Wichita, the SEA recommended, and the Board adopted, the only available option for avoiding the adverse impacts in the absence of an EIS: Prohibit the applicants from increasing traffic in Reno and Wichita until the completion of mitigation studies and the implementation of that mitigation.

Here, the SEA has chosen a different means of complying with NEPA, namely the preparation of an EIS, and does not have to recommend the elimination of every significant environmental impact, either immediately, or indeed, at all, as it was required to do in UP/SP. The SEA, therefore, should not use UP/SP as a model for developing its recommended environmental conditions. Instead, the SEA should recognize, when making its final mitigation recommendations, that the Board will only impose mitigation where the benefits of the mitigation outweigh any reduction to the public benefits to be realized by approval of the Transaction, and should provide the Board with the necessary tools to make this determination.

The Board, under an EIS, can weigh the benefits obtained from a constructive restructuring of freight rail transportation incident to a transaction within its jurisdiction against the necessary environmental impacts in determining whether mitigation should be ordered or the extent of mitigation. Likewise, it can and should weigh the benefits of the immediate systemwide efficiencies inherent in commencing execution of the Applicants' Operating Plans at once, rather than delaying the implementation of one or both of the plans in a specific area (which is apt to have impacts on transportation in other parts of the system) against permitting the environmental impacts to go unmodified for a period of time until plans for the remediation are finalized and/or the remediation put into effect.

Furthermore, it is essential that the SEA and the Board not allow a third party to impede approval of the Transaction by demanding that Applicants modify their Operating Plans either permanently or pending mitigation. Although Congress abolished the Interstate Commerce Commission in 1995, the Commerce Clause of the United States Constitution is still alive and well. The Commerce Clause grants Congress the power to regulate interstate commerce and where it has acted (and in some cases where it has not) prohibits the states from interfering with interstate commerce. Using its powers under the Commerce Clause, Congress has given the Surface Transportation Board, not any individual state or locality, the exclusive and plenary power to regulate railroad operations subject to Board jurisdiction, as well as railroad consolidations. See 49 U.S.C. §10501 (providing that the Board has “exclusive” jurisdiction over rail operations); Kings County, WA -- Petition For Declaratory Order -- Burlington, Northern R.R.Co. -- Stampede Pass Line, F.D. No. 33095 (served Sept. 25, 1996) (Board’s exclusive jurisdiction with respect to operations over rail line preempts local statutes). Thus, so long as the Board finds that the proposed Transaction is consistent with the public interest, the Board should approve the Transaction, even if a state or locality protests loudly that it deems the local environmental impact unacceptable. Simply put, the national interest in interstate commerce must take priority over a local environmental impact, if the only feasible remediation of that local impact would deprive the public of competitive or efficient transportation.

F. The Proposed Transaction Will Result in Numerous Systemwide Environmental Benefits and No Systemwide Significant Adverse Environmental Impacts

The DEIS concludes that there are numerous positive, systemwide environmental impacts that would flow from approval of the Transaction. CSX recognizes that, because positive impacts

do not require extended discussion of potential mitigation approaches and measures, the amount of text devoted to a discussion of positive impacts in the DEIS is small in comparison to the discussion addressing certain localized adverse impacts that SEA has preliminarily determined warrant mitigation. The positive impacts are, however, substantial and should be addressed in the FEIS in a manner consistent with their significance. These positive impacts of the Transaction are manifest in every major area of environmental analysis: safety, transportation, air quality, and energy.

Safety: The DEIS observes that predicted decreases in rail activities “would result in a small overall decrease in likelihood of freight rail accidents and derailments.” Chapter 4 at 4-10. The DEIS also correctly notes that the Transaction will reduce the opportunity for release of hazardous materials, resulting in “a slight safety improvement for rail transportation of hazardous materials and no significant systemwide adverse impacts related to hazardous materials transport.” Executive Summary at ES-19. This predicted decrease in the likelihood of accidents and derailments tells only part of the safety benefits that will accrue from the Transaction.

The October 21, 1997 comments submitted by the Department of Transportation and Federal Railroad Administration in this proceeding correctly observed that, “CSX and NS have had the two best safety records among large U.S. railroads for the last six years.” (DOT-3 at 17). In terms of the accidents/train miles measure used by DOT to assess rail safety performance, CSX has achieved the best record among all of the Class I railroads, with an accident rate that is one-half that of Conrail’s. While Conrail’s safety record has been commendable, the better record achieved by both CSX and NS offers a strong indicator that the Transaction will result in a net improvement of rail safety in the Eastern United States. The safety records of both CSX and NS

also stand in contrast to those of UP and SP. According to the DOT data described above, both of those Western railroads have had consistently higher accident rates than CSX or NS.

The level of safety planning, as reflected in the detailed Safety Integration Plans (“SIPs”) submitted by CSX and NS, further underscore the positive aspects of the Transaction. CSX has been engaged in detailed planning for the safe integration of Conrail since the spring of 1997, and this planning will have consumed well over one year by the time a decision is due to be issued in this proceeding. That level of planning effort, and CSX’s consultations with FRA concerning the integration of the railroads, is unprecedented in rail merger proceedings and underscores the importance that has been assigned to the achievement of a safe integration of the portions of the Conrail system allocated to the use of CSX. One important consequence of these planning efforts is that the best safety practices of CSX and Conrail will be identified and implemented on the expanded CSX system.

The Transaction will also significantly benefit highway safety. The truck diversion studies presented to the Board by CSX and NS indicate that a total of approximately 1 million intermodal units (trailers or containers) will be diverted from highway transport to the rail system. This diversion will result in a substantial net safety benefit. As noted in the DEIS, the associated reduction in truck-miles “could result in 1,600 fewer annual highway accidents,” including 31 crashes involving one or more fatalities. This projected savings in human lives deserves substantial weight in the environmental analysis of this Transaction.

Transportation: The transportation benefits associated with the Transaction -- enhanced rail competition, more efficient routings, new single-line rail opportunities and an improved infrastructure -- are uncontested in this proceeding. The DEIS does not address these benefits at

any length, but correctly concludes that the proposed Transaction “would positively contribute to a net overall improvement in both rail and highway transportation systems.” Vol 4 at p. 4-73.

Among the positive impacts identified in the DEIS are a more efficient use of rail system resources, a shift of freight from publicly funded highways to privately funded rail lines, and enhanced competitiveness of the rail system with highway carriage. As the DEIS correctly states, the “reduction in truck miles traveled would result in beneficial effects on air quality, energy consumption and the use and associated safety concerns of the interstate highway system.” Vol. 1 at 4-44.

The CSX Operating Plan describes at some length the new intermodal transportation opportunities that will be made possible by the Conrail acquisition, resulting from new single-line services linking, e.g., the northeast and the southeast, and the upper midwest with the southeast. These and other new single line routes will allow an expanded CSX system to compete for the transportation of cargo that has long been dominated by motor carriers, resulting in significant diversions to cleaner, safer and more fuel efficient rail transport. In addition, CSX is investing in substantial infrastructure improvements to its rail system, including improvements to intermodal terminals and to rail lines that will carry substantial amounts of freight projected to be diverted from highway carriage. The DEIS thus correctly concludes that the Transaction will benefit the highway system, result in reduced traffic and provide many shippers with more efficient routings. Executive Summary at ES-21. Highway maintenance costs will also decline.

The DEIS also correctly concludes that the Transaction “will have no significant effect on commuter rail.” Vol. 1 at 4-74. SEA properly determined that no transportation-related mitigation is required to address increased freight traffic on certain lines also used by New Jersey

Transit, Southeastern Pennsylvania Transportation Authority, the Maryland Rail Commuter System, Virginia Railway Express, or Amtrak.⁶ As the DEIS states, “there is sufficient capacity on all of these rail line segments [used by Amtrak] to accommodate the [projected] increases in freight trains,” and “[e]ach of the rail-line segments with commuter trains can accommodate the proposed Acquisition-related increase in freight traffic.” Chapter 4 at 4-30 and Executive Summary at ES-20.

Air Quality: The DEIS properly recognizes that the Transaction will result in “an overall improvement in air quality.” Chapter 4 at 4-70. SEA found that virtually all major emission components (including nitrogen oxides, breathable particulate matter, volatile organic compounds and carbon monoxide) will decrease as a consequence of the Transaction. These decreases are in large measure associated with the environmentally-friendly diversion of freight from highway to rail.

The DEIS also properly found another air quality benefit: “a reduction in the potential for accidental release of ozone-depleting materials. . . .” Vol. 1 at 4-62. This reduction is the result of a projected Transaction-related decrease in total car-miles and in freight handling at yards.

Energy: As in each of the other major areas of environmental concern, the Transaction will result in a net benefit to energy resources. This benefit will be realized in part because of reduced fuel consumption associated with truck diversions and more efficient rail routings. The annual reduction in fuel consumption resulting from truck to rail diversions would amount to 133.6 million gallons. See Vol. 1 at 4-47. As a result, SEA concluded that the Transaction

⁶ SEA did propose safety-related mitigation with respect to commuter and Amtrak operations on certain lines. This proposal is addressed in Section II.2 of these comments.

“would positively contribute to an overall net reduction in energy consumption.” Vol. 1 at 4-73. (The DEIS, however, erroneously reduces the predicted fuel savings by 53.5 million gallons, an amount of fuel attributed to increased rail operations. What the DEIS overlooks is that this increased fuel use by CSX and NS will be largely offset by decreased fuel use by other railroads and transportation modes.) SEA also correctly recognizes that the Transaction provides opportunities for more competitive routings and transportation alternatives for energy resources and for recyclable commodities.

* * *

As noted above, it is easy to lose the forest for the trees in an environmental review process that focuses on areas where mitigation may be appropriate and necessarily addresses general, environmental benefits relatively briefly. In this case, the over-arching fact that should not be obscured in the FEIS is that this Transaction presents an opportunity to achieve an important, and very significant, net plus for the environment in the areas of safety, transportation, air quality and energy. These benefits enhance the public interest. The FEIS should categorically so conclude. That conclusion and the non-environmental benefits of the Transaction are the benchmark against which local impacts and their appropriate remediation, if any, are to be measured.

II. Comments on Specific Mitigation Recommendations

CSX submits the following specific comments on the preliminary mitigation recommendations set forth in Volume 4, Chapter 7 of the DEIS.

1. Installation of Emergency Information Signs at At-Grade Crossings

The DEIS recommends that CSX and NS install emergency information signs that prominently display a toll-free telephone number and a unique crossing number at all at-grade crossings with active warning device signals. In addition, the SEA recommends that CSX and NS provide 24-hour, seven-day-a-week staffing to respond to calls to the toll-free telephone number.

Independently of the proposed Transaction, after consultation with the FRA, CSX has already begun installing emergency information signs meeting the SEA's specifications at at-grade crossings throughout the current CSX network. CSX anticipates that installation will be completed in the spring of 1998. CSX plans to expand this program to the Conrail lines which will be allocated to CSX if the Board approves the Transaction. CSX plans to assign crossing numbers to the at-grade crossings on the Conrail system, install the emergency information signs, and include the Conrail crossings in its database as soon as possible but in no case later than two years after the control date. Further, CSX and NS will coordinate with the Conrail Shared Assets Operator to ensure that a similar program is implemented within the Shared Assets Areas within that same time frame.

CSX will stipulate that it will voluntarily implement the safety measures described above. That stipulation accordingly may appropriately be included in the FEIS for consideration by the Board in evaluating the overall environmental effects of the Transaction. However, it would not

be appropriate for the Board to make any such voluntary program a condition of Board approval of the Transaction because it is not directly related to any effect from the Transaction. The recommendation applies to all at-grade crossings -- including those at which traffic will not increase significantly and those at which traffic will decrease as a result of the Transaction. Nevertheless, because CSX believes that the recommendation will have safety benefits apart from the Transaction, CSX has already commenced to implement the program on its own system and will voluntarily expand the program to the Conrail lines which will be operated by it if the Transaction is approved.

2. Safety: Passenger Rail Operations

The DEIS includes the most detailed analysis of effects on passenger rail services ever undertaken in the review of a railroad control transaction. The DEIS analyzes in detail all of the line segments shared by passenger trains and freight trains and appropriately concludes that there is adequate capacity on the lines for both the passenger traffic and the projected levels of post-Transaction freight traffic. Vol. 1 at 4-22 to 4-40. The DEIS concludes, however, based on a detailed statistical analysis, that Transaction-related traffic changes will significantly increase the risk of accidents between freight trains and passenger trains on about 15% of the miles (531 of 3,573 miles) shared by passenger and freight trains, and that these segments may thus warrant special safety mitigation measures. Vol. 1 at 4-12.

CSX strongly disagrees with the conclusion of the DEIS that the Transaction will have any adverse effect on the safety of passenger rail operations. Both CSX and NS are experienced in safely handling passenger operations on their systems and in working cooperatively with Amtrak and passenger agencies to enhance safety. Both railroads have achieved outstanding safety records, and both will continue after the Transaction to work proactively with passenger operators to ensure continued safety.

The DEIS proposes that CSX establish passenger trains as “superior,” and maintain 30 minute windows around passenger trains in relation to freight trains, on five CSX line segments over which there are both freight and passenger operations and where freight train operations are

expected to increase, albeit modestly.⁷ Although the DEIS never explains the purpose of the rule which was not suggested by FRA, Amtrak or any commuter agency, the recommendation appears to be designed to prevent head-on collisions with freight trains and to prevent freight trains from running into the back of passenger trains operating on the same track. Proposed Mitigation Measure No. 2(A), Chapter 7 at 7.2.2.⁸ In fact, the proposed mitigation would not enhance safety and would conflict with the FRA's exclusive right to regulate passenger train safety.

The CSX segments, identified in Table 7-3 for this mitigation, are:

Washington, D.C. to Point of Rocks, MD (C-003)
Savannah, GA to Jesup, GA (C-346)
Weldon, NC to Rocky Mount, NC (C-334)
Fredericksburg, VA to Potomac Yard, VA (C-101)
South Richmond, VA to Weldon, NC (C-103)

⁷ The DEIS is not internally consistent in its description of the proposed mitigation. Chapter 3, which identifies potential mitigation measures, does not even mention a separation rule among the options for consideration. See section 3.3.2, 3.3.3. Further, Chapters 5 and 7 are not consistent in their description of the proposed mitigation. The proposed superior train/train separation mitigation described in Chapter 7 of the DEIS contemplates that freight trains moving in the same or opposite direction on the same track on any of these line segments would need to be clear of the track at least 15 minutes before and 15 minutes after the expected arrival of a passenger train at any point. This proposed measure would thereby establish a 30 minute separation window around passenger trains moving on that track. See section 7.2.2 at p. 7-12.

By contrast, the discussion of mitigation of the individual line segments found in the state-by-state sections of Chapter 5 of the DEIS does not use the term "superior trains." Rather, Chapter 5 contemplates a proposed separation window under which freight trains, both opposing and moving in the same direction, would need to be clear of a point on the same track at least 15 minutes prior to the estimated arrival of a passenger train; no 15 minute window after a passenger train is proposed in Chapter 5. See sections 5-GA.4 at p. GA-5; 5-MD-5.1 At p. MD-9; 5-NC.4.1 at p. NC-4; 5-VA.5 at p. VA-8 and 5-DC.5.1 at p. DC-7. Further, whereas the mitigation proposed in Chapter 7 contemplates that the separation requirements would not apply when the freight train is moving in the opposite direction away from the passenger train, there is no similar qualification in the Chapter 5 description of the proposed mitigation.

⁸ Identical mitigation is proposed for four NS line segments and, subject to possible trackage rights for CP, a fifth NS segment.

Amtrak operates on each of these segments. In addition, CSX-operated MARC trains provide commuter services on the Washington/Point of Rocks line segment (“Point of Rocks” line) and Amtrak-operated VRE trains provide commuter services on the Fredericksburg /Potomac Yard segment (“Fredericksburg line.”) All but the Point of Rocks line form part of the north-south CSX corridor described in the CSX Operating Plan as the Atlantic Coast Service Route, a planned major traffic lane for transporting intermodal and general merchandise traffic between New England, the Middle Atlantic states, the Southeast and Florida.

CSX will show here as follows:

First, no passenger safety mitigation is warranted because, by any standard, operations on these line segments — which are already subject to FRA safety oversight -- are exceptionally safe and will remain equally as safe following the Transaction. The statistical analysis conducted by SEA to ascertain whether mitigation is warranted relied on data and assumptions that overstated the Transaction-related impacts of modestly increased freight traffic. For example, in conducting its statistical review of passenger/freight train collisions, the DEIS utilized a passenger train/freight train collision rate that was derived from collisions of a type that are unrelated to increased freight operations and that would not be addressed by the proposed mitigation, i.e., collisions resulting from freight trains and passenger trains operating on different tracks or from passenger trains hitting parked freight cars. The actual rate of passenger trains being hit head-on or from behind by freight trains operating on the same track, or vice-versa, is closer to zero, a fact that underscores that the mitigation proposal addresses an unlikely safety risk.

Second, even assuming that some mitigation might be warranted on certain line segments, modern signaling systems and other safety controls offer the highest levels of safety without the cumbersome procedures and efficiency sacrifices inherent in the proposed mitigation procedures. Train superiority and temporal separation practices of the type proposed in the DEIS, which are not even listed among the potential safety mitigation measures identified in Chapter 3 of the DEIS, have been outdated for decades, and their re-introduction on CSX now could well detract from safety.

Third, the proposed 15/30 minute separations would effectively curtail or significantly delay freight service on two of the five CSX line segments (Point of Rocks and Fredericksburg) during key daytime periods, imposing a substantial burden on commerce or forcing a reduction in the number of currently scheduled passenger trains on these lines. The proposed separations would not only result in CSX's inability to accommodate additional passenger service on these lines, but could well impair CSX's ability to divert time-sensitive traffic from highways to its rail system, thereby undermining important Transaction-related efficiency and safety benefits.

Fourth, to the extent that any mitigation might be appropriate, such mitigation should be in the form of a requirement that CSX consult with the FRA and the passenger agencies concerning safety enhancements that might be considered for these line segments. A consultation requirement would fully comport with the Board's obligation under NEPA to identify matters that other agencies might more appropriately address.

A. No Mitigation is Warranted on These Line Segments.

1. The Board Should Not Adopt Mitigation Measures That Interfere

With the FRA's Exclusive Authority to Regulate the Safety of
Passenger Operations

The Board should tread cautiously before imposing any special safety condition applicable to train operations, particularly passenger train operations. While CSX does not question the Board's right to identify legitimate, Transaction-related safety concerns through the NEPA process, the propriety of any proposed condition in the passenger safety area must be measured against the FRA's "plenary authority over the safety of the railroad industry."⁹ Section 202 of the Federal Railroad Safety Act of 1970, 49 U.S.C. 20101, grants the FRA the power to regulate "every area of railroad safety." The FRA has exercised that authority extensively, and as discussed further below is currently reviewing a variety of passenger train safety issues.

Congress has made clear that the FRA's role in regulating passenger train safety is exclusive. In explaining the 1973 deletion of language from section 801 of the Rail Passenger Service Act of 1970 that allowed the ICC to prescribe regulations "necessary to provide safe . . . service," the Conference Report on the Amtrak Improvement Act of 1973 stated as follows:

The Conference substitute rewrites Section 801 of existing law to clarify the jurisdiction of the Department of Transportation and the Interstate Commerce Commission over safety related and service related issues. First, this provision resolves a possible legislative inconsistency which results from the fact that Section 801 of existing law, as presently worded, authorizes the ICC to "prescribe such regulations as it considers necessary to provide safe and adequate service, equipment, and facilities for intercity rail passenger service." The Federal Railroad Safety Act of 1970, enacted only two weeks prior to the rail passenger Service Act, defined the Secretary of Transportation's jurisdiction over railroad safety to include "all areas of railroad safety." It is the intent of the committee of

⁹ DEIS, Vol. 5 App. B at B-2.

conference to make clear that the Secretary's jurisdiction over railroad safety is exclusive. The ICC, in prescribing its own regulations with respect to the adequacy of service, should take account of safety regulations prescribed by the Secretary of Transportation.

H.R. Conf. Rep. No. 93-587, at 12 (1973), reprinted in 1973 U.S.C.C.A.N. 2331, 2342 (emphasis added).

Congress's message was unambiguous -- the FRA has the sole authority to regulate rail safety. Moreover, nothing in the ICC Termination Act changes that fact. To the contrary, that statute curtailed the Board's limited authority with respect to commuter operations. See 49 U.S.C. 10501(c)(2)(providing that the Board does not have jurisdiction over commuter agencies other than with respect to access to facilities).¹⁰ In view of the Board's lack of authority to regulate with respect to passenger carrier safety matters, and FRA's exclusive jurisdiction and on-going activity in the area of passenger carriage safety, the Board should defer to its sister agency before adopting any passenger safety conditions, particularly a condition as far-reaching as that proposed in DEIS mitigation measure 2(a).¹¹

¹⁰ See H. Rep. 104-422, 104th Cong., 1st Sess. at 167 (Board jurisdiction modified to "reflect curtailment of regulatory jurisdiction in areas such as passenger transportation.")

¹¹ In fact, were the STB to impose the type of superiority/temporal separation proposed in the DEIS, such a condition could conflict with CSX's statutory right under section 402(e) of the Rail Passenger Service Act of 1976, 49 U.S.C. 24318, to petition for relief from the preference rule for Amtrak operations. The proposed freight passenger train separation condition is entirely unlike the preference for Amtrak trains that is contemplated by that statute or the CSX/Amtrak contract. Section 402(e) provides that except in an emergency, "Amtrak has preference over freight transportation in using a rail line, junction or crossing unless the Secretary of Transportation orders otherwise under this subsection." Neither this statute nor the Amtrak contract require any temporal separation between Amtrak and freight trains. The purpose of the statutory preference for Amtrak, in fact, has nothing to do with safety, but rather was designed to address on-time performance issues that arose in the 1970's. See Hearings before the Senate Committee on Commerce on S. 1763, 93rd Cong., 1st Sess. at 46, 105 (1973).

The FRA in fact has several pending rulemaking proceedings and other projects underway in connection with passenger safety. These include Passenger Equipment Safety Standards (FRA Docket No. PCSS-1), 62 Fed. Reg. 49728 (Sept. 23, 1997) and Passenger Train Emergency Preparedness (FRA Docket No. PTEP-1), 62 Fed. Reg. 8330 (Feb. 24, 1997). It is noteworthy that FRA has acknowledged the breadth of its interest in this area in its September 23, 1997 rulemaking notice in the Passenger Equipment proceeding:

rail passenger safety does involve the safety of the railroad system as a whole, including the track structure, signal and train control systems, operating procedures, and station- and platform-to-train interface design -- in addition to passenger equipment safety. To that end, FRA has active rulemaking and research projects in a variety of contexts that address non-equipment aspects of passenger railroad safety, including signal and train control systems.

62 Fed. Reg. 49732.

The proposed separation measure could well intrude upon, or conflict with, pending or future FRA proposals or plans to address passenger safety issues. Suffice it to say that any potential for conflict arising from the activities of more than one safety regulator should be scrupulously avoided.

The Board should also take note of the fact that neither the FRA nor any participant in the rail safety community known to CSX has proposed a temporal separation rule as a means of enhancing passenger train safety. Neither Amtrak, VRE nor MARC (nor any other commuter agency) has requested the proposed mitigation -- or any safety mitigation on any line segments -- in their filings with the Board. CSX works closely with these agencies on safety issues, and at no

point in CSX's safety-related dealings with any of these agencies have the notions of passenger train superiority or mandated temporal separations of trains as a means of ensuring safety been raised by any of these parties.

While Amtrak and VRE have filed comments with the Board requesting that certain conditions be imposed in connection with the Conrail acquisition (and MARC, through the State of Maryland, has supported the Transaction without requesting any conditions) none of these agencies have claimed that the Transaction will have any detrimental impact on the safety of their operations on any CSX lines. Nor have any passenger groups claimed that the Transaction will impair in any way the safe operations of passenger trains on any CSX lines, including the five lines identified by SEA for mitigation.

As a matter of sound public policy and deference to its sister agency, the Board should not intrude into a passenger safety area reserved for another agency that is already active on these matters. Nothing in NEPA requires that it do so. Rather, in addressing passenger safety mitigation, the Board appropriately fulfils its NEPA role by identifying potential safety issues for the FRA, leaving it to the agency to address those issues as it best sees fit. See Robertson, 490 U.S. at 352-353 (NEPA "imposes no substantive requirement that mitigation measures actually be taken;" agency preparing NEPA document fulfils its duty by identifying and evaluating environmental consequences that can be addressed only by another agency).

2. **The DEIS Fails to Justify the Conclusion that Any Mitigation is Warranted on the Identified Line Segments**

In determining the significance of impacts on passenger train safety, the DEIS first identified an annual rate at which passenger/freight train accidents occur. The DEIS then

identified the line segments shared by passenger and freight trains on which there would be an increase of at least one freight train/day as a result of the Transaction. Using the accident rate data, the DEIS then determined for each of the identified line segments (a) whether the Transaction-related change in the projected accident rate on each line segment would be greater than a presumed annual fluctuation of 25% and (b) whether the accident frequency was less than one accident in 150 years. CSX has several comments to offer on the DEIS methodology and the significance factors used in the DEIS as follows.

Appendix B of the DEIS explains that one element of the calculation of accident potential on the line segments that were reviewed in connection with the DEIS was a factor that assumed a passenger/freight train collision rate of 1.25 annually for Amtrak trains and 0.25 annually for commuter trains. See Vol. 5A, App. B at B-16. CSX understands that these accident rates were determined based on a review of freight/passenger collisions over a four year period, 1993 through 1996, inclusive.

Several points emerge from a review of the collisions that were considered in the preparation of the DEIS. First, there have been very few passenger/freight collisions in recent years. Second, an analysis of the collisions considered in the DEIS analysis shows that the proposed mitigation addresses a "problem" of passenger/freight train separation distances that does not justify the type of radical mitigation proposed, much less any mitigation.

Passenger/freight train collisions are very rare. Six passenger/freight collisions that occurred between 1993 and 1996 were considered in the calculation of the accident rates used in the DEIS analysis. There have in fact been only five such collisions during that four year period, all but two of which occurred on the lines of Western railroads.

The DEIS assumed that there were five Amtrak/freight train collisions and one commuter/freight train collision during the four year period studied, thus explaining the 1.25 and 0.25 annual accident rates. However, the one collision involving a commuter train was not properly considered because it was not a commuter/freight train collision. Rather, that one accident was an Amtrak/MARC collision in Silver Spring, Maryland in February 1996. Because this was a collision between two passenger trains, with no freight train involved, it should not have been counted in determining the rate of freight/passenger collisions. Accordingly, the actual annual rate of commuter/freight collisions during the four year study period was zero, not 0.25.

Further, a closer analysis of the considered Amtrak accidents shows that the proposed separation rules are designed to address a situation that experience shows is highly unusual. At least four of the five considered Amtrak collisions occurred in circumstances that would not be addressed by the proposed mitigation measure, *i.e.*, circumstances other than passenger and freight trains sharing the same track and traveling under power too closely to one another. The September 1993 collision that was considered in calculating accident rates occurred when an Amtrak train hit parked freight cars in a siding that was not long enough to accommodate the freight and passenger cars. The May 16, 1994 accident involving a CSX and Amtrak train occurred when the Amtrak train was struck by a trailer that had become unfastened from its mooring on a flat car that was part of a CSX train on an adjacent track and protruded over the track on which the Amtrak train was moving.¹² Similarly, the February 1995 incident involving an

¹² The CSX train was operating on an adjacent track, and because it was on a different track would not have been subject to a separation rule. CSX has taken several steps to prevent the recurrence of this type of accident, including improved securement of intermodal trailers.

Amtrak and a UP train occurred when the Amtrak train struck a load of steel that was projecting from a UP train located on an adjacent siding. A fourth collision that was considered occurred on BN's lines in March 1995, and was caused when the brakes on several parked BN freight cars failed, causing those cars to hit an Amtrak train. The freight cars were not connected to a locomotive at the time of the accident.

This review shows that at least four of the five collisions from which the 1.25 annual accident rate involving Amtrak trains was calculated occurred in circumstances that the proposed train separation mitigation rule would not have addressed, *i.e.*, circumstances that are unrelated to the level of freight train traffic on the same track as the passenger train traffic. These accidents did not involve freight and passenger trains moving under power and operating on the same track, and thus a separation rule designed to address freight and passenger trains sharing the same track would not have prevented the accidents. The appropriate annual accident rate that should have been used was thus 0.25 for Amtrak accidents, not 1.25.¹³

Had the appropriate (lower) accident rates for the type of accident of concern (*i.e.*, "head-on" and "hit from behind" accidents related to increased levels of freight operations) been used in the calculation of post-Transaction impacts, the predicted annual increases in accident rates shown on Attachment B-2 of Appendix B to the DEIS would have been markedly different.

¹³ The remaining collision considered in calculating the 1.25 annual accident rate was a March 1995 accident involving an Amtrak train operating on the BN system. In that incident, the Amtrak train, using a wye connection not normally used by passenger trains, backed into a BN locomotive located on the connection. It is not clear from the available facts that the proposed mitigation would have addressed this type of incident.

The expected post-Transaction passenger accident rate increase would have been much lower, underscoring that no mitigation is warranted on any of the identified line segments.

In fact, the proposed mitigation also would not address the causes of any of the few major collisions involving passenger trains colliding with other trains over the last several years. A summary of these collisions is set forth in an FRA rulemaking notice on Passenger Equipment Safety Standards, 62 Fed. Reg. at 49730 (Sept. 23, 1997). Not one of the major collisions involved a passenger train colliding with a freight train operating on the same track. The one collision involving a freight and passenger train that ended up on the same track was the 1987 collision in Chase, MD between a Conrail and an Amtrak train. However, that collision resulted when the Conrail engineer chose to ignore signals and occupy a track without permission. A separation rule of the sort proposed here would not have prevented a collision resulting from such actions by an engineer, who may have been disabled by drug use.¹⁴

The rate of passenger/freight collisions involving freight trains hitting passenger trains from behind or vice-versa on the same track is thus near zero. The facts thus show that passenger train safety mitigation designed to address an increase in the level of freight train operations is simply not warranted.

In addition, the 25% accident variability rate and 150 year accident occurrence factor used in the DEIS to assess significance appear to have been arbitrarily chosen, and the use of these factors would overstate Transaction impacts. The criteria used in the DEIS to assess the significance of safety impacts on passenger train operations was based on an assessment of

¹⁴ The DOT/FRA drug testing rules were not in effect at the time. Neither were the rules regarding engineer certification, which impose penalties for abuse of prohibited substances.

(1) post-Transaction accident variability and (2) a prediction of post-Transaction accident frequency. The DEIS identified for mitigation those line segments that, post-Transaction, would have a passenger/freight train accident variability rate of 25% or more and experience such an accident every 150 years or less.

A 25% accident variability criteria was chosen as a conservative proxy for the 30% annual accident variability rate that the DEIS reports for passenger train accidents over the last several years. See Volume 5A, App. B at B-17-B-18. However, the DEIS erred in using an annual accident variability rate as a “significance” factor -- if accidents varied 30% from some level before the Transaction, they can also be expected to vary 30% annually post-Transaction.

Instead of using the annual accident variability rate (or a “conservative” variation of it) as a measure of significance, the DEIS should have analyzed anticipated percentage increases in passenger train accidents that are Transaction-related in determining an appropriate measure of significance. CSX has undertaken such an analysis based on the post-Transaction accident percentage increases shown on Attachment B-2 of Appendix B. This analysis is reflected in the histogram of percentage changes in passenger accident rates set forth as Exhibit 1 and on the distribution chart of post-Transaction accident percentage increases set forth as Exhibit 2. Both of these exhibits are based on the data in Attachment B-2, which as shown above overstates the anticipated post-Transaction accident rates. A review of the distribution percentage changes based on post-Transaction increases in passenger accidents reveals that accident percentage increases of 39% or greater lie outside the expected range of the rate increases. The DEIS could appropriately have used a “conservative” factor of a “greater than 32%” increase in the post-Transaction accident rate as a measure of significance. This is because 32% is the end point of

the observed range of observations that are not “outliers,” i.e., that are part of the contiguous distribution of observations as shown on both exhibits. Had this more appropriate factor been used, four of the five CSX line segments would have dropped out of the mitigation pool-- Point of Rocks (29%); Weldon – Rocky Mount (30%), South Richmond – Weldon (25%) and Savannah - Jesup (32%).

As to the 150 year accident frequency factor, as discussed in greater detail below in connection with freight train safety (Mitigation Measure 7), the actual accident rate for each rail route mile is one accident every 49 years. Thus, a 70 year frequency factor would be quite conservative. That standard is met with respect to all of the CSX line segments identified for mitigation, except South Richmond-Weldon. However, the accident variability rate on that line segment is only 25%, which is lower than the significance threshold that CSX submits SEA should have used.

B. The Proposed Mitigation Relies on Archaic Notions of Train Operation That Overlook the Existence of Modern Signaling

Even assuming that some passenger safety mitigation were warranted, the proposed assignment of “superior” status to one type of train over another, and the proposed temporal separation of trains (e.g., the 15/30 minute separation rule proposed in the DEIS) would reintroduce into railroading operating procedures whose days have long since come – and are now long since gone. The proposed mitigation is outdated in concept and would detract from safety. While train superiority and temporal separation rules played a role in ordering train operations in the era prior to the introduction of modern train signals and communications, these procedures

were rendered obsolete beginning in the early part of this century, upon the advent of modern signals. Today, neither FRA rules nor rail operational rulebooks utilize the concepts of train superiority or temporal separation. Even when such rules were in effect -- decades ago and prior to the advent of modern signals -- rail rulebooks provided for a train to clear 5 minutes ahead of a passenger train schedule. On non-signaled main tracks, trains followed with a ten minute interval. Trains were never required to remain clear of the track after passage of a train, merely to follow according to signal rules or the "dark territory" (no signals) separation prescribed. A 30 minute "balloon" around each passenger train was unheard of, even in the 1940's. Further in the era when separation rules were in effect, such "superiority" rules were not designed as a safety measure at all, but as a means of enhancing the opportunity for trains to maintain on-time schedules.

Each of the five CSX line segments identified for mitigation is fully signaled with the modern signals used in large portions of the CSX system. Each line is equipped with Traffic Control System signals ("TCS"). TCS is a remote, dispatcher-controlled centralized traffic control system that provides the train engineer with substantial information about authority for movement including speed at control points, in addition to the "train or broken rail in block" information provided by intermediate block signals.

These signals and traffic control systems allow CSX trains and passenger trains to operate over the same track with safe headways of approximately four to five minutes between the trains. Such signals and systems provide tolerances that allow all trains, both freight and passenger, to safely share the same tracks. These systems are designed to prevent train collisions, while enhancing track capacity and service efficiency. The systems are recognized as safe by the FRA

and are in use throughout the rail industry. The analysis of the collisions discussed above underscores the fact that signals are in fact working to prevent trains from being hit in the rear.

In addition, the Point of Rocks and Fredericksburg line segments are double tracked and the latter segment is, in sections, triple tracked. Also, none of these line segments will experience a significant increase in the level of freight train operations -- those increases will range between 4.6 and 7.1 trains/day. These added frequencies can be accommodated with no compromise in safety. There are in fact several other line segments identified in Attachment B-2 to Appendix B of the DEIS on which both freight and passenger service levels are today much higher -- with no safety problem.

Modern signals and centralized traffic control provide a uniform and proven method of achieving the safe separation of trains that the DEIS seeks. By contrast, the temporal separation that is envisioned in the DEIS would not enhance safety beyond the levels achieved through these modern signal and traffic control systems, but could well detract from the safety of rail operations. The proposed mitigation measures would effectively undermine the utility and consistency of these safety systems on five line segments, in favor of an unconventional, non-technological approach for those segments of the type that pre-dates modern railroad operations. The introduction of this type of unusual operating rule on five line segments would undermine the safety that is achieved through the use of the uniform rules now in effect, introducing a "wild card" into CSX train operations. From a safety perspective, the introduction of such non-uniform rules enhances the possibility of confusion and human error -- thereby resulting in the real potential for a net reduction in safety.

Moreover, as noted above, the proposed mitigation is also not consistent with the DEIS description of appropriate passenger train safety mitigation, as set forth in Chapter 3 of the DEIS. Section 3.2.3 lists a series of potential passenger/freight train safety mitigation measures that the DEIS deemed appropriate to consider in connection with its analysis of acquisition-related safety impacts, but does not include passenger train superiority or temporal separations on the list.

The measures that are identified in section 3.2.3 (and incorporated for passenger trains by section 3.3.3) offer a more appropriate series of potential approaches to the enhancement of operating safety on lines over which both freight and passenger operations are conducted. As described in Exhibit 3 to these Comments, CSX already adheres to each of the pertinent safety mitigation measures that are identified in Chapter 3 of the DEIS with respect to the five line segments at issue. These measures provide a formidable, uniform and consistent measure of safety for those five line segments, consistent with modern procedures and technologies. The Conrail acquisition will not undermine, or change in any way, the utility of any these safety measures, and thus no mitigation is required.

C. The Proposed Mitigation Would Significantly Impair Operations on the CSX Lines, Lead to More Truck Traffic and Eliminate Important Transaction-Related Benefits

Were the proposed mitigation rule adopted, it would cause huge disruptions to CSX's north-south operations, effectively disabling CSX's use of the Fredericksburg line segment for freight movements and eliminating significant Transaction-related safety and transportation benefits resulting from improved intermodal service. In these circumstances, the absence of any demonstrable safety benefit offered by the proposal, and the absence of any evidence that the

modestly increased level of freight operations poses a risk to passenger safety, strongly argues against adoption of the proposed mitigation.

A 15/30 minute separation rule on the CSX system would make it impossible for freight trains and passenger trains to share the same tracks during periods of significant passenger use of the tracks on the Fredericksburg and Point of Rocks line segments, over which both commuter and Amtrak operations are conducted. Both freight and passenger service would suffer as a consequence.

Simulations undertaken by CSX have shown that the 30 minute separation balloon would have the effect of terminating or severely curtailing and delaying freight service on the Fredericksburg line (and thus on CSX's Atlantic Coast Service Route) for several blocks of daytime hours, particularly in the morning, late afternoon and early evening, or conversely, sharply reducing passenger service during these key hours. Assuming the current level of passenger service was maintained, CSX would have to radically alter its train operations and would be unable to meet its goals of providing enhanced service to time-sensitive intermodal freight moving on the Atlantic Coast Service Lanes. Alternatively, CSX might not be able to continue to accommodate the high level of passenger use of this line segment, which now accommodates 21 Amtrak trains and 12 VRE trains daily. While the level of impacts would not be quite as dramatic on the Point of Rocks line (which now accommodates 8 Amtrak and 17 MARC trains), it would be considerable and interfere significantly with freight operations on that line segment as well.

The massive interference with CSX's major north-south line would not only impair efficient rail operations, but would disable CSX's efforts to divert time-sensitive intermodal

freight from less safe, and less environmentally friendly, highway carriage to the national rail system. Indeed, one of the major public benefits of the CSX/NS acquisition of Conrail is the substantial improvement of intermodal rail transit times on the major "I-95" corridor between the Northeast and Southeast and the consequent projected diversion of large volumes of truck traffic to new Boston-Florida single-line rail service provided along the Atlantic Coast Service Lane. Four of the five CSX line segments on which the proposed mitigation would apply (all but the Point of Rocks segment) are vital links in the new north-south intermodal service that CSX proposes to initiate. The transportation benefits of that service would be sacrificed as a consequence of this proposed mitigation measure.

Safety would also suffer if the diversions are not achieved. According to DOT statistics, in 1993 (which is representative) the accident rate per ton mile was 0.4382 for trucks and 0.0015 for rail.¹⁵ Rail diversions thus offer a safety enhancement, as the approximately 300% lower rail accident rate illustrates. (The Environmental Report submitted with the Application reports that projected highway to rail diversions would result in a total of over 1,690 fewer annual truck crashes, including 429 crashes involving injuries and 21 crashes involving one or more fatalities.) A large number of projected diversions to the CSX Atlantic Coast Service Route are predicated on the diversion of freight off of the "I-95" Corridor – over 26,000 truckloads annually. See Application, Volume 2A, Verified Statement of Joseph Bryan at 257. The safety benefit associated with this large number of diversions will obviously be sacrificed in whole or large part were the proposed mitigation adopted.

¹⁵ Source: DOT: 1993 Commodity Flow Survey.

Further, the availability of passenger transportation could also suffer. If the proposed separation windows were adopted, CSX would be unable to entertain any proposals from commuter agencies to expand their services on these line segments, and would need to carefully re-evaluate its options with respect to continued passenger operations on certain segments. The proposed mitigation would effectively destroy the operational basis on which CSX is able to accommodate extensive Amtrak and commuter services on its lines, and hinder CSX's ability to work cooperatively with these passenger service providers with respect to future passenger service enhancements.

D. Any Additional Safety Measures Should Be Carefully Considered in Coordination with the FRA and the Passenger Agencies

For all of the reasons stated above, CSX does not believe that any special mitigation measures are called for in connection with the five line segments identified for mitigation in the DEIS. However, if any mitigation were to be imposed, the Board could appropriately consider a provision for consultations by CSX with the FRA and other relevant parties over possible further passenger train safety enhancements that may be appropriate for these line segments. Such a mitigation approach would be consistent with the settled proposition that where other governmental agencies have jurisdiction over matters that might warrant mitigation, the Board, lacking such jurisdiction, satisfies its NEPA obligations by identifying the issues that those agencies might address. See Robertson, 490 U.S. at 352-353; CEQ Notice, 46 Fed. Reg. 18031-32 (an EIS can appropriately identify matters outside the lead agency's jurisdiction so as to alert appropriate officials of other agencies).

CSX already retains an open dialogue on safety issues with the FRA and the passenger agencies. It is prepared to engage in careful and considered deliberation and study of safety issues on these line segments with all interested parties, specifically, FRA, Amtrak, VRE and MARC. Such considered rail industry and FRA safety consultations offer the appropriate response to any significant safety concerns involving passenger operations that may be identified.

3-6. Safety: Hazardous Materials Transportation

The DEIS includes the most detailed analysis of hazardous materials transportation ever undertaken in the environmental review of a control transaction. For the first time, the SEA required Applicants to isolate the hazardous materials component of their projected post-Transaction traffic so that potential changes in hazardous materials flows could be separately analyzed. The total volume of hazardous materials transported by rail is not expected to change materially as a result of the Transaction. However, because of changes in traffic patterns, some line segments will experience an increase in annual carloads of hazardous materials while other line segments will experience no change or a decrease. The DEIS proposes a series of measures designed to address the safe transportation of hazardous materials. As discussed further below, some of these measures overlap with existing CSX and industry practices, while others are not Transaction-related. Although CSX does not believe that any special mitigation measures are required, CSX does not object to a number of the recommendations, as explained below.

Any proposed measures should be considered in light of the fact that the DEIS concludes that the Transaction “should result in a slight safety improvement for rail transportation of hazardous materials and no significant systemwide impacts relating to hazardous materials transport.” Executive Summary at ES-19. Any proposals should also consider that CSX has an

extraordinarily successful record in the safe transportation of hazardous materials -- e.g., only 5 cars transporting hazardous materials experienced a release in 1996 even though 338,000 hazardous materials carloads were transported that year by CSX. CSX's pro-active efforts to enhance the safety of hazardous materials transportation are described at length in the Environmental Report that accompanied the Application (Volume 6A at 121-125) and in the CSX Safety Integration Plan at 168-177. CSX will not describe here all of the programs that it has in place with respect to the safe transportation of hazardous materials (several of which are described below), but encourages SEA to make note of these measures and programs in the FEIS.

The proposed series of mitigation measures concerning the transportation of hazardous materials would apply to line segments that would, based-on three year traffic projections presented by CSX and NS, become so-called "key routes" and "major key routes."¹⁶ As the DEIS reports, CSX determined just prior to the publication of the DEIS, that the data that CSX supplied to SEA overstated the extent of post-acquisition hazardous materials transportation. CSX has now supplied corrected data to SEA.

The key route concept comes from voluntary industry guidelines developed by the Association of American Railroads ("AAR"), to which CSX, NS and Conrail all subscribe. AAR's Key Route Guidelines are set forth in AAR Circular No. OT-55-B, "Recommended Railroad Operating Practices for Transportation of Hazardous Materials." According to the AAR definition, "key routes" are those line segments "with a combination of 10,000 car loads or intermodal portable tank loads of hazardous materials, or a combination of 4,000 car loadings of

¹⁶ As discussed further below, the term "major key route" does not comport with accepted industry terminology and CSX recommends not using this terminology.

PIH (Hazard Zone A or B), flammable gas, Class 1.1 or 1.2 explosives (Class A), and environmentally sensitive chemicals, over a period of one year.”

A table showing the 18 current or allocated CSX line segments and Shared Assets segments that CSX has determined (based on traffic projections) might become key routes post-Transaction is attached to this submission as Exhibit 4. Seven of the line segments would become new key routes based on traffic projections. These are shown in Part B of Exhibit 4.¹⁷ An additional 11 line segments, nine of which are today key routes, are projected to experience a doubling in hazardous material traffic and carry hazardous materials volumes in excess of 20,000 carloads annually. These routes, shown on Part A of the Exhibit, are addressed in connection with proposed Mitigation Measures 4(A) and 4(B).

Mitigation Measure 3(A). This measure would require that CSX comply with the OT-55-B guidelines before increasing the number of cars carrying hazardous materials on the line segments that are projected to experience increased hazardous materials traffic. This measure would apparently apply even if those line segments do not actually meet the key route thresholds.

CSX does not believe that any condition is warranted because it adheres as a matter of long-standing practice to the industry-standard key route safety procedures set forth in the AAR Circular. Thus, to the extent that any line segments meet the key route volume thresholds, CSX would apply the key route safety measures. Further, as Exhibit 4 shows, several of the line

¹⁷ An analysis of the CSX hazardous materials traffic plan data identifies six additional segments on which traffic projections indicate that the key route thresholds might be met. Those are segments C-766, C-767, C-768, C-769, S-232 and S-233, all currently on the Conrail system. No mitigation is warranted with respect to these line segments because Conrail already adheres to the Circular OT-55-B measures on these segments and CSX will continue that practice.

segments at issue are already key routes. No mitigation of the sort proposed in measure 3(A) is required for these line segments.

In the event that the Board imposes a condition, however, CSX recommends that the condition be structured so that CSX may retain the flexibility to adhere to any new industry standard that replaces, modifies or supplements the existing requirements in Circular OT-55-B. Those standards were developed in 1993, and could well be revised in future years. CSX should have the flexibility to adhere to any revised version of these standards that may be adopted in the future without the need to seek Board approval to modify a condition that requires adherence to the Circular OT-55-B requirements.

CSX also notes that the statement in the DEIS (Vol. 4 at 7-13) that the AAR's key route guidelines include "measures for visual rail defect inspections at least twice per week" is incorrect. Section II, paragraph B(2) of Circular OT-55-B states that main track on key routes "must be inspected by rail defect detection and track geometry inspection cars or any equivalent level of inspection no less than two times each year; and sidings must be similarly inspected no less than one time each year." FRA guidelines dictate minimum standards for track inspections.

As to the timing of implementation of any condition that may be adopted, CSX notes that a determination of whether a route is a key route or not is generally made based on an assessment of the level of hazardous materials traffic on the route during the previous twelve months. CSX is nonetheless prepared to comply with existing Key Route requirements in Circular OT-55-B for the identified line segments as of "Day One" (the date on which CSX and NS will implement their separate operating plans). However, any such condition should expire at the end of three years following Day One, at which time the determination of whether a line segment should be treated

as a key route should be made in the same manner that it is made throughout the rest of the CSX system (and the national rail system generally), i.e., on the basis of the actual level of hazardous materials carried. If the key route criteria are met, the key route obligations would attach to the specific line segment.

A three-year time frame for any mitigation measure concerning these line segments is appropriate because the traffic projections on which the mitigation has been proposed are three-year projections. If the projections prove accurate with respect to these line segments, then the key route test will have been met and CSX would apply the key route measures identified in the AAR Circular. On the other hand, CSX should not be bound to adhere to the key route obligations on line segments as to which the projections for increased hazardous material traffic in excess of the key route criteria are not met.

Proposed Mitigation Measure 3(A) also contemplates preparation of a Hazardous Materials Emergency Response Plan ("HMERP") for each local emergency response organization along the identified line segments. CSX understands that such organizations are the Local Emergency Planning Committees ("LEPC's"). CSX notes that under the Emergency Planning and Community Right-to-Know Act of 1986, 42 U.S.C. §§11001 *et seq.*, LEPC's are already required by law to develop hazardous materials emergency response plans. While this statute imposes no obligations on railroads, CSX will comply with the proposed mitigation measure, which it intends to implement by preparing and distributing an HMERP to appropriate county officials for distribution to the LEPC's. This HMERP -- which would supplement the plans already developed by the LEPC's -- would embrace information that CSX already makes available to local planning officials today, such as dispatcher phone numbers, an emergency response book

that contains information on how to address hazardous materials incidents, information on tank cars, and certain traffic flow information.

Mitigation Measure 3(B). Under this proposed mitigation measure, CSX would be obligated to comply with the AAR “Key Train” requirements before increasing the number of rail cars carrying hazardous materials on any train. These requirements are also set forth in AAR Circular No. OT-55-B, which defines a “key train” as one “with five or more tank car loads of poison inhalation hazard (Hazard Zone A or B) or 20 cars loads or intermodal portable tank loads of a combination of PIH (Hazard Zone A or B), flammable gas, Class 1.1 or 1.2 explosives (Class A), and environmentally sensitive chemicals.”

CSX agrees to adhere to this mitigation proposal, subject to the same caveat discussed above concerning possible future revisions or supplements to the standards currently described in Circular No. OT-55-B. CSX assumes that the intent of SEA is to require, as of Day One, that whenever CSX operates a train that, by virtue of the number of hazardous materials cars on the train and nature of those materials, meets the definition of a Key Train as set forth in the AAR Circular, CSX must comply with the Key Train requirements as to that train.

Mitigation Measure 3(C). This proposed measure would provide that if CSX has more stringent requirements than the provisions of the AAR “Key Route” or “Key Train” guidelines, it must comply with those requirements. CSX believes that it should have the flexibility to devise additional requirements and to modify those requirements based on experience. Thus, CSX does not believe that it would serve the public’s interest in safety for it to be tied to any specific requirements that may be in place today, but may be determined not to be justified tomorrow. Nor would it be fair to CSX to impose a requirement that effectively requires it to maintain

practices that no other railroad in similar circumstances would be obligated to maintain. This type of condition might serve, counter-productively, to stifle safety advancements.

As noted above, CSX agrees to adhere to the current industry safety standards for key routes for the identified line segments and key trains as set forth in Circular OT-55-B, or in any future modification of, or supplement to, those requirements. Adherence to these requirements offers a full and sound measure of safety. To the extent that CSX might do more, that choice should not be fettered by a condition obligating it to continue any additional practices where, for example, such additional practices are determined not to meaningfully enhance safety. For these reasons, CSX submits that this proposed mitigation measure should not be adopted.

Mitigation Measure 4(A). This proposed measure would apply to certain key routes which are defined in the DEIS to be those line segments on which hazardous materials traffic is projected to double and to exceed 20,000 carloads annually. Part A of Exhibit 4, which is based on the revised CSX data, indicates that there will be ten such key routes on the CSX system and one in the North Jersey Shared Assets Area. The additional mitigation proposed in 4(A) for these key routes is the preparation of HMERP's (as proposed for key routes in 3(A)) for local emergency response organizations along these segments. CSX agrees to this proposed mitigation measure.

CSX appreciates that SEA intends to impose a somewhat greater level of mitigation for routes that may carry a higher volume of hazardous materials than are transported on those lines currently. However, CSX does not believe that it is constructive, and that it could be confusing, to assign new terminology to such routes by calling them "major key routes," as the DEIS does. This terminology is not used or known in the rail or chemical industries or to hazardous materials

regulators and, in CSX's view, there is no need to introduce such terminology – the proposed mitigation can be imposed merely with reference to the hazardous materials volume on specific line segments without calling them “major key routes.”

Mitigation Measure 4(B). This proposed measure would obligate CSX to conduct real time or desktop emergency response drills at least once every two years with local emergency response officials on the line segments subject to the measure 4(A) proposed mitigation. CSX notes that this recommendation does not have a “sunset” provision and would not apply to other rail line segments, which currently carry as much or more hazardous materials traffic. As such, its implementation would create a double-standard.

CSX agrees that it would be useful to conduct one real-time or desktop emergency response simulation drill with local emergency response personnel within one year after Day One with respect to those routes projected to experience a doubling of hazardous materials traffic and carry in excess of 20,000 hazardous materials cars/year. Such a drill would be useful in familiarizing the local personnel with the HMERP's. Following the conduct of this drill, CSX proposes that it adhere to the requirements of Circular OT-55-B, as it may be amended in the future, with respect to these key routes. Such adherence is designed to ensure the continued safety of such routes. To the extent that local communities desire to conduct additional safety drills or to coordinate planning efforts with CSX, CSX is prepared to cooperate in such efforts, as it does today. However, the need for an emergency drill every two years has not been demonstrated for these line segments any more than it has been demonstrated for line segments that today (unrelated to the Transaction) carry even larger volumes of hazardous materials.

The impact that justifies a one-time drill is the projected Transaction-related increase of hazardous materials on these line segments. Once that drill has been conducted with the local emergency response officials, there is simply no Transaction-related justification for differentiating between these line segments and others that transport similar or even larger volumes of hazardous materials.

Mitigation Measure 5. This proposed measure would require CSX to provide a toll-free telephone number to local emergency response organizations on the line segments to which measures 3(A) and 4(A) would apply. The number would allow these personnel prompt access to the information about the nature of the hazardous materials cargoes on a particular train and appropriate response procedures in the event of a spill.

CSX does not oppose this proposal. CSX would provide this telephone number in the HMERP and would not otherwise make the number public.

Mitigation Measure 6. This proposal would require CSX to establish a so-called “Failure Mode and Effects Analysis” (“FMEA”) program for all CSX and Shared Assets Area rail yards and intermodal facilities to address sources and consequences of spills of hazardous materials that are stored or transported. The goal of this program would be to identify potential causes for spills and eliminate them prior to any possible incident.

CSX does not concur in this mitigation proposal for two fundamental reasons. First, the proposal does not address any Transaction-related impacts, but would apply to all rail yards and facilities, including those that will experience no change as a result of the Transaction or a decrease in activity. To that extent, the proposed mitigation exceeds the proper scope of mitigation as SEA itself has described that scope: “[t]he environmental mitigation condition . . .

must be directly related to the impact caused by the Acquisition.” Vol. 1 at 3-3. In fact, the DEIS acknowledges that the Transaction will result in a systemwide decline in yard activity and a consequent increase in the safety of hazardous materials transportation. Executive Summary at ES-19. The DEIS also concludes, at the same page, that CSX has procedures in place for handling hazardous materials storage and spills at its yards.

Imposition of a new condition of this type is thus directly contrary to SEA’s own stated standard for imposition of conditions. The recommendation is clearly targeted at an existing condition -- one which the DEIS acknowledges that CSX has procedures for handling. The measure should thus be rejected.

The second reason that proposed Mitigation Measure 6 should be rejected is that CSX has in place numerous programs that are the functional equivalent of an FMEA program. The proposed mitigation measure would impose a redundant, and thus pointless, requirement. The rail industry has for many years been actively engaged in identifying the causes of hazardous materials incidents and in eliminating those causes through a variety of programs in which CSX is an active participant. These efforts have resulted in a dramatic decline in hazardous materials releases over the last several years -- FRA statistics show that rail accidents involving hazardous materials releases decreased from 139 in 1978 to 34 in 1996. As noted above, at CSX, in 1996 out of 338,000 carloads carrying hazardous materials transported, there were only four derailments, involving five cars that resulted in the release of hazardous materials. Further, the number of CSX derailments with hazardous materials releases has declined dramatically and consistently over the last several years, from 15 in 1990 to only 3 in 1997. The success of several on-going

programs -- which are as effective for yard safety as line-haul safety -- renders the proposed mitigation redundant and therefore unnecessary.

Among the on-going industry programs designed to determine and eliminate the causes for hazardous materials spills is the Railroad Tank Car Safety Research and Test Project of the Railway Progress Institute and AAR. This Project, which has been active since 1970, is responsible for numerous studies and programs that have led to safer tank car transportation, including programs that have identified the vulnerabilities of tank cars and have led to improvements to tank car head protection, couplers, thermal protection standards and tank car bottom outlet protection. The Project has several on-going studies to further identify tank car vulnerabilities and develop improvements.

Another industry risk mitigation measure in which CSX participates is the AAR derailment prevention program that is designed to review accidents, assess their causes and consider prevention techniques. This program involves regular meetings/teleconferences involving CSX and other rail officials at which a variety of accident assessment/prevention issues are addressed.

In addition, as described in greater detail at pages 174-175 of the CSX SIP, CSX is a participant in CMA's Responsible Care program. One of the conditions of participation in that program is that CSX undertake risk assessments with respect to the transportation of hazardous materials. CSX does so in a variety of ways. These include the following:

1. CSX uses a Track Management Program model to assess the gross tonnage of freight moving over particular line segments, the characteristics of the traffic (including the extent to which hazardous materials and passengers are carried on the line segment) and the information

obtained from track inspections. This data is input into the model to allow CSX to assess where and how to devote capital to track upgrades, thereby reducing the level of risk on particular line segments.

2. CSX also does a risk assessment on chemical traffic that it transports to determine, based on flammability, toxicity, environmental impacts, and other relevant factors, whether a particular chemical poses a high, medium or low risk. Emergency training programs involving local emergency response personnel are geared to line segments based on the results of this analysis.

3. CSX reviews where non-accidental releases ("NAR's") occur on its system and works to identify trends in terms of types of cars, sources of cargo, and other factors. This process allows for risk-management planning to address causes of such incidents. This program has been successful. In 1997, CSX experienced the lowest number of NAR's of any recent year to date on the CSX system.

4. CSX implements a Train Accident Prevention program known as the TAPS program. This program consists of a series of committees -- a headquarters committee and separate committees for each service route, hump yard and satellite facility. The purpose of these committees is to analyze train accidents that occur on lines or at yards and other facilities (including accidents that result in the release of hazardous materials), determine the causes of these accidents and develop action plans to avoid repetition of such accidents.

In addition to these formal risk assessment and analysis programs, CSX's SIP, at pages 168 through 184, also discusses a variety of hazardous materials safety programs that are implemented by CSX. These include inspection and training programs and emergency notification

programs. In addition, as the SIP indicates, CSX intends to carefully review the Conrail hazardous materials program (which is similar in most major respects to the CSX program) and to retain those elements of the Conrail program that reflect the best industry practices.

Further, in addition to rail industry programs and CSX's own programs, CSX adheres to the requirements imposed by federal regulations adopted by DOT's Research and Special Programs Administration ("RSPA") for the transportation of hazardous materials. See 49 CFR at Sections 171 through 174. These detailed regulations of a sister agency of the Board govern virtually every phase of the safety of hazardous materials while they are in the possession of CSX.

In light of the substantial risk prevention efforts and safety regulations that are already in place, the need for any further mitigation in the nature of a mandatory new FMEA program has not been demonstrated. CSX already has active programs to address the sources and consequences of hazardous materials spills on its lines and facilities. Establishing a new FMEA program of the sort described in Mitigation Measure 6 would do no more than divert resources and energies from proven, existing programs to a redundant new program, the need for which has not been shown.

Finally, as a practical matter, the Board has neither the resources nor the expertise to draft regulations for, and enforce, a new safety program which would apply to hundreds of rail yards and intermodal facilities. The Board is not a safety regulatory agency. Any such effort would also present a serious risk of intruding on the jurisdiction of another federal agency and imposing requirements which would conflict with other federal regulations. Nothing in NEPA obligates the Board to pro-actively require the adoption of new programs that would neither enhance safety

beyond the level achieved by other programs and the regulations of other agencies nor address any Transaction-related impacts. The Board should accordingly not do so.

7. Safety: Freight Rail Operations

The DEIS includes the most detailed analysis of freight rail safety ever undertaken in the environmental review of a control transaction. For the first time, the SEA undertook a statistical analysis of the accident risk on a segment-by-segment basis. Although the DEIS concludes that there will be “a small overall decrease in the likelihood of freight rail accidents and derailments” as a consequence of the Transaction. (Vol. 1 at 4-10), the DEIS concludes on the basis of the statistical analysis that there will be a significantly increased risk of accident on a limited number of line segments. In proposed Mitigation Measure 7(A), SEA has proposed that CSX comply on three identified line segments with the FRA’s proposed rule, and any final rule that may eventually be issued by the FRA, in Docket No. RST-90-1, which contemplates “ton-mile based” inspections. Under the proposed rule, such inspections would have to be conducted at least once every 40 million gross ton miles of traffic on the line, or annually, whichever is more frequent. Proposed Mitigation Measure 7(B) would require annual training of CSX mechanical and track inspectors that dispatch trains, or check track, respectively, on the three identified line segments. These mitigation measures would apply over the following three line segments:

Berea to Greenwich, Ohio (C-061);

Greenwich to Willard, Ohio (C-068); and

Willard to Fostoria, Ohio (C-075).

The first of these segments is part of Conrail’s system today; the latter two are part of CSX’s current system. CSX does not agree that there would be any increased risk of accident on these three line segments warranting special safety mitigation for two reasons: .

First, the Transaction will have no detrimental impact on the safety practices of CSX. CSX has achieved one of the highest levels of safety in the rail industry through its safety and operating practices. These practices will not change as a consequence of the Transaction. CSX has carefully planned for the Transaction so that there will be no compromise on safety -- track maintenance and inspection standards, signal and communication systems and workforce training will not be reduced or compromised in any way. In fact, CSX's safety practices will be extended to the portion of the Conrail system to be allocated for CSX's use. Because CSX's safety record is better than Conrail's (as reported by DOT in its October 21, 1997 comments, DOT-3 at 17), the accident risk on the Conrail line segments to be allocated to CSX should decrease.

Second, CSX's Operating Plan was designed with full consideration of the existing capacities of the rail infrastructure and of planned capital improvements. The opportunity to acquire Conrail spurred CSX to undertake an unprecedented capital program to make improvements to its tracks, signaling systems and equipment, all of which promote safety as well as service to customers. Chief among these improvements is the doubletracking and associated signal upgrading (to bidirectional TCS signals) of CSX's B&O line from Chicago to Greenwich, Ohio and improvements to the Conrail line from Greenwich through Cleveland. See Application, Vol. 3A at 260. All three CSX segments identified in the DEIS as having a significantly increased risk of accident are on this line. This approximately \$200 million project, already underway and due to be completed by Day One, will result in these segments being among the most up-to-date on the entire CSX system. They will form part of the high-speed east-west corridor that CSX intends to use for the transportation of time-sensitive intermodal freight. It appears that the DEIS's statistical methodology did not factor in the upgrading of these line segments.

In addition, the significance criteria used by SEA for freight rail safety overstated the actual safety risk on these line segments. The DEIS included as part of its criteria a determination of whether the line segments at issue could experience an accident more frequently than every 100 years. The 100 year threshold was based on the proposition that in 1996 there were 1,078 freight and passenger train accidents on 126,682 miles of main line track, yielding an accident rate of one accident every 117 years on each rail mile. The DEIS then applied a more conservative figure of one accident every 100 years on each rail mile to assess significance.

However, FRA statistics indicate that there were actually 2,584 train accidents in 1996, not 1,078. See 1996 FRA Accident/Incident Bulletin. This means that on each mile of the rail system, an accident may occur every 49 years, not once every 117 years as reported in the DEIS. According to the DEIS, each of the three CSX line segments has a far lower post-Transaction accident rate than 49 years -- Berea to Greenwich (94 years); Greenwich to Willard (93 years) and Willard to Fostoria (95 years). See Attachment B-1 in Volume 5A. Accordingly, no mitigation is warranted on these segments for this additional reason.

Notwithstanding that the case for mitigation on the identified segments appears open to question, CSX's current annual track inspection and training programs with respect to these line segments, and associated personnel, already cover the requirements that are proposed as mitigation. While CSX does not believe that any mitigation is warranted, and opposes imposition of a condition that would constrain its ability to adopt equally effective alternative inspection and training programs, it would not change its current practices if these mitigation measures were imposed.

8. Safety: Highway/Rail At-Grade Crossings

In Table 7-4, the DEIS identifies 118 highway/rail at-grade crossings where improvements might be required. These recommendations are the result of an in-depth analysis by the SEA as to existing traffic at these crossings and the projected increases in traffic following the Transaction. As the basis for its analysis, the DEIS relies on DOT's Accident and Severity Prediction Formula to identify areas of potential mitigation. This formula is used to rank and identify potentially dangerous crossings. Although the result of this examination was the list of crossings mentioned above, this list should not constitute the final recommendation to the Board. The formula is appropriate for the DEIS because it identifies potential environmental safety concerns and highlights them for responsible state agencies. Further analysis, however, reveals that many of the crossings in Table 7-4 already have the suggested mitigation in place or that the recommended improvements have been funded and scheduled for installation. In other cases, more recent information reveals that mitigation is not necessary.

As discussed below, the FEIS should recognize the important state role in evaluating grade crossing safety. Although the Federal Highway Administration ("FHWA"), and to a lesser extent the Federal Railroad Administration ("FRA"), provide oversight and guidance in this area, the state agencies with jurisdiction over highways are in the best position to determine the proper level of warning device required at the highway/rail crossings. If the Board were to direct CSX to consult with state authorities, the Board would fully and properly fulfill its NEPA role. Specifically, it would be appropriate for the FEIS to recommend (1) an appropriate methodology to identify crossings that may sustain a Transaction-related impact thereby warranting some form of crossing improvement, and (2) a requirement that Applicants bring these crossings to the

8. Safety: Highway/Rail At-Grade Crossings

In Table 7-4, the DEIS identifies 118 highway/rail at-grade crossings where improvements might be required. These recommendations are the result of an in-depth analysis by the SEA as to existing traffic at these crossings and the projected increases in traffic following the Transaction. As the basis for its analysis, the DEIS relies on DOT's Accident and Severity Prediction Formula to identify areas of potential mitigation. This formula is used to rank and identify potentially dangerous crossings. Although the result of this examination was the list of crossings mentioned above, this list should not constitute the final recommendation to the Board. The formula is appropriate for the DEIS because it identifies potential environmental safety concerns and highlights them for responsible state agencies. Further analysis, however, reveals that many of the crossings in Table 7-4 already have the suggested mitigation in place or that the recommended improvements have been funded and scheduled for installation. In other cases, more recent information reveals that mitigation is not necessary.

As discussed below, the FEIS should recognize the important state role in evaluating grade crossing safety. Although the Federal Highway Administration ("FHWA"), and to a lesser extent the Federal Railroad Administration ("FRA"), provide oversight and guidance in this area, the state agencies with jurisdiction over highways are in the best position to determine the proper level of warning device required at the highway/rail crossings. If the Board were to direct CSX to consult with state authorities, the Board would fully and properly fulfill its NEPA role. Specifically, it would be appropriate for the FEIS to recommend (1) an appropriate methodology to identify crossings that may sustain a Transaction-related impact thereby warranting some form of crossing improvement, and (2) a requirement that Applicants bring these crossings to the

circumstances associated with a particular crossing. A state brings this information to the table when seeking FHWA approval of its plan for warning device protection.

Indiana begins with the federal accident data for each at-grade crossing in the state. The federal data also is used to evaluate the cost/benefit ratio of various improvement alternatives at a crossing, such as installing flashers or gates. This federal data, however, cannot incorporate every possible factor that influences the number of accidents at a crossing, and the data available is not always completely accurate. To compensate for this, Indiana adds to its analysis by performing a diagnostic site review, using actual accident history, and reviewing other pertinent factors. This analysis forms the basis for selecting and prioritizing safety improvement projects. Cost/benefit analyses are used in determining the final priority list. Thus, the crossings with the highest accident risk are not necessarily included in the final upgrade program.

Ohio and Kentucky use a methodology similar to Indiana's approach. These states use FHWA/FRA data to determine a preliminary crossing safety ranking, and then perform a diagnostic survey of each site that considers vehicle traffic and recent accident history. In Ohio, the survey team consists of the local highway authority, the Ohio Rail Development Corporation, the railroads, the FHWA and the Public Utilities Commission of Ohio. The states "update" the FHWA/FRA-method results before completing their final priority lists if changes in rail crossings (e.g. improved safety measures) recently have been performed. The states also consider field observations for their final listing.

Recently, Michigan proposed a four-factor methodology for prioritizing crossing upgrades: (1) a Five Year Car-Train Crash Frequency; (2) FHWA/FRA Top 100 Crossings in Michigan based on the FHWA/FRA Accident Prediction Equation; (3) Calculated Exposure

Reduction Potential Through Conventional Treatment (e.g. adding flashing-light signals to a crossing with passive warning; adding gates to a crossing with flashing-light signals; and adding gates to a crossing with flashing-light signals which are suspended on cantilever arms) ; and
(4) An identification of crossing needs based on field observations. After considering these factors, the state will decide on appropriate rail crossing upgrades.

3. The FEIS Should Recommend Consultation with
Appropriate State Agencies

By directing mitigation at certain highway/rail crossings, the SEA has stepped into the shoes of the states and the FHWA as the final arbitrator of the type of warning device required at each affected highway/rail crossing. Although the SEA has undertaken the responsibility of determining the appropriate level of warning devices, it has not done so in a manner consistent with the established regulatory process. Most importantly, the SEA has not obtained the type of information upon which states rely in making grade crossing decisions. As a result, the DEIS's recommendations are over-inclusive. For example, many of the improvements identified in the DEIS already are in place or are scheduled to be put in place in the near future. In other instances, more recent information indicates that mitigation is not warranted.

CSX's consultation with the state of Ohio demonstrates how the system should function. CSX has been working with the Public Utilities Commission of Ohio ("PUCO") and the Ohio Rail Development Corporation ("ORDC") to perform several rail corridor studies in northwest Ohio. In these studies, the parties placed particular emphasis on improving the consolidation of vehicular traffic at crossings, thereby reducing the number of crossings with a lower level of signal protection. Following joint field studies by CSX, PUCO, and ORDC, recommendations for signal

upgrades and improvements were developed and suggestions were made for closure of certain crossings.

One of the results of these outreach and consultation efforts was an agreement between CSX and PUCO/ORDC as to the proper level of crossing safety improvements needed for CSX's track improvements on the line segment from Greenwich, Ohio in Huron County to the Ohio/Indiana border at a point in Defiance County ("the B&O Corridor"). The DEIS examines crossings on the B&O Corridor and arrives at the same conclusions as PUCO and ORDC for three crossings -- 142 366F, 142 178R and 142 179X.¹⁸ PUCO and ORDC, however, recommended improvements at a number of additional crossings in the B&O Corridor that are not addressed in the DEIS. Thus, if the FEIS's final recommendation is for the Applicants to consult with appropriate state agencies, it is likely that the state mitigation will equal or exceed that currently in the DEIS.

Another area where the DEIS recommends mitigation involves crossings on the Toledo to Deshler line segment (segment C-065). Although the DEIS identifies fifteen crossings on this segment as requiring mitigation, CSX does not believe that mitigation is appropriate because any impacts from increased traffic are independent of the Transaction. The CSX Operating Plan, which provides the basis for the traffic figures in the DEIS, provides 1995 base figures and post-Transaction projected figures. The 1995 base for the CSX Toledo to Deshler line segment is 0.6 trains per day, and the projected post-Transaction traffic is 14.2 trains per day, for an increase of 13.6 trains per day on average. This increase led to the conclusion in the DEIS that the Transaction would result in certain impacts (including increased traffic) on this 36-mile line

¹⁸ For these crossings, the mitigation recommended in the DEIS already has been installed or is funded and scheduled for installation.

segment. However, in May, 1997, CSX resumed through train operations over the this line segment for reasons unrelated to the Transaction. Present traffic on the line is about 14 trains per day. Thus, there is no significant Transaction-related impacts on this line segment and no grade crossing mitigation would be appropriate in connection with this proceeding.

CSX has, however, worked with the state authorities to determine if traffic increases on the Toledo-Deshler line warranted any grade crossings upgrades. Of the fifteen crossings identified in the DEIS for this segment, PUCO already has determined that no improvements are warranted at eight crossings.¹⁹ For the remaining seven crossings in the DEIS, improvements that meet or exceed the DEIS requirements have been funded and scheduled for installation at five of the crossings.²⁰ Another crossing, 155 798S, does not trigger mitigation thresholds when 1992-96 data are applied to the DOT formula. Only as to one crossing on this line segment, 155 821J, would further consultation be appropriate if the increased traffic were indeed Transaction- related.

CSX is required to consult with the states regardless of whether the Board so orders. By ordering specific mitigation at a particular crossing, however, the Board runs the risk of inconsistent treatments at different crossings. A better approach would be to direct Applicants to consult with the party with the most expertise in this area, the state, to determine the appropriate level of improvement that may be warranted. This approach has worked successfully in the past and should be allowed to continue here.

¹⁹ These crossings are 155 789T, 155 799Y, 155 812K, 155 814Y, 155 819H, 155 820C, 155 839U, and 155 840N.

²⁰ These crossings are 155 755Y, 155 794P, 155 804T, 155 818B, and 155 838M.

C. The DEIS Overstates the Problem

Not only should the SEA allow the established regulatory process to address the potential safety issues identified in the DEIS, but a review of the DEIS reveals that only a few of the CSX crossings at issue actually may require additional mitigation.

First, as noted above, the fifteen crossings on the Toledo to Deshler line segment are not experiencing any traffic increases because of the Transaction. Thus, these fifteen crossings should not be subject to any mitigation.

In addition to these non-Transaction related crossings, CSX's consultant, ICF Kaiser, reviewed the DEIS methodology to determine whether the sixty-two (62) CSX rail crossings identified in the DEIS, including the fifteen on the Toledo to Deshler segment, were appropriately categorized. The results of ICF Kaiser's review are presented at Exhibit 5. This Exhibit has four components: (1) a report from ICF Kaiser summarizing its findings, (2) an appendix²¹ with a description of the current status at each crossing, (3) a summary table that highlights crossings where the DEIS incorrectly applies its own criteria and where mitigation would not be triggered if the most recent accident data (1992-96) were applied to the DEIS methodology, and (4) a table that contains ICF Kaiser's analysis as to all the CSX crossings. An explanation of the results of ICF Kaiser's review follows.

The DEIS separates highway/rail crossings into two categories. Category A consists of highway/rail crossings with an accident frequency rate of at least one accident every seven years (0.15 or higher accident frequency rate). The DEIS considers a projected accident frequency

²¹ For twenty-two of the crossings, the DEIS apparently lists an incorrect city, street or DOT crossing number. This information has been corrected in the Appendix prepared by ICF Kaiser. Crossings where information has been corrected are noted with an asterisk.

increase of 0.1 or greater for these crossings to be significant. Category B consists of highway/rail crossings with accident frequency rates of less than 0.15. For these crossings, a projected increase in accidents of 0.01 (an accident every 20 years), is viewed as significant.

ICF Kaiser identified eight (8) crossings that do not meet the DEIS Category A or Category B significance criteria. See Table 1 at Exhibit 5. It appears that the DEIS relies on the post-Transaction accident rates to determine whether a threshold was reached. If the correct pre-Transaction threshold is used, then no mitigation is required. Consequently, these crossings should be eliminated from further consideration. The crossings in this category are as follows:

342 417R	155 484V
155 632M	155 615W
155 496P	228 774H
155 391B	228 780L

ICF Kaiser's review also identified twenty-three (23) crossings where the state agency with jurisdictional authority already has reviewed the crossing, independent of the Transaction. These crossings already have in place, or are funded and scheduled to have in place, improvements that meet or exceed the recommendations in the DEIS. Consequently, these crossing should be eliminated from further consideration. The crossings in this category are:

142 179X	502 682Y
345 318D	155 755Y
345 329R	155 794P
342 470C	155 804T
342 481P	155 818B
342 416J	155 838M
342 425H	155 372W
342 850J	142 366F

155 645N	518 456X
518 507F	518 476J
532 688W	518 382H
142 178R	

For one crossing, 155 392H, the Indiana Department of Transportation already has reviewed the crossing and determined that the appropriate upgrade would be additional gates and improved control circuitry. The DEIS recommends a four-quadrant gate or a median barrier. As noted above, state transportation agencies are in the best position to determine the appropriate level of warning device that should be installed at each crossing in its jurisdiction. Thus, the decision of Indiana's DOT should be afforded deference. Consequently, this crossing should be eliminated from further consideration in the FEIS.

One crossing, 342 473X, was closed on May 22, 1996. Consequently, this crossing should be eliminated from further consideration.

ICF Kaiser identified another nine (9) crossings where the state agency with jurisdictional authority has begun analyzing the crossing. As of this date, however, final decisions have not been made and funding has not been approved. These state reviews should be permitted to continue. CSX will inform the appropriate state agency of the information in the DEIS relevant to each of these crossings. The crossings in this category are:

342 493J	155 465R
342 413N	155 476D
155 633U	155 380N
155 419P	511 027V
155 394W	

For the remaining twenty (20) crossings, ICF Kaiser reapplied the DEIS formula using more current accident history data than was available to the SEA. The FRA recommends that the accident data applied to the DOT formula be limited to the most recent five²² years. The DEIS relies on data from 1991-95 in its analysis. Since the completion of the DEIS, however, data from 1996 has become available. ICF Kaiser applied the more current data from 1992-96 to the DEIS methodology and found that sixteen (16) of these crossings²³ no longer triggered the DEIS category A or B significance criteria. These crossings are:

518 391G	155 799Y
342 829D	155 812K
155 637W	155 814Y
232 122V	155 819H
155 789T	155 820C
155 840N	155 839U
155 760V	155 395D
155 798S	345 269J

For the four (4) crossings not eliminated by the 1992-96 data, one is on the Toledo to Deshler line segment and should not be subject to any Transaction-related impacts (155 821J). For the three (3) remaining crossings, CSX agrees that further consultation with state officials may be appropriate to determine whether an upgrade is warranted. These crossings are:

345 246C	345 362R
----------	----------

²² See DOT/FRA Railroad-Highway Grade Crossing Handbook (FHWA-TS-86-215) (2d. Ed.) (Sept. 1986) at 73 (stating that “[a]ccident history information older than five years may be misleading because of changes that occur to crossing characteristics over time.”)

²³ As is noted on Table 1, all eight (8) crossings that the DEIS incorrectly identified as triggering a threshold also would not require mitigation using the 1992-96 data.

345 331S

9-11 Transportation: Highway/Rail At-Grade Crossing Delay

9. Increased Train Timetable Speeds

This recommended mitigation measure was deleted in the Supplemental Errata to the

DEIS.

10. Highway/Rail At-Grade Crossing Delay: Grade Separation Recommended The DEIS identifies Randolph Street in Garrett, Indiana as an at-grade crossing which meets the significance criteria for traffic delay mitigation, including for construction of a grade separation. This determination does not come as a surprise, as CSX has been in discussions with the City of Garrett and the Indiana Department of Transportation since 1995 regarding the possibility of a separation. There appears to be general agreement that the project has merit. Preliminary designs have been completed.

The unresolved question has been whether and when the project will receive priority for funding by the Indiana DOT. A railroad typically contributes five percent (5%) toward the construction of a grade separation where, as here, the separation will allow a grade crossing to be closed. CSX has offered to contribute more than the typical share because of the operational benefits of this separation. However, the Indiana Department of Transportation has not to date allocated funding for the balance. Discussions are ongoing and CSX is optimistic that the project will be funded and constructed.

The DEIS has served the purpose of identifying a crossing with a potential vehicle delay problem to the appropriate authorities -- the City of Garrett and the Indiana Department of Transportation. In this case, as explained above, the appropriate authorities were already aware of the situation, independent of the Transaction. There is no reason why the FEIS must recommend any further action with respect to this matter.

Moreover, the suggestion of a binding arbitration procedure in the event that agreement is not reached by the time the Final EIS is issued is problematic. CSX cannot find any statutory authorization by which the Board could compel the Indiana Department of Transportation to

enter into binding arbitration against its will, and it appears that Constitutional limitations would prohibit such a compelled arbitration. Perhaps the Indiana Department of Transportation would agree to such an arbitration (provided that state law would permit it to arbitrate a matter involving expenditure of public funds) as a condition on its availing itself of the Board's conditioning power, but it is far from clear why it would choose to do so. An arbitration is not a free-for-all. Like more formal legal proceedings, an arbitration proceeds through the application of rules to facts. The DEIS does not suggest any rules to determine the appropriate share of a grade separation at Randolph Street to be paid by CSX. CSX submits that the controlling precedent for determining CSX's share is set forth in the decisions of the Board's predecessor and in the Highway Safety Act of 1973 and regulations promulgated thereunder by the Secretary of Transportation, as explained below. The law is clear -- CSX's share of the cost of building a grade separation at Randolph Road should be 5 percent.

After a comprehensive investigation of train/motor vehicle accidents at rail-highway grade crossings, the ICC made the following finding:

(13) That highway users are the principal recipients of the benefits flowing from rail-highway grade separations and from special protection at rail-highway grade crossings. For this reason, the cost of installing and maintaining such separations and protective devices is a public responsibility and should be financed with public funds the same as highway traffic devices.

Interstate Commerce Commission Report No. 33440, Prevention of Rail-Highway Grade-Crossing Accidents Involving Railway Trains and Motor Vehicles, *supra*, 322 I.C.C. at 87.

The same policy consideration underlies 23 U.S.C. § 130(b), which governs the use of federal funding for the elimination of hazards of rail-highway crossings, including construction of

grade separations. Section 130(b) provides that the Secretary may require a railroad to pay for that share of a grade separation which represents the "net benefit to the railroad," but in no case greater than 10 percent. The Secretary has exercised his statutory authority under this provision through regulation at 23 C.F.R. § 646.210(b) and capped the railroad share at 5 percent:

(1) Projects for grade crossing improvements are deemed to be of no ascertainable net benefit to the railroads and there shall be no required railroad share of the costs.

* * *

(3) On projects for the elimination of existing grade crossings at which active warning devices are in place or ordered to be installed by a State regulatory agency, the railroad share of the project costs shall be 5 percent.

(4) On projects for the elimination of existing grade crossings at which active warning devices are not in place and have not been ordered installed by a State regulatory agency, or on projects which do not eliminate an existing crossing, there shall be no required railroad share of the project cost.

There is no apparent reason why the unanimous conclusion of the Board's predecessor, Congress and the Secretary of Transportation as to the appropriate share of railroad funding for a grade separation should be liable to be set aside by an arbitrator (or set aside by the Board) simply because attention has been drawn to a grade crossing through the NEPA review of a control transaction. There is no basis in any of this authority for penalizing a railroad by requiring a greater share from it on the ground that it has increased train traffic through a grade crossing, either by growing its business or because it has decided to reroute trains to provide more efficient service, whether in the context of a control transaction or otherwise.

CSX respectfully submits that the Board need not venture into these waters fraught with such legal uncertainty. As with grade crossing protection, there are well-established federal and

state programs and procedures for identifying and funding grade separations. The persons responsible for those programs will evaluate Randolph Street in light of the train traffic levels predicted in the CSX Operating Plan, and will balance the needs in the City of Garrett against the needs in other cities and towns in Indiana which may be as great or greater but which do not happen to be affected by the Transaction. Because the Board has chosen to undertake an EIS, it does not need to mitigate every potentially significant impact prior to approval of the Transaction.

11. Highway/Rail At-Grade Crossing Delay: Consultation Recommended

The DEIS (Supplemental Errata) identifies seven at-grade crossings on the CSX system which meet the significance criteria for traffic delay mitigation, but which do not meet the criteria for construction of a grade separation. The DEIS recommends that CSX consult with appropriate agencies to address potential traffic delay at these crossings. In the event that these consultations do not result in binding agreements, the DEIS suggests that the FEIS may recommend that CSX participate in the implementation of specified traffic delay mitigation. The seven crossings are as follows:

Dixie Hwy., Blue Island, IL
Broadway-135th St., Blue Island, IL
95th St., Evergreen Park, IL
E. 9th St., Hopkinsville, KY
W. Noel Ave., Madisonville, KY
Vine St, Hamilton, OH
Township Ave., Cincinnati, OH

A. The DEIS Performed Its Function As a Screening Tool

The DEIS identified these crossings for potential mitigation based on application of the Highway Capacity Manual Level of Service criteria for signalized intersections to the railroad grade-crossing context. This is the first time SEA has utilized this approach in assessing vehicle delay at grade crossings. CSX might have selected a somewhat different model. See the report of ICF Kaiser at Exhibit 6. However any model which includes only a limited number of factors can only be used as an initial screening tool for more detailed analysis.²⁴ CSX thus does not recommend using a different model in the FEIS.

²⁴ The DEIS formula is based on the following six factors: length of train, train speed, number of trains per day, average daily vehicle traffic, vehicle flow rate and number of road lanes.

CSX believes that it is the appropriate function of the EIS in this context to perform an initial screening analysis. This analysis provides a basis for the Board to determine whether the Transaction will cause widespread traffic delay problems. In light of the relatively limited number of crossings identified through this screening analysis, the Board can be confident that the Transaction will not produce this adverse effect.

Before mitigation is determined to be appropriate at a particular crossing, however, the screening analysis must be followed by much more detailed analysis. That detailed analysis requires site-specific information. CSX does not believe that this site-specific analysis should be undertaken by the Board through the environmental review process. That is the province of state and local transportation agencies. Those agencies have both the expertise regarding local conditions and the ability to prioritize local needs which the Board lacks. The appropriate recommendation with respect to the seven crossings identified as raising vehicle delay concerns is for CSX to consult with state agencies. It should then be entirely up to the state agencies to determine whether anything, and if so what, should be done.

B. Evaluation of the Seven Crossings Recommended for Consultation

With respect to three of the seven crossings, it appears that the significance criterion of the screening assessment (decrease to a post-Transaction level of service ("LOS") of D) would not be met if the best available information were used. These crossings are:

Dixie Hwy., Blue Island, IL
Broadway-135th St., Blue Island, IL
E. 9th St., Hopkinsville, KY

Therefore, these crossings should be deleted in the FEIS.

The Blue Island crossings are both on the Barr Yard to Blue Island line segment in the Chicago area. Based on the increased train traffic on the line, the DEIS predicts a decrease in LOS from B to D. In fact, however, ICF Kaiser has determined that LOS, as measured in the DEIS, will actually increase from a present level of E to C. See Exhibit 6, Table 1. The DEIS assumes a train speed of 20 mph both before and after the Transaction. In fact, however, average train speeds at these crossings are presently closer to 10 mph than 20 mph because of movements in and out of Barr Yard. Average train speeds after the Transaction are expected to average about 25 mph. This segment will benefit from the capital improvements planned for the Chicago area in connection with the Transaction and the implementation of the CSX Operating Plan which will allow for more fluid movements through Chicago, including in and out of Barr Yard. Accordingly, CSX expects that vehicle delays at the Dixie Highway and Broadway-135th St. crossings will decrease as a result of the Transaction even though more trains will operate through the crossings. CSX does not believe that any further mitigation is appropriate.

The DEIS also predicts a decrease to a post-Transaction LOS of D at the East 9th Street crossing in Hopkinsville, KY, based on an ADT of 16,000. The most current information from the Kentucky Transportation Cabinet, however, puts the ADT at 9,040. ICF Kaiser has computed the post-Transaction LOS using the more recent ADT as C, which does not warrant mitigation under the criterion of the DEIS. See Exhibit 6, Table 1. CSX therefore does not believe that consultation is required with respect to this crossing.

The DEIS should not be faulted; it could not reasonably take into account such specific information in the case of all the grade crossings to be examined on a 44,000-mile rail system. The DEIS has well performed its function as an initial screening tool.

CSX believes that it is appropriate to undertake consultation with respect to the remaining four crossings. It should be noted, however, that three of the remaining crossings are expected to experience increases of only three trains/day. These crossings are:

95th St., Evergreen Park, IL
Vine St, Hamilton, OH
Township Ave., Cincinnati, OH

With such a small predicted increase in train traffic, it is very difficult to determine in advance the actual effect of the Transaction on traffic delay. An increase in train traffic may not even occur on Day One. In addition, the daily operating time schedule of all the trains on these segments, which can make a material difference in vehicle delay, is not presently known. Moreover, a slight increase in average speed could effectively cancel out any increased vehicle delay from the few additional trains. With respect to 95th Street in Evergreen Park, IL, for example, the improvements in traffic flows in the Chicago area as a result of the implementation of the CSX Operating Plan might increase average speeds through this crossing such that vehicle delays might actually decrease at the crossing. It would thus not be surprising if the state agencies thought it prudent to take a "wait-and-see" approach with respect to these crossings.

With respect to the final crossing identified in the DEIS -- West Noel Ave. in Madisonville, KY -- it is worthy of note that this crossing will have a post-Transaction LOS of D, as measured in the DEIS, only because CSX defers to a local ordinance and operates through town at 20 mph. The track would permit speeds up to 50 mph. CSX would only have to operate at 25 mph to bring the LOS to C under the formula used in the DEIS. It would not be appropriate to require CSX to undertake any mitigation for vehicle traffic delay under these circumstances. Moreover, the City of Madisonville informed the Board by letter dated

January 20, 1998 that it did not believe any mitigation was warranted at this crossing.

It should be clear from this discussion that the final determination whether there is in fact a vehicle delay problem at these crossings and, if so, what mitigation might be appropriate, should be left to the state and local agencies which ordinarily handle these matters. There is no reason why the Board should intervene in this process.

12. Noise

A. The DEIS Indicates That There Are Not Widespread Significant Noise Impacts

The DEIS provides a comprehensive analysis of potential noise impacts and concludes that communities on only seven line segments (five CSX, one NS, and one in a Shared Assets Area) may have significant adverse noise impacts. In light of this analysis, the Board can be confident that the Transaction will not produce widespread unacceptable noise impacts.

The DEIS correctly reports that noise levels on some line segments will increase with increases in train traffic as a result of rerouting and diversions of traffic from other rail carriers and trucks. Where there is a rerouting or a diversion from another rail carrier, there will be commensurate decreases in noise impacts along other rail line segments. Where there is a diversion from trucks, there will be a commensurate decrease in noise impacts along the highways from which the freight was diverted. These decreases in noise levels were not specifically documented in the DEIS given the enormity of the task and the absence of a need for such particularized information. However, the FEIS should clearly acknowledge that there will be reduced noise levels along some line segments and highways in order to place in context the documented increases in noise.

The DEIS appropriately concludes that no mitigation can be imposed for horn noise, the dominant form of railroad noise, because FRA regulations require horns to be sounded at grade crossings for safety reasons. The DEIS concludes that mitigation for wayside noise is warranted where the wayside noise level exceeds 70 dBA L_{dn} and where the increase in wayside noise level as a result of the Transaction is 5 dBA L_{dn} or greater.

CSX will undertake field investigation of noise impacts on the identified line segments to better define the impacts. The DEIS employs a conservative screening methodology which is not designed to fully account for the effects of shielding, topography and background noise levels. The screening methodology thus overstates the actual noise impacts. Relevant local conditions will be identified during the field investigation. If it appears that the mitigation threshold criteria of the DEIS are met in a particular area, CSX will evaluate potential mitigation strategies.

B. SEA Should Exercise Caution in Imposing Noise Mitigation Measures Beyond Those Required by EPA

To our knowledge, this is the first time that significance criteria for wayside noise impacts have been suggested in a Board environmental review process. CSX believes that the significance criteria of 70 dBA and a 5 dBA increase set forth in the DEIS are reasonable. However, any form of Board-imposed mitigation for wayside noise is problematic for a number of reasons.

First, as stated above, horn noise predominates over wayside noise, but horn noise cannot legally be curtailed. Thus, the persons who experience the highest levels of railroad noise are those who live near grade crossings where the horns are sounded, but those residences are not in the areas proposed for mitigation. Horn noise levels drop as one moves away from grade crossings until at some point the wayside noise predominates. The areas which are candidates for mitigation under the DEIS criteria typically include a few houses at the edges of towns. Although the mitigation criteria make sense from a logical perspective, from a practical perspective it might seem odd to the residents of New London, Ohio, for example, that CSX might propose, or the

Board might require, the construction of a noise barrier for a handful of residents on the outskirts of town who experience lower noise levels than the other residents of the town.²⁵

Second, the issue of railroad noise has not, of course, arisen for the first time in this proceeding. The Environmental Protection Agency ("EPA"), in consultation with the Department of Transportation, regulates noise emissions from railroad equipment and facilities pursuant to Section 17 of the Noise Control Act of 1972, 42 U.S.C. § 4916. EPA has chosen to regulate by controlling the noise emissions at the source (locomotives and rail cars) and has rejected the approach of shielding receptors by noise barriers.²⁶ Inconsistent state and local regulation is expressly preempted. 42 U.S.C. § 4916(c). The areas proposed for mitigation were identified because of Transaction-related changes in train traffic (and thus noise levels) on the line segments. The absolute noise levels expected in these areas after the Transaction, however, are comparable to those experienced and to be experienced in many other communities at present and post-Transaction. In setting its noise emission standards, EPA has determined that these noise levels are acceptable. The Board should thus consider carefully whether it is prudent to impose additional noise mitigation measures as conditions in this proceeding.

As stated above, CSX is in the process of field investigation of the areas identified as potentially warranting mitigation and evaluation of possible mitigation strategies. Based on this analysis, CSX will determine whether consultation is appropriate with certain local governments.

²⁵ This concern does not apply in Cleveland and East Cleveland where the line through the residential areas is entirely grade separated and therefore horn noise is not an issue. CSX has already undertaken field investigation on the Mayfield to Marcy, OH and Quaker to Mayfield, OH line segments and has recently presented a proposed noise mitigation plan to the Cities of Cleveland and East Cleveland.

²⁶ EPA's regulations are described more fully in the comments of NS.

As noted above, CSX has already proposed a noise mitigation plan to Cleveland and East Cleveland and will continue to consult with those jurisdictions about that proposal.

C. There Are No Transaction-related Impacts on
the Deshler to Toledo Line Segment

With respect to the Deshler to Toledo line segment, CSX does not believe that any mitigation is appropriate in connection with Finance Docket No. 33388 because any impacts (noise or other) are not related to the Transaction. The CSX Operating Plan, which provides the basis for the traffic figures in the DEIS, provides 1995 base figures and post-Transaction projected figures. The 1995 base for the CSX Deshler to Toledo line segment is 0.6 trains per day, and the projected post-Transaction traffic is 14.2 trains per day, for an increase of 13.6 trains per day on average. This increase led to the conclusion in the DEIS that the Transaction would result in certain impacts (including noise impacts) on this 36-mile line segment. However, in May, 1997, CSX resumed through train operations over the Deshler to Toledo line segment for reasons unrelated to the Transaction. Present traffic on the line is about 14 trains per day. There will thus be no significant Transaction-related impacts on this line segment and thus no mitigation would be appropriate in connection with this proceeding.

14, 16, 17. Cultural and Historic Resources.

14. Exermont, IL

The DEIS recommends that CSX undertake no construction or modification of a new rail line connection in Exermont, Illinois until completion of the Section 106 process of the National Historic Preservation Act (16 U.S.C. 470f, as amended) (the "Section 106 process").

CSX will comply with this condition. On January 28, 1998, CSX provided the latest set of construction drawings to SEA and its contractors so that a Phase II archeological survey of the area in question could be completed by SEA's contractors.

16. 75th Street Interlocking Tower

The DEIS recommends that CSX maintain its interest in and take no steps to alter the historic integrity of the 75th Street Interlocking Tower in Chicago, IL until completion of the Section 106 process.

The proposed demolition of the 75th Street Interlocking tower is in no way related to this Transaction. The proposed connection at 75th Street will not affect the tower. CSX automated the 75th Street Interlocking in the fall of 1997 to improve operations through the interlocking. The tower is slated for demolition because it is no longer needed to control the interlocking.

Nonetheless, CSX has agreed to work with SEA and the Illinois State Historic Preservation Officer to document the tower before it is demolished.

17. Collinwood Rail Yard, Cleveland, OH

The DEIS recommends that CSX complete cultural and historic resource documentation for the Lake Shore and Michigan Southern (New York Central) Shops District at the Collinwood rail yard in Cleveland, Ohio no later than 180 days following the effective date of a final written

decision by the Board. Based on CSX's understanding of the documentation required, CSX will comply with this condition. CSX would like this work to commence as soon as possible to ensure that there is adequate time to complete it before construction planned for the yard begins. The Collinwood Yard will play a major role in CSX's planned intermodal services between the Eastern U.S. and Chicago, and its expansion will facilitate the environmentally-beneficial truck diversions that are projected.

19. Environmental Justice

In Finance Docket No. 33388, SEA is undertaking for the first time a specific analysis of the "environmental justice" effects of a proposed railroad control transaction. The DEIS presents the minority and low-income percentage of the population residing in the area potentially affected (as defined in the DEIS) by increases in traffic on rail line segments, increases in activity at rail yards, increases in truck traffic to intermodal facilities, and construction of new connections. Vol. 5A, App. K. The DEIS then recommends that CSX consult with communities having a certain percentage of minority and low-income individuals (often less than 50%) regarding mitigation of certain effects the DEIS says are "high and adverse." If that consultation does not result in binding agreements to implement mitigation measures, the DEIS indicates that the FEIS may recommend that such measures be imposed as conditions.

CSX strongly believes that the procedures used by the Board in all prior control transactions were adequate to ensure nondiscrimination in those proceedings and are adequate to ensure nondiscrimination in this proceeding. Demographic analysis is not required to protect against discrimination because the Board's implementation of the NEPA process applies neutral criteria to identify potential impacts and recommend mitigation throughout the entirety of the rail systems involved in the control proceeding. The DEIS improperly applies an analytical framework developed in the very different context of facility siting decisions to the analysis of operational changes on a fixed rail infrastructure. The proper analysis in this context requires a systemwide approach. Systemwide, this Transaction does not disproportionately affect minority or low-income populations.

In Executive Order No. 12898, dated February 11, 1994, President Clinton directed federal executive branch agencies to examine the effects of their actions on minority and low-income communities. Specifically, the Executive Order (Section 1-101) provides:

To the greatest extent practicable and permitted by law, . . . each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States . . . and the District of Columbia

The Executive Order requests that independent agencies, like the STB, comply with the Order. Section 6-604. The DEIS acknowledges that the STB is not bound by the terms of Executive Order 12898. Vol. 1 at 3-46. To the extent that the Order requires that the Board undertake a special demographic analysis, the Board should exercise its discretion not to do so. However, CSX believes that the Board may fully comply with the Executive Order through its existing regulations and procedures.

A. The Board's Traditional Environmental Review Process Adequately Protects Against Discrimination

Without expressly stating that it was conducting an "environmental justice" analysis, the Board has always applied the principles of the Executive Order through its existing environmental review process as set forth in its regulations (49 C.F.R. Part 1105). The effort reflected in the DEIS to develop new procedures to achieve those objectives is unnecessary. The DOT, for example, has made it clear that the Executive Order does not necessarily require any new process at all:

The Department does not intend that this Order be the first step in creating a new set of requirements. The objective of this Order is the development of a process that integrates the existing statutory and regulatory requirements in a manner that helps ensure that the interests and well being of minority populations and low-income populations are considered and addressed during transportation decision making.

62 Fed. Reg. 18377, 18378 (April 15, 1997). To date, the Board has not published an environmental justice strategy or other guidance document on implementation of the Executive Order. If the Board believes that it should adopt new procedures to comply with the Executive Order, the Board should initiate a rulemaking. CSX respectfully submits that it is not appropriate to launch a major new requirement in the environmental review process of this proceeding without prior public notice and comment.

It is not necessary for the Board to undertake special demographic analyses of the particular action presented here -- the approval of a railroad control application. The Board correctly decided that such an analysis was not required in its review of the Burlington Northern/Santa Fe and Union Pacific/Southern Pacific railroad control proceedings, both of which post-dated Executive Order 12898.

1. This Railroad Control Proceeding Does Not Present An Opportunity for Discrimination By the Board

The federal action at issue here -- the Board's decision whether to approve this Transaction -- does not present the potential for discrimination that the Executive Order was designed to protect against. Section 2-2 of the Executive Order sets forth the Order's substantive standard:

Each federal agency shall conduct its programs, policies, and activities that substantially affect human health or the environment, in a manner that ensures that such programs, policies and activities do not have the effect of excluding persons (including populations) from participation in, denying persons (including populations) the benefits of, or subjecting persons (including populations) to discrimination under, such programs, policies, and activities, because of their race, color, or national origin.

As with prior control applications, SEA has undertaken a comprehensive analysis of potential environmental impacts from this Transaction, independent of demographic considerations. This is not a situation in which an impact on minority or low income individuals might be overlooked, as the same analytical methods to identify potentially significant impacts were applied to all line segments, yards and intermodal facilities. Similarly, this is not a situation in which impacts on minority or low income persons could be dismissed or treated as less serious than impacts on others, because criteria for recommending mitigation were applied neutrally. Even making the unwarranted assumption that the Board might have some desire to discriminate (which it most assuredly does not), it did not have readily available demographic data to include or exclude impact areas on this basis. Given the lack of data, if for no other reason, everyone had to be treated equally.

Moreover, this is not a situation in which certain communities might be excluded from participating in the environmental review process. Notice of the proceeding and relevant information were widely circulated -- through distribution of Applicants' Environmental Report, the draft and final scoping notices, information packages from SEA, the DEIS and other means -- to more than 2,000 federal, state and local agencies everywhere where there could be environmental impacts from the Transaction throughout the eastern United States and the

Midwest. Moreover, the DEIS was translated into Spanish, and CSX understands that SEA is undertaking various outreach efforts in minority and low-income areas.

Thus, a demographic analysis is not necessary to ensure nondiscrimination. Where neutral criteria are plainly applied across the board, and no persons are excluded from the process, the Board can complete its environmental review without special consideration of race, national origin and income status.

Furthermore, CSX does not read the Executive Order to require preferential treatment of minority and low-income persons, so demographic information need not be considered for this purpose. Nothing in the Executive Order requires mitigation for safety concerns, noise, or traffic delay in one community but not a second community similarly situated with respect to the expected level of impacts, the only difference being the demographic composition of the communities. That is not to say, however, that where the Board determines that mitigation is warranted in a community based on neutral criteria, consultation about the most effective implementation of the mitigation is inappropriate. As discussed above, the Board uses screening assessment tools to identify problem areas, but the resolution of problems will often be more effective if specific local conditions are taken into account.

2. This Railroad Control Proceeding Does Not Present An Opportunity for Discrimination By CSX or NS

Similarly, application of the Order to this railroad control proceeding is not necessary to protect against any potential discrimination by CSX or NS. CSX and NS must take Conrail's rail network as it is; they propose to build a few short connections between existing lines, but are not building new routes. There were thus no significant decisions to be made regarding where to site

new facilities, the classic situation in which special environmental justice analyses have been undertaken.

Moreover, neither CSX nor NS had any reason either to favor or disfavor minority or low income populations in deciding how to route their trains after the Transaction. The factors which were taken into account in routing trains were transportation-related, and are discussed in the Operating Plans.²⁷

As the verified statements of John W. Orrison and D. Michael Mohan (Application Vols. 3A and 3B) attest, the Operating Plans for the expanded CSX and NS systems and for the Shared Assets Areas were devised to route freight traffic so as to provide the quickest, safest and most cost-effective rail transportation possible east of the Mississippi River, to the benefit of persons of every racial and income group. Some lines, yards and intermodal facilities will experience increased traffic under the Operating Plans, and some will experience decreased traffic.²⁸ Because minority and income status of populations in the vicinity of rail lines were not factors in the decision how to route the trains, it is to be expected that the increases and decreases in traffic over the 44,000 miles of rail lines at issue in the Transaction will be borne by minority and nonminority groups and persons of various income levels in reasonable proportion to their

²⁷ The primary factors are the origin and destination points for the expected freight shipments, geographic factors such as route distance and terrain, and the capacity of the tracks, yards and intermodal facilities.

²⁸ Systemwide, the total volume of rail freight traffic is predicted to increase because of the Transaction, with corresponding environmental benefits from decreased truck traffic. Systemwide, the total amount of activity in rail yards is expected to decrease because the expanded systems will allow for longer hauls and better blocking opportunities, with associated environmental benefits.

presence along the rail lines. As explained in NS' comments on the DEIS, that is what a statistical analysis conducted in response to the DEIS in fact demonstrates.

Thus, because of the fundamental nature of a major railroad control application and the standard environmental review thereof under NEPA, there is no significant risk of discrimination against minority and low-income populations. The Board should conclude that its existing procedures for control transactions fully satisfy Executive Order 12898. To the extent that the Board believes that the Order requires something more than its existing procedures in control transactions, the Board should exercise its discretion not to apply Executive Order 12898 in this proceeding. The appropriate procedure would be to initiate a notice and comment rulemaking for application to future Board proceedings. Such a procedure would allow for a full and open exploration of the criteria to be used in any environmental justice analysis to be undertaken in future cases.

B. If the Board Chooses to Apply a Demographic Analysis, It Must Employ a Methodology That is Consistent With the Executive Order

As is apparent from SEA's discussion of environmental justice (Vol. 1 at 3-46 to 3-52; Vol. 5A at K-1 to K-12), neither the Executive Order nor any guidance promulgated to implement the Order directly addresses the type of federal action presented here -- approval of a major railroad control transaction. The Department of Transportation's final order establishing procedures for applying the Executive Order to DOT programs, dated April 15, 1997, provides the most relevant guidance as it was drafted with transportation systems in mind, but even it stops far short of setting forth any directly applicable methodology. Department of Transportation Order to Address Environmental Justice in Minority Populations and Low-Income Populations, 62 Fed. Reg. 18377 (Apr. 15, 1997). Accordingly, SEA was faced with the challenging task of devising an analysis for this Transaction without any precedent and with very little guidance.

1. The Scope of Review is Too Broad

The Board should have limited the scope of its environmental justice review to new construction projects, and perhaps abandonments, related to the Transaction. The situation presented here is quite different from the situation which typically gives rise to an environmental justice concern -- the siting of a new facility. The railroad rights-of-way presently owned by CSX, NS and Conrail were established beginning in the mid-nineteenth century and were largely determined by the early twentieth century. Land was developed along the railroad tracks with full

knowledge that freight trains moved over the tracks.²⁹ It is, therefore, not appropriate to apply environmental justice methodologies developed in the context of choosing a site for a new facility.

In the draft scoping notice for the EIS, SEA had proposed to apply environmental justice analysis only to the proposed new construction projects and abandonments, which was consistent with the usual application of the concept. In the final scoping notice, SEA expanded the scope of its environmental justice analysis to include traffic and activity changes on existing infrastructure. SEA had it right the first time.

²⁹ The level of freight traffic on any given rail line varies through the years, sometimes greatly, with shifts in the origin and destination of shipments, the overall level of economic activity, plant closings and openings, competition from other railroads, development of substitute products for those shipped by existing rail customers, competition from trucks, and other factors. Moreover, a railroad's decision to change the level of traffic on a line is not ordinarily subject to review by any federal agency. Accordingly, it would not be reasonable for any individual or community along a rail line to expect that the level of traffic which existed in 1995 or any other year would never change.

What persons living along a rail line can expect, however, is that railroads will operate through their communities in compliance with company policies, railroad industry standards, and federal regulations designed to protect their health and welfare. Railroads are, of course, subject to comprehensive legal requirements imposed by the Federal Railroad Administration, Environmental Protection Agency, and other agencies. CSX, NS and Conrail also have adopted a host of industry standards and have implemented their own company-specific programs, particularly in the area of safety, which go beyond federal regulation. The company policies, industry standards and regulations are designed to promote safety and protect the environment whether one train or one hundred trains per day utilize a line. And it should go without saying that the company policies, industry standards and regulations are designed to provide the same high level of protection to all persons living in proximity to rail lines, regardless of their race, national origin or annual income.

2. The DEIS Fails to Determine Whether the Proposed Action Will Have a Disproportionate Effect on Minority and Low-Income Populations

Executive Order 12898 quite purposefully did not direct federal agencies to identify and address all "high and adverse human health or environmental effects of its programs, policies and activities on minority populations and low-income populations." Section 1-101. Rather, the Order directed federal agencies, where "practicable" and "appropriate," to identify and address "disproportionately high and adverse human health or environmental effects of its programs, policies and activities on minority populations and low-income populations." *Id.* (emphasis added).

The DEIS writes the critical disproportionality requirement out of the Order. Although the DEIS acknowledges the disproportionality requirement several times (Vol. 1 at 3-47, Step 4; Vol. 5A, App. K at K-3 and K-10), it is never applied.

The DOT Order defines the disproportionality requirement as follows:

g. Disproportionately high and adverse effect on minority and low income populations means an adverse effect that:

(1) is predominately borne by a minority population and/or a low-income population, or

(2) will be suffered by the minority population and/or low-income population and is appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the non-minority population and/or non-low-income population.

62 Fed. Reg. at 18381. The DEIS adopted the first part of the definition at Vol. 5A, page K-10.

Significantly, however, it improperly truncated the second part of the definition to omit the

reference to the comparative effects suffered by non-minority and non-low-income populations.

Id.

As explained below, CSX believes that analysis of disproportionality requires a statistical analysis of all the persons affected by the Transaction. The DEIS did not present any such statistical analysis. It did not present any analysis which compared the impacts on non-minority and non-low-income persons to those on minority and low-income persons. The DEIS states the following as its sole explanation of the methodology for determining whether adverse effects disproportionately affect minority or low-income communities:

SEA used qualitative analysis approach which included review of several different factual circumstances, including cumulative effects of exposure to health and environmental impacts from many sources, to determine the significance levels on a local case-by-case basis. A determination of a significant environmental justice impact specifically included SEA's consultation with affected communities.

Vol. 5A at K-10 to K-11. With all due respect, this analysis is relevant only to the question whether certain effects are "high and adverse," not whether they disproportionately affect certain populations. The answer to the question whether an impact is disproportionate cannot come from consultation with minority and low-income populations, who presumably have little knowledge of how other communities are being affected by the Transaction. The answer must come from statistical analysis to determine whether similar impacts occur in other communities which are not predominately minority or low income.

In order to determine whether the Transaction would have disproportionate effects on minority or low-income populations, one would need to assess the systemwide effects of the

proposed train traffic patterns on the populations along the 44,000 miles of rail line presently owned by CSX, NS and Conrail which are at issue in this Transaction.³⁰

The DEIS may have sought to avoid analysis of the disproportionality requirement because a rigorous application of that requirement to a rail transaction involving 44,000 miles of rail line would have been more difficult by many orders of magnitude than any such analysis performed under the Executive Order to date. The correct response, however, to this problem is for the Board to conclude that the type of demographic analysis in this context is not "practicable" and not "appropriate" (Executive Order Section 1-101), particularly because the Board is not even required to comply with the Executive Order. What is not permissible is for the DEIS simply to ignore this critical element of the analysis.

The DEIS compares the demographic composition of the population living in proximity to some of the rail line segments to that of the surrounding counties as a whole, but this is not an appropriate comparison group for purposes of analysis of disproportionality with respect to a fixed infrastructure such as a rail line system extending throughout the eastern United States. The DEIS may have been misapplying CEQ's formulation of disproportionality in taking this approach:

SEA used the following process to define whether an impact is disproportionately high and adverse on the affected population: 1) "determine whether environmental effects are significant, as employed by NEPA; and 2) determine whether these impacts are or may be having an adverse impact on minority populations or low-income populations that appreciably exceeds or is likely to exceed

³⁰ It is notable that the DEIS's summary of systemwide impacts did not even include environmental justice. Vol. 1 at 4-6. Environmental justice is improperly identified as only a "site-specific environmental issue."

those on the general population or other appropriate comparison group (CEQ Guidelines)."

Vol. 5A, App. K at K-3.

The DEIS analyzed the community around each individual rail segment as a separate population. While there may be some appropriate uses for a segment-by-segment analysis, a rail segment is not the equivalent of an individual facility, the typical subject of an environmental justice analysis. Segment end points are places where the level of train traffic changes, either because there is an origin or destination point, a rail yard or intermodal facility, or a junction point between rail lines. Rail segments vary greatly in length, from a minimum of one mile to a maximum of about 250 miles. The rail facility at issue in this Transaction is the entirety of the CSX, NS and Conrail systems. One should thus analyze the impacts on a systemwide basis. NS has undertaken a systemwide analysis of all CSX, NS and Conrail line segments using demographic information sorted by zip code which demonstrates that the Transaction will not have a disproportionate impact on minority or low income persons. The NS analysis is presented in its comments.

NS's analysis determined that the population in proximity to the rail lines involved in the Transaction is approximately 25% minority and 15% low-income.³¹ Of course, the composition of the individual communities along the rail lines varies from one end of the percentage scale to the other. CSX and NS do not control land use patterns, and cannot move their infrastructure. Therefore, any comparison of rail impacts can only be among the communities residing in proximity to the rail lines, not to persons residing elsewhere. Executive Order 12898 cannot

³¹ These figures are only very slightly higher than the composition of the United States as a whole, which is approximately 24% minority and 13% low-income.

prohibit rail transportation, or require mitigation which would be so extensive as to make rail transportation uneconomic, simply because some communities along rail lines have a higher percentage of minority and low-income persons than the rail population as a whole or the nation as a whole.³²

The NS analysis shows that the impact of the Transaction is not disproportionate because it is not "predominately borne by a minority population and/or a low income population." 62 Fed. Reg. At 18381. About 75% of the impact is borne by the non-minority population and about 85% of the impact is borne by the non-low-income population. In addition, the impact on minority and low-income persons is consistent with their proportion in the rail population as a whole.

Moreover, the adverse effect suffered by the minority population and/or low-income population will not be "appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the non-minority population and/or non-low-income population," the second criterion in DOT's definition of disproportionality. See id. The nature of the impacts are the same throughout the system, primarily safety concerns, noise and traffic delay. Using neutral criteria, the DEIS identifies the communities that are expected to experience significant impacts as a result of the Transaction. Some of these communities are predominately minority or low-income, and others are not. These are the segments to which mitigation is targeted. The

³² Taking the Executive Order to the extreme also points out how difficult it is in the context of a Transaction of this nature to account for the offsetting benefits to minority individuals and populations from rail traffic in terms of reduced truck traffic, improved employment opportunities supported by rail transportation, and other effects.

DEIS's "environmental justice" analysis is not necessary to ensure that these communities are not excluded from the benefits of mitigation.

C. Specific Recommendations for Consultation
with Communities with Significant Minority
or Low-Income Populations

The DEIS directs CSX to "consult with elected officials, appropriate local agencies, and community representatives" in the cities and towns listed on Table 7-9 to address the particular environmental impacts identified in Table 7-9, to the extent that those impacts are disproportionate. As explained above, this Transaction will not have a disproportionate impact on minority or low-income populations. There is thus no basis for directing CSX to embark upon special "environmental justice" consultations.

To the extent that (1) the application of neutral criteria has identified impacts potentially warranting mitigation, and (2) the crafting of the mitigation is properly informed by local considerations, CSX has undertaken and will continue to undertake consultations with appropriate officials regardless of the demographic composition of the community. With respect to the first point, because the Executive Order does not require a lower threshold for requiring mitigation in communities which are predominately minority or low income, there is no basis for directing CSX to consult with any communities in addition to those which have been identified for potential mitigation through application of SEA's neutral criteria.³³ With respect to the second

³³ Specifically, as explained below, SEA identified noise impacts on the Barr Yard-Blue Island, IL, Willow Creek-Pine Junction, IN, and Marion-Ridgeway, OH line segments, and at the 59th Street Chicago Intermodal Yard, even though the impacts do not meet SEA's neutral criteria for noise impacts. The DEIS states that although noise mitigation is not warranted "at this time," "noise effects have been included to consider potential cumulative effects." Vol. 4 at 7-48. CSX objects to any attempt to apply a cumulative effects analysis in this specific context. The DEIS includes no methodology for weighting and then cumulating the various adverse effects of rail traffic (grade crossing safety, traffic delay, noise, etc.). And of course there is no quantification in

point, there are some impacts which by their nature must be addressed through uniform, systemwide (if not nationwide) standards and are thus not the appropriate subjects of consultations with cities and towns designed to fine-tune mitigation in light of local conditions. Freight rail safety issues, including transportation of hazardous materials, fall into this category. Freight rail safety issues are comprehensively regulated by federal agencies, primarily the Federal Railroad Administration. State regulation is preempted by the federal regulatory scheme and by the Commerce Clause of the United States Constitution. Accordingly, it would not be consistent with sound transportation policy for CSX to undertake consultation with cities and towns regarding the design of special mitigation of any potential freight rail safety impacts identified in the DEIS. CSX will adhere to freight rail safety conditions proposed in the DEIS with respect to specific line segments that meet the DEIS' neutral tests of "significant impact." Further, CSX routinely meets with communities along its rail lines to discuss a wide variety of issues of interest to the communities. CSX will continue its community relations efforts. What CSX objects to is a discussion for the purpose of designing a special mitigation strategy for freight rail safety and hazardous materials transportation that would apply only in certain communities because of their demographic composition.

the DEIS of the benefits of the Transaction on a localized basis -- reduction of truck traffic, positive economic effects, and the like. It would be impossibly complicated to attempt such a cumulative impacts analysis in every community along the 44,000 miles of rail lines involved in this Transaction. NEPA does not require the impossible, nor does anything in the Executive Order on environmental justice require SEA to devise such a complex analysis specifically for minority and low-income populations. Independent evaluation of the neutral criteria for each of the impact areas SEA has devised and applied is sufficient.

The potential impacts which may be appropriate for consultation are thus grade crossing safety, traffic delay, and noise. The identification of the appropriate entity to consult with regarding appropriate mitigation measures depends on the nature of the issue.

The DEIS strongly encourages CSX to enter into "mutually-acceptable binding agreement[s] on the implementation of appropriate mitigation measures." Vol. 4 at 7-18. It must be noted, however, that whereas it might be appropriate to consult with a particular official about mitigation, it might not be appropriate to enter into an agreement with that particular official. For example, a local official might desire a grade separation, but the state would normally vest the decision whether to undertake a grade separation in a state official. Any agreement regarding the separation would have to be between CSX and the state official, not the local official.

CSX does not believe that agreements are appropriate with "community representatives" who are not representatives of duly-constituted state or local government agencies. SEA has conducted "outreach" to educate and solicit the views of community groups about the Transaction. Those community groups can make their views known to their governmental representatives. If the view of a particular group does not persuade their governmental representatives, however, there is no basis for an agreement between the group and CSX. In its draft order on environmental justice, DOT had proposed "an agreement . . . with the potentially affected protected populations" as one option for addressing disproportionately high and adverse effects." 60 Fed. Reg. 33899, 33901 (June 29, 1995). Numerous commentators opposed the provision as unworkable and subject to abuse. DOT agreed, and deleted the proposal from its final order on environmental justice. 62 Fed. Reg. 18377, 18378 (April 15, 1997). CSX agrees as well, and does not plan to enter into any such agreements.

Having stated these general points, we will now address the DEIS's specific directions.

1. Barr Yard to Blue Island, IL

The DEIS directs CSX to consult with Blue Island with respect to traffic delay. Two crossings are identified which may warrant mitigation for vehicle delay impacts -- Dixie Highway and Broadway-135th St. These crossings were included in Mitigation Measure 11. As explained above in connection with Mitigation Measure 11, CSX expects that capital improvements planned in connection with the Transaction and the implementation of CSX's Operating Plan will greatly improve traffic flow through Blue Island. Accordingly, it does not appear that any additional mitigation is required. CSX will consult with the City of Blue Island about these operational improvements.

2. 59th Street Chicago Intermodal Yard

The DEIS directs CSX to consult with Chicago with respect to noise from truck traffic to the 59th Street intermodal facility even though the noise level does not meet the DEIS's criteria for mitigation. CSX's proposed intermodal facility at 59th Street is addressed below in connection with Mitigation Measure 24. As explained below, CSX has already consulted with the Chicago City Council in connection with CSX's rezoning application for the facility and has reached agreement on mitigation measures for the facility as conditions to the approval of the rezoning application.

3. Willow Creek to Pine Junction

SEA has directed CSX to consult with Gary, Indiana with respect to a number of impact categories. Gary is a member of the Four Cities Consortium. As explained below in connection

with Mitigation Measure 27, CSX is presently consulting with Gary about these issues as part of its consultation with the Four Cities.

4. Alexandria Junction to Washington, DC

SEA has directed CSX to consult with Bladensburg, MD and Washington, DC with respect to hazardous materials transport because this route is expected to become a key route after the Transaction. As explained above, CSX does not believe that consultation is appropriate with local communities regarding the design of special mitigation measures related to transportation of hazardous materials through their communities. However, CSX will coordinate with Washington, DC and Prince George's County, MD regarding the Hazardous Materials Emergency Response Plans recommended in Mitigation Measure 3.

5. Quaker to Mayfield, Mayfield to Marcy, OH

CSX is in the process of consulting with Cleveland and East Cleveland with respect to a number of impact categories, as explained below in connection with recommended Mitigation Measure 21.

6. Marion to Ridgeway, Ohio

In the errata to the DEIS, SEA directed CSX to consult with respect to mitigation of noise impacts in Marion, Ohio. For the reasons set forth below, CSX respectfully suggests there is no basis for any noise mitigation in Marion.

First, SEA's stated concern in Marion, Ohio is noise impacts, but this segment does not meet the SEA's criteria for noise mitigation. Nor can noise be considered as a cumulative impact in Marion, because no other impacts have been identified that warrant mitigation. The objective of the Executive Order is nondiscrimination, not preferential treatment.

Second, it is not clear that any noise mitigation in Marion would even benefit minority or low-income persons. As stated in Appendix K (Vol. 5A at K-43), the population along the Marion-Ridgeway line segment, a 23.2-mile-long line segment in Marion and Hardin Counties, is 5.3% minority and 24.2% low-income. This segment was identified as raising environmental justice concerns because the low-income percentage is reportedly more than 10% higher than the low-income population of Marion and Hardin Counties as a whole. As explained above, this is not a permissible application of the disproportionality requirement of the Executive Order. Disproportionality can only be determined on a systemwide basis. Presumably the DEIS was seeking to identify those communities that might have less political influence than their wealthier, nonminority neighbors in the county. Relative power within the county might be an appropriate concern if the Board were deciding whether to approve the construction of a new rail line through Marion and was looking at two different routes, but the approach makes no sense in the context of the action actually before the Board.

The problem with the DEIS's approach becomes more apparent when one focuses on the precise area of the noise impacts. A maximum of about 50 residences within Marion on the Marion-Ridgeway segment would likely experience a perceptible increase in noise from increased traffic on the line.³⁴ If a noise barrier were built along the rail line in the vicinity of these affected residences, for example, it would benefit only the occupants of these homes. It would not benefit anyone else in Marion. The relevant population for purposes of an environmental justice analysis is thus the residents of these 50 or fewer houses. CSX cannot readily determine the race, national

³⁴ If shielding were fully taken into account (the model is not designed to do so), it is likely that many fewer residences would actually be affected.

origin or income level of this small population. Thus, it is far from clear that any noise mitigation in Marion would benefit the persons the Executive Order was issued to protect.

21, 24, 25, 27. Communities with Unique Circumstances

21. Cleveland

The DEIS directs CSX and NS jointly and/or separately to "continue to consult with the City of Cleveland, the City of East Cleveland, the Ohio Department of Transportation, elected representatives for Cleveland and other appropriate parties to address concerns about train traffic increases on the CSX's Quaker to Mayfield and Mayfield to Marcy rail line segments and NS's Cleveland to White and Cleveland to Ashtabula rail line segments." It further directs CSX and NS to "negotiate a mutually-acceptable binding agreement on train routing through Cleveland and mitigation measures for those routes that could experience potential significant environmental impacts."

The major rail routes of Conrail being allocated to CSX and NS in the Transaction form an "X", one leg of which is the Conrail lines from Boston and New York City (via Albany) to St. Louis and the other is the lines from New York (via Philadelphia) to Chicago. The cross-point of the Conrail "X" is in the Greater Cleveland area. One of the core concepts of the Transaction's allocation of the Conrail routes is that CSX will take the first-named leg of the "X", and NS will take the other leg. The "X" will no longer be operated as part of a single system, but the two legs of the "X" will be operated on a competitive basis by the two carriers.

Collectively, on the two branches of the "X", approximately 80-90 trains per day will be operated through Cleveland under the two carriers' operating plans. It should be noted that the Transaction will not materially change the number of trains traversing Cleveland on Day One (although traffic may ultimately increase in Cleveland as elsewhere on the CSX and NS systems as the benefits of the Transaction induce the diversion of freight from truck to rail). However,

instead of operations at the center point of the "X" being coordinated by a single railroad operating in its overall best economic interest, two rivals will operate their competitive services. The two railroads have proposed operating plans and allocations of routes in the Cleveland area that will permit each of the two to operate without interference with the other -- interference which could, of course, potentially lead to a "Houston" situation such as was encountered after the *UP/SP* combination and potentially one that would be more difficult to cure. Exhibit 7 shows the general layout of Conrail's lines through Cleveland, known locally as the "Lake Shore Line" and the "Short Line." CSX will principally operate over the Short Line and NS will principally operate over the Lake Shore Line. The end points of the CSX line segments as defined in the CSX Operating Plan are shown on Exhibit 7 for reference.

A. CSX Consultation Efforts to Date

Prior to the directive in the DEIS, CSX began meeting with appropriate state and local authorities throughout Ohio to consider creative options for addressing local concerns. Over the past eight months, CSX has met with PUCO and ORDC officials, and has cooperated with them in rail line studies to determine the need for improved rail grade crossing protection on certain line segments, among other things. CSX also has participated in many other public and private meetings. A variety of issues have been addressed, including economic development opportunities, safety at grade crossings, hazardous materials transport, commuter rail service, and other issues.

With respect to the Greater Cleveland area, CSX for several months has had meetings and conducted similar discussions with the Mayor of Cleveland and other City of Cleveland officials,

and the Mayors and officials of the Cities of East Cleveland, Brook Park, Berea, Olmsted Falls, and of Cuyahoga County.

Such meetings include:

- August 26, 1997 - Meeting with the Chairman of the Transportation Task Force of the Cleveland Growth Association ("CGA") to present the CSX operating plan and discuss the compatibility of routing plans with future development plans of the area;
- October 22, 1997 - Meeting with City of Cleveland's planning, law, and safety directors to discuss routing issues;
- October 28, 1997 - Meeting between CSX President John Snow and the Mayor of Cleveland to discuss that City's opposition to the CSX operating plan;
- November 6, 1997 - Meeting with East Shore Development Corporation to discuss the expansion at Collinwood Yard;
- November 7, 1997 - Meeting with commuter rail representatives, Cleveland Port Authority and the Director of the County Planning Commission to brief them on the Transaction;
- November 13, 1997 - Meeting with Collinwood area city councilman to discuss intermodal expansion;
- November 13, 1997 - Meeting with CGA staff member to discuss acquisition plan and commuter rail options;
- November 13, 1997 - Meeting with RTA to discuss commuter rail planning status;
- November 19, 1997 - Meeting with the Mayor of Berea to explain the acquisition and operating plan;
- December 5, 1997 - Meeting with the Mayor of Cleveland's staff to explain the rationale for the operating plan;
- January 12, 1998 - Meeting with the Mayor of Brook Park to discuss the operating plan and mitigation issues;

- January 14, 1998 - Meeting with City of East Cleveland officials, including the Mayor's Chief of Staff, the Police and Fire Chiefs, EMS Director and city councilmen to discuss the acquisition, noise mitigation, neighborhood beautification, job training and training and equipment for emergency responders;
- January 16, 1998 - Field inspection of Chicago intermodal facilities by City of Cleveland councilmen and other Cleveland officials to demonstrate improvements proposed for Collinwood Yard.
- January 21, 1998 - Joint CSX/NS meeting with the Mayor of Cleveland and his staff to discuss alternative routing proposals;
- January 21, 1998 - Joint CSX/NS meeting with the Mayor of Berea and the Mayor of Olmsted Falls to discuss alternative routings;
- January 22, 1998 - Train trip for the Mayor of Cleveland and other Cleveland officials, City of East Cleveland officials, and Cleveland area business associations to present the operating plan, Collinwood expansion plan, economic impact report, noise mitigation plan and CSX hazardous materials safety program;
- January 26, 1998 - Meeting with the Mayor of East Cleveland to discuss mitigation;
- January 27, 1998 - Joint CSX/NS meeting with the City of Cleveland Mayor and his staff to evaluate alternative routing proposals;
- January 30, 1998 - Meeting with clergy association leadership to discuss the operating plan and hazardous materials safety; and
- January 31, 1998 - Public meeting held by clergy association to discuss the operating plan and hazardous materials safety.

In dealings with most of the authorities contacted, substantial progress has been made.

However, as of the date of these comments, the City of Cleveland remains opposed to the Transaction's allocation of lines and routing of traffic through Cleveland. Mayor White recently proposed to "flip" the allocation and have CSX operate over the "Lake Shore Line" between

Berea and Collinwood Yard through downtown Cleveland and have NS operate over the "Short Line" between Berea and the Harvard connection (near Marcy) to the Conrail line to Pittsburgh and between Berea and Mayfield to NS's line to Buffalo.

CSX and NS have carefully analyzed alternative routing options, but no alternative routings for CSX and NS traffic through Cleveland have been found that would not involve (a) significant disruption and delay of East-West traffic flows, (b) substantial construction - related environmental impacts and enormous construction expenses, (c) delay and/or disruption of the implementation of competitive service under the Transaction, and (d) adverse environmental impacts both in the City of Cleveland and in other parts of Greater Cleveland. In fact, CSX and NS continue to believe that Applicants' allocation of lines and the routing of traffic through the Greater Cleveland area represent the most effective means of achieving the objectives of the Transaction and maximizing the public benefits for both national and local interests. The rail line allocations and proposed routings set forth in the Application:

- are consistent with the historical use of these lines;
- promote effective competition between CSX and NS and efficient, reliable service for East-West traffic moving through Cleveland;
- are cost-effective and make efficient and beneficial use of existing railroad infrastructures; and
- do not cause significantly different environmental impacts than alternative routings.

B. Applicants' Proposed Routing is Consistent with the Historical Use of the Lines

Cleveland historically has been a major hub for East-West railroad traffic. All of the Ohio predecessors of Conrail as well as the predecessors of CSX and NS have had major rail presences

in Cleveland for decades. More significantly, Conrail has designed its system so that both of its major routes cross in Cleveland, making Cleveland the center of its system. As a result, Cleveland is the most direct and efficient routing for traffic between Chicago and eastern points and, as detailed in Applicants' Rebuttal, rerouting traffic away from Cleveland is neither commercially nor operationally feasible and would substantially diminish the quality and competitiveness of East-West rail transportation. Rebuttal Verified Statement of John W. Orrison, Rebuttal Vol. 2A at HC-79 to HC-85.

Likewise, no viable alternatives have been identified for reallocating lines or rerouting rail traffic within Cleveland. Conrail presently uses two routes through Cleveland, the "Lake Shore Line" and the "Short Line." Both lines connect the Collinwood Yard on the northeast side of Cleveland with Berea to the southwest of Cleveland. Each line is approximately 20 miles long. As a result of the Transaction, NS will operate over the Lake Shore Line and CSX over the Short Line.

Both lines have carried substantial freight traffic since they were built. The Lake Shore Line was built in the mid 1800's by a predecessor of the Lake Shore and Michigan Southern Railway ("LS&MS"). At the turn of the century, the LS&MS was the western main line of the New York Central and Hudson River Railroad extending from Buffalo, NY through Cleveland to Chicago. Increasing amounts of passenger and freight traffic made it necessary to complete a four-main-track line from Buffalo to Toledo and farther West. In 1902, LS&MS created a subsidiary, the Cleveland Short Line Railway Company, to construct a belt line of railroad around the City of Cleveland and provide facilities for interchange between the eight railroads then serving Cleveland.

The Short Line was designed for high volume freight traffic. It is entirely grade separated through Cleveland and East Cleveland, in some places running on elevated track and in others through cuts below grade. The Short Line became an integral part of the expansion to four main tracks, and upon its completion in 1912, it became the bypass for freight traffic. By 1915, the line consisted of 19.64 miles of main track, 19.17 miles of second (main) track and 22.23 miles of sidings, making it well suited for handling heavy volumes of freight traffic.

Inter-yard pullers as well as through freight trains were scheduled across the Short Line for many years, averaging 30-40 freight trains per day. As the Lake Shore Line carried a heavy volume of regular passenger service as well as freight trains, the Short Line provided an efficient route for handling freight trains. The opening of the Cleveland Union Terminal in 1930 and its associated passenger route reduced some of the traffic on the Lake Shore Line by relocating a substantial amount of passenger train traffic to the Short Line. Nonetheless, even with the decrease in passenger traffic on the Lake Shore Line, the Short Line continued to carry between 25-30 freight trains per day throughout the 30's, 40's and 50's.

In connection with the construction of the Cleveland Union Terminal, the New York Central ("NYC") constructed a new alignment for its passenger trains from the Lake Shore Line at Collinwood and along the Short Line between Collinwood and University Circle (near Mayfield on Ex. 7). At University Circle, the passenger route diverted from the Short Line to reach the terminal. This line is now used by the RTA. This part of the Short Line -- the part that Cleveland says will be unacceptably affected by the passage of 40 freight trains per day -- had a multiple track right of way, with two tracks for passenger trains and two tracks for freight trains. All NYC passenger trains serving Cleveland moved over this line. As a result, regularly scheduled

passenger trains on this line averaged between 20 and 30 trains per day during the 1940's and 1950's and about 10 trains per day during the 1960's.³⁵ In addition, mail and express trains (including mail-carrying through passenger trains that did not have passenger stops in Cleveland) used this route to access the Union Terminal complex. As stated above, the RTA continues to operate along or near the Short Line in Cleveland and East Cleveland.

Conrail continues to route traffic over the Short Line to relieve congestion on the Lake Shore Line as needed, particularly during periods of heavy maintenance on the Lake Shore Line. During these times, an average 30-40 trains per day traverse the line.

It should be emphasized, therefore, that CSX's proposal to operate approximately 40 trains per day over the Short Line is not a deviation from the historical use of this line, but a resumption of the service for which the line is particularly well suited.

C. The Proposed Allocation Promotes Competitive, Efficient and Reliable Rail Service

The Applicants' plan for allocating lines and routing traffic through Cleveland is an important part of the overall plan to provide more efficient, cost-effective, reliable and competitive interstate rail transportation between the East Coast and points West. Allocating the Lake Shore Line to NS and the Short Line to CSX gives each carrier a direct through route through and beyond Cleveland that does not require the difficult task of sharing track or crossing the other's line anywhere at grade -- which with 80-90 trains a day planned could lead to chaos. Applicants identified no other way to accomplish this. Having parallel and non-interfering routes eliminates the very real problem of a bottleneck at Berea where the two Conrail lines cross. The

³⁵ It should be noted that most of the homes in this area were built in the 1920's and 1930's during the years of heaviest train traffic.

elimination of the bottleneck results in improved transit time for CSX and NS East-West trains. In addition, the ability of CSX and NS each to fully control the movements of its trains (and particularly time-sensitive intermodal trains which compete with trucks) unimpeded by the movements of the other carrier promotes more efficient and reliable East-West service.

Applicants' proposed allocation and routing enable CSX and NS to achieve their objective of each having a high quality, two-main-track route through Cleveland with the expenditure of reasonable sums to improve the existing rail infrastructure. CSX plans to spend about \$40 million to improve the Short Line and Collinwood Yard, including restoring double tracking to all but about one-and-a-half miles of the line, upgrading the signal system to install TCS on the newly constructed track, installing continuous welded rail, installing a defect detector at Marcy, and upgrading the intermodal facility at Collinwood Yard.³⁶ These investment decisions have been based on practical assessments of the costs and benefits of the proposed improvements.

D. Potential Alternatives for Reallocating Lines and Rerouting Traffic Entail Disproportionate Expense and Inefficiency Compared to Applicants' Proposed Routings

The City of Cleveland's proposal for reallocating lines and rerouting traffic through that City would entail disproportionate expense and pose operating problems that significantly undermine any purported benefits of such proposals. In order to avoid an increase of traffic on the CSX Quaker to Mayfield and Mayfield to Marcy segments, the City of Cleveland has proposed that the allocation of lines be "flipped," assigning the Short Line to NS and the Lake Shore Line to CSX. The proposed alternative would result in NS traffic moving over the Short

³⁶ CSX's investment in capital improvements in the Greater Cleveland area will total about \$75 million.

Line between Berea and the Harvard connection (near Marcy) and then onto its acquired Pittsburgh line or between Berea and Mayfield and onto its own Buffalo line. CSX traffic would move between Berea and Collinwood over the Lake Shore Line to its newly acquired routes to New York City/Northern, New Jersey via Buffalo and upstate New York.

This alternative would result in CSX and NS having to cross each other's lines at grade at Berea, creating either a major bottleneck at the crossing point or the need for an extensive and costly separation. It would also make it extremely difficult for NS to reach several facilities that it will serve, without substantial additional investment. In fact, the proposal would require several major construction projects, beyond those now contemplated, including:

- Construction of a flyover at Berea to enable the unrestricted crossover of CSX and NS trains to and from their connecting routes. An unrestricted crossover with about a 0.5% gradient and clearance for future improvements would be approximately 10,000-11,000 feet long and take at least 2 years to construct. Construction would necessitate the disturbance of existing residential and commercial structures, and would dramatically alter the existing character of the impacted area. In addition, the construction could potentially affect Berea's existing subterranean infrastructure, including sewer lines, water lines and utility and communication lines. Finally, the potential noise impacts of an elevated superstructure would require additional assessment and potentially significant mitigation efforts;
- Construction of a second track at the Harvard Connection in order for NS to operate. The construction of the track would necessitate the building of a bulkhead in the adjacent creek basin and could adversely affect the environmentally sensitive waterfall located in Mill Creek;
- Construction of substantial additional track required for NS to access Rockport Yard (where it maintains an operating base) and Ford Motor Company; and

- Initiation of a project to facilitate NS's efficient access to Whiskey Island, where iron for use in local steel production is transloaded from lake cargo vessels.

The costs of this proposal are unrealistically disproportionate to the benefits.

Construction of the mammoth superstructure of the flyover alone could cost in excess of \$100 million, without even considering the costs and impacts of relocating utilities, or the costs of related environmental mitigation.³⁷ But the true costs associated with this proposal go far beyond the capital needed to construct the additional projects. They also include the high public and private costs of entirely postponing and/or disrupting implementation of the Transaction,³⁸ risks of very serious environmental impacts in Berea, and serious on-going operational and customer service issues when construction is completed. Such detriments fly in the face of the railroad transportation policy goals of promoting sound, economical, competitive and efficient service.

Any suggestion that CSX and NS could share the Lake Shore Line is equally impractical. There is not sufficient right-of-way to accommodate new separate tracks. Sharing the same tracks would not give the shippers the benefit of two efficient, reliable East-West routes offered by two strong competitors. Like the "flip" alternative, it would create in Cleveland a bottleneck for the two competing routes, resulting in decreased efficiency and the unreliability of East-West movements. Similar problems of crossing at ground level, as in the "flip" alternative, would be created.

³⁷ Cleveland's consultant Parsons Brinckerhoff has estimated the cost of Cleveland's alternatives at \$148 to \$171 million, a significant item of which is the flyover structure at Berea. CSX has not yet developed its own estimates of the cost of the structure.

³⁸ Cleveland is not what Reno and Wichita were to the *UP/SP* combination -- points where operations could be frozen without systemwide damage. Cleveland is the central point on the Conrail route system and is central to the new long-haul operations of both CSX and NS.

Another proposal has been made to have a "neutral terminal operator" in Cleveland, presumably with operations conducted similarly to those of the unitary Conrail. But that would not resolve the problem; if there is to be coordination of the movements of CSX and NS through Cleveland, the coordination has to extend systemwide, since the trains that will move through Cleveland will be in large part trains making long-haul runs over most of the extended systems, East and West, of the two carriers upon the implementation of the Conrail route allocation. Thus, what is at issue is not the management of local traffic moving through Cleveland, but the efficient operation of interstate and even transcontinental traffic. While it is true that Conrail could economically and efficiently progress trains through Cleveland without the need for separations, the situation here is different. Unlike Conrail, a terminal operator would not have control over the scheduling and operation of all pertinent train movements from origin to destination. It may be expected that for competitive reasons CSX and NS would tend to schedule origination and arrival times for their long-haul movements that would put the competitive movements in Cleveland at about the same time of day. The terminal operator, therefore, would not be in a position to coordinate and facilitate the efficient movement of interstate rail traffic converging on Cleveland from all directions.

These proposed tinkering with the allocation of Conrail routes through Cleveland would have the most serious consequences. They would either entirely prevent the implementation of the CSX and NS operating plans (effectively annulling the Transaction), postpone their implementation while the necessary construction work was completed, or compromise them by greatly reducing capacity while construction proceeds at the critical throat of the system.

Rather than providing the benefits of more efficient and competitive rail service, the alternatives would create impediments to such service and thus be a disservice to the nation and to the City of Cleveland.

E. Rerouting Trains from the Lake Shore Line to the Short Line Will Have Significant Benefits for Cleveland Itself

CSX's Operating Plan will not only benefit the national transportation system, but will also benefit the City of Cleveland itself in a number of ways.

First, the Short Line is entirely grade separated through the City of Cleveland. A significant number of trains will be rerouted onto the Short Line, decreasing the number of trains traversing at-grade crossings on the Lake Shore Line. This will promote greater safety, decrease delays at crossings and promote improved vehicular traffic flows. Indeed, CSX's efforts to move traffic away from downtown Cleveland and onto the Short Line is consistent with the City of Cleveland's own prior proposals to do the same.

Second, the proposed upgrading of the Short Line will increase the speed at which trains traverse the line, thus shortening the overall "presence" of trains over line segments traversing Cleveland neighborhoods, and will also promote safe transport of freight through Cleveland.

Third, use of the Short Line will decrease the number of trains affected by the drawbridge on the Lake Shore Line. The drawbridge is opened, on average, 6,000 times a year. During the peak period in the summer, the bridge is opened approximately 3,000 times, primarily to permit passage of pleasure boats. Decreasing the number of trains crossing the drawbridge promotes smoother, more efficient operations for both vessels and trains through Cleveland.

Fourth, the implementation of the Operating Plan will allow Cuyahoga County (which includes Cleveland) to realize a net savings of over 1.9 million truck miles in truck diversions, which means a reduction of 4.15 truck accidents annually (1.06 of which would involve injuries) and net savings of about \$230,000 in annual highway maintenance costs. These benefits will be lost if the CSX and NS Operating Plans are not fully implemented.

Moreover, the impacts that will be experienced on the Short Line will be no different in nature or greater in magnitude than the impacts currently being experienced on the Lake Shore Line. Cleveland has described the impacts from CSX train traffic on residents living in proximity to the Short Line, without acknowledging that there are about the same number of residents in Cleveland along the Lake Shore Line. Both the Lake Shore Line and the Short Line pass through a mix of industrial, commercial and residential areas. Under the CSX Operating Plan approximately 40 CSX trains will pass through Cleveland each day. Whether they traverse Cleveland on the Lake Shore Line or on the Short Line they will unavoidably create some noise. The significant noise impacts are largely restricted to the first row of structures along the tracks. The number of Cleveland residents living along the Short Line is roughly comparable to the number of residents living along the Lake Shore Line.

The residents along the Lake Shore Line have been living their lives without serious adverse effects with higher levels of Conrail traffic on the Lake Shore Line than CSX is proposing to route over the Short Line. There are numerous locations throughout the eastern United States, including its major metropolitan centers, where rail traffic exceeds 40 trains per day. Comprehensive federal regulation, along with industry standards and company practices, ensure that rail freight transport will perform its important function in the economy without unacceptably

affecting the communities through which it passes, in terms of noise, safety or issues of public inconvenience such as traffic delay. Compared to other communities which do not have the benefit of a grade-separated rail corridor (including that portion of the Lake Shore Line in Cleveland near Kirtland Park where there are grade crossings), train traffic over the Short Line will have relatively less adverse effect because horns will not sound at grade crossings, there will be no risk of accidents at grade crossings, and vehicles will not be delayed at grade crossings.

CSX analyzed the noise impacts from its proposed operations over the Short Line in Cleveland and East Cleveland.³⁹ CSX identified about 250 residences on the Quaker to Mayfield and Mayfield to Marcy line segments which meet the DEIS's criteria for significant impact (70 dBA L_{dn} and an increase of 5 dBA L_{dn}). These residences are all in the first row of structures adjacent to the rail line. CSX proposed mitigation for 235 of the residences. The proposed mitigation is low noise barriers to shield the wheel/rail noise. High noise walls to block locomotive noise were determined not to be feasible. Although locomotive noise is louder than the wheel/rail noise, it is experienced for a much shorter time period. Because CSX recognized that the low barriers would not shield all rail noise, CSX proposed in addition to provide an offsetting benefit -- landscaping -- to provide a visual barrier and generally improve the appearance of the rail corridor.

To the extent that transport of hazardous materials has been raised as a concern, existing regulations and programs already ensure that the risk of a release of hazardous materials is

³⁹ TranSystems Corporation, "Evaluation of Noise Impacts From Proposed CSX Operations in Cleveland and East Cleveland, Ohio" (Jan. 1998).

extremely low. CSX will also comply with proposed Mitigation Measure 4 with respect to the Short Line, and provide enhanced emergency response training in Cleveland and East Cleveland.⁴⁰

CSX offered its noise mitigation plan as the most direct response to increased noise levels on the Short Line, and CSX is willing to consult with Cleveland and East Cleveland regarding other forms of offsetting benefits as well.⁴¹

Thus, looking solely at the interests of the residents of Cleveland itself, CSX does not believe that routing trains over the Short Line creates greater adverse effects than routing trains over the Lake Shore Line, as Cleveland has proposed. Indeed, the rerouting will provide a number of important benefits to Cleveland. To the extent that a significant change in traffic patterns will result from the Transaction, however, CSX has pledged to mitigate the effects of the change, either directly through measures such as noise barriers or indirectly by providing some offsetting benefits. Moreover, when one looks more broadly at the interests of the residents of the Greater Cleveland area, Mayor White's proposal is even less desirable because it seeks to impose on its neighbor to the southwest, Berea, a mammoth rail flyover structure which would have serious adverse effects in that community, both during the construction period and thereafter.

F. Conclusion

Consistent with the national rail transportation policy, the rail allocation and routing plan proposed by Applicants promotes "a safe and efficient rail transportation system," "ensure[s] the

⁴⁰ The routing choice between the Lake Shore Line and the Short Line will not affect the volume of hazardous materials moving through Cleveland, just the precise location.

⁴¹ Some programs of general benefit to the community which have been suggested and will be considered by CSX include capital improvement programs, commercial renovation rebate programs, housing renovation allowances, and employment training and preference programs.

development and continuation of a sound rail transportation with effective competition among rail carriers and other modes," and "foster[s] sound economic conditions in transportation and ensure[s] effective competition and coordination between rail carriers." 49 U.S.C. § 10101(3), (4) and (5). No alternative plan and no mitigation that would change the routing plan would be consistent with this standard.

The rail lines through Cleveland, given the basic geography of the Conrail system, will constitute a throat of commerce for the two carriers in their separate operation of the allocated parts of the Conrail system. For them to operate competitively, without interference with one another, the plan proposed by them is the only realistic plan. Effecting any of the alternative solutions would cause years of disruption and postponement of the implementation of a beneficial transaction that has been very long in its achievement already. Local opposition based on noise impacts -- which CSX has pledged to mitigate -- should not be permitted to cut this throat of commerce or choke it for a lengthy period of time. No mitigation involving route relocation in Cleveland ought to be proposed in the FEIS. If proposed, it should be rejected by the Board.

The only significant environmental impacts arising from use of the Short Line are noise impacts. The appropriate mitigation for this impact is not to throw out the Applicants' operating plans, but to implement a noise mitigation plan including noise barriers and offsetting benefits as CSX has offered to implement. The balancing that an EIS process involves is particularly important in a situation such as this.

24. Chicago, Illinois

The DEIS describes CSX's proposed construction of a new intermodal facility at 59th Street in Chicago, Illinois. The DEIS directs CSX to consult and reach a mutually-acceptable binding agreement with respect to traffic and noise mitigation measures for this facility.

As the DEIS reports, CSX filed a rezoning application with the City of Chicago which was supported by detailed reports documenting both potential benefits and adverse effects from the 59th Street facility (including increased traffic and noise). The application was thoroughly considered by the Chicago City Council and its staff. CSX engaged in extensive consultations with the communities surrounding the 59th Street facility, including with the City Council Members in Ward 15 and Ward 16, who supported the application.

On December 10, 1997, just after the DEIS went to print, the City Council approved the rezoning application. The approval included conditions designed to address adverse effects of the facility. CSX will submit documentation of the approval to SEA. CSX believes that this approval fully satisfies the recommendation in the DEIS, and that the FEIS should report that this matter has been resolved. Accordingly, no condition is warranted.

25. Newark, Delaware

CSX currently operates an average of 26.9 trains per day through Newark, Delaware (the Wilmere-Baltimore line segment of the CSX Operating Plan). The CSX Operating Plan projects that traffic on this line segment will increase only 1.9 trains per day. As the DEIS acknowledges, this minor increase in traffic does not exceed the Board's thresholds for environmental analysis. Vol. 3A at DE-16 to DE-17. CSX agrees with the conclusion in the DEIS that the "minor increase in train traffic would have only a minor incremental effect on the community." Vol. 3A at DE-17. The concerns raised by Newark in Finance Docket No. 33388 relate to pre-existing conditions. Id.

Despite these conclusions, the DEIS recommends that CSX consult with local agencies, the University of Delaware and the Delaware Department of Transportation regarding pedestrian safety issues. Vol. 4 at 7-21. The DEIS suggests that SEA might recommend mitigation in the FEIS if CSX does not enter into a binding agreement regarding mitigation measures.

CSX voluntarily commenced consultation with the University of Delaware and local agencies regarding pedestrian safety in Newark before SEA issued the DEIS. Those discussions have been very productive to date and CSX is optimistic that an agreement will be reached regarding a variety of measures that will enhance pedestrian safety in Newark. CSX will inform SEA if it reaches agreement with one or more parties regarding pedestrian safety in Newark, and SEA can document that agreement in the FEIS for consideration by the Board in evaluating the overall environmental effects of the Transaction.

However, it would not be appropriate for the Board to condition approval of the Transaction on any such voluntary agreement relating to what is clearly a pre-existing (non-

Transaction-related) situation in Newark. Nor would it be appropriate for the Board to impose any mitigation in the event that an agreement is not reached. The Board has repeatedly held that it will not impose conditions to address pre-existing matters. See UP/SP at 145; BN/SF at 56. This limitation is recognized in the DEIS itself. Vol. 1 at 1-10, 3-3. It is sufficient that the FEIS simply document any voluntary agreement that may be reached with respect to the pre-existing situation under discussion or, in the absence of such an agreement at the time of the FEIS, report that the parties are consulting.

27. The Four Cities Consortium

CSX, NS and Conrail currently operate freight rail service on a number of line segments through the cities of East Chicago, Hammond, Gary, and Whiting, Indiana (collectively referred to as the "Four Cities"). The DEIS analyzed the effect of traffic increases on vehicle delay at nine grade crossings in the Four Cities. The DEIS acknowledges that there is an existing problem with vehicle delay in the Four Cities. The DEIS concludes that the slightly increased delays resulting from Transaction-related traffic increases do not meet the DEIS's criteria for mitigation. Vol. 3A at IN-84.⁴²

Despite these conclusions, the DEIS recommends that CSX consult with representatives of the Four Cities, the Indiana Department of Transportation, and other appropriate parties regarding at-grade crossing delay and safety issues. Vol. 4 at 7-21. The DEIS suggests that SEA might recommend mitigation in the FEIS if CSX does not enter into a binding agreement regarding mitigation measures.

CSX notes at the outset that the traffic delay calculations in the DEIS for the nine crossings overstate the post-Transaction traffic delay. The calculations do not take into account the increased average speed on the Pine Junction to Barr Yard Line segment which will result from the capital improvements and operational improvements planned for the line and the Chicago area as a whole. When the increased speed is taken into account, CSX expects that traffic delays at the nine crossings will actually decrease as a result of the Transaction. See Joint Rebuttal

⁴² The DEIS also analyzed the effects of traffic increases on grade crossing safety throughout the Four Cities and concludes that traffic increases on the Willow Creek to Pine Junction line segment warrant grade crossing protection upgrades at four grade crossings on this segment. This recommendation is addressed in connection with recommended Mitigation Measure 8 above.

Verified Statement of James C. Rooney and T. Stephen O'Connor, Rebuttal Vol. 2 B at HC-277 /
to HC-317.

CSX voluntarily commenced consultation with the Four Cities and the Indiana Department of Transportation before the DEIS was issued. Those discussions have been very productive to date and CSX is optimistic that an agreement will be reached regarding a variety of measures in the Four Cities. CSX will inform the SEA if it reaches agreement with respect to the Four Cities, and the SEA can document that agreement in the Final EIS for consideration by the Board in evaluating the overall environmental effects of the Transaction.

However, it would not be appropriate for the Board to make any such voluntary agreement relating to what is clearly a pre-existing condition in the Four Cities a condition of Board approval of the Transaction. Nor would it be appropriate for the Board to impose its own condition in the event that an agreement is not reached. The Board has repeatedly held that it will not impose conditions to address pre-existing matters. See UP/SP at 145; BN/SF at 56. This limitation is recognized in the DEIS itself. See DEIS, Vol. 1 at 1-10, 3-3. It is sufficient that the FEIS simply document any voluntary agreement that may be reached with respect to the pre-existing situation under discussion or, if no agreement is reached by the time of the FEIS, report that the parties are consulting.

28-41. Recommended General Mitigation for
Proposed Construction Projects and
Abandonments

The DEIS recommends that CSX comply with fourteen specified mitigation measures in all construction and abandonment activities described in the DEIS. CSX will do so.

45. Cultural and Historic Resources Review of
Paris to Danville, IL Abandonment

The DEIS recommends that CSX retain its interest in and take no steps to alter the historic integrity of the line segment proposed for abandonment between Paris and Danville, IL until the Section 106 process is completed. CSX understands from a letter from the Illinois Historic Preservation Agency to Elaine Kaiser, dated January 13, 1998, that the Section 106 process is completed with respect to this line segment. CSX will contact the Illinois SHPO if archeological resources are found during the course of salvage activities, as recommended in the DEIS.

47, 48, 49. Operations over Four CSX Connections

The DEIS recommends that CSX comply with three specified mitigation measures in its operations over its connections at Crestline, Ohio, Willow Creek, Indiana, Greenwich, Ohio and Sidney, Ohio. CSX will do so.

III. Miscellaneous Comments

The DEIS notes that certain comments and requests for conditions (“CRCs”) filed on October 21, 1997 “raise environmental issues that SEA is considering” and that these issues will be considered “until the Final EIS is published.” Vol. 1 at 2-36. The DEIS also observes that it did not consider the Applicants’ December 15, 1997 rebuttal evidence and argument, which was filed three days after the DEIS was served. The 88 CRCs that requested conditions are listed in Appendix U of Volume 5C of the DEIS. That list also sets forth in very summary form what the DEIS describes as “the potential environmental effects of the conditions requested.” Vol. 1 at 2-36. In this section of its comments, CSX will briefly respond to two of the descriptions of potential environmental effects found in Appendix U -- specifically, the description of the environmental impacts of the conditions requested by certain members of the U.S. House of Representatives from New York and Connecticut and by Stark Development Board.

In addition, CSX will briefly respond to suggestions found in Chapter 5 of the DEIS with respect to the New Jersey Department of Transportation and New Jersey Transit Corporation, Southeastern Pennsylvania Transportation Authority, proposed Rockland County, NY commuter service and Amtrak service at Dunkirk, NY. With the exception of the Rockland County matter (which was not the subject of any filing with the Board of which CSX is aware), CSX has responded fully to each of the parties in its December 15 rebuttal. Specific references to the relevant portion of that rebuttal are set forth below.

1. Stark Development Board

The Stark Development Board (“SDB”), an economic development entity based in Stark County Ohio, has filed comments with the Board that request that CSX and NS offer special conditions with respect to an intermodal terminal (known as the Neomodal Terminal) located in that county on the lines of Wheeling & Lake Erie (“W&LE”) Railroad. Specifically, SDB requests a series of broad conditions that would require CSX and NS to (1) provide competitive pricing, schedules, market access and reliability to Neomodal, (2) work with W&LE to assure competitive rates, (3) integrate Neomodal into the CSX and NS systems and market it as if it were their own terminal, and (4) enter into long-term lift contracts to repay the loans used to pay for the Terminal’s construction. Alternatively, SDB asks that CSX and/or NS be required to purchase the Neomodal Terminal at fair market value and integrate it into their systems.

While the DEIS does not, and has no reason to, evaluate the merits of SDB’s requested conditions, the DEIS does note that the closing of the Neomodal Terminal might result in the “loss of environmental benefits like reduced highway congestion and air pollution.” DEIS, Appendix U at U-19. CSX briefly responds to this remark in the DEIS to ensure that the SEA does not confuse the general environmental benefits of intermodal rail transportation -- of which there are many -- with the merits of SDB’s requested condition -- of which there are none.

Simply put, the failure of the Neomodal Terminal to attract business is entirely unrelated to the proposed Transaction. The primary problem facing the Terminal is the Terminal’s location -- it is not located on or near either CSX’s or NS’ mainlines and is distant from major population and commercial centers. In an intermodal market where most freight is time sensitive, and where

competition with the door-to-door services offered by motor carriers is keen, SDB's decision to locate its Neomodal terminal far from CSX or NS mainlines places that terminal at a distinct disadvantage. All freight moving to or from the Terminal must be switched with W&LE at the nearest CSX and NS yards, an operation that adds both time and expense to the interchange of intermodal units.

For these reasons, the Neomodal terminal is not a financial success today -- a situation having nothing to do with the Transaction. Moreover, the Transaction will not reduce the level of intermodal service available to shippers or the area served by Neomodal. CSX respectfully refers the SEA to pages HC-471 through HC-477 of Volume 1 of Applicants' Rebuttal and to the Rebuttal Verified Statement of Peter Rutski of Volume 2 of Applicants' Rebuttal, for a detailed discussion of why the Board should deny SDB's request for conditions.

In sum, CSX is a firm believer in the economic and environmental benefits of intermodal rail transportation. As the truck diversion studies presented to the Board by CSX and NS indicate, approximately one million intermodal units (trailers or containers) will be diverted from highway transport to the rail system as a result of the proposed Transaction, thereby reducing highway congestion, air pollution, and highway accidents. Indeed, NS and CSX continue to serve Neomodal and to market that facility. However, the overall benefits of intermodal rail transportation do not justify a Board-imposed condition that requires Applicants to provide special treatment to, and indeed to finance or purchase, an intermodal facility of uncertain economic viability for whose creation they were not responsible.

2. East Side of Hudson Issues

Several commentors, including the Tri-State Transportation Campaign (TSTC) and Congressman Nadler, have requested that the Board require CSX and NS to take over the car float service across New York Harbor, currently operated by the New York Cross Harbor Railroad (NYCH). The common element uniting these requests for conditions is the long absence of a rail crossing over the Hudson River south of Albany. This is not a result of the Transaction. While the DEIS does not, and has no reason to, evaluate the feasibility or the merits of a Board-imposed takeover of NYCH, which is suggested by some commentors, the DEIS does note that a “[f]loat operation could reduce congestion on some segments by cutting 300 miles off shipments from New York to New Jersey.” DEIS, Vol. 5C at U-12. CSX briefly responds to this remark in the DEIS to make the point that the Board should not conscript CSX and NS to operate the NYCH’s existing car float service.

CSX welcomes all studies and analyses that consider methods for connecting rail lines on opposite sides of the river. The New York City Economic Development Corporation (“NYCEDC”) has recently launched a two year, \$5 million study, to commence this Spring, to consider alternatives to cross harbor freight movement. CSX has stated its willingness to participate as a resource in this study. If the NYCEDC or any other entity successfully develops a new Hudson River rail crossing, CSX will carefully analyze the merits of the new crossing to take advantage of it.

However, there is a significant difference between recognizing the limits of the current Hudson River crossings and requiring CSX and NS to operate NYCH’s car float service -- a

takeover that NYCH has not requested. In their December 15 filing with the Board, CSX and NS/ argued that TSTC and Congressman Nadler and his colleagues are attempting to use this forum to address a geographical reality that is wholly unrelated to the Transaction. See Applicants' Rebuttal, Vol. 1 at HC-133-36. The question of how to best carry rail traffic from one side of the Hudson River to the other existed well before the proposed Transaction. The Board should permit CSX and NS to utilize existing facilities and should certainly not attempt to address environmental or other consequences of a long-standing geographical reality by unilaterally requiring CSX and NS to purchase an operation which neither railroad desires to conduct. Neither should the Board impose any condition related to this matter while a study is underway to review the usefulness and feasibility of cross-harbor operations.

The DEIS also states that, "SEA has determined that the desired access improvement to the east side of the Hudson River would facilitates freight transport for lower New England." Chapter 5 at NY-42. To the extent that this statement is a reference to the car float operation, it has been addressed above. To the extent that it may also refer to proposals to operate freight trains through Hudson River passenger train tunnels, those proposals are addressed in Applicants' Rebuttal, Vol. 1 at HC-124-33 and in Vol. 2, Rebuttal Verified Statement of R. Paul Carey at HC-37-9 and Rebuttal Verified Statement of John W. Orrison at HC-597. As shown in the referenced portions of Applicants' Rebuttal, freight train operations through existing tunnels under the Hudson River and midtown Manhattan are not feasible due to clearance and operational constraints, as well as a local ordinance that would preclude such operations were they even possible.

3. New Jersey Department of Transportation and New Jersey Transit Corporation

The New Jersey Department of Transportation, the New Jersey Transit Corporation, and New Jersey Transit Rail Operations, Inc. (collectively referred to as "NJT") have requested that the Board require Applicants to cooperate with NJT in its efforts to initiate light rail transit service on Conrail's Bordentown Secondary between Trenton and Camden. The Bordentown Secondary will become part of the South Jersey/Philadelphia Shared Assets Area upon Board approval of the proposed Transaction. The DEIS does not recommend any mitigation with regard to the NJT's proposed light rail transit service. However, the DEIS "encourages" Applicants "to contact New Jersey Transit to ensure that the proposed Acquisition would not adversely affect any planned activities." Vol. 3B at NJ-38.

The DEIS was issued before Applicants filed their Rebuttal on December 15, 1997. Applicants' opposition to NJT's requested condition regarding its light rail project on Conrail's Bordentown Secondary was fully addressed in that document and will not be repeated herein. See Applicants' Rebuttal, Vol. 1 at HC-245 to 56; Rebuttal Verified Statement of R. Paul Carey, Vol. 2A at HC-34; Rebuttal Verified Statement of Paul Reistrup, Vol. 2B at HC-225.

Discussions are continuing with NJT on a variety of issues. CSX will inform SEA if it reaches agreement with NJT, and SEA can document that agreement in the FEIS for consideration by the Board in evaluating the overall environmental effects of the Transaction. However, it would not be appropriate for the Board to make any such voluntary agreement relating to the agreement a condition of Board approval of the Transaction. Nor would it be

appropriate for the Board to impose its own condition in the event that an agreement is not reached, for the reasons stated in Applicant's Rebuttal.

4. Southeastern Pennsylvania Transportation Authority

The Southeastern Pennsylvania Transportation Authority (“SEPTA”) has requested that the Board require Applicants to cooperate with SEPTA in its efforts to initiate light rail transit service on Conrail’s Morrisville and Harrisburg lines. Use of these lines will be allocated to NS, although CSX will have trackage rights over the Morrisville line. The DEIS does not recommend any mitigation with regard to SEPTA’s proposed light rail transit service. However, the DEIS “encourages” Applicants “to meet SEPTA . . . to ensure that the proposed Acquisition can be accomplished with out adversely affecting commuter rail plans.” Vol. 3B at PA-52.

The DEIS was issued before Applicants filed their Rebuttal on December 15, 1997. Applicants’ opposition to SEPTA’s requested condition regarding its light rail project on Conrail’s Morrisville and Harrisburg lines was fully addressed in that document and will not be repeated herein. See Applicants’ Rebuttal, Vol. 1 at HC-260-63; Rebuttal Verified Statement of R. Paul Carey, Vol. 2A at HC-34; Rebuttal Verified Statement of Paul Reistrup, Vol. 2B at HC-225.

Discussions are continuing with SEPTA on a variety of issues. CSX will inform SEA if it reaches agreement with SEPTA, and SEA can document that agreement in the FEIS for consideration by the Board in evaluating the overall environmental effects of the Transaction. However, it would not be appropriate for the Board to make any such voluntary agreement relating to the agreement a condition of Board approval of the Transaction. Nor would it be appropriate for the Board to impose its own condition in the event that an agreement is not reached, for the reasons stated in Applicant’s Rebuttal.

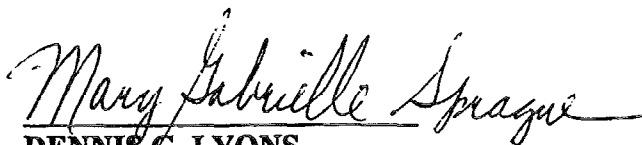

5. New York Rail Passenger Service

The DEIS notes that Rockland County, New York is studying the possibility of restoring commuter service on Conrail's River Line. The River Line would be allocated to CSX if the Transaction is approved, and would be part of CSX's main route between New York and Selkirk and from Selkirk east to Boston and west to Chicago. Because Rockland County never informed CSX of its study, CSX first learned of Rockland County's intentions when reading the DEIS. CSX will be willing to evaluate Rockland County's proposal if and when Rockland County's study receives the endorsement of a public agency authorized by the State of New York to operate commuter rail services.

The DEIS states that the City of Dunkirk, NY desires to have Amtrak's Lake Shore Limited stop there and reports that the "City and CSX reached a service agreement, but a dispute developed over the need to refurbish the existing station, which is owned by Conrail." Vol. 3B at NY-15. The DEIS has not accurately reported the facts. There is no agreement between CSX and the City with respect to such service. Amtrak has previously considered a Dunkirk stop, but has no plans to add a stop at Dunkirk for its Lake Shore Limited. That train -- the only Amtrak train to traverse Dunkirk -- passes through the city at about 4 a.m. on its eastbound and westbound trip, an hour that is not particularly conducive to a successful passenger operation. See Rebuttal, Vol. 1 at HC-279-80. Further, new passenger service at Dunkirk has nothing to do

with this Transaction. Whether such service is to be provided is a matter properly left for consideration by Amtrak, the City and Conrail or CSX in due course. It is not a matter that the Board should consider here.

EXHIBIT 3

DESCRIPTION OF CSX COMPLIANCE WITH POTENTIAL PASSENGER TRAIN SAFETY MITIGATION MEASURES DESCRIBED IN CHAPTER 3 OF THE DEIS

Chapter 3 of the DEIS, sections 3.2.3 and 3.3.3, describe a variety of potential mitigation measures for passenger rail safety as follows:

- Enhanced rail-safety programs, such as closer spacing of rail car defect detectors along rail lines.
- Increased frequency of track inspections, tank car inspections, and highway/rail at-grade crossing signal inspections.
- Toll-free numbers for use by emergency response forces in communities to contact railroad authorities.
- Training programs for community and emergency response personnel to enhance their abilities to respond to rail-related emergency incidents.
- Head-hardened rail-on-track curves in mountainous territory to reduce the risk of track breakage and serious derailments.
- Centralized train traffic control systems for safer rail operations.
- Replacement of old rails to reduce the risk of derailment.
- New track installation to increase the capacity of the rail line segment, which reduces the potential for train collisions.
- Improved rail signal system to make more efficient and safer use of track

In this exhibit, CSX will describe its existing compliance, on the five line segments identified for passenger train safety mitigation, with each of the nine measures described above.

1. Rail Safety Programs/Defect Detectors -- On each of the five CSX line segments at issue, and in fact on each line segment on which passenger operations are conducted on the CSX system, CSX applies special safety measures to enhance passenger safety. These measures are described below.

With respect to rail car defect detectors, these are already in place on each of the identified CSX segments. The industry standard is the placement of detectors approximately 40 miles apart. CSX has exceeded this standard on all of these line segments. The 42 mile Point of Rocks line segment thus has four detectors, with a fifth located just west of the Point of Rocks

terminus of this segment. The approximately 50 mile Fredericksburg line segment has five detectors, with a fifth located just north of Potomac Yard. The 45 mile Savannah-Jesup segment has three detectors. The 33 mile Weldon-Rocky Mount segment has 3 detectors, while the 65 mile South Richmond-Weldon segment has 4 detectors. These detectors are strategically located at appropriate distances and at points of ingress and egress from each of the segments.

2. Regular Inspection of Track -- CSX already has in place a program to inspect these segments at least twice per week, consistent with FRA requirements.

3. Toll Free Telephone Number -- The third potential mitigation measure identified in Chapter 3 is the establishment of toll free telephone numbers for use by emergency response forces to contact railroad authorities. This measure is already in place.

4. Emergency Response Training -- The fourth listed potential mitigation measure is training programs for local emergency response organizations. Such programs are already available to communities. As described at pages 218-219 of CSX's Safety Integration Plan, CSX has undertaken a variety of emergency safety activities in connection with MARC operations. CSX has worked closely with MARC officials to assist and instruct Emergency Responder Training classes for fire departments and medical teams along the Point of Rocks line. CSX also developed a complete training program for its crews operating MARC trains. That program keeps crews abreast emergency equipment and passenger evacuation instructions. In conjunction with Amtrak and Maryland commuter officials, CSX has prepared an emergency training video which it shows to all such crews. Crews are also periodically tested to ensure compliance with collision prevention and response procedures.

Similar training is undertaken in coordination with VRE and Amtrak. Further, crews operating VRE and MARC trains have been equipped with cellular phones for emergency use in the event that radio communications cannot be used for any reason. These phones have been pre-programmed with all pertinent numbers that the conductor needs.

5. Head-Hardened Curves -- The fifth potential mitigation measure identified in Chapter 3 is head-hardened rail-on-track curves in mountainous territory. None of the CSX line segments identified for mitigation traverses mountainous territory and therefore these measures are not relevant.

6. Centralized Traffic Control -- The sixth potential mitigation measure is centralized traffic control. As discussed above, each of the five segments at issue here already has an operational traffic control system. These systems offer a significant safety enhancement, eliminating the possibility of two trains receiving conflicting signals.

7. Replacement of Old Rails -- CSX adheres fully to FRA requirements in terms of track replacement.

8. Enhancement of Track Capacity -- The eighth potential passenger train mitigation measure is the enhancement of track capacity. There is no capacity problem in terms of current or projected freight and current passenger operations with any of the five lines that have been identified. The lines at issue are projected to experience only modest freight train frequency increases of between 4.6 and 7.1 trains/day, and these lines can readily handle this increased activity. Further, in order to accommodate increased passenger service, capacity improvements are being undertaken on both the Point of Rocks and the Fredericksburg lines, which are the two lines over which there are commuter, as well as Amtrak, operations. A track capacity enhancement project is already funded and in advanced engineering stages on the Point of Rocks line, while track improvements have been funded for the Fredericksburg line and some construction has begun.

9. Rail Signal Systems -- The final potential mitigation measure identified by SEA is improved rail signal systems. CSX is in the midst of a signal upgrade program in which pole lines are being replaced with more reliable (and easier to maintain) solid state microprocessors. This work has already been completed on the South Richmond–Weldon and Weldon–Rocky Mount segments, which now have radio-based code lines and electronic track circuits. Additional signal upgrades are also planned for the Savannah-Jesup and other line segments. The signal systems currently in place on each of the line segments provide fully adequate protection against train collisions.

Further, as discussed in the CSX SIP at page 141, an automatic train control system with cab signals is already in place on the Fredericksburg (RF&P) line. This system will be modified so that it is compatible with the system in use on certain of the Conrail lines and the Northeast Corridor. CSX, Amtrak and VRE locomotives operating on this segment are all required, under CSX rules, to be equipped with cab signals. A cab signal system is also being developed for use on the Point of Rocks line. By means of these cab signal systems, engineers are able to see the governing signal in the locomotive cab, thereby enhancing safety by reducing the possibility of missed signals.

EXHIBIT 5

ANALYSIS OF THE IDENTIFICATION OF RAILROAD
CROSSINGS POTENTIALLY REQUIRING MITIGATION
IN THE DRAFT ENVIRONMENTAL IMPACT STATEMENT
FOR THE PROPOSED CONRAIL ACQUISITION

February 2, 1998

Submitted to:

CSX Corporation and CSX Transportation, Inc.

Submitted by:

ICF Kaiser

9300 Lee Highway

Fairfax, Virginia 22031

I. Summary of Results

ICF Kaiser analyzed the sixty-two (62) CSX railroad crossings identified in the DEIS as requiring mitigation. ICF Kaiser performed a multi-step review of the DEIS findings to determine if the DEIS had characterized each crossing appropriately according to its own criteria.

First, ICF Kaiser determined that eight (8) crossings did not meet the DEIS' Category A or Category B significance criteria and were, therefore, inadvertently identified in the DEIS. It appears that the DEIS relied on the post-Transaction accident rates to determine whether a threshold was exceeded. If the correct pre-Transaction accident rate is used, no mitigation would be required at these eight crossings (reference Table 1, column 19).

Second, ICF Kaiser determined which of the remaining crossings already had in place, or were funded and scheduled to have in place, warning devices that met or exceeded the DEIS recommendation. Twenty-three (23) crossings meet this standard (reference Appendix).

Third, ICF Kaiser determined that at one crossing, the state agency with jurisdictional authority recommended an improvement that was different from what was recommended in the DEIS (reference Appendix).

Fourth, ICF Kaiser determined that another nine (9) crossings are in the process of being examined by appropriate state agencies for non-Transaction related issues. These projects are not yet funded and scheduled (reference Appendix).

Fifth, ICF Kaiser determined that one crossing was closed, and therefore cannot be subject to mitigation (reference Appendix).

Sixth, for the remaining twenty (20) crossings, ICF Kaiser recalculated the DEIS formula using more current accident history data than were available to the SEA. The DEIS relies on data from 1991-95 in its analysis. Since completion of the DEIS, data from 1992-1996 have become available. When these data are applied to the DEIS methodology, sixteen (16) crossings no longer trigger the DEIS Category A or B significance criteria (reference Table 1, column 20).

Finally, for the remaining four crossings, one is on the Toledo to Deshler line and should not be subject to any Transaction-related impact (155821J). For the final three crossings, consultation with state authorities may be appropriate (reference Appendix).

II. Detailed Methodology

The DEIS evaluated safety implications to motorists from increased train operations on rail line segments resulting from the proposed Acquisition.

The standard FRA method of calculating crossing safety was used. The procedure is described in Appendix B of the DEIS. The method calculates the risk of an accident at a highway/rail at-grade crossing based upon the characteristics of the grade crossing and statistical information regarding historic accident experience. The historic data are based on FRA records of accidents and incidents, along with the inventory of physical and functional crossing characteristics. ICF Kaiser performed calculations independent of those performed in the DEIS, using the same methodology. Calculations were performed for the pre- and post-Transaction train traffic conditions, and are presented on the attached Table 2. The method uses three formulae (reference pp. 22-24 of the DEIS):

$$a = K \times EI \times DT \times MS \times MT \times HP \times HL \quad [1]$$

$$B = [T_0 / (T_0 + T)] * (a) + [T / (T_0 + T)] * (N/T) \text{ where } T_0 = 1 / (0.05 + a) \quad [2]$$

$$\begin{aligned} A &= 0.8239 \times B \text{ (for crossings protected by passive devices only).} \\ &= 0.6935 \times B \text{ (for crossings protected by flashing lights only).} \\ &= 0.6714 \times B \text{ (for crossings protected by gates and flashing lights)} \end{aligned} \quad [3]$$

where:

a = the initial predicted number of accidents per year.

K = the basic accident prediction formula constant.

EI = the exposure index factor based on the product of the number of roadway vehicles and trains per day.

DT = the factor for the number of trains per day during daylight.

MS = the factor for maximum timetable speed.

MT = the factor for number of main tracks.

HP = the factor for paved roadway.

HL = the factor for number of roadway lanes.

B = the weighted average of predicted accident rate and actual accident history.

T = the number of years of recorded accident history.

T_0 = the weighting factor in DOT accident prediction formula.

N = the number of accidents recorded for a crossing in T years.

A = the final predicted number of accidents per year.

The first formula [1] is the result of multiple regression analyses performed on data from the FRA databases. The factors K through HL used to calculate (a) were derived using the methodology outlined in the attached reference Table, 3-1, "Equations for Crossing Characteristic Factors."¹ The value (a) is the Basic Yearly Accident Rate, calculated by ICF Kaiser for the pre-and post-Transaction train traffic loads [reference Table 2, columns 35 and 36]. All values used in formula [1] can be found in attached Table 2, columns 9 - 34. Variables that change between the pre- and post-Transaction case are listed in separate columns, side-by-side.

The results (a) of the first formula serve as an input to the second formula [2], which averages the initial predicted accident rates for a highway/rail at-grade crossing with the actual experience. FRA recommends that actual accident experience be limited to the most recent five year period. ICF Kaiser used data from the 1996 FRA database to obtain accident rates for 1992-1996 [reference column 9]. The second formula yields B, the weighted average of predicted accident rate and actual accident history for pre- and post-Transaction data [reference Table 2, columns 37 and 38].

The pre- and post-Transaction values (B) are adjusted in the third formula [3], which applies a constant to yield the Final Predicted Number of Accidents per Year (A). This value is again calculated for the

¹ Table 3-1, Rail-Highway Crossing Resource Allocation Procedure User's Guide, Third Edition, August, 1987.

pre- and post-Transaction cases [reference Table 2, columns 39 and 40]. The constant in formula [3] adjusts for the level of protection provided by warning devices at a specific crossing.

Criteria of Significance for Highway/Rail At-Grade Crossing Safety Effects

The DEIS used the following criteria to determine if each specific crossing warranted mitigation measures:

- The crossing was in the top 50 for the state in pre-Transaction accident rate; or
- The crossing had accident frequencies of at least 0.15 per year pre-Transaction and an increase of at least 0.01 accidents per year post-Transaction; or
- For crossings that did not meet or exceed the 50 highest frequencies or the 0.15 accident rate, the DEIS considered an increase of at least 0.05 accidents per year as significant.

ICF Kaiser applied these criteria to the calculated pre- and post-Transaction values of (A) to ascertain whether segments warranted potential mitigation, per the independent calculations using 1992-1996 data. Column 42 of Table 2 displays 'Y' if the segment warrants mitigation, and 'N' if it does not, *per the ICF Kaiser calculations using 1992-1996 FRA data.*

For comparison purposes, ICF Kaiser hand-entered the pre- and post-Transaction values of (A) calculated in the DEIS [reference Table 2, columns 43 and 44]. Column 47 displays the results of applying the DEIS criteria for safety mitigation to these DEIS values of (A).

Note that in both columns 42 and 47, a lower case 'y' represents a crossing in the top 50 crossings for a given state's accident frequencies, per 1996 FRA data.

Appendix: Crossing Safety Mitigation

(*) - indicates change from DEIS

Crossing: 345246C (KY)
Subdivision: Henderson
Segment: Evansville, IN to Amqui, TN
Segment ID: C-021

ANALYSIS OF THE METHODOLOGY FOR ESTIMATING TRAFFIC
DELAY AT RAILROAD/HIGHWAY AT-GRADE CROSSINGS
AS USED IN THE DRAFT ENVIRONMENTAL IMPACT STATEMENT
FOR THE PROPOSED CONRAIL ACQUISITION

February 2, 1998

Submitted to:

CSX Corporation and CSX Transportation, Inc.

Submitted by:

ICF Kaiser

9300 Lee Highway

Fairfax, Virginia 22031

Summary

ICF Kaiser reviewed the highway/rail at-grade crossing delay analysis used in the Draft Environmental Impact Statement (DEIS) for the Conrail Acquisition. A delay analysis like the one used in the DEIS can be appropriate as a screening tool to determine which crossings, if any, might cause a delay problem. However, the particular analysis used in the DEIS should not be used for a final characterization of impacts or a determination of mitigation. More specifically:

1. The 30-second delay criterion used for determining significant impact needs further evaluation;
2. The use of the Level of Service (LOS) criteria from the Transportation Research Board's Highway Capacity Manual (HCM), which was designed for signalized intersections, may not directly transfer to highway/rail at-grade crossings;
3. The analysis over-estimates stopped vehicle and average vehicle delays; and
4. The analysis did not include field observations that would indicate critical information such as actual queue size, actual average daily traffic (ADT), and the number of trains passing during the peak morning and evening traffic periods.

The approach in the DEIS tends to over-estimate the potential impacts of the transaction on railroad crossing delay. Determining whether significant (or even adverse) impacts might occur based on an approach that excludes site-specific information and input from the cognizant transportation agencies is inherently imprecise. Correctly implemented, parts of the methodology used in the DEIS could serve as an initial screening tool for examining a large number of crossings. However, this methodology is too simple to be used as a decision-making tool where large capital expenditures or operational changes are suggested as a possible solution (e.g., grade separations or changes in train speed). Efforts to calculate crossing-specific delay times without conducting field work (e.g., placing each crossing into the context of its surrounding road network, identifying nearby grade-separated crossings, observing actual queues and train lengths, as well as the number of trains that occur during peak morning and evening traffic periods) will result in a rough approximation of actual delay time. The discussion below includes an overview of the methodology used in the DEIS and addresses the use of the LOS criteria and the estimation of delay per stopped vehicle.

Overview of the Methodology Used in the DEIS

The DEIS analyzed traffic delay at highway/rail at-grade crossings to determine the potential impact on roadway performance. This approach is greatly expanded as compared to SEA's previous environmental documents. Using single-train event delays and delays occurring over an entire day as impact measures, the DEIS applied the average delay for all vehicles to determine an acceptable LOS for highway/rail at-grade crossings (LOS category "C" or better). Next, it established a criterion of 30-seconds for crossing delay per individual vehicle as a significant impact. However, the DEIS did not explain its selection of this 30-second criterion (whether this value came from earlier work or a recent derivation is not indicated). On the other hand, for measuring impacts to emergency response vehicles, the DEIS acknowledges that "[t]here are no national standards for measuring emergency response vehicle delay or the significance of any delay impacts." (reference Vol. 1, page 4-44) Absent any government standards or research to the contrary, the same conclusion should apply to common vehicle delay. Although estimated increases in delay can be used as an indicator of a potential delay problem, the actual need for any mitigation must consider a number of site-specific factors, not just vehicle delay, and must ultimately be determined by the transportation agency having jurisdiction over the road in question.

Use of Highway Capacity Manual Level of Service Criteria

LOS criteria are used to measure delay at signalized intersections and on stretches of highway. The DEIS used the LOS criteria for signalized intersections as a method for analyzing highway/rail at-grade crossing delays. The LOS criteria for signalized intersections, which are stated in terms of the average stopped delay per vehicle for a 15-minute analysis period, measure factors such as driver discomfort and frustration, fuel consumption, and lost travel time. Although not explicitly stated, the DEIS apparently characterized all highway/rail at-grade crossings as signalized intersections. The DEIS's table (reference page C-14), which correlates LOS and average delay per vehicle, is somewhat similar to the one found in the HCM entitled "Level-of-Service Criteria For Signalized Intersections." However, the HCM table

draws a correlation between LOS and delay per stopped vehicle,¹ not LOS and average delay for all vehicles² as presented in the DEIS.

In using the LOS criteria for highway/rail at-grade crossings, the DEIS did not acknowledge fundamental differences in operational characteristics between signalized intersections and grade crossings. Traffic signals and highway/rail at-grade crossings differ because traffic signals continuously operate in uniform cycles (red-green cycles) throughout most of the day as opposed to sporadic crossing events at highway/rail at-grade crossings.

Estimation of Delay Per Stopped Vehicle

In Volume 5A, Appendix C, pages C-11 and C-12 of the DEIS (as corrected by the errata dated January 21, 1998), crossing delay per stopped vehicle was calculated using the following equation which the DEIS sources to the Institute of Transportation Engineers, "Transportation and Traffic Engineering Handbook," Second Edition, 1982:

$$D_A = \frac{D_C \times (S_c / S_c - S_q)}{2} \quad [1]$$

where:

- D_A = crossing delay per stopped vehicle, in minutes
- D_C = time the train takes to pass the highway/rail at-grade crossing, including time for gate closing and opening, in minutes
- S_c = vehicle departure rate per minute per lane; (the basis for this is a rate of 1,400 vehicles per hour per lane, according to field measurements)
- S_q = vehicle arrival rate per minute per lane; (the basis for this is the daily traffic volumes for the roadway)
- 2 = factor to account for the average of the minimum and maximum vehicle delay

This equation does not appear in the "Transportation and Traffic Engineering Handbook" in this form to represent a relationship of delay per stopped vehicle. The equation the DEIS used to calculate crossing delay per stopped vehicle resembles the equation in the "Transportation and

¹ The DEIS defines this as the average amount of time a stopped vehicle would have to wait when traffic is stopped to let a train pass (reference Vol. 1, page 3-17).

² The DEIS defines this as the average delay experienced by all vehicles that would cross the tracks. This average delay figure includes both vehicles that would and would not be delayed by trains (reference Vol. 1, page 3-18).

Traffic Engineering Handbook,” for calculating the duration of the queue. The correct equation found in the publication that calculates the average minutes of vehicle delay is presented on the same page as the above equation in the “Transportation and Traffic Engineering Handbook.” The equation is expressed as follows,

$$d = r/2 (1 - s_r/q) \quad [2]$$

where: d = average minutes of vehicle delay
 r = duration of blockage (in minutes)
 s_r = flow rate (vehicles per minute) at bottlenecks during blockade
 q = average arrival rate of traffic (vehicle per minute) upstream of bottleneck

When the roadway is completely blocked (i.e., s_r = 0), as in the case of an at-grade railroad crossing, the equation reduces to:

$$d = r/2 \quad [3]$$

When an additional 0.30 minutes is added to allow for the waiting line of vehicles to dissipate, the equation resembles the average delay time equation presented in the Applicants’ Environmental Report, Volume 6A, Appendix D, page 246. This equation was developed by the Stanford Research Institute “Guidebook for Planning to Alleviate Urban Railroad Problems, prepared for the Federal Railroad Administration and Federal Highway Administration, August 1974, RP-31, Volume 3, Appendix C and has been used previously in the Environmental Assessments prepared for the BN/SF and UP/SP mergers.

$$D_a = D_c/2 + 0.3 \quad [4]$$

where: D_a = average delay time in minutes
 D_c = time required for the train to pass the crossing in minutes
 +0.3 = a constant to allow the waiting line of vehicles to dissipate

This equation more accurately reflects the crossing delay per stopped vehicle description presented earlier in the DEIS (reference Vol. 1, page 3-17) which states that the DEIS assumed that vehicles arrive at a crossing at a uniform rate and that the average delay for any particular roadway is half the time the crossing is activated, plus the time required for vehicles to clear the queue after the train has passed. However, rather than using this equation, which better reflects their description, the DEIS adopts equation [1] presented above. The rationale for the use of this equation is unclear.

The Importance of Field Observations

Field observations are important because generic modeled calculations may be revealed to be too conservative. For example, field observations could determine that during the most congested period of vehicular traffic, no trains block the crossing. Actual conditions may also show that during the peak train interval, very few vehicles use the roadway. At the site-specific level, various combinations of train length, train speed, vehicle arrival frequencies, and train frequencies should be considered based on actual conditions to decide the critical delay period.

Specific Vehicle Delay Time Calculations

In Table 1, LOS has been recalculated using the best available information for three grade crossings recommended for consultation. The table displays the inputs used in the DEIS's calculation of crossing delay per vehicle for these three crossings. The table also shows the average delays (in both minutes and seconds) for all vehicles and the resultant LOS category. Table 1 shows that when the best available information is used, the DEIS's criterion for mitigation (a decrease to LOS D) is not met.

Conrail takeover worries shippers

By MIKE MAGNER
NEWHOUSE NEWS SERVICE

WASHINGTON — Shippers of goods in the West are growing increasingly concerned about the proposed takeover of two railroad giants in the East.

Automakers, chemical companies and electric utilities are among the industries that have been squeezed by bottlenecks since Union Pacific Corp. acquired Southern Pacific Rail Corp. last year in the biggest rail merger in history.

Union Pacific's problems, largely blamed on beleaguered crews running more trains over fewer tracks, have led many rail-dependent industries to raise warning signals about the proposed sale of Conrail to CSX Corp. and Norfolk Southern Corp.

The \$10.2 billion Conrail purchase would give the two Virginia

Some fear merger of 2 rail giants could result in service bottlenecks

railroads' dominance over rail service in the eastern United States, with a 44,000-mile network linking every major city except Boston, Miami and Tampa, Fla.

But first the sale must be approved by the U.S. Surface Transportation Board, which replaced the Interstate Commerce Commission in 1995 as the nation's rail overseer. The board plans to decide on the sale in July.

"The Conrail deal isn't even consummated, but the concern would be if they go through same kind of meltdown as Union Pacific has gone through, we will have the same kind of worker fatigue and stress and the same kind of problems," said William Gebo, manager of North American rail services for Dow Chemical Co.

But more than \$20 million this year due to stalled rail shipments from its plants in Texas and Louisiana, Gebo said. Much of the freight had to be shifted to trucks at higher rates.

The Big Three automakers, who ship 70 percent of their new vehicles by rail, have had similar problems making deliveries to dealers in the West.

"Logistically, it's a disaster," said a Ford Motor Co. spokesman Tom Klipstine. "Once you start to have bottlenecks in one part of the industry, it affects the whole industry."

The tie-ups have increased shipping times by about 10 percent and forced some GM plants to stockpile cars, Klipstine said. Ford Motor Co. has reported similar problems.

GM generally supports mergers if done for sound business reasons, Klipstine said, but the Union Pacific delays have raised concerns about the Conrail takeover. "When you have problems, you have second thoughts about everything."

Advocates for the sale say it will result in cheaper and more efficient rail service because CSX and Norfolk Southern will aggressively compete for business, but share access to virtually all trunk lines east of Kansas City.

The two railroads, now serving the Midwest and the South, would divide up the 11,000-mile Conrail system linking the Midwest and the Northeast. Conrail was created by Congress in 1976 out of six bankrupt railroads, including Penn Central and New York Central.

SEE RAIL/4-G

Conrail takeover concerns shippers

RAIL FROM 1-G

"You're going from three companies and, if you will, a lock on the Northeast that Conrail has had since its creation, to two competing, strong companies," said Marcus Higginbotham, a spokesman for Norfolk Southern.

In their proposal to the Surface Transportation Board in June, CSX and Norfolk Southern claimed their consolidated services would attract enough freight to take a million trucks off the nation's highways, reducing air pollution, traffic accidents and road damage.

The American Trucking Association called that an "unsubstantiated claim," but said even if it were true, it would be a net loss from the industry.

The Federal Railroad Administration, which regulates train safety, has raised similar con-

cerns, leading the Surface Transportation Board to demand detailed safety plans this month from both CSX and Norfolk Southern.

Many businesses, including some that complained about poor service from Conrail, are urging approval of the sale. Nearly 500 of them, along with a few environmental groups, have joined a Washington lobbying group organized by CSX and Norfolk Southern, Transportation Advocates for Competition (TRAC).

"The merger's going to be the best thing for the whole country," said John Meyer, manager of rail operations for Hager Group Cos. near Grand Rapids, Mich., a group of wood-product suppliers that joined TRAC.

"We need the competitive balance in the East," said Meyer. He complains that Conrail is not responsive when there are freight delays.

Fourteen governors, mainly

from Northeastern and Southern states served primarily by one railroad, also have endorsed the Conrail sale.

But the high cost of the deal is troubling, two big industry groups opposed to it said in joint comments to the Surface Transportation Board.

The Chemical Manufacturers Association and the Society of the Plastics Industry noted that Conrail was worth \$6.3 billion and its stock was selling for \$71 a share on Oct. 15, 1996, when CSX offered \$8.1 billion, or \$89 a share, to acquire the railroad.

Norfolk Southern, seeking to avoid domination by CSX in the East, then offered \$100 a share. In April, the two railroads agreed to jointly purchase Conrail for \$115 a share, or \$10.2 billion.

If the sale is approved, the two railroads would have to raise an extra \$3.9 billion in debt. The chemical and plastics groups

said. In fact, the purchase plan calls for eliminating 10,000 jobs in the first year, while adding only 1,109 new ones, they said.

"Norfolk Southern and CSX can pay for their purchase of Conrail stock only if they faultlessly execute their strategy of increasing traffic while cutting personnel and costs substantially," the two groups said. "It is doubtful this can be done."

Power companies that rely exclusively on the railroads for coal shipments fear their dependence could lead to rate increases.

Consumers Energy Co., a large Michigan utility that uses 7.5 million tons of Western coal annually, has asked the Surface Transportation Board to block the Conrail sale.

"Ultimately, it will be high-volume, captive traffic — such as Consumers' coal traffic — which will finance the debt arising from the acquisition through unreasonably high rail rates," the utility told the board.

Re: Finance Docket No. 33388 - C S X
and Norfolk Southern - Control and
Acquisition - Community Notification.

We live at the corner of 3rd St.
and Adams. The 3rd St crossing is
about 1 block from our house. The
crossing is blocked numerous times
during the day. This causes more
traffic in our driveway with people
having to turn around. With increased
trains the situation will be worse.

Also ^{with} more trains the noise pollution
will be worse - Especially since the
trains have to whistle for the crossing.

Respectfully,

William & Leika Smick

Finance Docket No. 33388
Surface Transportation Board
1925 K Street NW
Washington, D.C. 20423-0001

ATTENTION: ELAINE K. KAISER

Dear Secretary:

We have reviewed the Draft Environmental Impact Statement "Supplemental Errata" and offer comments on Table 5-OH-11 (dated 1/20/89).

For Hamilton County, Ohio, the grade crossings listed at Winton Road (Segment No. C-063) and Mitchell Avenue (Segment No. C-063) do not exist anymore. The track which crossed these roads was used as an industrial spur track until a few years ago before it was abandoned and the track taken up. The mainline CSX tracks which run parallel to this line (see map) are the line which you referring to. This line, however, does not cross Winton Road or Mitchell Avenue. On the map, the mainline CSX line is shown in pink and the abandoned CSX industrial spur is shown in yellow.

We have enclosed the original plus ten copies as you requested. If you have any questions regarding the above information, please call me at (513) 621-6300.

Sincerely,

A handwritten signature in cursive script that reads "Reginald Victor".

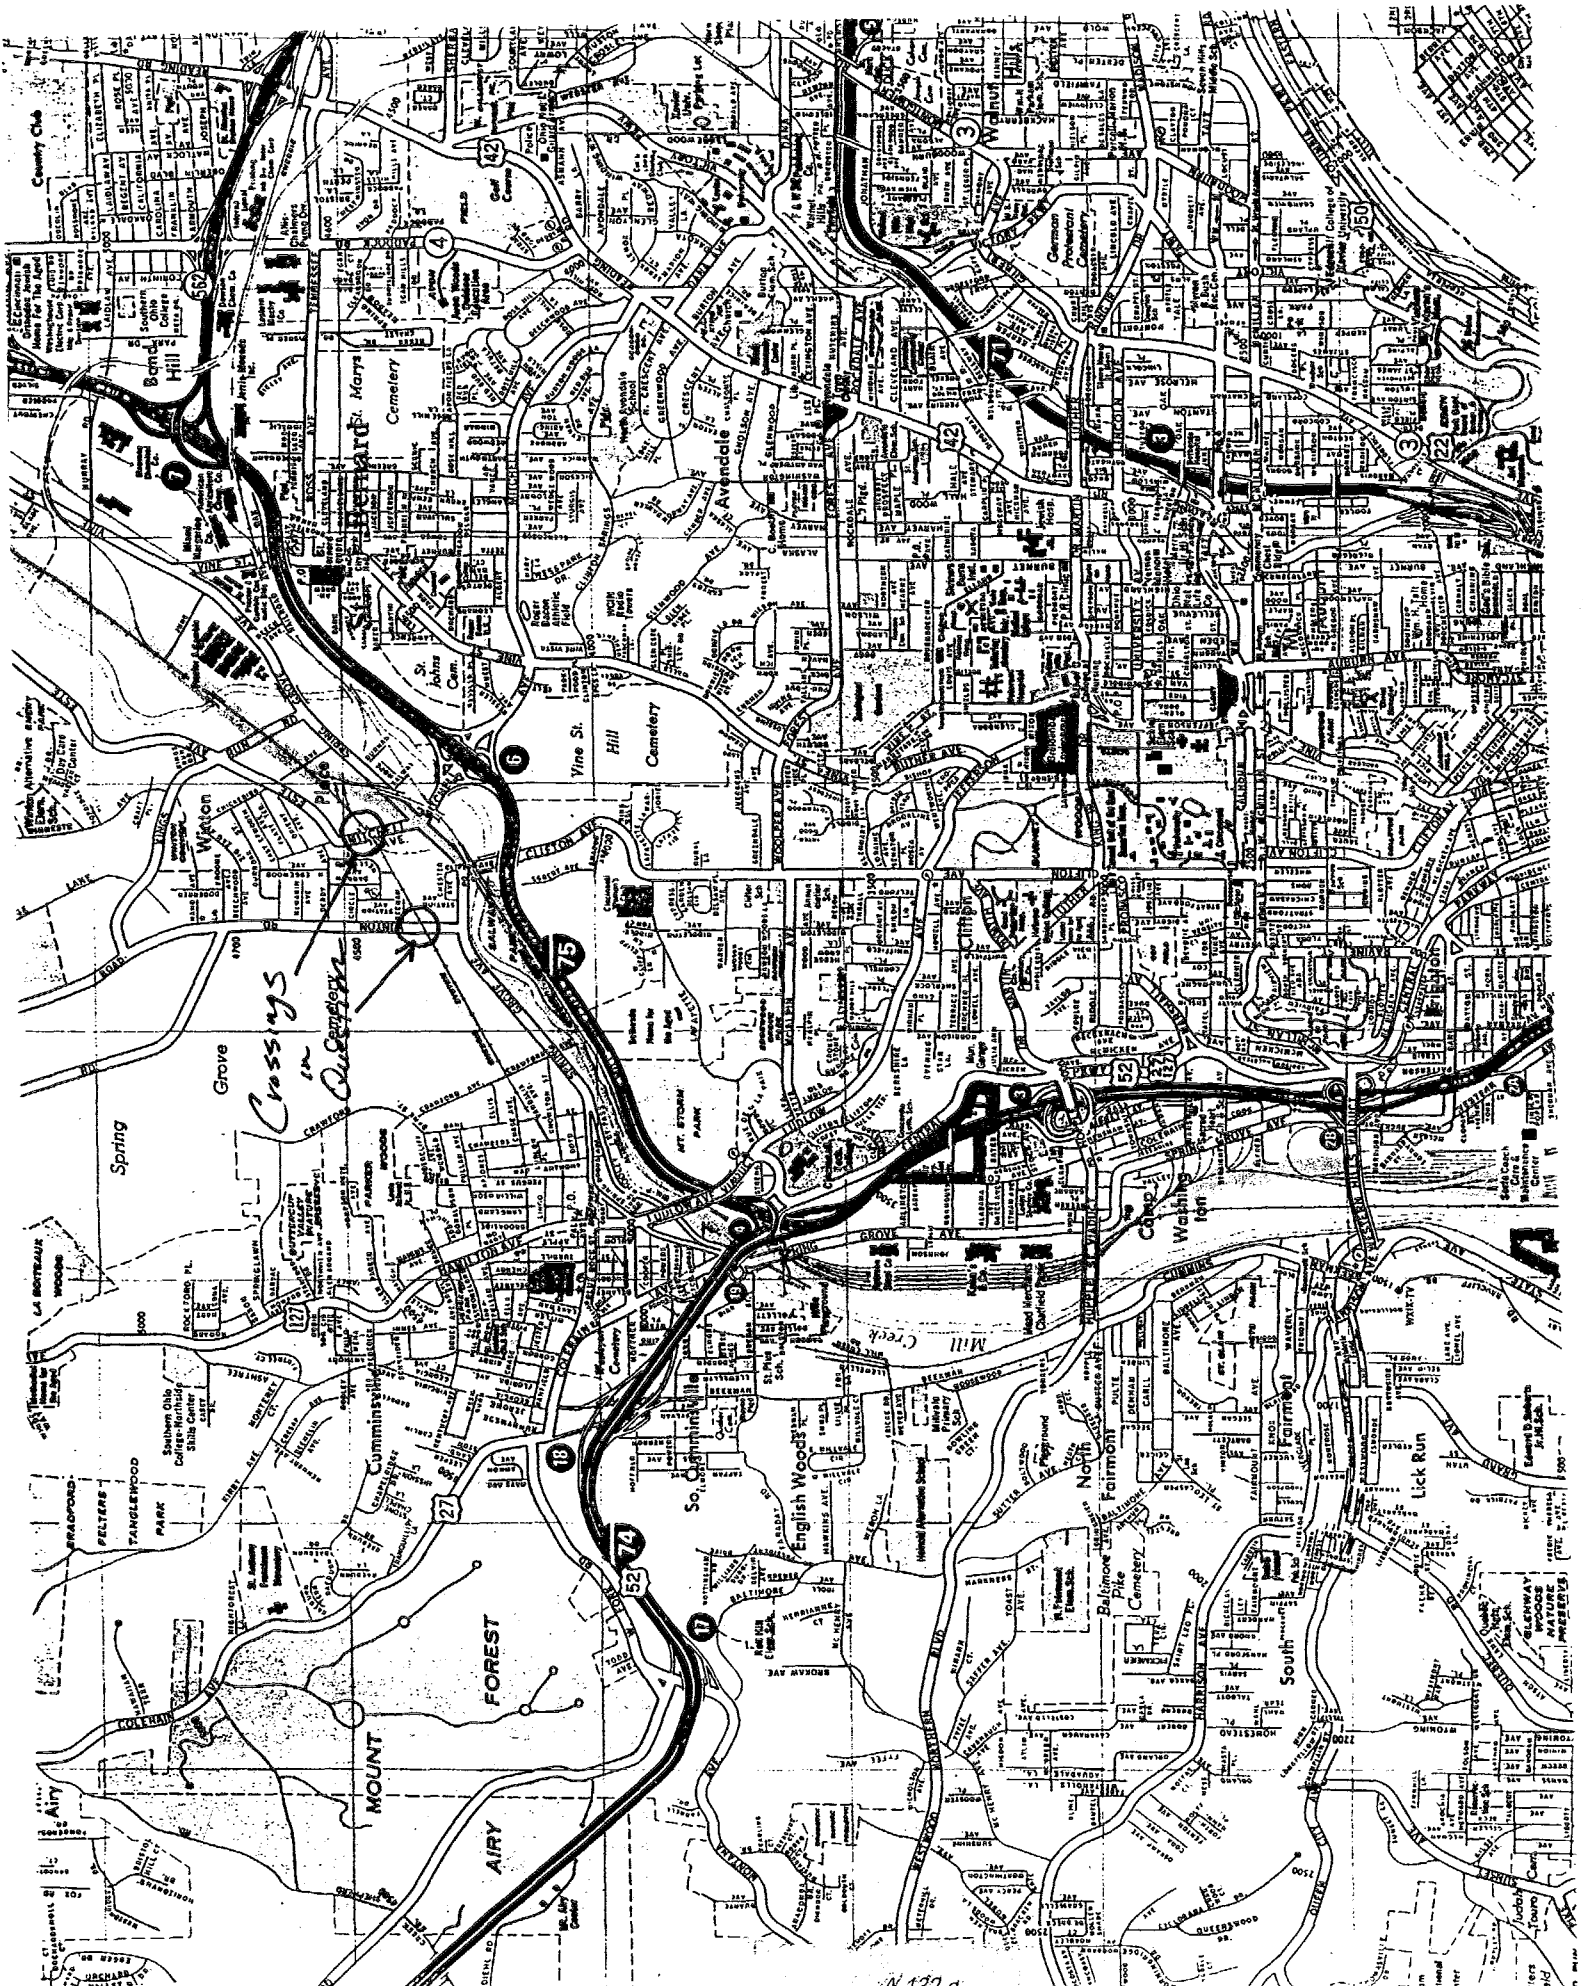

Reginald G. Victor
Transportation Engineer

Re: STB Finance Docket No. 33388
Draft Environmental Impact Statement, "Proposed Conrail Acquisition"

Dear Ms. Kaiser:

The Conservation Law Foundation ("CLF") appreciates the opportunity to submit comments on the Draft Environmental Impact Statement ("DEIS") for the proposed merger involving the acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad Corp. (the "Conrail merger").

CLF is New England's oldest environmental organization, with offices in Massachusetts, Vermont, New Hampshire and Maine. CLF's mission is to solve the environmental problems that threaten the people, natural resources, and communities of New England, using law, economics and science to design and implement strategies that conserve natural resources, protect public health, and promote vital communities in our region. CLF has long supported rail as an environmentally and economically sensible alternative to endless highway expansion and resulting urban sprawl and air pollution.

CLF's comments are on three issues, each of which was inadequately addressed in the DEIS. If the Surface Transportation Board ("STB") ultimately approves the merger application, CLF respectfully urges that the STB should impose the following three conditions:

1. CSX must cooperate with the Massachusetts Bay Transportation Authority ("MBTA") and Amtrak in the provision of improved, faster passenger rail service and increased access between Boston, Massachusetts and Albany, New York;

A-132-c

Conservation Law Foundation

2. CSX should make every effort to create an efficient intermodal transfer in the port of Boston, eliminating the current reliance on trucks to transfer cargo from the port to the rail yards; and
3. CSX must make every effort to improve freight rail service east of the Hudson River - especially from the ports of New York and New Jersey to New England.

Passenger service between Boston and Albany is hampered by the low speed limits imposed by Conrail. Although the track is Class Five and could accommodate speeds of 90 miles per hour, Conrail has mandated that no train exceeds 60 m.p.h. In order to attract passengers away from their cars -- where they can travel on Interstate 90, a highway with a speed limit of 65 m.p.h. -- passenger trains must be able to take advantage of the full speed capacity of the track infrastructure. CSX should make every effort to facilitate such improved service.

Currently, freight cargo that comes into the port in South Boston is transferred by truck for several miles to Conrail's rail yard. This extra step is clearly highly inefficient. The City of Boston is currently engaged in major planning, design and reconstruction with respect to several interstate highways and the entire South Boston seaport district. Now is an excellent opportunity for Conrail and CSX to work with the City and the Commonwealth of Massachusetts to explore connecting the rail facilities directly at the seaport, to make an efficient intermodal transfer from ship to rail without the use of trucks. If the merger is approved, CSX should be instructed to make every effort to bring such an intermodal facility into being.

Similarly, CSX should expand its provision of freight service between New York and New England to reduce the dependence on highway trucking--currently, Interstate 95 in Connecticut is heavily stressed by truck traffic, a situation that is inefficient, unsafe and uneconomic. The STB should accordingly extend two-carrier rail competition to destinations east of the Hudson River, to end Conrail's monopoly there rather than merely transferring it to CSX. This can be achieved if the STB requires CSX and NS to modify their acquisition and operating plans, with the key being for NS to extend its operations into the sector east of the Hudson River.

Specifically, NS should be required to purchase and operate cross-harbor car float facilities from New Jersey to Brooklyn, to restore this system to at least its former capacity. NS should also establish service on the Northeast Corridor to Connecticut and Massachusetts, joining CSX and providing competition in this key sector. A viable, active rail option is desperately needed in this congested truck route. Other specific improvements would enhance these basic capacities, but these are the minimum requirements the STB should impose on the merger if it is approved, and the final EIS should document the clear efficiencies and resulting environmental benefits to be gained from these changes.

Conservation Law Foundation

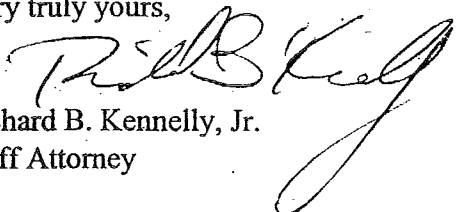

Some of the important economic and environmental benefits of trains include:

- **Efficiency:** Passenger trains are three times as energy-efficient as commercial air and six times as efficient as a car with one occupant. Freight trains are up to nine times more efficient than trucks. Switching only five per cent of U.S. highway driving to electrified rail would save more than one-sixth the amount of oil imported from the Middle East.
- **Air pollution:** Compared to heavy trucks, freight trains emit one-third the carbon dioxide and nitrogen oxide and one-tenth the hydrocarbons and diesel particulates.
- **Land use:** Trains can encourage more compact land-use patterns and concentrate economic development around town centers, rather than contributing to urban sprawl, as highways invariably do. More rail also translates into less traffic congestion and paved-over land; one railroad track can carry as many people per hour as eight lanes of highway.
- **Revitalization:** Trains can help revitalize old downtown areas that were originally built around rail. By adding a new travel option, rail increases tourism and economic development. A recent study of Virginia Metrorail concluded that the state had realized a \$1.2 billion net gain in tax revenues alone from its investment in trains. Other studies have shown that residential property values go up with access to rail.

For these and other reasons, CLF requests that you include analysis and conclusions in the final EIS with respect to these issues, so that the final EIS would urge the STB to impose the three conditions specified above should the STB approve the merger.

Thank you for considering these comments.

Very truly yours,

Richard B. Kennelly, Jr.
Staff Attorney

COMMENTS OF THE
NATIONAL RAILROAD PASSENGER CORPORATION (AMTRAK)
ON THE BOARD'S DRAFT ENVIRONMENTAL IMPACT STATEMENT
AND ON THE APPLICANTS' SAFETY INTEGRATION PLANS

The National Railroad Passenger Corporation ("NRPC" or "Amtrak") appreciates this opportunity to comment on the Draft Environmental Impact Statement ("DEIS") published by the Section of Environmental Analysis ("SEA") in these proceedings on December 12, 1997, as well as on the "Safety Integration Plans" submitted by the Applicants and included by SEA in the December 12 issuance.

In its comments, Amtrak will naturally focus on those portions of the DEIS that examine the impact of the proposed transaction on passenger rail operations -- and especially on those passages and preliminary conclusions in the DEIS that, we believe, should be modified in the final EIS. While Amtrak's comments will necessarily focus on those aspects of the DEIS to which it takes exception, Amtrak recognizes the very difficult task that SEA has faced in attempting, under very tight dead-

lines, to assess the impacts of a transaction that, if approved by the Board, will lead to changes in rail operations of far greater magnitude than have resulted from any prior rail merger.

As requested by SEA, these comments are divided into two parts: Part I, immediately following this introduction, addresses SEA's own conclusions regarding potential adverse impacts on commuter and intercity passenger service from the proposed transaction. Part II, which begins on page 18, comments separately on the "Safety Integration Plans" previously filed by NS and CSX, covering both their respective separate post-transaction operations and their proposed "Shared Assets Area" operations.

PART I COMMENTS ON THE DEIS

I. INTRODUCTION

The DEIS preliminarily finds that, in general, the proposed transaction (the "Conrail Acquisition") will not adversely affect either the operations or safety of Amtrak's passenger services. The DEIS concludes, among other things, that all of the lines used for passenger service have adequate capacity to handle proposed increases in freight operations without forcing reductions in present Amtrak train frequencies. The one exception relates to safety on nine line segments, eight of which are owned by freight railroads,¹ over which Amtrak operates and

¹ The ninth segment is the rail line between Kalamazoo, MI and Porter, IN which is owned by Amtrak. The DEIS identifies a similar risk on a tenth line segment, shared by freight and

that will experience increases in freight traffic as a result of the Acquisition. The DEIS preliminarily concludes that the Acquisition will unacceptably increase the risk of passenger-freight train collisions on these line segments, and proposes mitigation in the form of a 30-minute "window" for each passenger train.

Amtrak respectfully disagrees with the DEIS's conclusion that the merger is unlikely to cause capacity problems, and resulting deterioration in Amtrak's on-time performance, on any of the CSX, NS and Conrail-owned lines over which Amtrak operates. Amtrak also disagrees with the DEIS's conclusion that the merger will create appreciably increased safety risks on the nine line segments identified for mitigation measures, and with the efficacy and wisdom of the 30-minute window proposed to mitigate those perceived risks. In both cases, Amtrak believes that these preliminary conclusions result from shortcomings in the methodologies and data relied upon that, if corrected, would yield very different conclusions.

We discuss these points in greater detail below.²

commuter trains, over which Amtrak does not operate.

²In addition to the points discussed below, there are also three minor factual errors in the DEIS relating to Amtrak that SEA may wish to correct in the final DEIS. Page 4-28 of Volume 1 of the DEIS erroneously states that Canadian Pacific Railway has filed a responsive application for trackage rights between Detroit and Chicago, including rights over the Amtrak-owned line between Porter, IN and Kalamazoo, MI. Page 4-39 of the same volume incorrectly states that Amtrak operates through the Virginia Avenue Tunnel in Southeast Washington that CSX intends to improve. Finally, the summary of requests for conditions in Volume 5C of the DEIS at page U-13 states that the on-time

Consistent with the framework employed in Amtrak's October 21 Comments, we first discuss the DEIS's conclusions regarding the transaction's impact on passenger service safety and operations on the Amtrak-owned Northeast Corridor ("NEC") between Washington and New York, and then turn to its analysis of impacts on passenger service on other lines over which Amtrak operates.³

II. THE NORTHEAST CORRIDOR

The DEIS concludes that the Conrail Acquisition will have no adverse effects on passenger service on the NEC, both because of Amtrak's ownership and control of the NEC and because there is substantial excess capacity on the NEC during the nighttime hours to accommodate the increases in NEC freight train operations planned by the Applicants.

Amtrak agrees with SEA that Amtrak's ownership and control of the NEC is an important safeguard in ensuring that neither Amtrak nor commuter train services on the NEC will be harmed by the Acquisition. However, as discussed below, the DEIS appears to significantly overestimate the available capacity on the NEC for additional nighttime freight operations, and thus the NEC's ability to accommodate (i) all of Applicants' planned increases in freight operations on the schedules Applicants have proposed, and (ii) Applicants' plans to replace Conrail's freight

performance oversight condition Amtrak is seeking would apply only to Amtrak trains that will be operated by CSX, whereas it would actually apply to trains operated by NS as well.

³For convenience we discuss the Kalamazoo, MI to Porter, IN line in the latter context, even though it is owned by Amtrak.

operations between New York and Philadelphia with those of three separate entities (NS, CSX, and the Conrail Shared Assets Organization), and to have both NS and CSX share Conrail's operating rights between Philadelphia and Washington.⁴

A. Safety

The DEIS's analytic framework for identifying any adverse effects on the safety of rail passenger operations from the proposed transaction's changes in freight operations found no such problems on the NEC, and therefore proposed no mitigation conditions.

As indicated above, Amtrak agrees that safety will not be compromised on the NEC (for the reason, among others, that Amtrak will require strict compliance with its safety regulations and will not permit operations that might compromise safety). We therefore defer our discussion of the flaws in the DEIS's methodology for quantifying safety impacts and its proposed mitigation measures to the discussion of non-NEC effects in Section III, below.

A. Capacity

The DEIS concludes generally that there is substantial excess capacity to handle more freight traffic on the NEC during late night and early morning hours, despite several acknowledged bottlenecks, and that Amtrak can control the timing of freight

⁴Amtrak remains hopeful that its ongoing negotiations with the Applicants will produce a mutually satisfactory agreement on accommodation of Applicants' planned changes in NEC freight operations and operating rights.

access to preclude any operations that would interfere with passenger service.

Amtrak believes that the DEIS seriously underestimates the capacity constraints Amtrak faces on the NEC, even during the 10:00 p.m. - 6:00 a.m. period during which there are relatively few passenger trains operating. Comparisons of current and proposed freight levels to those that prevailed when Amtrak took over the Corridor in 1976 are meaningless, because passenger operations -- and especially commuter operations -- have grown exponentially since then, even during the late night and early morning hours. (See Amtrak's October 21 Comments, Verified Statement of James L. Larson ("Larson V.S."), at 9-10.) Track maintenance operations, which must be conducted almost entirely during the nighttime hours, typically entail temporary outages that further limit the NEC's capacity for significantly-increased freight service. Planned improvements to the Corridor -- both those planned for enhancing intercity passenger operations and bringing the NEC to a state of good repair, and those proposed by Applicant NS -- will cause still more restrictions on available capacity, especially at night. (*Id.*)

Amtrak takes particular exception to the DEIS's assumption that any capacity constraints on the most heavily-used portion of the Corridor, between Newark and Trenton, NJ, could be alleviated through assignment of nighttime freight trains to the two inside tracks while assigning off-hours passenger trains to the outside tracks. In the first place, as indicated in Amtrak's

comments (Larson V.S., at 7), the inside tracks are maintained to especially stringent standards to accommodate high-speed Metro-liners, and Amtrak tries to minimize freight use of those tracks because such operations cause significantly-increased track degradation and higher track maintenance expense. Second, because of operational and maintenance requirements, it is not possible to segregate passenger and freight operations in the manner that the DEIS assumes,⁵ even on portions of the NEC that have four tracks.⁶

This is not to say that some additional freight operations cannot be accommodated on this segment or elsewhere on the NEC. Rather, it is to emphasize that there are no easy "fixes". Thus, any determination of where, at what times, and in what numbers additional through freight trains can be handled, can only be made through a detailed, line-segment-specific analysis of the available track infrastructure, actual passenger and

⁵Because of operating and maintenance requirements, freight trains cannot be kept off the inside tracks altogether between Newark and Trenton or elsewhere. For example, Conrail's principal yards in the Newark and Trenton areas -- Oak Island and Morrisville -- can only be accessed via one of the inside tracks, and portions of the "clearance" route between Newark and Trenton for freight trains carrying high loads are via the inside tracks. Conversely, Conrail's Linden and Metutchen Yards in Northern New Jersey can only be accessed from track 1, an outside track that must also accommodate virtually all nighttime northbound Amtrak and commuter trains (because the northbound platforms at most commuter train stations, and the Metropark station where nearly all nighttime Amtrak trains stop, can only be accessed from track 1).

⁶Between Baltimore and Perryville, MD, which according to Applicants' operating plans will continue to have the highest density of freight traffic following the Acquisition, portions of the line have only two tracks.

freight train schedules and operating characteristics, maintenance of way track occupancy requirements, etc. Understandably, the DEIS preparation has not entailed any such comprehensive study of the NEC; but the necessary corollary is that the DEIS's preliminary conclusions and observations regarding the NEC capacity situation are ill-founded, and should not be retained in the final EIS.

III. PASSENGER OPERATIONS ON FREIGHT LINES

A. Safety

Amtrak applauds SEA's recognition of the critical need to protect the safety of passenger train operations from any adverse effects of the proposed transaction. While rail passenger service has traditionally been among the very safest modes of transportation, as the DEIS acknowledged, there is no room for "good enough" where safety is at issue. Even a single accident that results in the death or injury of an Amtrak passenger or employee is one too many.

Unfortunately, the DEIS's attempt to identify potential safety effects with an elaborate statistical analysis, although clearly well-intentioned and the product of much thought and effort, is fatally flawed, and as a consequence it has produced seriously misleading results. Moreover, the DEIS's recommended mitigation condition -- a 15-minute "window" before and after each passenger train on certain lines, during which freight trains would have to be cleared from the track the passenger train is using -- would do nothing to enhance safety, while

making it much more difficult, if not outright impossible, for passenger and freight services to co-exist efficiently on the affected lines.

At the outset, it is important to understand that collisions between freight trains and passenger trains occupying the same track -- the only type of accident that the thirty-minute window is intended to prevent -- are extraordinarily rare. Indeed, in Amtrak's nearly 27 years of existence, during which time it has operated over two million trains on lines shared with freight service, there has been only one such incident that resulted in fatalities to Amtrak passengers or employees: the tragic 1987 collision at Chase, Maryland, on the Northeast Corridor that resulted in the deaths of 16 Amtrak passengers and crew members. That collision was caused by a speeding Conrail "light engine" consist that was operated in blatant disregard of applicable safety rules and ultimately ignored a series of slow and stop signals to enter the path of a high speed Amtrak train.⁷

It is quite unlikely the addition of more safety rules would have prevented a collision that was caused by the Conrail crew's total disregard of the rules that were already in place.

⁷The Conrail locomotives were operated by Conrail employees who had recently used marijuana, and had cab signals and audible warning devices that had been intentionally disabled or otherwise rendered inoperable. The Conrail engineer, who subsequently pled guilty to manslaughter, admitted that he had violated numerous other safety rules, including failing to call out signals and failing to maintain a proper lookout.

The manner in which SEA calculated the frequency of collisions between Amtrak and freight trains results in a vast overstatement of the risk of such collisions. First, in concluding that there would be an average of 1.25 such collisions per year, SEA relied upon data from a period of just four years (1993-96) during which it identified a total of five such collisions. Given the rarity of such incidents, reliance upon data derived from only a very short period is likely to produce a result that is not representative of long term trends. Second, it appears that the five collisions SEA identified include all collisions between Amtrak and freight trains during this period, including those that resulted from an Amtrak train striking a load projecting from a freight train on an adjacent track and those that occurred on wyes and sidings (to which the 15-minute rule presumably would not apply). As a result, all of the calculations of passenger-freight train collision risks contained in the DEIS, including those for lines as to which SEA concluded that no mitigation was required, dramatically overstate the risk of the only type of collision -- a collision between a passenger train and a freight train occupying the same main line track -- that the mitigation condition is intended to prevent. Indeed, Amtrak is not aware of a single such collision that occurred during the four-year period (1993-96) from which SEA derived its accident frequency rate.

Another significant flaw in the methodology employed by the DEIS is its failure to give adequate recognition to the

advanced safety systems Amtrak has installed on the NEC. While the DEIS assumed that the existence of an Automatic Train Stop ("ATS") or Automatic Train Protection ("ATP") system would reduce the risk of a collision by 30%, when compared to a line equipped with signals but no other safety enhancements, Amtrak believes that the 30% figure understates the safety benefits of the ATS and speed control systems installed on the NEC, to say nothing of the more advanced "Advanced Civil Speed Enforcement System" ("ACSES") that Amtrak is presently developing for installation on portions of the NEC.⁸ While the failure to take account of the advanced safety systems on the NEC had no effect on the DEIS's recommended mitigation measures (since, even under SEA's methodology, mitigation was not deemed necessary on any portion of the NEC), the DEIS suggested that mitigation might be required on the Amtrak-owned Kalamazoo, MI to Porter, IN line without giving any consideration to the safety benefits of the Positive Train Control ("PTC") system presently being installed on the majority of this line segment as the result of a project in which FRA is participating.

Far from enhancing safety, a 30-minute separation rule might actually create risks of its own. It could induce a false sense of security on the part of affected crew members that in turn would lead to reduced vigilance, and even a willingness to "cheat" a bit on restrictions that all involved would realize are

⁸SEA's methodology also appears to have assumed that cab signal systems unaccompanied by ATS or ATP systems conferred no additional safety benefits, which obviously is not the case.

unduly harsh. Moreover, all of the lines for which the DEIS proposes the 30-minute separation rule have not only Automatic Block Signals (ABS) but also TCS (Traffic Control System) signal and switch operation, which provides an additional layer of human supervision and control to catch and forestall any mistakes that might be made by train crews. The proposed rule would have the perverse effect of requiring train crews to ignore the signals provided by these systems if they conflicted with the 15-minute rule, e.g., to stop and wait at a signal which otherwise would have allowed the train to proceed.

For the foregoing reasons, Amtrak urges SEA not to recommend the proposed 30-minute separation rule as a condition on any of the Applicants' rail lines. While Amtrak remains concerned that the increased freight usage on these and other lines following the merger that has prompted SEA to consider this rule will adversely affect the on-time performance of Amtrak's trains, it does not believe that this additional freight traffic will have an appreciable impact on safety.

B. Capacity and On-Time Performance

The DEIS concludes that all of the Applicants' lines that are shared by passenger service, including the CSX and Conrail lines about which Amtrak expressed particular concern in its October 21 Comments, can readily accommodate planned increases in freight service without preventing Applicants from meeting their contractual obligations to Amtrak. Amtrak is compelled to disagree, both with the apparent standards the DEIS used in

assessing passenger impacts, and with its conclusion that no adverse effects requiring mitigation are threatened.

The first and most pervasive flaw in the DEIS's approach is its failure to take account of actual and projected freight train schedules in determining whether increases in post-merger freight traffic would exceed a line's capacity. Instead, SEA assumed that the freight trains operated on each line following the Acquisition would be spread in a perfectly even fashion throughout the day, seven days a week, 365 days a year. Needless to say, this "perfect world" assumption does not comport with reality. Most rail lines experience numerous peaks and valleys in freight traffic in a single day because, among other things, intermodal trains tend to depart terminals in the evening and arrive very early in the morning, local freight service tends to be concentrated in the daylight hours, and trains moving in the same direction have a tendency to bunch up in "fleets", particularly on congested or single track lines. Volumes on most lines are higher during the week than on weekends, and there are also significant seasonal variations in freight traffic.⁹ Assuming that the Acquisition will create no capacity problems because freight trains will spread themselves out in a perfectly optimal fashion is like concluding that a highway with a capacity of 1,000 cars per hour will have adequate capacity as long as its

⁹See STB Service Order No. 1518, *Joint Petition for Service Order*, Decision served Oct. 31, 1997, at 6 (noting that seasonal increases in freight traffic would exacerbate the congestion problems that occurred after the Board's approval of the UP/SP merger).

total usage does not exceed 24,000 cars a day. As any rush hour commuter can attest, the reality will be otherwise.

It is particularly surprising that the DEIS reached its sweeping preliminary conclusions about post-merger capacities on passenger-train carrying lines without any apparent consideration of whether yards and terminal facilities accessed by those lines would have enough capacity to absorb merger-related increases in traffic. The need to utilize main line tracks and passing sidings to "hold" numerous trains that cannot be accommodated in overcrowded yards and intermodal terminals has been a principal cause of the unprecedented delays to both freight and Amtrak trains that have occurred on the Union Pacific and Southern Pacific Railroads following the Board's approval of their merger.¹⁰

¹⁰While the DEIS provided few details about how rail line capacities were calculated, and no information about the assumptions used or the capacities calculated for specific line segments, the information provided suggests other flaws in the methodology employed that would have contributed to overestimations of available capacity. For example, there is no indication that the methodology took into account, among many other things, the need to take tracks out of service for maintenance; the extended occupancy of main line tracks by local trains performing switching; or the fact that the average speed of some freight trains is considerably slower than the maximum permissible speeds that SEA apparently assumed to be the norm, which results in longer track occupancy that reduces capacity.

With respect to the Amtrak-owned portion of the Michigan Line between Porter, IN and Kalamazoo, MI the DEIS suggests that the line will be able to absorb all additional freight traffic that may result from haulage operations of Canadian Pacific Railway between Detroit and Chicago because it has "frequent sidings". (DEIS, vol. 1, p. 4-28). In actuality, additional and/or lengthened sidings may be required on both the Amtrak and Conrail-owned segments of the Michigan line in order to accommodate the (presently unquantified) number of CP haulage trains that will operate over this line, given that (i) the

Another major flaw is the DEIS's equation of adverse effect with a need to eliminate at least one passenger train outright. In fact, however, as Amtrak explained in its October 21 Comments, the most common effect of increased freight congestion on passenger operations is a material decrease in the on-time performance of the passenger trains. Amtrak's witness Larson described the serious problems Amtrak has been experiencing for some time with excessive train delays on certain of CSX lines slated for increased freight traffic after the Acquisition. There is every reason to believe that adding additional freight traffic to these lines will exacerbate the on-time performance problems that Amtrak already faces.

It is beyond cavil that intercity passenger trains must operate on schedule with a high degree of consistency if they are to meet the needs of the traveling public. The Board and its predecessor have recognized this on many occasions, beginning as far back as 1969.¹¹ Congress itself emphasized the importance of ensuring on-time Amtrak operations when it gave Amtrak trains

Amtrak-owned segment is being upgraded for higher speed service (something the DEIS does not mention), and (ii) the number and length of the sidings on the Michigan Line is based upon present passenger train requirements and the (minimal) volume of freight traffic that presently operates over the line, and not on the number and size of the freight trains that will utilize this line if the Acquisition is approved.

¹¹See *Adequacies -- Passenger Service -- Southern Pacific Co. Between California and Louisiana*, 335 I.C.C. 415, 434 (1969).

statutory priority over freights for dispatching purposes. See 49 U.S.C. § 24308(c).¹²

In sum, the methodology SEA used in its preliminary examination of adverse passenger service impacts is seriously flawed, as is the DEIS's assumption that the only such adverse impact worthy of consideration is the outright exclusion of passenger trains. The final EIS should acknowledge the limitations and shortcomings of the methodology the DEIS employed to quantify line capacities. It should also recognize that reductions in the on-time performance of Amtrak trains, caused by proposed freight service changes, would constitute adverse impacts on the quality of the human environment, and that such impacts must, if possible, be appropriately mitigated through the conditioning process.

The five-year on-time performance oversight condition that Amtrak has proposed is a reasonable and measured response to this problem. It will allow the Board to take into account the actual impact of the Acquisition on Amtrak's passenger service on specific lines, as opposed to the theoretical impact that will occur if (i) the hundreds of line capacity measurements SEA has calculated are all correct, (ii) Applicants' freight train operations are unerringly conducted in a manner that optimizes use of each line segment's capacity, and (iii) Applicants experience none of the yard and terminal congestion problems, and the

¹²See also 49 U.S.C. § 24101(c), requiring Amtrak trains to reach stations within 15 minutes of scheduled times "to the maximum extent feasible".

resulting spillover effects on main lines, that have followed the Board's approval of the UP/SP merger.

Amtrak's proposed condition also avoids the need for the Board to decide now, based on theoretical studies rather than actual experience, whether conditions should be imposed requiring Applicants to make capacity-enhancing improvements like those that SEA states it would have recommended if it had found that increases in freight traffic would adversely impact Amtrak's operations. It gives the Applicants the flexibility to address such problems by rescheduling their own operations, modifying dispatching procedures, or taking other steps that minimize or avoid the need for significant capital expenditures. Amtrak urges SEA to recommend the adoption of Amtrak's proposed condition in its final EIS.

IV. CONCLUSION

Amtrak recommends that, in the Final EIS, SEA not recommend that the Board impose the DEIS's proposed 30-minute separation rule, which is not necessary for safety reasons, and which could seriously hinder efficient passenger and freight operations on the affected rail lines. However, the final EIS should recognize the adverse impact that projected increases in freight operations over certain CSX and Conrail lines is likely to have on the on-time operation of Amtrak's trains, and should recommend that the Board impose the five-year oversight condition that Amtrak has recommended.

PART II
COMMENTS ON THE SIPS

Amtrak safety personnel have reviewed the "Safety Integration Plans" ("SIPs") filed by NS and CSX and incorporated in the DEIS and have the following comments:

Continued Use of NORAC Rules: As Amtrak has indicated in its prior filings, and as the Applicants have confirmed in their SIPs, all post-Acquisition operations over the NEC will be governed by the NORAC rules utilized by Amtrak, Conrail, and virtually all freight railroads and commuter authorities in the Northeast. In addition, the Applicants have represented that post-Acquisition operations over lines NS and CSX will acquire from Conrail, including those in the "Shared Assets" areas, will initially be conducted under NORAC rules. However, Applicants have also indicated that, over the longer term, they are considering adopting different sets of operating rules, including perhaps the rules NS and CSX currently use on their own lines, to govern lines acquired from Conrail.

The development of the NORAC rules was encouraged by the FRA. Those rules have been in effect for nearly ten years, and the Conrail operating employees who will be employed by Applicants if the Acquisition is approved are well acquainted with them. The principle behind the NORAC rules is that the adoption of a unified set of operating rules that apply on all railroads operating in a region enhances safety, particularly where there

are numerous trackage rights operations and extensive passenger services. Therefore, the possibility that Applicants will choose to adopt operating rules for properties acquired from Conrail that are different from the NORAC rules utilized on adjacent rail lines owned by Amtrak and commuter rail authorities that are traversed by the same trains operating over the former Conrail lines is a cause for some concern.¹³ Amtrak urges the Board to impose a condition specifying that the Board's prior approval shall be required before NS and CSX may adopt operating rules other than the NORAC rules for operations over lines to be acquired from Conrail.

Conversion of Cab Signal System on CSX Washington-Richmond Line: In response to DOT's concerns that the merger could result in a shortage of locomotives equipped with the 100HZ cab signal system utilized on the NEC and Conrail, CSX has represented that it will modify the cab signal system on its Washington to Richmond, VA line from 60HZ to 100HZ. As CSX notes, this will allow locomotives equipped with cab signals to be utilized on any line that requires them in the Northeast, and thus eliminate the incompatibility problems that could result in shortages of locomotives equipped with NEC-compatible cab signals. Amtrak

¹³For example, were Applicants to adopt operating rules for former Conrail lines other than NORAC rules, commuter trains that operate over both Amtrak-owned and former Conrail lines in the Boston area, and virtually all local freight trains that operate over the NEC, would be subject to two, and possibly three, different sets of operating rules that would change during their relatively short journeys depending upon which railroad they were operating over.

believes that CSX's plans for conversion of the Washington-to-Richmond line's cab signal system address DOT's concerns, and should be imposed as a condition of the Acquisition.

ACSES System: While CSX's SIP expressly states that CSX will cooperate with Amtrak in the development of the advanced ACSES train control system being developed for the NEC, the NS and CSAO SIPs do not specifically mention ACSES. Amtrak will, of course, require all railroads operating over the NEC to operate ACSES-compatible equipment after that system is installed. It assumes that the general representations in the NS and CSAO SIPs that operations over the NEC will conform to all applicable Amtrak operating rules encompass both ACSES and other safety-related modifications to its NEC operating rules that Amtrak may in the future adopt.

**COMMENTS OF THE TRANSPORTATION•COMMUNICATIONS
INTERNATIONAL UNION TO PROPOSED SAFETY INTEGRATION PLANS**

I. Introduction

The Transportation•Communications International Union (TCU) offers these Comments in response to the Safety Integration Plans (SIPs) submitted by Norfolk Southern (NS) and CSX, as required by the Board in Decision No. 52, issued on November 3, 1997. The TCU represents individuals employed in the carmen and clerical crafts on CSX, NS and Conrail. By virtue of their successful completion of an apprenticeship and journeyman program, the carmen are fully trained and qualified to conduct the freight car inspections and air brake tests mandated by federal law. Among the clerical employees the TCU represents are highly trained crew callers.

The SIPs submitted by the Applicants inadequately address the need for properly conducted freight car inspections and air brake tests with respect to: (1) the Applicants'

overreliance upon ill-trained and unqualified train crews to perform such inspections and tests; and (2) the Applicants' potential reliance upon a "block swapping" inspection procedure that is currently the subject of a joint study between the Federal Railroad Administration (FRA), Conrail, and the TCU. Further, the SIPs fail to address the concern (raised by the TCU in our earlier comments) over problems that are likely to arise from the Applicants' intent to rapidly consolidate crew calling operations.

II. The Applicants' SIP Submission Fail to Adequately Address the Need for Truly Qualified Personnel to Inspect Freight Cars and Air Brake Systems.

As noted in its initial comments in this matter, one of the TCU's primary safety-related concerns arising from this transaction is the proper inspection of freight cars utilized by CSX and NS following consummation of the transaction. In the SIPs subject to comment here, the carriers involved make assurances that they will utilize "qualified employees" to conduct the necessary air brake tests and pre-departure freight car inspections. See CSX SIP (Draft EIS Vol. 2), at 123; NS SIP (Vol. 2), at 122; CSAO SIP (Vol. 2), at 30. These assurances by the carriers beg the question of what constitutes a "qualified employee." Although train crews are permitted to conduct certain types of freight car inspections (i.e., pre-departure inspections regulated pursuant to 49 C.F.R. Part 215, Appx. D), their ability to do so is dependent upon the level of training they have received in detecting freight car defects.

FRA Director of Safety Edward English raised this very point in his Verified Statement accompanying the comments of the U.S. Department of Transportation regarding this transaction:

FRA is also concerned that the Applicants have enough individuals with adequate qualifications to perform train air-brake tests, pre-departure inspections of freight cars, and daily locomotive inspections, as required by federal law.

Verified Statement of Edward English, at 32 (emphasis added). As the TCU noted in its prior comments on this matter, both Applicants have proposed to eliminate interchange points throughout the existing Conrail system to allow smooth "through train" operations, see CSXT Operating Plan, Application Vol. 3A, §4, at 180-256; NS Operating Plan, App. Vol. 3B, §4, at 110-194, resulting in an increased distance between interchange points. Because qualified mechanical inspectors are predominantly stationed at interchange points, the elimination of these interchanges increases the likelihood that the Applicants will increasingly seek to utilize trainmen to perform 1,000 mile and pre-departure air brake inspection procedures. See TCU-6, Verified Statement of Richard A. Johnson, at 13.

As TCU noted in its earlier comments, the labor organization that represents trainmen -- the United Transportation Union (UTU) -- has previously testified before the FRA that its members are poorly trained for and unqualified to conduct such inspections. In the section of its SIP devoted to training issues, however, NS says nothing about training conductors to perform such tests; likewise, the CSAO SIP does not refer at all to air brake test and inspection training for its train crews. Though CSX's SIP expressly refers to the portion of its current conductor training program devoted to train inspection and air brake tests, CSX SIP, at 66, it is the TCU's understanding based upon informal discussions with FRA inspectors that the FRA has recently focused significant attention on conductor inspections in Augusta, Georgia. At that facility, CSX had eliminated qualified mechanical inspector positions and substituted train crew inspections, with the result that a substantial number of freight cars moved out of that facility with numerous undetected defects. Thus, the Board needs to question the effectiveness of CSX's program to train conductors to perform air brake tests and freight car inspections.

The consequences of permitting inspections by un- or underqualified train crews are perhaps best understood in light of recent safety reports from Conrail's Oak Island yard, located in Newark, New Jersey. In June and July of 1997, in correspondence directed to the Regional Administrators for the FRA's Regions 1 and 2, the TCU reported an alarming number of defects appearing on freight cars inspected at the Oak Island yard. See June 13, 1997, correspondence from BRC Gen. Vice President H.B. Lewin to FRA Region 1 Administrator Mark McKeon; June 16, 1997, correspondence from Lewin to McKeon; July 2, 1997, correspondence from Lewin and TWU IVP John Czuczman to FRA Region 2 Administrator David Myers; July 3, 1997, correspondence from Lewin to McKeon (TCU Exhibit 1). Included among these defects were inoperative or otherwise defective air brakes, leaking train lines, burnt brake shoes, and defective hand brake brackets. These defects were detected by qualified mechanical inspectors and, had they been undetected, could very well have resulted in derailments or collisions. The potential human cost of such accidents is magnified by the fact that Oak Island is located in the heart of the "Chemical Corridor," where substantial amounts of hazardous material freight is shipped. The "Chemical Corridor" is also one of the most densely populated geographic regions in the proposed CSX-NS-CSAO system.

The use of train crews, rather than qualified mechanical inspectors, to conduct necessary air brake tests and freight car inspections raises serious fatigue and hours of service issues. For example, conducting a proper intermediate air brake test requires the individual conducting the test to walk the full length of the train on both sides and determine whether the air brakes apply and release on both sides of each and every car on the train. With large consist trains, this procedure normally requires in excess of two hours to perform. By increasing the duties allocated to train crews to incorporate conducting these air brake tests and inspections, the

applicants will place greater strain on the ability of their train crews to comply with federal hours of service laws. At the same time, these added duties will increase fatigue among those crews, increasing the risk of train accidents or incidents that arise from human error. The SIPs submitted by the applicants say nothing about how they will address the fatigue and hours of service complications that arise specifically from assigning additional inspection and air brake test duties to the core duties performed by train crews.

The above problems cannot be answered by the applicants' vague promises of compliance with federal freight car inspection and air brake test statutes and regulations. Neither the NS nor the CSAO SIP answers the question of how train crews operating in those segments of the combined system will be adequately trained to supplant qualified mechanical inspectors in performing such tests and inspections. CSX's assertions that its training program for conductors will address these problems are undermined by the problems uncovered by the FRA at the carrier's Augusta yard. These safety problems are further complicated by the fatigue and hours of service issues raised by having train crews perform these inspections. The alarming number of air brake and other freight car defects found by mechanical inspectors (whose qualifications are beyond dispute) at Oak Island and other locations within the CSX, NS and Conrail systems make clear just how high the safety stakes truly are.

The Board has an express duty to see that transactions subject to its jurisdiction are implemented safely. The SIPs submitted by the applicants are insufficient to address many of the safety issues related to freight car inspections and air brake tests, and that the Board should not approve this transaction until the SIPs are amended to adequately deal with these concerns.

III. The Applicants' SIP Submissions Also Fail to Effectively Address Inspection Concerns With Respect to "Block Swapping" of Freight Cars.

Another aspect of the SIPs under consideration that is of considerable concern to the TCU is the practice of "block swapping" which, as stated by CSX in its SIP, "is utilized by all Class 1 railroads today, including CSXT and Conrail[.]" CSX SIP (Vol. 3A), at 133. Block swapping is a carrier practice by which the carrier switches a block or several blocks of cars from one train to another. Block swapping is not prohibited per se by FRA rules; however, FRA rules do require that a pre-departure mechanical inspection must be conducted whenever a freight car or block of cars is placed on a train. 49 C.F.R. §215.13. Likewise, whenever cars or blocks of cars are added to a train, the carrier is also required to conduct an initial terminal air brake test, as required by 49 C.F.R. §232.12.¹

Based upon informal discussions with FRA inspectors, TCU understands that both CSXT and Conrail in particular have engaged in a regular practice of block swapping without complying with existing federal safety regulations. In the latter case, the FRA oversaw a joint study between Conrail and the TCU, by which alternative inspection practices would be utilized by the carrier when specified trains in the Conrail system were "block swapped." Both Applicants cite this joint study in their SIPs, though they reserve judgment on applying it pending the outcome of the study. CSX SIP, at 133; NS SIP, at 122; CSAO SIP, at 32-33. One specific

¹ The FRA recognizes a narrow exception to this rule. Where a single, solid block of cars which has been previously tested is attached to a train, the carrier is not required to inspect the entire train, so long as the brakes on each and every car within the block have been inspected. 49 C.F.R. §232.12(a)(1)(ii). Rather, in that circumstance, the carrier need only determine that the pressure as gauged from the rear of the train is the same as that applied from the front. However, it is important to note that FRA has interpreted this exception to apply **only** when a **single** block of cars is added to a train. Further, the carrier is required to perform a pre-departure mechanical inspection of all cars in the block regardless of whether a single block or several blocks are added to a train.

requirement of these alternative procedures was that all inspections conducted pursuant to those procedures would be done by qualified mechanical inspectors, rather than by train crews. In application, however, this joint study has been unsuccessful, as a result of Conrail's failure to utilize qualified mechanical inspectors or, alternatively, merely removing trains from the list to be block swapped under the joint study procedures. As a result, the TCU has disavowed these alternative practices and it is our understanding that the FRA is likewise ready to abandon the joint study.

Both applicants state that they will perform block swap air brake inspections in accordance with FRA regulations. Regardless of whether or not such trains are "block swapped," these regulations demand that full mechanical inspections be conducted on any freight car attached to a train consist, and that full air-brake tests be conducted in all instances except when a single block of cars is attached. As noted above, TCU understands that both Conrail and CSX have engaged in block swapping without conducting the necessary inspections and tests; thus, a merely vague assertion that the Applicants will comply with federal regulations is inadequate. Indeed, the NS and CSAO SIPs specifically state that "[b]lock swapping' inspection practices as they now exist on Conrail" will continue after the transaction is consummated. NS SIP (Draft EIS, Vol. 2(B)), at 122; CSAO SIP (Vol. 2(C)), at 33. As stated above, Conrail's prior record of compliance with federal regulations on block swapped trains is anything but encouraging.

Given the record of both CSX and Conrail with respect to complying with federal regulations in block swapping situations, as highlighted by the recent Conrail joint study experience, the TCU respectfully submits that the best way to ensure such compliance is for the Board to demand a stronger and more definitive statement from the Applicants as to how they will insure that federal safety rules will be followed in the block swapping context. Further, the

Board should condition approval of the transaction upon strict oversight by the FRA of the Applicants' compliance with such rules.

IV. The Applicants' SIPs Fail to Address TCU's Concerns With Respect to Excessive Hours Worked By Crew Callers in the CSX System.

In its October 21, 1997, comments regarding the pending transaction, the TCU expressed serious concerns with respect to the excessive amounts of overtime worked by crew callers in the CSXT system. Those comments noted that regular crew management positions in the CSXT system remained unfilled and that the guaranteed extra board was staffed below the levels required by the collective bargaining agreement. See TCU-6 at 13. Those comments also cited the FRA's Safety Assurance and Compliance Program Report for CSXT, where the FRA concluded that, in the CSXT system, "The crew management staff is regularly overwhelmed given the demands of the job." Thus, we noted that the consolidation of Conrail's and CSXT's crew management systems, which under CSXT's Application was to be conducted over a seven month period, would exacerbate existing staffing problems resulting in increased fatigue among crew callers and errors in crew management which could undermine safety. The problems cited in the TCU's prior comments have not diminished since its October comments. Indeed, CSXT's crew calling operations are still understaffed by between twenty and thirty positions, and overtime problems among CSXT crew callers cited in TCU's earlier comments have not diminished.

The drastic increase in freight service that CSXT will undertake as a result of this transaction will only serve to exacerbate the current strain CSXT is experiencing with respect to crew management and, consequently, undermine the safe implementation of this transaction.

CSXT's proposed twenty-four week schedule for transferring Conrail's crew management operations to Jacksonville is far too rapid to allow for any useful assessment of how safely the transfer is being implemented. Therefore, in order to ensure that the transfer of Conrail's crew management operations is accomplished safely, the Board should condition approval of the transaction upon CSXT's adoption of an extended schedule for the transfer. Further, approval of the transaction should be conditioned upon strict FRA oversight of CSXT's crew calling operations, both during and for a reasonable period following the transfer of crew management operations.

Office File: CR04-02-97-965-Oak Island.150

Dear Mr. McKeon:

Please be advised that we have received a complaint concerning the movement of defective equipment into the Conrail Oak Island, New Jersey facility from various locations on the Conrail system in violation of Power Brake and Safety Appliance Regulations.

Below is a list of defective cars which were inspected on outbound at the Oak Island facility. As you can see, there are numerous cars which contain defective conditions under 49 CFR §231, Safety Appliance, 49 CFR §232, Power Brake as well as 49 CFR §215, mechanical defects which were also discovered during inspection.

The number of defective cars showing up in these trains simply do not all occur in route. These defects are being missed upon initial inspection or are simply not being observed for the lack of inspections or blocks are being swapped by Conrail without having been inspected.

Finance Docket No. 33388

CSX Corporation and CSX Transportation, Inc.,
Norfolk Southern Corp. and Norfolk
Southern Ry. Co.--Control and Operating
Leases/Agreements--Conrail Inc.
and Consolidated Rail Corporation
Transfer of Railroad Line by Norfolk
Southern Railway Company to CSX Transportation, Inc.

**COMMENTS OF THE ALLIED RAIL UNIONS IN RESPONSE TO
DRAFT ENVIRONMENTAL IMPACT STATEMENT**

Pursuant to Decision No. 52 in this proceeding, the Allied Rail Unions¹ submit these Comments concerning the safety analysis component of the environmental study of the proposed acquisition of control of, and division of, the Consolidated Rail Corp. ("Conrail") by CSX Transportation Inc. ("CSXT") and Norfolk Southern Corp. ("NS").² The ARU will first highlight a few general problems with Applicants' Safety Integration Plans

¹ "Allied Rail Unions" means the American Train Dispatchers Department/BLE ("ATDD"); Brotherhood of Locomotive Engineers ("BLE"); Brotherhood of Maintenance of Way Employes ("BMWE"); Brotherhood of Railroad Signalmen ("BRS"); International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers and Helpers ("IBB"); International Brotherhood of Electrical Workers (IBEW); The National Conference of Firemen & Oilers/SEIU ("NCFO"); Sheet Metal Workers' International Association ("SMWIA"); and Transport Workers Union of America.

²ARU incorporates in these Comments the arguments set forth in their earlier Response of Allied Rail Unions Concerning Environmental Report (ARU-21). ARU also incorporates herein the facts and arguments set forth at pp. 60-68 of their Comments Volume I (ARU-23).

("SIP") that are of concern to all of the ARU unions. ARU will then provide a summary of points made by individual unions that have provided statements concerning safety issues specific to their crafts which are attached to these Comments.

I. GENERAL COMMENTS REGARDING SAFETY INTEGRATION PLANS

A. Conflict Between CSX and NS Pronouncements On Safety Culture And The CSX And NS Labor Relations Plans

In their respective SIPs, both CSX and NS relied heavily on their plans for positive "Safety Cultures". E.g. CSX SIP at 28-46, 213; NS SIP at 6-7, 27-29, 205-214. CSX discussed a Safety Culture based on "mutual trust, respect and openness" (CSX SIP at 28), noted alleged corporate principles of valuing employees and respecting their dignity (*id.* at 31), stated an intention to establish safety planning teams which would include representatives of rail labor (*id.* at 45) and noted the importance of good morale which it said flowed from "respect for the views of its employees" and "establishment of an atmosphere of trust and co-operation" (*id.* at 213). NS spoke about the importance of labor-management meetings on safety matters (NS SIP at 29), recognized the importance of employee "quality of life" issues (*id.* at 205) and also stressed the value of good morale (*id.* at 214-15). However, CSX and NS fail to see any connection between a positive Safety Culture and a positive Labor Relations Culture. Unfortunately, the Applicants' Labor Relations Cultures,

especially as exemplified in their Appendices A to their Operating Plans and in their Rebuttal arguments, are antithetical to the Safety Cultures that they claim to endorse. On the labor relations side of things there is autocratic dictation of terms, not mutual respect trust and openness; and employee morale is afforded no weight when respect for employee views would become the slightest bit inconvenient in connection with the carriers' single-minded efforts to unilaterally implement rules that are perceived as advantageous to the carriers.

The ARU has shown that if CSX and NS implement the Transaction in the manner described in the their Operating Plans, their responses to the ARU's discovery, and their Rebuttal, employees represented by the ARU unions will lose significant rights under the rates of pay, rules and working conditions set forth in existing collective bargaining agreements ("CBA") as a result of unilateral action by CSX and NS.

Applicants have stated that *most* employees will not lose collective bargaining rights or their current representation and will work under CBAs that contain many of the same or similar provisions. Applicants' Rebuttal (CSX/NS-176) at 581-82. Applicants' Rebuttal repeatedly says that the CBAs of Conrail and CSX and NS are similar, functionally equivalent, or qualitatively comparable on balance. *E.g.* Applicants' Rebuttal at 573, 636-37. However, CSX and NS have not refuted the specific and detailed

declarations of officers of the ARU unions which show that employees will lose CBA rights under Applicants' plans. Applicants have also failed to state that the agreements they plan to impose contain "the same" terms as the existing agreements applicable to affected employees; or, more importantly, that individual provisions of the existing CBAs that are more advantageous for affected employees than comparable provisions in the agreements they plan to impose unilaterally will be "preserved". The various locutions employed by CSX and NS to minimize the loss of CBA rights of affected employees only confirm that, under Applicants' plans, some employees will in fact lose bargaining rights and/or their current union representation, and many will lose CBA rights.

Applicants have also taken issue with ARU's assertion that they plan unilateral implementation of their planned changes, noting that they intend to employ the *New York Dock* processes which involve "negotiations" and then "arbitration". Applicants' Rebuttal at 611. However, the sort of negotiations and arbitration that have occurred in recent years under *New York Dock* could not reasonably be characterized as bilateral; and the positions advanced by Applicants do not suggest any acknowledgment of bilateral processes.

In recent years, *New York Dock* arbitration has become a process whereby arbitrators and the Board rubber-stamp the plans

of the carriers, and in those rare instances where an arbitrator fails to accept the position of the carrier, the Board reverses the arbitrator. In the late 1980s the ICC took control of the process by assuming authority to review decisions of *New York Dock* arbitrators. Then the Commission held that *New York Dock* arbitrators are functionally agents of the STB whose decisions are reviewable for perceived failure to endorse carrier proposals that are claimed to be necessary to enhance the ICC/STB approved transaction, or even when they are not consistent with STB "policy". And some courts have accepted the notion that *New York Dock* arbitrators are the equivalent of Administrative Law Judges for the agency.

Additionally, the ICC/STB pronounced that *New York Dock* arbitrations are designed to foster any changes designed to realize that sort of efficiencies that the carriers presumably desired in effecting the approved transaction. The Board has further held that CBAs must give way to promotion of carrier efficiency, even when the efficiency cited is merely a reduction in labor costs. *CSX-Corp. Control--Chessie System*, (O'Brien Review Decision) F.D. No. 28905 (Sub-No. 27) (12/7/95). Moreover, as described in the ARU Comments and the Carriers' Rebuttal, the way the ICC/STB has defined the CBA rights preservation component of Art. I §2 of the *New York Dock* conditions, that provision has virtually ceased to exist. As a

result of these ICC/STB applications of the conditions, arbitrators have begun to simply impose the plans which the carriers have described as generally promoting efficiencies or savings (e.g. *O'Brien Review Decision* and decisions cited in Applicants' Rebuttal at 659-661, 673-674; ARU Vol III at 268). Since the Board's agents take this approach, and since the Board has stepped in when the carriers have not prevailed, it is entirely appropriate to describe the current *New York Dock* process as unilateral.

Indeed, the Applicants' positions with respect to issues raised by labor in this proceeding affirm the ARU characterization. CSX and NS ascribe a worthless meaning to Art. I §2, i.e. that it preserves only vested and accrued benefits such as pensions. *Id.* at 650. However, railroad industry retirement benefits are predominantly statutory, and Applicants would exclude such rights as supplemental unemployment benefits from the scope of Art. I §2. *Id.* Thus, Applicants would essentially limit the scope of preservation of agreement rights to a matter already protected by statute. Moreover, CSX and NS assert that application of the "protections" must enhance efficiency which is, in turn, described as savings for the carriers. And they state that the proposed Operating Plans and Appendices A reflect their best judgments on how to achieve efficiencies, so consideration of the existing CBAs and the

interests and desires of the affected employees and their unions are largely irrelevant. See e.g. Applicants' Rebuttal at 634-639, 648-649, 653-654. The Applicants' approach is perhaps best exemplified by the arrogant and condescending attitude expressed by their Labor Relations Vice Presidents in their joint deposition in which they revealed that they really had not read any of the Conrail CBAs, did not care about them and believed that their concerns about uniformity in payroll systems and ease of administration for labor relations officers and supervisors clearly outweighed any interests that employees might have in particular substantive CBA provisions which were attained through the give and take of collective bargaining. See excerpts of transcript, ARU Comments Vol. III (ARU-25) at 127-165. Thus it is quite clear that the Applicants see labor relations as a command process and not a bilateral process; and they plan to invoke the authority of this agency to legitimize their unilateral actions.

However, when CSX and NS were asked to explain how they will insure safe operations after they divide Conrail's trackage, they attempted to assure the FRA and the Board that safety concerns would be satisfactorily addressed and they relied heavily on asserted plans for Safety Cultures based on relations with their employees and their unions founded on mutual trust, respect, cooperation, openness and a recognition of the importance of

respect for the dignity of their employees and high employee morale. Such Safety Cultures are simply not compatible with the Labor Relations Cultures described above. If management can, and is prepared to, use the processes of this agency to abrogate solemnly undertaken contractual commitments, if management is willing to ignore employee interests allegedly because of costs involved with programming payroll systems or training labor relations staff, then management is not committed to relationships based on mutual trust respect, co-operation and openness; nor is it willing to recognize the importance of employee dignity and morale. To invoke administrative authorization to eliminate rights that were obtained through the give-and-take process of collective bargaining, where every employee gain was bought and paid for, is to deny a relationship of mutual trust, cooperation and openness and to reveal contempt for employee dignity and employee morale.

ARU is not alone with respect to concerns about the impact of railroad industry labor relations on railroad safety. In its report on CSXT's safety problems the FRA stated:

The ability to eliminate safety hazards and promote prevention of injuries, collisions, and derailments, is dependent upon an atmosphere of mutual trust, respect, and openness. Unfortunately, for decades the railroad industry has been characterized by a culture that engenders an adversarial relationship between management and labor rather than one of cooperation. Getting the job done without admitting a need for help is

the standard, leading to reluctance to ever take "bad news to the boss." The significance of this culture as an impediment to maximizing safety performance is readily evident throughout the U.S. rail system.

Executive Summary of FRA report on CSXT Operations at viii, ARU Comments Vol. III (ARU-25) at 227.

In short, the Safety Cultures described by the SIPs are fundamentally incompatible with the Labor Relations Cultures of these carriers. Accordingly, fundamental elements of the Applicants' SIPs are predicated on a false image of their relations with their employees.

B. CSX and NS Have Not Adequately Answered Safety Questions Engendered By Their Staffing Plans And Their Plans For Very Large Seniority Districts

The ARU has asserted that Applicants' plans to reduce their work forces will have adverse consequences for the safety of their operations. These assertions are supported by the reports issued by the FRA regarding post-transaction Union Pacific-Southern Pacific operations which found that tremendous emphasis had been placed on eliminating employees without regard for the consequences with respect to safe operations, and by the FRA report on CSXT which found that CSXT was already inadequately staffed in many crafts. Applicants responded by simply asserting that they will be adequately staffed. CSX SIP at 56, 123, 147, 162; NS SIP at 7, 143. But mere reiteration of prior assurances that the post-transaction operations will be adequately staffed

does not answer the concerns raised by the ARU or by the FRA. CSX and NS have not explained why they believe that the numbers of workers in each craft that they anticipate will be adequate to insure safe operations. In particular, Applicants have not explained how they can adequately maintain their track, right of way and signal systems with at least 500 fewer maintenance of way employees and 15 fewer signalmen, when they do not plan to abandon or downgrade any track, and they plan to upgrade track and run more and longer trains more frequently at faster speeds than at present.

Applicants assert that these job reductions will have no impact on safety because the remaining forces will be more productive due to their use of regional and system gangs. CSX SIP at 162; NS SIP at 143. But they have provided no details to support such bald claims. For example, they have not shown that the productivity level of current regional maintenance of way gangs is such that they would be able to replace 500 employees. They also have not shown that the existing maintenance of way work forces have sufficient "down time" for their work years to be increased to permit them to absorb the work that would have been done by the 500+ furloughed employees. Moreover, even if the Applicants could show that existing forces could absorb the work of 500+ employees under given current traffic levels and train speeds, they have not shown how existing forces could possibly

perform all necessary maintenance adequately when CSX and NS are running longer and heavier trains more often and at faster speeds. Moreover, comparisons to the larger job reduction projections in the UP/SP (Applicants' Rebuttal at 579) transaction are not valid because UP was planning to abandon certain lines and to sell others and UP was not projecting levels of increased traffic comparable to the projections put forth by CSX and NS. Thus Applicants have not adequately answered safety questions engendered by their plans to reduce their work forces.

Applicants have also failed to adequately address the concerns raised by ARU regarding the very large seniority districts planned for post-consummation operations. See ARU Comments Vol. I (ARU- 23) at 45-47; Response Of Allied Rail Unions Concerning Environmental Report (ARU-21) at 6-7. CSX and NS have attempted to minimize the potential for safety problems inherent in very large seniority districts simply by asserting that there will be no such problems, and noting that very large districts already exist elsewhere. Applicants rebuttal at 663-667 and 680-681. However, the problems raised by ARU can not be dismissed merely by denying their validity. As the ARU union officials explained, requiring employees to cover very large territories means that employees will work less frequently in familiar areas; safety is enhanced when operating employees,

dispatchers, maintenance of way employees and signalmen work areas where they have had significant prior experience.

Applicants have attempted to minimize the significance of this problem by saying that just because an employee may be placed within a very large district, that does not mean that he or she will be assigned all over the district. Applicants' Rebuttal at 667. However, Applicants certainly have not offered any commitments in that regard. Indeed they have not explained why they need such large districts if employees will not really be required to work at any location within a very large district; nor have they suggested a willingness to accept an arrangement whereby seniority districts would have sub-districts and employees could bid outside the sub-districts, but would not be obligated to accept work outside their sub-districts. Moreover, the Applicants have failed to acknowledge that the provisions of the *New York Dock* conditions could be used to compel employees to accept faraway assignments because refusal of an assignment within one's district can be used to deny benefits. Most employees may be regularly assigned to work relatively near their homes, but some employees could be compelled to accept faraway assignments on a regular basis, and many employees could be required to do so on an occasional basis. Such an inequitable and unnecessary arrangement must have a negative effect upon employee morale.

CSX and NS have also challenged ARU's assertion that very large seniority districts create safety problems, noting various places where very large districts already exist. Applicants' Rebuttal at 664-667, 680-681. However, the occurrence of the safety problems cited by ARU depends on the frequency with which the carrier actually assigns employees to faraway and less familiar work locations, the potential for such assignments increases significantly when very large seniority districts are created. ARU further submits that the safety problems cited by the FRA on UP and CSXT -- too few workers stretched too thin, and inadequately trained workers -- are related in part to overlarge seniority districts.

Thus ARU submits that the CSX and NS SIPs have failed to adequately answer the safety concerns raised by the ARU.

II. COMMENTS OF INDIVIDUAL ORGANIZATIONS REGARDING SAFETY INTEGRATION PLANS

In addition to the Comments above which address the Transaction related safety concerns of all of the ARU organizations, a number of the ARU unions have specific comments which are appended to this memorandum and summarized below.

A. The Brotherhood Of Maintenance Of Way Employes

The statement of Richard A. Inclima, BMWWE Director of Education and Safety (Attachment 1 hereto) identifies a number of problems with Applicants' SIPs that are specific to BMWWE-represented employees. Among other things, Mr. Inclima shows

that the Applicants' planned reductions in maintenance of way forces will have significant adverse effects on the safety of their operations. Moreover, Mr. Inclima takes issue with Applicants' assertion that increased reliance on regional and system gangs will allow Applicants to maintain smaller maintenance of way work forces. Indeed, he notes that increased reliance on such gangs can have adverse consequences for safety. Mr. Inclima also explains that Applicants' plan to use very large seniority districts will likewise have adverse effects on safe operations. Finally, Mr. Inclima notes that Applicants have failed to provide adequate explanations of their plans regarding future line sales and abandonments and the potential effects of such actions on track maintenance, their plans regarding training for their maintenance of way forces or their plans regarding coordination of dispatching and maintenance of way work.

B. Brotherhood Of Railroad Signalmen

The Statement of Roland E. McKenzie, General Chairman United General Committee [Conrail] addresses a number of deficiencies in the CSX and NS SIPs with respect to signalmen. Among other things, Mr. McKenzie explains that the very large seniority districts planned by CSX and NS will have adverse effects on the safety of operations. Mr. McKenzie also explains the importance of the Conrail signal service desk to day-to-day operational safety as well as long term tracking and analysis of signal

problems; CSX and NS plan to eliminate the service desk and this will impair efforts to maintain safe operations on the lines to be acquired by CSX and NS. Mr. McKenzie also demonstrates that Applicants have failed to provide adequate information regarding important safety issues pertaining to the planned Shared Assets Areas. Finally, Mr. McKenzie notes that Applicants' current plans will impair employee morale which will adversely affect the overall safety of train operations.

C. Brotherhood Of Locomotive Engineers

In *Ex Parte No. 574, Safe Implementation of Board Approved Transaction*, the Brotherhood of Locomotive Engineers submitted Comments which referred to problems in the CSX and NS SIPs which relate specifically to engineers. Among other things BLE criticized the SIPs for inadequate arrangements for training of engineers and familiarization of engineers with new territories and new equipment. BLE also expressed serious reservations about CSX and NS plans to protect engineers from harassment and retaliation in connection with reporting of safety problems. The ARU respectfully incorporates those comments in *Ex Parte No. 574* into these Comments.

CONCLUSION

For all of the foregoing reasons, the ARU submits that the final EIS should state that the Applicants' SIPs have not adequately responded to the issues raised by the Federal Railroad

Administration which led to the Board's issuance of Decision No. 52 in this proceeding.

Respectfully submitted,

Statement Of Richard A. Inclima

BEFORE THE SURFACE TRANSPORTATION BOARD

Finance Docket No. 33388

Comments of the
Brotherhood of Maintenance of Way Employes

The Brotherhood of Maintenance of Way Employes (BMWE) is a labor union representing 50,000 railroad track and bridge maintenance workers in the U.S. and Canada. BMWE respectfully submits the following comments to the docket.

BMWE urges the Board to fully consider the safety ramifications of the proposed Conrail acquisition especially in light of the safety and operational difficulties which continue to plague the recently merged Union Pacific and Southern Pacific Railroads. In that transaction, the operational and safety ramifications of the merger had not been thoroughly detailed by the Applicants for consideration and review by the Board. Since January 1997, nine on-duty employees were killed on the job at UPSP, more than double the number of fatalities from the previous year. Five of the fatalities occurred in three separate train-to-train collisions between June and August 1997 on the UPSP. There were also numerous other train accidents/incidents which had potentially serious safety and health ramifications for railroad

workers and the general public. These types of accidents underscore the operational difficulties which can and do occur in large financially inspired rail mergers.

To this very day operational difficulties plague the merged UPSP properties. Freight trains sit idle in rail yards, unable to move due to operational gridlock caused by the merger of these two colossus railroads. The American economy suffers from the UPSP's inability to service customers and move goods. Nationwide, rail employment continues to decline as carriers cut jobs and capital improvements to expedite the retirement of massive debt resulting from the financing of mergers and other railroad transactions. It is entirely possible that the NS/CSX/Conrail acquisition will result in operational and safety difficulties across the Eastern United States similar to those experienced by the UPSP.

We urge the Board to insist Applicants satisfy their obligation to submit complete and concise safety integration plans detailing how they will assure the safe integration of Conrail into their own already vast rail systems. The Board, with the assistance of FRA, should undertake a more comprehensive and detailed analysis of this transaction to assure that the Applicant's have developed safety integration plans which provide and maintain the requisite level of safety.

BMWE's comments will primarily focus on the potential safety

risks posed by the proposed acquisition of the Conrail System by NS and CSX as they relate to track, bridges, and structures. We urge the Board to consider the lack of specific details in the Applicants' submissions regarding the construction, renewal, and maintenance of track, bridges, and structures on the proposed merged properties. We believe the Board and FRA should determine specifically whether the individual Applicants can safely integrate operations based upon details of a comprehensive plan. Among other safety related issues, the Applicant's must be required to maintain sufficient manpower and equipment to safely and effectively maintain their right-of-way infrastructures across the entire proposed merged territories.

In reviewing the safety implications of the proposed Conrail acquisition, the Board should first undertake a comprehensive review of existing manpower levels in the maintenance of way (M/W) department of all three individual carriers. The Board should then closely compare these work force levels to the force levels anticipated upon completion of the merger. In the Labor Impact Exhibit filed on July 7, 1997, the three railroads state their intentions to abolish a total of 584 maintenance of way positions by the end of Year 2. A force reduction of this magnitude in M/W employment is difficult to comprehend in light of FRA's recent Safety Assurance and Compliance Program (SACP) audit report of CSX, dated October 16, 1997. In its SACP report, FRA found "that CSX lacks a fully consistent, sound track program across all parts of

the system." Safety exceptions were noted by FRA in the following areas at CSX: track inspections, control of water saturation of track structures, vegetation control, roadway worker protection compliance, test car operations, procedures manual, and defective rail detection. FRA also determined "that some CSXT track inspection and maintenance goals are based solely on the minimum Federal standards rather than more comprehensive CSXT standards. BMWE is also aware of problems with CSXT's bridge inspection and maintenance program. The very fact that CSXT is not maintaining its infrastructure to CSXT standards is indicative of current severe shortages in its maintenance of way work force levels. These infrastructure maintenance deficiencies will likely be further exacerbated if the pending merger is approved.

Norfolk Southern will also eliminate hundreds of M/W positions as part of its merger plans. While FRA has not yet conducted a SACP safety audit of NS, it is not unreasonable to assume that FRA will identify similar infrastructure safety deficiencies at NS. Even if no such conditions exist on NS, the Board must consider what safety impact the elimination of hundreds of M/W positions will have on NS over the long term. BMWE believes that the elimination of 584 maintenance of way positions will result in the merged railroads operating with less than adequate M/W force levels. Further reductions in already depleted M/W forces will likely result in increased track related derailments and potential public harm. These infrastructure maintenance concerns are

amplified in this transaction due the dense population of urban Eastern states and the large number of commuter and Amtrak passenger trains which will operate over the merged territories.

NS and CSX profess that planned reductions in their track maintenance forces will be offset by expanding the territories over which regional and system gangs will operate on the combined systems. However, the Applicants have failed to demonstrate that expanding the geographic territories of mechanized track maintenance crews will have a positive effect on safety.

BMWE believes that the expansion of regional and system gang territories can have the exact opposite adverse impact on the safety of the combined railroads' infrastructure. As territories of system and regional gangs increase, the program frequency of such gangs to work on any particular track segment decreases. With expanded territories, there will be a corresponding decrease in the number of times regional and system gangs will be able to revisit an area for additional production maintenance. As system gangs operate with reduced frequency on any given segment of track, the maintenance needs on that segment of track will increase due to less programmed maintenance and the anticipated increase in traffic volume.

As production gang territories increase, track maintenance between visits by regional and system gangs will become

increasingly dependant upon the utilization of maintenance of way section forces. Ironically it is maintenance of way section forces, a segment of the maintenance of way work force that has already been seriously depleted under the carriers' regional and system gang concept, which will likely suffer the brunt of the proposed steep reductions in M/W work force levels.

Thus, the Board must fully consider the impact of M/W work force reductions on the safe operation of the merged systems over the long term. In highly leveraged mergers of this nature, the Board must exercise broad authority to determine whether such workforce reductions are justified by economies of scale and better utilization of manpower and equipment as Applicants profess, or whether the reduction in work force levels is actually due to the carriers' desire to pay down their highly leveraged debt by laying off employees and curtailing track, bridge, and equipment maintenance.

Expanding the seniority districts of maintenance of way personnel poses a significant safety hazard to these employees who will be required to travel farther from home for longer periods of time in order for the corporations to reap their perceived business benefit. Expanding the already vast seniority districts of regional and system gangs will cause increased workplace fatigue and possible psychological and emotional stresses among M/W personnel forced to spend anywhere from weeks to months at a time

away from their families. Clearly, quality of life issues for M/W employees and their families have not been addressed by the Applicants. The burden of generating business benefits to support this merger should not be born by railroad employees and their families who have no choice other than to acquiesce to the will the these corporate giants.

In reviewing M/W workforce levels in this transaction the Board should also require the normalization of work force accounting to reflect the impact of seasonality inherent to M/W work. For example, a carrier may claim that it employs a M/W work force of 1,000. However, it is highly likely that a significant number of those 1,000 employees do not work year round due to the seasonality of M/W work. Thus, the Board should require the Applicants in this transaction to normalize their work force accounting to reflect the true number and geographic location of M/W employees projected to work each month inclusive of main and secondaries lines, yards, and sidings. In this manner, the Board will be positioned to determine the average number of M/W employees maintaining the infrastructure at different periods and geographic locations throughout the four seasons. Such accounting is especially critical to analysis of transactions such as this where a significant portion of the merged properties operate in northern climates where the track and bridge maintenance "window" is very narrow due to seasonal conditions.

The Board should also require Applicants to account for all pending and future abandonments, spin-offs, or sale of parallel lines. Such a requirement would allow the Board and FRA to analyze what impact increased traffic density may have on the remaining lines to be operated within the system. As traffic density grows due to increased business and the addition of traffic diverted from lines no longer in the system, track capacity is strained and the ability to conduct track and bridge maintenance and inspection is severely undermined. With more and more traffic being hauled on fewer track miles, the availability of track time for maintenance, inspection, and renewal becomes problematic because moving trains remains the carriers' number one priority. This problem is further magnified in light of the fact that merged railroads tend to offset their transaction debts by curtailing their work force and expanding the territories of their remaining employees after Board approval of the transaction)

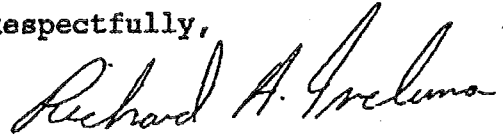

The Board must also assure that employees of the parties to this transaction are completely trained and qualified regarding how operating rules will be integrated to comply with the Railroad Operating Rules regulations, 49 CFR Part 217. Applicant employees on the three carriers are likely employing different variations of operating rules and practices, timetables, special instructions, bulletins, etc., governing the movement of trains and on-track equipment. Concise integration of different operating rules and

procedures is paramount to the safe operation of any merged rail system. The successful integration of rules and procedures system wide becomes especially critical in this instant case due to the vast expanse of high density territories subject to the pending transaction. Difficulties in integrating operating rules, procedures, and corporate cultures grow exponentially in relation to the size of the merger. Details outlining employee operating rules training and instruction, employee safety training, and the integration of differing corporate cultures should also be closely scrutinized by the Board and FRA.

Full integration of train dispatching and emergency response procedures also needs closer Board scrutiny. Detailed information regarding how the Applicants plan to integrate different train dispatching and emergency response procedures on the merged properties should be further analyzed by the Board. Train dispatchers should be required to take familiarization trips over their assigned territories and no dispatcher should be allowed to dispatch a territory unless carrier has provided the dispatcher with initial and thereafter annual familiarization trips over the territory. Complete knowledge of physical characteristic is a necessity for train dispatchers, train crews, and M/W work crews. Therefore, the Board should assure Applicants satisfy operational requirements to assure all employees possess the required physical characteristics and operating rule qualifications prior to operating on any segment of the system.

The BMWWE appreciates this opportunity to submit these comments
to Finance Docket No 33388.

Respectfully,

A handwritten signature in cursive script that reads "Richard A. Greluma".

Director of Education and Safety
Brotherhood of Maintenance of Way
Employees

Statement Of Roland E. McKenzie

UNITED GENERAL COMMITTEE

Brotherhood of Railroad Signalmen

ROLAND E. MCKENZIE, GENERAL CHAIRMAN

January 30, 1998

Response of the Brotherhood of Railroad Signalmen to the CSX and NS Safety Integration Plan.

Statement of Roland E. McKenzie:

Neither CSX nor NS addressed safety and movement of trains through the SAA (Shared Asset Areas). Presently, Conrail can control the flow of its own traffic in and out its yard areas. If the merger is approved with the CSX and NS they cannot. Traffic will be converging into those areas from all sides with both fighting over whose traffic is going to be handled first. This will undoubtedly be congested and a nightmare.

Neither the CSX nor NS had adequately addressed employee safety. As both railroad plans indicate, they desire to expand employee's seniority districts and work territories. This expansion covers several states. Employees would be required to spend much of their work life traveling to unfamiliar territories. This exposure coupled with sleep deprivation is extremely unsafe.

In the SAA it's indicated that training would continue, since the Conrail C&S training facility will be closed in Columbus, Ohio. The Signal Training in the SAA's will be non existent.

One aspect I note in the SIP is the corporate attitude toward drugs and alcohol and its testing. Norfolk and Southern does not and is not willing to submit its managers to drug and alcohol testing.

The following comments center around the abolition of Conrail's Service Desk and its relation to the SIPs filed by CSX and NS. The Service Desk is manned by C&S (Communications and Signals) employees, represented by the Brotherhood of Railroad Signalmen, 24 hours per day, 365 days per year. Present staffing consists of 12 Assistant Inspectors and 5 Inspectors, supervised by a URSA Supervisor and a Nonagreement Engineer, who concurrently manage the Signal and Communication Repair Shop and Training Center.

The Service Desk, located in Columbus, Ohio, currently serves Conrail as a "clearing hours" for both incoming and outgoing telephone (primarily) calls related to problems or incidents involving Signal Systems, Rail Highway Crossing Warning Systems, Communications Systems and various other systems or problems associated with the movement of trains. By collective bargaining agreement, the "Desk" serves to contact and dispatch Signal employees represented by the BRS for the trouble calls involving Maintainer's work outside their assigned hours. In practice, as the name Service Desk implies, the facility actually provides round-the-clock service handling incoming calls from the public private industry, law enforcement and emergency service agencies and Conrail Dispatchers and employees. These calls concern signal failures, rail highway warning systems failures or false actuations, trespassers, crossing accidents and potentially hazardous conditions such as automobiles stuck on the track or trackside fires or other emergency situations. The Service Desk employee takes the incoming call, determines the proper

Page Two

course of action according to Conrail's policies and dispatches either the appropriate Maintainer or other Carrier employee, generally acting as liaison between Dispatchers, maintainers, the public and Carrier Officers. This work continues whether during normal tours of duty or after hours. During periods of inclement weather, derailments or signal cutovers requiring round-the-clock coverage, it provides coordination of the necessary forces coming and going, retaining and enforcing hours of Service requirements during the process. Additionally, the Service Desk logs all corrective action taken as result of dispatching C&S employees, tracking corrective actions taken, actual hours worked, rest periods, etc.

The Desk serves as the depository for all records of permission for the application of jumpers (form CS39, sample enclosed), required when a signal or related apparatus is removed from service. The location of the device, action taken, times dates and names of the employees involved is recorded, as well as the removal of the jumpers when the device is restored to service. Dispatcher notification of this action, rail highway crossing warning system malfunction, signal system failure or any other action involving the safe movement of trains or the safety of the employees or the public is customarily coordinated with the Service Desk.

The information gathered and generated by the Service Desk employee is used to generate individually numbered Event reports (samples enclosed). These Event reports as well as the telephone conversations, are permanently stored through the use of recorded telephone lines and compute records. This process provides ready access in the event of the need for investigation of any Event by Carrier Offices, FRA Inspectors or others. Further, it provides a detailed database which can be queried to provide trends in trouble areas such as broken rails, pole line failures, vandalism, false activation of crossing warning devices or manufacturer's product reliability, to name a few. Reports tracking the events are generated daily and distributed electronically to a multitude of locations throughout the Conrail operating system.

Enclosed also, is a spreadsheet detailing the Events generated by the Service Desk for 1997. As one can see, nearly 61,000 Events were logged by the Desk for the calendar year, all of which were in one form or another relative to the safe and efficient operation of trains and thus capable of impacting the safety of Conrail's employees, the employees of other Carriers or the public. This means that on average, each day, over 166 safety related Events occurred which required the attention of Conrail employees whose sole responsibility were those Events. Over 18,000 Events alone were attributed to rail highway crossings, with another 24,000 attributed directly to switches, signals track circuits and code systems, all of which come under Federal regulations. Of the 18,394-rail highway crossing related events, 10,57 required Dispatcher notification as required under FRA regulations. 1755 Events involving the use of jumpers or the temporary removal apparatus from service were logged. These figures are even more indicative of the actual work involved when it is considered that many of the events required multiple tasks, such as when an event occurs involving rail highway crossing warning devices that must be reported to the Dispatcher, local law enforcement and includes a CS 39. This is in addition to fielding the

A-150-d

Statement of Roland E. McKenzie:

January 30, 1998

Page Three

originating call and locating and dispatching an employee or employees to address the problem. It is important to realize that nearly every event requires one or more related telephone calls in order to process, with the majority requiring multiple calls.

The SIP filed for the CSAO's makes no reference to the method(s) by which this critical safety function will be accomplished. Bearing in mind that the CSAO's are to be staffed by existing Conrail employees, it can only be assumed that these duties will be added to the workload of employees already carrying an optimum workload. There is no mention of either the physical means by which the incoming and outgoing calls are to be made, or where; nor is there mention of the training required for different employees to accomplish the necessary work. Bear in mind that Conrail Service Desk employees have performed this function, either on the Division level or as the consolidated desk, in excess of ten (10) years.

Commencing on Day 1, CSX proposes to route all incoming calls to their Police Department in Jacksonville. From there, it is assumed that the calls will be sorted and forwarded to the appropriate entity, who will then act upon them accordingly, resulting in built-in delays in dispatching personnel to complete critical safety related repairs. That particular function concerning the calling of Signal employees is currently handled by Electronic Specialist working in the Jacksonville Dispatching center, whose duties include calling Signal employees and performing the necessary signal work associated with the Dispatching Center. CSX does point out their intention to transfer their allocated workforce from the Conrail Service Desk to the Jacksonville Dispatching, but no mention is made of the training necessary to transform the Service Desk Assistant Inspector/Inspector to a Electronic Specialist. Nor do they consider that the current CSX employees will be totally unfamiliar with the acquired Conrail lines and vice versa for the transferred Conrail employees. If in fact any Conrail employees elect to accept the transfer. Further, no concern or plan of action was discussed to handle the safety complications that may occur as the result of operating under separate Operating Rules.

One last issue concerning the CSX SIP is that of employee morale. Put simply, it is doubtful that the mixing of cultures of the South, North and Northeast that must occur with the melding of

operations that CSX plans, will occur with as little impact as CSX indicates in their SIP. Given their attention to that detail, which is essentially none as express in the SIP, serious ramifications concerning safety of train operations could occur. CSX's inattention to detail would have us believe that there will be no language, custom or understanding barriers incurred complicating the communications between these geographic regions. This is quite simply an unlikely scenario.

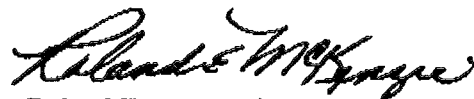

A-151-a

Statement of Roland E. McKenzie:
January 30, 1998
Page Four

Like CSX, NS proposed from Day 1, to route all calls to their Police Department, in Roanoke, Virginia. From there, the calls will presumably be sorted and those concerning signal or rail highway crossings requiring the attention of signal personnel, all of which are safety related, will once again presumably, be routed to the appropriate Dispatcher who will then dispatch the appropriate signal employee. Even more so than the CSX plan, this results in unavoidable delays in dispatching the appropriate employee to correct a safety sensitive problem. Further, it increases the workload on already taxed Dispatchers and Police personnel and dramatically increases response time and margins for error. There is no provision for training the Dispatchers for the additional workload. Nor is there mention of any type of database, other than for rail highway crossings, from which to draw information or in which to store information. This problem will be compounded at all phases of the process by NS's intent to reassign mileposts to the acquired Conrail lines.

Employee morale and thus their attention to safe operating practices will erode quickly under the NS plan. It is inconceivable that the Dispatchers and Police will accept the additional burden of work with enthusiasm. This will result in poor communication, delayed communication or no communication between the Police, Dispatchers and Signal personnel. Obviously, a Dispatcher will be forced to prioritize his/her work and the burdensome task of calling Signal employees in the middle of the night will doubtlessly fall somewhere short of the top priority. This will adversely affect the overall safety of train operation, the employees and the public.

I declare under penalty of perjury 28 USC 1746 that the foregoing is true and correct.

Mr. Vernon A. Williams, Secretary
Surface Transportation Board
1925 K Street NW
Washington, D.C. 20423-0001

Dear Secretary Williams:

I write to provide the comments of the American Public Transit Association (APTA) regarding STB Finance Docket No. 33388, *CSX Corporation and CSX Transportation, Inc., Norfolk Southern Corporation and Norfolk Southern Railway Company - Control and Operating Leases/Agreements-Conrail, Inc. and Consolidated Rail Corporation*. Many of the Association's commuter rail members are submitting their own comments directly to the STB or comments are being made on their behalf by their respective state governments. The views presented here do not necessarily represent those of the individual transit agencies or the government of states in which they are located.

Overview

The relationship of a commuter railroad to a freight railroad is that of a captive shipper - a purchaser of service who frequently pays a higher price and gets inferior service. As outlined below, APTA is concerned that the pending acquisition will perpetuate this unequal relationship, further degrading the service and economics of America's current and future publicly owned commuter railroads. Our concerns are based upon the applicants' representations in their filing, prior commuter railroad experience with the applicants, and prior commuter railroad experience with large-scale freight railroad mergers.

We urge the STB to put into place, as a stipulation to this acquisition, a process that will provide a means to resolve future disputes between freight and commuter railroads, and safeguard the public's interest in and investment in passenger rail service.

Background

About APTA

The American Public Transit Association is a private, nonprofit trade association that represents the North American transit industry. Established in 1882, APTA has more than 1,100 members including local mass transit systems, manufacturers and suppliers, and consultants to the transit industry. More specifically, APTA includes among its members approximately 400 American public and private mass transit systems, which carry over 95 percent of those using public transit in the United States.

APTA's Commuter Rail Members. APTA's fourteen U. S. commuter rail members include the eleven commuter railroads that will be affected by the pending acquisition, railroads that carry over 352 million passengers a year and over 1.2 million passengers every weekday. A list of APTA's commuter railroad members is attached.

Our commuter railroad members who are affected by the acquisition are located along the length of the East Coast – from Massachusetts south through Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, and Florida; as well as in the center of the nation, in Indiana and Illinois. In these corridors, commuter railroads play a central role in assuring mobility in the nation's largest and most densely populated urban areas, areas that also suffer from some of the worst traffic congestion and poorest air quality in the United States.

Significant Growth in Commuter Rail. The demand for commuter rail service is growing across the nation; indeed, ridership has increased 8.8% between 1993 and 1996. Established transit systems have gained 26 million new passenger trips a year during this period and new commuter rail operations that have recently become operational have experienced a 27% growth in ridership during the period.

Playing a role in the growth of commuter rail ridership has been the fact that since 1983 commuter railroads have invested billions of public tax dollars to improve their systems. These improvements have included investments in equipment and service, as well as investments in track and track structures. It is important to note that improvements to track and track structures have benefited both the commuter railroads and freight railroads. While a significant amount of the financing for these improvements has come from local, county and state resources, federal investments have clearly been the key element in the revival of commuter rail passenger service.

In a recently released report entitled *Commuter Rail: Serving America's Emerging Suburban/Urban Economy*, the economic benefits that commuter rail operations provide to the public were estimated to be \$5.2 billion a year. The report also noted that over 180 of the Fortune 500 companies are headquartered in areas served by the nation's commuter rail systems. These employers, as well as businesses of all sizes, rely upon the availability of efficient and effective commuter rail service to get workers to their jobs, on time, every day.

Without a doubt, the continued success and the future growth of commuter rail service is central to both regional and national economic strength, and the attainment of key national objectives. It is in this context that APTA provides comments about the proposed acquisition, an action that must be considered in light of both its current and future impact on commuter rail operators.

Comments

Transportation System Access

The most critical area of concern to commuter railroads regarding the proposed acquisition is the impact that it will have upon their ability to access railroad rights-of-way (ROW) in their service areas. While some commuter railroads own their own ROW and receive rents from freight railroads for the right to operate over commuter lines to reach freight customers and terminals, many more make rent payments to freight railroads for the right to operate over freight lines in providing commuter rail service.

All three of the freight railroads involved in this action – Conrail, CSX and NS – have existing operating agreements with commuter railroads. In a very real sense, commuter and freight rail operations are interconnected and interdependent, each having the ability to affect the economics and operating success of the other. The complexities of this relationship and the potential limitations that the acquisition could place on the ability of commuter railroads to provide passenger service at current levels, as well as to grow in the future, cannot be casually dismissed -- as has been done in the current application to the STB.

The inter-relationship of the freight and commuter railroads is further complicated by the way capital investments supporting commuter rail operations have been financed. It is important to understand that improvements made to upgrade freight tracks to permit passenger rail operations are generally carried out with public funds. In financing track, signal and related improvements to increase speeds to the level needed for efficient commuter rail operations or to achieve ride conditions appropriate for passenger operations, commuter railroads use public funds. In some cases these funds are federal grant receipts and in others they involve the use of state or local funds, including proceeds from long term debt.

The freight railroads, and specifically CSX, NS and Conrail, have benefited significantly from the investment of public funds, investments that have helped them obtain additional capacity and improve their private sector operations.

These investments of public funds makes it even more imperative that commuter rail interests in and access to the freight railroads be protected.

In looking at the proposal at hand, the STB has established a three-year period in which to assess the implications and impacts associated with the acquisition. Unfortunately, that timeframe does not cover the period when many existing operating agreements expire and when the issue of trackage rights governing future commuter rail operations will be reexamined. By focusing on such short term, three-year, projections of freight traffic, the STB will not be able to ensure that existing and future commuter rail operators receive fair or even reasonable treatment from CSX and NS beyond that period.

Based upon past experience, we fully expect that commuter railroads that rent access to the trackage of or rights from CSX and NS will be faced with projections of increased freight traffic in their next round of negotiations. This increase in freight traffic will, in all likelihood, result in demands that commuter rail service be reduced or that the commuter rail operators finance additional capital improvements to accommodate the increased traffic. A close examination of the renegotiated operating rights agreements that have been approved to date will reveal that reductions have already been made in commuter rail service in order to accommodate increased freight traffic. While these reductions may have been made in light of other gains by our members, this is a one-time situation brought on by the need for CSX and NS to receive support for this merger. APTA is concerned that this will not be true in the future.

Existing service. The CSX and NS application identifies freight traffic increases that are expected to occur in the corridors that are shared with commuter rail operators. However, the application fails to demonstrate that the shared track/capacity issue has been considered in detail and that commuter rail systems can be assured that their operations will not be affected. Among the freight traffic increases that are cited in the application are seven additional trains a day in VRE's Fredricksburg corridor (a 40% increase) and seven to eight trains a day in MARC's Brunswick corridor. While some might not perceive these to be major increases, they are when considered in light of current traffic in the corridors. We expect that increases such as these could have a significant impact on commuter rail operations.

System expansions. Also of great concern is the impact of the proposed acquisition on plans that commuter rail operators have been developing to expand their operations in the future. These expansion plans, which are undertaken to address regional goals for economic development and growth, or to find low cost solutions to congestion problems, are supportive of broader national economic and environmental goals.

Because commuter railroads generally utilize federal funds to finance expansion of their systems, these plans take a long time to become operational. Many of our commuter rail members' long-term plans to expand their operations through the use of rail freight tracks/ROW, which are not currently used or are underused, could be negatively affected by the acquisition.

The two examples that follow demonstrate how important it is that assurances be made to commuter rail agencies that reasonable accommodation will be made to allow them to access the rail lines for the operation of expanded levels of rail passenger service:

NJ TRANSIT has been working on the expansion of its commuter rail network for a number of years. Using both federal and state funds, the agency has been studying the potential for commuter rail service to be restored in corridors that have been under the control of Conrail in southern New Jersey and the NYS&W in northern New Jersey. The planned expansions of the commuter rail system are important components in the State of New Jersey's plans to realize its economic, mobility, and environmental goals.

The Southeastern Pennsylvania Transportation Authority (SEPTA) is another transit agency that is actively pursuing system expansion and New Start funding. The proposed Cross County and Schuylkill Valley Metro projects are focusing on new light rail lines or commuter rail service along existing freight rail corridors, parallel to active Conrail freight service. Both projects respond to changing regional demographic, development and travel needs, as well as the need for transit agencies to serve new markets, promote economic development and support community revitalization. The Schuylkill Valley Metro would also reconnect the Philadelphia and Reading metropolitan areas for the first time since 1981.

New commuter rail starts. Across the United States, there is keen interest in initiating new commuter rail services. As part of the nation's agenda to enhance mobility and air quality through the reduction of automobile traffic and regional plans to encourage economic development and growth, these efforts are made possible through the use of federal and/or local funds, including funds raised by long-term public debt. New commuter operations, utilizing existing freight rights-of-way, are in advanced stages of planning in: Portland, Maine; Burlington, Vermont; Raleigh-Durham, North Carolina; Jacksonville and Tampa, Florida; Atlanta, Georgia; Nashville and Memphis, Tennessee; Cleveland, Ohio; Milwaukee, Wisconsin; and St. Louis, Missouri.

In light of the large number of "new starts" commuter rail operations that are actively under consideration, it is important that the CSX/NS acquisition not be allowed to become a deterrent to the development of new systems.

If this acquisition leads to greater restrictions on access to freight railroad rights-of-way, the establishment of new commuter rail operations could be affected. APTA believes that the STB should use this acquisition as an opportunity to promote cooperation between CSX and NS and commuter rail operations, ensuring that rights-of-way that are necessary for passenger service are available to the public, over the long term.

The central importance that access to CSX and NS lines has for current commuter rail operators, as well as future growth in the service, clearly indicates the need for a way to resolve disputes on this issue. In their discussions with the applicants, some commuter rail operators have been able to agree upon some form of accommodation regarding access issues. However, many of these accommodations were influenced by the need for public agency support for the proposed acquisition, a factor that will not be present in the future. APTA believes that, as a condition to the approval of this acquisition, the STB needs to define a process that will ensure that fair and reasonable operating rights agreements can be established in the future, with fair and reasonable compensation to CSX and NS. Such an action by the Board will assure that commuter rail service in freight corridors is protected for the American public interest in the future.

Operating Service and Schedules

Closely associated with the issue of operating rights and the ability of our members to access freight lines, is the issue of how freight operations affect commuter rail service and schedules. Because the proposed acquisition directly affects some of the most highly concentrated rail corridors in the nation, where freight traffic shares space with heavily-used commuter and intercity passenger service, the issue of operating performance and ability to maintain on-time service schedules is critical. We expect that where increases in freight traffic are projected on lines that are also used for passenger traffic, conflicts between freight and commuter rail service schedules will also increase. The 40% increase in freight traffic in VRE's Fredricksburg corridor is illustrative of an area where on-time performance problems could be expected.

The experience of the Southern California Regional Rail Authority (see comments dated August 1, 1997 in Finance Docket No. 32760 [Sub-No. 21]) with recent rail mergers confirms the potential for freight traffic to interfere with established passenger operations. This point has been underscored in even more recent media accounts regarding Metrolink's (California) on-time performance problems on its Riverside Line that it rents from the Union Pacific. The problems that the Union Pacific has encountered following its recent merger has made it difficult for several of our members to get railroad management to focus on commuter rail issues. Dispatching and coordination problems have gone unresolved, on-time performance is not a concern and communications in general have been difficult as the freight railroad has focused on its own problems.

Commuter rail service issues have had very low, or no, priority and commuter passengers have suffered through unnecessary delays and degradations in the quality of service that they receive. The freight railroad has focused on backed-up freight traffic and ignored its commuter rail partners.

Our concern regarding this issue is further underscored by the prior experience of our members with the parties to the acquisition and the parties' stated desire to adopt existing agreements, some of which are outdated. Both NS and CSX, in spite of the existence of operating agreements designed to protect commuter operations, have caused significant schedule problems for the Virginia Railway Express (VRE). In incidents that occurred during the summers of 1996 and 1997 that were reported in local media accounts, VRE's ability to operate its service in accordance with published schedules was negated by the actions of the freight railroad owners.

Such interference, which results in delays in commuter rail service and poor on-time performance, encourages passengers to view transit services as unreliable. When faced with poor on-time performance, these riders have the option to return to their cars and will do so, further impacting the environmental and safety of the riders (see APTA's comments STB Environmental Impact Statement). In our experience, and in survey after survey conducted by transit properties across the nation, unreliable service and poor on-time performance are the biggest factors that cause transit riders to abandon public transit service in favor of private automobiles.

We note that the operating plans that have been formulated by CSX and NS provide no details about how they will accommodate passenger operations and work cooperatively with commuter rail operators to ensure that their schedules are maintained in shared corridors. Schedule interference, dispatching, and maintenance procedures are critical to assessing the impact of the acquisition, and the STB must insure that the efforts of commuter rail operators to provide high quality service to customers will not be undermined by the actions of the freight railroads. As with the issue of access, it is important that the STB provide a means to resolve potential disputes beyond the three-year timeframe, ensuring that future freight traffic increases are not a reason for commuter rail schedules and service to be interrupted.

In addition, we think it is appropriate to move towards incentive-based operating agreements in shared corridors, an idea that most freight railroads have not been willing to consider in the past.

Railroad Retirement

The Railroad Retirement System, like Social Security, is a pay-as-you-go pension system that is a holdover from the days when freight and passenger rail operations were combined. Under the provisions of the Railroad Retirement Act, both commuter and freight railroads are charged a payroll tax based upon the number of active employees working for each system. This tax supports the pensions provided to railroad employees across the country -- the only private sector retirement system that is mandated by Congress.

Over the years, freight railroad employment has dropped significantly as employees have retired and the industry has consolidated, while commuter rail operations and their publicly funded workforces have expanded. This new environment has created a situation in which commuter rail operators -- funded by public and taxpayer dollars -- are providing large and growing subsidies to the freight railroads in the form of pension payments to freight railroad retirees. The workforce reductions that will result from the proposed acquisition, as well as the previous freight railroad mergers, have served to exacerbate the current situation in which commuter rail employer tax burdens are three times that of FICA-based employers. APTA is concerned that the proposed action will result in additional cross-subsidization of the freight railroads by publicly funded commuter railroads.

APTA suggests that the STB review the 1990 report "Commission on Railroad Retirement Reform". Further, the impact that this acquisition and further declines in freight railroad employment will have on commuter rail systems needs to be considered by the STB in conjunction with the Railroad Retirement Board. The STB needs to impose conditions to this acquisition that will ensure that CSX and NS fund any negative financial impacts of the merger upon the commuter railroads' contributions to railroad retirement.

Conclusion

In the freight industry there is a group of customers who are known as "captive shippers," railroad customers who have no other alternatives in moving their products and are tied to one railroad. Because there is no competition for their business, captive shippers frequently pay higher rates and get poorer quality service.

The relationship of a commuter railroad to a freight railroad is that of a captive shipper. Commuter railroads that rent their tracks/ROW do not have an alternative way to transport their passengers. If they cannot use the tracks/ROW at the time that their customers want to travel, there is no need for their service. If their use of the railroad is subject to frequent delays, the quality of their service will be poor and it will go unused. And if they cannot gain reliable access to the railroad -- the only alternative is to abandon their passengers.

Our nation needs to maximize the public's use of mass transportation systems in order to enhance mobility and improve the environment. The establishment of cooperative and mutually beneficial relationships – not captive shipper relationships – between freight and commuter railroads is essential to the success and efficiency of the industry. The STB's review of the acquisition of Conrail's assets and rights by CSX and NS will play a role in how those relationships are defined in the future.

The American Public Transit Association urges you and the Board to ensure that commuter rail operations can continue to provide the American public with high quality and efficient transportation service.

Sincerely,

William W. Millar

BEFORE THE SURFACE TRANSPORTATION BOARD

STB FINANCE DOCKET NO. 33388

CSX CORPORATION ET AL - CONTROL AND OPERATING
LEASES/AGREEMENTS - CONRAIL, INC. ET AL

COMMENTS

E. I. DU PONT DE NEMOURS & COMPANY, INC.

DuPont is a \$43 Billion diversified chemical manufacturer with over 200 manufacturing sites and almost 100,000 employees worldwide. DuPont has long been recognized as a leader in safety, with close to a 200 year heritage of commitment to safe manufacture, handling and distribution of its products. DuPont's corporate policy is to ship only materials which can be handled, transported and used safely.

DuPont is also a major U.S. rail shipper, with over 50,000 shipments annually, including a significant portion which are hazardous materials. DuPont also has six major plants as well as numerous customer and transloading or terminal facilities in the Northeast. Thus, DuPont has a vital interest in the safe and seamless implementation of the Conrail acquisition.

DuPont commends the Board for its concern about the safety aspects of this transaction and for its foresight in Decision 52 of requiring Safety Integration Plans (SIP's) to be filed by the two acquiring railroads, as part of the Environmental Impact Statement.

DuPont further suggests that the content of the SIP's be incorporated in any future Board oversight process. Recent experience in the West only serves to underscore the importance of having well conceived and comprehensive plans for integrating the various operations, processes, and cultures related to safety. Implementation of the Conrail acquisition will be even more complex than those in the West, since it involves a unique division of an efficiently operating rail network. DuPont also believes that systemically including similar SIP's in other future rail transactions would be constructive.

DuPont feels so strongly about safety that we have already met individually with both CSX and Norfolk Southern to discuss the details of their respective SIP's. Additional follow-up meetings are planned. Both railroads have an outstanding safety record, and have made a good faith effort to plan for the safe integration of Conrail into their operations. The draft SIP's contain an excellent overview of their plans for a seamless transition. As would be expected at this point, many specific implementation details are not yet included and/or have yet to be developed.

DuPont, for these and other reasons, does not wish to comment on the specifics of the Plans at this time, but encourages the Applicants to continue development of them so that all safety processes are clearly defined, in place, and understood prior to "Day 1".

DuPont further encourages the Applicants to consider adopting where possible Best Practices already in place at Conrail.

One excellent example of such a Best Practice in Conrail's Five Year Plan is for implementation of the Chemical Manufacturers Association (CMA) Responsible Care® Partnership Program.

In summary, DuPont has high value for the Board's incorporation of safety planning and execution into the approved process for the Conrail acquisition. DuPont also supports inclusion of the SIP requirement in any further mergers, divestitures, or acquisitions which come before the Board.

Respectfully submitted,

Dear Ms. Kaiser:

The State Historic Preservation Office has reviewed the Environmental Impact Statement prepared concerning the above-named project. This office expects that the proposed undertaking will have no effect on historic, architectural, or archaeological resources listed on or eligible for the National Register of Historic Places. This comment upon our understanding that no changes to rail line segments, rail yards, or intermodal facilities and no new construction projects are proposed within Connecticut.

This office appreciates the opportunity to have reviewed and commented upon the proposed undertaking.

We recommend that the responsible agency provide concerned citizens with the opportunity to review and comment upon the proposed undertaking in accordance with the National Historic Preservation Act of 1966 and the Connecticut Environmental Policy Act.

For further information please contact Dr. David A. Poirier, Staff Archaeologist.

Sincerely,

John W. Shannahan
Director and State Historic

Finance Docket Number 33388
Surface Transportation Board
1925 K Street, NW, Room 500
Washington, D.C. 20423-0001

Attention: Elaine K. Kaiser

Ladies and Gentlemen:

Subject: Finance Docket 33388, Draft EIS

The Connecticut Department of Transportation (CDOT) appreciates the opportunity to comment on the Surface Transportation Board's (STB) "Draft Environmental Impact Statement, Proposed Conrail Acquisition" (DEIS) dated December 12, 1997.

Based upon the discussion of the impacts that the subject Acquisition may have on the state of Connecticut (DEIS, Volume 3A, Chapter 5), it appears that CDOT was unsuccessful in fully articulating the nature and depth of its concern for an unconditioned approval of the Primary Application. This is clearly demonstrated by a significantly understated categorization of the nature of CDOT's comments as "Air."

As stated in our August 5, 1997 submittal, the areas in Connecticut that will be directly affected by the Acquisition are not in attainment with the US Environmental Protection Agency's National Ambient Air Quality Standards. Notwithstanding the noise and public safety impacts associated with the current level of traffic congestion in the I-95 corridor, vehicular emissions in the corridor are what continue to seriously undermine efforts to achieve attainment. Clearly, traffic congestion and air quality are inextricably linked in this region.

Seemingly contradictory statements in the DEIS suggest that a general reconsideration of the impacts of the Acquisition in the state of Connecticut is appropriate. For example, it is stated in the DEIS that, "CSX and NS anticipate that due to predicted truck-to-rail diversions, Connecticut would experience a benefit in the areas of emissions, noise and safety." This assertion is apparently contradicted by the statement in the very same section that "...no rail line segments, rail yards or intermodal facilities

in Connecticut would experience increased traffic or activity..." Realistically, it is conceivable, if not likely, that traffic congestion and air quality will worsen if the Primary Application is approved in its current form.

In sharp contrast to CSX, NS enthusiastically indicated to CDOT (prior to April of 1997) that RoadRailer-type service would figure prominently in its business and operating plans. Should this type of intermodal service flourish in southern regions, but terminate west of the Hudson River in the North Jersey Shared Assets Area, it must follow that a significant number of containers destined for points east of the Hudson River will complete the trip by truck on I-95. Paradoxically, a plan which purports to reduce traffic congestion, as well as enhance air quality and public safety, will have quite the opposite effect in Connecticut.

To generally improve rail freight service in the region, as well as to address almost certain environmental impacts, CDOT recommended that the STB approve the Primary Application only with conditions to ensure full competitive access to Connecticut for two or more Class I carriers; to ensure competitive connections to national markets for short-line and regional railroads in New England; to provide true incentives for the truck-to-rail diversion of traffic in the I-95 corridor; and to ensure the application of uniform, competitive rates for shippers in Connecticut and other areas east of the Hudson River.

The Department contends that by extending the North Jersey Shared Assets Area as far easterly as New Haven, the aforementioned conditions could be rather simply met. Obviously, this would require greater use of an improved carfloat operation in New York Harbor and operation of RoadRailer-type trains through Penn Station, as commuter operations permit. Though each of these service options represent a viable alternative to a circuitous routing around the state of Connecticut, neither is currently utilized.

As a minimum, the STB must direct the CSX and NS to negotiate further with affected carriers to establish, by date certain, competitive rail access and effective gateways for markets east of the Hudson River. Then, assuming the STB retains jurisdiction as requested by CDOT and many other parties of record, specific conditions should be imposed if competitive access to the region has not been created.

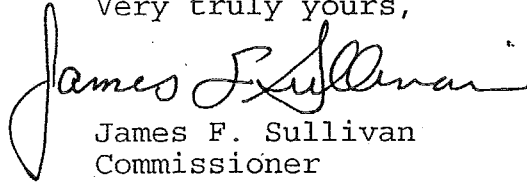

Given the limited information contained in the aforementioned section of the DEIS, CDOT is not wholly satisfied that the less obvious impacts of the Acquisition have been fully considered. It is CDOT's position that in areas of nonattainment,

January 30, 1998

such as the I-95 corridor in Connecticut, both the primary and secondary impacts of the Acquisition deserve far greater scrutiny. Further, there should be a far greater willingness on the part of the STB to exercise its full authority in prescribing mitigation in such areas.

Therefore, we respectfully request that the Board reconsider the environmental impacts that the Acquisition will have in the state of Connecticut.

Very truly yours,

A handwritten signature in cursive script that reads "James F. Sullivan". The signature is written in dark ink and is positioned above the typed name and title.

RE: Draft Environmental Impact Statement
"Proposed Conrail Acquisition"

Dear Ms. Kaiser:

Thank you for furnishing us with a copy of the above document, which had a service date of December 12, 1997.

Unfortunately, despite the fact that we had submitted (under date of July 31, 1997) written comment on the Notice of Intent to prepare an EIS, we did not receive the Draft EIS until January 7, 1998, and then only at our request.

We have reviewed the Draft EIS in particular Volume 3A, Chapter 5 State Settings, Impacts and Proposed Mitigation - Connecticut pp. CT-1 thru CT-5 and figure 5-CT-1.

1. **Principal Objection**

We respectfully disagree with the following statement in the first paragraph on page CT-1:

"There are no proposed Conrail Acquisition related activities in Connecticut that meet or exceed the Board's thresholds for environmental analysis."

As we clearly stated in our July 31, 1997 comment, the CSX/NS plan for Conrail provides that: 1) Only CSX will operate east of the Hudson River, and thus there will be no direct rail competitive service available east of the Hudson River, and 2) Neither CSX nor NS plans to operate truck-competitive rail intermodal service directly along the Northeast Corridor north and east of Newark, New Jersey.

EQUAL OPPORTUNITY EMPLOYER

A-156-b

Both CSX and NS clearly state that they will vigorously seek to divert to rail intermodal a significant amount of truck traffic now operating on the I-95 corridor, (Atlantic seaboard). If they are successful, the heavy truck traffic on I-95 in Connecticut, already intense, will increase significantly. ConnDOT reports that the 1996 average daily trailer truck traffic on I-95 is 10,416 trailer trucks, or 8% of a total traffic level of 130,200 vehicles/day. These added trucks on I-95 will be operating to and from CSX and NS intermodal terminals in Northern New Jersey. (Please refer to EIS, Volume 3B, Chapter 5, Page NJ-5 which indicated a total increase of 1,280 additional daily truck trips, an increase of 89%, to and from the four intermodal terminals in Northern New Jersey) (Enclosure 3) Also, we understand that NS may establish a rail/truck intermodal terminal near Middletown in Orange County, New York, which will add more trucks to I-84 through Danbury, Waterbury and Hartford. As may be seen by the enclosed map ("NETI" Study - 1994) of Connecticut and Rhode Island showing limited access highways expected to be severely congested by the Year 2000, we need a rail intermodal directly across the Hudson River at New York City with rail intermodal continuing into southern New England along the Northeast Corridor. (Enclosure 4)

Action Requested

The section of Environmental Analysis of the Surface Transportation Board should address this issue and recommend appropriate mitigation. We strongly believe that the appropriate mitigation is to recommend that the conditions demanded by the Intervention Petition of Congressman Jerrold Nadler and 23 other Members of Congress should be made condition of final approval of the CSX/NS Railroad Control Application.

2. Other comments on specific paragraphs in Connecticut Section:

- Page CT-1 - Transportation Facilities

Add words: "The principal truck highway corridor for New England is I-95, which, unlike I-84 and I-90, is a direct, water-level route directly along the Northeast Corridor, and thus is particularly attractive to long-distance, heavy truck traffic."

- Railroad Facilities

Add words: "Conrail has trackage rights on Amtrak and the Metro North Railroad from New York City to New Haven, but has failed to use them except for local freight service. And, Conrail limits the Providence and Worcester Railroad in the exercise of their overhead trackage rights to the movement of stone only, and then, no further west than Fresh Pond Junction, Long Island, N.Y.

- Page CT-2 - Proposed Conrail Acquisition Facilities in Connecticut

We strongly disagree with the statement:

"CSX and NS anticipate that, due to predicted truck-to-rail diversions, Connecticut would experience a benefit in the areas of emissions, noise and safety."

We would respond the rail portion of these truck to rail diversions will end on the west side of the Hudson River in New Jersey. Connecticut will therefore have more, not less, diesel truck emissions, heavy truck noise and truck safety impact. Also, we would suggest that the single, planned CSX Boston to Atlanta intermodal train via Albany, N.Y. is too circuitous as to be competitive with trucks on I-95. Rail intermodal on the electrified NEC means clean air!

- Page CT-3 - Passenger Rail Service, Amtrak and Commuter Rail
We note that in Volume 1, Chapter 4 Section 4.7 Transportation: Passenger Rail Operations at Page 4-28 the following conclusion has been drawn:

"After the proposed Acquisition, the number of freight trains on the NEC still would be no more than the number of freight trains on the NEC prior to the formation of Conrail in 1976. Since that time, there has been an increase in NEC capacity as a result of the Northeast Corridor Improvement Program (NECIP), including many of the facilities already mentioned and signal improvements. Through its operating control of the NEC, Amtrak controls the schedule for the necessary "track-out" time for maintenance of way, a substantial amount of which is done at night. As stipulated in the current Operating Agreement, which would be assumed by NS and CSX, it would be necessary for the Applicants and Amtrak to schedule freight operations carefully on the NEC.

In summary, the proposed increases in the number of freight trains on the Northeast Corridor should not affect existing passenger operations. These passenger operations occur mainly during the daytime hours. SEA believes at this time that there would be no Acquisition-related impact on passenger service on the Northeast Corridor by freight operations."

We would therefore conclude that, if the conditions demanded by the Intervention Petition of New York and Connecticut Members of Congress had actually been proposed as part of the CSX/NS Plan, the Section of Environmental Analysis would logically have drawn a similar conclusion as stated above regarding operations on the Northeast Corridor north of Newark, N.J., while giving due consideration of the particular concentration of rail traffic through the Penn Station tunnels. Indeed, a review of Table 4-7 Current and Proposed Operations on Amtrak's Northeast Corridor (pg. 4-25) the proposed post-acquisition train densities south of New York City are significantly higher than those north of New York City. In further support of this conclusion, we enclose an excerpt of our January 13, 1998 Rebuttal Statement to Applicants Rebuttal of December 1997. (Enclosure 2)

- Page CT-4 - Tables 5 CT-1 and 5-CT-2
We are amazed that the statements in both these tables, which, in our view, show no appreciation or understanding of the comments submitted by this Agency in its July 31, 1997 letter with enclosures.

Accordingly, we enclose a copy of our July 31, 1997 letter for your review.
(Enclosure 1)

3. **Conclusion**

In our opinion, the analysis contained in the Draft EIS could be summed up as follows: Because CSX plans little or no new service east of the Hudson River, and NS plans to confine their operations to west of the Hudson River, there are no "Acquisition Related" impacts to measure, and therefore no mitigation is necessary. We strongly believe that, given the CSX/NS plan, which gives the fullest intermodal advantage to the southern half of the Northeast Corridor, while denying these same advantages to the northern half of the Northeast Corridor, an Acquisition Related impact exists and should be remedied by the STB.

It should be noted that in 1985, Amtrak, Conrail and Norfolk Southern were prepared to permit operation of a "Road Railer" train carrying perishables from Florida to Hunt's Point Market in The Bronx through the Penn Station tunnels. And, even more significant, in January, 1997, Norfolk Southern officials, in a presentation before the Connecticut Public Transportation Commission, proposed to operate Road Railer and single container-on-flatcar trains directly through the Penn Station tunnels and northerly to New Haven, Connecticut!

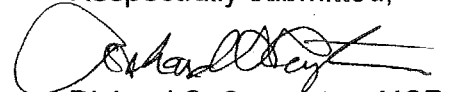

Action Requested

The draft environmental impact statement should be revised to reflect the foregoing concerns, and to recommend the conditions demanded by the New York/Connecticut Congressional Intervention Petition.

We respectfully request that this letter, with all its enclosures, be reproduced in the Final EIS.

Thank you for this opportunity to comment.

Respectfully submitted,

Richard C. Carpenter, AICP
Executive Director

**RE: Notice of Intent to Prepare an EIS
STB Railroad Control Application - Finance Docket No. 33388
(CSX Corporation et al)**

Dear Ms. Kaiser:

Thank you for your letter of July 3, 1997, informing us of your intent to prepare an Environmental Impact Statement (EIS) on the above named Railroad Control Application, and your request for comments on the proposed EIS scope that is part of the notice.

The South Western Regional Planning Agency consists of eight towns and cities in the southwestern corner of Connecticut. (These municipalities include Darien, Greenwich, New Canaan, Norwalk, Stamford, Weston, Westport and Wilton.)

Both I-95 and the Northeast Corridor rail line run directly through our region.

The South Western Region is also located near the center of the Greater New York/New Jersey/New England Air-Quality Non-Attainment area. See copy of portion of map entitled Air Quality Attainment Status Fig. 1-4, page 68 of volume 6A of 8, Docket No. 33388. The location of South Western Region is marked with an arrow. (Attachment 1)

At their regular meeting of July 7, 1997 the South Western Regional Planning Agency, (SWRPA) in accordance with their 1995 Regional Plan of Conservation and Development (Attachment 2) and in support of a letter dated June 18, 1997 from the South Western Region Metropolitan Planning Organization (SWRMPO) to Governor John Rowland of Connecticut (Attachment 3), unanimously authorized testimony to be submitted to the Surface Transportation Board, based on SWRPA and SWRMPO policy.

In addition to the excerpt from the SWRPA 1995 Regional Plan in Attachment 2, please see the excerpt from the SWRMPO Long Range Transportation Plan. (Attachment 4)

PURPOSE OF OUR COMMENT

The purpose of our comment is: 1) to inform the STB of our regional transportation policy, which advocates high speed, truck competitive, low-profile, intermodal rail freight service along the entire Northeast Corridor (NEC) directly through New York City, 2) to comment on the scope of the draft EIS to be prepared by the Surface Transportation Board's Section of Environmental Analysis, (SEA) and to urge that this EIS consider the environmental impact of not providing direct intermodal rail freight service directly along the NEC north of Newark, New Jersey to Boston, Massachusetts, and 3) to comment on the Railroad Control Application itself, in support of 1) and 2) above.

1. SOUTH WESTERN REGIONAL TRANSPORTATION POLICY

Official advisory land use/transportation policy of the South Western Region is set forth in the 1995 Regional Plan of Conservation and Development at pp. 68-70, prepared and adopted by the South Western Regional Planning Agency (SWRPA) (see Attachment 2)

The South Western Region Metropolitan Planning Organization, (SWRMPO) consists of the eight Mayors and First Selectmen and the three Transit Districts of the region. In cooperation with the Connecticut Department of Transportation, SWRMPO sets transportation policies and priorities for the region. The SWRMPO is deeply concerned about the rail freight service which will result from the division of Conrail between CSXT and Norfolk Southern.

To formally express this concern, SWRMPO sent a letter under date of June 18, 1997 to Governor John Rowland of Connecticut, urging him to request the STB to amend the proposal to provide for the shared use of the entire Northeast Corridor. (See Attachment 3)

This proposal is based on the Long Range Transportation Plan of the South Western Region Metropolitan Planning Organization (See Attachment 4)

2. COMMENT ON THE SCOPE OF THE DRAFT EIS

ENVIRONMENTAL IMPACT EAST OF HUDSON RIVER

The joint CSXT/NS plan to operate Conrail includes extensive and detailed environmental impact statements for many track connections, increased yard operations, and increased freight train density levels. These environmental studies even include the impact of abandoning several relatively obscure rail branch lines in western Indiana.

Despite the fact that the area east of the Hudson River (N.Y.C., LI, Conn. and Mass.) is part of the largest air quality non-attainment area in the U.S.A, there has been no environmental study of the impact of continuing (and therefore not improving) the present limited rail freight service east of the Hudson River.

In the draft scope of the EIS prepared by the STB Section of Environmental Analysis (SEA) it states:

"Under the NEPA process, SEA will evaluate only the potential environmental impacts of operational and physical changes that are directly related to the proposed transaction. SEA will not consider environmental impacts relating to existing rail operations and existing railroad facilities."

We would argue that the operational and physical changes proposed in this application, i.e. the new joint use of the southern half of the Northeast Corridor (Washington, DC - Newark) will environmentally impact the northern half (Newark-Boston) unless the same direct, competitive, intermodal rail freight service which will be available in the southern half is extended to the northern half of the Northeast Corridor.

In the EIS scope under Impact Category (pp. 36335-36336 of 62FR) the EIS will discuss: 1) the potential transportation system impacts of diversions of freight from trucks to rail and rail to trucks, as appropriate, 2) the energy impacts of diversions as above, 3) the air quality impacts of increases in truck traffic of more than ten (10) percent of the average daily traffic or fifty (50) vehicles a day, and evaluate emissions increases if the proposed transaction affects a Class I or Non-Attainment area as designated under the Clean Air Act, 4) the noise impact of an incremental increase in noise level of three decibels Ldn or more, and the 5) the environmental justice impacts of whether the result of the proposed contrast between rail service provided to the northern and the southern half of the Northeast Corridor would have a disproportionately high and adverse health affect or environmental impact on any minority or low-income group.

We would conclude that all of the foregoing impacts pertain to the Northeast Corridor.

3. COMMENT ON RAILROAD CONTROL APPLICATION

PROBLEM

Vehicular traffic congestion on I-95 has long been a serious problem, and is expected to worsen. A significant part of this problem are the large number of tractor trailers which operate every hour of the day. By contrast, not one through freight train of any kind operates over the parallel Northeast Corridor rail line north of Newark, N.J. This heavy truck traffic could be reduced, were competitive, north-south intermodal rail freight service provided directly along the Northeast Corridor rail line.

OPPORTUNITY

The division of the Conrail system between the Chessie System (CSXT) and Norfolk Southern (NS) railroads presents a major opportunity to improve rail freight service in the Northeastern U.S. The Surface Transportation Board (STB) review of the proposed division should maximize this opportunity.

Improvement will come from direct competition between CSXT and NS and between both railroads and the trucking industry. This competition should be reflected in 1) lower freight rates, 2) longer single line service without costly interchange between different railroads, 3) new and greatly improved north-south rail services instead of only the east-west service provided by Conrail and, finally 4) shared use of the Northeast Corridor (NEC) for high-speed, truck-competitive intermodal rail freight trains.

LESS SERVICE EAST OF HUDSON RIVER

Unfortunately, New York City, Long Island, Connecticut and New England will not fully share in these improvements. See Attachment 5 for Triple Crown Network and north-south Routes which, unfortunately, do not extend east of the Hudson River.

BACKGROUND AND PROPOSED CSXT/NS PLAN

The April, 1997 agreement between CSXT and NS, which constitutes the plan now before the STB, provides that only CSXT will operate east of the Hudson River, denying or significantly reducing the major benefits of direct competition, lower freight rates and direct, truck-competitive intermodal service to New York City, Long Island, Connecticut and New England.

Prior to this agreement, NS had stated its intention of operating directly along the entire NEC, through Penn Station, New York City, using "Roadrailer" type intermodal equipment and single container-on-flatcar type trains, both of which can operate in the restricted overhead clearance environment of the NEC. It reported that success was being achieved in solving the operating concerns of Amtrak and the commuter railroads. NS, which operates the Roadrailer trains, wants to use the NEC so it can directly compete with trucks.

Unfortunately, CSXT has no such plans for direct service along the NEC through New York City. Instead, only one conventional intermodal train is planned, operating between Atlanta, Georgia and Boston, Massachusetts, using the longer, slower route via Albany, New York.

Unfortunately, too, under the present plan now before the STB, the low profile Roadrailer trains will not provide service east of the Hudson River because only NS (and not CSXT) operates this type of equipment.

Roadrailleurs, which can operate through Penn Station New York City and the river tunnels and which can operate at passenger train speeds, will, however, for the first time, be operated by NS on the NEC, but only on the southern half, from Washington, DC to Newark, NJ.

The northern half of the NEC from Newark, New Jersey to Boston, Massachusetts, with fewer passenger trains than the southern half, will remain underutilized during off peak hours. Late at night, and until early dawn, it will be essentially empty. Such underutilization is particularly disturbing because the NEC is, like the highway system, owned, maintained and operated by the public. The public sector, like the private sector, should expect and receive the best possible return on its investment. (See Attachment 6 for Comparative Train Densities on NEC.)

The existing joint CSXT/NS application proposes joint passenger and freight operation of the Northeast Corridor (NEC) from Washington, DC north to Newark, NJ, which proposal we fully and enthusiastically support.

This joint use of the NEC is also important to Norfolk Southern, and we quote from p.226 of Vol. 3B of 8 (NS Operating Plan)

"The existing Roadrailer round trip between Newark and Atlanta, which operates five days a week, will be rerouted from the Hagerstown route to the NEC. Substantial mileage will be saved. This new route will permit TCS (Triple Crown Service) to compete with motor carriers for traffic between the Northeast and the Carolinas, something it cannot do using the Hagerstown route."

As may be seen, direct intermodal rail freight operation on the NEC is shorter in miles and permits direct competition with trucks, thus fulfilling one of the primary stated objectives of the Railroad Control Application presently before the STB.

North of Newark, New Jersey, the alternate routes to the NEC stated in the CSXT and NS operating plans are the proposed CSXT route to Boston via the existing Conrail lines: i.e. River Line to Albany and the Boston Line to Boston, or, as proposed by NS, the Hagerstown/ Harrisburg/ Scranton/ Binghamton/ Schenectady/Hoosac Tunnel route via Norfolk Southern, Delaware & Hudson (Canadian Pacific) and Guilford Transportation Industries lines.

Based on the NS statement quoted above, neither of these routes permit Triple Crown Services (TCS) or single container-on-flatcar intermodal (which can also operate through Penn Station) to directly and effectively compete with highway trucking along the entire north-south I-95 route.

Thus, extension of joint passenger/freight operations along the NEC through New York City and northeast to Boston and New England is the only practical competitive intermodal alternative to continued highway truck congestion.

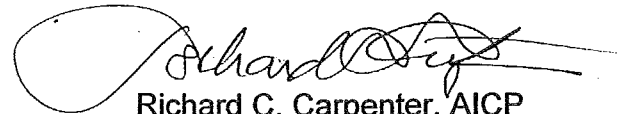

PROPOSED ACTION BY THE SURFACE TRANSPORTATION BOARD

Accordingly, we advocate that the EIS include a full review of this proposal, including the impact of a continuation of the status quo on air quality, safety, health and the economy. Such a review would be performed with a view toward persuading the STB to grant approval of the Railroad Control Application with appropriate conditions, namely, 1) permit and require operation of Roadrailer and single container-on-flatcar service through New York City via Penn Station to New Haven, Connecticut and beyond, and 2) require, in the interest of competitive rail freight service, joint access along this route to both CSXT and NS.

We fully acknowledge and appreciate that the freight service on the NEC should be high speed and compatible with intercity passenger and commuter rail operations.

Thank you for this opportunity to offer our comment.

Respectfully submitted,

Richard C. Carpenter, AICP
Executive Director

station location is adjacent to the Wheels Bus "pulse point" station in downtown Norwalk, and would provide direct connections from the station to employment sites throughout the city.

Danbury Peak-Hour Train Service

There is also a need for additional train service on the Danbury branch of the railroad, particularly running north during the peak afternoon rush hour. At present, there is inadequate rush hour train service running north to Danbury, even though there are many workers now commuting into the Region from the Danbury area each day. The addition of northbound train service between 4:45 and 6:00 PM would increase the convenience and efficiency of using mass transit to commute into the Region to work, a major goal of the 1995 Regional Plan. As a direct result of SWRPA efforts, PM peak hour northbound service was initiated in July, 1995. However, additional service is needed.

Increase Use of Rail System for Interstate Freight

A major contributing factor to the severe congestion and air quality problems plaguing the northeast corridor is the truck traffic which must use the region to get from New England to New York and points south and west. While the completion of I-287 in northern New Jersey offers a new way for truck traffic to bypass New York City and the South Western Region, going up the New York State Thruway to

The northeast corridor rail system can support additional freight usage to alleviate road congestion. Here, an Amtrak mail express train passes through Stamford station.

Newburgh instead of using the George Washington Bridge and I-95, additional freight traffic should be shifted onto the Region's rail network.

A new proposal for the larger tri-state region would greatly facilitate the transfer of some truck freight to rail lines. The Access to the Core plan being developed jointly by the Port Authority of New York and New Jersey, the Metropolitan Transit Authority, and New Jersey Transit would include provisions for direct rail freight access to Manhattan, possibly via the West Side Line and Oak Point link to New England, and to Long Island via the Hell Gate Line. Also, Road-Railer and single-container-on-flatcar service should be inaguarated through the Penn Station

Additional commuter parking lots, such as this satellite lot in Westport, are encouraged to increase rail usage.

tunnels. SWRPA supports the development and implementation of plans which could substantially reduce truck traffic and congestion throughout the Northeast Corridor.

7.5 Plan Policies

SWRPA's adopted transportation policies address a wide range of legislative, physical planning, and demand management issues:

- Encourage development of a balanced transportation system which uses a variety of modes operating in a complementary way to save energy, reduce congestion, improve air quality and highway safety, strengthen urban centers, and finally, to meet the needs of

all residents, including the transit-dependent and the disabled. Human-scale design and "traffic calming" techniques should be used.

- With the knowledge that financial resources are limited, analyze alternative fiscal and technical transportation strategies to meet regional needs. Such alternatives should:
 1. Promote truck-competitive, intermodal rail freight service along the Northeast Corridor.
 2. Promote shuttle buses to and from railroad stations.
 3. Promote improvement of highway safety laws, especially speed limits, and elimination of defective equipment on cars, buses and trucks. Increase State Police Troop "G" staffing to enforce safety laws. Increase weigh station operation and education in driving safety practices.
 4. Promote the use of less convenient locations and higher parking charges for single occupancy vehicles and also a weight/distance tax for heavy trucks.

7.6 Between Now and 2005

Seven specific areas of planning and programming emphasis are needed to help achieve the goals of the regional plan for improved transportation management and reduced automobile and truck traffic on the

Region's limited-access highway network.

- Complete capital maintenance programs for the Metro-North New Haven commuter rail line, ensuring continued and enhanced service, including through service at Stamford-New Haven to Hartford.
- Plan and implement an improvement program for U.S. Route 7 and Route 1 corridors. The SWRMPO should continue to advocate the completion of new U.S. 7 to Danbury.
- Continue traffic safety and traffic management improvements for U.S. Route 7, the Merritt Parkway, and I-95, especially:
 1. Construct the full interchange between the Merritt Parkway and U.S. 7, and extend New U.S. 7 from Grist Mill Road to Route 33 South in Wilton.
 2. Exit 8 approaches to I-95.
- Begin to shift some long haul truck freight to intermodal rail freight along the Northeast Corridor rail line.
- Provide for additional commuter parking at rail stations along the entire line to encourage transit use.
- Complete the planned enhancement of Stamford's Transportation Center, with expanded capacity through the use of center island platforms.
- Plan for the effect of additional traffic to and from outside the Region due to economic development not under our control.

LETTER TO GOVERNOR ROWLAND

**METROPOLITAN
PLANNING
ORGANIZATION**

One Selleck Street Suite #210 East Norwalk, CT 06855
Telephone: 203-866-5543 Fax: 203-866-6502

June 18, 1997

Hon. John G. Rowland
Room 200
State Capitol
Hartford, CT 06106

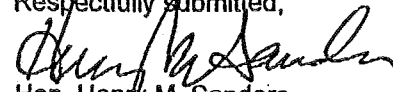

Dear Governor Rowland:

The South Western Region Metropolitan Organization has been deeply interested in the rail freight service which will result from the division of Conrail between the Norfolk Southern Corporation (NS) and the CSXT Corporation (CSXT). We respectfully urge you, as Governor, to request the Surface Transportation Board to amend the proposal before it to provide for the shared use of the entire Northeast Corridor. This would provide for competition along the Northeast Corridor and will encourage enhanced intermodal rail freight service, to ease congestion on I-95.

The mutual agreement reached in April between NS and CSXT provides that only CSXT will take over Conrail in New England and east of the Hudson River, including Conrail's trackage rights over Metro North between New York City and New Haven. NS by contrast, had proposed direct operation of "Road Railer" and single containers on flatcars through Penn Station, and directly along the Northeast Corridor toward Boston. CSXT now proposes the more circuitous routing (over 100 miles longer) from Boston west to Albany, thence south along the west bank of the Hudson River to Northern New Jersey. NS clearly states that it had been working out all operating concerns relating to direct operations thru Penn Station with Amtrak and the Long Island Railroad and with Metro North for operation on the New Haven Line.

We note that the CSXT/NS agreement of April 1997 allows for the joint use of the Amtrak Northeast Corridor from Philadelphia to Newark, which shares track space with New Jersey Transit and SEPTA trains. Accordingly, we urge that this same principle of shared usage could and should be extended eastward, across the Hudson River at least to New Haven, where Conrail trackage rights end. Continuation east and north in cooperation with the several existing regional railroads would then be possible. The proposed division of Conrail between NS and CSXT is now before the Surface Transportation Board for a decision.

Respectfully submitted,

Hon. Henry M. Sanders,
Chairman

FREIGHT SERVICE

Background

The South Western Region is situated along the primary freight service route to and from New England. Along the Northeast Corridor, within the South Western Region, the two transportation facilities which are available for freight transport are I-95 and the Northeast Corridor Rail Line, known locally as the New Haven Rail Line.

There is not a single through freight train operating east of New York City on the Northeast Rail Corridor. While the use of the Northeast Rail Corridor is restricted by low overhead clearance, horizontal clearance restrictions, intensive passenger train use, the Penn Station tunnels are the only direct crossing of the Hudson River and limited terminal facilities. This line is, however physically capable of accommodating "Road-Railer" and "Single-stack container" trains as well as freight cars that are not "over dimension".

Currently, all through rail freight which enters and leaves New England uses two rail routes through western Massachusetts. Trains from northern New Jersey and points south are forced to travel 150 miles north to Albany to cross the Hudson Rivers. This circuitous route increases the cost of rail shipments and increases delay so the a major portion of New England freight is moved by truck.

As noted in the South Western Region Long Range Transportation Plan 1993-2013, additional freight movement problems included:

1. Congested highways and streets slow trucks in many areas. This is compounded by poor curbside management.
2. Reliable delivery schedules are hard to maintain as a result of highway crowding; incidents, accidents, and construction delay; and circuitous routings caused by commercial traffic restrictions and outmoded, insufficient highway infrastructure.
3. Freight costs are high, relative to the rest of the nation, because of highway congestion, construction, incidents, also minimal use of rail, and the higher costs of doing business in the New York area. There is a lack of competitive warehousing and distribution centers east of the Hudson River.
4. Air pollution, particularly carbon monoxide and particulate matter, is generated by trucks and is locally intensified by prolonged truck idling and congestion. No effective air pollution control measures for large trucks exist at present.
5. Highways, along with water mains and other subsurface infrastructure, are damaged and fail at a faster rate as a result of heavy truck use. There are many missing, restricted or insufficient highway links.

Recent Developments and Proposals

There are three recent developments and proposals which affect the viability of rail freight in the South Western Region.

1. Proposed Merger of Eastern Railroads

Late in 1996, Conrail and CSXT railroad management announced plans to merge into a single railroad. This would reduce the number of major railroads in the eastern U.S. from three to two-the other being the Norfolk Southern Corporation. Norfolk Southern opposed the proposed CSX/Conrail merger and made a counter proposal. Negotiations are underway between the three companies. A final public determination will be made by the Surface Transportation Board which is the successor to the Interstate Commerce Commission (ICC). The Coalition of Northeastern Governors have adopted a policy concerning this merger, which calls for competitive service and Norfolk Southern representatives have publicly proposed and are actively pursuing the operation to "Road Railer" type and single container on flatcar intermodal trains directly through the Penn Station tunnels and along the Northeast Corridor/New Haven Rail line into southern New England. This proposal is consistent with the South Western Region transportation policy for many years.

2. New York Harbor Tunnel

Early in 1997, Mayor Rudolf Giuliani of New York City, proposed a rail freight tunnel under New York Harbor, which would provide a direct full clearance rail connection between the national rail freight system and New York City and New England.

3. Rhode Island Proposed Containerport

Rhode Island voters recently approved a state bond issue to finance capital improvements for a containerport on Narragansett Bay at the former Naval Air Station at Quonset Point. Direct North East Rail Corridor freight service connections would benefit this facility.

Process

Continue to monitor freight activities and studies and to participate in the Connecticut Public Transportation Commission (CPTC) and other organizations that discuss or impact freight. Findings and recommendations will be incorporated into future Transportation Plans and programs as appropriate.

Recommendations

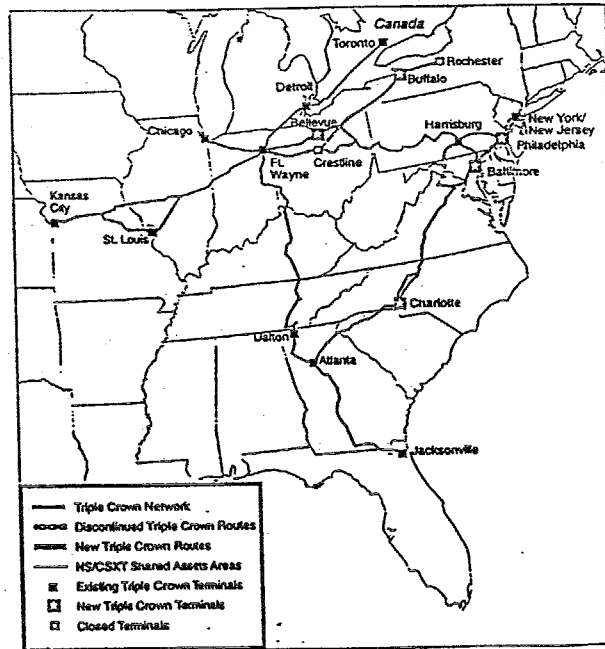

- Improve Rail Competitiveness
 - a. Revise public policy to actively promote and subsidize if necessary high-speed intermodal rail freight service along the Northeast Corridor via the Penn Station's tunnels, and directly along the Northeast Corridor Rail line.

- b. Provide full overhead clearance sufficient for "double-stack" containers. Encourage Connecticut to cooperate with New York, Rhode Island, and Massachusetts in this venture.
 - c. Continue advocacy through the Connecticut Public Transportation Commission (CPTC) as well as direct recommendations to appropriate state officials and the intermodal policies of the South Western Region Long Range Transportation Plan.
 - d. Identify and propose solutions to barriers to rail freight transport.
- Support those railroads who desire to provide high-speed intermodal rail freight service along the Northeast Corridor through New York City.
 - Support competitive rail freight service for New York City and all of New England by at least two major national railroads.
 - Support the proposed New York Harbor rail freight tunnel.
 - Support Incident Management Activities to reduce incident related congestion
 - Improve truck efficiency and safety
 - a. Support increased State Police patrols on I-95 and continue current enforcement activities.
 - b. Continue to support truck inspection activities.
 - c. Integrate freight movement, such as requiring off-street loading areas, into site planning, design and approval process. Provide incentives for retrofitting existing buildings with off-street loading areas.
 - d. Support alternative-fuel truck fleets.

LOCATION MAP OF NORTHEAST CORRIDOR RAIL LINE (NEC)

Certification of Richard C. Carpenter

Richard C. Carpenter, certifies under penalty of perjury as follows:

I am the Executive Director of the South Western Regional Planning Agency located in the southwestern corner of the State of Connecticut, at 1 Selleck Street, Suite 210, E. Norwalk, Ct. 06855. As such I am familiar with truck and rail traffic in southwestern Connecticut, the greater New York/New Jersey area, and in Southern New England.

Interstate Route 95, which traverses southwestern Connecticut, and is the most direct and only water level interstate route into New England, is one of the most heavily used truck routes in the United States. Heavy truck congestion on that highway is a major economic, safety and environmental problem.

At present, trucks servicing southern New England and crossing the Hudson River, have several options for access to the rest of the nation. They may use the Massachusetts Turnpike Bridge (I-90), the Newburg/Beacon Bridge (I-84) the New York Thruway Bridge (I-287) or the George Washington Bridge (I-95 and I-80). I understand that CSX Norfolk Southern intend to launch a major marketing campaign to service New England traffic from their terminals in Northern New Jersey. To the extent that this strategy is successful it will exacerbate the already critical truck traffic congestion, particularly on route I-95. Safety of motorists will be gravely affected and the already horrendous environmental problems associated with this heavy concentration of trucks will increase in direct proportion to the success of the CSX-NS marketing effort. A continued and indeed a successful effort by the rail industry to serve the New England market from New Jersey, instead of crossing the River directly by rail to New York City or Southern Connecticut points, is therefore directly contrary to the public interest and should not be allowed.

The Providence and Worcester Railroad and the Petitioners state that conflicts with passenger services eliminate service on the Northeast Corridor as a viable option or limit it to such an extent that the Board need not consider it. I attach hereto as Exhibit H, a copy of the New Haven Railroad April, 1946 employee timetable, (#159) which shows all scheduled passenger, and mail and express train movements between New York City and New Haven. I also attach as Exhibit I hereto a copy of the July, 1946 New Haven Railroad freight service timetable which lists all through freight movements. I note that in 1946, the same track structure as exists today was in service, with the exception that there are now three instead of four tracks for the short distance of 12 miles from Devon to New Haven, Connecticut. However, in 1946, the signal system on this line was considerably less sophisticated than today. Then, the signal system provided for two tracks east and two tracks west, instead of the four track bi-directional traffic control system that exists today, which provides considerably greater train capacity. Train speeds are slightly higher today, as compared with 1946.

The following train density comparisons are of interest:

	1946	1998
New Rochelle-Stamford	228 Passenger 22 freight	225 passenger 5 freight
Total	250	230
Woodmont-New Haven	111 Passenger 24 Freight	83 passenger 3 freight
Total	135	86
Pelham Bay-Hellgate Bridge	29 passenger 22 freight	27 passenger 2 freight
Total	51	29

The argument that there is no track capacity for freight services is not consistent with the former record of the New Haven Railroad.

Institution of freight service on the Northeast Corridor through New York would provide New England shippers with the first viable alternative to truck service since the Penn Central ended through freight services via the Bay ridge (Brooklyn) - Greenville (New Jersey) car floats.

RoadRailer service through Pennsylvania Station in New York is feasible. I personally attended tests of RoadRailer equipment through Pennsylvania Station of August 3, 1982. I saw RoadRailer trains passing through the station. Indeed, I am depicted in the photograph of that test which was published in Railway Age, Exhibit B to the affidavit of John F. McHugh above. Single container-on-flatcar (COFC) through the Penn Station tunnels is also feasible. Just such rail intermodal equipment presently runs at high speed through the Channel Tunnel between and England and France.

The reduction of truck dependence in New England and the reduction of emissions from truck traffic on Route 95 both in Connecticut and in New York State, are high regional priorities and the Board should not approve any plan which fails to address this truck congestion and emissions problem. The congressional proposal takes immediately available, practical steps to open two new access routes for this traffic to be handled by rail. Clearly, this constitutes a reasonable step to mitigate the effects of the planned CSX-NS marketing effort and would both better serve the shippers of this region with lower cost as well as more reliable services. Most significantly, the environment will be significantly improved to the extent that any such service is successful which is in marked contrast to the effect of the present CSX-NS proposal. Indeed, at a public meeting of the Connecticut Public Transportation Commission, in early 1997, but prior to their negotiations with CSX, representatives of Norfolk Southern stated their desire to operate Roadrailer and single container-on-flatcar (COFC) trains through the Penn Station tunnels.

Dear Ms. Kaiser

Attached is State of Delaware House Concurrent Resolution No. 59 and ten copies passed January 29, 1998, by the House of Representatives and Senate of the State of Delaware General Assembly.

The Resolution urges the Surface Transportation Board to reserve for future passenger rail use that portion of the existing Conrail lines in the State of Delaware that are included in the merger transaction of Conrail by Norfolk Southern Railroad and CSX Railroad.

Please consider this submission for the Finance Docket No. 33388 regarding the "Proposed Conrail Acquisition."

If there are any questions about the resolution of the Delaware General Assembly, please do not hesitate to contact me .

Sincerely,

Senator Harris B. McDowell, III, chair
Senate Energy and Transit Committee

HOUSE CONCURRENT RESOLUTION NO. _____

JAN 29 1998

URGING THE SURFACE TRANSPORTATION BOARD TO RESERVE FOR FUTURE PASSENGER RAIL USE THAT PORTION OF THE EXISTING CONRAIL LINES IN THE STATE OF DELAWARE INCLUDED IN THE MERGER TRANSACTION OF CONRAIL BY NORFOLK SOUTHERN RAILROAD AND CSX RAILROAD.

1 WHEREAS, the Surface Transportation Board is presently accepting public
2 comment on a Draft Environmental Impact Statement, Finance Docket No. 3388; and

3 WHEREAS, the Surface Transportation Board's Draft Environmental Impact
4 Statement pertains to the "Proposed Conrail Acquisition" regarding CSX Corporation and
5 CSX Transportation, Inc., Norfolk Southern Corporation and Norfolk Southern Railway
6 Company; and

7 WHEREAS, this proposed Conrail acquisition by Norfolk Southern Railroad and
8 CSX Railroad will impact the people of Delaware now and in the future; and

9 WHEREAS, the House of Representatives and Senate recognize the benefits
10 which accrue to the people of this state by the presence of the existing Conrail rail lines
11 throughout this state;

12 NOW, THEREFORE:

13 BE IT RESOLVED, that the House of Representatives and Senate of the 139th
14 General Assembly believes that it is extremely important to the economy of this state to

15 reserve the use of the existing Conrail rail lines that are included in the merger transaction
16 by Norfolk Southern Railroad and CSX Railroad.

17 BE IT FURTHER RESOLVED, that by reserving the use of these existing
18 Conrail rail lines they will be available for future passenger rail service.

19 BE IT FURTHER RESOLVED, that the preservation of these existing Conrail
20 rail lines for future passenger rail service will contribute significantly to the reduction of
21 VOCs and other air-borne pollutants, as identified by the Clean Air Act, as well as carbon
22 dioxide and other greenhouse gases.

23 BE IT FURTHER RESOLVED, that a copy of this House Concurrent Resolution
24 be delivered immediately to the Surface Transportation Board, 1925 K Street, NW,
25 Washington, DC 20423-0001.

SYNOPSIS

This Resolution urges the Surface Transportation Board to consider the preservation of existing Conrail rail lines in this state for future passenger service.

RE: CSX and Norfolk Southern control and acquisition of Conrail; Draft Environmental Impact Statement (DEIS)

Dear Ms. Kaiser:

Attached is the original letter containing the DE SHPO's comments on the DEIS, fax cover sheet, and fax confirmation, regarding the above-referenced. Ten copies of these documents, as well as this letter, are also enclosed.

I would like to add two editorial comments concerning the DEIS. First, it would be helpful if the FEIS contained more detailed maps of the rail segments under consideration. In Delaware, several of the line segments are very close together, making it difficult to identify segment starting/ending points on the small scale maps provided in the DEIS. Second, the DE SHPO's previous correspondence with STB (letter dated October 16, 1998), was not included with other SHPO correspondence in Appendix M of the DEIS.

Thank you for your consideration of these comments. If you have any questions, please do not hesitate to contact me.

Sincerely,

Gwen Davis

RE: CSX and Norfolk Southern control and acquisition of Conrail; Draft Environmental Impact Statement (DEIS)

Dear Ms. Kaiser:

Thank you for providing us with the DEIS documents. Our comments concern sections relating to compliance with Section 106 of the National Historic Preservation Act, generally, and issues affecting the State of Delaware, specifically. Where relevant, specific sections of the DEIS are cited.

APPROACH TO CULTURAL RESOURCES

In general, the DE SHPO finds the Surface Transportation Board, Section of Environmental Analysis (SEA)'s approach to identifying historic properties, and determining potential impacts thereon, to be inconsistent with Section 106 of the National Historic Preservation Act, and its implementing regulations (36 CFR Part 800).

In a number of locations within the DEIS, SEA indicates that it considers only construction and abandonment activities to be relevant to effects on historic properties. Appendix G (Volume 5A), specifically states that traffic changes for rail segments, rail yards, and intermodal facilities have "little effect" on historic and cultural resources. However, SEA provides no justification for this statement. It could well be argued that an increase of eight (8) trains per day on a line that runs through a historic district would have an effect, as defined in 36 CFR Part 800.9(a), and

Adverse Effects, as defined by 36 CFR Part 800.9(b)(2) and (3), specifically. We recognize that SEA had to develop and apply several criteria to address various environmental effects, such as noise and air quality. Nevertheless, SEA should recognize that even if these thresholds, either for environmental analysis or for significance, are not met by a certain rail segment, it does not necessarily mean that the Criteria of Adverse Effect established under 36 CFR Part 800.9(b) do not apply.

SEA also indicates that the Board is limited to imposing mitigating conditions on the Applicants only in circumstances involving abandonment and new constructions. This is cited as an additional reason for not looking at historic properties in terms of effects from the other three identified activity areas. However, this limitation does not impede the SEA from making recommendations for mitigation on a host of other environmental areas affected by activities that do not relate to abandonment or construction, as evidenced in Volume 4.

Volume 1, Chapter 3, Section 3.13.3 discusses potential mitigation strategies for effects on historic properties. SEA indicated that "typically", the Board will require HABS/HAER documentation for effects on structures. Although this is recognized as a standard mitigation measure, the SEA also should recognize that 36 CFR Part 800 requires that avoidance and minimization alternatives to Adverse Effects also be considered.

The SEA's discussion of "typical" Board requirements for mitigation of archaeological properties also seems to lack consideration of avoidance of resources, and is inconsistent with the Advisory Council's regulations. The DEIS states that the railroad will be required to "cease construction or abandonment salvage activities if significant archaeological resources are identified during salvage of a rail line approved for abandonment or new construction of a rail line. Activities could resume after the railroad contacts the appropriate SHPO regarding identification and evaluation of any artifacts that have been discovered." This is a reversal of the steps required by 36 CFR Part 800.4, and sets all such projects up as 800.11 situations (addresses unanticipated discoveries). Additionally, it appears to entrust the reporting of "significant archaeological resources" to rail construction workers, who may not have the expertise to identify such properties.

DELAWARE

Volume, 3A Chapter 5-DE describes the potential impacts to Delaware. Only four of the nine rail segments met the Board's threshold for environmental analysis. SEA did not find that transportation, energy, hazardous materials/waste sites, natural resources or land use/socioeconomics were relevant technical areas for analysis in Delaware. (This seems to contradict

chart provided in Executive Summary, which indicates that several lines met the threshold for HAZMAT issues). Of the remaining technical areas, SEA found that only Cultural Resources required further study (i.e, compliance w/Section 106 re Shell Pot Bridge). Nevertheless, SEA will also recommend coordination among CSX and concerned groups in the City of Newark regarding existing and future safety concerns, particularly at-grade crossings, despite the fact that the increase in rail traffic was not considered significant by the Board's standards. Volume 4 provides SEA's Preliminary Recommended Environmental Mitigation for these two issues, in comments Numbers 13 and 25, respectively. The DE SHPO concurs that these recommendations are appropriate.

However, in general, the DE SHPO views the Section 106 process to be incomplete for the entire undertaking, not just the Shell Pot Bridge. Specifically, 36 CFR Part 800.4 and 800.5 (identification, evaluation and determination of effects on historic properties), have not been appropriately addressed. Appendix G contains an overview of the SEA's research concerning identification and evaluation of historic properties. SEA identifies steps such as background research, development of historic contexts, application of the National Register of Historic Places criteria, and application of 36 CFR Part 800.9 (criteria of effect). In another section--Volume 3A, Chapter 5-DE--SEA indicates that, apparently through this process, they determined the Shell Pot Bridge to be eligible for the National Register. Note, however, that the DE SHPO has not received any formal Determination of Eligibility for this property. To the best of our knowledge, the only information SEA collected concerning this property is that which we ourselves provided to your consultant, McGinley Hart. Recently, the Delaware Department of Transportation has provided a draft historic context for railroad bridges. This may prove helpful in the formal evaluation of this, and other affected properties in Delaware.

The DE SHPO also provided information concerning other resources or potential resources on/near the Shell Pot Connector, as well as on the main CSX and Amtrak (NEC) lines; information on the latter was sent to the Applicants' consultant, Dames and Moore. We have no indication that the presence of these properties has been taken to account. Neither of the consultants visited our office to acquire complete information on known and potential historic properties in the Area of Potential Effect for the project. In particular, the Northeast Corridor, historically known as the Wilmington Rail Viaduct, is itself an identified historic property, that includes rail lines, bridges, and other related structures. Significant traffic increases are expected on rail segments on the Northeast Corridor. The STB and/or the Applicants will need to formally address affects on this historic property.

Letter to E. Kaiser
January 30, 1998

**RE: Draft Environmental Impact Statement, Proposed Conrail Acquisition,
Comments from the Delaware Department of Transportation (DelDOT)**

Dear Ms. Kaiser:

The Delaware Department of Transportation (DelDOT) has reviewed the Draft Environmental Impact Statement (EIS) for the proposed Conrail acquisition by CSX and Norfolk Southern (NS). We find the report clear and concise in some areas of analysis. However, there are several unresolved issues that must be addressed and further detailed. For your records, the Department and State strongly recommend that the Surface Transportation Board's Section of Environmental Analysis (SEA) consider or conditionally accept the following comments and conditions before the final analysis of the EIS may be evaluated.

Specifically, there are several areas:

Air Quality

The Department feels that the determination of air quality impacts in Delaware have been collected and evaluated incorrectly.

Emission estimates within the EIS show that the increased countywide air pollutant emissions will exceed the threshold for New Castle County, Delaware. The assessment also concludes that there will be localized increases in emissions, a concern for many Delawareans. However, the analysis of determining the overall impact with mitigation measures was

evaluated on a regional basis. We feel that impacts with mitigation measures should be determined on a localized basis, since the entire freight operations are a stationary or linear source.

In addition, the EIS in Delaware also states that increases in air pollution are not likely to affect compliance with air quality standards. However, there is no proof or concurrence in this statement or assessment. In order to be consistent with NEPA guidelines, the Department would like to see a concurrence letter from the Delaware Department of Natural Resources and Environmental Control's Air Quality Branch. The letter should state that there will be no impacts to air quality standards in New Castle County and within the State.

Within the evaluation table for Annual NO_x Emission Summary in New Castle County, the Department feels that truck diversion will not have immediate decrease of 49.18 annual tons per year. In addition, the denominator that is used to conclude a .61% increase in county NO_x emissions is outdated. Specifically, the analysis used to compare and evaluate the Existing County Total NO_x emissions comes from a 1995 figure. With such an outdated base figure, the overall percent increase of air pollution may be reaching the 1% threshold. The Department feels that updated information and numbers are necessary to fully determine and summarize the air quality analysis. The applicants "Netting" criteria used is not the best method, since it only dilutes numbers and figures.

In evaluating the air pollution data for Delaware, the anticipated NO_x emission from freight rail will be approximately 184.85 annual tons per year. From an overall basis in New Castle County, this amount may be considered significant in Delaware (despite it not exceeding a countywide 1% increase). In Delaware, we consider this additional amount significant due to our smaller and localized region. As a result, the Department further suggests that the SEA should conditionally accept the proposed Conrail acquisition only if proper coordination, permits, and/or concurrence has been obtained from the Delaware Department of Natural Resources and Environmental Control's Air Quality Branch.

Commuter Service and Passenger Rail Service

DelDOT, through the cooperation of SEPTA officials, has contracted for a major commuter line and station in Newark, DE (along the Amtrak's Northeast Corridor). This station and location is key to the multimodal system and the administration's mission in providing alternative transportation choices. The passenger service of SEPTA in Newark to Wilmington and locations further north has been a major regional investment in this State. Future plans not indicated within the EIS assessment are to expand this SEPTA service line and offer service within the Stanton, DE region (i.e. Churchmans Crossing). Why was this not considered?

What is also questionable within the EIS report is that the Department's commuter rail service (SEPTA in Delaware) operates over freight carriers. However, the EIS also mentions that freight carriers operate over regional commuter lines (i.e. DelDOT's new SEPTA contract).

The Department is not sure what to believe and is concerned over the contradictions of these statements. These need clarification.

Overall, will the Conrail acquisition impact the Department's future plans for additional frequency and times for commuter rail service along the Amtrak northeast corridor? The Department would like to know, in writing or in proof, that the Delaware regional commuter service (i.e. the DelDOT - SEPTA contract) will not be impacted currently or into the future. This also includes additional commuter rail service plans to expand service and frequency of times. There is no indication of this within the EIS report.

Cultural Resources

According to the NEPA guidelines, all additional bridges, building facilities, and rail yards that are expected to be improved or updated (as indicated) may be considered a secondary impact. Therefore, an inventory of existing facilities should have been historically evaluated.

Overall, the Department agrees that NS shall undertake no construction or modification of the Shellpot bridge near Wilmington, DE, until completion of the Section 106 process of the National Historic Preservation Act (16 U.S.C. 470f., as amended) and appropriate mitigation measures are identified. However, with this commitment, the Department cautions the interpretation of what is considered "appropriate" mitigation. Over the years, DelDOT's coordination on past and current projects with the Delaware State Historic Preservation Office (DE SHPO) has not always been a give and take process. It is the Department's belief that cultural resource measures obligated by applicants will be extended beyond the most feasible, reasonable, and appropriate measures as desired by the applicants. The DE SHPO has and will require measures that extend beyond the reasonable and feasible thresholds that may seem appropriate under the Section 106 regulations. In sum, the applicants may not adhere to the DE SHPO measures for cultural resource identification, alternative analysis, and appropriate mitigation.

Environmental Justice

The Department would like to know how the applicant obtained information in Delaware for evaluating the social-economic data of land uses and people who live along the rail lines. How did they conduct, collect, or verify the data to determine that minority or a low-income population did not meet the threshold for further environmental justice analysis? It seems that there was no field evaluation or consultation with area representatives, so this evaluation could be incorrectly documented.

The EIS report indicates that a copy of the report has been placed/sent to area locations with high proportions of minority and low income populations. However, the applicants never considered the time, transportation needs, literacy, and ability to understand and interpret such a lengthy, complex, and professional document. By the time an individual or community is aware and can understand the available information and associated impacts, it is after the fact.

Therefore, the Department would like to know in what areas of Delaware's minority and low-income populations was this EIS report made available. Who are the points of contact and were they explained the background of the project? Were they able to explain or understand the associated impacts so they could disseminate information out into their community?

Hazardous Waste

Two rail line segments, Wilsmere to Elsmere (C-084) and Bell to Edgemore (N-010), were determined in the executive summary as exceeding threshold limits in hazardous material. However, within the individual report and analysis for Delaware, there was no discussion or mention of this exceeded threshold. In fact, within the Delaware Summary of Analysis (Vol. 3-A), the applicants determined that the site specific analysis did not apply. The Department questions this analysis due to inaccuracies in indication levels. Will the Conrail acquisition impact hazardous waste threshold limits? The Department does not know because there are two different assessments within the EIS. The Department would like this formal analysis clarified and a response back to the Department before any final EIS decision is reached. In addition, the Department would also like proper time allotted in order to determine and respond to the SEA if there is a hazardous waste threshold limit exceeded in Delaware.

Areas of Special Concern – Newark, DE

The EIS mentions that the increase in freight trains may have minor adverse effects on the public (particularly pedestrian) safety, noise, emergency vehicle response, and hazardous material transport. The EIS determined that the minor increase in train traffic would have only a minor incremental effect on the community. However, this increase will tend to worsen the pre-existing conditions. In fact, they will be aggravated by the increased train traffic.

The Department concurs with the preliminary recommendation that CSX shall consult with local agencies, the University of Delaware, DelDOT, and other appropriate parties to address potential safety concerns regarding the three highway/rail at-grade crossings in Newark. Specifically, CSX shall meet with these parties to negotiate a binding mutual agreement on the implementation and funding allocation for measures to address safety concerns at these crossings. Appropriate measures could include quadrant gates, pedestrian gates and fences, pedestrian overpasses, safety education, or other measures to address pedestrian safety.

At this point, there have been no appropriate alternative mitigation measures by freight carriers that have included consultation with the Department. Since the Department feels that mutual agreements stated above may never be reached before the release of the final EIS, the Department feels that additional measures shall also be included as a developing alternative mitigation.

As an additional provision, there are several overpasses and underpasses that pose as an immediate problem for traffic and pedestrian/bike safety. It is the Department's position

that CSX shall also consult with local agencies, the University of Delaware, DelDOT, and other appropriate parties regarding overpasses and underpasses throughout the Newark, DE. Specifically, one example is located at Casho Mill Road in Newark.

Further Analysis Needed – Cumulative Impacts

It appears that the EIS overlooks the induced, additive, and synergistic impacts of cumulative impacts.

The EIS states that both CSX and NS plan to undertake future facility improvements in Delaware as part of the proposed Conrail acquisition. As it stands, the proposed Conrail acquisition related activity that would meet or exceed the Board's thresholds for environmental analysis in Delaware include increased train operations on a total of four line segments.

However, the Department disagrees with the assessment that there are no intermodal facilities or rail yards that would meet or exceed the Board's thresholds for environmental analysis. The Department requests that the EIS report further analyze and list increases in specific activities at certain intermodal facilities and rail yards.

The EIS also states that Delaware shippers would gain new and more efficient routes and services. Even the Port of Wilmington would gain extended market reach to the midwest and southeast through the expanded CSX and NS networks. As it stands, the proposed Conrail acquisition related changes would be largely limited to changes in train operations on existing rail lines. However, with the extended market outreach expected there are also futures costs and secondary impacts/changes that are brought upon the State's transportation system. This was not addressed in the EIS.

Because the SEA did not take into account the increased freight activity with preventative maintenance provisions, the Department feels that safety operations in both freight and passenger/commuter rail operations in Delaware was inaccurately evaluated. In addition, the SEA did not accurately assess and conclude in estimating the potential risks of an accident.

The Department would like to know how maintenance agreements for safety concerns and operations will be addressed. The safety and increased maintenance concerns are also important factors for passenger operations through Delaware. What will be the future maintenance agreements shared by Amtrak, CSX, NS, and other governing agencies such as DelDOT?

Overall, the Department would like a commitment that maintenance of facilities and infrastructure needs will consider improvements that go beyond replacing in-kind structures or the least expensive options. For example, the overpass at Casho Mill Road in Newark is a one lane overpass that is extremely dangerous and is a safety concern. A longer span bridge is needed to address concerns both for rail service and transportation service along the road. When this bridge is replaced (or any other for this matter) the Department, along with many governing agencies, public officials, and citizens, feels that multimodal needs and the safety

for this bridge should be addressed. This would include the provision of signs, lighting, sidewalks/bike lane additions, drainage, clearance, traffic calming, and/or wider travel lanes.

Within the EIS, the Department would like to know how CSX and NS plan to undertake facility improvements so as not to inhibit potential impacts caused by hazardous waste, traffic flow, multimodal investments and facilities, cultural and historic resources (including bridges and stations), noise, and passenger traffic. Even though the immediate Conrail acquisition may not immediately impact intermodal facilities and rail yards, future actions will. For example, the EIS states that there will be certain facility improvements in the future. How can the SEA properly consider any secondary impacts when CSX and NS appear to be segmenting phases and projects for future actions? There should be a direct correlation with impacts indicated for all anticipated future actions and facility improvements.

As a result, the Department does not concur with the statement that "there will be no intermodal facilities and rail yards that would meet or exceed the Board's thresholds for environmental analysis and there are no new connections or proposed abandonment." The Department believes that a long-range plan for the entire rail network should be established.

In addition, the EIS states that increased freight and operations require rehabilitation of the Shellpot Bridge. However, was there a proper assessment done to ensure that other bridges and high maintenance areas are not easily prone to accelerated safety concerns (i.e. secondary impacts of safety not evaluated)? This would not only include other Delaware rail bridges (underpasses and overpasses), but other freight and intermodal facilities, traffic intersections, sensitive land uses, and anticipated expansion areas as indicated within the EIS.

Realizing that increased freight train activity would increase the probability of a freight train accident, the Department would also like an analysis or evaluation of the increased maintenance program. Specifically, there should be a base line structural analysis of bridges (at underpasses or overpasses, creeks/streams, etc.) and other anticipated maintenance areas. The EIS should discuss these existing base line conditions and how the expected weight and frequency travel consolidation will potentially increase maintenance operations.

As a specific provision in Delaware, the Department would like a commitment from the CSX and NS that they will partner with DelDOT both financially and administratively to determine that:

- On a continual basis, traffic and pedestrian safety at at-grade crossings and at overpasses and underpasses will be improved as reasonably needed or warranted.
- The Department would also like to see a document or special conditions for continual inspection of bridges, rail lines, and safety equipment (gating and lighting, etc.) at grade intersections.
- The SEA should also request a commitment for added maintenance. The Department and State do not expect rail companies to implement a maintenance or replacement program

February 4, 1998

solely after an accident occurs. We want to ensure that an accident never happens. The Department wants a formal commitment and dedication that maintenance and inspection schedules are implemented on a more frequent basis. These measures should be adopted and concurred before the SEA approves of the acquisition application.

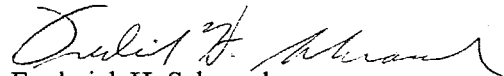

Noise

From the noise appendix table, the Department does not believe the consultants considered or measured sensitive noise receptors within the City of Newark. Noise study impacts in Newark should be considered because there are many sensitive receptors throughout this community.

The Department is also requesting that CSX and NS immediately commit to adopting and allocating funding programs towards implementing the future FRA rules on train horn blowing procedures. This should include a major commitment to instill or retrofit safety features, barriers, lights, and crossing arms, when required.

I hope that the Department's comments and stated positions are clear. If you have any questions or clarification, please contact me at 302-739-4575.

Very truly yours,

Frederick H. Schranck
Deputy Attorney General

Surface Transportation Board Finance Docket No. 33388: CSX Corporation and CSX
Transportation, Inc. Norfolk Southern Corporation and Norfolk Southern Railway
Company - Control and Operating Leases/Agreements - Conrail, Inc. and Consolidated
rail Corporation: Final Scope of the Environmental Impact Statement
Florida

Dear Ms. Kaiser:

In accordance with the procedures contained in 36 C.F.R., Part 800 ("Protection of Historic
Properties"), we have reviewed the referenced project(s) for possible impact to historic properties
listed, or eligible for listing, in the National Register of Historic Places. The authority for this
procedure is the National Historic Preservation Act of 1966 (Public Law 89-665), as amended.

A review of the Florida Site File indicates that no significant archaeological or historical sites are
recorded for or likely to be present within the project area. Furthermore, because of the project
location and/or nature it is unlikely that any such sites will be affected. Therefore, it is the opinion
of this office that the proposed project will have no effect on historic properties listed, or eligible
for listing, in the National Register of Historic Places.

If you have any questions concerning our comments, please do not hesitate to contact us. Your
interest in protecting Florida's historic properties is appreciated.

Sincerely,

George W. Percy, Director
Division of Historical Resources
and
State Historic Preservation Officer

RE: Docket No. 33388, "Proposed Conrail Acquisition"

Robert B. Hunter, AICP
Executive Director

Dear Mrs. Kaiser:

The Hillsborough County City-County Planning Commission has reviewed the draft Environmental Impact Statement, Docket No. 33388, "Proposed Conrail Acquisition." The Commission concurs with the findings of this report, namely, that this project will have no environmental impacts in Hillsborough County, with the exception of an increase in hazardous waste transport between Winston, FL and Plant City, FL (Site Id. C-403).

Consistent with the preliminary mitigation recommendation by the Surface Transportation Board's Section of Environmental Analysis (SEA), the Planning Commission would like to recommend that, at a minimum, CSX be required to bring the rail segment into compliance with Association of American Railroads (AAR) key route standards and practices prior to any increase in the transport of hazardous waste.

Thank you for the opportunity to comment on this project. Should you have any questions, future correspondence concerning this project should be directed to Shawn C. College, Senior Environmental Planner at (813) 272-5940.

Sincerely,

Robert B. Hunter,
Executive Director

RE: Surface Transportation Board - Finance Docket No. 33388 - CSX and Norfolk Southern -
Control and Acquisition - Conrail: Draft Environmental Impact Statement

Dear Ms. Kaiser:

The North Central Florida Regional Planning Council functions as the Regional Clearinghouse for Planning District III as designated by the State of Florida pursuant to Presidential Executive Order 12372.

The following comment is submitted on the above-referenced item in accordance with State Clearinghouse procedures.

The North Central Florida Regional Planning Council has no comment on this item.

Comments on this item were requested by the Council from 28 local governments located within the region. No comments on this item were received by the Council from any of these local governments. Please do not hesitate to call if you have any questions concerning this matter.

Sincerely,

Steven Dopp
Senior Planner

REC'D: 2/3/98

DOCUMENT # 2/3/98 11:23:18 AM

Dear Ms. Kaiser:

I am writing to you as a citizen of Cobb County, Georgia with comments and certain concerns regarding the draft environmental impact statement for the "Proposed Conrail Acquisition". My concerns relate to material in Volume 3A, Chapter 5, Section 5-GA, "Georgia Cumulative Effects". These concerns include the failure to include in Georgia's cumulative effects a related Norfolk Southern intermodal facility planned for Cobb County Georgia.

The proposed 830 acre intermodal facility would surround Clarkdale, Georgia, a historic village listed on the National Register of Historic Places. It would also severely impact 112 acres of wetlands through stormwater discharges, and destroy another 25 acres of wetland and replace them with retention ponds. In addition, the facility will place up to 1,643 additional tractor-trailors onto U.S. Highway 278 each day, severely impacting the air quality in Cobb County. Please note, Cobb County is a non-attainment area under the Air Quality Standards of the Clean Air Act. The existing traffic situation on U.S. Highway 278 is already bumper-to-bumper during peak hours each day.

As a result of the proposed project's detrimental effects on the densely populated residential areas which surround the proposed site, the local government with jurisdiction (Austell, Georgia) denied Norfolk Southern's request for a heavy industrial zoning. In an extremely unusual action that many feel violates the U.S. Constitution, Norfolk Southern then decided not to appeal the zoning, but rather obtained a federal court ruling that indicates the planned facility is NOT subject to local or state zoning laws or police powers.

Since the court ruling essentially leaves local or state governments with no authority to police or regulate railroad activities, we are totally dependent upon the federal NEPA and wetland process to review this planned facility. Again, we feel that this action is a gross misuse of the powers conferred by federal Interstate Commerce statutes.

We are asking that the Army Corps require a separate environmental impact statement for the proposed Cobb County facility. The Federal EPA has agreed with our initial assessment (that the project requires additional review), and we are waiting on the Army Corps' wetland permit decision.

Please note, the Georgia impacts outlined in your "Proposed Conrail Acquisition" Draft Environmental Impact Statement DO NOT contain the correct impact information for Georgia. We would ask that the Draft Impact Statement, and your Georgia analysis be modified to include the impact information outlined for Cobb County in the Army Corps' and EPA's review.

Thank you for the opportunity to comment on these matters. Please note that all of the local governments in this region of Georgia (Cobb County, Douglas County, Cities of Powder Springs, Austell, Clarkdale, Douglasville, and East Point) are on record opposing this facility. In addition, our congressman (Rep. Barr) and state legislators are also working with us on this situation.

Sincerely,

Brian Williamson
4690 Springgate Drive
Powder Springs, GA 30073

U.S. Army Corps of Engineers
P.O. Box 889
Savannah, Georgia 31402-0889

SUBJ: Norfolk Southern - 970001170

Dear Colonel Smith:

This is in response to your request for comments on the above referenced public notice. Norfolk Southern is seeking to impact approximately 24.8 acres of wetlands in connection with construction of an intermodal terminal facility on an 830 acre site. The facility will be used to annually shift up to 600,000 trailers or containers to and from rail cars. As mitigation for the project's wetland impacts the applicant originally proposed to preserve 87.6 acres of wetlands, and create 21.4 acres of wetlands. The applicant also proposed creating 21 acres of "bioretention" ponds. The proposed impact site is located near Austell, Cobb County, Georgia.

The Environmental Protection Agency (EPA) has reviewed the public notice and the large amount of supporting information provided by the applicant about the project. EPA has also reviewed many of the comments from environmental organizations and members of the public. Our review of the information raised a number of concerns regarding the project. We presented the concerns in detail in our letter of October 6, 1997, and recommended that the permit for the project, as proposed at that time, be denied. Our primary areas of concern were the scope of the alternatives analysis and the proposed compensatory wetland mitigation plan. We also acknowledged the many comments EPA has gotten from the public concerning stormwater impacts, noise, water quality impacts in the watershed, changes in land use, air quality impacts, increased traffic, and impacts to historic resources among others. EPA recommended that your office evaluate these issues to the fullest extent in the public interest review and under the National Environmental Policy Act. This is particularly important due to the applicant's apparent exemption from local land use controls.

On October 20, 1997, Robert Lord of my Wetlands Section Staff met with representatives of Norfolk Southern and members of your North Section staff to discuss EPA's concerns. Norfolk

Southern presented additional information on the alternatives analysis, which appears to have been more extensive than what was described in the application. Norfolk Southern also proposed additions and amendments to the compensatory wetland mitigation plan. These proposed changes and additional information made considerable progress in addressing EPA's concerns. However, we have yet to receive written documentation of the proposed changes to the application.

Since our October 6th letter, EPA has received additional comments and information from the public and local governments concerning the project. We have not fully evaluated this information. Unfortunately the Memorandum of Agreement on Section 404(q) does not allow much time between the 3(a) and 3(b) letters to address changes to a project by the applicant or to respond to a large volume of comments generated by a project such as this one. Also, your office has scheduled a public hearing on this project for November 12, 1997. We intend to have a representative attend the hearing and will would like to factor the public's comments into our evaluation of the project.

Therefore, based on the information currently on hand and yet to be reviewed, and pending the public hearing, our original concerns with this project have yet to be resolved. Thus, EPA has determined that this project does not comply with the Section 404(b)(1) Guidelines and we recommend that a permit for the project, as originally proposed, be denied. EPA has also determined that this project, as originally proposed, will impact aquatic resources of national importance and we retain the option to refer this project through the procedures outlined in the 1992 Memorandum of Agreement between EPA and the Department of Army, Part IV, Elevation of Individual Permits, paragraph 3(b), regarding Section 404(q) of the Clean Water Act.

Thank you for the opportunity to review this public notice. We look forward to continuing to work with your office, the applicant and other interested parties to resolve our concerns with the project. Should you have any questions regarding our comments, please contact Robert Lord of the Wetlands Section at 404-562-9408.

Sincerely,

John H. Hankinson, Jr.
Regional Administrator

SAVANNAH DISTRICT, CORPS OF ENGINEERS

NORTH AREA SECTION
3485 NORTH DESERT DRIVE
BUILDING 2, SUITE 102
ATLANTA, GEORGIA 30344

AUG 07 1987

REPLY TO
ATTENTION OF:

Regulatory Branch
970001170

JOINT PUBLIC NOTICE
Savannah District/State of Georgia

The Savannah District has received an application for a Department of the Army Permit, pursuant to Section 404 of the Clean Water Act (33 U.S.C. 1344), as follows:

Application Number: 970001170

Applicant:

Norfolk Southern
Attention: Mr. Larry Etherton
99 Spring Street, SW.
Atlanta, Georgia 30303

Location of Proposed Work: The site is located between C. H. James Parkway/U.S. 278 and Austell Powder Springs Road in Austell, Cobb County, Georgia. The site is traversed by Westside Road and Mathis Drive and includes Sweetwater Creek. The site is adjacent to but does not include the Thread Mill Mall or the associated historic neighborhood of Clarkdale.

Description of Work Subject to the Jurisdiction of the U.S. Army Corps of Engineers: To fill 24.76 acres of wetlands, streams and impoundments during the construction of an intermodal facility on an 830 acre site. The applicant proposes to impact 24.76 acres of the total 137.17 acres of waters of the U.S. found on the site. The applicant proposes to preserve 87.6 acres of wetlands, create 21.4 acres of wetland and 21.03 acres of bioretention. Bioretention would occur in the 4 detention facilities proposed for the site. These detention basins would be designed to provide wetland habitat and be planted with mast producing tree saplings. Wetland creation would occur at three on-site locations which are adjacent to Sweetwater Creek. These three sites would be excavated to a depth to intercept groundwater, planted with wetland plant species and monitored for 5 years to determine the success of the sites.

This facility would be used to shift the transportation of containers and trailers between highway and rail movement. The facility would be designed to handle 600,000 trailer/container lifts annually onto or off of rail cars. The facility would include 31,000 feet of rail loading and unloading track to accommodate 310 rail cars (each 100 feet in length), contain

54,000 feet of rail, support/storage track and 15,000 of rail lead track. The facility would also include 5,000 trailer/chassis parking spaces and 2,600 spaces for container storage.

The water quality control measures would consist of both structural and biological measures. A Spill Prevention Control and Countermeasure Plan and a Stormwater Pollution Prevention Plan would be developed for the facility before it is put into operation. In addition, control structures would be installed on all storm drain outfalls and on the detention pond outlet structures. This would allow isolation of any spilled material and would prevent the discharge of any material to Sweetwater and Powder Springs Creeks. Runoff from the equipment maintenance area would be pretreated using an oil/water separator prior to discharge into the sanitary sewer system. The stormwater detention ponds would be designed to provide sediment storage and a degree of nutrient uptake thereby reducing nitrogen and phosphorus loading in the receiving streams.

BACKGROUND

This Joint Public Notice announces a request for authorizations from both the U.S. Army Corps of Engineers and the State of Georgia. The applicant's proposed work may also require local governmental approval.

STATE OF GEORGIA

Water Quality Certification: The Georgia Department of Natural Resources, Environmental Protection Division, intends to certify this project at the end of 30 days in accordance with the provisions of Section 401 of the Clean Water Act, which is required by an applicant for a Federal Permit to conduct an activity in, on, or adjacent to the waters of the State of Georgia. Copies of the application and supporting documents relative to a specific application will be available for review and copying at the office of the Environmental Protection Division, Floyd Towers East, Suite 1070, 205 Butler Street, SW., Atlanta, Georgia 30334, during regular office hours. A copying machine is available for public use at a charge of 25 cents per page. Any person who desires to comment, object, or request a public hearing relative to State Water Quality Certification must do so within 30 days of the State's receipt of application in writing and state the reasons or basis of objections or request for a hearing. The application can also be seen in the Savannah District U.S. Army Corps of Engineers, North Area Section, 3485 North Desert Drive, Building 2, Suite 102, Atlanta, Georgia 30344.

State-owned Property and Resources: The applicant may also require assent from the State of Georgia which may be in the form of a license, easement, lease, permit, or other appropriate instrument.

U.S. ARMY CORPS OF ENGINEERS

The Savannah District must consider the purpose and the impacts of the applicant's proposed work, prior to a decision on issuance of a Department of the Army Permit.

Cultural Resources Assessment: Review of the latest published version of the National Register of Historic Places indicates that no registered properties or properties listed as eligible for inclusion are located at the site or in the area affected by the proposed work. Presently unknown archaeological, scientific, prehistorical, or historical data may be located at the site and could be affected by the proposed work. According to the applicant, within the Area of Potential Effects, historic resources eligible for the National Register of Historic Places are limited to the existing Clarkdale Historic District. This historic site is located adjacent to the project site and would be adversely effected by its development. Ten archaeological sites were recorded during intensive surveys of the site. According to the applicant, these sites are recommended ineligible for the NRHRP and no additional investigations are recommended.

Endangered Species: Pursuant to Section 7(c) of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 et seq.), we request from the U.S. Department of the Interior, Fish and Wildlife Service and the U.S. Department of Commerce, National Oceanic and Atmospheric Administration, National Marine Fisheries Service, or any other interested party, information on whether any species listed or proposed for listing may be present in the area.

Public Interest Review: The decision whether to issue a permit will be based on an evaluation of the probable impact including cumulative impacts of the proposed activity on the public interest. That decision will reflect the national concern for both protection and utilization of important resources. The benefit which reasonably may be expected to accrue from the proposal must be balanced against its reasonably foreseeable detriments. All factors which may be relevant to the proposal will be considered including the cumulative effects thereof; among those are conservation, economics, aesthetics, general environmental concerns, wetlands, historic properties, fish and wildlife values, flood hazards, flood plain values, land use, navigation, shoreline erosion and accretion, recreation, water supply and conservation, water quality, energy needs, safety, food and fiber production, mineral needs, considerations of

property ownership and in general, the needs and welfare of the people. Extensive studies have been submitted by the applicant and included: flood hazards, water quality, air quality, traffic studies, noise impacts, light impacts, hazardous materials and wetlands.

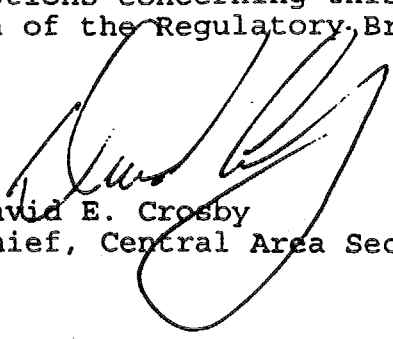

Consideration of Public Comments: The U.S. Army Corps of Engineers is soliciting comments from the public; federal, state, and local agencies and officials; Indian Tribes; and other interested parties in order to consider and evaluate the impacts of this proposed activity. Any comments received will be considered by the U.S. Army Corps of Engineers to determine whether to issue, modify, condition or deny a permit for this proposal. To make this decision, comments are used to assess impacts on endangered species, historic properties, water quality, general environmental effects, and the other public interest factors listed above. Comments are used in the preparation of an Environmental Assessment and/or an Environmental Impact Statement pursuant to the National Environmental Policy Act. Comments are also used to determine the need for a public hearing and to determine the overall public interest of the proposed activity.

Application of Section 404(b)(1) Guidelines: The proposed activity involves the discharge of dredged or fill material into the waters of the United States. The Savannah District's evaluation of the impact of the activity on the public interest will include application of the guidelines promulgated by the Administrator, Environmental Protection Agency, under the authority of Section 404(b) of the Clean Water Act.

Public Hearing: Any person may request, in writing, within the comment period specified in this notice, that a public hearing be held to consider this application for a Department of the Army Permit. Requests for public hearings shall state, with particularity, the reasons for requesting a public hearing. The decision whether to hold a public hearing is at the discretion of the District Engineer, or his designated appointee, based on the need for additional substantial information necessary in evaluating the proposed project.

Comment Period: Anyone wishing to comment on this application for a Department of the Army Permit should submit comments in writing to the Commander, U.S. Army Corps of Engineers, North Area Section, 3485 North Desert Drive, Building 2, Suite 102, Atlanta, Georgia 30344, no later than 30 days from the date of this notice. Please refer to the applicant's name and the application number in your comments.

If you have any further questions concerning this matter, please contact Mr. Aaron Valenta of the Regulatory Branch at (404) 763-7945.

Office of the Secretary
Case Control Unit
STB Finance Docket No. 33388
Surface Transportation Board
1925 K Street, NW
Washington, D. C. 20423-0001

CENTRAL ADMINISTRATIVE
REC'D: 2/2/98
DOCUMENT # 2/2/98

Dear Sirs:

ENVIRONMENTAL DOCUMENT

I have reviewed your Draft Environmental Impact Statement (Draft EIS) for the "Proposed Conrail Acquisition", Finance Docket No. 33388, issued by the Surface Transportation Board (STB), and would like to offer the following comments for your consideration and inclusion in the record.

The Draft EIS appears to be adequate except for the exclusion of one very important major project that is planned by the Norfolk Southern Railway Company (NS) - the construction and operation of an Intermodal-Rail Yard Facility in the Austell-Clarkdale-Powder Springs area in Cobb County, Georgia. This proposed 830-acre Intermodal-Rail Yard Facility is obviously linked if not directly dependent upon the Proposed Conrail Acquisition; and, it is clearly evident from the following data that this proposed Facility needs to become an integral part of the Draft EIS.

1. PROJECT LANDS

The proposed 830-acre project area is directly adjacent to the Boundaries of the City Limits of Austell, Clarkdale (a registered National Historic Site) and Powder Springs, Georgia. Project lands are relatively undisturbed and of valuable and highly productive mixed mature pine and upland hardwoods, bottomland hardwoods and 22 acres of highly productive unique wetlands. The woodlands are known to support excellent populations of deer, wild turkey, squirrel, rabbit and a wide variety of raptors and song bird species; whereas, the wetlands support good populations of game fish species, resident muskrat and beaver, as well as, resident and migratory waterfowl and wading bird populations. The waters immediately adjacent to the project area, Sweetwater and Powder Springs Creeks, also support the Alligator Snapping Turtle, a State Threaten reptile species, and the Highscale Shiner, a State Threaten fish species. In addition, the wetland areas that are proposed to be filled and destroyed also support a stand of a unique tree species - the Bald Cypress - which is far north of its normal northern range.

2. PROJECT FEATURES

The Project, as presently proposed, requires the excavation, filling, leveling and compacting some 450 acres of land. It is not known what NS plans to do with the remaining 380 acres of land, but it is anticipated that NS eventually plans to use these lands to expand their planned facility. Initial operation presently calls for 600,000 lifts annually, with a projected need of 800,000 lifts by the year 2005. To meet the initial need of 600,000 lifts annually, it is projected that 3,500 diesel semi-trucks (1 every 25

seconds), 100+ diesel powered trains (4 to 5 per trains/hour through the Cities of Austell, Clarkdale, and Powder Springs); and, a multitude of various types of diesel equipment will be operating in or adjacent to the project site daily. Based on this information, it is projected that there will be an increase of 25% in truck and train traffic in the area to meet the projected need of 800,000 lifts annually.

3. AIR QUALITY

The entire metropolitan Atlanta area, which consists of 14 Georgia Counties, is designated as a "Non-Attainment Area", or an area with significant air quality pollution levels. The Federal Highway Administration has formally advised the State of Georgia that if the air pollutant levels in the Metropolitan Atlanta area are not significantly reduced soon, Federal Highway Cost Sharing Funds will be withheld from the State. Therefore, one must question the rationale used by NS to develop the Austell/Clarkdale/Powder Springs Intermodal Facility when their present Inman and East Point Facilities and CSX's Georgia Facility are already contributing measurable air borne pollutants to the "Non-Attainment Area". Construction and operation of their proposed facility in Cobb County would obviously result in a further degradation of the air quality in this area potentially to hazardous breathing levels within the Cities of Austell, Clarkdale and Powder Springs as well as the immediately adjacent lands in Douglas and Paulding Counties.

4. WATER QUALITY

Construction and operation of the proposed Intermodal Facility will result in a 450-acre flat, level, compacted and paved (unvegetated) area interlaced with some 20 miles of track and a large number of semi-trailer parking spaces. Implementation of this project could result in substantial silt runoff into Sweetwater and Powder Springs Creeks during construction, and a considerable amount of pollutants being discharged during operational activities. For instance, on September 24, 1997, we experienced a 5.31 inch rainfall in the proposed project area. This would equate to nearly 20,000 acre feet of surface water laden with silt and/or contaminants spilling directly into Powder Springs and Sweetwater Creeks. As a result, a more elevated water level of Sweetwater Creek would have occurred in the Sweetwater Creek State Park area and in the Cities of Austell and Lithia Springs, as well as an elevated level of contaminants in Sweetwater Creek, a stream from which the Cities of Lithia Springs and East Point, Georgia, obtain their drinking water.

I also would like to bring to the attention of the STB the results of a December 1997 Well Feasibility Study recently conducted by Emery & Garrett Groundwater, Inc. for the City of Powder Springs. It should be noted that the Study Design was developed in mid-1996 with a primary objective to find additional water supply sources for the City of Powder Springs. Presently, most municipal and industrial water supplies in the Atlanta Metropolitan Area are derived from surface waters taken from rivers, streams and/or impoundments. Many, like the City of Powder Springs, are concerned that these water supplies will not be able to meet the rising demands for projected future withdrawal needs in view of the projected population growth rates in the area. Subsequently, this Study was contracted in June of 1997 before NS's proposed

Intermodal Facility in Cobb County was publicly advertised by the Savannah District Corps of Engineers in a August 7, 1997, Public Notice. It also must be pointed out that at no time during the Study was the Contractor made aware of the NS's proposed Intermodal Facility. The first phase of the City's Study was completed in December 1997 with the following findings:

- a. Six (6) potential water producing well siting locations were identified within the boundaries of the City of Powder Springs, with the potentially best producing Well Site being located on Powder Springs Creek immediately adjacent to and west of NS's existing rail line and north of the C. H. James Parkway (Ref. attached map).
- b. It also must be noted that this Well Site is adjacent to and just west of the proposed NS Intermodal Facility. Construction and subsequent operation of this facility could most certainly result in measurably less ground water recharge in the area as well as a significant contamination of this highly valuable drinking water source.

4. NOISE

It is firmly believed by many of the Cobb County citizens that the cumulative noise levels during the continual 24-hour operation of NS's Proposed Intermodal Facility will result in noise levels that could far exceed the dB comfort levels experienced by humans. A comprehensive study needs to be conducted by NS to determine the 24-hour cumulative average noise levels on all sides of the project area immediately adjacent to the site. Such a study needs to measure the 24-hour cumulative dB levels of the following equipment, all in simultaneous operation:

1.3 Stackers
26 Hostler Cabs
6 On site Diesel Tractors
3.4 Cranes and Sideloaders
4 On side Diesel Locomotives
3,500 diesel Trucks with Trailers
100 Diesel Locomotives with 50-100 Rail Cars¹

5. TRAFFIC

Traffic on the C. H. James Parkway is expected to become severely congested with the increase train and heavy truck traffic. It also is anticipated that the rates of minor and serious traffic accidents, along with the rate of human fatalities, are expected to substantially increase. Construction of the facility, as presently planned, will require the relocation of Westside Road directly across from the entrance of Garrett Middle School. This would result in increased commuter and semi-trailer traffic at the School entrance during both morning and evening school bus traffic periods, with a potential increase in

¹ Trains moving through or by the site, each to include an appropriate number of flat wheels.

hazardous traffic conditions for our school children. In the downtown Powder Springs area on the primary road entering the City from the West - Brownsville Road, present train traffic of approximately 50 trains/day currently creates significant traffic congestion problems. What will it be like with operation of the Intermodal Facility and 100 to 150 trains passing through the downtown area of Powder Springs each and every day?

6. AESTHETICS

No matter how high you build a levee or noise barrier, the site of a "Containerized Cargo Handling Rail Yard" along with that many diesel trains and such a large number of diesel trucks and trailers in what is now a relatively clean, undisturbed and unpolluted residential area, in the opinion of many if not most of the Citizens of Cobb County, is a totally unacceptable and unaesthetical addition to present environmental conditions. These factors in concert with the substantial increase in noise levels, air pollution, water pollution, traffic, traffic congestion, traffic accidents and the loss of a beautiful pleasing and picturesque scenic vista, in all probably would result in a severe degradation of our living environment.

7. ENVIRONMENTAL JUSTICE

The most immediate and severely impacted citizenry group in the entire proposed project area will be the residents of Clarkdale, Georgia. Not only is the entire Community included on the National Register of Historical Sites, but the Community basically consists of Senior Citizens living on low, fixed retirement incomes. Since this Intermodal Facility should definitely be an integral part of the "Proposed Conrail Acquisition", provisions of Executive Order 12898 must be taken into full consideration to prevent a disproportionately high and adverse environmental impacts to this Citizenry group.

8. GENERAL CONCERNS

For the record, a number of the groups or individuals that have taken formal positions of opposition to NS's proposed Intermodal Rail-Yard Facility as presently planned include the following:

U. S. Senator Paul Coverdale
U. S. Congressman Bob Barr
Georgia Senator Steve Thompson
Georgia Representative Earl Ehrhart
Georgia Representative Roy Barnes
Cobb County Commissioners
Douglas County Commissioners
Cobb Municipal Association
The City of Austell
The Community of Clarkdale
The City of Lithia Springs
The City of Powder Springs

The City of East Point
Many of the Citizens of Cobb, Douglas and Paulding Counties

In conclusion, I am of the opinion that the proposed NS Intermodal Facility must become an integral part of the Draft EIS for the "PROPOSED CONRAIL ACQUISITION". To do less, in my professional opinion, would violate the intent of the U. S. Congress with the passage of the National Environmental Policy Act (42 U.S.C. 4321), as amended, and do a great injustice to the Citizens of Cities of Austell, Clarkdale, Lithia Springs and Powder Springs, as well as those citizens in the unincorporated portions of Cobb County and adjacent lands in Douglas and Paulding Counties.

Sincerely,

Richard T. Huber Sr.

Attention: Elaine K. Kaiser
Environmental Project Director
Environmental Filing

RE: DECISION ID NO. 28629

Dear Ms. Kaiser:

This letter is in response to the December 12, 1997, Draft Environmental Impact Statement (EIS) sent to the Unified Government of Athens-Clarke County. In the EIS, comments were made about the feasibility of commuter rail between Athens and Atlanta and the impact the Conrail acquisition would have on a commuter rail line. Since the release of the Draft EIS in early December, an event has occurred which has increased the probability of commuter rail within the next 4-7 years.

To promote the commuter rail effort, the Governor of the State of Georgia has allocated approximately \$4 million for preliminary engineering for the corridor between Athens and Atlanta, making this segment a top priority. Presently, the Unified Government of Athens-Clarke County has allocated approximately \$2 million in sales tax revenues toward the design of a Multi-Modal Transportation Center (MMTC). The MMTC would serve as a transportation hub for the region and would also accommodate commuter rail.

These efforts at the state and local levels indicate the commitment of the transportation community to offer the public alternative ways to travel. It is the hope of the Unified Government of Athens-Clarke County that the acquisition of Conrail by CSX and Norfolk Southern will further this effort.

Please continue to keep us informed of all activities involving the acquisition of Conrail by CSX and Norfolk Southern, so that we may continue to effectively plan for the possibility of commuter rail in our region. As previously stated, commuter rail is a key element in the location and design of our Multi-Modal Transportation Center (MMTC) and the acquisition of Conrail could play a role in this development.

**ENVIRONMENTAL
DOCUMENT**

Attention: Elaine K. Kaiser, Environmental Project Director--Environmental Filing

Dear Ms. Kaiser:

The Atlanta Regional Commission (ARC) is the regional planning and intergovernmental coordination agency for the 64-city, 10-county Atlanta Region (Cherokee, Clayton, Cobb, DeKalb, Douglas, Fayette, Fulton, Gwinnett, Henry, and Rockdale counties). ARC also is the designated Metropolitan Planning Organization (MPO) under the Intermodal Surface Transportation Efficiency Act (ISTEA). It is in these capacities that we offer the following comments on the Draft Environmental Impact Statement (EIS) on the "Proposed Conrail Acquisition."

1. The Atlanta Region plus the adjoining counties of Paulding, Forsyth, and Coweta comprise a 13-county non-attainment area under the Clean Air Act Amendments. The Region's current problem is nitrogen oxides. The State of Georgia and the Atlanta Regional Commission are working very hard to meet air quality standards. The Draft EIS states that while there are localized increases in emissions, "the increases are not likely to affect compliance with air quality conformity." Any additional increases in nitrogen oxides are significant. In addition, we also are concerned about increases in volatile organic compounds, particulate matter, and carbon monoxide. Therefore, we request that the Final EIS more fully analyze this matter, particularly nitrogen oxides, on the Atlanta Region.

2. As the Atlanta Region attempts to meet air quality standards, commuter rail will be important to us as an alternative mode of travel. The Draft EIS should examine all opportunities for cooperation on commuter rail and both CSX and Norfolk Southern should be required to work with State Departments of Transportation on such opportunities as a part of the acquisition agreement.

3. At present both CSX and Norfolk Southern are proposing new intermodal facilities in the Atlanta Region--CSX in South Fulton County and Norfolk Southern in the City of Austell in Cobb County. We do not find reference in the Draft EIS to these proposed facilities and whether the acquisition will affect the impact of these facilities on the Atlanta Region.

Surface Transportation Board
January 30, 1998
Page 2

4. A concern pointed out by DeKalb County, one of our member counties, is that the total increase of hazardous materials traveling through DeKalb and the State of Georgia would more than double after the acquisition. Their recommendations (find attached) include bringing CSX rail line segments into compliance with the Association of American Railroads standards and practices for hazardous materials and to require CSX to develop Hazardous Materials Emergency Response Plan with the participation of county and municipal governments.

We appreciate the opportunity to comment on the Draft EIS and request that the Surface Transportation Board respond to the comments.

Sincerely,

A handwritten signature in black ink, appearing to read 'Harry West', is written over the typed name.

RE: Draft EIS on Proposed Conrail Acquisition by CSX/NS

Thank you for the opportunity to review the Draft EIS on the proposed Conrail acquisition. As a result of the proposed acquisition, the railroads would change the routing of many car loads of hazardous materials. While some rail lines would carry increased volumes of cars containing hazardous material, other lines would experience a shift of hazardous materials from one rail line to another. The total increase of hazardous materials traveling through DeKalb County (and the state) would more than double after the acquisition.

Both preliminary mitigation recommendations should be required to be completed before the acquisition is approved. The first recommendation is to bring CSX rail line segments into compliance with the Association of American Railroads standards and practices for hazardous materials. The second recommendation, that CSX develop a Hazardous Materials Emergency Response Plan with the participation of county and municipal governments, also should be required.

Another area of concern is with the air quality analysis. The Draft EIS states that while there are localized increases in emissions, "the increases are not likely to affect compliance with air quality." As the Atlanta region struggles with its Regional Transportation Plan (RTP) to meet air quality conformity, any additional increases in nitrogen oxides, volatile organic compounds, particulate matter, and carbon monoxide are significant. Although no details are given for the air quality analysis, conformity is an important issue for the region and some sort of mitigation should be recommended.

Sincerely,

Raymond R. White, Planning Director

Subject: Finance Docket No. 33388 - CSX and Norfolk Southern - Control and Acquisition - Community notification

Attn: Elaine K. Kaiser
Environmental Project Director
Environmental Filing

Good day,

Thank you for your letter directed to me as alderman on the Danville City Council on the above subject, giving notice that comments from the public are welcome. The following comments are submitted not as an alderman but as a property owner and resident of Danville at 311 East 3rd Street, Danville, IL.

My husband, Bill, and I share environmental and rail traffic concerns. Our property at 311 East 3rd Street (7.6 acres) abuts the Norfolk Southern Railroad bed northeasterly approximately 865 feet, between East 3rd Street and South Street, Danville.

Since our purchase of this property we have been very concerned about several areas the Draft Environmental Impact Statement addresses.

SAFETY:

A. Grade Crossing Safety

1. I challenge the number of trains the railroad indicated that run daily on the Norfolk-Southern line between Lafayette, Indiana and Tilton, Illinois.
2. Considering an engineer must actually see a red or green light before proceeding; the 3rd Street crossing (No. 479864Y) is blocked with gates down frequently each day. There have been several times that the 3rd Street crossing has been blocked for more that one hour and forty-five minutes (1' 45") and many, many times in excess of 20 minutes. The blocking of the 3rd Street crossing jeopardized our personal safety and compromises the integrity of our home in case or fire or other emergency. Our home within the city limits on the east side of the railroad bed, however the fire hydrant that would be used in case of a fire is west of the tracks. Blocked crossing - we have a big problem.

When the crossing has been blocked by a train for more than twenty (20) minutes we have called 911 to file a report and complaint . We have filed complaints with different departments in the City of Danville government: mayor, fire chief, police chief, and public works director, to no avail. **My personal feeling is: the railroad companies make up a multi-billion dollar empire with powerful P.A.C. support. When a gray-haired grandma calls 911 to complain about a train blocking 3rd Street in Danville, the railroad personnel smile at each other, say "So.....who cares!" and goes back to the "big board" in Atlanta.**

East 3rd Street is a **major artery for pedestrian and automobile traffic** traveling from South Gilbert Street east and then south/west to South View Middle School on Ninth Street and into a dense residential area . One solution to trains blocking the 3rd Street crossing is to build an overpass east on Fourth Street, from South Gilbert across the tracks to Highland Blvd.

Safety: you bet'cha I am concerned if rail transportation increases without the improvement of scheduling and/or building an overpass across the NS railroad bed.

3. I suggest that you secure documentation of fatalities at grade crossing in the Danville area.

TRANSPORTATION:

A: I realize whether we are in a **bull or bearish economy** the transportation of hard goods increases each year. The semi tractor/trailer industry can not move the products with as much efficiency as the railroads. I have no objection to the expansion of the railroads only if they solve the problem areas listed on your Proposed Acquisition Fact Sheet, i.e. safety, traffic, air quality, water quality, noise, cultural/historical resources and energy with **safety being the number one issue.**

AIR QUALITY:

A: With the increase in trains/diesel units, how much diesel effluent will be put into the air? Here I have special concerns since I am asthmatic and must continually medicate for irritants and allergens. The effluent particles invade homes and increase household chores with the homemaker continuously fighting dirt and dust deposits. How many additional tons of effluent will be discharged into the air adding to our pollution problems.

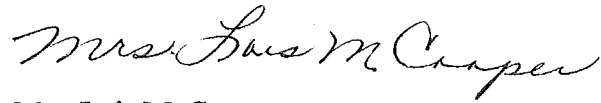

ENVIRONMENTAL IMPACT:

A: The steel in the rail bridge that spans the Vermilion River appears to be flaking. The integrity of this structure brings serious questions of safety. Will there be repair work done on this structure **before** increased rail traffic?

B: We walk in our woods frequently. We found bundles of railroad ties abandoned on our property along with remnants of steel beams. Will there additional environmental problems left un-corrected?

Thank you for allowing me to submit my comments on the Norfolk Southern and CSX Proposition. If I can furnish further information please write, phone or Email. A public hearing would negate mis-information that gets passed along during the finalization of proposition such as the NS/CSX/Conrail merger.

Respectfully,

A handwritten signature in cursive script that reads "Mrs. Lois M. Cooper".

VILLAGE OF TILTON

P. O. Box 6008
201 W. 5th Street
Tilton, Illinois 61833
Conrad (Dutch) Wantland
(217) 442-4178

January 9, 1998

CENTRAL ADMINISTRATIVE UNIT
REC'D: 1/15/98
DOCUMENT # 1/19/98 1:37:16 PM

To Whom it may concern;

In response to the Finance Docket No. 33388:

The Village of Tilton has a major problem with the railroad adding 14 more trains, that would be crossing on 14th street crossing. We are now in a constant struggle in trying to keep the crossing open because of the 24 trains, plus the switching of cars, that is done on the 14th street crossing. We have tried to work with the railroad on many occasions to solve the problem, by adding 14 more trains a day the only solution would be for the CSX and Norfolk Southern to build a viaduct or overpass, over the 14th street crossing. It is very important that the crossing be left open, as that is the only East West street connecting the Central Park area, of Tilton with the emergency vehicles, such as ambulance and fire trucks and the police. To use the alternate route, add 5 to 10 minute on the response time, and as you know that could be a matter of life and death.

Your help on this problem would be greatly appreciated. Enclosed is a newspaper clippings stating some of the problem the Village of Tilton are having.

A handwritten signature in cursive script that reads 'Conrad Wantland'.

Conrad Wantland
Mayor of Tilton

More train traffic possible for Tilton

By JODI HECKEL
News-Gazette Staff Writer

TILTON — The village of Tilton could be seeing a lot more train traffic — and street traffic tie-ups — if a proposed railroad merger is approved.

Tilton Mayor Conrad "Dutch" Wantland told village board members on Thursday that the proposed merger would increase the number of trains traveling through the village daily to 41. About 24 trains now pass through the village each

day.

The increased traffic would be the result of a proposed acquisition of Conrail by the CSX and Norfolk Southern railroads.

The trains travel along the Norfolk Southern tracks between Tilton and Lafayette, Ind. The train traffic has generated complaints from residents that say trains block the railroad crossing at 14th Street and back up traffic for extended periods of time.

When that crossing is

blocked, they say the only way to get between the east and west sides of town is over the G Street overpass or by taking the Cathin-Tilton Road on the north side of town.

"It will just close that road more," Wantland said. "Right now, it's a problem. Adding 17 more trains will really be a problem. We were looking for help, not something to close it more. That's a major east-west road for our emergency vehicles — our police, our fire, our

ambulance. Nothing short of an overpass would cure the situation."

Wantland said he received information about the increase in train traffic from the Surface Transportation Board, which is conducting an environmental analysis of the effects the proposed acquisition will have. Wantland said he will request the railroads pay for a viaduct over the tracks to alleviate the

See TILTON, A-6

Tilton

Continued from A-1

problem.

Last January, village officials voted to raise the fine on railroads that block street crossings from \$5 per offense to \$500. But the village backed off the plan a month later, citing the cost of enforcing the ordinance.

Trustees decided to let prosecutors enforce a state law on the matter.

The Surface Transportation Board will make its decision on the acquisition in July.

In other business:

■ Gutterridge asks for demolition help. Michael Gutterridge, owner of Gutterridge Harley-Davidson, 1606 Georgetown Road, told the board he is plan-

ning to expand his business to the west. He said he is hoping to purchase the land at S W. 16th St., where Dyno-Tune is now located.

Gutterridge said he wants to build an addition onto his building that would extend 80 feet to the west and put a larger parking lot to the west of that where the Dyno-Tune business is located. He asked the village to help by removing the Dyno-Tune building.

"My request is not out of line because I can't receive money from the TIF or enterprise zone as some new businesses have," Gutterridge said.

He did not have a cost estimate for demolition.

The board expects to vote on the question at its February meeting.

Dear Ms. Kaiser:

Our office has reviewed the Draft Environmental Impact Statement for the Proposed Conrail Acquisition. The statements in Volume 3A of the report regarding cultural resources in Illinois are accurate. We look forward to further consultation regarding the interlocking tower at 75th Street in Chicago and the archaeological investigations at Exermont. If you have any questions, please contact either Ms. Tracey Sculle, Cultural Resources Manager, 217/785-3977 or Mr. Joseph Phillippe, Staff Archaeologist, 217/785-1279.

Sincerely,
Anne E. Haaker

Dear Elaine K. Kaiser,

We heard that you are closing the Conrail railroad tracks, between Danville & Paris in Illinois. Therefore, we are interested in purchasing the land, two miles North of Chrisman near marker mile post 106.72. Our family, has owned land on both sides of the tracks, for over 125 years.

We would like to know who to contact, in order to purchase the land, or more information about what we need to do. If you would like to contact us, are phone number is (217)269-3007, after 6 p.m., or a phone number for us to call, to speak to someone in charge of this.

Sincerely yours,

Joe & Rita Mitchell

RE: Comments on Draft Environmental Impact Statement - Finance Docket No. 33388
Proposed Conrail Acquisition

Dear Ms. Kaiser:

I have reviewed the draft EIS for Finance Docket No. 33388 regarding both the proposed operational changes and construction projects as they would affect Champaign County and have the following comments.

1. Safety: Highway/Rail At-Grade Crossings

According to the EIS the criteria of significance for Class A crossings is a projected increase of .01 accidents per year. Class A Crossings are defined as ones with a current accident rate of .015 or more.

The EIS indicates that all Champaign County crossings fall below these thresholds except for CR 1000 E (TR 134D, FRA ID. 479930J). This crossing, located at the west edge of the Village of Tolono, is a Class A crossing with 3 accidents in the last 5 years and is projected to have an increase in accidents of .0118 [Table 5-IL-8]. The EIS notes, however, that "...these predicted increases (were found) to be below the criteria of significance." [p. IL-14]. This finding contradicts the SEA's criteria of significance. While the projected increase in the accident rate by itself is only slightly above the threshold of significance the current accident rate is forty times the threshold value!

I believe that by the SEA's criteria this is a significant and problematic crossing. It sees heavy semi-trailer truck traffic from a nearby grain storage facility and the crossing geometry is very poor (see enclosed Map No.1).

The CR 1000 E crossing should be studied in detail and possible mitigation measures should be evaluated.

2. Transportation: Passenger Rail Service

Impacts on the two daily Amtrak trains that serve Champaign County* will be proportionate to the increase in potentially conflicting freight train movements that could cause a delay to the Amtrak trains. These will arise from increased traffic on the Illinois Central related to NS trackage rights between Chicago, Kankakee and Gilman and by crossing movements at Kankakee, Tolono, Tuscola and Effingham. The City of New Orleans may also be affected by operating changes further south.

According to the EIS the proposed acquisition will lead to an increased NS train frequency using trackage rights on the Illinois Central between Kankakee and Gilman of five trains per day which is partially offset by a small reduction in crossing movements at Kankakee (-2.6 tpd). Additionally the additional train frequency on the NS (*nee* Wabash) line will add approximately 18 potential conflicting crossing movements at Tolono and the proposed new connection at Sidney will also add 6 potentially conflicting crossing train movements on the Union Pacific at Tuscola which will be offset by a similar reduction at Effingham. Any increase in potentially conflicting movements between Effingham and New Orleans appears to be small. Approximately 20 additional potentially conflicting train movements will be added between Chicago and Carbondale. Some additional conflicting movements may be added further south.

The SEA analysis only considers increased train movements on lines over which passenger trains also operate. It does not consider impacts from increased train movements through crossings or interlocking plants that intersect such lines. This is particularly important since railroads not hosting Amtrak trains through a given crossing or interlocking plant have no incentive to ensure on-time performance for the affected Amtrak trains. The SEA analysis concludes that the impacts on Amtrak operations in Illinois are not significant but there is likely to be some negative impact on the on-time performance of Amtrak trains operating on the Illinois Central.

The analysis of impacts should consider increases in potentially conflicting train movements at crossings or interlocking plants particularly where such crossings or inter-lockings are under the control of the railroad not hosting Amtrak trains.

* Nos. 58/59, the *City of New Orleans* and Nos. 391/392 the *Illini*.

3. Transportation: Roadway Crossing Delay

The SEA analysis sets a threshold of an increase of 8 tpd and an existing traffic volume of 5,000 ADT for its analysis of potential crossing delays. The EIS does not include analysis of the Ill. Rt. 130 crossing at Philo which the SEA indicates has an ADT of 3,500. Illinois Department of Transportation maps, however, indicate that this crossing had an ADT of 6,400 in 1991* and is anticipated to experience an increase of 18 tpd in train movements. (See enclosed Map No. 2).

Our data indicates that this crossing exceeds the threshold of significance and it should be evaluated in detail.

* Traffic counts in 1996 were not conducted at the same location but other counts in the area suggests that traffic on this stretch of Ill. Rt. 130 has increased approximately 10% since 1991.

4. Noise

The EIS indicates that there would be an increase of 64% in train gross ton miles between Tilton and Decatur. This is estimated to increase the number of residences and other noise sensitive land uses experiencing significant noise impacts from 946 to 1,477 or 56% along this rail line segment. The analysis does not break down the location of noise impacted land uses by County or other civil division.

The most intensive impacts will be to areas near grade crossings and track crossings or turnouts. The former due to sounding locomotive horns on approach to the grade crossing and the former due to wheel impacts at points where the rails are interrupted. The greatest impacts in Champaign County are likely to be in the villages along the line (Homer, Sidney, Philo, Tolono, Sadorus and Ivesdale). Tolono will be particularly affected due to the noise associated with the Illinois Central crossing. The background noise level in Tolono, however, is higher because of the presence of the Illinois Central. SEA concludes that these impacts are significant but do not warrant mitigation.

The impacts in Tolono are likely to be severe and disproportionate. It would also appear that there may be room at the NS / IC crossing to provide noise barriers of some kind.

The noise impacts in Tolono should be studied in detail and potential mitigation measures investigated.

5. Land Use Socio/Economics

The Sidney project (Finance Docket No. 33888, Sub. 5) will involve the conversion of approximately six acres of prime farmland and the separation of about 28 acres into an irregularly shaped area which will impede cultivation of some additional small area. The Tolono project will occur entirely within existing railroad ROW and so raises few land use issues.

Increased noise in Tolono (see discussion above) may have a negative effect on some property values in the residential area along Dagy Street which is immediately adjacent to the NS/Illinois Central crossing. The existing nuisance created by the crossing may already be capitalized in the current value of these properties.

Pending the results of a detailed study of the noise impacts in Tolono it may be appropriate to evaluate the property value impacts in the most intensively affected areas in Tolono and provide for compensation to the landowners if no feasible mitigation measures are identified.

I hope these comments are useful. If you have any questions please feel free to contact me at any time. You may also reach me by e-mail at: fddpz@ccrpc.org.

Sincerely,

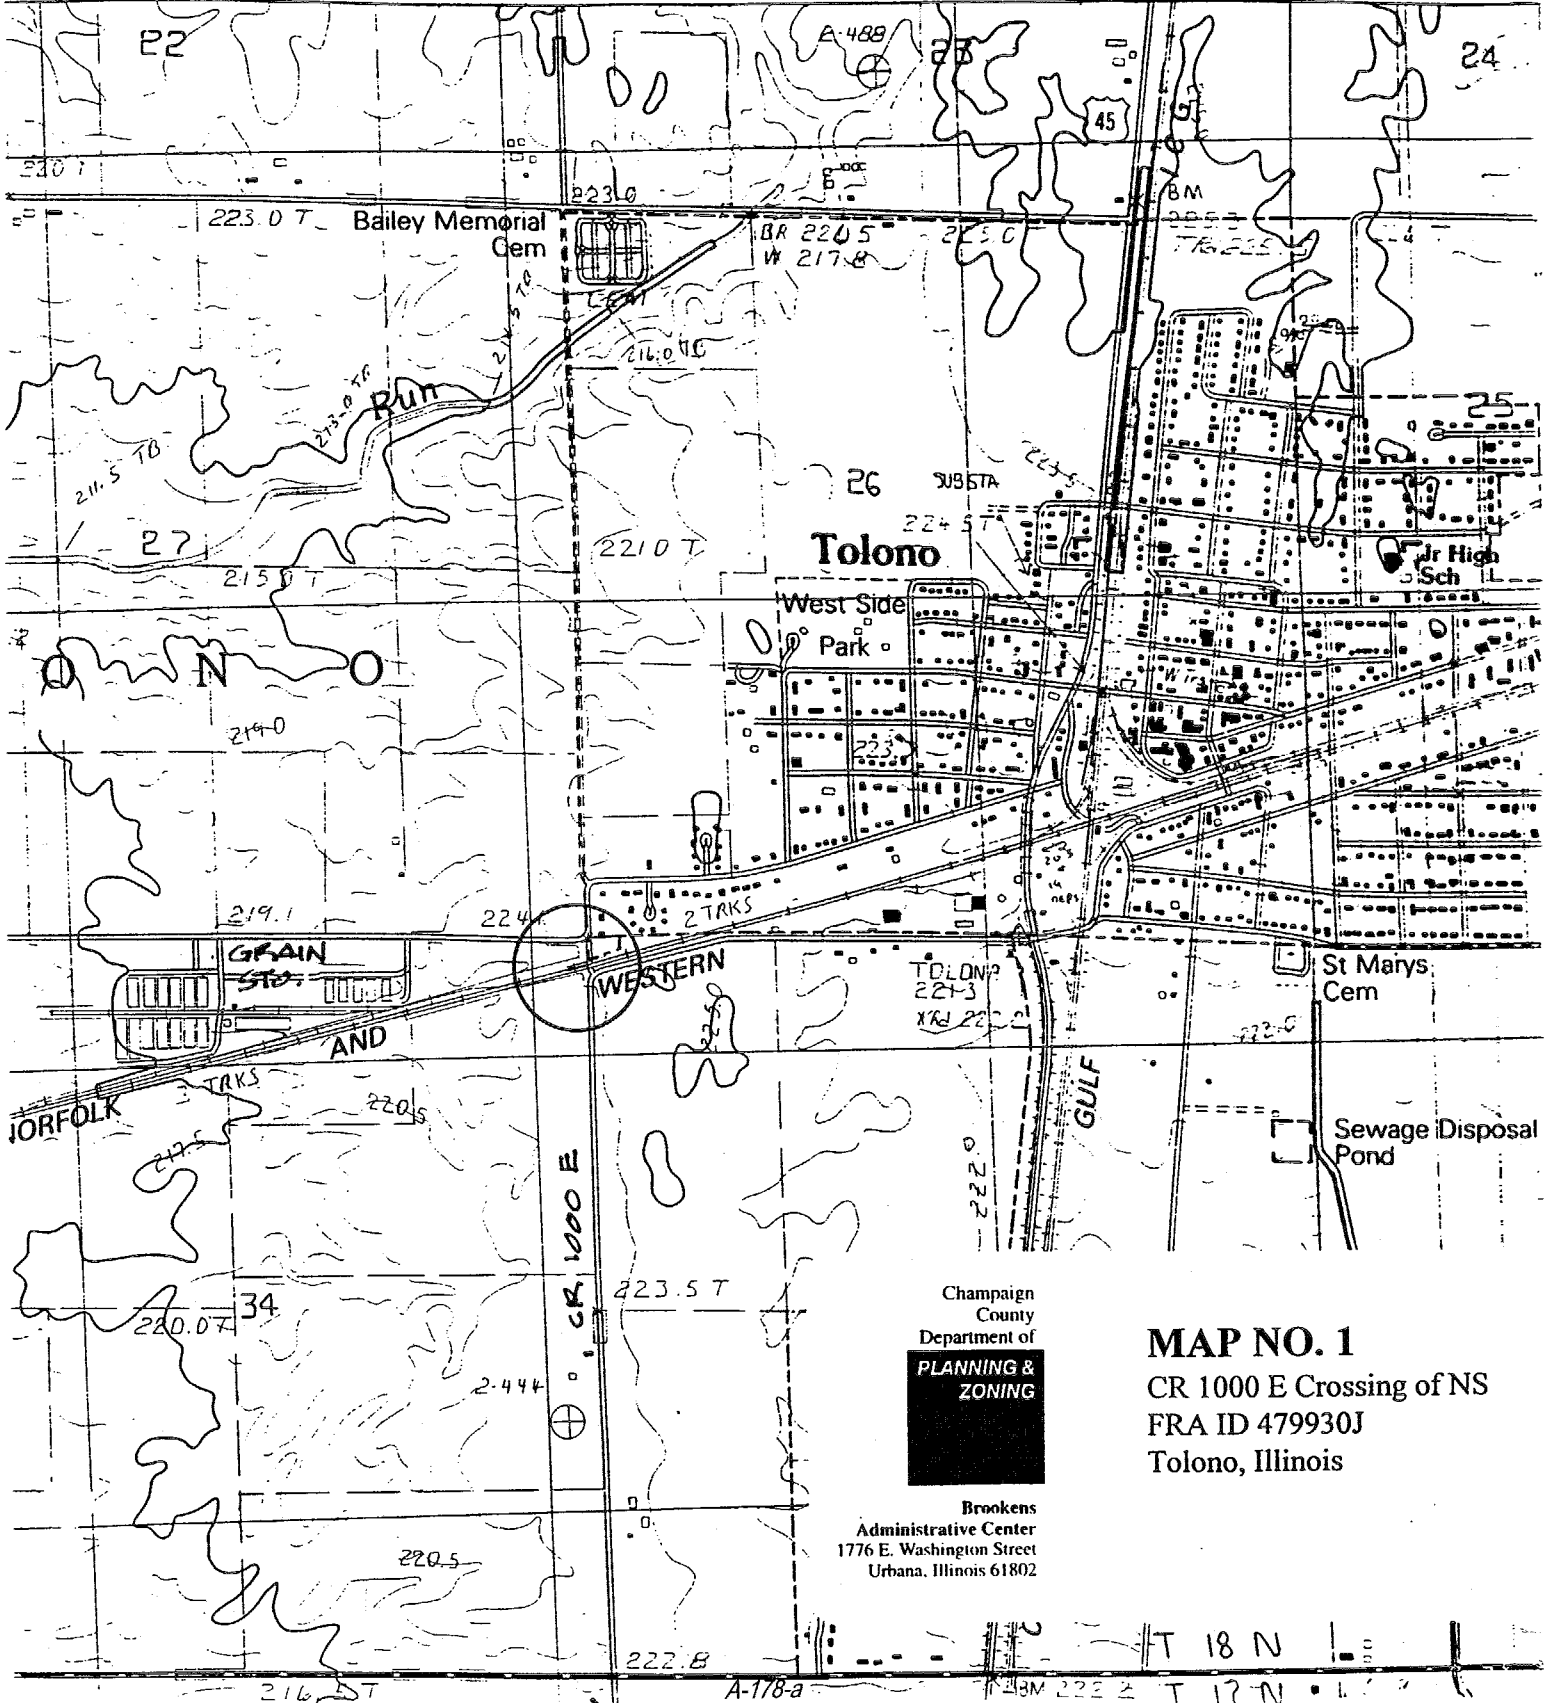

Frank DiNovo

DOCUMENT # 2/2/98 6:02:49 PM

Subject: Finance Docket No. 33388 - CSX and Norfolk Southern - Control and Acquisition - Community Notification

Attn: Elaine K. Kaiser
Environmental Project Director
Environmental Filing

Good morning:

The Quick families have been life-long residents of the 3rd Street Crossing area, here in Danville, Illinois. The following comments relate to the Norfolk Southern/C.S.X. acquisition and control of the Conrail Railroad.

We have seen an increase in the volume of trains at the East 3rd Street crossing. This is in addition to the switch engines with only a few cars. With the addition of trains we have seen the change from coal fired engines to diesel engines; air-horn blasting has become more frequent; and the crossing is blocked many more times.

The addition of more trains and switch engines making up longer trains going through our neighborhood, will mean that we will have additional air pollution from the fumes of the diesel engines. This is a definite health hazard especially for the elderly.

Increased trains will insure the air horns will be blasting away more frequently. Now there are times when engineers start blowing the air-horns from the Main Street crossing, across South Street and quit south of the East 3rd Street crossing, almost continuously. We must listen to all this noise inside and outside our homes twenty-four hours a day and seven days a week. This does get on a persons nerves. Therefore, increasing the train traffic will add to noise pollution.

We have a nice town and are hoping for growth, however the addition of 25 more trains will add to the blocking of streets all through Danville and will certainly hinder people from wanting to live here. Having 50 trains a day, plus switching will cut our town in half.

We agree the trains have been updated tremendously, at the price of poorer air quality, time wasted at blocked crossings, poor overpasses and underpasses, and irritation caused by more and longer air-horn (noise pollution) blasting. We ask you to consider our deep concerns which will impact our neighborhood and our town.

Respectfully,

Mr. Gene Quick

Mrs. Gene (Delores) Quick

Mr. Larry Quick

Dear Ms Kaiser,

I am writing on behalf of the Village of Tolono. Enclosed is a response to your draft of the Environmental Impact Statement dated December 12, 1997. The enclosed document has been reviewed and approved by the Board of Trustees for the Village of Tolono as our official response to the Environmental Impact Statement.

Our response is based upon comments from community members, investigation by the Village and a study by our engineering firm. In the event that you have additional questions or comments with regards to our materials, please feel free to contact us. Pursuant to your request, I am enclosing one original and ten copies.

**ASSESSMENTS OF THE PROPOSED RAIL LINE SEGMENT CONSTRUCTION
SOUTHEAST OF THE INTERSECTION OF THE IC AND NS LINE.**

This summary will address the proposed construction activities discussed in the draft environmental impact statement prepared by the surface transportation board section of the environmental analysis. The purpose is to address the proposed construction activities as they affect citizens of Tolono and their surrounding environment. It will address the potential impacts that include the areas of safety, transportation systems, land use, air quality, noise pollution, and socio-economic issues.

The document states that the construction would not result in any significant environmental impact. A review of the proposal together with the surrounding area and the comments from Village residents confirms that this statement is in error. There is a documented increase in noise, air pollution, traffic disruption, safety, and other effects on the adjacent residential area. The document notes that the "no action" alternative would not cause further disruption to the citizens of Tolono. Given that alternative, rail spurs in other locations would give the desired connection with lessor impact. This no action alternative is a practical and viable one and should be considered as the primary alternative as it relates to the Village of Tolono.

The following represents a specific review of the proposal and a summary of comments drawn from community members, Village officials, engineers and related professionals.

I. SAFETY

A. There is an increased probably of train accidents and derailments that expose local residents to additional hazard in the area. This hazard is particularly risky to area children. The proposed new spur would add another track to the main railroad crossing area for school children and during construction there would be no access across the tracks for the children.

The increased volume of train traffic would be from 21 to 39 trains per day on the Norfolk Southern line. The new traffic related to the spur line will be 2 trains per day. As a result, the probably of train accidents due to individuals crossing the tracks, and in particular, children crossing the tracks, presents a very real and detrimental risk. On the South side of the tracks, a home for the disabled creates additional pedestrian traffic by its residents.

B. The current draft of the environmental impact statement glosses over some very significant safety questions. The Surface Transportation Board provides for the environmental impact statement to require the following details:

"Discuss the potential environmental impacts of the proposed transaction on public health and safety with respect to the transportation of hazardous materials, including:

- (1) Changes in the types of hazardous materials and quantities transported or re-routed;
- (2) Nature of the hazardous materials being transported;
- (3) Applicants' safety practices and protocols;
- (4) Applicants' relevant safety data on derailments, accidents, and hazardous materials spills;
- (5) Contingency plans to address accidental spills;
- (6) Probability of increased spills given railroad safety statistics and applicable Federal Railroad Administration requirements; and
- (7) Location and types of hazardous substances at hazardous waste sites or hazardous materials spills on the right-of-way of any proposed connection or rail line abandonment site."

Tables in Chapter 5 of the Draft Document constitute a cursory summary but do not provide any detail and specifically do not address the particular issues in Champaign County and more importantly in Tolono, Illinois as they relate to the above criteria. The fact that detail for these important items is noticeably absent from the review is of great concern to the Village and members of the community. Trains traveling on the new spur line which will carry hazardous materials appear to be within 75 feet +/- the single family residences that are pre-existing along the railway. The local fire district does not have the equipment to handle hazardous material spills next to the residential areas especially with the increased probability of accidents and derailments. In addition, there is an increased probability of fires which would also present an unreasonable and dangerous challenge to the local fire district. The remaining unaddressed concerns involve questions on the types of hazardous materials the railroad cars will be transporting, specific safety practices, protocol and how they will have an impact on addressing this increased risk, and specific plans that will address potential derailments and resulting hazardous spills as they relate to these residential homes.

II. TRANSPORTATION

A. There will be additional vehicular delays at railroad crossings caused by the increase in train traffic. The report does not address the specific increase in time on the Norfolk Southern line when the number of trains has increased by 18 per day. At 15 miles per hour, the total delay in time for 39 trains per day is 2 hours 36 minutes per day assuming there is no train stoppage which would block crossing. Based on the day to day reporting of community members, it is clear that existing train traffic routinely blocks all of the crossing for an excessive amount of time. Access from one side of the community to the other is already stressed due to delays caused by trains. Any increase in train traffic would greatly burden an already stressed access to U.S. Route 45 from the east side of Tolono at Benham Street. The report does not address the continuing increase in the use of Benham Street nor does it address this increase of burden on the Village. The result in additional delay of traffic would clearly have a large negative impact on vehicular traffic at these crossing. More importantly, there would be an increased delay in the ability for emergency vehicles (police, fire and ambulance) to gain access from one side of the community to the other.

B. During construction, the lack of crossings would put a severe burden on emergency vehicles in the community. For residents, the lack of crossing including the closure of an arterial street (Benham) and a collector street (Elizabeth) and a local street (Bourne) would severely restrict vehicular traffic and have a significant impact on the ability of the average citizen to conduct business or otherwise reside in the community.

C. Daggy Street is a truck route used by farmers to deliver grain to the local elevators in addition to the use by the surrounding community. Closure during construction or potential overall elimination would have a significant impact on local citizens and this commercial traffic and could potentially require a change in the designation to one of the Village's other streets. This is clearly perceived as a negative impact.

III.

LAND USE

A. In reviewing the proposed rail construction as it relates to land uses there are the following observations. Rail construction will have a substantial impact on the residents adjacent to the new spur and along the Norfolk Southern tracks. The construction does not comply with the Village's land use plan in that the area adjacent to the proposed spur is zoned R-2, medium density residential. Almost all the residences built in the area are comprised of owner-occupied single family dwellings. It is impossible to imagine a more inconsistent use of land than heavy industrial rail use in the midst of single family residences.

In the event that the proposed spur will take place under R-2 Zoning it would be clearly inconsistent with the existing zoning use of the property. In the event that the proposed expansion takes place on the property adjacent to R-2, while potentially not directly violating R-2 zoning itself, the use will clearly be inconsistent with that of single family residences immediately adjacent to the use.

During construction there will be significant disturbance, noise, and risk proposed to these pre-existing properties. After construction, use of this property will burden adjoining property owners with excess noise, pollution, and risk of accidents and derailments.

B. There are no apparent effects on farm land.

C. There are no apparent effects on coastal areas.

IV.

AIR QUALITY

A. There will be a demonstrable increase in air emissions. The report noted an increase in the number of freight trains per day which will exceed the threshold number for air quality impact analysis. Based on the report, increases of VOC or NOx are considered to be significant if emissions exceed certain levels. Data in the report states that the increase rail activities would result in the increased levels of all pollutants. Thus, under the existing proposal there would be a demonstrated increase in air emissions and a significant decrease in air quality for the community.

V.

NOISE POLLUTION

A. With regard to noise impact on the immediate area, the report confirms that an increase in the number of freight trains will logically mean an increase in level of noise. Based upon a review of this draft, this increase will exceed the threshold number for noise impact analysis. Thus, it is reasonable to conclude that there will be a significant impact of noise on the immediate area which is comprised of owner occupied single family dwellings.

B. The report states that the change in train volume will result in an Ldn increase of 2.3 dBA exceeding the threshold for noise analysis. The current 65 dBA contour of 150 feet would

extend to 500 feet perpendicular to the tracks. Based upon this analysis it appears that within the report that there is a net effect of noise on the community is that more residents will be exposed to more noise resulting from the increased train traffic. Community members and others generally interpret this to be a significant and negative impact.

C. The references to noise in the report neglects to take into account the noise from wheel squeals on the spur. It is clear that trains on spurs generate wheel squeals not normally associated with main line traffic. While not quantified in the report, it seems obvious that wheel squeals would general additional noise as a result of the creation of the spur.

VI.

SOCIO-ECONOMIC ISSUES

In reviewing the socio-economical issues directly related to the changes in the physical environmental as a result of the construction, it is clear that the construction would result in the closure of public streets necessary for commercial, residential, and emergency vehicle traffic. In addition, there are concerns regarding damage to existing utilities which would be crossed. A trunk line water main which serves the southern portion of the village, the mobile home park, and other homes further south have no loop. If it is damaged, no other water service would be available until the damaged trunk line is repair. In addition, a 27 inch diameter storm sewer which serves the west side of the village and the newly constructed Route 45 retention basin is the only available storm water outlet. If it were to be damaged, no other storm water outlet would be available until it was repaired.

Installation of the spur would require borrow material which would result in increased elevations from the new construction. This raises the potential for increased flooding on adjoining residential areas. Storm water patterns are always effected by construction and the addition of improvous areas. Thus, a critical concern is the impact of drainage patterns on nearby structures which would have to be carefully analyzed and taken into account in the event of any construction.

CONCLUSION

A significant number of community members gave oral an written input in response to the information circulated by the railroad and community leaders. Attached, and by reference incorporated herein, are copies of letters received from area citizens.

The current draft includes a number of changes from the first draft resulting from comments at a public hearing about the original draft proposing the rail spur. It was explained that the original proposal overstated the size of the proposed rail spur and the current draft significantly reduces the size but still raises a number of concerns. It delivers the same amount of traffic as was originally proposed and while certain aspects have been corrected and issues addressed, the current draft of the impact statements still glosses over critical noise, air, and safety concerns originally raised in the first draft and raised again in this review.

Based upon current data in the environmental impact statement, a review of the site, discussion with community members, and thoughtful analysis, it is reasonable to conclude that the proposed merger raises significant safety issues, hazardous materials issues, transportation issues, land issues, socio-economic issues, noise pollution issues, and air quality issues that suggest that alternatives to adding a larger number of trains and a rail spur are far more preferable.

11 Nov 97

Miller & Henderson
Law Offices

Mr. Marc R. Miller

I attended the hearing and listened to the presentation by people from Norfolk and Southern.

In regards to the Spur Expansion, I would not be immediately impacted like the residents along Naggy St. I understand their concerns and would share them if my house was that close to the railroad — the present storage track as well as the spur. I live at the almost extreme north end of Tolono and this does move me away from the noise and other problems associated with trains using the spur.

I also listened to the presentation as it pertained to the almost doubling of the number of trains that will travel through Tolono if the Norfolk Southern does in fact acquire the additional company tracks as

they are attempting to do. This has nothing to do with the "Spur Expansion" as I understood their presentation.

My concern now has to do with the added dangers involved with more trains and movement across our village streets. The impact this will have on the movement of emergency vehicles and people and the difficulty in responding to people/businesses in need.

An additional concern of mine is the increase in hazardous materials that will be in our village at any given time and how our small Fire Protection District can react to some emergency situation dealing with these types of products. While I am quite proud and pleased with the Fire Protection District and have great faith in their training and abilities, are we putting people in harms way, both them and the general public?

I understand, I think, the driving forces that require business to get bigger in order to compete and turn a profit. However this doesn't lessen my concerns. Another consideration is how long before Norfolk Southern will approach the state/village with a suggestion to close a crossing because they too recognize the potential for accidents as well as the expense in upkeep to a crossing.

You may use any, all or none of this letter and I will be available if you wish to talk to me in person.

RE: Norfolk Southern Proposal

Gentlemen:

We as residents of 110 E. Marshall in Tolono are very much opposed to the proposed spur. We find the railroad crossings already blocked by trains much of the time delaying our getting in and out of Tolono. These are not just small delays, much of the time and sometimes more than one crossing is affected. We are already concerned about emergency vehicles being able to move freely in Tolono, and the complete closing of another crossing will, of course, only add to this problem greatly.

There are many young children in our neighborhood and the increased traffic would be a danger.

The noise from the trains is already significant, and additional noise will make things even more difficult. We find it trying to even leave windows open because of the noise.

The thought of hazardous material being routed through Tolono is also cause for concern. What would happen if a spill occurred? Who will be responsible for protecting the people of Tolono?

We wish to vigorously register our opposition to this proposal.

Very truly yours,

Frank R. Krasnowski

Patricia A. Krasnowski

RE: NORFOLK SOUTHERN TOLONO SPUR EXPANSION

Gentlemen,

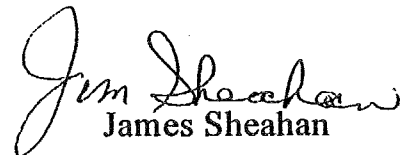

I've lived in Tolono six years. Railroads are part of our life here. I live on the tracks.

To this date the railroad has done no housekeeping along their tracks. Weeds have not been cut in this period. If any repairs are done, the old parts ---ties, spikes, plates to hold ties in place, etc are left to lie in the weeds where they are thrown. The railroads are very inconsiderate.

I find it difficult to believe anything they say. They will do as they please. Tolono has no legislation to control what they do. I think they should have.

I don't think you should wait until they start work on this project. I believe they will do this no matter what we Tolono citizens want. I repeat--they are inconsiderate.

Yours Truly.

James Sheahan

Village of Talono

November 12, 1997

RE: Norfolk Southern Talono Spur Expansion

TO Whom It May Concern:

In response to your request for resident concerns.

Our concerns are as follows.

1. The property values will decrease. Who will pay for the decrease in the value of the property.
2. If the railroad goes through with the spur expansion what is next to come? A rail yard? Who will want to live by a rail yard.
3. Having the fire and emergency services being delayed in getting to and from emergency situations.
4. Having more dangerous chemicals being transported or sitting idle in town.

5. Children having to cross a busier crossing trying to get to or from school or wherever they need to be.
6. Having the crossings being blocked more frequently which might make you or your children late.
7. Having increased noise from whistles that blow and banging of the cars also from squeaking of the wheels. We want be able to have our windows open for fresh air because of the increased noise.

Sincerely,

Terry Charles and Elizabeth Charles
204 South Bourne St.
Tolono, Ill 61880

Norfolk Southern Proposal;
Village Of Tolono.

With more trains running through town, there is always more danger of something going wrong. We have enough trouble getting across the crossings now. More trains would slow down traffic drastically.

I live at 117 E. Daggy, and from what I can see now we would have to give up the road in front of our home, or worse.

The quality of the air would also be lower, from diesel fumes and rail dust.

The added noise would make it harder to rest, especially for the little ones and those with breathing disorders.

I built our home 24 years ago, hoping we wouldn't have to move again. I'm 74 years old and I don't know where we would go if we had to move.

Having more trains would add to the danger of hazardous waste spills here in town.

If we have to have crossings closed here in town it would cause us to drive farther. It would be harder to get emergency vehicles to this part of town.

I do hope you will take all this into consideration before adding a spur onto the railroad.

Yours Truly.

Lawrence N. Wray

Norfolk And Western

Norfolk And Southern Proposal
Village of Tolono, Ill.

First I want everyone to know I'm not trying to stand in the way of progress.

I'm in favor of progress, but do we need to moove people, or endanger lives to get this progress.

I hope if the railroad does decide to go through, it will find a better way then to crowd us out.

I listened to the railroad people at the meeting the other night, but I dont understand how they could between the spur and the main rail.

I know if the railroad people decide to go through I cant do much to stop them or change their minds, but I've said what I have to say, so thanks for listening.

ATTN: NORFOLK SOUTHERN PROPOSAL
Village of Tolono
P.O. Box 667
Tolono, IL 61880

I live 2 houses north of the Elizabeth Street Railroad crossing. I have lived near railroad tracks nearly all my life. But since I have lived in Tolono near the Norfolk Southern tracks there has been a real concern to me for the children that have to cross the tracks.

The tracks have been blocked too much of the time with stopped trains. The trains blocking the crossing and the pressure to be at school on time have caused children to cross between railroad cars. It's also been reported to me that someone witnessed a youngster pushing his bicycle underneath a stopped train.

I have worked at the Tolono Village Hall since 1973 and have heard numerous complaints about trains blocking the railroad crossings.

If the rail traffic increases, I can't possibly imagine the potential hazard this will cause our school children.

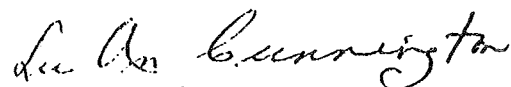

The complacency by the adults and young adults over the railroad crossings blocked, have made them do some very unsafe (and sometimes stupid) things. But when you have to deal with the blocked crossings day after day sometimes frustration takes over and accidents happen. I know of 2 deaths caused by going around the arms, since I have lived here.

Another real concern I have is the need for emergency medical treatment and fire protection. My husband is a volunteer fireman, and I know minutes can be the difference between life and death. Several years ago (maybe 15) the Tolono Fire Dept. responded to a call on the south end of town when the crossing arms were down. Two or three of the firemen left the emergency vehicle that was blocked by the crossing arms, and responded on foot for a few blocks. They knew they were responding to a heart attack call and timing was critical. The wife believed her husband was already dead, however the firemen began CPR and to this day this man is still alive and doing well. Had this been farther than a few blocks that man would have died.

Please consider the safety and health of the Tolono residents by not proceeding as planned.

P.S.

Not only are the arms down by stopped trains, there are no trains in sight.

Tolono, Il. 61880

RE: Rail Spur

To Whom It May Concern:

In response to your request for resident input.

1. Safety:

- A. Fire and emergency services could be delayed in getting to and from any situation that arises.
- B. Danger in more chemicals being transported through Tolono that might possibly derail and leak due to switching of trains.
- C. Children, elderly or anyone having to cross the tracks at any given time. (example: children going to school, elderly have to walk to go to the grocery store)

2. Transportation:

- A. This will close all major intersections to get across to the east side of Tolono. **THIS MAKES NO SENSE AT ALL.**
 - 1. Who will be held responsible for any DEATH that might happen due to no emergency vehicle being unable to get across the track.
 - 2. I'm sure the Village of Tolono will not want to be sued due to a death. We have lived in Tolono around these tracks all our lives and know for a fact that these trains are on the tracks for a long period of time.
 - 3. It is my understanding from some years ago each time a train has the crossing blocked, should be for a short period of time such as 10- 15 minutes. We have been held at a crossing for 30 minutes or longer.
 - 4. Will cause problems when we go to and from work. We will never know when to leave to go to work due to the trains coming and going.
 - 5. Children may be late for school, late getting home,

late getting to the next bus stop to get on the next bus.

6. Sunday morning, Sunday evening and Wednesday evening when we are trying to go to Church. With trains possibly blocking crossing.
7. Traffic accidents may occur due to people in line trying to get out of line and find another way to get in or out of town.
8. Unity High School and Unity Junior High School activities at the schools or away. Other school bring buses here for school activities. They could be late to and from and parents waiting to pick up the children will be worried and upset.

3. Land Use:

- A. Property values will decrease. who wants to live by a rail yard ? We don't
- B. Who wants to live where you can't open your windows, be out side without hearing all the noise due to just going through or being the switching station for 30-45 minutes or longer .
- C. We have enough noise now without more. WHY can't this be done outside of Tolono in the Country. Such as somewhere between Tolono and Pesotum or Tolono and Philo where few people are living. This would make more since.

4.. Air Quality:

- A. They will be burning an increase amount of train fuel in town and be doing this by spending more time in town.
- B. People with health problems. (example: breathing, lungs etc.)

5. Noise:

See #3 A and B

- A. The noise from all the switching, hooking and unhooking will increase and is already bad.
- B. Your nerves can only take so much noise.

6. Socio Economic/Human Issues:

- A. Quality of life? You will never be able to committ to anything You might have an appointment in town or outside of town but not get there on time.
- B. If we are late for work, we could lose our jobs due to the fact that the work force doesn't understand LATE for any reason.

Due to all the trains now in Tolono, the crossing arms are down and no trains are in sight. Even though it's against the law to cross with the arms down, it will happen more often. Is Tolono going to have a crossing guard on duty 24 hours a day for protection? **MAYBE THE RAILROAD SHOULD BE RESPONSIBLE FOR PROVIDING A CROSSING GUARD AT EACH CROSSING 24 HOURS A DAY AT THEIR EXPENSE.**

It seems that the convenience is for the railroad and could care less about the people who live in Tolono or visiting.

Sincerely,

Terry Charles Elizabeth Charles

Washington, D.C. 20423-0001

Subject: Finance Docket No. 33388-CSX and Norfolk Southern-Control
and Acquisition-Community notification

Attn: Elaine K. Kaiser
Environmental Project Director
Environmental Filing

Dear Surface Transportation Board,

The City of Danville, Illinois, is pleased and grateful to have the opportunity to comment on the draft EIS for the proposed Conrail Acquisition. Danville has been a partner with all the railroads down through the years to our mutual benefit. Legend has it that John Dillinger once came to Danville to scope out banks to rob but decided against it because there were too many railroad crossings.

The proposed acquisition brings several issues to the forefront for us as they relate both significantly and detrimentally to the the City of Danville.

Conrail owns and maintains a spur line through Danville that starts at Jackson St. south of Fairchild and goes north and northeast out of town. There are two grade separation structures at Fairchild and English Streets. Both of these grade are deficient in height. There are at-grade crossings at Jackson, Winter, Liberty and Bowman. Although these crossings are intact, the rails, the ties and the tie plates have been removed from the roadbed for all the stretches in between. We have been placed in the compromising position of placing "Exempt" signs at the crossings. We believe the railroad should be obligated to remove these structures and crossings or put the track back in service. It has been out of service for years.

The N S line from Tilton to Lafayette will experience a major increase in the number of trains from 23.6 to 41 per day. The number of hazardous materials cars on this line goes from 10,000 to

46,000 per year, a 460% increase. Projected accidents increase at every crossing in town. Average delays nearly double at every crossing in town. Air pollution from the trains increase significantly, over one hundred tons per year for the aggregate emissions along the entire line. This impact is increased for Danville disproportionately because of the lower train speed limits. No data was presented for the increased air pollution from the increased average vehicle delays resulting from the increase in trains, however this amount should nearly double also. Noise goes up significantly along this line, impacting several residential neighborhoods in town.

Our police station and ESDA are immediately adjacent to this line and can only cross it at an at-grade crossing either at South St. or Main Street. So we have a circumstance requiring a potential increase in response from emergency services (i.e. an increase in trains, hazardous materials, etc.) that by its own operation decreases our ability to respond (i.e. doubling waiting times at crossings). This has a ripple effect in our Fire Dept. response where secondary, backup, and support units often cross this line.

All of these conditions can be mitigated with selective implementation of grade separation structures along critical roadways. We would urge the SEA to take another look at Danville's overall picture as opposed to microanalyzing each crossing. We believe that a further analysis of this situation may warrant a grade separation structure at 3rd St., South St., Bowman and Voorhees Streets.

We concur with the SEA's recommendation to require binding arbitration with the railroads pursuant to a finding of an adverse impact which has been clearly demonstrated in Danville by the SEA's excellent and thorough job on the EIS.

Thank you for your consideration in this matter.

Sincerely yours,

Robert E. Jones
Mayor

BEFORE THE
SURFACE TRANSPORTATION BOARD

CSX AND NORFOLK SOUTHERN, CONTROL AND ACQUISITION
Finance Docket No. 33388

COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

CENTER FOR NEIGHBORHOOD TECHNOLOGY

2125 West North Avenue

Chicago, IL 60647

(773) 278-4800

In June 1997, two major freight railroads, CSX Corporation and Norfolk Southern Corporation, filed a joint application with the Surface Transportation Board (STB) to acquire and divide the assets of Conrail Inc. As part of the environmental review of the application, the STB directed its Section of Environmental Analysis (SEA) to prepare a Draft Environmental Impact Statement (Draft EIS) to address environmental issues and provide preliminary recommendations for mitigating possible effects of the Proposed Acquisition. The SEA has made the Draft EIS available for public review and is currently seeking public comments from all interested parties. The Center for Neighborhood Technology submits the following statement in response to the SEA's request.

The Center for Neighborhood Technology is a twenty-year-old not-for-profit organization which works to achieve sustainable community development through its four major program areas: transportation and air quality, sustainable manufacturing and recycling, community energy, and research and development. Located in the city of Chicago, the Center has developed a series of innovative projects which have had significant impacts in the fields of pollution prevention, energy conservation, and community development planning. The Center is a founding member and Chicago affiliate of the Surface Transportation Policy Project, and co-convenor of the Chicagoland Transportation and Air Quality Commission, a 130-member coalition that addresses issues of regional land use and planning. Projects sponsored by the Center in the area of transit-oriented development have been cited by the President's Council on Sustainable Development, of which the Center's president, Scott Bernstein, is a member.

The Surface Transportation Board is required by statute to approve a proposed rail acquisition if it determines the transaction is consistent with the public interest. By all indications, the public benefits of the Proposed Acquisition are substantial. Currently, much of the northeastern United States is served by Conrail alone, requiring both Norfolk Southern and CSX to interchange freight with Conrail in order to reach customers there. The proposed split of Conrail operations would introduce single-line service to northeastern markets, eliminating the need for costly and time-consuming intermediate switching. More efficient, single-line service will stimulate economic growth and shift freight movement from truck to rail, alleviating traffic congestion, wear and tear on highways, and lessening air pollution.

The Center for Neighborhood Technology is supportive of efforts to increase the volume of freight moved by rail, a substantially more energy efficient and environmentally benign transportation alternative than trucking. To the extent the Proposed Acquisition promises to bring about such a shift, the Center supports the Application. However, it is not clear from the petitioners' proposed Operating Plans that approval of the Application, as it stands, will benefit all communities and shippers equally.

The Center's concerns focus in particular on the likely effects of the Proposed Acquisition on industrial establishments and community residents located in the vicinity of the Lake Calumet area of southeast Chicago (see attached map). The center of Chicago's once-thriving steel industry, the area still provides employment for over 10,000 manufacturing workers. Leading industries include the steel-coil division of Joseph T. Ryerson and Son, which employs 400 workers at its Pullman facility. The area has highly-developed freight transportation infrastructure, including extensive rail coverage, deep water dockage, and barge access to the Mississippi River and St. Lawrence Seaway via the Calumet River.

At present, rail service to industries in the vicinity of Lake Calumet is provided almost entirely by Norfolk Southern, which maintains, and refuses to relinquish, exclusive trackage rights to customers on the eastern and western sides of Lake Calumet (see map). Classification service is provided by Norfolk Southern's Calumet Yard, where congestion and unavailability of crews have delayed shipments to and from Calumet industries for years. The absence of meaningful freight rail competition has undermined the competitive position of shippers located in the area, resulting in a significant loss of business.¹

The Proposed Acquisition threatens to make a bad situation worse. In its Operating Plan filed with the STB in support of the Application, Norfolk Southern anticipates a substantial reduction of capacity at Calumet Yard:

"The Operating Plan contemplates eliminating most classification and train functions performed at Calumet Yard and transferring them to [Norfolk Southern's] Elkhart, Indiana facility. This change will facilitate the reduction of 20 yard crews and the transfer of one local to Burns Harbor to serve Gary Sugar Works. We anticipate that three operating supervisors, three clerical positions, and four utility trainmen positions can be eliminated at Calumet. Seven locomotive units can be reassigned elsewhere. We also expect the elimination of sixty-five mechanical department positions."
(Operating Plan, Volume 3B, p. 184)

How the proposed restructuring of Calumet Yard will affect classification service to Lake Calumet industries is not addressed in the Operating Plan. Area manufacturers are thus understandably concerned, fearful that their already unreliable rail service might deteriorate further.

The Center for Neighborhood Technology is aware that the Surface Transportation Board has established a process for receiving comments related to the economic and competitive merits of the Proposed Acquisition, which is separate from the environmental review process. However, the Center respectfully submits that the proposed reduction of capacity at Calumet Yard is likely

¹See Illinois International Port District, Request for Conditions to the Approval of Application, Verified Statement of Anthony G. Ianello.

to have consequences which fall well within the scope of concerns addressed in the Draft Environmental Impact Statement. In particular, it is likely to lead Calumet area shippers to transport goods increasingly by truck rather than by rail, impacting regional air quality, traffic congestion, and undermining the competitive position of industries which provide jobs for residents of nearby low- and moderate-income communities.

It is well recognized that unsatisfactory rail service encourages shippers to move freight by truck that would otherwise be moved by rail. With more and more industries making the shift to just-in-time inventory control methods, on-time deliveries are more important now than ever before. Nothing demonstrates this better than Union Pacific Railroad's current struggle to integrate the operations of Southern Pacific following their 1996 merger. Unreliable rail service in the West has displaced an enormous amount of freight from rail to highways, leaving many over-the-road trucking firms operating at full or near-full capacity.

The public interest would not be served by a shift of freight from rail to truck in the Calumet area any more than it is served in the above instance. Air quality in the Calumet region is already poor. According to a 1994 study, fifty-four southeast Chicago firms failed to meet federal Emergency Planning and Community Right to Know (EPCRA) standards, producing 56,000 tons of carcinogens, 21,000 tons of developmental toxins, 221 tons of genetic toxins, and 38,000 tons of chronic toxins per year.²

Currently, the entire Lake Michigan basin is in severe non-attainment with the 1990 Clean Air Act Amendment's Ozone standard, largely due to emissions from the Gary-Chicago-Milwaukee Corridor. Under orders from the U.S. Environmental Protection Agency (EPA), Illinois and other states bordering Lake Michigan are required to prepare and implement plans which will reduce 1990 emissions of Volatile Organic Compounds (VOC) and Nitrogen Oxides (NO_x) at least 15 percent by the year 2007. The EPA's "Mobil5a" Mobile Source Emission Model shows that every million truck miles generate over 2.7 tons of VOC and 15.7 tons of NO_x.

In addition, in July 1997 the EPA announced new standards for particulate matter under the national ambient air quality standards (NAAQS), which the agency has determined are necessary to protect public health and the environment. The regulations include new standards for "fine" particles (smaller than 2.5 micrometers in diameter), which penetrate deeply into the lungs, leading to serious health effects. Studies indicate that diesel trucks produce nearly 5 percent of fine particle emissions.³ The introduction of more truck traffic into the Calumet area of Chicago can only worsen an already grim environmental situation, making compliance with federal clean air standards an ever-distant possibility.

There is, however, an alternative. The Illinois International Port District (the "Port of Chicago"), which operates Lake Calumet's harbor facilities, has filed a Request for Conditions to the approval of the Proposed Application. The Port of Chicago proposes that the STB remedy the lack of competitive rail service to the Lake Calumet area by requiring Norfolk Southern to grant operating rights to alternative freight carriers. Specifically, Norfolk Southern should provide trackage rights and access to Lake Calumet customers to two short line railroads, the Chicago South Shore and South Bend Railroad and Chicago Rail Link. Alternatively, or in addition to this, operating rights should be extended to CSX, which holds overhead trackage rights east of Lake Calumet under the proposed Operating Plan (see map).

² Source: "A Guide to Southeast Chicago's Major Polluting Industries," Citizens for a Better Environment, 1994.

³ Source: E.H. Pechan & Associates, "National PM Study: OPPE Particulate Programs Implementation Evaluation System, Final Report to EPA," Sept. 1994; E.H. Pechan & Associates, "Updates to Fugitive Emission Components of the National Particulate Inventory, Jan. 29, 1996.

The Center for Neighborhood Technology supports the Port of Chicago's Request for Conditions. As a result of a 1959 Interstate Commerce Commission decision, *Illinois Central Railroad Company, et al. Construction and Trackage Rights, Lake Calumet Harbor, Cook County, Ill.*, 307 ICC 493 (October 5, 1959), the Chicago South Shore and South Bend Railroad and Chicago Rail Link both have operating rights over Norfolk Southern-owned track into the southwest portion of Lake Calumet Harbor. However, neither carrier is allowed to serve industrial customers along this stretch of track, nor are they permitted access to potential customers further north and east of Lake Calumet along Norfolk Southern's lines. The Center urges that rail access be extended to these portions of the Lake Calumet area, providing industries there with a choice of competitive rail services. Norfolk Southern should continue switching traffic bound for Norfolk Southern destinations, but neutral switching services should be provided to shippers requiring access to competing railroads such as CSX and Burlington Northern.

The remedy sought by the Center promises to impose little hardship upon Norfolk Southern. First, the area in question generates low volumes of freight. Second, since Norfolk Southern would continue to switch its own customers, the only business it stands to lose is short-haul traffic bound for alternative points, an insignificant share of Norfolk Southern's overall business. Finally, competitive rail service will encourage more shippers to use rail. As the size of the overall rail shipping pie increases, Norfolk Southern's business in the area may well stabilize or even increase in the long run.

The Draft Environmental Impact Statement identifies only one outcome of the Proposed Acquisition serious enough to warrant mitigation measures in Chicago: the construction of a new intermodal facility at an abandoned Conrail yard on 59th Street. The Center for Neighborhood Technology urges the SEA to address the likely environmental consequences of Norfolk Southern's planned restructuring and downsizing of Calumet Yard in its Final EIS. Norfolk Southern justifies its Application by arguing that intensified competition and improved rail efficiencies resulting from the Proposed Acquisition will generate unprecedented public benefits (Application Before the Surface Transportation Board, Section 1180.6(a)(2)(i)). The STB should take steps to ensure that the same spirit of competition extends to local switching services as well as line-haul traffic. Otherwise, the result of the Proposed Acquisition for some communities may well be a shift of freight movement from rail to truck, with accompanying environmental consequences.

This statement is endorsed by the Citizens Commission for Clean Air in the Lake Michigan Basin (CCCALMB), a consortium of environmental groups from the four Lake Michigan states coordinated by Citizens for a Better Environment, The Center for Neighborhood Technology, and The Hoosier Environmental Commission. The Commission has been involved with the process of clean air compliance in all four Lake Michigan states, as well as being a member of the USEPA Ozone Transport Assessment Group and the Lake Michigan Air Directors Consortium. Alex Johnson has been CCCALMB's president since its inception.

CENTRAL ADMINISTRATIVE UNIT

ENVIRONMENTAL DOCUMENT

REC'D: 2/13/98

DOCUMENT # 2/12/98 5:00:12 PM

Office of the Secretary Case Control Unit Finance Docket No. 33388
Surface Transportation Board 1925 K Street, NW Washington DC 20423-0001
Attention: Elaine K. Kaiser, Environmental Project Director, E. Filing

Comments of Lionel Trepanier and the Blue Island Greens to the SEA and Board regarding the Conrail acquisition DEIS. John Wisner tells Trepanier comments he placed in the Mail February 2nd to be considered timely.

It's a Greens' position to support development of rail lines and the leveling of a playing field that has subsidized Truck and Air transport at the expense of Rail transport. Also, the Greens call for the reduction, restriction, limitation and removal of Hazardous Materials whenever and wherever possible, including during transport and storage on rails.

We suggest that the criteria used by SEA and the Board for their determination of where to require mitigation for increases in Haz-Mat shipments are inadequate and arbitrary and unreasonable.

Under the CSX NS Conrail proposal communities along approximately 117 Train routes are to receive some assurance of Hazardous Material (Haz-Mat) safety protections based upon a significance determination based upon the increasing hazard shipments thru or near these communities. Consider that communities proposed for Haz-Mat shipment increases that are currently on key routes even prior to the acquisition were already without effective Chemical spill response plans. Increasing the number of loads of Haz-Mat thru these communities without requiring a showing of effective emergency planning on each route proposed for a Haz-Mat shipment increase is unreasonable. Also the SEA and Board have not considered the cumulative impact on communities; specially noting but not limited to, Blue Island, Illinois; of increases in Haz-Mat shipments on several lines and transfers to parallel lines.

Actually a number of Key routes and Major Key routes set for Haz-Mat shipment increases under the proposal are already without real emergency response and prevention activities. Including Blue Island, many affected communities currently hosting Key Routes and even Major Key routes are without active LEPCs or effective Emergency or Evacuation plans. Increasing the Haz-Mat levels on these lines without requiring the Railroads to participate in Emergency Planning with the affected communities is unreasonable and dangerous.

And for all these communities and rail segments where the planned acquisition would increase the shipments of Hazardous Materials the Board should require CSX and NS to fund and develop with the input of and for the consideration of the affected communities, and the LEPCs, a Hazardous Materials Emergency Response Plan, or update; as well as railroad assistance, including funding, in the update of the affected LEPC Emergency Response Plans and training.

Based upon increases in the existing levels of Hazardous Materials shipments due to this acquisition the Railroads and the Board have a duty to insure that all routes and communities experiencing a potential increase in Haz-Mat shipment accident impacts have or are at least afforded the opportunity to develop emergency response, prevention, and training plans with the cooperation and funding of the railroads, NS and CSX. The proposed increase in the potential for Hazardous Material accidents.

For EVERY rail segment where the planned acquisition would increase the shipment of Hazardous Materials the Board should require the railroads to demonstrate that they have consulted with the affected communities at large and done their part under SARA Title III, the Emergency Planning and Community Right to Know Act (this has not happened in Blue Island nor Cook County, Illinois) in addition to your recommended mitigation 4(a) from page 7-13.

The criteria for mitigation for Haz-Mat shipment increases should also consider the surrounding community population and especially if the rail line is adjacent a chemical plant, Oil refinery or other explosive risk.

TWO AT GRADE CROSSINGS IN BLUE ISLAND

Further the Board should allow opportunity for public involvement and comment of the people of Blue Island upon mitigation measures that might be requested for two at grade crossings on Seg. C-010 in Blue Island. The people of Blue island have had no opportunity to comment upon mitigation required as a result of the acquisition. It was not until February 2, 1998 that we could confirm the need for CSX consultation with the people of Blue island based upon the difficulty the SEA had in providing information upon actual location of Highway at Grade crossings requiring mitigation that were repeatedly incorrectly reported to be in Calumet Park in the DEIS and Errata. The citizens of Blue island should be afforded a clear explanation of the impacts at the CSX crossings at 135-Broadway and at Western Ave. And an opportunity to voice their concerns and desires. This has not occurred yet.

The SEA should consider pedestrian impacts at the two grade crossings in Blue island. For this pedestrian dependant population a proper Grade separation analysis is not complete. Lacking of information of impact upon pedestrian movements the Board is underestimating and not having the opportunity to consider the impacts of the proposal upon the people of Blue Island.

The "Haz-Mat Black Hole" at Blue Island Junction. Consider that the proposal for transfer of hazardous materials at Blue Island Junction is tantamount to the impacts of a rail yard for the purpose of Environmental Justice and NEPA (National Environmental Policy Act) analysis classification. This refers to the "Haz-Mat Black Hole" at Blue Island Junction. The documentation shows 3 rail line segments converging at Blue Island Junction. Of these three lines, two show large but unequal increases in the number of Haz-Mat shipments. The third shows a slight decrease in Haz-Mat shipments. The numbers just don't add up! Expecially respond to the Hazardous Material (Haz-Mat) hole at Blue Island Junction.

Apparently the Railroad (CSX) proposes although the DEIS has not disclosed, the use Blue island Junction as a rail yard for unloading or otherwise breaking off many thousand shipments of Hazardous Materials. The DEIS has not analysed the potential accident increases resulting from this unloading, transfer and parallel rail line shipment of these Hazardous Materials. The rail yard operations at Blue Island Junction should be analyzed individually and cumulatively with the other Haz-Mat impacts here.

The Master Table of All Rail Line Segs should include all lines designated to take shipments of Hazardous Materials at Junctions such as Blue Island Junction.

SEA - Conrail

Greens / Trepanier 3-3

Cumulative Impacts analysis proposed for Hazardous Materials shipments.

The SEA and the Board should disclose and consider Mitigation of cumulative impact of increase Hazardous material shipments at Blue Island, Illinois and any other likewise affected communitities. As an example the cumulative increases in movements of Haz-Mat at Blue Island well exceeds 20,000 loads; at the Barr Yard, thirteen-thousand; and on Seg. C-011, seven-thousand loads, Blue Island Jct to 59th Street; and on Seg. C-023, eleven-thousand loads, Pine Jnt. to Barr Yard; and segment C-417, three-thousand loads, Blue Island Junction to Clearing; C-263, thirteen-thousand loads, Dolton to 75th Street; as well the attendant, yet undisclosed increases at the sub serving rail lines and rail yards such as the IHB rail yard at Blue island Illinois, and at Blue island Junction; requires the Board consider the cumulative impact on our communities of the cumulative increase in Hazardous material accident impacts and need for emergency planning, prevention and community education.

Without the mitigation of grade separation at western Ave and Broadway-135th there would likely be an increase in fatal accidents such that you should review the following disclosure included in the DEIS, "45 fewer accidents and save 1 life per year./ Illinois DEIS V. 5A, Table B-6."

Critique of criteria of significance for Haz-Mat rail accidents.

The criteria of significance, 'one accident expected every 100 years or less per mile of route', is arbitrary and capricious. It is reasonable and necessary to consider the greater impact of Haz-Mat accidents in urban areas vs. rural areas and also exacerbating pre-Acquisition conditions of contaminated air and possible industrial explosions adjacent the Tracks. Like consider in Blue island CSX has been moving explosives thru an Oil Refinery that stores 35,000 gallons of Hydrogen Fluoride, an extreme inhalation hazard chemical. An accident risk of 1 in a hundred that might be acceptable in a rural area is totally unacceptable for tracks just feet away from this refinery. Yet the SEA DEIS analysis of impacts of increase risk of Haz-Mat rail accidents and their arbitrary criteria of 1 accident per 100 years per mile of track ignores these reasonable factors that should be taken in consideration in determination of significance of Hazardous material accident risk increases.

The analysis of train delay in Blue Island considered exacerbating a pre-Acquisition condition and likewise the SEA should consider the exacerbation of existing Haz-Mat risks in Blue Island. The potential risk to our community from this acquisition is also significant because freight train accidents - in a chemical industrial corridor - present greater potential hazard.

We criticize the Preliminary Recommended Mitigation pg IL-85 59th Street Intermodal Construction. We ask SEA and the Board add a new bullet item - Development of an Emergency Response Plan. Plume mapping Worst Case analysis. Notification system. Escape plan, etc, for the Yard.

Thank-you for taking these comments.
Please respond to the issues we have raised as well.

Lionel P. Trepanier, personally and behalf the Blue Island Greens.
Secretary Blue island Greens, 708 396 - 1624
12601 Maple Blue island Illinois 60406

attention of the state agencies that have jurisdiction over highway/rail crossings. Where, as here, there are other governmental agencies responsible for representing the interests of the constituencies at issue, the Board can appropriately rely on those agencies to address any crossing safety or delay issues that the final EIS identifies. See Robertson, 490 U.S. at 352-53; C.E.Q. Notice, 46 Fed. Reg. 18026, 18031-32 (Mar. 23, 1983). Thus, it is entirely proper for the FEIS to recommend further consultation with appropriate state agencies. Once the relevant crossings are identified, the state agencies can review the individual circumstances at each crossing, recommend whether improvements are warranted, and work with the FHWA to install appropriate warning devices..

A. The DOT Accident and Severity Prediction Formula Should Not Be the Sole Basis for Requiring an Upgrade

The DEIS relies on the DOT Accident and Severity Prediction Formula to identify crossings that it believes should be upgraded. However, the formula's primary function is to rank and identify potentially dangerous crossings. Once potential sites are so identified, a state diagnostic team usually performs an in-depth on-site review to determine if an upgrade is warranted. It does not appear that this important on-site review was incorporated into the recommendations in the DEIS. Such a review would reveal that for some crossings, improvements already have been installed or that mitigation is otherwise not necessary. More importantly, by relying solely on the DOT formula for its recommendations, the DEIS does not take advantage of the lead role played by each state in deciding the appropriate warning device that should be placed at each crossing.

The DOT formula alone was not designed to result in a recommendation for a particular type of warning device. Ordinarily, the FHWA and FRA rely on the expertise of state highway

officials for this information. Indeed, the DOT User's Guide, which contains the DOT Formula used in the DEIS, acknowledges that "the judgment of state and local officials should all be considered before final improvement decisions are made." See Rail-Highway Crossing Resource Allocation Procedure - User's Guide, Third Edition, August 1987." The reason for state involvement is that the DOT formula does not incorporate crucial factors into its ranking such as: sight-distance, roadway geometrics, highway congestion, local topography, frequency of high-occupancy vehicles, and frequency of hazardous material transport vehicles. This information is obtained from on-site state diagnostic teams. Moreover, data that are applied to the DOT formula are obtained from FRA's crossing grade inventory and collision files, which are subject to keypunch and submission errors.

Not only did the DEIS fail to consider site-specific circumstances, but the DEIS has proposed the installation of certain devices, such as four-quadrant gates and median barriers, that are not approved either by the FRA or the FHWA's Manual of Uniform Traffic Control Devices ("MUTCD"). The MUTCD places responsibility for design, placement, operation, and maintenance of warning devices with the governmental body or official having jurisdiction. See MUTCD at 8A-1. In most states, warning devices at highway/rail crossing are required by statute to conform substantially to the MUTCD. Experimental devices such as four-quadrant gates and median barriers usually require specific permission from the state agency or toll facility responsible for the operation of the road where the experiment would take place.

Moreover, four-quadrant gates are best suited for roadway facilities more than 45 feet wide and median barriers are appropriate where there are no road or driveway connections within 70 to 100 feet of the crossing. Thus, even if such improvements were appropriate, without on-

site reviews it cannot be determined whether conditions exist that would allow installation of these measures.

The above points underscore that the appropriate recommendation for the FEIS would be for Applicants to consult with appropriate state officials under the established regulatory scheme. This would allow for consideration of all relevant facts and the installation of appropriate warning devices at all crossings.

B. The Established Regulatory Scheme Provides a Comprehensive Approach to Grade Crossing Safety

The DEIS's proposed mitigation measures, requiring the upgrading of certain crossings and the construction of grade separations at other crossings, interject the Board into an established and well-functioning federal-state regulatory regime. Although the DEIS properly identifies areas of concern, the final decisions on improvements should be left to the state agencies with the most knowledge and expertise in this area. Without such a give and take with FHWA, FRA, and the states, the Board would, in effect, be intruding on the funding and safety jurisdiction of its sister DOT agencies (FHWA and FRA), while also assuming a role reserved to the states of prioritizing and determining the appropriate warning device that should be installed at each crossing.

This is not a role that the Board should play. Nothing in NEPA suggests or requires that the Board, through its environmental-conditioning process, venture into areas where Congress has established a very sophisticated funding mechanism and assigned specific safety and funding roles to other federal agencies within DOT. It is perfectly acceptable for the Board to rely on these state and federal agencies to make crossing decisions.

1. The Established Federal Role

The FHWA, with assistance from the FRA, works with the respective state representatives to regulate safety and fund improvements at highway/rail crossings. These responsibilities began in 1970 with the passage of the Highway Safety Act (“HSA”) and the Federal Railroad Safety Act (“FRSA”). Section 205 (a) of the HSA called for “. . . a full and complete investigation and study of the problem of providing increased highway safety at public and private ground-level rail highway crossings. . . .” See Pub. L. 91-605, 84 Stat. 1714. Similarly, the FRSA directed the Secretary of Transportation to undertake “. . . a comprehensive study of the problem of eliminating and protecting railroad grade crossings and to provide recommendations for appropriate action.” See Pub. L. 91-458, 84 Stat. 971.

In response to Congress’s direction, the Department of Transportation (“DOT”) prepared a two-part study. Part I, which DOT submitted to Congress in 1971, addressed the crossing safety problem. In 1972, DOT submitted Part II of the study, which provided various recommendations, including a federal spending program to improve grade crossing safety.

One year later, Congress passed the Highway Safety Act of 1973. Pub. L. 93-87, 87 Stat. 250 (1973). As amended, the HSA governs the distribution of funds to states for the elimination of hazards at rail-highway grade crossings. To be eligible for funding, the Act requires the states to survey and analyze crossings and establish a schedule for improving those found to present the highest hazard levels.

The primary federal role in grade crossing improvements is one of funding. FHWA funds are apportioned to the states in the following manner: fifty (50) percent of the money is apportioned according to the ratio of the number of public crossings in each state to the total

number of public crossings in the entire country. 23 U.S.C. § 130(f). The remainder is apportioned on the basis of area, population and road mileage. See 23 U.S.C. §§ 104, 130. Federal funds may be used for improvements to any public highway/rail crossing, whether on or off the federal-aid highway system. 23 U.S.C. § 130.

When it was enacted, the federal funding statute, at Section 130(b), presented the Secretary of Transportation with the option of requiring the railroads to pay a small share (up to ten percent) of the costs of improvements that represented a “net benefit to the railroad.” When the Secretary promulgated implementing regulations for Section 130, however, these regulations explicitly recognized that the railroads derived no ascertainable benefit from grade crossing improvements:

(1) Projects for grade crossing improvements are deemed to be of no ascertainable net benefit to the railroads and there shall be no required railroad share of the costs.

23 C.F.R. § 646.210(b) (emphasis added). Indeed, these regulations reaffirmed existing policy at the ICC. In the early 1960's, the ICC authorized a comprehensive investigation of train/motor vehicle accidents at highway/rail crossings. The finding that resulted from the investigation was that:

highway users are the principal recipients of the benefits flowing from rail-highway grade separations and from special protection at rail-highway grade crossings. For this reason, the cost of installing and maintaining such separations and protective devices is a public responsibility and should be financed with public funds the same as highway traffic devices.

Interstate Commerce Commission Report No. 33440, Prevention of Rail-Highway Grade Crossing Accidents Involving Railway Trains and Motor Vehicles, 322 I.C.C. 1, 87 (Jan. 22, 1964).

Despite these well-established funding responsibilities, the DEIS can be read to suggest that CSX and NS should bear full responsibility for the costs of proposed mitigation at the crossings identified in Table 7-4. Simply because a crossing has been identified in a NEPA review of a railroad control transaction, however, does not mean that the established regulatory and funding system should be ignored. Requiring CSX and NS to bear the full costs of these improvements would be inconsistent with federal regulations and the spirit of the national grade crossing safety program.

2. The Role of the States

According to DOT, “[j]urisdiction over highway/rail grade crossings resides primarily with the States.” Department of Transportation “Railroad-Highway Grade Crossing Handbook” at 19 (FHWA-TS-86-215) (2d. Ed.) (1988). While the FHWA and FRA provide federal oversight, funding and guidance, in most instances, it is the states that are most familiar with the needs and dangers posed by a particular crossing. It is the states, therefore, that perform the on-site inspections and it is the states that are charged with protecting the health and welfare of its citizens. The federal government’s role is one of funding and approval of state determinations.

In the majority of the states, the overall authority for highway/rail crossing safety and consolidation lies with the state agency that oversees and regulates transportation. In a limited number of states, the responsibility for crossing safety and consolidation is vested in regulatory bodies with a broader scope, such as the Public Utilities Commission or the Public Service Commission. A few states apportion the responsibility among the state transportation agencies and other state agencies.

Regardless of the administrative structure, to qualify for federal funding, each State must “conduct and systematically maintain a survey of all highways to identify those railroad crossings that may require separation, relocation, or protective devices, and establish and implement a schedule of projects for this purpose.” 23 U.S.C. § 130(d). Pursuant to FHWA regulations, each state receiving federal aid also is required to develop a “highway improvement program” that establishes priorities to address highway hazards and provides guidance as to the evaluation and implementation of remedial measures. 23 C.F.R. § 924. In developing those priorities, the states are directed to consider and rank the dangers posed by grade crossings. 23 C.F.R. § 924.9(a)(4). Having developed this program, each state must evaluate its effectiveness and costs, § 924.13, and file yearly reports with the FHWA. 23 C.F.R. § 924.15.

Using the DOT’s Accident and Severity Prediction Formula, the FHWA calculates the accident risk at each crossing for all states based upon the characteristics of the grade crossing and statistical information on historic accident experience. The states, however, supplement this information with more recent data, (e.g., average daily traffic and accidents), and conduct site visits before deciding whether to upgrade highway/rail crossings. Under this approach, the individual needs of the local community can be considered along with any unique safety concerns for a particular crossing.

The DEIS recommends grade crossing mitigation in four states involving CSX lines: Indiana, Kentucky, Michigan and Ohio. As is discussed below, each of these states has developed an in-depth process for analyzing the type of warning devices that should be installed at highway/rail crossings. The states are in a unique position to assess the current status and

Vernon A. Williams
Secretary
Surface Transportation Board
1925 K Street, NW, Suite 700
Washington, D.C. 20423

Dear Mr. Williams:

We have reviewed the Environmental Assessment for the proposed acquisition and control of Conrail at Willow Creek and Alexandria in Madison and Porter counties, Indiana [FINANCE DOCKET #33388]. This review has been conducted pursuant to Section 106 of the National Historic Preservation Act (16 U.S.C. Section 470f) and implementing regulations found at 36 C.F.R. Part 800.

As long as the project remains within areas disturbed by previous construction, no known historic buildings, structures, districts, objects, or archaeological sites listed in or eligible for inclusion in the National Register of Historic Places will be affected by this project. However, if any archaeological artifacts or human remains are uncovered during construction, demolition, or earthmoving activities, state law (Indiana Code 14-21-1-27 and 29) requires that work must stop and that the discovery must be reported to the Division of Historic Preservation and Archaeology within two (2) business days. Additionally, in the event that artifacts or features are discovered during the implementation of the federally assisted project, activity, or program and a plan has not been developed, it is the federal agency's responsibility to contact the Advisory Council on Historic Preservation in accordance with 36 C.F.R. Section 800.11(b)(2). Thank you for your cooperation.

Very truly yours,

for Larry D. Macklin
State Historic Preservation Officer

Re: Finance Docket No. 33388
CSX Corporation and CSX Transportation Inc.,
Norfolk Southern Corporation and Norfolk
Southern Railway Company -- Control and Operating
Leases/Agreements -- Conrail Inc.
and Consolidated Rail Corporation

Dear Ms. Kaiser:

The Cities of East Chicago, Indiana; Hammond, Indiana; Gary, Indiana; and Whiting, Indiana (collectively, the "Four City Consortium" or the "Four Cities") hereby request that the Board's Section of Environmental Analysis ("SEA") provide them with additional information concerning the train speed inputs used by SEA's environmental contractor in calculating vehicle delay times at certain at-grade rail/highway crossings in the Four Cities area that will be adversely impacted by the Applicants' operating plans after the Conrail control transaction is consummated. The vehicle delay times calculated by SEA's contractor are included in the Draft Environmental Impact Statement ("DEIS") in the above proceeding served on December 12, 1997.

The information requested is necessary to enable the Four City Consortium to provide meaningful comments with respect to the DEIS's analysis of the environmental impacts of the Conrail transaction on the Four Cities region. Such comments are due on February 2, 1998. The information requested may also be useful in facilitating a negotiated solution to the problems raised by the Four Cities, as suggested by SEA, which would avoid

Elaine K. Kaiser
January 12, 1998
Page 2

the necessity for asking the Board to impose environmental mitigating conditions.

On October 21, 1997, the Four City Consortium filed Comments and Requests for Conditions in this proceeding which described certain negative environmental impacts from the Applicants' proposed division of Conrail. The negative impacts result primarily from Applicants' plans to move more traffic over line segments containing numerous highway/rail grade crossings. The Four Cities' Comments propose an Alternative Routing Plan that was developed to mitigate these negative environmental and related impacts, while requiring only minimal adjustments to the Applicants' proposed operating plans.

In the DEIS, SEA recognizes the concerns raised by the Four City Consortium, and recommends that the Applicants consult with the Four Cities and other appropriate parties to address the potential traffic delay and safety concerns raised by the Four Cities with respect to certain rail/highway grade crossings. (DEIS, Volume 3A, Chapter 5 at page IN-85.) The Four Cities and the Applicants are in the process of attempting to negotiate a mutually-acceptable agreement for measures to address these problems (which may include aspects of the Alternative Routing Plan). The first meeting of the parties for this purpose took place last Friday, and further meetings will be held in the near future.

One of the principal issues in dispute between the Four Cities and the Applicants is the amount of delay time that is or would be incurred by vehicles at certain rail/highway grade crossings in the Four Cities region that are impacted by the Applicants' operating plans. Crossing delay times are influenced heavily by train length and speed, among other factors. In order to be able to comment intelligently on the DEIS and respond to the Applicants' contentions, it is critical for the Four Cities to know what train speeds and other assumptions were used by the SEA's environmental contractor in developing crossing delay estimates for these crossings.

The DEIS indicates that SEA has analyzed 15 at-grade rail/highway grade crossings in the Four Cities area for vehicle delay. (Id., Volume 3A, Chapter 5 at page IN-84.) The Four Cities' consultant has inquired informally of SEA's environmental contractor as to the inputs used to calculate delay times for these crossings, including the train speeds used. However, the contractor would not divulge the specific train speeds or other assumptions used in developing delay times for the 15 crossings studied.

Accordingly, the Four City Consortium requests that SEA furnish it with the following inputs and assumptions used by SEA's environmental contractor in calculating the crossing delay times for the 15 grade crossings studied:

1. A list of all grade crossings in the Four Cities that were evaluated.
2. For each crossing evaluated (please provide the data separately for pre-and post-acquisition):
 - a. The number of trains assumed to use the crossing daily.
 - b. The train lengths assumed.
 - c. The train speeds assumed and the manner in which those train speeds were determined (if actual speeds, the source of the information concerning such speeds; if not actual speeds the basis for the speeds (e.g., FRA data, railroad timetable) and any adjustments made to approximate more closely actual speeds.
 - d. Any assumptions as to train weight and power (drawbar horsepower).
 - e. Average Daily Vehicular Traffic.
 - f. The number of vehicle lanes in each direction.
 - g. The number of tracks at the crossing.
 - h. The warning devices at the crossing.

In order to be able to make meaningful use of this information both in the settlement discussions with the Applicants and in preparing comments on the DEIS, the Four Cities respectfully request that it be provided to their undersigned counsel at the earliest practicable date. If SEA is unable to provide all of the data requested in a timely manner, the most critical items of information needed by the Four Cities are the

Princeton, IN 47670

Dear Secretary;

I am opposed to the Conrail Acquisition by CSX and Norfolk Southern of the Vincennes, Indiana to Evansville, Indiana (22.3/30.81) (CSX) rail segment.

A Toyota Factory is being built south of Princeton. They will manufacture the T100 pick up truck. They are to be manufactured by late 1998 and will be shipped by railroad through our town. Both CSX and Norfolk Southern move through our town on tracks that run parallel to each other. The Norfolk Southern crosses the CSX tracks at the south end of Princeton and results in our town being completely blocked for long periods. People are desperate to get to work, home, etc. and take chances by driving in front of the trains. See enclosed list of some of these accidents and deaths.

The additional problem of NUCLEAR WASTE being carried as a cargo on these trains adds to the Environmental Impact of Princeton. At the present time there are an estimated 50 trains by CSX and 19 trains by Norfolk Southern going through Princeton, When the production and shipping of the Toyota T100 truck begins we will have the required numbers to make an Impact Analysis due to Air Quality, Noise Threshold and Vehicular Traffic. See enclosed newspaper articles.

Sincerely,

Frankie Lu Eads

Safety's not an issue — it's the only issue

By SHIRLEY BLACKBURN
For The Daily Clarion

Safety isn't just one of the issues where rail crossing changes in Princeton are concerned. It's the only issue.

If the death of eight people, in less than a year, at county crossings without train-activated signaling is not enough motivation for further change, then one can only assume there will never be enough motivation for further change.

If the railroads, the appropriate governmental units, the city, the city's residents and all others involved in this issue do not work together to upgrade crossing safety, then the situation in this community will remain status quo--dangerous. And, if history is any guide, it will only be a matter of time before another motorist, who did not see the train and had no lights, gates or barricade to warn him of its pres-

A news analysis

ence, collides with that train at one of Princeton's crossings. Truth is, there may be close to 500 or more chances of that happening each and every single day here. There is presently no train-activated signaling at Clark, Monroe, Pinkney, Mulberry, Hart or Makenson Streets, all residential crossings just blocks apart on the south side of Princeton. Norfolk Southern confirms 19 scheduled and CSX estimates 50 scheduled trains daily through Princeton. This does not include "extras," which officials say could push the number of trains through this small community even higher than the almost 70 scheduled.

So, let's say 80 trains times six crossings without train-activated signaling. . . you do the math. Yes, we fought for and have lights and gates coming for

the Mulberry Street crossing and the Lyles Station Road crossing just north of town, but they will not be in place at least another year. Conditions have improved some at Lyles Station, with brush being removed and stop signs in place.

Yes, we have had a rail corridor review performed by the Indiana Department of Transportation (INDOT) and two subsequent hearings. The first, heavily promoted by the newspaper, was chaired by INDOT officials and poorly attended by the public. The second, also heavily promoted by the newspaper, was chaired by the city and well attended by the public. Objections to the planning commission's proposal to close some crossings in exchange for signalers ranged from 'only the railroads would benefit from any closures' to 'people killed at the crossings had their radios up and weren't paying attention' to 'what plans has the city made to handle traffic if closures are made.'

Continued on P.

Noise bothersome

To the officials of Princeton and to whom it may concern:

The problem: Train pollution, air and noise.

The south end of Princeton may be considered by some to be the slums of Princeton, but people are not garbage. We are real people with homes and families and try to take as good a care of our property as all other property owners in the city limits

We are people who vote and pay taxes just like all other property owners. We have always had our needs ignored, but now with everything going to Toyota, it's even worse.

Up until two years ago there was never a problem with trains. I repeat, never. Now, sometimes as many as five or six engines are left idling together for days at a time directly across the street from our homes. There is the constant smell of diesel exhaust (sometimes very bad). Constant vibration, our windows constantly rattle. The noise is

always there. Our walls are cracking, our foundations are setting deeper and deeper and our property values are becoming less and less.

Some of us have been to the mayor several times. We have tried to contact the trainmaster, but he's never there or doesn't want to be bothered.

When they switch the empty cars, we just ask that they be a little more gentle when they let the cars go. Sometimes in the early hours of the morning (five or six o'clock) it sounds like something has exploded. It rattles everything for several blocks.

In all this we did not say "take the yards out" or "move them away," nor were we ever hateful or mean. All we ask is that the engines be shut off when not being used, or to move them to the east of the water tower. Also, if they would bump the cars a little more gently, we would be less affected.

You can say "move," but we don't want to move any more than the rest of you would want to move from your area. Some of us have lived in the area more than 30 years and more. Do these same officials want us to be a constant hassle to them while they are at work or home, the answer is of course no! They sure do want our votes and for us to pay our taxes, but they will contact the right officials.

Nor will they insure the correct measures are being taken to keep the problem from recurring.

We are really going to have to consider the promises of our officials when we vote, as to whether or not they are working for the taxpayer-voter or for their own personal gain.

Nancy E. Bailey
Princeton

Another Gibson driver injured in train collision

Number of trains in county up

By MARK WILSON
Courier staff writer

PRINCETON, Ind. — A Princeton man injured at a train crossing Thursday became the latest of a growing number of car-train accident victims in Gibson County, despite safety efforts by police. Police said Corey Cabell, 20, Princeton, apparently attempted to

beat a train across an unmarked crossing on Mulberry Street at 6:12 p.m.

He was kept overnight at Gibson General Hospital and released Friday a hospital spokeswoman said. A passenger, Lamanda Peay, 18, of Newburgh, was taken to the hospital but not admitted, the spokeswoman said. No charges have been filed.

Gibson County Sheriff George Ballard attributes the accidents mostly to an increase in local train traffic, but also to human errors.

"We can make safer cars and safer highways, but guess what, accidents are still happening," he said. "There is a large number of crossings in Gibson County and a lot of drivers. Once in a while the two are going to meet."

Ballard said particularly bad spots in the county include the Fort Branch area and a crossing on Lyle Station Road just north of Princeton where two people died in 1996.

While the Lyle Station crossing is marked with a sign, the Mulberry Street crossing is not, Ballard said the Indiana Department of Transportation planned to install crossing gates last year at the Lyle Station crossing, but the work has not been done.

"The volume of trains in the area has increased a lot in the last three to four years," Ballard said. "Between Norfolk and Southern and CSX, I've heard there are about 50 trains going through Princeton in a 24-hour period now. Obviously, that number may increase as time goes by; what with Toyota and all."

In other business discussed at Monday's regular meeting: The board approved a six-week medical leave for Gibson County Sheriff's Department Capt. Rick Barr, after his existing sick days are exhausted. Members delayed appointment of an ad-hoc committee to study possible zoning laws for the county.

"I'm just here to get the dialogue going," he told commissioners. "I know that when you get into odd angles with Ind. 64, county roads which intersect at Delacroix also suggested altering the route of possibly three can work together."

Delacroix also suggested altering the route of possibly three can work together. "But once Toyota tells us what we need to know, then I hope we er road right now," he said. County Road 100 East or any other road right now," he said.

"I'm not here to request closing to assure traffic flow, he said. the guards and work with residents Norfolk Southern would pay for crossing to prevent long waits. He suggested commissioners consider closing the Ohio Street a crossing."

Ballard said particularly bad spots in the county include the Fort Branch area and a crossing on Lyle Station Road just north of Princeton where two people died in 1996. While the Lyle Station crossing is marked with a sign, the Mulberry Street crossing is not, Ballard said the Indiana Department of Transportation planned to install crossing gates last year at the Lyle Station crossing, but the work has not been done.

"The volume of trains in the area has increased a lot in the last three to four years," Ballard said. "Between Norfolk and Southern and CSX, I've heard there are about 50 trains going through Princeton in a 24-hour period now. Obviously, that number may increase as time goes by; what with Toyota and all."

Railroads looking for spur options
By ANDREA CULBRETH
Clarion Managing Editor

The City of Fort Wayne

Paul Helmke, Mayor

Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K Street N.W.
Washington, D. C. 20423-0001

Attention: Elaine K. Kaiser
Environmental Project Director

Re: Conrail Acquisition Impacts on Fort Wayne, Indiana

Dear Director:

Thank you for the opportunity to comment on the draft EIS prepared by your agency regarding the pending acquisition of Conrail by CSX and Norfolk Southern railroads. The City of Fort Wayne is supportive of the economic boost which the results of this merger will bring to this community.

At the same time, we are concerned that the residents of Fort Wayne and vicinity not bear undue burdens from this opportunity. After careful examination of the STB's identified impacts on the Fort Wayne area, and after consultation with my professional planning and engineering staffs, we have determined that the cumulative impacts on this community, particularly in areas of safety, disruption of surface roads, noise, hazardous materials transport, and on low income and minority neighborhoods deserve additional consideration by the STB, even though the SEA has not found many of these issues to meet their thresholds of mitigation.

We strongly support the SEA's recommendation to improve crossing warning equipment at Anthony Blvd. and Engle Rd. We also support the Federal safety requirements which come with the creation of Major Key Routes through Fort Wayne. We support the training and simulations with our emergency preparedness teams to enhance their ability to mitigate hazardous material discharges, and the preparation of an emergency preparedness plan for such occurrences.

Our Hazardous Materials Emergency Team advises me that they will need some equipment upgrades involving computer and metering/testing equipment to handle the fivefold increase in rail cars containing hazardous materials coming through this densely populated area. This is expected to cost between \$5,000 and \$10,000. We would like this cost to be borne by the railroads.

Surface Transportation Board

January 30, 1998

Page 2

Rail noise is a concern in Fort Wayne, particularly from train horns in the near east and southwest neighborhoods bordering affected lines where there are grade crossings. The SEA impact statement notes that the Federal Rail Administration is mandated, under the Swift Rail Act of 1994, to develop "Whistle Ban" regulations. It is stated that the Notice of Proposed Rule-Making is expected to be published in the first half of 1998. We hope these rules will create opportunities to safely reduce train horn sounding at grade crossings like those found in Fort Wayne.

We further understand that supplementary safety features, including four-quadrant gates, could create the "secured" crossings needed before it would be considered safe to delete train horns at those intersections. This feature is already recommended by the SEA to improve safety at the Anthony Blvd. crossing. In order to help mitigate the 90% increase in train horns sounded in Fort Wayne from this acquisition, we request that "secured" crossings be created for the grade crossings near the residential areas bordering the affected lines in Fort Wayne. These include crossings at:

Lumbard Street
Wabash Avenue
Fletcher Avenue

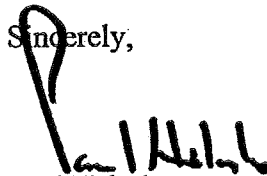

Winter Street
Brooklyn Avenue
Nuttman Avenue

We also encourage the development of loudspeaker "horn" technology at grade crossings to reduce the impact area of the train horns on nearby residences.

The residents most affected by noise are heavily minority and of low income at these locations, especially the first four, as noted in the SEA study. While we applaud the STB's efforts to inform these populations, mitigation will be more meaningful to the quality of life in these neighborhoods.

I hope that the SEA will seriously consider including these mitigations in their final draft impact statement to the Surface Transportation Board. This acquisition represents great economic opportunity for many. We hope that opportunity comes at a fair price.

Sincerely,

Paul Helmke
Mayor

Environmental Filing

**ENVIRONMENTAL
DOCUMENT**

Dear Ms. Kaiser:

Thank you for your letter and for the copy of the "*Proposed Conrail Acquisition*"
Draft Environmental Impact Statement.

The City of Lafayette, Indiana, supports the proposed Conrail acquisition by
Norfolk Southern and CSX Transportation.

As the EIS points out, the City has been working cooperatively with these
railroads, along with federal and state government, for over twenty-five years to
implement the Lafayette Railroad Relocation Project (see attached brochure).
CSX has been relocated and 18 at-grade crossings eliminated. The City's request
for federal funds for the last contract is pending with Congress. The last contract
will relocate Norfolk Southern and eliminate the final 24 at-grade crossings
bringing the project total to 42 (see attached status summary).

The final 24 crossings are the Norfolk Southern ones mentioned in the EIS and
are the most dangerous. The community will be devastated if the acquisition
goes through and the final federal funding for Railroad Relocation does not.

The mitigation you are counting on for the City of Lafayette, Indiana, depends
on a decision that we hope will be forthcoming from Congress, but is not yet
certain. Your communication of the importance of this final Railroad Relocation
funding to the appropriate subcommittees of Congress would be appreciated.

Sincerely,

Dave Heath, Mayor
City of Lafayette, Indiana

....is a unique transportation infrastructure project begun in the 1970's to consolidate four rail lines of two railroads into a new conflict-free corridor eliminating 42 at-grade crossings.

CONSTRUCTION STATUS BY SEGMENT

- #1 Completed 1987: Wabash Avenue Underpass
- #2 Completed 1992: State Road 26 Bridges over Wabash River
- #3 Completed 1993: Ninth Street Underpass
- #4 Completed 1994: CSX Relocation; 1995: Fifth Street; 1996: Depot Plaza

18 grade crossings eliminated!

#5 Norfolk Southern Relocation

Completed 1996: Bridges over Wabash Avenue and Ninth Street

- 1996-'98: Embankment & Bridge over US 52
- 1997-'98: Bridge over SR25
- 1999-'00: NS Relocation – *with additional federal funds*

24 grade crossings eliminated in final contract will bring total to 42!

FUNDING

Federal

- Federal Aid Highway Act of 1973 (Sec. 163) as amended
- Surface Transportation Act of 1987 (Sec. 149), Rail Safety, Minimum Allocation
- ISTEA '91, Sec. 1037, Transportation Enhancements, Minimum Allocation

State

- 12 grants from two different administrations of differing political parties

Local

- City of Lafayette, unanimous bi-partisan approval of bonding and financial program to provide non-federal share to complete project

Funding is 84% complete, but 2/3 of the benefits come from the final contract.

NATIONAL RECOGNITION

The Project has been frequently cited for its extensive public participation process, high quality of design, and near unanimous public consensus, specifically.....

- All-America City Award, 1995
- Federal Highway Administration Environmental Excellence Award, 1995
- USDOT National Transportation Award for Design Excellence, 1981
- Numerous state and local awards

*LAFAYETTE
RAILROAD
RELOCATION*

March 1993

The Lafayette Railroad Relocation Project . . .

Vitally Necessary to Growth and Development

Studies determined that 30-40 trains delay approximately 13,000 vehicles per day including ambulances, police, fire and 10 of 16 community bus routes. Tracks tri-sect the city and run for 14 blocks down the center of a major downtown street.

All 42 Crossings Eliminated

The project will consolidate 4.2 miles of NS double track, 1.26 miles of NS single track, and 2.6 miles of CSX single track into one conflict-free corridor through the city. Carefully studied alternatives were found to be ineffective or harmful to the area's transportation network. Do-nothing costs are high and perpetual.

Highway Trust Fund Provides Most of the Federal Share.

Gasoline tax money makes deficit impact minimal.

...will prevent crossing accidents.

National Design Award

Lafayette received one of only 17 awards of design excellence selected from 250 entries in the 1981 National Transportation Design Awards Program, co-sponsored by the U.S. Dept. of Transportation and the National Endowment for the Arts. Lafayette was the only railroad relocation project recognized.

Railroad Cooperation

From Norfolk Southern, CSX, and Amtrack

...will remove trains from 14 blocks of 5th St.

Strong Public Support

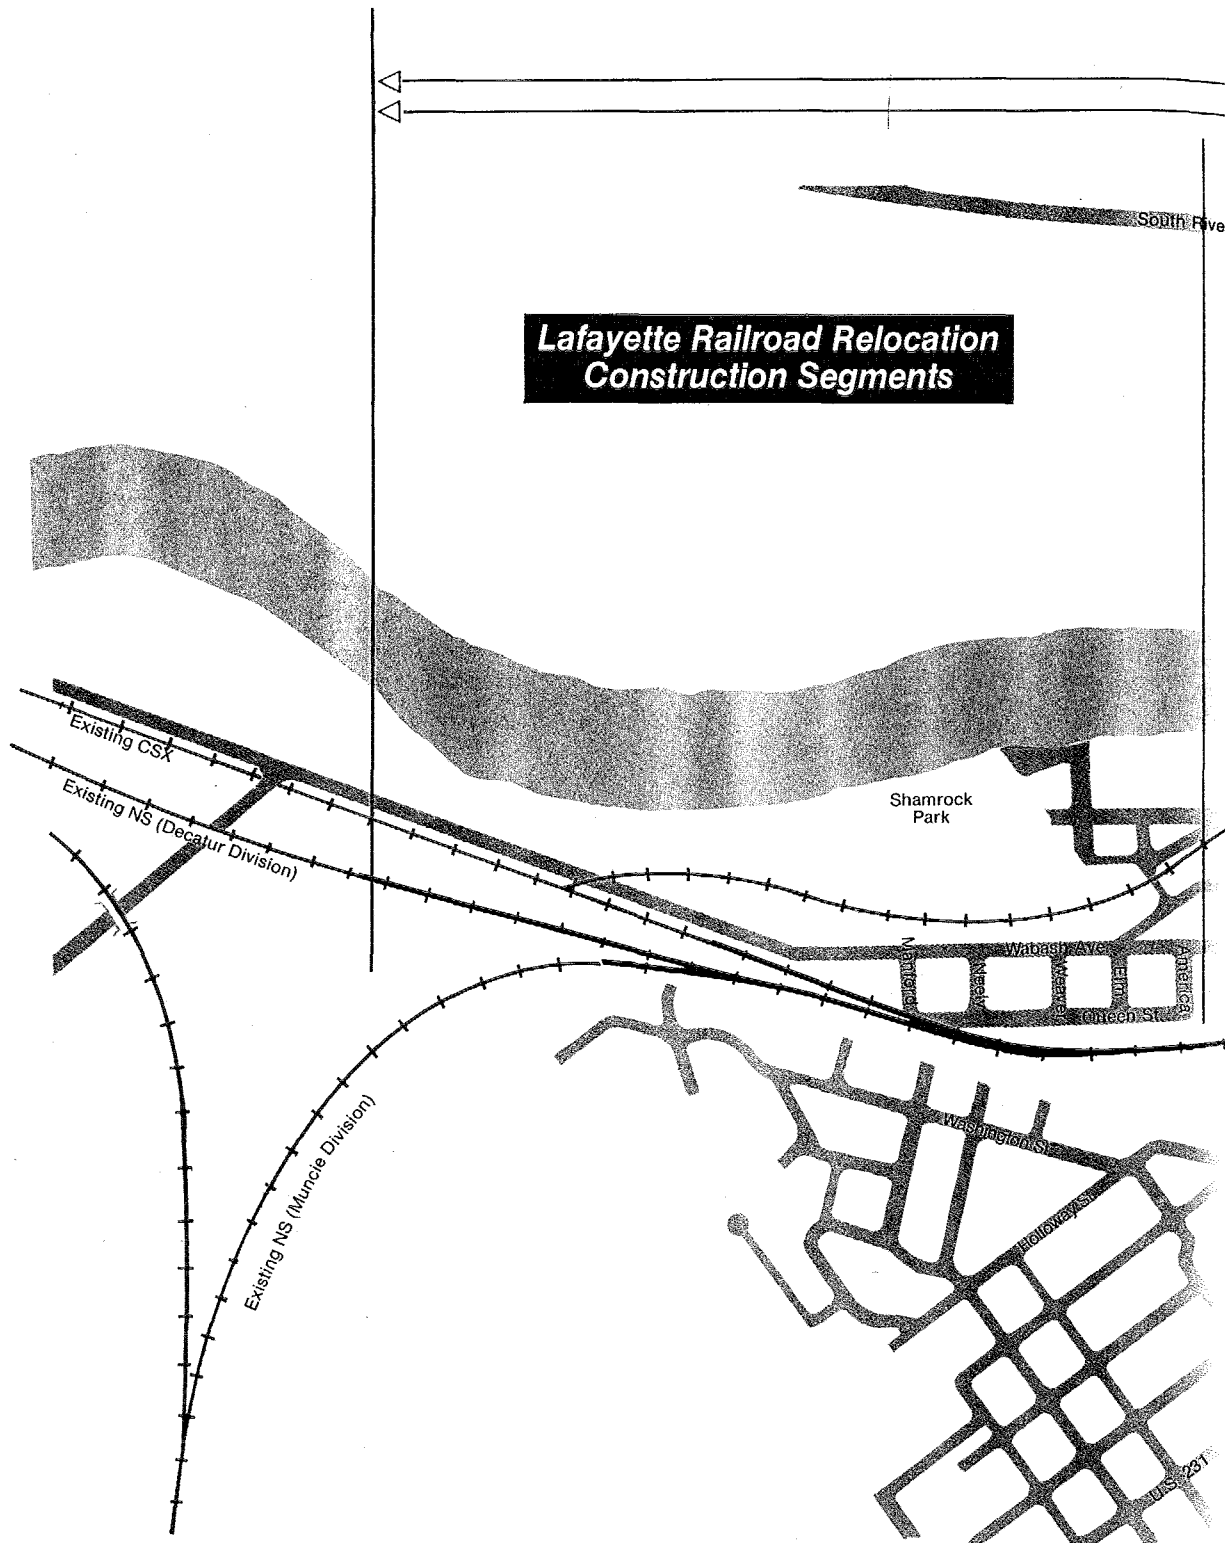

No opposition and many positive comments were expressed at the well attended Design Public Hearing. Thousands of individual and group contacts insured citizen input and responsive plan development in each of these phases:

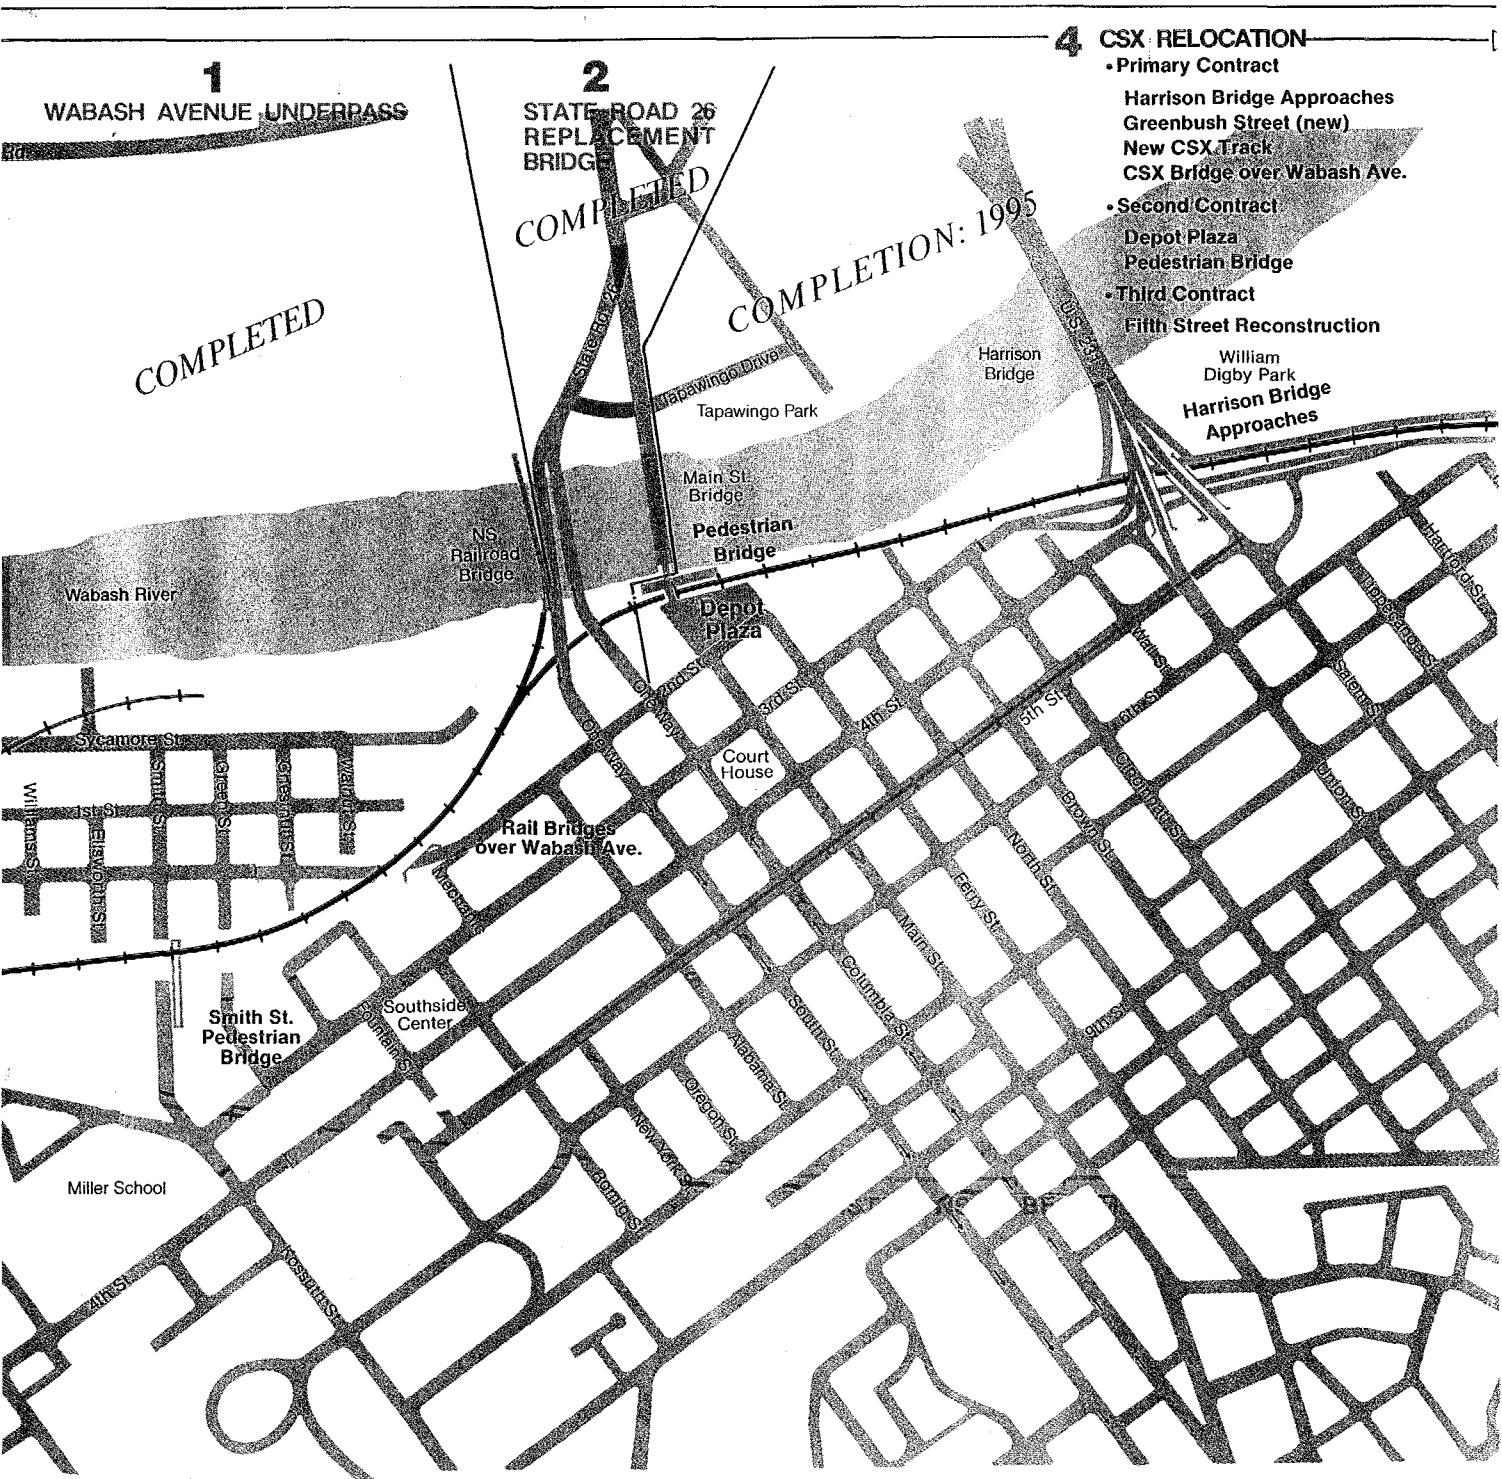

- 1969—Initial Studies
- 1979—Environmental Impact Approval
- 1981—Design Approval
- 1984—Final Design
- 1986—Construction Begins
- 1987—Segment #1 Completed (Wabash Avenue Underpass)
- 1992—Segment #2 Completed (State Road 26 Replacement Bridge)
- 1992—Segment #4 Primary Contract Construction Begins (CFX Relocation)
- 1993—Segment #3 Completed (Ninth Street Underpass)
- 1994—Segment #4 Second Contract Construction Begins (Depot Plaza)
- 1994—Segment #4 Third Contract Construction Begins (Fifth St. Reconstruction)
- 1995—Segment #5 Construction Begins (projected) (Norfolk Southern Relocation)
- 1998—Total Project Completion (projected)

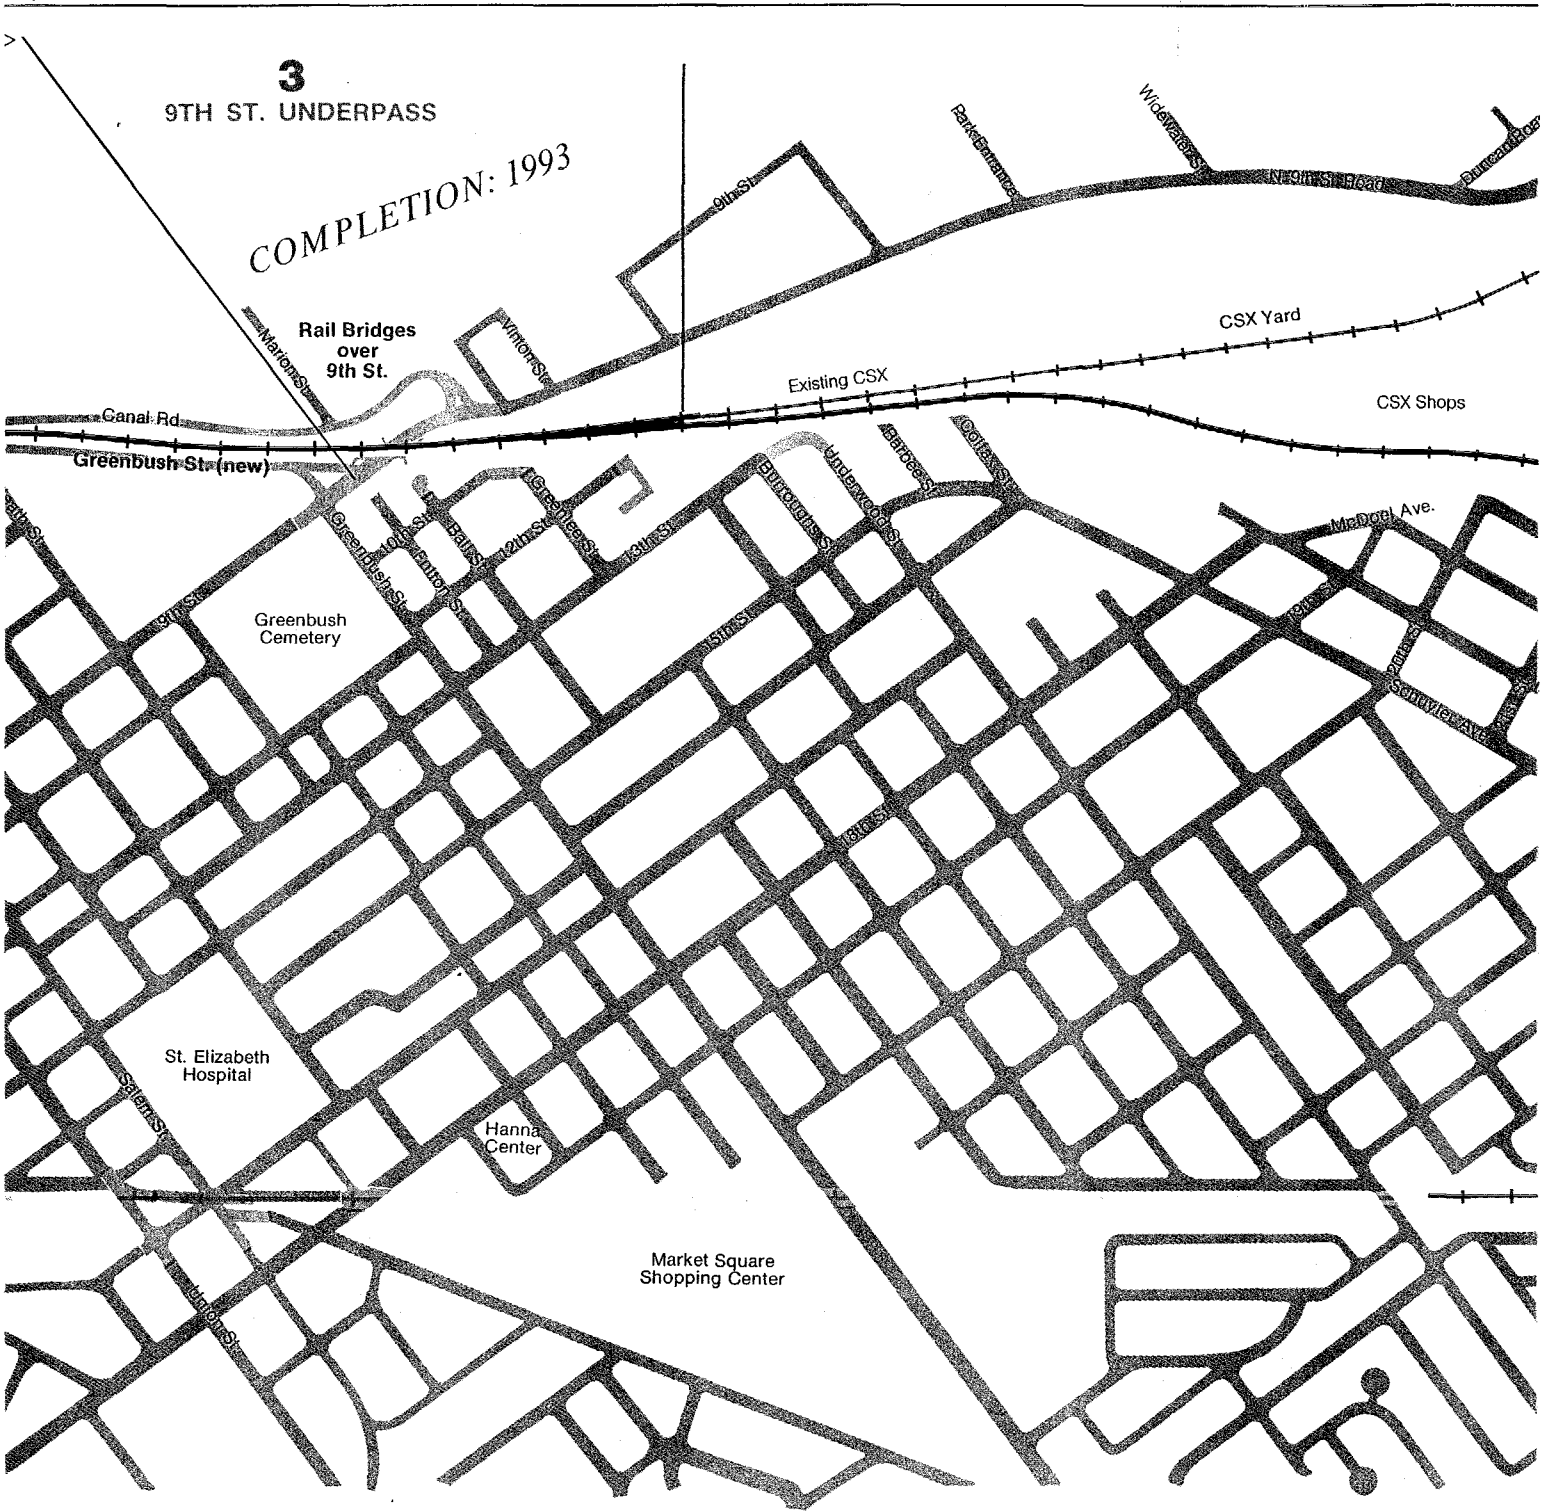

...will eliminate congestion and delays.

Lafayette Railroad Relocation Construction Segments

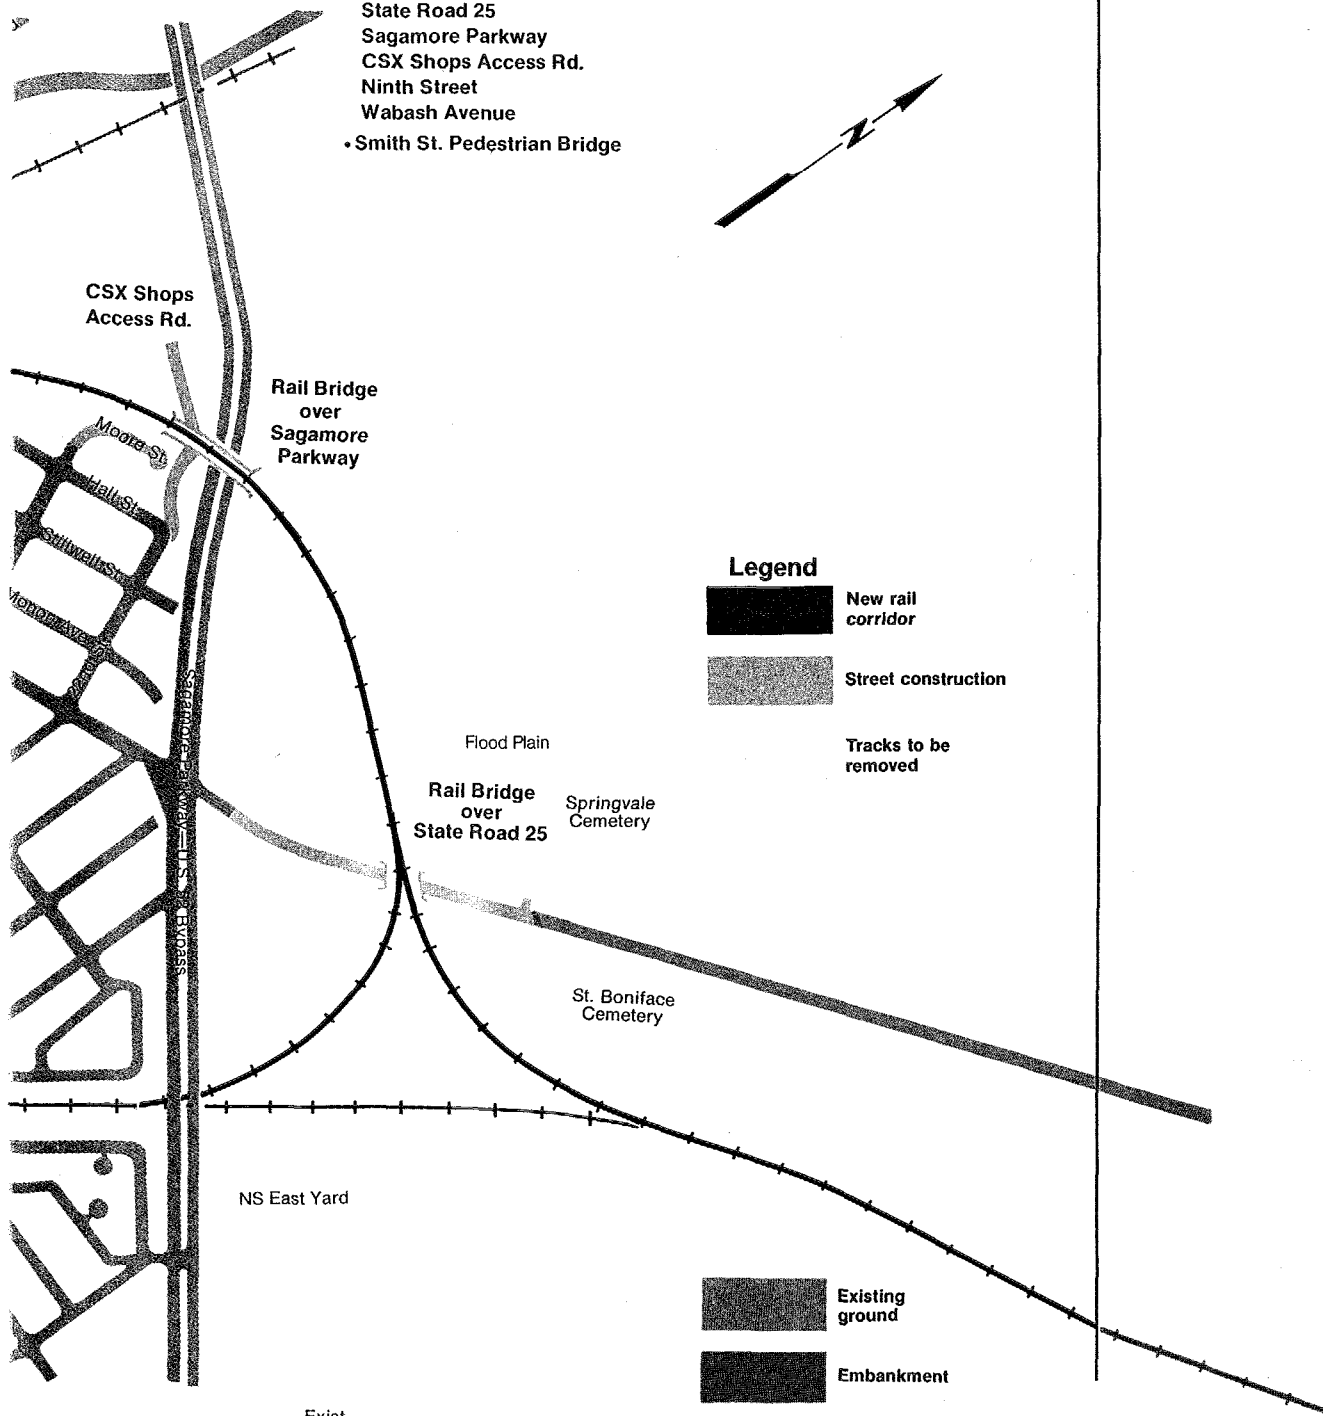

5 NORFOLK SOUTHERN RELOCATION

- Track Work
- Rail Bridges Over:
 - State Road 25
 - Sagamore Parkway
 - CSX Shops Access Rd.
 - Ninth Street
 - Wabash Avenue
- Smith St. Pedestrian Bridge

Legend

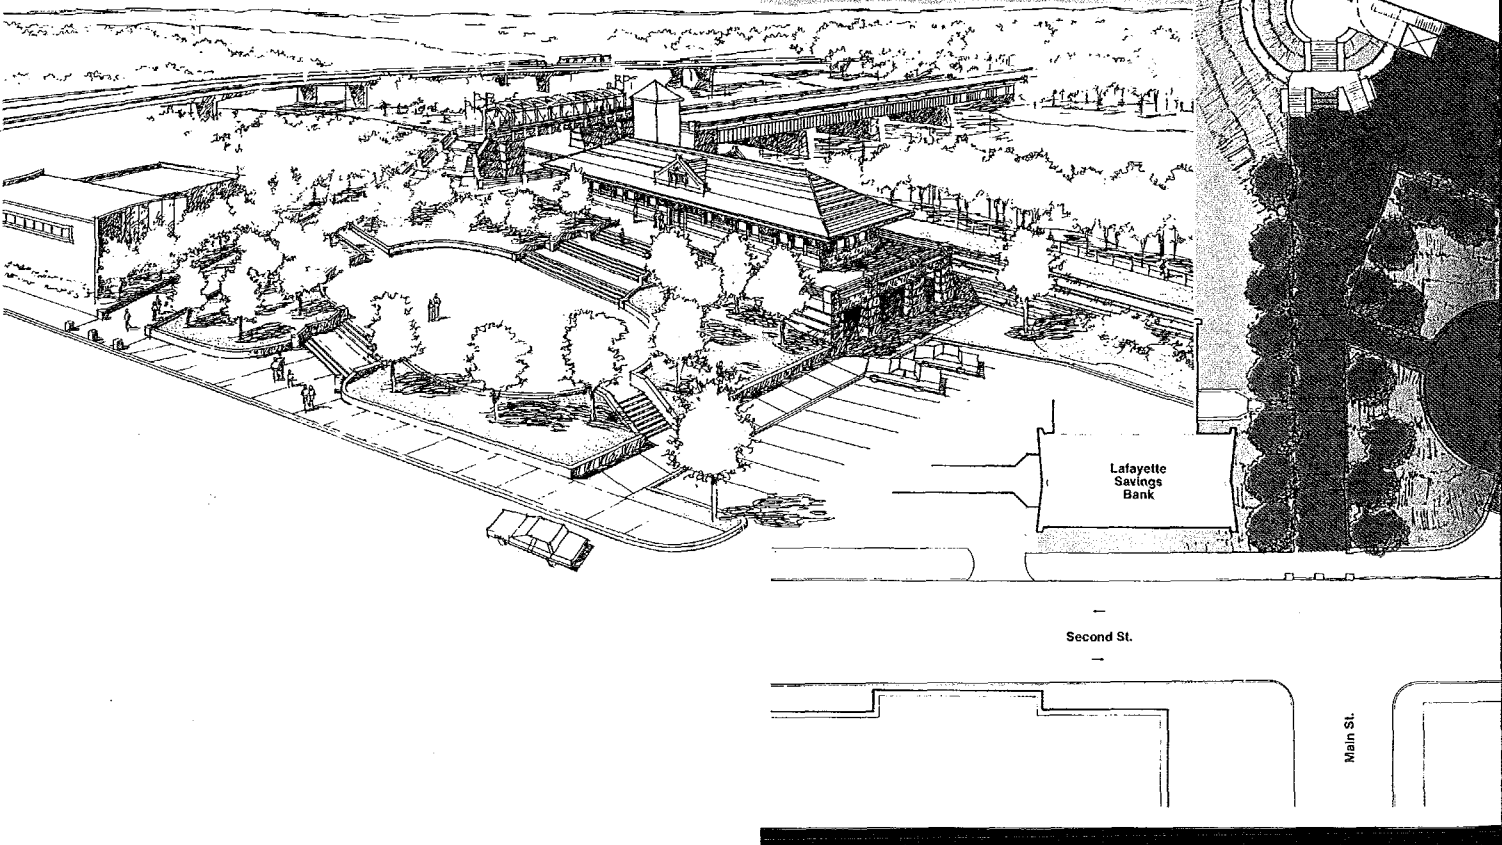

- New rail corridor
- Street construction
- Tracks to be removed

- Existing ground
- Embankment
- New track alignment

COMPLETED

Proposed Depot Plaza

The Depot Plaza is being developed as part of Segment #4 of the Lafayette Railroad Relocation Project to resolve many issues raised by relocating the tracks to the Downtown Business District.

The Big Four Depot will be moved to Second Street at Main and will provide mixed-use occupancy for Amtrak, Lafayette Public Transportation Corporation, and other possible future tenants. Amtrak trains will run on the most westerly railroad track in the new rail corridor.

o
ide
reater
ctions.
esterly

When Depot Plaza construction has been completed, Amtrak passengers will cross above the new rail corridor on an elevated pedestrian bridge which will provide access to the Amtrak waiting shelter on the west side of the rail corridor. The Main Street Bridge urban park, Heritage Trail, and Wabash River will also be accessible from the east via the pedestrian bridge. Elevators will be located on both ends of the pedestrian bridge to provide full accessibility to all levels.

Other features of the Plaza include a brick-paved gathering place and public open space, a fountain, landscaped green space, and a textured concrete wall on the east side of the corridor to provide visual and sound screening from the trains. City buses will load and unload passengers for all routes each half hour just north of the Plaza area, allowing the Plaza to function as an intermodal transportation facility.

The Depot Plaza is essential to the functional success of Lafayette's railroad relocation design, but it will also provide an attractive focal point for the project and for the central city revitalization efforts so important to the community.

RE: Conrail Acquisition Impacts on New Haven, Indiana

Dear Director:

Thank you for the opportunity to comment on the draft EIS prepared by your agency regarding the pending acquisition of Conrail by CSX and Norfolk Southern Railroads. The City of New Haven is supportive of the economic boost which the results of this merger will bring to this community.

At the same time, we are concerned that the residents of New Haven and vicinity not bear undue burdens from this opportunity. After careful examination of the STB's identified impacts on the New Haven area, and after consultation with my professional engineering staff, we have determined that the impacts on this community, particularly in the areas of safety, disruption of surface roads, noise and hazardous materials transport, deserve additional consideration by the STB, even though the SEA has not found many of these issues to meet their thresholds of mitigation.

Rail noise is a concern in New Haven, particularly from train horns in the neighborhoods bordering affected lines where there are grade crossings. The SEA impact statement notes that federal rail administration is mandated, under the Swift Rail Act of 1994, to develop "Whistle Ban Regulations". It is stated that the notice of proposed rule-making is expected to be published in the first half of 1998. We hope these rules will create opportunities to safely reduce train horn sounding at grade crossings like those found in New Haven.

"Equal Opportunity Employer"

Ms. Elaine K. Kaiser
February 2, 1998
Page Two

We further understand that supplementary safety features, including "four quadrant gates", could create this "secured" crossings needed before it would be considered safe to delete train horns at those intersections. In order to help mitigate the 90% increase in train horns sounded in New Haven from this acquisition, we request that "secured" crossing be created for the grade crossings near the residential areas bordering the affected lines in New Haven. These include crossings at:

West Street	Estella Avenue
Rose Avenue	Hartzell Road
Landin Road	Main Street
North Rufus Street	

In the past four years, the City of New Haven has experienced two serious accidents involving trains and automobiles, of which I have included a copy of the officer's standard crash reports for your review. The engineering staff feels that the installation of "secured" crossings would have eliminated the accident at North Rufus Street because at the time of the accident and presently, the only safety equipment in place are cross bucks at the crossing and advanced warning signs.

We also encourage the development of loud speaker "horn" technology at grade crossings to reduce the impact area of the train horns on nearby residents.

I hope that the SEA will seriously consider including these mitigations in their final draft impact statement to the Surface Transportation Board. This acquisition represents great economic opportunity for many. We hope that opportunity comes at a fair price.

Sincerely,

Lynn H. Shaw
Mayor
City of New Haven

SEE ATTACHED REPORT

NARRATIVE (Refer to Vehicle by Number)

UPON ARRIVAL AT SCENE, I FOUND V1 LODGED UNDER FREIGHT TRAIN CAR. DRIVER AND FRONT SEAT PASSENGER WERE BOTH TRAPPED INSIDE DRIVER'S COMPARTMENT AND DECEASED. BOTH REAR SEAT PASSENGERS WERE LYING ON ROADWAY BEHIND V1, HAVING BEEN REMOVED FROM VEH. BY PASSERBY. BOTH WERE TRANSPORTED TO HOSPITAL IN CRITICAL CONDITION.

WITNESSES HEARD COLLISION BUT DID NOT HEAR THE SQUEALING OR BRAKING TIRES.

UPON ARRIVAL, P/R CROSSING LIGHTS WERE ACTIVATED AND APPARENTLY WORKING PROPERLY.

TRAIN CONDUCTOR ADVISED THE TRAIN WAS STATIONARY AT TIME OF COLLISION.

Re: CSX Corp./Norfolk Southern Corp. -- Control and
Operating Leases/Agreement -- Conrail; Finance
Docket No. 33388

Dear Secretary Williams:

Enclosed are the originals and 10 copies each of the highly confidential and public versions of the "Comments of Indianapolis Power & Light Company on Draft Environmental Impact Statement" (IP&L-10) for filing in the above-referenced proceeding. The highly confidential pleading is being filed under seal in accordance with the Protective Order. Also enclosed is a 3.5" diskette containing the documentation in WordPerfect format.

Mr. Vernon A. Williams

**COMMENTS OF INDIANAPOLIS POWER & LIGHT COMPANY
ON DRAFT ENVIRONMENTAL IMPACT STATEMENT**

Indianapolis Power & Light Company ("IPL") is pleased to submit these comments on the draft Environmental Impact Statement ("DEIS") prepared by the Board's Environmental Section and its outside consultants and served on December 12, 1997. IPL's comments specifically concern Indianapolis, but also respond to a serious flaw in the analysis that IPL first pointed out in its August 6, 1997 comments on the scope of the DEIS (see Attachment 1). The DEIS does not specifically refer to those August 6, 1997 comments. Those comments took the position, which IPL believes to be irrefutable, that the Board cannot rely on an arbitrary threshold to avoid considering air quality (or other) environmental impacts if the impacts would or could constitute a violation of law. Here, the Board would commit reversible error if it were not to consider any adverse impact on air quality in an area such as Indianapolis that may be in violation of the Clean Air Act because of increased emissions caused by the proposed transaction as recommended in IPL's August 6, 1997 letter.

The serious flaw in the DEIS is that it sets thresholds for analysis of air quality impacts of the proposed transaction, below which it deems the impacts not worthy of consideration. On that basis, it concludes that there will not be an air quality impact of the transaction on Indianapolis. While IPL understands the temptation to set thresholds under NEPA, the use of such thresholds here would allow the Board to ignore clear violations of the Clean Air Act, as is the case in Indianapolis, as well as unnecessary inefficiencies that the transaction creates that would cause unnecessary air pollution. Indianapolis now has in place a "Nozone" program because it has been in violation of the National Ambient Air Quality Standard for ozone in the past, but it has barely achieved compliance with the ozone standards under the Clean Air Act. Despite its progress, Indianapolis is likely to again be in violation of the applicable ozone ambient air quality standard on certain days, particularly during warm periods. See Attachment 2 and 59 Fed. Reg. 54,395 (October 31, 1994). Increased emissions of diesel fumes from NS's and CSX's locomotives would therefore necessarily cause additional violations, thus requiring mitigation by the City of Indianapolis, Marion County, and the State of Indiana. If NS and CSX are proposing unnecessary inefficiencies that can be corrected, the Board has an obligation to make those corrections to avoid violations of the ozone NAAQS in Indianapolis.

Applicants are caught in a trap of their own making. CSX and NS agreed, between the two of them and without governmental direction, to divide Conrail in a manner that would result in CSX acquiring the Conrail line from Cleveland to St. Louis. As a result, Indianapolis would be by far the largest "2 to 1" region affected by the proposed transaction. Thus, while today Indianapolis is a "2-railroad town," if the transaction proposed by Applicants is approved without change, Indianapolis will become essentially captive to CSX. Even NS

Witness Mohan admitted that NS will not have much of a presence in Indianapolis. See CSX/NS-20, Application Vol. 3 p. 28 (“Although Indianapolis will be primarily served by CSX. . .”).

In order to keep NS from being more competitive with CSX in Indianapolis, what CSX apparently insisted on and NS ultimately accepted in Indianapolis was that NS would acquire only overhead trackage rights (except for rights to directly serve one shipper, a General Motors plant), which would necessitate all other NS traffic to use only the Hawthorne Yard in the southeast part of Indianapolis. That may well make sense for non-trainload traffic, which by definition makes use of such yards for blocking, switching, and rearranging cars, but it makes no sense for unit trains of coal to IPL’s two powerplants located in Indianapolis, the Stout and Perry K Plants. Clearly, the most efficient arrangement for handling of IPL’s coal unit trains would be to take them directly into and out of IPL’s powerplants in Indianapolis. (IPL has an interest in the efficient handling of the cars since it owns the cars that are used to take coal to the Perry K and Stout Plants.) CSX and NS have not proposed to do that in their Application (CSX/NS-18, et al., filed June 23, 1997), but Indiana Southern Railroad, Inc. (“Indiana Southern”) has made precisely that proposal for its trains in its Responsive Application in Finance Docket No. 33388 (Sub-No. 76). If Indiana Southern and Norfolk Southern are granted direct access through trackage rights to IPL’s Stout and Perry K Plants for coal shipments in which they participate, that would solve the problem. (A schematic illustrating Indiana Southern’s proposal trackage rights to Stout and Perry K is attached as Attachment 3.)

IPL’s Stout Plant is served today by The Indiana Rail Road directly, and by Indiana Southern/Conrail via switch over Indiana Rail Road via an interchange track at Raymond Street, not via Hawthorne Yard. Indiana Rail Road is an 89-percent owned subsidiary of CSX.

CSX/NS-18, Application Vol. 1, p. 271. Since the switch charge for IPL's trains is fixed, IPL has 2-railroad access to the Stout Plant. IPL also has demonstrated that it is feasible to build out from the Stout Plant to Conrail today. See IPL-3 (filed Oct. 21, 1997). Despite all of this, Applicants refuse to concede that Stout is a "2 to 1" destination, insisting that CSX and Indiana Rail Road are independent companies, even though under common ownership, and thus that they will compete with one another. E.g., Aug. 21, 1997 Dep'n of CSX Vice President Raymond L. Sharp at 14-16; Aug. 24, 1997 Dep'n Tr. of CSX Vice President William Hart at 30-31. Even without the "build out," which Applicants dispute the feasibility of, the Stout Plant qualifies as a "2 to 1" destination under the Board's standards in prior mergers, and under Mr. Hart's own standard (see CSX/NS-19, Application Vol. 2A, Hart V.S. at 146), because of the access to Conrail via switching.

In their Rebuttal filed on December 15, 1997, CSX and NS now appear to have abandoned the fiction that CSX will compete with Indiana Rail Road at the Stout Plant. Instead, they have adopted a new theory, that IPL's real competition for CSX/Indiana Rail Road at the Stout Plant is (a) truck and (b) its alleged ability to generate power at lower cost elsewhere on the system to "discipline" CSX/Indiana Rail Road.

In his Rebuttal Verified Statement (CSX/NS-177 at pp. P-518-21 and P-650-56) Mr. John Orrison, Vice President-Service Design for CSX, described the existing interchanges in Indianapolis, but nowhere claimed that Indiana Southern's proposed trackage rights into the Stout and Perry K Plants would be inefficient, or that it would not be more efficient to route NS-origin coal to Stout via an interchange west of the Stout Plant, rather than through the Hawthorne Yard. See id., especially p. P-656 (admitting that NS would have to use Hawthorne Yard for

deliveries to Stout, rather than having access directly or via the interchange with Indiana Rail Road at Raymond Street).

At IPL's Perry K Plant, the situation is almost the mirror image of that at the Stout Plant. Perry K is served directly by Conrail, but Indiana Rail Road can also serve the Plant via switching over the Conrail line. Thus, Applicants have conceded that the Perry K Plant is a "2 to 1" point entitling it to protective conditions if the proposed acquisition of Conrail is approved. Moreover, since the coal pile at Perry K is quite small, IPL maintains an emergency coal pile for Perry K at its Stout Plant (which is just a few miles away), and can (and has) trucked coal to Perry K from Stout. (The coal that IPL has trucked to Perry K from Stout is a relatively small percentage of the coal delivered to Stout and a relatively small percentage of the coal used at Perry K. IPL generally trucks coal only during emergencies.)

Despite Applicants' apparent concession that Perry K is a "2 to 1" destination, they insist that, if NS serves the Perry K or Stout Plant, it must take IPL's unit trains of coal to the Hawthorne Yard, rather than connect directly with Indiana Rail Road via switching, as Conrail can today, or be allowed to serve the Stout Plant directly via a build-out (since NS's trackage rights in Indianapolis would be only "overhead," and not local). Applicants would preclude efficient connections, as exist today, in favor of routing that traffic through Hawthorne Yard. Even Applicants conceded that there is absolutely no reason to route unit trains into and out of a Yard used for blocking and reconfiguring rail cars for less-than-trainload movements.

For example, NS Vice President Fox admitted in his deposition that the efficient routing of coal to IPL's Stout Plant, if such coal were to be used, would be not to route unit trains in and out of the Hawthorne Yard, but rather that NS would switch crews from NS to CSX at some point west of the Stout Plant. Tr. 149-52. But the Application provides no such assurance,

as Mr. Fox admitted, since it provides for routing such traffic into and out of the Hawthorne Yard. If Indiana Southern were to seek to have NS serve the Perry K Plant, it would not be able to do so where Indiana Southern now interchanges with Conrail (the "GM Yard" on the west side of Indianapolis), but rather the Hawthorne Yard (which, as we have said, is on the east side of Indianapolis).

If NS were to participate in a movement of western, low-sulfur coal to IPL's Stout Plant, the efficient routing, as NS Vice President Fox conceded, would be some point west of Stout, not the Hawthorne Yard east of Stout. And if NS were to participate in a movement of coal to the Perry K Plant, the efficient routing, and thus the one that would minimize air pollution, would be to allow NS to interchange the traffic where Conrail now interchanges the traffic -- in the "GM Yard," as it is referred to locally, on the west side of Indianapolis, where Indiana Southern's traffic now terminates, where it can be interchanged on the shortest available route into the Perry K Plant, which is in downtown Indianapolis.

The impact of the transaction proposed by CSX and NS on Indianapolis' air pollution should not be underestimated. CSX's public statements have indicated that it projects an increase in business to Indianapolis as well as diversion of a portion of Cincinnati traffic through Indianapolis. This information is contradicted by CSX Witness Orrison who contends, despite public statements to the contrary, that total traffic in Indianapolis will decrease or remain the same post-transaction. The uncertainty of increased traffic in Indianapolis coupled with CSX's promotion of trucking coal to IPL's Perry K and Stout Plants as IPL's competitive alternative justifies close scrutiny of the potential for any increase in ozone in Indianapolis and placement of responsibility for mitigation of any such increase on Applicants.

The Transaction Proposed by CSX and NS for Indianapolis
Would Be Inefficient and Could Cause Unnecessary Air Pollution

IPL therefore has three simple points to make. One, CSX has contended vigorously that IPL's real competition at the Stout Plant is truck, not Indiana Southern/Conrail (via switching). See, e.g., CSX/NS-177, Applicants' Rebuttal, Vol. 2A, pp. HC-194-204, Verified Statement of Thomas G. Hoback, and Vol. 2B, pp. HC- 500-22, Verified Statement of Gerald E. Vaninetti. If CSX succeeds in eliminating IPL's rail-to-rail competition at Stout from Indiana Southern/Conrail vis-a-vis CSX/Indiana Rail Road, it will expose IPL to the risk of having to resort to trucks to create competition for coal transportation at Stout, whereas in 1995 and 1996, when IPL was in negotiation with Indiana Rail Road leading up to the contract that took effect in 1997, IPL used rail, not truck, via Indiana Southern/Conrail and then switch via Indiana Rail Road, to compete with Indiana Rail Road. If CSX's analysis were correct (which it is not), IPL would have had to use trucks to compete with Indiana Rail Road during 1995-96.

Moreover, if CSX's analysis is correct that IPL's only effective competition for transportation of coal to the Stout Plant if the transaction proposed by CSX and NS is approved, IPL would need approximately 60,000 coal trucks to move the coal that the Stout Plant uses annually and that the rail mode carries almost exclusively now. This would amount to about 460 loaded and empty coal trucks going into and out of the Stout Plant, every business day of the year, or about 17-18 an hour, every hour of each business day, through numerous small towns and ultimately over an already congested, two-lane street in the City of Indianapolis, Harding Street, which is the only street providing truck access to the Stout Plant.

Two, the transaction will be unnecessarily inefficient in Indianapolis, especially for IPL's unit trains of coal, which should be handled as they are today -- directly into IPL's Plants via the most efficient connection, rather than inefficiently, into the Hawthorne Yard.

Moreover, if NS is to participate in a movement of coal to either the Stout or Perry K Plants, it should be able to do so as Conrail could today, with direct access to Stout via a build-out, or through switch on The Indiana Rail Road on the interchange track at Raymond Street, or with the ability to interchange with CSX/Indiana Rail Road west of Stout or at the interchange at Raymond Street with Indiana Rail Road. These efficient routings would necessarily reduce air pollution.

Third, due to the proposed transaction, projected increases in Indianapolis business as well as rerouting of Cincinnati traffic through Indianapolis threaten an increase in ozone in Indianapolis which should be closely scrutinized so that Applicants are required to bear the burden of any mitigation.

1. Additional Truck Traffic.

Through the testimony of Messrs. Hoback and Vaninetti cited above, CSX and NS insist that IPL's real competition for CSX/Indiana Rail Road at the Stout Plant is the truck mode, not Indiana Southern/Conrail. See CSX/NS-176, pp. HC-55-57. IPL vigorously disputes Applicants' contention, since as IPL informed CSX, all coal moved to Stout in 1995-97 via rail, not truck, but if the Board were to accept Applicants' contention, it follows that the result of the proposed transaction could be to cause IPL to move its coal to Stout via truck instead of by rail. Since IPL uses about 1.5 million tons of coal per year at Stout, using trucks with a capacity of about 25 tons, IPL would need about 60,000 coal trucks per year to move the same amount of coal. That means about 230 loaded, and 230 empty, trucks coming and going, 24 hours per day, on every business day, Monday-Friday, throughout the year, most likely through the congested I-465/Harding Street interchange. Applicants' Witness Vaninetti privately advised CP Rail and

See Attachment 4. He was right.

The Stout Plant is in the City of Indianapolis, which has the usual city traffic, and the only street access is via two-lane Harding Street. Moreover, such an immense number of coal trucks could have an even greater impact on the small towns that the coal trucks would have to drive through from one or more of the mines in southern Indiana that supply the Stout Plant to that Plant, several of which are more than 100 miles from the Stout Plant. Aside from the immense damage that such trucks could do to Harding Street, the congestion that such additional truck traffic would cause would add considerable air pollution to Indianapolis. Because Indianapolis has been in violation of the NAAQS for ozone in the recent past, and is barely in compliance at the present time, any increase in air pollution, particularly a substantial increase in nitrogen oxides (a precursor of smog and a likely cause of ozone) as would inevitably occur from adding that much truck traffic and resulting congestion to the City's roads, would very likely cause violations of the Clean Air Act which Indianapolis would then be required to mitigate. Given CSX's position, if the result of the transaction is to force IPL to use trucks at Stout, the Board cannot satisfy NEPA without considering and quantifying the impact on air quality of the trucks.

CSX's and NS's position that IPL can and should use trucks rather than rail to deliver coal to the Stout Plant to create competition flies in the face of their contrary arguments in all other forums than this one. CSX's and NS's trade association, the Association of American Railroads ("AAR"), as recently as November 1997 has been opposing legislative changes that would accommodate higher and wider trucks. In its position paper opposing use of trucks to move goods that can also move by rail, AAR stated (see Attachment 5):

“The Rail Industry’s Position on Bigger Trucks”

“Opposition to Bigger Trucks Is Widespread”

“But railroads aren’t alone in opposing bigger trucks. So do many highway safety advocates, citizen groups and environmentalists. . . .”

“Why Bigger Trucks Are a Bad Idea”

“* Bigger trucks would increase highway congestion. . . .”

“*Bigger trucks would create additional highway safety problems. . . .”

“*Bigger trucks would harm the environment. . . .”

“Bigger trucks may be more fuel efficient than smaller trucks, but they are not nearly as fuel efficient as trains. Every ton of freight diverted from rail to highway increases emissions of air pollutants by factors as high as nine.”

Rather than to allow the need for such mitigation to arise, it is the Board’s responsibility to approve this proposed transaction only if it prevents IPL’s effective loss of its current **rail-to-rail** competition from Indiana Southern/Conrail to CSX/Indiana Rail Road at Stout. Thus, it should condition the transaction, as IPL proposed in IPL-3 (filed October 21, 1997) and in testimony supporting Indiana Southern’s Responsive Application (ISRR-9, filed January 14, 1998), to permit Indiana Southern or NS or both to have direct access to the Stout Plant, or at least to allow Indiana Southern and Norfolk Southern to interchange IPL’s coal unit trains without requiring that they be moved into and out of the Hawthorne Yard.

2. The Transaction Proposed by CSX and NS for Indianapolis Will Be Inefficient.

It is quite obvious that, for three reasons, routing IPL’s and others’ unit trains of coal into and out of the Hawthorne Yard would be inefficient. One, the trains are not routed there today, demonstrating that efficient operating practices dictate another routing. Two, NS

and CSX are considering expanding the Hawthorne Yard, thus demonstrating that it is not capable of handling the traffic to be routed there. And three, such trains would cause congestion in the Yard, making the handling of all other trains in that Yard more inefficient.

The solution is simply to do what NS Witness Fox admitted would likely be done, and interchange IPL's coal unit trains somewhere other than Hawthorne Yard. (As stated previously, IPL has an interest in efficient handling of the cars because it owns the railcars used for moving its coal to Perry K and Stout Plants. Moreover, inefficiencies inevitably raise the railroads' costs, which could be passed along to the shipper.) The most efficient routing is as the trains are or would be routed today, i.e., (a) for Indiana Southern-origin traffic to Perry K, through the "GM Yard" directly to the Perry K Plant, whether Indiana Southern, NS, or CSX ends up delivering it, and for Indiana Rail Road-origin traffic into the Perry K Plant, at the existing interchange between Indiana Rail Road and Conrail, and (b) for Indiana Southern-origin coal into Stout, at the same existing interchange between Conrail and Indiana Rail Road, and the same interchange or some other efficient interchange west of Stout for NS-origin coal into Stout. Since the Applicants concede that those would be the most efficient means of serving those Plants, and they are or would be the approaches used today, they should be required, rather than what the Applicants propose.

3. Indianapolis Air Pollution.

Lastly, CSX's public statements have contended that it will increase business in Indianapolis, including rerouting traffic that now goes through Cincinnati (see, for example Attachment 6). The remaining Conrail business will presumably go to Norfolk Southern (there is no other railroad that could move it). If so, the Board's decision not to include Marion County,

Indiana among those areas whose air will be adversely affected by the proposed transaction is wrong.

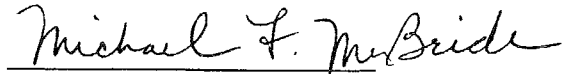

Despite these public claims that congestion elsewhere (e.g., Cincinnati) will be relieved by rerouting traffic through Indianapolis, CSX Witness Orrison appears to contend that total traffic in Indianapolis post-transaction will decrease. Frankly, we find this testimony impossible to reconcile with claims about rerouting traffic through Indianapolis. But, given the uncertainty, the Board must adopt a condition to any approval of the transaction requiring that Applicants mitigate any increase in ozone in Indianapolis associated with increased traffic due to the proposed transaction.

Conclusion

For the foregoing reasons, the Board should (1) mitigate the adverse environmental impact of the transaction proposed by CSX and NS by preserving IPL's right to be served directly at the Stout Plant by Indiana Southern or NS or both, as it could be served via Conrail today, so that IPL is not compelled to seriously consider moving some or all of the coal to the Stout Plant by using up to 60,000 loaded coal trucks each year into, and 60,000 empty coal trucks out of, the Stout Plant on a very busy, two-lane, City street, as well as through numerous small towns in Indiana between the coal mines from which IPL buys its coal and the Stout Plant, (2) mitigate the adverse environmental impact on air quality in Indianapolis by requiring CSX to permit NS to interchange and deliver IPL's coal trains in the most efficient manner, as is done today and would be done if Conrail were to have remained an independent railroad serving IPL's powerplants in Indianapolis, rather than to route IPL's coal trains into and out of the Hawthorne Yard, and (3) mitigate the adverse environmental impact on air quality in

Indianapolis by requiring that the Applicants mitigate any increase in ozone in Indianapolis associated with increased traffic due to the proposed transaction.

ATTN: Ms. Elaine K. Kaiser
Chief, Section of
Environmental Analysis
Environmental Filing

Re: CSX Corp./Norfolk Southern Corp. -- Control and
and Operating Leases/Agreements -- Conrail;
Finance Docket No. 33388

Dear Ms. Kaiser:

Indianapolis Power & Light Company ("IP&L") and The Ohio Valley Coal Company ("Ohio Valley") hereby submit their comments on the scope of the draft Environmental Impact Statement ("EIS").

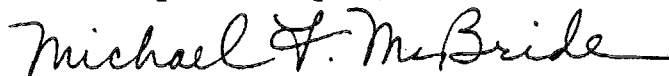

IP&L and Ohio Valley respectfully request that the Section of Environmental Analysis ("SEA") consider the potential adverse impacts on air quality in those regions in both Indiana and Ohio which will experience changes in service after the Conrail acquisition. Such areas will experience increases in switching activity, and, therefore, increases in air pollution, especially ozone and particulates. Accordingly, the EIS should

examine the post-Acquisition impacts in those counties which may become nonattainment areas for ozone as a result of the increased switching. Thus, the EIS should include an analysis of the air quality impacts in Marion County, Indiana (i.e., Indianapolis), as well as in Cuyahoga, Lake and Ashtabula Counties, Ohio (i.e., Cleveland and areas to the east). Because the Clean Air Act is administered at the state and local level, it follows that the Board's analysis must concern the same level of impacts, and not just focus on the overall impacts (as the Applicants would apparently have it).

IP&L and Ohio Valley further request that the EIS propose suitable measures to mitigate adverse environmental impacts in these counties, as well as any other protective conditions which may be necessary. These may include trackage rights for origin carriers to avoid unnecessary switching.

you
know about

NOZONE Action Days?

How do you know when ozone levels are high? Well, it takes an in-depth knowledge of meteorology, chemistry and physics. But in case you don't have the time or the library card for that sort of thing, we've done the hard work for you. We've created the symbols below for days when ozone levels are high. When you see it on TV or Nozone Action Day has been declared, this means your help is vital. And

it's not just you who can help. You can help your family, your town, your school, your business, your neighbors, your community.

A-197-a

you
know

OZONE

It's not over your head.

You can do your part to keep
Indy's air clean by taking the
bus or carpooling.

To find out more information
about transit routes,

OZONE

It's not over your head.

did you know

...did you know that Indianapolis has the cleanest air in the country? It's had perfect weather for 17 years.

Believe it or not, for 17 years, Indianapolis was on a list of cities with ozone pollution. But thanks to a number of efforts by the city and industries to reduce pollutants, our air is the cleanest it's been in years.

A-197-b

According to the EPA, Indianapolis has cleaner air. However, last summer, there were two days when the levels of an air pollutant called ozone were too high. This may seem insignificant, but if this becomes a trend, Indianapolis and surrounding counties will have an ozone problem.

did you know

...even though our air is clean, we're still at risk for air pollution?

...even though our air is clean, we're still at risk for air pollution?

did you know

that in order to keep ozone levels down, we need your help? So far in the battle to reduce ozone. But to further our success, we need your help. Sixty percent of ozone formation is due to the activity of individuals, not industry. So if we all do our part, Indianapolis can continue to have cleaner air.

did you know

there's good ozone and bad ozone? Whether ozone is "good" or "bad" depends on where it is. Ozone in the ozone layer is desirable. We all know this. We've all switched to lotions and non-aerosol sprays in an effort to preserve it. But there is a different kind of ozone problem that most people don't know about — man-made ozone near the earth's surface.

- ~ Ozone near the earth's surface is a major constituent of smog.
- ~ Ozone is formed when emissions from vehicles, lawnmowers and industry react in the air around us.
- ~ Ozone is made in the presence of sunlight, especially during hot weather.
- ~ Sixty percent of this ozone is created by the public, not business and industry.
- ~ Ozone is colorless.

did you know

that "bad" ozone can have damaging effects?

- ~ Of all air pollutants, ozone is the most detrimental to plant life.
- ~ According to the EPA, in 1995 ozone pollution caused more than \$2.7 billion in crop damage nationwide.
- ~ In high concentrations, ozone can be a health hazard.

did you know

if Indianapolis and the surrounding counties continue to have high ozone readings, we may face additional federal regulations?

Indianapolis has managed to govern itself well without the intervention of Uncle Sam. As long as we continue to do so, we can avoid strict, costly federal regulations such as:

- ~ Restrictions on the location and expansion of industry that would slow economic growth by keeping new job opportunities from coming to the area.
- ~ Mandatory vehicle inspection and maintenance programs for cars and trucks.
- ~ Mandatory controls at gas pumps that would result in higher gas prices.

did you know

that you can make a difference?

You've heard this line a thousand times. And every time you hear or read it, you're probably a little skeptical. It's hard to imagine that waiting to mow your lawn until dusk is going to make a difference in reducing air pollution. But remember our combined efforts were powerful enough to create air pollution. So if we all do our part to act responsibly about ozone, especially on Nozone Action Days, our actions will surely be able to reduce it.

Schematic of Routes to IPL Power Plants

OMITTED

Some elements of the trucking industry want to give states the right to put even bigger trucks on the nation's highways — double and triple trailer rigs known as longer combination vehicles (LCVs) that can be up to 120 feet long. For very valid reasons of self-interest, the railroad industry opposes this proposal.

Opposition to Bigger Trucks Is Widespread

But railroads aren't alone in opposing bigger trucks. So do many highway safety advocates, citizen groups and environmentalists — the American Automobile Association, the Arkansas Trucking Association, the Mississippi Trucking Association, American Public Health Association, Clean Air Council, Environmental Defense Fund, General Federation of Women's Clubs, International Association of Chiefs of Police, League of American Bicyclists, National Association of Police Organizations, National Association of Women Highway Safety Leaders, National League of Cities, National Sheriffs' Association and the National Trauma Foundation among others. In fact, between 75 and 80 percent of all Americans oppose permitting bigger trucks on all highways, according to a poll by the Tarrance Group.

Why Bigger Trucks Are a Bad Idea

Here are some of the key reasons why so many people and groups oppose bigger trucks:

- **Bigger trucks would increase highway congestion.** A single LCV has the same impact on highway congestion and traffic delay as 10 to 12 automobiles. Bigger trucks also would divert to highways several hundred million tons of freight currently moving by rail, adding millions of truck miles to highways that are already congested.
- **LCVs underpay their highway cost responsibility.** A triple trailer operating at the most common registered weight of 115,000 pounds pays only 70 percent of its federal highway cost responsibility, according to the most recent federal highway cost allocation study.
- **Bigger trucks would create additional highway safety problems.** Diverting freight from rail to highway has negative implications for highway safety. According to 1995 statistics, more than three times as many people died in truck-related accidents as in rail-related accidents, in spite of the fact that railroads provided more total freight transportation than trucks.
- **LCVs cause severe bridge damage.** National operation of LCVs would cost government agencies \$12.7 billion in bridge replacement costs. Those repairs would mean an additional \$59 billion in indirect costs for lost time and extra fuel burnt by auto drivers stuck in traffic because of bridge work.

LCVs aren't compatible with existing highways and traffic volumes. They have trouble merging or changing lanes, they have difficulty maintaining speed on upgrades, and they have a much larger blind spot than conventional trucks.

- **Bigger trucks would harm the environment.** Bigger trucks may be more fuel efficient than smaller trucks, but they are not nearly as fuel efficient as trains. Every ton of freight diverted from rail to highway increases emission of air pollutants by factors as high as nine.
- **Bigger trucks would harm the nation's railroads.** According to one recent survey of shippers, allowing bigger trucks on highways would cause them to shift to the highways freight that currently provides railroads with almost \$4.5 billion in annual revenues. This would sharply curtail railroad operating income and capital expansion programs. It would also force railroads to attempt to raise rates on remaining customers, abandon additional lines and rethink investment and maintenance expenditures that have sharply improved the rail infrastructure.
- **Intermodalism is a better idea.** Railroads and truckers have formed successful partnerships over the past few decades to move truck trailers and ocean containers long distances by rail — a practice known as intermodalism. Since 1980, this traffic has more than doubled. A single train can carry 280 trailers or containers, decreasing wear and tear on our highways and relieving congestion and pollution.

The Trucking Industry's "State Option" — The First Step to a National Mandate

Many in the trucking industry say they are not seeking nationwide authority for bigger trucks. Instead, they say they only want individual states to have the right to decide for themselves whether or not to permit bigger trucks on the highways of each state — this is not the case.

In the past, the trucking industry has viewed states rights as nothing more than a ploy to eventually force nationwide acceptance of bigger trucks. In the 1970s, for example, the trucking industry assured Congress it wasn't seeking nationwide authority to operate 80,000-pound trucks, just a state option to permit heavier trucks. By the early 1980s, the industry was complaining about operating difficulties created by "recalcitrant" states that hadn't increased weight limits. It successfully used this argument to gain legislation mandating a nationwide weight limit increase to 80,000 pounds in 1984.

Maintain the LCV Freeze

In 1991, Congress carefully considered the arguments proffered on increasing truck sizes, and it concluded that the public interest lay in halting the spread of larger trucks. That is why the Intermodal Surface Transportation Efficiency Act of 1991 contains a freeze on LCVs, permitting them to operate in the 17 states where they are already legal but nowhere else. Nothing has changed since Congress made that decision. The public interest lies in maintaining that freeze, and the next highway funding bill ought to reflect that.

#

KEY POINTS

Americans overwhelmingly oppose LCVs. Every poll ever done has shown huge majorities against expanded use of triples and long doubles. The most recent poll shows that 90 percent oppose triples, 76 percent oppose long doubles. 68 percent support the current freeze on the expansion of LCV use.

- The main reason people don't want to see longer or heavier trucks is their fear that bigger trucks are unsafe. There's plenty of engineering evidence supporting this public concern.
- Heavy combination trucks already have about twice the fatal accident rate per mile as automobiles. Today, almost all of these trucks are conventional, single trailer "tractor semitrailers."
- Yet LCVs have even worse stability, handling and other safety problems than conventional trucks. And while today LCVs are less than 1/2 of 1 percent of all truck traffic, according to the American Trucking Associations' own study, *20 percent of the combination trucks on the road would be LCVs if they were to be legalized nationwide*—the truckers' ultimate goal.
- The worst safety problem with LCVs is the fact that they just aren't compatible with the existing highway system and traffic volumes. They're so big and so slow (especially when trying to accelerate) that they have trouble merging or changing lanes in freeway traffic. Similarly, they have problems maintaining speed on upgrades (and then have trouble reducing speed, and braking, on downgrades). These speed differentials create serious safety risks. And (again because of their size) they have a much larger blind spot than conventional trucks.
- LCVs also present a greater safety risk simply because they have more trailers. As a result, LCVs suffer from increased "rearward amplification" (the "crack the whip" effect). They also have more trailer separations. And they offer a higher surface area to wind, increasing the risk of being literally blown off the road.
- Because LCVs are heavier than conventional trucks they cause more severe accidents (their greater length also means that they have a larger crash "footprint").
- LCVs make driving harder. Accidents are rare events. But sharing the road with LCVs—even when there isn't an accident—makes driving, already very stressful, even more difficult. Surveys of older drivers, for example, show consistently that having to share the road with trucks is one of the things they like least about driving.
- LCVs cause bridge damage. National operation of LCVs would cost government agencies \$12.7 billion in bridge replacement costs. That repair would mean \$59 billion in lost time and extra fuel burnt by auto drivers stuck in traffic because of bridge work.

- **LCVs are going to make our highway congestion problems worse. A single LCV has the same impact on highway congestion and traffic delay as 10 to 12 automobiles (or more than twice the impact of two conventional trucks). Diversion of freight from railroads to highways will compound this problem. Highway congestion is already our nation's number one transportation problem, with estimated annual costs of \$39 billion or more.**
- **LCVs underpay their highway cost responsibility. A triple trailer operating at the most common registered weight of 115,000 pounds pays only 70% of its Federal highway costs.**
- **Heavier single tractor trailer trucks also raise serious infrastructure and safety issues. (See the attached one pager on 97k trucks).**

Nationwide operation of 97,000 pound trucks would cost railroads \$2.4 billion. (Same ADL study as LCVs. Figures are cumulative).

FOR IMMEDIATE RELEASE

CSX RAIL PROPOSAL GREATLY ENHANCES INDIANA'S MARKET REACH THROUGHOUT THE EASTERN UNITED STATES

JACKSONVILLE, Fla., June 23, 1997 – Indiana will be a leading rail transportation hub, and Indianapolis will become a regional operations center in a proposal by CSX Corp. for operating the routes it plans to acquire from Conrail Inc.

CSX and Norfolk Southern Corp. today filed a joint application with the federal Surface Transportation Board to acquire the routes and assets of Conrail. One component of the application is CSX's proposed operating plan, which includes details about the company's expanded role in Indiana and planned capital expenditures in the state that will total in excess of \$120 million.

"Indiana overall, and Indianapolis in particular, will play an increasingly important role for CSX under this transaction," said John W. Snow, Chairman and Chief Executive Officer of CSX Corp. The plan calls for Indianapolis to become a regional operating headquarters and for Conrail's Avon Yard, to be acquired by CSX Transportation Inc. (CSXT), to become a major freight hub in the new CSX rail system. "CSXT's rail upgrade project across northern Indiana and Ohio will provide a highly efficient, high-capacity rail link between the Midwest and Northeast," Snow added.

Some details of the operating plan related to Indiana include:

- Indianapolis will become a new "service lane" headquarters for CSXT, where operations, crew management, dispatching, engineering, maintenance and service planning will be directed at the regional level. CSXT now operates seven regional centers of this type.
- CSXT's Chicago-Greenwich, Ohio, main line, which runs across northern Indiana will be upgraded as part of a project to create a high-capacity corridor between the Midwest and the Northeast. CSXT's capital investment on this project in Indiana is projected at \$110 million, with an additional \$6 million in expenditures in the state this year through the purchases of local services.
- Avon Yard, west of Indianapolis, will serve as a major classification yard for the CSXT system, expediting freight cars to the northeastern United States and assembling blocks of rail cars and entire trains for movement beyond the Mississippi River. Local freight operations at Indianapolis will be centered at Hawthorne Yard on the city's southeast side. Capital investment in yard and facility improvements in Indianapolis is estimated at \$10 million.
- CSXT also plans to acquire from Norfolk Southern a parallel route between Chicago, Fort Wayne and central Ohio that will be used as an auxiliary service route for bulk commodity freight traffic, such as grain and coal. Roughly \$6.5 million will be invested in track improvements.

"CSXT's customers will be able to reach new markets for their products and expand their options for obtaining raw materials and components," said A.R. "Pete" Carpenter, president and CEO of CSXT. "A fundamental advantage of the new system is its ability to link major producing markets in the South with consumer markets in the Northeast and Midwest with single-line service. The result will be a faster, more flexible and cost-efficient network."

Carpenter said more efficient, reliable rail transportation will make Indiana a more attractive location for economic development. He added that CSXT will increase its already aggressive efforts, working with state and local economic development offices, to bring new industries to Indiana and the region.

Indiana will be served by eight key CSXT service routes that will improve the state's railroad links to nearly every market in the East, Midwest and South by providing single-line service. These routes are:

- NORTHEASTERN GATEWAY SERVICE ROUTE - Chicago to Cleveland, Boston and New York via Gary and Auburn.
- EASTERN GATEWAY SERVICE ROUTE - Chicago to Pittsburgh, Washington, and Philadelphia via Gary and Auburn.
- ALTERNATE CHICAGO SERVICE ROUTE - Chicago to Cleveland via Fort Wayne.
- ST. LOUIS GATEWAY SERVICE ROUTE - St. Louis to the East Coast via Terre Haute, Indianapolis and Muncie.
- MICHIGAN-CHICAGO SERVICE ROUTE - Detroit to Chicago via Gary and Auburn.
- CHICAGO GATEWAY-SOUTHEAST SERVICE ROUTE - Chicago to Miami via Terre Haute and Evansville.
- CENTRAL SERVICE ROUTE - Southeast United States to Chicago and St. Louis via Indianapolis or Terre Haute.
- HEARTLAND SERVICE ROUTE - Nashville, Tenn., to Detroit and New England via Evansville, Terre Haute, Indianapolis and Muncie.

The Northeastern and Eastern Gateway routes will provide high-capacity rail lines between the Midwest and East across northern Indiana. Corridors to the Southeast will open grain and other market opportunities to Indiana customers now served by Conrail. Improved service for Indiana's auto and steel production facilities also will result.

The expanded rail system includes benefits for key commodity groups that make up a majority of rail freight traffic: coal, steel, automotive, grain, wood, paper products, chemicals, minerals and general merchandise traffic. Routes and connections were designed with customers in mind to facilitate commodity flows to expanded market areas created by the acquisition.

"The CSXT system will create vast new opportunities for rail movement of freight with increased efficiency and greater reliability," Carpenter said. "The single-line service and operating efficiencies that this acquisition will create will allow us to reduce transit times, often by one or more days depending on the route."

CSXT's operating plan will not result in any rail line abandonments in the state, nor is it expected to have an adverse impact on commuter passenger operations in the Chicago area.

CSX Corp. employs about 4,800 workers in Indiana with an annual payroll of \$115 million. About 1,400 are employees of CSXT and the remaining work for American Commercial Barge Lines, based in Jeffersonville, Ind.

CSXT and its 29,000 employees provide rail transportation and distribution services over an 18,500 route-mile network in 20 states,

the District of Columbia and Ontario, Canada. CSXT is a business unit of CSX Corp., headquartered in Richmond, Va.

CONCLUSION	57

The Four City Consortium consists of four contiguous communities located in Lake County in northwestern Indiana, immediately south and east of Chicago, Illinois. As a result of their strategic location, the Four Cities are traversed by numerous railroad lines, including every major line used by CSX, NS and Conrail to move traffic between the Chicago area and eastern points. There are approximately 208,000 residents in the Four Cities who are significantly and constantly impacted by the over 150 trains that pass through their neighborhoods daily.

The Four City Consortium was formed for the purpose of evaluating the proposed acquisition and division of Conrail by CSX and NS in terms of its potential environmental and other impacts on the Four Cities region; developing and proposing alternatives (including environmental mitigating measures) designed to ameliorate any adverse impacts on the region identified by the Four Cities; and providing regional input to the Board in its environmental review process.

In the Board's procedural schedule adopted for this proceeding, it determined that preparation of an EIS was warranted in its consideration of the Application because the proposed transaction has the potential for significant environmental impact. Decision No. 6, (served May 30, 1997) at 2-3. The Board, through its SEA, has conducted an initial environmental review of the proposed Conrail acquisition. The SEA's Draft EIS

¹(...continued)
merger operations. The Applicants' SIPs have been included by the Board as part of its Draft EIS.

contains an analysis of the potential environmental impacts of the proposed Conrail acquisition, and preliminary recommendations for environmental mitigation.²

The SEA has invited comments from the public addressing both the environmental and safety impacts of the proposed Conrail acquisition, and SEA's preliminary analyses and recommendations for mitigating the possible environmental effects of the proposed transaction contained in the Draft EIS. Under the Board's procedural schedule, after consideration of the above written comments, SEA anticipates issuing a Final EIS in late May, 1998.³ A final decision on environmental mitigation conditions will be made at the Board's voting conference scheduled for June 8, 1998 and in its written decision which will be served by July 23, 1998.

² According to SEA, the information used in preparing the Draft EIS was provided by the Applicants in their Environmental Report and Operating Plans filed with their Application in this proceeding, an Errata to the Environmental Report and Supplemental Environmental Report submitted by the Applicants on August 28, 1997, as well as information gained through supplemental environmental information directly provided by the Applicants to SEA. Other information used by SEA in preparing the Draft EIS included comments that have been submitted from interested parties to this proceeding as well as comments from the public. Additionally, in preparing the Draft EIS, the SEA consulted with other federal agencies, conducted its own independent environmental analysis, and conducted site visits. SEA engaged the assistance of a number of third-party contractors to assist with environmental analysis and field work, and to help prepare the Draft EIS. See Draft EIS, Vol. 1 at 1-8 to 1-11.

³ As announced in the Board's July 3, 1997 Notice of Intent to Prepare an Environmental Impact Statement, the Final EIS will address comments submitted on the Draft EIS and will include SEA's final recommendations, including appropriate environmental mitigation.

SUMMARY OF POSITION

After reviewing the CSX and NS operating plans as set forth in the Railroad Control Application in this proceeding, the Four Cities determined that implementation of those plans is likely to make the serious existing rail-related public health and safety problems in their region significantly worse. Accordingly, on October 21, 1997, the Four City Consortium filed Comments and Request for Conditions with respect to the merits of the proposed transaction (FCC-9) ("October 21 Comments"). In their October 21 Comments -- copies of which were provided to SEA -- the Four Cities identified and described the adverse environmental consequences likely to result from the Conrail transaction (particularly in the areas of rail/highway at-grade crossings delay/safety/emergency response), and proposed a solution intended to preserve the Applicants' post-acquisition routing flexibility for rail traffic moving to and from Chicago, while at the same time reducing the transaction's adverse impacts on their communities. The negative impacts associated with the Application are largely attributable to the Applicants' proposed increases in rail traffic movements over certain line segments heavily laden with rail/highway at-grade crossings, and the Applicants' planned reinstatement of rail service on a long-unused rail right-of-way that traverses directly through the heart of Gary, Indiana.

The Four Cities have conducted a review of the Draft EIS, as well as a review of the Application, the Applicants'

Safety Integration Plans ("SIPs") filed on December 3, 1997, and the Applicants' December 15, 1997 Rebuttal filing, and have specifically analyzed these documents as they pertain to environmental considerations and preparation of comments on the Draft EIS. In summary, the Consortium has concluded that both the Applicants and SEA (the latter through its analysis in the Draft EIS) have failed to consider adequately the significant adverse safety, socioeconomic, and environmental impacts in the Four Cities associated with the Applicants' proposed post-transaction operations. The SEA also failed to analyze adequately the Consortium's Alternative Routing Plan as required under applicable federal laws, regulations, and orders. Additionally, the SEA failed to consider adequately the significant cumulative impacts on the Four Cities that are associated with the proposed transaction. Finally, the SEA's recommended mitigation for the Four Cities, as set forth in the Draft EIS, completely fails to ameliorate these considerable impacts.

The reasons for the foregoing conclusions are detailed in the accompanying verified statements of Michael L. Cervay, the Director of Planning and Community Development for the City of Gary, Indiana ("Cervay Environmental V.S."); Philip H. Burris of L.E. Peabody & Associates, Inc. ("Burris Environmental V.S."); and Dr. Gary M. Andrew of L.E. Peabody & Associates, Inc. ("Andrew Environmental V.S.") as well as in the Four Cities' comments set forth below.

To be sure, SEA has recognized the legitimacy of some of the Four Cities' concerns and, indeed, has acknowledged in the Draft EIS that "even a small increase in [crossing] delays could exacerbate the problems faced by an urban area with several grade crossings."⁴ Accordingly, the Draft EIS contains SEA's recommendation that:

CSX and NS consult with representatives of the Four City Consortium and the Indiana Department of Transportation to address potential traffic delay and safety concerns at the nine highway/rail at-grade crossings in these communities [with a pre-acquisition level of service D]. Specifically, CSX and NS would meet with these parties to negotiate a mutually-binding agreement on the implementation and funding allocation for measures to address traffic delay and safety concerns at these crossings.

Draft EIS, Vol. 3A at IN-85; see also IN-87.

The Four Cities are appreciative of the SEA's acknowledgement of the negative environmental impacts of the proposed transaction on communities in northwest Indiana. The Four Cities also agree that the most efficient way to address the adverse impacts of the proposed transaction should be through negotiations among the affected parties (which the Four Cities wish had occurred before the filing of the Application). However, in the event the parties are unable to achieve an agreement prior to the SEA's completion of the Final EIS (expected in late-May, 1998), the Consortium strongly believes that upon careful consideration, the SEA must find that additional mitigation is required under

⁴ Draft EIS, Vol. 3A, Ch. 5 at IN-85.

applicable governing federal policies and principles for mitigating the significant environmental impacts that are likely to result from the Conrail control transaction as proposed by the Applicants.

The Four Cities have met on several occasions with CSX and NS representatives (and with Indiana DOT) in an effort to negotiate a mutually-acceptable solution to the problems raised by the Applicants' proposed post-transaction operating plans. Additional meetings are scheduled. It is uncertain at this time whether an agreement can be reached that will obviate the necessity for the imposition of environmental mitigating conditions.

With regard to the Four Cities, the Draft EIS specifically "invites public comments on appropriate mitigation that the Board could require in an event that a mutually-acceptable binding agreement cannot be reached prior to the release of the final EIS." Id. at IN-87. Accordingly, the Four Cities are submitting these detailed Comments on the Draft EIS. It is the Four Cities' intention to supplement these comments, as appropriate, upon the conclusion of the discussions with CSX and NS.

ENVIRONMENTAL RELIEF REQUESTED

To ameliorate the substantial adverse environmental, safety, and socioeconomic impacts of the Applicants' proposed transaction, the Four City Consortium respectfully requests that SEA recommend in its Final EIS that any approval of the Application be conditioned on the imposition of the Consortium's Alternative Routing Plan ("ARP") as well as continued Board oversight

to ensure that the ordered mitigation is achieved in the manner intended.

The ARP is described in detail in the Four Cities' Comments filed with the Board (with separate copies submitted to SEA) on October 21, 1997. It has two principal aspects. The first aspect of the ARP involves rerouting some CSX traffic that is projected to move between Willow Creek, IN and Calumet Park, IL from the CSX/BOCT line via Pine Junction (Gary), IN⁵ to a parallel route consisting of Conrail's Porter Branch (to be acquired by CSX) between Willow Creek and a proposed new connection with the Indiana Harbor Belt's ("IHB") Gary-Calumet Park line near Virginia Street in Gary.

The second aspect of the Four Cities' ARP involves an alternative to CSX's plan to acquire from NS and restore to service the portion of the former Pennsylvania Railroad ("PRR") Fort Wayne-Chicago line between Hobart, IN and Clarke Junction (Gary), IN, at a cost of \$13 million.⁶ Under the ARP, the post-transaction traffic that CSX proposes to move over this line

⁵ "BOCT" is the acronym for the Baltimore & Ohio Chicago Terminal Railroad Company, a wholly-owned CSX subsidiary. BOCT owns the portion of the Willow Creek to Calumet Park line between Pine Junction and Calumet Park. This BOCT line segment is particularly problematic because it is a heavily-used line having 20 rail/highway at-grade crossings over a distance of approximately six miles. Nine of these crossings have average daily vehicle counts ("ADT") above the SEA's threshold of 5,000.

⁶ This out-of-service line has 23 rail/highway at-grade crossings, many of which have been paved over. CSX proposes to rehabilitate this line to provide an alternative route for certain bulk trains that would otherwise operate via CSX's main line through Willow Creek.

would be rerouted to a parallel route via the NS's line between Hobart and Van Loon, IN, and thence via the Elgin, Joliet and Eastern Railway Company ("EJE") between Van Loon and a connection with both the EJE and CSX lakefront lines near Pine Junction.

The Four Cities' October 21 Comments demonstrated why their requested condition is necessary to minimize the adverse impacts that would result from the Conrail transaction. The Consortium also has clearly shown that this requested condition is operationally feasible, will produce positive public benefits, and will not cause any reduction in the public benefits otherwise produced by the transaction. In the analysis below, the Four Cities will also demonstrate the significant environmental impacts that are implicated by the transaction and how their proposed ARP will ameliorate many of these impacts.

If, after considering the Four Cities' ARP in more detail, the SEA still believes that negotiation between the Applicants and the Consortium is the most appropriate mitigation action, then the Four Cities would request, at a minimum, that the SEA's Final EIS recommend that moratoriums be placed on (1) any increase in railroad traffic moving over the BOCT line between Pine Junction and Calumet Park above current levels (28 trains per day), and (2) the rehabilitation of, and reinstatement of service on, the former PRR line between Hobart and Clarke Junction. These recommended moratoriums should remain in place until the Applicants and the Four Cities come to a binding resolution of this matter.

II.

ARGUMENT

SCOPE OF FOUR CITIES' COMMENTS

The Four Cities' Comments on the Draft EIS are divided into two separate parts. First, the Comments will review the statutory and regulatory framework governing the Board's review of the environmental impacts of the proposed Conrail acquisition, and the authority of the Board to impose conditions, including environmental conditions, to mitigate potentially adverse environmental impacts. Second, the Comments will address the environmental impacts on the Four Cities' region that would be caused by the proposed transaction and the manner in which these impacts should be mitigated in the Final EIS.

The SEA's Draft EIS identified eleven separate areas of environmental impact which SEA used for its analysis of the Applicants' proposed post-transaction operational activities. Through its "threshold screening process," described in detail in Appendices A through K of the Draft EIS, SEA essentially identified those activities that it believed warranted further review for possible mitigation. For the Four Cities, the most significant environmental impacts are caused as a result of increases in rail traffic over certain line segments, and re-instatement of rail operations over a long-unused rail right-of-way. Of the eleven areas of potential environmental impacts, the Consortium has identified eight of them as seriously impacting the Four Cities Region. These eight include the following:

- Safety;
- Traffic and Transportation Systems;
- Energy;
- Air Quality;
- Noise;
- Land Use and Socioeconomics;
- Environmental Justice; and
- Cumulative Impacts.

Each of these areas is evaluated, in turn, in the second part of these Comments on the Draft EIS. The Four Cities' analyses of these eight areas will include, among other things, a critique of SEA techniques and computational formulas utilized in its threshold screening process (as well as suggested corrections); a discussion of local impacts that SEA has failed to evaluate adequately (or impacts which SEA failed to evaluate altogether); a critique of the Applicants' operational assumptions impacting environmental analyses (and suggested remedial actions to correct for those flawed assumptions in the Final EIS); and proposed remedies to mitigate individual environmental impacts. In sum, this analysis seeks to offer meaningful suggestions on areas requiring additional review, and actions that SEA should take in the Final EIS to respond appropriately to the severe adverse environmental impacts the proposed transaction is likely to have on the Four Cities.

A. The Environmental Review Process

1. The Statutory Framework Governing STB Environmental Review of Proposed Mergers/ Consolidations

On June 23, 1997 CSX, NS, and Conrail filed a joint Application with the Board seeking authority for CSX and NS to acquire control of Conrail. The railroad control transaction that has been proposed by the Applicants, involving over 44,000 miles of rail lines and related facilities owned by these railroads, is a "major transaction" under the Board's regulations at 49 C.F.R. Part 1180 governing railroad consolidations.

As part of the Board's review of railroad control applications, the Board is required to evaluate economic, competitive, and environmental considerations. When evaluating a proposed railroad merger or control transaction, the Board's standard for approval is whether the transaction is "consistent with the public interest." 49 U.S.C. § 11324(c).⁷

The Four Cities' October 21, 1997 Comments set forth in detail the law governing the Board's review of proposed merger or consolidation transactions, and that discussion will not be repeated here. In general, however, under the Board's regulations, the Board must perform a "balancing test" in determining whether a proposed railroad consolidation is in the public interest. In conducting that test, the Board must weigh "the

⁷ The ICC Termination Act of 1995, Pub. L. No. 104-88, 109 Stat. 803 (1995), established the STB as well as its jurisdiction over railroad control transactions, including the Conrail control transaction being considered in this proceeding. The Board's governing standards for railroad consolidations are set forth at 49 U.S.C. § 11324.

potential benefits to applicants and the public against the harm to the public." 49 C.F.R. § 1180.1(c). If the Board determines that the overall effect of a proposed transaction is in the public interest, it still has broad authority to impose conditions on the consolidation in order to ameliorate potential adverse effects, including the authority to impose environmental mitigation conditions.

The Board in its Notice of Final Scope of Environmental Impact Statement (EIS), issued in this proceeding on October 1, 1997, set forth three separate alternatives that it will consider when reviewing the proposed transaction's impact on the environment:

In making its decision in this proceeding, the Board will consider public comments and SEA's environmental analysis contained in the EIS, including any proposed environmental mitigation. The alternatives SEA will consider in the EIS are: (1) approval of the transaction as proposed; (2) disapproval of the proposed transaction in whole (No-Action alternative); and, (3) approval of the proposed transaction with conditions, including environmental mitigation conditions.

Id. at 3 ("Notice of Final Scope"), see also Draft EIS, Executive Summary at ES-6.

The Board's standards for imposing environmental conditions in merger and control cases are consistent with its general authority to impose conditions in railroad control transactions under 49 U.S.C. § 11324(c). Among other things, "the record must support the imposition of the condition at issue, . . . there must be a sufficient relationship between the condition imposed

and the transaction before the agency, and the condition imposed must be reasonable." Notice of Final Scope at 3 n.2.

2. Requirements of the EIS Process

The statutory framework governing the EIS review process includes the National Environmental Policy Act ("NEPA"), 42 U.S.C. §§ 4321 et seq., the regulations issued by the Council on Environmental Quality ("CEQ"), 40 C.F.R. Pts. 1500-1508, and the Board's own environmental rules, 49 C.F.R. Pts. 1105 et seq., as well as other applicable environmental statutes, orders, and guidelines. Under NEPA, Congress declared that as a "national environmental policy" each federal agency should become a "trustee of the environment," with the responsibility to "assure for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings." 42 U.S.C. § 4331(b).

As noted above, the EIS process was devised to ensure that major federal actions with the potential for significant environmental impacts are closely evaluated. The EIS is a device that is designed to identify impacts, analyze impacts, and consider alternatives to proposed actions that might have significant environmental impacts. The CEQ regulations provide that the purpose of the EIS is as follows:

The primary purpose of an environmental impact statement is to serve as an action-forcing device to insure that the policies and goals defined in the Act are infused into the ongoing programs and actions of the Federal Government. It shall provide full and fair discussion of significant environmental impacts and shall inform decisionmakers and the public of the reasonable alternatives which

would avoid or minimize adverse impacts or enhance the quality of the human environment.

40 C.F.R. § 1502.1. One of the most important areas that an agency must focus on in an EIS is a detailed evaluation and assessment of alternatives to proposed actions. Because of the importance of this component of the EIS, the CEQ rules for addressing alternatives are set forth in detail below:

§ 1502.14 Alternatives including the proposed action.

This section is the heart of the environmental impact statement. . . . [I]t should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public. In this section agencies shall:

(a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated.

(b) Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.

(c) Include reasonable alternatives not within the jurisdiction of the lead agency.

(d) Include the alternative of no action.

(e) Identify the agency's preferred alternative or alternatives, if one or more exists, in the draft statement and identify such alternative in the final statement unless another law prohibits the expression of such a preference.

(f) Include appropriate mitigation measures not already included in the proposed action or alternatives.

When considering the "significance" of a transaction, CEQ Regulations require examination of both "context" and "intensity." See Id. at 1508.27. Context usually means that the impact of a proposed action should be evaluated in the context of the impact on a specific region or locale. Intensity, which refers to the severity of the impact, also requires an examination of the cumulative impacts on the environment of an action, even if individual environmental impacts themselves are not considered to be significant. CEQ Rules explain that "significance exists if it is reasonable to anticipate a cumulatively significant impact on the environment," and that "significance cannot be avoided by terming an action temporary or by breaking it down into small component parts." Id. at § 1508.27(b)(7). CEQ Rules further define cumulative impact as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time." Id. at § 1508.7

The requirement that an agency take a "hard look" at proposed actions, and not leave it up to the parties or the public to analyze a transaction for environmental impacts, is a central tenet of NEPA. Delegation of an agency's NEPA responsibilities is frowned upon as "the Commission may not delegate to parties and intervenors its own responsibility to independently investigate and assess the environmental impact of the proposal

before it." Illinois Commerce Comm'n v. ICC, 848 F.2d 1246, 1258 (D.C. Cir. 1988).

Finally, under CEQ rules, any recommended mitigation measures in an EIS are required to be effective enough to solve the problem at hand. There are five categories of mitigation measures that agencies must consider, including: i) avoiding impacts altogether, ii) minimizing impacts; iii) rectifying impacts through restoration of the affected environment; iv) reducing or eliminating the impact over time; and/or v) compensating for impacts by replacing or providing substitute resources or environments. Id. at § 1508.27(b)(7). On the subject of mitigation, the United States Supreme Court in Robertson v. Methow Valley Citizen's Council, 490 U.S. 332 (1989), stated:

To be sure, one important ingredient of an EIS is the discussion of steps that can be taken to mitigate adverse environmental consequences. The requirement that an EIS contain a detailed statement of possible mitigation measures flows both from the language of the Act and, more expressly, from CEQ's implementing regulations. Implicit in NEPA's demand that an agency prepare a detailed statement on "any adverse environmental affects which cannot be avoided should the proposal be implemented," is an understanding that an EIS will discuss the extent to which adverse affects can be avoided.

Id. at 347-351.

3. The Inadequacy of the SEA's Draft EIS

In the sections below, the Consortium will demonstrate the inadequacies of the Draft EIS as it pertains to the Four Cities, and show how those inadequacies can and should be ad-

dressed in the Final EIS. Specifically, the analysis will show that the SEA's examination of the proposed transaction fails adequately to inform the public of the proposed action because the agency failed to take a "hard look" at its adverse environmental impacts. The Draft EIS also insufficiently analyzed reasonable alternatives, including the Four Cities Alternative Routing Plan.⁸ Among other things, under the CEQ regulations set forth above, SEA: i) did not "rigorously explore and objectively evaluate" the reasonable alternative proposed by the Four Cities for railroad operations, ii) did not "devote substantial treatment" to the Four Cities' alternative in sufficient detail to adequately inform the public "so that reviewers may evaluate their comparative merits;" and iii) did not "identify the agency's preferred alternative or alternatives."

The SEA also failed to address adequately the substantial cumulative impacts that the proposed transaction will have on the Four Cities. This issue will be outlined in more detail below. However, suffice it to say, the Draft EIS insufficiently addressed the significant cumulative impacts of the Application on northwest Indiana, especially in light of the standard that such impacts must be viewed in the context of "other past,

⁸ As noted above, the Four Cities sent copies of their Comments and Request for Conditions directly to SEA, emphasizing the need to consider their contents in development of SEA's environmental analysis. (see Counsel's Exhibit 1). Four Cities' counsel also contacted SEA and advised that the Four Cities were prepared to respond to any questions SEA might have concerning the Consortium's Comments or its Alternative Routing Plan. The SEA's contractor in the Chicago area did, in fact, meet with representatives of the Four Cities in November, 1997.

present, and reasonably foreseeable future actions." The SEA found no appreciable cumulative impact in the Four Cities despite the fact that, combined, there are over 150 trains that pass through the Four Cities, the Four Cities have a total of 243 at-grade rail/highway crossings (many of which are extremely close together with resulting significant interrelated impacts), and the number of vehicles crossing rail lines at-grade exceeds 450,000 daily. See October 21 Comments, Argument at 11. Meanwhile, the region is a severe non-attainment area for a number of air pollutants, contains a population well over 50 percent minority, which is largely low-income, and has suffered for years from the impacts of regional environmental degradation.

The Draft EIS also fails to provide the public with sufficient meaningful information on the environmental impacts of the Conrail transaction to make an informed decision on the environmental merits of the Application. For the Four Cities, SEA found only isolated instances of significant impacts. Even in those individual instances where environmental thresholds were met, SEA largely brushed off such impacts as insignificant because the impacts were "offset systemwide" or, upon further review, the SEA concluded that the impacts were not actually significant enough to require mitigation.

Finally, while the Draft EIS at Volume 4 contains a laundry list of possible mitigation actions, by-and-large it contains no "detailed statement of possible mitigation measures." For the Four Cities, the SEA did not propose the Consortium's

proffered Alternative Routing Plan as a possible mitigation measure. Instead, the Draft EIS largely requests parties to "negotiate" matters where conflicts exist. As noted above, the Four Cities have been engaging in (and will continue until agreement or impasse) such negotiations with the Applicants over planned post-transaction movements in the area. While discussions have taken place, no resolution has been reached. If such negotiations fail, the SEA (and the Board) have a clear responsibility to consider environmental mitigating conditions such as the Four Cities' Alternative Routing Plan.

B. Environmental Impacts on the Four Cities

1. Safety

In their October 21 Comments, the Four Cities identified a number of safety problems that will be caused by the Conrail transaction -- and, in particular, by the Applicants' post-transaction operating plans. These adverse safety effects result from a combination of the large number of heavily-used rail/highway at-grade crossings in the region, and the increase in rail traffic projected for certain problematic lines. These lines include, in particular, the BOCT line between Pine Junction and Calumet Park and the former PRR line between Hobart and Clarke Junction. The adverse impacts on safety identified by the

Four Cities as a direct result of the Conrail transaction include the following:⁹

- Increased likelihood of crossing accidents. The increases in train traffic and, in some cases, train speeds will result in an increased likelihood of at-grade crossing accidents. Already, many residents and workers in the Four Cities are so frustrated by endemic crossing delays that they have developed an unfortunate habit of ignoring active crossing protection devices and running (or driving) around lowered crossing gates if a train is not actually occupying the crossing. This dangerous situation will be exacerbated by projected increases in train frequency, particularly on the BOCT line. The proposed reinstatement of train operations on the PRR Hobart to Clarke Junction line, which has been out of service for ten years, will also be problematic in terms of ignoring crossing protection devices as motorists have become used to crossing this line without having to worry about whether a train may be approaching.

- Interference with the provision of EMS services. The frequent crossing blockages habitually prevent emergency police, fire and ambulance vehicles from responding in a timely manner to calls that require such vehicles to use rail/highway at-grade crossings. Again, this problem is particularly acute with

⁹ See the Verified Statements by the City Planners of each of the Four Cities (Kimberly Gordon of East Chicago, Donald Thomas of Hammond, Michael Cervay of Gary, and Daniel Botich of Whiting), included in the Four Cities' October 21 Comments; Cervay Environmental V.S. at 16-20; Burriss Environmental V.S at 13-17.

respect to the crossings on the BOCT line, which runs in an east-west direction through the heart of the central business districts of East Chicago and Hammond. A total of 20 highways and streets cross the six-mile segment of this line between Pine Junction (Gary) on the east and the Indiana/Illinois state line on the west.¹⁰ These 20 crossings are so closely spaced that when a train stops anywhere in East Chicago or Hammond (as frequently occurs due to the existence of seven different at-grade railroad crossings of the BOCT line in these two communities alone), several rail/highway at-grade crossings are inevitably blocked. The projected increase from 27 to 33 trains per day over this segment, combined with their greater length and weight, will cause an already-intolerable safety situation to become worse.

- Climbing under and through stopped trains. Train stoppages and blocked crossings occur so frequently that pedestrians, particularly children, routinely climb under or through trains to get from one side of the tracks to the other. Again, this problem will be exacerbated by the Applicants' projected increases in train traffic in the region.

- Increased train speeds. Motorists have become used to slow-moving trains, particularly on the BOCT line, which contributes to the around-the-gates problem. In addition, vehicles traveling on east-west Chicago Avenue, which parallels the BOCT

¹⁰ Nine of these crossings, all located in East Chicago and Hammond, have average daily vehicular traffic counts ("ADT") greater than 5,000.

line through East Chicago and Hammond, routinely attempt to beat a train to the next open crossing. These problems may be exacerbated by CSX's proposal to raise the maximum train speed on the BOCT line to 40 miles per hour, as motorists who desire to cross this line will not expect increased speeds.¹¹

* * *

The DEIS acknowledges that these safety problems exist,¹² but it completely ignores their cumulative impact and proposes no specific mitigation measures to ameliorate the adverse safety effects of the Conrail transaction that are of principal concern. Moreover, SEA's thresholds for analysis of safety impacts (a line segment having an increase of eight or more trains per day as a result of the transaction and for which a statistical predicted accident rate per year per mile is met) appear to be arbitrary, certainly as applied to the out-of-service Hobart to Clarke Junction line.¹³

¹¹ As a practical matter, the stoppages caused by the large number of railroad at-grade crossings of the BOCT line will inhibit trains using this line from reaching anything approaching the full timetable speed. Nonetheless, any increase in speeds on this line could raise serious safety concerns.

¹² For example, the DEIS states at page IN-84 in Chapter 5 (Volume 3A) that "SEA acknowledges the concern identified by the Four City Consortium regarding the proposed Acquisition's potential impact on emergency vehicle response times. Similarly, at page IN-85 the following general statement is made: "SEA recognizes the concerns of the Four City Consortium regarding the pre-existing conditions and acknowledges that even a small increase in delays could exacerbate the problems faced by an urban area with several at-grade crossings."

¹³ The PRR Hobart to Clarke Junction line will have a post-acquisition "increase" of only five trains per day, and
(continued...)

Nor does the DEIS indicate that SEA has considered any alternatives to the Applicants' proposal, such as the Four Cities' Alternative Routing Plan, that would ameliorate these adverse safety effects. Although it was certainly reasonable for the SEA to encourage the parties to address these issues, the failure of the SEA to evaluate the Four Cities' Alternative Operating Plan in the Draft EIS effectively deprives the Four Cities of the opportunity to respond in these Comments to any errors, unjustified criticisms, etc., that might be made in such evaluation. Fulfillment of its statutory duties under NEPA requires SEA to consider specific measures to mitigate the transaction's identified adverse safety impacts.

We also note that, in compliance with Decision No. 52 served November 3, 1997, the Applicants have filed Safety Integration Plans ("SIPs") with respect to their post-transaction operations over their systems as reconfigured as a result of the acquisition and division of Conrail's lines. These SIPs were filed on December 3, 1997, or six weeks after the Four Cities' October 21, 1997 Comments were filed. Despite that fact, the Applicants' SIP's are very general in nature, and they do not address any of the specific safety concerns raised in the Four

¹³ (...continued)

since the pre-acquisition train frequency has been zero for the last ten years, obviously there have been no at-grade crossing accidents on this line for ten years. It is self-evident that the reactivation of 23 closed at-grade crossings on this line will cause enormous safety problems for motorists who are used to ignoring the possibility that a train may be approaching a crossing.

Cities' Comments. This is even more reason why these concerns must be addressed, and appropriate mitigation recommended, in the Final EIS for this case.

2. Traffic and Transportation Systems

One of the most significant adverse environmental impacts on the Four Cities region arising from the Conrail transaction relates to delays to vehicular traffic at rail/highway at-grade crossings. These delays have a significant impact on safety (as described in the preceding section) and air pollution emissions (described below), as well as an adverse economic impact resulting from unproductive time incurred by vehicle occupants while waiting for blocked crossings to clear.

In evaluating at-grade crossing vehicular delays in the Four Cities region, the DEIS considered only crossings having an ADT of 5,000 vehicles or greater as even eligible for mitigation. It also refused to consider mitigation for any individual crossing unless either (1) its post-acquisition "level of service" (LOS), as measured by average delay per vehicle in seconds, would be at "E" or worse (i.e., an average delay per vehicle of greater than 40 seconds) regardless of its pre-acquisition LOS, or (2) its LOS would decline from a pre-acquisition LOS of "C" or better (i.e., an average delay per vehicle of 25 seconds or less) to a post-acquisition LOS of "D" (i.e., an average delay per vehicle of 26 to 40 seconds).

The SEA's ADT and LOS thresholds may be reasonable for viewing the impacts of the transaction on individual grade

crossings, in terms of possible mitigation such as improvements to crossing protection devices. However, SEA's apparent decision to evaluate individual crossings in the Four Cities in isolation, without any consideration of cumulative increases in crossing delays for contiguous crossings or a related group of crossings, is both arbitrary and a violation of the Board's statutory duty to consider the cumulative environmental impacts of the proposed Conrail transaction. It is also inconsistent with SEA's determination to consider delay times for crossings having ADT's of less than 5,000 vehicles in other geographic areas affected by the transaction.

For example, in Cuyahoga County, Ohio, SEA decided to analyze all highway/rail grade crossings, regardless of whether they had an ADT of 5,000 vehicles. The reason for this was SEA's conclusion that Cuyahoga County had a relatively high incidence of vehicle delays at the many grade crossings in the county. See Draft EIS, Vol. 5A at E-17. However, according to Mr. Cervay, who has planning experience in Cuyahoga County as well as in Gary, "at-grade highway/railroad crossing problems are significantly worse in Lake County [Indiana] than in Cuyahoga County." Cervay Environmental V.S. at 26 n. 15. SEA's failure to conduct the same kind of detailed grade crossing delay study for the Four Cities region that it conducted for Cuyahoga County is puzzling at best, and arbitrary at worst.¹⁴ SEA should correct this

¹⁴ Similarly, in Tippecanoe County, Indiana, the SEA analyzed ten grade crossings in the City of Lafayette notwithstanding
(continued...)

oversight by analyzing all of the impacted grade crossings in the Four Cities for possible mitigation measures.

In addition to the inconsistencies described above, SEA's calculations of crossing delay times in the Four Cities are understated for at least three different reasons which are explained below.¹⁵

a. Number of Crossings Studied.

First, SEA inexplicably calculated delay times only for 15 of the 29 affected rail/highway grade crossings in the Four Cities having an ADT of 5,000 vehicles or more. In addition, as noted above, SEA did not study any of the grade crossings in the Four Cities having ADT's of less than 5,000 vehicles. The Four Cities, on the other hand, studied a total of 108 grade crossings (all those impacted by the changes in routings and rail traffic volumes that will result from the Conrail transaction, regardless of their ADT levels). Andrew Environmental V.S. at 6-8. The Four Cities' approach is consistent with the statutory directive to consider cumulative environmental impacts. This directive mandates that in circumstances presented by the Four Cities (and

¹⁴(...continued)
standing that they did not meet the LOS threshold criteria described above, and recommended preliminary mitigation until a proposed railroad relocation project (already in the works) can be completed or implemented. See DEIS, Vol. 3A at IN-89.

¹⁵ A fourth error in SEA's calculations has already been corrected. The SEA's original formula for calculating average delay times used the time for the last vehicle in the queue for each crossing, rather than the average time for all vehicles in the queue. This error was corrected in the Supplemental Errata to the DEIS served on January 21, 1998.

Cuyahoga County, Ohio), where a large number of contiguous grade crossings of lines that will experience a significant increase in rail traffic exist, delay times should be calculated for all of the impacted crossings.

b. Train Speeds.

Second, the train speeds used as inputs to SEA's formula used to calculate individual crossing delay times are inconsistent both with reality and with the Applicants' own data. As indicated by Messrs. Andrew and Burris in their accompanying testimony, SEA assumed that most trains would operate at maximum timetable speeds (with minor reductions in some instances to reflect operating conditions known to SEA's contractor). Thus, for the BOCT line between Pine Junction and Calumet Park, SEA assumed an average train speed of 25 MPH.¹⁶ For the PRR Hobart to Clarke Junction line segment, SEA assumed an average train speed of 10 MPH which is this line's present maximum timetable speed (although, in reality, this line segment is out of service at the present time).

In fact, maximum train speeds are very rarely (if ever) achieved on the six-mile segment of the BOCT line located in Indiana. The principal reason for this is the large number of at-grade railroad crossings of this line segment -- all of which are controlled by railroads other than CSX. Andrew Environmental V.S. at 13-14; Burris Environmental V.S. at 19-20. This means

¹⁶ The maximum authorized timetable train speed for this line is actually 35 MPH. Burris Environmental V.S. at 19.

that CSX trains frequently stop to allow trains to clear one or more of these crossings.¹⁷ According to CSX's own data, the actual average speed of trains moving over the BOCT line between Pine Junction and Barr Yard is 12.0 MPH. Andrew Environmental V.S. at 13.

CSX plans to increase the maximum authorized timetable train speed on the entire BOCT line between Pine Junction and Barr Yard from FRA Class 2 to FRA Class 3 track safety standards, thereby permitting an increase in the theoretical maximum train speed to 40 MPH. However, this is unlikely to have any material impact on actual train speeds on the six-mile segment of this line between Pine Junction and State Line Tower on the Indiana/Illinois border. The reason is that the same seven railroad grade crossings of this segment (all controlled by carriers other than CSX) will continue to exist -- which means that CSX trains will continue to have to stop on this segment to wait for railroad crossings to clear just as they do today. In addition, the CSX trains using this line after the Conrail transaction is consummated will be longer and heavier than the trains presently using the line, which means that the deceleration/acceleration time for trains that have to stop on this line will be longer than at present. However, to be conservative, the Four Cities have assumed that the post-transaction average train speed on the

¹⁷ The crossing delay study conducted by the Four Cities in September 1997 indicated that 58% of the CSX trains using the BOCT line between Pine Junction and State Line Tower come to a complete stop. Burriss Environmental V.S. at 20-21.

BOCT line will increase by 10% compared with the pre-transaction level, which yields an average train speed of 13.2 MPH. Andrew Environmental V.S. at 14-15; Burriss Environmental V.S. at 21-22.

With respect to the PRR Hobart to Clarke Junction line segment, CSX plans to restore this line to service and upgrade it from FRA Class 1 to FRA Class 3 track safety standards, thus also permitting a theoretical maximum train speed of 40 MPH. Again, however, the actual average train speed on this line is likely to be far less than the maximum timetable speed.¹⁸ The PRR line has two at-grade railroad crossings that will be controlled by CSX after the transaction is consummated, but that will have both a higher traffic density and a higher priority in terms of train movements through the crossings than the PRR line. This line also will connect with the CSX and Conrail lakefront lines (the latter to be acquired by NS), which will also have a very high traffic density and priority of movement. For these reasons, and based on data from CSX indicating that comparable lines have an average train speed that is less than 40% of the maximum authorized speed, a more appropriate post-transaction average actual train speed for the Hobart to Clarke Junction line segment is

¹⁸ The Applicants have both utilized the full maximum timetable speeds in their calculations of individual crossing delay times. See Joint Rebuttal Verified Statement of James C. Rooney and T. Stephen O'Connor at 14-17 (HC-293 to 296). The use of full timetable train speeds as projected post-transaction average speeds is clearly unsupported and unacceptable. The recent western service crisis being experienced by the Union Pacific Railroad demonstrates that the Board cannot and should not take such unsubstantiated and claimed operational improvements made in the context of a railroad control proceeding at face value.

14.6 MPH. Andrew Environmental V.S. at 14-15; Burris Environmental V.S. at 22-24.

c. Train Length.

The time a train occupies a grade crossing is a factor of its length as well as its speed. SEA's calculations generally assume an increase in average train length in northwestern Indiana of only 200 feet as a result of the Conrail transaction. However, this is inconsistent with CSX's own records, which indicate a post-transaction increase in average train length of 1,298 feet for the BOCT line between Pine Junction and Barr Yard. Andrew Environmental V.S. at 11-12; Burris Environmental V.S. at 24-25. This significant increase in train length has a substantial effect on calculation of vehicle delay times at grade crossings.

* * * *

The Four Cities' consultants have used SEA's own corrected formula for calculating crossing delay times, and have corrected the SEA's data inputs to reflect all impacted crossings, average actual train speeds, and the actual change in average train lengths. The result is that the Conrail transaction will result in a total increase in annual vehicle crossing delay time in the Four Cities from 204,385 hours to 355,265 hours, an increase of 150,880 hours or approximately 74%. Andrew Environmental V.S. at 9; Burris Environmental V.S. at 11. Implementation of the Four Cities' Alternative Routing Plan would reduce the total post-transaction annual vehicle delay time to

214,645 hours -- a very substantial mitigation of the 355,265 delay hours caused by Applicants' operation plans. Id.

In the final EIS for this proceeding, SEA should correct the data input errors to the formula used to calculate crossing delay times, and it should also calculate delay times for all 108 affected grade crossings in the Four Cities. As indicated above, these corrections clearly warrant mitigation for the significant net increase in crossing delay time that will result from the Applicants' post-transaction operating plans.

3. Energy

The SEA's consideration of potential increases in the consumption of energy resources (i.e., fuel) involved an analysis of truck-to-rail traffic diversions as a result of the Conrail transaction. Although the SEA acknowledged that the Applicants' have probably overestimated the truck-to-rail diversions that will occur, it basically accepted their figures indicating that the transaction will result in a net reduction in fuel consumption of approximately 80 million gallons of diesel fuel system-wide. *Burris Environmental V.S.* at 26-27.

The SEA also evaluated rail/highway grade crossings with an ADT of greater than 5,000 vehicles. Using a fuel consumption factor for idling vehicles of .65 gallons per hour, the SEA essentially determined that because there would be no significant system-wide changes in energy use due to vehicle crossing delays, no mitigation is necessary for individual crossings. The SEA also appeared to determine that any increased energy consump-

tion caused by vehicles idling at grade crossings was offset by overall fuel consumption reductions likely to result from post-acquisition truck-to-rail diversions.

With respect to the Four Cities region, the SEA's conclusions again ignore the cumulative impacts of crossing delays at the many interrelated grade crossings, particularly on the BOCT line between Pine Junction and Calumet Park. The Conrail transaction will clearly result in a substantial increase in fuel and oil consumption by idling vehicles delayed at blocked grade crossings in this region.

The SEA's failure to consider mitigation for energy (fuel and oil consumption) impacts in the Four Cities is a direct result of SEA's incomplete evaluation of grade crossing delays, discussed in the preceding section. When the revised total vehicle crossing delay time as calculated by Messrs. Andrew and Burris in their accompanying testimony is taken into account, the result is a post-transaction increase in fuel consumption. This causes annual fuel consumption costs caused by grade crossing delays to increase from \$180,208 to \$313,344. Burris Environmental V.S. at 38. If the Four Cities' Alternative Routing Plan were implemented, the total annual increase in fuel and oil consumption costs due to grade crossing delays would drop to \$209,400. Id. at 43, 48.

4. Air Quality

The Four Cities currently experience some of the worst air quality problems encountered anywhere in the midwest. Lake

County, in which the Four Cities are geographically situated, has the poorest overall air quality of any area in the State of Indiana.¹⁹ Cervay Environmental V.S. at 21. These impacts are largely a result of the heavy industrial activities that have sustained the area economically over the last century. Lake County does not meet Clean Air Act standards for air quality, and, as the Draft EIS has recognized, it is categorized by the Environmental Protection Agency ("EPA") as a severe "nonattainment" area for the emission of Ozone ("O3") (which is produced in part by volatile organic compounds ("VOCs")), oxides of nitrogen ("NOx"), and other chemical pollutants. Lake County is also partially nonattainment for Sulfur Dioxide ("SO2"), Carbon Monoxide ("CO"), and Particulate Matter ("PM").

Because of these air pollution problems, the Four Cities, in conjunction with state and federal officials, and with the cooperation of businesses and the public, have expended considerable time and resources in developing programs to improve area air quality. As a direct result of the severe pollution problems facing northwest Indiana, EPA has organized the Northwest Indiana Environmental Initiative. The Initiative is designed to focus resources and attention on improving the region's environment. Additionally the Initiative has developed an Action Plan, which includes strategies for improving northwest Indiana

¹⁹ Mr. Cervay's Environmental V.S. outlines in considerable detail the significant air quality impacts that the proposed transaction would have in the Four Cities. The economic consequences of these impacts are further quantified in Mr. Burris' Environmental V.S.

environmental problems. Cervay Environmental V.S. at 21-22, Exhibit MLC-2.

A significant problem facing the Four Cities is the emission of mobile source pollutants from vehicles, including ozone-producing VOCs, NOx, and CO emissions. Enforcement provisions of the Clean Air Act strictly regulate such emissions and the State of Indiana and local officials have spent considerable energy and resources on actions to conform with the EPA enforced standards. Among other things, EPA recently approved the State's Rate-Of-Progress Plan, which requires Lake County to take steps sufficient to reduce weekday ozone emissions by at least 15 percent over a six- year period. Id. at 24-25, Exhibit MLC-4. Lake County pollution control efforts include the implementation of an enhanced vehicle emission testing program, and requirements that gasoline providers sell only reformulated gasoline and install vapor recovery equipment on gasoline pumps. Id. at 25.

Unfortunately, the Draft EIS largely fails to consider the significant air pollution impacts that the proposed transaction would have on the Four Cities. As has been demonstrated throughout the Four Cities' October 21 Comments and in these Comments on the Draft EIS, these impacts will result from the increased blockage of highway traffic at railroad grade crossings that will occur as a result of the Applicants' post-transaction operating plans for this area.

In examining air quality impacts in the Draft EIS, for some communities -- such as those in Cuyahoga County, Ohio, as

previously discussed -- SEA decided to analyze all highway/rail at-grade crossings impacted by the Application, including those with ADT volumes under 5,000 vehicles. For Lake County, the SEA only considered crossings with ADT's over 5,000 vehicles, despite the well-documented at-grade highway/rail crossing problems that have been brought to the SEA's attention by the Four Cities. Cervay Environmental V.S. at 25-26. The Final EIS should consider the air pollution impacts of all impacted grade crossings in the Four Cities, and not just those crossings with ADT's over 5,000 vehicles.

- a. The SEA Failed to Consider Potential Sanctions Facing the Four Cities that are Implicated by the Transaction.

While northwest Indiana has made progress in improving air quality, the area must do much more to overcome environmental air quality problems in order to achieve Clean Air Act requirements. Under the SEA's formulae utilized for calculating air quality impacts in this proceeding, SEA concluded that net NOx emissions will increase by 83.76 net tons per year in Lake County. See Draft EIS, Vol. 3A at IN-41, Table 5-IN-22. While this level of impact is significantly above the SEA's threshold of 25.0 tons per year for the imposition of mitigation, SEA inexplicably determined that the impact was not significant enough to impose mitigation for the Four Cities.

Unfortunately, the SEA's analysis fails to consider the substantial impacts of non-action in the case of air quality in the Four Cities. Because of the Four Cities' nonattainment air

quality status, and specifically, its severe nonattainment status for NOx, any increases in air pollution may cause the region to violate its compact with EPA which requires it to substantially reduce ozone and other air pollution emissions as required under the federal Clean Air Act. Among other things, the Clean Air Act requires any increased sources of NOx emissions above 25 tons per year to be offset by a ratio of 1.3 to 1. See 42 U.S.C. § 7511a(d); Cervay Environmental V.S. at 27-28. Additionally, the Four Cities are facing the threat of sanctions in the form of blocked federal highway assistance grants for failing to achieve Clean Air Act standards, as well as other sanctions. See 42 U.S.C. § 7509; Cervay Environmental V.S. at 27. Again, SEA has acknowledged that significant air pollution impacts for the Four Cities are implicated by the proposed transaction, but its recommendations fail to comport with these critical federal/state compliance requirements.

For the above reasons, the Four Cities request that SEA, as part of its Final EIS, conduct a conformity determination to ascertain the impact of the Application on the Four Cities. Under the requirements of NEPA, in determining the significance of a potential impact on the environment, agencies are required to ascertain "[w]hether the action threatens a violation of Federal, State, or local law or requirements imposed for the protection of the environment." 40 C.F.R. § 1508.26. Additionally, the Clean Air Act specifies that "[n]o department, agency, or instrumentality of the Federal Government shall . . . permit[]

or approve[] any activity which does not conform to an implementation plan after it has been approved or promulgated under section 7410 of this title." 42 U.S.C. § 7506(c)(1). Section 7410 is a reference to state implementation plans, which are compacts between the states and EPA in the achievement of air quality standards. Cervay Environmental V.S. at 23. Conformance assurance is the "affirmative responsibility" of the agency head, who must ensure that activities will not:

- (i) cause or contribute to any new violation of any standard in any area;
- (ii) increase the frequency or severity of any existing violation of any standard in any area; or
- (iii) delay timely attainment of any standard or any required interim emission reductions or other milestones in any area.

Id. at 7506(c)(1)(B).

Because of the potential conflict of the Applicants' post transaction plans with federal/state air quality standards, as demonstrated above, the SEA should undertake a conformity determination for the Four Cities prior to any approval of the proposed Conrail Transaction. The Four Cities believe that their Alternative Routing Plan, if imposed as an environmental mitigating condition, would obviate the need for such a determination because of the amelioration of impacts that it would achieve.

b. The Draft EIS Failed to Consider the Socioeconomic Impact of Increased Air Pollution.

There would be significant socioeconomic impacts caused by post-transaction increases in air pollution in the Four Cities. In his accompanying verified statement, witness Burris has quantified the economic impacts on the Four Cities of the degradation in air quality caused by the transaction. In total, the anticipated costs associated with the implementation of the Applicants' post transaction plans on the Four Cities is \$3.4 million annually. Burris Environmental V.S. at 32. Mr. Burris has also measured the economic impact from emissions caused by vehicle delays at rail/highway grade crossings in the Four Cities, based on Federal Railroad Administration economic modeling formula. Specifically, Mr. Burris compared the cost of air pollution impacts that would be caused by Applicants' proposed operations over the Willow Creek to Calumet Park line segment and the Hobart to Clarke Junction line segment versus the cost of air pollution impacts resulting from current operations. The result is that annual vehicle emission costs will increase from \$463,000 under current operations to nearly \$851,000 under the Applicants' proposal. Id. at 36.

Additionally, as discussed below in the Land Use and Socioeconomics section, the Four Cities are involved in extensive economic redevelopment plans, largely involving the restoration and development of the Lake Michigan waterfront which spans the entire northern boundary of all of the Four Cities. Cervay

Environmental V.S. at 11-16. These plans are part of a larger effort that is being made by the region to move away from heavily industrial economic activities, and to promote cleaner forms of economic growth for the region. The restoration of the waterfront at Buffington Harbor alone already has resulted in over \$25 million in new annual tax revenues for the City of Gary alone. Id. at 12. To attract additional visitors to the region, and to continue to expand waterfront opportunities, however, significant improvements will be needed in the area of air quality in particular, as well as in other areas of environmental clean up.

* * * *

Unfortunately, despite acknowledging in the Draft SEA that significant air pollution impacts will result from the Conrail transaction, the SEA is not recommending -- and the Applicants are not initiating -- any air quality mitigation for the Four Cities. Such inaction is clearly unacceptable, especially in light of the important mitigation actions that state, county, and local officials have already undertaken to improve the region's air quality to conform to Clean Air Act standards, and in light of the critical importance of improved air quality for the success of areawide economic development efforts.

5. Noise

The SEA examined two kinds of noise impacts potentially resulting from the Applicants' post-transaction operating plans. These were wayside noise (i.e., wheel/rail interaction noise) and horn noise (which is an additional noise source at grade cross-

ings). SEA analyzed potential increases in noise for line segments experiencing a post-transaction increase of eight trains per day or a 100% increase in annual gross ton-miles. The noise thresholds used to determine whether mitigation is warranted were an incremental increase in noise levels of three decibels ("dBA") or more, or any increase resulting in a noise level of 65 dBA or greater.

For line segments meeting the SEA's environmental noise-analysis thresholds, SEA identified sensitive receptors (e.g., schools, libraries, hospitals, residences, retirement communities and nursing homes) in the affected area and quantified the noise increase for those receptors. For areas affected by wayside noise, SEA recommended mitigation for noise-sensitive receptors exposed to at least 70 dBA and an increase of at least five dBA due to increased rail activity.

Using these criteria, the SEA identified three line segments in the Four Cities as meeting its thresholds for noise analysis: the former PRR line segment between Tolleston and Clarke Junction, the former PRR line segment between Warsaw and Tolleston via Hobart, and the CSX line segment between Willow Creek and Pine Junction.²⁰ However, the SEA proposed no mitigation for any of these line segments. For receptors near grade crossings that would experience increases in horn-sounding noise

²⁰ SEA also determined that the Conrail line segment between CP-501 and Indiana Harbor (to be acquired by NS) met the thresholds for noise analysis, but that the increase in noise due to increased rail activity was insignificant and thus that receptor counts were unnecessary.

levels, SEA determined that mitigation was not feasible due to FRA regulations requiring locomotive horns to be blown at rail/highway grade crossings. For those areas affected by wayside noise, the SEA determined that none of the receptors was exposed to at least 70 dBA and an increase of at least five dBA due to increased rail activity, and therefore that no noise mitigation was warranted.

Although the SEA considers grade separations to be a noise mitigation option, it normally "does not consider grade separations to be cost-effective solely for noise mitigation." Draft EIS, Vol. 5A at F-11. However, the Four Cities have proposed an Alternative Routing Plan that makes extensive use of existing grade separations on the elevated IHB line which parallels the BOCT Pine Junction-Calumet Park line several miles to the south. The Four Cities have shown that their Alternative Routing Plan is a cost-effective mitigation option for a number of adverse environmental impacts, including increased noise pollution. In the Final EIS, the SEA should consider the Alternative Routing Plan as an effective means of mitigating noise as one of the cumulative impacts on the Four Cities resulting from the Applicants' proposed post-transaction train operations.

The SEA also failed to consider the fact that the PRR Hobart-Clarke Junction line is presently an inactive line that incurs no noise impacts from rail operations. A proposed low-income Gary housing project described by Mr. Cervay would lie in close proximity to this line, and would contain numerous recep-

tors (residences) that would suffer new noise impacts from the re-institution of rail service on this line. Cervay Environmental V.S. at 5-8. The SEA made no attempt to determine whether such impacts warrant mitigation.

6. Land Use and Socioeconomics

In determining the impact of the proposed transaction on land use and socioeconomics, the SEA scope of review was very narrow. In particular, the SEA's final order on the scope of the EIS review stated that the EIS would consider whether any proposed constructions or abandonments were "consistent with existing land use plans." See Notice of Final Scope of Environmental Impact Statement (EIS), served October 1, 1997, at 12. Additionally, the scoping order stated that SEA would "address socioeconomic issues shown to be related to changes in the physical environment as a result of the proposed transaction." Id.

For the Four Cities, the SEA did not identify the former PRR Hobart to Clarke Junction line segment in its analysis of land use and socioeconomics. As stated in these comments, CSX plans to acquire this inactive line from NS and restore it to service. Rehabilitation/construction costs are estimated at \$13 million. Because of its long inactivity, and because of the substantial rehabilitation work that would be necessary to restore this line into service, the line should be considered to be a construction project that meets the requirements of SEA's scoping order for consideration of land use and socioeconomic impacts.

Even if the SEA does not consider rehabilitation of the Hobart-Clarke Junction line to be a "construction project," because of its long inactivity, there will be substantial socioeconomic issues related to changes in the physical environment that would be caused by the restoration of this line to service. For these reasons, the SEA should consider the land use and socioeconomic impacts of construction on the former PRR line in its Final EIS.

In his accompanying testimony, Michael Cervay, the Director of Planning and Community Development for the City of Gary, has described a number of adverse socioeconomic impacts that will result from the reinstatement of rail service on the Hobart to Clarke Junction line. Cervay Environmental V.S. at 5-8 and 11-16. As is detailed in Mr. Cervay's statement, restoration of this line would negatively impact important housing, airport, and waterfront development plans in the Four Cities. For example, the line constitutes the northern boundary of the planned Roosevelt Manor low-income housing project. Because the PRR line has been inactive for the last ten years, and because of its poor condition, development plans for the housing project were made by the City of Gary and community planners involved with the project with the understanding that the housing project would not be impacted by future railroad operations. Restoration of the PRR line to service will cause significant impacts in terms of noise, air pollution, and traffic at reopened rail/highway grade crossings in the immediate vicinity.

The reinstatement of rail service on the PRR line would also interfere with the Four Cities' plans to expand the Gary/Chicago Airport. Cervay Environmental V.S. at 8-11. The PRR line passes immediately to the east of the airport. The airport's expansion plans have been ongoing for the past several years, and airport authorities anticipate that the expansion will include the institution of passenger service as well as increased cargo service. Without increasing the length of the runways and runway safety buffer zones, as required by Federal Aviation Administration regulations, the airport will be unable to take on passenger service and to handle increasing amounts of air cargo. If the out-of-service PRR line is reactivated, the runway extensions (and thus the airport expansion itself) will be blocked.

Finally, reinstatement of the PRR would impede plans for the redevelopment of Gary's Lake Michigan waterfront. Cervay Environmental V.S. at 11-16. As has been stated elsewhere in these comments, the redevelopment of the lakefront is a critical component of the region's long-term economic growth plans. The lakefront Buffington Harbor gaming facilities, which were opened two years ago, attract 10 to 12 million visitors annually, and provide thousands of jobs for local residents. The reactivated PRR line would intersect with the CSX and Conrail (NS) lakeshore main lines directly south of Buffington Harbor. The result would be to create significant vehicular and pedestrian congestion problems and disrupt the lakefront redevelopment plans in this area.

For all of these reasons, the SEA in its Final EIS should evaluate, for possible mitigation through the Four Cities' Alternative Routing Plan, the significant land use and socioeconomic impacts that the reinstatement of the former PRR line between Hobart and Clarke Junction would have on the Four Cities.

7. Environmental Justice

a. Implications of the President's Environmental Justice Order

Under Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, issued February 11, 1994 ("Environmental Justice Order"), the President ordered all federal agencies

to the greatest extent practicable and permitted by law . . . to make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations.

Guidance orders for the implementation of the Environmental Justice Order have been issued by several departments and agencies, including the CEQ, EPA, and the Department of Transportation ("DOT"). While CEQ and EPA have issued only draft guidance on procedures to be used for implementing the Environmental Justice Order, DOT issued a final order on environmental justice on February 3, 1997.²¹ The DOT Environmental Justice Order req-

²¹ See Department of Transportation (DOT) Order to Address Environmental Justice in Minority Populations and Low-Income Populations, 62 Fed. Reg. 18377 (Apr. 15, 1997). ("DOT Environmental Justice Order").

quires that all DOT offices ensure that steps are taken to ensure that any approved actions do not disproportionately impact minority or low-income populations.²² The DOT Environmental Justice Order directs that any "programs, policies or activities that will have a disproportionately high and adverse effect" on minority or low income populations should be avoided if at all possible.²³ Under the DOT Environmental Justice Order, such programs, policies, or activities may only be carried out if:

(1) a substantial need for the program, policy or activity exists, based on the overall public interest; and

(2) alternatives that would have less adverse effects on protected populations (and that still satisfy the need identified in subparagraph (1) above), either (i) would have other adverse social, economic, environmental or human health impacts that are more severe, or (ii) would involve increased costs of extraordinary magnitude.

The DOT Environmental Justice Order provides further guidance as follows:

²² While it is unclear whether the Board, as an independent entity established within DOT, is legally bound by the terms of the DOT Environmental Justice Order, in the Draft EIS, SEA stated that it is following the Order, as well as other draft guidance documents issued by other agencies addressing the implementation of the Executive Order. See Draft EIS, Vol. 3 at 3-47.

²³ "Programs, policies, and/or activities" as defined under the Order include "all projects, programs, policies, and activities that affect human health or the environment, and which are undertaken or approved by DOT." In addition, "disproportionately high and adverse effect on minority and low-income populations" is defined generally as an "adverse effect that . . . is predominately borne by a minority population and/or a low-income population."

DOT officials will ensure that [such actions] will only be carried out if further mitigation measures or alternatives that would avoid or reduce the disproportionately high and adverse effect are not practicable. In determining whether a mitigation measure or an alternative is "practicable," the social, economic (including costs) and environmental effects of avoiding or mitigating the adverse effects will be taken into account.

In the Draft EIS, the SEA generally identified its environmental threshold criteria for environmental justice analysis as follows. First, SEA examined population areas surrounding rail line segments potentially impacted by the proposed transaction.²⁴ SEA then determined whether greater than 50 percent of the population in these areas is minority or low income.²⁵ If the requisite threshold requirements were met, SEA examined whether a population zone on either side of a rail line segment (from 400 feet to 1,500 feet) was potentially impacted from an environmental perspective.

b. The SEA's Proposed Mitigation for Four Cities' Environmental Justice Impacts is Inadequate

The Applicants' proposed post-transaction operating plans present significant environmental justice concerns for the Four Cities, which have a substantial minority and low-income

²⁴ For nonattainment air quality areas, such as Lake County, Indiana, the SEA's threshold criteria was to examine rail line segments with anticipated increases in traffic levels of 3 trains/day.

²⁵ The SEA defined a minority person as "someone who is Black (Non-Hispanic), Hispanic, Asian American, American Indian or Alaskan Native. Draft EIS, Vol. 1, at 3-49. The SEA noted that while "poverty thresholds vary by size," it established a threshold of \$12,674 for a family of four, as set forth under the Department of Health and Human Services poverty guidelines.

population. 84 percent of the Gary population (97,626 of the total population of 116,646) is non-white/minority. 81 percent of the East Chicago population (28,264 of the total population of 34,740) is non-white/minority.

In the Draft EIS, SEA determined that the Warsaw to Tolleston (via Hobart) and the Tolleston to Clarke Junction line segments, both constituting part of the former PRR Fort Wayne line, present significant environmental justice impacts. Additionally, the SEA determined that the BOCT Willow Creek to Pine Junction line presents significant environmental justice impacts. See Draft EIS Vol. 5 at IN-74.

The SEA states in the Draft EIS that it has been conducting additional public outreach as well as additional studies to determine exactly how the environmental justice populations identified are impacted. In terms of mitigation, the Draft EIS states that for the State of Indiana, "SEA is currently developing additional mitigation strategies [beside public outreach] in coordination with the local communities in Indiana surrounding the sites and rail line segments and will report on these strategies in the Final EIS." Draft EIS Vol. 5 at IN-81. In the Draft EIS, SEA concludes that it is "determin[ing] the extent and nature of the potential environmental justice impacts. If an environmental justice impact exists, SEA will determine if mitigation would be practicable." Id.

The SEA's environmental justice analysis for the Four Cities is deficient in several regards. First, while the SEA

identified populations in the City of Gary to be affected by environmental justice impacts, it did not determine the population of the City of East Chicago, which is 81 percent minority, to be significantly impacted. In particular, the BOCT Pine Junction to Calumet Park line passes directly through East Chicago on the northern edge of the central business district. As described by East Chicago's Director of Planning and Business Development, Kimberly Gordon, in her Verified Statement in the Four Cities' October 21 Comments, the BOCT line has a number of heavily-used highway grade crossings that cause numerous safety and quality-of-life problems for East Chicago residents and workers. See October 21 Comments, Gordon V.S. at 4-6.

Despite Ms. Gordon's detailed account of the safety and environmental hazards caused by the Pine Junction to Calumet Park line segment (whose rail traffic will increase by six trains per day as a result of the Conrail transaction), and even though the community surrounding this line meets the Board's threshold standards, SEA apparently did not consider the area to be significant for environmental justice purposes. As noted above, SEA only considered the Willow Creek to Pine Junction line segment to have environmental justice impacts. However, a majority of the Pine Junction to Calumet Park line passes through the minority neighborhoods of Gary and East Chicago. For these reasons, the Board should include this line segment as significantly impacted for environmental justice mitigation purposes.

Reinstatement of the PRR Hobart to Clarke Junction line segment would also produce substantial environmental justice impacts on the heavily minority population of Gary. This line constitutes the northern border of the Roosevelt Manor low- to moderate-income housing project site. The SEA did not consider the fact that restoring this line segment to service would adversely impact the development of Roosevelt Manner and the future residents that will be purchasing new homes in the community. Cervay Environmental V.S. at 6-7. This area is populated by an 88 percent minority population. Id.²⁶

The Four Cities strongly believe that SEA must impose environmental justice mitigation in order to comply with environmental justice requirements. It is important to note that the two rail line segments that SEA has determined to be significantly impacted in terms of environmental justice, the former PRR line from Warsaw to Clarke Junction via Hobart and the CSX/BOCT line from Willow Creek to Pine Junction, are in part the very same line segments that the Four Cities have targeted as presenting significant safety, crossing delay, socioeconomic, and other environmental problems. Under the Four Cities' Alternative Routing Plan, the PRR line between Hobart and Clarke Junction would remain inactive post-transaction, and a significant portion of the rail traffic that would otherwise move over the CSX/BOCT

²⁶ This impact was also brought to SEA's attention by the Four Cities in their October 21 Comments. Cervay V.S. at 8-9, and Attachment No. 1.

line via Pine Junction would be shifted to other lines with a higher proportion of rail/highway grade separations.

As stated above, under applicable environmental justice requirements, if environmental justice populations are impacted, the SEA is required to impose an alternative if that alternative "would have less adverse effects on protected populations." The SEA failed to consider the Alternative Routing Plan as a potential means of mitigating environmental justice impacts. The Four Cities, both herein and in their October 21 Comments, have clearly demonstrated that the Alternative Routing Plan would have far less environmental impacts than the Applicants' proposal and would also produce substantial economic savings as compared to the Applicants' proposed operations plans. Accordingly, the law requires that the Alternative Routing Plan be implemented as an environmental justice mitigation measure.

8. Cumulative Impacts

The legal framework for the Board's consideration of the cumulative environmental impacts of the proposed transaction is set forth in the statutory review section at pages 12-17 above, and will not be repeated in detail here. In summary, NEPA's definition of cumulative impact is precisely what the phrase itself implies: impacts that individually may not be deemed significant, but when considered together on an incremental, cumulative basis, in context with past, present and other reasonably foreseeable actions, are significant. See the discussion at page 16, above. The CEQ guidance regulations provide

that "[c]umulative impacts can result from individually minor but collectively significant actions taking place over a period of time." 40 C.F.R. § 1508.7.

In the Draft EIS, the SEA states that it has reviewed the cumulative impact of the proposed transaction, not just on a systemwide basis, but also on a regional basis. See DEIS, Vol. 3 at 3-52. The SEA's methodology was to consider past, present, and planned projects and activities that could, when considered with potential impacts on the proposed Conrail acquisition, result in significant regional cumulative effects on air quality, safety, and transportation systems. Among other things, SEA stated that its Draft EIS would discuss the potential environmental impacts of construction or facility modification activities within railroad-owned right-of-way property . . . and additional environmental impacts related to the proposed transaction but not subject to Board approval." Id. at 3-53. However, the SEA did not examine any cumulative impacts involving either of the two line segments of principal concern to the Four Cities: the BOCT line between Pine Junction and Calumet Park, and the former PRR line between Hobart and Clarke Junction.

It should be readily apparent from both the Four Cities' October 21 Comments and these comments on the Draft EIS that the Applicants' post-transaction operating plans will have a very substantial cumulative impact on the Four Cities region, particularly in the area of rail/highway grade crossing safety and delays. A distinctive example of the serious cumulative

impact of the grade crossing problems facing the Four Cities' 208,000 residents is the "around-the-gates" phenomenon identified by Dr. Andrew (and the planning officials from each of the Four Cities). See, e.g., Andrew V.S. in the Four Cities' October 21 Comments at 16. In a September 1997 study of rail/highway grade crossings in the Four Cities, the study personnel witnessed an average of 484 vehicles per day ignoring railroad/highway safety devices at the twelve crossings studied. Id. Drivers throughout the Four Cities are at great risk of death or bodily injury to themselves and their passengers as a result of these actions. The September 1997 fatal Amtrak collision with a truck at a grade crossing in Gary, described in Mr. Cervay's accompanying testimony, demonstrates in graphic detail the seriousness of the problem. Cervay Environmental V.S. at 17-19. The flashing lights and warning gates at this crossing were operating properly when the collision occurred. Id.

The close proximity of numerous at-grade highway/rail grade crossings in the Four Cities is particularly problematic on the BOCT Pine Junction to Calumet Park line, which traverses western Gary as well as both the East Chicago and Hammond business districts. The 6.0-mile segment of this line in Indiana has 20 rail/highway grade crossings, nine of which are arterial roads as indicated by their ADT's which exceed 5,000 vehicles. These grade crossings are often used interchangeably by motorists when train crossing blockage occurs. Cervay Environmental V.S. at 19-20. For example, when motorists on one (or more) of the nine

main north-south arterial routes face blocked grade crossings on this line, they will often speed ahead to the next crossing in an attempt to "beat the train" across the intersection. The dangerous situation that this phenomenon has created cannot be overstated. Since trains on this line almost always block more than one grade crossing at a time, such crossing attempts by motorists are often futile. This creates even more motorist frustration.

While no single grade crossing of the BOCT line may warrant mitigation under the thresholds used by the SEA, collectively they present an enormous problem in terms of vehicle delay and safety. As indicated earlier in these Comments, the SEA deemed just such a form of cumulative impact in Cuyahoga County, Ohio, to warrant consideration of mitigation. There is simply no rational basis for failing to consider the cumulative impacts of delays at the numerous closely-spaced grade crossings on the BOCT line.

The Hobart to Clarke Junction line segment involves a change from zero trains per day at present to five trains per day post-acquisition, and the reopening of 23 inactive rail/highway grade crossings. This will result from CSX's proposal (at a cost of \$13 million) to rehabilitate this line segment and restore it to service. The Draft EIS indicates that SEA did evaluate "several different railroad related projects that do not normally require the approval of the Board such as proposed modifications of existing railroad properties, [and that it] included analysis of three of these projects in the Draft EIS because it concluded

that these projects could have potentially significant environmental effects off of existing right-of-way." Draft EIS, Vol. 1 at 3-56. Because SEA elected not to mention the specific projects analyzed in the Draft EIS, it is uncertain whether SEA evaluated CSX's proposed reinstatement of service on the Hobart to Clarke Junction line segment.

The Four Cities have outlined in great detail the significant cumulative environmental, safety, and socioeconomic impact that would result from the reinstatement into service of the PRR Hobart to Clarke Junction line. The reinstatement of this line would interfere with the Roosevelt Manor Affordable Housing Initiative, the expansion and upgrading of the Gary/Chicago Airport, and the ongoing development of the Lake Michigan lakefront area.

In discussing the cumulative effects of the Conrail transaction on the State of Indiana, the Draft EIS discusses cumulative impacts in only four short paragraphs. See Draft EIS, Vol. 5 at IN-81 to IN-82. The Draft EIS states that SEA is "unaware of any activities that would require a cumulative effects analysis" in the State, and that "[d]ue to a lack of cumulative effects, no mitigation measures are necessary." The Four Cities strongly urge the Board to evaluate in a meaningful fashion the significant cumulative environmental, safety, and socioeconomic impacts on the residents and communities of northwest Indiana region that would be created by the Applicants' proposed incremental increases in railroad traffic using the BOCT

line between Pine Junction and Calumet Park and the reinstatement of service on the portion of the PRR line between Hobart and Clarke Junction.

CONCLUSION

For all of the reasons set forth above and in the accompanying verified statements, the SEA should re-evaluate the adverse environmental impacts that the Applicant's post-acquisition operating plans would have on the Four Cities. As related earlier, the Four Cities' discussions with CSX and NS are continuing and the Four Cities will supplement these Comments as appropriate when the discussions are concluded. If the parties are unable to achieve an accommodation, the SEA should recommend in the Final EIS that the Four Cities' proposed Alternative Routing Plan be imposed as an appropriate environmental mitigating condition to approval of the Application that would ameliorate the adverse impacts in a manner that is consistent with the

overall objectives of CSX and NS in their proposal to acquire
Conrail.

Respectfully submitted,

THE CITIES OF EAST CHICAGO,
INDIANA; HAMMOND, INDIANA;
GARY, INDIANA; AND WHITING,

 Section of Environmental Analysis
 Surface Transportation Board
 ATTN: STB Finance Docket No. 33388
 1925 K Street, N.W.
 Washington, D.C. 20423-0001

Re: Finance Docket No. 33388
 CSX Corporation and CSX Transportation Inc.,
 Norfolk Southern Corporation and Norfolk
 Southern Railway Company -- Control and Operating
 Leases/Agreements -- Conrail Inc.
and Consolidated Rail Corporation

Dear Ms. Kaiser:

Enclosed please find three (3) copies of the Comments and Requests for Conditions of the Cities of East Chicago, Indiana; Hammond, Indiana; Gary, Indiana; and Whiting, Indiana (collectively, The Four City Consortium)(FCC-9) filed today with the Board as part of the above-referenced proceeding. Also enclosed, please find a computer diskette containing the text of this document in WordPerfect 5.1 format.

These copies of the Four Cities' Comments are being sent to the SEA because of the extensive negative environmental impacts that the Applicants' proposed division of Conrail would have on the Four Cities area, located in northwestern Indiana. The Four Cities' Comments address these environmental impacts in detail, which primarily are the result of Applicants' plans to move their traffic over line segments containing numerous at-grade highway/rail crossings. The Four Cities' Comments also describe an Alternative Routing Plan that was developed to mitigate the negative environmental and related impacts that would be caused under the Applicants' plan, while requiring only minimal adjustments to the Applicants' proposed operations plan. The Four Cities are requesting that the Board condition any approval of the Application on the imposition of this important alternative plan.

Elaine K. Kaiser
October 21, 1997
Page 2

Through an October 1, 1997 letter, you invited the public to submit comments on the potential environmental impacts that might result from the above-referenced transaction, and which might assist the SEA in their preparation of a draft and final Environmental Impact Statement ("EIS"). The Four Cities intends to fully participate in the environmental portion of this proceeding. We hope that the enclosed comments will assist you in better understanding the enormous environmental implications of the transaction on the Four Cities and northwest Indiana and that you will closely review these impacts as you develop the EIS.

Sincerely,

C. Michael Loftus
An Attorney for the Cities of
East Chicago, Indiana; Hammond,
Indiana; Gary, Indiana; and
Whiting, Indiana (collectively,
The Four City Consortium)

Enclosures

knowledgeable of the many planning and development challenges facing the communities in northwestern Indiana.

The Four Cities' October 21 Comments in this proceeding apprised the Board of the serious environmental, safety, and planning-related problems that are associated with CSX Transportation, Inc.'s ("CSX") and Norfolk Southern Railway Company's ("NS") (collectively referred to as the "Applicants") proposed post-transaction railroad operations and movements through the Four Cities and, in particular, through Gary.¹ These problems would result primarily from the Applicants' plans to increase the post-transaction railroad traffic moving over at-grade highway/rail crossings in the Four Cities and over line segments traversing heavily populated residential areas. The Applicants' proposed operations would also significantly interfere with regional land use and development plans. The Four Cities' October 21, 1997 Comments and my prior Verified Statement also urged the Board to adopt the Alternative Routing Plan as proposed by the Four Cities as a means of mitigating the adverse consequences of the proposed transaction.

One area of particular concern to the Four Cities in this proceeding is CSX's planned purchase and reinstatement of the out-of-service portion of the former Pennsylvania Railroad Fort Wayne-Chicago line (the "PRR line") between Hobart, Indiana

¹ The Four Cities' October 21, 1997 Comments included testimony from each of the four elected mayors and four city planners (including myself), from other federal and state elected officials, and from expert economic and engineering consultant witnesses.

and Clarke Junction, Indiana.² As mentioned in my previous Verified Statement, CSX projects that five trains per day will move over the currently unused Hobart to Clarke Junction line segment. See FCC-9, V.S. Cervay at 10. A major portion of this line segment, running from approximately Interstate 65 to Clarke Junction, spanning a distance of approximately 6 miles, will directly impact thousands of Gary residents and a number of City land use and development projects.

The purpose of this statement is, first, to inform the Board's Section of Environmental Analysis ("SEA"), which I understand is charged with preparing the Environmental Impact Statement ("EIS") in this proceeding, of the serious harm that would be caused to several important local and regional housing, infrastructure, and community development programs and plans if the former PRR line between Hobart and Clarke Junction is reinstated to service. CSX's plans for this line segment could put in jeopardy present plans by the City of Gary to assist in the construction of dozens of units of affordable (low-income) housing, plans for expanding the Gary/Chicago Airport, and regional waterfront development plans along Lake Michigan. Second, this statement will address two areas that I believe were not adequately addressed by the Board in its Draft EIS, and which

² This out-of-service line has 23 at-grade rail/highway crossings. CSX proposes to rehabilitate the PRR line in order to provide an alternative route for five daily bulk trains that would otherwise operate via CSX's main line through Willow Creek. According to the Applicants, restoring this line to service will cost \$13 million.

are of considerable concern to the Four Cities: at-grade highway/
railroad crossing safety problems and air pollution problems.³

I.

REINSTATEMENT OF THE FORMER PRR LINE WOULD SERIOUSLY IMPAIR
IMPORTANT HOUSING, AIRPORT, AND WATERFRONT DEVELOPMENT PLANS

I have had the opportunity to review the Application, the Applicants' Rebuttal (submitted to the Board on December 15, 1997), and the Board's Draft EIS filed on December 12, 1997 as they pertain to the Four Cities. Unfortunately, in both their Application and their Rebuttal the Applicants have failed to acknowledge any safety, environmental, or land use problems associated with the reinstatement of the PRR line between Hobart and Clarke Junction. CSX's planned reinstatement of the former PRR line through Gary appears to ignore serious environmental, safety, and other land use impacts in favor of uncertain efficiency gains. Additionally, the SEA in its Draft EIS did not consider any impacts associated with the reinstatement of this

³ Elsewhere in these Comments on the Draft EIS, and in particular in the Verified Statement of Philip H. Burris, the Consortium sets forth in detail the safety, congestion, air pollution, noise, environmental justice and other environmental problems associated with the reinstatement of the PRR line. While I concur with these concerns, in the interest of brevity I will not rehash this analysis. Nevertheless it is, of course, critical that the Board consider all environmental and safety impacts associated with the reinstatement of the PRR line, in addition to the land use, safety, and air pollution impacts mentioned in this Verified Statement, when it considers mitigation for the Four Cities in the Final EIS.

line.⁴ Despite the Applicants' (and the SEA's) failure to take into consideration the numerous problems that would be caused by the reinstatement of the former PRR line, the resulting impacts are of utmost concern to northwestern Indiana's elected representatives, regional planning officials, and residents and businesses for the reasons set forth below.

A. Reinstatement of the PRR Line Would Interfere with the Roosevelt Manor Affordable Housing Initiative

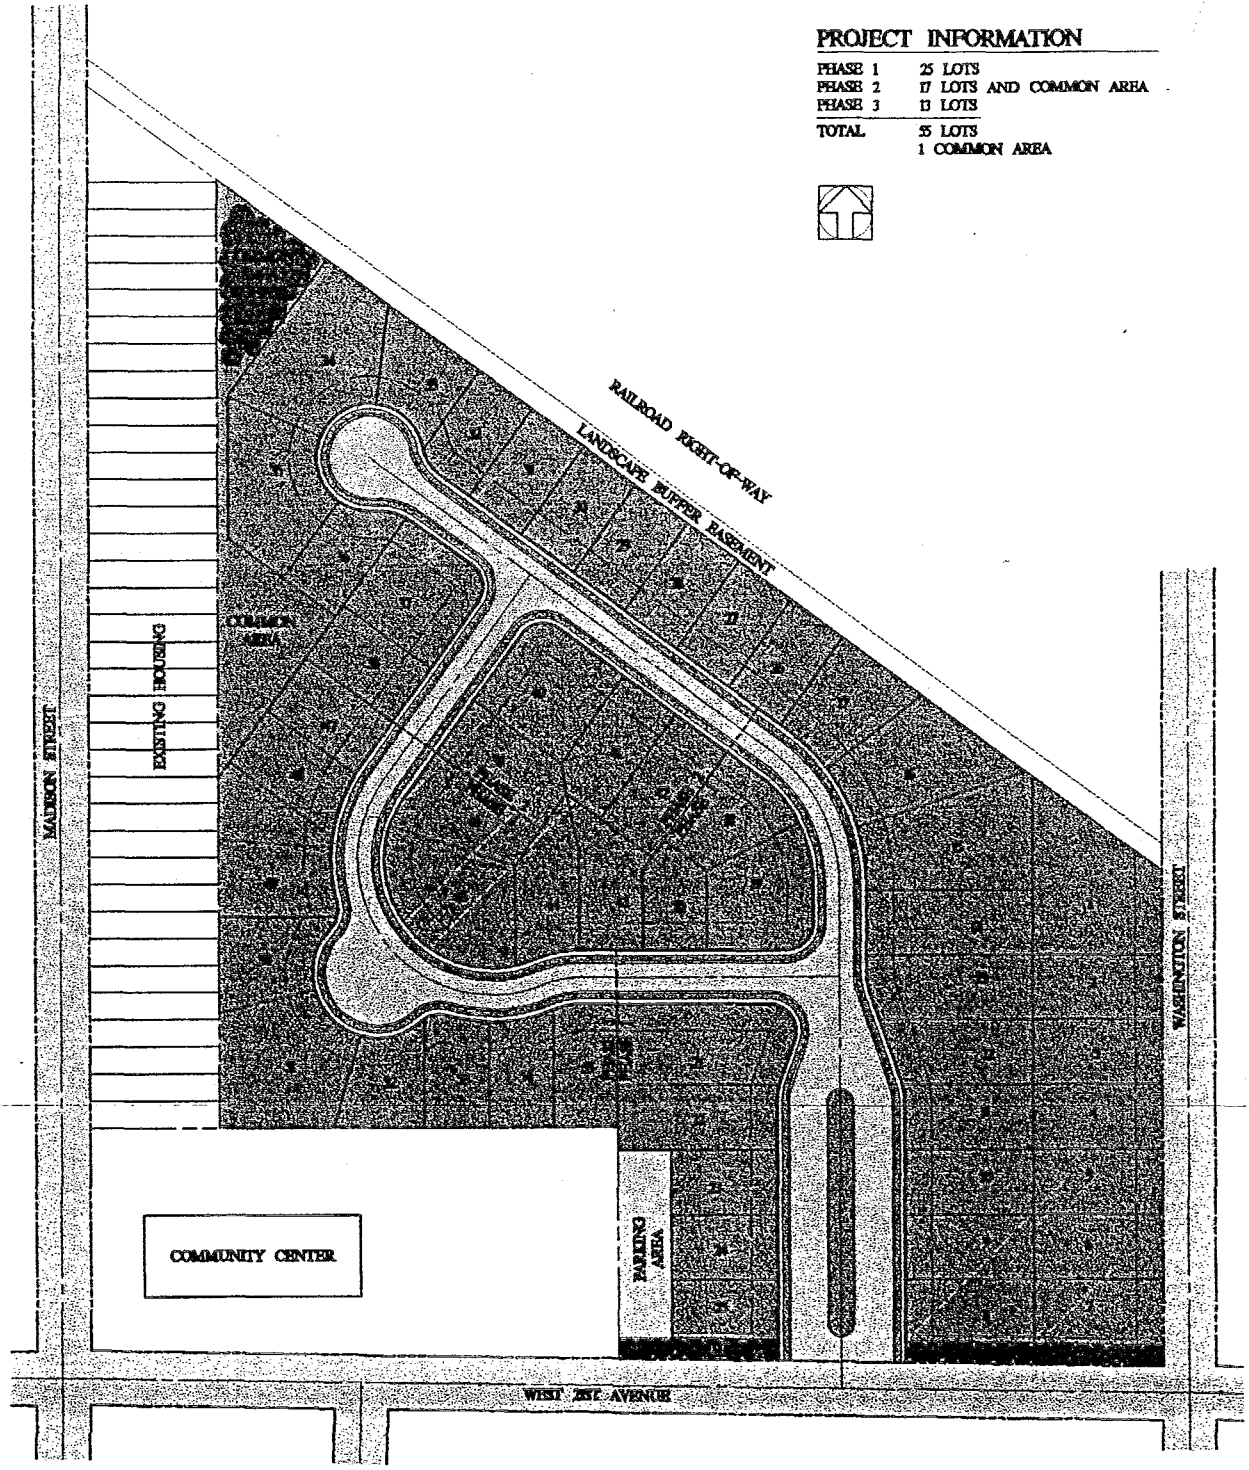

In my previous Verified Statement submitted to the Board in this proceeding, I attached a copy of a letter from the Broadway Area Community Development Corporation ("BACDC") discussing the Roosevelt Manor housing project. As referenced therein, since 1996 the BACDC has been engaged in consultations with Gary, federal and state officials with respect to the redevelopment of a 10-acre vacant property site, involving the construction of approximately 40 to 50 low- to moderate-income single family homes.⁵ This property is located in the Midtown neighborhood of Gary and is displayed on the map on the following page.

⁴ Four Cities officials and representatives of the Applicants have met during the past month to discuss the Applicants' planned operations in northwestern Indiana and the Consortium's concerns. During those meetings, the negative impacts that would result from reinstatement of the PRR line were discussed. Discussions between the Four Cities and the Applicants are ongoing, but to date no resolution has been achieved.

⁵ The homes will have an average construction cost of \$90,000 per unit, and will be situated on 50' X 125' lot parcels.

ROOSEVELT MANOR

 **BLACKBURN ARCHITECTS, INC.**
 ARCHITECTURE - LANDSCAPE ARCHITECTURE - ENGINEERING - INTERIOR DESIGN

DATE: AUGUST 12, 1997
 NOT TO SCALE
 PROJECT NUMBER: A8975

Substantial progress has been made on the actual development of the Roosevelt Manor housing project. An architect has been retained to design a site plan and infrastructure improvements, and phases I and II environmental testing is complete. Additionally, in consultation with the City of Gary, project planners have secured funding assistance through a federal Department of Housing and Urban Development ("HUD") program that will provide a total of \$250,000 in grants to prospective future low- and moderate-income home buyers in the form of down payment assistance.

The PRR Hobart to Clarke Junction line constitutes the northern boundary of the Roosevelt Manor site, which is located south of the Tolleston railroad crossing. The portion of the PRR line between Hobart and Tolleston has been out of service for approximately ten years. The track is significantly deteriorated, with shrubs and small trees growing between the tracks, etc., and most at-grade rail/highway crossings have been paved over. To our knowledge, Conrail (the successor to the PRR) had no plans to reinstate service over this line. Because of Conrail's long-standing lack of interest in reinstating the former PRR line north of Hobart to service, and because of the line's poor condition, City and BACDC planners assumed the line would continue to be inactive, and our plans were made with the understanding that development of the Roosevelt Manor housing project would not be impacted by future railroad operations.

The reinstatement of railroad operations by CSX over the PRR line would adversely impact the development of Roosevelt Manor and would harm the lives of families that will be purchasing new homes in the community. As noted above, the PRR line forms the northern boundary of the proposed housing development. Reinstatement of this line to service would pose substantial health and safety risks for families and children who will live and play in the community. Even if CSX proposed to place buffers or barrier mechanisms along this line (which it has not), the future residents would be exposed to safety and environmental harms associated with daily railroad operations. The proposed railroad operations would increase noise and air pollution due to both the five daily trains that would operate over the line and the reopening of 21 at-grade rail/highway crossings between Hobart and Tolleston which presently are closed.

In addition to the above problems, significant environmental justice concerns are raised by CSX's proposed operations over this line segment, which would disproportionately impact minority and low income populations. The City of Gary is comprised of an 84 percent non-white, minority population. According to 1990 United States Census data, the census tract in which Roosevelt Manor is to be constructed is comprised of an 88 percent non-white, minority population. Additionally, 43 percent of persons residing within this census tract have incomes below the poverty level. As mentioned above, the Roosevelt Manor

housing project is designed primarily for low or moderate income families. Of the initial 38 housing units to be constructed, 23 (or 61 percent) are slated for families with household incomes below \$37,120 -- which is well-below the Lake County median household income of \$46,400 for a family of four. There is a household income limitation of \$53,360 for the other initial 15 Roosevelt Manor homes slated for construction.

In summary, the proposed reinstatement of the PRR line between Hobart and Clarke Junction will have significant adverse effects on desperately needed housing development plans for low/moderate income Gary citizens that have not been addressed by SEA in its draft EIS.

B. Reinstatement of the PRR Line Would Interfere with Gary/Chicago Airport Expansion Plans

The portion of the Hobart-Clarke Junction line north of Tolleston forms most of the eastern boundary of the Gary/Chicago Regional Airport.⁶ Reinstatement of this line segment to service would also impact plans by the Gary/Chicago Airport to construct a new east-west runway and related buffer zones which is necessary to obtain the Federal Aviation Administration ("FAA") certification necessary for expansion of the airport. The planned expansion of the Gary/Chicago Airport offers the City

⁶ The airport was formerly known as the Gary Airport. In the fall of 1997, the Gary Airport Authority renamed the airport as the Gary/Chicago Airport in recognition of its new role as a regional airport through a 1995 Compact made with the City of Chicago to form a bi-state airport authority.

and the region a vitally important opportunity for economic development.

Together with federal, state, and private entities, the City has been actively planning a multimillion dollar Airport expansion project. In February, 1994 the first phase of the master plan for expansion was completed, and the second planning phase is currently underway.

The Gary/Chicago Airport is currently certified by the FAA as a Reliever/General Aviation Airport. The expansion plans for the airport will allow it to accommodate larger aircraft and more traffic, which is needed to reduce serious air traffic congestion problems being experienced at the Chicago O'Hare and Midway Airports. Increased air cargo and potential commercial air passenger service are envisioned.

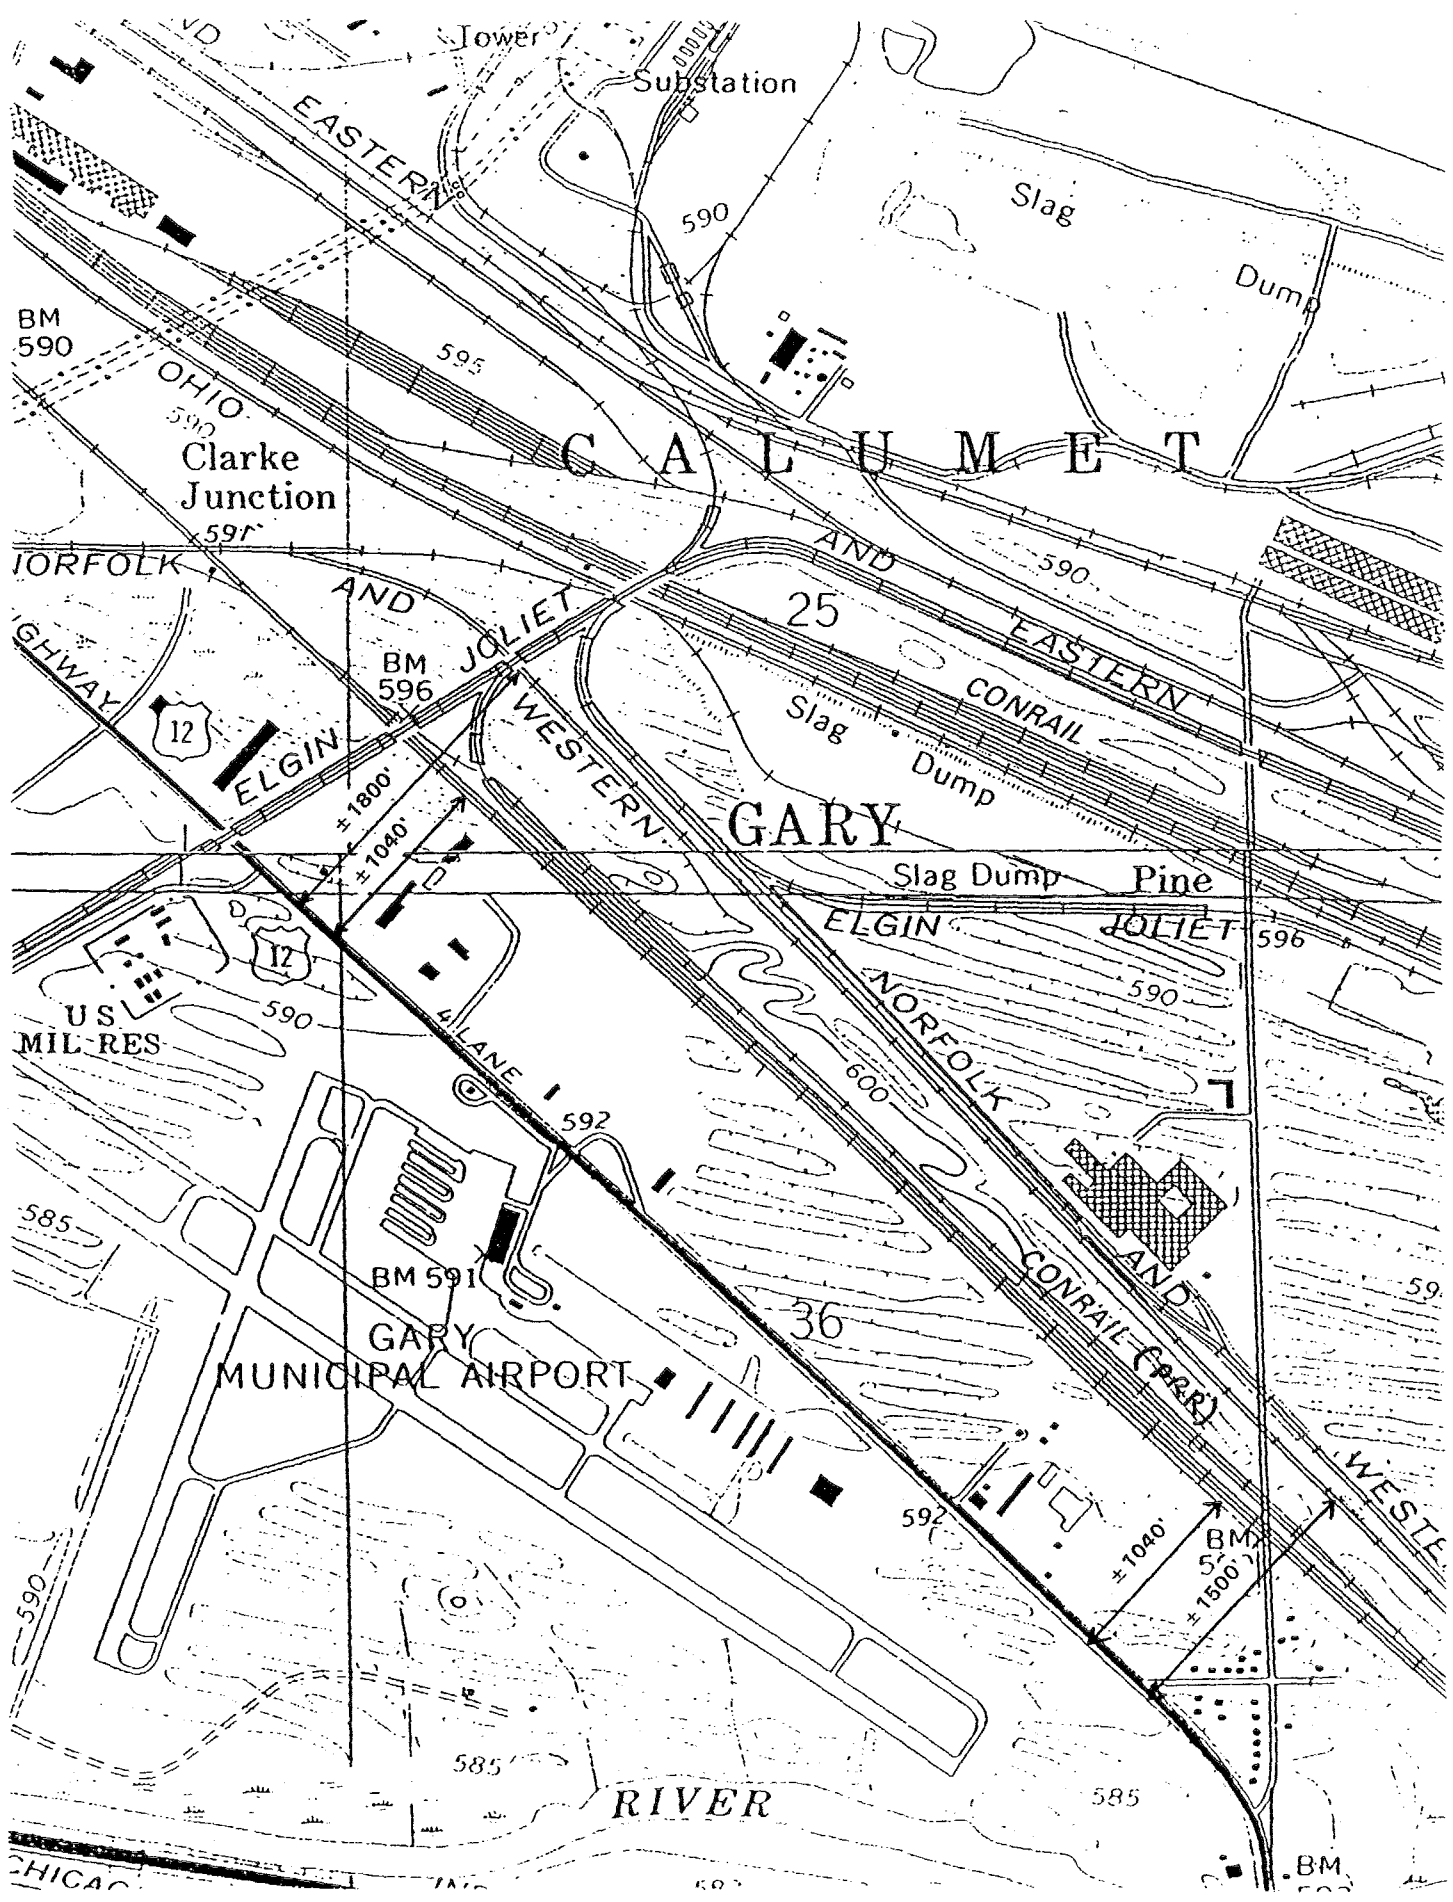

In order to expand operations at the Gary/Chicago Airport, its FAA certification must be upgraded from its present level of Reliever/General Aviation to Utility/Transport. Certification as a Utility/Transport Airport, however, will require at a minimum the lengthening of runway safety areas. Applicable FAA regulations will require 1,000 feet long by 500 feet wide runway safety areas at the ends of both the existing north-south runway and a proposed new (second) east-west runway. Additionally, under applicable federal regulations, every vertical foot of rise beyond the end of each runway buffer zone requires that an additional 50 feet of horizontal ground be clear of any obstruction within the runway safety buffer area.

The location of the Gary/Chicago Airport is shown on the map on the following page. The PRR line between Hobart and Clarke Junction lies in close proximity east of the Gary/Chicago Airport. If this line is reactivated, it will directly interfere with the City's airport expansion plans because it results in a 23-foot hard obstruction above the elevation of the track (which represents the height of trains operating over the line). As a result, 1,150 feet of additional clear land with no vertical obstruction at the east end of the Airport's existing or new runways (above and beyond the 1,000 foot minimum runway safety area) will be necessary for the Gary/Chicago Airport to obtain FAA certification as a Utility/Transport Airport.⁷

Absent the Conrail control transaction and CSX's plan to acquire the PRR line from NS and restore it to service, the City had planned to negotiate with NS to remove the track and vacate the portion of the line that is directly adjacent to the airport.⁸ This action would allow the airport expansion plans to proceed as planned. CSX's plan to restore the line to service, however, obviously would prevent the removal of this

⁷ The proposed reinstatement of the PRR line may also cause additional clearance problems because of the line's potential connections with (and crossings of) other railroad lines on the north, including an elevated line of the Elgin, Joliet & Eastern Railroad. These problems would likely require the acquisition of additional land for airport operations under the FAA's safety requirements.

⁸ As stated in the Four Cities' October 21, 1997 Comments, the PRR line segment between Tolleston and Clarke Junction is in inoperable condition, and some sections of track have already been removed. See FCC-9, Argument at 19-20 n.10.

obstruction. This would effectively block the planned expansion of the Gary/Chicago Airport.

CSX's proposal to upgrade the PRR line and to recommence its operation would be an extremely wasteful exercise. In essence, if the Application is approved in its current form, CSX will be expending considerable sums of money to reinstate a line to handle very light traffic -- five trains per day -- on land that will be needed in the near future to make room for the expansion of the Gary/Chicago Airport. The acute problems that the reactivation of the former PRR line would present to airport expansion plans are detailed in the attached letter from the firm of R.W. Armstrong, the City's airport engineering consultants, to Gary/Chicago Airport Authority officials. See Exhibit MLC-1. R.W. Armstrong prepared the master plan for the present site of the Airport in 1994. The letter was sent in response to a request made by Airport Authority officials that the firm review and report on the impact of the proposed reactivation of the PRR line on airport expansion plans.

For all the above economic, planning, and environmental perspective, the reinstatement of the PRR simply does not make sense.

C. Reinstatement of the PRR Line Would Impede Plans for the Redevelopment of the Gary Lakefront

CSX's proposed reinstatement of the PRR Hobart to Clarke Junction line segment would also adversely impact public investments already made and the pending plans for the

redevelopment of the Lake Michigan lakefront area. A central component of the Four Cities' plans for future economic development is its lakefront area. In particular, the Gary lakefront planning area spans approximately 25 square miles, bounded on the north by Lake Michigan, on the south by U.S. Route 12/20, on the east by County Line Road in the Miller Beach neighborhood, and on the west by the Gary/East Chicago boundary at Cline Avenue (State Route 912).

Regional lakefront development initiatives are significant undertakings, as much of the Lake Michigan shore area in Lake County, Indiana has been utilized primarily for industrial purposes for nearly a century. Gary's lakefront redevelopment efforts originated a few years ago with the redevelopment of Buffington Harbor. The Buffington Harbor casino project was first initiated in 1995 as a result of the issuance by the State of Indiana of two out of a total of five gaming licenses on Lake Michigan in an effort to assist economically distressed areas of the state. The project has been extremely successful, supplying thousands of jobs for area residents, and providing approximately \$25 million in tax revenues annually for the City.

The City has put together a draft waterfront master plan that, in its first phase, targets resources on the continued development of Buffington Harbor, including the construction of a performance arena seating approximately 5,000 people, a 301-room hotel (that is currently under construction), a 2,000- to 2,500-

car parking structure, and other retail and restaurant facilities. This first phase also includes railroad relocation and consolidation efforts. The second phase of the lakeshore redevelopment program includes major plans to restore and preserve the natural waterfront areas and improved vehicular and pedestrian access to the lakeshore. Included in this plan is the restructuring of the area into arranged neighborhoods that will include businesses (including retail, commercial, and conference/convention facilities), marina and harbor facilities, residential housing, museums, and parks and other open spaces for recreation and waterfront access.

Presently, vehicular and pedestrian access to the lakeshore is severely limited due in part to the many railroad tracks that parallel the entire lakeshore area. The proposed reinstatement by CSX of the PRR line from Hobart to Clark Junction is particularly problematic because it will intersect with CSX's and Conrail's lakeshore main lines⁹ directly south of Buffington Harbor. The result would be the disruption of lakefront planning opportunities, increased vehicular and pedestrian congestion, and exacerbated environmental and safety problems.

As part of Gary's waterfront development plan, a consolidation and/or relocation of the lakefront yards of the Elgin, Joliet & Eastern Railroad ("EJE") and the Indiana Harbor

⁹ I understand that the Conrail lakeshore line is to be acquired and operated by NS.

Belt Railroad ("IHB"), as well as the Conrail and CSX lakefront rail corridor will be necessary to optimize waterfront development and to promote pedestrian and vehicular access to the lakefront.¹⁰ Negotiations and engineering designs are underway among EJE and IHB, major local shippers (including Inland Steel, USX, and NIPSCO Industries), and the Cities of Gary and East Chicago. These efforts are expected to make more than 600 acres of contiguous lakefront property available for economic development.

In particular, a major thoroughfare system is planned to upgrade roads and improve access to the waterfront. Currently, as a result of the railroad and industrial land uses, vehicular access to the lakeshore is extremely limited. One of the major access points to the waterfront is planned from Cline Avenue. Under CSX's plan, the reactivated PRR line will connect with the lakefront lines at this same location. Another access point is planned for Clark Road, which intersects and crosses the former PRR line north of U.S. 12. The reactivation of the former PRR will greatly complicate these and other planned roadway access and movement plans.

The reactivation of the former PRR line by CSX will also impact the City's plans for the construction of pedestrian

¹⁰ I understand that a similar railroad relocation project has been undertaken by the City of Cincinnati, Ohio, where the City is developing a Central Riverfront project. Under an agreement between Cincinnati and NS, NS has agreed to vacate its track along the Ohio River to permit riverfront development. These plans are detailed in the Comments of City of Cincinnati, submitted to the Board in this proceeding on October 21, 1997.

walk and traffic ways in and around the waterfront. Extensive recreational and access trails for pedestrians are planned to connect the lakefront attractions to one another and to provide direct access from the existing southern neighborhoods. The additional railway traffic caused by the reactivation of the former PRR line will greatly complicate and, at a minimum, significantly increase the costs of the City's overall efforts to create a network of coordinated pedestrian/vehicular passageways to access the waterfront area and its plans to maximize the interconnection of neighborhoods, businesses, and various attractions.

Finally, it is important to stress that the continued redevelopment of the Gary waterfront and the enhancement and expansion of the Gary/Chicago Airport cannot be viewed in isolation from each other. In many ways, the two projects are mutually dependant upon one another. The existing Buffington Harbor development has attracted 10 to 12 million visitors annually, who travel to the area exclusively by highway vehicle. In terms of tourism development, it is expected that the enhancement and expansion of Buffington Harbor, and the other waterfront developments as set forth above, will attract many more thousands of weekly visitors. Meanwhile, the airport's expansion and, more specifically, its provision of passenger air transportation service, will promote access to the region for many visitors who might otherwise be unable to visit due to vehicular travel time concerns or for other reasons. The

upgraded Airport therefore will bring a whole new influx of visitors, convention business, etc. to the area which will greatly bolster the City's revitalization efforts and benefit lakefront businesses.

Ultimately, the hard work and planning being undertaken by Gary and officials of the other members of the Four City Consortium to preserve and revive the lakefront will hinge on the continued dialogue and coordination of a number of public and private participants who have joined together to develop a viable economic initiative. Further infrastructure investments, expansion and enhancement of the airport, reconfiguration of transportation corridors, rail line consolidation/relocation, and environmental cleanup are all necessary components to making the lakefront development a viable and thriving economic and community enterprise. The City of Gary is committed to making this important plan work and we are extremely concerned about CSX's plans to revive a long unused rail line segment (arrived at without any consultation with the Four Cities) which would significantly harm these important community revitalization plans.

II.

APPLICANTS' POST-TRANSACTION PLANS PRESENT SERIOUS INCREMENTAL SAFETY AND ENVIRONMENTAL IMPACTS

A. The Board and the Applicants Do Not Adequately Address Significant At-Grade Crossing Safety Problems

As stressed elsewhere in this statement and throughout the Four Cities' comments submitted in this proceeding (both in

our October 21, 1997 filing and in this filing), one of the Four Cities' major concerns with the Conrail transaction as proposed is its effect on at-grade railroad/highway crossings. In his verified statement, Mr. Burris outlines in great detail the environmental problems that the Application presents for the Four Cities. These include significant public health, safety, and economic problems which are in large part attributable to planned incremental increases in rail traffic over selected Four Cities line segments that contain a large number of at-grade rail/highway crossings. In considering these important impacts, it is critically important that the Board and SEA understand exactly why the Four Cities are so adamant about the need for mitigating the negative safety and environmental impacts that the Applicants' plan will have on the well-being of our citizens and communities.

Attached to this statement are press reports from last fall on the September 15, 1997 crash of Amtrak Train 371, the Pere Marquette, which struck an 18-wheel gravel truck at the Clark Road at-grade crossing in Gary (at Conrail Milepost 499.29), killing the driver and injuring 11 passengers and one Amtrak employee. See Exhibit MLC-2. This train was traveling from Grand Rapids, Michigan to Chicago, Illinois on the Conrail lakefront line (which is to be acquired by NS). This unfortunate incident demonstrates the dangerous conditions that are facing area citizens, railroad passengers, and railroad employees as a

result of trains operating over the numerous at-grade crossing corridors in the Four Cities.

Unfortunately, this accident is only one of several similar recent incidents occurring in the area. As reflected in a letter submitted to the Federal Railroad Administrator by Amtrak Chairman Thomas M. Downs, the accident is one of nine similar incidents that have occurred in the area involving Amtrak passenger trains since November 1995. See Exhibit MLC-3. These accidents have caused three deaths and several injuries. Mr. Downs' letter to the Federal Railroad Administrator explains that, because the railroad rights-of-way along the lakefront are not consolidated, and because highway traffic must cross several sets of tracks, "this area is dangerous, even when all railroad operating rules are followed and safety devices and crossing protection are functioning as intended." In response to Mr. Down's request, the FRA is coordinating efforts with other federal and state agencies, the City of Gary, and the railroads, to more closely study the many problem crossings located between Hammond and Gary.

Merely one-half mile to the south of where the September 15 Amtrak crash occurred, directly east of the Gary/Chicago Airport, Clark Road also crosses the PRR line between Clarke Junction and Tolleston at-grade. This is the same line segment, presently out of service, which CSX proposes to reactivate as part of its post-acquisition operating plan. If CSX's plans for the former PRR line are approved, 7,500 new daily

vehicle crossings will occur at the reactivated line's grade crossing of Clark Road -- a location where there are currently no active vehicular crossings. As I have indicated in this statement, Clark Road is anticipated to be a primary access point for vehicular traffic to and from the waterfront. Therefore, traffic levels are expected to increase significantly as the waterfront development activity grows.

Apparently, SEA's Draft EIS did not consider post-transaction operations over the Clark Road/PRR line crossing to be significant enough to warrant serious mitigation action. My understanding is that the SEA has recommended merely that gates be installed at this crossing. This is not sufficient mitigation. The Clark Road crossing where the September 15 train crash occurred has both flashing lights and gates. The driver of the truck involved in the September 15, 1997 Amtrak crash apparently ignored activated flashing lights and lowered gates. Unfortunately, such illegal crossings are not uncommon in the Four Cities. Despite the City's efforts to prevent illegal vehicular crossings, frustrated citizens who encounter numerous at-grade train crossings on a daily basis frequently ignore warning devices. Put simply, the Board must do much more than ordering the installation of two gates to mitigate the significant human safety problems inherent in the Applicants' post-transaction operating plans for the Four Cities region.

Amtrak President Downs's letter to the FRA points out a problem that is endemic to the Four Cities area, and that the

Draft EIS also fails to take into account. This is the large number of grade crossings in our region, which produces severe cumulative problems in terms of crossing delays. Several of the rail lines in the Four Cities region have numerous grade crossings located within close proximity to each other, and that are used interchangeably by motorists when train crossing blockage occurs. This is particularly problematic with respect to the east-west CSX line between Pine Junction and the Indiana/Illinois state line at State Line Tower. This line has 20 highway grade crossings, most of which are located in the central business districts of East Chicago and Hammond. While not all of these crossings meet the SEA's threshold for study in terms of possible mitigation (a daily average of 5,000 vehicles using the crossing), they all constitute alternatives for crossing this busy CSX line when one (or more) of the more heavily utilized crossings is blocked -- particularly when a train is stopped which occurs several times each day. These crossings cannot be considered in isolation from each other, and cumulatively they carry an enormous daily vehicular traffic volume.

III.

THE FOUR CITIES' AIR QUALITY CONCERNS

A. Four Cities' Air Quality Problems

Northwest Indiana has long suffered the effects of severe pollution caused during the past century largely as a

result of the industrial activities that have been the economic lifeblood of the region. Lake County, in which the Four Cities are located, continues to face severe environmental problems. These problems include air pollution, contaminated water and sediments, and numerous hazardous waste sites.

Lake County does not meet federal standards for air quality, and is categorized as a severe "nonattainment" area under the federal Clean Air Act for Ozone ("O3"), which is affected by emissions of volatile organic compounds ("VOCs") and oxides of nitrogen ("NOx"), and other air quality pollutants. Parts of Lake County are also nonattainment for Sulfur Dioxide (SO2), Carbon Monoxide ("CO"), and Particulate Matter ("PM").

According to Environmental Protection Agency ("EPA") statistics, Lake County has the poorest overall air quality of any area within Indiana. While efforts to clean up the area's air quality have not been easy, in the past several years, EPA, in conjunction with the Indiana Department of Environmental Management ("IDEM"), and county and local governments have spent a considerable amount of energy and resources in coordinating strategies to improve regional pollution related problems. Results are beginning to be achieved through various means, including stricter enforcement, rulemaking developments, and public awareness efforts. Achieving and maintaining healthy air-quality standards is extremely important to supporting a healthy community and citizenry.

In 1992, together with the assistance of IDEM, EPA organized the Northwest Indiana Environmental Initiative. The Initiative is designed to address the severe environmental problems facing the northwest Indiana region (covering Lake, Porter, and LaPorte Counties) and is managed by EPA. It is the first geographic program of its kind organized by EPA's Region 5.¹¹ Among other things, the Initiative has developed the Northwest Indiana Environmental Initiative Action Plan. First adopted in 1992, the Action Plan sets forth short and long term strategies for improving northwest Indiana environmental problems. The Northwest Indiana Environmental Action Plan is attached as Exhibit MLC-4.¹² The Initiative has been an important catalyst for promoting citizen involvement and implementing regional environmental remediation initiatives.

B. Emission Control and Mobile Source Standards

A major element of the Clean Air Act of 1990 was the inclusion of more stringent state mobile source air pollution reduction measures. Mobile sources of air pollution are produced

¹¹ EPA's Region 5 consists of the states of Minnesota, Wisconsin, Illinois, Michigan, Ohio, and Indiana.

¹² Included in Exhibit MLC-4 are maps displaying the Northwest Indiana Environmental Initiative Area. These maps also show the population densities, percent minority population, and percent low-income population of northwest Indiana, as compiled from U.S. Census Bureau data. Among other things, these maps show the substantial environmental justice populations of the Four Cities.

primarily from automobiles, buses, trucks, and other vehicles.¹³ A major component of vehicle emissions is ozone producing VOCs and NOx emissions, as well as CO. The EPA estimates that emissions from highway vehicles represent 33 percent of the overall national VOCs and 40 percent of the overall NOx emissions. To address the problems of mobile source pollution, among other things, the Clean Air Act tightened tailpipe emission standards for cars, buses, and trucks, and expanded Inspection and Maintenance ("I/M") programs for the testing of vehicles. As described below, the Act also imposes strict penalties on regions for failure to adopt comprehensive strategies to meet new federal pollution limitation standards.

The principal vehicle for the planning and adoption of programs aimed at attaining federal Clean Air Act standards is the State Implementation Plan ("SIP"), which in Indiana is developed and coordinated by IDEM. Under federal law, regional transportation plans must conform to the state SIP generally and to the transportation emission control measures included in the SIP in particular. For nonattainment areas, such as Lake County, failure to comply with the SIP can result in federal sanctions, including the loss of critical federal highway assistance grants.¹⁴ As is indicated in the attached news article,

¹³ They also come from off-highway mobile sources including railroads, snowmobiles, farm, and construction and lawn/garden equipment.

¹⁴ Sanctions for failure to attain clean air standards are set forth at 42 U.S.C. §§ 7509, Sanctions and Consequences of Failure to Attain. Besides economic sanctions, the Administrator

Northwest Indiana is struggling to solve its vehicle congestion problems in order to meet emission requirements, and unless additional steps are taken to improve traffic congestion/vehicular ozone emissions, there is a possibility that federal sanctions may be imposed. See Exhibit MLC-5. Another enforcement provision of the Clean Air Act that is targeted at severe nonattainment areas, such as Lake County, is the imposition of certain pollution offset requirements for VOC and NOx emissions. Under the Act, new sources or modifications of existing sources of pollution which increase emissions of VOCs or NOx by 25 tons per year or more must be offset by other area emission reductions at a ratio of 1.3 to 1. 42 U.S.C. § 7511a(d).

1. Indiana's 15 Percent ROP Plan

This past summer, EPA approved the State of Indiana's Rate-Of-Progress ("ROP") plan that governs the State's continued implementation of ozone attainment goals. See 62 Fed. Reg. 38457, at Exhibit MLC-6. The plan was submitted in accordance with the Clean Air Act, which requires states with ozone nonattainment areas classified as moderate and above to submit a SIP revision known as a 15% ROP plan. In short, states must implement plans that reflect actual reductions in weekday ozone

of EPA can also require that an area with increased sources of emissions offset any new emissions through reductions in other emissions, with a ratio of emission reductions to increased emissions of at least 2 to 1. The Administrator can also upgrade an area to the next level of nonattainment status, which would impose even more environmental mitigation requirements.

VOC emissions of at least 15 percent in the area over a 6 year period. For the State of Indiana, EPA has classified the counties of Lake and Porter as one of two state ozone nonattainment areas subject to the 15% ROP plan.

Several emission reduction programs have been undertaken in Lake County to help the area achieve Clean Air Act requirements. Lake County pollution control efforts include the implementation of an enhanced biennial vehicle I/M program for the testing of automobiles and light duty truck tailpipe emissions, the requirement that all gasoline providers in the county sell only reformulated gasoline, and the requirement that vapor recovery equipment be installed for gasoline pumps to capture vapors escaping during fueling. Even with these extremely complex and expensive ozone reducing programs, however, unless additional steps are taken to reduce the amount of pollution vehicles emit in northwest Indiana, Clean Air Act standards will be extremely difficult to meet.

C. The Draft EIS Fails to Protect the Four Cities From the Air Pollution Hazards Caused by the Application

A significant cause of air pollution that is impacted by the Applicants' proposed post-transaction operations in the Four Cities is the issue of emissions caused by highway traffic blocked at highway/rail at-grade crossings. As I understand from reviewing the Draft EIS, before analyzing an at-grade crossing for air pollution impacts, the SEA required several threshold criteria to be met. First, for nonattainment air quality areas,

such as Lake County, the SEA required there to be an increase of at least three trains per day over the impacted line segment, or a 50 percent increase in annual gross ton miles. From that group of selected line segments, the SEA elected to examine only those segments with rail crossings that have estimated average daily vehicle traffic counts of over 5,000.

For the Four Cities, this threshold criteria implemented by SEA for air pollution impact analysis eliminated dozens of crossings from review. Meanwhile, for at least one geographic area impacted by the Application, Cuyahoga County, Ohio, SEA decided to analyze all highway/rail at-grade crossings, including those with volumes over 5,000 vehicle per day and those with under 5,000 vehicles per day. The SEA apparently selected Cuyahoga County for more detailed analysis because it believed that the county had a relatively high amount of vehicle delays due to railroad/highway at-grade crossings. See Draft EIS, Vol. 5A, at E-17. Despite the serious highway/rail at-grade crossing congestion problems facing the Four Cities, which were outlined in detail in the Four Cities October 21, 1997 Comments submitted to the Board and to SEA, SEA elected not to conduct a detailed air emission analysis for all of the Four Cities' at-grade crossings over impacted line segments. The SEA's final EIS should include an analysis of all Lake County at-grade

highway/rail crossings, and not just those with over 5,000 vehicle movements.¹⁵

In the Draft EIS, SEA concluded that only one criteria pollutant met its thresholds for mitigation for Lake County. SEA determined that net NOx emissions increases for the county are 83.76 tons/year, significantly above the 25.0 tons/year threshold for imposing mitigation. However, SEA concluded that upon further review, NOx emissions in Lake County are not a significant factor contributing to area Ozone formation. SEA also concluded that because the increased NOx emissions are under 1 percent of existing (1995) county-wide NOx emissions, that mitigation is not necessary for the region.

The SEA's recommendations in the Draft EIS are inadequate for mitigating significant Four Cities' air pollution impacts for several reasons. First, they ignore the fact that any increase in air pollution levels caused by post-transaction incremental increases in traffic over lines in the Four Cities region will create significant impacts on the area's ability to meet required federal air quality standards. As mentioned above,

¹⁵ Immediately prior to assuming my current position as Gary City Planner, for 13 years I worked for the City of Cleveland and I lived during that time in Cuyahoga County, Ohio. While there, I served as an alternate to the Mayor of Cleveland on the Metropolitan Planning Organization for the Northeast Ohio Area Coordinating Agency. My experience as planner both in Cuyahoga County and Lake County gives me a unique perspective on environmental and safety issues facing the two areas. My experience is that while the air quality problems facing Lake and Cuyahoga counties are fairly similar, at-grade highway/railroad crossing problems are significantly worse in Lake County than in Cuyahoga County.

a number of far reaching programs have been implemented in Lake County that are designed to help the region meet Clean Air Act requirements. Increased emissions caused by the Applicants' planned post-transaction train movements could negate gains from these exacting enforcement programs.

As indicated above, if Lake County fails to meet requisite federal clean air standards, it faces the imposition of sanctions, including the potential loss of significant sources of federal highway funding. Additionally, the transaction may subject Lake County to strict federal air pollution emission offset requirements that require it to offset any new or increased NOx emissions of over 25 tons/year by a ratio of 1.3 to 1. For Lake County, that could mean that under the Board's NOx determined levels of 83.76 tons/year for Lake County estimated to result from the transaction, the county may be required to obtain an additional 109 tons/year of offsets. SEA has ignored these critically important ramifications in analyzing the impact on air quality of the Applicants' post-transaction plans.

The Application's negative impact on public health is by itself an important enough reason for the Board to impose more stringent and appropriate mitigation on the Applicants than the Draft EIS proposes for northwest Indiana. For the Four Cities, mitigating the Application's negative impacts on air quality is also vitally important to achieving our regional economic development goals. As mentioned in detail in this statement, the Four Cities are striving to promote new and cleaner forms of

economic growth for the region, with the focus being on waterfront development.

Anyone who has traveled through northwest Indiana is immediately aware of the severe pollution problems facing the area. Environmental mitigation is an essential part of waterfront planning. The Four Cities ability to draw residents and businesses to the proposed waterfront neighborhoods, and visitors from beyond northwest Indiana to these new businesses/attractions will largely depend on our success in cleaning up the environment. What is clear is that without cleaner air quality, along with other planned environmental restoration and remediation, the economic potential of the region's waterfront development plans will not be realized.

IV.

CONCLUSION

Local and regional officials have expended considerable time, energy, and resources in the promotion and adoption of efficient and environmentally benign infrastructure and development programs and policies to enhance the well-being of northwest Indiana citizens. As described in detail above, CSX's proposed reinstatement of the former PRR line would interfere with major community and regional redevelopment projects. Their plans would also cause serious safety and environmental problems (including environmental justice, air quality, etc.) which the Applicants and the SEA in its Draft EIS do not sufficiently address.

The Four Cities' Alternative Routing Plan provides an alternative to reinstatement of the out-of-service PRR line, which would easily accommodate the additional trains (five daily) that CSX has proposed moving over the line. The Alternative Routing Plan would not interfere with the important housing, airport, and lakefront development projects discussed above, which could proceed unimpeded. It would also eliminate the need to reinstate 23 highway at-grade crossings of the PRR line between Hobart and Clarke Junction, and the imposition of 115 new daily train/highway crossings in an area where there are currently no such crossings.

The Draft EIS indicates that SEA has examined all proposed construction projects to be undertaken by the Applicants to determine their impact on local land use plans. Unfortunately, in its evaluation, SEA did not consider CSX's major \$13 million construction project involving the restoration to service of the currently unused Hobart to Clarke Junction line segment. It is imperative that SEA (and the Board) closely examine the reinstatement of this line segment and the problems detailed in my testimony as it prepares the Final EIS for this major federal action. This analysis is especially important in light of the fact that the entire City of Gary, including the population residing along the PRR line, meets the Board's threshold requirements for environmental justice mitigation.

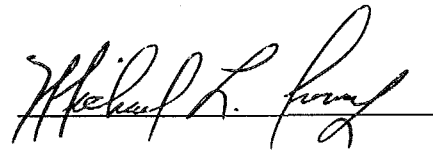

The Alternative Routing Plan set forth by the Four Cities provides a cooperative regional plan that minimizes the

Conrail transaction's impacts on northwestern Indiana while accommodating regional rail traffic movements. Upon further evaluation, I believe the Board will clearly see that the problems associated with the Applicants' plans to reinstate the Hobart to Clarke Junction line segment as outlined above are significant, and that the Consortium's Alternative Routing Plan should be adopted as a low-impact means of mitigation.

 Gary, Indiana 46406

RE: Railway Reactivation North of Industrial Highway
 Gary-Chicago Airport Impacts

Dear Mr. Dilts:

We are writing in response to your request for information on the impacts of reactivating an inactive rail line located northeast of Industrial Highway near Gary-Chicago Airport. **We recommend that the Airport Authority oppose any reactivation of this inactive rail line.**

We understand that there is a proposal being considered where the former Pennsylvania Railroad Ft. Wayne-Chicago Line ("PRR line") would be reactivated by CSX. The reactivation of this rail line would prevent the airport expansion plans. A segment of this line is located directly northeast of the Gary-Chicago Airport. In summary, because of the increasing activity and interest in the Airport and partnership with the City of Chicago to market and encourage the use of the airport, the Airport Authority is planning for an extended east-west runway or replacement runway to provide a longer landing surface and expanded capacity. The re-institution of rail service by CSX on the former PRR line will limit or stop the Airport expansion plans.

Although you are familiar with the facts, we have summarized the primary points that have led us to our recommendation to oppose reactivation of the PRR line.

- The Gary-Chicago Airport is one of the most important economic assets of the area. The airport is one of the closest aviation facilities to the downtown Chicago area. It has unused capacity will be tapped to meet the demands of Northwest Indiana and Southern Chicago residents and businesses.
- In 1995, the City of Gary joined forces through a Compact with the City of Chicago to form a bi-state airport authority, overseeing the capital improvements of the system of airports serving the Chicago area, including O'Hare International, Midway, and Gary-Chicago Airport. Under this compact agreement, significant capital investment has been and will be made in the Gary-Chicago Airport annually. In addition, a joint marketing effort is underway.

Page Two

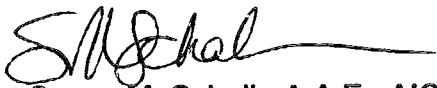

- The combination of capital and marketing investments is expected to produce new commercial activity. The local community and Airport Authority are promoting an incentive pool to attract candidate users to the facility. Several interested aviation operators are talking with the Airport about new passenger and cargo service.
- The present airfield configuration is confined on all sides by the toll road, power lines, Calumet River, and railroad tracks. To extend the existing runways presents serious challenges. While some of the standards have been grandfathered for the present airfield, in order to clear the approach areas and meet the rigorous demands of larger transport aircraft, reorientation or development of a new parallel east-west runway will be required to meet FAA threshold requirements for the upgrading of the Airport.
- The existing primary commercial service airports serving the Chicago area demonstrate the depth of the metropolitan area's aviation demands. O'Hare is the busiest airport in the world; and yet, despite the heavy activity at O'Hare, Midway's passenger and cargo activity continues to grow. Through the partnership with the City of Chicago, opportunities exist to allow growth to continue in the Chicago area, through the expansion of the Gary-Chicago Airport.
- The proposal to reactivate the former Pennsylvania Railroad Ft. Wayne-Chicago Line will negatively impact or block the expansion of the Airport. Accordingly, we oppose the reintroduction into service of the former PRR line.

Given these facts, we encourage the Airport Authority and communities within the service area of the Gary-Chicago Airport to **oppose the reactivation of the former PRR line.**

Please call me if you need additional information in regard to the facts provided within this letter.

Sincerely,

R. W. ARMSTRONG & ASSOCIATES, INC.

Amtrak train, truck collide; Lake Station driver is killed

LORI CALDWELL/POST-TRADING PHOTOS

Traffic patrolman Agnes Roberts views damage to an Amtrak passenger train that struck a tractor trailer Monday morning on North Clark Road.

■ Witnesses said the truck driver ignored flashing lights and lowered gates.

BY LORI CALDWELL
Staff Writer

GARY — An Amtrak train slammed into a tractor-trailer loaded with iron ore Monday morning, killing a Lake Station truck driver and injuring seven rail passengers.

It was the second accident in four days involving a passenger train and a truck at the series of crossings on North Clark Road, police said.

Wayne Hibbard, 34, of Lake Station, a driver for L.I.D. Trucking of Hammond, ignored flashing lights and lowered gates as he proceeded across the multi-track crossing in the industrialized area about 10 a.m., witnesses said.

Hibbard was hauling ore for Jack Gray Transport Inc., of Gary, Patrolman Agnes Roberts said.

"The engineer saw the truck on the track, put on the brake and just laid down," Roberts said. "That's really all you can do."

Engineer David Renz of Chicago was not injured in the crash, police said.

The Pere Marquette passenger train originated in Grand Rapids, Mich., and was scheduled to arrive at Union Station in Chicago about 10:30 a.m.

Seven passengers were treated for bumps and bruises at The Methodist Hospitals Northlake Campus, which saw 47 of the passengers.

Another 16 passengers were

taken to St. Catherine Hospital in East Chicago for evaluation, but none were injured, a spokeswoman said.

Amtrak arranged for alternate transportation for its customers, who were all taken to the Genesis Center after being checked at the hospitals, Chief John Roby said.

The impact ripped apart the truck, sending large rocks and pieces of the cab and engine flying down the track.

Hibbard's body was thrown about 200 feet. He was killed instantly, police said. A Lake County deputy coroner pronounced him dead at 11:34 a.m.

Witnesses told Roberts that Hibbard had stopped at the crossing gate, then proceeded across. There are three sets of multiple tracks between the gates, with short pieces of road between the groupings.

The passenger train was westbound on a track maintained by Conrail.

The rail corridor has been identified by the Indiana Department of Transportation as one of the most dangerous in the area. Indiana ranks fourth in the nation in crossing deaths.

On Friday morning, an Amtrak passenger train struck a tractor-trailer at a nearby crossing on North Clark Road, Roberts said.

In that accident, the truck driver was trapped in the truck, but sustained only minor injuries, she said. No one on the train was injured.

"He was extremely lucky," Roberts said of the truck driver involved in that accident.

Passenger Dave Betlejewski was in the last car of the train Monday. "We were slow through the yard, and had just speeded up to full speed," he said. Betlejewski was returning home from a weekend in Michigan.

"The train just bounced. That lasted about 30 seconds. The biggest thing was we would see debris flying past the windows. I'm just amazed the train is still on the track."

The authorized speed through the area is 79 mph, said Amtrak spokesman Rob Dellenger.

Although the train did derail, it remained upright after the collision, dragging parts of the truck westbound for almost 900 feet before it stopped.

The metal track was severed in two places during the collision. Several of the railroad ties were damaged as well.

The collision caused some delays in rail traffic, but full service was expected to resume late Monday night, Dellenger said.

For New Yorker Sikha Sarkan, the crash was more than an inconvenience.

"It was my first time on Amtrak, and probably my last," she said. Sarkan was on her way to Chicago to visit with her youngest son, Arjun, a freshman at Northwestern University.

She was scheduled to fly back to New York Monday evening.

"Everything was flying, the seats were torn out. All I could think was I didn't say goodbye to my sons," she said tearfully as she left the scene.

valve damage in 100 other patients on the drugs.

Other symptoms included chest pains, shortness of breath and swollen ankles.

Fenfluramine was approved by the FDA in 1973, and phentermine was approved in 1959. But they were never approved for use together.

The furor over the drugs began in July, when Mayo Clinic researchers released their study that linked the drugs to patients who showed up in operating rooms with unusual leaking heart valves.

Since the study was formally published in the New England Journal of Medicine in August, more cases have turned up, giant diet centers like Nutri-Systems have discontinued using the fen-phen combination, and the drugs' sales have fallen sharply, according to IMS America, which tracks pharmaceutical sales.

But it wasn't until cardiologists around the country began checking the hearts of patients who were taking the diet drugs, yet showing no symptoms of heart disease, that the FDA decided to act.

Nearly 300 patients from five medical centers who were taking the drugs with no symptoms were checked by echocardiogram — an ultrasound of the heart. Thirty percent showed abnormal heart valves.

"Clearly, with that information,

study results at a meeting with the FDA on Friday, Wyeth-Ayerst Laboratories, based in Philadelphia, agreed to voluntarily withdraw both drugs.

The company manufactures Pondimin and sells Redux. The company has also pulled the drugs from other countries.

Wyeth-Ayerst has sent letters to 450,000 physicians and pharmacists, are running full-page ads in newspapers today, and are offering advice and refunds to anyone with unused drugs.

For doctors who treat obese patients, reaction to the withdrawal has been mixed.

"I talked to two of my patients who really regret that they have to stop taking it," said Dr. Arthur Frank, a physician in Washington, D.C.

"One said, 'I wish I had the option of assessing whether the risk of heart disease is greater because of my weight, or because of the pills. Now, she doesn't have that option anymore.'"

Still, he said, "The FDA action is very prudent. It's clearly necessary."

Some physicians, who were reluctant to condemn the drug combination they say can be effective, said obesity itself is a serious health risk.

Obesity, the second leading cause of preventable death, can lead to heart disease, diabetes, and

ly prescribed. Hitzig is studying how fen-phen works to stop addictions like alcohol and cocaine, depression and obsessive-compulsive disorders. "I'm afraid we're throwing the baby out with the bath water."

For Potter, the drug withdrawal makes her breathe easier. She still has 80 pounds she wants to lose. But now, she's trying a low-salt, low-fat diet.

Her sister, once she stopped taking the drugs, gained back all of the weight. "It's just not worth it," Potter said.

Trains move slowly past accident scene

■ Amtrak service resumes through the North Clark Road crossing, where two accidents have occurred in five days.

Post-Tribune Staff Report

GARY — Amtrak trains resumed service through Northwest Indiana on Tuesday, a day after a train collided with a tractor-trailer, killing the truck driver.

Train speeds, however, were restricted near North Clark Road where the accident happened.

Wayne Hibbard, 34, of Lake Station was killed when he drove his tractor-trailer around lowered gates at the rail crossing, according to police.

Marc Magliari, Amtrak spokesman, said Tuesday the morn-

ing train from Chicago arrived in Niles, Mich., only 13 minutes late. Magliari said about 12 Amtrak trains pass through that crossing each day.

Next Tuesday, Operation Life-saver, a national rail-safety group, will be in Northwest Indiana to promote rail-crossing awareness, Amtrak officials said.

The group has invited several area law enforcement officials, public officials and judges to participate in the campaign.

As part of the effort, they will board a train that will pass through the North Clark Road crossing, which was the site of another train-truck wreck on Friday.

That rail corridor has been identified by the Indiana Department of Transportation as one of the most dangerous crossings in the area.

In the Friday accident, the truck driver was trapped in his truck, but received only minor injuries, according to reports.

EXHIBIT MLC-3

September 25, 1997

HONORABLE JOLENE M. MULLONS
Administrator
Federal Railroad Administration
U. S. Department of Transportation
400 Seventh Street, SW
Washington, DC 20590

Dear Jolene:

On September 15, 1997, Amtrak Train 371, the Pere Marquette, which was headed toward Chicago from Grand Rapids, Michigan, struck an 18-wheel gravel truck at Clark Road, 8 miles east of Hammond, Indiana, at Conrail MP 499.29. As a result, the entire consist including a locomotive and four passenger cars derailed incurring injuries to eleven passengers and one employee. The truck driver was killed.

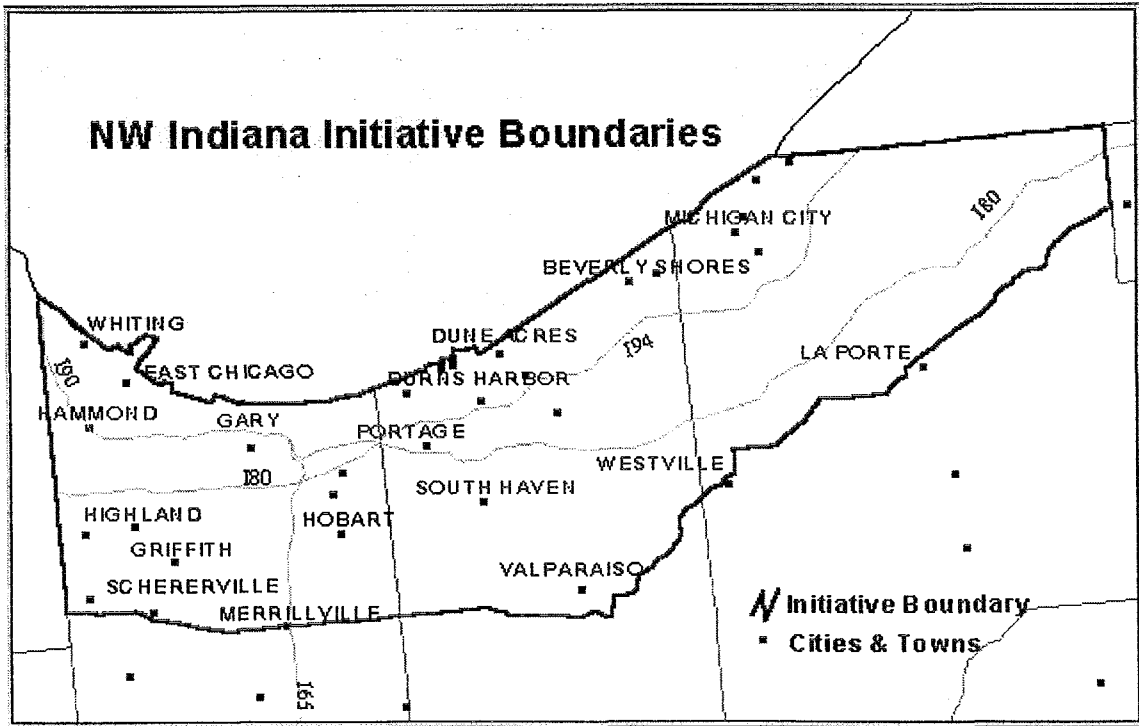

This crossing accident was the ninth similar occurrence involving Amtrak passenger trains in this area since November 1995. Several have resulted in injuries to people on the train and there have been three fatalities in the vehicles that have been struck. There have been over 50 accidents involving passenger and freight trains in the past 20 years in this particular area between Hammond and Gary. Conrail and CSX tracks are parallel to each other and highway traffic is required to cross both sets of tracks. As you can see, this area is dangerous, even when all railroad operating rules are followed and safety devices and crossing protection are functioning as intended.

This situation is of great concern to us at Amtrak. I am requesting that you arrange for your staff to examine the crossings, their protective devices and surrounding terrain to determine what can be done to effectively eliminate or greatly reduce the potential danger to all trains, passengers, operating crews, and to the public in this area. Your assistance would be greatly appreciated. If Amtrak can be of any help, please contact me immediately.

Sincerely,

Thomas M. Downs
Chairman, President and
Chief Executive Officer

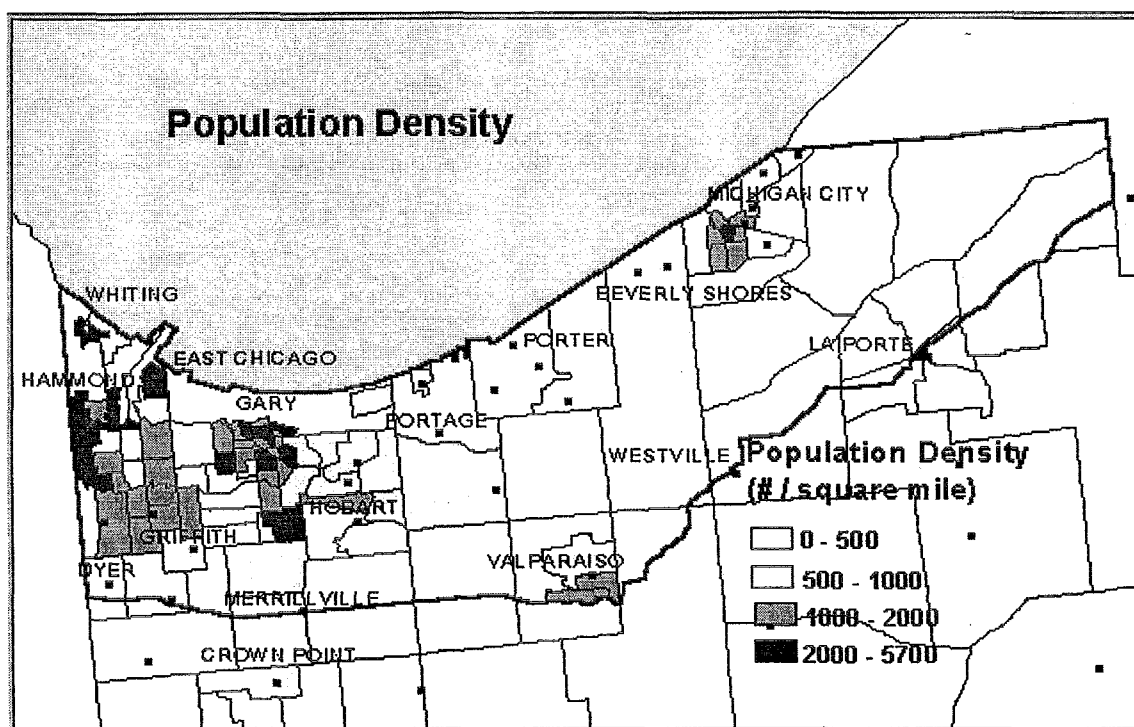

NW INDIANA INITIATIVE AREA

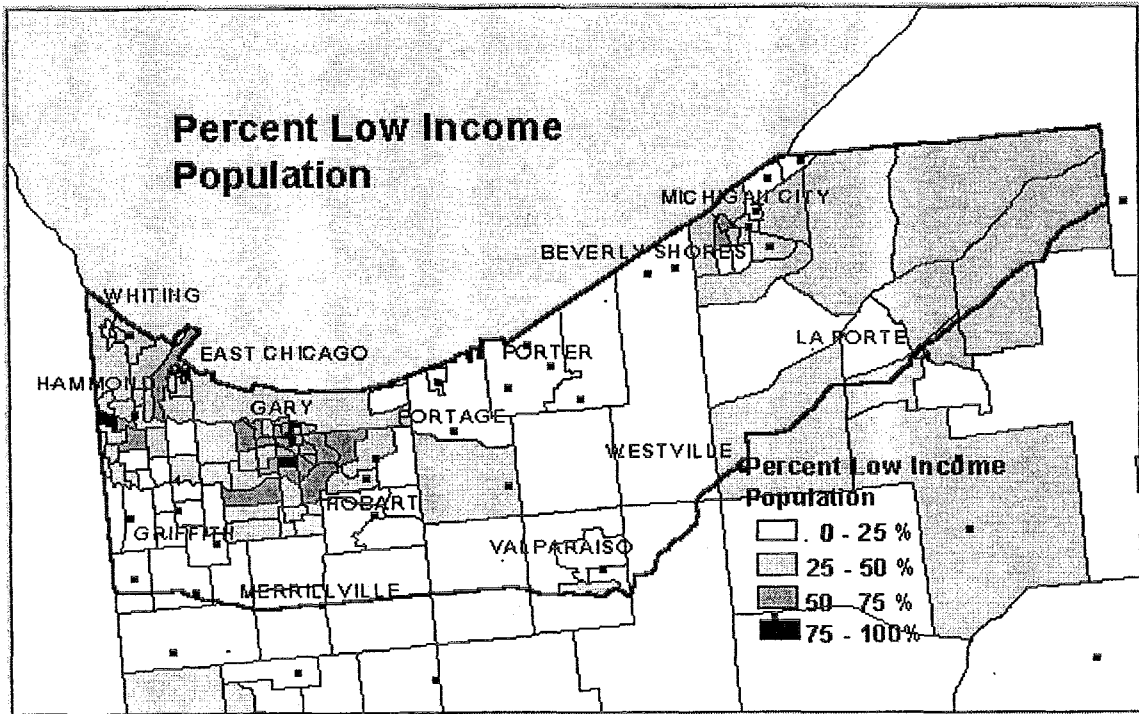

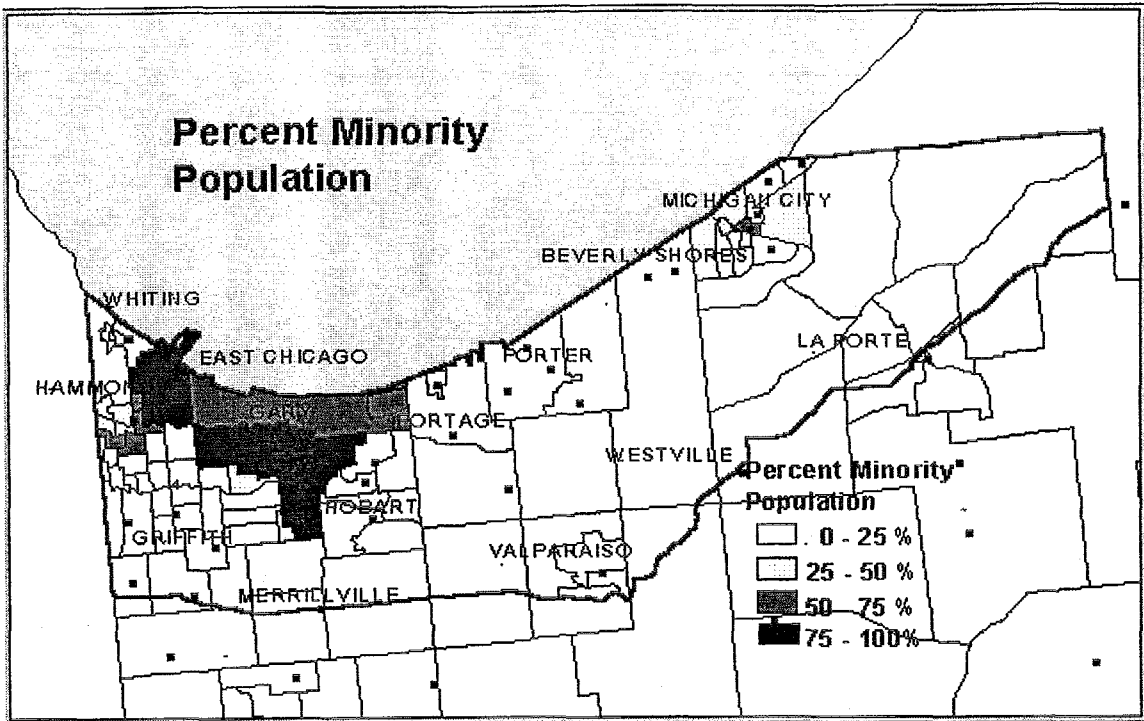

NW INDIANA INITIATIVE AREA

Demographic Maps

The following maps for the EPA's NW Indiana Initiative area were developed from the 1990 Decennial Census as published by the U.S. Bureau of the Census. The data are reflected in census tracts.

Northwest Indiana Environmental Initiative Action Plan

I. Background and Vision of the Northwest Indiana Environmental Initiative

- Northwest Indiana has suffered the effects of severe pollution through a century of industrial activity. As a consequence, contamination threatens the health and vitality of communities and surrounding ecosystems. The air quality of Lake and Porter counties does not meet Federal standards. Five to ten million cubic yards of contaminated sediments cover the bottom of the Grand Calumet River and Indiana Harbor Ship Canal, of which 150,000 cubic yards enter Lake Michigan each year. Millions of gallons of petroleum float atop the ground water in certain portions of Northern Lake County. Hundreds of sites require clean up, including seven Superfund sites and numerous leaking underground storage tank sites. The extent of these and other environmental challenges require special governmental action. During the last several years, EPA and IDEM have worked together to prevent further degradation and have begun developing long term solutions to restore ecological balance in the region.
- Starting with the 1992 Northwest Indiana Action Plan, EPA and IDEM joined in the Northwest Indiana Environmental "Initiative," designed to direct significant federal and state resources to the region. We have pursued certain short term strategies to relieve immediate threats to the environment and provide the ground work for longer term, more comprehensive solutions for the region. The heightened enforcement strategy of EPA and IDEM sends an important signal to the affected communities that future abuses will not be tolerated and past wrongs will be remediated.
- With the current Northwest Indiana "Action Plan," we intend to continue our geographic focus on Northwest Indiana. It reflects our agencies' continued commitment to work cooperatively to address some of the most environmentally challenging problems in the nation. Both agencies seek to clean up major waterways and contaminated lands, reduce the use of toxic substances, restore and protect strained ecosystems, and foster practices among industry and citizens that are sustainable for the long term health of the environment and people of Northwest Indiana. To that end, we have established a collaborative management arrangement involving teams from both agencies to craft strategies and work with the community to achieve the objectives of this Action Plan. By sharing information and strategically focusing our joint resources, we can use the limited resources each have to maximize governmental efforts in the area. Together, U.S. EPA and IDEM have already enhanced our communications and coordination in Northwest Indiana. Our evolving relationship allows us to continue collaborative strategies, maximize our resources, and bring about better environmental results for everyone in Northwest Indiana.

II. Major Environmental Goals and Key Principles of the Northwest Indiana Environmental Initiative:

- EPA and IDEM seek environmental restoration of the region and elimination of serious environmental stresses now threatening Lake Michigan. Several strategies, many initiated through the 1992 Northwest Indiana Action Plan, will be pursued under the Action Plan, including: improving the area's air quality; cleaning up contaminated sediments in the Indiana Harbor Ship Canal and Grand Calumet River; remediating and restoring contaminated lands and ground water; using pollution prevention as a tool to develop an overall environmental strategy with local industry and citizens; attaining high compliance with state and federal environmental laws; and continuing to develop and implement the Remedial Action Plan (RAP) for the Grand Calumet River, Indiana Harbor Ship Canal and Nearshore Lake Michigan Area of Concern and the Lake Michigan Lakewide Management Plan (LaMP).
- Several key principles will guide our efforts. Success will be measured through:
 - achieving tangible environmental improvements;
 - developing creative solutions and non-traditional ways of dealing with environmental problems that foster cooperation among affected groups;
 - closely coordinating strategies and action with other federal and state agencies and local governments;
 - encouraging involvement by affected groups such as industry, environmental groups, and citizens; and
 - using integrated, multi-media approaches consistent with long term environmental goals.
- The Initiative is based on a collaborative effort between EPA and IDEM. We have agreed to work together, sharing resources and information, and engaging in informed decision-making by involving all those who hold a stake in the process.

III. Scope of the Northwest Indiana Environmental Initiative

- This Initiative focuses on the most industrialized and developed portions of Northwest Indiana. Its geographic boundary approximates a crescent along the shore of Lake Michigan. In Lake County, the Action Plan addresses the area north of Route 30; in Porter County, the area north of Route 30 west of Valparaiso and north of Route 2 to the east of Valparaiso; and in LaPorte County, the area north of Route 2.

- This "Initiative" complements other major environmental planning efforts underway in Northwest Indiana, though their geographic boundaries differ. The RAP, which is lead by IDEM, designates the northern portion of Lake County as its area of concern. Both the LaMP, which is lead by EPA, and the Coastal Zone Management Program (CZMP), which is lead by DNR, address the drainage basin of Lake Michigan, although the boundaries for the CZMP have not been finalized. A number of watershed management planning efforts focus on drainage areas for specific waterbodies, including the Trail Creek Watershed in LaPorte County and the watersheds for George and Wolf Lakes in Hammond. IDEM's Northwest Regional Office augments these planning processes, and supports traditional regulator activities by providing services to the counties of Lake, Porter, and LaPorte.
- The objectives of this Action Plan represent strategies that EPA and IDEM have identified as critical to the long term restoration and protection of the region. NOTE: SPECIFIC ACTIVITIES UNDER EACH OBJECTIVE DO NOT REPRESENT ALL THE ACTIVITIES ENGAGED IN BY THE TWO AGENCIES, NOR DO THE OBJECTIVES THEMSELVES INDICATE ALL MATTERS OF CONCERN. RATHER, THEY REPRESENT THOSE ACTIVITIES THAT BOTH AGENCIES HAVE AGREED ARE CONDUCTIVE TO JOINT COLLABORATION OR IN NEED OF STRONG COORDINATION TO SUPPORT LONG TERM RESTORATION AND PROTECTION EFFORTS. Activities not jointly undertaken by EPA and IDEM will still be coordinated through the Initiative and be consistent with major Initiative strategies. The result of such cooperation will bring about stronger communications, more effective use of resources, and a better environment.

IV. Relationship of the Northwest Indiana Action Plan with Other Planning Processes

The effectiveness of this Action Plan depends greatly on maintaining close coordination and frequent communications with other major planning processes underway in the region. The activities under the Action Plan will further mutual goals shared by these longer term planning processes, and augment ongoing regional regulatory activities required by state and federal laws. Efforts will be made to strengthen communications and coordination among federal, state, and local units of government and agencies, as well as with private groups working within Northwest Indiana. Such coordination will ensure that the Initiative promotes broadly shared environmental priorities and the cooperative use of government and private resources to address regional problems.

V. Public Involvement in the Northwest Indiana Environmental Initiative

- EPA and IDEM are committed to providing citizens of Northwest Indiana with opportunities for input into the decision making process. We recognize that public involvement is important to our success. Consequently, our process to revise
- the 1992 Northwest Indiana Action Plan began with several "roundtable" meetings held among agency representatives and community leaders in Northwest Indiana. The comments of more than 60 individuals, representing industry, environmentalist, labor, and local government, helped guide the preparation of this Action Plan. In addition, the final draft of this Action Plan was widely circulated for public review and comment before final adoption. Our Action Plan seeks to create wide spread understanding of environmental challenges in Northwest Indiana and foster development of opportunities for the public and industry to cooperatively address environmental problems. To achieve this goal, IDEM and EPA will: (1) enhance public access to information concerning environmental problems (including consent decrees, technical documents and reports); (2) provide the public with opportunities for input and interaction; (3) identify and communicate both challenges and milestones; and (4) maintain flexibility to allow for implementation of new and different communication strategies to meet the public's changing priorities and needs.

VI. Environmental Justice

-
- Protecting the public health and the environment for everyone in Northwest Indiana is central to our mission. Yet because of the level of past environmental degradation, the historic concentration of industry in the region, the environmental issues presented by industry located there, and the presence of ethnic and socio-economic minorities within certain communities, the environmental challenges of Northwest Indiana raise unique concerns. Although our geographic initiative has allowed us to focus resources and efforts on Northwest Indiana, with this current Action Plan we have made emerging environmental justice issues an important consideration for our agencies.
- As society at large struggles with environmental justice concerns, EPA and IDEM are focusing on this issue. We are committed to working with the public to develop a mutual understanding of environmental justice and a direction for our work. By involving minority communities in our outreach efforts and exploring ways that we can be responsive to their concerns, we will further our efforts to protect everyone in Northwest Indiana, regardless of ethnic background or financial resources. As we identify and define environmental justice issues, we will undertake appropriate responses to them.

VII. Sustainable Development.

In the December 1993 roundtable meetings, several commenters suggested that "Sustainable Development" should be included in the Action Plan. EPA and IDEM agree that the concept and practice of sustainable development should be one of the guiding principles of how we accomplish our goals in Northwest Indiana. Indeed, President Clinton, announcing his Executive Order creating the President's Council on Sustainable Development, stated the following: "to grow the economy and preserve the environment for our children and our children's children, bringing together some of the most innovative people from business, from government, from the environmental movement, the civil rights movement, and the labor movement...I am asking [the Council] to find new ways to combine economic growth and environmental protection; to promote our best interests in the world community; to bring our people together to meet the needs of the present without jeopardizing the future."

But sustainable development as a global vision for the Northwest Indiana area is not so clearly defined. EPA and IDEM recognize that the agencies need to begin working with the communities of the area to come to some common understandings of what sustainable development is, what the desired outcomes of work should be, who the interested parties are, and what roles parties can and should play. The agencies will work together with the public to open up avenues for dialogue on these issues. For example, currently there is a significant movement toward redeveloping abandoned and unused urban sites. EPA and IDEM both recognize the importance of this "Brownfields" concept. EPA sees its role as one of removing impediments to redeveloping these Brownfield sites, providing the market with clear signals of EPA's interests, sharing information, and testing ideas. IDEM has an active role in cleaning up these sites through various state programs including the state's Voluntary Clean Up program. In addition, both agencies are engaged in transportation planning activities aimed at promoting growth patterns consistent with our environmental goals. These activities will be continued, and other activities will be explored, as we cooperate with communities in Northwest Indiana in the development of a shared vision of sustainable development for their region.

VIII. Implementation and Future Review of the NWIAP

- The Action Plan, with its six major strategies - Air Quality, Compliance and Enforcement, Land and Ground Water Remediation, Pollution Prevention, Remedial Action and Lakewide Management Plans, and Sediments - will be implemented jointly by EPA and IDEM. This Action Plan is not inflexible. It will be assessed continuously for progress by the agencies, and periodically reviewed by the public for major shifts in strategies and changing environmental priorities. Joint agency committees have been charged with implementation for strategies not already coordinated and implemented through base program work. Our agencies will work cooperatively with the public to ensure that the goals of this Initiative are achieved. Indicators of progress based on tangible environmental improvements will be developed and reported to the public. Our six strategies follow, with a brief explanation of our goals and objectives and the major activities that will guide our efforts over the next several years.

AIR QUALITY

Goal:

The air quality in Northwest Indiana will not interfere with the citizens' enjoyment of their region or threaten their health.

Objective:

To improve the area's air quality by: ensuring compliance with the new Clean Air Act Amendment requirements for the area; taking all steps needed to achieve and maintain health-based air quality standards; involving the public and improving their awareness of what we all can do to lessen air pollution; and initiating targeted efforts through enforcement, rule development, and public awareness.

Definitions:

- Criteria Pollutants: Pollutants identified in Title I of the Clean Air Act that include carbon monoxide, lead, nitrogen oxides, ozone, particulate matter, and sulfur dioxide.
- VOC: Volatile organic compounds, active in formation of ozone/smog.
- PM-10: Fine particulate matter (measured as PM-10).
- Title III: Portion of Clean Air Act Amendments of 1990 that outlines hazardous air pollutant control program.
- Title V: Portion of Clean Air Act Amendments of 1990 that outlines new state operating permit program.

Background:

- Lake County has the poorest overall air quality of any area within Indiana. Over the years, portions of this county have not met state and federal health standards for most of the criteria air pollutants. The smog problem persists in Porter County and possibly LaPorte County. Northwest Indiana, and Lake County in particular, also have high air emissions of

hazardous air pollutants.

- EPA and IDEM have spent considerable time and effort developing new rules and programs and enforcing existing laws to improve air quality in this region. These efforts have resulted in substantial improvement in air quality, especially for particulate matter, sulfur dioxide and carbon monoxide. However, problems still persist for ozone and other hazardous air pollutants.
- New control plans for particulate matter and sulfur dioxide have been established and are being implemented. The State of Indiana is working with Illinois, Wisconsin, and Michigan on a new smog/ozone control program aimed at eliminating the health threat from ozone before 2007. IDEM is also launching the Title III (Air Toxics) program that will lead to substantial reduction in emissions of hazardous air pollutants to reduce risk to public health. EPA is participating in developing these new programs and in guaranteeing their success.

Major Activities:

1. IDEM and EPA will develop a targeted compliance and enforcement strategy aimed at addressing the area's major air quality problems (ozone, PM-10 and toxic substance exposure). IDEM will work to reduce major nuisance problems related to odor, dust, and other air quality problems.
2. IDEM will prepare a statewide air toxic substances control program with an emphasis on activities in Northwest Indiana that will both evaluate the extent of excessive risk and address major problems with rules, compliance and outreach efforts. EPA will actively support IDEM through technical assistance and other means. The state air toxic substances program will incorporate all mandatory elements of the hazardous pollutant provisions of the Clean Air Act Amendments.
3. IDEM will work with the Clean Air Act Advisory Council - Northwest Indiana Committee to focus on their concerns relative to air quality in Northwest Indiana.
4. IDEM and EPA will continue to coordinate and cooperate in the Lake Michigan Ozone Project, and develop control measures to reduce ozone and smog.
5. IDEM and EPA will continue to coordinate closely on all significant regulations and programs required as part of the Clean Air Act Ozone State Implementation Plan to assure that the state rules and programs meet the federal requirements and to assure that EPA's review process supports the state's actions.
6. IDEM will collect and evaluate air quality monitoring data in the area to track improvements, and will increase sampling for hazardous air pollutants as part of the air toxic substances program.
7. IDEM and EPA will promote pollution prevention approaches during compliance and enforcement activities, public outreach efforts and, whenever practical, rulemaking.
8. IDEM will work to secure approval from EPA on the state's Fine Particulate Matter Implementation Plan and then closely coordinate state and federal compliance activities in the area.
9. IDEM will pilot an odor control program for the area, working with EPA wherever there is federal authority for effective air pollution reduction.
10. IDEM will implement an effective enhanced vehicle emission testing program with assistance from EPA that will provide better service to the motorists and more emission reductions.
11. IDEM will incorporate air quality consideration into transportation planning decisions and identifying effective mobile source control measures.
12. IDEM will prioritize implementation of the Clean Air Act's new Title V operating permits for major sources in Lake and Porter counties. IDEM's Small Business and Technical Assistance Program will work to assure compliance with Clean Air Act requirements for small businesses in the area.

Opportunities for Public Involvement

IDEM and EPA will develop a targeted compliance and enforcement strategy aimed at addressing the area's major air quality problems (ozone, PM-10 and toxic substance exposure). IDEM will work to reduce major nuisance problems related to odor, dust, and other air quality problems.

- IDEM and EPA will meet regularly to discuss progress and coordination on joint efforts in Northwest Indiana. The IDEM/EPA Northwest Indiana Air Committee is responsible for communicating on all matters involving or affecting the other agency to assure proper coordination and effective actions.
- The public, industry and local government can participate in meeting these objectives through IDEM's Clean Air Act Advisory Committee, public meetings and hearings, and other public processes associated with regulatory activity.

COMPLIANCE AND ENFORCEMENT

Goal:

Reduce the quantities of conventional and toxic pollutants existing within and entering the environment in Northwest Indiana.

Objective:

Use enforcement actions and other statutory authorities to achieve a high level of compliance with all federal and state environmental laws and to remediate contaminated sites.

Definitions:

- Supplemental Environmental Project (SEP): A project carried out by a polluter which has direct environmental benefits and is not otherwise required by law. Such projects can be used to offset a portion of the cash penalty.
- RCRA: Resource Conservation and Recovery Act of 1976; the law established rules to monitor hazardous substances from the time of production to disposal. It requires that safe procedures be used in treating, handling, using and disposing of hazardous substances.

Background:

- Many of EPA's and IDEM's joint efforts under the Action Plan focus on remediation and restoration of Northwest Indiana because of the environmental degradation that has occurred over many decades. But the long term benefits to the environment and to the citizens in Northwest Indiana, as well as the success of the Initiative, depend on whether ongoing regulated activities comply with federal and state environmental laws and regulations, now and in the future. Therefore, it is critical that IDEM and EPA continue our joint efforts in determining the compliance status of the industries and other regulated facilities operating in Northwest Indiana, and when appropriate, vigorously enforce against those not in compliance.
- Northwest Indiana presents difficult challenges with regard to compliance and enforcement for several reasons. First, many industries located in Northwest Indiana were established decades prior to modern environmental laws and regulations. Their processes and equipment were not designed to control or limit pollution into the environment. Some of these facilities have had difficulty adapting their processes and equipment to meet current environmental standards. As a result, many have experienced chronic compliance problems. In addition, and unfortunately, there have been some who have chosen to locate in Northwest Indiana who have not taken their environmental responsibilities and obligations seriously. Regulating such facilities requires vigilance and aggressiveness. Finally, because of the past significant degradation of all the environmental media - air, water and land - compliance and enforcement strategies must take into account that pollution can be shifted from one medium to another. As a result, IDEM and EPA will continue to focus on environmental improvement through a multi-media approach to compliance and enforcement, and by actively seeking through enforcement actions remediation of past contamination.

Major Activities:

1. Coordinate state and federal enforcement actions through the Compliance and Enforcement Committee (CEC) to ensure efficient use of state and federal resources.
2. Prioritize and target inspections and enforcement to ensure compliance.
3. Research the legal/judicial facets of sediment remediation, the remediation of contaminated ground water and the development of natural resource damage claims to enable state and federal enforcement personnel to bring cases which, if successful, will compel the remediation of past damages to the environment. Evaluate cases to determine the applicability of additional statutory authorities.
4. Consistent with Number 1, both agencies will pursue civil litigation and seek voluntary actions to remediate contaminated sites, including contaminated sediments in the Grand Calumet River/Indiana Harbor Ship Canal, and compel responsible parties to undertake clean up at contaminated sites to remove hazardous, toxic and solid wastes and to clean up leaking underground storage tanks.
5. EPA will follow its Supplemental Environmental Project Policy to facilitate inclusion of environmental and pollution prevention projects in its enforcement settlements. IDEM will complete its Supplemental Environmental Project Policy in order to do the same.
6. Work with local governments to identify their authorities and use them more effectively to address violators, including open dumpers, air pollution sources, and industrial dischargers to municipal sewage treatment plants.
7. At permitted and closing RCRA sites, prioritize and complete closure and/or corrective action.
8. Implement a compliance and enforcement strategy which increases inspection surveillance of and enforcement against sources of Volatile Organic Compounds (VOCs), Particulate Matter (PM-10), and toxic sources.
9. Continue to implement the Great Lakes Enforcement Strategy dated 9-15-93 for reducing toxic discharges to Grand Calumet River/Indiana Harbor Ship Canal.

Opportunities for Public Involvement:

- The citizens of Northwest Indiana have the opportunity and responsibility to be aware of problems and call them to the attention of their city and/or county officials, or contact IDEM or EPA about them. Additionally, citizen suit provisions exist in many state and federal laws, as another means to bring about compliance with the law.

LAND AND GROUND WATER REMEDIATION

Goal:

Protect Northwest Indiana from the release of hazardous substances, petroleum or petroleum-related substances and clean up of contaminated lands and ground water.

Objective:

Prevent the release of hazardous substances, petroleum or petroleum-related substances to the land or ground water; if releases occur, ensure the immediate containment and clean up; and use all applicable Federal and State authorities and programs to address the containment, removal and/or treatment of hazardous substances, petroleum or petroleum-related substances currently contaminating land or ground water of Northwest Indiana.

Definitions:

- Northwest Indiana Brownfields Redevelopment Project: A local initiative of East Chicago, Gary, and Hammond and IDEM to identify properties unused because of potential environmental contamination, and to encourage their remediation and reuse.
- Superfund: The Comprehensive Environmental Response, Compensation and Liability Act of 1980; the federal law which established a mechanism for identification and remediation of the worst hazardous substance contaminated sites in the U.S.
- Voluntary Remediation Program: A cooperative initiative between the state and private parties in which contaminated sites are remediated with state oversight and, upon successful completion of the remediation, a Covenant Not To Sue is issued to the property.
-

Background:

- Northwest Indiana has been the site of substantial industrial activity for over 100 years. Past industrial practices in Northwest Indiana often did not consider their future impact upon the environment and have resulted in significant contamination of the soils and ground water. This historical contamination has not only resulted in potential threats to human health and the environment but is now impacting the local economies through the real or perceived threat of environmental liability on properties within Northwest Indiana.
- IDEM and EPA have many different programs within their authority over the prevention and correction of pollution of the land and ground water. Northwest Indiana, because of its size and density, presents a major challenge to all involved. Through this Action Plan, EPA and IDEM will work to coordinate, and where possible, accelerate addressing land and ground water contamination.

Major Activities:

1. Continue to coordinate and aggressively pursue targeted actions to protect and remediate contaminated land and ground water through federal and state Superfund emergency and remedial programs, petroleum clean ups, corrective actions, closures and non-traditional efforts.
2. Improve coordination with other units of government to enhance protection and achieve clean up where no one agency or department has complete authority, and foster partnerships with other major stakeholders.

Efforts will continue to work with state and federal agencies, such as the Indiana Department of Natural Resources, Indiana Department of Commerce, U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, the National Biological survey, and local units of government. Through such efforts EPA and IDEM can effectively extend their programs and resources to address egregious problems over which neither agency has complete authority.

3. Identify and encourage the use of both innovative approaches and innovative technologies for land and ground water remediation.

The August 1994, execution of a voluntary Memorandum of Cooperation (MOC) by IDEM and EPA with local

industries is an example of an innovative approach to a vexing problem. The MOC describes a way to prevent future releases of petroleum to the Indiana Harbor Ship Canal from the ground water beneath the properties of the signatories. Several companies have agreed to voluntarily take measures to prevent the migration of petroleum to the canal which may be currently occurring. EPA and IDEM will also continue to research and use, where appropriate, new technologies to enhance the effectiveness of clean up actions.

4. Continue efforts to map, locate, and define the extent and thickness of petroleum-related products on or within, the soils and ground water.

The continuing mapping efforts will provide the location of pockets of "floating oil" on the ground water; assist in prioritizing clean ups and assist in evaluating the impacts on the environment.

5. Continue to assist and coordinate with the Northwest Indiana Brownfields Redevelopment Project through the identification of potential sites and through the innovative use of Indiana's Voluntary Remediation Program. IDEM and EPA will also seek out further opportunities to work with local units of government and industry for further "Brownfield" redevelopment opportunities throughout the entire geographic initiative area.

The implementation of the "Brownfields" approach will not only provide enhanced clean up and the protection of green fields outside the metropolitan areas but has the potential to result in positive economic impacts.

6. Identify and resolve regulatory barriers to achieving remediation of contaminated sites.

The purpose of this activity is to clearly define the authorities and tools state and federal staff may use to prevent and/or address spills, releases or existing contamination in the most effective manner. IDEM and EPA will review and develop a "tool box" of mechanisms which may be employed to obtain compliance under state and federal hazardous substance and oil pollution legislation.

Opportunities for Public Involvement:

IDEM and EPA rely on the public to help identify suspected locations of contamination in the soil and/or ground water. We will keep the public current on activities associated with clean ups and continue to encourage their participation in formal comment periods used to gather input on site specific projects. Throughout the implementation of this element of the Action Plan, EPA and IDEM will continue to look for and provide opportunities for further cooperation with the public, government agencies and industry.

POLLUTION PREVENTION

Goal:

Integrate pollution prevention and environmental stewardship into industry practices and public behavior in Northwest Indiana.

Objective:

IDEM and EPA will engage in a consistent effort promoting pollution prevention and environmental stewardship in Northwest Indiana. In general, IDEM will take the lead on pollution prevention in the region. Through this consistent effort by the agencies, industry and the public in Northwest Indiana can adopt pollution prevention and environmental stewardship practices. Success will be measured by integration of pollution prevention measures into other Action Plan activities. When this objective is met, the pollution prevention and environmental stewardship committee should no longer be necessary.

Definitions:

- Environmental Waste: All environmental pollutants, wastes, discharges or emissions, regardless of whether or how they are regulated, and regardless of whether they are released to the general environment or the workplace environment.
- CFR: Code of Federal Regulations.
- Toxic Materials: For purposes of this Action Plan, toxic materials are substances on the CERCLA Hazardous Substance list (40 CFR Part 302), and they also include toxic chemicals as defined by 40 CFR Part 372.
-

Background:

- Pollution prevention and, in the broader sense, environmental stewardship, are the primary mechanisms for positive change for IDEM and EPA activities in Northwest Indiana. Each agency has committed resources to the issues and will continue to emphasize pollution prevention as a priority. These efforts will be aggressively incorporated into the agencies' activities whenever possible.
- Indiana's program seeks a dramatic shift in perspective to pollution prevention, rather than incremental shifts towards this best approach. These incremental shifts from disposal to treatment to recycling, and then finally prevention, delay the time when the economic and environmental benefits of prevention can be realized. To promote this shift, Indiana has a strong definition of pollution prevention that is unique in the United States.
-
- EPA and IDEM believe it is important to recognize that while there are differences between state and federal pollution prevention legislation, EPA and IDEM are committed to working as partners in Northwest Indiana to achieve reductions in the generation of pollution and/or its release to the environment.
- Pollution prevention means the use of practices that reduce or eliminate the industrial use of toxic materials or the hazards associated with an environmental waste without diluting or concentrating the waste before the release, handling, storage, transport, treatment, or disposal of the waste.
- Pollution prevention consists of activities that directly impact the production of a product or the providing of a service. It includes product reformulation, production process redesign, housekeeping, environmental and process training, inventory control, preventive maintenance, energy conservation by the energy producer, and on-site closed-loop recycling. It does not include waste burning, waste exchanges, most recycling, or environmental remediation activities.
- Environmental stewardship includes pollution prevention, but is a broader concept. It means activities that protect the environment either directly or indirectly. Some examples of activities that are not pollution prevention but are environmental stewardship include: energy conservation (unless activity is by energy producer), waste minimization, environmental education, household hazardous waste collection, and sediment remediation.
-
- IDEM and EPA have active pollution prevention and environmental stewardship efforts in the region. For the most part, IDEM has taken the lead in implementing these efforts, with financial and/or technical support from EPA. The exceptions to this are the Steel Industry Pollution Prevention effort, which is entirely state funded, and EPA's Hazardous Waste Minimization Assessments, which were entirely federally funded. Other efforts include the Enviromobile, Hazardous Waste Minimization Studies, and the Grand Calumet River District Pollution Prevention Effort. In general, IDEM has taken the lead on these efforts with support from EPA.

Major Activities:

1. The Pollution Prevention Implementation Committee will aggressively integrate pollution prevention objectives into the other components of this Action Plan over the next two years. IDEM will facilitate integration by assigning a representative of the Office of Pollution Prevention and Technical Assistance to work on each of the objectives that address preventing future pollution. EPA will work with its staff to ensure that pollution prevention is an integral part of the Action Plan and the agency's efforts.
2. The EPA, with IDEM support, will continue to assist companies in their efforts to identify and evaluate pollution prevention, waste minimization, and environmental stewardship opportunities. In the future, assessment results will distinguish between pollution prevention, waste minimization, and environmental stewardship.
3. IDEM, with the support of EPA, has developed a measure of pollution prevention progress among manufacturers in the region. This committee will work with the citizens to get the information out in a format that is understandable.
4. This committee will promote opportunities within this Initiative for public and industry awareness of and participation in pollution prevention and environmental stewardship activities.

Opportunities for Public Involvement:

-
- The public, industry and local government are already working toward pollution prevention and environmental stewardship by participating in household hazardous waste collection, and environmental education, including the Enviromobile, teacher education, and continuing public forums on pollution prevention and environmental stewardship.

REMEDIAL ACTION PLAN AND LAKEWIDE MANAGEMENT PLAN

Goal:

Eliminate pollution that impairs beneficial uses in Lake Michigan and the Grand Calumet Area of Concern and restore those beneficial uses.

Objective:

Implement Annex 2 (see definition below) of the Great Lakes Water Quality Agreement (GLWQA) through the use of an ecosystem approach to address the environmental problems which impair beneficial uses of Lake Michigan and the Grand Calumet Indiana Harbor Ship Canal Area of Concern.

Definitions:

- Annex 2: A section within the GLWQA that requires any Great Lakes State with an area of concern to prepare a Remedial Action Plan (RAP). Annex 2 also requires the United States and Canada prepare Lakewide Management Plans (LaMP's) for each of the five Great Lakes.
- Area of Concern (AOC): A geographic area that fails to meet the objectives of the GLWQA and where such failure has caused or is likely to cause impairment of beneficial uses. There are 43 AOCs' surrounding the Great Lakes, one of which is in Indiana. The Grand Calumet Indiana Harbor Ship Canal Area of Concern is bounded by the State of Illinois on the west, Porter County on the east, Interstate 80/94 on the south, and the Indiana portion of Lake Michigan on the north.
- Ecosystem: The interacting components of air, land, water, and living organisms, including humans.
- Great Lakes Water Quality Agreement : A product of the 1909 Boundary Waters Treaty between the United States and Canada. The agreement, last amended in 1987, was negotiated and signed by both countries to protect and restore the water quality of the five Great Lakes and the waterways which connect them.
- Impairment to beneficial use: A change in the chemical, physical, or biological integrity of the Great Lakes System sufficient to cause any of the following: restrictions on fish and wildlife consumption; tainting of fish and wildlife flavor; degradation of fish and wildlife populations; fish tumors or other deformities; bird or animal deformities or reproduction problems; degradation of benthos; restrictions on dredging activities; eutrophication or undesirable algae; restrictions on drinking water consumption, or taste and odor problems; beach closings; degradation of aesthetics; added costs to agriculture or industry; degradation of phytoplankton and zooplankton populations; and loss of fish and wildlife habitat.
- International Joint Commission: The Boundary Waters Treaty of 1909 between the United States and Canada established a six-member commission which oversees water quality matters with regards to the Great Lakes and advises both countries. The commission reviews Lakewide Management Plans and Remedial Action Plans.
- Combined Sewer Overflow: A combined sewer system is a sewer system owned by a state or municipality that collects waste water and storm water through a single-pipe system and conveys it to a publicly owned treatment works plant. A combined sewer overflow is a structural device which discharges from the combined sewer system at a point prior to the publicly owned treatment works plant.

Lakewide Management Plans: A comprehensive effort to identify the critical pollutants within a Great Lake and determine what steps need to be taken to eliminate lakewide problems caused by both conventional and toxic pollutants.

- Remedial Action Plan: The identification of the causes of use impairments within a harbor, bay or tributary to a Great Lake, and the development of an implementation plan and schedule to address the problems which caused the impairments using an ecosystem approach.

Background:

- Annex 2 of the GLWQA requires Indiana to prepare a RAP for the Grand Calumet/Indiana Harbor Ship Canal AOC. In addition, Annex 2 requires the United States Government to lead the development of a lakewide management plan for Lake Michigan. Close collaboration between the federal government and the state of Indiana on both planning efforts is essential to their ultimate success and the long term protection and restoration of the AOC. While IDEM is charged with developing the process to produce a RAP, the comprehensive nature of the problems facing Northwest Indiana will require the continued involvement of many stakeholders, public and private, as long-term ecosystem approaches are pursued. EPA provides a uniquely supportive role of the State's RAP efforts, offering financial, technical and capacity building resources. Moreover, Indiana's contribution to the Lake Michigan LaMP will rely heavily on the remedial strategies developed through the RAP. The LaMP, in turn, will assist the development of the RAP by assessing the environmental impacts of current loadings to Lake Michigan and helping identify how future loadings can be reduced.
- Stage 1 of the RAP, an assessment of beneficial use impairments, was completed in January 1991. The development of key strategies to address such impairments during Stage II, which is the implementation phase of the RAP process, will be completed in 1995. The long term protection and restoration of the AOC is the chief aim of the tasks targeted initially for implementation or subsequently selected in bi-partisan fashion.
- Considerable progress has been made through IDEM and EPA's cooperation on AOC activities. Enforcement actions taken against polluters located within the AOC has prevented hundreds of thousands of pounds of pollutants from

entering the environment. A household hazardous waste collection program, funded by EPA and implemented by IDEM, resulted in the proper disposal of many harmful substances which might have ended up in the sewers, landfills or waterways. Another joint project between the agencies resulted in the Grand Calumet Sanitary Districts Toxic Pollution Prevention Project. This voluntary, collaborative project works with cities and industries to reduce discharges of chemicals to sewage treatment plants and, ultimately, the Grand Calumet River. Future efforts will include identifying further opportunities, and working with local communities, to minimize the adverse impacts of combined sewer overflows which have historically resulted in annual discharges of up to 7.3 billion gallons of untreated sewage and storm water in the Grand Calumet and Indiana Harbor Ship Canal.

Major Activities:

1. Identify persistent toxic substances and the sources from which they are being released into, and are affecting the ecosystem health of, Lake Michigan from the Grand Calumet River and Indiana Harbor Ship Canal through the review of existing data and information.
2. Estimate, on a gross scale, total pollutant loadings from the Grand Calumet River and Indiana Harbor Ship Canal into Lake Michigan through the review of all existing information systems, such as the Toxic Release Inventory, data bases, and sediment transport information generated by the U.S. Army Corps of Engineers.
3. For future reduction activities, develop critical pollutant load estimates for individual sources where data exists, and develop monitoring plans to gather data where none currently exist.
4. Identify and implement short-term and long-term pollution prevention and environmental stewardship activities to further reduce critical pollutant loads to Lake Michigan.
5. Complete the revisions to the Stage I RAP called for by the International Joint Commission in its review of the document. Establish a firm schedule to complete all remaining components of the Stage II RAP.
6. Implement watershed management plans for both Wolf and George Lakes and for the Grand Calumet River Lagoons at Marquette Park. Support the restoration of natural areas, especially wetlands, to continue the ecosystem restoration required by Annex 2.
7. Develop greater public involvement in pollution control, ecosystem protection, and the responsibilities of municipal government through workshops, open houses, and other events as may be determined by the agencies and the public and by facilitating open house events.
8. Support and provide special assistance to the LaMP/RAP Toxic Pollution Prevention Project as it expands in scope, providing limited technical assistance to dischargers to the Grand Calumet River and Indiana Harbor Ship Canal to reduce these dischargers' toxic pollutant loads on a voluntary cooperative basis.

Opportunities for Public Involvement:

- Annex 2 requires that the public be extensively involved in the development of every facet of both the RAP and LaMP. To meet this requirement the State of Indiana has established the Citizens Advisory for the Remediation of the Environment (CARE). CARE is an advisory group to the state composed of citizen members representing a broad array of backgrounds and interests. EPA and the four Great Lakes States rely on citizen input from groups such as the LaMP public forum. Additionally, both IDEM and EPA have held, and will continue to host, public workshops on specific issues brought forward by the public. The Action Plan was initiated to address several of the most difficult immediate environmental problems facing Northwest Indiana; the RAP process, however, is designed to protect and restore the environment in the Grand Calumet Area of Concern through the development of long term remedial and preventive strategies. That environment is shaped by the citizens of the area and the RAP must reflect their views of the future and what must be done to create that future.

SEDIMENTS

Goal:

To reduce the adverse impacts of contaminated sediments flowing into Lake Michigan from the Indiana Harbor Ship Canal and the Grand Calumet River and to restore these waterbodies for uses including fishing and wildlife habitat.

Objective:

EPA and IDEM will support the development of and implementation of the RAP for the Area of Concern to protect Lake Michigan from toxic sediments and restore the Grand Calumet River-Indiana Harbor Ship Canal ecosystem. These efforts will control contaminated sediments by means including dredging, in-place treatment and disposal.

Background:

More than twenty-five percent of the nation's steel making capacity is located in Northwest Indiana, along with several major petroleum facilities and other manufacturing plants. Largely as a result of past industrial pollution, substantial deposits of contaminated sediments have formed in the area's various waterbodies. The U.S. Army Corps of Engineers estimates that the Grand Calumet River and the Indiana Harbor and Ship Canal alone contain five to ten million cubic yards of contaminated sediments. This accumulation is due in large part to the suspension of maintenance dredging since 1972 because of the contaminated sediments. This in turn has led to approximately 150,000 cubic yards of these sediments carried into southern Lake Michigan annually. Therefore, IDEM and EPA have developed and will continue to develop strategies, not only to remediate existing contaminated sediment deposits, but to prevent future sediment contamination. Development of sediment disposal facilities, with public participation, is central to the resolution of this problem.

Major Activities:

- Because of the extent and variability of sediment contamination, EPA and IDEM have divided their activities into two categories. Category I consists of on-going or planned projects in the Indiana Harbor Ship Canal and Grand Calumet River aimed primarily at protecting Lake Michigan from the effects of contaminated sediments and improving quality. Category II activities involve development of further actions, using a basin or ecosystem wide approach. These activities will proceed, to the extent possible, as a joint venture between EPA and IDEM. Other long-range control and prevention strategies, such as ground water characterization, source controls, and ground water remediation, will eventually be developed as part of the RAP for the Area of Concern.
-
- Category I activities will:
 - pursue the dredging and disposal of contaminated sediments from the navigable portion of the Indiana Harbor Ship Canal -- the Federal Navigation Channel -- by cooperating with the U.S. Army Corps of Engineers. Such dredging will create a trap to reduce the flow of contaminated sediments into Lake Michigan. For other areas of the Indiana Harbor Ship Canal, IDEM and EPA will use all available tools, including the Inland Steel and LTV Steel Consent Decrees, to control as much sediment as possible;
 - focus on controlling contaminated sediments in the East Branch of the Grand Calumet River using all appropriate tools, including the implementation of the USX and Gary Consent Decrees;
 - pursue contaminated sediment control for the West Branch of the Grand Calumet River.
 - define appropriate measures for remediation and disposal of sediments addressed by the foregoing actions.
 - continue study of environmental conditions in the Indiana Harbor Ship Canal Grand Calumet River ecosystem and organize data to support site-specific actions, as well as analysis of basin-wide impacts of various sediment clean up or control alternatives.
- Category II activities will:

begin development of a comprehensive treatment/storage/disposal strategy for sediments removed from the Indiana Harbor Ship Canal and Grand Calumet River.

 - continue to identify and evaluate available mechanisms including enforcement, corrective action, and voluntary projects, to address non-remediated areas of the Indiana Harbor Ship Canal and Grand Calumet River;
 - continue the development of individual strategies targeting specific pollutants and broad strategies bringing together "responsible parties" to address key geographic areas.

Opportunities for Public Involvement:

The successful completion of this strategy requires significant public outreach by EPA and IDEM, and other involved agencies, on all aspects of this sediments strategy. The agencies will seek out opportunities for education and dialogue with the public regarding sediment control and remediation, and encourage their participation and comment on future sediments work.

Planners warned that road funding is at risk

"How are we going to get people to accept alternatives? The last time we tried this, people rejected it."

Rep. Chester Dohis,
D-Merrillville

■ Northwest Indiana not meeting regulations on traffic congestion, air quality.

BY ROBIN BIESEN
Times Staff Writer

PORTAGE — Transportation planners are warning Northwest Indiana motorists to get serious about alternative transportation, such as car pooling and mass transit.

The region's share of federal highway money might hang in the balance.

At a meeting Wednesday of the Northwestern Indiana Regional Planning Commission Executive Board, transportation planner Darren Henderson said the days when the region was able to squeak by federal regulations on traffic congestion and air quality are numbered.

"Northwest Indiana has done nothing so far to comply with federal (highway funding) legislation. The region has been able to pass the air quality test without modifications," Henderson said. "We are

See PLANNERS p. 2

quickly reaching the wall with air quality conformity. We will not get federal funding for expansion unless we make some changes."

State Rep. Chester Dohis, D-Merrillville, a member of the NIRPC board, doesn't dispute the need to reduce the number of single-occupant cars that crowd the region's thoroughfares.

Dohis squared off with NIRPC planners, though, over the need to re-study the issue of the region's overcrowded highways.

"What is different today than it was when you studied this 10 years ago?" Dohis asked those in charge of re-studying the problem. "Isn't there a study you can dust off instead of spending money to do it again?"

It is going to take more than another study to change the

behaviors that contribute to the problem of congested highways and poor air quality, he said.

"How are we going to get people to accept alternatives?" Dohis asked. "The last time we tried this, people rejected it."

Steve Strains, director of transportation planning for NIRPC, said it would take massive behavior modification to change what has become the status quo in Northwest Indiana.

"This goes to the basic issue of land use and transportation," Strains said. "We have to teach people to think differently about how we travel and we have to think about the alternatives that we provide for people."

At the heart of the issue has been the region's propensity to sprawl away from the urban, industrial cores.

Building new highways or adding capacity to existing corri-

dors simply encourages the problem to continue and escalate, Strains said.

"We can't continue to build and expand roads the way we used to," Strains said. "That is an option we can look at only after we look at other ways to mitigate congestion."

A report detailing the environmental impact of proposed road expansion projects is due to be delivered to the executive board in February.

Collection of Information

This rule contains no collection of information requirements under the Paperwork Reduction Act (44 U.S.C. 3501-3520).

Federalism

The Coast Guard has analyzed this rule under the principles and criteria contained in Executive Order 12612 and has determined that it does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

Environment

The Coast Guard considered the environmental impact of this proposal and concluded that under section 2.B.2. of Commandant Instruction M16475.1 (series), this proposal is categorically excluded from further environmental documentation. A Categorical Exclusion Determination is available by contacting Commander (mps), Eighth Coast Guard District, 501 Magazine Street, New Orleans, LA 70130-3396.

List of Subjects in 33 CFR Part 165

Harbors, Marine safety, Navigation (water), Reporting and recordkeeping requirements, Security measures, Vessels, Waterways.

Regulation

In consideration of the foregoing, Subpart F of Part 165 of Chapter 33, Code of Federal Regulations, is amended as follows:

PART 165—[AMENDED]

1. The authority citation for Part 165 continues to read as follows:

Authority: 33 U.S.C. 1225 and 1231; 50 U.S.C. 191; and 33 CFR 1.05-1(g), 6.04-1, 6.04-6, and 160.5; 49 CFR 1.46.

2. A new § 165.T08-041 is added to read as follows:

§ 165.T08-041 Safety Zone: St. Andrew Bay, Panama City Florida, Hathaway Landing Marina

(a) Location. The following area is a safety zone: In the vicinity of Hathaway Landing Marina between W 85-44' 9", N 30-11' 5" and W 85-44' 9", N 30-11' 3", and W 85-45' 1", N30-11' 7" and W 85-45' 1", N 30-11' 4". The zone is needed to protect personnel and property associated with the Jet Ski Waverunner Exhibition.

(b) Effective date. This section becomes effective at 11:30 A.M. July 20, 1997. It terminates at 4:30 P.M. on July 20, 1997 unless terminated sooner by the Captain of the Port. (c) Regulations: In accordance with the general regulations in § 165.23 of this part, entry

into this zone is prohibited unless authorized by the Captain of the Port.

Dated: June 12, 1997.

J.J. Kichner,

Captain, U.S. Coast Guard, Captain of the Port Mobile, Alabama.

[FR Doc. 97-18992 Filed 7-17-97; 8:45 am]

BILLING CODE 4910-14-M

ENVIRONMENTAL PROTECTION AGENCY**40 CFR Part 52**

[IN53-3; FRL-5860-4]

Approval and Promulgation of State Implementation Plan; Indiana

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: On June 26, 1995, and June 13, 1997, the State of Indiana submitted a Rate-Of-Progress (ROP) plan to reduce Volatile Organic Compounds (VOC) emissions in Lake and Porter Counties by 15 percent (%) from 1990 baseline levels by November 15, 1996, as a requested revision to the Indiana State Implementation Plan (SIP). On April 3, 1997, EPA issued a direct final approval of the Lake and Porter Counties 15% ROP plan, 3% contingency plan, and an Indiana Agreed Order requiring VOC emission controls on Keil Chemical Division, Ferro Corporation, located in Lake County (Keil). On the same day (April 3, 1997) EPA proposed approval and solicited public written comment on these requested SIP revisions. This proposed rule established a 30-day public comment period noting that if adverse comments were received regarding the direct final rule EPA would withdraw the direct final rule and publish an additional final rule to address the public comments. Adverse comments were received during the public comment period relating to the Keil SIP revision. EPA withdrew the direct final rule on May 23, 1997. In today's action, EPA is finalizing approval of the 15% ROP plan. Final action on the 3% contingency plan and the Keil agreed order will be addressed in a subsequent rulemaking action. The 15% ROP plan has reduced VOC emissions in Lake and Porter Counties by approximately 68,242 pounds (lbs) per day. VOC emissions combine with oxides of nitrogen in the atmosphere to form ground-level ozone, a pollutant which can cause inflammation of the lungs, decrease lung capacity, and aggravate asthma. The rationale for this rulemaking is discussed below.

DATES: This final rule is effective August 18, 1997.

ADDRESSES: Copies of the SIP revision request are available for inspection at the following address: (It is recommended that you telephone Mark J. Palermo at (312) 886-6082, before visiting the Region 5 office.)

U.S. Environmental Protection Agency, Region 5, Air and Radiation Division, 77 West Jackson Boulevard, Chicago, Illinois, 60604.

SUPPLEMENTARY INFORMATION:**I. Background on 15% ROP Requirements**

On November 15, 1990, Congress enacted amendments to the 1977 Clean Air Act (Act); Public Law 101-549, 104 Stat. 2399, codified at 42 U.S.C. 7401-7671q. Section 182(b)(1) requires States with ozone nonattainment areas classified as moderate and above to submit a SIP revision known as a 15% ROP plan. This plan must reflect an actual reduction in typical ozone season weekday VOC emissions of at least 15% in the area during the first 6 years after enactment (i.e., by November 15, 1996). The emission reductions needed to achieve the 15% requirement must be calculated using a 1990 anthropogenic VOC emissions inventory as a baseline, minus emissions that have been reduced by: (1) The Federal Motor Vehicle Control Program (FMVCP) measures for the control of motor vehicle exhaust or evaporative emissions promulgated before January 1, 1990; and (2) gasoline Reid Vapor Pressure (RVP) regulations promulgated by November 15, 1990 (55 FR 23666, June 11, 1990). In addition, the plan must account for net growth in emissions within the nonattainment area between 1990 and 1996.

In Indiana, two ozone nonattainment areas are subject to the 15% ROP plan requirement: The Lake and Porter Counties portion of the Chicago severe ozone nonattainment area, and the Clark and Floyd Counties portion of the Louisville moderate ozone nonattainment area. This rulemaking action addresses only the plan for Lake and Porter Counties; the Clark and Floyd Counties 15% ROP plan was approved on May 7, 1997 (62 FR at 24815).

II. Indiana's 15% ROP Submittal

The Act requires States to observe certain procedural requirements in developing SIPs and SIP revisions for submission to EPA. Section 110(a)(2)

and section 110(l) of the Act require that each State's SIP revision submitted under the Act be adopted by the State after reasonable notice and public hearing. The State of Indiana submitted a portion of the Lake and Porter Counties 15% ROP SIP revision on January 13, 1994. The SIP revision was reviewed by EPA to determine completeness shortly after submittal, in accordance with the completeness criteria set out at 40 CFR part 51, appendix V (1991), as amended by 57 FR 42216 (August 26, 1991). However, the submittal was deemed incomplete because the plan had not yet gone through public hearing and did not include fully adopted rules for all of the plan's control measures. Indiana held a public hearing on the plan on March 29, 1994. A summary of comments from that hearing and the Indiana Department of Environmental Management's (IDEM) response was submitted on July 5, 1994. IDEM sent a supplemental submittal on June 26, 1995, which included fully adopted rules for the Lake and Porter Counties 15% ROP plan. In a July 17, 1995, letter to Indiana, the State was notified that the SIP submittal was deemed complete.

III. Criteria for 15% ROP Approvals

The requirements for 15% ROP plans are found in section 182(b)(1) of the Act, and the following EPA guidance documents:

1. *Procedures for Preparing Emissions Projections*, EPA-450/4-91-019, Environmental Protection Agency, July 1991.

2. State Implementation Plans; General Preamble for the Implementation of Title I of the Clean Air Act Amendments of 1990; Proposed rule (57 FR 13498), **Federal Register**, April 16, 1992 (General Preamble).

3. "November 15, 1992, Deliverables for Reasonable Further Progress and Modeling Emission Inventories," memorandum from J. David Mobley, Edwin L. Meyer, and G. T. Helms, Office of Air Quality Planning and Standards, Environmental Protection Agency, August 7, 1992.

4. *Guidance on the Adjusted Base Year Emissions Inventory and the 1996 Target for the 15 Percent Rate of Progress Plans*, EPA-452/R-92-005, Environmental Protection Agency, October 1992.

5. "Quantification of Rule Effectiveness Improvements," memorandum from G. T. Helms, Chief, Ozone/Carbon Monoxide Programs Branch, Office of Air Quality Planning and Standards, Environmental Protection Agency, October 1992.

6. *Guidance for Growth Factors, Projections, and Control Strategies for the 15 Percent Rate-of-Progress Plans*, EPA-452/R-93-002, March 1993.

7. "Correction to 'Guidance on the Adjusted Base Year Emissions Inventory and the 1996 Target for the 15 Percent Rate of Progress Plans'," memorandum from G. T. Helms, Chief, Ozone/Carbon Monoxide Programs Branch, Office of Air Quality Planning and Standards, Environmental Protection Agency, March 2, 1993.

8. "15 Percent Rate-of-Progress Plans," memorandum from G. T. Helms, Chief, Ozone/Carbon Monoxide Programs Branch, Office of Air Quality Planning and Standards, Environmental Protection Agency, March 16, 1993.

9. *Guidance on the Relationship Between the 15 Percent Rate-of-Progress Plans and Other Provisions of the Clean Air Act*, EPA-452/R-93-007, Environmental Protection Agency, May 1993.

10. "Credit Toward the 15 Percent Rate-of-Progress Reductions from Federal Measures," memorandum from G. T. Helms, Chief, Ozone/Carbon Monoxide Programs Branch, Environmental Protection Agency, May 6, 1993.

11. *Guidance on Preparing Enforceable Regulations and Compliance Programs for the 15 Percent Rate-of-Progress Plans*, EPA-452/R-93-005, Environmental Protection Agency, June 1993.

12. "Correction Errata to the 15 Percent Rate-of-Progress Plan Guidance Series," memorandum from G. T. Helms, Chief, Ozone and Carbon Monoxide Programs Branch, Environmental Protection Agency, July 28, 1993.

13. "Early Implementation of Contingency Measures for Ozone and Carbon Monoxide (CO) Nonattainment Areas," memorandum from G. T. Helms, Chief, Ozone/Carbon Monoxide Programs Branch, Environmental Protection Agency, August 13, 1993.

14. "Region III Questions on Emission Projections for the 15 Percent Rate-of-Progress Plans," memorandum from G. T. Helms, Chief, Ozone/Carbon Monoxide Programs Branch, Office of Air Quality Planning and Standards, Environmental Protection Agency, August 17, 1993.

15. "Guidance on Issues Related to 15 Percent Rate-of-Progress Plans," memorandum from Michael H. Shapiro, Acting Assistant Administrator for Air and Radiation, Environmental Protection Agency, August 23, 1993.

16. "Credit Toward the 15 Percent Requirements from Architectural and Industrial Maintenance Coatings,"

memorandum from John S. Seitz, Director, Office of Air Quality Planning and Standards, Environmental Protection Agency, September 10, 1993.

17. "Reclassification of Areas to Nonattainment and 15 Percent Rate-of-Progress Plans," memorandum from John S. Seitz, Director, Office of Air Quality Planning and Standards, Environmental Protection Agency, September 20, 1993.

18. "Clarification of 'Guidance for Growth Factors, Projections and Control Strategies for the 15 Percent Rate of Progress Plans'," memorandum from G. T. Helms, Chief, Ozone/Carbon Monoxide Programs Branch, Office of Air Quality Planning and Standards, Environmental Protection Agency, October 6, 1993.

19. "Review and Rulemaking on 15 Percent Rate-of-Progress Plans," memorandum from G. T. Helms, Chief, Ozone/Carbon Monoxide Programs Branch, Office of Air Quality Planning and Standards, Environmental Protection Agency, October 6, 1993.

20. "Questions and Answers from the 15 Percent Rate-of-Progress Plan Workshop," memorandum from G. T. Helms, Chief, Ozone/Carbon Monoxide Programs Branch, Environmental Protection Agency, October 29, 1993.

21. "Rate-of-Progress Plan Guidance on the 15 Percent Calculations," memorandum from D. Kent Berry, Acting Director, Air Quality Management Division, Environmental Protection Agency, October 29, 1993.

22. "Clarification of Issues Regarding the Contingency Measures that are Due November 15, 1993 for Moderate and Above Ozone Nonattainment Areas," memorandum from D. Kent Berry, Acting Director, Air Quality Management Division, Environmental Protection Agency, November 8, 1993.

23. "Credit for 15 Percent Rate-of-Progress Plan Reductions from the Architectural and Industrial Maintenance (AIM) Coating Rule," memorandum from John S. Seitz, Director, Office of Air Quality Planning and Standards, Environmental Protection Agency, December 9, 1993.

24. "Guidance on Projection of Nonroad Inventories to Future Years," memorandum from Philip A. Lorang, Director, Emission Planning and Strategies Division, Office of Air and Radiation, Environmental Protection Agency, February 4, 1994.

25. "Discussion at the Division Directors Meeting on June 1 Concerning the 15 Percent and 3 Percent Calculations," memorandum from G. T. Helms, Chief, Ozone/Carbon Monoxide Programs Branch, Office of Air Quality

Planning and Standards, Environmental Protection Agency, June 2, 1994.

26. "Future Nonroad Emission Reduction Credits for Court-Ordered Nonroad Standards," memorandum from Philip A. Lorang, Director, Emission Planning and Strategies Division, Office of Air and Radiation, Environmental Protection Agency, November 28, 1994.

27. "Credit for the 15 Percent Rate-of-Progress Plans for Reductions from the Architectural and Industrial Maintenance (AIM) Coating Rule and the Autobody Refinishing Rule," memorandum from John S. Seitz, Director, Office of Air Quality Planning and Standards, Environmental Protection Agency, November 29, 1994.

28. "Transmittal of Rule Effectiveness Protocol for 1996 Demonstrations," memorandum from Susan E. Bromm, Director, Chemical, Commercial Services and Municipal Division, Office of Compliance, Environmental Protection Agency, December 22, 1994.

29. "Future Nonroad Emission Reduction Credits for Locomotives," memorandum from Philip A. Lorang, Director, Emission Planning and Strategies Division, Office of Air and Radiation, Environmental Protection Agency, January 3, 1995.

30. "Credit for the 15 Percent Rate-of-Progress Plans for Reductions from the Architectural and Industrial Maintenance (AIM) Coating Rule," memorandum from John S. Seitz, Director, Office of Air Quality Planning and Standards, Environmental Protection Agency, March 22, 1995.

31. "Fifteen Percent Rate-of-Progress Plans—Additional Guidance," memorandum from John S. Seitz, Director, Office of Air Quality Planning and Standards, Environmental Protection Agency, May 5, 1995.

32. "Update on the Credit for the 15 Percent Rate-of-Progress Plans for Reductions from the Architectural and Industrial Maintenance Coatings Rule," memorandum from John S. Seitz, Director, Office of Air Quality Planning and Standards, Environmental Protection Agency, March 7, 1996.

33. "Date by which States Need to Achieve all the Reductions Needed for the 15% Plan from Inspection and Maintenance (I/M) and Guidance for Recalculation," memorandum from Margo Oge, Director, Office of Mobile Sources, and John S. Seitz, Director, Office of Air Quality Planning and Standards, Environmental Protection Agency, August 13, 1996.

34. "Sample City Analysis: Comparison of Enhanced Inspection and Maintenance (I/M) Reductions Versus Other 15 Percent Rate of Progress Plan

Measures," E.H. Pechan and Associates, December 12, 1996.

35. "Modeling 15 Percent Volatile Organic Compound (VOC) Reduction(s) from I/M in 1999: Supplemental Guidance," memorandum from Gay MacGregor, Director, Regional and State Programs Division, and Sally Shaver, Director, Air Quality Strategies and Standards Division, Environmental Protection Agency, December 23, 1996.

36. "15% Volatile Organic Compound (VOC) State Implementation Plan (SIP) Approvals and the 'As Soon As Practicable' Test," memorandum from John S. Seitz, Director, Office of Air Quality Planning and Standards, and Richard B. Ossias, Deputy Associate General Counsel, Division of Air and Radiation, Office of General Counsel, Environmental Protection Agency, February 12, 1997.

For a 15% ROP plan SIP to be approved, the plan must adequately justify how much emission reduction is needed to achieve 15% emission reduction by November 15, 1996, and how the plan's control strategy will secure that reduction. The procedure for calculating the needed emission reduction is as follows:

(A) Calculate the "1990 ROP inventory" by subtracting from the area's "1990 base year inventory"¹ biogenic emissions, emissions outside of the nonattainment area, and pre-attainment banked emission credits;

(B) Calculate the "1990 adjusted base year inventory" by subtracting from the 1990 ROP inventory any emission reductions from the pre-1990 FMVCP and 1990 RVP Federal regulations which occur between 1990 and 1996;²

¹ Sections 172(c)(3) and 182(a)(1) of the Act require that nonattainment plan provisions include a comprehensive, accurate inventory of actual emissions which occurred in 1990 from all sources of relevant pollutants in the nonattainment area. This inventory provides an estimate of the amount of VOC and oxides of nitrogen produced by emission sources such as automobiles, powerplants and the use of consumer solvents in the household. Because the approval of such inventories is necessary to an area's 15% ROP plan and attainment demonstration, the emission inventory must be approved prior to or with the 15% ROP plan submission.

² The 1990 adjusted base year inventory represents the "baseline emissions" from which the 15 percent reduction is to be calculated, as specified under section 182(b)(1)(B) of the Act. Section 182(b)(1)(B) defines baseline emissions to mean the total amounts of actual VOC emissions from all anthropogenic sources in the ozone nonattainment areas during the calendar year of 1990, excluding emissions that are eliminated by the pre-1990 FMVCP and 1990 RVP regulations. In the General Preamble, EPA interprets "calendar year" emissions to consist of typical ozone season weekday emissions, based on the fact that the ozone National Ambient Air Quality Standard (NAAQS) (0.12 parts per million, one-hour average) is generally exceeded or violated during ozone season

(C) Calculate "15% of adjusted base year emissions" by multiplying the 1990 adjusted base year inventory by 15%;

(D) Calculate the "total required reductions by 1996" by adding emission reductions from the pre-1990 FMVCP and 1990 RVP federal rules to 15% of adjusted base year emissions calculation;³

(E) Calculate the "1996 emissions target level" by subtracting from the 1990 ROP base year inventory the total required reductions by 1996;

(F) Calculate the "1996 projected emission estimate" by either adding growth factors to the 1990 adjusted base-year inventory, or adding growth factors and required emission reductions to the 1990 ROP inventory; and,

(G) Calculate the "reduction required by 1996 to achieve 15% net of growth" by subtracting the 1996 target emissions level from the 1996 projected emissions level.

In determining what control measures a State can use in its 15% ROP plan strategy, the Act provides under section 182(b)(1)(C) that emission reductions from control measures are creditable to the extent that they have actually occurred before November 15, 1996. In keeping with this requirement, the General Preamble states that all credited emission reductions must be real, permanent, and enforceable, and that regulations needed to implement the plan's control strategy must be adopted and implemented by the State by November 15, 1996.

IV. Prior Rulemaking Action

On April 3, 1997, EPA published a direct final rulemaking action approving the Lake and Porter Counties 15% ROP plan and a 3% contingency measure plan for Lake and Porter Counties (62 FR 15844). As part of the 15% ROP plan, Indiana also submitted an agreed order requiring VOC emission controls on Keil Chemical Division, Ferro Corporation, located in Lake County (Keil). On the same day (April 3, 1997), EPA proposed approval and solicited public comment on these requested SIP revisions (62 FR 15867). The proposed rule established a 30-day public comment period, noting that if adverse comments were received regarding the

weekdays when ozone precursor emissions and meteorological conditions are most conducive to ozone formation. Ozone seasons are typically the summer months.

³ Under section 182(b)(1)(D), emission reductions pre-1990 and 1990 RVP regulations are not creditable toward meeting 15%. The emission reductions which occurred by 1996 from these regulations are added to emissions required to meet 15% to determine the total amount of emission reduction by 1996 for the area.

direct final rule EPA would withdraw the direct final rule and publish an additional final rule to address the public comments. The only set of comments received during the public comment period was from the Ferro Corporation regarding the Keil agreed order. Because these comments raised questions about the anticipated emissions reductions of the agreed order, EPA withdrew the direct final rulemaking on May 23, 1997 (62 FR at 28349).

Indiana originally claimed emission reductions from the Keil agreed order in the Lake and Porter 15% plan. The July 29, 1994, agreed order (Cause No. A-2250) requires the facility to meet certain control requirements. The agreed order was submitted with the 15% ROP plan for incorporation into the Indiana SIP so that the State could properly take credit for Keil's emission reductions.

Ferro Corporation's comment supported the Lake and Porter Counties 15% ROP plan, but requested that EPA recognize that Keil's VOC control installed pursuant to the agreed order has achieved more emission reductions than required under federal and State control regulations, and, consequently, the excess emission reductions "should

be credited as a banked pollutant for the future." Ferro Corporation also indicated that EPA and Indiana are still reviewing Keil's compliance determination method for the 25 tons per year VOC emission limit under the agreed order. Ferro requested that EPA agree that Keil should not be held in violation of the SIP for the 25 tons per year limit if EPA and Indiana determine that Keil should use a different compliance determination method.

EPA is currently evaluating the Ferro Corporation comments. To expedite final approval of the 15% ROP plan, Indiana submitted a letter on June 13, 1997, which states that it has changed the allocation of control measure reductions between the Lake and Porter Counties 15% ROP plan and the 3% contingency plan. The agreed order emission reductions (5327 lbs VOC per day) will be shifted from the 15% ROP plan to the 3% contingency plan, and remaining reductions from Inland Steel Flat Product's coke oven shutdown (759 lbs VOC per day) and the State's automobile refinishing rule (4619 lbs VOC per day) have been shifted from the 3% contingency plan to the 15% ROP plan. The amount of emission reductions claimed for the coke oven

shutdown and automobile refinishing rule was found by EPA to be acceptable in the April 3, 1997, direct final approval.

In today's action, EPA is promulgating final approval of the 15% ROP plan as adjusted by Indiana's June 13, 1997, letter. Because shifting emission reduction credit between the two plans does not affect the implementation of the plans' control measures, nor the achievement of 15% reduction required under the Act, reproposing approval of the 15% ROP plan is unnecessary. The 3% contingency plan is a separate requirement of the Act, and approval of the 3% contingency plan is not a prerequisite for approval of the 15% ROP plan. EPA will promulgate a final rulemaking on the 3% contingency plan once EPA completes its evaluation of the Ferro Corporation comments.

V. Analysis of Lake and Porter Counties 15% ROP Plan

Indiana's 15% ROP summary for Lake and Porter Counties is provided in the following table. This table has been adjusted from the table which appeared in the direct final to reflect the State's June 13, 1997, letter. (See part IV of this rulemaking).

15% ROP SUMMARY FOR LAKE AND PORTER COUNTIES

Calculation of Reduction needs by 1996		Lbs Voc/ DayAY
1990 Lake and Porter Counties Total VOC Emissions		424,721
1990 ROP Emissions (Anthropogenic only)		381,841
1990-1996 Noncreditable Reductions (Reductions from 1990 RVP and Pre-1990 FMVCP Regulations)		58,838
1990 Adjusted Base Year Emissions (1990 ROP Emissions minus Noncreditable Reductions)		323,003
15% of Adjusted Base Year Emissions		48,450
Total Required Emission Reductions by 1996 (15% of Adjusted Base Year Emissions plus Noncreditable Reductions)		107,288
1996 Target Level (1990 ROP Emissions minus Total Required Emission Reductions by 1996)		274,553
1996 Projected Emissions (1990 Adjusted Base Year Emissions plus Growth Factors)		342,683
Reduction needs by 1996 to achieve 15 percent net of growth (1996 Projected Emission minus 1996 Target Level)		68,130
Creditable Reduction from Mandatory Controls		
Mobile Sources:		
Enhanced Vehicle Inspection and Maintenance (I/M) Program (326 IAC 13-1.1)		6,817
Federal Reformulated Gasoline Program (40 CFR Part 80, Subpart D)		14,905
Area Sources:		
Stage II Gasoline Vapor Recovery (326 IAC 8-4-6)		9,824
Federal Architectural and Industrial Maintenance (AIM) Coatings Rule		2,920
Point Sources:		
Non-Control Techniques Guideline (CTG) Reasonably Available Control Technology (RACT) Rule (326 IAC 8-7)		4,559
Subtotal—Reductions from Mandatory Controls		39,025
Creditable Reductions From Non-Mandatory Controls		
Point Sources:		
Coke Oven Battery Shutdowns at Inland Steel Flat Products (326 IAC 6-1-10.1(k)(5))		23,609
Area Sources:		
Automobile Refinishing (326 IAC 8-10)		4,679
Residential Open Burning (326 IAC 4-1)		929
Subtotal—Reduction From Non-Mandatory Controls		29,217
Total Creditable Reductions from 15% ROP plan		68,242

A. Calculation of the 1990 Adjusted Base Year Emission Inventory

To determine the 1990 adjusted base year inventory, Indiana used the 1990 base year emission inventory approved by EPA on January 4, 1995 (60 FR 375), which was found to meet the requirements of sections 172(c)(3) and 182(a)(1) of the Act for Lake and Porter Counties. Total VOC emissions estimated from this inventory are 424,721 lbs VOC/day. Indiana subtracted biogenic emissions and emissions from outside Lake and Porter Counties from the 1990 base year inventory to determine that the 1990 ROP inventory level is 381,841 lbs VOC/day. No pre-enactment banked emission credit was included in this inventory.

Indiana used EPA's Mobile Source Emissions Model (MOBILE)5a to calculate the emission reductions from the pre-1990 FMVCP and 1990 RVP regulations; these reductions were subtracted from the 1990 ROP inventory level to find the 1990 adjusted base year inventory level of 323,003 lbs VOC/day. Indiana's documentation includes the actual 1990 motor vehicle emissions using 1990 vehicle miles traveled (VMT) and MOBILE5a emission factors, and the adjusted emissions using 1990 VMT and the MOBILE5a emission factors in calendar year 1996 with the appropriate RVP for the nonattainment area as mandated by EPA. The plan includes adequate documentation showing how the MOBILE5a model was run to calculate the expected emission reductions from FMVCP and RVP.

B. 1996 ROP Target Emission Level

To calculate the 1996 target emission level for Lake and Porter Counties, Indiana first multiplied the 1990 adjusted base year inventory by 0.15 to determine that the 15% required emission reduction by 1996 is 48,450 lbs VOC/day. Then, 58,838 lbs VOC/day of reductions from non-creditable control measures (pre-1990 FMVCP and 1990 RVP) were added to the 15% required reduction to find that the total required reductions by 1996 is 107,288 lbs VOC/day. Finally, Indiana subtracted the 1996 total required emission reductions from the 1990 ROP emission inventory to determine that the 1996 emission target level for Lake and Porter Counties is 274,553 lbs VOC/day.

The 15% ROP plan submittal adequately documents the calculations used to determine the Lake and Porter Counties target level by showing each step, discussing any assumptions made, and stating the origin of the numbers used in the calculations.

C. Projected Emission Inventory

To determine the 1996 projected emission inventory, Indiana has included in the 15% ROP plan the growth factors used together with documentation for the assumptions made. The point, area, and non-road mobile source emission inventories were projected using either source supplied data, population forecasts, historical data, or, where historical data were unavailable or not suitable to project, the U.S. Department of Commerce Bureau of Economic Analysis (BEA) regional growth data were used. The on-road mobile source emission inventory was projected using MOBILE5a. The State's calculations for growth in the on-road mobile, off-road mobile, industrial, and area source sectors is 10,180 lbs VOC/day, 1,298 lbs VOC/day, 4,692 lbs VOC/day, and 3,510 lbs VOC/day, respectively, for a total of 19,680 lbs VOC/day. These growth estimates were calculated in a manner consistent with EPA's guidance documents. The projected emissions were added to the 1990 adjusted base year inventory to determine that the 1990 projected emission inventory level is 342,683 lbs VOC/day.

D. Creditable Reductions from Control Measures

From the calculation of the 1996 target emission level and 1996 projected emission level, Indiana must reduce emissions in Lake and Porter Counties by 68,130 lbs VOC/day, to secure the 15% ROP reduction. The Lake and Porter Counties 15% ROP plan does meet this requirement. The total creditable emission reductions achieved by the 15% ROP plan are 68,242 lbs VOC/day. Emission reductions not needed to meet the 15% ROP requirement will be applied toward achieving post-1996 ROP reductions, leading to attainment of the ozone air quality standard.

The SIP submittal includes documentation indicating the sources or source categories which are expected to be affected by each control measure, the sources' projected 1996 emissions without controls, and the assumptions used to estimate how much the sources' 1996 emissions would be reduced by each control measure. These assumptions were derived primarily from Midwest Research Institute's April 30, 1993, document entitled "Support Document for Indiana's Lake and Porter Nonattainment Area 1996 Rate of Progress Plan," which was contracted by EPA to assist Indiana in developing the 15% ROP and contingency plans. A

review of the emission reduction credit taken for each control measure follows:

Enhanced I/M Program

Of the 15% ROP plans originally submitted to EPA, most contain enhanced I/M programs because they achieve more VOC emission reductions than most, if not all other, control strategies. However, because most States experienced substantial difficulties implementing enhanced I/M programs, only a few States are currently actually testing cars using the original enhanced I/M protocol.

On September 18, 1995 (60 FR 48029), EPA finalized revisions to its enhanced I/M rule allowing States significant flexibility in designing I/M programs appropriate for their needs. Further, Congress enacted the National Highway Systems Designation Act of 1995 (NHSDA), which provides States with more flexibility in determining the design of enhanced I/M programs. The substantial amount of time needed by States to re-design enhanced I/M programs in accordance with the final enhanced I/M rules and/or the guidance contained within the NHSDA, to secure State legislative approval when necessary, and set up the infrastructure to perform the testing program has precluded States from obtaining emission reductions from enhanced I/M by November 15, 1996.

Given the heavy reliance by many States on enhanced I/M programs to help satisfy 15% ROP plan requirements, and the recent NHSDA and regulatory changes regarding enhanced I/M programs, EPA has recognized that it was not possible for many States to achieve the portion of the 15% ROP reductions that are attributed to enhanced I/M by November 15, 1996. Under these circumstances, disapproval of the 15% ROP plan SIPs would serve no purpose. Consequently, under certain circumstances, EPA will allow States that pursue re-design of enhanced I/M programs to receive emission reduction credit from these programs in their 15% ROP plans, even though the emission reductions from the I/M program will occur after November 15, 1996.

Specifically, the EPA will approve 15% ROP SIPs if the emission reductions from the revised, enhanced I/M programs, as well as from the other 15% ROP plan measures, will achieve the 15% level as soon after November 15, 1996, as practicable. To make this "as soon as practicable" determination, the EPA must determine that the 15% ROP plan contains all VOC control strategies that are practicable for the nonattainment area in question and that

meaningfully accelerate the date by which the 15% level is achieved. The EPA does not believe that measures meaningfully accelerate the 15% date if they provide only an insignificant amount of reductions.

Indiana's enhanced I/M program for Lake and Porter Counties was approved by EPA on March 19, 1996 (61 FR 11142), and the State began testing vehicles under the new program on January 1, 1997. A single contractor, Envirotest, Inc., operates a test-only centralized network for inspections and re-inspection. The Indiana I/M program requires coverage of all 1976 and newer gasoline powered light duty passenger cars and light duty trucks up to 9,000 pounds Gross Vehicle Weight Rating (GVWR). All applicable 1981 and newer vehicles will be subject to a transient, mass emissions tailpipe test that includes the purge and pressure test. All applicable 1976 through 1980 vehicles will be subject to a BAR90 single-speed idle test that includes the pressure test. The I/M contractor has acquired all the emission test sites required under the State I/M contract, and all the test stations required have been constructed.

EPA has analyzed Indiana's enhanced I/M program to predict when the emission reductions claimed in the Lake and Porter Counties 15% ROP plan for the program will actually be secured. This analysis was based on the methodology specified in EPA's policy memoranda, "Date by Which States Need to Achieve all the Reductions Needed for the 15% Plan from I/M and Guidance for Recalculation," August 13, 1996, and "Modeling 15% VOC Reduction(s) from I/M in 1999—Supplemental Guidance," December 23, 1996. MOBILE5b runs were used to evaluate the credit using inputs that reflect actual program startup. Some of the input parameters of the modeling included: a January 1, 1997, program start date; start-up cutpoints as recommended by EPA; and expected evaporative test procedures available at start-up. The State has taken credit in the Lake and Porter Counties 15% ROP plan for 6,817 lbs VOC/day, or 3.41 tons per day reductions from enhanced I/M. Based on EPA's analysis, the emission reduction claimed will be secured by November 1999. See EPA's August 13, 1996, policy memorandum titled "Date by Which States Need to Achieve all the Reductions Needed for the 15% Plan from I/M and Guidance for Recalculation," for further discussion on the November 1999 date.

To determine whether there are other available potential control measures which can meaningfully accelerate the date by which a 15% reduction in VOC

emissions in Lake and Porter Counties can be achieved, EPA compared the Lake and Porter Counties 15% ROP and 3% contingency plans with control measures included in 15% ROP plans nation-wide, which are listed in EPA's report, "Sample City Analysis: Comparison of Enhanced I/M Reductions Versus other 15 Percent ROP Plan Measures," December 12, 1996, referenced in EPA's policy document "15% VOC SIP Approvals and the 'As Soon As Practicable' Test," February 12, 1997. Based upon the report, EPA believes there are no other potential control measures beyond those already included in the Lake and Porter Counties 15% ROP and 3% contingency plans which can secure a significant amount of emission reduction before November 1999.

Because Indiana's enhanced I/M program will secure emission reductions claimed under the Lake and Porter Counties 15% ROP plan by November 1999, and because there are no other potential control measures which can meaningfully accelerate the achievement of a 15% reduction in the counties before November 1999, the EPA finds that the Lake and Porter Counties 15% ROP plan does secure a 15% emission reduction as soon as practicable. On this basis, the emission reduction claimed for the Lake and Porter Counties enhanced I/M program under the 15% ROP plan is approvable.

Federal Reformulated Gasoline Program

The federal reformulated gasoline program (40 CFR part 80, subpart D) requires gasoline providers in Lake and Porter Counties to sell only gasoline which meets certain blending requirements to reduce pollution. The VOC reduction from reformulated gasoline was determined using the MOBILE5a model to estimate the difference between 1996 highway mobile source emissions at RVP 9.0, the level of control upon gasoline in Lake and Porter Counties before the reformulated gasoline requirement, and 1996 highway mobile source emissions with reformulated gasoline. Indiana has credited a 14,905 lbs VOC/day emission reduction from this program, which is acceptable.

Stage II Gasoline Vapor Recovery Rule

Indiana's Stage II rule (326 IAC 8-4-6) requires facilities that sell more than 10,000 gallons of gasoline per month to operate Stage II vapor recovery systems certified to have a control effectiveness of at least 95%. Indiana has estimated that the rule has a 84% program in-use efficiency, accounting for annual inspection program effects and the

exemption of facilities with a monthly gasoline throughput of less than 10,000 gallons. Indiana has credited a 9,824 lbs VOC/day emission reduction from this rule, which is acceptable.

Federal AIM Coatings Rule

Pursuant to section 183(e) of the Act, EPA proposed on June 25, 1996 (61 FR 32729), a national rule requiring manufacturers of AIM coatings to meet VOC content limitations. The March 7, 1996, EPA memorandum "Update on the Credit for the 15 Percent Rate-of-Progress Plans for Reductions from the Architectural and Industrial Maintenance Coatings Rule" allows States to take credit for a 20% reduction in AIM coating emissions, even though promulgation of the rule has been delayed. Based on this policy, Indiana has taken an emission reduction credit of 2,920 lbs VOC/day, which is acceptable.

Non CTG RACT Rule

Indiana's Non-CTG RACT rule (326 IAC 8-7) requires VOC controls on sources which have the potential to emit 25 tons of VOC emissions per year, and are not already covered under an existing CTG or part of a post-1990 CTG category.⁴ Sources subject to this rule are allowed to demonstrate compliance by choosing among any one of the following three available options: (1) Achieve an overall VOC reduction in baseline actual emissions of 98% by the addition of add-on controls or documented reduction in VOC-containing materials used; (2) achieve a level of reduction equal to 81% of baseline actual emission by the same means as stated above, where it is demonstrated that a 98% reduction in source emissions is not achievable; or (3) achieve an alternative overall emission reduction by the application of RACT as determined by the State and EPA. Indiana estimates that the rule's overall control efficiency is 81%, and has a rule effectiveness of 80%. Indiana has credited 4,559 lbs VOC/day in emission reductions from this rule, which is acceptable.

Coke Oven Battery Shutdowns at Inland Steel Flat Products

Inland Steel is required under Indiana's Particulate Matter rule 326 IAC 6-1-10.1(k)(5) to shut down

⁴ RACT is the lowest emission limitation that a particular source is capable of meeting by the application of control technology that is reasonably available, considering technological and economic feasibility. CTGs are EPA documents which provide recommendations on what EPA considers the presumptive norm for RACT for particular industries. Indiana was required to adopt the Non-CTG RACT rule by section 182(b)(2) of the Act.

numbers 6 through 11 coke batteries before 1996. The 1990 base year inventory emissions from these coke batteries, 23,609 lbs VOC/day, are being credited as emission reductions. These reductions are acceptable.

Residential Open Burning Rule

Under Indiana's rule 326 IAC 4-1, residential open burning is banned in Lake and Porter Counties. Indiana estimates 80% emission reduction and 80% rule effectiveness from this rule. An emissions reduction credit of 929 lbs VOC/day from the rule is acceptable.

Automobile Refinishing Rule

The State rule 326 IAC 8-10 requires automobile and mobile equipment refinishing shops to use lower VOC coatings, less-emitting spray-gun and spray-gun cleaning equipment, and improved work practices to reduce

VOC. To improve rule effectiveness, this rule also requires refinishing coating suppliers in the area to sell only coatings which meet the VOC limits required in the rule. In addition to documentation contained in the submittal, Indiana submitted supplemental documentation which indicates that an overall 77.8% emission reduction can be expected from all the control measures required by this rule, with 100% rule effectiveness. This documentation has been included in the docket for this rulemaking. Indiana has taken an emission reduction credit of 4,679 lbs VOC/day from this rule, which is acceptable.

E. Enforceability Issues

All measures and other elements in the SIP must be enforceable by the State and EPA (See sections 172(c)(6), 110(a)(2)(A) of the Act, and 57 FR

13556). The EPA criteria addressing the enforceability of SIPs and SIP revisions were stated in a September 23, 1987 memorandum (with attachments) from the Assistant Administrator for Air and Radiation (see 57 FR 13541). Nonattainment area plan provisions must also contain a program that provides for enforcement of the control measures and other elements in the SIP (see section 110(a)(2)(C) of the Act).

The control measures included in the Lake and Porter 15% ROP plan have been fully adopted by Indiana and have been submitted to EPA as revisions to the State's ozone SIP. The EPA has independently reviewed each control measure to determine conformance with SIP requirements under section 110 and part D of the Act, and the overall enforceability of the measure's requirements. Rulemaking action on each control measure is as follows:

Control measure	Date of EPA approval
Enhanced I/M Program (326 IAC 13-1.1)	March 19, 1996 (61 FR 11142).
Reformulated Gasoline (40 CFR Part 80, Subpart D)	Federal regulation promulgated February 16, 1994 (59 FR 7716).
Stage II Gasoline Vapor Recovery (326 IAC 8-4-6)	April 28, 1994 (59 FR 21942).
Federal AIM Coatings Rule	Proposed federal regulation for which Indiana can take credit. (See memorandum dated March 7, 1996, from John Seitz, Director, Office of Air Quality Planning and Standards to Regional Air Division Directors).
Non-CTG RACT (326 IAC 8-7)	July 5, 1995 (60 FR 34857).
Residential Open Burning Ban (326 IAC 4-1)	February 1, 1996 (61 FR 3581).
Auto Refinishing (326 IAC 8-10)	June 13, 1996 (61 FR 29965).
Coke Oven Battery Shutdown (326 IAC 6-1-10.1(k)(5))	June 15, 1995 (60 FR 31412).

F. Transportation Conformity 1996 Mobile Source Emissions Budget

Section 176(c) requires States to submit SIP revisions establishing the State's criteria and procedures for assessing the conformity of federal actions (transportation and general) to the SIP's purpose of eliminating or reducing the severity and number of violations of the NAAQS and achieving expeditious attainment of such standards, and that such activities will not: (1) Cause or contribute to any new violation of any standard in any area, (2) increase the frequency or severity of any existing violation of any standard in any area, or (3) delay timely attainment of any standard or any required interim emission reductions or other milestones in any area. To assure conformity with the SIP, conformity analyses for transportation projects must take into account the amount of on-road mobile source emissions that can be emitted in accordance with SIP emission reduction milestones. For the purposes of EPA transportation conformity determinations, the 1996 emission level for on-road mobile sources that is achieved from the 15% ROP plan,

constitutes the 1996 VOC mobile source emission budget for Lake and Porter Counties. This level, which is derived from MOBILE5a using 1996 projected on-road mobile source emissions with reformulated gasoline and enhanced I/M, is 50,015 lbs VOC/day. Therefore, final approval of the 15% ROP plan also approves the 1996 mobile source VOC emission budget of 50,015 lbs VOC/day.

For years after 1996, conformity determinations addressing VOCs must demonstrate consistency with this plan revision's motor vehicle emissions budget, and satisfaction of the build/no-build test, as defined under 40 CFR part 93.

G. Concluding Statement on 15% ROP Plan

The EPA has reviewed the Lake and Porter Counties 15% ROP plan SIP revision submitted to EPA as described above, and finds that the plans satisfy the requirements of section 182(b)(1) of the Act, as well as EPA guidance for such plans. Therefore, the EPA, in this action, is approving this plan as a revision to the Indiana ozone SIP.

VI. Final Rulemaking Action

The EPA approves Indiana's 15% ROP plan for Lake and Porter Counties, as a revision to the SIP. For transportation conformity purposes, final approval of the 15% ROP plan also approves the 1996 mobile source emission budget of 50,015 lbs VOC/day. This action will be effective on August 18, 1997.

Nothing in this action should be construed as permitting, allowing or establishing a precedent for any future request for revision to any SIP. Each request for revision to the SIP shall be considered separately in light of specific technical, economic, and environmental factors and in relation to relevant statutory and regulatory requirements.

VII. Administrative Requirements

A. Executive Order 12866

The Office of Management and Budget has exempted this regulatory action from Executive Order 12866 review.

B. Regulatory Flexibility

Under the Regulatory Flexibility Act, 5 U.S.C. section 600 *et seq.*, EPA must prepare a regulatory flexibility analysis

assessing the impact of any proposed or final rule on small entities. 5 U.S.C. sections 603 and 604. Alternatively, EPA may certify that the rule will not have a significant impact on a substantial number of small entities. Small entities include small businesses, small not-for-profit enterprises, and government entities with jurisdiction over populations of less than 50,000.

SIP approvals under section 110 and subchapter I, part D of the Act do not create any new requirements, but simply approve requirements that the State is already imposing. Therefore, because the Federal SIP approval does not impose any new requirements, the Administrator certifies that it does not have a significant impact on any small entities affected. Moreover, due to the nature of the Federal-State relationship under the Act, preparation of a flexibility analysis would constitute Federal inquiry into the economic reasonableness of the State action. The Clean Air Act forbids EPA to base its actions concerning SIPs on such grounds. *Union Electric Co. v. EPA.*, 427 U.S. 246, 256-66 (1976); 42 U.S.C. 7410(a)(2).

C. Unfunded Mandates

Under section 202 of the Unfunded Mandates Reform Act of 1995, signed into law on March 22, 1995, EPA must undertake various actions in association with any proposed or final rule that includes a Federal mandate that may result in estimated costs to state, local, or tribal governments in the aggregate; or to the private sector, of \$100 million or more. This Federal action approves pre-existing requirements under state or local law, and imposes no new requirements. Accordingly, no additional costs to state, local, or tribal governments, or the private sector, result from this action.

D. Submission to Congress and the General Accounting Office

Under section 801(a)(1)(A) as added by the Small Business Regulatory Enforcement Fairness Act of 1996, EPA submitted a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives and the Comptroller General of the General Accounting Office prior to publication of the rule in today's **Federal Register**. This rule is not a major rule as defined by section 804(2).

E. Petitions for Judicial Review

Under section 307(b)(1) of the Act, petitions for judicial review of this action must be filed in the United States Court of Appeals for the appropriate

circuit by September 16, 1997. Filing a petition for reconsideration by the Administrator of this final rule does not affect the finality of this rule for the purposes of judicial review nor does it extend the time within which a petition for judicial review may be filed, and shall not postpone the effectiveness of such rule or action. This action may not be challenged later in proceedings to enforce its requirements. (See section 307(b)(2)).

List of Subjects in 40 CFR Part 52

Environmental protection, Air pollution control, Hydrocarbons, Intergovernmental relations, Ozone.

Dated: July 8, 1997.

Michelle D. Jordan,
Acting Regional Administrator.

For the reasons stated in the preamble, part 52, chapter I, title 40 of the Code of Federal Regulations is amended as follows:

PART 52—[AMENDED]

1. The authority citation for Part 52 continues to read as follows:

Authority: 42 U.S.C. 7401-7671q.

2. Section 52.777 is amended by adding paragraph (k) to read as follows:

§ 52.777 Control Strategy: Photochemical Oxidants (hydrocarbon).

* * * * *

(k) On June 26, 1995, and June 13, 1997, Indiana submitted a 15 percent rate-of-progress plan for the Lake and Porter Counties portion of the Chicago-Gary-Lake County ozone nonattainment area. This plan satisfies the counties' requirements under section 182(b)(1) of the Clean Air Act, as amended in 1990.

BILLING CODE 6580-50-P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Parts 180, 185 and 186

[OPP-300507; FRL-5727-9]

RIN 2070-AB78

Vinclozolin; Pesticide Tolerance

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final Rule.

SUMMARY: This regulation establishes a time-limited tolerance for residues of the pesticide vinclozolin, [3-(3,5-dichlorophenyl)-5-ethenyl-5-methyl-2,4-oxazolidinedione] and its metabolites containing the 3,5-dichloroaniline (3,5-

DCA) moiety at 2.0 parts per million (ppm) in or on the food commodity succulent beans. The tolerance will expire and is revoked on October 1, 1999. A petition was submitted by BASF Corporation to EPA under the Federal Food, Drug, and Cosmetic Act (FFDCA) as amended by the Food Quality Protection Act of 1996 (Pub. L. 104-170) requesting the tolerance. BASF has requested that EPA revoke the tolerances for prunes, plums, tomatoes, grapes (excluding grapes grown for wine production), raisins, dried prunes and grape pomace. EPA will publish a document in the **Federal Register** to remove the revoked tolerances from the Code of Federal Regulations. BASF has deleted all residential uses, as well as, turf in parks, school grounds and recreational areas which would be expected to result in significant exposure to children from its vinclozolin registrations under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA).

DATES: This regulation becomes effective on May 30, 1997. Written objections and hearing requests must be received on or before September 16, 1997.

ADDRESSES: Written objections and hearing requests, identified by the docket control number, [OPP-30507], may be submitted to: Hearing Clerk (1900), Environmental Protection Agency, Rm. M3708, 401 M St., SW., Washington, DC 20460. Fees accompanying objections and hearing requests shall be labeled "Tolerance Petition Fees" and forwarded to: EPA Headquarters Accounting Operations Branch, OPP (Tolerance Fees), P.O. Box 360277M, Pittsburgh, PA 15251. A copy of any objections and hearing requests filed with the Hearing Clerk should be identified by the docket control number and submitted to: Public Information and Records Integrity Branch, Information Resources and Services Division (7506C), Office of Pesticide Programs, Environmental Protection Agency, 401 M St., SW., Washington, DC 20460. In person, bring copy of objections and hearing requests to: Rm. 1132, CM #2, 1921 Jefferson Davis Hwy., Arlington, VA 22202.

A copy of objections and hearing requests filed with the Hearing Clerk may also be submitted electronically by sending electronic mail (e-mail) to: opp-docket@epamail.epa.gov. Copies of objections and hearing requests must be submitted as an ASCII file avoiding the use of special characters and any form of encryption. Copies of objections and hearing requests will also be accepted on disks in WordPerfect in 5.1 file

**COMMENTS ON DRAFT
ENVIRONMENTAL IMPACT STATEMENT**

Verified Statement
of
Philip H. Burris
Vice President
L. E. Peabody & Associates, Inc.

On Behalf of
Four Cities Consortium

Due Date: February 2, 1998

I. INTRODUCTION

My name is Philip H. Burris. I am a vice president of the economic consulting firm of L. E. Peabody & Associates, Inc. The firm's offices are located at 1501 Duke Street, Alexandria, Virginia 22315. I am the same Philip H. Burris who submitted a verified statement in these proceedings as part of the Four City Consortium's Comments and Request for Conditions (FCC-9) filed on October 21, 1997. My qualifications are attached to my earlier verified statement.

I have been requested by the Cities of East Chicago, Indiana, Hammond, Indiana, Gary, Indiana and Whiting, Indiana (hereinafter referred to as the "Four Cities", "Four City Consortium" or "FCC") to comment on the Draft Environmental Impact Statement ("DEIS") served by the Surface Transportation Board's ("STB") Section of Environmental Analysis ("SEA") on December 12, 1997.

As part of my analysis of the DEIS, I have re-evaluated the impact on the Four Cities of the proposed acquisition and operation of Consolidated Rail Corporation ("Conrail")^{1/} by Norfolk Southern Corporation and its rail affiliates ("NS") and CSX Corporation and its rail affiliates ("CSX"), collectively referred to as "Applicants." My evaluation uses the SEA's formulae for calculating delay time at rail crossings, the SEA's factors for determining vehicular emissions resulting from the Applicants' operating plan, and certain revisions to the data relied on in my October 21, 1997 verified statement.

My statement is organized as follows:

^{1/} Including Conrail's 51 percent ownership interest in the Indiana Harbor Belt Railroad ("IHB")

- II. Background
- III. Summary
- IV. Comments Related to SEA's Conclusions in the DEIS
- V. Economic Impact of Applicants' Projected Increase in Rail Traffic
- VI. Comparative Analysis of Applicants' Proposal and FCC's Alternative Routing Plan
- VII. Conclusions

II. BACKGROUND

Each of the Four Cities named above is located in Northwest Indiana, at the southern tip of Lake Michigan. This region, which is part of the greater Chicagoland area, is densely populated with industrial development and residential communities. The industries (including steel mills, oil refineries, an electric generating station and a cement plant) are served by several railroads via hundreds of miles of mainline, switch, yard and industrial tracks.

The region is a major crossroads for transcontinental rail and motor carrier freight traffic. Three Class I railroads, four terminal and switching railroads, and a regional railroad operate in the area.^{2/} In addition, Amtrak provides inter-city passenger service and the Northern Indiana Commuter Transportation District ("NICTD") operates commuter passenger rail service in the region.

As stated in my October 21, 1997 verified statement, railroad operations over this extensive network currently cause significant safety problems and disruption of motor vehicle movements throughout the entire Four City region because of the dense industrial and residential population in the area. The present disruption of vehicular traffic at rail/highway grade crossings is barely manageable especially with regard to the provision of emergency services by the local governments. In the Four Cities alone, 243 at-grade rail/highway crossings exist.

^{2/} These carriers include, Conrail, NS, CSX, IHB, The Belt Railway Company of Chicago ("BRC"), the Elgin Joliet and Eastern Railway Company ("EJE"), the Baltimore, Ohio and Chicago Terminal Railroad ("BOCT"), and the Chicago South Shore & South Bend Railroad ("CSS&SB").

According to the Association of American Railroads ("AAR"), the state of Indiana has the fourth highest incidence of vehicle-train collisions and fatalities of any of the fifty states and the District of Columbia^{3/}. This statistic underscores the Four Cities' extreme concern regarding rail/highway safety.

As a result of the existing, barely manageable railroad congestion situation, the Four Cities are deeply concerned by the potential impact of the Applicants' plans to increase rail traffic on several rail lines in the Four Cities region. These concerns are exacerbated by the impact of the projected increase in rail traffic on the Cities' respective infrastructure improvement and economic development plans, which are vital to the economic recovery of the region. The public safety, emergency services, and economic development concerns of the Four Cities were described at length in the October 21, 1997 verified statements of the City Planners from each community.^{4/} The negative impacts of the proposed transaction on the construction of affordable housing, expansion of the Gary/Chicago Airport, and Lake Michigan waterfront development are addressed in the accompanying Verified Statement of Michael L. Cervay. Mr. Cervay's testimony also addresses the severe air pollution problems facing the Four Cities region and the adverse impact of the Applicants' plan on area-wide efforts to improve the environment.

In the EIS process, the SEA is charged with evaluating the impact of the Applicants' entire proposed transaction which covers dozens of states, hundreds of cities and line segments and

^{3/} Association of American Railroads, Overall Rail Casualty Data, preliminary 1996 FRA Data, obtained from the AAR internet web site; <http://www.aar.org/comm>; 9/17/97.

^{4/} These include the verified statements of Daniel A. Botich, Michael L. Cervay, Kimberly L. Gordon and Donald F. Thomas included in the Four Cities' Comments of October 21, 1997 (FCC-9).

thousands of mile of track. This analysis must be completed in an extremely short time frame. Because of time constraints, it is apparent that the SEA has examined the environmental impacts of the transaction in much less detail than is warranted in some circumstances, and the SEA has used formulas for evaluating certain impacts that rely on extremely generalized information and criteria. In short, the DEIS appears to identify only the most egregious and negative impacts, and its analysis glosses over many other serious impacts.

Unfortunately, this approach does not produce the most accurate result, nor does it lead to mitigation actions which address all serious environmental impacts. I believe that the Four Cities region is far more negatively impacted than SEA's conclusions in the DEIS would indicate. My testimony will identify why I believe this to be true and will review the Four Cities' alternative to the Applicants' proposed operating plan. This alternative will mitigate the majority of the negative environmental impacts in the Four Cities Region.

III. SUMMARY

Based on my review of the DEIS and my analysis of the impact of the Applicants' proposed operating plan, I believe the SEA has significantly understated the negative impact of the proposed operating plan on the Four Cities Region. In contrast to the SEA's findings, I have determined that the Applicants' proposed operating plan would have substantial adverse incremental impacts on safety and the provision of emergency services by the Four Cities, traffic congestion and delay, air quality, land use, and socioeconomic factors within the Four Cities.

Further, I have determined that the FCC's Alternative Routing Plan, as fully described in my October 21 verified statement, will mitigate the majority of the incremental adverse impacts of the Applicants' proposed operating plan. As a result, I believe it is incumbent on the SEA to consider and recommend the FCC's Alternative Routing Plan as an environmental mitigating condition to approval of the Applicants' acquisition and control of Conrail.

1. Economic Impact of Applicant's Projected Increase in Traffic

In my October 21, 1997 verified statement, I discussed the current levels of rail traffic over the key rail lines in the Four Cities, the adverse incremental impacts on safety, emergency services, traffic delays and other aspects of life in the Four Cities that would be caused by the proposed transaction, as well as the economic impact on the Four Cities. In this statement, I have revised my analysis of the economic impact related to the projected increase in Applicants' traffic above the current traffic levels and found that the annual cost to the public living and working in the Four Cities region equals a minimum of \$3.4 million. The net present value of

the cost to the cities for a twenty year period equals \$48.2 million. The discount factor used in this calculation is the Office of Management and Budget, Real Interest Rates on 30 year Treasury Notes and Bonds of 3.6 percent. The real interest rate is used because it recognizes the tax effects of investment by municipalities. The source for time discount factor is OMB Circular No. A-94, Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs. This is the source for discount rates used by the Federal Railroad Administration in evaluating rail/highway grade crossing improvements.

The increased costs are a result of four factors: 1) lost productivity resulting from incremental vehicle delays at rail/highway crossings; 2) additional fuel and oil consumption associated with the incremental delays; 3) the incremental emissions exhausted into the atmosphere resulting from the increased delays at rail crossings; and, 4) the increase in the number of rail/vehicle accidents, injuries and fatalities at rail crossings resulting from increased rail traffic.

I have not attempted to quantify the significant negative impact on the Region's economic growth, which will occur if service on the former Pennsylvania Railroad ("PRR") line between Hobart and Clarke Junction is reinstated. As Mr. Cervay indicates in his verified statement, renewed service on this line will prevent expansion of the Gary/Chicago Airport, which in turn will prevent the economic development of this airport as a utility/transport facility and significantly impair the economic redevelopment of the Lake Michigan waterfront. It would also interfere with the planned construction of 40-50 affordable homes for low-income Gary residents.

2. FCC Alternative Routing Plan

As described in my October 21, 1997 verified statement, the FCC has developed an Alternative Routing Plan which permits the flow of Applicants' projected traffic through the Four Cities in a manner that maximizes use of grade separated rail lines and minimizes millions of dollars of capital investment in rail line rehabilitation and upgrades proposed by the Applicants.

The FCC alternative addresses two proposed routes included in Applicants' operating plans. First, FCC proposes that CSX reduce the traffic it projects to move on the Willow Creek to Pine Junction and Pine Junction to Calumet Park lines^{5/} by using these lines primarily for westbound traffic, and using the IHB line for eastbound movements from Calumet Park, IL to a new connection with the Conrail Porter Branch near Tolleston (Gary), IN, and thence via the Porter Branch back to Willow Creek. This will effectively result in paired mainline tracks, each with traffic moving primarily in a single and opposite direction.^{6/} Exhibit PHB-3 attached to my October 21, 1997 verified statement is a map of the CSX Willow Creek to Calumet Park line via Pine Junction and the IHB/Conrail Porter Branch from Calumet Park to Willow Creek.

The CSX lines between Willow Creek and Calumet Park via Pine Junction have 27 at grade crossings, with 20 of these crossings located on the CSX/BOCT line between Pine Junction and

^{5/} The Pine Junction to Calumet Park line is owned by the BOCT, which is a wholly owned subsidiary of CSX. I will hereinafter refer to this line as the "CSX/BOCT line".

^{6/} Based on responses to the FCC's discovery requests, CSX has provided traffic diagrams (Bates numbers CSX 44 CO 00010-CSX 44 CO 000126) and data on computer diskettes, describing the existing CSX traffic flows within the Chicago-Northern Indiana region. This information identifies the individual trains traversing these routes and whether their direction is inbound or outbound thereby allowing for a determination as to the proportional flow of traffic in each direction.

Calumet Park which runs through the downtown areas of East Chicago and Hammond. By contrast, the IHB/Conrail Porter Branch line from Calumet Park to Willow Creek runs through a less developed area and has only three at grade crossings. The IHB/Conrail line also has thirteen grade separated crossings. As stated in the October 21, 1997 verified statement of Mr. Donald F. Thomas, City Planner for Hammond, the Federal, State and City governments have invested \$25 million in the grade separations on the IHB corridor.

The FCC's proposed shift of traffic from the CSX Willow Creek to Pine Junction and Pine Junction to Calumet Park lines to the IHB/Conrail Porter Branch lines will substantially reduce the number of at-grade highway crossings by the affected trains, thereby mitigating the most significant negative impacts on the Four Cities as a result of the Applicants' proposed operating plans.

The second route addressed by the FCC's Alternative Routing Plan is the portion of the former PRR Fort Wayne to Chicago line between Hobart and Clarke Junction via Tolleston, which is presently out of service but which CSX proposes to rehabilitate and place back into service. According to the information provided by CSX, both in its operating plan and in responses to discovery, CSX plans to connect this line to the Conrail Porter Branch at Tolleston, the NS Wabash spur north of Tolleston and the CSX/Conrail lakefront line north of Clarke Junction. The out-of-service PRR line is 11.75 miles in length and has 23 at-grade rail/highway crossings, which will be reactivated under the Applicants' proposal. Based on CSX's informal responses to FCC's Third Set of Interrogatories and Document Production Requests ("Third Discovery Requests"), it appears that CSX desires to reactivate the PRR line northwest of

Hobart to move coal and coke to the steel mills located on the Lake Michigan waterfront and other bulk commodities into and out of the Chicago region, thus keeping this slower-moving traffic off of CSX's main line through Garrett, IN.

The FCC opposes the reactivation of the out-of-service PRR line between Hobart and Clarke Junction. Such reactivation would entail reopening of 23 inactive rail/highway grade crossings, interfere with the City of Gary's effort to develop part of the area traversed by this line for a new low-income housing development, and prevent expansion of the Gary/Chicago Airport. To accommodate the five trains per day CSX expects to move over this line, the FCC proposes that the CSX trains destined to steel mills served by the EJE be routed from Hobart west to Van Loon over the NS's former Nickel Plate ("NKP") line via a new trackage rights agreement between CSX and NS. From Van Loon, FCC proposes that the CSX trains move north over the EJE via trackage rights to EJE's Kirk Yard to reach the same lakefront steel mills and to CSX's Curtis Yard for continued movement on CSX's lakefront line.^{2/}

CSX coal and coke trains destined to steel mills served by IHB can be moved from Hobart to Osborn over the NS former NKP line, where it connects to the IHB. From Osborn the traffic can move to either of the IHB-served steel mills.

^{2/} According to CSX's responses to the FCC's questions in lieu of deposition, it is apparent that CSX has an agreement with the EJE which allows "coal and coke deliveries to U.S. steel using CSX crews." If such an agreement were not in place and if CSX and EJE were unable to achieve such an agreement, establishment of an agreement could be required as a condition of the acquisition. Such a condition would allow CSX to obtain trackage rights to operate over the EJE line from Van Loon to Pine Junction, enabling it to deliver this traffic to the Gary area.

Exhibit PHB-4 attached to my October 21, 1997 verified statement is a map of the Hobart to Clarke Junction PRR line and the FCC's proposed alternative routing via NS and EJE.

3. Vehicular Delay At Grade Crossings

The FCC's Alternative Routing Plan would avoid the Applicants' planned increase in rail traffic moving over the CSX/BOCT line. Additionally, it will actually produce a decrease in vehicle delay hours from current levels, while allowing Applicants to move all of their projected traffic through the Four Cities region in an efficient manner. The table below summarizes current annual vehicle delay hours and those resulting from both the Applicants' projected traffic and operating plan and FCC's proposed Alternative Routing Plan, using the SEA's corrected formulas for calculating delay times with adjustments to various input data as described later in my testimony.

<u>Line Segment</u> (1)	<u>Current Delay Hours</u> (2)	<u>Applicants' Proposal Delay Hours</u> (3)	<u>FCC's Alternative Delay Hours</u> (4)
Willow Creek to Calumet Park	204,385	333,453	187,241
Hobart to Clarke Junction (via PRR)	0	21,812	0
Hobart to Clarke Junction (via Van Loon)	0	0	27,404
Total Hours	204,385	355,265	214,645

**4. Comparative Analysis of Applicants' Proposal
and the FCC's Alternative Operating Plan**

I have performed a comparative analysis of the Applicants' proposed operating plans for these two routes and the FCC's Alternative Routing Plan and determined that the FCC's Alternative results in an annual cost savings to the public and the Applicants of \$4.2 million. The net present value of these savings for a twenty-year period using the OMB discount factor discussed above equals \$59.3 million.

My comparative analysis is based on the same four factors listed in the previous section plus the change in rail operating costs and a return on investment on the capital required to implement each of the alternatives. Based on our calculations, the Applicants' operating costs will decrease slightly using the FCC's Alternative Routing Plan to operate between Willow Creek and Calumet Park, and increase slightly from Hobart to Clarke Junction. The Applicants' required capital costs will decrease significantly using the FCC Alternative as the Applicants will avoid the substantial expenditure of funds required to reactivate the PRR rail line.

IV. COMMENTS REGARDING SEA'S CONCLUSIONS IN THE DEIS

The SEA's DEIS identified 119 rail line segments as meeting or exceeding the STB's thresholds for environmental analysis. For these 119 segments the SEA examined 11 separate categories of environmental issues. Each of these issues will be discussed below to the extent they pertain to the Applicants' proposed operating plan and the FCC's Alternative Routing Plan.

1. Safety

The DEIS found four rail/highway grade crossings in the Four Cities region to be significantly impacted by the Applicants' proposed operating plan. These include County Line Road, Hobart Road, Lake Street and Clark Road, all located on CSX's Willow Creek to Pine Junction line segment. According to DEIS, a crossing will not be found significantly impacted unless it has a history of at least one accident every seven years (or 0.15 accidents per year) and an increase of at least 0.01 accidents per year.

a. Hobart to Clarke Junction Line

In the instance of Lake County, Indiana, the DEIS analysis is deficient because it fails to include the PRR line between Hobart and Clarke Junction which CSX intends to restore to service. This line segment has been out of service for approximately ten years. As a result, it cannot meet the DEIS criteria for having significant safety impact, as by definition, it has not had an accident in the past seven years.

In fact, vehicular accidents are more likely to occur on this line precisely because it has been out of service for more than seven years. Unfortunately as discussed below, throughout

the Four Cities' region, motorists regularly ignore crossing safety devices. Motorists will not be expecting trains to be using this line. There is no reason to believe motorists behavior will be any different with respect to the PRR line, particularly since drivers will not be used to having to deal with active grade crossings on this line.

The FCC Alternative Routing Plan avoids the likely high occurrence of accidents on the Hobart to Clarke Junction line segment by routing traffic over the currently used Hobart to Van Loon and Van Loon to Pine Junction line segments where the public is accustomed to the movement of rail traffic. Further, the Applicants' propose to reduce rail traffic on the Hobart to Van Loon line segment from the present 26 trains per day to 11 trains per day, thereby assuring ample capacity for handling Applicants' projected five trains per day scheduled for the restored PRR Hobart to Clarke Junction line segment.

b. Vehicles Around Gates

Another safety issue that is not addressed in the DEIS is the "around the gate" phenomenon identified and described by Dr. Gary M. Andrew in his October 21, 1997 verified statement included in FCC-9. In the September 1997 train delay study designed by Dr. Andrew, an average of 484 vehicles per day were observed going around activated gates at the 12 rail crossings included in the train delay study.

Rail traffic and the associated delays are so prevalent in the Four Cities region that the public frequently ignores crossing protection to avoid the ever-present delays at rail crossings. The SEA's formulaic approach to determining mitigation of safety problems at rail crossings

ignores the realities of behavior in these communities. This behavior cannot be overlooked, and it has been brought to the attention of the agency through both the Four Cities' October 21, 1997 testimony and these comments.

Two possible approaches to mitigate the around-the-gates phenomenon are to: 1) require the Applicants to install motion detectors at the control points which activate and deactivate crossing protection devices, thus permitting the devices to deactivate in those instances when trains have stopped moving^{8/} and have not cleared the control points; and/or 2) require the Applicants to install Jersey Barriers at heavily-used crossings to force motorists to observe closed gates at rail crossings. The best mitigation, of course, would be adoption of the Alternative Routing Plan for the reasons discussed in these, and the Four Cities earlier comments.

c. Disruption of Emergency Services

Another safety issue in the Four Cities is the disruption to the provision of emergency services by slow moving trains and stopped trains that are blocking highway crossings. As discussed in the verified statements of the city planners from each community included in FCC-9, current vehicle delays at rail crossings significantly impair the delivery of emergency services, such as fire, ambulance and police services. In many instances, the cities have, at significant expense, constructed duplicate facilities, and acquired extra equipment and emergency services personnel to minimize this disruption.

^{8/} As discussed in a later section, train stoppage in the Four Cities region often blocks numerous highway crossings at one time. This creates significant safety problems and causes substantial vehicle delays. This problem is especially significant on the CSX/BOCT line between Pine Junction and Calumet Park.

For example, the City of East Chicago incurred 9,688 delays in 1996 by police vehicles responding to emergency calls. This represents twenty percent of the total police emergency calls responded to by East Chicago in 1996. Further, of 1,594 medical emergencies responded to by EMS vehicles in East Chicago in 1996, 966, or 61 percent, were delayed at railroad crossings and in 241 of these instances, an additional emergency vehicle had to be dispatched to provide the needed service.

As noted previously, the extremely heavy rail traffic volumes that currently exist in the Four Cities region create a barely manageable situation for the residents, employees and emergency service providers in the region. Any increase in rail traffic in the Four Cities region, especially on the CSX/BOCT line from Pine Junction to Calumet Park which bisects the Cities of East Chicago and Hammond, will significantly add to this already difficult situation. The formulaic approach taken by the DEIS does not consider the significant safety problems which would be caused by even a small increment of additional rail traffic in this region.

The FCC Alternative Routing Plan, however, is a workable alternative which permits the carriers to move the projected volumes of traffic and minimizes the negative impact of these safety issues in the region. For example, the table below displays the number of daily occurrences of trains crossing highways for both the Applicants' operating plan and the FCC's Alternative Routing Plan.

	<u>Applicants' Operating Plan</u>	<u>FCC Alternative Plan</u>
Train-highway crossings	1313	1074

As discussed, requiring adoption of the FCC's Alternative Routing Plan as a condition to the approval of Applicants' acquisition and control of Conrail would offer important mitigation of the negative safety impacts resulting from Applicants' proposed operating plans.

2. Roadway Crossing Delays

The DEIS examined the impact of the Applicants' proposed operating plan on vehicular delays at rail/highway crossings and concluded that no significant increase in vehicle delays would occur in the Four Cities Region. I believe this conclusion is incorrect for several reasons, including: 1) the SEA limited its analysis to selected crossings with daily vehicle counts ("ADT") of greater than 5,000 vehicles, 2) the length of train data utilized by SEA is inconsistent with that found in the Applicant's documents and supporting workpapers, and 3) the SEA's train speed data overstates the actual operating speeds that can be achieved on the rail lines in the Four Cities region.

The accompanying verified statement of Dr. Andrew addresses each of the above factors leading to the DEIS' understatement of vehicular delay at rail crossings. Dr. Andrew's testimony demonstrates that when corrected for these errors, use of the SEA train delay formula results in a significant increase in the vehicular delay that would be experienced under the Applicants' operating plan as compared to that currently experienced in the Four Cities.

Further, Dr. Andrew's testimony shows that the FCC's Alternative Routing Plan results in significantly lower delay than does the Applicants' operating plan, while still accommodating Applicants' projected traffic volumes and desire for routing flexibility.

a. Crossings with Less Than 5,000 ADT

As noted by Dr. Andrew, the SEA's analysis of crossing delays ignores crossings with an ADT of less than 5,000. The 5,000 ADT criterion appears to be arbitrary as applied to the Four Cities situation because it ignores the cumulative impact of crossing delays in an area having numerous crossings in close proximity to each other.

For example, the CSX/BOCT line between Pine Junction and Calumet Park traverses the heart of both downtown East Chicago and downtown Hammond. Almost every north-south street in each community crosses this line at grade. These crossings are shown on Exhibit PHB-9 which is a series of maps showing the CSX/BOCT line produced by CSX in discovery. Nine of these crossings involve arterial highways having an ADT of more than 5,000; they are listed in revised Table 5-IN-45 on Page IN-85 of Chapter 5 of the DEIS. However, other road crossings lie between each of these heavily-used crossings, and motorists often attempt to use one of them if, as often happens, one (or more) of the arterial roads is blocked by a train.^{2/} While the ADT's for these other crossings are less than 5,000, all of them are impacted by delays at the arterial highway crossings. They must be considered as a group in assessing the cumulative impact of crossing delays on the CSX/BOCT line.

^{2/} Chicago Avenue parallels the CSX/BOCT line just to the south, and motorists wishing to cross this line customarily use Chicago Avenue to try to find a vacant crossing.

b. Train Operating Speeds

The SEA used track chart speeds and timetable speeds in its calculation of vehicular delay. According to conversations with the SEA contractor, these speeds were adjusted in some instances to better reflect actual operating circumstances in specific areas. When adjusted, the speeds were reduced by either five or ten miles per hour.

It is obviously better to use actual operating circumstances rather than unrealistic maximum track speeds. Maximum timetable speeds can rarely be achieved on average because of track restrictions and train stops and starts which require deceleration and acceleration. Obviously, on relatively short line segments where stops and starts are frequently experienced, lower average speeds will be achieved regardless of the maximum timetable speed.

In his original calculation of crossing delay times as reflected in his verified statement in FCC-9, Dr. Andrew relied on one-half the maximum timetable speed to estimate the operating speed for each line segment in calculating the vehicle delay time at rail/highway crossings. In his second verified statement, accompanying these environmental comments, Dr. Andrew has re-calculated vehicular delay times at rail crossings using the SEA formula, corrected to reflect actual train speeds. In this calculation, Dr. Andrew uses actual speeds where they are known and surrogates for actual speeds based on other available information where actual speeds are not known. Two specific line segments are addressed below.

i. CSX/BOCT Pine Junction to Calumet Park -- The CSX/BOCT Pine Junction to Calumet Park line segment has a timetable speed of 35 mph. According to CSX's January

23, 1998 Informal Response to the FCC's Third Discovery Requests, however, this line segment is crossed at-grade by another railroad ten times in the 7.2 miles between Pine Junction and Calumet Park. Because of these frequent rail crossings, which for the most part are controlled by carriers other than CSX, CSX trains on this segment must start and stop frequently which causes a significant reduction in average operating speeds. It is not surprising then, that based on information contained in CSX's own document (see CSX 12 CO 000102), the average train speed on this line segment is only 12.0 MPH.^{10/}

This information is further confirmed by the observations during the September 1997 train delay study, where the observed train speed for trains on this line was 12.5 MPH, and by radar speed checks performed by the Hammond Police Department in December 1997 that showed the average observed speed of trains actually moving on this line was 14.5 MPH.^{11/} In all three instances the average train speed on this line is less than 40 percent of the maximum time table speed and also significantly less than the 25.0 MPH speed used in the SEA calculations of train delay time.

The high incidence of trains stopping on this line is also confirmed by the September 1997 train delay study. During this study there were 18 observations of trains at stopped crossings between Clark and Calumet Streets, which all cross in the Pine Junction to Calumet Park segment at grade. Expansion of these 18 observations to represent total stopped trains during a one week period yields 112 stopped trains at the observed crossing locations per week. This

^{10/} The document is included in my workpapers.

^{11/} This average speed for trains observed by radar speed checks obviously would be reduced if stopped trains were also taken into account.

equates to 16 stopped trains per day or 58 percent of the 27.6 trains per day currently moving on this segment.

While it can be argued that the planned improvements on this line by CSX will enable the average speed to increase, significantly, this hypothesis is not supported by CSX's experience on other line segments in the Chicago area. Examination of the CSX document cited above shows that the CSX Willow Creek to Pine Junction line segment, which for all but two miles has a 60 MPH maximum timetable speed limit, has an actual average train speed of only 24.5 MPH. Further, the CSX Blue Island Junction to 75th Street line segment which has a 40 MPH maximum timetable speed, has an actual average train speed of only 12.0 MPH. Stated differently, regardless of the maximum allowable timetable speed based on the class of track standard, actual operating speeds are dictated by numerous other factors, especially in areas with numerous railroad crossings. As a result, an increase in maximum timetable speed will not necessarily result in any change in actual operating speed.

Further, CSX does not control dispatching at any of the ten at-grade railroad crossings on this line segment, and in many instances, either the other railroad's trains have priority or trains are dispatched on a first come, first served basis.^{12/} Even after CSX makes improvements to increase maximum train speed on this line, the dispatching train priority situation at the railroad grade crossings of this line will not change.

^{12/} A list of those crossings and the dispatchings priorities, obtained from CSX during discovery, is included in my workpapers.

Moreover, the additional investment in the line from Pine Junction to Calumet Park is unlikely to result in an increase in average operating speed for two additional reasons. First, CSX's investment to change from class 2 to class 3 track standard between Pine Junction and Calumet Park is most likely for capacity reasons, i.e., to allow CSX to handle the longer and heavier trains proposed in its operating plan, rather than to increase existing timetable speed on the line from 35 to 40 miles per hour. CSX proposes to increase the average train weight for trains on this segment from 4,070 gross tons per train to 5,324 gross tons per train, an increase of 31 percent.

Second, the proposed longer, heavier trains require more time to accelerate and decelerate to and from each stop. The increased acceleration and deceleration time combined with the frequent stops required by the ten rail crossings in this 7.2 mile segment, will prevent CSX from increasing its average operating speed on this line, even with the minimal increase in timetable speed from 35 to 40 miles per hour.

For all of the above reasons, I do not believe that CSX's average operating speed between Pine Junction and Calumet Park will increase above the current 12.0 mph. However, in order to be conservative, we are using vehicle delay hours for this segment based on an increase of current train speed of 10 percent or 13.2 mph. This increased train speed is used for both the Applicants' proposed operating plan and the FCC Alternative Routing Plan.

ii. PRR line between Hobart and Clarke Junction - The PRR line segment between Hobart and Clarke Junction has been out-of-service for approximately 10 years, and the

timetable speed limit on this line is 10 MPH. In the calculations of vehicle delay at rail crossings used in my October 21, 1997 verified statement, I assumed the continuation of the existing timetable speed for this line, which using Dr. Andrew's formula, assumes that operating speed equals one-half of this timetable speed.

When restating the vehicle delay times using the SEA formula, Dr. Andrew assumed an average operating speed on this line segment equal to 14.6 MPH. The reason for using this average train speed as follows:

On Rebuttal, for the first time, the Applicants claim an intent to restore this line to FRC Class 3 standards with a maximum timetable speed of 40 miles per hour. However, based on the percentages of maximum timetable speed developed for other CSX lines in the Chicago area as described above, CSX is likely to achieve only 36.6 percent of the maximum timetable speed or 14.6 MPH.

This percentage reduction is appropriate given CSX's intended use of the Hobart-Clarke Junction line and the existence of several railroad grade crossings of this line. CSX intends to restore service to this line to transport slow moving bulk trains, thereby removing them from its other line segments in the Four Cities region. According to CSX these other lines will be dedicated to moving high priority, service sensitive freight.

The PRR line crosses two of these high priority lines (the Porter Branch and the CSX/BOCT line) at-grade and connects with the CSX/Conrail lakefront lines at-grade. As a result, it is likely that at each of these crossings and at the connection, bulk trains will have to stop and wait

for any high priority or service sensitive train to pass prior to crossing or entering the high priority line. On a combined basis, the projected number of trains per day on these high priority lines equals 109 trains, or 4.5 trains every hour. This high frequency of high priority trains will certainly cause the heavy slow-moving bulk trains to stop and wait for priority trains to pass, thereby causing the bulk trains (with slow deceleration and acceleration speeds) to operate at much lower average speeds than the maximum timetable speed.

This situation will be exacerbated because, as noted in the previous section, the numerous railroad crossing interlockers on the CSX/BOCT Pine Junction to Calumet Park line will frequently cause trains on that line to stop. These stopped trains will most certainly have priority over the bulk trains using the Hobart-Clarke Junction line, which will be required to remain stopped until the priority trains have cleared through the area.

For all of the above reasons, we calculated vehicle delay times associated with these five trains assuming an average actual operating speed of 14.6 MPH.

c. Train Length

As stated previously, the train length information used by SEA in the DEIS is inconsistent with that found in Applicants' documents and supporting workpapers. Train length is a significant determinant in the calculation of vehicle delay hours. The difference in train lengths for current and post-acquisition for CSX line segments in the Four Cities region trains included in the DEIS is only 200 feet. Based on information found in the Applicants' documents we find

that the difference in current and post-acquisition train lengths range from a reduction of 356 feet to an increase of 1,298 feet depending on the line segment.

In response to the FCC's Second Set of Interrogatories and Document Requests, CSX provided the FCC the current and post acquisition train sizes (number of cars and tons) by line segment in the Four Cities region. Utilizing this information and information contained in CSX's 1995 R-1 Annual Report to the STB, I calculated the average train length for current and post-acquisition trains using each CSX line segments in the Four Cities region.

This train length information was used by Dr. Andrew in his calculation of vehicle delay hours for his October 21, 1997 verified statement. The information supporting my calculation of train length was included in the workpapers to my October 21, 1997 verified statement, at Bates Numbers 001191-001194 and 001159.

The table below displays the train lengths for CSX line segments relied on by the SEA in the DEIS and by Dr. Andrew in both his October 21, 1997 verified statement and his verified statement filed today.

CSX Train Lengths Four Cities Region (Length in feet)				
<u>Segment</u> (1)	<u>DEIS</u>		<u>FCC</u>	
	<u>Current</u> (2)	<u>Post Acquisition</u> (3)	<u>Current</u> (4)	<u>Post Acquisition</u> (5)
1. Willow Creek to Pine Jct	6,000	6,200	4,335	5,141
2. Pine Jct to Calumet Park	6,000	6,200	4,192	5,490
3. Calumet Park to Willow Creek	not used	not used	4,900	4,554
4. Hobart to Clarke Jct	6,000	6,200	---	5,306
5. Hobart to Van Loon	not used	not used	---	5,306

3. Air Quality Issues

The SEA's air quality calculations in the DEIS understate the expected Nitrogen Oxide ("NO_x") emissions from vehicles idling at at-grade crossings due to SEA's omission of lower traffic-density grade crossings from its analysis. SEA calculated an increase in NO_x emissions of 1.01 tons per year from vehicles delayed at at-grade rail crossings with a traffic density greater than 5,000 ADT^{13/}. Within the Four Cities area, only 14 of the 109 at-grade crossings affected by the Conrail transaction reach the threshold ADT level. As I stated previously, the cumulative impact of delays at all affected Four Cities crossings must be included in the emissions calculations. The cumulative impact of delays at all affected crossings increase the expected NO_x emissions from vehicle delays to 4.05 tons per year, an increase of 304%.^{14/}

^{13/} DEIS, Appendix E, Page E-16.

^{14/} See PHB work papers for calculation

The Alternative Routing Plan as proposed by the FCC ameliorates the effects of these additional NO_x emissions. As I discussed above, at-grade crossing delay times decrease by 41 percent if rail traffic is rerouted according to the FCC's Alternative Routing Plan. This decrease in delay time reduces the NO_x emissions by 1.6 tons per year.

Additionally, according to the DEIS, the decrease in emissions due to truck-to-rail diversions is overstated by the Applicants. As SEA states: "As noted in previous sections, SEA acknowledges that some overestimation of the truck-to-rail diversions has probably occurred; however, the air quality analysis is based on the figures provided."^{15/} While the SEA does not provide an estimated amount of the overstatement, any decrease in truck-to-rail diversions will obviously adversely impact air quality in the Four Cities area.

The increased NO_x emissions from both the inclusion of all FCC at-grade crossings and the overstatement of truck-to-rail diversions will exacerbate the negative impacts already recognized by SEA in the DEIS, but which it has elected to ignore. (For Lake County, Indiana, SEA determined that post-transaction operations in Lake County would result in an increase of 83.76 tons/year in NO_x emissions, which is well above the 25.0 tons/year in NO_x threshold level. Nevertheless, SEA proposed no mitigation.)

There are other reasons why the STB must pay close attention to the pollution impacts resulting from the Conrail transaction. First, the FCC lies in one of the most heavily polluted regions of the United States. This is confirmed by the EPA's declaration of Lake County as a

^{15/} DEIS, Chapter 4, Page 4-55.

severe non-attainment area for NO_x emissions as well as a non-attainment area for SO₂, CO and particulate matter. Any incremental increase in emissions is sure to exacerbate these area pollutant problems.

Second, as indicated in Mr. Cervay's accompanying testimony, the Four Cities and Lake County may lose federal highway funds if they fail to comply with mandated air quality standards. According to the Northwest Indiana Regional Planning Commission ("NIRPC"), Lake County stands to lose federal funding for highway expansion if it does not come into line with highway congestion and air quality standards. This factor, along with the already severe air pollution in the area, dictates that all efforts should be made to mitigate anticipated increases in emissions. For this reason also, the FCC Alternative Routing Plan must be given serious consideration by the STB in the Final EIS.

4. Socioeconomic Impacts

The Applicants' proposed train routings impose two deleterious socioeconomic impacts on the Four Cities Consortium which are not addressed by SEA in the DEIS. Both of these negative impacts are caused by restoration of service on the PRR Hobart to Clarke Junction line.

First, the Applicants' proposed reactivation of the PRR line would impede the expansion of the Gary/Chicago Airport ("GCA"). The Four Cities have initiated several industrial and tourism development projects to expand their industrial base and to revitalize their lake front properties. These projects are contingent upon the GCA expanding its capacity to become an effective supplement to Chicago's O'Hare International Airport for both cargo and passenger

traffic. This planned expansion requires that the GCA upgrade its current FAA certification as a Reliever/General Aviation Airport to certification as a Utility/Transport airport capable of handling expanded commercial traffic. This change in certification requires expansion of the overall airport complex. Most importantly for present purposes, it requires the expansion of the airport's two existing runways and the addition of a third runway as explained in Mr. Cervay's verified statement. Currently, the GCA has the available land to accommodate the North-South runway expansion and is negotiating with the EJ&E to allow a partial expansion and addition of the East-West runways on the west side of the airport line on the east side of the airport. Reactivation of the PRR however, would negate all expansion and addition efforts.

To safely meet expansion plans and to continue existing levels of operations, the runway construction must be performed in a sequential manner with the North-South runway completed before expansion and addition to the East-West runway. This will allow for continued airport use during the construction effort. The GCA's current land holdings when combined with the currently unobstructed area at the terminus of the North-South runway may be sufficient to meet FAA vertical obstruction regulations. Reactivation of the PRR line will be viewed as a hard obstruction for this runway and will require 1,150 feet of additional unobstructed space to provide an acceptable Runway Safety Area. Since the inactive PRR line lies within the boundaries of this obstruction-free zone, reactivation of this line will halt expansion of this runway.

The second socioeconomic impact is on a proposed affordable housing project in the City of Gary. The housing development, known as Roosevelt Manor, is bounded on the north by the

inactive PRR rail line. The Broadway Area Community Development Corporation (“BACDC”), a neighborhood based 503-C3 corporation formed to promote urban redevelopment and revitalization, has incurred considerable time and expense bringing this project to fruition. Much of this time has been spent obtaining a \$250,000 grant from the Department of Housing and Urban Development for down payment assistance for low-income and minority families. The BACDC’s initial plans and costs estimates were made under the assumption that the line would remain inactive. Reactivation of the line, at a minimum, will require additional costs to barrier the development from the adverse impacts of the proposed rail traffic and jeopardize the considerable time and expense previously incurred.

5. Environmental Justice

Chapter 5 of the DEIS describes the potential environmental justice effects of restoring the Hobart-Clarke Junction segment of the PRR line to service^{16/}. The DEIS specifically addresses the noise impacts along this segment; however, other deleterious effects, most noticeably in regard to safety, will also occur.

As discussed above, the Hobart to Clarke Junction line segment is presently inactive and would, after rehabilitation, see an expected rail traffic of five trains per day. While below the SEA’s eight train-per-day increase threshold for mitigation, logic dictates that an increase from zero trains per day to five trains per day substantially raises the risk of accident. This risk is magnified even further given the propensity of Four Cities’ residents to disregard crossing safety devices and to drive around lowered crossing gates.

^{16/} Draft Environmental Impact Statement, Chapter 5, Page IN-76.

The SEA also did not address the issue of the population's alternative uses of the inactive line. History shows that abandoned and inactive rail lines become surrogate rights of way for foot traffic and play areas for neighborhood children. Even with community outreach programs such as Operation LifeSaver, the risk to people neighboring the track substantially increases when a rail line that has been inactive for a period of several years is reactivated.

Given the demographics of the Four Cities area, reactivation of the Hobart to Clarke Junction line segment will have a disproportionate impact on a low income and minority population. As indicated by SEA, the population impacted by this line segment is 98.7% minority and the low-income population is more than 10% higher than the low-income population for Lake County as a whole.^{17/} Further, as stated above, the segment is the northeastern boundary of a housing development currently planned by the City of Gary targeted at the area's minority and low-income population.

Reinstatement of train service on this line will directly impact the quality of life of those living along it by exposing the populace to higher levels of noise and placing it at greater risk of accident. This is in direct contrast to the Department of Transportation's Order to Address Environmental Justice in Minority Populations and Low-Income Populations, OST Docket No. OST - 95 - 141 (50125).^{18/} The order provides the following mandate related to Department of Transportation related projects:

^{17/} Draft Environmental Impact Statement, Chapter 5, Page IN-76.

^{18/} This order outlines the DOT's response to Executive Order 12989 of February 11, 1994 outlining mandates for environmental justice.

The Operating Administration and other responsible DOT officials will ensure that any of their respective programs, policies, or activities that will have a disproportionately high and adverse effect on minority populations or low-income populations will only be carried out if further mitigation measures or alternatives that would avoid or reduce the disproportionately high and adverse effects are not practicable.^{19/}

In this particular situation, the STB clearly has a practical alternative. The FCC's Proposed Alternative Routing Plan would negate and avoid the safety and noise issues endemic to reactivation of this line segment by rerouting rail traffic to an existing line. This will help ameliorate the affects of the Conrail transaction and meet the requirements of the DOT's environmental justice policies, which the STB has adopted.

^{19/} Federal Register/Vol. 62, No. 72, Page 18380/April 15, 1997.

**V. ECONOMIC IMPACT OF APPLICANTS'
PROJECTED INCREASE IN RAIL TRAFFIC**

As stated previously, I have quantified the economic impact related to the projected increase in Applicants' traffic above the current traffic levels as set forth in the CSX and NS Operating Plans based on SEA's vehicle delay formula and certain revisions to the data. Based on my calculations, I have concluded that the annual cost to the public living and working in the Four Cities equals \$3.4 million. The net present value of the cost to the cities for a twenty year period equals \$48.2 million.

The cost to the public shown above does not include, however, any quantification of numerous additional factors which should be considered by SEA. These include, for example, the lost economic value to the Four Cities if the GCA fails to become a Utility/transport airport. This would include the loss of income from expanded air passenger traffic and the development of the proposed air freight hub. In addition, the quantification does not include the lost economic value resulting from reduced development the Lake Michigan waterfront, because the public can not easily access the waterfront by air travel.

Further, my calculations do not include the reduction in the quality of life that results from increased noise from incremental rail activity. Finally, my calculations do not include any account for the value of human life that will be lost as a result of increased accidents at rail/highway crossings because of increased rail traffic.

As with the calculations in my October 21, 1997 testimony, these costs are a result of four factors: 1) lost productivity resulting from incremental vehicle delays at rail/highway crossings; 2) additional fuel and oil consumption associated with the incremental delay; 3) the incremental emissions exhausted into the atmosphere resulting from increased delays at rail crossings, and; 4) the increase in the number of rail/vehicle accidents, injuries and fatalities at rail crossings resulting from increased rail traffic.

**1. Revisions to the Calculation
of the Impact of Applicants'
Projected Increase in Traffic**

As stated above, several revisions have been made in calculating the vehicle delay hours in the Four Cities. The revisions to my October 21, 1997 calculations of the impact of Applicants' projected traffic increase on certain Four Cities rail lines are based on the following factors: 1) use of the SEA vehicle delay formula, 2) adjustments to reflect actual average operating train speeds, and 3) corrections of the crossing data for the Conrail Porter Branch between Ivanhoe and Willow Creek.

a. SEA Vehicle Delay Formula

The use of the SEA vehicle delay formula is fully discussed above and in the accompanying testimony of Dr. Andrew and will not be repeated here.

b. Train Operating Speeds

Use of the most appropriate train operating speeds has been fully discussed previously and in the accompanying testimony of Dr. Andrew. That discussion will not be repeated here;

however, a summary of the timetable and operating speeds used to calculate vehicle delay hours in both our October 21, 1997 testimony and in our current testimony is provided below.

<u>Line Segment</u> (1)	<u>October 21 Testimony</u>		<u>February 2 Testimony</u>	
	<u>Maximum Train Speed</u> (2)	<u>Operating Train Speed</u> (3)	<u>Maximum Train Speed</u> (4)	<u>Operating Train Speed</u> (5)
1. Willow Creek to Pine Junction	79	39.5	60	24.5
2. Pine Junction to Calumet Park	25	12.5	35	13.2
3. Calumet Park to Ivanhoe	40	20	40	20
4. Ivanhoe to Willow Creek	10	5	40	20
5. Hobart to Clarke Junction	10	5	40	14.6

c. Highway Crossings on the Conrail Porter Branch

As correctly pointed out by Applicants' Rebuttal witnesses Rooney/O'Connor (see SCX/NS-177, Vol. 2B), in my October 21 testimony I incorrectly routed both the current traffic using the Conrail Porter Branch and Applicants' projected traffic over the IHB line segment between Ivanhoe and Virginia Street, rather than on the Porter Branch between Ivanhoe and Virginia Street. As a result of this error, I included only three rail/highway crossings on this line segment rather than the actual 11 crossings that exist on the Porter Branch. In my current calculations of the impact of the Applicants' projected traffic on the Four Cities using the Applicants' operating plans, I have used the ADT, train operating speed and incidence of accidents associated with these 11 crossings.

Based on the vehicle delay hours provided by Dr. Andrew, I have calculated the costs related to each of the above factors using precisely the same methodology that I used to calculate

the associated costs in my October 21, 1997 testimony with the exception of the costs related to incremental emissions. As fully described in my earlier testimony, I relied primarily on the factors contained in the FRA's model titled, *GradeDec Model - Highway-Rail Grade Crossing Investment Decision Support Tool*, Version 1.0. A copy of that model is contained in the workpapers supporting my October 21, 1997 testimony.

d. Vehicle Emissions Costs

Vehicle delay hours at rail crossings produce costs to the public related to emissions of Hydrocarbons, Carbon Monoxide and Nitrogen Oxides. These emissions are measured in grams per hour of idling time. The table below provides the emission rates for each pollutant as contained in the DEIS for highway/rail grade crossings emissions only.

<u>Vehicle Emission Rates Grams Per Hour of Idling</u>		
<u>Hydrocarbons (HC)</u>	<u>Carbon Monoxide (CO)</u>	<u>Nitrogen Oxides (NO_x)</u>
(1)	(2)	(3)
55.05	456.85	10.35

Based on the FRA *GradeDec* Model, the cost of emissions equals \$3,000 per ton for Hydrocarbons (Volatile Organic Chemicals), \$4,000 per ton for Carbon Monoxide and \$6,000 per ton for Nitrogen Oxides. Applying the SEA rates of emissions to the vehicle hours of delay fully developed by Dr. Andrew in his accompanying verified statement produces the grams of emissions by type of pollutant. I then converted the cost per ton to a cost per gram and applied it to the grams of pollutants emitted to yield vehicle emission costs for both the current traffic

levels and the Applicants' projected traffic. The table below shows the calculated vehicle emissions costs.

<u>Line Segment</u> (1)	<u>Emissions Cost</u>	
	<u>Current</u> (2)	<u>Applicants' Proposal</u> (3)
Willow Creek to Calumet Park	\$462,985	\$755,355
Hobart to Clarke Junction	---	49,411
Total	\$462,985	\$804,766

Source: Exhibit PHB-10.

2. Summary of Impact of Applicants' Post-Acquisition Increase in Rail Traffic on the Four Cities

The table below summarizes the lost productivity, fuel and oil consumption, emission and accident costs for both the current and Applicants' post-acquisition traffic levels. As shown in the table, Applicants' projected post-acquisition traffic levels will result in an annual additional cost to the public of \$3.4 million. The net present value of this cost for a twenty-year period equals \$48.2 million.

**Summary of Public Costs for
Current and Projected Traffic**

<u>Item</u> (1)	<u>Current Traffic</u> (2)	<u>Projected Traffic</u> (3)	<u>Difference</u> (4)
1. Vehicle Delay Hours	204,385	355,265	150,880
2. Lost Productivity Cost	\$3,270,166	\$5,684,247	\$2,414,081
3. Fuel and Oil Consumption	\$180,268	\$313,344	\$133,076
4. Emission and Pollutants	\$462,985	\$804,766	\$341,781
5. Accident Costs	\$1,222,790	\$1,755,731	\$532,941
6. Total Cost to the Public	\$5,136,209	\$8,558,088	\$3,421,879

VI. COMPARATIVE ANALYSIS OF ENVIRONMENTAL IMPACTS OF APPLICANTS' PROPOSAL AND FCC'S ALTERNATIVE ROUTING PLAN

As discussed previously, the FCC proffers alternative routings for two distinct segments of the Applicants' proposed operating plans for the region. These include 1) rerouting a portion of the traffic CSX proposes to move over the lines from Willow Creek to Pine Junction and from Pine Junction to Calumet Park to the IHB and Conrail Porter Branch lines from Calumet Park to Willow Creek via Virginia Street (Gary), and 2) rather than restoring service on the former PRR line from Hobart to Clarke Junction, routing the projected traffic for this line over a combination of the NS/NKP line from Hobart to Van Loon and the EJE line from Van Loon to Pine Junction, thus allowing movement of coal and coke by CSX to the lakefront steel mills and other bulk commodities to the CSX lakefront line.

As stated in the Summary and Conclusion Section, I have performed a comparative analysis of the Applicants' proposed operating plans for these two routes and the FCC's Alternative Routing Plan and determined that the FCC Alternative results in an annual cost savings to the public and the Applicants' of \$4.2 million. The net present value of these savings for a twenty year period equals \$59.3 million.

As with my October 21, 1997 testimony, my comparative analysis is based on the same four factors listed in the previous section plus the change in railroad variable operating costs and return on investment of the capital required to implement each of the alternatives. Based on my calculations the Applicants' operating costs will increase slightly under the FCC's Alternative

Routing Plan but Applicants' required return on investment of capital costs will be significantly reduced.

Applicants' required return on investment will be reduced because Applicants will be able to avoid the expenditure of funds required to reactivate the out-of-service PRR line from Hobart to Clarke Junction.

1. Revisions to the Comparative Analysis

Revisions to my comparative analysis of the Applicants' proposed operating plan for these two routes and the FCC Alternative Routing Plan are based on the following factors which have been discussed above: 1) use of the SEA vehicle delay formula as corrected in SEA's Supplemental Errata, 2) use of the SEA rate of emissions factors, 3) adjustment to more accurately reflect train operating speeds, 4) adjustments to the train length use by the SEA; and, 5) corrections to the rail/highway crossing data for the Conrail Porter Branch between Ivanhoe and Virginia Street.

In addition to these factors, four additional revisions have been made, each related to capital investment costs. First, the Applicants' capital investment required to upgrade the CSX/BOCT line from Pine Junction to Calumet Park has been reduced from the \$6.6 million included in my October 21, 1997 testimony to \$2.0 million. This revision is based on information provided by CSXT in its January 23, 1998 Informal Response to FCC's Third Discovery Requests.

Second, the capital investment associated with the FCC Alternative Routing Plan for Hobart to Pine Junction via Van Loon has been reduced by the \$277,933 associated with the

construction of a connection at Van Loon. This is based on conversations with the EJE, which has informed the FCC that this connections already exists.

Third, the capital investment associated with the use of the IHB line between Ivanhoe and Virginia Street has been increased by \$2.7 million. This increase is based on the testimony of Applicants' Rebuttal Witnesses Rooney/O'Connor, who point out that the portion of the IHB line between Ivanhoe and Chase Street must also be rehabilitated to accommodate traffic increases. Messrs. Rooney and O'Connor estimate the required rehabilitation equals \$2.7 million. When added to the investment amount included in my October 21 testimony, the total rehabilitation of the IHB line Between Ivanhoe and Virginia Street equals \$4.3 Million.

Finally, as stated in the October 21, 1997 verified statement of FCC witnesses Heinzmann/Dunn, the estimate of the capital expenditures to rehabilitate the PRR line to Class 2 condition equals \$7,017,167.^{20/} In rebuttal CSX asserts for the first time that the line will be restored to Class 3 serviceable condition. To estimate the cost of this rehabilitation, I have used the restoration cost information made available by Applicants' witnesses Rooney/O'Connor regarding rehabilitation of the IHB line from Ivanhoe to Virginia Street to Class 3 conditions.

Messrs. Rooney/O'Connor use a factor of \$200 per feet for this rehabilitation. I have accepted this factor and added the cost of constructing the required connections to the Porter Branch at Tolleston, the NS Wabash line, and the EJE line at Dunes. The resulting

^{20/} October 21, 1997 verified statement of Heinzman/Dunn, page 11.

rehabilitation cost for the PRR line to Class 3 condition is \$13,124,856. My calculation of the rehabilitation cost of the PRR line is shown in my workpapers.

A comparative analysis of the Applicants' proposed operations and each element of the FCC's Alternative Routing Plan is presented below.

a. Willow Creek to Calumet Park

The FCC's Alternative Routing Plan shifts traffic off CSX's Willow Creek to Calumet Park line via Pine Junction (this includes the heavily-impacted CSX/BOCT line) and makes use of the IHB and Conrail Porter Branch. The FCC proposal contemplates but does not necessarily require directional traffic flow, i.e., parallel mainline tracks with the majority of traffic on these lines operating in opposite directions.^{21/} Operation of parallel mainlines with directional flow is a common and desirable practice in the railroad industry.

Operating in this manner will significantly reduce the volume of traffic moving on the CSX/BOCT Willow Creek to Calumet Park line via Pine Junction. Reducing the traffic on this line, which has twenty at-grade crossings over a distance of approximately seven miles alone, and placing a portion of the traffic on the grade separated IHB line, will significantly reduce the disruption of vehicular traffic in the Four Cities region. This alternative will significantly mitigate the incremental adverse economic, safety and quality-of-life impacts that would otherwise affect the public in the Four Cities region.

^{21/} The plan would also work without directional traffic flow as a means to avoid the adverse incremental impacts of the increased traffic over the CSX/BOCT line. However, the directional flow arrangement would be significantly more efficient and would also be consistent with CSX's general plan to move traffic to and from Chicago in a counterclockwise direction.

The table below shows the annual delay costs, accident costs, mileage-related railroad operating costs and return on investment for the Applicants' projected traffic using both the Applicants' proposed operating plans and the FCC's Alternative Routing Plan.

Comparison of Annual Costs for Applicant's Proposal and FCC's Alternative Routing Plan			
<u>Willow Creek to Calumet Park</u>			
(000)			
<u>Cost Category</u> (1)	<u>Applicants' Proposal</u> (2)	<u>FCC's Alternative</u> (3)	<u>Difference</u> (4)
Train Delay Cost	\$5,335.2	\$2,995.9	\$2,339.4
Vehicle Fuel Consumption Cost	\$270.1	\$151.7	\$118.4
Vehicle Oil Consumption Cost	\$24.0	\$13.5	\$10.5
Vehicle Emissions Cost	\$755.3	\$424.1	\$331.2
Accident Cost	\$1,728.0	\$1,392.5	\$335.5
Rail Operating Cost	\$16,104.1	\$15,981.5	\$122.6
Rail Capital Investment	\$340.0 ^{1/}	\$1,071.6 ^{2/}	(\$731.6)
Net Savings			\$2,716.5

^{1/} The required investment is estimated to equal \$2,000,000 with a pre tax return on investment equal to 17 percent.

^{2/} Assumes capital investment to rehabilitate IHB abandoned line and construct connection to CSX (CR) equals \$4,303,762 and 2,000,000 to upgrade Pine Jct to Calumet Park with a pre tax return on investment equal to 17 percent. If upon closer examination, it is determined that the bridges on the out of service portion of the IHB alternative line require rehabilitation that proves to be uneconomic, then traffic should be routed on the IHB line to the current connection with Conrail at Ivanhoe rather than to a new connection east of Tolleston. This alternative would also result in less disruption to the Four Cities than Applicants' operating plan; however, it is not as favorable as FCC's preferred route.

The productivity cost, fuel and oil costs, emissions costs, accident costs, mileage related operating costs, and the return on investment shown in the above table for both the Applicants' proposal and the FCC's Alternative Routing Plan were calculated in the same manner used in

my October 21, 1997 testimony and as described in the previous section. The calculation of these costs is shown in Exhibit PHB-11.

As demonstrated above, the FCC's Alternative Routing Plan for the movement of Applicants' projected traffic between Willow Creek and Calumet Park results in a net annual reduction in public and railroad costs equal to \$2.5 million.

2. Hobart to Clarke Junction

Applicants' propose to reactivate the former PRR out-of-service rail line from Hobart to Tolleston and Tolleston to Clarke Junction. This out-of-service line has 23 at-grade crossings and two grade-separated crossings. CSX's operating plan and supporting documents indicate two distinct uses for this line. First, CSX intends to move five bulk trains per day, representing 12 million gross tons per year, over this line. CSX's January 23, 1998 Informal Responses to FCC's Third Discovery Requests indicate that these CSX trains include coal and coke moving to the lakefront steel mills and other bulk commodities moving to the Chicago area.

The second use Applicants intend for this line involves NS' service to the Gary Sugar Works, located on the former Wabash spur north of Tolleston. According to NS' January 28, 1998 Informal Responses to the FCC's Third Discovery Requests, NS plans to construct a connection between the Wabash spur and the Tolleston to Clarke Junction portion of the PRR line in order to permit NS to move traffic originating or terminating at Gary Sugar Works from the Wabash spur to the PRR line, then to the Conrail Porter Branch. This traffic can then move

in an easterly direction to Burns Harbor, IN (or vice versa in the case of traffic terminating at the Gary Sugar Works).

The FCC's Alternative Routing Plan for reactivating the Hobart to Clarke Junction line permits movement of these shipments described above, without the reactivation of the out-of-service PRR line and its 23 at-grade crossings.

a. Bulk Commodity Shipments

The FCC's Alternative Routing Plan contemplates the movement of the CSX coal and coke traffic destined to EJE-served facilities from Hobart over the NS/NKP line to Van Loon, where a connection exists with the EJE. The CSX trains would be operated by CSX crews over the EJE to the U.S. Steel Mill in Gary and other lakefront steel mills in the area. As stated previously, use of CSX crews to operate over the EJE is consistent with CSX's current plan for the movement of traffic from Pine Junction to the Gary lakefront.^{22/}

Coal and Coke destined to IHB served lakefront steel mills would move, using CSX crews, from Hobart to Osborn over the NS NKP line then over the IHB from Osborn to IHB's Michigan Avenue Yard, where CSX would interchange the traffic to IHB.

^{22/} Applicants' Rebuttal Witnesses Rooney/O'Connor claim that the movement of coal and coke trains over the EJE elevated line will require use of locomotive helper service to pull these heavy trains over the grade caused by elevating the line. They estimate the annual operating cost associated with the helper locomotive to equal \$825,000. Based on conversations with EJE personnel regarding current operations over this line, it has been learned that NS coal and coke trains currently move over the elevated portion of the EJE using three six-axle 3,000 horsepower units, without any assistance from locomotive helpers. This is the same locomotive consist that CSX uses to move its coal and coke trains into the Chicago area. As a result, I do not believe any locomotive helper service is required.

Using the FCC Alternative Routing Plan, other bulk commodity traffic CSX plans to move over the PRR line into the Chicago area, would move from Hobart to Van Loon, then to the EJE's Kirk Yard and then into CSX's Curtis yard. From Curtis yard the traffic can move into Chicago over the CSX lakefront line.

Applicants' Rebuttal witnesses Rooney/O'Connor claim that the FCC's Alternative Routing Plan will leave this traffic "up in the air" on EJE's elevated north/south line, greatly complicating the connection to CSX's mainline and requiring a disruptive at-grade crossing of Conrail's lakefront line (to be acquired by NS). This is not the case. A connection in fact exists between EJE's elevated line and CSX's Curtis Yard. This connection, which uses the EJE overhead bridge to cross the CSX and Conrail lakefront lines, is clearly shown on EJE's track engineering map included in my workpapers. CSX trains using the EJE elevated line would cross over the CSX and Conrail lines towards EJE's Kirk Yard until they clear the switch for the connection to Curtis Yard, then shove to CSX's Curtis Yard. This is the same move that is made currently to interchange traffic from EJE to CSX.

b. NS Sugar Spur Traffic

The FCC's Alternative Routing Plan accommodates the NS Gary Sugar Works traffic through the construction of a connection between the CSX lakefront line and the existing Conrail lakefront line just east of Pine Junction. This connection would permit NS to move traffic originated at the Gary Sugar Works along the Wabash spur, in a reverse move, to its current connection with the CSX Pine Junction to Calumet Park line. Once on the CSX Pine Junction

to Calumet Park line, the traffic can move forward through Pine Junction onto the CSX lakefront line then through the new connection with the existing Conrail lakefront line and east to Burns Harbor, IN (which is the staging point for this traffic).

Applicants' Rebuttal witnesses Rooney/O'Connor object to this routing and the connection at Pine Junction because they claim it would again require a disruptive at-grade crossing of Conrail's busy Chicago-Toledo mainline. This objection is misplaced, because this connection would be used by only one train in each direction each day, and not by all trains CSX intends to route over the PRR line. Thus any disruption that may occur as a result of NS service to the Gary Sugar Works would be minimal. Further, one must question the wisdom of restoring service to the PRR line and its 23 rail/highway crossings through a low income, minority area just to accommodate one train a day to the Gary Sugar Works in light of the fact that all of CSX's planned trains for this line can be accommodated using the FCC's Alternative Routing Plan.

The table below shows the delay costs, accident costs, mileage related railroad operating costs and return on investment for the Applicants' projected traffic using both the Applicants' proposed operating plan and the FCC's Alternative Routing Plan for the planned movements on the out-of-service PRR line.

Comparison of Costs for Applicants' Proposal and FCC's Alternative Hobart to Pine Jct (000)			
<u>Item</u> (1)	<u>Applicants' Proposal</u> (2)	<u>FCC's Alternative</u> (3)	<u>Net</u> (4)
Delay Cost	\$349.0	\$438.5	\$(89.5)
Vehicle Fuel Consumption Cost	\$17.7	\$22.2	\$(4.5)
Vehicle Oil Consumption Cost	\$1.6	\$2.0	\$(0.4)
Vehicle Emissions Cost	\$49.4	\$62.1	\$(12.7)
Accident Cost	\$27.8	\$241.6	\$(213.8)
Rail Operating Cost ^{1/}	\$1,202.8	\$1,378.5	\$(175.7)
Rail Capital Investment ^{2/}	\$2,231.2	\$47.2	\$2,184.0
Net Savings (Cost)			\$1,687.4

^{1/} Includes trackage rights payment of 3 mills per gross ton-mile.

^{2/} Assumes capital investment to rehabilitate PRR abandoned line and construct connections at Tolleston, Wabash and Dunes equals \$13,124,856 with a pretax return on investment equal to 17 percent, and assumes capital investment to construct connections at Pine Jct equal \$277,933 with a pre-tax return on investment equal to 17 percent.

As with the comparative analysis of the Willow Creek to Calumet Park lines, the productivity cost, fuel and oil costs, emissions cost, accident cost, the railroads' variable operating costs and the capital investment requirements shown in the above table for both the Applicants' proposal and the FCC's Alternative Routing Plan were calculated in the same

manner as in my October 21, 1997 testimony and as described in the previous section. The calculation of these costs is shown in Exhibit PHB-12.

Two additional issues must be addressed with respect to the calculation of the Applicants' variable cost as it relates to the FCC's Alternative Routing Plan. First, Witnesses Rooney/O'Connor argue that I have understated the trackage rights payment from CSX to NS and EJE for use of their facilities. My trackage rights payment has been calculated based on the fee of 3.0 mills per gross ton-mile on unit train traffic paid by Burlington Northern & Santa Fe ("BNSF") to Union Pacific Railroad Company ("UP") as approved by the STB in the recent proceedings involving UP's acquisition of Southern Pacific Railroad Company ("SP"). This payment is certainly an appropriate measure of the trackage rights fee payable by CSX to EJE.

Second, Witnesses Rooney/O'Connor claim that the FCC plan understates CSX's variable cost for the Hobart to Van Loon to Pine Junction route because it fails to account for the increased costs associated with mileage payments to shippers using their own railcars. To the extent that this is true, any understatement is insignificant for three reasons. First the FCC Alternative route is only four miles longer than that proposed by Applicants. Second, by CSX's own admission in its Informal Response to FCC's Third Discovery Requests, the coal and coke trains intended to move on the PRR rail line move in railroad-provided cars for which no mileage payment is required. Third, to the extent that other bulk commodity traffic moves over this alternative route it will move at least in part in railroad-provided cars, in which event no mileage payment is warranted.

As demonstrated above, the FCC's Alternative Routing Plan for the movement of Applicants' projected traffic between Hobart and Clarke Junction results in a net annual reduction in public and railroad costs equal to \$2.5 million annually. When combined with the net annual reduction of \$1.7 million for movement of the traffic between Willow Creek and Calumet Park, this produces a total net savings for the FCC's proposal of \$4.2 million a year as compared to the Applicants' plans.

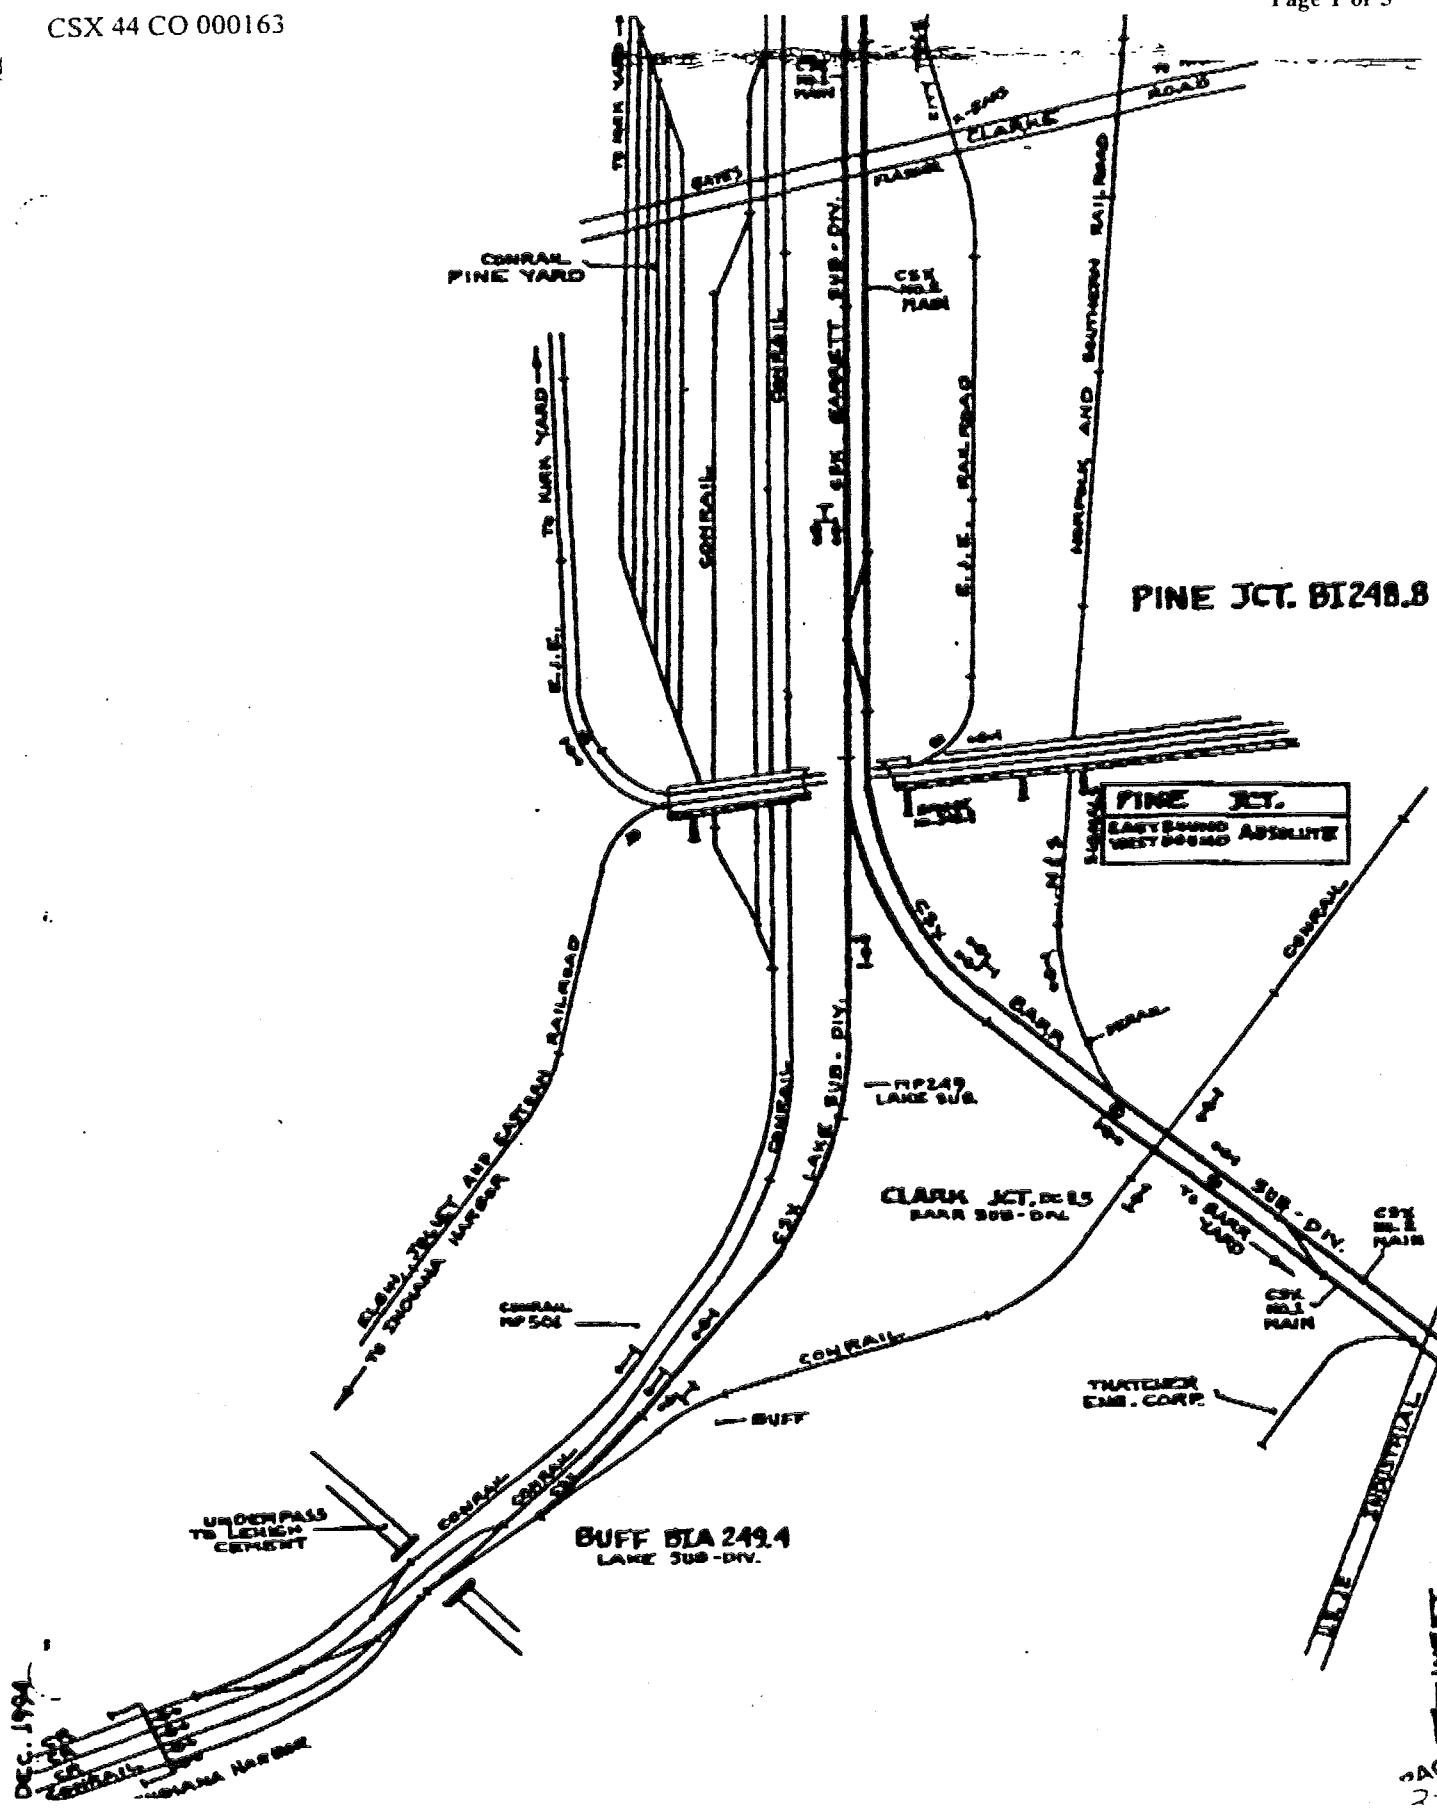

VII. CONCLUSION

The present levels of rail traffic in the Four Cities region cause significant safety problems and disruption of motor vehicle movements throughout the entire Four Cities region. The present situation is barely manageable, especially with regard to the provision of emergency services by the local municipalities. Applicants' projected increase in rail traffic on certain rail lines in the Four Cities region will exacerbate this situation and cause significant additional negative impacts to the Four Cities related to safety, increased vehicle delays, increased emissions in an area classified as a non-attainment area, land use, economic development and socioeconomic factors.

The SEA's approach in the DEIS does not lead to mitigation actions which address all serious environmental impacts and I believe that the Four Cities region is far more negatively impacted than SEA's conclusions in the DEIS indicate. Further, I believe these negative impacts must be thoroughly evaluated by the STB and mitigation actions imposed as a condition of this proceeding.

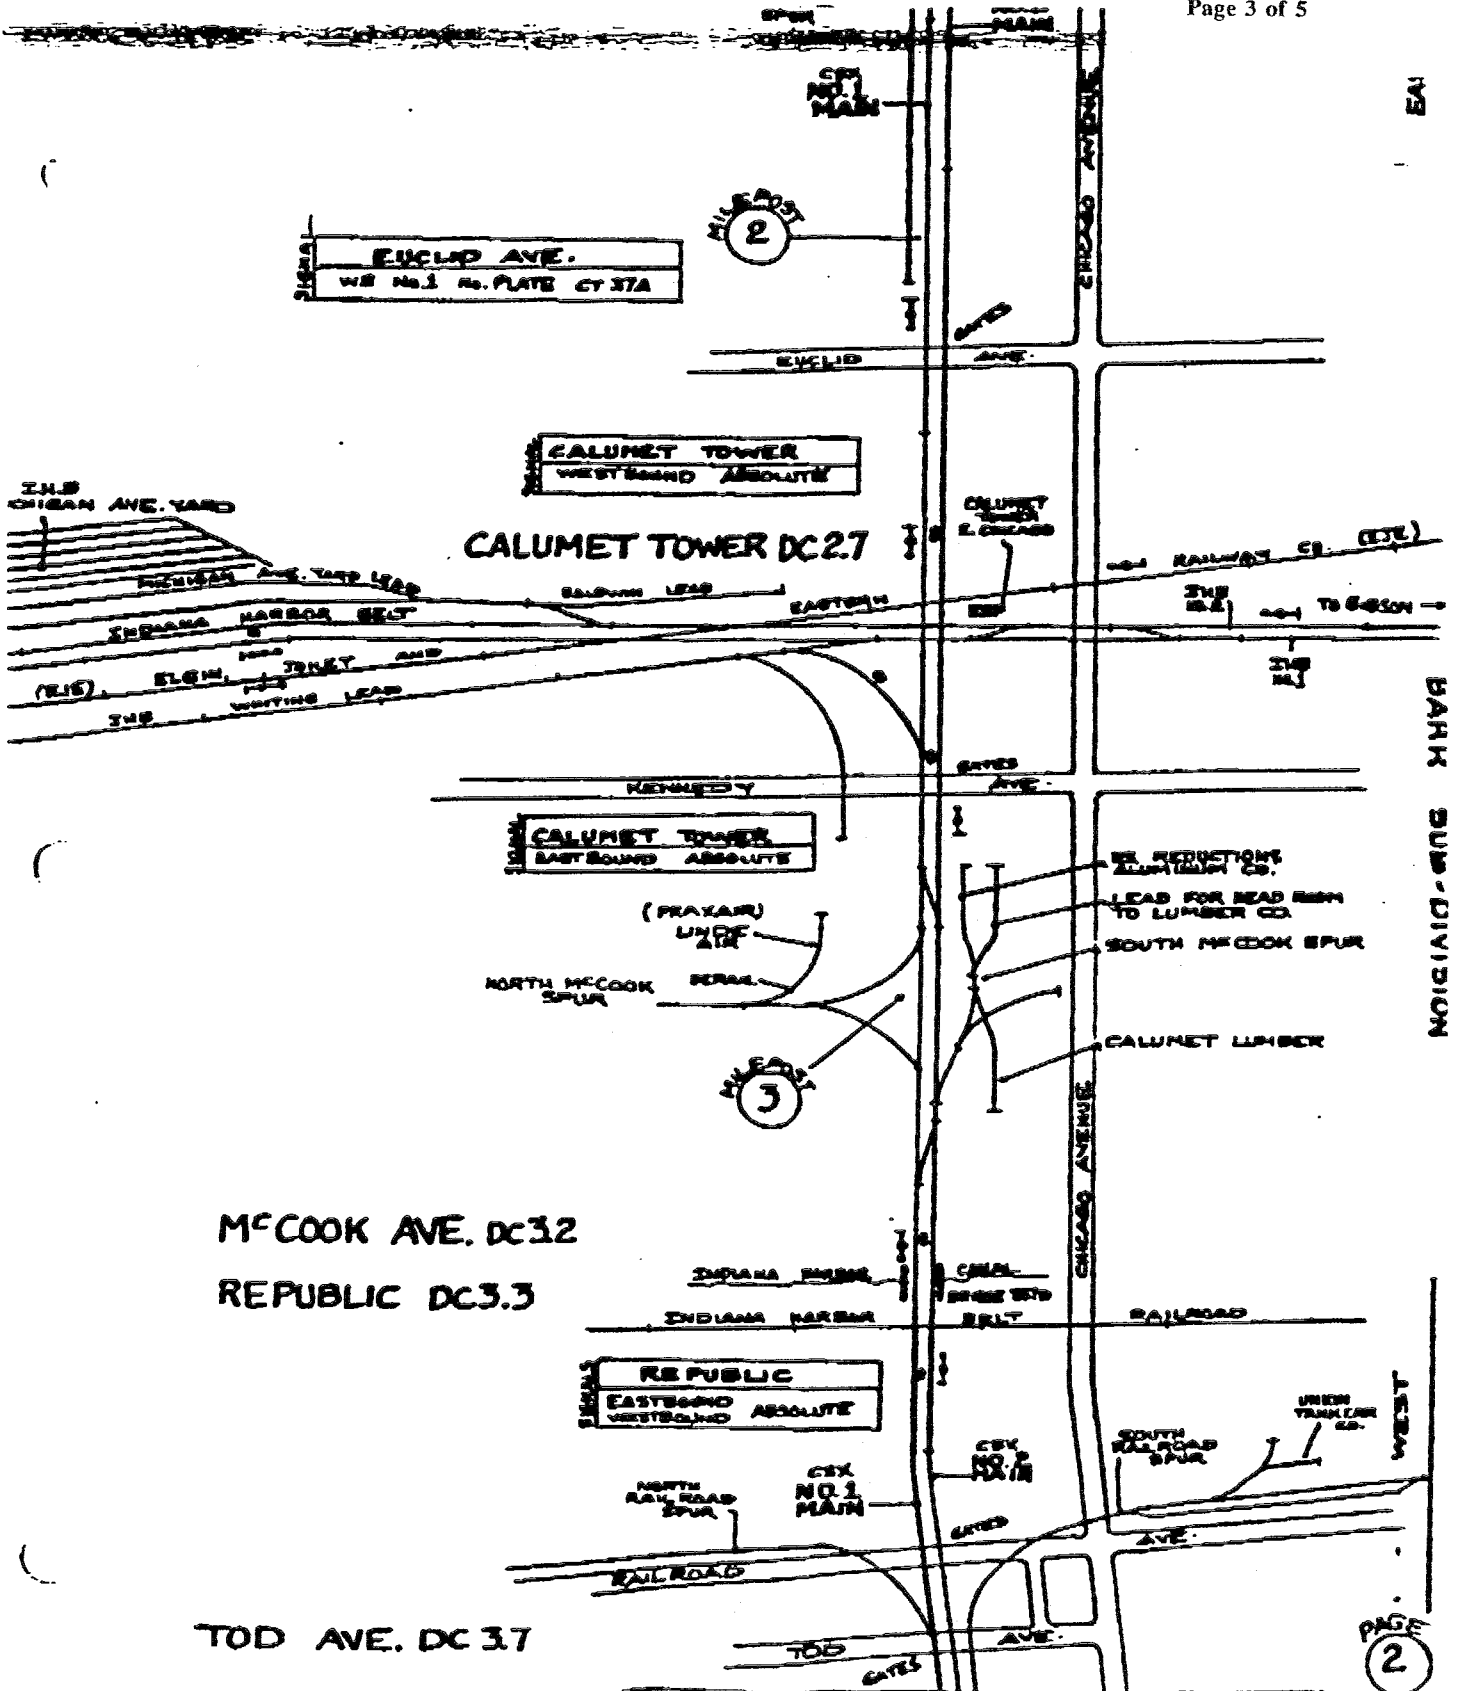

Finally, I believe the Alternative Routing Plan proposed by the FCC represents a reasonable and operationally feasible alternative to the operating plan proposed by the Applicants, and one which will mitigate many of the negative impacts related to the increased rail traffic proposed by Applicants, without inhibiting the movement of Applicants' traffic through the region.

I. INTRODUCTION

1 A. QUALIFICATIONS

2
3 My name is Gary Martin Andrew. I am a Senior Consultant with the economic consulting
4 firm of L.E. Peabody and Associates, Inc. located at 1501 Duke Street, Suite 200, Alexandria,
5 Virginia 22314. My resume and qualifications are set forth in my earlier Verified Statement
6 in this proceeding which was included in the Four City Consortium's Comments and Request
7 for Conditions filed October 21, 1997 (FCC-9).

8 9 B. ENGAGEMENT

10
11 I was requested by the Four City Consortium^{1/} ("FCC") to review and prepare written
12 comments on the Draft Environmental Impact Statement ("DEIS") issued by the Surface
13 Transportation Board in Finance Docket No. 33388. In particular, I was asked to concentrate
14 on the part of Chapter 5 of Volume 3A that deals with the impact on vehicular traffic at
15 rail/highway grade crossings and the corollary impacts on the environment that will result from
16 the proposed CSX/NS acquisition of Conrail ("Applicants' Proposal").

17

^{1/} The Four City Consortium consists of the cities of East Chicago, Indiana; Hammond, Indiana; Gary Indiana;
and, Whiting, Indiana.

Source: EXCEL Files Weekday_ADT.xls and Nite_WkEnd_ADT.xls.

1 Based upon my review of the DEIS and associated workpapers, I have concluded the
2 following:

- 3
- 4 ● The DEIS fails to calculate properly the aggregate effects of the Applicants' Proposal
5 on vehicular traffic in the Four Cities areas where serious problems involving vehicular
6 delay, public safety and air quality already exist. In particular the DEIS did not
7 consider the cumulative impact on vehicle delay hours the Applicants' Proposal would
8 cause at at-grade crossings with average daily traffic ("ADT") less than 5,000 vehicles
9 per day.
 - 10
 - 11 ● The data used in the DEIS differs significantly from the data presented by the
12 Applicants' Proposal and Applicants' responses to discovery as well as other available
13 sources. These differences occur in characteristics such as train lengths, train speeds,
14 vehicle departure rates, and ADT by time of day that have major impacts on the
15 estimates of vehicle delays in the area. In turn these changes in delays and exposures
16 have corresponding impacts on other environmental factors such as air quality, lost
17 productive time and safety.
 - 18
 - 19 ● The DEIS did not evaluate the reduced environmental impact of the FCC Alternative
20 Routing Plan that was developed and submitted to mitigate some of the impact of
21 Applicants' Proposal.
 - 22
 - 23 ● Using the corrections and additions that are required to provide full measurement of the
24 impacts of the Applicants' Proposal on vehicular traffic in the Four Cities area,
25 revisions to the DEIS are clearly necessary. These revisions are provided as
26 Exhibit GMA-2, Exhibit GMA-3 and Exhibit GMA-4.
 - 27

28

29 I have provided these results and the corrected model used in the DEIS to Mr. Phillip Burriss
30 for evaluating the various measures of environmental quality that are impacted by changes in
31 vehicular traffic.

32

1 The analyses supporting these conclusions are presented below under the following headings:

2
3 III. The Environmental Impact Statement Must Consider the Cumulative Effects of the
4 Applicants' Proposal

5
6 IV. Corrections to the Data and Model Used by the DEIS

7
8 V. The FCC Alternative Routing Plan Mitigates Adverse Environmental Impacts

9
10 VI. Proposed Revisions to the Environmental Impact Statement Analysis as it Pertains
11 to the Four Cities
12

1 **III. THE ENVIRONMENTAL IMPACT STATEMENT MUST CONSIDER**
2 **THE CUMULATIVE EFFECTS OF THE APPLICANTS' PROPOSAL**
3
4

5 The DEIS does not consider any changes in vehicle delays for at-grade crossings with traffic
6 density less than 5,000 vehicles per day [DEIS, Appendix C page 10]. Table 2 shows that 79
7 at-grade crossings in the Four Cities with ADT less than 5,000 vehicles per day will be affected
8 by the Applicants' Proposal. The DEIS analysis omits all of these crossings. Furthermore,
9 Table 2 shows that 29 at-grade crossings in the Four Cities with ADT of 5,000 or more vehicles
10 per day will be affected by the Applicants' Proposal. The DEIS provided data on only 15 of
11 these 29 at-grade crossings and failed to consider 14 of the 29 crossings or 48% fewer than
12 required by its own ADT volume threshold. The total number of neglected at-grade crossings
13 was 93, while the number of at-grade crossings analyzed was only 15.

14
15 Although use of the 5,000 vehicle per day threshold may be appropriate in some
16 circumstances, in an area like the Four Cities it clearly is not. Due to the large number of
17 crossings that fall below this threshold in this relatively concentrated area, ignoring the vehicle
18 delays at these crossings produces a highly inaccurate and misleading portrayal of the cumulative
19 impacts on the area.

Table 2
Crossings Involved in the Alternatives by ADT

<u>Crossing Type</u>	<u>At-Grade Crossings</u>				
	<u>Included in DEIS</u>	<u>Current Situation</u>	<u>Applicants' Proposal</u>	<u>FCC Alternative Routing</u>	<u>Total Required^{1/}</u>
(1)	(2)	(3)	(4)	(5)	(6)
1. Crossings with ADT < 5,000	0	31	54	47	79
2. Crossings with ADT > 15,000	15	15	19	23	29
3. Total At-Grade Crossings	15	46	73	70	108

Sources: Column (2)-DEIS Table 5-IN-9 (Revised).
Column (3) through (6)--EXCEL file Weekday_AD.T.xls in Workpapers.

^{1/} This column represents the unique number of crossings required to evaluate all of the alternatives of Columns (3), (4) and (5). The figure is less than the sum of Columns (3), (4) and (5) because of crossings that are included in more than one of columns (3), (4) and (5).

The cumulative effect of omitting these numerous at-grade crossings was a significant understatement of the number of vehicle hours of delay per year. In turn, these omissions resulted in an implicit^{2/} understatement of the changes in vehicle hours of delay per year.

Table 3 compares the vehicle delay hours for the current operations in the Four Cities area and for the Applicants' Proposal as computed considering only the 15 at-grade crossings in the DEIS versus considering all applicable at-grade crossings. The last line of Table 3 shows that failure to include the cumulative effect of all at-grade crossings understates the change in vehicle delays by 49,920 hours per year or 42 percent. Inclusion of the less-travelled crossings is

^{3/} Implicit in that the DEIS never explicitly stated the vehicle delay hours for the current and proposed operations.

1 particularly important in light of the high levels of traffic delay hours that currently exist in the
2 area. Therefore, I have included all at-grade crossings in my analysis.

3

1 **IV. CORRECTIONS TO THE DATA AND MODEL USED BY THE DEIS**
2
3

4 The data used in the DEIS deviate from data from other sources. In the case of train
5 lengths and train speeds, the DEIS data differs from the data provided by the Applicants as well
6 as from data collected in a recent traffic study in the Four Cities. The vehicle departure rate
7 used in the DEIS is significantly different from the actual observations in the affected area
8 because the DEIS apparently ignored truck traffic. Another problem is that the model used in
9 the DEIS assumes that the vehicular traffic and train traffic will be uniformly distributed in time.
10 Local data contradicts this assumption, requiring treating the weekday hours different than the
11 non-weekday hours where the data is available.^{4/}

12
13 The corrections necessary for the proper estimation of vehicular traffic delay statistics are
14 discussed below under the following topics:
15

- 16 A. Train Lengths;
17 B. Train Speeds;
18 C. Vehicle Departure Rate; and
19 D. Weekday Versus Night and Weekend Average Daily Traffic (ADT)
20

^{4/} There was an error in the DEIS formula for calculating average delay per stopped vehicle, but this error was corrected in the Supplemental Errata to the DEIS.

1 A. TRAIN LENGTHS

2
3 The data used in the DEIS for average length of train differs significantly from the data
4 presented by the Applicants. The average train length is a primary determinant in the calculation
5 of vehicle delay times [DEIS Appendix C page 11ff]. Table 4 compares the train lengths for
6 each rail line segment in the Four Cities area as presented in the DEIS with the train lengths
7 provided by the Applicants to the Four Cities in discovery. The train lengths used in the DEIS
8 are significantly different from the train lengths in the Applicants' discovery response. As
9 shown in Table 4, the train lengths provided in the DEIS in Columns (2) and (4) are always
10 larger than the corresponding train lengths provided by the Applicants' in Columns (3) and (5),
11 respectively. In this analysis, the differential between current and proposed train lengths is the
12 critical element - not the train lengths themselves. In the DEIS, the differences between current
13 and proposed train lengths are 200 feet in all but part of one segment, while in the Applicants'
14 data the differences between current and proposed train lengths are as large as 1,297 feet. It
15 should be noted that the values on train lengths for current operations obtained from the traffic
16 sample conducted by the FCC^{5/} agree with the data in Applicants' response to FCC Interrogatory
17 No. 7.

^{5/} See my previous Verified Statement in FCC-9.

Table 4 Train Lengths (feet)							
Road Segment (1)	Current		Proposed		Difference Proposed - Current

6. Tolleston, IN to Clarke Jct, IN	5,600-6,000	Not used	6,200	5,306	200-600	N.A.	

^{1/} From DEIS Volume 3A, Chapter 5, Table 5-IN-9, Page 1.
^{2/} Calculated from figures supplied in CSXT's Supplemental Response to FCC Interrogatory 7.

For the above reasons, I have used the train lengths derived from the data supplied by the Applicants for evaluating both pre- and post-acquisition conditions.

1 **B. TRAIN SPEEDS**

2
3 The DEIS uses values for train speeds that are not attainable in actual operations. For
4 example, Table 5-IN-9 of the DEIS uses 25 miles per hour as the current train speed for the
5 Barr Yard to Pine Junction Segment. The current maximum timetable speed in this segment is
6 35 miles per hour but the current average train speed in this area is approximately 12.0 miles
7 per hour. This value is developed from three sources of data: 1) data obtained in discovery
8 from the Applicants'^{6/}; 2) the traffic study conducted for the FCC under my supervision; and,
9 3) police radar observations.^{7/} The most reliable of these three sources is the CSX record that
10 shows the average speed on this segment is 12.0 miles per hour. The police radar observations
11 averaged 14.3 mph but these only involve trains that are in motion. Any amount of time that
12 a train is stopped results in a lower average speed on the segment. The CSX record contains
13 average duration to traverse the segment which accounts for any stops. If data were available
14 to adjust the radar observations for stopped trains, the estimate of 14.3 mph would be
15 considerably less.

16
17 The projected post-acquisition values for train speeds are similarly overstated. Even with
18 the improvements the Applicants' plan to make that will permit the speed limits to be raised in
19 certain areas, the average actual speeds in the Four Cities are not likely to approach even 50
20 percent of the speed limit. There are several conditions that will prevent the average speeds
21 from significantly increasing. First, there are several interlockers (rail-to-rail at-grade crossings)

^{6/} Bates No. CSX 12C0 000102 (Confidential).

^{7/} Provided in my workpapers.

1 in the area, especially in the Pine Junction to Barr Yard segment.^{8/} These have slower speed
2 restrictions and may require a full stop. As a result, the high level of rail traffic in the area
3 occasions the need for slow movement of trains to allow trains to cross other rail lines. Second,
4 the acceleration/deceleration times and distances are such that, given the various restrictions, the
5 speed limit cannot even be approximated in most segments. Third, the high density of
6 population and the large volume of vehicular traffic in the FCC area prevent higher speeds for
7 safety reasons.

8
9 Data provided by CSX confirms that train operations in congested areas like the Four Cities
10 are far lower than posted speeds. These data show numerous lines where average train speeds
11 are less than one half of the posted speed limit. Table 5 shows the speed limits and actual
12 speeds in mainline segments in or near various metropolitan areas with high population densities.
13 The average actual speed on these metropolitan segments is only 36.6 percent of the speed limit.

14
15 On the Pine Junction to Barr yard segment I have used the CSX average actual train speed
16 of 12.0 mph for the correct current train speed because of the three sources of evidence
17 discussed above. Applicants claim that the capital improvements in this segment to handle more
18 trains, longer trains and heavier trains and increase the speed limit to 40 mph will enable the
19 average speed to increase. I do not believe the average speed will increase at all because of the
20 increased number, length and weight of trains in a segment with many interlockers. However,
21 to be conservative, I have assumed a 10% increase in average train speed from 12.0 to 13.2 mph

^{8/} See Exhibit__GMA-1.

1 for the post acquisition analysis of both the Applicants Proposal and the FCC Alternative
2 Routing Plan.^{2/}

3
4 The other segment where we have obtained actual average train speeds is Willow Creek to
5 Pine Junction. The data from CSX noted above show the average train speed on this segment
6 to be 24.5 mph. I have used 24.5 mph for both current and post-acquisition train speeds on the
7 Willow Creek to Pine Junction segment.

8
9 The Hobart-Tolleston-Clarke Junction segment is currently out of service and the current
10 actual speed data are not available. Because I have no other data, I have used 36.6% of the 40
11 mph that Applicants state as the maximum speed on this segment. This is consistent with the
12 experience of CSX in other, similarly dense metropolitan areas. It is also consistent with the
13 planned use of this line to handle bulk trains so that higher priority traffic can be expressed on
14 CSX's lakefront line. These lower priority bulk trains will yield the right-of-way to other traffic
15 at several rail-to-rail at-grade crossings on this segment.

16
17 In all other areas, I have used 50% of the maximum speed limit for average train speed in
18 all calculations for current and proposed operating segments. Mr. Phillip Burris also discusses
19 the rationale for the train speed used in his evaluation.

^{2/} Because the Applicant relies on certain improvements to the Pine Junction to Barr Yard segment as the justification for an increased train speed, the Four Cities included this investment as a cost of the FCC Alternative Routing Plan as explained by Mr. Burris.

C. VEHICLE DEPARTURE RATE

The Supplemental Errata to the DEIS (at 2) gave the vehicle departure rate^{10/} for vehicles leaving the queue after the train has passed as 1400 vehicles per hour per lane (or 23.3 vehicles per minute per lane). The source for this was given as "field measurements". This value

^{10/} The vehicle departure rate is represented as Sc in the Appendix C of the DEIS.

1 appears to be the unimpeded flow for cars (only) leaving a queue at a stop light. The actual
2 departure rates from a queue across railroad tracks on the Pine Junction to Barr Yard segment
3 were much slower because of trucks and traffic congestion. Measurements of queue clearing
4 times and cars in queue reported in my Verified Statement in FCC-9 showed an average vehicle
5 departure rate of 10.18 vehicles per minute per lane for 7 at-grade crossings^{11/} on the Pine
6 Junction to Barr Yard segment.

7
8 This estimate of vehicle departure rate reflects the mix of cars and trucks and the congestion
9 that actually exists in this area. Therefore, I have used 10.18 vehicles per minute per lane
10 (610.8 vehicles per hour per lane) for the value of the vehicle departure rates at all at-grade
11 crossings on the Pine Junction to Barr Yard rail segment. Because I did not have sufficient
12 information to make an independent estimate for the other rail segments, I relied on the 1400
13 vehicles per hour per lane in the DEIS for all other segments.

14
15 **D. WEEKDAY VERSUS NIGHT-WEEKEND AVERAGE DAILY TRAFFIC (ADT)**

16 The model used in the DEIS assumes uniform traffic arrivals to the at-grade crossings
17 throughout the period under study. In the study of Pine Junction to Barr Yard at-grade crossings
18 we found that 60% of the vehicles were observed during the weekdays which account for 36%^{12/}
19 of the hours in a week. Meanwhile 32% of the trains passed during the weekday hours. The

^{11/} The observations for Columbia Ave. were omitted in the above calculation because of construction in the area.

^{12/} The weekdays are 6 am to 6 pm, Monday through Friday and account for 60 hours out of the 168 hours in a week (60/168 = 36%).

1 net result of the concentration of 60% of the vehicular traffic in 36% of the time is a significant
2 increase in delay times for vehicles that travel during the weekday hours.

3
4 I used this information and increased the effective ADT for 60 hours per week to reflect the
5 concentration of vehicles and ran 32% of the trains during the 60 weekday hours.^{13/} For nights
6 and weekends, I decreased the effective ADT for 108 hours per week to reflect the sparsity of
7 vehicular traffic and ran the remaining 68% of the trains during the 108 night and weekend
8 hours.^{14/} The two results were added together.

9
10 The adjustment was used only for the at-grade crossings on the Pine Junction to Barr Yard
11 segment. The data was not available to make such adjustments for the other segments;
12 therefore, I used the uniform assumption of the DEIS.

13
14 After making all of the input adjustments describe above, I used the DEIS formula (as
15 corrected by the SEA Supplemental Errata) to calculate revised vehicle delay times as presented
16 in this verified statement.

^{13/} The actual adjustment made to the ADT for weekdays was to multiply the ADT by 60% and then divide by 36% of the week. Thus, the effective rate of an ADT with 10,000 vehicles per day is 16,667 vehicles per day during the 60 weekday hours.

^{14/} The actual adjustment made to the ADT for nights and weekends was to multiply the ADT by 40% and divide by the 64% of the week. Thus, the effective rate of an ADT with 10,000 vehicles per day is 6250 vehicles per day during the 106 night and weekend hours.

1 **VI. PROPOSED REVISIONS TO THE ENVIRONMENTAL**
2 **IMPACT STATEMENT ANALYSIS RELATING TO THE FOUR CITIES**
3
4

5 Based on the discussion and data presented above and in my attached exhibits, I propose the
6 following revisions be included in the final environmental impact statement:

7
8 A. Revise Table 5-IN-9 as shown in my Exhibit __GMA-2:
9

- 10 1. To include the FCC Alternative Routing;
11
12 2. To include all at-grade crossings where the impact of the Applicants' Proposal will be
13 different than the FCC Alternative Routing;
14
15 3. To include the data corrections in train speeds and train lengths; and,
16
17 4. To include the corrected formula for average vehicle delay.
18

19 B. Revise Table 5-IN-45 as shown in my Exhibit __GMA-3:
20

- 21 1. To include the FCC Alternative Routing;
22
23 2. To include all at-grade crossings where the impact of the Applicants' Proposal will be
24 different than the FCC Alternative Routing;
25
26 3. To include the data corrections in train speeds and train lengths; and,
27
28 4. To include the corrected formula for average vehicle delay.
29

30 C. Include a Table 5-IN-Supplemental as shown in my Exhibit __GMA-4 that summarizes and
31 compares the environmental impacts on vehicular traffic resulting from the Applicants'
32 Proposal and the FCC Alternative Routing Plan.
33
34

Elaine K. Kaiser, Chief
Section of Environmental Analysis
Surface Transportation Board
Washington, DC 20423

Dear Ms. Kaiser:

We have reviewed the proposed Finance Docket No. 33388--CSX and Norfolk Southern--Control and Acquisition--Conrail; Compliance with Section 106 of the NHPA (request for SHPO review of all acquisition activities in Indiana other than the construction at Willow Creek [CSX] and Alexandria [NS]) County, Indiana. This review has been conducted pursuant to Section 106 of the National Historic Preservation Act (16 U.S.C. Section 470f) and implementing regulations found at 36 C.F.R. Part 800.

In regards to the architectural aspects of the project, the North Liberty Combination Depot is considered to be eligible for inclusion in the National Register of Historic Places because of its architectural and historical significance. It is an outstanding example of a board and batten depot. It is also an important historical resource, because it illustrates the development of the railroad in St. Joseph County. Please refer to the enclosed map for your reference.

Because the North Liberty Combination Depot is within the area of potential effect, it is our responsibility to determine the effect of the proposed rail line abandonment project on the depot. However, we need more information to enable us to evaluate the effect. How will the abandonment affect the use of the depot? Will the depot continue to be used for storage? Will the depot be sold or abandoned? Please explain in detail the proposed future plans for the depot. Once the above requested information is received by our office, the review process will continue. If you have any further questions about the above material, please call Michelle M. Daleiden or Ralph S. Wilcox at (317) 232-1646.

In regards to the archaeological aspects of the project, as long as the South Bend to Dillon Junction rail line abandonment project remains within areas disturbed by previous construction, no known

"EQUAL OPPORTUNITY EMPLOYER"

PRINTED ON RECYCLED PAPER

Page 2

archaeological sites listed in or eligible for inclusion in the National Register of Historic Places will be affected by this project. However, if any archaeological artifacts or human remains are uncovered during construction, demolition, or earthmoving activities, state law (Indiana Code 14-21-1-27 and 29) requires that work must stop and that the discovery must be reported to the Division of Historic Preservation and Archaeology within two (2) business days. Additionally, in the event that artifacts or features are discovered during the implementation of the federally assisted project, activity, or program and a plan has not been developed, it is the federal agency's responsibility to contact the Advisory Council on Historic Preservation in accordance with 36 C.F.R. Section 800.11(b)(2).

We concur with the findings of the report for both the **Butler** and **Tolleston** projects. Given the results of the archaeological overviews (Wharton and Skinner, 10/24/97), neither project area is likely to contain significant archaeological resources. As such, no known archaeological sites listed in or eligible for inclusion in the National Register of Historic Places will be affected by this project.

If any archaeological artifacts or human remains are uncovered during construction, federal law and regulations (16 USC 470, et seq.; 36 CFR 800.11, et al.) and, additionally, state law (Indiana Code 14-21-1), require that work must stop and that the discovery must be reported to the Division of Historic Preservation and Archaeology within two (2) business days. If you have any questions about the archaeological aspects of the project, please call Jim Mohow or Dr. Rick Jones at (317) 232-1646. Thank you for your cooperation.

Very truly yours,

Larry D. Macklin
State Historic Preservation Officer

RE: Draft Environmental Impact Statement - Recommended Mitigation for
Kentucky

Dear Ms. Kaiser:

This letter concerns the Draft Environmental Impact Statement (DEIS) issued by the Board's Section of Environmental Analysis on December 12, 1997, that directs CSX to consult with appropriate authorities in the Commonwealth of Kentucky regarding Acquisition-related impacts. Specifically, the DEIS directs CSX to consult with the City of Hopkinsville concerning a grade separation at East 9th Street, DOT #345-267 V.

The Kentucky Transportation Cabinet is the designated, lead agency overseeing these matters. The need for grade separations is determined by the Cabinet through a comprehensive statewide planning process and through input from local officials. This mitigation recommendation is best addressed through their existing procedures. The City's position is that mitigation is not warranted at this time.

Further, please note that the recommended grade separation is not appropriate for this site. East 9th Street is located within an established commercial and historic area and construction of a grade separation would have numerous adverse consequences.

Elaine Kaiser
Surface Transportation Board
January 20, 1998
Page 2

While the City appreciates the Board's interest, we prefer not to disrupt our community by grade separating East 9th Street.

Respectfully,

W.W. Bryan, Jr.

Attention: Elaine K. Kaiser
Environmental Project Director

Dear Ms. Kaiser:

This letter is being written to voice my objection to possible environmental upgrading planned by the Surface Transportation Board to the East 6th Street and Dudley Street crossings, as well as the proposed grade separation to the East 9th Street crossing, all of which are located in Hopkinsville, Kentucky.

These are historic, scenic areas and, in my opinion, this would detract from --rather than enhance-- the current surroundings.

Your willingness to leave the area as it currently exists would be greatly appreciated.

Sincerely,

A handwritten signature in cursive script that reads "James Bruce".

Board Section
Environmental Analysis
Release of Draft Environmental
Impact Statement
Proposed Conrail Acquisition

The Surface Transportation Board (Board) Section of Environmental Analysis (SEA) issued its Draft Environmental Impact Statement (EIS) for the proposed Conrail Acquisition on December 12, 1997. The Draft EIS discusses SEA's independent analysis of potential environmental impacts and includes SEA's preliminary recommendations for mitigating possible environmental effects of the proposed Acquisition of Conrail by Norfolk Southern (NS) and CSX.

The Draft EIS is currently available for public review and comment. Public comments are due by February 2, 1998. The public review and comment period for the Draft EIS and the Final EIS in making its final decision. The Board will issue its final written decision in July 1998.

SEA will consider all comments received in response to the Draft EIS in preparing the Final EIS and in making its final recommendations to the Surface Transportation Board (Board). SEA plans to serve the Final EIS in May 1998. The Board will consider the entire environmental record, including all public comment, the Draft EIS, and the Final EIS in making its final decision. The Board will issue its final written decision in July 1998.

SEA invites all interested agencies and the public to comment on the Draft EIS by providing copies of the Draft EIS to Federal, state, and regional agencies and county administrators for each potentially affected county, and to all parties who have specifically requested a copy. If you have questions regarding the Draft EIS, call SEA's toll-free Environmental Hotline at 1-888-889-1997 (TDD for the hearing impaired: 202-566-1695). Information about the proposed Acquisition and Draft EIS can also be found at the following Internet Web site: <http://www.conrailmer.com>.

All interested agencies, organizations, and individuals can comment on the Draft EIS by submitting written comments (include an original plus 10 copies) to the address listed below by February 2, 1998, the close of the public comment period.

Ms. Kaiser; I do not understand much about this Ad. Dad incorporated Sandy Valley Tr Co. in Paintsville Ky 1921 we had many subsidiaries that had Rail-Road Access. I never saw the deeds to the businesses they owned. Appears all the valuable information earned 1964 Paintsville, Ky. Carson suspected, and our Winchester Hill earned 1970's. Quite sure the most important documents kept. And that would be by Harold Kelley 1200 Bath Ave. Ashland, Ky and Charles Donald Wheeler, Wheeler Williams Advce. Rt 60 West Ashland Ky. If the 2 above names are claiming anything concerning CSX I can give you more information on that. And it could be listed in undercover names, if they had any claims on CSX. Kelley - ^{Assumed} Holloway

CPR's uses Assumed names, and others. My dad was Charles Wesley Wheeler b. 1875 d. 1931. The 2 above with help of Banks and Courts have Embezzled - Extorted all those businesses, and taken my dad's personal real mineral rights in Eastern Kentucky. They also did the same to my brother's Dolan E. Wheeler Estates. He controlled Along Southern Hill's Ests, owning the Capital stock 508 shares. Extortion Epists Every day. Robbing me of my legal inherited rights. I'm a 1/8th Heir of my Parents. A 1/4th Dolan 1/8th Mar 12, 1987. A 1/4th Heir of brother Dolan Estates. If the Names Underlined Above have any thing to do with Ad Write Me. I have More Information. Thank You -

Investigations loom over legislature

By MARK R. CHELLGREN
THE ASSOCIATED PRESS

FRANKFORT — The Kentucky General Assembly convened this week with the scent of scandal again in the air. The conduct of a few of its members and staff associates — personal and political — threatens again to taint the institution. At least three potential or actual investigations loom, and there is the big unknown about whether federal

ANALYSIS

authorities who worked just a few years ago to keep a similar thrum watch on the legislature are again under cover at the Capitol. All of this in the aftermath of Operation Bobbin, the existence of which was airily publically revealed less than a year ago, which found two dozen legislators' lobbyists and others guilty of a variety of offenses.

The most prominent of the new investigations involve Ken Dwyer, a General Assembly employee for a year who was in charge of logistics for the House of Representatives. He left his job and pleaded guilty to receiving a bribe. He was the on-site manager of prostitution and gambling private goings on in a strip club. Now that Dwyer has pleaded guilty and is cooperating with enforcement authorities, will remain to be seen

whether he will implicate legislators in the junkies he detected. By the way, House Majority Floor Leader Greg Stumbo acknowledged in October 1996 that he and other legislators remain in House with Downey. The former was taken by Mike Bowling, a legislator chairman of the House Judiciary Committee. Representative Memberly D'Arcy, former chairman of the Appropriations and

SEE STATE PAGE 10

State

FROM PAGE 1

Revenue Committee, fought harassment that took place in Downey's fourth-floor office at the Capitol. Dwyer is putting stamps on the House payroll. Sen. Elizabeth Holtzman, another Republican who has signed a formal complaint asking the legislative ethics commission to investigate a gross allegation recently, it was revealed that three legislative employees complained at the end of the 1996 session that there was drinking and sexual

microphones tables might be in use again. We don't comment on the investigation. We don't comment on what we do for the members of the House, said Michael Dwyer, attorney for the Western District of Kentucky. Obviously, that would be something that we could not firm up, Dwyer said. Beyer, a spokesman for the FBI, said But it may be something to ponder on legislators to ponder on again. JEFFREY

RE: Estate of Dola E. Wheeler

Dear Ms. Minix:

Thank you for calling me with concerns that you have regarding your brother's estate. I contacted the National City Bank in Ashland and received the enclosed letter dated October 25, 1994. Your concerns about this estate are very substantial and from every indication it would take a tremendous amount of time to assist you. It would be to your advantage to employ an attorney not so far away in order to keep attorney's fees more reasonable. Based upon the amount of work involved and the distance I decline to take your case. I wish you the very best in pursuing this matter.

Yours truly,

Roy Emerson Welch

Att: Charles Holbrook
Notorious

Dear Mr. Welch:

Per your request, I reviewed our closed account files and found the following information regarding the above referenced estate. Dola Wheeler passed away on March 12, 1987 and Third National Bank was appointed administrator of the estate by Court Order on April 1, 1987. The appointment was made subsequent to a petition made to the court by a Lula Wheeler Kennedy and a Charles D. Wheeler requesting the bank's appointment. Our files show the required estate inventory and accountings were filed with the Boyd District Court in Catlettsburg, Kentucky under file number 87-P-099. The final settlement for the estate was approved by the court in November 1991. To my knowledge, we currently do not have any trust department accounts for any of the Wheeler family members nor did we have any accounts established for any family members during the administration of the estate or subsequent to its closure.

Dola E. Wheeler, 81, of 1600 Johnson Avenue, Ashland, died at 10:45 p.m. Thursday, March 13, 1987, in Our Lady of Bellefonte Hospital in Russell, following an extended illness.

Mr. Wheeler, or D. E., as he was known to many, was born October 7, 1905, in Wheelersburg, Ky., in Magoffin County, the son of Charles Wesley and Elizabeth Jayne Wheeler.

He was a director and marketing agent for Sandy Valley Wholesale Grocery in his early years.

He was instrumental in helping to develop Hill 'N Dale Subdivision, and Southern Hills estates, and owned controlling interest. D. E. was a land developer, and he loved nature, people, and all things God saw that he needed while here on this earth.

He was gentle and kind to all who knew him. A southern gentleman and very hospitable person.

He attended many United Baptist services. This church was his faith, and heritage. He loved the old songs, and a few days before his passing, he lifted his weak arms, and sang an old song: "Amazing Grace How Sweet the Sound". I was told he sang it all the way through. Dola said he was ready to go.

To mourn his passing are three sisters: Mrs. Loula Wheeler Kennard of Ashland, Ky., Ruie Wheeler Ramsey of Whitesburg, Ky., Myrtle Wheeler Minix of Paintsville, Ky., with many living nieces and nephews. His deceased brothers are: Henry Melvin, Henry Harrison, Sherman Clay, Dona Wesley and Johnnie.

Dola E. Wheeler was at John Steen Funeral Home. Visitation was Saturday, March 14, 1987, from 5

until 9 p.m. Sunday morning, March 15, 9 a.m. until funeral.

The funeral was held at 2 p.m. Sunday.

Steen Funeral Home, Ashland Chapel, Elder Walter Pelphrey, Elder Samuel Colvin, and Brother Dewey McCarty, were in charge of the United Baptist Service, with many singers from the church singing the Old Baptist hymns and one in particular, "Amazing Grace".

Pallbearers were his nephews: James C. Kennard, William H. Wheeler, David Dolan Wheeler, Joseph Ramsey, Charles Donald Wheeler, Richard Roscoe Wheeler, Anthony Sparks Wheeler and Marcus Stephen Minix.

Interment was in the Ashland Cemetery.

CARD OF THANKS

We do wish to thank Dr. Ehrle, Dr. Rhodes, the painscaring nurses at Our Lady of Bellefonte Hospital, and the sitters that cared for him, were so very gentle, kind and devoted.

We thank the United Baptist Church for their comforting words, and the singers for their songs.

And for all the consoling words from so many who knew and loved Dola, and we thank you for the lovely floral arrangements.

And most of all we thank God for our kind, loving brother and uncle, Dola E. Wheeler.

EULOGY

Dola E. Wheeler, dear brother, uncle and friend, died Thursday, March 12, at eighty-one years of age. He was the fourth son of the late Charles Wesley and Elizabeth Jayne Wheeler. His early life was spent in Magoffin County. In the late 1920s, Mr. Wheeler acted as a sales agent for a Florida land company in the Florida "land boom". He was also a director and purchasing agent for Sandy Valley Grocery Company in the

A-265-C

1930s. In the 1950s and early 1960s he developed Hill 'N Dale Subdivision and Southern Hills Estates. He also owned and operated numerous stores and businesses in the area and was truly endowed with an entrepreneurial spirit. He loved animals and was never known to meet a stranger.

He attended the United Baptist Church and is survived by three sisters, Loula Wheeler Kennard of Ashland, Ruie Wheeler Ramsey of Whitesburg, and Myrtle Wheeler Minix of Paintsville; numerous nieces and nephews.

"To be honest, to be kind--to earn a little, to make the whole family happier for his presence" is the legacy that he leaves us. He was a man of quick wit, an eternal optimist, and a person who rejoiced in the entrepreneurial spirit. He will be sadly missed by all who loved him.

MY BROTHER DOLA E. WHEELER

Occasionally I look out and see--
A dear brother coming, and his name is D.E.

He is always humble, smiling and bright--

This is a most pleasing and delightful sight.

He loves nature's beauty that surrounds us all--

And all his people he cherishes, and is enthralled.

He likes the companionship of all children--mankind too--

I'm sure he has instructed and educated a few.

He enjoys roaming the ridges in Southern Hills

And feeds all the birds that fly onto his windowsills.

He cares for his dogs and all of the strays

He must possess much goodness to behave this way.

D. E. enjoys God's gifts of this beautiful Earth

I am awaiting his rebirth--

He reads his Bible, and is very well versed.

This is a trait that is instructed of us--

This describes a God fearing, hospitable Southern gentleman.

He is my brother and "special" is true.

I know his mother was proud of him too.

May he follow my prayers so when this life is over,

His journey he will pursue.

IN OUR VIEW

Ousted at KACo

Changes will help restore credibility

Kentucky's county judge-executives have taken a step toward regaining control and restoring credibility to their organization. It should not be the final step.

In a move led by the Kentucky County Judge-Executive Association, the trustees of the Kentucky Association of Counties' financially strapped All Lines Fund have voted to replace its third-party administrator and attorney.

The judge-executives says other changes may be forthcoming.

Greenup County Judge-Executive Bobby Carpenter said KACo Executive Director John Griggs' future is in doubt. Griggs later announced that he will retire early.

"Everyone is going to be held accountable," warned Morgan County Judge-Executive Sid Stewart, president of the judge-executives group.

Holding KACo's administrators accountable for the organization's problems is something that needed to be done years ago. But county officials looked the other way

Holding KACo's administrators accountable for the organization's problems is something that needed to be done years ago.

while KACo has been involved in one controversy after another in recent years.

Their nonchalant attitude changed radically when counties had to foot the bill to cover part of a \$9.4 million deficit in KACo's All Lines Fund, a self-insurance program that offered counties low rates for property and casualty protection. In this area, Boyd County has been asked to pay \$19,447; Greenup, \$17,868; Carter, \$11,248, and Rowan, \$27,314.

It is too bad that it took county officials so long to wake up to the serious problems at KACo. New leadership and increased oversight is the best way to restore credibility to KACo.

Norfolk Southern bids \$1 billion more than CSX on Conrail deal

By JEFFREY BRODEUR
THE ASSOCIATED PRESS

PHILADELPHIA — A bidding war broke out today for Conrail Inc., as Norfolk Southern Corp. said it would pay \$8.1 billion for the company, topping CSX's offer by nearly \$1 billion.

Either merger would create the nation's third-biggest railroad, a giant that would dominate the rail freight industry in the East.

Norfolk Southern's offer would mean \$100 per share in cash to Conrail stock holders, beating the CSX offer of a cash-and-stock mix that values Conrail at \$81.51 per share.

The CSX offer initially was worth \$8.4 billion, but its stock price has since fallen more than 6 percent, pulling down the bid's value to a little under \$7.2 billion.

Norfolk Southern, which had been rumored earlier this year to be interested in buying Philadelphia-based Conrail, had signaled its willingness to disrupt the CSX deal when it was announced Oct. 15.

"This proposal is better on every point than the CSX/Conrail proposal announced last week," said David R. Goode, chairman, president and chief

executive officer of Norfolk Southern.

If Virginia-based Norfolk Southern wins Conrail, the combination would create one of the country's biggest railroads, matching Norfolk Southern's strength in the Southeast with Conrail's extensive track network in the Northeast and Midwest.

"A combined Norfolk Southern-Conrail will create a more balanced eastern rail system and will do so by increasing, rather than diminishing, competition in the industry," Goode said.

A combined Norfolk Southern and Conrail would, like a CSX-Conrail deal, rank behind Union Pacific and Burlington Northern in terms of track mileage.

Unlike CSX, however, Norfolk Southern would give Conrail greater reach into the Southeast, where Norfolk Southern stretches as far as New Orleans and Jacksonville, Fla.

Conrail and CSX had no immediate comment.

In a letter to Conrail's Board of Directors, Goode said Norfolk Southern would consider locating the combined company's headquarters in Philadelphia.

In its deal, CSX said that the combined company would be renamed and based in Philadelphia, with CSX president John W. Snow as chairman.

Norfolk Southern had said it would take steps to involve itself in the CSX-Conrail deal and in today's announcement confirmed it had been trying to strike a deal with Conrail for years. Goode said he had suggested a combination as recently as 11 days before the CSX deal was announced.

"We regret that, despite knowing our long-term interest in joining Conrail with Norfolk Southern, your chairman ignored our longstanding offer to submit a business combination proposal to you," Goode said in the letter.

Norfolk Southern operates a 14,500 mile rail system in 20 states and Canada, as well as a trucking company. Conrail operates an 11,000-mile rail freight network in 12 Northeastern and Midwestern states, the District of Columbia, and Quebec.

CSX operates more than 18,000 miles of track running through 20 states in the East, Midwest, South and in Ontario. The rail business accounted for nearly half of last year's revenues.

Washington, D.C. 20423-0001

ATTENTION: Elaine K. Kaiser, Environmental Project Director, Environmental Filing

Dear Ms. Kaiser:

SUBJECT: Draft Environmental Impact Statement
Recommended Mitigation for Kentucky
Conrail Acquisition Proposal

Our Cabinet is reviewing the Draft Environmental Impact Statement (DEIS) issued by the Board's Section of Environmental Analysis on December 12, 1997, concerning the acquisition of Conrail by CSX and Norfolk Southern. One concern that required special consideration was the required coordination on the part of CSX for acquisition-related impacts in Kentucky. Specifically, the DEIS directs CSX to consult with the Kentucky Transportation Cabinet concerning upgrading the following grade crossings:

<u>FRA ID</u>	<u>Crossing Name</u>	<u>City</u>	<u>Recommended Mitigation</u>
345-246 C	Duffy Street	Hopkinsville	Upgrade to Flashing Lights
345-269 J	7th Street*	Hopkinsville	Upgrade to Flashing Lights
345-318 D	Moss Avenue	Earlington**	Upgrade to Flashing Lights
345-329 R***	West Center Street	Madisonville	Upgrade to Gates
345-331 S	West Noel Avenue	Madisonville	Grade Separation
345-362 R	West Dixon Street	Sebree	Upgrade to Gates
345-267 V	East 9th Street	Hopkinsville	Grade Separation

* Incorrectly shown as East 6th Street in the DEIS

** Incorrectly shown as Madisonville in the DEIS

*** Incorrectly shown as 155-645 N in the DEIS

KENTUCKY TRANSPORTATION CABINET
"PROVIDE A SAFE, EFFICIENT, ENVIRONMENTALLY SOUND, AND FISCALLY RESPONSIBLE TRANSPORTATION SYSTEM
WHICH PROMOTES ECONOMIC GROWTH AND ENHANCES THE QUALITY OF LIFE IN KENTUCKY."
"AN EQUAL OPPORTUNITY EMPLOYER M/F/D"

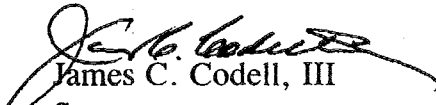

Elaine K. Kaiser
January 28, 1998
Page 2

We certainly understand the Board's interest and concern regarding the impacts of the seven at-grade locations for which safety-mitigated improvements are proposed.

Three of the locations have recently been upgraded or approved for additional work. These include the 7th Street crossing in Hopkinsville that has been upgraded to Cantilever Flashing Light Signals and Bell, the Moss Avenue crossing in Earlington that is proposed for upgrading from passive to Flashing Light Signals and Bell, and the West Center Street crossing in Madisonville that has been programmed for upgrading from Flashing Light Signals and Bell to Flashing Light Signals and Automatic Gates. The other locations on Duffy Street in Hopkinsville and West Dixon Street in Sebree will certainly be considered for upgrading in one of our future Crossing Warning Device Improvement Programs.

The proposed grade separations at East 9th Street in Hopkinsville and West Noel Avenue in Madisonville are located near the centralized business districts of those communities and near dense residential areas. The implementation of grade separation projects would have severe impacts on many businesses and residences. The economic impact to these communities, coupled with the impact on historic/cultural resources, makes the proposals unreasonable at this time. Therefore, the Cabinet cannot support or endorse the proposed mitigated separation at these locations.

Sincerely,

James C. Codell, III
Secretary

Washington, DC 20423-0001

CENTRAL ADMINISTRATIVE UNIT
REC'D: 2/3/98
DOCUMENT # 2/3/98 11.38.40AM

Dear Ms. Kaiser:

After considering Conrail's proposal concerning the sale of their railway to CSX and Norfolk, the City of New Orleans strongly opposes the acquisition. There are numerous considerations that would have a negative impact on the city, the environment and community residents.

One of our greatest concerns is the estimated doubling of hazardous materials traffic traveling through Louisiana. According to the SEA, more than 20,000 cars containing hazardous materials (hazmats) will be transported from Mobile, AL to New Orleans each year. Along with a greater number of cars comes an increased risk of accidents. We have serious concerns for the safety of community residents, the wetlands, and wildlife inhabiting areas near the railway. A hazmat accident, or any train accident, could pollute our drinking water supply and damage sensitive wetlands and wildlife in the area.

Not only do residents face a risk of contaminated drinking water, they also face the risk of exposure to hazardous fumes and materials. The SEA reports that it plans to recommend that CSX and NS be required to prepare a hazmat emergency response plan and implement a response drill with the voluntary participation of local emergency response teams once every two years. However, there is no guarantee that these plans will be prepared or implemented. If the assistance of local emergency response teams is voluntary, we have no guarantee that there will be enough staff to perform the necessary response plan in the event of an emergency.

The increase in traffic around the Oliver intermodal facility in New Orleans will create abundant problems for the residents living near the station and for those who travel on Almonaster Avenue, Florida Avenue, and Louisa Road. There will be an increase of sixty-three trucks per day traveling to and from the Oliver station. There will be an estimated increase of 126 trucks per day on Florida Avenue, and 113 more truck trips per day on Almonaster Avenue and Louisa Road. The EIS does not discuss how this increase in truck traffic will affect noise conditions and air quality. We believe the additional truck traffic will have a negative environmental impact on the community.

CITY HALL • NEW ORLEANS, LA 70112
(504)565-6400 • FAX(504)565-6423

AN EQUAL OPPORTUNITY EMPLOYER

A-267-c

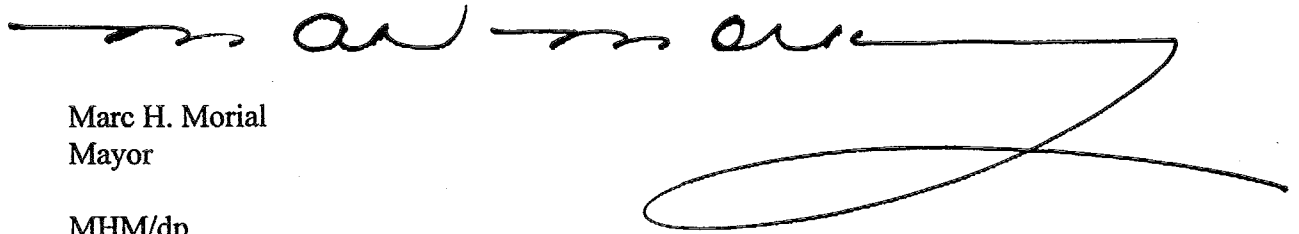

Page 2
Office of the Secretary
January 21, 1998

The area surrounding the Oliver station is composed primarily of low-income residential homes. Most of the houses are within several feet of the street and many houses on Florida and Almonaster have back yards adjacent to the facility. The increased activity and traffic will increase air pollution and cause noise disruption to the families in the area especially if truck traffic continues late at night and during the early morning hours. If the facility is in operation 24 hours, there will be no stop in the train and truck noise.

Safety is also a relevant concern for the residents near the Oliver station. There are numerous churches in the area as well as a playground. This means children are playing near the road and many pedestrians are getting in and out of cars parked on the street. Increased truck traffic can only result in a greater risk of accidents.

It is for these various reasons and a grave concern for the safety of the citizens living in this area of New Orleans that we oppose the acceptance of the Conrail proposal.

Sincerely,

STATE CLEARINGHOUSE REVIEW PROCESS

Reply Due Date: January 28, 1998
State Application Identifier: MD971222-1116
Project Description: DRAFT EIS - Proposed Conrail Acquisition CSX Corporation and CSX Transportation, Inc. Norfolk Southern Corporation and Norfolk Southern Railway Company
State Clearinghouse Contact: La Verne Gray

Dear Ms. Kaiser:

This letter acknowledges receipt of the referenced project. We have initiated the Maryland Intergovernmental Review and Coordination Process (MIRC) as of the date of this letter. You can expect to receive review comments and recommendations on or before the reply date indicated. Please place the State Application Identifier Number on all documents and correspondence regarding this project.

This project has been sent to the following agencies or jurisdictions for comment: The Maryland Departments of Budget and Management, Business and Economic Development, Housing and Community Development including the Maryland Historical Trust, Natural Resources, and Transportation; Baltimore City; Allegany, Baltimore, Cecil, Frederick, Harford, Howard, Montgomery, Prince George's, and Washington Counties; Wilmington Area Planning Council, Baltimore Metropolitan Council, Maryland National Capital Parks and Planning Commission-Montgomery County, Maryland National Capital Parks and Planning Commission-Prince George's County, Metropolitan Washington Council of Governments, Tri-County Council for Western Maryland; and the Maryland Office of Planning.

Your participation in the MIRC process helps to ensure that this project will be consistent with the plans, programs, and objectives of State agencies and local governments. Issues resolved through this process enhance the opportunities for project funding and minimize delays during project implementation.

If you need assistance or have questions concerning this review, please contact the staff person noted above. Thank you for your cooperation.

Sincerely,

Linda C. Janey, J.D.
Manager, Clearinghouse & Plan Review Unit

SUMMARY OF REVIEW COMMENTS ON DRAFT EIS "PROPOSED CONRAIL ACQUISITION"

State Application Identifier: MD971222-1116
Description: DRAFT EIS - Proposed Conrail Acquisition CSX Corporation and CSX Transportation, Inc. Norfolk Southern Corporation and Norfolk Southern Railway Company
Applicant: Surface of Transportation Board
Location: Nationwide
Approving Authority: Surface Transportation Board

Dear Ms. Kaiser:

In accordance with Presidential Executive Order 12372 and Code of Maryland Regulation 14.24.04, the State Clearinghouse has coordinated the intergovernmental review of the referenced project. This letter constitutes the summary of review comments on the Draft EIS "Proposed Conrail Acquisition" received to date.

Review comments were requested from the Maryland Departments of Budget and Management, Business and Economic Development, Housing and Community Development including the Maryland Historical Trust, Natural Resources, and Transportation; Allegany, Baltimore, Cecil, Frederick, Harford, Howard, Montgomery, Prince George's, and Washington Counties; the City of Baltimore; the Baltimore Metropolitan Council; the Maryland-National Capital Park and Planning Commission-Montgomery and Prince George's County; and the Tri-County Council for Western Maryland and the Maryland Office of Planning. As of this date, the Departments of Budget and Management, Transportation, Housing and Community Development including the Maryland Historical Trust, and Natural Resources; Montgomery, Frederick, Baltimore, Howard and Prince George's Counties; the Tri-County Council for Western Maryland; and the Maryland-National Capital Park and Planning Commission-Prince George's County have not submitted comments. Any comments received will be forwarded.

The Maryland Department of Business and Economic Development; Allegany, Cecil and Washington Counties; and the Maryland-National Capital Park and Planning Commission-Montgomery County; and the Metropolitan Washington Council of Governments; and the Maryland Office of Planning found this project to be consistent with their plans, programs, and objectives. The Wilmington Area Planning Council, whose jurisdiction includes Cecil County, Maryland, notes that they have no comments on how this proposal will impact Cecil County, Maryland.

The Baltimore Metropolitan Council and Harford County found this project to be generally consistent with their plans, programs, and objectives, but included certain qualifying comments summarized below.

Ms. Elaine K. Kaiser
January 28, 1998
Page 2

The City of Baltimore stated that their finding(s) of consistency is/are contingent upon the applicant taking the action(s) summarized below.

Summary of Comments:

The City of Baltimore states that the proposal is generally consistent with its plans, programs, and objectives. The endorsement is contingent upon implementation of mitigation items cited by the Surface Transportation Board.

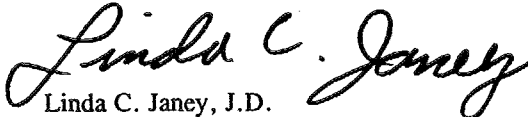

The Baltimore Metropolitan Council states that the proposal is generally consistent with its plans, programs, and objectives, however, the following qualifying comment is submitted for your consideration.

"Volume 3A of the report includes a section on the State of Maryland. Included in this section is an analysis of the proposed intermodal facility, the Triple Crown Service, that will be constructed in Baltimore City. From our review, the report does not, however, mention the improved clearances for 20' 2" double stack service that Norfolk Southern has proposed via Amtrak's Northeast Corridor to Perryville or the impacts that construction would have on the Perryville community."

Harford County states that there are no rail line segments in Harford County which meet or exceed the Board-designated environmental thresholds. The County also notes that this acquisition identifies that the MARC train service will not impact the Northeastern connection (i.e. Penn Line) going through Harford County since most freight rail traffic occur at night along this line. However, the report does not mention any further expansions of the MARC service along this lined its impact to that potential service. Currently, the Edgewood MARC station is planned to have a large parking lot expansion and the Aberdeen train station is in the development of a revitalization plan. Increased freight traffic could potentially impact the need for future MARC service.

If you have any questions about the comments contained in this letter please contact the State Clearinghouse at (410) 767-4490:

Sincerely,

Linda C. Janey, J.D.
Manager, Clearinghouse & Plan Review Unit

DRAFT ENVIRONMENTAL IMPACT STATEMENT
CSX/CONRAIL ACQUISITION
SURFACE TRANSPORTATION BOARD DOCKET 33888

These comments, prepared in response to the DEIS circulated by the Surface Transportation Board (STB) on the subject matter, focus on safety and transportation-related impacts that the acquisition may have on operations on CSX's Metropolitan Branch which traverses Montgomery County. The comments are based on information contained in the DEIS, supplemented by additional information developed from County and State sources. The comments are summarized below, and are described in detail in text following.

SUMMARY

We endorse the recommendation of the STB's Section of Environmental Analysis (SEA) that because of the significant amount of mixed freight and passenger train traffic on this line, a 15-minute "clear time" be mandated between freight and passenger trains.

We disagree with SEA's determination that there are no adverse impacts to safety or vehicle delay at CSX's Randolph Road at-grade crossing that require mitigation. We recommend that consideration be given to requiring CSX participation in the costs of constructing a grade separation at this location to mitigate the impact caused by additional freight operations on this line resulting from the acquisition.

We request that SEA conduct an evaluation of the extent to which increased freight traffic may have on safety aspects of CSX operation in the 11.4 miles where CSX is in "common corridor" alignment adjacent to Metrorail passenger service. The DEIS fails to acknowledge the existence of this operating environment or the safety risks as freight activity is increased. Most of this common corridor mileage is in Montgomery County, and there have been freight-related accidents in the past in this corridor. We recommend consideration of lowering the permissible 55mph freight speed in this corridor to 40 or 45mph

DETAILED REVIEW AND COMMENT

Impact on Passenger Service (MARC, Amtrak)

We endorse the DEIS preliminary recommendation of a 15-minute clear time between passenger and freight trains on lines carrying a significant number of passenger trains (SEA designates as "superior trains"), including the CSX Metropolitan Branch through our County. This practice would significantly reduce safety risks inherent in mixing freight and passenger service, and it would enhance passenger train schedule reliability, which is essential to retaining and increasing ridership on MARC commuter rail and Amtrak service on this line.

At-Grade Road Crossings: Impact on Safety and Traffic Delay

Page 7-4 of the DEIS notes that "One of SEA's major concerns in this Draft EIS is the potential delay of vehicular traffic at highway/at-grade crossing." Despite this statement of concern, we believe there are serious gaps in the analysis that result in the problem of at-grade crossings not being given sufficient consideration, at least in the case of one crossing in our County. There are four at-grade crossings in the County where motor vehicle traffic exceeds 10,000 ADT, the most significant of which is Randolph Road .

Randolph Road, a County-maintained urban arterial, carries 41,000 ADT, by far the heaviest volume among 3000 at-grade CSX/Conrail crossings in 23 states listed in the DEIS. (The DEIS lists only nine grade crossings where traffic is in the 20,000-30,000 range, only one in the 30,000-35,000 range (at 32,000), and no others higher.) Weekday train traffic at the Randolph crossing currently includes 2 Amtrak and 18 MARC commuter trains, and 23 freights, with the number of freights projected to increase by seven per day as a result of the acquisition. Despite these heavy volumes, the DEIS concludes that this crossing will not be adversely impacted to the point of warranting mitigation. In contrast, at some crossings in other states (such as Newark, Delaware), where the increase in freight train volume may be only two or three per day and crossing volume is much lower than 30,000 ADT, SEA is mandating that CSX arrive at binding agreements with localities to address implementation and funding allocations for mitigation that might include grade separations.

A shortcoming in the DEIS analysis methodology affects grade crossing safety and delays at the Randolph crossing, associated with assumed freight train speed and projected accident frequency. The DEIS assumes 50mph train speed at the Randolph crossing, an expectation that actual speed is 10mph lower than a posted limit of 60 in this segment. However, the actual limit in this segment is 55mph. Therefore the analysis should have assumed an operating speed of 45mph, which would result in longer vehicle delays. Further, as the report acknowledges, actual speeds in any segment can be lower than posted speeds due to curvature, gradient, train length, etc. For westbound trains, the Randolph Road crossing is within a 16-mile long up-grade of approximately one percent from Union Station to Rockville and Gaithersburg, which results in

actual speeds frequently below 35mph on long fully-load westbound freights. Therefore, the vehicle delays at Randolph crossing are significantly understated in the DEIS for current conditions, and will be more so under post-merger projections. It will come as news to the 41,000 motorists waiting for a train to clear this crossing that a Level of Service "B" exists at this crossing (as indicated in the DEIS), and is projected to be maintained at that level even with a 20% increase in train movements.

Also of concern is the projected increase of tonnage, and how CSX can provide sufficient motive power, given the current prohibition on pusher engines in this segment (see Metrorail-CSX common corridor discussion later). Likely results of the DEIS forecasted increases in train volume (20%) and tonnage (48%) on this line are: 1) CSX trains will be longer than the 6200 feet cited in the DEIS; 2) CSX will operate far more but shorter trains; and/or 3) There will be substantially slower freight speeds in the westbound (up-grade) direction than is assumed in the DEIS. In either case, or in combination, there would be substantial additional delay time at the Randolph Road crossing, as well as at the crossings of Forest Glen Road, South Summit Avenue, and Chestnut Street over and above the impact described in the DEIS.

With regard to the issue of motor vehicle/train accidents, the State DOT-managed "MARS" reporting system (Maryland Automobile Accident Reporting System) shows that for the four immediately preceding record years (1994 - 1997), one such accident occurred at the Randolph Road crossing. Also, data from a December 1988 "Randolph Road/Montrose Road Corridor Study Final Report" (page 55 excerpt attached) shows that two vehicle/train accidents occurred in 1986-87 and another three occurred during the period 1980-1985. Thus, in eleven out of the past 17 years for which data is readily available, there have been motor vehicle/train accidents at this crossing at the rate of one every two years. Assuming no accidents occurred in the other 6 years (1988-93), the accident rate was one every three years. For the future, the State Highway Administration predicts a vehicle/train accident rate of one every four years at this location, which is a significantly higher rate than the 19-year frequency projected in the DEIS for "Category A" crossings (DEIS Chapter 5, page MD-10).

Recent (January, 1998) contact with the Maryland State Highway Administration's railroad crossings traffic engineer elicited the information that Maryland does not maintain a formal "Top 50" list of high-risk railroad grade crossings, but if it did the Randolph Road crossing would be the top rated and the top candidate for grade separation.

In light of these data, the State of Maryland and Montgomery County have jointly conducted studies over several years to conceptually plan for a grade separated crossing of the CSX tracks. The County's adopted master plan shows such a separation, as does a Maryland State Highway Administration preliminary Final Environmental Impact Statement dated August 4, 1989 for the formerly proposed InterCounty Connector highway. A conceptual alignment and configuration (sketch attached) were produced as part of that environmental study, which shows how a grade separation could be designed to replace the at-grade crossing, with appropriate

connections to nearby arterial streets. Existing State-owned right-of-way would be used for most of the road realignment associated with grade separation.

We believe that the congestion and accident risk factors at the Randolph Road crossing are sufficient to warrant a requirement that they be mitigated by CSX participation in the cost of providing a grade separation at this location.

WMATA Metrorail/CSX Common Corridors (QN Tower site to Gaithersburg)

Another serious shortcoming of the DEIS is the lack of acknowledgment of potential safety issues on CSX's double-track Metropolitan Branch where it operates side-by-side with Metrorail along two segments totaling 11.4 miles where they are in common corridor (7.4 miles in Montgomery County and 4 miles in the District of Columbia.) The only separation between the CSX and Metrorail tracks are chain link intrusion detection fences and horizontal spacing of 20 to 30 feet (between track centers). Both the County and WMATA submitted preliminary comments on this situation in the summer of 1997, in response to STB's initial environmental report. The DEIS contains no acknowledgment or description of this operating environment and makes no reference to our concerns. As of the date of the DEIS, no site visits to the common corridor segments had been made in response to our or WMATA's comments on this issue.

There are two common corridor segments affecting CSX's Metropolitan Branch. In the Shady Grove to Twinbrook segment (5.4 miles), the corridor is used by 310 Metrorail trains per weekday on Metro's "A" route. In the Georgetown Junction-QN Tower segment (6 miles), there are 450 Metrorail trains per day on Metro's "B" route. Metrorail operates in revenue service from 5:30am-12:30am weekdays, and from 8:00am to 12:30am weekends. During the peak of weekday rush hours, Metrorail trains in the "B" route common typically carry 1000 persons/train, at 3-minute headway in each direction (1.5 minutes combined).

In 1987, there were two CSX freight train derailments which tore up several hundred feet of Metrorail "B" route trackage south of Takoma Park, and obstructed Metrorail service for several days. Fortunately, the derailments occurred during hours when Metrorail was not in revenue service. In response to these occurrences, CSX and WMATA jointly agreed in 1988 to a protocol which, although allowing continuation of CSX's 55MPH speed limit, mandated special precautions in freight operations in entire corridor. These included high/wide-load and dragging detectors, improved intrusion detection fences, track inspection, and improved communication between CSX and WMATA operations control centers. Also, in consideration of the long eastbound downgrade on the CSX Metropolitan Branch in Montgomery County and D.C., NTSB recommended that CSX discontinue use of helper locomotives in "push" mode while operating in this corridor.

March 1988

A-269-d

With CSX's projected increase in this common corridor of seven more CSX freight trains per day (a 20% increase), and a tonnage increase of 48%, the adequacy of the 1988 CSX protocol should be assessed anew as part of the DEIS, in order to assess the risk exposure that increased freight operations, especially longer and heavier trains, may have on the safety of adjacent transit service.

Of these two common-corridor segments in our County, the greater concern is the 6-mile CSX segment between former QN Tower and Georgetown Junction, where Metrorail's "B" route tracks are located between the eastbound and westbound CSX tracks. CSX straddles the Metrorail tracks, increasing the probability that a CSX accident or derailment could impact one or both Metrorail tracks. Because of this configuration, and because of close track spacing (20 feet c-c) and the higher volume of Metro "B" route train movements and passengers, this CSX segment was cited in a 1989 Metro study (excerpt attached) as having the very highest risk factor among six corridors where Metrorail and freight railroads exist side-by-side in the Washington D.C. region. It was in this segment that a stopped CSX westbound freight precipitated "reverse flow" operation of a westbound Amtrak passenger train on the eastbound CSX track, resulting in the February, 1996 multi-fatality Amtrak/MARC accident at Georgetown Junction (Silver Spring).

An increase of seven freight trains per day on this CSX Line warrants an up-to-date EIS evaluation of the 10-year old CSX/WMATA common corridor study, because of the recent-years occurrence of CSX train incidents (three major accidents over nine years involving freight operations) in this high-risk segment. Among other items to consider, we recommend that SEA mandate a CSX speed restriction through the common corridor segments that would limit freight operations to 40-45 MPH instead of the 55MPH speed now permitted.

MAP SHOWING CSXT/WMATA COMMON CORRIDOR STUDY AREA

JANUARY 1988

A-270-b

**WMATA
COMMON CORRIDOR STUDY**

FINAL REPORT

MAY 19, 1989

BOOZ • ALLEN & HAMILTON Inc.
in cooperation with
ABACUS TECHNOLOGY, Inc.

- Provided intrusion detection warning to CSXT's QN tower (connection between WMATA and railroad)
- Increased height of IDW fence (WMATA right of way)
- Integrated the IDW system with the automatic train protection speed control logic (WMATA system)
- Added IDW at Twinbrook (WMATA right of way)
- Added IDW at Hungerford Drive (WMATA right of way)

In addition, the opening of the Hagerstown connection between Norfolk-Southern and Conrail has rerouted a portion of eastern seaboard freight away from the Washington, D.C. metropolitan area. This has reduced the amount of exposure to potential common corridor incidents on the D, C, J and H routes. Added MARC service has also displaced freight service from the A and B routes particularly during peak hours contributing to the overall risk reduction (shown in Exhibit 6.1.1).

EXHIBIT 6.1.1
Common Corridor Risk Levels and Reductions Due To
WMATA and Railroad Initiatives

LINE/CORRIDOR	RELATIVE RISK LEVELS ¹		
	PRIOR ²	CURRENT ³	SAVINGS
RED - A	11.1	5.2	5.9
RED - B	59.4	26.5	32.9
YELLOW - C/J/H	3.7	1.6	2.1
ORANGE - D	12.5	3.6	8.9
GREEN - E	1.2	0.6	0.6
ORANGE - K	12.1	12.1	0
	100.0	49.6	50.4

¹ Relative to total common corridor risk under original design in 1986 set at 100.

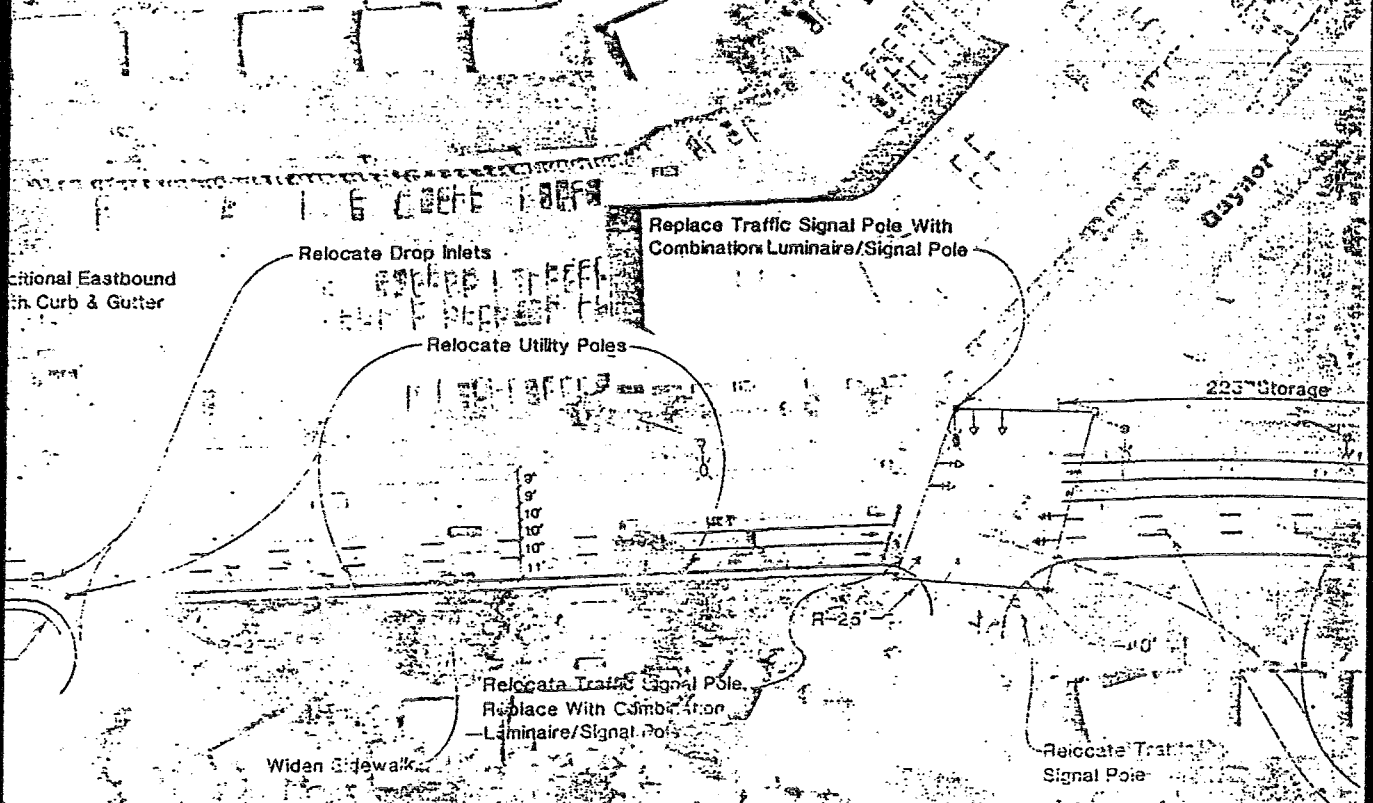

² "Prior" refers to original design in 1986 operating environment.

³ "Current" refers to ongoing actions to improve prevention and detection actions including modifications in place and planned as a result of the WMATA/CSXT Task Force recommendations.

Final Report

December, 1988

A-271-a

which is lighted with mercury vapor luminaires (Parklawn Drive to Georgia Avenue), there are numerous links and intersections with a night to day accident ratio equal to or greater than 2.0. Signalized intersections along Randolph Road-Montrose Road with ratios greater than 1.5 are listed below.

- Rocking Horse Road/Gaynor Road
- Veirs Mill Road
- Connecticut Avenue
- Georgia Avenue

No similar patterns were observed in the sections of the corridor illuminated with the brighter high pressure sodium luminaires.

One of the high accident locations was not discussed in the previous chapter - the intersection of Randolph Road and the B&O Railroad, just east of Nebel Street. This intersection has experienced two vehicle/train accidents during the study period, and an additional six vehicle accidents directly related to the operation of trains through the intersection. Another six vehicle accidents also may be related to the crossing. (This cannot be determined without reviewing the police accident reports.)

In addition to the two vehicle/train accidents occurring during 1986 and 1987, it was determined (from data provided from the State Highway Administration) that another three vehicle/train accidents occurred during the period from 1980 to 1985. This equates to an average accident rate of 0.71 accidents per year.

An accident rate less than one per year does not seem high compared to accidents occurring at highway intersections. The safety concern at rail-highway crossings, however, is the high potential for fatalities or serious injuries likely to occur at a crossing (e.g. on average, roughly one out of every 11 crossing accidents results in a fatality).

Fortunately, no fatalities have occurred at the rail-highway crossing on Randolph Road during the past ten years. However, the potential exists given the high roadway and train traffic volumes. Every effort should be made to make this crossing as safe as possible using the latest technologies in train detection and traffic control systems. Ideally, the crossing would be eliminated through grade separation. While expensive, this alternative would provide the greatest safety benefit as well as enhance traffic operations along the corridor. Federal highway funds (Section 130) may be available through the State Highway Administration for improvements at this crossing.

DOCUMENT # 2/4/98 5:02:57 PM

RE: Maryland Office of Planning Identification Number: MD971222-1116
Project: Draft EIS - CSX Railroad

Dear Ms. Kaiser:

Thank you for the opportunity to review the above referenced project. The document was circulated throughout the Maryland Department of the Environment (MDE) for review, and the following comments are offered for your consideration.

1. Construction, renovation and/or demolition of buildings and roadways must be performed in conformance with State regulations pertaining to "Particulate Matter from Materials Handling and Construction" (COMAR 26.11.06.03D), requiring that during any construction and/or demolition work, reasonable precaution must be taken to prevent particulate matter, such as fugitive dust, from becoming airborne.
2. If boilers or other equipment capable of producing emissions are installed as a result of this project, the applicant is requested to obtain a permit to construct from MDE's Air and Radiation Management Administration for this equipment, unless the applicant determines that a permit for this equipment is not required under State regulations pertaining to "Permits, Approvals, and Registration" (COMAR 26.11.02.). A review for toxic air pollutants should be performed. Please contact Dr. Justin Hsu, Ph.D., P.E., New Source Permits Division, Air and Radiation Management Administration at (410) 631-3230 to learn about the State's requirements and the permitting processes for such devices.
3. Fossil fuel fired power plants emit large quantities of sulfur oxide and nitrogen oxides, which cause acid rain. In addition, nitrogen oxide emissions contribute to the problem of global warming and also combine with volatile organic compounds to form smog. The MDE supports energy conservation, which reduces the demand for electricity and therefore, reduces overall emissions of harmful air pollutants. For these reasons, MDE recommends that the builders use energy efficient lighting,

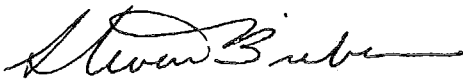

Ms. Elaine K. Kaiser
January 29, 1998
Page Two

computers, insulation and any other energy efficient equipment. Contact the U.S. EPA at (202) 233-9120 to learn more about the voluntary Green Lights Program which encourages businesses to install energy-efficient lighting systems.

4. The applicant should be advised that no cutback asphalt should be used during the months of June, July and August.
5. Lighting for security and parking needs to be shielded from nearby residences.
6. The EIS needs to include an air quality analysis for Harford County. Harford County has been designated by the U.S. EPA as a severe nonattainment area for ozone.
7. The EIS should cover impacts of the proposed merger on planning transit-oriented development-increasing night-time freight operations could make living near the rail stations less attractive from a noise standpoint.

Again, thank you for giving MDE the opportunity to review this project. If you have any questions, please feel free to call me at (410) 631-3656.

Sincerely,

Steven Bieber

Washington, D.C. 20423-0001

Re. CSX Corporation and CSX Transportation, Inc., Norfolk Southern Corporation and Norfolk Southern Railway Company—Control and Operating Leases/Agreements—Conrail, Inc. and Consolidated Rail Corporation. (Surface Transportation Board Finance Docket No. 33388)

Dear Mr. Williams:

On behalf of the Transportation Steering Committee (TSC), the metropolitan planning organization (MPO) for the Baltimore region, I am responding to your request to review the Surface Transportation Board's Draft Environmental Impact Statement.

The following comment is submitted for your consideration. Volume 3A of the report includes a comprehensive section on the State of Maryland. Included in this section is an analysis of the proposed Norfolk Southern Triple Crown Service that will be constructed in Baltimore City. From our review, the report does not, however, mention the improved clearances for 20' 2" double stack service that Norfolk Southern has proposed via Amtrak's Northeast Corridor to Perryville or the impacts that construction would have on the Perryville community. The double stack clearances were mentioned in the Governor's October 2, 1997 letter to the STB, which is attached.

Thank you for the opportunity to comment on this important matter. If you have any questions, please contact me at 410/269-0064.

Sincerely,

Jon Arason, Chairman
Transportation Steering Committee

RE: Finance Docket No.
33388, CSX Corporation and CSX Transportation,
Inc., Norfolk Southern Corporation and Norfolk
Southern Railway Company -- Control and
Operating Leases/Agreements -- Conrail, Inc. and
Consolidated Rail Corporation

Dear Mr. Williams:

Since last fall when the proposed merger of Conrail was first announced, the State of Maryland has been in continuous contact with both CSX and Norfolk Southern to ensure that any transaction that might result from a combination of railroads serving the State would protect the competitiveness of Maryland shippers and the interests of all Maryland citizens. At the outset, we established five major goals:

1. Preserve competition by having at least two Class I carriers serve the State.
2. Ensure the continuation of existing service and rail rates (for example, on the Eastern Shore of Maryland).
3. Maintain or increase rail employment in the State.
4. Secure commitments to specific infrastructure improvements necessary to achieve the purported benefits of the merger.
5. Preserve and enhance commuter rail service.

After months of negotiating with CSX and Norfolk Southern, we are pleased to say that the State has largely achieved these goals and has concluded letter agreements with both carriers that are attached hereto that ensure the following:

Harrisburg, Pennsylvania; 2) construct, reopen or convert an automobile distribution terminal in the Baltimore area; 3) expand or improve a conventional intermodal facility in Maryland; 4) construct a new Triple Crown RoadRailer® intermodal terminal in the Baltimore area; and 5) improve the track connection at Hagerstown, Maryland to facilitate the flow of traffic. CSX's Operating Plan includes investments benefiting the State of Maryland, including among others: 1) improvements on the former B&O line between the Port of Baltimore and Chicago, Illinois that will result in raising the track capacity west of Cumberland, Maryland to 50 trains per day and the operating speeds up to 70 miles per hour on most segments; and 2) improvements in the rail service to the auto distribution terminal in Jessup, Maryland (including, but not limited to increasing the clearance of the Virginia Avenue Tunnel) to permit service by tri-level auto rack cars.

Commitment to Commuter Rail Service. Both CSX and Norfolk Southern have assured the State that each will work with the State of Maryland to maintain (and, with respect to CSX, to enhance) commuter rail service for Maryland's citizens and honor all operating agreements that they may now, or in the future, have with the Mass Transit Administration. Norfolk Southern has also agreed to participate in a Northeast Corridor Advisory Team which will include as members, among others, the MASS TRANSIT ADMINISTRATION Freight Manager and the MARC Service Director.

While the State has accomplished most of its goals with respect to rail competition, service, employment, infrastructure and commuter service, there are still some issues of concern. The State will continue to work with CSX and Norfolk Southern to address these issues, which include assurances that: 1) the Port of Baltimore and Maryland shippers and coal producers will not be put at a competitive disadvantage as a direct result of the transaction or related conditions or agreements; and 2) NEC improvements and proposed operations will adequately address congestion, as well as speed and weight concerns.

In addition, the State may have concerns with issues that arise in the course of this proceeding; thus, it reserves the right to file additional comments on these and other matters. The State appreciates comments from the representatives of both railroads assuring the smooth integration of Conrail into the two railroads and commitments to assure the rapid delivery of the full benefits of the transaction. It is our expectation and understanding that commitments made by the railroads in their Operating Plans, as approved by the STB, will be subject to future enforcement via the STB.

Attention: Elaine K. Kaiser
Environmental Project Director
Section of Environmental Analysis

Dear Ms. Kaiser:

This letter is being submitted as the comments of the Mass Transit Administration of the Maryland Department of Transportation on the Surface Transportation Board Draft Environmental Impact Statement of the Proposed Conrail Acquisition (STB DEIS).

In Chapter 5 page MD-9 and Chapter 7 Section 7.2.2, the STB DEIS recommends a safety mitigation measure on several line segments including the Maryland line segment from Washington D.C. to Point of Rocks, Maryland (C-003). The safety mitigation measure is that CSX and NS establish passenger trains as "superior" trains and other trains would clear the tracks at least 15 minutes before and after the expected arrival of a passenger train at any point.

We support efforts that contribute to the safe operation of passenger and freight trains. There are a wide range of implications, however, to implementing this measure. Before a determination is made to proceed, it is proposed that several questions be addressed. Evaluating these concerns could be accomplished through an analysis, which could be carried out by the National Transportation Safety Board and the Federal Railroad Administration, with the participation of freight and commuter railroads. The analysis should answer such questions as past experience with this approach, potential safety benefits, routes where this might be beneficial, and impacts on present and future commuter and freight service operations and capacity expansion.

Re: Draft EIS - Proposed Conrail Acquisition
 CSX Corporation and CSX Transportation, Inc.
 Norfolk Southern Corporation and Norfolk Southern Railway Company
 State Clearinghouse No. MD971222-1116

Dear Ms. Kaiser:

Thank you for providing us with a copy of the above-referenced DEIS, for review and comment. The Maryland Historical Trust has reviewed the proposed actions for Maryland to assess their effects on historic properties, pursuant to Section 106 of the National Historic Preservation Act of 1966, as amended.

Maryland components of the undertaking include increased train operations on 13 rail line segments, construction of one rail line connection in Hagerstown, and construction of one intermodal facility in Baltimore. Based on the documentation presented in the DEIS, we concur that implementation of the Maryland actions will have no effect on historic properties, including historic structures and archeological sites, eligible for inclusion in the National Register of Historic Places. Further consultation with the Trust for Section 106 purposes is not needed unless the project scope changes.

If you have questions or require further assistance, please call me at (410) 514-7631.

Sincerely,

Elizabeth J. Cole

RE: Proposed Conrail Acquisition by CSX Corporation and Norfolk Southern (NS) Railroads,
Statewide, MA Financial Docket No. 33388 (MHC# 19523).

Dear Ms Kaiser:

Thank you for submitting the Draft Environmental Impact Statement (DEIS) (dated December 12, 1997) concerning the proposed Conrail acquisition which was received by the Massachusetts Historical Commission on December 19, 1997. It is understood that the proposed acquisition will involve the operation of various Conrail lines, properties, rail yards and other intermodal facilities. It is also understood that the acquisition will likely result in operating changes including increased freight traffic over rail lines, construction of new rail lines, and abandonments of rail lines.

MHC staff have reviewed the submitted DEIS. At this time the MHC concurs with the preliminary recommendations of the DEIS which established that to date there are no significant impacts identified in the state of Massachusetts. The MHC will expect that as the acquisition project evolves there may be additional changes which will require our continued involvement.

These comments are provided to assist in compliance with Section 106 of the National Historic Preservation Act (36 CFR 800).

If you have questions, please contact Paul Holtz at this office. Thank you for your cooperation.

Sincerely,

Judith B. McDonough

Re: CSX ACQUISITION OF CONRAIL - DEIR

Dear Ms. Kaiser:

At their meeting on January 14, 1998 the BRPC Executive Committee voted unanimously to forward the following comments on the Draft Environmental Impact Report (DEIR) for the Proposed Conrail Acquisition. These comments are a follow-up to comments we have previously submitted (copy attached).

1. Since the chart in the Executive Summary had Hazmat (332) checked as meeting the threshold on the NY to Westfield line, as well as other lines in Massachusetts, some explanation should have been made on page MA-2 of Volume 3A as to the nature of this threshold and why it was determined that a site-specific analysis did not apply.
2. We would like to see some assurance that this change in ownership will not absolve CSX, or Conrail, from any future liability from hazardous substances that may later come to light.
3. The response to our previously expressed concerns that CSX be cooperative with regard to shared uses of rail rights-of-way was limited and rather disappointing as it appears on page MA-4 of Volume 3A entitled "Future Services Under Study."

"...(BRPC) advocates that the Berkshire Scenic Railway Museum (BSRM) excursion train in Lenox, MA be granted trackage rights to the proposed intermodal transportation center in Pittsfield, Massachusetts. The BSRM presently does not have sufficient operating rights on the Housatonic Railroad Company to reach the connection to Conrail in Pittsfield. The Boston Line of Conrail is assigned to CSX."

We know this. However, progress is being made toward achieving that goal, at which time we hope the necessary cooperation from CSX will be forthcoming.

4. In addition, cooperation is also needed from CSX with regard to the efficiency of Amtrak passenger rail service, the viability of the proposed Intermodal Transportation Center in the Pittsfield CBD, and the potential abandonment and/or shared uses of other Conrail ROW.
5. We note that on Page MA-1, paper and plastics are missing in the list of important rail freight commodities in Massachusetts. Also, on that page, unless the Guilford Railroad which operates through the Hoosic Tunnel has ceased to operate, or has been downgraded, Conrail is not the only Class I railroad in Massachusetts.

We hope that our concerns will be given careful and serious consideration. If you have any questions or require any additional information, we will be pleased to oblige.

Yours truly,

Nathaniel W. Karns, AICP
Executive Director

Re: ACQUISITION OF CONRAIL (Docket # 33286)

Dear Mr. Hernandez:

The Berkshire County Commissioners have referred your letter of January 14, 1997 to us for response. In that letter you asked for comments and concerns regarding increased traffic on our primary rail freight line resulting from your proposed merger with Conrail. Given the relatively short time frame, we cannot provide a definitive response to your request at this time. However, we do understand that there will be additional opportunities to provide input and comment upon the proposal at a later time.

One issue that has come to our attention is the concern that the merger of rail freight companies will reduce the opportunities for competition among rail service providers. In addition, there are issues related to the utilization of abandoned rail lines, and trackage rights for tourist passenger services. Specifically, the secondary branch line from the North Adams Junction in Pittsfield north to the Lanesborough town line has not been used in some time, and has been identified as having potential utility as a public right-of-way for a bike path or possible highway use. Another concern has to do with trackage rights for the local scenic tourist train, the Berkshire Scenic Railway Museum, which would like to provide service into Pittsfield from the south.

Enclosed for your use is a copy of our 1993 Regional Transportation Plan which will provide further background information. Please note that this plan is currently being updated in accordance with ISTEA regulations, and a revision will be in place after March 31 of this year.

Yours truly,

Charles W. Cook
Transportation Planner

Re: CSX Acquisition of Conrail - Draft Scope for EIS

Dear STB:

Thank you for your invitation to comment on the proposed scope for the EIS for the Acquisition of Conrail by CSX in Berkshire County, Massachusetts. We have previously submitted comments to the railroad's consultants (copy attached). At this time we would also like to expand upon those comments.

While the proposed EIS will focus on construction of facilities and potential abandonments, our concerns are primarily focused on issues related to ownership and control of the railroads in Berkshire County. These concerns should perhaps be addressed in the EIS as issues of social equity. For example, we hope that CSX will be amenable to the continuation of Amtrak's rail passenger service in Pittsfield, and will cooperate in efforts to preserve that service and give it reasonable priority in scheduling. Also in regard to passenger service, we hope that CSX will be cooperative in allowing trackage rights for the Berkshire Scenic Railway Museum to provide tourist service into Pittsfield from the south.

There is also a feasibility study underway concerning the development of an Intermodal Transportation Center (ITC) in the Pittsfield CBD. Currently Conrail has a representative serving on the ITC study committee. We would hope for the cooperation of CSX in that study, and specifically with regard to the location of the Amtrak station and any air rights that may be necessary.

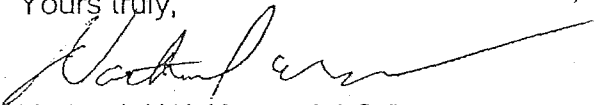

Another issue of concern is the future use of the secondary branch line in Pittsfield which extends to the town line in Lanesboro. This ROW has potential for use as a bike path and/or as

an alternative highway location pending the results of ongoing studies. We would also hope for the cooperation of CSX in this regard.

Finally, the preliminary EIS we received indicated that in Massachusetts there would be no increase in traffic "above STB thresholds" and therefore no impact. However, we would like the estimates to be shown demonstrating that they are below the threshold. Similarly, we would like to see the estimates of truck rail diversions in order to gauge the magnitude of the benefits alluded to in the preliminary EIS.

We appreciate the opportunity to provide these comments and understand that we will be given additional opportunities to comment on the Draft and Final EIS's as they become available. If you have any questions on these issues please feel free to contact the Charles Cook, Senior Transportation Planner, at 413-442-1521.

Yours truly,

Nathaniel W. Karns, A.I.C.P.

**ENVIRONMENTAL
DOCUMENT**

Dear Ms. Kaiser:

At the Montachusett Regional Planning Commission (MRPC) meeting held on Tuesday, January 27, 1998 members found that the Draft Environmental Impact Statement (DEIS) concerning the proposed Conrail acquisition does not conflict with regional goals, policies and objectives. According to the DEIS, the consolidation will not adversely affect environmental quality or transportation in Massachusetts. The Draft EIS indicates that there are no proposed new constructions or abandonments and that there would be no increased traffic or activity that meets the Board's thresholds for environmental analysis. CSX will operate all Conrail lines and facilities post-acquisition. SEA has also made a preliminary conclusion that there would be no significant cumulative effects associated with the proposed acquisition in the State of Massachusetts.

If you have any questions or desire further information please contact John Hume at (978) 343-9667 or Laila Michaud at (508) 345-7376 ext. 2245.

Very truly yours,

David Jarvenpaa

Re: Surface Transportation Board Finance Docket No. 33388 – CSX Corporation and CSX Transportation, Inc., Norfolk Southern Corporation and Norfolk Southern Railway Company – Control and Acquisition – Conrail Inc. And Consolidated Rail Corporation: Draft Environmental Impact Statement

Dear Ms. Kaiser:

This is in regard to the Draft Environmental Impact Statement (EIS) on the proposed acquisition of Conrail by Norfolk Southern and CSX Railroad. In order to allow for adequate review of this Draft EIS, we are requesting a 15 day extension of the review and comment period.

SEMCOG, the Southeast Michigan Council of Governments, is the designated Metropolitan Planning Organization (MPO) for Southeast Michigan. Its primary missions are 1) planning on issues that extend beyond individual government boundaries, and 2) intergovernmental relations in cooperation with local government, as well as state and federal agencies. The SEMCOG partnership strengthens efficient and effective local government supporting local planning through its technical, data and intergovernmental resources.

SEMCOG is working with both CSX Railroad and Norfolk Southern to conduct two informational meetings on the proposed acquisition and its effect on Southeast Michigan. We have waited to conduct these meetings so that they would correspond with the Draft EIS review period. As a result, the meetings are scheduled for January 21 and 28, 1998.

Our concern lies with the timing of the specified review and comment period. First, 45 days for reviewing a 3,000 page document is short. Second, the release of the document just before the two week holiday season on December 19, 1997 has effectively shortened the 45 day public comment period.

This is not only an important project for Southeast Michigan, it is also a large and complex project as reflected by the Draft EIS. A 15 day extension to the review period will allow Southeast Michigan communities, businesses and other attendees of our informational meetings necessary time for developing comments on the draft document.

I look forward to your response on this request.

Sincerely,

John M. Amberger
Executive Director

**Re: Finance Docket No. 33388 – CSX and Norfolk Southern –
Control and Acquisition – Conrail: Environmental Impact –
City of Northville**

Dear Ms. Kaiser:

The City of Northville is aware of plans for joint acquisition of Conrail Incorporated by CSX Corporation and Norfolk Southern Railway. We are also aware that the Section of Environmental Analysis for the Surface Transportation Board has prepared a Draft Environmental Impact Statement (EIS) and is accepting comments on all aspects of this transaction. The City of Northville appreciates this opportunity to comment, and offers the following.

The City of Northville is concerned that the subject acquisition will result in a significant increase in the amount of hazardous material moving through our community. From Appendix A-1 (Master Table of All Rail Line Segments) which we reviewed from your Draft Environmental Impact Statement, we have learned that there will be a 75% increase in the amount of hazardous material rail cars going through our community each year. This equates to 24 more rail cars of hazardous material per day.

As a residential community with only a volunteer fire department, the City objects to any plans to increase the amount of hazardous material transported through Northville. The City is not equipped to handle a catastrophic disaster which could result from a hazardous material accident or spill. Therefore, the City of Northville opposes this transaction and respectfully requests that the Surface Transportation Board deny this acquisition request unless it will result in the transportation of less, and not more hazardous material through our community.

Thank you for this opportunity to comment on the proposed Conrail acquisition.

Sincerely,

A handwritten signature in cursive script that reads "Gary Word". The signature is written in black ink and is positioned above the printed name and title.

RE: CONRAIL ACQUISITION INVOLVING CSX

Dear Ms. Kaiser:

The Village of Holly in the State of Michigan, would like to add comments to the Environmental Assessment to be performed on the above-mentioned acquisition.

The Village of Holly believes an increase in traffic will result if this acquisition goes through. Extra traffic will have an impact on our community.

As a means to mitigate these impacts we would like to recommend that an **annual meeting** be held between CSX and the municipalities in Western Oakland County to address these issues. The level of existing communication is too low. Additional traffic will exacerbate this. I volunteer the Village of Holly as the location of the first of these meetings.

Sincerely,

Mark Abeles-Allison
Village Manager

Dear Ms. Kaiser:

I have been informed that Highland Township will be affected by a recent joint acquisition of Conrail Incorporated by CSX Corporation and Norfolk Southern Railway. It is my understanding the merger will result in a 20% increase in tonnage shipped per day requiring longer trains and an average of 1.2 additional trains daily.

These increases are a source of concern and I think it's reasonable to expect assurances that all safety issues associated with this increased rail traffic will be addressed by CSX prior to its implementation. A letter to that effect would be appreciated. I look forward to hearing from you.

Sincerely,

John P. Stakoe
Highland Township Supervisor

**RE: DRAFT ENVIRONMENTAL IMPACT STATEMENT
ON THE PROPOSED ACQUISITION OF CONRAIL
BY NORFOLK SOUTHERN RAILROAD AND
CSX RAILROAD**

Dear Ms. Kaiser:

The City of Monroe wishes to express two concerns requiring the environmental impact of the acquisition of Conrail by Norfolk Southern Railroad and the CSX Railroad.

Due to the City of Monroe's proximity to Detroit much of the freight traffic generated by the greater Detroit Area travels through the City of Monroe bound for the rest of the county. The rail portion of this freight utilizes five main line tracks, two Conrail tracks, two CSX tracks and a Canadian National (Grand Trunk Western) track. The southbound Conrail track traverses a residential area in the east-central part of Monroe, and closely abuts a City street, Kentucky Avenue. In this area, some of the rail track lies less than thirty feet (30') from residences. The track prevents vehicle access to homes by eliminating the possibility of driveways and parking, and lies within a few feet of pedestrian sidewalks with no barrier protection. Besides the potential safety concerns, noise and vibration generated by daily rail operations (thru and yard movements) negatively impact local residents and a nearby school and playground. Residential property values in this area are adversely affected and all manner of daily living activities are worsened by the close proximity of this rail line.

The Norfolk Southern Railroad has expressed strong support for the Monroe Area Rail Consolidation project which would lead to the elimination of the southbound Conrail line. We believe that their strong commitment to safety will lead to the eventual abandonment of this track either by the full implementation of the Monroe Area Rail Consolidation or by their use of northbound Conrail as a bi-directional line through the Monroe area.

A-278-b

Ms. Elaine K. Kaiser
Environmental Project Director
Page Two
January 30, 1998

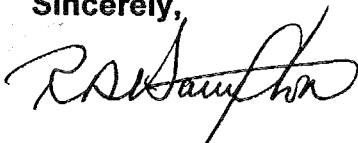

The City of Monroe requests that the Surface Transportation Board support the need to eliminate the southbound Conrail track thru the Monroe Area and encourage the Federal Highway Administration to fully fund the Monroe Area Rail Consolidation plan as approved June 2, 1997 by the FHWA.

The second concern involves the reports indication of increased train movements, including hazardous materials, on the existing CSX tracks in the western part of the City of Monroe. Table 5-MI-5 of the Draft Environmental Impact Statement indicates an increase in trains per day of 11.2 on this line and Table 5-MI-9 indicates an increase in annual hazardous material car loads from 14,000/year to 31,000/year as a result of the acquisition of certain Conrail lines by CSX.

The existing high level of train movements on the CSX track already causes the residents and motoring public much aggravation. The residential properties abutting these tracks will be negatively impacted by the increased traffic and the property owners have a right to be concerned by the significant increase in hazardous cargo being transported. The City Council was concerned enough by the blockages caused by the existing train movements along CSX tracks to commission a feasibility study for a grade separation on a selected street (see attached report). With an anticipated increase of train movements of approximately fifty percent (50%), the problem will be even more acute.

The City of Monroe requests that every effort to divert unnecessary "hazardous material" freight around the Monroe Urban Area be made and adequate measures to safeguard the public be taken. We also ask the CSX Railroad be directed to grade separate Elm Avenue in the City of Monroe.

Sincerely,

Robert A. Hamilton
City Manager

Re: Finance Docket #3338-CSX and Norfolk Southern-Control and Acquisition-
Conrail: Draft Environmental Impact Statement.

The comments to the Draft EIS are submitted from the City of Wixom, Michigan. We are commenting on safety issues concerning site-specific highway/road-at-grade-crossings and hazardous materials along key routes C-220 (Holly to Wixom, MI) and C-221 (Wixom to Plymouth, MI).

Wixom is located in the western part of Oakland County. The county has had about a 10% increase in population over the last ten years. Wixom had a 34% population increase between 1990 and 1995. Population estimates from the Southeast Michigan Council of Governments projects that Wixom's population growth from 1990 - 2000 will be 57%.

In addition to the population, businesses in Wixom increased by 62 (13.25%). We expect a growth of 18.5% this year for a total of 628 businesses in the community.

In an analysis of federal railroad safety records, the Detroit News reported in their issue of December 29, 1996 that Wixom, MI had the 92nd and 213th riskiest crossings among the 163,000 public railroad crossings in the nation. We believe that most accidents are the fault of motorists and have attempted to lower the possibility of accidents through law enforcement, education and working with the local CSX representatives. We still have concerns that the consolidation of rail lines will increase rail traffic and these are not addressed in the Draft EIS.

1. The first comment concerns highway/rail at-grade crossings in Wixom, MI
 - a. A Detroit News article, dated December 16, 1997, shows that the last traffic analysis of this intersection was done on January 7, 1985. The source is the Federal Railroad Administration whose database shows a daily total of 17 trains and a traffic volume of 14,700 automobiles. Traffic surveys used in a 1994 Environmental Assessment of possible changes to this intersection show a traffic count of 24,700 from data collected in 1992. The P.M. peak hour results show a total delay of 37,175 minutes with probable costs of \$2,738,225. The Level of Service (LOS) was rated as F.

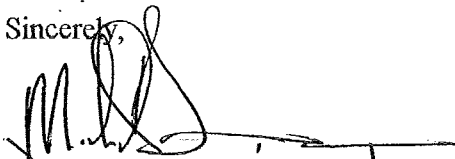

A-278-d

- b. The Draft EIS indicates there are 12 trains per day and that there would be a negligible increase in that number but an increase in tonnage of about 20%. (Draft EIS, Attachment ES-B, page 1 of 13). There may be several reasons for the different count. One could be that the crossings are positioned close to a Bulk Intermodal Distribution Services (BIDS) yard. During switching operations, the trains either activate the road crossing signals or enter the intersection and then reverse and reenter the yard. While this may not trigger a count as a "through train," the effect of these movements is to increase the delay time and the risk of accidents.
 - c. An analysis of the crossings and a consideration of site-specific mitigation should be part of the final EIS.
 2. The second area of comment is the increase of hazardous material along the two routes.
 - a. Our concern is to ensure that the municipalities along the route in Oakland County are prepared to assist in and properly react to any emergency involving the hazardous materials.
 - b. In response to an accident several years ago, there was a decrease in the amount of hazardous waste shipped along the routes. We have been informally notified by local CSX officials to expect an increase in the number of trains. The estimates were for a 50% increase. This is a strong indicator that traffic is being diverted to a more northerly route to relieve congestion.

The City of Wixom acknowledges that a measurable factor of the City's growth and prosperity is due to the proximity of the railroad for our businesses, such as Ford Motor Company. We wish to continue to work with CSX to ensure that effects of the consolidation do not damage the other contributing factors to the City's prosperity.

The point of contact for the City of Wixom is Frank Sheridan, Assistant City Manager; phone is (248) 624-0894, fax is (248) 624-0863.

Sincerely,

J. Michael Dornan
City Manager

1925 K Street NW, Room 500
Washington DC 20423-0001

CENTRAL ADMINISTRATIVE UNIT
REC'D: 2/2/98
DOCUMENT # 2/2/98 5:41:50 PM

Attn: Elaine K. Kaiser
Chief, Section of Environmental Analysis
Environmental Filing

We would like to list issues of concern pertaining to the Environmental Impacts of the proposed acquisition of Conrail by CSX Transportation and Norfolk Southern Railroad. These concerns were expressed at a public information meeting held at Monroe County Community College on January 21, 1998.

1. **Hazardous Materials:**
 - a) An increase is expected in traffic from 14,000 carloads annually to 31,000 carloads annually on CSX line between Carleton, MI and Toledo, OH. This will result in increased loads of hazardous materials traveling through the County, along with the potential for accidents resulting from these materials, thus endangering public safety.
 - b) With increased potential for an accident, the Monroe County Emergency Management Division will have to provide planning, training, and exercises to respond to these types of occurrences. In addressing this emergency response plan, the following is necessary:
 - i) Training for emergency responders (police, fire, Emergency Management, etc.)
 - ii) Specialized equipment for this type of response
 - iii) Exercise evaluators

- iv) Specialized emergency planning support, with expertise/guidance, if needed
 - v) Assistance and support with public information and education
 - vi) Additional public warning capabilities (sirens, alert monitors, etc.
 - vii) Support for exercises and drills that must take place. Monroe County is presently mandated by the federal government to participate in a very costly series of full-scale exercises for the Enrico Fermi II Nuclear Power Plant, on a biannual basis (large expense in personnel, resources and supplies). At this time, our estimated start-up costs would be between \$12,000 and \$15,000, and ongoing expenses would be \$8,000 annually.
- c) According to the Section on Environmental Analysis (SEA), railroads are encouraged to develop a hazardous materials response plan and carry out biannual exercises according to this plan, in cooperation with local governments. What level of commitment will be made by CSX to communities affected by the increased hazard? Monroe County would request reimbursement for initial and ongoing costs for emergency preparations. We would be willing to work with CSX to negotiate a plan for this.

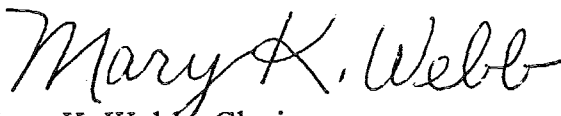

2. **Impact on Nuclear Plant Emergency Evacuation:** Increased rail traffic on NS and CSX, and faulty crossing warning systems could cause delays in evacuating the area around the Enrico Fermi II Nuclear Power plant in the event of an emergency. We do not find statements in the EIS regarding impacts on evacuation routes.
3. **Nuclear Waste:** The federal government will be assuming responsibility for all high-level radioactive wastes in the United States. They will be providing a central storage/disposal repository for these materials. As many of these materials will be transported by both truck and rail, what is the increased likelihood of an accident involving these items?
4. **Monroe Rail Consolidation Project:** Railroad support of Monroe's ongoing project to consolidate east side rail lines (Conrail/NS and CNNA) is essential to its success. This project has been in the planning stages for more than fourteen years, and preliminary engineering studies are being completed. Partial funding from the federal government has been secured, and phase one of the project, an underpass at the Conrail/North Dixie Highway grade

crossing is scheduled to get underway this spring. As additional funding is secured, ongoing phases will include the relocation of Conrail Warner Yard in Monroe, the needed crossovers to consolidate the Conrail lines with Grand Trunk CNNA lines through the City of Monroe, and Frenchtown and Monroe Townships, and construct the needed crossovers in order to abandon the redundant Conrail lines. Many years of planning for the project are just now beginning to result in implementation. Continued support from Conrail's successor is necessary for this project to be successful.

5. **Traffic Safety:** Significant increase in traffic on CSX line between Carleton, MI and Toledo, OH, and minor increase in traffic on Conrail (NS) line between Detroit and Toledo would mean more blocked grade crossings, causing delay of emergency vehicles, more potential train/car accidents, and general inconvenience to motorists. The Monroe County Road Commission needs railroad contact numbers to report problems on grade crossings. Problems observed at crossings along Telegraph Road and elsewhere need to be addressed.
6. **Economic Development Opportunities:** Cooperation of the railroads is essential to our local economic development efforts.
7. **Noise Mitigation:** With 11.2 more trains per day projected on the CSX line, railroads must continue efforts to mitigate noise impacts on local communities, especially residential areas. While this issue was addressed with regard to the line from Ecorse to Carleton, we feel it needs to be evaluated along the line running from Carleton to Toledo as well, including the City of Monroe.

We would like to thank SEMCOG for their assistance during the Environmental Review period.

Sincerely,

Mary K. Webb, Chairman
Monroe County Planning Commission

MONROE COUNTY
EMERGENCY MANAGEMENT
DIVISION

MITCHELL V. YUDASZ, JR., DIRECTOR
MICHAEL M. KATALINICH, ASSISTANT DIRECTOR
GLENDA S. WHITE, EMERGENCY RESPONSE PLANNER

JAN 30 1998

January 30, 1998

Mr. Royce Maniko, Director
Monroe County Planning Department
125 E. Second St.
Monroe, MI 48161

Dear Mr. Maniko:

I would like to offer some feedback from the members of this department in reference to the proposed acquisition of Conrail by CSX Transportation and Norfolk Southern Railroad. Pursuant to recent public information, we have some concerns reference the environmental impact and emergency preparedness issues:

1. Current transportation loads are approximately 14,000 cars annually. With the proposed acquisition, the load will increase to approximately 31,000 annually. As many of these rail cars transport hazardous materials, this will increase the potential for an accident involving these materials and ultimately, the safety of the public.
2. With the increased potential for accident, emergency management will have to provide planning, training and exercising to respond to these types of occurrences. In addressing this emergency response plan, the following is necessary:
 - a. Training for emergency responders (police, fire, emergency management, etc.)
 - b. Specialized equipment for this type of response.
 - c. Exercise evaluators
 - d. Specialized emergency planning support, with expertise/guidance, if needed.
 - e. Assistance and support with public information and education.
 - f. Additional public warning capabilities (sirens, alert monitors, etc.)
 - g. Support for exercises and drills that must take place. Because Monroe County is mandated by the federal government to participate in a very costly series of full-scale exercises on a biannual basis (large expense in personnel, resources and supplies). Additional full-scale exercises would be extremely difficult to accomplish without support.

In reading the section of Environmental Analysis (SEA), we notice that railroads are encouraged to develop a hazardous materials response plan and exercise this plan biannually with local governments in respect to the statement *volunteer*, what level of commitment will be made by CSX to communities affected by the increased hazard.

Thank you for considering our concerns

Very truly yours,

Mitchell Yudasz, Jr., P.E.M.
Emergency Management Director

**RE: Draft Environmental Impact Statement (Finance Docket No. 33388) -
Proposed CONRAIL Acquisition/U.S. Department of Transportation/Surface
Transportation Board Regional Clearinghouse Code: TR 970391**

Dear Ms Kaiser:

SEMCOG, the Southeast Michigan Council of Governments, has processed a review for the above Draft Environmental Impact Statement according to intergovernmental review procedures established in Presidential Executive Order 12372 and as the federal and state designated Metropolitan Planning Organization for U.S. Department of Transportation programs for Southeast Michigan.

We notified the following local government agencies of your project during our review and requested their comments:

Livingston, Macomb, Monroe, Oakland, St. Clair, Washtenaw & Wayne County Planning Offices

Detroit Planning & Development Department
Cities of Melvindale & River Rouge
Areawide Water Quality Board
Suburban Mobility Authority for Regional Transportation
Ann Arbor Transportation Authority

As of this date, the Livingston County Planning Department, Macomb County Planning & Economic Development Department, St. Clair County Metropolitan Planning Commission, Monroe County Planning Department and Commission, Monroe County Emergency Management Division and the Areawide Water Quality Board have submitted written comments, which are attached. We will forward additional comments, if any, for your information and attention.

ANITA ASHFORD
Chairperson
Councilmember
City of Port Huron

DOUGLAS WOOLLEY
First Vice Chairperson
Supervisor
Pittsfield Township

GERALDINE HOOD
Vice Chairperson
Supervisor
West Bloomfield Township

DIANA KOLAKOWSKI
Vice Chairperson
Commissioner
Macomb County
Board of Commissioners

DANTE J. LANZETTA, JR.
Vice Chairperson
Commissioner
City of Birmingham

MARJORIE THOMAS
Vice Chairperson
President, ISD of
St. Clair County
Board of Education

JOHN FUNK
Immediate
Past Chairperson
Commissioner
Monroe County

JOHN M. AMBERGER
Executive Director

♻️ Recycled paper

SEMCOG's staff has reviewed the Draft Environmental Impact Statement (DEIS) which you distributed. Our comments are included in total in the attached staff memo. These comments include input from two public information meetings held in Southeast Michigan.

An overriding comment is that the proposed acquisition will provide a more efficient and competitive rail system. Along with these overall comments in support of the project were some specific concerns that need to be addressed. Some of the comments we feel should be emphasized as they have potential significant impact on communities in Southeast Michigan include:

- The DEIS does not always clarify as to why or how SEA's process eliminates certain activities from impact consideration. The final EIS should clearly describe SEA's progressive elimination of potential concerns in the various analyses.
- There appears to be a discrepancy between the data used in the DEIS for Environmental Justice analysis. This discrepancy either needs to be explained or corrected and the potential for impacts reassessed.
- Concerns over the transport of hazardous materials were expressed from several counties and communities. Major issues related to the overall increase in volume on certain lines (particularly in Monroe County), consideration of impacts from the future transport of radioactive material from Detroit Edison's Enrico Fermi Nuclear Plant and costs associated with development and maintenance of emergency response plans.
- The need for continued support by the acquiring rail companies for the Monroe County Rail Consolidation Project. This project is the result of 14 years of planning and has just begun implementation processes. The support of Conrail's successor for this project is vital for its success.
- We understand that the DEIS cannot address existing concerns about the rail system. However, the final EIS should describe how the analysis considered the potential of exacerbating these problems via the acquisition. Specific concerns relate primarily to at-grade crossing safety and potential delay of emergency vehicles.

A final comment relates to our January 13, 1998 letter to Elaine K. Kaiser requesting a 15 day extension on the review and comment period. As of this date we have not received a response. The additional 15 days would have provided time for a more thorough analysis and would have allowed staff the time to answer at least some of the concerns in this memorandum.

Sincerely,

John M. Amberger
Executive Director

SUBJECT: Draft Environmental Impact Statement (Finance Docket No. 33388) -
Proposed CONRAIL Acquisition/U.S. Department of Transportation/
Surface Transportation Board

We have reviewed the Draft Environmental Impact Statement for the Proposed CONRAIL Acquisition (DEIS) submitted by the Surface Transportation Board's Section of Environmental Analysis (SEA). The DEIS was analyzed for its consistency with the adopted 2020 Southeast Michigan Regional Transportation Plan Goals and Objectives. In our review process we worked with representatives from the Michigan Department of Transportation, individual counties and communities, interest groups, CSX Corporation and Norfolk Southern.

In addition to staff review, input was garnered from Southeast Michigan community representatives, shippers and other stakeholders in the region's rail system via two public information meetings held January 21 and 28, 1998. SEMCOG worked with both CSX Corporation and Norfolk Southern in conducting these meetings on the proposed acquisition and its effect on Southeast Michigan. Written questions and comments from meeting participants are attached.

We agree that the proposed acquisition would result in greater rail system efficiencies and increase competition. Although this project will have positive impact on economic development in Southeast Michigan, a number of concerns and questions have been identified which require additional clarification from the SEA. These clarifications primarily pertain to three DEIS subject areas: Michigan Safety, Michigan Traffic and Transportation and Michigan Environmental Justice. Our comments follow under the appropriate subject heading.

Michigan Safety

Freight Rail Operations

Table 5-MI-1 on page 5-MI-3 of the DEIS identifies six rail line segments which meet or exceed board environmental thresholds. Subsequently, Table 5-MI-5 identifies three segments having met or exceeded these thresholds. This discrepancy needs to be clarified or corrected in the final EIS.

DEIS analysis of these three rail line segments determined that since the duration in predicted accident rates did not shorten to one every 100 years or less per mile, none of these segments were considered significant. Therefore SEA did not recommend mitigation.

Our concern lies in the fact that these three segment's accident duration rates did decrease by factors ranging from 1.6 to 5.5. Since SEA could not accurately predict either frequency or severity of actual accidents, we question whether the area may need to be investigated further. Further clarification or analysis by SEA is necessary in the final EIS.

Passenger Rail Operations

SEA analyzed four shared passenger/freight segments in Michigan that will experience an increase of one or more freight trains per day from the proposed acquisition. Because of the limited number of passenger rail accidents and the inability to accurately predict the accidents, SEA used increased freight activity on rail line segments to estimate the changes in passenger train accident risk.

Of the four segments in Michigan, three exceeded SEA's criteria of significance. One of these is owned and dispatched by Amtrak and SEA encourages Amtrak to address this issue. As for the remaining two segments, SEA's preliminary recommendation is that all freight trains, both opposing and moving in the same direction as passenger trains, be clear of the track at least 15 minutes prior to the estimated arrival of the passenger train.

First, SEA needs to clarify whether the recommended 15 minute freight train track clearing is an improvement on the current practice or just reinforcement of it.

Second, just as with the freight rail operations section above, the inability to accurately predict actual accidents along with the reduction in the duration of accident intervals (by factors ranging from 1.1 to 10) indicates this analysis may require further investigation. Further clarification or analysis by SEA is necessary in the final EIS.

Highway/Rail At-grade Crossing

We understand that the SEA does not have authority to require mitigation of pre-existing environmental impacts. However, the relationship between existing at-grade crossing problems and the proposed acquisition should be considered in this analysis. It has been brought to our attention (Detroit News Metro Section, Tuesday December 16, 1997) that there are numerous crossings in the Metro Detroit area that have experienced many accidents (five to nine) over a 10 year period. As many as one in five of these locations have not been inspected in the past 11 years. While the DEIS only addresses segments and crossings that are affected by the acquisition, the combined effect of these existing problems with the proposed acquisition needs to be addressed. In addition, for those crossings with serious concerns, efforts to correct the situation should not be delayed by approval of the acquisition.

The final EIS should provide additional analysis and clarification of this issue.

Rail Transport of Hazardous Materials

The major concern related to transport of hazardous materials (Haz Mat) by rail is a spill or accidental release resulting from a train accident. With an increase in hazardous freight materials, there are also concerns specifically related to training of emergency personnel and other related costs. Southeast Michigan communities are concerned with the matters that follow.

First of all, an increase in the amount of hazardous materials traveling through Monroe County is anticipated with the expected increase in traffic from 14,000 carloads annually to 31,000 carloads annually on the CSX line between Carleton, MI and Toledo, OH. With this increase in traffic, the potential for accidents with hazardous freight will also escalate, potentially endangering public safety.

With increased potential for an accident, the Monroe County Emergency Management Division will have to provide planning, training, and exercises to respond to these types of occurrences. The following necessary elements will need to be satisfactorily addressed as part of the emergency response plan:

- Training for emergency responders (police, fire, Emergency Management, etc.)
- Specialized equipment for this type of response
- Exercise evaluators
- Specialized emergency planning support, with expertise/guidance, if needed
- Assistance and support with public information and education
- Additional public warning capabilities (sirens, alert monitors, etc.)

- Support for exercises and drills that must take place. Monroe County is presently mandated by the federal government to participate in a very costly series of full-scale exercises for the Enrico Fermi II Nuclear Power Plant, on a biannual basis. At this time, the County estimates start-up costs at between \$12,000 and \$15,000, with ongoing expenses at \$8,000 annually.

Increased rail traffic on NS and CSX, and faulty crossing warning systems could cause delays in evacuating the area around the Enrico Fermi II Nuclear Power plant in the event of an emergency. There does not appear to be any statements in the DEIS regarding impacts on evacuation routes.

Secondly, Southeast Michigan communities would like to know the level of commitment that will be made by CSX to communities affected by the increased hazard. Would CSX be in a position to provide reimbursement for both initial and ongoing costs for emergency preparations? Are they willing to take responsibility in providing funds for public education programs? And are they willing to provide additional training for specialized equipment necessary to protect those who respond to a hazardous material accident at railroad?

Southeast Michigan communities would also like to further ascertain the impact on listed communities regarding Haz Mat Rail Service, as well as the number of shipments, schedules, training opportunities for their Haz Mat Team. This merger could provide the impetus for communication related to emergency Haz Mat Response.

In the estimated increase in annual hazardous material car load rate on page MI-13, does the post acquisition estimate include future disposal of high grade radioactive waste from Fermi and other nuclear plants within the system once the super dump in Nevada is functioning? How much of this projected increase is low level and how much is high level radioactivity? If this statistic does not include the high radioactive waste will anyone have any information on this in the future? Finally, how much biological waste is currently there?

Michigan Traffic and Transportation

Highway/rail crossing delay

Southeast Michigan communities have expressed concern with existing delays at highway/rail crossings. They are specifically concerned that an increase in freight traffic will further exacerbate already problematic situations. Furthermore, highway/rail crossing delays can also prove to be a hindrance in public safety matters. Finally, communities have asked for further explanation concerning the large percentage increases of freight traffic traversing their communities with no corresponding mitigation proposed. Some specific matters follow.

Plymouth Township and the City of Plymouth have multiple highway/rail crossings. The township provides fire service for both communities. There is only one route from the Township into the City that is completely free of rail crossings. Their concern is that the larger blocks of cars to be used in shipping will exacerbate an already serious safety problem. The community reports that emergency vehicles are unable to reach an emergency in a timely manner because of having to stop at a rail crossing for up to 20 minutes. They are also greatly concerned about extended blockage of the streets.

Another concern that SEMCOG staff addressed in a issue last year pertained to Canadian National Railway Company and Grand Trunk Western Railroad Incorporated's construction and operation of connecting tracks at Trenton, MI. The community indicated that they have an existing problem of vehicular congestion on Lathrop Street as a result of rail traffic. We could not identify from the information provided in the DEIS whether this existing situation would be further exacerbated.
