

Research Methods and Strategies

Evaluating the Impact of Educational Programs

Jennifer Anderson, Ph.D., R.D.
Professor and Extension Specialist
Colorado State University

*Food Safety Education Conference
September 28, 2006
Denver, Colorado*

What is Evaluation?

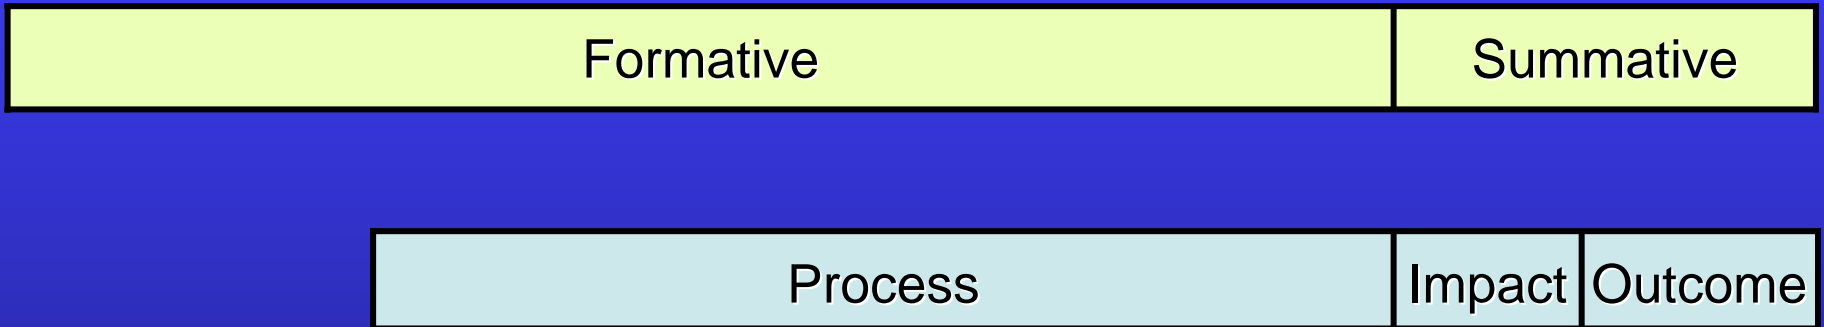

- The word *value* is in the word as it is the process of assessing value or worth of an educational endeavor.
- Did the program achieve the stated objectives?
- Did it serve some larger specified goals?
- Was it worth the cost?
- Did it influence the knowledge, attitude and behavior of target audience?
- What was the value to participants?

Why Evaluate?

- Evaluations can serve research purposes, program evaluation purposes or both.
- In research we investigate whether and how interventions work or not work.
- In practice settings it helps a person be accountable for programs they conduct.
- It may also be used to allocate resources.
- It may provide support to the program and/or gain visibility to a program. This could include policy efforts.
- And it can serve psychological purposes as it can be motivating to learn what has been effective.

Comparison of Evaluation Terms

Planning → Start of implementation → End of implementation

Outcome Evaluation

- Focuses on an ultimate goal or product of a program
- Generally measured by symptoms, signs, or physiological indicators on individuals
- Long-term in nature and takes more time and resources to conduct than impact evaluation.
- The *logic model* is an example and used to see if the evidence is a result of intervention. To conclude that outcomes are a result of an intervention an Impact evaluation must be done

Logic Model Example

INPUTS

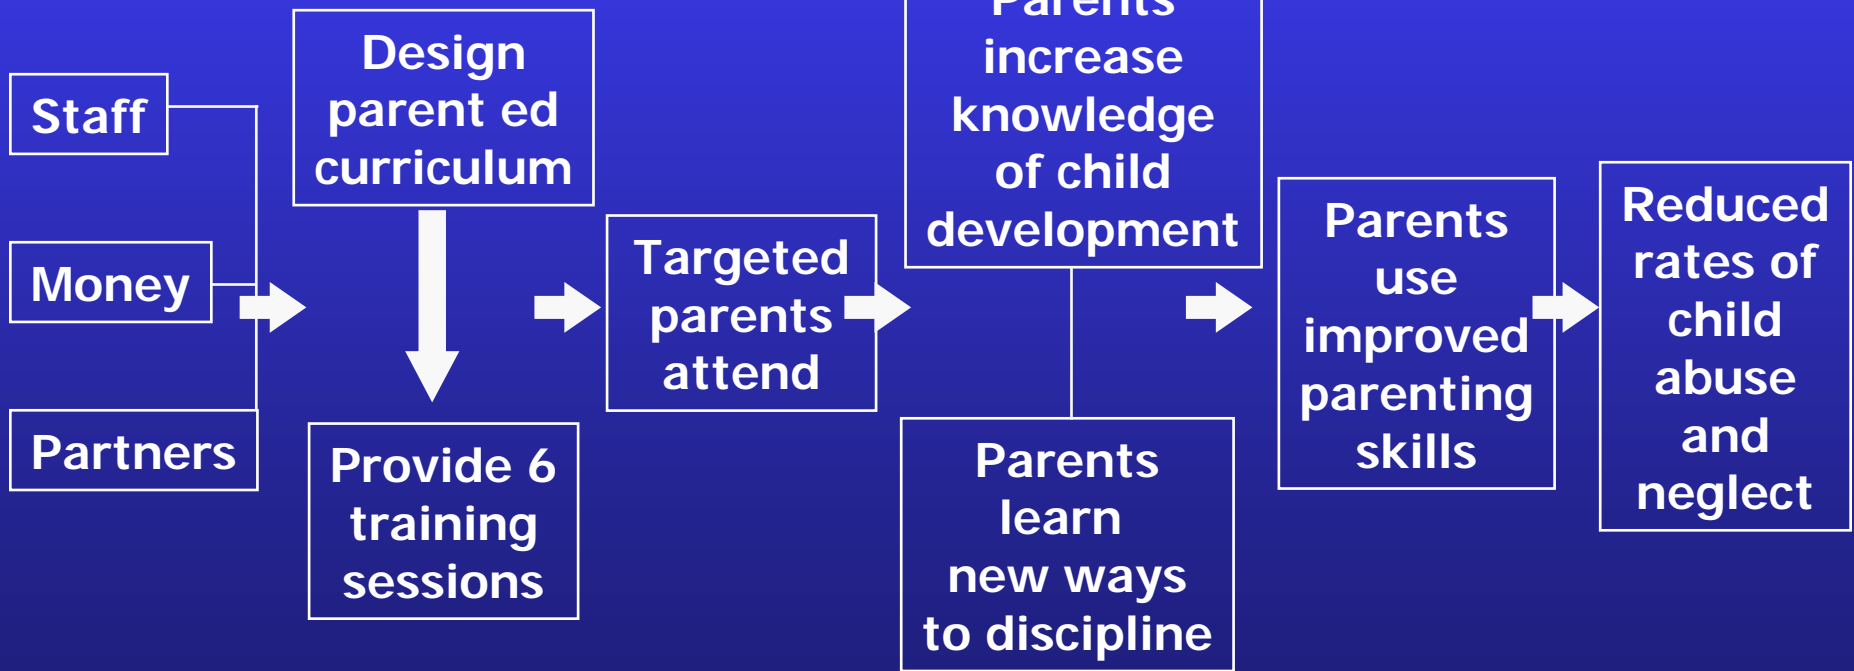

OUTPUTS

OUTCOMES

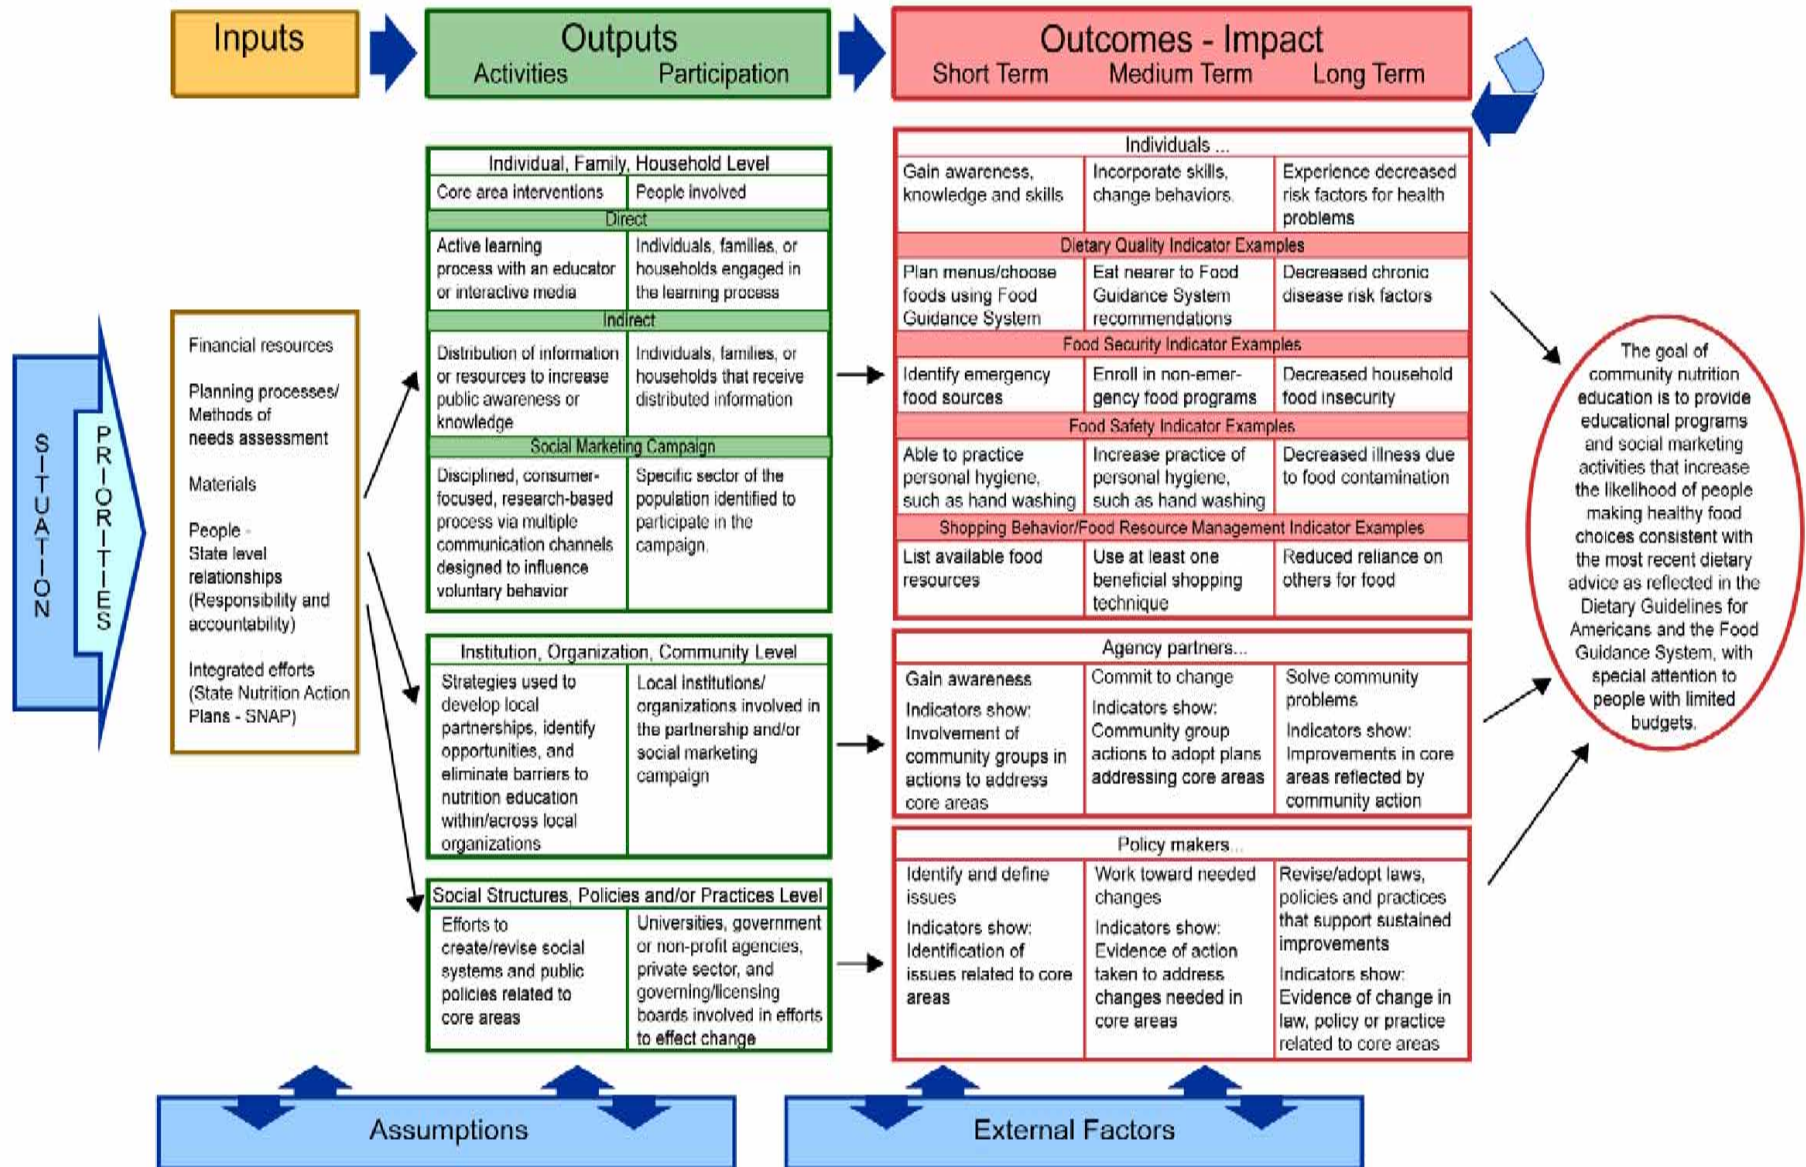

Learning

Action

Conditions

The Community Nutrition Education (CNE) Logic Model – Overview

Impact Evaluation

- Systematic design or plan used to eliminate alternative explanations for observed differences
- Focuses on “immediate observable effects of a program, leading to the intended outcomes of a program”
- Measures of awareness, knowledge, attitudes, skills, and behaviors yield impact evaluation data

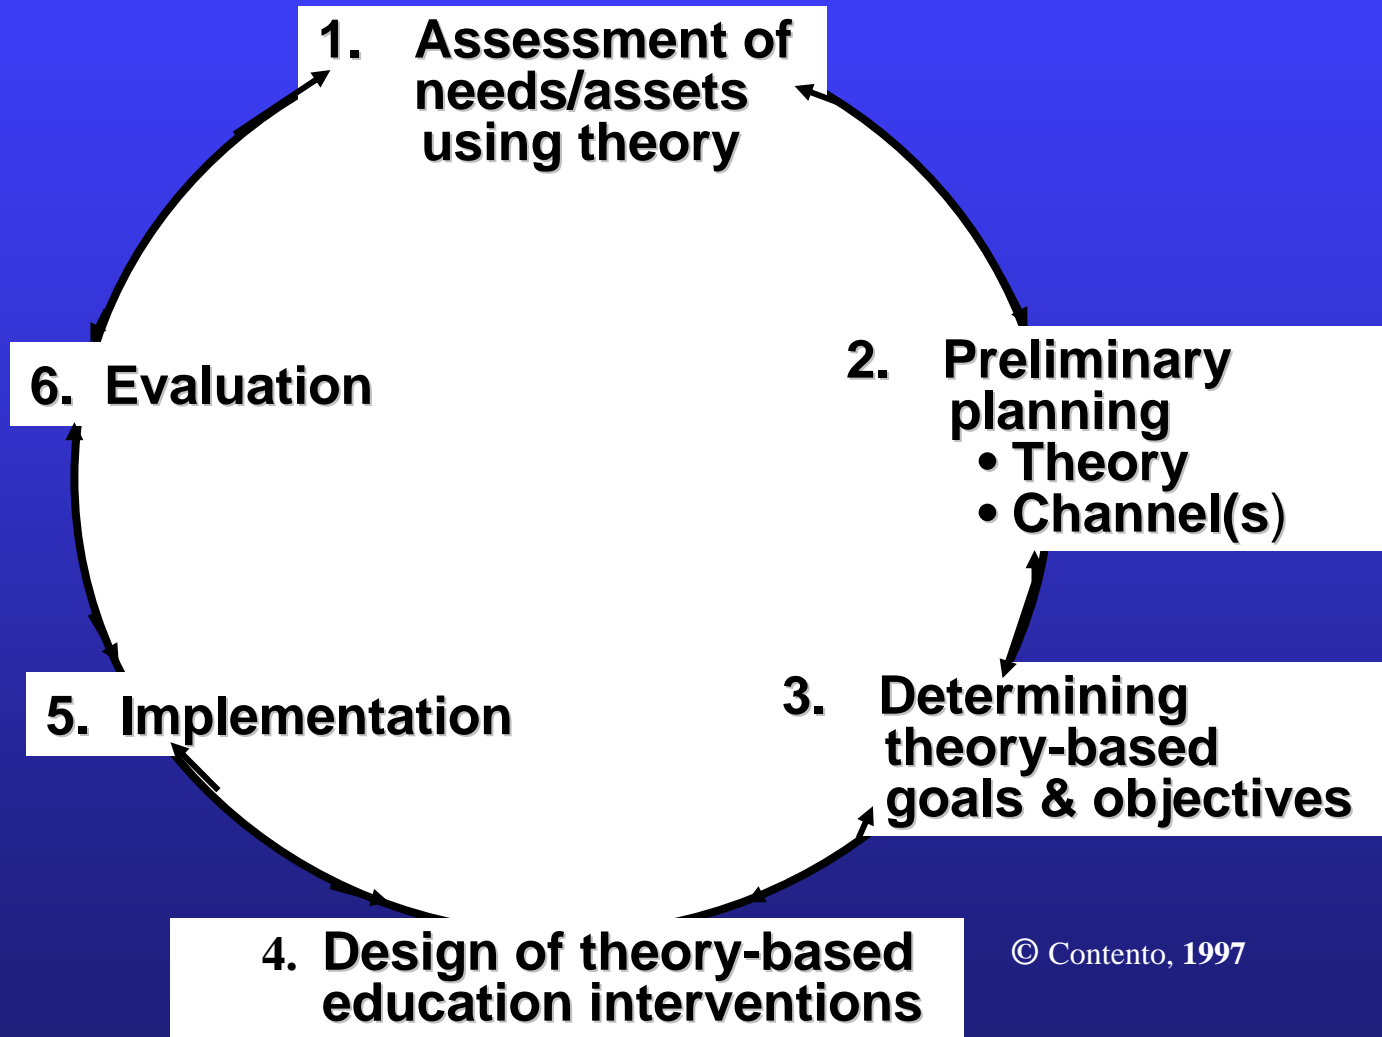

Formative Evaluation

- Any combination of measurements obtained and judgments made before or during the implementation of materials, methods, activities or programs
- Used to control, assure or improve the quality of performance or delivery
- Includes, but not limited to, a needs assessment or pilot testing a program

Summative Evaluation

- Summative evaluations provide overall effects and program accountability
- They include any combination of measurements and judgments
- Allow conclusions to be drawn about impact, outcome, or benefits of a program or method
- A good summative evaluation should report **why or why not** was the education effective...thus even summative evaluation may have formative implications

Framework for Designing Theory-based Interventions

Designing the Evaluation

- Process evaluation occurs during program and is a form of formative evaluation.
- Impact and outcome evaluation occur at the completion of the program and are considered forms of summative evaluation.
- Both sets of evaluation (process, impact, and outcome; formative and summative) take into account the need to conduct evaluation before and/or during the program and at the end of the program.
- Plans for all types of evaluation should be in place before and planned at the same time as program implementation.

Indicators and Measures

- Indicators need to be appropriate for your program
- Indicators could include
 - Increased knowledge about food safety
 - Changes in attitudes regarding food safety
 - Improved food safety practices
- Indicators need to be measurable

Factors to Consider When Choosing a Data Collection Method

- Exact indicators or measures of effectiveness
- Size of target audience
- Level of accuracy desired
- Purpose of evaluation
- How will the findings be used
- Resources available
- Qualitative vs. quantitative or both?

Types of Data Collection Methods

- Formative evaluation
 - In-depth interviews
 - Focus groups
 - Surveys (mail, telephone, Internet/web)
- Summative evaluation
 - Surveys (mail, telephone, Internet/web)
 - Observation
 - Diaries

Other Considerations

- Type of experimental design
- Use of Control Groups
- Determine adequate numbers to study
- Representative sample

Lessons Learned

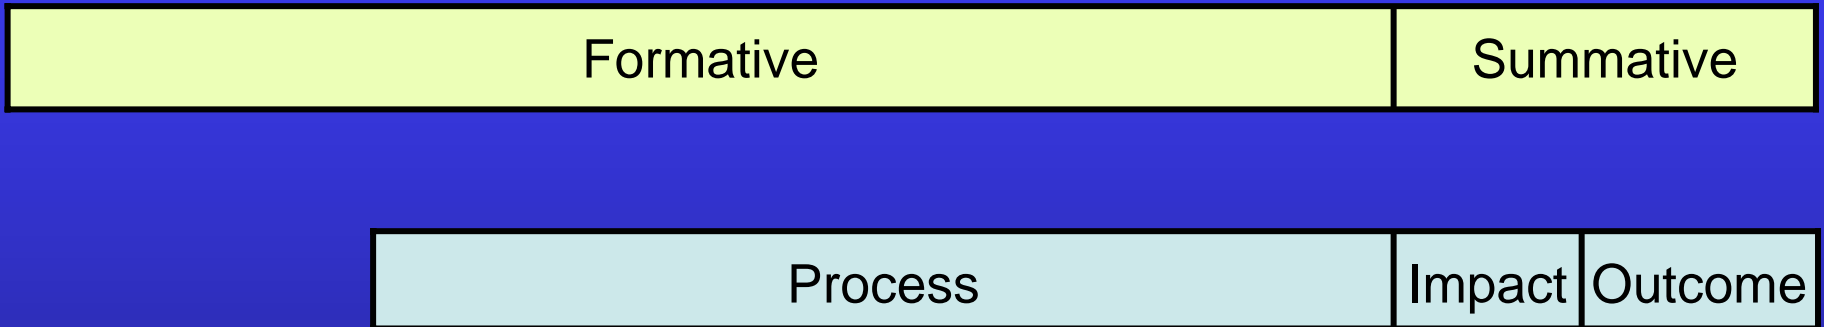

- Lesson 1 - Plan carefully
- Lesson 2 - Budget carefully for time and resources
- Lesson 3 - Evaluation is not easy but necessary!
- Lesson 4 - Evaluation is a learning experience
