

***Every Rock Tells a Story...***

**1850's:** Miners found **GOLD** in rivers.

**Today:** We can find **GOLD** in rocks that were deposited by ancient rivers that have dried up.

**???:** How do we recognize rocks that formed in rivers?

How are these rocks different from one another?

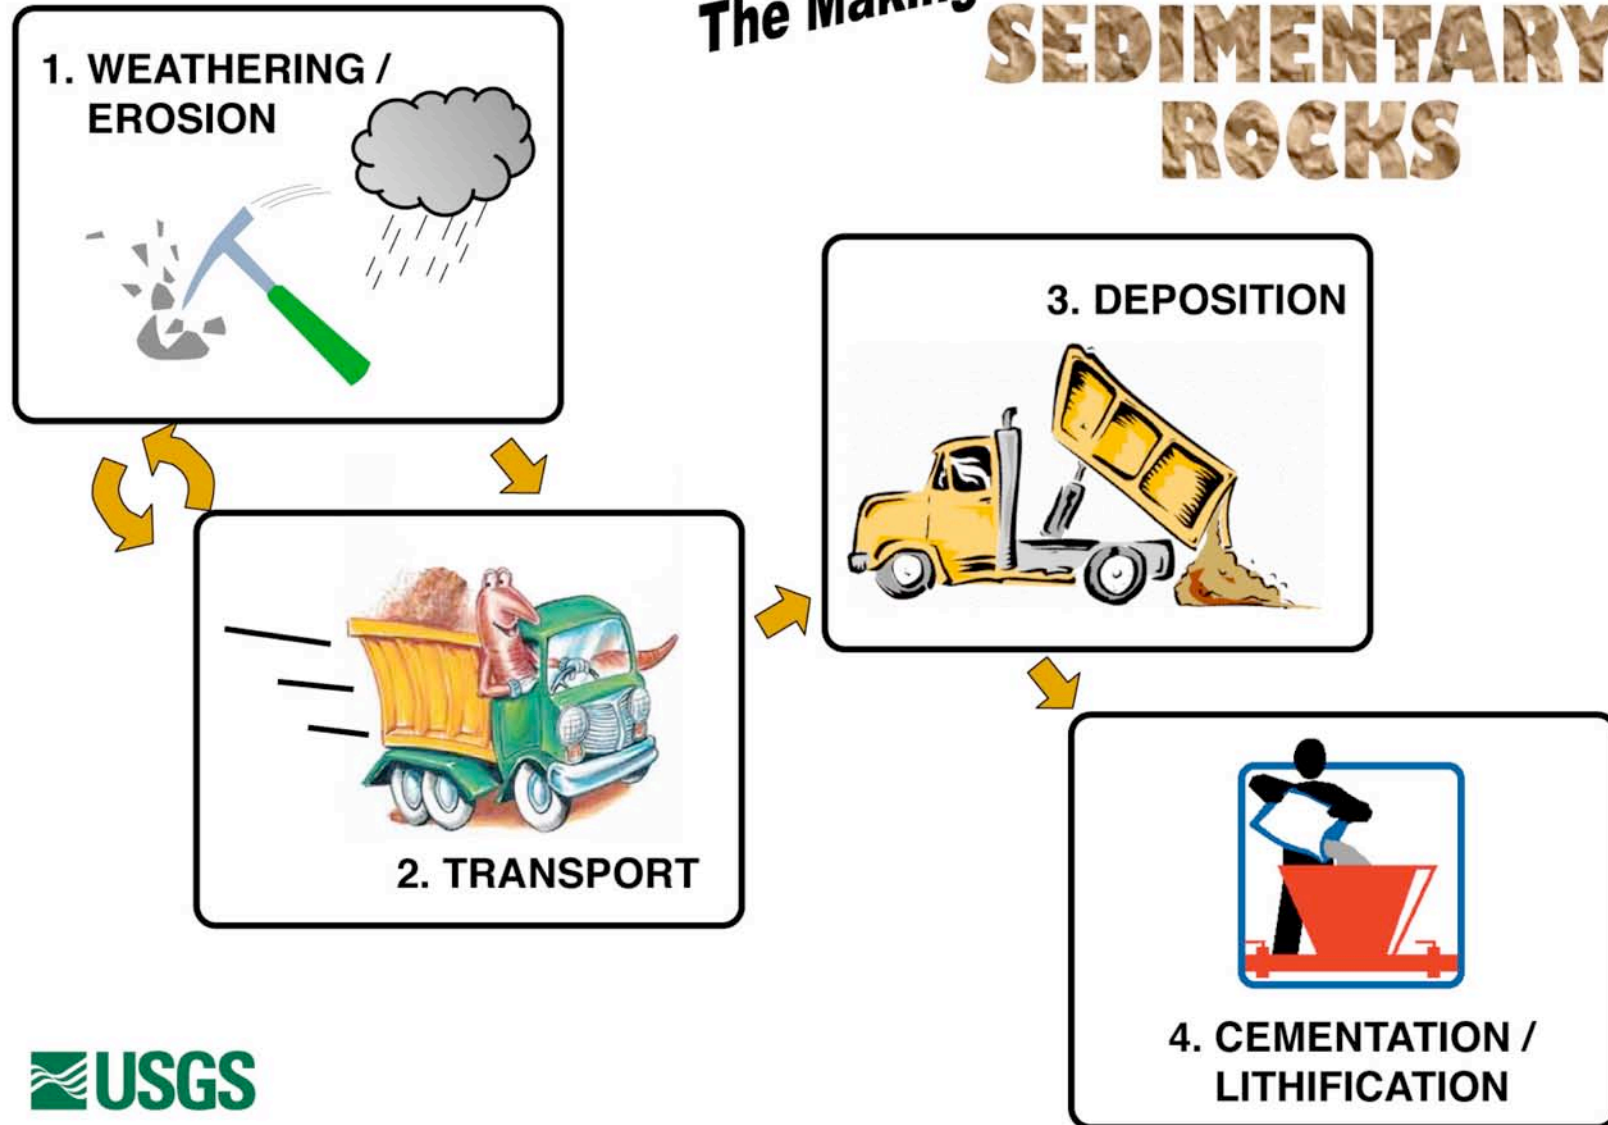

How are they similar?

# The Making Of SEDIMENTARY ROCKS

**ANGULAR**

**MEDIUM**

**ROUNDED**

low energy

small grains

High Energy

BIG Grains

<b>Location</b>	
<b>Colors</b>	
<b>.....All the same color?</b>	(underline most common colors above)
<b>Grain Size</b>	
<b>.....Minimum grain size</b>	___ cm
<b>.....Maximum grain size</b>	___ cm
<b>.....Typical grain size</b>	___ cm
<b>.....All the same size?</b>	
<b>Grain shapes</b>	Angular ... Medium Angular ... Medium Rounded ... Rounded
<b>Strength</b>	
<b>Other Comments</b>	

If you saw a rock like this in nature...

...what could you deduce about where it formed?

*Interpretation:*

**Natural tar seeps** produce rocks with **all black** grains *held together by tar*. Beaches produce grains that are *all the same size*. Tar occurs near some California beaches.

Angular Grains →

Angular Grains

+ a few rounded grains

*Interpretation:*

**Landslides** produce **angular** fragments spanning a *wide range of grain sizes*. Landslides are quick events that break the rocks apart but are not steady or long enough to round the grains

### *Interpretation:*

A **fast moving stream or river** is the only thing capable of moving **large** grains like these. The grains are rounded because they sat in the river for a while.

*Interpretation:*

**Beaches** produce **small, rounded** grains. They are rounded because repeated wave action slowly wears the pieces down. They are small because waves are not strong enough to move large boulders.

*Interpretation:*

How fast would water have to flow to push a **1 cm** pebble? It couldn't be too slow, but wouldn't have to be too fast either. A **small creek** would fit the bill. The **round** grains again indicate that it sat in the bed for a very long time.
