## Foreword

Projections of Education Statistics to 2009 is the 28th report in a series begun in 1964. This report provides revisions of projections shown in Projections of Education Statistics to 2008 and includes statistics on elementary and secondary schools and institutions of higher education at the national level. Included are projections for enrollment, graduates, classroom teachers, and expenditures to the year 2009.

In addition, this report includes projections of public elementary and secondary enrollment and high school graduates to the year 2009 at the state level. These projections were produced to provide researchers, policy analysts, and others with state-level projections developed with a consistent methodology. They are not intended to supplant detailed projections prepared in individual states.

The projections presented in this report reflect revisions influenced by the 1990 census. The revised population projections developed by the Bureau of the Census also reflect the incorporation of the 1997 estimates and latest assumptions for the fertility rate, net immigration, and mortality rate.

This report contains a methodology section describing models and assumptions used to develop the national
projections. The projections are based on a cohort survival model, an age-specific enrollment rate model, exponential smoothing models, and econometric models. The enrollment rate model uses population estimates and projections from the Bureau of the Census. The exponential smoothing models are based on the mathematical projection of past data patterns into the future. The econometric models use projections of exogenous variables from Standard and Poor's DRI, an economic forecasting service. Therefore, assumptions regarding the population and the economy are the key factors underlying the projections of education statistics.

Most of the projections include three alternatives, based on different assumptions about growth paths. Although the first alternative set of projections (middle alternative) in each table is deemed to represent the most likely projections, the low and high alternatives provide a reasonable range of outcomes.
In the forecast summary, key demographic and economic assumptions are presented in chart 1 and selected education statistics are shown in figure 1. A summary of the projections is available in a pocket-sized folder, Pocket Projections 2009.

Martin Orland, Associate Commissioner<br>Early Childhood, International, and Crosscutting Studies<br>Division<br>July 1999

## Acknowledgments

Projections of Education Statistics to 2009 was produced by the National Center for Education Statistics in the Early Childhood, International, and Crosscutting Studies Division under the general direction of Thomas D. Snyder, Director of the Annual Reports Program. The report was prepared by Debra E. Gerald, Mathematical Statistician, and William J. Hussar, Financial Economist.

Debra E. Gerald prepared national projections of the following: elementary and secondary enrollment (chapter 1 ); higher education enrollment (chapter 2); high school graduates (chapter 3); earned degrees conferred (chapter 4); and classroom teachers (chapter 5). She also prepared state-level projections of public elementary and secondary enrollment (chapter 8) and public high school graduates (chapter 9). In addition, she prepared the appendixes explaining the methodologies used to develop these projections and the data sources. William J. Hussar prepared the projections of expenditures of public elementary and secondary schools, including public school teacher salaries
(chapter 6) and expenditures of institutions of higher education (chapter 7). In addition, he prepared the appendixes explaining the methodologies used to obtain the expenditure projections, selected portions of the data sources, and glossary.

The technical review was done by Ellen Bradburn of the National Center for Education Statistics. Molly Soule of the Education Statistics Services Institute also provided assistance. The adjudication was done by Marilyn M. McMillen, Chief Statistician of the National Center for Education Statistics. Valuable assistance was also provided by the following reviewers: Chad Fleetwood of the Bureau of Labor Statistics; Vance Grant of the National Library of Education, Office of Educational Research and Improvement; Joe Marks of the Southern Regional Education Board; and William Fowler, Frank Morgan, John Sietsema, and Peter Stowe of the National Center for Education Statistics.

The cover was designed by Mark Ricks of Pinkerton Computer Consultants, Inc.

Forecast Summary

Figure 1
Percent change in selected education statistics: 1983-84 to 1997-98 and 1997-98 to 2008-09

*In constant 1996-1997 dollars

## Highlights National

Over the projection period, growth in the school-age and traditional college-age populations are expected to cause increases in enrollments.

Total public and private elementary and secondary enrollment is projected to increase 4 percent over the projection period.

Enrollment in higher education is projected to increase 14 percent over the projection period.

The number of high school graduates is projected to increase 23 percent over the projection period.

Over the projection period, the number of bachelor's degrees is projected to increase 8 percent.

The number of classroom teachers is projected to increase 4 percent over the projection period.

Current expenditures for public elementary and secondary schools are forecast to increase 25 percent from 1995-96 to 2008-09 in constant dollars.

Current expenditures per pupil are forecast to increase 16 percent for the period 1995-96 to 2008-09 in constant dollars.

Teacher salaries are projected to increase 1 percent in constant dollars between 1996-97 and 2008-09.

The 5- to 17-year old population is projected to increase from 50.4 million in 1997 to 52.6 million in 2009, an increase of 4 percent. The 18- to 24 -yearold population is expected to increase from 25.1 million in 1997 to 29.9 million in 2009, an increase of 19 percent (tables B3 and B4).

Total public and private elementary and secondary enrollment is projected to increase from 52.2 million in 1997 to 54.5 million in 2006. Then total enrollment is projected to remain steady through the year 2009, resulting in an increase of 4 percent from 1997 (table 1).

Higher education enrollment is projected to increase from an estimated 14.4 million in 1997 to 16.3 million by the year 2009, an increase of 14 percent. A 12-percent increase is projected under the low alternative and a 16 -percent increase is projected under the high alternative (table 3).

High school graduates from public and private high schools are projected to increase from 2.6 million in 1996-97 to 3.2 million by 2008-09, an increase of 23 percent. This significant increase reflects the projected rise in the 18-year-old population (table 26).

The number of bachelor's degrees is expected to increase from 1,160,000 in 1996-97 to $1,257,000$ by 2008-09, an increase of 8 percent (table 28).

Under the middle alternative, the number of classroom teachers is expected to increase from 3.04 million in 1997 to 3.17 million by the year 2009, an increase of 4 percent. A 2 -percent increase is projected under the low alternative and a 7 -percent increase is projected under the high alternative (table 32).

Under the middle alternative, a 25 -percent increase in current expenditures for public elementary and secondary schools is projected for the period from 1995-96 to 2008-09. Under the low alternative, current expenditures are projected to increase by 17 percent; under the high alternative, current expenditures are projected to increase by 32 percent (table 34).

Under the middle alternative, current expenditures per pupil in average daily attendance are forecast to increase 16 percent in constant dollars from 199596 to 2008-09. Under the low alternative, current expenditures per pupil are projected to increase 9 percent and under the high alternative, current expenditures per pupil are projected to increase 23 percent (table 34 ).

Under the middle alternative, teacher salaries are projected to increase 1 percent in constant dollars between 1996-97 and 2008-09. A 2-percent decline is projected under the low alternative and a 3 -percent increase is projected under the high alternative (table 36).

Current-fund expenditures are projected to increase in constant dollars in both public and private institutions.

Public elementary and secondary school enrollment (kindergarten through grade 12) is expected to increase between 1997 and the year 2009, but these increases will vary by region.

Changes in public school enrollment are projected to range from increases of 20 percent or more in some states to decreases in other states between 1997 and 2009.

Growth in the number of graduates from public schools will vary by region.

Increases in the number of public high school graduates are projected for most states.

Total current-fund expenditures of institutions of higher education are projected to increase 36 percent in constant dollars under the middle alternative from 1995-96 to 2008-09. Total current-fund expenditures are projected to increase at almost the same rate in public institutions and private institutions. A 36-percent increase is projected for public institutions and a 35 -percent increase is projected for private institutions (table 37).

## State-Level

Enrollment will increase most rapidly in the West, where total enrollment is expected to rise 11 percent. Enrollment in the South is projected to increase by 5 percent. The Northeast is expected to decrease by 2 percent, while the Midwest is projected to decrease by 1 percent (table 46).

Public school enrollment is projected to increase 4 percent between 1997 and the year 2009. The largest increases are expected in Arizona ( 21 percent), Idaho ( 20 percent), and Nevada ( 28 percent). The largest decreases are expected in the District of Columbia (10 percent), Maine ( 9 percent), North Dakota (8 percent), and West Virginia (7 percent) (table 46).

The number of public high school graduates is projected to increase 23 percent between 1996-97 and 2008-09. Across regions, the West is expected to rise by 35 percent. The Northeast is projected to grow by 20 percent. The South and Midwest are expected to increase by 24 percent and 13 percent, respectively, over the projection period (table 52).

Between 1996-97 and 2008-09, sizable increases are expected in Arizona (76 percent), California (41 percent), Florida (45 percent), North Carolina (48 percent), and Nevada (103 percent). Decreases are projected for the District of Columbia ( 5 percent), Louisiana ( 5 percent), North Dakota ( 8 percent), West Virginia (7 percent), and Wyoming (15 percent) (table 52).

Chart 1.—Summary of forecast assumptions to 2009

| Variable | Middle alternative | Low alternative | High alternative |
| :---: | :---: | :---: | :---: |

## Demographic <br> Assumptions

Population
18-24 year-old population
25-29 year-old population
30-34 year-old population
35-44 year-old population
Public elementary enrollment
Public secondary enrollment
Undergraduate enrollment
Gradute enrollment

Graduate enrollment
First-professional enrollment
Full-time-equivalent enrollment

Projections are consistent with the Census Bureau middle series estimates, which assume a fertility rate of 2.10 births per woman by the year 2009 , a net immigration of 820,000 per year, and a further reduction in the mortality rate.

Average annual growth rate of $1.5 \%$
Average annual growth rate $0.3 \%$
Average annual decline of $1.1 \%$
Average annual decline of $1.0 \%$
Average annual growth rate of $0.02 \%$
Average annual growth rate of $0.9 \%$
Average annual growth rate of $1.2 \%$
Average annual growth rate of $0.2 \%$
Average annual growth rate of $0.1 \%$
Average annual growth rate of $1.3 \%$

Same as middle alternative

Average annual growth rate of $1.4 \%$ Average annual growth rate of $0.4 \%$
Average annual growth rate of $0.4 \%$
Average annual growth rate of $1.5 \%$

## Economic Assumptions

Disposable income per capita in constant dollars

Annual percent changes range between $0.8 \%$ and $3.4 \%$ with an annual compound growth rate of $1.4 \%$.
Annual percent changes range between $0.0 \%$ and $1.6 \%$ with an annual compound growth rate of $0.6 \%$.

Inflation rate ranges between $2.1 \%$ and $3.5 \%$.

Annual percent changes range between $-2.3 \%$ and $2.3 \%$ with an annual compound growth rate of $0.6 \%$. ceipts to state and local governments per capita in constant dollars

Sum of personal taxes and nontax receipts and indirect business taxes and tax accruals (excluding property taxes) to state and local governments per capita in constant dollars

## Unemployment Rate (Men)

Age 18 to 19
Age 20 to 24
Age 25 \& over

Remains between $14.4 \%$ and $17.7 \%$.
Remains between $8.6 \%$ and $10.1 \%$.
Remains between $3.3 \%$ and $4.5 \%$.

Annual percent changes range between $0.0 \%$ and $2.8 \%$ with an annual compound growth rate of $0.9 \%$.
Annual percent changes range between $-0.6 \%$ and $1.0 \%$ with an annual compound growth rate of $0.1 \%$.
Inflation rate ranges between $3.2 \%$ and $5.0 \%$.
Annual percent changes range between $-3.0 \%$ and $0.7 \%$ with an annual compound growth rate of $-0.2 \%$.

Annual percent changes range between $-1.6 \%$ and $0.8 \%$ with an an nual compound growth rate of $0.2 \%$.

Annual percent changes range between $1.4 \%$ and $4.1 \%$ with an annual compound growth rate of $1.9 \%$.
Annual percent changes range between $-0.3 \%$ and $3.2 \%$ with an annual compound growth rate of $1.1 \%$.

Inflation rate ranges between $1.3 \%$ and $2.4 \%$.

Annual percent changes range between $-1.5 \%$ and $4.4 \%$ with an annual compound growth rate of $1.4 \%$.

Annual percent changes range between $-0.3 \%$ and $3.4 \%$ with an annual compound growth rate of $1.4 \%$.

## Unemployment Rate (Women)

Age 18 to 19
Age 20 to 24
Age 25 \& over

Remains between $12.0 \%$ and $13.8 \%$.
Remains between $7.8 \%$ and $9.1 \%$.
Remains between $3.7 \%$ and $4.3 \%$.

Remains between $14.4 \%$ and $20.2 \%$. Remains between $8.6 \%$ and $12.1 \%$. Remains between $3.3 \%$ and $5.6 \%$.

Remains between $13.7 \%$ and $17.4 \%$.
Remains between $7.5 \%$ and $9.8 \%$.
Remains between $3.0 \%$ and $4.3 \%$.

Remains between $11.5 \%$ and $13.5 \%$.
Remains between $7.5 \%$ and $8.9 \%$.
Remains between $3.4 \%$ and $4.2 \%$.

## Figures

1. Percent change in selected education statistics: 1983-84 to 1997-98 and 1997-98 to 2008-09 ..... viii
Births
2. Annual number of births, with projections: 1949 to 2009 ..... 5
School-Age Population
3. 3- to 5-year-old population, with projections: 1984 to 2009 ..... 5
4. 5- to 17-year old population, with projections: 1984 to 2009 ..... 6
5. School-age populations, with projections: 1984 to 2009 ..... 6
Elementary and Secondary Schools
6. Enrollment in elementary and secondary schools, by grade level, with projections: Fall 1984 to fall 2009 ..... 7
7. Enrollment in elementary and secondary schools, by control of institution, with projections: Fall 1984 to fall 2009 ..... 7
College-Age Population
8. College-age populations, (18-24 years and 25-29 years), with projections: 1984 to 2009 ..... 15
9. College-age populations, (30-34 years and 35-44 years), with projections: 1984 to 2009 ..... 15
Institutions of Higher Education
10. Enrollment in institutions of higher education, with alternative projections: Fall 1984 to fall 2009 ..... 16
11. Average annual growth rates for total higher education enrollment: Fall 1984 to fall 2009 ..... 16
12. Enrollment in institutions of higher education, by sex, with middle alternative projections: Fall 1984 to fall 2009 ..... 17
13. Average annual growth rates for total higher education enrollment, by sex: Fall 1984 to fall 2009 ..... 17
14. Enrollment in institutions of higher education, by attendance status, with middle alternative projections: Fall 1984 to fall 2009 ..... 18
15. Average annual growth rates for total higher education enrollment, by attendance status: Fall 1984 to fall 2009 ..... 18
16. Enrollment in institutions of higher education, by control of institution, with alternative projections: Fall 1984 to fall 2009 ..... 19
17. Average annual growth rates for total higher education enrollment, by control of institution: Fall 1984 to fall 2009 ..... 19
18. Enrollment in institutions of higher education, by type of institution, with alternative projections: Fall 1984 to fall 2009 ..... 20
19. Average annual growth rates for total higher education enrollment, by type of institution: Fall 1984 to 2009 ..... 20
20. Undergraduate enrollment in institutions of higher education, with alternative projections: Fall 1984 to fall 2009 ..... 21
21. Average annual growth rates for undergraduate enrollment: Fall 1984 to fall 2009 ..... 21
22. Postbaccalaureate enrollment in institutions of higher education, with alternative projections: Fall 1984 to fall 2009 ..... 22
23. Average annual rates of change for postbaccalaureate enrollment: Fall 1984 to fall 2009 ..... 22
24. Full-time-equivalent enrollment in institutions of higher education, with alternative projections: Fall 1984 to fall 2009 ..... 23
25. Average annual growth rates for full-time-equivalent enrollment: Fall 1984 to fall 2009 ..... 23
26. Enrollment in institutions of higher education, by age group, with middle alternative projections: Fall 1989, 1999, and 2009 ..... 24
27. Enrollment of men in institutions of higher education, by age group, with middle alternative projections: Fall 1989, 1999, and 2009 ..... 25
28. Enrollment of women in institutions of higher education, by age group, with middle alternative projections: Fall 1989, 1999, and 2009 ..... 25
High School Graduates
29. 18-year-old population, with projections: 1984 to 2009 ..... 52
30. High school graduates, with projections: 1983-84 to 2008-09 ..... 52
31. High school graduates, by control of institution, with projections: 1983-84 to 2008-09 ..... 53
32. Average annual rates of change for high school graduates: 1983-84 to 2008-09 ..... 53
Earned Degrees Conferred
33. Associate's degrees, with projections: 1983-84 to 2008-09 ..... 57
34. Associate's degrees, by sex of recipient, with projections: 1983-84 to 2008-09 ..... 57
35. Bachelor's degrees, with projections: 1983-84 to 2008-09 ..... 58
36. Bachelor's degrees, by sex of recipient, with projections: 1983-84 to 2008-09 ..... 58
37. Master's degrees, with projections: 1983-84 to 2008-09 ..... 59
38. Master's degrees, by sex of recipient, with projections: 1983-84 to 2008-09 ..... 59
39. Doctor's degrees, with projections: 1983-84 to 2008-09 ..... 60
40. Doctor's degrees, by sex of recipient, with projections: 1983-84 to 2008-09 ..... 60
41. First-professional degrees, with projections: 1983-84 to 2008-09 ..... 61
42. First-professional degrees, by sex of recipient, with projections: 1983-84 to 2008-09 ..... 61
Classroom Teachers
43. Elementary and secondary classroom teachers, with alternative projections: Fall 1984 to fall 2009 ..... 70
44. Average annual growth rates for classroom teachers: Fall 1984 to fall 2009 ..... 70
45. Elementary and secondary classroom teachers, by organizational level, with middle alternative projections: Fall 1984 to fall 2009 ..... 71
46. Average annual rates of change for classroom teachers, by organizational level: Fall 1984 to fall 2009 ..... 71
47. Elementary and secondary classroom teachers, by control of institution, with middle alternative projections: Fall 1984 to fall 2009 ..... 72
48. Average annual growth rates for classroom teachers, by control of institution: Fall 1984 to fall 2009 ..... 72
49. Pupil/teacher ratios, by organizational level, with middle alternative projections: Fall 1984 to fall 2009 ..... 73
50. Pupil/teacher ratios, by organizational level and control, with middle alternative projections: Fall 1984 to fall 2009 ..... 73

## Expenditures

51. Current expenditures of public schools (in constant 1996-97 dollars), with alternative projections: 198384 to 2008-0979
52. Current expenditures per pupil in average daily attendance of public schools (in constant 1996-97 dollars), with alternative projections: 1983-84 to 2008-09 ..... 79
53. Annual percentage change in current expenditures per pupil in average daily attendance of public schools (in constant dollars), with alternative projections: 1983-84 to 2008-09 ..... 80
54. Annual percentage change in current expenditures per pupil in average daily attendance of public schools and disposable income per capita (both in constant dollars), with middle alternative projections: 1983- 84 to 2008-09 ..... 80
55. Annual percentage change in current expenditures per pupil in ADA of public schools and education revenue receipts from state sources per capita (both in constant dollars), with middle alternative projections: 1983- 84 to 2008-09 ..... 81
56. Estimated average annual salaries of teachers in public schools (in constant 1996-97 dollars), with alternative projections: 1983-84 to 2008-09 ..... 82
57. Annual percentage change in estimated average annual salaries of teachers in public schools (in constant dollars), with alternative projections: 1983-84 to 2008-09 ..... 82
58. Annual percentage change in estimated average annual salaries of teachers in public schools (in constant dollars) and average daily attendance, with middle alternative projections: 1983-84 to 2008-09 ..... 83
59. Annual percentage change in estimated average annual salaries of teachers and current expenditures per pupil in ADA of public schools (both in constant dollars), with middle alternative projections: 1983-84 to 2008-09 ..... 83
60. Current-fund expenditures of public and private institutions of higher education (in constant 1996-97 dollars), with middle alternative projections: 1983-84 to 2008-09 ..... 90
61. Educational and general expenditures of public and private institutions of higher education (in constant 1996-97 dollars), with middle alternative projections: 1983-84 to 2008-09 ..... 90
Public Elementary and Secondary School Enrollment, by State
62. Map of the United States, by region ..... 100
63. Percent change in grades K-12 enrollment in public schools, by state: Fall 1997 to fall 2009 ..... 103
64. Percent change in public K-12 enrollment, by region: Fall 1997 to fall 2009 ..... 103
65. Percent change in grades K-8 enrollment in public schools, by state: Fall 1997 to fall 2009 ..... 104
66. Percent change in public K-8 enrollment, by region: Fall 1997 to fall 2009 ..... 104
67. Percent change in grades 9-12 enrollment in public schools, by state: Fall 1997 to fall 2009 ..... 105
68. Percent change in public 9-12 enrollment, by region: Fall 1997 to fall 2009 ..... 105
Public High School Graduates, by State
69. Percent change in number of public high school graduates, by state: 1996-97 to 2008-09 ..... 116
70. Percent change in number of public high school graduates, by region: 1996-97 to 2008-09 ..... 116
Methodology
71. General structure and methodology of the Education Forecasting Model (EDMOD) ..... 129

A6.2. Mean absolute percentage errors by lead time for current-fund expenditures and educational and general expenditures in constant dollars in public and private institutions of higher education by type ..... 168
Appendix B
Supplementary Tables
B1. Annual number of births (U.S. Census projections, Middle Series): 1949 to 2009 ..... 171
B2. Preprimary school-age populations (U.S. Census projections, Middle Series): 1984 to 2009 ..... 172
B3. School-age populations (U.S. Census projections, Middle Series), ages 5, 6, 5-13, and 14-17 years: 1984 to 2009 ..... 173
B4. College-age populations (U.S. Census projections, Middle Series), ages 18, 18-24, 25-29, 30-34, and 35- 44 years: 1984 to 2009 ..... 174
B5. Average daily attendance (ADA) in public elementary and secondary schools, change in ADA, the population, and ADA as a proportion of the population: 1983-84 to 2008-09 ..... 175
B6. Disposable income per capita (in constant 1996-97 dollars), with alternative projections: 1983-84 to 2008- 09 ..... 176
B7. Education revenue receipts from state sources per capita (in constant 1996-97 dollars), with alternative projections: 1983-84 to 2008-09 ..... 177
B8. Consumer Price Index (base year 1996-97), with alternative projections: 1983-84 to 2008-09 ..... 178
B9. Rate of change for the inflation rate based on the Consumer Price Index, with alternative projections: 1983-84 to 2008-09 ..... 179
B10. Personal tax and nontax payments to state and local governments, per capita (in constant 1996-97 dollars), with alternative projections: 1983-84 to 2008-09 ..... 180
B11. Indirect business taxes and nontax accruals, excluding property taxes, for state and local governments, per capita (in constant 1996-97 dollars), with alternative projections: 1983-84 to 2008-09 ..... 181

B12. Sum of personal tax and nontax payments and indirect business taxes and tax accruals, excluding property taxes, for state and local governments per capita (in constant 1996-97 dollars), with alternative projections: 1983-84 to 2008-09

B13. Enrollment in public elementary and secondary schools, by grade, with projections: Fall 1990 to fall 2009

## Introduction

## Guide to This Edition

This edition of Projections of Education Statistics to 2009 provides projections for key education statistics. This edition includes statistics on enrollment, graduates, classroom teachers, and expenditures in elementary and secondary schools and institutions of higher education. For the Nation, the tables, figures, and text contain data on enrollment, teachers, graduates, and expenditures for the past 14 years and projections to the year 2009. For the 50 States and the District of Columbia, the tables, figures, and text contain data on projections of public school elementary and secondary enrollment and public high school graduates to the year 2009. Similar methodologies were used to obtain a uniform set of projections for the 50 states and the District of Columbia. These projections are further adjusted to agree with the national projections of public elementary and secondary school enrollment and public high school graduates appearing in this report. These projections reflect 1997 estimates and population projections based on the 1990 census. Appendix A describes the methodology and assumptions used to develop the
projections. Appendix B contains tables of supplementary data. Data sources are presented in appendix C. Appendix D is a glossary of terms.

## Limitations of Projections

Projections of time series usually differ from the final reported data due to errors from many sources. This is because of the inherent nature of the statistical universe from which the basic data are obtained and the properties of projection methodologies, which depend on the validity of many assumptions. Therefore, alternative projections are shown for most statistical series to denote the uncertainty involved in making projections. These alternatives are not statistical confidence limits, but instead represent judgments made by the authors as to reasonable upper and lower bounds. Alternative projections are presented for higher education enrollment, classroom teachers, and expenditures of public elementary and secondary schools and institutions of higher education.

## Chapter 1

## Elementary and Secondary Enrollment

Between 1997 and the year 2009, enrollment will increase in elementary and secondary schools. The primary reason for the increase is the rising number of annual births between 1977 and 1990-sometimes referred to as the baby boom echo (table B1 and figure 2). After a period of stability and small declines, the number of births is expected to begin rising again after the turn of the century. Reflecting this, the 3- to 5 -year-old population is projected to decline 3 percent by 2005 and then increase 2 percent by 2009 (table B2 and figure 3.) Growth in the school-age populations is expected over the next 12 years (table B3 and figures 4 and 5). In 1997 and beyond, increases in the 5- to 13-year-old population are expected to cause rises in elementary enrollment through the year 2002. Over the projection period, the increase in the $14-$ to 17-year-old population, which started in 1991, will continue to influence the growth in secondary enrollment through 2007.

Projections of public elementary and secondary enrollment that have been produced over the last 15 years are more accurate than projections of public high school graduates and public classroom teachers that NCES has published over the same time period. For more information, see appendix A1, page 126.

## Elementary and Secondary Enrollment

In response to an increase in the 5- to 17-year-old population, total enrollment in public and private elementary and secondary schools increased from 44.9 million in 1984 to 52.2 million in 1997, an increase of 16 percent (table 1 and figure 6). Total enrollment is projected to increase for most of the projection period, reaching 54.2 million by the year 2009 , an increase of 4 percent from 1997.

## Enrollment, by Grade Group

Enrollments may also be grouped or summed by any span of grades. In this section, past and projected trends of enrollment in grades K-8 and 9-12 are examined. Enrollment in grades $\mathrm{K}-8$ increased from 31.2 million in 1984 to 37.7 million in 1997, an increase of 21 percent. Enrollment in grades $\mathrm{K}-8$ is projected to increase to 38.7 million in 2002 and 2003. Then, it is expected to decline slightly to 38.0 million by the year 2009, still reflecting an increase of 1 percent from 1997. Enrollment in grades 9-12 decreased from 13.7 million in 1984 to 12.5 million in

1990, a decrease of 9 percent. It then increased to 14.4 million in 1997. By the year 2009, enrollment in grades $9-12$ is projected to rise for most of the projection period to 16.2 million, an increase of 12 percent from 1997. Since enrollment rates for the school-age populations are nearly 100 percent for elementary grades and junior-high grades and close to 90 percent for high school grades, the historical and projected patterns of decline and growth in enrollment in grades $\mathrm{K}-8$ and grades $9-12$ reflect changes in the sizes of the 5 - to 13 -year-old population and the 14 - to 17 -year-old population.

## Enrollment, by Control of School

Enrollment in public elementary and secondary schools increased from 39.2 million in 1984 to an estimated 46.3 million in 1997, an increase of 18 percent (figure 7). Enrollment in public schools is projected to increase to 48.1 million by the year 2009, an increase of 4 percent from 1997.

Projections of enrollments in public elementary and secondary schools are based on projected grade retention rates. The retention rates for grades 2 through 10 are all close to 100 percent. Rates for grade 6 to grade 7 and grade 8 to grade 9 are significantly over 100 percent. Traditionally, these are the grades in which large numbers of private elementary students transfer to public secondary schools. The retention rates for grades 11 to 12 are about 90 percent. The grade retention rates are assumed to be constant throughout the projection period.

Since the mid-1980s, enrollment in private elementary and secondary schools has fluctuated between 5.2 million and 5.9 million. In 1997, an estimated 5.9 million students were enrolled in private elementary and secondary schools. Enrollment in private schools is projected to increase to around 6.0 million by the year 2009, an increase of 3 percent from 1997.

Projections of private school enrollment were derived using public school enrollment data. From 1970 to 1996, the ratio of private school enrollment to public school enrollment was calculated for grades $\mathrm{K}-8$ and grades $9-$ 12. These ratios were projected using single exponential smoothing, yielding a constant value over the projection period. This constant was applied to projections of public school enrollment for grades $\mathrm{K}-8$ and $9-12$ to yield projections of private school enrollment by grade group. By organizational level, it was assumed that enrollment for grades $\mathrm{K}-8$ was equal to elementary enrollment and enrollment for grades $9-12$ was equal to secondary enrollment.

This method assumes that the future pattern in the trend of private school enrollment will be the same as that in public school enrollment. A number of factors could alter the assumption of a constant ratio over the projection period. For more information, see appendix A, section A.1. However, the historical relationships between public and private schools have been stable.

## Enrollment, by Grade Group and Control of School

Enrollment by grade group in public elementary and secondary schools shows trends similar to those of total enrollment. Enrollment in grades K-8 of public schools increased from 26.9 million in 1984 to 33.2 million in 1997. Enrollment in grades K-8 of public schools is projected to increase to 34.1 million in 2002. Then, it is expected to decrease to 33.4 million by the year 2009, still an increase of 1 percent from 1997. Enrollment in grades 9-12 of public schools decreased from 12.3 million in 1984 to 11.3 million in 1990, a decrease of 8 percent. Then, it increased to 13.1 million in 1997. Thereafter, $9-12$ enrollment is expected to increase to 14.9 million by the year 2007 , and then slightly drop to 14.7 million by 2009 , showing an overall increase of 12 percent from 1997. For information on projections of enrollment by grade in public elementary and secondary schools, see table B13 in appendix B, Supplementary Tables.

Enrollment by grade group in private elementary and secondary schools will show patterns similar to those in public schools since the private school enrollment projection methodology assumes that private school enrollment will reflect trends in public school enrollment. Enrollment
in grades $\mathrm{K}-8$ of private schools is projected to increase from an estimated 4.6 million in 1997 to 4.7 million in 2002 and then decline to 4.6 million in 2009, an increase of 1 percent from 1997. Enrollment in grades $9-12$ of private schools is projected to increase from an estimated 1.3 million in 1997 to 1.5 million by the year 2009, an increase of 12 percent.

## Enrollment, by Organizational Level

According to the Common Core of Data survey, elementary level is composed of any span of grades not above grade 8; secondary level is composed of grades beginning with the next grade following the elementary grades and ending with or below grade 12. Enrollments may also be aggregated by the level of school attended by students. The reported enrollment in elementary schools is smaller than enrollment in kindergarten through grade 8 because it excludes enrollment in grades 7 and 8 in secondary schools. Enrollment in elementary schools increased from 28.0 million in 1984 to 34.7 million in 1997, an increase of 24 percent (table 2). Enrollment in elementary schools is expected to continue to increase to 35.5 million in the year 2001, before declining to 34.8 million by the year 2009. Enrollment in secondary schools, including 7 th and 8 th graders in secondary schools, decreased from 16.9 million in 1984 to 15.3 million in 1990, a decrease of 9 percent. Then, this number increased by 14 percent to 17.4 million in 1997. Enrollment in secondary schools is projected to rise to 19.6 million by 2007 and then decrease to 19.3 million in 2009, an increase of 11 percent from 1997.

(This table was prepared August 1998.)

## Chapter 2

## Higher Education Enrollment

Enrollment in institutions of higher education* is expected to rise between 1997 and the year 2009. Changes in age-specific enrollment rates and college-age populations will affect enrollment levels over the next 12 years (figures 8 and 9). The most important factor in the projected rise of college enrollment is the projected increase of 19 percent in the traditional college-age population of 18- to 24-year-olds (table B4). The 25 - to 29 -year-old population is projected to decrease by 9 percent between 1997 and 2002, and then increase by 14 percent between 2002 and 2009. The 30 - to 34 -year-old population will decrease by 12 percent between 1997 and 2009. The 35 - to 44 -year-old population will increase by 2 percent between 1997 and 1999, and then decrease by 12 percent between 1999 and 2009. The increases in the younger population are expected to offset the loss of students from the older populations, thereby contributing to the increases in college enrollment over the projection period. The enrollment projections do not take into account such factors as the cost of a college education, the economic value of an education, and the impact of long distance learning due to technological changes. Projections of higher education enrollment that have been produced over the past 12 years are more accurate than projections of master's degrees and doctor's degrees, but less accurate than projections of public elementary and secondary enrollment that NCES has published over the same time period. For more information, see appendix A1, page 126.

## Total Higher Education Enrollment

In 1984 and 1985, college enrollment stood at 12.2 million. Then it increased, reaching 14.5 million in 1992. By 1997, it had decreased to an estimated 14.4 million (table 3 and figure 10). Under the middle alternative, college enrollment is projected to rise to 16.3 million by the year 2009, an increase of 14 percent from 1997. This will represent an average annual growth rate of 1.1 percent over the projection period. Between 1997 and 2003, college enrollment is projected to increase at an average annual growth rate of 1.0 percent. Between 2003 and 2009, it will grow at an average annual growth rate of 1.1 percent (figure 11). The 18 - to 24 -year-old population is projected to increase 19 percent by the year 2009. This increase in the younger population is expected to offset the expected

[^0]decline in the number of 25 - to 34 -year-olds enrolled in college.

The following tabulations show key enrollment statistics: (1) the average annual rate of growth (in percent) for 1984-97 and alternative projected rates of change for 19972009 and (2) average annual rates of change for 198491 and 1991-97 and the middle alternative projected rates of change for 1997-2003 and 2003-2009. (Calculations are based on unrounded numbers. A percent of 0.0 indicates that the number is between 0.0 and 0.05 .)

## Average annual rate of change (in percent)

|  | 1984-97 | Projected 1997-2009 |  |  |

| 2-year ..................... | 3.2 | -0.2 | 0.9 | 1.0 |
| Undergraduate .......... | 2.3 | -0.1 | 1.2 | 1.2 |
| Graduate .................. | 2.9 | 1.0 | 0.0 | 0.5 |
| First-professional ..... | 0.1 | 0.3 | -0.7 | 0.9 |
| Full-time-equivalent ..... | 2.1 | 0.0 | 1.2 | 1.4 |

Under the low alternative, college enrollment is projected to increase from an estimated 14.4 million in 1997 to 16.0 million by the year 2009. This will represent an
average annual growth rate of 0.9 percent, for an increase of 12 percent over the projection period.

Under the high alternative, college enrollment is expected to increase from an estimated 14.4 million in 1997 to 16.7 million by the year 2009. This will represent an average annual growth rate of 1.2 percent, for an increase of 16 percent over the projection period.

Higher education enrollment projections were based on projected enrollment rates, by age and sex, which were then applied to population projections by age and sex developed by the Bureau of the Census. The middle series population projections, which assume middle fertility and net immigration, were used. The age-specific enrollment rates by sex and attendance status were projected based on an econometric estimation of relationships to relevant macroeconomic variables such as income and unemployment rates, proxies for relative earnings, by age group.

## Alternative Projections Based on Three Economic Scenarios

Three sets of projections are presented for enrollment in institutions of higher education to indicate a range of possible outcomes. Each set of projections is based on alternative assumptions concerning the economy. The middle, low, and high alternatives of college enrollment are based on the base, pessimistic and optimistic scenarios of the economy developed by Standard \& Poor's DRI for the projections of disposable income and unemployment rates. Under the three alternatives, full-time and part-time enrollment rates by age of men and women are modeled. The age-specific enrollment rates of men and women enrolled full-time are a function of dummy variables by age, $\log$ of four-period weighted average of real disposable income per capita, and $\log$ unemployment rate by age group. The age-specific enrollment rates of men and women enrolled part-time are a function of dummy variables by age and $\log$ of four-period weighted average of real disposable income per capita. These relationships will continue through 2009. For more information, see appendix A, section A.1.

The key determinants of higher education enrollment are household income, which represents ability to pay, and an age-specific unemployment rate, which acts as a proxy for opportunity costs faced by students. Both of these measures are likely to decline during a weak or pessimistic economy, with the result that the estimated opportunity costs will be lower. This will have a positive impact on higher education enrollment, as students face less attractive alternatives. This will be apparent in the short term, resulting in a potential reversal in the expected pattern across the alternative economic scenarios. As a result, the high alternative projections will be lower than the low alternative projections. However, in the long term, the effect of the per capita income variable dominates the effects of the unemployment rate. As expected, this results in a pattern where the high alternative projections are greater than the low alternative projections.

## Enrollment, by Sex of Student

Women played a major role in the increase of enrollment between 1984 and 1997. The enrollment of women in college increased from 6.4 million in 1984 to an estimated 8.1 million in 1997, representing an average annual growth rate of 1.8 percent, for a 27-percent increase over the period (figure 12). Under the middle alternative, enrollment of women is expected to increase to 9.4 million by the year 2009, an increase of 16 percent from 1997. This will represent a growth rate of 1.3 percent per year. The rate of growth will be about the same during the first half of the projection period (1997-2003) and the second half (2003-2009), 1.3 percent per year versus 1.2 percent per year (figure 13). As a share of total college enrollment, women were 56 percent of all college students in 1997 compared with 52 percent in 1984. Women are expected to increase their share to 58 percent of college enrollment in the year 2009. Under the low alternative, enrollment of women is expected to increase from 8.1 million in 1997 to 9.2 million by the year 2009, representing a growth rate of 1.1 percent per year. Under the high alternative, enrollment of women is expected to increase from 8.1 million in 1997 to 9.7 million by the year 2009, representing a growth rate of 1.5 percent per year.

The enrollment of men in college increased from 5.9 million in 1984 to 6.5 million in 1992, before decreasing to an estimated 6.3 million in 1997 . Under the middle alternative, enrollment of men is expected to increase to 6.9 million by the year 2009, a 10 -percent increase from 1997, for an average annual growth rate of 0.8 percent. Under the low alternative, enrollment of men is expected to increase from 6.3 million in 1997 to about 6.9 million by the year 2009, representing a growth rate of 0.7 percent per year. Under the high alternative, enrollment of men is expected to increase from 6.3 million in 1997 to 7.0 million by the year 2009, representing a growth rate of 0.9 percent per year.

## Enrollment, by Attendance Status

Full-time enrollment increased from 7.1 million in 1984 to an estimated 8.1 million in 1997 (figure 14). This is an average annual growth rate of 1.0 percent, for an increase of 14 percent over the period. Under the middle alternative, full-time enrollment is expected to increase another 19 percent to 9.7 million by the year 2009, representing an average annual growth rate of 1.5 percent. Over the projection period, the growth rate for the 1997-2003 period will be lower than the growth rate for the 2003-2009 period, 1.3 percent per year versus 1.6 percent per year (figure 15). Under the low alternative, full-time enrollment is expected to increase from 8.1 million in 1997 to 9.5 million by the year 2009, representing a growth rate of 1.3 percent per year. Under the high alternative, full-time enrollment is expected to increase from 8.1 million in 1997 to 9.9 million by the year 2009, representing a growth rate of 1.7 percent per year. Full-time enrollment is
expected to rise at a faster rate over the next 12 years than part-time enrollment. This changing pattern is driven by the influx of young traditional college-age students who tend to go to college full-time.

Part-time enrollment increased from 5.1 million in 1984 to an estimated 6.3 million in 1997. This is an average annual growth rate of 1.5 percent, for an increase of 22 percent over the period. Under the middle alternative, parttime enrollment is expected to increase at an average annual growth rate of 0.5 percent and reach 6.7 million by the year 2009, for an increase of 6 percent over the projection period. The growth rate for part-time enrollment during the 1997-2003 period will be the same as the growth rate for the 2003-2009 period, 0.5 percent. Under the low alternative, part-time enrollment is expected to increase from 6.3 million in 1997 to 6.5 million by the year 2009, representing a growth rate of 0.3 percent per year. Under the high alternative, part-time enrollment is expected to increase from 6.3 million in 1997 to 6.8 million by the year 2009, representing a growth rate of 0.7 percent per year.

## Enrollment, by Control of Institution

Enrollment in public institutions grew from 9.5 million in 1984 to an estimated 11.2 million in 1997, increasing at an average annual rate of 1.3 percent, for an increase of 18 percent over the period (figure 16). Under the middle alternative, public enrollment is expected to increase to 12.7 million by 2009 , rising by an average annual growth rate of 1.1 percent, for an increase of 13 percent over the projection period. During the projection period, enrollment in public institutions is projected to increase at an average annual growth rate of 1.0 percent during the 19972003 period and 1.1 percent during the 2003-2009 period (figure 17).

Under the low alternative, public enrollment is expected to increase from 11.2 million in 1997 to 12.5 million by the year 2009 , representing a growth rate of 0.9 percent per year. Under the high alternative, public enrollment is expected to increase from 11.2 million in 1997 to 13.0 million by the year 2009, representing a growth rate of 1.2 percent per year.

Enrollment in private institutions, which include nonprofit and proprietary, increased from 2.8 million in 1984 to an estimated 3.2 million in 1997, increasing at an average annual growth rate of 1.1 percent, for an increase of 15 percent over the period. Under the middle alternative, private enrollment is expected to increase to 3.6 million by 2009 , rising by an average annual growth rate of 1.1 percent, for an increase of 14 percent over the projection period. During the projection period, enrollment in private institutions is projected to increase at an annual growth rate of 1.0 percent during the 1997-2003 period and 1.2 percent during the 2003-2009 period.

Under the low alternative, private enrollment is expected to increase from 3.2 million in 1997 to slightly under 3.6 million by the year 2009, representing a growth rate
of 1.0 percent per year. Under the high alternative, private enrollment is expected to increase from 3.2 million in 1997 to 3.7 million by the year 2009, representing a growth rate of 1.3 percent per year.

## Enrollment, by Type of Institution

Enrollment in 4-year institutions increased from 7.7 million in 1984 to an estimated 8.8 million in 1997, increasing at an average annual growth rate of 1.0 percent, for a 14 percent increase over the period (table 4 and figure 18). Under the middle alternative, enrollment in 4-year institutions is expected to rise to 10.1 million by the year 2009, increasing at an average annual growth rate of 1.1 percent, for a 15 -percent increase over the projection period. During the projection period, enrollment in 4-year institutions is projected to increase at an annual growth rate of 1.1 percent during the 1997-2003 period and 1.2 percent during the 2003-2009 period (figure 19).
Under the low alternative, enrollment in 4-year institutions is expected to increase from 8.8 million in 1997 to 9.9 million by the year 2009, representing a growth rate of 1.0 percent per year. Under the high alternative, enrollment in 4-year institutions is expected to increase from 8.8 million in 1997 to 10.3 million by the year 2009, representing a growth rate of 1.3 percent per year.

Enrollment in 2-year institutions rose from 4.5 million in 1984 to an estimated 5.6 million in 1997, increasing at an average annual growth rate of 1.6 percent per year, for a 23-percent increase over the period (table 5). Under the middle alternative, enrollment in 2-year institutions is expected to rise to 6.2 million by the year 2009, increasing at an average annual growth rate of 0.9 percent, for a 12-percent increase over the projection period. During the projection period, enrollment in 2-year institutions is projected to increase at an annual growth rate of 0.9 percent during the 1997-2003 period and 1.0 percent during the 2003-2009 period.

Under the low alternative, enrollment in 2-year institutions is expected to increase from 5.6 million in 1997 to 6.1 million by the year 2009, representing a growth rate of 0.8 percent per year. Under the high alternative, enrollment in 2-year institutions is expected to increase from 5.6 million in 1997 to 6.4 million by the year 2009, representing a growth rate of 1.1 percent per year.

## Enrollment, by Age

The alternative projections of higher education enrollment by age, sex, and attendance status are shown in tables 6A and 6B (middle alternative), table 7 (low alternative), and table 8 (high alternative). Projections of college attendance rates appear in appendix table A1.3. These projections are based on age-specific enrollment data from the Bureau of the Census and enrollment data from NCES.
Under the middle alternative, the period from 1989 to 2009 will be one of change in the age distribution of
college students. In contrast to recent patterns, younger students are expected to become more prevalent on college campuses. The enrollment of students who are 18- to 24 -years old increased from 7.8 million in 1989 to an estimated 7.9 million in 1997, an increase of 2 percent (tables 6A and 6B and figure 26). However, this number is expected to increase to 9.8 million by the year 2009, an increase of 24 percent from 1997. As a result, the proportion of students who are 18 - to 24 -years old, which fell from 57 percent in 1989 to 55 percent in 1997, is projected to be 60 percent by the year 2009 .

On the other hand, the enrollment of students who are 25 years old and over increased from 5.6 million in 1989 to an estimated 6.3 million in 1997, an increase of 13 percent. This number is projected to be about the same in the year 2009. The proportion of students 25 years old and over rose from 41 percent in 1989 to 44 percent in 1997. This proportion is projected to be 39 percent by the year 2009 .

## Enrollment, by Level

Undergraduate enrollment increased from 10.6 million in 1984 to an estimated 12.4 million in 1997, increasing at an average annual growth rate of 1.2 percent, for a 16-percent increase over the period (table 14 and figure 20). Under the middle alternative, undergraduate enrollment is expected to increase to 14.3 million by the year 2009, at a growth rate of 1.2 percent per year, for a 15 -percent increase over the projection period. During the projection period, undergraduate enrollment is projected to increase at an annual growth rate of 1.2 percent during the 19972003 period and 1.2 percent during the 2003-2009 period (figure 21).

Under the low alternative, undergraduate enrollment is expected to increase from 12.4 million in 1997 to 14.0 million by the year 2009, representing a growth rate of 1.0 percent per year. Under the high alternative, undergraduate enrollment is expected to increase from 12.4 million in 1997 to 14.6 million by the year 2009, representing a growth rate of 1.4 percent per year.

Graduate enrollment rose from 1.3 million in 1984 to an estimated 1.7 million in 1997, at an average annual growth rate of 2.0 percent, for a 30 -percent increase over the period (table 17 and figure 22). Under the middle alternative, graduate enrollment is expected to increase to 1.8 million by the year 2009, increasing at an average annual growth rate of 0.2 percent, for a 3-percent increase over the projection period. During the projection period, graduate enrollment is projected to show no change during the 1997-2003 period and increase at a rate of 0.5 percent during the 2003-2009 period (figure 23).

Under the low alternative, graduate enrollment is expected to remain relatively stable between 1997 and 2009. Under the high alternative, graduate enrollment is expected to increase slightly from 1.7 million in 1997 to 1.8 million by the year 2009 , representing a growth rate of 0.4 percent per year.

First-professional enrollment increased from 279,000 in 1984 to an estimated 286,000 in 1997, an average annual growth rate of 0.2 percent, for a 3-percent increase over the period (table 20 and figure 22). Under the middle alternative, first-professional enrollment is expected to increase to 291,000 by 2009 . This represents an annual growth rate of 0.1 percent over the projection period, a 2-percent increase from 1997. During the projection period, first-professional enrollment is projected to decrease at a rate of 0.7 percent during the 1997-2003 period and increase at a growth rate of 0.9 percent during the 2003-2009 period (figure 23).

Under the low alternative, first-professional enrollment is expected to remain stable through the year 2009. Under the high alternative, first-professional enrollment is expected to increase from 286,000 in 1997 to 299,000 by the year 2009 , representing a growth rate of 0.4 percent per year.

## Full-Time-Equivalent Enrollment

Full-time-equivalent enrollment increased from 9.0 million in 1984 to an estimated 10.4 million in 1997, increasing at an average annual rate of growth of 1.1 percent, for a 16-percent increase over the period (table 23 and figure 24). Under the middle alternative, full-time-equivalent enrollment is expected to increase to 12.1 million by the year 2009 , increasing at an average annual growth rate of 1.3 percent, for a 16-percent increase over the projection period. During the projection period, full-time-equivalent enrollment is projected to increase at an annual growth rate of 1.2 percent during the 1993-2002 period and 1.4 percent during the 2003-2009 period (figure 25).

In public institutions, full-time-equivalent enrollment, which was an estimated 7.8 million in 1997, will be 9.1 million by the year 2009 (table 24). In private institutions, full-time-equivalent enrollment, which was an estimated 2.6 million in 1997, will be 3.0 million by the year 2009 (table 25).

Under the low alternative, full-time-equivalent enrollment is expected to increase from 10.4 million in 1997 to 11.9 million by the year 2009, representing a growth rate of 1.1 percent per year. Under the high alternative, full-time-equivalent enrollment is expected to increase from 10.4 million in 1997 to 12.3 million by the year 2009, representing a growth rate of 1.5 percent per year.

## Chapter 3

## High School Graduates

The number of high school graduates is projected to increase 23 percent over the projection period, reflecting the overall rise in the 18 -year-old population (figure 29). Increases in the number of graduates are expected for both public and private schools. The significant rise in the number of graduates reflects the increase in the 18 -year-old population over the projection period, rather than changes in the graduation rates of 12 th graders.

However, projections of graduates could be impacted by changes in policies affecting graduation requirements. Projections of public school graduates that have been produced over the past 15 years are less accurate than projections of public elementary and secondary enrollment, but more accurate than projections of earned degrees by level that NCES has published over the same time period. For more information, see appendix A2, page 141.

## Total High School Graduates

A high school graduate is defined as an individual who has received formal recognition from school authorities, by the granting of a diploma, for completing a prescribed course of studies at the secondary level school. This definition does not include other high school completers, high school equivalency recipients, or other diploma recipients.

The number of high school graduates from public and private schools decreased from 2.8 million in 1983-84 to 2.6 million in 1985-86 (table 26 and figure 30). After 1985-86, this number increased to 2.8 million in 198788. Then, it decreased to around 2.6 million in 199697, a decrease of 4 percent from 1983-84, or an average annual rate of decline of 0.4 percent. The total number of high school graduates is projected to rise to 3.2 million by 2008-09, an increase of 23 percent from 1996-97, or an average annual growth rate of 1.7 percent. During the projection period, the growth rate will be higher in the first half of the projection period (1996-97 to 200203) than the growth rate in the second half (2002-03 to 2008-09), 2.0 percent per year versus 1.4 percent per year.

## High School Graduates, by Control of Institution

The number of graduates of public high schools decreased from 2.5 million in 1983-84 to 2.4 million in 1985-86 (figure 31). Then, it increased to 2.5 million in 1987-88 before declining to about 2.4 million in 199697, a decrease of 5 percent from 1983-84, or an average annual rate of decline of 0.4 percent. Over the projection period, public high school graduates are projected to increase to 2.9 million by 2008-09, an increase of 23 percent from 1996-97, or an average annual growth rate of 1.7 percent. During the projection period, the growth rate will be higher in the first half of the projection period (1996-97 to 2002-03) than the growth rate in the second half (2002-03 to 2008-09), 2.0 percent per year versus 1.4 percent per year (figure 32).

The number of graduates of private high schools is projected to increase from an estimated 276,000 in 199697 to 338,000 by $2008-09$, an increase of 22 percent, or an average annual growth rate of 1.7 percent. During the projection period, the growth rate will be higher in the first half of the projection period (1996-97 to 200203) than the growth rate in the second half (2002-03 to 2008-09), 2.0 percent per year versus 1.4 percent per year.

(This table was prepared July 1999.)

## Chapter 4

## Earned Degrees Conferred

The historical growth in enrollment of women in institutions of higher education has led to a substantial increase in the number of earned degrees conferred. Between 198384 and 1996-97, the number of degrees awarded to women rose at all levels. In 1996-97, women earned the majority of associate's, bachelor's, and master's degrees, and twofifths of doctor's and first-professional degrees. Over the projection period, the number of degrees awarded to men and women will continue to rise at most levels.

Projections of earned degrees by level and sex were based primarily on college-age populations and higher education enrollment by level enrolled and attendance status. There are many factors that affect future levels of earned degrees such as choice of degree, demand for occupations, etc. These factors were not included in the models used to develop the projections. Projections of earned degrees by level that have been produced over the last 13 years are less accurate than projections of public elementary and secondary enrollment, higher education enrollment, and public high school graduates that NCES has published over the same time period. For more information, see appendix A3, page 143.

## Associate's Degrees

Between 1983-84 and 1984-85, the number of associate's degrees increased from 452,240 to 454,712 . Thereafter, it decreased to 435,085 in 1987-88. Since then, it increased to an estimated 561,000 in 1996-97 (table 27 and figure 33). It is projected to increase to 628,000 by 2008-09, an increase of 12 percent from 1996-97. The number of associate's degrees awarded to men decreased from 202,932 in 1984-85 to 186,316 in 198889 , before rising to an estimated 222,000 in 1996-97 (figure 34). This number is projected to increase to 236,000 by 2008-09. The number of associate's degrees awarded to women fell from 249,536 in 1983-84 to 245,038 in 198788. Thereafter, it increased to an estimated 339,000 in 1996-97, an increase of 36 percent from 1983-84. This number is projected to increase to 392,000 by $2008-09$, an increase of 16 percent from 1996-97.

## Bachelor's Degrees

The number of bachelor's degrees increased from 974,309 in 1983-84 to an estimated $1,160,000$ in 199697, an increase of 19 percent (table 28 and figure 35). This number is expected to remain relatively stable between

1997-98 and 1999-2000, and then increase to $1,257,000$ by $2008-09$, an increase of 8 percent from 1996-97. The number of bachelor's degrees awarded to men increased from 482,319 in 1983-84 to 485,923 in 1985-86 and then declined for two years, before rising to 532,881 in 1992-93. Then, this number decreased to an estimated 520,000 in 1996-97 (figure 36). This number is expected to decrease to 505,000 by $2000-01$ and then increase to 531,000 by $2008-09$, an increase of 2 percent from 1996-97. The number of bachelor's degrees awarded to women increased from 491,990 in 1983-84 to an estimated 640,000 in 1996-97, an increase of 30 percent. This number is expected to increase to 725,000 by $2008-09$, an increase of 13 percent from 1996-97.

## Master's Degrees

The number of master's degrees increased from 284,263 in 1983-84 to an estimated 416,000 in 1996-97, an increase of 46 percent from 1983-84 (table 29 and figure 37). This number is expected to decrease to 379,000 in 200203 as the 25 - to 34 -year-old population is projected to decline during the projection period. Then, it is projected to increase to 400,000 by 2008-09. The number of master's degrees awarded to men decreased from 143,595 in 198384 to 141,269 in 1986-87. Then, it increased to an estimated 180,000 in 1996-97 (figure 38). This number is projected to decrease 159,000 in 2002-03 and then rise to 164,000 by 2008-09. The number of master's degrees awarded to women increased from 140,668 in 1983-84 to 236,000 in 1996-97. This number is expected to be around 236,000 in 2008-09.

## Doctor's Degrees

The number of doctor's degrees increased from 33,209 in 1983-84 to about 44,900 in 1996-97, an increase of 35 percent (table 30 and figure 39). This number is expected to decrease to 43,400 in 2003-04 and then increase to 44,300 by $2008-09$. The number of doctor's degrees awarded to men increased from 22,064 in 1983-84 to an estimated 26,800 in 1996-97. This number is expected to decrease to 26,100 by 2008-09 (figure 40 ). The number of doctor's degrees awarded to women rose from 11,145 in 1983-84 to an estimated 18,100 in 1996-97, an increase of 62 percent. The number of doctor's degrees awarded to women is projected to be 18,200 by $2008-09$. The
share of doctor's degrees awarded to women, which was 34 percent in 1983-84 and 40 percent in 1996-97, is projected to be 41 percent by 2008-09.

## First-Professional Degrees

The number of first-professional degrees awarded rose from 74,468 in 1983-84 to 75,063 in 1984-85. Then, it decreased to 70,735 in 1987-88. Thereafter, it increased to about 77,700 in $1996-97$ (table 31 and figure 41). This number is expected to increase to 78,100 in $1997-$ 98 and then decrease to 71,300 in 2003-04. Thereafter, it will increase to 74,300 by $2008-09$. The number of
first-professional degrees awarded to men decreased from 51,378 in 1983-84 to 43,846 in 1990-91 (figure 42). Then, it increased to an estimated 45,000 in 1996-97. This number is projected to decrease to 39,400 by 2004-05. Thereafter, it is projected to increase to 40,300 by $2008-09$. The number of first-professional degrees awarded to women increased from 23,090 in 1983-84 to an estimated 32,700 in 1996-97, an increase of 42 percent. This number is expected to increase to 34,000 by $2008-09$, an increase of 4 percent from 1996-97. The women's proportion of first-professional degrees rose from 31 percent in 198384 to 42 percent in 1996-97. By 2008-09, this proportion is expected to rise to 46 percent.

## Chapter 5

## Classroom Teachers

Between 1997 and 2009, the number of classroom teachers in elementary and secondary schools is projected to rise, primarily due to the increase in school enrollment during this period. Increases are expected in the numbers of both elementary and secondary teachers. The number of secondary teachers will increase at a faster rate than the number of elementary teachers. The numbers of both public and private teachers are projected to grow. The projections do not take into account increases in the number of teachers which would be due to the effects of the proposed initiative to reduce elementary class sizes.

Three alternative projections of the numbers of classroom teachers were developed to indicate a range of possible outcomes. These alternatives are based on different economic assumptions about the growth path for one of the key variables in the teacher model-education revenue receipts from state sources per capita. Under the middle alternative, education revenue receipts from state sources per capita is projected to increase by 8 percent between 1997 and 2009. The low alternative assumes that education revenue receipts from state sources per capita will increase by 2 percent over the projection period. The high alternative assumes that education revenue receipts from state sources per capita will increase by 14 percent during this period. The second variable in the teacher model, enrollment by organizational level, is the same for all three alternatives.

## Average annual rate of change (in percent)

|  | 1984-97 | Projected 1997-2009 |  |  |

| Secondary ................ | 0.1 | 2.1 | 1.0 | 0.4 |
| Public ..................... | 1.7 | 1.4 | 0.6 | 0.1 |
| Private .................... | 0.6 | 1.5 | 0.5 | 0.0 |

## Elementary and Secondary School Teachers

The number of classroom teachers in elementary and secondary schools increased from 2.51 million in 1984 to about 3.04 million in 1997, an increase of 21 percent (table 32 and figure 43). Under the middle alternative, the number of classroom teachers is projected to increase to 3.17 million by the year 2009, increasing at an average annual growth rate of 0.4 percent, for a 4-percent increase over the projection period. The growth rate will be higher in the first half of the projection period (1997-2003) than in the second half (2003-2009), 0.6 percent per year versus 0.1 percent (figure 44). Under the low alternative, the number of classroom teachers is projected to increase to 3.10 million by the year 2009, increasing at an average annual growth rate of 0.2 percent. Under the high alternative, classroom teachers are projected to increase to 3.24 million by the year 2009 , increasing at an average annual growth rate of 0.5 percent.

## Classroom Teachers, by Organizational Level

The number of elementary teachers increased from 1.45 million in 1984 to 1.83 million in 1997, an increase of 26 percent from 1984 (figure 45). Under the middle alternative, the number of elementary teachers is projected to increase to 1.86 million by 2009 , an increase of 1 percent from 1997; this increase represents an average annual growth rate of 0.1 percent per year. During the projection period, the growth rate in the 1997-2003 period will be 0.3 percent, while the rate of decline in the 20032009 period will be 0.1 percent (figure 46). Under the low alternative, the number of elementary teachers is projected to increase to 1.82 million by the year 2009, decreasing at an average annual rate of 0.1 percent. Under the high alternative, elementary teachers are projected to increase to 1.90 million by the year 2009, increasing at an average annual growth rate of 0.3 percent.

The number of secondary classroom teachers increased from 1.06 million in 1984 to about 1.20 million in 1997, an increase of 14 percent from 1984. Under the middle alternative, the number of secondary teachers is projected to increase from 1.20 million in 1997 to 1.31 million by the year 2009, resulting in an increase of 9 percent. This increase will represent an average annual growth rate of 0.7 percent over the projection period. During
the projection period, the growth rate in the 1997-2003 period will be 1.0 percent, while the growth rate in the 2003-2009 period will be 0.4 percent. Under the low alternative, the number of secondary teachers is projected to increase to 1.29 million by the year 2009, increasing at an average annual growth rate of 0.6 percent. Under the high alternative, secondary teachers are projected to increase to 1.34 million by the year 2009 , increasing at an average annual growth rate of 0.8 percent.

## Classroom Teachers, by Control of School

The number of classroom teachers in public elementary and secondary schools increased from 2.17 million in 1984 to about 2.65 million in 1997, an increase of 22 percent from 1984 (figure 47). Under the middle alternative, the number of public school teachers is projected to increase to 2.77 million by the year 2009, resulting in an increase of 4 percent from 1997. This increase will represent an average annual growth rate of 0.4 percent. During the projection period, the growth rate in the 1997-2003 period will be 0.6 percent, while the growth rate in the 20032009 period will be 0.1 percent (figure 48). Under the low alternative, the number of public school teachers is projected to increase to 2.71 million by the year 2009, increasing at an average annual growth rate of 0.2 percent. Under the high alternative, public school teachers are projected to increase to 2.83 million by the year 2009, increasing at an average annual growth rate of 0.5 percent. Projections of public classroom teachers that have been produced over the last 15 years are nearly as accurate as projections of public high school graduates, but less accurate than projections of public elementary and secondary teachers that NCES has published over the same time period. For more information, see appendix A4, page 152.

The number of classroom teachers in private elementary and secondary schools was an estimated 388,000 in 1997. Under the middle alternative, this number is projected to increase to 401,000 by the year 2009, an increase of 3 percent from 1997. This increase will represent an average annual growth rate of 0.3 percent. During the projection period, the growth rate in the 1997-2003 period will be 0.5 percent, while the growth rate in the 2003-2009 period will be 0.0 percent. Under the low alternative, the number of private school teachers is projected to increase to 393,000 by the year 2009, increasing at an average annual growth rate of 0.1 percent. Under the high alternative, private school teachers are projected to increase to 410,000 by
the year 2009, increasing at an average annual growth rate of 0.5 percent.

## Pupil/Teacher Ratios

A broad relationship between the number of pupils and teachers can be described by the pupil/teacher ratio. The pupil/teacher ratios were computed based on elementary and secondary enrollment by organizational level and the number of classroom teachers by organizational level.

The pupil/teacher ratio in elementary schools decreased from 19.3 in 1984 to 18.4 in 1992. Then, it increased to 18.9 in 1997 (table 33 and figure 49). Under the middle alternative, this ratio is projected to decline to 18.8 by the year 2009. Under the low and high alternatives, the pupil/teacher ratio in elementary schools is expected to range between 18.3 and 19.2 by the year 2009.

For public elementary schools, under the middle alternative, the pupil/teacher ratio is projected to decrease from 19.4 in 1997 to 19.2 by the year 2009 (figure 50). Under the low and high alternatives, the pupil/teacher ratio in public elementary schools is projected to range between 18.7 and 19.6 by the year 2009 . For private elementary schools, under the middle alternative, the pupil/teacher ratio is projected to decrease from 16.6 in 1997 to 16.5 by the year 2009. Under the low and high alternatives, the pupil/teacher ratio in private elementary schools is expected to range between 16.1 and 16.8 by the year 2009.

For secondary schools, the pupil/teacher ratio decreased from 16.0 in 1984 to 14.3 in 1990. Next, it increased to about 14.8 in 1992. Then, it declined to 14.5 in 1997. Under the middle alternative, this ratio is projected to increase to 14.7 by 2009 . Under the low and high alternatives, the pupil/teacher ratio in secondary schools is projected to range between 14.4 and 15.0 by the year 2009.

For public secondary schools, under the middle alternative, the pupil/teacher ratio is projected to increase from 14.8 in 1997 to 15.0 by 2009. Under the low and high alternatives, the pupil/teacher ratio in public secondary schools is expected to range between 14.7 and 15.3 by the year 2009. For private secondary schools, under the middle alternative, the pupil/teacher ratio is projected to increase from 11.6 in 1997 to 11.9 by the year 2009. Under the low and high alternatives, the pupil/teacher ratio in private secondary schools is projected to range between 11.7 and 12.1 by the year 2009 .

Although private school classroom teachers represented 13 percent of total classroom teachers in 1997, private school enrollment was 11 percent of total enrollment. This indicates that private schools have more teachers for a
given number of students than do public schools; that is, private school pupil/teacher ratios are smaller than public school pupil/teacher ratios.

(This table was prepared August 1998.)

# Expenditures of Public Elementary and Secondary Schools 

Current expenditures are projected to increase by 25 percent in constant dollars between school years 199596 and 2008-09 in the middle set of projections presented in this chapter. Average annual teacher salaries in public elementary and secondary schools in constant dollars are projected to increase 1 percent during that period. (Note that all percent changes presented in this chapter were calculated using unrounded numbers.) These projections are based on assumptions concerning economic growth and assistance by state governments to local governments which are discussed in appendix A5. Other sets of projections, based on alternative economic scenarios, are also discussed. No projections for private schools are presented as there are no regular data collections for private school expenditures.

There are many factors that may affect future school expenditures and teacher salaries that were not considered in the production of the projections presented in this chapter. These include: 1) recent policy initiatives to decrease classroom size; and 2) potential changes in the distribution of elementary and secondary teachers as older teachers retire and are replaced by younger teachers. Projections of current expenditures that have been produced over the last eleven years are generally less accurate than the recent NCES projections of public elementary and secondary enrollment, public high school graduates, and classroom teachers, more accurate than the recent NCES projections of higher education enrollment, earned degrees, and teacher salaries, and of similar accuracy to recent NCES projections of expenditures of institutions of higher education. Projections of teacher salaries that have been produced over the last eleven years are generally less accurate than the recent NCES projections of public elementary and secondary enrollment, public high school graduates, classroom teachers, current expenditures in elementary and secondary schools, and expenditures of institutions of higher education, and of similar accuracy to recent NCES projections of higher education enrollment and earned degrees.

## Current Expenditures

## Past Trends

Current expenditures increased from $\$ 180.2$ billion in 1983-84 to $\$ 262.3$ billion in 1995-96 using constant 199697 dollars and the Consumer Price Index (table 34 and
figure 51). (The 1995-96 school year is the last year for which current expenditures are available.) This was an increase of 46 percent. Current expenditures are estimated to increase to $\$ 276.8$ billion by 1997-98, an increase of 54 percent since 1983-84. From 1983-84 to 199596, current expenditures per pupil in average daily attendance rose 28 percent to $\$ 6,320$ (table 34 and figures 52 and 53). Current expenditures per pupil in average daily attendance increased an estimated 30 percent from 1983-84 to 1997-98. Current expenditures per pupil in fall enrollment (table 35) increased 27 percent from 198384 to 1995-96.

Historically, education expenditures have followed a path similar to general economic trends. For much of the period since 1983-84, the economy has been rising. Current expenditures have also been rising during that period. (See figure 54 for a comparison of the growth rates of current expenditures per pupil and one major indicator of the state of the economy, disposable income per capita, and table B6 for the values of disposable income per capita.)

The amount that local governments spend on education is also historically associated with the amount of state education aid to local governments (table B7). There was a rapid rise in state education aid to local governments during the period from 1983-84 to 1995-96. (See figure 55 for a comparison of the growth rates of current expenditures per pupil and revenue receipts from state sources per capita.)

Current expenditures, which had already been increasing, have increased each year since 1983-84. The percent increase has not been constant over that time, however. Most of the largest of the percent increases occurred from 1984-85 to 1989-90. That was the period when disposable income per capita and state education aid per capita were also increasing most rapidly. Also during that period, enrollments, which had been falling since the early 1970s, entered a period of steady increases. Since 1989-90, current expenditures have not been increasing as rapidly. Disposable income per capita and state education aid per capita have been increasing at lower rates than in the mid-1980s as well.

The percentage of total disposable income spent on public elementary and secondary school current expenditures has increased slightly from 1983-84 (4.4 percent) to 199596 ( 4.8 percent) (tables 34, B5 and B6). The year 198384 is notable because enrollment as measured by average
daily attendance reached its lowest level since 1962-63 and has been increasing annually since then.

Current expenditures per pupil in average daily attendance as a percentage of disposable income per capita rose from 28.2 percent in 1983-84 to 30.2 percent in 199596.

## Alternative Projections

Three sets of projections are presented for current expenditures in this chapter. Each set of projections is based on alternative assumptions concerning the economy. These assumptions together with the methodology used to produce the current expenditure projections are discussed in appendix A5.

The projections in this chapter are presented in both constant 1996-97 dollars and in current dollars. The projections were developed in constant dollars and then placed in current dollars using projections for the Consumer Price Index (CPI) (table B8). Three alternative sets of projections for the CPI were used, one for use with the middle alternative projections, one for use with the low alternative projections, and one for use with the high alternative projections. As the set of projections for the CPI developed for use with the low economic growth projections is rising at the most rapid rate and that developed for use with the high economic growth projections is rising at the slowest rate, it is frequently the case that the expenditure projections in current dollars from the low economic growth set of projections are higher than those from the other two alternative sets of projections.

In the middle alternative projections, current expenditures in constant 1996-97 dollars are projected to increase steadily throughout the forecast period, reaching \$326.8 billion in 2008-09. This is an increase of 25 percent over the 1995-96 level, and 18 percent over the estimated level for 1997-98. Current expenditures are projected to increase most rapidly during the first half of the period. This is also the period during which enrollments are expected to increase most rapidly.

Current expenditures per pupil in average daily attendance are projected to increase by 16 percent to $\$ 7,306$ from 1995-96 to 2008-09 (table 34 and figure 52).

In the middle economic growth projection, total current expenditures as a percentage of total disposable income are projected to decrease to 4.4 percent from 1995-96 to 2008-09. Current expenditures per pupil in average daily attendance as a percentage of disposable income per capita are projected to decrease slightly, from 30.2 percent to 28.8 percent during the same period.

In the low economic growth projections, both current expenditures and current expenditures per pupil are projected to increase more slowly than in the middle set of projections. Current expenditures are projected to increase by 17 percent from 1995-96 to 2008-09, reaching
$\$ 307.9$ billion at the end of the forecast period. Current expenditures per pupil in average daily attendance are projected to reach $\$ 6,885$ by 2008-09, an increase of 9 percent since 1995-96.

In the high economic growth projections, current expenditures are projected to increase by approximately 32 percent over the $1995-96$ level to $\$ 346.4$ billion in 2008-09. Current expenditures per pupil in average daily attendance are projected to increase by 23 percent to $\$ 7,746$ since 1995-96.

## Teacher Salaries

## Past Trends

The period from 1983-84 to 1997-98 has been dominated by two different patterns for teacher salaries in constant dollars (table 36 and figures 56 and 57).

Teacher salaries had reached the bottom of a period of steady declines in 1980-81, and then entered a period of steady and relatively rapid growth. From 1983-84 to 1989-90, teacher salaries increased 14.6 percent, from $\$ 34,259$ to $\$ 39,262$. During this period, current expenditures and the revenues of state governments were increasing rapidly. (See figure 59 for a comparison of the growth rates for teacher salaries and current expenditures per pupil.) It was during that period when enrollment, which had also been in a period of steady decline, began increasing again.

From 1989-90 to 1997-98, teacher salaries declined 1.5 percent. During much of that period, the economy, current expenditures, and revenues of state and local governments had not been increasing as rapidly as earlier.

## Alternative Projections

As with current expenditures, three sets of projections are presented for teacher salaries. The methodology and the assumptions used to produce these projections are discussed in appendix A5.

In the middle economic growth projections, the average teacher salary in constant 1996-97 dollars is projected to reach $\$ 39,037$ in $2008-09$ (table 36 and figure 56). This is a 1-percent increase from the level estimated for 1997-98.

In the low alternative projections, teacher salaries are projected to fall slightly throughout the projection period. The average salary is projected to fall to $\$ 38,003$ in 200809, a decrease of about 2 percent from 1997-98. (See figure 57 for a comparison of the growth rates for the alternative sets of projections.)

In the high alternative projections, the average teacher salary is projected to reach $\$ 40,083$ in 2008-09, an increase of about 4 percent from 1997-98.

## Chapter 7

# Expenditures of Institutions of Higher Education 

The steady growth in higher education expenditures that has marked the 1980s and early 1990s is expected to continue throughout the 1990s and beyond with total current fund expenditures projected to increase 36 percent from 1995-96 to 2008-09 in constant dollars. (Note that all percent changes presented in this chapter were calculated using unrounded numbers.) Key assumptions behind these projections include: (1) the economy continues to grow at a steady rate; (2) inflation rates remain near current levels; (3) and enrollments increase as in the middle alternative projections presented in chapter 2. Projections based on alternative economic scenarios are discussed below.

The higher education system is examined by both control of institution (public versus private) and by type of institution ( 4 -year versus 2 -year). For each of these sectors of higher education, two different types of expenditures-current-fund expenditures and educational and general expenditures-are examined. Educational and general expenditures consist of those current-fund expenditures that are for activities that are directly related to the education of students. Expenditures for such activities as auxiliary enterprises, e.g. student dormitories, cafeterias, and bookstores, and university hospitals are excluded. All expenditure data have been adjusted for inflation. Since the historical trends and the projections of current-fund expenditures and educational and general expenditures are similar, emphasis is given to current-fund expenditures.
There are many factors that may affect future higher education expenditures that were not considered in the production of the projections presented in this chapter. Projections of expenditures of institutions of higher education that have been produced over the last seven years are generally less accurate than the recent NCES projections of public elementary and secondary enrollment, public high school graduates, and classroom teachers, more accurate than the recent NCES projections of higher education enrollment, earned degrees, and teacher salaries, and of similar accuracy to recent NCES projections of current expenditures in elementary and secondary schools.

## Past Trends

Following a well-established trend, current-fund expenditures have increased significantly since 1983-84 (table 37 and figure 60). In real terms, current-fund expenditures increased 53 percent from 1983-84 to 1995-96. (1995-

96 is the last year for which there are actual data.) The rate of increase in current-fund expenditures during this period has not been consistent with years of rapid growth and others of slow growth. Factors that are associated with current-fund expenditures during these periods include: (1) the economy as a whole, and, for public institutions, the economic situation of state and local governments; (2) the inflation rate; and (3) enrollments.

The greatest increases in current-fund expenditures occurred from 1983-84 to 1986-87, when current-fund expenditures rose 18 percent. The economy was increasing steadily during that period with disposable income per capita rising 8 percent.

The 29 percent increase that occurred from 1986-87 to 1995-96 was partly due to the rapid increase in enrollments that occurred during that time. The number of students as measured by full-time-equivalent enrollment rose 14 percent. From 1983-84 to 1986-87, full-time-equivalent enrollment fell slightly.

While current-fund expenditures in both public and private institutions rose, they did not rise at the same rate. From 1983-84 to 1995-96, current-fund expenditures increased 48 percent in public institutions and 61 percent in private institutions (table 37).

For the period under examination, educational and general expenditures have been an almost constant percentage of current-fund expenditures (increasing from 78 percent in 1983-84 to 79 percent in 1995-96). Hence, the trend for educational and general expenditures is similar to that for current-fund expenditures (table 38 and figure 61). Total educational and general expenditures in constant dollars increased 56 percent from 1983-84 to 1995-96. There was a 48 percent increase in educational and general expenditures in public colleges from 1983-84 to 199596 and a 71 percent increase in private colleges.

Since the trends of current-fund expenditures for the different sectors show some differences, the data are examined separately for each sector, except private 2-year institutions. Expenditures are examined both as a total and per student in full-time-equivalent (FTE) enrollment.

The trend for private 2-year projections is not shown separately because there have been significant additions to the universe of private 2-year institutions since 198081. Private 2 -year institutions comprise the smallest of the higher education sectors. In 1995-96, they accounted for 1 percent of total current-fund expenditures and 2 percent of FTE enrollment.

## Public 4-Year Institutions

The trend for current-fund expenditures in public 4year institutions is very similar to that for all institutions (table 39). From 1983-84 to 1995-96 current-fund expenditures increased 48 percent with the most rapid growth occurring from 1983-84 to 1986-87. Current-fund expenditures rose 18 percent during that time, while full-timeequivalent enrollment increased by 1 percent.

As with total current-fund expenditures, current-fund expenditures per student rose each year from 1983-84 to 1995-96. Most of the increase occurred from 198384 to 1986-87 when current-fund expenditures per student rose 17 percent. From 1986-87 to 1995-96, when FTE enrollment rose 11 percent, current-fund expenditures per student rose 14 percent.

The trend for educational and general expenditures (table 40) is similar to that for current-fund expenditures.

## Public 2-Year Institutions

Current-fund expenditures in public 2-year institutions increased 12 percent from 1983-84 to 1986-87 (table 41). A further 33-percent increase in current-fund expenditures occurred from 1986-87 to 1995-96, when FTE enrollments rose 21 percent.

A somewhat different pattern emerges when public 2year current-fund expenditures are placed in per student terms. Between 1983-84 and 1986-87, current-fund expenditures per student rose 18 percent. From 198687 to 1995-96, current-fund expenditures per student rose 10 percent.

The trend for educational and general expenditures (table 42) is similar to that for current-fund expenditures.

## Private 4-Year Institutions

Like public institutions, current-fund expenditures in private 4 -year institutions rose rapidly throughout the 1980 s and into the 1990s. From 1983-84 to 1995-96, total currentfund expenditures rose 62 percent (table 43).

Expenditures per student also increased significantly during the period from 1983-84 to 1995-96. The greatest increases occurred from 1983-84 to 1986-87, when cur-rent-fund expenditures per student rose 20 percent. After that, as enrollments increased, current expenditures per student have continued to increase, but not at as rapid a rate. From 1986-87 to 1995-96, current expenditures per student rose 15 percent.

The trend for educational and general expenditures (table 44) is similar to that for current-fund expenditures.

## Alternative Projections

Projections have been prepared for each of the sectors of higher education. The methodology and assumptions used to produce these projections are discussed in appendix A6.

There are three sets of projections for the public 4year, public 2 -year, and private 4 -year sectors. Due to the short time series of consistent data, only one set of projections was produced for the private 2 -year sector. This set of projections for private 2 -year institutions is not examined separately.

The projections in this chapter are presented in both constant 1996-97 dollars and current dollars. The projections were developed in constant dollars and then placed in current dollars using projections for the Consumer Price Index (CPI). Three alternative sets of projections for the CPI were used, one for use with the middle alternative projections, one for use with the low alternative projections, and one for use with the high alternative projections. As the set of projections for the CPI developed for use with the low alternative projections is rising at the most rapid rate and that developed for use with the high alternative projections is rising at the slowest rate, it is frequently the case that the current dollar projections from the low alternative set of projections are higher than those from the other two alternative sets of projections.

All of the alternative projections indicate an increase in current-fund expenditures throughout the remainder of the century. In the middle alternative projection, currentfund expenditures are projected to reach $\$ 265.5$ billion in 2008-09. This is a 36 -percent increase from 199596 , the last year for which there are actual data. In the low alternative projection, current-fund expenditures are projected to increase to $\$ 259.3$ billion. In the high alternative projection, the figure for 2008-09 is $\$ 271.2$ billion.

A similar pattern is seen for educational and general expenditures. In the middle alternative projection, educational and general expenditures are projected to be $\$ 208.5$ billion in 2008-09, a 34-percent increase from 1995-96. In the low alternative projection, educational and general expenditures are projected to increase to $\$ 202.5$ billion. In the high alternative projection, the figure for 200809 is $\$ 214.0$ billion.

It should be noted that private institutions are in the process of going from one accounting model to another. This change will affect revenues and expenditures of private institutions beginning with data for 1996-97. Work has also begun on changing the accounting model of public institutions, but a new accounting model for public institutions will probably not be implemented until the early part of the next century. The terms current-fund expenditures and educational and general expenditures are not used in the new accounting model for private institutions and will not be used in the new accounting model for public institutions. Cross-walks have been developed for use in comparing the data gathered from private institutions under the old accounting model and the new accounting model, but these cross-walks can only approximate the values for current-fund expenditures and educational and general expenditures that would have been produced under the old accounting model. Hence, there is uncertainly about the future of projections of higher education expenditures in future editions of Projections of Education Statistics.

## Public 4-Year Institutions

There are only small differences in the trends among the various sectors of higher education. In public 4-year institutions, current-fund expenditures are projected to reach $\$ 138.4$ billion in the middle alternative projection in 2008-09 (table 39). This is a 37 -percent increase from 1995-96 to 2008-09. In the low alternative projection, the value for 2008-09 is $\$ 136.6$ billion, and in the high alternative projection, it is $\$ 140.1$ billion.

Since full-time-equivalent (FTE) enrollment is projected to increase by 15 percent from 1995-96 to 2008-09, the rate of increase for expenditures is lower on a per student basis. In the middle alternative projection, a 19 -percent increase is projected for the period from 1995-96 to 200809 compared with 18 percent for the low alternative projection and 21 percent for the high alternative projection.

## Public 2-Year Institutions

Expenditures are also projected to increase in public 2-year institutions. For instance, in the middle alternative
projection, current-fund expenditures are projected to reach $\$ 29.0$ billion in 2008-09 and expenditures per student are projected to increase to $\$ 8,397$. When the low alternative projection is used, with its lower growth path for revenues of state and local governments per capita, lower values for current expenditures are found. When the high alternative projection is used, with its higher growth path for revenues of state and local governments per capita, higher values are found.

## Private 4-Year Institutions

The trends for private 4 -year institutions exhibit the same patterns as other types of institutions. Total currentfund expenditures are seen as increasing each year. In the middle alternative projection, from 1995-96 to 200809 , they are projected to increase 36 percent. Currentfund expenditures per student are projected to increase 19 percent during the same time.

## State-Level Projections

Figure 62
Map of the United States, by region

## Chapter 8

# Public Elementary and Secondary Enrollment 

Public elementary and secondary school enrollment is projected to rise between 1997 and the year 2009, but growth will vary widely across the Nation (table 45 and figure 63). Enrollment will increase in the Western and Southern regions, where public school enrollment is expected to rise 11 percent and 5 percent, respectively. A decrease of 2 percent is projected for the Northeastern region, while a decrease of 1 percent is expected in the Midwestern region (table 46 and figure 64).

## Public School Enrollment

Over the projection period, public school enrollment is expected to vary across states. The Northeast will have enrollment decreases in eight out of nine states. Decreases will occur in Connecticut ( 3 percent), Maine ( 9 percent), Massachusetts (1 percent), New Hampshire ( 0.6 percent), New York (1 percent), Pennsylvania (4 percent), Rhode Island (4 percent), and Vermont ( 6 percent). An increase of 2 percent is expected in New Jersey. Over the projection period, enrollment will grow between 1997 and 2003 in most states, while it will decline between 2003 and 2009.

In the Midwest, enrollment will increase in three of the states between 1997 and 2009. Increases are projected for Illinois ( 7 percent), Indiana ( 3 percent), and South Dakota ( 1.0 percent). Decreases are projected for Iowa ( 6 percent), Kansas ( 0.8 percent), Michigan ( 4 percent), Minnesota ( 3 percent), Missouri ( 0.6 percent), Nebraska ( 2 percent), North Dakota ( 8 percent), Ohio ( 5 percent), and Wisconsin (3 percent).

Enrollment increases are projected for many of the Southern states between 1997 and 2009. Increases are projected for Georgia ( 12 percent), North Carolina ( 7 percent), Tennessee ( 8 percent), and Texas (11 percent). Smaller increases are expected for Alabama ( 2 percent), Delaware ( 0.9 percent), Florida (4 percent), Maryland ( 2 percent), Mississippi ( 0.6 percent), and Virginia (4 percent). Decreases in enrollment have been projected for Arkansas ( 0.6 percent), the District of Columbia (10 percent), Kentucky ( 2 percent), Louisiana ( 5 percent), Oklahoma (6 percent), South Carolina ( 5 percent), and West Virginia (7 percent).

All of the states in the West are expected to show increases in enrollment between 1997 and 2009. Increases are expected in Alaska ( 9 percent), Arizona ( 21 percent), California (10 percent), Colorado ( 9 percent), Hawaii (18
percent), Idaho (20 percent), Nevada (28 percent), New Mexico ( 15 percent), and Utah ( 11 percent) over the projection period. Smaller increases are expected in Montana ( 3 percent), Oregon ( 4 percent), Washington ( 6 percent), and Wyoming (3 percent).

## Elementary Enrollment

Between 1997 and 2009, public elementary school enrollment in kindergarten through grade $8(\mathrm{~K}-8)$ is expected to increase by less than 1 percent. Increases in elementary enrollment are expected to occur in less than half of the states across the Nation (table 47 and figure 65). These expected increases in elementary enrollment are a reflection of immigration and the rising number of births beginning in 1977, rather than changes in the attendance rates of young children. The NCES projections do not account for enrollment increases that may be caused by changing state and local policies about the provision of prekindergarten and kindergarten programs. Expansion of these programs could lead to higher enrollments at the elementary school level.

Elementary enrollment is expected to show a decrease of 6 percent in the Northeast between 1997 and 2009 (table 48 and figure 66). All states are expected to show decreases. These decreases are projected for Connecticut ( 9 percent), Maine ( 9 percent), Massachusetts ( 6 percent), New Hampshire (3 percent), New Jersey (2 percent), New York (6 percent), Pennsylvania ( 6 percent), Rhode Island ( 7 percent), and Vermont ( 6 percent).

A decrease in elementary enrollment has been projected for the Midwestern region. Between 1997 and 2009, enrollment in the Midwest is projected to decrease by 3 percent. Ten of the twelve states in this region are projected to show decreases. These will occur in Illinois (1 percent), Iowa ( 5 percent), Kansas ( 0.6 percent), Michigan ( 6 percent), Minnesota (4 percent), Missouri (3 percent), Nebraska ( 0.4 percent), North Dakota ( 5 percent), Ohio (6 percent), and Wisconsin (4 percent). Increases are expected for Indiana (2 percent) and South Dakota (4 percent).

An increase of 2 percent is expected for the Southern region between 1997 and 2009. Increases are expected in Georgia (8 percent) and Texas (8 percent). Smaller increases are projected for Alabama (1 percent), Tennessee (4 percent), and Virginia ( 0.4 percent). Decreases are pro-
jected for Arkansas (2 percent), Delaware (2 percent), the District of Columbia (11 percent), Florida ( 2 percent), Kentucky (3 percent), Louisiana (4 percent), Maryland ( 0.9 percent), North Carolina ( 0.6 percent), Oklahoma ( 6 percent), South Carolina ( 6 percent), and West Virginia (5 percent). Most of the growth in the states will occur between 1997 and 2003.

Elementary enrollment in the Western states is expected to rise between 1997 and 2009, an increase of 8 percent. Over the projection period, enrollment increases are anticipated for Alaska (10 percent), Arizona ( 12 percent), Hawaii (16 percent), Idaho (21 percent), Nevada (14 percent), New Mexico (16 percent), Utah (13 percent), and Wyoming (10 percent). Other enrollment increases are projected for California (7 percent), Colorado ( 6 percent), Montana (5 percent), Oregon (3 percent), and Washington (4 percent). Most of the growth in the states will occur between 1997 and 2003.

## High School Enrollment

Between 1997 and 2009, enrollment in public high schools (grades 9 through 12) is expected to increase by 12 percent (table 49 and figure 67 ). Over the projection period, enrollment increases are projected in all of the regions.

The Northeast is projected to increase by 8 percent between 1997 and 2009 (table 50 and figure 68). Increases are expected in Connecticut ( 11 percent), Massachusetts (12 percent), New Jersey (13 percent), and New York (10 percent). Other enrollment increases are expected for New Hampshire (4 percent), Pennsylvania (3 percent), and Rhode Island ( 2 percent). Decreases are projected for Maine
(11 percent) and Vermont (6 percent). Most of growth in the states will occur between 1997 and 2003.

The Midwestern region is expected to show an increase of 5 percent in high school enrollment between 1997 and 2009. An increase of 26 percent is projected in Illinois. Other enrollment increases are expected in Indiana (7 percent), Michigan ( 2 percent), Minnesota ( 0.1 percent), and Missouri (4 percent). Decreases are projected in Iowa (8 percent), Kansas (1 percent), Nebraska (4 percent), North Dakota (13 percent), Ohio (2 percent), South Dakota (5 percent), and Wisconsin ( 0.5 percent).

Between 1997 and 2009, public high school enrollment in the South is projected to increase by 13 percent. Over the projection period, increases are expected in Florida (22 percent), Georgia (25 percent), Maryland (11 percent), North Carolina ( 29 percent), Tennessee ( 17 percent), Texas (19 percent), and Virginia (12 percent). Other increases are expected for Alabama (4 percent), Arkansas (3 percent), Delaware (7 percent), and Mississippi (2 percent). Decreases are expected for District of Columbia (9 percent), Kentucky ( 0.8 percent), Louisiana ( 6 percent), Oklahoma (5 percent), South Carolina (3 percent), and West Virginia (10 percent).
The Western region's public high school enrollment is expected to increase by 20 percent between 1997 and 2009. Between 1997 and 2009, increases have been projected for Arizona (48 percent), California (20 percent), Colorado (17 percent), Hawaii (22 percent), Idaho (17 percent), Nevada (68 percent), New Mexico (14 percent), and Washington (10 percent). Smaller increases are expected for Alaska ( 6 percent), Oregon ( 8 percent), and Utah (6 percent). Decreases are expected for Montana (3 percent) and Wyoming (12 percent).

## Chapter 9

## Public High School Graduates

The projected increases in public high school enrollment (grades 9 through 12) between 1997 and 2009 will cause corresponding increases in the number of public high school graduates. The number of public high school graduates is expected to increase by 23 percent between 1996-97 and 2008-09. This increase will be reflected in many states, with 42 states showing increases (table 52 and figure 69). Each region of the country is expected to reflect this increase in the number of public high school graduates. Projected trends in the number of public high school graduates by state could be impacted by changes in policies affecting graduation requirements.

The number of public high school graduates in the Northeast is expected to increase 20 percent between 199697 and 2008-09 (table 52 and figure 70). Large increases are expected in Connecticut ( 28 percent), Massachusetts (29 percent), New Hampshire ( 22 percent), New Jersey (23 percent), New York (21 percent), Pennsylvania (12 percent), Rhode Island (13 percent), and Vermont ( 9 percent). Maine is projected to decrease by 3 percent.

The number of public high school graduates in the Midwest is expected to increase by 13 percent between 199697 and 2008-09. Increases are expected in Illinois (38 percent), Michigan (11 percent), Minnesota (11 percent), and Missouri (14 percent). Smaller increases are projected for Indiana ( 9 percent), Kansas ( 5 percent), Nebraska (4
percent), Ohio ( 5 percent), and Wisconsin ( 8 percent). Decreases are projected for Iowa ( 0.2 percent), North Dakota (8 percent), and South Dakota (3 percent).

Between 1996-97 and 2008-09, the number of public high school graduates in the South will increase by 24 percent. The largest increases are expected in Delaware (21 percent), Florida (45 percent), Georgia (36 percent), Maryland ( 25 percent), North Carolina (48 percent), Tennessee (20 percent), Texas (30 percent), and Virginia (20 percent). Other increases are projected for Alabama (4 percent), Arkansas (13 percent), Kentucky (1 percent), Mississippi (3 percent), Oklahoma (10 percent), and South Carolina ( 7 percent). Despite an overall increase in the region, three Southern locales are expected to have declines in the number of graduates. Decreases are expected in the District of Columbia ( 5 percent), Louisiana ( 5 percent), and West Virginia (7 percent).

The number of high school graduates in the West is expected to increase, rising by 35 percent. The largest increases are expected in Alaska ( 16 percent), Arizona (76 percent), California (41 percent), Colorado (31 percent), Hawaii (28 percent), Nevada (103 percent), New Mexico (20 percent), Oregon (17 percent), and Washington (25 percent). Other increases are projected in Idaho (11 percent) and Utah (3 percent). Decreases are projected for Montana ( 0.8 percent) and Wyoming ( 15 percent).

## Technical Appendixes

## Appendix A

## Projection Methodology

The general procedure for Projections was to express the variable to be projected as a percent of a "base" variable. These percents were then projected and applied to projections of the "base" variable. For example, the number of 18 -year-old college students was expressed as a percent of the 18-year-old population for each year from 1972 through 1996. This enrollment rate was then projected through the year 2009 and applied to projections of the 18 -year-old population from the Bureau of the Census.

Enrollment projections are based primarily on population projections. Projections of classroom teachers, high school graduates, earned degrees conferred, and expenditures are based primarily on enrollment projections.

Exponential smoothing and multiple linear regression are the two major projection techniques used in this publication. Single exponential smoothing is used when the historical data have a basically horizontal pattern. On the other hand, double exponential smoothing is used when the time series is expected to change linearly with time. In general, exponential smoothing places more weight on recent observations than on earlier ones. The weights for observations decrease exponentially as one moves further into the past. As a result, the older data have less influence on these projections. The rate at which the weights of older observations decrease is determined by the smoothing constant selected.

$$
\begin{aligned}
P= & \alpha X_{t}+\alpha(1-\alpha) X_{t-1}+\alpha(1-\alpha)^{2} X_{t-2} \\
& +\alpha(1-\alpha)^{3} X_{t-3}+\ldots
\end{aligned}
$$

## Where:

$P=$ projected value
$\alpha=$ smoothing constant $(0<\alpha<1)$
$\mathrm{X}_{\mathrm{t}}=$ observation for time t

This equation illustrates that the projection is a weighted average based on exponentially decreasing weights. For a high smoothing constant, weights for earlier observations decrease rapidly. For a low smoothing constant, decreases are more moderate. Projections of enrollments and public high school graduates are based on a smoothing constant of $\alpha=0.4$.

The farther apart the observations are spaced in time, the more likely it is that there are changes in the underlying social, political, and economic structure. Since the observations are on an annual basis, major shifts in the underlying process are more likely in the time span of just a few
observations than if the observations were available on a monthly or weekly basis. As a result, the underlying process tends to be unstable from one observation to the next. Another reason for using high smoothing constants for some time series is that most of the observations are fairly accurate, because most observations are population values rather than sample estimates. Therefore, large shifts tend to indicate actual changes in the process rather than noise in the data.

Multiple linear regression is also used in making projections, primarily in the areas of teachers, earned degrees, and expenditures. This technique is used when it is believed that a strong causal relationship exists between the variable being projected (the dependent variable) and independent causal variables. However, this technique is used only when accurate data and reliable projections of the independent variables are available.

The functional form primarily used is the multiplicative model. When used with two independent variables, this model takes the form:

$$
\mathrm{Y}=\mathrm{aX} \mathrm{X}_{1}{ }^{\mathrm{b}_{1}} \mathrm{X}_{2} \mathrm{~b}_{2}
$$

This equation can easily be transformed into the linear form by taking the natural $\log (\ln )$ of both sides of the equation:

$$
\ln \mathrm{Y}=\ln (\mathrm{a})+\mathrm{b}_{1} \ln \mathrm{X}_{1}+\mathrm{b}_{2} \ln \mathrm{X}_{2}
$$

The multiplicative model has a number of advantages. Research has found that it is a reasonable way to represent human behavior. Constant elasticities are assumed, which means that a 1 percent change in $\ln X$ will lead to a given percent change in $\ln \mathrm{Y}$. This percent change is equal to $b_{1}$. And the multiplicative model lends itself easily to 'a priori'" analysis because the researcher does not have to worry about units of measurement when specifying relationships. In fact, the multiplicative model is considered the standard in economic analyses. For additional information, see Long-Range Forecasting: From Crystal Ball to Computer by J. Scott Armstrong (John Wiley and Sons, 1978, pp. 180-181).

## Caveats

Because projections are subject to errors from many sources, alternative projections are shown for some statistical series. These alternatives are not statistical confidence intervals, but instead represent outcomes based on alternative economic growth patterns. Alternative projections were developed for higher education enrollment, classroom teachers, and expenditures in public elementary and secondary schools and institutions of higher education.

## Assumptions

All projections are based on underlying assumptions, and these assumptions determine projection results to a large extent. It is important that users of projections understand the assumptions to determine the acceptability of projected time series for their purposes. In each section of appendix A, there are descriptions of the primary assumptions upon which the projections of time series are based.

For most projections, low, middle, and high alternatives are shown. These alternatives reveal the level of uncertainty involved in making projections, and they also point out the sensitivity of projections to the assumptions on which they are based.

Many of the projections in this publication are demographically based on Bureau of the Census middle series projections of the population by age. These middle series population projections are based on the 1990 census. The future fertility rate assumption, which determines projections of the number of births, is one key assumption in making population projections. The middle series population projections assume an ultimate complete cohort fertil-
ity rate of 2.10 births per woman by the year 2009 and a net immigration of 820,000 per year. This assumption plays a major role in determining population projections for the age groups enrolled in nursery school, kindergarten, and elementary grades. The effects of the fertility rate assumption are more pronounced toward the end of the projection period, while the immigration assumptions affect all years.

For enrollments in secondary grades and college, the fertility assumption is of no consequence, since all students enrolled at these levels were already born when the population projections were made. For projections of enrollments in elementary schools, only middle series population projections were considered. Projections of high school graduates are based on projections of the percent of grade 12 enrollment that are high school graduates. Projections of associate, bachelor's, doctor's, and first-professional degrees are based on projections of college-age populations and higher education enrollment, by sex, attendance status and level enrolled by student, and by type of institution. Projections of higher education enrollment are also based on projections of disposable income per capita and unemployment rates. The projections of classroom teachers are based on education revenue receipts from state sources and enrollments. The projections of expenditures of public elementary and secondary schools and institutions of higher education are based on enrollments and projections of disposable income per capita and various revenue measures of state and local governments. Projections of disposable income per capita and unemployment rates were obtained from Standard and Poor's DRI. Therefore, many additional assumptions made in projecting disposable income per capita and unemployment rates apply to projections based on projections of these variables.

## A1. Enrollment

## National

Enrollment projections were based on projected enrollment rates, by age and sex, which were applied to population projections by age and sex developed by the Bureau of the Census. These enrollment rates were projected by taking into account the most recent trends, as well as the effects of economic conditions and demographic changes on a person's decision to enter college. The enrollment rates were then used in the Education Forecasting Model (EDMOD), which consists of age-specific rates by sex and by enrollment levels (nursery school through college). The model has 4 stages. See figure 71.

## Education Forecasting Model

The first stage of EDMOD is an age-specific enrollment model in which enrollment rates are projected and applied to age-specific population projections. This stage, which is used separately for each sex, includes the following categories: (1) elementary grades $1-8$, (2) secondary grades 9-12, (3) full-time college enrollment, and (4) part-time college enrollment. Within an enrollment category, where applicable, enrollment rates were projected by individual ages 3 through 24 and for the age groups 25 to 29 , 30 to 34 , and 35 years and over.

Enrollments by age and age groups from the Bureau of the Census were adjusted to NCES totals to compute enrollment rates for 1972 through 1996. Different economic assumptions were made to produce low, middle, and high alternative projections of enrollment rates to the year 2009.

## Elementary Grades 1-8

Projections of elementary enrollment rates were considered for ages 5 through 18. Elementary enrollments are negligible for other ages. Because most elementary enrollment rates have been close to 100 percent from 1972 to 1996 , alternative enrollment rate projections were not computed. The only set of enrollment rate projections computed was based on the assumption that rates will remain constant through the year 2009 (table A1.1). The enrollment data by age were prorated to agree with NCES totals. The Bureau of the Census does not revise enrollment estimates by age, but population estimates are revised regularly.

## Secondary Grades 9-12

Projections of secondary enrollment rates were considered for ages 12 through 34 . Secondary enrollment rates have fluctuated within a narrow range from 1972 to 1996. Therefore, alternative enrollment rate projections were not
calculated. The only set of projections computed was based on constant enrollment rates (table A1.2).

## College Full-Time and Part-Time Enrollment

Projections of full-time and part-time college enrollments were considered only for ages 16 and over. College enrollment is negligible for earlier ages. Three alternative projections were made using various economic assumptions. Table A1.3 shows enrollment rates for 1996 and low, middle, and high alternative projected enrollment rates for 2004 and 2009.

Table A1.4 shows the equations used to project enrollment rates for men by attendance status. Table A1.5 shows the equations used to project enrollment rates for women by attendance status.

## Enrollment in Public Elementary and Secondary Schools, by Grade Group and Organizational Level

The second stage of EDMOD projects public enrollment in elementary and secondary schools by grade group and by organizational level. Public enrollments by age were based on enrollment rate projections for nursery and kindergarten, grade 1, elementary ungraded and special, secondary ungraded and special, and postgraduate enrollment. Grade retention rate projections were used for grades 2 through 12. Table A1.6 shows the public school enrollment rates and table A1.7 shows the public grade-retention rates for 1996 and projections for 2004 and 2009. The projected rates in tables A1.6 and A1.7 were used to compute the projections of enrollments in elementary and secondary schools, by grade, shown in table 1.

## College Enrollment, by Sex, Attendance Status, and Level Enrolled; and by Type and Control of Institution

The third stage of EDMOD projects enrollments in institutions of higher education, by sex, attendance status, and level enrolled by student and by type and control of institution. For each age group, the percent of total enrollment by age, attendance status, level enrolled, and type of institution was projected. These projections for 2004 and 2009 are shown in tables A1.8 and A1.9, along with actual values for 1996. For all projections, it was assumed that there was no enrollment in 2-year institutions at the postbaccalaureate level (graduate and first-professional).

The projected rates in tables A1.8 and A1.9 were then adjusted to agree with the projected age-specific enrollment rates in the first stage of EDMOD. The adjusted rates were then applied to the projected enrollments by age group, sex, and attendance status from the first stage of

EDMOD to obtain projections by age group, sex, attendance status, level enrolled, and type of institution.

For each enrollment category-sex, attendance status, level enrolled, and type of institution-public enrollment was projected as a percent of total enrollment. Projections for 2004 and 2009 are shown in table A1.10, along with actual percents for 1996. The projected rates were then applied to the projected enrollments in each enrollment category to obtain projections by control of institution.

For each category by sex, enrollment level, and type and control of institution, graduate enrollment was projected as a percent of postbaccalaureate enrollment. Actual rates for 1996 and projections for 2004 and 2009 are shown in table A1.11. The projected rates in table A1.11 were then applied to projections of postbaccalaureate enrollment to obtain graduate and first-professional enrollment projections by sex, attendance status, and type and control of institution.

## Full-Time-Equivalent Enrollment, by Type and Control of Institution and by Level Enrolled

The fourth stage of EDMOD projects full-time-equivalent enrollment, by type and control of institution and by level enrolled. For each enrollment category by level enrolled and by type and control of institution, the full-time-equivalent of part-time enrollment was projected as a percent of part-time enrollment. Actual percents for 1996 and projections for 2004 and 2009 are shown in table A1.12.

These projected percents were applied to projections of enrollment by level enrolled and by type and control of institution from the third stage of EDMOD. The projections were added to projections of full-time enrollment (from the previous stage) to obtain projections of full-time-equivalent enrollment.

## Projection Accuracy

An analysis of projection errors from the past 15 editions of Projections of Education Statistics indicates that the mean absolute percentage errors (MAPEs) for lead times of $1,2,5$, and 10 years out for projections of public school enrollment in grades $\mathrm{K}-12$ were $0.4,0.6,1.3$, and 2.4 percent, respectively. For the 1 -year-out prediction, this means that one would expect the projection to be within 0.4 percent of the actual value, on the average. For projections of public school enrollment in grades K 8 , the MAPEs for lead times of $1,2,5$, and 10 years were $0.5,0.7,1.6$, and 3.6 percent, respectively, while those for projections of public school enrollment in grades $9-12$ were $0.8,0.9,1.1$, and 3.8 percent for the same lead times.

For projections of total enrollment in higher education, an analysis of projection errors based on the past 12 editions of Projections of Education Statistics indicates that the MAPEs for lead times of 1,2 , and 5 years were 2.2,
3.4 , and 5.8 percent, respectively. For the 1 -year-out prediction, this means that one would expect the projection to be within 2.2 percent of the actual value, on the average.

## Basic Methodology

The notation and equations that follow describe the basic models used to project public elementary and secondary enrollment.

## Public Elementary and Secondary Enrollment

Let:
i $\quad=$ Subscript denoting age
$\mathrm{j} \quad=$ Subscript denoting grade
t $=$ Subscript denoting time
$\mathrm{K}_{\mathrm{t}} \quad=$ Enrollment at the nursery and kindergarten level
$\mathrm{G}_{\mathrm{jt}} \quad=$ Enrollment in grade j
$\mathrm{G}_{1 \mathrm{t}}=$ Enrollment in grade 1
$\mathrm{E}_{\mathrm{t}} \quad=$ Enrollment in elementary special and ungraded programs
$\mathrm{S}_{\mathrm{t}} \quad=$ Enrollment in secondary special and ungraded programs
$\mathrm{PG}_{\mathrm{t}}=$ Enrollment in postgraduate programs in secondary schools
$\mathrm{P}_{\mathrm{it}} \quad=$ Population age i
$\mathrm{RK}_{\mathrm{t}}=$ Enrollment rate for nursery and kindergarten
$\mathrm{RG}_{1 \mathrm{t}}=$ Enrollment rate for grade 1
$\mathrm{RE}_{\mathrm{t}}=$ Enrollment rate for elementary special and ungraded programs
$\mathrm{RS}_{\mathrm{t}}=$ Enrollment rate for secondary special and ungraded programs
$\mathrm{RPG}_{\mathrm{t}}=$ Enrollment rate for postgraduate programs
$\mathrm{EG}_{\mathrm{t}}=$ Total enrollment in elementary grades (K-8)
$\mathrm{SG}_{\mathrm{t}}=$ Total enrollment in secondary grades (9-12)
$\mathrm{R}_{\mathrm{jt}}=$ Retention rate for grade j : the proportion that enrollment in grade $j$ in year $t$ is of enrollment in grade $\mathrm{j}-1$ in year $\mathrm{t}-1$.

Then:

## Higher Education Enrollment

For institutions of higher education, projections were computed separately by sex and attendance status of student. The notation and equations are:

Let:
i $\quad=$ Subscript denoting age except:

$$
\mathrm{i}=25 \text { : ages } 25-29
$$

$\mathrm{i}=26$ : ages $30-34$
$\mathrm{i}=27$ : ages 35 and over for enrollment (3544 for population)
t $=$ Subscript denoting year
$\mathrm{E}_{\mathrm{it}} \quad=$ Enrollment of students age i
$\mathrm{P}_{\mathrm{it}} \quad=$ Population age i
$\mathrm{R}_{\mathrm{it}} \quad=$ Enrollment rate for students age i
$\mathrm{T}_{\mathrm{it}}=$ Total enrollment for particular subset of students: full-time men, full-time women, part-time men, part-time women

## Then:

$$
\mathrm{T}_{\mathrm{it}}=\sum_{\mathrm{i}=16}^{27} \mathrm{E}_{\mathrm{it}}
$$

## Where:

$\mathrm{E}_{\mathrm{it}} \quad=\mathrm{R}_{\mathrm{it}}\left(\mathrm{P}_{\mathrm{it}}\right)$

## Methodological Tables

Table A1.13 gives the rates used to calculate projections of enrollments and basic assumptions underlying enrollment projections. Methods used to estimate values for which data are not available appear in table A1.14.

## Private School Enrollment

Projections of private school enrollment were derived in the following manner. From 1970 to 1996, the ratio of private school enrollment to public school enrollment was calculated by grade level. These ratios were projected using single exponential smoothing, yielding a constant value over the projection period. This constant was then applied to projections of public school enrollment by grade level to yield projections of private school enrollment. This method assumes that the future pattern in the trend of private school enrollment will be the same as that in public school enrollment. The reader is cautioned that a number of factors could alter the assumption of a constant ratio over the projection period.

## State-Level

This edition contains projected trends in elementary and secondary enrollment by grade level in public schools from 1998 to the year 2009. This is the sixth report on state-level projections for public school elementary and secondary education statistics.

Public school enrollment data from the National Center for Education Statistics' Common Core of Data survey for 1970 to 1996 were used to develop these projections. This survey does not collect data on enrollment for private schools. In addition, population estimates for 1970 to 1997 and population projections for 1998 to 2009 from the U.S. Department of Commerce, Bureau of the Census were used to develop the projections.
Table A1.15 describes the number of years, projection methods, and smoothing constants used to project enrollments in public schools. Also included in table A1.15 is the procedure for choosing the different smoothing constants for the time series models.

The grade retention method was used to project public elementary and secondary school enrollment by state. The grade retention method starts with 6-year-olds entering first grade and then follows their progress through public elementary and secondary schools. The method requires calculating the ratio of the number of children in one year who "survive" the year and enroll in the next grade the following year.

Projections of enrollment in public elementary and secondary schools by state were developed using primarily the grade retention method. Kindergarten and first grade enrollments are based on projected enrollment rates of 5 - and 6-year-olds. These projected enrollment rates are applied to population projections of 5- and 6-year-olds developed by the Bureau of the Census.

Enrollments in grades 2 through 12 are based on projected grade retention rates in each state. These projected rates are then applied to the current enrollment by grade to yield grade-by-grade projections for future years. Enrollment rates of 5- and 6-year-olds and retention rates are projected using single exponential smoothing. Elementary ungraded and special enrollments and secondary ungraded and special enrollments are projected to remain constant
at their 1996 levels. To obtain projections of total enrollment, projections of enrollments for the individual grades (kindergarten through 12) and ungraded and special classes were summed.

The grade retention method assumes that past trends in factors affecting public school enrollments will continue over the projection period. This assumption implies that all factors influencing enrollments will display future patterns consistent with past patterns. Therefore, this method has limitations when applied to states with unusual changes in migration rates. This method implicitly includes the net effect of such factors as migration, dropouts, deaths, nonpromotion, and transfers to and from private schools.

## Adjustment to National Projections

The sum of the projections of state enrollments was adjusted to equal the national projections of public school $\mathrm{K}-12, \mathrm{~K}-8$, and $9-12$ enrollments shown in table 1. For details on the methods used to develop the national projections for this statistic, see the section on national enrollment projections in this appendix.

Figure 71

## General structure and methodology of the Education Forecasting Model (EDMOD)

Table A1.1.-Elementary enrollment rates, by age and sex

| Age | Boys |  | Girls |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 1996 | 1998-2009 | 1996 | 1998-2009 |

## $\mathrm{R}^{2}=$ Coefficient of determination.

F-Statistic $=$ Obtained statistic for the F value.

## Where:

Dummy(age) $=1$ for each age and 0 otherwise.
Rho(age) $=$ Autocorrelation coefficient for each age.
LNURM $=$ Log unemployment rate.

LNPCIMA $=$ Log of four-period weighted average of per capita real disposable income.
NOTE: The regression method used to estimate the full-time and part-time equations was pooled least squares with first-order autocorrelation correction. The time period used to estimate the equations is from 1975 to 1996. The number of observations is 242 . For additional information, see The Modern Forecaster by Hans Levenbach and James P. Cleary (Van Nostrand Reinhold Company Inc., New York, 1984, pp. 354-373).

F-Statistic $=$ Obtained statistic for the F value.

## Where:

$\operatorname{Dummy}($ age $)=1$ for each age and 0 otherwise.
Rho(age) = Autocorrelation coefficient for each age.
LNURM $=$ Log unemployment rate.

LNPCIMA $=$ Log of four-period weighted average of per capita real disposable income.
NOTE: The regression method used to estimate the full-time and part-time equations was pooled least squares with first-order autocorrelation correction. The time period used to estimate the equations is from 1975 to 1996. The number of observations is 242 . For additional information, see The Modern Forecaster by Hans Levenbach and James P. Cleary (Van Nostrand Reinhold Company Inc., New York, 1984, pp. 354-373).

| Graduates/grade 12 enrollment | 27 | Single exponential smoothing | 0.4 | Empirical research |

## A2. High School Graduates

## National

Projections of public high school graduates were developed in the following manner. The number of public high school graduates was expressed as a percent of grade 12 enrollment in public schools for 1972 to 1996. This percent was projected using single exponential smoothing and applied to projections of grade 12 enrollment to yield projections of high school graduates in public schools. (This percent does not make any specific assumptions regarding the dropout rate. The effect of the 12 th grade dropout proportion is reflected implicitly in the graduate proportion.) The grade 12 enrollment was projected based on grade-by-grade retention rates. This percent was assumed to remain constant at levels consistent with the most recent rates. This method assumes that past trends in factors affecting graduation ratios, such as dropouts, migration, and public/private transfers will continue over the projection period. In addition to student behaviors, the projected number of graduates could be impacted by changes in policies affecting graduation requirements.

Projections of private high school graduates were derived in the following manner. From 1970-71 to 1996-97, the ratio of private high school graduates to public school graduates was calculated. These ratios were projected using single exponential smoothing, yielding a constant value over the projection period. This constant value was then applied to projections of public high school graduates to yield projections of private high school graduates. This method assumes that the future pattern of private high school graduates will be the same as that of public high school graduates. The reader should be aware that a number of factors could alter the assumption of a constant ratio over the projection period.

## Projection Accuracy

An analysis of projections from models used in the past 15 editions of Projections of Education Statistics indicates that the mean absolute percentage errors (MAPEs) for projections of public high school graduates were 0.6 percent for 1 year ahead, 1.3 percent for 2 years ahead, 1.6 percent for 5 years ahead, and 3.8 percent for 10 years ahead. For the 2-year-ahead prediction, this means that one would expect the projection to be within 1.3 percent of the actual value, on the average.

## State-Level

This edition contains projections of high school graduates from public schools by state from 1997-98 to 2008-09. Public school graduate data from the National Center for Education Statistics' Common Core of Data survey for 1969-70 to 1996-97 were used to develop these projections. This survey does not collect graduate data for private schools.

Projections of public high school graduates by state were developed in the following manner. For each state, the number of public high school graduates was expressed as a percent of grade 12 enrollment in public schools for 1970 to 1996 . This percent was projected using single exponential smoothing and applied to projections of grade 12 enrollment to yield projections of high school graduates in public schools. Projections of grade 12 enrollment were developed based on the grade retention method discussed in section A1, Enrollment. This percent was assumed to remain constant at levels consistent with the most recent rates. This method assumes that past trends in factors affecting public high school graduates will continue over the projection period.

## A3. Earned Degrees Conferred

Projections of associate's, bachelor's, master's, doctor's, and first-professional degrees by sex were based on demographic models that relate degree awards to college-age populations and college enrollment by level enrolled and attendance status.

## Associate's Degrees

Associate's degree projections by sex were based on undergraduate enrollment by attendance status in 2-year institutions. Results of the regression analysis used to project associate degrees by sex are shown in table A3.1.

## Bachelor's Degrees

Bachelor's degree projections by sex were based on the 18 - to 24 -year-old population and undergraduate enrollment by attendance status in 4-year institutions. Results of the regression analysis used to project bachelor's degrees by sex are shown in table A3.2.

## Master's Degrees

Master's degree projections by sex were based on fulltime graduate enrollment by sex. Results of the regression analysis used to project master's degrees by sex are shown in table A3.3.

## Doctor's Degrees

Doctor's degree projections for men were based on fulltime male graduate enrollment and the unemployment rate. Doctor's degree projections for women were based on the 35 - to 44 -year-old population of women and fulltime female graduate enrollment. The results of the regres-
sion analysis used to project doctor's degrees by sex are shown in table A3.4.

## First-Professional Degrees

First-professional degree projections by sex were based on first-professional enrollment by attendance status in 4 -year institutions. Results of the regression analysis used to project first-professional degrees by sex are shown in table A3.5.

## Methodological Tables

These tables describe equations used to calculate projections (tables A3.1 through A3.5), and basic assumptions underlying projections (table A3.6).

## Projection Accuracy

An analysis of projection errors from similar models used in the past 13 editions of Projections of Education Statistics indicates that mean absolute percentage errors (MAPEs) for bachelor's degree projections were 2.1 percent for 1 year out, 3.1 percent for 2 years out, and 6.5 percent for 5 years out. For the 1-year-out prediction, this means that one would expect the projection to be within 2.1 percent of the actual value, on the average. For firstprofessional degrees, the MAPEs were 2.4, 3.3, and 4.6 percent, respectively. For doctor's degrees, based on the past 12 editions of Projections of Education Statistics, the MAPEs were 2.5, 4.1, and 9.7 percent, respectively. MAPEs for master's degrees, based on the past 11 editions of Projections of Education Statistics, were 2.0, 4.2, and 12.3, respectively. MAPEs for associate's degrees, based on the past nine editions of Projections of Education Statistics, were 2.3 percent for 1 year out, 3.5 percent for 2 years out, and 6.2 percent for 3 years out.

Table A3.1.-Equations for associate's degrees

|  |  |  | Equation | $\mathbf{R}^{2}$ | Durbin-Watson statistic ${ }^{1}$ | Estimation technique |

| Women | The number of first-professional degrees awarded to women is a linear function of full-time first-professional enrollment lagged 1 year and part-time first-professional enrollment lagged 2 years. This relationship will continue through 2008-09. | Middle | 31 |

## A4. Classroom Teachers

## Public Classroom Teachers

The number of public elementary and secondary classroom teachers was projected separately for the elementary and secondary levels. The elementary teachers were modeled as a function of local education revenue receipts from state sources per capita and elementary enrollment. Secondary teachers were modeled as a function of local education revenue receipts from state sources per capita (lagged 3 years) and secondary enrollment. Local education revenue receipts from state sources were in constant 198687 dollars. These models differ from those shown in Projections of Education Statistics to 2008 because disposable income per capita is omitted from the equations.

The equations in this section should be viewed as forecasting rather than structural equations, as the limitations of time and available data precluded the building of a large-scale, structural teacher model. The particular equations shown were selected on the basis of their statistical properties, such as coefficients of determination ( $\left.R^{2} s\right)$, the t -statistics of the coefficients, the Durbin-Watson statistic, and residual plots.

The multiple regression technique will yield good forecasting results only if the relationships that existed among the variables in the past continue throughout the projection period.

The public elementary classroom teacher model is:

$$
\begin{aligned}
\text { ELTCH } & =b_{0}+b_{1} \text { SGRANT } \\
& +b_{2} \text { ELENR }
\end{aligned}
$$

## where:

ELTCH is the number of public elementary classroom teachers.

SGRANT is the level of education revenue receipts from state sources per capita in 1986-87 dollars; and

ELENR is the number of students enrolled in public elementary schools.

Each variable affects the number of teachers in the expected way. As the state spends more money on education and as enrollment increases, the number of elementary teachers hired increases.

The public secondary classroom teacher model is:

```
SCTCH = b b + b }\mp@subsup{b}{1}{}\mathrm{ SGRANT3
    + b}\mp@subsup{b}{2}{}\mathrm{ SCENR
```

where:

SCTCH is the number of public secondary classroom teachers;

SGRANT3 is the level of education revenue receipts from state sources per capita in 1986-87 dollars, lagged 3 years; and

SCENR is the number of students enrolled in public secondary schools.

Each variable affects the number of teachers in the expected way. As the state spends more money on education and as enrollment increases, the number of secondary teachers hired increases.

Table A4.1 summarizes the results for the elementary and secondary public teacher models.

Enrollment is by organizational level, not by grade level. Thus, secondary enrollment is not the same as grade 912 enrollment because some states count some grade 7 and 8 enrollment as secondary. Therefore, the distribution of the number of teachers is also by organizational level, not by grade span.

## Private Classroom Teachers

Projections of private classroom teachers were derived in the following manner. For 1960 to 1995, the ratio of private school teachers to public school teachers was calculated by organizational level. These ratios were projected using single exponential smoothing, yielding a constant value over the projection period. This constant value was then applied to projections of public school teachers by organizational level to yield projections of private school teachers. This method assumes that the future pattern in the trend of private school teachers will be the same as that for public school teachers. The reader is cautioned that a number of factors could alter the assumption of constant ratios over the projection period.

The total number of public school teachers, enrollment by organizational level, and education revenue receipts from state sources used in these projections were from the Common Core of Data (CCD) survey conducted by NCES. The proportion of public school teachers by organizational level was taken from the National Education Association and then applied to the total number of teachers from CCD to produce the number of teachers by organizational level.

Disposable income was obtained from Standard and Poor's DRI and population data, used for per capita calculations, were from the Bureau of the Census.

## Projection Accuracy

An analysis of projection errors from the past 15 editions of Projections of Education Statistics indicated that the mean absolute percentage errors (MAPEs) for projections
of classroom teachers in public elementary and secondary schools were 0.9 percent for 1 year out, 1.1 percent for 2 years out, 2.2 percent for 5 years out, and 3.4 percent for 10 years out. For the 2 -year-ahead prediction, this means that one would expect the projection to be within 1.1 percent of the actual value, on the average.

Table A4.1.-Equations for public elementary and secondary classroom teachers

|  |  |  | Equation | $\mathbf{R}^{2}$ | Durbin-Watson statistic ${ }^{1}$ | Estimation technique |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Elementary | ELTCH | = | $213.3+\underset{(4.8)}{1.4 \mathrm{SGRANT}}+\underset{(3.4)}{0.02 \mathrm{ELENR}}$ | 0.99 | 1.5 | AR1 ${ }^{2}$ |
| Secondary | SCTCH | $=$ | $103.5+\underset{(10.3)}{\text { 1.5SGRANT3 }}+\underset{(6.1)}{0.03 \text { SCENR }}$ | 0.94 | 1.4 | AR1 ${ }^{3}$ |

## $\mathrm{R}^{2}=$ Coefficient of determination.

${ }^{1}$ For an explanation of the Durbin-Watson statistic, see J. Johnston, Econometric Methods, New York: McGraw-Hill, 1972, pages 251-252.
${ }^{2}$ AR1 indicates an estimation procedure for correcting the problem of first-order autocorrelation. In this equation, rho is equal to 0.99 with a $t$-statistic of 59.2. For a general discussion of the problem of autocorrelation, and the method used to forecast in the presence of autocorrelation, see G. Judge, W. Hill, R. Griffiths, H. Lutkepohl, and T. Lee, The Theory and Practice of Econometrics, New York: John Wiley and Sons, 1985, pages 315-318.
${ }^{3}$ AR1 equals an estimation procedure for correcting the problem of first-order autocorrelation. In this equation, rho is equal to 0.65 with a t-statistic of 3.9.

## Where:

ELTCH =Number of public elementary classroom teachers, in thousands
SCTCH =Number of public secondary classroom teachers, in thousands
SGRANT =Education revenue receipts from state sources per capita SGRANT3 =Education revenue receipts from state sources per capita lagged 3 years
ELENR =Number of students enrolled in public elementary schools, in thousands
SCENR =Number of students enrolled in public secondary schools, in thousands
NOTE: Numbers in parentheses are t-statistics. The time period of observations used in the equation for elementary teachers is from 1960 to 1995. The time period used in the equation for secondary teachers is from 1965 to 1995.

## A5. Expenditures of Public Elementary and Secondary Schools

Econometric techniques were used to produce the projections for current expenditures and average teacher salaries. The equations in this chapter should be viewed as forecasting equations rather than structural equations. The particular equations shown were selected on the basis of their statistical properties, such as coefficients of determination ( $\mathrm{R}^{2} \mathrm{~s}$ ), the t -statistics of the variables, the Durbin-Watson statistic, and residual plots. These econometric models will yield good forecasting results only if the relationships that existed among the variables in the past continue throughout the projection period.

## The Elementary and Secondary School Current Expenditure Model

There has been a large body of work, both theoretical and empirical, on the demand for local public services such as education. * The elementary and secondary school current expenditure model is based on this work.

The model that is the basis for the elementary and secondary school current expenditure model has been called the median voter model. In brief, the theory states that spending for each public good in the community (in this case, education) reflects the preferences of the 'median voter'" in the community. This individual is identified as the voter in the community with the median income and median property value. Hence, the amount of spending in the community reflects the price of education facing the voter with the median income, as well as his income and tastes. There are competing models in which the level of spending reflects the choices of others in the community, such as the 'bureaucrats." The median voter model was chosen as the basis of the elementary and secondary school current expenditure model as it has been the one most thoroughly studied.

There have been many empirical studies of the demand for education expenditures using the median voter model. In most instances, researchers have used cross-sectional data. The elementary and secondary school current expenditure model was built on the knowledge gained from these cross-sectional studies and was adapted from them for use in a time-series study.

In a median voter model, the demand for education expenditures is typically linked to four different types of variables: 1) measures of the income of the median voter; 2) measures of intergovernmental aid for education going indirectly to the median voter; 3) measures of the

[^6]price to the median voter of providing one more dollar of education expenditures per pupil; and 4) any other variables that may affect one's tastes for education. The elementary and secondary school current expenditure model contains variables reflecting the first three types of variables. The model is:
\[

$$
\begin{aligned}
\ln (\text { CUREXP }) & =\mathrm{b}_{0}+\mathrm{b}_{1} \ln (\mathrm{PCI})+\mathrm{b}_{2} \ln (\mathrm{SGRNT}) \\
& +\mathrm{b}_{3} \ln (\mathrm{ADAPOP})
\end{aligned}
$$
\]

where:
In indicates the natural log;
CUREXP equals current expenditures of public elementary and secondary schools per pupil in average daily attendance in constant 1982-84 dollars;

PCI equals disposable income per capita in constant 1992 dollars;

SGRNT equals local governments' education revenue receipts from state sources, per capita, in constant 198284 dollars; and

ADAPOP equals the ratio of average daily attendance to the population.

The model was estimated using the AR1 model for correcting for autocorrelation. This was done because the test statistics were significantly better than those from the ordinary least squares (OLS) estimation, and the Dur-bin-Watson statistic was in the inconclusive region when the model was estimated using OLS. This is the seventh edition of Projections of Education Statistics in which this method of estimation, rather than OLS, was used. Ordinary least squares was used in the previous four editions of Projections of Education Statistics. The sample period was from 1959-60 to 1995-96.

The projected values for current expenditures per pupil for the period from 1996-97 to 2008-09 are not the numbers which appear in table 34 . For each scenario, the projected values for 1996-1997 and 1997-98 were from the NCES Early Estimates and the value for 1998-99 was calculated by applying the growth rate from 199697 to 1997-98 on the value for 1997-98. For the remaining years for each of the alternative scenarios, the projected percent changes produced by the model were then used to produce projections of current expenditures per pupil.

There are potential problems with using a model for local government education expenditures for the nation as a whole. Two such problems concern the variable SGRNT. First, the amount of money which local govern-
ments receive for education from state governments varies substantially by state. Second, the formulas used to apportion state moneys for education among local governments vary by state.

Beginning in 1988-89, there was a major change in the survey form used to collect data on current expenditures. This new survey form produces a more complete measure of current expenditures; therefore, the values for current expenditures are not completely comparable to the previously collected numbers. In a crosswalk study, data for a majority of states were also collected for 198687 and 1987-88 that were comparable to data from the new survey form. A comparison of these data with those from the old survey form suggests that the use of the new survey form may have increased the national figure for current expenditures by approximately 1.4 percent over what it would have been if the survey form had not been changed. When the model was estimated, all values for current expenditures before 1988-89 were increased by 1.4 percent.

The results for the model are shown in table A5.1. Each variable affects current expenditures in the direction that would be expected. With high levels of income (PCI) or revenue receipts from state source (SGRNT), the level of spending increases. As the number of pupils increases relative to the population (that is, as ADAPOP increases), the level of spending per pupil falls.

From the cross-sectional studies of the demand for education expenditures, we have an estimate of how sensitive current expenditures are to changes in PCI and ADAPOP. We can compare the results from this model with those from the cross-sectional studies. For this model, an increase in PCI of 1 percent, with SGRNT and ADAPOP held constant, would result in an increase of current expenditures per pupil in average daily attendance of approximately 0.55 percent. With PCI and SGRNT held constant, an increase of 1 percent in ADAPOP would result in a decrease in current expenditures per pupil in average daily attendance of approximately 0.33 percent. Both numbers are well within the range of what has been found in cross-sectional studies.

The results from this model are not completely comparable with those from some of the previous editions of Projections of Education Statistics. First, as with the previous edition, the population number for each school year is the Bureau of the Census's July 1 population number for the upcoming school year. In earlier editions, each school year's population number was the average of an economic consulting firm's (either Standard and Poor's DRI or the WEFA Group) estimated population numbers of each quarter in that school year. Second, there have been changes in the definition of the disposable income.

Projections for total current expenditures were made by multiplying the projections for current expenditures per pupil in average daily attendance by projections for average daily attendance. The projections for total current expenditures were divided by projections for fall enrollment to produce projections of current expenditures per pupil
in fall enrollment. Projections were developed in 198284 dollars and then placed in 1996-97 dollars using the Consumer Price Index. Current-dollar projections were produced by multiplying the constant-dollar projections by projections for the Consumer Price Index.

Three alternative sets of projections for current expenditures are presented: the middle alternative projections; the low alternative projections; and the high alternative projections. The alternative sets of projections differ because of varying assumptions about the growth paths for disposable income and revenue receipts from state sources.

The alternative sets of projections for the economic variables, including disposable income, were developed using variations of three economic scenarios prepared by Standard \& Poor's DRI (DRI) for use on its U.S. Quarterly Model. The U.S. Quarterly model is an econometric model of the U.S. economy developed by DRI for the personal computer which projects more than 1,200 economic concepts. Periodically, DRI supplies alternative scenarios of the economy, including long-term scenarios. Users have the option of either producing projections directly from the scenarios supplied by DRI or first altering some of the underlying assumptions of the scenarios and then producing the projections. The February 1998 series of long-term scenarios was used as the base for the three sets of alternative economic projections used here, although there were some changes in the underlying assumptions.

DRI's trend scenario was used as a base for the middle alternative projections of the economic variables. DRI's trend scenario depicts a mean of possible paths that the economy could take over the forecast period, barring major shocks. The economy, in this scenario, evolves smoothly, without major fluctuations. The only change from DRI's trend scenario was that the most recent middle set of population projections as developed by the Bureau of the Census was substituted for DRI's population projections.

DRI's February 1998 pessimistic scenario was used as a base for the low alternative projections. As with the middle set of projections, the Bureau of the Census's recent middle set of population projections was substituted for DRI's population projections. For the low alternative projections, some changes were made in some of DRI's assumptions concerning personal income that resulted in lower projections for disposable income.
Similarly, DRI's February 1998 optimistic scenario was used as a base for the high alternative projections. The Bureau of the Census's recent middle set of population projections was substituted for DRI's population projections and some changes were made in some of DRI's assumptions concerning personal income that resulted in higher projections for disposable income.
DRI's U.S. Quarterly Model and their February 1998 long-term scenarios, were used to generate three sets of projections, the middle alternative projections, the low alternative projections, and the high alternative projections.
In the middle alternative projections, disposable income per capita rises each year from 1998-99 to 2008-09 at rates between 0.8 percent and 3.4 percent. In the low
alternative projections, disposable income per capita ranges between 0.0 percent and 2.8 percent, and in the high alternative projections, disposable income per capita rises at rates between 1.4 percent and 4.1 percent.

The alternative projections for revenue receipts from state sources were produced using the following model:

$$
\begin{aligned}
\ln (\text { SGRNT }) & =b_{0}+b_{1} \ln (\text { PERTAX1 }) \\
& +b_{2} \ln (\text { ADAPOP }) \\
& +b_{3} \ln (\text { RCPIANN/RCPIANN1 })
\end{aligned}
$$

## where:

In indicates the natural log;
SGRNT equals local governments' education revenue receipts from state sources, per capita, in constant 198284 dollars;

PERTAX1 equals personal taxes and nontax receipts to state and local governments, per capita, in constant 1982-84 dollars lagged one period;

ADAPOP equals the ratio of average daily attendance to the population;

RCPIANN equals the inflation rate measured by the Consumer Price Index; and

RCPIANN1 equals the inflation rate measured by the Consumer Price Index lagged 1 period.

This equation was estimated using the AR1 model for correcting for autocorrelation. The sample period was from 1960-61 to 1995-96. These models are shown in table A5.1.

The values of the coefficients in this model follow expectations. As state governments receive more revenue (higher PERTAX1), they have more money to send to local governments for education. As the enrollment increases relative to the population (higher ADAPOP), so does the amount of aid going to education. Finally, in years with rapidly increasing inflation (higher RCPIANN/RCPIANN1), the real dollar values of revenue receipts from state governments to local governments would fall, other things being equal.

This is the third edition of the Projections of Education Statistics in which this model has been used to create projections of SGRNT. The model used in Projections of Education Statistics to 2006 was identical to the model used in this edition except that it contained a second measure of state and local government revenue. In earlier editions, similar models were used except the variables were not in $\log$ form.

Three alternative sets of projections for SGRNT were produced using this model. Each is based on a different set of projections for personal taxes and the rate of change in the inflation rate. The middle set of projections was produced using the values from the middle set of alternative
projections. The low set of projections was produced using the values from the low set of alternative projections and the high set of projections was produced using the values from the high set of alternative projections. In the middle set of projections, personal taxes and nontax receipts increase at rates between -2.3 percent and 2.3 percent. In the low set of projections, personal taxes and nontax receipts increase at rates between -3.0 percent and 0.7 percent. In the high set of projections, personal taxes and nontax receipts increase at rates between -1.5 percent and 4.4 percent.

The projected values for revenue receipts from state sources for 1997-98 and 1998-99 are not the numbers which appear in table B7 and which were used in the production of the projections of current expenditures per pupil. Rather, alternative sets of projections were calculated by dividing the differences between the 1996-97 and 19992000 projections by three and adding those values to the 1996-97 values to produce projected values for 199798 and then adding those values again to new 199798 projections to produce new projections for 1998-99. This produced a smoother growth path for revenue receipts from state sources.

In the middle set of projections, revenue receipts from state sources increase at rates between 0.0 percent and 1.6 percent for the period from 1998-99 to 2008-09. In the low set of projections, they increase at rates between -0.6 percent and 1.0 percent. In the high set of projections, they increase at rates between -0.3 percent and 3.2 percent.

## The Elementary and Secondary Teacher Salary Model

Most studies conducted on teacher salaries, like those on current expenditures, have used cross-sectional data. Unlike current expenditures models, however, the models for teacher salaries from these existing cross-sectional studies cannot easily be reformulated for use with timeseries data. One problem is that we do not have sufficient information concerning the supply of qualified teachers who are not presently teaching. Instead, the elementary and secondary salary model contains terms that measure the demand for teachers in the economy.

The elementary and secondary teacher salary model is:

$$
\begin{aligned}
\ln (\text { SALRY }) & =b_{0}+b_{1} \ln (\text { CUREXP })+b_{2} \ln (\text { ADAPOP }) \\
& +b_{3} \ln (A D A 1 / A D A 2)
\end{aligned}
$$

## where:

In indicates the natural log;

SALRY equals the estimated average annual salary of teachers in public elementary and secondary schools in constant 1982-84 dollars;

CUREXP equals current expenditures of public elementary and secondary schools per pupil in average daily attendance in constant 1982-84 dollars;

ADAPOP equals the ratio of average daily attendance to the population;

ADA1 equals the average daily attendance lagged 1 period; and

ADA2 equals the average daily attendance lagged 2 periods.

The model was estimated using the period from 195960 to $1995-96$ as a sample period. The AR1 model for correcting for autocorrelation was used as the DurbinWatson statistic was in the inconclusive region when the model was estimated using OLS.

While there are values for teacher salaries through 199798, the model was estimated using the period from 195960 to 1995-96 as there are values for current expenditures only through 1995-96. The actual values for teacher salaries for 1996-97 and 1997-98, not those estimated using the model, appear in table 36. The projected values for teacher salaries for the projection period from 1998-99 to 200809 also are not the numbers which appear in table 36 . Rather, three new sets of projections for teacher salaries were calculated using the projected percent changes produced by the model.

Due to the effects on current expenditures caused by the change in survey forms discussed above, the values for current expenditures for 1959-60 to 1987-88 were increased by 1.4 percent when the salary model was estimated. The coefficients of the salary model are different than if the unadjusted numbers for current expenditures had been used and hence the forecasts are different.

The results for this model are also shown in table A5.1. There is no literature for comparing the sizes of the coefficients. However, the direction of the impact each variable has on salaries is as expected: as the level of spending per pupil increases (higher CUREXP), more teachers can be hired, so demand for teachers increases and salaries may increase; as the number of students increases (higher ADAPOP and ADA1/ADA2), demand for teachers may increase, so salaries may increase.

This model was also used to produce the projections of teacher salaries presented in the Projections of Education Statistics to 2008, Projections of Education Statistics to 2007 and the Projections of Education Statistics to 2006. In seven earlier editions, similar models were used except the variables were not in log form.

As with current expenditures, three different scenarios are presented for teacher salaries. The same projections for ADAPOP and ADA are used for each alternative projection; the sole difference between the projections is in the projection for current expenditures. The middle alternative projection for salaries uses the middle alternative projection for current expenditures. The low alternative projection for salaries uses the low alternative projection for current
expenditures. The high alternative projection for salaries uses the high alternative projection for current expenditures.

Current expenditures, average teacher salaries, and the number of teachers are interrelated; analysis was conducted to see whether the projections of these three time series were consistent.

The number of teachers was multiplied by the average salary and then divided by current expenditures for every school year from 1983-84 until 2008-09 (using the middle alternative projection for teachers, salaries, and current expenditures). The resulting value shows the portion of current expenditures that is spent on teacher salaries. The portion of current expenditures that goes toward teacher salaries has been in a slow downward trend, with the teacher salary share falling from 41 percent in 1983-84 to 38 percent in 1995-96. With the projected values, the portion of current expenditures that go toward teacher salaries continues to fall slowly, falling to 33 percent in 2008-09. The results of this analysis indicate that the projections of these three time series are consistent.

## Projection Accuracy

This is the eleventh consecutive year in which Projections of Education Statistics has contained projections of current expenditures and teacher salaries. The actual values of current expenditures and teacher salaries can be compared with the projected values in the previous editions to examine the accuracy of the models.

The projections from the various editions of Projections of Education Statistics were placed in 1981-82 dollars using the Consumer Price Indices that appeared in each edition.

The same set of independent variables has been used in the production of the current expenditure projections presented in the last eleven editions of the Projections of Education Statistics including this one. There have been some differences in the construction of the variables however. First, with the Projections of Education Statistics to 1997-98, calendar year data were used for disposable income, the population, and the Consumer Price Index. With the later editions, school year data were used. Second, there have been two revisions in the disposable income time series. Third, there have been two changes to the population variable. In the more recent editions, including this one, the Census Bureau's July 1 number for the population has been used. In the earlier editions, an average of the quarterly values was used. Also in the more recent editions, the U.S. Bureau of the Census's population projections have been used. In the earlier editions, the population projections came from an economic consulting firm, either DRI or the WEFA Group.

There has also been a change in the estimation procedure. In the more recent editions, the AR1 model for correcting for autocorrelation was used to estimate the model. In the earlier editions, ordinary least squares was used to estimate the model.

There are several commonly used statistics which can be used to evaluate projections. The values for one of these, the mean absolute percentage error (MAPE), are presented in table A5.2. MAPEs are presented for total current expenditures, current expenditures per pupil in average daily attendance, and teacher salaries.

To calculate the MAPEs presented in table A5.2, the projections of each variable were first grouped by lead time, that is: all the projections of each variable that were a given number of years from the last year in the sample period were grouped together. Next, the percent differences between each projection and its actual value were calculated. Finally, for each variable, the mean of the absolute values of the percent differences were calculated, with a separate average for each lead time. These means are the MAPEs. Hence, in table A5.2, there are a series of MAPEs for each variable with a different MAPE for each lead time.

For some editions of the Projections of Education Statistics, the first projection to be listed did not have a lead time of one year. For example, in Projections of Education Statistics to 2002, the first projection to appear was for 1990-91. This projection was calculated using a sample period ending in 1988-89, so it had a lead time of two years. The value that appeared for 19891990 was from NCES Early Estimates. Only those projections which appeared in an edition of Projections of Education Statistics were used in this evaluation.

Some of the differences between the actual values and the projected values for current expenditures and current expenditures per pupil are due to the change in the survey form for current expenditures that took place in 198889. The results of the crosswalk study suggest that values for current expenditures as presently collected are approximately 1.4 percent higher than they would have been if no change had been made. If the projections for 198889, 1989-90, and 1990-91 which appeared in Projections of Education Statistics to 1997-98, Projections of Education Statistics to 2000, Projections of Education Statistics to 2001: An Update, are increased by 1.4 percent, some MAPEs decrease. MAPEs for current expenditures and current expenditures per pupil after this adjustment has been made can also be found in table A5.2.

Projections for teacher salaries also appeared in the ten most recent editions of Projections of Education Statistics. Beginning with the Projections of Education Statistics to 2006, there was one major change in the model used for teacher salary projections; all the variables were placed in $\log$ form. With this change in functional form, there was also a change in the way the change in enrollment was measured. In the most recent editions, the change in enrollment was measured by taking the ratio of the average daily attendance lagged one period to the average daily attendance lagged two periods. In the previous three editions of Projections of Education Statistics, the change in enrollment was measured by the change from the previous year in average daily attendance lagged one period. In Projections of Education Statistics to 1997-98, Projections of Education Statistics to 2000, and Projections of

Education Statistics to 2001, both the change in average daily attendance lagged one period and the change in average daily attendance lagged two periods were included in the model.

There was another difference between the model used to produce the teacher salary projections in Projections of Education Statistics to 1997-98 and those used in the later editions including this one: variables in the model were calculated using calendar year data for the population and the Consumer Price Index rather than school year data as in previous editions.

## Sources of Past and Projected Data

Numbers from several different sources were used to produce these projections. In some instances, the time series used were made by either combining numbers from various sources or manipulating the available numbers. The sources and the methods of manipulation are described here.

The time series used for current expenditures was compiled from several different sources. For the school years ending in even numbers from 1959-60 to 1975-76, the numbers for current expenditures were taken from various issues of Statistics of State School Systems, published by NCES. The numbers for the school years ending in odd numbers during the 1960s were taken from various issues of the National Education Association's Estimates of School Statistics. For the school years ending in odd numbers during the 1970s, up to and including 1976-77, the numbers were taken from various issues of Revenues and Expenditures for Public Elementary and Secondary Education, published by NCES. For the school years from 197778 until 1995-96, the numbers were taken from the NCES Common Core of Data survey and unpublished data.

For 1974-75 and 1976-77, expenditures for summer schools were subtracted from the published figures for current expenditures. The value for 1972-73 was the sum of current expenditures at the local level, expenditures for administration by state boards of education and state departments of education, and expenditures for administration by intermediate administrative units.

Note that although the data from the different sources are similar, they are not entirely consistent. Also, the NCES numbers beginning with 1980-81 are not entirely consistent with the earlier NCES numbers, due to differing treatments of items such as expenditures for administration by state governments and expenditures for community services.

An alternative source for current expenditures would have been the Bureau of the Census's F-33 which offers statistics at the district level. This level of detail was not needed, however.

For most years, the sources for the past values of average daily attendance were identical to the sources for current expenditures. For 1978-79, the number was taken from Revenues and Expenditures for Public Elementary and Secondary Education.

Projections for average daily attendance for the period from 1995-96 to 2008-09 were made by multiplying the
projections for enrollment by the average value of the ratios of average daily attendance to the enrollment from 1986-87 to 1997-98; this average value was approximately 0.93 .

The values for fall enrollment from 1959-60 to 197778 were taken from issues of the NCES publication Statistics of Public Elementary and Secondary Schools. The 1978-79 value was taken from the NCES Bulletin of October 23, 1979, 'Selected Public and Private Elementary and Secondary Education Statistics." The values from 1979-80 to 1996-97 were taken from the NCES Common Core of Data survey. The projections for fall enrollment are those presented in Chapter 1.

For 1959-60 to 1995-96, the sources for revenue receipts from state sources were the two NCES publications Statistics of State School Systems and Revenues and Expenditures for Public Elementary and Secondary Education and the NCES Common Core of Data survey. The methods for producing the alternative projections for revenue receipts from state sources are outlined above.

The estimates for average teacher salaries were taken from various issues of the National Education Association's Estimates of School Statistics.

The projected values for disposable income, personal taxes and nontax receipts to state and local governments, and indirect business taxes and tax accruals to state and
local governments, were developed using projections developed by DRI's U.S. Quarterly Model. Projected values of the Bureau of Labor Statistics' Consumer Price Index for all urban consumers, which was used for adjusting current expenditures, teacher salaries, revenue receipts from state sources, and the state revenue variables, were also developed using the U.S. Quarterly Model.

Both the historical and projected values for the population were supplied by the U.S. Bureau of the Census.

The values of all the variables from DRI were placed in school-year terms. The school-year numbers were calculated by taking the average of the last two quarters of one year and the first two quarters of the next year.

The Elementary and Secondary School Price Index was considered as a replacement for the Consumer Price Index for placing current expenditures and teacher salaries in constant dollars. As projections of the price index are required for placing the forecasts into current dollars, and as there are no projections of the Elementary and Secondary School Price Index, the Consumer Price Index was used. There are other price indexes, such as the implicit price deflator for state and local government purchases, that could have been used instead of the Consumer Price Index. These alternatives would have produced somewhat different projections.

# Table A5.1.-Equations for current expenditures per pupil in average daily attendance, estimated average annual 

 salaries of teachers, and education revenue receipts from state sources| Dependent variable |  |  | Equation | $\mathbf{R}^{2}$ | Durbin-Watson statistic | Estimation technique | Rho |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Current expenditures per pupil | $\ln$ (CUREXP) |  | $\begin{aligned} & -\underset{(-0.96)}{1.090}+\underset{(2.46)}{0.519 \ln (\mathrm{PCI})}+\underset{(4.91)}{0.628 \ln (\mathrm{SGRNT})} \\ & - \\ & -0.352 \ln (\mathrm{ADAPOP}) \\ & (-2.76) \end{aligned}$ | 0.997 | 1.829 | AR1 | $\begin{aligned} & 0.420 \\ & (2.47) \end{aligned}$ |
| Estimated average salaries salaries | $\ln$ (SALRY) | $=$ | $\left.\begin{array}{rl}  & 7.60+0.45 \ln (\mathrm{CUREXP}) \end{array}\right) \underset{(5.85)}{0.68 \ln (\mathrm{ADAPOP})}$ | 0.982 | 1.511 | AR1 | $\begin{aligned} & 0.833 \\ & (7.74) \end{aligned}$ |
| Education revenue receipts from state sources per capita | $\ln$ (SGRNT) | $=$ | $\begin{aligned} & 2.4+0.70 \ln (\text { PERTAX1 })+\underset{(4.77)}{0.48 \ln (\text { ADAPOP })} \\ & (21.1)(29.9) \\ & -0.03 \ln (\text { RCPIANN } / \text { RCPIANN } 1) \\ & (-1.91) \end{aligned}$ | 0.992 | 1.982 | AR1 | $\begin{gathered} .420 \\ (2.56) \end{gathered}$ |

*AR1 is an estimation procedure for correcting the problem of firstorder autocorrelation. For a general discussion of the problem of autocorrelation, and the methods to correct it, see J. Johnston, Econometric Methods, New York: McGraw-Hill, 1972, chapter 8. For a discussion of the method used to forecast in the presence of autocorrelation, see G. Judge, W. Hill, R. Griffiths, H. Lutkepohl, and T. Lee, The Theory and Practice of Econometrics, New York: John Wiley and Sons, 1985, pages 315-318.

## Where:

| ln | indicates the natural log |
| :---: | :---: |
| CUREXP | $=$ Current expenditures of public elementary and secondary schools per pupil in average daily attendance in constant 1982-84 dollars |
| SALRY | $=$ Estimated average annual salary of teachers in public elementary and secondary schools in constant 198284 dollars |
| SGRNT | =Local governments' education revenue receipts from state sources, per capita, in constant 1982-84 dollars |

| PCI | Disposable income per capita in constant 1992 dollars |
| ---: | :--- | ---: | :--- |
| ADAPOP $=$ | Ratio of average daily attendance to the population |
| PERTAX1 $=$ | Personal taxes and nontax receipts to state and local govern- |
|  | ments, per capita, in constant 1982-84 dollars lagged <br>  <br> one period |
| RCPIANN $=$ Inflation rate measured by the Consumer Price Index |  |
| RCPIANN1 = Inflation rate measured by the Consumer Price Index lagged |  |
|  | 1 period |
| ADA1 $=$ | Average daily attendance lagged 1 period |
| ADA2 $=$ | Average daily attendance lagged 2 periods |

NOTES: The time period of observations used in the equation for revenue receipts from state sources is from 1960-61 to 1995-96. The time period of observations used in the equations for current expenditures and teacher salaries is from 1959-60 to 1995-96. Numbers in parentheses are t-statistics. $\mathrm{R}^{2}=$ Coefficient of determination, adjusted for degrees of freedom. For an explanation of the Durbin-Watson statistic, see J. Johnston, (1972), pages 251-252. Rho is the first order autocorrelation coefficient estimated when AR1 is used. (This table was prepared November 1998.)

Table A5.2.-Mean absolute percentage errors by lead time for current expenditures, current expenditures per pupil in average daily attendance (ADA), and estimated salaries of classroom teachers in public elementary and secondary schools

| Lead Time (years) | Mean absolute percentage errors |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Current expenditures |  | Current expenditures - Adjusted ${ }^{1}$ |  | Estimated average annual salaries |
|  | Total | Per pupil in ADA | Total | Per pupil in ADA |  |
| One ............................. | 1.3\% | 1.1\% | 0.9\% | 0.8\% | 1.3\% |
| Two ........................... | 2.1\% | 1.4\% | 1.6\% | 1.1\% | 1.6\% |

| Ten ............................ | - | - | - | - | 16.0\% |

[^7]- The actual value of current expenditures was not available to calculate mean absolute percentage errors of lead times of ten years.

SOURCES: U.S. Department of Education, National Center for Education Statistics, Projections of Education Statistics, various issues. (This table was prepared September 1998.)

# A6. Expenditures of Institutions of Higher Education 

One current-fund expenditure model and one educational and general expenditure model were estimated for each of three types of higher education institutions-public 4year; public 2-year; and private 4-year. In each case, econometric techniques were used. Due to the lack of a consistent database for private 2-year schools, the last actual values, for 1994-95, were used as constants. These values for private 2-year schools were used in the tables for expenditures in all institutions (tables 37 and 38.)

The higher education econometric models were selected on the basis of their statistical properties, such as the coefficients of determination ( $\mathrm{R}^{2}$ ), the t -statistics of the variables, the Durbin-Watson statistic, and residual plots. These econometric models will yield good forecasting results only if the relationships that existed among the variables in the past continue throughout the projection period.

## Higher Education Institutions Expenditure Models

Similar econometric models were developed for the three types of institutions. While there has been significantly less work by economists studying the factors influencing higher education finance data than those influencing elementary and secondary finance data, there have been some valuable studies. This body of work was used in building these models.

In Chapter 7, some of the factors that are historically associated with the level of expenditures are discussed. These are: (1) the state of the economy; (2) the inflation rate; and (3) enrollments. Each of the models presented here contains variables measuring at least two of these three factors. Either disposable income per capita or revenues of state and local governments per capita was used to measure the state of the economy. Two measures of the inflation rate were considered: the rate of change in the inflation rate; or a dummy for years with inflation rates greater than 8 percent. In each equation, an enrollment variable was included.

For each dependent variable, a number of alternative specifications were examined. In each case, the choice of the final specification was made after considering such factors as the coefficients of determination, the $t$-statistics of the variables, residual plots, and ex-post mean absolute percent errors. The final specification of each model has the dependent variables and some of the independent variables as first differences.

## The Public 4-Year Institutions Expenditure Models

The public 4-year institutions current-fund expenditure model is:

$$
\begin{aligned}
\text { DPUTCUR4 } & =b_{0}+b_{1} \text { DSTREV1 }+b_{2} \text { DPUFTE } 4 \\
& +b_{3} \text { DUMMY }
\end{aligned}
$$

## where:

DPUTCUR4 is the change from the previous year in current-fund expenditures per student in full-time-equivalent (FTE) enrollment in public 4-year institutions in constant 1982-84 dollars;

DSTREV1 is the change from the previous year in the sum of personal tax and nontax receipts to state and local governments and indirect business taxes and tax accruals, excluding property taxes, to state and local governments, per capita, in constant 1982-84 dollars lagged one year;

DPUFTE4 is the change from the previous year in FTE enrollment in public 4-year institutions in thousands of students; and

DUMMY is a dummy variable equaling 1 when the inflation rate is greater than 8 percent and 0 otherwise.

This model and the other econometric models were estimated using a sample period from 1968-69 to 1995-96. Ordinary least squares was used to estimate all the public institution models.

The results for this model are in table A6.1. Each variable affects current-fund expenditures in a logical fashion. The more revenues that state and local governments receive, the more expenditures they can make for public institutions of higher education. In a year with high inflation (DUMMY equals 1), current-fund expenditures in constant dollars are lower than they would have been otherwise. The more students in public 4 -year institutions, the less money to be spent per student.

Three projections were produced: the middle alternative set of projections, the low alternative set of projections, and the high alternative set of projections. Each set of projections was based on a different set of assumptions for the revenues of state and local governments per capita. The projections for revenues of state and local governments per capita and the other economic variables used to produce the higher education expenditure projections were produced using the U.S. Quarterly Model of Standard \& Poor's

DRI (DRI). The development of these alternative sets of projections is discussed in Appendix A5.

In the middle set of alternative projections, the revenues of state and local governments per capita increase at rates between -1.0 percent and 1.9 percent. In the low set of alternative projections, the revenues of state and local governments per capita increase at rates between -1.6 percent and 0.8 percent. In the high set of alternative projections, the revenues of state and local governments per capita increase at rates between -0.3 percent and 3.4 percent.

Projections for total current-fund expenditures were made by multiplying the projections for current-fund expenditures per student in FTE enrollment by projections for FTE enrollment. Projections were developed in 1982-84 dollars and then placed in 1996-97 dollars using projections for the Consumer Price Index. Current dollar projections were produced by multiplying the constant dollar projections by projections for the Consumer Price Index. All the higher education total expenditure projections, all expenditure projections in 1996-97 dollars, and all the current dollar projections were calculated in similar fashion.

A model for educational and general expenditures of public 4-year institutions was developed using the same variables as the current-fund expenditure model. The model is:

$$
\begin{aligned}
\text { DPUED4 } & =b_{0}+b_{1} \text { DSTREV1 }+\mathrm{b}_{2} \text { DPUFTE4 } \\
& +\mathrm{b}_{3} \text { DUMMY }
\end{aligned}
$$

## where:

DPUED4 is the change from the previous year in educational and general expenditures per student in FTE enrollment in public 4-year institutions in constant 1982-84 dollars.

This model is also shown in table A6.1.
As with current-fund expenditures, each variable affects expenditures in the expected way.

## The Public 2-Year Institutions Expenditure Models

The public 2-year institutions current-fund expenditure model has a form similar to the public 4-year institutions current-fund expenditure model except that the public 2year institutions model does not contain any inflation variables. The model is:

DPUTCUR2 $=b_{0}+b_{1}$ DSTREV1 $+b_{2}$ DPUFTE 2

## where:

DPUTCUR2 is the change from the previous year in current-fund expenditures per student in FTE enrollment in public 2-year institutions in constant 1982-84 dollars; and

DPUFTE2 is the change from the previous year in FTE enrollment in public 2-year institutions in thousands of students.

The results for this model are in table A6.1. Again, DSTREV1 has the expected positive effect on expenditures and the FTE enrollment variable has the expected negative impact.

The public 2-year institutions educational and general expenditure model is virtually identical to its current-fund expenditures counterpart. It is:

DPUED2 $\quad=b_{0}+b_{1}$ DSTREV1 $+b_{2}$ DPUFTE 2

## where:

DPUED2 is the change from the previous year in educational and general expenditures per student in FTE enrollment in public 2-year institutions in constant 1982-84 dollars.

The results of this model appear in table A6.1.

## The Private 4-Year Institutions Expenditure Models

The private 4-year institutions current-fund expenditure model is:

$$
\begin{aligned}
\text { DPRTCUR4 } & =\mathrm{b}_{0}+\mathrm{b}_{1} \text { DPCI }+\mathrm{b}_{2} \text { DPRFTE } 4 \\
& +\mathrm{b}_{3} \text { ININCR }
\end{aligned}
$$

## where:

DPRTCUR4 is the change from the previous year in current-fund expenditures per student in FTE enrollment in private 4 -year institutions in constant 1982-84 dollars;

DPCI is the change from the previous year in disposable income per capita in 1992 dollars;

DPRFTE4 is the change from the previous year in FTE enrollment in private 4 -year institutions to the population in thousands; and

ININCR is the rate of change in the inflation rate measured by the Consumer Price Index.

The model was estimated using the AR1 method for correcting for autocorrelation.

The three alternative sets of projections for currentfund expenditures were produced using varying assumptions about the growth paths for disposable income and the rate of change in the inflation rate measured by the Consumer Price Index. These disposable income and inflation rate projections were also developed using the DRI's U.S. Quarterly Model.

In the middle set of projections, disposable income per capita rises each year from 1998-99 to 2008-09 at rates
between 0.8 percent and 3.4 percent. In the low set of projections, disposable income per capita increases at rates between 0.0 percent and 2.8 percent. In the high set of projections, disposable income per capita increases at rates between 1.4 percent and 4.1 percent.

In the middle set of projections, the inflation rate varies between 2.1 percent and 3.5 percent. In low set of projections, it varies between 3.2 percent and 5.0 percent, and in the high set of projections, it varies between 1.3 percent and 2.4 percent.

The private 4 -year institutions educational and general expenditure model is:

$$
\begin{aligned}
\text { DPRIED4 } & =b_{0}+b_{1} \text { DPCI }+b_{2} \text { DPRFTE } 4 \\
& +b_{3} \text { ININCR }
\end{aligned}
$$

where:
DPRIED4 is the change in educational and general expenditures per student in FTE enrollment in private 4year institutions in constant 1982-84 dollars.

The results of this model appear in table A6.1.

## The Private 2-Year Institutions Expenditure Models

Unlike the other higher education variables, econometric methods were not used for either private 2-year currentfund expenditures or private 2-year educational and general expenditures. This was due to a change in the sample universe for private 2 -year institutions. The period for which the private 2-year universe is relatively consistent, from 1982-83 to 1995-96, has only fourteen observations. This is too short a period for econometric techniques, so another means of projecting private 2-year institution expenditures was required. To compute national totals for all institutions despite this deficiency, another method of estimation was used. Both current-fund expenditures per student and educational and general expenditures per student were assumed to stay constant at the last year for which there are data, 1994-95. These values for private 2-year schools were used in the tables for expenditures in all institutions (tables 37 and 38.)

## Projection Accuracy

This is the eighth time in the past eleven years that Projections of Education Statistics has contained projections of higher education expenditure data. The other seven editions were the Projections of Education Statistics to 2008, Projections of Education Statistics to 2007, Projections of Education Statistics to 2006, Projections of Education Statistics to 2005, Projections of Education Statistics to 2004, Projections of Education Statistics to 2003 and Projections of Education Statistics to 2000. The projections that appeared in the six most recent editions of Projections of Education Statistics were developed using the same
methodology as that presented here. Those that appeared in Projections of Education Statistics to 2000 were produced using different models.

There are several commonly used statistics which can be used to evaluate projections. The values for one of these, the mean absolute percentage error (MAPE), are presented in table A6.2. MAPEs are presented for currentfund expenditures and for educational and general expenditures by several different breakdowns. Two alternative sets of MAPEs are presented: with one set, the projections from the last six editions of the Projections of Education Statistics were used in the calculations; with the other, the projections from the Projections of Education Statistics to 2000 were also included.

To calculate the MAPEs presented in table A6.2, the projections of each variable were first grouped by lead time, that is: all the projections of each variable that were a given number of years from the last year in the sample period were grouped together. Next, the percent differences between each projection and its actual value were calculated. Finally, for each variable, the mean of the absolute values of the percent differences were calculated, with a separate average for each lead time. These means are the MAPEs of each variable for each lead time which are presented in table A6.2.

## Sources of Data

The current-fund expenditure data and the educational and general expenditure data are from the 'Financial Statistics of Institutions of Higher Education'" and the Integrated Postsecondary Education Data System (IPEDS) 'Finance" surveys of the National Center for Education Statistics (NCES). One manipulation of the educational and general expenditures numbers was required. From 1968-69 to 1973-74, student-aid expenditures were a separate component of current-fund expenditures. From 1974-75 on, scholarships and fellowships have been a component of educational and general expenditures. Hence, for the period 1968-69 to 1973-74, student aid was added to the published numbers for educational and general expenditures.

The full-time-equivalent (FTE) enrollment data are from the 'Fall Enrollment in Colleges and Universities"' surveys of NCES. The FTE enrollment figures for 1968-69, 196970, and 1970-71 were estimated using part-time and fulltime enrollment data. Full-time-equivalent enrollment was derived by adding one-third of the part-time students to the number of full-time students for those three years.

The projected values for disposable income and the revenues of state and local governments per capita were developed using the DRI's U.S. Quarterly Model. Projected values of the Bureau of Labor Statistics' Consumer Price Index for all urban consumers, which were used for adjusting the higher education finance data, and the implicit price deflator for personal consumption expenditures, which was used for adjusting disposable income per capita, were also developed using the U.S. Quarterly Model. DRI supplied the historic values for these variables.

Both the historical and projected values for the population were supplied by the U.S. Bureau of the Census.

The Higher Education Price Index was considered as a replacement for the Consumer Price Index for placing the higher education expenditures in constant dollars. As projections of the price index are required for placing the forecasts into current dollars, and as there are no
projections of the Higher Education Price Index, the Consumer Price Index was used.

The values of all of the variables from DRI were placed in academic-year terms. The data were available in quarterly format so the academic-year numbers were calculated by taking the average of the last 2 quarters of 1 year with the first 2 of the next year.

Table A6.1.-Equations for current-fund expenditures per student in full-time-equivalent enrollment and educational and general expenditures per student in full-time-equivalent enrollment in public 4-year institutions, public 2-year institutions, and private 4-year institutions

| Dependent variable |  |  | Equation | $\mathbf{R}^{2}$ | Durbin-Watson statistic | Estimation technique | Rho |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Current-fund expenditures per student in public 4-year institutions | DPUTCUR4 |  | $\begin{aligned} & 255+2.45 \text { DSTREV1 }-\underset{(-5.55)}{0.002 \text { DPUFTE4 }} \\ & (5.13)(2.36) \\ & -214 \text { DUMMY } \\ & (-3.12) \end{aligned}$ | 0.671 | 1.88 | OLS |  |
| Current-fund expenditures per student in public 2-year institutions | DPUTCUR2 |  | $\begin{array}{ll} 21.1+3.37 \text { DSTREV1 } & -0.001 \text { DPUFTE2 } \\ (0.76)(5.08) & (-4.75) \end{array}$ | 0.742 | 2.17 | OLS |  |
| Current-fund expenditures per student in private 4-year institutions | DPRTCUR4 |  | $\begin{aligned} & 452+0.30 \mathrm{DPCI}-0.009 \mathrm{DPRFTE} 4 \\ & (3.86)(2.23) \\ & -487.2 \mathrm{ININCR} \\ & (-5.84) \end{aligned}$ | 0.765 | 1.91 | AR1 | $\begin{array}{r} 0.73 \\ (5.14) \end{array}$ |

* OLS $=$ Ordinary Least Squares. AR1 is an estimation procedure for correcting the problem of first-order autocorrelation. For a general discussion of the problem of autocorrelation, and the methods to correct it, see J. Johnston, Econometric Methods, New York: McGraw-Hill, 1972, chapter 8. For a discussion of the method used to forecast in the presence of autocorrelation, see G. Judge, W. Hill, R. Griffiths, H. Lutkepohl, and T. Lee, The Theory and Practice of Econometrics, New York: John Wiley and Sons, 1985, pages 315-318.

## Where:

$$
\begin{aligned}
& \text { DPUTCUR4 =Change from the previous year in current-fund expenditures } \\
& \text { per student in full-time-equivalent (FTE) enrollment in } \\
& \text { public 4-year institutions in constant 1982-84 dollars } \\
& \text { DPUTCUR2 =Change from the previous year in current-fund expenditures } \\
& \text { per student in FTE enrollment in public 2-year institu- } \\
& \text { tions in constant 1982-84 dollars } \\

& \text { 2-year institutions in constant 1982-84 dollars }
\end{aligned}
$$

DPRIED4 =Change in educational and general expenditures per student in FTE enrollment in private 4-year institutions in constant 1982-84 dollars
DSTREV1 =Change from the previous year in the sum of personal tax and nontax receipts to state and local governments and indirect business taxes and tax accruals, excluding property taxes, to state and local governments, per capita, in constant 1982-84 dollars lagged one year
DPCI $=$ Change from the previous year in disposable income per capita in 1992 dollars
DPUFTE4 =Change from the previous year in FTE enrollment in public 4-year institutions in thousands of students
DPUFTE2 =Change from the previous year in FTE enrollment in public 2-year institutions in thousands of students
DPRFTE4 $=$ Change from the previous year in FTE enrollment in private 4 -year institutions to the population in thousands
DUMMY =Dummy variable equaling 1 when the inflation rate is greater than 8 percent and 0 otherwise
ININCR $=$ Rate of change in the inflation rate measured by the Consumer Price Index
NOTES: The time period of observations used in the equations-is from 1968-69 to 1995-96. Numbers in parentheses are t-statistics. R ${ }^{2}$ $=$ Coefficient of determination, adjusted for degrees of freedom. For an explanation of the Durbin-Watson statistic, see J. Johnston, (1972), pages $251-252$. Rho is the first order autocorrelation coefficient estimated when AR1 is used. (This table was prepared November 1998.)

Table A6.2.-Mean absolute percentage errors by lead time for current-fund expenditures and educational and general expenditures in constant dollars in public and private institutions of higher education by type

(This table was prepared August 1998.)

Table B5.-Average daily attendance (ADA) in public elementary and secondary schools, change in ADA, the population, and ADA as a proportion of the population: 1983-84 to 2008-09

${ }^{1}$ Projections of average daily attendance were made by multiplying the forecasts for enrollment reported in chapter 1 by the average value of the ratio of average daily attendance to the enrollment from 1986 to 1995 , approximately 0.93 percent.
${ }^{2}$ Average daily attendance is projected.
NOTE: Calculations were made using unrounded numbers. Historical numbers may differ from those in previous editions.

## Appendix C

## Data Sources

## Sources and Comparability of Data

The information in this report was obtained from many sources, including Federal and state agencies, private research organizations, and professional associations. The data were collected by many methods, including surveys of a universe (such as all colleges) or of a sample, and compilations of administrative records. Care should be used when comparing data from different sources. Differences in procedures, such as timing, phrasing of questions, and interviewer training mean that the results from the different sources are not strictly comparable. More extensive documentation of one survey's procedures than of another's does not imply more problems with the data, only that more information is available.

## Accuracy of Data

The accuracy of any statistic is determined by the joint effects of "sampling' and 'nonsampling'" errors. Estimates based on a sample will differ from the figures that would have been obtained if a complete census had been taken using the same survey instruments, instructions, and procedures. Besides sampling errors, both surveys, universe and sample, are subject to errors of design, reporting, processing, and errors due to nonresponse. To the extent possible, these nonsampling errors are kept to a minimum by methods built into the survey procedures. In general, however, the effects of nonsampling errors are more difficult to gauge than those produced by sampling variability.

## Sampling Errors

The standard error is the primary measure of sampling variability. It provides a specific range-with a stated con-fidence-within which a given estimate would lie if a complete census had been conducted. The chances that a complete census would differ from the sample by less than the standard error are about 68 out of 100 . The chances that the difference would be less than 1.65 times the standard error are about 90 out of 100 . The chances that the difference would be less than 1.96 times the standard error are about 95 out of 100 . The chances that it would be less than 2.58 times as large are about 99 out of 100 .

The standard error can help assess how valid a comparison between two estimates might be. The standard error
of a difference between two sample estimates that are uncorrelated is approximately equal to the square root of the sum of the squared standard errors of the estimates. The standard error (se) of the difference between sample estimate ' 'a'" and sample estimate ' $b$ '" is:

$$
\mathrm{se}_{\mathrm{a}-\mathrm{b}}=\left(\mathrm{se}_{\mathrm{a}}^{2}+\mathrm{se}_{\mathrm{b}}^{2}\right)^{1 / 2}
$$

Note that most of the standard errors in subsequent sections and in the original documents are approximations. That is, to derive estimates of standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, most of the standard errors presented provide a general order of magnitude rather than the exact standard error for any specific item.

## Nonsampling Errors

Both universe and sample surveys are subject to nonsampling errors. Nonsampling errors are of two kinds-random and nonrandom. Random nonsampling errors may arise when respondents or interviewers interpret questions differently, when respondents must estimate values, or when coders, keyers, and other processors handle answers differently. Nonrandom nonsampling errors result from total nonresponse (no usable data obtained for a sampled unit), partial or item nonresponse (only a portion of a response may be usable), inability or unwillingness on the part of respondents to provide information, difficulty interpreting questions, mistakes in recording or keying data, errors of collection or processing, and overcoverage or undercoverage of the target universe. Random nonresponse errors usually, but not always, result in an understatement of sampling errors and thus an overstatement of the precision of survey estimates. Because estimating the magnitude of nonsampling errors would require special experiments or access to independent data, these magnitudes are seldom available.
To compensate for suspected nonrandom errors, adjustments of the sample estimates are often made. For example, adjustments are frequently made for nonresponse, both total and partial. An adjustment made for either type of nonresponse is often referred to as an imputation, that is, substitution of the "average" questionnaire response for the nonresponse. Imputations are usually made separately within various groups of sample members that
have similar survey characteristics. Imputation for item nonresponse is usually made by substituting for a missing item the response to that item of a respondent having characteristics that are similar to those of the nonrespondent.

Although the magnitude of nonsampling errors in the data used in this Projections of Education Statistics is frequently unknown, idiosyncrasies that have been identified are noted on the appropriate tables.

## Federal Agency Sources

## National Center for Education Statistics (NCES)

## Common Core of Data

NCES uses the Common Core of Data (CCD) survey to acquire and maintain statistical data on the 50 states, the District of Columbia, and the outlying areas from the universe of state-level education agencies. Information about staff and students is collected annually at the school, LEA (local education agency or school district), and state levels. Information about revenues and expenditures is also collected at the state and school district level.

Data are collected for a particular school year (July 1 through June 30) via survey instruments sent to the states by October 15 of the subsequent school year. States have 2 years in which to modify the data originally submitted.

Since the CCD is a universe survey, the CCD information presented in this edition of Projections of Education Statistics is not subject to sampling errors. However, nonsampling errors could come from two sources-nonreturn and inaccurate reporting. Almost all of the states submit the CCD survey instruments each year, but submissions are sometimes incomplete or too late for publication.

Understandably, when 57 education agencies compile and submit data for over 85,000 public schools and approximately 15,000 local school districts, misreporting can occur. Typically, this results from varying interpretation of NCES definitions and differing recordkeeping systems. NCES attempts to minimize these errors by working closely with the Council of Chief State School Officers (CCSSO).

The state education agencies report data to NCES from data collected and edited in their regular reporting cycles. NCES encourages the agencies to incorporate into their own survey systems the NCES items they do not already collect so that those items will also be available for the subsequent CCD survey. Over time, this has meant fewer missing data cells in each state's response, reducing the need to impute data.

NCES subjects data from the education agencies to a comprehensive edit. Where data are determined to be inconsistent, missing, or out of range, NCES contacts the education agencies for verification. NCES-prepared state summary forms are returned to the state education agencies for verification. States are also given an opportunity to
revise their state-level aggregates from the previous survey cycle.

Washington, DC 20208
Private School Universe Survey, 1995-96 The Private School Survey (PSS) is designed to collect data from all private schools in the 50 states and the District of Columbia. This survey was conducted in 1995-96 by the U.S. Bureau of the Census for the National Center for Education Statistics (NCES). The counts presented are estimates derived from an area frame as well as a census of lists; an estimate of the total undercount is also given.

Since 1983, NCES has used a dual frame approach for building its private school universe. The dual frame consists a list frame and an area frame. The list building component was the primary means for improving coverage of private schools. To identify schools that may have been overlooked in the list building component, an area frame component was also included. The combination of the universe list and additional schools identified in the area search comprised schools in the 1995-96 Private School Universe Survey. The basis of the 1995-96 list frame was the 1993-94 PSS.

Beginning in 1995, NCES also collected data from schools for which kindergarten is the highest grade. Those 1995-96 PSS schools meeting the pre-1995 definition of a private school (including any of grades 1 through 12) are referred to as traditional schools. Schools with kindergarten, but no grade higher than kindergarten, are referred to as kindergarten terminal (k-terminal) schools. NCES requested and collected membership lists from 26 private school associations and religious denominations. The associations were asked to include schools that met the new PSS school definition when they provided lists. The 50 states and the District of Columbia were asked to provide lists of private schools meeting the traditional definition of a school, as well as separate lists of programs which might include a kindergarten. These requests were made with the traditional state sources (the education departments) and also with other departments, such as health or recreation. As a result of these efforts, approximately 5,525 schools were added in 1995, for a total of 31,698 traditional schools on the private school universe list.

Using primary sampling units (PSUs), the 1995-96 PSS area frame was designed to produce 50 percent overlap with the previous PSS. By maintaining a 50 percent overlap of PSUs, the reliability of estimates of change was maintained at a reasonable level. The United States was divided into 2,054 PSUs, each consisting of a single county, independent city, or cluster of geographically contiguous areas. A minimum of two PSUs were allocated to each of the 16 strata ( 32 PSUs). An additional 26 PSUs were
allocated to the 16 strata to more nearly approximate a uniform sampling fraction of PSUs from each stratum.

The strata were defined the same way as in the 199394 PSS area frame design: (a) four Census regions (Northeast, Midwest, South, West), (b) metro/nonmetro status (two levels) and (c) whether the PSU's percent private school enrollment exceeded the median percent private enrollment of the other PSUs in the census region/metro status strata (two levels - using 1990 Census data).

A total of 124 distinct PSUs were in the area sample. Within each of the 124 PSUs, the Census Bureau attempted to find all eligible private schools. A block-by-block listing of all private schools in a sample of PSUs was not attempted. Rather, regional office field staff created the frame by using such sources as yellow pages, non-Roman Catholic religious institutions, local education agencies, chambers of commerce, and local government offices. (Roman Catholic religious institutions were not contacted because their lists are usually current.) Once the area search lists were constructed, they were matched with the NCES private school universe list. Schools that did not match the universe list were considered part of the area frame.

The data collection phase consisted of two stages: A mailout/mailback stage and a telephone follow-up stage. The Census Bureau mailed PSS questionnaires to a total of 40,866 private schools on October 13, 1995. One week after the initial mailout, a postcard was sent reminding the school staff to complete and return the questionnaire. On November 22, 1995, a second questionnaire was sent to the schools not responding to the first. A reminder postcard was sent one week after the second mailout. The return rate for first mailout was 46 percent while the return for the second mailout was 67 percent.

On February 29, 1996, the Census Bureau began telephone interviewing for schools not responding to the mail questionnaire. An additional 4,730 schools from the area frame operation were added to the workload at this time. Interviewing took place at the Census Bureau's two Computer Assisted Telephone Interviewing (CATI) facilities located in Hagerstown, MD and Tucson, AZ. CATI followup continued through May 22, 1996. Additional followup was conducted in the Census Bureau's 12 Regional Offices for the 1,474 schools that could not be contacted by telephone. The final return rate was 99 percent.

## Stephen P. Broughman

Elementary/Secondary and Libraries Studies Division National Center for Education Statistics
555 New Jersey Avenue NW
Washington, DC 20208-5651
Private School Early Estimates System: 1992-93. Early in September 1992, advance questionnaires were mailed to a national probability sample of 1,167 private elementary and secondary schools. Telephone collection of the data began in early October and was completed in mid-October. The telephone data collection used Computer Assisted Telephone Interviewing (CATI) technology
to collect the data and perform preliminary edits. The overall response rate was 93.3 percent: 1,045 of the 1,120 eligible schools. Some 47 of the original 1,167 schools in the sample were determined to be out-of-scope. After adjusting for out-of-scope schools, the weighted estimate of private schools is 26,011 .

The sampling frame used for the Private School Early Estimates Survey was the 1991-92 NCES Private School Survey (PSS). This survey collected information on the number of teachers and students in private schools, by school religious orientation and level as well as actual and projected counts of high school graduates. The PSS, and therefore the early estimates survey, uses two nonoverlapping frames: the list frame of approximately 24,000 eligible schools (the universe list), and an area frame developed by the Census Bureau, consisting of 355 schools identified in 124 sampled geographic areas (Primary Sampling Units or PSUs). The area frame is constructed from a sample survey designed to capture those schools not included in the universe list and is repeated every 2 years. The 355 schools identified in the sampled areas are weighted to a national estimate of the number of private schools not included in the universe list. This weighted number is then added to the universe count to produce an estimate of the total number of private schools in the United States.

For the early estimates, the list frame was stratified by level of school (elementary, secondary, and combined) and religious orientation (Catholic, other religious, and nonsectarian). Within strata, schools were further sorted by Census region (Northeast, Midwest, South, and West), by urbanicity (urban, suburban, and rural) within region, and by student membership size within urbanicity. Each school in the sorted frame was assigned a sampling measure of size equal to the square root of student membership.

The area frame was stratified by level of school (elementary, secondary, and combined) and religious orientation (Catholic, other religious, and nonsectarian). Within strata, schools were further sorted by FIPS (Federal Information Processing Standards) state code, by PSU within state, and by student membership within PSU. Samples were selected with probabilities proportionate to size from each stratum. The measure of size used for this purpose was the square root of student membership multiplied by the inverse of the probability of selection of the PSU in which the school is located.

The estimation procedure is a two-step process. The first step is to produce estimates based on the NCES frame for private schools (1991-92 Private School Survey [PSS]). These estimates are adjusted for total school nonresponse, as well as item nonresponse. The second step is to update the PSS-based estimates, using the data collected in the 1992 Early Estimates Survey (EES). This EES update is a ratio estimate of the 1992 estimate from EES divided by the 1991 estimate based on the 1991 PSS data for the EES sample. The estimates in the tables are the PSS-based estimates times the EES update. The early estimates in this report incorporate the relevant esti-
mates from the PSS and update them using data collected in the EES.

The private school early estimates are based on a sample; these estimates may differ somewhat from figures that would have been obtained if a complete census of private schools had been taken using the same questionnaire and procedures. The standard error indicates the magnitude of the sampling error, the variability due to sampling when estimating a statistic. It indicates how much variance there is in the population of possible estimates of a parameter for a given sample size. Standard errors can be used as a measure of the precision expected from a particular sample. If all possible samples were surveyed under similar conditions, intervals of 1.96 standard errors below to 1.96 standard errors above a particular statistic would include the true population parameter being estimated in about 95 percent of the samples. This is a 95 percent confidence interval. For example, for the ratio of private school pupils to private school teachers in 1992-93, the estimate for all private schools is 14.9 and the standard error is 0.2 . The 95 percent confidence interval for this statistic extends from 14.9 - ( 0.2 times 1.96 ) to $14.9+(0.2$ times 1.96$)$ or from 14.5 to 15.3 . The standard error for the $4,964,258$ students in private schools is 116,612 . The 95 percent confidence interval for this statistic extends from 4,735,698 to $5,192,818$.

Estimates of standard errors were computed using a variance estimation procedure for complex sample survey data known as balanced repeated replication (BRR)-a technique that splits the sample into several different halfsamples. Weight-adjusted estimates are computed from the half-samples. Finally, the standard error of the half-sample estimates is used as an approximation for the full-sample standard error. The standard errors for private school early estimates for school years 1991-92 and 1992-93 are shown in the table below.

| Students <br> $(\mathbf{1 9 9 2 - 9 3})$ | Teachers <br> $(\mathbf{1 9 9 2} \mathbf{- 9 3})$ | Graduates <br> $(\mathbf{1 9 9 1}$ |
| :---: | :---: | :---: |
| $116,612.2$ | $8,714.8$ | $6,071.4$ |

Survey estimates are also subject to errors of reporting and errors made in the collection and processing of the data. These errors, called nonsampling errors, can sometimes bias the data. While general sampling theory can be used to estimate the sampling variability of an estimate, nonsampling errors are not easy to measure and usually require either an experiment conducted as part of the data collection procedure or use of data external to the study.

Nonsampling errors may include such things as differences in the respondents' interpretation of the meaning of the questions, differences related to the particular time the survey was conducted, or errors in data preparation. The content of the survey was developed in consultation with representatives of private school associations attending NCES meetings for users and providers of private school data. The questionnaire and instructions were reviewed
extensively by NCES staff. The CATI instrument provided on-line internal consistency checks (i.e., totals equal sum of parts) as well as consistency checks with 1991 data for the sample schools. Interviewers resolved discrepancies with the school during the course of the interview. Machine editing of the questionnaires was conducted to check the data for accuracy and consistency. Data inputs into the CATI system were transferred directly to data bases, avoiding potential keying errors.
Undercoverage in the list and area frames is another possible source of nonsampling error. The area frame was used to complement the list frame through the identification of schools missing from the list frame. The area frame represents approximately 10 percent of the total number of private schools. The 1991-92 list and area frame updates to the PSS were reflected in this year's early estimates, and so schools newly opened since 1989 are included in those new estimates.

Questions concerning the Private School Early Estimates System can be directed to:

## Integrated Postsecondary Education Data System

The Integrated Postsecondary Education Data System (IPEDS) surveys all postsecondary institutions, including universities and colleges, as well as institutions offering technical and vocational education beyond the high school level. This survey, which began in 1986, replaces and supplements the Higher Education General Information Survey (HEGIS).
The IPEDS consists of several integrated components that obtain information on who provides postsecondary education (institutions), who participates in it and completes it (students), what programs are offered and what programs are completed, and both the human and financial resources involved in the provision of institutionally based postsecondary education. Specifically, these components include: institutional characteristics, including institutional activity; fall enrollment, including age and residence; fall enrollment in occupationally specific programs; completions; finance; staff; salaries of full-time instructional faculty; and academic libraries.

The higher education portion of this survey is a census of accredited 2- and 4-year colleges. Prior to 1993, data from the technical and vocational institutions were collected through a sample survey. Beginning in 1993, all data are gathered in a census of all postsecondary institutions. Thus, some portions of the earlier data will be subject to sampling and nonsampling errors, while some portions will be subject only to nonsampling errors.
Prior to the establishment of IPEDS in 1986, HEGIS acquired and maintained statistical data on the characteristics and operations of institutions of higher education. Implemented in 1966, HEGIS was an annual universe
survey of institutions listed in the latest NCES Education Directory, Colleges and Universities.

The information presented in this report draws on IPEDS surveys that solicited information concerning institutional characteristics, enrollment, degrees, and finances. The higher education portion of this system is a census of accredited 2- and 4-year colleges. Since these surveys cover all institutions in the universe, the data are not subject to sampling error.

However, they are subject to nonsampling error, the sources of which vary with the survey instrument. Each survey will therefore be discussed separately. Information concerning the nonsampling error of the enrollment and degrees surveys is drawn extensively from the HEGIS Post-Survey Validation Study conducted in 1979.

Institutional Characteristics. This survey provides the basis for the universe of institutions presented in the Directory of Postsecondary Institutions. The universe comprised institutions that met certain accreditation criteria and offered at least a 1-year program of college-level studies leading toward a degree. All of these institutions were certified as eligible by the U.S. Department of Education's Division of Eligibility and Agency Evaluation. Each fall, institutions listed in the previous year's Directory were asked to update their information.

Fall Enrollment. This survey has been part of the IPEDS or HEGIS series since 1966. The enrollment survey response rate was relatively high; the 1995 response rate was 97.0 percent. Major sources of nonsampling error for this survey were classification problems, the unavailability of needed data, interpretation of definitions, the survey due date, and operational errors. Of these, the classification of students appears to have been the main source of error. Institutions had problems in correctly classifying first-time freshmen, other first-time students, and unclassified students for both full-time and part-time categories. These problems occurred most often at 2-year institutions (private and public) and private 4 -year institutions. In the 1977-78 HEGIS validation studies, the classification problem led to an estimated overcount of 11,000 full-time students and an undercount of 19,000 part-time students. Although the ratio of error to the grand total was quite small (less than 1 percent), the percentage of errors was as high as 5 percent for detailed student levels and even higher at certain aggregation levels.

Beginning with fall 1986, the survey system was redesigned with the introduction of the Integrated Postsecondary Education Data System (IPEDS) (see above). The new survey system comprises all postsecondary institutions, but also maintains comparability with earlier surveys by allowing HEGIS institutions to be tabulated separately. The new system also provides for preliminary and revised data releases. This allows the Center flexibility to release early data sets while still maintaining a more accurate final data base.

Completions. This survey was part of the HEGIS series throughout its existence. However, the degree classification taxonomy was revised in 1970-71, 1982-83, and 1991-
92. Collection of degree data has been maintained through the IPEDS system.

Though information from survey years 1970-71 through 1981-82 is directly comparable, care must be taken if information before or after that period is included in any field of study comparison. The nonresponse rate did not appear to be a significant source of nonsampling error for this survey. The return rate over the years was high, with the response rate for the 1994-95 survey at 97 percent. Because of the high return rate, nonsampling error caused by imputation was also minimal.

The major sources of nonsampling error for this survey were differences between the NCES program taxonomy and taxonomies used by the colleges, classification of double majors and double degrees, operational problems, and survey timing. In the 1979 HEGIS validation study, these sources of nonsampling were found to contribute to an error rate of 0.3 percent overreporting of bachelor's degrees and 1.3 percent overreporting of master's degrees. The differences, however, varied greatly among fields. Over 50 percent of the fields selected for the validation study had no errors identified. Categories of fields that had large differences were business and management, education, engineering, letters, and psychology. It was also shown that differences in proportion to the published figures were less than 1 percent for most of the selected fields that had some errors. Exceptions to these were: master's and doctor's programs in labor and industrial relations (20 percent and 8 percent); bachelor's and master's programs in art education ( 3 percent and 4 percent); bachelor's and doctor's programs in business and commerce, and in distributive education ( 5 percent and 9 percent); master's programs in philosophy (8 percent); and doctor's programs in psychology ( 11 percent).

Financial Statistics. This survey was part of the HEGIS series and has been continued under the IPEDS system. Changes were made in the financial survey instruments in fiscal years (FY) 1976, 1982, and 1987. The FY 76 survey instrument contained numerous revisions to earlier survey forms and made direct comparisons of line items very difficult. Beginning in FY 82, Pell Grant data were collected in Federal restricted grants and contracts revenues and restricted scholarships and fellowships expenditures. The introduction of the Integrated Postsecondary Education Data System (IPEDS) in the FY 87 survey included several important changes to the survey instrument and data processing procedures. While these changes were significant, considerable effort has been made to present only comparable information on trends in this report and to note inconsistencies. Finance tables for this publication have been adjusted by subtracting the largely duplicative Pell Grant amounts from the later data to maintain comparability with pre-FY 82 data.

Possible sources of nonsampling error in the financial statistics include nonresponse, imputation, and misclassification. The response rate has been about 85 to 90 percent for most of the years reported. The response rate for the FY 1995 survey was 94 percent.

Two general methods of imputation were used in HEGIS. If the prior years' data were available for a nonresponding institution, these data were inflated using the Higher Education Price Index and adjusted according to changes in enrollments. If there were no data for the previous four years, current data were used from peer institutions selected for location (state or region), control, level, and enrollment size of institution. In most cases, estimates for nonreporting institutions in IPEDS were made using data from peer institutions.

Beginning with FY 87, the new system (IPEDS) comprises all postsecondary institutions, but also maintains comparability with earlier surveys by allowing 2 - and 4 year HEGIS institutions to be tabulated separately. The finance data tabulated for this publication reflect totals for the HEGIS or higher education institutions only.
To reduce reporting error, NCES used national standards for reporting finance statistics. These standards are contained in College and University Business Administration: Administrative Services (1974 Edition) and the Financial Accounting and Reporting Manual for Higher Education (1990 Edition) published by the National Association of College and University Business Officers; Audits of Colleges and Universities (as amended August 31, 1974), by the American Institute of Certified Public Accountants; and HEGIS Financial Reporting Guide (1980), by NCES. Wherever possible, definitions and formats in the survey are consistent with those in these four accounting texts.

## Bureau of the Census

## Current Population Survey

Current estimates of school enrollment, as well as social and economic characteristics of students, are based on data collected in the Census Bureau's monthly survey of about 60,000 households. The monthly Current Population Survey (CPS) sample consists of 729 areas comprising 1,973 counties, independent cities, and minor civil divisions throughout the 50 states and the District of Columbia. The sample was initially selected from the 1980 census files and is periodically updated to reflect new housing construction.
The monthly CPS deals primarily with labor force data for the civilian noninstitutional population (i.e., excluding military personnel and their families living on posts and inmates of institutions). In addition, in October of each year, supplemental questions are asked about highest grade completed, level of current enrollment, attendance status, number and types of courses, degree or certificate objective, and type of organization offering instruction for each member of the household.

The estimation procedure used for the monthly CPS data involves inflating weighted sample results to independent estimates of characteristics of the civilian noninstitutional population in the United States by age, sex, and race. These independent estimates are based on statistics from decennial censuses that include statistics on births, deaths, immigration, and emigration and statistics on the population in the armed services. Generalized standard error tables are in the Current Population Reports. The data are subject to both nonsampling and sampling errors.

More information is available in the Current Population Reports, Series P-20, or by contacting:

## Education and Social Stratification Branch Bureau of the Census <br> U.S. Department of Commerce <br> Washington, DC 20233

School Enrollment. Each October, the Current Population Survey (CPS) includes supplemental questions on the enrollment status of the population 3 years old and over. The main sources of nonsampling variability in the responses to the supplement are those inherent in the survey instrument. The question concerning educational attainment may be sensitive for some respondents who may not want to acknowledge their lack of a high school diploma. The question of current enrollment may not be answered accurately for various reasons. Some respondents may not know current grade information for every student in the household, a problem especially prevalent for households with members in college or in nursery school. Confusion over college credits or hours taken by a student may make it difficult to determine the year in which the student is enrolled. Problems may occur with the definition of nursery school (a group or class organized to provide educational experiences for children) where respondents' interpretations of "educational experiences" vary.

Questions concerning the CPS "School Enrollment" survey may be directed to:
Education and Social Stratification Branch
Bureau of the Census
U.S. Department of Commerce

Washington, DC 20233
State population projections. These state population projections were prepared using a cohort-component method by which each component of population changebirths, deaths, state-to-state migration flows, international in-migration, and international out-migration-was projected separately for each birth cohort by sex, race, and Hispanic origin. The basic framework was the same as in past Census Bureau projections. Detailed components necessary to create the projections were obtained from vital statistics, administrative records, census data, and national projections.

The cohort-component method is based on the traditional demographic accounting system:
$\mathrm{P}_{1}=\mathrm{P}_{0}+$ B $-\mathrm{D}+\mathrm{DIM}-\mathrm{DOM}+\mathrm{IIM}-\mathrm{IOM}$
where:
$P_{1} \quad=$ population at the end of the period
$\mathrm{P}_{0} \quad=$ population at the beginning of the period
B $\quad=$ births during the period
$\mathrm{D} \quad=$ deaths during the period
DIM $=$ domestic in-migration during the period
$\mathrm{DOM}=$ domestic out-migration during the period
IIM $=$ international in-migration during the period
IOM $=$ international out-migration during the period
To generate population projections with this model, the Census Bureau created separate data sets for each of these components. In general, the assumptions concerning the future levels of fertility, mortality, and international migration are consistent with the assumptions developed for the national population projections of the Census Bureau.

Once the data for each component were developed, it was a relatively straightforward process to apply the cohortcomponent method and produce the projections. For each projection year the base population for each state was disaggregated into eight race and Hispanic categories (nonHispanic white; non-Hispanic black; non-Hispanic American Indian, Eskimo, and Aleut; non-Hispanic Asian and Pacific Islander, Hispanic white; Hispanic black; Hispanic American Indian, Eskimo, and Aleut; and Hispanic Asian and Pacific Islander), by sex, and single year of age (ages 0 to $85+$ ). The next step was to survive each age-sex-race-ethnic group forward 1 year using the pertinent survival rate. The internal redistribution of the population was accomplished by applying the appropriate state-tostate migration rates to the survived population in each state. The projected out-migrants were subtracted from the state of origin and added to the state of destination (as in-migrants). Next, the appropriate number of immigrants from abroad were added to each group. The populations under age 1 were created by applying the appropriate age-race-ethnic-specific birth rates to females of childbearing age. The number of births by sex and race/ethnicity were survived forward and exposed to the appropriate migration rate to yield the population under age 1. The final results of the projection process were adjusted to be consistent with the national population projections by single years of age, sex, race, and Hispanic origin. The entire process was then repeated for each year of the projection.

More information is available in the Census Bureau Population Paper Listing 47 (PPL-47) and Current Popu-
lation Report P25-1130. These reports may be obtained from:

## Other Sources

## National Education Association

## Estimates of School Statistics

The National Education Association (NEA) reports teacher, revenue, and expenditure data in its annual publication, Estimates of School Statistics. Each year, NEA prepares regression-based estimates of financial and other education statistics and submits them to the states for verification. Generally, about 30 states adjust these estimates based on their own data. These preliminary data are published by NEA along with revised data from previous years. States are asked to revise previously submitted data as final figures become available. The most recent publication contains all changes reported to the NEA.

## Standard and Poor's DRI

Standard and Poor's DRI provides an information system that includes more than 125 databases: simulation and planning models; regular publications and special studies; data retrieval and management systems; and access to experts on economic, financial, industrial, and market activities. One service is the DRI U.S. Annual Model Forecast Data Bank, which contains annual projections of the U.S. economic and financial conditions, including forecasts for the federal government, incomes, population, prices and wages, and state and local government, over a long-term (10 to 25-year) forecast period.

## Glossary

## Data Terms

Associate's degree: A degree granted for the successful completion of a subbaccalaureate program of studies, usually requiring at least 2 years (or the equivalent) of fulltime college-level study. This term includes degrees granted in a cooperative or work-study program.

Average daily attendance (ADA): The aggregate attendance of a school during a reporting period (normally a school year) divided by the number of days school is in session during this period. Only days on which the pupils are under the guidance and direction of teachers should be considered days in session.

Average daily membership (ADM): The aggregate membership of a school during a reporting period (normally a school year) divided by the number of days school is in session during this period. Only days on which the pupils are under the guidance and direction of teachers should be considered as days in session. The average daily membership for groups of schools having varying lengths of terms is the average of the average daily memberships obtained for the individual schools.

Bachelor's degree: A degree granted for the successful completion of a baccalaureate program of studies, usually requiring at least 4 years (or the equivalent) of full-time college-level study. This term includes degrees granted in a cooperative or work-study program.

Classroom teacher: A staff member assigned the professional activities of instructing pupils in self-contained classes or courses, or in classroom situations. Usually expressed in full-time equivalents.

Cohort: A group of individuals that have a statistical factor in common, for example, year of birth.

College: A postsecondary school that offers a general or liberal arts education, usually leading to an associate, bachelor's, master's, doctor's, or first-professional degree. Junior colleges and community colleges are included in this term.

Constant dollars: Dollar amounts that have been adjusted by means of price and cost indexes to eliminate inflationary factors and allow direct comparison across years.

Consumer Price Index (CPI): This price index measures the average change in the cost of a fixed market basket of goods and services purchased by consumers.

Current dollars: Dollar amounts that have not been adjusted to compensate for inflation.

Current expenditures (elementary/secondary): The expenditures for operating local public schools, excluding capital outlay and interest on school debt. These expenditures include such items as salaries for school personnel, fixed charges, student transportation, school books and materials, and energy costs.

Current expenditures per pupil in average daily attendance: Current expenditures for the regular school term divided by the average daily attendance of full-time pupils (or full-time-equivalency of pupils) during the term. See also current expenditures and average daily attendance.

Current-fund expenditures (higher education): Money spent to meet current operating costs, including salaries, wages, utilities, student services, public services, research libraries, scholarships and fellowships, auxiliary enterprises, hospitals, and independent operations. Excludes loans, capital expenditures, and investments.

Current Population Survey: See Appendix C, Data Sources.

Disposable income: Current income received by persons less their contributions for social insurance, personal tax, and nontax payments. It is the income available to persons for spending and saving. Nontax payments include passport fees, fines and penalties, donations, and tuitions and fees paid to schools and hospitals operated mainly by the government. See also personal income.

Doctor's degree: An earned degree carrying the title of doctor. The Doctor of Philosophy degree (Ph.D.) is the highest academic degree and requires mastery within a field of knowledge and demonstrated ability to perform scholarly research. Other doctorates are awarded for fulfilling specialized requirements in professional fields, such as education (Ed.D.), musical arts (D.M.A.), business administration (D.B.A.), and engineering (D.Eng. or D.E.S.). Many doctor's degrees in both academic and professional fields require an earned master's degree as a prerequisite. First-professional degrees, such as M.D. and D.D.S., are not included under this heading.

Educational and general expenditures: The sum of current funds expenditures on instruction, research, public service, academic support, student services, institutional support, operation and maintenance of plant, and awards from restricted and unrestricted funds.

Elementary school: A school classified as elementary by state and local practice and composed of any span of grades not above grade 8. A preschool or kindergarten school is included under this heading only if it is an integral part of an elementary school or a regularly established school system.

Elementary and secondary schools: As used in this publication, includes only regular schools, that is, schools that are part of state and local school systems and also most private elementary and secondary schools, both religiously affiliated and nonsectarian. Schools not included in this term are subcollegiate departments of institutions of higher education, American residential schools for exceptional children, federal schools for Indians, and federal schools on military posts and other federal installations.

Enrollment: The number of students registered in a given school unit at a given time, generally in the fall of a year.

Expenditures: Charges incurred, whether paid or unpaid, that are presumed to benefit the current fiscal year. For elementary and secondary schools, these include all charges for current outlays plus capital outlays and interest on school debt. For institutions of higher education, these include current outlays plus capital outlays. For government, these include charges net of recoveries and other correcting transactions other than for retirement of debt, investment in securities, or extension of credit. Government expenditures include only external transactions, such as the provision of perquisites or other payments in kind. Aggregates for groups of governments exclude intergovernmental transactions.

Expenditures per pupil: Charges incurred for a particular period of time divided by a student unit of measure, such as average daily attendance or average daily membership.

First-professional degree: A degree that signifies both completion of the academic requirements for beginning practice in a given profession and a level of professional skill beyond that normally required for a bachelor's degree. This degree is based on a program requiring at least 2 academic years of work before entrance and a total of at least 6 academic years of work to complete the degree program, including both prior required college work and the professional program itself. By NCES definition, first-
professional degrees are awarded in the fields of dentistry (D.D.S. or D.M.D.), medicine (M.D.), optometry (O.D.), osteopathic medicine (D.O.), pharmacy (D.Phar.), podiatry (D.P.M.), veterinary medicine (D.V.M.), chiropractic (D.C. or D.C.M.), law (LL.B. or J.D.), and theological professions (M.Div. or M.H.L.).

First-professional enrollment: The number of students enrolled in a professional school or program that requires at least 2 years of academic college work for entrance and a total of at least 6 years for a degree. By NCES definition, first-professional enrollment includes only students in certain programs. (See first-professional degree for a list of programs.)

Full-time enrollment: The number of students enrolled in higher education courses with total credit load equal to at least 75 percent of the normal full-time course load.

Full-time-equivalent (FTE) enrollment: For institutions of higher education, enrollment of full-time students, plus the full-time equivalent of part-time students as reported by institutions. In the absence of an equivalent reported by an institution, the FTE enrollment is estimated by adding one-third of part-time enrollment to full-time enrollment.

Full-time worker: In educational institutions, an employee whose position requires being on the job on school days throughout the school year at least the number of hours the schools are in session; for higher education, a member of an educational institution's staff who is employed full time.

Graduate: An individual who has received formal recognition for the successful completion of a prescribed program of studies.

Graduate enrollment: The number of students who hold the bachelor's or first-professional degree, or the equivalent, and who are working toward a master's or doctor's degree. First-professional students are counted separately. These enrollment data measure those students who are registered at a particular time during the fall. At some institutions, graduate enrollment also includes students who are in postbaccalaureate classes but not in degree programs.

High school: A secondary school offering the final years of high school work necessary for graduation, usually including grades 10,11 , and 12 (in a 6-3-3 plan), or grades $9,10,11$, and 12 (in a 6-2-4 plan).

Higher education: Study beyond secondary school at an institution that offers programs terminating in an associate, baccalaureate, or higher degree.

## Higher education institutions (traditional classifications):

4-year institution: An institution legally authorized to offer and offering at least a 4-year program of collegelevel studies wholly or principally creditable toward a bachelor's degree. A university is a postsecondary institution that typically includes one or more graduate professional schools.

2-year institution: An institution legally authorized to offer and offering at least a 2-year program of collegelevel studies that terminates in an associate degree or is principally creditable toward a baccalaureate.

Higher Education Price Index: A price index which measures average changes in the prices of goods and services purchased by colleges and universities through currentfund education and general expenditures (excluding expenditures for sponsored research and auxiliary enterprises).

Instructional staff: Full-time-equivalent number of positions, not the number of individuals occupying the positions during the school year. In local schools, it includes all public elementary and secondary (junior and senior high) day-school positions that are in the nature of teaching or the improvement of the teaching-learning situation. Includes consultants or supervisors of instruction, principals, teachers, guidance personnel, librarians, psychological personnel, and other instructional staff. Excludes administrative staff, attendance personnel, clerical personnel, and junior college staff.

Master's degree: A degree awarded for successful completion of a program generally requiring 1 or 2 years of full-time college-level study beyond the bachelor's degree. One type of master's degree, including the Master of Arts degree (M.A.) and the Master of Science degree (M.S.), is awarded in the liberal arts and sciences for advanced scholarship in a subject field or discipline and demonstrated ability to perform scholarly research. A second type of master's degree is awarded for the completion of a professionally oriented program, for example, an M.Ed. in education, an M.B.A. in business administration, an M.F.A. in fine arts, an M.M. in music, an M.S.W. in social work, or an M.P.A. in public administration. A third type of master's degree is awarded in professional fields for study beyond the first-professional degree, for example, the Master of Laws (LL.M.) and Master of Science in various medical specializations.

Part-time enrollment: The number of students enrolled in higher education courses with a total credit load of less than 75 percent of the normal full-time credit load.

Personal income: Current income received by persons from all sources minus their personal contributions for social insurance. Classified as "persons" are individuals
(including owners of unincorporated firms), nonprofit institutions serving individuals, private trust funds, and private noninsured welfare funds. Personal income includes transfers (payments not resulting from current production) from government and business such as social security benefits, military pensions, and so forth, but excludes transfers among persons.

Postbaccalaureate enrollment: The number of graduate and first-professional students working toward advanced degrees and students enrolled in graduate-level classes but not enrolled in degree programs. See also graduate enrollment and first-professional enrollment.

Private institution: A school or institution that is controlled by an individual or agency other than a state, a subdivision of a state, or the federal government; that is usually supported primarily by other than public funds; and the operation of whose program rests with other than publicly elected or appointed officials.

Property tax: The sum of money collected from a tax levied against the value of property.

Public school or institution: A school or institution controlled and operated by publicly elected or appointed officials and generally deriving its primary support from public funds.

Pupil-teacher ratio: The enrollment of pupils at a given period of time, divided by the full-time-equivalent number of classroom teachers serving these pupils during the same period.

Revenues: All funds received from external sources, net of refunds and correcting transactions. Noncash transactions such as receipt of services, commodities, or other receipts 'in kind'" are excluded, as are funds received from the issuance of debt, liquidation of investments, or nonroutine sale of property.

Revenue receipts: Additions to assets that do not incur an obligation that must be met at some future date and do not represent exchanges of property for money. Assets must be available for expenditures.

Salary: The total amount regularly paid or stipulated to be paid to an individual, before deductions, for personal services rendered while on the payroll of a business or organization.

School: A division of the school system consisting of students in one or more grades or other identifiable groups and organized to give instruction of a defined type. One school may share a building with another school or one school may be housed in several buildings.

Secondary instructional level: The general level of instruction provided for pupils in secondary schools
(generally covering grades 7 through 12 or 9 through 12) and any instruction of a comparable nature and difficulty provided for adults and youth beyond the age of compulsory school attendance.

Secondary school: A school including any span of grades beginning with the next grade following an elementary or middle school (usually 7,8 , or 9 ) and ending with or below grade 12. Both junior high schools and senior high schools are included.

Senior high school: A secondary school offering the final years of high school work necessary for graduation.

Student: An individual for whom instruction is provided in an educational program under the jurisdiction of a school, school system, or other educational institution. No distinction is made between the terms "student" and "pupil," although 'student' may refer to one receiving instruction at any level while '"pupil', refers only to one attending school at the elementary or secondary level. The term "student'" is used to include individuals at all instructional levels. A student may receive instruction in a school facility or in another location, such as at home or in a hospital. Instruction may be provided by direct student-teacher
interaction or by some other approved medium, such as television, radio, telephone, or correspondence.

Tax base: The collective value of sales, assets, and income components against which a tax is levied.

Total expenditure per pupil in average daily attendance: Includes all expenditures allocable to per pupil costs divided by average daily attendance. These allocable expenditures include current expenditures for regular school programs, interest on school debt, and capital outlay. Beginning in 1980-81, expenditures for administration by state governments are excluded and expenditures for other programs (summer schools, community colleges, and private schools) are included.

Unclassified students: Students who are not candidates for a degree or other formal award, although they are taking higher education courses for credit in regular classes with other students.

Undergraduate students: Students registered at an institution of higher education who are working in a program leading to a baccalaureate or other formal award below the baccalaureate, such as an associate degree.

## Statistical Terms

Autocorrelation: Correlation of the error terms from different observations of the same variable. Also called serial correlation.

Degrees of freedom: The number of free or linearly independent sample observations used in the calculation of a statistic. In a time series regression with $t$ time period and k independent variables including a constant term, there would be $\mathrm{t}-\mathrm{k}$ degrees of freedom.

Dependent variable: A mathematical variable whose value is determined by that of one or more other variables in a function. In regression analysis, when a random variable, y , is expressed as a function of variables $\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots$, plus a stochastic term, then y is known as the 'dependent variable."

Double exponential smoothing: A method that takes a single smoothed average component of demand and smoothes it a second time to allow for estimation of a trend effect.

Durbin-Watson statistic: A statistic testing the independence of errors in least squares regression against the alternative of first-order serial correlation. The statistic is a simple linear transformation of the first-order serial correlation of residuals and, although its distribution is unknown, it is tested by bounding statistics that follow R. L. Anderson's distribution.

Econometrics: The quantitative examination of economic trends and relationships using statistical techniques, and the development, examination, and refinement of those techniques.

Estimate: A numerical value obtained from a statistical sample and assigned to a population parameter. The particular value yielded by an estimator in a given set of circumstances or the rule by which such particular values are calculated.

Estimating equation: An equation involving observed quantities and an unknown that serves to estimate the latter.

Estimation: Estimation is concerned with inference about the numerical value of unknown population values from incomplete data, such as a sample. If a single figure is calculated for each unknown parameter, the process is called point estimation. If an interval is calculated within which the parameter is likely, in some sense, to lie, the process is called interval estimation.

Exogenous variable: Variables for which the values are determined outside the model but which influence the model.

Exponential smoothing: A method used in time series to smooth or to predict a series. There are various forms, but all are based on the supposition that more remote history has less importance than more recent history.

Ex-ante forecast: When forecasting a dependent variable for some time period $t$ using a model with at least one independent variable, the forecast of the dependent variable is an ex-ante forecast if the values for the independent variables for time period $t$ are themselves not known.

Ex-post forecast: When forecasting a dependent variable for some time period $t$ using a model with at least one independent variable, the forecast of the dependent variable is an ex-post forecast if the actual values for the independent variables for time period $t$ are the known. Ex-post forecasts are often used in forecast evaluation.

First-Order serial correlation: When errors in one time period are correlated directly with errors in the ensuing time period. Also called autocorrelation.

Forecast: An estimate of the future based on rational study and analysis of available pertinent data, as opposed to subjective prediction.

Forecasting: Assessing the magnitude which a quantity will assume at some future point in time: as distinct from "estimation," which attempts to assess the magnitude of an already existent quantity.

Forecast horizon: The number of time periods into the future which are forecasted. Forecasts for next year are said to have a 1-year forecast horizon.

Function: A mathematical correspondence that assigns exactly one element of one set to each element of the same or another set. A variable that depends on and varies with another.

Functional form: A mathematical statement of the relationship among the variables in a model.

Independent variable: In regression analysis, when a random variable, y , is expressed as a function of variables $\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots$, plus a stochastic term, the x 's are known as 'independent variables."

Lag: An event occurring at time $\mathrm{t}+\mathrm{k}(\mathrm{k}>0)$ is said to lag behind an event occurring at time t , the extent of the lag being k . An event occurring k time periods before another may be regarded as having a negative lag.

Maximum likelihood estimation: A method of estimating a parameter or parameters of a population by that value (or values) that maximizes (or maximize) the likelihood of a sample.

Mean absolute percentage error (MAPE): The average value of the absolute value of errors expressed in percentage terms.

Model: A system of postulates, data, and inferences presented as a mathematical description of a phenomenon such as an actual system or process. The actual phenomenon is represented by the model in order to explain it, to predict it, and to control it.

Ordinary least squares (OLS): The estimator that minimizes the sum of squared residuals.

Parameter: A quantity that describes a statistical population.

Projection: In relation to a time series, an estimate of future values based on a current trend.
$\mathbf{R}^{2}$ : The coefficient of determination; the square of the correlation coefficient between the dependent variable and its OLS estimate.
$\mathbf{R}^{\mathbf{2}}$ (also called the adjusted $\mathbf{R}^{2}$ ): The coefficient of determination adjusted for the degrees of freedom.

Regression analysis: A statistical technique for investigating and modeling the relationship between variables.

Rho: A measure of the correlation coefficient between errors in time period $t$ and time period $t$ minus 1 .

Serial correlation: Correlation of the error terms from different observations. Also called autocorrelation.

Standard error of estimate: An expression for the standard deviation of the observed values about a regression line. An estimate of the variation likely to be encountered in making predictions from the regression equation.

Time series: A set of ordered observations on a quantitative characteristic of an individual or collective phenomenon taken at different points in time. Usually the observations are successive and equally spaced in time.

Time series analysis: The branch of quantitative forecasting in which data for one variable are examined for patterns of trend, seasonality, and cycle.

Variable: A quantity that may assume any one of a set of values.
