

CURRENT INDUSTRIAL REPORTS

Survey of Plant Capacity: 1994

MQ-C1(94)

U.S. Department of Commerce
Economics and Statistics Administration
BUREAU OF THE CENSUS

Acknowledgments

This report was prepared under the direction of **Stephen Andrews**, Assistant Division Chief, Manufacturing and Construction Division. Within the Manufacturing and Construction Division, the preparation of this report was performed under the supervision of **Elinor Champion**, Chief, Environment, Technology, and Innovation Branch, and **Ron Taylor**.

Review and analysis of the MQ-C1, Survey of Plant Capacity data were performed by **Sharon Boyer**, **Philippe Morris**, **Yvette Moore**, and **Lisa Dunlop**.

The electronic computer programs for the MQ-C1 were developed under the direction of **Sarah Baumgardner**, Assistant Division Chief for Economic Surveys, Economic Statistical Methods and Programming Division. Within the Economic Statistical Methods and Programming Division, the development of the programs was performed by **Steven Potemkin**, **Roxanne Liebermann**, and **Ralph Davis** under the supervision of **Francis Bush**, Chief, Current Economic Indicators Branch.

Lillie M. Skinner coordinated the various phases of the publication process.

The staff of Administrative and Customer Services Division, **Walter C. Odom**, Chief, performed publication planning, design, composition, editorial review, and printing planning and procurement. **Margaret A. Smith** provided publication coordination and editing.

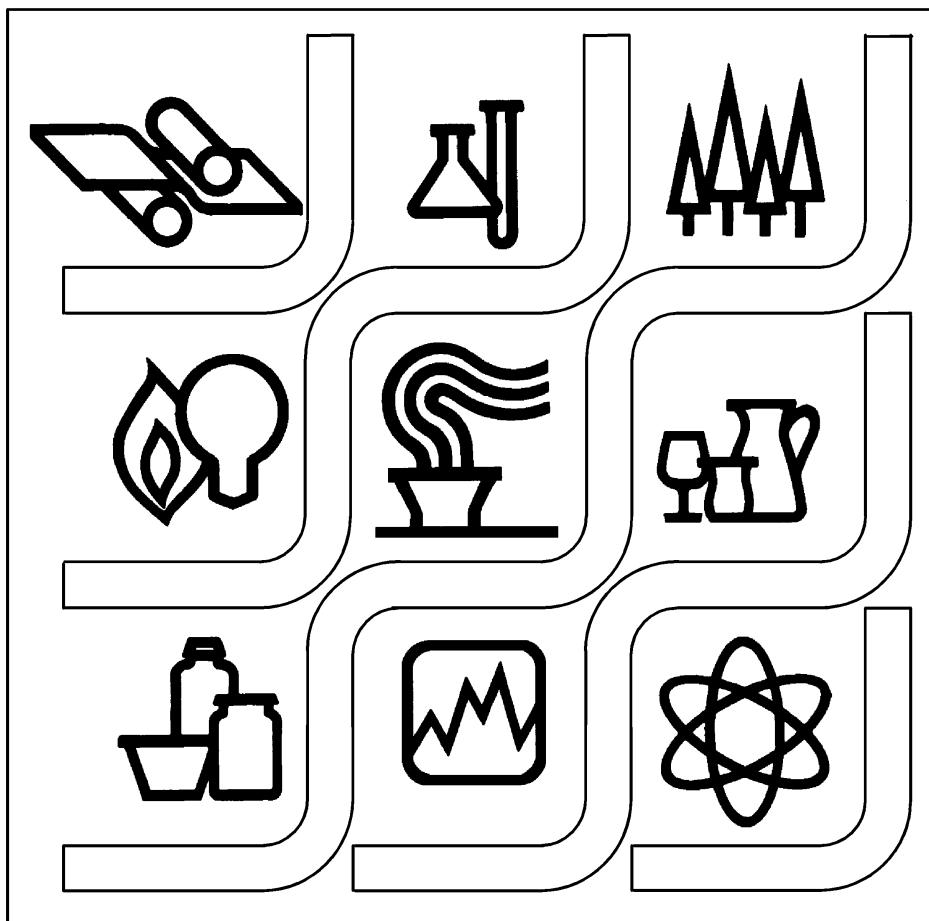

A special acknowledgment is due to the many businesses whose cooperation was essential to the success of this report.

Introduction

SUMMARY OF 1994 SURVEY RESULTS

U.S. domestic manufacturing plants used an estimated 80 percent (± 1 percentage point) of their full production capacity for the fourth quarter of 1994 and 78 percent (± 1 percentage point) for the fourth quarter of 1993. This estimated 2-percent increase from 1993 to 1994 is statistically significant at the 90-percent confidence level. Durable goods industries in the fourth quarter of 1994 operated at a 4-percent lower rate (± 1 percentage point) than nondurable goods industries with a full production utilization rate of 78 percent compared to 82 percent for nondurable goods industries. Advance processing industries for 1994 operated at a 6-percent lower rate (± 1 percentage point) than primary processing industries with a full production utilization rate of 78 percent compared with 84 percent for primary processing industries. Durable goods industries are manufacturing industries in which products have a normal life expectancy of 3 years or more. Standard Industrial Classification (SIC) major industries 24, 25, 32, 33, 34, 35, 36, 37, 38, and 39 are considered durable goods industries. Nondurable goods industries are manufacturing industries in which products generally have a life expectancy of less than 3 years. SIC major industries 20, 21, 22, 23, 26, 27, 28, 29, 30, and 31 are nondurable goods industries. Primary processing industries are industries in which products are generally the first processed output of raw materials in the manufacturing process. SIC major industries 22, 24, 26, 29, 30, 32, 33, and 34 are classified as the primary processing industries. Advance processing industries are industries in which products are considered finished manufactured items. SIC major industries 20, 21, 23, 25, 27, 31, 35, 36, 37, 38, and 39 are advance processing industries.

Among the major industries with the lowest utilization rates of their full production capacity in the fourth quarter of 1994 were instruments and related products (SIC 38) at 72 percent and transportation equipment (SIC 37) at 74 percent. Among the industries with the highest utilization rates for 1994 were petroleum and coal products (SIC 29) at 89 percent, and textile mill products (SIC 22), paper and allied products (SIC 26) and primary metal industries (SIC 33) all at 87 percent. Full production capacity is broadly defined as the maximum level of production an establishment could attain under normal operating conditions. In this report, the full production utilization rate is a ratio of the actual level of operations to the full production level.

The utilization rates based on the national emergency production level of operations generally follow the trends for full production rates. National emergency production is broadly defined as the greatest level of production an establishment can expect to sustain for 1 year or more under national emergency conditions. The national emergency production utilization rate is a ratio of the actual level of operations to the national emergency production level. Table 1a summarizes full production utilization rates and table 1b summarizes emergency production utilization rates, at two-, three-, and four-digit SIC industry levels, for fourth quarters 1989 through 1994. Tables 2a, 2b, and 2c show both full and emergency production utilization rates, at the two-, three-, and four-digit SIC industry levels, for fourth quarters 1994-1993, 1992-1991, and 1990-1989, respectively. Estimates are subject to sampling variability and nonsampling error. The range at which estimates are tested in this report is at the 90-percent confidence level. Appendix A contains reproductions of the survey form and instructions; appendix B describes the qualification of the data; and appendix C contains a description of the survey sample and estimating procedure.

REVISIONS TO THE SURVEY OF PLANT CAPACITY UTILIZATION

Beginning with the 1990 survey, data were collected at 2-year intervals. The 1994 survey is the third data collection period. During the review of 1993 and 1994 fourth quarter data, inconsistencies in the 1989-1990 and 1991-1992 reporting and estimation were noted. This report includes a comprehensive review of data for fourth quarters 1989 through 1994 to include corrections to erroneously reported data and incorrect sampling applications.

In addition, the reader should also note that the Bureau of the Census used new criteria for defining capacity levels beginning with 1990 Survey of Plant Capacity Utilization. In prior capacity utilization surveys, the Bureau of the Census used preferred level of operation and practical capacity. Preferred level of operation was defined as a level that a plant preferred not to exceed because of costs or other considerations. Implicit in the preferred level was the idea that there was a level of production at which profits for a plant are maximized. At preferred level of operation, a plant's marginal revenue for its operations would equal its marginal costs. Practical capacity was defined as the maximum level of production that a plant could reasonably

expect to attain using a realistic employee work schedule and the machinery and equipment in place during the time period covered by the survey.

In developing new definitions of capacity levels for the 1990 Survey of Plant Capacity Utilization, the Bureau of the Census sought to improve the consistency of reporting across industries for the survey, and also to make it less difficult for respondents to report estimates of capacity levels in the survey. Due to definitional differences in capacity, care should be taken when comparing the utilization rates from the 1990, 1992, and 1994 surveys with previous Bureau of the Census surveys of plant capacity utilization and other measures of capacity. Other measures of capacity employ different methodologies which may yield different utilization levels.

INDUSTRIAL CLASSIFICATION

Industrial classification definitions for 1990, 1992, and 1994 survey estimates will differ from prior years' survey estimates for certain industries. Estimates for the 1990,

1992, and 1994 surveys are classified by revised manufacturing industries definitions described in the 1987 edition of the Standard Industrial Classification (SIC) Manual published by the Office of Management and Budget.

ABBREVIATIONS AND SYMBOLS

The following abbreviations and symbols appear frequently in the tables:

—	Represents zero.
(D)	Withheld to avoid disclosing data for individual companies.
(S)	Data suppressed because they did not meet publication standards. This includes data cells with strong evidence of bias or where the level of imputation exceeds 50 percent.
(X)	Not applicable.
n.e.c.	Not elsewhere classified.
SIC	Standard Industrial Classification.

¹A description of the standard error is given in appendix B, "Qualifications of the Data" of the report.

Note: Some data are revised to include additional information. See introduction for a discussion of the revision.

Appendix A. **MQ-C1 Report Form and Instructions**

The MQ-C1 form and instructions are shown on the following pages.

DUE DATE:

FORM MQ-C1
(11-30-94)U.S. DEPARTMENT OF COMMERCE
BUREAU OF THE CENSUS

OMB No. 0607-0175: Approval Expires 12/31/95

SURVEY OF PLANT CAPACITY UTILIZATION

FOURTH QUARTER 1994 (October-December)

Item 1a OPERATIONAL STATUS

Mark (X) ONE box which best describes this establishment at the end of 1994. See instructions for reporting.

101 In operation - Complete items 1 through 6.102 Temporarily idle103 Sold or leased to another company - Report new owner or operator in item 1b104 Permanently ceased operations

105	Month	Year
Give date		

Item 1b NEW OWNER OR OPERATOR

106 Name _____ Employer Identification Number _____

Number and street _____ City _____ State _____ ZIP Code _____

IMPORTANT PLEASE READ INSTRUCTIONS AND DEFINITIONS BEFORE
COMPLETING FORM
Item 2 FOURTH QUARTER OPERATIONS

Report actual operations for the following items:

a. Number of days per week in operation

b. Number of plant hours per day in operation

c. Market value of production

Key code	ACTUAL OPERATIONS		
	1994	1993	1992
20			
21			
22	Mil. Thou. Dol.	Mil. Thou. Dol.	Mil. Thou. Dol.

Item 3 FULL PRODUCTION CAPABILITY

a. At full production capability, what is the percent increase from actual production (item 2c) in the fourth quarter of 1994 at which this plant could operate for a sustained period? Assume:

- only machinery and equipment in place
- normal downtime.
- the same product mix as in the fourth quarter.
- the number of shifts and hours of plant operations under normal conditions **ARE NOT** higher than that attained by your plant at any time during the past 5 years.
- overtime pay, availability of labor, materials, utilities, etc. **ARE NOT** limiting factors.

b. Convert percent increase (item 3a) to decimal form. Examples: 0% = .00 10% = .10 150% = 1.50

Key code	PERCENT INCREASE		
	1994	1993	1992
30	%	%	%
31			

c. Calculate increase in value of production (Multiply item 2c by 3b)

d. Calculate value of production at full production (Add items 2c and 3c)

Key code	VALUE OF PRODUCTION		
	1994	1993	1992
	Mil. Thou. Dol.	Mil. Thou. Dol.	Mil. Thou. Dol.
32			
33			

Item 3 FULL PRODUCTION CAPABILITY 1994 – Continued

e. If your estimate of fourth quarter value of production at full production capability has changed compared to 1993, check the primary reasons.

341 Building capital expenditures

347 Change in method of operation

342 Machinery capital expenditures – *Include new, replaced, or enhanced machinery*

348 Change in product mix or product specifications

343 Building retirements

349 Change in material input

344 Machinery retirements

350 Other – *Specify* ↗

345 Price changed but product mix is the same

346 Revised estimation assumption with no change in plant or operations

351 _____

Item 4 FOURTH QUARTER ACTUAL OPERATIONS VS FULL PRODUCTION CAPABILITY FOR 1994

Compare your estimates of actual value of production and value of production at full production capability.

a. If during the fourth quarter this plant's actual operations are less than full production capability, check primary reasons your actual operation fell short of full production.

401 Not most profitable to operate at full production capability

408 Logistics/transportation constraints

402 Insufficient supply of materials

409 Sufficient inventory of finished goods on hand

403 Insufficient orders

410 Strike or work stoppage

404 Insufficient supply of local labor force/skills

411 Seasonal operations

405 Lack of sufficient fuel or electric energy

412 Environmental restrictions

406 Equipment limitations

413 Other – *Specify* ↗

407 Storage limitations

414 _____

b. If operations in the fourth quarter are less than full production capability, how quickly would it be possible to increase to that level? Assume sufficient demand for your product.

CHECK THE SHORTEST AMOUNT OF TIME YOU WOULD REQUIRE.

415 Less than 3 months 416 3 to 6 months 417 7 to 12 months 418 More than one year

Item 5 NATIONAL EMERGENCY PRODUCTION

a. In the event of a **national emergency**, what is the percentage increase from the actual operations at which this plant could operate for a sustained period of **one year or more? Assume:**

- **full use of all** your machinery and equipment, including that requiring reconditioning.
- plant production **as close to 168 hours per week as possible**, assuming extra shifts.
- **minimal** downtime.
- funding, labor, materials, components, utilities, etc., **are fully available to you and your suppliers.**
- your product mix **is** permitted to change.
- you can sell **all** your output
- the percentage should be equal to or greater than item 3a.

PERCENT INCREASE	
1994	1993
50	%

b. If operations in the fourth quarter are **less** than national emergency production, how quickly could you increase to the national emergency production level if given emergency priority by the government?

CHECK THE SHORTEST AMOUNT OF TIME YOU WOULD REQUIRE.

505 Less than 3 months 506 3 to 6 months 507 7 to 12 months 508 More than one year

60 Remarks

Item 6 PERSON TO BE CONTACTED REGARDING THIS REPORT – Print name and telephone number.

601 Name

Telephone →

602 Area code

Number

INSTRUCTIONS AND DEFINITIONS

1994 SURVEY OF PLANT CAPACITY UTILIZATION

AUTHORITY AND CONFIDENTIALITY – Response to this inquiry is required by law (title 13, U.S. Code). By section 9, of title 13, U.S. Code, your report to the Census Bureau is confidential. It may be seen only by sworn Census Bureau employees and may be used only for statistical purposes. The data cannot be used for regulation or enforcement. Copies of your report retained in your files are immune from legal process.

PLEASE READ CAREFULLY BEFORE COMPLETING FORM

Public reporting burden for this collection of information is estimated to vary from 30 minutes to 8 hours per response (with an average of 2 hours), including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding the burden estimate or other aspect of this collection of information including suggestions for reducing this burden to the Associate Director for Administration, Room 2069, FB-3, Bureau of the Census, Washington, DC 20233-0001; and to the Office of Management and Budget, Washington, DC 20503.

WHO SHOULD REPORT?

This report covers the manufacturing establishment named in the address box of the form. If your company operates more than one location, REPORT ONLY FOR THOSE ESTABLISHMENTS SELECTED FOR THIS SAMPLE SURVEY.

THE PLANT MANAGER OR ENGINEER SHOULD COMPLETE THIS REPORT BECAUSE OF THE NATURE OF QUESTIONS ASKED.

WHAT PERIOD SHOULD EACH REPORT COVER?

The report form covers the fourth quarter of calendar year 1994.

Please report comparable data for 1993 for survey items 2a through 3d and 5a. Data for 1992 are printed on the form if the plant was selected to participate in the 1992 survey.

HOW TO REPORT

Report market value of production in thousands of dollars. For example, if value of production is 1,125,628 dollars the preferred entry is:

Mil.	Thou.	Dols.
1	126	000

Although, you may report as follows:

Mil.	Thou.	Dols.
1	125	628

For information concerning the possible use of reporting formats other than the form provided, such as computer tape, diskette, or printouts, contact Mr. Ron Taylor at (301) 457-4659.

NAME AND ADDRESS

Review the name and address of this plant printed in the top right corner of the report form. Line out any errors and make any necessary corrections or additions in the address box.

Item 1a – OPERATIONAL STATUS

Report the status of operations at this plant at the end of 1994.

In Operation – Complete items 1 through 6.

Idle Plants – Complete items 1 through 6.

a. If this plant was temporarily idle during the entire period covered by the survey, report actual operations for the various items as zero where appropriate.

b. If this plant was temporarily idle during only part of the period covered by the survey, report the actual operations for the time the plant was in operation.

For both cases, report full production capability based on the plant's peak quarterly production during the year 1994.

Sold or Leased Plant – If this plant was sold or leased to another company to operate, indicate the month and year this action took place and report the new owner or operator in item 1b. If you still maintain records for this plant, complete items 2 through 6. If you are no longer responsible for information about this plant, complete item 6 and return the form.

Permanently Ceased Operations – If this plant was in operation at any time during the fourth quarter, complete items 1 through 6. Report full production capability on the plant's normal fourth quarter production.

SPECIAL NOTE:

Seasonal Operations – (A) If this plant's operations are usually temporarily idle during the fourth quarter due to seasonal factors, report as instructed for idle plants. **(B)** If this plant was not temporarily idle during the fourth quarter but its operations vary substantially due to seasonal factors, complete items 1 through 6, and report full production capability based on the plant's peak quarterly production during the year 1994. For both types of seasonal operations, be sure to check "Seasonal operations" in item 4a if this is the primary reason actual operations are less than full production capability.

Item 1b – NEW OWNER OR OPERATOR

If there was a change in operator during the year or the establishment operated part of the year only, report in item 1b any change and give name and address of the new operator.

Item 2 – ACTUAL OPERATIONS

Report the actual operations of this plant in the fourth quarter 1994.

Days Per Week in Operation – In reporting days per week in operation, use the most typical pattern during the period.

Plant Hours Per Day – Report the typical number of hours the plant was in production during a single day, and not number of person hours worked.

If your plant has departments or assembly lines which operate at varied periods of time, report days per week and plant hours per day for the production department operating the greatest number.

Market Value of Production – Report the value of production based on estimated sales price(s) of what was produced during the fourth quarter, not fourth quarter sales. If production at this plant consists of only interplant transfers, use method (2) below to calculate market value of production.

Three methods to estimate market value of production are:

- (1) Estimate the sales price(s) of item(s) produced, then multiply the sales price(s) by the total number of items produced during the fourth quarter.
- (2) Use book figures of actual production costs plus an estimate of markup to cover overhead and profit.
- (3) Use fourth quarter value of shipments f.o.b. (freight on board) from the plant (including that value of interplant transfers within a company, in addition to direct costs of production but excluding resales and miscellaneous receipts) plus any additions to the finished stock of inventories during the fourth quarter, minus any shipments from inventories present before the fourth quarter (excluding materials and supplies).

Items 3, 4, and 5

Refer to the specific instructions provided with each item on the report form.

Item 3 and 4 refer to full production capability. Item 5 refers to national emergency production.

Note: For item 3a – percent increase from actual production to full production capability, if actual operations are at full production capability, report 0%. Report item 5a – percent increase from actual production to emergency production as instructed for item 3a.

DEFINITIONS AND ASSUMPTIONS

Full Production Capability – The maximum level of production that this establishment could reasonably expect to attain under normal operating conditions.

In estimating full production capability, consider the following:

- Assume only the machinery and equipment in place and ready to operate will be utilized. **Do not** consider facilities or equipment that would require extensive reconditioning before they can be made operable.
- Assume normal downtime, maintenance, repair, and cleanup.
- Assume number of shifts and hours of plant operations under normal conditions are not higher than that attained by your plant any time during the past 5 years.
- Assume overtime pay, availability of labor, materials, utilities, etc., are not limiting factors.

- Assume a product mix that was typical or representative of your production during the fourth quarter. If your plant is subject to considerable short-run variation assume the product mix of the current period.

- Do not assume increased use of productive facilities outside the plant for services (such as contracting out subassembly work) in excess of the proportion that would be normal during the fourth quarter.

National Emergency Production – The maximum level of production that this establishment could expect to attain and sustain for one year or more under national emergency conditions of multiple work shifts.

National emergency conditions are situations such as a military mobilization or natural disaster which are likely to create widespread excess demand requiring additional work shifts.

In estimating national emergency production consider the following:

- Assume all machinery and equipment in place (include the machinery and equipment that would require extensive reconditioning before they could be made operable) will be utilized.
- Assume minimal downtime and multi-work shift operations.
- Assume the maximum number of shifts and maximum hours of plant operation that can be attained by your plant under emergency condition (e.g., 168 hours of operations per week less plant maintenance downtime.)
- Assume overtime pay, availability of labor, materials, utilities, etc., are not limiting factors.
- Assume a 7-day work week.
- Assume a 24-hour work day.
- Assume your product mix can change.
- Assume increased use of productive facilities outside the plant for services (such as contracting out subassembly work) in excess of the proportion that would be normal during the fourth quarter.

(The emergency production percentage increase should be equal to or greater than item 3a. In many cases, it should be significantly greater.)

For plants in which there is no difference between the level of production at full production capability and at national emergency production, report the same value for items 3a and 5a. In the remarks section of the report indicate why the levels of full production and emergency production are the same (e.g., plant already produces at 168 hours per week.)

If you have any questions concerning the definitions or instructions, please contact the Environment, Technology, and Innovation Branch of the Manufacturing and Construction Division on (301) 457-4659.

Appendix B.

Qualifications of the Data

DEFINITIONS AND CONCEPTS

Although survey respondents were provided detailed instructions for estimating full production capacity and national emergency production capacity (see appendix A), it is extremely difficult to translate the concept of plant capacity into a working definition which is applicable to all industries and situations. A host of problems are inherent in any attempt to measure capacity. Following are some of the more significant:

1. Telephone conversations with respondents have revealed that there are a variety of methods by which plants can measure their capacity. For example, it is customary for petroleum refineries to use an engineering concept of capacity based on maximum throughput during around-the-clock operations, with allowance made for maintenance or other necessary downtime. Other industries use different methods. They might base capacity on the maximum number of work hours of their labor force, on a past peak performance period, or on any number of other methods.

In order to improve the consistency of reporting across industries, the Bureau of the Census made an attempt to prescribe a standardized method for calculating levels of capacity and capacity utilization. Respondents across industries were asked to report production by the plant for actual, full production, and national emergency levels of production, in terms of market value of production, and given specific assumptions to follow in estimating each level of production (see appendix A). The capacity utilization rates estimates produced in this report are calculated as a ratio of actual value of production to full production and national emergency values of production.

2. Full production limitations. Respondents were instructed as follows when estimating full production capacity: "Do not consider overtime pay, availability of labor, materials, utilities, etc., to be limiting factors." However, some respondents appear to be unrealistic in reporting their full production operations. For example, some establishments defined full production capacity as continuous operations (7 days a week, 24 hours a day) even though they were currently operating a single shift and admitted they could not expect realistically to operate continuously with their present plant and equipment or within their industry or locality. Census staff members have discussed the most questionable estimates with respondents and adjusted the

reports were appropriate; however, there is a distinct element of subjectivity, and it is apparent that not all plants have defined full production capacity in realistic terms.

3. National emergency production limitations. Some individual plants do not differentiate between their full production capacity and national emergency capacity, while some do. Therefore, for some individual plants, the levels of capacity and capacity utilization rates calculated for full production and national emergency are the same. For these plants, no measurable difference between full production and national emergency capacity levels or capacity utilization can be obtained.

Census staff members have discussed the most questionable estimates with respondents and adjusted the reports where appropriate; however, there is a distinct element of subjectivity, and it is apparent that not all plants have defined national emergency capacity in realistic terms.

4. Year-to-year variations in reported data. There is considerable year-to-year change in reported capacity and capacity utilization for individual plants. Some of this reflects real change in capacity due to additions or retirements of plant and equipment, change in product mix, or change in productivity. Other changes; however, are the result of response variations which are part of the nonsampling errors described in the following section on sampling and nonsampling errors. These variations, which often result from different personnel completing the form, include different judgmental decisions about work patterns and what plant and equipment to include in estimating capacity. At the summary levels, the individual establishment changes (either up or down) have a tendency to cancel each other.

SAMPLING AND NONSAMPLING ERRORS

The survey estimates are subject to both sampling and nonsampling errors. Nonsampling errors include various response and operational errors; errors of collection, reporting, transcription, and bias due to nonresponse, etc. These errors would also occur if a complete canvass were conducted under the same conditions as this survey. Most of the important operational errors were detected and corrected in the course of the review of the data for reasonableness and consistency.

However, because of the definitional and conceptual problems associated with this survey, it is likely that the response errors are greater in magnitude than for other manufacturing surveys in which respondents are asked to report data that are generally kept as a matter of record. Explicit measures of the nonsampling errors are not available. As derived, the estimated standard errors, which are discussed below, include part of the effect of these non-sampling errors. The total error, though, will exceed the standard errors shown and, for particular estimates, may exceed the standard errors by a considerable amount.

The panel selected for this survey was sampled using probabilities proportionate to size whereby each sampling unit was given an independent chance of selection. The particular sample selected was but one of many similar probability samples that could have resulted using this sampling methodology. Probabilities were assigned so that an expected sample size of approximately 10,000 would result, but the independent feature of the sample design does not preclude samples being drawn of a size other than 10,000. Each of the possible samples would yield somewhat different sets of results. The sampling errors—the differences between the estimates obtained from the sample actually selected and the results theoretically obtainable from a comparable complete canvass of the same target universe—are unknown. However, the estimated standard error of the level of the utilization rate and the estimated standard error for the year-to-year change are guides to the potential size of the sampling error.

The estimated standard error of a utilization rate, or of a year-to-year change in a utilization rate, may be used to define a confidence interval about that rate or change such that the complete coverage result will be included within that interval with known probability. As examples:

1. The interval defined by one standard error below the estimate of level or change to one standard error above contains the complete coverage results with approximately 67-percent confidence.
2. The interval defined by two standard errors below and above the estimate of level or change contains the complete coverage result with approximately 95-percent confidence.
3. The interval defined by three standard errors below and above the estimate of level or change contains the complete coverage result with approximately 99-percent confidence.

Thus, an inference that the complete coverage result lies within the indicated intervals would, with the prescribed confidences, be correct. For example, if an estimated utilization rate is shown as 80 percent, with an associated standard error of 3 percent, there is approximately 67-percent confidence that the interval 77 percent to 83 percent includes the complete coverage rate, about 95-percent confidence that the interval 74 percent to 86 percent would include the complete coverage rate, and approximately 99-percent confidence that the interval 71 percent to 89 percent would include the complete coverage rate.

Note that the estimates of the standard errors are derived from the sample and are also subject to sampling error.

Appendix C.

Description of Survey Sample and Estimating Procedure

SURVEY SAMPLE

The estimates presented in this report are derived from a probability sample which initially contained approximately 10,000 manufacturing establishments. The sample was selected from the 1992 Census of Manufactures augmented with birth establishments that were formed subsequent to 1992. The use of the census as the basic frame represented a departure from previous sample selection operations which used the most recently selected Annual Survey of Manufactures (ASM) as the sampling frame. The annual survey was itself sampled from the census of manufacturers.

The 1992 Census of Manufactures universe contained about 370,000 establishments. Approximately 237,000 records were mailed a census form while the remainder were imputed based on administrative data obtained from Internal Revenue Service and/or Social Security Administration records. These small administrative record cases were not part of the sampling frame for the Survey of Plant Capacity Utilization. This is consistent with past sampling operations in which the ASM mail sample—selected from the mailed census universe—served as the prime survey frame. All major manufacturing industry groups are represented in the survey. After updating operations, about 9,800 of the approximately 10,000 sample cases were mailed. About 8,800 plants, or 88 percent, responded with usable data.

For the sampling operation, probabilities of selection were assigned proportionate to census of manufactures' total value of shipments. Actual probabilities were based upon predetermined reliability constraints established by industry. Each industry was classified in 1 of 4 priority categories. One category consisted of industries identified by the Department of Defense as important while the other categories were based upon analysis performed by the Bureau of the Census and resulted in high, medium, and low priorities being established. The constraints assigned these categories were subject to the overall limitation of the sample size to about 10,000 establishments. When selected, an establishment's sample weight is the inverse of its probability of selection. Probabilities were adjusted prior to sampling if its inverse exceeded 180.

ESTIMATING PROCEDURE

The estimated full production rates shown in this report for the four-digit SIC industries in table 1 were computed in the following manner:

$$R_j = \frac{\sum_i W_{Tij} VPA_{ij}}{\sum_i W_{Tij} VPF_{ij}}$$

where R_j is the utilization rate for the j th four-digit SIC industry, WT_{ij} is the sampling weight for establishment i in four-digit industry j ; VPA_{ij} is the actual value of production for establishment i in four-digit industry j ; VPF_{ij} is the value of production at the full production level; and the summations are for those establishments reporting value of production at both actual and full production level. (National emergency production rates are computed similarly, by substituting national emergency production (VPE) for VPF in the above formula.) This method does not require the estimation of data for individual nonrespondents. The process assumes that utilization rates for nonrespondents are the same as the average rates for respondents.

The estimated rates for the level of utilization shown in this report for the three- and two-digit SIC industries were computed in the following manner:

$$R_{(K)} = \frac{\sum_j VA_j}{\sum_j \left(\frac{VA_j}{R_j} \right)}$$

where $R_{(K)}$ is the utilization for the K th industry group (K can be three- or two-digit SIC or U.S. total); VA_j is the value added for the j th four-digit industry as published in the most recent ASM or census of manufactures; and VA_j/R_j is the value added for the j th four-digit industry adjusted to full production or national emergency production levels of operation.

Value added is defined as the difference between sales values and the cost of merchandise sold without further manufacture, processing, or assembly.

Value added is used when aggregating three- and two-digit SIC industry measures to avoid duplication in figures of production that result when products of some establishments are also input materials for other establishments.

Most users of industrial data consider value added to be the best value measure available for comparing the relative economic importance of manufacturing among industries and geographic areas. Therefore, using value added in the methodology to derive utilization rate measures should provide better estimates.

Estimates of the variances of the estimates for utilization rates of four-digit SIC industries were computed as:

$$\sigma^2(R_j) = \sigma^2(A_j/B_j) = \frac{1}{B_j^2} [\sigma^2(A_j) + R_j^2 \sigma^2(B_j) - 2R_j \sigma(A_j B_j)]$$

where $A_j = i (WT_{ij}) (VPA_{ij})$

$B_j = (WT_{ij}) (VPF_{ij})$

$$\sigma^2(A_j) = \text{Variance of } A_j = \sum_j (WT_{ij}) (WT_{ij} - 1) (VPA_{ij})^2$$

$$\sigma^2(B_j) = \text{Variance of } B_j = \sum_j (WT_{ij}) (WT_{ij} - 1) (VPF_{ij})^2$$

$$\sigma(A_j B_j) = \text{Covariance of } A_j \text{ and } B_j = \sum_j (WT_{ij}) (WT_{ij} - 1) (VPA_{ij}) (VPF_{ij})$$

Estimates of variances of higher level aggregates $R_{(K)}$ were computed as follows:

$$\begin{aligned} \sigma^2(R_{(K)}) &= \frac{1}{\left[\sum_j \left(\frac{VA_j}{R_j} \right) \right]^2} \left[\sum_j \sigma^2(VA_j) + R_{(K)}^2 \left[\sum_j \left(\frac{VA_j^2}{R_j^4} \right) (\sigma^2(R_j)) \right] \right. \\ &\quad \left. - 2R_{(K)} \sum_j \left(\frac{1}{R_j} \sigma^2(VA_j) \right) \right] \end{aligned}$$

where $\sigma^2(VA_j)$ is the ASM estimate of variance for value added in industry j , and where the summations range over the set of four-digit industries comprising the higher level industry group K . When census year value added data are utilized, then the variance terms $\sigma^2(VA_j)$ reduce to zero.

Estimates of the year-to-year change in the utilization rates at all SIC levels is the difference between the 2 yearly rates. We have not directly calculated estimates of the variances of the year-to-year change. For this publication, we assumed no correlation between the yearly rates. This assumption almost certainly results in an overstatement of the actual variances of change. Estimates of the variances of the year-to year change between 1994 and 1993 were computed as:

$$\sigma^{94-93} = \sqrt{\sigma^2 94 + \sigma^2 93}$$
