

following a tagged whale to observe its behavior), and controlled exposure to playbacks of a whale-finding sonar, airgun sounds, and/or sperm whale (*Physeter macrocephalus*) social vocalizations (codas). When the DTAGs are retrieved after release, small fragments of sloughed skin are often found in the suction cup. These tissue samples will be exported from field sites and imported for genetic analyses.

Project 1 will involve applying DTAGs to a variety of whale and dolphin species to study the baseline behavior of animals tagged throughout the North Atlantic. There are three main goals of Project 1: (1) to obtain continuous sampling of marine mammal vocal and motor behavior, (2) to determine correction factors that can be applied to visual sighting data to better estimate population and stock abundance, and (3) to serve as a control group for Projects 2 and 3, described below.

For Project 2, tagged whales and dolphins in the Mediterranean Sea will be used as test subjects in controlled tests of a whale-finding sonar developed by a North Atlantic Treaty Organization (NATO) undersea research lab in Italy. Maximum received level will be 160 dB re 1 μ Pa rms. Playbacks of sperm whale codas will be used as a control stimulus. The goal of Project 2 is to validate the effectiveness of a whale-finding sonar, to calibrate measurements of the target strength of marine mammals as a function of aspect, and to assess the received levels at which animals that can hear the sonar may start to show changes in behavior.

For Project 3 the responses of tagged sperm whales to short impulses from airgun arrays at received levels no higher than 180 dB re 1 μ Pa rms will be studied in the Gulf of Mexico. Playbacks of sperm whale codas will be used as a control stimulus. These studies will involve visual observations of surfacing sperm whales, passive acoustic tracking of diving sperm whales, and tagging sperm whales with DTAGs. The primary research objective of the Project 3 airgun playbacks is to determine what characteristics of exposure to specific sounds evoke behavioral responses in marine mammals.

The purpose of the research, as stated in the application, is to study the biology, foraging ecology, communication, and behavior of cetacean species, with a focus on their responses to anthropogenic sounds in the marine environment. The permit will be valid for a period of five years.

Issuance of this permit, as required by the ESA, was based on a finding that such permit (1) was applied for in good

faith, (2) will not operate to the disadvantage of the endangered species which is the subject of this permit, and (3) is consistent with the purposes and policies set forth in section 2 of the ESA.
