Measuring the Effect of Benefits and Taxes on Income and Poverty: 1992

NOTE TO USERS. The estimates in this report are controlled to national population totals by age, race, sex, and Hispanic origin. The population controls used in the preparation of estimates for the years 1991 and 1992 are based on results of the 1980 census. The estimates in this report for 1991 and 1992, therefore, may differ from estimates that would have been obtained using 1990 census results brought forward to the survey date. Population controls incorporating 1990 census results will be used for survey estimation beginning in 1994.

The Census Bureau has developed three additional definitions of income for 1991 and 1992. These include: 1) a fully developed tax and noncash income definition without the value of Medicare and Medicaid, 2) an after-tax income definition without any other adjustments excluding the Earned Income Tax Credit (EITC), and 3) an after-tax income definition with EITC. A complete description of these definitions can be found in appendix J.

INTRODUCTION

This report presents alternative measures of income and poverty for the calendar year 1992. These data were derived from information collected in the March 1993 Current Population Survey (CPS) conducted by the Bureau of the Census, with input from other data sources such as Internal Revenue Service, U.S. Department of Agriculture, Department of Labor, Bureau of Labor Statistics, and Health Care Financing Administration.

All demographic surveys, including CPS, suffer from undercoverage of the population. This undercoverage results from missed housing units and missed persons within sample households. Compared to the level of the 1980 Decennial Census, overall CPS undercoverage is about 7 percent. Undercoverage varies with age, sex, and race. For some groups, such as 20 to 24 year old Black males, the undercoverage is as high as about 35 percent. The weighting procedures used by the Census Bureau partially correct for the bias due to undercoverage. However, its final impact on estimates is unknown. For details, see appendix D.

Traditionally, income and poverty data presented in Census Bureau reports have been based on the amount of money income received during a calendar year

before any taxes and excluding capital gains. This definition of income is narrow and does not provide a completely satisfactory measure of the distribution of income. The omission of data on taxes, realized capital gains, and the value of noncash benefits has an effect on comparisons over time and between population subgroups.

The official income definition reflects the content of the March Current Population Survey questionnaire. The March questionnaire contains no questions about taxes and, until 1980, contained no questions about the receipt of noncash benefits. Since March 1980, the questionnaire has included items on the receipt of benefits from government programs (e.g., foodstamps, housing assistance, Medicare, and Medicaid) and from employers (e.g., health insurance).

In the early 1980's the Census Bureau embarked on separate research programs to examine: 1) the effect of government noncash benefits on poverty and 2) the effect of taxes on income distributional measures. An expansion and integration of these research efforts led, in December 1988, to the publication of a report entitled *Measuring the Effect of Benefits and Taxes on Income and Poverty: 1986* (Current Population Reports, Series P-60, No. 164-RD-1). That report presented calculations showing how income and poverty estimates changed when specific taxes were deducted and specific benefits were added to the income definition. This report presents updated estimates of the incremental effect of benefits and taxes on income and poverty for 1992.

The 1992 Federal tax estimates in this report are based, in part, on 1991 IRS statistics, since 1992 IRS data were not available in time to be used for deriving 1992 estimates. For that reason, the 1992 Federal tax estimates in this report should be considered preliminary.

The brief explanation of the income definitions shown in this report are:

1. **Money income excluding capital gains before taxes.** This is the official definition used in Census Bureau reports.
2. **Definition 1 less government cash transfers.** Government cash transfers include nonmeans-tested transfers such as Social Security payments, unemployment compensation, and government educational assistance (e.g., Pell Grants) as well as means-tested transfers such as Aid to Families with

Dependent Children (AFDC) and Supplemental Security Income (SSI). (For a complete listing of transfer income, see definitions 9 and 12.)

3. **Definition 2 plus capital gains.** Realized capital gains and losses are simulated as part of the Census Bureau's Federal individual income tax estimation procedure.
4. **Definition 3 plus health insurance supplements to wage or salary income.** Employer-provided health insurance coverage is treated as part of total worker compensation.
5. **Definition 4 less Social Security Payroll taxes.**
6. **Definition 5 less Federal income taxes.** The effect of the Earned Income Tax Credit is shown separately in Definition 7.
7. **Definition 6 plus the Earned Income Tax Credit.**
8. **Definition 7 less State income taxes.**
9. **Definition 8 plus nonmeans-tested government cash transfers.** Nonmeans-tested government cash transfers include Social Security payments, unemployment compensation, worker's compensation, nonmeans-tested Veteran's payments, U.S. Railroad Retirement, Black Lung payments, Pell Grants, and other government educational assistance (Pell Grants are income-tested but are included here because they are very different from the assistance programs that are included in the means-tested category).
10. **Definition 9 plus the value of Medicare.** Medicare is counted at its fungible value.
11. **Definition 10 plus the value of regular-price school lunches.**
12. **Definition 11 plus means-tested government cash transfers.** Means-tested government cash transfers include AFDC, SSI, other public assistance programs, and means-tested Veteran's payments.
13. **Definition 12 plus the value of Medicaid.** Medicaid is counted at its fungible value.
14. **Definition 13 plus the value of other means-tested government noncash transfers.** These include food stamps, rent subsidies, and free and reduced-price school lunches.
15. **Definition 14 plus net imputed return on equity in own home.** This definition includes a calculated annual benefit of converting one's home equity into an annuity, net of property taxes.

MEASUREMENT ISSUES: VALUATION OF NONCASH BENEFITS

The Bureau of the Census has a continuing interest in improving the methods used to value noncash benefits. A description of some of the basic measurement issues is given below:

1. *What value should be assigned to Medicare and Medicaid coverage?* Technical papers prior to the P-60, No. 164-RD-1 report presented poverty estimates based on an income definition that counted as income the full market value (mean government outlays per enrolled in a given risk class) of Medicare and Medicaid benefits. Comparisons of the market value of these benefits with the official poverty threshold showed that the market value of these benefits was frequently very high compared with the poverty thresholds and sometimes exceeded them. It became apparent to many analysts that it was inappropriate simply to count the full market value of Medicare and Medicaid and then use the resulting income figure to determine poverty status. The valuation approach adopted for this report is the "fungible value" approach: the benefits of being covered by Medicare or Medicaid are counted as income to the extent that they free up resources that could have been spent on medical care. The estimated fungible value depends on family income, the cost of food and housing needs, and the market value of the medical benefits. If family income is not sufficient to cover the family's basic food and housing requirements, the fungible value methodology treats Medicare or Medicaid as having no income value and assigns a value of zero. If family income exceeds the cost of food and housing requirements, the fungible value of Medicare and Medicaid is equal to the amount which exceeds the value assigned for food and housing requirements (up to the amount of the market value of the medical benefits).

A separate issue concerns the choice of risk classes to use in calculating mean outlays. The risk classes for Medicare include the aged and the disabled. Those for Medicaid include the elderly, blind, or disabled adults, nondisabled adults, and children. For both programs, mean government outlays and, therefore, assigned income values, vary by State of residence. There are questions as to the appropriateness of these risk classes because a shift from one risk class to another or from one State to another can result in a change in assigned income. A related issue for the purpose of calculating mean outlays for the Medicaid program is whether the universe should include persons who receive benefits because they are "medically needy." These persons were excluded in the universe for

these calculations because they have medical expenses much higher than the general population covered by Medicaid.

2. *What method should be used to determine the subsidy value of housing assistance?* The estimates shown in this report are based on a model that attempted to measure the factors that determine the market rental value of nonsubsidized rental units. The model was then used to estimate the market rental value of subsidized units. The model-based estimate of the market rental value of subsidized units was then compared with the actual rent paid by residents of subsidized units and the difference was accepted as the subsidy value. This measurement technique is complex and the results depend on the specification of the model.

3. *What method should be used to measure the income flow from housing equity?* Persons with home equity have the potential to receive income that is not included in traditional measures of cash income. Two methods have been used to measure the income flow from owner-occupied housing.

The first method estimates net rental income. The procedure estimates the market rent which the owner-occupied unit would receive in the rental market and deducts various costs of homeownership including mortgage interest, depreciation, maintenance costs, and property taxes. There are significant measurement difficulties with this method. For example, the market rental value of owner-occupied housing is usually not directly observable and estimates based on rental units must consider differences in quantity and quality between the two types of units.

The second methodology (the one used in this study) applies a rate of return to home equity to obtain an estimate of the income that the household would receive if it chose to shift the amount held as home equity into an annuity paying income to the household. (See appendix B for a description of the methodology and the 1992 rate of return used to calculate this benefit.) This approach avoids many of the estimation problems of the first approach. The primary measurement problems associated with the net imputed rate of return approach are the lack of home equity data from the CPS, and the necessity of choosing an appropriate rate of return.

4. *Should an income definition that includes the net imputed return on home equity be used in the determination of poverty status?* A concern with adding this component to an income definition has to do with the way the original poverty thresholds were defined. Because this component (net imputed return on home equity) was not part of the income definition used in calculating the poverty "multiplier," there is an argument for not including it in an

income definition that is used to determine poverty status. This argument holds, to some degree, for any income component that was not part of the original definition. A counter-argument, that certain income components (e.g., food stamps) were small or non-existent at the time the poverty definition was developed, clearly does not apply to home equity.

5. *Should school lunch subsidies be counted as income, and if so, how should they be valued?* For this report, school lunch subsidies (including those associated with regular-price lunches) have been counted as income at their full subsidy value. There are two issues of concern. The first is whether it is consistent to count school lunch subsidies when the value of subsidized meals consumed in a business situation are not counted. The latter meals include those consumed by business travelers for which the traveler is reimbursed, and those consumed in a business setting that are paid for by an employer. If a decision is made to count school lunch subsidies, an issue remains about whether the full amount of the subsidy should be counted as income. Families who participate in this program have no choice about the quantity and type of food and their perception of the income value of the benefit may be well below the full subsidy value.

OTHER MEASUREMENT ISSUES

1. *What corrections should be made for underreporting?* Household respondents tend to underreport some types of income and the problem can be severe for those sources that are received at irregular intervals or for those sources about which the household respondent may have limited information. The Census Bureau expects to intensify its research in this area to obtain more current and accurate estimates of the extent of the problem and to identify methods for adjusting for underreporting.

2. *Should the experimental CPI-U-X1 index be used to adjust poverty thresholds through time?* Poverty data are based on a definition developed in 1965 by researchers at the Social Security Administration. Year-to-year adjustments for inflation are made to the poverty thresholds based on the official Consumer Price Index (CPI-U). Prior to 1983, the official CPI-U measured housing cost changes using a procedure which included changes in the asset value of homes and led to excessive growth in the index during the late 1970's as housing prices and interest rates increased rapidly. In 1983, in an effort to solve this problem, the Bureau of Labor Statistics (BLS) introduced a rental equivalence approach to measuring housing cost changes. The official CPI-U time series, therefore, is based on an asset approach

to homeownership prior to 1983 and on a rental equivalence approach from 1983 to the present. In order to provide a consistent time series, BLS constructed an experimental series (CPI-U-X1) for 1967 through 1982 based on the rental equivalence approach. Since the effect of adjusting poverty thresholds for inflation is cumulative, a lower measure of inflation in the past results in lower current thresholds. If poverty thresholds had been updated between 1967 and 1982 based on the experimental CPI-U-X1 rather than the official CPI-U, the current thresholds would be approximately 8 percent lower and fewer people would be classified as below the poverty level. It should be noted that proper selection of the most appropriate CPI index is only one of many issues surrounding the accuracy of the current poverty definition. The resolution of some of the other poverty definition questions would have considerably more impact on the number of poor and poverty rate. Other definitional issues include (1) the food-to-total-income ratio inherent in the current definition; (2) the use of different thresholds for the elderly in one- and two-person households; (3) how and whether to incorporate the value of medical benefits and other noncash benefits; (4) the exclusion of the homeless in the CPS since it is a household survey; (5) the use of pre-tax or after-tax income; (6) regional cost of living differences; and (7) the inclusion of assets and liabilities.

3. *Should the experimental CPI-U-X1 index be used to adjust income measures through time?* Based on a consensus among economists consulted, a decision was made to use the CPI-U-X1 to adjust the income measures (e.g., median household income) shown in this report.

HIGHLIGHTS

(Figures in parentheses denote 90-percent confidence intervals.)

- The use of a fully adjusted income definition, that is, one that includes the effect of taxes, cash and noncash benefits, capital gains, employee health benefits, and net return on home equity results in a more equal distribution of income than under the official money income definition.
- It has long been known that both taxes and transfers have an equalizing effect on the distribution of income. One of the important findings of the Bureau's tax and benefit research is that the effect of government transfers is much more significant than taxes in redistributing income.
- Under four of the definitions (definitions 2, 3, 5, and 8), median household income showed a real decline between 1991 and 1992. Neither the official money income definition nor the fully adjusted income definition showed a change in real income .
- When year-to-year comparisons were made between 1991 and 1992, poverty estimates of the number of poor persons increased under all definitions except definition 13, which adds the value of Medicaid, and definition 15, which adds the net imputed return on home equity in own home. When poverty rates are compared, eight of the 15 show a statistically significant increase in poverty, though neither the official nor the fully adjusted definitions show an increase.
- Based on the official money income definition, the median income of Black households was 57.6 (± 2.0) percent of the White median income in 1992. The use of a definition of income that has been broadened to include the effect of taxes and noncash benefits results in a ratio of 64.3 (± 1.6) percent.
- The ratio of median income of households with a householder of Hispanic origin to White households was 70.6 (± 2.6) percent under the official definition, compared with 75.6 (± 2.2) percent based on the broadened definition of income that includes taxes and the value of transfer benefits.
- Analyses of the incremental effect of adding or subtracting income sources show that when the current income measure was modified to exclude government money transfers (definition 2), the number of persons below the poverty level rose sharply from 36.9 (± 0.9) million to 57.3 (± 1.1) million and the poverty rate rose from 14.5 (± 0.3) percent to 22.6 (± 0.4) percent.
- The incremental effect of subtracting income and payroll taxes from income (definitions 5, 6, 7, and 8) was to produce higher estimates of the number of persons in poverty (an increase of 1.7 (± 0.8) million) and the poverty rate (an increase of 0.7 (± 0.4) percentage points).
- The addition of nonmeans-tested government cash transfers (primarily Social Security) to an income definition that included only private sector income had a strong effect on poverty estimates; the number of persons in poverty decreased by 17.9 (± 1.4) million and the poverty rate decreased by 7.1 (± 0.3) percentage points.
- The effect of adding means-tested cash transfers (primarily AFDC and SSI) was small compared with nonmeans-tested cash transfers. The addition of means-tested cash transfers (definition 12) to an income definition that included private sector income and government nonmeans-tested cash transfers reduced the estimate of persons in poverty by 2.8 (± 0.7) million and the poverty rate by 1.1 (± 0.3) percentage points.
- The addition of means-tested noncash transfers (food stamps, housing, and Medicaid) to an income definition that included cash income from the private and

government sectors reduced the number in poverty by 3.4 (± 0.6) million and the poverty rate by 1.3 (± 0.3) percentage points.

- The incremental effect of some income components was different for Whites than for Blacks or persons of Hispanic origin. For example, the addition of nonmeans-tested government cash transfers to an income definition based on private sector income reduced the number of persons in poverty by 37.3 (± 1.3) percent for Whites, 14.5 (± 3.0) percent for Blacks, and 13.8 (± 3.8) percent for persons of Hispanic origin.
- On average, poverty estimates using the CPI-U-X1 to adjust poverty thresholds were approximately 1.4 (± 0.3) percentage points and 3.6 (± 1.2) million persons lower than estimates using the CPI-U.

DISTRIBUTIONAL EFFECTS OF BENEFITS AND TAXES

Taxes, government transfers, and other benefits have substantial effects on the level and distribution of income. These effects can be seen by examining distributional changes under the 15 different definitions of income used in this report. Text tables A through E and detailed table 1 show data on the distribution of income under the 15 definitions.

Under the official definition of income (definition 1), which is based on money income before taxes and includes government cash transfers, aggregate household income totaled \$3,761 billion in 1992 for the 96.4 million households in the United States. (See table A.) Median household income was \$30,786. Looking at the distribution of definition 1, household income by income

quintiles, 3.8 percent of the total was received by the lowest quintile, 9.4 percent by the second quintile, 15.9 percent by the third quintile, 24.1 percent by the fourth quintile, and 46.8 percent by the highest quintile (see table B). The degree of income inequality is summarized by the Gini index, which is a statistic that varies between 0 (perfect equality) and 1 (perfect inequality). In 1992, the Gini index of household income under definition 1 was .430.

Definition 2 shows the effect on the income distribution when income is defined to exclude government cash transfers. This definition represents the amount and distribution of income generated by the private sector. The exclusion of government cash transfers lowered aggregate household income by \$327 billion to \$3,435 billion, and lowered median household income by 10.2 percent, to \$27,655. The distribution of income generated by the private sector was much more unequal than the distribution under the official definition of income. (See table B.) The exclusion of cash transfers resulted in declines in the shares of income received by the lowest two quintiles of households (from 3.8 percent to 1.0 percent, and from 9.4 percent to 7.8 percent, respectively), and increases in the shares of income received by the two highest quintiles (from 24.1 percent to 25.3 percent, and from 46.8 percent to 50.4 percent, respectively). The Gini index under this definition of income, .490, was 14.0 percent higher than the index under the official income definition (.430).

The distributional effect of capital gains and losses is shown in definition 3. The addition of net capital gains to the definition of income resulted in an increase of \$82 billion in aggregate income, from \$3,435 billion to \$3,517 billion. Capital gains are concentrated in the upper

Table A. Median, Mean, and Aggregate Household Income, by Definition of Income: 1992

[Total households = 96,391,000]

Definition of income	Median income	Mean income	Aggregate income (in billions)
Income before taxes:			
1. Money income excluding Capital gains (current measure)	\$30,786	\$39,020	\$3,761.2
2. Definition 1 less government cash transfers	27,655	35,633	3,434.7
3. Definition 2 plus capital gains	27,879	36,485	3,516.8
4. Definition 3 plus health insurance supplements to wage or salary income	29,350	38,147	3,677.0
Income after taxes:			
5. Definition 4 less Social Security payroll taxes	27,472	35,967	3,466.9
6. Definition 5 less Federal income taxes (excluding the EITC)	25,301	31,609	3,046.9
7. Definition 6 plus the Earned Income Tax Credit (EITC)	25,376	31,698	3,055.4
8. Definition 7 less State income taxes	24,684	30,505	2,940.4
9. Definition 8 plus nonmeans-tested government cash transfers	27,651	33,530	3,232.0
10. Definition 9 plus the value of Medicare	28,964	34,438	3,319.5
11. Definition 10 plus the value of regular-price school lunches	28,977	34,450	3,320.6
12. Definition 11 plus means-tested government cash transfers	29,139	34,811	3,355.5
13. Definition 12 plus the value of Medicaid	29,395	35,015	3,375.1
14. Definition 13 plus the value of other means-tested government noncash transfers	29,522	35,288	3,401.4
15. Definition 14 plus net imputed return on equity in own home	31,321	37,555	3,620.0

Table B. Percentage of Aggregate Income Received by Income Quintiles and Index of Income Concentration, by Definition of Income: 1991 and 1992

Definition of income	1992 quintiles					1992 Gini index	1991 quintiles					1991 Gini index
	Lowest	Second	Third	Fourth	Highest		Lowest	Second	Third	Fourth	Highest

portion of the income distribution (89.3 percent of aggregate capital gains were received by households in the highest quintile in 1992). Thus, the inclusion of capital gains results in an even less equal distribution of income. Under this definition, there were increases in both the share of income received by the highest quintile (from 50.4 percent to 51.3 percent) and in the Gini index (from .490 to .497). There was also a significant decline in the median income of all households.

Employer contributions to health insurance represent a major source of private sector compensation, as shown in definition 4. In 1992, these wage supplements

were estimated to be \$160 billion, raising aggregate household income to \$3,677 billion. Their effect on median household income was to increase it by 5.3 percent, to \$29,350. Since health insurance benefits are received by persons throughout the income distribution and do not vary by a significant degree in value, the inclusion of these benefits did not have a significant effect on income inequality, as reflected in the fact that there was no significant change in the Gini index under this income definition.

The effect of taxes on the distribution of income are shown in definitions 5 through 8. Definition 5 shows the effect of Social Security payroll taxes. In the aggregate,

these taxes totaled \$210 billion in 1992, lowering aggregate income to \$3,467 billion. The inclusion of payroll taxes resulted in a 6.4 percent decline in median household income, to \$27,472. Social Security payroll taxes did not have a significant impact on income inequality, as shown by the fact that their inclusion did not result in a change in the Gini index.

Definition 6 shows the effect of Federal individual income taxes prior to the inclusion of the Earned Income Tax Credit (EITC). Definition 7 shows the effect of the EITC separately. The 1992 estimate of Federal individual taxes (excluding the EITC) was \$420 billion; its inclusion lowered median household income by 7.9 percent, to \$25,301. Though Federal individual income tax rates are progressive, the effect of Federal income taxes on the redistribution of income was relatively minor. Federal income taxes lowered the Gini index by only 4.2 percent, from .499 to .478.

The aggregate value of the EITC was estimated to be \$9 billion in 1992. About 10 million households were estimated to be eligible for this credit in 1992; the mean benefit was \$830.¹ The credit had no discernable effect on income summary measures.

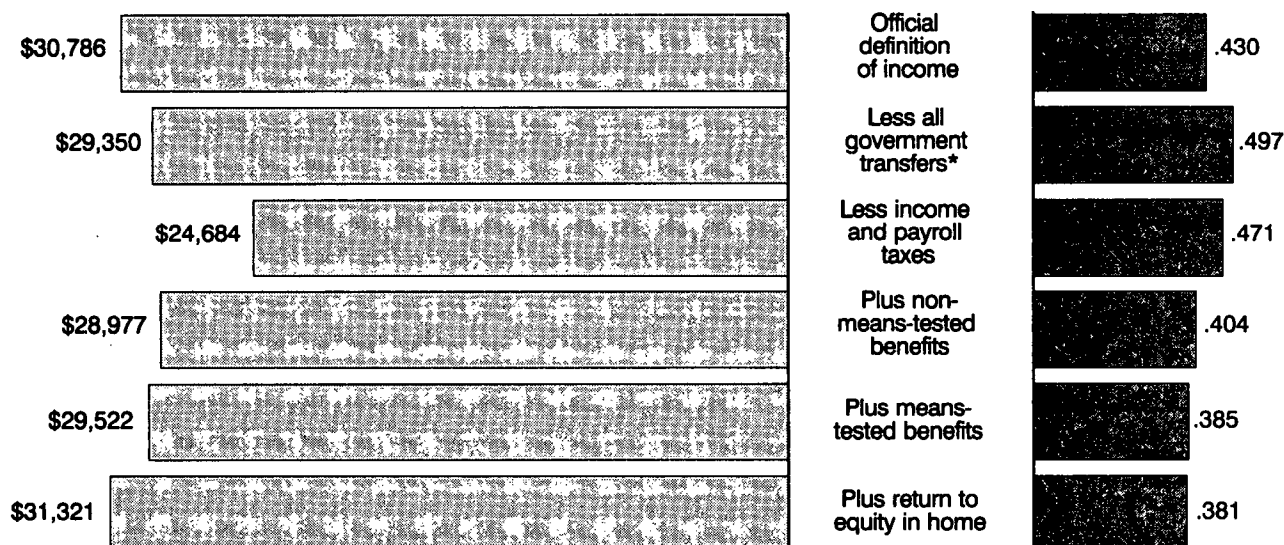

¹Since the EITC is a refundable tax credit, this amount includes both the amount taxes were reduced as a result of the credit and the amount received by the recipient (if the credit was greater than Federal income taxes owed).

The effect of State individual income taxes (definition 8) was to lower aggregate income by \$115 billion, to \$2,940 billion. After accounting for State income taxes, median household income was reduced by 2.7 percent, to \$24,684. State individual income taxes had little or no effect on the share of income going to each quintile. The effect of the taxes on the Gini index was also quite small, reducing it from .476 to .471.

At this point, one can assess the combined effect of Federal and State individual income taxes and Social Security payroll taxes on the distribution of income. Overall, these taxes lowered aggregate household income by \$737 billion, from \$3,677 billion to \$2,940 billion. Their effect on median household income was to lower it by 15.9 percent, from \$29,350 to \$24,684 (see figure 1). The combined effect of taxes on the Gini index was to reduce it by 5.2 percent, from .497 to .471.

The effect of government transfers on the distribution of income are shown in definitions 9 through 14. Nonmeans-tested government cash transfers (definition 9) include Social Security and Railroad Retirement, nonmeans-tested Veterans' payments, unemployment and workers' compensation, and Pell Grants. These benefits, totaling \$292 billion in 1992, raised median household income by 12.0 percent, to \$27,651. Nonmeans-tested cash transfers had a significant effect on income inequality. They increased the share of income going to the lowest quintile (from 1.1 percent to 3.6 percent), and

Figure 1.
Median Household Income and Gini Index, by Income
Definition: 1992

*Includes capital gains and employer supplements for health insurance.

lowered the share of income going to the highest quintile (from 48.6 percent to 45.1 percent). These payments also had a significant effect on the Gini index, lowering it by 11.9 percent, from .471 to .415.

Definitions 10 and 11 show the effect of nonmeans-tested government noncash transfers. Adding the fungible value of Medicare (definition 10) increased aggregate income by \$88 billion, and raised median household income by 4.7 percent, to \$28,964. The effect of Medicare on income inequality was minor; its inclusion in the income definition lowered the Gini index by 2.7 percent, to .404. The value of regular-price school lunches (definition 11) had no significant effect on income distribution measures. The aggregate value of this benefit was only \$1 billion in 1992.

Definition 12 shows the effect of adding means-tested cash transfers to the income definition. These include AFDC and other public assistance payments, Supplemental Security Income, and means-tested Veterans' payments. Overall, means-tested cash transfers raised aggregate income by \$35 billion in 1992, though these payments had no statistically significant effect on median household income. Means-tested cash transfers had a significant effect on the share of income received by the lowest quintile, raising it from 3.8 percent to 4.4 percent. None of the other quintiles were affected. Their effect on the Gini index was to lower it from .404 to .395.

Definitions 13 and 14 show the effect of means-tested government noncash transfers on the income distribution. The fungible value of Medicaid (definition 13) was \$20 billion in 1992. The inclusion of the fungible value of Medicaid in the definition of income had no significant effect on the Gini index, but did result in a slight increase in change in median household income.

The effect of means-tested government noncash benefits other than Medicaid is shown in definition 14. These benefits include food stamps, free or reduced-price school lunches, and rent subsidies. The value of these benefits was \$26 billion in 1992. The addition of these benefits to the income definition had no statistically significant effect on median household income, though their inclusion did have an effect on the Gini index, lowering it from .392 to .385.

At this point, an assessment of the combined effect of the tax and transfer systems on the distribution of income is possible. The taxes measured in this study lowered aggregate income by \$737 billion, and lowered median household income by 15.9 percent, while the value of all government transfers raised aggregate income by \$461 billion, and raised median household income (from its lower after-tax base) by 19.6 percent.

An important finding of the Census Bureau's tax and benefit research was that government transfers were much more significant than taxes in lowering income inequality. In 1992, taxes lowered the Gini index by 5.2

percent (from .497 to .471) while transfers lowered the Gini index by 18.3 percent (from .471 to .385).

Definition 15 shows the effect of including net imputed return on home equity to the definition of income. This income component raised aggregate household income by \$219 billion, and raised median household income by 6.1 percent, to \$31,321. The inclusion of net imputed return on home equity did not have an effect on the Gini index, a reflection of the fact that homeowners are spread throughout the income distribution.

The fully-adjusted income aggregate, one that takes into account the effect of taxes, transfers, and other benefits, was estimated to be \$3,620 billion in 1992, lower than the aggregate under the official income definition (\$3,761 billion). It is important to note that the distribution of income was more equal under the fully-adjusted income measure, as reflected in the lower Gini index (.381) than under the official measure (.430).

CHANGES IN INCOME BY DEFINITION: 1991-92

Based on the official definition of income, median household income remained unchanged for all households between 1991 and 1992 in real terms. As shown in table C, there was an apparent decline in real income between 1991 and 1992 for eight of the other 14 definitions of income shown in this report, however, only four (definitions 2, 3, 5, and 8) were statistically significant. The decline under the definition of money income generated by the private sector (definition 2) median household income declined by 1.7 percent; under definition 3 median income declined by 1.3 percent; under definition 5 median income declined by 1.2 percent; and under definition 8 median income declined by 1.0 percent.² There was no change in real median household income under the fully-adjusted income measure (definition 15).

MEDIAN INCOMES: 1979 TO 1992

In addition to showing the 1991 to 1992 changes, table D shows changes in median household income by definition of income for the period 1979 to 1992 divided into the following subperiods: 1979 to 1983, 1983 to 1989, and 1989 to 1992. The years 1983 and 1989 were chosen as peaks and troughs in the relevant time series. 1979 is the first year for which these calculations are possible.

Under definition 1, the official measure that counts money income before taxes but does not count capital gains, the period from 1979 to 1983 was marked by a

²There were no statistically significant differences between the decline in median household income under definitions 2, 3, 5, and 8.

15. Definition 14 plus net imputed return on equity in own home	31,321	31,399	-0.2

* Significant at the 90-percent confidence level.

decline in real median household income. In 1983, median household income was \$29,607, or 5.1 percent lower in real terms than the 1979 figure of \$31,209.

The table shows that in 1983, median household income was lower than in 1979 for 14 of the 15 definitions of income figures. There was no statistically significant change under definition 15 which includes in the income definition the net imputed returned on home equity. It is of interest that the decline in household income from 1979 to 1983 under definition 14 (3.5 percent), was lower than the decline under definition 1 (5.1) for those years, pointing out that one of the effects of using a more comprehensive definition of income (which includes the effect of taxes and noncash benefits) was to soften the impact of declining real incomes.

The period from 1983 to 1989 was marked by increases in real median household income, regardless of which income definition is used. These increases ranged between 7.1 percent (definition 15) and 12.5 percent (definition 2). Under definition 1, median household income was \$32,706 in 1989 (10.5 percent higher than the 1983 figure of \$29,607).

The most recent period, 1989 to 1992, saw declines in real median household income. These declines are visible under each of the income definitions and range from -3.1 percent (definition 14) to -8.5 percent (definition 2). Under definition 1, median household income was \$30,786 in 1992, or 5.9 percent lower than the 1989 figure of \$32,706. The decline in real income under definition 15 was 4.8 percent. The percentage declines for these two definitions are not statistically different from each other.

INCOME CHARACTERISTICS OF SELECTED POPULATION GROUPS

Different income definitions result in quite different income distributions and summary measures for all households. As shown by the 1992 income data presented in table E, the equalizing effect of taxes and transfers affects income comparisons between population subgroups to varying degrees.

Under the official income definition, the median income of Black households (\$18,660) was 57.6 percent of the White median (\$32,368). Subtracting cash transfers and adding capital gains and health insurance supplements (definition 4) reduced the ratio to 53.3 percent (\$16,636/\$31,214). The subtraction of Federal and State income taxes and payroll taxes (definition 8) results in an increase in the ratio to 57.4 percent (\$14,989/\$26,124),³ and the addition of cash and noncash transfers (definition 14) results in a further increase in the Black-to-White income ratio to 64.3 percent (\$19,878/\$30,893).

Using a broader definition of income also has an effect on comparisons of the income of White households to those with a householder of Hispanic origin. Based on the official income definition, the median income of Hispanic-origin households (\$22,848) was 70.6 percent that of White households (\$32,368). Based on a definition of income that has been broadened to include the effects of taxes and transfers (definition 14), the ratio was 75.6 percent (\$23,347/\$30,893).

³Black-to-White income ratios under definitions 1 and 8 were not significantly different from one another.

* Significant at the 90-percent confidence level.

Differences in income ratios by income definition can be observed when comparing households with a female householder, no husband present, with related children, to married-couple households with children. Under the official income definition, the median income of households with a female householder, no husband present, with children was 33.4 percent of that of married-couple households with children (\$14,896/\$44,545). Based on a definition of income that includes the effect of taxes and transfers (definition 14), the ratio increased to 44.4 percent (\$17,703/\$39,936).

The importance of income definitions to differences between population subgroups is particularly apparent for households with children and elderly households. Under definition 1, median money income was \$36,474 for households with children under 18 years of age, and \$18,378 for households with members 65 years old and over. Thus in 1992 the median income of the latter group was 50.4 percent of the median income of the former group. Subtracting cash transfers and adding

capital gains and employer-provided health insurance (definition 4) lowered the ratio to 21.0 percent (\$7,853/\$37,469). The payment of taxes (definition 8) raised the ratio slightly, to 23.8 percent (\$7,568/\$31,735). The addition of cash and noncash transfers (definition 14) more than doubled the ratio, bringing it to 67.0 percent (\$22,749/\$33,959), and adding the effect of home equity (definition 15) resulted in a further increase in the ratio to 74.0 percent (\$26,055/\$35,189).

POVERTY STATUS

Text tables F through L show how poverty estimates changed when income was defined to include or exclude certain components. The starting point for each of the tables is the current income measure (money income excluding capital gains before taxes) that is used to produce the official poverty estimates. Table F shows how the overall poverty figures changed when specific components were subtracted or added to the definition

Table E. Median Household Income by Selected Characteristics and Definition: 1992

*Significant at the 90 percent confidence level.

of income. In 1992, the official estimate of the number of persons in poverty (definition 1) was 36.9 million, or 14.5 percent of the population.

When the current income measure was modified to exclude government cash transfers (definition 2) the number of persons below the poverty line rose sharply, from 36.9 million to 57.3 million, and the poverty rate rose from 14.5 percent to 22.6 percent.

Adding in capital gains and the value of employer-provider health insurance (definitions 3 and 4) had a relatively minor effect on the poverty estimates. The combined effect of the two additions was to reduce the number in poverty from 57.3 million to 55.7 million and the proportion in poverty from 22.6 percent to 21.9 percent.

Income definitions 5, 6, 7, and 8 deduct income taxes (Federal and State) and payroll taxes and add the Earned Income Tax Credit (EITC) to income definition 4. Adjusting the income definition for taxes produced an increase of 1.7 million in the estimate of the number of persons in poverty (from 55.7 to 57.4 million) and an increase of 0.7 percentage points in the poverty rate (from 21.9 percent to 22.6 percent). Definition 7 shows the effect of the EITC on poverty separately. The data show that when the EITC was added to a measure of income after deducting Federal income taxes, the number of poor decreased by 1.9 million and the poverty rate declined by 0.8 percentage points.

Definitions 9 through 14 introduce specific types of government transfers, both cash and noncash, and table F shows the extent to which these transfers reduced poverty estimates. The addition of nonmeans-tested government cash transfers (primarily Social Security) had a very strong impact on poverty estimates. The addition of this income component reduced the estimate of the number of persons in poverty by 17.9 million persons (from 57.4 to 39.5 million), and reduced the estimated poverty rate from 22.6 to 15.5 percent (see definition 9). The addition of the fungible value of Medicare (definition 10) had a relatively minor effect on poverty estimates, reducing the number from 39.5 to 38.3 million and the rate from 15.5 to 15.1 percent.

Adding the subsidy value of regular-price school lunches to the definition of income (definition 11) did not have a statistically significant effect on the number of poor or the poverty rate.

The effect on poverty estimates of adding means-tested cash transfers (primarily AFDC and SSI) was small compared to the effect of adding nonmeans-tested cash transfers. Adding in means-tested cash transfers (definition 12) reduced the estimate of the number of persons in poverty by 2.8 million (from 38.3 to 35.5 million), compared to the previously cited reduction of 17.9 million after adding nonmeans-tested cash transfers. The poverty rate associated with definition 12 was 14.0 percent, down 1.1 percentage points from the previous definition. The next definition (13) shows the

effect of defining income to include the fungible value of Medicaid. The addition of this component had a relatively small effect: the estimated number in poverty fell from 35.5 to 33.1 million, and the rate fell from 14.0 percent to 13.0 percent. The addition of other means-tested noncash benefits, which include food stamps, school lunches, and rent subsidies (definition 14), lowered the estimate of the number of persons in poverty from 33.1 to 29.7 million and lowered the poverty rate from 13.0 to 11.7 percent.

Definition 15 adds to income the net imputed return on equity in one's home. The appropriateness of determining poverty status by using an income definition that includes this component was discussed earlier in this report. The addition of this component reduced the estimated number of persons in poverty by 3.2 million (from 29.7 to 26.5 million) and reduced the estimated poverty rate by 1.3 percentage points (from 11.7 to 10.4 percent).

A review of the data shows that the income component that had the largest incremental effect on the poverty estimate was Social Security (the primary component of nonmeans-tested government cash transfers). Other types of government transfers had smaller incremental effects.

CHANGES IN POVERTY BY DEFINITION: 1991-92

When year-to-year comparisons were made between 1991 and 1992, poverty estimates of the number of poor persons increased significantly under all definitions except definition 13, which adds the value of Medicaid, and definition 15, which adds the net imputed return on home equity in own home. When comparing poverty rates between 1991 and 1992, there were fewer significant changes. Of the 15 income definitions, only 8 showed a statistically significant increase.

From 1991 to 1992, the official estimate of the number of persons in poverty (definition 1) increased by 1.2 million persons (from 35.7 to 36.9 million). The poverty rate did not change significantly. When poverty status was calculated using an income definition that excluded government cash transfers (definition 2), the number of poor increased from 1991 to 1992 by 2.5 million (from 54.8 to 57.3 million) and the poverty rate increased by 0.8 percentage points (from 21.8 to 22.6 percent). Using a definition which includes only private sector income (definition 4), the number of poor increased by 2.6 million and the poverty rate increased from 21.1 to 21.9 percent. When income was defined to exclude income and payroll taxes from private sector income (definition 8), the poverty rate showed a year-to-year increase, from 21.8 to 22.6 percent. When all government nonmeans-tested cash and noncash benefits were included in income (definition 11), the poverty rate

increased between 1991 and 1992 from 14.6 to 15.1 percent, however, when all means-tested benefits were included (definition 14), the poverty rate did not change significantly. Finally, under the most comprehensive definition of income which includes the net return on home equity (definition 15), again, the poverty rate did not change significantly.

POVERTY STATUS: 1979 TO 1992

In addition to showing the 1991 to 1992 changes, table G shows changes in poverty, respectively for the period 1979 to 1992 divided into the following subperiods: 1979 to 1983, 1983 to 1989, 1989 to 1992, and 1991 to 1992. The years 1983 and 1989 were chosen as peaks and troughs in the relevant time series.

Under definition 1, the period from 1979 to 1983 was marked by an increase in the percent of persons in poverty. In 1983, the percent of persons in poverty under definition 1 was 15.2 percent, or 3.5 percentage

points above the 1979 rate of 11.7 percent. The data in table G show that the 1983 poverty rates were higher than the 1979 rates for all 15 definitions.

The period from 1983 to 1989 was marked by a decline in the poverty rate. Under definition 1, the poverty rate in 1989 was 12.8 percent, or 2.4 percentage points lower than the 1983 figure.

The period 1989 to 1992 saw an increase in the percentage of persons in poverty. Under definition 1, the 1992 poverty rate of 14.5 percent was 1.7 percentage points higher than the 1989 rate of 12.8 percent.

POVERTY STATUS OF SELECTED POPULATION GROUPS

Tables H and I show data for persons of all races and for Whites, Blacks, Asians or Pacific Islanders, and persons of Hispanic origin. The data show that the poverty rate for Whites is lower than the rates for Blacks and persons of Hispanic origin regardless of the income

Table G. Percent of Persons in Poverty, by Definition of Income: 1979 to 1992

*Significant at the 90-percent confidence level.

definition. However, the data also show that the incremental effect of some income components is different for Whites than for Blacks, Asians or Pacific Islanders, or persons of Hispanic origin. Among Whites, the incremental effect of adding nonmeans-tested government cash transfers (primarily Social Security) to the income definition was to reduce the poverty estimate by 37.3 percent (from 41.7 to 26.1 million). The effect on Blacks was to reduce the estimate by 14.5 percent (from 13.4 to 11.5 million), and the effect on persons of Hispanic origin was to reduce the estimate by 13.8 percent (from 8.2 to 7.0 million).

The incremental effect of income components on the poverty status of persons by age group is shown in table J. The data show that the effect of government transfers on the poverty status of the elderly is large compared to the effect of such transfers on the poverty status of young persons. The percent of older persons (65 years and over) in poverty was 50.3 percent before government transfers were added to the income definition (definition 8). The addition of nonmeans-tested cash transfers (primarily Social Security) reduced the rate to 14.8 percent (definition 9) and the addition of other government transfers brought the rate to 10.4 percent

(definition 14). The total effect of adding government transfers was to reduce the poverty rate of older persons by 79.3 percent. Among those under 18 years of age, the before-transfer poverty rate was 24.7 percent (definition 8) and the addition of all government transfers brought the rate to 16.7 percent (definition 14). The effect of government transfers was to reduce the poverty rate of young persons by 32.4 percent.

Counting the net imputed return on equity in one's own home has a larger effect on poverty rates for older persons than for other age groups. Table J shows that counting this component would reduce the poverty rate of persons 65 years and over by 40.4 percent (from 10.4 to 6.2 percent), compared with 20.8 percent (from 7.7 to 6.1 percent) for persons 45 to 64 years, and 6.4 percent (from 9.4 to 8.8 percent) for persons 25 to 44 years.⁴

The probability of being in poverty is strongly associated with the type of family to which a person belongs. Table K shows poverty rates for persons in families with children by whether the family is a married-couple family

⁴The difference in the poverty rates based on definition 15 for persons 65 years and over (6.2 percent) was not statistically different from the poverty rate for persons 45 to 64 years of age.

¹Persons of Hispanic origin may be of any race.

or a family with a female householder, no husband present. The estimates are shown for Whites, Blacks, Asians or Pacific Islanders, and persons of Hispanic origin.

The official poverty figures show that persons in married-couple families had much lower poverty rates than persons in families with a female householder, no husband present. Among Whites, the rate was 8.7 percent for those in a married-couple family with children and 40.3 percent for those in a female householder family with children and no husband present. The comparable figures were 16.5 and 60.4 percent for Blacks, 9.8 and 38.4 percent for Asians or Pacific Islanders, and 24.7 and 58.5 percent for persons of Hispanic origin.⁵

The data in table K also show the incremental effect on poverty rates of adding various components to and subtracting taxes from the definition of income. The poverty rates associated with income definitions 9 through

⁵The poverty rate for Asians or Pacific Islanders in married-couple families with children (9.8 percent) was not statistically different from the poverty rate for White married-couple families with children (8.7 percent). The poverty rate for White families with a female householder, no husband present with children (40.3 percent) was not statistically different from the Asian and Pacific Islander families with a female householder, no husband present with children (38.4 percent). Similarly, the poverty rate for Black families with a female householder, no husband present with children (60.4 percent) was not statistically different from persons of Hispanic origin in the same category (58.5 percent).

14 show the extent to which government transfers lower the poverty rate among the universe of persons who live in families with children. In total, government transfers produced sizable reductions in the poverty rates, but some groups were characterized by high rates of poverty even after all government transfers were included. A comparison of the poverty rates associated with definitions 8 and 14 (pre- and post-transfers) show that transfers reduced the poverty rate of Whites in married-couple families with children from 10.7 percent to 6.4 percent, a reduction of 40.2 percent. Among Blacks and persons of Hispanic origin in married-couple families with children, government transfers reduced the poverty rate by 40.9 percent (from 20.8 percent to 12.3 percent) and 36.7 percent (from 28.6 percent to 18.1 percent), respectively.⁶ Persons in families with a female householder, no husband present had much higher pre-transfer and post-transfer poverty rates. The effect of government transfers was to reduce the poverty rate of Whites in this family category from 46.0 to 30.3 percent. Among Blacks and persons of Hispanic origin in this

⁶The reductions of 40.2 percent for Whites, 40.9 percent for Blacks, and 36.7 percent for persons of Hispanic origin in the previous sentences were not statistically different.

¹Persons of Hispanic origin may be of any race.

family category, government transfers reduced the poverty rate from 66.4 percent to 46.9 percent and from 64.4 percent to 43.6 percent respectively.⁷

POVERTY STATUS UNDER AN ALTERNATE PRICE INDEX

Poverty estimates based on poverty thresholds adjusted over time for inflation by the CPI-U-X1 series are shown in table L. Since the poverty thresholds based on the CPI-U-X1 are approximately 8 percent lower than the official thresholds based on the CPI-U, the poverty estimates shown are lower than estimates based on the

⁷The poverty rates for Blacks in families with female householder, no husband present (66.4 percent) as well as for Blacks in married-couple families with children (46.9 percent) were not statistically different from persons of Hispanic origin in the same categories (64.4 percent and 43.6 percent, respectively).

CPI-U. The section on measurement issues in this report noted that the selection of an appropriate price index is only one of many issues surrounding the current poverty definition. The resolution of other issues could have a considerably larger impact on estimates of the number of poor and poverty rate than the issue of which price index should be used.

On average, the poverty rates based on the CPI-U-X1 are approximately 1.4 percentage points and 3.6 million persons lower than estimates based on the official thresholds. Figure 2 presents a time series of the poverty rate based on the CPI-U and the CPI-U-X1. Using the official definition of income (definition 1), the 1992 poverty rate based on the CPI-U-X1 was 13.1 percent compared to 14.5 percent based on the CPI-U. Using definition 14 (which includes the effect of taxes, cash and noncash benefits, capital gains, and employee health benefits) the poverty rate under the CPI-U-X1

Table L. Number and Percent of Persons in Poverty, by Definition of Income: 1992 and 1991
(Poverty Thresholds Based on CPI-U-X1)

[Total number of persons was 253,969,000 in 1992 and 251,179,000 in 1991. Numbers in thousands]

*Significant at the 90 percent confidence level.

Figure 2.
Poverty Rates by Definition of Income and Type
of Deflator: 1959 - 1992

Note: Income definition 1 is the official definition of income in Census Bureau reports. Income definition 14 includes the effect of taxes, capital gains, employee benefits, and cash and noncash benefits.

was 10.3 percent compared to 11.7 percent based on the CPI-U. Adding net equity in own home to the income definition (definition 15) results in a poverty rate based on the CPI-U-X1 of 9.2 percent compared with 10.4 percent based on the CPI-U.

Changes in poverty estimates over time based on the CPI-U-X1 and the CPI-U show the same general patterns as the income definition changes.

USER COMMENTS

The Census Bureau welcomes the comments and advice of data users. We are particularly interested in receiving comments about this report because of its experimental nature. If you have suggestions or comments, please write to:

Appendix A. Definitions and Explanations

Population coverage. This report includes the civilian noninstitutional population of the United States (the 50 States and the District of Columbia) and members of the Armed Forces living off post or with their families on post, but excludes all other members of the Armed Forces. The poverty data also exclude unrelated individuals under 15 years of age. Poverty rates exclude inmates of institutions, Armed Forces members in barracks, and unrelated individuals under 15 years from the denominator as well as numerator.

Money income. Income distributions and income summary measures (such as medians and means) shown in definition 1 of this report are limited to money income before payments of Federal, State, local, or Social Security (FICA) taxes and before any other types of deductions, such as union dues and Medicare premiums. Total money income is the sum of the amounts received from wages and salaries, self-employment income (including losses), Social Security, Supplemental Security Income, public assistance, interest, dividends, rent, royalties, estates or trusts, Veterans' payments, unemployment and workers' compensations, private and government retirement and disability pensions, alimony, child support, and any other source of money income which was regularly received. Capital gains (or losses) and lump-sum or one-time payments such as life insurance settlements are excluded.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group.

Per capita income. Per capita income is the mean income computed for every man, woman, and child in a particular group. It is derived by dividing the total income of a particular group by the total population (excluding patients or inmates in institutional quarters) in that group.

Gini ratio. The Gini ratio (or index of income concentration) is a statistical measure of income equality ranging from 0 to 1. A measure of 1 indicates perfect

inequality, i.e., one person has all the income and the rest have none. A measure of 0 indicates perfect equality, i.e., all persons having equal shares of income. All Gini ratios appearing in this report were computed using grouped data. For a more detailed discussion, see Current Population Reports, Series P-60, No. 123.

Constant dollars. Some of the income figures for previous years have been converted to 1992 constant dollars in order to discount for changes in consumer prices. These adjustments were made based on changes in the experimental version of the average annual Consumer Price Index for All Urban Consumers (CPI-U-X1). These index values are shown in table A-1.

Nonresponse. Nonresponse in household surveys has two main components. The first, often termed noninterview, consists of those occupied sample housing units for which no interview was obtained. In the March CPS, about 4 to 5 percent of all sample households are determined to be noninterviews. Noninterviews result because the household members refuse to participate in the survey or because the occupants could not be found at home at any time during the survey week. The survey weights of the interviewed households are adjusted to reflect the loss of these noninterviews. The second component of nonresponse, usually referred to as item nonresponse, represents failure to obtain answers to specific questions for households that do participate in the survey. Item nonresponse occurs because individuals may refuse to answer some questions or because the answers to some of the questions are not known and cannot be accurately estimated by the respondent. The magnitude of item nonresponse for amounts of income received varies considerably by the type of income. For example, the item nonresponse rate for wage and salary amounts is about 20 percent, compared with 23 percent for Social Security income and 37 percent for dividends. The data processing system used for the March CPS makes assignments (imputes) of values when survey responses are missing. These imputations are made on a case-by-case basis using the respondent's reported information to develop an appropriate substitute value.

Poverty definition. Families and unrelated individuals are classified as being above or below the poverty level using the poverty index originated at the Social Security

Table A-1. Annual Average Consumer Price Indexes: Official (CPI-U) and Experimental (CPI-U-X1) 1967 to 1992

Administration in 1964 and revised by Federal Inter-agency Committees in 1969 and 1980. The poverty index is based solely on money income and does not reflect the fact that many low-income persons receive noncash benefits such as food stamps, Medicaid, and public housing. The index is based on the Department of Agriculture's 1961 Economy Food Plan and reflects the different consumption requirements of families based on their size and composition. It was determined from the Department of Agriculture's 1955 Survey of Food Consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the Economy Food Plan. For smaller families and persons living alone, the cost of the Economy Food Plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. The poverty thresholds are updated every year to reflect changes in the official Consumer Price Index (CPI-U). The index values are shown in table A-1. The average poverty threshold for a family of four was \$14,335 in 1992, about 3.0 percent higher than the comparable 1991 cutoff of \$13,924. Weighted average poverty thresholds by size of family are shown in table A-2.

Poverty thresholds versus administrative poverty income guidelines. The poverty thresholds in table A-2 are averages of the 48 different thresholds (which vary by family size, number of children and age of

householder for one- and two-person families) which are used by the Census Bureau in determining the poverty status of persons from income data furnished by respondent surveys and the decennial census. Our average poverty thresholds are similar but not identical to the "administrative poverty income guidelines" which are issued by the Department of Health and Human Services (HHS). The HHS poverty guidelines are used for administrative purposes such as determining eligibility for a particular assistance program rather than for determining poverty status in surveys. The guidelines are usually applied in combination with other eligibility criteria, such as asset limits, and may be used as multiples (e.g., children in families with income below 185 percent of their appropriate income guidelines may be eligible for the reduced-price school lunch program).

The HHS guidelines represent rounded versions of the average weighted poverty thresholds adjusted to provide equal differences between each family size (rather than using the equivalency scale inherent in the poverty thresholds). The 1993 poverty guidelines issued in the *Federal Register* (see *Federal Register*, Volume 58, No. 28, Feb. 12, 1993, pp. 8287-8289) are based on the 1992 poverty thresholds in table A-2. The guidelines use the reference year "1993" since they are applied for eligibility purposes in that year. The poverty thresholds are called "1992" because in our March 1993 CPS we ask income information for the previous calendar year (1992).

For further information on the poverty guidelines, contact the Office of the Assistant Secretary for Planning and Evaluation, Department of Health and Human Services, Washington, DC. 20201

Household. A household consists of all persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

Table A-2. Weighted Average Poverty Thresholds in 1992

Size of family unit	Threshold
One person (unrelated individual)	\$7,143
15 to 64 years	7,299
65 years and over	6,729
Two persons.....	9,137
Householder 15 to 64 years	9,443
Householder 65 years and over	8,487
Three persons	11,186
Four persons	14,335
Five persons.....	16,952
Six persons	19,137
Seven persons.....	21,594
Eight persons.....	24,053
Nine persons or more.....	28,745

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards or employees who share the housing unit. A person living alone in a housing unit or a group of unrelated persons sharing a housing unit as partners is also counted as a household. The count of households excludes group quarters.

Family. The term "family" refers to a group of two or more persons (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered members of the same family. Thus, if the son of the householder and the son's wife are in the household, they are treated as part of the householder's family. However, a lodger and his wife not related to the householder or an unrelated servant and his wife are

considered as additional families not a part of the householder's family. These unrelated subfamilies are not included in the count of total families.

Unrelated individuals. The term "unrelated individuals" refers to persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the householder or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Appendix B. Description of Methods Used to Value Noncash Benefits

Food stamps. The March supplement to the CPS collects information on the face value of food stamps received by households during the calendar year and on the number of persons in each household who were in a food stamp reciprocity unit. This information was used to determine the face value of food stamps received by families and unrelated individuals during the calendar year. The income value of food stamps was set equal to their face value.

School lunches. The March supplement collects information on the number of children in each household who usually ate a complete hot lunch offered at school and the number who received free or reduced-price lunches because they qualified for the Federal School Lunch program. The income value of the school lunch program for each participant family was calculated by determining the annual subsidy received by each child depending on whether the lunches were regular price, reduced price, or free. Information on subsidies per meal was obtained from the Department of Agriculture.

The subsidies include benefits under the Bonus Commodity Program by distributing the market value of the bonus commodities equally over all lunches served.

During the process of obtaining data for 1992 school lunch program subsidy rates, we found a problem with our calculations of the reduced price and free school lunch rates for prior years. The problem was that the reduced price and free school lunch rates used were total subsidy rates that already included the regular price school lunch rate. Therefore, our calculations double counted the regular price school lunch rates. The problem started with the 1985 rates and resulted in rates that were approximately 13 to 17 cents too high per lunch for the reduced price and free school lunch programs. It did not affect the regular price school lunch subsidy rates. This is a minor problem that should not have a significant effect on the reported income and poverty results. Corrected subsidy rates were used for this year (1992).

Housing subsidies. The March supplement collects information on the number of households living in public or subsidized housing units, but a rather complex procedure is required to estimate the income value of these housing subsidies.

Because the CPS does not collect data on housing costs, the basis for the calculation of the value of housing subsidies was the 1985 American Housing

Survey. This data file was used to calculate the actual gross rent (rent plus utilities) paid by families in subsidized housing and the rent these families would have been expected to pay had their units not been subsidized. The calculation of actual rent was taken directly from survey responses. The calculation of the rent the family would have expected to pay if the unit was not subsidized required the development of a statistical model that measured the effect of certain housing characteristics on gross rent.

For each of the four major regions, a model was estimated from the universe of two bedroom nonsubsidized units that related gross rent to (a) number of bathrooms, (b) number of appliances, (c) number of housing flaws, and (d) presence of satisfactory neighborhood services. The coefficients of the model were then used with the universe of subsidized units to determine the amount these units would have rented for had they not been subsidized.

The two items of information—actual rent and predicted rent—provide a measure of the income value of the housing subsidy.

The complete model contained two additional features not described above. First, the relative subsidies observed for two bedroom units were assumed to apply as well to smaller and larger units (there were insufficient observations to perform separate analyses for these units). Second, because the required rent payment in some subsidized housing is dependent on the income of the family, subsidies were estimated for families with incomes under \$6,000, \$6,000 to \$9,999, and \$10,000 and over.

The estimated subsidies shown in table B-1 are the 1985 estimates updated to reflect changes in shelter costs. These estimates were used as measures of the income value of housing subsidies.

Medicare and Medicaid. The March supplement collects information on the number of persons who were covered by Medicare and/or Medicaid at any time during the previous calendar year. For the purpose of preparing income estimates it was assumed that anyone who was covered at any time during the year was covered for the entire year. For reasons described in the front text of this report, the income value of benefits from Medicare and Medicaid was defined as the fungible value of the benefits. The principle that was followed in determining fungible value can be summarized as follows:

Table B-1. Estimates of Monthly Rent Subsidies, by Number of Bedrooms, Region, and Income Level: 1992

Region and income level of family	One bedroom	Two bedrooms	Three or more bedrooms
Northeast			
Income under \$6,000.....	\$238	\$279	\$313
Income \$6,000 to \$9,999.....	216	257	288
Income \$10,000 and over.....	90	108	119
Midwest			
Income under \$6,000.....	144	185	209
Income \$6,000 to \$9,999.....	131	169	193
Income \$10,000 and over.....	55	71	80
South			
Income under \$6,000.....	166	199	250
Income \$6,000 to \$9,999.....	153	182	231
Income \$10,000 and over.....	63	76	95
West			
Income under \$6,000.....	199	249	329
Income \$6,000 to \$9,999.....	182	230	301
Income \$10,000 and over.....	76	95	125

Note: Data from the American Housing Survey were used to determine how much families living in nonsubsidized units with characteristics similar to the subsidized units pay for rent. The difference is the rent subsidy.

Medicare and Medicaid benefits are counted as income to the extent that they free up resources that could have been spent on medical care.

The model used to measure fungible value has the following elements:

1. Medicare and/or Medicaid benefits have no income value if the family is unable to meet basic food and housing requirements or if the family has no remaining resources after meeting basic food and housing requirements. The cost of basic food requirements is determined by the cost of the Department of Agriculture's Thrifty Food Plan (the lowest cost of several food plans). The cost of basic housing is taken from the Department of Housing and Urban Development's Fair Market Rent series that measures market rent levels for standard quality housing in each U.S. county.
2. Medicare and/or Medicaid benefits have full income value (defined to be the mean government outlay for families in a given risk class) if the resources of the family after deducting amounts required for basic food and housing costs were as great or greater than the mean Medicare and/or Medicaid outlays for families in the same risk class.
3. Medicare and/or Medicaid benefits have partial income value if the resources of the family are higher than the level specified in element 1 but lower than the level specified in element 2.

The actual calculation involves the following steps:

For a given family, determine:

A = Cost of basic food and housing.

B = Amount of resources (includes money income, food stamps, and housing subsidies).

C_1 = Mean Medicare outlays for families in the risk class to which this family belongs.

C_2 = Mean Medicaid outlays for families in the risk class to which this family belongs.

Then, the income value of Medicare and/or Medicaid

= \$0 if B is less than or equal to A

= $C_1 + C_2$ if (B-A) is greater than or equal to $C_1 + C_2$

= X if B is greater than A and (B-A) is less than $C_1 + C_2$

Table B-2. Cost of Thrifty Food Plan: 1992

Sex and age	Annual amount

¹Data by risk class were not available for 1992. The estimates in this table were prepared by applying factors to the 1992 total expenditures data from the Health Care Financing Administration. These factors were based on the relationship between the risk class expenditures and total expenditures in 1991.

Note: D.C. was based on Maryland data for 1991 and 1992 and applied to D.C. data for 1991 to come up with data for 1992 for D.C.

where $X = (r \cdot C_1) + (r \cdot C_2)$ and

$$r = \frac{B - A}{C_1 + C_2}$$

Table B-2 shows the cost of the Thrifty Food Plan for 1992, table B-3 shows mean outlays per enrollee for the Medicare program, and table B-4 shows mean outlays per beneficiary for the Medicaid program.

Employer contributions to health insurance. The March supplement collects information on the number of persons who were covered at any time during the previous calendar year by a health insurance plan obtained through an employer or union. The supplement also collects information on whether the employer paid for all, part, or none of the cost of the plan.

For the purpose of this report, employer contributions to health insurance plans are treated as a form of wages and the entire estimated value of the employer contribution is counted as income.

The best data source available for measuring the amount employers contribute to health plans was the 1977 National Medical Care Expenditures Survey (NMCES). That survey had a relatively large sample size and included data on contributions that were obtained by conducting interviews with the employers of persons who were in the household portion of the NMCES sample.

The procedure for estimating the value of employer contributions for persons and families on the March 1993 CPS data file involved the following steps:

1. An enhanced NMCES data file was prepared by adding two variables not on the original file. The two variables were total earnings during the year and usual hours worked per week. The variables were created by statistically matching NMCES and CPS using the appropriate demographic and economic variables that were available from both sources. The match made it possible to assign the earnings and full-time/part-time variables to the NMCES file.
2. The enhanced NMCES file was used to estimate a model that related employer contributions to a set of explanatory variables. The variables chosen were ones that are also available on the CPS file. The list of variables included (1) type of plan (family or individual), (2) proportion of cost paid for by employer (part or all), (3) level of earnings, (4) type of worker (full-time or part-time), (5) industry, (6) occupation, (7) sector (private or government), (8) region, (9) residence, (10) personal characteristics such as age, race, marital status, and education.
3. The model was run on the March 1993 CPS file to obtain estimates of the amount of employer contributions for each worker whose employer paid all or part of the cost of his or her health plan. The model was run after deflating 1992 earnings to 1977 dollars.

Source: Health Care Finance Administration.

The estimates produced by this model were then inflated to 1992 estimates by multiplying the 1977 level estimates by the 1977 to 1992 change in employer contributions per covered employer.

- For those persons who worked for the Federal government in 1992, the amount of employer contribution was calculated using administrative data. Separate calculations were made for postal and non-postal employees.

Net imputed return on equity in own home. Home-owners with a positive amount of home equity receive income in the form of housing services but that income is usually omitted from estimates of the distribution of income. There are two possible approaches to measuring this income. The net rental income approach begins with an estimate of the amount the home would rent for in the market and subtracts expenses related to home ownership such as mortgage interest, property taxes,

maintenance costs, depreciation, and insurance. The net rental approach presents very serious measurement difficulties and was not used for this report. The approach that was chosen applies a rate of return to the estimated amount of home equity.

The March supplement collects information on whether the housing unit is owned or rented, but does not collect information on home equity. The rate of return approach was implemented by preparing an enhanced CPS file that used information on the 1991 American Housing Survey (AHS) file to assign values of home equity and amounts of property taxes to CPS households. The file was created by statistically matching each CPS household to an AHS household with similar characteristics. (The procedures used in matching the two files are described in appendix C.)

The estimate of the amount of income derived from home equity is dependent on the rate of return that is chosen. The rate chosen for this report was the average rate of return on high-grade municipal bonds (from the Standard and Poor's series). This rate was 6.41 percent in 1992. Because homeowners pay property taxes, the final estimate of the amount of income derived from home equity is made equal to the imputed return less the amount of property taxes paid.

Methodology Used to Value Noncash Benefits in Earlier Years. The following reports describe the methods and procedures used to value noncash benefits for years 1986 to 1991.

P-60, No. 164-RD-1 *Measuring the Effect of Benefits and Taxes on Income and Poverty: 1986*

P-60, No. 170-RD *Measuring the Effect of Benefits and Taxes on Income and Poverty: 1987-88*

P-60, No. 169-RD *Measuring the Effect of Benefits and Taxes on Income and Poverty: 1989*

Appendix C. Description of Methods Used to Estimate Taxes and Capital Gains

INTRODUCTION

This section describes the methodology and procedures which were developed to estimate taxes associated with the income information on the March 1993 CPS microdata file. In all, four types of taxes were simulated: 1) Federal individual income taxes, 2) State individual income taxes, 3) property taxes on owner-occupied housing, and 4) payroll taxes.

Development of the after-tax simulation procedures began with the March CPS annual demographic supplement. This microdata file contains demographic and economic information for approximately 60,000 sample households and the persons living in these households. It includes detailed information on household and family relationship; age; marital status; race and ethnicity; educational attainment; weeks and hours worked during the calendar year; occupation, industry, and class of worker of the job held longest during the calendar year; and income amounts for wages and salary, nonfarm and farm self-employment income, interest, dividends, rental income, estates and trusts, royalties, pension income, unemployment compensation, and sources of nontaxable income.

The second major element in the simulation system was statistical summaries of individual income tax returns compiled by the Internal Revenue Service. These statistics are made available in the IRS publication series, Statistics of Income (SOI). Some unpublished statistical summaries from the IRS were also used to develop these procedures.

A third element was the 1991 American Housing Survey microdata file. This element was used to assign property taxes paid to the March CPS sample households residing in owner-occupied housing.

The system for estimating taxes paid and after-tax income created a modified March CPS microdata file. This file was formed by expanding the March CPS format to include variables relevant to the simulation of taxes paid. The detailed tables contained in this report were derived from this modified March CPS data file.

Federal Income Taxes

Simulation of Federal income taxes required up to four separate operations. First was the formation and classification of tax filing units using household relationship, marital status, and dependency rules. Second,

was the calculation of adjusted gross income for each of those units. Third was the simulation of amount of Federal income taxes paid. Finally, the calculation of earned income tax credits was made, when applicable.

Formation and classification of Federal income tax filing units. A Federal tax filing "unit" was defined as any individual (or married couple) with either \$400 in self-employment income, \$1,000 in wages or salary, or a total of \$1,000 in interest, dividends, rents and royalties, estates and trusts, or pension income in 1992. These income levels were chosen because they either corresponded to tax laws or helped bring the estimated number of filing units on the CPS in line with IRS Statistics of Income (SOI) data.

The next step in the formation of Federal tax filing units was the assignment of dependency status. The algorithm for assigning dependency for each tax unit used the following rules:

- All filing primary family householders and spouses were included as dependents on their own tax returns.
- All children under age 15 who were members of the primary family were counted as dependents on the return of the family householder. Children aged 15 and over (except related subfamily members) with a total taxable income of less than \$1,000 were assigned dependency to the tax return of the primary family householder. Children aged 15 and over who were students were assigned dependency to the primary family householder regardless of income level.
- All other primary family members (except related subfamily members) with taxable income of less than \$1,000 were assigned as dependents on the tax return of the primary family householder.
- Related subfamilies having at least one Federal tax filing unit were treated separately in the same manner as primary families. Members of a related subfamily containing no Federal tax filing unit were assigned dependency to the tax return of the primary family householder.
- All unrelated subfamilies were treated in the same manner as primary families.

- Primary and secondary unrelated individuals age 15 and over were treated as dependents only on their own tax returns.

All simulated filing units were classified into one of three return types. Married couples and persons whose marital status was "married, spouse absent in Armed Forces" were assumed to file joint returns. Unmarried family householders with dependents were assumed to file head of household returns. All other persons classified as Federal tax filing units were assumed to file as single individuals.

Computation of adjusted gross income and capital gains. Adjusted gross income (AGI) for each simulated tax filing unit was calculated by summing the income amounts from all taxable sources and an imputed amount for capital gains. The sources of CPS income included in AGI were wages and salaries, net farm and nonfarm self-employment income, net rental and royalty income, dividends, interest, estates and trusts, income from private and government pensions, unemployment compensation, and alimony.

Capital gains were imputed to tax filing units based on data obtained from a Statistics of Income (SOI) public use file and reports summarizing information reported on 1991 Federal tax returns. These data provide estimates of the probability that a filing unit in a given matrix cell reported capital gains and the mean amount of capital gains for that cell. The variables in this probability matrix were: level of AGI, type of return, and age of tax filer. A Monte Carlo technique was used to randomly assign capital gains: a random number (between 0 and 1) was generated for each filing unit; if that number was less than or equal to the probability of filing units in that matrix cell reporting capital gains, the mean amount of capital gains, as computed above, was added to that unit's AGI. This procedure does not control on other characteristics that might affect the allocation of this source of income. As a result of the fact that capital losses can be greater than capital gains for some groups, the net effect of capital gains (definition 3) in table 1 of this report can be negative.

In 1992, a portion of Social Security income was included in AGI if the sum of AGI and half of the total Social Security amount exceeded \$25,000 (\$32,000 for joint returns). In these cases, the lesser of 1) one-half of the Social Security payments or 2) one-half of the difference between the modified AGI and the income limit was included in AGI.

Payments to Individual Retirement Accounts (IRA's) were simulated for the 1992 tax model. The May 1983 CPS pension supplement (updated to reflect changes in IRA regulations) was used to estimate probabilities of tax-filing units contributing to IRA's and the average amounts contributed. Average IRA contributions are

updated annually based on SOI data. These probabilities were then used to assign IRA contributions to individual tax-filing units on the CPS file. The IRA payments were deducted from the total income received by the tax-filing units in order to compute adjusted gross income.

Computation of taxable income and taxes paid.

Taxable income was computed by subtracting the estimated allowable deductions from AGI. The first step in this process consisted of predicting which filing units itemized deductions.

Homeownership was determined to be the most important variable available from the CPS for assigning itemization status to tax filers. Outlined below is a step-by-step description of the procedures used to assign itemization status.

1. A statistical match was made of the March CPS and American Housing Survey (AHS) data files in order to assign a monthly mortgage amount and a property tax amount to each owner-occupied unit on the March CPS file.
2. Probabilities of itemizing for homeowner, tax-filing units were computed by size of monthly mortgage payment from the 1979 Income Survey Development Program (ISDP) test panel. Probabilities for renters were computed by AGI level.
3. The probabilities described in step 2 were used to randomly assign itemization status within monthly mortgage (or AGI) intervals using the same Monte Carlo technique used in the assignment of capital gains.
4. The amount of itemized deductions for tax filing units was computed using a matrix showing the ratio of itemized deductions to AGI for all units by AGI interval, type of tax return, and presence of a home mortgage. The ratios of itemized deductions to AGI were computed using a 1984 SOI public use file and 1991 SOI data.

Next, a standard deduction was estimated for each tax filing unit by multiplying the number of exemptions by \$2,300. Taxable income was then estimated by subtracting the itemized and standard deductions from AGI. Tax liability was then computed using the appropriate tax schedule for that simulated return type.

The dependent child care credit was simulated for the 1992 Federal tax model and subtracted from the total tax liability. This credit allows tax filers to deduct a portion of child care expenses while they work or look for work. Data from the June 1982 CPS supplement were used to estimate probabilities of tax filers paying for child care. These estimates are updated annually from SOI data.

The earned income tax credit was simulated for the 1992 tax model. These tax credits were used in the calculation of net Federal tax liability and computation of after-tax household income for filing units with one or more dependent children, less than \$22,370 in AGI, and earnings between \$1 and \$22,370. Since the earned income tax credit can be larger than Federal tax liability, the net effect of Federal income taxes (definition 7) in table 1 of this report can be negative.

The simulation procedures do not capture variations in proportions of income paid in taxes within AGI intervals. The proportion of income paid in taxes for households with similar AGI amounts may differ relative to factors such as race, age of household members, number of household members, and marital status. The extent to which these variations exist has not been measured, therefore, caution should be used when interpreting relatively small differences between the incomes of various subgroups of the population.

The lack of variation in proportions of income paid in taxes within AGI intervals is due in large part to the use of aggregate-level IRS data in the simulation process, as described previously in the appendix. The use of aggregate-level IRS data was necessary because the detailed information needed to simulate tax liability are not currently available on an individual-level basis (i.e., from a matched CPS-IRS microdata file).

Published IRS estimates play a significant role in the simulation of Federal income taxes. Proportions of tax filers claiming capital gains, average capital gains, itemized deductions as a percentage of AGI, and average child care credit amounts are the major IRS-based components in the CPS Federal tax simulation procedure. In the preparation of 1992 Federal tax estimates, IRS data were not available. As a result, 1991 IRS data were used in the simulation. Though it is not expected that the use of 1991 IRS data seriously biases the 1992 CPS estimates, the Federal tax data in this report should be considered as preliminary. In the preparation of next year's report, the 1992 Federal tax estimates will be recomputed based on 1992 IRS data.

State Individual Income Taxes

There were 44 States that required payment of individual income taxes in 1992. For the purpose of this model, the definitions of tax filing units and AGI used for the estimation of Federal income taxes were also used for the simulation of State income taxes.

The amounts of State individual income taxes paid were computed by developing a model of each State's income tax regulations. Information on the State tax systems was obtained from a publication entitled, *State Tax Handbook*, October 1, 1991. State tax rates and brackets are updated annually to reflect changes in State tax regulations. While every detail of each State's income tax system was not simulated, most of the important aspects were accounted for.

Property Taxes on Owner-Occupied Housing

In order to simulate property taxes for owner-occupied housing units, the March 1992 CPS simulation file was statistically matched to a file from the 1989 American Housing Survey (AHS). Since the AHS file contained responses to questions on annual property tax expenses the statistical match allowed the transfer of property tax amounts to CPS records when a CPS and AHS household were found to have similar characteristics. The group of variables used to match the two files were: age of householder, State, SMSA and central-city status of the household, household income, household size, number of living quarters, and the race, sex, and educational attainment of the householder. Using a very detailed combination of recodes based on the above variables, the two files were matched. If there was no AHS household with the exact combination of characteristics as a particular CPS household, a match was then attempted at a new level that did not have quite as much detail. This was repeated until a match was found for every CPS household.

Households on the AHS file that did not answer the question dealing with property tax expenses were ineligible for the match. Since monthly mortgage expenses, which were used to simulate itemization status for Federal taxpayers, were also assigned to CPS households using this match, households that did not answer the AHS questions on that subject were similarly excluded from the match.

Property taxes paid on secondary residences, such as vacation homes, could not be simulated. Also, the proportion of rent that pays the property taxes on renter-occupied housing units was not estimated.

The estimation procedures for property taxes paid by homeowners produces estimates that do not correspond precisely with those available from the AHS. These differences are mainly the result of differing universes and use of the statistical matching procedure.

Payroll Taxes

The Social Security payroll tax (FICA) was simulated using occupation of longest job and earnings data reported on the CPS.¹ Social Security payroll taxes were calculated directly from the reported CPS earnings using the Social Security payroll tax formula for 1992. For wages and salary, the tax rate used was 7.65 percent up to a maximum of \$55,500.

¹According to the National Income and Product Accounts published by the Bureau of Economic Analysis (BEA), Social Security (FICA) payments are not treated as taxes. Instead, they are included under Federal Government receipts as "Contributions for Social Insurance." We have included them under the broad heading of taxes as they are mandatory deductions from gross earnings.

The tax rate for self-employment was 15.30 percent of the amount between \$400 and \$55,500. Not all workers were assigned coverage under Social Security and, therefore, a small number were not subject to Social Security taxes. Some Federal employees and specific proportions of workers in certain occupation groups were assigned noncovered status. Unpublished statistics supplied by the Social Security Administration were used to make these assignments.

Methodology Used to Estimate Taxes and Capital Gains from Earlier Years. Following is a list of reports describing the methods and procedures which were developed to estimate taxes for earlier years:

Appendix D. Source and Accuracy of Estimates

SOURCES OF DATA

Data from the American Housing Survey (AHS), the Income Survey Development Program (ISDP), and the Internal Revenue Service (IRS) were combined with Current Population Survey (CPS) data to create simulations of taxes paid, number of tax filing units, adjusted gross income, and other tax characteristics for the March 1993 CPS.

In addition, this report uses the *State Tax Handbook* from Commerce Clearing House as information sources for tax data. For noncash valuation estimates, this report uses data from the Department of Agriculture (USDA), the Health Care Financing Administration (HCFA), and the Department of Housing and Urban Development (HUD).

A description of sources of data from which these estimates were derived follows. Except for the CPS, these descriptions are brief. See the other appendices of this report and publications on the appropriate surveys for more details.

American Housing Survey. The Bureau of the Census collects housing data for the Department of Housing and Urban Development. The population covered by the sample for the AHS, which was called the Annual Housing Survey before 1984, includes all housing units in the United States. A structure must meet specific criteria developed by the Bureau of the Census before it is termed a housing unit. For a more detailed description of the sample design, see the report *Current Housing Reports, Series H150-89, The American Housing Survey for the United States in 1989*, U.S. Department of Commerce.

The AHS is no longer conducted in even-numbered years, so property tax estimates in this report are based on the 1991 AHS. Also, for the noncash estimates, 1985 AHS data were used in a model to estimate the value of public housing. For more details on the AHS model used to estimate public and subsidized housing values, please see Appendix B of this report.

Income Survey Development Program. The ISDP was the research and development phase for the Survey of Income and Program Participation (SIPP). The ISDP was used to examine and resolve design, operational, and technical issues for SIPP. The household sample for the 1979 ISDP was a nationwide multiple

frame sample. The majority of sample households in the ISDP came from addresses contacted in the 1976 Survey of Income and Education. The remainder of sample households were selected from a reserve file of sample cases maintained by the Bureau of the Census. For a more detailed description of this sample design see the report *Wage and Salary Data from the Income Survey Development Program: 1979 (Preliminary Data from Interview Period One)*, Current Population Reports Special Studies Series P-23, No. 118.

Internal Revenue Service Data. Much of the IRS data in this report comes from the Statistics of Income (SOI) series, in particular the SOI Bulletin *Individual Income Tax Returns, Preliminary Data: 1991*, Spring 1993. This report, based on a sample drawn from all tax returns filed in 1992, presents information on taxpayers' incomes, exemptions, deductions, credits, and taxes.

Data from Other Sources. Information on State tax systems is published in *State Tax Handbook*, October 1, 1991, from Commerce Clearing House, and has been updated to reflect changes in State income tax rates.

Much of the data on cash and noncash benefits are from administrative records. Values of school lunches and food stamps are from USDA unpublished data. Medicaid and Medicare data come from HCFA unpublished records. Also, USDA and HUD data are used to compute Medicaid and Medicare values. See Appendix B for more detail.

The Consumer Price Index (CPI) is used in the poverty section of this report. For more detail on the CPI, see Current Population Reports, Series P-60 No. 184, *Money Income in the United States: 1992*.

CURRENT POPULATION SURVEY

Most CPS estimates in this report come from data obtained from the March 1993 CPS. The Bureau of the Census conducts the survey every month, although this report uses only March data for its estimates. The March survey uses two sets of questions: the basic and the supplement.

Basic CPS. The monthly CPS collects primarily labor force data about the civilian noninstitutional population. Interviewers ask questions concerning labor force participation about each member 15 years old and over in every sample household.

The present CPS sample was selected from the 1980 Decennial Census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 sample areas comprising 1,973 counties, independent cities, and minor civil divisions. About 60,000 occupied housing units are eligible for interview every month. Field representatives are unable to obtain interviews at about 2,600 of these units because the occupants are not home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented in July 1985.

Table D-1 summarizes changes in the CPS designs for the years for which data appear in this report.

Table D-1. Design of the March Current Population Survey

Interview period	Number of sample areas	Housing units eligible ¹	
		Interviewed	Not interviewed
1990-1993.....	729	57,400	2,600
1989.....	729	53,600	2,500
1986-1988.....	729	57,000	2,500
1985.....	² 629/729	57,000	2,500
1982-1984.....	629	59,000	2,500
1980-1981.....	629	65,500	3,000

¹Excludes about 2,500 Hispanic households added from the previous November sample. (See "CPS March Supplement.")

²The CPS was redesigned following the 1980 Decennial Census of Population and Housing. During phase-in of the new design, housing units from the old and new designs were in the sample.

CPS March Supplement. In addition to the basic CPS questions, field representatives asked supplementary questions in March about money income and work experience for the previous year.

To obtain more reliable data for the Hispanic-origin population, the March CPS sample was increased by about 2,500 eligible housing units, interviewed the previous November, that contained at least one sample person of Hispanic origin. In addition, the sample included persons in the Armed Forces living off post or with their families on post.

CPS Estimation Procedure. This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, sex, and Hispanic/non-Hispanic categories. The independent estimates are based on statistics from decennial censuses of population; statistics on births, deaths, immigration, and emigration; and statistics on the size of the Armed Forces. The independent population estimates used for 1980 (March 1981 CPS) to present were based on updates to

controls established by the 1980 Decennial Census. For more details on the change in independent estimates, see the section entitled "Introduction of 1980 Census Population Controls" in an earlier report (Series P60, No. 133). The estimation procedure for the March supplement included an additional adjustment so that the husband and wife in a household received the same sample weight.

The estimates in this report for 1983 (from March 1984 CPS) and later also employ a revised survey weighting procedure for persons of Hispanic origin. In previous years, weighted sample results were inflated to independent estimates of the noninstitutional population by age, sex, and race. There was no specific control of the survey estimates for the Hispanic population. Since then, the Bureau of the Census developed independent population controls for the Hispanic population by sex and detailed age groups. Revised weighting procedures incorporate these new controls. The independent population estimates include some, but not all, undocumented immigrants.

Simulation techniques are used to obtain estimates of after-tax income based on CPS data. For more details on this procedure, see the pertinent sections of this report.

ACCURACY OF THE ESTIMATES

Since the CPS estimates come from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two types of error: sampling and nonsampling. The accuracy of an estimate depends on both types of errors, but the full effect of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates.

The standard errors provided here primarily measure the CPS sampling error. They also partially measure the effect of some of the CPS nonsampling errors in responses and enumeration, but they do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

Nonsampling Variability. There are several sources of nonsampling errors including the following:

- Inability to get information about all sample cases.
- Definitional difficulties.
- Differences in interpretation of questions.
- Respondents' inability or unwillingness to provide correct information.
- Respondents' inability to recall information.

- Errors made in data collection, such as recording and coding data.
- Errors made in processing the data.
- Errors made in estimating values for missing data.
- Failure to represent all units with the sample (undercoverage).

CPS undercoverage results from missed housing units and missed persons within sample housing units. Compared to the level of the 1980 Decennial Census, overall CPS undercoverage is about 7 percent. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias due to undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race-Hispanic group. Furthermore, the independent population controls have not been adjusted for undercoverage in the 1980 census.

A common measure of survey coverage is the coverage ratio, the estimated population before ratio adjustment divided by the independent population control. Table D-2 shows CPS coverage ratios for age-sex-race groups for a recent month. The CPS coverage ratios can exhibit some variability from month to month, but these are a typical set of coverage ratios. Other Census Bureau household surveys experience similar coverage.

Answers to questions about income or noncash benefits often depend on the memory or knowledge of one person in a household. Recall problems can cause underestimates of income in survey data, because people can easily forget minor or irregular sources of income. Respondents may also misunderstand what the Bureau of the Census considers income or noncash benefits, or may simply be unwilling to answer these questions correctly because they think the questions are too personal. For more discussion, see Appendix F, "Underreporting of Cash Income and Noncash Benefits".

For additional information on nonsampling error including the possible effect on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

Comparability of Data. Data obtained from the CPS and other sources are not entirely comparable. This

results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources.

Caution should also be used when comparing estimates in this report (which reflect 1980 census-based population controls) with estimates for 1980 and earlier years (which reflect 1970 census-based population controls). This change in population controls had relatively little impact on summary measures such as means, medians, and percent distributions. It did have a significant impact on levels. For example, use of 1980-based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 1981 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since no independent population control totals for persons of Hispanic origin were used before 1983, compare Hispanic estimates over time cautiously.

A number of changes were made in data collection and estimation procedures beginning with the March 1980 CPS. The major changes were the use of a more detailed income questionnaire, the use of the "householder" concept, the introduction of the new farm definition, and use of more detailed income intervals in the upper range of the income distribution. Due to these and other changes, one should use caution when comparing estimates from 1979 through 1992 with estimates for earlier years. A description of these changes and the effect they had on the data is given in the section "Modifications to the March 1980 CPS" of an earlier report (Series P-60, No. 129).

Another major change is that CPS income estimates for 1985 are the first based entirely on households selected from the 1980 census-based sample design. Estimates by type of residence category such as metropolitan, nonmetropolitan, farm and nonfarm, which were omitted from the 1984 report because of the mixed 1970 and 1980 census sampling frame used for the March 1985 CPS, have been resumed. The residence categories reflect metropolitan areas defined as of June 1984. In addition, the March 1986 CPS supplement questionnaire was revised to enable the coding of higher amounts of earnings from longest job.

Note When Using Small Estimates. Summary measures (such as means, medians, and percentage distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful

information when computed on a smaller base. However, estimated numbers are shown even though the relative standard errors of these numbers are larger than those for the corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Estimation of Median Incomes. The methodology for computing median income has been changed over the past few years. The computations have been done using either Pareto interpolation or linear interpolation. Currently, linear interpolation is used to estimate all medians. Pareto interpolation assumes a decreasing density of population within an income interval, whereas linear interpolation assumes a constant density of population within an income interval.

Estimates of median income for 1979 through 1987 and associated standard errors have been calculated using Pareto interpolation if the estimate is larger than \$20,000 for persons or \$40,000 for families and households. This is because the width of the income interval containing the estimate is greater than \$2,500. Estimates of median income for 1976, 1977, and 1978 and associated standard errors were calculated using Pareto interpolation if the estimate was larger than \$12,000 for persons or \$18,000 for families and households. This is because the width of the income interval containing the estimate is greater than \$1,000. All other estimates of median income and associated standard errors for 1976 through 1992 and almost all of the estimates of median income and associated standard errors for 1975 and earlier were calculated using linear interpolation.

Thus, use caution when comparing median incomes above \$12,000 for persons or \$18,000 for families and households for different years. Median incomes below those levels are more comparable from year to year since they have always been calculated using linear interpolation. For an indication of the comparability of medians calculated using Pareto interpolation with medians calculated using linear interpolation, see Series P-60, No. 114, *Money Income in 1976 of Families and Persons in the United States*.

Sampling Variability. Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described in "Standard Errors and Their Use," are primarily measures of sampling variability, although they may include some nonsampling error.

Standard Errors for Data from Surveys other than CPS. To compute standard errors of data obtained from the SOI reports, see the SOI Bulletin *Individual Income*

Tax Returns, Preliminary Data: 1991, Spring 1993. To compute standard errors of AHS data, see the report *Current Housing Reports, Series H150-89, The American Housing Survey for the United States in 1989*. The Bureau of Labor Statistics (BLS) collects data to compute the CPI; contact the Census Bureau's Housing and Household Economic Statistics Division for information on how to compute the standard error for the CPI. Data from other sources are from administrative records and as such are not subject to sampling error.

Standard Errors for Data from the CPS Sample and Their Use. A number of approximations are required to derive at a moderate cost, standard errors applicable to all estimates in this report. Instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics.

Table D-3 provides standard errors of estimated numbers. Tables D-4, D-5, and D-6 provide standard errors of estimated percentages. Table D-7 has standard error parameters for persons, families, households, and unrelated individuals. Table D-7 also provides factors to apply to the standard errors in tables D-3 through D-6. Table D-8 provides the year-to-year correlation coefficients for poverty and income characteristics.

The sample estimate and its standard error enable one to construct a confidence interval. A confidence interval is a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average result of all possible samples.

Some statements in the report may contain estimates followed by a number in parentheses. This number can be added to and subtracted from the estimate to calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (± 1.0)", the 90-percent confidence interval for the estimate, 1.7 percent, is 0.7 percent to 2.7 percent.

Standard errors may be used to perform hypothesis testing. This is a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the White poverty rate to the Black poverty rate.

Tests may be performed at various levels of significance. The significance level of a test is the probability of concluding that the characteristics are different when,

Table D-2. CPS Coverage Ratios

Age	Non-Black		Black		All persons		
	Male	Female	Male	Female	Male	Female	Total
0 to 14 years	0.948	0.960	0.913	0.930	0.943	0.955	0.949

NOTE: These coverage ratios are for May 1993.

in fact, they are the same. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better. This means that the absolute value of the estimated difference between characteristics is greater than or equal to 1.645 times the standard error of the difference.

Standard Errors of Estimated Numbers. There are two ways to compute the approximate standard error, s_x , of an estimated number shown in this report. The first uses the formula

$$s_x = fs, \quad (1)$$

where f is the appropriate factor from table D-7, and s is the standard error of the estimate obtained by interpolating in table D-3.

The second method uses formula (2), from which the standard errors in table D-3 were calculated. This formula will provide more accurate results than formula (1).

$$s_x = \sqrt{ax^2 + bx} \quad (2)$$

Here x is the size of the estimate and a and b are the parameters from table D-7 for the particular characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters which gives the largest standard error.

Illustration

Table 1 shows that there were 8,893,000 households that received means-tested government cash transfers in 1992. Use the appropriate parameters from table D-7 and formula (2) to get

Number, x	8,893,000
a parameter	-0.000012
b parameter	2,058
Standard error	132,000
90% conf. int.	8,676,000 to 9,110,000

The standard error is calculated as

$$s_x = \sqrt{-0.000012 \times 8,893,000^2 + 2,058 \times 8,893,000} = 132,000.$$

The 90-percent confidence interval is calculated as $8,893,000 \pm 1.645 \times 132,000$.

The alternate calculation of the standard error using formula (1) with $f = 1.0$ from table D-7 and $s = 131,000$ by interpolation from table D-3, is

$$s_x = 1.0 \times 131,000 = 131,000$$

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more.

Table D-3. Standard Errors for Poverty and Income Characteristics: 1992

Size of estimate (thousands)	Household income			All families in poverty	Persons in poverty		
	Total, White	Black, other	Hispanic		Total, White	Black, other	Hispanic
75	12	13	13	13	27	27	27
100	14	15	15	15	31	31	31
250	23	24	23	24	49	49	48
500	32	33	33	34	69	68	68
750	39	40	40	42	84	83	83
1,000	45	46	45	48	97	96	95
2,500	71	70	67	79	153	147	144
5,000	100	92	83	116	216	199	189
7,500	121	103	84	149	263	231	212
10,000	139	107	70	178	302	251	219
15,000	168	95	...	234	365	265	192
25,000	210	338	461
50,000	270	587	612
75,000	295	831	698
100,000	293	1,074	742
125,000	264
150,000	197

Note: From table D-7:

a =	-0.000012	-0.000109	-0.000175	-0.000093	-0.000040	-0.000322	-0.000470
b =	2,058	2,243	2,243	2,243	9,502	9,502	9,502

Multiply these standard errors by the appropriate factor in table D-7 to obtain the correct standard error.

Table D-4. Standard Errors of Estimated Percentages of Households and Families for Income Characteristics: 1992, Total, or White

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.3	3.6	5.0	7.2	8.3
100	2.0	3.1	4.3	6.2	7.2
250	1.3	2.0	2.7	3.9	4.5
750	0.7	1.1	1.6	2.3	2.6
500	0.9	1.4	1.9	2.8	3.2
1,000	0.6	1.0	1.4	2.0	2.3
2,500	0.4	0.6	0.9	1.2	1.4
5,000	0.3	0.4	0.6	0.9	1.0
7,500	0.2	0.4	0.5	0.7	0.8
10,000	0.2	0.3	0.4	0.6	0.7
15,000	0.2	0.3	0.4	0.5	0.6
25,000	0.1	0.2	0.3	0.4	0.5
50,000	0.09	0.1	0.2	0.3	0.3
75,000	0.07	0.1	0.2	0.2	0.2
100,000	0.06	0.1	0.1	0.2	0.2
125,000	0.06	0.09	0.1	0.2	0.2
150,000	0.05	0.08	0.1	0.2	0.2

Note: From table D-7:

b=2,058

Multiply these standard errors by the appropriate factor from table D-7 to obtain the correct standard error.

When the numerator and denominator of the percentages are in different categories, use the factor or parameter from table D-7 indicated by the numerator.

The approximate standard error, $s_{x,p}$, of an estimated percentage can be obtained by use of the formula

$$s_{x,p} = fs. \tag{3}$$

In this formula, f is the appropriate factor from table D-7, and s is the standard error of the estimate obtained by interpolation from tables D-4 through D-6.

Alternatively, formula (4) will provide more accurate results:

$$s_{x,p} = \sqrt{\frac{b}{x} p (100-p)}. \tag{4}$$

Here x is the total number of persons, families, households, or unrelated individuals in the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter from table D-7 associated with the characteristic in the numerator of the percentage.

Table D-5. Standard Errors of Estimated Percentages of Households and Families for Income Characteristics (Black or Hispanic) and of Families Below the Poverty Level: 1992

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.4	3.8	5.2	7.5	8.6
100	2.1	3.3	4.5	6.5	7.5
250	1.3	2.1	2.8	4.1	4.7
500	0.9	1.5	2.0	2.9	3.3
750	0.8	1.2	1.6	2.4	2.7
1,000	0.7	1.0	1.4	2.1	2.4
2,500	0.4	0.7	0.9	1.3	1.5
5,000	0.3	0.5	0.6	0.9	1.1
7,500	0.2	0.4	0.5	0.7	0.9
10,000	0.2	0.3	0.4	0.6	0.7
15,000	0.2	0.3	0.4	0.5	0.6
25,000	0.1	0.2	0.3	0.4	0.5
50,000	0.09	0.1	0.2	0.3	0.3
75,000	0.08	0.1	0.2	0.2	0.3
100,000	0.07	0.1	0.1	0.2	0.2

Note: From table D-7:
b=2,243

Multiply these standard errors by the appropriate factor from table D-7 to obtain the correct standard error.

Table D-6. Standard Errors of Estimated Percentages of Persons Below Poverty Level: 1992

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
75	5.0	7.8	10.7	15.4	17.8
100	4.3	6.7	9.2	13.3	15.4
250	2.7	4.2	5.8	8.4	9.7
500	1.9	3.0	4.1	6.0	6.9
750	1.6	2.5	3.4	4.9	5.6
1,000	1.4	2.1	2.9	4.2	4.9
2,500	0.9	1.3	1.8	2.7	3.1
5,000	0.6	1.0	1.3	1.9	2.2
7,500	0.5	0.8	1.1	1.5	1.8
10,000	0.4	0.7	0.9	1.3	1.5
15,000	0.4	0.5	0.8	1.1	1.3
25,000	0.3	0.4	0.6	0.8	1.0
50,000	0.2	0.3	0.4	0.6	0.7
75,000	0.2	0.2	0.3	0.5	0.6
100,000	0.1	0.2	0.3	0.4	0.5

Note: From table D-7:
b=9,502

Multiply these standard errors by the appropriate factor from table D-7 to obtain the correct standard error.

Illustration

Table 1 shows that in 1992, 9.2 percent of the 96,391,000 households received means-tested government cash transfers. Use the appropriate parameter from table D-7 and formula (4) to get

Percentage, p	9.2
Base, x	96,391,000
b parameter	2,058
Standard error	0.1
90% conf. int.	9.0 to 9.4

The standard error is calculated as

$$s_{x,p} = \sqrt{\frac{2,058}{96,391,000} 9.2(100.0 - 9.2)} = 0.1.$$

The 90-percent confidence interval for the estimated percentage of households receiving means-tested government cash transfers is calculated as $9.2 \pm 1.645 \times 0.1$.

The alternate calculation of the standard error using formula (3) with $f = 1.0$ from table D-7 and $s = 0.1$ by interpolation from table D-4 is

$$s_{x,p} = 1.0 \times 0.1 = 0.1.$$

Standard Errors of Estimated Differences. The standard error of the difference between two sample estimates is approximately equal to

$$s_{x-y} = \sqrt{s_x^2 + s_y^2 - 2rs_x s_y} \quad (5)$$

Table D-7. Standard Error Parameters for Poverty, Income, and Nonincome Characteristics: 1992

Notes: For regional estimates multiply the a and b parameters by 0.74, 0.98, 1.04, and 1.06 for Northeast, Midwest, South, and West, respectively. Multiply the a and b parameters by 1.5 for nonmetropolitan residence categories.

Table D-8. Year-To-Year Correlation Coefficients For Poverty and Income Estimates

Characteristic	Below poverty level				All income levels	
	1972 to 1983 or 1984 to 1992		1983 to 1984		1959 to 1992 ^a	
	Persons	Families	Persons	Families	Persons	Families
Total	0.45	0.35	0.39	0.30	0.30	0.35
White	0.35	0.30	0.30	0.26	0.30	0.35
Black	0.45	0.35	0.39	0.30	0.30	0.35
Other Races	0.45	0.35	0.30	0.30	0.30	0.35
Hispanic	0.65	0.55	0.56	0.47	0.45	0.55

Notes: These correlations are for comparisons of consecutive years. For comparisons of nonconsecutive years, assume the correlations are zero. Correlation coefficients for 1983-84 are lower than those for 1982-83 or 1984-85 because of the phase-in of the new sample design.

where s_x and s_y are the standard errors of the estimates, x and y . The estimates can be numbers, percentages, ratios, etc. The correlation coefficient, r , can be determined from table D-8 for year-to-year comparisons for CPS income estimates of numbers and proportions; for other comparisons, assume that r equals zero. This will represent the actual standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration

Table 1 shows that the median before-tax 1992 income of White households was \$32,368 and the median before-tax 1992 income of Black households was \$18,660. The apparent difference between the median before-tax income of White and Black households in 1992 was \$13,708. Table 1 also shows the approximate standard errors, s_x and s_y , are \$159 and \$386, respectively. Use formula (5) with $r=0$ to get

	x	y	difference
Estimate	\$32,368	\$18,660	\$13,708
Standard error	\$159	\$386	\$417
90% conf. int.	\$32,106 to \$32,630	\$18,025 to \$19,295	\$13,022 to \$14,394

The standard error of the difference is calculated as

$$s_{x-y} = \sqrt{159^2 + 386^2} = 417$$

The 90-percent confidence interval for the estimated difference is calculated as \$13,708 \pm 1.645 x \$417. Because this interval does not contain zero, we can conclude with 90-percent confidence that the median before-tax income of White households in 1992 was larger than the median before-tax income of Black households.

Standard Errors of Estimated Ratios. Certain estimates, such as mean values for persons in families or households shown in the tables, were calculated as the ratio of two numbers. For example, the mean number of persons per family or household is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families or households}}{\text{total number of families or households}}$$

Ratios of before-tax to after-tax estimates are also discussed in this report. For example, the ratio of mean household income before and after taxes is calculated as

$$\frac{x}{y} = \frac{\text{mean household income before taxes}}{\text{mean household income after taxes}}$$

Standard errors for these ratios may be approximated as shown below. There are four cases to consider. In the first two cases, the denominator y represents a count of families or households of a certain class, and the numerator x represents a count of persons with the characteristic of interest who are members of these families or households. In the third case, the numerator x and denominator y represent before-tax and after-tax estimates, and the fourth case represents different definitions of income to measure poverty.

Case 1: There is at least one person having the characteristic in every family or household of the class: for example, the mean number of persons per family or the mean number of persons per family with a male householder. For ratios of this kind, approximate the standard errors using the following formula:

$$s_{x/y} = \frac{x}{y} \sqrt{\left(\frac{s_x}{x}\right)^2 + \left(\frac{s_y}{y}\right)^2 - 2r \frac{s_x s_y}{xy}} \quad (6)$$

The standard error of the estimated number of families or households, s_y , and the standard error of the estimated number of persons with the characteristics in those families or households, s_x , may be calculated by methods described earlier. In formula (6), r represents the coefficient of correlation between the numerator and the denominator of the estimate. In the above examples, and for other ratios of this kind, use 0.7 as an estimate of r .

Case 2: The number of persons having the characteristic in a given family or household may be 0, 1, 2, 3, or more; for example, the mean number of persons under 18 years of age per household. For this kind of ratio, use formula (6), but assume r is equal to zero. If r is actually positive (negative), then this will overestimate (underestimate) the standard error of the ratio.

Case 3: The numerator and denominator represent before-tax and after-tax estimates. For example, the numerator may be the mean income of families or households of a certain type before taxes, and the denominator may be the mean income for the same category of families or households after taxes. For such ratios, s_x and s_y represent the standard errors of before-tax and after-tax estimates, respectively. Assume that r is equal to 0.7 for before-tax and after-tax estimates.

Case 4: The numerator and denominator are different definitions of income to measure poverty. See the sections below on poverty estimates for more detail.

Standard Errors of Within-Year Differences in Poverty Estimates Using Different Income Measures.

Estimate the standard error for the difference of two poverty estimates (numbers or percentages), using different definitions of income to evaluate poverty, for a given year with the formula

$$s_{x,y} = S_d \quad (7)$$

The value $d = |x - y|$, is the absolute difference between the two estimates x and y . Estimate s_d from formula (1) or (2) where d is the size of the estimate, or from formula (3) or (4) where d is the estimated percentage.

Standard Errors of Ratios of Two Poverty Estimates Using Different Income Measures. Estimate the standard error of the ratio of the number of persons in poverty using two different definitions of income with the formula

$$s_{x/y} = \frac{x}{y} \sqrt{\left(\frac{s_x}{x}\right)^2 - \left(\frac{s_y}{y}\right)^2} \quad (8)$$

where s_x and s_y are the estimates of the standard errors of the estimates x and y (poverty estimates using different methods of estimating income) as determined by formula (1) or (2).

Standard Errors of Estimated Means for Grouped Data. The formula used to estimate the standard error of a mean for grouped data is

$$s_{\bar{x}} = \sqrt{(b/y)S^2} \quad (9)$$

In this formula, y is the size of the base and b is the appropriate b parameter for the characteristic from table D-7. The variance, S^2 , is given by the following formula:

$$S^2 = \sum_{i=1}^c p_i \bar{x}_i^2 - \bar{x}^2, \quad (10)$$

where

\bar{x} = the mean of the distribution, defined by

$$\sum_{i=1}^c p_i \bar{x}_i,$$

c = the number of groups: i indicates a specific group, taking on values 1 through c ;

p_i = the estimated proportion of households, families or persons whose values for the characteristic (x -values) fall in group i ; and

$\bar{x}_i = (A_{i-1} + A_i) / 2$, where A_{i-1} and A_i are the lower and upper interval boundaries, respectively, for group i .

The value \bar{x}_c is assumed to be the most representative value of the characteristic for households, families or persons in group i . Group c is open-ended, i.e., no upper interval boundary exists. For this group an approximate average value is

$$\bar{x}_c = (3/2)A_{c-1}. \quad (11)$$

Contact Demographic Statistical Methods Division of the Bureau of the Census for the method to compute the standard error of a mean for two or more combined distributions.

Note that because the formula for the standard error of a mean involves several approximations, this statistic will generally be different from the tabled value.

Standard Errors of a Median. The sampling variability of an estimated median depends upon the form of the distribution and the size of its base. One can approximate the reliability of an estimated median by determining a confidence interval about it. (See the section "Standard Errors and Their Use" for a general discussion of confidence intervals.) Estimate the 68-percent confidence limits of a median based on sample data using the following procedure.

1. Determine the standard error on 50 percent using either formula (3) or formula (4).
2. Add to and subtract from 50 percent the standard error determined in step 1.
3. Using the distribution of the characteristic, determine the upper and lower limits of the 68-percent confidence interval by calculating the values corresponding to the two points computed in step 2. Use Pareto interpolation for any point in an income interval greater than \$2,500 in width, and linear interpolation other wise. The formulas for interpolation are:

$$\text{Pareto: } X_{pN} = \exp \left[\frac{\text{Ln}(pN/N_1)}{\text{Ln}(N_2/N_1)} \text{Ln}(A_2/A_1) \right] A_1 \quad (12)$$

$$\text{Linear: } X_{pN} = \frac{pN - N_1}{N_2 - N_1} (A_2 - A_1) + A_1, \quad (13)$$

where

X_{pN} = estimated upper and lower bounds for the confidence interval ($0 \leq p \leq 1$). For purposes of calculating the confidence interval, p takes on the values determined in step 2. Note that X_{pN} estimates the median when $p = 0.50$.

N = for *distribution of numbers*: the total number of units (persons, households, etc.) for the characteristic in the distribution.

= for *distribution of percentages*: the value 1.0.

p = the values obtained in step 2.

A_1, A_2 = the lower and upper bounds, respectively, of the interval containing X_{pN} .

N_1, N_2 = for *distribution of numbers*: the estimated number of units (persons, households, etc.) with values of the characteristic greater than or equal to A_1 and A_2 , respectively.

= *for distribution of percentages*: the estimated percentage of units (households, families, persons, etc.) having values of the characteristic greater than or equal to A_1 and A_2 , respectively.

exp is the exponential function.

Ln is the natural logarithm function.

A mathematically equivalent result is obtained by using common logarithms (base 10) and antilogarithms.

4. Divide the difference between the two points determined in step 3 by two to obtain the standard error of the median.

Use of the above procedure could result in standard errors which differ from those given in the detailed tables. The reasons for this discrepancy are the use of a more detailed distribution than that given in the tables in determining the published standard errors, and the rounding of numbers to thousands in the published tables. Linear interpolation was almost always used to compute the published medians and standard errors. Occasionally, a median may lie in an open-ended interval. To calculate its standard error the user must call Housing and Household Economic Statistics Division of the Census Bureau to obtain the methodology.

Standard Error of Estimated Per Capita Income.

Certain mean values in this report represent the per capita income for households of a certain class. The mean per capita income is approximately equal to

$$\bar{x} = hm / p, \quad (14)$$

where

h = number of households in the class,

m = mean income for households in the class,

p = number of persons in households in the class, and

\bar{x} = mean per capita income of persons in households in the class.

To approximate standard errors for these means, use the formula

$$s_x = \frac{hm}{p} \sqrt{\left(\frac{s_m}{m}\right)^2 + \left(\frac{s_p}{p}\right)^2 + \left(\frac{s_h}{h}\right)^2 - 2r \frac{s_p s_h}{ph}} \quad (15)$$

In this formula, r represents the correlation between p and h . There are two cases to consider, depending on the nature of the class:

Case 1: The class represents households containing a fixed number of persons. For example, h could be the number of 3-person households. In this case, there is an exact correlation between the number of persons in households and the number of households. Therefore, $r = 1.0$ for such households.

Case 2: The class represents households of other demographic types, for example, households in distinct regions, households in which the householder is of a certain age group, and owner-occupied and tenant-occupied households. In this and other cases in which the correlation between p and h is not perfect, use 0.7 as an estimate of r .

Standard Error of an Estimated Aggregate Cash Value. Aggregates such as adjusted gross income or aggregate taxes paid as described in "Methodology and Procedures" are computed by multiplying the mean cash value per household or tax filing unit, \bar{x} , by the number of households or tax filing units, y :

$$T = \bar{x}y, \quad (16)$$

where T is the aggregate to be computed.

Both \bar{x} and y have a standard error, so the standard error of a product must be computed. Approximate the standard error of an aggregate with the formula

$$s_T = \sqrt{\bar{x}^2 s_y^2 + y^2 s_x^2} \quad (17)$$

where s_x is computed using formula (9) and s_y is computed using formula (2). In the above formula, the correlation r between \bar{x} and y is assumed to be zero. If r is actually positive (negative), then this formula will underestimate (overestimate) the standard error of the product. To compute standard errors of mean taxes paid, call Housing and Household Economic Statistics Division of the Bureau of the Census to obtain detailed distributions.

Standard Error of an Index of Income Concentration. Please contact Demographic Statistical Methods Division of the Bureau of the Census for the method of estimating the standard error of an index of income concentration.

Appendix E. Program Descriptions and Data Collection

This appendix contains brief descriptions of each public in-kind transfer program covered in the March CPS, a description of the questions used to collect the data, and an evaluation of the data quality. The description of each program begins with a statement of program objectives and is followed by general comments regarding program characteristics, eligibility, and so forth. Next is a review of the survey questions and the limitations associated with the question wording and design.

FOOD STAMPS

The Food Stamp Act of 1977 defines this Federally funded program as one intended to "permit low-income households to obtain a more nutritious diet." (From title XIII of P.L. 95-113, The Food Stamp Act of 1977, declaration of policy.) Food purchasing power is increased by providing eligible households with coupons which can be used to purchase food. The Food and Nutrition Service (FNS) of the U.S. Department of Agriculture (USDA) administers the Food Stamp program through State and local welfare offices. The Food Stamp program is the major national income support program to which all low-income and low-resource households, regardless of household characteristics, are eligible.

The Food Stamp Act was amended by the 1981 Omnibus Budget Reconciliation Act which changed the criteria used to determine food stamp eligibility (P.L. 97-35, title I, subtitle A). As of October 1, 1981, households without an elderly or disabled member must have gross monthly income below 130 percent of the Federal poverty level. Previously, eligibility was based on "countable" income (gross income less specified deductions for shelter, medical expenses, child care, etc.) so, e.g., a household with a gross income of twice the poverty guideline and substantial specified deductions could have been eligible for food stamps. Households meeting the income requirement may be ruled ineligible for the program on the basis of their holdings of assets (resources).

The questions on participation in the Food Stamp Program in the March CPS were designed to identify households in which one or more of the current members received food stamps during the calendar year. Once a food stamp household was identified, a question was asked to determine the number of current household members covered by food stamps during the year.

Questions were also asked about the number of months food stamps were received and the total face value of all food stamps received during that period.

SCHOOL LUNCHES

The National School Lunch Program is designed "to help safeguard the health and well-being of the Nation's children by assisting the States in providing an adequate supply of foods" (P.L. 79-396, the National School Lunch Act of 1946) for all children at moderate cost. Additional assistance is provided for children determined by local school officials to be unable to pay the "full established" price for lunches. Like the Food Stamp program, the National School Lunch Program is administered by the Food and Nutrition Service of the U.S. Department of Agriculture through State educational agencies or through regional USDA nutrition services for some nonprofit private schools.

All students eating lunches prepared at participating schools pay less than the total cost of the lunches. Some students pay the "full established" price for lunch (which itself is subsidized), while others pay a "reduced" price for lunch, and still others receive a "free" lunch. Until January 1981, children were eligible for free school lunches if their household's income was below 125 percent of the poverty guidelines or reduced-price lunches if their household's income was between 125 and 195 percent of the poverty guidelines. The term "income" basically followed the Census Bureau definition but excluded certain Federal benefits and specified "hardship" expenses. Effective January 1, 1981, the hardship exclusion was replaced by a standard deduction. (Ref. Federal Register, Vol. 46, No. 11, January 16, 1981.) Beginning August 13, 1981, the income definition was amended to a gross income concept with the standard deduction being eliminated. At the same time, the income eligibility criteria were changed to 130 percent for free lunches and to 185 percent for reduced-price lunches. (Ref. Omnibus Budget Reconciliation Act of 1981, P.L. 97-35, title VIII.)

The questions on the March CPS provide a limited amount of data for the School Lunch program. Questions concerning the program were designed to identify the number of household members 5 to 18 years old who "usually" ate hot lunches during the year. This defined the universe of household members receiving

this noncash benefit. This approach was necessary because the majority of children benefit indirectly; i.e., they pay full-established price but are not aware that these lunches are subsidized. A second question identified the number of members receiving free or reduced-price lunches.

PUBLIC OR OTHER SUBSIDIZED HOUSING

There are numerous programs designed to "remedy the unsafe and unsanitary housing conditions and the acute shortage of decent, safe, and sanitary dwellings for low-income families" (U.S. Housing Act of 1937, declaration of policy). Several Federal, State, and local agencies administer these programs. Some are funded by USDA (for rural families) or State-local agencies, but most are administered by the Department of Housing and Urban Development (HUD). Among the most important HUD rental housing programs are Low Rent Public Housing and Sections 8, 236, and 101 (rent supplements) of various U.S. Housing Acts.

Low Rent Public Housing projects are owned, managed, and administered by a local housing authority. Partial financing may be provided by the State or HUD. Participation in public housing is determined by two factors: program eligibility and the availability of housing. Income standards for initial and continuing occupancy vary by local housing authority, although the limits are constrained by Federal guidelines. Rental charges, which, in turn, define net benefits, are set by a Federal statute not to exceed 30 percent of adjusted monthly money income. A recipient household can be a family or two or more related persons or an individual who is handicapped, elderly, or displaced by urban renewal or natural disaster. Other HUD programs provide similar types of housing assistance to low-income families and individuals.

Two of the more common types of programs in which Federal, State, and local funds are used to subsidize private sector rental housing are rent supplement and interest reduction plans. Under a rent supplement plan (e.g., Sections 8 and 101), the difference between the "fair market" rent and the rent charged to the tenant is paid to the owner by a government agency. Under an interest reduction program (e.g., Section 236), the amount of interest paid on the mortgage by the owner is reduced so that subsequent savings can be passed along to low-income tenants in the form of lower rent changes.

There were two questions dealing with public and low-cost rental housing on the March CPS supplement questionnaire. The first question identified residence in a housing unit owned by a public agency. The second question identified beneficiaries who were not living in public housing projects but who were paying lower rent because of a government subsidy.

MEDICAID

The Medicaid program is designed to furnish medical assistance for needy families with dependent children and for aged, blind, or disabled individuals whose incomes and resources are insufficient to meet the costs of necessary medical services.¹ The program is administered by State agencies through grants from the Health Care Financing Administration (HCFA) of the Department of Health and Human Services.

Medicaid is, for the most part, a categorical program with complex eligibility rules which vary from State to State. There are two basic groups of eligible individuals: the categorically eligible and the medically needy. The major categorically eligible groups are all Aid to Families with Dependent Children (AFDC) recipients and most Supplemental Security Income (SSI) recipients.² Other categorically eligible groups are (1) those who meet basic State cash assistance eligibility rules (the aged, blind, or disabled; needy single parents with children; and, in some States, needy unemployed parents with children who are not currently receiving money payments) and (2) needy persons meeting categorical eligibility standards who are institutionalized for medical reasons (e.g., low-income elderly persons in nursing homes). Institutionalized persons are not included in the CPS universe and, therefore, are not reflected in the CPS reciprocity statistics.

In many States, Medicaid coverage is also extended to the medically needy: persons meeting categorical age, sex, or disability criteria and having money incomes and assets which exceed eligibility levels for cash assistance but are not sufficient to meet the cost of medical care. Families with large medical expenses relative to their incomes and assets may also meet medically needy eligibility standards by "spending down" (i.e., having high enough medical expenses) to obtain eligibility.

The Medicaid question on the March CPS attempted to identify all persons 15 years old and over who were covered by Medicaid at any time during the year. In March 1988, a question on childrens' Medicaid coverage was added to the CPS questionnaire. The term "covered" means enrolled in the Medicaid program, i.e., had a Medicaid medical assistance card or incurred medical bills which were paid for by Medicaid. In order to be counted, the person did not necessarily have to receive medical care paid for by Medicaid.

¹Taken from Title XIX of the 1965 Amendments to P.L. 89-97, *The Social Security Act*, "Grants to States for Medical Assistance Programs," declaration of policy.

²In 1981, Public Law 97-35 made several changes in AFDC eligibility determinations under the Medicaid program. Changes in treatment of earnings and other income and resources have resulted in some persons being dropped not only from the AFDC rolls but also off of automatic Medicaid coverage. Some of these individuals may be able to regain coverage if their State offers medically needy protection; however, the range of available benefits may be less.

After data collection and creation of an initial micro-data file, further refinements were made to assign Medicaid coverage to children. In this procedure, all children under 21 years old in families were assumed to be covered by Medicaid if either the householder or spouse reported being covered by Medicaid. AFDC recipients in all States and SSI recipients living in the 36 States which legally require Medicaid coverage of all SSI recipients were also assigned coverage.

MEDICARE

The Medicare program consists of two separate but complementary health plans to provide adequate medical care for the aged and disabled. The Hospital Insurance Plan (Part A) is designed to provide basic protection against the costs of hospital and related post-hospital services. In addition to the elderly, this plan also covers virtually all persons under 65 years old who receive Social Security or Railroad Retirement benefits based on long-term disability. Part A is financed

jointly by employers and employees through Social Security payroll deductions. Qualified persons 65 years old and over who are not otherwise eligible for Part A benefits may pay premiums directly to obtain this coverage. The Supplemental Medical Insurance Plan (Part B) is a voluntary plan which builds upon the hospital insurance protection provided by the basic plan and is available to all Medicare Part A beneficiaries. It provides insurance protection covering physicians' and surgeons' services and a variety of medical and other health services received either in hospitals or on an ambulatory basis. It is financed through monthly premium payments (\$31.80 per month in 1992) by each enrollee and further subsidized by Federal general revenue funds.

The Medicare question on the March CPS attempted to identify all persons 15 years old and over who were covered by Medicare at any time during the year. The term "covered" means enrolled in the Medicare program. In order to be counted, the persons did not necessarily have to receive medical care paid for by Medicare.

Appendix F. Underreporting of Cash Income and Noncash Benefits

This appendix discusses some important aspects of underreporting and its measurement and presents some estimates of underreporting for 1987 and 1984. The general survey phenomenon that is commonly termed underreporting actually refers to the tendency of household surveys to underestimate the number of income or noncash benefit recipients and/or the amount of income or benefits received. There are three main causes for underreporting. These are failure to report receipt of the income type, underreporting of the amount received, and misclassification of the income type received.

Accurately measuring the extent of underreporting of cash income and noncash benefits is difficult for many of the income types and noncash benefit programs. There are two main components of measuring underreporting: the number of income or noncash benefit recipients and the total amount of income or benefits received. Measuring the survey undercount of recipients for the March CPS is extremely difficult because independent estimates (benchmarks or controls) for the CPS noninstitutional, "ever-received during the year" recipient concept are difficult to validate. In addition, some of the administrative sources required for the derivation of independent estimates have significant errors themselves.

The data in table F-1 show comparisons of CPS aggregate money income in 1987 with independent estimates. Comparisons of the CPS estimates with the independent totals reveal that overall income in the survey after allocation is underreported by about 11 percent. However, wide variations are found in the amount of underreporting by source of income. Underreporting tends to be more pronounced for public assistance, unemployment and workers' compensation, and property income.

Various population subgroups receive a higher proportion of their total income from certain income sources, such as interest and dividends for the elderly and public assistance for female family householders. The differential underreporting between income types, therefore, affect the estimates of some population subgroups more than others.

Estimates of the extent of underreporting for most noncash benefits are less well defined. Following are discussions of the underreporting for each benefit type.

Food stamps. The March CPS estimate for the face value of food stamps received in 1984 was about \$7.6

billion, 71 percent of the independent estimate derived for that year. The 20.1-million recipient (persons covered) estimate for 1984 compares to a 26.1-million independent estimate of recipients. Since this independent estimate was developed using USDA monthly person reciprocity counts and average months of participation as reported in the CPS, it is difficult to validate its accuracy.

School lunches. The March CPS data for 1984 show 10.8 million children usually eating free or reduced-price school lunches and 17.5 million usually eating full-price school lunches. Since independent estimates on the "ever-participated" universe are not available for this group, comparisons of the CPS estimates with peak monthly average daily participation have been made. These peak figures were 11.6 million for free or reduced-price lunches and 11.4 million for full-price lunches. The CPS estimate is 93 percent of the peak monthly average for free or reduced-price. The CPS estimate of full-price lunch participants was about 54 percent higher than the peak monthly figure. The obvious conceptual differences between the CPS and USDA figures make these comparisons difficult to interpret.

Public or other subsidized housing. In 1984 the March CPS estimate for the number of households residing in public or other subsidized rental housing was 3.6 million. An independent estimate was derived by summing housing units in (1) low-income public housing, (2) Section 8 (including Section 202), (3) rent supplements (Section 101), and (4) Section 236. This summing yielded a figure of 3.3 million. While the CPS estimate was about 9 percent higher than the independent figure, it is likely that the survey estimate contains some units, such as student or military housing, that were not intended to be counted. The magnitude of this problem is probably small, but unknown.

Medicare. The independent estimate for persons covered by Medicare is probably the most reliable of all independent estimates. In 1984, this figure was 28.4 million persons. This compares to a survey estimate of 28.2 million, 0.9 percent higher than the control. The survey count probably contains some persons covered by Medicaid that report coverage under Medicare by mistake. The magnitude of this misreporting problem is not known.

Table F-1. Comparisons of CPS Aggregate Money Income in 1987 With Independently Derived Estimates, by Income Type

(Billions of dollars)

Source of income	Independent estimate	CPS estimate	CPS as a percent of independent
Total	3,297.1	2941.4	89.2
Wages and salaries	2,215.9	2202.4	99.4
Self-employment	266.7	188.2	70.6
Social Security ¹	193.6	178.7	92.3
Supplemental Security Income	11.5	9.5	82.8
Aid to Families with Dependent Children	16.4	11.9	72.8
Interest, dividends, and rental income	358.4	202.9	56.6
Veterans' payments	14.2	9.7	68.5
Unemployment compensation	14.0	10.4	74.6
Workers' compensation	14.2	9.2	64.8
Private, government, and military pensions	192.2	118.4	61.6

¹Includes Railroad Retirement benefits.

Medicaid. The CPS estimate of 19.3 million for 1984 was about 3 percent higher than the "unduplicated" administrative figure of 18.7 million persons "ever receiving" benefits available from the Health Care Financing

Administration (HCFA). This HCFA figure has not been adjusted for decedents or the institutionalized population and does not include persons who were covered by Medicaid but did not receive benefits in 1984.

Appendix G. U.S. Senate Statement, "Data Collection and Poverty Level"

Official poverty statistics published by the Bureau of the Census currently ignore billions of dollars of Government in-kind benefits, such as food stamps, public housing rental subsidies, and medical care. The Congressional Budget Office has estimated that including in-kind benefits in the income statistics would cause the number of people in poverty to decline to about 9 million as compared with official statistics showing nearly 25 million people in poverty. The official statistics show no significant reduction in recent years in the incidence of poverty, although in-kind benefit programs have expanded greatly.

The Committee considers it essential that official poverty statistics reflect, at the earliest possible date, the effects of in-kind benefits. Without such information, Congress and the Executive Branch cannot be certain that Government transfer programs are properly targeted.

The Census Bureau has recognized the need for better data on in-kind benefits. The most recent March Current Population Survey has collected data on some types of in-kind program benefits. In addition, Census has under way an experimental survey—known as the Survey of Income and Program Participation—which collects more extensive data. However, Census has not yet published the data collected thus far and has no current plans for integrating such data with cash income data now reported routinely.

The Committee has inscribed language in the bill directing the Secretary of Commerce to expedite the program of collecting, through surveys, data on benefits received and data on participation in federally funded,

in-kind benefit programs. Programs on which data are to be reported include, but are not necessarily limited to, food stamps, Medicaid, Medicare and subsidies in areas such as housing, nutrition, child care, and transportation. The Secretary of Commerce is further directed to continue research and testing of techniques for assigning monetary values to in-kind benefits and for calculating the impact of such benefits on income and poverty estimates. The Secretary of Commerce is also directed to include in survey reports, beginning no later than October 1, 1981, appropriate summaries of data on in-kind benefits and estimates of the effect of in-kind benefits on the number of families and individuals below the poverty level.¹

Note: The above language was modified in conference but the substance of the new language was similar and included the statement "the Secretary should include in survey reports beginning no later than October 1, 1981, appropriate summaries of data on in-kind benefits and estimates of the effect of in-kind benefits on the number of families and individuals below the poverty level."²

¹Departments of State, Justice, and Commerce; The Judiciary and Related Agencies Appropriation Bill, 1981. U.S. Senate, 96th Congress, 2d Session, September 16, 1980: 30-34.

Appendix H. Bureau of Labor Statistics' Statement on Use of CPI-U-X1

The Bureau of Labor Statistics (BLS) developed an experimental Consumer Price Index (CPI-U-X1) for researchers who wish to make historical comparisons with the current Consumer Price Index for All Urban Consumers (CPI-U) which uses the rental equivalence approach to measuring shelter services. Prior to 1983, the measurement of homeowner costs included changes in the asset value of homes. Recognizing that this approach mixed the investment and consumption aspects of homeownership, the BLS initiated an extensive research effort in the early 1970's to develop a better methodology. Following extensive study and testing, the CPI-U was officially converted to a rental equivalence measure in 1983. This rental equivalent approach is a methodology that isolates the shelter services component and, therefore, is a superior measure.

When the new methodology was introduced, the historical series were not revised. Price indexes are used for escalation and other contractual purposes that

require the parties to agree on one official series. Moreover, the BLS did not have the basic data or the resources to convert all of its historical series (including local area indexes) to the new methodology. The refinements that were ultimately developed before the methodology was officially introduced into the CPI—notably a larger sample of renters and a reweighting of the shelter component—could not be incorporated into the CPI-U-X1. Nonetheless, for many purposes the CPI-U-X1 can serve as an adequate proxy for what the national index would have been using the rental equivalence measure. Therefore, BLS recommends the use of the CPI-U-X1 to those who need to use a CPI series that treats homeowner costs consistently over time.

Appendix I. Estimates of Poverty Using CPI-U-X1

The poverty statistics in the report are based on a poverty definition developed by the Social Security Administration (SSA) in 1964 and revised in 1969 and 1981. Poverty thresholds are adjusted annually for price changes. The Federal Government's official poverty statistics are based on annual adjustments made using the official CPI for all urban consumers (CPI-U). The availability of the experimental CPI-U-X1 series makes it possible to produce an experimental series on poverty. (See appendix H for a statement from the Bureau of Labor Statistics on the use of the CPI-U-X1.)

The experimental poverty statistics in this report were derived using micro-level data from CPS files and poverty thresholds adjusted by the CPI-U-X1. Average poverty thresholds for 1992 based on the CPI-U-X1 are shown in the following table. The CPI-U-X1 series is available back to 1967 and shows a smaller price rise over the 1967-1983 period than does the CPI-U series (the CPI-U-X1 rose by 174.4 percent over the period; the CPI-U rose by 198.2 percent). For each year since 1968, poverty thresholds based on the CPI-U-X1 series are lower than thresholds based on the CPI-U series.

It should be noted that to be consistent with official poverty estimates through time, poverty thresholds were

recalculated based on the poverty definition which applied in that year. For example, current poverty thresholds vary by the size of the family and the number of children under 18. Prior to 1982, in addition to family size and number of children, the poverty thresholds also varied by farm/nonfarm residence and sex of householder.

The historical tables presented in this appendix show data for 1968 through 1992 using poverty thresholds based on the CPI-U-X1.

Weighted Average Poverty Thresholds in 1992 Based on the CPI-U-X1, by Size of Family

Size of family unit	Weighted average thresholds
One person (unrelated individual)	\$6,572
15 to 64 years	6,716
65 years and over	6,191
Two persons	8,407
Householder 15 to 64 years	8,689
Householder 65 years and over	7,809
Three persons	10,292
Four persons	13,190
Five persons	15,598
Six persons	17,608
Seven persons	19,869
Eight persons	22,131
Nine persons or more	26,449

¹Figures based on new processing procedures. The 1987 and 1988 figures are also revised to reflect corrections to files after publication of the 1988 advance report, Money Income and Poverty Status in the United States: 1988, P-50, No. 166.

²Persons of Hispanic origin may be of any race.

Note: Prior to 1979 unrelated subfamilies were included in all families. Beginning in 1979 unrelated subfamilies are excluded from all families.

Table I-4. Percent of Persons in Poverty, by Definition of Income: 1979 to 1992 (Poverty Thresholds Based on CPI-U-X1)

(Persons as of March of the following year. For meanings of symbols, see text)

Year	Total (thous.)	Before taxes				After taxes			
		Money income—			Definition 3 plus health insurance supplements to wage or salary income	Definition 4 less Social Security payroll taxes	Definition 5 less Federal income taxes	Definition 6 plus Earned Income Tax Credit	
		Excluding capital gains (current measure)	Definition 1 less government transfers	Definition 2 plus capital gains

Appendix J. Income Definitions 16, 17, and 18

This appendix contains brief descriptions of three additional definitions of income that have been added to this report. These additions are based on user requests for income definition combinations that go beyond the 15 definitions shown in the body of this report. The additional definitions (definitions 16, 17, and 18) are only available for income years 1991 and 1992 (see tables J-1 and J-2). These additional definitions are:

16. Nonmedical income. Definition 14 less medical programs. This is cash income plus all noncash income except imputed income from own home, minus the fungible values of Medicaid and Medicare.

17. Money income after taxes (except EITC). This is definition 1 (official cash income) minus Federal

and State income taxes, minus payroll taxes, minus the Earned Income Tax Credit (EITC), plus capital gains, and minus capital losses.

18. Money income after taxes. This is definition 17 plus the EITC.

Comparison of definition 14 and definition 16 shows the overall effect of medical programs. Analysts have found this comparison useful, particularly if they question the Census Bureau's method for valuing medical care (admittedly a difficult problem).

Comparison of definition 18 versus definition 17 shows the incremental effect of the EITC when income is computed on a money income basic. Comparison of definitions 7 and 6 shows the same effect using private sector income as the basic.

Table J-2. Percent of Persons in Poverty After Taxes by Selected Characteristics and Definition of Income: 1991 and 1992

[Numbers in thousands. Persons as of March of the following year]

Characteristic	1992			1991				
	Total	Definition 14, less medical programs (Def 16)	Definition 1, less taxes without EITC (Def 17)	Definition 1, less taxes with EITC (Def 18)	Total	Definition 14, less medical programs (Def 16)	Definition 1, less taxes without EITC (Def 17)	Definition 1, less taxes with EITC (Def 18)
Total.....	253,969	12.6	15.8	14.9	251,192	12.2	15.4	14.7

18. LINE NUMBER

19. What was ... doing most of LAST WEEK -

Working Keeping house Going to school or something else? Working (Skip to 20A) ... WK With a job but not at work ... J Looking for work ... LK Keeping house ... H Going to school ... S Unable to work (Skip to 24) ... U Retired ... R Other (Specify) ... OT

20. Did ... do any work at all LAST WEEK, not counting work around the house? (Note: If farm or business operator in hh., ask about unpaid work.)

Yes No (Go to 21)

20A. How many hours did ... work LAST WEEK at all jobs?

0 0 0 1 1 1 2 2 2 3 3 3 4 4 4 5 5 5 6 6 6 7 7 7 8 8 8 9 9 9

20B. CHECK ITEM

49+ (Skip to item 23) 1-34 (Go to 20C) 35-48 (Go to 20D)

20C. Did ... lose any time or take any time off LAST WEEK for any reason such as illness, holiday or sick work?

Yes No How many hours did ... take off?

0 0 0 1 1 1 2 2 2 3 3 3 4 4 4 5 5 5 6 6 6 7 7 7 8 8 8 9 9 9

(Correct 20A if lost time not already deducted; if 20A reduced below 35, correct 20B and fill 20C)

20D. Did ... work any overtime or at more than one job LAST WEEK?

Yes No How many extra hours did ... work?

0 0 0 1 1 1 2 2 2 3 3 3 4 4 4 5 5 5 6 6 6 7 7 7 8 8 8 9 9 9

(Correct 20A and 20B as necessary if extra hours not already included and skip to 23.)

20E. Did ... work any overtime or at more than one job LAST WEEK?

Yes No How many extra hours did ... work?

0 0 0 1 1 1 2 2 2 3 3 3 4 4 4 5 5 5 6 6 6 7 7 7 8 8 8 9 9 9

(Correct 20A and 20B as necessary if extra hours not already included and skip to 23.)

21. (If J in 19, skip to 21A.) Did ... have a job or business from which he/she was temporarily absent or on layoff LAST WEEK?

Yes No (Go to 22)

21A. Why was ... absent from work LAST WEEK?

Own illness On vacation Bad weather Labor dispute New job to begin within 30 days (Skip to 22B and 22C) Temporary layoff (Under 30 days) Indefinite layoff (30 days or more or no def. recall date) (Skip to 22C) Other (Specify)

21B. Is ... receiving wages or salary from his/her employer for any of the time off LAST WEEK?

Yes No

21C. Does ... usually work 35 hours or more a week at this job?

Yes No (Skip to 23 and enter job held last week)

22. (If LK in 19, skip to 22A.) Has ... been looking for work during the past 4 weeks?

Yes No (Go to 24)

22A. What has ... been doing in the last 4 weeks to find work? (Mark all methods used; do not need list.)

Checked with - pub. employ. agency pvt. employ. agency employer directly friends or relatives Placed or answered ads Nothing (Skip to 24) Other (Specify in notes, e.g., JTPA, union or prof. register, etc.)

22B. At the time ... started looking for work, was it because he/she lost or quit a job or was there some other reason?

Lost job Quit job Left school Wanted temporary work Change in home or family responsibilities Left military service Other (Specify in notes)

22C. 1) How many weeks has ... been looking for work?

0 0 0 1 1 1 2 2 2 3 3 3 4 4 4 5 5 5 6 6 6 7 7 7 8 8 8 9 9 9

2) How many weeks ago did ... start looking for work?

0 0 0 1 1 1 2 2 2 3 3 3 4 4 4 5 5 5 6 6 6 7 7 7 8 8 8 9 9 9

3) How many weeks ago was ... laid off?

0 0 0 1 1 1 2 2 2 3 3 3 4 4 4 5 5 5 6 6 6 7 7 7 8 8 8 9 9 9

22D. Has ... been looking for full-time or part-time work?

Full Part

22E. Could ... have taken a job LAST WEEK if one had been offered?

Yes No Why not?

Already has a job Temporary illness Going to school Other (Specify in notes)

22F. When did ... last work at a full-time job or business lasting 2 consecutive weeks or more?

Within last 12 months (Specify) (Month) _____

1 to 5 years ago More than 5 years ago Never worked full-time 2 wks. or more Never worked at all (Skip to 23. If layoff entered in 21A, enter job, either full- or part-time, from which laid off. Else enter last full-time job lasting 2 weeks or more, or never worked.)

23. DESCRIPTION OF JOB OR BUSINESS

23A. For whom did ... work? (Name of company, business, organization or other employer.)

23B. What kind of business or industry is this? (For example: TV and radio mfg., retail shoe store, State Labor Dept.)

23C. What kind of work was ... doing? (For example: electrical engineer, stock clerk, typist, farmer.)

23D. What were ...'s most important activities or duties at this job? (For example: types, keeps account books, files, sells cars, operates printing press, finishes concrete.)

23E. Was this person An employee of a PRIVATE Co., bus., or individual for wages, salary or comm. ... P A FEDERAL government employee ... F A STATE government employee ... S A LOCAL government employee ... L Self-empl. in OWN bus., prof. practice, or farm Is the business incorporated? Yes ... I No ... SE Working WITHOUT PAY in farm, bus. or farm ... WP NEVER WORKED ... NEV

23F. CHECK ITEM:

Entry (or NA) in item 20A Entry (or NA) in item 21B All other cases (Skip to 26)

24. CHECK ITEM: (Rotation number) First digit of SEGMENT number is: 0 2, 3, 4, 6, 7 or 8 (Skip to 26) 1 or 5 (Go to 24A)

24A. When did ... last work for pay at a regular job or business, either full- or part-time?

Within past 12 months 1 up to 2 years ago 2 up to 3 years ago 3 up to 4 years ago 4 up to 5 years ago 5 or more years ago Never worked (Go to 24B) (Skip to 24C)

24B. Why did ... leave that job?

Personal, family (incl. pregnancy) or school Health Retirement or old age Seasonal job completed Slack work or business conditions Temporary nonseasonal job completed Unsatisfactory work arrangements (Hours, pay, etc.) Other

24C. Does ... want a regular job now, either full- or part-time?

Yes Maybe - it depends (Specify in notes) No Don't know (Go to 24D) (Skip to 24E)

24D. What are the reasons ... is not looking for work? (Mark each reason mentioned)

Believes no work available in line of work or area Couldn't find any work Lacks nec. schooling, training, skills or experience Employers think too young or too old Other pers. handicap in finding job Can't arrange child care Family responsibilities In school or other training If health, physical disability Other (Specify in notes) Don't know

24E. Does ... intend to look for work of any kind in the next 12 months?

Yes It depends (Specify in notes) No Don't know (If entry in 24B, describe job in 23, otherwise, skip to 26)

25. CHECK ITEM: (Rotation number) First digit of SEGMENT number is: 0 2, 3, 4, 6, 7 or 8 (Skip to 26) 1 or 5 (Go to 25A)

25A. How many hours per week does ... USUALLY work at this job?

0 0 0 1 1 1 2 2 2 3 3 3 4 4 4 5 5 5 6 6 6 7 7 7 8 8 8 9 9 9

25B. Is ... paid by the hour on this job?

Yes No (Go to 25C) (Skip to 25D)

25C. How much does ... earn per hour?

Dollars Cents 0 0 0 0 0 0 1 1 1 1 1 1 2 2 2 2 2 2 3 3 3 3 3 3 4 4 4 4 4 4 5 5 5 5 5 5 6 6 6 6 6 6 7 7 7 7 7 7 8 8 8 8 8 8 9 9 9 9 9 9

25D. How much does ... USUALLY earn per week at this job BEFORE deductions? Include any overtime pay, commissions, or tips usually received.

0 0 0 0 0 0 1 1 1 1 1 1 2 2 2 2 2 2 3 3 3 3 3 3 4 4 4 4 4 4 5 5 5 5 5 5 6 6 6 6 6 6 7 7 7 7 7 7 8 8 8 8 8 8 9 9 9 9 9 9

25E. On this job, is ... a member of a labor union or of an employee association similar to a union?

Yes No (Skip to 26) (Ask 25F)

25F. On this job, is ... covered by a union or employee association contract?

Yes No (Go to 26)

FOLLOW-UP INFORMATION – TRANSCRIBE THIS INFORMATION FROM THE CPS-1 AND CONTROL CARD BEFORE SENDING THEM TO THE RO.

ALL CPS-1s AND CONTROL CARDS MUST BE SENT TO THE R.O. BY SATURDAY, MARCH 20.
ALL 666s MUST BE MAILED TO R.O. BY SATURDAY, MARCH 27.

- (1) Complete items 3, 6-9, 77, 79, 82 and 84 on page 1.
- (2) Complete items 18A, 18B, 18D, and 18G1 for each 16+ person. (p. 3, 4, 5, 6).
- (3) Record below the industry and occupation description from CPS-1 Items 23A-23E as applicable. You will need to refer to it when filling item 45 in your followup interview.
- (4) Complete items 56D and 56, (p. 7 and 8, respectively).
- (5) Note below Names and Line No.'s of persons (and item numbers, if necessary) needing followup. Also, as necessary note address, telephone, and 'best time to call' information from control card.
