AN ABSTRACT OF THE DISSERTATION OF

WAYNE E. THOGMARTIN, for the Doctor of Philosophy degree in ZOOLOGY,
presented on 31 November 2001, at Southern Illinois University, Carbondale.

TITLE: Spatio-temporal dynamics of Northern Bobwhite (*COLINUS VIRGINIANUS*) in
Illinois

MAJOR PROFESSOR: Alan Woolf

Northern Bobwhite (*Colinus virginianus*) are declining in abundance throughout their distribution. This decline is traditionally tied to degradation and loss of habitat. In Illinois, the bobwhite population has been rather stationary after a severe decline in the 1970s despite continued loss of habitat important to this species. Thus, objectives of my dissertation were to 1) estimate historical temporal and spatial patterns in bobwhite population dynamics and determine their contribution to current dynamics; 2) estimate bobwhite population distribution and abundance; 3) determine the spatial structure of current populations; and, 4) determine environmental and historical factors at multiple spatial scales contributing to the distribution, abundance, and persistence of bobwhite. I used multiple logistic and spatial linear regression to relate climatological and landscape variables to bobwhite presence and abundance in Illinois, respectively. The models were parameterized with counts from the North American Breeding Bird Survey and validated with data from annual Christmas Bird Counts and Illinois Department of Natural Resources surveys of bobwhite. The spatial linear model accounted for small scale

spatial autocorrelation between nearby survey sites. I found that residual effects of historical winter weather influenced extant bobwhite distribution, resulting in a fairly contiguous distribution of suitable landscape-level habitat throughout the western and south-central portion of Illinois. Landscape variables positively associated with the likelihood of bobwhite presence included amount of small grain agriculture and forested land within a 5,000 ha landscape; Shannon's Evenness Index and the mean number of days in winter with >2.5 cm of snow were negatively associated with presence. At a habitat suitability index value of 0.5, the mean model predicted 71,294 km² (48.9% of the state) of potentially suitable habitat for bobwhite. Within these suitable landscapes, shape of small grain agriculture fields, proportion of the landscape in sedimentary soils, variation in row crop field size, and various aspects of wood patches influenced bobwhite abundance. Variables most important to bobwhite occurred at the 5,000 ha scale. Other major findings included identification of a strong association between bobwhite and the El Niño Southern, Arctic, and Pacific Decadal Oscillations (R^2 's ≥ 0.73), the importance of gross habitat area over number of suitable neighbors in determining metapopulation persistence, and 175 landscape patches deemed depauperate and suitable for translocation of birds from occupied habitat. Also, human habitation was found to be directly related to increased probability of population extirpation, and that increasing urbanization in Illinois will continue to degrade and remove suitable habitat. My results suggest if a focus in wildlife management in Illinois is directed at bobwhite, then there will need to be, in addition to appropriate field- or site-level features, a focus on surrounding landscapes.

ACKNOWLEDGMENTS

Financial support for this dissertation was provided by Federal Aid in Wildlife Restoration Project W-106-R, Graduate School, and the Illinois Department of Natural Resources. I am honored to have received both the Illinois Federation of Outdoor Resource Users Scholarship and the Hilda A. Stein Scholarship for the Study of Ornithology. I thank the Department of Zoology for employment in my final semester as a teaching assistant. Finally, I derived some additional monetary support from DCI Biologicals and Federal Direct Stafford loans.

I would like to acknowledge members of my committee, David Gibson, Karen Lips, Matthew Nicholson, Alan Woolf, and John Roseberry for their oversight and guidance. My only regret is that I did not make a greater effort to engage John in more discussions regarding bobwhite and their ecology. Dr. Woolf was exceedingly supportive in allowing me to develop various fruitful (and sometimes not so fruitful) lines of research.

Amy Fairbairn, Heather J. Hayes, Brian C. Nelson, and Clinton I. Walters provided data entry. Rick L. Requarth provided invaluable geographic information system and network support. Gary D. Mohr provided use of a valuable GIS macro. J. P. Biggers, D. Birkenholz, D. Dann, J. Deneal, K. Dierkes, M. Hartley, J. Hampson, J. Herkert, L. B. Hunt, L. Johnson, D. Kassebaum, E. Kershner, V. Kleen, R. Korotev, D. Martin, L. McKeown, K. McKullen, S. Patti, L. Princen, T. Strole, J. Walk, J. Walsh, D. Williams, and H. Wuestenfeld provided spatially-referenced locations for selected North

American Breeding Bird Survey (NABBS) stops. I thank P. Allen from the Cornell Lab of Ornithology, Ithaca, New York, for providing Christmas Bird Count data used for validation of the models I created. Larry David from the Illinois Department of Natural Resources (IDNR) provided NABBS and IDNR count data. I wish to acknowledge the use of F. L. Poole's bobwhite drawings, which occur as watermarks before each part of the dissertation.

Peers in the Lab made my 3.5 years at SIUC truly enjoyable, with special thanks to R. Gray Anderson, Clay K. Nielsen, and Marrett D. Grund. I also have to acknowledge the numerous members of the intramural flag football power MoleRats (3-3 in '98, 4-2 in '99, 9-2 in '00, and 5-3 in '01), of which I was coach, general manager, part-time player, and frequent member of the Injured Reserve.

I thank my mother, Marilyn, for her early support, for without it I do not believe I would have attempted, much less accomplished, these doctoral studies. Finally, I thank my wife Jennifer for the support she was able to provide, and for the greatest gift one could receive, one-year-old Emma, to whom I dedicate this dissertation.

| Chapter 10 | Conclusions and Management Recommendations | 212 |
| Literature Cited | | 224 |
| Appendix 1 | Magnitude of research across various scales and levels of organization (sensu Morrison et al. [1998:241]). | 255 |
| Appendix 2 | Northern Bobwhite population trends in Illinois as estimated by estimating equations by the North American Breeding Bird Survey. Slope (β) is the annual percent change in abundance per year, P is the probability value for the test statistic, n is the number of years from which the trend is estimated, s^2 is the variance in route abundance, and \bar{x} is mean count of bobwhite on individual routes for the period 1966–1998. | 256 |
| Appendix 4.A | First-order lag plots for each route of the North American Breeding Bird Survey in Illinois meeting criteria for analyses. Ordinate axis is the transformed count data lagged 1 year, whereas abscissa axis is original transformed data. | 258 |
| Appendix 4.B | First-order lag plots for each route of the Illinois Department of Natural Resources Bobwhite Call Count Survey meeting criteria for analyses. Ordinate axis is the transformed count data lagged 1 year, whereas abscissa axis is original transformed data. | 262 |
| Appendix 5.A | Route-specific estimates for the rate of change (r_{d0}), serial correlation (ρ), variance in population rate of change (V_r , V_{re}), years to quasi-extinction (T_{qe}), and probability of persistence for the next 100 years for North American Breeding Bird Survey routes in Illinois. n is the number of years from which estimates were derived, ρ is the Spearman rank correlation coefficient for consecutive annual estimates of r , and V_r and V_{re} are variance estimates for r (Foley 1994, 1997). Significant correlations denoted by asterisk. | 267 |
| Appendix 5.B | Route-specific estimates for the rate of change (r_{d0}), serial correlation (ρ), variance in population rate of change (V_r , V_{re}), years to quasi-extinction (T_{qe}), and probability of persistence for the next 100 years for Illinois Department of Natural Resources Bobwhite Call Count Survey routes. | 269 |

| | | |
|--------------|---|-----|
| Appendix 7.A | Environmental variables related to bobwhite abundance indices in univariate spatial linear models. The configuration variables were also assessed for specific land use classes (e.g., row crop, small grains, woods, and grassland). Details of the configuration variables are available in McGarigal and Marks (1995). | 271 |
| Appendix 7.B | Evaluating other landscape models of Northern Bobwhite response. | 273 |
| Appendix 7.C | From an Information Theoretic perspective, the influence of environmental and historical parameters on presence/absence of Northern Bobwhite in Illinois, as determined from North American Breeding Bird Survey data ($\log(\mathcal{L}) = 469.1$, pseudo- $R^2 = 0.455$). | 280 |
| Appendix 7.D | Equations for relevant configuration variables. | 281 |
| Appendix 9 | Location (Universal Transverse Mercator coordinates of the patch centroid), network identifier, number of neighbors within network, proportion of those neighbors predicted to be unoccupied or sparsely occupied, patch size, and mean landscape suitability for patches potentially suitable for translocation. Variable-specific rankings are provided parenthetically for the first 26 patches. | 284 |

LIST OF TABLES

| TABLE | PAGE |
|--|------|
| 2.1. Summary statistics for estimating equations describing temporal trends in Northern Bobwhite abundance in Illinois, 1966–1998, as derived from North American Breeding Bird Survey counts. Slope (β) is the annual percent change in abundance per year, s^2 is the variance in route abundance, and \bar{x} is mean count of bobwhite on individual routes for the period 1966–1998. | 32 |
| 3.1. Varimax-rotated principal components, ordered by time, describing historical periods of Northern Bobwhite abundance in the quail range of Illinois. Only loadings $\geq 0.300 $ are shown and only loadings $\geq 0.487 $ are significant at $P < 0.05$. Loadings defining periods are highlighted in bold. Percent is the percentage of total explained variation provided by the eigenvector. h^2 , the communality, is the proportion of variation explained by the eigenvectors. Abundance data were derived from the Illinois Department of Natural Resources call count surveys. | 45 |
| 3.2. Varimax-rotated principal components of North American Breeding Bird Survey Call Counts, ordered by time, describing historical periods of Northern Bobwhite abundance across Illinois. Only loadings $\geq 0.300 $ are listed and only loadings $\geq 0.325 $ are significant at $P < 0.05$. Loadings defining periods are highlighted in bold. Percent is the percentage of total explained variation provided by the eigenvector. h^2 , the communality, is the proportion of variation explained by the eigenvectors. | 49 |
| 3.3. Semivariance model parameters for quail range and state-wide measures of abundance, as defined by Illinois Department of Natural Resources (quail range) and North American Breeding Bird Survey (state-wide) call count data, respectively. Nugget is the unexplained spatial variance, usually attributed to measurement error or variance at scales smaller than the smallest distance between survey sites. Sill is the total explained variance. Range is the distance over which counts are significantly correlated. R^2 is a measure of model fit, whereas reduced sums of squares is a measure of the remaining unexplained variation. | 52 |

| | |
|--|-----|
| 3.4. Moments of change between periods in Northern Bobwhite abundance, as defined by state-wide North American Breeding Bird Survey and quail range Illinois Department of Natural Resources call counts, in Illinois. Change in the quail range was analyzed only between periods, and did not include the 2 transition periods. Units are in interpolated counts. | 58 |
| 3.5. Correlation matrix between periods of spatially-explicit representations of Northern Bobwhite abundance across Illinois and within the historical quail range, as derived from North American Breeding Bird Survey and Illinois Department of Natural Resources call count data, respectively. The correlation coefficients represent the degree of similarity between spatial representations of bobwhite distribution. | 59 |
| 4.1. Competing autoregression models of NABBS time series (1973–1997). Total is the time series of annual counts for the entire state, whereas Mean is the average model of the 26 time series and range is the range of observed model coefficients. AICc is the Aikike’s Information Criterion corrected for small samples. | 77 |
| 5.1. Mean model parameter estimates for extinction models derived from North American Breeding Bird Survey and Illinois Department of Natural Resources call counts of Northern Bobwhite. Population rate of change is denoted by r , ρ is the serial autocorrelation of environmental effects, V is the variance in population rate of growth when $r = 0$ and $r \neq 0$, respectively, T_e is time to extinction, and $P(t)$ is the likelihood of extinction within the next century. | 97 |
| 5.2. Comparison of counts of Northern Bobwhite predicted to be extinct by 1998 and results of counts conducted from 1997–2000. NR indicates the route was not run; NA indicates the data were not available. | 104 |
| 5.3. Least-squares estimates of the relationship between variance in the rate of change and mean abundance of Northern Bobwhite populations in Illinois since 1980. | 108 |
| 5.4. Coefficients of variation estimated for local populations of avian species. Except for 3 larger-bodied galliforms included for comparison, only non-galliform species with coefficients similar to Northern Bobwhite were included. | 110 |
| 6.1. Source and world wide web location for oscillation indices. | 125 |

| | |
|--|-----|
| 6.2. Parameter coefficients for the top 10 multivariate autoregressions relating global climatological phenomena to detrended mean annual North American Breeding Bird Survey counts of Northern Bobwhite; models are listed from most to least explanatory. AR is the autoregressive parameter coefficient. Δ AIC is the difference in AIC units between the best model (i.e., the model with the lowest AIC) and the nominate model. AIC weights are the relative model confidence. | 130 |
| 6.3. Mean parameters from univariate general linear models regressing bobwhite abundance against spatially-explicit climatological predictors. Years refers to the number of years (1967–1998, $n = 32$) in which regression was significant. | 134 |
| 6.4. Multiple linear regressions of spatially-referenced annual Northern Bobwhite abundance and climatological variables in Illinois. | 136 |
| 6.5. Model accounting for large-scale trend in Northern Bobwhite abundance in Illinois, between 1985 and 1998. | 138 |
| 7.1. Influence of environmental parameters on presence/absence of Northern Bobwhite in Illinois, as determined from North American Breeding Bird Survey data. Non-transformed median is provided for occupied (with range) and unoccupied habitat. | 155 |
| 7.2. Influence of environmental parameters on relative Northern Bobwhite abundance in Illinois, as determined by North America Breeding Bird Survey data. | 163 |
| 8.1. Demographic conditions used in simulations of population performance and resultant fundamental net reproductive rate (λ). The implemented conditions were the particular parameter values used in the mechanistic metapopulation model. | 187 |
| 8.2. Mean and maximum movements (km) observed in bobwhite. | 189 |
| 8.3. Somers' D rank correlation (D) between colonization or extirpation event and selected scale-specific environmental variables. The value for C is the proportion of times a randomly selected positive event (1) has a test value greater than that for a randomly chosen null event (0); proportions equal to 0.5 indicate no difference between positive and null events. Sample size was large ($824 \geq n \geq 1,048$) in all cases. | 192 |
| 8.4. Results of logistic regression of colonization probabilities and environmental variables. TCAI is Total Core Area Index, MCAI is Mean Core Area per Patch, MNN is Mean Nearest Neighbor, and MPI is Mean Proximity Index. | 193 |

| | |
|--|-----|
| 8.5. Competing logistic regressions of extirpation probabilities and environmental variables. MCA2 is Mean Core Area per Disjunct Patch, IJI is Interspersion and Juxtaposition Index, MCAI is Mean Core Area per Patch, and CLAND is Amount of Core Area. All variables were transformed except for IJI. Transformation was \log_{10} except for CLAND, which was arcsin-square root transformed. | 195 |
| 8.6. Time to extirpation for Northern Bobwhite metapopulations in Illinois regressed against population size (nee habitat area) and number of populations in metapopulation. | 199 |
| 7.B.1 Parameters (Slope (SE), t -statistic, and P -values), log-likelihoods (\mathcal{L}) and Aikike's small-sample Information Criterion (AICc) from logistic models, at each of 4 scales, of Northern Bobwhite presence/absence in Illinois. Model variables were determined by Burger et al. (<i>personal communication</i>) and presence was determined from North American Breeding Bird Survey data ($n = 3,000$). | 275 |
| 7.B.2 Parameters (Slope (SE), t -statistic, and P -values), log-likelihoods (\mathcal{L}) and Aikike's small-sample Information Criterion (AICc) for linear models, applied at each of 4 scales, to North American Breeding Bird Survey data ($n = 2,295$) for Northern Bobwhite in Illinois. Model variables determined by Michener et al. (2000); response is the mean count, detrended and transformed, from 1985–1998. | 277 |

LIST OF FIGURES

| FIGURE | PAGE |
|--|------|
| 1.1. Annual North American Breeding Bird Survey (BBS) and Illinois Department of Natural Resources (IDNR) Bobwhite call counts, harvest in Illinois, and Christmas Bird Counts (CBC)/Hour from 1967 to 1998. A higher-order polynomial was fitted to the BBS data to demonstrate the general trend in the time series. | 7 |
| 1.2. Distribution of North American Breeding Bird Survey (in gray) and Illinois Department of Natural Resources Bobwhite Call Count Survey (in black) locations in Illinois. | 16 |
| 1.3. Annual area surveyed by Illinois Department of Natural Resources (IDNR) Bobwhite Call Count and North American Breeding Bird Surveys (NABBS) in Illinois. | 20 |
| 1.4. Distribution of Christmas Bird Count locations (with 12.1 km buffer delineating survey area) and Illinois Department of Natural Resources Ring-necked Pheasant call counts in Illinois, 2 independent data sets used to validate spatially-explicit models of Northern Bobwhite habitat. | 25 |
| 2.1. Deterministic negative trend in Northern Bobwhite abundance associated with area in Illinois devoted to farmland. Farm area was determined by the National Agricultural Statistical Service. Indices were associated with farm area with Pearson product-moment correlation. | 34 |
| 2.2. Distribution of mean rates of change (r) for North American Breeding Bird Survey (BBS) and Illinois Department of Natural Resources (IDNR) Northern Bobwhite route-level call counts. | 35 |
| 3.1. Annual extent (km) in spatial autocorrelation (Range A_0) and degree of explained spatial variance ($C/(C_0+C)$) in North American Breeding Bird Survey counts of Northern Bobwhites. Filled circles above dashed line indicate years in which bobwhite counts were autocorrelated state-wide. Dashed line is the North-South distance for Illinois. | 55 |
| 3.2. Historical distribution of Northern Bobwhite in the quail range of Illinois, as determined from Illinois Department of Natural Resources (IDNR) spring call count surveys. Relative abundance is the number predicted per site following IDNR protocol. | 56 |

| | |
|---|----|
| 3.3. Historical distribution of Northern Bobwhite across Illinois, as determined from North American Breeding Bird Surveys. Relative abundance is the number predicted per site following NABBS call count protocol. | 57 |
| 4.1. Mean autocorrelation (ACF) and partial autocorrelation (PACF) function for time-series of Northern Bobwhite abundance as determined by North American Breeding Bird Surveys. According to Nisbet and Gurney (1984), due to the short extent of the time series, correlations ≥ 6 are tentative. Significant correlations $\geq 0.392 $. | 71 |
| 4.2. Autocorrelation function for NABBS of Northern Bobwhite in Illinois, grouped by period. Polynomials were fitted to the different classes to assist in visualizing patterns in the ACFs. Significant correlations were those $\geq 0.392 $. | 73 |
| 4.3. Biplots of first, second, and third principal components of land use classes in Illinois landscapes occupied by cycling (1) and non-cycling (0) Northern Bobwhite populations. | 75 |
| 4.4. Plot of synchrony by distance for Northern Bobwhite population dynamics in Illinois. A, based on 10-stop increments of North American Breeding Bird Survey (NABBS) data. B, based on route-level NABBS data. | 76 |
| 5.1. Coefficient of variation (CV) (\pm SE) in annual North American Breeding Bird Survey counts of Northern Bobwhite in Illinois. The black line at CV = 1.4 denotes the mean CV over the period. The vertical rectangle denotes a period of severe winters in the late-1970s (Chapter 6). | 94 |
| 5.2. Observed annual extinction, colonization, and occupancy rates for Northern Bobwhite at North American Breeding Bird Survey locations in Illinois. The vertical rectangle denotes a period of severe winters in the late-1970s (Chapter 6). | 95 |
| 5.3. Frequency of extinction and recolonization events in Northern Bobwhite of Illinois, as determined from North American Breeding Bird Survey call counts. | 98 |

| | |
|--|-----|
| 5.4. Time to quasi-extinction for Northern Bobwhite in Illinois as a multivariate non-linear function of mean index to abundance, variance in population rate of change, and the temporal autocorrelation. Bubble size varies as a function of temporal first-order autocorrelation, and the lines denote the distance of the bubble from the time to extinction surface. Data are from North American Breeding Bird Survey counts; plots based on Illinois Department of Natural Resources call counts are similar. | 99 |
| 5.5. Time to quasi-extinction for Northern Bobwhite in Illinois as a function of variance in the rate of change. | 101 |
| 5.6. Time to quasi-extinction for Northern Bobwhite populations in Illinois as determined for Illinois Department of Natural Resources (IDNR) and North American Breeding Bird Survey (BBS) routes, 1981–1998. | 102 |
| 5.7. Geographical extent of predicted times to quasi-extinction for Northern Bobwhite in Illinois. Data were interpolated by inverse distance weighting of information from 12 neighboring survey locations, with 1 outlier removed from the NABBS interpolation. Contours are at 100-yr intervals. | 103 |
| 6.1. Bobwhite abundance and distribution retracted considerably in the late-1970s, probably due to a series of severe winters. | 121 |
| 6.2. Pearson product-moment correlations between mean Northern Bobwhite count as determined by the North American Breeding Bird Survey and weather parameters. Acronyms are provided in text. Indices of bobwhite abundance indicated a sharp decline in abundance in 1979, which is highlighted in this figure. | 127 |
| 6.3. Least-squares regression of mean annual North American Breeding Bird Survey counts of Northern Bobwhite and the Pacific Decadal Oscillation, as annually measured in May. | 129 |
| 6.4. Time series plots of bobwhite abundance indices and explanatory variables. Model A refers to the first (6 variable) model in Table 6.2, whereas Model B refers to the second (7 variable) model. | 132 |
| 6.5. Partial regression plots demonstrating relative influence of climatological (SPRPRCP, mean spring precipitation (cm); MPDSI, modified Palmer Drought Severity Index; CVPRCP, coefficient of variation in mean spring precipitation) and land use (amount (ha) of row crop agriculture in 5,000 ha landscape) conditions on regional trends in Northern Bobwhite abundance in Illinois, 1985–1998. | 139 |

| | |
|--|-----|
| 7.1. Probability plots, with 95% confidence intervals, for each predictor variable in a logistic regression of Northern Bobwhite presence in Illinois, 1985–1998. SEI is Shannon’s Evenness Index, J' . | 156 |
| 7.2. Potentially-occupied landscapes for Northern Bobwhite (with lower and upper confidence intervals) in Illinois, as derived from North American Breeding Bird Survey data. The outline delineates mean condition in all 3 plots. | 158 |
| 7.3. Amount of potentially suitable Northern Bobwhite habitat in Illinois at various levels of the habitat suitability index, based on the mean model condition. HSI = 0.50 is the mean condition defining lower limit of suitable habitat. Circles highlight habitat at HSI = 0.90. | 160 |
| 7.4. Log-likelihoods for null spatial linear models. The appropriate neighborhood accounting for spatial autocorrelation in bobwhite abundance was the neighborhood (in this case, $n = 62$) resulting in maximization of the log-likelihood. | 161 |
| 7.5. Partial regression plots demonstrating relative influence of environmental variables (see Table 7.2) on Northern Bobwhite relative abundance in Illinois, 1985–1998. | 165 |
| 7.6. Proportion of occurrence, mean count per stop, proportion of sites with Northern Bobwhite at risk of extirpation, and coefficient of variation in bobwhite counts by land use / land cover class. Data are from the Illinois portion of the North American Breeding Bird Survey for 1985–1998. | 167 |
| 7.7. Theoretical relationships of Northern Bobwhite to various land use/land cover classes. The relative positions, range, and slope of the relationships are currently unknown. The gray parallelogram represents a theoretical optimal configuration of the land cover classes for bobwhite in Illinois. | 174 |
| 8.1. Dispersal probability function derived from reported bobwhite dispersal movements. The black line is a polynomial (95% CI) fitted to the observed values. | 190 |
| 8.2. Potentially suitable Northern Bobwhite habitat in Illinois delineated into unique metapopulations by a 2-km buffer representing the typical maximum dispersal distance of the species. | 197 |
| 8.3. A) Frequency distribution of suitable habitat patch sizes and B) patches per metapopulation for Northern Bobwhite in Illinois, as determined from a model of landscape-level habitat suitability. | 198 |

| | |
|--|-----|
| 9.1. Suitable Northern Bobwhite habitat in Illinois predicted to be unoccupied or sparsely populated (in black) based on effects of historical winter weather of the late-1970s. | 210 |
| 9.2. Habitat most suitable for translocation of Northern Bobwhite. The top 20 choices are numbered and are a darker gray. | 211 |

PROLOGUE

Environment is the theater, as G. Evelyn Hutchison once remarked, and evolution is the play. My intent in the following thesis is to review the performance of one of Illinois' native actors, the Northern Bobwhite. In doing so, I hope to learn more about *actors* in general, in effect, what their cues and motivations are? I also hope I may learn something about the way the theater is constructed and how, when the sets are changed for each new play, the actor responds to these changes. I ask, why, for instance, does our actor occur in some scenes and not in others? We know the director plays no favorites, and thus leaves our actor out of scenes which beg for her performance. Why? In the end though, I am especially interested in how the theater caretakers, playwrights, and stage hands may provide future scenes for our favorite actor.

Carbondale, Illinois
