SUPPLEMENTARY INFORMATION:

A. Background

This proposed rule amends the DFARS to standardize the use of geographic terms, for consistency with the definitions of the following terms found in section 2.101 of the Federal Acquisition Regulation: “United States”; “contiguous United States”; “customs territory of the United States”; and “outlying areas”.

This rule was not subject to Office of Management and Budget review under Executive Order 12866, dated September 30, 1993.

B. Regulatory Flexibility Act

DoD does not expect this rule to have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601, *et seq.*, because the rule standardizes DFARS terminology, but makes no substantive change to policy. Therefore, DoD has not performed an initial regulatory flexibility analysis. DoD invites comments from small businesses and other interested parties. DoD also will consider comments from small entities concerning the affected DFARS subparts in accordance with 5 U.S.C. 610. Such comments should be submitted separately and should cite DFARS Case 2001–D003.

C. Paperwork Reduction Act

The Paperwork Reduction Act does not apply because the rule does not impose any information collection requirements that require the approval of the Office of Management and Budget under 44 U.S.C. 3501, *et seq.*

RIN 2127-AH71

Federal Motor Vehicle Safety Standards; Accelerator Control Systems

AGENCY: National Highway Traffic Safety Administration (NHTSA), DOT.

ACTION: Withdrawal of rulemaking.

SUMMARY: In July 2002, NHTSA published an NPRM proposing to update Federal Motor Vehicle Safety Standard (FMVSS) No. 124, the agency's safety standard for vehicle accelerator

control systems, to make explicit its applicability to new types of engines and throttle controls, particularly electronic ones. The proposal included a number of new test procedures to address different types of powertrain technology. One of those test procedures involved measurement of engine speed under realistic powertrain load conditions on a chassis dynamometer. That procedure was "technology-neutral" and was included to allow testing of vehicles that could not readily be tested by one of the other procedures included in the proposal that were technology specific.

As discussed in this document, the agency is withdrawing the NPRM while it conducts further research on issues relating to chassis dynamometer-based test procedures for accelerator controls.

SUPPLEMENTARY INFORMATION:

I. Background

Federal Motor Vehicle Safety Standard (FMVSS) No. 124, *Accelerator Control Systems*, provides for safe control of engine power by a vehicle's driver-operated accelerator. For vehicles that are operating with their accelerator controls intact, FMVSS No. 124 requires the rapid return of the throttle to the idle position (within one second for light vehicles and two seconds for heavy vehicles) when the accelerator pedal is released. For vehicles that experience disconnections in the linkage between their accelerator pedals and throttling devices, FMVSS No. 124 requires return to idle in an equally rapid fashion. By virtue of FMVSS No. 124's requirements, drivers are ensured that releasing the accelerator pedal will prevent the engine from continuing to power the drive wheels at a level greater than the idle level, even if the accelerator linkage breaks.

New engine control technology such as "throttle-by-wire" systems have significantly changed the nature of accelerator control functions and failure modes. Throttle linkages have become less common, and now "disconnections" or "severances" as referred to in the standard could just as easily involve electrical wires as they could rods, levers, and cables. In

interpretation letters, NHTSA has stated that electrical wires and connectors in an electronic system are analogous to mechanical components in a traditional system and are therefore covered by FMVSS No. 124. However, complexity in electronic accelerator control systems is much greater than in mechanical ones, especially in terms of the powertrain responses that can result from failures in such systems.

In order to update FMVSS No. 124, NHTSA published a Request for Comments in 1995 (60 FR 60261) and, after consideration of comments received, issued an NPRM in 2002 (67 FR 48117).

The agency proposed that the standard specify explicitly the components and types of disconnections and severances to be covered in electronic accelerator control systems. NHTSA also proposed that the standard include new test procedures to better address different types of powertrains. A manufacturer could choose any one of the test procedures as a basis for compliance, and a "universal" chassis dynamometer test was included as a last resort in cases where the other procedures were inapplicable.

In making the proposal, NHTSA sought not to expand the scope of the existing Standard, but to merely clarify the standard's applicability to accelerator control systems associated with various powertrains including gasoline engines, diesel engines, electric motors, and hybrids. The new procedures in the proposal were all premised on return to a "baseline" idle condition measured on a normally operating vehicle, analogous to return of a throttle plate to the idle position.

The proposal included three technology specific test procedures plus a "universal" test procedure. The first of the proposed technology specific test procedures was essentially the existing air throttle plate position test of the current Standard, normally applicable to conventional gasoline engines. The second test procedure was measurement of fuel flow rate, normally applicable to diesel engines. The third test procedure was measurement of input current to a drive motor, applicable to electric vehicles. The last procedure was measurement of drivetrain output via engine speed, conducted on a chassis dynamometer. This was considered a universal test because it could be applied to gasoline, diesel, or electric vehicles.
