FIGURE 1. STRUCTURE OF TRANSFER FILES	3
---	---

1. Overview

This **Networx OSS Verification – Mechanized/Bulk Order Formats** document is intended to provide the specifications for an interface record to be used in Networx OSS Verification Testing for Test Case 3 – Bulk Orders. This will also be the default format for electronically-provided orders for Test Case 1 – Single Orders. It is hoped that they will also be used to exchange mechanized and bulk orders between Government Agencies and Networx contractors in under the Networx Universal and Networx Enterprise contracts.

1.1 Types of Mechanized/Bulk Orders

The Networx OSS Verification Mechanized/Bulk Order Formats support the issuance of the following order configurations:

Order Configuration	Example
A single order for a single service instance at a single location	Anti-virus management for one “seat” at a small local office
A single order for multiple service instances at a single location	Block of voice services and telephone numbers for a single location
Related services at multiple locations	Multi-point private line service
Multiple orders with the same date	Output from internal Agency ordering system for a specified day or portion of a day

1.2 Networx-Specific Data Types

The majority of data fields in the Networx OSS Verification Mechanized/Bulk Order Formats are consistent with industry data types and utilize industry standard field definitions. Data types that are unique to Networx are as follows:

- Agency Service Request Number (ASRN)
- Agency Hierarchy Code (AHC)
- Contract Line Identification Number (CLIN)
- Unique Billing Identifier (UBI)

1.2.1 Agency Service Request Number (ASRN)

The ASRN is the number by which the ordering agency identifies the Service Request. This ASRN may refer to a single order or to a project, as specified in the Networx Universal and Networx Enterprise RFPs *Section C.3.2.2.7 Step 8-- Service Delivery Project Plans*. For the purpose of the Networx OSS Verification Mechanized/Bulk Order Formats, ASRN has been mapped to the industry standard 16-character Purchase Order Number (PON) data field.

1.2.2 Agency Hierarchy Code (AHC)

The AHC is a 28-character field used by Federal Government Agencies to define billing hierarchies and relationships. The first four characters designate the Agency. The remaining 24 characters are used in different ways by different agencies and must be retained intact on all Networx ordering and billing documents, files and information exchanges, including any trailing zeroes or spaces. The AHC

has been added to the data fields on the Billing and Contact record of the Networx OSS Verification Mechanized/Bulk Order Formats.

1.2.3 Contract Line Identification Number (CLIN)

As indicated in Networx Universal and Networx Enterprise RFPs *Section C.3.5 Service Ordering*, the CLIN is critical to the Government’s effort to automate ordering, billing and inventory verification. CLINs identify each billable element of a service offering and related service features.

The CLIN is a seven digit numeric field. Leading zeroes should be retained. The Networx Mechanized/Bulk Order Format contains a CLIN field for a service in the Networx Service Record and CLIN fields for each service feature in the Networx Feature Information Record. If a service or feature has more than one associated CLIN, only one CLIN will appear on the service request, although the FOC and SOCN will contain all relevant CLINs for the service or feature.

The CLIN included on service requests must be as follows:

NRC	MRC	USAGE	ORDERING CLIN
yes or no	yes	yes or no	MRC
yes	no	yes or no	NRC

1.2.4 Unique Billing Identifier (UBI)

The purpose of a UBI is to uniquely identify a single service and all components of that service separately from all other services being provided from within that same category of Networx services. The contractor must provide a Unique Billing Identifier (UBI) to identify each billed record. The Government requires the contractor to assign a unique identifier for each component of the billed service that map to the UBI. The contractor may use existing fields in its systems to provide the UBI. The contractor is allowed to determine the form of the UBI for each service (especially those with multiple components) and must provide it on the Service Order Completion Notice as well as in the Detail Billing file. In the Networx OSS Verification Mechanized/Bulk Order Formats, the UBI is defined as a 53-character field in the Administrative record for each service request (order).

2. Order Structure and Overall Format

This section describes the underlying concept, file structure, record structure and record use for the Networkx OSS Verification Mechanized/Bulk Order Formats.

2.1 Mechanized/Bulk Order Underlying Concept

All US-based telecommunications carriers are familiar with ASR records and use them on a daily basis. The formats for the exchange of mechanized/bulk order information specified in this document utilize this existing standard. Specifically, the formats specified are based upon the ATIS Access Service Request (ASR), Mechanized Interface Specifications, Issue 23, ASR Version 34, March 2007, ATIS-0404100-0034.

Many standard ASR fields represent data that is required for Networkx orders. Meanwhile, there are other standard ASR data fields that are not needed for Networkx orders. There are still other fields that Networkx requires that are not included in standard ASR data fields.

In defining Networkx-compatible ASR records, standard fields have been retained whenever such data is required. In some cases, Networkx data has been mapped to a standard ASR field where the meanings are similar. Data fields that are unique to Networkx have been assigned to optional ASR record locations. Fields that are not needed are either not used or used to contain Networkx-specific information.

2.2 Record Layout and File Structure

Each file contains fixed format, fixed length records padded to 1200 bytes. The structure of a file of service requests is illustrated in Figure 1. For more information on file structure and record identification and sequencing, see the ATIS Access Service Request (ASR), Mechanized Interface Specifications, Issue 23, ASR Version 34, March 2007, ATIS-0404100-0034. The data type for all fields is ‘character’.

Figure 1. Structure of Transfer Files

The first record in each file must be the Header Record that identifies the type of file being transmitted. When a file’s Header Record is in error, the entire file is rejected. Following the Header Record, each file contains a specific set of records that convey the information for the access request. When no Application Records exist for a file, a Header Record must be transmitted for that file with “0” (zero) in the count field.

2.3 Types of Records

As described above, specific ASR record type formats have been retained where appropriate. This applies to the Request File Header, the Administrative Record for each service request, the Billing and

Contact Record for each service request and Service Location Information Records. Unused fields in appropriate record types may be utilized for Networx-specific information.

2.3.1 Request File Header

The Request File Header provides information about the file itself, including the date of the file, the number of requests and records in the file and sufficient information to identify the file. The layout of the Request File Header for Networx mechanized/bulk orders is shown in Appendix A.

2.3.2 Administrative Record

Each order (request) in the mechanized/bulk order file will begin with an Administrative Record. This record contains general information about the administration of the order such as sufficient information to identify the order in subsequent communications. This record also identifies the type of service related to the service request.

Networx-specific data requirements have been mapped to standards-defined fields in the Administrative Record and an additional Networx data field has been identified in undefined bytes of this record. The layout of the Administrative Record for Networx mechanized/bulk orders is shown in Appendix B.

2.3.3 Billing and Contact

Each order (request) in the mechanized/bulk order file will contain a Billing and Contact Record. This record contains authorization and billing information for the order and contact information pertinent to the entire order. Networx-specific data requirements have been mapped to standards-defined fields in the Billing and Contact Record and additional Networx data fields have been identified in undefined bytes of this record. The layout of Billing and Contact Records for Networx mechanized/bulk orders is shown in Appendix C.

2.3.4 Networx Service Information

Each order (request) in the mechanized/bulk order file will contain one and only one Networx Service Information record. The Networx Service Information record contains information about the entire service being ordered. This includes:

- The service description
- The base CLIN for the service
- A case number if the CLIN is ICB (priced on an individual case basis)
- Whether the order is for routine or critical service level
- Information about reserved number blocks if appropriate
- Billing Telephone Number
- Information on access arrangements.

This record is based on ASR Service Specific record formats but is heavily customized to the information needs of the Networx ordering process. Since this is a custom record for the Networx contracts, it will carry the record type “N.” This record conforms to the conventions for service-specific record types, but has unique field designations beyond the record header data. The layout of the Networx Service Information record is shown in Appendix D.

2.3.5 Networx Service Feature Information

The Networx Service Feature Information record conforms to the format for company-specific service associated records. This record contains requested Networx service features and associated CLINs, as

well as case numbers for ICB CLINs. The layout of the Networx Service Feature Information record is shown in Appendix E.

2.3.6 Networx Associated Circuit Information

Each circuit segment (or calling card with unique name or telephone number with unique accounting or authorization code) will be identified in a Networx-Associated Circuit Information record. This record is based on ASR Company Specific Associated Circuit Information record formats but is customized to the needs of the Networx ordering process. The layout of the Networx Associated Circuit Information record is shown in Appendix F.

2.3.7 Service Location Information

For each Networx service location, a related Service Location Information record should be created. If an Associated Circuit Information Record exists for that location, it will use the same REFNUM as the Service Location Information Record. The Service Location Information record specifies location-related information including address and contacts. The layout of the Service Location Information record is shown in Appendix G.

2.4 Color Key for This Document

To distinguish between formats specified in ATIS standards and adaptations for the Networx OSS Verification Mechanized/Bulk Order Formats, this document uses color coding of text and background (in tables). This convention is as follows:

CASE	EXAMPLE
Where a new record type, data field or definition has been created for Networx use or redefined for Networx use, text references are in red.	text references are in red
Where a standards-defined field has been mapped to a Networx-specific ordering data field, the field is shown in the record format with a yellow background.	<div style="border: 1px solid black; background-color: yellow; padding: 5px; display: inline-block;">yellow</div>
Where a standards-defined field is not used but the record format is retained, the field is shown in the record format with a gray background.	<div style="border: 1px solid black; background-color: gray; padding: 5px; display: inline-block;">gray</div>
Where a standards-defined field is not required for Networx use, but may be useful for communications between an Agency and a Contractor by mutual agreement in future uses of this mechanized/bulk ordering specification, the field is shown in the record format with an orange background.	<div style="border: 1px solid black; background-color: orange; padding: 5px; display: inline-block;">orange</div>

3. Networkx Ordering Data Elements Cross-Reference to Record Fields

Field Name	Field Name / ASR Reference	Record Type	Field #
Unit 1: Order Heading			
Contract Number	VTA	Billing & Contact	45

4. Networx Mechanized/Bulk Order File Structures

The following are some examples of possible Networx order file structures.

4.1 Agency “A”

Agency A wishes to order voice services for a location with 400 telephone lines, a multipoint private line circuit from their data center to 10 distributed server locations and 35 wireless phones for a single location plus a number of other services. This is the initial file and the initial request for all orders.

The mechanized/bulk order file for this scenario will look something like Table 4-1. Record Type (REC_TYP) values are:

- * – Header record; one per file; must be first record
- S – Administrative record; one per order; must be first record of order
- D – Billing and Contact record; one per order; must be second record of order
- N – Networx Service record; one per order; must be third record of order
- F – Associated records including Feature Information, Circuit Information and Service Location records.

Record Identifier (REC_ID) values define specific types of Associated records:

- 10 – Feature Information records
- 30 – Circuit Information records
- 40 – Service Location records.

Record Codes (REC_CODE) and Record Extensions (REC_EXT) simply identify multiple Associated records of the same type (the same REC_TYP and REC_ID) within the same order. REC_CODE values always begin with 00; REC_EXT values always begin with A and increment one letter at a time through Z. When REC_EXT reaches Z, the next record of that type will have a REC_CODE incremented by 1 (e.g., 01) with a REC_EXT of A.

The Record Mode (REC_MODE)

- I = Initial Request (Forward Feed) indicates that the request is being submitted for the first time and must be used when the request has never been sent. If an initial request was rejected and all records associated with the request were also rejected, the records can be resubmitted with an ‘I’ or ‘C’ value. However, if the Admin Record (REC_TYP = ‘S’) on the initial request was accepted, then all records associated with this request must be resubmitted with a REC_MODE of ‘C’.
- C = Change Request (Forward Feed)
- R = Response (Reverse Feed)
- X = Resend (Forward Feed) indicates that the request was previously sent and should exist in the provider’s database but the provider has asked for a resend of the request.

Networx OSS Verification – Mechanized/Bulk Order Formats

Table 4-1. Agency "A" Initial mechanized/bulk Order

4.2 Agency “B”

Agency “B” wishes to order 42 calling cards, 50 mobile telephones, VoIP service for a remote office with 12 lines and Combined service for that same remote office. This is the initial file and the initial request for all orders.

The mechanized/bulk order file for this scenario will look something like Table 4-2.

Table 4-2. Agency "B" Initial mechanized/bulk Order

REC_TYP	REC_ID	REC_CODE	REC_EXT	REC_MODE	DESCRIPTION	ORDER

5. Per Service Mechanized/Bulk Order Information

In the paragraphs below, complete record and field information is illustrated for Voice Services (Section 5.1.) Since many fields and allowed values are the same across all Networx services, for a selection of Networx services only those fields that differ by service are shown to illustrate the variability.

5.1 Voice Services

Voice services orders will contain an Administrative record, a Billing and Contact record, a Networx Service record, one or more Networx Features records, one or more Networx Circuit records and one or more Service Location records. Table 5-1 shows the Administrative Record data fields used for Networx Mechanized/Bulk Orders and the allowed values for each.

Table 5-1. Administrative Record Fields and Values for Voice Services

Field Name	Allowed Values
REC_TYP	S
REC_MODE	I on initial transmission; otherwise C or X
AP_CODE	<i>Valid 2-character code for contractor</i>
CCNA	NTX
PON	<i>Valid ASRN</i>
ACT	N(New), C(Change), D(Disconnect), M(Inside move), R(Record only change) or T(Outside move)
D_SENT	<i>Valid current date</i>
T_SENT	<i>Valid current time</i>
DDD	<i>Valid desired due date (Customer Want Date)</i>
EXP	Y or N
<CKR> UBI	<i>Blank on initial order; Contractor assigned value thereafter</i>
QTY	<i>Numeric</i>
QTY2	<i>Numeric</i>
BAN	<i>Contractor assigned account number</i>
<ACTL> NICODE	<i>Valid Networx Inventory Code</i>
REMARKS1	<i>Unformatted text as needed</i>
CCVN	<i>“T” in first byte for transition orders</i>
TSP CONTROL	Y or N
AFG	Y
SPEC	VS
PSL	<i>CLLI for primary location if different from NICode</i>
EI	Y or N

Table 5-2 shows the Networx Billing and Contact record data fields and appropriate values for Voice Services Networx orders.

Table 5-2. Billing & Contact Record Fields and Values for Networkx Orders

Field Name	Allowed Values
REC_TYP	D
REC_MODE	I
AP_CODE	<i>Valid 2-character code for contractor</i>
CCNA	NTX
PON	<i>Valid ASRN</i>
ACT	N(New), C(Change), D(Disconnect), M(Inside move), R(Record only change) or T(Outside move)
BILLNM + SBILLNM	Billed Agency Name
BILL_ADD1	<i>Valid billing address for Billed Agency</i>
BILL_ADD2	<i>Valid billing address for Billed Agency</i>
BILL_CITY	<i>Valid billing city for Billed Agency</i>
BILL_STATE	<i>Valid billing state abbreviation for Billed Agency</i>
BILL_ZIP	<i>Valid billing zip code for Billed Agency</i>
BILLCON	<i>Billing contact for order</i>
BILLCON_TEL	<i>Valid telephone number for billing contact</i>
BILLCON EMAIL	<i>Valid email address for billing contact</i>
<INIT> DAR	<i>Valid DAR for Agency and order</i>
<VTA> CONT_NUM	<i>Valid Contract number</i>
AHC	<i>Valid Agency Hierarchy Code</i>
STO	A(ANI-based), P(designated percent-based) or blank

Table 5-3 shows the Networkx Service Record data fields and appropriate values for Voice Services Networkx orders.

Table 5-3. Networkx Service Record Data Fields and Valid Values for Voice Services

Field Name	Allowed Values
REC_TYP	N
REC_MODE	I
AP_CODE	<i>Valid 2-character code for contractor</i>
CCNA	NTX
PON	<i>Valid ASRN</i>
ACT	N(New), C(Change), D(Disconnect), M(Inside move), R(Record only change) or T(Outside move)
SVC	<i>Description of valid service</i>
SVC_CLIN	0014nnn
ICB_CN	<i>Not valid for Voice Services</i>
BDW	<i>Not valid for Voice Services</i>
TF_TRANS	<i>Not valid for Voice Services</i>
SAL	R(routine) or C(critical)
DIDR2	<i>npa-nxx-xxxx-mpa-nxx-xxxx</i>
DIDR3	<i>npa-nxx-xxxx-mpa-nxx-xxxx</i>

Network OSS Verification – Mechanized/Bulk Order Formats

Field Name	Allowed Values
DIDR4	<i>npa-nxx-xxxx-mpa-nxx-xxxx</i>
DIDR5	<i>npa-nxx-xxxx-mpa-nxx-xxxx</i>
ACTYPE	DED(dedicated), ON_NET(on-net) or OFF_NET(off-net circuit-switched)
ACPROV	<i>Y or N</i>

Table 5-4 identifies Network Feature Information record data fields and valid values for Voice Services.

Table 5-4. Feature Information Record Data Fields and Valid Values for Voice Services

Networkx OSS Verification – Mechanized/Bulk Order Formats

Field Name	Allowed Values
FEAT32	<i>Valid description of a voice services feature</i>
FEAT_CLIN32	<i>CLIN associated with feature description above: 0019nnn</i>

Table 5-5 shows the Networkx Circuit information record fields and allowed values for Voice Services.

Table 5-5. Networkx Circuit Information for Voice Services

Field Name	Allowed Values
REC_TYP	F
REC_ID	30
REC_CODE	00 to 99
REC_EXT	A to Z
REC_MODE	I
AP_CODE	<i>Valid 2-character code for contractor</i>
CCNA	NTX
PON	<i>Valid ASRN</i>
ACT	N(New), C(Change), D(Disconnect), M(Inside move), R(Record only change) or T(Outside move)
REFNUM	<i>Numeric 001 through 999 sequentially for Circuit records and associated Service Location records</i>
SEDD	<i>Unformatted description of Service Enabling Device or fielded format: Description, Unit Type, Manufacturer, Model, Release, Version</i>
CARD_NAME	<i>Valid name for calling card</i>
ACC	<i>Access description [if ACC_PROV=Y]</i>
ACC_CLIN	<i>Access CLIN [if ACC_PROV=Y]</i>

Table 5-6 illustrates the Networkx Service Address Location Information fields and values for Voice Services. Note that each Address record includes a Reference Number (REFNUM) that corresponds to the REFNUM in the Circuit record.

Table 5-6. Networkx Service Address Location Information Fields and Values for Voice Services

Field Name	Allowed Values
REC_TYP	F
REC_ID	44
REC_CODE	00 to 99
REC_EXT	A to Z
REC_MODE	I
AP_CODE	<i>Valid 2-character code for contractor</i>
CCNA	NTX
PON	<i>Valid ASRN</i>
ACT	N(New), C(Change), D(Disconnect), M(Inside move), R(Record only change) or T(Outside move)
REFNUM	<i>Numeric 001 through 999 sequentially for Circuit records and associated Service Location records</i>

Field Name	Allowed Values
PI	Y or N
SERVICE ADDRESS	<i>Unformatted service address information or fielded service address information</i>
<AAI> COUNTRY	<i>Country identification for non-US locations</i>
SPOT	Y or N
LCON	<i>Valid local contact name</i>
ACTEL	<i>Valid telephone number for location access</i>
ACC	<i>Unformatted information on location access</i>
LCON_EMAIL	<i>Valid email for local contact</i>
JURIS	<i>Valid jurisdiction code</i>
LREMARKS	<i>Unformatted general information on location (e.g., hours, driving directions)</i>
SWC	<i>Serving wire center for location</i>

5.2 Circuit Switched Data

Circuit Switched Data Services orders will contain an Administrative record, a Billing and Contact record, a Networx Service record, up to 1 Networx Features records, one or more Networx Circuit records and one or more Service Location records. Table 5-7 shows the Administrative Record data fields that vary across services with the unique values for Circuit Switched Data Services.

Table 5-7. Circuit Switched Data Services Administrative Record Field Values

Field Name	Allowed Values
SPEC	CSDS

There are no service-variable Networx Billing and Contact record data fields and appropriate values.

Table 5-8 shows the service-variable Networx Service Record data fields and appropriate values for Circuit Switched Data Services Networx orders.

Table 5-8. Service Record Data Fields and Valid Values for Circuit Switched Data Services

Field Name	Allowed Values
SVC_CLIN	0020nnn
ICB_CN	<i>Not valid for Circuit Switched Data Services</i>

Table 5-9. Feature Information Valid Values for Circuit Switched Data Services

Field Name	Allowed Values
FEAT1	<i>Valid description of a Circuit Switched Data Services feature</i>
FEAT_CLIN1	<i>CLIN associated with feature description above: 0029nnn</i>
...	
FEATn	<i>Valid description of a Circuit Switched Data Services feature</i>
FEAT_CLINn	<i>CLIN associated with feature description above: 0029nnn</i>

Table 5-10 shows the service-variable Networkx Feature Information record data fields and appropriate values for Circuit Switched Data Services Networkx orders.

Table 5-10. Networkx Circuit Information for Circuit Switched Data Services

Field Name	Allowed Values
SEDD	<i>Unformatted description of Service Enabling Device or fielded format: Description, Unit Type, Manufacturer, Model, Release, Version</i>
CARD_NAME	<i>Not valid for Circuit Switched Data Services</i>

There are no service-variable Networkx Service Address Location Information record data fields and appropriate values. Circuit Switched Data Services orders will normally have one Service Address Location record.

5.3 Toll-Free

Toll-Free Services orders will contain an Administrative record, a Billing and Contact record, a Networkx Service record, 1 to 4 Networkx Features records, one or more Networkx Circuit records and one or more Service Location records. Table 5-11 shows the Administrative Record data fields that vary across services with the unique values for Toll-Free Services.

Table 5-11. Administrative Record Unique Field Data for Toll-Free Services

Field Name	Allowed Values
SPEC	TFS

There are no service-variable Networkx Billing and Contact record data fields and appropriate values.

Table 5-12 shows the service-variable Networkx Service Record data fields and appropriate values for Toll-Free Services Networkx orders.

Table 5-12. Service Record Data Fields and Valid Values for Toll-Free Services

Field Name	Allowed Values
SEDD	<i>Unformatted description of Service Enabling Device or fielded format: Description, Unit Type, Manufacturer, Model, Release, Version</i>
CARD_NAME	<i>Not valid for Toll-Free Services</i>

There are no service-variable Networx Service Address Location Information record data fields and appropriate values. Toll-Free Services orders will normally have one Service Address Location record.

5.4 Combined

Combined Services orders will contain an Administrative record, a Billing and Contact record, a Networx Service record, up to 1 Networx Features records, one or more Networx Circuit records and one or more Service Location records. Table 5-15 shows the Administrative Record data fields that vary across services with the unique values for Combined Services.

Table 5-15. Administrative Record Unique Field Data for Combined Services

Field Name	Allowed Values
SPEC	CS

There are no service-variable Networx Billing and Contact record data fields and appropriate values.

Field Name	Allowed Values
SEDD	<i>Unformatted description of Service Enabling Device or fielded format: Description, Unit Type, Manufacturer, Model, Release, Version</i>
CARD_NAME	<i>Not valid for Combined Services</i>

There are no service-variable Networx Service Address Location Information record data fields and appropriate values. Combined Services orders will normally have one Service Address Location record.

5.5 Private Line

Private Line Services orders will contain an Administrative record, a Billing and Contact record, a Networx Service record, up to one Networx Features records, two or more Networx Circuit records and two or more Service Location records. Table 5-19 shows the Administrative Record data fields that vary across services with the unique values for Private Line Services.

Table 5-19. Administrative Record Unique Field Data for Private Line Services

Field Name	Allowed Values
SPEC	PLS

There are no service-variable Networx Billing and Contact record data fields and appropriate values.

Field Name	Allowed Values
FEAT1	Valid description of a Ethernet Services feature
FEAT_CLIN1	CLIN associated with feature description above: 0199nnn
...	
FEATn	Valid description of a Ethernet Services feature
FEAT_CLINn	CLIN associated with feature description above: 0199nnn

Table 5-34 shows the service-variable Networx Feature Information record data fields and appropriate values for Ethernet Services Networx orders.

Table 5-34. Networx Circuit Information for Ethernet Services

Field Name	Allowed Values
SEDD	Unformatted description of Service Enabling Device or fielded format: Description, Unit Type, Manufacturer, Model, Release, Version
CARD_NAME	Not valid for Ethernet Services

There are no service-variable Networx Service Address Location Information record data fields and appropriate values. Ethernet Services orders will normally have one Service Address Location record.

5.9 Premises-Based IP VPN

Premises-Based IP VPN Services orders will contain an Administrative record, a Billing and Contact record, a Networx Service record, up to one Networx Features records, 1 or more Networx Circuit

records and 1 or more Service Location records. Table 5-35 shows the Administrative Record data fields that vary across services with the unique values for Premises-Based IP VPN Services.

Table 5-35. Administrative Record Unique Field Data for Premises-Based IP VPN Services

Field Name	Allowed Values
SPEC	PBIPVPN

There are no service-variable Networx Billing and Contact record data fields and appropriate values.

Table 5-36 shows the service-variable Networx Service Record data fields and appropriate values for Premises-Based IP VPN Services Networx orders.

Table 5-36. Service Record Data Fields and Valid Values for Premises-Based IP VPN Services

Field Name	Allowed Values
SVC_CLIN	0200nnn
ICB_CN	Valid ICB Case Number
BDW	Not valid for Premises-Based IP VPN Services
TF_TRANS	Not valid for Premises-Based IP VPN Services
SAL	R(routine) or C(critical)
DIDR2	Not valid for Premises-Based IP VPN Services
DIDR3	Not valid for Premises-Based IP VPN Services
DIDR4	Not valid for Premises-Based IP VPN Services
DIDR5	Not valid for Premises-Based IP VPN Services

Table 5-37 shows the service-variable Networx Feature Information record data fields and appropriate values for Premises-Based IP VPN Services Networx orders.

Table 5-37. Feature Information Record Data Fields and Valid Values for Premises-Based IP VPN Services

Field Name	Allowed Values
FEAT1	Valid description of a Premises-Based IP VPN Services feature
FEAT_CLIN1	CLIN associated with feature description above: 0209nnn
...	
FEATn	Valid description of a Premises-Based IP VPN Services feature
FEAT_CLINn	CLIN associated with feature description above: 0209nnn

Table 5-38 shows the service-variable Networkx Feature Information record data fields and appropriate values for Premises-Based IP VPN Services Networkx orders.

Table 5-38. Networkx Circuit Information for Premises-Based IP VPN Services

Field Name	Allowed Values
SEDD	<i>Unformatted description of Service Enabling Device or fielded format: Description, Unit Type, Manufacturer, Model, Release, Version</i>
CARD_NAME	<i>Not valid for Premises-Based IP VPN Services</i>

There are no service-variable Networkx Service Address Location Information record data fields and appropriate values. Premises-Based IP VPN Services orders will normally have one Service Address Location record.

5.10 Synchronous Optical Network (SONET)

SONET Services orders will contain an Administrative record, a Billing and Contact record, a Networkx Service record, up to one Networkx Features records, 2 Networkx Circuit records and 2 Service Location records. Table 5-39 shows the Administrative Record data fields that vary across services with the unique values for SONET Services.

Table 5-39. Administrative Record Unique Field Data for SONET Services

Field Name	Allowed Values
SPEC	SONETS

There are no service-variable Networkx Billing and Contact record data fields and appropriate values.

Table 5-40 shows the service-variable Networkx Service Record data fields and appropriate values for SONET Services Networkx orders.

Table 5-40. Service Record Data Fields and Valid Values for SONET Services

Field Name	Allowed Values
SVC_CLIN	0154nnn
ICB_CN	<i>Valid ICB Case Number</i>
BDW	<i>Not valid for SONET Services</i>
TF_TRANS	<i>Not valid for SONET Services</i>
SAL	R(routine) or C(critical)
DIDR2	<i>Not valid for SONET Services</i>
DIDR3	<i>Not valid for SONET Services</i>
DIDR4	<i>Not valid for SONET Services</i>
DIDR5	<i>Not valid for SONET Services</i>

Table 5-41 shows the service-variable Networkx Feature Information record data fields and appropriate values for SONET Services Networkx orders.

Table 5-41. Feature Information Record Data Fields and Valid Values for SONET Services

Field Name	Allowed Values
FEAT1	<i>Valid description of a SONET Services feature</i>
FEAT_CLIN1	<i>CLIN associated with feature description above: 0209nnn</i>
...	
FEATn	<i>Valid description of a SONET Services feature</i>
FEAT_CLINn	<i>CLIN associated with feature description above: 0209nnn</i>

Table 5-42 shows the service-variable Networkx Feature Information record data fields and appropriate values for SONET Services Networkx orders.

Table 5-42. Networkx Circuit Information for SONET Services

Field Name	Allowed Values
SEDD	<i>Unformatted description of Service Enabling Device or fielded format: Description, Unit Type, Manufacturer, Model, Release, Version</i>
CARD_NAME	<i>Not valid for SONET Services</i>

There are no service-variable Networkx Service Address Location Information record data fields and appropriate values. SONET Services orders will normally have two Service Address Location records (originating and terminating.)

5.11 Managed Network

Managed Network Services orders will contain an Administrative record, a Billing and Contact record, a Networkx Service record, up to one Networkx Features records, 1 or more Networkx Circuit records and 1 or more Service Location records. Table 5-43 shows the Administrative Record data fields that vary across services with the unique values for Managed Network Services.

Table 5-43. Administrative Record Unique Field Data for Managed Network Services

Field Name	Allowed Values
SPEC	MNS

There are no service-variable Networkx Billing and Contact record data fields and appropriate values.

Table 5-44 shows the service-variable Networx Service Record data fields and appropriate values for Managed Network Services Networx orders.

Table 5-44. Service Record Data Fields and Valid Values for Managed Network Services

Field Name	Allowed Values
SVC_CLIN	0280nnn
ICB_CN	<i>Valid ICB Case Number</i>
BDW	<i>Not valid for Managed Network Services</i>

Appendix F. Networx-Specific Circuit Information

RECORD TYPE: F

RECORD ID: 30A

DATA AREA LENGTH: 148

NUMBER OF FIELDS: 14

Key: Not used	Combined	Optional	Mapped for Networx	
	NAME	STRT	LTH	FIELD DESCRIPTION
1	REC_TYP	1	1	BATCH INPUT RECORD TYPE
2	REC_ID	2	3	BATCH INPUT RECORD ID
	REC_CODE	2	2	BATCH INPUT RECORD CODE
	REC_EXT	4	1	BATCH INPUT REC. EXT CODE
3	REC_MODE	5	1	BATCH INPUT RECORD MODE
4	ICSC	6	4	IC SERVICE CENTER
	AP_CODE	6	2	TWO CHARACTER PROVIDER ID (CONTRACTOR NAME)
	OFF_CODE	8	2	OFFICE CODE
5	CCNA	10	3	CUSTOMER CARRIER NAME ABBREVIATION
6	ASR	13	10	ACCESS REQUEST NUMBER
7	ASR1	23	8	ADD'L ASR ORDER NO. FIELD
8	PON	31	16	PURCHASE ORDER NUMBER (ASRN)
9	REQTYP	47	2	REQUISITION TYPE
10	ACT	49	1	ACTIVITY TYPE
11	VER	50	2	CUSTOMER ASR VERSION
