ACKNOWLEDGMENTS

This report was prepared under the direction of **Kimberly P. Moore**, Assistant Chief for Special Studies and M3 Programs, Manufacturing and Construction Division. Within the Manufacturing and Construction Division, the preparation of this report was performed under the supervision of **Julius Smith Jr.**, Chief, Special Studies Branch, and **Dave Gromos**.

Review and analysis of the MQ-C1, Survey of Plant Capacity data were performed by **Maryellen Johnson**.

The sampling and estimation methodologies of the Survey of Plant Capacity were developed under the direction of **Paul L. Hsen**, Assistant Chief for Research and Methodology, Manufacturing and Construction Division. **Stacey Cole**, Chief of the Manufacturing Programs Methodology Branch, supervised the implementation of the methodologies. The sample design, estimation, and quality measures were developed by **Daniel Tulp Jr.**

The publication process was coordinated by **Arlinda Allen, Enid Winters, Harriet Lee,** and **Paula Capoen** under the supervision of **Nishea Quash**, Chief of the Census & Related Programs Support Branch.

The computer programs used to collect, tabulate, and impute the Survey of Plant Capacity data were developed under the direction of **Deborah Tasky**, Assistant Chief for Annual Surveys and Related Programs, Economic Statistical Methods and Programming Division. The programs were developed by **Steven Potemkin, Nestor Baez,** and **Diane Musachio** under the supervision of **Edward Bates**, Chief, Manufacturing and Company Statistics Annuals Branch.

Jamie Peters and **Crystal Wade** of the Administrative and Customer Services Division, **Walter C. Odom**, Chief, provided publications and printing management, graphics design and composition, and editorial review for print and electronic media. General direction and production management were provided by **James R. Clark**, Assistant Chief, and **Wanda Cevis**, Chief, Publications Services Branch.

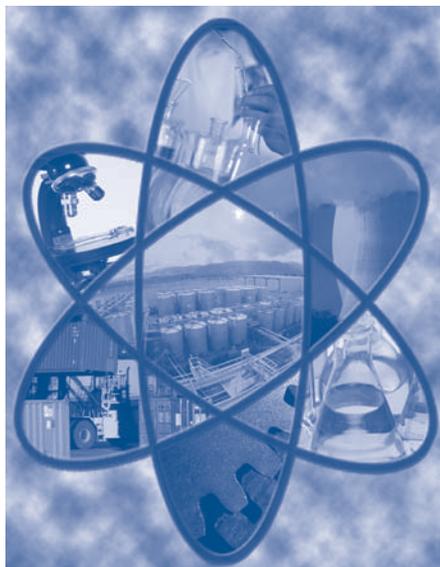

A special acknowledgment is due to the many businesses whose cooperation was essential to the success of this report.

Introduction

SUMMARY OF 2005 SURVEY RESULTS

U.S. domestic manufacturing plants used an estimated 71 percent (± 1 percent) of their full production capacity for the fourth quarter of 2005 and 70 percent (± 1 percent) for the fourth quarter of 2004. The durable goods industries fourth quarter 2005 rate of 70 percent (± 1 percent) was similar to the rate of 71 percent (± 1 percent) observed for the nondurable goods industries. Durable goods industries are manufacturing industries in which products have a normal life expectancy of 3 years or more. North American Industry Classification System (NAICS) subsectors 321, 327, 331, 332, 333, 334, 335, 336, 337, and 339 are considered durable goods industries. Nondurable goods industries are manufacturing industries in which products generally have a life expectancy of less than 3 years. NAICS subsectors 311, 312, 313, 314, 315, 316, 322, 323, 324, 325, and 326 are nondurable goods industries.

The advanced processing industries fourth quarter rate of 70 percent (± 1 percent) was slightly lower than the rate of 73 percent (± 1 percent) estimated for primary processing industries. Primary processing industries are industries in which products are generally the first processed output of raw materials in the manufacturing process. NAICS subsectors 313, 314, 321, 322, 324, 326, 327, and 331 are classified as the primary processing industries. Advanced processing industries are industries in which products are considered finished manufactured items. NAICS subsectors 311, 312, 315, 316, 323, 333, 334, 335, 336, 337, and 339 are advanced processing industries.

Among the manufacturing subsectors with the lowest utilization rates of their full production capacity in the fourth quarter of 2005 were leather and allied product manufacturing (NAICS 316) at 65 percent and machinery manufacturing (NAICS 333) at 67 percent. Among the manufacturing subsectors with the highest utilization rates for 2005 were primary metal manufacturing (NAICS 331) at 79 percent and petroleum and coal products manufacturing (NAICS 324) at 76 percent. Full production capacity is broadly defined as the maximum level of production an establishment could attain under normal operating conditions. In this report, the full production utilization rate is a ratio of the actual level of operations to the full production level.

Manufacturing subsectors with the lowest utilization rates of their national emergency production capacity in the fourth quarter of 2005 were leather and allied product manufacturing (NAICS 316) and furniture and related product manufacturing (NAICS 337), both at 42 percent and miscellaneous manufacturing (NAICS 339) at 43 percent. Among the manufacturing subsectors with the highest utilization rates of 2005 were petroleum and coal products manufacturing (NAICS 324) at 73 percent and primary metal manufacturing (NAICS 331), at 69 percent. National emergency production is broadly defined as the greatest level of production an establishment can expect to sustain for 1 year or more under national emergency conditions. The national emergency production utilization rate is a ratio of the actual level of operations to the national emergency production level.

Table 1a summarizes full production utilization rates and Table 1b summarizes emergency production utilization rates, at three-, four-, five-, and six-digit NAICS industry levels, for fourth quarters 2001 through 2005. Table 2 shows both full and emergency production utilization rates and standard errors for fourth quarters 2004 and 2005, and the standard error of the change in utilization rates from 2004 to 2005 at the three-, four-, five-, and six-digit NAICS industry levels. Estimates are subject to sampling variability and nonsampling error. The range at which estimates are tested in this report is at the 90-percent confidence level. Appendix A contains reproductions of the survey form and instructions; Appendix B describes the qualifications of the data; and Appendix C contains a description of the survey sample and estimating procedure.

INDUSTRIAL CLASSIFICATION

The industrial classification definitions are based on the 2002 edition of the North American Industry Classification System (NAICS) manual published by the Office of Management and Budget.

SURVEY DESCRIPTION

Data are obtained from manufacturing establishments by means of a mailed questionnaire. Respondents are asked to report their actual production, full production, and national emergency production levels of operation for the fourth quarter of the year in terms of value of production. From these reported dollar values, utilization rates for full production and national emergency production are derived. Year-to-year changes in these rates are affected by changes in the estimated capacity of industrial plants due to factors such as capital expenditures, capital retirements, changes in the workforce, changes in prices, changes in product mix, and changes in respondents' estimates of productivity.

Final estimates are based on information collected from a sample of approximately 17,000 manufacturing and publishing establishments. Estimates in this release are based on response from approximately 80 percent of the survey panel.

ABBREVIATIONS AND SYMBOLS

The following abbreviations and symbols appear frequently in the tables:

- Represents zero.
- (D) Withheld to avoid disclosing data for individual companies.
- (NA) Not available.
- NAICS North American Industry Classification System.
- ^a Data cells with a level of imputation exceeding 50 percent.

MQ-C1 Report Form and Instructions

The MQ-C1 form and instructions are shown on the following pages.

FORM **MQ-C1**
(11-17-2005)

U.S. DEPARTMENT OF COMMERCE
Economics and Statistics Administration
U.S. CENSUS BUREAU

SURVEY OF PLANT CAPACITY UTILIZATION FOURTH QUARTER 2005 (October–December)

NOTICE – YOUR RESPONSE IS REQUIRED BY LAW (Title 13, United States Code). By section 9 of the same law, **YOUR REPORT IS CONFIDENTIAL.** It may be seen only by persons sworn to uphold the confidentiality of Census Bureau information and may be used only for statistical purposes. The law also provides that copies retained in your files are immune from legal process.

In correspondence pertaining to this report refer to the ID NUMBER (ID) (11 digits)

IMPORTANT

PLEASE READ INSTRUCTIONS AND DEFINITIONS BEFORE COMPLETING FORM

Please correct errors in name, address, and ZIP Code. ENTER street and number if not shown.

NOTE — If you need a copy of the instructions, please visit www.census.gov/cir/www/mqc1pag2.html

Item 1 OPERATIONAL STATUS

Mark (X) ONE box which best describes this establishment at the end of 2005. See instructions for reporting.

- | | |
|---|--|
| <p>12 <input type="checkbox"/> In operation – Complete items 2 through 6.</p> <p>13 <input type="checkbox"/> Temporarily idle – See instruction sheet – Complete items 2–6.</p> | <p>14 <input type="checkbox"/> Sold or leased to another company
See instruction sheet</p> <p>15 <input type="checkbox"/> Permanently ceased operations –
See instruction sheet.</p> |
|---|--|

} Give date sold or closed	16	Month	Year

Item 2 VALUE OF PRODUCTION

ACTUAL PRODUCTION

		4th QTR. 2005		4th QTR. 2004	
		Mil.	Thou.	Mil.	Thou.
a.	Report market value of actual production for the 4th quarter of 2005	23			

FULL PRODUCTION CAPABILITY

		4th QTR. 2005		4th QTR. 2004	
		Mil.	Thou.	Mil.	Thou.
b.	Estimate the market value of production of this plant as if it had been operating at full production capability in the 4th quarter of 2005. Assume:	34			

- only machinery and equipment **in place and ready to operate.**
- normal downtime.
- Labor, materials, utilities, etc. **ARE FULLY AVAILABLE.**
- the number of shifts, hours of operation, and overtime pay that can be **sustained** under **normal** conditions and a **realistic** work schedule in the long run.
- the **same product mix** as in the fourth quarter.

c. Divide your **actual production estimate** by your **full production estimate.** Multiply this ratio by 100 to get a percentage. Enter this percentage in the box.

Capacity Utilization:

Is this a reasonable estimate of your sustainable capacity use in the 4th quarter?

Yes No – Please review your full production estimate

d. If your estimate of 2005 fourth quarter **full production capability** has changed compared to 2004, mark (X) the primary reasons.

- | | |

|--|--|

Item 3 WORK PATTERNS OF FOURTH QUARTER OPERATIONS 2005

Column (1-3) – Report work patterns for **each shift of actual operations** in the **4th quarter of 2005**.
 If the plant did not operate a second or third shift, do not complete the corresponding columns.
 Column (4) – Report work patterns as if the plant operated at **full production capability** as defined in item 2b.

	Actual Operations									Full Production Capability			
	Shift one			Shift two			Shift three			Number of shifts per day			
	(1)	(2)	(3)							(4)			
90													
a. Days per week in operation	91												
b. Plant hours per week in operation	92												
c. Weeks in operation in the quarter	93												
d. Total number of production workers	94												
e. Temporary production workers included in line d (not on the payroll and hired through temporary agencies or as their own agent; see instructions)	95												
		Mil.	Thou.	Hrs.	Mil.	Thou.	Hrs.	Mil.	Thou.	Hrs.	Mil.	Thou.	Hrs.
f. Total hours worked by production workers	96												
g. Hours worked by temporary production workers (included in line f)	97												
h. Overtime hours worked by production workers (included in line f)	98												

Item 4 FOURTH QUARTER ACTUAL OPERATIONS VS FULL PRODUCTION CAPABILITY FOR 2005

- a. If this plant's **actual** production in the 4th quarter was **less** than **full production capability**, mark (X) the primary reasons:
- | | | |
|--|--|--|
| 51 <input type="checkbox"/> Not most profitable to operate at full production capability | 55 <input type="checkbox"/> Lack of sufficient fuel or electric energy | 60 <input type="checkbox"/> Strike or work stoppage |
| 52 <input type="checkbox"/> Insufficient supply of materials | 56 <input type="checkbox"/> Equipment limitations | 61 <input type="checkbox"/> Seasonal operations |
| 53 <input type="checkbox"/> Insufficient orders | 57 <input type="checkbox"/> Storage limitations | 62 <input type="checkbox"/> Environmental restrictions |
| 54 <input type="checkbox"/> Insufficient supply of local labor force/skills | 58 <input type="checkbox"/> Logistics/transportation constraints | 68 <input type="checkbox"/> Other – <i>Specify</i> ↘ |
| | 59 <input type="checkbox"/> Sufficient inventory of finished goods on hand | 69 <input type="text"/> |
- b. If **actual** operations in the 4th quarter were **less** than **full production capability**, how quickly could you increase to that level, if necessary? Assume sufficient demand for your product. Mark (X) the shortest amount of time you would require.
- 71 Less than 3 months 72 3 to 6 months 73 7 to 12 months 74 More than one year

Item 5 NATIONAL EMERGENCY PRODUCTION

NATIONAL EMERGENCY PRODUCTION

	4th QTR. 2005		4th QTR. 2004	
	Mil.	Thou.	Mil.	Thou.
a. Estimate the value of production for this plant as if it had been operating under national emergency conditions in the 4th quarter of 2005.				
99				

Assume:

- **full** use of **all** your machinery and equipment, including that requiring reconditioning.
- **plant production as close to 168 hours per week as possible**, including extra shifts.
- **minimal** downtime.
- **funding, labor, materials, components, utilities, etc., are fully available to you and your suppliers.**
- your product mix **is** permitted to change.
- you can sell **all** of your output

See the instruction sheet for additional guidance.

- b. If **actual** operations in the 4th quarter were **less** than **national emergency production**, how quickly could you increase to the national emergency production level if given emergency priority by the government? Mark (X) the shortest amount of time you would require.
- 82 Less than 3 months 83 3 to 6 months 84 7 to 12 months 85 More than one year

 JEFFERSONVILLE, IN 47132-0001**

FORM MQ-C1 (11-17-2005)

**INSTRUCTIONS FOR
THE SURVEY OF PLANT CAPACITY UTILIZATION
DURING THE FOURTH QUARTER 2005**

	Page
General Instructions	2
Item by Item Instructions	2
Item 1 – Operational Status	2
Item 2 – Value of Production	3
Item 3 – Work Patterns of Fourth Quarter Operations	4
Item 4 – Fourth Quarter Actual Operations vs. Full Production Capability	5
Item 5 – National Emergency Production	5
Examples	6

AUTHORITY AND CONFIDENTIALITY – Your response is required by law (Title 13, United States Code). By section 9 of the same law, your report is confidential. It may be seen only by persons sworn to uphold the confidentiality of Census Bureau information, and may be used only for statistical purposes. The law also provides that copies of your report retained in your files are immune from legal process. Response is not required to any information collection form unless it displays a valid approval number from the Office of Management and Budget. This 8-digit number appears in the upper right corner of the form.

PUBLIC REPORTING

Public reporting burden for this collection of information is estimated to average 2.25 hours per response, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to: Paperwork Project 0607-0175, U.S. Census Bureau, 4700 Silver Hill Road, Stop 1500, Washington, DC 20233-1500. You may e-mail comments to Paperwork@census.gov; use "Paperwork Project 0607-0175" as the subject.

WHO SHOULD REPORT?

This report covers the manufacturing plant or printing facility named in the address box of the form. If your company operates more than one location, **REPORT ONLY FOR THOSE PLANTS SELECTED FOR THIS SAMPLE SURVEY**. A report form and instruction sheet are enclosed for each plant selected.

Since some of the information necessary to complete this form may not be in your records, **CONSULT THE PLANT MANAGER** on questions regarding full production capability and emergency production.

WHAT TO REPORT?

This survey form primarily asks for 3 levels of operating capability of this plant in the fourth quarter of 2005:

- (1)** the market value of actual goods produced;
- (2)** the value of products that could have been produced if the plant was operating at full capacity in the fourth quarter; and
- (3)** the value of products that could have been produced if required in a national emergency.

If 2004 data are NOT printed on the form, you do not need to enter data for that period.

WHEN TO REPORT

Complete the survey form and return it in the enclosed return envelope by the date printed on the top of the form. If you have misplaced the return envelope, mail the completed form to:

U.S. Census Bureau
1201 East 10th Street
Jeffersonville, IN 47132-0001

HOW TO REPORT

Answer all questions on the report form. Follow the instructions for each item given on this sheet.

Report market value of production figures in **thousands of dollars**. For example, if value of production is 1,125,788 dollars, enter the figure as follows:

Mil.	Thou.
1	126

NAME AND ADDRESS

Review the name and address of this plant printed in the top right corner of the report form. Line out any errors and make any necessary corrections or additions in the address box.

Item 1 – OPERATIONAL STATUS

Report the status of operations at this plant at the end of 2005 by marking the appropriate box. If:

In Operation – Complete items 2 through 6.

Idle Plants – Complete items 2 through 6.

- a.** If this plant was temporarily idle during the **entire fourth quarter** report actual operations as zero where appropriate.
- b.** If this plant was temporarily idle during **only part of the fourth quarter** report the actual operations for the time the plant was in operation.

Item 1 – OPERATIONAL STATUS – Continued

For both cases, report full production and emergency production capabilities based on the plant's **peak** quarterly production during 2005.

Sold or Leased Plant – If this plant was sold or leased to another company, indicate the month and year this action took place.

- a. If you still maintain records for this plant, complete items 2 through 6.
- b. If you do not have 4th quarter information about this plant, complete item 6 only and return the form.

Permanently Ceased Operations – Indicate the month and year when operations ceased at this plant. If the plant was in operation at ANY time during the fourth quarter of 2005, complete items 2 through 6. Report full production and emergency production capabilities, as if the plant operated the **entire** quarter.

SPECIAL NOTE:

Seasonal Operations

- a. If this plant is usually temporarily idle during the fourth quarter *due to seasonal factors*, report as instructed for idle plants.
- b. If this plant was not temporarily idle during the fourth quarter, but its operations vary substantially from quarter to quarter, *due to seasonal factors*, complete items 2 through 6, and report full production and national emergency production capabilities based on the plant's **peak** quarterly production during the year.

For both types of seasonal operations, check "Seasonal Operations" in item 4a if actual operations are less than full production capability.

Item 2 – VALUE OF PRODUCTION

Item 2a – MARKET VALUE OF PRODUCTION

Report the value of production based on estimated sales price(s) of what was produced during the fourth quarter, not fourth quarter sales. If production at this plant consists of only interplant transfers, use method (2) below to calculate market value of production.

Three methods – to estimate market value of goods produced during the fourth quarter:

- (1) Estimate the sales price(s) of item(s) produced, then multiply the sales price(s) by the total number of items produced during the fourth quarter.
- (2) Use book figures of actual production costs plus an estimate of markup to cover overhead and profit.

- (3) Use fourth quarter value of shipments f.o.b. (freight on board) from the plant (including the value of interplant transfers within a company, in addition to direct costs of production, but excluding resales and miscellaneous receipts) plus any additions or subtractions to the finished stock of inventories present before the fourth quarter (excluding materials and supplies). [Value of production = value of shipments + value of ending inventory – value of beginning inventory].

SPECIAL NOTE:

Do **not** include manufacturing contracted to others. If you contract out all of your manufacturing, please state this in the "Remarks" section, complete item 6, and return the form.

Job shops and custom orders: For actual production, report value of work done in the fourth quarter of 2005.

Publishing/printing plants: For actual production, report your printing sales only (NOT advertising sales) for the location named in the address box of the form. Do not include any printing that is contracted out. **If you do not perform any printing activities, please indicate so in the remarks section on the back of the form.**

Item 2b – FULL PRODUCTION CAPABILITY

Read the definition and assumptions regarding full production capability. Estimate your market value of products that would have been produced if the plant was operating at full capacity in the fourth quarter. Use one of the two methods suggested below or your own computations.

Full Production Capability – The maximum level of production that this establishment could reasonably expect to attain under **normal** and **realistic** operating conditions fully utilizing the machinery and equipment in place. In estimating market value at full production capability, consider the following:

- Assume **only** the machinery and equipment in place and ready to operate will be utilized. Do not include facilities or equipment that would require extensive reconditioning before they can be made operable.
- Assume **normal** downtime, maintenance, repair, and cleanup. If full production requires additional shifts or hours of operation, then appropriate downtime should be considered in the estimate.
- Assume number of shifts, hours of plant operations, and overtime pay that can be sustained under **normal** conditions and a **realistic** work schedule.
- Assume labor, materials, utilities, etc. are fully available.
- Assume a product mix that was **typical** or representative of your production during the fourth quarter. If your plant is subject to short-run variation assume the product mix of the current period.

Item 2b – FULL PRODUCTION CAPABILITY – Continued

- Do not assume increased use of productive facilities outside the plant for services (such as contracting out subassembly work) in excess of the proportion that would be normal during the fourth quarter.

SPECIAL NOTE:

Job shops and custom orders: For full production, estimate the market value of work that you could have accomplished under sustainable operating conditions and if you had sufficient orders.

Publishing/printing plants: For full production, report printing sales for this location as if it were running at peak circulation.

Two Methods to estimate market value of production when operating at full production capability:

- (1) If you have a reliable or accurate estimate of your plant's sustainable capacity utilization rate: **Divide** your market value of production at **actual** operations (item 2c) by your current **rate of capacity** utilization (in decimal form). For example, if your value of actual operations for the fourth quarter is \$1,200,000 and your plant is currently at 80% capacity, divide \$1,200,000 by 0.80 for a full production capability of \$1,500,000.

$$\frac{\text{Actual Value of Production}}{\text{Capacity Utilization Rate}} = \text{Market value of production at Full Capacity}$$

Your plant's capacity utilization rate should be based on a capacity output measure that your plant could have sustained under **normal**, not emergency, conditions.

- (2) For each product, estimate the number of items that could have been produced if operating at full production, as defined by the assumptions given. Multiply the number of items produced by its sales price (or market value). For example, if you can produce 25,000 items in the fourth quarter, under full production criteria, and the sales price (market value) for each item is \$4.50, then multiply 25,000 times \$4.50 for a full production capability of \$112,500.

$$\text{Number of items produced} \times \text{Sales price (Market Value)} = \text{Market value of production at Full Capacity}$$

If producing **more than one product**, **sum** the market values of production at full production estimated for each product (assuming the same product mix) for a **total** value of full production for the plant.

Enter your estimate for value of full production in item 2b.

Item 2c – CAPACITY UTILIZATION

- (1) Divide your estimate for actual production (Item 2a) by full production (Item 2b) capability. Multiply this number by 100. Enter this percentage in the box.
- (2) **Is this a reasonable percentage of your sustainable capacity use in the 4th quarter of 2005?** Mark (X) yes or no. If no, please review your full production capability estimate. If yes, continue with the next item.

Item 2d – Comparing full production capability between fourth quarters of 2004 and 2005

If the value of full production for the fourth quarter of 2005 differs from 2004, mark (X) the primary reasons for the change.

Item 3 – WORK PATTERNS OF FOURTH QUARTER OPERATIONS

Actual Operations – In columns 1 through 3, report work patterns for the following characteristics covering each *production shift* of actual operations in the 4th quarter of 2004. Report based on the average number of shifts per day in the fourth quarter. Do not consider maintenance, administrative, or support operations as additional shifts. Do not consider overtime hours as additional shifts. If the plant did not operate a second or third shift, do not complete the corresponding columns.

a. Days per week in operation – For each shift, report the typical number of days per week in operation for the fourth quarter. If your plant has departments or assembly lines that operate varied number of days *within a shift*, report days per week in operation for the department operating the greatest number of days per week for that shift. For example, if one production line operates 7 days per week during the first shift and a second production line operates 5 days per week during the first shift, report that the first shift operates 7 days per week.

b. Plant hours per week – For each shift, report the typical number of **hours the plant was in production** during a single week. If your plant has departments or assembly lines that operate at varied periods of time *within a shift*, report hours per week in operation for the production department operating the greatest number of hours per week for that shift. **Do not report the number of person hours worked (see below).**

c. Weeks in operation in the quarter – For each shift, report the total number of weeks the plant operated during the fourth quarter. NOTE: The fourth quarter of the year covers 13 weeks.

d. Total number of production workers – For each shift, report the total number of production workers at this establishment, including both permanent (payroll) and temporary employees who were paid during the pay period which included November 12. Include all persons on paid sick leave, paid holidays, paid vacation during this pay period.

NOTE: **Include** workers (up through the line-supervisor level) engaged in fabricating, processing, assembling, inspecting, receiving, packing, warehousing, shipping (but not delivering), maintenance, repair, janitorial, guard services, product development, auxiliary production for plant's own use (e.g., power plant), record keeping, and other closely associated services. Include truck drivers delivering ready-mixed concrete.

Item 3 – WORK PATTERNS OF FOURTH QUARTER OPERATIONS – Continued

Exclude nonproduction personnel, including those engaged in supervision above line-supervisor level, sales, sales delivery (truck drivers and helpers), advertising, credit, collection, installation and servicing of own product, clerical and routine office functions, executive, purchasing, finance, legal, personnel (including cafeteria, etc.), professional and technical.

- e. Number of temporary production workers –** For each shift, report the number of *temporary production workers* **not** on the payroll (hired through temporary help agencies or as their own agent) and working during the pay period including November 12. Include temporary production workers who perform the same tasks as listed above. **Do not include part-time workers.**
- f. Total hours worked by production workers –** For each shift, report number of hours worked by all production workers in the fourth quarters (both those on the payroll and temporary production workers). Include overtime hours, but excluded paid vacations, holidays, and sick leave.
- g. Hours worked by temporary production workers –** For each shift, report number of hours worked by temporary production workers included in the total hours worked by production workers (line f). Include overtime hours worked by temporary production workers.
- h. Overtime hours worked by production workers –** For each shift, report number of overtime hours included in the total hours worked by production workers (line f).

Full production capability – In column 4, report work patterns for each characteristic as if the plant operated at full production capability in the 4th quarter of 2005. Use the criteria defined for Full Production Capability in item 2b.

Enter the number of shifts per day at full capacity in the box provided in the upper right hand corner. **See examples of responses to item 3 on page 6.**

Item 4 – FOURTH QUARTER ACTUAL OPERATIONS VS. FULL PRODUCTION CAPABILITY

Compare the actual value of production in the fourth quarter of 2005 to the estimated value of full production.

Item 4a – Mark (X) reasons why your actual operations were less than the estimated value of full production capability, if appropriate.

Item 4b – Select a time period that would have been reasonable to increase output to full production level.

Item 5 – NATIONAL EMERGENCY PRODUCTION

Read the definition and assumptions regarding national emergency production. Estimate your value of production under national emergency conditions for the fourth quarter of 2005. Use your own computations or methods similar to those described for estimating full production capability.

SPECIAL NOTE: Your value of production at national emergency levels should be **greater than or equal to** your value of full production capability. If it is less than your full production capability, please review your computations.

National Emergency Production – The maximum level of production that this plant could expect to attain and sustain for one year or more under national emergency conditions.

National emergency conditions are situations, such as a military mobilization or natural disaster, which are likely to create widespread excess demand requiring additional work shifts.

For example, military mobilization may require increased production of food, clothing, building supplies, and conversion of plants to produce alternative products in addition to traditional defense hardware. Devastation from natural disasters, such as hurricanes, floods, earthquakes, or fire, may require increased production of similar goods as well as increased production to compensate for plants damaged or destroyed.

In estimating national emergency production, consider the following:

- Assume full use of **all** machinery and equipment in place (including machinery and equipment that would require extensive reconditioning before they could be made operable).
- Assume minimal downtime and **multi-work shift** operations.
- Assume plant production as close to 168 hours per week as possible, including extra shifts (e.g., operating 7 days per week, 24 hours per day less minimal downtime).
- Assume overtime pay, availability of labor, materials, utilities, etc., are **fully available** to you and your suppliers.
- Assume you can sell all your output.
- Assume your product mix can change.
- Assume increased use of productive facilities outside the plant for services (such as contracting out subassembly work) in excess of the proportion that would be normal during the fourth quarter.

SPECIAL NOTE

Jobs shops and custom orders: For national emergency production, estimate the market value of work that could have been done if you received additional orders assuming maximum number of employees working multiple shifts that the facility can accommodate.

Publishing/printing plants: For national emergency production, report value of printing if operating machinery as close to 168 hours/week as possible.

Item 5b – Select a time period that would have been reasonable to increase output to emergency production level, if required.

If you have any questions concerning the definitions or instructions, please contact the Special Studies Branch of the Manufacturing and Construction Division on (301) 763-4667.

Example 1. A plant with one 8-hour shift operating 5 days/week

- a. Days per week in operation.
- b. Plant hours per week in operation
- c. Weeks in operation in the quarter
- d. **Total number of production workers**
- e. **Temporary** production workers **included** in line d (not on the payroll and hired through temporary agencies or as their own agent; see instructions).
- f. **Total hours worked by production workers**
- g. Hours worked by temporary production workers (**included** in line f)
- h. Overtime hours worked by production workers (**included** in line f)

Actual Operations									Full Production Capability		
Shift one (1)			Shift two (2)			Shift three (3)			Number of shifts (4)		
5									7		
40									56		
13									13		
32									44		
2									4		
Mil.	Thou.	Hrs.	Mil.	Thou.	Hrs.	Mil.	Thou.	Hrs.	Mil.	Thou.	Hrs.
	15	880								17	680
		240									600
		0									0

Example 2. A plant with Two Production Shifts and One Maintenance Shift

- a. Days per week in operation.
- b. Plant hours per week in operation
- c. Weeks in operation in the quarter
- d. **Total number of production workers**
- e. **Temporary** production workers **included** in line d (not on the payroll and hired through temporary agencies or as their own agent; see instructions).
- f. **Total hours worked by production workers**
- g. Hours worked by temporary production workers (**included** in line f)
- h. Overtime hours worked by production workers (**included** in line f)

Actual Operations									Full Production Capability		
Shift one (1)			Shift two (2)			Shift three (3)			Number of shifts (4)		
7			5						7		
56			40						112		
13			13						13		
110			50						210		
10			0						0		
Mil.	Thou.	Hrs.	Mil.	Thou.	Hrs.	Mil.	Thou.	Hrs.	Mil.	Thou.	Hrs.
	53	200		24	800					117	000
	1	200			0						0
		0			0						0

Example 3. A plant in Continuous Operation

- a. Days per week in operation.
- b. Plant hours per week in operation
- c. Weeks in operation in the quarter
- d. **Total number of production workers**
- e. **Temporary** production workers **included** in line d (not on the payroll and hired through temporary agencies or as their own agent; see instructions).
- f. **Total hours worked by production workers**
- g. Hours worked by temporary production workers (**included** in line f)
- h. Overtime hours worked by production workers (**included** in line f)

Actual Operations									Full Production Capability		
Shift one (1)			Shift two (2)			Shift three (3)			Number of shifts (4)		
7			7			7			7		
56			56			56			168

	168	480		168	480		104	000		505	440
		0			0			0			0
		200			200			0			0

Appendix B.

Qualifications of the Data

DEFINITIONS AND CONCEPTS

Although survey respondents were provided detailed instructions for estimating full production capacity and national emergency production capacity (see Appendix A), it is extremely difficult to translate the concept of plant capacity into a working definition which is applicable to all industries and situations. A host of problems are inherent in any attempt to measure capacity. Following are some of the more significant:

1. Telephone conversations with respondents have revealed that there are a variety of methods by which plants can measure their capacity. For example, it is customary for petroleum refineries to use an engineering concept of capacity based on maximum throughput during around-the-clock operations, with allowance made for maintenance or other necessary downtime. Other industries use different methods. They might base capacity on the maximum number of work hours of their labor force, on a past peak performance period, or on any number of other methods.

In order to improve the consistency of reporting across industries, the U.S. Census Bureau made an attempt to prescribe a standardized method for calculating levels of capacity and capacity utilization. Respondents across industries were asked to report production by the plant for actual, full production, and national emergency levels of production, in terms of market value of production, and given specific assumptions to follow in estimating each level of production (see Appendix A). The capacity utilization rates estimates produced in this report are calculated as a ratio of actual value of production to full production and national emergency values of production.

2. Full production limitations. Respondents were instructed as follows when estimating full production capacity: "Do not consider overtime pay, availability of labor, materials, utilities, etc., to be limiting factors." However, some respondents appear to be unrealistic in reporting their full production operations. For example, some establishments defined full production capacity as continuous operations (7 days a week, 24 hours a day) even though they were currently operating a single shift and admitted they could not expect realistically to operate continuously with their present plant and equipment or within their industry or locality. Census Bureau staff have discussed the most questionable estimates with respondents and adjusted the reports where appropriate; however, there is a distinct element of subjectivity, and it is apparent that not all plants have defined full production capacity in realistic terms.
3. National emergency production limitations. Some individual plants do not differentiate between their full production capacity and national emergency capacity. Therefore, for some individual plants, the levels of capacity and capacity utilization rates calculated for full production and national emergency are the same. For these plants, no measurable difference between full production and national emergency capacity levels or capacity utilization can be obtained.

Census Bureau staff have discussed the most questionable estimates with respondents and adjusted the reports where appropriate; however, there is a distinct element of subjectivity, and it is apparent that not all plants have defined national emergency capacity in realistic terms.

4. Year-to-year variations in reported data. There is considerable year-to-year change in reported capacity and capacity utilization for individual plants. Some of this reflects real change in capacity due to additions or retirements of plant and equipment, change in product mix, or change in productivity. Other changes, however, are the result of response variations that are

part of the nonsampling errors described in the following section on sampling and nonsampling errors. These variations, which often result from different personnel completing the form, include different judgmental decisions about work patterns and what plant and equipment to include in estimating capacity. At the summary levels, the individual establishment changes (either up or down) have a tendency to cancel each other.

SAMPLING AND NONSAMPLING ERRORS

The survey estimates presented in this report are subject to both sampling and nonsampling errors. Nonsampling errors include various response and operational errors; errors of collection, reporting, transcription, and bias due to nonresponse, etc. These errors would also occur if a complete canvass were conducted under the same conditions as this survey. Most of the important operational errors were detected and corrected in the course of the review of the data for reasonableness and consistency.

However, because of the definitional and conceptual problems associated with this survey, it is likely that the response errors are greater in magnitude than for other manufacturing surveys in which respondents are asked to report data that are generally kept as a matter of record. Explicit measures of the nonsampling errors are not available. As derived, the estimated standard error provides a measure of sampling error only. The total error will most likely exceed the standard errors shown.

The panel selected for this survey was sampled using probabilities proportionate to size. Independent samples were chosen for each sample industry, except for the publishing industry group, where the sample was controlled at the industry group only. Probabilities were assigned to control sampling allocation by industry subject to the constraint of a predetermined total sample size. These probabilities determined an expected sample size for each industry. The sampling procedure used ensured that this expected sample size was exactly realized. The particular sample selected was but one of the many probability samples of this size that could have resulted using this sampling methodology. Each of the possible samples would yield somewhat different sets of results. The sampling errors—the differences between the estimates obtained from the sample actually selected and the results theoretically obtainable from a comparable complete canvass of the same target universe—are unknown. However, the estimated standard errors of the utilization rates and the year-to-year changes are guides to the potential sizes of these sampling errors.

The estimated standard error of a utilization rate, or of a year-to-year change in a utilization rate, may be used to define a confidence interval about that rate or change such that the complete coverage result will be included within that interval with known probability. As examples:

1. The interval defined by one standard error below the estimates rate or change to one standard error above contains the complete coverage result with approximately 67-percent confidence.
2. The interval defined by two standard errors below and above the estimates rate or change contains the complete coverage result with approximately 95-percent confidence.
3. The interval defined by three standard errors below and above the estimates rate or change contains the complete coverage result with approximately 99-percent confidence.

Thus, an inference that the complete coverage result lies within the indicated intervals would, with the prescribed confidences, be correct. For example, if an estimated utilization rate is shown as 80 percent, with an associated standard error of 3 percent, there is approximately 67-percent confidence that the interval 77 percent to 83 percent includes the complete coverage rate, about 95-percent confidence that the interval 74 percent to 86 percent would include the complete coverage rate, and approximately 99-percent confidence that the interval 71 percent to 89 percent would include the complete coverage rate.

Note that the estimates of the standard errors are derived from the sample and are also subject to sampling error.

Appendix C.

Description of Survey Sample and Estimating Procedure

SURVEY SAMPLE

The 2005 survey estimates presented in this report are derived from a sample of about 17,000 establishments covering the manufacturing sector, North American Industry Classification System (NAICS) codes 31–33, and the publishing industry group, NAICS code 5111: Newspaper, Periodical, Book and Database Publishers. Data are collected from the publishing industry group so that the Federal Reserve Board (FRB), one of the funding agencies for the Survey of Plant Capacity Utilization (SPCU), can maintain continuity of production and capacity measures that are featured in their statistical release, “*G.17: Industrial Production and Capacity Utilization*,” a principal federal economic indicator. The original sample for the 2004 SPCU was selected using the 2002 Economic Census as the primary frame source. This sample is being maintained for a 5-year cycle and supplemented with birth establishments each survey year to account for sample attrition. In other words, a sample of birth establishments is selected each intermediate survey year to replace establishments from the previous survey cycle that are no longer active, thus preserving the desired sample size of roughly 17,000 establishments. When the original sample was selected for the 2004 SPCU, the primary frame source was supplemented with a universe of birth establishments that came into existence in 2003, subsequent to the 2002 Economic Census. For the 2005 SPCU, a universe of birth establishments that came into existence in 2004 was created and a sample of roughly 400 establishments was selected to supplement the ongoing sample for the 2005 survey. This birth sample was selected using a probability proportionate to size (pps) sample design, similar to that employed for the 2004 SPCU sample selection, which is described in detail below.

The sampling frame for the 2004 SPCU was limited to establishments that were actually mailed a Census form. The remaining Census cases were imputed based on administrative data obtained from Internal Revenue Service and/or Social Security Administration records. These small administrative record cases were excluded from the sampling frame for the 2004 SPCU. As a result, the Census portion of the sampling frame consisted of roughly 217,500 establishments: almost 205,200 plants from the manufacturing sector and around 12,300 establishments from the publishing industry group. The supplemental birth universe consisted of almost 11,000 establishments.

The primary portion of the 2004 SPCU sample was selected using a pps sample design. The measure of size on which probabilities of selection were based for each establishment in the frame was the total value of receipts from the Census. There was a small portion of this frame, less than 200 establishments, with zero receipts data that did not seem to be legitimate based on other data reported for these plants. This would have implied a zero measure of size for all of these establishments. Since there was some doubt about the validity of these zero data, a simple random sample of 50 establishments was selected from these plants. Simple random sampling was also employed to select a sample of 450 birth establishments from the birth universe.

As mentioned earlier, the primary portion of the 2004 SPCU sample was selected using a pps sample design with Census total receipts used as the measure of size for each establishment in the frame. For every establishment in the frame, this measure of size was used to assign probabilities of selection for the 2004 SPCU sample. Establishments actually selected for the sample were assigned sampling weights equal to the inverse of their respective probabilities of selection.

Sampling was conducted independently for each NAICS-6 industry, so actual probabilities of selection were dependent on the final sample size determined for each industry. This determination was based upon a level of priority assigned to each industry and the overall constraint that the total sample size would be limited to around 17,000 establishments. Industry priority was based

on requirements specified by the survey sponsors, the FRB and the Department of Defense (DOD). Both the FRB and the DOD furnished lists of priority NAICS-6 industries and these lists were merged together to provide one unduplicated master list of priority industries for sampling. In response to some external interest in industries with significant value-added data, research was also done to determine a preliminary set of important NAICS-3 industries in terms of value-added data obtained from the 2003 Annual Survey of Manufactures (ASM). Value added is defined as the difference between sales values and the cost of merchandise sold without any further manufacturing, processing, or assembly. NAICS-3 industries were deemed to be important if their value-added contribution was more than 5 percent of the U.S. value-added total. Under these criteria, there were six NAICS-3 industries identified as important value-added industries.

All of the aforementioned priority requirements were combined to determine the final NAICS-6 industry priorities for sampling purposes. All FRB and DOD priority NAICS-6 industries from the six important value-added NAICS-3 industries were designated as priority-1 industries. These 75 NAICS-6 industries were sampled under the tightest error constraints. The remaining FRB and DOD priority NAICS-6 industries, together with the balance of NAICS-6 industries from the six important value-added NAICS-3 industries, were designated as priority-2 industries. These 237 NAICS-6 industries were sampled under error constraints slightly looser than those enforced for the highest priority industries. All of the remaining 167 NAICS-6 industries were designated as priority-3 industries and were sampled under the loosest error constraints.

The 2004 SPCU sample selection was accomplished using Tillé sampling, a pps fixed sample size sampling methodology that ensured the exact desired sample size for each NAICS-6 industry was realized. This fixed sample size methodology was first used to select the entire SPCU sample for the 1999 survey. In previous sample selections, Poisson sampling was employed, which yielded sample sizes that, under repeated applications, varied from the expected sample sizes. The Tillé sampling methodology guarantees that the exact expected industry sample sizes resulting from the specified error constraints and sample selection probabilities are obtained. Therefore, under Tillé sampling, sample size is no longer a random variable, as it was under Poisson sampling, so any sample variance due to variation in sample size is eliminated. Prior to sampling, an adjustment was made to all assigned probabilities that fell below some specified minimum probability. This adjustment, which reset the original selection probabilities to this minimum probability, helped guard against exceedingly large sample weights (inverse of the probability of selection). This was done to help prevent sample estimates from being so adversely affected by establishments reporting data much more significant than expected relative to their measures of size. The minimum probability for the 2004 SPCU was set to 0.02, thus ensuring a maximum sample weight of 50. This minimum probability rule resulted in a slight increase in the originally allocated industry sample sizes.

Working within the sample size constraints of roughly 17,000 establishments from the manufacturing sector and about 300 establishments from the publishing sector, and incorporating the NAICS-6 industry prioritization scheme described above, error constraints were established for each sample industry so as to ensure that the total sample size would be around the target of 17,300 establishments. Several iterations were performed to test various error constraints for each of the three priority industry groups to determine the set of error constraints that would yield the desired target sample size. As a result, sampling from the pps portion of the frame was controlled under error constraints of 0.05 for priority-1 NAICS-6 industries, 0.11 for priority-2 industries, and 0.20 for priority-3 industries. Under these error constraints, a sample of roughly 16,800 establishments was selected from the pps portion of the sampling frame. This sample, combined with the simple random samples of birth establishments and zero receipts cases, yielded a final total sample of about 17,300 establishments, about 17,000 from the manufacturing sector and roughly 300 from the publishing sector.

ESTIMATING PROCEDURE

The estimated full production rates shown in this report for the 6-digit NAICS industries in Table 1a were computed in the following manner:

$$R_j = \frac{\sum_i WT_{ij} VPA_{ij}}{\sum_i WT_{ij} VPF_{ij}}$$

where R_j is the utilization rate for the j th 6-digit NAICS industry; WT_{ij} is the sampling weight for establishment i in 6-digit industry j ; VPA_{ij} is the actual value of production for establishment i in 6-digit industry j ; VPF_{ij} is the value of production at the full production level; and the summations are for those establishments with reported or imputed value of production at both actual and full production level. National emergency production rates in Table 1b are computed similarly, by substituting national emergency production (VPE) for VPF in the above formula. Imputed nonrespondent data were included because the utilization rates for nonrespondents were not necessarily imputed at the average rate for respondents.

The estimated utilization rates for the higher level manufacturing industry groupings (total manufacturing sector, subsectors, industry groups, durable goods industries, nondurable goods industries, advance processing industries, and primary processing industries) were computed in the following manner:

$$R_{(K)} = \frac{\sum_j VA_j}{\sum_j \left(\frac{VA_j}{R_j} \right)}$$

where $R_{(K)}$ is the utilization rate for the K th industry group; VA_j is the value added for the j th 6-digit industry as published in the most recent ASM or economic census; and VA_j/R_j represents the value added for the j th 6-digit industry adjusted to full production or national emergency production levels of operation.

Value added is used when aggregating to higher levels to avoid duplication in figures of production that result when products of some establishments are also input materials for other establishments.

Most users of industrial data consider value added to be the best value measure available for comparing the relative economic importance of manufacturing among industries and geographic areas. Therefore, using value added in the methodology to derive utilization rate measures should provide better estimates.

In accord with the sample design, estimates for publishing are presented at the industry group level only. These estimates are not included in any of the aggregated manufacturing estimates. Since the value added concept is not applicable to the publishing industry, the industry group estimates are derived in the same manner as the 6-digit industry estimates described above for manufacturing, except that the summations range over all establishments within the industry group.

The estimated variances for the sample estimates based on the fixed sample size methodology are calculated as shown below. The equations shown refer to full production utilization rate variances. Similar calculations for emergency utilization rate variances are computed by substituting VPE for VPF. The variable γ_i is an establishment variable that arises from the use of the fixed sample size method. For the 6-digit NAICS industries and publishing industry group, the variances were computed as:

$$\sigma^2(R_j) = \sigma^2(A_j/B_j) = \frac{1}{B_j^2} [\sigma^2(A_j) + R_j^2 \sigma^2(B_j) - 2R_j \sigma(A_j B_j)] \quad (1)$$

where $A_j = \sum_i WT_{ij} VPA_{ij}$

$B_j = \sum_i WT_{ij} VPF_{ij}$

$$\sigma^2(A_j) = \sum_i \gamma_i \left(i \sum_{l=1}^i (WT_{lj} VPA_{lj})^2 - \left(\sum_{l=1}^i WT_{lj} VPA_{lj} \right)^2 \right)$$

$$\sigma^2(B_j) = \sum_i \gamma_i \left(i \sum_{l=1}^i (WT_{lj} VPF_{lj})^2 - \left(\sum_{l=1}^i WT_{lj} VPF_{lj} \right)^2 \right)$$

$$\sigma^2(A_j B_j) = \sum_i \gamma_i \left(i \sum_{l=1}^i WT_{lj}^2 VPA_{lj} VPF_{lj} - \left(\sum_{l=1}^i WT_{lj} VPA_{lj} \right) \left(\sum_{l=1}^i WT_{lj} VPF_{lj} \right) \right)$$

Estimates of variances of higher level manufacturing aggregates $R_{(K)}$ were computed as follows:

$$\sigma^2(R_{(K)}) = \frac{1}{\left[\sum_j \frac{VA_j}{R_j}\right]^2} \left[\sum_j \sigma^2(VA_j) + R_{(K)}^2 \left(\sum_j \left[\left(\frac{1}{R_j^2}\right) \sigma^2(VA_j) + \left(\frac{VA_j^2}{R_j^4}\right) \sigma^2(R_j) \right] \right) - 2R_{(K)} \sum_j \left[\left(\frac{1}{R_j}\right) \sigma^2(VA_j) \right] \right] \quad (2)$$

where $\sigma^2(VA_j)$ is the ASM estimate of variance for value added in industry j , and where the summations range over the set of 6-digit industries comprising the higher level industry group K . When census year value added data are utilized, the variance terms $\sigma^2(VA_j)$ reduce to zero.

Table 2 shows standard errors of the utilization rates. Standard errors are the square root of the corresponding variances. Estimated standard errors of the changes in utilization rates from 2004 to 2005 are also presented in Table 2. For more information regarding these estimates, contact the Special Studies Branch at 301-763-7657.

IMPUTATION

A new imputation methodology was implemented beginning with the 2003 survey. The new methodology utilizes the industry average to impute data for the current year if the plant's response was not received in time to meet publication deadlines. Prior to 2003, the estimates for these cases were derived using reported data from the plant in the previous survey.
