

When one new home in ten meets ENERGY STAR specifications, the change will keep 6 billion pounds of greenhouse gas emissions out of our air.

Features like airtight construction, additional insulation, high-performance windows, and energy-efficient heating and cooling systems are included in every ENERGY STAR® labeled home, helping to save energy, reduce air pollution, and protect the earth. These features also make your home more comfortable—with fewer drafts, quieter rooms, and better indoor air quality. Live more comfortably and make the world a cleaner place. Ask about the ENERGY STAR label for new homes.

change.
