According to Census 2000, there were 115.9 million housing units in the United States. Most of these housing units had people living in them ( 105.5 million or 91.0 percent of all housing units). The remaining 10.4 million units (9.0 percent) were vacant on Census Day. Between 1990 and 2000, the United States housing inventory increased by 13.6 million units or 13.3 percent. The South ${ }^{1}$ ( 17.5 percent) and the West ( 16.7 percent) regions experienced higher rates of housing growth than the Midwest ( 10.1 percent) and the Northeast ( 6.6 percent).

This report, part of a series that analyzes data from Census 2000, highlights housing in 2000 and changes in housing characteristics between 1990 and 2000 in regions, states, metropolitan areas, counties, and large cities.

Housing tenure identifies a basic feature of the housing inventory, whether a unit

> A housing unit is a house, an apartment, a mobile home, a group of rooms, or a single room occupied, or intended for occupancy, as separate living quarters. Separate living quarters are those in which the occupant(s) live separately from any other people in the building and which have direct access from outside the building or through a common hall.

is owner or renter occupied. It has been collected since 1890. The Census 2000 question on tenure was identical to the one used in 1990. For 1990, the response categories were expanded to allow the respondent to report whether the unit was owned with a mortgage or loan or owned free and clear (without a mortgage). The distinction between units owned with a mortgage and units owned free and clear was added in 1990 to improve the count of owner-occupied units, as research after the 1980 census indicated some respondents did not consider their units owned if they had a mortgage.

declined from 1890 to 1920. A robust economy in the 1920s raised the homeownership rate, but the Great Depression drove the rate to its lowest level of the century 43.6 percent in 1940. The post-World War II surge in homeownership was remarkable. A booming economy, favorable tax laws, a rejuvenated home building industry, and easier financing saw homeown-

Data on vacancy status have been collected since 1940. Vacancy status and other characteristics of vacant units were determined by enumerators obtaining information from property owners and managers, neighbors, rental agents, and others. Vacant units were subdivided into six housing market classifications: for rent; for sale only; rented or sold, not occupied; for seasonal, recreational, or occasional use; for migrant workers; and other vacant.

Owning one's home has long been considered a part of the "American Dream." Census 2000 showed that about 2 out of 3 householders (69.8 million, 66.2 percent) attained this goal.

Owner-occupied units included those with one or more mortgages as well as those owned free and clear. The remaining 35.7 million occupied units ( 33.8 percent) were rented or occupied without payment of cash rent. The increase in the number of owner-occupied homes in the United States ( 10.8 million, 18.3 percent) far outpaced the change in the rental inventory ( 2.7 million, 8.3 percent) during the 1990s.

In 1890, less than half of United States households owned their homes. The homeownership rate
ership explode nationally, topping 60 percent in just two decades. In 1990, about 64 percent of U.S. households owned their homes.

In 2000, 3.8 million vacant housing units were on the market either for sale only or for rent. Another 0.7 million housing units were recently rented or sold and were awaiting occupancy at the time the census was conducted. The count of vacant housing units included 3.6 million units for seasonal, recreational, or occasional use. This vacancy category also included housing units that were temporarily
occupied at the time of enumeration entirely by people with a usual residence elsewhere; these occupants were counted at the address of their usual place of residence. A small number of vacant units ( 25,000 units) were intended for occupancy by migratory workers employed in farm work during the crop season. The remaining 2.3 million vacant housing units were classified as "other vacant" and included units held for personal reasons of the owner as well as units held for occupancy by a caretaker or janitor.

The majority of householders in each of the four census regions owned their homes.

In 2000, homeownership rates were 61.5 percent in the West, 62.4 percent in the Northeast, 68.4 percent in the South, and 70.2 percent in the Midwest. More than a third (26.4 million, 37.7 percent) of all owner-occupied homes were located in the South. The next largest segment was in the Midwest ( 17.4 million, 24.9 percent). The West ( 13.4 million, 19.2 percent) and the Northeast ( 12.7 million,

18.1 percent) contributed the balance of the homeowner inventory.

Among the 35.7 million renteroccupied units in the United States, about a third ( 12.3 million, 34.4 percent) were located in the South and about 8.4 million ( 23.5 percent) in the West. The remaining renter-occupied homes were about evenly distributed between the Northeast ( 7.6 million, 21.4 percent) and the Midwest ( 7.4 million, 20.6 percent).

Among the states, Nevada showed the largest percentage gain in housing units between 1990 and 2000.

The housing stock in Nevada increased 59.5 percent in the 1990s, from 519,000 to 827,000. Other western states with rapid increases in their housing inventories were Arizona (31.9 percent), Utah (28.4 percent), and Idaho (27.7 percent). California led the country in the total number of housing units in the United States in 2000 (12.2 million) and grew by more than 1.0 million units ( 9.2 percent) over the course of the decade.

In the South, North Carolina led the way with a 25.0 percent increase in the number of housing units, closely followed by Georgia ( 24.4 percent) and South Carolina (23.1 percent). Florida added 1.2 million units, the largest absolute gain among the 50 states, and increased its stock of housing by 19.7 percent between 1990 and 2000. Housing growth below the 10-percent level in the South was evident in just three states - Louisiana, Oklahoma, and West Virginia. The remaining states in the region all posted gains above the national level of 13.3 percent. The housing stock in the District of Columbia, however, declined slightly (-1.3 percent) from its 1990 level.

Housing growth in states in the Northeast (6.6 percent) and the Midwest (10.1 percent) was generally somewhat slower than the national pace ( 13.3 percent). Connecticut and North Dakota (both about 5 percent) were considerably below the national level.

In 2000, as in 1990, West Virginia and Minnesota maintained their positions as the states with the highest proportions of owner-occupied housing.

While the majority of occupied units in all 50 states were owner occupied, about 3 out of 4 households in West Virginia ( 75.2 percent) and Minnesota (74.6 percent) owned their homes. As in 1990, New York ranked at the bottom with respect to homeownership ( 53.0 percent) in 2000. Renters outnumbered owners in Washington, DC, where about 2 out of 5 ( 40.8 percent) were homeowners.

Nevada, Arizona, and Idaho also posted high growth in their stock of rental units, adding respectively, 39.4 percent, 24.0 percent, and 20.1 percent more rental units since 1990. The rental inventories in four states (Alaska, Illinois, lowa, and Michigan) remained relatively unchanged between 1990 and 2000, while the rental inventory in the District of Columbia declined 3.5 percent.

## One in ten homes in the South were vacant on Census Day.

With 9 percent of United States housing vacant in 2000 , regional rates ranged from less than 8 percent in the West to more than 10 percent in the South. Three states in the Northeast, four in the South, and six in the West had total vacancy rates that exceeded 12 percent. Housing markets were especially "tight" (less than 7 percent of units were vacant) in five states: California, Illinois, Connecticut, lowa, and Massachusetts.

Many states with a higher-than-average proportion of vacant units had a sizeable number of homes classified as "Vacant - for seasonal, recreational, and occasional use" in Census 2000 (see Table 2). These units make up a class commonly referred to as "vacation" homes,

Table 2.

## Ten States With the Highest Percentage of Seasonal, Recreational, or Occasional Use Homes: 2000

| Hawaii | 460,542 | 25,584 | 5.6 |

Source: U.S. Census Bureau, Census 2000 Summary File 1.
which can be big summer estates on Long Island, time-sharing condos in Fort Lauderdale, or simple fishing cabins in northern Michigan. Although many analysts have used this category to estimate the number of second homes in a given area, the category also includes units occupied on an occasional basis as corporate apartments and other temporary residences where all the household members reported that their residence was elsewhere.

On a percentage basis, three northern New England states - Maine (15.6 percent), Vermont (14.6 percent), and New Hampshire (10.3 percent) - topped the list. Florida is the clear leader in the number of these seasonal, recreational, and occasional-use properties $(483,000)$, followed by California (237,000), New York $(235,000)$, and Michigan $(234,000)$.

Homeowners were a majority in nearly all United States counties.

In 2000, owners outnumbered renters in all but 36 ( 1.1 percent) of the 3,141 counties and equivalent areas. Homeownership was fairly uncommon among households living in New York City, where only

1 in 5 households (19.6 percent) in Bronx and (20.1 percent) in New York (Manhattan) counties and about 1 in 3 ( 34.3 percent) in Kings County (Brooklyn) were homeowners. Other counties with homeownership rates below 30 percent were Chattahoochee in Georgia (27.0 percent), Aleutians West Census Area (a county equivalent) in Alaska (27.8 percent), and the very small county of Kalawao on the island of Molokai in Hawaii where all 115 occupied housing units were rented.

## Alcona County in Michigan

(89.9 percent) and Elbert County in Colorado (89.6 percent) topped the list in terms of the highest proportion of households who owned their homes. Other counties notable for their high rates of ownership (about 89 percent) were Powhatan and New Kent Counties in Virginia and Keweenaw County in Michigan.

## Florida's metropolitan areas

 were leaders in terms of homeownership.Five areas in the Sunshine State Punta Gorda, Ocala, Fort Pierce-Port St. Lucie, Sarasota-Bradenton, and Fort Myers-Cape Coral - were among the top ten metropolitan areas with the largest proportions
of owner-occupied units in 2000. Two other metropolitan areas in Michigan - Jackson and SaginawBay City-Midland - joined Barnstable-Yarmouth (Massachusetts), Houma (Louisiana), and Sharon (Pennsylvania) to round out the list.

In only five metropolitan areas were owners outnumbered by renters. These included the two large Northeastern primary metropolitan statistical areas (PMSAs) - Jersey City, New Jersey (30.7 percent) and New York, New York (34.7 percent) - and two PMSAs on the West Coast - Los Angeles-Long Beach (47.9 percent) and San Francisco (49.0 percent). The fifth metropolitan area where fewer households owned (45.6 percent) rather than rented was Bryan-College Station, Texas, home of Texas A\&M University.

Renters outnumbered owners in many of our country's largest cities.

In the four largest United States cities in 2000, most households were renters. About 70 percent of households in New York City, 61 percent in Los Angeles, 56 per-

cent in Chicago, and 54 percent in Houston rented their homes. Renters were also a majority (56.8 percent) of households in Dallas, the eighth largest city in 2000 (see Table 4). Households in San Diego were almost evenly split
between renters ( 50.5 percent) and owners (49.5 percent). Homeownership was more common among the remaining largest cities in 2000 Philadelphia, Phoenix, San Antonio, and Detroit.

Table 5.
Family Type by Tenure: 2000

${ }^{1}$ Children represent own children under 18 years.
Source: U.S. Census Bureau, Census 2000 Summary File 1.

## ADDITIONAL FINDINGS ON TENURE

## Which type of family had the highest rate of homeownership?

About 4 out of 5 married-couple families owned their homes in 2000. Empty nesters and other married couples without children under the age of 18 were more likely (84.8 percent) than married couples with children ( 76.9 percent) to own their homes.

More than half ( 55.4 percent) of the families maintained by men without spouses were homeowners, compared with about half (49.6 percent) of families maintained by women without spouses.

## In 2000, were people living alone more likely to own or rent their homes?

The answer depends on the gender of the householder. In 2000, more women ( 15.5 million) than men ( 11.8 million) lived alone. Approximately 8.7 million (56.0 percent) of women who lived alone owned their homes, compared with 5.5 million ( 47.0 percent) of the lone male householders.

What proportion of United States households were comprised of two or more unrelated people, and are these households more likely to rent or own their homes?

The Census Bureau uses the term "nonfamily households" to include people living alone as well as those householders who only live with people who are not related to the householder by birth, marriage, or adoption. In 2000, the 6.5 million householders who lived with other unrelated individuals represented about 6 percent of all United States occupied households. About 2 out of 5 (39.5 percent) of these householders owned their homes.

## How likely are young house－ holders to be homeowners？

Homeownership was directly relat－ ed to the age of the householder． The youngest householder age group（under 25 years of age）had the lowest level of homeownership （17．9 percent）．The percentage of homeowners increased to 45.6 among householders between the ages of 25 and 34 and contin－ ued to increase up to a peak of about 81 percent for householders 65 to 74 years of age．

## ABOUT CENSUS 2000

Homeownership rates have served as an indicator of the health of the Nation＇s economy for decades．Data on vacant units are needed by feder－ al and local agencies in order to evaluate the overall state of housing markets．

The federal government uses this information to allocate Section 8 and other housing program subsi－ dies that assist Americans to afford decent，safe，and sanitary housing． Local organizations use the informa－ tion to assess neighborhood stabili－ ty and to plan road，health，and transportation improvements in their communities．
