Monroe County expressed their concern that significant increase in traffic on the CSX line between Carleton, MI and Toledo, OH, and minor increase in traffic on Conrail (NS) line between Detroit and Toledo would mean more blocked grade crossings, causing delay of emergency vehicles, more potential train/car accidents, and general inconvenience to motorists. The Monroe County Road Commission needs railroad contact numbers to report problems on grade crossings. Problems observed at crossings along Telegraph Road and elsewhere need to be addressed.

The final EIS should address these locations, identify the criteria used and indicate why these additional locations were not identified as problem issues.

Michigan Environmental Justice

Comparison of DEIS data on the low-income population with data supplied by the U.S. Department of Housing and Urban Development (HUD) revealed significant discrepancies. Of the three areas presented as meeting the threshold requirements significant for environmental justice impacts, all given values appear to underestimate the low-income populations.

For example, in Table 5-MI-20 the low-income population is reported as 38.79% of the total population. HUD data indicates that this new construction project is located in a block group that is 63.8 percent low-income. Even when all block groups within 1400 feet of the proposed construction site are included in a best-case scenario, the HUD data indicates that there is a low-income population of 53.7 percent.

Since the DEIS did not provide a detailed explanation of the method used to determine both the boundary definition and the percent of low-income people in the affected areas, it is not possible to identify the potential cause of this variation.

We have two primary concerns related to this section. First, if the data is not correct there may be additional rail segments that do meet or exceed thresholds and should be subjected to further analysis. Second, it is not clear how the Ecorse Junction construction (NX-08), Rougemere rail yard (CY-03) activity, and W. Detroit-Delray rail segment were determined not to have any environmental justice impact. Absent any explanation, we question their elimination to the extent the HUD and DEIS data discrepancies were used in the determination.

The final EIS needs to either clarify these discrepancies by providing a better description of process and data used. Or the final EIS needs to re-evaluate this issue using corrected data.

Finally, regarding the need for noise mitigation in the Detroit-N. Yard segment, the final EIS should include a complete list of all communities and groups involved in the process and a full description of the process used and basis for its conclusions.

A final comment relates to our January 13, 1998 letter to Elaine K. Kaiser requesting a 15 day extension on the review and comment period. As of this date we have not received a response. The additional 15 days would have provided time for a more thorough analysis and would have allowed staff the time to answer at least some of the concerns in this memorandum.

**Proposed Conrail Acquisition by CSX and Norfolk Southern
January 21, 1998 Questions**

Name: Tom Deku **Phone:** 734-782-2692
Representing: Monroe County Planning Commission
Address: 4880 Dauncy, Flat Rock, MI 48134

Question/Comment:

In the estimated increase in annual hazardous material car load rate on page MI-13; does the post acquisition estimate include disposal in future of high grade radioactive waste from Fermi and other nuclear plans within the system once the super dump in Nevada is functioning? How much of this projected increase is low level and how much high level radioactivity. If this statistic does not include the high radioactive waste has anyone any information on this in the future. I didn't ask the table to comment - but how much biological waste is there?

Name: Hedwig Kaufman (Mrs.) **Phone:** 734-289-3541
Representing:
Address: 1515 E. Hurd Rd., Monroe, MI 48162

Question/Comment:

1. Does the EIS consider the issues concerning increased traffic, crossing blockages, etc. as they affect the Enrico Fermi Emergency Response Plan?
 2. Is NS aware of the need for improving crossing signals/gates: much of the existing equipment malfunctions frequently, depending on local citizens notifying authorities who in turn notify Conrail.
-

**Proposed Conrail Acquisition by CSX and Norfolk Southern
January 21, 1998 Questions**

Name: Arthur Shufflebarger **Phone:** 248-684-1515
Representing: Village of Milford
Address: 1100 Atlantic St., Milford, MI 483811

Question/Comment:

Will the CSX policy of maintenance within communities be reviewed and a greater commitment made? Currently, replaced railroad ties are disposed of along embankment of rail line, brush and junk trees are allowed to grow, overpasses are unpainted, pedestrian only crossing is required to be served by full automatic signal, track grades are raised making crossing an ever increasing "hump". These exist in a fully developed community not open rural area.

Name: Phil Wagner **Phone:** 734-483-1092
after February 1st
Representing: Western Wayne County Haz Mat Team
Address: 222 S. Ford Blvd., Ypsilanti, MI 48198-6067

Question/Comment:

1. I would like to further discuss the impact on listed communities regarding Haz Mat Rail Service, number of shipments, schedules, training opportunities for their Haz Mat Team. This merger appears to give us a better potential for communication relating to emergency Haz Mat Response.
 2. Specific information on Conrail line thru Ypsilanti/Willow Run. The Western Wayne County Fire Department Mutual Aid Association provides emergency Haz Mat response with it Hazardous Incident Response team (HIRT) to the following communities: Ypsilanti Township, Van Buren Township, Redford Township, Plymouth Township, Superior Township, Canton Township, Northville Township and the Cities of Wayne, Romulus, Inkster, Livonia, Plymouth, Garden City, Dearborn Heights, Taylor, Westland, Northville, Dearborn, Metro Airport, Novi and Farmington Hills.

Representing: City of Dearborn Office of Emergency Management
Address: 3750 Greenfield, Dearborn, MI 48128

Question/Comment:

Will there be a change in the 24-hour emergency number for derailments/leak notification. What is the present number?

Name: Dave Dysard **Phone:** 419-241-9155 x118
Representing: Monroe County Planning Commission
Address: 4880 Dauncy, Flat Rock, MI 48134

Question/Comment:

What specific mitigation measures will be completed in the noise abatement area? Please list some examples of measures (preferably nearby Toledo vicinity) implemented previously. What is being done to address Ann Arbor Railroad's loss of traffic with Norfolk Southern? And keeping it a viable railroad for communities it serves?

Are railroad's prepared to subsidize local communities for additional safety training and equipment (especially HAZMAT) that will be required because of the transaction?

**Proposed Conrail Acquisition by CSX and Norfolk Southern
January 21, 1998 Questions**

Name: Glenda White **Phone:** 313-241-6400
Representing: Monroe County Emergency Management Division
Address: 965 S. Raisinville Rd., Monroe, MI 48161

Question/Comment:

Hazardous Material Plan Development and exercising every other year. With local government that volunteers to do so (Pg MI-13) What commitment is CSX going to make to communities being affected by the increase of hazardous material shipments? Are they willing to take responsibility in providing funds for public education programs, additional training plan writing specialized equipment necessary to protect our first responders and all those that would respond to a Hazmat accident at railroad.

Are railroad's prepared to subsidize local communities for additional safety training and equipment (especially HAZMAT) that will be required because of the transaction?

Name: Ed Clemente **Phone:** 313-284-6000
Representing: Southern Wayne County Chamber of Commerce
Address: 220600 Eureka Rd., Suite 315, Taylor, MI 48180

Question/Comment:

A list of endorsers of both Norfolk Southern and CSX.

Example of endorsement letter

Rationale for needing the endorsement if it is still of use.

**Informational Meeting
Proposed Conrail Acquisition by CSX and Norfolk Southern
January 28, 1998 Questions**

Name: Kathleen Keen McCarthy **Phone:** 734-453-3840
Representing: Supervisor, Plymouth Township
Address: 42350 Ann Arbor Rd.

Question/Comment:

Plymouth Township and the City of Plymouth have multiple sites of rail crossings. The township provides fire service for both communities. There is only one route from the Township into the city that is completely free of rail crossings. Our concern is that the larger blocks of cars to be used in shipping will exacerbate an already serious safety problem. I have personally witnessed emergency vehicles being stopped for 20 minutes at a rail crossing, flashers going, unable to reach the emergency in a timely manner. Fortunately, we were able to call for other assistance in the life threatening situation, but as providers of emergency services, we are concerned about extended blockage of the streets.

Name: M. J. Newbourne **Phone:** 313-849-2910
Representing: Intermodal Associates/All Points Transport/MTA
Address: P.O. Box 1938, Dearborn, MI 48126

Question/Comment:

1. What will the service level be from New York area Intermodal Terminals (Dockside, Kearney) to Detroit?
2. What will the service level be from Baltimore area Intermodal Terminals to Detroit?

For NS - Mr. Higgenbotham

Would you provide any details possible on Intermodal to/from Detroit.

**Informational Meeting
Proposed Conrail Acquisition by CSX and Norfolk Southern
January 28, 1998 Questions**

Name: Monica Schmit **Phone:** 313-838-3190

Representing: M.O.S.E.S.

Address: 8520 Metttetal, Detroit, MI 48227

Question/Comment:

1. Concern about increased freight traffic especially in poor and minority communities. We want statistics regarding the percentage increase throughout Michigan.
 2. Concern about increased toxic material transport through communities. We want statistics regarding the percentage increase throughout Michigan.
 3. Concern about impact on wildlife in Michigan. We want information about this.
 4. We are concerned about the negative impacts on the Cleveland Ohio community as a result of this acquisition. (Increased toxic material and freight traffic)

Detroit MI 48226

Re: TR 970391 Review of Draft Environmental Impact Statement -
Proposed Conrail Acquisition

Dear Mr. Pfaff:

The Draft Environmental Impact Statement (EIS) pertains to the proposed acquisition of Conrail by Norfolk Southern Railroad (NS) and CSX Railroad and contains preliminary analyses and recommendations for mitigating the possible environmental effects of the proposed Conrail Acquisition. The Surface Transportation Board (Board) of the U. S. Department of Transportation is responsible for acting upon this acquisition request.

According to CSX and NS, the purpose of the proposed Conrail Acquisition is to provide a more efficient rail transportation system in the eastern United States and to increase rail competition in the Northeast. They maintain that a well-managed rail network, configured in response to market forces, would increase competitive options for shipper, and yield substantial efficiencies and corresponding benefits to the shipping public. Further, the Applicants claim that there is a benefit to the public when railroads spread their fixed costs over a broader traffic base because the per-unit costs of shipping freight decline. The proposed Conrail Acquisition would also have environmental benefits, such as system-wide reductions in fuel consumption and air pollutant emissions.

The proposed Conrail Acquisition would result in some rerouting of rail traffic, increasing traffic for some rail line segments and rail yards, while decreasing traffic for others. It would also result in a decrease in long-haul truck traffic, although there could be increased local truck traffic and around new and existing intermodal facilities.

Only 514 miles of track would remain in the Conrail system, if the proposed Conrail Acquisition is approved and implemented, and would be operated as Shared Assets Areas located in northern New Jersey, southern New Jersey/Philadelphia, and Detroit, Michigan.

Page 2

The Section of Environmental Analysis (SEA) has determined that three projects (two rail yard expansions and a bridge renovation) could potentially result in environmental impacts beyond the existing railroad right-of-way. The remaining projects - minor actions with the potential for only small and temporary impacts - do not require further analysis.

Both CSX and NS plan to undertake extensive activities in Michigan as part of the proposed Conrail Acquisition. The related activities that would meet or exceed the Board's thresholds for environmental analysis include increased train operations on a total of six rail line segments, construction of one rail line connection, increased activity at one intermodal facility in Detroit, and increased number of rail cars handled at one rail yard in Detroit. There are no proposed abandonments. No Michigan rail line segments which meet or exceed Board environmental thresholds are located in Livingston County.

SEA conducted an analysis to evaluate the potential change in safety on all rail line segments where the proposed acquisition would result in eight or more additional freight trains per day. SEA did not consider an increase significant unless the predicted accident rate shortened the duration between accidents to one every 100 years or less per mile. In Michigan, SEA found that no rail line segments met its criteria of significance and does not recommend mitigation.

SEA determined a potential impact to be significant if the projected annual increase in accidents between freight trains and passenger trains was greater than 25 percent and the frequency was less than one accident in 150 years. SEA determined that the increased risk for passenger train accidents for three rail line segments exceed its criteria for significance. However, none pass through Livingston County.

For all Category A highway/rail at-grade crossings, SEA considered the accident frequency rate increase of one accident every 100 years to be significant. For all Category B highway/rail at-grade crossings, SEA considered the accident frequency rate increase of one accident every 20 years to be significant. SEA determined that the proposed acquisition would significantly increase the predicted accident risk at one highway/rail at-grade crossing in Wayne County.

SEA analyzed all rail line segments where the number of car loads containing hazardous materials would increase as a result of the proposed acquisition. SEA determined that two rail line segments in Michigan carrying increased amounts of hazardous material are of potential concern. These are the rail line segment between Carleton and Toledo and that between Detroit and Plymouth, neither of which traverse Livingston County.

Because there is no existing commuter rail service in Michigan, SEA has determined there will be no adverse effects and no mitigation is required.

Six counties (excluding Livingston County) have highway/rail at-grade crossings for which SEA performed vehicle delay calculations. The proposed acquisition would have no significant effect on vehicle delay at highway/rail at-grade crossings in Michigan, and SEA does not propose mitigation.

Because there are no highway/rail at-grade crossings within the limits of construction, it is SEA's preliminary conclusion that there would be no effect on highway traffic from the proposed Ecorse Junction Connection in Wayne County.

The analysis of the intermodal operations in Detroit-Melvindale shows that the total daily increase in truck traffic will be less than two percent of the average daily traffic for all the study area roadways. Therefore, it is SEA's preliminary conclusion that these increases in truck traffic would have insignificant effects on the area roadways.

Two NS, one CSX, and three Shared Area rail line segments, one NS intermodal facility, and one CSX rail yard in Michigan exceeded the Board's threshold for air quality analysis. While there are localized increases in emission in some of the six counties in Michigan (excluding Livingston County) which include these rail facilities, SEA has determined that air quality will not be significantly affected and no mitigation is necessary.

To analyze the potential noise impacts of the proposed acquisition, SEA evaluated five rail line segments and one intermodal facility that would meet or exceed the Board's thresholds for environmental analysis of noise. None are located within Livingston County.

Since SEA determined there would be no adverse impacts to cultural resources, SEA did not recommend mitigation.

In analyzing the effects on hazardous waste sites for the proposed acquisition, the primary issue addressed was whether proposed construction and abandonment activities would disturb contaminated areas. The only Michigan site investigated for potential hazardous materials or waste impacts is the Ecorse Junction Connection in Wayne County. SEA identified three hazardous waste sites or other related concerns within 500 feet of the proposed connection. In addition, the locations of four sites are unknown and could not be mapped. Because existing regulatory requirements of other agencies and standard construction practices of the railroad adequately address potential disturbance of contaminated areas, it is SEA's preliminary determination that no additional mitigation is necessary.

SEA determined that the potential for impacts to natural resources would most likely be associated with site-specific projects related to the proposed abandonment of rail lines and construction of new connector lines, rail yards, and intermodal facilities. SEA determined that potential impacts to natural

Richard W. Pfaff, Jr.
January 12, 1998
Page 4

resources could occur at Ecorse Junction in Wayne County. Due to Best Management Practices used in the railroad's construction specifications and regulatory programs governing effects on wetlands, water resources, and protected species, it is SEA's preliminary determination that no mitigation is necessary. However, as a condition of approval, SEA would require NS to conform to its standard natural resources specifications during construction.

It is SEA's preliminary determination that there would be no significant impacts to land use associated with the proposed acquisition at the Ecorse Junction site. Because there are no significant impacts, SEA does not recommend mitigation.

In Michigan, intermodal facilities and associated truck routes with proposed changes in activity levels did not meet either the minority or low-income population thresholds for further environmental justice analysis. The only rail line segment meeting either the minority or low-income population thresholds is located within the City of Detroit. If an environmental justice effect exists, SEA will determine if mitigation would be practicable.

Summary: The only rail line segment passing through Livingston County does not require environmental analysis (see attached map).

Sincerely,

William D. Wagoner, AICP
Director

Proposed Conrail Acquisition
Section of Environmental Analysis/U.S. Department of Transportation

Dear Mr. Amberger:

In accordance with Presidential Order 12372 procedures, we have reviewed the Section of Environmental Analysis/U.S. Department of Transportation Draft Environmental Impact Statement to the Surface Transportation Board, U.S. Department of Transportation.

The Macomb County Department of Planning and Economic Development staff has reviewed the EIS and is not aware of any conflicts with any plans currently in our office. On this basis, we would recommend favorable consideration by the U.S. Department of Transportation.

If there are any questions regarding these comments, please contact our office.

Sincerely,

Bernard E. Giampetroni

RE: TR970391 - Draft Environmental Impact Statement (Finance Docket No 33388) Proposed Conrail Acquisition

Dear Mr. Pfaff:

At their meeting of January 21, 1998, the St. Clair County Metropolitan Planning Commission considered the above referenced grant request. Following review and consideration of the enclosed staff report and discussion of the facts and issues, the Commission acted to support the staff recommendation "that SEMCOG be notified that the proposed acquisition appears to have no impact on St. Clair County and therefore does not conflict with any adopted plans of the County."

Should you have any questions, please do not hesitate to give us a call.

Sincerely,

Gordon Ruttan
Planning Director

STAFF REPORT

FOR: County Planning Commission

MEETING DATE:

January 21, 1998

BY: Bill Kauffman, Senior Planner

ITEM NUMBER:

12 A

SUBJECT: Clearinghouse Review SEMCOG #: TR 970391 **PROJECT TITLE:** Draft Environmental Impact Statement (Finance Docket No. 33388) - Proposed Conrail Acquisition. The Federal Surface Transportation Board in Washington, D.C., has prepared a draft Environmental Impact Statement (EIS) on the proposed joint acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad. The preliminary analyses and recommendations for mitigating possible environmental effects of the proposed acquisition are contained in this document. It has been released to the public for review and comment during the review period which ends on February 2, 1998. The County has received a copy of the full EIS. We have been asked, through the clearinghouse review process, to comment on the proposal and draft document in relationship to any County plans or programs.

In preparing this report, staff has limited their review to the executive summary and the chapter which deals with potential impacts in the State of Michigan.

BACKGROUND: In June 1997, the three railroads involved applied to the Surface Transportation Board (STBD) for authority for CSX and Norfolk and Southern (NS) to acquire Conrail. Conrail assets would be divided between CSX and NS. However, some portions of Conrail would be operated jointly. The acquisition of Conrail is intended to provide a more efficient rail transportation system to the eastern United States and to increase rail competition in the northeast. Such a move is believed to increase competitive options for shippers.

The STBD reviews proposed railroad mergers and acquisitions, taking into account economic, competitive, and environmental considerations. The STBD can approve the request with no conditions, approve with conditions to reduce potential impacts, or disapprove the merger.

Conrail operates 520 miles of track in Michigan (14% of the State's total rail miles), CSX operates 809 miles (21%), and NS operates 126 miles or 3% of the State's total rail miles. St. Clair County is served by these three railroads and CSX operates a rail-related service in Port Huron.

DRAFT EIS FINDINGS: Based on the operating plans submitted by the applicants, the STBD evaluated the impacts of individual aspects of the proposed acquisition which exceeded thresholds for environmental analysis. Proposed impacts which exceed those thresholds include six rail line segments, construction of one rail line connection, increased activity at one intermodal facility in Detroit, and an increase number of rail cars handled at one rail yard in Detroit. There are no proposed abandonments. None of the proposed changes are located in St. Clair County, and there appears to be no impact on rail service or traffic in St. Clair County.

COMMENTS BY OTHER AGENCIES: Staff has not solicited comments from any other agency as there is no proposed impact on St. Clair County.

STAFF RECOMMENDATION: Staff recommends that SEMCOG be notified that the proposed acquisition appears to have no impact on St. Clair County and therefore does not conflict with any adopted plans of the County.

REVIEW CHECKLIST:

Submittal received SEMCOG: Dec. 26, 1997

Comments due to SEMCOG: Jan. 23, 1998

January 13, 1998 TR970391.RR

ROYCE R. MANIKO, AICP
DIRECTOR

January 30, 1998

Mr. Richard W. Pfaff, Jr.
Regional Review Office Coordinator
Southeast Michigan Council of Governments
660 Plaza Drive, Suite 1900
Detroit, MI 48226

Dear Mr. Pfaff:

We would like to list issues of concern pertaining to the Environmental Impacts of the proposed acquisition of Conrail by CSX Transportation and Norfolk Southern Railroad. These concerns were expressed at a public information meeting held at Monroe County Community College on January 21, 1998.

1. **Hazardous Materials:**

- a) An increase is expected in traffic from 14,000 carloads annually to 31,000 carloads annually on CSX line between Carleton, MI and Toledo, OH. This will result in increased loads of hazardous materials traveling through the County, along with the potential for accidents resulting from these materials, thus endangering public safety.
- b) With increased potential for an accident, the Monroe County Emergency Management Division will have to provide planning, training, and exercises to respond to these types of occurrences. In addressing this emergency response plan, the following is necessary:
 - i) Training for emergency responders (police, fire, Emergency Management, etc.)
 - ii) Specialized equipment for this type of response
 - iii) Exercise evaluators
 - iv) Specialized emergency planning support, with expertise/guidance, if needed
 - v) Assistance and support with public information and education

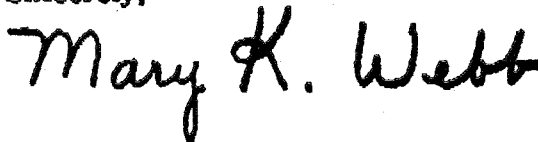

- vi) Additional public warning capabilities (sirens, alert monitors, etc.
 - vii) Support for exercises and drills that must take place. Monroe County is presently mandated by the federal government to participate in a very costly series of full-scale exercises for the Enrico Fermi II Nuclear Power Plant, on a biannual basis (large expense in personnel, resources and supplies). At this time, our estimated start-up costs would be between \$12,000 and \$15,000, and ongoing expenses would be \$8,000 annually.
- c) According to the Section on Environmental Analysis (SEA), railroads are encouraged to develop a hazardous materials response plan and carry out biannual exercises according to this plan, in cooperation with local governments. What level of commitment will be made by CSX to communities affected by the increased hazard? Monroe County would request reimbursement for initial and ongoing costs for emergency preparations. We would be willing to work with CSX to negotiate a plan for this.
2. **Impact on Nuclear Plant Emergency Evacuation:** Increased rail traffic on NS and CSX, and faulty crossing warning systems could cause delays in evacuating the area around the Enrico Fermi II Nuclear Power plant in the event of an emergency. We do not find statements in the EIS regarding impacts on evacuation routes.
3. **Nuclear Waste:** The federal government will be assuming responsibility for all high-level radioactive wastes in the United States. They will be providing a central storage/disposal repository for these materials. As many of these materials will be transported by both truck and rail, what is the increased likelihood of an accident involving these items?
4. **Monroe Rail Consolidation Project:** Railroad support of Monroe's ongoing project to consolidate east side rail lines (Conrail/NS and CNNA) is essential to its success. This project has been in the planning stages for more than fourteen years, and preliminary engineering studies are being completed. Partial funding from the federal government has been secured, and phase one of the project, an underpass at the Conrail/North Dixie Highway grade crossing is scheduled to get underway this spring. As additional funding is secured, ongoing phases will include the relocation of Conrail Warner Yard in Monroe, the needed crossovers to consolidate the Conrail lines with Grand Trunk CNNA lines

through the City of Monroe, and Frenchtown and Monroe Townships, and construct the needed crossovers in order to abandon the redundant Conrail lines. Many years of planning for the project are just now beginning to result in implementation. Continued support from Conrail's successor is necessary for this project to be successful.

5. **Traffic Safety:** Significant increase in traffic on CSX line between Carleton, MI and Toledo, OH, and minor increase in traffic on Conrail (NS) line between Detroit and Toledo would mean more blocked grade crossings, causing delay of emergency vehicles, more potential train/car accidents, and general inconvenience to motorists. The Monroe County Road Commission needs railroad contact numbers to report problems on grade crossings. Problems observed at crossings along Telegraph Road and elsewhere need to be addressed.
6. **Economic Development Opportunities:** Cooperation of the railroads is essential to our local economic development efforts.
7. **Noise Mitigation:** With 11.2 more trains per day projected on the CSX line, railroads must continue efforts to mitigate noise impacts on local communities, especially residential areas. While this issue was addressed with regard to the line from Ecorse to Carleton, we feel it needs to be evaluated along the line running from Carleton to Toledo as well, including the City of Monroe.

We would like to thank SEMCOG for their assistance during the Environmental Review period.

Sincerely,

Mary K. Webb, Chairman
Monroe County Planning Commission

DIVISION

MITCHELL V. YUDASZ, JR., DIRECTOR
MICHAEL M. KALANICH, ASSISTANT DIRECTOR
GLENDA S. WHITE, EMERGENCY RESPONSE PLANNER

JAN 30 1998

January 30, 1998

Mr. Royce Maniko, Director
Monroe County Planning Department
125 E. Second St.
Monroe, MI 48161

Dear Mr. Maniko:

I would like to offer some feedback from the members of this department in reference to the proposed acquisition of Conrail by CSX Transportation and Norfolk Southern Railroad. Pursuant to recent public information, we have some concerns reference the environmental impact and emergency preparedness issues:

1. Current transportation loads are approximately 14,000 cars annually. With the proposed acquisition, the load will increase to approximately 31,000 annually. As many of these rail cars transport hazardous materials, this will increase the potential for an accident involving these materials and ultimately, the safety of the public.
2. With the increased potential for accident, emergency management will have to provide planning, training and exercising to respond to these types of occurrences. In addressing this emergency response plan, the following is necessary:
 - a. Training for emergency responders (police, fire, emergency management, etc.)
 - b. Specialized equipment for this type of response.
 - c. Exercise evaluators
 - d. Specialized emergency planning support, with expertise/guidance, if needed.
 - e. Assistance and support with public information and education.
 - f. Additional public warning capabilities (sirens, alert monitors, etc.)
 - g. Support for exercises and drills that must take place. Because Monroe County is mandated by the federal government to participate in a very costly series of full-scale exercises on a biannual basis (large expense in personnel, resources and supplies). Additional full-scale exercises would be extremely difficult to accomplish without support.

In reading the section of Environmental Analysis (SEA), we notice that railroads are encouraged to develop a hazardous materials response plan and exercise this plan biannually with local governments. In respect to the statement *volunteer*, what level of commitment will be made by CSX to communities affected by the increased hazard.

Thank you for considering our concerns

Very truly yours,

Mitchell Yudasz, Jr., P.E.M.
Emergency Management Director

SUBJECT: Draft EIS (Finance Docket #33388) Proposed Conrail Acquisition
Regional Clearinghouse Code: TR 970391
Surface Transportation Board

Rail Transport of Hazardous Materials

The draft Environmental Impact Statement (EIS) has identified two railroad segments in Southeast Michigan which have exceeded threshold requirements for transport of hazardous waste and are a concern. One extends from Detroit to Plymouth and is designated as a Key Route: greater than 10,000 car loads per year. CSX is therefore required to bring the segment into compliance with the American Association of Railroad Key Route standards and practices — 50 miles an hour maximum on class 2 rails. AWQB staff recommends coordinating all spill response planning activities with Wayne County's Local Emergency Planning Committee (LEPC), the State Police and the Michigan Department of Environmental Quality (MDEQ).

The other route extends from Carleton to Toledo and has been designated a Major Key Route: traffic volume doubles to 20,000 car loads per year. In this case CSX is required to prepare a Hazardous Material Emergency Response Plan and conduct simulation exercises every two years with involvement of local and county emergency response personnel. We concur, the need for coordination with the Monroe County Local Emergency Planning Committee is very important.

AWQB staff recommends the identification of all significant waterways and wetlands along both of the railroad segments with scenarios for protecting the sites in case of a spill.

Hazardous Waste Sites

The Section of Environmental Analysis (SEA) of the Surface Transportation Board has identified three hazardous waste sites within 500 feet of the proposed rail connection at the proposed Ecorse Junction rail connection. In addition, the SEA has reports of four additional hazardous waste sites in the area, the locations of which are unknown.

The Rouge River is located about 1,000 feet from the Ecorse Junction. The Rouge River is a Great Lakes Area of Concern. Planning and implementation is underway to clean up and maintain the river. The river and the City's sewer system should be protected to the fullest extent possible from any construction activities that will disturb these hazardous waste sites and contribute contaminants from runoff. The draft Environmental Impact Statement notes that Norfolk Southern will conduct appropriate surveys to more precisely locate these sites in order to avoid them during construction or remediate them. AWQB staff recommends coordinating site survey's with the MDEQ and Wayne County Departments of Environment and Health.

RE: Finance Docket No. 33388 –CSX and Norfolk Southern – Control and Acquisition –
Conrail: Draft Environmental Impact Statement

I am writing in response to the request for comments regarding the EIS of CSX acquisition of Conrail lines within Michigan.

As a community currently served by CSX we have concerns regarding the policy of maintenance and service CSX will afford those communities now on the Conrail system that will shortly be served by CSX. Issues we feel should be addressed include:

1. Replaced wooden ties are disposed of by simply throwing them down on the embankment forming the right-of-way for the track. We believe that a developed urban area should be given more consideration especially given the prominent and visible location of the rail lines as it passes in a community.
2. Cutting and trimming of brush and junk trees is not regularly done. We believe that a developed urban area should be given more consideration, especially given the prominent and visible location of the rail lines as it passes through town.
3. The deterioration of overpasses, both for safety concerns which are probably more the accepted topic of the railroad, and the general upkeep of rusty unpainted overpasses as they clearly occupy a prominent role to the community.
4. The location of pedestrian crossings (for pedestrians only) in a downtown setting, currently requires the installation of a fully automatic roadway-style signalization totally installed at the municipality expense.

A-287-c

January 30, 1998

Page 2

5. The continued maintenance of the track base is accomplished by raising the tracks by 4 – 5 inches every 2 to 3 years. At street crossings the roadways are gradually starting to “peak”, making the approach increasingly dangerous. The approaches to the crossings must be corrected.

Thank you for the opportunity to air our concerns. Please call if I maybe of any assistance.

Sincerely,

Finance Docket #33388
Surface Transportation Board
1925 K Street, NW
Washington, D.C. 20423-0001

Re: Proposed acquisition of Conrail by Norfolk Southern Railroad
& CSX Railroad

Dear Ms. Kaiser:

The City of Taylor upon review of Chapter 5 of the Environmental Impact Statement (EIS) for the acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad would like to address the following concerns.

The average daily traffic (ADT) counts utilized in the December, 1997 EIS, do not match the information the City of Taylor has attained from Wayne County Department of Public Service (WCDPS). The (WCDPS) "24 Hour Traffic Volume Counts", dated December 1, 1996, shows significantly higher traffic counts than those shown in the EIS. A change in traffic counts will affect the analysis of highway/rail at grade crossings and the analysis of highway/rail crossing delays. We request that the correct traffic counts be considered.

We are also concerned that the additional train traffic through the City of Taylor proposed in the EIS may affect the emergency response activities of police, fire and rescue. Obviously anything that could reduce response time will impede and threaten the health, safety and welfare of our citizens.

Ms. Elaine K. Kaiser
February 1, 1998
Page 2

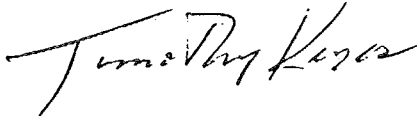

The summary of potential affects of rail transport of hazardous materials was vague. The estimated carloads of hazardous materials between Carleton, MI and Toledo, OH doubles according to the EIS, but there is no reference to any increase between Carleton, MI and Ecorse, MI. Are all hazardous materials off-loaded in Carleton?

The increase in train traffic, according to the EIS, will increase noise. The EIS suggests various methods to mitigate the impact of noise. The EIS also recommends the railroads meet with the communities to decide how best to accomplish mitigation. To date, we have not had any contact with the railroads.

We have many concerns relating to the proposed acquisition. Foremost, is the lack of information the City of Taylor has received from the Section of Environmental Analysis of the Surface Transportation Board. Secondly, the City has serious concerns relating to traffic delay problems and the associated level of service of our roads due to the increased train traffic.

Please feel free to call me at (734) 374-2733 to further discuss these issues.

Very truly yours,

Timothy Keyes,
Special Projects Manager

Attn: Chief, Section of Environmental Analysis

Dear Sir or Madam,

I would like to take this opportunity to express my gratification and support for the assistance we have received from Conrail Hazardous Materials Systems during our training programs at the Middlesex County Fire Academy.

I would like to thank both Skip Elliot and Alan Richter for their dedication and commitment to the emergency service groups in New Jersey. Without their support, we would not have been able to successfully complete the hazardous materials training programs we have conducted for hundreds of students at our fire academy.

I hope and urge that with the impending merger of Conrail, provisions can be made to continue a hazardous materials support system that will be available to assist the various agencies as it has done in the past. A serious void will occur without a training and response group being available to the emergency services in New Jersey concentrating on rail emergencies.

Sincerely,

Rory R. Zach

SUBJECT: NORFOLK SOUTHERN AND CSX FREIGHT MERGER

Gentlemen

The Somerset County Chamber of Commerce has been a strong proponent for reactivating the West Trenton Passenger Rail service. I personally testified before the Congressional Transportation Committee, along with Mayor Kenneth Scherer of Hillsborough and Congressman Bob Franks. Currently we are working with NJ Transit on the West Trenton study funded by the Surface Transportation appropriations. We have been proponents of national rail infrastructure improvements.

The Norfolk Southern and CSX freight merger plan has been of great interest to the Somerset County Chamber of Commerce. Our local economy relies on an excellent rail infrastructure system, both passenger and freight.

We are requesting that the Surface Transportation Board make as a condition of approval on the merger that the West Trenton Line accommodate dual use of both freight and future rail passenger service and that existing passenger rail service serving Somerset County not be adversely impacted at the expense of expanded freight service.

The Chamber organized a successful West Trenton Coalition of supporters reaching from Bucks County, Pennsylvania to Union County, NJ. More recently we are active supporters of the Raritan Valley Line Coalition.

THE STATE OF NEW JERSEY
DEPARTMENT OF TRANSPORTATION
NJ TRANSIT

JANUARY 10 2013

Congressman Franks has been a strong advocate of rail infrastructure enhancements and an effective community leader.

Cordially

Barbara C. Roos

**RE: Finance Docket No. 33388
Draft Environmental Impact Statement
CSX and Norfolk Southern
Control and Acquisition of Conrail
National Historic Preservation Act Consultation**

Dear Ms. Kaiser:

As Deputy State Historic Preservation Officer for New Jersey, in accordance with 36 CFR Part 800: Protection of Historic properties, as published in the Federal Register on September 2, 1986 (51 FR 31115-31125), I am providing consultation comments for the above referenced Draft Environmental Impact Statement.

SUMMARY: The initial activities proposed by Norfolk Southern Railroad and CSX Railroad as part of the proposed acquisition of Conrail will not have an effect on historic properties. Proposed projects at Elizabeth (Union County) and Flemington Junction (Hunterdon County) may have an effect upon historic resources listed in or eligible for listing in the National Register of Historic Places (NRHP). Additional information regarding the scope of these two proposed projects is needed before an assessment of effect can be completed. Abandonment of right of way and modification or replacement of railroad structures, such as bridges, tunnels, stations, signal and interlocking towers, are the types of activities that have, in the past, effected historic railroad properties in New Jersey and have been the subject of Section 106 consultation.

These comments are in response to your initial letter of October 23, 1997 to Mr. Robert Shinn, Commissioner, Department of Environmental Protection, and the Draft Environmental

Ms. Elaine K. Kaiser
HPO-A98-137
January 29, 1998
Page 2 of 3

Impact Statement (DEIS), Finance Docket No. 33388, Proposed Conrail Acquisition, dated December 12, 1997.

Based upon the information in your letter and the DEIS, I concur that, with the possible exception of projects at Elizabeth (Union County) and Flemington Junction (Hunterdon County), the proposed Conrail acquisition will not have an effect on historic properties. My concurrence with this assessment of no effect is based upon the DEIS conclusion that no abandonment of railroad right of way is proposed for within New Jersey and that construction activities associated with changes to existing Conrail New Jersey operations are currently limited to construction of track connections in Ridgefield and Little Ferry (Bergen County).

The Historic Preservation Office is pleased to know that the Environmental Analysis Section has requested additional information regarding the proposed projects at Elizabeth and Flemington Junction and looks forward to participating in further consultation in accordance with Section 106 requirements. Although the shops of the former Central Railroad of New Jersey (CRRNJ) in Elizabeth (Union County) have been demolished, the right of way, yard trackage, and shop site are part of the NRHP eligible CRRNJ Main Line Historic District.

Although the proposed Conrail acquisition, with the two potential exceptions noted above, will not effect historic resources, the historic significance and NRHP eligibility of numerous resources being acquired from Conrail should be acknowledged. Over the past few years the Historic Preservation Office has participated in Section 106 consultation that has identified railroad rights of way eligible for listing in the National Register of Historic Places as linear historic districts. Although not all NRHP eligible or potentially eligible railroad rights of way have been identified, a number of the rights of way evaluated by the SHPO as eligible for the NRHP are among the assets to be transferred from Conrail to Norfolk Southern and CSX. The former Central Railroad of New Jersey right of way from Elizabeth (Union County) to Phillipsburg (Warren County) cited above received a Determination of Eligibility (DOE) from the Keeper of the NRHP on November 30, 1995. Consequently, future activities resulting in substantial alteration or abandonment, either partial or complete, of these rights of way would have an effect on historic properties.

Additionally, as part of survey and planning activity, Section 106 consultation, and the processing of National Register of Historic Places nominations, numerous railroad and related related resources have received SHPO opinions of NRHP eligibility or have been listed in the National Register of Historic Places. These historic resources include bridges (overhead and undergrade), stations (passenger and freight), and other structures associated with railroad operations (signal and interlocking towers, tunnels, and civil engineering features such as cuts and fills). Although many of these historic resources are owned by New Jersey Transit or other public agencies, NRHP eligible bridges and other structures are among the assets being acquired

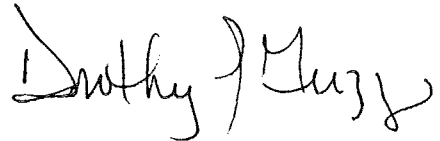

Ms. Elaine K. Kaiser
HPO-A98-137
January 29, 1998
Page 3 of 3

from Conrail. Here also, future activities, such as the substantial alteration or demolition of these bridges, structures or buildings, would have an effect on historic properties.

The Historic Preservation Office hopes that, after recognizing the historic significance and NRHP eligibility of particular railroad resources, continued use and operation will ensure appropriate preservation.

The Historic Preservation Office appreciates having an opportunity to offer these comments on the Draft Environmental Impact Statement as part of the Section 106 consultation process. If you have any questions regarding these comments or the identification and evaluation of railroad related historic resources, please contact HPO staff Charles Scott at (609) 633-2396.

Sincerely,

Dorothy P. Guzzo
Deputy State Historic
Preservation Officer

Re: Finance Docket No. 33388

Dear Ms. Kaiser:

According to the National Ambient Air Quality Standards(NAAQS) set by the Clean Air Act Amendments(CAAA), Bergen County, NJ is designated as severe non-attainment for both Ozone and CO. A major objective of the County is to achieve healthful levels of air quality to both improve the quality of life for Bergen County residents and advance the important goals of the CAAA. The County has recently reviewed the Draft Environmental Impact Statement (DEIS) for the "Proposed Conrail Acquisition." We are taking this opportunity to comment on two issues.

After reviewing the New Jersey section of *Volume 3b: State Settings, Impacts and Proposed Mitigation* we concluded that section 5-NJ9 New Jersey Air Quality could be violating the General Conformity Rule. The General Conformity Rule was established in response to Section 176 of the CAAA. The General Conformity rule includes emissions thresholds. If they are exceeded by any Federal action, the General Conformity Rule is triggered. For Bergen County, a severe non-attainment area, any action that emits more than 25 tons of NO_x annually, triggers the General Conformity rule. For Bergen County an increase in 208 tons of NO_x annually will occur as a result of the Conrail acquisition.

Ms. Elaine K. Kaiser
January 30, 1998
Page 2

For Bergen County with a population of 848,000 and a private sector workforce of 420,000, any increase in harmful pollutants - such as NO_x will be felt by our residents and workers.

After reviewing the New Jersey section of *Volume 3b: State Settings, Impacts and Proposed Mitigation* we concluded that section 5-NJ9 New Jersey Air Quality could be violating the General Conformity Rule. The General Conformity Rule was established in response to Section 176 of the CAAA. The General Conformity rule includes emissions thresholds. If these thresholds are exceeded by any Federal action, the General Conformity Rule is triggered. For Bergen County, a severe non-attainment area, any action that emits more than 25 tons of NO_x annually triggers the General Conformity rule. For Bergen County an increase in 208 tons of NO_x annually will occur as a result of the Conrail acquisition.

Additionally, the rule indicates that an emissions off-set must occur within the same non-attainment area that the increase occurred. The way the analysis is presented in the DEIS, it looks like they used the entire 26 state acquisition area to calculate the emissions off-set. This seems to be in direct violation of the General Conformity Rule.

Issue 2: the Economy

Our second major area of concern relates to Bergen County's transportation capacity to move people and goods, by road and rail, both within our highly congested landscape and between it and the region surrounding us at all compass points.

As described in detail in the enclosed Planning Essay, our six-year analysis of our economy and its transportation assets has produced the following conclusions. All are discussed in detail in our Planning Essay, enclosed.

Bergen County is New Jersey's economic engine. Inside our boundaries on but 3% of the state's land mass are found the state's highest and densest concentrations of population, people in the work force, number of businesses, number of jobs -- all generating the states highest total value of real estate, its highest total of state income tax dollars, and total of retail sales tax dollars.

Further, the great preponderance of this economic power is squeezed into 40% of our county's land mass. Shown on Figure 28 of the Planning Essay, that core is also the place where the county's highest levels of congestion are

concentrated. This congestion relates not only to the concentration of economic assets just described, but to the fact that the preponderant volumes of regional

Ms. Elaine K. Kaiser

January 30, 1998

Page 3

traffic we experience also travel the regional roads that cross that core. Figure 26 shows that the number of trips taken within the county's economic core each day is three times larger than the number in the balance of the county.

Our research also reveals the near impossibility of expanding existing road and bus capacity to sustain the core's present economic strength into the future. Therefore new rail transit capacity has become absolutely essential. Three critical rail lines cross that core -- the Susquehanna and Western, the West Shore and the Northern Branch. All three were examined in detail in the Planning Essay, and all three offer important rail transit opportunities. *We are concerned that the large increases in freight traffic contemplated in the Impact Assessment will also generate the capacity to undercut our direly needed rail transit relief.*

Of these three corridors, however, one -- *the Susquehanna and Western carrying Light Rail eastward from the I-80's junction with the Garden State Parkway* -- best addresses the following critical economic conditions. Of the three rail corridors, the Susquehanna and Western contains:

- o 48% of the population found in all three;
- o 61% of the employment found in all three;
- o 51% of all the households found in all three;
- o 45% of the real estate value found in all three;
- o 64% of the office space found in all three;
- o 51% of all work trips taken each day in all three.

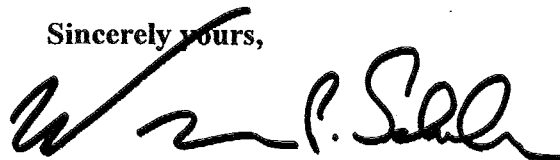

As well, the work trips taken inside the Susquehanna corridor are 51% higher in number than those taken in the other two corridors combined.

In sum, then, both areas of our concern -- air quality and economic -- are important to our county's capacity to continue to serve the key roles it plays in our metropolitan region and state.

We stand ready to discuss any of these issues with you.

Ms. Elaine K. Kaiser
January 30, 1998

Bergen County Executive

/cm
enclosure: Planning Essay

**Bergen County Department of Planning and Economic Development
1997 State Development and Redevelopment Plan
Cross Acceptance Planning Essay**

Back in 1988, Bergen County and its 70 municipalities conducted a "Cross Acceptance" process as our substantial input to the new State Development and Redevelopment Plan as drafted for our response. Over a 14 month period, we held 210 meetings with you, and several other joint sessions among municipal and business leaders. To help guide our deliberations, we also shared a "straw poll" with each other that took the temperature of our planning sentiments, preferences and needs.

In the heat of what would turn out to be an unprecedented burst of growth in our county's and state's history, we invented, together, a *capacity based approach to planning* – the first attempted in our state. It was designed to anticipate future growth in Bergen County by measuring, together, how much open land remained to be developed according to the zoning in place in each municipality.

With each municipal delegation, we also took a crack at a "20 year capital plan" – another first – in which we estimated together, using cost criteria culled from conversations with municipal engineers and public works managers, such municipal items as fire engines, back hoes, ambulances, street maintenance, replacing roofs on public buildings and the like.

We also made lists, together, of what we called "environmental treasures" that our sentiments told us to try to protect, if only ways to do this could be mustered as our landscapes were crowding while filling in and closing in. We could see redevelopment already taking hold, popping up lot by lot, often in the form of large houses rebuilt in place next to small ones. We knew it would take new zoning and planning tools to keep the best pockets remaining in our natural landscapes, to find ways to capture the redevelopment phases instead of being captured and that it would be expensive to buy land in the path of development driving up acquisition costs.

These data became a supplement to the already prodigious body of information describing each of our county's six, planning "subregions" over time in our traditional and detailed, yearly Bergen County Data Books.

From that effort, Figures 1 and 2, on the following pages and sampled from Volume II of our 1989 Cross Acceptance Report, show Hackensack's land capacity for population and employment growth as estimated then, along with the total of such samplings for all 14 municipalities in its Central Bergen subregion. These would become known as the "pink charts."

This is a Planning Essay, similar in form to the one we wrote back in 1988 at the beginning of that Cross Acceptance effort. From our discussions, it became part of the Introduction to the Report we wrote back then. *Its purpose here is to show how and where we have sustained and expanded this capacity based approach to planning since then.* So this chance to revisit and update the New Jersey State Development and Redevelopment Plan provides an excellent

BERGEN COUNTY SECTORS

opportunity for us to revisit these topics over the next few months.

This 1997 essay opens with many of the insights from our County's first Cross Acceptance Report to the State in 1989. It outlined the emergence of suburban counties in major metropolitan areas as the major locus of the US economy. Coming at the end of the "go-go-1980s" Bergen County's response was dominated by a concern with the "consequences" of this growth on our scarce infrastructural and environmental capacity. So, in a straw poll conducted with our mayors and planning board member in each one of our 70 municipalities we identified major concerns with:

- Environmental Planning and loss of open space (71%);
- Traffic congestion (90%), especially the potential impact of opening I-287 on northwest Bergen; and
- Fiscal capacity to pay for growth (82%) as the supply of vacant developable land began to dry up.

Yet, almost while we were working, New Jersey entered a period that turned out to be the most profound economic recession since the Great Depression of the 1930s. Many of the service sector jobs created during the 1980s were lost, compounding the effects of a shrinking manufacturing base. Although New Jersey is still in a long economic expansion and has regained the same number of jobs back, they are different in nature. So, today, we face the challenges of sustaining economic performance in New Jersey's single largest economy while erecting the land use and infrastructure foundation for the 21st Century economy.

This draft essay also expands the framework established in Cross Acceptance-1988 to take into account the new economic, land use and transportation investment context that has emerged more clearly since then, and particularly how this new context is reflected in several new transportation initiatives we have taken since then in response.

Planning Context 1997. Some of it is the same. And some has changed. The Future Isn't What It Used To Be.

Forty years ago, little more than a generation, Bergen County and our geographic counterparts in metropolitan areas across the nation were predominantly low-density suburban, cradled in pleasant natural settings, and growing energetically. The nation's economy was expanding on a strong industrial base, its big cities were places of manufacture and trade, freight moved predominantly by rail, open land was referred to as "undeveloped," and an airplane trip was a big adventure.

Most all commuting occurred *between suburbs and cities* and *within cities*, families were "headed" by a father who worked and nurtured by a mother who stayed home, and big stores, called "department stores," were a relatively quick trip to the city away (the mall had not yet been invented). The big Interstate Highways were under construction but not yet in use. "Someday," people said, "when all this construction is over with, we'll be able to drive all the way from Boston to San Francisco without hitting one traffic light." Imagine.

And oh yes, back then "country" air was "fresh," drinking water was clean and plentiful, abundant land was over the next ridge, poison ivy, treated with calamine lotion, was what you got while playing in vacant lots and nearby woods, and Norman Rockwell was memorializing all these vignettes in the Saturday Evening Post.

Can this snapshot of an economic past be only a generation removed from the plans we now set out to make? *Yes it can.* For momentous changes over the intervening 40 years *have made the future for today's parents something it didn't used to be for theirs.* Put most simply, and still surprising to many in the enormity of its dimensions, the nation's economic geography — where we place our buildings and the roads, rails, pipes and wires to support them — has changed steadily into something remarkably different from what it used to be. So have our lives.

Looking back, and assisted mightily by a broad body of new information, we can now see post-World War II New Jersey in new retrospect. We were, indeed, growing rapidly into a collection of "bedroom" suburbs and small cities just a short drive to the two large cities just beyond our borders. (People still repeated Ben Franklin's quip that New Jersey was a "keg tapped at both ends.") The same land pattern characterized many other such places across the nation. Spurred by returning soldiers starting families, and by federally supported home mortgages, then by sewers, and then by revenue sharing dollars to local governments, our state's economy bounded ever more exuberantly into the countryside. Bergen County grew more and it grew faster than any county in New Jersey, and among the fastest in the nation.

A powerful new idea started to take hold — that this kind of growth opportunity would have tremendous staying power, and even that its capacity to create new wealth to divide up was becoming a "tide to lift all boats". It might even bless generations yet to come with higher standards of living than their parents had had. The words "A New American Century" crept into the language. "If we can go to the moon," people said more frequently, "why can't we" (you fill in the blank).

Across the country in places like ours, population and employment forecasts were nearly impossible to make. Schools were built and filled in waves. As all these new families grew, the many segments of the economy grew to meet, absorb and incorporate them into it. Somewhere along the line, the kids would come to be called Baby Boomers. Hula Hoops. Woodstock. Employment. Life Insurance. With the first of the Boomers having reached age 50 on January 1, 1996, pensions and social security are next.

The State Plan and the Emergence of a Suburban Economy, 1950-1990: Three Trends.

The first round of "Cross Acceptance" in 1988 occurred against the backdrop of major structural shifts in the US economy. These were the outcome of *three national trends, each with its own momentum but with their collective effects awesome in combination, that came to dominate a rapidly changing economic landscape.* Over these last 40 years:

- The nation's job base has been shifting inexorably from manufacturing to services. In 1943, New Jersey's manufacturing jobs numbered 961,200, our high water mark, and constituted 55.4% of the state's employment base. By 1990, two huge shifts had occurred. Total manufacturing jobs statewide *had decreased by almost half* (to 500,000), and service jobs had grown so rapidly that manufacturing's share of total employment inside our state's borders

had dropped steadily *from one out of every two jobs to one in seven.*

- As the national economy grew to absorb the Baby Boom's unprecedented numbers, *both jobs and population were moving to and growing side by side within suburbs* in such increasing numbers that a land use and nationwide economic revolution has become the cumulative effect. The Interstate Highway system did get to San Francisco from Boston, but its second phase of "rings," built outside the cities within the nation's metropolitan areas (Rte. 495 outside Boston, Rtes. 287 and 295 around Trenton, etc.), ended up feeding the suburban land use revolution.

Our New Jersey Turnpike and Garden State Parkway run pretty much north – south, but, today, the majority of their daily users are not traveling from New York to Philadelphia. They carry north-south and east-west regional and local travelers who jump on and off to get to hundreds and hundreds of disparate destinations. To illustrate these changed patterns, Bergen County gathers 200,000 of its daily work force of 550,000 from 330 municipalities outside Bergen and in four states. The Ben Franklin anecdote died along the way to this momentous change.

- And American as apple pie, the car would become how 85% of our much larger work force now commutes – *now mostly between suburban homes and suburban jobs* rather than between suburbs and cities or within cities. *While the total number of Americans who take transit to work has grown hardly at all over this entire, 37 year period, the number who now work has more than quintupled.*

The consequences of three trends merged to create a massive new land form called the “metropolitan area” – offering yet another new word for planners to use. They also became the basis for new formulas for the Federal Government to use in distributing and redistributing the nation’s wealth. In great surges and migrations of population and employment, the largest of these metropolitan areas formed and grew outward from the country’s rims – on our East and West coasts, and along the shores of the Great Lakes and the Gulf of Mexico.

Back in the 1960s, the Interstate Highways were popping up all over the country. But their consequences for land development had not yet taken hold. The economy and its transportation support systems, and the land settlement patterns that are the consequences of both in combination, were focused predominantly at the region’s center. All three were centralized. The further one traveled from the center, the lower the population densities and the more rural the landscapes became. Transportation, with common and central destinations, could pursue economies of scale with considerable efficiency and ease of choice.

But note these statistics: While New Jersey was losing 850,000 acres of farmland between 1950 and 1990, the entire state was gaining 2.7 million in population, and 1.7 million in jobs. And Newark, our largest city, was experiencing a population loss of 163,555 (from 438,776 to 275,221); and a job loss of 83,915 (from 201,067 to 117,152). Newark’s 1950 total was 14.8% of all jobs in New Jersey; by 1990, it represented 3.9%. Our state’s remaining five largest cities (Jersey City, Camden, Paterson, Trenton and Elizabeth) saw their combined employment drop by 170,120, from 274,559 in 1950 to 188,354 in 1990.

The biggest surprise has been that, of the two reciprocally pulsing expansions of population and of jobs, the relocation of *where business is conducted* has had much the more telling effects on the new suburban futures we were inventing back then in the 1950s and 1960s with such gusto. Companies to which employees had traveled to center cities were deciding *not to stay put*. In a growing swarm, they were choosing, instead, to *pick up and move to where the expanding numbers of their customers were choosing to live*. (See Figure 4 on the next page.)

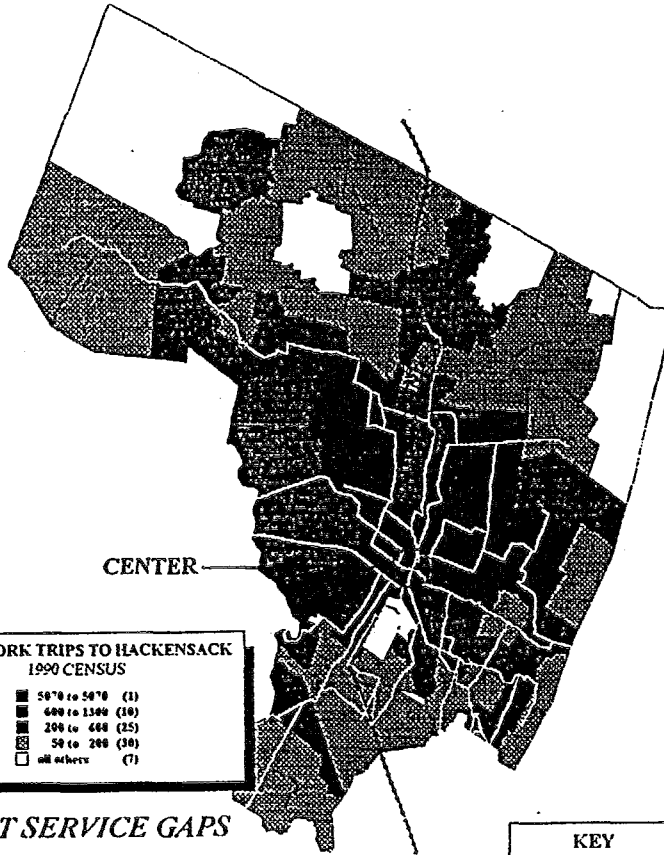

Entrepreneurs from the retail sector became the first of many to respond to this rising suburban market. Alexander’s was the first free-standing mall built in the United States, landing in 1957 as if dropped by helicopter onto Paramus’ smooth flowing, largely local Routes 4/17 interchange. The new store had a big parking lot easy to get to. *Who would have pictured here the nation’s mightiest retail concentration 20 years later?* And its multi-purpose,

multi-directional, all day, *regional* traffic jam.

Just outside Boston, a rube back then in 1957's Massachusetts was someone who still thought Jordan Marsh was a swamp. Becoming famous in suburb talk the nation over were the new subdivisions named for the ecosystems they were displacing. Hickory Acres.

As the full dimensions of this population and real estate explosion became visible -- 76 million children were born between 1946 and 1964, comprising the largest such event in our history -- other businesses picked up and followed the retail pioneers in ever more expansive waves. Still other start-up companies chose this expanding suburban market. They all saw this rising tide of new residents as not only constituting a new and rapidly expanding *customer base*. It would become their new *work force*, as well. *And as the baby boomers have grown up and entered the work force, most have chosen to live, work, and then to start families in the suburbs as their parents had done. Their children are now doing the same.*

Meanwhile, the suburban schools built to accommodate all these new families became magnets for more homeowners, helping to drive upward the new spirals of real estate development. The people who were building the new stores and homes in farm and wood lots would become known as "real estate developers." Those that inhabited them would become the economy.

To accommodate these surges, zoning was re-invented by municipal leaders, in ever more ingenious ways, to "attract" the "best" mix of burgeoning opportunities that each town decided it wanted to assemble. Jeffersonian democracy in action. Some got their way -- particularly in places where the booming markets were strongest. Others didn't. Rural towns engaged in the very same exercise, but fewer things came their way -- to start with.

The Federal Government, urging each municipality to fashion its own menu of residential and commercial "sectors," sweetened the advice by sending money to each town to do its own "Master Plan" to shape its own destiny. To read those master plans today is to discover that they all looked and sounded pretty much alike. They are probably part of the origin of the term "cookie cutter suburbs." As the economy grew and new markets developed, each town could always *adjust the zoning of remaining land* to capture the best of the expanding markets. An apt comparison is this: corporations expend their financial assets in pursuit of their economic goals; municipalities "spend" their land.

And as the need for new and expanding municipal services grew -- police, road repair, libraries, schools, parks, hospitals -- local Master Plans were adjusted to attract businesses with high tax potential. As this became more common, it became known as "fiscal zoning." As well, State governments grew, supported by national taxes *sent back* to the states from Washington, to provide "regional" services -- sewage treatment, reservoirs, colleges, high capacity regional roads, regional parks and nature preserves. In time, these and other regional facilities *would compete with one another for scarcer (and more expensive) sites in more crowded landscapes. The same competition arose inside the changing master plans of more crowded municipalities.*

As these powerful changes developed momentum, single municipalities evolved into clusters of municipalities who came to share similar fates and fortunes. An example of the former is Edison, whose employment growth symbolizes this enormous economic/spatial shift across New Jersey and many metropolitan areas like our own. By 1990, the township of Edison's employment (62,935) had eclipsed the job bases of four of the state's six largest cities, approached that of Jersey City's (63,412), was more than half again that of Elizabeth (39,117), was nearly double that of Paterson (34,568), was more than double that of Camden (28,028), and nearly triple that of Trenton (23,225). In higher density suburban and metropolitan landscapes like these, transportation planners and investors have new clusters of customers to serve, and more difficult decisions to make.

As jobs and population dispersed into some 25 large, metropolitan areas, travel patterns shifted away from the traditional suburb to city flow, towards the more familiar -- and more perplexing -- overlapping rivulets and streams of traffic, many of which do *not* lead to major cities. So a great many more trips are now being taken across our metropolitan transportation networks and in hundreds of different directions in each one of them than was the case in 1960.

Yet, our investments have not kept up with the great surges of growth between 1950 and 1990. In 1960, investment in public infrastructure was 2.5% of Gross National Product. By 1990, after a period of national growth unprecedented in our history, that number had dropped to 1%. So, we are challenged to find transportation solutions to the unprecedented growth in demand on a network designed for a different economic geography and with rising costs for maintenance and rehabilitation in a difficult investment climate. As the current debates about reauthorization of ISTEA clearly show, the stakes are high and the competition deadly.

In sum, over the past forty years we have seen a number of dramatic shifts in:

- what our economy now produces;
- who now produces it and where;
- who purchases the goods and services we produce;
- where and at what densities we now live and work;
- how we travel about the landscape of our work residence and recreation; and
- what we import and what we used to export.

We discover ourselves inhabiting a transformed economy on a transformed landscape and in need of a transformed transportation system. Bergen County has been an active participant in the creation of this new economy and as the next sections show is developing an investment agenda to protect the economic power we have in place while preparing for the new rounds of growth and re-use that lie ahead. (See Figures 5, 6, 7 and 8 following.)

The New Service/Information Economy: Bergen County's All Day Economic Landscape.

As our nation's life was unfolding like this, so was our state's. By 1990, New Jersey, the nation's fifth smallest state, had become the eighth largest economy among the 50 states. Were we a nation, our economy would constitute the world's 18th largest. But among these eight, New Jersey possesses *the most compact economy of them all*. And within New Jersey, among the 21 counties, Bergen County *continues to constitute the state's largest single economic concentration, and on but 3% of the state's land mass*.

Bergen County's economic geography was transformed in much the same way as was the nation's, *but with greater intensity and speed*. Between 1950 and 1996 our population increased by *more than half* to 848,000 while our housing stock doubled to 324,000, and while *total employment and vehicle miles driven* within our borders more than *quadrupled* to 550,000, and 5.0 billion, respectively.

No other county in the State of New Jersey contains economic concentrations this large, or endures more miles driven in and through it. (See Figure 9 on the next page.) *And we are still growing*. The 1996 Census estimates put Bergen's population up by 41,000 since the 825,000 recorded in the 1990 Census.

30-year economic revolution and concentrated its dynamics. Over that short, unprecedented spurt Bergen County's stock of rental office space increased by 308% from 8 million square feet to 26 million square feet, also the highest in the state. This yields a strong economic base, but it is the land use that generates the most traffic all day long.

The office boom in Bergen County that occurred between 1982 and 1989 came at the tail end of this

This burst, representing the embedding of the service/information economy into our already crowded landscape, would upset and came close to overturning the present transportation network's now-limited capacities to handle the new traffic flows. During the most rapid interval of this transformation, between 1970 and 1995, the number of trips per day inside our county shot upward from 2.8 million to 3.2 million. In highway terms, this increase would have required us to build 248 new lane miles of road to keep up with the

Figure 9.

NEW JERSEY IN THE TRAFFIC ZONE

In New Jersey, Bergen County has the:

Most Lanes

Most Auto Registrations

Most Vehicle Miles Traveled

onslaught — enough to add a lane stretching from Hackensack to Atlantic City and back. We did not.

This is the radically changed metropolitan landscape, designed specifically for the automobile *but now being overpowered by it, for which newly conceived forms of transit are needed*. In metropolitan regions like ours the nation over, this has become a matter of substantial economic urgency. As we come to grips with these changes, and with the service economy now generating heavy, mixed traffic *all day long*, we discover that different balances of different mixes of transit service are necessary in different landscapes — urban, suburban, and rural.

From Growth Management to Sustained Economic Performance: Cross Acceptance 1997.

Back in 1988, during our first Cross Acceptance marathon, we knew we were in an unusual economic expansion. But we didn't know how it would turn out. Now we do. The results would be eye-popping. This section describes these changes and shows the way in which key themes of congestion, economic performance and stretched transportation capacity come together in Bergen County's economic core. The critical role of transportation in sustaining the economic heart of New Jersey's largest county economy is identified as a prelude to the new array of intermodal transportation investments identified below.

New Jersey's 1989-1992 recession, our worst and most painful in the 60 years since the Great Depression, would stop dead in its tracks the astonishing, six year employment boom that had just preceded it and that had crystallized our planning during Cross Acceptance One. The largest and longest since World II, our extraordinary 1980's boom had contributed 621,500 new jobs to the state's economy at an unprecedented rate of 90,000 new jobs per year. This contrasts with the *annual average rate of job growth, across eight business cycles since 1950, of 50,000 new jobs per year*.

Then, and at a comparably dizzying pace, the recession saw the state abruptly lose 242,000 jobs over the next 3 years — *more than 4 of every 10 added during the boom*. Having added jobs at 90,000 per year over 7 years, we then lost jobs at 80,000 per year over 3 years. The ones we *lost* would not all come from the huge increment we had *added*, however. The other, more tenacious economic forces described here were still at work.

Finally, in September of 1997, the state would finally have gained back the *number of jobs* - - 242,000 — *lost between 1989 and 1992* — making this five-plus year recovery cycle our longest on record, as well, since the Great Depression. Again, *these would not all be the same jobs we lost* — powerful forces still at work and expected to remain at work. This is to say that, beyond these wild swings in the business cycle, the clear imprint of the major *economic trends* since 1950 remains in place. The '80s speeded them up, and the '90s slowed them down.

Now we're back on the job creation track. And the congestion of the late '80s is back and growing. It contributes to the thinking we must do about expanded roles for transit. The future isn't what it used to be.

Bergen County's Targeted Response to Cross Acceptance in 1988.

Open Space Initiatives

In 1990, after a period of intense analysis of land development and growth capacity launched with our 70 municipalities during State Plan Cross Acceptance in 1988, and in response to straw polls we took of this entire delegation, Bergen County launched a 5,000-acre open space crusade. Over these nine years, we are closing in on doubling all the acreage we had assembled in county parks and natural areas in all the years prior to 1988.

Capital Planning Capacity

As an extension of the land and zoning capacity calculations we performed with all 70 municipalities during Cross Acceptance in 1988, we then developed a series of computer-based models to help us anticipate traffic growth lurking in land available as zoned, and traffic to anticipate with the upcoming (1992) completion of Interstate 287's "missing link" and its interchanges in Bergen County in Oakland (at Route 208) and in Mahwah (at Route 17 and Interstate 84 in New York State).

We also launched an associated analysis of our transportation network's present and future conditions and needs. We began by determining the central relationships between our economic assets and the capacities of the regional and local roadway and transit systems to sustain them into the future. Our investigation incorporated a careful look at the economy of the county *and its economic distribution* -- the *density* of its key land uses for defining transit opportunities. We discovered that we had, and have, new and growing transportation needs to address for our transformed landscape.

Bergen County's Five Major Transportation Investment Initiatives Since Cross Acceptance in 1988.

All of the changes discussed here -- economic, geographic, spatial and demographic - have contributed mightily to the massive changes in the make-up of our transportation needs -- for moving people and goods -- by road and rail, by car, truck and bus, and by train, plane and ship. Most of these facilities, local and regional, do not match up very well today, with the major elements now in place having been built in a different era for a different economy in a different competitive atmosphere.

In Bergen County, cars, buses and trucks compete for limited space on roads. One of our recent studies showed us that Bergen County draws 40% of its our daily work force from 330 municipalities outside of Bergen County in 4 states. In 1990, trucks now handle some part of their trip to market *for 90% of what we manufacture, import, grow and sell*. They are everywhere. Just as competitively, rail freight, commuter rail and Light Rail compete for limited track and terminal capacity. Close by in our region, air freight competes for ground and runway space with air passenger space, shipping competes for landside space with new urban waterfront-oriented homes and jobs, and *all of these compete with each*

other and with natural ecosystems for precious waterfront space. Intermodal planning as compared with Intramodal planning is urgent stuff.

Every one of these competitors is supported by major interest groups pursuing economic strength, and each has a competing vision for what the "balance" should be. Those who plan in order to forge a compatible mix of all of these have their hands more than full. That includes us. We have thought hard about all of these in the preparation of the five major transportation initiatives described here.

Improving the Efficiency of the Existing Highway Network

On the *highway side*, depicted in Figure 10, we saw the vital importance of expanding the Routes 4/17 Interchange -- both in its future capacity to absorb larger traffic flows from the surrounding region, *and of greater importance, to help attack East-West congestion by expanding the ease and speed with which of all of its users can change direction to gain access to more destinations.* We began our work to design its future for the mix of local and regional travelers whose thousands of separate paths converge here daily. At county scale, nearly all of Bergen County's 37,000 private sector businesses -- the largest concentration in the state -- *find some members of their work force dependent on this congealing interchange in their journeys to and from work.* To expand and re-align it, then, is also a decision to strengthen the business climate in our county.

Pretty much the same number of people pass through this interchange daily -- the number hovers around 250,000 -- as cross the Hudson River from all of New Jersey every morning by bridge, train, tunnel and PATH. Its present loop system was built with pride in 1934, but for Model A's putt-putt putting through a landscape of homes amidst celery farms. We formed a partnership of mall owners, municipal officials, county engineers and NJ Department of Transportation engineers, rolled up our sleeves and turned on the Computer Aided Design software. The preliminary design was complete and acceptable to all parties in 14 months and is funded in the Transportation Improvement Program. See Figure 11.

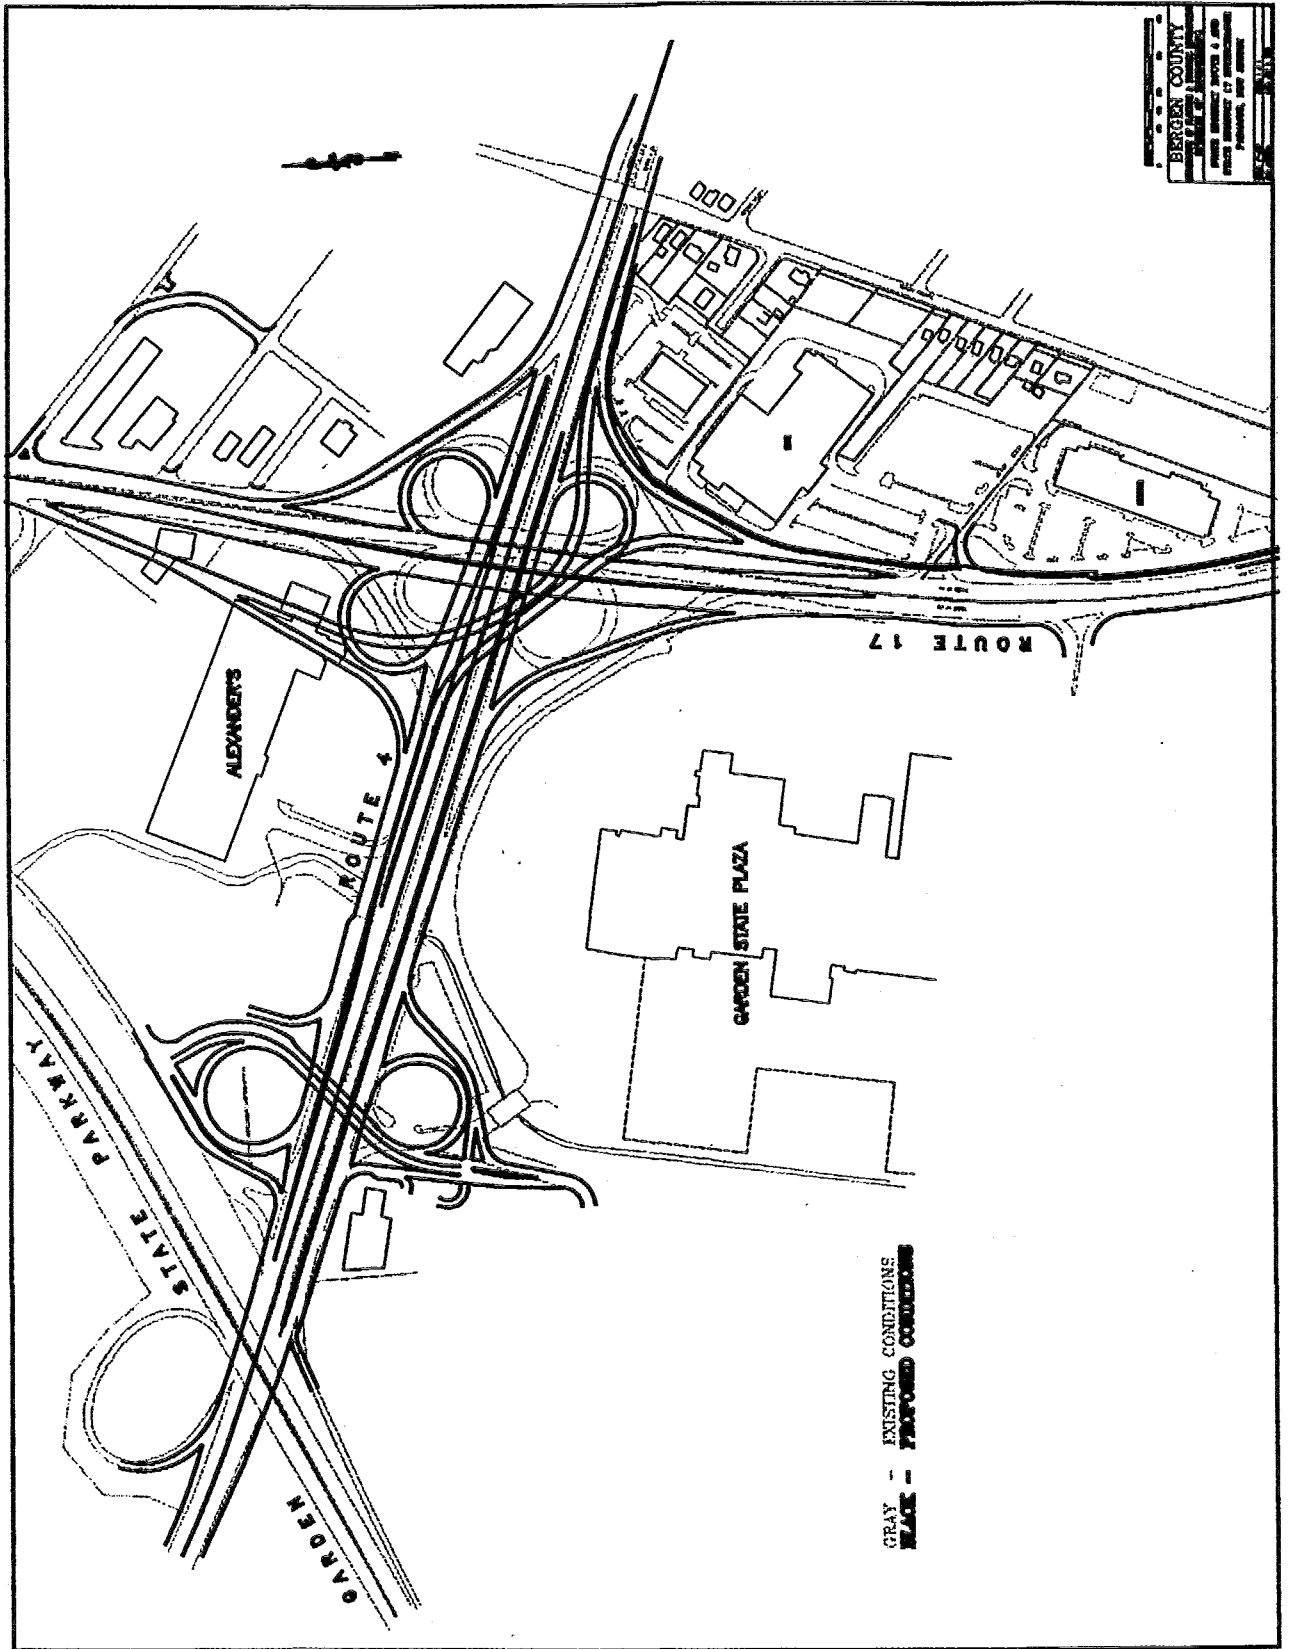

Enhancing the Capacity of the Existing Commuter Rail Transit System

On the *transit side*, we discovered first that while buses now carry the majority of our transit users today, *their ability to sustain our economic and transportation future is seriously limited by the Lincoln Tunnel, its crowded Exclusive Bus Lane on Routes 3 and 495, and by the congested roadways leading to both.* In short, buses traveling our 124 routes are trapped in the traffic they seek to displace, including the large, long distance complement of them that passes through Bergen County with "closed doors."

This led to our concentration on advocating for the Secaucus Transfer *and its ability to induce more rail riders as parking can be assembled* at upwards of 100 New Jersey stations along all of its connecting lines. Three -- the Main, Bergen and Pascack Valley lines -- currently carry commuter rail traffic southward across Bergen County to Hoboken. Rail freight grows steadily on two of them.

To best prepare ourselves for the benefits this magnificent new rail facility will deliver to

Figure 11.

Bergen County and our entire region, we joined NJ Transit's ambitious effort to double the parking spaces along the Bergen, Main and Pascack Valley lines – from 4,000 to 8,000 – in time for its opening. The Secaucus Transfer/Allied Junction project, a public/private partnership with enormous potential for helping induce transit friendly land use, will also increase substantially the number of destinations our rail riders can reach along these three lines. Put simply, the greater the number of riders, the better and more frequent, and thus the more attractive the service can be.

The Bergen, Main and Pascack lines could potentially be joined at the Secaucus Transfer by a fourth and or fifth – the West Shore and/or the Northern Branch – as future products, not yet tested, from another, ongoing Bergen County/NJ Transit partnership. In this partnership formed in September of 1996, Bergen County and New Jersey Transit are conducting, together, a Major Investment Study of the comparative mobility strengths offered by various combinations of three potentially new rail transit services in Eastern and central Bergen County – along all or portions of the West Shore, the Northern Branch, and of what we call the “Cross County Line” from central Bergen to Weehawken on half of the existing Right of Way of the Susquehanna and Western line. (See Figure 12, following.)

Both the Routes 4/17 interchange and the Secaucus Transfer have been funded, with the Secaucus Transfer under construction and scheduled to open in 2002. The Routes 4/17 interchange, along with other nearby components adjusted to fit its design, is scheduled for construction in 1998, 1999 and 2000.

The Hudson Bergen Light Rail Transit line: It can tie Bergen County's residents, work force and economy to Hudson County, its Waterfront, Weehawken's New York Waterway Ferry, Hoboken (to downtown Manhattan via Ferry and Path); Jersey City's Journal Square and Newark by PATH from Hoboken, Newport and Exchange Place; Liberty State Park, and Bayonne.

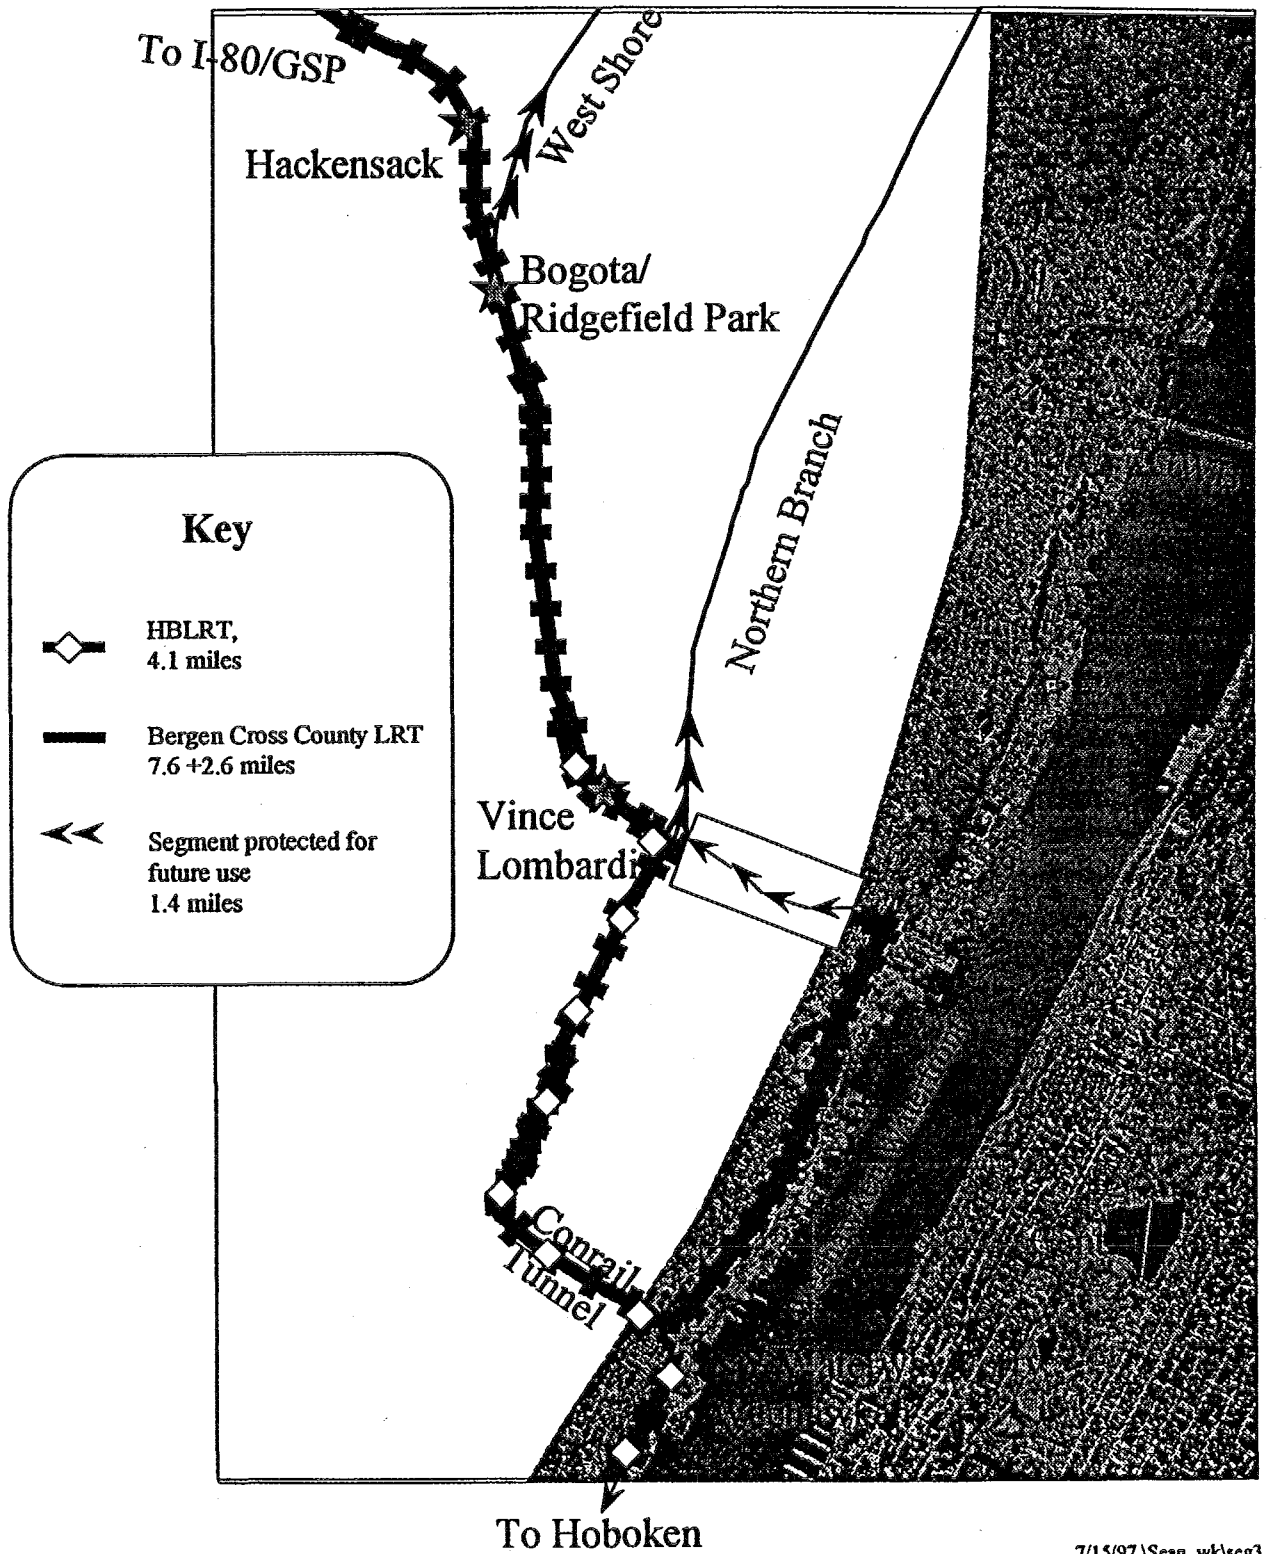

Since Cross Acceptance in 1988, a *third major, regional transportation initiative* has also entered our planning landscape – the Hudson Bergen Light Rail Transit line. As was the case with the Routes 4 and 17 projects which we initiated, and the Secaucus Transfer which we advocated strongly for, the Hudson Bergen Light Rail immediately became another major investment opportunity for us to study, to influence in its configuration, and join in its funding advocacy. Figure 13 shows the route that was chosen, in 1993, from eight alternatives studied and evaluated over its seven year gestation period.

This major new Light Rail project, whose first funded segment was chosen for construction between Bayonne and Hoboken, named the Vince Lombardi Park-Ride in Ridgefield as its final and northernmost destination, and Bergen County's only stop on the 32-stop line. Its arrival date was estimated, by NJ Transit, for the year 2010. As was the case with the 4/17 interchange, we have worked strenuously in many forums over the last four years to bring its final design, funding and construction much closer to the present.

This choice for its northern terminus was not a good place for us. People coming in on its trolleys from Hoboken and Weehawken to the south will step off into a Park-Ride nestled between two spurs of the NJ Turnpike. So they will have no easy way to get to our offices, homes, hospitals, colleges and all the other auto-attractive destinations listed in Bergen's

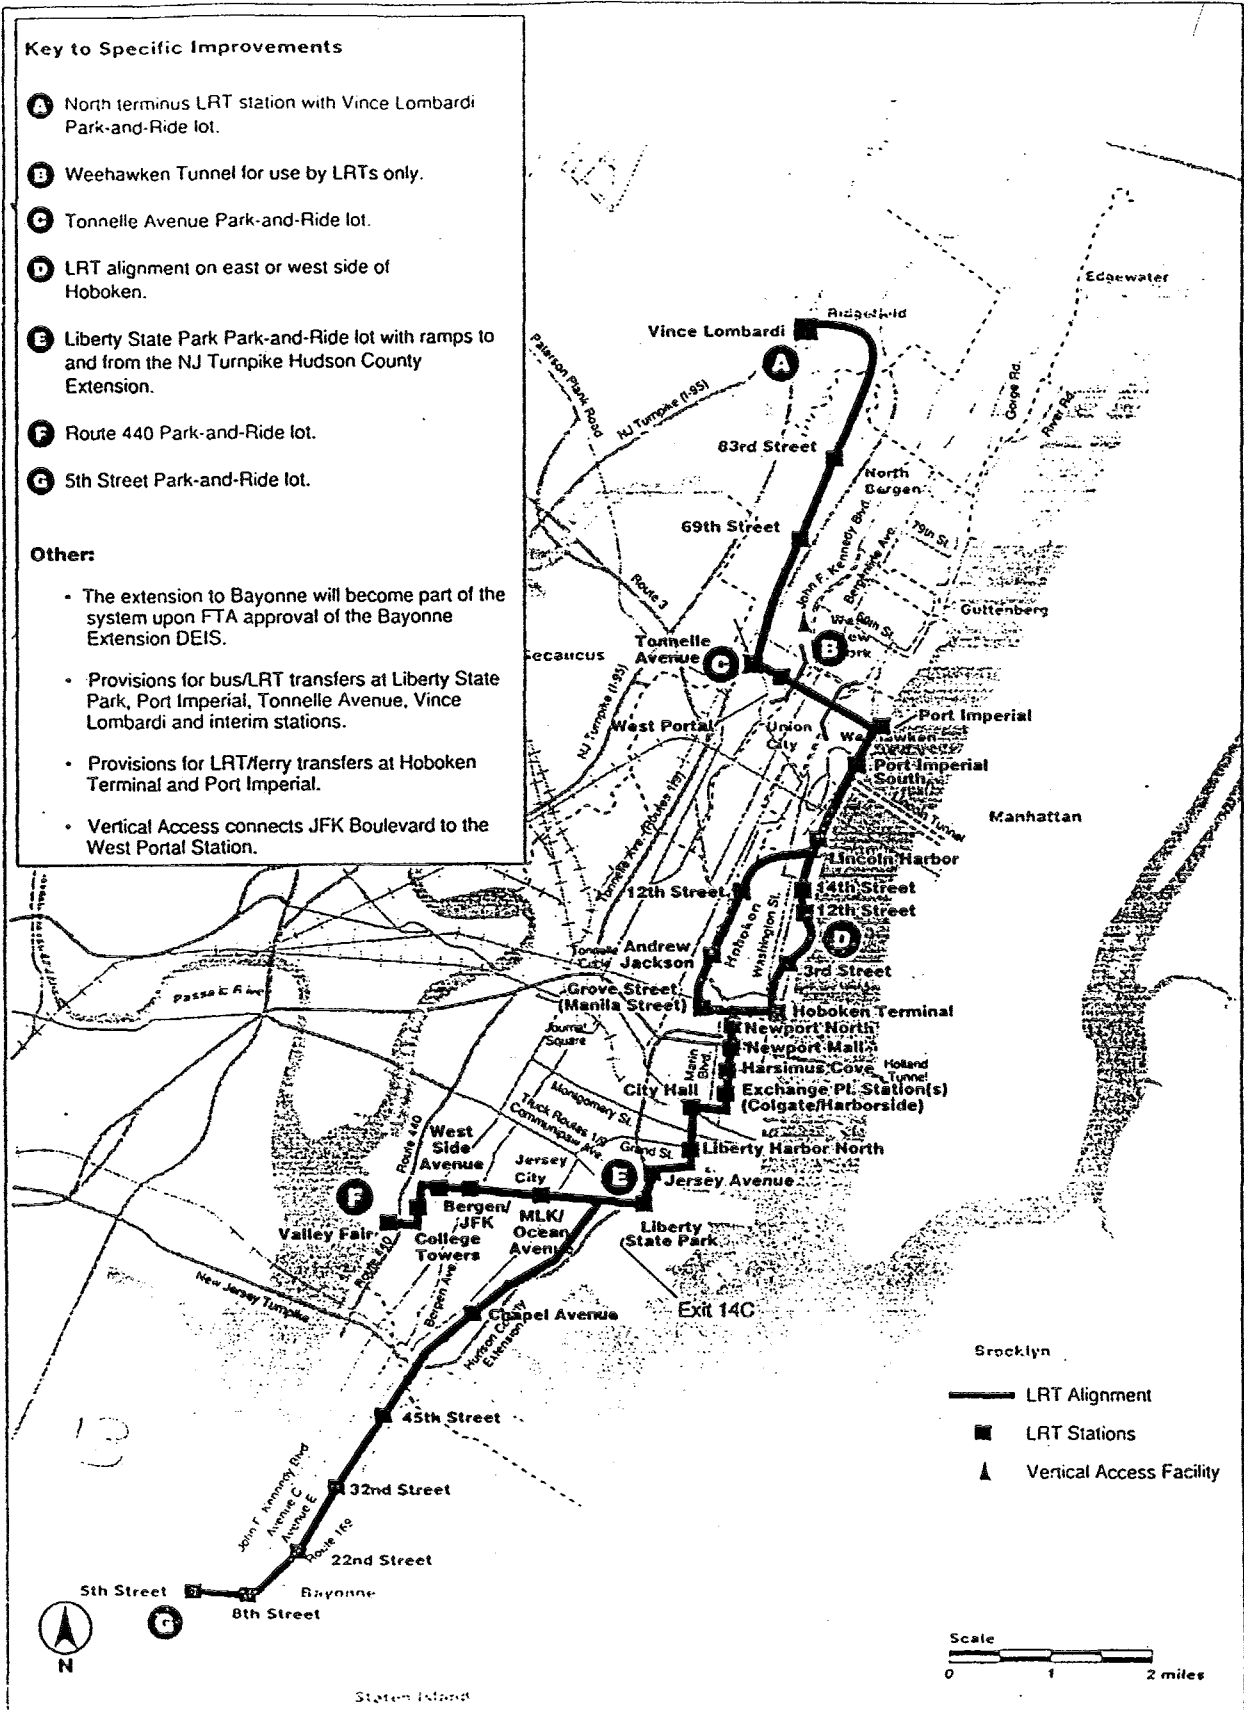

Figure 12.

The Bergen Cross County Light Rail Adds Two Extensions to The Hudson Bergen Light Rail

Figure 13.

Waterfront Corridor Preferred Alternative

Yellow Pages. As configured, then, it effectively carries passengers in only one direction – southbound – and from a point hard to reach for our 848,000 residents.

So while this station helps the rest of the line with ridership derived via Park-Ride from Interstate 95 drivers – a positive feature – the whole system’s ridership is *not* increased in its strength by rail riders from the south, including cross commuters from New York City. So an additional consequence is financial. Without much “reverse commuting” capacity, it loses customers whose fares could help support its operating costs if only northbound users could be accommodated, and southbound passengers could be substantially increased in their numbers. *Further, the loss of Light Rail access to Edgewater and to the Hudson River Waterfront southward to Weehawken, now booming along a two lane (Level of Service F) road was a substantial one.*

To correct these deficiencies without disturbing its standing in the Urban Core as a completed FEIS project with a full funding agreement for its first, Bayonne to Hoboken stage, we have devised and tested the engineering and environmental feasibility of the project we call the Cross County Line. More on that below.

Missing Mobility Options: New Transit Investments and Economic Performance.

There has always been a close connection between transportation capacity and land use and economic development in Bergen County. The transit connections along our commuter rail roads and bus network have linked Bergen County’s residential values to Manhattan’s high-wage jobs sustaining local tax bases and schools. The highway connections to the nation have been the pathways along which the explosive growth in jobs outlined earlier have grown. Yet, as growth has matured, and regional investment lagged the explosive growth in regional commuters headed to – and through – Bergen County four new investment principles have emerged.

1. Our transportation investments must be targeted to areas where the outcomes for economic performance are highest. Here we must always balance the need to protect the results of past growth and the need to liberate the possibilities for the new high value service economy emerging in our midst. We must consider:
 - where our needs and our opportunities most strongly merge in the rail choices available to us;
 - who our most productive economic partners in the region are; and
 - which rail transit linkages offer us the best opportunities to link together our most important, shared assets. For example, our strongest linkages are to Hudson County and Manhattan, and not to Rockland County (See Figures 14 and 15 on the next pages).
2. We need to think in terms of a single integrated multi-modal transportation network that can accommodate the competing needs of its many customers that have different needs at different times of the day. Although investment has lagged behind demand in Bergen Count, the in-place investment in roads and rail has a replacement value in excess of \$25 billion – more than the entire projected federal funding for north Jersey over the next 20 years. So looking for places where we can increase the productivity of the existing system by connecting its disparate pieces, filling service gaps, or providing for easy changes

Figure 14.

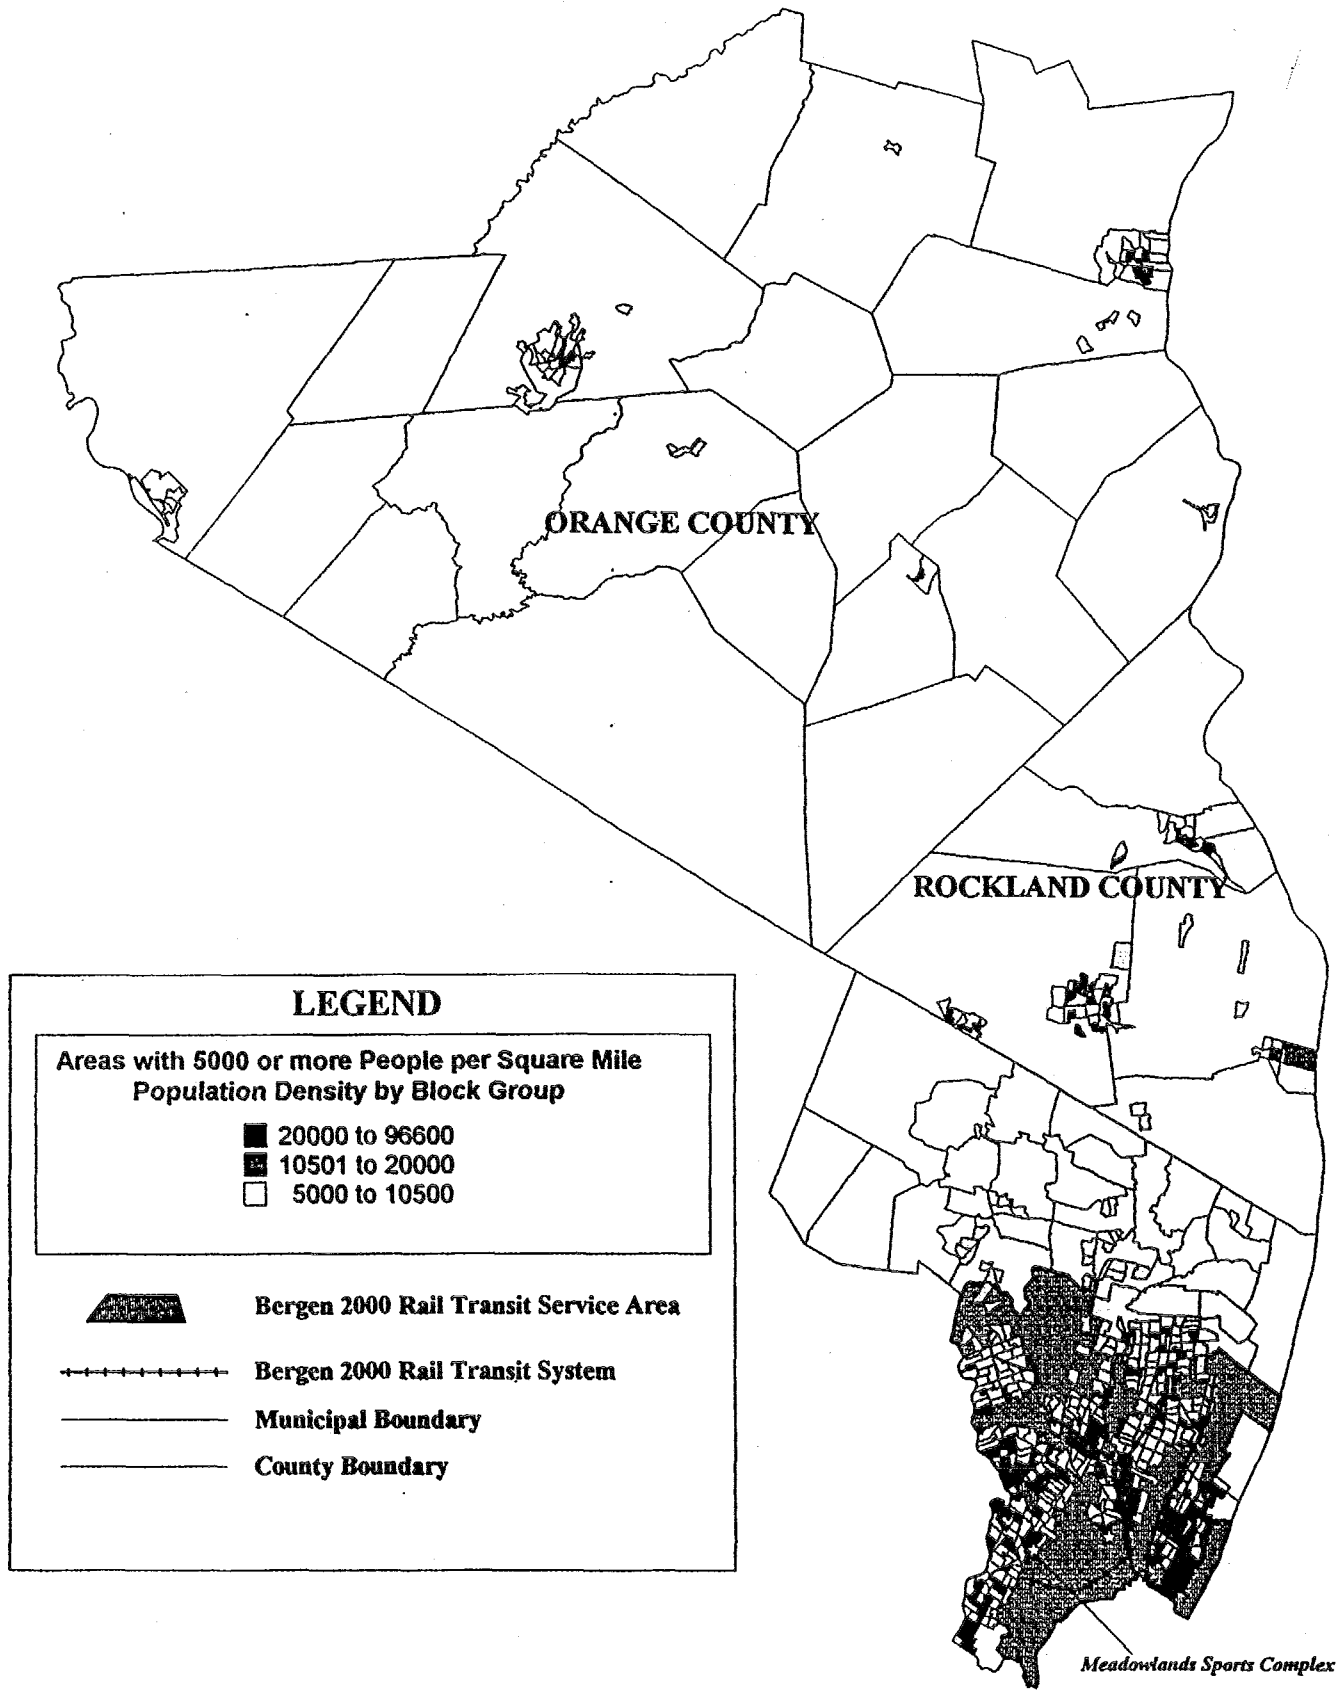

Figure 15.
Transit Investments Should be Targeted to High density areas first

between modes (rail to bus, bus to Light rail, auto to light rail) will not only provide new capacity but increase the return on investments already made. We can no longer afford to make investments without regard to their implications for the efficiency of the overall network both in terms of existing facilities and services and other investments they may induce.

3. We need to tailor solutions, both in terms of their scale and timing, to the available funding sources. Despite the heroic efforts of ISTEA to reverse the decline in spending identified above, it is likely that that the flow of federal and state funds to transit and other transportation projects in northern New Jersey will lag behind the rising needs for system maintenance and capacity expansion. So in developing transportation investments we must think not only in terms of the "ultimate" or "perfect" solution, but also in terms of a "phased approach". In some cases it might be possible to advance the goals of a specific transportation investment by beginning with a "critical component" or by a more limited service configuration, or lower cost technology that can be expanded as the market grows and/or funding becomes available. Even when this might increase the overall cost of the project these costs must be weighted against the benefits that are delivered earlier. There is nothing more futile than developing the perfect solution for which funding is not available.

In doing this we must consider new sources and partnerships. *What private sector assistance can be enlisted?* Bergen County has already established a record of success in integrating our own planning and investment with the planning and investment of others – very much at the heart of the State Development and Redevelopment Plan's major goals. Examples are Routes 4/17, the Edgewater Waterfront, the Hackensack Medical Center, our Essex Street initiative, which includes the redesign of the Essex Street interchange with Route 17, and others.

4. Investment choices must be supported by our municipal partners who are keen to take advantage of the economic benefits of transit investments through matched land use and transportation investments. For a transit system to be truly successful, the design process must encourage active participation from those who will help determine its outcome.

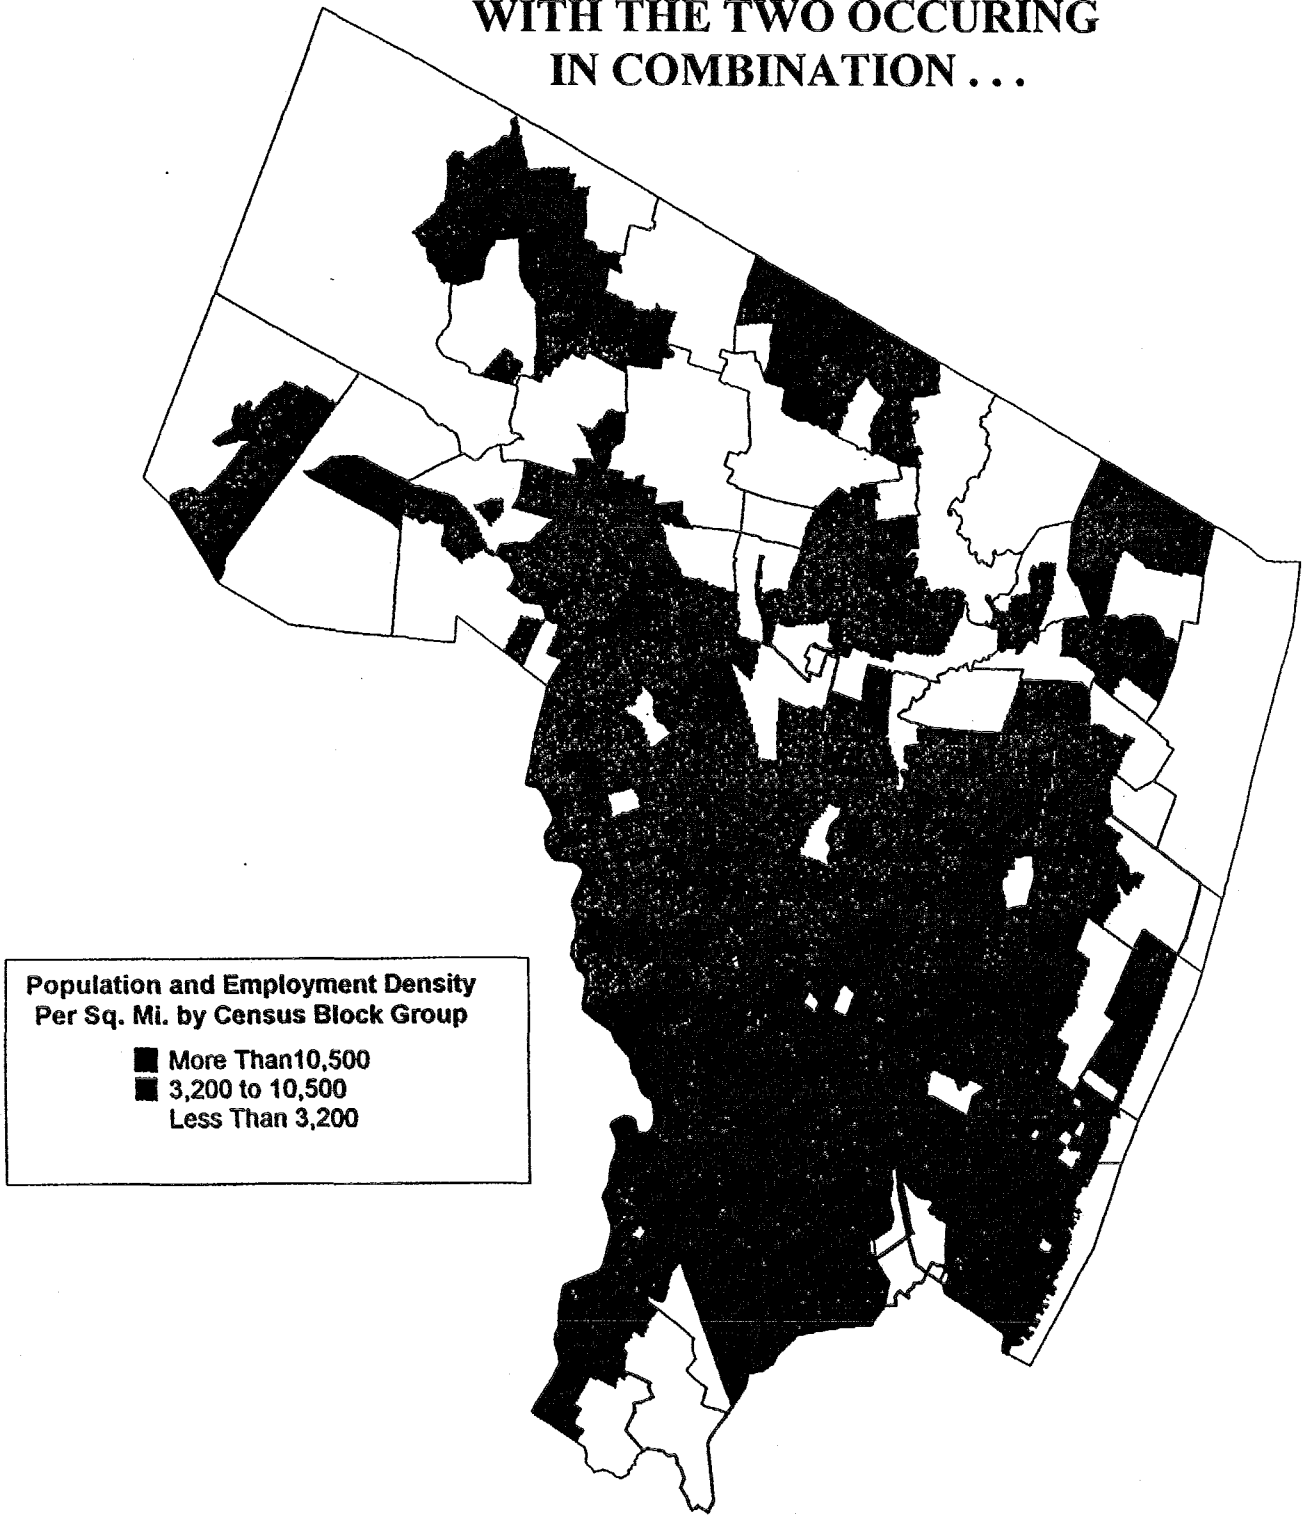

These themes come together in *Bergen County's economic and transportation core*, described in the next section.

Investing in Economic Performance in Bergen County's Economic & Transportation Core.

Our investigations of the key relationships between the patterns of economic development, land use and transportation countywide led us unerringly to the identification and detailed description of Bergen County's economic and transportation core. In a 98 square mile, centrally located core – several illustrations follow – are concentrated, first, our county's highest concentration of population per square mile and employment per square occurring in combination with each other (Figure 16).

Figures 17 and 18, following, show how a much broader and related series also occur coterminously here. For example, this economic core is also the county's financial core, including its capacity to generate our highest concentrations of assessed value, offices, income earned and taxes – sales, property, and income – generated. As Bergen County is the State's economic engine, this is the county's.

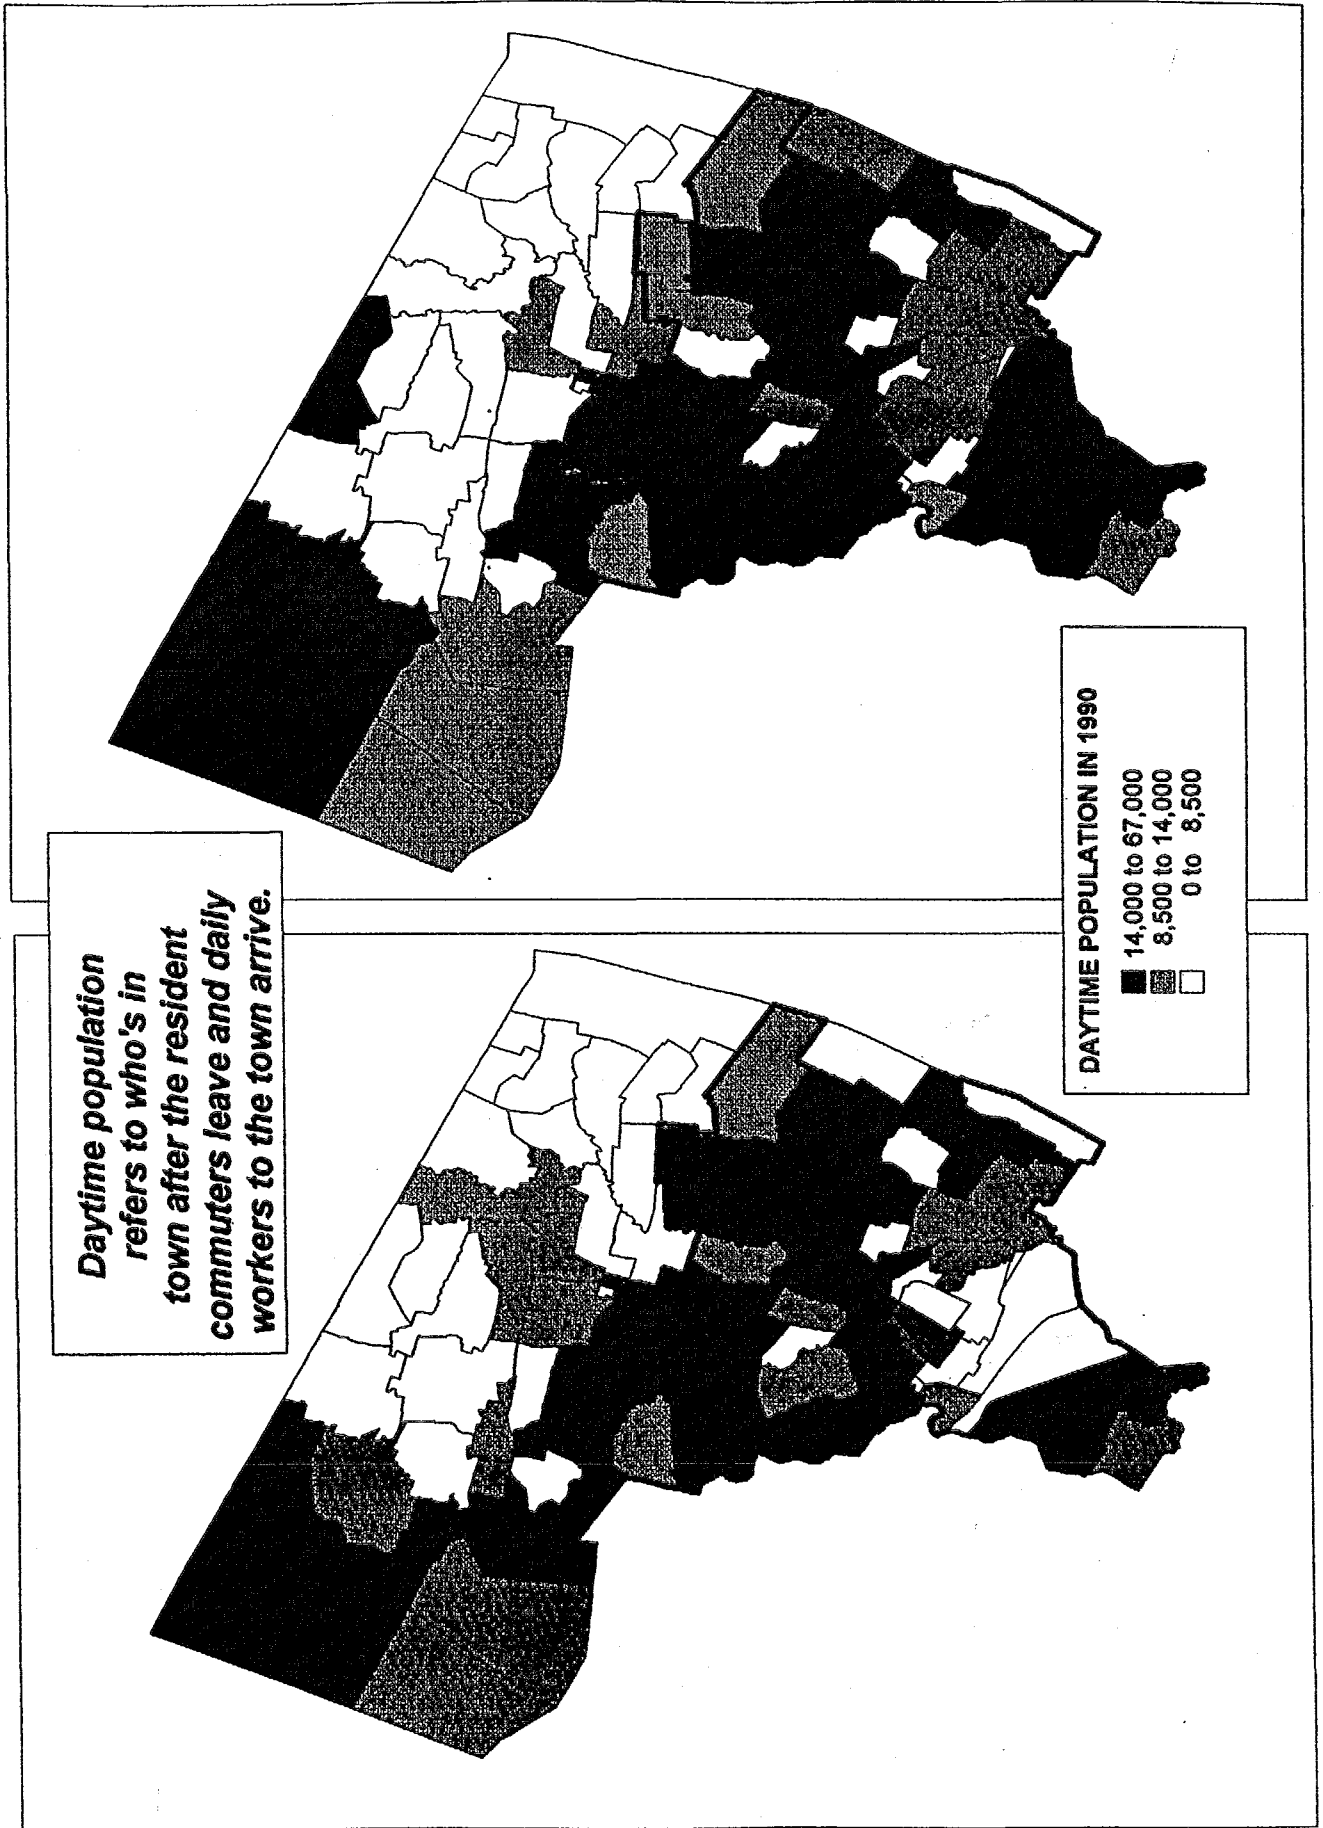

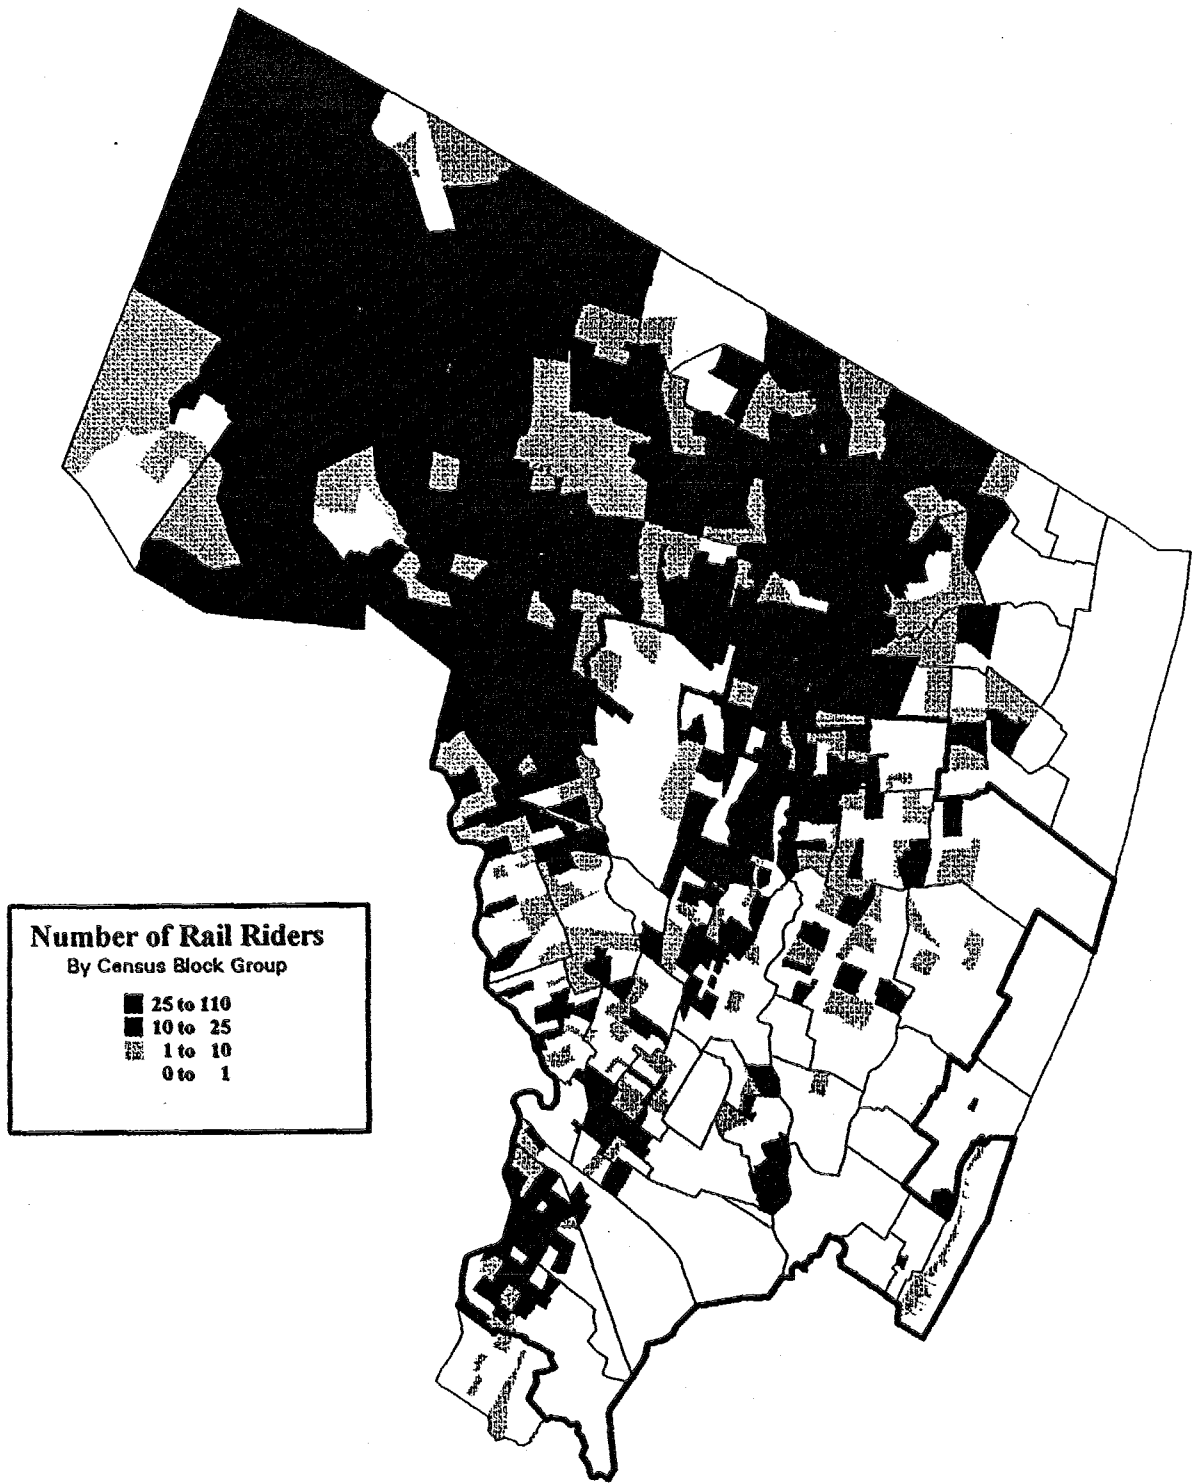

Figure 25.

Number of Rail Commuters in Bergen County, 1990

Unrelieved Congestion as Consequence.

In our search to find where and how these land uses in the Core best reinforce one another in the transit opportunities they are capable of spawning, we have also discovered and catalogued the following:

- three times the car trips per square mile in the core than we find within the remaining 60% of the county (Figure 26);

the core contains the most highly congested portions of the county, because here is where the worst traffic entanglements in the county occur all day long between *regional travelers streaming into the county from without to work, shop or pass through to more distant destinations, and the local voyages of our residents to places of work and other destinations inside the county and beyond* (Figure 27). As noted, this traffic, an earlier signal of economic success, has now become a suffocating force. A series of graphics illustrates these points;

- the preponderant *growth capacity* of the core, measured in land available as zoned, and in terms of transportation capacity *unavailable to support that growth*;
- the relatively small share of in-core commuting that commuter rail transit carries today *from the core to the region beyond and the negligible share from the region into the core*. Only 2% of Bergen's 420,000 residents who leave for work each morning take the commuter rail service offered at today's 28 stations on the Main, Bergen and Pascack Valley lines;
- the near impossibility of expanding existing road and bus capacity *to sustain the core's present economic strength into the future*; the long standing absence of east-west roadway AND transit capacity *in the core, within the county at large, and within the region whose transportation facilities extend us the possibilities that are ours to use, influence, and to adapt to in the transit-friendly development and redevelopment planning we are capable of putting into place*; and of great significance; and,
- *realizable rail capacity within the core that can fill key transportation voids to highly positive results using existing rail rights-of-way. Our findings about this last characteristic are described below.*

Three Rail Transit Options Under Study for Eastern Bergen County.

As summarized above, the County's Core was identified and evaluated in the contrast of its key features with the remaining 60% of the County's land mass.

At this point, the inquiry becomes finer grained. The following maps, charts and graphics (Figures 28-33) summarize this evaluative process as applied to each of the three rail lines under the joint Major Investment Study being conducted by New Jersey Transit and Bergen County:

- **all or part of the West Shore Line;**
- **all or part of the Northern Branch Line; and**
- **a portion of the New York Susquehanna line from I-80/Garden State Parkway to the Vince Lombardi Park Ride in Ridgefield, with an additional leg northward from the Weehawken Light Rail Terminal/NY Waterways Ferry on the Hudson Bergen Light Rail Transit line. Its name is the Cross County Line.**

Figure 26.

The Core, Congestion, and Rail Service

The core is where the county's highest concentrations of congestion are found - right where the highest employment and population concentrations are also located. This graphic shows that the number of trips per square mile *inside the core area* is three times larger than the number *in the balance of the county*.

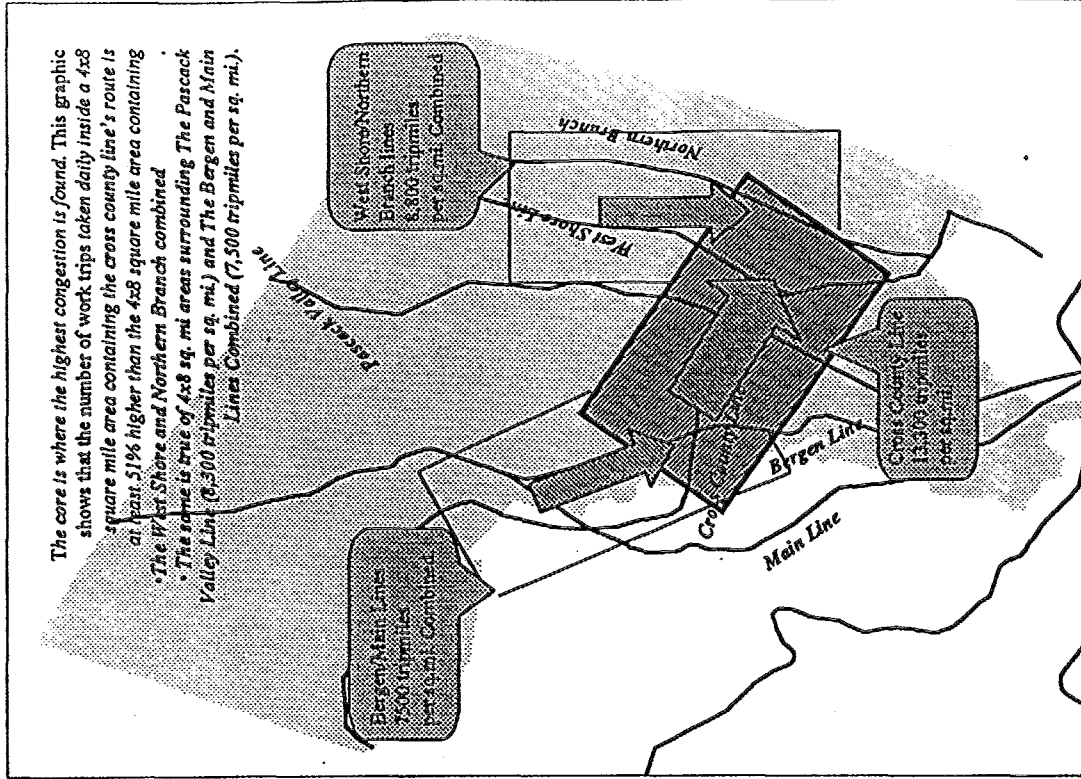

Figure 27.

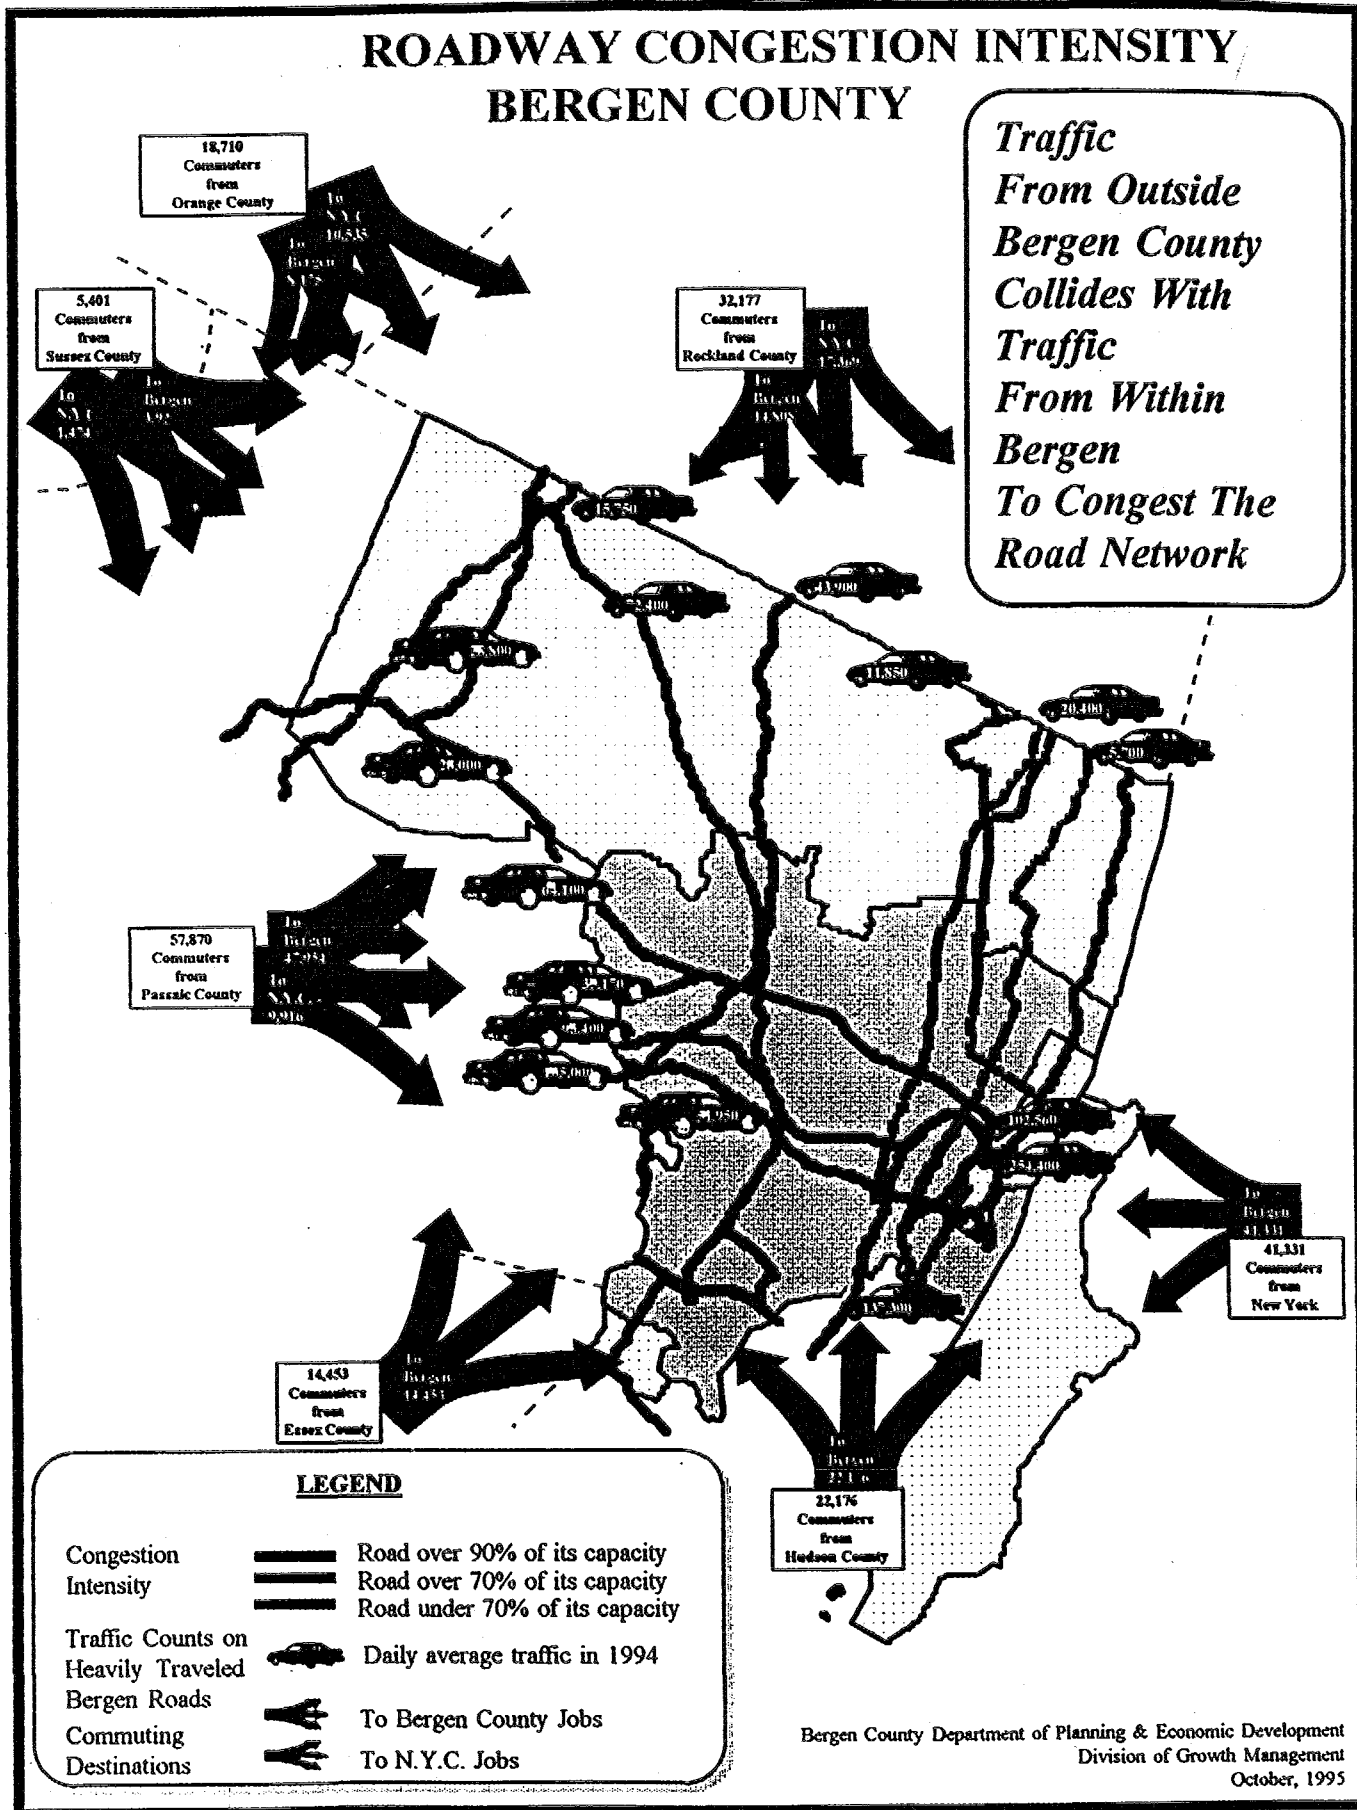

Figure 28.

Rail Transit Network Serving The Core

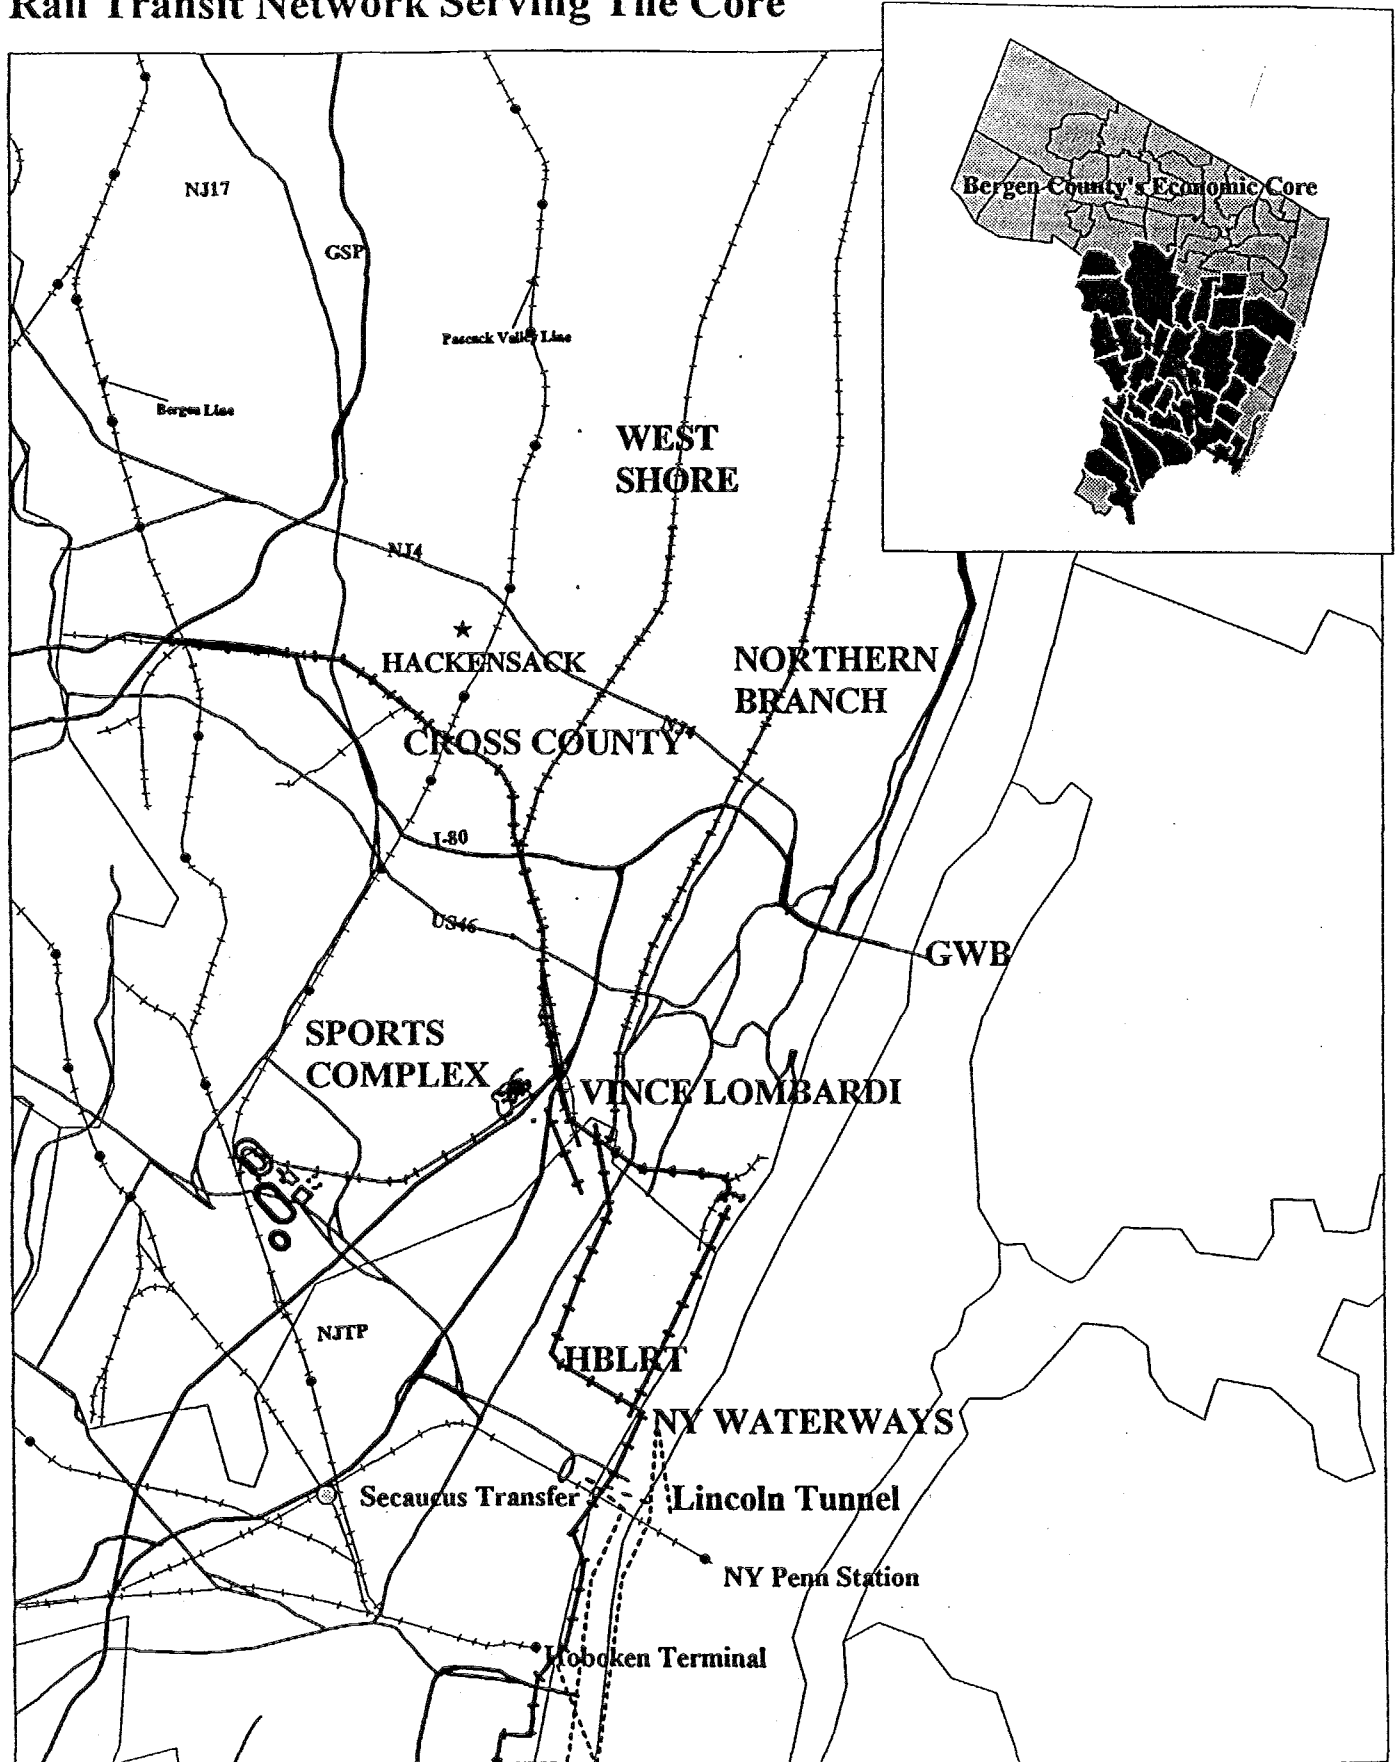

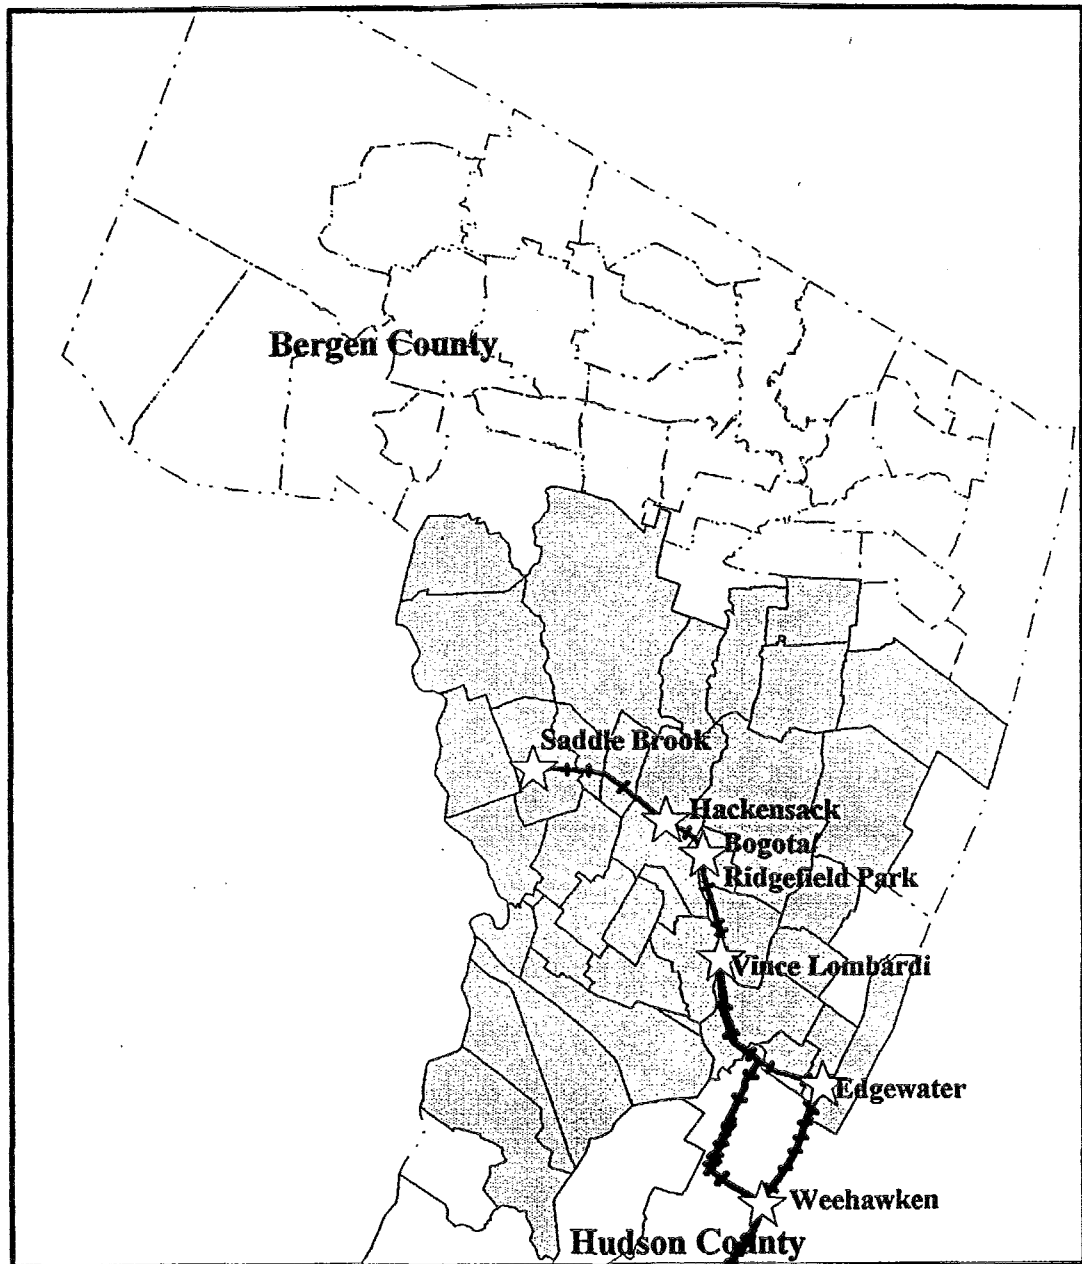

Figure 29.

Bergen County's Economic Core occupies 40% of the county's land base. Traversed by the Cross County Line's 3 segments, this core contains:

- 70% of the County's 420,000 residents in the work force
- 72% of the County's 550,000 jobs
- 64% of the County's population of 845,000
- 65% of the County's 310,000 households
- 64% of the County's 417,840 commuters

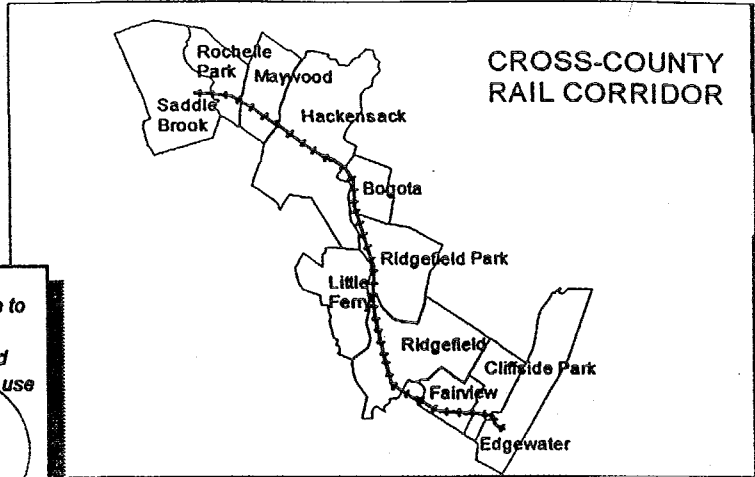

Figure 32.

THE THREE RAIL CORRIDORS

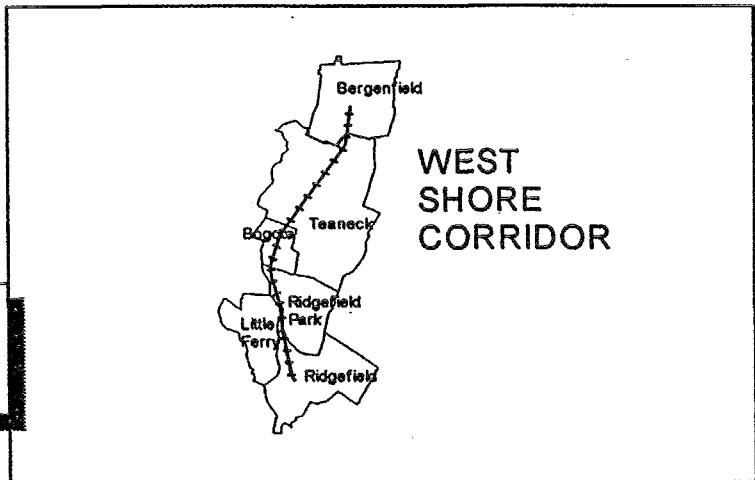

CROSS-COUNTY	74,738
WEST SHORE	43,697
NORTHERN BRANCH	30,491

Provide rail transit service to households and housing stock already in place and utilize transit friendly land use to grow from that base.

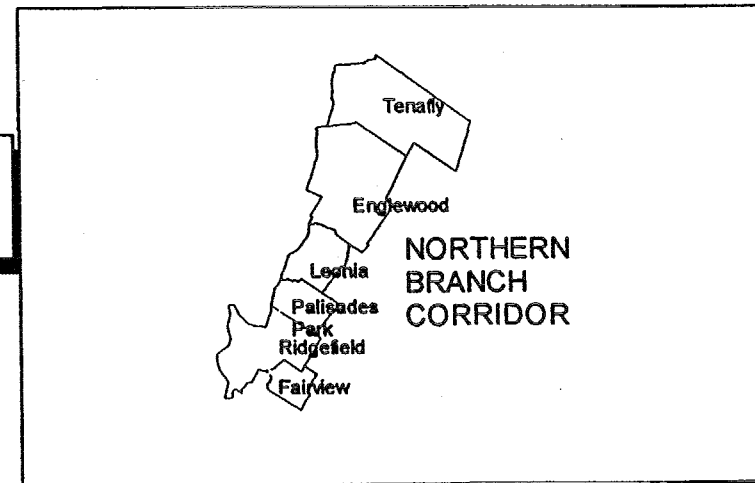

CROSS-COUNTY	79,667
WEST SHORE	45,200
NORTHERN BRANCH	32,487

CROSS-COUNTY	9,268
WEST SHORE	4,174
NORTHERN BRANCH	3,931

Provide rail transit service to people in households with NO cars at their disposal.

CROSS-COUNTY	24,206
WEST SHORE	16,975
NORTHERN BRANCH	10,722

Provide rail transit service where cars owned per family can be reduced.

* NOTE: Five municipalities lie in more than one of the 3 corridors. They are Bogota, Fairview, Little Ferry, Ridgefield and Ridgefield Park.

Intelligent Transit Systems Link Roads to Rails.

A **fifth** initiative, one which some of you have seen (Lodi, Hackensack, Rochelle Park, Maywood, Teterboro, South Hackensack, Bogota, Teaneck, Paramus, River Edge and Saddle Brook in some exploratory public outreach), is something we call the Community Commuter.

Designed as an integral part of this multi-faceted transit solution, Bergen County's concept for a demand-responsive, 16 hour per day, customer generated van service has now been fleshed out as part of a simultaneous research effort funded by the North Jersey Transportation Planning Authority, the Metropolitan Planning Organization for our 13-county region. Because expanded transit carries with it an appropriately scaled set of parking opportunities for its new customers, and because we present this idea as a way to provide access to the Light Rail all day long as a way to minimize the need for new parking, we see the benefit of advancing the two companion projects together in integrated fashion for simultaneous implementation. The on-demand van system uses state-of-the-art Global Positioning technology, on-board computer access, and adapts existing software already developed for rail freight dispatching and for package delivery systems like those utilized by UPS. We are currently seeking funding for the first phase.

We see this kind of service as a superb complement to the Light Rail transit opportunities advanced here, and for greater commuter rail access without having to rely completely on expanded parking lots at or near the center of town. *As narrated in our study (see Figures 34 to 36 beginning on the next page), this on-demand van system, utilizing small loops or a large network we picture as overlaying much of the County's core, has dozens of other applications as well.*

A. Nelessen Associates, Inc.
in association with
SG Associates, Inc.,
HNTB, Inc.
October, 1996

Figure 35.

Executive Summary

Figure 36.

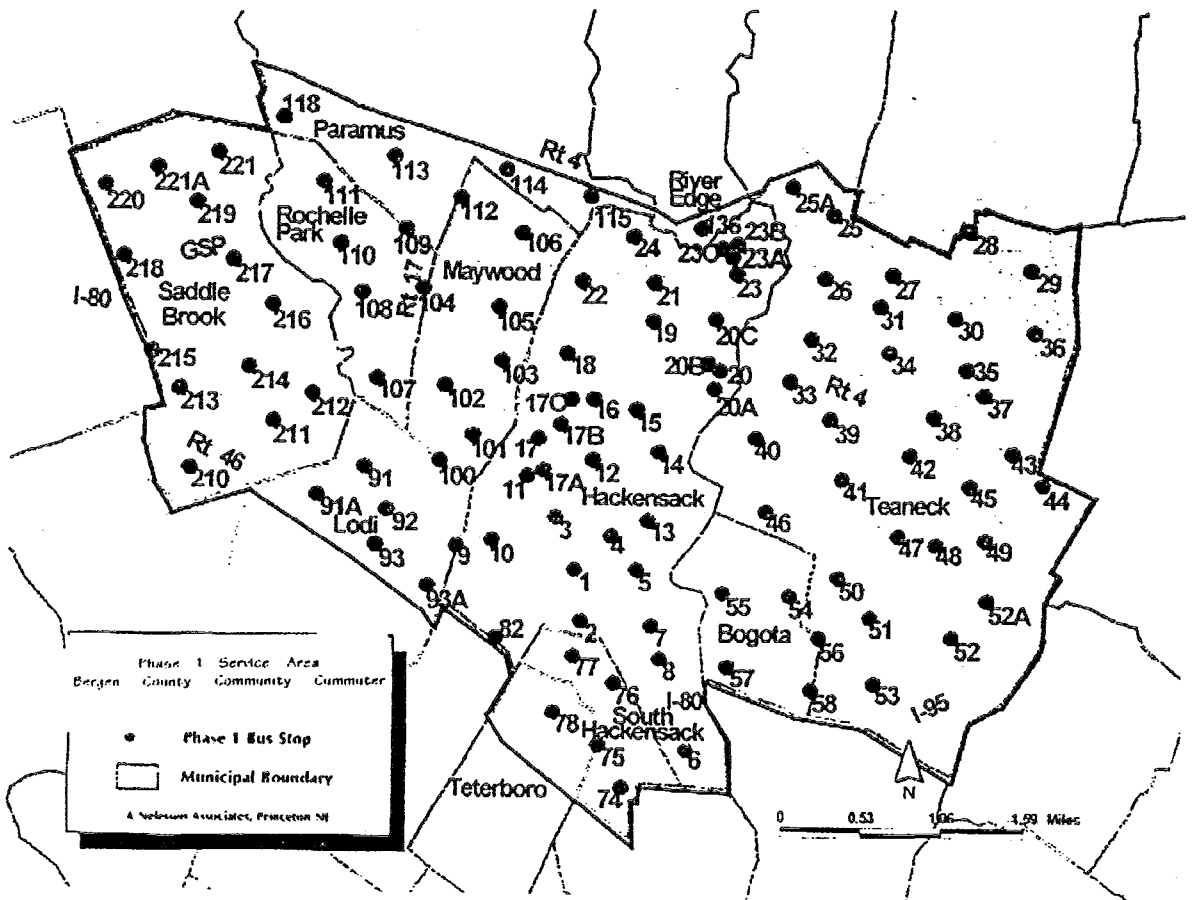

Service Area

Hackensack was selected as the "center" of the study area because of its high ratio of jobs to housing. From there, an initial market area for the service was selected by driving fifteen minutes from the county courthouse in all directions during weekday and weekend peak hours, as well as the mid-morning, midday and evening hours. The map below indicates the extent of the area.

In order to further contain the scope of this experiment and the costs for start-up service, this initial market area was further reduced to a first phase service area shown below.

Eleven (11) towns are included in the first phase service area. Of these eleven towns, eight are totally within the service area and three are partially within in the service area. The first phase service area contains:

- an 18 square mile area
- 123, 945 residents;
- over 62,787 jobs;
- 28,904 AM work trips made by people who live and work in first phase service area;
- 57,808 total work trips;
- 371,835 total trips (assuming that work trips are approximately 16% of total trips).

Executive Summary

Economic Performances Influences the Choice of Technology.

In selecting a rail transit technology which provides the best match to the new all-day economy?

Which investment choices, considered in combination, offer us the best opportunities to connect productively together, for the first time, the now separate and distinct elements of our present transportation network -- our highways and Interstates?

Which rail transit alternative is the best choice in this arena as the first buildable stage of a larger network of choices not foreclosed but advanced in their possibilities by such a choice?

Summary and Conclusions

There are two "Since" themes in this planning essay:

I. *Since 1950*, when they used the parts of the today's transportation system that were available then, but for different purposes and to travel to different destinations than we travel to today. So it *was a network* back then. The linebackers, safeties, and interior linemen functioned as a unit.

Back then, the Interstate Highways were popping up all over the country. But their consequences for land development had not yet taken hold. *The economy and its transportation support systems, and the land settlement patterns that are the consequences of both in combination, were focused predominantly at the region's center.* All three were centralized. The further one traveled from the center, the lower the population densities and the more rural the landscapes became.

Transportation, with common and central destinations, could pursue economies of scale with considerable efficiency and ease of choice.

No longer.

Between 1950 and 1990, our economy and its geography have changed enormously, converting yesterday's network into a series of pieces that do not work well today for most of the trips most of us now take across most of the day. These prodigious changes were taking place over a 40 year period during which, save for the Interstates, investment in public infrastructure, including in transportation, was dropping from 2.5% of GNP in 1950 to 1.0% in 1990 during a period of unprecedented population and employment growth in the nation and in our state.

The automobile, with which we are said to have fallen irrationally in love, solved these economic and transportation mismatches for awhile. And it has also helped create the other mismatches we face today. But along with the buses and trucks that have helped

Bergen County (and places like us across the nation) adapt our needs to the highway portions of our transportation system, our cars are overpowering the road network and threatening to suffocate the economy they started out serving. The Routes 4/17 interchange and the Model A were perfect technology companions in 1935.

II. *Since 1988* is the second "Since" theme, when Cross Acceptance One arrived on our doorsteps with some remarkable opportunities we saw and seized together, but with others more visible to us today because we can now see the outcomes of that incredible 1980's boom.

Here is a third. *Since* Cross Acceptance began in 1988, yet another transportation initiative landed in our laps -- the 1991 *Intermodal Surface Transportation Efficiency Act* of 1991, many of whose purposes for the nation's Metropolitan Areas matched those that New Jersey's State Development and Redevelopment Plan held for our own Metropolitan landscapes -- part urban, part suburban, and part rural. I S T E A.

ISTEA and Cross Acceptance II.

Because the traffic we were experiencing tied so directly to the new landscape of our economy, ISTEA said, we had to rethink transportation, as well. The new transportation system we could build *inside the one we already have (it's much too expensive to dismantle)* would have to be *Intermodal*. Then it could turn the *separate pieces* of our system back into a *network* again, each of whose parts could help and serve the others.

So while the State Plan was focusing on our *landscapes* that were being overrun, ISTEA focused on the transportation system's inadequacies *for serving these same landscapes*. ISTEA went a giant step further than had other transportation bills before it, however. It instructed us to find ways to focus on *land use while we focused on transportation*. Cross Acceptance Two gives us excellent chances to revisit and strengthen the capacity based planning perspective we invented and applied eight years ago, starting with the capacity of the land to contain the buildings that our collective zoning assigns to it.

In ISTEA, the word *Intermodal* means *among the modes*, and the "modes" include roads -- state, local, county and Interstate, and the cars, buses and trucks that converge on them; rails -- for rail transit and rail freight of the various types; airports -- for air passenger and air freight of many new types; harbors -- and their transcontinental and global freight shipping opportunities (and impediments), along with their places where freight is exchanged to other freight modes; and the whole new infrastructure of information transmission. We work in this last vineyard, as well.

ISTEA also focused on the word *Efficiency* -- among the modes, across the economy, and within the new land use settings described at the beginning of this Planning Essay. The two in combination, intermodal and efficiency, liberate terrific possibilities for setting up an *intermodal network approach* to integrated transportation investment in Bergen County.

Among other things, this Intermodal Surface Transportation Efficiency Act also seized upon extensive Circle of Mobility planning already in place in our state, and embodied its

major elements into an Urban Core that brought the Secaucus Transfer and the Hudson Bergen Light Rail Transit line to the forefront of Northern New Jersey's and Bergen County's intermodal opportunities.

Planning is first *about* something -- in this case about our economy, our environment, our landscape patterns, and about the much too disparate transportation elements that cross our county from our region without connecting very well to any of our determinants of economic success. With transportation the most prominent public investment we ever make in our economy, the opportunities and obligations are large here.

Second, planning becomes *for* something. Springing from the research recounted in this Planning Essay, what recommendations for action surface? Here are ours:

FIRST: From the extensive research discussed above, we come first to the conclusion that, among the few modes remaining at our disposal for moving people across our economy's landscape, *Light Rail is the logical technology of intermodal choice.* It rises and bends, jump starts and quick-stops, glides and slides more silently and less interruptedly through our settled landscape than any of the other modes. Moreover, it can knit together our present array of passenger carrying roads and rails such that the *people who use both* can travel much more productively on *each* of them and on *both of them in various combinations.* Better than any other *mode* at our disposal, it can make a *network* (again) out of a disconnected entanglement.

Who knows better than those who live here that Bergen County is the place where scores of transportation investments have been made at different times and which, for today's needs, do not connect together well. Picture how Routes 4, 46, 17, 80, the Turnpike, the Parkway and our commuter rail lines appear *on a map* like they actually meet here to serve one another's purposes. But try making the connections *on the ground* to actually accomplish such miracles. In spite of this, the state's greatest economic concentration has been assembled here in Bergen County on but 3% of the state's land mass.

So hit or miss will no longer suffice. The great preponderance of our transportation analysis and investment energy since 1988 has focused on the mismatches recited throughout this Planning Essay. As pointed out above, another such mismatch is between the sheer size of the 1950's commuter rail network that passes through Bergen County and the small number of people who find productive ways to utilize the service available on it in 1997. Two percent of Bergen's residents who get up on Monday morning to go to work take the train from one of our 28 commuter rail stations. Saddle Brook is a prime example of a centrally located place, in the heart of Bergen County's economic core and at the junction of several transportation lifelines -- none of them Intermodal -- and that has not been able to benefit precisely because of the many disconnects. Rather, Saddle Brook and the towns adjacent endure the traffic that is led to and through this place. We have formed a multi-party partnership to tackle these issues. The goal is to add economic strength while reducing congestion.

As the technology of choice:

- Light Rail, more nimbly and with much greater flexibility than commuter rail, can respond to economic change and opportunity. That is, the economy is not

forced to adapt to IT;

- Light Rail's station sites have strong economic development and redevelopment capacity, offering excellent opportunities to the private sector and to municipalities which need to strengthen and sustain their changing economic base;
- With its service/information economic base already in place, Light Rail offers more powerful connective support than any other mode for businesses and residents alike;
- Light Rail permits small stations to be added without large parking lots;
- The Light Rail system is easily expandable. It can start with one-car trains and expand to two and three car trains as the market grows;
- Light Rail's quick starts and stops do not create congestion at the center of the towns it passes through;
- Through feeder bus or feeder van loops, known to be effective with Light Rail, ridership can be increased and service areas expanded;
- An eventual interconnection with the West Shore at the Vince Lombardi Park-Ride would offer excellent potential access from the north to the Hackensack Meadowlands, the Sports Complex, and the Secaucus Transfer/Allied Junction site; and,
- Light Rail, with its 12 minute service frequencies all day long, is capable of competing with the automobile in convenience and speed. It will also provide greater reliability of travel times, for our businesses and residents, than do our cars so often trapped in traffic with no escape.

SECOND: Our greatest transportation needs, for both roads and rails, are for much improved EAST-WEST capabilities that tap into, protect and sustain the prodigious economic asset base in the County's Core.

The Bergen Cross County Light Rail line, running parallel to Routes 80, 4 and 46, can both rescue the core of Bergen County's economy -- the county's largest concentration in the state's largest economic stronghold -- and stimulate greater economic strength, staying power and redevelopment opportunities keyed to transit friendly land use choices. The days when we can reach onto the shelf for congestion-generating, auto dependent uses in such crowded landscapes are numbered and counterproductive.

Neither of the two lines under consideration for selection as the first operable segment in the Major Investment study being jointly conducted by New Jersey Transit and Bergen County can accomplish this. They both run north-south; neither contains the sheer volume

of economic assets so vital to the entire county's economic future; and neither makes connectable contact with so many of the county's and the region's transportation lifelines. *Both, however, are and will be needed in the intermodal transportation network of transportation network of our economic future, and both can connect into the intermodal spine that the Cross County Light Rail line would provide.* This is to day that Bergen County has largely lived off of the transportation investments in place in the 1950s, as has our region with its huge increases in regional travelers who use and depend on these same lifelines.

THIRD: This Planning Essay also shows how the Core of Bergen's economy -- the state's most concentrated such place -- is also where the worst of our congestion can be found. It is also the place, however, where our best transportation opportunities reside, because *here is where our transportation links to our region also converge with the best opportunities for interlinkage.* The Hudson Bergen Light Rail streams northward to us from Hudson County, with a key intermodal link in Weehawken from and to New York City. It will carry regional and local travelers to and from economic destinations very attractive to us, and that make us very attractive to them. Bergen and Hudson hold 700,000 jobs between them; *this represents one fifth of all the jobs in New Jersey.*

FOURTH: The Bergen Cross County Rail line, better and sooner than can either of the two other lines under study, "pulls together" the major strands of the transportation network strategy we have been pursuing for eight years since Cross Acceptance One. As described above, these include the Routes 4/17 interchange, designed to permit much easier capacities for drivers to change directions, the Secaucus Transfer with its potential to connect to 100 commuter rail stations in our region as parking and reverse commuting capabilities are established, and the Hudson Bergen Light Rail Transit line with its enormous inter-regional and intermodal opportunities. Without the Cross County, however, the Vince Lombardi is only a place from which to take a cab, after being dropped off by the Hudson Bergen, to one of Bergen's 550,000 job opportunities.

FIFTH: Better than can either of the other two lines under examination in the Major Investment Study, the Bergen Cross County Light Rail line makes possible the delivery of thousands of new passengers/customers *from* Bergen County's 848,000 population base, the state's largest, *to* the New York Waterway Ferry at Port Imperial in Weehawken. Used "in reverse" -- we used to call this "cross commuting" before travel in the service/information economy became so multi-directional -- the Cross County also enables the delivery, via the Hudson Bergen Light Rail line, of thousands of additional Hudson Bergen riders *to* Bergen's 550,000 job base *from* work force strongholds in Hudson County, Manhattan, and Newark. Today's congestion on major and "minor" highways, including the narrow, two mile, two lane strand called River Road on north Hudson's waterfront, make this impossible to accomplish.

Through well chosen interconnections, we can *strengthen our roads by strengthening our transit services.* *Intermodal Surface Transportation Efficiency Act.* As well, this Planning Essay shows how the Core of our economy is also *where our best transportation opportunities reside, because here is where the strongest transportation links to our region also converge with the best opportunities for interlinkage.*

The results from our nine years of research since 1988, including the most recent of our rail analyses conducted by investing \$1.5 million in county dollars into Fatal Flaw engineering and environmental analysis, show us the Cross County Line's unmatched integrative capacity to bring the three major investments described above together such that a network is re-established here.

SIXTH: Once we saw this potential for the Cross County line, we invested \$1.5 million in county dollars to put its possibilities to a series of feasibility tests. What bridges could block our way? Did existing freight travel close out our Light Rail possibilities on the portion of the Susquehanna and Western from which this service could be extracted? Did we have to go into the Vince Lombardi Park Ride -- with its daunting wetland problems and high structure costs -- in order to get started? Were there other environmental puzzles that could turn this into a typical, multi-year marathon? Would Light Rail have to travel on local streets? Could it occupy a right of way that would not tie up traffic in the center of towns along its path? Could it curve and bend over and around other major obstacles in its path (existing rail yards, for example)? Would it require new bridges with their typical delays and perplexing permit tangles? Could it merge seamlessly with the Hudson Bergen without disrupting in any way the impressive results of its Final Environmental Impact Statement already in hand?

Wherever any potential impediments were encountered in our engineering analyses, each and every one was solved.

SEVENTH: Using completely integrated, high speed, 12 minute frequency service all day long, the Bergen Cross County Light Rail line, in combination with the Hudson Bergen Light Rail, will also link all of these economic assets to Hoboken with its intermodal exchanges to PATH east to downtown Manhattan and west to Journal Square and Newark, and to the southern Jersey City waterfront with the same intermodal choices east and west bound, and as well, to Bayonne. All of these destinations are multi-directional and reverse linked as well. The West Shore and the Northern Branch lines can contribute in these ways, but not to the extent that the Cross County can.

So in its county-wide anti-congestion, economic strengthening, and inter-regional and intermodal connecting capacities, the Bergen Cross County Light Rail line's east-west linkage to the Hudson Bergen Light Rail Line offers the greatest mobility and benefit mix among the three lines under study in the NJ Transit/Bergen County Major Investment Study partnership. Its role as an integrative spine, however, offers strong opportunities, as well, for the West Shore and the Northern Branch as north-south connectors to the entire regional transit network now coming our way. As the work already completed to date shows, a solid variety of connecting possibilities is coming into focus. For some examples:

- As Light Rail, the Northern Branch could slip easily and seamlessly into the Hudson Bergen Light Rail line;
- The same is possible for the West Shore via an achievable link to the Cross County line in Ridgefield Park where, literally, one station could serve both lines and, for whoever needed them, offer transfers between them;

- **The Vince Lombardi hub could also offer the West Shore line a commuter rail link southward to the Hackensack Meadowlands, the Sports Complex, the Secaucus Transfer/Allied Junction station, and Hoboken;**
- **There may also be opportunities, not yet examined in detail, that could offer both the West Shore and the Northern Branch, through the utilization of Multiple Unit Light Rail Vehicles, compatible access to both the Weehawken Tunnel and the Secaucus Transfer using trackage along the west side of the Palisades;**
- **It would be possible as well, for both the West Shore and the Northern Branch to start up Light Rail service at their southern ends where job opportunities, residential concentrations and congestion levels are highest, with stations added northward as passenger market conditions and transit friendly land use beckoned; and,**
- **Were commuter rail to emerge as the rail technology of choice for either the West Shore or the Northern Branch, the information available in the Major Investment Study to date suggests that this service would likely have to originate in Rockland County.**

Several regional maps are incorporated into this document which show where and how all of these interconnections are located and can function in integrated fashion. And all of these travel opportunities *will grow more valuable and will gain higher and higher use as our highway network, formerly the key to this portion of our region's economic success but now largely maxed out in its possibilities, grows more congested as the outer region around this inner region grows and expands.* So these strategies are focused jointly on protecting and sustaining the region's center.

As the many costs of operating densely settled landscapes rise, attacking congestion involves more than modeling, inventorying and counting the traffic. We have certainly done that here as prelude. It also involves understanding the new congestion's new economic, demographic and land settlement determinants. They, too, have been investigated on the way to making the recommendations you see here.

The twin ideas that new roads generate more traffic and that new ratable pay the costs of dealing with it are too dismissive on their face for the hard thinking we have ahead of us. Women didn't enter the work force in droves in the 1980s because roads were built. Transit, too, provides new opportunities for its new users. So do new restaurants, new jobs and day care centers. Are we to avoid all of these in the name of avoiding the symptoms of the transportation pickle we are in? The pickle we're in covers 40 years of growing in new ways and at unprecedented speed without giving enough thought to the transportation consequences.

In Bergen County, where location, location, and location have earned us a traffic jam, it's clear that Light Rail transit carefully chosen and carefully captured in its opportunities is now the prime remedy of choice. It doesn't end there, however. ISTEA and the State Development and REDEVELOPMENT Plan are a couple of pretty good dance partners for

the Cross Acceptance work ahead of us. *Transit friendly land use can be pursued very profitably in this setting.* Matching the two to other infrastructure scales, like sewers and water supply, is a pretty good idea, too. At the base of these questions is one we asked each other in 1988: What does the zoning of available land and redevelopable land portend for the infrastructure systems that help deliver us or deny us a quality of life?

The "re-words" will also come into play in the planning that we are all called upon to consider doing next — words like redevelopment, re-use, rethinking, recreating, and remembering. Redevelopment, for example, need not only be about bigger or better buildings on land cleared of their former structures. It can also be about recouping open spaces, at those wonderful smaller scales at we also know how to work, and that also got overlooked in the eight business cycles we experienced since World War II. Redevelopment *this time around* can and ought to be about how we can link together the land use friendly transit on our near horizon with transit friendly land use ideas. The way land is developed next will be central to how well these new transportation network improvements, should we be fortunate and passionate enough to get them funded, can last and can serve us.

We will be suggesting some approaches to redevelopment in these contexts at the Cross Acceptance regional meetings coming up.

Finance Docket No. 33388
Surface Transportation Board
1925 K Street, N.W.
Washington, DC 20423-0001

Gentlemen:

Somerset County would like to offer testimony regarding the above merger as it relates to the West Trenton Line and Raritan Valley Line. The West Trenton Line is currently owned by Conrail and provides service through southern Somerset County and northern Mercer County connecting with the existing West Trenton station in Ewing Township and the Raritan Valley Line in Bound Brook. It also connects at West Trenton with existing passenger service provided by SEPTA into Pennsylvania. The West Trenton Line passes through the following municipalities: Bound Brook, Bridgewater, Manville, Hillsborough and Montgomery Township in Somerset County and Hopewell, Hopewell Borough, Pennington and Ewing in Mercer County.

This line is currently used by Conrail for freight service and consists of updated rail infrastructure. These same communities traversing this line are also some of the fastest growing suburban municipalities in the region, and have supported together with the County and the regional Chambers of Commerce, a reactivation of the line for both dual freight and passenger service. Congressman Bob Franks has been a strong supporter of this effort and helped secure needed federal funds to develop an environmental impact report and operating plan for reactivating passenger service along the West Trenton Line.

Somerset County is asking that the Surface Transportation Board in considering the Conrail/Norfolk Southern/CSX Merger to condition its approval on the West Trenton Line accommodating both freight and rail passenger service and allowing New Jersey Transit to negotiate future passenger rights with CSX and other freight lines operating on the West Trenton Line.

Elaine K. Kaiser

Page 2

In addition, the County is requesting that the Surface Transportation Board not approve of any merger and freight operating plan that adversely affects existing rail passenger service on the Raritan Valley Line which ties into Penn Station in Newark, New Jersey. Passenger service on this line has shown marked increases and is vital from a regional mobility and economic standpoint.

We appreciate the Surface Transportation Board taking these comments into consideration as well as those of the State of New Jersey when rendering its final decision. Thank you.

Sincerely,

Robert Bzik, AICP/P.P.

Re: Surface Transportation Board Finance Docket NO. 33388
CSX Corporation and CSX Transportation, Inc., Norfolk
Southern Corporation and Norfolk Southern Railway
Company, Conrail, Inc. and Consolidated Rail Corporation:
Comments on Draft Environmental Impact Statement
Our File No: 14142

Dear Ms. Kaiser:

Kindly accept the following responses to the Draft Environmental Impact Statement (DEIS) from the Township of Woodbridge, New Jersey (hereinafter referred to as "Woodbridge"), with respect to the above-referenced matter. Woodbridge desires to respond to the DEIS regarding this merger as it impacts upon the citizens of Woodbridge with respect to safety, noises and air quality. Woodbridge's concerns with respect to these categories are as follows:

- 1) Safety. Since 1981 there have been nine (9) documented hazardous material leaks from train cars requiring responses from the County of Middlesex, New Jersey, as well as Woodbridge emergency response personnel. Additionally, Woodbridge receives complaints from local residents on a regular basis regarding the storage of hazardous material train tank cars on the stretches of track which run along residential neighborhoods, particularly in the Port Reading and Sewaren sections of Woodbridge. In many areas, these hazardous material storage train cars are less than fifty (50) feet from residential property lines.

Volume 3B, Pages 5-29, NJ-10 indicates that the route between Trenton, New Jersey and the Port Reading section of Woodbridge will become a "Major Key Route" as well as a "New

Key Route". This will increase the number of hazardous material carloads between Trenton and Port Reading from 7,000 to 20,000 annually. Needless to say, this is a significant increase in hazardous carload traffic which will further exacerbate the problems that Woodbridge has been experiencing with respect to this very serious safety issue.

- 2] Noise. This is the leading type of complaint that Woodbridge has received from area residents who live near or along the tracks, particularly in the Port Reading and Sewaren sections. Woodbridge has found noise readings as high as eighty-nine (89) decibels at residential property lines. Woodbridge's local noise code prohibits noise levels above fifty-five (55) decibels at night and sixty-five (65) decibels during the day. We do recognize that due to federal preemption in this area, however, surface carriers need not comply with State and local noise codes and are only regulated by the more liberal decibel allowances and related conditions of the Federal Railroad Administration (F.R.A.). Unfortunately, with train noise allowances of over ninety (90) decibels and a minimum noise measurement distance of one hundred (100) feet, the F.R.A. regulations clearly do not address the legitimate public health concerns and special circumstances of Woodbridge residents who live as close as fifty (50) feet to the train tracks.

Additionally, the Port Reading section of Woodbridge has not been mentioned at all in the DEIS analysis regarding noise impacts of the planned merger (NJ-26). Woodbridge hereby requests that the Port Reading section be analyzed prior to the final environmental impact statement being prepared. We are confident that if this section of Woodbridge is properly analyzed, the Surface Transportation Board's Section of Environmental Analysis will discover that the noise levels are significant and need to be addressed.

- 3] Air Quality. A significant complaint that Woodbridge receives from residents is the excessive idling of train engines directly behind their residences. The train engine emissions while idling are an added cause of complaint and concern, particularly during the spring and summer seasons. It has been necessary for the Middlesex County Air Pollution division to respond to three (3) incidents during 1997 with respect to air quality associated with idling train engines.

Ms. Elaine K. Kaiser
January 30, 1998
Page Three

Woodbridge recognizes that many of the issues raised above may technically not have to be addressed during your review of this merger due to extensive federal preemption in this area of regulation. I assure you, however, that Woodbridge's concerns with respect to these issues are very legitimate and a source of significant public outcry from our citizens. Most importantly, Woodbridge has, in the past, had very strained relations with existing Conrail management with respect to these issues. It is our hope that your department's review of the merger will take into account some of Woodbridge's concerns and adequately address them. At the very least, we hope that with your department's input, Woodbridge may be able to open lines of communication with the new Conrail management in order to explore resolution of these issues.

Sincerely,

James M. Davy
Business Administrator

COMMENT OF THE VILLAGE OF RIDGEFIELD PARK, NEW JERSEY TO THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

TO: Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K Street
Washington, DC 20423-0001

Please be advised that the Village of Ridgefield Park, New Jersey (the "Village") provides the following comments to the Draft Environmental Impact Statement ("DEIS") prepared and issued by the Surface Transportation Board Section of Environmental Analysis in the referenced matter.

Martin T. Durkin, Esq.
Durkin & Boggia, Esq.
Centennial House
71 Mt. Vernon Street
P.O. Box 378
Ridgefield Park, New Jersey 07660

January 30, 1998

COMMENT

The Village is troubled that its previously-voiced concerns regarding the construction of cross-tracks within its corporate boundaries remain largely unaddressed.¹ Specifically, DEIS notes as follows regarding the construction of the two rail connections within the Village:

Because there are no highway/rail at-grade crossings within the limits of construction, SEA concluded that there would be no effect on highway traffic from this proposed rail line connection. There would be no short term vehicular delays and detours during construction of this rail connection. The construction would be performed in accordance with applicable Federal, state and local regulations for construction projects.^[2] Construction traffic would use the Bergen Turnpike to travel to and from the construction.

(DEIS, Vol. 3B at p. NJ-12-13.) The Glossary contained within the same volume defines "highway/rail at-grade crossing" as "[t]he location where a local street or highway crosses railroad tracks at the same level or elevation."

In fact, there are two such highway/rail at-grade crossings within the Village which should be evaluated. These are Mt. Vernon Street and the Bergen Turnpike. As noted in the Village's Comment to the application in the referenced matter, these major thoroughfares are already subject to prolonged blockage (as much as one hour at a time) caused by the so-called refueling and light maintenance facility operated by the New York Susquehanna & Western Railway ("NYS&W") in the Village and the operation of NYS&W in making up its freight trains.

Commencing in the evening or during the day on week-ends, NYS&W proceeds to make up its freight trains by moving cars from its freight siding just north of Mt. Vernon Street to its main track both north and south of Mt. Vernon Street. This operation, which takes forty five

¹ Actually, there appears to be some discrepancy contained within DEIS as to the actual location of the proposed cross-tracks. At Vol. 3B, p. NJ-6, it states that the two connections are to be constructed in the Village. Alternatives to the proposed location outside of the Village are addressed and rejected. However, reference is made to a map, designated as Figure 5-NJ-5, which shows the construction sites as outside of the Village. Obviously, this uncertainty needs to be resolved.

² As to the performance of construction in accordance with local regulations, the Village notes that, to date, it has not been contacted by anyone from the interested railroads with respect to the proposed construction.

minutes to one hour, coupled with the proposed switching operations in the Village and the expansion of the CSX yard (see *infra*) will further exacerbate the severe traffic congestion and blockage at the Mt. Vernon Street and Bergen Turnpike crossings. Also, lengthy freight trains consisting of as many as 150 cars, operated by Conrail and NYS&W, enter the Little Ferry Yard in Ridgefield³ at speeds of approximately 5-10 miles per hour, causing even more delay.

The prolonged blocking of Mt. Vernon Street and the Bergen Turnpike by various railroad activities effectively splits the Village into two sectors, eastern and western, for extended periods of time. Numerous businesses located on the western side and area residents are negatively affected. Of even greater concern is the possibility that emergency vehicles located in the Department of Public Works yard located on the western side of the railroad tracks will be unable to timely respond to fires or other emergencies which may occur when the tracks are blocked. The Village does not believe that the DEIS has given this very serious issue adequate consideration, and requests that a comprehensive analysis be conducted, including vehicle delay and queues.

In addition to the foregoing, the Village is very concerned regarding plans by CSX to expand its Little Ferry facility.⁴ Under the circumstances, *i.e.*, the evident aggressiveness with which CSX and Norfolk Southern intend to compete for business, the Village believes it is reasonable to conclude that an expansion of the Little Ferry facility will create a significant volume of additional rail traffic. The immediate proximity of the facility to the Village can only worsen its existing traffic problems. Moreover, the Village is additionally concerned because, as a result of the recent management buyout of NYS&W's parent company, the Delaware Otsego

³ It should be noted that the Borough of Ridgefield is a separate corporate entity from the Village of Ridgefield Park; moreover, the "Little Ferry Yard" is located in the Borough of Ridgefield and not in the Borough of Little Ferry.

⁴ According to an article in the March 1998 issue of Trains Magazine (a copy of which is annexed hereto as Exhibit A), CSX and Norfolk Southern will be spending a total of \$303,000,000 over the next several years to build and expand intermodal terminals. Of this amount, CSX will be spending some \$83,000,000 several of its facilities, including Little Ferry.

Corporation, by Norfolk Southern, CSX and Walter Rich, Delaware Otsego's CEO, both CSX and Norfolk Southern have a presence within the Village -- that is, the NYS&W's refueling and light maintenance facility -- that is separate and apart from any proposed cross-tracks. The Village is concerned that this light maintenance facility, too, will be subject of the railroads' plans for expansion. As it is, there are at times as many as twelve or thirteen engines idling for extended periods of time at the facility which contribute large amounts of air pollutants within the Village. The Village is fearful that this pollution will dramatically increase with the addition of increasing numbers of slow-moving engines to the tracks.

The Village strongly urges the Surface Transportation to consider both the immediate and long-term impacts of the railroads' activities both in and around the Village. Immediate acts taken by the railroads will facilitate more expansive and intrusive acts in the future.

A-309-c

Exhibit A

Will Eastern intermodal match the hype?

By BILL STEPHENS

WHEN FEDERAL REGULATORS fire the starting gun on the split of Conrail and its coveted intermodal franchise, the name of the game for CSX and Norfolk Southern will be competition. Competition in one of the nation's largest intermodal lanes, New York-Chicago. Competition over new routes between the Northeast and Southeast. And, the railroads hope, more effective competition with the real nemesis—trucks.

CSX and NS plan to spend nearly \$303 million between them to build and expand intermodal terminals. They're banking on getting big results—the diversion of 797,300 truckloads from road to rail annually, with 475,700 going to NS and 321,600 to CSX. "We may be a little bullish on Year 1, but by the third year we should be at that number or above it," says Cindy Lee, a general manager for CSX Intermodal. In 1997, NS carried almost 1.07 million containers and trailers, CSX more than 700,000, and Conrail 1.22 million.

What will be the largest post-merger intermodal change? "That's like asking what's the difference between Earth and Jupiter," says Thomas Finkbinder, NS vice president-intermodal. "Different worlds, different program ... People are missing that fact. The intermodal world is going to be 100 percent different."

Difference No. 1: For the first time in three decades, intermodal shippers will have a choice of how to get their trailers or containers between Chicago and New York. Thus it's unclear

BILL STEPHENS

TV7 meets TV12 near Buffalo on what will become CSX's portion of Conrail's Water Level Route.

exactly how Conrail's vast New York-Chicago intermodal pie will be split. It is clear, however, that service will be more frequent, as CSX and NS propose a combined 29 trains to eventually link the Windy City and North Jersey, up from CR's daily average of 17. And service will be faster.

Ask any railroader why today's hot trains can't match—or sometimes even touch—the schedules of trains of 30 years ago, and you'll get an earful. Trains are longer, hence slower. Yesterday's three- and four-track main lines are now two-track, while the old double-track routes are now single. A greater emphasis on safety, from adhering to the speed limit to more thorough train inspection procedures, slows things down. And speed, they'll say, isn't as important as consistency.

Nonetheless, CSX and NS plan to turn back the clock by slashing New York-Chicago times—nearly to those offered by the New York Central and Pennsylvania three decades ago—in order to be truck-competitive. On tap: a handful of 26-hour schedules, echoing the days of 24-hour Central Flexi-Vans and Pennsy TrucTrains.

Conrail's New Jersey-Chicago intermodal schedules average 30 to 32 hours. "Twenty-six hours is the magic number in terms of being truck-competitive," Finkbinder says. It means the railroads can offer late-night departures with early-morning arrivals.

How will CSX and NS slash some intermodal schedules when CR could not? By balancing route density, raising speeds, and improving terminals.

• Density changes—Conrail fun-

nels traffic from its busy former NYC and PRR mains onto the ex-NYC Water Level Route west of Cleveland, making it the most-densely trafficked section of CR's system. While this maximizes use of the line, it can create congestion. After breakup, there will be two fast, high-density Cleveland-Chicago routes: CSX's Northeast Gateway (NYC-B&O via Greenwich, Ohio) and NS's Penn (Water Level). While the hotshots use those double-track speedways, slower unit and merchandise trains generally will run via two single-track routes, CSX and NS over what will be CSX's Alternative Chicago Gateway (an upgraded and re-signaled PRR, Crestline-Fort Wayne-Chicago); NS also will have its former Nickel Plate. East of Cleveland, NS plans to make the NKP and Conrail's Southern Tier (ex-Erie, Buffalo-Binghamton-North Jersey) into a major intermodal corridor free of most other traffic. West of Cleveland, these trains will use the Penn Route.

- Raising track speeds—CSX's Northeast Gateway will be a 70-mph racetrack between Chicago and Selkirk (Albany), N.Y., up from the current 60. CSX also will extend three sidings on Conrail's single-track River Line (Selkirk-North Jersey, former West Shore). On the Southern Tier, NS will boost track speed from 50 mph to 60, and eliminate slow orders.

- Improved terminals—CSX and NS have ambitious plans for new and expanded terminals [chart, page 26] that will be more efficient, have more capacity, and have new mainline connections for increased flexibility.

CSXT Executive Vice President John Anderson touted the new service during a November Railway Supply Group meeting in Chicago. The Northeast Gateway Route, he said, will be a "world-class intermodal link between Chicago and New York that will be reliable, and offer transit times that are 2½ hours faster than the fastest Conrail train." Four of CSX's 12 planned Chicago-North Jersey trains will run on 26½- to 28-hour schedules. Lower priority and stack train schedules show across-the-board improvements over Conrail. But Anderson may have been a bit overenthusiastic. At least two CR trains—TVLA and the once-a-week TV80—currently run on 26½-hour schedules, albeit at off-peak times.

Initially, NS plans to maintain Conrail's 30- to 32-hour New Jersey-

Chicago van schedules over the Penn Route (former Lehigh Valley-Reading-PRR-NYC). Four of its proposed 17 Chicago trains, however, will compete with CSX on 26- to 28-hour schedules via the Southern Tier.

This move has surprised some observers since Conrail has long ignored the Tier, a line it never wanted but didn't want anyone else to have, either. The result has been benign neglect. Conrail has intermittently run intermodals on the Tier, on schedules 3 hours slower than the Water Level Route between North Jersey and Buffalo. NS and CSX, meanwhile, have teamed up with regional carrier Susquehanna to run North Jersey-Chicago in 35 hours. But NS will make the Tier a real main line again—something it was in the 1960's when Erie Lackawanna used much of it for premium United Parcel Service piggybackers. "I can run schedules over the Tier within 30 minutes of the New York Central way," Finkbiner says. That's because the stacks will have the line virtually to themselves, and will be able to highball in and out of North Jersey's Croxton Yard.

Ultimately, NS would like to use the Penn Route—at 921 miles the shortest post-merger New Jersey-Chicago lane—for expedited New Jersey-Chicago intermodals. But Finkbiner says improving Penn schedules will depend largely on how much of the line's carload freight is diverted to CSX's Northeast Gateway Route, freeing up capacity for more intermodals. NS plans to run about 50 daily trains over the former Pennsy across the Keystone State.

Difference No. 2: Not only do CSX and NS plan to run faster New York-Chicago schedules, but they plan to increase business by serving short- and medium-haul markets in which Conrail showed little interest. NS expects to gain 220,500 loads a year simply by offering service in "local markets" such as New Jersey-Toledo, while CSX will card Philadelphia-Detroit service. New intermodal hubs and higher traffic densities should enable CSX and NS to offer the shorter hauls by allowing consolidation of blocks for common destinations.

Cleveland will become a major intermodal hub for CSX. Trains from Memphis, St. Louis, Chicago, and the Northeast will converge on an expanded Collinwood Yard. NS, which has a big Atlanta hub, will build simi-

The Fab Four

New faster intermodal schedules

Conrail intermodal trains average 30 to 32 hours between Chicago and New Jersey, although two trains—TVLA and the Thursday-only TV80—run on 26½-hour schedules. CSX and NS each plan to offer four trains on truck-competitive schedules reminiscent of those offered by the New York Central and the Pennsylvania in the 1960's.

CSX

Northeast Gateway Route (former B&O and NYC via Greenwich, Ohio, and Syracuse, N.Y.)

Symbol	Origin/Destination	Transit Time
Q164	Chicago, 59th St./Little Ferry	28 hours
Q167	North Bergen/Bedford Park	26.5 hours
Q168	Bedford Park/North Bergen	27.5 hours
Q169	North Bergen/Bedford Park	26.5 hours

Norfolk Southern

Southern Tier Route (ex-NYC, NKP, Erie via Buffalo) or Penn Route (ex-NYC, PRR, RDG, LV via Harrisburg)

Symbol	Origin/Destination	Transit Time
DSCGCX-1	Chicago, 47th St./Croxton	26 hours
DSCGCX-2	Chicago, Global 1/Croxton	26 hours
DSCXCG-1	Kearny-APL/Chicago, Global 1	28 hours
DSCXCG-2	Croxton/Chicago, 47th St.	27 hours

*NS has not yet determined a post-merger symbol system. In this case, DS=double stack, CG=Chicago, CX=Croxton, N.J.

lar centers at Harrisburg and Toledo. Harrisburg will serve terminals in New Jersey, Philadelphia, Baltimore, and New England, plus Kansas City and Chicago. Toledo will handle Chicago, K.C., and St. Louis trains, plus Buffalo, Philly, and Jacksonville.

Difference No. 3: Although the merger's new north-south intermodal lanes are small when compared to New York-Chicago, they represent new opportunities to battle truckers. Railroad's version of the Mason-Dixon line—the dividing points between CR and the Southern lines at Philadelphia and Hagerstown—has long stymied effective intermodal service between Northeast and Southeast. With its short hauls, CR has had little incentive to build north-south intermodal business. Interchange, meanwhile, often equals delay.

As a result, Eastern rail intermodal has 22 percent of potential traffic that moves at least 500 miles, but only 9 percent of the market in north-south lanes, leaving 91 percent on the roads. This poor showing comes in the nation's most densely populated

J.J. YOUNG JR.

Trains NE-98 and PB-1 of intermodal-rich Erie Lackawanna met at Binghamton, N.Y., central point of today's Southern Tier route of Conrail, which NS plans to restore to virtually all-intermodal.

How to spend \$303 million

CSX—\$83 million

321,600 trucks diverted annually	
Cleveland, Collinwood Yard	Expand
South Philadelphia	New, at CR Greenwich Yard site
Chicago, 59th Street	New, at former PRR yard
Chicago, Bedford Park	Expand
Chicago, Forest Hill	Expand

area. "If we just introduce good competition and get back to the average share nationwide, we double the business," Finkbinder says.

NS doesn't propose faster schedules over Hagerstown. "We're proposing more consistency. We're not as consistent as we'd like to be in those lanes," Finkbinder says, noting that it's only 75 miles from Hagerstown to Conrail's intermodal hub at Harrisburg. "What's the incentive to do wonderful stuff with that train? I'm not sure I'd do much different."

Unlike NS's experience with Conrail, Lee gives high marks to the four premium-service trains CSX and Conrail jointly run between New Jersey and Florida. The consistent service, Lee says, "is driven by a large mutual customer that rides the train." That customer is UPS.

Nonetheless, erasing the Mason-Dixon Line will bring down an intermodal barrier. "We see a lot of opportunity from Memphis to the Northeast, where you don't have intermodal service today," Lee says.

New direct services will include:

- New Jersey-Memphis—CSX, Little Ferry-Memphis, 33 hours westbound, 58 hours eastbound, both via Cleveland; NS to serve Memphis off Harrisburg-New Orleans trains.
- New Jersey-Jacksonville—CSX, 28 hours, improving current 31 1/2-hour joint service with Conrail; NS to provide connections via Atlanta.
- Boston-Atlanta—CSX, 51-hour service; connections to Florida from New Jersey, to Mobile and New Or-

leans from Atlanta. NS will reach New England by Harrisburg-Albany haulage rights on Delaware & Hudson and a connection with Guilford.

- New Jersey-Atlanta—NS, two pairs of 32-hour trains.
- Harrisburg-Kansas City—NS, 45 hours via Toledo. CSX, 36 hours, New Jersey-St. Louis (its end-of-line).
- Northeast-New Orleans—NS, 46 hours from Harrisburg, with connections to Dallas via KCS at Meridian, Miss. Also, Baltimore-N.O., 51 hours; CSX, connecting service via Atlanta.

Difference No. 4: CSX and NS will fight for the same business, but with different weapons. This is partly because of different route structures, partly current traffic bases, and partly different perspectives.

NS will continue to emphasize double-stack and RoadRailer. "Stack is a lot more profitable business than trailers," says Finkbinder. Most principal NS-Conrail intermodal routes are already cleared for domestic stacks, and the few gaps will be cleared: Harrisburg-Baltimore; Front Royal-Roanoke, Va.; and Columbus-Cincinnati. Triple Crown will dramatically increase its RoadRailer network, adding new terminals in Baltimore, Morrisville, Pa., and Charlotte, N.C.

CSX won't be stack-capable in the I-95 and I-85 corridors, thanks largely to Howard Street Tunnel in Baltimore, and the B&O west also lacks stack clearances. But CSX is high on TOFC, its largest and fastest-growing market segment. "There are still a lot of trucks out there," Lee says.

Not everyone shares the two systems' rosy outlook. The Chemical Manufacturers Association and The Society for the Plastics Industry told the STB that already thin intermodal profit margins would become even slimmer with rail-to-rail competition plus truckers fighting back to keep their business. And to haul more intermodal traffic—necessary to help pay for Conrail—the groups say CSX and NS will have to devote more people and locomotives, which will bog down service.

These concerns and others mean that, pending STB approval of the merger, CSX and NS will not only have to compete with each other and truckers, but with their own intermodal hype. **I**

Re: F-97-481
Surface Transportation Board
Finance Docket No. 33388
CSX Corporation and Norfolk Southern Corporation
Conrail Acquisition

Dear Ms. Feigenbaum and Sanford:

The Department of State has received a copy of the Draft Environmental Impact Statement for the proposed acquisition of Conrail by the CSX and Norfolk Southern Companies. However, we also need a completed Federal Consistency Assessment Form (blank enclosed) for consistency review purposes. Once we have received the FCAF, we will contact you if additional information may be necessary for our review.

You and the Surface Transportation Board will be notified of our decision when we have completed our review of this proposed activity for its consistency with the New York State Coastal Management Program.

Please call Mr. Vance A. Barr at (518) 474-6000 if you have any questions.

Sincerely,

William F. Barton

Dear Chairman Morgan,

To keep Rodney Slater of U.SDOT advised, we have just faxed to him (1/13/98) information on the the New York City Rail Freight issue, both economically and environmentally

Since we added information which was not included with our 1/10/98 letter to you (sent Priority Mail) we believe you should have this information in your file as well.

I hate to burden the record, but believe you may be interested in all the available information

Sending, therefore the copy of letter to Hon. Rodney Slater and the attachments.

Should you require any clarification whatsoever, we shall be promptly responsive

Sincerely yours,

Zee Frank

 F. 718-292-9698

January 13, 1998

Hon. Rodney Slater, Secretary
 United States Department of Transportation
 400 Seventh Street, S. W.
 Washington, D. C. 20590

Honorable Sir

We would like to add to the letter sent certified to you, December 12, 1997, and trust this will be also addressed when you have an opportunity to respond.

On January 7, 1998, the matter of the CSX/NS merger in New York City was addressed by Mr. Daniel King of the Surface Transportation Board. It was held by the MPO (NYMTC) of New York City. The questions were posed by those who were concerned that New York City is being locked out of Rail Freight, despite the fact that the Oak Point Rail Link to access direct rail to New York City is completed

The blockade is caused by one man who wants to replace most of the Harlem River Intermodal Terminal with noxious, polluting uses. We enclose the Forbes Magazine which describes one of the hazardous/pollutant uses, by quoting New York Times Mr. John Tierney. One man wishes to destroy 2/3rds of the Harlem River Intermodal Terminal with such uses.

As the Secretary/CFO of the United States Department of Transportation, destruction of a new \$35,000,000 Intermodal Terminal should be obviously a major blow for the Global participation of New York City, the richest rail freight market in the United States.

Although the attendees at the January 7, 1998 included Federal, State and City officials, ...not one had a rebuttal to the stated devastation of the economy for New York City, should this man be allowed to proceed. ...Hence the economic health of the United States is thus threatened.

Page 2

It appears that everyone is awaiting the power of your office to rectify what is obvious to all, a power play by one man to doom the economy of New York City. We mention this as an economic disaster as apparently "money" speaks as the almighty God.

But, there is in fact a human destruction to be considered, which cynics override

Following the speakers, in clergy garb, clearly misplaced amongst civilian suits, stood up a tall, handsome man, who you would think would not be involved in New York City's hidden burden for those who fall prey to the creators of profitable, polluting and deadly particulates, they generate

It took six years for this community to have a foul, uninhibited polluting medical incinerator, to be shut down. Now, deadly deinking is planned per Michael Walsh report and John Tierney NYTimes, of "deadly pollutants. Added now, is a massive putrid garbage facility. Instead of Rail converting Trucks to Rail it is being decimated by one man's lust. The Rail project planned and signed since 1982 by both New York State DOT and the United States Coast Guard, will instead be used to kill people.

To quote the handsome clergyman... He described his knowledge of this community having performed the marriages for these people and now he states he is burying their children... 5 years old etc caused by this pollution. Yes, there are handsome, intelligent, vibrant and caring people in New York City (The clergyman, we have learned, is from St. John's Church, NYC, J. Parrish)

I find I have to defend the people in New York City as worth saving. And, since "peoples" finally have become an issue, we are adding some articles for your further consideration

Respectfully submitted,

Zee Frank

Via Fax 202-366-7202, 10 pages (Please acknowledge with document control No.)

Attachments, Forbes Magazine, (2 pages - November 17, 1997, Pages 104 and 108), re. Deinking pollution, etc.

Also, for your interest I enclose an article in the Ecologist (2 pages "Environmental Sell Out" Jan-Feb '96) which shows how a City is made prey to a conspiracy to replace rail with pollutants ie: deinking. A plan designed per the article in Upstate New York to infiltrate the community of New York City. This was written by a former Policy Analyst for New York City Department of Environmental Protection.

It is significant that the NRDC representative in the above article, blasted the South Bronx Air Coalition who finally managed to get the Medical Incinerator closed down. The NRDC representative did his blasting in the newspapers questioning the integrity of the South Bronx principal. Subsequently NRDC of Washington, had the NRDC representative place an article in that media apologizing for NRDC's disparaging remarks. NRDC at a recent City Council meeting at City Hall was "booted". Consequently the apology appeared, but the plans to build the deinking in place of rail land continues. This community is #1 in Asthma in the United States.

As you can see, we have good cause to defend the peoples of New York City from such conspiracies. The big question is Why should we have to?

The report on the deadly particulates was written by Michael Walsh, (4 pages, 4/24/96) (said to be the former chief of Motor Vehicles of the United States Environmental Protection Agency) It referred to the "deinking" facility alone and added: will be massive additional particulates that will replace rail land.

Using 2/3rds of the Harlem River Intermodal Terminal for these pollutant uses to replace Rail Land is deadly to the people in the community and a direct hit to the economy of New York City and to the United States.

Oddly, if a foreign country came in and destroyed New York City's Rail, we would be sending in our boys (and girls) to retaliate. I wonder if this one man who lusts to destroy the rail, ever served his country. My family during World War II contributed to US victory, when it meant survival. Frankly I believe our fortune, created the world respect that the United States now enjoys, by other generations. It is your generation that needs to protect that respect. And, New York City deserves that protection.

A-311-b

You are in big, big trouble if you promote the Ten Commandments in school, but preaching the recycling religion is increasingly de rigueur.

Why recycling is garbage

By Dan Seligman

Ten good reasons not to participate in America Recycles Day (Nov. 15).

1. We begin with the obvious. The core purpose of recycling is to conserve raw materials. But there is no present or prospective shortage of raw materials, so there is no need to conserve them. Airtight logic, eh? As economist Julian Simon keeps reminding us, impending shortages are invariably signaled in higher prices, but raw material prices keep falling (in real, inflation adjusted terms).

2. There is also no shortage of landfill space. As guys from the Cato Institute keep mentioning, a hole in the ground 100 yards deep and 30 miles square could hold all the waste produced in this country during the next thousand years. To be sure, that assumes present rates of waste production. If we doubled the rate, we might have to dig another hole in a few hundred years.

3. There is a genuine shortage of leisure time in the land. This has obviously not occurred to the promoters of America Recycles Day, but bundling up newspapers and

sending used LaserJet toner cartridges back to Hewlett-Packard can cut into the cocktail hour.

3(a). Washing cloth diapers at home is also a net subtraction from leisure time and is known to occasion feelings of revulsion among home makers. It remains, however, the preferred solution of Earth Day celebrants, since cloth diapers are presumed to be biodegradable, and sending them out for washing results in a lot of pickups and deliveries by vehicles using evil fossil fuels. So what are homemakers to do? The record shows that seven to eight years ago they were being arm-twisted by environmentalists and regulators into buying reusable cloth diapers. More recently, common sense and Procter & Gamble public relations—they are not completely antithetical—have clearly prevailed. Disposable diapers today have an estimated 80% of the market.

4. The honorary chairman of America Recycles Day is a politician who goes around taking plainly illegal campaign contributions from a Buddhist temple.

5. Depending on whom you believe, the self-same Vice President had something or nothing to do with the federal grants received by a recycling company called Molten Metal Technology, whose head contributed money to endow an academic chair in memory of Al Gore's sister.

6. The recycling laws are criminalizing people like John Mocombe, the increasingly famous amateur filmmaker. For folks who missed the Oct. 16 Associated Press story about John, he got arrested for trucking thousands of bottles

The late news from the diaper front is that two powerful forces—Procter & Gamble public relations and plain old common sense—have combined to win the war.

Did Princess Diana inspire the dreamer who trucked 20,000 cans and bottles to Michigan, where you get a dime for each one? We may never know.

and cans from New York, where they pay only 5 cents, to Michigan, where you get a dime. At last report, Mocombe was pleading guilty to fraud. And we still can't figure out what the crime was.

6(a). Additional essential details on the case: When asked whether his caper had been inspired by a somewhat similar story line in an old *Seinfeld* episode—the one where Kramer and Newman use a postal truck for hauling bottles and cans to Michigan—Mocombe denied it. He said he sought the dimes because he needed money to make a movie about the plight of the homeless. He also said he had been inspired by the idealism of Princess Diana.

6(b). Sudden after thought on the Mocombe case: Maybe the crime was perjury.

7. Based on knowledge and belief, and supported by Jerry Taylor, director of natural resource studies at the Cato Institute, we would say recycling usually makes economic sense when it happens "naturally"—when it's not mandated by government—and usually doesn't make sense when it happens only because it has been thusly mandated. Taylor says economic waste associated with mandated recycling probably runs into the tens of billions of dollars.

7(a). Recycling is a farce when municipalities spend heavily on it and then have to pay people to take away the stuff—a standard scenario across the land. And recycling is a logical, totally inescapable development when the end product has some genuine market value. Several years ago, when newspaper prices were skyrocketing, cities all over America found them-

selves having to deal with freelance recyclers who got to be called "paper rustlers"—characters who were snatching and reselling the bound-up papers at curbside before the municipal sanitation department came along. One of our favorite 1995 editorials was the one in the *Houston Chronicle* calling for jail and other stern measures to deal with the thieves while simultaneously worrying that this exercise shouldn't turn into "harassment of the homeless." Luckily or otherwise, the problem went away in 1996, when newsprint prices collapsed. Unfortunately for the homeless, the prices are still weak.

8. Amazing detail: Arguably the best, most devastating critique of recycling to appear in recent years was a long, fact freighted June 30, 1996 article in, of all places, the Sunday magazine section of the liberal *New York Times*. The article, by staff writer John Tierney, says that "recycling may be the most wasteful activity in modern America" and along the way shoots down just about every environmentalist claim for recycling you have ever heard.

8(a). Why, Tierney asks in the course of one shoot-down, do we have so many government mandates for recycling paper? There is certainly no shortage of trees. The data show three times as much virgin timber in the U.S. today as in 1920. And the newspaper recycling process is itself a source of pollution: "fumes and noise from collection trucks, solid waste and sludge from the mills that remove ink and turn the paper into pulp. Recycling newspaper actually creates more water pollution than making new paper."

9. Proponents of recycling are tony writers, as evidenced by every other sentence in Al Gore's *Earth in the Balance*, also by the following mangled verbiage recently noted on the Hewlett Packard toner cartridge recycling Web site: "We proactively avoid 154 hazardous materials from being used in our products...."

10. We now live in a country where, to plagiarize a thought of Yale Professor David Gelernter, you are in big, big trouble if you promote the Ten Commandments in school, but preaching the recycling religion is increasingly de rigueur. Even though most of the kids getting indoctrinated were wearing disposable diapers just a few years earlier

Environmental sell out.

AUTHOR: Salzman, Lorna.

SOURCE: The Ecologist, v. 26 (Jan./Feb. '96) p. 39.

ABSTRACT: Mainstream environmental groups are inhibiting the efforts of grassroots and less conciliatory environmental groups. Mainstream groups soak up the majority of funds from large donor organizations and they cooperate with these large donors, thereby giving projects the support of "the environmental community." An example of a conciliatory environmental group, the Natural Resources Defense Council (NRDC), supporting a project and putting itself forward as representing the environmental community is outlined. The NRDC backed an industrial park development in the South Bronx, New York, which was chosen at the expense of a proposed freight center that would have contributed to clean air.

Environmental Sell Out

The article "Democracy for Hire". (*The Ecologist*, Sept/Oct 1995) may have shocked many, but not those of us who have watched mainstream environmental groups compromise and sell out because they have thrown their lot in with those whose largesse supports them — congressional committee leaders, mass media, corporate givers and wealthy foundations anxious to give funds to only the most reputable (i.e. non-controversial and appealing) organizations.

As a result, the Natural Resources Defense Council (NRDC) and the Environmental Defense Fund (EDF) between them probably monopolize half of all foundation grants in the US. Staff and board members of those groups either sit on foundation boards or have cultivated close relationships with them in order to influence how and where these foundations spend their money.

What this means to underfunded, grassroots and less conciliatory environmental groups is obvious in financial terms. In political terms, it means that when government, the press or corporations need credibility on an environmental issue, they quickly turn to these same groups, whose name, status, influence and opinions are interpreted as representing the "environmental community" — when, in most cases, the exact opposite is true.

An example of this took place in New York. Years ago, the Department of Transportation targeted a parcel of vacant, publicly-owned land on the South Bronx waterfront as a freight centre, where freight trains could unload cargo for local distribution by truck and barge, and vice versa. The Department spent over \$300 million on upgrading the incoming rail line. Such a freight centre would contribute to cleaner air (the area nearby has the highest asthma rate in New York City), decreased truck traffic, decreased energy

local job creation, and a sound use of waterfront for water-dependent uses rather than luxury high-rise housing or "yuppy" commercial development.

But a politically well-connected developer prevailed on the Department of Transportation to renege on its commitment to the freight centre and to publicly-owned and public interest uses of the site. Instead, the Department signed a 99-year lease with the developer to construct an industrial park on the site.

The developer knew that it stood a better chance of getting public and media support for the project if it had "the environmental community" on its side. Thus, a representative of the Empire State Economic Development Authority, which was responsible for privatizing the site, contacted Alan Hershkowitz of the Natural Resources Defense Council and proposed that the industrial park could include a de-inking and pulp plant which utilized recycled newsprint. Hershkowitz jumped at the opportunity and sought some Swedish sponsors for the plant. Well-placed news articles demonstrated how the giveaway of this land to a private developer, with gigantic subsidies that would effectively balance out the developer's entire investment (subsidies which were never mentioned), would be beneficial and environmentally sound.

Community groups and nearby residents disagreed. Together with the Urban Environmental Alliance, they went to court to challenge the deal. They won the first round but lost the appeal. The dispute will now go to the state appellate court. NRDC was used, in effect, as a battleship to split the community. NRDC was supported by a well-funded local development group, Banana Kelly, but opposed by the South Bronx Clean Air Coalition, the Business/Labor/Community Coalition, and other smaller groups and individuals.

To counter NRDC's bad "knag" from the opposition, the *New York Times* and *The New Yorker* ran extensive favourable coverage of the plan. All the cogent facts were omitted, and stress placed on NRDC's credibility, while the leading lawyer and opponent was dismissed as a "rail buff".

One omitted fact was that the freight centre had been the idea of the Department of Transportation, not the opposing "rail buff".

Another was that there are several alternate sites for a pulp plant in the South Bronx (but only one for the freight centre). NRDC rejected them all, claiming that they were "contaminated". In fact, they rejected

locating on publicly-owned land, they could avoid any in-depth environmental review and the plan for the industrial park and plant could be expedited.

NRDC's Hershkowitz has blasted opponents for misusing the environmental process. But the fact that this site is NRDC's preferred site because it will escape environmental review undermines his accusation.

In addition, the state's own environmental consultants produced studies clearly indicating that in terms of environmental impact, the industrial park would have far graver impact than the freight centre. This report and several others were deliberately withheld from the public (and from the courts too, apparently).

Community, grassroots and regional environmental groups who do not want to appease corporations, media or congress are thus at a dual disadvantage: they are deprived of funds because NRDC and EDF get most of the foundation funding — and NRDC and EDF get most of the funding because funders know they will be non-confrontational and work within the system (for example, EDF's campaign to get McDonald's to switch to paper trays instead of styrofoam). When NRDC and EDF get favourable press treatment for their willingness to "work with corporations", the funders can feel justified in having supported these groups.

A NRDC representative recently stated baldly: "we don't need to do anything different". That statement indicates that the speaker is either out of touch with reality or actively working to subvert any movement for real social change.

CASTing Light

It was with disappointment that I read the article "Democracy for Hire: Public Relations and Environmental Movements" (*The Ecologist*, Sept/Oct 1995) by John C. Stauber and Sheldon Rampton. The characterization of CAST was inaccurate and raises questions about your integrity.

The Council for Agricultural Science and Technology (CAST) was created in 1972 by scientific societies, not by Shandwick. Last year, CAST contracted with Dorf and Stanton (now Shandwick) to review CAST's communications efforts and to assist in media assistance for a Sustainable Agriculture conference in Washington, DC.

MEMO

To: David G. Hawkins
 From: Michael P. Walsh
 Subject: Comments On BCPC EIA
 Date: April 24, 1996

Thank you for sharing the material with me. I have several comments which are summarized below.

1. Adverse Health Effects Will Result From Any Increase in Particulate Air Quality Levels

"The primary standards protect the public health, and represent levels at which there are no known significant effects on human health." Based on this statement and the conclusion that the NAAQS will be met, the EIA concludes that the increased volumes of heavy duty diesel powered vehicles, even though they are estimated to increase localized PM10 levels "presumably will have no adverse health impact".

In fact recent data indicates that any level of PM10 causes potentially serious adverse health effects.

For example, by correlating daily weather, air pollutants and mortality in six US cities, scientists have discovered that non accidental death rates tend to rise and fall in near lockstep with daily levels of particulate - but not with other pollutants.¹ Because the correlation held up even for very low levels - in one city to just 23 percent of the US federal limit on particulate - these analyses suggested to the researchers that as many as 60,000 US residents per year may die from breathing particulate at or below legally allowed levels.²

More recently, another study has emerged showing a strong linkage between particulate air pollution and mortality.³ The study is distinctive in that it used a prospective cohort design that allowed for direct control of other individual risk factors such as cigarette smoking, diet, etc. In addition, the study was larger and represented a larger geographic area than any other study to date.

Air pollution data from 151 US metropolitan areas were linked with individual risk factors in

¹ "An Association Between Air Pollution And Mortality In Six U.S. Cities", Dockery, et al., The New England Journal of Medicine, December 9, 1993

² "Air Pollution and Daily Mortality in Philadelphia", Dr. Ioulia Schwartz, presented at the 1991 meeting of the American Lung Association, Anaheim, CA, May 1991.

³ Pope et al. 1993

David G Hawkins

Page 2

April 24, 1996

662,130 adults who resided in these areas when they were enrolled in this study in 1962. Deaths were ascertained through 1989. Sulfates and fine particulate air pollution were associated with a difference of approximately 15 to 17% between mortality risks in the most polluted cities and in the least polluted cities. Even in cities that meet the US Federal clean air standards, the risk of death is 2 to 6 percent higher than in the cleanest cities.

Based on the available data, the World Health Organization recently estimated that every 50 ug/m³ increase in PM10 would lead to a 6% increase in mortality; a 25 ug/m³ increase would cause a 3% increase in hospital admissions for respiratory conditions; a 7 ug/m³ increase would cause a 5% increase in bronchodilator use among asthmatics, etc.⁴ In conclusion, the WHO decided that "No specific guidelines are recommended for PM because there was no obvious exposure concentration and duration that could be judged a threshold and decreased by uncertainty factors to avoid risk. Rather, the data base on PM suggests a continuum of effects with increasing exposure".

2. Diesel particles are more hazardous than most other particles.

Diesel particles, because of their chemical composition and extremely small size, have raised a host of health and environmental concerns.

a. Cancer Risk

Diesel particulate matter consists mostly of three components: soot formed during combustion, heavy hydrocarbons condensed or adsorbed on the soot, and sulfates. In older diesels, soot was typically 40 to 60 percent of the total particulate mass. Developments in in-cylinder emissions control have reduced the soot contribution to particulate emissions from modern emission controlled engines considerably, however. Much of the remaining particulate mass consists of heavy hydrocarbons adsorbed or condensed on the soot. This is referred to as the soluble organic fraction of the particulate matter, or SOF. The SOF is derived partly from the lubricating oil, partly from unburned fuel, and partly from compounds formed during combustion. The relative importance of each of these sources varies from engine to engine.

A comprehensive assessment of the available health information on diesel particulate was carried out by the International Agency For Research on Cancer (IARC) in June 1988 and concluded that diesel particulate is probably carcinogenic to humans. The term "carcinogen" is used by the IARC to denote an agent that is capable of increasing the incidence of malignant tumors.⁵

Studies conducted at the Fraunhofer Institute have suggested that the diesel particle itself,

⁴"Update and Revision of the Air Quality Guidelines For Europe", World Health Organization, 1995.

⁵WHO

David G. Hawkins
 Page 3
 April 24, 1996

stripped of the organic and other materials on the surface, may also be carcinogenic. Confirmatory studies under the auspices of the Health Effects Institute, a jointly funded industry - Government program, recently verified this conclusion. These results, and recent findings from other laboratories, suggest that (1) the small respirable soot particles in diesel exhaust are primarily responsible for lung cancer developing in rats exposed to high concentrations of diesel emissions, and (2) at high particle concentrations, the mutagenic compounds adsorbed onto the soot play a lesser role, if any, in tumor development in this species.* This is quite significant as it indicates that it is important to control the particles themselves and not just the organic material sitting on the surface of the carbon.

b. Small Particles Are More Hazardous Than Other Particles

Size Distribution of Typical Particles

Particle diameters span more than four orders of magnitude, from a few nanometers to one hundred micrometers. Combustion-generated particles, such as those from power generation, from automobiles, and in tobacco smoke, can be as small as 0.01 µm and as large as 1 µm. Particles produced in the atmosphere by photochemical processes range in diameter from 0.05 to 2 µm. Fly ash produced by coal combustion ranges from 0.1 to 50 µm or more. Wind-blown

dust, pollens, plant fragments, and cement dusts are generally above 2 µm in diameter.

Recent measurements of the size distributions of primary particles confirm U.S. Environmental Protection Agency conclusions that most fugitive dust emissions are in particles larger than 2.5 µm and that the majority of emissions from combustion sources are in sizes smaller than 2.5 µm. As illustrated above diesel emissions are almost all less than 1.0 µm in size; particles in this size range are especially hazardous because when breathed in, they are able to penetrate to the deepest part of the lung where the critical gas exchange takes place.

This was reinforced when, in November 1992, EPA staff released a report on the PM National Ambient Air Quality Standard (NAAQS) which argues that smaller particles are more hazardous than large particles. This is the latest manifestation of a pattern which indicates that diesel particulate represents a very serious health concern.

As noted in the report, because of their physical properties, fine particles (less than 2.5 microns

* "Pulmonary Toxicity of Inhaled Diesel Soots and Carbon Black in Chronically Exposed Rats", Masuyama, et al. Health Effects Institute Research Report Number 68, October 1994

David G. Harkum
Page 4
April 24, 1996

in size) are more likely than coarse particles (those between 2.5 and 10 microns) to contribute to exposures measured in the epidemiology studies. Examinations of air quality aspects of the time series PM_{10} mortality studies¹ also support this suggestion:

Air quality properties of PM_{10} in the areas studied imply that daily measures of PM_{10} are driven by underlying changes in $PM_{2.5}$ levels. First, $PM_{2.5}$ is highly correlated with PM_{10} in study locations. Furthermore, the day-to-day variation of $PM_{2.5}$ concentration is predominantly greater than the day-to-day variation in coarse fraction concentration in these areas; thus, day-to-day variations in PM_{10} levels are driven by variations in fine particle levels, and the coarse fraction is much less variable. Finally, in the Eastern U.S., where most studies were conducted, $PM_{2.5}$ represents a large fraction of the PM_{10} mass (63 percent of mass on average in the Eastern U.S.). In specific Western U.S. cities studies, fine particles were used as measurements (e.g., Los Angeles, CA; Santa Clara County, CA; Denver, CO) or fine particles tend to dominate the PM_{10} measurements (e.g., woodsmoke communities in winter and stagnation conditions of low wind speed in conjunction with combustion sources).

Epidemiological studies associate outdoor levels of PM to health endpoints. In general, stationary monitor fine particles levels are better related to personal exposure measures than are coarse fraction levels. The spatially homogeneous nature of fine particles means community-oriented monitors on which most studies are based may better represent fine than coarse particles. Coarse particles are higher near sources and their levels drop off with distance from the source. Thus, the community-based monitor may not represent exposure to coarse particles as well as exposure to fine particles.²

Moreover, outdoor-origin fine particles are better able to infiltrate indoors in air conditioned or heated areas than are coarse particles; once inside, fine particles will remain suspended for longer periods of time. Thus, outdoor fine particles contribute more to exposure because people spend a significant amount of time indoors. It follows that time series associations between variations in particle concentrations at outdoor monitors and both personal exposures and related health effects in populations that spend most of their time indoors are more likely due to fine particles. The recent time series studies providing a direct comparison between outdoor PM_{10} and $PM_{2.5}$ and personal exposure show that both indicators are significantly related to variations in personal exposure, but that fine particles show substantially stronger associations. By inference, the coarse fraction association must be smaller even than for PM_{10} .

¹These time series attempts to use standard techniques to relate short-term variations in air quality measurements to short-term variations in health endpoints are (a) typically using a 24-hour period as a unit of measure (e.g., daily PM_{10} concentrations and daily deaths or hospital admissions) while accounting for confounding factors.

²This does not imply that the coarse fraction does not contribute to the observed health effects, only that the time series studies would not be the most effective tool to establish coarse fraction associations.

David G. Harkness

Re: Proposed Conrail Acquisition

Dear Ms. Kaiser:

After review of the Draft EIS of the proposed acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad, it appears that a small piece of track running between the city of Rensselaer and the city of Troy in New York State is not listed in the Master Table of All Rail Line Segments. This track, presently owned by Conrail, is approximately 4 miles long and serves several businesses in South Troy.

As owner of the South Troy Industrial Park, the Rensselaer County Industrial Development Agency is interested in seeing this track maintained and continued. The South Troy Industrial Park is located along the track and openly seeks firms which require rail to fill the park. A loss of this rail line would mean the loss of possible businesses as well as a loss of necessary service to many of the businesses surrounding the South Troy Industrial Park.

We assume that, since CSX Railroad will acquire the tracks leading to this portion of track, that this portion of track would also be taken over by CSX Railroad. If not, please inform me of the intentions for this portion of track.

Sincerely,

Robert L. Pasinella, Jr.

REC'D: 2/5/98
DOCUMENT # 2/5/98 3.28.43 PM

Attention: Elaine Kaiser
Environmental Project Director
Environmental Filing

Dear Ms. Kaiser:

Thank you for the opportunity to review the DEIS on the "Proposed Conrail Acquisition".

St. Lawrence County has no comments on the document inasmuch as the proposal would not alter existing rail infrastructure in our County. We are hopeful; however that an increased emphasis on rail traffic to Montreal - which we believe is a goal of CSX - will have a positive effect on the economics of the system.

Sincerely,

R. Shawn Gray, Chairman

Investment Study. (Comments by the Chief, Metropolitan Planning Division.)

April 11, 1997 "The proposed CSX Transportation System" "The New CSX will Help New York Go
NY Times Farther Than Ever Before" "The proposed division of Conrail is subject to review and
approval by the Surface Transportation Board. And, we'll compete head-to-head
with trucks on price, speed and the quality of our logistical expertise"
But CSX, full page in the New York Times.....clearly showed no service to New York City.

Page 2

Fiscal Report ISTFA/1997 New York Metropolitan Transportation Council cited that " 50 percent of the NHS funds, or more with congressional approval, could be transferred to the Surface Transportation Program (STP) which includes funding for all other road categories outside NHS, transit modes as well as pedestrian and bicycle facilities " * (See comment re bicycle facilities, etc below)

1-28-98 Daily News In view of the severe importance to the economy and environment, and the present oversight by the Surface Transportation Board, today's media release that the Bronx has the very lowest income in the ^{N.Y.} entire United States, should take priority! .. The economic, environmental concerns are particularly urgent and justifies that the Surface Transportation Board ... put on the agenda, the environmental review of this crucial area and move aggressively to protect "environmental justice" for this community

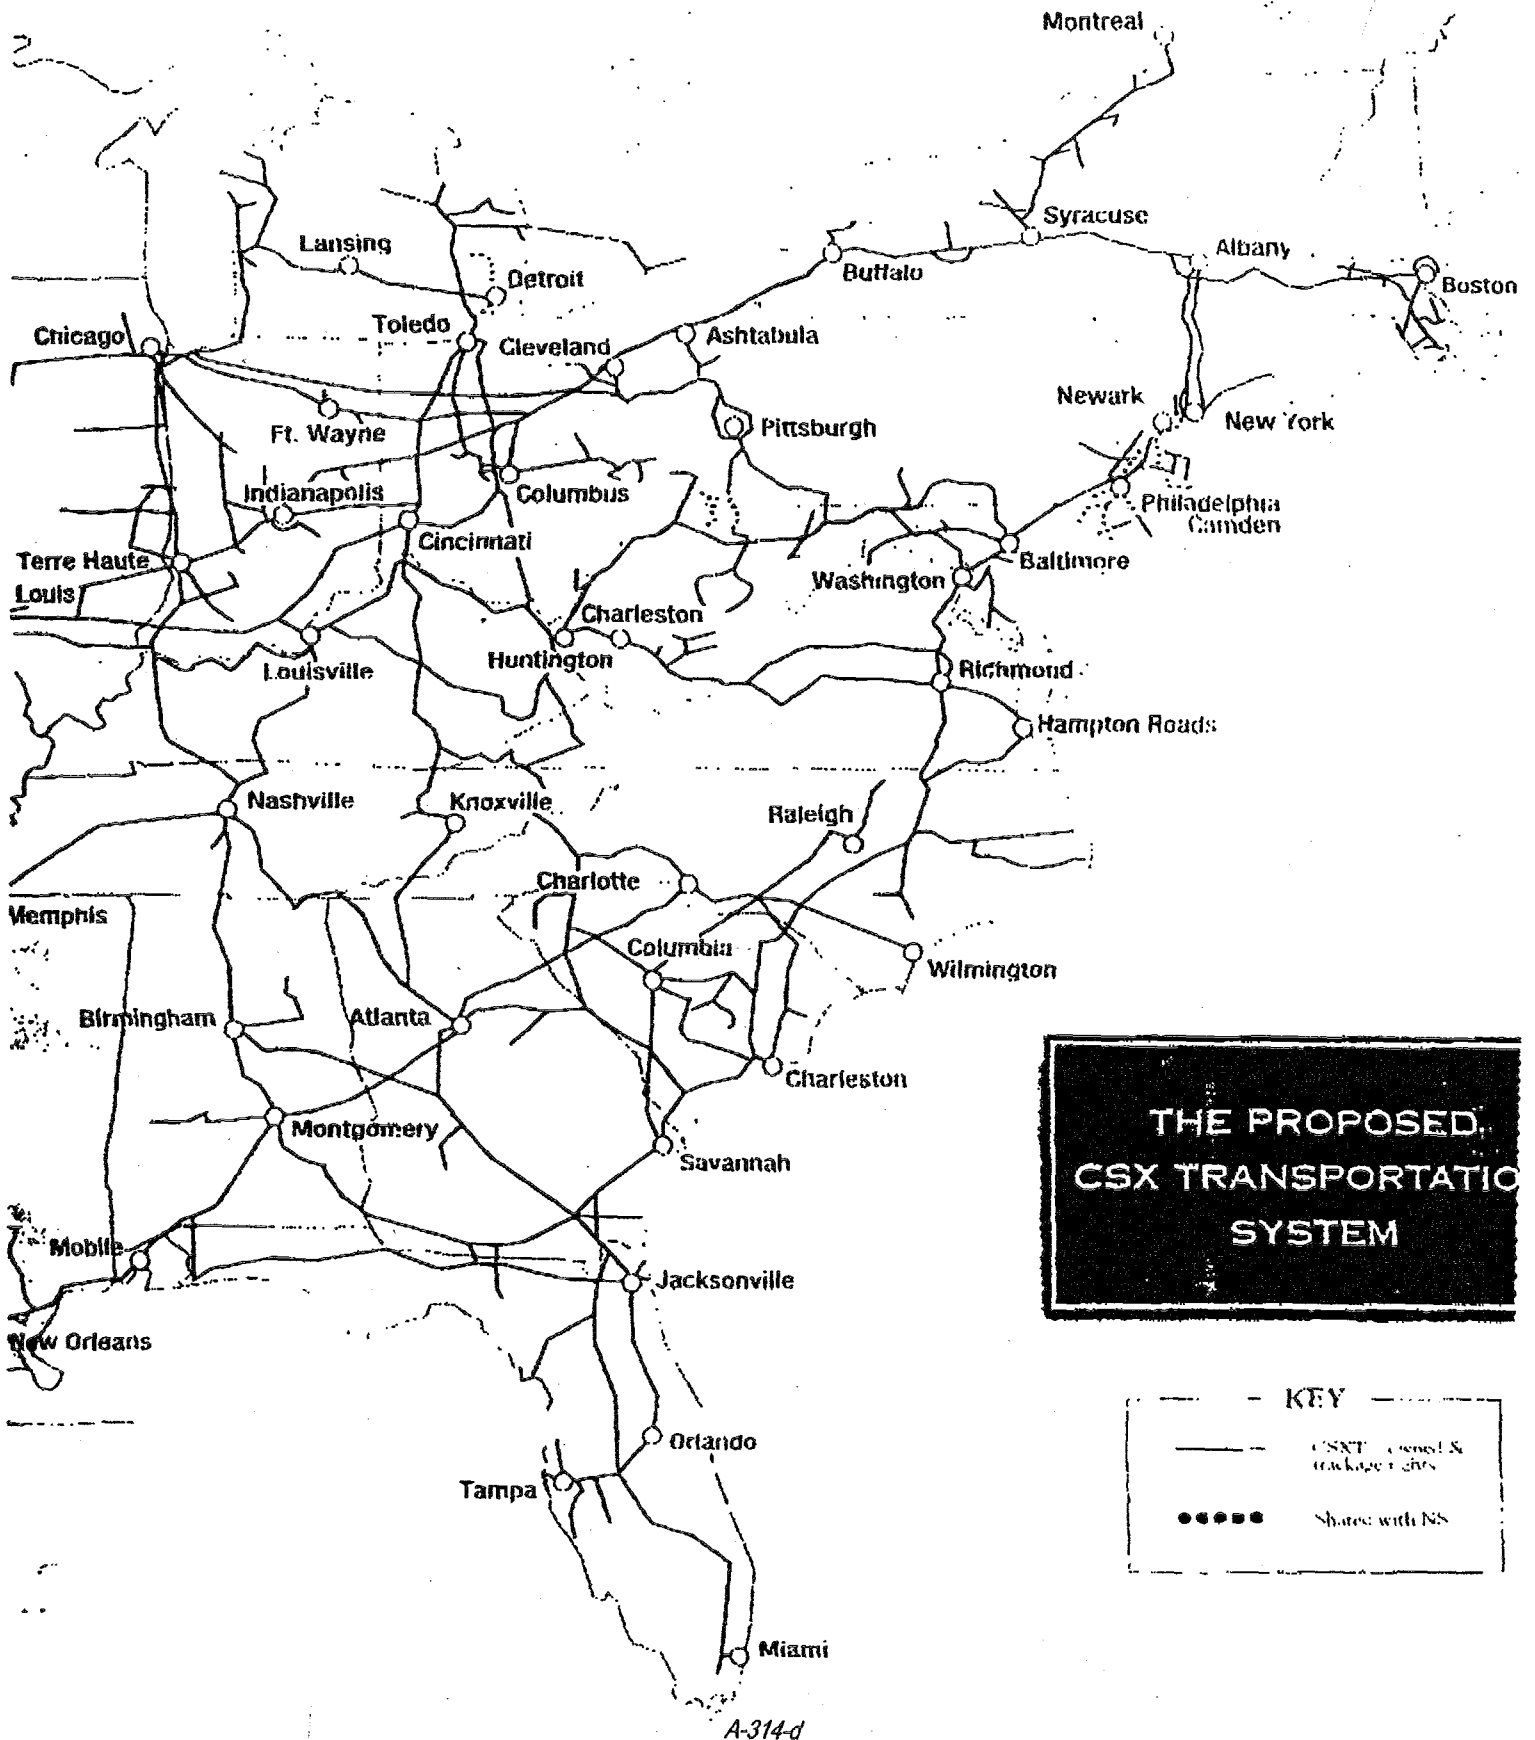

We attach the New York Times CSX Ad (as 2 pages in letter size) and Today's 1/28/98 media release on the Bronx (also as 2 pages in letter size)

*(Back in 1982, The Federal Government provided for recreational, "bicycle path, etc " along the waterfront etc to replace the mileage of waterfront lost to the Bronx by the Oak Point project. This was consistent with the plans for the Harlem River Intermodal Terminal. But present greed instead, will instead close the waterfront for another mile and exploit this community with added pollution and destruction of Rail Land for the private profit of largely one man. The Surface Transportation Board has the authority to protect the rail infrastructure for the City's economy and to finally thwart those who would doom the health and economy of this hostage community). Whether it is the Bronx or Bosnia, a helping hand is needed

Respectfully submitted for your consideration,

Zee Frank

A Bronx bumper

County is poorest in state, sez U.S.

By BOB KAPPS/STATEN
Daily News Bureau, City

Despite major revitalization efforts locally and a healthy citywide and national economy, Bronx residents have slipped to the bottom of the state's economic ladder, newly released U.S. census data say.

The data also project the borough's 1992 slightly in population to below 1.2 million, though a firm figure was unavailable.

Sandwiched between the soaring Wall Street fortunes of Manhattan and the residential wealth of Westchester, the Bronx has replaced rural Franklin County as having the lowest median household income of the state's 62 counties.

Putnam County replaced Nassau County as having the highest median household income in the state, officials said, with Rockland, Westchester, Dutchess, and Orange also moving into the state's top 10 counties in that category.

The figures, based on income data through 1993, show Bronx households having a median (the exact middle) annual income of \$19,881. That compares to \$41,331 for Staten Island, the highest in the city.

... father, Wiler Getaj, who was driving, saw the door open and was trying to stop.

Anthony, who died early Monday at the Westchester County Medical Center in Valhalla, had not been in a child-restraint seat. The law requires all children under age 4 to ride in federally approved child seats.

The Westchester County district attorney's office would not comment on whether any charges would be filed in the child's death.

Harlem

Gov. Pataki yesterday named Diane Philippotts president of the Harlem Community Development Corp.

Philippotts was director of commercial development for the Empire State Development Corp.'s division of economic revitalization.

"With Harlem developing as a viable and sustainable real estate market, a person of Diane Philippotts' experience and expertise in the industry is crucial to getting the job done," Pataki said.

The HCCDC replaced the scandal-stricken Harlem Urban Development Corp.

PRESIDENT CLINTON saw up side of today's Bronx when he toured Charlotte Gardens with Fernando Ferrer last month. It was vastly improved from what President Jimmy Carter saw 20 years earlier (top).

PRES. CLINTON

CONT.

Are we living in one country, are we living in one state? Does it mean that everybody has equal economic opportunities? If you have this kind of poverty concentrated the way it is, can you have equal opportunities without some kind of sharing?"

In one sense, the Bronx is lucky, he noted. As opposed to other counties around the state, the borough does not have to rely on its own resources.

"It's not the taxpayers of the Bronx who pay for the Bronx. It's the taxpayers of New York City — and the city is much richer than the Bronx."

The main problem for the economic stability of the borough, Bosworth said, has been its shifting population patterns.

"The Bronx, historically, has always been a place of immigration. People come in, they work themselves up and move on," said Bosworth.

But in a new global economy that has shifted to high technology and overseas labor markets, that may have changed the face of the Bronx.

"The people who benefit mainly from the city's economic boom are ... computer and finance-based people," he said, "and those are not the people who move to the Bronx."

**Re: Letter of Invitation
Letchworth State Park
High Bridge Replacement Proposal Meeting Feb. 9, 1998
Norfolk-Southern Railway Corporation**

Dear Interested Party:

Recently, our office was contacted by representatives of Norfolk-Southern Railroad concerning a proposal potentially impacting the High Bridge at Letchworth State Park, in Livingston County. This is an historic bridge within one of the most scenic settings in the New York State System of Parks.

The High Bridge carries railroad traffic and is currently part of the interests held by Conrail. It is our understanding that Norfolk-Southern and CSX Railroads are considering the purchase of those interests from Conrail. As part of that process they are evaluating engineering design alternatives and procedural requirements relating to replacement of the bridge elsewhere on park property.

Since the initial contact, we have identified the potential applicability of State and Federal regulations and review processes, as well as the interests of agencies at both levels of government. We have also outlined a list of issues and concerns regarding the proposal.

My purpose in writing, is to invite you to attend a meeting to discuss the High Bridge proposal and the requirements surrounding its review. The meeting has been scheduled for Monday, February 9, 1998 at 1 P.M. It will be held in the Letchworth State Park Visitor Center Conference Room. A site visit will follow the meeting.

A preliminary agenda, as well as a site map and directions to the park are included for your reference. Comments on the proposed agenda are welcome.

Office of the Secretary
Case Control Unit
STB Finance Docket No. 33388
Surface Transportation Board
1925 K. Street, N.W.
Washington, DC 20423-0001

ATTENTION: Ms. Elaine K. Kaiser
Environmental Project Director
Section of Environmental Analysis

Dear Ms. Kaiser:

Re: Comments on the Draft STB DEIS Finance Docket No. 33388
Proposed Conrail Acquisition CSX Corp. and CSX Transportation, Inc.
Norfolk Southern Corporation and Norfolk Southern Railway Company
Control and Operating Leases/Agreements Conrail Inc. and
Consolidated Rail Corporation

My major concern remains the issue of ownership of the Suffern to Port Jervis segment. Under Norfolk-Southern control, Metro-North Railroad Corporation will be prohibited from investing in the \$88.5 million needed for right-of-way improvements and the resulting loss of \$104 million worth of additional capital improvements to support MNRC long-term service expansion plans for the line through 2020.

It is important that a way be found to secure the use of these funds for these purposes.

Set forth below, are the other issues that we wish to have addressed:

- . The estimated annual number of hazardous materials cars ranges from 0 to 18,000 for Norfolk Southern segments N-062 and N-063 and from 21,000 to 31,000 for CSX. These represent significant increases. There is no documentation as to types of material to be transported through Orange County, nor is there a calculation for any truck diversion to account for these increases and that would be offsetting.
- . Air quality exceedances and their likely impact on our ozone air quality compliance levels.
- . There is no calculation of highway/rail at-grade crossing accident frequencies for:

ORANGE COUNTY, N.Y.

Highway/Rail At-Grade Crossings

<u>Municipality</u>	<u>Crossing</u>	<u>Railroad</u>	<u>Activity Accessed</u>
T. of Newburgh	Danskammer Rd.	CSX	Elec. Power Generator
T. of Newburgh	River Rd.	CSX	Elec. Power Generator
C. of Newburgh	Park Place	CSX	Yacht Club/Marina
C. of Newburgh	Washington St.	CSX	Yacht Club/Marina
C. of Newburgh	S. William St.	CSX	Public Works
C. of Newburgh	Renwick St.	CSX	Public Works
T. of New Windsor	Verplank Ave.	CSX	Ship Yard, Gas + Fuel Oil Tank Farm
V. of Cornwall-on-Hudson	Shore Rd.	CSX	Village Park & Yacht Club/Marina
V. of Cornwall-on-Hudson	Clark St.	CSX	" " "
V. of Cornwall-on-Hudson	Hudson St.	CSX	" " "
V. of Highland Falls	Station Rd.	CSX	
T. of Highlands	USMA South Dock	CSX	Oil Tank Farm Service Treatment Plat
T. of Highlands	Mine Rd.	CSX	Yacht Club
T. of Tuxedo	E. Village Rd.	NS	Residential

- . Economic benefits to Orange County are not documented per my letter of August 13, 1997.
- . Safety mitigation measures do not take into account, the number and spacing of railroad passenger station with the expected MHRC increase in the number of passenger trains per week on NS Segments N-062 and N-063. Their figures were submitted to you on October 20, 1997. The figures show an increase in ridership over the next 23 years of 173%, with an increase in the number of trains from 99 to 203 per week; also, the inadequacy of the Moodna Viaduck on the Suffern to Campbell Segment (N-062) both in terms of structural soundness and carrying capacity. Both pose a major safety concern.

Orange County, N.Y.

Base Year and Post Acquisition Railroad Activity

Attention: Ms. Elaine K. Kaiser
Environmental Project Director
Section of Environmental Analysis

Dear Ms. Kaiser:

Thank you very much for promptly sending me a copy of the Draft Environmental Impact Statement, Finance Docket 33388 of the Surface Transportation Board concerning the Proposed Conrail Acquisition.

My comments on the Draft EIS are concerned with safety at highway/rail at-grade crossings. The main point I wish to convey is that improvements to safety at highway/rail at-grade crossings are Federally funded using Highway Trust Funds. This is only stated in the Draft EIS by CSX Transportation and Norfolk Southern.

This funding issue is a major omission in the Draft EIS which states in several instances "SEA intends to recommend that the Board impose a condition requiring the Applicants to upgrade the crossing warning devices." (Page ES-18 in the Executive Summary.

There are two errors in this statement: (1) States have the authority to order a railroad to upgrade warning devices at a crossing or to install warning devices at a crossing without them; and (2) STB implies that the railroads will pay for these safety improvements, but does NOT mention Federal funding.

The Draft EIS can easily lead a reader to believe that funding is not important because the railroads will provide the funds. This is NOT SO.

The attachment presents comments on specific segments of the Draft EIS.

ROBERT W. McKNIGHT

Railway Signaling Historian
1600 East Avenue, Apt. 1112
Rochester, New York 14610-1633
Tel: (716) 256-1342

My education and work experience includes the following:

Bachelor of Electrical Engineering degree from Clarkson College of Technology in 1950.

Communications & signal editor of RAILWAY AGE for 22 years, and editor of Railway Signaling & Communications for 16 years.

Editor of The Signalman's Journal, official publication of the Brotherhood of Railroad Signalmen for 8 years.

From 1981 through 1988 was Director of Engineering for the Communication & Signal Division, Association of American Railroads.

I represented the AAR on the National Committee on Uniform Traffic Control Devices for 8 years, and have been a member of its Highway Railroads Grade Crossing Technical Committee for 15 years. The NCUTCD advises Federal Highway Administration on the Manual on Uniform Traffic Control Devices.

Cordially yours,

Robert W. McKnight

Comments by Robert W. McKnight 1/29/98
Surface Transportation Board Docket 33388
Draft Environmental Impact Statement

EXECUTIVE SUMMARY

Page ES-18, last sentence, 1st paragraph
"SEA intends to recommend that the Board impose a condition requiring the Applicants to upgrade the crossing warning devices at these 118 crossings as follows:"

CSX, NS and Conrail are referred to collectively as the "Applicants." according to Footnote 4 on page 1-1 of Volume 1 Chapter 1 Purpose of an Need for the Conrail Acquisition.

Who is going to pay for these upgrades? SEA does not say, but the implication seems clear- Applicants will.

However, Federal funding is available for improving safety at highway/rail at-grade crossings. This Federal funding for improving safety at such crossings is authorized by Section 130 USC 23 by the Intermodal Surface Transportation Efficiency Act of 1991. Extension of the provisions of this Act was extended for Fiscal Year 1998 by the US Congress last fall in 1997.

This Federal funding for improving safety at highway/rail at-grade crossings should have been stated in the Draft EIS in the Executive Summary and throughout the DEIS. Unfortunately, many people will read the Executive Summary and probably Volume 1 of the Draft EIS and skip over the rest of the volumes. From the reading of these first two volumes, readers can reasonably infer that CSX, NS and Conrail will pay for all these crossing improvements. It is not so.

I believe it is important to set the record straight at this point. What takes place and some history are important to a true understanding of the situation.

Federal funds are allocated to states on general guidelines set by the Federal Highway Administration. Generally such factors as population of the state, miles of Federal aid and non-Federal-aid highways, and number of

motor vehicles are considered in apportioning funds from the Highway Trust Fund to states.

States use an accident prediction formula and accident history to develop annual lists of highway/rail at-grade crossings deemed candidates for safety improvements. States annually request Federal funds from FHWA for this safety improvement program.

For individual crossings, usual practice is to have a diagnostic team with representatives of the state department of transportation or highway department, a railroad engineer, often from the signal department, and a representative from the local road authority or community. The team visits each crossing considered for safety improvements, takes photographs, measurements, etc. and determines what improvements should be made. Following this, the state regulatory agency orders the railroad to submit an engineering design and cost estimate to the state for making the improvements as regards crossing warning devices. Changes to highway signs, pavement markings and other highway changes would be submitted by the local road authority or the state highway department. After the safety improvements are completed and the crossing inspected by state engineers, the railroad submits its bill and the state pays using Federal funds.

Funds under the Section 130 program usually provide for 90% funding with the state, railroad or local community paying the 10%.

Public funding for improving safety at highway/rail at-grade crossings originated with the Interstate Commerce Commission in February 1964 in Docket 33440, titled "Prevention of Rail Highway Grade Crossing Accidents Involving Railway Trains and Motor Vehicles." On page 87 of the ICC Docket 33440 it reads:

"(13) That highway users are the principal recipients of the benefits flowing from rail-highway grade separations or from

special protection at rail highway grade crossings. For this reason, the cost of installing and maintaining such systems and protective devices is a public responsibility and should be financed with public funds the same as highway traffic devices."

Later the US Supreme Court upheld the ICC position on using public funds to improve safety at highway/rail at-grade crossings.

In 1973, the US Congress enacted the Federal Aid Highway Act of 1973 and the Federal Highway Safety Act of 1973. Together, they provided \$87.5 million for the installation of warning devices at highway/rail at-grade crossings on the Federal aid system for 3 years, 1974-1976. For the same period \$250 million was set aside for crossings not on the Federal aid system. This program for improving safety at highway/rail at-grade crossings continues today.

Federal Highway Administration (FHWA) reported in 1994 that for the period 1978-1993 that \$2.937 billion of Federal funds was spent on this safety program, but that it had prevented 8,000 fatalities and 36,000 injuries. Savings in lives and injuries, according to FHWA, saved \$8.3 billion. Thus the cost/benefit ratio is 35% or benefits are 2.85 times the costs.

Page ES-18, 6th paragraph

"SEA believes that safety at highway/rail at-grade crossings could be improved if a mechanism were in place to notify the railroad of stopped vehicles and other obstructions that could create safety risks for motorists and train operations."

Does SEA realize that to prevent a collision of a train with a stalled vehicle, it might well require the active warning devices to operate or barriers to close the crossing up to 2 minutes before the train would arrive at the crossing. The timing depends upon the weight and speed of the train, to determine its braking distance to

stop before hitting the stalled vehicle. This could be a very costly project to equip each crossing with a vehicle detector and a radio or communications link to notify approaching trains of stalled vehicles on the crossing.

SEA recommendations in this paragraph concerning toll free telephone numbers and a "unique crossing identification number" would indicate that SEA staff has not been out in the "real world."

Association of American Railroads/Federal Railroad Administration (AAR/FRA) inventory numbers have been installed at highway/rail at-grade crossings for several years. As for the toll free numbers, Texas has had this system in service for several years. Most railroads, certainly Class 1's have these 800 number systems either in service totally, or in part and are working toward complete installations.

Also, several railroads give local police officials a direct line to call the railroad because experience indicates the general public often call the police first with a problem.

Page ES-21

Item 1- Increased train speeds may be a problem as some communities have laws regulating train speeds through them. If raising the train speed requires changes in the signal system to provide proper braking distance, who pays for these costs? This probably would not be federally funded unless the railroad had to change the controls for the warning devices at highway/rail at-grade crossings.

Item 2- Separated grade crossings would come under federal funding, but the state makes the decision, not the railroad or the Surface Transportation Board.

Item 3- A good idea. The railroads and STB working with states and local communities can make this an effective approach to improving safety at highway/rail at-grade crossings.

Item 4. A good idea.

Paragraph following Item 4: This is a bad idea to have binding arbitration. This idea suggests using "political clout and power" to solve problems. Again, talking about crossing safety. There is Federal funding available and all it takes is a positive cooperative approach of railroads, states and local communities.

VOLUME 1

Chapter 3, Page 3-11

First paragraph under 3.4.3, last sentence beginning "In addition, the Board . .

. . requiring the railroad to complete the following:"

The portion underlined just above is NOT correct concerning these bulleted items below:

*"Adding or upgrading highway/rail warning devices.

*"Installing or upgrading automatic gates and warning devices."

These two items require cooperation with the state and the local road authority, and are performed under an order of the state regulatory authority.

*"Adding or improving 'Stop' lines and other traffic control pavement markings.

*"Installing new or additional warning signs, such as those stating 'Do Not Stop on Tracks'

*"Constructing a roadway median to reduce the opportunity for vehicles to maneuver around an activated crossing gate."

These are functions authorized and performed only by the state and local road authority. The railroad has no jurisdiction in this area of activity.

*"Establishing a toll-free telephone number . . . "

CSX, NS and Conrail have such call-in systems in service in whole or in part, and they are progressing the systems. (See Volume 2-CSXT statement pages 1980199; NS statement pages 187-188, 193)

*"Improving visibility at highway/rail at-grade crossings by clearing vegetation or installing lighting to illuminate passing or stopped trains.

This is a joint responsibility of the railroad and the local road authority and often the local community. Also, for clearing vegetation it may require cooperation of owners of property adjacent to the crossing. Illumination is often the responsibility of the local road authority or the local community.

Chapter 3, page 3-34 Grade Crossing Noise Effects

I agree with SEA's position to wait for Federal Railroad Administration's proposed regulation. However, it is worth noting that FRA issued a report in July 1990 titled "Florida Train Whistle Ban" and on page 1 it states:

"Train whistles make a difference in highway-rail crossing safety. This report reviews and analyzes the Florida East Coast Railway Company's (FEC) experience in the 65 months since the first nighttime whistle ban ordinance went into effect along its operating corridor in 1984. The whistle bans, imposed by individual counties and cities, impact only those crossings equipped with gates, flashing lights, bells and special advance warning signs and are effective only between the hours of 10 pm and 6 am. The advance warning signs read: "NO TRAIN HORN, 10PM 6AM."

Since the whistle bans have been imposed, the FEC's nighttime accident experience at 511 impacted crossings has tripled. At 89 similar crossings where the bans have not been imposed, nighttime accident experience in the last 5 years has increased 23%. The combined daytime and nighttime accident experience at FEC's impacted crossings has increased 75%, while going down 17% at the non-impacted crossings."

McKnight comments STB 33388 page 7 1/29/98

Table 1 on page 6 of this 1990 report covers Impacted Crossings, Nighttime Experience. The Crossing-Months Experience is 23,474 and it covers the time frame from 10PM until 6AM.

Pre-Ordinance: 39 accidents

Post-Ordinance (Whistle Ban in effect: there were 115 accidents.

On July 26, 1991, FRA issued an emergency order that required FEC to resume sounding train whistles after 10 PM at highway/rail at-grade crossings in Florida.

VOLUME 2 Safety Integration Plans

CSXT pages 192-201. Very commendable statement on policy and procedures to improve safety at highway/rail at-grade crossings. This is a good positive statement concerning present and future actions in this area of safety activity.

NS pages 185-196. A very positive statement concerning NS policy regarding safety at highway/rail at-grade crossings. It has a good description of present practices and what NS will do following the acquisition.

NS should be commended for its ability to shorten the time from the state request for crossing improvements until completion. On page 187 NS states: "Presently, NS Communication & Signal forces average 10 months total for railroad handling from the time a state DOT first request engineering and cost estimates through completion of construction and activation."

CSAO pages 43-46. Here again, a good statement of policy, objectives and action following acquisition by CSXT and NS.

Federal Railroad Administration comments on page 49.

FRA comments appear to have been written without regard to CSXT statements pages 192-201 and NS statements on pages 185-196 in this Volume 2.

McKnight comments STB 33388 page 8 1/29/98

FRA states in the first paragraph following the four bulleted items:

"Neither carrier, NS or CSX, focuses on highway-rail crossing and trespass safety prevention issues and other such issues involving public safety and emergency response." THIS IS NOT TRUE.

I am concerned that FRA statements in the Draft EIS in Volume 2 pages 1-51 are generally negative and show a biased view against the railroad industry and its safety practices. The general safety record in the rail industry has been declining for several years. Only 1996 was a temporary increase. And the accidents only happened on a few carriers.

Unfortunately, in recent years FRA's solution to problems is to promulgate more regulations. If there is a problem, FRA will come up with regulations as solutions.

VOLUME 4

Chapter 7, pages 7-7 and 7-8.

Although SEA admits that STB does not determine where a grade separated crossing is to be located and funded, SEA pushes for mediation and binding arbitration for 5 such proposed grade separations. This attitude of SEA is biased and unwarranted.

Here again SEA does not know the facts, or ignores them concerning these improvement projects for grade crossing safety. SEA should talk to FHWA and states concerning this matter. As I have mentioned earlier, this is an area of jurisdiction of states and local road authorities working with railroads.

Page 7-8, 2nd paragraph, last sentence.

"For communities on the final list where parties have not reached a negotiated agreement, SEA intends to recommend that the Board require the Applicants (CSX, NS and Conrail) to participate in a binding arbitration process to determine the funding allocation for those communities on the final list." This statement is reprehensible. Is SEA threatening both states, local communities and railroads?

McKnight comments STB 33388 page 9 1/ 29/98

Chapter 7 Table 7-4, pages 7-26 through 7-33.

"Preliminary Recommended Highway/Rail At-Grade Crossings That May Warrant Safety Improvements."

Here again it should be noted that Federal funding is available authorized by Section 130 USC. Railroads working with states and local road authorities can make safety improvements to highway/rail at-grade crossings.

Table 7-7 pages 7-43 through 7-46. Delays can be reduced through cooperation of the railroads, states, local communities and proper regulatory agencies.

VOLUME 5B

Appendix N, page 8

It should be noted that with reference to FHWA, concerns with the Manual on Uniform Traffic Control Devices (MUTCD) are handled by the Office of Highway Safety under the Associate Administrator for Safety & System Development.

Also to be handled with FHWA is the matter of Federal funding for safety improvements at highway/rail at-grade crossings. This area is handled by FHWA's Office of Engineering under the Associate Administrator for Program Development.

VOLUME 5C

Appendix S

Three Norfolk Southern letters deserve commendation for positive attitude and a pro-active plan to improve safety at highway/rail at-grade crossings. My strong support is for these projects as proposed by NS and congratulate them on their positive approach.

The letters are dated Nov. 25, 1997, as follows:

* Norfolk Southern Mitigation Proposal for Erie, Pennsylvania.

* Norfolk Southern Mitigation Proposal for Muncie, Indiana Line Segment Muncie to Alexandria.

McKnight comments STB 33388 page 10 1/29/98

* Norfolk Southern Mitigation Proposal
for Lakewood, Rocky river, West Lake and Bay
Village, Ohio and on to Vermilion, Ohio.

VOLUME 6 ABANDONMENTS

Pages 1, 2, 22, 36

Page 22, Section 2.1.3.8 Transportation
this is a positive approach to improving
safety at highway/rail at-grade crossings by
CSXT proposing to abandon 29 miles of line
between Danville and Paris, IL. This
abandonment will eliminate the need for 29
public and 16 private highway/rail at-grade
crossings.

A second major approach to improving
safety at highway/rail at-grade crossings is
the proposed abandonment of 21.5 miles of line
between South Bend and Dillon Junction, IN by
the Norfolk Southern. This abandonment will
eliminate 20 public and 19 private
highway/rail at-grade crossings.

CONCLUDING COMMENTS

My main concern with the Draft EIS is
with safety at highway/rail at-grade
crossings, which I have addressed.

I do wish to commend SEA with a generally
good report. But there are some areas with
which I have concern and/or disagreement, but
will not comment on as I have less expertise
than others who will no doubt comment.

This concludes my comments.

Finance Docket No. 33388
Surface Transportation Board
1925 K Street NW
Washington, DC 20423-0001

Dear Ms. Kaiser,

The Schuyler County Environmental Management Council is an advisory body appointed by the County Legislature to address matters of local environmental concern. In such capacity we have received and reviewed the Draft Environmental Impact Statement, "Proposed Conrail Acquisition", Finance Docket No. 33388.

Data within this document indicates that the rail line within Schuyler County, a 15-mile piece of Segment ID# N-060 (Corning, NY - Geneva, NY), can expect a 500% increase in gross freight tonnage, should the Conrail Acquisition proceed. Although the absolute increase in the number of trains per day is small (from 0.2 to 1.6/day), this nonetheless constitutes a significant change in the status quo for our community and we wish to make known concerns that we hope can be addressed in the final draft of the impact statement. Our concerns are as follows:

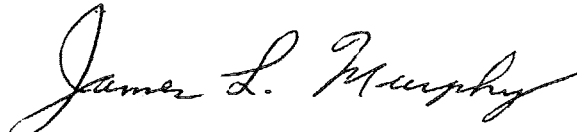

- A rural route of such limited use may not receive the necessary line upgrades expected for line segments having a comparable percent increase in tonnage but more heavily trafficked in numbers of trains per day.
- There is a large number of rural at-grade crossings whose traffic levels are below the threshold for mitigation measures as described in the impact statement. Many of these crossings occur on secondary roads leading to farms, wineries and private homes. Will our 500% increase be sufficient to result in upgraded traffic warning signals?

- Training and equipment are needed for local volunteer emergency response teams who may be required to respond to accidents involving hazardous materials. Our concern here is heightened because the rail line through our county will traverse farmland and vineyards. Responding emergency volunteers must be prepared to protect themselves and effectively contain spills of hazardous materials should they occur. To what extent would the Conrail Acquisition result in such training and equipment for our local volunteers?

There is no doubt that the increase in rail traffic as outlined in the draft statement will result in significant positive environmental impacts such as more efficient use of fossil fuels, reduced truck traffic on highways and lessened air pollution. The Schuyler County Environmental Management Council supports this change as it strives to protect our local environment from any adverse consequences resulting from this change.

We look forward to your timely response to our concerns.

Sincerely,

James L. Murphy, Chair
Project Review Committee,
Schuyler County EMC

Washington, DC 20423-0001

SUBJECT: STB Finance Docket No. 33388

The Capital District Transportation Committee (CDTC), the metropolitan planning organization for the Albany, NY area, has reviewed the Draft Environmental Impact Statement (DEIS) for the Conrail acquisition.

CDTC has ongoing concerns with the effective implementation of the safety integration plan, the accommodation of passenger trains over the long term (on-time performance, high-speed initiatives in NYS), negotiated competitive access to New England via Albany, and competitive freight access on the east side of the Hudson River to NYC. We will continue to monitor the private negotiations on these matters and STB proposed actions. However, the DEIS does not provide an environmental basis for the imposition of conditions in these matters. Based on the findings in the DEIS, the CDTC does not see the need to impose conditions on the acquisition specific to our region at this time.

CDTC will be an ongoing participant in this proceeding. Policy matters, such as an extended STB oversight period, will be addressed in subsequent submittals.

Thank you for this opportunity to comment.

Sincerely,

John P. Poorman

BEFORE THE
SURFACE TRANSPORTATION BOARD

Finance Docket No. 33388

METRO-NORTH COMMUTER RAILROAD COMPANY'S COMMENTS
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

Metro-North Commuter Railroad Company ("Metro-North") hereby submits its comments on the Draft Environmental Impact Statement ["DEIS"] on the proposed acquisition of Conrail by Norfolk Southern and CSX. The DEIS was prepared by the Surface Transportation Board's Section of Environmental Analysis ["SEA"] and distributed on December 12, 1997.

Our comments are set forth in three sections. The first section pertains to Metro-North's operations east of the Hudson River on the Harlem, Hudson and New Haven Lines which radiate in the east and north directions out of Grand Central Terminal in New York City. The second section pertains to Metro-North's West of Hudson service, in particular to that segment between Suffern, NY and Port Jervis, NY where the NS/CSX proposal contemplates transfer of the existing Conrail owned trackage to Norfolk Southern. This segment is used by passenger trains operated under contract for Metro-North by NJ Transit Rail Operations, Inc. ("NJ Transit"). The third section relates to a matter of general applicability.

Section I -- East of Hudson Operations

- (A) The discussion of commuter rail service contained in Volume 1 of the DEIS (§ 4.7.1) states that Metro-North carries 201,000 daily passengers. Based on 1997 ridership, that number should be 218,000 daily passengers.
- (B) The ownership information regarding several line segments set forth in the "Master Table Of All Rail Line Segments" (attachment ES-B to the Executive Summary) appears to contain some incorrect information regarding Metro-North lines. Specifically, segments C-701 through and including C-705 are listed as presently in Conrail ownership to be transferred to CSX ownership. This is true only insofar as freight service responsibility is concerned. Legal ownership of segments C-701 and C-702 is vested in the State of Connecticut. That portion of segment C-703 between Norwalk and the New York-Connecticut state line also is owned by the State of Connecticut; the section between the state line and New Rochelle is owned by Metropolitan Transportation Authority, a public benefit corporation of the State of New York and Metro-North's parent agency. Segments C-705 and C-729 are owned by American Premier Underwriters, Inc. and subject to a long term lease to Metropolitan Transportation Authority. All of these lines are maintained and controlled by Metro-North which operates commuter railroad service over them.

(C) There is discussion of New York State Railroad Passenger Service at pages NY-14 through NY-16 of Volume 3-B. At the bottom of page NY-14 the statement is made that Metro-North, Amtrak and Conrail conduct operations pursuant to the rules developed by the Northeast Operating Rules Advisory Committee. This statement is incorrect as to Metro-North which employs its own operating rules. That same paragraph contains a statement that Metro-North carries 61.3 million passengers annually on its three main lines. During the calendar year 1997, 62.6 million passengers were transported by Metro-North.

Section II -- Suffern-Port Jervis Line

(A) Fifteen minute clearing window for passenger trains. To address passenger rail safety, the DEIS proposes that Norfolk Southern establish passenger trains as "superior," and maintain certain separations (30 minutes according to Chapter 7 and 15 minutes according to Chapter 5) between passenger and freight trains, on several line segments over which there are both freight and passenger operations. See proposed Mitigation Measure No. 2(A), Chapter 7 at 7.2.2 and Chapter 5 at 5-NY.5.1. The line segment between Campbell Hall and Port Jervis (N-063) would be one of these segments.

(1) The Description of the Proposed Mitigation in the DEIS/is
Confusing and Inconsistent

Chapter 3 of the DEIS describes a series of potential mitigation measures that the Board might consider in the event that a determination were made that some acquisition-related mitigation was appropriate with respect to passenger train safety. See section 3.3.3 (which refers to the list of potential mitigation measures set forth in connection with freight train safety in section 3.2.3). Nowhere in Section 3.3.3 or the section cross-referenced in it - in fact nowhere in Chapter 3 - is there any reference to the freight/passenger train separation rules as an appropriate or potential mitigation measure that might be warranted.

Such a separation rule nonetheless appears (and the potential mitigation measures listed in Chapter 3 do not) in the sections of the DEIS (Chapters 5 and 7) describing the mitigation that SEA has proposed. However, to further confuse matters, the descriptions of the proposed train separation rule in Chapters 5 and 7 are not consistent with one another.

The proposed superior train/train separation mitigation described in Chapter 7 of the DEIS contemplates that freight trains moving in the same or opposite direction on the same track on any of these line segments would need to be clear of

the track at least 15 minutes before and 15 minutes after the expected arrival of a passenger train at any point. This proposed measure would thereby establish a 30 minute separation window around passenger trains moving on that track. See Section 7.2.2 at p. 7-12.

By contrast, the discussion of mitigation of the individual line segments found in the state-by-state sections of Chapter 5 of the DEIS does not use the term "superior trains." Rather, Chapter 5 contemplates a proposed separation window under which freight trains, both opposing and moving in the same direction, would need to be clear of a point on the same track at least 15 minutes prior to the estimated arrival of a passenger train; no 15 minute window after a passenger train is proposed in Chapter 5. See Sections 5-NY.5.1 at pages NY-9 and NY-10. Further, whereas the mitigation proposed in Chapter 7 contemplates that the separation requirements would not apply when the freight train is moving in the opposite direction away from the passenger train, there is no similar qualification in the Chapter 5 description of the proposed mitigation. The Executive Summary reflects the "Chapter 7" description.

While the DEIS is internally inconsistent as between Chapter 3 (no train separation rule even contemplated), Chapter 5 (a 15 minute rule) and Chapter 7 (a thirty minute rule), for the

variety of reasons described below, Metro-North submits that neither the mitigation proposed in Chapter 5 nor that described in Chapter 7 is necessary and appropriate.

(2) There is no Evidence that the Proposed Mitigation will Enhance Safety

The statistical review of passenger/freight train collisions undertaken by SEA considered collisions of a type that would not be addressed by the proposed mitigation, i.e., collisions resulting from freight trains and passenger trains operating on different tracks or from passenger trains hitting parked freight cars. The actual rate of passenger trains being hit from behind by freight trains or vice versa, is closer to zero, and thus the mitigation proposal addresses an unlikely safety risk.

(3) The Proposed Mitigation Relies on Archaic Notions of Train Operation That Overlook the Existence of Modern Signaling and will not Enhance Safety

Even assuming that some mitigation were warranted, the proposed assignment of "superior" status to one type of train over another, and the proposed temporal separation of trains (e.g., the 15/30 minute separation rule proposed in the DEIS) would re-introduce railroad operating procedures which have

been outdated for decades. While train superiority and temporal separation rules played a role in ordering train operations in the era prior to the introduction of modern train signals and communications, these procedures are obsolete on lines having modern signal systems.

The Port Jervis Line presently is equipped with a Centralized Traffic Control System ("CTC"), a remote dispatcher-controlled system with automatic block signals that provide the engineer with information about other trains on the line segment, as well as other important information.

Such signals and systems provide tolerances that allow all trains, both freight and passenger, to safely share the same tracks. These systems are designed to prevent train collisions, while enhancing track capacity and service efficiency. The systems are recognized as safe by the FRA and are in use throughout the rail industry.

Metro-North plans installation of a new signal system to further enhance safety on this line. NJ Transit presently is installing automatic train control/positive train stop with cab signals on the portion of the Southern Tier Line between Hoboken and Suffern, which it owns. During the next few years Metro-North plans to extend this system the remaining 65 miles from Suffern to Port Jervis at a cost of \$33.4 million. Upon

completion, it will be necessary for Norfolk Southern or any other freight operator to use properly equipped locomotives as lead units on all trains traversing this line. This project will greatly enhance safety since an emergency breaking application will be instituted in the event that an engineer should pass a stop signal. We respectfully submit that both the existing signal system and the planned state of the art system can be relied upon to properly separate trains without resort to the 15/30 minute separation rule proposed in the DEIS.

The reintroduction of outmoded concepts of train superiority and temporal separation also is a move in the wrong direction from the perspective of efficient train operations. A 15/30 minute separation rule would make it difficult for freight trains and passenger trains to share the same tracks for during certain periods of the day. Metro-North's present Trackage Rights Agreement with Conrail provides that passenger trains shall have priority and we expect that arrangement to continue regardless of whether Metro-North or Norfolk Southern obtains control of the Port Jervis Line. That being said, it also is necessary to state that Metro-North and its West of Hudson Service Operator, NJ Transit, do not desire to disrupt Norfolk Southern's important freight operations or to make it more difficult for NS to move its trains over the line. Clearly the temporal separation envisioned in the DEIS would

reduce the capacity of the line at a time when the capacity needs to be enhanced to accommodate the additional passenger and freight trains which NS and Metro-North are planning to operate over it. What is needed is very careful dispatching by personnel who are sensitive to the needs of each service, not a series of rigid rules which would be more suitable to non-signalized ("dark") territory from a past era in railroading.

(4) The Proposed Mitigation could Impair Metro-North's Plans for Additional Passenger Trains

Quite frankly, Metro-North also fears that its plans for additional passenger train operations, as set forth herein and in its testimony previously filed in this proceeding [MNCR-2] could be impaired if the 15/30 minute separation windows were to be mandated. This mitigation measure would effectively decrease the capacity of the line and make it more difficult for both passenger and freight services to co-exist on the same trackage. Both service operators would have a more difficult time working together in a cooperative spirit to accommodate each other if confronted with a rigid rule of this nature. The importance of this cooperation becomes even more apparent when one considers that much of the future passenger service expansion will be filling in some of the existing gaps between passenger trains during off-peak hours and on

weekends. As these trains are added, there will be fewer "windows" of time when no passenger trains are on the line and it will be increasingly necessary for freight and passenger trains to pass each other enroute.

(5) Additional Safety Measures Should be Carefully Considered in Coordination with FRA and Other Passenger Railroads

Section 202 of the Railroad Safety Act of 1970 [49 U.S.C. § 20101], grants to the Federal Railroad Administration the power to regulate "every area of railroad safety". FRA has promulgated extensive safety regulations and presently is considering several additional proposals relating to passenger train issues. No proposal similar to the 15/30 minute time separation has been proposed to or is under consideration by FRA. Moreover, to the best of our knowledge, no passenger or freight railroad operating in the United States has requested the evaluation of such a proposal. Under these circumstances, Metro-North submits that any adoption of such a drastic departure from modern railroad operating practice should be handled by the Federal Railroad Administration by means of the rule making process. This would enable careful and deliberate consideration by FRA and all concerned parties.

(B) Capacity of the Line. The discussion of New York State Passenger Rail Service at Section 5-NY.8 contains references

to the Suffern-Port Jervis Line including the fact that Norfolk Southern proposes increasing traffic to a total of 12 trains per day. The provision dealing with the summary of potential effects and preliminary recommended mitigation [5-NY.8.1] states that based on the evaluation of railroad capacity issues and information provided by the Applicants including Metro-North operating plans and existing and projected train traffic, SEA concluded that the existing capacity of the commuter rail line segments could accommodate the proposed increase in freight train levels. Further discussion of this line appears at pages 4-33 through 4-36 where it is observed that the portion of the line with single track and passing sidings does not permit substantial operating flexibility during the commuter peak periods.

In order to enable a more complete evaluation of this matter, we are providing the following information:

- Metro-North's present operation on the Port Jervis Line consists of 17 revenue and one non-revenue passenger train on Monday through Thursday; on Fridays there is one additional revenue passenger train. Saturday service consists of seven revenue passenger trains. On Sundays there are six revenue and one non-revenue passenger train. The current operating timetable, containing the schedules of both revenue and non-revenue passenger

trains, is attached as Exhibit A.

- Toward the end of 1996, Metro-North reached agreement with NJ Transit Rail Operations, Inc. on the business terms of a long term operating agreement covering this line. Two of the principal provisions of this agreement are Metro-North's capital contribution toward NJ Transit's Secaucus Transfer Project and NJ Transit's agreement to operate additional passenger trains for Metro-North. That agreement was signed on October 6, 1997 and became effective as of July 1, 1996. Some of the agreed-upon schedule enhancements were incorporated into the October 26, 1997 timetable. The agreement also provides for a total of up to seven roundtrip (i.e., 14 trains) weekday off-peak trains and up to eight roundtrip Metro-North express trains on each Saturday, Sunday, and holiday. Moreover, effective with the opening of the Secaucus transfer station in 2002, NJ Transit also has agreed to operate one additional peak hour Metro-North express train in each direction. A copy of the relevant pages from the new Metro-North/NJ Transit agreement is attached as Exhibit B. The agreement reflects the minimum number of new trains; even more service could result from future negotiations between Metro-North and NJ Transit.

- Attached as Exhibit C is a Verified Statement of Howard Permut which was filed with the Board in support of Metro-North's comments and request for conditions in this proceeding. This statement and the attached tables demonstrate the service increases and ridership growth which have been attained during the period of Metro-North's stewardship over this line. It sets forth the projected growth in Port Jervis Line service and ridership which will be accelerated by the completion of the Secaucus Transfer station in 2002. It also discusses the capital investment already made by Metro-North for this line as well as the future investment of \$93.5 million needed to bring the line to a proper condition to accommodate a reasonable level of passenger service and freight operation. Finally, Mr. Permut's statement references an additional \$104,000,000 of capital improvements to support the long term service expansion plans through the year 2020. We are providing this information because we believe Metro-North should be given control of this line either by purchase acquisition or a very long term lease in order to justify the planned capital investment of public funds to bring the line to the proper condition for the projected operations. The line in its present state simply cannot accommodate the added service planned by both NS and Metro-North.

Based on the information provided in Volume 1, pages 4-35 and 4-36, we assume NS has advised SEA that it plans to operate the freight trains during the periods of little or no passenger traffic. However, some of the schedules filed by NS in this proceeding do not bear that out. See, e.g., NS-19, book 2 of 4, at page 3 showing the schedule of train DSCGRX(1) between Chicago and Croxton at times which were in direct conflict with several westbound passenger trains. Although we appreciate NS's intention to operate freight service primarily during the non-passenger periods, as pointed out in Section II A (4) infra, there will be fewer such periods as passenger service is expanded pursuant to our contract with NJ Transit. Thus, some enhanced facilities and very careful dispatching will be needed to enable the passenger and freight operations to co-exist on this line. We also believe NS may have made some changes in its projected freight schedules contained in NS-19 and suggest that SEA further pursue this matter.

(C) Hazardous Materials Transport. In Volume 3B, page 5-30, it is recommended that line segments designated N-062 and N-063 comprising the territory between Suffern and Port Jervis, NY be designated as a new Key Route for the transportation of hazardous materials. Further elaboration of this is contained at page NY-13 which indicates that hazardous material carloads over these segments will increase from zero pre-acquisition to 18,000 post-acquisition.

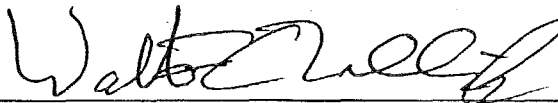

Metro-North concurs in the recommendation that NS bring this rail line segment into compliance with AAR Key Route standards and practices. Because the route now would host a very substantial level of hazardous material carloads, as compared with virtually none at present, we further recommend NS develop a Hazardous Materials Emergency Responsive Plan and take further measures as if this were a Major Key Route. Although much of this railroad line traverses areas of low population density, some portions pass through developed communities which should have the proper information and hazardous materials emergency response training.

Section III -- Matter of General Applicability

(A) Highway-Rail grade crossings. Metro-North supports the recommended steps for enhancing safety at highway-rail grade crossings as set forth in Volume IV, Section 7.2.1.

Respectfully submitted,

Notes

Agreement for Operation by NJ TRANSIT RAIL OPERATIONS, INC.
of Certain Rail Passenger Service on the Main Line/Bergen County
Line, and Pascack Valley Line for METRO-NORTH COMMUTER RAILROAD
COMPANY

***** ***** ***** ***** ***** *****

This Agreement, executed this 6th day of October, 1997 to be effective as of July 1, 1996 (except as otherwise herein expressly provided), is made between NJ TRANSIT RAIL OPERATIONS, INC. ("NJTRO"), an instrumentality of the State of New Jersey, with offices at One Penn Plaza East, Newark, New Jersey 07105, and METRO-NORTH COMMUTER RAILROAD COMPANY ("M-N" or "Metro-North"), a public benefit corporation of the State of New York with offices at 347 Madison Avenue, New York, New York 10017.

WITNESSETH:

WHEREAS, effective July 1, 1985 NJTRO and Metro-North entered into an agreement entitled "Agreement between NJ TRANSIT Rail Operations and Metro-North Commuter Railroad for Certain Rail Passenger Service on the Main Line/Bergen County Line and Pascack Valley Line" (the "Prior Agreement"); and

WHEREAS, supplemental letter agreements dated October 7, 1991 and September 27, 1995 and another such agreement effective May 23, 1994 were entered into by the parties (the "Supplemental Agreements"); and

WHEREAS, pursuant to Section 2.02 of the Prior Agreement, the Prior Agreement was terminated by NJTRO for the purpose of negotiating a new agreement; and

WHEREAS, pursuant to Section 2.03 of the Prior Agreement, NJTRO continued to provide rail passenger service and Metro-North continued to reimburse NJTRO for said rail passenger service pending the execution of a new agreement, and

WHEREAS, NJTRO and Metro-North have reached agreement on appropriate new terms and conditions for provision of and compensation for services described herein as a replacement for the Prior Agreement and the Supplemental Agreements;

NOW, THEREFORE, in consideration of the foregoing recitals and mutual promises contained herein, NJTRO and Metro-North agree as follows effective as of July 1, 1996 (except as otherwise herein expressly provided):

3.03 NJTRO Control

NJTRO retains the right to establish the overall policies governing the management and operational control of the M-N Service Area, including but not limited to dispatching and control of all trains, except (i) as otherwise provided in this Agreement, and (ii) for any management and maintenance performed by M-N or third parties on properties required for M-N Service beyond the end of NJTRO ownership at M.P. 31.5 on the Main Line/Bergen County Line. This right to maintain operational control shall include, but not be limited to, the flexibility to adjust schedules and consists on a daily basis, regardless of other provisions of this Agreement, based on emergency or other unanticipated circumstances with which NJTRO management may be presented on any given day.

3.04 NJTRO Operations

(a) Effective July 1, 1996, NJTRO shall provide the M-N Service in accordance with the operating schedules identified in Exhibit 1 hereto, and as they may be amended from time to time pursuant to this Agreement or other agreement of the Parties. Upon the commencement of service to the Secaucus Transfer Station, the said operating schedules (as the same may have been amended as herein provided) shall be revised to provide that all trains operated in M-N Service (except Shuttle Trains) shall stop at that station unless M-N otherwise directs NJTRO.

(b) The scheduled non-stop running time between Suffern and Hoboken shall be 41 minutes and shall not be changed without the agreement of both Parties. Said running time shall be incorporated into the next timetable change after execution of this Agreement.

(c) Within 90 days after the execution of this Agreement, the Service Standards set forth in Exhibit 2 hereto shall be established, observed and reported to M-N by NJTRO for all trains operated in M-N Service. M-N may also perform random inspections at Hoboken and Port Jervis to observe compliance. Delays reasonably attributable to track, signal system and other right-of-way problems in the territory West of Suffern shall be excluded from the on time performance calculations as per Exhibit 2, Items 1 through 4.

(d) NJTRO shall perform "E-cleaning" of the Metro-North owned fleet of coaches on a 90-day cycle at Hoboken or the Meadows Maintenance Complex. The cost of this work is included in the Base Cost set forth in Section 7.01(a). This work shall be performed in accordance with NJTRO's standards applicable to its coaches as set forth in Exhibit 9. NJTRO shall furnish weekly records of all E-cleaning performed on coaches used in M-N Service on the Port Jervis Line to Metro-North's Superintendent-West of Hudson. In the event that experience demonstrates that the work is not being

performed adequately, in M-N's judgement, the parties will meet to develop remedial action.

(e) NJTRO shall perform overnight car cleaning at Port Jervis, which shall include the functions set forth in Exhibit 8.

(f) The parties will conduct monthly meetings to review operations, finances and other matters relating to the M-N Service. Each party will provide to the other its data regarding compliance with the Service Standards at said meetings.

3.05 Service Changes--Port Jervis Line

(a) One additional AM Peak NY State Express Train shall be operated and one additional PM Peak NY State Express Train shall be operated effective with the October 1997 timetable. Said new trains shall operate on the schedules shown in Exhibit 3 subject to minor adjustments. NJTRO acknowledges that M-N has provided NJTRO with one additional cab car and three additional coaches for operation of these trains. Pursuant to Section 5.02(b) of this Agreement, NJTRO will provide the locomotive for these trains until M-N has acquired and provided to NJTRO a new or remanufactured locomotive. The annual costs of operating these additional trains shall be \$501,000 based on FY'96 dollars. Such costs shall be adjusted to reflect changes in the AAR Index as provided in Section 7.01(a).

(b) The following additional service shall also be operated effective with the October 1997 timetable on the schedules shown in Exhibit 3, subject to minor adjustments:

- Convert existing train 54 to a NYS Express Train;
- Convert existing trains 55, 57 and 63 to NYS Express Trains;

NJTRO acknowledges that M-N has provided NJTRO with one additional cab car for operation of these trains. Pursuant to Section 5.02(b) of this Agreement, NJTRO shall provide an additional locomotive for these trains until M-N has acquired and provided to NJTRO a new or remanufactured locomotive. The annual costs of the service changes covered by this Section 3.05(b) shall be \$330,000 based on FY'96 dollars. Such costs shall be adjusted to reflect changes in the AAR Index as provided in Section 7.01(a).

(c) Effective with the opening of the Secaucus Transfer Station, the following service shall be added if requested by Metro-North at least 90 days prior to such station's opening (so long as NJTRO gives Metro-North sufficient advanced notice of such opening to permit 90-days' notice; otherwise such request will be given reasonably in advance of such station opening):

- One M-N Express Train or, if M-N so elects with NJTRO concurrence, a NYS Express Train to arrive Hoboken between the hours of 6:45 AM and 9:15 AM;
- One M-N Express Train or, if M-N so elects with NJTRO concurrence, a NYS Express Train to depart Hoboken between the hours of 5:15 PM and 8:15 PM.

The costs of the additional trains authorized by this subsection (c) shall be calculated on an incremental basis in accordance with the provisions of Exhibit 5. Operation of the additional trains authorized by this subsection (c) is subject to the condition that sufficient Metro-North equipment is available, as calculated pursuant to Exhibit 4A.

(d) Upon Metro-North's request, additional AM Peak and PM Peak NYS or M-N Express Trains shall be operated provided that M-N provides sufficient equipment, sufficient NJTRO crews are available to operate such trains and the additional trains do not exceed NJTRO's physical capabilities or unreasonably interfere with NJTRO's then existing or planned trains. The costs of any such additional M-N Service trains shall be calculated on an incremental basis in accordance with the provisions of Exhibit 5.

(e) Upon Metro-North's request, a total of up to seven round trip weekday off-peak¹ NYS or M-N Express Trains and up to eight round trip NYS or M-N Express Trains on each Saturday, Sunday and holiday shall be operated provided that (i) sufficient equipment owned by M-N and/or NJTRO is available, and (ii) NJTRO has available to it with such schedule change crews to operate the additional service requested by M-N pursuant to this subsection (e). In any event, subject only to the condition that sufficient M-N and/or NJTRO equipment is available, any additional service requested by M-N as provided in this subsection shall be operated no later than one year following M-N's request for such additional service as from time to time (but not more frequently than every six months) made. The costs of any such trains shall be calculated on an incremental basis in accordance with the provisions of Exhibit 5.

(f) Upon Metro-North's request, special one-day/pre-holiday trains shall be operated or timetable changes made to allow for such special service, provided that sufficient M-N and/or NJTRO equipment is available. The costs or credits of any such trains shall be calculated on an incremental basis in accordance with the provisions of Exhibit 5.

(g) To the extent that M-N is obligated to furnish additional equipment to permit the M-N Service or schedule changes authorized

¹All trains other than AM Peak or PM Peak Trains.

pursuant to the provisions of this Section 3.05 to be implemented, such equipment shall be compatible with the equipment then used in the Hoboken equipment pool for M-N Service.

(h) NJTRO and M-N are jointly responsible for service changes to Common and Connecting Trains.

(i) Any M-N Service or schedule changes authorized by this Agreement shall be implemented upon ninety (90) days' notice by the party desiring the change, except for the changes authorized by Subsection (a), (b), (c) and (e) above which shall become effective as provided in those subsections. With respect to the Main Line/Bergen County Line, M-N may amend the schedules therefor unilaterally at any time on ninety (90) days' notice to NJTRO for the purpose of eliminating a train from M-N Service. The certification requirements of Section 2.04 shall apply to any such notice.

(j) The costs of any additional trains requested by M-N above the level specified in Exhibit 1 hereof not covered by subsections (a) and (b) hereof shall be calculated on an incremental basis in accordance with the provisions of Exhibit 5. The credit for M-N Service reductions requested by M-N shall be calculated on an incremental basis in accordance with the provisions of Exhibit 5.

(k) In accordance with the provisions of Section 3.01 hereof, Metro-North is responsible for making appropriate arrangements with Conrail or any successor in interest thereto for the use of its line and facilities west of Milepost 31.5 at Suffern for any service change authorized by this Section 3.05. In the event that Conrail or its successor in interest to such line and facilities should take exception to any of the service changes authorized by this Section 3.05, such service change shall be held in abeyance until arrangements with Conrail or such successor to permit such change have been made.

3.06 Service Changes--Pascack Valley Line

(a) Upon Metro-North's request, special one-day/pre-holiday trains shall be operated or timetable changes made to allow for such special service, provided that sufficient equipment and NJTRO crews are available.

(b) NJTRO and M-N are jointly responsible for the any service changes to Common Trains.

(c) In the event that NJTRO proposes the discontinuance of a particular Common Train, M-N has the right to retain that train to serve M-N Stations.

(d) Any service or schedule changes authorized by this section 3.06 shall be implemented upon ninety (90) days' notice by

VERIFIED STATEMENT

OF

HOWARD PERMUT

My name is Howard Permut, and my business address is 347 Madison Avenue, New York, New York 10017. I am Vice President of Planning and Development for Metro-North Commuter Railroad ("Metro-North"), a position I have held since 1991. From 1983 through 1991, I was Director of Planning and Marketing for Metro-North.

Metro-North has funded commuter railroad passenger service between Hoboken, New Jersey and Port Jervis, New York since January 1, 1983. This service is operated by NJ Transit Rail Operations, Inc. ("NJ Transit") under an operating agreement with Metro-North and is an extension of NJ Transit's commuter service beyond the limits of its territory at Suffern, NY.

Metro-North recently successfully renegotiated a new contract with NJ Transit that grants Metro-North explicit rights to significantly expand service in the future as well as commits Metro-North to fund certain capital improvements to meet projected growth in ridership (described in more detail below).

Growth In Port Jervis Line Service and Ridership Since 1983

The amount of service provided on the Port Jervis line and the number of customers making use of the line have both grown dramatically in the fourteen years since Metro-North started funding and improving the service (See Table 1 attached).

The overall number of trains operated weekly on the Port Jervis line has increased from 22 to 99 (corresponding to an increase of 350%, 1982 to present) while the number of customers using the line grew 69% between 1984 and 1996 (the last year for which complete data is available). Reflecting the fact that the Port Jervis line serves both commuters and discretionary ridership markets, Metro-North has increased service on the line during both peak and off-peak periods on weekdays as well as on weekends and holidays.

Projected Growth in Port Jervis Line Service and Ridership: 1996 - 2020

Orange County population is projected to be the fastest growing county in the MTA District over the next ten years. Furthermore, the County is experiencing significant demographic change by becoming more of a residential service area to the Manhattan and New York City job market. This trend will be accelerated by the completion of the Secaucus Transfer station in 2002. The opening of this new link in the transportation network will for the first time provide Port Jervis line customers commuter rail access to midtown Manhattan (at Penn Station). Port Jervis line customers (as well as customers using other NJ Transit Hoboken Division rail lines) destined for midtown Manhattan will be able to transfer to Northeast Corridor rail service at Secaucus thereby receiving a significantly faster and more reliable trip than they could previously get by transferring to PATH service at Hoboken. The reduced travel time and improved reliability for travel to Midtown is expected to produce significant gains in rail ridership, both by improving Metro-North's market share among Orange County residents currently making such trips to Midtown as well as by spurring overall higher growth in total travel to Midtown from the County in the years following the opening of the transfer station.

In total, this will result in significant increases in Port Jervis line ridership over the next 23 years. By the year 2020, total annual ridership on the Port Jervis line is projected to grow to 2.1 million (corresponding to a 173% increase from 1996 levels) and Metro-North plans to increase the number of trains operated from 99 to 203 per week (increase of 105%) during that same 23 year period.

Port Jervis Line Capital Expenditures

In support of the major service improvements that have already been made or are planned in the near future, Metro-North has made major capital improvements on the Port Jervis line. Overall, Metro-North has expended \$101.1 million (1997 \$) in capital funds on the line since 1983 (See Table 3 for details). This includes Metro-North's contribution of \$53 million toward the construction of the Secaucus Transfer station now underway in the Meadowlands.

This money is in addition to the significant capital investment made by New York State DOT in the early 1980's to upgrade the portion of the Port Jervis line between Harriman and Middletown. This work included major track rehabilitation, signal improvements, and the construction of three new rail stations and rehabilitation of one major station with associated parking.

In addition, Metro-North estimates that an investment of \$93.5 million, of which \$88.5 million is for right-of-way improvements, would be needed to bring the Port Jervis Line to a proper condition to accommodate a reasonable level of passenger service and freight operation.

Finally, Metro-North has developed plans for \$104 million (1997 \$) worth of additional capital improvements on the Port Jervis line to support the railroad's long-term service expansion plans for the line through 2020.

Jean Cunningham
Slover & Loftus

Dear Jean:

I have just received notification of the action to be taken by Norfolk-Southern in the City of Dunkirk. This action would permit Norfolk-Southern to close certain railroad crossings in the city and make those crossings cul-de-sacs.

As Mayor of this fair city, I wish to express my strong opposition to such an action. I am prepared to file an injunction on the easement Norfolk-Southern has contracted with the City. It is the position of this city that Norfolk-Southern relocate the Norfolk-Southern line to the Conrail line. We urge the Norfolk-Southern organization to comply with our request in the interest of safety, health and welfare for our fine residents.

As Mayor of the City of Dunkirk, I go on public record today to protest the action of Norfolk-Southern. I am also ready to invoke legal proceedings to prevent Norfolk-Southern access through the city.

Thank you for your consideration and reply.

Very truly yours,

ROBERT D. KESICKI
Mayor

Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K Street, NW
Washington, DC 20423-0001

Dear Madam or Sir:

The following comments on the Draft Environmental Impact Statement (DEIS) for the acquisition of Conrail by CSX and Norfolk Southern are submitted on behalf of the Tri-State Transportation Campaign (Tri-State), a consortium of thirteen environmental, transportation and planning groups working together to promote an economically and environmentally sound transportation system in a thirty-three county area in metropolitan New York. Tri-State seeks to reduce reliance on cars and trucks throughout the region in order to reduce congestion and pollution and support rational land use planning. One hundred citizens' groups and local officials have joined as affiliate members.

In these comments, Tri-State is submitting its concerns regarding the DEIS that has been prepared for the proposed Conrail acquisition. We believe that additional action on the part of the Surface Transportation Board (Board) in developing a complete picture of the economic and environmental impact of the applicants' plan is required pursuant to NEPA and the Board's guidelines related to rail consolidations and mergers.

As has been noted in our previous submissions, Congress has sought to encourage competitive rail service and infrastructure improvement through its regulation of the railroad industry. Congress has indicated its concern that the management of these transportation assets take into consideration all factors that are related to the "public health and safety." See 49 U.S.C. §§ 10101(8) and (14).

In order to better protect that health and safety, the Board has the authority to impose conditions upon proposed railroad consolidation transactions. See 49 U.S.C. § 11324 (c). Such conditions must be imposed when the merger may result in effects that are harmful to the public. See 49 U.S.C. § 11324(d); Union Pacific - Control - Missouri Pacific, Western Pacific, 366 I.C.C. 462, 562-65 (1982). The applicants' plan details changes in traffic and business patterns as a result of the consolidation that will increase both rail and truck usage in an already congested region, bringing profound environmental impacts.

These environmental impacts are not adequately addressed in the DEIS. The Railroad Consolidation Procedures require that the applicants detail any impact that changes in service may

A-332-c

have on the public welfare. See 49 C.F.R. § 1180.8 (a)(2). This requirement has been interpreted as ensuring that the Board will have all facts that may be required in order for the Board to be able to make an informed decision on the merits of the consolidation proposal and to comply with its statutorily required duties. See Union Pacific, Missouri Pacific - Control - Chicago and North Western, 9 I.C.C. 2d 939, 950 (1993). The DEIS fails to address both the negative environmental impact of some of the results of the merger as outlined in the applicants' proposal and the impacts, positive or negative, of some alternatives to the applicants' proposal. We believe in particular that a Supplemental EIS is required in this case to evaluate the beneficial impacts that the proposed conditions submitted by Tri-State and others would have, especially in terms of the thresholds for air quality and how they are affected by changes in rail and intermodal activity. See 49 C.F.R. 1105.7(e)(5).

I. The Board failed to analyze certain significant and reasonable alternatives to the proposed action in the DEIS.

As part of the DEIS for the proposed action, the Board is required to consider any reasonable alternative to the proposed action and to provide an adequate discussion of the alternatives it considers. In particular, CEQ requires federal agencies to compare the environmental impacts of the proposed action to the impacts of the alternatives. According to CEQ, this alternatives analysis is the "heart" of the EIS.

In preparing the DEIS for the Conrail acquisition, the Board failed to consider many reasonable and highly significant alternatives to the proposed action. The Board evaluated three alternatives: the No-Action alternative, the proposed acquisition and the proposed acquisition with conditions. The conditions "could include ... modifications that other parties have requested in Inconsistent and Responsive Applications to the Board." DEIS at ES-3. The potential impacts of the proposals included in the fifteen "inconsistent and responsive applications" received by the Board are reviewed in the DEIS. Unfortunately, the eighty-eight remaining commentors did not receive such consideration in the DEIS and are very nearly ignored. Yet while the classification of comments as "inconsistent and responsive applications," on the one hand, or as "comments and requests for conditions," on the other, may be relevant to the Conrail acquisition proceedings, it is of no significance for the NEPA process, which is distinct. Moreover, this classification of comments does not reflect on the importance or the magnitude of the potential environmental impacts of the conditions contained in the comments, so should not be regarded as a sound basis for determining which conditions should be evaluated as part of the alternative "proposed acquisition with conditions." Indeed, the table in Appendix U of the DEIS states that many of the conditions that were included among "comments and requests for conditions" had potential impacts that are either "unknown" or "could increase rail operation above thresholds on affected segments." No further analysis was provided, however. Such further analysis must be included in the EIS.

By not conducting an adequate assessment of alternatives, the Board denies itself the opportunity to make a fair and informed independent decision on the environmental impacts of this transaction, which by law must precede its decision on the acquisition.

II. The conditions requested by Tri-State would have significant impacts.

Tri-State submitted comments on the scope of the EIS on August 6, 1997 requesting that the scope be modified to include a detailed assessment of alternatives of the type "proposed action with conditions." On October 20, 1997, Tri-State submitted comments to the Board requesting five conditions be included in the Board's decision to permit NS and CSX to acquire Conrail. On November 22, 1997, in response to the applicants' circulation of a supplemental operating plan for the North Jersey Shared Assets Area, Tri-State submitted comments to the Board reaffirming its original conditions and requesting that the Board require four additional conditions for the acquisition. These conditions would have assured two carrier competition for the 12.5 million persons residing in the East of Hudson portion of the Tri-State Region, the nation's largest metropolitan area and would have established important environmental protection mechanisms for the two carriers serving the West of Hudson portion of the region. Tri-State, on January 12, 1998, submitted a rebuttal to arguments raised by the applicants in their response to Tri-State's two requests for conditions. The nine conditions in these two requests would have significant effects in the four Impact Categories that we cited in our scoping submission, namely: 2. Transportation Systems, 3 Land Use, 5 Air Quality and 10. Environmental Justice.

Tri-State's conditions would have comparable effects to those requested in the comments filed on October 20, 1997 by Congressman Jerry Nadler and twenty-three members of the Congressional delegations of New York and Connecticut. Their position has since been endorsed by the City of New York and the State of New York. To regard the conditions requested by Tri-State and by the Congresspeople, on which the Board has made no decision to date, as insufficiently significant to warrant a thorough evaluation in the EIS is unreasonable.

A. Considerable potential for rail freight traffic exists East of the Hudson

In its various submissions to the Board, Tri-State identified studies conducted by Mercer Management Consulting, Inc. of the commercial opportunities for enhanced carload and intermodal freight to the East of Hudson sector of the Tri-State region. The applicants themselves used this firm to advance their arguments for the acquisition. The first of these studies, the New York Downstate Rail Freight Study, was completed in May 1995. That study found that as much as 22.9 million tons of freight destined for the downstate region was potentially divertable to rail, based on its survey of shippers in that region. The downstate region includes New York City, Long Island and Putnam and Westchester Counties, a very large portion of the East of Hudson sector of the Tri-State region. Rail freight could increase from 3% to about 25% of total freight market demand. At an average load of 17 tons per truck used by the applicants, this would amount to over 1.35 million truckloads per year diverted to rail for the downstate NY area. This is more than the 1.03 million truckloads the applicants expect to divert to rail for the entire eastern portion of the U.S.,¹ trumpeted as the major environmental benefit of their proposed action. These

¹ It should be noted that the Board's DEIS raises concerns about the validity of the applicants' estimate, suggesting that this environmental benefit is exaggerated through double counting. The Board did not estimate the amount of this exaggeration, nor explain the basis for its concern.

estimates are imprecise, but clearly if the potential truck-to-rail diversion resulting from the applicants' proposal is significant, then the diversion resulting from the conditions proposed by Tri-State is significant as well.

The Mercer study also suggests that 10.1 million tons would use an improved cross-harbor car float route. Car float improvements are one of Tri-State's key conditions for the acquisition. The Mercer study identified three critical factors for gaining this increased rail freight activity in the Downstate NY Region: (1) lower costs and improved service, (2) credibility in the marketplace, and (3) ability to raise capital. One of Tri-State's proposed acquisition conditions, extending NS service across the harbor to provide competitive rail service to points East of the Hudson, would allow great improvement with respect to all three of these factors.

In a second study, "Intermodal Goods Movement Study: NYC Rail Freight Access," completed in January 1997, Mercer Management found, using a somewhat different set of assumptions, that an improved cross-harbor car float link would attract 6 million tons of freight, mostly in rail carloads. This study detailed the economic and environmental consequences of a shift of this magnitude from truck to rail, so that information is readily available to the Board. This study also found that a roadtrailer-type operation through Penn Station was physically practical, could be initiated with very little investment and could be in operation in a very short time frame. Tri-State requested that NS be allocated rights to operate this service as a condition for the acquisition.

A third study prepared by Transmode Consultants, Inc., "The Oak Point Link Market Development Initiative" was completed in May 1994. This study estimated the market potential for three intermodal terminals located East of the Hudson at 245,000 to 430,000 trailers, or 4.2 to 7.3 million tons, per year. Transmode claimed that these market levels would bring cost per train to competitive levels. Tri-State proposed conditions that would result in competitive intermodal rail access East of Hudson, for CSX using conventional piggyback service at the Harlem River Yard and for NS using double-stack service at 65th St. yard. Beneficial use of these facilities, developed at considerable public expense, would reduce truck movements across seriously congested Trans-Hudson highway crossings. They would also help to accommodate increased intermodal traffic projected by the applicants, reducing their investment in, and potential negative environmental consequences of, yard expansion in North Jersey.

B. Retaining West of Hudson carload freight is important

The applicants estimate that 797,376 truckloads of freight will be diverted to intermodal rail service as a result of the acquisition. Another 186,947 truckloads will be diverted to carload rail freight. Although the applicants claim that carload freight is the "lifeblood" of their industry, 81% of the truck traffic expected to shift to rail as a result of the action before the Board would be to intermodal. As important as intermodal traffic is, this

emphasis on intermodal was the basis for Tri-State's expressed concern and proposed condition that the applicants make a special effort to retain carload freight in North Jersey, and not shift existing carload traffic to intermodal. While restored competitive rail service in the West of the Hudson sector would produce substantial environmental benefits, these effects are not evaluated in the DEIS. The Board cannot make an adequate determination of the environmental consequences of Tri-State's proposed condition based on the information contained in the DEIS.

Tri-State also raised concerns about the relocation of freight away from the North Jersey Shared Assets Area to more remote locations. This would increase truck miles in the region. The DEIS does not provide information to evaluate Tri-State's proposed condition to avoid this environmental negative, namely that NS and CSX must monitor the cost of operating the shared asset lines and provide assurance to the Board that costs are below levels that would encourage shippers from relocating to more remote points in western NJ and eastern PA.

C. Protracted disagreement over proposed rail passenger service improvements could deny the region the benefits of these improvements.

In the past, expansion of commuter rail service or intercity rail passenger service has led to protracted arguments among service providers about how track can be shared and about the extent of new rail investment that must be made to accommodate the expansion. Tri-State suggested in its comments of November 22, 1997 that, as a condition for approval of the acquisition, the Board establish, in cooperation with USDOT, arbitration procedures that will assure prompt resolution of disputes. The DEIS offers no specific evidence that disputes will be resolved and makes no attempt to assess the environmental consequences of the long delays that have characterized service expansion proposals in recent years.

Amtrak at present has operating agreements with Conrail, NS and CSX that expire in 2006, 2000 and 2002 respectively. The DEIS makes no mention of the consequences of not extending these agreements in a timely fashion. Furthermore, the DEIS deals only with maintenance of existing levels of service over existing routes. Accommodating increased levels of service, higher speed or new routes will almost certainly lead to disputes that, if not quickly resolved, could deny the public the benefits of these new rail services and lead to air quality consequences that are negative with respect to the "no action" alternative. While higher levels of public support will be needed to continue and expand Amtrak service in the future, the arbitration mechanism that Tri-State proposed for commuter rail service proposals could be extended to Amtrak intercity service improvements.

D. The conditions requested by Tri-State would have significant effects in several Impact Categories.

The Board's failure to quantify the impacts of Tri-State' proposed conditions leaves the agency unable to suitably assess key environmental impacts in four key areas:

1. Transportation Systems

The Tri-State region's arterial highway system is among the most congested in the nation. Car, bus and truck traffic experiences extraordinary delays, especially at the Hudson River crossings. Heavy truck traffic also contributes a great deal to the deterioration of pavements and structures. Trucks routinely use local and collector streets to avoid delays on major highways, resulting in vibration that damages buildings and producing noise in residential neighborhoods. Truck crashes are more severe than car crashes and take a heavy toll in deaths and injuries. Crashes and breakdowns add greatly to congestion, especially where off-loading of goods is required.

By failing to describe the potential changes in truck use that would occur if Tri-State's proposed conditions were added to the transaction, the DEIS fails to provide the Board with important information that might affect its decision on whether to include these conditions in its decision.

2. Land Use

In NYC, the Department of City Planning has specified zoning to preserve manufacturing locations that are adjacent to rail lines. Tri-State's conditions would result in better rail service to these locations, reinforcing the city's land use and zoning plan. The applicants' plan will result in continuing single-carrier non-competitive freight rail service, perpetuating the existing deteriorating rail service East of the Hudson and diminishing the value of these unique rail-accessible sites. NYC's land use plan has reserved space for intermodal facilities at Harlem River Yard and 65th St. Yard. The applicants' plan is silent on the provision of NS or CSX service to these terminals.

Land use plans in Westchester County and in Connecticut also reserve space zoned for manufacturing and distribution along Conrail-operated lines. Tri-State's proposed conditions for two carrier service from Oak Point Yard in the Bronx to New Haven, CT would make this land use activity more valuable.

The Board should assess the consistency of the applicants' plan and the plan with the conditions recommended by Tri-State with municipal land use plans for communities East of the Hudson. This assessment should be part of a Supplemental EIS.

The New Jersey State Plan for Development and Redevelopment calls for concentrating development in older, denser cities and along transportation corridors. NJ Governor Christie Whitman reaffirmed her support for these state policies in her address at the beginning of her second term as Governor in January 1998, in which she proposed to preserve 300,000 acres over the next four years. Existing carload freight shippers in the North Jersey Shared Assets Area are generally located in

areas in which development or redevelopment is consistent with the State Plan. Union County, for example, is seeking to bolster business on the Staten Island Railroad and Rahway Valley Lines by reinstating rail freight service. The Tri-State condition calling for Board intervention to monitor and preserve carload freight in this area will add an extra measure to preserve the consistency between the applicants' plan and land use plans in New Jersey. Were CSX and NS to encourage shippers to relocate outside the shared assets area, new development would occur in areas that the State Plan seeks to preserve as open land.

3. Air Quality

Most of the Tri-State Region is a severe non-attainment area for ozone, and one county is in non-attainment for particulates. Due to New Jersey's failure to produce an adequate attainment plan for ozone, the State will be under a "conformity freeze" beginning on April 10, 1998 during which no new transportation programs and plans can be adopted. EPA's recent revision of the health-based air quality standards confirm that the region's problem is even more serious than previously acknowledged. Most of the air quality benefits that are expected to result from the Conrail acquisition, due to shifting freight from truck to rail, will lie outside of the Tri-State Region, or the Ozone Transport Region in the northeast. The Tri-State conditions would increase the air quality benefits within the region as well. The Board cannot make an informed decision on this benefit without a detailed assessment of air quality impacts of the Tri-State conditions.

4. Environmental Justice

In the Tri-State region, persons of color and other minorities are more likely to live in New York City and in other older cities in the region. Shifting freight from truck to rail has the potential to benefit residents of these communities, many of whom suffer from respiratory ailments exacerbated by air pollution. Shifting freight activity from truck to carload freight and reducing the drayage mileage for intermodal freight would yield substantial benefits to these communities. Tri-State's proposed conditions will achieve these results to greater effect than the applicants' plan without conditions. The Board will not have this information available if it does not perform a comprehensive assessment of the impacts of the Tri-State conditions. Dismissing these conditions without this assessment is not consistent with NEPA, the Civil Rights Act or Executive Order 12898 (Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, February 11, 1994, 59 F.R. 7629(1994)). Additional investigation of the alternatives suggested by Tri-State and others is supported by the DOT's own order for compliance with Executive Order 12898, which governs Federal actions to address Environmental Justice in minority and low-income populations. 60 FR 33899 (1995). Compliance with the Executive Order is a stated key element in DOT's Environmental Justice strategy. Id. at 33900. The Board is required to take

into account any mitigation measures that may be developed during the comment period. Id at 33902.

The Board is left to make its decision on the railroads' application with regard to the conditions proposed by Tri-State on the basis of only the information submitted by the applicants. The applicants, meeting behind closed doors, decided to deny two-carrier competition for the East of Hudson sector. They chose not to take similar action elsewhere; they did not assign all of Conrail's properties and operating rights to a single carrier for service in the states of Ohio or Pennsylvania.

III. The Board should prepare a supplemental EIS containing an analysis of additional alternatives.

The DEIS' omissions can only be corrected by the Board's preparation and circulation of a Supplemental EIS. Much of the information needed for such a Supplemental EIS is readily available in the studies identified above. Tri-State requests that the Board conduct a thorough investigation of the environmental impacts of the conditions proposed by Tri-State and submit a Supplemental Environmental Impact Statement for consideration by all parties. Tri-State's request for a Supplemental Environmental Impact Statement is reasonable and customary in situations such as the proposed merger. The DOT procedures for the application of environmental laws clearly provide for supplemental reports when additional relevant environmental information is discovered during the public comment process. These supplemental reports are needed in order "to address substantial changes in the proposed action or significant new and relevant circumstances or information". 49 C.F.R. § 1105.10 (a)(5). Clearly the conditions proposed by Tri-State and other interested parties during the comment period have provided significant information that needs to be considered. The DOT procedures for the implementation of environmental laws also call for the Section of Energy and Environment to independently analyze related materials during the comment period in order to provide information to the Board that can be considered in its final decision. A Supplemental EIS may be required to further assist the Board in its deliberations. 49 C.F.R. § 1105.10 (a)(5)(b).

The conditions requested by Tri-State and others offer a substantial opportunity for a positive environmental impact on the New York metropolitan area without detriment to the economic interests of the parties involved in the merger. To fail to consider these alternatives completely would benefit none of the parties involved and would clearly not serve the public interest.

Respectfully submitted,

Handwritten signature of Edward Lloyd in cursive script, followed by the initials "TL".

Edward Lloyd

-- Control and Operating Leases/Agreements --
Conrail Inc. and Consolidated Rail Corporation

**COMMENTS OF
THE NEW YORK CITY ECONOMIC DEVELOPMENT CORPORATION
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT**

New York City Economic Development Corporation ("NYCEDC"), by its undersigned counsel, hereby submits its comments with respect to the Draft Environmental Impact Statement (the "DEIS") served by the Board's Section of Environmental Analysis ("SEA") on December 12, 1997. The DEIS was prepared to analyze the impact on the environment of the proposed acquisition of Conrail Inc. and Consolidated Rail Corporation ("Conrail") by CSX Corporation and CSX Transportation, Inc. (collectively, "CSX") and Norfolk Southern Corporation and Norfolk Southern Railway Company ("NS")¹.

While recognizing limited potential adverse impacts on a portion of the greater region of which New York City is a major part, the DEIS provides no analysis whatsoever of the impacts on the City itself. This is a glaring omission in view of the

¹CSX and NS are sometimes referred to collectively herein as "Applicants".

Applicants' statement that availability of direct rail competition in Northern New Jersey will be sufficient for potential shippers, including intermodal shippers, who are located on the east side of the Hudson River and the New York Harbor, suggesting that substantial volumes of truck traffic will be moving over the highways and bridges that lead to and cross the River to reach those terminals. R.V.S. Kalt at 15-17. To provide a complete picture of the impact of the transaction on the metropolitan region, of which the City is a major part, the final EIS should include an analysis of the impact on the air quality and other aspects of the environment that will be adversely affected by the introduction of more trucks to the region's highways and greater congestion at and surrounding the already crowded choke points such as the affected bridges' toll plazas.

In a Rebuttal Verified Statement filed with respect to the City's joint application with New York State for trackage rights over lines on the east side of the Hudson River, including lines in Queens and the Bronx², Seth O. Kaye, Director of the Mayor's Office of Transportation for the City of New York, explained the issues already facing New York City. See, Rebuttal Verified Statement of Seth O. Kaye, included in Joint Rebuttal Statement of the State of New York and the New York City Economic Development Corporation, NYS-25/NYC-18 (Public Version), filed January 14, 1998. He stated the following:

Nearly 50,000 trucks cross the City's bridges and tunnels daily. These trucks are then routed on only three major truck routes that must provide access to the New York City, Long Island, and Southern New England markets. Endemic traffic congestion, air pollution, and infrastructure deterioration are some obvious symptoms of this access problem. ... It is important to understand that the impacts of encouraging further truck movements to northern New Jersey for the

²This joint responsive application has been docketed at Finance Docket NO. 33388 (Sub-No. 69).

benefit of competitive rail access is a serious concern for the City with respect to economic development and improving air quality. In recognizing the impact of transportation policy on air quality, the City is concerned that the lack of competitive rail access to New York City will hinder its efforts to improve air quality and to come into compliance with the Clean Air Act.

Id. at 1.³ He went on to note that EPA has designated the City or a portion of the City as being in non-attainment with three of the six criteria pollutants -- ozone, carbon monoxide, and particulate matter -- and that the City is part of the New York Metropolitan Area ("NYMA"), which EPA has designated as a severe non-attainment area for ozone. *Id.* at 3. Continuing, he noted the following:

Because the City is in severe non-attainment for ozone, the City must reduce emissions so as to attain the NAAQS for ozone by 2007. As a severe non-attainment area, the City must also achieve steady interim reductions in ozone before 2007 so that it will be able to attain the NAAQS by 2007. The NYMA was required to reduce volatile organic compounds -- an ozone precursor -- by 15 percent by 1996 and must further reduce volatile organic compounds by an additional three percent for each year between 1996 and 2007. The Clean Air Act also requires reductions in nitrogen oxides -- another ozone precursor.

Trucks and other motor vehicles are a major source of ozone precursors in New York City. For example, in its Proposed Revision to the New York SIP dated March 1997, the New York State Department of Environmental Conservation indicates that in 1990, motor vehicles were responsible for 43 percent of the total emissions of volatile organic compounds and 43 percent of the total emissions of nitrogen oxides in the NYMA. Moreover, heavy duty diesel vehicles are responsible for a disproportionately large share of the emissions of nitrogen oxides from on-road vehicles in the NYMA.

Id. at 3-4. He concluded by noting that:

The need for additional truck trips in the City in order to carry goods to New Jersey will likely impede efforts to improve the City's air quality. Moreover, the added congestion that may be caused by increased truck trips could increase the emissions attributable to idling vehicles.

³A copy of Mr. Kaye's Verified Statement is attached to these Comments at Tab 1.

In sum, reliance on motor carrier freight transportation between New York City and Northern New Jersey will have a negative impact upon the City from both an economic perspective, as well as an air quality perspective.

Id. at 5.

The increased traffic that Applicants project will move to and from the terminals in northern New Jersey forms the basis for a substantial part of New York City's concern, yet the DEIS provides no assessment whatsoever of the potential impacts of this traffic on the environment in the communities surrounding the terminals. According to the DEIS, Applicants project a total of 333,666 increased lifts per year at the Little Ferry, Croxton, E-Rail, South Kearny, North Bergen and Portside intermodal terminals. See DEIS vol. 5A, Appendix E, Attachment E-6 at p. 2 of 3. Some of this traffic will originate in northern New Jersey. However, much of it will originate in New York City, on Long Island or in southern New England, moving to the intermodal terminals via New York City's highways and bridges. While the DEIS does study the impact of that traffic at the terminals, showing increases in various pollutants at those locations, it does not inquire into the source of that traffic and does not study the impact of the increased truck traffic on emissions. Nor does it recognize, and therefore provides no analysis of, the potentially significant impacts on air pollution in other parts of the New York metropolitan region that will share the burden of this increased motor carrier freight transportation.

The City of New York is concerned because the DEIS fails to consider the full magnitude of truck diversions to and from New Jersey that is likely to occur. Even if the joint responsive application for trackage rights on the east side of the Hudson is

approved, the impact of the potential traffic to and from these terminals on the surrounding communities must be assessed.

Applicants' reliance upon the thresholds included in 49 C.F.R. Part 1105 for determining potential impacts on air quality misses this point. The Board's regulations here provide a floor, not a ceiling on the scope of the analysis, and to effectively address potential impacts the DEIS should take a broader look. A broader perspective is even more crucial in the context of the New York metropolitan region, one of the largest population and commercial centers in the world. For the purposes of this transaction, the required minimum analysis is not sufficiently rigorous to provide a good measure of the impacts of the proposed transactions on air quality in New York City. The threshold analysis looks only at the obvious and direct effects on increases by line segment, rail yard, or intermodal facility. Adding additional truck trips to the region to carry goods to and from New Jersey will likely increase emissions of nitrogen oxides in both New Jersey and New York. Moreover, the added congestion on roadways linking New York and New Jersey that may be caused by increased truck trips could slow traffic. This increased traffic congestion will further increase pollutant emissions.

Further, the SEA has failed to comply with the regulations requiring it to study alternatives to the transaction structure that Applicants have proposed. 42 U.S.C.A. § 4332(C)(3)(iii)(1994). Here, the SEA has studied only one alternative -- no transaction. The SEA should instead be studying additional viable alternatives, including those proposed by NYCEDC.

For the Final EIS to be complete, which the DEIS is not, SEA should study carefully the potential numbers of additional truck trips, the likely routes, as well as the

number of truck miles travelled in New York (including Long Island), New Jersey, Connecticut, and other states in New England that may feed traffic to the northern New Jersey terminals absent the availability of competitive service that will be provided by the trackage rights the City and State are jointly seeking in the responsive application in F. D. No. 33388 (Sub-No. 69). Additionally, the DEIS should examine the air quality implications of increased traffic congestion caused by an increase in the number of trucks travelling on City streets and the Hudson River crossings. Moreover, SEA should take into consideration the impacts of this increased truck traffic on noise, economic development and other quality of life issues in the affected City neighborhoods.

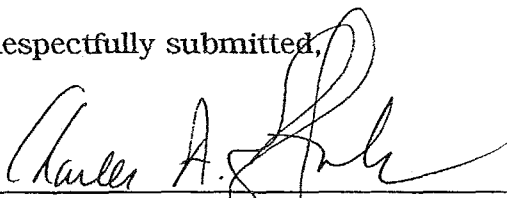

CONCLUSION

The DEIS does not address any issues regarding air quality or other impacts on the City of New York from the changes in traffic patterns projected to result from this transaction. Other counties in the New York State and New Jersey region are addressed because they house line segments, yards or terminals that will see direct effects from the transaction. The problems this transaction will create go beyond those isolated locations. New York City, working with its neighbors in these counties, is constantly assessing ways to reduce emissions and improve air quality. To insure presentation of a complete picture of the environmental impacts of the proposed transaction, SEA should undertake a study of the sources of the intermodal traffic Applicants project for the New Jersey terminals, and determine the impacts along the routes to and from those terminals. In view of the Applicants' reliance upon the availability of direct rail

competition in northern New Jersey, the Final EIS should consider fully the impact of this additional traffic on the entire region, including the City. While approval of the City's and State's joint responsive application will diminish this impact by keeping some of the traffic off the congested highways, the Final EIS must include a careful assessment of the impact on the City. Without that, and approval of the trackage rights on the line on the east side of the Hudson, as well as a determination of the further mitigation that will be required to resolve the environmental concerns, the Final EIS will be as incomplete in this respect as the DEIS.

**REBUTTAL VERIFIED STATEMENT OF
SETH O. KAYE**

I am Seth O. Kaye, Director of the Mayor's Office of Transportation for the City of New York. In that capacity, I am responsible for coordinating the City's policy on a variety of transportation issues, including aviation, surface transportation, maritime activity, and freight movement. I have also been involved in ensuring that air quality issues are considered in the development of the City's transportation policy. In the formulation of transportation initiatives and related issues, the City places a strong emphasis on creating an environment that is both hospitable to business and that improves the quality of life in New York City. With this in mind, the Mayor's Office of Transportation is very concerned about the impacts of freight movement into and out of New York City.

Nearly 50,000 trucks cross the City's bridges and tunnels daily. These trucks are then routed on only three major truck routes that must provide access to the New York City, Long Island, and Southern New England markets. Endemic traffic

congestion, air pollution, and infrastructure deterioration are some obvious symptoms of this access problem. Given that New York City is accessible to people and goods by only a limited number of bridges and tunnels, rail freight access offers the best alternative for the fast, efficient, and economical movement of goods. To this end, the Mayor's Office of Transportation has been working with NYCEDC in its effort to prevent the expected negative impacts of not providing competition on the Hudson Line. It is important to understand that the impacts of encouraging further truck movements to northern New Jersey for the benefit of competitive rail access is a serious concern for the City with respect to economic development and improving air quality. In recognizing the impact of transportation policy on air quality, the City is concerned that the lack of competitive rail access to New York City will hinder its efforts to improve air quality and to come into compliance with the Clean Air Act.

Pursuant to the Clean Air Act, the United States Environmental Protection Agency ("EPA") has promulgated National Ambient Air Quality Standards ("NAAQS") for six pollutants. Those six pollutants -- known as "criteria pollutants" -- are ozone, carbon monoxide, particulate matter, sulfur dioxide, nitrogen dioxide, and lead. The NAAQS specify the maximum concentrations for each pollutant in the ambient air that EPA has deemed to be adequately protective of human health. As required by the Clean Air Act, for each pollutant, EPA has classified each area in which the pollutant concentration exceeds the applicable NAAQS based on the severity of the pollution. Based on these classifications, the Clean Air Act prescribes certain control measures and establishes deadlines by which each non-

attainment area must come into attainment. The Clean Air Act further provides for sanctions for failure to reach attainment by the applicable deadlines.

The Clean Air Act also requires that each state develop and submit to EPA for approval a State Implementation Plan ("SIP"). The SIP sets forth what measures -- including those mandatory measures prescribed by the Act -- the state will undertake to attain the NAAQS.

EPA has designated the City or a portion of the City as being in non-attainment with three of the six criteria pollutants -- ozone, carbon monoxide, and particulate matter. All three of these pollutants may pose serious threats to human health. Ozone is an irritant that is believed to cause permanent damage to human lung tissue. It particularly affects the young, the elderly, and those suffering from asthma and other respiratory diseases. Carbon monoxide bonds strongly with hemoglobin in the blood, impairs mental functions and fetal development, and aggravates cardiovascular diseases. Particulate matter less than ten microns in diameter ("PM₁₀") can be inhaled into the lungs and can cause respiratory problems.

The City is part of the New York Metropolitan Area ("NYMA"), which EPA has designated as a severe non-attainment area for ozone.¹ Because the City is in severe non-attainment for ozone, the City must reduce emissions so as to attain the NAAQS for ozone by 2007. As a severe non-attainment area, the City must also achieve steady interim reductions in ozone before 2007 so that it will be able to attain the NAAQS by 2007. The NYMA was required to reduce volatile organic

¹ The Clean Air Act sets forth five non-attainment classifications for ozone based on the severity of the ozone pollution: marginal, moderate, serious, severe, and extreme.

compounds -- an ozone precursor -- by 15 percent by 1996 and must further reduce volatile organic compounds by an additional three percent for each year between 1996 and 2007. The Clean Air Act also requires reductions in nitrogen oxides -- another ozone precursor.

Trucks and other motor vehicles are a major source of ozone precursors in New York City. For example, in its Proposed Revision to the New York SIP dated March 1997, the New York State Department of Environmental Conservation indicates that in 1990, motor vehicles were responsible for 43 percent of the total emissions of volatile organic compounds and 43 percent of the total emissions of nitrogen oxides in the NYMA. Moreover, heavy duty diesel vehicles are responsible for a disproportionately large share of the emissions of nitrogen oxides from on-road vehicles in the NYMA.

Among the measures undertaken by the City and State to reduce ozone pollution are preconstruction review and stringent controls on stationary sources, more stringent vehicle inspection and maintenance programs, reformulated fuels, and reformulated consumer products (such as paints, hairsprays, and deodorants).

The City also suffers from carbon monoxide pollution. EPA has classified the City as a moderate non-attainment area for carbon monoxide.² Motor vehicles are a large contributor to the City's carbon monoxide pollution problem. The City and State have made efforts to reduce carbon monoxide emissions by conducting preconstruction review of proposed projects to ensure compliance with the carbon monoxide standards, implementing traffic control measures and measures to reduce

² The Clean Air Act sets forth two classifications for both carbon monoxide and particulate matter non-attainment areas: moderate and serious.

vehicle miles travelled, and controlling stationary sources of carbon monoxide, among other things.

Finally, New York County (Manhattan) has been designated by EPA as a moderate non-attainment area for PM₁₀. Diesel engines (such as those used in trucks that would likely be used to transport goods to rail lines across the Hudson River) are a major source of particulate pollutants.

Compliance with the ozone and particulate matter NAAQS may become more difficult in the future because EPA has recently promulgated stricter NAAQS for both pollutants based on a review of scientific data to determine whether the existing NAAQS are sufficiently protective of public health. The stricter ozone and particulate matter NAAQS may require the City and State to take additional measures to come into compliance.

As set forth above, motor vehicle emissions are major contributors to ozone, carbon monoxide, and particulate matter pollution in New York City. The need for additional truck trips in the City in order to carry goods to New Jersey will likely impede efforts to improve the City's air quality. Moreover, the added congestion that may be caused by increased truck trips could increase the emissions attributable to idling vehicles.

In sum, reliance on motor carrier freight transportation between New York City and Northern New Jersey will have a negative impact upon the City from both an economic perspective, as well as an air quality perspective. For that reason, NYCEDC's Responsive Application, which is designed to relieve motor vehicle congestion by offering freight shippers competitive rail service along the East side of the Hudson River, should be approved.

VERIFICATION

I, Seth O. Kaye, verify under penalty of perjury that I have reviewed the foregoing Rebuttal Verified Statement, and that all of the facts stated therein are true and correct. Further, I certify that I am qualified and authorized to verify and file this Rebuttal Verified Statement on this 14th day of January, 1998.

Re: Comments on Draft EIS

Dear Ms. Elaine K. Kaiser,

The Seneca Nation is please to submit comments on the Draft EIS of the Proposed Conrail Acquisiton. The comments are interim until the formal Nation approval process is met. The Seneca Nation Environmental Protection Department must submit comments to the Tribal Council for approval. However, our Tribal Council will not meet prior to the February 2, 1998 comment deadline. Therefore, a resolution is pending.

Thank you for the opporunity to comment.

Simperely,

Lisa Maybee, Director
Environmental Protection Department

Seneca Nation of Indians Interim Comment
on the Draft EIS "Proposed Conrail Acquisition"

page 6-3 Volume 4

SEA expanded the Land Use/Socioeconomic Issues section to specifically state that the EIS will address the potential environmental impacts of proposed rail line construction and abandonment activities on Native American reservations and sacred sites.

The Seneca Nation of Indians holds title to the Allegany, Cattaraugus, and Oil Springs reservations. Conrail has a small rail yard located on the Allegany Reservation. The Seneca Nation will not consider reclaiming the Salamanca railyard since there are major concerns of diesel and PCB contamination on site. There is documentation of spills through the US EPA and possibly New York State Department of Environmental Conservation. However, Conrail has failed to inform officials of the Seneca Nation. The Seneca Nation has serious concerns regarding the environmental integrity of the Conrail yard.

Another portion of the rail road extends through the Cattaraugus Reservation located in Irving, New York. This portion is identified as a "key route" through Western New York with an increase in volume of hazardous cargo from 7,000 to 26,000 carloads per year. (Chapter 5, NY 38, Native American Issues) The Seneca Nation lacks the capability to respond to emergent situations. Although there is an significant increase through the Cattaraugus Reservation there are no identified environmental justice impacts to Seneca Nation community in the EIS. How does CSX and Norfolk Southern plan to address the limited capacity to respond in some communities.

Environmental Justice addresses impacts to low income and minority populations. It appears the Seneca Nation would fall under this definition in some respect, although, there is no mention of any activities which may impact the Seneca Nation community in the proposed EIS. (Environmental Justice, Chapter 5) The Seneca Nation is a sovereign entity therefore must be addressed as such. Contact must be directly through the officials of the Seneca Nation. The Seneca Nation does not recognize New York State jurisdiction specifically relating to permit requirements. The Seneca Nation has several written laws like the Solid Waste Ordinance, Natural Resource Law, Pesticide/Herbicide Ordinance, etc., which are enforceable through the tribal Peacemaker Court system. Any individual or entity requesting work or proposing activity to be performed on the land of the Seneca Nation must recognize and abide by tribal rules.

There is major concern regarding the right-of-way of Conrail. The acquisition of the rail line needs an accurate title search. The status of the easement is

questionable. Adequate documentation must be provided to the Seneca Nation by Conrail prior to any new negotiation with CSX.

Cultural Resources - Methods Page 3-38 of Volume 1

Significant cultural resources (that is, historic properties)

SEA conducted archival searches and site visits to determine the presence of historic properties. SEA presented a preliminary eligibility and determination of effects to the SHPA in every state potentially affected by the proposed abandonment's and construction. Under the NHPA, any historic or archaeological resource listed on or eligible for listing on the National Register of Historic Places requires review under NHPA Section 106. The definition of cultural resource appears to be different from the Seneca Nation perspective.

Appendix G, describes the screening process, data sources, evaluation criteria and analysis, etc., and determination of significance based on age, type use, uniqueness, contest in local and national history and other factors as outlined in the National Register. Abandonment would cause impacts to cultural resources in instances of salvage, change of ownership, and maintenance activities. Construction of new connections would cause impacts due to physical destruction, damage, or alteration of historic property.

COMMENTS OF
THE STATE OF NEW YORK
ON DRAFT ENVIRONMENTAL IMPACT STATEMENT

The State of New York, acting by and through its Department of Transportation ("New York"), hereby submits these Comments on the Draft Environmental Impact Statement ("DEIS") served December 12, 1997 by the Board's Section of Environmental Analysis ("SEA").

IDENTITY AND INTEREST

New York is a sovereign state, and a full party of record in this proceeding. The New York State Department of Transportation is the executive department responsible for supervising and administering State policies and interests relating to rail transportation through, within, or affecting New York.

New York and its citizens have an obvious and substantial interest in the preservation and enhancement of their environment. As both federal and state law and policy mandate,

and the long-term health, comfort, and well-being of New Yorkers require, the State must continue taking affirmative steps toward a cleaner, safer environment. At the same time, New York must guard vigilantly against proposals or projects that threaten to detract from the progress being made in the environmental arena.

The Applicants'¹ proposed division and subsequent operation of Conrail's assets threatens to impede New York's on-going efforts to protect the quality of air in certain areas of the state from any further deterioration, and to restore the same as quickly as possible to acceptable levels. The Applicants have not taken appropriate and necessary steps -- nor does the DEIS recommend that they do so -- to ensure that their transaction, at the very least, does nothing to exacerbate New York's already serious air quality problems. As discussed below, the Board must closely examine the DEIS' conclusions regarding system-wide, regional, and New York air quality impacts, and recognize the substantial -- but not unavoidable -- adverse effect that Applicants' transaction will have on New York's air quality and air quality improvement plans.

New York further urges the Board to examine the DEIS' analysis of passenger rail safety issues. Though New York places the highest priority on safe railroad operations, New York does

¹ For purposes of these Comments, all references to "Applicant(s)" indicate either or both CSX and NS. All references to "CSX" include CSXC, CSXT, and their wholly owned subsidiaries; all references to "NS" include NSC, NSR, and their wholly owned subsidiaries; all references to "Conrail" include CRR, CRC, and their wholly owned subsidiaries.

not agree with the mitigation recommended to alleviate perceived safety impacts on one line segment located in New York. As detailed below, New York supports the Comments filed by Metro-North Commuter Railroad Company ("Metro-North") in this regard, and, consistent with those Comments, asks that the Board reject SEA's proposed mitigation measure.

THE DRAFT EIS

A. Air Quality Impacts And Mitigation Affecting New York

As the Board's NEPA-implementing² regulations require, the Applicants' Environmental Report ("ER")³ and the DEIS examine potentially significant effects of the proposed transaction upon several environmental impact categories. In particular, the ER sets forth Applicants' views as to the transaction's projected effect on air quality, which conclusions the DEIS reviews. This air quality analysis addresses system-wide, regional, and local impacts of changed "Acquisition-related" railroad activities, and assesses the need for measures mitigating increases in air pollutant emissions.⁴ Specifically, SEA considered the effect of increased operations on rail line segments, and at rail yards and intermodal facilities, as well as emissions resulting from abandonments and construction projects within the Applicants'

² See 49 C.F.R. pt. 1105.

³ CSX/NS-23 Application, vol. 6A-B, filed June 23, 1997; CSX/NS-54 Application, vol. 6. Supplemental Environmental Report, filed Aug. 28, 1997.

⁴ See DEIS, vol. 3B at NY-18.

proposed new systems. SEA estimated the likely contribution of these operations and activities to NOx, CO, VOC, SO2, PM-10, and Pb pollution.⁵

According to the DEIS, SEA concluded that transaction-related increases in emissions of these pollutants -- system-wide, regionally, and in New York State -- require no mitigation.⁶ System-wide, SEA first determined, emissions of all six pollutants will increase. SEA further found, however, that predicted truck-to-rail freight transportation diversions should produce decreases in NOx, CO, VOCs, PM-10, and Pb emissions, "offsetting" the acknowledged transaction-related increases in these same pollutants. Relying on this conclusion -- and thus the Applicants' truck diversion estimates supporting it -- SEA declined to recommend any mitigation for system-wide increases in emissions of these five pollutants. Though SEA found that system-wide SO2 emissions will likely increase even after adjusting for estimated truck diversions, SEA considered the "small relative increase" in such emissions "insignificant," and thus not subject to mitigation.⁷

⁵ "NOx" refers to nitrogen oxides, pollutants which contribute to the formation of ozone ("O3"). "CO" refers to carbon monoxide; "VOCs" refers to volatile organic compounds, another ozone precursor. "SO2" refers to sulfur dioxide; "PM-10" refers to particulate matter of less than ten microns in diameter; "Pb" refers to lead. See DEIS, App. E at E-2.

⁶ See DEIS, vol. 1 at 4-56, 4-63; vol. 3B at NY-24.

⁷ DEIS, vol. 1 at 4-56.

SEA's regional air quality analysis, similarly, reveals that the proposed transaction will exacerbate regional air pollution, unless Applicants' ambitious truck-to-rail diversion estimates accurately predict "offsetting" emissions savings. SEA's regional analysis evaluated NOx emissions only, focusing exclusively on the transaction's potential harm to the Northeast Ozone Transport Region ("OTR").⁸ SEA concluded that 6 of the states within the OTR -- including New York -- as well as the District of Columbia, would experience an increase in transaction-related NOx emissions.⁹ SEA then turned to the Applicants' truck diversion predictions, and subtracted from the OTR's acknowledged NOx emissions increases all projected NOx "savings" attributable to diverted trucks. This adjustment resulted in a "small" net reduction of NOx emissions for the OTR as a whole, and the SEA's recommendation against any mitigation.¹⁰ As in the "system-wide" analysis, this regional determination depends almost entirely on the existence of "NOx emissions decreases from truck diversions more than offset[ting] . . . increases in NOx emissions."¹¹

⁸ The Northeast OTR, designated and defined by section 184(a) of the Clean Air Act, as amended ("CAA"), consists of a group of northeastern states subject to special regulation focused on reducing the ozone transport problem of that region. See 42 U.S.C. §§ 7401 et seq.

⁹ DEIS, vol. 1 at 4-59.

¹⁰ Id.

¹¹ Id. (emphasis added).

SEA's evaluation of New York's "local" air impacts again identifies acquisition-related activities predicted to increase air pollution. Through application of its various thresholds and screening levels, SEA selected certain New York counties facing increased NOx emissions for closer examination; SEA determined at the outset that no other pollutant emissions warranted review.¹² For each New York county evaluated, SEA estimated NOx emissions increases; for some counties, SEA discounted these increases as insignificant, either by comparison to the county's overall pollution problem, or in light of the area's attainment status. For the remaining counties considered, SEA acknowledged that NOx emissions "could contribute to O3 formation on a regional level," and generally directed "refer[ence] to [DEIS] Chapter 4 for further discussion of the potential effects on regional air quality."¹³ As discussed supra, SEA recommended no regional air quality mitigation. As a result, therefore, SEA's only determinations regarding local New York air quality either: (1) disregard increased NOx pollution, citing an allegedly small degree of increase or relatively clean air impacted; or (2) simply shift focus to regional impacts, without providing for their mitigation.

¹² SEA's analysis "thresholds" eliminated from DEIS consideration the impacts of the transaction on CO, VOCs, SO2, PM-10, and Pb emissions in New York. New York submits that this was in error, and urges the Board on re-examination to carefully evaluate the thresholds SEA used, and determine the adequacy of their protection for air quality.

¹³ DEIS, vol. 3B at NY-22 (emphasis added).

B. Passenger Rail Safety Impacts Affecting New York

The DEIS also examines the proposed transaction's potential effects on a variety of safety-related issues. In particular, SEA evaluated the possibility of "increased accidents between freight and passenger trains" operating over the same track.¹⁴ After identifying line segments meeting its analysis "threshold,"¹⁵ SEA estimated the change in accident frequency likely to result from added freight trains on those lines. If the accident risk increased "significantly," SEA recommended mitigation. Specifically, SEA proposed that "all freight trains . . . be clear of the main track" at issue, "at least 15 minutes prior to the estimated arrival of the passenger train."¹⁶ This, SEA determined, would "reinforc[e] passenger trains' priority over freight trains," and ensure that "the passenger train can pass safely and without delay."¹⁷ SEA proposed no other measures to reduce increased risks of passenger/freight train collisions.

SEA's New York passenger train safety analysis focused on twelve line segments; only one of the twelve, SEA found,

¹⁴ DEIS, vol. 3B at NY-8.

¹⁵ SEA only analyzed segments carrying both freight and passenger trains that would experience a post-transaction increase of one or more freight trains per day. DEIS, vol. 3B at NY-8.

¹⁶ DEIS, vol. 3B at NY-10.

¹⁷ DEIS, vol. 3B at NY-10.

warranted safety mitigation.¹⁸ For the 30-mile segment from Campbell Hall to Port Jervis in southeastern New York, SEA directed the Applicants to "establish passenger trains as 'superior' trains," and, accordingly, "clear . . . the track" during the 15-minute period before and after "the expected arrival of a passenger train at any point."¹⁹ As Metro-North's Comments point out, and New York agrees, this "priority" designation is both unnecessary and potentially disruptive of future passenger operations over any lines affected by such a mitigation measure.

COMMENTS OF THE STATE OF NEW YORK

I.

Air Quality Concerns

New York has a significant investment in and responsibility for preserving and improving air quality, particularly in non-attainment areas surrounding and including New York City. New York respectfully submits that SEA's review and proposed mitigation of air quality impacts -- system-wide, regionally, and in New York -- are inadequate. In the first place, SEA relies heavily on uncertain truck diversion figures to conclude that the transaction threatens no significant system-wide and regional air quality impacts. SEA then compounds that error by failing to consider local impacts of all but one of the six pollutants

¹⁸ The other eleven segments met SEA's threshold for passenger train safety analysis, but were not projected to experience an increase in accident frequency sufficient to trigger mitigation. Id.

¹⁹ DEIS, vol. 4 at 7-12.

studied, and its conclusion that the sixth -- NOx -- will cause no cognizable harm in New York ignores the realities of air quality in New York City's metropolitan area, and proceeds on the misguided notion that "small" increases in air pollution, or increases affecting attainment areas only, are acceptable.

As discussed below, the Board must take a far more skeptical view of the crucial truck-to-rail diversion estimates central to SEA's air quality findings. In addition, the Board must adhere to the statutory and policy mandates governing air quality control, and act affirmatively to further the nation's and New York State's goals of reducing air pollution as quickly and comprehensively as possible.

A. New York Must And Will Continue Taking Steps To Improve and Protect Its Air Quality

As discussed at length in New York's prior filings in this proceeding, the State has long worked to implement programs improving its air quality.²⁰ New York's downstate counties, in particular, face serious air pollution challenges as a result of excessive and increasing vehicle emissions of CO, and ozone precursors NOx and VOCs.²¹ Of the ten counties comprising the

²⁰ See NYS-24/NYC-17, Joint Rebuttal Statement of the State of New York and the New York City Economic Development Corporation, filed Jan. 14, 1998 at 24-27; R.V.S. John F. Guinan at 11-13; R.V.S. Seth O. Kaye.

²¹ The United States Environmental Protection Agency ("EPA") has estimated that mobile sources are responsible for close to 50% of the annual emissions of NOx nation-wide, over one-third of the annual emissions of VOCs nation-wide, and over 75% of the annual emissions of CO nation-wide. See Emission Standards for Locomotives and Locomotive Engines, 62 Fed. Reg.

New York Metropolitan Area ("Area"), all are within ozone non-attainment regions.²² Seven -- including New York City's five counties -- are non-attainment for CO; New York County is a non-attainment area for PM-10 as well.²³ These non-attainment designations indicate that each affected county is not in compliance with federal air quality standards applicable to those pollutants.²⁴

New York, in addition, must grapple with the regional ozone problem plaguing a "contiguous corridor of [ozone] nonattainment counties" in the OTR.²⁵ OTR states, like New York, suffer the effects of ozone pollution transported up-wind or down-wind across state lines. This transport phenomenon affects OTR states' ability to achieve and maintain compliance with ozone standards. New York's highway vehicle emissions are a key factor in its impact on regional ozone formation: projected NOx emissions from New York's highway vehicles for the year 2007 exceed

6,366 (Feb. 11, 1997).

²² See DEIS, vol. 5A App. E at Attach. E-1. Nine of the ten are further classified as "severe" ozone non-attainment areas -- the most serious of five possible classification levels. Id.

²³ Id.

²⁴ The CAA and implementing regulations establish National Ambient Air Quality Standards ("NAAQS") for certain "criteria" air pollutants. To date, EPA has set NAAQS for CO, Pb, NOx, O3, PM-10, and SO2. See CAA, 42 U.S.C. §§ 7408-7409; DEIS, vol. 5A App. E at E-2.

²⁵ DEIS, vol. 1 at 4-58. See Finding of Significant Contribution and Rulemaking for Certain States in the Ozone Transport Assessment Group Region for Purposes of Reducing Regional Transport of Ozone, 62 Fed. Reg. 60,318, 60,337-40 (Nov. 7, 1997).

those of all other OTR states.²⁶

In light of its non-attainment problems and inclusion in the OTR region, New York has initiated a number of programs and projects aimed at reducing air pollution. As detailed in its prior Rebuttal filing, New York has implemented the Congestion Mitigation and Air Quality Improvement Program ("CMAQ"), a long-term, multi-agency effort focused on, among other things, diverting truck traffic to other transportation modes.²⁷ CMAQ has resulted in the State's coordinated investment with the Port Authority of New York and New Jersey of over \$10 million to subsidize car float operations across New York Harbor. The State and the Port intended this alternative cross-harbor route to reduce reliance on trucks, and, at the same time, decrease truck-related air pollutant emissions.²⁸ New York has expended another \$200 million over the last dozen years to subsidize construction of Oak Point Link, an intermodal facility designed to improve and expand railroad service into and out of the metropolitan New York City area.²⁹ Again, a major benefit of this project is reduced dependence on trucking, and corresponding air quality improvements.

In addition to these particular programs, as a general matter New York also conducts a thorough review of all proposed,

²⁶ Id. at 60,358.

²⁷ See NYS-24/NYC-17 at 25; V.S. Guinan at 11.

²⁸ Id.

²⁹ NYS-24/NYC-17 at 24-25; V.S. Guinan at 5.

federally-funded transportation projects affecting nonattainment and maintenance areas, to ensure their consistency with state and federal air quality improvement plans and mandates. More specifically, New York's Metropolitan Planning Organizations ("MPOs") engage in "conformity" analyses evaluating such projects' expected impact upon emissions of non-attainment pollutants regulated by the State's official air quality plan ("SIP").³⁰ The New York City Metropolitan Area's MPO, for example, "NYMTC,"³¹ recently completed its conformity determination for the Area's Transportation Improvement Plan ("TIP") governing future transportation-related projects in the region.³² Through extensive, detailed, and coordinated review,³³ NYMTC verified that every activity contemplated by the TIP will contribute to the reduction of vehicle-produced, non-attainment pollutants -- NOx, VOCs, and CO -- in the Metropolitan Area. The TIP will yield emissions levels lower than 1990 "base year" levels, and lower than pre-TIP implementation levels. Consistent with both state and federal

³⁰ "SIP" refers to "State Implementation Plan," a lengthy, complex, and continuously updated document prepared pursuant to the CAA by all states. See CAA, 42 U.S.C. § 7410. Federally-funded transportation programs states implement must "conform" to the strategies and provisions contained in an approved SIP. See CAA, 42 U.S.C. § 7506 (c); 40 C.F.R. pts. 51, 93.

³¹ "NYMTC" is an acronym for the New York Metropolitan Transportation Council.

³² A copy of NYMTC's "1998 TIP and Plan/SIP Conformity Determination and Supporting Analysis," dated September, 1997, is in New York's document depository.

³³ A number of state agencies and municipal bodies participate in the review process.

policy, NYMTC's planned transportation improvements neither "cause[] or worsen[] air quality violations," nor "delay[] attainment" of ozone, CO or PM-10 NAAQS.³⁴ To the contrary, NYMTC's TIP makes additional strides in restoring to a healthy, acceptable level air quality in downstate New York.

The importance of continued air quality improvement through programs like CMAQ and TIP transportation projects will only intensify in coming years. The EPA recently promulgated new, more stringent ozone NAAQS, increasing the number of designated non-attainment areas, and rendering ozone attainment more difficult to achieve.³⁵ This change forces states, like New York, facing ozone attainment challenges, to implement the most effective and efficient NOx control measures possible. The EPA, in addition, has issued a Notice of Proposed Rulemaking outlining suggested SIP revision requirements for states contributing to ozone transport in the eastern United States.³⁶ The EPA's proposed rules will force New York and other states to adopt SIP measures ensuring that they meet state-specific NOx emissions "budgets" set by the EPA.³⁷ These NOx budgets include a "highway vehicle component," prescribing the maximum highway-source

³⁴ See 62 Fed Reg. at 60,358 (describing the purpose and significance of determining conformity).

³⁶ See 62 Fed. Reg. 60,318 (November 7, 1997).

³⁷ Id.

NOx emissions permitted in each state.³⁸ The adoption of these proposed regulations, along with the more stringent NOx standards, will render all the more crucial effective air quality control in New York, and careful avoidance of activities and projects undermining NOx emissions reduction.

B. Absent Sufficient Truck-To-Rail Diversion, The Applicants' Transaction Will Significantly Harm Air Quality

Despite New York's firm commitment to improving and preventing further deterioration of its air quality, the transaction Applicants propose threatens to compromise New York's efforts in this regard. Absent Board-directed action by the Applicants to ensure that sufficient high-pollutant truck traffic diverts to rail, the transaction will have an unacceptably severe, adverse impact upon New York's air quality interests.

1. The Board Must Act To Protect System-Wide And Regional Air Quality

As discussed above, the DEIS proposes no mitigation for system-wide, regional, or New York air quality impacts resulting from transaction-related activities. SEA's failure to recommend system-wide or regional mitigation derives directly from its conclusion that predicted truck-to-rail diversions will "offset" acknowledged increases in various air pollutants. Generally speaking, truck diversions certainly do produce positive air quality impacts. The Applicants themselves champion as a major benefit of their transaction "air emissions savings . . . real-

³⁸ Id. at 60,355-58.

ized as a result of substantial truck-to-rail diversions."³⁹ "Rail transport," Applicants emphasize, "is much more fuel efficient than truck transport;" truck-to-rail diversions "[t]herefore . . . reduce fuel consumption, [and] result in reduced emission of most pollutants."⁴⁰ Indeed, Applicants claim, "[t]he most significant change in air emissions resulting from the Acquisition is the emissions decrease that would result from . . . diverted truckloads."⁴¹ As the EPA adopts additional and more stringent air emission standards, Applicants further acknowledge, "the beneficial effect of diverting freight from trucks to rail [will] . . . become even greater."⁴²

Though both Applicants and the SEA endorse and rely on air quality benefits produced by truck diversions, the magnitude of the diversions predicted to result from the subject transaction is by no means certain. To the contrary, diversion estimates provided by the Applicants, and figuring so prominently into the SEA's analysis, may seriously overstate truck traffic reductions, and correspondingly underestimate detrimental air quality impacts. Several factors point to this conclusion. To begin with, as SEA admits, CSX and NS calculated the diversion estimates used in the DEIS; SEA adopted their figures without

³⁹ CSX/NS-23 Application, vol. 6B at 17; see also CSX/NS-177 Rebuttal, vol. 2B, R.V.S. Peter A. Rutski at 3.

⁴⁰ CSX/NS-23 Application, vol. 6B at 71.

⁴¹ Id. at 81.

⁴² Id. at 102.

detailed review or additional analysis.⁴³ The Applicants, of course, have every incentive to make optimistic assumptions and judgments supporting high truck diversion figures: reduced trucking constitutes one of the transaction's major alleged benefits.⁴⁴

In addition, SEA acknowledges, "some overestimation of the truck-to-rail diversions has probably occurred."⁴⁵ "Anti-trust law principles," SEA explains, "preclude the railroads from cooperatively dividing freight transport between them."⁴⁶ "[S]ince CSX and NS [thus] independently developed their estimates of truck-to-rail diversions, there may be some double counting."⁴⁷ It is likely, in other words, that CSX and NS to some extent each predicted capturing certain same portions of current freight truck traffic; both, therefore, submitted emissions savings figures to the SEA for those diverted movements. Because only one of the two carriers could actually attract the subject truck traffic, however, their overlapping predictions distort emissions savings results.

⁴³ See DEIS, vol. 5A, App. E at E-3-4, E-15; vol. 1 at 4-54-55.

⁴⁴ See CSX/NS-23 Application, vol. 6B at 117; CSX/NS-19 Application, vol. 2A, V.S. Darius W. Gaskins, Jr.; V.S. John Q. Anderson; CSX/NS-23 Application, vol. 2B, V.S. Thomas L. Finkbiner; CSX/NS-176 Rebuttal, vol. 1 at HC-15-17; HC-463.

⁴⁵ DEIS, vol. 1 at 4-55.

⁴⁶ DEIS, vol. 1 at 4-41.

⁴⁷ DEIS, vol. 5A, App. C at C-3.

Finally, the railroads' -- and thus SEA's -- diversion projections fail to account for increased trucking that very well may result from the transaction and its aftermath. Though Applicants discount increased truck use as "minimal" and "negligible,"⁴⁸ the Applicants' plans for accommodating certain shipping and receiving markets belie this conclusion. Specifically, and in response to concerns raised by New York and the New York City Economic Development Corporation,⁴⁹ Applicants posit that the New York City metropolitan area east of the Hudson River will enjoy competitive post-transaction transportation options based on the availability of trucking. More particularly, Applicants claim that competition between CSX and NS in northern New Jersey will benefit east-of-Hudson shippers. This, they say, results from those shippers' access to the competitive New Jersey area by way of a truck connection across the Hudson River.⁵⁰ "Substantial traffic in the East-of-Hudson region," Applicants argue, "can be and/or [is] already trucked by trailer or container" to northern New Jersey.⁵¹ In the absence of competitive rail ser-

⁴⁸ CSX/NS-23 Application, vol. 6B at 17; see DEIS, vol. 1 at 4-54 (citing Applicants' conclusion that "only a negligible amount of freight would be diverted from rail to trucks or other delivery modes").

⁴⁹ See NYS-10 Comments of the State of New York, filed October 21, 1997; NYS-12/NYC-11 Joint Responsive Application of the State of New York and the New York City Economic Development Corporation, filed October 21, 1997; NYS-27/NYC-17.

⁵⁰ See CSX/NS-176 Rebuttal at HC-125-127; CSX/NS-177 Rebuttal, V.S. Joseph P. Kalt; V.S. Peter A. Rutski.

⁵¹ CSX/NS-177 Rebuttal, R.V.S. Kalt at 15 (emphasis added).

vice east of the Hudson, Applicants contemplate shippers' increased and long-term use of truck transportation to access competition on the west side. Indeed, Applicants cite "ample trucking alternatives" as justification for failing to provide those shippers with the alternative of competitive east-side rail service.⁵² This truck-oriented approach to east-of-Hudson shipping calls into question, once again, the accuracy of SEA's assumptions regarding decreased truck use, and the air quality determinations dependent on those assumptions.

In light of the very probable overestimation of truck diversion figures, SEA's conclusions regarding system-wide and regional air quality impacts are dubious at best. As a result, the Board must take independent action to ensure that transaction-related activities do not compromise system-wide and regional air quality. To this end, New York urges that the Board endorse conditions on the proposed transaction that will ameliorate air quality. In particular, New York submits that approval of the trackage rights its Responsive Application requests⁵³ would encourage the substitution of rail transportation for highway trucking, and thus contribute to the reduction of motor vehicle-related air pollution. By providing an attractive rail option to east-of-Hudson shippers, New York's proposed trackage rights operations would facilitate precisely the type of truck-

⁵² Id. at 17.

⁵³ NYS-12/NYC-11 Joint Responsive Application of the State of New York and the New York City Economic Development Corporation, filed October 21, 1997.

to-rail diversions Applicants and the SEA so strongly support. Such diversions, all concur, would bring about a corresponding reduction in truck emissions of NOx, VOCs, CO and other pollutants.

2. The Board Must Act To Protect Local Air Quality

The positive air quality impact that implementation of New York's trackage rights would entail extends beyond system-wide and regional pollution offsets resulting from truck diversions. Authorization of competitive rail service on the Hudson River's east side would also assist the New York City metropolitan area in meeting its local air pollution challenges. As discussed above, the ten counties comprising this region of the State are non-attainment areas for ozone, and in some combination, for CO and PM-10 as well. Though most of these counties received no detailed air impact review in the DEIS, several will in fact face increased post-transaction rail operations within their borders, and suffer corresponding air pollution effects.⁵⁴ The diversion of downstate truck traffic to east-of-Hudson rail transportation would assist in off-setting emissions produced by these added transaction-related activities, and advance the area's progress toward attainment status.

In addition to authorizing New York's requested trackage rights, the Board must conduct a careful review of SEA's conclusions regarding local air impacts outside of the New York metropolitan area. SEA accepts and dismisses far too readily air

⁵⁴ DEIS, Executive Summary, Attach. ES-B.

pollution increases predicted to affect attainment areas only, or result in allegedly small relative increases in emissions. This approach is inconsistent with New York's comprehensive and on-going efforts to reduce air pollution as quickly as possible state-wide, and is at odds with federal policy encouraging and mandating air pollution control measures. Incremental reductions in air pollution, and the preservation of attainment-level air quality, clearly advance the ultimate goal of achieving clean, healthy air, and should not be dismissed as insignificant or undeserving of protection.

II. Safety Concerns

A. SEA's Proposed Passenger Train Safety Mitigation Is Unnecessary and Inadvisable

As Metro-North's Comments discuss, SEA's proposed passenger train "priority" designation would do little to improve safety on lines shared by freight and passenger traffic. More sophisticated and reliable control systems and signals exist that guard against train collisions, and ensure compatible operation of multiple trains on the same track. New York's Port Jervis line is equipped with such modern control devices, and would not benefit from the SEA's well-intended but cumbersome and minimally effective mitigation measure.

Metro-North also points out, and New York agrees, that imposition of a 30-minute clearance "window" will reduce the capacity of the subject line. New York supports Metro-North's position that this effect threatens to impede planned future

expansion of passenger service on the Port Jervis Line, and endorses Metro-North's opposition to the mitigation on this ground. New York, like Metro-North, intends to increase passenger train service on other lines through the State in coming years,⁵⁵ and views priority designations as incompatible with maximum efficient use of those rail lines. New York respectfully submits that the Board should reject the priority mitigation SEA suggests.

CONCLUSION

As outlined above, the DEIS does not adequately investigate the proposed transaction's likely harmful effects on system-wide, regional, and New York air quality. New York urges the Board to re-examine the SEA's findings, focusing on the issues identified by these Comments, and adopt conditions facilitating the preservation and improvement of air quality. In addition, New York asks that the Board reject SEA's recommended

⁵⁵ See NYS-10 Comments, V.S. James A. Utermark at 17-19.

passenger safety mitigation, as its problematic effects outweigh any benefits to rail safety it may have.

Respectfully submitted,

-CONTROL AND OPERATING LEASES/AGREEMENTS-
CONRAIL INC. AND CONSOLIDATED RAIL CORPORATION

COMMENTS OF JERROLD NADLER AND 23 OTHER MEMBERS OF CONGRESS
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

Twenty four Members of Congress, variously representing the people of the States of New York and Connecticut comment on the Draft Environmental Impact Statement as follows:

INTRODUCTION

The Draft Environmental Impact Statement (DEIS) relating to the petition of CSX and Norfolk Southern (the Petitioners) to divide Conrail between them, assumes, as fact, that as CSX will acquire Conrail's assets east of the Hudson. It then finds that CSX does not intend to increase service on those assets. The DEIS therefore concludes that there is no reason for an environmental review or for any mitigation of adverse environmental effects. On this initial flawed premise the DEIS ignores the major adverse environmental and social-economic effects which are inevitable from the plan.

The petitioners have declared that they will allow no improvement of rail service in downstate New York or in southern New England. This fact is due exclusively to a deal made between the petitioners. At the same time they extol the benefits to be derived by this region from the high quality, competitive rail services which they will jointly provide in New Jersey. They declare that this increased service will benefit the east of the Hudson market. They declare that they will increase their market share east of the Hudson by using trucks to serve local industry from New Jersey rail heads. The DEIS ignores that aspect of the plan entirely. It also ignores the economic dislocation which can be expected by the partial, but not the complete, end of the Conrail monopoly by the applicants. Far from being a no-action plan for the down state New York and Connecticut, the plan will impose severe adverse environmental and economic changes on this metropolitan region to the extreme disadvantage of downstate New York and of Connecticut. The DEIS ignores all of these effects, fails to consider alternatives and is, thus, absolutely inadequate. The proposed acquisitions, unmodified to mitigate adverse environmental and economic consequences, are not in the public interest.

APPLICABLE STANDARDS

Congress made it clear in 42 USC 4331 that the goal of the environmental policy of the United States was, in relevant part, to:

...
(2) assure for all Americans, safe, healthful, productive and esthetically and culturally pleasing surroundings;

(3) attain the widest range of beneficial uses of the environment without degradation, risk to health or safety, or other undesirable and unintended consequences;

...
(5) achieve a balance between population and resource use which will permit high standards of living and a wide sharing of life's amenities;

(6) enhance the quality of renewable resources and approach the maximum attainable recycling of depletable resources.

To achieve these goals 49 USC 4332 mandates that the Board, as a federal agency, must review:

- i. the environmental impact of the proposed action,
- ii. any adverse environmental effects which can not be avoided should the proposal be implemented,
- iii. alternatives to the proposal,
- iv. the relationship between local short term uses of man's environment and the maintenance and enhancement of long-term productivity, and
- v. any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented.

Executive Order No. 12898 dated February 11, 1994 requires that:

To the greatest extent practicable and permitted by law,....each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies and activities on minority populations and low-income populations.

The DEIS is insufficient to meet any of these legal requirements or to "assure that (the

Board gives) proper consideration to the environmental consequences of their actions" / Douglas County v. Babbitt 48 F. 3d 1495, 1498 (9th Cir. 1995). The DEIS also does not assure that the public is informed about the environmental impact of the proposed action. Supra.

PRELIMINARY STATEMENT

The DEIS first segments the various parts of the plan and then limits its analysis to local effects of each segment. To accomplish even that unlawful analysis it then sets threshold criteria for a determination that an adverse environmental effect caused by truck traffic requires analysis. That threshold is an increase of 50 truck trips per day or a 10% increase on any roadway. There is no legal or logical basis for any such threshold. The DEIS unlawfully fails to consider the cumulative effects of the plan in any regard. Here, the major cumulative effect is in the region east of the Hudson which includes the counties with the highest rates of respiratory disease in the nation. An increase of any amount of truck traffic requires in depth analysis. The price of any increase in such traffic is the serious illness or death of the residents of such a region which illnesses and deaths occur in direct proportion to any increase in such traffic. Thus, the DEIS violated the law by segmenting the program, by localizing its separate effects and by ignoring cumulative effects. The DEIS is also legally invalid as it sets thresholds for analysis, applied uniformly, which have no scientifically or legally established validity in any case but which ignore the environmental frailty of the regions in question. Indeed the addition of any truck traffic within a maximum non-attainment area, where people are presently dying in large numbers from the effects of the particulate emissions from already high levels of such traffic, is an absolutely unacceptable legal or moral result. Where, as here, the region is already well above any acceptable threshold for truck traffic, any plan for federal action which could even remotely result in an increase in such traffic requires a full review and the imposition of sufficient mitigation to neutralize such adverse effects. Any other result is irrational.

The action proposed is the partial end of the Conrail monopoly. Rather than break up this monopoly in its entirety, the petitioners urge that one area of the nation be left out. That area, being the city of New York and its eastern environs, has the nation's largest population center, its highest gross domestic product, a large minority population and the largest disparity between its richer and poorer residents. Not only does the plan not end the rail monopoly east of the Hudson, it is to maintain present levels of non-service in that area. Yet, petitioners project a marked increase of the rail market share of this region's freight to be achieved by trucking regional freight to and from the petitioner's New Jersey terminals. The downstate New York and Connecticut economy is, thus, to be placed in an untenable competitive position by the uneven end to the Conrail monopoly while at the same time tremendous environmental degradation is to be imposed on the region's poorest and sickest residents by the addition of at least one thousand trucks per day to the region's already overcrowded roads and bridges. Yet none of these effects is mentioned, let alone analyzed, in the DEIS.

The DEIS dismisses all suggested modifications of the plan as having no adverse environmental effects and, thus, not requiring analysis. Where, as here, the plan

provides for no mitigation of monumental adverse environmental and social-economic consequences of the action proposed, the possible mitigating effects of all practical alternative proposals must be analyzed.

The DEIS must be comprehensive enough to alert the Board and the public of the gravity of the error which has been urged upon them by these petitioners. The DEIS is thus entirely insufficient.

AIR QUALITY AND ENVIRONMENTAL JUSTICE

As set forth in detail in the congressional Delegation's Petition (page 8 footnote 7) and in the reply affidavits submitted previously, New York City is at the center of the nation's largest air quality non-attainment area. The Bronx, one of the City's five boroughs, is the epicenter of the non-attainment zone and as the direct result has the highest rates of respiratory disease in the nation. The map attached hereto as Exhibit A demonstrates why. The Bronx is crisscrossed by I-95-295, the Cross Bronx Expressway, I-87, the Major Deagan Expressway, I-278-95, the Bruckner Expressway and I-288, the Sheridan Expressway, all major trucking arteries. While taking no action to improve direct rail access to this region, the proposal before the Board calls for a large increase in use of the applicants' northern New Jersey intermodal terminal facilities to serve this market. Two thirds of the region's population live and work east of the Hudson. Two thirds of all cargo handled anywhere in the region will be en-route to or from the effected region, east of the Hudson. The proposal calls for an increase of 1,280 truck trips a day at the northern New Jersey terminals (Vol. 3 B pg. NJ-13-NJ-17) and deals only with the local effects of those proposed traffic increases (See ex NJ-36). However, it can be assumed that over one thousand of those trips will originate or terminate in downstate New York and Connecticut and that all of that traffic, no matter its origin or destination, must be routed via the George Washington Bridge, due to clearance restrictions on all other crossings and circuitry. Inevitably that traffic will traverse northern Manhattan and the Bronx.

Due to the focusing of truck traffic caused by the regional road system, northern Manhattan and the Bronx, under the petitioner's plan, will be burdened with a large increase in traffic. Also, due to the petitioner's plan, the same residents who's health will be markedly and adversely effected, will see no off-setting economic benefits from this increased traffic. This problem is not addressed in the DEIS.

To conform with the minimum requirements of law the exact amount of new traffic through northern Manhattan the Bronx and other regional neighborhoods must be determined and the adverse environmental effects reviewed and stated. It is clear that the addition of one thousand trucks per day to the 30,000 per day presently crossing Manhattan on Rt. 95 or to the 20,000 presently using the Cross Bronx Expressway including half of the 12,221 presently crossing to and from Connecticut, or to the 10,000 now using the Major Degan, is an unacceptable environmental result that requires mitigation. Indeed, the numbers in question are well over even the thresholds for impact analysis stated in table K-1 of Appendix K. Thus, the lack of an impact analysis violates

the law as well as even the standards accepted for this DEIS by the Board.

The stated goal of the petitioners is to draw traffic from all truck carriage. Trucks serving Westchester County and southern Connecticut, via all highway service, use the Tappan Zee Bridge in large numbers, See Exhibit A. If the NS-CSX plan is successful, a substantial amount of that traffic will be drawn away from the Tappan Zee Bridge and will cross the George Washington Bridge to access the North Jersey intermodal facilities. Again the addition of hundreds of heavy trucks to the highways of Manhattan and the Bronx is an inevitable and profound adverse environmental effect. The DEIS however confines its review of the environmental effects of this plan to truck traffic increases within areas close to the terminals, entirely within a confined area of New Jersey. This is particularly disturbing where, as here, the terminals are spread across Essex, Union and Bergen Counties, dividing the direct local effects between these areas. But this added traffic all concededly flows onto the Rt.-95 artery. The cumulative effect of this traffic added to Rt.-95, the George Washington Bridge and the highways east of the Hudson is far greater than the local effect, yet is un-mentioned. The DEIS does not comply with the requirements of the law or with its own stated standards for review. Indeed, any decision based upon an EIS which is conspicuously flawed in the inception and which does not deal with environmental problems, which are the obvious result of the plan reviewed, would be irrational.

The profound effect on truck traffic through the City of New York and on the already overcrowded highways of downstate New York and southwestern Connecticut is an actual, imminent and not a conjectural or hypothetical effect of the changes in throughput projected by the petitioners for the New Jersey facilities (See NJ-5 Volume 3B Chapter 5). It is suggested that the effects in question are avoidable. The steps demanded jointly by the Congressional Delegation, the State of New York, and the City of New York as well as those demanded by the Tri-State Transportation Campaign would all result in substantial mitigation of these inevitable adverse environmental effects and constitute both an alternative and a means of mitigation. The Board has an absolute obligation to "study, develop and describe appropriate alternatives to the recommended courses of action to any proposal which involves unresolved conflicts concerning alternative uses of available resources". Such resources, it is submitted, include the health and safety of the residents of northern Manhattan and the Bronx, and of all residing along these overburdened highways as well as this region's finite highway capacity.

Therefore, the amount of the projected increase of truck traffic across New York City and in southern New England must be quantified to allow full consideration of the adverse environmental consequences to New York and Connecticut from increased use of New Jersey intermodal facilities. The DEIS must study viable alternatives. The amount of traffic which could be drawn off the region's highways in critical areas by direct rail freight service by car float and RoadRailer (TM) based services to and through the City of New York onto Long Island and to Westchester and Connecticut, must be quantified. If significant mitigation of the environmental and social-economic effects can be achieved by such service and if such service will not threaten the viability of the petitioners, it must be suggested to the Board in the EIS as a necessary condition to mitigate the inevitable adverse effects of the present plan.

ECONOMIC DISLOCATION WHICH IS AN INEVITABLE EFFECT OF THE PLAN DESTROYS THE LONG TERM EFFICIENT USE OF REGIONAL ASSETS

The plan will provide no improvement to rail service to the east of the Hudson River. Alternatives proposed by the Congressional Delegation, the goals of which have been endorsed by the City and State of New York, as well as the slightly different proposal made by the Tri-State Transportation Campaign, do provide improved services and would not only enhance economic opportunity east of the river but would remove over 14 million tons of freight from the highways each year in the near term with minimal investment in infrastructure.

Not only does the Bronx have the sickest lungs in the nation, it is also the poorest county in the State of New York. The median household income in the county is \$19,881 as compared with a national average of \$31,241. The unemployment rate in the Bronx is 9.8%, among the highest in the nation. 46.97% of the children of the Bronx live below national poverty levels. These are facts which are directly related to the hemorrhage of industrial activity which this City has experienced due to the withdrawal of effective rail transportation over the last quarter century. Continuing to block effective service to this City and region, as is the goal of the petitioners' plan, is not in the public interest nor does it assure the maintenance and enhancement of long-term productivity of this region's population and the efficient exploitation of its economic assets. These factors are not reviewed in the DEIS nor are the mitigating effects of the proposed alternatives.

The Board has the power to impose all the conditions demanded by the Congressional Delegation and by Tri-State Transportation Campaign. It may refuse to allow the continuation of an existing service pattern even where a monopoly is not created by the action proposed (but where one is simply maintained) where, as here, the public interest requires such action.

Here, the proposed action is not to cause harm to just a single shipper. It will harm a major population center. The public interest can not be served by any plan which maintains a monopoly over nearly one tenth of the nation's population, particularly where, as here, that monopoly declares in advance that it has no intention of serving that region and indeed has entered into a non-competitive agreement barring adequate service in that region. The petition is a declaration by the petitioners that they will not provide needed service and such declaration gives the Board the right and obligation to act.

The law provides that where, as here, an operator refuses to provide adequate service on a rail line, the Board may require conveyance of that line to a responsible operator which will provide needed services if the Board determines that:

- (A) the rail carrier operating such line refuses within a reasonable time to make the necessary efforts to provide adequate service to shippers who transport traffic over the line;

(B) the transportation over such line is inadequate for the majority of shippers who transport traffic over the line;

(C) the sale of such line will not have a significantly adverse financial effect on the rail carrier operating such line;

(D) the sale of such line will not have a significant adverse effect on the overall operational performance of the rail carrier operating such line; and

(E) the sale of such line will be likely to result in improved railroad transportation for shippers that transport traffic over such line.

CSX's statement, upon which the DEIS's non-analysis of regional effects is based, that it will not increase service over the lines to be transferred to it, is a refusal to serve shippers in the downstate region. That refusal is simply an extension of Conrail's standing similar refusal which has limited service to the presently inadequate level. The record also confirms the inadequacy of service provided by the harbor rail car float operator. The petition of the Congressional Delegation, joined by the State of New York and the City of New York, is a petition by the owners of the rail lines in question in the Congressional Delegation's petition (as well as those the subject of the Tri-State Transportation Campaign demands) seeking transfer of many of these assets and rights to the Conrail Shared Assets Operator (CSAO). These governmental officials are specifically defined as persons with standing to seek such relief under Section 10907 of Title 49. The State and City of New York, as owners of the effected non-petitioner rail lines, are persons with standing to seek inclusion of those lines in the merger plan under 11324(c). Therefore the transfer of the east of Hudson assets to the CSAO, is a viable option the effects of which must be reviewed in the EIS.

The current cross harbor float operator is handling 30 cars per day and that is an increase in its traffic. In spite of a \$5 per ton cost advantage over routing traffic via Conrail's Selkirk Yard (the only rail transportation option the petition contemplates maintaining) the cross harbor operation has no discernible share of Long Island or City traffic. That operator's service is unreliable and is not used by shippers due to a pattern of poor service and frequent breakdowns caused by its inability to maintain its assets. Studies conducted by the City, using highly respected experts in the transportation field, indicate that two thirds of the 98 million tons of freight generated in the downstate region, which is within the rail industry's usual market, could use the cross harbor operation if good service were available. It determined that institution of good service would quickly raise traffic handled from nearly nothing to over 14 million tons per year (823,520 17 ton trucks per year, 2,261 trucks per day), with minimal investment in infrastructure. The present operator is not and can not provide service needed by shippers who should be using the line. Therefore, the transfer of the line, as demanded, is not only a viable option, but it provides a positive environmental and economic result, in marked contrast to the plan as advocated by the petitioners.

Direct, all rail service, from Long Island points to landfills outside the area,

has been restricted by an agreement between the Long Island Railroad freight service operator, the New York and Atlantic Railroad, (NY&A) and the Borough President of Queens prohibiting the transport of municipal solid waste (MSW) through Queens via Conrail for five years. This agreement resulted from the long delays in movement of MSW cars through the NY&A interchange with Conrail at Fresh Pond, Jt. in Queens. The capacity of Conrail's present one-train-a-day service from Fresh Pond Jt. to Oak Point, combined with the limited capacity of Conrail's single-train-a-day from Oak Point west, combined with the lack of yard capacity at Oak Point, results in MSW cars being held at Fresh Pond, located in a residential neighborhood, for substantial periods of time creating, significant detrimental environmental effects in that area. The NY&A agreement with Queens constitutes an absolute refusal to handle traffic offered to the railroad. Thus, granting the CSAO access to Fresh Pond to handle that traffic via the cross harbor floats, which have substantial unused capacity, is mandated by 49 USC 10907 and is also a viable option which would mitigate present and future highway traffic across the Bronx.

In the face of this absolute refusal by CSX to provide service adequate to serve the shippers who wish to use rail services on Long Island, including Brooklyn and Queens many proposals are being made to barge MSW to the Bronx to be loaded on rail cars their. Transfer of facilities in southern New England, the Bronx and on Long Island to the CSAO, providing direct access by the Long Island Railroad and the Providence and Worcester to both petitioners, is mandated by law. It is a viable option which would greatly mitigate existing and future truck traffic, as well as the presently contemplated major concentration of MSW transfer operations in the Bronx and it must be considered by the EIS as available alternative.

The inevitable environmental degradation which can be predicted from the plan requires significant mitigation. The direct all rail diversion of 14 million tons of freight per year, 2,261 trucks per day, one part of the similar Congressional Delegation's and Tir-State's proposals, is a significant, environmentally positive step. The Congressional Delegation's Petition, that of the State and City of New York and that of Tri-State Transportation Campaign each constitute viable alternatives which are reasonable and available mitigating steps. The EIS must review the environmental and economic significance of these similar and complementary proposals and if they do provide mitigation, the EIS must recommend approval of the petition conditioned on acceptance by the Petitioners of:

1. extending of the CSAO across New York Harbor by car-float to interchange directly with the Long Island Railroad and the Providence and Worcester east of the Hudson River and directly accessing Oak Point Yard, Harlem River Yard, and the New York Produce Terminal at Hunts Point;
2. allowing any operator to provide RoadRailer service on the entire Northeast Corridor;
3. access by another carrier on the lines accessing the region east of the Hudson.

CONCLUSION

The plan will end the balance in economic disabilities of the Northeast. Downstate New York and Connecticut are to remain economically isolated at the end of the CXS system. CSX assures the Board that it will provide no increase in Conrail's one-train-per-day in each direction policy. In marked contrast, New Jersey will receive full competition between two well financed railway giants. Such a change will inevitably cause a new exodus of employment opportunity from New York and Connecticut. It will cause the spread of industrial development in New Jersey, invading presently open spaces. No review of the social-economic effects of ending a monopoly in one third of the region and continuing it in the other two thirds can be found in the DEIS. Where, as here, monumental environmental and social-economic consequences are an inevitable result of the action proposed, the agency has an obligation to fully review those changes and to take appropriate steps to mitigate. Pursuant to the mandate contained in Executive Order 12898, and applicable law, where, as here, the inevitable result of the proposed federal action will be to move jobs away from an already impoverished, largely minority, population while subjecting that population to substantial environmental degradation, such plan must be rejected or modified to impose extensive mitigation.

For the above reasons and for those asserted by other interested parties, relative to this region, the Congressional Delegation urges extensive revision of the EIS to conform to the requirements of law.

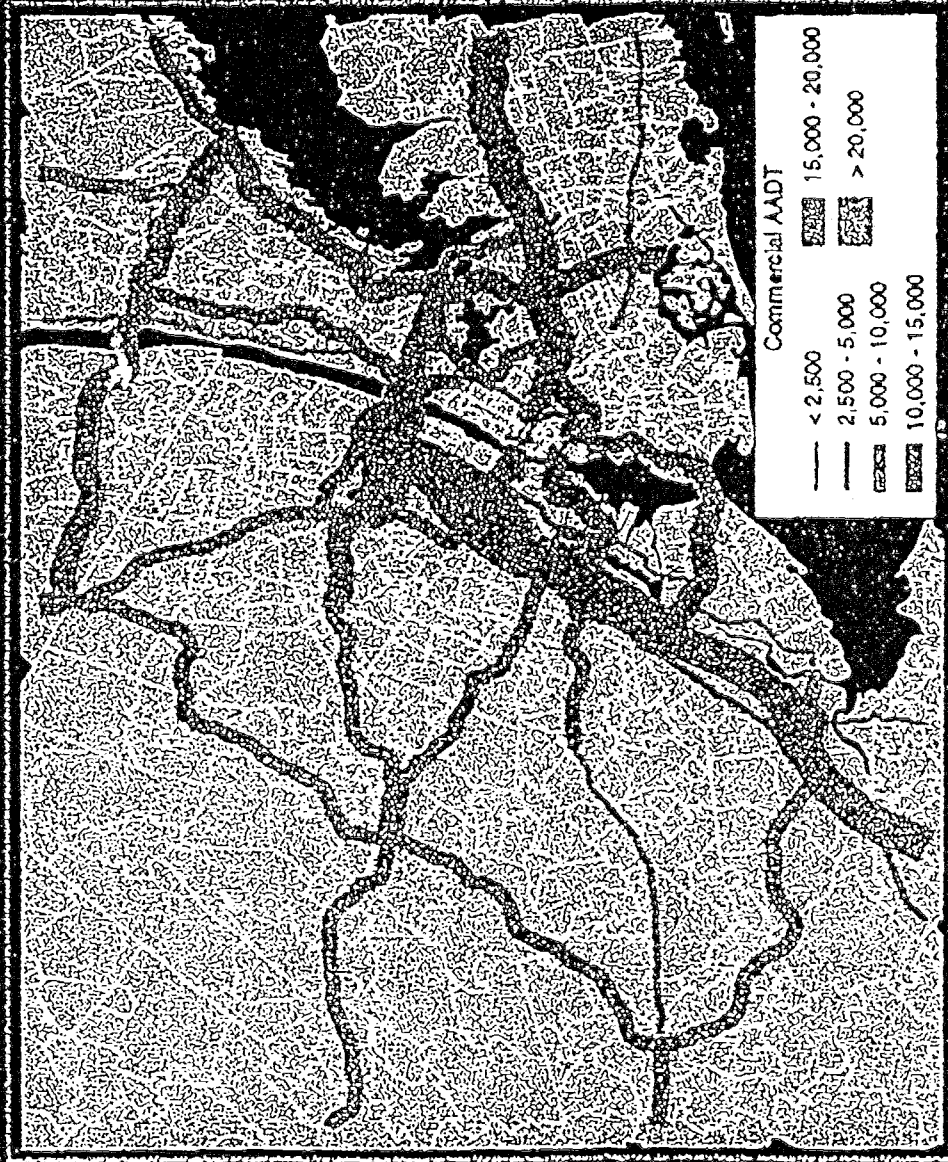

Dated, New York, N.Y.

Attention: Elaine K. Kaiser
Chief, Section of Environmental Analysis
Environmental Filing

Dear Ms. Kaiser:

We have received the draft Environmental Impact Statement for the proposed acquisition of Conrail by Norfolk-Southern Railroad and CSX Railroad. We have the following concerns that we would like to have addressed in considering this acquisition:

1. Long Delays at Downtown Crossings

For many years now, we have been concerned about the length of time required for freight trains to clear the crossings in the central business district of the City of Rocky Mount. These crossings are known locally as East Grand, Goldleaf, Thomas, Sunset-Tarboro, Hill-Western, Nash-Marigold, and Bassett. The north bound freights clear these crossings in a reasonable time period, but the southbound freights slow to a crawl as the trains enter the yard on the south end of town. We have tried without success to encourage CSX to make whatever improvements are required on the south end so that southbound trains could clear the downtown crossings more timely. According to the Environmental Impact Statement, the merger will increase the number of freight trains significantly and we believe this increase will exacerbate this long-standing concern over long delays at these rail crossings.

The long delays at these rail crossings are of concern for these reasons:

- a) The City of Rocky Mount's population of 58,000 is split by the railroad tracks in the ratio of one-third to two-thirds. Long delays at crossings result in delayed public safety (police, fire and rescue) response to calls for help as public safety vehicles must take "the long way around" to get to the scene of the call.
- b) The City operates a fixed route bus transportation service. Long delays at crossings disrupt the service schedule which adversely affects the reliability of the public transit service.
- c) Like many cities in North Carolina and in the US, Rocky Mount's central business district has sustained the loss of retail business to the suburban malls and shopping centers. Our efforts to revitalize the central business district are made difficult by the phenomenon of long delays at crossings. Increased delays will increase this difficulty as existing and prospective business operators realize that the railroad is a barrier to customers. It is important to realize that the CSX main line bisects Main Street.

Rocky Mount has a very limited number of separated crossings available as alternative routes for public safety, public transit, and general motorists. The Raleigh Road (Highway 97) overpass is considered adequate. However, the Sutton Road underpass and the Riverside Drive underpass are completely inadequate as they are remotely situated and will handle only automobiles and pickup trucks. The Sutton Road tunnel floods out very frequently and will accommodate only one lane in one direction at a time. We have engaged a traffic engineering consulting firm to study alternative locations for separated crossings and we hope that the post acquisition railroad will cooperate with us in accomplishing whatever crossing improvements we pursue following the completion of our consultant's work.

2. Hazardous Materials

Appendix A-1 of the environmental impact study indicates a significant increase in the number of cars and number of tons of hazardous materials through Rocky Mount (Segments C-334 and C-335). We have been fortunate not to have had an accident in the central business district, but the increase that will result from the acquisition is of great concern to us.

3. Passenger Rail Safety

Table 5-2 (pages 5-31) indicates an expected increase in the number or frequency of passenger train accidents in our area (Segment C-334). We are greatly concerned about this as we have been working to upgrade our AMTRAK passenger station so that travel by train will become more attractive as a mode of transportation. The passenger station at Rocky Mount boards and debords approximately 50,000 passengers per year from our area.

Related to this concern is the effect of increased freight traffic on AMTRAK schedules. Passengers frequently complain about late trains. Reliability of service is important to the attractiveness of AMTRAK as a mode of transportation and we believe that increased freight traffic will exacerbate the problem of unreliability of scheduled service.

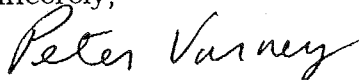

4. Crossing Safety

For several years, we have experienced problems with the gates at the downtown crossings going down randomly with no train in sight. We have kept data on this situation and a summary is enclosed.

This mysterious and random activation of the crossing gates results in anger and frustration by motorists and we believe the reduced respect for the protection equipment increases the frequency of "gate-running." We are greatly concerned about crossing safety and reliability of equipment is important to maintain respect for safety measures. We have expressed our concern to CSX about this, but the random gate activation continues year after year. We would like to have this situation addressed before you allow the acquisition to proceed.

We appreciate the opportunity to comment on the Environmental Impact Statement and we hope you will give our concerns serious consideration.

Sincerely,

Peter F. Varney
Assistant City Manager

Dear Ms. Kaiser:

Re: Finance Docket No. 33388-CSX and Northern Southern -Control and Acquisition
of Conrail **DEIS**: Distribution List of Environmental Documents

The N.C. State Clearinghouse sent you a letter December 2, 1997 requesting that environmental documents relating to the above referenced acquisition be forwarded to this office for distribution to the affected counties. At that time we did not realize the number of counties that were potentially affected by this proposed action. The volume of this mailing resulted in a less effective method of handling both in terms of time and cost.

Therefore, I am requesting that future documents issued on this matter be sent directly to the County Managers on your list. The State Clearinghouse would like to continue to receive twenty (20) copies for distribution to state agencies.

Thank you for your cooperation in this matter. Please call if you have any questions.

Sincerely,

A handwritten signature in cursive script that reads "Chrys Baggett".

January 13, 1998

MEMORANDUM

TO: Melba McGee
Office of Legislative and Intergovernmental Affairs

FROM: Alan Klimek, Director 

SUBJECT: Project No. 98-E-0404
Environmental Assessment
Draft Environmental Impact Statement
Proposed Conrail Acquisition

The Division of Air Quality has reviewed the above document. The Impact Statement evaluates the potential environmental effects of the proposed acquisition of Conrail, Inc. and Consolidated Rail Corporation by CSX Corporation and CSX Transportation, Inc. and Norfolk Southern Corporation and Norfolk Southern Railway Company. This proposed action would include railways in North Carolina. An air quality permit is not required for this permit.

In addition, the contractors should take care to comply with open burning provisions during any land clearing. Adequate wetting, reseeding and covering of disturbed areas should be utilized during earth moving operations to mitigate any adverse impact from fugitive dust emissions.

Should you require further information in this regard, please advise.

RE: Comments on DEHNR # 97-0456; DWQ#11495
CSX and Conrail Merger - Railroad Traffic Increase; Scoping Request;
Northampton and Union Counties

The Division of Water Quality (DWQ) has reviewed the proposed projects described in the scoping package described above. As described in the document, an Environmental Report (ER) will be prepared in support of a merger request between CSX Corp. and Conrail Inc. Railroads. It is assumed the ER will address the anticipated rail traffic changes expected on two spurs located in Northampton and Union Counties in North Carolina. The WQ Division has the following comments on the proposal:

- a. The portion of the project within Northampton County will occur along the Seaboard Coast Line, which parallels Hwy. 301 between Weldon, NC and Emporia, VA, downstream of Roanoke Rapids Lake, a water supply for Roanoke Rapids and Weldon. The project will not cross any surface waters designated for use as water supplies.

The portion of the railroad within North Carolina spans both the Roanoke and the Chowan River Basins. The portion of the project area within the Roanoke River Basin lies within the Roanoke River Watershed, Sub basin #03-02-08, and is below the intakes for any surface water supplies. The portion of the project within the Chowan River Basin (Meherrin River Watershed, Subbasin # 03-01-02) Basin has been identified as having Nutrient Sensitive Waters (NSW). The Meherrin River was identified in 1995 as supporting its uses and with good biological water quality. No surface water supplies exist in the Chowan River Basin. Major streams crossed by this rail line include:

<u>Stream Name</u>	<u>River Basin</u>	<u>Surface Water Classification</u>	<u>Use Support Rating</u>
Jacks Swamp	Chowan	Class C - NSW	Support Threatened
Roanoke River	Roanoke	Class C	Supporting

- b. The portion of the project within Union County will occur approximately parallel to Hwy. 75 between Hancock, SC and Monroe, NC, through Haxhaw, NC.

The portion of the railroad within North Carolina spans both the Catawba and the Yadkin Pee Dee River Basins. The portion of the project area within the Catawba River Basin lies within the Waxhaw Creek Watershed, Subbasin #03-08-38 and crosses tributaries of the East and West Forks of Twelvemile Creek, which is rated as partially supporting its uses. The portion of the project within the Yadkin Pee Dee River Basin is located within the Richardson Creek Watershed, Subbasin # 03-07-14. It appears that the rail line crosses a tributary to Bearskin Creek, classified as Class C. The project is partially within the protected area for the Richardson Creek Water Supply Watershed, which has a classification of WS-IV and supplies public water supply to the City of Monroe. Major streams crossed by this rail line include:

<u>Stream Name</u>	<u>River Basin</u>	<u>Surface Water Classification</u>	<u>Use Support Rating</u>
West Fork of Twelvemile Creek	Catawba	Class C	Undetermined
East Fork of Twelvemile Creek	Catawba	Class C	Undetermined
Bearskin Creek	Yadkin	Class C	Not Available

- c. Increases in railroad traffic may produce additional quantities of chemicals from normal train operations that may be spread, through stormwater events, from the train tracks into surrounding surface waters. The Environmental Report should identify and quantify the amounts (if possible) of all potential chemicals that may leak out of operating trains (from both cargo being hauled and the trains themselves) or be used on the tracks by the train companies during normal operations, such as oils, greases, toxics and salts. The report should also evaluate the potential to surface water quality possible from these chemical inputs, including effects on aquatic life and surface drinking water sources.
- d. As train traffic increases, so does the likelihood of derailments and collisions. The ER should evaluate the potential risk of these incidents on surface water quality in the project areas. The report should identify and implement appropriate mitigation measures into the project to assure protection of surface water quality.

Please give me a call at 919-733-5083, ext. 567 if you have any questions.

MEMORANDUM

FILE COPY

TO: Melba McGee
FROM: Michelle Suverkubbe *MS*
THROUGH: Alan Clark *AC*
RE: Comments on DEHNR # 97-0552; DWQ #11534
CSX and Conrail Merger - Railroad Traffic Increase;
Scoping Request from Frisco, VA to Bostic, NC;
Multiple Counties

The Division of Water Quality (DWQ) has reviewed the proposed project described in the scoping package described above. As described in the document, an Environmental Report (ER) will be prepared in support of a merger request between CSX Corp. and Conrail Inc. Railroads. It is assumed the ER will address the anticipated rail traffic changes expected on the CSX rail segment located between the towns of Frisco, Virginia and Bostic, North Carolina. The WQ Division has the following comments on the proposal:

- a. The project will transverse Mitchell, McDowell and Rutherford Counties in North Carolina. The project extends the entire N-S width of the state at this location and transverses the Broad, Catawba and French Broad River Basins. The southern portion of the project area lies within the Broad River Watershed, Subbasin #03-08-02. Within this river basin (mostly located within Rutherford County), the project may potentially cross surface waters designated for use as water supplies. The middle portion of the project lies within the Catawba River Basin (Subbasin # 03-08-30), while the northern portion of the project within North Carolina lies within the French Broad River Basin (Subbasin # 04-03-06).

Major rivers crossed or paralleled by this spur include the Second Broad River, the Broad River, the Catawba River, and the North Toe River. The project also appears to cross several other small tributaries of these river systems.

For important information on the existing classifications, use support ratings and quality of the surface waters potentially impacted by the proposed project, please see the enclosed Basinwide Water Quality Management Plans for the French Broad and the Catawba River Basins. The Broad River Basinwide management plan is not yet completed.

- b. Increases in railroad traffic may produce additional quantities of chemicals from normal train operations that may be spread, through stormwater events, from the train tracks into surrounding surface waters. The Environmental Report should identify and quantify the amounts (if possible) of all potential chemicals that may leak or spill out of operating trains (from both cargo being hauled and the trains themselves) or be used on the tracks by the train companies during normal operations, such as oils, greases, toxics and salts. As train traffic increases, so does the likelihood of derailments, spills, collisions and accidents. The report should evaluate the potential to surface water quality possible from these chemical inputs, including effects on aquatic life and surface drinking water sources. The ER should also evaluate the potential risk of these incidents on surface water quality, including drinking waters, in the project areas. The report should discuss and include appropriate mitigation measures into the project to assure protection of surface water quality from these incidents.

Please have the project applicant give me a call at 919-733-5083, ext. 567 if they have any questions.

MEMORANDUM

TO: Melba McGee, Environmental Coordinator
Office of Legislative and Intergovernmental Affairs

From: Owen F. Anderson, Piedmont Region Coordinator
Habitat Conservation Program

Date: January 29, 1998

SUBJECT: Draft Environmental Impact Statement for Proposed Acquisition of Conrail by
CSX and Norfolk Southern, Statewide Project, NC 98-E-0404

Staff biologists with the North Carolina Wildlife Resources Commission have reviewed Chapter 5, Volume 3B of the Environmental Impact Statement (EIS) for potential impacts to fish and wildlife resources and sensitive habitats in North Carolina. Our comments are provided in accordance with provisions of the National Environmental Policy Act (42 U.S.C 4332(2)(c)) and the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C 661-667d), and the North Carolina Environmental Policy Act (G.S. 113A-1 through 113A-10; 1 NCAC 25).

We had previously provided scoping comments on this project on three occasions and expressed concerns about particular segments of certain rail lines involved in this acquisition and about impacts from intermodal facilities. However, we could not find any reference to scoping comments provided by our agency.

We are pleased that the acquisition will not have any adverse impact on the State of North Carolina's plans for use of some rail corridor for intercity and commuter rail service in the Raleigh, Durham and Greensboro corridor.

There is no analysis of impacts for natural resources in North Carolina. The applicants have indicated that no CSX or Norfolk Southern (NS) rail yards or intermodal facilities in North Carolina will experience increased traffic or activity that would meet or exceed the Surface Transportation's Board thresholds for environmental analysis and that there are no new connections or proposed abandonment. CSX and NS anticipate, due to predicted truck-to-rail diversions, North Carolina would experience a benefit in the areas of emissions, noise, and safety. The document states that no analysis would be performed for natural resources since no new construction or abandonment would occur in North Carolina. However, the Board determined that six rail line segments in North Carolina would experience significant increases in annual car loads of hazardous materials and two lines would become major key routes. Major key routes are those that would show a doubling of annual cars of hazardous materials and exceed 20,000 cars annually.

Conrail-CSX,-NS Merger
98-E-0404

2

January 29, 1998

We do not follow the reasoning of the Board to evaluate the impacts of the hazardous materials transport on a line segment but not consider the impacts of this increase traffic on natural resources of an area. Also, it seems logical that just based on the increased traffic of hazardous material in certain segments, Hamlet to Monroe (increase from 26,000 to 60,000 cars annually) and (Monroe to Clinton, SC increase of 14,000 to 49,000 cars annually) that there would be a corresponding increase in traffic at area rail yards or intermodal facilities. However, the document states that no threshold is exceeded for evaluation of environmental impacts for these facilities.

We request that our scoping comments be acknowledged and entered into the record. We have included them as an attachment.

We appreciate the opportunity to comment on this Draft EIS. If we can provide further assistance, please contact our office at (919) 528-9886.

MEMORANDUM

TO: Melba McGee,
Office of Legislative and Intergovernmental Affairs

FROM: Owen F. Anderson, *Owen F. Anderson*
Piedmont Region Coordinator
Habitat Conservation Program

DATE: February 14, 1997

SUBJECT: Scoping comments for CSX-Conrail Consolidation, Project No. 97-0456

Staff biologists with the North Carolina Wildlife Resources Commission have reviewed the subject document. Our comments are provided in accordance with certain provisions of the National Environmental Policy Act (42 U.S.C. 4332 (2) (c)), the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661-667d) and the North Carolina Environmental Policy Act (G.S. 113A-1 through 113A-10; 1 NCAC 25).

We do not expect significant adverse impacts to fish and wildlife resources or their respective habitats; since the facilities are already in place and are currently in use. However, the route does cross several streams including the Roanoke River. Therefore, accidents or spills along the route or at any intermodal facilities and stormwater runoff from intermodal facilities have the potential to cause significant adverse impacts to aquatic and terrestrial habitats of North Carolina.

The Roanoke River lies directly beneath the railroad line that is being considered for consolidation. This river provides important habitat for numerous species of fish and other aquatic organisms and associated terrestrial wildlife. The Roanoke River downstream of the rail corridor provides important spawning habitat for anadromous fish, including striped bass and hickory shad.

Waxhaw Creek in Union County, North Carolina and Lancaster County, South Carolina provides habitat for the Carolina heelsplitter, a federally and state listed endangered freshwater mussel. Although it does not appear that the rail line crosses Waxhaw Creek in North Carolina, toxic spills to tributaries or within the watershed within North Carolina or in the immediate downstream stretches in South Carolina could have significant impacts to this endangered species.

We request that the following items be addressed in the environmental report:

1. Discuss any secondary development expected with increase movement of freight. This would primarily be associated with intermodal facilities.

CSX-Conrail Consolidation

2

February 14, 1997

2. Discuss the practices and facilities that will be installed to address typical stormwater runoff from any intermodal facilities.
3. Discuss procedures and facilities that will be installed at intermodal facilities to contain toxic material in the event of a spill or an accident.
4. Provide information on what procedures and equipment that will be in place to contain hazardous materials from spills into terrestrial and aquatic habitats, including lakes and rivers. This discussion should place special emphasis on the impacts to anadromous fish in the Roanoke River and the Carolina heelsplitter in Waxhaw Creek.

We appreciate the opportunity to provide input during the early stages of this proposed acquisition. If we can be of further assistance, please contact Wayne Jones at (919) 443-3536 or me at (919) 528-9886.

Subject: Increased Train Traffic Associated with Proposed Merger
of Norfolk Southern Corporation with Conrail

Dear Ms. Sanford:

Biologists on our staff have reviewed the Danville VA to Blacksburg SC route. It is our understanding that an increase of three trains per day is anticipated and that no new facilities are planned at this time.

We would not expect significant adverse impacts to fish and wildlife resources or their respective habitats; since the facilities are already in place and are currently in use. However, the route does cross a number of streams and lakes; therefore, accidents or spills along the route or at intermodal facilities and stormwater runoff from intermodal facilities have the potential to cause significant adverse impacts to aquatic and terrestrial habitats of North Carolina.

We would request that the following items be addressed in the environmental report:

1. Discuss any secondary development expected with increase movement of freight. This would primarily be associated with intermodal facilities.

January 31, 1997

2. Discuss the practices and facilities that will be installed to address typical stormwater runoff from intermodal facilities.
3. Discuss procedures and facilities that will be installed at intermodal facilities to contain toxic material in the event of a spill or accident.
4. Provide information on what procedures and equipment that will be in place to contain hazardous materials from spills into terrestrial and aquatic habitats, including lakes and rivers.

We appreciate the opportunity to provide input during the early stages of this proposed acquisition. If our office can be of further assistance, please contact me at (919) 528-9886.

Sincerely,

Re: Finance Docket No. 33388 -- CSX and Norfolk Southern -- Control and Acquisition --
CSX Crestline Connector Project, Crawford County, Ohio

Dear Ms. Kaiser,

This is in response to correspondence from your office dated November 26, 1997, providing the additional requested information concerning the Crest Tower. The comments of the Ohio Historic Preservation Office (OHPO) are submitted in accordance with provisions of the National Historic Preservation Act of 1966, as amended (16 U.S.C. 470 [36 CFR 800]); the Surface Transportation Board (STB) serves as the lead federal agency.

The November 26, 1997, correspondence provides a detailed discussion of vibration factors caused by changes from the proposed project. Based on the information presented in the documentation, we concur with your assessment that the proposed Crestline connector project will have no effect on the Crest Tower, a property determined eligible for inclusion in the National Register of Historic Places. We feel that the correspondence makes an important distinction between cosmetic damage and the more serious issues of architectural and structural damage. If there is any cosmetic damage, the data presented in the correspondence supports the conclusion that it will be a long term development that is much more manageable than the effects of any architectural or structural damage. Therefore, this office doesn't object to the proposed construction of the Crestline connector as described in your October 15, 1997, correspondence.

Any questions concerning this matter should be addressed to David Snyder at (614) 297-2470, between the hours of 8 am. to 5 pm. Thank you for your cooperation.

Sincerely,

Mark J. Epstein, Department Head
Resource Protection and Review

Re: Finance Docket No. 33388 -- CSX and Norfolk Southern -- Control and Acquisition --
Conrail, Ohio

Dear Ms. Kaiser,

This purpose of this letter is to transmit to your office letters from four interested parties submitted to the OHPO in response to the request for public input regarding the above referenced Conrail acquisition project. The correspondence from the interested parties provides information, comments and concerns for historic preservation issues and is submitted under provisions of the National Historic Preservation Act. The comments of the Ohio Historic Preservation Office (OHPO) are submitted in accordance with provisions of the National Historic Preservation Act of 1966, as amended (16 U.S.C. 470 [36 CFR 800]); the Surface Transportation Board (STB) serves as the lead federal agency.

We feel that the comments are helpful and useful, and in several cases provide the important function of extending the range of options for preservation for your consideration. Letters were received for the Norfolk Southern connector, Bucyrus, Crawford County, construction and changes in the Cleveland area, and construction and changes in the Columbus area. We have also received telephone calls regarding this project as a result of requests for public input. I believe that we were able to resolve the questions raised thus far from telephone inquiries.

The letter from the Bucyrus Historical Society has been instrumental in developing the basis for a Memorandum of Agreement for the demolition of the TOC Freight House. It is our expectation that this agreement will be drafted in the near future and submitted to this office for review.

The letter from the Cleveland Landmarks Commission raises preservation concerns for several areas including the Collinwood Yard. It is our opinion that the information and concerns help in establishing a broader context to interpret historic properties and evaluate effects in the Cleveland area. We recommend that additional consideration should be given to this part of the project. The extent of changes in the Collinwood Yard pose problems for resolving preservation concerns, and we feel that working with the Cleveland Landmarks Commission could help in framing the approaches along a broader background.

Ms. Elaine K. Kaiser
December 19, 1997
Page 2

The letter regarding the Buckeye Intermodal Terminal Yard makes a request for clarification of the Area of Potential Effects for the project. We recommend revisiting this part of the project to ensure that the area considered encompasses the full range of work and modifications.

Finally, the letter from the Glen Echo resident expresses concern for the preservation of a contributing element to the Glen Echo Historic District. We recommend that specific conditions be imposed to control construction in this area to avoid any impacts to this feature. We also recommend that the construction people contact this office when construction reaches this area so that personnel from this office can have an opportunity to monitor the construction.

Any questions concerning this matter should be addressed to David Snyder at (614) 297-2470, between the hours of 8 am. to 5 pm. Thank you for your cooperation.

Sincerely,

David Snyder, Archaeology Reviews Manager
Resource Protection and Review

Ms. Elaine K. Kaiser,
Chief,
Section of Environmental Analysis,
Surface Transportation Board,
1925 K Street NW,
Washington, D. C. 20423

Dear Ms. Kaiser:

Re: FD-33388, planned increased
heavy freight traffic through
northwestern Cleveland, Ohio
suburbs

I have written before requesting termination of freight traffic along the line through Bay Village-Westlake, Ohio and other western suburbs, but I would like to reiterate that the chief safety concern is that a derailment or collision causing a derailment will result in a disaster in loss of life, injuries, and severe destruction of people's homes.

In this regard, please refer again to my letter of September 26th and the accompanying police report about a very low speed derailment in 1982 that only good fortune and a few feet averted a catastrophe.

This is an excellent example of the kind of surprise situation that can arise with so much traffic along one track as the railroads wish to have approved. It also should be noted that this apparently was not a high speed situation, and the train merely stopped to avoid a collision. If there had been a collision between train and car, most of the cars of the train could have derailed, sending them careening into backyards and even houses for a mile of residential homes. The kind of breakdown of a car that caused the derailment in 1982 could happen again at any time, especially with such a heavy increase in freight traffic and the increase in population over the past 15 years who need to use the crossings much more often than anyone did in 1982.

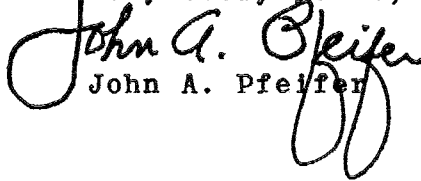

So the increased threat of crossing incidents, compounded by the increased population having to use the crossings and the increase in toxic and even atomic waste carried on the freight cars headed west, would greatly jeopardize the population living 100 feet or so from the tracks all the way from Cleveland well into adjacent Lorain County.

In the opinion of my neighbors and I, the extreme danger is not an environmental problem with clean air or vibration but of a drastically increased likelihood of a serious derailment or collision that would result in death and massive destruction of property.

I wanted to point this out because most of the articles and letters I have read on this subject seem to be more concerned about serious but much more modest environmental and safety concerns--dirtier air, increased vibration, and an increase in individuals being struck at crossings by trains. I think the real major concern is to avoid a catastrophic case of multiple deaths, serious injuries, and extensive property damage.

As always, the judicious consideration of these dangers by you and your staff is appreciated.

Very truly yours,

John A. Pfeiffer

Re: Finance Docket No. 33388 -- CSX and Norfolk Southern -- Control and Acquisition --
Conrail, Ohio

Dear Ms. Kaiser,

The purpose of this letter is to provide additional comments in response to correspondence from your office dated October 15, 1997 (received October 20) regarding the above referenced Conrail acquisition project, with additional information provided during a meeting on October 17, 1997. The correspondence provides a compilation of information and reports of identification level survey, evaluation, and assessment of effects for the Conrail acquisition project. The comments of the Ohio Historic Preservation Office (OHPO) are submitted in accordance with provisions of the National Historic Preservation Act of 1966, as amended (16 U.S.C. 470 [36 CFR 800]); the Surface Transportation Board (STB) serves as the lead federal agency.

This letter provides comments on project components not specifically addressed in our comments of October 28, October 30, October 31, December 17, and December 19, 1997. Correspondence from your office includes preliminary reporting of identification survey efforts including the four documents titled: (1) "Results of the Ongoing Phase I Archaeological Survey of Proposed Railroad Construction of Connections between Conrail and Norfolk Southern Lines in Erie, Franklin, and Ottawa Counties, Ohio, and two Proposed Railroad Yard Expansions in Cuyahoga, Huron, and Seneca Counties, Ohio" by Dawn Herr, John F. Schweikart, and Jeffrey Darbee, October 10, 1997; (2) "Historic Property Report for Proposed Construction for CSX/Conrail Railroad Consolidation in Sidney, Shelby County, Ohio" by Janet L. Friedman and Geoffrey Henry, October 4, 1997; (3) "Historic Property Report for Proposed Construction for CSX/Conrail Railroad Consolidation in Greenwich, Huron County, Ohio" by Janet L. Friedman and Geoffrey Henry, October 9, 1997; and (4) "Historic Property Report for Proposed Construction for CSX/Conrail Railroad Consolidation in Crestline, Jackson Township, Crawford County, Ohio" by Janet L. Friedman and Geoffrey Henry, October 8, 1997. The correspondence also includes extensive documentation on the Toledo Pivot Bridge, and the Bucyrus T&OC Depot and Freight House properties. The comprehensive coverage and the detailed information presented, including completed inventory forms with supporting documentation and photographs, have been very helpful in completing our review of this information.

A-353-d

Ms. Elaine K. Kaiser
December 24, 1997
Page 2

The discussion of the Area of Potential Effects (APE) for the different classes of construction in this project was helpful. We feel that the usage was thorough and helped to organize identification efforts. We note that many of the concerns presented to this office reflect public views of more extensive impacts than considered under the APE. We recommend that at least in the Cleveland area you should consider expanding the area encompassed under the APE. Expansions might also be considered in the Toledo and Columbus areas. In these metropolitan areas the project extends past several historic districts, and the increases in rail traffic and other changes resulting from this project could have impacts on the setting and other defining characteristics of these historic districts.

Based on the information presented in the report, we concur with the recommendations to complete the work at the Willard Yard. It is our understanding that the work includes wetland mitigation that might include construction of a wetland in another area. Coordination with this office is recommended to determine if survey is needed in the wetland mitigation area.

Based on the information presented in the report on the Collinwood Yard, we concur that the yard is eligible for inclusion in the National Register of Historic Places. We note that there have been several significant changes in this yard that are not directly under jurisdiction of this project. We are concerned about the demolition of structures that offer unusual opportunities for adaptive reuse. It is our understanding that at least two contributing elements to the Collinwood Yard property are still intact, the Quaker Tower and the Fueling Tower. We concur with your recommendations for recordation of significant structures in the Collinwood Yard. We strongly recommend that the Cleveland Landmarks Society be involved in reviewing the recordation plans and results for the Collinwood Yard. We also recommend that you consider concerns expressed by the Cleveland Landmarks Society and discuss possible treatment alternatives with this organization.

Based on the information presented, we concur with your recommendations that the four properties (three bridges and 1 culvert) along the Toledo-Maumee Rail Line abandonment are not eligible for inclusion in the National Register of Historic Places.

We concur that the Toledo Pivot bridge is eligible for inclusion in the National Register of Historic Places. Documentation should include detailed recordation of the engineering components, and we recommend further consultation with this office concerning documentation requirements for this adverse effect.

We concur that the section proposed for work between Weber and Hudson streets in Columbus has been extensively disturbed and no additional archaeological investigations are needed. However, as noted in our December 19, 1997, letter, this project area appears to

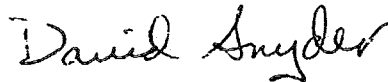

Ms. Elaine K. Kaiser
December 24, 1997
Page 3

include a contributing element to the Glen Echo Historic District and care is needed to avoid impacts. We strongly recommend further review of the proposed work in Columbus to ensure that eligible or listed properties are not impacted.

Based on the information presented in the report, we concur with the recommendations to complete the work at Oak Harbor. Also, we concur with your findings that no property eligible for inclusion or included in the National Register of Historic Places will be affected by the proposed construction at Vermilion.

Additional coordination for some components of this project is recommended, however coordination with this office has been completed for several components and we don't object to construction being initiated in these areas. Please don't hesitate to contact this office if you have any questions about coordination needs for any of the components or if you feel that clarification or specific comments on a particular component would be helpful. Any questions concerning this matter should be addressed to David Snyder at (614) 297-2470, between the hours of 8 am. to 5 pm. Thank you for your cooperation.

Sincerely,

David Snyder, Archaeology Reviews Manager
Resource Protection and Review

Re: Docket Number FD33388

To Whom It May Concern:

ENVIRONMENTAL DOCUMENT

I am writing in regard to the proposed acquisition of Conrail by Norfolk Southern and CSX. This merger will triple train traffic through my community of Lakewood, Ohio, one of the most densely populated cities between New York City and Chicago. The impact of this increased train traffic on our community will be devastating. I live quite close the tracks, and the noise from train whistles and rumbling train cars, the increased dust and debris will make living where I do unbearable if the number of trains is tripled.

In addition, I am appalled at the audacity of Norfolk Southern's suggestion that taxpayers assume part of the cost of rerouting this increased train traffic. In my mind, **this is tantamount to blackmail**. NS is threatening the westshore communities with a choice: either endure the increased train traffic, or pay to have the trains diverted. It reminds me of the crime bosses who demanded small business owners pay "protection costs" during the 1920s. This cannot be allowed. NS and CSX are not non profit enterprises. They should not be subsidised by taxpayers.

I beg you to use common sense. Please insure that the decent, hardworking people of the westshore communities of Cleveland, Ohio are protected from big business and its ability to negatively change our lives. The lack of regard NS and CSX has for the quality of life we have established here in our cities is just another example of how big business lacks a conscience. **We rely on you to make sure there is ethical and fair treatment of the citizens of our communities.**

PLEASE DO NOT ALLOW INCREASED TRAIN TRAFFIC THROUGH THE WESTSHORE COMMUNITIES OF CLEVELAND, OHIO.

Thank you for your consideration of my request. I trust in the fairness and the clearthinking of your committee.

Sincerely,

Kathy Ingersoll
Resident, Lakewood, Ohio

To whom it may concern, December 28, 1997

I am writing in opposition of the Plan for dramatic increase in rail traffic in the Cleveland and West Shore area.

The most alarming ramifications of this proposal are the various safety issues associated with the disruption of ambulance, police, and fire department services. The obvious health and economic impact also make this proposal most unwelcome.

Please carefully consider these issues prior to your decision in June. Please choose to re-route increased ~~for~~ traffic through less densely populated areas.

Best Regards,

Lena Macfarlane

REC'D: 1/15/98
DOCUMENT # 1/19/98 11:59:12

Attn.: Elaine K. Kaiser
Chief, Section of Environmental Analysis
Environmental Filing

Dear Ms. Kaiser:

I am writing on behalf of the Village of Wellington, Ohio, Mayor Barbara O'Keefe and Wellington Council Members regarding the proposed merger of CSX and Norfolk and Southern Railroads in an attempt to acquire certain Conrail properties. Obviously, any municipality that will be affected by this merger will have concerns as to how this proposed project will impact their community. This is why I am writing.

I feel that due to Wellington's proximity to the railroad, we will incur much greater environmental impacts than others. I am attaching a map so that you can better visualize the potential problems. As you can see, our Village is dissected by two state routes; Route 58 runs north and south, while Route 18 runs east and west. The point at which these two routes intersect is our central business district and the location of our only traffic light. There is already heavy traffic and by having the two state routes we experience a lot of truck traffic as well. Route 58 is classified as Lorain County's north-south corridor to Route 71.

Please note that the railroad in question intersects both Route 58 and Route 18 less than 1/4 mile away from our one traffic light, so needless to say, we currently experience significant disruption in traffic flow. With the proposed increase in trains traveling through Wellington of 14.5 -54.16 (Berea to Greenwich), traffic could be at a complete standstill for lengthy periods of time!!

Such disruption of traffic is more than just an aggravation or an inconvenience; this would contribute to loss of sales for downtown businesses and cause untimely delivery of services. While it is certainly frustrating for school bus drivers transporting children, employees trying to get to work and drivers trying to make deliveries, it is **dangerous for the people that require vital and immediate attention to be deprived of timely service by our police, fire and ambulance departments just because of train traffic.** Our town is split in half by these railroads with the police and ambulance on one side and the Fire Department on the other. Our Fire Department does have two small trucks housed on the other side of the tracks, but they would not provide adequate coverage for a house or business fire.

Wellington Fire Department is responsible for approximately 125 square miles of rural area in this southernmost part of Lorain County. The tracks running through town which include 7 crossings, do not present the only stumbling block for our department; there are 22 other crossings in our district that may need to be negotiated when traveling to the scene of a fire. Fire calls in 1997 totaled 362 as of December 29. These same circumstances prevail for our ambulance squad. Last year alone they made in excess of 700 runs. Both fire and ambulance are run by volunteers, so when the siren sounds it is imperative that those in town respond to the call. Depending on the seriousness of the call, police are often requested for traffic control at the scene. These services are **severely compromised by untimely arrivals due to train delays.**

Another area of major concern is that of unguarded crossings. As previously mentioned, there are 29 crossings that need to be negotiated in our area. One death is too many; Wellington has had 4 in the past 8 years! There were two fatalities in 1989 at the Barker Street Crossing. Most recently in 1992, 4 teenagers were involved in a car/train accident that resulted in two deaths. With the proposed **increase** in the number of trains from 14.5 -54.16, we feel such risk is elevated. It took the deaths of two young men to get lighted crossings gates at the Webster Road crossing; we do not want to experience such tragedy again. We want to feel safer knowing that our residents and those simply passing through and not familiar with the area, are better protected.

We would be remiss if we failed to mention our concern over the transporting of hazardous materials through our area. Again, **proximity** to the railroad places us at **greater risk** should there be **derailment**. We have approximately 4100 residents living within a 2 mile radius. Based on the product, wind direction and the weather, our Safety Services Director has determined that if a spill occurred at any of the crossings within the Village, 2/3 of the residents would need to be evacuated.

Finally, we are concerned with the quality of the crossings. We currently undergo approximately 4-5 crossing repairs per year; with the additional track being laid, the amount of repairs are likely to increase. The increased traffic will cause a rapid deterioration of the road which has a substantial impact on the community when crossings are closed for repairs. The **condition of the recently installed track at the North Main Street crossing is deplorable** and no trains have even traveled over it yet!! These railways should be required to install state of the art crossings if their proposed project is accepted.

In summary, I would like to reiterate that the very location of our small community to the proposed railway **burdens us with the potential for increased safety concerns and environmental degradation.** We urge the Board to carefully analyze our concerns and would certainly welcome you to visit Wellington and witness first hand the magnitude at which our everyday lives are currently impacted by the railway. In viewing our community, you no doubt would realize our concern and the scope of potential environmental problems confronting us in the event of a hazardous cargo spill. We **implore you to help us preserve the safety and well being of our community and its residents.**

Sincerely,

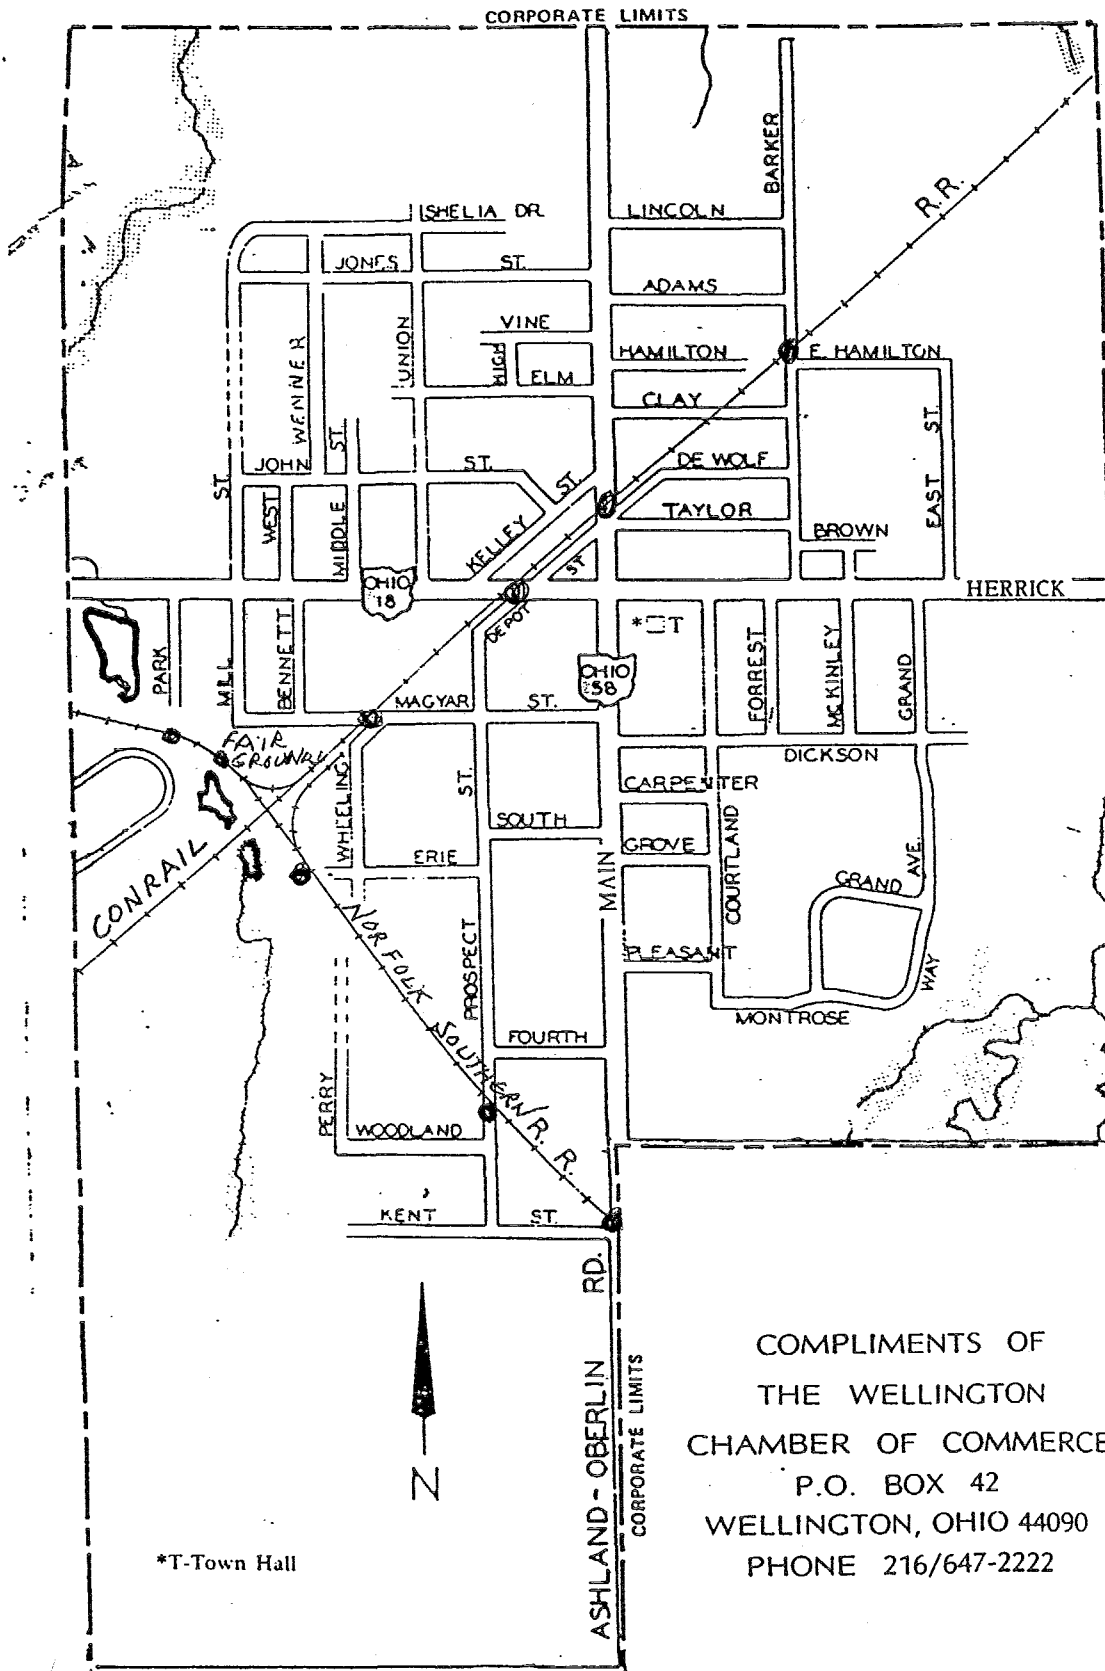

Karen Webb, Clerk Treasurer

ENVIRONMENTAL DOCUMENT

January 5, 1997

U.S Transportation Board
Attn: SEA - Finance Docket 33388
1995 "K" Street, NW
Washington, D.C. 20433

Subject: Proposed merger of NS and CSX

Gentlemen:

Within a four block area, adjacent to the Meridian Condominium, in which my wife and I live, there is a concentration of approximately 3,500 to 4,000 residents in buildings varying from six to thirty stories high.

Today, I visited the post office on West 117th Street, south of the railroad track, which divides our city. As I entered the post office a train started to cross 117th Street, blocking all vehicular traffic. At that moment an ambulance, with lights flashing, and siren sounding, came to a halt at the crossing. Four minutes later, as I left the post office, that ambulance was still waiting. That delay compounded by time to reach the thirtieth floor of Winton Place could truly be a matter of life or death. Delaying response to a fire alarm of like duration could be catastrophic.

I attended the meeting in September, 1997, along with approximately 600 concerned citizens, including officials of all the various communities through which the railroad track passes, Congressman Dennis Kucinich, and Steve LaTourette.

At no time did I hear a claim that the total amount of goods, including hazardous waste, shipped between New York and Chicago was going to increase. Nor was there any effort to convince us that there was any benefit to be realized by the communities affected. As a matter of fact, it was declared by the railroad representatives, that the threefold increase in rail traffic through our area, was solely to give NS/CSX a competitive advantage.

It is my serious concern that the decision whether to, or not, approve the proposal will be based not on what is morally right and in the best interest of those most directly affected, but on the amount of money contributed by some lobbyist to the political fund of either party.

Sincerely

Re: Conrail/NSRR Merger

This letter is to reiterate a vigorous protest against proposed plans to as much as treble freight train travel through the suburbs north and west of Cleveland, Ohio.

The safety, environment and real estate values of such cities as Westlake, Rocky River, Lakewood and Cleveland are already severely and adversely impacted by trains currently traversing them; to greatly increase the flow of trains for the financial benefit of the railroads, but to the detriment of the residents of these suburbs would be unconscionable.

The proposal should be rejected!

Sincerely,

Federal Surface Transportation Board
Section of Environmental Analysis (SEA)
1925 K Street N.W.
Washington, D.C. 20423

Dear Sir or Madame:

Enclosed is a copy of a resolution urging Congress and the Federal Surface Transportation Board to deny Norfolk Southern (NS) and CSX Transportation's proposal for joint acquisition of Conrail, Inc. which was unanimously passed by the Olmsted Falls City Council at their special Council meeting held on December 22, 1997.

Thank you for your attention to this matter.

Very truly yours,

Barbara A. Walker

Barbara A. Walker
Clerk of Council

Enclosure

RESOLUTION NO. 100-97 (AMENDED)

INTRODUCED BY: Mayor Tom Jones and Council As A Whole

A RESOLUTION URGING CONGRESS AND THE FEDERAL SURFACE TRANSPORTATION BOARD TO DENY NORFOLK SOUTHERN (NS) AND CSX TRANSPORTATION'S PROPOSAL FOR JOINT ACQUISITION OF CONRAIL, INC., AND DECLARING AN EMERGENCY.

WHEREAS, Norfolk Southern (NS) and CSX Transportation are proposing joint acquisition of Conrail, Inc. and plan to increase the number of freight trains through the City of Olmsted Falls; and

WHEREAS, the rail traffic through the City of Olmsted Falls is now between 80 and 100 crossings per day and the current track system supplies no overpass or underpass to relieve automobile or truck traffic; and

WHEREAS, the proposal will be brought before the Federal Surface Transportation Board before June, 1998 for approval; and

WHEREAS, any increase in daily freight train use would create additional Health and Safety concerns for the City of Olmsted Falls due to the fact that response time for emergency paramedic and fire runs are increased due to stopped or slow moving trains blocking all crossings in the City which does not have an overpass or underpass available for use by emergency vehicles, whereby minutes in response time can often mean the difference between life and death. Further, should our emergency vehicles be forced to turn around due to a blocked crossing and be diverted to another hospital further away than Southwest General Health Center, additional precious minutes would be lost; and

WHEREAS, an increase in daily freight train use would adversely impact the ability of all types of coordinated mutual aid responses between the City of Olmsted Falls and the surrounding communities to best utilize each other's paramedics, fire and police forces and equipment in a predictable and timely fashion; and

WHEREAS, there are numerous safety concerns at all rail crossings due to increased rail traffic which would increase the risk of collisions between trains and cars, trucks and pedestrians; and

WHEREAS, there are concerns over health and safety due to potential increase in the transporting of hazardous materials which in case of derailment would necessitate the evacuation of many residents of Olmsted Falls as well as an elementary school with a student body of our 700 pupils near the tracks; and

Resolution 100-97 (AMENDED)

Page Two

WHEREAS, an increase in daily freight train use would add to environmental concerns with regard to noise and air pollution that are already bad due to the nearness of the City to Cleveland Hopkins Airport; and

WHEREAS, total isolation of our community from the north and south during heavily traveled time on the tracks would impact both the City's and adjacent communities residential and business districts; and

WHEREAS, the stopping of traffic on State Route 252 for long periods of time adds to the air pollution in Cuyahoga County that is forced to have "Ozone Alert Days"; and

WHEREAS, an increase in rail traffic would have a negative impact on property values which directly impacts both the City and School budgets; and

WHEREAS, the City of Olmsted Falls has filed a Notice of Intent to Participate with the Federal Surface Transportation Board so that they may become "Parties of Record".

NOW, THEREFORE, BE IT RESOLVED BY THE COUNCIL OF THE CITY OF OLMSTED FALLS, COUNTY OF CUYAHOGA AND STATE OHIO:

SECTION 1. That the Council of the City of Olmsted Falls, Ohio opposes the acquisition of Conrail, Inc. by Norfolk Southern and CSX Transportation, which as a result of this acquisition would increase rail traffic on the route connecting Vermilion, Ohio to Cleveland, Ohio, thereby creating health and safety concerns to the residents of this City.

SECTION 2. That Council urges all citizens of the City of Olmsted Falls to support their efforts in this opposition by forwarding letters of concern to the Federal Surface Transportation Board, Section of Environmental Analysis (SEA), 1925 K Street N.W., Washington, D.C. 20423, in an effort to have these concerns incorporated into the final version of the Environmental Impact Statement which will be considered by the Federal Surface Transportation Board prior to its final decision.

SECTION 3. That the Clerk of Council is hereby directed to submit a copy of this Resolution to the Federal Surface Transportation Board, Senator Michael DeWine, Senator John Glenn, Congressman Dennis J. Kucinich, Governor George V. Voinovich, State Senator Gary C. Suhadolnik, State Representative Edward F. Kasputis, State Representative Rocco Colonna, the Olmsted Township Trustees, Cuyahoga County Commissioners, NOACA, RTA, the Regional

SECTION 4. That it is found and determined that all formal actions of this Council concerning and relating to this legislation was adopted in an open meeting of this Council and that all deliberations of this Council and of any of its committees that resulted in such formal action were in meetings open to the public in compliance with all legal requirements.

SECTION 5. That this legislation is hereby declared to be an emergency measure necessary for the preservation of the public health, safety and welfare, and for the further reason stated in the preamble hereof, and further provided it receives the affirmative vote of two-thirds of all members elected to Council, it shall take effect and be in force immediately upon its passage and approval by the Mayor.

Chairperson, Surface Transportation Board
Case Control Unit, STB Finance Docket No. 33388
1925 K Street, NW
Washington, DC 20423-0001

Dear STB Chairperson:

I am among some 55 Conrail signal department employees who will be trying to fit in somewhere if the buyout of Conrail is approved on July 23, 1998. I cannot in my own mind understand why the CSX Corporation (CSX) and Norfolk Southern Corporation (NS) would choose to close our excellent System Signal Shop/School/Service Desk complex in Columbus, Ohio. I know personally that Conrail's Signal Engineering Department feels strongly that our shop in Columbus can provide a great benefit to the new rail systems as we have been for over 20 years to our own system.

From bidding for signal work outside of Conrail in recent years, we know that we are competitive with other shops throughout the country. Why then would NS/CSX choose to close one of Conrail's most valuable assets? From the viewpoint of NS/CSX, it is simply a financial decision. It's cheaper! NS traditionally contracts out its signal wiring work (except for a small shop in Roanoke, VA), and CSX has a shop in Savannah, GA.

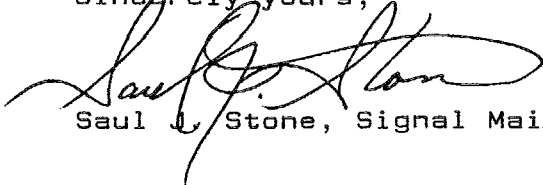

My argument is that both the Chessie System and Norfolk Southern are making a bad decision. We were told that this was a "bean counter" decision. How foolish and tragic that a company would think short-term in an area that requires long term planning for a railroad to operate smoothly year in and year out.

Conrail's success story was partly the result of our system shop and school's cooperative effort to work with both engineering and field forces to create a signal control system capable of handling high speed high volume freight traffic. In 1976 the biggest problem was rebuilding into one railroad what had been six bankrupt railroads. The American taxpayer pumped billions into the Consolidated Rail Corporation. Much of the rail and signal system was in disrepair, freight was delivered late, and business was poor. Our government envisioned a future rail system for the northeast that could again provide economically for our countries transportation needs. Our system shop and training center was vital in that transition.

The Conrail signal system today includes tens of thousands of electrified highway/rail crossing systems, interlockings (signal and switching control systems), and many other control systems that have been engineered, built, and wired at our shop. Today these control systems allow us to compete successfully with other carriers and with the trucking industry. The dream that Congress envisioned in 1976 has been more than fulfilled--it has been surpassed!

With Conrail's state-of-the-art train/truck intermodal systems, we help eliminate some of the highway nightmares that seem to worsen every year and thus threaten our economic wellbeing. If these systems fail to provide reliable service for future generations, can we then look back to a time when two railroads decided to make the most money with the least investment? It is my dream that the two railroads purchasing Conrail will not try to fix something that already works very well. Help keep our system shop/school/service desk complex in Columbus, Ohio open for business. Protect one of Conrail's most valuable assets from being written off as a liability. RSVP.

Sincerely yours,

Saul J. Stone, Signal Maintainer

P.S. We have recently celebrated at our shop over 900 days injury free!

BUCYRUS HISTORICAL SOCIETY

202 S. WALNUT ST. - BUCYRUS, OHIO 44820

Jan. 12, 1998

Elaine K. Kaiser

Environmental Project Dir.
Section of Environmental Analysis
SURFACE TRANSPORTATION BOARD
1925 K Street NW, 5th Floor/Suite 500
Washington, DC 20423-0001

In response to your recent correspondence of Dec. 19, 1997 re Finance Docket No. 33388 - CSX and Norfolk Southern - Control and Acquisition - Conrail, we submit the following for the record and for your further action if necessary.

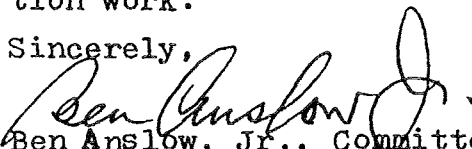

The Bucyrus Historical Society now owns the building known as the Toled and Ohio Central Railroad Passenger Station, located on E. Rensselaer Street in Bucyrus, Ohio. Norfolk Southern has also pledged to deed us a 110 ft. by 230 ft. parcel, appr. .58 acre, on which the building stands. This parcel will not interfere with the N/S plan for a spur line in the area.

Also, part of our agreement with N/S is first refusal on any or all elements of the old T & OC Freight Station, located across the street from the passenger station. It is our understanding the freight station is scheduled for demolition, for construction of the spur line.

Current owner of the freight building is Quinn Brothers, a local contractor. We are assuming they will be adequately compensated for the loss of this property.

It is also our understanding Quinn Brothers is interested in gaining the contract for demolition of that building. We would be in favor of this if our first refusal rights are made clear to them before anything is removed and demolition is begun. If they are not in agreement with this we would recommend another local contractor be selected for the demolition work.

Sincerely,

Ben Anslow, Jr., Committee Chairman
BUCYRUS HISTORICAL SOCIETY, Station Project

Dear Ms Kaiser:

This letter is in regards to the Proposed Acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad. We are against any acquisition that will increase the amount of rail traffic through our suburb of Rocky River. We are presently down to just one track and less rail traffic than in previous years. This is better because there is less noise pollution and all pedestrian and vehicle crossings are safer. In the future, we would not want to see any road crossings closed in Rocky River, Lakewood or any other cities through which these tracks run. We think this acquisition is a bad idea for all the suburbs affected.

Thank you,

Jill Duffin

Re: Norfolk Southern and CSX Corporation

Dear Board Members:

This letter is to notify the U.S. Surface Transportation Board that the Board of Trustees Lakewood Hospital Association unanimously passed a resolution opposing the current proposal by Norfolk of Southern and CSX Corporation for the acquisition and allocation of Conrail, Inc.'s assets, primarily because of its impact on the health and safety of our community. In the unfortunate event that this proposal is approved, the disposition of the assets proposal must include a mechanism to ensure that necessary, continuous emergency access to Lakewood Hospital will not be interrupted.

The City of Lakewood is divided in half along the north-south direction by the rail tracks. Although the tracks have twenty-seven (27) grade crossings spanning the City limits, there is only one underpass whereby vehicles may cross the City in a north-south direction without rail interruption. Lakewood Hospital is located south of the rail tracks, while thirty percent (30%) of the ambulance and paramedic runs to Lakewood Hospital originate north of the rail tracks.

Although there are many quality of life and public safety issues which would be adversely affected by an increase in rail traffic, and which we deplore as a member of the Lakewood community, we are outwardly concerned with only one issue: our mission to provide health care to our community.

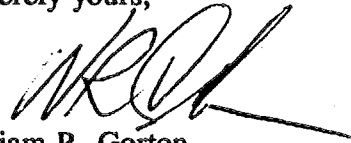

In cases of a medical emergency, emergency teams have four minutes to perform emergency cardio-pulmonary resuscitation and ten minutes to provide advanced life support. A delay in emergency response decrease survival and recovery rates. Currently, Lakewood Hospital and the paramedics have collaborated to establish excellent response times in spite of the existing point of access limitations. A detour to the current underpass, which is located at the city's west end or to the city of Cleveland on the east, would add from five to fifteen minutes to a run. Alternative health care facilities are even further away. The increase of rail traffic, without consideration of additional rail bypasses, seriously jeopardizes the Hospital and paramedics' ability to respond in a timely fashion.

U.S. Surface Transportation Board
January 12, 1998
Page Two

If the current proposal is approved, Lakewood Hospital Board of Trustees is concerned that any increase in daily freight train traffic would greatly interfere with Lakewood Hospital and the City ambulance and paramedic squads' ability to respond timely to medical emergencies. With only one underpass allowing continuous vehicle traffic, the City has no alternative to accommodate this increased rail traffic.

In its review of any proposal of Norfolk Southern and CSX Corporation for the acquisition and allocation of Conrail, Inc.'s assets, the Surface Transportation Board must recognize the impact of any proposal on the delivery of emergency medical services within the City of Lakewood.

Sincerely yours,

William R. Gorton
Chairman, Board of Trustees

Washington, DC 20423-0001

Attention: Elaine K. Kaiser
Environmental Project Director
Section of Environmental Analysis

Dear Ms. Kaiser:

On behalf of METRO Regional Transit Authority, I would like to thank the Surface Transportation Board for expanding the final Scope of the Environmental Impact Statement of the Proposed Acquisition of Conrail by CSX and Norfolk Southern last fall.

From our understanding of the Draft Environmental Impact Statement (DEIS), the effects of the transaction on proposed passenger rail operations were determined to be not significant enough to evaluate. We understand that the primary role of the STB (and its predecessor, the ICC) is to regulate business concerns. However, we are concerned that this proposed merger will leave permanent, unchangeable constraints on both existing and potential passengers rail services in the country.

Under the Draft EIS, the STB chose not to examine many possible problems:

"If the analysis indicated that the rail line segments could accommodate the higher volumes, SEA's preliminary conclusion was that the proposed Acquisition would have no adverse impact on passenger train operations." (DEIS, Volume 1: page 3-14)

The SEA has established a tight time line to review the most significant rail merger in the history of the United States. By deciding not to look at future interactions of the applicants with commuter rail providers, even those with existing agreements, the STB has remained silent concerning the responsibility the railroads have as a public utility. This is the same responsibility the phone industry, electric providers, and gas companies have to individuals citizens.

“SEA determined that impacts of freight operations on passenger rail service would be significant if the anticipated post-Acquisition increases in freight operations resulted in the need to reduce passenger service. . . However, the current operating agreements preclude any reduction in service. Any significant impact that would result from increased post-Acquisition freight operation could occur only after expiration of a current agreement.” (DEIS, Volume 1: page 3-16)

The STB has decided not to be involved in the relationship between the railroad and passenger services after the expiration of existing contracts. Potentially, the uncooperative freight railroads could leave existing or potential passenger operators unable operate, thereby stranding thousands of rail passengers. Displaced commuters will create a greater demand on the over-burdened highway system. In total, higher energy consumption and greater public investment in road construction will be created.

Many agencies in the State of Ohio expressed concerns about passenger service. The STB did review these requests and commented:

“SEA has determined that evidence exists of a potential cumulative effect associated with commuter rail planning and funded activities in Northern Ohio including, but not limited to Toledo, Akron, Lorain, and Cleveland.” (DEIS, Volume 3B: page OH-129).

According to the SEA’s review, METRO’s trackage rights request (MRTA-1) could produce traffic above the level considered significant. (DEIS, Volume 5C: page U-15)

However, the SEA states that it has not found any activities that will be impacted:

“At this point in its investigation, SEA is unaware of any other activities that would require a cumulative analysis.” (DEIS, Volume 3B: page OH-129).

The SEA concludes its investigation in Ohio by making the following comment:

“Therefore based on its independent analysis and all information available to date, SEA has made a preliminary conclusion that there would be no other significant cumulative effects associated with the proposed Acquisition in the State of Ohio.” (DEIS, Volume 3B: page OH-129).

This merger presents an opportunity for passenger rail services to be expanded in the United States. The SEA has performed a detailed analysis of the diversion of freight between highway and rail transportation modes. A similar analysis should be conducted as it involves passenger movement.

We feel the following recommendation of the SEA should be strengthened:

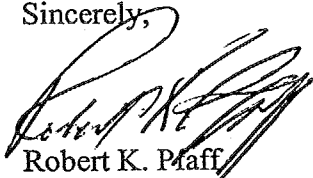

"The SEA encourages the Applicants to meet with the agencies responsible for the commuter rail studies to ensure that the proposed Acquisition can be accomplished without negative effect to commuter rail plans." (DEIS, Volume 3B: page OH-129).

This position assumes that the railroads will negotiate in good faith with passenger agencies. The scope of the review needs to be expanded to include having the Applicants address the potential negative impact on passenger rail operations caused by the merger. SEA needs to actively retain jurisdiction in this matter to assure that the Acquisition can be accomplished without negative consequences on passenger rail operations.

We understand the STB is under a very tight schedule; however, we must ask one point to be changed in the Draft Environmental Statement. Table 5-OH-51 indicates METRO Regional Transit Authority commented on the abandonment in Toledo, Ohio. It appears the SEA misunderstood our comment. Our comments do not concern Toledo. The scope of our letter concerned only Akron, Cleveland, and Canton, Ohio.

In closing, we ask the SEA to view passenger access on an equal basis as freight access to this large multi-modal transportation utility. If you have any questions regarding this statement, please do not hesitate to contact Kirt Conrad, Planner, or myself at (330) 762-7267.

Sincerely,

Robert K. Pfaff

Office of the Secretary
 Case Control Unit
 Finance Docket No. 33388
 Surface Transportation Board
 1925 K Street, NW
 Washington, D.C. 20423-0001

Dear Surface Transportation Board:

After reviewing the Draft Environmental Impact Statement issued in December, we have several concerns that persist regarding the possible negative impact the CSXT/NS/Conrail acquisition could have on the city of Fostoria, Ohio, particularly in the realm of public safety.

Fostoria is adamant about needing over/underpasses built by the railroads involved to ensure that emergency vehicles can reach their citizens without being stranded on the opposite side of the tracks by a train. What good is an ambulance to a dying person if it can't get to them? If there was a fire on one side of town and a train was passing through, the house and anyone inside of it could be burnt to ashes before the fire truck stuck on the opposite of the tracks could reach them.

The major concern that Fostoria has expressed throughout this process is that without over/under passes, the emergency vehicles of the community will not have access to significant portions of the community for a substantially increased period of time. All three major rail lines that serve Fostoria will have increased traffic.

This problem can be easily solved with the building of under/over passes in the city; however, Fostoria hasn't been given that simple insurance yet. The city of Fostoria isn't against the acquisition, but it shouldn't be asked to sacrifice the safety and security of its' residents because of it.

Their request is not unreasonable and Fostoria officials have indicated that they are discouraged by the lack of comments in regards to their city's unique situation. Fostoria doesn't have the funds to build these over/underpasses nor should they be expected to in this situation. City officials realize that the under/overpasses are expensive, but both CSXT and NS are spending huge sums of money in other areas of this acquisition and the situation they are planning to create in Fostoria is life-threatening. If the two railroads are responsible businesses, it would be expected that they'd look for ways to preserve the safety and well being of the communities they serve and attempt to accomodate their reasonable requests.

The City of Fostoria officials also disagreed with the indicator maps (Figures 5-OH-1a & 1b) enclosed, depicting CSX and NS facilities separately do not clearly indicate the systems intersecting in Fostoria, therefore, diminishing or misleading the community concerns.

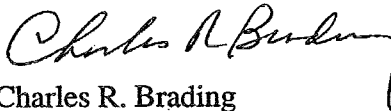

Submitted in the Preliminary Safety and Environmental Comment period were other concerns of the city about the acquisition's effects on Fostoria. Safety Force Ingress/Egress issues were highlighted particularly in the "Iron Triangles", which were expected to see increased train traffic. Increased blockage at grade crossings would significantly increase vehicle traffic loads on existing highway/underpass systems. Grade separations were again mentioned as the most effective resolution to the increased risk of injury and delay for emergency forces.

We ask that the Board consider Fostoria's critical situation and refuse to grant CSXT and NS the acquisition of Conrail unless they provide the city with over/underpasses sufficient to allow emergency vehicles to adequately serve the people of Fostoria when a train is passing through the area.

Thank you for your attention.

Sincerely,

Rex Damschroder

Ms. Elaine K. Kaiser
Environmental Project Director
Section of Environmental Analysis
Surface Transportation Board
1925 K Street, NW
Washington, DC 20423-0001

Dear Ms. Kaiser:

I am taking this opportunity to make our concerns known concerning the proposed merger of the rail lines that go through our village.

The main concern is for the safety and welfare of the residents of the village. Our safety services, except the police department, are all volunteers. Thus, the fire department and EMS are going to be greatly impaired with an additional 50 trains passing through the village on a daily basis. We cannot have these services on both sides of the tracks for obvious reasons of lack of funding and personnel.

Our Village Council, Village Administrator and I have discussed this situation and have come to a conclusion that an underpass must be considered to allow these emergency vehicles access to the residents and territories they serve.

We know the solution will not be easy, but at the same time mandatory. We have no funds at the present time or in the future to make our needs a reality. Your help with this project is needed. I am looking forward to working with your department in this urgent matter.

Respectfully,

Dorothy Sholes, Mayor
Village of New London

Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K Street, NW
Washington, DC 20423-0001

Although the acquisition of Conrail by CSX and NS can do much to improve rail related economic development in Ohio and the North Central\Eastern United States, the impact; as it seems, to the life and general welfare of residents in Seneca County, Ohio will be at risk. Through the review of the Draft EIS it is understandably clear that minimum standards were used to establish rail segments of high environmental impact not geographical areas and political sub-divisions that will be negatively impacted. Impacts of development, air quality, transportation and rail cargo (ie. Hazardous waste) seem to be the focus on a rail line segment basis. There is however; short of federaly protected species, and wetlands, no local impacts identified for remediation before the acquisition can take place. It should be noted that at a meeting held on November 25, 1997 at the request of Congressman Paul Gillmor, the STB stated that the rail lines will be required to work with local agencies to remediate local concerns. On page 7-18 of Vol. 4, Chapter 7, regarding Environmental Justice, the STB states, "CSX and NS shall consult with elected officials, appropriate local agencies, and communities representatives to address Acquisition-related environmetal impacts in affected communities that SEA has identified..." There are two such places in Seneca County that as a planning agency, we feel may warrent environmental justice mitigation.

1. Rail Segment, C-075. Tiffin, Ohio, Seneca County

- The State of Ohio designated Sceinic Sandusky River, has many attributes specific to environmental justice mitigation.

1. The Sceinic Sandusky River, with a watershed area of 428.21 square miles of watershed in Seneca County alone, is very vulnerable to flash flooding.
2. The Sandusky River is a direct conduit to Lake Erie, protected by the Federal Clean Water Act.
3. The City of Tiffin is protected from flooding by a concrete river wall. This wall, built shortly after a devistating flood that crippled Tiffin in 1913, has aged beyond its design life.
4. The double track of CSX that is estimated to carry a total of 54,000 rail cars of Haz Mat material per year crosses this river in the center of Tiffin.

It is our opinion that the river wall should be brought up current design standards through the Army Corp of Engineers to a point that ensures protection of the rail line durring a 500-1000 year flood event.

A-362-b

2. The City of Fostoria has attributes of all listed "potential impacts" on Table 7-9, Vol. 4.
 1. The City of Fostoria will be impacted by a total of 141,000 rail cars of Haz Material per year.
 2. The City of Fostoria will have an average additional 31.1 trains per day (from Volume 3-B, Table 5-OH-6, Page OH-15)
 3. Fostoria is impacted by acquisition, from four rail line segments. (C-075, C-070, C-206, C-228) This impact will cause traffic delays due to stopped trains waiting for interlock availability.
 4. Fostoria relies on an underpass corridor through the city for maintaining traffic. The corridor currently to capacity will experience an increase as motorists shift from feeder streets to the main corridor so they do not have to wait for a stopped train.
 5. Fostoria has two "iron triangles". These are areas of the city that CAN NOT receive emergency services during parts of each day. As rail traffic increases the time at which these "iron triangles" are cut off from safety forces will increase. It is our concern that this will present a life or death situation to the residents in Fostoria.

It is our opinion that Fostoria needs an improved highway\corridor system with underpasses or overpasses to allow for the fluid flow of traffic and preservation of life.

Seneca County has adopted, through resolution of the Regional Planning Commission and most other local political jurisdictions impacted by rail, design standards and requirements for grade crossing safety. Page 200 of Volume 2, under Grade Crossing Safety, gives CSX the ability to choose between Conrail and CSX best management practices for grade crossings. Seneca County is plagued by humped crossings, 4 to 8 feet in height and with 0 visibility across the tracks. Will the railroad be required to bring these crossings up to local standards? If not, Why?

In Volume 2, Page 7 of the Preliminary Comments of the United States Department of Transportation, it is stated that safety is of paramount importance in the acquisition and that detailed planning and implementation will reduce the risk of accidents. It is stated in Additional Major Issues #9 and # 10 that consideration by the board should be given to *'whether the transaction will have adverse environmental impacts on the communities,' and 'If the transaction would have adverse environmental impacts on communities, whether these effects can be eliminated or mitigated through conditions on the transaction.'* The scenarios posed at the beginning of this letter with the impact of the river wall in Tiffin and life threatening situations in Fostoria, are the epitome of these comments. The Regional Planning Commission urges the STB to review these situations and the merit of US DOT in remediating these concerns.

In the verified statement of Ed English, Vol 2, Page 48, Traffic Flow Changes, it is stated that route rehab will increase capacity and traffic in the line between Chicago, Ill and Cleveland, Ohio, and increase speeds to 80mph (FRA Class 5). Section 3(B), Chapter 7.2.2, Page 7-12, Volume 4, identifies maximum operating speeds of 50mph for "Key Trains". In light of incidents occurring in 1997 regarding the UP/SP that involved several train\train collisions, the Seneca Regional Planning Commission believes that operating speeds of Key Trains @ 50mph, and standard freight at 80mph is inherently dangerous. Because dispatch for CSX is in Jacksonville, Fl. the potential for an accident related to dispatch error in relating speeds and the further potential that that error is in response to a "full train inspection.." of a Key Train, warrants consistency in train speeds.

In Volume 4, Page 7-13 to 7-14, Sections 4(A), CSX and NS shall prepare Haz Mat Emergency Response

Plans for each local emergency response organization along Major Key Routes. How do we ensure proper training is given to our local organizations, and how will they be involved in developing the plan. (Seneca County has several voluntary departments on a Major Key Route.) Further, the Regional Planning Commission believes that a separate emergency response plan must be developed for the Sandusky River in Tiffin, Ohio. Only hours of impact to several other communities and Lake Erie. Section 4(B), CSX and NS shall implement ... drill ... on each Major Key Route. Will there only be one drill for all the emergency response organizations in the full (C-075) Section?

In Vol 3B, Page OH-14, The increase potential change in Safety of the Major Key Route (C-075) going into Fostoria, Oh is "significant". The increase to the Key Route (C-070) going into Fostoria is not "significant" in that the accident interval is less than 100 but it is much lower than pre acquisition (256 down to 162). The Regional Planning Commission is concerned that multiplicity must be realized in evaluating impact to Fostoria.

1. The interlock
2. The iron triangles
3. The increase train speeds
4. The position of 4 rail segments (one key, one major key)
5. The increase of hazardous waste
6. Traffic flow projections
7. Increased stopped trains and traffic

It is our opinion that these and other impacts not listed will be life threatening to residents in Fostoria and warrant further attention before issuing approval.

Thank you for your kind consideration of our concerns.

In a common interest,

Mark R. Zimmerman
Director Seneca Regional Planning Commission

ENVIRONMENTAL DOCUMENT

Telephone 235 5010

To whom it may concern:

I have reviewed the SEA report on the Environmental Impact Statement regarding the proposed acquisition of Conrail by NS and CSX railroad. I appreciate the magnitude of your study. Your extensive research included safety, transportation systems, energy, air quality, noise, cultural and historic resources, hazardous materials and waste sites, natural resources, land use and socioeconomic environmental justice, across 24 states, the district of Columbia, and the Canadian Provinces of Ontario and Quebec. Your decision will affect 90 million people. I learned from your study that your preliminary conclusion is that there were no significant cumulative effects on any of the issue areas.

I disagree.

In fact, the EPS report identifies concerns in each of the areas reviewed, but possible remedies were stated to correct these problems. I believe your review and decisions were made from the top down rather than from the bottom up. A good decision starts from the bottom and works up. At this time the bottom is represented by local residents and small communities that would feel great impact, and in fact could destroy them. We in Olmsted Falls, Ohio are one of these small communities. We already have between 80 and 100 train crossings per day, and our current track system supplies no overpass or underpass to relieve automobile or truck traffic. Our little City's population is increasing. Adding 1000 homes to our town means additional automobile traffic across our already inadequate rail crossings. To add more rail traffic, which the acquisition of Conrail to NS and CSX would do means that our town is in trouble. There will be greater risk of train, auto accidents, greater nuisance from noise, greater air pollution, greater potential for hazardous waste spills, greater time loss for police and emergency vehicles to service residents in all parts of our town, and greater mental anguish from long and stopped trains.

I hope you will seriously consider the plight of the 90 million people who will be affected, and the impact of this acquisition on the lives of the people in our City, Olmsted Falls.

Thank you,

Jean Johnson
Ward II Councilman

Mid-Ohio Regional Planning Commission

An association of local governments providing planning, programs and services for the region.

Attention: Elaine K. Kaiser, Chief
Section of Environmental Analysis
Environmental Filing

Dear Ms. Kaiser:

Our organization has had an opportunity to review the "Proposed Conrail Acquisition" Draft Environmental Impact Statement (DEIS) and would like to provide some comments for consideration.

First, we would like to commend the Surface Transportation Board's Section of Environmental Analysis on this effort. This draft report presents an impressive amount of information in a well-organized and concise manner. This effort has benefited from the hard work of your staff and has allowed organizations throughout the country, such as ourselves, the opportunity to make well-informed decisions based on your information and analysis.

While reviewing these documents, we noticed that there were a few areas that needed clarification and some key elements that seem to have been omitted and need addressing. Specifically, we would like to take the opportunity to bring to your attention the following:

1. The DEIS finds one intermodal facility in Ohio, Discovery Park, with proposed increases in truck traffic which would exceed the board's threshold for Environmental Analysis (Volume 3A page OH-21). However, the report fails to provide a summary of the analysis and any mitigation strategies developed from that analysis. Environmental Justice is a key part of this analysis and we believe any risk areas need to be included in this statement to ensure all the mitigation strategies that should be taken are clearly laid out for the companies to follow.

A-363-b

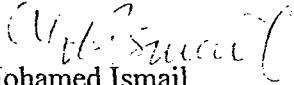

Elaine K. Kaiser
Page 2

January 20, 1998

2. Table 5-OH-8, which presents a county-by-county summary of the Rail At-Grade Crossing safety analysis, does not exist. Our organization is concerned that the grade crossing between Norfolk Southern's main line feeding the Discovery Yard and Williams Road in southern Franklin County (Columbus, Ohio metropolitan area) has been omitted from the analysis. The estimated ADT on Williams Road is over 6,000 based upon a 1994 traffic count by the city of Columbus. This grade crossing needs operational and geometric design upgrades, a fact that has been well known in our region for a long time. This grade crossing meets the fundamental criteria to be included in the above referenced table for safety purposes and we are concerned that it was not considered.

We are looking forward to having the above issues incorporated in the final version of the SEA Environmental Impact Statement. Thank you for the opportunity to provide our comments and participate in the Merger Review proceedings.

Sincerely,

Mohamed Ismail
Director of Transportation

Position on Norfolk Southern/CSX Acquisition
Finance Docket 33388
City of Olmsted Falls, Ohio

The City of Olmsted Falls, Ohio is firmly opposed to the proposed acquisition of ConRail trackage by Norfolk Southern and CSX because of the impact that increased rail traffic will have on our town unless certain mitigations are introduced.

We protest any attempt to vacate usage of the current Norfolk Southern (former Nickel Plate) Tracks known as segment N-80 on the Cleveland-Vermilion Run and divert traffic to segment N293 also known as the Cleveland to Vermillion Run or to Segment C-061 known as the Berea to Greenwich Run..

We also challenge the accuracy of traffic figures projected on line segments N293 and C-061 (Exhibit 1 and 2) because they do not indicate total traffic, lacking information regarding special trains, passenger trains, short engine hauls and work trains, all of which impact the total time crossings are blocked. Maria Ward of the PR staff on the ConRail Dearborn Division indicates that actual traffic on Segment N293 averages 93 trains per day. This is confirmed by the Berea Tower (see map Exhibit 1 and 2) which handles between 90 and 105 trains per day. The Berea Tower notes 16 actual trains per day on Segment C-061. We would request that STB-SEA confirm the accurate daily count from ConRail Dearborn Division for the Erie to Chicago run and the ConRail Indianapolis Division for the Berea to St. Louis run. Our experience shows actual trains on segments noted above to be much higher as indicated.

The reason we challenge the figures is the direct effect those numbers have on blocked crossings per day for emergency runs, school bus transportation and general traffic. As noted on the enclosed map, Exhibit 3, the City of Olmsted Falls is situated in an area where both line segments bisect the town and corresponding traffic on heavily traveled St. Rt. 252, Columbia Road.. The average daily traffic count for the portion of Columbia Road crossing line Segment C-061 at crossing FRA ID 524367U is based on Cuyahoga County (Ohio) Engineer Traffic Study of July 20, 1993 and is determined to be in excess

of 9500 ADT. The average daily traffic count for the portion of Columbia crossing Segment N293 is determined by the same source to be in excess of 11,500 ADT. The need for an up-to-date traffic count is necessary as traffic has increased due to more homes in the area and traffic from southern Lorain and Medina Counties using SR 252 to gain access to Interstate Rts. 480 and 90 to our north.

Using the statistics for blocked crossing time in Table C-5 it is calculated that Columbia Road on Segment C-061 will be blocked 2.8 hours per day when trains are traveling at 30 miles an hour. This creates an untenable situation for our safety forces in emergency response whether to fires, medical squad runs, or general police emergencies. The only potential solution to this problem (created also for the City of Berea to the East) is that both Cities would respond to any fire or medical call in a proscribed area, at the same time, thus creating a heavy economic burden on the City's treasury in both communities. It seems this situation requires the mitigation measure outlined in Section 3.7.3 on page 3-19 of the Draft EIS. Specific communications between the railroads and emergency dispatch center would almost certainly be required. That situation could be resolved also by a separated grade crossing to eliminate Acquisition-related impacts on the crossing. The City of Olmsted Falls cannot fund a second fire facility nor the staff to maintain it in the area of town which would be blocked by traffic on Segment C061. (Exhibit 7.)

On Line Segment C-061 the Ldn would need to be calculated for the housing developments immediately before the FRA ID 524367U and 524368B because there is less than 80 rods or 1320 feet separating these segments and the Ohio Revised Code requires trains whistles to be sounded three times when approaching grade crossings. Compounded with the ambient wayside noise outlined on page OH-74 unless some measure mitigates the noise at said crossings the noise would exceed 70 Ldn, which is unacceptable for residential areas. (See Figure 3.1 in Exhibit 4.)

We would request consideration for Grade Mounted Horn systems outlined on Page F-12 of the EIS on crossings FRA ID 524364Y, FRA ID 524367U and FRA ID 524368B on Segment C-061. The State of Ohio Revised Code (Sections 4955.32 and 4999.04 Exhibit 6B) contains directions for warning at grade crossings. It gives individual communities the right to introduce regulations of such warnings with the municipal corporation limits. (See Figure F-13 in Exhibit 5 and 6.)

Similarly we would request Grade Mounted Horn systems outlined on page F-12 on four at-grade crossings on Segment N293 which already are in a 65-70 Ldn because of location under the approach to Cleveland Hopkins International Airport which has announced plans to extend the major SW runway from 8999 feet to 12,500 ft. putting nearly half the town under the 70-75Ldn in that area. (See Figure F-13, Exhibit 5 and 6.)

Both segments, N293 and C061, bearing increased traffic would increase delay in general traffic but more specifically in Public School busses trying to deliver children to two elementary schools, one parochial school, one middle school and one high school on time. The delay in educational attendance must be addressed. These buildings are outlined on the enclosed map. Also included are logs from the Olmsted Falls School Transportation Bus Garage noting problems with trains. State law requires busses not to cross tracks when signals are engaged. Our school busses run nine shifts per day beginning at 6:40 a.m. and concluding at 5:05 p.m., not including special routes such as athletic events and field trips. Furthermore, the Cities of Lakewood and Fairview Park (to our north) house their school transportation stock at the Olmsted Falls School Bus Garage and blocked crossing lead to delays in these two systems also. (Exhibit 8)

Segment N293 traverses the Olmsted Falls Historic District which has two buildings on the National Register of Historic Places within 500 feet of that line segment. We are sure you must do a Section 106 Review as outlined in the National Historic Preservation Act of 1966 referred to on page G-2 of your EIS. Mitigation measures might also include the Grade Mounted Horn System outlined on Page F-12. (Exhibit 9 Historic District)

One of our recurring problems with Segment N293 is trains that stop and block railway crossings or trains that slow below 30mph because of approaching crossover of segments C061 and N293 in the City of Berea, Ohio to our east. As trains approach the next signalization to the East of Lewis Road which curves to the northeast because of limited sight distance. Trains have slowed to below 30 mph as they head East causing four blocked crossings. We understand there

will be, but find no reference to, the elimination of this crossover at the Berea. Because trains heading East cannot have clear sight distance of the next signal for the next signal which advises either slowing to below 30 or preparing to stop for access to the yard, prudent engineers slow to be ready. We have had to repeatedly levy fines against ConRail in local court for blockages of crossing exceeding five minutes in length. The legislation has held up in higher court and will remain on our local books. (Exhibit 10.)

Enough is enough. Our town cannot be permitted to be a scapegoat for benefit of all the surrounding communities and the Airline industry and the Railroad industry. We are a middle class community of nearly 3,000 homes and very little industry and a growing population because of affordable housing.

We request that you thoroughly review and respond to our position before approval is given to this proposed acquisition and proper mitigations be implemented.

Sincerely yours,

Thomas C. Jones, Mayor

Notes of Decisions and Opinions

Scope 1

I. Scope

This section does not apply to a road constructed by a railroad company having the powers of eminent domain and the duties of a

common carrier. Hence although a coal mining company owns all the stock in such railroad company, freight tendered by any other shippers must be received. *Barlotti & Son v. Public Utilities Commission* (Ohio 1921) 103 Ohio St. 647, 134 N.E. 468.

4955.31 Plan must be approved

Before a person constructs a railway across a railroad as provided in section 4955.30 of the Revised Code, he shall submit the plan of construction to the public utilities commission for its approval, which at the cost of such person for traveling expenses or otherwise, must see that the structure in all respects conforms to the requirements of such section.

WARNING SIGNS AND SIGNALS

4955.32 Use of locomotive signal at crossing

Older Revised Code

Every company shall attach to each locomotive engine passing upon its railroad a bell of the ordinary size in use on such engines and a steam or compressed air whistle. When an engine in motion and approaching a turnpike, highway, or street crossing or private crossing where the view of such crossing is obstructed by embankment, trees, curve, or other obstruction to view, upon the same line with the crossing, and in like manner where the railroad crosses any other traveled place, by bridge or otherwise, the engineer or person in charge of such engine shall sound such whistle at a distance of at least eighty and not further than one hundred rods from such crossing and ring such bell continuously until the engine passes the crossing.

This section shall not interfere with the proper observance of an ordinance passed by the legislative authority of a municipal corporation regulating the management of railroads, locomotives, and steam whistles on locomotives, within the limits of such municipal corporation.

1. In general

If a spur track of a railroad does not extend eighty rods from a highway, rendering compliance with RC 4955.32 impossible, negligence cannot be bottomed upon a claimed violation thereof. *Gigliotti v. New York, C. & St. L. R. Co.* (Ohio App. 1958) 107 Ohio App. 174, 157 N.E.2d 447, 8 O.O.2d 76.

RC 4955.32 and 4955.34 do not deprive a railroad of the defense of contributory negligence. *Glinsey v. Baltimore & O. R. Co.* (C.A.6 (Ohio) 1974) 495 F.2d 565, certiorari denied 95 S.Ct. 232, 419 U.S. 968, 42 L.Ed.2d 184.

GC 8856 (RC 4955.34), read with this section does not change rule of Ohio respecting separability of actions against master and servant under certain conditions. *Ammond v. Pennsylvania Railroad Co.* (C.A.6 (Ohio) 1942) 125 F.2d 747, 23 O.O. 172, certiorari denied 62 S.Ct. 1283, 316 U.S. 691, 86 L.Ed. 1762.

Violation of this section constitutes negligence per se. *Baltimore & O. R. Co. v. Joseph* (C.A.6 (Ohio) 1940) 112 F.2d 518, 18 O.O. 151, certiorari denied 61 S.Ct. 551, 312 U.S. 682, 85 L.Ed. 1121, certiorari denied 61 S.Ct. 710, 312 U.S. 714, 85 L.Ed. 1144.

2. Sounding bell and whistle

The defendant company was required to sound a whistle at a distance of at least eighty, and not further than one hundred, rods from the crossing, and to ring the bell continuously until the engine passed the crossing. *Cleveland, C. C. & St. L. R. Co. v. Kuhl* (Ohio) 1931) 123 Ohio St. 552, 176 N.E. 222.

Section 3336, Rev. St., requires the engineer having in charge an engine in motion to ring the bell and sound the whistle on approaching a place where the road crosses any highway or traveled place, by a bridge or other structure. *Toledo & O. C. Ry. Co. v. Jump* (Ohio 1893) 50 Ohio St. 651, 35 N.E. 1054.

The failure of a locomotive engineer to sound a whistle as the locomotive approached a grade crossing, is not the proximate cause of the death of a passenger in an automobile which collided with the side of the locomotive which had come to rest on that crossing where the driver and occupants of the automobile were so far away that they would not have heard such sound had it been given.

EMERGENCY 235-1212

January 22, 1998

To: Mayor Jones
Council President Smith

Re: Proposed Increase in Train Traffic

The Fire Department has a great interest in railroad activities as the trains often impact us in our community. With the fire station located next to the tracks at the north end of town we see first hand the numbers of trains, their speeds, their stops, the blocked crossings, the malfunctioning gates, and on occasion a delay in our emergency responses.

In Olmsted Falls we have the unfortunate situation of having two different rail lines serving two different service areas. This in effect divides the city into 3 different areas or zones, with the fire station located in the center zone, which is the largest of the 3 and consequently has the most emergencies. Approximately 50% of our calls are in this center zone; with about 25% each for the northern and southern zones. Fortunately being located near the north tracks, segment N293, we can determine almost immediately if we are blocked from crossing the north tracks. If we should encounter a delay crossing to the north we can immediately call Olmsted Twp. Fire Department to respond to our emergency call so as to reduce any delay caused by the train and potentially save a life or in the case of fire reduce property damage.

The southern tracks, segment C061, have not created as many problems for us because their volume is low when compared to the north tracks. (Approximately 14 on C061 as compared to 80+ on N293). However we are not aware that a train is potentially blocking our response until we are several minutes into the response and approach the crossing. Mutual aid is then called from Berea, Strongsville, or Columbia Twp. This extended delay could have fatal or costly consequences for our residents.

A-367-c

EXHIBIT 7

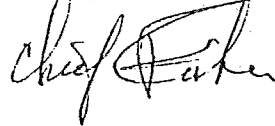

It has been projected we could see a 250% increase in the train traffic for the southern tracks. Because of our situation as explained above I would suggest an automatic response from Berea Fire Department for any call to the southern zone. Our fire department would also respond and once we are clear the tracks we would call Berea off or take over the emergency once we arrive on the scene. To provide a degree of fairness for Berea we would offer the same automatic response to their community for the section of Bagley Road that is west of the tracks and potentially blocked from their fire department. Potential cost increases for call back manpower for Olmsted Falls could be around \$8,000.00 per year.

I have been told there are communications systems available that can send a signal from the railroad to an emergency dispatch center to advise of an approaching train. This may be valuable for our purposes and definitely worth looking into.

If I can be of any service regarding these matters please contact me.

Sincerely,

Chief William Fisher

ORDINANCE NO. 5-95 (as amended)

INTRODUCED BY: Mayor Tom Jones

AN ORDINANCE REAFFIRMING THE BOUNDARIES
OF THE OLMSTED FALLS HISTORIC AREA CONSERVATION
DISTRICT, REPEALING ALL LEGISLATION INCONSISTENT
HEREWITH AND DECLARING AN EMERGENCY.

WHEREAS, the City of Olmsted Falls, Ohio has previously established the boundaries of its Historic Area Conservation District; and

WHEREAS, based upon information from Joseph N. Schaller, P.E. from the office of Michael Benza and Associates, Inc., City Engineer for the Municipality, the previous boundaries were modified in February 1990; and

WHEREAS, the said Joseph N. Schaller, P.E., has recommended that the boundaries of the Historic Area Conservation District, as revised, should be presented to Council for approval; and

WHEREAS, the said Joseph N. Schaller, P.E., has prepared a map indicating the current boundaries of the Olmsted Falls Historic Area Conservation District, a copy of which is attached hereto, marked Exhibit A and incorporated herein by reference; now, therefore,

BE IT ORDAINED BY THE COUNCIL OF THE CITY OF OLMSTED FALLS, OHIO,
THAT:

SECTION 1. The boundaries of the Olmsted Falls Historic Area Conservation District are hereby reaffirmed to conform with the modifications approved in February 1990 as evidenced in the map outlining the boundaries of the said Historic Area Conservation District attached hereto, marked Exhibit A and incorporated herein as if fully rewritten.

SECTION 2. All prior legislation inconsistent with this legislation in whole or in part are repealed to the extent necessary to avoid conflict with this Ordinance.

SECTION 3. That the Council finds and determines that all formal actions of this Council relating to the adoption of this Ordinance have been taken at open meetings of this Council; and that deliberations of this Council and of its committees, resulting in such formal action, took place in meetings open to the public, in compliance with all statutory requirements including the requirements of Section 121.22 of the Ohio Revised Code.

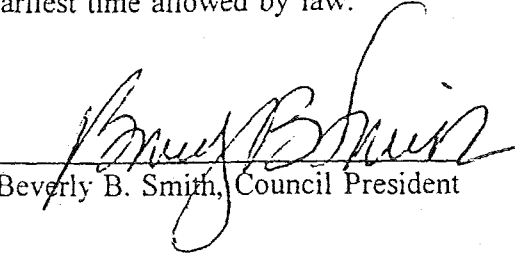

2 11 14 13

ORDINANCE NO. 5-95 (as amended)

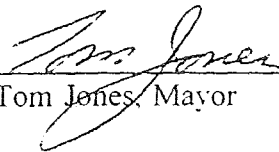

Page -2-

SECTION 4. This Ordinance is hereby declared to be an emergency measure necessary for the immediate preservation of the health, safety and welfare of the residents of Olmsted Falls for the reason that the revised boundaries were approved in February 1990 and should be established by law as soon as practicable. It shall therefore take effect immediately upon passage by the affirmative vote of not less than five (5) members elected to Council and approval by the Mayor or otherwise at the earliest time allowed by law.

654.01 OBSTRUCTING STREETS BY RAILROAD COMPANIES.

(a) No railroad company shall obstruct or permit or cause to be obstructed a public street, road or highway by permitting a railroad car, locomotive or other obstruction to remain upon or across it for longer than five minutes to the hindrance or inconvenience of travelers or a person passing along or upon such street, road or highway. No railroad company shall fail, at the end of each five minute period of obstruction of a public street, road or highway, to cause such railroad car, locomotive or other obstruction to be removed for sufficient time, not less than three minutes, to allow the passage of persons and vehicles waiting to cross.

This section does not apply to obstruction of a public street, road or highway by a continuously moving through train or caused by circumstances wholly beyond the control of the railroad company, but does apply to other obstructions, including without limitation those caused by stopped trains and trains engaged in switching, loading or unloading operations.

Upon the filing of an affidavit or complaint for violation of this section, summons shall be issued to the railroad company pursuant to Ohio R.C. 2935.10(B), which summons shall be served on the regular ticket or freight agent of the company in the county where the offense occurred. (ORC 5589.21)

(b) Should any railroad crossing be closed by a railroad company for purposes of construction at or around such crossing, such railroad company shall provide written notification to the City at least thirty days prior to the commencement of such construction or, in the case of emergency construction where at least thirty days notice cannot be given, such written notice shall be given as soon as the railroad company has knowledge that the construction will occur. Further, such railroad company shall provide flagmen and the proper

personnel to direct detoured traffic at any such crossing, which flagmen and personnel shall be provided under the supervision of, and with the approval of, the Chief of Police.

(c) Whenever a police officer or law enforcement officer determines that a railroad train, locomotive or railroad car is in violation of this section, he or she shall proceed as follows:

- (1) The officer shall order the train crew to open such train.
- (2) After such train is opened, the officer shall make a physical arrest of the conductor, or such other person in charge of such train, locomotive or railroad car and cause such person to post bond in accordance with the degree of misdemeanor of which he or she is charged.

(d) Whoever violates any of the provisions of this section is guilty of a misdemeanor of the first degree. Punishment shall be as provided in Section 698.02. Organizations violating any of the provisions of this section, as provided in Section 606.08, shall be punished as provided in Section 698.04. (Ord. 74-84. Passed 5-29-84.)

654.02 CLIMBING UPON RAILROAD CARS.

(a) No person shall climb, jump, step or stand upon or cling or attach himself to a locomotive, engine or car upon the track of a railroad, unless in compliance with law or by permission under the rules and regulations of the corporation managing such railroad. (Ord. 81-73. Passed 12-11-73.)

(b) Whoever violates this section is guilty of a misdemeanor of the fourth degree. Punishment shall be as provided in Section 698.02.

654.03 SPEED OF TRAINS.

(a) No person shall operate or cause to be operated a locomotive, railroad train or railroad car at a rate of speed greater than thirty miles per hour while within the corporate limits of the City.

(b) No person shall operate or cause to be operated a locomotive, railroad train or railroad car at such a slow rate of speed, without good and sufficient reason or cause, so as to detour or delay traffic unnecessarily.

(c) For the purpose of this section the engineer and conductor, if physically present on the railroad train, locomotive or railroad car, shall each be deemed to be operating or causing to be operated the locomotive, railroad train or railroad car.

(d) Whoever violates any of the provisions of this section is guilty of a misdemeanor of the first degree. Punishment shall be as provided in Section 698.02. Organizations violating any of the provisions of this section, as provided in Section 606.08, shall be punished as provided in Section 698.04. (Ord. 74-84. Passed 5-29-84.)

Washington, DC 20423-0001

CENTRAL ADMINISTRATIVE UNIT

REC'D: 2/2/98
DOCUMENT # 2/2/98 551.13PM

Dear Secretary and Members of the Surface Transportation Board:

I am writing in opposition to the CSX/Conrail merger that will negatively affect the residents of Ward 10 located in the northeast portion of the City of Cleveland. In light of the research prepared by the City presented in the environmental impact statement by the surface transportation board, and the concerns I hear from neighborhood residents, it is clear to me the proposed merger between CSX and Conrail is at the cost of residents in neighborhoods I represent.

The proposed increase of trains comes on tracks that cut right through my ward. These tracks are rarely used at present, and in some places run through densely populated neighborhoods. An increase in train traffic would affect many people in profound ways.

Delays in traffic at crossing, especially delays in emergency vehicle traffic could create a life-threatening problem for Ward 10 residents. As the shipping of train cargo is virtually unregulated, in the event of an accident, the proposed train traffic is more likely to create a significant health hazard and emergency situation in Ward 10, for which the City must be constantly prepared. The value of real property for residents adjacent to the tracks could plummet, as the location would be increasingly less desirable. Finally the quality of life would be diminished from such dramatic increases in train traffic, and the resulting loss of air quality and increase in noise.

The City prepared and filed a great deal of information in this regard, and indicated that the neighborhoods most affected are black and low-income neighborhoods. Ward 10 includes the Euclid Green, Collinwood and Forest Hills neighborhoods. My community is among those proposed to receive the most damage from this proposal, therefore, I oppose the CSX/Conrail merger.

Sincerely,

Roosevelt Coats

DOCUMENT # 1/29/98 2.00.34 PM

Dear Ms. Kaiser;

As a resident and business owner located in Vermilion, Ohio, I am requesting that you provide the necessary protection of the North shore communities of Lake Erie from the harms created by the proposed rail mergers. Vermilion, like its sister lake shore communities, is densely populated, with housing, churches, businesses and schools within 500 feet of the CSX and NS tracks. The proposed merger would increase rail traffic four times the current volume as well as increase the hazardous transports from nine thousand (9,000) cars to thirty two (32,000) cars per year.

You state in your environmental analysis that you intend to recommend to CSX and NS certain emergency response plans be prepared for communities in case of a spill. This is laudable, but considering the increased probability of a spill because of such high volume of hazardous materials in such close proximity to Lake Erie, insufficient. Surely we have learned something from the Valdez spill in Alaska — keep hazards away from water sources. This is not the wilderness, northern Ohio is dependent on Lake Erie for potable water.

The proposed merger will send over fifty (50) trains each day through the heart of Vermilion. The tracks cross each north to south street, effectively cutting Vermilion in half. This is a very unsafe system for the timely response for fire, police and emergency medical vehicles. With over two trains per hour, this means too frequent delays for north/south traffic seeking access to major interstate highways.

Today the Cleveland Plain Dealer reports that the merger proponents promise ninety (90) jobs in the Collinwood yards; as a "creation of jobs and service to the community." Ninety jobs in Cleveland does not enhance any other community for the cost in safety, decrease in property values or quality of life drained from it by this proposal.

Very truly yours,

Gail M. Schaffer

Ms. Elaine K. Kaiser,

My name is Mary Olyne Myracle, I live in Vermilion. This letter is about my concern with the possibility of increased train traffic through our community. Our city is split by the tracks, the downtown and emergency services on the north and a large section of private homes on the south. It scares me to think of the ambulance on one side of the tracks, a person in desperate need on the other side and a train between them. There is not an alternate route that does not take at least 20 minutes, which could prove to be deadly to a person in need.

I know you are a very busy person and concerned with many issues that affect many people. Please take a moment to consider the people of Vermilion and look at an alternative to the increase in the train traffic.

Sincerely yours,

Mary Myracle

Elaine K. Kaiser
Surface Transportation Board
1925 K Street, NW
Washington, DC. 20423-0001

Dear Ms. Kaiser

I am writing in reference to the proposed acquisition of the Conrail lines that run through our community (Vermilion, OH) by CSX and Norfolk and Southern Railroads.

It is my understanding that this acquisition would increase the traffic on these tracks that run adjacent to Lake Erie. It is my opinion that allowing this merger would be very devastating not just Vermilion, but to the entire state of Ohio. **Lake Erie is the greatest natural asset that this state has.** The current rail traffic already limits the ability to develop along Lake Erie. The transportation of hazardous waste risks contamination of the lake (as demonstrated with the major derailment of a train just last summer just feet away from Sandusky Bay).

You have heard the concerns about the safety issues for the communities like Vermilion, but the issue is much larger. Lake Erie is an asset that belongs to the entire state (and to some degree the entire country). Instead of considering something that could possibly endanger the future of such a valuable asset, you should be considering the use of eminent domain to acquire the tracks for use by passenger rail, enhancing access to Lake Erie, and increasing it's value.

Take steps to save Lake Erie for future generations, don't put it at risk.

Sincerely,

A handwritten signature in cursive script, appearing to read 'Bob Higley'.

Washington, DC 20423-0001

Dear Ms. Kaiser:

This letter is pursuant to the attached correspondence concerning Ashta Chemicals. Ashta Chemicals has indicated that if reciprocal switching is granted, they could reduce their annual freight costs by \$500,000 to \$100,000.

Ashta has met with both CSX and Norfolk Southern regarding our concerns over increased transportation costs and delays in transit times.

I would appreciate it if small business concerns like Ashta could be afforded a fair opportunity to not be adversely impacted by the proposed Conrail acquisition.

Sincerely,

ASHTABULA COUNTY COMMISSIONER

Duane S. Feher

December 19, 1997

Re: Finance Docket No. 33388 -- CSX and Norfolk Southern -- Control and Acquisition --
Conrail: Draft Environmental Impact Statement

Dear Interested Parties:

Recently, the Surface Transportation Board's Section of Environmental Analysis (SEA) sent you the Draft Environmental Impact Statement (EIS) for the Proposed Acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad. SEA wants to (1) correct two dates in the procedural schedule included in the Draft EIS and (2) clarify that the Draft EIS is comprised of a separate Executive Summary and six volumes of text. These six volumes are divided into nine separate books.

Specifically, the procedural schedule included in the Executive Summary (Table ES-1, pp. ES-7 to ES-8) and in Chapter 1 (Table 1-1, p. 1-9) of the Draft EIS incorrectly states the due dates for filing rebuttals in support of Inconsistent and Responsive Applications and for submitting briefs to the Board. The correct due dates are: (1) **January 14, 1998** for the filing of rebuttals in support of Inconsistent and Responsive Applications and (2) **February 23, 1998** for all parties to submit briefs. A corrected copy of the Board's entire Procedural Schedule is enclosed with this letter.

SEA welcomes written comments on all aspects of the Draft EIS as well as suggestions on mitigation measures to address potential environmental impacts that could result from the Proposed Conrail Acquisition. As noted in the Draft EIS, all comments must be submitted by **February 2, 1998**.

If you have any questions about the Board's Procedural Schedule or would like additional information about the environmental review process, please call SEA's toll-free Environmental Hotline at 1-888-869-1997, or visit our website at <http://www.conrailmerger.com>.

Sincerely yours,

Elaine K. Kaiser

November 24, 1997

Mr. Duane S. Feher
County Commissioner
25 West Jefferson Street
Jefferson, OH 44047

Dear Mr. Feher:

Enclosed, please find ASHTA's brief regarding the proposed acquisition of Conrail by the Norfolk Southern RR and the CSX RR. This brief was submitted to the Surface Transportation Board on October 21, 1997.

~~Since the 1970's Ashtabula, OH has been closed to Reciprocal Switching and captive to Conrail. ASHTA has requested~~
as a condition of the merger, Reciprocal Switching in Ashtabula. This would allow for rail competition to exist again in Ashtabula. The basis of our research is as follows:

- * Reciprocal Switching existed previously in the early 1970's with the Penn Central and the Norfolk and Western RR. The Penn Central ran the East West line to Buffalo, NY and the Norfolk & Western ran an additional East-West lane to Buffalo, NY. When the respective railroad merged to form Conrail, the Reciprocal Switching agreement was eliminated.
- * Having access to a second major Class I railroad in Ashtabula would benefit all of the Ashtabula shippers through competitive freight rates. ASHTA alone spends more than \$4.3 million annually in rail freight costs. If Reciprocal Switching is granted, we could realize estimated freight savings of \$500,000 to \$1 million annually. This is significant to ASHTA and would allow for improvements to our plant located in Ashtabula, OH and possible expansion of our facility.
- * Reciprocal Switching would also allow for improved transit times by eliminating switches to a second carrier. Improved transit times allows our customers to receive product faster. It is still unknown how much of ASHTA's business that is currently Conrail direct shipments that will become a two-railroad movement, CSX handing off to the Norfolk Southern. It is our experience that anytime two railroads are involved, freight rates are higher. In addition, transit times are usually increased by one to three days. This also increases our cost of doing business because these cars are not available for shipment to other customers or terminals.
- * With the proposed acquisition of Conrail, CSX will have the East-West line to Buffalo, NY and Norfolk Southern will have the North-South line to Youngstown, OH. All Ashtabula rail traffic is pulled from the industry and taken to the West Yard. In the West Yard, trains are built and shipped to Buffalo. Norfolk Southern trains will cross the East-West CSX line just east of the West Yard. ~~A~~
~~switching agreement could be used to switch cars to the Norfolk Southern. It is believed that this~~
~~space is in good condition and would not require additional capital for improvements. With the close~~
~~proximity of the spur to the West Yard, it makes sense to allow the shippers access to the Norfolk~~
~~Southern RR.~~

ASHTA has met with both the CSX and Norfolk Southern regarding our concerns over increased transportation costs and delays in transit times. ~~CSX has not committed our request for Reciprocal Switching (see Exhibit D) and Norfolk Southern was also noncommittal (see Exhibit C). Further, with this expensive acquisition, ASHTA asked both~~

~~agreements have them would be paying for the merger.~~ Norfolk Southern responded that in addition to the revenue from the merger, they had stopped buying back their own stock which they had been doing in previous years at approximately \$500 million per year. CSX responded that they have a "Truck Busters" initiative to take business away from the trucking industry. ASHTA does not have enough business to benefit from the Truck Buster program. Other than economies of scale arguments we read in the press, they have not offered any other plan for paying down the huge debt they will incur upon the culmination of the acquisition. We can only assume the debt will be repaid via freight rate increases. This is counter to both the NS and CSX public commentary on how their respective acquisitions of Conrail will increase competition and service.

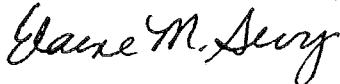

We believe we have voiced valid concerns as current experience with the UP/SP merger has proven an increase in ~~freight rates of 30% and significant delays in transit to our customers.~~ The UP/SP problems were not foreseen or expected as a result of the merger and we know that this has caught many shippers and the STB unaware.

This summarizes ASHTA's position with the proposed acquisition and break up of Conrail. I would appreciate an opportunity to discuss this with you further at your convenience prior to your meeting with the ~~Ohio Attorney General's Office.~~ Please call me at 440-997-6858 when you receive this letter to arrange a mutually agreeable time to meet with you and Mr. Boggs either at your office in Jefferson or our office in Ashtabula.

If for some reason we are unable to meet, I would like to call and discuss this with you and Mr. Boggs prior to your meeting. If you feel it would be appropriate, I will arrange to travel to Columbus with one of my associates in order to attend the meeting and clarify our position with the Attorney General's Office.

Thank you for the opportunity to review our position. I look forward to hearing from you in the near future.

Sincerely,

Elaine M. Sivy

RESOLUTION NO. 1998-7

A RESOLUTION EXPRESSING CONCERNS OF THE MEMBERS OF THE HURON CITY COUNCIL REGARDING THE CSX/NS PROPOSED RAILROAD MERGER.

WHEREAS, members of the Huron City Council recognize there are many environmental issues in Erie County, Ohio that have not been resolved regarding the CSX/NS proposed railroad merger, and;

WHEREAS, members of the Huron City Council are concerned about the maintenance of the railroad crossings within the corporation limits, and;

WHEREAS, members of the Huron City Council are extremely concerned about the increased transportation of hazardous waste material through the City of Huron, Ohio.

NOW, THEREFORE, BE IT RESOLVED BY THE COUNCIL OF THE CITY OF HURON, OHIO:

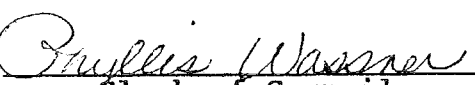

Section 1. That this Council will not support the merger of CSX/NS unless all environmental issues and concerns in Erie County, Ohio have been addressed and resolved.

Section 2. That this Council will not support the merger unless they are provided with written assurance that regular maintenance of the railroad crossings within the corporate limits will be done with specific attention being given to the Rye Beach Road, Main Street, River Road and Berlin Road grade crossings.

Section 3. That this Council will not support the merger until they are satisfied that safety measures have been implemented to assure the safe transport of shipments of all hazardous waste materials throughout Erie County, Ohio.

Section 4. That the Clerk of Council be, and she hereby is, directed to forward a copy of this Resolution to the Erie County Commissioners, the Surface Transportation Board and the U. S. Representative and Senator from this district.

Edward Asher, Mayor

Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K Street, N. W.
Washington, D. C. 20423-0001

Dear Ms. Kaiser:

The Citizens Advisory Board of the Eastgate Development and Transportation Agency (EDATA), serving Mahoning and Trumbull Counties, Ohio as an advisory board to the General Policy Board of EDATA, the regional metropolitan planning organization, is concerned with the proposed acquisition of Conrail and the impact it will have on the Youngstown-Ashtabula (Youngstown Branch of Conrail) Railroad Line.

The increase in trains per day along this line will exceed 100 percent and could create the following environmental impacts: noise (engine, wheels and horn) from increased traffic on the line; safety from at-grade crossings that have inadequate monitoring controls; environmental justice which will impact minority and low-income communities that are located in close proximity to the line; and hazardous materials transportation where the Youngstown-Ashtabula Line has been identified as a Major Key Route.

The transportation of hazardous materials is probably the most important environmental issue due to the residential development in close proximity to the railroad line. This issue must be thoroughly addressed by the Board's Section of Environmental Analysis to insure that appropriate response procedures are in place in the event of a train accident (derailment) or hazardous materials release, and that these procedures are acceptable to local emergency response organizations located in the vicinity of this railroad line.

Your consideration of these environmental issues would be appreciated.

Sincerely,

Nancy D. Brundage

ENVIRONMENTAL DOCUMENT

Office of the Secretary
 Surface Transportation Board
 Washington, D.C. 20423-0001

Dear Secretary and Members of the Surface
 Transportation Board:

We are writing in opposition to the CSX/Conrail merger that will negatively affect the residents of Ward 10 located in the northeast portion of the City of Cleveland. In light of the research prepared by the City presented in the environmental impact statement by the Surface Transportation Board, and the concerns we hear from neighborhood residents, it is clear to us that the proposed merger between CSX and Conrail is at the cost of residents in our neighborhoods.

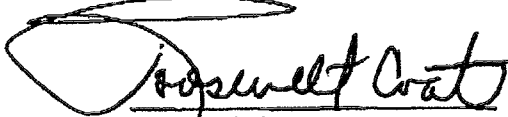

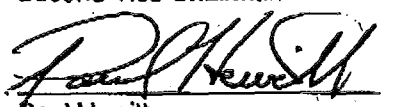

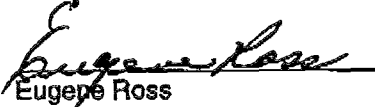

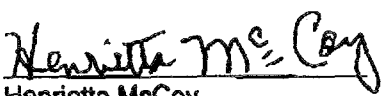

The proposed increase of trains comes on tracks that cut right through our communities. These tracks are rarely used at present, and in some places run through densely populated neighborhoods. An increase in train traffic would affect many people in profound ways.

Delays in traffic at crossing, especially delays in emergency vehicle traffic could create a life-threatening problem for our communities. As the shipping of train cargo is virtually unregulated, in the event of an accident, the proposed train traffic is more likely to create a significant health hazard and emergency situation in our neighborhood, for which the City must be constantly prepared. The value of real property for residents adjacent to the tracks could plummet, as the location would be increasingly less desirable. Finally the quality of life would be diminished from such dramatic increase in train traffic, and the resulting loss of air quality and increase in noise.

 Willie McCladdie

The City prepared and filed a great deal of information in this regard, and indicated that the neighborhoods most affected are black and low-income neighborhoods. The communities are: Euclid Green, Collinwood and Forest Hills neighborhoods. Our community is among those proposed to receive the most damage from this proposal; therefore, we oppose the CSX/Conrail merger.

Sincerely,

REC'D: 2/3/98
 DOCUMENT # 2/3/98 3:26.39 PM

Attention: Elaine K. Kaiser; Environmental Project Director, Environmental Filing

Dear Ms. Kaiser:

I understand at this time the Surface Transportation Board and its members are conducting a comment period for interested parties to offer their concerns regarding the proposed changes resulting from the acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad. I would like to take this opportunity to share with you some of my concerns and those concerns brought to my attention by the local officials within my district.

This proposed acquisition will affect Huron County, specifically Greenwich and Willard, Ohio, which are both among my district. Among these two areas there have been several concerns including, but not limited to, the following: underpasses, proper signalization, access road, safety of children going to and from school, emergency vehicle access for public safety, and the possibility of long delays causing increased anxiety to the motoring public.

Due to the volume of concerned citizens from all parts of Ohio, Senator Oelslager and Representative Bateman held a special Joint Legislative Transportation Committee for the purpose of reviewing the CSX merger with Conrail and the merger's impact upon Ohio and its citizens. During those committee meetings many individuals and local officials from all over Ohio came to testify, including my constituents from Greenwich and Willard, Ohio and Huron County officials. At the conclusion of the subject in committee, Senate Concurrent Resolution (SCR) 14 was introduced.

SCR 14 opposes the sale of Conrail to CSX and Norfolk Southern unless certain conditions are imposed on the sale by the Federal Surface Transportation Board which mitigate the commercial and community harm caused by the proposal. Recognizing that the final decision regarding this matter will be made by the Surface Transportation Board, I would respectfully request the board and its members to take under serious consideration my concerns as well as those concerns submitted by the citizens and local officials who will be directly affected by the outcome of the board's decision.

A-373-c

Elaine K. Kaiser
January 26, 1998
Page 2

To the credit of the railroad company, CSX has been attempting to work with and address those concerns raised by Huron County officials. However, there are still areas that have not yet been resolved between the railroad company and Huron County. It is critical that these remaining concerns be resolved prior to the approval of this acquisition.

If during your consideration of this matter you or any of the board members would like to speak to me regarding my thoughts and concerns, please feel free to contact my office. Thank you for your consideration and attention in this matter, and I trust my comments will be of service to both you and the board.

Sincerely,

Dick Schafrath
State Senator

ENVIRONMENTAL DOCUMENT

January 26, 1998

Ms. Elaine K. Kaiser
Environmental Project Director
Surface Transportation Board - Finance Docket No. 33388
1925 K Street, NW
Washington, DC 20423-0001

Dear Ms. Kaiser:

I am asking you to strongly consider the impact of the requested merger of Conrail and Norfolk & Southern Railroads on the communities to be affected by the resulting increased train traffic. Vermilion, Ohio is one such community.

As a resident and small business owner I am greatly concerned about the results of this merger and what it would do to our community and our quality of life. My primary concerns:

- Tremendously increased traffic on the existing tracks;
 - Increased noise and air pollution;
 - Rerouting of school buses;
 - * Increased student ride-time, as well as increased fuel consumption. Both would be very detrimental to a school system with existing financial strains.
 - Increased difficulty to travel throughout the community.
 - * The merger could possibly cut off much needed traffic and revenue for "downtown" and Liberty Avenue businesses.
 - Higher probability of automobile and/or pedestrian accidents at railroad crossings.
- Increased traffic of hazardous waste;
 - Greatly endangers the environmental safety of Lake Erie.
 - * Why risk Ohio's one Great Lake and a beautiful natural resource, not to mention the safety of lake-front residents?
 - * One toxic spill would contaminate the water source for many communities and devastate a growing tourist industry.
- Diminished response time of local safety forces to emergencies;
 - Geographically speaking, increased train traffic would cutoff many residents from receiving adequate responses from police and fire protection as well as emergency medical assistance.
- Long-term damage to an already depressed local economy;
 - Reduced accessibility due to heavier train traffic could hamper Vermilion's ability to support existing businesses, as well as, its ability to attract new businesses.
 - The tourist trade is one of Vermilion's sources of revenue. Increased train traffic would decrease the community's appeal to vacationers, boaters, fishermen, etc.

Vermilion and surrounding communities have nothing to gain and everything to lose with this merger. Put yourself in the position of those who will be directly affected by this merger. Vote in favor of the quality of life for your constituents and against this proposed merger. Thank you for your time and consideration.

Sincerely,

Pamela J. Holt-Higley

RE: Comments on Draft E.I.S.
for Conrail Merger

1. *SENECA COUNTY OHIO SETTING*

Located in North Central Ohio. One hour southeast of Toledo, 2 hours west of Cleveland and 1 1/2 hours north of Columbus.

Rural with sporadic development.

The City of Fostoria is situated principally within Seneca County.

2. *RAILROAD FACILITIES IN/AFFECTING SENECA COUNTY*

Rail lines

5 separate lines

*4 lines are Class I railroads
(2 lines CSX and 2 lines NS)

*1 line Short Line - Port Authority

Major Rail Yards

1. Bellevue (NS) existing facility sits on northeast County line Seneca/Sandusky/Huron
2. Willard (CSX) an existing yard that will become a key terminal (including fueling facility) is only 5 miles east of Seneca County in Huron County

Rail Mixing Plant

NS has just begun operation at this plant on the east side of Fostoria.

3. SAFETY CONCERNS

A. General Comments

The City of Fostoria is in Seneca County. Fostoria possesses many unique problems. These problem areas spill over to the surrounding townships in our County. The key item that appears to have been totally ignored in the draft EIS is that train traffic does not "pass through" Fostoria; switching and turning movements are performed here. This currently results in trains stopped, blocking city streets, county roads and township roads while waiting to get through Fostoria. It is not uncommon now for Fostoria, county and township roads to be blocked by stopped trains for over one (1) hour. What will happen when 22 trains per day are added to C-075, 10 trains per day added to C-070 and 8 trains per day to N-071? While all these trains are stopped, waiting for turning movements, the county and township roads east, north and south of Fostoria will be blocked. This will interfere with emergency, fire, police, EMS and totally disrupt normal vehicle movement. This entire situation, Fostoria and the surrounding townships, must be analyzed and satisfactorily addressed before this office can support this merger.

B. Freight Rail Operation

SEA has listed CSX line C-075 as having a "significant increase" for accident rates between cars and freight trains. However, SEA appears to have analyzed each line separately and has not taken into account the major adverse compounding effect that drastically increasing three Class I Lines (C-070 by 10 trains; C-075 by 22 trains; N-071 by 8 trains) will have in one county. We strongly believe that quality of life in Seneca County will be very adversely effected by this increase.

The "extensive" capital improvements proposed for Fostoria, need to be extended to the surrounding townships.

C. Highway/Rail at Grade Crossings

SEA has identified four crossings in our County as Class A significance.

This office believes that this number is low. Seneca County has the dubious designation of consistently ranking in the top five (5) Ohio counties for grade crossing fatalities. An increase in train traffic can only serve to increase this statistic.

Seneca County currently has a "hump" crossing problem. Over two years ago, a county-wide standard was developed and adopted. With our limited funds, we have only been able to get a handful of the 160 plus crossings up to standard. We strongly believe that as

part of this merger approval, all the effected highway/rail at grade crossings must be upgraded to our County Standards. (copy attached)

At a minimum, the CSX line C-075 (increase of 22 trains per day) should have lights and gates installed at all crossings.

D. Hazardous Material Transport by Rail

SEA has identified C-070 and C-075 as being "major key routes" and C-070 is also "new key route" for transporting hazardous materials.

The suggested mitigation does not begin to go far enough to protect the citizens living along these routes. CSX should provide training for the local EMS, fire, police on at least a six month basis since many of the personnel are volunteer. There needs to be advance communication with the EMA Director at least monthly on what material will be moving through that month.

E. Roadway Crossing Delay

SEA has chosen to only look at crossings with 5000 ADT. As we stated earlier in the Safety Concerns - General Comments, the existing train traffic already causes unacceptable road blockages in and around Fostoria. There needs to be a detailed review of Fostoria and the surrounding townships to see how the proposed increase in train traffic is going to back-up into the townships. Just because most of our local ADTs are less than 5000 does not mean we have significantly less safety concerns. Currently Seneca County consistently ranks in the top five (5) counties in the State of Ohio regarding accidents at rail crossings.

This report has generally ignored the Fostoria problem and totally ignored the extended problems created in the townships. When our County is currently experiencing one (1) hour blockages of roads, we strongly believe that the following summary statement is totally inappropriate "the proposed Conrail acquisition would have no significant effect on vehicle delay for most at-grade crossings in Ohio. However seven crossings in Butler, Cuyahoga, Hamilton and Lorain Counties...".

We will strongly oppose this merger until the problems in Fostoria and the surrounding townships are properly addressed.

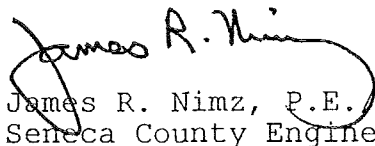

F. Seneca County Air Quality

SEA has already identified a 29% in NO_x emissions. Again this is assuming trains are passing through. What are the real air quality problems that need to be addressed by stopped trains and blocked roads? Just because we are in an attainment area, we should not be

subjected to such large increases without mitigation.

- G. The general concern of the study was to evaluate the results of the merger against "preacquisition" numbers instead of using this as an arena to fix some of the existing problems associated with rail commerce in a proactive manner. Also the future growth of rail commerce along these lines and their impact in all of the above items was not discussed.
- H. Future law will allow communities to apply for noise reviews which disallow the train engineer from blowing the hour in areas with four quadrant gates or similar warning devices. What will happen if and when the warning devices fail? Based upon past history with CSX, it is not uncommon for them to close a crossing for repair work without seeking the needed permits or advising the proper emergency response agencies. The crossing may remain closed for 3-8 weeks with no workers in the area for weeks on end. Only after calling the PUCO do we get action. With this track record, is there any way to mitigate better response to the local agencies as well as minimizing the closure time of the crossing.

Very truly yours,

James R. Nimz, P.E./P.S.

Surface and Transportation Board
Washington, D.C. 20423

Re: Proposed Railroad merger of Conrail and Norfolk & Southern

Dear Sirs:

Upon review of the Surface and Transportation Board impact study of the merger of Conrail and Norfolk & Southern, I am submitting the following comments. Please note that as Mayor of the City of Vermilion, Ohio, I am responding on behalf of all citizens of our community.

The plans that are being proposed indicate that Vermilion will be the only city that will experience the full impact of a merger. Increased train traffic will be routed through Vermilion and a connector rail is expected to be constructed just west of our city limit. This connector will allow rail traffic to switch from one line to the other. This addition, along with greatly increased train traffic raises concern for many reasons. I will address only a few of the more important.

The City of Vermilion is divided into four unequal areas by the two rail lines that cross at a location in the north-central area of the most densely populated section of the city. There are twelve (12) road crossing locations, six (6) on each track. The city currently has five (5) grade separations. While on paper this may seem like an adequate percentage of grade separations, it is not. The city is also divided east from west by the Vermilion River. This river has only one bridge crossing north of the two sets of tracks. That bridge is on Liberty Avenue. The next closest is the bridge on the State Route 2 interstate highway. There are no grade separations on the south west section of the rail system. Likewise, the entire south east portion of the City of Vermilion and all of Brownhelm Township will be adversely effected due to the limited grade separation conditions and by increased rail traffic. This situation allows for the entire south west section of the City of Vermilion, and both Vermilion Townships to become isolated from the area of the community that houses all of the safety forces.

The City of Vermilion provides safety services that include fire protection, police protection, and ambulance services, to approximately 28,100 citizens in the City of Vermilion, Brownhelm Township, and Vermilion Township. As with all emergency service delivery programs, response time is most critical to the survival rates of our citizens. The ambulance response time is currently averaging 5.5 minutes per run. This response time will be increased by as much as 7 to 10 minutes if the railroad crossings are congested with additional train traffic as proposed. This would result in an average response time that would greatly put our residents at a much greater safety risk. It is indeed unfair, and most unacceptable to have the residents of the greater Vermilion area be adversely affected by outside actions that will provide absolutely no benefit or return for our sacrifice.

A-375c

Surface and Transportation Board

January 27, 1998

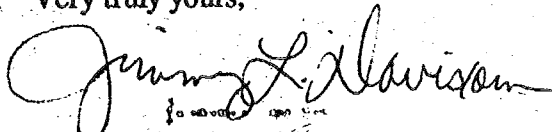

Page 2

The City of Vermilion is experiencing some of its most difficult economic times in the history of the community. The Lorain Ford Motor company recently ceased production on the passenger care line, and as a result many of our residents are now being forced to either find other work, or relocate. The status of the remaining commercial van production activity is rumored to be subject to change in the near future. This economic uncertainty has been amplified by the defeat of seven Vermilion School levies. As a result of the serious nature of the shrinking tax base in our area, it is critical that a more diverse and stable tax base be established through the controlled growth of light industry and office development. It must be recognized that increased rail traffic that would limit or restrict the efficient and effective delivery of services will adversely affect the city's ability to be successful in its efforts to rebound and rebuild from the current financial hardships.

In addition to the safety concerns and the financial stability concerns, the entire area is struggling to correct and manage storm water runoff in an effective manner. A recent storm water management study conducted by a consulting engineering firm has noted that several of the areas most critical drainage obstructions are the railroad culverts on Edson Creek on the west side of the city. No work should be considered in this area without an extensive review, and an upgrade of the existing drainage systems.

I ask that no action be taken on the merger of these railroads until all of these issues can be addressed in a manner that will not depreciate the quality of life nor adversely affect the future growth and economic opportunities of the City of Vermilion and the neighboring townships. The integrity of our community must not be compromised in any manner.

Very truly yours,

Jimmy L. Davis
Mayor

Re. Comments on proposed Conrail Acquisition

Dear Mrs. Kaiser,

The Oxford Township Trustees would like to take the opportunity to express its concerns on the acquisition of Conrail. Norfolk and Southern's east and west main line from Vermilion to Bellevue cuts through the middle of Oxford Township. Five roads are crossed by this rail line. Four of the five crossings have blinking lights, three of the five have safety gates, and one crossing on Thomas road has neither lights nor gates.

We have concerns that we feel must be addressed before we can come to a conclusion on the acquisition. They are the following: 1. **Crossing Safety** 2. **Crossing Delays** and 3. **Hazardous Materials**

Crossing Safety- With the eleven (11) additional trains per day from Vermilion to Bellevue and the speed that the trains will be traveling, we strongly feel that all crossings should be equipped with **safety gates and lights**. Numerous deaths have occurred at three of the four crossings in Oxford Township. We can only perceive that with eleven additional trains per day, we can expect additional casualties unless crossings are properly equipped with safety gates and lights.

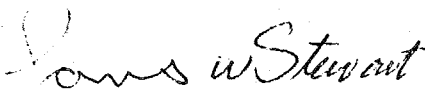

Crossing Delays- As a Township with no fire department of its own, we must rely on fire protection from two adjoining Townships- Milan and Groton. They have volunteer fire departments that assist our needs. With the crossing delays already at an alarming rate and with the increase of eleven more trains per day, we believe our fire protection and Emergency Medical Service will greatly be affected. We have access to a pond that has a dry hydrant installed and provides the southern half of the Township with water for fire protection. This water source is located in the town of Kimball and when crossing delays occur, fire protection becomes nullified.

Hazardous Materials- Oxford Township understands that the rail line from Vermilion to Bellevue would increase its number of hazardous loads, from 9,000 to 15,000 cars annually. We find this increase very **alarming!** Since 1990, Erie County has experienced four derailments and five accidents at the Bellevue rail yard. We are concerned that this increase will definitely add to additional spills and we would request the mitigation be established for key route designations and this be expanded to include more than material accident simulations.

The Oxford Township Trustees appreciate the opportunity to express our concerns. We hope they are taken seriously. If any questions arise please don't hesitate to call or write. Any correspondence would be greatly appreciated.

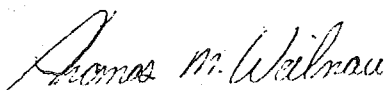

Sincerely,

Oxford Township Trustees

RESOLUTION NO. 1998-7

A RESOLUTION EXPRESSING CONCERNS OF THE MEMBERS OF THE HURON CITY COUNCIL REGARDING THE CSX/NS PROPOSED RAILROAD MERGER.

WHEREAS, members of the Huron City Council recognize there are many environmental issues in Erie County, Ohio that have not been resolved regarding the CSX/NS proposed railroad merger, and;

WHEREAS, members of the Huron City Council are concerned about the maintenance of the railroad crossings within the corporation limits, and;

WHEREAS, members of the Huron City Council are extremely concerned about the increased transportation of hazardous waste material through the City of Huron, Ohio.

NOW, THEREFORE, BE IT RESOLVED BY THE COUNCIL OF THE CITY OF HURON, OHIO:

Section 1. That this Council will not support the merger of CSX/NS unless all environmental issues and concerns in Erie County, Ohio have been addressed and resolved.

Section 2. That this Council will not support the merger unless they are provided with written assurance that regular maintenance of the railroad crossings within the corporate limits will be done with specific attention being given to the Rye Beach Road, Main Street, River Road and Berlin Road grade crossings.

Section 3. That this Council will not support the merger until they are satisfied that safety measures have been implemented to assure the safe transport of shipments of all hazardous waste materials throughout Erie County, Ohio.

Section 4. That the Clerk of Council be, and she hereby is, directed to forward a copy of this Resolution to the Erie County Commissioners, the Surface Transportation Board and the U. S. Representative and Senator from this district.

Edward Asher, Mayor

ENVIRONMENTAL
DOCUMENT

Dear Madam,

Let me start by saying we have been property owners in Vermilion, Ohio for approx. 28 years. We are voicing our concerns about the plans for CSX and Norfolk Southern to acquire Conrail. We have safety concerns if train traffic increases. Not only do the trains block safety forces north and south of the tracks, but hazardous waste transported by rail will increase and become even a more serious concern. The increased train traffic would cause major blockage throughout the city and having safety forces detain for very valuable time during emergencies. Several times in the last 4 years we have seen emergency vehicle held up due to train traffic. Thank God it did not cause a death due to the delay.

These plans could create environmental issues and great concerns throughout the entire state of Ohio.

Please give these issues considerations.

Thank you,
ROBERT & NORMA PINKIE

MEMORANDUM

DOCUMENT # 2/12/98 10:21:20 AM

TO: Elaine Kaiser
U.S. Surface Transportation Board

FROM: Reverend Charles J. Matthews; Reverend David Wheeler
United WE-CANI, BOLD and United Pastors in Mission

RE: Conrail Acquisition

DATE: January 28, 1998

On behalf of United WE-CANI, BOLD and United Pastors in Mission we want to inform you of recent developments in the Conrail acquisition, and to submit a request. Although there had been intensive dialogue and negotiations between several communities within the region, solutions have not been forthcoming. In addition, we see our region being divided, with one community pitted against the other.

Given the Board's request that all effected parties work towards mutually agreeable settlements on this issue, we propose that a Regional Rail Summit, co-convened by our organizations with the City of Cleveland, City of Lorain and other key stakeholders, be held within the next 30 days. The purpose of this Summit would be to have all of the most adversely impacted communities meet together and forge a unified response to the acquisition. Following the Summit, meetings with rail companies executives would be arranged.

We are requesting that the results, agreements and consensus put forth by this Rail Summit be included as part of the EIS. We request that the STB revise it's procedural schedule and extend its comment period to accommodate for the Regional Rail Summit. We ask that the results from this Summit, and the subsequent agreements reached with the Rail companies, be included as official conditions of the acquisition proposal. We would hope that your representatives attending our January 31st meeting could make an official announcement regarding this request.

We want to thank you for your commitment and dedication to public outreach in these proceedings. We acknowledge the enormity of the task before you. We encourage you to view our work in regards to the Regional Summit as a means towards the most effective and broad-ranging mitigation for this area.

We look forward to your response.

RE: January 31st, 1998 Public Meeting on the Conrail Acquisition; Signing onto a Regional Position Paper

DATE: January 26, 1998

CONTACT: Faith Based Organizing for Northeast Ohio
(216) 881-2344

Members of three faith-based community organizations in Northeast Ohio are requesting your participation in opposing the proposed Conrail acquisition currently before the U.S. Surface Transportation Board. As you already know, we are sponsoring a Regional Public Meeting on this issue to be held Saturday, January 31st from 2:00 pm – 4:00 pm at Mt. Sinai Baptist Church in Cleveland. At this event, we will present the enclosed position paper. This position paper serves as the foundation for our opposition to this acquisition.

We are asking that you consider and reflect upon this position paper and publicly declare your support of the document at the January 31st meeting. We expect quite a few public officials to attend and speak, therefore, we ask that you prepare a 5 minute presentation that focuses on the following: 1) specific response to points of the position paper; 2) your commitment to participate in a Rail Summit convened by Faith Based Organizing in Northeast Ohio and; 3) additional ideas and reflections you have on this issue. We will provide you the opportunity to officially sign on to the position paper on January 31st.

We look forward to your immediate response.

REGIONAL POSITION PAPER

CSX and N/S Acquisition of Conrail

As congregations who are members of United WE-CAN!, United Pastors in Mission, and BOLD, we join in the following declarations of faith and purpose:

- **The call to justice in the public arena comes from God who leads us to "do justice, love kindness and walk humbly with our God." (Micah 6:8)**
We stand together called by God to move people of faith powerfully into the public arena to create economic and social justice for all.
- **We commit ourselves to overcome barriers that divide us. We know that racial and economic segregation throughout our region drives powerful wedges between Black and White, wealthy, middle class and poor people. The result is an unstable region where Black and Latino people are trapped in concentrated poverty, mature suburbs struggle with declining tax bases and services, and a select few communities receive public and private investments for massive development at the expense of valuable open space.**

We pledge to organize and take public action to seek the greater good of the metropolitan region. Therefore, we are called to address the following issue:

CSX and Norfolk Southern (NS) railroads want to spend \$10.3 billion to acquire and operate the most profitable Conrail rail lines. The proposed acquisition involves 44,000 miles of rail track spanning from New York to Illinois and from Philadelphia to Florida. Of all affected states, Ohio will be the most adversely impacted by this proposal, with the Northeast Ohio Region experiencing the most severe negative consequences.

We cannot afford, as a region, to proceed with a "business as usual" approach to resolving issues related to the proposed acquisition of Conrail by CSX and Norfolk Southern Railroads.

In this case, communities are pitted against one another, fear is appealed to rather than justice, and a "divide and conquer" strategy is taken. This strategy further fragments cities, suburbs and counties from one another.

The result is a dangerous threat to a unified regional vision and strategy that strengthens the viability of the entire metropolitan region.

As people of faith, United WE-CAN!, United Pastors in Mission and BOLD oppose the acquisition and call for the resolution of the following points:

1. SAFETY AND QUALITY OF LIFE

Because the re-routing of train traffic by CSX and NS will dramatically increase traffic through our communities, increasing volume of up to 785% through densely populated areas; and because this train traffic will adversely effect the health, safety and quality of life of people who live in these communities; and because the federal, state and local

governments have no standards which seek to protect the quality of life within these communities as it relates to railroad commerce;

Therefore, be it resolved that the U.S. Surface Transportation Board, U.S. Congressional Representatives and state and local officials draft industry wide environmental justice standards designed to protect the health, safety and quality of life within the communities impacted by the rail road commerce. These standards should include specific limits on the number of trains allowed to travel through densely populated urban and suburban communities.

2. PUBLIC SUBSIDIES

Because CSX and NS are expecting to make more than \$1.8 billion in yearly profits as a result of this acquisition (as reported by Standard and Poor's Stock Reports); and because this dramatic increase in yearly profits will more than cover the anticipated infrastructure costs and improvements associated with this acquisition; and because federal laws exempts rail companies from any and all real estate tax obligations;

Therefore, be it resolved that the State of Ohio does not use any of its public transportation dollars to subsidize the NS and CSX rail improvements.

3. COMMUTER RAIL ACCESS

Because access to CSX and NS rail lines for proposed future commuter rail projects is jeopardized; and because the future health and vitality of this region depends upon accessible, affordable and equitable transportation for all people who live and work within this region;

Therefore, be it resolved that CSX and NS guarantee access to their rail lines for proposed future commuter projects, and that NS guarantees access to the rail lines from Lorain-Westshore-Cleveland for the proposed commuter project; and be it further resolved that the U.S. Surface Transportation Board includes these guarantees as a condition of the acquisition approval.

4. HAZARDOUS MATERIAL TRANSPORT AND JOBS

Because CSX and NS reported an increase of hazardous materials through Cuyahoga and Lorain Counties totaling 611% and 261% respectively; and because these increases will occur in conjunction with the elimination of 490 safety and maintenance jobs by CSX and NS; and because the Federal Rail Administration have only 380 rail inspectors for 1 million rail cars and 300,000 miles of track;

Therefore be it resolved that the U.S. Surface Transportation Board imposes a moratorium on the elimination of any and all safety and maintenance jobs by CSX and NS as a result of this acquisition.

5. CALL FOR REGIONAL SOLUTION

Finally, because rail companies are actively taking advantage of the diverse and fragmented interests of local mayors and public officials representing our communities;

Be it resolved that all elected officials, pertinent planning agencies and community stakeholders participate in a Rail Summit within the next 30 days to create a specific regional response to this acquisition. The Rail Summit will be convened by Faith Based Organizing in Northeast Ohio.

ENVIRONMENTAL DOCUMENT CITY of FOSTORIA

P. O. Drawer H
FOSTORIA, OHIO 44830

CENTRAL ADMINISTRATIVE UNIT
REC'D: 2/2/98
DOCUMENT # 2/2/98 5.37.09 PM

January 28, 1998

Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K. Street, NW
Washington, DC 20423-0001

Board Members:

The City of Fostoria is concerned that its safety concerns are almost completely ignored and inadequately addressed in the Draft Environmental Impact Statement, in fact, the lack of comments would leave one to wonder if the City's comments, submitted with the State of Ohio during the Preliminary Safety and Environmental Comment Period, were considered.

Although segments C-070 (Marion-Fostoria) and C-075 (Willard-Fostoria) are identified as meeting the threshold for analysis by the SEA neither the individual nor the cumulative impacts of the increased rail traffic are considered on a community wide basis for safety and grade crossing delays.

The foremost item of concern remains the ingress/egress issues raised in the Preliminary Safety and Environmental Comment Period. The measurable delay for emergency responders will be dramatically increased as a result of the acquisition. Our estimates indicate that with nearly a 30% increase in rail traffic throughout the community, utilizing the SEA's formula, a at-grade crossing will be blocked over 12 of the 24 hours, which is over 50% of the day. Under the existing current volume levels, a train is blocking one or more at-grade crossing in Fostoria nine and one quarter (9.25) hours out of each twenty-four hour day.

We agree that not all of the crossing will be blocked at the same time, however an emergency vehicle has no schedule as to what time of day the crossing it needs will be blocked. With any given rail crossing blocked over half of the day, it becomes apparent that some alternative provision needs to be made for the safety of the residents within the Iron Triangles in particular.

It is strongly recommended that the potential for these two areas to become isolated by rail movements, and the unreliability and unpredictability of direct emergency service routes, be

considered in addition to the established SEA criteria. The construction of grade separations in both areas is highly recommended.

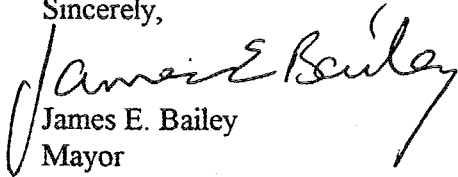

As a result of the acquisition, the City of Fostoria stands to be significantly impacted in the amount of Hazardous Material rail car loads on an annual basis. The Draft EIS indicates an increase of forty (40%) percent, from 85,530 car loads per year to 119,710 when evaluating the cumulative impacts of all three rail lines within the community. Mitigation recommendations are included within the State of Ohio filing.

Additional evaluation by SEA is necessary to totally realize the impact within Fostoria, the Draft EIS fails to recognize that the rail systems not only intersect in the center of the community, but also have a interchange capability, both having a negative impact when considering Emergency Responders.

The City has participated in the preparation of the recommendations being submitted by the State of Ohio and fully concur with them.

Your consideration is greatly appreciated.

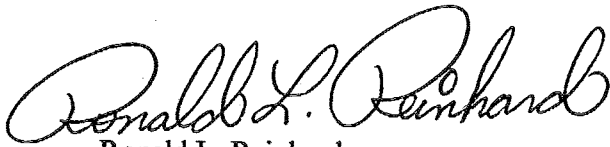

Sincerely,

James E. Bailey
Mayor
City of Fostoria, Ohio

ENVIRONMENTAL
DOCUMENT

Dear Ms. Kaiser,

1-28-9

This letter is in response to the Draft Environmental Impact Statement. We live in Rocky River, a west side suburb of Cleveland. Our home is located 2 blocks from the train tracks. We have lived in this neighborhood for 11 yrs. This is a solely residential neighborhood.

We would like to respond to the applicants - NS statement that 16.4 trains per day travel on this section of track. When they announced their intention of buying the track and increasing the amount of trains by 20, this is when they increased their train load to 16.4 trains, before that we would say 10 trains a day on average came through, not even 13.5 trains as is stated. This increase of 16.4 trains has already started problems. Now in one hour, 3 trains can come through running 5 minutes in duration. This considerably stops traffic. The traffic gets blocked down to our home 2 blocks away. The traffic includes cars, RTA buses, school buses and trucks, all idling for 5 minutes. This results in more noise, pollution and

safety concerns of children trying to cross streets and getting on and off school buses. Also after the train has gone by, the cars speed away trying to make up time, putting pedestrians at a greater risk. Not to mention, our emergency response vehicles not being able to get through.

Being a resident of Rocky River and being familiar with the residential areas of Lakewood, Bay Village, Westlake and Cleveland, we have to state our concerns over Highway / Rail at Grade crossings safety of both cars and children needing to cross the tracks to get to schools, parks, neighbors houses Emergency Response Delay, Hazardous Materials transported, noise, vibration, lowered property values and air quality remain the same! We feel that letting the applicants - NS increase their train load would be a detriment to all West Shore communities. We feel if trains would increase people would move out of our area and move further west causing problems to our city of Rocky River as well as to the City of Cleveland.

We feel the following mitigation activities should take place.

The best scenario would be for the applicant - NS to build a new train track south of Cleveland in areas that are not developed yet. The next scenario would call for the board to limit the trains to 13.5 per day and have the applicant - NS figure out where to reroute the other trains. The applicant - NS should be required to improve it's tracks, gates and lights at Highway / Rail crossings, to increase train speed after improving rail line segments and taking care of noise problems. All of this should be done at the expense of the applicant - NS. They are a business which operates ~~at~~^{for} a profit and if they want to increase their productivity they should pay for it like other business does. Also, the board should retain jurisdiction to impose additional environmental mitigation for a least 20 yrs or longer.

We thank you for your time and consideration on this matter. We hope you take the feelings and concerns of the residents of this area into account, when making your final statement.

Sincerely,
Clay and Debra Klee

Finance Docket No. 33388
Surface Transportation Board
1925 K Street NW
Washington, D.C. 20423-0001

Dear Sir/Madam:

I am writing on behalf of my constituents who reside in the Fifth District of Ohio. As part of my continued commitment to safe rail operations in my District, please include my correspondence in your analysis of the potential environmental impacts of the proposed Conrail acquisition.

As you may know, I recently had the opportunity to bring concerned elected officials together with representatives from both rail companies and the government entities involved with the acquisition. I was pleased that the Surface Transportation Board accepted my invitation to be present at the meetings.

The major areas of concern relate to the public safety of drivers, pedestrians and school children which must be adequately addressed. The most critical concern which I share with my constituents is that areas in several communities will not have an emergency response access when certain crossings are blocked by trains. This is true particularly in the communities of Fostoria, Greenwich and Willard. The redeployment of trains caused by the acquisition may decrease air quality, increase noise, force farm machinery onto major highways and cause traffic delays.

It appears from your draft Environmental Impact Statement (EIS) that Conrail acquisition will greatly impact all of Ohio. While some areas of Ohio will benefit economically from the acquisition, I urge the Board to approve the acquisition only if they redress the negative impacts, including the safety issues.

Finance Docket No. 33388
Surface Transportation Board
1925 K Street, NW
Washington, D.C. 20423-0001

Attention: Elaine K. Kaiser
Environmental Project Director
Environmental Filing

Dear Sir or Madam:

We are writing to express our concerns regarding the proposed acquisition of Conrail by Norfolk and Southern Railroad and CSX Railroad.

Vermilion Township is targeted to receive a proposed connection that will join Conrail and Norfolk and Southern rail lines on Coen Road. This connection will cause added congestion to traffic in the Vermilion City and Vermilion Township areas. This increased activity will have an enormous impact on crossings being blocked to emergency vehicles, pedestrians and other modes of transportation. Hazardous material is also a concern to all affected by the increased use of the rail system in this area. Crossing gates and lights are a priority in this area for any new intersection that will be added because Coen Road is a heavily traveled roadway to by pass Vermilion.

Vermilion Township has experienced severe seasonal drainage problems in the area targeted for the new connection. A large area to the south is drained by the culverts under the railroad and the size of these culverts would need to be increased to provide adequate drainage.

Vermilion Township also has two railroad crossings not protected by crossing gates and lights just west of the new merge area, which are on the Norfolk and Southern line. They are the Stanley Road crossing and the Barnes Road crossing. These two crossings will need gates and lights because of the proposed increase of train traffic.

Office of the Secretary
January 28, 1998
Page 2

To sum up our concerns, safety and drainage are a priority and unless these concerns are resolved to our satisfaction, we must oppose the merger.

Preservation of public peace, health and safety have always been a priority in Vermilion Township, and one in which we wish not to compromise.

Sincerely,

Board of Trustees
Vermilion Township

Charles W. Kishman, Chairman Charles W. Kishman

Janet E. Knittle, Trustee Janet E. Knittle

Washington, DC 20423-0001

Dear Ms. Elaine Kaiser:

As the elected officials of Berlin Township, Erie County, Ohio we have an obligation to protect the safety and welfare of our citizens. We feel the "Proposed Conrail Acquisition" will have many negative effects on our citizens.

The proposed closing of Smokey Road and Jeffries Road in Berlin Township will impact Fire and Ambulance response times. Berlin-Milan Local Schools will experience increased transportation cost and also increase students ride time.

The increase in hazardous material transports are a major concern for our Township residents. The Berlin Township Volunteer Fire Department does not have the equipment or personnel to handle a hazardous material accident.

The increase in train traffic will cause additional risk to motorists at all railroad crossings.

Attached are letters from Berlin Township Fire Department, North Central Emergency Medical Services, and Berlin-Milan Local School District.

Thank You for your consideration.

Sincerely,

BERLIN TOWNSHIP TRUSTEES

Berlin Twp. Trustees

Berlin Twp. Fire Dept.

Gentleman:

It has been brought to my attention that the Norfolk and Western Railroad is thinking about closing two crossings in Berlin Township; these being Smokey and Jeffries roads.

As fire chief I am opposed to both of these crossings being closed because of life safety concerns with both decisions.

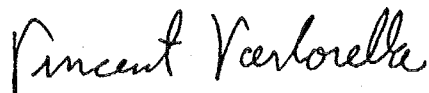

A response North of the tracks on Jeffries from the Berlin station would require going to Knight road and backtracking to the incident adding minutes of valuable time to the response. A fire south of the tracks on Smokey would add time to a response from the Ceylon Station.

As you are aware, we are volunteers, and can't always guarantee a full compliment of firefighters from either station at any time.

Anything you can do to stop this from happening would be greatly appreciated. I don't understand why you would close crossings when thousands have been spent on crossings gates!

Thank You for Your Consideration.

Respectfully

Vincent Vartorella Chief

NORTH CENTRAL EMS

DONALD B. BALLAH

Berlin Heights Township Trustees
9 E Main St.
Berlin Heights, OH 44814

January 22, 1998

Dear Trustees:

It has been brought to my attention that there is some consideration of closing some roads at the railroad crossings in Berlin Township. In the rural setting, EMS response is difficult because of geographic restrictions. Sometimes, it increases response time.

By taking access away for emergency vehicles to travel through the township without restriction, it is my belief that this may increase response times to some constituents in our Berlin Township area.

Speaking as an advocate of the Township residents who may need the services that North Central EMS provides, I would like to express our concern. I hope that there would be some reconsideration on the closing of any township roads within Berlin Heights Township, specifically Jefferies Rd. and Smokey Rd.

Sincerely,

Donald B. Ballah
Executive Director

A-381-a

BERLIN-MILAN LOCAL SCHOOLS
WILLIAM LALLY, SUPERINTENDENT
STEVEN C. GARRIS TREASURER

JANUARY 24, 1998

To whom it may concern:

It is the understanding of the Berlin-Milan Board of Education that the Railroad wants to make the following changes to the rail system running through Berlin Township:

1. Increase train traffic by 245% from eleven to twenty seven trains per day.
2. Increase the speed and size of trains being used on these tracks.
3. Close the roads at the crossings of Smokey Road and Jeffries Roads.

The Berlin-Milan Board of Education protests these changes and urges that the Railroad reconsider and modify its plans.

Closing those roads will be a detriment to our bus transportation system causing children to increase their ride time as well as cost the school a significant increase in transportation costs. We may be forced to hire additional drivers so that both sides of the closed roads can be serviced in a timely manner.

Increasing the size, speed and frequency of trains in our district will also create a significant safety concern. Our buses must cross those tracks many times each day, and although we have excellent, professional drivers, we acknowledge that we live in an area where snow, ice, fog, and rain can set upon us quickly and create adverse driving conditions.

There are several questions which we would like to pose.

1. Are all crossings in our district equipped with flashing lights?
2. Are all crossings in our district equipped with crossing gates?
3. Are the crossing gates in our district the kind which stop cars from trying to "go around" the gate?
4. Have all other options of a safer nature been explored?

I realize that you are in the transportation business and ultimately your business is to optimize the return of investment for your owners. However we are in the "children" business. We have no profit motive and our only agenda is to educate children in a effective and safe manner. In order to keep the children safe, we request and strongly urge you to keep all of our roads open and to install the best lights and crossing gates at every intersection.

If you would like to meet with our Superintendent, Treasurer and/or Transportation Director please advise them by calling 419-499-4625. They will be happy to meet with you and further clarify our position on this important topic. Thank you for your consideration.

Respectfully

Re: Finance Docket No. 33388 - Draft Environmental Impact Statement (EIS) for the Proposed Acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad.

Dear Ms. Kaiser:

Pursuant to your request, this office has reviewed the EIS document for the proposed acquisition of Conrail by NS and CSX Railroads. After a careful review of all documentation, we offer the following comments relative to the potential environmental impact that could result from the proposed Conrail acquisition.

Currently, both CSX and Conrail Railroads have rail line segments that run through the City of Dayton's delineated Well Field Protection Areas. The Well Field Protection Area is a geographically sensitive setting which overlies the sole source aquifer system that supplies the City's drinking water. A map is attached for your reference.

According to Volume 5A, Appendices B: Safety, Attachments B 3-5, Pg. 6 of 8 (in ea. section), certain post-acquisition conditions exist with regard to hazardous material transport and anticipated accident intervals which have the potential to increase the threat to the City's drinking water supply. The aforementioned attachments detailed many proposed increases in car loads and reportable mainline hazardous material releases, ranging from 16 to 58.7%. In addition, the proposed interval between train accidents per mile could increase by as much as 10 to 57%.

The post-acquisition changes noted in Volume 5A are of concern to the City of Dayton, because an increase in carloads of hazardous materials through the City's sensitive areas would create a heightened threat for potential releases in the Well Field Protection Areas. Furthermore, it should be noted that both CSX and Conrail have a history of accidental releases of hazardous materials within the City's Well Field Protection Areas. Although the sites where the releases occurred were properly cleaned up, railroad personnel responding to the releases had no prior knowledge about the Well Field Protection Areas or the importance of properly remediating the site.

A review of Volume 2, Safety and Integration Plans reveal that a comprehensive program exists for mitigating potential releases. However, specific training on mitigating contamination in groundwater sensitive areas, such as Dayton's Well Field Protection Areas was not noted. The ability to properly mitigate spills requires emergency response personnel to have a heightened level of preparedness. Proper training allows quick and responsive cleanup of sites before groundwater contamination occurs. Our office recommends that specific training be required and added to the Safety and Integration Plans which would cover how to handle chemical releases in groundwater sensitive areas for CSX and Norfolk employees that are responsible for responding to accidental releases in the Dayton area.

Based on the extensive outreach for public comments, our office is confident that the Surface Transportation Board's Section of Environmental Analysis will address the concerns noted above and evaluate the level of preparedness that would exist once the acquisition has taken place.

Thank you for your cooperation and consideration. If you have question concerning the above comments, please contact Donna Gorby-Lee, Environmental Manager at (937) 443-3725.

Sincerely,

Donna Gorby-Lee, Env. Manager
City of Dayton, Department of Water

ENVIRONMENTAL DOCUMENT

Dear Ms. Kaiser:

The Northeast Ohio Four County Regional Planning and Development Organization (NEFCO) has completed its intergovernmental review of the Draft Environmental Impact Statement. As a result of comments received in this review, the NEFCO General Policy Board passed a resolution recommending that clearance of this project be delayed until the reviewers' comments have been satisfactorily addressed.

A statement by the Akron Metropolitan Area Transportation Study (AMATS), the Metropolitan Planning Organization for Summit and Portage Counties, notes that the STB disregarded AMATS' recommendations stated in August 1997 to evaluate the impacts of the acquisition on **proposed** passenger rail service. An additional comment was received by METRO Regional Transit Authority, an active participant in developing commuter rail operations in northeast Ohio. METRO also stated concerns about the lack of an analysis in the Draft EIS of the effects of the takeover on proposed passenger rail operations and the possibility of freight railroads rejecting the idea of commuter service on their lines. Copies of these comments are enclosed.

Should you have any questions regarding the intergovernmental review process or this letter, please do not hesitate to contact me.

Sincerely,

A handwritten signature in cursive script that reads "Sylvia R. Chinn-Levy".

**RESOLUTION OF THE
NEFCO BOARD**

WHEREAS, NEFCO has been designated by the Governor of the State of Ohio as the Area Clearinghouse for Summit County, effective March 28, 1984, and has accepted the responsibility for the review of all applications for federal or state funding that originate in the NEFCO Region which require Intergovernmental Review in accordance with Executive Order 12372; and

WHEREAS, it is the responsibility of the NEFCO Board to solicit review and comments from units of local government and interested parties through the Project Review Notification and Review System procedures which were formally adopted March 28, 1984; and

WHEREAS, the NEFCO Intergovernmental Review Committee has reviewed the following Statewide project:

STATEWIDE PROJECT

1. Proposed Conrail Acquisition - Draft EIS (OH971217-0198-DEIS)

NOW, THEREFORE, BE IT RESOLVED, by the NEFCO Board:

- I. NEFCO recommends that clearance of this project should be delayed until the applicant has satisfactorily addressed the concerns stated in the enclosed comments.
- II. Be it further resolved that the Executive Director is hereby authorized to transmit a certified copy of this resolution, and any comments, to the applicants and the funding agency, as is appropriate.

Certified as action taken by the NEFCO
General Policy Board at its meeting of

**Comments on OH971212-0198-DEIS
Proposed Conrail Acquisition - Draft EIS**

The Surface Transportation Board (STB), in preparing its Draft Environmental Impact Statement (DEIS), decided to limit the scope of its assessment of the Conrail takeover by CSX and NS to actual and potential impacts on existing services and activities. This STB decision effectively rejected the concerns raised by AMATS in its August 5, 1997 submission and the similar concerns submitted by METRO RTA regarding the Conrail takeover impacts on proposed rail passenger services in northeast Ohio. Approval of the CSX/NS takeover of Conrail without addressing the takeover's potential long range impacts may further complicate implementation of such proposals as Canton-Akron-Cleveland, and Aurora-Solon-Cleveland commuter rail service. Similar impacts may be felt on proposed Youngstown-Akron-Columbus intercity rail passenger service. AMATS therefore requests that clearance on this project be delayed until the applicant has satisfactorily addressed these concerns.

Attention: Elaine K. Kaiser
Environmental Project Director
Section of Environmental Analysis

Dear Ms. Kaiser:

On behalf of METRO Regional Transit Authority, I would like to thank the Surface Transportation Board for expanding the final Scope of the Environmental Impact Statement of the Proposed Acquisition of Conrail by CSX and Norfolk Southern last fall.

From our understanding of the Draft Environmental Impact Statement (DEIS), the effects of the transaction on proposed passenger rail operations were determined to be not significant enough to evaluate. We understand that the primary role of the STB (and its predecessor, the ICC) is to regulate business concerns. However, we are concerned that this proposed merger will leave permanent, unchangeable constraints on both existing and potential passengers rail services in the country.

Under the Draft EIS, the STB chose not to examine many possible problems:

"If the analysis indicated that the rail line segments could accommodate the higher volumes, SEA's preliminary conclusion was that the proposed Acquisition would have no adverse impact on passenger train operations." (DEIS, Volume 1: page 3-14)

The SEA has established a tight time line to review the most significant rail merger in the history of the United States. By deciding not to look at future interactions of the applicants with commuter rail providers, even those with existing agreements, the STB has remained silent concerning the responsibility the railroads have as a public utility. This is the same responsibility the phone industry, electric providers, and gas companies have to individuals citizens.

Thank you for your participation in this valuable review and comment process.

RECEIVED
JAN 13 98
NEFCO

“SEA determined that impacts of freight operations on passenger rail service would be significant if the anticipated post-Acquisition increases in freight operations resulted in the need to reduce passenger service. . . However, the current operating agreements preclude any reduction in service. Any significant impact that would result from increased post-Acquisition freight operation could occur only after expiration of a current agreement.” (DEIS, Volume 1: page 3-16)

The STB has decided not to be involved in the relationship between the railroad and passenger services after the expiration of existing contracts. Potentially, the uncooperative freight railroads could leave existing or potential passenger operators unable operate, thereby stranding thousands of rail passengers. Displaced commuters will create a greater demand on the over-burdened highway system. In total, higher energy consumption and greater public investment in road construction will be created.

Many agencies in the State of Ohio expressed concerns about passenger service. The STB did review these requests and commented:

“SEA has determined that evidence exists of a potential cumulative effect associated with commuter rail planning and funded activities in Northern Ohio including, but not limited to Toledo, Akron, Lorain, and Cleveland.” (DEIS, Volume 3B: page OH-129).

According to the SEA’s review, METRO’s trackage rights request (MRTA-1) could produce traffic above the level considered significant. (DEIS, Volume 5C: page U-15)

However, the SEA states that it has not found any activities that will be impacted:

“At this point in its investigation, SEA is unaware of any other activities that would require a cumulative analysis.” (DEIS, Volume 3B: page OH-129).

The SEA concludes its investigation in Ohio by making the following comment:

“Therefore based on its independent analysis and all information available to date, SEA has made a preliminary conclusion that there would be no other significant cumulative effects associated with the proposed Acquisition in the State of Ohio.” (DEIS, Volume 3B: page OH-129).

This merger presents an opportunity for passenger rail services to be expanded in the United States. The SEA has performed a detailed analysis of the diversion of freight between highway and rail transportation modes. A similar analysis should be conducted as it involves passenger movement.

We feel the following recommendation of the SEA should be strengthened:

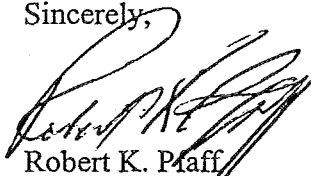

"The SEA encourages the Applicants to meet with the agencies responsible for the commuter rail studies to ensure that the proposed Acquisition can be accomplished without negative effect to commuter rail plans." (DEIS, Volume 3B: page OH-129).

This position assumes that the railroads will negotiate in good faith with passenger agencies. The scope of the review needs to be expanded to include having the Applicants address the potential negative impact on passenger rail operations caused by the merger. SEA needs to actively retain jurisdiction in this matter to assure that the Acquisition can be accomplished without negative consequences on passenger rail operations.

We understand the STB is under a very tight schedule; however, we must ask one point to be changed in the Draft Environmental Statement. Table 5-OH-51 indicates METRO Regional Transit Authority commented on the abandonment in Toledo, Ohio. It appears the SEA misunderstood our comment. Our comments do not concern Toledo. The scope of our letter concerned only Akron, Cleveland, and Canton, Ohio.

In closing, we ask the SEA to view passenger access on an equal basis as freight access to this large multi-modal transportation utility. If you have any questions regarding this statement, please do not hesitate to contact Kirt Conrad, Planner, or myself at (330) 762-7267.

Sincerely,

Robert K. Pfaff
General Manager, Secretary-Treasurer

**RE: Case Control Unit
Finance Docket #33388**

TO: Members of the Surface Transportation Board

In response to your offer to interested parties to comment, protest, and request protective conditions, we respond with the understanding that all comments, protests, and requests will be given full consideration, and that a follow up response be received from your Board.

Regarding the acquisition of Consolidated Rail Corporation (hereinafter Conrail) by CSX Corporation (hereinafter CSXC) and Norfolk Southern Corporation (hereinafter NSC), we find that there will be an extreme increase in the economic stability of CSXC and NS. However, there will be an extreme increase in rail traffic within our City, causing natural and economic environmental disaster.

As you are well aware, there are numerous railroad grade crossings within our City. If this acquisition is granted, **ALL** vehicular traffic at railroad crossings will be halted up to three (3) times as much as was experienced prior to the acquisition.

The City of Ashtabula's railroad traffic is already heavy.

Due to the calculated increase in crossing delays, noise pollution, ground tremors and other environmental problems caused by the increased rail traffic, property values are going to decrease, or at best plateau at their present values.

Several merchants will be forced to go out of business because customers will become frustrated with vehicular traffic flow gridlock every time a train comes through our community. With an increase in rail traffic, comes a higher risk of tragedy to human life, due to the inability of our police, fire and rescue services to move expeditiously through the City.

Ashtabula City Councilor James Trisket is a Firefighter/Paramedic and knows what it is like when a train is blocking access to a burning structure, or when a person is suffering a major "threat to life" emergency. When a person is suffering a cardiac arrest, only 4 to 6 minutes is allowed to be provided effective cardio-pulmonary resuscitation before permanent brain damage occurs. In other medical emergencies, such as diabetic keto-acidosis, seizures, asthma, anaphylaxis, etc., one only has minutes to provide emergency medical care before there is damage to the patient.

There are many evenings trains travel at very slow rates of speed or are stopped on multiple railroad crossings simultaneously, that if someone wanted to they could jump on the trains with little concern for injury. This occurs on a daily basis, and continues to increase as we are experiencing increased rail traffic already without such a proposed acquisition.

The City of Ashtabula has had more than its share of economic hardships over the past 35 to 40 years. While the nation was in various recessions, the City of Ashtabula experienced a deep depression, and continues working to this day to climb out. As a community, we pull together to support any business interested in locating in our town. However, every business requires outside customers to survive, which outside customers this proposed acquisition would deter.

We believe in competition. We also believe that changes should benefit business; and we welcome those changes. At the same time, if change causes an adverse negative impact on a city, village or township, we believe that the creator of that negative impact should compensate the community for their hardship.

We propose that the controlling railroad body consider making the following changes and/or concessions for the City of Ashtabula:

STB - Conrail/CSXC/NSC

January 28, 1998

page 3

The ability of citizens and emergency services to maneuver throughout the City of Ashtabula shall not be hampered more than at present. To do so requires that the controlling railroad body install three (3) over or underpasses on their east/west rail lines and two (2) over or underpasses on their north/south rail line, all at a height clearance that will allow easy passage of full-sized tractor trailers and fire/ladder trucks. All expenses, including property acquisitions, would be absorbed by the controlling railroad body. This would relieve the anticipated traffic flow problems for merchants, delivery service vehicles, citizens and emergency services. Further, the controlling railroad body should be responsible for regulating the transport of hazardous materials through our community and partially fund any training of local rescue crews necessary. The replacement and/or upgrade of several "at-grade crossings" will be essential to ensure greater safety.

In the event that our above changes and/or concessions are not approved by the Surface Transportation Board, we still propose the construction of an over or underpass at each of their two lines of concern and on State Route 84, all of which are within the Corporate city limits of the City of Ashtabula. We also propose the construction of a second Fire Station on the south side of the tracks, to be furnished and equipped with apparatus, as required by NFPA standards. This and all other expenses related shall be absorbed by the controlling railroad body. Please note that the above changes and/or concessions are negotiable

There shall be no expenses assessed to the City of Ashtabula or its citizenry, outside of partial financial responsible we may incur for hazardous material training of City employed rescue personnel.

It goes without saying that CSXC and NSC will make a substantial profit from the proposed acquisition, which could alleviate any financial woes, for decades to come, these corporations may have forecast.

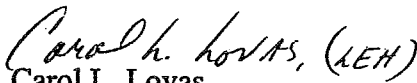

Attached is a copy of Table 5-OH-8 "Ohio Highway/Rail At-Grade Crossing Accident Frequency report. I would like to call to your attention that the report states that at Railroad Segment N-070; FRA ID #471983Y; Street Name Main Street there is a Flasher, when actually there is a Gate.

The City of Ashtabula **WILL** experience devastation if the proposed acquisition is granted and our changes/concessions noted above are ignored.

STB - Conrail/CSXC/NSC
January 28, 1998
page 4

The City of Ashtabula needs the assistance of the Surface Transportation Board in order to realize a **Positive** effect on our community if, in deed, this acquisition comes to fruition.

Respectfully submitted,

Carol L. Lovas
President of Council
City of Ashtabula, Ohio

Attn: Elaine K. Kaiser, Environmental Project Director

Located in University Circle, Abington Arms is an HUD assisted high rise apartment building for low-income elderly and mobility disabled residents. Abington was built in this cultural area to offer its residents a quality living environment. We have a total of 152 units with 157 tenants with approximately 60 in the disabled category.

Abington Arms is located approximately 475 feet from the bridge, with elevated railroad tracks, in Little Italy, an Historic District. Of great concern to us is the new CSX merger. Their proposed route will increase freight rail traffic through our area from 20 trains/day to approximately 81 trains/day and as the economy improves, volume would also increase. The negative impact on our residents, in terms of health and well-being is enormous; ie, a triple increase of noise levels which cannot be ameliorated because the tracks are elevated; dangerously increased levels of pollutants and carcinogenic materials in the immediate environment; and the increased probability of accidents involving railroad transported hazardous materials.

Abington Arms is only one of many HUD assisted senior apartment buildings located in the University Circle area comprised of approximately 1200 units, with approximately 1210 elderly, of which 225 could be identified as disabled. A daytime railroad accident, involving an hazardous spill, necessitating evacuation of these numbers of people plus all of the other approximately 30,000 people who work in the University Circle area daily would be a disaster of immeasurable proportions.

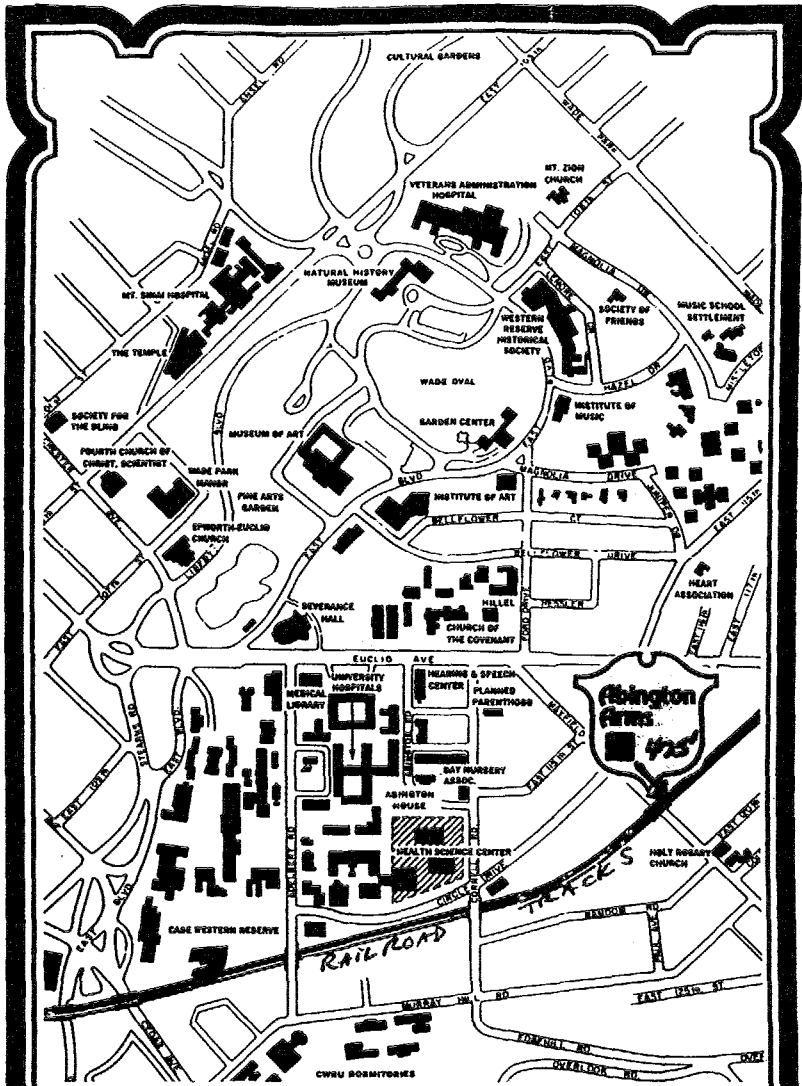

Please consider the alternate routes proposed by our City of Cleveland Mayor White.

Most sincerely yours,

ABINGTON ARMS

Elizabeth B. Heil,
Administrator

COPY

After the review of the draft environmental impact study, we would like to submit the following:

We are asking you to consider safety concerns in your decision making process. Please note items I and II are life threatening to the residents of southern Huron County, Ohio.

I) Public Safety Concerns -- 9-1-1 calls, a house fire with residents trapped inside; a student at South Central High School involved in a multi car accident leaving the school; an armed robbery in progress; or even a cardiac arrest -- How do we explain we can't respond because the railroad crossings are blocked? Please do not ask us to put children's lives, along with many others, in jeopardy.

We are meeting with CSX officials regarding three major access routes for public safety responders in Greenwich, Willard, and New London. We have reached an agreement for the Greenwich area with a grade separation replacing two grade crossings. The special signals on U.S. Route 224 and Townsend Avenue crossing may not assure access by public safety forces as stated above. This can only be resolved by grade separations.

However, Willard and New London public safety access has not been addressed to meet our concerns for saving lives and property. As a result of the Willard yard expansion Section Line 30 will change from two tracks to five sets of tracks and becomes part of the CSX yard expansion plan, this will create the very real potential for an accident causing release of hazards materials. The need for an overpass in Willard at Section Line 30 is a major safety issue for the entire area. CSX has agreed to participate financially in an overpass, but no dollar amount has been agreed upon. CSX's engineer stated that this major overpass will cost between 4 and 5 million dollars, we do not have the funding to even participate in the building of the overpass to correct CSX's crossing blockages, and feel they should pay 100%.

Environmental Review Comments

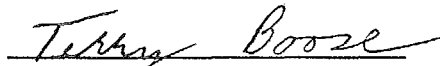

New London will be split in half with all safety forces on the south side of CSX/Conrail tracks. We must have one unobstructed access to provide public safety. We have asked CSX to provide an underpass at Euclid Road, New London, Ohio, with no answer as of yet. With the increase in projected trains per day this is a life threatening situation.

- II) Huron County will see an increase of hazardous materials car loads from 16,000 per year to a projection of 69,000 car loads per year due to CSX and Conrail's east, west, north, and south lines coming through Huron County. This is an extremely high exposure to possible hazardous materials and a real threat to our lives and environment. We need help from CSX for response planning, training, and exercise/drills. We also need additional hazmat response equipment to be prepared.
- III) Water runoff, culverts, bridges and farm tiles must be addressed for additional capacity to avoid flooding.
- IV) Private grade crossing to avoid loss of access to farm fields must be offered to those farmers affected.
- V) Dust, noise, and vibrations will lead to decreased property values along railroad routes:
How do we compensate property owners?

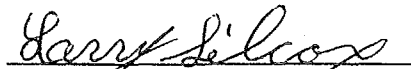

We still have unresolved safety issues, which have not been addressed. These must be resolved for the protection of our residents! We ask you to make our safety concerns a condition of the proposed merger.

Sincerely,

BOARD OF HURON COUNTY COMMISSIONERS

Terry Boose, President

Larry Silcox, Vice President

Karen Wilhelm

Ms. Elaine K. Kaiser
Environmental Project Director
Section of Environmental Analysis
Surface Transportation Board
1925 K Street, NW
Washington, DC 20423-0001

Dear Ms. Kaiser:

I am taking this opportunity to make our concerns known concerning the proposed merger of the rail lines that go through our village.

The main concern is for the safety and welfare of the residents of the village. Our safety services, except the police department, are all volunteers. Thus, the fire department and EMS are going to be greatly impaired with an additional 50 trains passing through the village on a daily basis. We cannot have these services on both sides of the tracks for obvious reasons of lack of funding and personnel.

Our Village Council, Village Administrator and I have discussed this situation and have come to a conclusion that an underpass must be considered to allow these emergency vehicles access to the residents and territories they serve.

We know the solution will not be easy, but at the same time mandatory. We have no funds at the present time or in the future to make our needs a reality. Your help with this project is needed. I am looking forward to working with your department in this urgent matter.

Respectfully,

A handwritten signature in cursive script that reads "Dorothy Sholes".

**ENVIRONMENTAL
DOCUMENT**

Dear Sirs,

The Church of the Covenant is located in University Circle, Cleveland, Ohio. The CSX and NS railroads have proposed a change in rail traffic through the City of Cleveland which would dramatically increase rail traffic through the heavily congested University Circle area. We oppose this plan and urge the Surface Transportation Board to adopt an alternate plan proposed by Cleveland mayor, Michael White.

Our church has a large number of elderly members who live in the Judson retirement and nursing communities in close proximity to the rail line. We also serve students at Case Western Reserve University located next to the rail lines. We feel that these populations of our members, particularly the elderly and infirm, are endangered by the proposed heavy traffic, 81,000 cars/year, of Hazardous Materials. It would be difficult to rapidly evacuate these members in the event of an accident accompanied by a spill of hazardous materials.

Our church is a leading advocate for the poor, and powerless and for minorities in Cleveland. We have by intention a racially diverse congregation. We object to the proposed plan of the CSX and NS railroads which will place the burden of an increase in noise, pollution, and danger of hazardous spills on the minority and low income population through which this increased rail traffic will pass.

Sincerely yours,

Arnold J. Dahm, President
Church of the Covenant

January 30, 1998

The Honorable Michael R. White
Mayor, City of Cleveland
601 Lakeside Avenue
Cleveland, Ohio 44114

Dear Mayor White:

Thank you for bringing to our attention the proposal by CSX and Norfolk Southern to increase significantly the number of trains being routed through University Circle. These tracks run directly through our campus, where we accommodate 10,000 students and nearly 5,000 faculty and staff members. In discussion with University Circle, Inc., and our institutional neighbors here in the Circle, it is apparent that the proposed increase in train traffic raises important issues that need to be examined before the project can proceed.

At best, the increased noise generated by additional traffic would be a nuisance. Perhaps more troublesome is the effect of the increased vibration that would be produced. These are matters we will need to examine carefully.

Most disturbing, however, is the prospect that emissions from train engines would be quadrupled in an area which previous studies (not conducted by CWRU) have shown to be one in which air currents do not rapidly disperse. Thus, particulates and other emissions from increased train traffic might be expected to concentrate in the University Circle area, a situation that has implications for public health. We have not had an opportunity to study this matter adequately yet, but I suspect it is an issue that will be of interest to the larger community as well.

My heartfelt request is that the Surface Transportation Board expect that the railroads engage the community in a thorough discussion of these and other concerns that have been raised about their proposal, including a review of the environmental consequences of the change. We support your effort to secure such a commitment, and we will cooperate with your office in doing so.

Sincerely,

Agnar Pytte
President

Dear Ms. Kaiser,

I am writing to you regarding grave concerns I have related to the proposed radically increased routing of train traffic through University Circle by CSX and Norfolk Southern.

I manage over 625 suites and 70,000 square feet of office and retail establishments some directly adjacent to and others in close proximity to the Mayfield Road elevated tracks.

Over 400 of my residents live in low income HUD subsidized properties for the elderly and handicapped and low income families. Abington Arms, a HUD Building for low income elderly and handicapped, is located less than 500 feet from the elevated tracks.

I do not believe that the data provided by CSX and NS sufficiently relates the negative impact of increased traffic of approximately 20 some trains a day to 80 plus trains a day. While the added noise alone for elevated tracks is of concern, my greater concern is the heavy increase of pollutants that not only significantly impact air quality, but may in fact be introducing carcinogenic and other pollutants with wide reaching medical repercussions.

With the increased transportation of toxic waste, comes the increased potential for the devastating effect of a major spill which would occur in this densely populated area.

5025 Swetland Court

Fax 216-289-9600

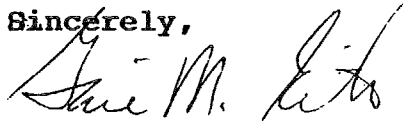

A-388-c

You may not be aware of the unique nature of University Circle. Directly adjacent to the rail line is the historic community of Little Italy and nationally renowned hospitals and university. The Circle is home to many cultural institutions including, the world renowned Cleveland Museum of Art and the Cleveland Orchestra. The Circle is also the home of an additional 1200 HUD subsidized suites for the elderly, as well as many conventional apartments and businesses. Studies show that upwards of 30,000 people populate the Circle on any given day.

On behalf of myself, my residents and neighbors, I urge you to demand from the train companies more inclusive information on the adverse affects. I further urge you to support the alternate plans proposed by Mayor Michael R. White, which takes the additional traffic through the industrial corridors with minimal impact upon the residential neighborhoods.

I believe an open meeting with yourself and the residents and institutions of University Circle will enable you to make a more informed decision that would best benefit the community as a whole.

Sincerely,

Gail M. Eovito
Senior Property Manager

DOCUMENT**

To whom it may concern:

I am writing to express my concerns regarding the NS-CSX Proposal, now before the Federal Surface Transportation Board in Washington, on Lakewood, Ohio.

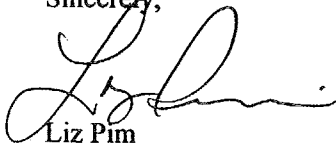

As I have written before, I strongly disagree with this proposal for all of the reasons you have already heard.

I have some questions I would like answered which are listed below:

- 1.) Why is it that between 2:00am and 3:15am of January 28th (I guess that would make that the 29th), five trains came through Lakewood? Three pounded through between 2:00 and 2:30am and the other two between 2:30 and 3:15am. That's too many trains!!! We didn't sleep the rest of the night!
- 2.) How many trains are permitted to go through Lakewood at night?
- 3.) How many trains are permitted to go through Lakewood during a 24 hour period?
- 4.) Why isn't there a limit as to how much train traffic is permitted after midnight?
- 5.) Why aren't resident's of all communities involved allowed to vote on these issues?
- 6.) Would anyone from the board like to spend an evening at my home so that you would have an opportunity to truly understand our dilemma?

Please do not send me a general letter; I would like my questions answered. If I sound angry - I am. I am considering seeking legal counsel.

Sincerely,

Liz Pim

RE: Drainage Concerns relating to the C.S.X.
Expansion in Willard & Greenwich, Ohio
Finance Docket No. 33388

Dear Surface Transportation Board,

Several landowners in the area of this proposed project have contacted our office with concerns about the effects that the proposed expansion will have on the drainage of their farms. Some have been told that the existing culverts under the railroad will be extended rather than replaced with new larger and deeper culverts. We have identified at least 10 culverts in Huron County along the proposed route of the expansion.

Agriculture is the number one industry in Huron County and statistics indicate that good drainage is one of the most essential parts of a successful farming operation. We feel it vitally important to be sure that this project will not have a negative impact on the drainage of this area.

It has been our experience that most railroad culvert pipes are more than 100 years old and are usually not deep enough and sometimes not large enough to provide good agricultural drainage. Please review the attached "Inventory and Evaluation" that was completed upon the request of a local landowner / farmer that is effected by this expansion. The conclusion of the attached evaluation clearly indicates the inadequacy of both the size and depth of the existing 16" culvert pipe. We feel that now would be the time to upgrade the entire length of this and other inadequate structures to meet today's standards.

It is our opinion that planning for the future now will benefit both the railroad, by not having to worry about replacing these old structures when they eventually fail, and the agricultural community in the area by providing a drainage outlet that meets today's standards.

Please contact me if you have any questions.

Sincerely,

Cary Brickner

RE: Culvert Pipe Evaluation
C.S.X. Expansion

Dear Don,

The following is an evaluation with recommendations that you have requested regarding the 16 inch culvert pipe that crosses the railroad on your property.

Existing Conditions:

There is a 16" smooth wall culvert pipe that passes under the C.S.X. Railroad. This culvert is located approximately 900 ft. west of Daniels Rd. (T.R.#70) in Great Lot 7, Section 4, Norwich Township, Huron County, Ohio.

Elevation shots revealed a difference of 2.0 feet from the natural ground to the bottom of the 16 inch culvert.

The pipe is about 70 feet in length and drains to the north.

There is a shallow clay subsurface tile that outlets just south of the culvert which serves as the subsurface drainage outlet for an area of 60 acres of land.

Evaluation: The existing 16 inch, 70 ft. long culvert pipe will carry an estimated flow rate of 12.1 c.f.s. (Cubic Feet per Second) "Attachment B"

Extending the 16 inch pipe to a distance of 300 feet will reduce the estimated flow rate to 9.3 c.f.s. "Attachment C"

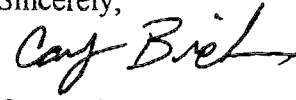

The runoff computation sheet indicates that 9.3 c.f.s. does not provide the minimum capacity of 10 c.f.s. for good agricultural drainage (Q_b). A 1yr. frequency storm would require a flow rate of 31 c.f.s. and the standard of a 10 yr. storm is 78 c.f.s. "Attachment A"

According to U.S.D.A. standards, the minimum depth of the railroad culvert for subsurface drains for this situation is 3.5 ft. This allows for the minimum cover of 2 feet, 0.5 feet for the tile itself and 1.0 of freeboard. (which is the difference between the bottom of the tile and the bottom of the culvert.)

Conclusion: A deeper and larger culvert pipe should be installed. The new culvert should be installed at least 1.5 feet deeper than the existing 16 inch culvert and would require a 48" diameter culvert to carry the peak flow of a 10 yr. storm. "Attachment E"

If you, or anybody from the Railroad have any questions or concerns, please contact me.

Sincerely,

A handwritten signature in black ink that reads "Cary Brickner". The signature is written in a cursive style with a large, sweeping initial "C".

CENTRAL ADMINISTRATIVE UNIT

REC'D: 2/3/98

DOCUMENT # 2/3/98 2:22:55 PM

January 29, 1998

To whom this my concern,

I am writing to tell you that I am absolutely opposed to Norfolk, Southern and CSX transportation to purchase Conrail.

I live in Vermilion, Ohio, off West River Road, approximately one mile from two different railroad tracks that cross West River Road, and one mile from RT. 2 Vermilion rest area, where each and every night twenty to thirty trucks stop over night on each side of RT.2, Vermilion Rest Area.

Last year ther was some type of chemical spill from one of the trucks. Lucky for us it wasn't serious, but it could have been.

This is a very serious situation, two train track carrying dangerous chemicals, and both sides of Rt. 2 allowing trucks to spend an over night one mile from my home, carrying who knows what?

I don't know how the other residents feel about this threat, but I feel this is not the kind of problem any of us need. I have family that lives two blocks away from the train tracks, I fear for them.

I pay \$1,600.00 a year for property taxes (on a very small home). The taxes are for fire and police protection plus. I also pay \$49.00 per year for E.M.S, ambulance service.

I need to have my home and life protected which means that I need firemen and police here to put out the fire BEFORE it gets out of control, and the immediate response of the police when I need them. Where would I be if the fire company or the police sit helplessly by waiting for a train to pass, or a toxic spill to be cleaned up?

We are excellant residents and tax payers of Vermilion, and we are absolutly against this purchase .

We are also sick of the train whistles that startle us out of a sound sleep at 2:00a.m., why does that conductor blow that whistle so frenzied? What is his train carrying? If more trains go threw Vermilion at all hours of the day and night blowing, blowing, blowing, what do you think the residents will do than?

I hope you will reconsider this purchase, and keep Vermilion off the news waiting for a catastrophe to happen.

Or better, live on this side of the tracks, see how you like it.

Sincerely hoping you reconsider the purchase.

CENTRAL ADMINISTRATIVE UNIT

REC'D: 2/5/98
DOCUMENT # 2/5/98 10:22:02 AM

Dear Ms. Kaiser:

At the invitation of the Section of Environmental Analysis of the Surface Transportation Board, the Lorain County Board of Commissioners is taking this opportunity to register its concerns with regard to the proposed CONRAIL ACQUISITION as those concerns relate to cities, townships and villages located within its County borders. The comments are based on the review of the Draft Environmental Impact Statement (DEIS). The Commissioners acknowledge the thoroughness of the six volume, 3000 page document, particularly as regards the listing and identification of Lorain County Rail Line Segments which will be impacted with approval of the proposed acquisition.

Additionally, the Board of Lorain County Commissioners recognizes that the Surface Transportation Board is presented with a very challenging and complex decision, made difficult by the many issues involved, all of which must be given careful consideration prior to the final decision being made.

With regard to the DEIS generally, the attempts to be objective and to utilize the various formulas to calculate such things as "average delay time"; "number of vehicles in queue per crossing"; anticipated increase in accidents at grade crossings", etc. have resulted in a favorable conclusion for the acquisition's approval. However, we believe the conclusions are less than realistic when looked at logically.

The Board has been made aware that due to the construction projects undertaken and completed by CSX, many Lorain County Officials thought the opportunity to register concerns and request mitigation strategies did not exist. Furthermore, the County has not received sufficient information on the revised routing plan proposed by NS, which would eliminate additional trains on the Cleveland-Vermilion Rail Line Segment. Therefore we believe the comment period, which is set to expire on February 2, 1998, needs to be extended.

We will reserve comment on the Cleveland-Vermilion Rail Line Segment labeled *N-080* which we understand is under additional review based on the submission by Norfolk Southern, of an alternate route which would eliminate the originally projected increase in number of trains from 13 to 34. The focus of our comments relate to the Berea to Greenwich Rail Line Segment labeled *C-061*.

Within Lorain County, Rail Segment *C-061* is 27 miles with a projected increase in the number of trains per day from 14 to 54 and a projected increase in the number of annual hazardous Material carloads from 16,000 to 51,000. In our County 35 grade crossings were analyzed for safety/accident frequency. Four (4) of those crossings meet or exceed your criteria of 5,000 plus ADT and were analyzed for vehicle delay and queues. The four are listed below from North to South:

1. Elyria Twinsburg Rd. (RT 82) in Eaton Township - ADT= 6,020
2. Main Street in Grafton Village (Rt 57) - ADT= 5,750
3. North Main Street in Wellington Village (Rt. 58) - ADT= 8,120
4. Herrick Avenue in Wellington Village (Rt. 18) - ADT= 7,870

COMMENTS ON RESULTS OF ANALYSIS

A. Hazardous Material: the DEIS determined that the rail segment is currently a "Key Route" and that the increase warranted an up grade to "Major Key Route" and is in need of mitigation. The recommended strategies are not sufficient.

B. Safety/Accident Frequency: of the 35 crossings, one, Pitts Road was found to have a significant likelihood for increased accidents. The recommended mitigation is to install flashing lights. We believe that with increased opportunity (increase in number of trains per day) operating at speeds of 60 mph, more accidents will occur. The DEIS uses a one accident every 100 years as a norm, and sets a "significance" threshold for increase at 1 accident every 13 years. The Village of Wellington has experienced four (4) accidents resulting in death in the last 8 years.

C. Vehicle Delay and Queues: A Supplemental Errata dated 1/21/98 has eliminated as significant and therefore not in need of mitigation, the crossings in Wellington Village. This document specifies that a formula was inaccurately formulated which determined that the "Level of Service (LOS)" at these crossings was "B" currently and would be reduced to LOS "D" after acquisition. That determination warranted a mitigation strategy increasing the speed of the trains from 50 mph to 55 mph. The new formula results in a current LOS of "A" and a post acquisition LOS of "B" and therefore is not significant.. It is not logical that an increase in the number of trains per day from 14 to 54; an increase in train length from 5,260 feet to 6,200 feet; an increase in the number of vehicles delayed per day from 145 to 583; an increase in the number of vehicles in line per lane (2) from 14 to 16; and increases in average delay per vehicle, could take place, and the result be a Level of Service determination of B. We understand that LOS A means "...free flow..." and that LOS B means "...Reasonably free, stable flow.... slight decline from LOS A".

The definitions of Level of Service (LOS) are found in the *Transportation Research Board Highway Capacity Manual, Special Report 209, 1985*

Our final comment on the DEIS is that it does not account for the geographic isolation from necessary emergency services, such as fire and ambulance protection, that is likely to occur, particularly at the crossings above highlighted. In addition, the Village of Wellington has a separate fire district and ambulance district that serves rural areas surrounding their borders.

The Lorain County Board of Commissioners generally opposes the approval of the merger because of the tremendous adverse impacts to our County. However, in lieu of abject opposition the Board urges, in the strongest terms possible, that conditions mitigating some of the adverse impacts be placed on approval. The recommendations specified below represent those conditions we believe to be minimal to any approval of this proposed acquisition of Conrail by CSX and NS.

RECOMMENDATIONS:

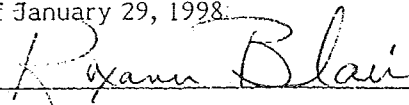

- A. REDUCE THE NUMBER OF ADDITIONAL TRAINS PERMITTED
- B. PROVIDE FOR RAIL SEPARATION AT THE NORTH MAIN (WELLINGTON) AT GRADE CROSSING
- C. LIMIT/RESTRICT RAIL CAR SWITCHING ACTIVITIES TO NIGHT HOURS TO REDUCE CONGESTION
- D. CREATE A WRITTEN EMERGENCY RESPONSE PLAN FOR RAIL PERSONNEL AND LOCAL SERVICE PROVIDERS
- E. INSTITUTE AND FUND AN ANNUAL JOINT TRAINING PROGRAM FOR RAIL PERSONNEL AND LOCAL PROVIDERS
- F. PROVIDE PRIOR NOTIFICATION OF NUCLEAR SHIPMENTS

Please contact us with any questions regarding these comments or recommendations.

The foregoing resolution was introduced upon a motion by Commissioner Michael A. Ross, seconded by Commissioner E. C. Blair, and upon roll call: Ayes: All.

Motion carried

I, Roxann Blair, Clerk of the Board of Commissioners of Lorain County, Ohio, do hereby certify that the above Resolution No. 98-82 is a true copy as it appears in Journal No. 98 on date of January 29, 1998.

ENVIRONMENTAL
DOCUMENT

January 29, 1998

Dear Secretary

I am writing this letter to express my strong opposition to the great increase of rail traffic thru Vermilion that will result from the proposed merger of CSX, Norfolk and Southern, and Conrail.

My greatest concern is the present Norfolk and Southern tracks which do not have a grade separation in Vermilion. Even with the present low volume of traffic on this track, all crossings are frequently block by a switching, slow, or stopped train. This necessitates a 15 Min trip to Vermilion road via Rt. 2. Vermilion Rd. is not a good alternative as it could be blocked at the Conrail track. The only sure route is Baumhart Rd. which is even further. This situation is extremely critical relative to the response time for safety vehicles which are all located north of the N & S tracks. This situation can only worsen to the point of being dangerous if rail traffic is increased.

Another major concern is the greatly increased noise as all of these trains blow their loud horns several times for each crossing. The Conrail track is presently one of the busiest in the country and all of the horn blowing is a real nuisance, especially at night in the summer when the residents windows are open. The one comment from all guests is "How do you stand all of the railroad noise." Although this is not a clear direct danger as the above concern, it is an indirect danger. All of the horn blowing resulting from heavy rail traffic greatly diminishes its warning effect. If horns are heard all of the time, one gets use to the noise and does not take notice. This argument was successfully used several years ago by a plaintiff in lawsuit involving a train fatality in Vermilion.

This noise certainly is a quality of life issue. It seems ludicrous that we spend millions to quiet aircraft and highway noise and do nothing to attenuate railroad noise which in some cases originates less than 30' away from private homes. That we would willingly double the noise without any mitigating acts is truly unconscionable. With the proposed increase in traffic, this noise level will be continuous and unbearable!

Last there is the inconvenience caused by blocked rail crossings of which there are nine in little Vermilion.

Whatever you can do to prevent this increase in traffic from happening will be most appreciated by all of the Vermilion citizens. If I can do anything further please contact me.

Sincerely

Ronald J Geil

RE: Comments on Draft E.I.S.
for Conrail Merger

1. **SENECA COUNTY OHIO SETTING**

Located in North Central Ohio. One hour southeast of Toledo, 2 hours west of Cleveland and 1 1/2 hours north of Columbus.
Rural with sporadic development.
The City of Fostoria is situated principally within Seneca County.

2. **RAILROAD FACILITIES IN/AFFECTING SENECA COUNTY**

Rail lines

- 5 separate lines
 - *4 lines are Class I railroads
(2 lines CSX and 2 lines NS)
 - *1 line Short Line - Port Authority

Major Rail Yards

1. Bellevue (NS) existing facility sits on northeast County line Seneca/Sandusky/Huron

81 Jefferson Street • Tiffin, Ohio 44883
Phone: 419-447-4550 Fax: 419-447-0556

2. Willard (CSX) an existing yard that will become a key terminal (including fueling facility) is only 5 miles east of Seneca County in Huron County

Rail Mixing Plant

NS has just begun operation at this plant on the east side of Fostoria.

3 SAFETY CONCERNS

A. General Comments

The City of Fostoria is in Seneca County.

Fostoria possesses many unique problems. These problem areas spill over to the surrounding townships in our County. The key item that appears to have been totally ignored in the draft EIS is that train traffic does not "pass through" Fostoria; switching and turning movements are performed here. This currently results in trains stopped, blocking city streets, county roads and township roads while waiting to get through Fostoria. It is not uncommon now for Fostoria, county and township roads to be blocked by stopped trains for over one (1) hour. What will happen when 22 trains per day are added to C-075, 10 trains per day added to C-070 and 8 trains per day to N-071? While all these trains are stopped, waiting for turning movements, the county and township roads east, north and south of Fostoria will be blocked. This will interfere with emergency, fire, police, EMS and totally disrupt normal vehicle movement. This entire situation, Fostoria and the surrounding townships, must be analyzed and satisfactorily addressed before this office can support this merger.

B. Freight Rail Operation

SEA has listed CSX line C-075 as having a "significant increase" for accident rates between cars and freight trains. However, SEA appears to have analyzed each line separately and has not taken into account the major adverse compounding effect that drastically increasing three Class I Lines (C-070 by 10 trains; C-075 by 22 trains; N-071 by 8 trains) will have in one county. We strongly believe that quality of life in Seneca County will be very adversely effected by this increase.

The "extensive" capital improvements proposed for Fostoria, need to be extended to the surrounding townships.

C. Highway/Rail at Grade Crossings

SEA has identified four crossings in our County as Class A significance. This office believes that this number is low. Seneca County has the dubious designation of consistently ranking in the top five (5) Ohio counties for grade crossing fatalities. An increase in train traffic can only serve to increase this statistic.

Seneca County currently has a "hump" crossing problem, Over two years ago, a county-wide standard was developed and adopted. With our limited funds, we have only been able to get a handful of the 160 plus crossings up to standard. We strongly believe that as part of this merger approval, all the effected highway/rail at grade crossings must be upgraded to our County Standards.

At a minimum, the CSX line C-075 (increase of 22 trains per day) should have lights and gates installed at all crossings.

D. Hazardous Material Transport by Rail

SEA has identified C-070 and C-075 as being "major key routes" and C-070 is also "new key route" for transporting hazardous materials,

The suggested mitigation does not begin to go far enough to protect the citizens living along these routes. CSX should provide training for the local EMS, fire, police on at least a six month basis since many of the personnel are volunteer. There needs to be advance communication with the EMA Director at least monthly on what material will be moving through that month.

E. Roadway Crossing Delay

SEA has chosen to only look at crossings with 5000 ADT. As we stated earlier in the Safety Concerns General Comments, the existing train traffic already causes unacceptable road blockages in and around Fostoria. There needs to be a detailed review of Fostoria and the surrounding townships to see how the proposed increase in train traffic is going to back-up into the townships. Just because most of our local ADTs are less than 5000 does not mean we have significantly less safety concerns. Currently Seneca County consistently ranks in the top five (5) counties in the State of Ohio regarding accidents at rail crossings.

This report has generally ignored the Fostoria problem and totally ignored the extended problems created in the townships. When our County is currently experiencing one (1) hour blockages of roads, we strongly believe that the following summary statement is totally inappropriate "the proposed Conrail acquisition would have no significant effect on vehicle delay for most at-grade crossings in Ohio. However seven crossings in Butler, Cuyahoga, Hamilton and Lorain Counties ...".

We will strongly oppose this merger until the problems in Fostoria and the surrounding townships are properly addressed.

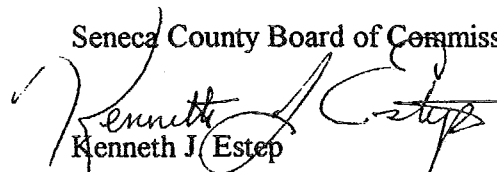

F. Seneca County Air Quality

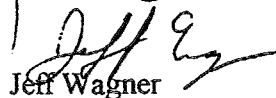

SEA has already identified a 29% in NO_x emissions. Again this is assuming trains are passing through. What are the real air quality problems that need to be addressed by stopped trains and blocked roads? Just because we are in an attainment area, we should not be subjected to such large increases without mitigation.

- G. The general concern of the study was to evaluate the results of the merger against "preacquisition" numbers instead of using this as an arena to fix some of the existing problems associated with rail commerce in a proactive manner. Also the future growth of rail commerce along these lines and their impact in all of the above items was not discussed.
- H. Future law will allow communities to apply for noise reviews which disallow the train engineer from blowing the horn in areas with four quadrant gates or similar warning devices. What will happen if and when the warning devices fail? Based upon past history with CSX, it is not uncommon for them to close a crossing for repair work without seeking the needed permits or advising the proper emergency response agencies. The crossing may remain closed for 3-8 weeks with no workers in the area for weeks on end. Only after calling the PUCC do we get action. With this track record, is there any way to mitigate better response to the local agencies as well as minimizing the closure time of the crossing.

Very truly yours,

Seneca County Board of Commissioner

Kenneth J. Estep

Washington, DC 20423-0001

Dear Ms. Kaiser,

I would like to voice several concerns on the proposed Conrail Acquisition. Rail traffic will increase in our small municipality from 14 to 54 trains per day. We object to that great an increase.

Our Fire Department and Rescue Squad is manned by volunteers. Our Village has a full-time Police Force. The increased rail traffic and increased length of trains will isolate one side of our Village/Township from their emergency vehicles and/or emergency personnel. This can become a life threatening situation if needed personnel or equipment cannot get to a disturbance, an accident or fire scene in a timely manner. I would like to remind you that minutes, if not seconds, can mean life or death in many situations. For safety reasons we must state that we disapprove of the increased traffic.

On the same note, we believe there is a need for flashing lights at our Township Railroad Crossings. These crossings are dangerous now. If the increased rail traffic is allowed, they will become deadly.

We also must insist that if this plan is permitted to go forward, that a written Emergency Response Plan for Rail Personnel and Local Service Providers be implemented with joint training provided and funded by the railroad on an annual basis.

We need to have our concerns addressed. We do not feel that the time period for voicing our concerns is long enough for us to review all the issues which would affect our community; therefore, with due respect we request an extended hearing time period so that we and our citizens may respond to the railroad's request for this expansion.

It is hoped that you will take our concerns under advisement.

Respectfully,

Donna R. Stewart
Donna R. Stewart
Mayor, Village of LaGrange

January 1998

Dear Ladies and Gentlemen,

I oppose the acquisition of Conrail by NS and CSX railroad, and urge you to do so also. I am a resident of Olmsted Falls, Ohio where we already have between 80 and 100 train crossings per day, and our current track system supplies no overpass or underpass to relieve automobile or train traffic. The acquisition would increase the number of train crossings in our City.

The increase in daily train use would create additional health and safety concerns for the City of Olmsted Falls residents due to the fact that emergency paramedics trips to the hospital could be prevented or delayed due to stopped or slowing trains blocking all crossings in the City.

There are other safety concerns at all rail crossings due to increased rail traffic which would increase the risk of collisions between trains and cars, trucks and pedestrians. I also have concerns over health and safety matters due to potential increase in the transporting of hazardous materials, which in the case of a derailment would necessitate the evacuation of many residents of Olmsted Falls as well as an elementary school with a student body of our 700 pupils near the tracks.

I believe an increase in daily train use would add to environmental concerns with regard to noise and air pollution that are already bad due to the proximity of Cleveland Hopkins Airport. I also feel an increase in rail traffic would have a negative impact on property values which directly affects both the City and School budgets.

Please use your influence to discourage the acquisition of Conrail by CSX and NS.

Thank you,

Residents opposing the acquisition of Conrail by NS and CSX.

Attn: Elaine K. Kaiser,
Environmental Project Director

Dear Ms. Kaiser:

Last Wednesday a group of University Circle executives met to review the proposed routing of CSX and Norfolk Southern freight traffic through University Circle in Cleveland, Ohio. As was clear from our numerous questions, many of us have significant concerns, particularly from a safety perspective.

As detailed, the possibility that up to 81,000 freight cars containing hazardous cargo would be transiting through University Circle annually. While the accident statistics that were presented are somewhat reassuring, it was expressed quite clearly that the possibility of serious accident cannot be eliminated. I would like to most strongly encourage you to convey to the Surface Transportation Board the unique nature of the University Circle area. It certainly has the largest concentration of hospitals, nursing and elderly care facilities and other institutions, such as our own Cleveland Hearing & Speech Center, which work with very special populations. How could a hazardous cargo accident be contained should it occur within the confines of densely populated University Circle?

This organization, Cleveland Hearing & Speech Center, must express its particular concerns regarding the significant increases in noise which such volumes of rail traffic would create. On a daily basis our agency serves persons with significant hearing loss resulting from long term exposure to noise. We also see the psychological consequences to persons who suffer from noise exposure. Why are the noise abatement considerations which always are applied to airports not relevant to this instance? Should there not be similar noise abatement regulations which apply to the railroad industry.

11206 Euclid Avenue
Cleveland, Ohio

4 4 1 0 6

Of an even more significant nature is our concern that the proposed rail traffic is being routed through low income neighborhoods. Are there not alternative routes that could be used?

While I understand the need for railroad transportation, particularly in a booming economy, I am hoping that the questions raised in this letter can be constructively addressed and reviewed.

Sincerely,

A handwritten signature in cursive script that reads "Bernard P. Henri, Ph.D." The signature is written in black ink and is positioned below the word "Sincerely,".

Re: Erie County, Ohio's Response to Proposed NS/CSX Acquisition of Conrail

Dear Ms. Kaiser:

Pursuant to the Surface Transportation Board's request, please find Erie County, Ohio's comments regarding the Draft Environmental Impact Study (EIS) for the proposed NS/CSX acquisition of Conrail. Enclosed for your review are:

- 1) Resolution 98-39, which is the Erie County Commissioners' objection to the NS/CSX application to acquire Conrail;
- 2) Erie County's response to the Draft EIS "Proposed Conrail Acquisition"; and
- 3) Legislation and letters from various other political subdivisions within our County.

If you have any questions in regards to the County's position, please feel free to contact us at (419) 627-7672.

Sincerely,

Michael J. Bixler
County Administrator

Erie County - Lake Erie's Port of Opportunity

Surface Transportation Board

RESOLUTION NO. 98-39

RESOLUTION OF THE BOARD OF COUNTY COMMISSIONERS OF ERIE COUNTY, OHIO, FOR THE PURPOSE OF OBJECTING TO THE PROPOSED ACQUISITION OF CONRAIL, INC., AND CONSOLIDATED RAIL CORPORATION (CONRAIL) BY CSX CORPORATION AND NORFOLK AND SOUTHERN RAILWAY COMPANY (NS), AND REQUESTING THAT THE SURFACE TRANSPORTATION BOARD NOT APPROVE THE ACQUISITION.

The Board of County Commissioners of Erie County, Ohio, met this 29th day of January, 1998, in Regularly Scheduled Special Session with the following members present: Harold C. Butcher, Thomas M. Ferrell, Jr. and Nancy C. McKeen.

Mr. Ferrell introduced the following resolution and moved its adoption.

WHEREAS, an application has been submitted by CSX Corporation and the Norfolk and Southern Railway Co. (NS) requesting approval of the acquisition of Conrail, Inc. and the Consolidated Rail Corporation (Conrail); and

WHEREAS, the proposed acquisition of Conrail, Inc. and the Consolidated Rail Corporation (Conrail) by CSX Corporation and Norfolk and Southern Railway Co. will adversely effect the health and safety of residents and visitors to Erie County, Ohio; and

WHEREAS, the proposed acquisition will result in increased rail traffic and that increase will disrupt the motor vehicle traffic movements in many areas of the County; and

WHEREAS, the increase in rail traffic will result in the isolation of sections of our three cities (Sandusky, Huron, and Vermilion), thereby affecting their ability to provide emergency service delivery (police, fire and emergency medical services) which in turn will create unacceptable delays and could have the potential to threaten life as well as property; and

WHEREAS, the proposed increase in rail traffic will have detrimental social consequences for County residents including a percentage of the population which is classified as low-to-moderate income persons as well as minority persons; and

WHEREAS, Erie County, Ohio, questions some of the assumptions and methodology employed in developing the Surface Transportation Board's "Draft Environmental Impact Statement" and the resulting conclusion from the same (in particular the use of Average Daily Traffic levels that do not address the concern of smaller urban and rural communities); and

WHEREAS, comments and objections to the proposed acquisition must be filed with the Surface Transportation Board by February 2, 1998; and

WHEREAS, it is deemed necessary in order to provide for the preservation of the public peace, property, health, safety and convenience of Erie County, Ohio, its citizens and businesses; and

BE IT RESOLVED BY THE BOARD OF COUNTY COMMISSIONERS OF ERIE COUNTY, OHIO:

THAT, the County Administrator of Erie County, Ohio, be and hereby authorized to forward to the Surface Transportation Board notice of the County's objection to the proposed acquisition of Conrail, Inc. and the Consolidated Rail Corporation (Conrail) by CSX and the Norfolk and Southern Railway Co.; and

THAT, the copies of the County's objection to the proposed acquisition of Conrail, Inc. and Consolidated Rail Corporation (Conrail) be forwarded to Congressman Paul E. Gillmor, U. S. Senators Glenn and DeWine, State Senator Robert Latta, State Representative Daryl Opfer, and the Ohio Rail Development Commission; and

THAT, this Board of County Commissioners hereby finds and determines that all formal actions relative to the adoption of this resolution were taken in an open meeting of this Board; and that all deliberations of this Board and of its committees, if any, which resulted in formal action, were taken in meetings open to the public in full compliance with applicable legal requirements, including Section 121.22 of the Revised Code.

Mrs. McKeen seconded the motion for the adoption of said resolution; and the roll being called upon its adoption, the vote resulted as follows:

Roll Call: Mr. Ferrell, Aye; Mrs. McKeen, Aye; Mr. Butcher, Aye.

Adopted: January 29, 1998.

CERTIFICATE

I, Carolyn Spayd, Clerk of the Board of County Commissioners of Erie County, Ohio, hereby do certify that the above is a true and correct copy of resolution adopted by said Board under said date, and as same appears in Commissioners' Journal, Volume #106.

Clerk
Board of County Commissioners
of Erie County, Ohio

Re: Draft EIS for the "Proposed Conrail Acquisition"

Dear Ms. Kaiser:

Enclosed please find Erie County's Comments regarding the proposed Conrail acquisition. If you have any questions regarding this matter I can be reached at 419-627-7682.

Sincerely,

Michael J. Bixler
County Administrator

Erie County's response to the
Draft Environmental Impact Statement
" Proposed Conrail Acquisition "

We appreciate the opportunity to comment on the Draft Environmental Impact Statement " Proposed Conrail Acquisition ". We have arranged a number of meetings in our area to review the above noted document. These meetings included a meeting with Congressman, Paul E. Gillmor. Based on our review and input from the area meetings we offer the following comments:

I. HIGHWAY/RAIL AT GRADE CROSSINGS 5-OH.6.

The following is an excerpt from the Environmental Impact Statement (EIS):

" SEA'S safety analysis showed that for the 36 highway/rail at-grade crossings studied in Erie County, the predicted increases in accident frequency would range from 0.0035 to 0.0677. This translates into a range of increases from one (1) accident every 286 years to one (1) accident every 15 years. SEA determined that the predicted increases was significant at Skadden Rd. (CR 42). This highway/rail at-grade crossing is classified as Category A. SEA found the predicted increases at the other locations to be below the criteria for significance."

We are concerned that this great increase in accident rates is not considered as significant. It is notes that the proposed mitigation to this significant increase in accident rates is the addition of a flashing light at Skadden Rd. It is further notes that the Skadden Rd. Crossing presently has flashing lights. As a County, we are also concerned that roadways with less than 5,000 ADT were not reviewed for at crossing safety or for at crossing delays. We would request that with the increase in accident rates from one (1) accident every 286 years to one (1) accident every 15 years, that the SEA again review the safety at our rail crossings to ensure the safety to individuals traveling through Erie County will not be compromised.

II. ROADWAY CROSSING DELAY 5-OH.9

The following is an excerpt from the Environmental Impact Statement (EIS)

" The three crossings analyzed in Erie County would have a minimal increase in crossing delay per stopped vehicle. The levels of service under post-Acquisition conditions would be B and C. The largest increase in maximum queue would be one vehicle."

We are concerned that only 3 crossings were reviewed in Erie County and that no review was undertaken on roadways with less than 5,000 ADT. Erie County has numerous crossings with significant delays which encourage motorists who are held up at a crossing to find alternate routes. In addition, perceived additional delays could encourage motorists to risk crossing trackage when signals are first activated. Such a situation increases the potential for car/train accidents. Slow moving trains are a significant problem in many areas of Erie County. The conclusion that the largest increase in maximum queue would be one vehicle is unrealistic.

III. INTERMODAL FACILITIES

As indicated in the EIS, NS had planned to move its TCS facilities from Crestline, Ohio, to Bellevue, Ohio. In October 1997 NS notified SEA that this intermodal facility would be moved to Sandusky, Ohio, rather than Bellevue. Since this facility is projected to be located in Erie County, we would request that additional information be provided prior to the final EIS. It is noted that the truck traffic is projected to increase by 65 trucks/day and this increase would need to be addressed and the impact determined.

It is further noted that roadway officials have not approached the City or County to discuss any preliminary plans for such a relocation.

IV. CONSTRUCTION: VERMILION CONNECTION

The following is an excerpt from the EIS:

“NS proposes to build a rail connection between the existing northeast-southwest Conrail and NS lines west of the City of Vermilion. The proposed action would connect two parallel tracks that are approximately 2,100 feet apart. The connection would be approximately 5,300 feet long. It would accommodate 12 trains per day. Figure 5-OH-5, presented at the end of this state discussion, shows the area of the proposed rail line connection.”

“The new rail connection would involve the construction of a new at-grade crossing at Coen Road. This roadway has an ADT Volume of 420 vehicles, as indicated in the Federal Railroad Administration database. Based on this low ADT volume, SEA concluded that the new highway/rail at-grade crossing would result in insignificant vehicle delay and queues. SEA performed a highway/rail at-grade crossing accident risk analysis at this new crossing based on installation of a gate warning device consistent with the existing warning devices along Coen Road at the Conrail and NS tracks. The results of this study, summarized in Table 5-OH-12, indicate an accident frequency of 0.0007 accidents per year, or one accident every 1,429 years. Based on these results, SEA has preliminarily concluded that the accident risk at this new highway/rail at-grade crossing would be negligible.”

“The proposed Acquisition would create typical short-term vehicular delays and the need for detours during construction of this rail connection. NS would perform the construction in accordance with applicable Federal, state, and local regulations for construction projects. Construction traffic would use Risdén or Coen Roads to travel to and from the Construction site.”

“The vertical difference in elevation between the track beds and the adjacent roadway surface is approximately ten feet. Steep roadway grades are used to transition between the track and roadway elevations. The new highway/rail at-grade crossing would be approximately 525 feet north of the existing NS crossing and approximately 2,000 feet south of the existing Conrail crossing. This new crossing, located 525 feet from the existing crossing, would result in a “roller coaster” effect for vehicular traffic along Coen Road.”

“SEA determined that the Coen Road crossing would be significantly affected and it is SEA’s preliminary recommendation that NS *consider* the following mitigation strategy to alleviate the vertical alignment of Coen Road.”

“Raise the elevation of Coen Road between the NS crossing and the new crossing to minimize the “roller coaster” effect of the grade variation. “

This section indicates that NS consider elevating Coen Road to eliminate the “roller coaster”. It is noted Tables 5-2 Summary of Impact Warranting Mitigation indicates that NS shall raise the elevation of Coen Road. We would request that the word “consider” used on page OH-41 be changed to “shall” as in Table 5-2.

V. RAIL TRANSPORT OF HAZARDOUS MATERIALS

Three of the rail line segments that run into or from Erie County will experience significant increases in car loads containing hazardous materials. The Vermilion to Bellevue rail line would increase from 9,000 car loads to 15,000 car loads annually, the Oak Harbor to Bellevue line would increase from 3,000 car loads to 18,000 car loads annually and the Cleveland to Vermilion line would increase from 9,000 to 32,000 car loads annually, of hazardous waste. Since 1990 Erie County has experienced four(4) derailments and five(5) accidents at the Bellevue yard. We are concerned that with this train traffic increase additional spills will occur. We would request the mitigation be established for key route designations and this be expanded to include more than material accident simulations.

VI. COMMENTS ERIE COUNTY EMERGENCY MANAGEMENT AGENCY

I do have several concerns as noted below.

1. We have a limited number of over/under passes in the county. With additional train traffic, response to public safety calls must be addressed.

2. Our two hospitals, along with schools and retirement/care centers are located extremely close to these tracks. The additional train traffic would increase the likelihood of hazardous materials spills (derailments). This must be addressed.

VII. COMMENTS ERIE COUNTY SHERIFF'S DEPARTMENT

TO: Michael Bixler, Erie County Administrator

FROM: Capt. G. D. Hovey, Operations Officer

RE: Obstruction to Traffic on Public Roadways

In regards to our conversation of this date I am forwarding to you a copy of an incident reported to this agency. This is the result of numerous calls to this office by citizens reporting the obstruction of public right-of-ways by trains. These occurrences have increased in the past several weeks and primarily effect the following roadways:

State Route 99
Patten Tract Road
Ransom Road

The concern is not only the fact that the public is denied the use of the obstructed roadways, and the act itself violates state law, but these conditions increase the risk of delaying emergency services and the delivery of necessary care to those in need of such services.

It has been ascertained that the present conditions may only become worse in this area as the proposed merger will increase rail activity in this region. It is strongly recommended that some arrangements be made, in the early stages, to rectify this existing problem and prepare to address any future troubles before they arise.

Thank you for your cooperation in this matter, and please call if you need anything further.

VIII. GENERAL COMMENTS

The City of Sandusky and the City of Vermilion would be experiencing significant increases in rail traffic. The City of Sandusky is particularly concerned with impact of isolating the western sector of the city with existing and additional rail traffic. The city has previously identified the need for a grade separation crossing at US Route 6 (Venice Rd.) And a preliminary engineering report has been prepared identifying grade separation options. The funds need to be provided to allow for the construction of a structure as noted above.

The City of Vermilion is concerned the additional train traffic will increase emergency response time in many areas of the City. It is further noted the city is also concerned with additional delays at existing crossings.

The County questions some of the assumptions and methodology used in the development of the EIS in particular eliminating the review of roadway with ADT of less than 5,000 vehicles.

It is our opinion that projected delays and safety considerations at highway/rail grade crossings need to be reconsidered to minimize the negative impacts of the proposed Conrail acquisition on the residents of Erie County, Ohio.

RESOLUTION NO. 002-98R

A RESOLUTION OBJECTING TO THE PROPOSED ACQUISITION OF CONRAIL, INC. AND CONSOLIDATED RAIL CORPORATION (CONRAIL) BY CSX CORPORATION AND NORFOLK AND SOUTHERN RAILWAY COMPANY (NS), AND REQUESTING THAT THE SURFACE TRANSPORTATION BOARD NOT APPROVE THE SAME AND DECLARING AN EMERGENCY.

WHEREAS, an application has been submitted requesting approval of the acquisition of Conrail, Inc. and the Consolidated Rail Corporation (Conrail) by CSX Corporation and the Norfolk and Southern Railway Co. (NS); and

WHEREAS, the proposed acquisition of Conrail, Inc. and the Consolidated Rail Corporation (Conrail) by CSX Corporation and Norfolk and Southern Railway Co. would result in physical and operational changes in the City of Sandusky, Ohio, and Erie County, Ohio; and

WHEREAS, the proposed acquisition will result in increased rail traffic within the City of Sandusky, Ohio, and that increase will result in the disruption of motor vehicle and pedestrian traffic movements in many areas of the City; and

WHEREAS, the increase in rail traffic will result in the isolation of sections of the City of Sandusky, Ohio, thereby affecting the City's ability to provide emergency service delivery (police, fire and emergency medical services) which in turn will create unacceptable delays and could have the potential to threaten life as well as property; and

WHEREAS, the proposed increase in rail traffic will have detrimental social consequences for City residents including a large percentage of the population which is classified as low-to-moderate income persons as well as minority persons; and

WHEREAS, the City of Sandusky, Ohio, has been designated as an "Impacted City" reflecting distress factors related to socio-economic conditions, and any use of City funds to address the impacts of the proposed rail acquisition would have the effect of reducing funds available to meet recognized local needs; and

WHEREAS, the City of Sandusky, Ohio, has recently completed a strategic planning process (1997) which process identified the need for continued economic development efforts, particularly in the western section of the City which would be isolated by increased rail traffic; and

WHEREAS, the City of Sandusky, Ohio, is in the process of finalizing a Comprehensive Plan to guide the future growth and development of the City and that the plan emphasizes the need for protecting and enhancing the potential of the western section of the City for both residential and industrial development, and that area of the City would be isolated by increased rail traffic; and

WHEREAS, the City of Sandusky, Ohio, has previously identified the need for a grade separation crossing on U.S. Route 6 (Venice Road) at the NS tracks and any increase in rail traffic as proposed

the need for a grade separation crossing on U.S. Route 6 (Venice Road) at the NS tracks and any increase in rail traffic as proposed through this acquisition would further exacerbate transportation problems in the City; and

WHEREAS, the City of Sandusky, Ohio, questions some of the assumptions and methodology employed in developing the Surface Transportation Board's "Draft Environmental Impact Statement" and the resulting conclusion from the same (in particular the use of ADT levels that do not address the concern of smaller urban and rural communities); and

WHEREAS, comments and objections to the proposed acquisition must be filed with the Surface Transportation Board by February 2, 1998; and

PAGE 2 - RESOLUTION NO. 002-98R

WHEREAS, it is deemed necessary in order to provide for the preservation of the public peace, property, health, safety and convenience of the City of Sandusky, Ohio, its citizens and businesses, the City Commission finds it advisable to declare this Resolution to be an emergency measure and to take effect immediately upon its adoption; and NOW THEREFORE,

BE IT RESOLVED BY THE CITY COMMISSION OF THE CITY OF SANDUSKY, OHIO:

Section 1. That the President of the City Commission and the City Manager of the City of Sandusky, Ohio, be and hereby are authorized to forward to the Surface Transportation Board notice of the City's objection to the proposed acquisition of Conrail, Inc. and the Consolidated Rail Corporation (Conrail) by CSX and the Norfolk and Southern Railway Co.; and

Section 2. That copies of the City's objection to the proposed acquisition of Conrail, Inc. and Consolidated Rail Corporation (Conrail) be forwarded to Congressman Paul E. Gillmor, U.S. Senators Glenn and DeWine, State Senator R. Latta, State Representative Opfer, the Ohio Rail Development Commission, and Erie County; and

Section 3. That for the reasons set forth in the preamble hereto, this Resolution is hereby declared to be an emergency measure which shall take effect and be in full force immediately upon its passage, and due authentication by the President and the Clerk of this Commission of the City of Sandusky, Ohio.

RE PROPOSED CONRAIL ACQUISITION

Dear Ms. Kaiser:

It is with great concern that we address the situation of the proposed acquisition and the effects that it will have on the area of Erie County, Ohio. We are concerned that these changes are being considered without efficient and correct data findings.

Safety being the first and foremost issue for those of us elected to office, to serve the residents of this area, we truly question whether this has been addressed accordingly.

While an increase in rail traffic may or may not be present with the proposed acquisition, it would certainly affect every resident of the public whom used the area roadways. Of which, we can probably agree, are the majority. If an increase in accidents, or an increase in emergency response times are not major factors and given the appropriate consideration with your review and studies, then the acquisition truly becomes one of selfishness and control and not a true Environmental Impact factor at all.

In one specific area, Oxford Township, when crossing delays occur, fire protection becomes nullified. **Is the loss of human life, due to train crossings being blocked so that emergency vehicles cannot access a community, not a valid and reasonable request for further consideration and alternate plans for such a merger.**

The assumptions and methodology used in the development of the EIS, are certainly questionable, and require review prior to any proposals being considered.

In addition to reviewing these issues, there are no reasons for any person to favor this proposed acquisition, no benefits to the persons living within the area, no benefits to the persons responsible for maintaining and servicing these roadways, **and no benefits of safety in any measure for the public.**

COPY

Page 2
January 30, 1998

The maintenance of the rail crossings in our area alone, are of great concern. Please take time to view and travel at several specific crossings. The first being, Camp Road, the second being, Rye Beach Road, and the third, being in the City of Huron. All crossings are in poor and inexcusable condition and we receive complaints on these "rough" crossings on a regular basis. If maintenance and improvement of these areas were a trade off for the increased speed and usage, perhaps the public would be more accommodating of such an acquisition.

Since we, the Board of Township Trustees, of Huron Township, elected to office by the Township residents, feel that there are many environmental issues that have not been resolved or discussed regarding the CSX/NS proposed railroad merger, and, since we are extremely concerned about these issues. **It is here, with written notice, that we, The Board of Trustees of Huron Township, state that we are not in support, of said acquisition.**

With this written notice of non-support being sent to all area Representatives of the State of Ohio, we truly hope you will re-consider and examine the potential impacts on the communities affected by this merger, and bring them to the attention of the persons proposing said acquisition. We will continue to seek other public entities and public officials to help us block said acquisition until a time when some resolve is made for the concerns presented and expressed.

Any correspondence would be greatly appreciated.

Sincerely,

HURON TOWNSHIP TRUSTEES

Donald G. Ritzenthaler, President
Robert C. Boos

Finance Docket 33388

Dear Mr. Williams:

In response to the Surface Transportation Board's (STB) draft Environmental Impact Statement (EIS), I continue to harbor serious concerns with proposed freight rail changes of the CSX and Norfolk Southern (NS) Corporations. My apprehension is based on the vast negative impact these proposed routes could have on my Congressional District and the greater Cleveland, Ohio area.

Recently, CSX and Norfolk Southern have indicated an interest in alleviating effects of their proposal that could prove harmful to Cleveland communities. However, to date, no agreeable solution has been found. Therefore, I strongly urge the Surface Transportation Board to not approve this acquisition without sufficient mitigation to the affected communities.

The proposed increase in rail traffic through Cleveland is almost exclusively in low-income minority neighborhoods. In one area, rail traffic is projected to increase nearly 1200 percent. This means that families living near these railroad tracks will see almost 15 times more trains, from three trains daily to 44. Other areas will see increases ranging from more than 100% to more than 500%.

The STB found cause to address the issue of environmental justice in its draft EIS. Executive Order 12898 states, in part, that "...each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations..." I encourage the STB to adhere to EO 12898 when issuing a final ruling on the CSX/NS acquisition of Conrail.

CSX and Norfolk Southern's proposal will not only have a large impact on my constituents' quality of life, but I believe it may also have a negative economic impact on local residents. More than 60,000 citizens live within 1,000 feet of railroad tracks in

Mr. Vernon A. Williams
January 30, 1998
Page 2

Cleveland. The dramatic increase of rail traffic will expose these residents to train noise at virtually any hour, further reduce property values for those who can least afford to move, and ship greater amounts of hazardous materials through these neighborhoods by rail. Increased rail traffic also poses a large risk to children who cross these tracks on their way to and from school. Children who live near the tracks may not be aware of the greater frequency with which freight trains will be operating.

Another major safety concern is the strain on public safety services in areas with at-grade rail crossings. The increase in rail traffic will delay the response times for emergency medical, law enforcement, and fire fighting services at the numerous rail crossings throughout Cleveland. Worse yet, these are areas that already have emergency service response times slower than more affluent parts of the city. I remain concerned about the increased potential for loss of life.

It is possible that the CSX/NS proposal may result in some increase in economic development in Cleveland. At least one of the rail companies involved has proposed making Cleveland a hub for their service networks, which is commendable. Nevertheless, approval of this plan should not harm the everyday interest of the general public.

For the aforementioned reasons, I am requesting that the Surface Transportation Board pose effective steps to mitigate the CSX/Norfolk Southern rail proposal for the citizens of Cleveland or deny approval of their plan. Please do not hesitate to contact me if I may provide further comments or assistance in this very important matter.

Sincerely

LOUIS STOKES
Member of Congress

Attention: Elaine K. Kaiser, Chief
Section of Environmental Analysis
Environmental Filing

Dear Ms. Kaiser:

I am writing to you in response to the draft Environmental Impact Study of the Conrail sale/merger that was release on December 12, 1997.

I offer on behalf on the Village of Oak Harbor the following comments:

- Nothing is mentioned in the report about the problems of backed up traffic on State Route 163 in downtown Oak Harbor. Yes, there is an existing problem now, but with an increase of 200% in train traffic, there will also be a 200% increase in traffic backups. We fear because of this, the motoring public will find other routes to travel. This will be detrimental to our downtown businesses. We are also concerned about the traffic stopped by trains interfering with the fire department. They are located just ½ block east of the crossing. Our department is a volunteer force, this means they would have problems getting to the station for a call and will have problems getting out of the station with the trucks when they get there.
- Hazardous Material Mitigation: It is suggested that the railroad coordinate training with the local emergency hazardous material response units. We are proud to say that our department is very well trained. The problem is you can be well trained, but if

A-399-d

you don't have the equipment, the training is of no use. Equipment is very expensive. We estimate costs for hazardous material suits to be as high as \$24,000.00.

- Noise Mitigation: We feel this needs to be addressed also. This will take someone other than the railroad or the Village to study. We would like to see a professional engineer hired to study this situation before a definite answer is given.

We have begun discussion with Norfolk Southern Railroad concerning these matters. It is too premature for the Village to agree to anything. This matter needs to be studied in depth prior to any decisions being made.

We will make ourselves available to meet and discuss with your board on any of the above mentioned matters.

Sincerely,

A handwritten signature in cursive script, appearing to read "Tim Wilkins".

DOCUMENT # 2/4/98 4:48:31 PM

January 30, 1998

Dear Surface Transportation Board Members,

I am writing in opposition to the proposed acquisition of the Conrail Railroad by Norfolk and Southern and CSX. The Broadway community of Cleveland has Conrail lines going through it, and if the sale goes forward with the current routes and proposed increase in train traffic, our community would be severely impacted in a negative way.

In addition to the issues that have been outlined by the City of Cleveland, there is an additional problem that would be created and an environmental impact to a scenic resource in our community. One of the current Conrail lines (which is proposed to become Norfolk Southern property) that runs north-south through the east side of Cleveland, lies only 20 feet north of the tallest waterfall in Cuyahoga County. The historic Mill Creek Falls, 45 feet high, is currently being negatively impacted by the train traffic. The land next to the tracks has been eroding and falling into the waterfall. I have enclosed photos of the situation and a map of the trail and falls plans.

We have been working with the Cleveland Metroparks on a plan to preserve the falls and develop them with a scenic overlook. If the sale goes forward and the train traffic increases, the erosion will worsen and the danger of the trains would make the falls development impossible. This would be a terrible blow to our community. We ask you to either oppose the sale or make Norfolk and Southern move the tracks away from the falls. If you would like additional information, please contact me at (216) 429-1182. Thank you very much,

Sincerely,

RE: Draft Environmental Impact Statement
"Proposed Conrail Acquisition"

Dear Reader:

Upon review of the Draft Environmental Impact Statement, Finance Docket No. 33388, "Proposed Conrail Acquisition" the City of Sandusky, Ohio, hereby submits the following written comments regarding this document. Enclosed also please find Resolution 002-98R passed by the City Commission of the City of Sandusky in open session on January 26, 1998. This document states the resolve of the City of Sandusky to oppose the proposed acquisition of Conrail by CSX and Norfolk and Southern Railway Co. This course of action is required and based on concerns raised by review of the Draft EIS. This opportunity to voice the City's concern prior to a decision being made by the Surface Transportation Board relative to this acquisition is appreciated.

On a macro-scale the Draft EIS (DEIS) states that increased use of rail for shipping will result in a decrease in truck traffic and a decrease in highway accidents because of the decrease in truck traffic. An analysis of this statement as it relates to local communities develops some very disturbing realities.

Decreased truck traffic means:

- A) Fewer trucks using interstate highways and major state routes however the number of trucks making local deliveries and using local routes will remain the same and may in fact increase depending upon the location of an intermodal facility.
- B) Fewer trucks making cross county hauls decreases the amount of fuel purchased and therefore fewer dollars in the gas tax fund. This means less dollars available for highway/roadway maintenance, repairs and improvements.

- C) When, realizing the above two comments in concert it can be seen that at-grade crossings in most urban settings will experience the same amount or more vehicular traffic as experienced pre-acquisition while the density of rail traffic will increase. This combination leads toward an increased need for safety measures as well as inconvenience issues which will force grade separations. With fewer dollars in highway funds, traditional sources of funding for grade separations will not be able to contribute toward new projects in any meaningful way.

It truly is in our overall best interest to encourage as much transportation of goods by rail as possible. Until such time as trains make delivery of goods in each municipality the increased rail density will continue to conflict with vehicle traffic causing safety and delay problems. The solution is to separate the conflicting movements through individual grade separations or by relocating the rail lines to the less populated areas very similar to what was done with our interstate system. Either option is expensive and must be paid for from the revenues charged to move goods. It is therefore suggested that a fund be established based on tonnage of goods moved that will be dedicated to solving the problems created by vehicular and rail conflicting movements. Since the owners of the rail companies will benefit from the increased rail traffic the fund must be provided for by the rail companies.

The City of Sandusky also questions the applicability of the average vehicle delay time. Using the average time allows the actual delay (from the time crossing guards go down to when they return to the up position) to be divided in half. The greatest traffic safety concern is not with the vehicle that approaches the mid point of the queue but is with the first or second vehicle in the queue. Will these drivers anticipate a long delay and therefore take the risk of crossing by going around guards or over the crossing while the lights are flashing? Total length of delay experienced by the first vehicle in the queue is the factor which leads to irritation and the decision for risk taking and is therefore the time that must be used in analysis and decision making.

Another concern of the City is the threshold limit of 5000 ADT for analysis of grade crossings. Where did the ADT originate and what year were the traffic counts taken? Who took the counts and what method was used? The assumption that roadway segments carrying less than 5000 ADT will not experience problems at crossings is not a valid assumption. Many problems can be caused by seasonal or hourly peaks of traffic volume which are not consistent with an average traffic volume. Was there any consideration for seasonal peaks of traffic volume in highly congested tourist areas? Was there any consideration of rush

hour traffic on certain roadways due to plant adjacency or industrial locations? There is also the speed of the train to consider which should change the threshold value of ADT used. If line segments of rail will experience very slow train movement (5-10 mph) the affect at any crossing will be greater than if the train is moving 45 mph. Was this considered in the analysis or is there a possibility of removing the threshold ADT value?

Specific to Sandusky, Ohio, there are many concerns. The footnote to Table 5-OH-2 Page OH-9 of Chapter 5 Volume 3B indicates that NS notified SEA that its intermodal facility would be moved to Sandusky, Ohio. There has been no contact to the City from NS regarding this issue and the City has no idea of what is being planned or the impact of this action. Does anybody know what this entails? Is the City to be included in these discussions? Will this mean an increase truck traffic of 65 vehicles per day and if so on which routes? The City feels it needs answers to these questions before any evaluation of impact can be made.

The Bellevue, Ohio, to Sandusky Docks, Ohio, rail segment is predicted to see an increase of freight traffic estimated at 10.3 trains per day. It is our understanding that this increase will be for east-west connection onto the current Conrail east-west main line. Is this true? The document does not indicate if the rail traffic is to dead-end at the dock or to make east-west connection. For either scenario the speed of the trains will be between 5 and 10 mph due to either the stopping at the dock or the tight turning radius onto the Conrail mainline. Within one half mile of the Conrail mainline the NS Bellevue to Sandusky Dock line crosses two (2) major roadways. These roadways are Tiffin Avenue (SR 101) and Venice Road (USR 6). With total train traffic, post acquisition, of 11.7 trains per day each crossing will be closed for 6.5 minutes eleven times a day or an hour and eleven minutes each day. This directly impacts emergency response time to the entire west end of Sandusky. It also hinders the ability to provide for economic development in the west end thereby limiting the City's ability to expand its economic base.

The City of Sandusky has "Impacted City Status" with 53% of its population in the low to moderate income level and a significant minority population (23%). Any funds that the City expends to resolve problems caused by rail traffic will not be available for other projects or services which may directly benefit the L-M income and minority populations. There will be significant problems caused by the increased rail traffic which will cause economic hardships and social injustice.

There is also a significant residential population along the existing Conrail line and at the NS/Conrail diamond. With increased rail traffic will come increased hazardous material shipments. Sandusky Bay, a major recreational water and water supply, is also adjacent to this rail line. Any hazardous material incident will have grave impacts to human health and safety as well as significant environmental impacts. Within the last 5 years there have been three derailments in or adjacent to Sandusky. The increased possibility that hazardous materials will be involved in future derailments is a great concern. The suggested solution is to increase training and awareness of the haz-met teams in the area. This will not be sufficient. A concerted effort must be made to evaluate and assess each community for the types of incidents which may occur and the associated appropriate response. If the communities do not have the necessary equipment to appropriately respond then the rail company must be responsible for working with the cities to equip them for any accident and bear the financial responsibility of doing so.

It is hoped that further dialogue will take place concerning this acquisition. There are many issues which need to be discussed and the solutions must be incorporated into whatever plan of mitigation is decided upon. The City of Sandusky would like to be a part of the process as a decision is being formulated. Again, the City is appreciative of this opportunity and looks forward to more dialog on this subject.

Sincerely,

Brent R. Smith, Director of
Engineering Services

RESOLUTION NO. 002-98R

A RESOLUTION OBJECTING TO THE PROPOSED ACQUISITION OF CONRAIL, INC. AND CONSOLIDATED RAIL CORPORATION (CONRAIL) BY CSX CORPORATION AND NORFOLK AND SOUTHERN RAILWAY COMPANY (NS), AND REQUESTING THAT THE SURFACE TRANSPORTATION BOARD NOT APPROVE THE SAME AND DECLARING AN EMERGENCY.

WHEREAS, an application has been submitted requesting approval of the acquisition of Conrail, Inc. and the Consolidated Rail Corporation (Conrail) by CSX Corporation and the Norfolk and Southern Railway Co. (NS); and

WHEREAS, the proposed acquisition of Conrail, Inc. and the Consolidated Rail Corporation (Conrail) by CSX Corporation and Norfolk and Southern Railway Co. would result in physical and operational changes in the City of Sandusky, Ohio, and Erie County, Ohio; and

WHEREAS, the proposed acquisition will result in increased rail traffic within the City of Sandusky, Ohio, and that increase will result in the disruption of motor vehicle and pedestrian traffic movements in many areas of the City; and

WHEREAS, the increase in rail traffic will result in the isolation of sections of the City of Sandusky, Ohio, thereby affecting the City's ability to provide emergency service delivery (police, fire and emergency medical services) which in turn will create unacceptable delays and could have the potential to threaten life as well as property; and

WHEREAS, the proposed increase in rail traffic will have detrimental social consequences for City residents including a large percentage of the population which is classified as low-to-moderate income persons as well as minority persons; and

WHEREAS, the City of Sandusky, Ohio, has been designated as an "Impacted City" reflecting distress factors related to socio-economic conditions, and any use of City funds to address the impacts of the proposed rail acquisition would have the effect of reducing funds available to meet recognized local needs; and

WHEREAS, the City of Sandusky, Ohio, has recently completed a strategic planning process (1997) which process identified the need for continued economic development efforts, particularly in the western section of the City which would be isolated by increased rail traffic; and

WHEREAS, the City of Sandusky, Ohio, is in the process of finalizing a Comprehensive Plan to guide the future growth and development of the City and that the plan emphasizes the need for protecting and enhancing the potential of the western section of the City for both residential and industrial development, and that area of the City would be isolated by increased rail traffic; and

WHEREAS, the City of Sandusky, Ohio, has previously identified the need for a grade separation crossing on U.S. Route 6 (Venice Road) at the NS tracks and any increase in rail traffic as proposed through this acquisition would further exacerbate transportation problems in the City; and

WHEREAS, the City of Sandusky, Ohio, questions some of the assumptions and methodology employed in developing the Surface Transportation Board's "Draft Environmental Impact Statement" and the resulting conclusion from the same (in particular the use of ADT levels that do not address the concern of smaller urban and rural communities); and

WHEREAS, comments and objections to the proposed acquisition must be filed with the Surface Transportation Board by February 2, 1998; and

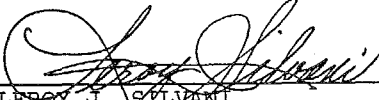

WHEREAS, it is deemed necessary in order to provide for the preservation of the public peace, property, health, safety and convenience of the City of Sandusky, Ohio, its citizens and businesses, the City Commission finds it advisable to declare this Resolution to be an emergency measure and to take effect immediately upon its adoption; and NOW THEREFORE,

BE IT RESOLVED BY THE CITY COMMISSION OF THE CITY OF SANDUSKY, OHIO:

Section 1. That the President of the City Commission and the City Manager of the City of Sandusky, Ohio, be and hereby are authorized to forward to the Surface Transportation Board notice of the City's objection to the proposed acquisition of Conrail, Inc. and the Consolidated Rail Corporation (Conrail) by CSX and the Norfolk and Southern Railway Co.; and

Section 2. That copies of the City's objection to the proposed acquisition of Conrail, Inc. and Consolidated Rail Corporation (Conrail) be forwarded to Congressman Paul E. Gillmor, U.S. Senators Glenn and DeWine, State Senator R. Latta, State Representative Opfer, the Ohio Rail Development Commission, and Erie County; and

Section 3. That for the reasons set forth in the preamble hereto, this Resolution is hereby declared to be an emergency measure which shall take effect and be in full force immediately upon its passage, and due authentication by the President and the Clerk of this Commission of the City of Sandusky, Ohio.

ENVIRONMENTAL DOCUMENT

January 30, 1998

Ms. Elaine K. Kaiser, Chief
Surface Transportation Board
Section of Environmental Analysis
1925 K Street, NW
Washington, DC 20423-0001

RE: COMMENTS ON DRAFT EIS FOR PROPOSED
CONRAIL ACQUISITION - FINANCE DOCKET NO. 33388

CENTRAL ADMINISTRATIVE UNIT

REC'D: 2/2/98

DOCUMENT # 2/2/98 11:31:21 AM

Dear Ms. Kaiser:

NOACA, as the Metropolitan Planning Organization (MPO) representing 2.1 million residents, five counties and 172 municipalities in Northeast Ohio, has reviewed the Draft Environmental Impact Statement (DEIS) produced as part of the Conrail acquisition. There are three broad categories of concern that the NOACA Governing Board requests that the Surface Transportation Board makes conditions for approval of the takeover.

1. The operating plan submitted by the railroads is not acceptable to the communities of Northeast Ohio. As a condition, before approval, NOACA requests that the Surface Transportation Board demand that both Norfolk Southern and CSXT negotiate with and find an operating plan that is acceptable to the City of Cleveland, the Ohio Rail Development Commission, Congressman Dennis Kucinich, Congressman Louis Stokes, Congressman Steve LaTourette, and the NOACA Governing Board.
2. After agreement on an acceptable operating plan, NOACA requests as a condition that the railroads negotiate with the affected communities, the State of Ohio and the NOACA Governing Board that appropriate protection, including some grade separations, be ensured for all grade crossings. Particular concern should be given to those crossings which have more than 8,000 vehicles per day on the roadway and more than 24 trains per day on the railroad.
3. Should the Surface Transportation Board approve the Conrail takeover, then the approval should be conditional on a plan of deliberate implementation with clearly identified steps, so that logistics and safety problems that have occurred in the western United States do not happen in Ohio.

Ms. Elaine K. Kaiser, STB
January 30, 1998
Page -2-

A Resolution of the NOACA Governing Board will be placed on the Agenda for the Board's next meeting on March 13. That resolution will be forwarded to the Surface Transportation Board upon adoption.

In addition, NOACA has an interest in commuter rail. We are in the midst of an ISTEA-funded study on its feasibility of commuter rail on existing tracks throughout northeast Ohio. Further, we are aware of issues and concerns raised by communities throughout northeast Ohio on matters of safety, pollution, noise, quality of life impacts, environmental justice, etc. We believe those issues, as well as the ones we raise, merit the consideration of the Surface Transportation Board too.

We appreciate the opportunity to express our concerns and trust this information will assist in your process. If we can be of assistance as your review continues, please call or write us.

Sincerely,

Howard R. Maier
Executive Director

HRM/RE/3665s

c: Honorable Dennis Kucinich, U.S. Representative 10th District
Honorable Louis Stokes, U.S. Representative 11th District
Honorable Steven LaTourette, U.S. Representative 19th District
Honorable Sherrod Brown, U.S. Representative 13th District
Honorable Michael DeWine, U.S. Senator
Honorable John Glenn, U. S. Senator
Honorable Michael White, Mayor, City of Cleveland
Thomas O'Leary, Executive Director, Ohio Rail Development Commission

Enclosures

Condition #1 -Revising the Operating Plan

Since August of 1997 there has been a great amount of concern about the severe impacts of the proposed operating plan on the communities of Northeast Ohio. Addressing these concerns about safety, access and noise, a proposed alternative plan was submitted by Congressman Kucinich. The Congressman's plan involved changes to the Norfolk Southern operations.

In January of 1998 the Mayor of Cleveland proposed two alternatives to the operating plan. Both of these alternatives involved significant changes by both railroads. The Cleveland proposal was reported to cost an additional \$171 million.

Many communities are concerned about the impacts of changes in railroad operations. It would be unjust to approve a plan that places the adverse impacts on densely populated urban neighborhoods. It is likewise understood that the two railroads are in business to make profits. They are not public bodies or charities. Further, it is understood that the two railroads intend to be in competition with each other as well as with trucks, ships and any other freight carriers.

The condition that has been requested by NOACA is compatible with the request of Cleveland Mayor Michael White. The NOACA condition also acknowledges the role of the US Congress and the action already taken by Congressman Kucinich. An acceptable operating plan will be a plan that is accepted by the railroads, by the communities, by the state and by the NOACA Governing Board. Anything not acceptable to one or more of these parties should not be approved by the Surface Transportation Board.

Condition #2 - Protection or Separation of High Traffic Grade Crossings

NOACA staff have assembled an extensive GIS-based analysis of all railroad crossings on the proposed mainlines in Northeast Ohio. Tables and maps are attached.

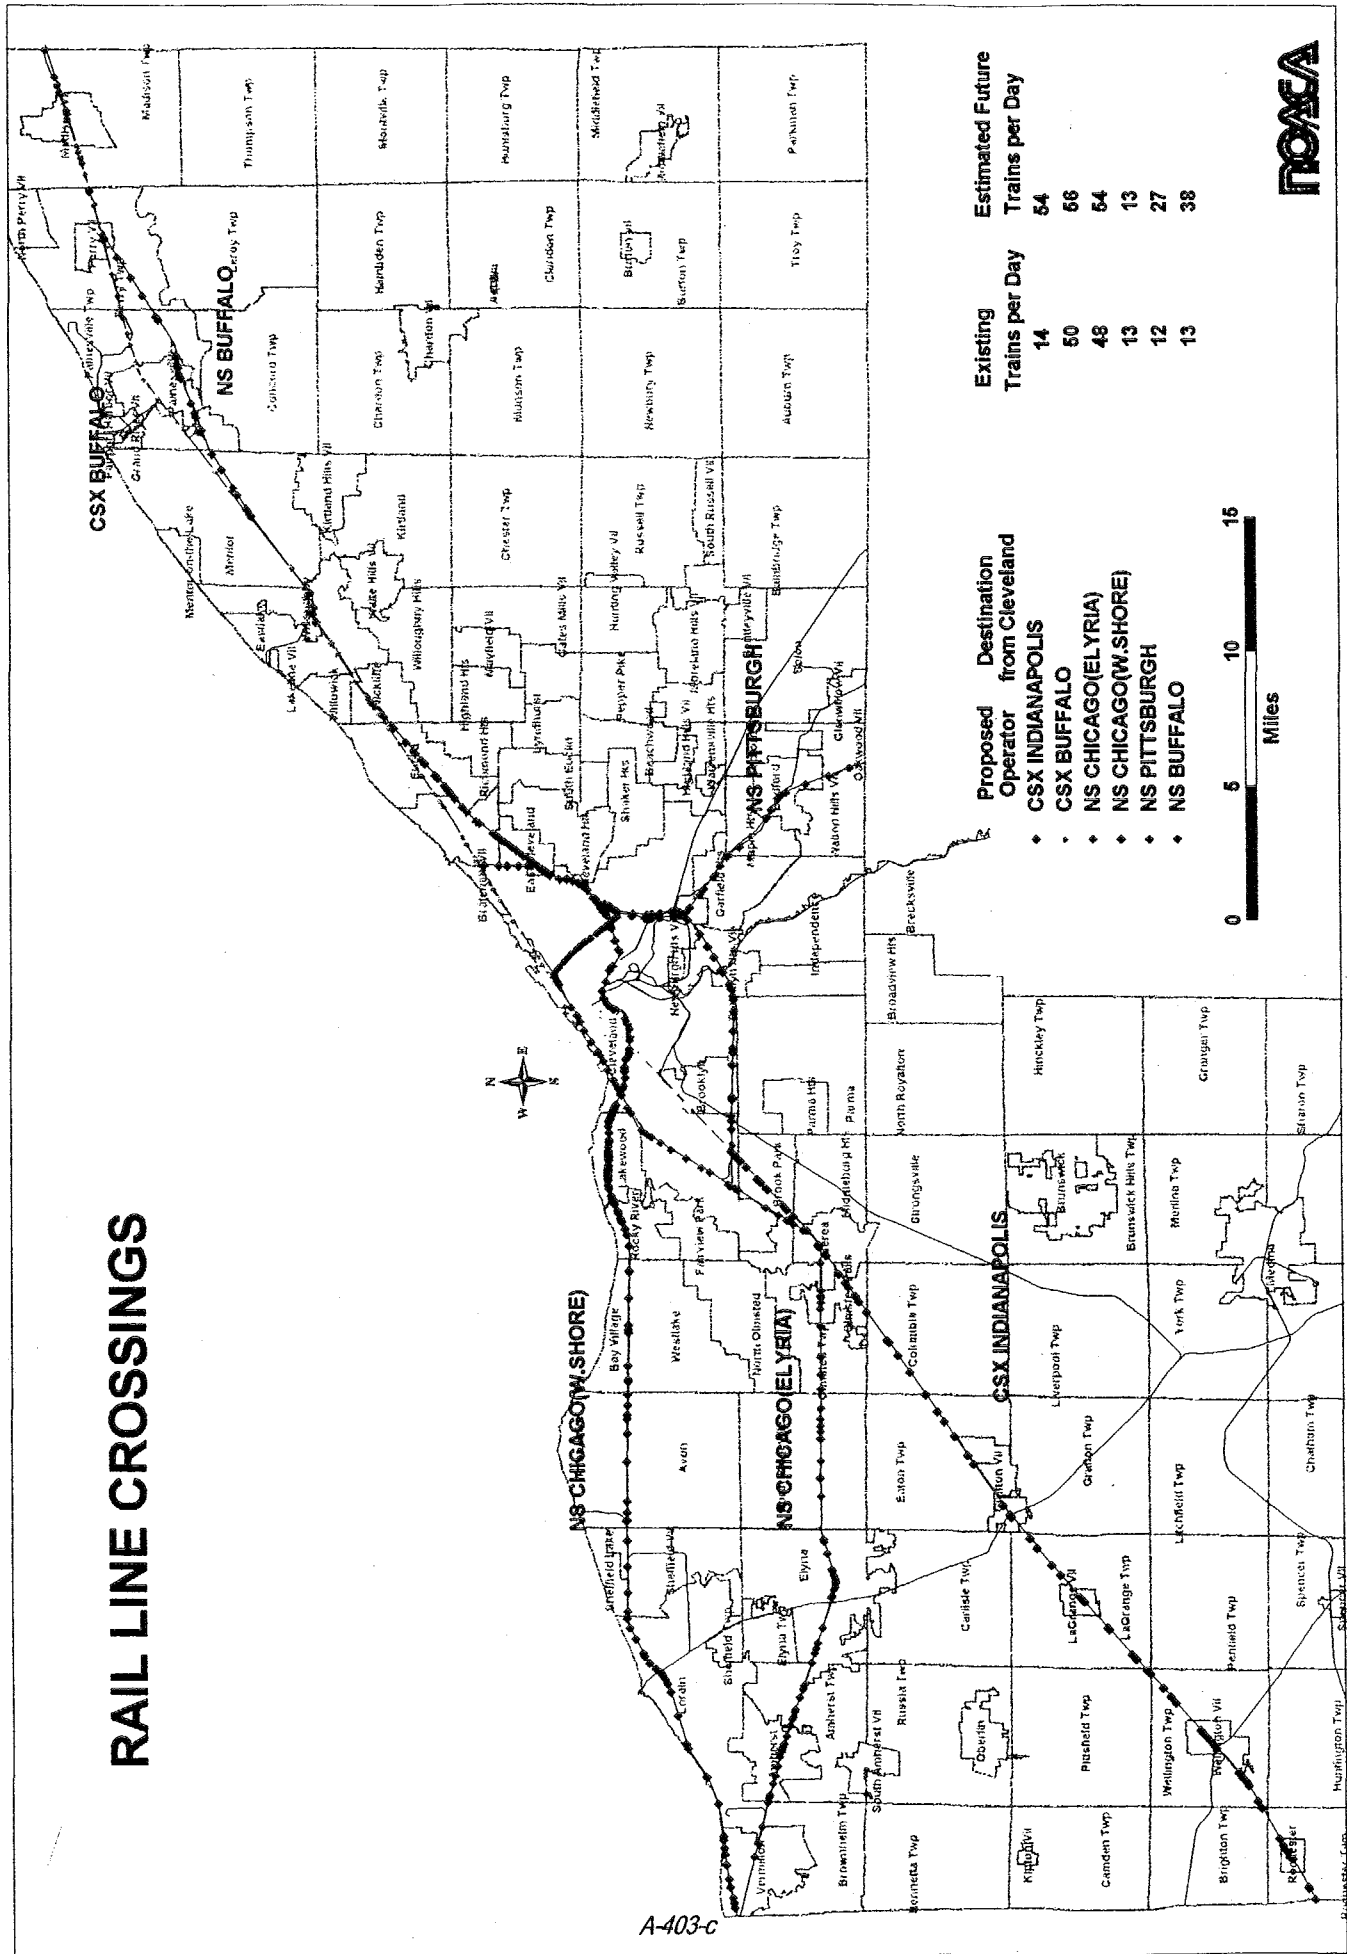

Norfolk Southern has proposed a response to earlier objections to its operating plan. The railroad proposed to move most of its through trains, from its line along the lakeshore communities, to the Conrail line through Berea, Olmsted Falls and Elyria which it will acquire. Examination of the revised proposal indicates that there will be 19 at-grade crossings with a highway traffic volume of at least 8000 vehicles per day and a train volume of at least 24 trains per day. (Estimates are over 38 trains per day.

There are seven at-grade crossings which have two mainline railroads. One of them is in Cuyahoga County at Front Street in Berea. The other six are in Lake County. They are at Lloyd Road in Wickliffe, at East 305th Street in Willowick, at Erie Street in Willoughby, at Hopkins Road and Heisley Road in Mentor, and at Lake Road in Madison. Because of the added hazard of two sets of mainline tracks, all of these crossings should have protection with gates. Some of them have been proposed as grade separations.

Condition #3 - Deliberate Implementation of Conrail Takeover

Many concerns have been raised about public safety when the Conrail takeover is complete. With train crews operating on unfamiliar tracks, with the large increase in hazardous materials that will be carried, with high train volumes on tracks that have not recently had high volumes, there are many possibilities for confusion which could lead to disaster. In the western United States, safety problems were so extensive that the Federal Railroad Administration sent safety teams more than once to investigate. The Governing Board of NOACA, speaking for over two million citizens, requests that if approval of the Conrail acquisition is granted, the Surface Transportation Board ensures that this transition is safe.

CURRENT STATUS OF NOACA'S COMMUTER RAIL STUDY

Attached drawing shows all of the rail corridors considered in the initial screening of commuter rail. At the January 22, 1998 NOACA Transportation Advisory Committee meeting, it was recommended to the Governing Board that the corridors screened by the NOACA Commuter Rail Advisory Committee be selected for full feasibility analysis. See attached map and table. The feasibility of commuter rail is closely related to the operating plan ultimately chosen for northeast Ohio.

NOACA Commuter Rail Advisory Committee

Results of Phase I Screening Analysis

Corridors/Alignments recommended for Full Feasibility Analysis:

1a/b. Lake West	Cleveland - Lorain (Sandusky)	NS
2a. West	Cleveland - Elyria (Oberlin)	CR (NS)
3b. Southwest	Cleveland - Medina	CSX
3c. Southwest	Cleveland - Medina	I-71
4d. South	Cleveland - Akron	CR/Sum
4e. South	Cleveland - Akron	WLE/Sum
4f. South	Cleveland - Akron	Randall/WLE
4k. South	Akron - Canton	Sum
6a. East	Cleveland - Aurora	Randall
7. Lake East	Cleveland - Ashtabula (Conneaut)	CR (CSX)/NS
9b/c. Outer Crescent	Wadsworth - Akron - Kent	CR/Sum
Cleveland CBD	North Coast Transportation Center	
Cleveland CBD	Location close to Tower City

Ms. Elaine K. Kaiser
Chief
Section of Environmental Analysis
Surface Transportation Board
Washington, DC 20423

January 30, 1998

Dear Ms. Kaiser,

I am writing on behalf of Ohio Canal Corridor, a grassroots non-profit organization whose mission is to develop the Ohio & Erie Canal National Heritage Corridor from Cleveland to Zoar, Ohio. The prime area of our concern lies in Cuyahoga County; as such, I will limit my comments to this area.

As it concerns the proposed merger, Ohio Canal Corridor is worried that increased train traffic would eliminate a beneficial community project in the Broadway/Warner/Turney area. There, the rail track is aligned alongside the 45 foot Mill Creek Waterfall. A community plan illustrates an opportunity to rediscover the waterfall by providing access with a trail to a nearby metropolitan park, Garfield Park. The community plan depicts direct access along the train corridor to a series of decks and platforms from which the public could view the falls.

This same plan shows a commuter train stop near the Broadway/Turney intersection. Since the falls is expected to be a prime destination attraction in our evolving national heritage corridor, the rail link would allow easy and practical access to it and the park system.

The Mill Creek Waterfall represents the center of early settlement in Cleveland. Before the construction of the canal, more people lived here than in the city of Cleveland.

A second concern involves opportunities gained through a merger and centers on the extension of the Cuyahoga Valley Scenic Railroad from its current northern end point at Rockside Rd. to Tower City in Cleveland's Flats. A merger deal that results in surplus trackage from Rockside Rd. through LTV to Tower City would enable the Scenic Railroad to complete a downtown Cleveland connection. This connection is vital to the growth of the Scenic Railroad and to the fulfillment of its mission as the only scenic railroad in America to link to the urban center of a major city.

Any merger of this proportion is laced with pains of change. It is my hope that any agreements reached will look to further community projects that add to the quality of life, while mitigating to highest degree possible the issues of noise and air quality.

Sincerely,
Tim Donovan

DOCUMENT # 2/19/98 11:11:53 AM

January 30, 1998

Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K Street, N.W.
Washington D.C. 20423-0001

Dear Ms. Kaiser,

I am writing to you regarding grave concerns I have related to the proposed radically increased routing of train traffic through University Circle by CSX and Norfolk Southern.

I manage over 625 suites and 70,000 square feet of office and retail establishments some directly adjacent to and others in close proximity to the Mayfield Road elevated tracks.

Over 400 of my residents live in low income HUD subsidized properties for the elderly and handicapped and low income families. Abington Arms, a HUD Building for low income elderly and handicapped, is located less than 500 feet from the elevated tracks.

I do not believe that the data provided by CSX and NS sufficiently relates the negative impact of increased traffic of approximately 20 some trains a day to 80 plus trains a day. While the added noise alone for elevated tracks is of concern, my greater concern is the heavy increase of pollutants that not only significantly impact air quality, but may in fact be introducing carcinogenic and other pollutants with wide reaching medical repercussions.

With the increased transportation of toxic waste, comes the increased potential for the devastating effect of a major spill which would occur in this densely populated area.

5025 Sweetland Court

Richmond Hts., Ohio 44143

Phone 216-261-5000

Fax 216-289-9600

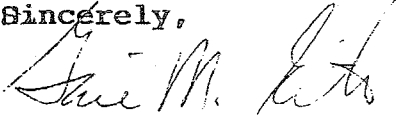

A-409-a

You may not be aware of the unique nature of University Circle. Directly adjacent to the rail line is the historic community of Little Italy and nationally renowned hospitals and university. The Circle is home to many cultural institutions including, the world renowned Cleveland Museum of Art and the Cleveland Orchestra. The Circle is also the home of an additional 1200 HUD subsidized suites for the elderly, as well as many conventional apartments and businesses. Studies show that upwards of 30,000 people populate the Circle on any given day.

On behalf of myself, my residents and neighbors, I urge you to demand from the train companies more inclusive information on the adverse affects. I further urge you to support the alternate plans proposed by Mayor Michael R. White, which takes the additional traffic through the industrial corridors with minimal impact upon the residential neighborhoods.

I believe an open meeting with yourself and the residents and institutions of University Circle will enable you to make a more informed decision that would best benefit the community as a whole.

Sincerely,

Gail M. Eovito
Senior Property Manager

DOCUMENT

January 30, 1998

To: Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K Street, NW
Washington, D.c. 20423-0001

From: Ben Gleason
4808 Timberview Drive
Vermilion, Ohio 44089

Subject: Railroad train traffic expansion.

Dear Sir:

Often people, companies, towns, cities, townships, get all excited about changes that they perceive will benefit the community or their companies. These ideas become all encompassing and become almost tunnel vision. They allow big development for tax revenue but they forget what happens with no regard for the excessive traffic. The results is accidents almost weekly.

This problem will occur if you allow railroad traffic expansion. The railroads want profits. Those profits should not be at the expenses or inconvenience of the community people.

Dear Board Members:

The Toledo Metropolitan Area Council of Governments (TMACOG) hereby submits the enclosed comments on the Draft Environmental Impact Statement (DEIS) on the Conrail acquisition by Norfolk Southern (NS) and CSX. TMACOG appreciates the efforts of SEA to address the difficult task involved in documenting the impacts of such a large transaction on the myriad of local communities affected. We have reviewed the DEIS with representatives of our communities and support those conclusions. We recommend the implementation of the mitigation measures recommended particularly the noise mitigation measures for several listed corridors, the improvements related to the new connections in our area, and better inspections and emergency response plans. We feel, however, there were several significant omissions in the analysis and recommendations.

Specifically, our representatives felt strongly that the recommendations of the DEIS were not adequate in three specific areas. The first of these is NS and CSX must be required to share the substantial financial burden that the proposed changes will place on local communities regarding purchasing equipment to deal with potential hazardous materials emergencies. The second omission was that NS and CSX must be required to share the financial burden to grade separate three (3) roadways required for emergency routes to areas of Fostoria, Ohio. These are effectively "landlocked" for substantial portions of every day use due to increased train traffic and conflicts of train movements because of the changes proposed. Finally, CSX and NS must be required to augment the inadequate amount of funding currently available to implement the crossing protection upgrades called for by the DEIS in northwest Ohio.

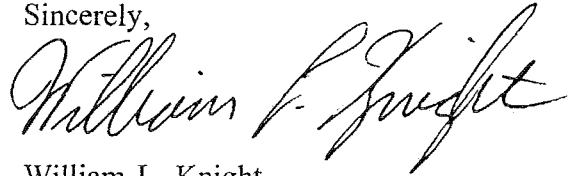

In addition, there are two issues that our representatives feel, very strongly, needs to be addressed but realize they are not directly related to the changes brought about by this transaction. We have submitted those issues to request any assistance that STB might be able to suggest and to see that they are addressed. These are:

- 1) the continued raising of rail lines over level terrain (during maintenance/rehabilitation) that has resulted in very unsafe steep at-grade crossings; and,
- 2) the increased propensity of trains to barely "hang over" crossings and block them unnecessarily because engine crews do not know the exact position of the last car on the train since the elimination of cabooses.

Enclosed are the original and 10 copies of our statement. Also enclosed is a 3.5" diskette containing the document in WordPerfect format.

Sincerely,

William L. Knight
Executive Director

Enclosure: Comments of the Toledo Metropolitan Area Council of Governments on the
Draft Environmental Impact Statement
- Proposed Conrail Acquisition (Finance Docket No. 33388)

COMMENTS OF THE TOLEDO METROPOLITAN AREA COUNCIL OF
GOVERNMENTS
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT
- PROPOSED CONRAIL ACQUISITION (FINANCE DOCKET NO. 33388)

Page 1 of 4

Summary of Comments - Our comments are summarized in the six points below. More detailed comments follow.

1. There will be a substantial increase of hazardous materials transported through several communities in our area as outlined by SEA in the DEIS. These communities will have to upgrade their capabilities to respond to potential emergencies involving these cargos including training, purchase of suits, and other very expensive equipment. We strongly support the requirement for training sessions. Further, we urge the Board to require the railroads to share the financial burden with our local communities of the purchase of additional training and safety equipment that the rail changes will necessitate. A statewide or regional fund, underwritten by the railroads, should be put in place to hold and distribute these funds. Specific communities identified in Table 5-OH-10 include the following in our area: Oak Harbor (600% increase), Fostoria (216 to 800% increase on lines), Fremont (600%), Clyde (600%), and Wood County (216 to 414% increase on lines). Table 5-MI-9 in Michigan lists Monroe County (221% increase).
2. The DEIS does not adequately evaluate the negative impact on community safety of delays at blocked crossings for emergency vehicles trying to reach areas "landlocked" by increased train traffic in Fostoria, Ohio. STB must require NS and CSX to share the financial burden to build grade separations at Town Street, Tiffin Street, and Jones Road to serve these areas. The City of Fostoria and State of Ohio are also submitting comments on this issue.
3. We concur with the SEA on the need for crossing protection upgrades in our area that they list in the DEIS in Table 5-OH-9. We believe, however, that STB must require CSX and NS to contribute funding to augment the limited amount of funding already available to complete these improvements. We applaud the agreement already reached with CSX and PUCO for improvements on the current CSX main line but many other crossings also need improvement.
4. We urge the Board, as a condition of approval of the application, to direct CSX and NS to implement noise control measures on the three rail line segments analyzed for noise in our area. These are: C-065 Toledo to Deshler; N-079 Oak Harbor to Bellevue; and, S-020 Carleton to Ecorse. In addition the noise measures should be extended from Carleton to Toledo.
5. We support the recommendations of the SEA relative to connections at Oak Harbor, and Vermillion to eliminate the grade differentials and improve crossing protection and ask that this be required as a condition of Board approval and not simply directing NS to "consider" this.
6. We concur and strongly support implementation of the other mitigation measures that affect our area including increased track inspections, better mechanical inspections, "key route" improvements, and development of emergency response plans and simulations.

COMMENTS OF THE TOLEDO METROPOLITAN AREA COUNCIL OF
GOVERNMENTS
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT
- PROPOSED CONRAIL ACQUISITION (FINANCE DOCKET NO. 33388)

Page 2 of 4

Background

The Toledo Metropolitan Area Council of Governments (TMACOG) is a voluntary association of local governments composed of counties; municipalities; townships; the Toledo-Lucas County Port Authority; the Toledo Area Regional Transit Authority; and other special districts and authorities; and school districts in Erie, Lucas, Ottawa, Sandusky and Wood Counties in Ohio, and Monroe County in Michigan. TMACOG is established under the provisions of Chapter 167 of the Ohio Revised Code and Michigan Public Act No. 7. TMACOG is responsible for planning and intergovernmental relations in several areas including transportation, water quality, air quality, energy, housing, regional development, federal grant review and comment, rural development, and urban revitalization. TMACOG has been designated by federal and state agencies in each of these categories.

TMACOG represents the interest of local units of government with regard to transportation, community development, and redevelopment issues of regional significance and provides planning expertise on these issues. Specifically, because of the significant implications of the proposed acquisition of Conrail and related rail transportation issues on the region, the Board of Trustees directed staff to develop an appropriate response to this issue working with and through a Board subcommittee known as the Railroad Task Force. Representatives of the cities, villages, counties and others affected by the sale of Conrail were participants in developing these comments.

After much deliberation and several public forums on this issue the TMACOG Railroad Task Force on January 15, 1998 directed staff to present this position to Surface Transportation Board.

Comments

1. Hazardous Materials: Members of TMACOG are very concerned with the shifting of these cargos to different routes than at present and increasing the amount of hazardous materials on rail lines. The DEIS listed nine line segments in our area with significantly increased car loads of Hazardous Materials. Increases on these lines range from 116% to 700%. These segments will impact several communities in our area. Specific communities identified in Table 5-OH-10 in our area in Ohio include: Oak Harbor (500% increase), Fostoria (116 to 700% increase on lines), Fremont (500%), Clyde (500%), and Wood County (116 to 314% increase on lines). In 5-MI-9 in Michigan Monroe County (121% increase) is listed. Because of this greatly increased exposure local emergency response personnel will need to upgrade their capability to respond to potential emergencies involving these cargos including training, purchase of suits, and other very expensive equipment.

1. Mitigation: CSX and NS must be required to provide funding for equipment and training for emergency service providers at various locations in our region. These providers will furnish HazMat response in multi-jurisdictional areas (through mutual aid agreements) to provide coverage of the entire area. The funding provided by the railroads could underwrite a statewide or regional fund put in place to hold and distribute these funds in the most efficient manner. We also strongly support the requirement for training provided by the railroads as listed in the DEIS.

COMMENTS OF THE TOLEDO METROPOLITAN AREA COUNCIL OF
GOVERNMENTS
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT
- PROPOSED CONRAIL ACQUISITION (FINANCE DOCKET NO. 33388)

Page 3 of 4

2. Fostoria Emergency Response Issue: Train traffic will increase on all six rail segments entering Fostoria and conflicts/interactions between the lines will also increase significantly. The DEIS does not evaluate the deleterious impact on community safety of delays at blocked crossings relative to access by emergency vehicles to areas "landlocked" by increased train traffic. There are several neighborhood areas that will be in the triangular areas between very busy lines. The attached map highlights these areas. Access to these neighborhoods is across these very busy lines with crossings at locations that will be blocked by trains waiting for a green signal through the Fostoria control points or proceeding very slowly through complex track work. These areas could be potentially completely blocked from access by City emergency response teams with access only from unincorporated adjacent areas without these services nearby.

2. Mitigation: STB must require NS and CSX to share the financial burden to build grade separations at Town Street, Tiffin Street, and Jones Road to serve these areas. The attached map shows the location of these proposed grade separations. In addition to primary access to the landlocked areas the grade separations will also allow the railroads to improve their train traffic congestion problems and, once grade separations are in place, would allow the closure of nearby local streets further improving safety. The City of Fostoria and State of Ohio comments also address this issue.

3. Grade Crossing Protection Upgrades Issue: We concur with the DEIS in the need for upgraded crossing protection on lines experiencing large growth in the number of trains. There are 20 locations identified in the TMACOG area. Many of these currently only have crossbucks and will need upgraded to lights and gates. The funding for crossing protection upgrades in the State of Ohio is already inadequate to deal with the many crossings that need to be upgraded. The addition of these locations only exacerbates this situation.

3. Mitigation: STB must require CSX and NS to contribute funding to augment federal and state resources to complete the required crossing protection upgrades. They could contribute the funding annually over a certain period of years to underwrite a state or regional fund to complete these improvements. We do wish to acknowledge and applaud CSX for its agreement with the Public Utilities Commission of Ohio to upgrade crossings along the CSX main line in northwest Ohio.

4. Noise Issues: Three line segments in our area meet the DEIS threshold for noise mitigation and will indeed be severely impacted especially Oak Harbor. In the limited time of review of the DEIS local communities along the line have not reached agreement with the railroads involved as to appropriate mitigation measures. In addition, Monroe County has identified significant impacts on the next line segment south of Carleton (Carleton to Toledo).

4. Mitigation: We urge the Board, as a condition of approval of the application, to direct CSX and NS to implement noise mitigation measures on the three rail line segments analyzed for noise in our area and extend the Michigan corridor south to Toledo.

COMMENTS OF THE TOLEDO METROPOLITAN AREA COUNCIL OF
GOVERNMENTS
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT
- PROPOSED CONRAIL ACQUISITION (FINANCE DOCKET NO. 33388)

Page 4 of 4

5. New Connections Issues: The DEIS evaluates impacts from two new rail connections to be built in our area - Oak Harbor and Vermillion. The SEA concluded on both that a road crossing the new connections at grade would have a “roller coaster” effect from the grades that would result from standard practices of construction. The way to address this is to raise the road between two crossings. SEA recommended that NS “consider” this when designing the new connections.

5. Mitigation: We support the recommendations of the DEIS and ask that the recommendation be required as a condition of Board approval and not simply direct NS to “consider” this.

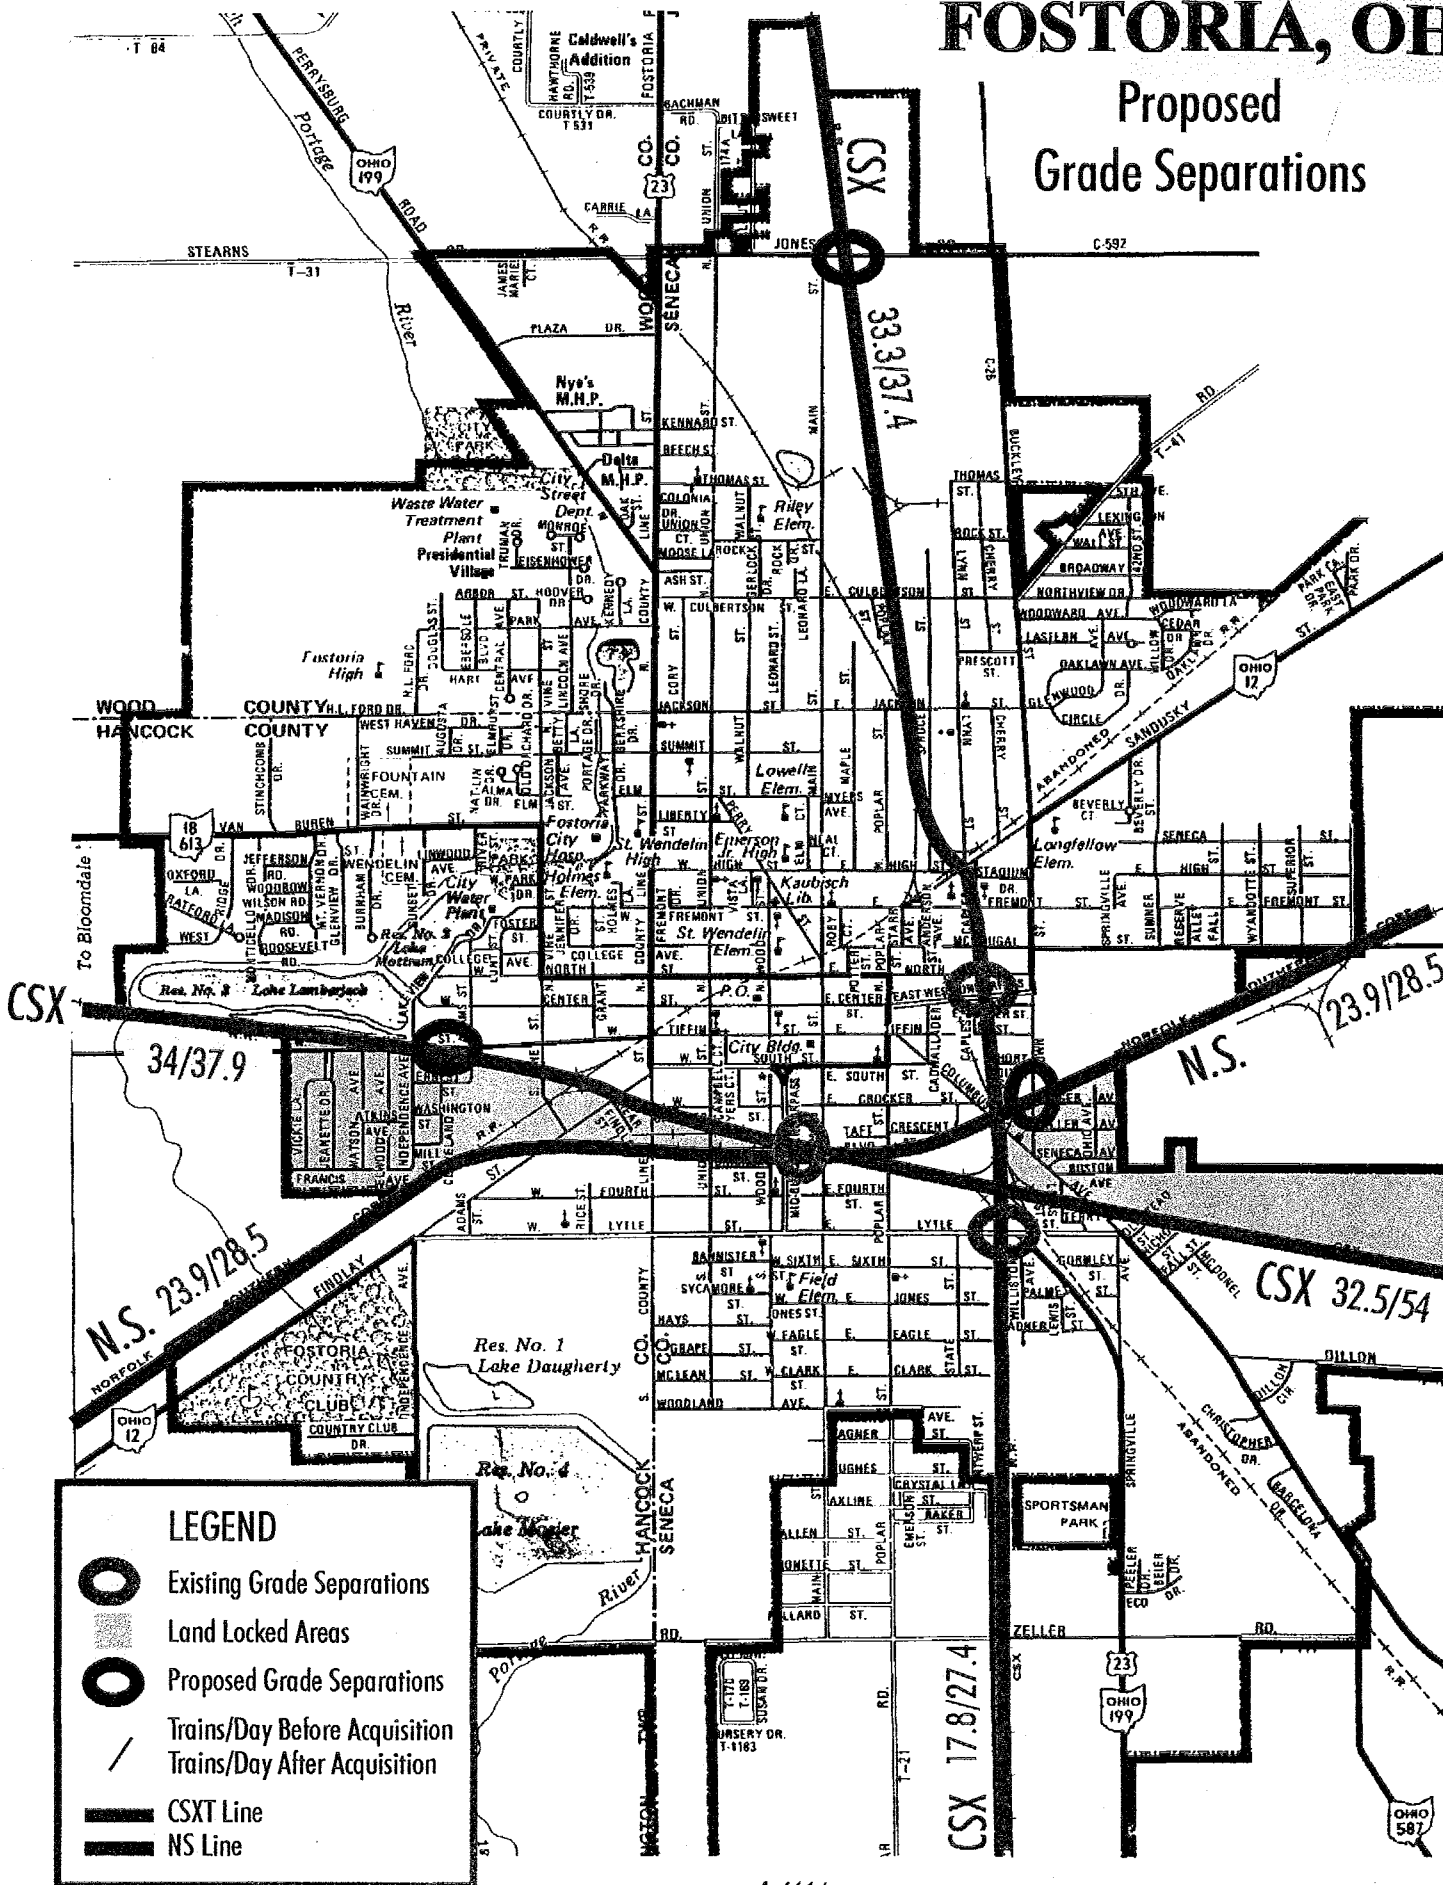

6. Other Mitigation Recommendations: We concur and strongly support implementation of the other mitigation measures outlined in the DEIS that affect our area including increased track inspections, better mechanical inspections, improvements/upgrades to hazardous materials “key routes,” and development of emergency response plans and simulations.

Two Other Issues for Guidance - TMACOG members identified two other issues to request the Board for some guidance. We realize that these are not a direct impact of the transaction evaluated in the DEIS but they are an environmental impact of ongoing rail operations in the area. The first is the issue of raising the level of the railroad track on each round of track maintenance. This is resulting in very steep unsafe grade crossings. Vehicle sight distances are greatly limited. Long wheel base vehicles are at risk to “hang up” on the tracks. This must be an issue throughout many portions of the United States and it must be resolved. Raising the grade of the roadway is an additional financial burden to area road agencies that many cannot meet. Are there measures that can be used to limit the practice of raising the rail level? Is the Board able to help in granting some relief to local road agencies?

The second issue is the lack of information for the train crew on where the end of the train is relative to blocked street crossings. Longer trains are ever more frequently blocking crossings by one or two car lengths as they wait for control signals. Train crews no longer have information on the location of the end of the train. In other locations railroad signals and control block locations that may have been laid out with some sympathy to local communities in the past no longer provide good “parking spaces” for today’s longer trains. Is there some way that these issues can be addressed? We would greatly appreciate any Board action, information or other help that you can provide on these issues.

**Re: CSX and Norfolk Southern (NS)
Proposed Acquisition of Conrail**

Dear Office of the Secretary:

University Circle Incorporated (UCI) is the nonprofit planning and service organization for University Circle. **University Circle** is the cultural, medical, and educational center of Cleveland and northeast Ohio – it is one-square mile in size and home to 44 institutions (with an additional 35 institutions in the area immediately adjacent to its boundaries). University Circle is a very unique area, not only to the city of Cleveland but nationally – no other city in the world has such a prominent concentration of institutions. I have enclosed a copy of our current annual report that lists all of these institutions.

I am writing on behalf of many UCI member institutions to document our concern that we have not been afforded the opportunity to meet, raise questions, and obtain specific information about the many potential impacts of the proposed merger of CSX and Norfolk Southern in our community. It is UCI's role to insure that the quality of its environment is not only preserved, but continually improved. The density of the Circle's daily population makes infrastructure matters critical. Note that:

- Our health care institutions serve 1.7 million patients who come to the Circle each year;
- University Circle is an employment center with approximately 26,800 employees (for a point of reference, downtown Toledo draws 25,000 employees daily);

University Circle Incorporated
January 30, 1998
Pg. 2

- 16,400 students are enrolled in Circle educational institutions, the largest of which is Case Western Reserve University;
- More than 5,000 people reside in University Circle; and
- As a major tourist destination, the Circle attracts 2 million visitors annually.

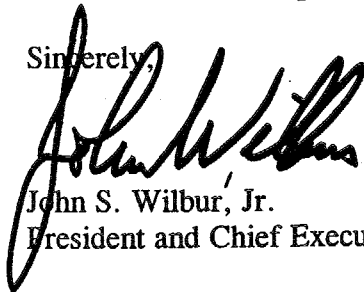

University Circle institutions play a significant economic role in Cleveland. Since 1990, University Circle institutions have invested approximately \$500 million in capital expenditures to build state-of-the-art facilities, and expect to invest more than \$200 million in additional capital expenditures during the next five years.

It is our collective concern that the increased train traffic that will result from the proposed CSX merger will adversely affect our economic progress and plans. We base this on the convictions that the increased traffic will adversely affect air quality; increase noise pollution (which may prove problematic to The Cleveland Orchestra); and bring hazardous materials into the Circle creating the potential need for emergency evacuation in an area with three major hospitals.

Based on the issues identified, UCI and many of its institutions support the city's proposal that alternate routes should be considered that would lessen the impact on residential, business, and other non-industrial neighborhoods of Cleveland. In addition, we believe that representatives of the railroads should meet with members of our community to discuss such impacts.

I strongly encourage you to read the enclosed statements from specific individual institutions addressing their specific concerns.

Sincerely,

John S. Wilbur, Jr.
President and Chief Executive Officer

About University Circle and University Circle Incorporated

The story of University Circle begins with blacksmith Nathaniel Doan, a member of Moses Cleaveland's surveying party that founded our city in 1796. He soon found city living not to his liking and moved his family to a woodland area just five miles to the east along an old Indian trail that would become Euclid Avenue. As Doan's Corners (as it came to be called) flourished, the leading citizens of the day recognized the area's potential and began to create something extraordinary—something that would distinguish our city from all others.

Three significant events shaped the destiny of this location. In 1882, Jephtha H. Wade, founder of the Western Union Telegraph Company, thought the area well enough developed to donate 75 acres of land to the city of Cleveland for a public park and an art gallery. When Western Reserve University moved from Hudson (Ohio) in 1882, railroad tycoon Amasa Stone donated \$500,000 to establish Adelbert College in memory of his son. And, in 1885, real estate magnate Leonard Case, Jr. relocated his Case School of Applied Sciences to the site from downtown.

The streetcar line that served Euclid Avenue made a turnaround at East 107th Street—the stop was called University Circle—and so the area was given its name. By 1900, the colleges and beautiful setting attracted other organizations and an educational and cultural district of note was becoming a reality. As was Jephtha Wade's dream, The Cleveland Museum of Art was built in 1916 overlooking the Wade Park Lagoon. The Cleveland Orchestra was given a permanent home when Severance Hall opened in 1931; that same year, University Hospitals was dedicated.

By 1950, 34 institutions had chosen University Circle as their home—but the Circle was facing some serious challenges. In the words of Mr. Stanley A. Ferguson, then president of University Hospitals: "...after nearly 20 years of depression and war, the institutions in University Circle faced a mammoth need for expansion and improvement... the city's population had grown... people were enjoying more leisure time and were looking for worthwhile ways of spending it... museums, libraries, and concerts were filled as never before... however, expansion was more than a matter of money or determination because there just wasn't enough room, and because the area was becoming built up like a patchwork quilt."

Enter one of Cleveland's most spirited civic leaders, Mrs. William G. Mather, who recognized that University Circle was at a pivotal point. Her vision and generosity made possible the hire of the renowned Boston planning firm of Adams, Howard & Greeley, and after a rigorous 18-month study, the *1957 University Circle Master Plan* was issued. The Plan not only gave direction for the Circle's orderly growth, it did something inspiring: it reaffirmed that Cleveland had succeeded in creating the most impressive concentration of educational, cultural, and medical institutions in the country.

Perhaps the most important recommendation made was to "establish a central organization to administer the Plan and give it some real authority." And so, with full institutional support, the University Circle Development Foundation (the predecessor of University Circle Incorporated) was formed. Initial efforts were focused on creating a land bank to purchase and hold available land until needed by an institution for expansion. Soon, services that could be provided more efficiently if done collectively—parking, shuttle bus service, public safety, architectural review, and landscaping of common areas—were added. The stability provided by these services gave new confidence to the institutions and the Circle's growth skyrocketed.

In 1970, the University Circle Development Foundation was reorganized as University Circle Incorporated (UCI) with an added emphasis on strengthening the relationship between University Circle and its adjacent neighborhoods. In its outreach to the broader community, UCI began working closely with neighborhood organizations to build housing and provide access to broader community resources. UCI's Community Education Program was created in 1973 to bring the Circle together with Cleveland schoolchildren—a wonderful collaboration that thrives today. The *1990 University Circle Master Plan*, which updated the 1957 Plan, strongly reinforced the importance of neighborhood partnerships.

UCI's reorganization moved it from simply being the "caretaker" of the Circle's physical environment (although that role remains very important) to being a catalyst for economic development and an advocate for the whole of University Circle as a major force in the progress of our city and Northeast Ohio. Uniquely positioned to look to the future with a collective eye on behalf of the institutions it serves, UCI has been dedicated to ensuring the excellence of University Circle for 40 years.

From the Chairman and President

This is a milestone year for University Circle Incorporated (UCI)—our 40th anniversary—and in the spirit of celebration we are presenting this report to the larger community by its inclusion in *Cleveland Magazine*. University Circle is a very special place and Clevelanders are rightly proud of it—as a source of civic pride it has long ranked high on the list of city assets.

What many do not know about University Circle, however, is that since 1957 there has been an organization dedicated exclusively to ensuring the Circle's collective well being. As described in the preceding introduction, the 1950's brought the Circle to a turning point that was met boldly and determinedly by the formation of UCI. It is our privilege to work on behalf of this organization that is integral to the success of a remarkable concentration of institutions—one only needs to consider the level of achievement that is reached every day in this one square mile to understand the Circle's significance.

The core of what UCI does for the Circle is tangibly depicted on the following pages. Our services make it possible for each of our member institutions to thrive in a place that is safe, convenient, orderly, and beautiful—and to carry on with their important work for their visitors, clients, and patrons. But it is the combination of providing day-to-day services, framing longer-term strategies, and taking the collective long view that captures UCI's role. Simply put, UCI is working to make University Circle—today and tomorrow—a vibrant, active community that is known as one of the truly extraordinary urban districts in the country.

We are glad to report that the financial status of UCI is sound. UCI's unrestricted operating revenue for the year totaled \$15.3 million, which included annual fund contributions of \$472,000. In addition, UCI received \$1.4 million in endowment fund gifts. We acknowledge the foundations, business organizations, public agencies, and individuals who so generously contributed to this organization.

Our gratitude is also extended to UCI's Board of Trustees and our dedicated volunteers. With sad regret we note the deaths of four of our trustees, three of them noteworthy women who served us so well: Dr. Ruth R. Miller, Mrs. A. Dean Perry, and Mrs. Herman L. Vail. Frank R. Borchert, Jr., Vice President for Budget & Planning at Case Western Reserve University, will be much missed as a colleague and friend.

We are grateful for the contributions of our valued employees and acknowledge each of our member and associate member institutions for all that they bring to the quality of life in Cleveland and Northeast Ohio.

R. Thomas Stanton
Chairman of the Board of Trustees

John S. Wilbur, Jr.
President and Chief Executive Officer

September, 1997

Tom Stanton (standing) and John Wilbur are pictured with the handsome park bench in front of UCI's Administrative Office on Magnolia Drive. It is one of many being placed throughout University Circle by The Circle Bench Project — an endowed beautification program started by UCI in 1996.

Public Safety

When the University Circle Police Department was formed in 1959, it was the only private police department in the country. The bold thinking that led to its creation was that of civic leader Mrs. William G. Mather and T. Keith Glennan, the president of Case Institute of Technology, both of whom were instrumental in creating University Circle Incorporated two

years earlier. In 1959, public safety was a primary concern among the Circle institutions and there was full agreement that a police department exclusively dedicated to University Circle would complement the efforts of the Cleveland Police Department and enhance the security efforts of each institution.

Thirty-eight years later, the UCPD's success speaks for itself—by any measure, University Circle has long been one of Cleveland's safest areas. The presence of the UCPD, along with its reputation for quick response, is a strong deterrent to criminal activity in the Circle. Minimized opportunity coupled with timely and decisive intervention in actual criminal incidents has characterized the UCPD's safety strategy since its inception.

This year, in its continued dedication to community policing, the 28-member department increased the presence of officers in the Circle's busiest area—the intersection of Mayfield Road and Euclid Avenue—by opening a mini-station in an attractive storefront on Euclid. With an ever-growing number of special events in University Circle, the UCPD has hired 4 part-time officers who are available when extra police power is needed—this federally-funded part-time program has worked very well during the past year. Congratulations are extended to two longtime members of the force, James Radca and Kenji Kurokawa, who were recently promoted to the rank of sergeant.

Now in its third year, the University Circle Mounted Courtesy Patrol has proved to be a popular addition to the Circle's security efforts. Comprised of 12 seasoned equestrians, the Patrol rides in pairs on weekends from June through October to provide friendly assistance and information to Circle visitors. Recently, two Patrol members graduated from the Cleveland Heights Police Academy and now serve as part-time UCPD officers.

“University Circle is safe today because for nearly 40 years the institutions that comprise University Circle have been committed to making it safe.”

—Chief Timothy J. Peppard, University Circle Police Department

We keep this one-square mile *safe.*

Parking and Transportation

University Circle is a dynamic urban neighborhood—5,000 people live within its one-square mile and every day more than 15,000 employees and 16,000 students come here to work and learn. To take in a concert, exhibit, or lecture—or to keep a medical appointment, thousands more visit daily. The 70-plus institutions located within the Circle and its adjacent rim have diverse missions and, accordingly, have different needs. But common to all of the institutions is the need for well-run functional elements, such as parking and transportation, so that they can successfully carry on with their business. University Circle Incorporated has not only been instrumental in providing these services for decades, but in constantly bringing together the Circle institutions to discuss how best to meet their ever-changing needs.

UCI maintains a fleet of 20 buses that transports more than one million passengers annually. Known fondly

“We want our visitors to have a positive experience in University Circle even before they enter our museum. The Circlelink shuttle is a fine example of how the Circle institutions have come together to provide a visitor amenity that makes the total University Circle experience a friendly one.”

—Dr. James E. King, Director, The Cleveland Museum of Natural History

as the “greenies” for many years because of their color, the updated look of our vehicles reflects the attention we pay to their maintenance and appearance. This free shuttle service efficiently delivers employees from parking lots to workplaces, takes students to all points of the CWRU campus, and is available to casual visitors. To better serve the latter, Circlelink service was created—its friendly, easy-to-spot buses and signs make it particularly appealing to those visiting the Circle for the first time.

Most urban centers face the challenge of providing adequate parking space where it is most needed, and with its high concentration of institutions and people, University Circle is no exception. To that end, UCI and eight Circle institutions work collaboratively to provide accessible, safe, and cost-effective parking. Included in the system are 11 parking garages and 51 parking lots containing more than 10,000 parking spaces. In keeping with the level of service that the University Circle institutions warrant, our parking lot attendants are ready at a moment’s notice to provide assistance to our customers—from fixing flat tires to supplying emergency gasoline.

We make museum **hopping** easy.

A-414-a

Community Planning

“University Circle is the most outstanding institutional complex in the country—it truly sets Cleveland apart from all other cities. Without a doubt, the decades of guidance and planning provided by University Circle Incorporated have made the Circle what it is today.”

—Michael R. White, Mayor, City of Cleveland

University Circle did not happen by chance—well-planned community development has always been critical to the success of University Circle and its institutions. While Circle institutions have individual development plans, University Circle Incorporated works for the collective whole to allow the Circle to reach its maximum potential. To this end, there have been two major planning tools for the Circle—the 1957 and the 1990 University Circle Master Plans—both were created by the Circle institutions and implemented under UCI’s guidance.

The 1957 Master Plan accomplished many things, including the formation of UCI to oversee the Circle’s progress. The need for a coordinated approach to physical development led to the creation of a “land bank” to allow UCI to buy available land and hold it until needed by Circle institutions for expansion or for projects that benefit the Circle community. To ensure that the Circle’s high architectural standards were maintained, the Architectural Review Board was established—its nationally noted architects continue to review all proposed building plans.

The 1990 Plan, which re-examined and updated the 1957 Plan, set forth new development guidelines to make the Circle more accessible, coherent, and beautiful. A few examples of completed and proposed projects include the comprehensive wayfind-

ing system comprised of 100 handsome signs and the multi-headed lanterns lighting the Fine Arts Garden. With the goal of redesigning Euclid Avenue as the Circle’s “main street,” a task force made up of institutional representatives is reviewing proposed plans. Although still in the planning stages, the building of an apartment complex at the corner of Euclid Avenue and Ford Drive remains a priority. Add to these the extraordinary level of investment our institutions have made in keeping with the Master Plan’s goals—since 1990 new building projects have exceeded \$350 million.

One of the most important components of our planning efforts is maintaining strong partnerships with the neighborhoods adjacent to University Circle and working together to improve their respective residential and commercial areas. Currently, UCI is focusing on the refurbishment of East 105th Street at the Circle’s northern edge. The well-being of University Circle and that of its surrounding neighborhoods are inextricably linked; we are dedicated to planning that is mutually beneficial.

We take care of this special **place.**

Community Outreach

In 1970, University Circle Incorporated was reorganized so that it could take a more active role in serving the neighborhoods around the Circle both in terms of physical development and in the programs it offered. One goal was to bring the area children more closely together with the Circle's cultural institutions; to that end, UCI's Community Education Department was established in 1973.

Each year, this effort reaches 35,000 Cleveland students through many worthwhile programs. The

most comprehensive is the Field Trip Program that serves students from 26 Cleveland schools and arranges field trips with 16 of the Circle's cultural institutions. The field trips are designed to be relevant to current lesson plans to maximize each student's experience. In addition to providing the admission fees, UCI provides transportation on our "Enrichment Express" buses. (When UCI buses are not in use for school programs, they shuttle senior adults who live in the

University Circle area to many Circle museums and events.)

Other offerings include the Artist in Education Program that arranges in-school residencies for artists who lend their expertise in dance, drama, visual arts, and creative writing—this year museum visits will add a valuable dimension. For a select group of outstanding high school students, the Summer Scholar Program provides a five-week internship at one of 15 University Circle institutions.

For the first time, a program is being offered that addresses the learning needs of preschool children. Modeled after a Smithsonian Institution program, the Early Learning Initiative is an exciting effort that brings together seven Circle institutions and five area preschools under the direction of UCI's Museum Education Specialist, Diane V. Hansson. This important collaboration features a curriculum that takes full advantage of the wonderful museum collections and performances offered by the participating institutions.

"The lives of more than two million Cleveland schoolchildren have been enriched by visits to University Circle's museums, theaters, concert halls, and gardens—and University Circle Incorporated has made this possible. We look forward to working together to serve many more."

—Ms. Elizabeth O. Ward, Principal, Harvey Rice Elementary School

We open doors that never close.

Tourism and Promotion

"Cleveland is enjoying remarkable tourism growth which has contributed significantly to the state's economy and has helped propel Ohio to its rank of sixth in the nation in the number of leisure visitors. An outstanding attraction, University Circle is vital to our national standing as a destination."

—George Zimmerman, State Tourism Director, Ohio Division of Travel & Tourism

University Circle has been a prime visitor destination for more than 75 years. Both local visitors and out-of-towners alike are drawn to what is perhaps the most impressive cultural center that has ever been built—today, it attracts more than 2 million visitors annually. With nine museums, outstanding performing arts organizations, and beautiful gardens, there is constant activity—the rich architectural heritage and beauty of the setting are a bonus. Add to that great local restaurants and the ease of getting around on the free Circlelink shuttle; the result is a perfect destination that satisfies a wide range of interests from symphony-goers to families seeking a full day of fun.

Tourism is one of the fastest growing industries in the world—U.S. tourism generates \$422 billion annually. Cleveland is happily seeing an increase in its tourism market and University Circle is a full partner in the efforts of both the Convention & Visitors Bureau of Greater Cleveland and the Ohio Division of Travel & Tourism.

To garner a greater share of the group tour segment of the market and to better position the Circle as a fascinating destination, five of the Circle's largest attractions—The Cleveland Museum of Natural History, The Cleveland Play House, The Cleveland Museum of Art, The Cleveland Orchestra, and The Western Reserve Historical Society—have come together under the direction of University Circle Incorporated to hire Nancy Feighan, the Circle's first Tourism Manager. With a focus on group tours, she is packaging and selling the Circle to groups from many states, as well as Canada.

In addition to tourism, UCI works in other ways to promote University Circle. Now in its second year, the *University Circle Calendar of Events* remains in high demand and more than 500,000 *Visitor Guides* are distributed annually. We handle inquiries from all over the world—not only about the Circle as a cultural mecca, but as a medical and educational center as well.

To showcase this extraordinary place and to encourage people to visit, two annual community events are hosted in the Circle. Coordinated by UCI, the summer's "Parade The Circle Celebration" and December's "Holiday CircleFest" have become beloved traditions and are enjoyed by thousands.

We make our **tourists** smile.

University Circle Incorporated (UCI)

is the nonprofit planning, service, and development organization established in 1957 to provide a quality environment for University Circle's cultural, educational, medical, religious, and health and human services institutions.

University Circle Incorporated 10831 Magnolia Drive Cleveland, Ohio 44106-1887

Design: Nancy Wasylshyn, Wasylshyn Design. **Editor:** Whitney E. Holian, UCI Director of Public Relations
Cover and Advertisement Photography: Don Snyder. **Other photography:** Roger Mastroianni/The Cleveland Museum of Natural History; Roger Mastroianni/The Cleveland Orchestra; Robert E. Woude

A multifaceted organization, UCI's many areas of responsibility are:

- Planning and facilitating physical development in the Circle;
- Buying and assembling properties to make them available for projects that benefit the Circle community;
- Maintaining public safety through the University Circle Police Department;
 - Managing many of the Circle's parking areas;
- Working with adjacent neighborhoods toward mutual goals and benefits;
 - Providing a Circle-wide transportation system;
- Introducing Cleveland's schoolchildren to the resources of Circle institutions through educational programs;
 - Enhancing the area's natural beauty; and
- Promoting University Circle as one of Cleveland's and Northeast Ohio's prime tourist destinations and most important assets.

Timothy J. Peppard
Chief of Police

January 30, 1998

Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K. Street, N.W.
Washington, D.C. 20423-0001

ENVIRONMENTAL DOCUMENT

Ladies or Gentlemen:

CSX and Norfolk Southern Railroads have filed a joint application with the Surface Transportation Board to acquire the Conrail Railroad, and subsequently divide Conrail's assets. I have been advised that this joint venture will result in a threefold increase in freight train traffic thru University Circle to include 44,000 carloads of hazardous waste.

University Circle is the cultural, medical, and educational center of Cleveland and Northeast Ohio. It is the home of internationally renowned museums, illustrious performing arts organizations, an eminent university and college, noted music and art schools, prominent hospitals and clinics, important health and human service agencies and many religious institutions.

Maintaining public safety in University Circle is the responsibility of the University Circle Police Department (UCPD). A key ingredient of the UCPD mission is to provide a safe environment that allows the valuable institutions located in the Circle to thrive. I would be remiss in my responsibility to this mission if I failed to express my concern for the affect the proposed rail plan may have on the safety and quality of life in University Circle. This community has yet to be engaged in dialogue by the parties to the proposed acquisition. This lack of inclusion is both inappropriate and unacceptable. University Circle is far too important to the life and vitality of greater Cleveland to be excluded from a decision that will have affect thru the next millennium. I request you consider University Circle as this process proceeds.

Sincerely,

Timothy J. Peppard
Chief of Police

DOCUMENT**

5613 Huron St.

Vermilion, OH 44089

January 31, 1998

To Members of the Surface Transportation

I am writing to express our concerns about the proposal for acquisition of Conrail by Norfolk and Southern and CSX Transportation, which would result in the doubling of train traffic through Vermilion, Ohio.

Vermilion is a beautiful town which attracts many visitors due to the unending efforts of its devoted citizens. The town's quality of life should be recognized as an important factor in addition to concerns relating to the railroad business.

Thank you for your consideration

Hayd Cramer

REC'D: 2/5/98

DOCUMENT # 2/5/98 5:30:58 PM

Dear Sirs:

I appreciate the opportunity to voice my opinion
As a community worker & resident of Cleveland Ohio.
I was present for "Regional Public Meeting" held
January 31, 1998. In Cleveland at Mt. Sinai Baptist
Church.

ENVIRONMENTAL
DOCUMENT

Topic: Conrail Acquisition

I am very much opposed to this project!!

I am concerned, over the fact, that, transportation
of "Bad Materials and other foreign matter will
be traveling in my neighborhood. Families, men,
women and children will be affected. Our Health &
Environment will decline. My vote is NO! NO!

Please find another way to solve your problems.
I will pray, that, Answers will come soon.

Thank you,
Diane Lawler

ENVIRONMENTAL DOCUMENT

CENTRAL ADMINISTRATIVE UNIT
REC'D: 2/4/98
DOCUMENT # 2/4/98 4:52:25 PM

January 31, 1998

Dear Member,

Please join with Major Michael White, Congressman, Louis Stokes, 20 clergy from WE-CAN (Westside/Eastside Congregations Acting Together Now), United Pastors in Mission and Broad-faith Organizing for Lorain's Development, Antioch Baptist Church, and Mt. Siani Baptist Church to stop the merger between Conrail by CSX and Norfolk Southern railroads to increase the transport of hazardous cargo through poor communities.

The communities most effected would be poor and Black, like Kinsman and Fairfax in Cleveland. Collinwood and the Detroit Shoreway would also be affected. This merger has also drawn opposition from Congressmen Dennis J. Kucinich, Sherrod Brown, Steven C. LaTourette, Sen. Mike DeWine and Gov, George Voinovich.

If you oppose this merger as well, please sign your name below today, in that, this letter must be post-marked no later than February 2, 1998.

ENVIRONMENTAL DOCUMENT

To Whom It May Concern:

I am writing this letter to voice my opposition to the proposed merger of CSX and Southern Railroads. I take this position after obtaining all the information made available through Media, News Articles and my attendance at the recently held Summit held on January 31, 1998 in Cleveland Ohio.

I believe that it is incumbent upon each person in the position to make a decision in this regard to do so after thoroughly searching and considering every aspect of the issue and its impact thereof.

I further contend that there are far-reaching effects of this proposed merger that warrant the ut-most consideration, i.e.

1. The potential for Health Hazards that are compounded by the proposed elimination of Railroad Maintenance Employees.
2. The proposed expansion disproportionately targets Minority and Low Income Communities.
3. Real Estate value depreciation.
4. Taxpayers being burdened with additional sacrifices through being taxed for the infructing of proposed expansion.

These are very real issues that will not go away unless they are resolved through resolving not to allow this proposal to become a reality.

Sincerely,

Idelle White

DOCUMENT # 2/6/98 338.039199

Thank you for taking the time to read

I am writing in regards to the sale of
Council to CSX and Norfolk Southern.

Justice and Fairness will not be
served if this "deal" goes through as set
presently. The railroads will be gaining

over a billion dollars yearly, yet they
are asking for our tax dollars to pay to

upgrade the rails they will be using. They
would make that much as profit in their

first quarter! Why should we subsidize their profit?

Second the routes that they also have

chosen to use would cripple & destroy

A-420-c

the railroads that will go to the...

The areas will be cut off from the other side of the tracks an average of 10 hrs. per day. That's around 42% of the day that emergency services such as Fire, Paramedics, & Police would not have access to these areas.

Third Nuclear Waste will be transported through this corridor, just feet away from homes. Not to mention the transporting of Hazardous Materials, which cannot by government mandated go through the same areas by truck.

So far the only solutions to the problems brought to them has been to plant trees, build berms w/ railroad ties, to

suppress the sounds. All which would
be extremely ineffective, & too short term
of a fix.

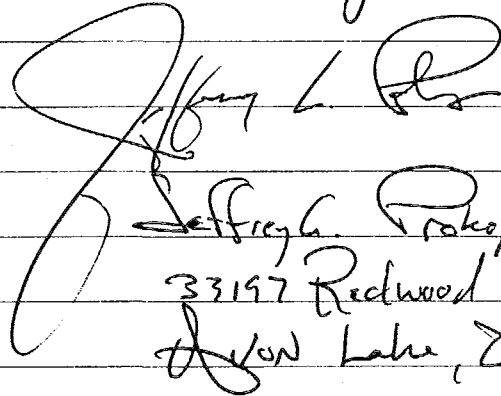

Basically the question comes down
to one thing...

... "Would you or the corporate
planners of CSX & Norfolk Southern want
to live in these areas? I know I
would not. Where is the Justice? Where
is the fairness? Who is this country going
to support, the large corporations or the
people (who put them in office?) Please reconsider
this buyout. Do not allow it to go through
as it stands. Force them to negotiate

in good faith with all the commitments
to be effected. Please don't let
the people of this country down.

Thank You Again for Your Time

Sincerely

Jeffrey Prokop

Dear Sirs:

I am a member of the BOLD Team here in Korain, and I attended the meeting in Cleveland yesterday. I feel that the rail merger is very bad for all of us for many reasons. These reasons will all be stated at the meeting.

I hope you will take note of how the people in Ohio feel about this. It's bad for all of us.

Please consider our health and welfare when you arrive at a decision.

Sincerely yours,
William P. LaFrance

Attention: Elaine K. Kaiser
Environmental Project Director
Environmental Filing

Dear Ms. Kaiser:

On behalf of the Cities of Bay Village, Rocky River, and Lakewood, Ohio, I am submitting comments on the December 12, 1997 Draft Environmental Impact Statement. These comments include the following items:

- 1) BRL-6: Comments of City of Bay Village, City of Rocky River, and City of Lakewood, Ohio on the Draft Environmental Impact Statement;
- 2) Supplemental Verified Statement of Kevin F. Beirne;
- 3) Verified Statement of Brian F. Moran;
- 4) Verified Statement of James M. Sears;
- 5) Verified Statement of Edward J. Walter, Jr.;
- 6) Verified Statement of David H. Minott;
- 7) Supplemental Verified Statement of James R. Linden;
- 8) Supplemental Verified Statement of Christopher M. Flynn;

- 9) Supplemental Verified Statement of Donald L. Wagner; and
- 10) Discovery and Research Documents Cited In BRL-6, to wit:
 - a) NS-67-P-00484;
 - b) NS-32;
 - c) NS-67-P-02406;
 - d) NS-67-P-00739;
 - e) NS-67-P-01705;
 - f) NS letter of December 8, 1997;
 - g) BRL speed research;
 - h) NS letter of October 30, 1997;
 - i) NS letter of December 12, 1997;
 - j) Ohio Realtor, December 1997.

Respectfully submitted,

Steven J. Kalish

COMMENTS OF
CITY OF BAY VILLAGE,
CITY OF ROCKY RIVER,
AND CITY OF LAKEWOOD, OHIO
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

Pursuant to the schedule adopted for this proceeding, the cities of Bay Village, Rocky River, and Lakewood, Ohio (collectively referred to as "BRL") submit their comments on the Draft Environmental Impact Statement ("DEIS") issued December 12, 1997. Following a brief discussion of the background data, BRL's comments will be presented in three principal areas.

First, we will discuss the mitigation proposed by the DEIS. We will demonstrate that the proposed mitigation is inconsistent with the Surface Transportation Board's ("Board" or "STB") responsibilities under (1) the ICC Termination Act of 1995 ("ICCTA"); (2) the National Freight Transportation Policy of the U.S. Department of Transportation; and (3) the National Environmental Policy Act ("NEPA").

Second, we will discuss the analysis contained within the DEIS. We will demonstrate that major elements of the DEIS quantitative analysis are premised upon (1) unsupported assertions by Norfolk Southern Railway Company ("NS") and (2) erroneous input data. We will further demonstrate that major elements of the standards utilized by the DEIS to determine the need for mitigation are fatally flawed.

Finally, BRL will discuss the available data and will present our proposals for mitigation.

BACKGROUND

As summarized in BRL-2, Preliminary Environmental Comments of City of Bay Village, City of Rocky River, and City of Lakewood, BRL's concerns with the proposed division and control of Consolidated Rail Corporation by NS and CSX Transportation, Inc. arise out of the NS proposal to increase the daily level of traffic on its Cleveland, Ohio to Vermilion, Ohio line segment from a Base Case 13.5 trains per day^{1/} to a Post-Acquisition Case 34.1 trains per day. Even assuming, arguendo, that the NS estimate of 34.1 trains per day has any basis in fact, a subject discussed infra, the NS proposal would mean that, on average,

^{1/} BRL note that NS asserts that its current number of trains on the Cleveland to Vermilion line segment is 16.4. DEIS Volume 3B, OH-135. BRL urge the Board to ignore the NS assertion as unsupported in the record. BRL counted each NS train each day during the period October 3 through November 3, 1997 and again during the period January 2 through 16, 1998. The average number trains per day was 14.78 in the first period studied and was 13.1 trains per day in the second period studied.

there would be one NS train operating every 42 minutes on this line segment.

The impacts of operation of one train every 42 minutes are discussed in BRL-2 and infra. Air quality would be degraded; railroad-generated noise would increase to levels unacceptable for residential areas; pedestrians and street traffic would be placed in increased danger; street traffic would be delayed; the ability of public safety providers, i.e. police, fire, and ambulance services, to reach victims in a timely manner would be seriously degraded; and property values would be reduced.

As also discussed in BRL-2, and as later confirmed by NS, none of these impacts is unavoidable. To the contrary, as explained in the November 25, 1997 letter from Bruno Maestri, System Director, Environmental Protection of NS^{2/}, an alternative route is available for all, or virtually all^{3/}, the additional trains proposed for operation by NS over the line segment. And, NS is willing to use this alternative route. The one thing that

^{2/} This letter is reproduced in Volume 5C, Appendix S of the DEIS. See also, DEIS, Volume 2 at 196. BRL note that at Volume 3B, OH-138, the DEIS states that it received the NS plan on October 29, 1997. Since that document is not included in the DEIS, and since NS has not provided that document in response to discovery requests, BRL request that it be provided in the FEIS.

^{3/} Mr. Maestri does not explain the operational reason why the proposed alternative route cannot be used for all of the additional traffic or, for that matter, why it cannot be used for all traffic proposed for this line segment.

NS is unwilling to do is to pay for the construction asserted to be necessary to make this alternative route viable.^{4/}

Reduced to its essentials then, the NS approach to this transaction is a simple one. On the one hand, NS proposes a consolidation with Conrail that it says will provide it "net operating benefits [read "profits"] in a normal year of \$553 million"^{5/} On the other hand, NS proposes that the public either suffer the environmental degradation that would result from the consolidation or pay the cost of the steps necessary to eliminate that degradation.^{6/}

BRL do not accept the "heads I win, tails you lose" bargain offered by NS. For the reasons stated herein, we request that the final environmental impact statement ("FEIS") recommend (and that the Board order) NS to undertake and fully fund the construction of the alternate route outlined by Mr. Maestri. We further request that the FEIS recommend (and the Board order) no increase in traffic over the Cleveland to Vermilion line segment.

I. THE DEIS PROPOSED MITIGATION

The recommended mitigation for BRL is as follows:

^{4/} Mr. Maestri has estimated a cost of approximately \$47 million for the construction package outlined in his letter. NS-67-P-00484.

^{5/} CSX/NS-18 at 19.

^{6/} Among the costs contemplated by NS is the suggestion that Lakewood close several grade crossings. DEIS, Volume 3B at OH-139. This is not an action the Board can require Lakewood to take and Lakewood has advised NS on more than one occasion that it will not close its streets for the convenience of the railroad.^{6/}

20. NS shall continue to consult with local and county government agencies, the Ohio Department of Transportation, elected representatives from the west Cleveland suburbs and the City of Cleveland, and other appropriate parties to address concerns about train traffic increases on the Cleveland to Vermilion rail line segment (Nickel Plate Line). Specifically, NS shall meet with these parties to negotiate a mutually-acceptable binding agreement on the construction and funding allocation of NS's preliminary alternative routing plan to balance train traffic on the Cleveland to Vermilion rail line segment and the Lakeshore Line through Berea, and associated improvements that include new rail line connections, possible grade separations, upgrading warning devices at some highway/rail at-grade crossings, and highway/rail at-grade crossing closures. The preliminary mitigation plan developed by NS was recently submitted to SEA. SEA invites public comments on appropriate alternative mitigation that the Board could require in the event that the parties cannot reach a mutually-acceptable binding agreement prior to issuing the Final EIS.⁷¹

BRL respectfully submit that the quoted language does not constitute "recommended mitigation." Rather, as recognized in the final sentence, the DEIS contains no recommended mitigation in the hope that interested parties can reach agreement with NS. Failing that, the DEIS effectively proposes to "start from scratch" in the FEIS.

Given Board precedent, the approach taken by the DEIS is perilously close to a finding that information gathered to date does not require the imposition of any mandatory mitigation

⁷¹ DEIS, Volume 4 at 7-19, Section 7.2.4, paragraph 20. The wording of the preliminary SEA recommendation in Volume 3B at OH-140 is slightly different, but the substance appears to be the same.

burden on NS. That is, in Finance Docket No. 32760^{8/}, Decision No. 71 clarified that when the Board stated, in Decision No. 44, that it believed that the cost of environmental mitigation "should be shared", it meant to say that the final mitigation plan would include both "mandated" mitigation, "which the Board will require UP/SP to implement and entirely fund" and "alternative" mitigation which would "not be binding absent a voluntary agreement by the parties to share costs..."

Here, the DEIS discusses nothing other than "alternative" mitigation, thus leading to a concern, we trust unfounded, that no mandated mitigation is contemplated to address the "unique circumstances" created by the NS proposal for the Cleveland to Vermilion line segment. Such an approach, if taken in the FEIS, would be inconsistent with the law, with USDOT policy, and with STB policy as stated in the DEIS.

The ICCTA states that it is the policy of the United States Government, in regulating the railroad industry, "to operate transportation facilities and equipment without detriment to the public health and safety."^{2/} This policy cannot be implemented in this proceeding without mandating environmental mitigation measures.

^{8/} Union Pacific Corporation, Union Pacific Railroad Company, And Missouri Pacific Railroad Company--Control And Merger--Southern Pacific Rail Corporation, Southern Pacific Transportation Company, St. Louis Southwestern Railway Company, SPCSL Corp., And The Denver And Rio Grande Western Railroad Company.

^{2/} 49 U.S.C. § 10101(8).

USDOT policy is to reduce "social costs of environmental degradation" and to ensure that these social costs "are more accurately reflected in the price of transportation services."^{10/} This is particularly important where, as here, a regulated entity seeks Board authorization for a transaction that is designed to dramatically enhance its "bottom line." As noted supra, NS projects annual net operating benefits of \$553 million as a result of this transaction. It would be inconsistent with USDOT policy to allow NS to do so while, at the same time, passing off the "social costs" of its transaction to the public.

Finally, there are only two circumstances in which the Board requires that the cost of environmental mitigation be shared. The first is when that mitigation is designed to remedy pre-existing environmental impacts.^{11/} The second is when the involved mitigation contemplates solutions that are more "far reaching" than needed to resolve the concerns rising directly from the railroad's proposal.^{12/} Neither of these circumstances is present here. The mitigation outlined by Mr. Maestri would not address pre-existing environmental impacts of NS operations through BRL in that it would not reduce the number of trains operating through BRL. Further, that mitigation is not, as discussed herein, more far reaching than necessary to mitigate

^{10/} United States Department of Transportation, National Freight Transportation Policy, 62 F.R. 785 (January 6, 1997).

^{11/} DEIS as ES-15.

^{12/} See F.D. 32760, Decision No. 71, supra.

the environmental damage resulting directly from the NS proposal to increase the number of trains operating through BRL by 153%.

The differences between the STB's analysis and the NS approach are telling. NS asserts that it has conducted a "preliminary financial analysis of the proposed alternative route [which] indicates that its cost far outweighs any economic benefits to NS, making implementation of this mitigation proposal unjustified without public funding."^{13/} Even assuming, arguendo, that NS actually has performed such an analysis,^{14/} the fact remains that a cost/benefit analysis which looks only at the benefits to the railroad cannot be dispositive. As explained supra, the rationale for environmental mitigation is not that the railroad will profit thereby. Rather, the rationale for environmental mitigation is that it is required to fulfill the STB's obligations under the ICCTA and NEPA.

II. THE DEIS ANALYSIS

A. Cumulative Impacts Have Been Ignored

While the "West Cleveland Suburbs, Ohio" have been identified as an "area of special concern" at the outset of the

^{13/} DEIS, Volume 2 at 196.

^{14/} BRL requested such analyses in their Interrogatory and Document Request No. 25 and NS provided no such document in its response. BRL again requested the documents referenced by Mr. Maestri on December 23, 1997. To date, NS has not responded. BRL note that the mitigation proposal offered by Mr. Maestri would give NS two routes into Cleveland from the west. Thus, this proposal may permit NS to institute directional operations, i.e. using one route for east bound trains and another route for west bound trains. If this is the case, NS would not be required to place trains on sidings, thus enhancing its operations.

DEIS^{15/}, the remainder of the DEIS fails to address the cumulative environmental impacts on BRL. That is, while individual environmental components of the NS proposal, e.g. noise and air quality degradation, are discussed, albeit incorrectly, the cumulative impact of these components is ignored. In taking this approach, the DEIS implicitly rejects the logic of USDOT's October 21, 1997 Preliminary Comments.^{16/} In addressing highway-rail crossings, USDOT noted that a large increase^{17/} is projected for the "NS line through Lakewood, Ohio" and stated that "all of the crossings on [this segment] should be analyzed together as a corridor and mitigation measures designed to reduce risk along entire segments rather than on a crossing-by-crossing basis."^{18/}

BRL join USDOT in advocating a cumulative impacts approach in the FEIS. While substantial time and effort must, of necessity, be expended in an examination of the "trees", the Board should not lose sight of the "forest", i.e. the total environmental and socio-economic impact of a dramatic increase in trains on BRL. By way of example of these cumulative impacts, BRL would reference Volume 5A of the DEIS. Attachment E-3, County Total Emissions Increases for Threshold Activities, in

^{15/} DEIS, Executive Summary, ES-12.

^{16/} DOT-3.

^{17/} USDOT incorrectly stated that the increase would be 13 trains per day. As noted supra, the actual claimed increase over the base period is 20.6 trains per day.

^{18/} USDOT-3 at 24.

Decreasing Order of Total NOx (Prior to Netting Analysis), reveals that the seven counties that will experience the highest emissions increases are all located in Ohio. Cuyahoga County, in which BRL are located, has the unenviable distinction of being ranked #1. In fact, the DEIS finds that NOx, CO, VOC, SO2, and PM emission increases in Cuyahoga County would be 39% greater than in Lorain, Ohio, which has the #2 spot in the list.^{19/}

At the same time, Attachment F-1, Rail Line Segments that Meet STB Requirements for the Noise Analysis, establishes that the proposed traffic increases for the Cleveland-Vermilion line segment would result in greater noise impacts than would be experienced on any other line segment. According to the DEIS, in the post acquisition environment, there would be 4,439 receptors on this line segment^{20/}, 83% higher than on any other line segment. And, the data in Attachment F-1 reveals that the increase in receptors on this line segment, i.e. 2,245 is greater

^{19/} BRL request clarification of the DEIS air quality analysis in the FEIS. We note for example that Attachment E-3 states that the NOx increase for Cuyahoga County would be 1,272 tons/year, a figure derived from Attachment E-2 at 9. However, the Attachment E-2 NOx totals are substantially smaller than the totals in Attachment E-4. By way of example, Attachment E-2 at 8 finds the NOx increase for the Vermilion to Cleveland line segment to be 39.66 tons per year. In contrast, Attachment E-4 at 9 finds the NOx increase for the same line segment to be 111.76 tons per year. The FEIS must resolve this apparent discrepancy.

^{20/} As noted infra, the DEIS has significantly undercounted the number of sensitive receptors on the Cleveland to Vermilion line segment.

than the total number of post-acquisition receptors on all but one line segment studied for the DEIS.^{21/}

The point here is a basic one. The three standards that the Board considers in designing environmental mitigation are whether the proposed condition is "reasonable", whether it is "directly related to the action proposed for approval", and whether it is "supported by the information developed during the environmental analysis."^{22/} Just as USDOT recognizes that these standards cannot be met simply by analyzing individual grade crossings, these standards cannot be met simply by viewing individual impacts, e.g. air quality or noise. Rather, it is the total impact of the NS proposal on BRL that must determine whether a mitigation proposal meets the Board's three criteria.

Prior to turning to an analysis of whether the DEIS accurately reflects the nature of the "trees", let us consider what the "forest" looks like using the DEIS data for the areas of particular concern to BRL.

1) Safety, Highway/rail at-grade crossings: The data in Attachment B-7 establishes a clear rationale for USDOT's call to examine cumulative impacts. That is, in unexplained contrast to its approach of considering "freight rail accidents" on a line

^{21/} The DEIS fails to note the reasons for this fact, i.e. (1) the BRL communities are densely populated and (2) there are 36 unseparated grade crossings in BRL over a distance of only 9.68 miles, approximately one crossing per quarter mile. NS response to BRL-1, requests 4 and 5. In Lakewood, there are 27 grade crossings in 2.48 miles. NS-67-P-02406. This is one grade crossing every 485 feet.

^{22/} DEIS, ES-14.

segment basis,^{23/} the DEIS examined "highway/rail at-grade crossing safety" on a crossing by crossing basis and considered mitigation for certain crossings "if the accident frequency increased by one additional accident every 100 years."^{24/} This was error.

Volume 3B, Table 5-OH-8 establishes that between West 117th Street, the border between Cleveland and Lakewood^{25/}, and Bradley Road, the western-most crossing considered in Bay Village, the Post Acquisition annual accident frequency would be 0.5824 greater than the Pre-Acquisition annual accident figure. In other words, the DEIS predicts that BRL will experience one additional accident at a grade crossing every two years as a result of the NS proposal. The fact that these accidents may occur at any one of the 36 contemplated crossings in BRL, rather than at a single pre-identified crossing, is of little comfort to the citizens of BRL.^{26/} This additional accident every two years on trackage through BRL that has been described by a Norfolk Southern manager of grade crossing safety as "one of the most

^{23/} DEIS, Volume 1 at 3-6 and Volume 3B at OH-14.

^{24/} DEIS at ES-18 and Volume 1 at 3-10.

^{25/} The border actually is in the middle of West 117th Street.

^{26/} The conclusion to the contrary in DEIS, Volume 3B at OH-20, has relevance only to the question as to whether the NS proposal gives rise to a need for grade separations at individual crossings. It does not address the point of concern to BRL, whether the combined impact of environmental degradation justifies requiring NS to pay for the rerouting plan it has devised.

dangerous in our 15,000 miles of track"^{27/} is part of the cost of the NS proposal to obtain "net operating benefits in a normal year of \$553 million."

2) Hazmat accidents: While the DEIS predicts that post-acquisition interval between mainline hazardous materials accidents will remain substantial, Attachment B-1, it also predicts a 252.4% increase in hazmat releases on the Cleveland to Vermilion line segment, id.^{28/} This also is part of the cost of the NS proposal to obtain "net operating benefits in a normal year of \$553 million."

3) Highway/rail at-grade crossing traffic delay: The data in the Supplemental Errata, Table 5-OH-11 (Revised), establish that, as a result of the proposed increases in NS traffic volumes, the average delay per vehicle at the five crossings considered would increase by 163%. Even assuming, arguendo, that the resulting average delay does not leave BRL with a "level of

^{27/} NS-67-P-00739. BRL comment later in this document on the DEIS use of level of service data in order to determine the need for grade separations. As we discuss, the approach taken by the DEIS is to place a heavy weight on pre-existing conditions. If that approach is to be taken, then the FEIS must give heavy weight to the existing level of danger resulting from NS operations within BRL. As explained in a December 19, 1991 NS memorandum, "Train traffic thru [sic] Lakewood can be at various speeds and the majority of the present warning systems are not of the constant warning time type. Train/auto accidents are not uncommon." NS-67-P-01705.

^{28/} Attachment B-5 identifies the Cleveland-Vermilion line segment as a "new major key route" for hazardous materials. Volume 3B, Table 5-OH-10, finds that NS will increase its annual car loads of hazmats from 9,000 to 32,000 on this line segment.

service" poor enough to warrant mitigation when considered alone,^{29/} the fact remains that this increase in average delay per vehicle also is part of the cost of the NS proposal to obtain "net operating benefits in a normal year of \$553 million."

4) Air Quality: As explained above, Cuyahoga County, Ohio, in which BRL are located, would experience substantially higher emissions increases than any other county considered in the DEIS. Volume 3B, Table 5-OH-16, finds that these increases exceed the emissions screening level "after netting" and further finds that these emissions would exceed 1% of total county emissions for NOx. Even assuming, arguendo, that this "significant"^{30/} increase is not sufficient, standing alone, to warrant environmental mitigation^{31/}, this increase also is part of the cost of the NS proposal to obtain "net operating benefits in a normal year of \$553 million."

5) Noise: As also explained above, the woefully inadequate DEIS noise analysis (see infra) finds that the number of receptors on the Cleveland-Vermilion line segment would be 4,439. Even assuming, arguendo, that this number is not understated, it is still 83% higher than on any other line segment. Each of these "receptors", a rather bland term including homes, schools, and hospitals, would experience railroad noise 34.1 times per

^{29/} The description of the DEIS standard is found in Volume 1 at 3-19. A discussion of the major errors in the DEIS LOS computations is found infra.

^{30/} DEIS, Volume 3B at OH-50.

^{31/} DEIS, ES-22-23.

day. This is once every 42 minutes, 24 hours per day, seven days per week, 365 days per year.

The DEIS suggests that, as a result of a pending rulemaking before the Federal Railroad Administration, the Board should not propose specific mitigation for the railroad horn noise impacts of the NS proposal.^{32/} This is a non-sequitur in light of the Board's ability to prevent these impacts through methods that are not contrary to anything that FRA could oppose, e.g. rerouting of traffic. This noise increase, which can be mitigated through the additional construction suggested by Mr. Maestri, is part of the cost of the NS proposal to obtain "net operating benefits in a normal year of \$553 million" and must be considered in determining whether proposed mitigation is reasonable.

6) Pedestrian Safety: "SEA did not separately consider potential pedestrian impacts."^{33/} BRL cannot ignore pedestrian safety and see no reason why the FEIS should do so. As reported in BRL-2 and BRL-3, children attending 22 elementary and middle schools in BRL cross the tracks each day. The additional risk to these children is part of the cost of the NS proposal to obtain "net operating benefits in a normal year of \$553 million."

7) Emergency Response: The DEIS found two ways to evaluate the potential effect of the Conrail acquisition on emergency vehicle response times, i.e. crossing delay per stopped vehicle

^{32/} DEIS, ES-23; Volume 3A at 5-9; and Volume 3B at OH-71.

^{33/} DEIS, Volume 1 at 4-13.

and total daily crossing blockage time.^{34/} However, the DEIS concludes that "it is impossible to predict actual delays that would occur as a result of Acquisition-related changes in train traffic"^{35/} and further states that train traffic "potentially [affects] emergency response time."^{36/}

BRL disagree. There is nothing "potential" about the impact of trains on emergency response time. It is fact. BRL-2 establishes that emergency service providers are blocked by NS trains approximately 253 times per year under current conditions. Applying the percentage increase in trains projected by NS, this would rise to 640 emergency service delays each year following the Conrail acquisition. This is almost two emergency vehicles per day that would be blocked by trains. The inability of emergency services vehicles to reach victims, including those needing immediate attention for cardiac or other life threatening accidents or illnesses, in a timely manner also is part of the cost of the NS proposal to obtain "net operating benefits in a normal year of \$553 million."

What then can be said about the cumulative impacts (as determined by the DEIS) of the NS proposal on BRL and its citizens? The DEIS provides no such analysis and BRL are unaware of any method that would demonstrate that mitigation would not be "reasonable" under the circumstances identified by the DEIS as

^{34/} DEIS, Volume 1 at 3-18.

^{35/} DEIS, Volume 1 at 4-44.

^{36/} DEIS, Volume 3B at OH-134.

augmented by the information provided in BRL-2 and BRL-3. One additional railroad accident every two years, a 163% increase in average delay per vehicle, higher emissions increases than any other county, 4,439 adversely impacted sensitive noise receptors, and two emergency vehicle delays per day must, by any standard, be considered a "reasonable" justification for environmental mitigation.^{37/}

BRL do not gainsay that \$47 million, the NS cost estimate of its mitigation proposal to eliminate the environmental damage to BRL, is a substantial sum. But, even in the unlikely event that the entire cost of this mitigation were to be expensed in one year, it would be only 8% of that year's "net operating benefits in a normal year of \$553 million." If this cost is amortized over only ten years, the minimum one would expect, it would be only 0.8% of those years' "net operating benefits." Again, this would be a reasonable expenditure even if the data presented in the DEIS fully reflected the environmental harms to BRL resulting from the NS proposal. However, as will be demonstrated in the next section of these comments, that is not the case.

B. The DEIS Understates Environmental Impacts

While the DEIS asserts that SEA has "reviewed and verified" the data submitted by NS,^{38/} a review of the DEIS establishes that the data used to perform analyses of each of the matters

^{37/} As discussed *infra*, the marketplace already is responding to the environmental harms NS proposed for the BRL communities. Houses near the tracks are not selling.

^{38/} DEIS, Volume 3A at 5-2.

considered are incorrect. BRL request that the FEIS correct these errors in the manners discussed below.

1) Train Speeds: In Volume 5A at A-1, the first data element listed for verification is train speeds. According to Section A.4.2, the DEIS utilized two different speeds in its analysis. For purposes of its safety analysis, the DEIS used the maximum operating speed. This maximum speed also was used in the DEIS calculations of Average Delay Per Vehicle.^{39/} For purposes of air quality analysis, the DEIS used what it described as "typical freight train speed." However, this speed was deemed equal to the maximum operating speed when the maximum operating speed is 35 mph and below.^{40/}

The approach taken by the DEIS is in serious error when applied to BRL. We note at the outset that NS has no data as to its average speeds in BRL. According to a December 8, 1997 letter from counsel for NS to BRL, "NS has not calculated average speeds for these trains. However, NS notes that average speeds are never higher than allowed by the FRA for the class of track over which NS operates."

At least part of the reason that NS does not operate at its maximum allowable mainline track speed through BRL is that, also according to the December 8th letter, 20% of its trains utilize a

^{39/} See, e.g. Table 5-OH-11.

^{40/} The maximum speed at the easternmost 31 grade separations in BRL (36 including 117th Street) is 35 mph.

siding within BRL.^{41/} The maximum speed entering, operating through, and leaving the siding is 25 mph.^{42/}

A more important reason that NS does not operate at anywhere near its maximum speed in BRL is the inherent danger of operating through communities with so many grade crossings over such a short distance. As noted supra, in Lakewood there is one grade crossing every 485 feet. Moreover, because of track curves and the number of buildings located close to the tracks, NS engineers are unable to see many of the crossings until they are close to them and thus they run the trains far below the maximum speed. As recounted in BRL-2 at 9, a review of police accident reports in Lakewood for railroad/street vehicle accidents since 1992 revealed an average speed for the NS trains of 31 mph. The Lakewood police confirmed this figure by using a radar gun to determine the average speed of NS trains during the period January 22 through January 27, 1998. The average speed at Bunts Road in Lakewood during that period was 30.6 mph, substantially lower than the 35 mph speed used by the DEIS.

Similarly, the Bay Village police used radar guns to determine the speed of NS trains during the period January 22 through January 27, 1998. The average speed at Dover Road was 38.9 mph, substantially lower than the 50 mph speed used in the DEIS.

^{41/} This siding has been identified as Clague Siding, located between MP B 193.9 and MP B 197.0. NS-32 at 6.

^{42/} NS-32, response to interrogatory 1(d).

Rocky River police also used radar guns to determine the speed of NS trains during the period January 22 and January 26, 1998. The average speed at the Elmwood crossing was only 23 mph.

Even these figures overstate the "average" speed of NS trains during the course of a year in that they do not include "speed" data for trains that stop prior to or in the middle of a crossing. Just such an event happened on January 22nd. An eastbound NS train entered the view of the police at 4:30 p.m. and was initially clocked at 34 mph. However, it started to slow at 4:32 p.m. and then stopped. When it finally cleared the Elmwood crossing, it was traveling at only 8 mph.

In light of these facts, several changes are required in the FEIS. First, the FEIS should premise its speed calculations on the results of the BRL police analysis, i.e. average speeds of 30.6 mph in Lakewood, 23.0 mph in Rocky River, and 38.8 mph in Bay Village.

Second, the FEIS should discount these speeds to reflect situations in which NS trains stop as they move through BRL.

Third, the FEIS should determine whether NS post-acquisition operations would increase the percentage of trains utilizing Clague Siding in Rocky River as a result of increased density on the line segment. If this is the case, then the average speeds shown above for Rocky River should be adjusted downward.

Fourth, the fact that approximately 20% of NS trains over this line segment utilize Clague Siding must be reflected in the FEIS in two regards. First, Clague Siding crosses Columbia Road

at grade, thus requiring the recalculation of impacts on Columbia Road traffic to reflect the use of the siding. Second, locomotives stopped at the siding are not normally shut down.^{43/} In virtually all cases, they remain in operation as the train sits on the siding for one hour, two hours, and sometimes longer periods, thus giving rise to air and noise pollution not contemplated by the DEIS.

2) Trains Per Day: The second data element listed in Volume 5A at A-1 is trains per day. BRL take it as a given that any train count projection in a consolidation proceeding will be, at best, an estimate. Post-consolidation business levels and experience will determine the precise number of trains operating over the Cleveland-Vermilion line segment. Notwithstanding this fact, the FEIS must utilize a number of trains in order to calculate estimated environmental impacts of various types. However, NS has not provided any data to support the train count upon which the DEIS relies.

At the outset, BRL note that NS already has revised its train counts once in this proceeding. See, CSX/NS-54, the August 28, 1997 document which reduced the proposed train count over the Cleveland to Vermilion line segment from 37.8 trains per day to 34.1 trains per day.

Of greater importance, NS cannot "verify" its train count for this line segment. The October 30, 1997, letter from counsel

^{43/} This information was provided in a December 12, 1997 letter from counsel for NS.

for NS to BRL admitted that "Norfolk Southern does not have a list identifying each train that is projected to travel over this line segment, and would have to perform a special study to make such an identification." If NS does not have such a list, the DEIS could not have verified the NS projection.

BRL request that the FEIS reexamine the train count issue and provide all data used to "verify" the number of trains expected to operate over the Cleveland to Vermilion line segment. If NS continues in its inability to identify these trains, the FEIS should conclude that it is unable to calculate the environmental impacts of the Conrail acquisition on BRL.

3) Noise: Following its erroneous conclusion that locomotive noise should not be considered in designing mitigation, the DEIS considered "wayside noise effect."^{44/} Rail line segments were deemed eligible for noise mitigation "for noise sensitive receptors exposed to at least 70 dBA Ldn and an increase of at least 5 dBA Ldn." Id.

The DEIS wayside noise effect analysis is entirely incorrect. First, as noted above, the DEIS ignores all of the noise generated by the 20% of NS trains that idle on Clague Siding. That is, NS admits that, in the post acquisition environment approximately seven of its trains will sit on Clague Siding each day for an unknown amount of time with the locomotives running. The FEIS must perform an analysis of the noise impact on the sensitive receptors of this siding noise.

^{44/} DEIS, Volume 3B at OH-74 and Volume 5A, Appendix F.

Second, the DEIS analysis errs in that it omits any consideration of the number of "sensitive receptors" in the determination of whether mitigation is required. The significance of this is established, by way of example, at page 2 of Attachment F-1. There, the Oak Harbor to Bellevue line segment is deemed eligible for noise mitigation because its change in dBA is 5.5 (resulting from a 253% increase in the number of trains). However, there are only 513 sensitive receptors on that segment. In contrast, while the change in dBA is "only" 4.0 for the Cleveland to Vermilion segment (resulting from an increase of "only" 153% in the number of trains), the number of sensitive receptors found by the DEIS on this line segment is 4,439.^{45/}

Stated another way, even using the understated DEIS numbers, approximately nine times as many sensitive receptors (read "people" living in predominantly residential areas) would be affected by increased noise on the Cleveland to Vermilion line segment. The fact that the percentage increase in noise level is less than would be experienced on another line segment (solely because of a smaller percentage increase in the number of trains) should not be dispositive when a vastly greater number of people

^{45/} BRL maintain that the DEIS count of sensitive receptors is substantially understated. The enclosed verified statements of Kevin F. Beirne, Brian F. Moran, and James M. Sears identify 1,338 sensitive receptors in Rocky River, 3,944 sensitive receptors in Lakewood, and 1,920 sensitive receptors in Bay Village in the post-acquisition case. Thus, these three communities alone have 7,202 sensitive receptors, 62% more than the DEIS found for the entire Cleveland to Vermilion line segment.

would be adversely impacted by unacceptable noise levels. Mitigation is required.

Consider also the finding of the DEIS "that wheel/rail noise from train operations may last three to four minutes per location..."^{46/} This means that if NS increases its trains by 20.6 to a total of 34.1 trains per day, the 4,439 sensitive receptors on the Cleveland to Vermilion line segment would be subject to this noise between 1.7 and 2.3 hours per day, seven days per week, 365 days per year.

This is a greater noise frequency than would be experienced on the Oak Harbor to Bellevue line segment (resulting from the fact that the total number of trains on the Oak Harbor to Bellevue line segment would be less than on the Cleveland to Vermilion line segment). And, the Cleveland to Vermilion line segment would experience a greater increase in number of trains than would be experienced on the Oak Harbor to Bellevue line segment (20.6 trains per day as compared to 19.5 trains per day). Accordingly, the DEIS mitigation proposals are not based on total noise, total railroad noise impacts, or the total increase in the number of trains. Rather, those proposals are premised on nothing more than the percentage increase in trains, an unreasonable basis on which to determine the need for mitigation. This error should be corrected in the FEIS in the manner suggested herein.

^{46/} DEIS, Volume 3B at OH-137.

Third, the above-noted "70 dBA Ldn and 5 dBA Ldn increase" standard also is arbitrary and capricious in that it ignores the standards adopted by other federal agencies. As explained in the verified statement of Edward J. Walter, Jr., the Environmental Protection Agency and the Department of Housing and Urban Development (HUD) use 55 decibels as their goal for outdoor noise in residential areas. Outdoor noise above 65 dB but not exceeding 75 dB is "normally unacceptable" for HUD assisted development. Outdoor noise above 75 dB is "unacceptable" to HUD.

In light of the clear HUD standard for acceptable noise levels, the DEIS standard for considering the significance of noise increases cannot be justified. If noise levels will increase to a level deemed unacceptable by HUD as a result of increased train movements, it makes no sense to say that this level of noise does not require mitigation simply because the increase in noise is less than approximately 320%, i.e. a 5 dB increase. Accordingly, BRL request that the FEIS abandon the 70 dBA Ldn/5 dBA Ldn increase standard in favor of one that is consistent with HUD's approach. That is, if residential neighborhood noise would increase to a level above the 75 dBA HUD standard as a result of the Conrail acquisition, mitigation should be mandated to permit the neighborhood to remain below the 75 dBA level.

Without such a standard, the quality of life of the residents of "sensitive receptors" would be severely impacted and their economic losses also would be great. That is, as Mr.

Walter explains, not only would unacceptable noise levels prohibit HUD funding for new development, but such noise levels also are recognized by HUD to be "a marketability factor" for existing facilities. That is, HUD considers this factor in determining the amount of insurance or other assistance that may be given.

HUD is not alone in viewing the noise NS proposes to visit on the BRL communities as a "marketability factor." Prospective purchasers also consider noise in determining the value of housing. As recently reported in the Ohio Realtor, a Lakewood Realtor has stated that "Houses next to the tracks are virtually unsellable. I have seen four listings in Lakewood that are directly on the tracks that have sold for substantially less dollars."

In brief, increased noise translates to lower property values, another cost proposed to be borne by the BRL communities to allow NS to obtain "net operating benefits in a normal year of \$553 million."

These are not unfounded concerns of the thousands of citizens of Lakewood, Rocky River and Bay Village who reside in the vicinity of the NS tracks. As reflected in Mr. Walter's exhibits EJW-2 and EJW-3, with 34.1 trains per day, the noise levels at the 100 feet distance will be above 75 dB, i.e. "unacceptable" at eight of the nine tested locations. In fact, noise will, on average, be at the 75 dB level 164 feet from the tracks. The 65 dB level, i.e. the bottom end of the "normally

unacceptable" level, would not be reached for hundreds of feet from the NS tracks.

To say that these levels do not give rise to the need for mitigation because the noise level has not increased by 320%, i.e. an increase of 5 dB, is flatly absurd. If an increase in pre-existing levels from 65 dB to 70 dB is worthy of mitigation, a locale with a pre-existing dB level of between 70 and 75 should not have to experience a 320% increase in noise in order to justify mitigation. This is precisely the case in the BRL communities. The average 100' Ldn at 13.5 trains per day is 72.6. At 34.1 trains per day, the average 100' Ldn would be 76.6, well above the HUD level of "unacceptable."

There are two fundamental points here. First, the 70 dba/5 dBA Ldn increase standard is meritless. If a quantitative approach is to be used, the HUD standards should be adopted. Assuming, arguendo, that any reason exists not to adopt the HUD standards, then the Ldn increase required for mitigation should decline as the pre-existing 100' Ldn figure increases in order to reflect the severity of the actual noise increase.

Second, under any reasonable standard, the 100' Ldn levels and the number of sensitive receptors within the 65 db contour line in the BRL communities which would result from an increase in the number of trains per day to 34.1 demand mitigation. As computed by Mr. Walter, the 100' Ldn levels range from a "low" of 70.6 to a high of 81.1 and average 76.6. Given the thousands of

people that would be faced with unacceptable noise levels, NS should be ordered to take its additional trains elsewhere.

4) Air Quality: As explained by the verified statement of David H. Minott, the DEIS air quality analysis ignores the fact that projected CO impacts resulting from motor vehicles queued at grade crossings exceed the "significant impact level" by substantial amounts at Hird Avenue in Lakewood. In light of Mr. Minott's findings, NS should be required to perform a refined air-quality modeling assessment for motor vehicle queuing at all BRL grade crossings. The results of this analysis, verified by the Board, should be included in the FEIS.

5) Maximum Delay For At-Grade Crossings And Its Impact On Emergency Services: As noted supra, the train speed issue cuts across a number of the DEIS analyses. One affected calculation is the purported "estimated maximum delay (in minutes) for at-grade roadway crossings" found in DEIS, Volume 3B, Table 5-OH-53. It should be clear that the figures shown in this table cannot possibly be the "maximum" delay at the BRL grade crossings with the highest ADTs. Rather, since this table assumes that NS will operate each one of its trains at the maximum authorized speed, Table 5-OH-53 must be relabeled as the estimated "minimum" delay at at-grade crossings.

The maximum delay at at-grade crossings should be computed to reflect the likely average speeds as discussed above and the correct "time in minutes for gate closing and opening prior to and after the passage of the train", discussed infra. By way of

example, if a value of 30.1 mph is used for speed through Lakewood and a value of 0.66 is used for gate up and down time, the daily blockage caused by 34.1 trains would be 86.87 minutes, 20% greater than shown in Table 5-OH-53 for Lakewood locations.

We note in this regard that the DEIS has failed to recognize that changes in the total blocked crossing time per day are a more than reasonable tool to estimate changes in the number of emergency vehicles that would be delayed every year in BRL if NS is allowed to operate 34.1 trains per day. That is, in Volume 3B at OH-137, the DEIS states: "SEA has not predicted frequencies of delay for emergency response vehicles, due to the inherent uncertainties and obvious localized issues such as locations of responding emergency vehicles." BRL submit that this statement is incorrect and that our contention that the proposed increase in NS traffic would result in over 600 delays to emergency services vehicles annually can be verified easily.

Based on the data in BRL-2, we know that the Lakewood, Bay Village, and Rocky River police, fire, and EMS services are blocked by trains at least 253 times per year under current conditions. If total blocked crossing time per day with 34.1 trains per day is 258% of total blocked crossing time per day with 13.5 trains per day, as computed by Table 5-OH-53, then it must be assumed that delays to emergency vehicles will increase by roughly the same percentage. Stated another way, the FEIS must assume that there would be approximately 653 emergency vehicle delays per year if NS operates 34.1 trains per day. BRL

submit that this is an unacceptable result and requires mitigation.

6) Roadway Crossing Delay: As described in DEIS Volume 1 at 3-19, the DEIS uses a "level of service" ("LOS") analysis to measure the significance of delays to highway traffic resulting from increased rail traffic. Simply stated, the DEIS does not consider the impact of additional rail traffic on highway traffic to be significant unless it results "in (1) a post-Acquisition level of service E and F regardless of the pre-Acquisition condition, or (2) a reduction from pre-Acquisition level-of-service C or better to a post-Acquisition level of service D."^{47/}

BRL note at the outset that the DEIS LOS analysis reasonably may be characterized as "a straw that broke the camel's back" approach. That is, in all but the most extreme situations, even if the impact of increased rail traffic on street traffic would be severe, it would not give rise to a mitigation recommendation unless the pre-existing condition was poor at best. In fact, the only grade crossing for which a grade separation is recommended by the Supplemental Errata has a pre-acquisition LOS of D.

This approach to traffic mitigation differs markedly from the above-described approach to noise mitigation. In the noise context, a finding that mitigation is necessary is actually less likely if pre-acquisition noise levels are high. That is, a 5 db

^{47/} Note that this second option for relief does not appear in Volume 5A at C-15. Thus, it is not clear which of these two sets of criteria were used by the DEIS. This issue should be clarified in the FEIS.

increase is less likely if the pre-acquisition noise level is 70 db than if it is 65 db. In contrast, in the context of viewing traffic impacts, unless the pre-acquisition LOS is high, the post-acquisition LOS could not rise to a level at which a grade separation is considered necessary.

BRL urge reconsideration of these inconsistent approaches in the FEIS. The key issues in designing environmental mitigation are that the mitigation "must be reasonable" and "must be directly related to the impact caused by the Acquisition."^{48/} Accordingly, if grade separations are to be ordered because a currently bad LOS would be made worse by the Conrail acquisition, noise mitigation must be ordered if currently bad noise levels would be made worse by the Conrail acquisition.

A review of the Supplemental Errata, Table 5-OH-11 (Revised), establishes part of the basis for BRL's concern with vehicle delays. According to the DEIS analysis, the "average delay per vehicle", i.e. the numerical equivalent of the LOS grade, would increase by 163% at the five BRL crossings considered, West 117 St, Bunts Rd, Columbia Rd, Dover Center Rd, and Bradley Rd, as a result of the Conrail acquisition. Even assuming, arguendo, that the average delay per vehicle has been calculated accurately, but see infra, this is a substantial increase in average vehicle delay. And yet, because of its failure to consider cumulative impacts, the DEIS does not consider whether this increase in average vehicle delay should

^{48/} DEIS, Volume 1 at 3-3.

serve as part of the justification for environmental mitigation. This is error. The purpose of environmental mitigation should be to identify not just substantial individual environmental degradations, but to identify all environmental degradations and to return communities, as closely as possible, to the pre-existing condition.

In any event, the "pre" and "post" "crossing delay per stopped vehicle" and "average delay per vehicle" must still be calculated accurately. And, it is clear that the figures presented in Table 5-OH-11 (Revised) are not accurate for the following reasons.

First, as discussed previously, the DEIS has erred in utilizing the maximum allowed speed rather than a reasonable estimate of an average speed. Reducing the speed used in the calculations to the average speed of the trains is necessary to arrive at accurate crossing delay and average delay data.

Second, as also discussed previously, the DEIS has erred in accepting a post-acquisition trains per day figure that NS has not been able to verify.

Third, in computing the "blocked crossing time per train, another of the components of both the crossing delay and the average delay, the DEIS utilized an understated, i.e. 0.50 minutes, constant to reflect the "time in minutes for gate closing and opening prior to and after the passage of the train."^{49/} According to the October 30, 1997 letter from counsel

^{49/} DEIS, Volume 5A at C-11.

for NS to BRL, NS gates "begin their downward motion after a train has been detected and the gate delay time (no less than three (3) seconds after activation of the warning devices) has expired. The time in question may vary from 22 seconds to 27 seconds prior to the arrival of a train at the crossing." The December 8, 1997 letter from counsel for NS to BRL clarified that the above-noted "three seconds is in addition to the 22 to 27 second variance." In other words, the "gate down time" will range from 25 to 30 seconds for an approximate average of 27.5 seconds.

Also according to NS, its "gates are electrically programmed to raise in not more than twelve (12) seconds after a train has cleared the crossing circuit."^{50/}

In brief, the actual NS "time in minutes for gate closing and opening prior to and after the passage of the train" averages 39.5 seconds (27.5 + 12). Accordingly, 0.66 should be substituted for 0.50 in the FEIS formula.

III. CONCLUSION AND REQUEST FOR MITIGATION

As detailed hereinabove, the DEIS, notwithstanding errors that substantially understate environmental impacts, has confirmed BRL's initial view that the Norfolk Southern proposal to dramatically increase traffic on the Cleveland to Vermilion line segment would result in environmental degradation that must be mitigated. When the environmental impacts of this transaction are considered individually, they are severe. When they are

^{50/} NS-32, response 6(b).

considered in the aggregate, they amount to nothing less than an assault on quality of life.

BRL have been advised that other parties representing Ohio interests will be presenting a mitigation proposal to the Board that would address the concerns, not only of BRL, but of other Ohio locales, including Cleveland. If such a mitigation proposal were to be adopted by the Board, BRL would, of course, be entirely supportive.

However, if, for any reason, a "global" solution cannot be found that would resolve the concerns of the Greater Cleveland area, BRL believe that the only mitigation step that will completely eliminate the harms of the NS proposal to BRL is adoption of the mitigation plan outlined by Mr. Maestri on November 25, 1997.^{51/} Following a recalculation of the

^{51/} For purposes of clarity, BRL also wish to review other mitigation suggestions, including those contained in BRL-2. We adhere to our view that (1) the best mitigation that SEA can recommend is a condition limiting NS traffic over the Cleveland to Vermilion line segment to the Base Case level; and (2) SEA should recommend that the Board retain jurisdiction over this proceeding for purposes of expanding environmental mitigation should the acquiring railroads' operations be significantly different than those contemplated in the FEIS. At the least, NS should be required to (1) install gates and lights at all grade crossings in BRL; (2) pay for the construction of a new Fire/EMS station in Rocky River north of the tracks (see the Supplemental Verified Statement of James R. Linden); (3) replace the Clague Siding with a new siding west of BRL; (4) repair the bridge located to the west of the Westlake Hotel; and (5) follow the best practices permitted by the Federal Railroad Administration for noise abatement following completion of FRA's ongoing study. Given that NS is not operating at its maximum speed limit today, we see no benefit to expenditures to increase that speed limit. Neither do we see a benefit to improved communications between NS and emergency services providers unless those improvements can be fully integrated into existing computer dispatching programs. We
(continued...)

environmental data as requested herein, the FEIS should recommend, and the Board should order, NS to implement that plan at its sole cost at the earliest practicable date.

In no event should the FEIS adopt the "consultation" approach found in the DEIS. That approach, which places all bargaining power in the hands of NS, constitutes an abdication of the STB's responsibilities under the ICCTA and NEPA and will do nothing to mitigate the environmental damage NS proposes.

This is not to say that BRL are unwilling to enter into discussions with NS and others in order to find a mutually acceptable global solution or to use our good offices to assist NS in its effort to secure funding for elements of its mitigation proposal that would be of benefit to our neighbors, e.g. the proposed grade separations in Berea and Olmsted Falls. However, the fact remains that it is NS that is proposing this transaction and it is NS that will enjoy "net operating benefits in a normal year of \$553 million." If, for any reason, public funding is not available to assist NS in these efforts, it is NS that should

^{51/}(...continued)

have serious questions as to whether new grade separations are feasible within BRL. However, if a "global" solution is not found, and if the Maestri solution is not mandated, BRL recommend that NS be required to fund studies to determine whether grade separations are feasible and be required to fully fund grade separations where feasible in BRL.

bear the cost. The citizens of Lakewood, Bay Village, and Rocky River should not be held hostage by NS.

VERIFIED
STATEMENTS

**SUPPLEMENTAL VERIFIED STATEMENT
OF
KEVIN F. BEIRNE**

My name is Kevin F. Beirne, Building Commissioner, City of Rocky River, Rocky River, Ohio. I previously submitted a verified statement consisting of two written pages and Exhibits KFB-1 and KFB-2. That statement was verified by me to be true on October 6, 1997. I wish to supplement my previous statement at this time.

Since then, revised data has been collected regarding the number of sensitive receptors within the Pre- and Post-Acquisition 65 dBA L_{dn} noise contour based on the information collected by Dr. Edward J. Walter & Associates regarding acquisition noise impact (i.e. the areas exposed to an average noise level of 65 dB, L_{dn}) on the City of Rocky River. The methodology utilized by Edward Walter, Jr. to obtain noise contour distances in feet is set forth in his Verified Statement and summarized in Exhibit EJW-2.

Three locations were monitored within the City of Rocky River, Normandy Manor, Elmwood Park, and the Westlake Hotel. Based upon a Pre-Acquisition average of 13.5 trains per day, distances of 145, 450, and 410 feet respectively were obtained. These figures increased to 335, 920, and 850 feet respectively assuming an Applicant estimated Post-Acquisition increase to 34.1 trains per day.

Pre-Acquisition points were plotted in both directions (North and South) of the tracks and connected by a straight line as demonstrated within Figure F-3, Page F-12 in the DEIS. The number of sensitive receptors within that area were counted. Nine hundred and thirty (930) sensitive receptors were located within the Base Case area,

including one nursing home. No churches or schools are located within the Base Case noise contour.

The Post-Acquisition numbers obtained by Edward Walter & Associates were also plotted and connected via a straight line in both directions (North and South) of the tracks. One thousand three hundred and thirty eight (1338) sensitive receptors were counted within the Post-Acquisition area including three schools, one church, and one nursing home. A comparison of the Base Case and Post-Acquisition sensitive receptor figures reveals that an additional four hundred and eight (408) sensitive receptors will be affected if the Acquisition at issue is approved as proposed. This represents a net increase in the number of sensitive receptors who will be affected of 43.9%. This 43.9% increase is unacceptable to the City of Rocky River and its residents.

VERIFIED STATEMENT

OF

BRIAN F. MORAN

My name is Brian F. Moran, and I am the Building Commissioner for the City of Lakewood, Ohio, and have been since July 1, 1990. I have been employed by the City of Lakewood since June 5, 1978, and possess the following credentials and licenses to perform the duties required by the position: State of Ohio - Class I Building Official; State of Ohio - Class III Field Inspector; State of Ohio - Electrical Safety Inspector; State of Ohio - Plumbing Inspector; Council of American Building Officials - Certified Building Official. A copy of my resume outlining my professional qualifications is attached hereto as Exhibit "A."

I was asked to chart on a map of the City of Lakewood chart the following distances on the map attached hereto as Exhibit "B:"

- A. Cohasset Place – 480 feet (Perimeter 1) and 970 feet (Perimeter 2) both north and south of the Norfolk-Southern railroad tracks;
- B. Bunts Road – 1040 feet (Perimeter 1) and 1825 feet (Perimeter 2) both north and south of the Norfolk-Southern railroad tracks; and
- C. Virginia Avenue – 510 feet (Perimeter 1) and 1020 feet (Perimeter 2) both north and south of the Norfolk-Southern railroad track.

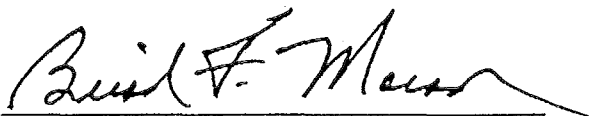

I then determined how many "sensitive receptors," residences (dwelling units), churches, schools and hospitals were located within both Perimeter 1 and Perimeter 2 as follows:

1. There are 1020 structures located in Perimeter 1 containing 2335 dwelling units.
2. There are 1018 structures located in Perimeter 2 containing 1584 dwelling units.
3. There are 2038 structures located in both areas with a total of 3919 dwelling units.
4. Included within both areas are also:
 - 6 schools
 - 1 hospital
 - 7 churches
 - 3 nursing homes
 - 2 assisted living facilities
 - 5 parks
 - 1 library

Graduated 1967 from Cuyahoga Community College -- Associate Arts Degree
Business Management

Continuing education -- Seminars and schooling required for building, electrical,
H.V.A.C. and plumbing State licenses yearly from 1978 to
present.

Experience

July 1, 1990 to Present -- Chief Building Official for the City of Lakewood, Ohio.

Chief Building Official for the City of Lakewood, Ohio, population 60,000. Responsible for the supervision and management of the largest suburban Building Department in the State of Ohio, consisting of a staff of twenty (20) full-time and two (2) part-time employees with an annual budget of \$923,000.00 for Fiscal Year 1997. The City of Lakewood is an inner ring suburb of metropolitan Cleveland, consisting of five and a half square miles, with 12,594 one and two family structures and 988 multi-family structures with a total of 28,683 dwelling units. While the City is totally developed with an aging housing stock and commercial district, it has undergone revitalization with its new City Center Project and aggressive housing inspection and rehabilitation programs.

Job duties include, but are not limited to, overall supervision of the Building Department in relation to Building and Zoning Codes. Administration's representative to the Planning Commission, Board of Zoning Code of Appeals, Board of Building Standards/Architectural Review Board and Lakewood Reinvestment Housing Council. Issuance and inspection of all building, plumbing, electrical and H.V.A.C. permits. Licensing of all contractors, rental dwelling units, solicitors, vendors, coin operated amusement devices, bowling alley and billiard rooms and other licenses as required by the Codified Ordinances.

Resume for Brian F. Moran continued...

Experience Continued...

January 1988 to June 1990 -- Assistant Building Commissioner for the City of Lakewood.

Assistant Building Commissioner in charge of all residential properties (12,781 dwelling units). Supervision of four Building Inspectors and two Complaint Investigators regarding new construction, remodeling work, building, electrical, plumbing, heating, ventilation, air conditioning, and all building and maintenance complaints concerning absentee and owner occupied properties. Record keeping, training of new inspectors, representation of the Administration at Architectural Review Board, Board of Zoning Code of Appeals, and Planning Commission meetings. Housing Officer for the Lakewood Community Reinvestment Area Housing Council Tax Abatement Program.

June 1978 to January 1988 -- Employed by the City of Lakewood Building Department as a Building Inspector in the Commercial Division.

Building Inspector of new and existing buildings relating to building, electrical, plumbing and heating, ventilation and air conditioning. Associated record keeping; trained new inspectors; represented the Administration at various appeal board meetings; issued building, electrical, plumbing, heating and ventilation and air conditioning permits; inspected for retail Certificates of Occupancy; made annual inspections; made complaint inspections; etc. Acted as backup supervisor for Assistant Commissioners during their absence.

October 1968 to June 1978 -- Employed as a Junior Civil Engineer by the Cuyahoga County Engineer.

Junior Civil Engineer in supervisory position of four to seven men involving field construction layout. Inspected various jobs such as highway and bridge construction, sewer, water, and gas line installation, new building layout, etc.

October 1965 to June 1978 -- Part-time remodeling subcontractor with various general contractors.

1964 to 1967 -- College student.

Resume for Brian F. Moran continued...

Special Qualifications

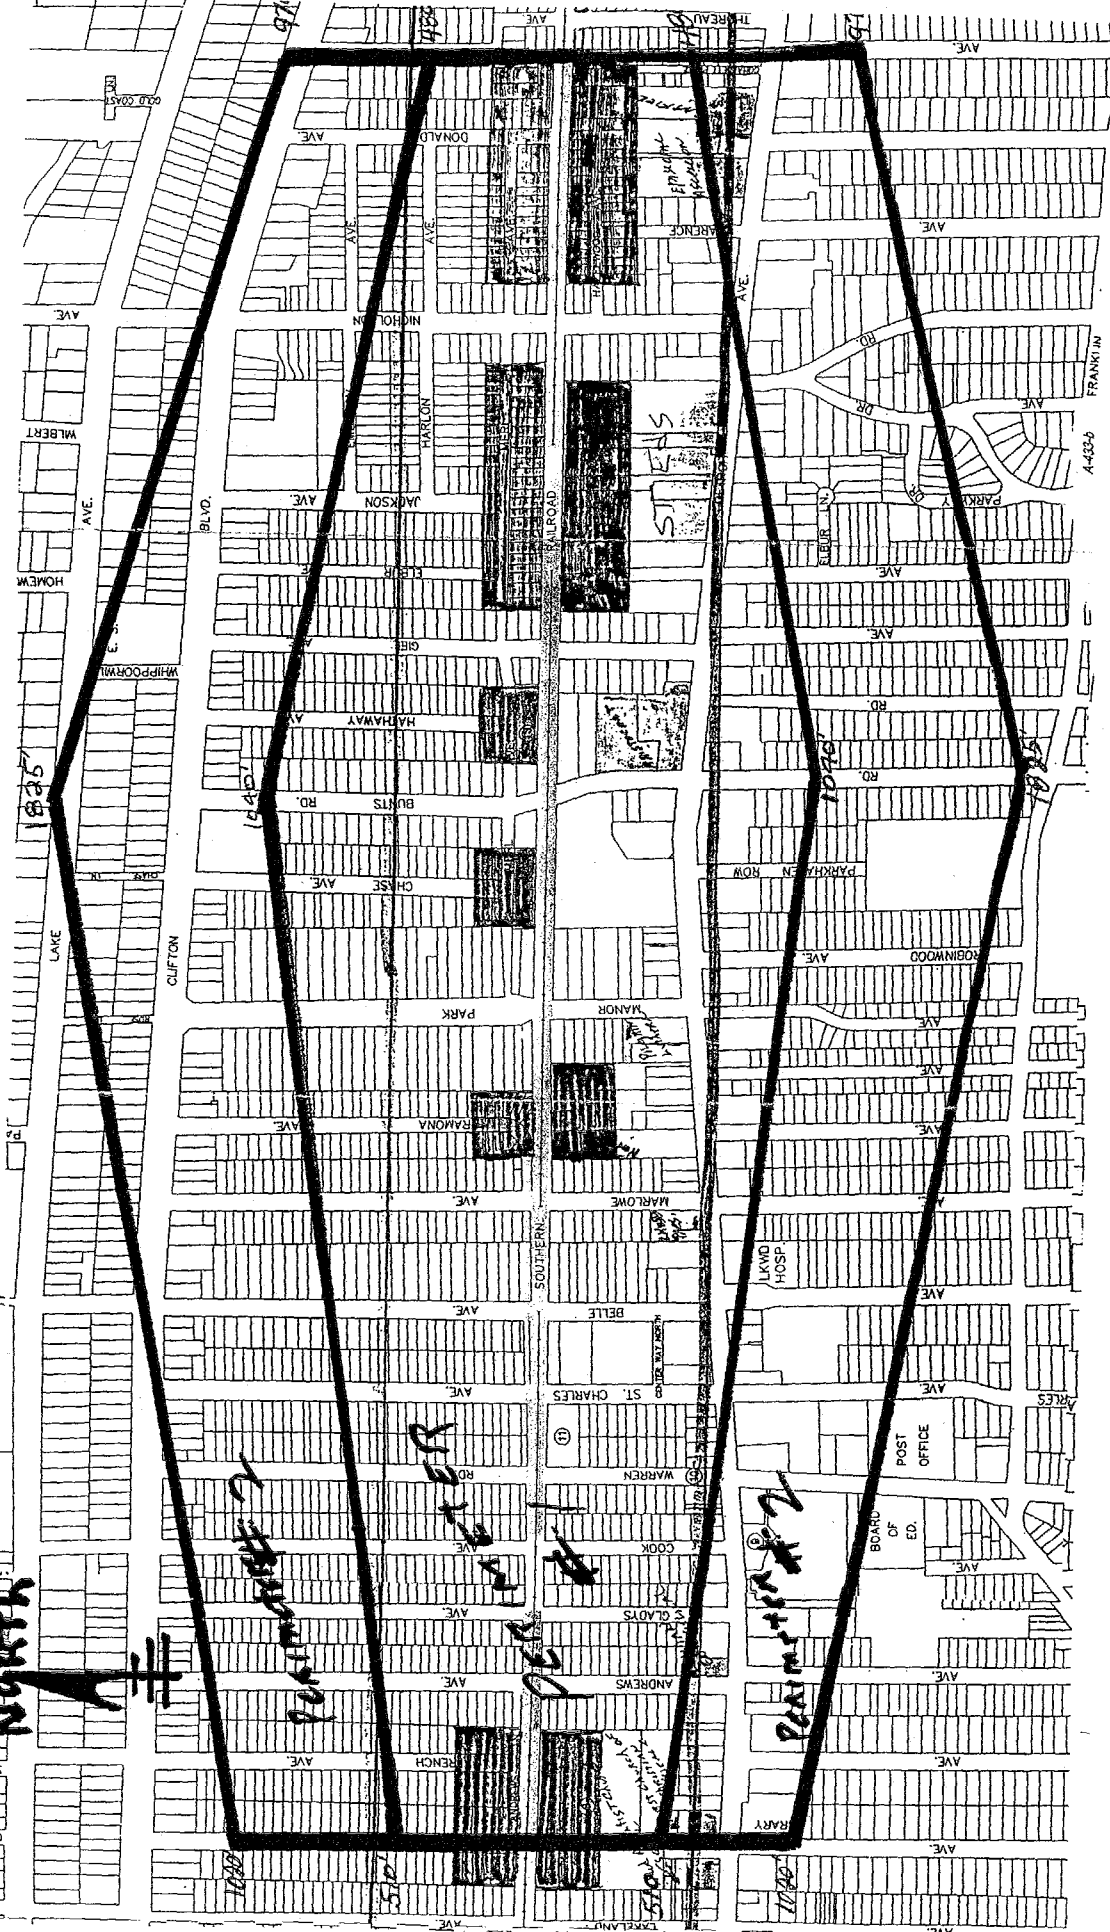

Presently hold the following State of Ohio Certificates of Competency:

Class I – Chief Building Official
Class III – Field Inspector
Electrical Safety Inspector #728
Certified Plumbing Inspector #370
Council of American Building Officials Certified Building Official
Certificate #900

Personal History

Fifty-three years of age and resident of the City of Fairview Park for the past nine years with wife of 30 years, Norma Jean Moran. Three children: Matthew, 28; Kelly, 26, and Erin, 21. Member of St. Angela's Parish, the West Park Knights of Columbus, the Building Officials Conference of Northeast Ohio, the Ohio Association of Plumbing Inspectors, the International Association of Electrical Inspectors, the Western Reserve Division of the International Association of Electrical Inspectors, the Council of American Building Officials, the Building Officials and Code Administrators, the National Fire Protection Association, and the Lakewood Reinvestment Area Housing Council.

VERIFIED STATEMENT OF
EDWARD J. WALTER, JR.

My name is Edward J. Walter, Jr. I am Vice President and Chief Executive Officer of Dr. Edward J. Walter & Associates, Inc., 9241 Ravenna Road, C-6, Twinsburg, Ohio 44087. A statement of my qualifications is attached as EJW-1.

I have been engaged by the cities of Rocky River, Lakewood, and Bay Village, Ohio to examine the impact of the proposed increase in the number of Norfolk Southern trains from an average of 13.5 per day to an average of 34.1 trains per day. My findings are attached in tabular form in EJW-2 and EJW-3.

Prior to discussing my findings, I want to outline the methodology my firm utilized in compiling data. As an initial matter, my firm did not seek to determine noise impacts along the entire Cleveland to Vermilion line segment. Rather, we examined noise impacts on three locations in each of the BRL communities, i.e. Normandy Manor, Elmwood Park, and Westlake Hotel in Rocky River; Dover Center, Naigle Road, and Parkside Road in Bay Village; and Cohasset Place, Bunts Road, and Virginia in Lakewood. As shown in EJW-2, these locations included two wayside locations and one crossing location for each of the three communities.

Once approximate locations were selected for our tests, our noise measurement equipment (Quest Technologies Model 2900 Integrating/Logging Sound Level Meter Type 1) was installed at distances of either 140 feet or 150 feet from the Norfolk Southern track. At each location, measurements were taken over approximately 24 hours. Our tests began on November 19, 1997 at

the Normandy Manor location in Rocky River and ended on December 19, 1997 at the Virginia location in Lakewood. The equipment was monitored at all times by a technician.

For obvious reasons, the number of Norfolk Southern trains passing by each location on the day of our tests did not equal the 13.5 train average used as the Base Case in the Conrail acquisition proceeding. Thus, while I have presented the LDN(65) values actually recorded in the EJW-2 column headed "actual train values", I have converted those values in the next column, headed "13.5 trains/day", in order to give the Surface Transportation Board LDN(65) values for the Base Case.

It is important to note two facts with regard to the data I have compiled. First, while the noise measurement was done by my firm, we have consistently applied the Norfolk Southern methodologies as presented in Appendix B, Noise Methodology.

Second, while the LDN(65) distances shown for the locations vary widely, this is not an unusual result. Any number of location-specific factors, including topography and ambient noise levels, affect LDN(65) distances.

The next column of EJW-2 again reflects a conversion of the actual train values to demonstrate the results if the number of trains is increased to 34.1 per day, i.e. the number of trains Norfolk Southern says it will average in the Post-Acquisition environment.

It is my understanding that representatives of Rocky River, Bay Village, and Lakewood will be reviewing maps to determine the

number of "sensitive receptors" located within the distances from the Norfolk Southern tracks shown in my 13.5 trains per day and 34.1 trains/day columns to develop totals for the three communities in the Base Case and Post Acquisition environments. I consider this to be a reasonable use of my data.

The next three columns on EJW-2 present the 100 feet LDN levels as measured ("actual train values"), for the Base Case ("13.5 trains/day"), and for the Post Acquisition Case ("34.1 trains/day"). As shown in the final column, the change from the Base Case number of trains to the Post Acquisition number of trains is 4.0 dB.

It is my understanding that the Draft Environmental Impact Statement proposes no mitigation measures when the change in dB is less than 5.0. Given the number of sensitive receptors affected in these three communities and the high noise levels already present in these locations, I believe the DEIS approach to be in error.

In order to explain the basis for my position, I first want to explain the significance of changes in dB levels. As reflected in the Handbook of Noise Measurement (pages attached at EJW-4), a change of 3 dB indicates an approximate doubling of noise. A change of 4 dB (the predicted change for Rocky River, Bay Village, and Lakewood) indicates a noise level approximately 2.5 times the original, and a dB level 5 higher than the status quo indicates a resulting noise level approximately 3.2 times the prior level.

Since phrases such as "doubling" and "tripling" do not give a clear picture of the significance of the resulting noise level, I have attached EJW-5, regulations of the Office of the Secretary, U.S. Department of Housing and Urban Development. As may be seen in Section 51.101(a)(3), page 287, "HUD assistance for the construction of new noise sensitive uses is prohibited generally for projects with unacceptable noise exposures and is discouraged for projects with normally unacceptable noise exposure." "Noise sensitive uses" are defined in the same section to include housing, nursing homes, and hospitals, what the DEIS calls "sensitive receptors."

Section 51.101(a)(4) also points out the obvious fact that "environmental noise is a marketability factor" for existing facilities and HUD considers this factor "in determining the amount of insurance or other assistance that may be given."

HUD's "exterior noise goals", found in Section 51.101(a)(8), are that these levels "not exceed a day-night average sound level of 55 decibels." HUD notes that this level is recommended by the Environmental Protection Agency as a goal for outdoors in residential areas. HUD further states that "for the purposes of this regulation and to meet other program objectives, sites with a day-night average sound level of 65 and below are acceptable and are allowable." In order to place this in context, the Board thus should note that moving the 65 Ldn line further away from the tracks, the result of increasing the number of trains, means that additional homes and other receptors will be in a noise zone

that is neither acceptable nor allowable. Thus, when we say that additional sensitive receptors would be placed within the 65 Ldn contour line, what we are really saying is that the amount of noise experienced by these receptors has become unacceptable.

The above-noted standards of acceptability for HUD assistance for the construction of new noise sensitive uses are contained in Section 51.103(c) of HUD's regulations, page 289. As may be seen, "normally unacceptable" is defined as "above 65 dB but not exceeding 75 dB." "Unacceptable" is defined as "above 75 dB." Using these definitions, the data in EJW-2 thus mean that at a distance of 100' from the Norfolk Southern tracks, 13.5 trains a day result in a dB that is "normally unacceptable" for all but one location and that one location, Bunts Road, is in the "unacceptable" category.

With 34.1 trains per day, the results are reversed. That is, one location, Normandy Manor, remains in the "normally unacceptable" category and every other location would be placed in the "unacceptable" category.

EJW-3 quantifies the extent of the "unacceptable" noise levels under the Norfolk Southern proposal, i.e. the locations experiencing Ldn (75) with 34.1 trains per day. As may be seen, the contour line for noise levels deemed unacceptable by HUD would range from a low of 38 feet from the tracks at the Normandy Manor location to 360 feet at the Bunts Road location. On average, all receptors within 164 feet of the track would experience unacceptable noise levels. Given that receptors on

both sides of the track are affected, a strip of land approximately 328 feet wide along the right of way would experience noise levels HUD states are unacceptable.

When faced with these results, it is clear to me that the STB's 5 dB change criterion of significance ignores reality. An increase in the number of trains from 13.5 to 34.1 on the line passing through Rocky River, Bay Village, and Lakewood would create a large area that would be unacceptable under HUD criteria and would create an even larger area in which HUD would recognize that the marketability of the property would be adversely affected.

A-437-b

weighting networks (L_C-L_A) is frequently noted. (This difference in decibels is called the "harmonic index" in that application only.) It serves, as indicated above, to give some idea of the frequency distribution of the noise. This difference is also used in other noise-rating techniques in conjunction with the A-weighted sound level.

2.6 COMBINING DECIBELS.

A number of possible situations require the combining of several noise levels stated in decibels. For example, we may want to predict the effect of adding a noisy machine in an office where there is already a significant noise level, to correct a noise measurement for some existing background noise, to predict the combined noise level of several different noise sources, or to obtain a combined total of several levels in different frequency bands.

In none of these situations should the numbers of decibels be added directly. The method that is usually correct is to combine them on an energy basis. The procedure for doing this is to convert the numbers of decibels to relative powers, to add or subtract them, as the situation may require, and then convert back to the corresponding decibels. By this procedure it is easy to see that a noise level of 80 decibels combined with a noise level of 80 decibels yields 83 decibels and not 160 dB. A table showing the relation between power ratio and decibels appears in Appendix I. A chart for combining or subtracting different decibel levels is shown in Appendix II.

The single line chart of Figure 2-4 is particularly convenient for adding noise levels. For example, a noisy factory space has a present A-weighted level at a given location of 82 dB. Another machine is to be added 5 feet away. Assume it's known from measurements on the machine, that at that location in that space, it alone will produce an A-weighted level of about 78 dB. What will the over-all level be when it is added? The difference in levels is 4 dB. If this value is entered on the line chart, one finds that 1.5 dB should be added to the higher level to yield 83.5 dB as the resultant level.

2.7 VIBRATION.

Vibration is the term used to describe continuing or steady-state periodic motion. The motion may be simple harmonic motion like that of a pendulum, or it may be complex like a ride in the "whip" at an amusement park.

Figure 2-4. Chart for combining noise levels.

Appendix II

Chart for Combining Levels of Uncorrelated Noise Signals*

TO ADD LEVELS

Enter the chart with the NUMERICAL DIFFERENCE BETWEEN TWO LEVELS BEING ADDED. Follow the line corresponding to this value to its intersection with the curved line, then left to read the NUMERICAL DIFFERENCE BETWEEN TOTAL AND LARGER LEVEL. Add this value to the larger level to determine the total.

Example: Combine 75 dB and 80 dB. The difference is 5 dB. The 5-dB line intersects the curved line at 1.2 dB on the vertical scale. Thus the total value is $80 + 1.2$ or 81.2 dB.

TO SUBTRACT LEVELS

Enter the chart with the NUMERICAL DIFFERENCE BETWEEN TOTAL AND LARGER LEVELS if this value is less than 3 dB. Enter the chart with the NUMERICAL DIFFERENCE BETWEEN TOTAL AND SMALLER LEVELS if this value is between 3 and 14 dB. Follow the line corresponding to this value to its intersection with the curved line, then either left or down to read the NUMERICAL DIFFERENCE BETWEEN TOTAL AND LARGER (SMALLER) LEVELS. Subtract this value from the total level to determine the unknown level.

Example: Subtract 81 dB from 90 dB. The difference is 9 dB. The 9-dB vertical line intersects the curved line at 0.6 dB on the vertical scale. Thus the unknown level is $90 - 0.6$ or 89.4 dB.

*This chart is based on one developed by R.Musa.

Office of the Secretary, HUD

§ 50.43

accordance with paragraphs (a) through (d) of § 50.23.

§ 50.35 Use of prior environmental assessments.

When other Federal, State, or local agencies have prepared an EA or other environmental analysis for a proposed HUD project, these documents should be requested and used to the extent possible. HUD must, however, conduct the environmental analysis and prepare the EA and be responsible for the required environmental finding.

§ 50.36 Updating of environmental reviews.

The environmental review must be re-evaluated and updated when the basis for the original environmental or compliance findings is affected by a major change requiring HUD approval in the nature, magnitude or extent of a project and the project is not yet complete. A change only in the amount of financing or mortgage insurance involved does not normally require the environmental review to be re-evaluated or updated.

Subpart F—Environmental Impact Statements

§ 50.41 EIS policy.

EIS's will be prepared and considered in program determinations pursuant to the general environmental policy stated in § 50.3 and 40 CFR 1505.2 (b) and (c).

§ 50.42 Cases when an EIS is required.

(a) An EIS is required if the proposal is determined to have a significant impact on the human environment pursuant to subpart E.

(b) An EIS will normally be required if the proposal:

(1) Would provide a site or sites for hospitals or nursing homes containing a total of 2,500 or more beds; or

(2) Would remove, demolish, convert, or substantially rehabilitate 2,500 or more existing housing units (but not including rehabilitation projects categorically excluded under § 50.20), or which would result in the construction or installation of 2,500 or more housing units, or which would provide sites for 2,500 or more housing units.

(c) When the environmental concerns of one or more Federal authorities cited in § 50.4 will be affected by the proposal, the cumulative impact of all such effects should be assessed to determine whether an EIS is required. Where all of the affected authorities provide alternative procedures for resolution, those procedures should be used in lieu of an EIS.

§ 50.43 Emergencies.

In cases of national emergency and disasters or cases of imminent threat to health and safety or other emergency which require the taking of an action with significant environmental impact, the provisions of 40 CFR 1506.11 and of any applicable § 50.4 authorities which provide for emergencies shall apply.

PART 51—ENVIRONMENTAL CRITERIA AND STANDARDS

Subpart A—General Provisions

Sec.

- 51.1 Purpose.

AUTHORITY: 42 U.S.C. 3535(d), unless otherwise noted.

SOURCE: 44 FR 40861, July 12, 1979, unless otherwise noted.

Subpart A—General Provisions

§ 51.1 Purpose.

The Department of Housing and Urban Development is providing program Assistant Secretaries and administrators and field offices with environmental standards, criteria and guidelines for determining project acceptability and necessary mitigating measures to insure that activities assisted by the Department achieve the goal of a suitable living environment.

§ 51.2 Authority.

This part implements the Department's responsibilities under: The National Housing Act (12 U.S.C. 1701 *et seq.*); sec. 2 of the Housing Act of 1949 (42 U.S.C. 1441); secs. 2 and 7(d) of the Department of Housing and Urban Development Act (42 U.S.C. 3531 and 3535(d)); the National Environmental Policy Act of 1969 (42 U.S.C. 4321); and the other statutes that are referred to in this part.

[61 FR 13333, Mar. 26, 1996]

§ 51.3 Responsibilities.

The Assistant Secretary for Community Planning and Development is responsible for administering HUD's environmental criteria and standards as set forth in this part. The Assistant Secretary for Community Planning and Development may be assisted by HUD officials in implementing the responsibilities established by this part. HUD will identify these HUD officials and

24 CFR Subtitle A (4-1-97 Edition)

their specific responsibilities through FEDERAL REGISTER notice.

[61 FR 13333, Mar. 26, 1996]

§ 51.4 Program coverage.

Environmental standards shall apply to all HUD actions except where special provisions and exemptions are contained in each subpart.

Subpart B—Noise Abatement and Control

§ 51.100 Purpose and authority.

(a) It is the purpose of this subpart B to:

(1) Call attention to the threat of noise pollution;

(2) Encourage the control of noise at its source in cooperation with other Federal departments and agencies;

(3) Encourage land use patterns for housing and other noise sensitive urban needs that will provide a suitable separation between them and major noise sources;

(4) Generally prohibit HUD support for new construction of noise sensitive uses on sites having unacceptable noise exposure;

(5) Provide policy on the use of structural and other noise attenuation measures where needed; and

(6) Provide policy to guide implementation of various HUD programs.

(b) *Authority.* Specific authorities for noise abatement and control are contained in the Noise Control Act of 1972, as amended (42 U.S.C. 4901 *et seq.*); and the General Services Administration, Federal Management Circular 75-2; *Compatible Land Uses at Federal Airfields.*

[44 FR 40861, July 12, 1979, as amended at 61 FR 13333, Mar. 26, 1996]

§ 51.101 General policy.

(a) It is HUD's general policy to provide minimum national standards applicable to HUD programs to protect citizens against excessive noise in their communities and places of residence.

(1) *Planning assistance.* HUD requires that grantees give adequate consideration to noise exposures and sources of noise as an integral part of the urban environment when HUD assistance is

provided for planning purposes, as follows:

(i) Particular emphasis shall be placed on the importance of compatible land use planning in relation to airports, highways and other sources of high noise.

(ii) Applicants shall take into consideration HUD environmental standards impacting the use of land.

(2) *Activities subject to 24 CFR part 58.*

(i) Responsible entities under 24 CFR part 58 must take into consideration the noise criteria and standards in the environmental review process and consider ameliorative actions when noise sensitive land development is proposed in noise exposed areas. Responsible entities shall address deviations from the standards in their environmental reviews as required in 24 CFR part 58.

(ii) Where activities are planned in a noisy area, and HUD assistance is contemplated later for housing and/or other noise sensitive activities, the responsible entity risks denial of the HUD assistance unless the HUD standards are met.

(3) *HUD support for new construction.* HUD assistance for the construction of new noise sensitive uses is prohibited generally for projects with unacceptable noise exposures and is discouraged for projects with normally unacceptable noise exposure. (Standards of acceptability are contained in § 51.103(c).) This policy applies to all HUD programs providing assistance, subsidy or insurance for housing, manufactured home parks, nursing homes, hospitals, and all programs providing assistance or insurance for land development, redevelopment or any other provision of facilities and services which are directed to making land available for housing or noise sensitive development. The policy does not apply to research demonstration projects which do not result in new construction or reconstruction, flood insurance, interstate land sales registration, or any action or emergency assistance under disaster assistance provisions or appropriations which are provided to save lives, protect property, protect public health and safety, remove debris and wreckage, or assistance that has the effect of restoring facilities substantially as they existed prior to the disaster.

(4) *HUD support for existing construction.* Noise exposure by itself will not result in the denial of HUD support for the resale and purchase of otherwise acceptable existing buildings. However, environmental noise is a marketability factor which HUD will consider in determining the amount of insurance or other assistance that may be given.

(5) *HUD support of modernization and rehabilitation.* For modernization projects located in all noise exposed areas, HUD shall encourage noise attenuation features in alterations. For major or substantial rehabilitation projects in the Normally Unacceptable and Unacceptable noise zones, HUD actively shall seek to have project sponsors incorporate noise attenuation features, given the extent and nature of the rehabilitation being undertaken and the level or exterior noise exposure. In Unacceptable noise zones, HUD shall strongly encourage conversion of noise-exposed sites to land uses compatible with the high noise levels.

(6) *Research, guidance and publications.* HUD shall maintain a continuing program designed to provide new knowledge of noise abatement and control to public and private bodies, to develop improved methods for anticipating noise encroachment, to develop noise abatement measures through land use and building construction practices, and to foster better understanding of the consequences of noise. It shall be HUD's policy to issue guidance documents periodically to assist HUD personnel in assigning an acceptability category to projects in accordance with noise exposure standards, in evaluating noise attenuation measures, and in advising local agencies about noise abatement strategies. The guidance documents shall be updated periodically in accordance with advances in the state-of-the-art.

(7) *Construction equipment, building equipment and appliances.* HUD shall encourage the use of quieter construction equipment and methods in population centers, the use of quieter equipment and appliances in buildings, and the use of appropriate noise abatement techniques in the design of residential structures with potential noise problems.

(8) *Exterior noise goals.* It is a HUD goal that exterior noise levels do not exceed a day-night average sound level of 55 decibels. This level is recommended by the Environmental Protection Agency as a goal for outdoors in residential areas. The levels recommended by EPA are not standards and do not take into account cost or feasibility. For the purposes of this regulation and to meet other program objectives, sites with a day-night average sound level of 65 and below are acceptable and are allowable (see Standards in §51.103(c)).

(9) *Interior noise goals.* It is a HUD goal that the interior auditory environment shall not exceed a day-night average sound level of 45 decibels. Attenuation measures to meet these interior goals shall be employed where feasible. Emphasis shall be given to noise sensitive interior spaces such as bedrooms. Minimum attenuation requirements are prescribed in §51.104(a).

(10) *Acoustical privacy in multifamily buildings.* HUD shall require the use of building design and acoustical treatment to afford acoustical privacy in multifamily buildings pursuant to requirements of the Minimum Property Standards.

[44 FR 40861, July 12, 1979, as amended at 50 FR 9268, Mar. 7, 1985; 61 FR 13333, Mar. 26, 1996]

§51.102 Responsibilities.

(a) *Surveillance of noise problem areas.* Appropriate field staff shall maintain surveillance of potential noise problem areas and advise local officials, developers, and planning groups of the unacceptability of sites because of noise exposure at the earliest possible time in the decision process. Every attempt shall be made to insure that applicants' site choices are consistent with the policy and standards contained herein.

(b) *Notice to applicants.* At the earliest possible stage, HUD program staff shall:

(1) Determine the suitability of the acoustical environment of proposed projects;

(2) Notify applicants of any adverse or questionable situations; and

(3) Assure that prospective applicants are apprised of the standards contained

herein so that future site choices will be consistent with these standards.

(c) *Interdepartmental coordination.* HUD shall foster appropriate coordination between field offices and other departments and agencies, particularly the Environmental Protection Agency, the Department of Transportation, Department of Defense representatives, and the Department of Veterans Affairs. HUD staff shall utilize the acceptability standards in commenting on the prospective impacts of transportation facilities and other noise generators in the Environmental Impact Statement review process.

[44 FR 40861, July 12, 1979, as amended at 54 FR 39525, Sept. 27, 1989; 61 FR 13333, Mar. 26, 1996]

§51.103 Criteria and standards.

These standards apply to all programs as indicated in §51.101.

(a) *Measure of external noise environments.* The magnitude of the external noise environment at a site is determined by the value of the day-night average sound level produced as the result of the accumulation of noise from all sources contributing to the external noise environment at the site. Day-night average sound level, abbreviated as DNL and symbolized as L_{dn} , is the 24-hour average sound level, in decibels, obtained after addition of 10 decibels to sound levels in the night from 10 p.m. to 7 a.m. Mathematical expressions for average sound level and day-night average sound level are stated in the Appendix I to this subpart.

(b) *Loud impulsive sounds.* On an interim basis, when loud impulsive sounds, such as explosions or sonic booms, are experienced at a site, the day-night average sound level produced by the loud impulsive sounds alone shall have 8 decibels added to it in assessing the acceptability of the site (see Appendix I to this subpart). Alternatively, the C-weighted day-night average sound level (L_{Cdn}) may be used without the 8 decibel addition, as indicated in §51.106(a)(3). Methods for assessing the contribution of loud impulsive sounds to day-night average sound level at a site and mathematical expressions for determining whether a sound is classed as "loud impulsive"

are provided in the Appendix I to this subpart.

(c) *Exterior standards.* (1) The degree of acceptability of the noise environment at a site is determined by the sound levels external to buildings or other facilities containing noise sensitive uses. The standards shall usually apply at a location 2 meters (6.5 feet) from the building housing noise sensitive activities in the direction of the predominant noise source. Where the building location is undetermined, the standards shall apply 2 meters (6.5 feet) from the building setback line nearest

to the predominant noise source. The standards shall also apply at other locations where it is determined that quiet outdoor space is required in an area ancillary to the principal use on the site.

(2) The noise environment inside a building is considered acceptable if: (i) The noise environment external to the building complies with these standards, and (ii) the building is constructed in a manner common to the area or, if of uncommon construction, has at least the equivalent noise attenuation characteristics.

SITE ACCEPTABILITY STANDARDS

	Day-night average sound level (in decibels)	Special approvals and requirements
Acceptable	Not exceeding 65 dB(1)	None.
Normally Unacceptable	Above 65 dB but not exceeding 75 dB	Special Approvals (2) Environmental Review (3). Attenuation (4).
Unacceptable	Above 75 dB	Special Approvals (2). Environmental Review (3). Attenuation (5).

Notes: (1) Acceptable threshold may be shifted to 70 dB in special circumstances pursuant to § 51.105(a).
 (2) See § 51.104(b) for requirements.
 (3) See § 51.104(b) for requirements.
 (4) 5 dB additional attenuation required for sites above 65 dB but not exceeding 70 dB and 10 dB additional attenuation required for sites above 70 dB but not exceeding 75 dB. (See § 51.104(a).)
 (5) Attenuation measures to be submitted to the Assistant Secretary for CPD for approval on a case-by-case basis.

[44 FR 40861, July 12, 1979, as amended at 49 FR 12214, Mar. 29, 1984]

§ 51.104 Special requirements.

(a)(1) *Noise attenuation.* Noise attenuation measures are those required in addition to attenuation provided by buildings as commonly constructed in the area, and requiring open windows for ventilation. Measures that reduce external noise at a site shall be used wherever practicable in preference to the incorporation of additional noise attenuation in buildings. Building designs and construction techniques that provide more noise attenuation than typical construction may be employed also to meet the noise attenuation requirements.

(2) *Normally unacceptable noise zones and unacceptable noise zones.* Approvals in Normally Unacceptable Noise Zones require a minimum of 5 decibels additional sound attenuation for buildings having noise-sensitive uses if the day-night average sound level is greater than 65 decibels but does not exceed 70 decibels, or a minimum of 10 decibels of

additional sound attenuation if the day-night average sound level is greater than 70 decibels but does not exceed 75 decibels. Noise attenuation measures in Unacceptable Noise Zones require the approval of the Assistant Secretary for Community Planning and Development, or the Certifying Officer for activities subject to 24 CFR part 58. (See § 51.104(b)(2).)

(b) *Environmental review requirements.* Environmental reviews shall be conducted pursuant to the requirements of 24 CFR parts 50 and 58, as applicable, or other environmental regulations issued by the Department. These requirements are hereby modified for all projects proposed in the Normally Unacceptable and Unacceptable noise exposure zones as follows:

(1) *Normally unacceptable noise zone.*
 (i) All projects located in the Normally Unacceptable Noise Zone require a Special Environmental Clearance except an EIS is required for a proposed project located in a largely undeveloped area, or where the HUD action is

likely to encourage the establishment of incompatible land use in this noise zone.

(ii) When an EIS is required, the concurrence of the Program Assistant Secretary is also required before a project can be approved. For the purposes of this paragraph, an area will be considered as largely undeveloped unless the area within a 2-mile radius of the project boundary is more than 50 percent developed for urban uses and infrastructure (particularly water and sewers) is available and has capacity to serve the project.

(iii) All other projects in the Normally Unacceptable zone require a Special Environmental Clearance, except where an EIS is required for other reasons pursuant to HUD environmental policies.

(2) *Unacceptable noise zone.* An EIS is required prior to the approval of projects with unacceptable noise exposure. Projects in or partially in an Unacceptable Noise Zone shall be submitted to the Assistant Secretary for Community Planning and Development, or the Certifying Officer for activities subject to 24 CFR part 58, for approval. The Assistant Secretary or the Certifying Officer may waive the EIS requirement in cases where noise is the only environmental issue and no outdoor noise sensitive activity will take place on the site. In such cases, an environmental review shall be made pursuant to the requirements of 24 CFR parts 50 or 58, as appropriate.

[44 FR 40861, July 12, 1979, as amended at 61 FR 13333, Mar. 26, 1996]

§ 51.105 Exceptions.

(a) *Flexibility for non-acoustic benefits.* Where it is determined that program objectives cannot be achieved on sites meeting the acceptability standard of 65 decibels, the Acceptable Zone may be shifted to L_{dn} 70 on a case-by-case basis if all the following conditions are satisfied:

(1) The project does not require an Environmental Impact Statement under provisions of § 51.104(b)(1) and noise is the only environmental issue.

(2) The project has received a Special Environmental Clearance and has received the concurrence of the Environmental Clearance Officer.

(3) The project meets other program goals to provide housing in proximity to employment, public facilities and transportation.

(4) The project is in conformance with local goals and maintains the character of the neighborhood.

(5) The project sponsor has set forth reasons, acceptable to HUD, as to why the noise attenuation measures that would normally be required for new construction in the L_{dn} 65 to L_{dn} 70 zone cannot be met.

(6) Other sites which are not exposed to noise above L_{dn} 65 and which meet program objectives are generally not available.

The above factors shall be documented and made part of the project file.

[44 FR 40861, July 12, 1979, as amended at 61 FR 13334, Mar. 26, 1996]

§ 51.106 Implementation.

(a) *Use of available data.* HUD field staff shall make maximum use of noise data prepared by others when such data are determined to be current and adequately projected into the future and are in terms of the following:

(1) *Sites in the vicinity of airports.* The noise environment around airports is described sometimes in terms of Noise Exposure Forecasts, abbreviated as NEF or, in the State of California, as Community Noise Equivalent Level, abbreviated as CNEL. The noise environment for sites in the vicinity of airports for which day-night average sound level data are not available may be evaluated from NEF or CNEL analyses using the following conversions to DNL:

$DNL = NEF + 35$

$DNL = CNEL$

(2) *Sites in the vicinity of highways.* Highway projects receiving Federal aid are subject to noise analyses under the procedures of the Federal Highway Administration. Where such analyses are available they may be used to assess sites subject to the requirements of this standard. The Federal Highway Administration employs two alternate sound level descriptors: (i) The A-weighted sound level not exceeded more than 10 percent of the time for the highway design hour traffic flow, symbolized as L_{10} ; or (ii) the equivalent

sound level for the design hour, symbolized as L_{eq} . The day-night average sound level may be estimated from the design hour L_{10} or L_{eq} values by the following relationships, provided heavy trucks do not exceed 10 percent of the total traffic flow in vehicles per 24 hours and the traffic flow between 10 p.m. and 7 a.m. does not exceed 15 percent of the average daily traffic flow in vehicles per 24 hours:

$DNL-L_{10}$ (design hour)—3 decibels
 $DNL-L_{eq}$ (design hour) decibels

Where the auto/truck mix and time of day relationships as stated in this section do not exist, the HUD Noise Assessment Guidelines or other noise analysis shall be used.

(3) *Sites in the vicinity of installations producing loud impulsive sounds.* Certain Department of Defense installations produce loud impulsive sounds from artillery firing and bombing practice ranges. Noise analyses for these facilities sometimes encompass sites that may be subject to the requirements of this standard. Where such analyses are available they may be used on an interim basis to establish the acceptability of sites under this standard. The Department of Defense uses day-night average sound level based on C-weighted sound level, symbolized L_{Cdn} , for the analysis of loud impulsive sounds. Where such analyses are provided, the 8 decibel addition specified in § 51.103(b), is not required, and the same numerical values of day-night average sound level used on an interim basis to determine site suitability for non-impulsive sounds apply to the L_{Cdn} .

(4) *Use of areawide acoustical data.* HUD encourages the preparation and use of areawide acoustical information, such as noise contours for airports. Where such new or revised contours become available for airports (civil or military) and military installations they shall first be referred to the HUD State Office (Environmental Officer) for review, evaluation and decision on appropriateness for use by HUD. The HUD State Office shall submit revised contours to the Assistant Secretary for Community Planning and Development for review, evaluation and decision whenever the area affected is changed

by 20 percent or more, or whenever it is determined that the new contours will have a significant effect on HUD programs, or whenever the contours are not provided in a methodology acceptable under § 51.106(a)(1) or in other cases where the HUD State Office determines that Headquarters review is warranted. For other areawide acoustical data, review is required only where existing areawide data are being utilized and where such data have been changed to reflect changes in the measurement methodology or underlying noise source assumptions. Requests for determination on usage of new or revised areawide data shall include the following:

(i) Maps showing old, if applicable, and new noise contours, along with brief description of data source and methodology.

(ii) Impact on existing and prospective urbanized areas and on development activity.

(iii) Impact on HUD-assisted projects currently in processing.

(iv) Impact on future HUD program activity. Where a field office has determined that immediate approval of new areawide data is necessary and warranted in limited geographic areas, the request for approval should state the circumstances warranting such approval. Actions on proposed projects shall not be undertaken while new areawide noise data are being considered for HUD use except where the proposed location is affected in the same manner under both the old and new noise data.

(b) *Site assessments.* Compliance with the standards contained in § 51.103(c) shall, where necessary, be determined using noise assessment guidelines, handbooks, technical documents and procedures issued by the Department.

(c) *Variations in site noise levels.* In many instances the noise environment will vary across a site, with portions of the site being in an Acceptable noise environment and other portions in a Normally Unacceptable noise environment. The standards in § 51.103(c) shall apply to the portions of a building or buildings used for residential purposes and for ancillary noise sensitive open spaces.

(d) *Noise measurements.* Where noise assessments result in a finding that the site is borderline or questionable, or is controversial, noise measurements may be performed. Where it is determined that noise measurements are required, such measurements will be conducted in accordance with methods and measurement criteria established by the Department. Locations for noise measurements will depend on the location of noise sensitive uses that are nearest to the predominant noise source (see § 51.103(c)).

(e) *Projections of noise exposure.* In addition to assessing existing exposure, future conditions should be projected. To the extent possible, noise exposure shall be projected to be representative of conditions that are expected to exist at a time at least 10 years beyond the date of the project or action under review.

(f) *Reduction of site noise by use of berms and/or barriers.* If it is determined by adequate analysis that a berm and/or barrier will reduce noise at a housing site, and if the barrier is existing or there are assurances that it will be in place prior to occupancy, the environmental noise analysis for the site may reflect the benefits afforded by the berm and/or barrier. In the environ-

mental review process under § 51.104(b), the location height and design of the berm and/or barrier shall be evaluated to determine its effectiveness, and impact on design and aesthetic quality, circulation and other environmental factors.

[44 FR 40861, July 12, 1979, as amended at 61 FR 13334, Mar. 26, 1996]

APPENDIX I TO SUBPART B—DEFINITION OF ACOUSTICAL QUANTITIES

1. *Sound Level.* The quantity in decibels measured with an instrument satisfying requirements of American National Standard Specification for Type 1 Sound Level Meters S1.4-1971. Fast time-averaging and A-frequency weighting are to be used, unless others are specified. The sound level meter with the A-weighting is progressively less sensitive to sounds of frequency below 1,000 hertz (cycles per second), somewhat as is the ear. With fast time averaging the sound level meter responds particularly to recent sounds almost as quickly as does the ear in judging the loudness of a sound.

2. *Average Sound Level.* Average sound level, in decibels, is the level of the mean-square A-weighted sound pressure during the stated time period, with reference to the square of the standard reference sound pressure of 20 micropascals.

Day-night average sound level, abbreviated as DNL, and symbolized mathematically as L_{dn} is defined as:

$$L_{dn} = 10 \log_{10} \left[\frac{1}{86400} \left(\int_{0000}^{2400} 10^{[L_A(t)+10]/10} dt + \int_{2200}^{2400} 10^{L_A(t)/10} dt + \int_{2200}^{2400} 10^{[L_A(t)+10]/10} dt \right) \right]$$

Time t is in seconds, so the limits shown in hours and minutes are actually interpreted in seconds. $L_A(t)$ is the time varying value of A-weighted sound level, the quantity in decibels measured by an instrument satisfying requirements of American National Standard Specification for Type 1 Sound Level Meters S1.4-1971.

3. *Loud Impulsive Sounds.* When loud impulsive sounds such as sonic booms or explosions are anticipated contributors to the noise environment at a site, the contribution to day-night average sound level produced by the loud impulsive sounds shall have 8 deci-

bels added to it in assessing the acceptability of a site.

A loud impulsive sound is defined for the purpose of this regulation as one for which:

(i) The sound is definable as a discrete event wherein the sound level increases to a maximum and then decreases in a total time interval of approximately one second or less to the ambient background level that exists without the sound; and

(ii) The maximum sound level (obtained with slow averaging time and A-weighting of a Type 1 sound level meter whose characteristics comply with ANSI S1.4-1971) exceeds

the sound level prior to the onset of the event by at least 6 decibels; and

(iii) The maximum sound level obtained with fast averaging time of a sound level meter exceeds the maximum value obtained with slow averaging time by at least 4 decibels.

[44 FR 40861, July 12, 1979; 49 FR 10253, Mar. 20, 1984; 49 FR 12214, Mar. 29, 1984]

Subpart C—Siting of HUD-Assisted Projects Near Hazardous Operations Handling Conventional Fuels or Chemicals of an Explosive or Flammable Nature

AUTHORITY: 42 U.S.C. 3535(d).

SOURCE: 49 FR 5103, Feb. 10, 1984, unless otherwise noted.

§ 51.200 Purpose.

The purpose of this subpart C is to:

(a) Establish safety standards which can be used as a basis for calculating acceptable separation distances (ASD) for HUD-assisted projects from specific, stationary, hazardous operations which store, handle, or process hazardous substances;

(b) Alert those responsible for the siting of HUD-assisted projects to the inherent potential dangers when such projects are located in the vicinity of such hazardous operations;

(c) Provide guidance for identifying those hazardous operations which are most prevalent;

(d) Provide the technical guidance required to evaluate the degree of danger anticipated from explosion and thermal radiation (fire); and

(e) Provide technical guidance required to determine acceptable separation distances from such hazards.

[49 FR 5103, Feb. 10, 1984, as amended at 61 FR 13334, Mar. 26, 1996]

§ 51.201 Definitions.

The terms *Department* and *Secretary* are defined in 24 CFR part 5.

Acceptable separation distance (ASD)—means the distance beyond which the explosion or combustion of a hazard is not likely to cause structures or individuals to be subjected to blast overpressure or thermal radiation flux levels in excess of the safety standards in § 51.203. The ASD is determined by ap-

plying the safety standards established by this subpart C to the guidance set forth in HUD Guidebook, "Siting of HUD-Assisted Projects Near Hazardous Facilities."

Blast overpressure—means the pressure, in pounds per square inch, in excess of normal atmospheric pressure on the surrounding medium caused by an explosion.

Danger zone—means the land area circumscribed by the radius which delineates the ASD of a given hazard.

Hazard—means any stationary container which stores, handles or processes hazardous substances of an explosive or fire prone nature. The term "hazard" does not include pipelines for the transmission of hazardous substances, if such pipelines are located underground or comply with applicable Federal, State and local safety standards. Also excepted are: (1) Containers with a capacity of 100 gallons or less when they contain common liquid industrial fuels, such as gasoline, fuel oil, kerosene and crude oil since they generally would pose no danger in terms of thermal radiation of blast overpressure to a project; and (2) facilities which are shielded from a proposed HUD-assisted project by the topography, because these topographic features effectively provide a mitigating measure already in place.

Hazardous substances—means petroleum products (petrochemicals) and chemicals that can produce blast overpressure or thermal radiation levels in excess of the standards set forth in § 51.203. A specific list of hazardous substance is found in appendix I to this subpart.

HUD-assisted project—the development, construction, rehabilitation, modernization or conversion with HUD subsidy, grant assistance, loan, loan guarantee, or mortgage insurance, of any project which is intended for residential, institutional, recreational, commercial or industrial use. For purposes of this subpart the terms "rehabilitation" and "modernization" refer only to such repairs and renovation of a building or buildings as will result in an increased number of people being

VERIFIED STATEMENT
OF
DAVID H. MINOTT

My name is David H. Minott. I am Vice President of Alternative Resources, Inc. Alternative Resources, Inc., (ARI) has reviewed information we were furnished concerning the projected air quality impacts of the proposed Conrail Acquisition. Supplied to ARI for review were air-quality-related excerpts from the Draft Environmental Impact Statement (EIS), December 1997, prepared for the proposed Conrail Acquisition by the Section of Environmental Analysis (SEA) of the Surface Transportation Board (STB). Portions of the EIS that ARI has reviewed are as follows:

- Volume 1, Chapter 3, pages 3-25 through 3-30;
- Volume 1, Chapter 4, pages 4-49 through 4-63, plus 4-70 and 4-71;
- Volume 3B, Chapter 5, pages OH-44 through OH-70; and
- Appendix E, plus Attachments E-1 through E-10.

For background, ARI also reviewed portions of the Environmental Report (ER) that had been prepared earlier (June, 1997) by CSX and Norfolk Southern for the proposed Acquisition.

ARI has reviewed the approach STB used in the EIS to project changes in train traffic, motor vehicle queuing and associated air-pollutant emissions. There was insufficient information available to ARI, however, to permit more than a general review of the projected emissions changes. Accordingly, ARI has directed most of its efforts towards independent evaluation of the air quality impacts to expect from the proposed Acquisition. While STB considered impacts on the system-wide and county levels, ARI has focused on impacts to expect at the local level, specifically in Cuyahoga County, along the Vermillion-to-Cleveland rail segment (number N-080), in Lakewood, Rocky River and Bay Village.

Based on ARI's review of the information supplied to us, and on our independent assessment of air quality impacts, ARI has prepared comments regarding air-quality aspects of the EIS. Summary comments are offered below, followed by more detailed comments that provide documentation and further discussion.

SUMMARY COMMENTS

1. ARI found STB's non-assessment of impacts on the local scale to be lacking. While projected emissions increases within the County may be offset by emissions decreases within the County, this is not the case with regard to air quality *impacts*. Lakewood, Rocky River, and Bay Village would experience increased air quality impacts from trains and queued motor vehicles. Berea and other locales to the south will receive the benefit of reduced air quality impacts due to emissions reductions there. Accordingly, ARI has assessed the potential for localized air quality impacts in Lakewood, Rocky River, and Bay Village.
2. Modeling of air quality impacts due to queued motor vehicles at the most heavily-impacted crossing in the County (Hird Avenue, Lakewood) indicates a potential for significant, localized air quality impacts due to increased emissions of carbon monoxide. In addition, marginally-significant impacts were projected adjacent to the most heavily impacted crossings in Rocky River (Wager Road) and Bay Village (Columbia Road).
3. The simplified modeling performed here is likely conservative; that is, projected impacts may be overstated. Nonetheless, because potentially significant impacts are indicated for carbon monoxide, ARI recommends that the project proponent perform a refined air-quality modeling assessment for motor-vehicle queuing at the Hird Avenue crossing to demonstrate compliance with the ambient standards for carbon monoxide.

DETAILED COMMENTS

1. Local Air Quality Impacts – General

Considering emissions increases and emissions decreases projected for a given study area, and comparing the net emissions change with the entire emissions inventory for that study area, can be an appropriate approach for assessing air quality impacts on a large scale. ARI concurs that the assessments in the EIS of impacts system-wide and county-wide (e.g., Cuyahoga County) adequately demonstrate that significant air quality impacts should not be expected on the system-wide and County-level scales.

ARI, however, does not consider that same approach to be technically appropriate for evaluation of impacts on a local scale, for example, in the vicinity of the tracks and grade crossings of the Vermillion-to-Cleveland rail segment, in Lakewood, Rocky River, and Bay Village. While projected emissions increases in one portion of a given study area may be offset by projected emissions decreases at other locations in the same study area, this does not mean that air quality *impacts* from the emissions increases are offset by decreased *impacts* from the emissions reductions. This is because for most air pollutants of concern for this proposed acquisition – CO, SO₂, PM₁₀, Pb and in cases, NO_x – the maximum air quality impacts from trains and motor vehicles will occur in the immediate vicinity of the

tracks and grade crossings. If the projected emissions increases and decreases occur in different locations of the study area, then the locations of increased air quality impacts and the locations of decreased impacts will not coincide.

To illustrate, the STB projects sizeable emissions increases for the Vermillion-to-Cleveland rail segment (Norfolk Southern) that traverses the north portion of Cuyahoga County, through Lakewood, Rocky River, and Bay Village; STB projects substantial emissions decreases, however, for the Vermillion-to-Cleveland rail segment (formerly Conrail) that runs through Berea in the southern portion of the County (EIS, Tables 5-OH-20 and 21). At points, these two rail segments are about 10 miles apart. This means that communities such as Lakewood, Rocky River, and Bay Village will receive the air quality impacts from increased train and motor vehicle emissions projected for the northern leg of the Vermillion-to-Cleveland segment, while Berea will accrue the air quality benefit from decreased emissions projected for the southern leg of that segment. Again, the locations of increased air quality impacts and the locations of decreased air quality impacts do not coincide; the increased and decreased impacts do not offset each other.

Because the EIS did not address the possibility of significant, localized air quality impacts, ARI has assessed the potential for such impacts via simplified, air quality modeling. Projected air quality impacts are presented for increased motor-vehicle emissions in Comment No. 2.

2. **Local Air Quality Impacts for Motor-Vehicles Queued at Grade Crossings.**
ARI has performed simplified air quality modeling to develop rough estimates of air quality impacts to be expected from motor vehicles queuing at the Hird Avenue grade crossing in Lakewood. STB has projected that crossing to experience the greatest motor-vehicle delays due to new train traffic of all crossings in Lakewood, Rocky River, or Bay Village (EIS, Attachment E-10, P. 1 of 3).

Air pollutant emission rates were estimated due to the increases in motor-vehicle queuing anticipated at the Hird Avenue grade crossing. Those emissions estimates, documented in Attachment 1, were developed for average-hourly queuing and for peak-hourly queuing conditions. The emissions estimates, expressed in units of grams of pollutant emitted per second per square meter of area, are given below:

	Average Hourly Emission Rate (g/s/m ²)	Peak-Hour Emission Rate (g/s/m ²)
NO _x	2.3x10 ⁻⁵	3.3x10 ⁻⁵
CO	1.3x10 ⁻⁴	1.8x10 ⁻³
SO ₂	6.2x10 ⁻⁸	8.3x10 ⁻⁷
PM ₁₀	4.0x10 ⁻⁸	5.3x10 ⁻⁷

US EPA recommends a specific model for assessing air quality impacts from queued motor vehicles. ARI, however, does not have the detailed information

needed as input to that model. Therefore, ARI has applied another air quality model, US EPA's ISCST3 model, which ARI considers technically appropriate for making simplified air-quality-impact predictions in this case. To assess maximum impacts, ARI modeled impacts at a location immediately adjacent to the queued motor vehicles and railroad tracks. Detailed description and documentation of ARI's application of the ISCST3 model are presented in Attachment 2.

Following application of the model, the significance of the modeled air quality impacts was assessed, by comparing the impacts with threshold concentrations set by US EPA that define a significant impact; i.e., Significant Impact Levels ("SILs"). For reference, impacts have also been compared with the National Ambient Air Quality Standards that US EPA has set for each pollutant. These comparisons are made below:

<u>Pollutant</u>	<u>Averaging Period</u>	<u>Motor Vehicle Impact($\mu\text{g}/\text{m}^3$)</u>	<u>Significant Impact Level ($\mu\text{g}/\text{m}^3$)</u>	<u>National Ambient Standard ($\mu\text{g}/\text{m}^3$)</u>
NO _x	Annual	0.6	1	100
CO	8-hour	3,260	500	10,000
	1-hour	4,657	2,000	40,000
SO ₂	Annual	0.02	1	80
	24-hour	0.03	5	365
	3-hour	2.0	25	1,300
PM ₁₀	Annual	0.01	1	50
	24-hour	0.04	5	150

From the comparison, it is apparent that the projected CO impacts exceed significant-impact thresholds. This suggests that motor vehicle queuing at the Hird Avenue crossing as a result of new train passages could have a significant air quality impact for CO. This is potentially important, given that there may not be much margin between current ambient levels of CO and the ambient standard for CO. To explain further, STB notes that Cuyahoga County is designated as a "maintenance area" by US EPA for CO (EIS, Attachment E-1, P.7), meaning the County has been brought into compliance with the ambient standards for CO, after formerly being in violation of those standards. Should ambient levels of CO increase significantly, this could put the County back into violation of the ambient standards for that pollutant.

In Rocky River and Bay Village, STB had projected, respectively, the Wager Road and Columbia Road crossings to be most heavily impacted by increased motor-vehicle queuing. Based on the modeling, CO impacts projected to be significant at Hird Avenue, would, by comparison, be projected to be marginally significant at the Wager Road and Columbia Road crossings.

The simplified modeling performed here is likely conservative; that is, projected impacts may be overstated. Nonetheless, because potentially significant impacts are indicated for CO, ARI recommends that the project proponent perform a refined air-quality modeling assessment for motor-vehicle queuing at the Hird Avenue crossing to demonstrate compliance with the ambient standards for CO.

ARI STAFF WHO CONDUCTED THIS REVIEW

Serving as ARI's lead for this independent review was David H. Minott, C.C.M. Mr. Minott is a co-founding Principal of ARI, where he directs all environmental services. He has a Bachelor's Degree in Meteorology and a Master's Degree resulting from dual curricula in business administration and environmental technology. Mr. Minott is a Board-Certified Consulting Meteorologist (C.C.M.) and is also certified as a Qualified Environmental Professional (QEP). Mr. Minott has 24 years' professional experience as an air quality consultant.

Mr. Minott was assisted by Cynthia L. Burkhardt, C.C.M. Ms. Burkhardt is a Senior Air Quality Scientist at ARI. She has both Bachelor's and Master's Degrees in meteorology, and has over ten years' experience as an air quality professional. Ms. Burkhardt is also a Certified Consulting Meteorologist (C.C.M.) and a Qualified Environmental Professional (QEP).

ATTACHMENT 1

ESTIMATION OF MOTOR-VEHICLE EMISSION RATES
FOR MODELING OF AIR QUALITY IMPACTS AT GRADE CROSSINGS
ON THE VERMILLION-TO-CLEVELAND RAIL SEGMENT

1. Of all grade crossings in Lakewood, Rocky River and Bay Village, the grade crossing projected by STB to experience the greatest increase in motor-vehicle queuing delays is the Hird Avenue crossing in Lakewood (EIS, Attachment E-10, P. 1 of 3). Accordingly, pollutant emission rates and air quality impacts have been assessed for that intersection as a worst case.
2. Calculate average hourly emission rates for queued motor vehicles at the Hird Avenue grade crossing.
 - From the EIS (Attachment E-10, P. 1 of 3), STB estimates an average of 20.6 new trains per day traversing the rail segment, with about 22 vehicle-hours of delay occurring per day as a result at the Hird Avenue crossing. This is an average of 0.86 trains passing per hour, and an average of 1.07 vehicle-hours of delay per train at Hird Avenue.
 - Average emission rates were calculated using the "emission factors" appearing in the EIS, Table E-9, which STB developed based on US EPA guidance. The emission factors are given in units of grams of pollutant emitted for each hour that a motor vehicle idles. The per-vehicle emission factors are:

	<u>g/hr</u>	<u>g/sec</u>
NO _x	11.4	3.2x10 ⁻³
CO	567	0.16
SO ₂	0.285	7.9x10 ⁻⁵
PM ₁₀	0.188	5.2x10 ⁻⁵

- As noted above, there is an average of 1.07 vehicle hours of delay (idling) per train passage at Hird Avenue. Thus, using the above emission factors, the average, per-train emission rates for queued motor vehicles are:

Average Emissions from Queued
Motor Vehicles per Train Passage:

	<u>g/hr</u>	<u>g/sec</u>
NO _x	12.2	0.0033
CO	607	0.17
SO ₂	0.31	8.6x10 ⁻⁵
PM ₁₀	0.20	5.6x10 ⁻⁵

Emissions for lead (Pb) are not included because few motor vehicles use leaded gasoline.

- But at Hird Avenue crossing, there are 0.86 trains passing per hour on average, not one per hour. So, the emission rates above need to be adjusted; i.e., multiplied by the ratio of 0.86/1. The resulting average hourly emissions from queued motor vehicles at the Hird Avenue crossing are as follows:

	<u>Average Hourly Emissions (g/s)</u>
NO _x	.0028
CO	.15
SO ₂	7.4x10 ⁻⁵
PM ₁₀	4.8x10 ⁻⁵

3. Calculate the peak-hour emission rates for queued vehicles at the Hird Avenue intersection.

- The peak hour emissions would occur during an hour that has maximum motor-vehicle queuing (commuter rush hour) and would have the peak number of train passages in an hour.
- As noted above, there are 1.07 vehicle-hours of delay for queued motor vehicles, on average, per train passage at Hird Avenue. If one assumes four minutes are required for a train to traverse the grade crossing, this implies that 16 motor vehicles queue at the Hird Avenue crossing, on average, for each train passage.
- If 16 vehicles queue per train passage on average, then ARI assumes that four times this number, 64 vehicles, queue when a train passes during commuter rush periods.
- As noted above, 0.86 trains traverse the Hird Avenue crossing per hour on average, or just under one per hour. Given this, ARI estimates that three trains would pass during a peak hour.

- Peak-hour queuing would occur when a peak train hour (3 trains per hour) coincides with a commuter rush period (64 motor vehicles queuing for 4 minutes per train). Thus, peak-hour queuing would be 64 vehicles queuing for a total of 12 minutes during the peak hour, as three trains pass during that hour.
- Motor vehicle emission rates have been calculated for peak-hour queuing, using the emission factors given above. These emission factors, as noted previously, give grams of pollutant emitted per hour of motor-vehicle idling. The 64 vehicles that queue during the peak hour do so for only 12 minutes total, or one-fifth of that hour. Accordingly, the emission factors above, which presume a full hour of idling, have been divided by five to yield "effective" emission factors for use in calculating peak-hour emissions. The effective emission factors are:

Effective Per-Vehicle Emission Factors
for Peak Hour Queuing:

	<u>g/hr</u>	<u>g/sec</u>
NO _x	2.3	6.4×10^{-4}
CO	113	0.32
SO ₂	.057	1.6×10^{-5}
PM ₁₀	.038	1.0×10^{-5}

- The peak-hour emission rates for Hird Avenue (64 motor vehicles queued for 4 minutes for each of 3 train passages during the peak hour) are as follows, based on multiplying 64 vehicles times the effective emission factors above:

	<u>Peak-Hour Emissions (g/s)</u>
NO _x	0.040
CO	2.1
SO ₂	0.0010
PM ₁₀	0.00064

ATTACHMENT 2

MODELING OF AIR QUALITY IMPACTS DUE TO MOTOR VEHICLE DELAYS AT GRADE CROSSINGS FROM TRAIN INCREASES ON THE VERMILLION-TO-CLEVELAND RAIL SEGMENT

1. ARI has performed simplified air quality modeling to develop rough estimates of air quality impacts to be expected from motor vehicles queuing at the Hird Avenue grade crossing in Lakewood. STB has projected that crossing to experience the greatest motor-vehicle delays due to new train traffic of all crossings in Lakewood, Rocky River, or Bay Village (EIS, Attachment E-10, P. 1 of 3).
2. The air quality model which US EPA would recommend for this application would be a model such as US EPA's CAL3QHC model, which is intended specifically for assessing air quality impacts from queued motor vehicles. ARI, however, does not have the detailed information needed as input to this type of model; e.g., information about the vehicle "fleet", and about queuing numbers, frequency and geometries. Accordingly, ARI has applied another air quality model, the ISCST3 model, which it considers technically appropriate for making simplified air-quality-impact predictions in this case. ISCST3 is a US EPA model which employs the standard, Gaussian dispersion algorithm.
3. The ISCST3 model has been applied in its screening mode. That is, meteorological data input to the model were comprised of a pre-established set consisting of all feasible combinations of wind speed and atmospheric stability conditions. A computer printout documenting all input and output information for this application of the ISCST3 model is included in this Attachment.
4. In applying the ISCST3 model, the queued motor vehicles were simulated as an emissions "area source". That is, the emissions are assumed to emanate from a rectangular area that encompasses the queued vehicles. As noted in Attachment 1, peak-hour emissions would occur due to 64 motor-vehicles queued at the crossing for each train passage. It has been assumed that 32 vehicles queue in two lanes (16 vehicles per lane), on each side of the tracks. The queues are presumed to orient normal to the tracks. Emissions from all 64 queued vehicles have been assumed to emanate from a rectangular area source, 200 meters long by 6 meters wide, bisected width-wise by the tracks.

5. Average hourly and peak hourly emission rates for queued motor-vehicles at the Hird Avenue crossing were given in Attachment 1, in grams per second. Dividing these by the area of the area source (1,200 square meters) yields area-source emissions rates in grams per second per square meter, as is needed for input to the ISCST3 model:

	Average Hourly Emission Rate (g/s/m ²)	Peak-Hour Emission Rate (g/s/m ²)
NO _x	2.3x10 ⁻⁶	3.3x10 ⁻⁵
CO	1.3x10 ⁻⁴	1.8x10 ⁻³
SO ₂	6.2x10 ⁻⁸	8.3x10 ⁻⁷
PM ₁₀	4.0x10 ⁻⁸	5.3x10 ⁻⁷

6. The ISCST3 model was run with a nominal emission rate for the 200m x 6m area source of 1 gram per second per square meter (this was specifically accomplished by dividing the 200m x 6m area source into four, equal, sub-area sources, each emitting at a nominal 0.25 g/s/m²). With this "unit" emission rate, the model predicted a maximum 1-hour impact adjacent to the tracks of 2,587,087 micrograms per cubic meters (μg/m³). To obtain pollutant-specific impacts, one multiplies the pollutant-specific emission rates given above by the 2,587,087 μg/m³ concentration resulting from the unit emission rate. Resulting, maximum 1 hour concentrations for average hourly emissions and for peak-hour emission rates are given below:

	Average Hourly Impact (μg/m ³)	Peak-Hour Impact (μg/m ³)
NO _x	6.0	85
CO	336	4657
SO ₂	0.16	2.2
PM ₁₀	0.10	1.4

7. The ISCST3 model, applied in its screening mode, yields predicted 1-hour impacts. Impacts for other averaging periods of interest – 3 hours, 8 hours, 24 hours, and annual – have been scaled from the 1-hour values, using the following standard scaling factors respectively: 0.9, 0.7, 0.4, and 0.1.
8. Following application of the model, the significance of the modeled air quality impacts has been assessed by comparing the modeled impacts with threshold concentrations set by US EPA that define a significant impact; i.e., Significant Impact Levels ("SILs")¹. The SILs have regulatory status with regard to assessing impacts from "point" emissions sources such as stacks. While the SIL thresholds do not have regulatory status in assessing impacts from "mobile" sources (trains, motor vehicles), they are appropriate benchmarks in a technical sense for

¹ US EPA, New Source Review Manual, Table C-4, Office of Air Quality Planning and Standards, October, 1990, (Draft).

assessing the significance of impacts from mobile sources. For reference, impacts have also been compared with the National Ambient Air Quality Standards that US EPA has set for each pollutant.

9. The SIL thresholds and ambient standards have been established by US EPA for specific averaging times that vary with the pollutant. In modeling impacts from queued motor vehicles, the peak hourly emission rates given above were used to assess impacts for short-term averaging periods (1, 3, and 8 hours), and average hourly emission rates were used to assess impacts for longer-term averaging periods (24-hour, annual).
10. Modeled impacts are compared below with SIL thresholds and ambient standards:

<u>Pollutant</u>	<u>Averaging Period</u>	<u>Motor Vehicle Impact ($\mu\text{g}/\text{m}^3$)</u>	<u>Significant Impact Level ($\mu\text{g}/\text{m}^3$)</u>	<u>National Ambient Standard ($\mu\text{g}/\text{m}^3$)</u>
NO _x	Annual	0.6	1	100
CO	8-hour	3,260	500	10,000
	1-hour	4,657	2,000	40,000
SO ₂	Annual	0.02	1	80
	24-hour	0.03	5	365
	3-hour	2.0	25	1,300
PM ₁₀	Annual	0.01	1	50
	24-hour	0.04	5	150

From this comparison, it is apparent that impacts from SO₂ and PM₁₀ are well below the SIL thresholds, and represent only minor fractions of the ambient standards. That air quality impacts from motor vehicles queuing at grade crossings are projected to be minimal for SO₂ and PM₁₀ is important, as ambient levels for those pollutants in Cuyahoga County currently violate the ambient standards.

The projected impact of NO_x is essentially at the SIL threshold concentration, indicating a marginally-significant impact. The projected CO impacts exceed SIL thresholds. This suggests that motor vehicle queuing at the Hird Avenue crossing as a result of new train passages could have a significant air quality impact for CO. This is potentially important, given that there may not be much margin between current ambient levels of CO and the ambient standard for CO. To explain further, STB notes that Cuyahoga County is designated as a "maintenance area" by US EPA for CO (EIS, Attachment E-1, P. 7), meaning the County has been brought into compliance with the ambient standards for CO, after formerly being in violation of those standards. Should ambient levels of CO increase significantly, this could put the County back into violation of the ambient standards for that pollutant.

The simplified modeling performed here is likely conservative; that is, projected impacts may be overstated. Nonetheless, because potentially significant impacts are indicated for CO, ARI recommends that the project proponent perform a refined air-quality modeling assessment for motor-vehicle queuing at the Hird Avenue crossing to demonstrate compliance with the ambient standards for CO.

11. As noted in Attachment 1, the Hird Avenue crossing in Lakewood was projected by STB to have the greatest new motor-vehicle delays in the county; i.e., an increase of 22 vehicles-hours of delay per day, on average. By comparison, the most heavily impacted crossings in Rocky River and Bay Village, respectively, were projected by STB to be the Wager Road crossing at 5 vehicle-hours of delay per day, and the Columbia Road crossing at 7.1 vehicle-hours of delay per day (EIS, Attachment E-10, P. 1 of 3). Impact levels from motor vehicles queued at the Wager Road and Columbia Road crossings would be proportionately reduced from impact levels presented above for Hird Avenue. Based on the modeling, CO impacts projected to be significant at Hird Avenue, would be projected to be marginally significant at the Wager Road and Columbia Road crossings. NO_x impacts projected to be marginally significant at the Hird Avenue crossing would be projected not to be significant at the Wager Road and Columbia Road crossings.

SUPPLEMENTAL VERIFIED STATEMENT
OF
JAMES R. LINDEN

My name is James R. Linden, Director of Public Safety-Service, City of Rocky River, Rocky River, Ohio. I previously submitted a Verified Statement consisting of two pages and Exhibits JRL-1 and JRL-2. That statement was verified by me to be true on October 6, 1997.

I wish to expound upon my previous opinion concerning the need for construction of a new fire station North of the railroad tracks should the train increase estimated by Norfolk Southern in conjunction with the proposed acquisition be approved by the Surface Transportation Board. It is my belief that the construction of a new fire station North of the tracks at an estimated construction cost of \$1.1 million, an estimated equipment cost of \$98,649.85 and an annual expense for personnel costs of \$800,000 would all be a necessary, life saving measure.

This belief is based in part upon the Verified Statements of Rocky River Fire Chief Christopher M. Flynn and Robert J. Alban, P.E., Rocky River's City Engineer. Such statements detail the expected increase in Emergency Vehicle response times and vehicle crossing delays as a result of the proposed tripling of train traffic. These increases are unacceptable. The resultant delays are more than mere inconvenience, but the difference between life and death. Without the construction of a new fire station, residents on the North side of the City face a risk three times as great after the acquisition that an

ambulance or fire truck on the way to their house will be forced to reroute or to sit through a deadly delay.

As Safety Service Director, it is my job to eliminate this risk. That job can only be completed by adding a second station and employing 40% more personnel to man it, both at a considerable, non-budgeted expense to the City of Rocky River, Ohio.

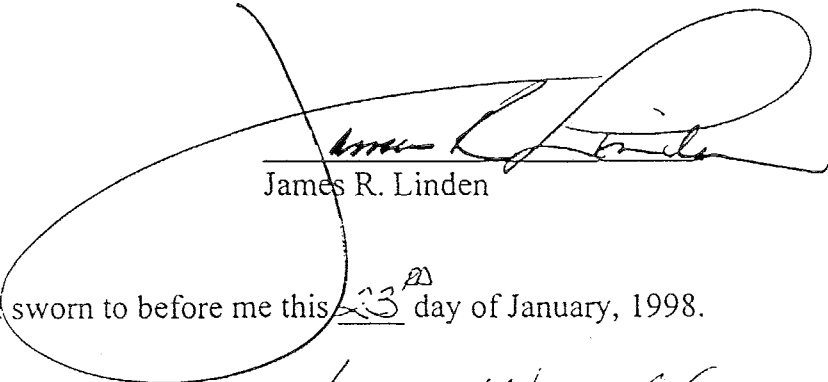

VERIFICATION

STATE OF OHIO

SS.

COUNTY OF CUYAHOGA

I, James R. Linden being duly sworn, depose and say that I have read the foregoing, know the contents thereof, and the same is true and correct.

James R. Linden

**SUPPLEMENTAL VERIFIED STATEMENT
OF
CHRISTOPHER M. FLYNN**

My name is Christopher M. Flynn, Fire Chief, City of Rocky River, Ohio. I previously submitted a Verified Statement on behalf of the City of Rocky River consisting of six written pages and attached Exhibits labeled CMF-1 through CMF-6. That statement was verified to be true by me on October 6, 1997.

I wish to supplement my statement at this time by including the parenthetical phrase "(See Exhibits CMF-3 - CMF-5 for response time information)." at the end of the second paragraph of page two of my original Verified Statement.

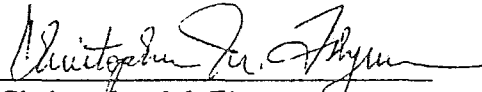

VERIFICATION

SUPPLEMENTAL VERIFIED STATEMENT
OF
DONALD L. WAGNER

My name is Donald L. Wagner, Chief of Police, City of Rocky River, Rocky River, Ohio. I previously submitted a verified statement consisting of four written pages and Exhibits DLW-1 through DLW-6. That statement was verified by me to be true on October 6, 1997.

I wish to supplement my previous statement at this time by correcting the second sentence in the second paragraph of page three of said Verified Statement to read: "[T]his proposal, if put into effect will affect the quality of life as it directly relates to Police Services provided to Rocky River citizens North of the Railroad."

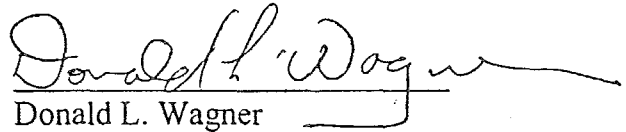

VERIFICATION

STATE OF OHIO

SS.

COUNTY OF CUYAHOGA

I, Donald L. Wagner being duly sworn, depose and say that I have read the foregoing, know the contents thereof, and the same is true and correct.

Burns & McDonnell is conducting an environmental analysis of this NS proposal to reroute the additional post-Acquisition freight rail traffic away from the West Shore to Vermilion corridor. Upon completion of this work, NS will provide SEA and the third-party consultants with a copy of the written analysis.

FUNDING OF NS TRAFFIC REROUTING AND GRADE CROSSING PROPOSAL

NS expects that both the rerouting project and the grade crossing closure and upgrade project will qualify for federal and state funding.

An "order of magnitude" estimate of the cost of the proposal to reroute the increased NS rail traffic resulting from the proposed Acquisition is \$46,950,000. This includes approximately \$24,350,000 to upgrade the existing Conrail track from CP 190 to Cloggsville, \$14,000,000 to construct the grade separation at Front Street in Berea, \$5,600,000 to construct the grade separation at Fitch Street in Olmsted Falls and \$3,000,000 to construct the second connection at Vermilion. NS estimates the cost of upgrading the West Shore to Vermilion at-grade public crossings to be approximately \$2,300,000. The cost of closing redundant at-grade crossings in Lakewood has not been calculated as it is dependent upon the location and number of such crossings to be eliminated. NS proposes that discussions with local and state officials be renewed to determine which of the grade crossings in the City are appropriate for closure and which should be upgraded to include both flashing lights and gates.

Both projects will require not only political and regulatory support from the federal government, the State of Ohio, and local officials but the commitment of public funding for these important safety-enhancing projects. To that end, NS will seek all available assistance from local, state and federal authorities to obtain the necessary funding to permit these projects to go forward to construction. Rerouting of the increased post-Acquisition rail traffic from the Lakewood corridor would take place upon completion of the proposed rerouting construction project.

SURFACE TRANSPORTATION BOARD

CSX CORPORATION AND CSX TRANSPORTATION, INC.
NORFOLK SOUTHERN CORPORATION AND
NORFOLK SOUTHERN RAILWAY COMPANY
—CONTROL AND OPERATING LEASES/AGREEMENTS—
CONRAIL INC. AND CONSOLIDATED RAIL CORPORATION

STB FINANCE DOCKET NO. 33388

NORFOLK SOUTHERN CORPORATION AND
NORFOLK SOUTHERN RAILWAY COMPANY'S RESPONSES TO
THE FIRST SET OF INTERROGATORIES AND
FIRST SET OF DOCUMENT PRODUCTION REQUESTS FROM
THE CITY OF BAY VILLAGE, CITY OF ROCKY RIVER, AND CITY OF LAKEWOOD
TO NORFOLK SOUTHERN (BRL-1)

Norfolk Southern Corporation and Norfolk Southern Railway Company (collectively, "NS") hereby respond to BRL-1, the first set of interrogatories and first set of document production requests to NS from the cities of Bay Village, Rocky River, and Lakewood, Ohio ("BRL" or "Requester").

GENERAL RESPONSES

The following general responses are made with respect to all of the requests and interrogatories.

1. NS will conduct a reasonable search for documents responsive to the requester's documents requests. Except as objections are noted herein,^{1/} all responsive documents will be made available for inspection and copying in Applicants' document depository, which is located at the offices of Arnold & Porter in Washington, D.C. Copies of documents will be supplied upon payment of duplicating costs (including, in the case of computer tapes, costs for programming, tapes and processing time).

2. Production of information or documents does not necessarily imply that they are relevant to this proceeding, and is not to be construed as waiving any objection stated herein.

3. In line with past practice in cases of this nature, NS has not secured verifications for the answers to interrogatories herein. NS is prepared to discuss the matter with requester if this is of concern with respect to any particular answer.

4. Where objections have been raised as to the scope of the interrogatory, NS is willing to discuss searching for and producing information covered by a more limited request or interrogatory taking account of the stated objection.

GENERAL OBJECTIONS

The following general objections are made with respect to all of the interrogatories and documents requests. Any additional specific objections are stated at the beginning of the response to each interrogatory or document request.

^{1/} Thus, any responses that state that responsive documents are being produced is subject to the General Objections, so that, for example, any documents subject to attorney-client privilege or the work product doctrine are not being produced.

1. NS objects to production of, and is not producing, documents or information subject to the attorney-client privilege, the work product doctrine and/or the joint or common interest privilege, or administratively confidential documents or information.

2. NS objects to production of, and is not producing, documents prepared in connection with, or information relating to, possible settlement of this or any other matter.

3. NS objects to production of, and is not producing, public documents or information that is readily available, including but not limited to documents on public file at the Surface Transportation Board ("STB"), the Securities and Exchange Commission, or any other government agency or court, or that have appeared in newspapers or other public media.

4. NS objects to the production of, and is not producing, draft verified statements and documents related thereto. In prior railroad consolidation proceedings, such documents have been treated by all parties as protected from production.

5. NS objects to the production of, and is not producing, information or documents that are as readily obtainable by the requester from its own files or members.

6. NS objects to the production of, and is not producing, information or documents containing confidential or sensitive commercial information, including information subject to disclosure restrictions imposed by law in other proceedings or by contractual obligation to third parties, and that is of insufficient materiality to warrant production here even under a protective order.

7. NS objects to the requests to the extent that they seek documents or information in a form not maintained by NS in the regular course of business and not readily

available in the form requested, on the ground that such documents or information could only be developed, if at all, through unduly burdensome and oppressive special studies, which are not ordinarily required and which NS objects to performing.

8. NS objects to the interrogatories and requests as overbroad and unduly burdensome to the extent that they seek information or documents for periods prior to January 1, 1995.

9. NS objects to any requests that seek information regarding current or future operations on, or any other plans or activities relating to, or employment on, rail lines or properties other than those that NS currently owns or operates, or with respect to future operations, Conrail line segments that NS will operate at the relevant future time. The best source of information with respect to such matters is the Applicant that owns or operates the line or property in question, or will do so at the relevant future time.

10. NS incorporates, as if fully set forth herein, its General Objections 10, 11, 12, 13 and 14 set forth in NS-9, pertaining to the definitions and instructions set forth in ACE-4 incorporated by reference by BRL into BRL-1. See BRL-1, Definitions and Instructions.

11. NS objects to BRL's definition of the applicable "Line Segment" ("the Cleveland, OH to Vermilion, OH line segment") as overbroad and irrelevant in that the Line Segment as defined by requester includes underlying links located outside of requesters' geographical limits. For purposes of its response to these interrogatories, NS construes that term to refer to the NS link from milepost B 185.6 (Cloggsville) to milepost B 205.5 (Avon Lake).

INTERROGATORIES AND DOCUMENT REQUESTSInterrogatory and Document Request No. 1:

Identify, for each of the Base Case 13.5 trains per day and for each of the Post-Acquisition Case 34.1 trains per day:

- a) the origin;
- b) the destination;
- c) the average length;
- d) the average speed of the train over each grade crossing in Bay Village, Rocky River, and Lakewood;
- e) the amount of hazardous materials freight;
- f) the time of day the train does and/or will operate over the Line Segment;
- g) train/horn equipment;
- h) train/horn sounding sequences within Bay Village, Rocky River, and Lakewood;
- i) train speeds during sounding sequences within Bay Village, Rocky River, and Lakewood;
- j) ground-borne vibration levels within Bay Village, Rocky River, and Lakewood; and
- k) the maximum, minimum, and average time that the train has and/or will block each grade crossing within Bay Village, Rocky River, and Lakewood.

For purposes of your responses to items (a) and (b), you may respond "Bridge Traffic" if none of the freight either originates or terminates on this Line Segment.

1. NS objects to this request as unduly burdensome and overly broad. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

a) The NS Operating Plan shows 13.5 trains/day (Base Case) and 34.1 trains/day (Post Acquisition Case) operating or projected to operate over the segment from Cleveland to Vermilion, OH. Corresponding numbers for the Line Segment (Cloggsville-Avon Lake) are 12.3 trains per day (Base Case) and 31.9 trains per day (Post Acquisition Case). These trains currently carry bridge traffic and are projected to carry bridge traffic destined for points other than Bay Village, Rocky River and Lakewood. No regular local service is

operated over the Line Segment. If any local traffic were to move over the Line Segment, NS anticipates that this traffic would be handled by road switchers working out of Sheffield Yard at Avon Lake on an as-needed basis.

b) See response to subpart (a) above.

c) The average lengths of trains operating over the Line Segment for the Base Case and Post Acquisition Case are approximately 4100 feet and approximately 3900 feet respectively.

d) Average train speed over each grade crossing is as follows: MP B 189.2 (Cleveland/Lakewood City Line) to MP B 194.5 (Elmwood) - 35 miles per hour; MP 194.5 (Elmwood) to MP B 199.6 (Cuyahoga/Lorain Co. Line) - 60 miles per hour - intermodal; MP B194.5 (Elmwood) to MP B 199.6 (Cuyahoga/Lorain Co. Line) - 50 miles per hour - other freight trains. Clague Siding, located between MP B 193.9 and MP B 197.0, is a controlled siding used for meeting trains on the single track link. Trains entering and running through this siding are limited to 25 miles per hour.

e) Base Case: 26 carloads/day; Post Acquisition Case - 89 carloads/day.

f) Projected train schedules may be found in Applicants' depository. See NS-21-CO-07358-09247.

g) Airhorns are of various configurations depending upon locomotive manufacturer, horn manufacturer, locomotive age, etc. All subject horn equipment meets or exceeds FRA specification for this type of appliance.

h) Whistle signal 14(L) -- consisting of two long, one short and one long sounds -- is used in advance of each crossing at grade, unless otherwise provided by ordinance or special instruction.

i) See response to subpart (d) above.

j) NS is not in possession of information regarding any such ground-borne vibration levels.

k) A responsive document will be placed in Applicants' depository.

Interrogatory and Document Request No. 2:

Provide a disk containing the computer model and input data used to develop your response to 1(k).

2. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

Assuming normal operations, calculations of maximum, minimum, and average time that each train will block a grade crossing were made utilizing average train lengths and expected train speeds, taking into account the type of train and acceleration and deceleration factors. See response to Interrogatory 1(k). No computer model was used to make these simple calculations.

Interrogatory and Document Request No. 3:

For the base case and the post acquisition case provide:

a) the total train miles on the Line Segment; and

b) the total rail car miles.

3. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

a) Total train miles per year for the Cleveland-Vermilion line segment are as follows: Base Case: 182,810; Post Acquisition Case: 461,765. Total train miles per year for the Cloggsville-Avon Lake line segment are as follows: Base Case: 89,790; Post Acquisition Case: 232,870.

b) Total rail car miles per year for the Cleveland-Vermilion line segment are as follows: Base Case: 12,282,140; Post Acquisition Case: 28,145,685. Total rail car miles per year for the Cloggsville-Avon Lake line segment are as follows: Base Case: 5,883,800; Post Acquisition: 14,279,588.

Interrogatory and Document Request No. 4:

Identify, by mile-post numbers, each grade crossing in Bay Village, Rocky River, and Lakewood.

4. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

Responsive documents will be placed in Applicants' depository.

Interrogatory and Document Request No. 5:

For each identified grade crossing:

- a) describe the form of grade crossing protection currently in place, e.g. cross-bucks, flashers, gates and lights, grade separations;
- b) provide the maximum timetable speed; and
- c) identify the track class.

5. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

A responsive document will be placed in Applicants' depository.

Interrogatory and Document Request No. 6:

For each identified grade crossing that is protected by gates and lights, provide the amount of time:

- a) prior to the arrival of the train that the gates start coming down; and
- b) after the passing of the train that the gates are fully up.

To the extent that the information provided in response to (a) and (b) would not be applicable to each base case and/or post-acquisition train passing through the identified grade crossing, explain the reason for the difference and provide the applicable maximum and minimum times for each grade crossing.

6. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

- a) Protective devices in place meet both NS and FRA requirements. Gates are electronically programmed to begin to lower less than four (4) seconds after lights begin to flash.
- b) Gates are electrically programmed to raise in not more than twelve (12) seconds after a train has cleared the crossing circuit.

Interrogatory and Document Request No. 7:

For each of the proposed additional 20.6 trains per day:

- a) identify the portion of the current routing to be replaced by use of the Line Segment;
- b) explain why the current routing, e.g. the Conrail routing, may not, can not, or should not be used in the post-acquisition environment;
- c) identify all routings not involving the Line Segment considered by Norfolk Southern as a replacement for the current routing;
- d) describe the rationale for rejecting the routings identified in your response to (c).

7. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

a) NS objects to this subpart on the basis that the term "current routing to be replaced" is vague and ambiguous. NS anticipates diverting traffic from other carriers and other routes. To the extent that the increase represents traffic diverted from other carriers or other routes, identification of its current routing would require a burdensome special study which NS is not required to perform. To the extent the increased traffic represents new traffic, there is no "current routing." Train schedules for the post-acquisition case were developed by preparing an origin-destination data base of traffic that would be expected to move over the expanded NS system, and then building a network of trains to move this traffic in an efficient and timely manner. The new train networks were developed on a "zero-based" model -- current routing was not an input into the model.

b) NS objects to this subpart as vague and ambiguous. Upon approval and consummation of the proposed Transaction, CSX will control and operate trackage on Conrail's line between Cleveland (CP 181), Buffalo and points East. NS will compete for traffic between points West of Vermilion and East of Cleveland using its own ownership route (former Nickel Plate).

c) NS objects to this subpart on the basis that the term "replacement for the current routing" is vague and ambiguous. NS assumes that in this subpart the term "current routing" is intended to mean post-acquisition routing. In regard to post-acquisition routing, NS considered two alternative routes: the Cleveland Shortline to Berea and the Cloggsville Connection.

d) The Cleveland Shortline was dismissed as an alternative route because train dispatching would not be under the control of NS and also because of concerns about scheduling and congestion.

The Cloggsville Connection was dismissed as an alternative route because of the substantial expense that would be necessary to upgrade the route and build new connections.

Interrogatory and Document Request No. 8:

Describe the manner in which the projected increase of 20.6 trains per day was calculated. This description should include any assumptions as to freight gained or lost in the post-acquisition environment, but such assumptions may be stated in a way that eliminates any confidential data.

8. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

See the NS Operating Plan, Volume 3B, Section 2.0, pages 90 - 94.

Interrogatory and Document Request No. 9:

Provide all documents used to calculate the proposed increase of 20.6 trains per day. Again, you may eliminate any confidential data.

9. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

Responsive documents have been placed in Applicants' depository. See, e.g., work papers supporting the NS Operating Plan and the Verified Statements of D. Michael Mohan and John H. Williams.

Interrogatory and Document Request No. 10:

Provide all projections of numbers and lengths of trains per day over this Line Segment for:

- a) the first 12 months post-acquisition; and
- b) each of years two through ten post-acquisition.

In the event Norfolk Southern's projections applicable to (a) and (b) include ranges of numbers and/or lengths, those ranges should be provided in your responses to (a) and (b).

10. NS objects to this request on the basis that it would require NS to undertake a burdensome special study which NS is not required to undertake. The studies performed to develop the NS Operating Plan included detailed traffic analysis and operations simulation for the base year 1995 and the post-acquisition period, assumed to be three years after approval and consummation of the Transaction. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows.

- a) and b) Figure D.6-2 of Volume 3B presents data for normal year operations.

Train lengths can be found in the work papers supporting the NS Operating Plan.

Interrogatory and Document Request No. 11:

For the period commencing January 1, 1992:

- a) list all derailments, collisions, accidents, and/or incidents experienced by Norfolk Southern on this Line Segment;
- b) for each event listed in (a), provide a copy of any report made to FRA;
- c) identify the nearest grade crossing to each accident/incident;
- d) identify all accidents involving personal injury and/or death;
- e) identify all accidents involving property damage and provide a dollar quantification of such damage if known;
- f) identify and describe all events involving any release or spill of hazardous materials (as defined by FRA); and
- g) for each event identified in (d) and (e), provide a copy of any report made to either FRA or the U.S.D.O.T. Research and Special Programs Administration.

NS objects to this interrogatory to the extent that it seeks information pertaining to events occurring prior to January 1, 1995, and NS is not producing information or documents pertaining to any such events. NS also objects to producing, and is not producing, information or documents available publicly through the Federal Railroad Administration or any other government agency. Without waiving any objection, and subject to the foregoing objections and the general Objections stated above, NS responds as follows:

- a) Responsive documents, if any, to the extent not publicly available, will be placed in the Applicants' depository.
- b) These documents are available to requester from public sources.
- c) For events occurring at grade crossings, see the documents produced in response to subpart (a). As to events occurring not at grade crossings, NS objects to this subpart as it would require a special study, which NS is not required to perform.
- d) Responsive documents, if any, to the extent not publicly available, will be placed in Applicants' depository.
- e) Responsive documents, if any, to the extent not publicly available, will be placed in Applicants' depository.
- f) None.
- g) These documents are available to requester from public sources.

Interrogatory and Document Request No. 12:

Identify all communication methods presently available to Norfolk Southern to provide advance warning of an approaching train to emergency service providers, i.e. police, fire, and ambulance, in Bay Village, Rocky River, and Lakewood.

NS objects to this Interrogatory as vague and ambiguous, particularly with respect to the phrase "all communication methods presently available." Without waiving any objection, and subject to the foregoing objection and the General Objections stated above, NS responds as follows:

NS does not routinely provide advance notification of approaching trains. All NS crossings are posted with a sign showing NS' Police "Hot Line" number (1-800-946-4744). In the event of an emergency, local emergency service providers may use this number for 24-hour access to NS' Police Service Center, which, in turn, is in contact with all dispatching offices.

Interrogatory and Document Request No. 13:

Identify all grade crossings in Bay Village, Rocky River, and Lakewood previously considered for grade separations.

NS objects to this interrogatory as vague and ambiguous with respect to the phrase "previously considered." Without waiving any objection, and subject to the foregoing objection and the General Objections stated above, NS responds as follows:

NS has no records indicating that grade separations have been considered for any crossing in Bay Village, Rocky River, or Lakewood. Such decisions are made by appropriate state officials and NS is not privy to their records.

Interrogatory and Document Request No. 14:

For each identified grade crossing, provide all documents in Norfolk Southern's possession addressing:

- a) the advantages and/or disadvantages of such grade separations; and
- b) the cost of such grade separations.

NS objects to this interrogatory as vague and ambiguous with respect to the phrase "each identified grade crossing." NS construes that phrase to refer to grade crossings, if any, identified in response to Interrogatory No. 13 immediately above. Without waiving any objection, and subject to the foregoing objection and the General Objections stated above, NS responds as follows:

See response to Interrogatory No. 13.

Interrogatory and Document Request No. 15:

Provide copies of:

- a) all written complaints, concerns, or the like relating to Norfolk Southern operations over the Line Segment on or after January 1, 1992; and
- b) all responses to the items provided in response to (a).

NS objects to this interrogatory as vague and ambiguous with respect to the phrase "or the like". NS also objects to this interrogatory to the extent that it seeks information pertaining to events occurring prior to January 1, 1995. Without waiving any objection, and subject to the foregoing objections and the General Objections stated above, NS responds as follows:

NS will place responsive documents, if any, in the Applicants' depository.

Interrogatory and Document Request No. 16:

Provide all documents supporting the description of Cuyahoga County in the Supplemental Environmental Report (Volume 6), page 85.

Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

Responsive documents will be placed in Applicants' depository.

Interrogatory and Document Request No. 17:

Is Norfolk Southern aware of any inconsistent application or other proposal in this proceeding that would result in a use of the Line Segment different from that proposed by Norfolk Southern? If so, identify that proposal.

NS objects to this interrogatory as vague and ambiguous, with respect to the phrases "other proposal" and "use of the Line Segment different from that proposed by Norfolk Southern." Without waiving any objection, and subject to the foregoing objection and the General Objections stated above, NS responds as follows:

A number of parties have served descriptions of anticipated inconsistent or responsive applications and public comments in Finance Docket No. 33388, and those documents speak for themselves.

Interrogatory and Document Request No. 18:

Describe the proposed use of what appears to be a water route between Buffalo and Detroit that Norfolk Southern will acquire from Conrail.

NS objects to this interrogatory as vague and ambiguous, with respect to the phrase "what appears to be a water level route between Buffalo and Detroit." Without waiving any objection, and subject to the foregoing objection and the General Objections stated above, NS responds as follows:

In order to clarify this request, counsel for requester provided NS with a copy of a Rand-McNally map. The "water level route" referred to in this interrogatory and shown on that map appears to be the shore of Lake Erie and not a rail route.

Interrogatory and Document Request No. 19:

Describe all benefits to Norfolk Southern relating to the increased usage of the Line Segment. To the extent possible, provide dollar qualifications [sic] for such benefits.

NS objects to this interrogatory as vague and ambiguous in its use of the term "benefits." NS also objects to this interrogatory as requiring an unduly burdensome and oppressive special study, which NS is not required to perform. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

The requested information is not available, as NS has not undertaken to calculate benefits to itself on a line segment-by-line segment basis.

Interrogatory and Document Request No. 20:

Provide all documents dated January 1, 1992 and after discussing compliance with federal, state, and/or local environmental requirements which specifically relate to the Line Segment or any portion thereof.

NS objects to this interrogatory as overly broad. NS also objects to this interrogatory to the extent that it seeks documents for periods prior to January 1, 1995, and NS is not producing any such documents. Without waiving any objection, and subject to the foregoing objection and the General Objections stated above, NS responds as follows:

Responsive documents, if any, will be placed in the Applicants' depository.

Interrogatory and Document Request No. 21:

Provide all documents dated January 1, 1992 and after discussing post-acquisition locomotive and motor vehicle exhaust emissions on or near any portion of the Line Segment.

NS objects to this interrogatory to the extent that it seeks documents for periods prior to January 1, 1995, and NS is not producing any such documents. Without waiving any objection, and subject to the foregoing objection and the General Objections stated above, NS responds as follows:

Air quality impacts in Cuyahoga County are discussed in Environmental Report Volume 6B, Section 8.1.1.1.2 (as corrected by the Supplemental Environmental Report).

Interrogatory and Document Request No. 22:

Provide all documents discussing train operational considerations on the Line Segment that may affect post-acquisition street vehicle safety, pedestrian safety, hazardous materials transport, potential for derailment, impact on biological resources, traffic delay, noise, emergency vehicle response time, or local economic factors.

NS objects to this interrogatory to the extent that it seeks documents for periods prior to January 1, 1995, and NS is not producing any such documents. NS also objects to this interrogatory as vague and ambiguous. Without waiving any objection, and subject to the foregoing objection and the General Objections stated above, NS responds as follows:

The Environmental Report submitted by the Applicants discusses the anticipated impacts, if any, of projected train operations on the Line Segment on, among other things, noise, transportation and safety (including grade crossing safety and hazardous materials transport).

Interrogatory and Document Request No. 23:

Describe all known environmental consequences of increasing traffic over the Line Segment to the extent proposed and provide all documents in Norfolk Southern's possession relating to such consequences.

NS objects to this request as vague and ambiguous, unduly burdensome and overly broad. Without waiving any objection, and subject to the General Objections stated above, NS responds as follows:

The Applicants have complied with the Board's environmental regulations by submitting an Environmental Report as Volume 6 of the Application. The Environmental Report constitutes NS' description of the consequences of increasing traffic over the Line

Segment on the various environmental factors to be considered by the Board. The Board's Section of Environmental Analysis ("SEA") and its independent environmental consultants are in the process of analyzing and evaluating the environmental consequences of the operational changes proposed in the Application. To the extent that SEA has required any further data from NS for purposes of such analysis, such data will be described and discussed in the Draft Environmental Impact Statement ("DEIS") that will be issued by the Board. The DEIS will also address mitigation measures, if any, being considered and/or recommended by the Board.

Interrogatory and Document Request No. 24:

Describe all known methods of eliminating and/or mitigating all known environmental consequences of increasing traffic over the Line Segment to the extent proposed and provide all documents relating to such methods. Your response to this question should include all documents containing standards and other methods of evaluating whether grade crossing protection of various types, including grade separations, pedestrian grade separations, and pedestrian gates, should be in place.

NS objects to this request as vague and ambiguous, unduly burdensome and overly broad. Without waiving any objection, and subject to the General Objections stated above,

NS responds as follows:

See response to Request No. 23.

Interrogatory and Document Request No. 25:

For each described method provide:

- a) the known cost;
- b) whether and when Norfolk Southern will implement the method; and
- c) as applicable, why Norfolk Southern will not implement the method.

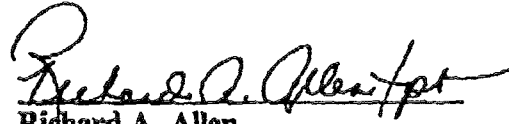

FROM ZSR LAW

NS objects to this request as vague and ambiguous, unduly burdensome and overly broad. Without waiving any objection, and subject to the General Objections stated above,

NS responds as follows:

See response to Request No. 23.

Mr. C. R. Tripp, P. E., Admin.
Bureau of External Contracts
Ohio D O T
P. O. Box 899
Columbus, OH 43216-0899

Dear Mr. Tripp:

We are currently holding in abeyance eight (8) grade crossing warning device projects in the City of Lakewood, Cuyahoga County. These eight are Cove Avenue, Brockley Avenue, Bunts Road, Bonnieview Avenue, Belle Avenue, Hurd Avenue, Webb Avenue and Manor Park Avenue.

By letters of July 17, 1986; December 18, 1986; and March 6, 1987, you were requested to approve the upgrading of all crossings in the City of Lakewood due to the close proximity of the crossings; i.e., 27 grade crossings in 2.48 miles. As noted in Mr. Janosko's letter of July 17, 1986, all crossings can be done for a 35% increase over the cost to upgrade the first five crossings listed above.

Would you please review the Lakewood situation and advise your approval to proceed as previously recommended.

Very truly yours,

F. H. McIntyre

cc: Ms. T. B. Mahan - Your letter of May 30, 1989, referred to AFE 85-4239. AFE's 85-4237, 85-4238, 85-4240 and 85-4241 should have similar charges. It is recommended that ODOT be billed for all charges incurred to date on these projects. If ODOT does not respond, we will cancel the projects and the AFE's.

CLEVELAND FREE TIMES

...can use that as up. ever wonder how the guy pushing that mile-long behemoth feels about your little stunt?

We took a ride on the train to get a firsthand perspective of the engineers who have to deal with the serious injuries and death that occur when their trains flatten an anxious motorist or a kid playing chicken. We almost got a story we didn't want to report.

It's Wednesday November 25, the day before Thanksgiving, and the Norfolk Southern 146 is passing through Lakewood. It's 8:30 am, a tense time for the engineer and conductor of this eastbound train because they have to pass 33 crossings in a three-mile stretch. Cars are darting across the tracks and dozens of kids walking to school are also crossing. A group of sixth through eighth graders from Horace Mann Middle School decide to break across the tracks at Webb Road, about 75 feet in front of the train. The tracks are wet from last night's rain. Suddenly, one of the kids slips between the east and westbound tracks. My god, we're going to hit him! Our hearts leap from our chests. There is a gasp. There is no way to stop.

Just as suddenly, the kid picks himself up and scrambles off the track. Norfolk Southern 146 misses him by three feet, and as we pass, the kid is still squirming his way off the other side of the tracks, while his buddies remain frozen just out of harm's way.

Chances are the people in that train cab have hit and killed people like you. It happens more often than any of us would like to think. But when a car or a person makes a move across or alongside those tracks with a train in sight, the railroaders are helpless. It takes a fully loaded train going 35 miles per hour about half a mile to stop.

Thirteen-year-old Brian Kochan didn't have to die. He's the Middleburg Heights boy who was killed last month on the Conrail tracks near the Stadium. You heard the story. He

and his father Michael were leaving a Sunday afternoon Browns game and, like hundreds of other fans, were walking along the railroad tracks. Brian was hit by a Conrail train and died that evening. Conrail says he had been using the Mall C footbridge. His family and friends are in agony.

Conrail reports that its trains were involved in 413 accidents that caused 41 fatalities across the country in 1991. The total for all railroads in Ohio for 1991 were 324 accidents and 55 deaths. In Cuyahoga County during the last five years there have been 35 accidents between cars, people and trains on Norfolk Southern tracks alone. Twenty-two of those accidents have happened in Lakewood. One person was killed on Lakewood's tracks in 1989. Danny Giber, Norfolk Southern's manager of grade crossing safety, says that the three-mile stretch through Lakewood is "one of the most dangerous in our 15,000 miles of track."

Crossing safety is not the only problem in Lakewood. Norfolk Southern says trespassing is increasing. Trespass-

...who was pushing the train that almost hit the little child during our trip. "You always have that sickening feeling in your stomach that you're going to hit them," he says. "The only thing I can do is use the extra whistle and bell ringing, and hopefully they'll get out of the way."

Zap has been riding the rails for 29 years and has had his share of accidents. Two months ago he hit a semi in Coonocast because the trucker wasn't looking. The truck's fuel tank exploded. The driver was seriously injured.

Zap admits he has been involved in a few fatalities. How does he deal with it? "There's nothing you can do about it," he says, his voice tightening. "I don't really talk about it, you know." The fact that he's helpless to stop or swerve when a car or kid darts in front of his train doesn't make it any easier.

Bob Kahle was the conductor during our morning ride. The conductor is in charge of the train, making sure the tracks are clear, the right switches are thrown, and the cars reach their proper destination. Bob has likewise seen too

much injury and death in 20 years working for the railroad.

He thinks about the guy who apparently wasn't looking and simply walked in front of his train in Ashtabula. The words come just as slowly when talking about the deaths of two Geneva women. "We had two young women in Geneva who took the one's sister to work," he recalls. "All three came up over the tracks, and the one being dropped off at work told her sister, who was driving, that she should slow down and look for trains when she goes back across the tracks. They dropped the sister off and came right back up over the crossing and we hit 'em. Killed both of 'em."

Kahle says accidents like that happen quickly, but the image of it never leaves your mind. "It's like a slap in the face. It happens so fast," he says. "There's glass and ballast flying and the train kicks the car up

and you keep dragging it with you and you can see the people inside, which is even worse."

What can be done to prevent accidents? One thing the railroads are trying to do is increase their safety margin by shutting down tracks. Next week, for example, Norfolk Southern plans to close one of its two east-west tracks running through Lakewood and the rest of northeast Ohio. With all traffic on one track, there's less of a chance a motorist, thinking the tracks are clear after seeing one train pass, will proceed across and get hit by a train coming from the other direction.

Another move is the closing of crossings. Norfolk Southern has proposed eliminating a dozen or so of the 33 crossings in Lakewood. Turnarounds would have to be built for the dead-end streets. Some city officials are supportive of the move. Public hearings are underway.

However, railroaders say accidents are part of the job. They say it's a question of time. Motorists and pedestrians are constantly trying to save time and the trains can't stop in time.

It takes a fully loaded train going 35 miles per hour about half a mile to stop.

WCJ

Please find attached five letters written to the state of Ohio regarding projects that have been approved in Lakewood, Ohio. As information, state approval for five of the projects (Bonnieview, Cove, Belle, Brockley, Bunts) was received in 1985 and approval for Nicholson was received 10/21/91. We have been trying to convince the state that a corridor approach to these projects would be more sensible from an engineering and monetary standpoint. The difficulties that must be addressed when upgrading only a select few among the twenty-eight includes existing AFTAC frequency conflicts, limitations caused by having to couple around insulated joints, and additional line work.

Presently we are waiting for the state to approve two additional estimates for Hird Ave. and Manor Park. Assuming state's approval the total monies approved for the eight Lakewood projects would be \$1,064,453. DLH and I feel that for this amount of money all 28 crossings (W. 117th to Webb St.) could have a minimum of a 3000GCP box installed thus eliminating approximately 40 insulated joints and also allowing us to expand our frequency selection. Most of the active circuits on the pole line could also be eliminated and I understand that the pole line thru Lakewood has been an on going problem, even to the extent of getting the FRA involved.

Train traffic thru Lakewood can be at various speeds and the majority of the present warning systems are not of the constant warning time type. Train/auto accidents are not uncommon. The implementation of the GCPs would make for a safer and more manageable crossing warning system as a whole.

If the state chooses at a later time to upgrade other crossings in Lakewood, it would be less expensive because some of the complications will have already been addressed.

I was unable to locate the state's response to FHM's most recent letter of 6/27/90 although I vaguely recall the possibility of running across same which directed us to continue with the projects on an individual basis. Regardless, having discussed this with ATH, we both agreed that since the approved monies have the potential of increasing with the Hird Ave. and Manor Park projects we should approach the state one last time for their consideration of the 28 crossings.

ATH mentioned getting Danny Gilbert involved since "corridor " projects have recently become a catch word for many states.

Re: Motion of City of Bay Village, City of Rocky River, and
City of Lakewood to Compel Discovery Responses from
Norfolk Southern and Request for a Discovery Conference
(BRL-4)

Dear Mr. Kalish:

As a follow-up to our telephone conversations concerning
supplementation and clarification of Norfolk Southern's (NS)
responses to the BRL's First Set of Discovery Requests (BRL-1),
Norfolk Southern is supplying the following information:

Interrogatory and Document Request No.1: Identify for each
of the Base Case 13.5 trains per day and each of the Post-
Acquisition Case 34.1 trains per day: c) the average length;
d) the average speed of the train over each grade crossing
in Bay Village, Rocky River and Lakewood; (f) the time of
day the train does and/or will operate over the Line
Segment; (k) the maximum, minimum, and average time that the
train has and/or will block each grade crossing within Bay
Village, Rocky River and Lakewood.

NS responded to subsection 1(c) as follows: "The average
length of trains operating over the Line Segment for the Base
Case and Post Acquisition Case are approximately 4100 feet and
approximately 3900 feet respectively. To clarify, this reference
is to the Avon Lake to Cloggsville link.

As to subsection 1(d), NS responded that the speeds given
were average train speeds. In order to clarify NS' response, NS
explained that these speeds were actually maximum speeds. BRL
now seeks verification as to whether NS knows the average speeds
for these trains. NS has not calculated average speeds for these
trains. However, NS notes that average speeds are never higher
than allowed by the FRA for the class of track over which NS
operates.

CORRESPONDENT OFFICES: LONDON, PARIS AND BRUSSELS

ZUCKERT, SCOUTT & RASENBERGER, L.L.P.

Steven Kalish, Esq.

December 8, 1997

Page - 2 -

As to subsection 1(f), NS responded that reference to train schedules placed in its document depository. BRL explained that the reason for this request was to determine variation in noise levels throughout the day, as well as possible delays to street traffic, and that a response giving an overall average, i.e., the percentage of trains that would be travelling over the Line Segment during certain times throughout the day, would be acceptable to BRL. In order to determine noise levels at specific hours of the day, NS would be required to conduct a special study which it has not undertaken as of this date.

In regard to subsection 1(k), NS responded by depositing responsive documents in its depository. BRL questions how NS could know the average time a train will block a grade crossing, if it has not computed average speeds. The information set forth in these documents was computed as follows:

a) For each crossing, the "average" speed over the crossing (which actually was maximum speed) either 35 MPH, 50 MPH or 60 MPH was used to compute the minimum blockage time in seconds for each case.

Example for Hird Avenue - 35 MPH = 51.33 feet per second (FPS) - 3900 foot train (merged case) ÷ 51.33 FPS = 76 seconds minimum blockage time.

b) For each crossing, the slowest speed over the crossing (25 MPH for crossings in or within a train length of the siding, otherwise same as maximum speed) was used to compute the maximum blockage time in seconds for each case.

Example for Columbia Road - 25 MPH = 36.66 feet per second (FPS) - 3900 foot train length (merged case) ÷ 36.66 FPS = 106 seconds maximum blockage time.

c) The maximum blockage times were adjusted for those crossings within the zones of deceleration or acceleration. (Linda St., Morwood St., Bassett Rd., and Bradley Road) to take into account typical deceleration and acceleration rates, which were estimated based on typical train weights and motive power.

d) Average blockage times were computed using the maximum and minimum blockage times, and assuming that

- 20% of trains take the siding and run at 25 MPH
- 80% of trains remain on the main track, and run at 50 or 60 MPH west of MP B194.5

ZUCKERT, SCOUTT & RASENBERGER, L.L.P.

Steven Kalish, Esq.

December 8, 1997

Page - 3 -

- 26% of the trains are piggyback in the Base Case (22% in Post Acquisition Case) and can run at 60 MPH
- 54% of the trains are merchandise in the Base Case (58% in Post Acquisition Case) and can run at 50 MPH

Interrogatory and Document Request No. 6(a):

For each identified grade crossing that is protected by gates and lights, provide the amount of time (a) after the passing of the train that the gates are fully up.

NS responded that protective devices in place meet both NS' and FRA requirements and that gates are electronically programmed to begin to lower less than four (4) seconds after lights begin to flash. Although Norfolk Southern maintains that it provided a full and complete response to this request, NS further clarified its response to Interrogatory No. 6(a) as follows:

In general, gates will begin their downward motion after a train has been detected and the gate delay time (no less than three (3) seconds after activation of the warning devices) has expired. The time in question may vary from 22 seconds to 27 seconds prior to the arrival of a train at the crossing. These times meet both NS and FRA requirements to allow for a minimum of 20 seconds warning time prior to the arrival of a train at a crossing.

In response to BRL's subsequent question about the above clarification, the three seconds is in addition to the 22 to 27 second variance.

Interrogatory and Document Request No. 9: Provide all documents used to calculate the proposed increase of 20.6 trains per day.

NS responded by reference to work papers supporting the NS Operating Plan, and the Verified Statements of D. Michael Mohan and John H. Williams. BRL subsequently requested a more specific reference, and NS agreed to determine that portion of NS' work papers supporting the Errata to Primary Application (CSX/NS-35). Those NS work papers may be found in the NS document depository at NS-32-HC-00001-000092; NS-32-CO-00001-00104; and NS-31-P-00001-00006.

Interrogatory and Document Request No. 10: Provide all projections of numbers and lengths of trains per day over

ZUCKERT, SCOUTT & RASENBERGER, L.L.P.

Steven Kalish, Esq.

December 8, 1997

Page - 4 -

this Line Segment for a) the first 12 months post-acquisition; and b) each of years two through ten post-acquisition.

NS responded to subsections (a) and (b) by reference to Volume 3B, Figure D.6-2. In addition, NS explained that train lengths could be found in the work papers supporting the NS Operating Plan. BRL has requested a more specific reference, and NS agreed to review the matter.

In order to segregate information on the Line Segment, NS would be required to review all of the referenced work papers. NS continues to believe that it has provided a full response to this request and once again notes that this identical response has been given to numerous discovery requests without objection.

Interrogatory and Document Request No. 16: Provide all documents supporting the description of Cuyahoga County in the Supplemental Environmental Report (Volume 6), page 85.

Documents NS-67-P-00063 and 00064 are responsive to this request. Copies of these documents are attached.

I trust that this satisfies all follow-up questions to NS responses to BRL-1. NS will respond to Interrogatory Nos. 21 through 25 of BRL-1 on a rolling basis commencing the week of December 15, 1997 and has agreed to provide the entirety of its response as quickly as reasonably practical.

Sincerely,

Patricia E. Bruce

SUBJECT OPERATIONS

TO Capt. D. Clark

DEPT. _____

FROM Chief Biscotti

DEPT. _____

As we discussed earlier, our attorney has asked us to gather certain data on train traffic through the Westshore area. We must time train traffic and clock each train's speed during the dates and times listed below. Rocky River and Bay Village will obtain similar data on each train. Please have someone assigned to sit at Bunts and the tracks during the time periods indicated and obtain the required data. Bay Village will notify us on E/B trains via LEERN. We will notify River and Bay regarding W/B trains via LEERN. I placed a stop watch in the DIC's office to time the trains. The Laser Unit is to be used to measure the speed. Forward data to me on January 26, 1998.

Subject: OPERATIONS - Railroad

To Lt. Malley, Lt. Sabala Dep't _____

From Capt. D. Clark Dep't _____

The railroad survey conducted did not produce sufficient data, and will have to be continued. Please assign someone to sit at Bunts and the tracks during the below time period and obtain the required data. We will be notified of EB trains, and will have to notify Rocky River and Bay Village of WB trains, via LEERN. The stopwatch is still in the OIC office, and the laser should be used to measure speed. Forward the data to me on 1-27-98.

Monday, January 26th - 1800 hrs. - until five (5) trains have been measured

ROCKY RIVER

POLICE DEPARTMENT COMMUNICATION

TO: Chief Wagner

FROM: Lt Sharp

SUBJECT: TRAIN DETAIL

DATE: 1/22/98

Sir,

A train detail was conducted on 1/22/98 at the Elmwood crossing from 1530hrs until 1800hrs. One train passed eastbound at 1630hrs. The train entered view at 34mph and started to slow at 1632hrs. Two minutes and thirty seconds into timing it's passing the train stopped. At 1633hrs the train started to move eastbound. At 1634hrs the train cleared the Elmwood crossing traveling at 8mph. The crossing was blocked for four minutes and fifty seconds.

Note: While sitting near the tracks the ground could be felt shaking as the train passed. I looked at the brick house to the northwest of the crossing as it appeared to have had mortar repairs. I wonder if the train shaking the ground contributed to this condition and if additional trains would result in increased property damage?

Respectfully,

Lt Robert Sharp

Re: Norfolk Southern's Response to the First Set of
Interrogatories and First Set of Document Production
Requests from the City of Bay Village, City of Rocky
River and City of Lakewood (BRL-1)

Dear Mr. Kalish:

We are writing as a follow-up to our telephone conversation the week before last regarding questions that you had about Norfolk Southern's Responses to the First Set of Interrogatories and First Set of Document Production Requests from the City of Bay Village, City of Rocky River and City of Lakewood (BRL-1).

As an initial clarification, Norfolk Southern responded to BRL-1 with reference to the links lying within the Cleveland OH to Vermillion OH line segment from milepost B 185.6 (Cloggsville) to milepost B 205.5 (Avon Lake) because these links are located within the Cities of Bay Village, Rocky River and Lakewood (the "Three Cities"). Norfolk Southern provided detailed responses to several of these requests with reference to both the links lying within the Three Cities, as well as to the Cleveland to Vermillion line segment as a whole.

You questioned why Norfolk Southern's response to Interrogatory and Document Request No. 1(d) did not match the mileposts for Cloggsville to Avon Lake. The response to Interrogatory and Document Request No. 1(d) referred to certain grade crossings lying within the Three Cities, and therefore there was not a one to one correlation with the beginning (Cloggsville) and ending (Avon Lake) mileposts referenced in General Objection No. 11. As further clarification, the train speeds referenced in response to Interrogatory No. 1(d) are maximum train speeds.

In response to your inquiries regarding identification of trains that are projected to travel over the Cleveland to

ZUCKERT, SCOTT & RASENBERGER, L.L.P.

Steven J. Kalish

October 30, 1997

Page - 2 -

Vermillion line segment, we again refer you to the projected train schedules that were placed in Applicants depository on August 29, 1997. See Norfolk Southern's Response to Interrogatory and Document Request No. 1(f). Norfolk Southern does not have a list identifying each train that is projected to travel over this line segment, and would have to perform a special study to make such an identification. Norfolk Southern objects to performing and is not required to perform such a study. We understand that all information necessary to identify these trains is contained in the projected train schedules.

You claimed that Norfolk Southern's response to Interrogatory and Document Request No. 6(a) was incomplete. Norfolk Southern maintains that it provided a full and complete response to this request. However, to address your concerns, we are providing the following information. In general, gates will begin their downward motion after a train has been detected and the gate delay time (no less than three (3) seconds after activation of the warning devices) has expired. The time in question may vary from 22 seconds to 27 seconds prior to the arrival of a train at the crossing. These times meet both NS and FRA requirements to allow for a minimum of 20 seconds warning time prior to the arrival of a train at a crossing.

In regard to the issue of documents to be produced by Norfolk Southern, we note that on October 17th we faxed you documents Bates stamped NS-67-P-00034-00035 in response to Interrogatory and Document Request No. 1. These documents show the maximum, minimum and average time that a train has and/or will block each grade crossing within the Three Cities. On October 21st, we faxed you documents Bates stamped NS-67-P-00036-00062 and NS-67-CO-00011-00027 in response to Interrogatory and Document Request No. 11. As per your request, we provided documents from Norfolk Southern's files, as well as documents that would be available to your clients from the FRA. Also, in response to your request, documents were provided for the period 1992 to the present. We would like to confirm at this time that Norfolk Southern is not in possession of any documents dated after January 1, 1992 that would be responsive to Interrogatory and Document Request No. 20 specifically relating to the Three Cities. However, in response to an identical request from the City of Cleveland, Norfolk Southern placed responsive documents associated with lines through the City of Cleveland in Applicants' depository last week. See NS-73-CO-00095-00126. We will place documents responsive to Interrogatory and Document Request No. 16 in the depository shortly, and we are in the process of trying to locate a more legible copy of the document produced in response to Interrogatory and Document Request Nos. 4

and 5. We will let you know if we are successful in locating same.

Finally, you questioned the fact that NS had objected to producing documents based on the assertion that certain requested information was provided to the Board's Section of Environmental Analysis ("SEA") and its independent environmental consultants on an administratively confidential basis. With regard to this matter, we will be back in touch with you shortly.

We trust that this addresses the issues discussed during our telephone call. If you have any questions, please do not hesitate to contact us.

Sincerely,

Scott M. Zimmerman

Patricia E. Bruce

Re: Second Set of Interrogatories and Second Set of
Requests for Production of Documents from City of Bay
Village, City of Rocky River, and City of Lakewood to
Norfolk Southern

Dear Mr. Kalish:

In response to BRL's follow-up questions to its first set of
interrogatories and document requests, Norfolk Southern (NS)
provides the information below. NS hereby incorporates its
general objections set forth in NS-32 (Norfolk Southern's
Responses to the First Set of Document Requests from the City of
Bay Village, City of Rocky River, and City of Lakewood to Norfolk
Southern).

In NS-32, response 1(a), NS explained that while the NS
Operating Plan shows 13.5 trains per day for the base case and
34.1 trains per day for the post acquisition case, the comparable
train counts for the Cloggsville-Avon Lake segment are 12.3 and
31.9 respectively. BRL has requested NS to supplement this
information. NS responds as follows:

(a) The beginning milepost number for the Cleveland to
Vermillion line segment is B 185.6; the ending milepost number is
222.7.

(b) Train counts previously provided include through trains
and, where operated, local freight trains. Switching movements
are not included, although there are no regularly scheduled
switching movements on the link in Bay Village, Rocky River, and
Lakewood.

(c) The number of trains operating over the Cloggsville-
Avon Lake segment is less than the number of trains operating
over the Cleveland-Vermillion line segment because more trains
run west of Avon Lake to handle traffic between Bellevue and

ZUCKERT, SCOUTT & RASENBERGER, L.L.P.

Steven Kalish, Esq.
December 12, 1997

industries in the Avon Lake area. Because train statistics for the Cleveland-Vermillion line segment were calculated by taking the mileage-weighted average of the statistics for the underlying links (one of which is the Cloggsville-Avon Lake link), the higher number of trains on the westerly links resulted in a higher number for the Cleveland-Vermillion line segment.

(d) The average number of trains operated by Norfolk Southern in the Base Case over crossings at Linda Street and Morewood Street was the same.

(e) As mentioned in the response to 26(b) above, there are no regularly scheduled switching movements in Bay Village, Rocky River, or Lakewood. Trains originating in, or destined to these points are very light and sporadic. (In fact there were none in 1996, the most recent year for which full data is available). If there were any local traffic for these points, it would be picked up or delivered by a road switcher operating out of Sheffield Yard at Avon Lake.

In NS-32, response 1(c), NS provided the average lengths of trains operating over the Line Segment. NS provides the following additional information with regard to that response:

(a) The average train lengths provided are not applicable to both the Cleveland to Vermillion line segment and the Cloggsville to Avon Lake line segment.

(b) Average train lengths are as follows:

	Base Case	Post Acquisition Case
Cleveland-Vermillion line segment	4200 ft	3900 ft.
Cloggsville-Avon Lake link	4100 ft	3900 ft.

(c) The response to number 1(c) was calculated by using the following formula:

Daily cars over link ÷ daily trains over link x average freight car length (60 ft) + length of typical motive power (3 units x 70 ft). Resulting estimates were rounded to the nearest 100 feet.

In NS-32, response 1(d), NS noted that trains entering and running through Clague Siding are limited to 25 miles per hour. With regard to this response, NS provides the following information:

ZUCKERT, SCOUTT & RASENBERGER, L.L.P.

Steven Kalish, Esq.
December 12, 1997

(a) Trains would stop on the mainline east or west of Clague Siding only in unusual or emergency situations. An example of such a situation would be if the remotely controlled switches and signals controlling entry to the siding were not working properly, a train might stop to allow crew members to ascertain that it was safe to proceed.

(b) No trains are scheduled to stop on the mainline track. The number of emergency or unusual stops was not calculated by NS. To make such a calculation, NS would be required to undertake a burdensome special study which it is not required to perform.

(c) The number of trains entering Clague Siding was not calculated by NS. For purposes of responding to BRL's prior interrogatories, it was assumed that 20% of trains passing the Clague Siding would enter it.

(d) Trains entering Clague Siding from the east begin to reduce speed at about MP B192.5, depending on train handling characteristics of an individual train and the operating practices of the individual engineer.

(e) Trains leaving Clague Siding toward the east would reach maximum allowable mainline track speed at about MP B192.5, depending upon whether or not the train is accelerating from a stop, and depending on tonnage of the particular train and motive power assigned to the train.

It should be noted that maximum allowable track speed is not governed by law, but is set by the railroad taking into account track condition and operating conditions, subject to FRA requirements regarding track class.

(f) Columbia Road is crossed at grade by the Clague Siding. Trains would not stop on the crossing except in unusual or emergency situations, because the siding extends 2.3 miles east of the crossing, and this distance is adequate to contain most trains operated by NS.

(g) Locomotives of trains stopped in the siding are not normally shut down. The average amount of time that each train remains in the siding was not calculated by NS, and would be difficult to calculate since train operating times vary somewhat from day to day. Dispatchers do attempt to minimize delay in sidings for a number of reasons.

A train waiting for a meet with another train is somewhat like an automobile waiting at a red light. The engine is

ZUCKERT, SCOUTT & RASENBERGER, L.L.P.

Steven Kalish, Esq.
December 12, 1997

- Heavy gradients
- Lack of appropriate track connections at several points
- Lack of signal system
- Deteriorated bridges
- Lack of a main track around Rockport Yard.

Estimates of the cost of constructing necessary facilities are nearly \$25 million.

In response to interrogatory 1(k), NS showed the same minimum, average and maximum street blockage times for each crossing between Hird Avenue on the east and Webb Road on the west, but showed different figures for Linda Street and Bradley Road. Figures for Linda Street through Bradley Road are different because, west of Linda Street, some trains are slowing for or accelerating from Clague Siding, which has a lower speed limit. In addition, allowable speeds for intermodal trains are higher than for merchandise trains west of MP B194-5.

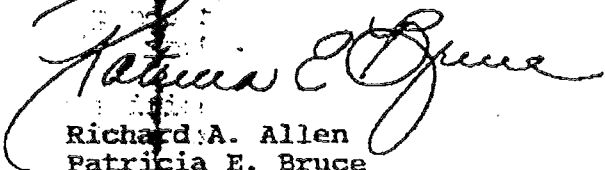

NS-67-CO-00011 may be reclassified as "public." With regard to that document, a code key will be provided to BRL shortly.

NS objects to BRL's request for information and documents regarding the manner in which it has worked with state and local officials to seek improvements in grade crossing safety along the West Shore corridor including Bay Village, Rocky River and Lakewood as overly burdensome. NS notes that recent work has been undertaken to improve crossing safety including installation of gates at a number of crossings in the area. We are in the process of gathering responsive information, and responsive documents, if any, will be made available to BRL shortly.

The attached map shows the Cleveland Vermillion line segment and the NS Chicago-Pittsburgh line.

We trust that this fully responds to BRL's most recent requests.

Sincerely,

Richard A. Allen
Patricia E. Bruce

Some Cleveland residents find living on the wrong side of the tracks costly

by Catherine Giffether

Ellie Luchini is waiting for the colonial on a very desirable street in Lakewood to "pop."

It's been three long weeks without one showing, Luchini needs to look no further than the railroad tracks that pass by the house.

"It's a darling house that should have sold by now," said Luchini, a REALTOR with Realty One in Bay Village. "It is priced perfectly—\$119,000—and completely redone. But people are concerned about the safety issue, sound and noise."

That's a common theme that is being replayed among REALTORS and community residents in the past months since Norfolk Southern Corporation has announced plans to merge with another rail line, CSX Corporation, in an effort to triple rail traffic through Northern Ohio cities including Lorain, Avon Lake, Bay Village, Lakewood and others.

"Some people love trains, the sound of them eight times a day is fine," said Luchini. "But the idea of them passing by 24 times a day just doesn't work."

Residents have spearheaded groups to oppose the plan, held meetings that have drawn more than 600 people with poignant stories about children killed by passing trains, and gotten the support of local and state politicians. Letter writing campaigns have sent out an estimated 7,000 letters to politicians and rail officials with the Surface Transportation Board—the official

federal body that will make a determination on the proposed merger and increased rail traffic.

For Stephen FitzGerald, the battle with Norfolk Southern has proven to be "the boom of a lifetime." Just six days after he began his job as community relations director for Lakewood, the city's mayor came to him asking him to help organize a task force exploring the rail issue.

FitzGerald had just left a longtime job doing publicity for the International Brotherhood of Locomotive Engineers. "I thought I had left that industry behind," he said. In fact, his 11 years with the rail industry helped him route information to the appropriate people in a timely fashion.

Another irony: the proposal by Norfolk Southern has seemed to strengthen the neighborhood quality of Lakewood, said FitzGerald. "The tone is one of activism and mobilization," he said. "People who live within a half mile of the tracks have lived comfortably with the status quo." It is the possible change and tripling of rail traffic that has them up in arms and, in fact, prior to the issue being raised, few people even paid attention to the railroad tracks, or living near them.

Greater Cleveland RTA has proposed commuter lines into Cleveland and should that possibility happen, living near the tracks could actually be a boon, said FitzGerald. That possibility is a separate issue from the tripled freight traffic and details would need to be worked out with Norfolk Southern and RTA.

"Houses next to the tracks are virtually unsellable... I have seen four listings in Lakewood that are directly on the tracks that have sold for substantially less dollars. That can be advantageous to the buyer if they are willing to put up with the noise, dirt and safety issues."

REALTOR Paula Reed, with Lucion & Associates, Century 21, in Lakewood, says the possibility of tripling of rail traffic has affected at least three potential sales. "Houses next to the tracks are virtually unsellable," she said. "I have seen four listings in Lakewood that are directly on the tracks that have sold for substantially less dollars. That can be advantageous to the buyer if they are willing to put up with the noise, dirt and safety issues."

Many complaining the increased rail traffic would cut off residents from needed safety services in the event of medical emergencies. Then too, they are worried about greater threat to life and limb since children and adults both continue to walk the tracks, despite increased educational efforts to inform them of safety hazards.

Bay Village resident Barbara O'Pray built her dream home near the tracks, knowing full well they ran by her home. "It's my dream house, but after a while it becomes your nightmare," she said. "Sure I knew the tracks were already here, but had I known what the plans were to increase

traffic, I would have never built here. We are left with white elephants and I will not put another cent into my house. This destroys the appreciation in our house, destroys the neighborhood and increases turnover—if someone can sell their home."

The Norfolk Southern proposal is still before the Surface Transportation Board, which can rule on the matter with or without conditions imposed on the rail companies. Norfolk Southern spokesman Pat McCune said the projected train increase would be incremental over a two to five-year period.

He added, "Any time there is an increase in the number of trains planned... that could possibly have an impact on real estate. I don't have firsthand knowledge of home values depreciating. I could say to those concerned that this is the safest railroad in the nation and we have been for eight years... I know that doesn't ease concerns. But it is real, it is legitimate and safety is our company mantra that we strive for each and every year."

--CONTROL AND OPERATING LEASES/AGREEMENTS--
CONRAIL INC. AND CONSOLIDATED RAIL CORPORATION

COMMENTS OF THE CITY OF BEREA (REQUESTING CONDITIONS) TO DRAFT ENVIRONMENTAL IMPACT STATEMENT

The City of Berea Respectfully Submits the following comments to the Draft EIS in the above-referenced matter:

I. Executive Summary

The City of Berea is uniquely situated and, therefore, uniquely impacted among the Westshore communities due to the convergence of the two rail lines within the City limits of Berea.

Berea is primarily a densely populated residential area with limited highway access that is frequently blocked by railroad traffic under the current 80.3 train per day baseline. Additionally, Berea's population under the 1990 US census is 19,051 and has remained in the 18,000 to 20,000 range for years. In that same period, the percentage of minority residents is approximately 6.9% black and Hispanic residents. It is significant to the abatement and remediation requests as set forth herein that approximately 86% of the black residents of the City of Berea reside in the census tracts adjacent to the rail lines. See, Attachment J, Community Reinvestment Area Report, City of Berea, 1994 Planning Resources Incorporated. Over one-third (37%) of the black population of Berea resides in the census tracts lying in the northeast area of Berea which, although geographically small, is densely populated and would be impacted by the proposals set forth in the CSX/NS applications in virtually every manner.

In June, 1997, CSX, and NS filed a railroad control application with the Surface Transportation Board to acquire control of Conrail Inc. and Consolidated Rail Corporation (Finance Docket No. 33388). As part of the Railroad Control Application, NS and CSX have proposed increasing freight traffic on the Berea-Greenwich and Short-

Berea routes from 27.9 trains per day to 101.5 trains per day (Vol. 6B of 8, EIS Draft, page 356, Chart 18-3) . NS and CSX have also proposed decreasing the freight traffic along the Cleveland-Vermillion route through Berea from 52.4 trains per day to 28.4 trains per day (Vol. 3B of 8, page 462). The net post acquisition increase in trains per day through Berea, if the merger were to be approved as originally proposed, would be from 80.3 trains per day, to 129.9 trains per day, an increase of 49.6 trains per day, or a 61.8 percent increase.

Under the original plan, NS proposed increasing freight traffic along NS's Cleveland-Lakewood-Vermillion route from 16.4 trains per day to 34.1 trains per day, an increase of 17.7 trains per day (Vol. 5C, Nov. 25, 1997 letter of . On November 25, 1997, NS amended its application to reroute the additional 17.7 trains originally proposed for Cleveland-Lakewood-Vermillion, to the Cleveland-Berea-Vermillion route. The additional 17.7 trains per day under the amended proposal would increase Berea's train traffic from 129.9 trains per day to 147.6 trains per day. This represents an 83.8 percent increase in train traffic through Berea above the pre-acquisition baseline of 80.3 trains per day.

The Berea-Greenwich route is an northeast-southwest line southwest of Cleveland, Ohio, originates in the southwest corner of Cuyahoga County, traverses the southern half of Lorain County, and approaches Greenwich from the southeast corner of Huron County. The Short-Berea route traverses the southwestern quarter of Cuyahoga County from downtown Cleveland to Berea, Ohio. The Conrail mainline along the Cleveland-Berea-Vermillion route traverses the southwest quarter of Cuyahoga County from downtown Cleveland through Berea, Ohio, and across the northern half of Lorain County to Vermillion. All these routes, with respect to Berea, traverse heavily populated urban/suburban residential neighborhoods.

The Berea-Greenwich route is an northeast-southwest line southwest of Cleveland, Ohio, originates in the southwest corner of Cuyahoga County, traverses the southern half of Lorain County, and approaches Greenwich from the southeast corner of Huron County. The Short-Berea route traverses the southwestern quarter of Cuyahoga County from downtown Cleveland to Berea, Ohio. The Conrail mainline along the Cleveland-Berea-Vermillion route traverses the southwest quarter of Cuyahoga County from downtown Cleveland through Berea, Ohio, and across the northern half of Lorain County to Vermillion. All these routes, with respect to Berea, traverse heavily populated urban/suburban residential neighborhoods.

It is the intent of this response to the Draft Environmental Impact Statement (DEIS) to present information about the impact of the proposed Conrail merger Berea, Ohio. Berea is a densely populated residential area with limited highway access that is frequently blocked by railroad traffic under the 80.3 train per day baseline. This report will present information on the possible effects an 83.8 percent increase in train traffic will have on Berea: emergency response time, hazardous and nuclear material transport, reductions in railroad labor and railroad safety, air pollution emissions and noise pollution.

In the area of emergency response time, this report will focus on medical emergency response times. The increasing transport of hazardous and nuclear material via railroad will be examined. Information about the decades-long trend to reduce railroad safety and maintenance personnel, and the overall safety of railroad transportation will be presented. There will also be a section detailing information about the significant increase in air pollution emissions as well as noise pollution as a result of the proposal by CSX and NS to significantly increase the number of trains to be routed through Berea, Ohio.

II. Purpose and Need for Agency Action

It is the contention of the City of Berea, I in its Petition for intervention and Party of Record status, that due to the residential nature of the City, a comprehensive city-specific Environmental Impact Statement (EIS) should be conducted forthwith. It should include all relevant information in this report. It is also the contention of Berea that an objective analysis will reveal that the existing freight train traffic *already* presents considerable hazards to this residential community. It will further reveal that any increase in traffic, especially an increase of the magnitude proposed by the applicants, will have such an adverse effect that mitigating measures, other than grade separations at key highway-rail crossings, will have a negligible impact. It will further reveal that mitigation will be necessary for noise and air quality. It is the position of the City of Berea that unless grade separations are built at the current grade-crossings at Front Street and Bagley Road, the Conrail merger application should be denied.

III. Description of the Affected Environment

Mitigation will be necessary for environmental justice, noise, safety, air quality and traffic flow. It is the position of the City of Berea that unless such environmental justice, noise and air quality and traffic flow concerns of Berea are addressed and grade separations are built at key current grade-crossings, including the heavily traveled crossings at Front Street, and at Bagley and Sheldon Roads, that the Conrail merger application should be denied.

Berea, Ohio, is a city in the southwestern corner of Cuyahoga County, less than 14 miles from downtown Cleveland, and adjacent to Cleveland Hopkins International Airport. Berea is mostly residential, with a growing base of light industry to the south of Bagley Road and west of the Berea-Greenwich route. The residential base is also growing with new homes to the north of the Conrail mainline west of the Rocky River. The community is served by police and fire stations to the east of the tracks. Berea is primarily served by Southwest General Hospital in Middleburg Heights, Ohio, immediately adjacent to the City of Berea to the east.

Although overpasses at Rocky River Drive and at Sheldon Road relieve some congestion at the Front Street and Bagley Road grade crossings, they are of limited use. The industrial area described above is blocked from police, fire, and hospital access at Bagley

Road and access through Rocky River Drive is difficult at best and treacherous at the extreme. The residential area north of Bagley Road are primarily south of Sheldon Road and east of Rocky River Drive. Police and fire department access to these areas is difficult because of congestion at the grade separations at Rocky River Drive and Sheldon Roads, and often access is out of the way. This is especially problematic for emergency access to Southwest General Hospital. A particularly difficult situation occurs when commercial semi trucks attempt access through the overpass at Rocky River Drive. Approximately twelve times per year, a truck becomes stuck under the overpass, completely blocking access across Berea except through Sheldon Road at the far northeast corner of the city. See Attachment I, Traffic Flow analysis, incorporated herein.

IV. Description of Alternatives

Berea already experiences an average of 80.3 trains per day. On Mondays and Tuesdays, that number is closer to 70 trains per day. But on Thursdays, Fridays, Saturdays, and Sundays, the number rises closer to 100 trains per day. The train traffic is a virtual wall to anyone trying to cross from one side of the tracks to the other. The existing number of trains is the saturation point.

Any increase in train traffic through Berea will have to be accompanied by the construction of grade separations at Sheldon Road, Bagley Road and at Front Street (for both tracks) to meet the health, safety and welfare needs of the residents of the City of Berea. This is especially necessary at Front Street, just east of the switch between the Conrail mainline and the Short-Berea route. The two rail lines, between Front Street and the switch, form a triangle with Front Street, in which traffic will often be trapped between two sets of trains. The rail lines crossing Front Street must be separated from the road to facilitate reasonable highway traffic if there is to be an increase in rail traffic through Berea. There are many emergency response situations where minutes can make the difference between life and death. Police and firefighters face such situations every day.

A. Emergency Response Time

There are many emergency response situations where minutes can make all of the difference between life and death.

There are 17 identifiable factors that contribute to the outcome of cardiac arrest. Of these, the most important factor is the time between the onset of cardiac arrest and cardiopulmonary resuscitation (CPR). The second most important factor affecting the outcome of cardiac arrest is the time to defibrillation in cases of ventricular fibrillation (when the heart is still quivering as opposed to being completely stopped). And the third most important factor affecting the outcome of cardiac arrest is the time between the onset of cardiac arrest and the initiation of basic life support and advanced life support. The American Heart Association has recommended that patients receive basic life support within four minutes, and advanced life support within eight minutes, both of which can be administered by EMS personnel.

Given an increase of freight traffic from 80.3 to 147.6 trains per day, there will be an average of more than 6 trains per hour traversing the city every day. It currently takes on average four minutes for a train to pass through a grade crossing. On average, therefore, 24 minutes out of every hour of *every day, on average, will see Berea experience blocked access to emergency services. More than one third of the time, on average, an EMS team will encounter a passing train* at a grade crossing and will be forced to double its response time to eight minutes, beyond the time recommended for basic life support, and just within the recommended time for advanced life support. See, Traffic Count Attachment I, incorporated herein by reference.

Thousands of motor vehicles travel the affected City streets. (See Attachment H).

B. Hazardous Material and Nuclear Waste Transport

According to the Federal Railroad Administration (FRA), approximately 11.353 million tons of hazardous material were shipped through Cuyahoga County in 1995 (Attachment A). Cleveland is a major corridor city for railroad traffic; therefore, it is highly probable that an 83.8 percent increase in train traffic along the Cleveland-Berea axis will result in a comparable increase in the shipments of hazardous material along the Cleveland-Berea axis. According to the FRA, 4.243 million tons of hazardous material were shipped by along the Cleveland-Berea axis in 1995. An 83.8 percent increase will result in the transport of 7.799 million tons of hazardous material traversing Berea.

According to the Federal Code of Regulations (49 CFR 172.101), there are more than 3,000 materials classified as hazardous, including arsenic, chloroform, cyanides, formaldehyde, lead, mercury, and propane — a highly flammable liquefied petroleum gas which comprises the bulk of transported hazardous material. Chemical product shipments via rail increased by 27 percent between 1991 and 1995, totaling 1.8 million carloads. In 1995 alone, there were 1,330 incidents involving hazardous materials released from rail cars (Attachment B, pg. 16). Yet chemical rail transport is exempt from federal and community “right-to-know” laws. It should be noted, however, that FRA data on hazardous material transport and accidents are derived from the industry’s own reports, and the General Accounting Office finds these reports “inaccurate and incomplete” (Attachment C, pg. 1).

Because radioactive material is considerably more dangerous than hazardous material, it is classified and regulated differently. The Department of Energy has confirmed that radioactive waste passes through Cuyahoga County, although the frequency and exact quantities were not obtainable. Furthermore, it has been recently reported that radioactive waste passes along the Conrail tracks through Berea on a regular basis (Attachment D). The frequency and magnitude of radioactive material being transported along the Cleveland-Berea axis should be determined by the Surface Transportation Board as part of the environmental analysis required under federal law. The findings should be used to

calculate the level of risk to Berea and other densely populated areas in the event of an accident or derailment.

The United States Congress is currently considering H.R. 1270, a bill that legislates the siting of a temporary high-level nuclear waste storage facility near Yucca Mountain in Nevada. High-level waste consists mostly of the spent nuclear fuel rods from commercial nuclear utility reactors. Should this bill become law, Cuyahoga County will become a major transportation route for high-level radioactive waste traveling from the East Coast to Nevada.

Approximately 2,733 rail shipments of high-level radioactive waste will traverse Cuyahoga County en route to Nevada, much of which will be transported via the Conrail mainline. Large rail casks weighing about 125 tons would contain high-level radioactive waste, defined as spent nuclear fuel rods contaminated with plutonium and other highly radioactive elements. The average rail cask will carry about 175 pounds of plutonium. To date, no transport cask has had full-scale physical testing (Attachment E, pg. 2).

Three years inside the reactor core makes the fuel over a million times more radioactive than unused fuel. Unshielded, irradiated reactor fuel that has been stored for ten years will deliver a lethal dose to anyone within a meter in less than three minutes. A single pound of plutonium could cause cancer in every person alive today if it were divided and deposited in the lung tissue. It is estimated that a fully prepared state emergency response system capable of responding to an accident involving high-level radioactive waste would cost \$5.6 million annually in 1981 dollars, an expense Ohio has not anticipated. (Attachment E, pg. 1).

C. Reductions in Labor and Railroad Safety

According to R.W. Godwin, general chair of the Brotherhood of Locomotive Engineers, NS and CSX will lay off hundreds of railroad workers whose jobs are to maintain safe railroad cars and track conditions. These layoffs are system wide. The consequences for the general public could be lethal considering the movement of hazardous material and nuclear waste by rail through the densely populated communities of Cuyahoga County, including Berea. The table below is a summary of anticipated layoffs by NS and CSX resulting from the proposed acquisition of Conrail:

Carmen	Inspect and maintain rail freight cars: 330 positions abolished
Trackmen	Inspect and maintain tracks, switches and crossings: 473 positions abolished
Signalmen	Inspect and maintain wayside signals and crossing protection: 54 positions transferred and 25 abolished
Railroad Police Officers	Protect railroad equipment and signals from vandalism: 46 positions abolished
Locomotive Maintenance	Inspect and maintain locomotives: 5 boilermakers abolished, 53 electricians abolished, 46 laborers abolished, 85 machinists abolished

Supervisors	Oversee maintenance workers: 78 jobs abolished
Train Dispatchers	Insure safe passage of trains: 25 jobs abolished

These anticipated layoffs come after almost two decades of declining maintenance and safety personnel on railroads. For example, between 1985 and 1995, Union Pacific doubled the ratio of its car shipments to workers from 85:1 to 170:1. Freight trains at one time were served by five or six people, but are now frequently staffed by one engineer and one conductor. (Attachment B, pg. 17)

Railroad employees are expected to work 12-hour shifts, take eight hours off, then return to work. But despite the 12-hour limit, the FRA recently found that Union Pacific routinely violates this limit, keeping workers on the job as long as 17 hours. Furthermore, rail workers can be called back to the job with little more than two hours notice. One NS engineer was quoted in *The Washington Monthly* as saying: "I've been forced to go out when I was so exhausted I hallucinated. . . . I've seen things that weren't there, almost gone past signals I thought were one color when they were another." (Attachment B, pg. 17). At the same time that railroads have significantly reduced staff, the Federal Railroad Administration (FRA) has reduced the number of safety inspectors. Currently, there are 380 inspectors for over one million cars and 300,000 miles of track. (Attachment B, pg. 19).

The decrease in safety inspections results from FRA instituting a new cooperative safety program in 1993. Rather than use violations and civil penalties against railroads for noncompliance with safety regulations, "FRA has emphasized cooperative partnerships with other federal agencies, railroad management, labor unions, and the states." (Attachment F, pg. 4).

Because railroad safety has improved greatly over the last three decades — due in large part to technological advances — GAO could not determine the effectiveness of FRA's program. However, it should be noted that "FRA has implemented its Safety Assurance and Compliance Program with 33 railroads. This method has improved the safety on many large railroads, *but Norfolk Southern Corporation has refused to participate until FRA substantiates safety problems at the railroad.*" (Attachment F, pg. 5, emphasis added). That a major railroad company would refuse to participate in a safety program instituted by the federal government does not bode well for the residents of Berea who rely upon the federal government as well as the railroad for their very safety.

Accidents at railroad crossings are the leading cause of deaths associated with the railroad industry; almost half of all rail-related deaths are caused by collisions of trains and vehicles at public crossings (Attachment C, pg. 1). More than 1,000 people die each year as a result of grade-crossing accidents (Attachment F, pg. 4). Any increase of rail traffic through Berea, particularly an increase of 83.8 percent for a total number of trains approaching 150 per day, require grade separations at the major rail-highway crossings of Front Street and Bagley Road.

D. Emissions

Since most locomotives in the US are powered by diesel engines, air pollution emitted by trains will consist mostly of Particulate Matter (PM) and precursors to ozone (Nitrogen Oxides or NO_x, and Hydrocarbons or HC). Locomotives account for nearly five percent (5 percent) of all air pollution emission in the country.

According to the applicants' application, air pollution emission will *increase* in Cuyahoga County by 1,800 tons per year, or 3.6 million pounds, as a result of the increase in freight traffic (Railroad Control Application, Vol. 6B, pg. 364-365). These air pollution emissions include Nitrogen Oxides (NO_x), Carbon Monoxide (CO), Volatile Organic Compounds (VOC), Sulfur Dioxide (SO₂), Particulate Matter (PM) and Lead (Pb). CSX rail traffic will increase the above air pollution emissions in Cuyahoga County by almost 1,000 tons per year. NS rail traffic will increase the above air pollution emissions by more than 800 tons per year. Combined, this is an increase of 1,800 tons per year.

Of the 1,800 tons of air pollution emissions, the applicants estimate that 1,505.19 tons will consist of NO_x. According to figures from the Environmental Protection Agency (EPA), 1,505.19 tons per year of NO_x is equivalent to increasing automobile traffic by 86,505 passenger cars (Attachment G, pg. 3). Additionally, NO_x combine with Hydrocarbons (HC) in the atmosphere to form secondary PM (which was not estimated in the Railroad Control Application). For every 100 tons of NO_x emitted, approximately 4 tons of secondary PM is formed. Thus, there will be an additional increase of secondary PM by 60 tons per year.

NO_x emissions have significant health and environmental effects. NO_x is a major component of smog and acid rain. NO_x emissions combine with HC in the atmosphere and, in the presence of sunlight, form ground-level ozone. NO_x also contributes to the secondary formation of breathable PM. NO_x can react with ammonia, other constituents, and moisture to form certain types of PM, including nitrate fine particles and acidic aerosols.

Ozone is a highly reactive pollutant that damages lung tissue, causes congestion, and reduces vital lung capacity, in addition to damaging vegetation. Acid rain damages buildings and crops, and degrades lakes and streams (and it should be noted that Berea, Ohio, is bisected by the Rocky River, a major tributary to Lake Erie and part of the Cleveland MetroPark System). PM causes headaches, eye and nasal irritation, chest pain, and lung inflammation. Environmental impacts of PM include reduced visibility and deterioration of buildings.

Healthy adults who exercise moderately can experience a 15 to 20 percent reduction in lung function from exposure to low levels of ozone over several hours. Damage to lung tissue may be caused by repeated exposures to ozone, which can lead to a shortened life span. Ozone aggravates asthma, and 14 Americans die every day from asthma, a rate three times greater than just 20 years ago.

Because children breathe more air per pound of body weight than adults, increases in ground-level ozone is even more harmful to them. Children make up 25 percent of the population but comprise 40 percent of the asthma cases. Children also comprise a disproportionate number of asthma attacks, increased use of medication, and more emergency room visits as a result of ozone exposure.

PM easily reaches the deepest recesses of the lungs. Scientific studies have linked PM, especially fine particles (alone or in combination with other air pollutants), with premature death, aggravated asthma, and chronic bronchitis. As is the case with ozone, the elderly, children and individuals with preexisting heart or lung disease are especially vulnerable.

Cuyahoga County is currently not attaining the National Ambient Air Quality Standards for Sulfur Dioxide (SO₂) or PM₁₀, particles smaller than 10 micrometers in diameter. Therefore, any increase in emissions as a result of increased freight traffic will cause a further delay in attaining the EPA's new Ambient Air Quality Standards for PM_{2.5} (which will not take effect for several years).

Cuyahoga County does meet EPA's current 1-hour 0.12 parts per million (ppm) ozone standard. However, based on the most recently available quality assured data (1993-1995), the county does not meet EPA's recently issued 8-hour 0.08 ppm ozone standard. An increase in NO_x emissions, a precursor to ozone formation, would exacerbate this problem.

According to estimates reported to EPA for Cuyahoga County in 1990, 15,263 tons per year of NO_x are emitted from stationary sources, and 26,804 tons per year of NO_x are emitted from mobile sources, resulting in a total NO_x emission estimate of 42,067 tons per year for Cuyahoga County in 1990. Thus, 1,500 tons per year of NO_x would be an increase of approximately 3.5 percent.

Under the Clean Air Act, areas that do not meet the ozone standards are required to achieve a 3 percent reduction per year (after growth) in VOC and/or NO_x emissions. While the implementation plan for EPA's new 8-hour 0.08 ppm ozone standard will not be final until late 1998, it seems very likely that it will include a continuation of the 3 percent per year rate-of-progress measure. A 3.5 percent increase in NO_x in the air means that significant additional reductions of NO_x from local businesses or vehicles would be needed to offset this increase to meet the ozone standard expeditiously.

The applicants state that they have only estimated the increase in air pollution emissions, and not the decrease in emissions resulting from less truck traffic. However, it should be noted that the increase in air pollution emissions from freight traffic is a guaranteed, quantifiable amount; whereas, the decrease in emissions from truck traffic is not known or measurable. In fact, due to increased rail traffic, PM₁₀ emissions from railroads have doubled between 1970 and 1995. Yet this increase in PM₁₀ emissions has not resulted in

a concomitant reduction in truck traffic emissions during the same period. Moreover, according to area shippers along the Cleveland-Berea axis, reduced competitive opportunities caused by the Conrail acquisition could actually increase the truck traffic among the Cleveland-area shippers (Attachment H).

E. Noise

Noise pollution is considerably more difficult to quantify; however, qualitatively it is no less harmful to a community's well-being than air pollution emissions. According to the Railroad Control Application, noise pollution will increase significantly as a result of the proposal by NS and CSX to increase train traffic through Berea by 83.8 percent. With trains passing through Berea at a rate of six times per hour, or at a duration of 24 minutes out of every hour, residents can expect constant disruptions from horns and engine noise. Constructing grade separations at Bagley Road and Front Street will eliminate horn-blowing at two key locations in Berea and will remove noise from the ground level.

V. Conclusion

Given the reductions in railroad workers, increasing rail shipments, including those of hazardous materials and nuclear waste, severely limited options for improved grade-crossing safety, increasing emissions and noise pollution, and the potentially divisive and isolating nature of the increased rail traffic through the City of Berea—a community unique among the Westshore communities with respect to the CSX/NS application, the City of Berea submits that increasing the number of freight trains to the order of magnitude sought by CSX/NS is totally unacceptable. The health and safety of the people of Berea and the surrounding area are at stake.

However, if the application is to be approved, the City of Berea seeks conditions in the form of remediation and abatement, as follows: The City hereby seeks conditions and mitigation for Berea through noise abatement, city-specific emergency programs and training, and grade separations, as follows, and consistent with the issues raised herein further requests: i) that a noise barrier be constructed along North Rocky River Drive behind the homes on the north side of the tracks on North Rocky River Drive and the nursing home located in close proximity thereto; ii) that a noise barrier be constructed adjacent to the rails at Abbeyshire Drive; iii) that adequate grade separations be constructed for a) Sheldon Road (over or underpasses), b) Front Street (for both tracks, consistent with the EIS, but not necessarily as an overpass), and c) Bagley Road (where traffic flow is very high); iv) that the rail siding along and parallel to Butternut Lane be eliminated; v) that a grade separation be constructed at West Street in Olmsted Falls, (but sought by The City as noise abatement for the residents of Berea living very near to the area); vi) that the applicants prepare a city-specific hazardous material emergency response program and assist in the training of Berea police, fire and emergency personnel; and vii) that the present overpass at North Rocky River Drive be refurbished, and The City further seeks that the environmental study address the impact upon and the

concomitant needs of the City of Berea and its residents, including aesthetic remediation and other just relief as this Board deems proper, or alternatively, The City seeks a denial of the railroad control application filed with the STB to acquire control of Conrail Inc. and Consolidated Rail Corporation in Finance Docket No. 33388.

The Case for More Regulation

If you thought ValuJet's deadly cargo was poorly regulated, wait till you hear what the trucks and trains are getting away with

BY NURITH C. AIZENMAN

IN MARCH OF 1996, ALL 1,700 RESIDENTS OF Weyauwega, Wisconsin skipped town for three weeks—involuntarily. The reason for their impromptu spring break: an 81-car train carrying propane and sodium hydroxide derailed and exploded just outside the city center, creating a toxic fire so dangerous the entire community had to be evacuated while authorities struggled to contain it. But the Weyauwegans should consider themselves lucky. In Chicago this past August, 19 people were treated for chemical exposure at area hospitals after the hose on a truck pumping sulfur trioxide into a holding tank broke and released a 50 foot high lethal cloud. And in California several years earlier, 700 people fell ill after a tanker-car full of metam sodium plunged into the Sacramento River, killing all water life within 40 miles and contaminating California's largest reservoir.

These events point to a disturbing trend: serious accidents involving the transport of hazardous materials, or "hazmats," on trucks and trains have become an almost daily occurrence. In 1995 alone, there were 12,712 incidents involving hazardous materials released from trucks and 1,330 from rail cars. But what's really remarkable about these cases is that they were not more disastrous. Considering the recent massive increase in the volume of hazardous materials streaming across our nation's highways and railroads, combined with the industry's cavalier attitude towards safety and the government's cross-your-fingers-and-hope-for-the-best approach to regulation, it's a wonder we haven't witnessed a truly devastating catastrophe. Environmentalists warn it's only a matter of time before we're treated to a tragedy on the scale of the 1984 accident in Bhopal,

India—where 3,500 people were suffocated in their sleep by a 20-ton cloud of methyl isocyanate seeping from a Union Carbide plant.

That's not to say there haven't been lots of close calls. Last December, the Department of Transportation's Federal Railroad Administration (FRA) discovered that despite the fact that military bombs being carried aboard a Union Pacific train had broken through their containers and were protruding onto the floor of a flat car, the company had allowed the train to travel from Oklahoma to California through several major terminals without taking any corrective action. As one FRA official noted in an internal memo: "[Union Pacific] needs a big time wake up call. ... The way we see it, if they can't take care of class A explosives, makes you wonder what they are doing with other HM [hazardous materials]."

And there are plenty of other hazardous materials to wonder about. Between 1990 and 1995, hazmat transport by rail increased 27 percent to almost 18 million cars a year, each one carrying a payload that makes the lethal cargo aboard ValuJet flight 592 look like a shipment of fire-retardant blankets. Pick your poison: there are toxic-by-inhalation chemicals like chlorine and hydrogen fluoride, which can roll across miles of countryside in ground-hugging clouds that burn your body tissue, fill your lungs with fluid and cause you to literally drown in your own juices. There are explosives like ammonium nitrate—mix that with a little fuel and it's Oklahoma City time. Then, of course, there are your run-of-the-mill flammables, like liquefied petroleum gas, or propane, which comprises the bulk of the roughly four billion tons of hazardous materials hauled across our highways every year, and which, when released, vaporizes into a volatile

gas that can ignite into a jet flame if so much as a spark comes near. And finally, there's the mother of all hazmats, nuclear waste, which could become a lot more familiar if the government goes ahead with plans to open a temporary nuclear materials repository in Nevada. By as early as 1999, up to 100,000 shipments of highly radioactive spent fuel from reactors across the country could begin the long journey to the storage site by rail and truck—in containers whose crash worthiness has been tested almost exclusively through computer simulations. With all these goodies making their way from sea to shining sea, perhaps it's not surprising that even some chemical company executives are reaching for their gas masks. "It scares the living daylights out of me," confides one former DuPont official.

Dying for a Job

The ugly reality of our industrial advances and booming economy is that we need—or at least want—more and more products made from dangerous substances. Unless we drastically change our consumption habits, one way or another these hazardous materials are going to have to be lugged around the country. But surely our government and industries have taken steps to ensure that the vehicles hauling these toxins are piloted by specially trained experts—crack professionals, alert and ready for the worst, right? Try zombified novices, bleary-eyed and poorly prepared.

To start with, hazardous material transporters are dangerously overworked. At the railroads, the rise in hazardous shipments has been accompanied by large scale downsizing. According to a study by an environmental group called The Good Neighbor Project, between 1985 and 1995, Union Pacific, by far the nation's largest hazmat rail carrier, doubled the ratio of its car shipments to workers from 85:1 to 170:1. Freight trains once served by teams of 5 or 6 people are now left in the hands of one engineer and a conductor. This duo is expected to work for up to 12 hours, take 8 hours off (for eating, sleeping, bill paying, etc.), then come back for more. The length of their shifts is bad enough: It's hard to imagine staying focused on your favorite TV show for 12 hours straight, let alone an endless stretch of railroad track—especially as viewed from an overheated, deafeningly loud engine cabin. But to make matters worse, rail workers are generally scheduled without regard to the basic requirements of a normal sleep cycle. Thus an engineer who is happily tucked in bed at 3 a.m. on one morning, is just as likely to find himself at the head of a 70-car train at 3 a.m. on the next—having received no more than two hours advance notice. "I've been forced to go out when I was so exhausted I hallucinated," recalls one

Norfolk Southern engineer, "I've seen things that weren't there, almost gone past signals I thought were one color when they were another."

Maybe that's what happened to the engineer of a Union Pacific train who was killed in July after he sped past a rail stop sign near Rossville, Kansas, and collided with an oncoming train. Hazardous materials aboard his train were burned in the crash, and Rossville's residents had to be evacuated. The collision was one of three fatal Union Pacific accidents since June that finally prompted the Federal Railroad Administration to launch an 80-man inspection of the rail company—the most extensive investigation in the agency's history. After a week of probing, the FRA declared itself shocked, shocked, to discover that everyone from dispatchers, to engineers, to yard workers, were being "worked to the bone." Yet for years rail workers' unions have complained about such problems; last spring the Brotherhood of Locomotive Engineers even tried to shut Union Pacific down with a strike over safety, but they were halted by a court order. Still, according to the FRA's spokesman Jim Gower, the FRA "wasn't really aware of the vastness of the problem."

But this was only the tip of the iceberg. The FRA also found that Union Pacific routinely violates the already onerous 12-hour work limit—often keeping workers on duty for up to 17 hours at a stretch. Topping it all off, the agency determined that the training many workers receive is grossly inadequate and in some cases nonexistent—with some employees ordered to operate sophisticated equipment they've never been taught to use.

Among the things a good training program might emphasize would be the importance of watching for smaller problems that could be the harbinger of bigger ones. But even if they were taught to do so, rail workers might be disinclined to report any trouble they find. Many rail companies reward managers with a cash bonus tied the safety record of the track under the manager's jurisdiction. CSX Transportation, for instance, has awarded a total of \$45 million in company stock since 1995 under its "Take Stock in Safety" program. Sounds like a great incentive system, but the result, according to United Transportation Union's legislative director, J.M. Brunkenhoefer, is that many middle managers strongly discourage the rail workers they supervise from reporting accidents—threatening potential whistle blowers with either layoffs or "investigations" into the whistle blower's responsibility.

Of course, the railroads sometimes run into pesky FRA rules requiring that certain types of accidents be reported, for instance those in which a rail worker is injured seriously. No problem—the companies simply send workers to the doctor with a special note, like one

from CSA that asks that whenever possible, use of equally prudent NON-REPORTABLE treatment is encouraged in order to minimize reporting of less significant minor injuries to the Federal Railroad Administration." Among the "reportable" treatments doctors are urged to avoid: "issuing a prescription, injections, closing a wound with sutures, butterfly, staple or steri-strip, application of immobilizing cast, sling or splint, ... [and] restriction of employee's work activity." To be sure, the letter assures doctors that "appropriate treatment should be based upon your professional medical judgment," but the message from CSX management to the doctor and, more importantly, to its employees couldn't be more blunt: Don't Rock the Boat.

That message was apparently heard loud and clear by the team aboard a CSX train that sideswiped an Amtrak passenger car and caused a derailment near Arlington, Va., this past July. Twice during the train's two-hour journey, crews on passing trains radioed the CSX crew with the warning that one of its flatcars was leaning precariously. Nonetheless, the crew ignored the warning and continued forward because a CSX supervisor had already inspected the car and insisted there was no danger.

Highway to Hell

But intimidated, badly trained and dog-tired as they may be, rail workers are still the envy of truckers. That's because while truckers can only be legally required to drive a mere 10 hours a day, trucking companies routinely—and knowingly—put them on schedules that make a mockery of the law. Consider the timetable of 23-year-old Peter Conway, the driver of a semitrailer loaded with 9,200 gallons of propane headed east on I-287 through New York state in July of 1994. Some time earlier, Conway's truck had been side-lined by a breakdown for 10 hours. Like most truckers, he was being paid by the mile as opposed to the hour, so after his rig was fixed, Conway faced a Hobson's choice: make up the lost time or take a financial hit. He opted to press on. On July 27, Conway's truck drifted off the left shoulder of the highway near White Plains and struck the column of an overpass. The propane leaking from his truck's damaged tank ignited—propelling the container 300 feet through the air onto a nearby house, which was quickly engulfed in flames. Conway was killed, and 23 others were injured. Although Conway had falsified the log book in which he was legally required to enter his work time, federal investigators were able to determine that he had been driving almost continuously for over 35 hours. Their unsurprising conclusion: Conway had dozed off at the wheel.

He's certainly not the first, nor the last, to have done

so. A recent governmental study shows that up to 70 percent of truck crashes were probably caused by fatigue. Another study determined that at least 58 percent of truckers had violated hours-of-service rules. In fact, log books are so routinely doctored that truckers have taken to calling them "comic books."

But even if he's awake, there's no guarantee the driver of that monster hazmat truck roaring up behind you on the highway is even marginally competent—or that his rig is remotely safe. Take the case of Willis Curry, a Washington D.C. trucker who, since 1988, has managed to amass 31 citations for such traffic violations as speeding, carrying overweight loads, disobeying red lights and ignoring railroad cross warnings. Back in January, the Department of Transportation's Federal Highway Administration (FHWA) informed Curry's employer of his record and he was promptly fired. But the FHWA waited until April to alert D.C. authorities that his license should be revoked. Two months later Curry, still the proud bearer of a D.C. license and now a driver for a local dump truck company, collided with the car of a young mother and her one-year-old son.

Police determined that the brakes on Curry's dump had failed. This should not have come as a surprise. Curry's vehicle gave a whole new meaning to the term "dump" truck. It had been cited for 28 mechanical safety violations in two random inspections last year. And during the first inspection the truck's wiring was so defective that when the brake pedal was pushed the windshield wipers started going. On both occasions the truck had been ordered off the road for repairs.

But the story doesn't end there. After Curry's accident, no action was taken to investigate the dump's owner, or to revoke Curry's license. It wasn't until ten days later, when Curry made a routine request for a duplicate license, that a city clerk happened to notice his record and confiscated his license. And Curry quickly managed to win it back, with the proviso that he only drive between 4 a.m. and noon on weekdays. At 2 p.m. the very next week, Curry was once again behind the wheel when the brakes on his dump failed a second time, causing the 30-ton truck to veer out of control and roll over onto a car driven by a teenage honor student. The boy was killed instantly. It is small consolation that Curry's truck wasn't carrying anything more dangerous than sand. Next time we may not be so lucky.

It's hard to say which was the greater menace to society, Curry or his truck. And that's not unusual. On the rare occasions when the Department of Transportation does random roadside inspections, nearly one out of every three rigs they pull over is found to be either unsafe, driven by an unsafe trucker, or both.

Danger Zone

Defective equipment is a problem with which rail workers are also all too familiar. A 1995 surprise inspection of a Union Pacific rail yard in Fort Worth, Texas, found that 37 percent of the rail cars there were faulty—over a third of them with brake problems. And according to Union Pacific itself, 12 percent of the 8,000 plus chemical tank cars it inspected last year turned up “exceptions” like poor positioning of the tops on the cars, or mislabeling of their contents. That wasn’t news to rail employees; they say it’s not uncommon to work on a train with up to eight “sleeper cars” whose contents, hazardous or otherwise, are unknown to them.

This is no minor inconvenience. Different hazardous materials pose different risks and, in the event of an accident, it’s essential for emergency responders to know what they’re dealing with. For instance, if an unsuspecting fireman unleashed a fire hose on an accident involving metam sodium, rather than dousing any flames, there’s a good chance the water would react with the chemical to form a nasty mustard gas-like compound. Similarly, if an emergency crew allowed a small amount of water to drip over a spill of hydrogen peroxide, the heat generated by the subsequent chemical reaction could cause nearby fuel to erupt into a major inferno.

Just as frightening as the trains themselves are the tracks on which they travel. About 85 percent of rail transport occurs over “dark” areas where there is no automated signaling. Instead, engineers must rely on dispatchers to talk them through their journey. Yet, as the FRA recently “discovered,” dispatchers are often unfamiliar with the tracks through which they are expected to guide a train—in many cases they haven’t even traveled the route once. So perhaps it’s not surprising that a June FRA inspection of Union Pacific found that 80 percent of dispatcher orders contained at least one error.

And even when there are signals along the track, they are not necessarily configured to maximize safety. In a 1993 overhaul of a stretch of railroad whose users include a Maryland commuter service line, the railroad’s owner, CSX, did away with a large number of warning signals along the track. Under the new system, yellow “slow down” signals indicating that a red “stop” signal is soon to follow are now placed *before* some train stations even if the “stop” sign they are referring to lies way beyond the station. So engineers driving trains that make station stops must somehow remember to pull out of the station at a slow speed; the intermediate signals that would have reminded them about the abrupt stop signal coming up after the station are no longer there. It’s hard to conceive of a more accident-prone system. Yet neither CSX nor the FRA so much as paused to consider

the safety implications before installing it.

Three years after CSX put in the new system, the inevitable occurred. On a snowy night in February of 1996, the engineer of a Maryland commuter train forgot (or didn’t notice) the yellow signal before the Kensington, Md., station and pulled out of the station at 60 miles an hour. By the time he saw the stop sign and slammed on the brakes it was too late. Moments later he smashed into the fuel tank of an oncoming Amtrak. Eleven people were killed in the crash and subsequent conflagration. Still, despite instituting some other safety changes, CSX has kept the risky signal system in place.

A Free Ride

But how does the industry get away with it? Where are all those government regulators conservatives are so fond of disparaging? Turns out they’re not nearly as meddlesome as the GOP would have you think. A July study by the General Accounting Office (GAO)—which monitors federal agencies for Congress—found that in just one year, the number of safety inspections conducted by the FRA decreased by 23 percent. And between 1992 and 1995 the percentage of railroads inspected for hazardous materials safety by the FRA fell from 34 percent to 21 percent.

That’s hardly surprising considering how depleted the FRA’s forces are. “You’ve got 380 inspectors for over 1 million cars and 300,000 miles of track,” notes the United Transportation Union’s Brunkenhoefer. Compare that with the Federal Aviation Administration’s 3,028 inspectors—132 for hazardous materials alone—and it’s tough not to agree with Brunkenhoefer that “the FRA is stretched too thin.” Last year, Representative James Oberstar, the ranking minority member of the House Transportation Committee, introduced a bill that would have doubled the number of inspectors. But the Republican leadership didn’t even allow a hearing on it.

Oberstar plans to reintroduce his bill this fall. But he’s unlikely to get much thanks from the FRA. The agency has long been criticized for failing to stand up to the railroads, but the current climate in Washington has the FRA positively cowed. Discussing the FRA’s role with agency officials is an almost eerie experience—the party line they spout couldn’t be more anti-regulatory if it had been drafted by Newt Gingrich: The lack of inspectors? “Not an issue,” FRA spokesman Jim Gower hastens to assure; “We’ve streamlined and are able to do more with less.” How? “By making use of the inspectors the railroads employ.” The GAO is underwhelmed by the FRA’s new approach. In its July report, the GAO expressed concern that the FRA leaves almost all oversight of bridge safety in the hands of railroad companies.

But the FRA maintains there's no cause for alarm; it's all part of a new "cooperative" way of doing business that began under the Clinton administration. The idea is to move away from using violations and civil penalties as the primary means of obtaining compliance with the regulations. Instead, the agency relies on "partnerships" with the railroad companies. If you're wondering what that means, take a look at the way the FRA has responded to the results of its—admittedly laudable—massive investigation of Union Pacific. You might expect that the agency's discovery that rail employees are being dangerously overworked would prompt it to change the rules governing their schedule. How retro! "New regulations are not the answer," the FRA's Gower patiently explains. Instead, the FRA will simply ask Union Pacific to mend its ways: "After all, it's in their own interest." Union Pacific officials agree—pointing out that they're hiring an additional 2,600 employees this year. But just how much relief will those new hires be able to provide for the company's exhausted 54,000-strong work force? Officials like Barry Sweedler at the National Transportation Safety Board (NTSB)—the independent agency responsible for investigating accidents and making recommendations to transportation regulators—think the FRA is being naive. "What you have today is an industry that's willing to accept a certain number of collisions every year," observes Sweedler.

To be sure, over the years the FRA has introduced some important technical requirements that have made rail transport safer. For instance, it recently decreed that all train cars must be linked with special couplers to help prevent them from separating during derailments. For added protection, tanks carrying hazmats are required to be fitted with steel head shields, coated in thermal insulation, and equipped with special devices to keep their bottom outlets from being sheared off in the event of an accident. Unfortunately, the railroads don't have to fully comply with all these new regs until 2006.

Even many of the FRA-mandated innovations that are actually in use were required by the FRA only after fatal foot-dragging. That was the case with a backup braking system called a "two-way end-of-train device" that allows an engineer to use a radio signal to apply brakes from the back of his train if his locomotive brakes fail. The FRA did not mandate use of the devices on all trains traveling through mountainous terrain until February of 1996—seven years after the NTSB first recommended them, and only after a runaway train had derailed at the bottom of the steep Cajon Pass in California not once, but *twice*. Similarly, while the FRA has (after over a decade of urging by the NTSB) finally conceded the considerable potential of using satellite-based

proximity warning systems to alert engineers, and even apply the brakes, when one train is speeding or about to collide with another, the agency is now merely helping the rail companies run pilot projects—rather than insisting that they install it on a timetable.

And there are still plenty of cheap and life-saving innovations out there that the FRA continues to ignore. Take the laser systems that could be used to alert trains when the track over vulnerable areas like bridges has been misaligned. Such misalignments have been the cause of some of the most horrific accidents in recent memory—like the 1993 Alabama derailment in which 47 people perished. Yet though cheap models of this system have been put forward, the FRA has no plans to require them. Heck, they still don't even mandate that engine cabins be equipped with radios!

The Department of Transportation's record on hazmat trucking is just as deplorable. As you may have gathered from the case of dump truck driver Willis Curry, enforcement of the law by the Department's Federal Highway Administration is laughable. A March study by the Department's Inspector General—a sort of in-house independent watchdog—found that in 1995, only 25 percent of trucking companies were reviewed by the Federal Highway Administration (FHWA) to see if they complied with safety rules. What's more, about two-thirds of the nation's interstate carriers have *never* been rated for safety. Most alarming, the Inspector General determined that 22 percent of trucking companies with high rates of on-the-road violations and accidents had never been rated for safety, and 42 percent had not been rated in the past two years.

What's going on? Part of the problem is that the 529 federal and state inspectors available to the FHWA are simply incapable of covering all 345,000 interstate trucking companies. But the Inspector General also found that FHWA inspectors were spending far too much time on less urgent activities like educational outreach. Furthermore, while the Department of Transportation does maintain a national database of driver and vehicle violations that it uses to identify high-risk targets for inspection, the criteria for determining who is high-risk puts too much weight on factors like how many passengers a vehicle carries, instead of how many times it has been pulled off the road for being unsafe. To make matters worse, violations of state and local traffic laws are often never entered into the database. Why? Because states are not actually required by the FHWA to transmit the information. Of course, states *are* required to pass on the results of federally-funded safety compliance reviews and random roadside inspections, but they usually fail to do so quickly. Even when they do, the FHWA

RAILROAD SAFETY**DOT Faces Challenges in
Improving Grade Crossing
Safety, Track Inspection
Standards, and Passenger
Car Safety**

Statement for the Record by
Phyllis F. Scheinberg, Associate Director,
Transportation and Telecommunications Issues,
Resources, Community, and Economic
Development Division

Madam Chairman and Members of the Subcommittee:

We appreciate the opportunity to provide this statement for the record on several issues affecting safety on the nation's rail lines. Recent rail accidents at Cajon Pass, California; Silver Spring, Maryland; and Weyauwega, Wisconsin, have heightened concern about the safety of passenger and freight lines in the United States. Since 1987, GAO has issued many reports describing safety problems on the nation's rail lines. This statement is based on recent GAO reviews of safety at highway railroad crossings, the adequacy of track safety inspections and enforcement, and the safety of passenger cars operated by commuter railroads and Amtrak. In summary, we found the following:

- Accidents at railroad crossings are the leading cause of deaths associated with the railroad industry; almost half of all rail-related deaths in the United States are caused by collisions of trains and vehicles at public railroad crossings. In 1994, these collisions killed 501 people and injured 1,764 others. Strategies to improve safety at railroad crossings include targeting funds to high-risk areas through revisions in the Department of Transportation's (DOT) formula for distributing railroad improvement funds to the states; closing more railroad crossings; installing new technologies, such as four-quadrant gates, at the most dangerous crossings; and developing education and enforcement programs that increase the public's awareness of the dangers of railroad crossings. Although DOT has an action plan incorporating these strategies, the plan will be costly to implement and will require DOT to seek congressional approval to implement key proposals.
- The Federal Railroad Administration (FRA) has developed an overall strategy for inspecting and enforcing track safety standards. As we recommended in our 1994 report,¹ to further strengthen the rail safety program, FRA needs to include site-specific data on volumes of passenger and hazardous materials traffic in its inspection plan and improve the reliability of its accident and injury data. Information on the numbers of passengers and amounts of hazardous materials transported is important since train routes carrying these types of traffic must be adequately maintained to prevent accidents that will injure passengers or expose populated areas to chemical risks. Accurate and complete information on the numbers of accidents and injuries is equally important in identifying high-risk routes. However, FRA's database, derived from the industry's reports to FRA, is inaccurate and incomplete. Without reliable informa-

Railroad Safety: Continued Emphasis Needed for an Effective Track Safety Inspection Program. GAO/RCED-94-56, Apr. 22, 1994.

on passenger and hazardous materials traffic, accidents, and injuries, FRA and its inspectors do not have the means to direct inspectors to the routes that have the highest potential for accidents.

- Although Amtrak and commuter railroads transport over 20 and 330 million passengers, respectively, each year, FRA has established few regulations concerning passenger car safety. FRA does not have minimum safety standards for mechanical components on passenger cars, as it does for freight cars and locomotives. In 1984, FRA informed the Congress that it planned to study the need for standards governing the condition of safety-critical passenger car components. The Congress subsequently directed FRA, in the Swift Rail Development Act of 1994, to complete rulemaking governing passenger car safety by 1999.

Improving Railroad Crossing Safety

On October 25, 1995, Americans were reminded of the dangers that drivers/passengers often face when they travel over railroad crossings in the United States. On that day, in Fox River Grove, Illinois, seven high school students were killed when a commuter train hit a school bus.

The potential for tragedies like the one at Fox River Grove is significant—the United States has over 168,000 public highway-railroad intersections. The types of warning for motorists at these crossings range from no visible devices to active devices, such as lights and gates. About 60 percent of all public crossings in the United States have only passive warning devices—typically, highway signs known as crossbucks. In 1994 this exposure resulted in motor vehicle accidents at crossings that killed 501 people and injured 1,764 others. Many of these deaths should have been avoided, since nearly one-half occurred at crossings where flashing lights and descended gates had warned motorists of the approaching danger.

In August 1995, we issued a comprehensive report on safety at railroad crossings.² We reported that the federal investment in improving railroad crossing safety had noticeably reduced the number of deaths and injuries. Since the Rail-Highway Crossing Program—also known as the section 115 program—was established in 1974, the federal government has distributed about \$5.5 billion (in 1996 constant dollars) to the states for railroad crossing improvements. This two-decade investment, combined with a reduction in the total number of crossings since 1974, has significantly lowered the accident and fatality rates—by 61 percent and 34 percent.

²Railroad Safety: Status of Efforts to Improve Railroad Crossing Safety. (GAO/RCED-95-191, Aug. 1995).

respectively. However, most of this progress occurred during the first decade, and since 1985, the number of deaths has fluctuated between 466 and 682 each year (see app. 1). Since 1977, the federal funding for railroad crossing improvements has also declined in real terms. Consequently, the question for future railroad crossing safety initiatives will be how best to target available resources to the most cost-effective approaches.

Our report discussed several strategies for targeting limited resources to address railroad crossing safety problems. The first strategy is to review DOT's current method of apportioning section 130 funds to the states. Our analysis of the 1995 section 130 apportionments found anomalies among the states in terms of how much funding they received in proportion to three key risk factors: accidents, fatalities, and total crossings. For example, California received 6.9 percent of the section 130 funds in 1995, but it had only 4.8 percent of the nation's railroad crossings, 5.3 percent of the fatalities, and 3.9 percent of the accidents. Senators Lugar and Coats have proposed legislation to change the formula for allocating section 130 funds by linking the amounts of funding directly to the numbers of railroad crossings, fatalities, and accidents. Currently, section 130 funds are apportioned to each state as a 10-percent set-aside of its Surface Transportation Program funds.

The second means of targeting railroad crossing safety resources is to focus the available dollars on the strategies that have proved most effective in preventing accidents. These strategies include closing more crossings, using innovative technologies at dangerous crossings, and emphasizing education and enforcement. Clearly, the most effective way to improve railroad crossing safety is to close more crossings. The Secretary of Transportation has restated FRA's goal of closing 25 percent of the nation's railroad crossings, since many are unnecessary or redundant. For example, in 1994, the American Association of State Highway and Transportation Officials found that the nation had two railroad crossings for every mile of track and that in heavily congested areas, the average approached 10 crossings for every mile. However, local opposition and localities' unwillingness to provide a required 10-percent match in funds have made it difficult for the states to close as many crossings as they would like. When closing is not possible, the next alternative is to install traditional lights and gates. However, lights and gates provide only a warning, not positive protection at a crossing. Hence new technologies such as four-quadrant gates with vehicle detectors, although costing about \$1 million per crossing, may be justified when

accidents persist at signalled crossings. The Congress has funded research to develop innovative technologies for improving railroad crossing safety.

Although installing lights and gates can help to prevent accidents and fatalities, it will not preclude motorists from disregarding warning signals and driving around descended gates. Many states, particularly those with many railroad crossings, face a dilemma. While 35 percent of the railroad crossings in the United States have active warning devices, 50 percent of all crossing fatalities occurred at these locations. To modify drivers' behavior, DOT and the states are developing education and enforcement strategies. For example, Ohio—a state with an active education and enforcement program—cut the number of accidents at crossings with active warning devices from 377 in 1978 to 93 in 1993—a 75-percent reduction. Ohio has used mock train crashes as educational tools and has aggressively issued tickets to motorists going around descended crossing gates. In addition, DOT has inaugurated a safety campaign entitled “Always Expect a Train,” while Operation Lifesaver, Inc., provides support and referral services for state safety programs.³

DOT's educational initiatives are part of a larger plan to improve railroad crossing safety. In June 1994, DOT issued a Grade Crossing Action Plan, and in October 1995, it established a Grade Crossing Safety Task Force. The action plan set a national goal of reducing the number of accidents and fatalities by 50 percent from 1994 to 2004. As we noted in our report, whether DOT attains the plan's goal will depend, in large part, on how well it coordinates the efforts of the states and railroads, whose contributions to implementing many of the proposals are critical. DOT does not have the authority to direct the states to implement many of the plan's proposals, regardless of how important they are to achieving DOT's goal. Therefore DOT must rely on either persuading the states that implementation is in their best interests or providing them with incentives for implementation. In addition, the success of five of the plan's proposals depends on whether DOT can obtain the required congressional approval to use existing funds in ways that are not allowable under current law. The five proposals would (1) change the method used to apportion section 130 funds to the states (2) use Surface Transportation Program funds to pay local governments a bonus to close crossings, (3) eliminate the requirement for localities to match a portion of the costs associated with closing crossings, (4) establish a \$15 million program to encourage the states to improve r

³Operation Lifesaver is a private, not-for-profit organization supported by federal and railroad funds and dedicated to improving safety through education and improved law enforcement. Operation Lifesaver programs are currently operated in 49 states.

corridors, and (5) use Surface Transportation Program funds to increase federal funding for Operation Lifesaver.

Finally, the action plan's proposals will cost more money. Secretary Pena has announced a long-term goal of eliminating 2,250 crossings where the National Highway System intersects Principal Rail Lines. Both systems are vital to the nation's interstate commerce, and closing these crossings is generally not feasible. The alternative is to construct a grade separation—an overpass or underpass. This initiative alone could cost between \$4.5 billion and \$11.3 billion—a major infrastructure investment

DOT established the Grade Crossing Safety Task Force in the aftermath of the Fox River Grove accident, intending to conduct a comprehensive national review of highway-railroad crossing design and construction measures. On March 1, 1996, the task force reported to the Secretary that “improved highway-rail grade crossing safety depends upon better cooperation, communication, and education among responsible parties if accidents and fatalities are to be reduced significantly.” The report provided 24 proposals for five problem areas it reviewed: (1) highway traffic signals that are supposed to be triggered by oncoming trains; (2) roadways where insufficient space is allotted for vehicles to stop between a road intersection and nearby railroad tracks; (3) junctions where railroad tracks are elevated above the surface of the roadway, exposing vehicles to the risk of getting hung on the tracks; (4) light rail transit crossings without standards for their design, warning devices, or traffic control measures; and (5) intersections where slowly moving vehicles, such as farm equipment, frequently cross the tracks.

Improving Track Safety

Under the Federal Railroad Safety Act of 1970, as amended, FRA is responsible for regulating all aspects of railroad safety. FRA's safety mission includes 1) establishing federal rail safety rules and standards; 2) inspecting railroads' track, signals, equipment, and operating practices; and 3) enforcing federal safety rules and standards. The railroads are primarily responsible for inspecting their own equipment and facilities to ensure compliance with federal safety regulations, while FRA monitors railroads' actions.

We have issued many reports identifying weaknesses in FRA's railroad safety inspection and enforcement programs. For example, in July 1996 we reported on FRA's progress in meeting the requirements, set forth in the Federal Railroad Safety Authorization Act of 1980, that FRA submit

the Congress a system safety plan to carry out railroad safety laws.⁴ The act directed FRA to (1) develop an inspection methodology that considered carriers' safety records, the location of population centers, and the volume and type of traffic using the track and (2) give priority to inspections of track and equipment used to transport passengers and hazardous materials. The House report accompanying the 1980 act stated that FRA should target safety inspections to high-risk track—track with a high incidence of accidents and injuries, located in populous urban areas, carrying passengers, or transporting hazardous materials. In our 1990 report, we found that the inspection plan that FRA had developed did not include data on passenger and hazardous materials routes—two important risk factors. In an earlier report, issued in April 1989, we noted problems with another risk factor—accidents and injuries.⁵ We found that the railroads had substantially underreported and inaccurately reported the number of accidents and injuries and their associated costs. As a result, FRA could not integrate inspection, accident, and injury data in its inspection plan to target high-risk locations.

In our 1994 report on FRA's track safety inspection program, we found that FRA had improved its track inspection program and that its strategy for correcting the weaknesses we had previously identified was sound. However, we pointed out that FRA still faced challenges stemming from these weaknesses. First, it had not obtained and incorporated into its inspection plan site-specific data on two critical risk factors—the volume of passenger and hazardous materials traffic. Second, it had not improved the reliability of another critical risk factor—the rail carriers' reporting of accidents and injuries nationwide. FRA published a notice of proposed rulemaking in August 1994 on methods to improve rail carriers' reporting. In February 1996, FRA reported that it intended to issue a final rule in June 1996.

To overcome these problems, we recommended that FRA focus on improving and gathering reliable data to establish rail safety goals. We specifically recommended that FRA establish a pilot program in one FRA region to gather data on the volume of passenger and hazardous materials traffic and correct the deficiencies in its accident/injury database. We recommended a pilot program in one FRA region, rather than a nationwide program, because FRA had expressed concern that a nationwide program would be too expensive. The House and Senate Appropriations

⁴Railroad Safety: New Approach Needed for Effective FRA Safety Inspection Program (GAO/RCED-90-194, July 31, 1990).

⁵Railroad Safety: FRA Needs to Correct Deficiencies in Reporting Injuries and Accidents (GAO/RCED-89-109, Apr. 5, 1989).

Conference Committee echoed our concerns in its fiscal year 1995 report and directed the agency to report to the Committees by March 1995 on how it intended to implement our recommendations. In its August 1995 response to the Committees, FRA indicated that the pilot program was not necessary, but it was taking actions to correct the deficiencies in the railroad accident/injury database. For example, FRA had allowed the railroads to update the database using magnetic media and audited the reporting procedures of all the large railroads.

We also identified in our 1994 report an emerging traffic safety problem—the industry's excessive labeling of track as exempt from federal safety standards. Since 1982, federal track safety standards have not applied to about 12,000 miles of track designated by the industry as "excepted;" travel on such track is limited to 10 miles per hour, no passenger service is allowed, and no train may carry more than five cars containing hazardous materials. We found in our 1994 report that the number of accidents on excepted track had increased from 22 in 1988 to 65 in 1992—a 195-percent increase. Similarly, the number of track defects cited in FRA inspections increased from 3,229 in 1988 to 6,057 in 1992. However, with few exceptions, FRA cannot compel railroads to correct these defects. According to FRA, the railroads have applied the excepted track provision far more extensively than envisioned. For example, railroads have transported hazardous materials through residential areas on excepted track or intentionally designated track as excepted to avoid having to comply with minimum safety regulations. In November 1992, FRA announced a review of the excepted track provision with the intent of making changes. FRA viewed the regulations as inadequate because its inspectors could not write violations for excepted track and railroads were not required to correct defects on excepted track.

FRA stated that changes to the excepted track provision would occur as part of its rulemaking revising all track safety standards. In February 1993, FRA reported that the task of revising track safety regulations would be taken up by FRA's Railroad Safety Advisory Committee. FRA noted that this committee would begin its work in April 1996 but did not specify a date for completing the final rulemaking. The Congress had originally directed FRA to complete its rulemaking revising track safety standards by September 1994.

Improving Passenger Car Safety

In September 1993, we issued a report examining whether Amtrak had effective procedures for inspecting, repairing, and maintaining its

passenger cars to ensure their safe operation and whether FRA had provided adequate oversight to ensure the safety of passenger cars.⁶ We found that Amtrak had not consistently implemented its inspection and preventive maintenance programs and did not have clear criteria for determining when a passenger car should be removed from service for safety reasons. In addition, we found that Amtrak had disregarded some standards when parts were not available or there was insufficient time for repairs. For example, we observed that cars were routinely released for service without emergency equipment, such as fire extinguishers. As we recommended, Amtrak established a safety standard that identified a minimum threshold below which a passenger car may not be operated, and it implemented procedures to ensure that a car will not be operated unless it meets this safety standard.

In reviewing FRA's oversight of passenger car safety (for both Amtrak and commuter rail), we found that FRA had established few applicable regulations. As a result, its inspectors provided little oversight in this important safety area. For more than 20 years, the National Transportation Safety Board has recommended on numerous occasions that FRA expand its regulations for passenger cars, but FRA has not done so. As far back as 1984, FRA told the Congress that it planned to study the need for standards governing the condition of safety-critical passenger car components.

Between 1990 and 1994, train accidents on passenger rail lines ranged between 127 and 179 accidents each year (see app. 2). In our 1993 report, we maintained that FRA's approach to overseeing passenger car safety was not adequate to ensure the safety of the over 330 million passengers who ride commuter railroads annually. We recommended that the Secretary of Transportation direct the FRA Administrator to study the need for establishing minimum criteria for the condition of safety-critical components on passenger cars. We noted that the Secretary should direct the FRA Administrator to establish any regulations for passenger car components that the study shows to be advisable, taking into account any internal safety standards developed by Amtrak or others that pertain to passenger car components. However, FRA officials told us at the time that the agency could not initiate the study because of limited resources.

Subsequently, the Swift Rail Development Act of 1994 required FRA to issue initial passenger safety standards within 3 years of the act's

⁶Amtrak Safety: Amtrak Should Implement Minimum Safety Standards for Passenger Cars (GAO/RCED-93-136, Sept. 22, 1993).

enactment and complete standards within 5 years. In 1995, FRA referred the issue to its Passenger Equipment Safety Working Group consisting of representatives from passenger railroads, operating employee organizations, mechanical employee organizations, and rail passengers. The working group held its first meeting in June 1995. An advance notice of proposed rulemaking is expected in early 1996, and final regulations are to be issued in November 1999. Given the recent rail accidents, FRA could consider developing standards for such safety-critical components as emergency windows and doors and safety belts as well as the overall crashworthiness of passenger cars.

In conclusion, safety at highway-railroad crossings, the adequacy of track safety inspections and enforcement, and the safety of passenger cars operated by commuter railroads and Amtrak will remain important issues for Congress, FRA, the states, and the industry to address as the nation continues its efforts to prevent rail-related accidents and fatalities.

Accidents and Fatalities at Public Railroad Crossings 1975-94

JAN 21 1998

The Honorable Dennis J. Kucinich
U.S. House of Representatives
Washington, D.C. 20515

Dear Congressman Kucinich:

Thank you for your letters on behalf of one of your constituents concerning radioactive materials being shipped on Consolidated Rail Corporation (Conrail) trains near his home on Preston Avenue in Cleveland, Ohio. Your office asked us to identify the radioactive material (including radioactivity), the origin and destination of the shipments, the number of times this material was shipped over the Conrail line through Ohio's 10th District, the amount of radioactive materials transported, and the number of railcars utilized during these shipments.

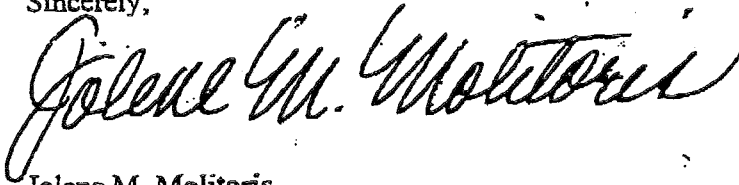

Our investigation disclosed that the material is under the name "radioactive material, low specific activity, n.o.s." Low specific activity means that the material has very low levels of radioactivity. The actual level of radioactivity for these shipments is 1.85 times 10 to the ninth power Becquerels. This level of radioactivity is generally emitted from natural ore materials which are mined from the earth. According to the shipper's material fact sheet, these shipments pose no risk to persons handling or transporting the packagings, or the general public.

These shipments originate in Boyertown, Pennsylvania and are transported by highway to Scranton, Pennsylvania. From Scranton, the shipments are transported by rail to Cisco, Utah and then by highway to the final destination in Blanding, Utah.

About 40,000 pounds of radioactive material is placed in each intermodal box. Anywhere from two to ten intermodal boxes are loaded on individual railcars. From October 1997 until January 16, 1998, 824 shipments (i.e., intermodal boxes) were transported on approximately 200 railcars that passed through Cleveland, Ohio. The shipper informs us that the final shipments are expected to leave Boyertown on January 30.

I appreciate your interest in railroad safety and look forward to working with you on other transportation issues of importance to you and your constituents.

Sincerely,

A handwritten signature in cursive script that reads "Jolene M. Molitoris". The signature is written in black ink and is positioned above the typed name.

Questions and Answers: High-Level Nuclear Waste Shipments

What is in a high-level nuclear waste cask?

Irradiated fuel from commercial nuclear utility operation of nuclear power reactors. Three years inside the reactor core makes the fuel over a million times more radioactive than unused fuel. The total—the Department of Energy projects 85,000 metric tonnes by the time the existing reactors close—contains 95% of all of the radioactivity of the Nuclear Age. The shipping program and the Bills in Congress that would authorize it, will transfer the liability for this waste from the nuclear utilities to the US taxpayer. It will take thirty years, or more, of continuous shipping to move the fuel from reactor sites to Nevada. The first year and each year after, more irradiated fuel will move than all the shipments of this material to date. Today, only about 35% of the projected 85,000 metric tonnes has been generated.

How dangerous is this stuff?

Unshielded, irradiated reactor fuel that has been stored for 10 years will deliver a lethal dose to anyone within a meter in less than three minutes. Radiation, even lethal levels, cannot be detected by human senses. Splitting uranium atoms releases heat that is used to make electricity, it also increases radioactivity. The broken pieces of uranium atoms are lighter elements called fission products. These include strontium-90, cobalt-60 and cesium-137, all sources of intensely penetrating radiation. Cesium is chemically similar to potassium. If released to the environment, it concentrates in the muscle and gonads in the body, as well as in cow's and mother's milk. Cesium can be concentrated by the food chain. Humans, being at the top of the food chain, may receive an ingested dose of cesium thousands of times higher than the concentration in the immediate environment. The intense gamma radiation of fission products is an immediate danger to those exposed in an accident. A large rail cask holds as much cesium as would be released by 200 Hiroshima bombs. The total shipping program will move almost 2 million times more cesium than was released at Hiroshima. Cesium is just a fraction of the radioactivity in the shipping casks and in the bomb that destroyed Hiroshima August 6, 1945.

What about long term impacts?

Each cask contains radioactive elements like plutonium that will persist if released to the environment for hundreds of thousands of years. An average rail cask will carry about 174 pounds of plutonium. A total of almost 2 million pounds of plutonium will be mobilized on the roads and rails nationally. Plutonium is well-known as a carcinogen. For reference, a single pound of plutonium could cause cancer in every person alive today, if it were divided and deposited in the lung tissue. If instead, all 2 million pounds of plutonium were released to the environment, (lowering the dose), there would be at least 1,500,000 fatal cancers from plutonium 239 alone. There would also be many non-fatal cancers as well as a host of non-cancer effects, genetic effects, sterility and other human suffering. Other species would also be affected. The total plutonium 239 in the shipping campaign is 128 times more than the total released to the environment by below-ground weapons tests, worldwide.

Is there radiation risk, even if there is no accident in my community?

Yes. Federal regulation allows radiation to penetrate the shielding of the transport cask at a rate up to 10 millirems an hour measured 2 meters from the cask. This would be comparable to a chest x-ray for each hour that a worker or a member of the public was close to the cask. Traffic jams or stops for fueling are situations that could lead to repeated or ongoing radiation exposures for individuals living and working along transport routes. Cumulative low-dose radiation exposure impose a measurable impact in a population. Health studies have shown that this type of exposure causes *more* cancer per unit of dose than acute exposures in the higher dose range. If a person is exposed to 10 millirems, once a year, the Nuclear Regulatory Commission assigns a 1 in 2850 chance of fatal cancer from that lifetime exposure.

What is "Multi-Purpose Canister Base Case?"

A scenario defined by the Department of Energy for projections about the shipping campaign. It assumes the use of the largest containers that are possible at each site (rail preferred over truck). The Multi-Purpose Canister (MPC) would seal huge amounts of waste—the large one holds 21,000 pounds—in a container at the reactor site. This canister is then to be put in a transport overpack for shipping. The large rail MPC holds over 20 times the radioactive waste as the old truck casks. The MPC has not yet been built, tested or licensed. To date, no transport cask has had full-scale physical testing. The Department of Energy has instead relied on computer simulations. The scenario also assumes no new reactors. Current reactor operations are projected to end in 2030.

What about the Bottom Line—the Economic Factors?

Part of routine transport for this dangerous material is local preparedness. Local emergency responders will in nearly all cases be the first to assess an accident scene. The Nuclear Regulatory Commission (NRC) estimated in 1981 (NUREG/CR-2225) that the price tag for a fully prepared state emergency response system would cost \$5.6 million annually (1981 dollars). This does not include infrastructure improvements and maintenance that are likely associated with state efforts to designate alternate routes. Congress is making no direct effort to ensure any level of funding will be available. Other economic impacts include cost of unrecovered health impacts, negative effects on business, tourism, property value and property marketability, and unclear liability for these effects.

NRC also made a 1980 estimate of the costs associated with an accident. Even a small fraction of the radioactivity in a single shipping cask were released in an urban area, the clean up costs would be on the order of \$2 billion dollars. "Clean up" means transferring the radioactivity somewhere else. Though it started as high-level waste, clean-up from contamination would currently be designated "low-level" waste. It is not clear who would pay for the clean-up or disposal from a high-level civilian waste transport accident. In most cases "clean-up" would scar the site or alternately, quite a bit of radioactivity may be left behind as a 'sacrifice zone.'

Factoids:

Total "Base Case" projected rail casks: 9,421; total truck casks: 6,217. 15,638 casks total.

If Congress lifts the cap on how much waste could go to an "interim storage site" and if instead of the "MPC Base-Case" scenario, only trucks are used, there would be over 60,000 shipments nationwide.

An average rail car carries 174 pounds of plutonium. A truck cask carries 38 pounds of plutonium.

The shipment of 85,000 MTU of high-level waste will also move 1,800,000 pounds of plutonium.

The plutonium 239 alone in these shipments could generate over 1,500,000 cancers if released. This amount of plutonium 239 is more than 120 times greater than the total released to date by below-ground nuclear weapons testing, worldwide.

The total of 85,000 metric tonnes that is to be shipped contains nearly 2 million times more cesium than the Hiroshima bomb.

RAIL TRANSPORTATION

Federal Railroad Administration's New Approach to Railroad Safety

GAO/RCED-97-142

Resources, Community, and
Economic Development Division

B-275984

July 23, 1997

The Honorable James L. Oberstar
Ranking Democratic Member
Committee on Transportation and
Infrastructure

The Honorable Robert E. Wise, Jr.
Ranking Democratic Member
Subcommittee on Railroads
Committee on Transportation and
Infrastructure

The Honorable Bruce F. Vento
House of Representatives

In response to your request, this report provides information on operational and safety trends in the railroad industry, and describes how the Federal Railroad Administration (FRA) has responded to these trends by developing a new partnering approach for improving safety on the nation's rail lines.

As arranged with your offices, unless you publicly announce its contents earlier, we plan no further distribution of this report until 30 days after the date of this letter. At that time, we will send copies of this report to interested congressional committees, the Secretary of Transportation, and the Administrator of FRA. We will also make copies available to others upon request.

If you or your staffs have any questions, I can be reached at (202) 512-2834. Major contributors to this report are listed in appendix V.

John H. Anderson, Jr.
Director, Transportation Issues

Executive Summary

Purpose

In 1980, the Congress passed the Staggers Rail Act, which fostered substantial changes in the railroad industry. By 1995, fewer large freight railroads accounted for most of the industry's revenue and train miles. At the same time, these freight railroads substantially reduced their workforce and track networks. In response, the Congress and railroad labor have raised concerns that these changes in the industry could compromise safety.

The Ranking Democratic Member of the House Committee on Transportation and Infrastructure, the Ranking Democratic Member of that Committee's Subcommittee on Railroads, and Representative Bruce L. Vento asked GAO to describe (1) relationships that existed between operational and safety trends in the railroad industry from 1976 to 1995 and (2) the Federal Railroad Administration's (FRA) approach to improving safety on the nation's rail system. GAO was not able to identify any direct relationships between operational and safety trends because of limitations in the data that were available for the 1976 to 1995 period. Therefore, this report provides information on safety trends for the entire railroad industry and describes how FRA has responded to both operational and safety trends to develop a new partnering approach to improving safety on the nation's rail lines. In addition, chapter 1 provides information on operational trends in the freight industry.

Background

In 1995, the railroad industry consisted of Amtrak (the nation's largest passenger railroad), 14 large freight railroads—collectively known as class I railroads—as well as over 600 regional and smaller railroads. The industry had changed significantly since the Staggers Rail Act made it federal policy that railroads would rely, where possible, on competition and the demand for services, rather than on regulation to establish reasonable rates. Prior to the act, several of the largest freight railroads were earning a negative rate of return on investment and at least three were bankrupt. The deregulation contributed to changes in the composition and operation of the rail industry. From 1976 through 1995 the nation's largest freight railroads cut costs; increased the tonnage a train carried and the distance this tonnage was carried; downsized their workforce; and eliminated, sold, or abandoned thousands of miles of unprofitable or little-used track.

Since 1970, FRA has been responsible for regulating all aspects of passenger and freight railroad safety under the Federal Railroad Safety

of 1970, as amended.¹ In that capacity, FRA prescribes regulations and issues orders that relate to railroad equipment, track, signal systems, operating practices, and those aspects of railroad workplace safety that pertain primarily to the movement of trains. The Occupational Health and Safety Administration (OSHA) regulates those aspects of railroad workplace safety that are typical of any industrial workplace. FRA also enforces the Hazardous Materials Transportation Act as it pertains to the transportation of hazardous materials by rail.

Results in Brief

Railroad safety has improved significantly over the past 20 years. Reported accident and injury rates are down 70 and 74 percent, respectively, from 1976 levels. Railroad industry representatives attribute the reductions to improvements made to the railroads' plant and equipment. However, labor representatives expressed concern that, despite this progress, heavier loads and increased traffic may adversely affect rail safety in the future. Rail safety data indicate that the progress in reducing accidents has slowed in recent years. While preliminary data for 1996 show improvements in key safety statistics, about 1,000 people die each year as a result of grade-crossing accidents and trespassing, 11,000 railroad employees are injured, and thousands of people are evacuated from their homes as a result of the hazardous materials that are released during train accidents.

FRA instituted an important shift in its safety program in 1993 to address safety problems in the rail industry. Rather than using violations and civil penalties as the primary means to obtain compliance with railroad safety regulations, FRA has emphasized cooperative partnerships with other federal agencies, railroad management, labor unions, and the states. The partnering efforts generally focus on the nation's larger railroads and have resulted in FRA inspectors' conducting fewer site-specific inspections of the railroad industry overall. While the preliminary data for 1996 show improvements, it is too early to determine if FRA's new approach will sustain a long-term decline in accidents and fatalities. In addition, FRA has allocated fewer resources to responding to concerns about the level of workplace injuries for railroad employees and railroad bridge safety.

¹In 1994, the Federal Railroad Safety Act of 1970, and other federal railroad safety statutes, were repealed, codified, and reenacted as chapters 201-213 of title 49, United States Code.

Principal Findings

Safety on the Nation's Railroads Has Generally Improved

Safety on the nation's railroads has improved since 1976, although the most rapid decrease in accidents occurred before 1987. FRA and industry officials attribute these improvements to advancements in technology, increased investment focused on a downsized infrastructure, and a more scientific approach toward reducing injuries. However, class I freight railroads, which account for most of the industry's revenue and train-miles, are now using fewer people, locomotives, and cars to haul more tonnage over fewer miles of track. Labor officials believe that these changes in operations could lead to more rail collisions and accidents as a result of greater congestion and fewer qualified employees to perform essential maintenance. While current safety trends are positive, it is uncertain how further advancements in technology or reductions in employment will affect safety in the future.

Nonetheless, further improvements in safety are needed, since more than 1,000 people die each year as a result of fatal collisions between cars and trains or as a result of trespassers on railroad property being struck by trains. Hazardous materials releases resulting from train accidents show no clear trends between 1978 and 1995. About 261,000 people were evacuated across the United States because of rail-related hazardous materials releases occurring over these years. Concerns remain about evacuations because the volume of chemical traffic increased by over one-third from 1976 to 1995.

FRA's New Safety Strategy Involves Partnerships

Beginning in 1993, FRA reassessed its safety program to leverage the agency's resources and established a cooperative approach that focused on results to improve railroad safety. With rail traffic expected to grow through the remainder of the 1990s and beyond, FRA anticipated the need for new approaches to enhance site-specific inspections. As a result, FRA formalized this shift with the establishment of three new initiatives. First, in 1994, FRA took the lead responsibility for coordinating the Department of Transportation's multiagency plans to reduce fatalities at rail-highway crossings. Second, in 1995, FRA formally established the Safety Assurance and Compliance Program through which the agency works cooperatively with railroad labor and management to identify and solve the root cause of systemic problems facing the railroads. Third, in 1996, FRA established the Railroad Safety Advisory Committee to develop recommendations for

the agency's more complex or contentious rulemakings by seeking consensus among the parties affected by the rulemakings.

It is too early to determine if FRA's collaborative efforts will produce a sustained decline in rail accidents and fatalities. FRA credits its grade-crossing plan with contributing to a 19-percent drop in fatalities in 1996. Whether the plan contributed to the decline is uncertain: Past trends indicate that the total number of railroad fatalities declined by 34 percent from 1976 to 1983 (from 1,630 to 1,073) but then fluctuated within a range of 1,036 and 1,324 deaths between 1983 and 1995. FRA has implemented its Safety Assurance and Compliance Program with 33 railroads. This method has improved the safety on many large railroads, but Norfolk Southern Corporation has refused to participate until FRA substantiates safety problems at the railroad. With regards to the Advisory Committee, the FRA Administrator has referred seven major rulemaking tasks to it. While the committee has developed proposed regulations on track safety and radio communications standards, efforts to develop freight power brake regulations have encountered problems in the negotiations among FRA, railroad labor, and railroad management.

To accommodate the new initiatives, FRA has shifted some of its resources away from site-specific inspections, which have historically served as FRA's primary means of ensuring compliance with safety regulations. The 53,111 inspections conducted in 1995 were 23 percent below the 68,715 inspections conducted in 1994. As a result, a greater number of railroads are not receiving inspections, and inspectors are conducting fewer reviews of the railroads' own inspection efforts.

In addition, there are two important areas of railroad safety that FRA's collaborative approach does not systematically address: workplace safety for railroad employees and the structural integrity of railroad bridges. While a 1978 policy statement by FRA provides guidance on which workplace safety issues FRA and OSHA should cover, the two agencies' inspection presence on railroad property varies greatly. FRA routinely inspects the railroads' track, equipment, and operating practices. In contrast, OSHA inspectors visit railroad property only in response to an employee or union complaint about working conditions or when investigating a workplace accident. In January 1997, FRA revised its injury reporting requirements to capture additional information on workplace injuries, including where an injury occurred, what activity was being performed at the time, and what was the probable cause of the injury. According to FRA, the new information will provide better data for future

rulemakings. Because these requirements only recently became effective, FRA has yet to accumulate sufficient data for analysis. Once sufficient data are collected, the agency will be able to determine the causes of the most frequent and serious injuries and focus efforts on corrective actions.

FRA does not have regulations governing the structural integrity of the 100,700 railroad bridges in the nation. Instead, a 1995 Statement of Agency Policy provides guidelines for railroads to use for the formulation of their own bridge management programs. FRA inspectors do not cite specific defects for bridge conditions, nor do they recommend violations, as they do for track, signal, or equipment problems. Instead, FRA inspectors call conditions to the attention of railroad bridge maintenance and engineering officials. According to FRA, inspectors normally use informal procedures to advise railroad personnel of bridge problems. If a bridge condition presents a hazard of death or personal injury, and the bridge owner does not correct the condition, FRA exercises its emergency authority to restrict or prohibit train operation over the bridge. The railroad industry agrees with FRA's policy that regulations are not needed to address issues related to structural conditions of bridges. Railroad labor officials disagree and note that bridge safety is equally as important as track safety, for which FRA has regulations.

Recommendations

GAO recommends that the Secretary of Transportation direct the FRA Administrator to, in cooperation with the industry, where appropriate, (1) analyze injury data collected under the revised reporting requirement to determine the workplace safety issues that lead to the most numerous or the most serious injuries; (2) in areas where efforts to obtain voluntary corrective action do not address the causes of these injuries, consider developing regulations; and (3) use appropriate mechanisms, including the Safety Assurance and Compliance Program, to ensure that a finding of potential structural problems on a bridge is properly addressed by the bridge owner.

Agency Comments and GAO's Response

GAO provided a draft of this report to the Department of Transportation (DOT) for its review and comment. GAO met with departmental officials, including the FRA Administrator, Deputy Administrator and Associate Administrator for Safety. The officials indicated that they agreed with many portions of the draft report's historical perspective but said that the report did not adequately reflect the more recent accomplishments and potential of the Safety Assurance and Compliance Program. The official

said that this program represents a fundamentally new approach to working with railroads to ensure regulatory compliance and accelerate safety improvements. The officials explained that although old methods of encouraging regulatory compliance contributed to a substantial reduction in railroad accidents between 1978 and 1986, the agency had determined that further progress would require new approaches.

FRA officials maintained that the Safety Assurance and Compliance Program provides the tools to leverage its limited resources while achieving continued safety improvements. The approach was based on President Clinton's directive to federal regulatory agencies that inspection and enforcement programs be designed to achieve results, not punishment. The officials indicated that the program establishes a framework for FRA to work cooperatively with railroad management and labor to identify and solve key safety issues. The officials indicated that while the program provides new tools to further enhance railroad safety, FRA will continue to make full use of all the enforcement options at its disposal as necessary and has begun to focus on enforcement where it is most likely to reduce accidents, injuries, and hazardous materials release. FRA officials produced statistics that they maintain demonstrate the program's substantial accomplishments during the 3 years since its initial implementation. Finally, while agreeing with two of GAO's three recommendations, FRA commented on GAO's recommendation that the agency consider developing regulations to address the issues that continue to cause the most numerous or serious workplace injuries. FRA officials said that the agency would limit its consideration of regulations to those areas that are related to train operations.

In response to FRA's comments, GAO included additional information on the accomplishments the agency's new rail safety program has achieved by highlighting safety statistics for 1993 through 1996 and providing detailed information on the successes with the Safety Assurance and Compliance Program. GAO also included FRA's performance goals for improving rail safety that illustrate how rail safety has improved since 1993. However, reaching conclusions on FRA's new safety program by isolating safety improvements over the most recent 3-year period ignores past trends in railroad safety. Over the past 20 years, noteworthy reductions in railroad accidents, fatalities, and injuries were often followed by periods in which railroad safety subsequently worsened. As GAO concluded, it is too early to tell if FRA's efforts will sustain improvements in railroad safety over an extended period of time. Finally, GAO disagrees with FRA's contention that the agency should limit its consideration of regulations to those areas th

said that this program represents a fundamentally new approach to working with railroads to ensure regulatory compliance and accelerate safety improvements. The officials explained that although old methods of encouraging regulatory compliance contributed to a substantial reduction in railroad accidents between 1978 and 1986, the agency had determined that further progress would require new approaches.

FRA officials maintained that the Safety Assurance and Compliance Program provides the tools to leverage its limited resources while achieving continued safety improvements. The approach was based on President Clinton's directive to federal regulatory agencies that inspection and enforcement programs be designed to achieve results, not punishment. The officials indicated that the program establishes a framework for FRA to work cooperatively with railroad management and labor to identify and solve key safety issues. FRA officials produced statistics that they maintain demonstrate the program's substantial accomplishments during the 3 years since its initial implementation. Finally, while agreeing with two of GAO's three recommendations, FRA commented on GAO's recommendation that the agency consider developing regulations to address the issues that continue to cause the most numerous or serious workplace injuries. FRA officials said that the agency would limit its consideration of regulations to those areas that are related to train operations.

In response to FRA's comments, GAO included additional information on the accomplishments the agency's new rail safety program has achieved by highlighting safety statistics for 1993 through 1996 and providing detailed information on the successes with the Safety Assurance and Compliance Program. GAO also included FRA's performance goals for improving rail safety that illustrate how rail safety has improved since 1993. However, reaching conclusions on FRA's new safety program by isolating safety improvements over the most recent 3-year period ignores past trends in railroad safety. Over the past 20 years, noteworthy reductions in railroad accidents, fatalities, and injuries were often followed by periods in which railroad safety subsequently worsened. As GAO concluded, it is too early to tell if FRA's efforts will sustain improvements in railroad safety over an extended period of time. Finally, GAO disagrees with FRA's contention that the agency should limit its consideration of regulations to those areas that

are related to train operations. FRA would have matters related to non-train operations under the purview of OSHA. But should FRA's analysis of workplace safety data show a preponderance of non-train-related injuries, the agency should not foreclose the need to consider regulations covering such injuries. Additional agency comments are included in chapter 3. FRA officials had additional technical and clarifying comments that GAO incorporated throughout the report, where appropriate.

Attachment G

Environmental Fact Sheet

Environmental Benefits of Proposed Emission Standards for Locomotives

The Environmental Protection Agency (EPA) is proposing emission standards for oxides of nitrogen (NOx), hydrocarbons (HC), carbon monoxide (CO), particulate matter (PM) and smoke for newly manufactured and remanufactured locomotives and locomotive engines. The proposed standards will achieve approximately a two-third reduction in NOx emissions and will reduce HC and PM emissions by half.

Overview of Rulemaking

EPA is proposing emission standards for locomotives that will provide significant emission reductions to help states comply with National Ambient Air Quality Standards (NAAQS) for ozone and PM. The proposed rule is expected to be finalized by the end of 1997 and take effect in 2000. Since locomotive emissions have not been regulated before, it was necessary for EPA to create a comprehensive program, including not only emission standards, but also test procedures and a full compliance program. Three separate sets of emission standards are proposed, with applicability of the standards dependent on the date a locomotive is first manufactured. The first set of standards (Tier 0) are proposed to apply to locomotives and locomotive engines originally manufactured from 1973 through 1999, any time they are remanufactured in calendar year 2000 or later. The second and third sets of standards (Tier I and Tier II) will apply to locomotives and locomotive engines originally manufactured on or after January 1, 2000 (Tier II stan-

ards will take effect on January 1, 2005). These locomotives and locomotive engines will also be required to meet the same standards at each subsequent remanufacture. The Agency is also proposing a rigorous emission testing program to make sure that locomotives comply with these standards for the life of the locomotive.

Health and Environmental Concerns

Most locomotives in the U.S. are powered by diesel engines. Thus locomotives have significant NOx emissions, as well as HC and PM emissions, all of which have significant health and environmental effects. NOx is a major component of smog and acid rain. NOx emissions combine with HC in the atmosphere to form ground-level ozone, the primary constituent of smog. Ozone is a highly reactive pollutant that damages lung tissue, causes congestion, and reduces vital lung capacity, in addition to damaging vegetation. Acid rain damages buildings and crops, and degrades lakes and streams. NOx also contributes to the formation of secondary PM. PM causes headaches, eye and nasal irritation, chest pain, and lung inflammation. Environmental impacts of PM include reduced visibility and deterioration of buildings.

Locomotive Emission Inventories

Locomotive NOx emissions are estimated to represent about 4.7 percent of NOx emissions from all mobile and stationary sources in the U.S. Locomotive PM and HC emissions are both estimated to represent less than one-quarter of one percent of total national emissions. Thus, the focus of the proposed regulation is on NOx emission reductions. It should be noted that in some urban areas that have very high rail traffic, such as Chicago or El Paso, NOx emissions can represent nearly one-tenth of the total NOx inventory.

Current National Locomotive Emission Inventories

	Millions Per Year	Percent of Total Inventory (All Sources)
NOx	980,000	4.7
PM-10	24,000	0.1
HC	38,000	0.2

What Are the Environmental Benefits?

When fully phased-in, the proposed emission standards will reduce NO_x emissions from locomotives by nearly two-thirds, and HC and PM emissions by half. However, they will also achieve very significant emission reductions in the near term. These reductions, which are shown below, are being heavily relied upon by those areas that have very high rail traffic, as well as Southern California, which has moderately high rail traffic and very significant air quality needs. To put these national NO_x emission reductions into context, the 348,000 ton per year reduction expected in 2005 would be equivalent to removing about 20 million passenger cars from the road. In addition, NO_x emission reductions will also lead to reductions in ambient concentrations of secondary PM. It has been estimated that about 4 tons of nitrate particulate is formed from every 100 tons of NO_x emitted. Thus, the secondary PM reduction expected in 2005 is about 14,000 tons per year.

Projected National Emission Reductions (Metric Tons Per Year)

Year	2005	2010	2015	2020
NO _x	348,000	382,000	417,000	451,000
PM	300	1,700	3,200	4,700
HC	400	2,500	4,500	6,600
Secondary PM*	14,000	15,000	17,000	18,000

* Assumes 4 tons of nitrate particulate formed for each 100 tons of NO_x emitted.

Reductions from Existing Locomotive Fleet

The fact that so much of the NO_x emission reduction will come early in the program is due to the Tier 0 standards that apply to existing locomotives when they are remanufactured. These standards are a unique feature of this proposed regulation, and would represent the first time that EPA has regulated the remanufacturing of an existing fleet on such a large scale. Such regulation of the remanufacturing process is critical because locomotives are generally remanufactured five to ten times during their total service lives (typically 40 years or more). Standards that would only apply to locomotives originally manufactured after the effective date of the rule would not achieve significant emissions reductions until those future locomotives replaced a significant number locomotives in the existing fleet. For the first 13 years of the program, the majority of projected NO_x emission reductions will be the result of the Tier 0 emission standards that apply to existing locomotives.

Projected NOx Emission Reductions From Locomotives Manufactured Before and After January 1, 2000 (Metric Tons Per Year)

Year	2005	2010	2015	2020
Tier 0 (Pre-2000 Locomotives)	275,000	234,000	194,000	153,000
Tier I & II (Later Locomotives)	73,000	148,000	223,000	298,000

For More Information

Information on the proposed rule is available electronically via the EPA Internet server via the dial-up modem on the Technology Transfer Network (TTN), an electronic bulletin board system (BBS).

Attachment H

**STATEMENT TO THE FEDERAL RAILROAD ADMINISTRATION
SEPTEMBER 21, 1997**

**BY:
WESTERN-ELMWOOD-BEREA CORPORATION (WEBCO)
Anita R. Brindza, Executive Director**

The Western-Elmwood-Berea Corporation (WEBCO) is a twenty-three year old industrial-based not-for-profit economic development corporation primarily serving the manufacturing and service base on the west side of Cleveland in the Berea Road/West 117th Street area. The forty member group focuses on industrial retention and growth through strategies based in investment, vision, planning, cohesion and collaboration.

The WEBCO membership is opposed to any decision by the Surface Transportation Board that will divert freight traffic now being served by CONRAIL on the line that runs through the heart of the west side manufacturing district to the area of the airport and city of Berea. WEBCO does not support putting additional freight on the Westshore line that runs through the heart of residential neighborhoods in Cleveland and the west suburbs.

Receipt of raw materials and shipping of finished products by WEBCO members and other industrial plants is now virtually "*invisible*" to the residential population of Cleveland and its suburbs due to the availability of below grade or above grade track service that CONRAIL provides. Most residents remain unaware of the large machinery, paper products, chemicals, steel, automotive components and other raw materials and finished products that are shipped weekly in and out of the west side via rail.

If companies were forced into making a decision to only ship via truck, surface traffic would quadruple. For every rail car that now is utilized, it would take three to four tractor trailers to service the company's needs. Quadrupling truck traffic exponentially increases the likelihood of accidents throughout our area.

In addition to safety issues, it is critical to note that many of the WEBCO member companies have been in business more than 50 years and employ hundreds of Cleveland and Lakewood residents in good paying positions with full benefits. At a time when companies are attempting to compete in a global economy, forcing manufacturers to increase costs through higher shipping expenses and perhaps longer shipping times only defeats our ability to remain competitive in the marketplace. When operating costs soar, businesses close, residents are laid-off and tax dollars are lost.

This stable, viable and growing industrial pocket of industry WEBCO represents has been serviced by CONRAIL and its predecessor for decades. Most of the companies own railroad sidings connecting their businesses to CONRAIL service. Whether the sidings are currently in use or not, the access to rail is imperative relative to decisions and choices about current and future competitiveness. Industrial real estate is greatly devalued when rail service is diminished or abandoned.

In closing, I stress the key works are SAFETY and COMPETITIVENESS. The WEBCO companies strongly advocate to maintain the status quo on the rail line that now services their current and future needs. While the trackage is in need of investment, the status quo is far more desirable than shipping through residential neighborhoods or losing access to the tracks through any merger agreements. Ensuring the public's safety and the ability to make sound business decisions are paramount to the WEBCO membership.

Thank you.

MEMORANDUM

To: Gregory M. Sponseller, Director of Law & Prosecutor
From: Paul I. McCumbers, Jr., Dir. of Public Safety/Service
Date: January 28, 1998
Subject: Front Street/Bagley Road Traffic Counts

As part of a November 19, 1996 Traffic Signal Warrant Study that was done by Traff-Pro Consultants, Inc., all intersections in the City of Berea were reviewed and traffic counts performed. The following information is from that report, and a copy of the particular pages are attached for your review:

The average traffic flow at the Front Street crossings was 10,613 vehicles per day.

The average traffic flow at the Bagley Road crossings was 17,135 vehicles per day.

The information contained in this report is copyrighted, and has been developed exclusively for the party named above by Planning Resources Incorporated. This information, research and methodologies used are the properties of Planning Resources Incorporated, and reproduction and/or use of the contents of this report in whole or in part is prohibited without the express written consent of Planning Resources Incorporated.

I. DESCRIPTION OF CRA BOUNDARIES

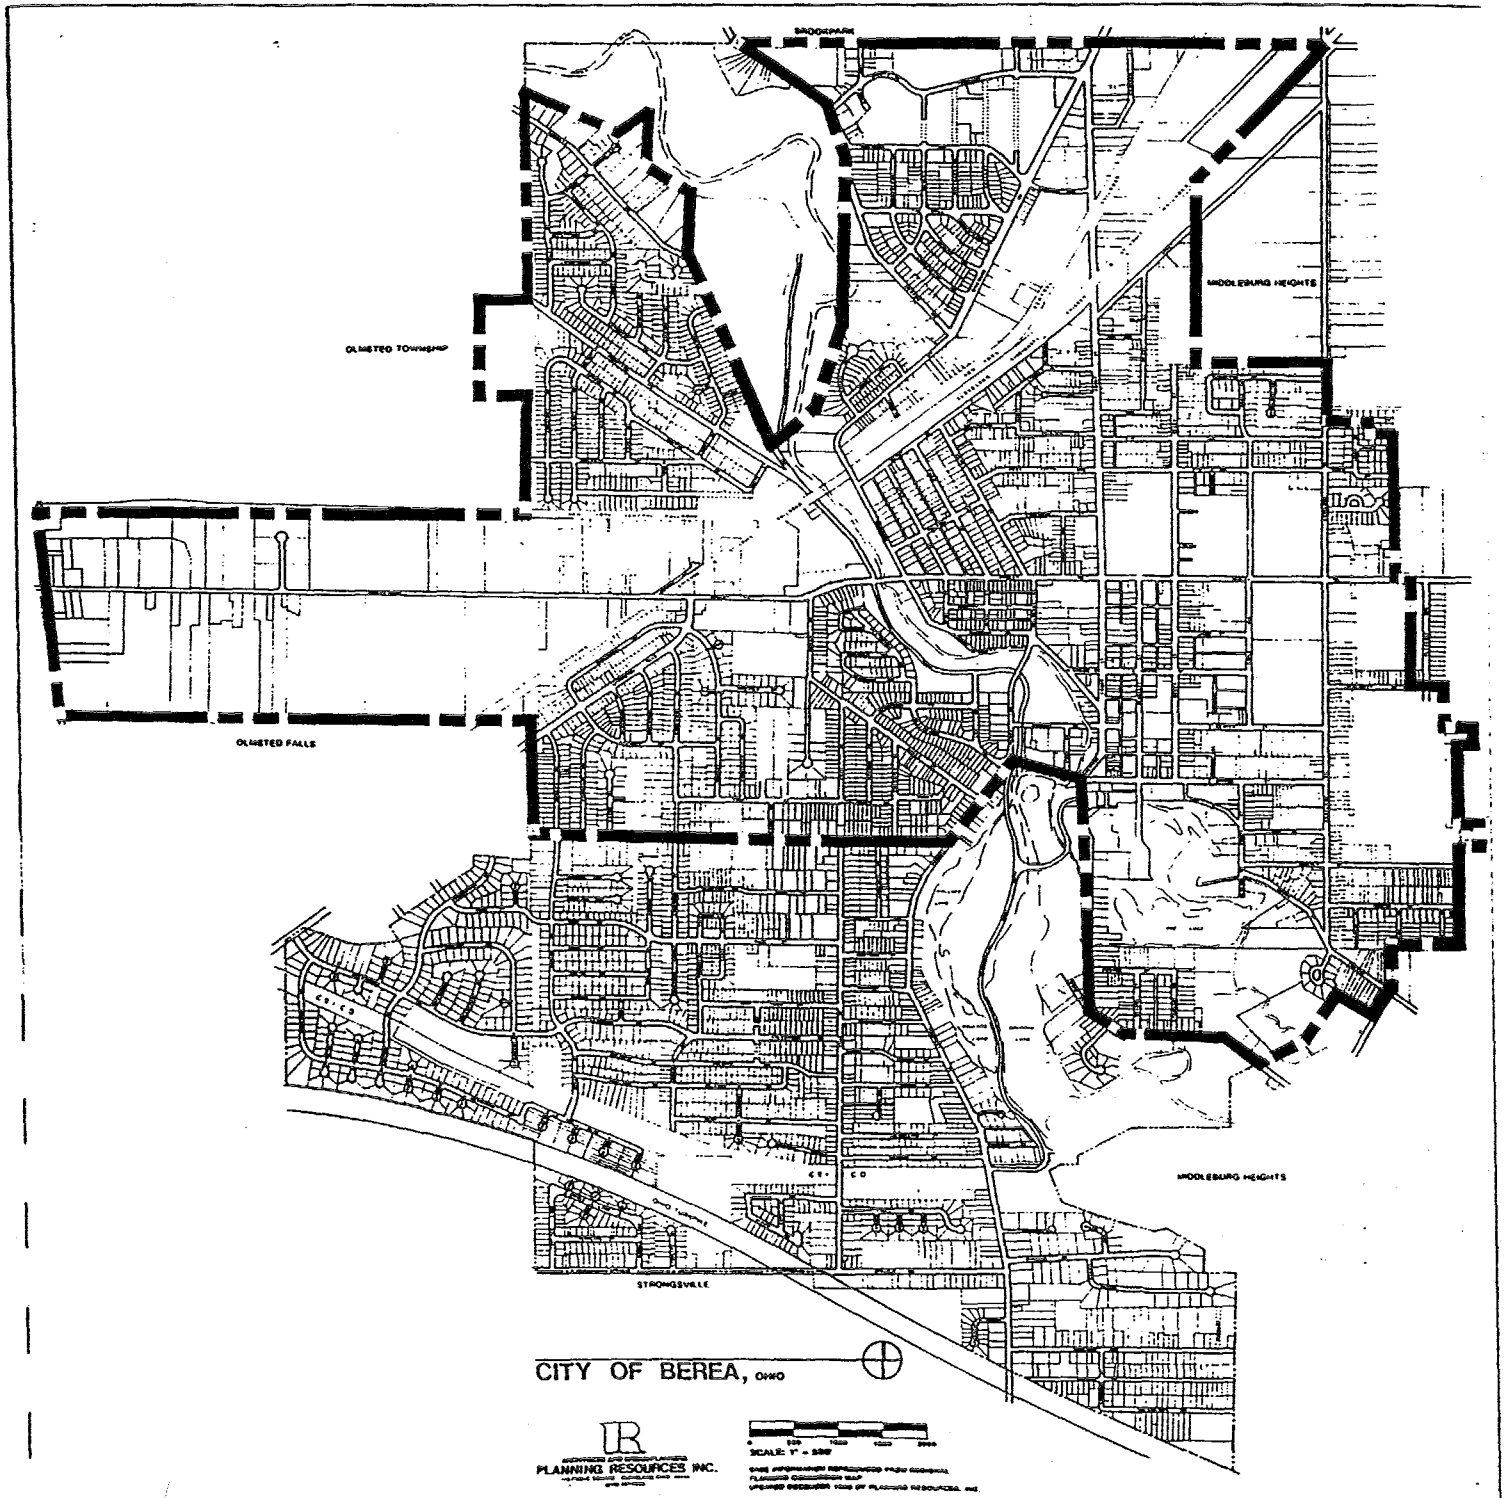

The City of Berea has undertaken a review of housing conditions and structures within the following described area to determine if the construction and repair of housing, commercial, and industrial facilities or structures are discouraged, in order to assess the establishment of a Community Reinvestment Area (CRA) in accordance with Section 3735.65 of the Ohio Revised Code.

The boundaries of the proposed CRA are described generally below using recognizable physical features. Please note that the CRA boundaries described below are intended to include all properties which directly abut or face the boundary of the CRA, but are outside of the described area. The CRA Boundary Map (Map 1) illustrates the proposed area.

In general, the Community Investment Area includes the following Census Tracts: 1341, 1342.03, 1342.04 and 1343. The CRA includes all areas of the city, except the Metroparks - Rocky River Reservation and the Berea Wastewater Treatment Plant, that are north of West Avenue, Prospect Avenue, and West Bridge St, and east and north of Riverside Drive. The CRA Boundary is generally described as follows:

Beginning at a point on the municipal boundary which is the intersection of the centerline of Brookpark Road and Grayton Road; thence following municipal boundary and said centerline of Brookpark Road east to its intersection with the Conrail railroad tracks; thence southwest along municipal boundary and said railroad tracks; thence continuing south along the municipal boundary; thence continuing east along the municipal boundary to the intersection of the centerline of Eastland Road; thence south along the municipal boundary and the Eastland Road centerline to its intersection with the centerline Wendy Drive; then east along the municipal boundary; thence south following said municipal boundary (until parallel with the southern end of Andrew Street), thence continuing east along municipal boundary (until just east of the southern end of Fuller Street); then continuing south along the municipal boundary across Fowles Road and continuing along Eastland Road; thence following municipal boundary in a northwesterly direction; thence continuing along said municipal boundary in a southwesterly direction until its intersection with the centerline of Riverside Drive; thence following said Riverside Drive centerline in a northeasterly direction to its intersection with the centerline of Main Street; thence continuing north along the centerline of Riverside Drive to its intersection with the centerline of W. Bridge Street; thence west along the W. Bridge Street centerline to its intersection with the centerline of Prospect Street; thence southwest along the Prospect St. centerline to its intersection with the centerline of West Ave; thence west along the West Avenue centerline to its intersection with the municipal boundary; thence north along the municipal boundary; thence west along the municipal boundary; thence north along the municipal boundary and the

centerline of Lewis Road; thence east following the municipal boundary along the south side of the Conrail tracks; thence north along the municipal boundary, crossing Barrett Road to the Metroparks-Rocky River Reservation; thence southeast along the property line of the Metroparks to the intersection with the western property line of the Berea Wastewater Treatment Plant, thence south along said property line to its intersection with Barrett Road, thence southeast along the Barrett Road centerline to its intersection with the centerline of Metropolitan Park Boulevard; thence east from that intersection crossing the Rocky River; thence north following the property line of the Metroparks to its intersection with Grayton Road; thence following the Grayton Road centerline in a northwesterly direction to the place of the beginning; and including all properties outside of the above described area that are directly abutting and/or facing the above described boundaries.

II. DESCRIPTION OF THE COMMUNITY REINVESTMENT AREA

A. Existing Land Use

The proposed Community Reinvestment Area (CRA) contains a mixture of land uses, including single family and multiple family residential, commercial, office, industrial, recreation/open space and vacant land. The CRA contains the City's Central Business District, as well the campus of Baldwin-Wallace College and the older residential neighborhoods that developed around the sandstone quarries in the late nineteenth and early twentieth centuries. Two rail lines cross the CRA from the southwest to the northeast creating a physical barrier that funnels traffic through underpasses on both sides of North Rocky River. The abrupt change in elevation on both sides of the Rocky River forms another physical barrier between neighborhoods. The physical barriers isolate individual neighborhoods.

The total CRA comprises approximately 2,167 acres. Residential uses occupy 39% of the total land area of the CRA. The early central neighborhoods developed on the urban street grid pattern, while the neighborhoods which developed between 1950-1974 follow a more suburban pattern of curved streets and cul-de-sacs. Approximately 127 acres (6%) are commercial. Retail services occupy the bulk of the commercial land which is largely concentrated in the central business district. Industrial operations occupy nearly 8% of the CRA land area. The large manufacturing operations are clustered between the two rail lines which converge at the switching yard. Light industrial and some heavy industrial uses are located along the West Bagley Road Industrial Corridor. Recreation and open space uses occupy 7% of the total land area. Public/institutional uses comprise approximately 10% of the CRA land area, largely due to the Baldwin-Wallace College campus. Vacant land comprises nearly 19% of the CRA land area. The majority of the vacant land is located on both sides of Bagley Road west of the Conrail tracks. Street and railroad right of ways occupy about 8% of the CRA land area.

Generalized Existing Land Use (1990)
CRA

Land Use	Acres	Percent
Single Family Residential	822	38%
Multiple Family Residential	30	1%
Commercial	127	6%
Office	59	3%
Recreation/Metroparks	150	7%
Public/Institutional	217	10%
Light Industrial	57	3%
Heavy Industrial	108	5%
Vacant Open Land	422	19%
R.O.W.	175	8%
TOTAL LAND AREA	2,167	100%

Overall, approximately 80% of the land area of the CRA has been developed. Most of the vacant land is along Bagley Road and is zoned for industrial uses. Little opportunity exists for development of new residential housing without consideration of annexation, or for the accommodation of new commercial uses without consideration of redeveloping older commercial or mixed-use areas.

An Existing Land Use Map for the entire City, completed as part of the *Berea Comprehensive Plan*, is available at City Hall.

All traditional municipal services including water, sanitary and storm sewers, gas, and electric service are available to all areas within the proposed CRA.

B. Zoning

The City does not anticipate any changes to the existing zoning classifications as a result of the establishment of the CRA area. The CRA area includes the following zoning districts: R-SF-A, R-SF-B, R-T, MF-MD, MF-HD, R-O, N, CC, G, LI, and GI. Existing zoning

classifications permit single family and multiple family residential uses, townhomes, residence-office uses, neighborhood commercial uses, commercial centers, general commercial uses, and light industrial and general industrial uses. The uses to be designated as eligible for tax exemption will be consistent with the zoning regulations applicable to the CRA.

C. Inventory of Historic Structures

The historic buildings of Baldwin-Wallace College and the adjacent residential neighborhoods enrich the physical character of the CRA area and the City as a whole. Berea's early commerce and its civic institutions have shaped the City's Central Business District and surrounding neighborhoods. The City's history is expressed in the scale and the character of the central business district, Baldwin-Wallace College, and its surrounding neighborhoods.

Berea's central neighborhoods developed in the late nineteenth and early twentieth centuries around the sandstone quarry and markets in the center of town. There are 4 buildings in the CRA, in addition to the Lyceum Village Square and German Wallace College area, which are eligible for listing on the National Register for Historic Places. There are approximately 27 buildings and 1 structure of architectural significance in the CRA which are listed on the Ohio Historic Inventory as eligible for National Register designation. These buildings are located east of Rocky River Drive. Many are in close proximity to Baldwin Wallace College. The inventory sheets are attached in Appendix A.

D. Socio-Economic Characteristics

The following statistics were obtained from the 1990 Census of Housing Characteristics and General Characteristics of the Population for the City of Berea and the census tracts that make up the proposed CRA.

The 1990 Census showed that there were 12,541 people residing within the proposed CRA, or about 66% of the City's entire population. However, 76% of the total number of persons with incomes below poverty resided within the proposed CRA. In addition, approximately 86% of the City's black population, and 69% of all persons over 65 years of age resided within the CRA.

Per capita income and average household income for the CRA were both below the overall per capita income and household income levels for the City. The CRA also had a higher percentage of households classified as having low and moderate incomes (LMI). There were 4,735 households in the City with low and moderate incomes. Approximately 3,386 low and moderate income households, or 72% of the total resided within the CRA.

Summary of Socio-Economic Characteristics

	CT 1341	CT 1342.03	CT 1342.04	CT 1343	CRA Total	City of Berea	CRA % of City
Population	1,066	2,921	4,144	4,410	12,541	19,051	66%
Per Capita Income	\$13,555	\$14,988	\$14,854	\$11,858	\$13,721	\$14,867	92%
Household Income	\$35,151	\$38,712	\$35,176	\$35,767	\$36,234	\$39,061	93%
Persons Below Poverty	52	117	214	176	559	739	76%
LMI Households	22%	26%	28%	24%	27%	25%	
Black Persons	391	88	105	284	868	1,014	86%
Persons 65+	182	317	852	426	1,777	2,578	69%

E. Housing Characteristics and Conditions

Housing characteristics are an indicator of an area's physical condition. As the table below indicates, the proposed CRA has a higher percentage of renter occupied units and a lower percentage of owner occupied units than the City as a whole. Approximately 70% of the total number of vacant units in the City are located within the CRA.

Housing Units - 1990

	City of Berea		CRA Area	
Owner Occupied	4,898	67.7%	2,809	60.0%
Renter Occupied	2,138	29.5%	1,727	36.9%
Vacant	206	2.8%	146	3.1%
Total Units	7,242	100.0%	4,682	100.0%

The value of owner occupied housing is also a measure of a neighborhood's marketability and reinvestment in housing. The median value for single family homes ranged from \$64,300 (CT 1341) to \$77,300 (CT 1343) for the census tracts within the CRA compared to \$74,600 for the City as a whole. The median value of homes was lower in 3 of the 4 census tracts than for

B-W
H.S.
ROBINSONS
5

the City as whole. (See Appendix B for maps of census data by census tract.)

The age of the City's housing stock is another indicator of housing conditions. The costs of maintenance and rehabilitation generally increase sharply as housing ages beyond 40 years. Approximately, 19% of the City's housing stock was built in 1939 or earlier. Approximately 24% of the housing units within the CRA were built prior to 1940. Over 81% of the pre-1939 housing units in the City are located within the proposed CRA. Approximately 30% of all occupied housing units in Berea are over 40 years old, while over 37% of the occupied housing units in the CRA are over forty years old.

A wind-shield survey of residential exterior conditions was completed by Planning Resources, Inc. in August of 1992 as part of the *Berea Comprehensive Plan*. The survey evaluated exterior rehabilitation needs which are generally indicative of interior needs as well. This survey classified buildings based on four categories: (1) Sound, (2) Minor Deficiencies, (3) Major Deficiencies, and (4) Substandard. In general, residential buildings classified as having minor deficiencies show signs of neglect or postponed maintenance, but this has little or no effect on a building's structural condition. Buildings classified as having major deficiencies generally exhibit extensive exterior defects and conditions that are not correctable through normal maintenance, and involve a structural element such as a sagging roof ridge/rafters, cracked foundation, etc. A building classified as substandard exhibits an extensive accumulation of defects to a point where major structural elements are adversely impacted and the cost of repairs usually exceeds the market value of the property.

The table below illustrates, by census tract, the condition ratings for residential buildings within the CRA. The table shows that overall housing conditions within the CRA as good, but that they are not as good as the City as a whole. The CRA contains 57.7% of all of the residential structures surveyed, but contains over 75% of the buildings with minor deficiencies and over 78% of the buildings with major deficiencies. All 13 substandard residential buildings are located within the CRA.

Major rehabilitation needs and deficiencies and substandard conditions were visible in the CRA Area in residential areas adjacent to commercial and industrial activities bounded by Depot Street and the Conrail tracks, North Front Street, and Riverside Drive. Major deficiencies and substandard conditions were visible in 40% of the housing units in this area. Traffic noise, and competition with commercial uses have discouraged reinvestment in the existing housing in that area. Building with frontage on Front Street, North Rocky River Drive and Depot Street are now being converted to office and commercial uses.

Building Conditions Survey (August 1992)

Census Tract	Condition				Total
	Sound	Minor	Major	Substandard	
1341	204	43	3	0	250
1342.03	736	71	16	7	830
1342.04	885	161	41	5	1092
1343	631	173	27	1	832
CRA Total	2,456	448	87	13	3,004
Percent	81.7%	14.9%	2.9%	0.4%	100.0%
City Total	4,482	592	111	13	5,203
CRA % of City Tot.	54.8%	75.7%	78.4%	100.0%	57.7%

As is typical of small cities, there are several pockets of residential homes scattered throughout the CRA area that need rehabilitation and maintenance assistance. Other neighborhoods that exhibit maintenance needs include the Riverside Drive area between Coe and Baldwin Lakes, and the neighborhoods east of Coe Lake along East Center, East Bridge, Eastland and Waverly Street. Another neighborhood found to have several homes with maintenance needs is bounded by Riverside, Grayton and Emerson. All of these neighborhoods have also been designated by Cuyahoga County as Improvement Target Areas (ITAs).

The survey indicated that 86% of Berea's housing stock is well maintained. Visible rehabilitation needs are concentrated in the central neighborhoods, which are within the proposed CRA, where structures are generally older and require more maintenance. Census Tract 1342.04 has the highest number and percentage of housing units that have major deficiencies or are substandard. Census Tract 1343 has the highest percentage of residential structures with minor deficiencies (20.8%).

Because of the limited land available for new residential construction, Berea needs to consider programs, including the establishment of a CRA, to address housing conditions and maintenance needs in the older residential neighborhoods to achieve stability and ensure that long range viability of its housing units for future generations.

Cuyahoga Urban County Improvement Target Area Study

The Cuyahoga County Planning Commission and the Cuyahoga County Department of

Development performed a condition survey¹ of all residential and commercial structures, and streets in Berea in 1991-1992 for the purpose of designation of Improvement Target Areas (ITAs) Five property elements for residential structures and eight property elements for commercial structures received a numerical score based on whether minor, moderate or major deficiencies were noted. The property received a total score. Properties with scores over the threshold score were determined to be substandard. Properties with scored below the threshold were determined to be sound or in need of only minor repair. The table below presents the total number of substandard properties in the City and CRA as identified by Cuyahoga County.

ITA Survey 1991-1992
Total Number of Substandard Properties²

Structure Type	1-3 Family	Multiple Family	Comm/Office	Total
Berea	418	1	42	461
CRA ³	323	1	40	364
Percent in CRA	77%	100%	95%	79%

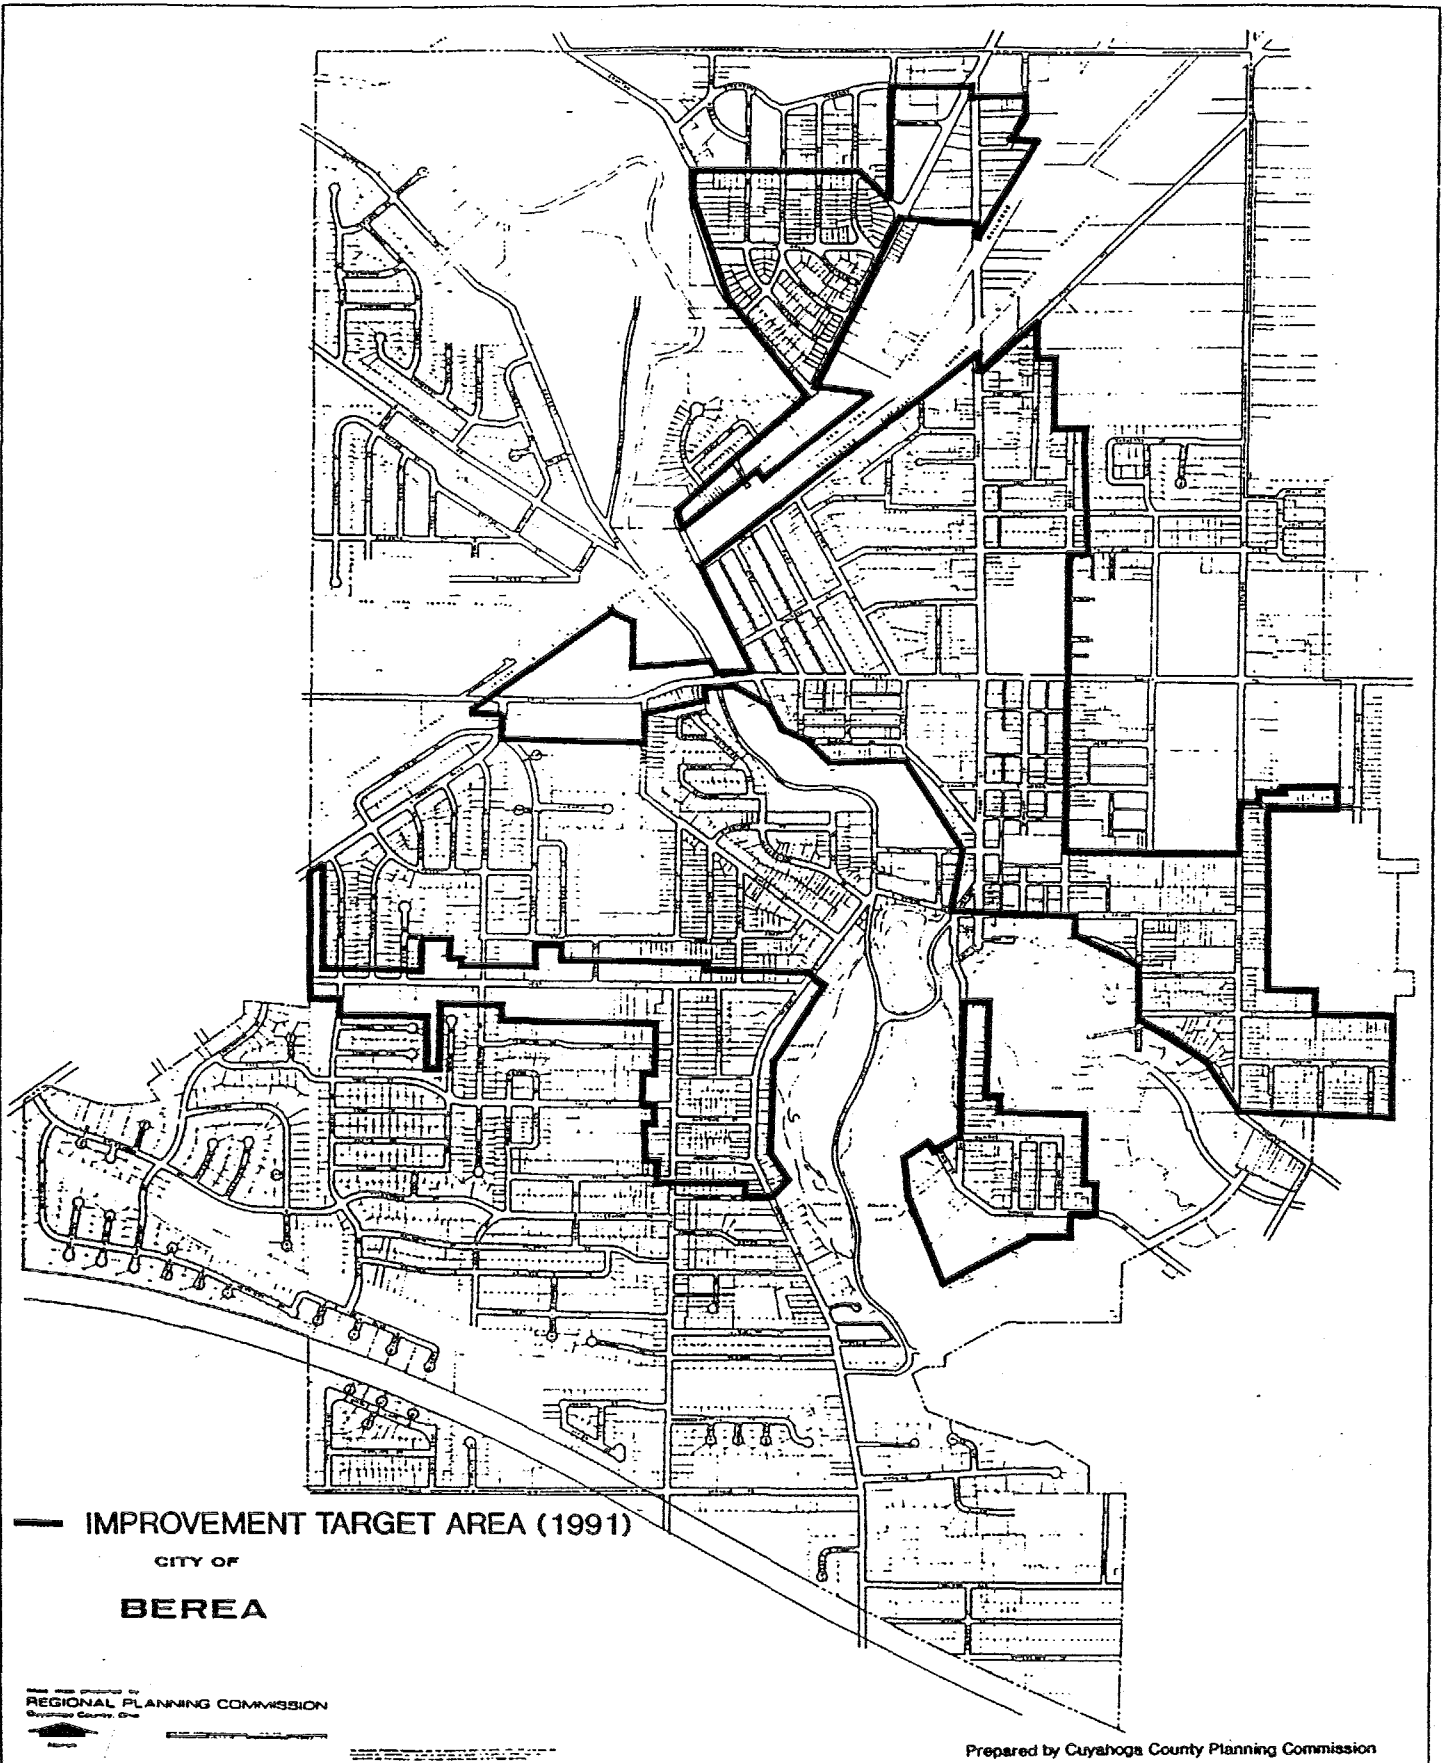

As the table above indicates, there are 364 substandard properties within the proposed CRA. Almost 89% of the substandard properties identified within the CRA are 1-3 family residences. Approximately 79% of all identified substandard properties in the City are located in the CRA and 95% of all identified substandard commercial properties are located within the CRA.

Areas with significant concentrations of substandard properties (20 or more substandard properties within a 50 acre area) were designated as ITAs. Map 2 illustrates the designated ITAs within the City of Berea. Note that the locations of the ITAs closely correspond to the neighborhoods identified by the Planning Resources, Inc. survey as having concentrations of properties with maintenance and rehabilitation needs. The proposed CRA includes the majority of the designated ITA areas.

¹The County utilized a methodology of comprehensive and standardized field surveys and mathematical standards to identify blighted areas. This methodology was developed by the Cuyahoga County RPC in 1984. The methodology was approved by the U.S. Department of Housing and Urban Development (HUD) in 1984.

² Cuyahoga County Planning Commission, *Cuyahoga Urban County Improvement Target Area Study*, 1992.

³ This number does not include those substandard structures which directly abut or face the proposed CRA boundary.

Maps which illustrate the results of the Cuyahoga County ITA building and right-of-way surveys are available at City Hall.

F. Private Reinvestment in the CRA Area

A review of building permits issued for the last 5 years indicates the need for the City to continue to take aggressive steps to encourage private reinvestment and revitalization in the residential neighborhoods within the CRA. Private reinvestment is needed to preserve the City's existing housing stock rather than allowing the abandonment and deterioration of housing. The lack of attention toward housing maintenance and public improvements accelerates the possibility of neighborhood deterioration.

- * New housing construction permits in the CRA declined by 46% between 1992 and 1993.
- * Over 90% of all demolitions between 1989-1993 were within the CRA.
- * The total value of all single-family residential construction and renovation/rehabilitation permits issued in the City between 1989-1993 equals \$17,431,935. However, only 20% of this value, or \$3,504,587, was invested in the renovation and rehabilitation of existing homes within the CRA area.
- * At least \$5 million dollars of additional private investment is needed for renovation and rehabilitation within the CRA to correct just the exterior housing deficiencies identified the Planning Resources, Inc. housing condition survey in August of 1992.

III. SUMMARY

The establishment of a CRA was proposed in the *Berea Comprehensive Plan* after an extensive analysis of housing, land use and economic conditions to strengthen private incentives for maintenance and reinvestment in the City's older neighborhoods. New construction in the outlying suburbs during the 1990's will continue to pull middle income households from older communities, such as Berea, leaving behind a growing surplus of existing housing which is in need of continual maintenance to prevent future blight and deterioration. In addition, noise, traffic, land use conflicts, and other environmental risks associated with adjacent industrial and commercial activities has accelerated the decline of the older, central residential neighborhoods in the CRA area, and has created a blighting influence.

The limited number of vacant land tracts and improved highway access to more rural communities has limited new housing construction in the City to only 200 units during the past decade. The City must pro-actively preserve its existing housing stock by encouraging private reinvestment. It is reasonable to assume that the older housing stock will require more maintenance than newer structures. More maintenance translates into additional costs for

property owners. Maintenance attention must be focused on the older housing units before the costs get too high. Existing housing must be regenerated through new investment to maintain a steady appreciation of value. Older housing must be rehabilitated and worn-out structures must be replaced in order to revitalize neighborhoods.

Existing retail buildings need to be upgraded, but demand for downtown retail space has not been strong enough to support revitalizing older commercial space. The visible deterioration of older buildings fosters public perceptions of a dying downtown. Most small businesses lack the resources to finance the purchase or renovation of older commercial space in the downtown. Marginal industrial uses exist between Depot Street and the rail line. Adjacent residential properties are blighted by the encroachment of industrial and warehouse uses because there is no defined buffer that separates the two districts.

The proposed CRA area exhibits social, economic, and physical characteristics that are by comparison more severe than for the City as a whole. A higher percentage of older housing coupled with a higher percentage of households with lower incomes has led to greater concentrations of housing deficiencies in the CRA. The area does qualify for designation as a Community Reinvestment Area.

<p>42. Further Description of Important Features</p> <p>Large square stone house with a shallow hip roof, a central brick chimney, and three dressed stone elevations. The windows have stone lintels and projecting lug sills with minimal surrounds. The paneled, sidelighted door has Tuscan pilasters and a transom light. The rear elevation is treated with random ashlar, as is the rear service wing.</p>		6. Brown, John, Residence			
<p>43. History and Significance</p> <p>This house is said to have been built in 1860 by John Brown. Architecturally, it is an interesting combination of Greek Revival detail and Italianate forms such as the square plan and hip roof. It is perhaps the most elegant house in Berea.</p>		7. Brown, John, Residence			
<p>44. Description of Environment and Outbuildings</p> <p>The structure stands at the corner of a residential street and a side alley. There is a commercial front across the alley and several smaller uses nearby.</p>		8. Brown, John, Residence

16. Further Description of Important Features Square sandstone structure with a shallow hip roof, a wide frieze, and paired brackets. Double-hung windows with dressed stone lintels and lug sills. Hip-roofed front porch with screening infill. Central entrance flanked by elongated 2x2 windows. Rear shed-roof lean-to probably a later addition.		27. Other Surveys in Which Included	39. Endangered? By What? Yes <input type="checkbox"/> No <input checked="" type="checkbox"/>
43. History and Significance P. French was a real estate agent and justice of the peace in Berea. H.E. French was the first vice-president of the Library Association, founded in 1883. John Asling, born in Canada, came to Berea in 1870. He established and presided over the West Cuyahoga County Fair Association, was a county sheriff from 1897 to 1900 and a county commissioner from 1900 to 1902		46. Prepared by Fisher	
44. Description of Environment and Outbuildings The house is shielded from a heavily trafficked road by a dense growth of shrubs and evergreens. There is a new firestation and houses from a variety of periods nearby.		47. Organization WRHS

<p>42. Further Description of Important Features</p> <p>Small stone church with a steep gable roof and a parapet gable with a gabled wall steeple. This has a round-arched opening above a large circular window and a lower Palladian motif containing a central pointed-arch window. Corner gabled entrance vestibule of wood. Side windows paired under dressed stone lintels. Rusticated ashlar walls in alternating wide and narrow courses. Modern addition on two sides.</p>	<p>43. History and Significance</p> <p>This church is constructed with the locally quarried sandstone. Its architecture is reminiscent of the massive weightiness of the Richardsonian tradition, although its central pointed-arch window contradicts that impression. The rear additions were added in the 1960's and 1970's.</p>	<p>44. Description of Environment and Outbuildings</p> <p>The building stands on a corner lot, across from the Baldwin-Wallace campus. It faces a side residential street.</p>	3. Other Name(s)

CSX Corporation and CSX Transportation Inc.,
Norfolk Southern Corporation and
Norfolk Southern Railway Company
-- Control and Operating Leases/Agreements --
Conrail Inc. and Consolidated Rail Corporation

**COMMENTS OF THE CITY OF CLEVELAND, OHIO
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT**

The City of Cleveland, Ohio, by its undersigned counsel, hereby submits its comments with respect to the Draft Environmental Impact Statement (the "DEIS") served by the Board's Section of Environmental Analysis ("SEA") on December 12, 1997. The DEIS was prepared to analyze the impact on the environment of the proposed acquisition of Conrail Inc. and Consolidated Rail Corporation ("Conrail") by CSX Corporation and CSX Transportation, Inc. (collectively, "CSX") and Norfolk Southern Corporation and Norfolk Southern Railway Company ("NS").¹

The DEIS falls far short of achieving its purpose. While recognizing the multi-faceted problem this transaction will create for Cleveland, it minimizes the scope by focussing on regional impacts rather than on the direct impacts to the many

¹CSX and NS are occasionally referred to jointly in these Comments as "Applicants."

communities located along the railroads' lines in the Cleveland area. By looking broadly at the issues, rather than on the serious adverse impacts the transaction will have across Cleveland and throughout its neighboring communities, the study minimizes the impacts on the minority and low income populations who would bear the worst brunt of the proposed transaction. Worse, it falls far short of recommending satisfactory or effective mitigation measures for the many and extensive impacts the transaction will cause.

I. INTRODUCTION

The City of Cleveland will experience a devastating increase in noise, vibration, potential exposure to hazardous materials, delays to emergency response vehicles at crossings -- all from a significant increase in train frequencies. The railroads' response to the City's concerns have been inadequate or nonexistent. CSX's proposal to plant trees and install low noise walls made of railroad ties along the Short Line will not mitigate the three-fold increase in noise impact on the adjacent residential neighborhoods. NS has made no proposals to mitigate the impacts of their intended actions.

The DEIS almost recognizes the scope of Cleveland's problem, but has proposed that CSX and NS talk to the communities. This is not enough. The purpose of an EIS is to assess comprehensively the adverse impacts on the natural and human environment, and to propose comprehensive and effective solutions. The DEIS in this case, despite its bulk and the appearance of thoroughness its size implies, does not begin to address the serious harm that Cleveland and its suburban neighbors will experience. The shortcomings in the DEIS begin with problems in the methodology

used to address certain of the impacts, and end with the failure to identify and recommend appropriate mitigation.

Cleveland has summarized the substantial impacts of this transaction on its neighborhoods in its Comments and Request for Conditions, filed on October 21, 1997 (CLEV-9).² SEA acknowledges many of those impacts. In some neighborhoods, such as the Kinsman/South Broadway neighborhood, train frequencies will increase by more than 1000%. City-wide, more than 64,000 residents live within 1,000 feet of the two railroads' routes. As Cleveland explained in CLEV-9 and as has been documented in studies conducted by the Mayor and his staff, the negative impacts of the increased train traffic include safety hazards, noise, vibration, odor, dust, congestion and decreases in access, property values and overall quality of life for residents along these rail corridors. Among the harmful impacts, emergency response times will be jeopardized as trains block crossings for periods of time ranging from 2 to 10 minutes. Volumes of hazardous materials transported through Cleveland's residential neighborhoods will increase from zero (0) to forty-four thousand (44,000) carloads in east side neighborhoods and from seven thousand (7,000) to eighty-one thousand (81,000) carloads in University Circle, the region's second largest employment center and home of nationally prominent cultural, educational and medical institutions -- the Cleveland Symphony, the Cleveland Museum of Art, Case Western Reserve University,

²Cleveland provided SEA with a copy of its comments on November 6, 1997. To avoid burdening the record with duplicative recitation of the facts presented there, Cleveland incorporates CLEV-9 by reference as though fully set forth.

and University Hospitals, as well as 40 other institutions of regional and national significance.

The impacts on University Circle, masked by the way the DEIS and Applicants have drawn the line segments used in the study, have drawn criticism not just from the Mayor of Cleveland but from civic, religious, institutional and business leaders in that community. Copies of letters to the STB that explain of the unique nature of the University Circle area and statements of extreme concern about the extraordinary impact of the NS/CSX proposal on this region are attached to these comments at Tab 1. These letters are from: John S. Wilbur, Jr., President and Chief Executive Officer of University Circle, Inc., a non-profit planning and service organization for University Circle ("It is our collective concern that the increased train traffic that will result from the proposed CSX merger will adversely affect our economic progress and plans. We base this on the convictions that the increased traffic will adversely affect air quality; increase noise pollution (which may prove problematic to the Cleveland Orchestra); and bring hazardous materials into the Circle creating the potential need for emergency evacuation in an area with *three major hospitals.*") (emphasis supplied); Bernard P. Henri, Ph.D., Executive Director, Cleveland Hearing & Speech Center (" ... Cleveland Hearing & Speech Center must express its particular concerns regarding the significant increases in noise which such volumes of rail traffic would create."); Timothy J. Peppard, Chief of Police, University Circle Police Department; Elizabeth B. Heil, Administrator, Abington Arms, an HUD assisted high rise apartment building for low-income elderly and mobility-disabled residents ("The negative impact on our residents, in terms of health and well being is enormous; i.e. a triple increase of the noise levels

which cannot be ameliorated because the tracks are elevated; dangerously increased levels of pollutants and carcinogenic materials in the immediate environment; and the increased probability of accidents involving railroad transported hazardous materials."); Arnold Dahm, President of the Church of the Covenant ("We feel that these populations of our members, particularly the elderly and infirm are endangered by the proposed heavy traffic, 81,000 carloads/year of Hazardous Materials. It would be difficult to rapidly evacuate these members in the event of an accident accompanied by a spill of hazardous materials."); Agnar Pytte, President, Case Western Reserve University; Gail M. Eovito, Senior Property Manager, Associated Estates Management Company ("While the added noise alone for elevated tracks is of concern, my greater concern is the heavy increase of pollutants that not only significantly affect air quality, but may in fact be introducing carcinogenic and other pollutants with wide reaching medial repercussions. With the increased transportation of toxic waste, comes the increased potential for the devastating effect of a major spill which could occur in this densely populated area.")

The focus in the DEIS on impacts by line segments has created an analysis that masks the impacts on the disadvantaged populations that live and work along the routes the companies plan to use to route their trains after the transaction. In the Cleveland area, as the railroads' lines head towards the east or west from the center of the City, the population densities decrease and the demographics of the population shift to more affluent, less racially and culturally diverse communities. By basing impact measurements on line segments that are longer than the stretches that extend through the low income and minority populations Cleveland has identified in CLEV-9, the DEIS and the Applicants dilute the analysis of the problems this transaction will create. The

President's Environmental Justice Order requires more rigorous attention to the impacts on the disadvantaged populations that will see, hear and feel the effects of the proposed transaction.

There is only one way to most effectively mitigate these harms: rerouting trains away from the residential communities and into the industrial corridors that have rail lines already serving them. Because the Applicants have not been able, despite their expertise and substantial resources available, to find any rerouting alternatives, the Mayor of Cleveland has spent his and his staff's time and resources to study the problem carefully and find a proposed solution. The solutions proposed by Cleveland are discussed in Section IV of these Comments. Cleveland recognizes that these are not the only possible alternatives that CSX and NS should consider. However, an analysis of these possible solutions can form the baseline for beginning to create a solution that meets all of the parties' objectives. Relying on the expertise of staff and of rail industry professionals and consultants the City has retained, the City has proposed two alternative routing arrangements that are designed to prevent the potentially devastating impact of the enormous increase in freight traffic that will result from the CSX/NS proposal. Either of the Cleveland solutions would limit the harm to Cleveland's neighborhoods while at the same time providing an arrangement that will allow CSX and NS to move cross-country traffic efficiently through the City, which is a key junction point on both of their systems. As explained more fully in section IV, below, the Cleveland solution will improve upon the CSX/NS proposal by:

- Redirection freight traffic from residential areas to industrial corridors;
- Substantially reducing the adverse impacts on minority and low-income populations;

- Providing grade separations to minimize emergency response times and improve traffic flow;
- Minimizing increases in noise levels;
- Decreasing the need to spend money on mitigation measures that will have limited positive effects, which, in turn will allow the railroads to spend money on providing efficient and competitive freight service, thus enhancing regional development.

Cleveland recognizes that neither of its solutions to the problems CSX and NS will create will come free. According to the City's studies, the cost will be in the range of \$148 to \$171 million, which includes the cost of investment in improvements to the infrastructure in the adjacent City of Berea. NS and CSX have projected a cost of \$72 million to construct improvements in Cleveland, but this does not include the cost of mitigating the substantial noise, hazardous materials, safety and crossing delay concerns raised by this proposal.

The City believes that the cost to mitigate the existing CSX/NS proposal will continue to escalate as the railroads confront the true costs of mitigation in the City and in the adjacent suburbs. In fact, as Cleveland and its suburban neighbors have focussed attention on the serious problems this transaction will create, CSX and NS have both begun to demonstrate their willingness to spend money to appease the concerns of the various communities. However, more will be required. According to the City's analysis, the actual cost to the railroads of implementing their own proposals, with their proposed mitigation measures that provide, at best, only a partial solution, would be \$107 million. In the context of a proposed transaction that is projected to

yield to the two rail giants a total of nearly \$1 billion in benefits annually³, the differential between the cost of implementing the current NS/CSX proposal and the cost of the Cleveland solution diminishes in scope.

In preparing both its estimate of the full cost of mitigating the railroads' proposal and the two alternative routing proposals, the City has been true to its tradition of being a city that designs and builds things that work. Cleveland is a city with a 200 year tradition of engineering and precision manufacturing. From its early years as the center of the country's oil and steel industries to its preeminence as a center of automotive and machine tool manufacturing, to its more recent pioneering role in biomedical and polymer research, the Greater Cleveland community takes pride in being a community that designs products to micrometer tolerances and manufacturing them more effectively than others. The City's approach to solving the multiple problems created by the proposed Conrail acquisition reflects this disciplined approach. The City has retained recognized professional experts and has tasked them to analyze the existing proposal and to develop workable alternatives that will best meet the needs of the railroads, the City and its suburban neighbors. The City takes the position that it needs an efficient through railroad system but not at the expense of existing residential communities and unique institutional districts. City staff and the City's consultants identified and evaluated numerous rail routing alternatives -- at the City's expense -- two of which it believes will best balance the interests of the railroads, the

³Railroad Control Application, filed June 23, 1997, at Vol. 1, p.19.

City and the suburbs and which will provide a 100-year "global fix" that will best serve these parties.

The alternatives proposed by the City are just the beginning of the analysis that is required at this stage. While the City has done some analysis of the comparative impacts of its proposals (see Section IV, *infra*), SEA should undertake a careful analysis of these alternatives as part of its obligations under the applicable regulations before issuing the final EIS with respect to the proposed transaction.

These Comments are divided into three sections: a generalized discussion of defects in the DEIS; a description of specific areas that Cleveland has identified as requiring additional study because the DEIS does not fully assess the impacts on the City; and a description of the Cleveland solutions, along with a description of the ways these alternative routing arrangements will diminish, where they do not remove entirely, the otherwise enormous impacts of the proposed transaction.

II. GENERAL COMMENTS

A. Methodology

1. The study does not focus adequately on impacted neighborhoods or communities.

Because the scope of the SEA's analysis is so broad, encompassing nearly one half of the country, it does not deal in detail on the impacts to specific communities within the regions studied. The study does, to be sure, begin on a state-wide level, then break down into county or city-specific analyses. For the most part, however, the analysis is by line segment. If the line segment studied is too long or encompasses more than one town, or more than one distinct community within the larger region

traversed by the line segment, the impacts on a particular location that may in fact be substantial, are masked.

For example, segment N-075, Ashtabula to Cleveland, is 50 miles long. DEIS, vol. 3B, Table 5-OH-1 at OH-6. It traverses three counties -- Ashtabula, Cuyahoga and Lake -- and crosses several communities within those counties. The aggregate impacts over this line, when analyzed in terms of the entire segment and the population along it, minimizes the impacts on the large population concentrations closer to the heart of Cleveland. If, for example, the particulate emissions were studied along this line segment, the impact to residents in more densely populated segments would appear smaller than it actually is as a result of spreading the measurement along a lengthier corridor. Similarly, Table 5-OH-49 DEIS, vol. 3B at OH-120, states that only 22.4% of the population along this segment falls within the low income category. However, for the 13 mile stretch in Cuyahoga County, the population demographics is different, and higher. The percentage of people living in poverty is higher, and the impact is far more serious and more accurately stated, if this line segment was studied in smaller segments that correspond to the Cleveland neighborhoods identified in CLEV-9. The comparison is even more dramatic when one looks at the demographics within the City and compares them with the demographics on the Cleveland-Ashtabula NS segment (N-075) as a whole. This 50-mile segment is estimated by the SEA to have a total population of 71,286, with 47.6% minority and 22.4 low income. Cleveland's analysis of this segment within the City (1000 feet from the centerline) is 19,853, with 67% minority and 38% low income. See CLEV-9, VS Morrison at Attachments 1 and 2. These dense urban neighborhoods clearly deserve more detailed and focused

examination than is possible when environmental impacts are analyzed using rail segments that are up to 50 miles long.

Before completing the Final EIS, SEA should require the studies that have been done to focus more on the individual neighborhoods and communities such as University Circle which are along these line segments. While it is tempting, due to the sheer magnitude of the transaction being studied, to assess impacts on a regional basis, SEA can not permit the use of such a broad approach to trivialize the impacts on the individuals and the communities that will feel the adverse effects of the increases in train frequency that will plague Cleveland's residential, commercial and cultural centers.

2. The analysis of air quality impacts is incomplete.

Similarly, the assessment of the impacts of the transaction on air quality in Cleveland misses two important points about increased emissions because of the regional, rather than a more localized, approach that the study takes. While giving some attention to air quality, the DEIS does not address localized air quality impacts and fails entirely to analyze particulate emissions (PM₁₀) which may have serious health consequences to the young, elderly and infirm. While the impacts of air pollution on these populations are alluded to in the DEIS's section on Environmental Justice, SEA has made no attempt to quantify, analyze or propose mitigation for the effects of the dramatic increase in rail traffic on these sensitive populations.

For example, the DEIS does not take into account the unique dispersion patterns and populations concentrated in University Circle, an institutional district through which over 80 trains will pass each day. As indicated in the attached letter from Agnar

Pytte, the President of Case Western Reserve University (included in Tab 1), the dispersion characteristics found within the University Circle district demand specific detailed analysis and clearly defined mitigation.

3. The DEIS assessment of risk from hazardous materials incidents employs an arbitrary measure, fails to account for variability in the data and side steps the need for mitigation in Cleveland.

One aspect of the study of increases in Hazardous Material incident potential raises questions about the validity of the study overall, since it seems designed to trivialize the increased risk and to avoid finding impacts that are sufficient to warrant further study or mitigation, or both. Table 5-OH-6, DEIS Vol. 3B at OH-15, shows changes in years between accidents. For two segments in Cleveland (C-072 and C-073) the interval changes from one accident every 1344 years and 666 years, per mile on the segments, respectively, to one accident every 101 years per mile on both segments. These same rail segment will experience an enormous increase in the volume of hazardous materials transport. **In fact, this is the largest (by far) increase across in hazardous material transportation across the entire system, yet SEA requires no further analysis of potential mitigation.** On segment C-072, the number of trains will increase by 40.4 per day (Table 5-OH-6), and the amount of hazardous materials shipped on the segment will increase from 0 to 44,000 carloads annually (Table 5-OH-10, DEIS Vol. 3B at OH-30). On segment C-073, train frequencies will increase by 37.0 per day (Table 5-OH-6) and the amount of hazardous materials shipped also will increase from 0 carloads to 44,000 carloads annually (Table 5-OH-10).

Moreover, the differing demographics along the various line segments demonstrates another fundamental flaw in the one accident per 100 years per mile

standard. In Cleveland, the population densities along these lines are high and thousands of people live within 1,000 feet of the tracks. The situation in rural counties is different. To be sure, people live near the two carriers' tracks throughout their systems. But in rural, less densely populated areas, the number of people per mile who are placed at increased risk of exposure to hazardous materials declines dramatically. Any increase in exposure to this risk requires careful study to determine whether other alternatives might provide a safer, or at least less risky, solution. In this case, where CSX and NS propose some of the highest increases in hazardous materials carloads across their newly configured systems, the population density along the routes in the City of Cleveland suggests that a different standard should be used.

In view of these enormous increases (enormous whether measured in terms of raw numbers or of percentage increases), SEA should have pursued studies of whether mitigation is warranted. SEA's description of its methodology for study of mitigation of hazardous materials impacts includes the following statements:

"To be conservative, SEA applied a level of one accident per 100 years as the significance criteria for determining when mitigation is warranted.

....

SEA determined that, nationally over the last 20 years, the number of accidents varies plus or minus 10 percent each year from the previous year."

DEIS Vol. 1 at 3-7. This appears to say that the statistical variation is plus or minus 10% between years. For line segments C-072 and C-073, the projected incident rate was every 101 years, apparently plus or minus 10 years. This could mean an accident every 91 years, or one every 111 years. To be conservative and careful about protecting

the lives of the citizens who live and work along these lines, an enormous increase in hazardous material traffic and a dramatic increase in the rate of likelihood of an incident should have led SEA to determine that these line segments required the next level of analysis of mitigation. No such analysis was conducted.

With respect to this issue, the DEIS side steps the mitigation issue through arbitrary manipulation of statistics to the potentially serious detriment of the people of Cleveland. The discussion below of the relative costs of the NS/CSX proposal and the Cleveland solution includes in the cost of implementing the current proposal, estimates for containment and other mitigation of hazardous materials spills. The DEIS should study mitigation that will be required for the types of materials that NS and CSX expect will be moved across the lines in the City of Cleveland, and assess whether, as the City believes, the best mitigation is to reroute the traffic as proposed by the Cleveland solution.

B. Environmental Justice

The NS/CSX proposal falls squarely within the requirements of Executive Order 12898, which focuses on whether federally approved or mandated actions have a disproportionately high and adverse impact on minority and low income populations.

See Executive Order No. 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low Income Populations, §1-101, 3 C.F.R. 859 (1995), 30 Weekly Comp. Pres. Doc. 276 (Feb. 11, 1994). In CLEV-9, Cleveland explained in detail the scope of the impacts on the City's poor and minority populations. *E.g.*, CLEV-9 at 10 - 11 and Verified Statements of Hunter Morrison at Attachments 1 and 2, and Terri

D. Hamilton at 3 - 11. The DEIS recognizes the importance of this issue and, in fairness, does not minimize the impacts, stating:

Proposed rail increases would affect these populations because of the following:

- The lack of financial resources and options to move away from the affected area.
- The lack of financial resources to install necessary home improvements such as sound insulation, air conditioning and air filters.
- A higher number of senior citizens, disabled persons and children represented in lower-income households who are prone to the hazards associated with freight rail lines such as limited mobility and sensitivity to noise or other impacts.

DEIS, vol. 3B at OH-149. Incredibly, and notwithstanding this recognition of the magnitude of problem, there is no careful analysis of the communities and the respective effects on each.

Worse, the only specific mitigation recommended to date is outreach. This is far from enough. Informing the public about the transaction will not mitigate its impacts. This approach ignores the economic reality of the residents along the lines whose lives will be most severely impacted by the transaction. They will not necessarily have a choice, upon learning of the enormous increases in trains, in noise, in volumes of hazardous materials, in delays in response time by police and ambulances, to go elsewhere. NS and CSX must be required to take actions that will address the substantial and "disproportionately adverse" impacts of this transaction on the minority and poor populations of Cleveland, and the DEIS should enumerate those actions with specificity.

C. Lack of Specific Recommendations for Mitigation of Projected Harms

For each of the areas where specific harms were identified, the DEIS goes no further than to recommend further consultation. This is not sufficient. In the methodology section of the DEIS, SEA lists general approaches to mitigation for the various types of harm. See DEIS at vol. 1, chapter 3. Now is the time to be more specific. The role of the EIS process is to identify and recommend solutions for the adverse impacts that will result from the transaction being scrutinized. In preparing the Final EIS, SEA needs to list each of the areas studied and identify the specific harm that will be addressed. Adoption of either of Cleveland's alternative solutions will fix much of those harms. However, even after that, at-grade crossings in some locations will still see increased train frequencies and, thus increased delays. Increased train traffic on some lines will continue to produce increased noise and other air pollutant emissions. Any solutions should be identified now, as part of this process, since it is this transaction that is causing the harm to the area in the first instance.

D. Absence of Analysis of Alternatives

Neither applicants nor the SEA staff identified alternatives to the proposed transaction, except for the no action alternative, that is, "no transaction." This is simply not credible. With the robust rail network that exists in and around Cleveland, there are other ways to route this traffic than the system proposed in the NS/CSX Operating Plans. Indeed, because of the railroads' unwillingness to come forward with solutions, other than their initial carve-up of Conrail assets that was negotiated without concern for the neighborhood impacts or consultation with the City, and because SEA likewise has failed to identify practical alternatives to the railroad's existing plan,

Cleveland has been forced to develop and present practical alternatives. In Part IV of these comments, Cleveland will describe these alternatives to the proposed transaction and, to the extent that the resources and information are available, will analyze and compare the impacts on the residents of Cleveland from the proposal as presented by the railroads, to the environmental impacts from the alternatives. SEA should complete the study of the Cleveland solution. Upon confirming the City's initial determination that these alternatives provide a realistic and effective solution to the environmental problems created by the proposed transaction, SEA should recommend that the STB not approve the transaction without imposition of the Cleveland solution as a mitigating condition to that approval.

III. SPECIFIC ISSUES

In the previous section, Cleveland identified some broad categories of deficiencies in the DEIS. This section focusses on specific issues raised by the increases in train frequencies, carload volumes and hazardous materials transported through the City, and proposes approaches to further assessment of the issues that will bring the analysis in the DEIS to a level that is consistent with SEA's obligation under the STB's regulations, under NEPA 49 U.S.C. § 4332(C), and under the CEQ guidelines, 40 C.F.R. Part 1502.

A. Noise

1. The DEIS.

The grossly oversimplified evaluation of noise impacts, which provides an indication of the number of additional residences in corridors that are included in the estimated 65dB contour, does not provide enough information for a thorough evaluation

of impacts. The DEIS does not even comply with the STB regulations implementing its obligations under NEPA, 49 C.F.R. §1105.7 (e)(6), which require the evaluation to go much further than this DEIS goes and *quantify the noise increase for these receptors*.

At its own expense, the City of Cleveland has undertaken continuous noise monitoring along the sensitive sections of the Short Line (identified by the Applicants as line segment C-073) and has conducted an independent study of the noise impacts of the dramatic increases in traffic on this currently little-used line.⁴ Looking at this line segment, which runs through the neighborhoods of Forest Hills, Glenville and the University Circle institutional district and abuts the Little Italy historic district, it is evident that the DEIS does not consider the following:

- The actual number and nature of sensitive receptors for which an impact is predicted;
- The noise level at the receptors;
- The effectiveness of any proposed mitigation;
- The effects of the proposed additional track that will be located closer to some homes, which will also create a scenario in which two trains could be passing over a line segment simultaneously; or
- Whether alternative routes in Cleveland would have less of an impact.

Moreover, the SEA is not clear about when noise mitigation would be considered appropriate. Although the EIS indicates that it would be negotiated at receptors where noise levels are 70dBA and have a 5dBA increase in noise. This threshold is too high.

⁴The City hired the firm of Parsons Brinckerhoff to advise on the engineering and operating aspects of this transaction and to conduct various preliminary studies such as the noise monitoring study referred to here.

Federal Transit Administration ("FTA") noise criteria are specified in terms of increments in L_{dn} (daytime noise level) above the existing ambient L_{an} , and not in terms of a specific absolute level of 70 dBA. Also, the DEIS does not take into consideration situations where ambient noise is low yet incremental increases in noise are significant.

2. The CSX Noise Study

CSX has provided the City with a technical report entitled "CSX Noise Analysis, Cleveland, Ohio" that was prepared by TranSystems Corporation and presented to the City's staff and experts on January 22, 1998. The report purports to address the localized issue of noise in the City. The report purports to address the localized issue of noise in the City. It fails to do so. Upon review, the CSX Noise Analysis Document was found to include several inaccuracies and omissions. It identified one parochial and four public schools (including three in East Cleveland), one university, and one hospital (Kaiser) within one fourth of a mile from the centerline of the Short Line track between Quaker and Rockport. Review of this analysis showed that one of the schools (Murray Hill) that was identified as being a receptor in the corridor no longer functions in that capacity, but has been converted to an art gallery. In addition, Kaiser Hospital was mislocated on the map and is not within the corridor. Conversely, at least three parochial schools were not identified in the analysis nor was University Hospital or numerous churches, parks and playgrounds, and cultural institutions. Importantly, no historic resources were identified as being noise receptors. While the City's experts have not yet had the opportunity to conduct a complete analysis, the following observations follow the first review of this purported study:

a. The Assessment Methodology. The methodology used in the CSX report does not adequately address the sensitivity of the receptors in the corridor. The noise metric used to describe the existing conditions in the project area was an L_{eq} value, which is based on short-term noise monitoring for a single train event. This descriptor does not adequately address noise impacts in sensitive areas and is not normally used in train noise impact assessments. The evaluation of train noise impacts in the sensitive areas should be based on measurements taken over a longer period of time, typically 1-hour or 24-hours, depending on the type of land use.

Land uses not involving nighttime sensitivity would typically require a determination of 1-hour L_{eq} . For residential land uses, on the other hand, nighttime sensitivity is an important consideration. The appropriate measurement duration is a 24-hour period, with noise levels measured on an hourly basis through a 24-hour period. The appropriate metric that is normally applied for residential land uses is the L_{dn} (day/night) noise levels calculated from 24-hour data, which accounts for the additional sensitivity during sleeping hours.

The CSX methodology projects a 65 L_{dn} noise contour based on a train noise model, which was modified to account for topography. It also projected a 70 L_{dn} contour using the erroneous assumption that there would be a 5dBA increase halfway between the 65dBA contour and the railroad tracks. The uncertainties associated with this procedure makes the CSX noise impact assessment suspect, if not invalid.

The following impact assessment procedure, which is the widely accepted standard, should have been used:

- Identify areas of sensitive land uses and classify them based on their day and nighttime sensitivity.
- Monitor L_{eq} (1-hour) and L_{dn} (24-hours) noise levels at sites likely to experience the greatest project impacts. The locations selected by the CSX consultant are inappropriate for a rail traffic project impact assessment. None of the sampling locations in Collinwood included the homes closest to the tracks. The only sampling location reported in the Collinwood section, for example, was located 250 feet from the track, and is shielded by industrial buildings. There was no sampling reported in the area where the homes are immediately adjacent to the tracks in sections 2 and 3 (as defined in the CSX report) in the City of East Cleveland and the Cleveland neighborhoods of Forest Hills and Glenville. The reliance on 24-hour monitored data and the use of the L_{dn} metric is critical in segments of the corridor where residential land uses predominate and the increase in frequency of nighttime train movements is proposed.
- Calibrations of the train noise model using the monitored data.
- As required by the STB procedures, plot future 65 & 70 L_{dn} noise contours using the calibrated model. Although this portion of the procedure, the plotting of the future noise level contours to identify impacts based on the number of properties within the two contours, has been followed by the CSX consultants, these contours are not valid because they did not use an appropriate methodology. A more appropriate approach in sensitive areas where levels of impact need to be disclosed and the effectiveness of mitigation needs to be tested, is to apply FTA methodology. The impact assessment procedure contained in the FTA methodology is based on an allowable increase in future project noise levels compared to the existing ambient L_{dn} noise levels. Under this methodology, projected future noise contours more indicative of the actual resulting conditions would be established.

b. Results of Continuous Noise Monitoring by City of Cleveland.

Because of the inadequacies of the studies reported in the DEIS, and of CSX's and NS's unwillingness to work with the City to assess impacts and required mitigation, Cleveland's consultant Parsons Brinckerhoff conducted its own study of the noise impacts of the Applicants' proposals. The results of that limited noise monitoring

program conducted in sensitive residential areas adjacent to the tracks, are included here. This program included 24-hour continuous noise monitoring in the rear yard of a residential property adjacent to the rail corridor in the East 131st Street vicinity of Cleveland, in the area designated by CSX as Zone 3 (the Forest Hills neighborhood of the City). The data were collected on January 21 and 22, 1998.

Based on this data, L_{dn} noise levels were determined to be 66 at a typical residential receptor adjacent to the tracks. Based on CSX projections of future train movements (44 per 24-hour period), with 65 percent of the train operations occurring during the night (10PM-7AM), and a speed increase of 15 mph over the existing speed, a level of 81 L_{dn} is projected—an increase in L_{dn} of 15. This projected level is significantly greater than the level projected in the CSX report for this corridor segment. ***By subjective measures, residents will experience a tripling of existing noise levels.*** Furthermore, according to FTA criteria, allowable increases in L_{dn} in a zone with an ambient L_{dn} of 66 is limited to a value of 1, which is far less than the project increase of 15.

The City's consultants also monitored day and nighttime noise levels at a residential location near Bellaire and West 130th Street in the Puritas - Longmead neighborhood. This is adjacent to the Conrail Flats Industrial Branch, a rail corridor on the west side of the City on which NS plans to increase rail traffic following the acquisition. Daytime noise levels of about 65 dBA at the site appear to primarily result from aircraft activity in the area. However, at night in the absence of aircraft noise, the nighttime noise levels were found to be low, in the range of 40 to 45 dBA. Future noise levels resulting from rail traffic would increase both at night and in the

day. Daytime noise levels would not likely increase significantly, but nighttime levels would likely require mitigation measures such as noise barriers.

c. The Effectiveness of Mitigation. The measures proposed by the CSX study fail to mitigate the noise impacts that will be created by the dramatic increase of freight traffic that CSX proposes to run on the Short Line through the neighborhoods of Cleveland and East Cleveland and through the University Circle district. CSX has proposed the installation of landscaped noise berms to mitigate noise impacts that will result from the increased rail traffic. In reality, this proposal will address only wheel/rail noise, and even reduction will be very limited. It erroneously assumes that by reducing the wheel/rail noise, the L_{dn} level, which more accurately represents the impacts that would be noticed by residents, would be significantly reduced. The report itself indicates that at the location where monitoring was performed, the wheel/rail noise is near background noise levels. The peak noise levels, though of shorter duration, are reported to be 15-20 dBA higher than the background noise levels. Consequently, the short duration high peak levels will determine the L_{dn} noise levels. These peak levels are associated with the elevated noise sources (such as the engine exhaust and train horns). The impact from these sources would remain untouched by the recommended mitigation.

The report provides no quantification of the impact level or effectiveness of mitigation (in terms of its ability to affect noise levels). The low landscaped berm and railroad tie walls that are recommended in the CSX report simply do not provide a credible method for mitigation of the substantial increases in noise along the affected line segments. The cosmetic approach to a serious noise problem

fails to mitigate the noise that will be generated by the dramatic increase in freight traffic on the Short Line. The berms, trees and low railroad tie walls will, at best, achieve a noise reduction of 5 L_{dn}, nowhere near the 15 required to eliminate the project impact on the adjacent communities. The landscape-only "solution" proposed by CSX as the sole noise mitigation measure on the segment between Fairhill Road and Norman in the Fairfax neighborhood, is completely without noise mitigation value. Simply put, the "solution" proposed by CSX to mitigate the **three-fold increase** in noise through predominantly minority residential communities, University Circle and the Little Italy historic district, is inadequate, impermanent, and unacceptable.

B. Vibration

The DEIS contains virtually no reference to the increases in vibration from the increased train frequency, and includes no analysis or description whatsoever of sensitive receptors. This is particularly important in the portions of the alignment where homes encroach on the railroad right-of-way. Interior vibration levels may be of particular importance as the effect of increased vibration levels may be magnified by the structure, depending on type. These impacts could be significant since train vibration levels can be magnified 10VdB by the house structure. Before issuing a Final EIS, SEA should complete a study of the increases in vibration along the segments that will experience the largest increase in train frequencies, and determine the location of the sensitive receptors that are least likely to tolerate substantial increases in vibration, as well as the impact of the increases on the numerous residences that are adjacent to these lines.

C. Air Quality

The DEIS only addresses air quality at a regional level. As is the case with noise, it is not sufficient to say that increases in train operations in one location will be offset by decreases in another. This is a localized issue and must be addressed on that level. Dispersion modeling should have been utilized along the critical corridors with increasing rail traffic to evaluate the potential for a localized impact -- particularly with respect to particulate matter (PM₁₀). Where significant increases in the number of trains are proposed in sensitive land use corridors, a more refined analysis should have been completed to assess whether localized and problematic increases would occur and whether a viable alternative would eliminate or reduce these impacts.

Of particular concern to the City is the University Circle district. The City has examined the additional burden that will be placed on this employment center and unique institutional district by the dramatic increase in rail traffic on the right of way that lies between the core of Case Western Reserve University and University Hospitals campus and the Little Italy historic district. The City's analysis is summarized in the table attached to these Comments at Tab 2. Data prepared by the City predicts that the CSX/NS proposal will result in the emission in the University Circle area of an additional 35,092 pounds of carbon monoxide, 160,838 pounds of nitrogen dioxide, 14,622 pounds of particulate matter (PM₁₀), and 4,679 pounds of organic compounds. City studies indicated an increase in 10 carcinogenic pollutants as a result of the implementation of this proposal. Worse, prior studies of wind patterns in the vicinity of the Case Western Reserve campus indicate that the dispersion of pollutants is limited and that unique wind patterns may exist which allow concentration of pollutants in this

area. See Letter from Agnar Pytte, President of Case Western Reserve University, included in Tab 1.

Clearly, given the dramatic increase in freight traffic due to the combined actions of CSX and NS, the intensity of development and the concentration of sensitive receptors, and the uniqueness of the University Circle and Little Italy districts, special attention to air pollution impacts on these districts is necessary for the final EIS. Further analysis that specifically addresses the concentration and dispersion of pollutants and the impact of air pollution on the sensitive receptors and populations must be undertaken.

As reflected in the summary table attached at Tab 2, the project is estimated to result in increases in criteria pollutants (those for which National Ambient Air Quality Standards have been set), as well as hazardous air pollutants. While an increase in criteria pollutant emissions may not represent a significant increase in pollutant burden on a regional basis, it may result in impacts at sensitive receptors in the immediate project vicinity. Even where it is determined through a detailed dispersion modeling analysis at this and other sensitive portions of the corridor (including the University Circle segment, in which the two combined rail lines would create an even greater increase in a segment adjacent to the Rainbow Babies and Childrens Hospital and the Abington Arms subsidized elderly apartment building) that primary or secondary standards may not be exceeded, increases in emissions may represent a degradation of existing environmental conditions. The increase in carcinogenic pollutants is especially troublesome here given the proximity of nearby residences, and the cumulative effect that may result from exposure to numerous

carcinogens. For example, the Abington Arms apartment complex, which is home to senior citizens and handicapped persons living in unassisted arrangements less than 500 feet from the elevated tracks in this area. See Letter dated January 29, 1998, from Elizabeth B. Heil, Administrator, Abington Arms, to Elaine Kaiser, a copy of which is included in the letters attached to these Comments at Tab 1. The 1210 elderly residents, of whom 225 can be identified as disabled, are more susceptible to disease and the numerous ailments that come from poor air quality and living in close proximity to sources of air and noise pollution.

In addition, it should be noted that a portion of the respirable particulate matter (PM₁₀) is less than 2.5 microns in diameter, a size for which a new standard has been promulgated due to health risk concerns – and for which no local exposure background data exists.

D. Hazardous Materials

CSX and NS propose to increase the volume of hazardous materials transported across some lines in the City of Cleveland from zero to 44,000 carloads per year. Through University Circle, the combined plans of the two railroads indicate that hazardous materials volumes will grow from the current volume of 7,000 carloads per year to 81,000, one of the largest hazardous materials concentrations on the former Conrail system, according to the information supplied with the DEIS. **In fact, this is the largest (by far) increase across in hazardous material transportation across the entire system, yet SEA requires no further analysis of potential mitigation.** Worse, because of the proximity of some of these line segments to each other, the numbers of carloads predicted are in some cases substantially understated. In response

to this enormous increase, the mitigation proposed by the DEIS is -- safety drills! Surely, more study and a substantially heightened level of mitigation -- that reduces the risk rather than merely responding to the disaster once it occurs -- is required for this line.

The magnitude of the railroads' disregard for the impact of their proposals on the lives of the people of Cleveland is perhaps most glaring when viewed in the context of the potential disasters that could occur with this volume of this traffic moving so close to the bedroom windows of these communities. Projected accident rates along the Short Line through the City of East Cleveland, the Cleveland neighborhoods of Forest Hills, Glenville, and Fairfax and the University Circle and Little Italy districts (line segments C-072 and C-073) are projected to grow from 1:666 years per mile and 1:1344 years/mile, respectively, to 1:101 years per mile on both -- a rate curiously just above the 1:100 years/mile threshold for "significance" that SEA defines in the DEIS. The proximity of the Short Line to people's homes, the fact that the line runs through these neighborhoods on elevated section and is therefore difficult to access, and the fact that, elsewhere in the DEIS, the SEA acknowledges that accident rates may fluctuate on a year-to-year basis by as much as 10%, should indicate that the Short Line deserves special and careful scrutiny before the SEA can properly determine that this line is suitable for conversion from a little-used bypass to main line freight service with one of the highest HazMat throughput to found in the entire CSX/NS proposal.

The situation in University Circle is even more urgent. The combined accident rates of the two independent rail lines which will operate through the Circle -- CSX at

1:101 years/mile and NS at 1:118 years/mile -- suggest that a true accident rate along the two mile section of parallel operations will be 1:54 years/mile, a rate significantly worse than the SEA's criteria for significance. Given this fact alone, let alone the concentration of employees, students, patients, elderly and poor households, along with other sensitive receptors in this important commercial, residential, cultural and institutional area of the City, require that special attention and study be given to this section before the Final EIS is prepared and accepted, and not at some yet-to-be specified time in the future.

Furthermore, these lines pass not only residences but scores of health care facilities, senior citizen residences, schools, and businesses. The Abington Arms complex, referred to above, is but one example. Despite the presence of all of these potential victims of a hazardous materials incident, Applicants have provided no plans for evacuation routes to insure that affected citizens can escape. There is no discussion of an obligation on the part of the railroads to develop these plans in consultation with the affected communities' leaders. Safety drills are a necessary but nowhere close to a sufficient measure to mitigate the potential impact of the transportation of this volume of hazardous materials through these communities.

A few points bear particular emphasis. First, the DEIS Table 5-OH-55, which identifies five Cleveland area segments that will become key routes, underestimates the impacts and risks by the increased load of hazardous materials on the key routes. The five key routes include:

- C-072 Mayfield-Marcy
- C-073 Quaker-Mayfield

C-069 Marcy-Short
C-074 Short-Berea
N-081 White-Cleveland

The study fails to mention that segments of C-072 (Mayfield-Marcy) and C-073 (Quaker-Mayfield) are parallel and quite close to segment N-075 (Cleveland&Ashtabula), thereby increasing the overall load of hazardous materials in this rail corridor. The three lines occupy the same depressed/elevated rail corridor for a distance of about 2.5 miles with a separation distance of approximately 100 feet or less. The actual increase in hazardous materials transport frequency in this corridor is from 7,000-cars/year base case to a total of 81,000-cars/year-post acquisition.

Second, the proposed mitigation measures are inadequate. These proposed measures include no requirement for physical spill containment/collection and/or remediation in the event of the statistically projected eventual accident. These new key routes are located in primarily residential neighborhoods where topography and/or physical structures limit access to the rail corridor. For these segments, unless the Cleveland alternative is approved, mitigation must be required that will equip these line segments with spill containment/collection facilities. Segments that meet these criteria are:

- C-073/N-075 and C-073 - Elevated trackage with current access at each end of a 2-mile segment. Noise mitigation measures could limit access, but would be required to adequately mitigate the projected three-fold increase in noise levels on this segment will further limit access.
- C-072/N-075 - Depressed and elevated trackage.

Additionally, segment C-072 (Elevated trackage) meets this criteria, but is located in an area with less residential density.

No matter what route is used for movement of these commodities through Cleveland, even the Cleveland alternative, mitigation measures to address the presence of this volume of hazardous materials must be part of the solution mandated by the STB. These facilities should be designed with the objective of collecting spilled liquid materials before the material can enter a natural waterway or impact a residential area, thereby minimizing the spread of contaminated materials onto adjoining properties endangering the health and safety of the local residents. The system would consist of a series of drainage channels, piping, and valves as well as detention basins and/or vaults, as required.

A typical hazardous materials spill containment system would consist of three parts: conveyance, containment, and discharge. Attached at Tab 3 are schematic concept drawings prepared by Parsons Brinckerhoff for a typical system.⁵ Normally, the system will convey storm drainage through the system without containment in the pond or vault. This would be accomplished through the construction of drainage ditches adjacent to the railroad track. Such ditches would be designed to convey the peak runoff volume to the containment structure without flooding. Preliminary calculations were made that indicated ditch 1-foot deep and 7 feet across at the channel top would provide adequate capacity to convey the storm runoff in the Cleveland area.

⁵Cleveland recognizes and emphasizes that these are preliminary concept drawings only. Working together, the City, SEA and the railroads can develop a containment system that will address the potential spills along the affected lines.

Unlike a normal drainage ditch, a ditch that must also serve to convey hazardous materials would include an impervious membrane. This membrane, either a clay layer or an impervious geotextile, would be installed in the ditch to prevent hazardous materials from seeping into the surrounding soils.

Since much of the track is elevated, it is most likely built on fill material that would quickly absorb the hazardous substance, making cleanup more challenging. The discharge would be conveyed from the ditch via inlets to underground pipes to the containment structure. These pipes will be concrete pipes ranging from 12" to 18" in diameter. Other materials may be used if proper protection from potentially damaging hazardous materials is provided. Properly coated steel or ductile iron pipe may be substituted. The runoff (storm drainage or hazardous materials) will discharge from the underground pipe into a containment structure. This structure would either be a below ground vault or a surface pond. In either case the overall volume of the structure would be the same. It is assumed that in the event of an accident, a maximum spill of 20,000 gallons would be expected. This volume equates to the capacity of one fully loaded liquid tank car or the fuel capacity of six locomotives. A catastrophic accident is unlikely and would likely over-exert any containment measures. The hazardous materials containment system is designed to contain materials from fuel spills, low speed collisions, and/or tank failures.

NS or CSX could choose to use surface ponds, vaults, or both depending on site constraints and/or financial issues. Surface ponds are generally less expensive than large, cast-in-place concrete vaults. However, ponds require more space, flat terrain, and may require property purchases. A vault can be "squeezed" into the

confined space of a railroad corridor. A more thorough analysis of the type of structure to use would have to be made during the preliminary design phase of the project. A sketch of both structures is included in Tab 3.

The outlet would typically be a pipe connected to the storm sewer system or with an outfall to a nearby water body. The outlet pipe would be equipped with a manual control valve. This valve would remain in the open position to allow rainwater to discharge freely from the pond. In the event of a hazardous materials spill, the valve would be closed by the response team, thereby containing the spill within the corridor and the containment structure. As part of the cleanup process, materials would be removed from the containment structure and the right-of-way before the outlet valve would be opened.

E. Impact on Existing Highway Infrastructure, Including Bridges

The substantial increase in rail traffic through the City of Cleveland will create adverse effects that will ripple through a host of aspects of the City's life and the infrastructure that supports it. Increased truck traffic to and from the new Collinwood Yard intermodal facility is conservatively estimated by the applicants to show growth of only 49 trucks per day, see DEIS vol. 3B at OH-42, in order to avoid the 50 truck per day threshold that would require further study.

The extent of the impact on the City goes far beyond those 49 (or more) truck trips per day to and from Collinwood, creating impacts on the environment that require further careful study. What, for example, will be the impact on the infrastructure from increased delays to vehicle traffic at crossings? When cars and trucks are blocked at grade crossings, traffic will seek alternative routes through

residential neighborhoods. Besides the deterioration of streets not designed for this level of traffic loading, the quality of life in the residential areas will suffer from increased traffic, more air pollution that accompanies vehicle traffic, and the increased safety risks that follow as well.

Increased train traffic will also have an impact on the crossings themselves, having further effect on the citizens that use them. Grade crossings are subject to faster deterioration due to increased train frequency. As a result, the adjacent roadways are subject to increased raveling, and potholes appear. Safety is diminished as vehicles cross the uneven tracks. Crossings in Cleveland at East 40th, East 39th, East 53rd, Bessemer, London, Nottingham and West 110th that will see substantial increases in freight traffic will require attention to be able to withstand the impacts of the volumes projected by Applicants.

F. Delays in Emergency Response

The DEIS correctly identifies increased delays at grade crossings as an area of significant impact from the Conrail acquisition. Specifically, Table 5-OH-54, DEIS, vol. 3B at OH-146, identifies "Estimated Maximum Delay for At-Grade Roadway Crossings on NS Cleveland-Ashtabula Line" for two crossings that meet SEA's threshold. The City of Cleveland shares this concern, and agrees with this designation. However, the table underestimates the actual impacts of the transaction. The way the criteria are applied to the two intersections in Cleveland suggests that, when applied properly based on the realities of train movements and vehicle usage of Cleveland's busy streets, the impacts will be as bad as was projected in CLEV-9 (see VS Denihan) and will require more mitigation than NS and CSX have planned.

One of the table's criteria, the change in crossing delay per stopped vehicle, is a function solely of the slightly increased train lengths. While the incremental change is not significant, this criterion is not relevant. The other criterion, total blocked time, is significant and is understated for Dille Road because the train speed used in the calculation ($V = 50$ mph) is too high. Train speeds are limited to 35 miles per hour less than 1.5 miles from this crossing. With a train length of 5,000 feet, and the need for the train to be within authorized speed before entering the limit for the decreased speed, it is highly unlikely that speeds significantly over 35 mph will occur at this location. The total blocked time for Dille Road is more likely to be as much as 70.3 minutes, which results in a ***more than three-fold increase over pre-acquisition levels.***

The actual impacts are also understated, as the DEIS correctly notes, because the potential for delay in emergency response times is so significant and so difficult to quantify. In fact, the situation is even worse than the picture the DEIS paints because the areas that are potentially isolated by rail traffic delays at crossings are at the far reaches of the City limits. No Cleveland emergency services are located on the south side of the tracks in this vicinity.

The increased delays at crossings across the City will create a problem that NS and CSX must mitigate. SEA should require a recheck of the data for all of the crossings in the City to determine whether the actual speeds of the trains through crossings are, like Dille Road, less than the posted speed at the track at that location. Reality, not the optimal situation, should govern the analysis. When that is done, SEA should require NS and CSX to work with the City to identify the actual delays expected to occur at busy grade crossings and to implement plans to mitigate these delays and

insure that the residents of the affected areas will not suffer from increased response time for police, fire, and rescue vehicles delayed by an increase in the frequency and length of trains crossing City arterial streets.

G. Historic Resources

The DEIS recognizes that "[c]ultural resources include historic and archaeological features", DEIS, vol. 3B at OH-75. However, without further study of the impacts of the transaction on structures or use patterns in places like Cleveland that will experience dramatic increases in train frequencies, the DEIS then concludes that "potential effects to cultural resources would most likely occur during new construction and rail line proposed abandonment activities that meet or exceed the Board's threshold for environmental analysis." *Id.* Contrary to this conclusion, many local landmarks and historic districts face the potential for experiencing the types of adverse effects outlined by the Advisory Council on Historic Preservation that are listed in the DEIS itself, including "physical destruction, damage or alteration; isolation; introduction of elements that are out of character; neglect; and transfer, lease or sale." DEIS, vol. 1, section 3.13 at 3-38. Because of the impacts on the surroundings and the quality of life that the substantial increase in train frequencies will bring, the City's historic structures and districts face some or all of these risks, and SEA should conduct further study of the impacts.

One tool available to communities seeking to protect areas of historic significance is the designation of "historic districts". In Cleveland, such districts can be designated on a national basis, as part of the National Register of Historic Places, or on a local basis, as Cleveland Landmark Districts. National Register Districts are

protected by virtue of the fact that federally funded development and exterior renovation in these districts is evaluated for compatibility by a hierarchy of local, state and national review bodies. The Cleveland Landmarks Commission, designated by the State Historic Preservation Officer as a "Certified Local Government", undertakes the local review of National Register designations and actions which may affected listed properties and districts. Local Cleveland Landmark Districts are created by legislative action of the City government and provide protection to listed properties and districts by virtue of the fact that all development and exterior renovations in these districts must be evaluated for appropriateness by the Landmarks Commission.

Currently in the City, 26 historic districts are listed on the National Register and 19 districts are designated as local Landmark Districts. Many of the districts listed nationally are also included within larger locally-designated districts. Of the 19, 14 are located on the City's east side, including four in the Downtown area. The National Register Districts are concentrated in four areas of the City: Downtown, Ohio City, Shaker Square and University Circle. Among the largest locally-designated districts is Little Italy, adjacent to University Circle. This Landmark District has approximately 375 buildings in it and, since its designation in the 1980's has become a vibrant arts and restaurant district immediately adjacent to the cultural resources of University Circle.

The Cleveland Landmarks Commission maintains a listing of existing and potential landmark properties and districts and undertakes surveys and studies necessary to determine the eligibility of potential properties and districts for local and national designation. In 1985, the Landmarks Commission, in cooperation with the

City's Department of Community Development, undertook a complete city-wide survey of residential and commercial areas to identify additional locations warranting consideration for historic designation based on architectural significance. the City Planning Commission subsequently adopted the Landmarks Commission's recommendations as part of the Citywide Plan, the official General Plan of the City of Cleveland. Among the largest of such eligible districts was the Magnolia Drive/Wade Park Avenue District in University Circle.

Two historic districts lie within half a mile of the proposed CSX/NS routes through University Circle: Little Italy and the Hessler Road and Court District. Two National Register Districts -- the Mather College Historic District and the Wade Park Historic District -- lie in the immediate vicinity as do 17 individually-listed properties:

- Parkside Dwellings
- Allen Memorial Medical Library
- Mary Chisholm Painter Gate
- Cozad-Bates House
- Holy Rosary Church
- Cleveland Museum of Art grounds
- Garfield Memorial
- Ford Motor Co. (Cleve. Inst. of Art)
- Mayfield Theatre
- Severance Hall
- Church of the Covenant
- Backus School of Law
- Amasa Stone Chapel
- Flora Stone Mather Hall
- Lakeview Cemetery
- Wade Memorial Chapel
- Cedar Glen Apartments

The routing proposed by CSX and NS, which is immediately adjacent to Little Italy, will have a serious detrimental impact on this district. The cumulative impacts of increased noise and pollution resulting from the dramatic increase in freight train traffic, will degrade the quality of this district. The same is true for the Hessler Road and Court District, a unique multi-family residential community, and for the Mather College District. The cumulative effects on the environment in these two Historic Districts, and upon individually listed buildings, have not been analyzed.

Severance Hall, the home of the Cleveland Orchestra, is a good example of the buildings in this area that are of particular concern. Built in 1931 of porous sandstone, it is highly sensitive to pollution. The increased burden of pollutants -- specifically particulate matter from the projected 80 or more multi-engine trains that will operate daily one block south of Severance Hall -- is of grave concern.

The DEIS makes no mention of any of these culturally significant buildings and districts. Presence or absence of construction is an inadequate criterion for determining the likelihood of impact on cultural resources like the many in Cleveland, the use and the longevity of which will be dramatically affected by the increased train frequencies proposed by CSX and NS. For the final EIS to be complete, SEA should require a careful analysis of the impacts of the proposed transaction on the City of Cleveland's many historic resources.

IV. DESCRIPTION OF THE CLEVELAND SOLUTION, AND COMPARISON OF IMPACTS

The evaluation of alternatives has been called the heart of the EIS by the CEQ. 40 C.F.R. § 1502.14. There should be a comparison of reasonable alternatives on relevant environmental and other grounds, particularly when a locally identified, environmentally preferable alternative exists. In making its decision, the STB should be informed of the full range of alternatives, and given a complete assessment of their commercial and operating viability along with the required comparison of the relative environmental impacts of each. In this case, the DEIS includes no analysis that could provide the Board with a basis to make that decision. The City of Cleveland is proposing alternatives here, and these Comments include some preliminary comments

on the cost and the comparative impacts on the environment. However, just as NS and CSX should have developed alternative routing arrangements in the first instance, they, working together with SEA, should be responsible for preparation of careful, objective review of the solutions proposed by Cleveland.

A. The Cleveland Solution

The City of Cleveland has identified operationally feasible alternatives for the routing of freight through the City. These alternatives reduce the net level of environmental impact. They route most rail traffic through industrial corridors, minimizing impacts on residential neighborhoods, reducing safety hazards and preserving quality of life. These plans provide a "global fix" because they not only benefit Cleveland's neighborhoods, but they provide a solution to the traffic increases or congestion problems that would otherwise be created for the west shore suburbs, East Cleveland, Euclid, Berea and others. The new traffic patterns will allow CSX and NS to provide efficient, competitive freight service, preserve the ability to provide commuter rail service in the future, and enhance regional development.

Each of the alternatives was assessed in terms of its ability to reduce the potential for noise, air quality, hazardous materials, and environmental justice impacts to the City of Cleveland while providing for efficient rail movement through the City. The two alternatives identified by the City and the original and modified alternatives identified by NS and CSX were evaluated in a screening procedure. This was based on the number of sensitive receptors located at critical distances to the tracks and socio-economic profile of neighborhoods most affected. Based on that analysis, both City alternatives were estimated to meet the goals and objectives of achieving a lower

potential for environmental impact. It is therefore recommended that a second tier EIS that will include the alternatives identified by the City, be prepared to address the localized affect.

CSX and NS have submitted an operating plan that calls for one primary CSX route and two primary NS routes through greater Cleveland. CSX would use a route from Greenwich in Huron County through Berea to Short, a rail junction near Brookpark Road/West 150th Street⁶. CSX would use the Short Line route, which parallels I-480 to White (located in the Broadway area south of Harvard), then via University Circle and East Cleveland to the Collinwood Rail Yard.

NS traffic destined for Pittsburgh and beyond would also enter the area at Berea, then use the Lake Shore route via the Cleveland Lakefront. It would then use the former Pennsylvania Railroad route via the east side of Cleveland and Bedford. The second NS route, for traffic destined to Buffalo and beyond in the northeast, would use the existing NS route from Bellevue, which passes through the western suburbs, skirts the south edge of downtown Cleveland, then passes through University Circle to Euclid.

While all of these routes use existing lines, some will see tremendous increases in rail traffic. As a result of concerns expressed by the western suburbs, NS submitted an alternative plan to reroute a portion of its Buffalo traffic to the Flats Industrial Track (the former Clark Branch) corridor, which diverges near Cloggsville (near west 25th Street) and runs to Short and Berea. This alternative plan would require substantial public funding. This alternative plan would require substantial public funding and

⁶Maps showing the original CSX/NS proposal, the CSX/NS proposal as revised in November 1997, and the two Cleveland alternatives are attached at Tab 4.

would substantially increase NS traffic through the City of Berea as a result of reducing traffic through the West Shore suburbs to the north.

Cleveland has a better idea. It has studied the configuration of lines in the region and developed two alternative arrangements that reverse the ownership of the lines in the area from the arrangement proposed by CSX and NS. In the first Cleveland alternative solution, CSX traffic from Greenwich would continue to enter the region in Berea, but would use the Lake Shore route via the Cleveland Lakefront to Collinwood. This line is currently used heavily by rail traffic. NS traffic bound for Pittsburgh and beyond would continue to enter the area at Olmsted Falls/Berea, but would use the Short Line to White, then diverge southeast through Bedford. In Alternative Number 2, NS Pittsburgh traffic would not use the Flats Industrial Track north and east of Short, using instead the Short Line east to Marcy. The southern portion of the Short Line would become NS's main line for both Pittsburgh and Buffalo traffic flows. At Marcy, NS traffic bound to and from Buffalo would continue on the existing Short Line through University Circle to Mayfield. Near the existing Mayfield connecting track, a new higher-speed connection would be built between the Short Line and the NS line to Buffalo for trains to join the existing route.

Under both alternatives, each railroad would also have the use of a secondary line for overflow traffic, transfer movements, maintenance needs and emergency use. CSX's secondary route would be via the Short Line from Collinwood to Berea as CSX has currently proposed in its operating plan. Ownership of the Collinwood to Marcy segment could be in the hands of CSX. Trackage rights over NS would be required from Marcy to Berea. NS's secondary route for Pittsburgh traffic would also be the via

the route it now designates as its primary route, that is from White to the Cleveland Lakefront to Berea. Under the City's alternatives, the route from the Cleveland Lakefront to Berea would be via trackage rights over CSX.

Both of Cleveland's alternative solutions accept the fundamental premise of the railroads' revised proposal (see the second map included in Tab 4): to mitigate the impacts of increased freight traffic through the West Shore suburbs and Cleveland's Edgewater and Detroit Shoreway neighborhoods⁷, it will be necessary to divert the traffic southward through Berea. Cleveland's two alternative solutions differ from the revised CSX/NS proposal by addressing the increased road - rail conflicts that will result in Berea and, in so doing, enabling the rerouting of traffic on the east side of Cleveland away from predominantly residential neighborhoods to predominantly industrial corridors. Both of Cleveland's alternatives also maintain joint access by both railroads to key shippers and yards. This includes the Ford Motor plants in Brookpark, the Chevrolet plant in Parma, and NS's Rockport Yard. Traffic that must use the secondary routes to achieve maximum efficiency could also be accommodated -- at this time the City's proposals would not preclude use of the line between the Lakefront and White (the Conrail Cleveland line) for limited traffic such as the NS (post-acquisition) ore traffic from the Port of Cleveland. The only requirement here would be NS's use of trackage rights to cross lines assigned to CSX (under the City's proposed arrangements) over the Cuyahoga River drawbridge.

⁷These neighborhoods' populations and the impacts of the Applicants' proposed routing are reviewed in detail in CLEV-9.

Both Cleveland alternatives require the two carriers' traffic flows to cross each other at Berea, and both propose to meet the problem of converging rail traffic in Berea on a permanent basis. In recognition of the railroads' need for efficient and competitive options, Cleveland proposes grade separation of the two lines through use of a rail/rail overpass structure. Other components of the project would include elimination of both Front Street at-grade crossings as well as elimination of the grade crossing at Bagley Road. In addition, the Cleveland solutions include grade separation on the NS Nickel Plate Line in Cleveland and Euclid at London and Nottingham/Dille Roads.

B. Infrastructure Requirements

Cleveland developed these alternatives with a "global fix" in mind. To this end, infrastructure components of the alternatives include those required to mitigate the impacts on the City of Cleveland and to meet the railroads' needs. These proposals recognize and account for the improvements Cleveland has assumed would be required to mitigate the impacts on Cleveland's suburban neighbors in conjunction with these alternatives. The following listing of infrastructure improvements, like the cost estimates that follow, are based on the City's work with its consultants and provide the beginning, not the end, of the analysis of the operating feasibility, the cost and the environmental impacts of these solutions.

The key infrastructure elements of the two alternative solutions include the following⁸:

- (1) Alternative One:

⁸Locations of the various projects and improvements are in the vicinity of the locations identified on the maps included in Tab 4.

- Berea rail/rail grade separation project, referred to above and described more fully in the text attached at Tab 5
- Flats Industrial (West Side) Connection, as proposed (and cost estimated) by NS
- Short Line capacity improvements between Short and Marcy
- Harvard Connection (Marcy to Short) Secondary Track -- provides subgrade improvements, additional capacity and lessened gradient
- Nottingham/Dille Road Underpass -- mitigates transportation and emergency response time impacts caused by increased traffic on the NS Cleveland - Ashtabula line
- London Road Overpass -- mitigates transportation and emergency response time impacts caused by increased traffic on the NS Cleveland - Ashtabula line
- Noise/Vibration Mitigation Allowance -- preliminary investigation suggests that certain line segments, even under the Cleveland solution alternatives, may require mitigation measures to reduce noise and vibration impacts. Additional evaluation by SEA prior to completion of the Final EIS is necessary.
- Track/Signal Allowance at West End Rockport/Ford Yard -- allowance to improve track conditions and signalization on the easterly lead track between the west end of Rockport Yard and Ford Yard. This is intended to increase flexibility and the capacity for switching movements at Rockport and at Ford Yard. Additional operating and engineering investigation is required.

(2) Alternative Two:

- Berea rail/rail grade separation project, referred to above and described more fully in the text attached at Tab 5
- University Circle connection -- allowance for connecting the NS Buffalo line to the Short Line
- Short Line capacity improvements between Short and Marcy, as proposed and cost-estimated by CSX. Additional improvements may be required from Marcy to Mayfield, including the provision of

additional capacity in the tunnels, depending on NS's operational needs.

- Harvard Connection (Marcy to Short) Secondary Track -- provides subgrade improvements, additional capacity and lessened gradient
- Nottingham/Dille Road Underpass -- mitigates transportation and emergency response time impacts caused by increased traffic on the NS Cleveland - Ashtabula line
- London Road Overpass -- mitigates transportation and emergency response time impacts caused by increased traffic on the NS Cleveland - Ashtabula line
- Hazardous Materials Mitigation -- preliminary investigation suggests that certain line segments within the City may require mitigation measures, even under the proposed alternatives. Further analysis is required.
- Noise/Vibration Mitigation Allowance -- preliminary investigation suggests that certain line segments, even under the Cleveland solution alternatives, may require mitigation measures to reduce noise and vibration impacts. Additional evaluation by SEA prior to completion of the Final EIS is necessary.
- Track/Signal Allowance at West End Rockport/Ford Yard -- allowance to improve track conditions and signalization on the easterly lead track between the west end of Rockport Yard and Ford Yard. This is intended to increase flexibility and the capacity for switching movements at Rockport and at Ford Yard. Additional operating and engineering investigation is required. A portion of the cost of constructing these improvements may already be included in the NS estimates for the cost of the West Side Connection.

C. Comparison of Benefits of the Cleveland Alternatives

Cleveland's Alternative One provides a host of benefits to both the carriers and to the City. These include the following:

- The highest concentrations of rail traffic are concentrated in the existing industrial corridors in and around the City, *away from the City's residential, commercial and institutional neighborhoods.*

- Train traffic in Cleveland's Collinwood and Forest Hills neighborhoods will decrease, minimizing impacts on residents.
- Train frequencies in the City's west shore neighborhoods and the adjacent communities will decrease, minimizing the impacts on residents, businesses and infrastructure.
- Both of the at-grade crossings on Front Street in Berea will be grade-separated. Benefits include elimination of traffic and emergency response delays, and dramatic decreases in noise from train horns.
- Grade separation of the Bagley Road CSX crossing in Berea will similarly reduce delays and noise.
- Grade separation of two of the four at-grade crossings heavily affected by increased NS traffic in the Euclid/Green neighborhood.
- Decreases the length of the CSX route through Cleveland by 2.7 miles.
- Decreases the length of the NS Pittsburgh route by 7.3 miles, including elimination of the drawbridge crossing.
- Minimizes freight traffic on certain key line segments potentially of interest to the public sector for the development of commuter rail services, such as the Cleveland Lakefront to Erie Crossing, Harvard or White and Lorain to Cleveland Lakefront.

Alternative Two provides many of the same benefits, but with even greater reductions in the impact on the City's neighborhoods, as described more fully below. The major difference between the two alternatives is in the impact on NS operations. As compared to Alternative One, the NS Buffalo route distance would be .3 miles longer as opposed to the route that uses the West Side (Cloggsville) connection. It also increases traffic on the Short Line. However, it has the advantage of providing NS with a route that does not include use of the drawbridge. It may also permit a reduction in the need for continued investment in operations at the East 55th Street Yard.

Recognizing the complex operating issues and trade-offs that would be involved in adoption of either of these scenarios for either of CSX or NS, the City does not aspire to submit with these comments a detailed comparison of the operating impacts of the two alternatives for the two carriers. However, Cleveland does submit that both of these alternatives are feasible and should be carefully evaluated by SEA and by CSX and NS in order to comply fully with the requirements of the CEQ guidelines.

D. Comparison of Alternatives

The City has had three focal points in mind while considering solutions to the problems created for its and its suburban neighbors' populace by the NS/CSX proposal - reduction of impacts on the communities through routing trains away from sensitive residential and institutional sections and into the industrial corridors where they belong; reduction of the astonishingly disproportionate impact on low income and minority communities; and recommendation of a solution that is at the same time operationally and economically feasible for the two carriers. The City's two recommended re-routing arrangements accomplish all three.

To begin with the train frequencies on the line segments through the residential communities, such as Cleveland - Vermilion on NS, Quaker - Mayfield, and Mayfield - Marcy diminish dramatically. Cleveland estimates the following numbers of daily train movements under the City's alternative routing arrangements, determined based on information available from the Application and other documents in this proceeding:

Train Frequencies

Line Segment	CSX/NS Revised Plan	Cleveland Solution -- Alternative One	Cleveland Solution -- Alternative Two
C-069 Marcy-Short	45.8	28.1	48.3
C-072 Mayfield-Marcy	43.8	Minimal*	20.2
C-073 Quaker-Mayfield	43.8	Minimal	Minimal
C-074 Short-Berea	50.6**	50.6**	50.6**
C-691 Quaker-Drawbridge	12.9	54.2	54.2
N-074 Cleveland-Short	17.7	17.7	2.0
N-075 Ashtabula-Cleveland	36.6	36.6	36.6 (Minimal west of Mayfield)
N-080 Cleveland-Vermilion (NS)	16.4	16.4	16.4
N-081 White-Cleveland	29.7	2.0	2.0
N-293 Cleveland-Vermilion (CR)	32.9	50.6	50.6

** Will be reduced by the number of trains using Rockport and the connection to Berea, improving conditions at grade crossings on this segment.

* Minimal, in this table means traffic ranging from zero to an average of several daily trains.

In terms of noise impacts, the number of sensitive receptors at critical distances (properties estimated to be within about 75 feet) from the nearest tracks were evaluated for each segment. This evaluation identifies the number of receptors expected to be affected, and the distance along the right-of-way that may require some form of mitigation. As shown in the following table, the number of affected residents and the amount of additional mitigation required both decline dramatically:

Preliminary Noise Analysis

<u>Alternative Route</u>	<u>Number of Receptors</u>	<u>Potential Length of Noise Mitigation Required</u>
Original CSX/NS Operating Plan	154	17,000 feet
Revised CSX/NS Plan	173	20,250 feet
Cleveland Solution -- Alternative One	84	12,300 feet
Cleveland Solution -- Alternative Two	25	6,500 feet

A preliminary study of comparative vibration impacts, using similar methodology, estimated houses located within a critical distance from the nearest track:

Preliminary Vibration Analysis

<u>Alternative Route</u>	<u>Number of Receptors</u>	<u>Potential Length of Mitigation Required</u>
Original CSX/NS Operating Plan	62	15,850 feet
Revised CSX/NS Plan	54	13,300 feet
Cleveland Solution -- Alternative One	33	6,550 feet
Cleveland Solution -- Alternative Two	16	4,900 feet

The reduction in impacts on the City's neighborhoods in every respect is obvious. While many of the at-grade crossings remain, the frequency of train operations will not increase to a point where delays from train movements pose a nearly constant threat to the health and safety of the communities' residents. Hazardous materials will continue to be moved through and near the City, but mitigation is available that could

be effective on corridors where the lines are accessible and do not pass so close to the bedroom windows of such a substantial number of households, schools, hospitals and cultural institutions. The minority and disadvantaged populations of the City will not bear the overwhelming share of the burdens of a transaction from which they will derive virtually no benefit. As shown on the table attached at Tab 6, the relative impacts of the two Cleveland solutions on the poor and minority communities are substantially less than the impacts described in CLEV-9. In order to accurately and objectively compare the Original and Revised proposals with the two Alternatives advanced by the City, the City undertook an Impact Analysis which examined the impact of additional freight traffic on people living within 1000 feet of each rail segment in the City. Base demographic data for this analysis was prepared for the City by Cleveland State University, using their Census mapping capabilities. The number of persons, minority persons, Hispanic persons, and persons of low income were calculated for each 1000-foot wide line segment in each of the four alternatives. Implementation of Alternative One will affect 49,547 people within 1000 feet of the combined rail corridors. Of these 18,359 (37.1%) are non-white, 2,955 (6%) are Hispanic and 14,458 (29.2%) are low income. The impacts from implementation of Alternative Two have a similar effect of reducing the environmental injustice of the CSX/NS proposal. It affects 32,625 people living within 1,000 feet of the rail lines, of whom 17,794 (54.5%) are non-white, 319 (1%) are Hispanic and 10,361 (28.7%) are low income. From the table that resulted, it is possible to compare each of the alternatives in terms of number of persons affected by increased freight traffic in each alternative. To adjust and account for the variations in impact that occur with varying levels of increased freight traffic on each

line segment, the City developed an "Impact Index" both rail proposals and both City proposals. That index considered two factors: 1) the number of additional trains proposed for a particular segment and 2) the number of residents living within 1,000 feet of the tracks. For each scenario or alternative, consideration was given to only those rail lines where an increase in freight traffic was proposed. Mathematically, the formula can be expressed as follows:

$$\frac{\text{additional trains per day on each affected rail segment} \times \text{population within 1,000 feet of tracks on each segment}}{\text{divided by 100,000}}$$

For each of the alternative scenarios, the Impact Index numbers for each affected segment were added to compute the overall Impact Index for the alternative.

The City's proposals make sense in relation to all three of the principal objectives the City has stated throughout its attempts to address the substantial impacts of this proposed transaction on Cleveland and its neighboring communities: it reduces of impacts on the communities through routing trains away from sensitive residential and institutional sections and into the industrial corridors where they more belong; it reduces the astonishingly disproportionate impact on low income and minority communities; and provides a solution that is at the same time operationally and economically feasible for the two carriers. As described more fully in the next section, the City's solution is more expensive than either of the NS/CSX proposals, but these costs pale by comparison to the nearly \$1 billion in annual economic benefits that the two railroads have stated they will achieve on the backs of the people of this City and its neighbors and without regard for the burdens on their lives that their proposals will create.

E. Cost of the Alternatives

Neither the Applicants' original proposed routing and operating arrangements through the City of Cleveland, nor the City's solutions to the problems the Applicants will create by those arrangements, is without cost. The City's solutions require more investment in infrastructure improvements but present a fair solution to the problems the City did not seek and from which it will derive relatively little benefit. As shown in the table attached at Tab 7, the cost of completing the improvements and mitigation required to implement the various operating scenarios is:

Operating Scenario	Estimated Cost of Improvements
CSX/NS Original Operating Plan	\$28,100,000
CSX/NS Plan, revised on November 25, 1997, to include Cloggsville/West Side Connection	\$72,100,000
CSX/NS Plan, as revised on November 25, 1997, and including additional mitigation estimated to be required to begin to address impacts of the proposed transaction	\$107,225,000
Cleveland Solution -- Alternative One	\$171,500,000
Cleveland Solution -- Alternative Two	\$147,780,000

The meaningful comparison here is among the last three rows on the above table. While the Applicants' revised operating plan included some cost of capital improvements in and around the City of Cleveland, it did not reflect the cost of the noise mitigation, crossing improvements, hazardous material spill containment, vibration mitigation and other measures that would be required to begin to offset the impacts of the transaction. The City has estimated the cost of some of that mitigation,

and those estimates are reflected in the adjustment to Applicants' proposal in the cost on the third scenario in the above table. It bears emphasis here that the cost of noise mitigation in this scenario is for measures that likely will not fully address the substantial increases in noise from wheels, from locomotive engines and from train horns that will result from implementation of the revised CSX/NS proposal while also being acceptable in terms of visual impacts and access for emergency response. In reality, the cost on this line is understated by the amount that would be required to construct further mitigation.

The estimates to complete the City's proposed solutions are based on preliminary assessments by the City's staff and consultants. Cleveland recognizes that as engineering work and additional expertise is brought to the analysis of all of these alternatives, the costs will change. The data available to the City suggests that its solutions are realistic and prudent, but they remain conceptual in nature. As the railroads' needs develop based on a further understanding of the implications of the revised operating scenarios, the costs could change. Additional savings through changes elsewhere in the area might be realized, and additional costs might be incurred as the precise requirements become known.

V. **CONCLUSION**

There is no substitute for careful analysis of the potential impacts of a transaction of the scope of this one on the communities along the railroads' lines, and there is no excuse for those railroads' failure to consider from the outset the impacts this transaction will have on the City of Cleveland and its neighboring suburbs. These

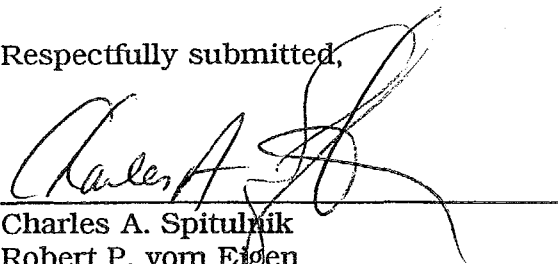

Comments begin the meaningful assessment of those impacts, and note the additional work that is required before a Final EIS can be prepared.

The City of Cleveland has striven to devise rerouting plans that will reduce the impacts on its residents, the fabric of its communities' lives and on the institutions it has fostered and housed over the course of its 200 year history. No matter which alternative rerouting plan is finally selected, there are some elements that must be included in any solution to the serious adverse impacts this transaction will create for Cleveland and the surrounding communities. The mandates of the President's Environmental Justice Order must be at the forefront of SEA's consideration of these impacts and of the solutions that Cleveland has presented. Unless the Applicants are willing to adopt rerouting arrangements that accomplish the City's objectives, SEA should recommend and the STB should impose train limits or curfews that hold the neighborhoods harmless from the impacts they will experience from the implementation of Applicants' proposal. Fairness to Cleveland, its residents and its neighbors should prevent the STB from approving the proposed transaction without requiring mitigation of the substantial impacts it will otherwise create -- not trifling attempts to appease the citizens by planting trees and erecting low, nearly useless noise walls, but real efforts to reduce noise and intrusion into the peoples' lives by adoption

of a rerouting alternative that truly and effectively addresses the problems that the proposed transaction will create.

**Re: CSX and Norfolk Southern (NS)
Proposed Acquisition of Conrail**

Dear Office of the Secretary:

University Circle Incorporated (UCI) is the nonprofit planning and service organization for University Circle. **University Circle** is the cultural, medical, and educational center of Cleveland and northeast Ohio – it is one-square mile in size and home to 44 institutions (with an additional 35 institutions in the area immediately adjacent to its boundaries). University Circle is a very unique area, not only to the city of Cleveland but nationally – no other city in the world has such a prominent concentration of institutions. I have enclosed a copy of our current annual report that lists all of these institutions.

I am writing on behalf of many UCI member institutions to document our concern that we have not been afforded the opportunity to meet, raise questions, and obtain specific information about the many potential impacts of the proposed merger of CSX and Norfolk Southern in our community. It is UCI's role to insure that the quality of its environment is not only preserved, but continually improved. The density of the Circle's daily population makes infrastructure matters critical. Note that:

- Our health care institutions serve 1.7 million patients who come to the Circle each year;
- University Circle is an employment center with approximately 26,800 employees (for a point of reference, downtown Toledo draws 25,000 employees daily);

University Circle Incorporated
January 30, 1998
Pg. 2

- 16,400 students are enrolled in Circle educational institutions, the largest of which is Case Western Reserve University;
- More than 5,000 people reside in University Circle; and
- As a major tourist destination, the Circle attracts 2 million visitors annually.

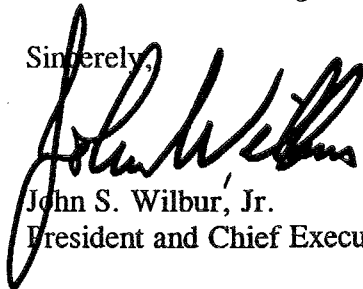

University Circle institutions play a significant economic role in Cleveland. Since 1990, University Circle institutions have invested approximately \$500 million in capital expenditures to build state-of-the-art facilities, and expect to invest more than \$200 million in additional capital expenditures during the next five years.

It is our collective concern that the increased train traffic that will result from the proposed CSX merger will adversely affect our economic progress and plans. We base this on the convictions that the increased traffic will adversely affect air quality; increase noise pollution (which may prove problematic to The Cleveland Orchestra); and bring hazardous materials into the Circle creating the potential need for emergency evacuation in an area with three major hospitals.

Based on the issues identified, UCI and many of its institutions support the city's proposal that alternate routes should be considered that would lessen the impact on residential, business, and other non-industrial neighborhoods of Cleveland. In addition, we believe that representatives of the railroads should meet with members of our community to discuss such impacts.

I strongly encourage you to read the enclosed statements from specific individual institutions addressing their specific concerns.

Sincerely,

John S. Wilbur, Jr.
President and Chief Executive Officer

Featured throughout this report are the public service advertisements that appear in Cleveland Magazine in conjunction with the quarterly University Circle Calendar of Events. They depict the major services provided by University Circle Incorporated—what we do day-to-day for this very special place called University Circle and for all of those who come here.

About University Circle and University Circle Incorporated

The story of University Circle begins with blacksmith Nathaniel Doan, a member of Moses Cleaveland's surveying party that founded our city in 1796. He soon found city living not to his liking and moved his family to a woodland area just five miles to the east along an old Indian trail that would become Euclid Avenue. As Doan's Corners (as it came to be called) flourished, the leading citizens of the day recognized the area's potential and began to create something extraordinary—something that would distinguish our city from all others.

Three significant events shaped the destiny of this location. In 1882, Jephtha H. Wade, founder of the Western Union Telegraph Company, thought the area well enough developed to donate 75 acres of land to the city of Cleveland for a public park and an art gallery. When Western Reserve University moved from Hudson (Ohio) in 1882, railroad tycoon Amasa Stone donated \$500,000 to establish Adelbert College in memory of his son. And, in 1885, real estate magnate Leonard Case, Jr. relocated his Case School of Applied Sciences to the site from downtown.

The streetcar line that served Euclid Avenue made a turnaround at East 107th Street—the stop was called University Circle—and so the area was given its name. By 1900, the colleges and beautiful setting attracted other organizations and an educational and cultural district of note was becoming a reality. As was Jephtha Wade's dream, The Cleveland Museum of Art was built in 1916 overlooking the Wade Park Lagoon. The Cleveland Orchestra was given a permanent home when Severance Hall opened in 1931; that same year, University Hospitals was dedicated.

By 1950, 34 institutions had chosen University Circle as their home—but the Circle was facing some serious challenges. In the words of Mr. Stanley A. Ferguson, then president of University Hospitals: "...after nearly 20 years of depression and war, the institutions in University Circle faced a mammoth need for expansion and improvement... the city's population had grown... people were enjoying more leisure time and were looking for worthwhile ways of spending it... museums, libraries, and concerts were filled as never before... however, expansion was more than a matter of money or determination because there just wasn't enough room, and because the area was becoming built up like a patchwork quilt."

Enter one of Cleveland's most spirited civic leaders, Mrs. William G. Mather, who recognized that University Circle was at a pivotal point. Her vision and generosity made possible the hire of the renowned Boston planning firm of Adams, Howard & Greeley, and after a rigorous 18-month study, the *1957 University Circle Master Plan* was issued. The Plan not only gave direction for the Circle's orderly growth, it did something inspiring: it reaffirmed that Cleveland had succeeded in creating the most impressive concentration of educational, cultural, and medical institutions in the country.

Perhaps the most important recommendation made was to "establish a central organization to administer the Plan and give it some real authority." And so, with full institutional support, the University Circle Development Foundation (the predecessor of University Circle Incorporated) was formed. Initial efforts were focused on creating a land bank to purchase and hold available land until needed by an institution for expansion. Soon, services that could be provided more efficiently if done collectively—parking, shuttle bus service, public safety, architectural review, and landscaping of common areas—were added. The stability provided by these services gave new confidence to the institutions and the Circle's growth skyrocketed.

In 1970, the University Circle Development Foundation was reorganized as University Circle Incorporated (UCI) with an added emphasis on strengthening the relationship between University Circle and its adjacent neighborhoods. In its outreach to the broader community, UCI began working closely with neighborhood organizations to build housing and provide access to broader community resources. UCI's Community Education Program was created in 1973 to bring the Circle together with Cleveland schoolchildren—a wonderful collaboration that thrives today. The *1990 University Circle Master Plan*, which updated the 1957 Plan, strongly reinforced the importance of neighborhood partnerships.

UCI's reorganization moved it from simply being the "caretaker" of the Circle's physical environment (although that role remains very important) to being a catalyst for economic development and an advocate for the whole of University Circle as a major force in the progress of our city and Northeast Ohio. Uniquely positioned to look to the future with a collective eye on behalf of the institutions it serves, UCI has been dedicated to ensuring the excellence of University Circle for 40 years.

From the Chairman and President

This is a milestone year for University Circle Incorporated (UCI)—our 40th anniversary—and in the spirit of celebration we are presenting this report to the larger community by its inclusion in *Cleveland Magazine*. University Circle is a very special place and Clevelanders are rightly proud of it—as a source of civic pride it has long ranked high on the list of city assets.

What many do not know about University Circle, however, is that since 1957 there has been an organization dedicated exclusively to ensuring the Circle's collective well being. As described in the preceding introduction, the 1950's brought the Circle to a turning point that was met boldly and determinedly by the formation of UCI. It is our privilege to work on behalf of this organization that is integral to the success of a remarkable concentration of institutions—one only needs to consider the level of achievement that is reached every day in this one square mile to understand the Circle's significance.

The core of what UCI does for the Circle is tangibly depicted on the following pages. Our services make it possible for each of our member institutions to thrive in a place that is safe, convenient, orderly, and beautiful—and to carry on with their important work for their visitors, clients, and patrons. But it is the combination of providing day-to-day services, framing longer-term strategies, and taking the collective long view that captures UCI's role. Simply put, UCI is working to make University Circle—today and tomorrow—a vibrant, active community that is known as one of the truly extraordinary urban districts in the country.

We are glad to report that the financial status of UCI is sound. UCI's unrestricted operating revenue for the year totaled \$15.3 million, which included annual fund contributions of \$472,000. In addition, UCI received \$1.4 million in endowment fund gifts. We acknowledge the foundations, business organizations, public agencies, and individuals who so generously contributed to this organization.

Our gratitude is also extended to UCI's Board of Trustees and our dedicated volunteers. With sad regret we note the deaths of four of our trustees, three of them noteworthy women who served us so well: Dr. Ruth R. Miller, Mrs. A. Dean Perry, and Mrs. Herman L. Vail. Frank R. Borchert, Jr., Vice President for Budget & Planning at Case Western Reserve University, will be much missed as a colleague and friend.

We are grateful for the contributions of our valued employees and acknowledge each of our member and associate member institutions for all that they bring to the quality of life in Cleveland and Northeast Ohio.

R. Thomas Stanton

Chairman of the Board of Trustees

John S. Wilbur, Jr.

President and Chief Executive Officer

September, 1997

Tom Stanton (standing) and John Wilbur are pictured with the handsome park bench in front of UCI's Administrative Office on Magnolia Drive. It is one of many being placed throughout University Circle by The Circle Bench Project — an endowed beautification program started by UCI in 1996.

Public Safety

When the University Circle Police Department was formed in 1959, it was the only private police department in the country. The bold thinking that led to its creation was that of civic leader Mrs. William G. Mather and T. Keith Glennan, the president of Case Institute of Technology, both of whom were instrumental in creating University Circle Incorporated two

years earlier. In 1959, public safety was a primary concern among the Circle institutions and there was full agreement that a police department exclusively dedicated to University Circle would complement the efforts of the Cleveland Police Department and enhance the security efforts of each institution.

Thirty-eight years later, the UCPD's success speaks for itself—by any measure, University Circle has long been one of Cleveland's safest areas. The presence of the UCPD, along with its reputation for quick response, is a strong deterrent to criminal activity in the Circle. Minimized opportunity coupled with timely and decisive intervention in actual criminal incidents has characterized the UCPD's safety strategy since its inception.

This year, in its continued dedication to community policing, the 28-member department increased the presence of officers in the Circle's busiest area—the intersection of Mayfield Road and Euclid Avenue—by opening a mini-station in an attractive storefront on Euclid. With an ever-growing number of special events in University Circle, the UCPD has hired 4 part-time officers who are available when extra police power is needed—this federally-funded part-time program has worked very well during the past year. Congratulations are extended to two longtime members of the force, James Radca and Kenji Kurokawa, who were recently promoted to the rank of sergeant.

Now in its third year, the University Circle Mounted Courtesy Patrol has proved to be a popular addition to the Circle's security efforts. Comprised of 12 seasoned equestrians, the Patrol rides in pairs on weekends from June through October to provide friendly assistance and information to Circle visitors. Recently, two Patrol members graduated from the Cleveland Heights Police Academy and now serve as part-time UCPD officers.

“University Circle is safe today because for nearly 40 years the institutions that comprise University Circle have been committed to making it safe. ”

—Chief Timothy J. Peppard, University Circle Police Department

We keep this one-square mile

© DON SNYDER PHOTOGRAPHY

University Circle is not only one of Cleveland's most beautiful areas—it is one of the safest.

Created in 1959 by University Circle Incorporated, the 28-member University Circle Police Department is unique in that it serves the 44 important institutions that make their home in University Circle's one-square mile.

A full-service police department, the UCPD's success is noteworthy given University Circle's concentration of institutions and activity—during an average day, 35,000 people come here to work, study, or visit.

FOR MORE INFORMATION ABOUT UNIVERSITY CIRCLE INCORPORATED, CALL 216/791-3900.

Established in 1957, University Circle Incorporated is the non-profit service organization dedicated to ensuring the excellence of University Circle—the cultural, medical, and educational center of Northeast Ohio.

A-510-d

Parking and Transportation

University Circle is a dynamic urban neighborhood—5,000 people live within its one-square mile and every day more than 15,000 employees and 16,000 students come here to work and learn. To take in a concert, exhibit, or lecture—or to keep a medical appointment, thousands more visit daily. The 70-plus institutions located within the Circle and its adjacent rim have diverse missions and, accordingly, have different needs. But common to all of the institutions is the need for well-run functional elements, such as parking and transportation, so that they can successfully carry on with their business. University Circle Incorporated has not only been instrumental in providing these services for decades, but in constantly bringing together the Circle institutions to discuss how best to meet their ever-changing needs.

UCI maintains a fleet of 20 buses that transports more than one million passengers annually. Known fondly

“We want our visitors to have a positive experience in University Circle even before they enter our museum. The Circlelink shuttle is a fine example of how the Circle institutions have come together to provide a visitor amenity that makes the total University Circle experience a friendly one.”

—Dr. James E. King, Director, The Cleveland Museum of Natural History

as the “greenies” for many years because of their color, the updated look of our vehicles reflects the attention we pay to their maintenance and appearance. This free shuttle service efficiently delivers employees from parking lots to workplaces, takes students to all points of the CWRU campus, and is available to casual visitors. To better serve the latter, Circlelink service was created—its friendly, easy-to-spot buses and signs make it particularly appealing to those visiting the Circle for the first time.

Most urban centers face the challenge of providing adequate parking space where it is most needed, and with its high concentration of institutions and people, University Circle is no exception. To that end, UCI and eight Circle institutions work collaboratively to provide accessible, safe, and cost-effective parking. Included in the system are 11 parking garages and 51 parking lots containing more than 10,000 parking spaces. In keeping with the level of service that the University Circle institutions warrant, our parking lot attendants are ready at a moment’s notice to provide assistance to our customers—from fixing flat tires to supplying emergency gasoline.

We make museum hopping easy.

DON SNYDER PHOTOGRAPHY

University Circle's one-square mile is an extraordinary cultural, medical, and educational center—complete with free **Circlelink** shuttle service provided seven days a week by University Circle Incorporated.

Whether you are here to visit the Circle's wonderful museums, take a class at one of its prominent schools, enjoy a superb performance, or keep an important appointment in this renowned medical hub, we are here to serve you.

Community Planning

"University Circle is the most outstanding institutional complex in the country—it truly sets Cleveland apart from all other cities. Without a doubt, the decades of guidance and planning provided by University Circle Incorporated have made the Circle what it is today."

—Michael R. White, Mayor, City of Cleveland

University Circle did not happen by chance—well-planned community development has always been critical to the success of University Circle and its institutions. While Circle institutions have individual development plans, University Circle Incorporated works for the collective whole to allow the Circle to reach its maximum potential. To this end, there have been two major planning tools for the Circle—the 1957 and the 1990 University Circle Master Plans—both were created by the Circle institutions and implemented under UCI's guidance.

The 1957 Master Plan accomplished many things, including the formation of UCI to oversee the Circle's progress. The need for a coordinated approach to physical development led to the creation of a "land bank" to allow UCI to buy available land and hold it until needed by Circle institutions for expansion or for projects that benefit the Circle community. To ensure that the Circle's high architectural standards were maintained, the Architectural Review Board was established—its nationally noted architects continue to review all proposed building plans.

The 1990 Plan, which re-examined and updated the 1957 Plan, set forth new development guidelines to make the Circle more accessible, coherent, and beautiful. A few examples of completed and proposed projects include the comprehensive wayfind-

ing system comprised of 100 handsome signs and the multi-headed lanterns lighting the Fine Arts Garden. With the goal of redesigning Euclid Avenue as the Circle's "main street," a task force made up of institutional representatives is reviewing proposed plans. Although still in the planning stages, the building of an apartment complex at the corner of Euclid Avenue and Ford Drive remains a priority. Add to these the extraordinary level of investment our institutions have made in keeping with the Master Plan's goals—since 1990 new building projects have exceeded \$350 million.

One of the most important components of our planning efforts is maintaining strong partnerships with the neighborhoods adjacent to University Circle and working together to improve their respective residential and commercial areas. Currently, UCI is focusing on the refurbishment of East 105th Street at the Circle's northern edge. The well-being of University Circle and that of its surrounding neighborhoods are inextricably linked; we are dedicated to planning that is mutually beneficial.

We take care of this special place.

• DON SAYER II PHOTOGRAPHY

University Circle did not happen by chance. Well-planned **community development** has always been essential to the Circle—and University Circle Incorporated provides the vision and services necessary to maintain the quality environment so important to this very special place.

Our wayfinding system is comprised of 100 handsome signs that efficiently guide you to your Circle destination. It is but one example of the coordinated approach taken by University Circle Incorporated and its 44 member institutions to make University Circle a better place for our visitors.

FOR A BROCHURE ABOUT OUR COMMUNITY DEVELOPMENT PROGRAM, CALL UNIVERSITY CIRCLE INCORPORATED, 216/751-3908.

Established in 1957, University Circle Incorporated is the non-profit service organization dedicated to ensuring the excellence of University Circle—the cultural, medical, and educational center of Northeast Ohio.

A-511-d

Community Outreach

In 1970, University Circle Incorporated was reorganized so that it could take a more active role in serving the neighborhoods around the Circle both in terms of physical development and in the programs it offered. One goal was to bring the area children more closely together with the Circle's cultural institutions; to that end, UCI's Community Education Department was established in 1973.

Each year, this effort reaches 35,000 Cleveland students through many worthwhile programs. The

most comprehensive is the Field Trip Program that serves students from 26 Cleveland schools and arranges field trips with 16 of the Circle's cultural institutions. The field trips are designed to be relevant to current lesson plans to maximize each student's experience. In addition to providing the admission fees, UCI provides transportation on our "Enrichment Express" buses. (When UCI buses are not in use for school programs, they shuttle senior adults who live in the

University Circle area to many Circle museums and events.)

Other offerings include the Artist in Education Program that arranges in-school residencies for artists who lend their expertise in dance, drama, visual arts, and creative writing—this year museum visits will add a valuable dimension. For a select group of outstanding high school students, the Summer Scholar Program provides a five-week internship at one of 15 University Circle institutions.

For the first time, a program is being offered that addresses the learning needs of preschool children. Modeled after a Smithsonian Institution program, the Early Learning Initiative is an exciting effort that brings together seven Circle institutions and five area preschools under the direction of UCI's Museum Education Specialist, Diane V. Hansson. This important collaboration features a curriculum that takes full advantage of the wonderful museum collections and performances offered by the participating institutions.

"The lives of more than two million Cleveland schoolchildren have been enriched by visits to University Circle's museums, theaters, concert halls, and gardens—and University Circle Incorporated has made this possible. We look forward to working together to serve many more."

—Ms. Elizabeth O. Ward, Principal, Harvey Rice Elementary School

UNIVERSITY CIRCLE INCORPORATED

COMMUNITY EDUCATION PROGRAM

University Circle is a non-profit organization that provides living education and the program together with the educational resources available in the community is one of the most important factors provided by University Circle.

Since its creation in 1971, our Community Education Program has helped over two million students together with the important individuals. Under its care, the program provides education to entry level students in the field of...

Tourism and Promotion

"Cleveland is enjoying remarkable tourism growth which has contributed significantly to the state's economy and has helped propel Ohio to its rank of sixth in the nation in the number of leisure visitors. An outstanding attraction, University Circle is vital to our national standing as a destination."

—George Zimmerman, State Tourism Director, Ohio Division of Travel & Tourism

University Circle has been a prime visitor destination for more than 75 years. Both local visitors and out-of-towners alike are drawn to what is perhaps the most impressive cultural center that has ever been built—today, it attracts more than 2 million visitors annually. With nine museums, outstanding performing arts organizations, and beautiful gardens, there is constant activity—the rich architectural heritage and beauty of the setting are a bonus. Add to that great local restaurants and the ease of getting around on the free CircleLink shuttle; the result is a perfect destination that satisfies a wide range of interests from symphony-goers to families seeking a full day of fun.

Tourism is one of the fastest growing industries in the world—U.S. tourism generates \$422 billion annually. Cleveland is happily seeing an increase in its tourism market and University Circle is a full partner in the efforts of both the Convention & Visitors Bureau of Greater Cleveland and the Ohio Division of Travel & Tourism.

To garner a greater share of the group tour segment of the market and to better position the Circle as a fascinating destination, five of the Circle's largest attractions—The Cleveland Museum of Natural History, The Cleveland Play House, The Cleveland Museum of Art, The Cleveland Orchestra, and The Western Reserve Historical Society—have come together under the direction of University Circle Incorporated to hire Nancy Feighan, the Circle's first Tourism Manager. With a focus on group tours, she is packaging and selling the Circle to groups from many states, as well as Canada.

In addition to tourism, UCI works in other ways to promote University Circle. Now in its second year, the *University Circle Calendar of Events* remains in high demand and more than 500,000 *Visitor Guides* are distributed annually. We handle inquiries from all over the world—not only about the Circle as a cultural mecca, but as a medical and educational center as well.

To showcase this extraordinary place and to encourage people to visit, two annual community events are hosted in the Circle. Coordinated by UCI, the summer's "Parade The Circle Celebration" and December's "Holiday Circlefest" have become beloved traditions and are enjoyed by thousands.

We make our TOURISTS

© DON SNYDER PHOTOGRAPHY

University Circle Incorporated welcomes tourists from near and far to the most remarkable cultural center in the world. **University Circle** is not only a beautiful destination, it is one of the most beautiful. With nine museums, outstanding performing arts, and wonderful gardens, all in 400 square miles, it offers the perfect combination of culture and fun.

University Circle Incorporated strives to make the Circle visitor-friendly for all of our guests.

Our Tourist Manager works exclusively with mainstream travel.

The Circle is here to help you bring even more visitors to this not-to-be-missed place.

UNIVERSITY
CIRCLE

Established in 1910, University Circle is the largest and most prominent neighborhood in Cleveland, Ohio. It is home to the world's largest concentration of cultural institutions, including the Cleveland Museum of Art, the Cleveland Orchestra, and the Cleveland Public Library. University Circle is a vibrant and diverse community that offers a rich and rewarding experience for all who visit.

University Circle Incorporated (UCI)

is the nonprofit planning, service, and development organization established in 1957 to provide a quality environment for University Circle's cultural, educational, medical, religious, and health and human services institutions.

University Circle Incorporated 10831 Magnolia Drive Cleveland, Ohio 44106-1887

Design: Nancy Warkentin, Warkentin Design Editor: Winney E. Bohan, UCI Director of Public Relations Cover and Advertisement Photography: Don Snyder Other photography: Jeff Lutz, The Cleveland Museum of Natural History, Roger Abramson, The Cleveland Orchestra, Robert F. Wood

A multifaceted organization, UCI's many areas of responsibility are:

- Planning and facilitating physical development in the Circle;
- Buying and assembling properties to make them available for projects that benefit the Circle community;
- Maintaining public safety through the University Circle Police Department;
 - Managing many of the Circle's parking areas;
- Working with adjacent neighborhoods toward mutual goals and benefits;
 - Providing a Circle-wide transportation system;
- Introducing Cleveland's schoolchildren to the resources of Circle institutions through educational programs;
 - Enhancing the area's natural beauty; and
- Promoting University Circle as one of Cleveland's and Northeast Ohio's prime tourist destinations and most important assets.

Attn: Elaine K. Kaiser,
Environmental Project Director

Dear Ms. Kaiser:

Last Wednesday a group of University Circle executives met to review the proposed routing of CSX and Norfolk Southern freight traffic through University Circle in Cleveland, Ohio. As was clear from our numerous questions, many of us have significant concerns, particularly from a safety perspective.

As detailed, the possibility that up to 81,000 freight cars containing hazardous cargo would be transiting through University Circle annually. While the accident statistics that were presented are somewhat reassuring, it was expressed quite clearly that the possibility of serious accident cannot be eliminated. I would like to most strongly encourage you to convey to the Surface Transportation Board the unique nature of the University Circle area. It certainly has the largest concentration of hospitals, nursing and elderly care facilities and other institutions, such as our own Cleveland Hearing & Speech Center, which work with very special populations. How could a hazardous cargo accident be contained should it occur within the confines of densely populated University Circle?

This organization, Cleveland Hearing & Speech Center, must express its particular concerns regarding the significant increases in noise which such volumes of rail traffic would create. On a daily basis our agency serves persons with significant hearing loss resulting from long term exposure to noise. We also see the psychological consequences to persons who suffer from noise exposure. Why are the noise abatement considerations which always are applied to airports not relevant to this instance? Should there not be similar noise abatement regulations which apply to the railroad industry.

Cleveland, Ohio

4 4 1 / 0 6

216.231.8787.Voice & TTY.Fax.216.231.7141

A-515-a

Of an even more significant nature is our concern that the proposed rail traffic is being routed through low income neighborhoods. Are there not alternative routes that could be used?

While I understand the need for railroad transportation, particularly in a booming economy, I am hoping that the questions raised in this letter can be constructively addressed and reviewed.

Sincerely,

A handwritten signature in cursive script that reads "Bernard P. Henri, Ph.D." The signature is written in dark ink and is positioned below the word "Sincerely,".

Surface Transportation Board
1925 K. Street, N.W.
Washington, D.C. 20423-0001

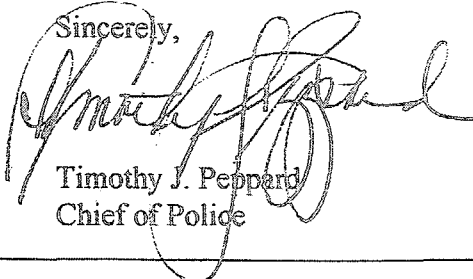

Ladies or Gentlemen:

CSX and Norfolk Southern Railroads have filed a joint application with the Surface Transportation Board to acquire the Conrail Railroad, and subsequently divide Conrail's assets. I have been advised that this joint venture will result in a threefold increase in freight train traffic thru University Circle to include 44,000 carloads of hazardous waste.

University Circle is the cultural, medical, and educational center of Cleveland and Northeast Ohio. It is the home of internationally renowned museums, illustrious performing arts organizations, an eminent university and college, noted music and art schools, prominent hospitals and clinics, important health and human service agencies and many religious institutions.

Maintaining public safety in University Circle is the responsibility of the University Circle Police Department (UCPD). A key ingredient of the UCPD mission is to provide a safe environment that allows the valuable institutions located in the Circle to thrive. I would be remiss in my responsibility to this mission if I failed to express my concern for the affect the proposed rail plan may have on the safety and quality of life in University Circle. This community has yet to be engaged in dialogue by the parties to the proposed acquisition. This lack of inclusion is both inappropriate and unacceptable. University Circle is far too important to the life and vitality of greater Cleveland to be excluded from a decision that will have affect thru the next millennium. I request you consider University Circle as this process proceeds.

Sincerely,

Timothy J. Peppard
Chief of Police

Located in University Circle, Abington Arms is an HUD assisted high rise apartment building for low-income elderly and mobility disabled residents. Abington was built in this cultural area to offer its residents a quality living environment. We have a total of 152 units with 157 tenants with approximately 60 in the disabled category.

Abington Arms is located approximately 475 feet from the bridge, with elevated railroad tracks, in Little Italy, an Historic District. Of great concern to us is the new CSX merger. Their proposed route will increase freight rail traffic through our area from 20 trains/day to approximately 81 trains/day and as the economy improves, volume would also increase. The negative impact on our residents, in terms of health and well-being is enormous; ie, a triple increase of noise levels which cannot be ameliorated because the tracks are elevated; dangerously increased levels of pollutants and carcinogenic materials in the immediate environment; and the increased probability of accidents involving railroad transported hazardous materials.

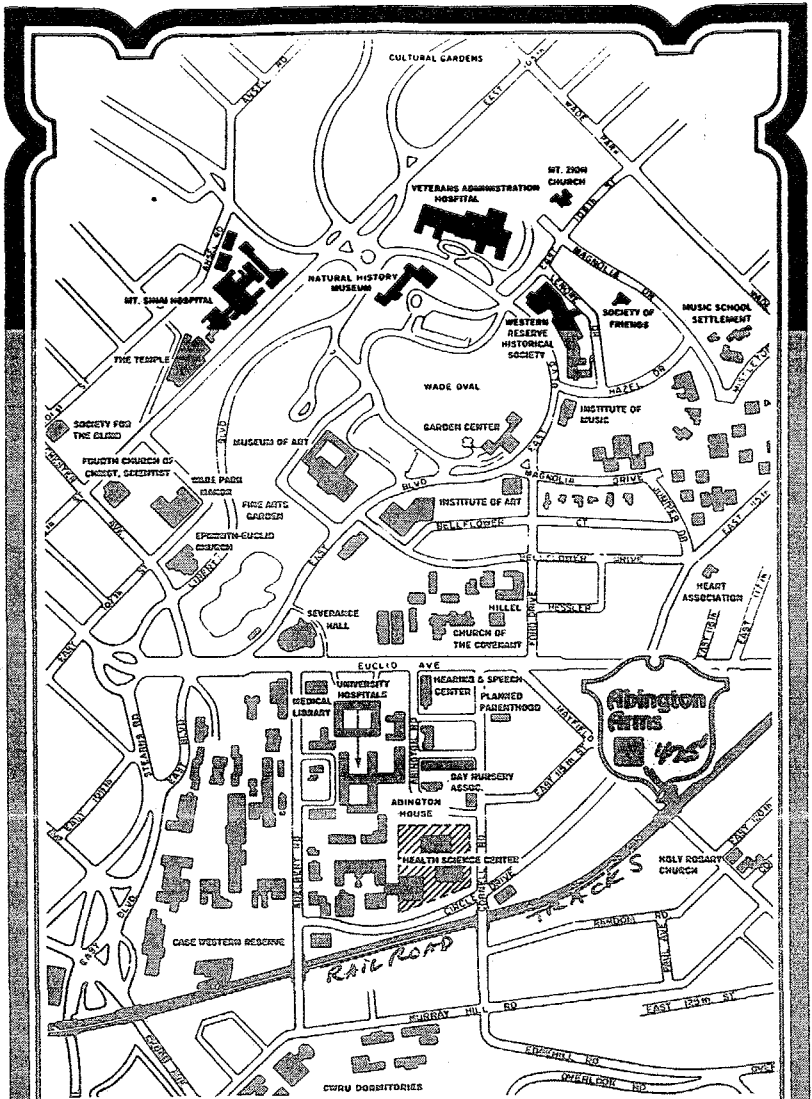

Abington Arms is only one of many HUD assisted senior apartment buildings located in the University Circle area comprised of approximately 1200 units, with approximately 1210 elderly, of which 225 could be identified as disabled. A daytime railroad accident, involving an hazardous spill, necessitating evacuation of these numbers of people plus all of the other approximately 30,000 people who work in the University Circle area daily would be a disaster of immeasurable proportions.

Please consider the alternate routes proposed by our City of Cleveland Mayor White.

Most sincerely yours,

ABINGTON ARMS

Case Control Unit
Finance docket No. 33388
Surface Transportation Board
1925 K Street, N.W.
Washington D.C. 20423-0001

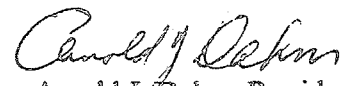

Dear Sirs,

The Church of the Covenant is located in University Circle, Cleveland, Ohio. The CSX and NS railroads have proposed a change in rail traffic through the City of Cleveland which would dramatically increase rail traffic through the heavily congested University Circle area. We oppose this plan and urge the Surface Transportation Board to adopt an alternate plan proposed by Cleveland mayor, Michael White.

Our church has a large number of elderly members who live in the Judson retirement and nursing communities in close proximity to the rail line. We also serve students at Case Western Reserve University located next to the rail lines. We feel that these populations of our members, particularly the elderly and infirm, are endangered by the proposed heavy traffic, 81,000 cars/year, of Hazardous Materials. It would be difficult to rapidly evacuate these members in the event of an accident accompanied by a spill of hazardous materials.

Our church is a leading advocate for the poor, and powerless and for minorities in Cleveland. We have by intention a racially diverse congregation. We object to the proposed plan of the CSX and NS railroads which will place the burden of an increase in noise, pollution, and danger of hazardous spills on the minority and low income population through which this increased rail traffic will pass.

Sincerely yours,

Arnold J. Dahm, President
Church of the Covenant

CASE WESTERN RESERVE UNIVERSITY

January 30, 1998

The Honorable Michael R. White
Mayor, City of Cleveland
601 Lakeside Avenue
Cleveland, Ohio 44114

Dear Mayor White:

Thank you for bringing to our attention the proposal by CSX and Norfolk Southern to increase significantly the number of trains being routed through University Circle. These tracks run directly through our campus, where we accommodate 10,000 students and nearly 5,000 faculty and staff members. In discussion with University Circle, Inc., and our institutional neighbors here in the Circle, it is apparent that the proposed increase in train traffic raises important issues that need to be examined before the project can proceed.

At best, the increased noise generated by additional traffic would be a nuisance. Perhaps more troublesome is the effect of the increased vibration that would be produced. These are matters we will need to examine carefully.

Most disturbing, however, is the prospect that emissions from train engines would be quadrupled in an area which previous studies (not conducted by CWRU) have shown to be one in which air currents do not rapidly disperse. Thus, particulates and other emissions from increased train traffic might be expected to concentrate in the University Circle area, a situation that has implications for public health. We have not had an opportunity to study this matter adequately yet, but I suspect it is an issue that will be of interest to the larger community as well.

My heartfelt request is that the Surface Transportation Board expect that the railroads engage the community in a thorough discussion of these and other concerns that have been raised about their proposal, including a review of the environmental consequences of the change. We support your effort to secure such a commitment, and we will cooperate with your office in doing so.

Sincerely,

Agnar Pytte
President

Surface Transportation Board
1925 K Street, N.W.
Washington D.C. 20423-0001

Dear Ms. Kaiser,

I am writing to you regarding grave concerns I have related to the proposed radically increased routing of train traffic through University Circle by CSX and Norfolk Southern.

I manage over 625 suites and 70,000 square feet of office and retail establishments some directly adjacent to and others in close proximity to the Mayfield Road elevated tracks.

Over 400 of my residents live in low income HUD subsidized properties for the elderly and handicapped and low income families. Abington Arms, a HUD Building for low income elderly and handicapped, is located less than 500 feet from the elevated tracks.

I do not believe that the data provided by CSX and NS sufficiently relates the negative impact of increased traffic of approximately 20 some trains a day to 80 plus trains a day. While the added noise alone for elevated tracks is of concern, my greater concern is the heavy increase of pollutants that not only significantly impact air quality, but may in fact be introducing carcinogenic and other pollutants with wide reaching medical repercussions.

With the increased transportation of toxic waste, comes the increased potential for the devastating effect of a major spill which would occur in this densely populated area.

5025 Swetland Court

Richmond Hts., Ohio 44143

Phone 216-261-5000

Fax 216-289-9600

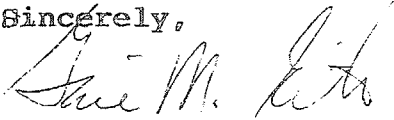

A-517-d

You may not be aware of the unique nature of University Circle. Directly adjacent to the rail line is the historic community of Little Italy and nationally renowned hospitals and university. The Circle is home to many cultural institutions including, the world renowned Cleveland Museum of Art and the Cleveland Orchestra. The Circle is also the home of an additional 1200 HUD subsidized suites for the elderly, as well as many conventional apartments and businesses. Studies show that upwards of 30,000 people populate the Circle on any given day.

On behalf of myself, my residents and neighbors, I urge you to demand from the train companies more inclusive information on the adverse affects. I further urge you to support the alternate plans proposed by Mayor Michael R. White, which takes the additional traffic through the industrial corridors with minimal impact upon the residential neighborhoods.

I believe an open meeting with yourself and the residents and institutions of University Circle will enable you to make a more informed decision that would best benefit the community as a whole.

Sincerely,

Gail M. Eovito
Senior Property Manager

**Potential Incremental Increase of Criteria and Toxic (Non-Carcinogenic and Carcinogenic) Air Pollutants
in the Collinwood Corridor**

No.	Pollutants ¹	Increase in Emissions (Due to Increase in Train Operations)
		lb/year
Criteria Polutants and VOCs		
1	Carbon Monoxide	42,874
2	Nitrogen Dioxide	196,506
3	Particulate Matter (PM-10)	17,864
4	Total Organic Compounds (as CH ₄)	5,717
Carcinogenic Pollutants		
1	Benzene	1.60E+01
2	Formaldehyde	1.63E+00
3	Acetaldehyde	5.20E-01
4	Acrolein	1.62E-01
5	Propylene	5.75E+01
6	Benzo(a)pyrene	5.30E-03
7	Benzo(a)anthracene	1.28E-02
8	Anthracene	2.54E-02
9	Pyrene	7.65E-02
10	Chrysene	3.15E-02

Note:

1. Pollutants and their emission factors were selected based on information provided in the EPA Document AP-42 "Compilation of Air Pollutant Emission Factors," Emission Factors for Large Stationary Diesel Engines, Section 3.4.1 through 3.4.4.

Assumptions used in the analysis:

1. The maximum rated power of 6,000 hp was assumed for each diesel engine.
2. Increase in exposure to potential emissions due to train traveling through corridor was estimated using the following assumptions:
 - Link length = 3 miles
 - Train average speed = 30 mph
 - Number of trains increased = 37 train a day.
 - Number of days per year = 365 days

Berea Grade Separation

The construction of a rail/rail grade separation in Berea requires an engineering and construction effort on the scope of a major freeway interchange. Two primary existing Conrail lines converge from each direction in BE Tower interlocking, located in the northern portion of the City of Berea. These lines extend from Chicago; St. Louis via Greenwich; Buffalo via the Cleveland Lakefront and CP 190; and Pittsburgh via the Short Line. Additionally, Front Street, a major arterial roadway, crosses both main lines at grade about 1200 feet to 1600 feet east of the Tower itself.

Based on conceptual analysis, it appears that the best design solution would locate an NS double track line from Chicago to the Short Line over a CSX double track line from Greenwich to the Lakefront. Two potential schemes were developed. One would keep CSX approximately at grade, with the NS line changing in elevation. The total distance involved would be about 10,000 feet and would result in a gradient of 0.6 percent or less. At the south crossing of Front Street, an underpass would carry Front Street under NS, with the new roadway about 6 feet below current elevation. Front Street would continue downgrade to pass under CSX at the north crossing, about 23 feet below current elevation. All dimensions are approximate only. The approaches to the rail/rail overpass would be earth embankment wherever no encroachment on adjacent property owners would result. Significant lengths of retaining walls were included, and would be required to accomplish this objective.

At the rail/rail separation, a second scheme would raise NS about 15 feet above its current elevation, and drop CSX 15 feet. This would allow the approach distances to be reduced to 7500 feet, with gradients of 0.6% or less on both CSX and NS. This would also have the benefit of minimizing structural quantities and visual impacts, and minimizing the impact on Front Street. In this scheme, the north Front Street crossing

would be an overpass over the railroad. In either scheme, Front Street gradients would be in the 5 percent range after accounting for vertical curvature and sight distances. However, as a trade-off, this scheme appears to have greater constructibility challenges because of the need for traffic to be maintained on both railroads and on Front Street. Temporary relocations and structures are likely required.

Obviously, additional schemes that involve other final railroad and roadway elevations, with corresponding cost and benefit trade-offs, are also possible, and should be considered.

A connection track, oriented eastbound from NS to the CSX corridor leading to the Lakefront, is included to accommodate Amtrak trains and NS trains that must pick up and set off at Rockport. The connection, designed for 40 mph, could diverge from the NS main line near the crest of the overpass, then curve north to parallel CSX. It would tie into the existing Conrail south control siding located parallel and immediately southeast of the two CSX main line tracks. Ownership of the control siding would be with NS. This arrangement would allow NS trains destined for Rockport to reach the yard without conflicting with any CSX traffic.

Alternatively, the connection track could be located east of the properties just east of Front Street. The county owns vacant parcels, proposed to be the location of a waste transfer station, that appear to be sufficient to accommodate the connection and the transfer station if desired. A portion of the connecting track would be located parallel to Front Street, about 800 feet to the east. In either case, the connecting track would reach grade west of the next at-grade crossing, Sheldon Road.

The control siding is currently used by Conrail trains working at Rockport, so little change in operating practices would be necessary. If additional capacity is required at the west end of Rockport, since some yard switching would likely occur

there, the parallel second lead track (which leads also to Ford Yard) would be upgraded and could be signaled. Ford plant switching is performed from the west end of the Ford Yard, so it appears reasonable that any conflict with switching movements would be minimal, and would be mitigated by the upgrade of the second lead track, which is now only lightly used.

This conceptual investigation did not include detailed consideration of utility impacts. It is known, however, that in Berea the Northeast Ohio Regional Sewer District interceptor sewer does parallel the line from the Lakefront, then crosses under the tracks to parallel the line to Greenwich. According to our information, this sewer is located about 60 feet below grade. Additional investigation is necessary, but no insurmountable conflict appears to exist.

To accommodate the needs of the public and of the railroads, the project would include the following components:

- Rail/rail grade separation and approaches
- Grade separation of Front Street from both railroads. The south crossing with NS likely involves NS over the road, while at the north crossing with CSX Front Street could go either over or under the railroad, depending on the configuration selected for the rail/rail overpass
- Reconstruction of Front Street for its entire length through the two railroad crossings, beginning near the First Street intersection to the south and continuing to or beyond the Emerson Street intersection to the north
- Connection track from NS to CSX for Rockport trains and Amtrak
- Modification of the NS (north) stone arch bridge over the Rocky River. No modification appears necessary to the CSX (south) bridge, now under reconstruction
- Replacement of the NS (north) bridge over Rocky River Drive. No modification appears necessary to the CSX (south) bridge
- Sheldon Road crossing of the line to the Lakefront may require grade separation for the scheme with CSX at-grade, depending on the rail/rail bridge elevation. This crossing is not affected with a partial NS up/CSX down scheme

Most construction can occur on railroad-owned property except:

- A Front Street grade separation will require property impacts, even under the railroads' plans
- ⊙ A temporary connection track may be required west of the Rocky River over NEORS D property
- ⊙ The connection east of Front through county property

The consideration of this grade separation project in Berea was not taken lightly; the proposed project involves numerous trade-offs and significant engineering and construction phasing considerations. However, it appears very feasible, and should be considered.

NEIGHBORHOOD IMPACTS OF FREIGHT RAIL TRAFFIC INCREASES
Comparison of Alternatives

ALTERNATIVE	TRAINS per DAY current → proposed (or lines with proposed increases)	RESIDENTS LIVING WITHIN 1,000 FEET OF RAIL LINES PROPOSED FOR INCREASED FREIGHT RAIL TRAFFIC					IMPACT INDEX*	
		POP.	% NON- WHITE	% HISPANIC	% BELOW POVERTY	MEDIAN INCOME		GRADE CROSSINGS
NS/CSX Original Proposal	42 → 115 174% increase	67,847	52.3% (35,489 persons)	5.3% (3,598 persons)	37.0% (25,132 persons)	\$14,868	13	22.4
NS/CSX Revised Proposal (12/5/97)	42 → 115 174% increase	68,317	51.6% (35,260 persons)	4.7% (3,207 persons)	33.9% (23,50 persons)	\$16,282	7	21.4
Alternative 1: La keshore/ West Side	46 → 67 46% increase	49,547	37.1% (18,359 persons)	6.0% (2,955 persons)	29.2% (14,58 persons)	\$17,456	4	8.1
Alternative 2: La keshore/ Short Line	46 → 67 46% increase	32,625	54.5% (17,794 persons)	1.0% (319 persons)	28.7% (10,561 persons)	\$16,175	4	5.2

* The "Impact Index" numbers were determined on the basis of the following calculation:

$$\text{additional trains per day on each rail line segment} \times \text{population within 1,000 feet of tracks on each rail line segment} + 100,000 = \text{Impact Index}$$

The rail line segments and the associated neighborhoods are identified on the maps and tables which show the neighborhood impacts of increased freight rail traffic.

Higher impact numbers indicate greater impacts on neighborhoods. Lower impact numbers indicate lesser impacts on neighborhoods.

Improve Track/Signals near Rockport/Ford	\$0	\$0	\$0	\$2,000,000	\$2,000,000	PB estimate
CSX Bagley Road Underpass	\$0	\$0	\$15,000,000	\$15,000,000	\$15,000,000	PB estimate
Bessemer Ave. Crossing Realignment	\$0	\$0	\$300,000	\$0	\$0	City of Cleveland estimate
TOTAL	\$28,100,000	\$72,100,000	\$107,225,000	\$171,500,000	\$147,780,000	***

Notes:

These estimates should be considered conceptual in nature, and are subject to change following further investigation.

These estimates generally do not include improvements common to all alternatives, such as Collinwood intermodal improvements.

* Norfolk Southern's revised submittal regarding the Flats Industrial (West Side) Connection is actually dated 11/25/97.

** It is our understanding that CSX's estimate for this Short Line segment and Cuyahoga River bridge upgrade, originally documented at \$11.6M, may increase to over \$18M. Note that this uncertainty does not affect the comparison of the costs of the alternatives.

*** Several estimates are based on railroad-provided figures. Following the re-designation of ownership of certain segments, evaluation by the other railroad may result in the need for different improvements with different costs. This is especially true regarding the possible need for the Harvard tunnels and improvements on the Short Line from Marcy to Mayfield in Alt. 2.

VERIFIED STATEMENT OF EMMANUEL ONUNWOR

1. I am Emmanuel Onunwor, Mayor of the City of East Cleveland. I submit this verified statement on behalf of the City of East Cleveland regarding the environmental and safety effects of the above-captioned transaction.

2. We have reviewed the issues facing the City of East Cleveland as addressed in the Draft Environmental Impact Statement ("DEIS") prepared by the Section of Environmental Analysis ("SEA"). We are deeply concerned about the adverse impacts the people of the City of East Cleveland will face as a result of this transaction if proper mitigation measures are not imposed.

3. Specifically, we oppose the current DEIS and Application because they do not adequately address issues regarding safety, transportation of toxic materials and substantial increase in volume of rail traffic in and around the City of East Cleveland.

4. The people of the City of East Cleveland will experience the significant effects the City of Cleveland has described in detail in their Comments filed October 21, 1997 and in the Comments on the DEIS which they are filing today. We are working closely with the City of Cleveland to develop alternative

routing scenarios in order to diminish the environmental impacts on our residents. We, like the City of Cleveland, strongly believe that aggressive alternatives, such as re-routing trains, are necessary to avoid serious adverse impacts upon our residents. The mitigation proposed by the SEA in the DEIS is insufficient to address the environmental impacts on our residents.

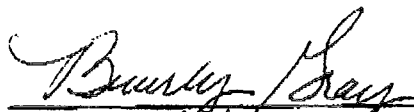

5. The City of East Cleveland, therefore, urges the SEA to reexamine the environmental impacts of the transaction upon the City of East Cleveland and the City of Cleveland. Particularly, we suggest the SEA examine alternatives, such as re-routing of trains, in order to avoid serious adverse impacts upon our residents. We are anxious to consider suggestions and recommendations, including those proposed by the City of Cleveland, that adequately address these significant issues.

VERIFICATION

I, Emmanuel Onunwor, verify under penalty of perjury that I have reviewed the foregoing Verified Statement, and that all of the facts stated therein are true and correct. Further, I certify that I am qualified and authorized to verify and file this Verified Statement. Executed on this 2nd day of February, 1998.

Emmanuel Onunwor

Subscribed and sworn to
before me this 2nd
day of February, 98.

Re: Proposed acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad

Dear Ms. Kaiser:

Attached is a survey the Erie County Engineer of Ohio has completed relative to the proposed Conrail acquisition.

It is considered imperative those conditions are met as delineated in the tabular form attached and as further addressed following, in order such an acquisition be recommended, due to the substantial increase in railway traffic of between 2 and 8 times current daily volume.

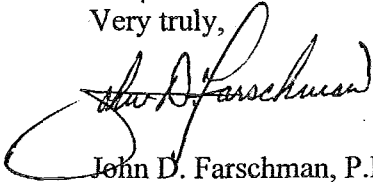

Please note that there is an existing underpass on Miller Road which was not addressed. It lies about midway between the Cities of Sandusky and Bellevue, Ohio and will provide the only means of emergency access between the east and west side of the N & W Railroad. Without it emergency equipment will not be able to access either side during any time the crossing may be closed due to this increased rail traffic. It is necessary that this underpass be reconstructed to accomodate physically large fire equipment and provide for other situations including but not limited to medical, or those of a national emergency nature.

Additionally there is need to consider possible major reconstruction at the Perkins Avenue - Cleveland Road intersection at the Conrail tracks just east of the City of Sandusky which has not been addressed in any form of which I am aware.

Similarly it is believed due to the high volume of truck and other vehicle traffic on S. R. 99, an overpass should be constructed over the existing N & W Railroad. There already are major highway traffic delays there with the existing volume of rail traffic, and this can only get worse by completing this acquisition.

Please consider these requests in any action which is to be taken relative to this subject matter..

Very truly,

John D. Farschman, P.E., P.S.

Re: Proposed Conrail CSX Norfolk Southern Merger

Dear Ms. Fisher:

I am writing to oppose the abovementioned merger for three reasons:

- 1) I live in the Broadway neighborhood in Cleveland. All of the proposals I have seen, including the Mayor's compromise proposal have a huge increase in train traffic at the vicinity of Broadway and Harvard, a few blocks from my house. I am worried about the increased hazardous waste, the noise, and the dirt that the extra train traffic will create.
- 2) I am committed to mass transit, particularly trains, there has been a proposal to put a commuter rail stop at the Broadway Harvard intersection. I believe the merger will be the end of that proposal.
- 3) My life's work has been the revitalization of cities. For ten years I have lived and worked in the Broadway neighborhood, and we have made significant progress in increasing the attractiveness of this neighborhood as a place for people to choose to live. I believe the merger, with the increased train traffic will have a significant negative impact and wipe out much of the progress we have made. Cities have taken the brunt of the "negative" features of our modern culture. To survive and prosper, they can no longer be a dumping ground, or a pass through for things which are detrimental, without being compensated in such a way to allow cities to lessen the negative effects.

Thank you for considering my comments.

Respectfully,

Marie Kittredge

RESPONSIVE COMMENTS TO
DRAFT ENVIRONMENTAL IMPACT STATEMENT
AND
REQUEST FOR PROTECTIVE CONDITIONS
SUBMITTED ON BEHALF OF
THE OHIO ATTORNEY GENERAL,
OHIO RAIL DEVELOPMENT COMMISSION
AND
THE PUBLIC UTILITIES COMMISSION OF OHIO
.

I. INTRODUCTION

A draft Environmental Impact Statement (draft EIS) was issued by the Surface Transportation Board's Section on Environmental Analysis (SEA), on December 12, 1997. That draft EIS incorporated safety integration plans which were filed by CSX Transportation and Norfolk Southern Corporation (collectively "Joint Applicants") as required in the Board's Decision No. 52. Interested parties were invited to file responsive comments concerning the draft EIS by February 2, 1998. Such comments are to be considered by SEA in preparation of the final EIS expected to be issued in May of 1998. Specifically, the SEA seeks comment on the feasibility of mitigation matters proposed in the draft EIS and invites parties to submit additional and/or alternative

mitigation proposals. These comments are timely submitted on behalf of the Ohio Attorney General, the Ohio Rail Development Commission (ORDC), and the Public Utilities Commission of Ohio (PUCO) (collectively "Ohio").

II. STATEMENT OF INTEREST

Ohio experiences prolific rail traffic. Three Class I railroads and over 30 short-line and regional rail carriers operate throughout the state. Ohio has a significant stake in issues involving safety, traffic flows, noise abatement, environmental-related matters, and other issues raised by this Joint Application. With nearly 6,500 public highway-railroad grade crossings located throughout Ohio, issues of crossing safety and traffic congestion are of paramount concern to the state.

Ohio applauds the efforts of the SEA staff in identifying and discussing the myriad of issues addressed in the draft EIS. Ohio recognizes, as does the SEA, that a cooperative railroad-public partnership is critical to the effective resolution of many of these issues. The PUCO, in coordination with ORDC, has regularly involved railroad and local governmental officials in the process by which public highway-railroad grade crossings are identified and selected for publicly-funded construction of

active warning devices. Ohio certainly endorses continuation of this process.¹

If granted, the proposed Joint Application will have profound impacts upon Ohio communities and residents in both urban and rural areas throughout the state. Although Ohio is actively participating in recognizing problems and developing solutions to minimize or mitigate these impacts, state financial resources are extremely limited. This fact, coupled with the significant benefits that the Joint Applicants seek to realize under the proposed transaction mandates that the railroads be required to participate throughout the process of identifying serious environmental and safety problems and contribute heavily from their considerable expertise and resources to redress the adverse impacts that post-Conrail Acquisition increased levels of rail traffic will have upon the State of Ohio.

Ohio here makes some general observations that will be discussed in greater detail below. Ohio believes that construction of grade separations should be made a larger part of the mitigation effort in Ohio, particularly in areas where post-merger train traffic volumes are expected to increase dramatically over existing levels.² Obviously, construction of

¹ Ohio concurs in SEA's recognition that significant public outreach activities by the Joint Applicants are critical to a thorough understanding and assessment of local safety, congestion and environmental justice concerns discussed in the draft EIS.

² See attached map depicting post-merger traffic increases/decreases. Exhibit 1.

grade separations promotes public safety and reduces railroad liability exposure by eliminating the opportunity for train-vehicle collisions. Grade separations also relieve vehicle traffic congestion and attendant problems, including emergency vehicle response. Ohio has identified below several locations for which grade separation projects will be particularly effective in mitigating serious problems which will result from the proposed Conrail acquisition. The locations specifically mentioned do not represent a complete list of communities with grade separation needs.

In the area of grade crossing safety, Ohio believes that implementing a "corridor" approach more efficiently and economically promotes crossing safety. A corridor study focuses upon rail segments for safety upgrades rather than simply identifying single crossings over a scattered area. By focusing upon the rail segments that the Joint Applicants have targeted for significant train traffic increases Ohio can most effectively assess and address Acquisition-related safety impacts. In addition to identification of grade crossings for safety upgrades, PUCO/ORDC also evaluates the feasibility of closing public grade crossings permanently to public vehicular traffic as part of any corridor analysis. Development of comprehensive corridor safety plans by State officials working together with motivated railroad representatives provides for a more focused and efficient employment of limited state resources while maximizing the positive deployment of railroad resources.

Ohio has successfully negotiated several smaller corridor-type agreements with the Class I railroads. The so-called "B&O corridor" project represents a recent example of how effectively the joint efforts of railroads and Ohio officials can be in addressing significant safety concerns that arise from the Conrail Acquisition application. This agreement is discussed in greater detail below and is provided as Exhibit 2 to these comments. Other relevant heavy rail traffic corridors are also under study by PUCO/ORDC as of this writing and are referenced later in these comments. Insufficient time has simply not permitted PUCO/ORDC and the Joint Applicants to complete assessment of the impacts on these other corridor areas and to fully evaluate required mitigation measures, allocation of cost responsibility for such measures and other related issues. Ohio requests that the Board impose a condition directing the Joint Applicants to reach and finalize agreements with Ohio that address such issues on all environmentally significant corridors identified by Ohio and direct CSX and NS to commit to full compliance with such agreements prior to increasing train traffic over existing levels on any of these corridor segments, including the B&O corridor.

In sum, Ohio maintains that it is in the best position to identify areas within its borders that will be most heavily impacted by the proposed Conrail acquisition and, in coordination with the Joint Applicants, to evaluate and tailor solutions to most effectively address those impacts. Although the SEA is to

be commended for the time and effort spent in designing study parameters and proposing specific mitigation measures, Ohio is confident that the sheer magnitude of the project and the corresponding time constraints imposed upon limited SEA staff resources have precluded the more "localized" approach that must be taken to ensure that the uniqueness of Ohio problems are captured in Ohio solutions. Ohio believes that it can more effectively assess and address post-Acquisition impacts through negotiated agreements with the Joint Applicants that will themselves target specific areas and identify specific projects to mitigate such impacts.³ Ohio concurs with the observation of the SEA staff that many of the environmental impacts addressed in the draft EIS can be "most effectively resolved" through mutually-acceptable agreements involving the Joint Applicants, affected local communities and appropriate government agencies. Executive Summary at ES-15. Ohio has successfully negotiated the B&O corridor safety agreement and is progressing negotiations with Applicants on other corridors. In committing considerable effort and resources to progressing specific talks with the major railroad stakeholders Ohio clear objective is to present the Board with Ohio-specific safety agreements and mitigative

³ Perhaps the most glaring example of this fact is the omission from the draft EIS text of any mention of Fostoria, OH, an area that all parties, including the Joint Applicants, have recognized for some time would be significantly impacted under the Conrail Acquisition Plan. In assessing specific solutions to Ohio-specific impacts, the Board should give due regard to Ohio-specific facts and circumstances rather than simply relying upon the more generalized "rule of thumb" thresholds for environmental analysis devised by the SEA staff to trigger remedial measures.

measures. The Board should order the Joint Applicants to diligently and in good faith negotiate with Ohio to reach agreements that comprehensively address Ohio's concerns and which will effectively mitigate impacts upon Ohio that will be occasioned if the proposed Transaction is approved.

III. CONDITIONS

The State of Ohio asserts that the Joint Application, as proposed, is not in the public interest and should be denied unless the Board directs that the following conditions attach in addition to other essential relief as previously identified:

(a) The Board should expressly recognize the important and primary role that Ohio occupies in addressing issues relative to grade crossing safety and rail/public traffic congestion and safety-related issues within the State. The Joint Applicants should be required to assume a significant role in identifying and funding safety improvements needed to address impacts upon Ohio that will result from post-Acquisition increased rail operations within the state. The Board should order and impose as a condition that the Joint Applicants continue good faith negotiations with Ohio officials for the safety improvements along rail corridors with significant adverse environmental impacts resulting from the Conrail Acquisition. As a condition to approval of the application, the railroads should be required to enter into firm agreements with Ohio that assess Ohio impacts

and provide for appropriate mitigation measures, including construction of active warning devices at public crossings and construction of grade separations where essential as remedial measures, to alleviate public traffic congestion and facilitate emergency vehicle response. Ohio has committed its efforts and its resources in order to submit such agreements for the Board's consideration in the next 90-120 days. The Joint Applicants should be required to cooperate with Ohio in completing such agreements, which must include significant railroad funding commitments, and to commit to fulfilling their obligations thereunder before implementing any significant increases in rail traffic over certain Ohio rail corridors as contemplated in the Application.

(b) The Board should order and impose upon the Joint Applicants more stringent requirements regarding rail transportation of hazardous materials. The Board should also require more frequent track and equipment inspections than those discussed in the OT-55B. Ohio urges the Board to impose reporting requirements to ensure that the Joint Applicants allocate resources sufficient to demonstrate a firm commitment to safe hazardous materials transportation. In this regard, the Board should require the Joint Applicants to expand current employer and public response training programs and to report annually for the next five years regarding the nature and effectiveness of such expanded programs. Where significant increases in hazardous materials traffic will occur in specific

corridors, the Joint Applicants should be ordered to fund equipment purchases, travel and tuition expenses for advanced training and the costs associated with development of community emergency response plans for public agencies. The Joint Applicants should also be required to earmark funds to be specifically used for community emergency response training and equipment grants. The Board should also order the Joint Applicants to annually report on hazardous materials incidents and violations on "key" and "major key" routes, and the Board should urge development of specific monetary sanctions for patterns of violations along such routes.

IV. OEPA CONCERNS

The Ohio Environmental Protection Agency has also reviewed the draft EIS in the context of potential impacts of the proposed Acquisition on Ohio communities. OEPA is very much concerned that key air quality and emissions were not adequately addressed in the draft EIS. These include the fact that there is no suggested mitigation for 7,000 tons per year for increased nitrogen oxide emissions. There is also insufficient information in the draft EIS from which to determine the impact of the merger on the 1-hour and 8-hour national air quality standards for ozone. Also the draft EIS does not address the impact of increased emissions of particulate on national air quality

standards for PM. See attached copies of internal OEPA memoranda addressing the specific concerns.⁴

V. DISCUSSION

Ohio Highway/Rail At-Grade Crossing Safety

A. B&O Corridor Agreement

On November 25, 1997, the Public Utilities Commission of Ohio (PUCO) adopted an agreement to enhance safety at public grade crossings located along 75 miles of the "B&O" corridor extending from Greenwich, Ohio to the Ohio/Indiana border. See Exhibit 2. Ohio selected this corridor, which contains a large number of passively protected crossings, in response to significant increases in train traffic levels that CSX expects to occur under the proposed Acquisition. CSX has announced plans to make significant capital investments to double track this corridor to accommodate greater volumes of higher-speed train traffic as part of double-track service CSX expects to offer linking Cleveland and Chicago. Post-Acquisition train traffic is expected to more than double on certain portions of this corridor. This milestone public safety agreement allocates costs of safety upgrades⁵ to reflect the increased accident prediction

⁴ See Exhibit 3.

⁵ The PUCO's policy is to promote maximum protection at public grade crossings through installation of both traffic gates and flashing warning lights at public grade crossings. The PUCO evaluates and ranks crossings for publicly-funded safety upgrades by applying the federal Accident Prediction Formula.

formula ranking for corridor crossings due to physical and operational changes at those locations. Additionally, the agreement requires PUCO and the ORDC to work closely with local communities to identify grade crossing locations that could be closed permanently as an alternative to construction of warning devices. In the event a grade crossing originally targeted for construction of warning devices is closed, the B&O corridor agreement is flexible enough to permit transfer of dollars earmarked for crossing improvements to be applied for safety projects at other locations within the defined corridor.

The B&O Corridor Safety Agreement is the reasoned end product of extensive negotiations between CSX and Ohio officials to achieve a common goal - to proactively address heightened grade crossing safety concerns occasioned by CSX-proposed, Acquisition-related operating changes along this corridor. This public-private partnership recognizes the various stakeholders and invites them to participate in resolution of important safety concerns. As the PUCO noted on page four of its Order,⁶ the B&O corridor agreement represents only an initial step to address Acquisition-related safety concerns, and the PUCO fully expects CSX cooperation in assessing other impacted areas and developing responsive mitigative measures. Ohio expects to reach similar types of safety agreements with the NS and Conrail as well, negotiations for which are currently underway. Given the highly localized nature of grade crossing safety and the many factors

⁶ Exhibit 2, p. 4.

that must be considered, Ohio requests that the Board direct the Joint Applicants to continue cooperative negotiations with State of Ohio officials and local communities on corridor-type crossing safety agreements that will most efficiently deploy limited resources.

B. Corridor Evaluation Approach

Since 1989, the PUCO, in conjunction with ORDC, has administered a program to identify public grade crossings for construction of federally-funded automatic warning devices. Under Ohio law, the PUCO is charged with developing and maintaining an index which ranks or prioritizes Ohio public crossings for funded safety improvements. Ohio utilizes the federally-adopted Accident Prediction Formula to perform this ranking. Since 1990, the PUCO has ordered installation of traffic gates and warning lights at nearly 800 public grade crossings throughout Ohio at a cost of over \$88 million. The PUCO administers a limited state-funded program which typically results in construction of safety upgrades at an additional 10-12 public crossings per year. The PUCO also makes limited state funds available to qualifying local communities for interim types of safety improvements such as installation of overhead lighting and rumble strips to heighten public awareness of crossing dangers. PUCO/ORDC has been very active in recent years in working closely with local governmental authorities to permanently close grade crossings to vehicular traffic under

arrangements which often involve railroad-provided incentives which assist local authorities in addressing other important community needs.

PUCO/ORDC has been both active and aggressive in addressing crossing safety issues and PUCO/ORDC believes that all stakeholders, public and private, must provide input and actively participate in solutions. Ohio officials have increasingly recognized the wisdom of targeting rail corridors or segments, rather than isolated crossings at scattered locations, for safety improvements. These corridor studies involve a focused review of rail segments by Ohio officials, local interests and the railroad and appropriately evaluate the feasibility of crossing closures. Based upon considerable experience Ohio has found that this approach represents a superior methodology for evaluating and targeting crossings for safety upgrades in response to significant increases in rail traffic in comparison with the "all the eggs in one basket" approach employed by the SEA in the draft EIS.

WEAKNESS OF SEA CROSSING SAFETY ANALYSIS

The SEA's efforts to address crossing safety issues, although commendable, nonetheless suffer from two key flaws; (1) use of 1995 base year information, and (2) a tendency to analyze individual crossing locations in isolation. The SEA's use of 1995 data to evaluate crossing safety is inadequate since the risk level of any crossing can rise or fall dramatically based

upon changing circumstances. By not using the latest information from the states, the SEA also appears to have duplicated analysis which has already been performed. For example, 20 of 35 crossings that the SEA has recommended for safety upgrades have already been selected by PUCO for construction of gates and lights as part of Ohio's ongoing grade crossing safety program.

The need for current accident information data is particularly important. In evaluating crossings for safety upgrades, Ohio considers the most recent five years of crash information. Of the Ohio crossings evaluated in the draft EIS, over 10 percent (125 of 900) had different accident histories when 1993-1997 data was considered rather than when 1991-1995 data was used. This, in turn, can artificially inflate or reduce perceived risks at particular crossing locations. Extrapolating 1991-1995 data also led to an evaluation of gated crossings using crash data for periods prior to installation of safety devices. At only two (Crossing Nos. 155821J and 473668W) of seven crossings for which the SEA recommended installation of quad gates or barriers did accidents occur following installation of the safety devices.

Use of 1995 baseline data for analysis does not reflect current train volumes. The Deshler-Toledo corridor represents a prime example. Under the SEA analysis, this corridor increases from 0.6 trains per day to 14.2 trains daily. In fact, CSX added

over 13 trains per day⁷ on this corridor beginning in May, 1997 (independent of the Acquisition Application), resulting in a much smaller increase in train traffic which might call into question the SEA-proposed mitigation measure.

Likewise, use of current vehicle traffic data is of obvious importance to any safety analysis, and reliance upon only the national data base may not capture changing vehicle traffic volumes through a crossing. A sampling by PUCO illustrated the following wide discrepancies in ADT:

<u>Crossing No.</u>	<u>SEA/ADT</u>	<u>PUCO/ADT</u>
155799Y	510	1612
155814Y	1270	2239
142313G	540	1133
142314N	540	1828

The SEA's use of "stale" national data base information calls into question the reliability of the Ohio crossings selected and proposed by SEA for mitigation.

While the FRA accident prediction formula is a good tool for use in prioritizing crossings and allocating available funding,

⁷ The present pre-Acquisition train count on this segment indicated in the draft EIS may be incorrect. By letter dated June 4, 1997, CSX informed the PUCO Railroad Division that existing traffic on this segment was at a rate of approximately 10 trains per day.

it was never intended to provide the type of surgical precision that the SEA has applied in the draft EIS. Ohio has long recognized this fact and, therefore, uses this formula only as a beginning point in its crossing safety analysis. The failure to use the latest data can produce results that are not adequate in identifying locations where accidents are likely to occur in the future.

STRENGTHS OF OHIO CORRIDOR APPROACH

Ohio has demonstrated that the more effective approach to grade crossing safety is to develop a comprehensive plan for improved protection along entire corridors using updated information and broader analysis of the local situation. Ohio has undertaken such an approach in its efforts to prepare for the changing traffic patterns resulting from the proposed acquisition of Conrail.

As a beginning point in its analysis, Ohio considers the risk factor of the crossing considering the new level of train traffic with revised traffic counts and the most recent five years of accident data. If passenger trains are running on the segment of tracks, the maximum timetable speed is adjusted accordingly. The potential for consolidation projects along the corridor is then considered. The age of current circuitry is evaluated on gated crossings. Finally, *actual site visits* are scheduled to evaluate the lay of the land or nearby obstructions that make a crossing more risky than it appears from the data

analysis. All of these issues cannot be considered by simply projecting a risk factor from national data base information. This complete analysis can only be done at the state level.

Using the Board's environmental threshold levels, Ohio expects train traffic to significantly increase on 21 affected line segments, (see map included as Exhibit 1) including the aforementioned B&O Corridor which will serve as a CSX main line for east-west traffic and is currently undergoing major track and signal improvements in anticipation of significantly increased train traffic in the post-Acquisition time period.⁸ Given the significant magnitude of projected train traffic increases, PUCO/ORDC is committed to the corridor approach on other segments including the existing Conrail segment from Greenwich to Collinwood, and NS lines from Cleveland to Ashtabula, Ashtabula to Youngstown, Bellevue to Oak Harbor, and Cleveland to Vermilion and all corridors where there are significant impacts. (See Exhibit 1). In this regard, Ohio identified crossings with an accident frequency as low as 0.043 (as opposed to SEA's 0.15 threshold) as sufficiently impacted to warrant construction of safety improvements. In the case of the B&O Corridor Agreement, which provides for upgrades to flashing lights and gates at 39 crossing locations, PUCO/ORDC used the latest vehicular and train counts available to produce a revised FRA Prediction Formula ranking for all crossings on the corridor. This ranking was then compared with the existing ranking to develop average post

⁸ See Exhibit 1.

acquisition increases in risk along the corridor. Using this figure as a benchmark, Ohio negotiated a cost sharing agreement with CSX to upgrade these locations.

The negotiated "B&O corridor" agreement is mutually beneficial and illustrates the effectiveness of a public-private partnership to promote public grade crossing safety by reducing the probability of accidents. In preparation for this agreement, PUCO/ORDC representatives inspected and updated data on almost 150 public crossings on this corridor, nearly two-thirds of which are only passively (crossbuck signage) protected. PUCO/ORDC conducted an extensive public outreach program which included meetings with various county, township, and local officials in six counties to discuss possible closures in exchange for upgrades at those crossings not initially selected as part of the agreement. This process is continuing and Ohio expects to receive local agreement on closing and/or upgrading potentially another 20 crossings on the B&O corridor. Once completed, Ohio will be very close to achieving maximum protection (lights and gates or closures) at each of the public crossings on the CSX B&O corridor between Greenwich, Ohio, and the Ohio/Indiana state line in advance of significantly increased post-Acquisition train traffic. Ohio believes that public outreach efforts are essential to obtain a thorough understanding of impacts and assessment and evaluation of appropriate solutions.

Ohio urges that the SEA employ a two-pronged approach to mitigation in this area. First, the SEA should recognize the

important role states have traditionally played in identifying and selecting grade crossing locations for upgraded warning devices. As administrators of grade crossing improvement programs, the states are the best and most complete source of information on pending and planned projects, as well as other local conditions which may impact crossings selected for upgrade. Any effective mitigation plan must, therefore, include Ohio as a significant partner in the selection of grade crossings for safety improvement.

Secondly, the railroads must be required to assume a significant role in funding safety improvements on these corridors since their proposed actions will directly contribute to the increased public risk. The railroad's financial commitment should be commensurate with the increased risks created by their proposed operations within each corridor.

Considering these factors, Ohio recommends that the Board include a condition directing the Joint Applicants to timely reach agreements with Ohio for the improvement of grade crossings on rail corridors deemed environmentally significant. The Board should direct that the Joint Applicants not be permitted to operate at increased post-Acquisition train levels until completed agreements are in place with Ohio and the railroads have committed to complete their assigned responsibilities as expeditiously as possible.

Should the Board choose not to direct the Joint Applicants to work closely with Ohio on implementing a corridor approach to

grade crossing safety and, instead, chose to evaluate all crossings and select particular locations for mitigation, the Board must, to most effectively address impacts, do so based upon the most current information. In that event, Ohio recommends that the Board's staff coordinate with Ohio officials to ensure that the Board has the best information possible with which to identify and select crossings for safety upgrades. That process should be concluded before SEA completes its final Environmental Impact Statement and makes specific recommendations to the STB regarding conditions that should be adopted should the Application be granted.

Ohio also urges the SEA to reconsider its approach to the type of warning devices that it has recommended in the draft EIS. Ohio maintains that any upgrades should include both gates and lights, rather than just flashing lights. Lights alone are not a cost effective solution. The major cost of upgrading a crossing involves the initial design and installation work and the addition of traffic gates results in only a minor increase in costs, while eliminating the need for an expensive enhancement in the event of continuing accidents at the locations.

Additionally, the SEA should reconsider its recommended use of four quadrant gates and barriers as a safety mitigation measure. While Ohio is not philosophically opposed to their use, such devices currently are experimental in nature and require additional time and expense for state agencies in securing necessary approvals. Site-specific considerations should be

taken into account. For example, use of median barriers on rural area crossings may prove impractical in light of the need to move large farm machinery through a crossing. Additionally, the need for circuitry upgrades should be evaluated prior to any decision to install four-quadrant gates at a crossing location. Ohio strongly recommends that the use of these types of proposed mitigative measures not be routinely ordered by the Board unless the Board is prepared to coordinate changes in existing federal program requirements with the FHWA.

C. Rail Transportation of Hazardous Materials

As a cross roads state and a major industrial and manufacturing center, Ohio experiences a large volume of hazardous materials movements through its borders. As indicated in table B8-3, Ohio had more hazardous materials incidents than any other state on the Applicants' systems between 1992 and 1996. Ohio enjoys the dubious distinction of being the site of the largest hazardous materials-related evacuation, resulting from a 1986 derailment and fire on the CSX system near Miamisburg, Ohio.

Ohio clearly has a vested interest in safe rail transportation of hazardous materials and, consequently, has been a leader in efforts to address this area. Those efforts have included development of a comprehensive system of carrier registration, civil penalties, and funding of emergency response training. Ohio's program was designed as a multi-modal program to improve the safety of our citizens regardless of the mode

chosen by chemical manufacturers and marketers to ship their products.⁹

Ohio finds it particularly noteworthy to note that table B8-4 of the draft EIS shows that the two most frequent causes of hazardous materials incidents on Applicants' rail lines, between 1992 and 1996, are human error and package failure. Ohio believes this demonstrates short comings in existing railroad employee training and operating practices relative to the inspection, loading and transportation of hazardous materials shipments. Such shortcomings need to be addressed.

The Joint Applicants and the SEA have devoted significant text to discussion of hazardous materials "key routes" and the special care taken in the areas of employee training and emergency response training. Ohio has two concerns in this regard. First, "key routes" represent a voluntary concept nowhere incorporated in existing Federal Railroad Administration regulations and it is not clear that legal sanctions exist for railroad failures to follow these guidelines, even when they have been incorporated into railroad operating policies. Secondly, the guidelines are minimal in nature and represent more of a baseline for acceptable operations rather than a goal of excellence. The number of incidents listed in Table B8-4 speaks

⁹ Ohio is particularly concerned about rail transportation of hazardous materials throughout the State. As a result of railroad lawsuits, Ohio has been unable to implement its safety regulations for this mode of hazardous materials transport, although Ohio actively regulates hazardous materials carriage over its highways.

volumes in demonstrating that promulgation of these guidelines has not solved the problem of the accidental release of deadly chemicals along rail corridors and within rail yards. Given the anticipated level of increased hazardous material movements resulting from this acquisition, particularly in and around Cleveland, Ohio believes the railroads and federal regulators can and should do more to ensure safe transportation of these materials.

While Ohio believes that greater overall efforts are required by the railroads to train employees and inspect cars and packages transporting hazardous materials, the SEA's draft EIS approach of focusing upon particularly high density routes is reasonable to address increases in hazardous material traffic expected to result in certain lines as a result of the Conrail Acquisition. It is essential, however, that the Board take steps to ensure that the guidelines are actually implemented and consistently followed. The guidelines should also be strengthened and more broadly applied than as proposed in the draft EIS. Ohio urges the Board in the first instance to require that all key routes, not just newly identified key routes, be brought into compliance with the key route standards of OT-55B. The Board should also specifically condition any approval of the Acquisition upon demonstration of compliance with these guidelines through reporting procedures over the next five years designed to reveal any patterns of FRA citations or incidents along each key route.

On major key routes, as defined in the draft EIS, the Board should order additional requirements over existing OT-55B in the area of frequency of track and equipment inspections. Similarly, there should be reporting requirements detailing the number of employees devoted to these activities to ensure a continuing level of commitment to safe hazardous materials transportation. Joint Applicants should be required to expand current employee and public emergency response training and to report annually for the next five years regarding the frequency and nature of classes conducted and persons trained. In addition, the Joint Applicants should be required to specifically fund equipment purchases, travel and tuition expenses for advanced training, and the costs associated with development and implementation of community emergency response plans for public agency emergency responders which will be necessitated by substantial increases in hazardous materials traffic over specific routes. Given the heavy volumes of hazardous material train traffic that certain areas of Ohio will experience and the fact that many areas must rely upon volunteer emergency services, ordering of such funding by the Board will provide an absolutely essential supplement to minimal local resources that are available and is critical to ensure the availability of effective emergency response services.

Finally, adequate sanctions should be established for patterns of violations on both key and major key routes. As a condition to approval of the Acquisition, the Applicants should be subject to continuing Board oversight for a period of not less

than five years and the Board should urge development of specific monetary sanctions for patterns of violations of key route and major key route conditions established by the Board. Money raised by these payments should be used to fund community emergency response training and equipment grants.

D. Roadway Crossing Delays

The impacts associated with vehicle traffic delays and resulting congestion are of great concern to local communities in Ohio. In Section 5-OH.9, the SEA analyzed the effects of the proposed Conrail acquisition on roadway systems at existing highway/rail at-grade public crossings. In developing its approach to crossing delays the SEA has erred in two respects. First, the SEA has relied too heavily upon a statistical review based upon numbers of vehicles, train cars and speeds, while failing to take into account real world conditions that result in blocked crossings. Secondly, even if one argues that a mere statistical approach is appropriate, SEA's use of a 5,000 ADT threshold for consideration is far too high and has resulted in elimination of severely impacted locations.

Effective evaluation of this issue can only be achieved through on-site field reviews in affected communities along routes of environmental significance to examine the factors which contribute to crossing blockage. Factors contributing to these conditions can include operational problems which cause trains to slow beyond normal speeds or delay progress altogether. Examples

include location of control points, proximity to rail yards or sidings, lack of appropriate signals, delays at diamonds or other aspects of rail operations that cause trains to occupy crossings for an extended period. Additional factors that must be considered are the nature and location of businesses along the lines serviced by the railroad.

Use of the arbitrary 5000 ADT figure results in severely-impacted locations in smaller communities being overlooked under the SEA analysis even though these locations are currently experiencing serious blockage problems. The most remarkable failure of the SEA approach is highlighted by the absence of any discussion whatsoever of the serious problems faced by Fostoria. Ohio is presenting the Fostoria issue not only as an issue to be remediated but also as an example of what detailed local analyses is likely to reveal in other Ohio communities.

The City of Fostoria is a major railroad junction where existing railroad traffic and switching operations negatively impact vehicular traffic flow and emergency vehicle response. In its October 21 response to the STB, the State of Ohio highlighted its concerns regarding the acquisition of Conrail and its ramifications which will exacerbate Fostoria's environmental and safety problems. Included in that filing was the Verified Statement of Charles I. Dodge, Administrative Assistant to the Mayor of Fostoria and the statement of Philip G. Pasterak of Parsons Brinckerhoff Ohio, Inc. concerning the serious impacts of the proposed Acquisition on Fostoria. The SEA's environmental

analysis of the Conrail Acquisition, however, completely ignored these issues and failed to discuss the serious safety and environmental impacts on Fostoria. Therefore, the State of Ohio, working with the City of Fostoria, commissioned Parsons Brinckerhoff to prepare a comprehensive environmental analysis to focus on the magnitude of these issues. The Fostoria Remediation Study is attached as Exhibit 4.

All three of the intersecting railroad lines in Fostoria are projected to receive significant increases in rail traffic. Currently, an average of 84 trains pass through the city every day. As a result of the Conrail Acquisition by NS and CSX, the number of trains in Fostoria will increase by nearly 30 percent to 108 trains per day. The most critical impact from increasing rail traffic is on safety and emergency response time.

Two areas of the community, one to the east and one to the west, have been dubbed "Iron Triangles" by emergency response forces. This is because of the difficulties in identifying reliable and direct ingress/egress to the areas as a result of heavy train traffic blocking the at-grade crossings. Vehicular crossing delays are compounded by slow moving rail traffic switching from one mainline onto another.

The SEA's draft EIS inadequately addresses these impacts on Fostoria as a result of the Acquisition, and is grossly inadequate. Although rail segments C-070 (Marion-Fostoria) and C-075 (Willard-Fostoria) are identified as meeting the threshold for analysis by the SEA neither individual nor cumulative impacts

of increased traffic are considered on safety and grade crossing delays. In fact, the nature of the rail configuration in Fostoria, with three major rail/rail crossings, will cause impacts far in excess of the sum of the traffic increases on the three individual rail lines. Crossing delays will be compounded by stopped trains and trains moving at low speeds and a significant number of trains using slow speed connection tracks. These tracks and turnouts are not, and in most cases cannot be, configured for speed in excess of 15 mph. Typical speeds are likely closer to 10 mph. For the proposed 6200 foot typical CSX post-Acquisition train, this will result in a blocked crossing time per diverging train of 7.5 minutes. The SEA has failed to take into account these real world conditions that result in blocking critical crossings and emergency ingress routes.

Moreover, the arbitrary SEA threshold of 5000 ADT resulted in the elimination of two critical highway/railroad crossings from the evaluation process. Both crossings provide emergency vehicular ingress into Fostoria's isolated "Iron Triangle" neighborhoods. The more detailed Ohio analysis, which considered the interrelationships of the street network with actual train operating speeds, indicates that both Columbus Avenue and Tiffin Street must be considered significantly impacted.

Currently, the procedure for responding to a police or fire emergency situation in the two triangle areas in Fostoria is to dispatch two vehicles along separate routes, increasing the chances of successfully entering the triangles. In the event

that both routes are unimpeded and both vehicles are able to cross the tracks, the first crew determines whether to enter the scene immediately, possibly compromising their own safety, or wait until the second vehicle arrives with backup. This additional time is critical. For example, experts claim that, each additional; minute a fire burns, the fire typically doubles in its size and intensity. As the Ohio analysis illustrates, with the large volume of trains passing through Fostoria each day, the likelihood of encountering a train blocking an at-grade crossing is very high. The choice of the route to the site of an emergency can be very confusing to emergency personnel who have no reliable way of predicting which crossings will be blocked at a particular time of day.

According to the SEA's formula, under current volumes, a train is blocking one or more at-grade crossings in Fostoria 4.6 hours of each 24 hour day. That equates to 19 percent of the day that a crossing is inaccessible to emergency vehicles. With the increased train volumes resulting from the Acquisition, a crossing will be blocked over 6 of the 24 hours, which is over 25 percent of the day. Not all of the crossings will be blocked at the same time; however, an emergency vehicle has no schedule as to when crossing it needs will be blocked. With any given rail crossing blocked over fourth of the day, it becomes apparent that some alternative provision needs to be made for the safety of residents within the Iron Triangles.

Based on Ohio's analysis of the ingress/egress routes into Fostoria's Iron Triangle areas, the Columbus Avenue/east triangle area meets the criteria for a location requiring a grade separation. The post Acquisition LOS decreases one grade to LOS "E" or "F" following the Acquisition and rail traffic increases by eight trains. Additionally, the west triangle area also meets this criteria when considering a 33.9 increase on the CSX line along with the 4.6 increase on NS traffic. An increase of train speeds will provide only a partial, and relatively insignificant, mitigation of impacts on vehicular delay.

The potential for these two Iron Triangle areas to become isolated by rail movements and served by unreliable and unpredictable emergency service routes is very real and, therefore, the need for the construction of grade separations for both areas is strongly indicated. A grade separation for Town Street under the NS is recommended to mitigate east triangle impacts. Town Street provides a less expensive alternative to grade separating Columbus Avenue. And a grade separation for Tiffin Street over CSX is recommended to mitigate west triangle impacts. Conceptual engineering of these crossings shows that construction of these structures is feasible.

The crossing at Jones Road also has safety implications as there is the potential for the east half of the City to be temporarily cut off from ambulance services. With the next parallel road to Jones being so far to the south, a blocked crossing could add an extra 3.6 minutes to an ambulance's

response time to an incident just east of the tracks on Jones Road. As a result, a grade separation for Jones Road over CSX (C&O) should also be considered. In addition to the safety concerns associated with increased rail traffic blocking at-grade crossings, Fostoria also has concerns about the economic development viability near the CSX crossings at Jones Road. Jones Road is a highly traveled trucking route serving one of Fostoria's major commercial and industrial zones. Stopped trains often block the road and trigger the crossing gates for extended periods. Severe delays in vehicle transport will discourage other new business and industry ventures from wanting to locate in the City, thereby hindering economic growth

At minimum, additional measures that should be implemented include the upgrading of grade crossing circuitry to state-of-the-art motion detection systems. Such a relatively inexpensive improvement would minimize the time that Jones Road Traffic is blocked without the presence of a train across the crossing. The improved circuitry would reduce over activation of the current warning devices. Conceptual engineering of this crossing indicates that it is feasible to construct.

Ohio, once again, urges that the STB must carefully consider the Fostoria safety issues in the proper perspective. All of those concerns are buttressed by the underlying Fostoria Remediation Study which provides a comprehensive technical analysis of Fostoria's problems. Ohio believes that the recommendations for the construction of three grade separations is

completely warranted. In this light, Ohio recommends that the STB order the Joint Applicants to enter negotiations with the state and local officials and to develop agreements for resolving the environmental and safety impacts in Fostoria. This includes defining the cost sharing for construction of the three grade separations.

Attached is a letter from the Mayor of the City of Fostoria (Exhibit 5) and a copy of a letter addressed to the STB by a city official (Exhibit 6), both of which emphasize the very serious concerns of responsible city officials as to the impact of the proposed Transaction on public safety and access to essential emergency services absent adequate remedial action.

Again Fostoria is only one example of the serious problems Ohio is finding. Other locations including Ashtabula, Olmstead Falls, Berea, Bellevue, Defiance County, Oak Harbor, Clyde, Greenwich, Wellington, Grafton, and New London are being reviewed in terms of their need for mitigation measures. Cleveland has raised serious concerns in this regard as well. Such locations may well require construction of grade separations to effectively solve crossing delay and emergency response concerns if the proposed Transaction is approved. It is therefore critical that the Board ensure that these remedial requirements are recognized and place sole or significant financial responsibility upon the Joint Applicants for needed construction and improvements which will be required to safely accommodate expanded rail operations under the Acquisition Application.

Applying its methodology, the SEA has identified Ohio crossings which will incur significant delays. SEA's proposed fix to these problems calls for the railroads to increase train speeds in three locations and to consult with local and state highway officials on mitigation measures for the other crossings. Ohio disagrees that increasing train speeds through urban areas constitutes a safe and workable solution for crossing congestion, unless it is done only after it is determined to be safe and feasible after comprehensive review of existing signaling, operating practices and grade crossing protection systems in the affected areas. Ohio agrees with SEA's conclusion that crossing delay issues are most effectively resolved where the Joint Applicants and local and state highway officials work together on a cooperative basis. The input of all concerned stakeholders is critical to an effective identification of other significantly impacted locations and assessment of mitigation measures and appropriate in this proceeding. Commitment of resources and funding to accomplishment of remedial steps as found to be necessary.

Ohio recommends that, as a condition of approval of the Application, the railroads be required to reach agreements with Ohio that address all areas of concern. These agreements must include significant railroad funding commitments to ensure that mitigation measures are completed. The Board should direct that the Joint Applicants not operate at post-Acquisition increased traffic levels until firm agreements have been executed.

E. Toledo Deshler Rail Line Segment

In light of the prior dormancy of train traffic on the Toledo-Deshler rail segment, Ohio concurs with and recommends that the Board adopt the SEA's proposed mitigation measures for the nine remaining (*i.e.* those not currently the subject of PUCO projects) passively-protected grade crossings that are listed on Table 5 OH-56 (page OH-154). Consistent with PUCO policy, Ohio recommends that mitigative measures at each of these remaining crossings include both flashing warning lights and traffic control gates.

As background information, the SEA has included for specific comment this 36-mile section of track that traverses through portions of Lucas, Wood, and Henry Counties in northwestern Ohio. Ohio is somewhat unclear as to why the SEA chose to specifically comment since this increased traffic is not solely an Acquisition related issue. The line in question was essentially dormant until May 1997 when CSX increased the traffic from .6 to 13.6 trains per day. Post acquisition traffic raises this level to 14.2 trains per day. While this is a significant percentage increase over the prior dormancy level, it still pales in comparison with the increases on other lines in Ohio.

Ohio had previously identified grade crossing warning device projects along this line but deferred further action on these projects when the traffic decreased to minimal levels. Had there been better coordination between CSX and Ohio regulators

regarding reactivation and level of train activity on this line, Ohio would have been in a better position to respond to the increased risk. The PUCO has directed installation of five projects (gates and lights) since the reactivation of this line segment. These current projects include the following crossing locations: Main Street - FRA No. 155760V - Henry County; Kellogg Road - FRA No. 155794T - Wood County; Middletown Pike - FRA No. 155804T - Wood County; Eckel Junction Road - FRA No. 155818B - Wood County; Ford Road - FRA No. 155838M - Wood County.

F. Cleveland Specific Issues

Ohio supports the concept of a comprehensive approach to resolving environmental issues raised by the City of Cleveland and other area jurisdictions including Lake, Bay Village, Rocky River, Berea, and North Olmstead. Cleveland lies at the heart of Conrail's system, the crossing point of the so-called "Big X" through which more than 100 trains per day pass.

Ohio believes that the division of Conrail through Cleveland as envisioned in the proposed transaction may be workable but only from the railroad perspective. Ohio does not, however, believe it is the optimal plan when the adverse safety and environmental impacts are taken into account.

The City of Cleveland has outlined two alternative route configurations that would route most of the increased rail traffic that would result from the proposed acquisition through

Cleveland and neighboring industrial corridors. Capable engineers retained by the City of Cleveland have proposed concrete and workable solutions that would not only effectively move trains through Cleveland, and would ameliorate most of the worst adverse environmental impacts.¹⁰

In this light, Ohio recommends that the Joint Applicants in good faith negotiate the proposals as outlined in the attached press release (Exhibit 6) and resolve the substantial adverse environmental and safety impacts that will result from the proposed transaction.

Ohio realizes that it is asking the STB to take extraordinary action for Cleveland area issues. We trust that the STB recognizes that the tremendous adverse impacts to the Cleveland area from the proposed transaction make such extraordinary measures to ensure that the serious problem faced by Cleveland area communities will be resolved. Ohio strongly urges that the STB require that essential safety and environmental agreements between Cleveland area communities, State officials and the Applicants be concluded prior to any increase in existing traffic levels.

G. Arbitration

Ohio maintains that it is in the best position to assess and evaluate the nature and magnitude of Acquisition-related impacts

¹⁰ See Exhibit 7.

within its borders and to develop solutions that best recognize and address Ohio's unique circumstances. The SEA has indicated that it is considering making a recommendation to the Board that would require the Joint Applicants to participate in mediation and binding arbitration with local and state officials where grade separations are necessary to address Acquisition-related traffic delays. Executive Summary at ES-21. Ohio is opposed to SEA's suggestion for a number of reasons. Ohio is primarily responsible for the safety and health of its communities. Safety-related traffic routing and congestion issues are inherently local in nature and resolution of these issues, including who should bear the costs of mitigation measures, should be assessed and determined by Ohio officials. Ohio is actively pursuing remedial measures to address such situations through negotiations with the Joint Applicants. Ohio recognizes that costs of mitigation of safety and environmental problems arising from the proposed acquisition of Conrail are important issues and Ohio intends to continue working closely with the Joint Applicants to ensure that legitimate mitigation measures are implemented. As demonstrated by the B&O Agreement, Ohio is fully prepared to identify significantly impacted areas and develop responsive solutions through negotiated arrangements with the Joint Applicants. Any substantial increase of traffic over specific corridors should be conditioned on completion and commitment to negotiated agreements. Should fundamental differences arise in such negotiations, Ohio maintains that the

necessarily involved public safety and health issues do not lend themselves to resolution through arbitration or mediation. Rather, resort should be directly to the STB for its prompt resolution.

VI. CONCLUSION

There exist a number of unique circumstances facing Ohio as a result of the proposed Conrail acquisition application. Solutions to Ohio impacts must be tailored by responsible Ohio officials to specific facts and circumstances. Ohio maintains that impacts substantially affecting the safety, health and welfare of its citizens and communities are most effectively addressed through joint negotiations which allow all stakeholders to meaningfully participate in development of solutions. Ohio is ready, willing and able to accomplish fair and appropriate solutions through negotiations which must be concluded before traffic is increased over adversely affected corridors and communities which will otherwise suffer serious adverse effects to the detriment of all concerned.

BEFORE

THE PUBLIC UTILITIES COMMISSION OF OHIO

In the Matter of the Adoption and Imple-)
mentation of the Joint Railroad Corridor) Case No. 97-1540-RR-UNC
Safety Agreement for the CSX Transporta-)
tion, Inc. B & O Rail Corridor.)

ENTRY

The Commission finds:

- (1) Section 4907.471, Revised Code, requires the Commission to survey all public crossings of railroads at grade and to devise a formula, consistent with applicable federal requirements, for determining the probability of accident at each such crossing, taking into account for each such crossing a variety of factors including volume of vehicular and train traffic, train type and speed, limitations of view, and intersection angle.
- (2) Under this statute, the Commission also is required to classify all such public crossings according to such formula and to prepare a priority list for the protection of such crossings, giving highest priority to the crossings at which the Commission finds the highest probability of accident, and lowest priority to the ones at which it finds the least probability of accident.
- (3) Pursuant to the priority ratings established as provided above, the Commission may direct the installation of warning devices at any such railroad highway grade crossing it determines to be in need of additional protective devices. The assignment of any part or all of the cost of the installation and subsequent maintenance of such devices shall be by the Commission in any proportion it determines proper that is consistent with any applicable federal requirements.
- (4) On June 23, 1997, the Surface Transportation Board (STB) accepted for consideration the railroad control application and related filings submitted to the Board by the CSX Corporation and CSX Transportation, Inc. (collectively referred to as "CSX"); the Norfolk Southern Corporation and the Norfolk Southern Railway Company (collectively referred to as "NS"); and Conrail, Inc. and the Consolidated Rail Corporation (collectively referred to as "Conrail"). The railroad control application seeks STB approval for the acquisition by CSX and NS of control of Conrail and the division of Conrail's assets by

and between CSX and NS. The proposed transaction involves over 44,000 miles of rail lines and related facilities covering a large portion of the eastern United States. The proposed acquisition will have a dramatic and substantive impact on rail operations in the state of Ohio.

Currently, the state of Ohio has approximately 5,800 miles of rail line within its borders. Conrail is Ohio's largest railroad operating over approximately 1,700 miles of rail line. Within Ohio, CSX and NS currently operate over approximately 1,460 and 900 rail miles, respectively.

- (5) On May 19, 1997, CSX announced plans to spend more than \$220 million to upgrade rail service in Ohio and Indiana as part of an overall plan to maximize its pending acquisition of Conrail operations and assets. Included in this project was a proposal by CSX to lay approximately 113 miles of new parallel track along the 270-mile former B&O rail route between Chicago and Greenwich, Ohio. The announced improvements would eventually allow CSX to provide full double-track service on part of a CSX-Conrail route between Cleveland and Chicago.

The construction will include improvements to bridges, railroad connections, sidings and train control signals. CSX plans to upgrade about 75 miles of existing track in Ohio to accommodate faster trains. As part of its proposed updated and upgraded operations, CSX plans to increase the number of trains operating daily over the B&O corridor by approximately 70 percent and to increase the speed of those trains to 70 miles per hour. As a result, a greater number of trains traveling at greater speeds will traverse approximately 140 passively protected grade crossings along the B&O corridor.

- (6) Prior to the STB filing and its announcements relative to Ohio operations, CSX approached Commission staff about safety concerns it had as a result of the anticipated increase in train traffic and speed along an expanded and upgraded B&O corridor. The Commission, in cooperation with the Ohio Rail Development Commission (ORDC), conducted a study of the CSX rail segments between Greenwich and the Indiana state line along the corridor to determine the impact the proposed CSX operations would have on safety at the grade crossings located along the corridor.

- (7) Following the study, the PUCO and ORDC staff entered into negotiations with CSX for a joint project to enhance grade crossing safety in advance of the significant increase in train traffic and train speed along the B&O corridor. The goal of the project is to enhance safety at as many grade crossings along the corridor as possible before the anticipated increase commences. The result of the negotiations is the Railroad Corridor Safety Agreement attached to this entry and incorporated by reference herein.
- (8) By using the factors set forth in Section 4907.471, Revised Code, and incorporating data related to the proposed post-Conrail operations of CSX on the B&O corridor, the Commission has identified the 39 grade crossings set forth in the agreement attached to this entry at which CSX has agreed to upgrade existing automatic warning devices to flashing lights and roadway gates. Further, the railroad and the staff have negotiated a cost sharing on these projects which provides that 44 percent of the cost of the project will be paid by CSX. The agreement also incorporates the recently negotiated "lump sum" payment concept which provides for further cost savings at the 26 crossings in this group which do not pose special engineering considerations. As is standard in agreements with railroads relative to the installation of warning devices, the cost of perpetual maintenance at each of these crossings will be borne by CSX.
- (9) The agreement reached between the Commission, CSX and ORDC is unprecedented and is designed to proactively address heightened grade crossing safety concerns along the B&O corridor that will see a greater volume of CSX trains traveling at greater speeds. The parties have agreed to jointly share in the costs of the safety projects. The proposed agreement provides for project cost allocation that reflects the increased accident prediction formula ranking of the crossings caused by physical and operational changes at these locations and incorporates the cost savings achieved as a result of 39 simultaneous projects.

Additionally, the Commission and ORDC agree to work with CSX and local communities to identify whether any of the grade crossings identified herein may be closed to vehicular traffic as an alternative to the installation of warning devices. The agreement is flexible enough to account for that possibility by providing that in the event of a closure of a

crossing identified herein, any money otherwise to have been spent for the installation of active warning devices at such crossing shall be applied to safety upgrades at any location within the B&O corridor.

Finally, the agreement provides that CSX shall complete the projects within one year from the date the Commission adopts the agreement or the effective control date as authorized by the STB, whichever comes earlier.

- (10) The parties do not view this agreement as answering all safety concerns or as concluding their joint efforts directed to enhance safety along the B&O corridor. Further, this agreement does not and cannot address other important concerns such as traffic congestion and emergency response in those areas affected by increased train traffic resulting from the Conrail acquisition. The parties contemplate further efforts on this corridor as well as on all other CSX rail lines that will experience an increase in train traffic generated by the acquisition of Conrail. Further, the Commission and the ORDC have begun preliminary discussions with NS to reach an agreement on similarly impacted NS rail corridors. Finally, this agreement does not preclude the Commission from taking whatever action it deems appropriate relative to rail safety on this corridor.
- (11) Grade crossing safety is one of the Commission's highest priorities. In light of the increased operations by CSX as a result of its acquisition of operations and assets of Conrail, the Commission believes that this historic agreement goes a long way to address safety concerns along the B&O corridor. We appreciate the efforts of our staff, the ORDC and CSX in addressing safety issues related to the Conrail acquisition and commend them for their proactive response in this matter. The agreement is reasonable and should be adopted by this Commission.
- (12) In order to provide for increased public safety during the pendency of these improvements, the Commission urges each local government agency with jurisdiction over the location of these crossings to make an immediate assessment of interim physical improvements which would enhance driver awareness of the crossing. The Commission will assist local governments with the cost of improvements such as rumble

strips, illumination, improved signage or other safety enhancements at these locations. Applications for this funding should be made to the Commission's Transportation Department, Rail Division, which shall review all proposals. In the event the Department finds the improvements appropriate, the Department director is hereby authorized to execute a contract with the government agency and obligate money from the state grade crossing safety fund for these improvements, not to exceed \$3,000 per crossing. Similar assistance shall be extended to communities where previously authorized warning improvements are pending.

- (13) Section 4905.54, Revised Code, requires every public utility or railroad and every officer of a public utility or railroad to comply with every order, direction and requirement of the Commission. That section further provides that any public utility or railroad which fails to comply with any order, direction or requirement of the Commission, shall forfeit to the state not more than \$1,000 for each such failure, with each day's continuance of the violation being considered a separate offense. The Commission expects CSX to comply with this entry in a timely manner. However, the railroad's failure to so comply will subject it to the forfeiture provisions set forth in Section 4905.54, Revised Code.

It is, therefore,

ORDERED, That Railroad Corridor Safety Agreement entered into by and between Commission staff, ORDC and CSX Transportation, Inc. be adopted by the Commission. It is, further,

ORDERED, That as set forth in the agreement, projects for the installation of additional protective devices be authorized for the public grade crossings identified in the agreement. It is, further,

ORDERED, That the preliminary engineering and construction costs associated with these installation projects be funded as set forth in the Agreement. It is, further,

ORDERED, That in accordance with staff's recommendations, CSX submit with the Commission's Railroad Division, as soon as possible, site plans and proposed time schedules for the installation of automatic flashing lights and highway gates at the crossings set forth in the attached agreement and, additionally, CSX is directed to submit cost estimates for the crossings set forth in Schedule C of the agreement. It is, further,

ORDERED, That because this Entry only approves and adopts the attached agreement, CSX not commence with the acquisition of materials and construction without first having been so authorized by the Commission following the submission of all required plans and estimates. It is, further,

ORDERED, That the installation projects be completed at these crossings no later than November 25, 1998, or the effective date of control as authorized by the Surface Transportation Board in Finance Docket No. 33888, whichever comes first. It is, further,

ORDERED, That the railroad notify Commission staff and the ORDC at the time the installations are completed and the signals and lights are activated, at which time the devices may be inspected. It is, further,

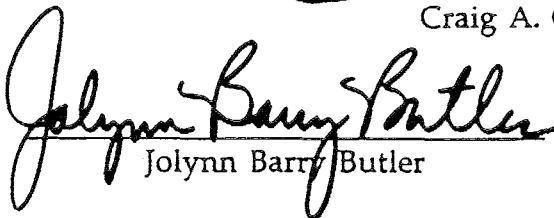

ORDERED, That all interested local governmental entities having jurisdiction of the roadway at the crossings identified herein may apply for Commission funding of up to \$3,000 for supplemental improvements at these crossings during the pendency of the construction projects by filing an application with the Commission's Transportation Department, Rail Division, as set forth in Finding 12. It is, further,

ORDERED, That a copy of this entry be served upon CSX Transportation, Inc.; the Ohio Rail Development Commission; the Board of Commissioners for Defiance, Hancock, Henry, Huron, Seneca and Wood counties; the mayors of Greenwich, Tiffin, Fostoria, Bairdstown, North Baltimore, Hamler, Holgate, and Defiance, Ohio; the Board of Trustees for Ripley Township (Huron County), Venice, Reed, Hopewell and Loudon Townships (Seneca County), Washington Township (Hancock County), Bloom and Jackson Townships (Wood County), Marion Township (Henry County), and Richland, Delaware and Mark Townships (Defiance County); and all other parties of record.

RAILROAD CORRIDOR
SAFETY AGREEMENT

This Railroad Corridor Safety Agreement is entered into by and among CSX Transportation, Inc. (CSXT or Railroad), the Ohio Rail Development Commission (ORDC) and the Public Utilities Commission of Ohio (PUCO) and is intended to facilitate the grade crossing safety improvements outlined herein.

RECITALS

WHEREAS, many of Ohio's public grade crossings are currently passively protected by crossbuck signage or equipped only with flashing warning lights;

WHEREAS, the PUCO has statutory authority to regulate to promote the welfare and safety of railroad employees and the traveling public pursuant to Ohio Revised Code 4905.04;

WHEREAS, the PUCO is responsible for evaluating public highway-railroad grade crossings to determine the need for upgrading active warning devices and apportioning the costs thereof pursuant to Ohio Revised Code 4907.471;

WHEREAS, the Federal Aid Highway Safety Act of 1973 and the Intermodal Surface Transportation Efficiency Act of 1991, and subsequent amendments thereto provide funding for the cost of safety upgrades to eliminate hazards at public grade crossings, which funding is administered jointly by the PUCO and ORDC pursuant to Ohio Revised Code Section 4907.476;

WHEREAS, the parties hereto propose to facilitate the improvements identified in this Agreement in accordance with the Federal Aid Policy Guide (FAPG) and applicable provisions of Title 23 of the United States Code pursuant to the terms hereof;

WHEREAS, CSXT is a principal party in a Finance Docket No. 33388, presently pending before the federal Surface Transportation Board (STB), jointly filed by CSXT and Norfolk Southern Corporation to gain control and operation of the rail transportation system of Consolidated Rail Corporation (the STB case);

WHEREAS, CSXT has identified a transportation corridor extending from Greenwich, Ohio in Huron County to the Ohio/Indiana border at a point in Defiance County (the B&O corridor) that will require expansion of the existing transportation system to accommodate a greater volume of its trains traveling at higher rates of speed that are expected to result from the STB case;

WHEREAS, CSXT, ORDC, and the PUCO jointly desire to address heightened grade crossing safety concerns along the B&O corridor route that are presented as a result of increased CSXT train volumes and speeds expected along this route;

WHEREAS, CSXT, ORDC, and the PUCO wish to jointly share in the costs of enhancing public safety at B&O corridor grade crossings;

WHEREAS, this agreement is the product of extensive negotiations by and among CSXT, ORDC, and the PUCO to promote grade crossing safety within Ohio;

NOW THEREFORE, CSXT, ORDC, and PUCO agree as follows:

I. B&O CORRIDOR CROSSINGS

The B&O corridor railroad/highway grade crossing locations subject to this agreement are those identified on Schedule A attached hereto. This list may be modified by agreement of the parties. CSXT, ORDC, and the PUCO have reviewed all of the crossings on the B&O corridor and contemplate that the grade crossings listed on Schedule A will be targeted for installation of safety enhancements in the form of traffic gates and flashing lights to provide maximum warning for the traveling public of approaching train traffic.

PUCO/ORDC agree to compensate CSXT for the cost of grade crossing safety improvements pursuant to the terms of this Agreement. Additionally, PUCO/ORDC agree to work with CSXT and local communities to identify whether any of the grade crossing locations identified on Schedule A may be permanently closed to public vehicular traffic as an alternative to installation of automatic warning devices. Public grade crossing closures, if any, shall be separately identified and negotiated on a case-by-case basis. In the event of closure of a Schedule A grade crossing, money otherwise to have been applied for installation of active warning devices at that crossing shall be applied to safety upgrades at any location within the B&O corridor mutually agreed upon by the parties.

II. COSTS OF GRADE CROSSING SAFETY UPGRADES

A. Costs

PUCO/ORDC and CSXT agree that the Federal Accident Prediction Formula (FAPF) utilized by the PUCO to prioritize public grade crossings for federally-funded safety upgrades, constitutes an appropriate mechanism upon which to allocate the costs, as between CSXT and PUCO/ORDC of all safety upgrades contemplated under this Agreement. In this regard, the parties agree to an allocation that reflects the increased FAPF ranking of the crossings on Schedule B caused by physical and operational changes at these locations. On this basis, PUCO/ORDC and CSXT agree to pay 56% and 44% respectively of the costs associated with installation of safety upgrades at Schedule B crossing locations.

PUCO/ORDC and CSXT agree that the total price for all safety upgrades at crossings shown on Schedule B shall be determined with reference to the concepts

set forth in the "Lump Sum" agreement recently negotiated between PUCO/ORDC and CSXT. In accordance with that agreement, PUCO/ORDC and CSXT agree that the total price for each Schedule B crossing safety improvement shall be \$81,600, an amount calculated with reference to the PUCO/ORDC-CSXT agreed upon lump sum amount for double track signal territory crossings with motion sensor circuitry, which is \$96,000, and further discounted by 15 percent. The parties acknowledge and agree that the costs of preliminary engineering are included in this amount.

B. Special Circumstances

The parties have identified certain characteristics at particular grade crossings located within the B&O corridor for which installation of active safety warning devices will require more engineering design work thereby increasing the cost required for performing the installation. This includes "railroad control points," which are those locations where there may exist a public crossing in close proximity to another grade crossing such that warning device signal circuits overlap, a track cross-over, a controlled track switch, or an interlocker. These grade crossings are listed on the attached Schedule C.

The actual cost of safety upgrades at each grade crossing identified on Schedule C shall be allocated as between CSXT and PUCO/ORDC in the same manner as specified in Section II (A), without discount. All billings shall be subject to the same provisions outlined in Section II (C), except that one hundred percent of preliminary engineering costs incurred for safety improvements to Schedule C crossings shall be reimbursed with state funds provided by the PUCO.

C. Billing

The railroad may bill ORDC monthly or periodically for materials and work completed. Progressive invoices may be submitted for work performed during the previous month or period showing the portion of the Lump Sum amount that is due the Railroad. The Railroad shall be paid the agreed upon price for each improvement upon final acceptance by the ORDC of work performed on that improvement. A final bill shall be submitted to ORDC within ninety (90) days after completion of improvement. Upon completion of installation of warning device improvements and inspection of same by the Railroad, the Railroad shall promptly activate the warning devices for public use. The Railroad shall provide written notification to PUCO of the date(s) on which the Railroad inspected the devices and placed them into public service. A project shall be deemed completed when the grade crossing safety improvement is activated for use by the public. ORDC shall pay all invoices within thirty (30) days after receipt of a proper invoice.

D. Completion

The Railroad shall complete the safety upgrades on the B&O corridor crossings listed on Schedule A and as may be amended by the parties from time to time,

by the earlier of the effective control date as authorized by the Surface Transportation Board in Finance Docket No. 33888 or 12 months from the date of issuance by the PUCO of its order adopting this agreement, except as provided below. In the event of closure of any B&O corridor crossing as referenced in Section I of this Agreement, the completion date for installation of active warning devices at a crossing substituted therefor shall be negotiated by the parties but shall, in no event, exceed 12 months from the date on which the closure is finalized unless otherwise agreed by the Parties.

III. RECORD KEEPING REQUIREMENTS

The Railroad shall make all records, plans, correspondence and other materials associated with any safety improvement performed under this Agreement available for examination and reproduction by authorized representatives of the U.S. Government, the State of Ohio and/or their agents. All project records shall be maintained by the Railroad for three years after final acceptance of the project or three years after the resolution of any disputes that may arise as part of any project.

The Railroad will make available to the U.S. Government, State of Ohio, or their authorized agents, their books, records, papers and materials pertaining to the Railroad costs of performing improvements.

IV. TERMINATION

In the event the STB fails to approve the pending application in Finance Docket No. 33388, CSXT reserves the right to terminate further performance under this agreement upon terms mutually agreeable to the parties hereto. This Agreement shall otherwise terminate at the end of the next biennium, June 30, 1999. If the safety upgrades covered under this Agreement are not completed by that date, it is the expressed intention of the parties to renew this Agreement for a successive biennium period until such time as all work contemplated herein has been satisfactorily completed.

Any renewal thereof is subject to the determination by PUCO/ORDC that sufficient funds and the authority to spend funds have been provided by the Ohio General Assembly to ORDC for the purposes of this Agreement and to the certification of funds by the Office of Budget and Management as required by the Ohio Revised Code, Section 126.07. If PUCO/ORDC determines that sufficient funds have not been appropriated for the purposes of this Stipulation, or if the Office of Budget and Management fails to certify the availability of funds, this Agreement will be terminated.

V. OHIO ETHICS LAW REQUIREMENTS

The Railroad agrees to adhere to the requirements of Ohio Ethics Law as provided by Section 102.04 of the Ohio Revised Code. O.R.C. Section 102.04 (A) prohib-

its a state official or employee from receiving compensation, other than from his own agency, for personal services rendered in a case proceeding, application, or other matters before any state agency. O.R.C. Section 102.04 (B) prohibits state officials and employees from selling goods or services to state agencies, except by competitive bidding.

It is understood by the parties that non-elected state officials and employees may qualify for an exemption under O.R.C. Section 102.04 (D), if (1) the agency with which the officials or employee seeks to do business is an agency other than the one with which he services; and, (2) prior to rendering personal services or selling or agreeing to sell goods or services, the official or employee files and O.R.C. Section 102.04 (D) settlement with the Ohio Ethics Commission, the agency with which he serves, and must include a declaration that the person disqualifies himself for a period of two (2) years from any participation in his official capacity as a board or commission member in any matter involving any official or employee of the agency with which he seeks to do business.

It is expressly understood and agreed to by the parties that a failure by the Railroad to file a declaration statement is required under O.R.C. Section 102.04 (D), may be considered by PUCO/ORDC to constitute a breach of material condition of this contract and the State may, if it so elects, void this contract.

VI. EQUAL EMPLOYMENT OPPORTUNITY

In carrying out this Agreement, the Railroad shall not discriminate against any employee or applicant for employment because of race, religion, color, sex, sexual orientation, national origin, handicap, age, or Vietnam-era veteran status. The Railroad will ensure that applicants are hired and that employees are treated during employment without regard to the aforementioned factors.

Such action shall include, but not be limited, the following: Employment, Upgrading, Demotion, or Transfer; Recruitment or Recruitment Advertising; Lay-off to Termination; Rates of Pay or other forms of Compensation; and Selection for Training including Apprenticeship.

The Railroad agrees to conspicuously post for employees and applicants for employment, notices setting forth the provisions of this nondiscrimination clause. The Railroad will, in all solicitations or advertisements for employees placed by or on behalf of the Railroads, state that all qualified applicants will receive consideration for employment without regard to race, religion, color, sex, sexual orientation, national origin, handicap, age, or Vietnam-era veteran statues. The Railroads shall incorporate the foregoing requirements of this paragraph in all of its contracts for any of the work prescribed herein (other than subcontracts for standard commercial supplies or raw materials) and will require all of its subcontractors for any part of such work to incorporate such requirements in all subcontracts for such work.

VII. DRUG FREE WORKPLACE

The Railroad agrees to comply with all applicable statutes and federal laws regarding a drug-free workplace. The Railroad shall make a good faith effort to ensure that all Railroad employees, while working on state property, will not purchase, transfer, use or possess illegal drugs or alcohol or abuse prescription drugs in any way.

VIII. HOLD HARMLESS PROVISION

The Railroad covenants and agrees to indemnify and hold, the PUCO/ORDC and their agents and employees harmless from and against any loss, claim, cause of action, damages, liability (including, within limitation, strict or absolute liability in tort or by statute imposed), charge, cost or expense (including, without limitation, counsel fees to the extent permitted by law), predicated on personal injury or death; or loss of or damage to property, and arising from work negligently performed pursuant to this Agreement. In case any action involving any work covered by this Agreement is brought by or against any party or parties, said party or parties shall promptly notify the other party or parties of such action.

This Agreement does not represent any admission of liability on the part of any party hereto. If the PUCO rejects all or any part of this Agreement, any party may, in writing submitted within ten days of the PUCO's order, elect to withdraw its consent to this Agreement, in which event this Railroad Corridor Safety Subsidy Agreement shall be deemed a nullity, and shall not constitute any part of the record in this proceeding.

The undersigned respectfully join in recommending that the PUCO issue an Order approving and adopting this Agreement in accordance with the terms set forth herein.

Subject: Conrail Merger EIS
Date: February 2, 1998

Attached is a summary of the EIS performed by a member of the DAPC staff. The more important points that should be considered are:

1. There will be a statewide increase of emissions of nitrogen oxides (NO_x) of over 7000 tons per year. This is a significant amount, although it is distributed throughout a number of counties in the state. However, U.S. EPA has proposed a statewide budget for NO_x to reduce the impacts of transport on downwind states. These emission increases from the merger will need to be offset by decreases from other source categories (e.g. utilities).
2. The EIS examined emissions in relative percentages to existing emissions from a county. For carbon monoxide and NO_x, if there was a significant increase in emissions, additional air quality impacts were performed. The report indicates that there will be no adverse impacts due to these pollutants. However, carbon monoxide increases in Cuyahoga County remain a particular concern due to the county's former nonattainment status.
3. There is no analysis of the air quality impact on the former one-hour ozone standard. Due to the increases in NO_x, there will be local and regional effects on ozone air quality. The draft EIS did not examine the effect of the merger on the one-hour ozone standard.
4. There is no analysis with respect to the new air quality standard for ozone. During the summer of 1997, U.S. EPA promulgated a new eight-hour standard for ozone. Much of Ohio does not conform to this new standard and it can not be determined what impact of the merger will be on the new standard.
5. In the summer of 1997, U.S. EPA promulgated a new ambient air quality standard for PM_{2.5}. There is no quantification of PM_{2.5} emissions from the increased train traffic. It is expected that many areas of the state will not comply with the new standard, and the increased diesel particulates will exacerbate the problem, but it is impossible to quantify by how much, since this pollutant was not addressed.

Please contact me at 644-2270 if you have any question.

INTER-OFFICE COMMUNICATION

TO: Bob Hodanbosi, DAPC
FROM: Harry Judson, DAPC
DATE: February 2, 1998
RE: Proposed Conrail Acquisition EIS

The proposed Conrail acquisition will result in expanded rail lines in Ohio, upgraded routes and new connectors, and new construction of rail yards and intermodal facilities.

The acquisition will increase rail emissions as a result of expanded railway systems and increased traffic. Some of these increased emissions will be offset by truck to rail diversions resulting in less highway truck traffic and congestion.

Additional rail routes and improvements in signal systems will result in more efficient rail movement, faster trains, and less auto idling at grade crossings.

A new intermodal facility in Columbus will increase ADT by 4%. This is considered insignificant and will have no impact on air quality in Franklin County.

In evaluating specific air pollutants, only NOx and CO show exceedances of the "screening threshold." Diesel emissions, unlike auto emissions, are low in hydrocarbon emissions.

Increased county emissions as a result of increased rail activity were evaluated for each county in Ohio. Three of Ohio's "moderate" counties exceed a 1% increase in total county emissions for NOx. Again this increase will not affect ambient air quality levels. In modeling analyses, a threshold level of 100 additional tons/year was looked at since this is the size of a major stationary source. In corridors where CO levels are projected to exceed 100 tons/year, the dispersion effects of CO from a moving source will significantly reduce the impact of CO from rail traffic. Based on the draft EIS, the increases in emissions will "not affect compliance with air quality standards."

The total Statewide increase in NOx emissions from this project (obtained by adding the increases for the individual counties) amounts to 20.17 tons/day. In 1990, statewide point source emissions of NOx were estimated to be 1777 tons/day. Assuming point source emissions amount to approximately 30% of the total point, area and mobile source inventory, the proposed project will increase statewide NOx emissions by 0.378%. When comparing the impact to existing point source NOx emissions, a 1.13% increase would occur.

Although mention is made of new NOx reduction requirements for train engines, no analysis or estimate of impact is presented.

No mention is made of the impact of NOx increases on the stricter new ozone standard to be implemented in 2003 (NOx being a precursor), nor the impact on the OTAG SIP call requiring Ohio to reduce utility NOx emissions by 85%.

**CONRAIL ACQUISITION
FOSTORIA REMEDIATION STUDY**

Prepared for: Ohio Rail Development Commission
City of Fostoria, Ohio

Prepared by: **PARSONS BRINCKERHOFF**
Cleveland, Ohio
January 31, 1998

A-538-d

BACKGROUND INFORMATION

The City of Fostoria is located in Northwest Ohio, and has a population of approximately 15,000. It is predominately a manufacturing community with major ties to auto manufacturing and agricultural industries. A major rail junction, the community currently has twenty-two (22) at-grade crossings because of the 45,000 feet (8.6 route miles) of main line rail corridors within the city. These crossings have a major impact on both vehicular and pedestrian traffic.

Three grade separations exist in the community, and are located on the designated state highway system. The location of these grade-separated crossings, in conjunction with motorists' tendency to avoid potential delays at grade crossings, has a channeling effect on vehicular traffic causing congestion in the downtown area.

Fostoria is located at the junction of three distinct rail lines:

- Norfolk Southern Lake Division Fostoria District (oriented generally east-west, connecting Bellevue to Chicago). Traffic includes a wide range of commodities, including coal, general merchandise, and some intermodal traffic.
- CSX former B&O (oriented generally east-west, connecting Pittsburgh to Chicago). Traffic includes all types, with significant intermodal traffic.
- CSX former C&O Columbus subdivision (oriented generally north-south, connecting Columbus and Toledo). Traffic is primarily coal south of Fostoria, with significant other traffic north of Fostoria.

The lines and the current/projected traffic levels are shown on the attached Figure 1. Each line is double track within the City, and the lines cross each other at grade in the southern portion of the City. Because of this arrangement, rail traffic can generally pass through the City on only one line at any given time, although it is possible for two trains (one on each of the two tracks) on the same line to operate simultaneously. A limited number of other simultaneous movements are also possible. According to the CSX/NS Operating Plan as filed with the Surface Transportation Board (STB), about 84 daily trains pass through the city, including both through movements and movements using connecting tracks.

The rail configuration is complicated by active connection tracks joining the lines, especially those joining the two CSX lines. Currently, a significant amount of rail traffic changes direction in Fostoria via the four CSX connection tracks, which are designated by physical location (northeast, southeast, etc.) relative to the B&O/C&O crossing. This crossing is also the location of the building housing the operating control point for the area, called "F" Tower. Although dispatching on all lines is handled remotely from central offices, the crossings and connections themselves remain under the control of an operator at "F" Tower, who takes

direction and input from the individual dispatchers.

These connections and their common uses are described as follows:

- **Northeast Connection:** Heavily used by Willard-Toledo/Michigan trains, including significant automobile industry traffic.
- **Southeast Connection:** Used by Willard-Columbus merchandise and coal trains.
- **Southwest Connection:** Used by local freight movements and unknown, but likely limited, number of through trains.
- **Northwest Connection:** Previously heavily used by Cincinnati-Deshler-Fostoria-Toledo trains. Traffic on this connection has assumed to decrease as a result of CSX's increasing use of the direct Deshler-Toledo line.
- **NS Connections:** Join both former B&O and former C&O to NS in the northeast quadrant of the crossing. Traffic is relatively light, consisting of transfer movements between the two railroads.

Movements on these connection tracks require significantly longer time to pass through the city, since speeds are generally limited to 10 to 15 mph over the connections themselves because of high curvature (order-of-magnitude 15 degrees) and short-length turnouts. Trains must slow to this speed while approaching the area, and cannot begin to accelerate until the entire train has traversed the connection.

It is important to note that neither the proposed Operating Plan nor other data available to date includes information regarding the number of movements on the respective connecting tracks. This data is critical to the accurate estimation of merger-related impacts on the city. For this analysis, assumptions regarding the distribution of traffic were made based on observation and a general understanding of northern Ohio traffic patterns.

CONRAIL ACQUISITION

As noted previously, the number of daily trains passing through Fostoria will increase from about 84 to 108 as a result of the acquisition. The STB has the obligation to review environmental and other impacts of traffic changes resulting from the acquisition. The city of Fostoria experiences numerous problems because of the existing rail traffic levels, but these impacts will increase following the merger. The State of Ohio and city take the position that these merger-related impacts be acknowledged and addressed as a condition to any approval of the acquisition.

PROBLEM DEFINITION

With all three major rail lines receiving increased traffic, there will be significant negative impacts on the safety, movement of vehicular traffic, economic development, and overall quality of life issues for the citizens of Fostoria. Perhaps the most critical impact is safety and emergency response time.

Two areas of the community, one to the east and one to the west, have been dubbed "Iron Triangles" by emergency response forces. This is because of the difficulties in reaching the areas quickly and reliably as a result of the at-grade crossings being blocked by trains. The location of the police, fire, and ambulance services and the hospital are shown on Figure 2.

The West Triangle area is defined as the area south and west of the CSX (formerly Baltimore & Ohio) line crossing West Tiffin Street, and north of the NS line crossing Findlay Road. It currently includes 198 homes, 3 businesses (one of which maintains chlorine on the premises), and 1 power substation. This area is detailed in Figure 3.

The East Triangle area is south and east of the NS line and north and east of the CSX (B&O) line. CSX also has a switching yard immediately east of the Columbus Avenue grade crossing, which generates additional train movements. This is compounded by slow moving rail traffic diverging onto the former C&O lines. The East triangle has 98 households, 8 businesses, and 1 church. The area is shown in Figure 4.

Based on observation and past practice, east-west trains awaiting clearance to proceed through Fostoria typically are held west of Findlay Street and east of Columbus Avenue, which helps keep these two roadways open to provide access to the two sectors. However, moving trains (some at slow speeds) and trains stopped clear of the crossings but within the limits of the electronic crossing circuit detection systems (thereby activating crossing warning systems including gates) can still block access for emergency vehicles. The proposed increase in rail traffic volume will be expected to heighten this risk following the merger.

Train delays at Fostoria as a result of the acquisition will also have effects on the northern Ohio rail network and on other cities in the Fostoria area. Following the Conrail acquisition, according to the proposed Operating Plan, both CSX and NS will each have a primary and a secondary Chicago-East Coast route traversing northern Ohio. This is a total of four main lines, two of which cross at Fostoria. Similarly, northwest Ohio will have four main north-south (Cincinnati/Columbus-Toledo) routes, one of which crosses at Fostoria, while a second (CSX via Deshler) is operationally related to Fostoria. A third, the Conrail (to become CSX) Toledo Line via Findlay, will be significantly downgraded. The fourth is NS via Bellevue.

This means that operating conflicts and congestion at Fostoria are likely to have significant spill-over effects on the rail network in northern Ohio. This will affect numerous stakeholders in terms of environment impacts, safety hazards, and competitive issues.

DRAFT EIS

The SEA's Draft Environmental Impact Statement almost completely ignores impacts on Fostoria as a result of the acquisition, and is grossly inadequate. Although segment C-070 (Marion-Fostoria) and C-075 (Willard-Fostoria) are identified as meeting the threshold for analysis by the SEA, neither the individual nor the cumulative impacts of the increased traffic are considered on safety and grade crossing delays.

In fact, the rail system configuration in Fostoria, with three major rail/rail crossings, will cause impacts far in excess of the sum of the traffic increases on the three individual rail lines because:

- crossing delays will be compounded by stopped trains and trains moving at speeds far below maximum or reasonably-expected speeds while awaiting other trains to clear at-grade rail crossings
- a significant number of trains will diverge from former B&O to former C&O trackage, requiring the use of slow speed connection tracks. These tracks and associated turnouts are not, and in most cases cannot be, configured for speeds in excess of 15 mph. Typical speeds are likely closer to 10 mph. For the proposed 6200 foot typical CSX post-acquisition train, this will result in a blocked crossing time per diverging train of 7.5 minutes.

It can only be assumed that the Columbus Avenue and Tiffin Street crossings are not evaluated for impact because of low traffic volumes. While documented traffic volumes are not currently available (and could in fact be below the SEA threshold of 5000 ADT), the arterial nature of the roadways and the potential for the two areas to be completely isolated by rail traffic, warrant that the roadways be considered for mitigation.

CRITERIA OF SIGNIFICANCE FOR TRANSPORTATION EFFECTS

The SEA identifies crossing delay per vehicle and average delay for all vehicles as key criteria for transportation (convenience) effects at crossings. Fostoria presents a challenge in evaluating these effects because of multiple at-grade crossings that may be encountered in a typical auto journey, and because of inter-relationships involved in rail operating patterns. However, to illustrate the approximate effects of the acquisition, sample analyses were performed for major roadway access routes in the east and west triangles.

For the sample analysis of the east triangle, assumptions were made for the southerly Columbus Avenue crossing (east triangle) of the former B&O. This is a key emergency response route because of the ability to reach the south side of this crossing via the underpass roadways. An ADT of 5000 (no traffic data is available) was assumed. Train movements assumed include the passage of 18 diverging-movement trains at 10 mph (estimated, not provided by available Applicant data) and the passage of 36 through trains at 40 mph (assumes an increase in allowable speed resulting from CSX's improvements to the line). This totals 54 trains as shown in the Operating Plan. This would result in a Level of Service for the crossing far below the threshold for level "F", with an average delay per vehicle of about 100 seconds. Even if diverging rail movements and vehicular traffic levels are less than assumed, conditions at the crossing are likely to fall below the acceptable threshold level of service.

Alternative routes into the east triangle are Columbus Avenue from the north, which crosses both CSX (C&O) and NS, which makes delays a significant risk. Town Street is only affected by NS, and may experience a lower increase in delay as a result of the acquisition, but it is located at the west end of a yard and of the distribution center lead track, increasing potential delays from switching movements.

A similar analysis for the Tiffin Street B&O crossing results in an average delay per vehicle of about 35 seconds. Although this may not meet the SEA threshold criteria for "significant impact", which is a value over 40 seconds, especially considering potential inaccuracies in traffic volume assumptions, the isolated nature of the area must be considered on the basis of unacceptable emergency response time. The only alternative for access to this area is CR 262 west of town, a detour of over three miles. Vine Street and Findlay Street include NS crossings, and do not provide access to the major portion of the triangle.

Even if the assumptions used in the analyses are somewhat inaccurate, based on the Columbus Avenue analysis, it appears likely that the east triangle area will violate the threshold levels. The justification for the west triangle area may be less strong on a transportation basis, but will be further supported by emergency response issues. By any measurable standards, it is difficult to suggest that conditions in these two areas are acceptable, and will remain acceptable under post-acquisition traffic levels.

CRITERIA FOR EMERGENCY VEHICLE RESPONSE

To determine the delays encountered by emergency vehicles at at-grade crossings, the Surface Transportation Board's Section of Environmental Analysis (SEA) used a formula to calculate the Total Daily Blocked Crossing Time. The Total Daily Blocked Crossing Time is an indicator of the risk of delay since it indirectly

measures the probability that an at-grade crossing will be blocked at the time that an emergency vehicle would need to cross the tracks.

It is found by multiplying the blocked crossing time per train by the number of daily trains. This formula assumes the train is moving at a constant speed, slightly less than the maximum allowable speed. It does not include the additional startup or slow down time required for trains stopping near crossings, nor does it include time for trains to stop and allow other trains to pass or switch tracks.

Detailed analyses will be provided in a following section. A simple review of Table C-6 in the DEIS Appendix, however, shows that the increase in total daily blocked crossing time is over 50% for increases in train frequency of 32.5 to 54, as will be experienced on the south crossing of Columbus Avenue regardless of assumed operating speed. The additional diverging-movement trains will increase this further.

The increase in total blocked crossing time in the west triangle at Tiffin Street is less substantial, because rail traffic will increase only from 34 to 37.9 daily trains. Again, however, because of the potential isolation of the area, mitigation is warranted as described in the following section. Additionally, even the SEA does not establish criteria as to the threshold levels for acceptable emergency response time effects.

CURRENT EMERGENCY RESPONSE PRACTICES

The procedure for responding to police or fire emergency situations in the two triangle areas is to dispatch two vehicles along separate paths, increasing chances of successfully entering the triangles. In the event that both vehicles are able to cross the tracks, the first crew determines whether to enter the scene immediately, possibly compromising their own safety, or wait until a second vehicle arrives with backup. This additional time is critical, because experts claim that each additional minute a fire burns, a fire can double in its size and intensity.

Table 1 below compares approximate response times for police, fire, and ambulance services along various reasonable existing routes into the Iron Triangles. Each of the routes includes only one at-grade crossing, and it is assumed that no train or vehicular traffic delays are encountered. With the large volume of trains passing through Fostoria, the likelihood of encountering this "perfect condition" is dangerously low.

RAIL CROSSING	POLICE	FIRE	AMBULANCE
TO WEST TRIANGLE			
Tiffin Street	2.11	1.96	4.95

Twp. Road 262	8.80	8.48	12.89
Independence	2.56	2.44	5.15
Adams Street	2.34	2.22	4.93
TO EAST TRIANGLE			
Town Street	1.96	2.41	6.07
Columbus Ave.S	3.38	3.13	7.47

**Table 1 – Existing Emergency Response Times (minutes)
Assumes No Delays at Rail Crossings**

Table 2 below shows the response times of each emergency service into the Iron Triangles assuming that only one moving train impedes the emergency vehicle's progress and that each vehicle arrives just as the gates are being lowered. It was assumed that CSX trains were 6200' long and traveled at 15 miles per hour (mph) when using a connection to another track. While this appears to represent the worst case scenario, train speed could well be lower. NS trains were assumed to be 5000' long and travel at speeds of 35 mph.

RAIL CROSSING	POLICE	FIRE	AMBULANCE
TO WEST TRIANGLE			
Tiffin Street	7.31	7.16	10.15
Twp. Road 262	10.92	10.6	15.01
IndependenceSt	4.68	4.56	7.27
Adams Street	7.54	7.42	10.13
TO EAST TRIANGLE			
Town Street	4.08	4.53	8.19
Columbus Ave.S	8.58	8.33	12.67

**Table 2 – Emergency Response Times (minutes)
With Delay Resulting from Encountering One Moving Train**

Although few firm standards exist, it is understood that fire professionals recognize 3 minutes or less as good, acceptable response times, depending on local conditions. Seven minutes is often considered to be beyond the acceptable threshold. Some of the response times in Table 2 are within the acceptable limits, however as mentioned earlier, they do not take into account stopped trains blocking a crossing or those starting up from or slowing down to a stopped position. If any of those situations occur, the response time will be far longer.

Comparing Tables 1 and 2, in the event that no train is blocking the tracks the shortest response time into the west triangle is via Tiffin Street. If a train is blocking Tiffin, Independence Street becomes a more favorable route whether or not a moving train also blocks it. This makes the route choice even more confusing to emergency personnel who have no reliable way of predicting which crossings will be blocked at a particular time of day.

According to the SEA's formula, under current volume levels a train is blocking one or more at-grade crossings in Fostoria more than four and one half hours (4.6) hours out of each twenty-four hour day. That equates to 19% of the day that rail traffic will affect emergency vehicles directly. The knowledge of this risk also has an indirect affect as emergency response forces attempt to predict crossing conditions. With the increased train volumes resulting from the acquisition, a crossing will be blocked over six hours, which is over 25% of the day. It is apparent that some alternate provision must be made for the safety of residents within the Iron Triangles.

JONES ROAD CROSSING IMPACTS

A third area of Fostoria was analyzed to identify impacts of the acquisition. Jones Road, near the north city line, is the most highly traveled roadway in the county. It handles high volumes of industrial transport for which there is no nearby parallel route. Train delays at the CSX (C&O) crossing are common as trains await clearance to proceed through Fostoria and to switch cars for local industries. A part of the problem is the location of absolute signals at the east end of the Fostoria Center Siding, just south of the crossing. Trains often proceed up to this signal, when traffic delays would be minimized if trains waited north of the crossing. Stopped trains often trigger the crossing gates for extended periods of time, physically blocking vehicles from crossing the tracks.

In addition to the safety concerns associated with increased rail traffic further blocking the at-grade rail crossings, Fostoria has concerns about its future economic viability and overall livability. Fostoria recently supported the opening of a new intermodal auto mixing plant on the NS route south of Jones Road and east of town. Severe delays in vehicular transport will discourage other new business and industry ventures from wanting to locate their facilities in the City thereby hindering economic growth. With the additional trains generated from both the Conrail acquisition and the new mixing plant, the delays could become so lengthy, that other existing businesses would be forced to relocate.

Crossing delays at Jones Road also have safety implications. There is the potential for the east half of the city to be cut off from ambulance services, or at minimum, experience long delays because of circuitous detour routings. With the next parallel road to Jones being relatively far to the south, a blocked crossing

could add an extra 3.6 minutes to an ambulance's response time to an incident just east of the tracks on Jones Road.

MITIGATION ALTERNATIVES

Three general approaches to minimize or mitigate the effects of rail congestion in Fostoria appear worthy of further consideration. These are:

- the re-routing of rail traffic onto other rail lines in the region,
- the minimization of travel time for rail traffic through Fostoria, and
- local roadway access and safety-related improvements in Fostoria.

Regional Re-routing

The Operating Plan dramatically reduces traffic levels (from about 12 to fewer than 2) on the Conrail (to become CSX) Columbus-Toledo Toledo Line, even though this is a relatively direct through route. It is suggested that impacts on Fostoria could be minimized by diverting some traffic from the CSX Columbus Subdivision to the Toledo Line.

Other re-routing possibilities is noted in the following section.

Minimize Travel Time through Fostoria

The number of trains operating through Fostoria is proposed to increase from about 84 to about 108, depending on the distribution of trains using the various connection tracks. While this increase is of concern, the relative distribution of traffic on the connection tracks will have a particularly significant effect on the amount of rail congestion and thereby roadway congestion and delays at crossings.

This is because at maximum speeds of 15 mph through the connection tracks, the amount of time required for a CSX train to pass a crossing in Fostoria is a maximum of 5.2 minutes, is more likely 7.5 minutes, and could easily exceed 10 minutes. However, a through train traveling at 40 mph could pass within about three minutes. This example is intended to be illustrative, and may not accurately reflect current average travel times. Regardless, it is apparent that the total travel time for all trains through Fostoria is likely to decrease as the number of CSX trains using the connection tracks is minimized.

This could be accomplished by:

- routing Chicago-Toledo or Cincinnati-Deshler-Toledo traffic via the line north from Deshler, minimizing traffic on the northwest connection.
- routing some Willard-Toledo traffic via Deshler, decreasing traffic on the

northeast connection.

- routing some Columbus-Willard traffic via Greenwich, decreasing traffic on the southeast connection (depending on the need re-classify trains at Willard).

Local Access Improvements including Grade Separated Crossings

SEA established criteria for the identification of locations requiring grade separation. These are:

- Post acquisition traffic levels must decrease one LOS grade and be "E" or "F" following the acquisition. Based on the previous analysis, the Columbus Avenue/east triangle meets this criteria. The Tiffin Street/west triangle likely does not meet this criteria.
- Acquisition-related rail traffic must increase by at least eight daily trains. The east triangle meets this criteria based on the former B&O alone. The west triangle meets this criteria when considering cumulative impacts of a 3.9 increase in B&O traffic in addition to a 4.6 increase in NS traffic.
- Increased train speeds are infeasible or insufficient. Because of the uncertainties and inter-relationships involved in rail operating patterns in Fostoria, increased train speeds will provide only a partial, and relatively insignificant, mitigation of impacts.

The east triangle very likely meets these criteria. The west triangle may meet this criteria, but certainly approaches these criteria. Additionally, however, the potential for these two areas to become isolated by rail movements is very high, and the unreliability and unpredictability of direct emergency service routes is very dangerous. These conditions must be considered in addition to the above criteria. It is strongly recommended that measures for mitigation be required, including the construction of grade separations in both areas.

SPECIFIC ALTERNATIVE IMPROVEMENTS

Alternatives were developed based on the previous analysis, a brief analysis of alternatives, field visits to the sites, review of City/CSX correspondence, and personal interviews, and conceptual engineering design of three potential grade separations.

East Triangle

Alternative solutions for this area include:

- Grade separation of Columbus Avenue at B&O. Limited available distance for

approaches and significant impacts on adjacent properties.

- Grade separation of Columbus Avenue at NS, C&O, and connection tracks. Existence of multiple tracks complicates this approach.
- Grade separation of Town Street. Railroad already higher than roadway.
- Grade separation of Lewis Street at B&O. Narrow road with poor alignment.
- Grade separation of B&O at new location east of city. Costly because of significant new connector roadways required, and requires detour of at least one mile.
- Grade separation of TR 43 at B&O east of city. Same as new location above, with detour of as much as three miles.
- Grade separation of CR 60 at NS east of city. Same as above, with detour of almost three miles even if NS access road is used.

A preliminary review suggests that a separation at Town Street under the NS main line and connection track is the most beneficial alternative, with a relatively low cost. Although this involves construction on the NS line, while it may be that CSX operations directly cause a disproportionate delay and blockage of roadways to the east triangle, it is important to consider that the acquisition of Conrail is a joint undertaking by both NS and CSX. Both companies must be held responsible to mitigate impacts, and solutions should be global in nature.

Conceptual design was performed, with sketches following this report. A 25 mph design speed was used. The project will require relocation of 24" sanitary sewer and 6" water lines. A pump station for storm water will be needed with a suitable outlet point, which has not been researched at this time. Impacts on adjacent properties include minor takings on the north side, with a commercial business and four residences on the south side taken. The construction of retaining walls would decrease this impact, but increase costs.

The project is estimated to cost about \$6.2 million.

West Triangle

Alternative solutions for this area include:

- Grade separation of Tiffin Street. Crossing is at a skew angle, requiring roadway alignment changes.
- Grade separation of Adams Street. Extremely limited distance for approach roadways.

- Grade separation of Findlay Street over either NS or B&O. Would require construction of a connector road through industrial properties parallel to NS siding trackage in the Mennel Mill.
- Grade separation of TR 262 west of town. Would involve detour of over three miles.

The overpass of Tiffin Street over CSX (B&O) appears to be the best solution to serve the west triangle. To guarantee access to industries on Vine and Findlay Street, the improvement of access through industrial facilities, at least for emergency use, is required. Unless new information becomes available, we do not agree with CSX's October 10, 1997 assessment that this site is not feasible for a separation.

As shown in sketches following this report, conceptual design used a 25 mph design speed, but a 35 mph version could likely be considered. An overpass was selected to minimize impact on the 36" raw water line that crosses the site on a north-south line, but the overpass must also be designed to avoid impacts. The design would require the closing intersections of Tiffin with Watson, Elwood, and south Independence. Rail at-grade crossings would be eliminated at Tiffin, and could be considered at Cleveland and Adams. A major issue to further research involves environmental impacts on the property require north of the existing right-of-way. Property impacts include taking one residence (total) and other land takes.

The project is estimated to cost about \$2.1 million, if no significant environmental remediation is necessary.

Jones Road

Alternatives for mitigation of impacts at Jones Road were:

- Grade separation of Jones Road over CSX
- Rail operational changes that could minimize the amount of time the crossing is blocked or signals are activated

A grade separation was evaluated, as shown in the sketches following this report. Design parameters included a 45 mph design speed (w/ min. K factor for vertical curves), relocation of existing sanitary and waterlines because of excessive fill heights, and the use of retaining walls along the north side of Jones Street to lessen the impact to the existing commercial properties. Access to those sites located in the northwest quadrant would require agreements with adjoining owners. The business located in the southwest quadrant would lose access to the north end of the building.

The project is estimated to cost about \$4.5 million. The overall amount of work, length of project and total cost could be reduced by lowering the design and posted speed to 35 mph.

Alternatively, crossing delays can be minimized by:

- Ensuring that the crossing protection systems are operating correctly.
- Upgrade of crossing protection systems to motion-detection systems. This would minimize the time that signals are activated when trains are not blocking the crossing.
- Implementation and enforcement by CSX of prohibitions on trains entering the crossing until clearance is available through town.

Design Note

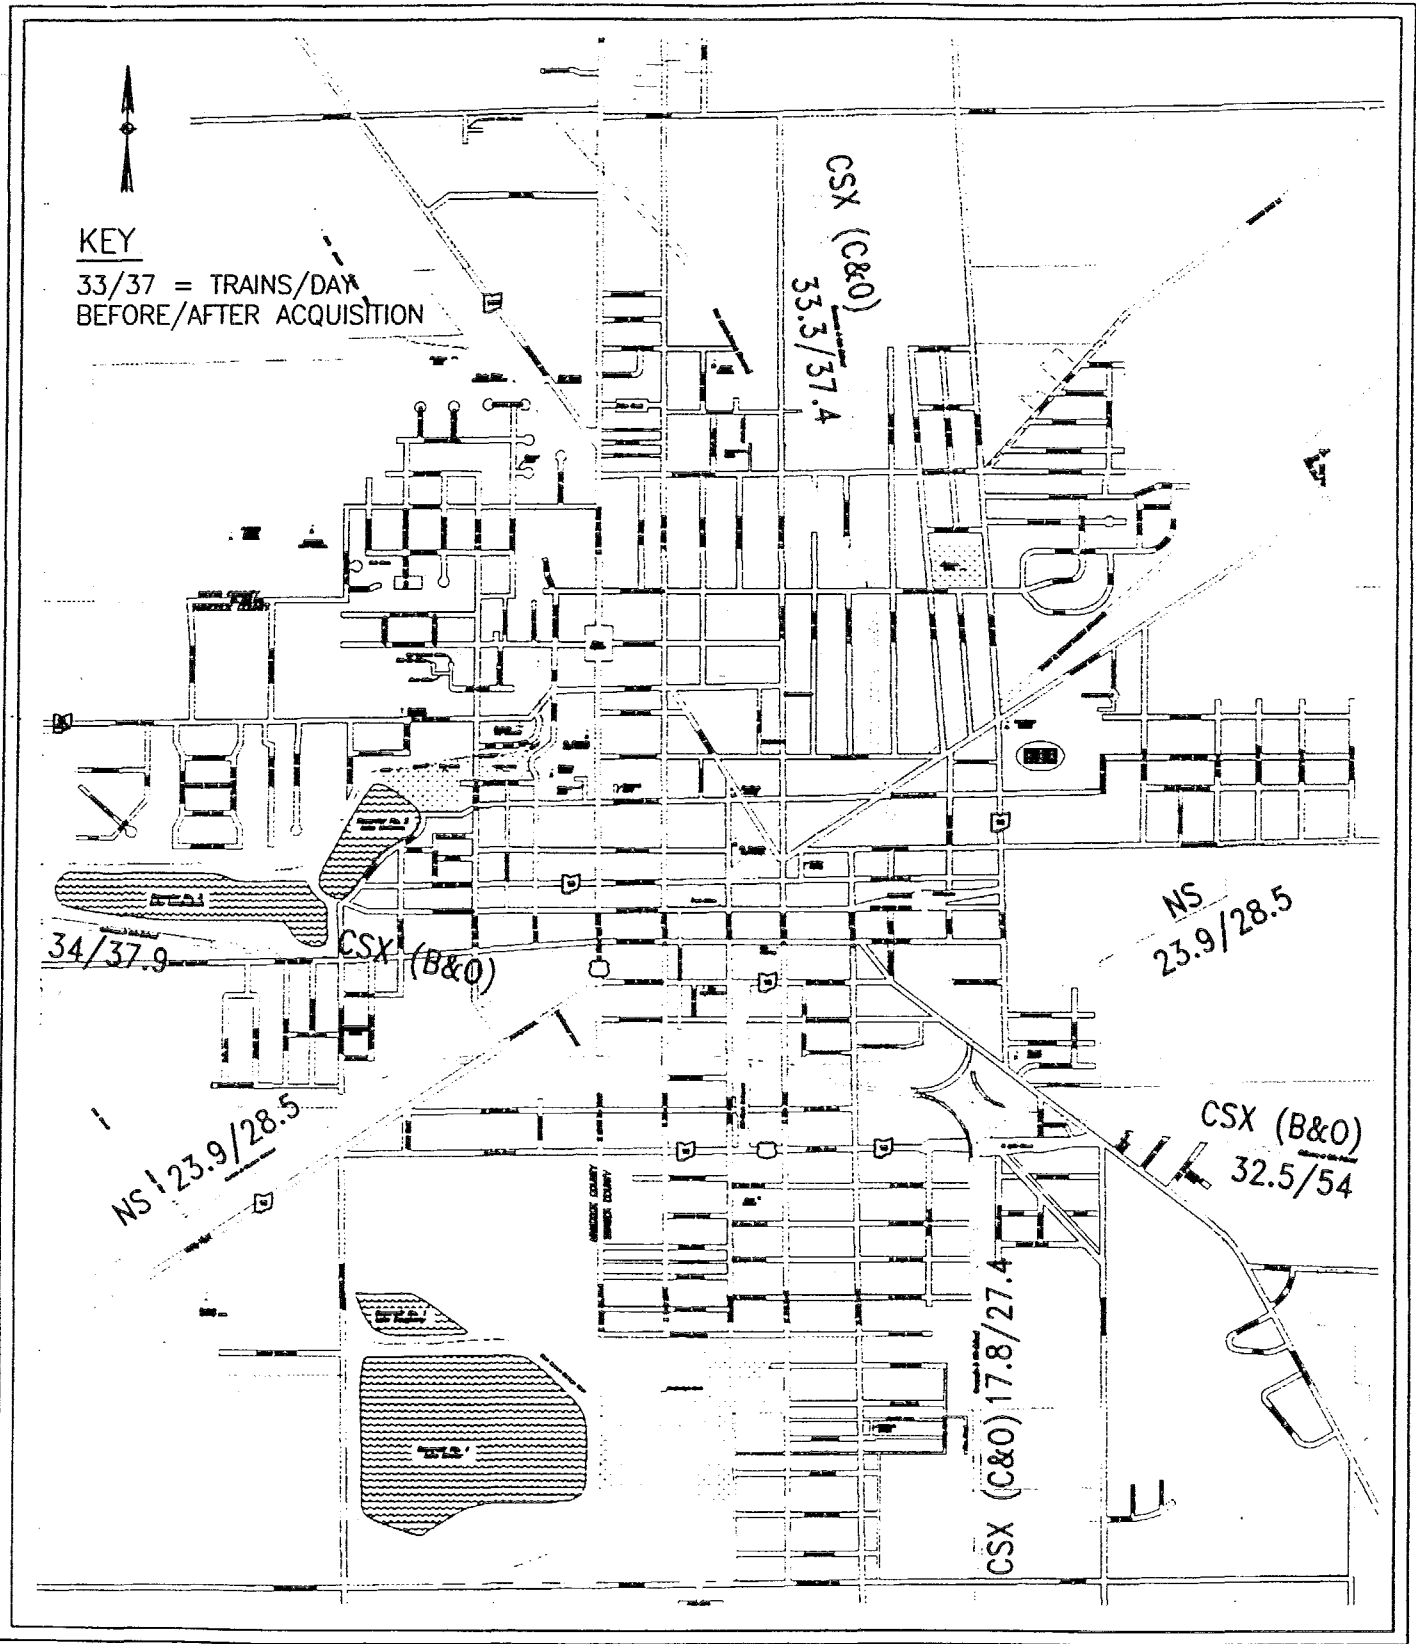

All grade separation designs described here are conceptual, and do not address all aspects of the proposed solution in detail. However, in our opinion all are determined to be feasible, and are recommended for consideration.

RECOMMENDATIONS

In order to mitigate the impacts resulting from increased rail traffic resulting from the Conrail acquisition, a number of remediation measures were considered including rerouting rail traffic outside Fostoria, providing grade separations, and improving various aspects of the rail operations. The following improvements appear feasible and justified:

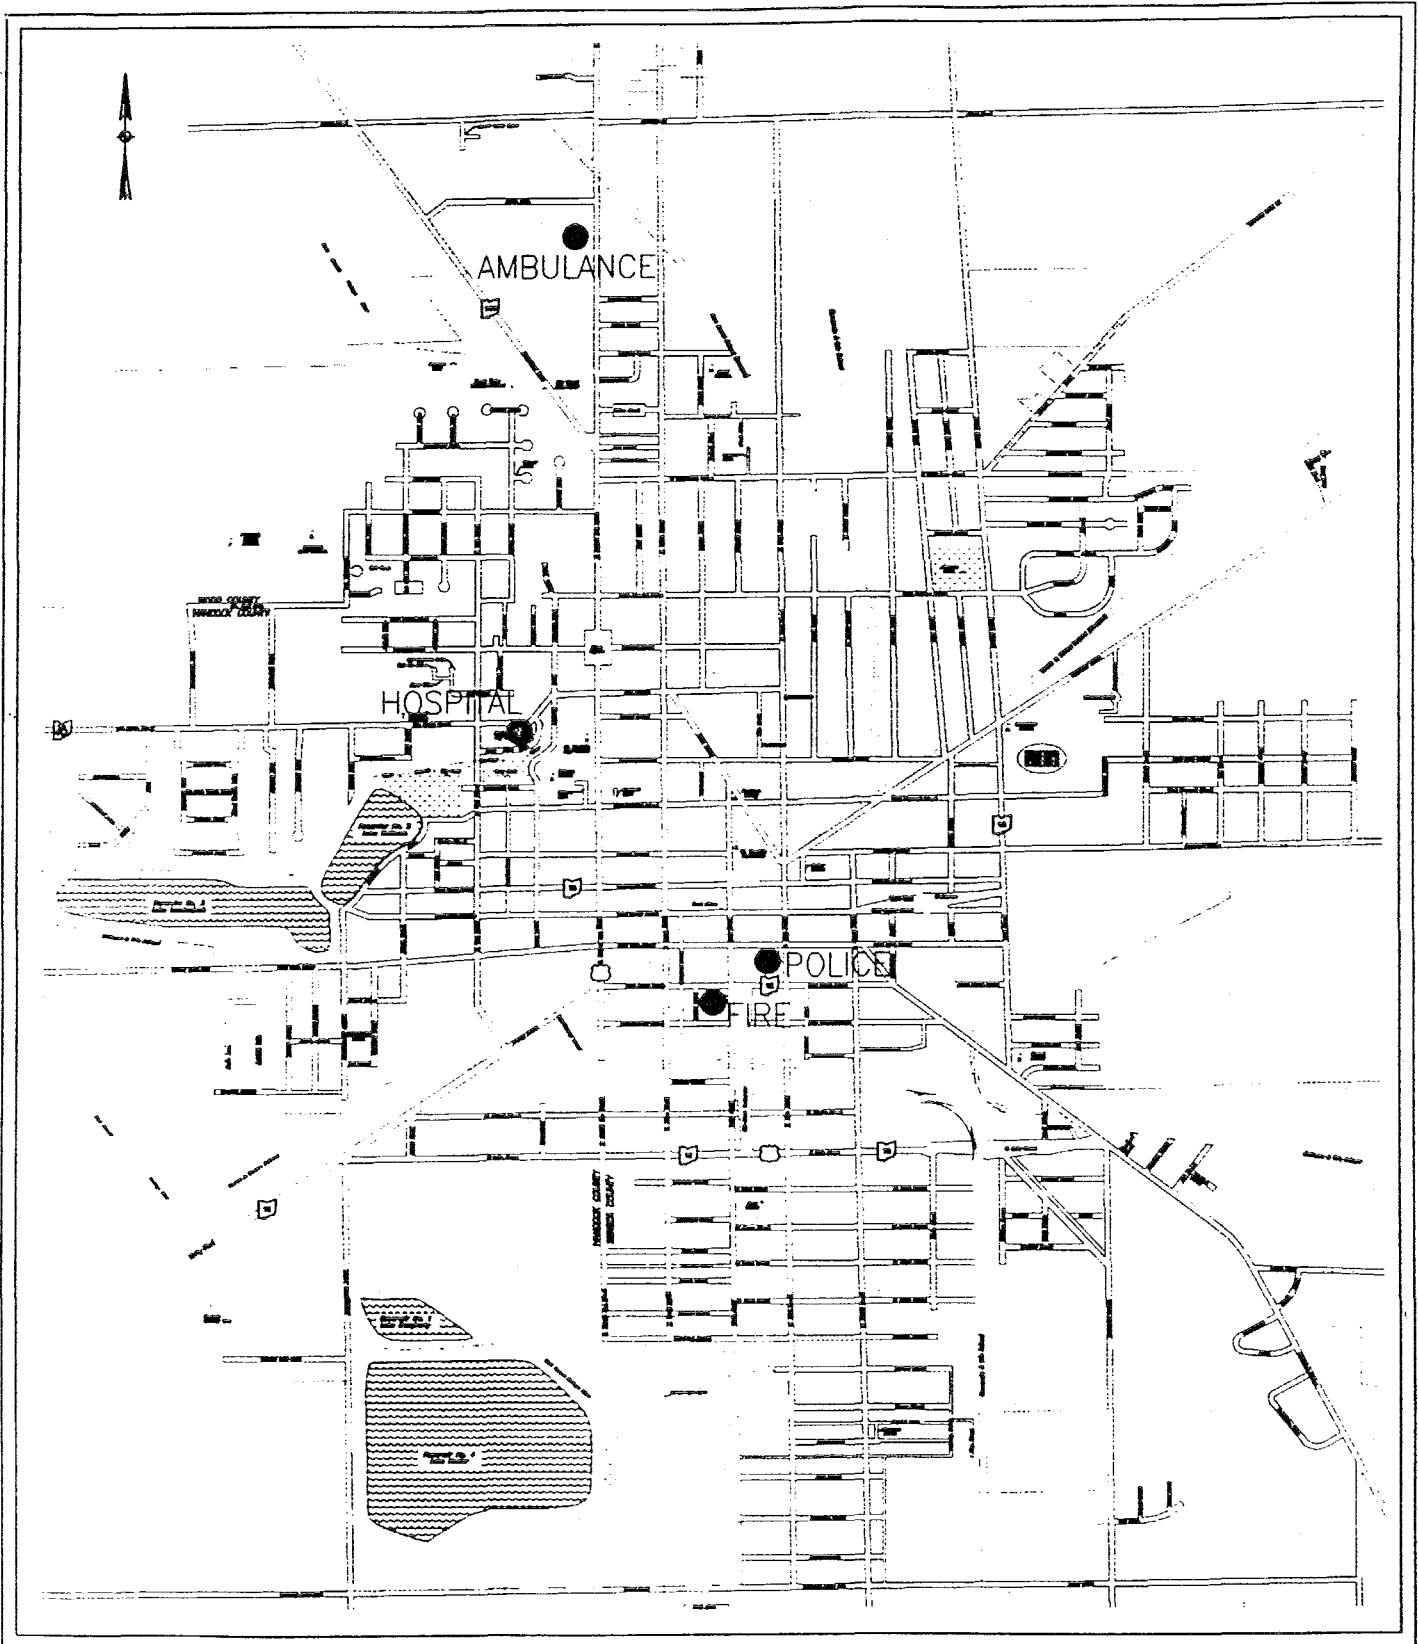

- A grade separation for Town Street under the NS is recommended to mitigate east triangle impacts.
- A grade separation for Tiffin Street over CSX (B&O) is recommended to mitigate west triangle impacts.
- A grade separation for Jones Road over CSX (C&O) should be considered, but may not be warranted solely by the acquisition's relatively minor increase in rail traffic from 33.3 to 37.4. At minimum, additional measures that should be implemented include the upgrading of grade crossing circuitry to state-of-the-art motion detection systems to minimize the time the crossing is blocked without the presence of trains on the crossing itself.

Mr. Thomas M. O'Leary, Director
Ohio Rail Development Commission
50 West Broad Street, 15th Floor
Columbus, Ohio 43215

Dear Mr. O'Leary:

Subject: Environmental and Safety Issues: Conrail Acquisition by CSX and Norfolk Southern

The acquisition of Conrail by CSX and Norfolk Southern will have significant impacts on the City of Fostoria. The City of Fostoria is alarmed that its safety concerns about the effect of the increased traffic are almost completely ignored and inadequately addressed in the Draft Environmental Impact Statement. In fact, the lack of comments would leave one to wonder if the City's comments, submitted with the State of Ohio during the Preliminary Safety and Environmental Comment Period, were considered.

Three rail lines cross in Fostoria; each will see an increase in traffic following the acquisition. Although segments C-070 (Marion-Fostoria) and C-075 (Willard-Fostoria) are identified as meeting the threshold for analysis by the SEA, neither the individual nor the cumulative impacts of the increased rail traffic are considered on a community wide basis for safety and grade crossing delays.

The City has participated in the preparation of the recommendations being submitted herewith by the State of Ohio and fully concur with them.

Emergency Response: The Draft EIS does not address the ingress/egress issues raised during the preliminary safety and environmental comment period. In addressing the delay issue in other communities, the EIS states "no national standards exist for measuring levels of significance of delay specifically for emergency vehicles. Obviously, time is critical for these vehicles to reach the scene of an accident, fire, or other emergency." We would submit that a delay for emergency responders is measurable to the degree that experts claim that each additional minute a fire burns, the fire typically doubles in its size and intensity, therefore potentially increasing the severity of injury to persons or pets who may be in the structure, the dollar amount of damage to the structure(s) and the risk of increased injury to the responders. All of these are factors

affecting the Fire Rating of a community which in turn effects its economic development capabilities. Measurable effects of delay in medical treatment can be assessed simply by evaluating the chain of survival, for instance, of all patients who collapse with sudden cardiac arrest, those in ventricular fibrillation, 70%-90%, have the greatest chance of survival. A patient's chance of survival is dependent on a strong "chain of survival" in their community. Missing links in this chain result in less than optimal programs and unnecessary deaths. The chain of survival is defined as **Early Access:** The Emergency Medical System must be activated immediately to reduce total response time. **Early CPR:** CPR initiated immediately (within 1-4 minutes) maintains oxygenation of vital organs, such as the brain and heart. This is essential if later defibrillation and medications are to be effective. **Early Defibrillation:** If the victim receives CPR within 4 minutes and defibrillation within 8-12 minutes, there is a significantly improved chance of survival. **Early Advanced Cardiac Life Support:** Definitive treatment such as administration of medications and airway stabilization, increases the chances of survival from 0% for no treatment to 30-40% with Early ACLS employed.

Due to our unique conflicts between our rail and road system, the City of Fostoria has required its contract EMS to provided the community with a certified Advanced Life Support Unit at all times.

Our problems with projecting emergency police, fire and medical services to where they are needed will be severely aggravated with the significant increase of rail traffic that will occur under the proposed merger, our community is entitled to essential mitigation.

Mitigation recommendation: That CSX and NS provide for grade separations at Town Street, W. Tiffin Street and Jones Road. Once the grade separations are completed, the City and Railroads could than consider closing a number of existing at grade crossing within the community. In addition to providing essential access for emergency services the necessary grade separations should also enable the railroads to improve their train traffic congestion problems associated with the three rail intersections and interchange capabilities within the community.

Hazardous Materials: As a result of the acquisition Fostoria stands to be significantly impacted in the amount of Hazardous Material quantities on a yearly basis. The Draft EIS indicates an increase of forty (40%) percent, 85,530 car loads per year to 119,710. The cumulative increase in hazardous materials volume exceeds the 20,000 car loads volume that results from the three lines the EIS deems very significant.

Mitigation recommendation: That CSX and NS provide funding for training and equipment for the Fostoria emergency service providers, who will, as a result, provide HazMat response not only in the City limits but also outside its corporation (as Mutual Aid) within a definable geographic area. CSX and NS should conduct hazardous material accident simulations (training) with the participation of emergency service providers at least once every two years. Participants in these exercises will include county and municipal government, fire, police and emergency response teams.

Rail capabilities: The Draft EIS does not clearly indicate the local rail conditions. Figures 5-OH-1a & 1b depicting rail segments in Ohio clearly misleads one when looking at the NS system. Figure 5-OH-1b fails to indicate the Fostoria interchange with CSX. Submitted herewith are the appropriate drawings depicting the actual conditions. As is evident, Fostoria includes the intersection of three rail lines, but also provides an interchange capability. As is evident, the interchange capability requires a significant reduction in train speed to negotiate, therefore increasing the delay at grade crossing times considerably. This in turn creates delays at the remaining crossings throughout the community as other train traffic waits.

Unemployment: December 1997 unemployment figures indicate that the area unemployment numbers are above State and National percentages as follows: National 4.4%, State of Ohio 4.6% and Fostoria Area (Seneca County) at 6.1%.

Low to Moderate Income Status: The City of Fostoria currently utilizes the Community Development Block Grant (CDBG) programs whenever it can. The community as a whole has been classified as "Low to Moderate Income" in regards to utilizing these funds. The community is also designated as a full-authority, distress-based Enterprise Zone based in part on the distress criterion requiring that a prevalence of the commercial or industrial structures in the designated zone are either vacant or demolished or vacant and tax delinquent. The program, through the State of Ohio Department of Development, allows the community to offer Tax Abatements for Real and Personal Property Taxes to industries as an Economic Development tool.

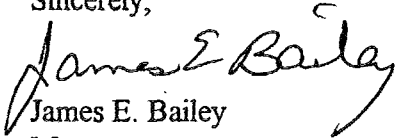

The City entertains prospective new industries on a regular basis, however, even with a utility infrastructure in place and capable of meeting their needs, the community has been plagued by inadequacies with its road transportation capabilities, therefore resulting in removal from consideration by the prospective industry.

New NS Auto Mixing Center: The new auto mixing center, located on the East side of the community, owned by Norfolk Southern is an example of the communities commitment to growth

and cooperate atmosphere with the railroads. The addition on the sanitary sewer system to accommodate the facility is a \$512,000.00 (all local monies) investment by Fostoria for the growth potential of the area as a whole. In conjunction with the increased rail traffic for the facility, a trucking facility is currently under construction to serve the mixing center with over the road capabilities. We understand that the trucking requirements will be in the range of 100 truck loads per day leaving the facility thereby increasing the congestion on an already overloaded road system.

Your assistance and cooperation is appreciated.

Sincerely,

James E. Bailey
Mayor
City of Fostoria, Ohio

Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K. Street, NW
Washington, DC 20423-0001

Board Members:

The City of Fostoria is concerned that its safety concerns are almost completely ignored and inadequately addressed in the Draft Environmental Impact Statement, in fact, the lack of comments would leave one to wonder if the City's comments, submitted with the State of Ohio during the Preliminary Safety and Environmental Comment Period, were considered.

Although segments C-070 (Marion-Fostoria) and C-075 (Willard-Fostoria) are identified as meeting the threshold for analysis by the SEA neither the individual nor the cumulative impacts of the increased rail traffic are considered on a community wide basis for safety and grade crossing delays.

The foremost item of concern remains the ingress/egress issues raised in the Preliminary Safety and Environmental Comment Period. The measurable delay for emergency responders will be dramatically increased as a result of the acquisition. Our estimates indicate that with nearly a 30% increase in rail traffic throughout the community, utilizing the SEA's formula, a at-grade crossing will be blocked over 12 of the 24 hours, which is over 50% of the day. Under the existing current volume levels, a train is blocking one or more at-grade crossing in Fostoria nine and one quarter (9.25) hours out of each twenty-four hour day.

We agree that not all of the crossing will be blocked at the same time, however an emergency vehicle has no schedule as to what time of day the crossing it needs will be blocked. With any given rail crossing blocked over half of the day, it becomes apparent that some alternative provision needs to be made for the safety of the residents within the Iron Triangles in particular.

It is strongly recommended that the potential for these two areas to become isolated by rail movements, and the unreliability and unpredictability of direct emergency service routes, be

considered in addition to the established SEA criteria. The construction of grade separations in both areas is highly recommended.

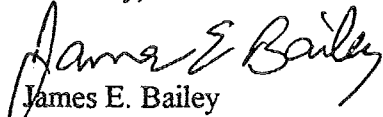

As a result of the acquisition, the City of Fostoria stands to be significantly impacted in the amount of Hazardous Material rail car loads on an annual basis. The Draft EIS indicates an increase of forty (40%) percent, from 85,530 car loads per year to 119,710 when evaluating the cumulative impacts of all three rail lines within the community. Mitigation recommendations are included within the State of Ohio filing.

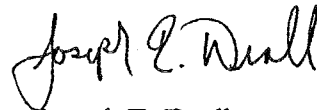

Additional evaluation by SEA is necessary to totally realize the impact within Fostoria, the Draft EIS fails to recognize that the rail systems not only intersect in the center of the community, but also have a interchange capability, both having a negative impact when considering Emergency Responders.

The City has participated in the preparation of the recommendations being submitted by the State of Ohio and fully concur with them.

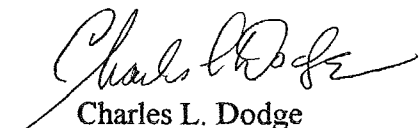

Your consideration is greatly appreciated.

January 27, 1998

MAYOR WHITE INTRODUCES "GLOBAL FIX" TO MINIMIZE TRAIN TRAFFIC IMPACT ON CLEVELAND AND REGION

CSX plans for railroad ties and earthen berms will not resolve significant damage to neighborhoods from increased traffic; Mayor says Cleveland will not act at the expense of its neighbors

Cleveland Mayor Michael R. White and City Planning Director Hunter Morrison today outlined two alternative route configurations that route most of the rail traffic resulting for the CSX and Norfolk Southern (NS) corporations' acquisition of Conrail through Cleveland's (and its neighbors') industrial corridors – thereby minimizing the impact on residential neighbors, reducing safety hazards and preserving the quality of life.

The City's plans were developed to prevent the potentially devastating impact of the dramatic increase in freight train traffic that will result from the CSX/NS route proposal. Collectively, the two railroads propose a three-fold increase in train traffic through affected Cleveland neighborhoods. The unveiled plans, Mayor White said, while substantially reducing the adverse impacts of the increased traffic on thousands of Clevelanders who live near the railroads, will also provide a long-term solution to the railroads' need to move cross country train traffic through Cleveland, a key junction in their national systems.

Last week, CSX publicly announced their "noise abatement" and "beautification" program that they claimed would address many of the problems created by the new train traffic. The CSX plan proposes a low railroad tie wall, earthen berms and trees to mitigate the impact of the increased traffic and noise. Mayor White today said that CSX plans were "inadequate and a band aid approach. We expect the railroads to find realistic and permanent solutions to the problems they are creating. Serious health, safety and quality of life concerns cannot be addressed by some railroad ties, trees and mounds of dirt. The noise abatement program would have little impact on the tripling of the noise level which residents will experience."

-more-

A-549-d

CSX/NS Alternative -- p. 2

Philip Pasterak of the national transportation, planning and engineering consulting firm Parsons Brinckerhoff said the CSX plans will have little impact on reducing the increased noise level. He equated the tripling of the noise level with the difference between the noise of an average car with a heavy truck. He also indicated that a significant portion of CSX's increase in operations will occur at night while people are trying to sleep.

Mayor White appointed a task force of City representatives, along with Pasterak, to review the CSX/NS proposal, hear residents' concerns and work with the CSX and NS to reach a settlement. The mayor and the task force believe the City's alternative routes represent a realistic approach and a real solution to both community concerns and the railroads' economic interests.

"These alternative plans are viewed as a 'global fix' because they not only benefit City of Cleveland neighborhoods, but also other cities including west shore communities, East Cleveland, Euclid, Berea and others," Mayor White said. "The new traffic patterns would maintain the railroads' ability to provide efficient and competitive freight service, preserve the future ability to operate commuter rail passenger service and enhance regional economic development."

The City's alternative route plans, Mayor White said, greatly improve upon the current joint proposal of the railroads by:

- Redirecting freight traffic from residential areas to industrial corridors;
- Substantially reducing the adverse impacts on minority and low income populations;
- Providing grade separations to minimize emergency response times and improve traffic flow.
- Minimizing changes in noise levels
- Decreasing the need to spend money on mitigation measures with limited effectiveness; Providing railroads' the ability to offer efficient and competitive freight service, and enhancing regional economic development.

Mayor White said that although the City's alternative routes would cost more, that increase is dwarfed by the enormous increases in revenues and savings the railroads will experience three years after they acquire the Conrail assets. Together, CSX and Norfolk Southern will realize an addition of nearly one billion annually (CSX - \$435.8 million and Norfolk Southern -- \$553 million). Preliminary estimates, according to Parsons Brinckerhoff, indicate the cost of the two alternatives to be in the range of \$148 to \$171 million. A significant cost item under both City proposals is the need to invest in improvements in Berea. This includes over pass structures for both rail lines and roadways.

The current CSX/NS proposal is estimated to cost \$72 million but fails to mitigate numerous noise, hazardous materials, safety and roadway crossing delay concerns. The actual cost of the railroad proposal with additional mitigation is estimated to be \$107 million, with significant impacts remaining unresolved, according to Parsons Brinckerhoff.

-more-

CSX/NS Alternative - p. 3

Thomas O'Leary, Executive Director of the Ohio Rail Development Commission, said the alternative proposals would avoid potential mitigation, such as train limits, grade separations, appropriate hazardous materials and safety precautions and noise and vibration abatement. "This mitigation will directly affect the revenues expected by the railroads after the acquisition of Conrail. For this reason the estimated cost of the alternatives advanced today by the City of Cleveland are appropriate and reasonable for a real fix," he said.

The current CSX/NS route plan would collectively increase freight train traffic three fold in the City of Cleveland, according to City studies. The impact on individual neighborhoods is even greater. For instance, in the Kinsman/South Broadway neighborhood, CSX proposes increasing trains from 3 to 44 per day, an increase of over 1000%.

More than 64,000 residents in eight neighborhoods live within 1,000 feet of the routes. The negative impact of the increased train traffic includes safety hazards, noise, vibration, odor, dust, congestion and decreases in access, property values and overall quality of life for residents along the railroad corridor. Among the harmful impacts, emergency response times are jeopardized as trains block crossings anywhere from two to 10 minutes and hazardous waste transport would increase from zero to 44,000 carloads in east side neighborhoods and from 7,000 to 81,000 car loads in University Circle.

The City today also said that CSX claims of economic benefits resulting from the Conrail acquisition are vague, ambiguous and misleading. For instance, CSX claims their proposal will support 25,036 jobs in the region. "When you look at the fine print," the Mayor remarked, "you discover that they count one job ten times by using the confusing term 'worker/years'." For instance, their employment projections for industrial development are for 12,000 worker/years, which really translates into 1,200 jobs over 10 years. In addition, their economic impact summary did not distinguish between existing jobs and new jobs. CSX does not pinpoint overall economic benefits for the City of Cleveland, but instead cites region-wide projections. "The current CSX/NS routing proposal disproportionately harms Cleveland neighborhoods. The negative impacts in Cleveland caused by the proposed routing system were not considered by CSX," Mayor White added.

FACTS ON CITY OF CLEVELAND ALTERNATIVE ROUTES FOR CXS/NS RAIL TRAFFIC

The City of Cleveland has developed two alternative route configurations that route most rail traffic through industrial corridors, minimize impact on residential neighborhoods, reduce safety hazards and preserve the quality of life.

CSX traffic from Greenwich would continue to enter the region in Berea, but would use the Lakeshore route via the Cleveland lakefront to Collinwood. This line is currently heavily used by rail traffic. NS traffic bound for Pittsburgh and beyond would continue to enter the area at Olmsted Falls/Berea but would use the Short Line to the Broadway-Harvard area, then diverge southeast through Bedford.

The two alternative routes differ in the routing of NS traffic to Buffalo. Both, however, minimize rail traffic in the west shore communities by routing this traffic via Berea. One alternative would route this traffic via the Plata Industrial Track corridor as proposed by NS, while the other would have this traffic continue east on the Short Line, diverging north at Broadway/Harvard to Euclid. In Berea, the two lines would be grade separated by construction of a rail/rail overpass. Both existing Front Street at-grade crossings would be eliminated by construction of an overpass and underpass. In Collinwood, grade crossings at Dille and London roads would be replaced by underpasses.

The plans are viewed as a "global fix" because they not only benefit City of Cleveland neighborhoods, but also other cities, including the west shore communities, East Cleveland, Berea and others. The positive impact of these two alternative routes include:

- Routing traffic through industrial corridors and minimizes rail traffic through residential neighborhoods, therefore enhancing the quality of life.
- Minimizing changes in noise levels.
- Not disproportionately affecting minorities and low-income residents.
- Providing grade separations to minimize emergency response times and improve traffic flow.
- Minimizing rail traffic on several key future commuter rail routes.
- Providing grade separation of highway/rail crossings in Berea.
- Providing railroads' with the ability to offer efficient and competitive freight service and enhances regional economic development.

FACTS ON CSX/NS PROPOSED ROUTES

The plan for the acquisition of Conrail submitted by CSX and Norfolk Southern significantly affects rail traffic densities in Cleveland and Northeast Ohio. Numerous parties, including the City of Cleveland and many other public agencies and municipalities, have identified harmful impacts which include:

- **Significantly increased rail traffic through residential neighborhoods would have a devastating impact on the quality of life in communities.**
- **More than 64,000 Cleveland residents live within 1,000 feet of the routes affected. Collectively, rail traffic through residential neighborhoods would increase by three-fold. The impacts on individual neighborhoods are even greater. In Kinsman-South Broadway, CSX proposes increasing trains from 3 to 44 per day, an increase of over a 1,000%.**
- **Noise levels would triple -- the difference between a car and heavy truck. Neighborhoods would also experience increased dust, odor and vibration.**
- **Emergency response times by police, fire and Emergency Medical Service would increase; Trains block crossings anywhere from two to 10 minutes. The chance of survival of a person in cardiac arrest decreases 50% with a 2 minute delay, 75% with a 3 minute delay and beyond 3 minutes survivability is 0%.**
- **Hazardous waste transport would dramatically increase -- from zero to 44,000 carloads a year on the Short Line and from 7,000 to 81,000 car loads in University Circle.**
- **Property values would decrease, as would overall quality of life.**
- **Minorities and low-income residents are disproportionately affected.**
- **Costs to railroads are minimized with little consideration for public impacts.**
- **Rail traffic on the west shore is minimized only in NS's proposal, also requiring public funding.**
- **Grade separation of road crossing in Berea is provided only in NS's proposal, also requiring public funding.**

NEIGHBORHOOD IMPACTS OF FREIGHT RAIL TRAFFIC INCREASES
Comparison of Alternatives

ALTERNATIVE	TRANS PER DAY current → proposed (on lines with proposed increases)	RESIDENTS LIVING WITHIN 1000 FEET OF RAIL LINES PROPOSED FOR INCREASED FREIGHT RAIL TRAFFIC				MEDIAN INCOME	GRADES CROSSINGS	IMPACT INDEX*
		POP.	% NON- WHITE (persons)	% HISPANIC (persons)	% BELOW POVERTY (persons)			
NS/CSX Original Proposal	42 → 115 174% increase	67,847	52.3% (35,489 persons)	5.3% (3,598 persons)	37.0% (25,132 persons)	\$14,868	13	22.4
NS/CSX Revised Proposal (12/5/97)	42 → 115 174% increase	58,317	51.6% (30,260 persons)	4.7% (3,217 persons)	33.9% (23,150 persons)	\$16,282	7	21.4
Alternative 1: Lakeshore West Side	46 → 67 46% increase	49,547	37.1% (18,357 persons)	6.0% (2,955 persons)	29.2% (14,458 persons)	\$17,456	4	8.1
Alternative 2: Lakeshore Short Line	46 → 67 46% increase	32,625	54.5% (17,794 persons)	1.0% (317 persons)	28.7% (10,361 persons)	\$16,175	4	5.2

* The "Impact Index" numbers were determined on the basis of the following calculation:

additional trains per day on each rail line segment × population within 1,000 feet of tracks on each rail line segment

÷ 100,000 = Impact Index

The rail line segments and the associated neighborhoods are identified on the maps and tables which show the neighborhood impacts of increased freight rail traffic.

Higher impact numbers indicate greater impacts on neighborhoods. Lower impact numbers indicate lesser impacts on neighborhoods.

February 2, 1998

Elaine Kaiser, Environmental Project Director
Surface Transportation Board Section of Environmental Analysis
1925 K Street, NW
Washington, DC 20423-0001

**ENVIRONMENTAL
DOCUMENT**

Dear Director Kaiser:

I would like to take this opportunity to urge the Surface Transportation Board Section of Environmental Analysis to oppose the sale and consolidation of Conrail with CSX and Norfolk Southern Railroad.

The State of Ohio's House and Senate Joint Transportation Committee had numerous public hearings on the proposed acquisition of Conrail by CSX and Norfolk Southern Railroad. During our hearings, we heard testimony stating that if the merger occurs, Agriculture, Ohio's largest industry, would be regulated to a third world economic development policy because of tentative plans to focus on transporting unprocessed Ohio grains to certain areas of the country.

We heard testimony that the Plastics Industry transports 75-80% of plastic raw materials by rail. The profit margins on some products are thin enough that even a slight price increase could produce substantial losses of market share. The plastics industry supports more than 100,000 jobs in Ohio and adds an estimated \$16.3 billion annually to the state's economy.

The Ohio Mining and Reclamation Association is concerned about heavy cost increases to pay for feeder lines and abandoned lines. And I have great concern that this merger will create jobs in the Eastern United States at the expense of the Ohio Coal Industry.

The Ohio Steel Industry Advisory Council, representing numerous steel companies and approximately 30,000 employees is also very concerned about the merger and is against any expedited approval process.

CSX and Norfolk Southern have agreed to pay \$10.2 billion for Conrail, this is \$4 billion more than Conrail's stock prior to the transaction, and ten times what the Federal Government paid for Conrail ten years ago. Certainly shippers, Ohio's Businesses, will be responsible for this transaction since there is no other railroad companies with whom they may ship their goods. The only winner is big business, the railroad company, not the people of Ohio or the Shippers' of Ohio.

I gave several examples during the hearings showing the greed, arrogance, and lack of caring for our communities by CSX railroad. CSX and Norfolk Southern are worried about their bottom line and not the people of Ohio. They will Monopolize the railroad industry in Ohio if this transaction occurs, which will cause many Ohio businesses to fail and many Ohioans their jobs.

The Brotherhood of Locomotive Engineers provided valuable testimony, stating that the merger would add longer trains and more traffic, without adequate staffing, resulting in more frequent accidents. The individual stated that he has been through two mergers in 30 years with the industry and believes that neither has been good.

How true these words are. In a Wall Street Journal Article on October 2, 1997 entitled *A Big Railroad Merger Goes Terribly Awry In a Very Short Time-- Union Pacific is Hammered Over Service and Safety* stated:

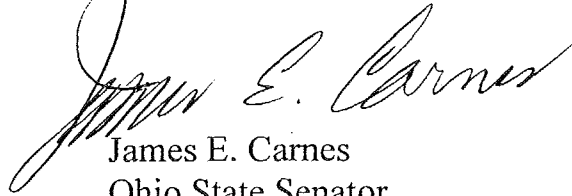

Its railroad safety record, marred by three fatal crashes in three months, is being characterized as a fundamental breakdown by federal regulators. Its route system has slipped into near gridlock west of the Mississippi River, with thousands of freight cars backed up for miles in the Houston area alone. Its chairman had to publicly apologize in August to its big customers.

Service has become so bad that customers say Union Pacific Corp., the nations largest railroad can't account for millions of dollars of shipments for weeks at a time.

We do not want this to exist in Ohio. Less competition will hurt Ohio's citizens.

I urge you to oppose the proposed acquisition of Conrail by Norfolk Southern and CSX Railroad.

Sincerely,

A handwritten signature in cursive script that reads "James E. Carnes". The signature is written in black ink and is positioned above the printed name and title.

RE: Finance Docket No. 33388

**ENVIRONMENTAL
DOCUMENT**

Dear Ms. Kaiser:

As Member of Congress representing Ohio's 10th district, and as a Party of Record to this proceeding, I hereby submit an original and twenty-five copies of Comments on the Draft Environmental Impact Statement as issued by the Surface Transportation Board's Section on Environmental Analysis for Finance Docket No. 33388.

Thank you for your consideration.

Sincerely,

Dennis J. Kucinich
Member of Congress

**COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT
AS ISSUED BY THE SURFACE TRANSPORTATION BOARD'S
SECTION ON ENVIRONMENTAL ANALYSIS
FILED BY CONGRESSMAN DENNIS J. KUCINICH**

Congressman Dennis J. Kucinich, representing the 10th Congressional District of Ohio, hereby submits these comments in response to the Draft Environmental Impact Statement (DEIS) as issued by the Surface Transportation Board's Section on Environmental Analysis.

The finding by SEA that Norfolk Southern's Cleveland-Vermilion rail line segment — traversing the west side of Cleveland, Lakewood, Rocky River, Bay Village and Westlake — meets or exceeds the Board's thresholds for further analysis is encouraging. It is also encouraging that a considerable amount of attention (Section 5-OH-20) was devoted to the effects of nearly tripling freight train traffic through these densely populated, residential areas.

However, upon closely reading SEA's findings, there are contradictions. SEA

recommends that Norfolk Southern and the affected communities “shall meet” to “negotiate a mutually-accepted binding agreement” in Section 5-OH.20 (Ohio Areas of Concern). However, several of SEA’s findings prior to this section apply statistical analyses to conclude that mitigation for most specific safety and environmental measures are not needed — conclusions that disregard the unique character of the West Shore communities. The DEIS is therefore ambiguous when it finds that the Cleveland-Vermilion line does not meet most criteria for mitigation, but later singles out the west side of Cleveland and West Shore communities as an area of particular concern.

Should a “mutually-accepted binding agreement” be unobtainable, recommended mitigation on the part of SEA becomes all the more crucial. Specifically, if an agreement is not reached before the STB considers the final merger agreement, it is not clear which conclusions will be given more weight — that mitigation in most safety and environmental areas is not needed, or that Cleveland and the West Shore communities are of particular concern. Contradictions in SEA’s Final Environmental Impact Statement (FEIS) could become grounds for the applicants to argue that no mitigation is needed, and should not be imposed as a condition of the merger. Clearly, these contradictions need to be reconciled — or at the very least addressed — in the Final Environmental Impact Statement.

Finally, no increase in rail traffic in the Cleveland area will be acceptable as a result of the Conrail acquisition unless it is mitigated by adequate and appropriate grade separations in the Cities of Berea and Olmsted Falls. Those two communities in the southwest corner of Cuyahoga County, and the 10th Congressional District, will bear a disproportionate burden as a result of the Conrail acquisition. The needs of those communities’ residential and commercial transportation require adequate and appropriate grade separation.

I. SECTION 5-OH.2 PROPOSED CONRAIL ACQUISITION ACTIVITIES IN OHIO

SEA finds that the NS Cleveland-Vermilion line is one rail line segment that meets or exceeds the Board's environmental thresholds (Table 5-OH-1, pg. OH-6).

The DEIS states, "Both CSX and NS plan to undertake extensive activities in Ohio as part of the proposed Conrail Acquisition. The proposed Conrail Acquisition-related activities that meet or exceed the Board's thresholds for environmental analysis in Ohio include increased train operations on a total of 36 rail line segments" (pg. OH-3).

As stated above, it is encouraging that SEA finds the Cleveland-Vermilion line to be one of the 36 rail line segments that meets or exceeds the Board's thresholds for analysis. Specifically, SEA found that the proposed increase in freight train traffic met the Board's requirements for further analysis in the following six areas: rail operation safety, at-grade crossing safety, hazardous material transport, roadway crossing delays, air pollution emissions, and noise pollution.

However, of these areas that exceed the Board's thresholds for further analysis, only one — hazardous material transport — warranted SEA to recommend mitigation (Table 5-OH-10, pg. OH-30). As stated above, these conclusions are ambiguous when coupled with SEA's later conclusion that the area affected by NS's proposal to nearly triple freight train traffic on its Cleveland-Vermilion line is concerning enough to merit special consideration.

II. 5-OH.4 OHIO SAFETY: FREIGHT RAIL OPERATIONS

SEA finds that the increase in freight train traffic on the Cleveland-Vermilion line will not cause a significant enough number of freight train accidents to warrant mitigation (Table 5-OH-6, pg. OH-15).

SEA evaluated the potential change in safety on all rail line segments where the proposed Conrail Acquisition would result in eight or more additional freight trains per day. Clearly, with

an increase (using the numbers that Norfolk Southern submitted in its application) from 13.5 to 37.8 trains per day, that criterion is met.

The DEIS states, "While increased freight train activity would increase the probability of a freight train accident, SEA did not consider an increase significant unless the predicted accident rate shortened the duration between accidents to one every 100 years or less per mile" (pg. OH-14). SEA's predicted accident rate for the Cleveland-Vermilion line drops from one accident per mile every 336 years to one accident per mile every 127 years (Table 5-OH-6, pg. OH-15).

The Federal Railroad Administration (FRA) does not require railroads to report rail operation accidents in a form that will reveal the number of accidents that have occurred on a particular rail segment. Thus, it is not possible to know if the NS Cleveland-Vermilion line has experienced more accidents than the "predicted accident rate." However, while applying an imprecise "predicted accident rate" may be acceptable when dealing with sparsely populated and/or highly industrialized areas, it is not acceptable when dealing with densely populated, residential areas where accidents can be far more devastating. A different calculation is needed when determining if mitigation is needed for densely populated, residential areas.

Using a strict "predicted accident rate" to determine if mitigation is warranted without looking at the unique character of the West Shore communities could endanger citizens. As stated in the Responsive Environmental Report, filed with the Board on October 1, 1997, Lakewood is the most densely populated area between New York and Chicago. It has 27 at-grade railroad crossings within 2.7 miles, more than any other city in the country. Much of the population resides on one side of the tracks while major emergency services are on the other side of the tracks. An accident in Lakewood could not only cause harm within the immediate vicinity, but would have a multiplying factor if emergency vehicles are not able to cross the tracks because a derailed train is blocking the way.

While SEA predicts an accident every 127 years per mile, the damage done to citizens because of the geography of this densely populated, residential area could be catastrophic when

compared to most other areas. Mitigation that reduces the likelihood of accidents is most assuredly needed in this densely populated, residential area that is literally bisected into north and south segments by Norfolk Southern's railroad tracks. However, mitigation that closes off grade crossings along the West Shore line would not be acceptable because it would have the effect of closing those roads off to emergency vehicles permanently. Street closings, therefore, would not be an appropriate form of mitigation.

III. 5-OH.6 OHIO SAFETY: HIGHWAY/RAIL AT-GRADE CROSSINGS

SEA finds that additional freight train traffic on the Cleveland-Vermilion line that would cause an increase in highway/rail at-grade crossing accidents to be "below the criteria for significance" (pg. OH-20).

SEA used two different calculations to predict if increased freight traffic would cause significantly more at-grade crossing accidents. The Cleveland-Vermilion line was not specifically mentioned in this section. In fact, despite two different calculations, SEA determined that every single at-grade crossing in Cuyahoga County did not meet the "criteria for significance". Thus SEA does not recommend mitigation for at-grade crossing safety in the entire region.

Again, predicted accident rates may be appropriate for areas where at-grade crossings are few and far between. However, as stated above and in the Responsive Environmental Report filed on October 1, 1997, the west side of Cleveland and the West Shore communities are densely populated, residential areas. Lakewood is particularly vulnerable in this area as it has 27 at-grade crossings within 2.7 miles. Clearly, imprecise "predicted accident rates" are not reliable enough under these circumstances.

Actual experience reveals that accidents in this area exceed STB's criteria. According to Table 5-OH-8 in the DEIS (pg. 5, 6), there were fourteen at-grade crossing accidents in Cuyahoga County along the Cleveland-Vermilion line between 1991-1995. Two at-grade

crossings (Cook Avenue and Andrews Avenue) experienced two accidents between 1991 and 1995. Two accidents in four years not only exceeds the predicted accident rate, but also meets the Board's "criteria for significance". Furthermore, both of these crossings have only gates and no flashers.

At a minimum, these two crossings should warrant mitigation. The fact that the DEIS does not find mitigation warranted indicates a shortcoming in the SEA's universal application of "predicted accident rates" for all areas despite wide variations in population density, community composition, geography, traffic patterns, etc. Nevertheless, closing of grade crossings along the West Shore line would be inappropriate because to do so would block off needed emergency services. Therefore, the only appropriate mitigation is to not allow an increase in freight train traffic along the West Shore line.

IV. 5-OH.7 RAIL TRANSPORT OF HAZARDOUS MATERIAL

SEA finds that an increase in hazardous material transport on the Cleveland-Vermilion line as a result of additional freight train traffic is potentially significant, and mitigation is recommended (Table 5-OH-10, pg. OH-30).

The DEIS states, "SEA applied two different criteria to determine if the effects of rerouting hazardous material car loads are potentially significant: 1) The volume of hazardous materials transported on a rail line would be 10,000 or more car loads per year. The Acquisition-related change in volume of hazardous material car loads would upgrade a rail line segment to a key route designation. 2) The volume of hazardous material car loads doubles, and exceeds 20,000 or more carloads per year. SEA has termed rail line segments which meet these criteria a 'major key route'" (pg. OH-29).

The Cleveland-Vermilion line, post-Acquisition, is one of ten rail line segments in all of Ohio that will become a New Key Route as well as a Major Key Route in the transportation of hazardous materials (hazmats). SEA recommendations include requiring CSX and NS to bring

the rail line segments into compliance with the Association of American Railroad's key route standards and practices ("base level"), and that CSX and NS develop a Hazardous Materials Emergency Response Plan to contain and minimize the potential effects of any accidents or incidents ("expanded mitigation").

Because hazmat transportation through the west side of Cleveland and the West Shore communities will increase by 255 percent (from 9,000 to 32,000 car loads per year), the recommended mitigation is wholly inadequate. STB should simply not allow 32,000 car loads of hazmats per year to traverse any densely populated, residential areas, much less a densely populated, residential area which has more at-grade crossings than anywhere else in the nation.

Furthermore — assuming railroads use appropriate containers — hazardous material transport is not dangerous in and of itself, and is only dangerous when an accident occurs. This being tautological, it begs the question: how can SEA justify its finding that the potential increase in rail operation and at-grade crossing accident rates are not significant? Given the circumstances of a 255 percent increase in hazardous materials being transported through a densely populated, residential area — in conjunction with the geographic and traffic patterns of the area — application of an imprecise "predicted accident rate" is rendered all the more inappropriate for the west side of Cleveland and the West Shore communities.

V. 5-OH.9 ROADWAY CROSSING DELAY

SEA finds that the additional freight train traffic will not cause significant roadway crossing delays, and does not recommend mitigation (pg. OH-33).

The DEIS states for Cuyahoga County, "Of the 12 crossings analyzed in Cuyahoga County, 10 would have a minimal increase in crossing delay per stopped vehicle." The two crossings that SEA determines will have more than a minimal increase in crossing delays were not along NS's Cleveland-Vermilion rail line segment.

SEA analyzed six at-grade railroad crossings along NS's Cleveland-Vermilion line in Cuyahoga County: West 110th St., West 117th St., Bunts Rd., Columbia Rd., Dover Center Rd., and Bradley Rd. All six of these at-grade crossings meet the Board's criteria for having 5,000 or more Average Daily Traffic (ADT). Three of these crossings have 10,000 or more ADT.

Despite ten pages of calculation formulas and explanations, it defies logic that the SEA could determine that tripling the freight train traffic in an area with more at-grade crossings than anywhere else in the country will have only "minimal" effects. For example, West 117th has more than 15,000 ADT. At the current level of 13.5 trains per day, vehicular delays as trains pass results in a maximum number of vehicles in a queue per lane of 16. Yet SEA calculates that all things remaining equal except an increase of freight train traffic to 37.8 trains per day will result in only one additional vehicle in a queue per lane (17).

Furthermore, in Table 5-OH-11, SEA determines that there will be significant increases in the numbers of vehicles that will experience delays, but does not consider it to be enough to warrant mitigation. For example, at West 110th Street, currently 116 vehicles are delayed per day. Post-Acquisition, 300 vehicles will experience delays at West 110th Street (158 percent increase). At West 117th Street, 305 vehicles experience delays, but post-Acquisition, 785 vehicles will experience delays. Clearly, the increased number of vehicles experiencing delays is more than "minimal".

Despite SEA's finding in this section that traffic delays do not warrant mitigation, SEA states in Section 5-OH.20.1 that

Between the west side of Cleveland and Vermilion, there are 88 crossings (public and private) along the NS line, including 67 highway/rail at-grade crossings. These numerous crossings influence highway traffic patterns on the west side of Cleveland and in the West Shore communities, causing traffic delays while trains pass. Safety concerns raised by all the affected communities include delays in emergency response, vehicular crossings, and pedestrian access....

SEA observed during site visits that train traffic causes delays at the 27 Lakewood crossings, potentially affecting emergency response time. A substantial

portion of the Lakewood population, including many elderly citizens, resides north of the rail line, while the major emergency medical facilities and fire rescue services are located south of the tracks. Emergency response delays could also affect the Cudell-Edgewater neighborhood in west Cleveland, Rocky River, Bay Village, Westlake, and communities extending into Lorain County” (pg. OH-134).

The issue of traffic delay is perhaps the most contradictory of the findings by SEA. As SEA noted in Section 5-OH.20.1, emergency response time is the most critical issue facing the west side of Cleveland and the West Shore communities. SEA calculated that significantly more vehicles will experience traffic delays, and saw for itself that delays occur at the current level of freight train traffic. Despite these overarching factors, SEA still did not recommend mitigation. These contradictory findings need to be resolved in the Final Environmental Impact Statement. And again, because of the need for emergency vehicle access, road closings are not appropriation mitigation. The only appropriate mitigation for the West Shore is to keep freight traffic at or below current levels.

VII. 5-OH.12 OHIO AIR QUALITY

SEA finds that the net NOx emissions is above the emissions screening threshold of 100 tons/year, and thus found the net emissions increase to be potentially significant; however, SEA finds that mitigation is not needed.

The DEIS states, “While there are localized increases in emissions in some counties, the increases are not likely to affect compliance with air quality standards. Therefore, SEA has determined that air quality will not be significantly affected and no mitigation is necessary” (pg. OH-70).

According to the applicants’ own filing with STB, NOx pollution emissions will increase in Cuyahoga County by 1,500 tons/year. This is 1,400 tons/year above the Board’s screening threshold for NOx. As stated in the Responsive Environmental Report filed with STB on October 1, 1997, using the Environmental Protection Agency’s own calculations, an additional 1,500

tons/per of NOx air pollution emissions will be an increase of approximately 3.5 percent.

Under the Clean Air Act, areas that do not meet the ozone standards are required to achieve a 3 percent reduction per year in NOx emissions. A 3.5 percent increase in NOx means that significant additional reductions of NOx from local businesses or vehicles would be needed to offset this increase to meet the ozone standard. Specifically, since 3 percent reductions are already required, and the additional freight train traffic is going to add another 3.5 percent, the additional freight train traffic more than doubles the amount of NOx reductions needed in order for Cuyahoga County to be in compliance.

These facts — that the applicants admit NOx emissions will be 1,400 tons/year above the Board’s own screening threshold, and this increase will require Cuyahoga County to more than double its reductions in order to be in compliance — stand in clear opposition to SEA’s conclusion that “While there are localized increases in emissions in some counties, the increases are not likely to affect compliance with air quality standards” (pg. OH-70).

Furthermore, to justify a determination that no mitigation is necessary based on the fact that the increases are not likely to affect “compliance” with air quality standards is highly dubious. In fact, more emissions won’t affect Cuyahoga County’s compliance with air quality standards because Cuyahoga County already is not in compliance with air quality standards. Is SEA arguing that because Cuyahoga County already has too much air pollution that a little more won’t hurt? Clearly, a little more will hurt. Mitigation is absolutely required for air pollution emissions, which are a direct result of increased (as well as present) train traffic.

VIII. 5-OH.13 OHIO NOISE

SEA finds that the Cleveland-Vermilion line would experience increased noise levels that meet the Board’s analysis threshold, but does not find it eligible for mitigation.

The DEIS states, “Train noise sources include diesel locomotive engine and wheel-rail interaction noise (or wayside noise) and horn noise. ... SEA performed an analysis to identify ...

where the proposed changes in operations meet or exceed the Board's environmental analysis thresholds. ... SEA counted sensitive receptors (e.g., schools, libraries, hospitals, residences, retirement communities, and nursing homes) within the noise contours for both pre-Acquisition and post-Acquisition operating conditions" (pg. OH-71).

For NS's Cleveland-Vermilion, SEA found that the additional freight train traffic would increase noise levels by 81 percent. SEA then counted sensitive receptors along the Cleveland-Vermilion line (e.g. schools, libraries, etc.), and found the number of sensitive receptors would jump from 2,194 to 4,439. According to Table 5-OH-42, NS's Cleveland-Vermilion line will have more than twice the number of sensitive receptors than any other rail line in Ohio.

However, NS's Cleveland-Vermilion line is not on the list of rail segments that SEA finds eligible for noise mitigation. Even if mitigation had been recommended, the methods proposed by SEA to reduce noise are wholly inadequate. Noise barriers are not feasible along the track through Cleveland, Lakewood, Rocky River, Bay Village and Westlake; traffic would be seriously disrupted. Sound insulation for these densely populated communities would be economically infeasible, and rail lubrication is not adequate. Further, SEA says that for horn sounding, "mitigation is not currently feasible."

That SEA could determine mitigation is not needed for a densely populated, residential area — which will experience an 81 percent increase in noise and will have more than twice the number of sensitive receptors than anywhere else in the state — illustrates the profound shortcomings of these analyses. As SEA itself noted in Section 5-OH-20.1, "A post-Acquisition increase of rail traffic on the NS Cleveland-Vermilion corridor would increase noise levels from both mechanical wheel/rail noise and horn soundings. ... For instance, locomotives must sound their horns through much of Lakewood because its 27 highway/rail at-grade crossings are spaced only hundreds of feet apart" (pg. OH-137). A steady stream of horn blasts 37 times a day would severely disrupt the peace of these residential communities.

Furthermore, according to *Environmental Health Perspectives*, studies have shown that

noise can hinder the ability of children to learn, harm a population's health, and cause major annoyance. In a study of children who attended a school situated beside some railroad tracks, it was found that students who spent the entire six years of elementary school on the side of the school closest to the tracks were a full year behind students who had spent the entire six years on the quieter side facing away from the tracks. The author was later able to get a noise abatement system on the tracks, and after retesting the children, found that the reading level had become identical on both sides of the building. A recent study by the same author shows that those who say they are bothered by local noise levels rate their general health more poorly than those who say they are not bothered by local noise. And a study of the effects of noise on people found that people's expectations of noise level are most predictive of annoyance. "In fact, mere loudness accounts for less than 50 percent of annoyance from noise."¹

Similar to the misapplication of "predicted accident rates" to densely populated, residential areas, SEA has misapplied noise measurements to west side of Cleveland and the West Shore communities. Densely populated, residential areas are simply not appropriate places for a steady stream of horn blasts 37 times a day. SEA noted this in a later section of the DEIS, but it is contradicted by SEA's earlier finding that this segment of railroad is not even eligible for mitigation. This contradiction needs to be resolved in the Final Environmental Impact Statement.

¹Environmental Health Perspectives, Plane Pollution; Vol. 105, No. 12, Dec. 1997.

IX. 5-OH.20 OHIO AREAS OF CONCERN

SEA's recommendation that Cleveland area communities negotiate a settlement with the railroads is ambiguous, does not address the environmental and commercial impact of Berea, Olmsted Falls, and southwestern Cuyahoga County.

A. SEA recognizes the west side of Cleveland and the West Shore communities as an area of particular concern, and recommends that local officials meet with NS to reach an agreement, but SEA ambiguities diminish the value of this recommendation.

A considerable amount of discussion about the effects of tripling freight train traffic in these communities is afforded in the DEIS. Some statements by SEA are encouraging. For example, "SEA observed during site visits that an increase in rail traffic on the NS rail line may affect traffic patterns at the numerous highway/rail at-grade crossings The proposed increase in rail traffic may cause significant impacts to vehicular movement and travel times, including emergency response services. In addition, SEA has determined that vehicular delays on cross-street traffic would occur more often under post-Acquisition conditions, particularly if such rail operations coincided with peak highway traffic hours" (pg. OH-136). However, when these statements are compared with SEA's previous finding that mitigation for traffic delays along the Cleveland-Vermilion line is not needed, SEA's conclusions are ambiguous, and should be clarified in the Final EIS.

After covering nearly all the issues raised in the Responsive Environmental Report — including grade crossing safety, emergency response, hazardous material transport, noise, air quality, and commuter rail — SEA recommends the following: the Board should retain jurisdiction to impose additional environmental mitigation for a period of no less than ten years; NS should be required to improve its highway/rail at-grade crossings on this rail line segment; if train speeds can be increased without increasing safety problem, NS should be required, at its sole expense, to improve the rail line segment to permit its trains to operate at faster speeds; to

mitigate noise problems, NS should be required to follow the best practices permitted by FRA” (5-OH-140). SEA further recommends that NS and local officials meet to reach a “mutually-accepted binding agreement”. Those are seemingly clear recommendations, but their clarity is lessened by other contradictory statements in the DEIS.

SEA also references NS’s mitigation proposal that was submitted to the Board on October 29, 1997. The mitigation proposal would re-route all additional freight train traffic through Berea on the Flats Industrial Track. SEA notes that the alternate routing is not currently available, and would require the completion of substantial improvements and construction of track and ancillary facilities. This mitigation includes grade separations at Front Street in Berea, and Fitch Street in Olmsted Township. The approximate cost of the mitigation is \$50,000,000. Furthermore, the cities of Berea and Olmsted Falls have indicated that they require additional grade separations at Bagley Road and Columbia Road, respectively, on the Cleveland-Indianapolis route.

This alternative plan has potential, but it also has several problems. First and foremost, it is unclear where funding in excess of \$50,000,000 is going to come from. Secondly, NS has stated that it cannot possibly finish all necessary construction before the STB rules on the final merger agreement. NS admits that the day the merger is approved, the west side of Cleveland and the West Shore communities will see an immediate increase in traffic by ten additional trains per day. This is unacceptable, and in itself is deserving of separate comment in the final EIS for purposes of protecting communities from the adverse consequences of a possible “phase-in” mitigation plan which reroutes increased traffic out of the West Shore area but only after mitigation-related construction is completed. No community should suffer the consequences of the railroads’ lack of immediate alternatives. Thirdly, rather than merely diverting the additional freight train traffic, all of the freight traffic should be taken off this single-track rail line segment that cuts through densely populated, residential areas. Some of the freight train traffic should be shifted out of the area completely, and the rest should be shifted onto tracks that serve shippers

who need rail service for their businesses. The rail line segment could then be made available for commuter rail.

B. The DEIS does not adequately address Berea's and Olmsted Falls's environmental concerns and the needs of those communities for mitigation against the effects of the proposed Conrail acquisition.

The Ohio Cities of Berea and Olmsted Falls would be disproportionately affected by the proposed Conrail acquisition. As part of the Railroad Control Application, NS and CSX have proposed increasing freight traffic on the Berea-Greenwich and Short-Berea routes from 27.9 trains per day to 101.5 trains per day. NS and CSX have also proposed decreasing the freight traffic along the Cleveland-Vermillion route through Berea from 52.4 trains per day to 28.4 trains per day. The net post acquisition increase in trains per day through Berea, if the merger were to be approved as originally proposed, would be from 80.3 trains per day, to 129.9 trains per day, an increase of 49.6 trains per day, or a 61.8 percent increase.

Under the aforementioned plan, NS proposed increasing freight traffic along NS's Cleveland-Lakewood-Vermillion route from 16.4 trains per day to 34.1 trains per day, an increase of 17.7 trains per day. On November 25, 1997, NS amended its application to reroute the additional 17.7 trains originally proposed for Cleveland-Lakewood-Vermillion, to the Cleveland-Berea-Vermillion route. The additional 17.7 trains per day under the amended proposal would increase Berea's train traffic from 129.9 trains per day to 147.6 trains per day. This represents an 83.8 percent increase in train traffic through Berea above the pre-acquisition baseline of 80.3 trains per day.

The Berea-Greenwich route is an northeast-southwest line southwest of Cleveland, Ohio, originates in the southwest corner of Cuyahoga County, traverses the southern half of Lorain County, and approaches Greenwich from the southeast corner of Huron County. The Short-Berea route traverses the southwestern quarter of Cuyahoga County from downtown Cleveland to Berea, Ohio. These two routes constitute the local segment of the Cleveland-Indianapolis route.

The Conrail mainline along the Cleveland-Berea-Vermillion route traverses the southwest quarter of Cuyahoga County from downtown Cleveland through Berea, Ohio, and across the northern half of Lorain County to Vermillion.

All these routes, with respect to Berea and Olmsted Falls, traverse heavily populated urban/suburban residential neighborhoods. They are also situated within an important commercial district of Cuyahoga County which makes heavy use of intermodal transportation, including rail and truck transportation, and air traffic at the adjacent Cleveland Hopkins International Airport.

An 83.8 percent increase in train traffic will cause local and commercial transportation along Ohio Route 237 (Front Street), Sheldon Road, West Street, and Bagley Road in Berea, Ohio Route 252 (Columbia Road) and Maple Way in Olmsted Falls, and Fitch Street in Olmsted Township, causing the surrounding communities to bear a disproportionate burden of inconvenience due to heavy train traffic along the Conrail mainline and the Cleveland-Indianapolis route. This burden includes interference with police and fire crews reaching emergency situations; ambulances and other emergency medical services reaching injured and sick individuals and transporting them to the hospital; school buses attempting transportation of schoolchildren to and from schools; access of residents of these communities to their homes and other destinations; and access of trucks and other commercial vehicles to their pickup and delivery destinations. Grade separations on each of the aforementioned routes would be an appropriate mitigation against the effects of an 83.8 percent increase in rail traffic the proposed merger will cause.

X. CONCLUSION

SEA should reconcile the contradictory conclusions reached in the DEIS, clarify its recommendations about a “mutually-accepted binding agreement,” and recommend adequate and appropriate mitigation in the form of grade separations for Berea and Olmsted Falls.

As outlined above, there are contradictory conclusions reached by SEA. These contradictions should be reconciled, or at the very least addressed, in the Final EIS. SEA should also detail what actions it recommends to the Board if an agreement between NS and representatives of the west side of Cleveland and the West Shore communities is not obtained. In particular, the Final EIS should indicate which of SEA's conclusions should be given more weight in the final decision of STB; namely, the conclusion that in most instances, the SEA has determined that the effects of tripling freight train traffic on the NS Cleveland-Vermilion line do not need mitigation, or SEA's conclusion that the west side of Cleveland and the West Shore communities are areas of special concern, and STB should impose conditions on the merger with respect to the Cleveland-Vermilion line.

SEA's recommendations in Section 5-OH.20 are encouraging because they reflect a recognition on the part of SEA that this is an area of concern. However, the recommended mitigation in this section presumes that STB could approve NS's proposal to triple freight train traffic on the Cleveland-Vermilion line under certain circumstances. Mitigation that includes closing grade crossings along the West Shore would present a danger to the affected communities because it would permanently block emergency vehicle access. It is the position of Congressman Kucinich, local officials and residents that tripling freight train traffic through the west side of Cleveland and the West Shore communities is not acceptable under any circumstances. Furthermore, any viable alternative must include grade adequate and appropriate grade separations in Berea and Olmsted Falls that would enable those communities' local and commercial traffic to bear the burden of an increase in train traffic along the Conrail mainline and the Cleveland-Indianapolis route.

REC'D: 2/13/98

DOCUMENT # 2/13/98 4:13:24 PM

I am a resident of Vermilion, Ohio. A small town of about 13000 people with about a 6 mile lake frontage along Lake Erie. I am writing to you today to express my concern about the recently announced railroad merger and the predicted increase of rail traffic through my town. I am sure you will hear from our local government, as well as some of those concerned citizens that are not too jaded to think that writing a letter has a chance of influencing big business decisions. Our little town is having some serious problems at the moment - Ford Motor Co. partially closing the local assembly plant plus the local school system has had to borrow money from the State to continue in operation for 98. These two factors alone have managed to negatively impact local businesses as well as the local real estate market. NOW comes the train issue. . .We already deal with a fairly high number of trains and so far, it has not been a safety or economic concern. Even though, I am sure that we do lose some tourist overnight trips at the local marinas, due to the train whistles at night. This we can handle - BUT increase rail traffic, even a little, and I think it certainly becomes a safety concern. We need to be able to get fire and ambulance service to both sides of the tracks without any delay. Given the small number of residents, it would be extremely burdensome to provide equal services on all sides of all our current tracks.

We would most certainly need overpasses.

It is also being reported in the local papers that part of what is being proposed as cargo for this increased rail traffic is hazardous waste. I understand the logical need to remove this type of risk from the highway- BUT what about the risk to many cities water supplies if an accidental spill should contaminate our river, or Lake Erie. Would ~~be~~ ^{we} not be talking about an international incident?

Some articles have also proposed a commuter rail from Cleveland to those western suburbs close to us. . . This is a terrific idea. We could get more people off the roads too!!

Thank you for your time in reading my ideas and your helpful input to whatever governing body will be making decisions that will certainly hopefully improve the quality of life for myself and my neighbors, rather than add further burdens to an already burdened community.

Sincerely,

Isabelle H. Chamberlain
Real Estate Broker

my concern is if CSX Railroad constructs the additional fueling track west of Daniels Rd, that I will not have access to part of my farm. Currently there is a farm crossing that gives me access. Will the RR continue to provide a crossing for me to gain access to the rear portion of my farm (BRANDAL FARM)?

Please advise if any additional details are needed.

Re: Proposed Acquisition of Conrail by
Norfolk Southern Railroad and CSX Railroad

Dear Ms. Kaiser:

We have just received a copy of your letter of December 12, 1997, which asks for comments regarding the above proposed acquisition.

We wish to ask if this comment time could be extended, as it does not give adequate time for people to be notified to respond.

We do not have a Conrail crossing in our township but feel that we would still be affected because of our fire and ambulance service coming from the neighboring town of Wellington, which does have a Conrail crossing.

Thank you for considering our comments.

Very truly yours

SUMMARY

RAILROAD TRAFFIC CONCERNS

The proposed acquisition of Conrail Inc. by Norfolk Southern Corp. and CSX Transportation threatens to drastically increase rail traffic through residential areas throughout the state.

Our local concerns center around the tracks that bisect West Cleveland and particularly our suburb, Lakewood, and the other suburbs of Rocky River, Bay Village and Avon Lake.

All of these communities share concerns about delayed response for emergency vehicles, and about the possibilities escape routes being blocked in the case of a hazardous waste spill.

Lakewood alone, however, must deal with safety concerns brought by children of all ages crossing the tracks on their walk to and from school. Students in all the other communities are bussed. Lakewood's boundaries encompass just five square miles, and this area is served by ten elementary schools, three middle schools and one high school. The probability of death or serious injury with these many children moving through the city daily on foot would skyrocket were train traffic to triple.

A related concern is that of the effects of increased traffic on real estate values. Houses near the tracks will decrease in value, having a definite effect on tax revenues generated, and therefore on the funding for schools.

Attached is the West Shore Report--a summary of the problem issued by the office of Representative Dennis Kucinich.

**ADDENDUM TO
COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT
AS ISSUED BY THE SURFACE TRANSPORTATION BOARD'S
SECTION ON ENVIRONMENTAL ANALYSIS
FILED BY CONGRESSMAN DENNIS J. KUCINICH**

Congressman Dennis J. Kucinich, representing the 10th Congressional District of Ohio, hereby submits this addendum to his comments in response to the Draft Environmental Impact Statement (DEIS) as issued by the Surface Transportation Board's Section on Environmental Analysis (SEA) for the purpose of relaying newly acquired information about the City of Brooklyn, Ohio.

Brooklyn, Ohio, is a west-side residential and industrial suburb bordering Cleveland at Brooklyn's west, northwest, and east sides, and bordering Parma, Ohio, at its south side. Three sets of railroad tracks currently traverse Brooklyn. A Conrail line, formerly Cleveland's Short Line, crosses Brooklyn parallel to Brookpark Road near Brooklyn's southern border. Another Conrail line abuts Brooklyn's northwest border with a spur crossing Ridge Road just south of the

northernmost tip of Brooklyn. And a CSX line from Cleveland to Medina crosses Brooklyn from the northeast edge to the southwest edge.

The Draft Environmental Impact Statement did not address the environmental effects that the proposed Conrail merger will have on the City of Brooklyn. This office requests that the SEA investigate the effects that the proposed rail merger will have on the City of Brooklyn and include the results of that investigation in its Final Environmental Impact Statement.

An analysis of the effects on the City of Brooklyn should include the following:

- If the Conrail merger is approved, what noise and safety mitigation will be offered to the residents living adjacent to the Conrail line parallel to Brookpark Road? Residents on Idlewood Drive, Summer Lane, Kennedy Drive, Southwood Drive, Autumn Lane, Springwood Drive, and Melody Lane live in homes abutted by the Conrail tracks to the south and Interstate 480 to the north. The only evacuation routes in the event of a hazardous material spill at that segment of the rail line are Idlewood Drive at the eastern edge of the neighborhood, and Southwood Drive at the western edge of the neighborhood. A derailment along this section of track would pose a clear and immediate threat to public safety. An increase in trains will increase the risk of a hazardous waste spill in the event of a derailment. Furthermore, an increase in trains will increase the noise levels experienced residents living adjacent to the tracks on Idlewood Drive. Noise mitigation may be necessary.
- The Cleveland-Medina CSX route crosses American Road in Brooklyn. American Road is the access road for employees of American Greetings, Brooklyn's largest employer, employing approximately 3,000 workers. An increase in train traffic along this line will result in an increase in delays for American Greetings's workers and could result in traffic queues as far as Tiedeman Road. The SEA should investigate whether mitigation against the effects of traffic delays on American Road would be warranted.
- The Cleveland-Medina CSX route also abuts the Spring Crest-Pepper Ridge Drive neighborhood, which is already subject to significant noise from train traffic. Sixty-three homes are located there. The SEA should investigate whether noise mitigation is warranted if there is an increase in train traffic as a result of the merger.
- The Conrail line abutting the northwest edge of Brooklyn crosses Ridge Road at an at-grade crossing. Ridge Road is a major north-south commuter route between Cleveland and the southwestern suburbs. The SEA should investigate the effect that an increase in train traffic along this Conrail route would have on commuter traffic on Ridge Road, and recommend mitigation as appropriate.

The aforementioned investigations should be conducted by the SEA in preparation for its Final Environmental Impact Statement. This office, in conjunction with the Office of the Mayor of Brooklyn, Ohio, will provide additional assistance as necessary in order to help the SEA investigate these important environmental issues.

**ERRATA TO
COMMENTS OF THE CITY OF CLEVELAND, OHIO
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT**

On February 2, 1998, the City of Cleveland, Ohio, filed its Comments on the Draft Environmental Impact Statement ("DEIS") issued by the Section of Environmental Analysis ("SEA") on December 12, 1997. By these Errata, the City makes the following corrections to those Comments:

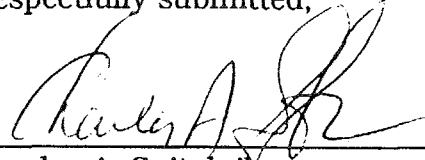

PAGE	LINE	CORRECTION
2	2	Delete the word "on" and replace it with the word "at"
2	12	Delete the word "have" and replace it with the word "has"
2	15	Delete the word "their" and replace it with the word "its"
4	6	Delete the word "of" between the words "explain" and "the"
5	12	Delete the word "medial" and replace it with the word "medical"
6	7	Delete "available," between the word "resources" and "to"

PAGE	LINE	CORRECTION
6	22	Delete the word "Redirection" and replace it with the word "Redirecting"
7	10	Add the word "million" after the number "\$148"
9	19	Delete the word "on" and replace it with the word "with"
10	20	Insert "%" after "22.4"
12	14	The word "segment" should be "segments"
12	15	Delete the word "across" after the word "increase"
19	8	The sentence "The report purports to address the localized issue of noise in the City" appears twice. Delete the second one.
19	13	The word "form" should be "from"
19	18	Delete the word "was" and replace it with the word "were"
23	9	Insert the word "that" between the words "even" and "reduction"
27	2	Insert a comma after the word "arrangements" and insert the word "is" before the word "less"
27	20	Delete the word "across" between the words "increase" and "in"
28	20	Insert the word "be" between the words "to" and "found"
29	3	Delete the word "Given" and change the "t" at the beginning of the word "this" from lower to upper case
29	6	Change the word "require" to "requires"
30	22 & 23	Delete the words "will further limit access"
31	1	Change the word "criteria" to "criterion"
31	19	insert the words "that a" between the words "indicated" and "ditch"
37	5	Change the word "affected" to "affect"
37	17	Insert a comma (",") between "1980's" and "has"
38	3	Change the "t" at the beginning of the word "the" from lower case to upper case

PAGE	LINE	CORRECTION
41	20	The phrase "This alternative plan would require substantial public funding" appears twice. Delete the second one
42	23	Delete the word "the" between the words "be" and "via"
44	16	Delete the word "are" and replace it with the word "is". Add an "s" to the word "provide"
48	21	The title " <u>Train Frequencies</u> " refers to the table that follows at the top of the next page and should be moved to the next page
52	16	Delete the word "more"
52	23	Delete the word "their" and replace it with the words "the railroads"
52	5	Change the word "rial" to "rail"
52	9	Substitute the symbol "÷" for the words "divided by"
52	14	Delete the word "of" after the word "reduces"
52	16	Delete the word "more" after the word "they"
52	23	Delete the word "their" and replace it with the words "the railroads", then add an apostrophe after the word "railroads"

Ref. Finance Docket 33380

Dear Mr. Williams

I live in the 13th Congressional District under the jurisdiction of Congressman Sherrod Brown in the City of Lorain Ohio, presiding Mayor the Honorable Joseph Kozman.

This letter is in reference to the Surface Transportation Board's (STB) draft STB Environmental Impact Statement (EIS) and the impending merger of CSX and Norfolk Southern rail lines.

The safety of the residents should be of major concern to you as well as the citizens of Lorain County therefore we must be assured that the highest steps possible be created in your consideration of the approval or denial of this merger. In Lorain we have approximately 17 crossings and the safety of our traffic and citizens must be affected at all times in a secure atmosphere. Please be advised as a concerned citizen I request your assistance to be just in your decisions when this is presented to your board.

Let it be noted that I ^{STRONGLY} OPPOSE the
pending merger of CSX, Northern Pacific + Conrail
Railroad for the following reasons:

- A. Environmental Pollution - for all
- B. Noise Pollution - especially for those near the track
- C. Safety Hazards - Possible Chemical spills -
- D. The use of Taxpayer's money to help fund this merger
- E. Railroad Crossings tying up traffic all the
time because of increased train runs.
(Also Fire Trucks + Rescue Squads ^{+ police} may be hampered
in aiding victims if tied up at these crossings)

And on & on -

~~Again - I strongly oppose the merger.~~
~~The effects on people would be devastating.~~

Signed

ENVIRONMENTAL FILING

Thursday, February 05, 1998

Position on Norfolk Southern/CSX Acquisition
Finance Docket 33388
Royalton Acres Development Corp. and Flair Corporation

Royalton Acres Development Corporation and its sister company Flair Corporation (collectively "Flair") oppose the proposed acquisition of ConRail trackage by Norfolk Southern and CSX because of the negative impact that increased rail traffic will have on the residents of homes we have built and continue to build in the City of Olmsted Falls, Ohio.

Flair endorses the comments of the City of Olmsted Falls in regard to this matter and makes additional comments as follows.

Flair protests any attempt to vacate usage of the current Norfolk Southern (former Nickel Plate) tracks known as segment N-80 on the Cleveland-Vermillion Run and divert traffic to segment N293 also known as the Cleveland to Vermillion Run or to segment C-061 also known as the Berea to Greenwich Run. The current traffic on segment C-061 is 16 trains per day. If the acquisition of the ConRail trackage is allowed, traffic is expected to increase to 54.2 trains per day; i.e., 239%.

Flair vehemently opposes any increased rail traffic on segment C-061 because of the deleterious effect it will have on the residents living on Raintree Boulevard, Summerset Lane, Laurel Drive, Cyprus Drive, Holly Lane, and Magnolia Drive (the "Raintree Community") in Olmsted Falls, Ohio (See Exhibit "A"). As the past and current developer of the Raintree Community, Flair is keenly aware of the tremendous noise and disturbance caused by the current level of rail traffic. Any additional traffic would unfairly plague the Raintree Community.

The Raintree Community consists of approximately 230 homes. The distance from the Raintree Community to segment C-061 is approximately 1,320 feet. This minimal separation of homes from rail, already results an excessive and unacceptable noise level. The noise level generated at the Raintree Community from train whistles and ambient wayside noise exceeds 70 Ldn. Any increase of traffic would exacerbate the noise situation to an intolerable level. It is unreasonable to expect the residents of Raintree to be burdened with any additional rail traffic.

Additional rail traffic along segment C-061 will worsen an already unacceptable traffic situation at crossings FRA ID 524367U and 524368B. Any increase in the number of blockage at these crossings will result in unacceptable delays of emergency vehicles, school buses, and general traffic. As described in the City of Olmsted Falls comments, a blockage on Columbia Road on segment C-061 of 2.8 hours per day is untenable. The potential delay to emergency response time cannot be tolerated. Further, with the only egress from the Raintree Community being to Sprague Road (*next to crossing FRA ID 524368B*), it is unreasonable to expect the Raintree Community residents to endure any further delay in coming and going from their homes. If one wishes to bypass the rail crossing at Sprague Road, an additional 4.3 miles must be traveled, and even then

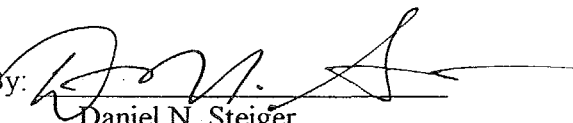

Thursday, February 05, 1998

Page 2: Flair Corp.'s Position on Proposed Acquisition: Finance Docket 33388

it is still possible to get stopped by the same train as it passes through crossing FRA ID 524367U. Any attempt by a Raintree resident to travel east along Sprague Road from his home, or to get home when arriving from the east, is already subject to delay by trains passing through the crossings and will only get worse if traffic along segment C-601 is allowed to increase.

For the foregoing reasons, Flair opposes the proposed acquisition of ConRail trackage by Norfolk Southern and CSX.

Sincerely,
Roylton Acres Development Corp.
and Flair Corporation

Section of Environmental Analysis

Dear Ms. Kaiser:

RE: FINANCE DOCKET NO. 33388-CSX & NORFOLK SOUTHERN-CONTROL & ACQUISITION-CONRAIL: DRAFT ENVIRONMENTAL IMPACT STATEMENT

The Lorain County Community Alliance is a Council of Governments formed under Ohio Revised Code representing the 275,000 residents of Lorain County, Ohio. On October 3, 1997, (copy enclosed) the Alliance notified the Surface Transportation Board of its concern regarding this proposal, noting a possible detrimental impact on our proposed operation of commuter rail service over freight rail corridors in this region.

At today's meeting of the Alliance, members voted to affirm the actions of the Lorain County Board of Commissioners taken on January 29, 1998 in the form of Resolution No. 98-82 (copy enclosed.) This Resolution specifically recommends the following:

- a. Reduce the number of additional trains permitted.
- b. Provide for rail separation at the North Main (Wellington/S.R. 58) at grade crossing.
- c. Limit/restrict rail car switching activities to night hours in order to reduce congestion.
- d. Create a written emergency response plan for rail personnel & local providers.
- e. Institute and fund an annual joint training program for rail personnel & local providers.
- f. Provide prior notification of nuclear shipments.

Please contact the undersigned with any questions regarding the resolution, comments or recommendations.

Thank you,

LORAIN COUNTY COMMUNITY ALLIANCE

Betty Blair, Chair

Re: Proposed Conrail Acquisition

Enclosed is a copy of Resolution No. 98-82, adopted by the Lorain County Board of Commissioners on January 29, 1998.

This Resolution is registering concerns with regard to the proposed CONRAIL ACQUISITION relates to cities, townships and villages located within its County borders. These comments are based on review of the Draft Environmental Impact Statement (DEIS).

Also within the resolution is an outline of recommendations that serve as a minimal to any approval of this proposed acquisition of Conrail by CSX and NS.

This is being forwarded for your information and files.

Dear Ms. Kaiser:

At the invitation of the Section of Environmental Analysis of the Surface Transportation Board, the Lorain County Board of Commissioners is taking this opportunity to register its concerns with regard to the proposed CONRAIL ACQUISITION as those concerns relate to cities, townships and villages located within its County borders. The comments are based on the review of the Draft Environmental Impact Statement (DEIS). The Commissioners acknowledge the thoroughness of the six volume, 3000 page document, particularly as regards the listing and identification of Lorain County Rail Line Segments which will be impacted with approval of the proposed acquisition.

Additionally, the Board of Lorain County Commissioners recognizes that the Surface Transportation Board is presented with a very challenging and complex decision, made difficult by the many issues involved, all of which must be given careful consideration prior to the final decision being made.

With regard to the DEIS generally, the attempts to be objective and to utilize the various formulas to calculate such things as "average delay time"; "number of vehicles in queue per crossing"; anticipated increase in accidents at grade crossings", etc. have resulted in a favorable conclusion for the acquisition's approval. However, we believe the conclusions are less than realistic when looked at logically.

The Board has been made aware that due to the construction projects undertaken and completed by CSX, many Lorain County Officials thought the opportunity to register concerns and request mitigation strategies did not exist. Furthermore, the County has not received sufficient information on the revised routing plan proposed by NS, which would eliminate additional trains on the Cleveland-Vermilion Rail Line Segment. Therefore we believe the comment period, which is set to expire on February 2, 1998, needs to be extended.

The definitions of Level of Service (LOS) are found in the *Transportation Research Board Highway Capacity Manual, Special Report 209, 1985*

Our final comment on the DEIS is that it does not account for the geographic isolation from necessary emergency services, such as fire and ambulance protection, that is likely to occur, particularly at the crossings above highlighted. In addition, the Village of Wellington has a separate fire district and ambulance district that serves rural areas surrounding their borders.

The Lorain County Board of Commissioners generally opposes the approval of the merger because of the tremendous adverse impacts to our County. However, in lieu of abject opposition the Board urges, in the strongest terms possible, that conditions mitigating some of the adverse impacts be placed on approval. The recommendations specified below represent those conditions we believe to be minimal to any approval of this proposed acquisition of Conrail by CSX and NS.

RECOMMENDATIONS:

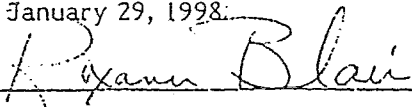

- A. REDUCE THE NUMBER OF ADDITIONAL TRAINS PERMITTED
- B. PROVIDE FOR RAIL SEPARATION AT THE NORTH MAIN (WELLINGTON) AT GRADE CROSSING
- C. LIMIT/RESTRICT RAIL CAR SWITCHING ACTIVITIES TO NIGHT HOURS TO REDUCE CONGESTION
- D. CREATE A WRITTEN EMERGENCY RESPONSE PLAN FOR RAIL PERSONNEL AND LOCAL SERVICE PROVIDERS
- E. INSTITUTE AND FUND AN ANNUAL JOINT TRAINING PROGRAM FOR RAIL PERSONNEL AND LOCAL PROVIDERS
- F. PROVIDE PRIOR NOTIFICATION OF NUCLEAR SHIPMENTS

Please contact us with any questions regarding these comments or recommendations.

The foregoing resolution was introduced upon a motion by Commissioner Michael A. Ross, seconded by Commissioner E. C. Blair, and upon roll call: Ayes: All.

Motion carried

I, Roxann Blair, Clerk of the Board of Commissioners of Lorain County, Ohio, do hereby certify that the above Resolution No. 98-82 is a true copy as it appears in Journal No. 98 on date of January 29, 1998.

RE: RESOLUTION TO SURFACE TRANSPORTATION BOARD

Attached is copy of the Resolution adopted October 3, 1997, by the Lorain County Community Alliance, a Council of Governments formed under Ohio Revised Code, notifying the Surface Transportation Board of its concern that as proposed, the acquisition of Conrail by NS and CXST may have a significant adverse impact on the 275,000 residents of Lorain County. The Resolution urges that special note be given to the fact that both the Northern and Southern routes of NS traverse Lorain County, while the South to North route of CSXT also traverses our County. (Map is attached.)

The Lorain County Community Alliance members urge the Surface Transportation Board to view all viable and applicable solutions to this proposed merger. The County does have an Intermodal Plan which calls for east-west commuter rail service using Norfolk Southern lines together with north-south access, part of the Lorain Port Authority's Groveport Project.

Thank you,

Encs.

"New Partnerships for the Future"

(Regarding the matter of the acquisition of)
(Conrail by NS and CXST.)

October 3, 1997

NOW THEREFORE, BE IT RESOLVED by the Lorain County Community Alliance that:

The Lorain County Community Alliance represents 275,000 residents of Lorain County which is the 9th largest county in the State of Ohio. The Lorain County Community Alliance, (LCCA), a Council of Governments formed under Ohio Revised Code, section 167.08, provides a means of obtaining a more adequate and effective level of public service for all residents. This Alliance wishes to notify the Surface Transportation Board of its concern that as proposed, the acquisition of Conrail by NS and CXST may have a significant adverse impact on the residents of Lorain County.

The Lorain County Community Alliance will continue to monitor current and future documents related to the proposed acquisition, to coordinate with other interested parties, specifically the Ohio Rail Commission, Greater Cleveland Regional Transit Authority, Lorain County Transit Authority, Lorain Port Authority, Lakeshore Railway Association and others that may be identified, and to participate with these interested parties, as well as State and Federal legislators, in working toward a regional position on the proposal including specific concerns as well as possible alternatives.

The Lorain County Community Alliance recognizes that while this acquisition may offer the potential for economic redevelopment, Alliance members are also concerned with the possible negative impacts, both locally and regionally. This acquisition may have a detrimental impact on the possibility of operating commuter rail service over the freight rail corridors in the region. Safety related issues are an increased possibility, auto/train pedestrian accidents, possible air pollution, noise pollution and hazardous cargo shipments as well as possible delays in emergency equipment response. Special note should be given to the fact that both the Northern and Southern routes of NS traverse Lorain County, while the South to North route of CSXT also traverses our county. (see attached map)

RE: Finance Docket No. 33388 - CSX and Norfolk Southern - Control and Acquisition
Conrail: Draft Environmental Impact Statement

Dear Ms. Kaiser:

Thank you very much for your recent communication concerning input regarding the draft Environmental Impact Statement on the referenced project. The draft EIS refers to the fact that the City of Erie's 19th Street tracks will be removed as part of the consolidation effort. At this point, our primary concern is to ensure that industrial rail customers along this route continue to receive necessary service for their current and future industrial needs. If the appropriate sidings are still available to access customers and suppliers, the removals in other sections would be of great benefit to north/south automobile traffic flow in the City of Erie.

We are also concerned that after the tracks are removed, that the appropriate highway intersection geometries are put back in place. The railroad tracks currently create much longer and wider crossing points than would be typical, and these should be adjusted as part of the reconstruction process.

We would very much appreciate your assistance in helping us to ensure that local expectations are met as part of this very complicated process.

Sincerely,

Joyce A. Savocchio
Mayor

Re: 19th Street Railroad Tracks, Erie, PA

Dear Elaine K. Kaiser:

This is my thought, and opinion, among comment, concerning the railroad tracks running through Erie, Pa on 19th Street.

I was born in the family home in 1938 on 19th street, where the trains ran every 15 minutes just so many feet from our home. From 1938 until this very time, my family and all other families throughout the Nickle Plate route of those trains have been complaing about those tracks for many good reasons.

As I see it today, and for many years previously (25 to be exact), I see absolutely no reason why those tracks should be there anymore. Very few trains run through that district anymore, and, there is no justifiable reason why any trains could not be reverted and transferred over to the New York Central tracks lower in town, known as the 15th street tracks.

I cannot count the accidents and lives lost because of those tracks over the past years they have been there. I saw numerous ones uncountable. And it must have cost the Railroad companies millions for reparations and in insurance claims over those many years too.

I for one oppose those tracks being in front of my home in Erie. The state could gain from a state straight highway going through 19th street in its place. Thank you kindly.

Re: Comments - Draft EIS Proposed Conrail Acquisition

Dear Ms. Kaiser:

In conjunction with Section 6.3.3 Draft EIS "Comment Period", Column 4, chapter 6, Page 6-14, December 1997, of the Draft Environmental Impact Statement relative to "Proposed Conrail Acquisition"; that which follows are comments arranged as individual exhibits. In review of the six volumes of the Draft EIS, it is felt a response to a multitude of isolated specific cases would be self defeating, as in the limited time frame involved to develop a "Final EIS", would cause a large number of such comments would become lost. Also, the major points on which I have focused in this submission would lose their significance.

The attached seven exhibits; which cover the gist of my comments, and part of my response, are as follows:

- Exhibit I Rail Highway Crossings
- Exhibit II Electric Traction Issues and Clearances
- Exhibit III Federal Railroad Administration Report
- Exhibit IV Taking of Property Rights
- Exhibit V Mitigation Rules
- Exhibit VI Environmental Justice Analysis
- Exhibit VII Abandonments -Military Infrastructure

Overall, consider the Draft EIS an overkill in respect to its contribution in any respect towards assisting to making an improved self sustaining transportation system. (Yes there are a few constructive comments). One must recognize that both NS and CSX are competitive enterprises; both by design with each other; and more significantly, being unable to raise rates against their competition by trucks and other means of transportation. One must exercise prudent judgement as to the luxury of being able to accomplish every thing one might want to accomplish and in addition, every thing others think one should do as well; keeping in mind the shipper has the option of taking his business else where or even site his business at another location.

Receipt of a "final" copy of the EIS will be appreciated when it is published.

If someone is offended by my style, sorry; for it at times is harsh to force ones attention to what I am saying.

Thanking you in advance, I remain,

Very truly yours,

Belknap Freeman, PE

Exhibit I Rail Highway Crossings

Draft EIS Proposed Conrail Acquisition Docket 33388

Comments - Letter 19 January '98 to SEA of STB

In the "Section of Environmental Analysis" (SEA) text, all the way through the report, suggested mitigation strategies to address significant highway/rail at grade crossings problems, to the casual reader, place the onus on the railroads. There are few who would read, say foot note 4, at the bottom of page 7-7 of Volume 4, which reads in part:

"...Therefore, it is not SEA's intent at this time to recommend that the Board require a separated grade crossing where the local community finds this approach undesirable or is unwilling to fund an appropriate share."

As the Surface Transportation Board is an outgrowth of the former Interstate Commerce Commission, in the realm of "Safety", as related to Rail Highway Crossings at Grade, under the heading of References" as laid out starting on Page R-1 of Volume 4 of the Draft EIS, it is of concern to note the failure to include the Interstate Commerce Commission's Docket # 33440 of February 1964, titled "Prevention of Rail Highway Grade Crossing Accidents Involving railway Trains and Motor Vehicles".. In order to refresh ones memory, and motivate one to go back to "square one" prior to attempting to "reinvent the wheel", of the Docket's Findings, the 13th of 14 is cited from its page 87 of the docket, as follows:

"(13) That highway users are the principal recipients of the benefits flowing from rail-highway grade seperations or from special protection at rail highway grade crossings. For this reason, the cost of installing and maintaining such systems and protective devices is a public responsibility and should be financed with public funds the same as highway traffic devices."

Rosemont, PA 19010
19 January '98

Exhibit II Electric Traction Issues and Clearances
Draft EIS Proposed Conrail Acquisition Docket 33388
Comments Letter 19 January '98 to SEA of STB

Scattered throughout the various Volumes of the Draft Environmental Statement are references to "actions" to be taken to improve overhead clearances. As an example, attention is invited to Table 5-DC-11 (Page DC-21, Volume 3B) where it states "CSX has proposed to increase the clearance of the Virginia Avenue Tunnel as part of a long standing project". In Volume 3B, Page VA -3, "NS plans significant capacity improvements on its Shenodoah Corridor, including raising clearances between Riverton and Roanoke". How prior to any concept of acquisition of Conrail, jointly by NS & CSX, Conrail had accomplished considerable work, partly paid for by the State of Pennsylvania, to raise overhead clearances on the former Main Line of the original Pennsylvania Railroad. In addition to these efforts, Conrail also paid Amtrak to raise the height of the electric traction catenary where possible at various tight sites (e.g. Across the Perryville Bridge over the Susquehanna River - MP 60).

Now comes Business Development of Amtrak, who have commissioned LTK Engineering Services, to accomplish various studies to determine how Amtrak might maximize the opportunity of obtaining an additional revenue stream from the assets of its right of way. The principal scenario has the "vision" of eliminating the need for Amtrak's existing 138,000 Volt 25 Hertz transmission lines (Which net the New York - Washington together as one continuous system - without interruptions to trains and as seen by the utilities, a benign load), and to reuse the existing space to build new transmission lines that may be employed to "wheel electric power". To implement such a proposal would involve expenditure of redistributed tax dollars to convert Amtrak's existing 25 Hertz 12,500 Volt catenary to a concept of 60 Hertz catenary at 25,000 Volts.

Further, as height of the electric traction catenary is already a limiting factor on use of doubler stack container loads, Business Development would in one step decrease the existing overhead clearance almost a foot all over the New York - Washington and Harrisburg Routes (As added spacing would be required between the catenary and its supports from overhead structures such as overhead bridges and tunnels, and additional clearance would be required between the catenary contact wire and the dynamic height of the vehicle below). One might cite specific overhead clearance figures at assorted spots here and there on a before and after basis; but that would be "hog wash", for the overall clearance would be reduced every where.

Besides the risk of Amtrak's Business Development ever attempting to implement its "vision", there are two other electric traction issues that might be mentioned as involving the Draft EIS.

The Table 2-4 "Shared Assets Rail Line Segments that might exceed the Broad Thresholds For Environmental Analysis" Page 2-21 of Volume 1 of the Draft EIS more than substantiate that there is an anticipated increase use of the existing NE Corridor of Amtrak (As well as numerous other references such as Table 4-7 on Page 4-25 of Volume !).

On page 197 and 204 of Volume 2 (NS Safety Integration Plan, reference is made to NS crews operating over the NE Corridor should be qualified on the operating rules of Amtrak. In such a situation, it should be highlighted that besides qualification in NORAC Operating Rules, that qualification in the "Electrical Operating Instructions" (AMT-2) be specifically mentioned, as not to be overlooked.

On page 221 of Volume 2, as well as page 44 of the DOT Preliminary Comments, mention is made of the necessity to resolve the software and compatibility of various computer systems on the various properties. When operating under the catenary system, it is imperative that such computer systems identify in an accurate manner, car height, car height and specific features of a load such as use of a tarpaulin cover. (When the NE Corridor, pre Amtrak days, rally carried a major volume of freight, "Height Detectors" were employed in the area of MP 83, in advance of the last freight yard before the tunnels in Baltimore, such as to have the opportunity to drill "excess height cars" that might have inadvertently got by the system. It was essential to maintain excellent track surface at the site of the "height detector" to prevent vertical bounce [dynamic clearance] and tarpaulin covered loads were always a problem as they fluttered in the wind or air stream as a result of the trains travel).

As CSX has its own right of way somewhat parallel to the Corridor, and NS is at risk to being subject to loss of available overhead clearance in their use of the Amtrak NE Corridor, by possible mischief on the part of Business Development, so much for competition !!!! (This is particularly significant when one considers "container and trailer loads " are a major area for rail traffic growth when competitive service times are possible).

Rosemont, PA 19010
19 January 1998

Exhibit III Federal Railroad Administration

Draft EIS Proposed Conrail Acquisition Docket 33388

Comments - Letter 19 January, '98 to SEA of STB

The Federal Railroad Administration (FRA), under the umbrella or caption of the United States Department of Transportation, submitted Preliminary Comments, in their submission of October 21, '97, as presented in Volume 2 "Safety Integration Plans", in particular, the verified statement of Edward R. English.

Not to nit pick; but to improve the text of the FRA preliminary comments, that which follows are intended to be constructive.

On page numbered 19 of English's paper, in the caption relating to "NORAC Rule Book", as many of the Northeast facilities such as Metro North, NJ Transit, Amtrak and SEPTA are arranged with electric traction facilities, for emphasis as to its importance, both for operating safety and the safety for the individual; that qualification in Electric Traction Operating Rules (e.g Amtrak's AMT-2) be included just as well as reference to NORAC Operating Rules.

This same comment applies in other sections of the FRA preliminary report such as its paragraph "c) Railroad Operating Rules" as found on its page numbered 30.

On page 36 there is reference to increased levels of double stack intermodal traffic anticipated by NS, yet expanding this to the entire acquisition effort, it can be recognized the concept of "increased clearance height" is an extensive issue else where. (Prior comments in Exhibit II of this critique). Attention is invited to the issue, that the FRA, in their oversight of the Northeast Corridor Improvement Program have been supportive of the same mischief credited to Business Development of Amtrak, in Exhibit II, with the "vision" of converting the electric traction facilities of the NE Corridor New York to Washington from their present versatile 25 Hertz benign configuration to a "cheap and dirty" 60 Hertz configuration. The ultimate outcome of such a proposal would be to decrease all overhead clearances by approximately a "foot"; thus to restrict further any opportunity for expansion of high loads than even as presently existing..

The FRA Preliminary report on its page 39, raises many questions as to the application of continuous cab signals and train and/or speed control concepts on the various systems (or lack thereof). The report ought to support an evaluation of the use of a sixty hertz track code as contrasted with use of 100 Hertz (particularly in today's realm of 100 Hertz inverters) (e.g. Immunity from induced

energy from commercial sources, the improved selectivity of higher carrier frequency making it possible to add aspects, rather than be limited to a simple "stop" or "go". The ability to improve coupling with the track rails, thus carry across track discontinuities in the track structure, etc.

.The FRA have not faced the issue of use of 60 Hertz in association with rule books which state the "cab signal" does not apply when negotiating track crossovers, not has the FRA addressed the issue of Amtrak locomotives operating in the Northwest in their cab signal territory, being forced to disable or cut out their "speed control" feature; yet over a period of years, spending both the taxpayers money and that of the railroads involved as well [in the millions] in the quest for a more exotic system, which at best has yet been recognized only as a non vital system, dependent upon existing wayside signal systems for ultimate safety].

In paragraph e) S & T C Concerns- Other, the reports page 41, there are three issues which might well be expanded.

The concept of any Positive Train Control concept must be examined not only from the standpoint of where it is going, maintenance and obsolescence to be considered as well as cost; but whether it could be successful in being able to handle existing rail traffic levels as experienced else where (e.g. the six track configuration west of Elizabeth ,NJ, of Amtrak) to say nothing of increased growth. Also how it might stack up with and compare with such developments as the nine aspect continuous cab signal system presently in service, say in Amtrak's New England territory. After all the FRA touts "interoperability").

The concept of signalman's territory is interesting and for "horror stories" Miami, Fla, comes to mind, with a maintained from Atlanta,GA (No body local wanting territory, low seniority , to hold job must travel) Who is to cover on week-ends in reasonable time? What on the impact of , or intent of the hours of service rules, involved with the time required to commute from Atlanta,GA to Miami ? (Part 218 of Title 49 CFR).

The reference to "CSAO Areas" raise numerous concerns as the FRA report mentions; but to add emphasis, certain issues ought to also be considered. One is the issue of control of "hours of service" under the hours of service rules for signal forces. The second is concern for the organizational characteristics and responsibility for signal plans and implementation of the FRA's rules and regulations, record keeping, et all, especially in light of such statements --(In the report, the comment was made that signal and communications work tasks at CSAO's would be accomplished by contractors, with no mention as to whom or where would the coordination, supply of and review of plans and specifications would be handled in such an environment).

In its section , page 48, in the FRA report, leans heavy on the subject of Rail Highway Crossings. It conveys the impression of a heavy burden of cost on the railroads, and fails to recognize such historic background as exemplified by the earlier ICC Order in their Docket 33440 (Which is not known to have been declaimed null and void). [Previously mentioned in Exhibit 1 of this set of comments in response to the Draft EIS.].

Rosemont, PA 19010
19 January '98

Exhibit IV Taking of Property

Draft EIS Proposed Conrail Acquisition Docket 33388

Comments Letter 19 January '98 to SEA of STB

The Draft Environmental Impact Statement in several individual instances, brings up the subject of Cultural and Historic Resources; for example, on page 7-17 of Volume 4, when it reads:

"13. NS shall undertake no construction or modification of the Shellpot Bridge near Wilmington, Delaware, until completion of the Section 106 process of the Historic Preservation Act (16 USC 470f as amended)."

[see also page DE-12 of Volume 3A, where it states the Delaware State Historical Society has determined that the Shellpot Bridge is eligible for inclusion in the National Register of Historic Bridges, and the proposed rehabilitation may effect the bridge.] (See also Page 204 of NS Safety Intergration Plan, Volume 2, where it indicates NS would intend to rehab the bridge and associated branch to by-pass the Amtrak Main Line through the Wilmington Station Area).

I find such a restriction, "taking of property". Not a building with only local utilization; but rather a facility that serves a wider purpose in Interstate Commerce, particularly as it serves to by pass freight trains around another establishment that was blessed with the anointment of being a Historic Facility. (Remember back a few years, before Amtrak chased the freight off the Corridor, that was a function the bridge previously served).

It is repugnant to impose a delay to a logical problem only on the basis that "just now" it is considered a possible eligible structure for inclusion in the National Register of Historic Bridges and may be impacted by any rehabilitation needs.

If this seems a harsh attitude towards "Federal Supremacy" and the bureaucrats who tend to such matters; maybe it is because of my continued dislike of a situation some twenty years ago concerning the redistribution of tax dollars I was involved with to relocate an entire telephone exchange and its associated cable plant out of the Wilmington Train Station within a critical time frame, allegedly only because we had previously raised the floor some 4 inches than the original station floor that was to be restored, as part of preservation of a historic site.

Now that the effort to restore the station to its original appearance, are we risking its status as we delay

the use of the Shellpot as a means to keep freights away from the terminal?As a result, are we going to experience a displaced load on a freight train that passing through the station, will serve to damage the overhanging platform shelter structures??

The rationale' of these comments also apply to other sites, such as Illinois, where suddenly we have a problem associated with a historic place, evidently not of sufficient importance to have been addressed previously; but now all of a sudden a big problem. Is it a case of one seeing an opportunity only now to make an issue of an object only when one might hold a project hostage as a means to accomplish ones own agenda????

Belknap Freeman, PE
Rosemont, PA 19010
19 January 1998

Exhibit V Mitigation Rules

Draft EIS Proposed Conrail Acquisition Docket 33388

Comments Letter 19 January 1998 to SAE of STB

In Volume 4, "SEA's Preliminary Recommended Environmental Mitigation" as outlined in Chapter 7, page 7-12, under caption "7.2.2 Recommended Regional Mitigation", sub title "Safety: Passenger Operations", reads in part:

"By establishing those passenger trains as "superior", trains moving in the same or opposite direction on the same track^{freight trains} would be clear of the track at least 15 minutes before and 15 minutes after the expected arrival of a passenger train at any point. This requirement would not apply when any is moving in the opposite direction, away from a passenger train."

This is a proposed rule that is capable of creating massive delays; also it is poorly written. It is obvious, its author has never been in the situation on a locomotive of a passenger train, say # 574, operating in "manual block territory", receiving a train order which read: "Train 574 you are running 2½ hours late" - which interpreted, says, as you are 2½ hours late, stay that way - do not try to make up scheduled time Why?? Because in "Manual Block Territory", where there are "Yard Limits", a yard crew, who by the rules must clear up 15 minutes prior to the scheduled time of arrival of a "passenger train", is given the same train order "Train 574 you are running 2½ hours late"; thus allowing the yard crew the additional time to complete or continue his work.

Now the "SEA" paragraph as written employs the word "expected" -- what if the passenger train is running late?? And how does he stay that way?? And how does the freight train know??

To implement the SEA proposed rule could cause a considerably longer delay than a half hour (15 minutes before and 15 minutes after) as the track layout and specific train were matched to get him in the right place in order to execute the minimum of 15 minutes.

In a manual block operation, the only unit delayed is the local "switcher" within a well defined limit for the "yard limits". In a manual block territory, it is only that way because there is insufficient traffic to justify an installation of an appropriate signal system.

When one starts to place serious arbitrary cumulative delays on through freight trains, one overlooks the impact

that many such moves have schedules; scheduled times to pass blocks of cars for "meets" for other through freight trains with coordination of schedule critical times, et all. (I have lived through the situation where our BNY 16 had a higher priority than our passenger train - account of the guaranteed delivery of Ford Motor's cars of "roof panels" in the train every night and the General Supt of Transportation knew how to find me if I managed to screw it up).

The proposed SEA rule as it is presented in the Draft EIS lacks the opportunity to determine just what impact it has as a mischief maker as the listing of track segments that precede the rule as presented on page 7-12, fail to indicate type of operation (CTC, Automatic Block, Manual Block, APB, Train Order, etc.) or number of tracks, sidings, siding length, et all. (The listings in Volume 3A, Chapter 5 "State Settings, Impacts and Proposed Mitigation" Pages 5-14 to 5-47 inclusive, provide no clue as to the extenuating circumstances surrounding such a requirement).

In Volume 3B, Pages MI-8 and MI-9, the infinite wisdom and significance of "Federal Supremacy" unfolds when the SEA, in the middle of page MI-8 state in part:

"Given the limited number of passenger train accidents, SEA was unable to accurately predict either the severity, location or timing of actual accidents. SEA therefore focused on estimating the potential risks of accidents..."

Out of this admission of "bankruptcy" as to ones qualification to be an "oracle"; as stated in the next to last sentence of the first paragraph of page MI-9, the SEA go on to state:

"....It is SEA's preliminary recommendation that all freight trains, both opposing, and moving in the same direction as passenger trains, be clear of the main tracks at least 15 minutes prior to the estimated arrival of the passenger train..."

This further demonstrates that in the pious dignity of all the SEA's outpourings, we say one thing in one part of a Volume and something else in the same Volume. For example, on page MI-9 as cited above, we employ the words "estimate arrival", while on page 5-28 of the same Volume, we state "expected arrival", which represents two different situations if taken literally.

Has anyone made a study of siding lengths, spacing of sidings, type of control, number of following trains, impact on hours of service of crews, et all???

Richard A. Freeman
Belknap Free, man, PE

19 January 1998

Exhibit VI Environmental Justice Analysis

Draft EIS Proposed Conrail Acquisition Docket 33388

Comments Letter 19 January '98 to SEA of STB

Appendix K is an interesting document in several respects. Firstly it is not conducive to good race relations in its singling out and defines areas that are given a stigma of being below par. There is an impression of building "expectations", yet not identifying anything constructive as a consequence of what any increased activity might be, such as added jobs from the area in say a "yard activity".

It does provide as a useful tool, as an indication where a higher level of security may be required; but it does not define the extent of exposure to "mother's little darlings" who are turned out on their own, to wander, and at times are injured or cause injury or damage to a railroad property. (At times, to even bring a lawsuit against the railroad for its failure to provide what the plaintiff defines as an appropriate "baby sitting function" in having failed to prevent their being injured and/or to protect them from their own folly. (There is no cap on the limits of liability for a railroad in some of these situations).

Exhibit VII Abandonments - The Military Infrastructure

Draft EIS Proposed Conrail Acquisition Docket 33388

Comments Letter 19 January '98 to SEA of STB

In a review of Volume 6 "Abandonments", on the NS references, there are comments as to clients who will have to resort to "trucks". (But no depth of data as to just what type shipper is involved).

As a personal matter, my interests include the military, and am sufficiently naive as to still believe rail access to a military facility is still a national asset; especially with the down grade and de-activation of a major number of military facilities in recent years.

The format of the Environmental Impact Statement covers many areas, which would enter the category of "who cares" if we were to become involved in another World War II type conflict, where our very existence was at stake. Yet in the format of the EIS, there is no mention, even a negative response, as to abandonment of any form of military support infrastructure in the EIS.

Our movement of troops and supplies by air in today's activity is highly vulnerable to supply of fuel, aircraft and pilots; not an arrangement adopted to a lengthy engagement.

(As late as last week, in a trip to McGuire Air Force Base (and its adjacent Fort Dix facility) it is still with concern, to drive over a former rail-highway crossing area with the evidence of the former rail right of way extending through the trees). Having spent almost five years on Active duty in WW II in Panama, England Africa and Italy, originally having been originally drafted prior to the start of the War, and after 26 active years in the Reserve Program, now a retired Colonel, one must recognize my strong feelings in this area.

Attention: Elaine K. Kaiser, Environmental Project Director, Environmental Filing

Subject: Environmental Correction Request: Acquisition of Conrail Corporation by Norfolk Southern Railroad Company

Dear Ms. Kaiser:

The City of Harrisburg has a grave concern with an overflow drainage problem caused by lack of storm water accommodation along the Conrail line through the City of Harrisburg. The periodic flooding caused by inadequate drainage facilities leading from the Conrail tracks at this very heavily traveled intersection in the City is a **safety related issue**. We request that Norfolk Southern Railway Company, Inc. be directed to correct the situation as a condition of approval of the acquisition of Conrail.

The rail segment identified in Draft EIS Volume 3B, Chapter 5, 5-P.A. 4.1, and depicted on the USGS and Commonwealth of Pennsylvania DER Topographic and Geologic Survey, Harrisburg East Quadrangle, PA-Dauphin Co., 7.5 Minute Series (Topographic) 1969, (attached) is identified as the Reading Railroad running between Penn Central Rail Road and the Reading Rutherford Yards to the east. The track falls in elevation from the vicinity of 26th Street, Harrisburg at BM (elevation) 403 to 13th Street, BM (elevation) 338, a difference of 65 feet in a distance of about 1 1/4 miles. The drainage from that large area is funneled down the tracks to a point in the City where there are no facilities to transport stormwater runoff to the natural drainage channels (Paxton Creek and Susquehanna River). At that point, stormwater overflows parking lots and private property and then runs into the City streets, causing property damage and accidents. One such incident occurred in 1995 during an unusually severe thunderstorm. Attached is an accident report involving a City Fire Bureau Hook and Ladder Truck that collided with cross traffic on Cameron Street (the busiest truck route in the City, carrying 35,200 vehicles per day), when its

brakes were rendered inoperable by the vast amount of storm run off flowing down the street. Although this is an unusually severe example, incidents of this nature occur several times during each spring and summer as thunderstorms pass through the area. Further, local Conrail Track Supervisors have reported that at times they have halted trains passing over that section of rail because storm runoff had accumulated to a depth sufficient to cover the tracks, rendering the rail road **unsafe** for passage.

The City of Harrisburg respectfully requests that The Surface Transportation Board direct Norfolk Southern to construct proper stormwater drainage facilities to carry runoff from the rail road bed described above to the Paxton Creek. You may contact Mr. Joseph Link, P.E., City Engineer for any further information concerning this matter. (Phone 717-255-3091)

With warmest regards, I am

Yours sincerely,

Stephen R. Reed
Mayor

SUBS: ACCIDENT WITH INJURIES 07-16-95 CAMERON ST
AND BERRYHILL ST

AT 0232 TOWER 1 WAS DISPATCHED TO REPORTED TREES DOWN ON WIRES WITH FIRE @ 13 ROW HALL MANOR. TOWER 1 RESPONDED FROM 16TH & WALNUT ST VIA 13TH STREET. WHILE PASSING TOWER 3 WHO WAS ON A CALL IN THE 300 BLOCK OF S. 13TH ST, DRIVER DAVE HOUSEAL NOTIFIED US BY RADIO THAT S. 13TH ST @ THE RAILROAD ~~OFF~~ BRIDGE WAS BLOCKED BY TREES AND WIRES. AT THIS TIME I PROCEEDED TO MAKE A RIGHT TURN ONTO BERRY HILL ST BECAUSE I WAS ALREADY AWARE OF STREET BLOCKAGE AT BERRYHILL & 17TH ST.

UPON TURNING ONTO BERRY HILL ST (WEST BOUND) FF YATES AND MYSELF NOTICED A LARGE AMOUNT OF VARIOUS STORM DEBRIS SCATTERED ACROSS THE STREET UPON PASSING CRESCENT ST, WE ENCOUNTERED A TREMENDOUS AMOUNT OF WATER FLOW COMMING FROM MY ~~RIGHT~~ LEFT SIDE FROM THE PARKING LOT OF A WAREHOUSE FACILITY. MY SPEED WAS ESTIMATED TO BE UNDER 10 MPH WITH WARNING LIGHTS AND SIRENS ACTIVATED.

I PROCEEDED TO APPLY THE TOWERS BRAKES BUT THE VEHICLE DID NOT RESPOND, I THEN DOWN SHIFTED TO FIRST GEAR, HOWEVER MY REDUCED SPEED PREVENTED THE TRANSMISSION FROM ENGAGING THE GEAR. I HOLLERED TO FF YATES TO FLOOR THE SIREN THAT I WAS UNABLE TO STOP - I REACHED DOWN TO THE PARKING BRAKE SWITCH ON THE CENTER CONSOLE AND TURNED IT ON, AGAIN TO NO REACTION BY THE VEHICLE. A-570d

87. NARRATIVE

The operator of Unit #2 and the front seat passenger of Unit #2 could not be interviewed at the scene as they had been transported via Capital Region EMS to the Harrisburg Hospital prior to my arrival on the scene. Officer Kenneth Bittner also of the Traffic Safety Unit arrived on scene and I directed him to the Harrisburg Hospital to check on the injured individuals. REFER TO ATTACHED SUPPLEMENTAL REPORT OF OFFICER KENNETH BITTNER.

I then instructed Officer LeRoy Lucas of the Forensics Unit to photograph the accident scene which he did and he also assisted me in taking measurements of the final rest of Unit #2.

I further examined Unit #2 and observed severe front end damage to the vehicle. Upon examining the inside of the vehicle I observed two (2) head strikes to the inside of the windshield, one in the center with a large clump of hair attached, and one on the passenger side which indicates that neither the operator or front seat passenger were seatbelted. This vehicle was towed from the scene by Don's Towing to 1128 Jonestown Road City.

I also examined Unit #1 and observed scuff marks on the drivers side front tire along with a cut in the tire and also damage to the ladder steps which the driver uses to enter the cab.

Officer Kenneth Bittner returned to the accident scene from the Harrisburg Hospital and at that time we checked the road surface and located the point of initial contact which was a scrape on the road surface. We did take measurements of this scrape and its location on the roadway.

THIS INVESTIGATION IS CONTINUING.

<p>0300 hrs. on 16 July 95 I received a phone call at home in regards to a traffic accident that had just occurred at Cameron and Berryhill Sts. The accident involved a City of Harrisburg Fire truck and another single vehicle. I arrived on the scene at approx. 0325 hrs. Upon arriving I was advised by Sgt. Butler that both occupants of the car were injured and were at Harrisburg Hospital.</p> <p>Upon arriving at the hospital I first interviewed the passenger, Jonathan S. McNeil. McNeil stated that he was at home when he received a phone call from Stacey Tippit asking if he would ride with her to Up-town Harrisburg to pick-up a friend. Stacey told him that she was afraid to drive alone in the rain and wanted him to go along. He thought that they were traveling on Cameron St. The last thing he could remember was that Stacey was attempting to get the windshield wipers to come on because they were not working. McNeil did not remember anything about the accident itself. He had no idea what speed they were traveling and he had no idea how the accident occurred. Because of hitting his head he was having trouble remembering what had occurred. He stated that he had one beer at a bar before he got home. He did remember that he was in the right front passenger seat</p>

57. NARRATIVE - IDENTIFY PRECIPITATING EVENTS, CAUSATION FACTORS, SEQUENCE OF EVENTS, WITNESS STATEMENTS, AND PROVIDE ADDITIONAL DETAILS							
Tuesday, 18 July 1995							
On this date at approximately 1000 hours, I went to VMC and located Unit #1 the fire apparatus aka Tower #1. At that time I used black spray paint and sprayed around the left front tire and then had the truck moved so that I could measure the contact patch left by that portion of the tire that is in contact with the road surface. The patch measured 12" wide and 10" in length and the tires PSI is 110 to 120 according to Les McClure the Fire Bureau mechanic. The fire truck was also weighed at the Sewage Plant scales and showed that the truck weighs 45,420 lbs unoccupied.							
The above information relative to the tire contact patch and PSI, I was able to determine that in order for the fire truck (Unit #1) to have hydroplaned, it would have to of been travelling at a minimum speed of 79.5 mph, which is not consistent with the statment of the operator of Unit #1 and the witness, Michael Yanishak (REFER TO SUPPLEMENTAL REPORT OF OFFICER KENNETH BITTNER). Furthermore at that type of speed, the operator of Unit #1 could never of made the short radius of the turn in which he negotiated.							
In conclusion to the lack of braking power of Unit #1, it is believed that due to the large volume of water over the road surface over the curbs on both sides of the street, that the brake pads and brake shoes got wet therefore no friction was made resulting in the loss

87. NARRATIVE - IDENTIFY PRECIPITATING EVENTS, CAUSATION FACTORS, SEQUENCE OF EVENTS, WITNESS STATEMENTS, AND PROVIDE ADDITIONAL DETAILS					
18 July 95 at 2115 hrs I interviewed Mr. Michael Yanishak of 403 Summit Rd. New Cumberland Pa 17070, ph#774-5933, by phone. He stated that on 16 July 95 at approx 0250 hrs he was standing under the railroad bridge at Cameron and Berryhill st on the west sidewalk. His car was parked in the car wash parking lot. He was waiting for the storm to subside before going to his car. He heard sirens and when he looked up he saw a Hbq Fire Bureau truck comming west on Berryhill St. The truck had both its sirens and lights on. He stated that the truck was traveling at a slow rate of speed. As the truck got closer to Cameron St. it appeared to speed up. It did not stop but contined into the street. He never did see the other car until it was struck . He also stated that it was raining out very h ard and the water running down Berryhill St was very heavy. He was watching the fire truck the whole time and did not see anyother traffic.

RE: Draft EIS, Conrail Acquisition

Dear Ms. Kaiser:

The Beaver County Planning Commission, at its meeting of January 20, 1998 had the following comments:

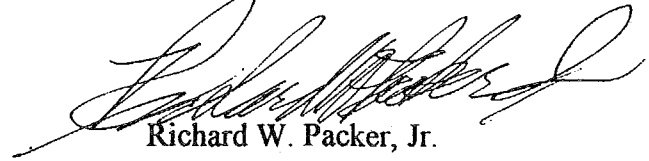

1. The Commission endorses SEA's proposal that the AAR's voluntary hazardous material "Key Route" guidelines be required as the minimum mitigation measures to be adopted.
2. The Commission also recommends that SEA mandate its preliminary recommended mitigation that the railroads provide 24 hour telephone access to their dispatching centers to all emergency response forces in the communities along the key routes.
3. The Commission requests that SEA require the now voluntary AAR standards for Major Key Routes (over 20,000 car loads annually) for Key Routes, i.e. "provide enhanced emergency preparedness by developing a Hazardous Materials Emergency Response Plan and participate with local governments in hazardous materials response training and simulations" (page 4-20). In this area, the most practical approach would be to involve local municipalities through the County's Emergency Management Agency.

Vernon Williams, Secretary
Surface Transportation Board
1925 K Street S.W.
Finance Docket 33388
Washington, D.C. 20423

Dear Mr. Williams:

It has come to the attention of the Local Emergency Planning Committee (LEPC) in Allegheny County that recent purchase of Conrail by Norfolk Southern and CSX Transportation approved by the Surface Transportation Board will have a profound affect on the operation of the LEPC and the citizens of Allegheny County.

It is our understanding that Norfolk Southern who will be operating the Pittsburgh division does not employ Hazardous Material Field Personnel as was the case with Conrail. Considering the volume of traffic and the terrain in Allegheny County, the omission of this local hazardous material personnel creates a potentially dangerous situation in Allegheny County.

Mr. Tim Mannas who has been Conrail's Local Hazardous Material Field staff in this area has been an integral part of the LEPC's planning, training, and a vital source of information on this all important aspect of Emergency Management in Allegheny County.

The Allegheny County LEPC hereby requests that the approval by the Surface Transportation Board to this consolidation of railroad transportation include a condition that the position of Hazardous Material Field Personnel be retained specifically in the Pittsburgh area.

Please let us know what you are willing and able to do to maintain the current high level of rail transportation safety in Allegheny County.

Sincerely,

Carl W. Banks

Attn: Elaine K. Kaiser

Dear Ms. Kaiser:

The Port Authority of Allegheny County is the major public transportation provider in the Pittsburgh region. Its service area includes all of Allegheny County and small portions of Beaver, Westmoreland, and Armstrong Counties.

Port Authority staff has reviewed the Draft Environmental Impact Statement (DEIS) for the Proposed Conrail Acquisition. The major change within Port Authority's service area would be Norfolk Southern's acquisition of all local Conrail lines. Although the DEIS discusses commuter rail, there is no consideration of other transit modes.

Port Authority presently owns and operates a 25-mile Light Rail Transit (LRT) system, the 4.3-mile South Busway, and the 6.8-mile Martin Luther King, Jr. East Busway. A third busway, the 6.1-mile Airport Busway/Wabash HOV facility is under construction. Engineering and design is currently underway for a 2.3-mile extension to the East Busway. The locations of these facilities are shown on the enclosed map.

A short portion of the LRT system utilizes a former railroad tunnel and bridge. The East Busway was constructed on a portion of the Conrail right-of-way made available when the railroad consolidated its operations from three and four tracks to two tracks. The right-of-way is along Conrail's Pittsburgh Line (ID N-263). Similarly, Port Authority intends to construct the East Busway Extension property parallel to the Conrail Pittsburgh Line. Port Authority is also negotiating with Conrail to purchase right-of-way for the Airport Busway/Wabash HOV facility.

Accordingly, Conrail has extensive experience working with Port Authority while the busways and Stage I LRT were being developed. Existing Conrail agreements with Port Authority will be honored by purchasers. Further project development for the new busways will require Norfolk Southern's cooperation when negotiating agreements involving insurance, access, and property acquisition for the new busway projects.

Additionally, Port Authority will be considering new transit facilities in other corridors as part of its long-range planning activities. Usage of other railroad lines (either through purchase or shared rights of way) will be investigated. Port Authority anticipates that both CSX and Norfolk Southern lines will be considered. Information from both railroads on operating or abandonment status, train volumes, right-of-way widths, and other aspects of the rights-of-way will be requested.

Other transit systems in the geographic area of the merger are also considering usage of railroad rights of way for major transit projects. Accordingly, the scope for transportation chapter of the DEIS should be broadened to include consideration of modes of transit other than commuter rail.

Port Authority requests that the Surface Transportation Board require the following as a condition for approving the merger:

- Norfolk Southern cooperate with Port Authority when negotiating agreements involving insurance, access, and property acquisition for the new busway projects.
- Norfolk Southern and CSX will cooperate with Port Authority in planning, engineering, and construction of any other transit projects.

Port Authority staff reviewed the train volume information in the Master Table of all Rail Line Segments (Appendix A-1) for all lines in Southwestern Pennsylvania. Some of the 1996 volumes on the Conrail lines appear to be low.

In particular, the table lists 1996 daily train volumes on the Thomson to Jacks Run segment (ID N-269) at 15.5 trains per day. Conrail provided a schedule to Port Authority indicating that 25 trains use this line on a daily basis .

The table also shows that Norfolk Southern intends to decrease daily volumes to 9.9 daily trains. Did Norfolk Southern make its projections on a base of 15.5 trains per day or use other factors to estimate future volumes?

Port Authority originally intended to use a portion of this segment [ID N-269] for the Airport Busway/Wabash HOV facility. However, due to the installation of a 2nd track and increase in Conrail operations on this line, cost of construction increased significantly and this portion of the busway plan was eliminated as no longer being economically feasible. If Norfolk Southern does intend to reduce the number of trains using this segment, Port Authority may resume its interest in sharing this right-of-way.

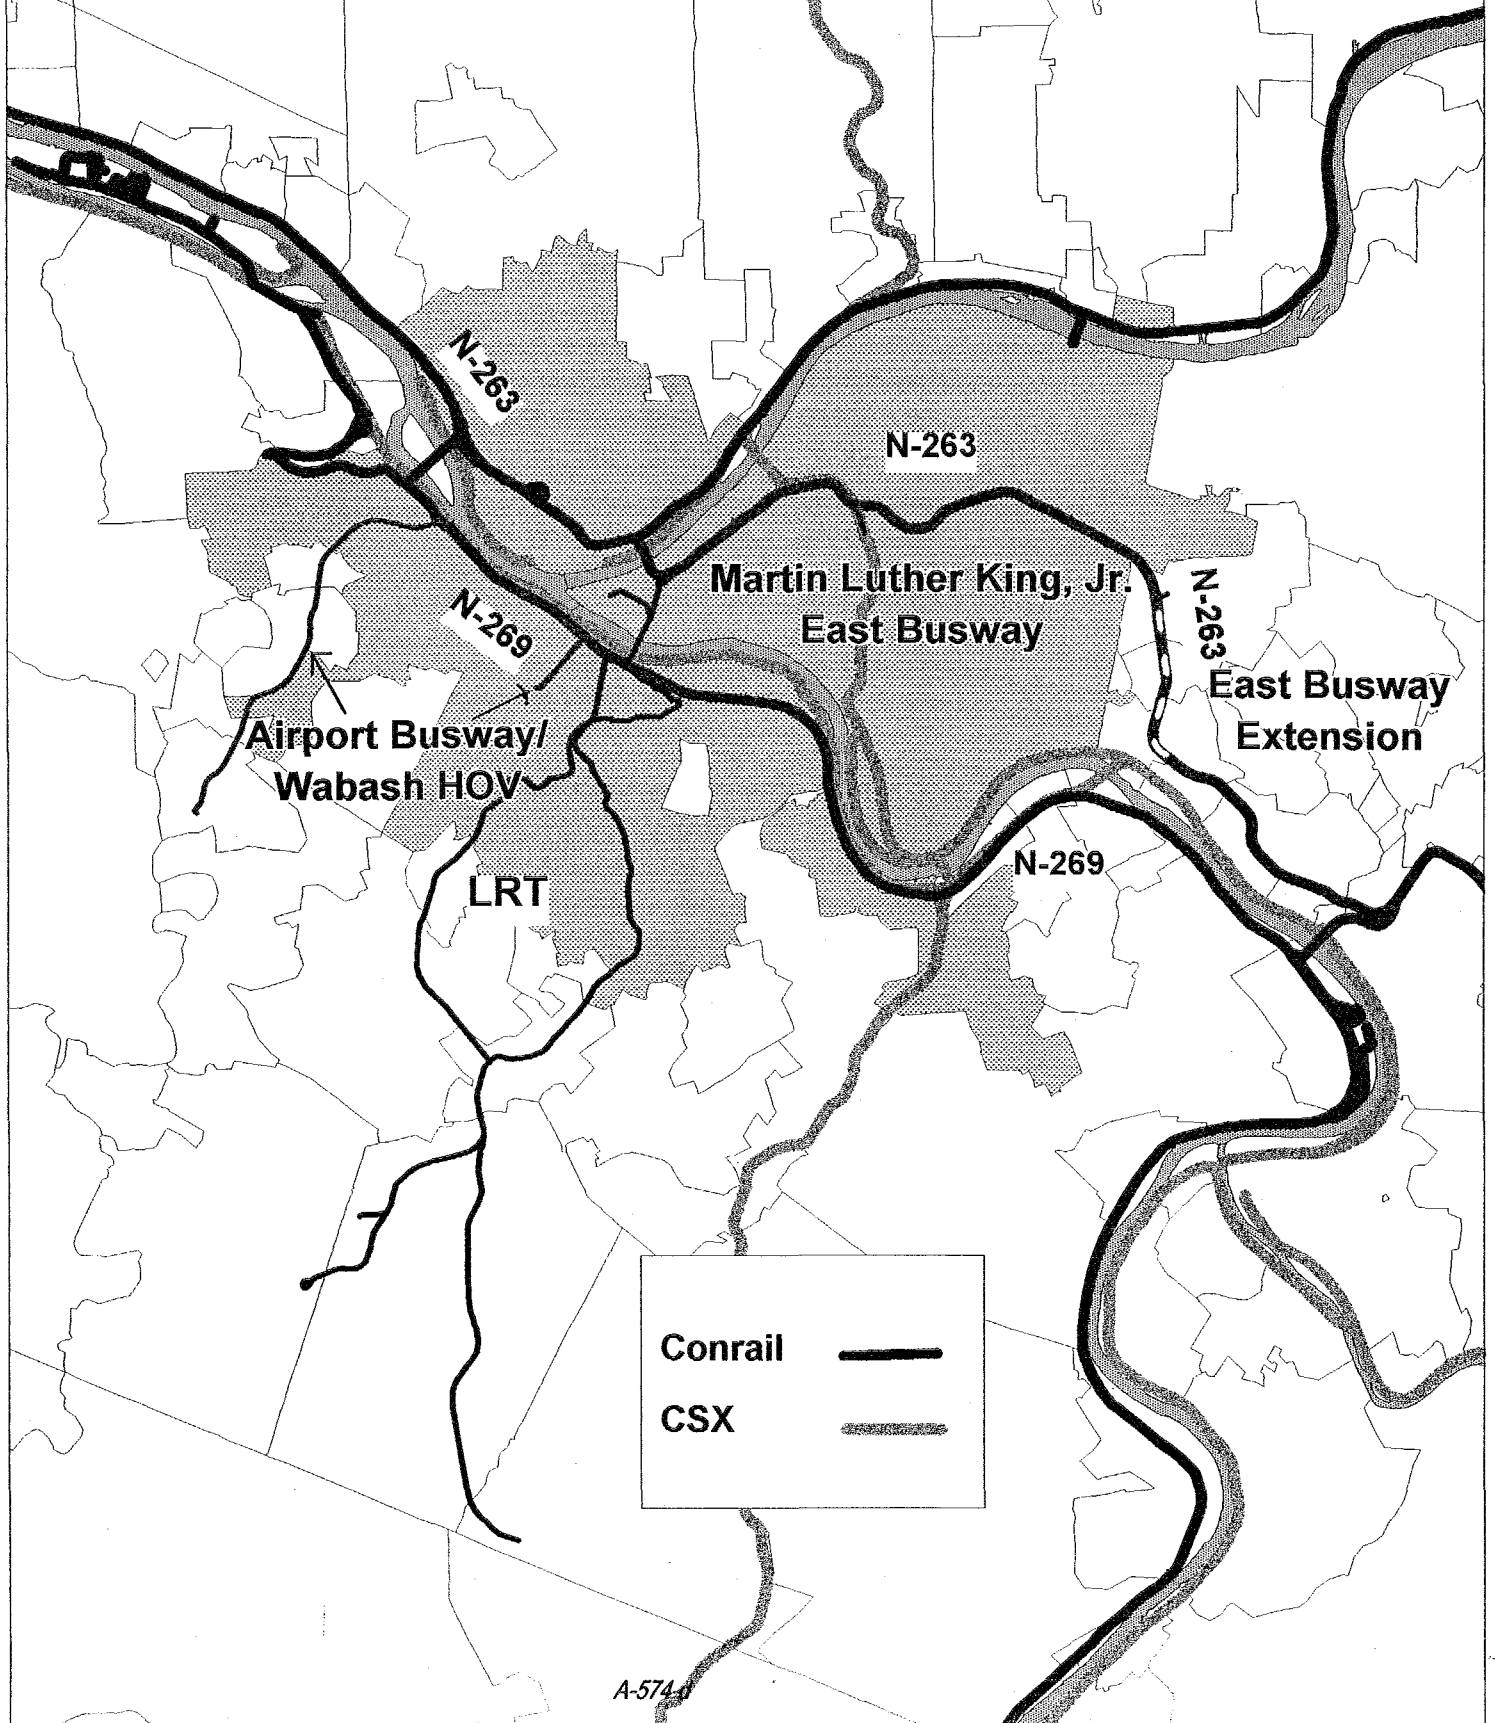

Sincerely,

Paul Skoutelas
Executive Director

To the Board:

I am writing as an interested party to submit comments on the Draft EIS in hopes that you will incorporate my concerns into any final decision or order pertaining to the proposed Conrail/CSX acquisition. I am an adjacent landowner to the Conrail owned Enola Low-Grade line in Southern Lancaster County, PA. [Dkt. No. AB-167 (Sub-No. 1095X)] This line is no longer active and it is my understanding that Conrail as part of an order from the former ICC was to retain it's interest in and take no steps to alter the historic bridges of the line until completion of the 106 historic preservation act process. It is also my understanding that this process is not complete. I am concerned that this rail line and condition may be overlooked when conveyed to CSX. My understanding of the Historic Preservation Act is that conveyance is an adverse impact and the 106 - mitigation process would be triggered.

This historic rail line (recognized by the Curator of Transportation History at the Smithsonian Museum as one of the most historically significant rail lines in the country) and it's beautiful stone arch bridges has been determined eligible for listing on the National Register and therefore should be included in any Environmental Impact Assessment. All decisions concerning conveyance should come under review of the National Advisory Council, with opportunity to comment from the public and interested parties to help mitigate any adverse effect the conveyance of the line to CSX may have. Please include this line in the list of assets Conrail is conveying and consider the impact on this historic line and it's bridges insuring that the condition imposed by ICC and STB remains in effect. Please order all additional protection measures possible so that this important historic national resource remains intact.

Sincerely,

Barry Longenecker

SUBJECT: EIS for Proposed Acquisition of CONRAIL by
Norfolk Southern Railroad and CSX Railroad
Section 106 Compliance re: CONRAIL's Enola Branch of the Low Grade Line,
Lancaster County, PA

Dear Ms. Kaiser:

Please be advised that the Historic Preservation Trust of Lancaster County is an intervenor in the suit, FAST v. PA Public Utility Commission, in the Commonwealth Court of Pennsylvania, No. 3003 C.D. 1997, which deals with CONRAIL's abandonment of its property in Lancaster County, PA, the former Enola Branch of the Low Grade Line of the Pennsylvania Railroad.

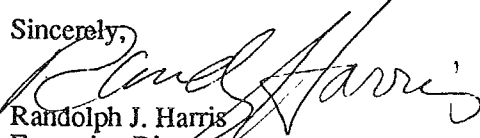

The Trust is also an "interested person," for purposes of the Section 106 process, in an administrative action relative to this property, which has been determined eligible, in total, for listing in the National Register of Historic Places by the PA SHPO in April, 1994.

Please consider the Trust an interested person, pursuant to Section 106 and 36 CFR Part 800, in the subject case before STB. This correspondence is to notify you of our interest in seeking compliance with the Section 106 process, and the protection of the historic and cultural resource, relative to the pending historic preservation condition placed by STB on its abandonment action regarding the subject property.

On January 12, 1998, I wrote to the Advisory Council on Historic Preservation, seeking a determination by the Keeper of the National Register of the eligibility for NR listing of the subject resource. There is an apparent conflict among the parties involved in this administration action as to the scope and content of the historic resource. Enclosed is my letter to the Advisory Council. Please also see the enclosed letter from the Curator of Transportation of the National Museum of American History, who attests to the significance of the subject railroad property.

Thank you for the opportunity to comment on this action, which will affect a resource of major historic and cultural significance. Please call if I can answer any questions on this matter.

Sincerely,

Randolph J. Harris
Executive Director

Ms. Charlene Dwin Vaughn
Advisory Council on Historic Preservation
1100 Pennsylvania Avenue
Suite 809
Washington, D.C. 20004

Dear Ms. Vaughn:

SUBJECT: Request for Determination of Eligibility
Adverse Effect on Historic and Cultural Resources
Atglen-Susquehanna Branch A.K.A. Enola Low Grade Line
Formerly of the Pennsylvania Railroad, ca 1903
Lancaster and Chester County, PA
PA SHPO ER No. 89-1632-042-B
Conrail File No. MPAC-486
Pennsylvania Public Utility Commission PUC Docket No. A-00111016
Surface Transportation Board (Formerly ICC) Docket No. AB-167
(Sub-No. 1095X)

I am requesting that your office review the enclosed correspondence pursuant to CFR 800(6) (e), regarding public requests to the Council. The Historic Preservation Trust of Lancaster County is an interested person in this case, as I interpret the referenced regulations. The Trust objects to the methods being employed by Consolidated Rail Corporation, an applicant before the U.S. Surface Transportation Board, relative to the Section 106 process.

The enclosed correspondence clearly shows that the SHPO (Pennsylvania Historical and Museum Commission) revised its evaluation of the subject resource in 1994, making it more inclusive and comprehensive than an earlier 1989 analysis and evaluation. The revised evaluation was based on more extensive information made available to SHPO through site work, research, and planning analysis, performed by a qualified professional.

The applicant before the federal agency official, however, has refused to acknowledge the revised SHPO opinion that the entire railroad line, inclusive of all of the property that had been purchased, developed and, in essence, organized at about the turn of the 20th Century for use by the Pennsylvania Railroad, is eligible in total for listing in the National Register of Historic Places. Rather, Conrail has proceeded in this case, based on the 1989 determination by SHPO that only certain railroad bridges or crossings are eligible for the National Register.

Conrail's involvement with the Section 106 process has been limited only to those structures identified as eligible in the early evaluations and correspondence with SHPO, and for which SHPO has made a finding of adverse effect. Please also note the enclosed October 17, 1994 letter from SHPO to Conrail, which states, in part, that Conrail should notify your office of the finding of adverse effect of "contributing structures" to the resource and to begin the consultation process. We understand that the your office to date has not been officially notified in this case.

Given these issues, I believe there is an apparent conflict or discrepancy about the scope and definition of the resource in this case. Therefore, I am requesting that your office to contact the agency official and to seek a determination of eligibility regarding the resource from the Keeper of the National Register of Historic Places.

Thank you for your attention to this matter. Please contact me if you have any questions.

Sincerely,

A handwritten signature in cursive script, appearing to read "Randolph J. Harris".

NATIONAL MUSEUM of AMERICAN HISTORY

*...inspiring a broader understanding of our nation
and its many peoples.*

April 2, 1997

Mr. Randolph J. Harris
Executive Director
Historic Preservation Trust of Lancaster County
123 North Prince Street
Lancaster, PA 17603

Dear Mr. Harris:

Re: Former Pennsylvania Railroad 'Low-Grade' Line
Lancaster and Chester Counties, Pennsylvania

My understanding is that, as a result of a proposed agreement discussed with the Pennsylvania Public Utilities Commission, the successor to the Pennsylvania Railroad -- the Consolidated Rail Corporation -- would convey sections of the historic 'Low-grade' right of way in parcels to several local governments. I also understand that many historic bridges and crossings along this 23-mile, former rail line would be threatened.

Of course, I can take no formal position in such a legal proceeding. But, frankly, I fully support the development of the line, intact, as a recreational and educational trail, as the Friends of the Atglen-Susquehanna Trail have proposed. As a resource for both citizens and tourists to Lancaster and Chester Counties, such a trail would be unique.

With the line's great stone arch bridges, its level grade over such an expanse of land, and the stunning views of Lancaster County farms along the way, the 'Low-grade line' would become one of the premier hiking and biking trails in all of North America. Segmented and destroyed, the line would become nothing more than a monumental earthworks.

The 'Low-grade line' was part of an enormous civil engineering project of the late 19th and early 20th centuries, initiated by Alexander Cassatt (brother of the painter, Mary Cassatt), then president of the Pennsylvania Railroad. Penn Station in New York, the Hudson River Tunnels, and the 'Low-grade line' were all part of this vast program. The historic significance of the line is unquestioned.

I urge you and your colleagues in Lancaster County to continue to work to save this corridor in its entirety, including its bridges and crossings. We should be conserving and developing this great legacy as a unique national resource for future generations. And in the wonderful setting of Lancaster County, future generations will thank you for preserving this trail -- in contrast to the commercial shopping developments threatening to blanket other parts of the county. Balance is critical.

If I can be of any further help in this effort, please call. The phone is 202/357-2025, and the fax is 357-4256.

Cordially,

William L. Withuhn

Attention: Elaine K. Kaiser, Environmental Project Manager
Section of Environmental Analysis

Dear Ms. Kaiser:

The Lancaster County Transportation Coordinating Committee, the Metropolitan Planning Organization for Lancaster County, Pennsylvania, appreciates the opportunity to review the Draft Environmental Impact Study (DEIS) of the proposed Conrail acquisition prepared by the Section of Environmental Analysis of the Surface Transportation Board. We previously commented on Volumes 6, 6a, 6b, and 6c of the Environmental Report prepared for the applicants, CSX Corporation and Norfolk Southern Corporation.

The following are our comments on the DEIS, based on our review of Chapters 2 and 5-PA.

1. No mention is made of either Conrails' New Holland Branch or its Lititz Branch, both of which are reached via Amtrak's Keystone Corridor. Nor, is there any mention of the branch line between Columbia, PA and the Dillerville Junction with Amtrak. We noted this deficiency in our previous comments as these three branch lines serve important industries in our county.
2. Lancaster County is not analyzed for increased emissions, apparently because it did not reach the emissions screening threshold of 50 tons per year. In reaching this threshold conclusion, it does not appear that the DEIS accounted for emission increases from 330 additional truck trips per day traveling on PA283 in Lancaster County to reach the proposed conventional intermodal facility near the town of Rutherford Heights via Interstate 283 and US322. We believe these truck emissions

should be estimated and included in our total.

3. Many of these additional truck trips will also use deficient and unsafe portions of US30 in eastern Lancaster County to reach PA283 and the proposed conventional intermodal facility. This is a concern of Lancaster County particularly in light of recent fatal accidents on this stretch of US30 which already has heavy truck volumes.
4. We note the preliminary conclusion of the DEIS that no rail line segments, rail yards, or intermodal facilities in Pennsylvania warrant noise mitigation. The DEIS also notes that the Federal Railroad Administration (FRA) has indicated that it will propose new rules on train horn blowing procedures in 1998. It would be helpful for the final EIS to note the names of all communities located on rail lines that might qualify for "quiet zones" under FRA's proposed new rules in 1998.

We trust you will consider our comments and incorporate them in the final EIS document about the proposed acquisition. If you have any questions about our comments, please call Chris Neumann, Chief Transportation Planner, at (717) 299-8333. Thank you.

Sincerely,

Terry L. Kauffman, Chairman
Lancaster Co. Transportation Coordinating Committee

**RE: Environmental Filing
Proposed Conrail Acquisition**

Dear Ms. Kaiser:

The Pennsylvania Turnpike Commission is grateful for the opportunity to comment on the December 12, 1997, Draft Environmental Impact Statement (DEIS) for the Proposed Conrail Acquisition. For the past eight years, the Pennsylvania Turnpike Commission has been planning improvements for the regional transportation system for Southwestern Pennsylvania. The result is a multi-billion dollar expansion program that consists of more than 90 miles of new roadway which includes a program of seven independent projects that comprise the Mon/Fayette Expressway and Southern Beltway Projects (see attached regional map). Attached to this letter as part of our comments, we have included testimony presented by the Pennsylvania Turnpike Commission to the Pennsylvania State House Transportation Committee on Conrail Acquisition.

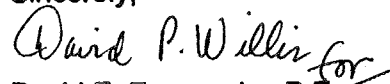

The Mon/Fayette Expressway and Southern Beltway Projects have been authorized and funded through three acts of the Pennsylvania General Assembly (Act 61 in 1985, Act 26 in 1991, and Act 3 in 1997). All of the seven projects comprising more than 90 miles of toll road expansion in Southwestern Pennsylvania have been approved in accordance with the Federal Joint Planning Regulations which were promulgated subsequent to passage of the Intermodal Surface Transportation Efficiency Act (ISTEA). In particular, the Mon/Fayette Expressway project from PA 51 to Pittsburgh, which has the most involvement with existing Conrail and CSX rail lines, is included on the Long Range Plan for the Southwestern Pennsylvania Regional Planning Commission (SPRPC) as well as the Regional Transportation Improvement Plan (TIP). In addition, a combined Congestion Management Study (CMS)/Major Investment Study (MIS) for this project has been completed in accordance with 23 CFR 450.318 (and related regulations). Both the CMS and MIS have been approved by SPRPC with input from the Pennsylvania Department of Transportation and the Federal Highway Administration in accordance with applicable Federal Regulations. In summary, this project is well along in the planning process and has received all required Federal, State and Local planning approvals at this stage of project development. We have invested considerable time and money in this process and would hope that our plans could be coordinated with your plans for the benefit of Southwestern Pennsylvania.

The Mon/Fayette Expressway and Southern Beltway projects have continued support from the Federal Highway Administration (FHWA). The following are our comments on the Proposed Conrail Acquisition, and the anticipated changes, as they relate to the Mon/Fayette Expressway and Southern Beltway Projects.

1. **Pitcairn Intermodal Facility** - The increased activity at the Pitcairn Intermodal Facility and its effect on the existing highway network and our proposed Mon/Fayette Expressway has not been addressed. As written, **Chapter 5-PA.10 Pennsylvania Transportation: Roadway Effects from Rail Facility Modifications** of the DEIS does not address impacts to the proposed roadway network.
2. **Increased Traffic on CSX Line - Attachment ES-B, Master Table of All Rail Line Segments** provides information on rail lines that appear to be involved under the Proposed Conrail Acquisition. Six of these rail segments (C-082, C-086, N-263, N-268, N-269, and N-270) are directly affected by the PA 51 to Pittsburgh Mon/Fayette Expressway Project. Rail line segments C-082 and C-086 are projected to increase by 74 and 77 percent (million gross tons), respectively. The preliminary design for the Mon/Fayette Expressway, specifically the PA 51 to Pittsburgh project, proposes the relocation of up to eight miles of this CSX track. The potential inability to relocate this track because of the increase in use of the line caused by the Proposed Conrail Acquisition may require us to reevaluate this highway alternative. We are concerned that this impact to our planned project was not considered in this DEIS and therefore mitigation for this impact may not be included in your potential approval of the Conrail Acquisition.
3. **Early Coordination** - As discussed above, there are six rail segments that appear to be directly affected by our PA 51 to Pittsburgh Mon/Fayette Expressway Project. Work will include bridging over, and the relocation of numerous railroad tracks, signals, communication, and other railroad facilities. **Attachment ES-B** indicates that all six rail segments are expected to remain in use after the Proposed Conrail Acquisition. Early coordination with Conrail, Norfolk Southern and CSX during the Preliminary Design phase of our project is necessary for its successful completion. In some cases, the railroad involvements are so substantial that the proposed highway alternatives may not be feasible without total commitment for cooperation by the owners of the railroad facilities. We request that this issue be described along with SEA's recommendation for mitigation in **Chapter 5-PA.16 Pennsylvania Area of Concerns**.

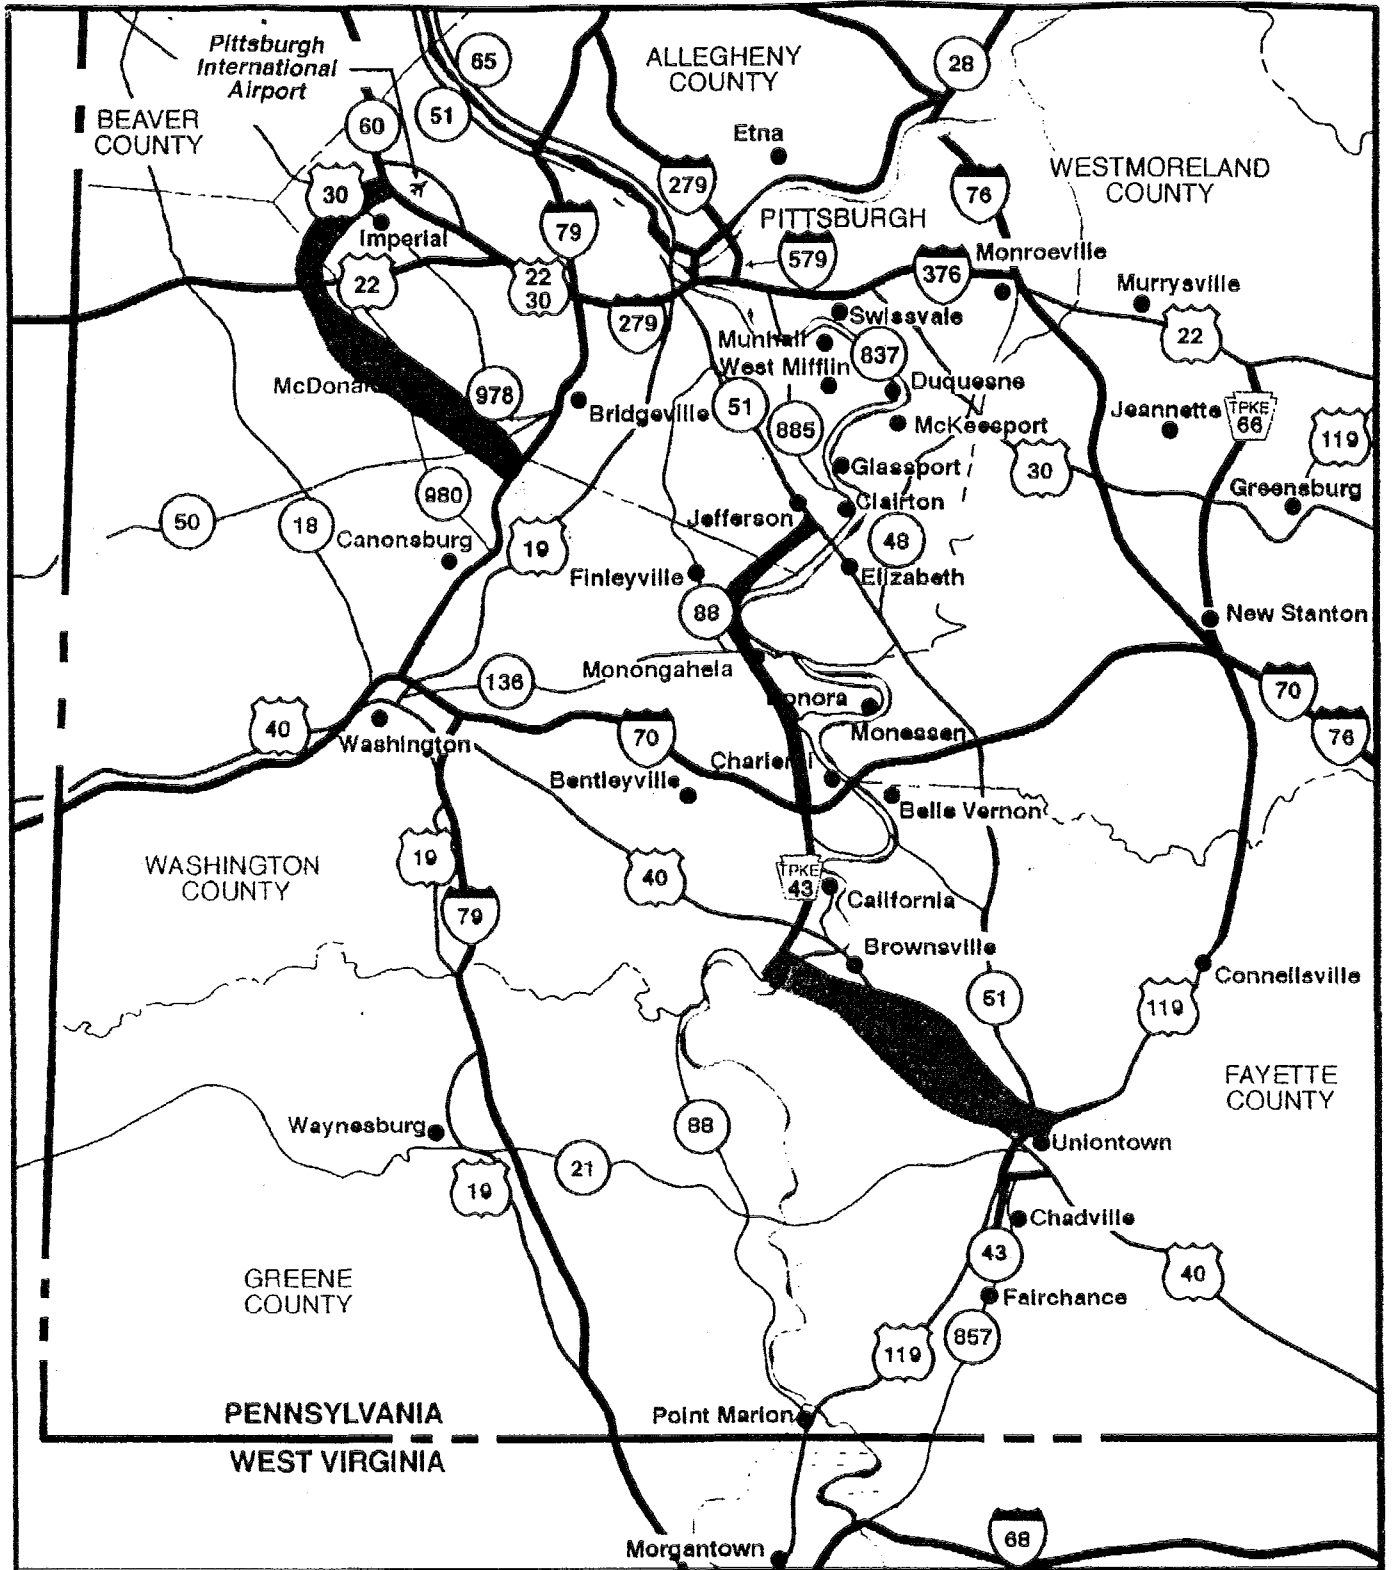

The Turnpike Commission would like to acknowledge that initial coordination with Conrail and Norfolk Southern took place during a meeting on January 20, 1998. In addition, there has been contact between the Turnpike Commission and CSX. While the Turnpike Commission has raised a few of these comments of concern to Conrail, CSX and Norfolk Southern, these issues have not been totally resolved. We request that the SEA consider these issues during their review of State and Agency Comments on the DEIS and their discussion of mitigation measures. The success of the Mon/Fayette Expressway and the improvements to the regional transportation system in Southwestern Pennsylvania which would also support efficient railroad operations, depend on the successful coordination of all parties. If you have any questions regarding the issues we have raised, or require additional information, please call me at (717) 986-9688.

Sincerely,

David E. Zazworsky, P.E.
Special Assistant to the
Turnpike Commissioners

Pennsylvania House Transportation Committee
Honorable Richard A. Geist, Chairman**

**Presented:
October 16, 1997**

**Testimony to the
Pennsylvania House Transportation Committee
Concerning the Acquisition of Conrail
by CSX and Norfolk Southern**

Chairman Geist, and other members of the Pennsylvania House Transportation Committee, I want to thank you for the opportunity to come before your Committee today with testimony concerning the proposed acquisition of Conrail by CSX and Norfolk Southern railroads.

The five-member Pennsylvania Turnpike Commission was created in 1937 with powers to construct, finance, operate and maintain the Pennsylvania Turnpike System. Since opening in 1940 with 160 miles of road, the Turnpike System has been continually growing, building and expanding. Currently, the Turnpike System consists of 506 miles of limited access highways.

In the mid-80's, the Turnpike Commission began an ambitious, multi-billion dollar expansion program. Authorization for these improvements came through three acts of the Pennsylvania General Assembly. In 1985, the General Assembly passed Act 61. This Act, the Turnpike Organization, Expansion and Toll Road Conversion Act, directed the Pennsylvania Turnpike Commission to construct and enhance the existing Turnpike and to expand the toll highway system. In 1991, Act 26 allocated 14 percent of a 55 mill increase of the Oil Company Franchise Tax to the Turnpike Commission which provides approximately \$40 million annually for the construction of Act 61 and Act 26 projects. In 1997, Act 3 provided the Commission with an additional \$28 million per year for Act 61 and Act 26 projects.

Among the projects authorized by these Acts are the Mon/Fayette Expressway and the Southern Beltway projects. Consisting of seven independent projects, the planned improvements stretch from the West Virginia border in the South to I-376 in Pittsburgh to the North, and from Jefferson Borough in the East, to the Pittsburgh International Airport in the West. These seven projects are shown on the attached color-coded map.

These transportation projects will bring much needed highway capacity, congestion relief, and highway access improvements; will stimulate economic development efforts; and will provide employment opportunities for Southwestern Pennsylvania. When all these projects are completed, the Commonwealth will have made a multi-billion dollar investment in the economic prosperity of Southwestern Pennsylvania.

A project critical to making the Mon/Fayette Expressway a reality, and the subject of our concern here today, is the proposed expressway from Route 51 in Jefferson Borough to I-376 in Pittsburgh and Monroeville. This highway will carry the most traffic of all the proposed projects, will provide an expressway alternative around the Squirrel Hill Tunnel, and will be a key component of a potential beltway south of the City of Pittsburgh. Currently, a Draft Environmental Impact Statement is being developed and is scheduled to be circulated in the Spring of 1998.

However, another equally important component of redevelopment and economic vitality for the region is efficient and effective rail service. Both highway and rail facilities are needed to provide the flexibility in transportation options needed for the movement of freight and people in the region. We wish to start working together now with the current or future owners of the railroads so that we can complete this needed improvement to the region's transportation network. This is our prime motivation for appearing before your Committee at this hearing today.

Construction of the Mon/Fayette Expressway from PA 51 to I-376 in Pittsburgh and Monroeville will require the bridging over and relocation of numerous railroad tracks, signals, communications and other railroad facilities. In order for the Pennsylvania Turnpike Commission to proceed toward construction, we need the involvement of the owners of these railroad facilities now during the Environmental Impact Statement and Preliminary Design phase of our project. Usually, final approvals by railroad companies come at the final design stage of a highway project, when very specific engineering details are available. In this particular situation, the railroad relocations are so substantial that some of the highway alternatives may not be feasible without a total commitment of cooperation by the owners of the railroad facilities.

Cooperation, as well as timely coordination, to accommodate rail and highway needs in this severely restricted, narrow corridor is paramount to the achievement of our goals. Without appropriate review and approvals from the railroads during this Environmental Impact Statement phase, the alternative selected may be invalidated, which would cause a significant delay in project development and substantially increase the cost of the proposed transportation improvements.

Our project will have direct effects on Conrail, CSX and Union Railroad tracks and related facilities. Our initial estimate indicates that approximately 10 miles of railroad tracks belonging to Conrail, CSX and Union railroads would have to be relocated. In addition, numerous grade-separated crossings over existing tracks and yards will need to be constructed. This construction can be potentially disruptive to railroad operations if not thoroughly coordinated. These railroad relocations may also affect other facilities located in the railroad right-of-way. I have provided copies of maps that show the general locations where these relocations would be required.

Because of the number of parties involved and the complexity of the issues to be resolved, it is imperative that the Pennsylvania Turnpike Commission get early and full cooperation from the affected railroad companies - especially Conrail, Norfolk Southern and CSX - so that a mutually satisfactory resolution - on a timely basis - can be achieved for both the highway and railroad facilities.

Immediate cooperation is needed so that the Commission can proceed in a timely manner to complete the Environmental Impact Statement and obtain a Record of Decision for this major project. By working through these issues at this time, we can develop an alignment that will mutually accommodate and benefit both transportation modes - highway and rail - and serve the residents and businesses of the Commonwealth of Pennsylvania and our interstate clients.

We have begun the necessary coordination with Conrail, CSX and Union Railroad. We have provided preliminary plans of our project to the Engineering Department of each Railroad. We are concerned that the pending acquisition will limit Conrail's ability and willingness to work with us.

Summary

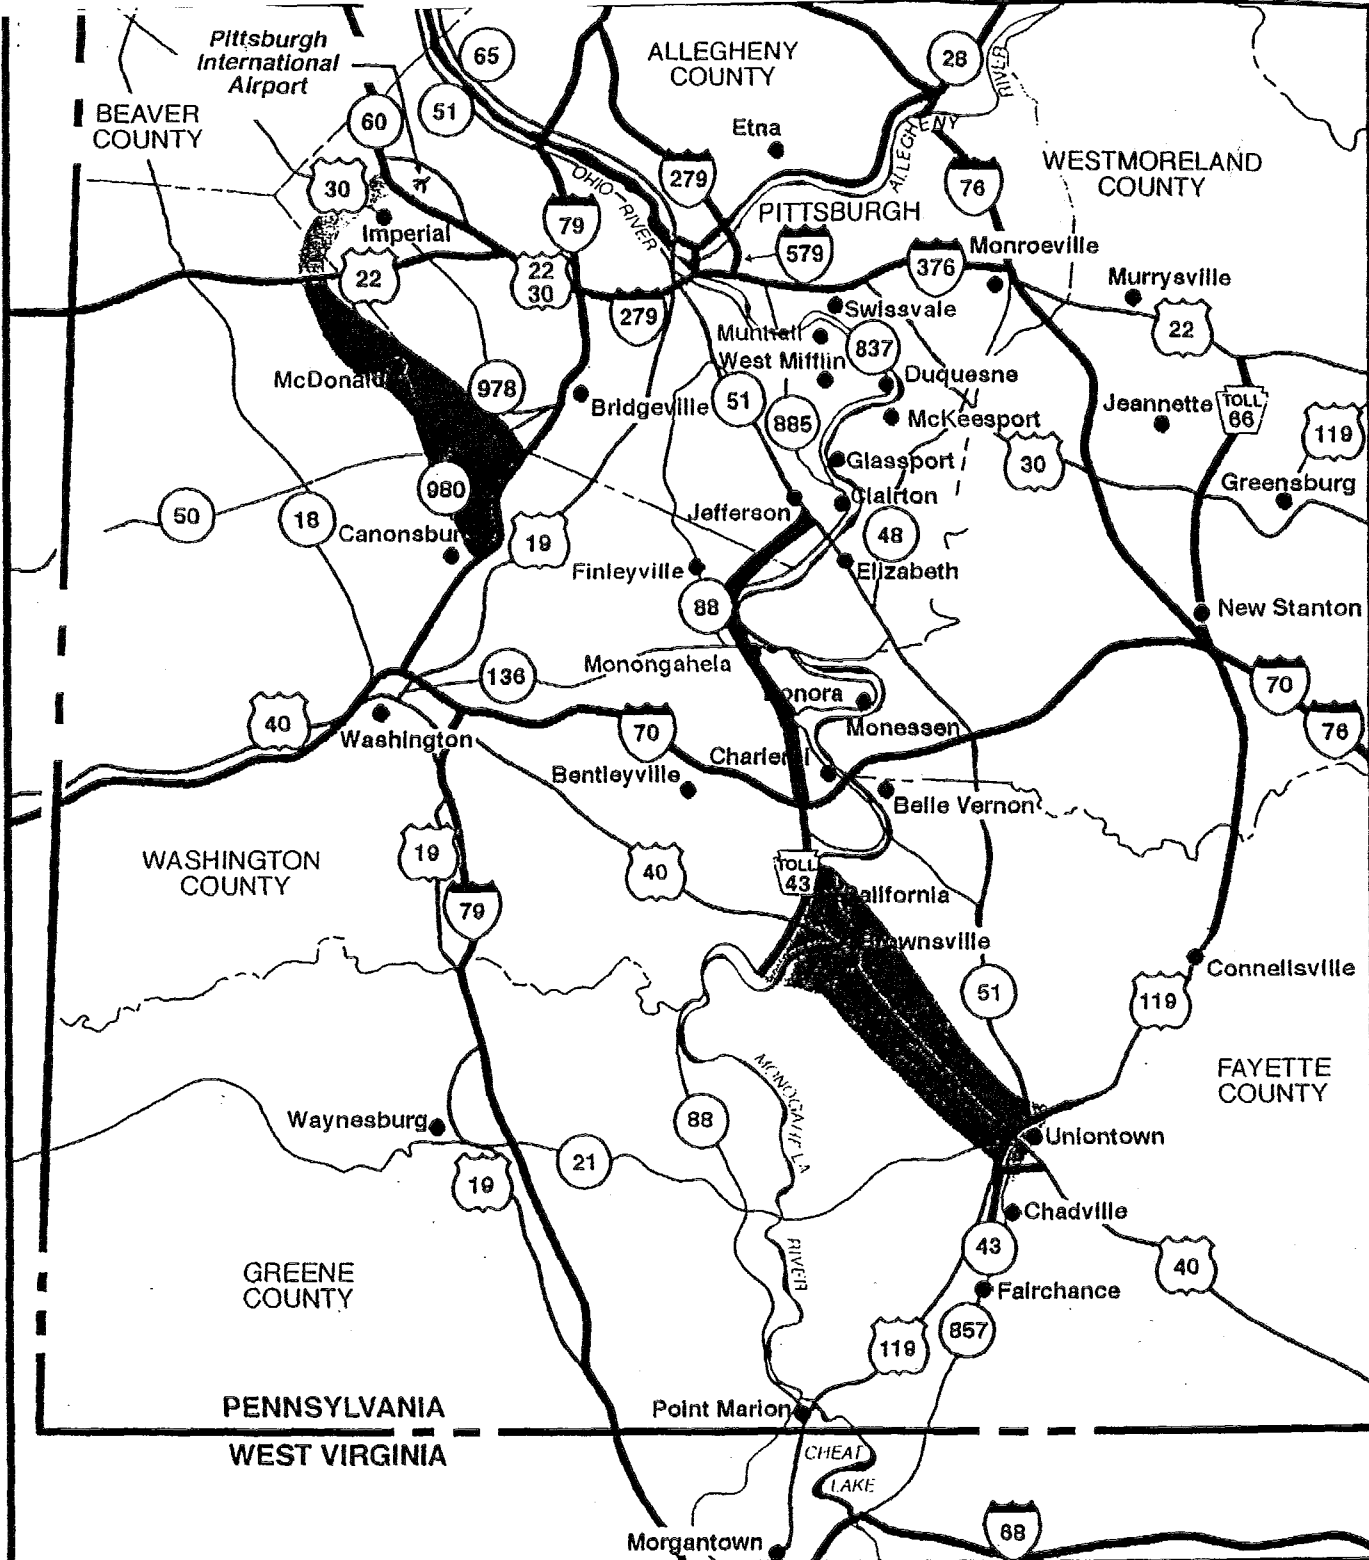

Allow me then to summarize the needs of the Pennsylvania Turnpike Commission related to the effect of the acquisition of Conrail on our plans for the Mon/Fayette Expressway Project from PA 51 in Jefferson Borough to I-376 in Pittsburgh and Monroeville.

1. We need a commitment from Conrail, CSX and Norfolk Southern to coordinate, cooperate and accommodate our highway. Unless we have such a commitment, our plans for a multi-billion dollar investment in the Mon Valley will be significantly delayed.
2. We need to expedite coordination with the current and future owners of the railroad facilities. This coordination must take place prior to completion of our Draft Environmental Impact Statement so that we can be assured of the feasibility of our alternatives.
3. We must be assured that any agreements we make now with Conrail regarding relocation or reconstruction of their facilities will be honored by the eventual owners of these facilities (CSX and Norfolk Southern).
4. We need the timely review and approval of our proposed plans by all appropriate railroad officials, before the sale of Conrail is complete, to avoid delays and attendant increased costs.

5. We would appreciate the support of this Committee before the Surface Transportation Board (formerly the Interstate Commerce Commission) to achieve the four needs I have just enumerated, and to incorporate appropriate conditions in any Surface Transportation Board Order approving the acquisition of Conrail.

Thank you Chairman Geist, for providing the opportunity to testify on behalf of the Pennsylvania Turnpike Commission for this very important project that is extremely important to the future of the City of Pittsburgh and Southwestern Pennsylvania.

**COMMENTS OF THE SOUTHEASTERN PENNSYLVANIA
TRANSPORTATION AUTHORITY TO THE DRAFT ENVIRONMENTAL
IMPACT STATEMENT AND SAFETY INTEGRATION PLANS**

The Southeastern Pennsylvania Transportation Authority ("SEPTA") hereby submits the following comments to the Draft Environmental Impact Statement ("DEIS") prepared by the Surface Transportation Board Section of Environmental Analysis ("SEA") and the Safety Integration Plans ("SIPs") prepared by the Applicants, CSX Corporation ("CSX") and Norfolk Southern ("NS").

I. INTRODUCTION

SEPTA operates an extensive integrated mass transportation system, consisting of trolley, motorbus, subway, elevated and regional commuter rail routes throughout the Philadelphia metropolitan area. SEPTA is a body corporate and politic which exercises the public powers of the Commonwealth of Pennsylvania as an agency and instrumentality thereof. SEPTA's commuter system is conducted pursuant to the Pennsylvania Public Transportation Law, Act 26 of 1991, as amended by Act 4 of 1994, 74 Pa. C.S.A. §§ 1701 et seq. SEPTA operates one of the

oldest and most extensive commuter rail and transit systems in the country. It carries an average of 90,000 passenger trips per day on its Regional Rail Division alone, and provides a significant and essential component of the daily movement of the population of Southeastern Pennsylvania.

SEPTA operates, on a daily basis, over 500 commuter trains in the Philadelphia area and is charged with providing safe, efficient and reliable commuter service to its public transit passengers. SEPTA's regional rail system currently operates in close coordination with significant freight lines which are currently operated by Conrail in the densely populated Philadelphia area. A portion of SEPTA's regional rail system, involving two commuter lines, operates on track segments owned by Conrail, while Conrail's freight operations utilize all or portions of eleven SEPTA commuter lines. SEPTA's operations on lines shared with Conrail are a key component of SEPTA's passenger services.

Pursuant to their Primary Application and Joint Operating Plan, the Applicants propose to each acquire certain of Conrail's trackage rights to operate freight service on lines Conrail currently shares with SEPTA. The Applicants also propose to increase the volume and type of freight traffic on certain lines to be acquired from Conrail to the potential detriment of SEPTA's public transit service. SEPTA is particularly concerned with the impact the proposed Merger and Acquisition ("Acquisition") will have on its ability to provide safe and reliable commuter services and to expand those operations to meet the growing needs of the region. It is of utmost importance that the Applicants provide sufficient information with regard to its proposed post-Acquisition routing of freight traffic in and through Southeastern Pennsylvania to permit assessment of the environmental and safety risks and to allow for appropriate mitigation of any

detrimental safety, environmental or operational impacts. The following comments address factors identified in the DEIS and SIPs which concern SEPTA and pose a threat to SEPTA's current operations and ability to meet the public transit needs of Southeastern Pennsylvania.

II. ROUTING OF LOCAL FREIGHT TRAFFIC TO THE LANSDALE CLUSTER

Of great concern to SEPTA, from both a safety and operational standpoint, is the route by which the Applicants plan to move local freight traffic to the Lansdale Cluster¹ following Acquisition. According to the Joint Operating Plan, freight operations on SEPTA lines centered around Lansdale will be allocated to CSX. Today, Conrail serves that territory from Abrams Yard via the Stoney Creek Branch, yet the Applicants propose to split the allocation of the Stoney Creek Branch between NS and CSX, while Abrams yard, the local yard by which CSX could access the Lansdale Cluster, is to be allocated exclusively to NS. Therefore, the only logical route by which CSX's Lansdale Cluster could be connected to other lines assigned to CSX is through SEPTA's Main Line route via Wayne Junction, where all but two of SEPTA's rail routes and several hundred commuter trains operate on a daily basis. The use of SEPTA's Main Line to route local freight traffic to the Lansdale Cluster is absolutely unacceptable to SEPTA and would undoubtedly cause significant adverse operational, safety and environmental impacts to SEPTA's passenger transit service in the Southeastern Pennsylvania region.

Precisely for the purpose of removing local freight traffic from SEPTA's Main Line and avoiding the associated hazards, Conrail and PADOT extensively renovated the Stoney Creek

¹ Consists of the SEPTA owned lines of the former Reading Railroad in the northern suburbs of Philadelphia.

Branch so that Conrail's local freight traffic could access the Lansdale Cluster via Abrams Yard in Norristown. By proposing to divide the Stoney Creek Branch between the Applicants, while allocating the Lansdale Cluster to CSX and Abrams Yard to NS, the Applicants would appear to revert to using a route which was long ago discontinued by Conrail and would disrupt the present freight and commuter operations in the Southeastern Pennsylvania region.

Despite the significant ramifications of routing freight traffic through SEPTA's heavily utilized Main Line, and altering the present freight operations in the region, the Applicants have completely failed to address this issue in either their operating plans or SIPs. Page 223 of CSX's SIP reads as follows:

Conrail operates over a one-mile SEPTA-owned segment on Norristown, PA. The trackage rights on that segment will be allocated to NS with CSXT also retaining limited overhead trackage rights for dimensional traffic. Conrail also operates local service over several other routes in the Philadelphia area owned by SEPTA, NJT or AMTRAK. These routes would become part of the South Jersey/Philadelphia Shared Assets Area, and thus the safety aspects of operations on those routes will be addressed in the Shared Assets SIP. (emphasis supplied).

This statement by CSX is simply incorrect. Most of the SEPTA-owned lines in the Lansdale Cluster are to be allocated to CSX, not to the Conrail Shared Assets Operations ("CSAO"). In fact, the CSAO SIP neither lists these lines nor addresses the safety or environmental effects of routing traffic to the Lansdale Cluster via SEPTA's Main Line. In addition, NS' SIP exhibits confusion as to SEPTA's concerns with regard to this issue. At page 200, NS states: "The Norristown concern involved SEPTA's perception that CSXT trains, in order to serve the Stoney Creek Branch, would have to execute a reverse movement over tracks shared with SEPTA trains in downtown Norristown." As discussed at Part III. infra, SEPTA is concerned that CSX will

route dimensional, doublestack freight traffic through Norristown using a “wye” movement, but this in no way concerns the issue of CSX’s routing of local freight traffic to the Lansdale Cluster via SEPTA’s Main Line.

Although it is not stated, it may in fact be the Applicants’ intention to in fact route local freight traffic to the Lansdale Cluster from either West Falls or Woodbourne via Abrams Yard. This would require NS to grant CSX overhead trackage rights for local freight destined for the Lansdale Cluster, assuming that NS has any right to assign to CSX, on a non-exclusive basis, without SEPTA’s consent, the rights to operate over SEPTA lines between Norris Interlocking and a portion of SEPTA’s Stoney Creek Branch.² If CSX does not intend to use Abrams Yard, SEPTA asserts that the environmental and safety impacts of the alternative route through SEPTA’s Main Line have not been addressed. A thorough analysis of this issue would yield the conclusion that routing freight traffic through SEPTA’s Main Line is unworkable.

III. ROUTING OF DIMENSIONAL FREIGHT TRAFFIC THROUGH NORRISTOWN, PENNSYLVANIA

According to NS’ Operating Plan, NS proposes to grant CSX permanent overhead trackage rights to operate excess dimensional traffic (which it is assumed could mean doublestack freight trains, as well as multi-level and high-and-wide), including doublestack freight trains, over (1) the Norristown Connector (owned by SEPTA), (2) the track between CP

² In fact, it is unclear whether the Applicants have the ability to assign Conrail’s trackage rights over SEPTA owned lines to both parties simultaneously without SEPTA’s consent. Conrail has maintained that its trackage rights under the 1979 sales agreement are exclusive. For NS and CSX each to retain those rights (or in one instance, potentially NS, CSX and CSAO) belies Conrail’s long-standing argument that the trackage rights over SEPTA-owned lines are exclusive.

River (West Falls) and Abrams, Pennsylvania and (3) Conrail's Morrisville Line between CP-King and Woodburne (CP-Wood), Pennsylvania, plus run-around rights on a short portion of SEPTA's Norristown Line. See NS Operating Plan, volume 3B at page 108. The Applicants provide no information as to the volume and frequency of freight traffic CSX plans to operate pursuant to this grant of permanent trackage rights or the environmental and safety impacts to the Norristown area. At page 4-37 of the DEIS, it is stated that the proposed transaction would have no adverse effect on SEPTA's passenger service on the Norristown, Pennsylvania Connector due to NS' proposed increase of only 2.6 freight trains per day in that area. The DEIS nowhere addresses NS' proposed grant of permanent trackage rights to CSX, the environmental impact of increased doublestack freight traffic in the Norristown area or the potential threat CSX's dimensional freight traffic poses to SEPTA's maintenance of safe and reliable passenger service on its existing Route R6 Norristown Line.

Based on the description of the proposed grant, SEPTA anticipates that CSX dimensional freight traffic will execute a run-around or "wye" movement as it proceeds from West Falls to Abrams (Norris Interlocking) and through to Conrail's Morrisville Line. See SEPTA diagrams A and B. CSX's run-around move will interfere with SEPTA's Route R6 trains for lengthy periods of time, block heavily traveled grade crossings and require the raising of catenary not cleared for dimensional traffic. Moreover, the grant of "permanent" trackage rights to CSX could adversely affect SEPTA's ability to convert its own track and right of way on the Norristown Line to any mode not compatible with CSX's operations. Despite the significance of

this proposed grant to CSX, the Applicants have failed to address the adverse effects likely to flow from increased doublestack freight traffic through the Norristown area.

Operationally, it is anticipated that in order for a CSX doublestack freight train to execute the run-around movement from Abrams (Norris Interlocking), it would likely move slowly backwards through both the trailing point switch at Norris Interlocking and the facing point switch at Island Interlocking, until it reaches the trailing point switch at Bridge Interlocking. At Bridge Interlocking, the CSX train would intercept SEPTA's Route R6 Norristown Line on an electrified single track. On weekdays, SEPTA's Route R6 operates over 50 trains in this area from 5 A.M. to 12:20 P.M., and runs continuously during the peak periods (6:30 A.M. to 9:30 P.M.) and approximately every 30 to 60 minutes during off peak hours. The CSX doublestack train would continue backing from Bridge Interlocking onto the Stoney Creek Branch through Elm Interlocking. Between Bridge Interlocking and Elm Interlocking, there are two heavily used grade crossings at Main Street and Marshall Street and the Route R6 Main Street passenger station. Beyond Elm Interlocking on the Stoney Creek Branch, there are two more grade crossings at Elm Street and Sterigere Street.

Once the CSX doublestack train reaches the Stoney Creek Branch and receives a signal to reverse, it would retrace its path to Bridge Interlocking, once again intercepting SEPTA's Route R6, this time at Elm Interlocking. From Bridge Interlocking, the CSX doublestack train would proceed to Kalb Interlocking using a sharply curved electrified single track used by SEPTA's Route R6 trains. Presently, the catenary lines at Bridge Interlocking are not cleared for movement of doublestack freight traffic, making the track segment from Bridge Interlocking to

Kalb Interlocking inaccessible by doublestack trains. Next, proceeding against the flow of SEPTA's outbound Route R6 trains, the CSX doublestack train would continue through Kalb interlocking for approximately 0.5 miles until it reached Ford Interlocking. At Ford Interlocking, the CSX train would access the Conrail Morrisville Line on a single track connection to the main route to Morrisville. The overhead trackage rights granted to CSX by NS extend to Wood Interlocking on Conrail's Trenton Line, where such dimensional trains would interface with SEPTA's Route R3 West Trenton Line operations.

The movement of CSX doublestack trains from West Falls, through the highly congested Norristown area, to the Morrisville and Trenton Lines, adversely impacts SEPTA's operation of both its Route R6 Norristown and Route R3 West Trenton Lines. Freight traffic in Norristown is limited to a speed of 10 miles per hour. While the CSX doublestack trains make the cumbersome wye and reverse movement from Abrams (Norris Interlocking) to the Stoney Creek Branch, presumably at speeds below 10 miles per hour, they would block SEPTA's Route R6 commuter service. After completing the reverse movement, the CSX doublestack trains, as they make their way to Conrail's Morrisville Line, would again intercept SEPTA's Route R6 at speeds of 10 miles per hour or less, further hindering the safe and reliable service SEPTA currently provides on the Norristown Line.

In addition to the delays likely to result from the wye and reverse movement of long doublestack freight trains on the Norristown Line, SEPTA is fearful that CSX's undisclosed use of the trackage rights to be granted by NS will cause an increase in freight traffic not addressed by the DEIS. The DEIS considers NS' proposed 2.6 train per day increase in freight traffic to be

minimal. However, the proposed increase by NS in combination with CSX's utilization of the trackage rights to be granted by NS, threatens to worsen SEPTA's passenger service and the coordination of freight and transit operations in the already constrained and congested Norristown area. Even if and when NS completes its planned Pattenburg Tunnel Clearance Project, the uncertain impact of CSX's infusion of dimensional freight traffic could serve to diminish or even negate any benefit to be derived on the Norristown Line. Additionally, due to the present growth in passenger demand, SEPTA has plans to increase passenger service on the Norristown Line, and is studying the feasibility of conversion from commuter rail to a more cost effective rail mode. The grant of "permanent" trackage rights to CSX to operate doublestack freight traffic could preclude SEPTA from converting its track to meet the transit needs of the region.

NS' proposed grant of permanent doublestack freight trackage rights to CSX would likely have detrimental effects on SEPTA's Route R3 West Trenton Line as well. CSX's freight traffic which would be routed through Norristown, as discussed above, will meet SEPTA's Route R3 West Trenton Line between Wood Interlocking and Trent Interlocking, presenting a real possibility for delays and unreliable service. In addition, the Pennsylvania Department of Transportation ("PADOT") will renovate I-95 beginning in 2000, in areas currently served by SEPTA's Routes R3 and R7. As part of a mitigation plan, SEPTA's Routes R3 and R7 will serve as an alternate means of travel for drivers displaced by the PADOT renovations. Depending on the volume of freight traffic CSX plans to operate through Norristown and through the Wood and Trent Interlockings, SEPTA's Route R3 West Trenton Line will be faced with

increased freight traffic and possible delays and unreliable passenger service at a time when its ridership is likely to increase dramatically.

NS should be precluded from granting permanent trackage rights which would hinder SEPTA's ability to operate over its own lines in accordance with the needs of the Norristown area. In order to assess properly the environmental, safety and operational consequences of NS' grant of permanent trackage rights to CSX, the Applicants, and in particular CSX, must provide a detailed explanation of their planned freight operations in this region. It is clear that CSX must commit to operating its doublestack freight traffic via the Conrail line it has been assigned, from West Falls to Woodburne. Applicants have failed to determine the adverse impacts to SEPTA should CSX operate their dimensional traffic via Norristown. However, if it is concluded that the impacts to SEPTA are acceptable in the short term (and thus far that has not occurred), then as applicants have demonstrated elsewhere in their plans, a 3 year time period should be ample for CSX to clear its own route between Philadelphia and North Jersey.

IV. DISPATCHING ON LINES TO BE ALLOCATED TO CSX

At page 48 of the CSAO SIP, the Applicants state that under the proposed Acquisition communication in the Shared Assets Area ("SAA") will be enhanced by the consolidation of the dispatching function into a single facility located in Mt. Laurel, New Jersey. Conrail currently dispatches its Philadelphia region rail lines from Mt. Laurel using a number of different dispatching assignments. While the Applicants' proposed change to the dispatching function appears beneficial on its face, it fails to account for the right CSX would have as a successor to

the 1990 Trackage Rights Agreement between Conrail and SEPTA to revoke, upon sixty days notice, the dispatching rights currently held by SEPTA for its Route R8 Fox Chase Line over a 3.5 mile section of the Conrail Trenton Line between Newtown Junction (NX) and Cheltenham Junction Interlockings. Should CSX exercise the right to revoke, the dispatching function would likely move to CSX's central dispatch location in Jacksonville, Florida. Instead of the relatively close dispatching point in Mt. Laurel, where Conrail currently controls the trackage adjacent to SEPTA dispatched territory owned by both SEPTA and Conrail, SEPTA's Route R8 commuter service could be conceivably placed at the mercy of a dispatcher located nearly 900 hundred miles away in the state of Florida.

SEPTA is faced with the same situation between Wood and Trent Interlockings where its Route R3 West Trenton Line, as discussed at Part II. above, interconnects with CSX doublestack traffic emanating from the Norristown area, as well as CSX manifest trains using the Trenton Line. SEPTA currently dispatches this territory, but CSX would have the right to revoke SEPTA's dispatching function and move it to Jacksonville, Florida to the detriment of SEPTA's ability to continue its provision of reliable commuter service. The problems associated with CSX's right to revoke and move the dispatching function are exacerbated by the PADOT's planned renovation of I-95 in areas where SEPTA's Routes R3 West Trenton and R7 Trenton Lines presently operate. As discussed above, SEPTA's Route R3 will become an alternate means of travel for drivers displaced by the PADOT renovations. Therefore, the ridership on SEPTA's Route R3 is expected to greatly increase over the next four years at the same time CSX would have the right to move the dispatching function out of the region. PADOT has committed

over \$57 million to improve facilities on these two lines to handle increased ridership. Specific to SEPTA's Route R3, signal improvements, overnight commuter car storage, station parking expansion and station improvements are funded.

It should be noted that SEPTA and Conrail separated passenger and freight operations along the Trenton Line between Neshaminy Falls and Woodburne. SEPTA believes that similar arrangements can be made between Woodburne and West Trenton, thereby alleviating the potential negative impacts associated with this dispatching function issue.

**V. CUMULATIVE EFFECT ANALYSIS OF THE PROPOSED
ACQUISITION'S IMPACT ON SEPTA'S EXPANSION
OVER THE MORRISVILLE AND HARRISBURG LINES**

As asserted in SEPTA's Comments and Request for Conditions, in order to properly meet the expanding transit service needs of its ridership in the Southeastern Pennsylvania region and beyond, SEPTA is currently studying the feasibility of utilizing a portion of Conrail's Harrisburg Main Line from Norristown to Reading and Conrail's Morrisville Line from Glen Loch to Morrisville. It is identified in the DEIS that a cumulative effects analysis is appropriate to determine whether SEPTA's planned expansion can be carried out in conjunction with the Applicants' increase in freight traffic in Montgomery County. At Table 5-PA-35, it is stated that "Freight traffic may limit potential for passenger service to expand." To mitigate this harm to expanded commuter rail service, it is stated in the DEIS that the SEA has encouraged the Applicants to meet with SEPTA "to ensure that the proposed Acquisition can be accomplished without adversely affecting commuter rail plans." It is respectfully submitted that SEPTA has

met with the Applicants regarding expanded passenger service on the Harrisburg and Morrisville Lines to no avail.

Prior to the proposed Acquisition, SEPTA was in a position to complete its studies of the Harrisburg and Morrisville Lines, obtain funding for the expansion of its commuter rail service and undertake the necessary steps to meet the public need for expanded passenger service to Reading and from Glen Loch to Morrisville. If there is a likelihood, as stated in the DEIS, that the proposed Acquisition will block SEPTA's efforts to expand over the Harrisburg and Morrisville Lines, SEPTA and the commuting public will be detrimentally effected by the proposed Acquisition and SEPTA will be unable to meet the expanding needs of the region. It is clear by the language of the DEIS that the SEA recognizes the need for expansion in the region and seeks to avoid activity by the Applicants that would thwart such expansion. Accordingly, SEPTA requests that the SEA further consider this issue and propose a mitigation measure that will protect SEPTA's ability to expand its commuter rail service over the Harrisburg and Morrisville Lines.

VI. CONRAIL TRAIN DENSITIES

Figure D.6-1 of the DEIS indicates that train densities from Eastwick, Pennsylvania to Marcus Hook, Pennsylvania will undergo a daily increase from 3.0 freight trains to 7.8 freight trains. SEPTA was told verbally by the Applicants that this significant increase is incorrect, but no errata sheet correcting these figures has been provided. If the Applicants do not intend to correct these figures, they would be proposing an increase of over 260% on lines between these

two points. Such an increase is of great significance and has the potential of adversely impacting SEPTA's existing plans to increase the frequency of its Route R1 Airport Line service from 30 minute headways to 20 minute headways.

VII. SIGNIFICANT INCREASES IN ANNUAL HAZARDOUS MATERIAL CAR LOADS ON SEPTA'S ROUTE R8 FOX CHASE LINE

Table 5-PA-8 of the DEIS notes an estimated increase of 15,000 cars per year of hazardous material at Newtown Junction on SEPTA's Route R8 Fox Chase Line. This constitutes a 300% increase in hazardous material cars on SEPTA's Route R8. However, no mitigation measures regarding this potentially adverse impact have been proposed.

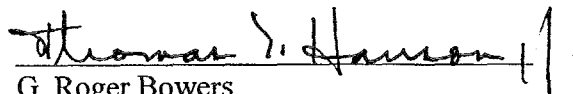

VIII. SEPTA'S 1982 OPERATING AGREEMENT WITH AMTRAK

The last sentence of the fourth paragraph on page PA-20 of the DEIS states: "SEPTA's 1987 operating agreement with AMTRAK expires in 2016." The operating agreement to which this sentence refers is actually SEPTA's 1982 agreement with AMTRAK which remains in effect unless either party provides 120 days notice of termination. The referenced 1987 agreement is the 47 station lease agreement between SEPTA and AMTRAK which expires December 31, 2016.

IX. CONCLUSION

In summary, the conclusion reached at page 4-31 of the DEIS that commuter operations in the Philadelphia metropolitan area would be "unaffected by the proposed Acquisition" is false, due to the incomplete, unclear and unintentionally perhaps incorrect statements of the Applicants. The routing of local freight traffic to the Lansdale Cluster via SEPTA's Main Line, the proposed grant of permanent trackage rights for dimensional freight traffic through Norristown, the negative impacts of moving the dispatching on CSX lines to Jacksonville, Florida and the blocking of SEPTA's planned expansion along the Harrisburg and Morrisville Lines are all issues with significant implications for the future of the Philadelphia metropolitan area. Furthermore, the substantial increases in train densities from Eastwick to Marcus Hook and hazardous waste cars along SEPTA's Route R8 Fox Chase Line pose significant, unexplained threats to SEPTA's operations. Substantial adverse impacts to the Southeastern Pennsylvania region are likely to result from the proposed Acquisition should the Applicants fail to address the issues herein raised and thoroughly analyze and ameliorate their potential adverse effects.

RE: Draft Environmental Impact Statement for Proposed Conrail Acquisition

Dear Ms. Kaiser:

On January 22, 1998 the Tri-County Regional Planning Commission had the opportunity to review the Draft Environmental Impact Statement in STB Finance Docket No.33388 and the Errata sheet. We offer the following comments.

We wish to formally register our exception to the Draft EIS due to the regional method used to treat air quality and intermodal terminal access. These issues should be addressed on a local level to assure compliance with existing air quality and congestion mitigation goals that have been established to meet federal CAAA (1990) and ISTE (1991) requirements. The potential impacts have not been adequately delineated in the DEIS because the regional assessment used is not appropriate for assessing the local and corridor impacts. Additional details of our review and concerns of the DEIS document follow.

With regard to the recommended mitigation to improve safety at Highway/Rail at-grade crossings, we are pleased that those intersections in our area identified under Category A will be improved to a safer status. We continue to point out, as in our earlier correspondence (9/25/97), the Duke St. intersection in Hummelstown Borough, currently under the 5,000 vehicle threshold, is growing due to recent subdivision approvals. The crossing currently has no gate and is controlled by flashing lights only. We encourage additional safety measures be considered at this location. Also, the report does not mention speed limits. Several of our municipalities desired reduction in speed through their jurisdictions.

Section 5-PA.8 Passenger Rail Service fails to indicate under the "Future Services Under Study" subsection, the pending Major Investment Study currently being financed in the Harrisburg

A-586-d

region. The proposed corridor for rail service runs from Carlisle Borough in Cumberland County, through Harrisburg City in Dauphin County, to Lancaster City in Lancaster County. As mentioned previously, we would like the opportunity to have meaningful discussion with the freight operator should the issue present itself in the future.

Based upon our review of the Draft EIS, the issue of the proposed intermodal facility at Rutherford Yard has the largest impact on the area of any acquisition effect. We do not concur with the described traffic flow into the facility. Currently, truck traffic into the Triple Crown Facility has two options as the report indicated. The Rupp Hill Road route while incorrectly delineated was correct as an option. We agree it is a difficult route to negotiate in a tractor trailer. The second route accessing Grayson Road we feel was incorrectly portrayed. Our experience with traffic in that area is that trucks traveling Route 322 in an eastbound direction would bypass the facility, turn left onto Mushroom Hill Road proceed northerly to a left turn on Grayson Road, then backtrack to the facility. Mushroom Hill Road, is in fact the critical path of this travel route. Currently, the Mushroom Hill Road intersection is severely congested due to Big Box retail and strip mall development. An additional 660 truck trips would only further aggravate the existing congestion. We do, however, request the site developer consider the plan previously submitted to Swatara Township by Conrail for a similar facility at the location. By exiting Route 322 eastbound at PenHar Drive and turning right onto PenHar Drive, the proposed entrance would form the fourth leg of a current "T" intersection and allow very easy access to the site, while avoiding altogether the Mushroom Hill intersection and the "serpentine" Rupp Hill Road.

It appears a thorough review of air quality emissions was completed, although as a marginal non-conformity area we would like to see efforts put into mitigating facility emissions instead of reliance upon "Systemwide, the diversion would outweigh the increased emissions from increased rail activity." as a disclaimer. While we agree this is a probable statement, we are obligated to support the health, safety and welfare of all our local constituents and would request local impacts be measured.

The issue of noise has been discussed frequently by our local municipalities. We understand the safety issue involved with horn-blowing and will direct our municipalities to apply for "quiet zone" status once FRA regulations have been put in place.

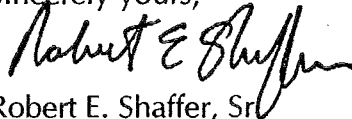

In addition to the factors addressed in this draft EIS, we have other concerns. Cumberland and Perry Counties have active railways that may be impacted by additional rail traffic, yet received very little notation in this document. Most of the municipalities have developed with the rail line in mind and have zoned appropriately. Some have historically benefitted from the railroad's existence, however, the railroad must act in a responsible and even neighborly fashion when traveling through these municipalities. We are concerned also with the maintenance, repair and upgrade of facilities in response to the proposed increased traffic. This especially comes to light with last year's freight derailment on the Rockville bridge and fatal accident in Hummelstown Borough. Please keep these issues in mind when preparing the acquisition agreement.

We further appreciate the effort in mitigating the potential environmental justice impacts in our Harrisburg-Rutherford area. We offer our assistance in alleviating this situation.

While much effort has been put into the preparation of the Draft EIS and review, and the analysis of the situation is ongoing, the materials in the Draft EIS concerning air quality and highway traffic impacts do not accurately reflect the conditions and should be revised before local concurrence can be given. Further, comments provided locally relating to the Rutherford Intermodal facility appear to contradict materials contained in the DEIS. A full disclosure on the Rutherford and/or Harrisburg sites is needed prior to assessing the impact on the local environment and a specific written clarification of proposed action is requested. Additional facts and analyses need to be acquired and completed so that proposed future changes to the highway infrastructure and traffic flow/mode split can be properly evaluated. Currently, this is not possible using the information within the Draft EIS.

Given our analysis of the Draft EIS for the proposed Conrail Acquisition, we formally withhold our agreement with the program as presented pending receipt of additional details and clarifying analyses of the issues as stated above. We thank you for the opportunity to review this document and express our local concerns. Should there be any questions concerning this review please contact, Tim Reardon, Associate Executive Director, at the staff office. We look forward to working with the eventual operators in our area on common issues.

Sincerely yours,

Robert E. Shaffer, Sr.

SECTION OF ENVIRONMENTAL ANALYSIS

ENVIRONMENTAL
DOCUMENT

DEAR MS. KAISER:

AFTER REVIEWING THE ENTIRE DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS) ON THE PROPOSED ACQUISITION OF CONRAIL BY NORFOLK SOUTHERN RAILROAD AND CSX RAILROAD, PERSONALLY I CAN SEE NO REASON WHY THE SURFACE TRANSPORTATION BOARD SHOULD NOT APPROVE THE PROPOSED CONRAIL ACQUISITION.

THE PENDING APPROVAL OF THE CONRAIL ACQUISITION BY THE SECTION OF ENVIRONMENTAL ANALYSIS (SEA) WOULD PROVIDE A MORE EFFICIENT RAIL TRANSPORTATION SYSTEM IN THE EASTERN UNITED STATES AND WOULD INCREASE RAIL COMPETITION IN THE NORTHEAST, IT WOULD ALSO HAVE ENVIRONMENTAL AND SAFETY BENEFITS BY REDUCTIONS IN FUEL CONSUMPTION, AIR POLLUTANT EMISSIONS, AND THE NUMBER OF TRACTOR TRAILER TRUCKS THAT TRAVEL OUR INTERSTATE HIGHWAY SYSTEM.

AGAIN, IN RESPONSE TO REVIEWING THE DRAFT (EIS), I'M 100 PER-CENT IN FAVOR OF (SEA) APPROVING THE ACQUISITION OF CONRAIL BY NORFOLK SOUTHERN RAILROAD AND CSX RAILROAD

SINCERELY YOURS,
Richard H. Moffitt

**COMMENTS OF THE SOUTHEASTERN PENNSYLVANIA
TRANSPORTATION AUTHORITY TO THE DRAFT ENVIRONMENTAL
IMPACT STATEMENT AND SAFETY INTEGRATION PLANS**

The Southeastern Pennsylvania Transportation Authority ("SEPTA") hereby submits Part
X of its comments on the Draft Environmental Impact Statement ("DEIS") prepared by the
Surface Transportation Board Section of Environmental Analysis ("SEA") and the Safety
Integration Plans ("SIPs") prepared by the Applicants, CSX Corporation ("CSX") and Norfolk
Southern ("NS").

X. TIME SPACING BETWEEN FREIGHT AND PASSENGER TRAINS

According to pages 4-12 and 4-13 of Volume 1 of the DEIS, the SEA has proposed
greater time spacing between freight and passenger trains as a safety measure on nine rail line
segments situated in the states of Georgia, Maryland, Michigan, New York, North Carolina,
Indiana, Virginia and the District of Columbia. A more detailed description of the time spacing
is provided at page 7-12 of Volume 4, where it is stated that "... trains moving in the same or
opposite direction on the same track would be clear of the track at least 15 minutes before and 15

minutes after the expected arrival of a passenger train at any point.” To propose time spacing on train segments or territories already protected by signals is totally contrary to accepted safety practices. The signals regulate the flow of rail traffic on signalized lines and properly maintain safety for passenger trains. SEPTA asserts that there is no need for the proposed time spacing, and objects to this mitigation measure to avoid the imposition of time spacing on SEPTA’s current or future signalized lines or any lines over which SEPTA operates.

Respectfully submitted,

G. Roger Bowers

**ENVIRONMENTAL
 DOCUMENT**

Dear Ms. Morgan:

As Chairman of the Pennsylvania Emergency Management Council and the State Emergency Response Commission, I write to comment on the proposed merger between Norfolk Southern and Conrail. It is important that the concerns of the emergency services community and the Commonwealth be provided to your Board for inclusion in the final environmental impact report.

For many years the Local Emergency Planning Committee's (LEPC) in Pennsylvania have enjoyed a productive relationship with Conrail's Local Hazardous Materials Field Staff. These dedicated local Conrail employees have provided valuable assistance and expertise to our hazardous materials responders and emergency management officials.

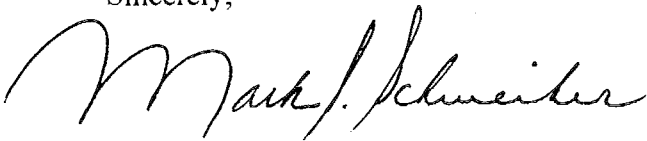

I have been informed that, as Norfolk Southern is currently organized, such locally-based hazmat staff people do not exist. ***It is important that a continuity of service be provided in this specialized area. Hazardous materials teams must continue to be an important part of effective emergency response after the merger is finalized.*** Environmental issues surrounding a potential accident on the rail lines have immediate and long-term impact on the environment and the citizens of the affected areas. Concerns regarding the potential loss of this resource exist in many counties in Pennsylvania and specifically in Pittsburgh where main rail lines run through the heart of the business and residential districts. These individuals also provide planning that addresses mitigation efforts already in place with Conrail.

Page Two, Linda J. Morgan

On behalf of the Council and the Commission I would respectfully request that you include in your final report a requirement for this valuable, system-wide safety resource to be continued following the merger. In this way we, in partnership with Norfolk Southern, can continue to provide the outstanding level of hazmat service and expertise to the citizens of the Commonwealth.

If you have further questions regarding this request, you can contact my office at (717) 787-3300. I appreciate your efforts in this matter and look forward to a successful resolution to this issue.

Sincerely,

Ms. Elaine K. Kaiser, Chief
Section of Environmental Analysis
Surface Transportation Board
1925 K Street, NW
Washington, DC 20423-0001

Dear Ms. Kaiser,

Thank you for the opportunity to review the Draft Environmental Impact Statement (DEIS) for the proposed Conrail Acquisition. Please see our comments below:

General Comments

As stated in the DEIS document, the major adverse environmental impacts occurring from the operational changes pursuant to the acquisition, such as the resulting increases or decreases in train traffic on line segments, appear to be minimal. The Department views more significant impacts may result from site specific abandonments, modifications and new construction. The amount of specific detail concerning such developments as related to Pennsylvania operations is not included in the DEIS. An adequate level of detail for new modifications and construction is necessary in order to understand the full impacts of the acquisition.

Conrail's facilities have been in operation for many years, during which waste material handling practices likely would not be deemed acceptable by today's standards. Indeed, past Department investigations have found contamination, and we expect more investigations will be carried out in the future. Hence, any future construction projects at existing Conrail facilities where fueling, maintenance or related operations have occurred should incorporate investigations for contamination.

Specific Comment

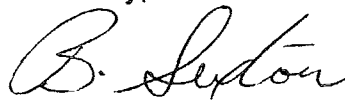

Section 3-15.3 outlines mitigation strategies which are consistent with DEP's regulatory process. We encourage the continued focus on implementing mitigation strategies which incorporate the use of best available technologies in order to remain consistent with the Department's strategies. We will look forward to reviewing the analysis methods and mitigation strategies in the Final Environmental Impact Statement (FEIS) upon completion.

Subject: Draft EIS for Proposed Conrail Acquisition, Docket # 33388

Dear Ms. Kaiser:

The City of Harrisburg hereby submits supplemental comments to those previously provided on January 20, 1998 by the City Engineer, Joseph Link. The draft EIS (Chapter 5-PA) identifies two proposed actions that the developer would take in the Harrisburg area. The EIS states that NS would close the existing conventional intermodal facility in the City of Harrisburg and relocate this facility adjacent to the Conrail Triple Crown Service facility in Rutherford Heights. This relocation would result in an additional 660 truck trips per day on local roads such as Mushroom Hill and Grayson Rd. that are either poor truck routes or are already severely congested due to existing development. The EIS also states that half of the additional truck traffic will use Interstate 283 and the other half Interstate 83. All additional truck traffic is expected to use Rt 322.

Interstates 83 and 283 and US Rt. 322 are the most heavily traveled routes leading into, through, and out of the City of Harrisburg. The additional 660 trucks per day will only aggravate the situation. As the largest municipality in the region, City residents, commuters, and businesses are likely to bear a significant portion of the adverse impacts resulting from the proposed changes. When mitigation measures are considered, including the locations for investment activities, jobs, and other potential benefits, the City of Harrisburg should be a focal point for such activity.

Thank you for the opportunity to comment.

Sincerely yours,

Daniel R. Lispi,
Project Director

**SUMNER
COUNTY**

Gallatin
Goodlettsville
Hendersonville
Portland

In a letter dated August 4, 1997, the Nashville Area Metropolitan Planning Organization (MPO) responded to a Request for Comments on the Proposed EIS regarding the Proposed Acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad.

In summary, our office expressed concern with the following EIS topics: air quality, the potential for passenger rail service, and safety.

In January 1998, the Nashville Area MPO received copies of the Draft EIS. In review of the Draft EIS, the following points of clarification and comments are provided:

**WILLIAMSON
COUNTY**

Brentwood
Franklin

- Page TN-14 of "Proposed Conrail Acquisition", Draft Environmental Impact Statement, Volume 3B, the following statement is made: "EPA has designated Davidson County as a nonattainment area for particulate matter, and a maintenance area for O3."

Davidson County is in fact *attainment* for particulate matter, and should be so noted in your analysis.

**WILSON
COUNTY**

Lebanon
Mt. Juliet

- Table 5-TN-7 (revised) *Tennessee Highway/Rail At-Grade Crossing Vehicle Delay and Queues* of the Draft Environmental Impact

Statement Supplemental Errata identifies train speeds at five at-grade crossings in Davidson County as follows:

Craighead Rd.	40 mph
Berry Rd.	40 mph
Davidson Rd.	40 mph
Thompson Ln.	50 mph
Una-Antioch Pike	50 mph

According to the Charter of the Metropolitan Government of Nashville and Davidson County, Title 12, Chapter 12.76, Section 12.76.20 *Speeds for Railroad Trains* and information provided by the Chief Traffic Engineer for Nashville-Davidson County, the maximum allowable train speeds at these locations are as follows:

Craighead Rd.	35 mph
Berry Rd.	35 mph
Davidson Rd.	35 mph
Thompson Ln.	40 mph
Una-Antioch Pike	45 mph

Due to the fact that these speeds are slower than those indicated in the aforementioned table, we request they be used to recalculate the vehicle delay and queues at highway/rail at-grade crossings as well as the respective Levels of Service for each roadway.

Again, thank you for the opportunity to comment on the Draft EIS. Should you have any questions or comments, please do not hesitate to contact me at 615/862-7215.

Sincerely,

Paige L. Watson

Re: Finance Docket No 33388
CSX & Norfolk Southern -- Control & Acquisition
Conraid

Dear Ms. Kaiser:

We have received a delivery of the volumes of the Draft EIS relative to the reference docket, correct in accord with the subsequent notice letter of December 19, 1997, clarifying: 1) dates of the procedural schedule; and 2) arrangement of the volumes compiling the Draft EIS.

Our interest in the Draft EIS and the overall action that our region should at least be maintained with the level of services and access to rail line that we now have. We would not want the control and acquisition action to result in any additional filings for abandonment's' by the rail company serving our region.

We appreciate this opportunity to comment on the Draft EIS. If we have additional comments we are aware that they must be delivered on or before February 2, 1998.

Re: Proposed Conrail Acquisition

Dear Ms. Kaiser:

The Department of Conservation and Recreation (DCR) has searched its Biological and Conservation Data System (BCD) for occurrences of natural heritage resources from the project area. Natural heritage resources are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, and significant geologic formations.

DCR has reviewed the Draft Environmental Impact Statement (DEIS) for the acquisition of Conrail by Norfolk and Southern and CSX. Based on the information contained in the DEIS it appears that the Virginia portion of this project involves increased traffic on several existing lines. We do not anticipate that the increase in traffic along existing lines will adversely affect natural heritage resources.

We understand that no new connections or intermodal facilities are currently proposed in Virginia. However, DCR would appreciate the opportunity to review any site-specific expansions or new rail lines that are proposed in the future.

Thank you for the opportunity to comment on this project.

Sincerely yours,

A handwritten signature in cursive that reads "John R. Davy, Jr." followed by a date "1/20/98".

John R. Davy, Jr.

/jeg

**A RESOLUTION OF THE
WARREN COUNTY BOARD OF SUPERVISORS
RE: FINANCE DOCKET NO. 33388 – PROPOSED ACQUISITION OF CONRAIL BY
NORFOLK SOUTHERN RAILROAD AND CSX RAILROAD: DRAFT
ENVIRONMENTAL IMPACT STATEMENT**

Whereas, Warren County, Virginia is currently served by the Norfolk-Southern Railway; and

Whereas, in the last decade, this community has experienced a significant increase in rail traffic as a result of express freight traffic on the line from Riverton Junction to Manassas; and

Whereas, the citizens of Warren County have experienced impacts due to noise, air quality and significant traffic conflicts at grade crossings during this period; and

Whereas, industrial development in the county, including the Virginia Inland Port, has occurred because of the availability of local rail service, but has not been the main cause of traffic increases; and

Whereas, the Environmental Report received July, 1997 projected changes in the three major rail segments centered on Riverton Junction in Front Royal – north toward Harrisburg a 77% increase from 11.1 to 19 trains per day; south to Roanoke, a 210% increase from 3.9 to 12.3 trains per day; and east to Manassas, a 22% reduction from 11.3 to 8.8 trains per day, and

Whereas, the Draft Environmental Impact Statement dated December 12, 1997 concludes there is only minimal impact for air quality, noise, grade crossing conflicts and accidents for Warren County, despite the fact that air quality and noise impacts exceeded the Surface Transportation Board's thresholds; and

Whereas, the train traffic projections are highly speculative given the strategic location of Riverton Junction for east coast and Midwestern rail traffic and high probability of increased freight through traffic, and

Whereas, the citizens of Warren County are already coping with the current increases in through traffic as previously noted,

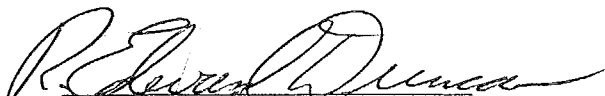

NOW, THEREFORE, BE IT RESOLVED the Warren County Board of Supervisors petitions the Surface Transportation Board to consider the high probability of more significant environmental impacts on this, community due to the proposed acquisition; and

BE IT FINALLY RESOLVED that the Final Environmental Impact Statement include a requirement for a five year review period from the effective date of the final decision for the assessment of environmental impacts and remediation options.

Washington, DC 20423-0001

RE: Draft Environmental Impact Statement
"Proposed Conrail Acquisition"

Dear Sir or Madam:

I am writing on behalf of the Council of the Town of Ashland, Virginia. We have reviewed the Draft Environmental Impact Statement ("EIS") for the Proposed Conrail Acquisition and have the following comments:

1. The analysis of passenger rail service does not show Ashland among those localities with AMTRAK service (Volume 3-B, Page VA-14), although we currently have eight passenger trains with regular stops in Ashland. The Town of Ashland has long been a strong supporter of AMTRAK services and ridership at this stop has increased significantly over the past several years. We believe that the acquisition of Conrail should not, in any way, impede the continued potential for growth of AMTRAK services in this area. This is a concern in view of the projected increase in length of freight trains.
2. England Street in Ashland (identified as England Street in Hanover County, on Segment No. C-102 on Table 5-VA-7 (Revised)) is the major east-west roadway in this area. This major highway carries a significant amount of traffic within the community and provides a critical transportation link to western Hanover. It appears that the EIS uses erroneous information with regard to the present condition at England Street and therefore does not provide an accurate picture of the effect of the Conrail

acquisition. It is understood that the Supplemental Errata dated January 21, 1998 shows a reduction in the Average Delay per Vehicle (and thereby improved Levels of Service) in both Pre-Acquisition and Post-Acquisition conditions. However, the Table still shows a vehicle count (ADT) of 7,775 at the England Street crossing. Two traffic counts from the Virginia Department of Transportation taken within three blocks in either direction from the tracks in 1995 show daily volumes of 9,654 and 16,549 vehicles. Given the road network in the area, the higher number is probably the more accurate reflection of crossings at the tracks. We believe that the actual vehicle count at the England Street crossing is therefore at least twenty-four percent and as much as two hundred thirteen percent higher than indicated in the EIS. The EIS also shows train speeds at this point of 50 mile per hour when they are, in fact, either 35 or 45 mph depending on the time of day. Additionally, in a letter to the Town in 1997, CSX made a commitment to maintain these speeds through Ashland "...for the foreseeable future". Based on the erroneous information, the Average Delay ("ADV") is calculated to be 3.35 minutes Pre-Acquisition (4.9 minutes Post-Acquisition) and a Level of Service for crossing vehicles of A for both Pre- and Post-Acquisition conditions. We believe that using more accurate data for this location may reduce the Level of Service to unacceptable levels.

The narrative indicates "...a minimal increase in crossing delay per stopped vehicle... The maximum queue would increase by one vehicle." (Volume 3-B, Page VA-17) However, given the erroneous information previously cited, this determination may also be incorrect. Further, the "Post Acquisition" condition shows an ADV of 4.9 minutes, an increase of 1.55 minutes, or 46.3% if the formula were based on correct information.

3. The EIS does not make any provision for emergency vehicle response or the unique circumstances resulting from extended crossing delays. (Volume 1, Page 4-44) A fire station and rescue squad are located one block away from the railroad crossing. There are no other responders within many miles of the crossing. High occupancy college dormitories are located across the tracks from the two stations. "Average delays" for emergency vehicles in excess of five minutes (and more for those actually stopped for trains) may endanger lives and property in the Ashland area.

4. The land use adjacent to the railroad tracks in Ashland includes the historic downtown business district. The railroad tracks are immediately adjacent to Railroad

Avenue at grade level, meaning vehicles drive parallel to and within five feet of the train tracks. The Ashland downtown is part of the national historic register. The sidewalks and stores along Railroad Avenue in the downtown shopping district are within thirty feet of the railroad tracks. The increase in the length and number of trains as the result of the Acquisition and the high levels of human occupancy within very close proximity of the tracks pose an increasing potential danger to the Ashland community.

5. Finally, it appears that the table showing Highway-Rail At Grade Crossing Accident frequency for the CSX rail segments has been omitted from the report. Table 5-VA-4 does show data for Norfolk Southern rail segments in Virginia.

The Town of Ashland was founded by the Richmond, Fredericksburg and Potomac Railroad in the mid-1800s. The community has long associated itself with the railroad which runs through its very center. However, the Town is concerned about the potential adverse effects of the proposed acquisition of Conrail on the Ashland community, particularly in terms of potential increased AMTRAK service, increased traffic delays, emergency response time and increased potential danger to the historic downtown. We would request that you revise the EIS to reflect the erroneous data described above. Further evaluation of the other effects of the merger on Ashland appears warranted. Specifically, the Town requests that the Surface Transportation Board:

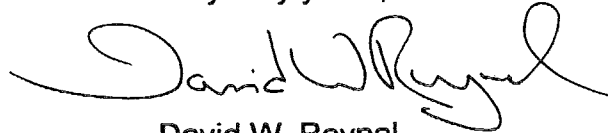

a. Correct the EIS to show Ashland as an AMTRAK stop, correct the train speed to 35/45 mph and recalculate the formula with the higher traffic volumes for Route 54. If the level of service of traffic on England Street deteriorates to an unsatisfactory level, provide some form of mitigation to the thousands of motorists who use this road, including possibly the construction of grade-separated crossings on alternative crossing routes. Grade separation on Route 54 in the middle of the historic downtown would be highly inappropriate.

b. Provide a special review of the unique circumstances in Ashland, in light of the erroneous data, the increase in delays, the impact on emergency vehicle crossings, and the high level of human occupancy immediately adjacent to railroad tracks in downtown and determine whether other means of mitigation are appropriate.

To Whom It May Concern:

The Commonwealth of Virginia has reviewed the Draft Environmental Impact Statement developed by the Section of Environmental Analysis which concerns the proposed acquisition of Conrail by Norfolk Southern and CSX.

In accordance with the Section of Environmental Analysis' letter dated December 12, 1997, we are attaching the original and ten copies of our specific comments. These comments include an update of the information concerning one crossing.

Thank you for the opportunity to comment on the draft.

Sincerely,

Leo Bevon

Attention: Elaine K. Kaiser

Environmental Filing

Commonwealth of Virginia
Comments
Draft Environmental Impact Statement
STB Finance Docket No. 33388

1. Clarke County, 5-VA.6.1, Pg. VA-10 – The report indicates that there is a significant affect at the crossing of Route 7. It recommends (Table 5-VA-5, Pg. VA-12) that four – quad gates or median barriers be installed. The present crossing has lights and gates and a new rubber surface. When other crossings which have more highway traffic and higher train speeds are compared, it does not appear that four quad gates are required. The Department is planning to review all the crossings to identify the needs or changes in priorities.
2. Warren County, 5-VA.6.1, Pg. VA-11 – Flashing lights and gates are scheduled to be installed. This is Route 658, DOT 468-6345.
3. Page County, Table 5-VA-13, Pg. VA-23 – This table does not include a line for truck diversions. Mr. Mark Wollschlager explained that the diversions would be from Interstate 81 and that route is not located in Page County. While this is true, I-81 does lie in the valley between the two mountain ranges and it would appear that there would be some positive affect caused by the diversions.
4. Track clearance, Pg. ES-17, Chapter 7; Pg. 7-12 – It is stated that SEA intends to recommend that all trains moving in the same or opposite directions on the same track would be clear of the track at least 15 minutes before and 15 minutes after the expected arrival of a passenger train at any point. The Commonwealth has been advised that this is not present day practice. It is anticipated that this would reduce the capacity of the line. Future improvements will allow the trains to switch to parallel tracks; however, this work will not be completed in the near future. More information is needed on what the writers desire to achieve, and if other options can be used. It is suggested that this recommendation be given more study, before final actions are taken.

Tom Christoffel, Executive Director
Lord Fairfax Planning District Commission
103 East Sixth Street
Front Royal, Virginia 22630

Dear Tom:

Please find enclosed the Resolution regarding the CSX & Norfolk Southern Control/Environmental Impact which the Town Council adopted in their January meeting.

Should you have any questions or if we can be of any further assistance in this matter, please do not hesitate to contact us.

Sincerely,

A handwritten signature in cursive script that reads 'Martha M. Graves'.

Martha M. Graves
Town Manager

Enclosure

RESOLUTION

WHEREAS, in the Lord Fairfax Planning District, Virginia's Northern Shenandoah Valley, Clarke County and the Towns of Berryville and Boyce; Warren County and the Town of Front Royal; Page County and the Towns of Luray, Shenandoah and Stanley; and Shenandoah County and the Towns of Toms Brook, Woodstock, Edinburg and Mt. Jackson have Norfolk-Southern Railway access; and Frederick County and the Towns of Middletown and Stephens City, and City of Winchester are served by CSX; and

WHEREAS, in the last fifteen years, the Northern Shenandoah Valley has emerged as a multimodal transportation hub with telecommunications infrastructure, these being key factors in local economic development promotion; and

WHEREAS, Warren County and the Town of Front Royal have experience a significant increase in rail traffic as a result of express freight traffic on the line from Riverton Junction to Manassas with citizens experiencing impacts due to noise, air quality and significant traffic conflicts at grade crossings during this period; and

WHEREAS, industrial development in the region, including the Virginia Inland Port, has occurred because of the availability of local rail service, but has not been the main cause of traffic increases; and

WHEREAS, the DRAFT ENVIRONMENTAL IMPACT STATEMENT concludes there is only minimal impact for air quality, noise, grade crossing conflicts and accidents for areas of the region, despite the fact that air quality and noise impacts exceeded the Surface Transportation Board's thresholds; and

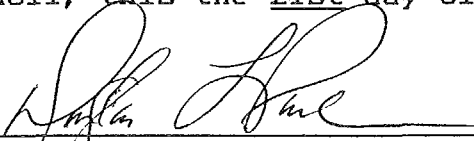

WHEREAS, the train traffic projections are highly speculative given the strategic location of Riverton Junction for east coast and Midwestern rail traffic and high probability of increased freight through traffic, and

WHEREAS, significant through traffic may interfere with local service to industry and efforts to expand local service for existing and new users, including passenger rail for Civil War Battlefield tourism, and therefore the economic base of the region:

NOW THEREFORE BE IT RESOLVED THAT the Lord Fairfax Planning District Commission petition the Surface Transportation Board to consider the high probability of more significant environmental impacts on this region and its communities due to increases in rail traffic volume as a result of the proposed acquisition; and

BE IT FURTHER RESOLVED that the Final Environmental Impact Statement include a requirement for a five year review period from the effective date of the final decision for the assessment of environmental impacts and remediation options.

Adopted by the Stanley Town Council, this the 21st day of January, 1998.

Douglas L. Purdham, Mayor

Section of Environmental Analysis

Re: Draft Environmental Impact Statement
for the Proposed Conrail Acquisition

Dear Ms. Kaiser:

The City of Lynchburg appreciates the opportunity to comment on the Draft Environmental Impact Statement ("EIS") relating to the proposed Conrail acquisition.

The City is particularly interested in the potential impact of the proposed Conrail acquisition because rail transportation is vital to our region. Unlike most regions of its size, the Lynchburg area is not served by an interstate highway. Therefore, the region is heavily dependent on both the Norfolk Southern and CSX rail lines for its transportation needs. **We would strongly oppose any aspect of the proposed merger that would lead to reduced rail traffic through Lynchburg.**

Although we have carefully reviewed the draft EIS, we have not been able to conclude with certainty that the proposed merger will not adversely affect rail service to Lynchburg. The draft EIS's narrative discussion of the proposed acquisition suggests that the Lynchburg area will not be affected. However, the "Emissions Changes for Rail Yards" chart at Attachment E-5 of Appendix E indicates that

International
City
Management
Association

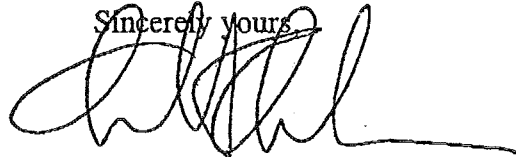

Ms. Elaine K. Kaiser
January 29, 1998
Page 2

the acquisition would lead to a substantial reduction in rail cars traveling through Lynchburg. (See, the sixth column, "Activity Change" and reference to a 3,402 rail car reduction).

We request a clarification regarding the impact of the proposed acquisition on rail service to Lynchburg before the EIS is finalized. Again, we would be opposed to the acquisition if it would lead to reduced rail traffic through Lynchburg.

If you have any questions about the above, please feel free to contact me or Terry Reid at (804) 847-1360. Thank you again for the opportunity to comment. I look forward to your response.

Re: Your letter dated December 12, 1997 - Draft Environmental Impact Statement (EIS) on the proposed acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad - Submission of Comments by Resolution

Dear Ms. Kaiser:

The Lord Fairfax Planning District Commission's Transportation Planning Technical Committee met to review the Draft Environmental Impact Statement. The concerns of the region, relative to the environmental impacts, are that they can not all be accurately predicted at this time and therefore it is requested that the Final Environmental Impact Statement include a requirement for a five year review period from the effective date of the final decision for the assessment of environmental impacts and remediation options. This is set out in the enclosed resolution.

Sincerely

Thomas J. Christoffel
Executive Director

Dear Ms. Kaiser,

The Front Royal Town Council, during its regular meeting held January 26, 1998, voted to adopt a resolution pertaining to Finance Docket #33388 regarding the CSX and Norfolk Southern Control and Acquisition of Conrail Draft Environmental Impact Statement. I have enclosed the original, plus ten copies, of the resolution for your consideration.

Very truly yours,

Rhonda S. North, CMC/AEE
Clerk of Council

RSN\

cc: Director of Planning

R E S O L U T I O N
REGARDING FINANCE DOCKET NO. 333889
CSX AND NORFOLK SOUTHERN
CONTROL AND ACQUISITION OF CONTRACTS
DRAFT ENVIRONMENTAL IMPACT STATEMENT

WHEREAS, the Town of Front Royal, Virginia and Warren County are currently served by the Norfolk-Southern Railway; and,

WHEREAS, in the last decade, this community has experienced a significant increase in rail traffic as a result of express freight traffic on the line from Riverton Junction to Manassas; and,

WHEREAS, the citizens of the Town of Front Royal and Warren County have experienced impacts due to noise, air quality and significant traffic conflicts at grade crossings during this period; and,

WHEREAS, industrial development in the County, including the Virginia Inland Port, has occurred because of the availability of local rail service, but has not been the main cause of traffic increases; and,

WHEREAS, the Environmental Report received July 1997 projected changes in the three major rail segments centered on Riverton Junction in Front Royal – north toward Harrisburg, a 77% increase from 11.1 to 19.6 trains per day; south to Roanoke, a 210% increase from 3.9 to 12.3 trains per day; and east to Manassas, a 22% reduction from 11.3 to 8.8 trains per day; and,

WHEREAS, the Draft Environmental Impact Statement dated December 12, 1997 concludes there is only minimal impact for air quality, noise, grade crossing conflicts and accidents for the Town of front Royal and Warren County, despite the fact that air quality and noise impacts exceed the Surface Transportation Board's thresholds; and,

WHEREAS, the train traffic projections are highly speculative given the strategic location of Riverton Junction for east coast and midwestern rail traffic and the high probability of increased through freight traffic; and,

WHEREAS, the citizens of the Town of Front Royal are already coping with the current increases in through traffic as previously noted.

NOW, THEREFORE BE IT RESOLVED, that the Front Royal Town Council petitions the Surface Transportation Board to consider the high probability of more significant environmental impacts on this community due to the proposed acquisition; and,

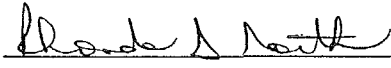

AND BE IT FURTHER RESOLVED, that the Final Environmental Impact Statement include a requirement for a five year review period from the effective date of the final decision for the assessment of environmental impacts and remediation options.

**COMMENTS OF THE TOWN OF HAYMARKET
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT**

Pursuant to the Final Procedural Schedule adopted in Decision No. 6, served May 30, 1997, The Town of Haymarket, a body corporate and politic of the Commonwealth of Virginia, ("Haymarket"), submits its comments on the December 12, 1997 Draft Environmental Impact Statement ("DEIS") in the above-entitled proceeding. For the reasons stated herein, the Section of Environmental Analysis ("SEA") is requested to ensure that the final Environmental Impact Statement ("EIS") includes a provision contemplating Surface Transportation Board ("Board" or "STB") oversight over the environmental impacts of the proposed transaction (referred to herein as the "Conrail consolidation") for at least the same length of time that the Board maintains oversight with regard to the economic aspects of the consolidation.

BACKGROUND

On June 6, 1997, Haymarket submitted its Notice Of Intent To Participate in this proceeding (TOH-1). At that time, as now, Haymarket's sole concern with the Conrail consolidation was with regard to potential environmental impacts of increased Norfolk Southern Railway Company ("NS") traffic over what is commonly

known as its "B Line" which runs through Haymarket.^{1/}

Haymarket's concerns with NS operations over the B Line are neither new nor unsubstantiated. As reported in the November 21, 1997 letter from Mayor Kapp to SEA's Elaine Kaiser (attached hereto), there have been three railroad accidents in the last fourteen months in the Haymarket area, i.e. a November 21, 1996 fatality caused by a train/passenger vehicle collision, a May 2, 1997 train derailment, and a July 11, 1997 train/tractor trailer collision.

Haymarket is aware of the fact that the NS operating plan contemplates a reduction in the average number of through trains operating over the B Line.^{2/} We also are aware of the fact that the Board's environmental review in cases such as this is limited to areas of increased activity.^{3/} Accordingly, Haymarket does not seek imposition of specific environmental conditions at this time other than the reporting condition described herein. However, given that the NS operating plan is not binding on the railroad, given the clear potential for increased operations over the B Line in the relatively near future, and given Board precedent in maintaining oversight over major consolidations,

^{1/} In the Applicants' June, 1997 Railroad Control Application, the B Line is identified as the NS Riverton Jct VA to Manassas VA line segment. See e.g. CSX/NS-20 at 465, Figure D.6-2. The B Line is part of what NS describes as the "Piedmont Route." CSX/NS-19 at 243, Figure TLF-8.

^{2/} This reduction is from 11.3 trains/day to 8.8 trains/day. Id.

^{3/} See e.g. DEIS, ES-15.

Haymarket requests the imposition of an environmental oversight condition on the Conrail consolidation.^{4/}

THE RATIONALE FOR ENVIRONMENTAL OVERSIGHT

Unlike construction activity, which is well-defined and usually of short duration, the process of consolidating major railroads can vary substantially from original plans and can take years. By way of example, while the Union Pacific/Southern Pacific merger was consummated in 1996^{5/}, the process of actually coordinating those two railroads still is not complete and the shifting of traffic between various line segments also is not complete.^{6/} Of perhaps greater importance, experience gained in the early years of railroad consolidations can and does result in railroad operations that differ markedly from those contemplated in the consolidation applications.

This is not to say or even to suggest that the NS operations data presented to the Board in this case was prepared in bad faith in an attempt to minimize the cost of environmental

^{4/} Environmental oversight would not be required if either NS were to agree to a cap on its average daily movements on the B Line equal to the 8.8 trains per day projected in its operating plan or if the Board were to condition its approval of the merger on such a cap.

^{5/} See Finance Docket No. 32760, Union Pacific Corporation, Union Pacific Railroad Company, And Missouri Pacific Railroad Company - Control And Merger -- Southern Pacific Railroad Corporation, Southern Pacific Transportation Company, St. Louis Southwestern Railway Company, SPCSL Corp., And The Denver And Rio Grande Western Railroad Company, Decision No. 44. (cited hereafter as "UP/SP, Decision No. 44").

^{6/} See e.g. the 1996 Union Pacific Annual Report which gave a mid-1998 target date for the completion of the integration of Union Pacific and Southern Pacific.

mitigation. Rather, Haymarket notes only that experience gained after the consolidation has been consummated can have a significant effect on the traffic actually operating over any given line segment.

By way of example, Haymarket would point again to the UP/SP merger. The applicants in that proceeding proposed a major corridor upgrade for their trackage between Topeka and Fort Worth.^{2/} However, UP now proposes to upgrade a different route for its coal movements to Oklahoma and Texas.^{3/} Thus, the original line segment density studies prepared by UP/SP, upon which the STB's environmental analysis was premised, will not accurately portray the facts two to three years after consummation of the merger.

In this case, there is ample reason for concern that the NS portrayal of its future use of the B Line, i.e. a reduction of 2.5 trains per day,^{4/} understates what will happen two to three years after consummation of the Conrail consolidation. On the one hand, NS projects reduced traffic on the B Line (part of the Piedmont Route) as a result of a rerouting of traffic from the Piedmont Route to the Shenandoah Route. CSX/NS-18 at 538. On the other hand:

^{2/} Id.

^{3/} See eg. the July 1, 1997 Applicants' Report On Merger And Condition Implementation at 24-25 and the August 4, 1997 Comments Of The Lower Colorado River Authority And The City Of Austin, Texas at 6-7.

^{4/} CSX/NS-20 at 464.

- 1) NS states that the B Line is part of one of the "Primary Expanded NS Corridors." CSX/NS-20 at 112, Figure 13.3-5;
- 2) NS also states that the B Line is part of its "New Intermodal Service Network." CSX/NS-20 at 161, Figure 13.3-22;
- 3) NS also states that the B Line is part of its "Improved Norfolk/Hampton Roads--Detroit Route." CSX/NS-19 at 248, Figure TLF-12;
- 4) NS also identifies the B Line as part of its "Piedmont Route." CSX/NS-19 at 243, Figure TLF-8;
- 5) NS also states that the portion of the Piedmont Route that includes the B Line "will be used for traffic destined to Philadelphia and northern New Jersey as well as for all doublestack and multi-level automobile traffic. At Harrisburg, connections with other CR routes to be operated by NS will be made for traffic to/from Pittsburgh, Buffalo and New England." CSX/NS-18 at 536; and
- 6) NS also explains that the Piedmont Route, of which the B Line is a part, will also connect with its "Bridge Route" for "access to the Southeast and with the Penn Route to the West." CSX/NS-18 at 534.

In light of the fact that the claimed reduction in traffic on the B Line is contingent upon the proposed upgrade of the Shenandoah Route and in light of all of the above-summarized expected uses of the B Line, as described by NS, the NS's projected reduction in its use of the B Line cannot reasonably be deemed certain. Stated another way, the Board can no more reach a final conclusion at this time as to the environmental impacts of the Conrail consolidation than it can reach a final conclusion at this time as to the competitive impacts of that consolidation.

THE REQUESTED OVERSIGHT CONDITION

The concept of continued Board oversight in major consolidation procedures is by no means novel. By way of example, in its August 6, 1996 decision in the UP/SP merger proceeding, the Board stated:

We also will impose as a condition the 5-year oversight period to examine whether the conditions we have imposed have effectively addressed the competitive issues they were intended to remedy.^{10/}

The Board further stated:

We retain jurisdiction to impose additional remedial conditions if, and to the extent, we determine that the conditions already imposed have not effectively addressed the competitive harms caused by the merger.^{11/}

Here, continued Board oversight is known to be acceptable to NS. See, e.g. the Agreement Between The National Industrial Transportation League, Norfolk Southern, and CSX. CSX/NS-176 at

^{10/} UP/SP Decision No. 44 at 107.

^{11/} Id. at 146. See also Ordering Paragraph No. 6 at 231.

771.^{12/} Notably, the NITL/NS/CSX agreement is not limited to "competitive issues." Rather, that agreement states:

The Board should require specific oversight of the implementation and effect of the transaction for a three-year period. This condition is not intended to limit the authority of the Board to continue oversight beyond the three-year period, or limit the right of any party, including the Organization, to request continued oversight if conditions at the end of the three year period warrant such a request.

In light of this agreement, the Haymarket request for Board oversight over environmental impacts should not be controversial. However, since Haymarket notes that the quarterly reports mandated by the NITL/NS/CSX agreement do not specifically contemplate a reporting of the data of concern to Haymarket^{13/}, we request that the reports mandated by the NITL/NS/CSX agreement be augmented by the adoption of the following language.

For the purposes of monitoring the environmental impacts of the Conrail consolidation on the Town of Haymarket, NS shall file on a monthly basis with the Board, and provide a copy to counsel for Haymarket, verified copies of station passing reports of train movements through Haymarket, VA for each day of each preceding month. Such reports shall be filed and served for each month of the first five years following consummation of the Conrail consolidation.

^{12/} See also, CSX/NS-176 at 708, 726-728.

^{13/} However, the reporting requested by Haymarket is fully consistent with item (e) of the reports contemplated by the NITL/CSX/NS agreement, i.e. "any other matters about which the Board or Council reasonably requests information."

CONCLUSION

Unlike the construction elements of the instant proceeding, which can be described with particularity, the operational elements, including the number of trains operating over each line segment are, at best, estimates. Here, Haymarket has presented more than ample justification for its concern that NS has understated the potential for increased traffic through a community that has experienced severe problems, including one fatality, as a result of the current level of NS operations. The requested reporting condition would not create an undue burden for NS and would permit the Board to take necessary action in the event that NS operations through Haymarket later prove to require environmental mitigation. The requested reporting condition should be recommended by SEA and should be adopted by the Board.

Respectfully submitted,

The Town Of Haymarket

Re: Finance Docket No. 33388
CSX/Norfolk Southern/Conrail

Dear Ms. Kaiser:

I write as the Mayor of the Incorporated Town of Haymarket, Virginia, approximately 40 miles west of Washington, DC. Our small historic town is transected by the "B Line" of the Norfolk Southern railroad that transports freight to and from the Hampton Roads port and points west.

We are extremely concerned about the safety of our area residents and the future impact of Norfolk Southern's use of the B Line. This freight rail line travels through a densely populated residential neighborhood in Haymarket, along a feeder stream for a major public water source, past a pre-Civil War church and across U.S. Route 29, one of the most heavily traveled highways along the East Coast and already the most dangerous rail/public highway crossing in Virginia.

In the last year alone there have been two major rail accidents and one death in our immediate area. On May 2, 1997, a freight train derailed at Route 29, narrowly missing an occupied day care center, a propane storage yard and a gas station. On July 11, 1997, a train struck a tractor trailer near the same crossing. Sadly, on November 21, 1996, a local resident was killed when her car was struck by a train at an unguarded crossing.

The potentials for environmental and public safety disasters are great along the B Line. Nearly two years ago Norfolk Southern announced it intended to greatly increase freight traffic along this line, which provoked substantial public outcry and expressions of concern by local fire and rescue agencies. However Norfolk Southern's organization plan filed before your agency in connection with the Conrail acquisition shows freight traffic not increasing, but in fact, slightly decreasing.

On behalf of the Town, I strongly appeal for your assistance in ensuring Norfolk Southern is held to its plan for not increasing freight traffic on the B Line after its acquisition of Conrail lines. We believe this commitment must be reflected as part of its safety integration plan -- ordered by your agency on November 3 -- exactly because this is a significant safety issue for our community.

A-598-c

Ms. Elaine K. Kaiser
November 21, 1997
Page 2

Further, we request that the Surface Transportation Board retain jurisdiction over Norfolk Southern's future use of the B Line after its decision on the acquisition to assure the health and well-being of our local residents.

Thank you for your kind consideration.

Sincerely,

John Kapp
Mayor

**Re: Finance Docket No. 33388, CSX Corporation and CSX Transportation, Inc.,
Norfolk Southern Corporation and Norfolk Southern Railway Company --
Control and Operating Leases/Agreements -- Conrail Inc. and Consolidated
Rail Corporation**

Dear Secretary Williams:

This letter constitutes the comments of Northern Virginia Transportation Commission and Potomac and Rappahannock Transportation Commission ("NVTC" and "PRTC", respectively, and the "Commissions" collectively) on the Draft Environmental Impact Statement ("DEIS") served by the Surface Transportation Board's Section of Environmental Analysis ("SEA") on December 12, 1997.

I. Summary

As is more fully explained below, the Commissions believe that the preliminary conclusion of the DEIS that the proposed Conrail acquisition will have no adverse impact on the Virginia Railway Express ("VRE")¹ commuter rail transportation system is wrong. The Commissions believe that SEA needs to comprehensively re-examine this very important issue and develop conditions for inclusion in the Final Environmental Impact Statement ("FEIS") to mitigate the adverse impact of the

¹ NVTC and PRTC are political subdivisions of the Commonwealth of Virginia organized pursuant to the Transportation District Act of 1964, § 15.1-1340 *et seq.* VA Code Ann. NVTC and PRTC jointly own the VRE commuter rail service. Amtrak conducts and manages VRE's commuter rail operations pursuant to a contract with the Commissions. VRE's right to utilize the rail lines of the Applicants is established by contracts between the Commissions and CSX, NS and Conrail, respectively.

E-MAIL: gotrains@vre.org

proposed Conrail acquisition on VRE. In addition, the Commissions believe that the SEA's preliminary proposed mitigation condition that would require greater time spacing between freight and passenger trains is not necessary to ensure continued safe passenger operations on the line between Potomac Yard and Fredericksburg and therefore should not be included in the FEIS.

The Commissions' specific comments on these topics (and other related topics) are summarized below. A full discussion of the impact of the proposed Conrail acquisition on VRE is set forth in the Comments and Requests for Conditions of the Commissions, which was filed with the Board on October 21, 1997. The Commissions' Comments and Requests for Conditions in the "economic" part of the proceeding are directly related to the environmental considerations raised in this letter and, therefore, we incorporate them by reference and request that SEA carefully review them in the course of preparation of the FEIS. We are submitting ten copies of our Comments and Request for Conditions herewith and would be pleased to provide SEA with additional copies upon request.

II. SEA's Conclusion Of No Adverse Impact On VRE Is Wrong

VRE provides a valuable service to Northern Virginia commuters. VRE data compiled for submission to the U.S. Department of Transportation's ("U.S. DOT") National Transit Database reveal that in FY 1997 VRE provided 57,116,170 passenger miles of service at an average cost of only 32 cents per passenger mile. This compares very favorably with costs of operating single-occupant automobiles. VRE has operated without a passenger fatality or even serious injury since 1992. At VRE's FY 1997 level of ridership (1,758,471 passenger trips), the reduction of automobile usage by VRE passengers reduced consumption of gasoline by approximately 2.9 million gallons.²

VRE presently operates 24 trains on two routes. Twelve trains operate on the CSX Fredericksburg Line and 12 trains operate on the NS Manassas Line. With respect to the Fredericksburg Line, the DEIS concludes that "the proposed increase in CSX freight trains is not expected to adversely affect commuter service. SEA has analyzed the segment and believes, based upon the information available, that mitigation is not necessary at this time." DEIS at 4-39. With respect to the Manassas Line, the DEIS concludes that "[b]ased upon the information available at this time, there does not appear to be an adverse impact on commuter service to Manassas. SEA does not believe mitigation is necessary at this time." DEIS at 4-40. The Commissions believe that both of these conclusions are wrong.

As explained below, the segments of the NS Manassas Line and the CSX Fredericksburg Line used by VRE will experience very heavy increases in freight traffic. These lines do not have the capacity to absorb these increases while accommodating current levels of passenger service. This is especially true because freight operating times are erratic. CSX and NS have proposed no capital improvements of their own to expand capacity on these overburdened lines. The result will be

² Comments and Request for Conditions of Northern Virginia Transportation Commission and Potomac and Rappahannock Transportation Commission ("VRE Request for Conditions"), VRE-8, at 13; Verified Statement of Stephen A. MacIsaac and Richard K. Taube, which accompanied the VRE Requests for Conditions, at 9-13.

increased failure to dispatch VRE trains on time, with falling VRE ridership and a return to single-occupant automobiles by dissatisfied VRE customers. Air quality will certainly deteriorate as a result. The final EIS should document and evaluate these adverse impacts and propose appropriate mitigation measures.

Both CSX and NS have indicated that their proposed Operating Plans for the post-acquisition era will result in substantial increases in freight train operations on the rail lines over which VRE provides service. Increased freight operations will further clog these already busy rail transportation arteries. The NS Operating Plan projects an increase of two freight trains per day on the line between Manassas and Alexandria. Although VRE is very concerned about the impact of this acknowledged increase, VRE has developed information indicating that NS may in fact increase daily freight trains over the Manassas Line by four or more trains per day.³ In addition, NS has acknowledged that the Manassas Line is a much more direct and desirable route for NS coal and other traffic to the Baltimore and Wilmington markets than the NS Hagerstown - Harrisburg route, creating the distinct likelihood that greater volumes of coal traffic ultimately will be re-routed over the Manassas Line to the detriment of VRE commuter rail operations.⁴

The CSX Operating Plan poses even greater concerns because of the very substantial increases in freight service CSX plans for the already highly congested Fredericksburg Line. According to the CSX Operating Plan, the CSX line between Fredericksburg and Alexandria currently carries 28 passenger trains per day (12 VRE trains and 16 Amtrak trains) and is projected to experience an increase of seven freight trains per day. This represents a 43 percent increase in freight train operations on this 49-mile segment. The post-acquisition increase in freight operations on the other part of the Fredericksburg Line, between Potomac Yard and CP - Virginia Avenue, is even more dramatic. This line presently carries a minimum of 42 passenger trains per day (24 VRE trains and a minimum of 18 Amtrak trains) and will have an increase of 11 freight trains per day, which represents a 61 percent increase over the pre-acquisition level. Furthermore, most of the added freight trains on the Manassas and Fredericksburg Lines will operate during the VRE operating periods (i.e., Washington, D.C. rush hour periods).⁵ Even so, CSX has not identified a single capacity-enhancing investment on the Fredericksburg Line other than publicly funded improvements that will only be made if they enhance or improve VRE service.

The CSX Operating Plan itself reveals that among the rail lines with passenger trains that will experience moderate to substantial increases in freight activity, the Fredericksburg Line (and particularly the segment between Potomac Yard and CP - Virginia Avenue) is among the most affected by freight train increases in the entire Country. Table 13.8-2 of the CSX Operating Plan (Application ("App."), Vol. 3A at 409-12) lists projected increases in both CSX and NS freight trains on CSX and Conrail-acquired line segments with passenger service. Although there are more than 100 lines listed, only six line segments are projected to have an increase of ten or more freight

³ Verified Statement of Charles H. Banks ("Banks VS"), which accompanied the VRE Request for Conditions, at 9.

⁴ VRE Requests for Conditions at 16-17; Banks VS at 9, 18-20.

⁵ VRE Request for Conditions at 18.

trains per day. With the exception of the Potomac Yard to CP - Virginia Avenue segment, none of these segments carries significant passenger traffic. App., Vol. 3A at 409. In contrast, the Potomac Yard to CP - Virginia Avenue line segment carries more than 42 passenger trains per day. App., Vol. 3A at 412. Accordingly, of all the CSX/Conrail lines that are scheduled to undergo substantial post-transaction increases in freight traffic, the line that has by far the greatest volume of passenger operations is the Potomac Yard to CP - Virginia Avenue segment. The potential impact, therefore, of substantial projected increases in freight traffic on lines already carrying substantial passenger traffic -- and the corresponding need to protect such passenger operations -- is nowhere more clearly evident than on the CSX/Conrail Fredericksburg Line.⁶ Although the Application asserts that the Fredericksburg Line has "sufficient capacity" to accommodate freight increases without adverse impact on commuter service, App., Vol. 3A at 276, even before the merger CSX Chairman John Snow characterized the Fredericksburg Line as "one of the most capacity constrained segments of the entire CSX system." Letter from John Snow to Terrence Spellane, Potomac and Rappahannock Transportation Commission, June 28, 1995.⁷

The methodology that CSX and NS used to arrive at projected freight train densities as a result of the acquisition was made without any consideration of passenger operations. The Applicants assert that any possible conflicts or adverse impacts on VRE commuter rail service could be resolved through more careful scheduling of freight trains. Scheduling adjustments and refinements will not resolve the issue.⁸

Nothing filed by Applicants since the submission of their Environmental Report (CSX/NS-23) alleviates the Commissions' concerns. On December 15, 1997, Applicants filed their rebuttal to, inter alia, the VRE Request for Conditions. As is explained in the DEIS Verified Statement of Charles H. Banks, attached hereto as Exhibit A, Applicants have continued to ignore the adverse impact of the proposed Conrail acquisition on VRE operations.

In consideration of these key factors, as well as all of the other factors described in the VRE Request for Conditions and accompanying verified statements, the Commissions are perplexed by the DEIS conclusion that the train increases of CSX are "well within the capacity" of the Fredericksburg Line and that the NS Manassas Line has "more than sufficient capacity to accommodate expansion of VRE service."

The DEIS indicates that "CSX has begun certain signal and crossover track improvements which will add some operating flexibility and reliability to the route." DEIS, Vol. 1 at 4-39. Although the Commissions cannot be sure which signal and crossover track improvements are referred to in the DEIS, it seems likely that SEA is referring to certain capital improvements that are being made at the behest of VRE and the expense of the public and for the benefit of VRE service. As noted above, CSX has not identified a single capacity-enhancing investment on the Fredericksburg Line that it

⁶ VRE Request for Conditions at 18-19.

⁷ VRE Request for Conditions at 19-20.

⁸ VRE Request for Conditions at 28-31; Banks VS at 5-10.

intends to pay for. CSX only identifies publicly funded improvements, but these will only be made if they enhance or improve VRE's service.

Approximately one-third of VRE's annual capital budget is devoted to improvements to the Fredericksburg Line. The improvements are funded by the Virginia Department of Rail and Public Transportation ("VDR&PT"), using federal funds. VRE has paid for the Woodbridge crossover (approximately \$1.25 million) north of Quantico Bridge and is predisposed but not committed to pay for the Aquia crossover south of Quantico Bridge. The addition of these crossovers would double the number of crossovers in the area and help both freight and passenger trains avoid delays. Again, VRE is predisposed but not committed to pay for track and signal improvements between a point near Potomac River (RO) and a point near Telegraph Road (AF), at an expense of approximately \$2,650,000. These track and signal improvements are designed to increase train speeds, decrease travel time and consequently increase VRE ridership.⁹ The first thing that should be noted is that the Woodbridge/Aquia crossover and the track and signal improvements between the Potomac River and Telegraph Road would be installed only if VRE's service would benefit from them. The Commissions are pleased that there is also a benefit to the freight service from these publicly funded improvements, but it should be recognized that the improvements will not be made if they do not enhance VRE service. Thus, unless CSX is prepared to represent that it will make the improvements even if public funding is not forthcoming, SEA should not assume that the improvements will be made or factor the improvements into its consideration of the environmental impact of the proposed Conrail acquisition.¹⁰

Other statements in the DEIS indicate that SEA needs to undertake a more careful study of VRE operations. For example in Volume 1, on page 4-39, the DEIS erroneously states:

CSX has also proposed in its Operation Plan certain improvements to the Virginia Avenue tunnel in Southeast Washington, D.C. The improvements would improve the movement of both passenger and freight trains through this tunnel, which currently is a constraint to passenger train operations in the District of Columbia. [Emphasis Added]

Neither VRE nor Amtrak trains run through the Virginia Avenue tunnel. Although the planned improvements to the Virginia Avenue tunnel will permit faster movement of freight trains through that tunnel and that, in turn, might result in somewhat higher capacity on the CSX line between

⁹ VRE's capital improvement program also contains a plan to add a new bridge over Quantico Creek, at an expense of approximately \$20 million, which would add an additional track to replace the track that CSX demolished shortly before VRE began operations. The additional span of bridge at Quantico Creek would enhance the benefit of the Woodbridge/Aquia crossovers.

¹⁰ The same point should be made about the planned siding at Lorton. In Applicants' rebuttal submission, Mr. Reistrup promotes the Lorton siding. Applicants' Rebuttal, CSX/NS-176, Vol. 2B, Rebuttal Verified Statement of Paul H. Reistrup at P-259. Public funding will not be used for that siding unless it provides a benefit to VRE service.

Potomac Yard and CP - Virginia Avenue, the fact that the SEA is under the impression that Amtrak and VRE trains run through the Virginia Avenue tunnel is indicative of a need to re-examine more thoroughly (and accurately) the operations of VRE and reach more careful conclusions regarding the impact of the proposed Conrail acquisition on VRE operations.

Moreover, there is no indication that SEA conducted any analysis of (i) the magnitude of increased capacity on the Potomac Yard to CP - Virginia Avenue line as a result of the Virginia Avenue tunnel improvements or (ii) the increase in delays or reduction in capacity on the line during the period when the improvements are being made. If the Virginia Avenue tunnel improvements are proffered as mitigation of the adverse impact of the proposed Conrail acquisition on VRE, then the extent of the benefit must be quantified. Moreover, as the Virginia Avenue tunnel improvements are prompted by the proposed Conrail acquisition, SEA needs to establish conditions to mitigate the adverse impact on VRE operations during the construction.

III. SEA's Proposed 15-Minute Headway Condition Is Not Necessary For Safety

With respect to the CSX Line between Fredericksburg and Potomac Yard (among other segments), the SEA has preliminarily proposed a condition under which freight trains "moving in the same or opposite direction on the same track would be clear of the track at least 15 minutes before and 15 minutes after the expected arrival of a passenger train at any point." DEIS at 7-12.

Review of the DEIS provides no insight into how the proposed mitigation is supposed to improve safety or, indeed, what incidents the proposed measure is designed to prevent. It would appear rooted in a desire to have freight trains in the clear at meeting or passing points on a single track railroad, but does not seem appropriate for a double-track railroad such as the Fredericksburg Line, with cab signals installed for bi-directional operations.

Time spacing is an old railroad practice used when poor communications technology could not be relied upon for safety. The requirement to be in the clear at least five minutes in advance of any potential conflict was appropriate given the state of signal system technology at the time and certainly reduced rail accidents. The Commissions fail to see how establishing a 15-minute separation period is necessary for safety today.

Further, the Commissions believe that the SEA has not examined and evaluated the tremendous burden the proposed mitigation would place upon the VRE operations on the Fredericksburg - Potomac Yard segment. With block signal systems, trains can follow safely as short as five minutes apart. To mandate a spacing of not less than 15 minutes would mean stretching by three times the length of the current interval. Where CSX and NS can now safely insert a freight train between commuter trains operating on 30 to 60 minute headways, they would be completely forestalled under the proposed mitigation condition from using their own tracks for hours during peak passenger periods. As that impact would prove to be an intolerable burden on CSX, the most likely outcome would be for CSX to cease its willingness to host VRE trains upon contract expiration or to achieve the same thing by failing to dispatch VRE trains reliably enough to encourage commuter rail ridership.

IV. An Adverse Impact On VRE Would Have An Adverse Impact On Air Quality

Northern Virginia is designated as a "serious" ozone area by the U.S. Environmental Protection Agency. Accordingly, the region must prepare air quality plans and spend millions of dollars to devise methods to reduce the ozone to acceptable levels. An emissions analysis performed by NVTC in 1994 showed that for each work day, reduced automobile traffic from VRE service results in 0.06 fewer tons of hydrocarbons, 0.42 fewer tons of carbon monoxide, 0.19 fewer tons of nitrogen oxide and 0.07 fewer tons of volatile organic compounds (the controlling pollutant in smog formation in the Washington, D.C. area). These amounts are net of the extra auto trips by VRE customers to and from VRE stations.¹¹ Thus, any adverse impact of the proposed Conrail acquisition on VRE would have an adverse impact on air quality in Northern Virginia.

The Commissions appreciate this opportunity to submit comments on the DEIS. The Commissions are committed to working with SEA to provide further information regarding the foregoing comments and to consult with SEA regarding the impact of the proposed Conrail acquisition on VRE.

**DEIS Verified Statement
of
Charles H. Banks**

I. Qualifications and Introduction

My name is Charles H. Banks. I am President of R.L. Banks & Associates, Inc. ("RLBA"), a firm of transportation economists and engineers, with offices at 1717 K Street, NW, Washington, DC 20006 and at 4 Britton Avenue, Belvedere, CA 94920. I have been RLBA's principal in charge of providing Commuter Rail Economic and Operations Consulting Services for the Virginia Railway Express ("VRE") since RLBA was awarded that competitively bid five-year service contract on June 26, 1995.

The co-owners of VRE, Northern Virginia Transportation Commission ("NVTC") and Potomac and Rappahannock Transportation Commission ("PRTC") (collectively, the "Commissions"), are today filing comments on the Draft Environmental Impact Statement ("DEIS") served by the Surface Transportation Board's Section of Environmental Analysis ("SEA"). The Commissions believe that the preliminary conclusion of the DEIS that the proposed Conrail acquisition will have no adverse impact on VRE operations is wrong. The Commissions believe that SEA needs to comprehensively re-examine this very important issue and develop conditions for inclusion in the Final Environmental Impact Statement ("FEIS") to mitigate the adverse impact of the proposed Conrail acquisition on VRE.

Applicants' Environmental Report (CSX/NS-23) contained very little information with which VRE could evaluate the impact of the proposed Conrail acquisition on VRE. Nothing filed by Applicants since the submission of their Environmental Report alleviates the Commissions' concerns. VRE filed Comments and Requests for Conditions in the so-called "economic" part of the proceeding that are directly related to the environmental considerations raised in its comments. On December 15, 1997, Applicants filed their rebuttal to, inter alia, the VRE Request for Conditions. In the rebuttal filing, Applicants side-stepped VRE's evidence (set forth in its Request for Conditions) of the harms from the proposed Conrail acquisition. The purpose of this verified statement is to point out the major flaws in Applicants' rebuttal.

A. The STB Needs to Look at the Entire Fredericksburg Line Over Which VRE Operates

To get an accurate picture of freight and passenger train operations on the Fredericksburg Line after consummation of the proposed Conrail acquisition, one must look at the entire line between Fredericksburg and Washington, D.C., not just one segment of it. The Commissions have done so, but the Applicants have not. The Applicants' approach is arbitrary and somewhat misleading.

In Applicants' Rebuttal, CSX/NS-176, Vol. 2A, Rebuttal Verified Statement of John W. Orrison ("Orrison RVS"), at P-606, Mr. Orrison claims:

Correct presentations of the string line charts show that there is no conflict between the proposed CSX train operations with respect to known VRE train operations.

However, in this, CSX's only attempt to quantify the impact of additional trains on the Fredericksburg Line, Mr. Orrison failed to prepare a string line chart of the entire

CSX/Conrail line between Fredericksburg and CP Virginia. He played it safe but coy by depicting only seven miles of largely triple-track territory, completely ignoring any string line depiction of the approximately 45.7 miles of largely double-track railroad over which VRE operates, not to mention a short single-track segment in the vicinity of the Quantico Bridge. In contrast, the analysis in my verified statement accompanying the Commissions' Request for Conditions (the "Banks VS") covered the entire rail line segment.

Had Mr. Orrison prepared a complete string line chart, it would have shown the exact opposite of what his analysis shows. At least six VRE and Amtrak trains will be delayed every weekday by proposed CSX freight trains. VRE clearly presented the data in my earlier verified statement at 7 and 8 and Attachment B thereto. I now have prepared two string line charts to analyze Mr. Orrison's contentions. One depicts scheduled trains from Fredericksburg to Washington on the eastward track while the second charts all scheduled Washington to Fredericksburg trains on the westward track. When Mr. Orrison's string line approach is extended to cover the entire CSX/Conrail line, not just triple-track territory, significant conflicts occur:

CSX [] will delay VRE#310 and Amtrak #86 every day (see Banks VS at 7);

CSX#[] will delay VRE#301 every day (see Banks VS at 8);

CSX#[] will delay VRE #306 every day (see Banks VS Attachment B);

CSX#[] will delay VRE#307 every day (see Banks VS at 8); and

CSX#[] will delay Amtrak#66 every day (see Banks VS at 8).

Even my analysis paints an optimistic picture because the string line charts were premised upon the simplifying assumption that all Fredericksburg to Washington trains could operate on a continuous eastward track while all trains in the opposite direction could operate on the westward track. It, therefore, did not even take into account the considerable impacts arising from the single-track segment at Quantico Creek through which all trains must be funneled in both directions, one at a time, causing additional delays to opposing trains.

Moreover, string line charts cannot possibly depict accurately the location of train meeting points given the variance at which CSX freight trains deviate from schedule each and every day. Banks VS at 10-11. String charts are merely a “best case” laboratory exercise. Even as deficient as the string line approach is in reflecting realistic and less than perfect operating conditions of real railroading, it predicts that the CSX operating plan will result in major conflicts to VRE trains.

In sum, even were CSX to achieve the kind of laboratory perfect conditions it has proffered, in which each freight train runs exactly on time, a string line chart of proposed existing passenger and proposed freight operations depicts daily delays to four of the twelve VRE passenger trains operating between Washington and Fredericksburg each weekday. VRE on-time performance on the Fredericksburg Line would plunge to 67 percent, absent any impacts which might arise from track, signal and other CSX delays.

B. CSX and the STB Cannot Assume That Planned Capacity/Flexibility-Enhancing Capital Improvements Will Be Made on the Fredericksburg Line

Both Mr. Orrison and Paul H. Reistrup, another witness for the Applicants, make much of CSX's efforts to increase capacity on the Fredericksburg Line. All of the cited improvements are at least partially funded by passenger train/public sector interests, primarily VRE and the Commonwealth of Virginia. (See Exhibit One hereto.) Public funding for capacity improvements will not happen if VRE service will not benefit from the improvements. As proposed, the Conrail acquisition will have serious adverse effects on VRE operations and it is therefore unlikely that the capital improvements touted by Applicants would benefit VRE sufficiently to justify public expenditures. Thus, SEA should not assume, as Applicants have, that public money will be available. Absent a commitment by CSX to fund the capital improvements itself, SEA should not assume the capital improvements will be made.

Mr. Reistrup states:

One should also take into account the effect of the recent improvements to the line, some funded by CSX and some funded by VRE, and the additional improvements planned for the line.

CSX has completed several capital improvement projects on portions of the Fredericksburg line and is continuing to improve the remaining portions. These projects, funded entirely by CSX, include: 1) replacing rail and ties, 2) improving the ballast shoulder, 3) upgrading signal relays to modern microprocessors; and 4) installing CTC modern dispatch bi-directional signaling.

* * *

One important improvement CSX has planned and will fund is the clearance and track upgrade of the Virginia Avenue Tunnel in the District of Columbia. The tunnel project will permit track speed to increase from the present 10 mph to 25 mph or more, allowing freight trains to travel much more quickly over the line segments used by VRE.

Applicants' Rebuttal, CSX/NS-176, Vol. 2B, Rebuttal Verified Statement of Paul H. Reistrup ("Reistrup RVS"), at P-248-49.

Mr. Orrison adds:

Nonetheless, CSX continues to advance its efforts to improve VRE's on-time performance. One means by which CSX seeks to increase service levels is by improving capacity and service over the Atlantic Coast Service Route, over segments of which VRE operates. Improving the track will move traffic over this line more quickly and create greater capacity for freight and passenger trains. An example of CSX's commitment to improve track and train operational capacity is the plan to modify the Virginia Avenue Tunnel and more than double the track speed in the tunnel area (from 10 mph to 25 mph or more) to improve train meets in Washington, D.C.

Orrison RVS at P-611.

The Commissions have made significant improvements to the Fredericksburg Line, using public monies to improve VRE service. The Commissions plan to make additional significant improvements, again using public funds, provided that the improvements enhance VRE service. If the planned improvements would not help VRE service, or if, in the alternative, no VRE service survives to be supported, no public expenditures will be made to improve the utility of CSX freight trackage. Thus, unless CSX is prepared to represent that it will make the improvements even if public funding is not forthcoming, SEA should not assume that the improvements will be made or factor the improvements into its consideration of the environmental impact of the proposed Conrail acquisition.

It is certainly questionable whether the so-called CSX improvements to the Fredericksburg Line relied upon so heavily by Mr. Reistrup can properly be categorized as "capital improvements". I would characterize them instead as maintenance of way expenditures, an operating expense. They merely restore the line to repair normal or

accidental wear and tear on the property. They do not add capacity or functionality to the corridor. Ties wear out; even welded rail eventually must be replaced; ballast shoulders must be restored to prevent track buckling. The signal relays at Rosslyn which Mr. Reistrup cites are nothing more than replacements of in-place infrastructure which was destroyed in last summer's major freight train derailment which also damaged VRE service and decimated VRE ridership. The modern signaling system to which Mr. Reistrup avers can hardly be accepted on its face as an "improvement," since a CTC installation with cab signals has been installed on this line segment for many years. In short, none of the improvements cited by Mr. Reistrup added capacity to the line in preparation for the coming onslaught of new rail freight traffic.

Conrail's depository timetable shows a maximum authorized speed through the tunnel of [] mph. VRE marvels that the only example CSX can muster of how it will improve the Fredericksburg Line to accommodate significantly increased freight traffic is to raise a temporary speed restriction to less than the authorized speed in Conrail's depository timetable. The freight train speed through the tunnel has been 30 mph or faster for decades. It seems strange to temporarily lower a speed, then be given credit by SEA for increasing it to less than historical levels.

Likewise, the benefit to VRE seems speculative. While the Virginia Avenue Tunnel project may represent a significant clearance improvement for CSX, the only benefit VRE may realize is the extent to which partially restoring freight train operating speeds can help CSX hide its dispatching errors when freight trains are advanced ahead of passenger trains with inadequate time to clear the main track. If an eastbound CSX freight

cannot clear CP Virginia ahead of a passenger train, it should be held at the Potomac River. Similarly, if a slow westbound freight train would delay a passenger train, it should be held at CP Virginia to follow the passenger train. Even at the proposed increased, but less than timetable, speed of [] mph within the tunnel, it is less than the allowable passenger train speed of [] mph across the Potomac River and [] mph between the Potomac River and CP Virginia (except [] mph on two curves).¹ If CSX operates an eastbound freight train immediately ahead of a passenger train it will likely delay that [] mph train.

Applicants do not offer one capital improvement paid for absent government funding which will improve line segment throughput capacity. Since, for the reasons stated previously, SEA cannot properly assume that capacity improvements will be made with public funds, SEA cannot point to any planned capital improvement that will enhance capacity and offset the impact of the proposed Conrail acquisition on VRE passenger service.

C. Freight Trains Consume More Capacity Than Passenger Trains

The Applicants would like any STB analysis of freight and passenger train activity to be based on the premise that VRE trains consume more capacity than freight trains and therefore disproportionately constrain the Fredericksburg Line. In fact, the opposite is true. At P-245, Mr. Reistrup states:

First, VRE erroneously assumes that capacity on the line is constrained by freight traffic, when in fact it is constrained by passenger traffic. An additional freight train does not "consume" the same amount of capacity as an additional passenger train. The RF&P line from Fredericksburg to Alexandria is double-track (except for the bridge at Quantico) with CTC bi-directional signaling. There would be no

¹ NS-21-CO-01257

question that this line would have more than adequate capacity if all the trains expected to operate over the line post-Transaction were freight trains.

“Capacity” is the problem, but contrary to Mr. Reistrup’s contention, a single freight train consumes more capacity than does a single passenger train. Freight trains change speeds more gradually than passenger trains and cannot be operated as frequently as passenger trains on a line with the characteristics of the Fredericksburg Line. Passenger trains can accelerate and decelerate more quickly, which means they can more quickly reach high speeds on segments permitting such speeds and maintain those high speeds for longer periods before there is a need for a brake application to operate over a lower speed segment or stop at a station. Thus, on the Fredericksburg Line, as shown in Table 1, the average speeds achieved by CSX trains operating in both directions between Alexandria and Richmond were [] miles per hour for intermodal trains and [] miles per hour for other freight trains, each considerably slower than the 54 and 44 mile per hour averages achieved by Amtrak and VRE trains, respectively between Alexandria and either Richmond or Fredericksburg.

Table 1: Average Train Speeds of Different Train Types Between Alexandria and Points South

Train Type	Endpoints	Miles	Average Elapsed Time (Hours)	Average Speed (Miles Per Hour)
Amtrak	Alexandria and Richmond	100	1.9	54
VRE	Alexandria and Fredericksburg	46	1.1	44
CSX Intermodal	Alexandria (Potomac Yard) and Richmond (Greendale)	101	[]	[]
CSX Other Freight	Alexandria (Potomac Yard) and Richmond (Greendale)	101	[]	[]
CSX Other Freight	Alexandria (Potomac Yard) and Richmond (Acca Yard)	102.6	[]	[]

Sources: CSX Train Operations Train Inquiry 9/18/97 – 10/17/97; RLBA calculations.

Another way of determining whether and to what extent there is congestion on the Fredericksburg Line is to examine the elapsed time between Alexandria and Richmond recorded by CSX Intermodal and other (general) freight trains. If there is no capacity problem on the Fredericksburg Line other than that posed by VRE operations, as CSX claims, then one would expect CSX trains to operate more quickly when VRE trains do not operate. The fact that VRE trains do not operate on the weekends provides an ideal control case for evaluation. The results of analyses drawn from CSX actual data are summarized in Table 2. It shows that CSX freight trains operate no faster on the weekend when VRE does not operate any trains than they do during the week. Congestion is such a constant that CSX trains are no better off in the absence of VRE operations than with them.

**Table 2: CSX Freight Trains
Average Elapsed Travel Times
Weekday Vs. Weekend Average Travel**

Train Type	Endpoints	Weekday	Weekend
CSX Intermodal	Between Alexandria (Potomac Yd.) and Richmond (Greendale)	[] hrs	[] hrs
CSX Freight	Between Alexandria (Potomac Yd.) and Richmond (Greendale)	[] hrs	[] hrs
CSX Freight	Between Alexandria (Potomac Yd.) and Richmond (Acca Yd.)	[] hrs	[] hrs

Sources: CSX Train Operations Train Inquiry 9/18/97 – 10/17/97; RLBA calculations.

Likewise, one would expect that CSX trains would be subject to fewer delays when VRE was not active on the Fredericksburg Line than when it was. However, this is not the case. As shown in Tables 3 and 4, respectively, whether one includes both early

and late freight trains or just the late CSX freight trains, the average variance from schedule and hours of delay are no worse during the days when VRE operates than when it does not.

**Table 3: Average Variance from Schedule
All CSX Trains**

Period	Sample Number of Trains	Trains per day	Average Variance
Daily (7 days)	[]	[]	[] hours
Weekends Only	[]	[]	[] hrs

Sources: CSX Train Operations Train Inquiry 9/18/97–10/17/97; RLBA calculations.

It can be seen in Table 3 that the same number of CSX trains operate on weekends as operate during the week, and yet on weekends, when freed from VRE train interference, the CSX trains still do not run on schedule. In fact, variance from schedule is slightly worse on weekends when VRE trains do not operate.

Table 4: Average Hours of Delay - All CSX Trains

Period	Sample Number of Trains	Trains per day	Average Variance
Daily (7 days)	[]	[]	[] hrs
Weekends Only	[]	[]	[] hrs

Sources: CSX Train Operations Train Inquiry 9/18/97 – 10/17/97; RLBA calculations.

Further, the values in both preceding tables demonstrate that CSX freight trains are not able adhere to a schedule on weekends, which suggests that there are significant capacity problems even in the absence of VRE trains and track occupancy.

No matter how one looks at the data, there is no factual basis that supports a finding that VRE passenger trains in general take longer than freight trains to traverse the

Fredericksburg Line and that VRE trains are contributing significantly to the congestion problem.

Verification

I, Charles H. Banks, declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge, information and belief. Further, I certify that I am qualified and authorized to file this Verified Statement.

— INVESTMENT ANALYSIS —
— REVISED —

VIRGINIA RAILWAY EXPRESS
VERSUS EQUIVALENT
HIGHWAY CAPACITY

Kathleen Benton

Northern Virginia Transportation Commission

April 24, 1995

A-604-c

This analysis compares the cost of constructing and operating the Virginia Railway Express, a commuter railroad in Northern Virginia, to the cost of constructing an equivalent lane of Interstate highway in the I-66 and I-95 corridors in which VRE operates, and operating enough automobiles in those lanes to serve the same number of peak period commuters as are projected to use VRE during Fiscal Year 1996. The analysis demonstrates that at present levels of operation, between 1992 (VRE's start-up year) and 2012, VRE will cost \$264 million less to build, maintain, and operate than would the lanes of Interstate. While VRE is not a substitute for all highway construction and cannot solve all of the region's commuting problems, the railway was and continues to be a very sound investment decision by the citizens of Northern Virginia.

The Virginia Railway Express (VRE) began commuter rail operations in June, 1992. Ridership has grown steadily, reaching an average daily level of about 8,000 passenger trips. The two commissions sponsoring VRE (Northern Virginia Transportation Commission and Potomac & Rappahannock Transportation Commission) have purchased locomotives, railcars, fuel and insurance; contracted with Amtrak for maintenance and crews; built facilities; and leased access to tracks from three freight railroads and Amtrak. In addition, the Virginia Department of Transportation has built parking lots and participating local governments have constructed several stations. Operating and capital costs of the project are currently financed jointly by customer fares, six participating and two contributing jurisdictions, and state aid. As of Fiscal Year 1995, federal funding is also available for capital projects.

Estimated total construction, capital, and operating costs for the VRE project were approximately \$150 million through FY 1994. The approved operating and capital budget for FY 1996 is about \$27.3 million. To what extent are expenditures of such magnitude justified in an era of scarce public resources?

The VRE project has delivered significant benefits, including removing the equivalent of a rush-hour lane of low-occupant vehicles from the crowded I-66 and I-95 corridors of Northern Virginia (see page 3). Customers rate the quality of service as excellent, and ridership is growing despite two four-percent fare increases and an overall fare level that exceeds the average cost of parking automobiles in core employment locations.

Compared to other commuter rail systems in the United States and Canada, VRE provides exceptional service at an operating cost below the national average on a per passenger mile basis, while recovering a greater percentage of those costs from customers, as demonstrated below, using the most recent federal and VRE data available:

Federal Transit Administration Section 15 Data	Operating Cost Per Pass. Mile	Fare Per Pass. Mile	Recovery Ratio (Fares/Op. Cost)	Average Trip Length	Pass. Miles Per Vehicle Mile
National Avg., FY 93	\$.30	\$.14	.48	22 miles	32
VRE, FY 1994	\$.24	\$.13	.55	32 miles	60

Also, a significant part of VRE's initial \$150 million cost has been invested in assets that, with appropriate maintenance, will continue to yield benefits for 20 years or longer. These assets include railcars, locomotives, and a self insurance trust. The fact that many of these assets can be readily liquidated has served to minimize the initial risk to Virginia taxpayers. For example, as of June 30, 1994, the insurance fund contained \$20.8 million in liquid assets.

Despite the current success of VRE and its potential to expand rapidly to serve future needs, the project should be evaluated in comparison to competing alternatives. In an environment in which severe traffic congestion restricts peak period commuting, buses, carpools, vanpools, and low occupancy vehicles all rely on the existence of sufficient highway capacity. Consequently, VRE's costs should be compared to the equivalent costs of building and maintaining new highways to serve peak hour commuters as well as the costs of operating competing transportation modes on those highways during peak periods.

The following analysis compares the costs of moving passengers along these corridors on VRE to the costs of its principal competitor, the private automobile. Costs are grouped into four primary categories to assure comparability: 1) initial capital investments, 2) maintenance and administration, 3) the cost of providing the transportation itself, and 4) air quality considerations. Detailed information regarding assumptions, sources, and calculations is provided in the attached worksheets.

- 1) Initial capital investments: \$86.5 million (VRE) v. \$338 million (Interstate)

The initial costs of establishing the fixed facilities of the VRE system were \$66.1 million. This includes the costs of constructing parking lots and stations, upgrading track and signals, and building yards and maintenance facilities. The costs of purchasing VRE railcars and locomotives are accounted for in category 3 below. In addition, VRE has provided \$20.7 million to the Commonwealth's Division of Risk Management to establish a self-insurance trust. This investment yields interest which is used to pay the premiums for additional private insurance.

To cover an equivalent distance with interstate highway in Northern Virginia, the respective costs are about \$4.4 million per lane-mile in the inner suburbs and Prince William County and \$2.7 million per lane-mile in the Stafford County area. These estimates are taken from comparable construction projects in the approved Virginia Fiscal Year 94-95 Six-Year Improvement Program, and include the costs of some engineering as well as construction. While some highway construction costs might be lower (e.g. paving existing shoulders to create an additional lane,) it should also be noted that the figures only reflect costs to construct lanes up to the Virginia bank of the Potomac River, and not on the bridges crossing the Potomac or in the District of Columbia. District of Columbia staff has indicated that the cost of such construction in the District would be so prohibitively expensive that they could not provide an estimated cost. Furthermore, this figure does not include right-of-way, which in some congested areas of the corridor would be very expensive.

Highway costs also do not reflect the significant level of investment in insurance reserves necessary for VRE, because the liability of the Commonwealth is capped by state statute. Thus, while motorists are provided with some protection through privately obtained insurance, the state does not have to insure itself against lawsuits. Sponsors of VRE chose to change state statutes to waive the \$25,000 cap in order to provide explicit protection to VRE customers. Insurance has been provided in order to indemnify the railroads and protect customers for an annual aggregate of up to \$200 million in damages.

Determining the theoretical maximum capacity of the VRE facilities versus the highway is problematic. VRE capacity is constrained in the short term by available parking, freight train competition for track time, and available rolling stock. Nonetheless, under current conditions VRE can move about 3,700 people per hour during rush hours (five trains of seven cars on each line with a capacity of 106 people per car). A highway lane could carry about 2,300 people per hour at equivalent speeds assuming the current regional average of 1.14 persons per car, and in fact, this number is nearly exactly that found by inbound traffic counts on I-395 just before the 14th Street Bridge during the peak morning hour. Of course, if auto occupancies were assumed to be greater (for instance, if more lanes were reserved for high occupancy vehicles) the assumed capacity of the highway lane would be correspondingly increased. Similarly, assuming more railcars, more frequent trains, or other VRE improvements not presently available would boost the capacity of the VRE alternative in this analysis.

Both highway and the rail corridors also perform functions other than carrying commuter traffic. For instance, both the tracks used by VRE and the highways used by passenger vehicles carry freight and can provide defense capabilities in a national emergency. These non-commuting benefits, however, are not within the scope of this analysis, since the underlying assumption of the analysis is that the region is contemplating an investment to relieve rush hour congestion in two mainline corridors in order to move commuters more effectively. Existing highway and rail capacity is

already available for freight and national defense needs and for off-peak transportation.

VRE total initial investment costs are \$86.5 million, compared to highway costs of \$338 million. Of course, while these two investments accomplish the same purpose – laying down the facilities upon which vehicles can move – it should be remembered that they do have dissimilar characteristics. VRE capacity is available for trips in both directions, but permission of the railroads is required to expand the frequency of service. Once an agreement is reached, capacity could be increased significantly at relatively little marginal cost. A single lane of highway would have to be reversible to provide the same two-way capacity enjoyed by VRE. Furthermore, while an interstate lane can also accommodate vehicles during off-peak hours, once it is filled to capacity during rush hours, the only way to accommodate more vehicles is to construct yet another lane, requiring at least another \$338 million capital investment. During peak hours, the tracks used by VRE are not at maximum capacity, and can accommodate an increase in of VRE patronage.

VRE	System	\$66,134,806
	Insurance Trust Fund	<u>20,368,000</u>
		\$86,502,806
Interstate	68 miles @ \$4.4 million/mile (Inner Jurisdictions)	\$300,000,000
	14 miles @ \$2.7 million/mile (Stafford County)	37,800,000
		<u>\$337,800,000</u>

2) Maintenance and Administration: \$14.1 million annually (VRE) v. \$2.9 million annually (Interstate - partial costing)

Based on the level of service provided in the Fiscal Year 1996 budget, the annual cost of maintaining and administering VRE will be just over \$14 million. This figure covers payments to the freight railroads for use of the tracks, improvements to those tracks, operation of the fare vending systems, marketing costs, maintenance and refurbishment of the stations and parking lots, and other general overhead. Corresponding interstate highway maintenance costs are budgeted at \$41,000 per lane mile, or \$3.4 million for the equivalent distance. Overhead costs of administration by VDOT and local authorities as well as costs of police protection are omitted, as are the costs of maintaining the bridges across the Potomac River and highways in the District of Columbia. Conversely, the costs of customer security and system maintenance are fully included within VRE's budget.

VRE	System Costs (Tracks extending from outlying stations to Union Station)	\$13,990,473 Per Year
	Costs to jurisdictions of maintaining stations & lots	<u>139,628</u> Per Year
		\$14,130,101
Interstate	82 miles @ \$41,000/mile	\$3,362,000 Per Year
	VDOT expenditures:	
	Overhead	N/D
	Legal expenses & settlements	N/D
	Cost of Maintaining Bridges over Potomac	N/D
	Police expenditures: Highway Patrol	N/D

N/D = Not Determined

3) Costs of Providing Transportation: \$.22 (VRE) v. \$.30 (Interstate) Per Passenger Mile

A portion of VRE's mission is to operate safe and reliable transportation on the facilities it built, leases, and maintains. To acquire rolling stock, pay crews and buy fuel to accomplish this costs about 22 cents per passenger mile at projected ridership levels. As passenger loads grow, this per-passenger-mile cost will decrease.

The Federal Highway Administration has calculated that the average cost to the public to acquire private compact automobiles and operate them along the same corridor is 26 cents per mile. This analysis also takes into account the cost of parking those cars once they arrive at their destination – whether that is a rural parking lot or one in the urban core. Neither the VRE nor the vehicular numbers reflect "user fees," or charges to the passenger which are directed back into the system being utilized. For instance, VRE fares, which are used to cover costs already accounted for in this analysis, are not included here. Similarly, fuel taxes and registration fees, which are traditionally dedicated to highway systems, have been deducted from the federal estimates of operating costs for an automobile.

Independently performed ridership estimations project an FY 96 ridership of 8,672 daily trips. Assuming that these trips average 35 miles one-way (reflecting VRE's current use versus the 32 miles shown in the table for Fiscal Year 1994 on page two), VRE costs in this category total about \$15.95 million for FY 1996. (The \$15.95 million is greater than VRE's Fiscal Year 1996 operating budget would indicate, because it includes the annual debt service for rolling stock, a figure generally considered to be

a capital budget item, but included in this section for comparability to auto costs.) The same number and length of trips by low-occupant automobiles would cost approximately \$22.4 million annually. This is based on the cost of those vehicles driving an average of 35 miles each way along the Interstate; neither analysis calculates the cost of accessing either the VRE station or the highway.

The cost of parking has been added to each mode based on an estimate of the value of the space used by those automobiles. Thus, due to higher land values, the estimated "cost" of parking in the urban core is significantly higher than that of leaving one's automobile at an outlying station. Most VRE commuters, and many of those who drive into the urban core, do not actually pay for parking, but the opportunity cost of the space their car uses is paid by someone, be it the local jurisdictions (in the case of the VRE parking lots), employers, or the public in general, as cars parked on the street take up room that could be used for other purposes, such as buildings, sidewalks, or parks. For the purposes of this calculation, the number of spaces used in each case was assumed to be 3,803: the number of passengers divided by the regional average auto occupancy rate.

VRE	Acquiring and operating rolling stock	\$15,951,617 Annually
	$\$15,951,617 / (8,672 \text{ passenger trips} \times 35 \text{ miles} \times 250 \text{ working days}) = .17$	
	Per Passenger Mile	
	Parking (\$.61/space)	<u>580,110</u> Annually
		\$16,531,727 Annually
Interstate	Acquiring and operating private automobiles	
	\$.26/Passenger Mile x 8,672 passenger trips	
	x 35 miles x 250 working days =	\$17,303,650 Annually
	Parking (\$5.40/space)	<u>5,134,737</u> Annually
		\$22,438,387 Annually

4) Air Quality Considerations: \$276,000 (VRE) v. \$4.4 million (Interstate) Annually

Based on current levels of service, VRE trains annually emit 1.8 tons of hydrocarbons, 1.3 tons of carbon monoxide, and 1.9 tons of oxides of nitrogen. However, if current VRE riders were to use the interstate instead, they would add about 22.3 tons of HC, 147.6 tons of CO and 40.6 tons of Nox to the region's air each year. These figures demonstrate the *difference* between commuters starting their cars and driving to work and those same commuters starting their cars, driving to the train station, and finishing their commute on the train.

Because Northern Virginia is in a "serious" non-attainment area with regards to federal air quality standards, transportation-related measures must be employed to reduce air pollution levels. In upcoming years, the region will be required to meet ever stricter standards, and the marginal cost of actions to reduce emissions can be expected to rise. In the event that the region does not meet its required targets, federal transportation monies may be withheld.

Currently, the average cost of eliminating a ton of hydrocarbon emissions through Transportation Control Measures either adopted or considered by the Metropolitan Washington Transportation Planning Board is estimated to be \$98,000. The average cost of eliminating a ton of oxides of nitrogen, the other pollutant for which the region must meet a federal emissions budget, is estimated at \$56,000. Consequently, the cost of mitigating VRE's air emissions would be approximately \$276,000, as opposed to a cost of \$4.4 million to mitigate those emissions generated if VRE riders drove on the interstate instead. Thus, VRE can be seen to be saving the region approximately \$4.1 million annually in air quality investments.

5) The Bottom Line: Net Present Valuation of Cost over Twenty Years at \$417 million (VRE) v. \$681 million (Interstate)

Considering the above cost comparisons, Northern Virginia's choice of VRE over the equivalent peak period capacity of a new highway lane in the congested I-95 and I-66 corridors makes sound economic sense. VRE is nearly four times less expensive for initial start-up expenses, if insurance costs are assumed to be comparable. While on an annual basis, VRE may cost more to maintain and administer than the hypothetical new highway lane, the actual provision of peak-period transportation using VRE is less costly than using the private automobile, and VRE is a big winner in air pollution savings.

Commuter rail also presents the public, both those using and those in the vicinity of the various modes of transportation, with fewer risks of injury. While fatality rates for commuter rail are only slightly lower than those on highway systems (.08 fatalities

per ten million passenger miles traveled v. .11 on the highways) non-fatal injury rates on highway systems are more than three times as high as those on commuter rail systems - 9.76 injuries per 10 million passenger miles traveled versus 2.9 injuries to passengers for the same amount of travel on commuter rail.

Looking to the future, peak capacity can be added to VRE at a considerably lower marginal cost than that at which it can be added to the Interstate system. Adding two lanes of peak period capacity to the Interstate highway would cost at least \$676 million (twice the \$338 million required for one lane). Of course, the acquisition of right-of-way would become more expensive and difficult with each additional lane. This escalation in costs due to acquisition of right-of-way is easily demonstrated by the I-395 corridor in Arlington, where there is very little room for the highway to expand without causing great disruption to the surrounding communities.

This disparity in the marginal costs of increased capacity would remain even if the existing railroad tracks were to become so congested as to require construction of an additional track. While clearly this would drive up the cost of the initial capital investment in VRE, the cost of building track in this region is currently estimated at \$2 million per mile, still less than the estimated cost of most of the highway construction in this analysis. The marginal costs of extending service on VRE or extending the extra lane on the Interstate would also vary greatly; while both the capital and the maintenance figures for the Interstate are based on a per mile number, and thus increase as the length of the road increases, the administrative costs to VRE would only increase slightly, resulting in an overall decrease in the cost per mile of service.

Of course, VRE cannot completely replace the private automobile. Many people cannot conveniently access a station, work somewhere other than along the mainline corridor, or must travel at times other than peak periods. Having a highway system that is safe and reasonably free of congestion is essential to accommodate those persons' travel needs. But many commuters can be effectively served by VRE. If the removal of those commuters from the highways eliminates the need to expand highway capacity, then the cost of that rail alternative versus the cost of expanded roadways provides an economic measure of the public investment value of the alternatives.

In this analysis, considering the stream of relative costs over an assumed 20 year investment horizon, with no assumed salvage value and a discount rate of seven percent (a conservative estimate of the federal cost of borrowing funds for twenty years,) the net present value of VRE savings relative to the new peak period highway capacity and associated automobile costs is an astonishing \$263.6 million. Assumptions, sources, and calculations underlying this analysis are contained in the following worksheets.

1st Comparison -- VRE vs. Additional Lane of Interstate April 24, 1995

This analysis compares the start-up and operating costs of VRE to the costs of adding one lane of interstate from Manassas (Rte. 234) and Fredericksburg, Va. to the Potomac River to serve peak period commuters. The analysis assumes FY 96 projected levels of VRE ridership and congested Interstate highways in the two corridors.

Sources and Calculations

1) Initial Capital Investment: \$86.5 million (VRE) v. \$337 million (I/S)

Cost of putting the stationary system in place (planning, engineering, laying pavement, building stations, etc.)

1) A	VRE	System	\$66,134,806
		Insurance Trust Fund	<u>20,368,000</u>
			\$86,502,806
	Stations & Parking	18,617,000	
	Yards	8,169,000	
	Inventory	1,338,000	
	Cash Available	1,905,000	
	Debt Service Reserves	13,962,806	
	Jur'l. Stations & Parking	<u>22,143,000</u>	
		66,134,806	

State liability is legally limited: thus highway systems are not required to be insured as are rail systems.

1) B	Interstate	68 miles @ \$4.4 million/mile =	\$299,200,000
		14 miles @ \$2.7 million/mile =	<u>\$37,800,000</u>
			\$337,000,000

Cost in Stafford County (14 miles) based on average figure for outer jurisdictions. VDOT Office of Transportation Planning

Cost in other jurisdictions (68 miles) based on average of cost per lane mile of Northern Virginia Interstate construction projects listed in the Virginia Commonwealth Transportation Board FY 94-95 Six Year Improvement Program. Costs do not include rights-of way, and would most likely be higher due to extreme difficulties in acquiring Rights of Way in certain portions of the corridors.

3) Cost of Providing Transportation (Per Passenger Mile): \$0.22 (VRE) v. \$0.30 (I/S)

Cost of moving people along the corridor, either in rail cars or automobiles, and maintaining vehicles.

A VRE Cost of acquiring and operating rolling stock

		FY 96
Operating Budget		11,073,315
CIP		250,000
Locomotive Lease		320,000
Debt Service		4,308,302
		15,951,617
Annual cost	Rolling Stock:	15,951,617
Parking Costs	(\$0.61/day/car)	\$580,110 Per Year
Annual Total		\$16,531,727

Average Daily Ridership (Projected):	4,336
Average Trip Length	35
Working Days in Year:	250
Average Rolling Stock Cost per Passenger Mile:	0.22

3)B Interstate Cost of acquiring, operating, and parking automobile 0.30 Per Passenger Mile

Travelling	17,303,650
Parking	5,134,737
Total	\$22,438,387

Cost of acquiring and operating automobile	0.26 Per Mile
Average Number of Cars:	3,803
Average Trip Length	35
Working Days in Year:	250
Average Annual Total Costs:	\$17,303,650

Cost to owner of operating vehicle based on calculations by FHWA, 1991 (Pub. #FHWA-PL-92-019)
 Figure includes depreciation, insurance, maintenance, and fuel.
 Does not include taxes or registration fees (regarded as transfer, as are VRE fares).

Parking Costs	(\$0.40/day/car)	\$5,134,737 Per Year
---------------	------------------	----------------------

$$\frac{4336 \text{ Passengers}}{1.14 \text{ (avg. vehicle occupancy)}} = 3,804 \text{ vehicles not travelling to core daily}$$

Average parking cost based on April, 1995 survey of parking garages; \$0.40/day is proportional average of monthly parking fees in the analysis zones of the four inner VRE stations, prorated to determine daily rate. Rates in the area of particular stations are listed below:

King Street: \$4.00	L'Enfant Plaza: \$7.00
Crystal City: \$3.60	Union Station: \$5.60

April 24, 1995

4) Emissions Factors: \$276,000 (VRE) v. \$4.4 million (US)

4)A	VRE	HC/VOC Costs:	\$172,085			
		NOx Costs:	\$104,273			
		Annual Costs:	\$276,357			
	HC/VOC:	Cost/Ton	\$98,334	NOx:	Cost/Ton	\$55,612
		Tons/year	1.75		Tons/year	1.875
			\$172,085			\$104,273

8 trains x 38 miles + 12 trains x 58 miles = 1000 miles

Pollutant	Emissions Factor (g/mi)	Mileage	Working Days	Kilograms Per Year	Tons Per Year
HC	30.8	1000	250	7700	1.75
CO	22	1000	250	5500	1.25
NOx	33	1000	250	8250	1.875

4)B	Interstate	HC/VOC Costs:	\$2,192,848			
		NOx Costs:	\$2,255,067			
		Annual Costs:	\$4,447,915			
	HC/VOC:	Cost/Ton	\$98,334	NOx:	Cost/Ton	\$55,612
		Tons/year	22.3		Tons/year	40.55
			\$2,192,848			\$2,255,067

Interstate emissions calculations detailed on attached page.

Estimate is of emissions from cars projected to be removed from highways due to VRE. Increased capacity would also increase demand, and therefore emissions, as commuters switched from buses, etc. to low-occupant vehicles.

Emissions due to trips to stations have been subtracted from Interstate emissions. (Figures take into account cold starts, VMT, and hot soaks, and account for emissions generated by trips to stations.)

The cost of emissions mitigation projects is based on Metropolitan Washington Transportation Planning Board staff estimates of the costs and benefits of Transportation Control Measures that have been included in the metropolitan Washington FY 95-00 Transportation Improvement Program (TIP) or that are being considered for inclusion in the FY 96-01 TIP.

5) The Bottom Line

- 5) A VRE Commuter rail data from FY 1992 Section 15 data, published by Federal Transit Administration, Office of Technical Assistance and Safety
- 5) B Interstate Safety data published in Table FI-1 of "Highway Statistics", 1992, published by the Federal Highway Administration, U.S. DOT.

RE: Draft Environmental Impact Statement on Proposed Conrail
Acquisition

Dear Ms. Kaiser:

The Department of Environmental Quality (DEQ) is responsible for coordinating Virginia's review of federal environmental documents and responding to the appropriate officials on behalf of the Commonwealth. In this instance; however, the DEIS was not distributed by DEQ, but was sent directly to the appropriate agencies by the proponent. The Commonwealth of Virginia Agencies may respond directly. The following are the comments of DEQ.

The proposed project is the resulting operations of the assets of the acquisition of Conrail by CSX and Norfolk Southern (NS). Under the proposal, the existing CSX and NS systems would be expanded and would substitute two competing railroads for the existing Conrail system in the Northeast (including Virginia) and upper Midwest.

The DEQ offers the following comments and recommendations:

1. **Air Quality.** DEQ's Office of Air Data Analysis offers the following comments:

Finance Docket Number 33388
February 6, 1998
Page Two

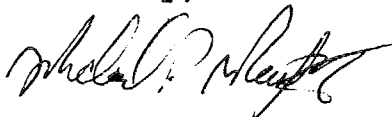

- The rerouting and realignment of freight train operations in Virginia by the CSX and NS railroads are anticipated to pose a noticeable air quality impact locally and regionally within Virginia;
- A demonstration of conformity to the State Implementation Plan (SIP) is required of a federal action occurring in an ozone nonattainment area (Clean Air Act Amendments of 1990, Section 176(c), 40 CFR, Parts 6,51 and 93) regardless of the screening criteria established for this DEIS; and
- For specific details please refer to the attached February 6, 1998, memo from Dona Huang.

Please continue to work with Dona Huang, DEQ's Office of Air Data Analysis, concerning the demonstration of conformity. She can be reached at (804) 698-4405.

2. Federal Consistency Certification. Pursuant to the Coastal Zone Management Act of 1972, as amended, the proposed activities must be operated and constructed in a manner which is consistent with the Virginia Coastal Resources Management Program (VCRMP). In this regard, the proponents must receive all applicable permits and approvals listed under the Enforceable Programs of the VCRMP (Attached).

Thank you for the opportunity to comment on the DEIS for the proposed activity. The comments of the reviewing agency are attached for your review and consideration.

Sincerely,

Michael P. Murphy
Customer Service Director

DEPARTMENT OF ENVIRONMENTAL QUALITY
OFFICE OF AIR DATA ANALYSIS

MEMORANDUM

TO: Thomas Felvey, Office of Environmental Impact Review

FROM: Dona Huang, Senior Environmental Engineer 

SUBJECT: Draft Environmental Impact Statement on the Proposed Conrail Acquisition

DATE: February 6, 1998

Thank you for the opportunity to review the referenced subject. The Office of Air Data Analysis would like to make several comments regarding the project.

1. The rerouting and realignment of freight train operations in Virginia, by the CSX and Norfolk Southern (NS) railroads as a result of the joint acquisition of Conrail services, are anticipated to pose a noticeable air quality impact locally and regionally within Virginia. Therefore the impact must be addressed on two tiers. The significant portion of the impact, as defined by the study, occurs along two state designated Class 1 areas and a federally designated serious ozone nonattainment area.
2. For the regional level analysis, the jurisdictions bordering or containing the Class 1 areas should be addressed as one region in order to capture the overall benefits and disbenefits of the project to the Class 1 areas. The issues of haze, ozone, acid rain deposition and nitrogen oxides affecting the Class 1 areas are not restricted geographically to jurisdictions proximal to the Class 1 areas. Transport processes, and the formation of ozone and acid rain occurring upwind from the impacted areas must be considered. Therefore, the evaluation of emissions saved from truck diversions should be accounted for on a regional level and not on the jurisdictional level where interstate highways such as I-81 are located for truck diversion analysis.
3. However on the local level, where rail segments come within 10 Km of a Class 1 area, consideration should be made to minimize at-grade crossing delay, noise, and fugitive emissions to avoid impacting local air quality and vista. As project sponsor is aware, the prevention of significant deterioration (PSD) standard for a stationary source located within 10 Km of a Class 1 area is equal to or greater than one microgram per cubic meter (1 ug/m^3) per 24 hour period.
4. Emission impact to jurisdictions located in the northern Virginia serious ozone

nonattainment area should be evaluated together as a region. A demonstration of conformity to the State Implementation Plan (SIP) is required of a federal action occurring in an ozone nonattainment area (Clean Air Act Amendments of 1990, Sect. 176(c); 40 CFR, Parts 6, 51, and 93) regardless of the screening criteria established for this EIS. Any netting of emission impact should include benefits and disbenefits from rail operation, truck diversion, vehicular at-grade crossing delay, intermodal/terminal operation, railyard operation, impact to passenger rail services and ridership capacity, etc.

5. Because of the nature of the impact from the proposed project to the transportation community, it is important that the emission benefits from truck VMT removal and emission disbenefits from at-grade crossing delay be related to the metropolitan planning organization (MPO) for the area. The information should be shared with the MPO to facilitate the regional transportation conformity determination. It should be noted that the transportation aspect of a federal action must be found conforming by the transportation conformity determination process (40 CFR 51.853(a)).

6. For the local level impact, a localized hot-spot analysis should be performed for areas experiencing additional at-grade crossing delay and for intermodal or railyard facilities experiencing additional operation.

7. It is also necessary to re-evaluate the emissions from rail operations occurring in the Richmond and the Hampton Roads ozone maintenance areas under the general conformity context regardless of this EIS screening criteria.

8. Please explain why the impact to the port activities in Hampton Roads was below the screening threshold when in fact Sect. 5-VA.2 indicated that the "...Monogahela coal fields of western Pennsylvania would add another source of coal traffic for the CSX-served export docks at Newport News, and NS-served export docks at Norfolk."

9. With respect to the emission analyses on vehicular at-grade crossing delay, this office would like to suggest strengthening the analyses to reflect delay experienced during the summer ozone peak-hour period. The various delay indicators were evaluated as an annual daily average occurrence. On the local level, during favorable ozone forming summer conditions, even an acceptable increase in vehicular delay (according to the study) at an at-grade crossing may contribute to the already aggravated air quality condition. Furthermore, in our scoping comments, we indicated that certain at-grade crossings at the Prince Williams County and Manassas City have already experienced unacceptable congestion and delay during the peak commuting hours due to train crossings, and the Virginia Department of Transportation has begun looking into possible solutions to this problem. How are the existing unacceptable crossing delays incorporated into and reflected in this study?

10. Please explain the rationale and mathematical equation used in the estimation of the "Average Delay for All Vehicles" in page C-13. Based on the equation, the units do not work out correctly. Please explain the use of conversion factor "24" - number of hours per day to be divided by conversion factor "1440" - number of minutes per day. Please explain why the

spreadsheet exhibited in Table 5-VA-7 contains units for "Average Delay per Vehicle (All Vehicles)" as "sec/veh" whereas the aforementioned equation provides units of "min/veh".

11. Please explain why the mathematical equation used to evaluate the "Number of Vehicles Delayed Per Day" did not incorporate the same assumptions used by the "Maximum Vehicle Queue" equation to address peak-hour traffic.

12. Please explain the derivation of factor "0.0833" in the "Average Delay for All Vehicles" equation and how peak-hour traffic was weighted.

13. The Department would like to suggest that the train speed and train length data used in the at-grade crossing studies be reflective of the peak-hour traffic scenario. This refers to the average train speed and length at the at-grade crossing encountered during peak hours. Our experience with certain local crossings suggests that the train speed and length encountered during peak-commuting hours were much slower and longer, respectively.

14. As indicated in Table 4-17, there are additional NS and CSX estimated truck diversion emissions occurring in jurisdictions not included in the netting analyses as well as jurisdictions affected by truck diversion. Therefore, the net adjusted state total for Virginia is a reduction of 647 tons per year of NO_x vs. a gain of 800 tons per year from the netting analyses. Unfortunately, the adjusted state total did not include NO_x growth from jurisdictions that were determined to be below the screening threshold. It would be beneficial to prepare a summary table of NO_x emissions from all jurisdictions affected by this project.

15. Based on the argument above, Table 4-17 is not a comprehensive summary of estimated NO_x emissions changes in the Northeast Ozone Transport Region (OTR).

16. Please provide the CSX and NS truck diversion data (if possible, by jurisdiction) for our information and emission inventory tracking purposes. As indicated in the document, there is potential double counting of truck diversion by CSX and NS, please provide some information on the magnitude of this potential.

If you or the project sponsor has any questions regarding these comments, please feel free to call me at (804) 698-4405.

Dear Ms. Kaiser:

The West Virginia Division of Natural Resources (WVDNR) has reviewed the Draft Environmental Impact Statement for the "Proposed Conrail Acquisition" prepared by the Surface Transportation Board. The WVDNR anticipates few adverse impacts to fish and wildlife to result from the acquisition of Conrail by CSX and Norfolk Southern.

Sincerely,

RE: Comments on CSX & Norfolk Southern-Control & Acquisition

I would like to request a community meeting in Anacostia to discuss the proposed Conrail Acquisition. I have reviewed the information that you were so kind to send me through the mail. However, there are several issues that I am extremely concerned about:

- First, a community of color will be disproportionately exposed to poorer air quality with a potential increase from 23.9 trains to 30.8 trains per day if this project is approved. This becomes an environmental justice issue that needs to be addressed.
- Secondly, if the air quality in this already distressed community is impaired what kind of responsibility will the company take for the eminent impact this will have on the public health of our children, seniors, HIV/AIDS population, cancer population, etc.?
- Thirdly, I am concerned about the safety measures as it relates to the public.
- Fourthly, the potential for noise pollution will increase and ultimately adversely impact this community. What kind of measures will be taken to deal with this issue as it relates to the health of the community?
- Fifthly, we certainly do not need anymore highway congestion in Southeast than we already have. The EIS does not clearly articulate how this will be addressed.
- How many residents from Ward 8 will be employed through this effort? As a proponent of environmental stewardship, my responsibility is to look at this issue as it relates to environmental justice, economic development and public health.

3008-24th Place, S.E. Washington, D.C. 20020 (202) 678-1978

Conrail Acquisition
January 5, 1998
Page 2

Our natural resources in distressed urban communities are quite limited when we look at quality of life issues. I am concerned that the real issues that will ultimately impact the people that live and work near the railways are the ones who will ultimately suffer in the name of efficiency. Again, I would like to recommend a public hearing in Ward 8 at Young's Memorial Church where Rev. Herbert B. Chambers is the Pastor. He would be happy to open his doors to afford you an opportunity to address the community's concerns. Should you require any further information regarding this matter, please do not hesitate to contact me on (202) 678-1978.

Your attention and consideration in this matter is deeply appreciated.

Attention: Elaine K. Kaiser
Environmental Project Director
Environmental Filing

Dear Ms. Kaiser:

We appreciate the opportunity to submit the following written comments on the Draft Environmental Impact Statement (DEIS), dated December 12, 1997, on the proposed acquisition of Conrail by Norfolk Southern Railroad and CSX Railroad (Applicants).

Scope of the Environmental Impact Statement (EIS)

By the enclosed letter of August 6, 1997, we recommended that Surface Transportation Board (STB) expand the EIS scope to include an analysis of changes in level of operations on freight rail lines that are in common corridors with rapid rail systems. We expressed the concern that increased railroad traffic increases the probability and potential severity of catastrophic rail accidents and increases our risk exposure and the associated costs of liability insurance and indemnification. However, in spite of our comments, the DEIS still does not include the analysis of the common corridors of freight rail and rapid rail operations.

We believe that the cause for this omission may be a failure to differentiate between preexisting conditions and the anticipated new conditions of the proposed transaction, namely additional trains, increased train lengths and higher train speeds. STB states in its July 1, 1997 Notice of Intent that "the Board's practice consistently has been to mitigate only those environmental impacts that result directly from the transaction." It is our conviction that a critical result of the Conrail acquisition with more frequent and longer trains will be an increased likelihood of severe rail accidents in the common corridors, a result which was unaccounted for in the planning and development of those corridors and which, therefore, is a new condition.

Our concerns are reinforced by the findings of the Federal Railroad Administration's (FRA) Safety Assurance and Compliance Program Report

for CSX Transportation, Inc., dated October 16, 1997. The fact that FRA found a general lack of consistency in maintaining a comprehensive CSX signal oversight program and defects on CSX main tracks is extremely pertinent to our stance that the EIS scope must address common corridor safety.

Conditions of Common Corridor Operations

We wish to make STB aware of the common corridor operations and history, which includes freight rail accidents that justify our position above on the EIS scope.

There are five distinct common corridor segments in our rapid rail system. These are within the STB line segments C-003, C-101, C-034, C-035, and N-315. Our system is in revenue operations from 5:30 AM to 12:00 midnight on weekdays and from 8:00 AM to 12:00 midnight on weekends. There are high numbers of both freight, passenger and rapid rail trains in the common corridors. For example, within STB line segment C-003 (Metro Wheaton Line), 24 freight trains, 20 passenger trains and 462 rapid rail trains currently share the corridor during a typical weekday. The distance between freight/passenger and rapid rail track centerlines is 20 feet.

Since start of rapid rail operations in 1976, there have been two freight rail accidents in the common corridor which caused physical damage and service disruption to the rapid rail system. For the 32 miles total of common corridor, the accident frequency per route mile is then once every 16 years, greatly more than the 100 years for freight train accidents.

Analyses of the Environmental Impacts in Common Corridors

We recognize that STB may need to develop a segment-specific method to evaluate the potential net effect of the proposed acquisition on rapid rail safety since the methods for freight and passenger rail operation safety effects do not apply to common corridor safety. We are ready to provide STB with base data and to assist in the development of the methodology, which should incorporate the additional number of freight trains, increased train lengths, greater tonnage and higher train speeds as factors.

Potential Mitigation Strategies for Rapid Rail Safety in Common Corridors

On page 3-7 of the DEIS, STB has identified mitigation strategies that can reduce significant safety risk impacts. These include enhanced rail-safety programs, increased frequency of track inspections and replacement of old rails. Other possible mitigation measures to mitigate the increased risk in the common corridors include, but are not necessarily limited to, the following:

Elaine K. Kaiser
Surface Transportation Board
Page 3

1. Publication and distribution of the integration of the best practices of Conrail and the Applicants' safety processes, per DEIS Volume 2, Safety Integration Plans.
2. Speed restrictions of freight trains as recommended in 1988 by the CSX and WMATA Joint Operating Safety Committee.
3. A Hot Box Detection System installed on each freight track.
4. A High-and-Wide Load detection system installed on each freight track.
5. A Dragging Equipment detection system installed on each freight track.

The systems identified in items 3, 4 and 5 above are to be connected to the Applicants' central control systems. Hot Line connections should be provided and maintained between the Applicants' and our control centers. The Applicants should annually conduct an inventory of the safety devices and monitors within the common corridors and should regularly ensure that all devices and monitors are in proper working order. The Applicants should be required to obtain our approval for any addition, deletion or modification of the safety devices and monitors.

The increased freight traffic will increase our liability and present an added financial burden for higher insurance and indemnification costs. We feel strongly that the Applicants should reimburse us for the additional incremental costs of liability insurance and indemnification of the common corridor due to the increased risk.

We look forward to receiving constructive responses to our concerns from the Surface Transportation Board as part of the EIS process. If you have any questions regarding our comments, please feel free to contact Mr. Richard Bochner, Acting Manager of Project Development. Mr. Bochner may be reached at (202) 962-1252.

Sincerely,

John C. Elkins

Washington, DC 20423-0001

Attention: Elaine K. Kaiser
Chief, Section of Environmental Analysis
Environmental Filing

Dear Ms. Kaiser:

This letter is in response to your July 3, 1997 letter to our General Manager which transmitted the Surface Transportation Board's (STB) Notice of Intent to Prepare an Environmental Impact Statement (EIS) and Request for Comments on the Proposed EIS Scope in the above docket. The Washington Metropolitan Area Transit Authority's (WMATA) Metrorail rapid transit system shares approximately 32 miles of corridor with the CSXT Railroad and approximately two (2) miles of corridor with the Norfolk Southern Railroad. Thus we are interested in any actions which could potentially impact railroad operations within our common corridors. Our interest relative to the proposed control of Conrail by CSXT and Norfolk Southern focuses primarily on safety.

We are concerned that the proposed action will increase railroad traffic in the Washington, D.C. metropolitan area and thus increase our exposure to incidents on the common corridors due to railroad operations. Not only is this a concern to us from an operations and passenger safety perspective, but the increased exposure would also have long-term financial implications due to our agreements with CSXT and its predecessors. These agreements require WMATA to bear the costs of all liability insurance and to indemnify the railroad within the common corridors.

To address our concerns, it is requested that the EIS Scope address the increased railroad traffic from a safety perspective in terms of the additional trains, increased train lengths and higher train speeds which may result from this action. Our opinion is that increased railroad traffic increases the

A-611-a

probability and potential severity of catastrophic rail accidents and increases our risk exposure and the associated costs of liability insurance and indemnification.

Our review of the railroad's Environmental Report and the proposed EIS scope has generated the following revisions and comments on the scope:

Environmental Impact Analysis (page 8)

Insert the following new proposed activity after 3.

4. Anticipated changes in level of operations on rail lines that are in common corridors with rapid rail operations.

It is recommended that STB expand its threshold for addressing environmental impacts from the current increase of eight (8) trains per day on the rail lines to consider also increased train lengths and higher train speeds as well since all three factors will affect the safety of the rapid rail operations in the common corridor.

STB should also define a distance threshold for addressing environmental impacts within common corridors. For instance, the distance between the centerlines of WMATA's Red Line and CSX in some corridors is as close as 20 feet. As part of the analysis, the STB's EIS should identify all locations of common corridors within the above distance threshold by tabular listings and by maps.

Impact Category 1 Safety (page 9)

Insert the following new impact category after C.

- D Address potential effects of increased freight traffic, such as additional trains, increased train lengths and higher train speeds, on rapid rail operations in common corridors.

The STB's EIS should evaluate the increased probability and then the potential severity of catastrophic rail accidents between rail line and rapid rail operations within common corridors due to the additional trains, increased train lengths and higher train speeds which may result from this action. This information was not included in the Environmental Report.

Mitigation

Among the possible mitigation measures to offset the possible increased

Elaine K. Kaiser
Surface Transportation Board
Page 3

probability and higher risk exposure of accidents between rail line and rapid rail operations within common corridors, WMATA requests that the EIS consider the following requirements:

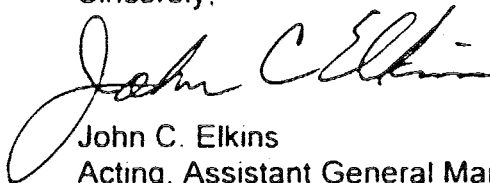

- A. The railroads will conduct an inventory of the safety devices and monitors currently in operation within the corridors shared with WMATA. The railroads will require written concurrence from WMATA for any addition, deletion or modification of these safety devices and monitors.
- B. To offset the potential financial burden that the increased freight traffic would have on WMATA, the railroads will reimburse WMATA for the additional incremental costs of liability insurance and indemnification of the common corridor due to the increased risk.

Addressing the above safety related issues in the EIS will provide a basis for determining the appropriate course of action, if any, necessary to mitigate the potential impacts.

In addition to the above comments, we request that your mailing list be revised for the name of our General Manager, Mr. Richard A. White.

We look forward to working with the Surface Transportation Board during this EIS process. If you have any questions regarding our comments and proposals, please feel free to contact Mr. Richard Bochner, Acting Manager of Project Development. Mr. Bochner may be reached at (202) 962-1252.

Sincerely,

John C. Elkins

ENVIRONMENTAL DOCUMENT

Office of the Secretary
Case Control Unit
Finance Docket No. 33388
Surface Transportation Board
1925 K Street, NW
Washington, DC 20423-0001

Attn: Elaine K. Kaiser
Chief, Section of Environmental Analysis
Environmental Filing

Dear Ms. Kaiser:

The following comments are provided on the Draft Environmental Statement (DEIS) the for Proposed Conrail Acquisition:

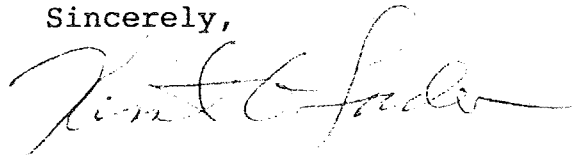

1. The DEIS does not address common corridor use with the Metrorail system of the Washington Metropolitan Area Transit Authority. No analysis is presented on potential accident risk as a result of increased freight train activity in the common corridors with Metrorail.
2. The DEIS identifies tunnel improvements to increase clearance at the Virginia Avenue Tunnel to accommodate increased freight traffic and to eliminate a current restriction that affects passenger rail operations as related to the proposed acquisition. However, the report does not state whether these proposed improvements would meet or exceed Surface Transportation Board thresholds for environmental analysis of

noise, safety, environmental justice or other potential impacts.

3. There is no analysis provided on ground-borne vibration. According to Federal Transit Administration guidance, ground-borne noise sounds louder than broadband noise. The guidance also suggests that shifting freight traffic to other routes can impact ground-borne vibration.
4. In Washington, DC, it is the region, including jurisdictions in Maryland and Virginia, that is in non-attainment. Although each state and the District of Columbia are ultimately responsible for reaching and maintaining attainment, they have adopted a coordinated strategy through the Washington Metropolitan Area Air Quality Committee (MWACQ). To our knowledge, the analysis of potential effects did not include consultation with this body which has established the emissions value for the area. We do not believe that a conclusion of no significant impact is appropriate without determining if there are impacts on the region's emissions reduction and maintenance plans.

Should you have any questions or require any additional information, please contact me.

Sincerely,

Kenneth G. Laden,
Acting Administrator

February 2, 1998

The Honorable Vernon A. Williams
Secretary
Surface Transportation Board
1925 K Street, N.W.
Washington, D.C. 20423

Re: CSX Corporation and CSX Transportation, Inc., Norfolk Southern Corporation and Norfolk Southern Railway Company – Control and Operating Leases/Agreements – Conrail Inc., and Consolidated Rail Corporation

Dear Mr. Williams:

I am writing on behalf of United Parcel Service (“UPS”) to oppose a condition that we understand the Surface Transportation Board’s environmental section proposes to ask the Board to impose on the CSX/Norfolk Southern acquisition of Conrail.

Specifically, this proposed condition would require all trains moving in the same and opposite directions on the same track to be clear of the track at least 15 minutes before and 15 minutes after the expected arrival of a passenger train at any point. It has been recommended that the Board impose this requirement, which we think is extremely onerous, on identified CSX rail segments in Georgia, Maryland, North Carolina, Virginia and Washington, D.C., and on Norfolk Southern lines in Indiana, Michigan and New York.

UPS relies heavily on the intermodal services the railroads provide over the corridors affected by the proposed limitation. Our business is consumer oriented and our shipments are time sensitive. Accordingly, any restraints on the timely movements of our freight impact our ability to serve our customers.

The proposed 30-minute window to clear the tracks would be detrimental to our business. Therefore, this proposed condition should not be imposed. It will only add unnecessary delays to the efficient movement of time-sensitive freight.

We therefore respectfully ask the Board to reject the proposed 30-minute window. Thank you for your consideration.

Sincerely,

Arnold F. Wellman
Vice President, Domestic and International
Public Affairs
