Measuring the Effect of Benefits and Taxes on Income and Poverty: 1989

INTRODUCTION

Traditionally, income and poverty data presented in Census Bureau reports have been based on the amount of money income received during a calendar year before any taxes and excluding capital gains. This definition of income is narrow and does not provide a completely satisfactory measure of the distribution of income. The omission of data on taxes, capital gains, and the value of noncash benefits has an effect on comparisons over time and between population subgroups.

The narrow income definition reflects the content of the March Current Population Survey questionnaire. The March questionnaire contains no questions about income or other taxes and, until 1980, contained no questions about the receipt of noncash benefits. Since March 1980, the questionnaire has included items on the receipt of benefits from government programs (e.g., food stamps, housing assistance, Medicare, and Medicaid) and from employers (e.g., health insurance).

The Census Bureau has had a research program on the measurement of taxes and the value of noncash benefits for the past few years and in December 1988 published a report entitled *Measuring the Effect of Benefits and Taxes on Income and Poverty: 1986* (Current Population Reports, Series P-60, No. 164-RD-1). That report presented calculations showing how income and poverty estimates changed when specific taxes were deducted and specific benefits were added to the income definition.¹ This report presents updated estimates of the incremental effect of benefits and taxes on income and poverty for 1989, along with summary statistics from 1988 and 1987. A supplemental report, to be released later this year, will contain the full sets of estimates for 1988 and 1987.

The income definitions that are shown in this report are explained briefly below. Descriptions of methods used to value noncash benefits and estimate taxes are contained in appendixes B and C, respectively.

1. Money income excluding capital gains before taxes. This is the official definition used in Census Bureau reports.

¹Federal individual income tax estimates in this report should be considered as preliminary. See appendix C for further details.

2. Definition 1 less government cash transfers. Government cash transfers include nonmeans-tested transfers such as Social Security payments, unemployment compensation, and government educational assistance (e.g., Pell Grants) as well as means-tested transfers such as AFDC and SSI.
3. Definition 2 plus capital gains. Capital gains and losses are simulated as part of the Census Bureau's Federal individual income tax estimation procedure.
4. Definition 3 plus health insurance supplements to wage or salary income. Employer-provided health insurance coverage is treated as part of total worker compensation.
5. Definition 4 less Social Security payroll taxes.
6. Definition 5 less Federal income taxes. This definition includes the effect of the Earned Income Tax Credit.
7. Definition 6 less State income taxes.
8. Definition 7 plus nonmeans-tested government cash transfers. Nonmeans-tested government cash transfers include Social Security payments, unemployment compensation, worker's compensation, nonmeans-tested Veteran's payments, U.S. Railroad Retirement, Black Lung payments, Pell Grants, and other government educational assistance (Pell Grants are income-tested but are included here because they are very different from the assistance programs that are included in the means-tested category).
9. Definition 8 plus the value of Medicare.
10. Definition 9 plus the value of regular-price school lunches.
11. Definition 10 plus means-tested government cash transfers. Means-tested government cash transfers include AFDC, SSI, other public assistance programs, and means-tested Veteran's payments.
12. Definition 11 plus the value of Medicaid.
13. Definition 12 plus the value of other means-tested government noncash transfers. These include food stamps, rent subsidies, and free and reduced-price school lunches.
14. Definition 13 plus net imputed return on equity in own home.

MEASUREMENT ISSUES

Some of the methods used to value noncash benefits differ considerably from those used in the previous series of technical papers. The changes were made on the basis of Census Bureau research and the comments and analysis of data users. A description of some of the basic measurement issues is given below:

1. *What value should be assigned to Medicare and Medicaid coverage?* The previous series of technical papers presented poverty estimates based on an income definition that counted as income the full market value (mean outlays for families in a given risk class) of Medicare and Medicaid benefits. Comparisons of the market value of these benefits with the official poverty threshold showed that the market value of these benefits was frequently very high, compared with the poverty thresholds, and sometimes exceeded them. It became apparent to many analysts that it was inappropriate simply to count the full market value of Medicare and Medicaid and then use the resulting income figure to determine poverty status. The valuation approach adopted for this report is the fungible value approach. The benefits of being covered by Medicare or Medicaid are counted as income to the extent that they free up resources that could have been spent on medical care. Additional information on the fungible approach is contained in appendix B.

A separate issue concerns the choice of risk classes to use in calculating mean outlays. The risk classes for Medicare include the aged and the disabled. Those for Medicaid include the elderly, blind, or disabled adults, nondisabled adults, and children. For both programs, mean outlays and therefore assigned income values vary by State of residence. There are questions as to the appropriateness of these risk classes because a shift from one risk class to another or from one State to another can result in a change in assigned income. A related issue for the purpose of calculating mean outlays for the Medicaid program is whether the universe should include persons who receive benefits because they are "medically needy." These persons were excluded in the universe for these calculations; because they have very high medical expenses their inclusion would have caused mean outlays to be higher and would have increased assigned income values.

2. *What method should be used to determine the subsidy value of housing assistance?* The estimates shown in this report are based on a model that attempted to measure the factors that determine the market rental value of nonsubsidized rental units. The model was then used to estimate the

market rental value of subsidized units. The model-based estimate of the market rental value of subsidized units was then compared with the actual rent paid by residents of subsidized units and the difference was accepted as the subsidy value. This measurement technique is complex and the results depend on the specification of the model. Additional testing will be conducted to verify that the model is robust.

3. *What method should be used to measure the income flow from housing equity?* Persons with home equity receive housing services that are not included in measures of cash income. Two methods have been used to measure the income flow from owner-occupied housing. The first method estimates net rental income. The procedure estimates the market rent which the owner-occupied unit would receive in the rental market and deducts various costs of homeownership including mortgage interest, depreciation, maintenance costs, and property taxes. There are significant measurement difficulties with this method. For example, the market rental value of owner-occupied housing is usually not directly observable and estimates based on rental units must consider differences in quantity and quality between the two types of units. The second methodology (the one used in this study) applies a rate of return to home equity to obtain an estimate of the income that the household would receive if it chose to shift the amount held as home equity into an interest-earning account. This approach avoids many of the estimation problems of the first approach. The primary measurement problems associated with the net imputed rate of return approach are the lack of home equity data on the CPS data file and the necessity of choosing an appropriate rate of return.

4. *Should an income definition that includes the net imputed return on home equity be used in the determination of poverty status?* A concern with adding this component to an income definition has to do with the way the original poverty thresholds were defined. Because this component (net imputed return on home equity) was not part of the income definition used in calculating the poverty "multiplier," there is an argument for not including it in an income definition that is used to determine poverty status. This argument holds, to some degree, for any income component that was not part of the original definition. A counter-argument, that certain income components (e.g., food stamps) were small or non-existent at the time the poverty definition was developed, clearly does not apply to home equity.

5. *Should school lunch subsidies be counted as income, and if so, how should they be valued?* For this

report, school lunch subsidies (including those associated with regular-price lunches) have been counted as income at their full subsidy value. There are two issues of concern. The first is whether it is consistent to count school lunch subsidies when the value of subsidized meals consumed in a business situation are not counted. The latter meals include those consumed by business travelers for which the traveler is reimbursed, and those consumed in a business setting that are paid for by an employer. If a decision is made to count school lunch subsidies, an issue remains about whether the full amount of the subsidy should be counted as income. Families who participate in this program have no choice about the quantity and type of food and their perception of the income value of the benefit may be well below the full subsidy value.

6. *What adjustment should be made for underreporting?* Household respondents tend to underreport some types of income and the problem can be severe for those sources that are received at irregular intervals or for those sources about which the household respondent may have limited information. (See appendix F for a discussion of this issue.) The Census Bureau expects to intensify its research in this area to obtain more current and accurate estimates of the extent of the problem and to identify methods for adjusting for underreporting.
7. *Should the experimental CPI-U-X1 index be used to adjust poverty thresholds through time?* Poverty data are based on a definition developed in 1965 by researchers at the Social Security Administration. Year-to-year adjustments for inflation are made to the poverty thresholds based on the official Consumer Price Index (CPI-U). The official CPI-U measured housing cost changes using a procedure which included changes in the asset value of homes and led to excessive growth in the index during the late 1970's as housing prices and interest rates increased rapidly. In 1983, in an effort to solve this problem, the Bureau of Labor Statistics (BLS) introduced a rental equivalence approach to measuring housing cost changes. The official CPI-U time series, therefore, is based on an asset approach to homeownership prior to 1983 and on a rental equivalence approach from 1983 to the present. In order to provide a consistent time series, BLS constructed an experimental series (CPI-U-X1) for 1967 through 1982 based on the rental equivalence approach. BLS recommends the use of this series to provide a consistent treatment of homeownership costs (see appendix H).

Since the effect of adjusting poverty thresholds for inflation is cumulative, a lower measure of inflation in the past results in lower current thresholds. If poverty thresholds had been updated between

1967 and 1982 based on the experimental CPI-U-X1 rather than the official CPI-U, the current thresholds would be approximately 8 percent lower and fewer people would be classified as below the poverty level.

The use of the CPI-U-X1 produces lower current estimates of the level of poverty, but similar trends in poverty are observed regardless of the CPI used. The use of the CPI-U-X1 index produces estimates of poverty rates of 10.5 percent in 1974, 10.4 percent in 1978, 13.7 percent in 1983, and 11.4 percent in 1989. The official estimates (based on the official CPI-U) for these years are 11.2 percent in 1974, 11.4 percent in 1978, 15.2 percent in 1983, and 12.8 percent in 1989. Both series show a sharp increase from 1978 to 1983 and a decline from 1983 to 1989. The 1989 rate in both series is higher than the 1978 rate. For further discussion of this issue, see Current Population Reports, Series P-60, No. 168, *Money Income and Poverty Status in the United States: 1989*.

It should be noted that which CPI index is most appropriate is only one of many issues surrounding the accuracy of the current poverty definition. The resolution of some of the other poverty definition questions would have considerably more impact on the number of poor and poverty rate. Other definitional issues include (1) the food-to-total income ratio inherent in the current definition; (2) the use of different thresholds for the elderly in one- and two-person households; (3) how and whether to incorporate the value of medical benefits and other noncash benefits; (4) the exclusion of the homeless in the CPS since it is a household survey; (5) the use of pre-tax or after-tax income; (6) regional cost of living differences; and (7) the inclusion of assets and liabilities.

HIGHLIGHTS

(Figures in parentheses denote 90-percent confidence intervals.)

- The use of a fully adjusted income definition, that is, one that includes the effect of taxes, cash and noncash benefits, capital gains, employee health benefits, and net return on home equity results in a more equal distribution of income than under the official money income definition.
- It has long been known that both taxes and transfers have an equalizing effect on the distribution of income. One of the important findings of the Bureau's tax and benefit research is that the effect of government transfers is much more significant than taxes in redistributing income.
- Based on the official money income definition, the median income of Black households was 59.5 (± 2.1) percent of the White median income in 1989. The use

of a definition of income that has been broadened to include the effect of taxes and noncash benefits results in a ratio of 65.7 (± 1.7) percent.

- The ratio of median income of households with a householder of Hispanic origin to White households was 76.6 (± 2.5) percent under the broadened definition of income that includes taxes and the value of transfer benefits, compared with 72.1 (± 2.4) percent based on the original money income definition.
- Analyses of the incremental effect of adding or subtracting income sources show that when the current income measure was modified to exclude government money transfers (definition 2), the number of persons below the poverty level rose sharply from 31.5 (± 0.8) million to 49.1 (± 1.0) million and the poverty rate rose from 12.8 (± 0.3) percent to 20.0 (± 0.4) percent.
- The incremental effect of subtracting income and payroll taxes from income (definitions 5, 6, and 7) was to produce higher estimates of the number of persons in poverty (an increase of 2.1 (± 0.8) million) and the poverty rate (an increase of 0.9 (± 0.3) percentage points).
- The addition of nonmeans-tested government cash transfers (primarily Social Security) to an income definition that included only private sector income had a strong effect on poverty estimates; the number of persons in poverty decreased by 15.6 (± 0.7) million and the poverty rate decreased by 6.4 (± 0.3) percentage points.
- The addition of means-tested cash transfers (primarily AFDC and SSI) was small compared with nonmeans-tested cash transfers. The addition of means-tested cash transfers (definition 11) to an income definition that included private sector income and government nonmeans-tested cash transfers reduced the estimate of persons in poverty by 2.3 (± 0.6) million and the poverty rate by 0.9 (± 0.3) percentage points.
- The addition of means-tested noncash transfers (food stamps, housing, and Medicaid) to an income definition that included cash income from the private and government sectors reduced the number in poverty by 5.1 (± 0.6) million and the poverty rate by 2.1 (± 0.3) percentage points.
- The incremental effect of some income components was different for Whites than for Blacks or persons of Hispanic origin. The addition of nonmeans-tested government cash transfers to an income definition based on private sector income reduced the number of persons in poverty by 37.6 (± 1.2) percent for Whites, 14.3 (± 1.4) percent for Blacks, and 11.1 (± 1.7) percent for Hispanics.

- When year-to-year comparisons were made in poverty estimates, most of the definitions of income did not show a statistically significant change in the number of poor or the poverty rate between 1988 and 1989. However, two measures which include the effect of taxes, cash and noncash benefits, capital gains and employee health benefits (definitions 12 and 13) did show a statistically significant decline in the poverty rate from 1988 to 1989 (from 12.1 (± 0.4) percent to 11.7 (± 0.3) percent and from 10.8 (± 0.3) percent to 10.4 (± 0.3) percent, respectively).
- On average, poverty estimates using the CPI-U-X1 to adjust poverty thresholds were approximately 1.3 (± 0.3) percentage points and 3.3 (± 0.6) million persons lower than estimates using the CPI-U.

DISTRIBUTIONAL EFFECTS OF BENEFITS AND TAXES

Taxes, government transfers, and other benefits have substantial effects on the level and distribution of income. These effects can be seen by examining distributional changes under the 14 different definitions of income used in this report. Text tables A through D and detailed table 1 show data on the distribution of income under the 14 definitions.

Under the official definition of income (definition 1), which is based on money income before taxes and includes government cash transfers, aggregate household income totaled \$3,409 billion in 1989 for the 93.3 million households in the United States. (See table A.) Median household income was \$28,910. Looking at the distribution of definition 1 household income by income quintiles, 3.9 percent of the total was received by the lowest quintile, 9.6 percent by the second quintile, 15.9 percent by the third quintile, 24.0 percent by the fourth quintile, and 46.7 percent by the highest quintile. The degree of income inequality is summarized by the Gini index, which is a statistic that varies between 0 (perfect equality) and 1 (perfect inequality).² In 1989, the Gini index for definition 1 household income was .429.³

Definition 2 shows the effect on the income distribution when income is defined to exclude government cash transfers. This definition represents the amount and distribution of income generated by the private sector. The exclusion of government cash transfers lowered aggregate household income by \$258 billion to \$3,151 billion, and lowered median household income by 7.6 percent, to \$26,720. The distribution of income generated by the private sector was much more unequal

²A description of the Gini index can be found in appendix A.

³Shares of aggregate income in this report are slightly different from those published in Current Population Reports, Series P-60, No. 168, *Money Income and Poverty Status in the United States: 1989*, since they are computed from grouped data rather than individual data.

Table A. Median, Mean, and Aggregate Household Income, by Definition of Income: 1989

(Total households = 93,347,000)

Definition of income	Median income	Mean income	Aggregate income (billions)
Income before taxes:			
1. Money income excluding capital gains (current measure).....	\$28,906	\$36,520	\$3,409.0
2. Definition 1 less government cash transfers	26,715	33,757	3,151.1
3. Definition 2 plus capital gains	26,868	35,198	3,285.6
4. Definition 3 plus health insurance supplements to wage or salary income	28,091	36,551	3,411.9
Income after taxes:			
5. Definition 4 less Social Security payroll taxes	26,379	34,630	3,232.6
6. Definition 5 less Federal income taxes	24,168	30,133	2,812.8
7. Definition 6 less State income taxes	23,442	28,829	2,691.1
8. Definition 7 plus nonmeans-tested government cash transfers	25,641	31,298	2,921.6
9. Definition 8 plus the value of Medicare	26,511	32,014	2,988.4
10. Definition 9 plus the value of regular-price school lunches	26,523	32,025	2,989.4
11. Definition 10 plus means-tested government cash transfers	26,644	32,320	3,017.0
12. Definition 11 plus the value of Medicaid	26,779	32,444	3,028.6
13. Definition 12 plus the value of other means-tested government noncash transfers	26,859	32,643	3,047.1
14. Definition 13 plus net imputed return on equity in own home	29,620	36,319	3,390.3

than the distribution under the official definition of income. (See table B.) The exclusion of cash transfers resulted in declines in the shares of income received by the lowest two quintiles of households (from 3.9 percent to 1.5 percent, and from 9.6 percent to 8.2 percent, respectively), and increases in the shares of income received by the two highest quintiles (from 24.0 percent to 25.0 percent, and from 46.7 percent to 49.4, respectively). The Gini index under this definition of income, .481, was 12.1 percent higher than the index under the official income definition (.429).

The distributional effect of capital gains and losses is shown in definition 3. The addition of net capital gains to the definition of income resulted in an increase of \$135 billion in aggregate income, from \$3,151 billion to \$3,286 billion. Capital gains are concentrated in the upper portion of the income distribution (93.2 percent of aggregate capital gains were received by households in the highest quintile in 1989). Thus, the inclusion of capital gains results in a less equal distribution of income. Under this definition, there were increases in both the share of income received by the highest

Table B. Percentage of Aggregate Income Received by Income Quintiles and Index of Income Concentration, by Definition of Income: 1989

(Total households = 93,347,000)

Definition of income	Lowest quintile	Second quintile	Third quintile	Fourth quintile	Highest quintile	Gini index
Income before taxes:						
1. Money income excluding capital gains (current measure).....	3.9	9.6	15.9	24.0	46.7	.429
2. Definition 1 less government cash transfers	1.5	8.2	15.9	25.0	49.4	.481
3. Definition 2 plus capital gains.....	1.5	7.8	15.3	24.2	51.1	.496
4. Definition 3 plus health insurance supplements to wage or salary income	1.4	7.8	15.4	24.4	50.9	.495
Income after taxes:						
5. Definition 4 less Social Security payroll taxes	1.4	7.8	15.3	24.1	51.3	.498
6. Definition 5 less Federal income taxes	1.7	8.6	16.1	24.8	48.9	.474
7. Definition 6 less State income taxes	1.7	8.8	16.3	24.9	48.2	.467
8. Definition 7 plus nonmeans-tested government cash transfers	3.9	10.3	16.4	23.9	45.5	.417
9. Definition 8 plus the value of Medicare	4.1	10.7	16.6	23.8	44.8	.407
10. Definition 9 plus the value of regular-price school lunches	4.1	10.7	16.6	23.8	44.8	.407

quintile (from 49.4 percent to 51.1 percent) and in the Gini index (from .481 to .496). There was no significant change in the median income of all households.

Employer contributions to health insurance represent a major source of private sector compensation, as shown in definition 4. In 1989, these wage supplements were estimated to be \$126 billion, raising aggregate household income to \$3,412 billion. Their effect on median household income was to increase it by 4.6 percent, to \$28,090. Since health insurance benefits are received by persons throughout the income distribution and do not vary by a significant degree in value, the inclusion of these benefits did not have a significant effect on income inequality, as reflected in the fact that there was no significant change in the Gini index (.495) under this income definition.

The effect of taxes on the distribution of income are shown in definitions 5 through 7. Definition 5 shows the effect of Social Security payroll taxes. In the aggregate, these taxes totaled \$179 billion in 1989, lowering aggregate income to \$3,233 billion. The inclusion of payroll taxes resulted in a 6.1 percent decline in median household income, to \$26,380. Social Security payroll taxes did not have a significant impact on income inequality, as shown by the fact that their inclusion did not result in a change in the Gini index.

Definition 6 shows the effect of Federal individual income taxes on the income distribution. This definition also includes the effect of the Earned Income Tax Credit. The 1989 estimate of Federal individual taxes was \$420 billion; its inclusion lowered median household income by 8.4 percent, to \$24,170. Though Federal individual income tax rates are progressive, the effect of Federal income taxes on the redistribution of income was relatively minor. Federal income taxes lowered the Gini index by only 4.8 percent, from .498 to .474.

The effect of State individual income taxes (definition 7) was to lower aggregate income by \$122 billion, to \$2,691 billion. After the inclusion of State income taxes, median household income was reduced by 3.0 percent, to \$23,440. State individual income taxes had little or no effect on the share of income going to each quintile. The effect of the taxes on the Gini index was also quite small, reducing it from .474 to .467.

At this point, one can assess the combined effect of Federal and State individual income taxes and Social Security payroll taxes on the distribution of income. Overall, these taxes lowered aggregate household income by \$721 billion, from \$3,412 billion to \$2,691 billion. Their effect on median household income was to lower it by 16.5 percent, from \$28,090 to \$23,440 (see figure 1). The combined effect of taxes on the Gini index was to reduce it by 5.7 percent, from .495 to .467.

Figure 1.

**Median Household Income and Gini Index,
by Income Definition: 1989**

*Includes capital gains and employer supplements for health insurance.

The effect of government transfers on the distribution of income are shown in definitions 8 through 13. Nonmeans-tested government cash transfers (definition 8) include Social Security and Railroad Retirement, nonmeans-tested Veterans' payments, unemployment and workers' compensation, and Pell Grants. These benefits, \$231 billion in 1989, raised median household income by 9.4 percent, to \$25,640. Nonmeans-tested cash transfers had a significant effect on income inequality. They increased the share of income going to the lowest quintile (from 1.7 percent to 3.9 percent), and lowered the share of income going to the highest quintile (from 48.2 percent to 45.5 percent). These payments also had a significant effect on the Gini index, lowering it by 10.7 percent, from .467 to .417.

Definitions 9 and 10 show the effect of nonmeans-tested government noncash transfers. Adding the fungible value of Medicare (definition 9) increased aggregate income by \$67 billion, and raised median household income by 3.4 percent, to \$26,510. The effect of Medicare on income inequality was minor; its inclusion in the income definition lowered the Gini index by 2.4 percent, to .407. The value of regular-price school lunches (definition 10) had no significant effect on income distribution measures. The aggregate value of this benefit was only \$1 billion in 1989.

Definition 11 shows the effect of adding means-tested cash transfers to the income definition. These include AFDC and other public assistance payments, Supplemental Security Income, and means-tested Veterans' payments. Overall, means-tested cash transfers raised aggregate income by \$28 billion in 1989, though these payments had no statistically significant effect on median household income. Means-tested cash transfers had a significant effect on the share of income received by the lowest quintile, raising it from 4.1 percent to 4.6 percent. None of the other quintiles were affected. Their effect on the Gini index was to lower it from .407 to .399.

Definitions 12 and 13 show the effect of means-tested government noncash transfers on the income distribution. The fungible value of Medicaid (definition 12) was \$12 billion in 1989. The inclusion of the fungible value of Medicaid in the definition of income had no significant effect on the Gini index, nor did it result in a change in median household income.

The effect of means-tested government noncash benefits other than Medicaid is shown in definition 13. These benefits include food stamps, free or reduced-price school lunches, and rent subsidies. The value of these benefits was \$19 billion in 1989. The addition of these benefits to the income definition had no statistically significant effect on median household income, though their inclusion did have an effect on the Gini index, lowering it from .397 to .391.

At this point, an assessment of the combined effect of the tax and transfer systems on the distribution of

income is possible. The taxes measured in this study lowered aggregate income by \$721 billion, and lowered median household income by 16.5 percent, while the value of all government transfers raised aggregate income by \$356 billion, and raised median household income (from its lower after-tax base) by 14.6 percent. An important finding of the Census Bureau's tax and benefit research was that government transfers were much more significant than taxes in lowering income inequality. Taxes lowered the Gini index by 5.7 percent (from .495 to .467) while transfers lowered the Gini index by 16.3 percent (from .467 to .391).

Definition 14 shows the effect of including net imputed return on home equity to the definition of income. This income component raised household income by \$343 billion, and raised median household income by 10.3 percent, to \$29,620. The inclusion of net imputed return on home equity did not have an effect on the Gini index, a reflection of the fact that homeowners are spread throughout the income distribution.

The fully adjusted income aggregate, one that takes into account the effect of taxes, transfers, and other benefits, was estimated to be \$3,390 billion in 1989, not significantly different from the aggregate under the official income definition (\$3,409 billion). It is important to note that the distribution of income was more equal under the fully adjusted income measure, as reflected in the lower Gini index (.392) under the fully adjusted measure than under the official measure (.429).

CHANGES IN INCOME BY DEFINITION: 1987-89

Based on the official definition of income (before taxes and the value of noncash benefits), median household income grew by 1.3 percent for all households between 1988 and 1989 in real terms. As shown in table C, there were increases in real incomes between 1988 and 1989 under 9 of the other 13 definitions of income shown in this report.

Table C also examines the changes in median household income by income definition between 1987 and 1989.⁴ Changes over this period were not uniform across definitions of income. Median household income grew by 1.6 percent under the official income definition over this period, not significantly different from the 2.1 percent increase when the definition of income was changed to exclude government cash transfers and include capital gains and health insurance supplements (definition 4). Under definition 7 (definition 4 minus taxes) there was no significant change in household

⁴Estimates prior to 1987 (such as those presented in Series P-60, No. 164-RD-1, *Measuring the Effect of Benefits and Taxes on Income and Poverty: 1986*) are not strictly comparable to those from 1987 to 1989, as a result of processing differences. See Series P-60, No 166, *Money Income and Poverty Status in the United States: 1988* for a description of how processing differences relate to the Census Bureau's tax and benefit estimates.

* Significant at the 90-percent confidence level.

income between 1987 and 1989, while there was a significant increase under definition 13 (definition 7 plus the value of government cash and noncash transfers). Under the broadest definition of income (definition 14) there was no significant change in median household income between 1987 and 1989.

INCOME CHARACTERISTICS OF SELECTED POPULATION GROUPS

Different income definitions result in quite different income distributions and summary measures for all households. As shown in table D, the equalizing effect of taxes and transfers also affects income comparisons between subgroups of the population.

Under the official income definition, the median income of Black households was 59.5 percent of the White median. Subtracting cash transfers and adding capital gains and health insurance supplements (definition 4) reduced the ratio to 56.1 percent. The subtraction of Federal and State income taxes and payroll taxes (definition 7) results in an increase in the ratio to 60.4 percent,⁵ and the addition of cash and noncash transfers (definition 13) results in a further increase in the Black-to-White income ratio to 65.7 percent.

Using a broader definition of income also has an effect on comparisons of the income of White households to those with a householder of Hispanic origin.

Based on the official income definition, the median income of Hispanic households (\$21,920) was 72.1 percent of that of White households (\$30,410). Based on a definition of income that has been broadened to include the effects of taxes and transfers (definition 13), the ratio was 76.6 percent.

Differences in income ratios by income definition can be observed when comparing households with a female householder, no husband present, with related children, to married-couple households with children. Under the official income definition, the median income of households with a female householder, no husband present, with children was 35.0 percent of that of married-couple households with children (\$14,030 versus \$40,100). Based on a definition of income that includes the effect of taxes and transfers (definition 13), the ratio increased to 45.0 percent.

The importance of income definitions to differences between population subgroups are particularly apparent in the comparison of households with children under 18 years of age to those with members 65 years old and over. In 1989 the median income of the latter group was 49.4 percent of the median income of the former group. Subtracting cash transfers and adding capital gains and employer-provided health insurance (definition 4) lowered the ratio to 22.1 percent. The payment of taxes (definition 7) raised the ratio slightly, to 25.1 percent. The addition of cash and noncash transfers (definition 13) more than doubled the ratio, bringing it to 65.0 percent, and adding the effect of home equity resulted in a further increase in the ratio to 70.3 percent.

⁵Black-to-White income ratios under definitions 1 and 7 were not significantly different from one another.

Table D. Median Household Income, by Selected Characteristics and Definition of Income: 1989

Characteristic	Definition 1 (current measure)	Definition 4 (definition 1 less govern- ment cash transfers plus capital gains and employee health benefits)	Definition 7 (definition 4 less taxes)	Definition 13 (definition 7 plus govern- ment transfers)	Definition 14 (definition 13 plus return on home equity)

¹Persons of Hispanic origin may be of any race.

POVERTY STATUS

Text tables E through I and detailed tables 2 through 7 show how poverty estimates changed when income was defined to include or exclude certain components. The starting point for each of the tables was the current CPS income measure (money income excluding capital gains before taxes) that is used to produce the official poverty estimates. Table E shows how the overall poverty figures changed when specific components were subtracted or added to the definition of income. In 1989, the official estimate of the number of persons in poverty (definition 1) was 31.5 million, or 12.8 percent of the population, not statistically different from the corresponding 1988 estimates (31.7 million persons in poverty or 13.0 percent). The 1989 poverty rate (12.8 percent) was lower than the 1987 poverty rate of 13.4 percent.

When the current income measure was modified to exclude government money transfers (definition 2) the number of persons below the poverty line rose sharply, from 31.5 million to 49.1 million, and the poverty rate rose from 12.8 percent to 20.0 percent.

Adding in capital gains and the value of employer-provided health insurance (definitions 3 and 4) had a relatively minor effect on the poverty estimates. The combined effect of the two additions was to reduce the number in poverty from 49.1 million to 47.7 million and the proportion in poverty from 20.0 percent to 19.4 percent.

Income definitions 5, 6, and 7 deduct income taxes (Federal and State) and payroll taxes from income definition 4. Adjusting the income definition for taxes

produced an increase of 2.1 million in the estimate of the number of persons in poverty (from 47.7 to 49.9 million) an increase of 0.9 percentage points in the poverty rate (from 19.4 percent to 20.3 percent).

Definitions 8 through 13 introduce specific types of government transfers, both cash and noncash, and table E shows the extent to which these transfers reduced poverty estimates. The addition of nonmeans-tested government cash transfers (primarily Social Security) had a very strong effect. The addition of this income component reduced the estimate of the number of persons in poverty by 15.6 million persons (from 49.9 to 34.3 million), and reduced the estimated poverty rate from 20.3 to 13.9 percent (see definition 8). The addition of the fungible value of Medicare (definition 9) had a relatively minor effect on poverty estimates, reducing the number from 34.3 to 33.1 million and the rate from 13.9 to 13.4 percent. Adding the subsidy value of regular-price school lunches to the definition of income (definition 10) did not have a statistically significant effect on the number of poor or the poverty rate.

The effect on poverty estimates of adding means-tested cash transfers (primarily AFDC and SSI) was small compared to the effect of adding nonmeans-tested cash transfers. Adding in means-tested cash transfers (definition 11) reduced the estimate of the number of persons in poverty by 2.3 million (from 33.0 to 30.7 million), compared with the previously cited reduction of 15.6 million. The poverty rate associated with definition 11 was 12.5 percent, down 0.9 percentage points from the previous definition. The next definition (12) shows the effect of defining income to include the

Table E. Number and Percentage of Persons in Poverty, by Definition of Income: 1989, 1988, and 1987

(Total number of persons was 245,992,000 in 1989, 243,530,000 in 1988 and 240,982,000 in 1987. Numbers in thousands)

* Significant at the 90-percent confidence level.

fungible value of Medicaid. The addition of this component had a relatively small effect: the estimated number in poverty fell from 30.7 to 28.8 million, and the rate fell from 12.5 percent to 11.7 percent. The addition of other means-tested noncash benefits including the income value of food stamps, school lunches, and rent subsidies (definition 13) lowered the estimate of the number of persons in poverty by 3.2 million (from 28.8 to 25.6 million) and lowered the poverty rate from 11.7 to 10.4 percent.

Income definition 14 adds to the income definition the net imputed return on equity in own home. The appropriateness of determining poverty status by using an income definition that includes this component was discussed earlier in this report. There is a serious measurement issue, but the data are presented in this report for reasons of completeness. The addition of this component reduced the estimated number of persons in

poverty by 3.8 million (from 25.6 to 21.8 million) and reduced the estimated poverty rate by 1.5 percentage points (from 10.4 to 8.9 percent).

A review of the data shows that the income component that had the largest effect on the poverty estimate was Social Security (the primary component of nonmeans-tested government cash transfers). Other types of government transfers had smaller incremental effects.

The 14 definitions of income produced similar results when year-to-year comparisons were made in poverty estimates. Most of the definitions (definitions 1 through 11 and definition 14) did not show a statistically significant change in the number of poor persons or the poverty rate between 1988 and 1989. However, two measures of income (definitions 12 and 13), which include the income value of means-tested government noncash transfers, did show a statistically significant decrease in the poverty rate from 1988 to 1989 (from

12.1 to 11.7 percent and from 10.8 to 10.4 percent, respectively). Between 1987 and 1989, nine of the definitions of income did not show a statistically significant change in the poverty rate. The official definition (definition 1) and income definitions 11 through 14 did show a decrease in the poverty rates between 1987 and 1989.

Tables F and G show data for persons of all races and for Whites, Blacks, and persons of Hispanic origin. The data show that the poverty rate for Whites is lower than the rates for Blacks and Hispanics regardless of the income definition, but the data also show that the incremental effect of some income components is different for Whites than for Blacks or persons of Hispanic origin. Among Whites, the incremental effect of adding nonmeans-tested government cash transfers (primarily Social Security) to the income definition was to reduce the poverty estimate by 37.6 percent (from 36.3 to 22.7 million). The effect on Blacks was to reduce the poverty estimate by 14.3 percent (from 11.6 to 9.9 million), and the effect on Hispanics was to reduce the estimate by 11.1 percent (from 6.6 to 5.9 million).

The incremental effect of income components on the poverty status of persons by age group is shown in table H. The data show that the effect of government transfers on the poverty status of persons 65 years and over is large compared to the effect of such transfers on the poverty status of young persons. The percent of older persons (65 years and over) in poverty was 48.1 percent before government transfers were added to the income definition (definition 7). The addition of nonmeans-tested cash transfers (primarily Social Security) reduced

the rate to 13.6 percent (definition 8) and the addition of other government transfers brought the rate to 8.7 percent (definition 13). The total effect of adding government transfers was to reduce the poverty rate of older persons by 81.9 percent. Among those under 18 years of age, the before-transfer poverty rate was 22.3 percent (definition 7) and the addition of all government transfers brought the rate to 15.2 percent (definition 13). The effect of government transfers was to reduce the poverty rate of young persons by 31.8 percent.

Counting the net imputed return on equity in own home has a larger effect on poverty rates for older persons than for other age groups. Table H shows that counting this component would reduce the poverty rate of persons 65 years and over by 41.4 percent (from 8.7 to 5.1 percent), compared with 22.5 percent (from 7.1 to 5.5 percent) for persons 45 to 64 years, and 11.1 percent (from 8.1 to 7.2 percent) for persons 25 to 44 years.⁶

The probability of being in poverty is strongly associated with the type of family to which a person belongs. Table I shows poverty rates for persons in families with children by whether the family is a married-couple family or a family with a female householder, no husband present. The estimates are shown for Whites, Blacks, and persons of Hispanic origin.

⁶The poverty rate based on income definition 14 for persons 65 years old and over (5.1 percent) was not statistically different from the poverty rate based on definition 14 for persons 45 to 64 years old (5.5 percent). In addition, the poverty rate based on definition 13 for persons 45 to 64 years old (7.1 percent) was not statistically different from the poverty rate based on definition 14 for persons 25 to 44 years old (7.2 percent).

The official poverty figures show that persons in married-couple families had much lower poverty rates than persons in families with a female householder, no

husband present. Among Whites, the rate was 7.5 percent for those in a married-couple family with children and 37.8 percent for those in a female householder

family with children and no husband present. The comparable figures for Blacks were 15.2 and 56.1 percent, and for persons of Hispanic origin, the figures were 21.6 and 58.4 percent.⁷

The data in table 1 show the incremental effect on poverty rates of adding various components to and subtracting taxes from the definition of income. The incremental effect of subtracting taxes from income is shown by comparing the poverty rates associated with definition 4 with the rates associated with definition 7. Among persons in married-couple families with children, for example, the effect of subtracting taxes from income definition 4 (definition 4 includes money income less government transfers plus capital gains and employer health insurance contributions) was to increase the poverty rate from 8.5 to 9.3 percent among Whites and from 22.4 to 24.9 percent among persons of Hispanic origin. Subtracting taxes from income did not have a statistically significant effect on the poverty rate of Blacks in these families. Among persons in families with a female householder, no husband present, subtracting

taxes did not have a statistically significant effect on the poverty rates for Whites, Blacks, or persons of Hispanic origin.

The poverty rates associated with income definitions 8 through 13 show the extent to which government transfers lower the poverty rate among the universe of persons who live in families with children. In total, government transfers produced sizable reductions in the poverty rates, but some groups were characterized by high rates of poverty even after all government transfers were included. A comparison of the poverty rates associated with definitions 7 and 13 (pre- and post-transfers) show that transfers reduced the poverty rate of Whites in married-couple families with children from 9.3 percent to 6.0 percent, a reduction of 35.5 percent. Among Blacks and persons of Hispanic origin in married-couple families with children, government transfers reduced the poverty rate by 45.2 percent (from 18.6 percent to 10.2 percent) and 29.3 percent (from 24.9 percent to 17.6 percent), respectively.⁸ Persons in

⁷The poverty rate for Blacks in female householder families with children (56.1 percent) was not statistically different from the comparable poverty rate for persons of Hispanic origin (58.4 percent).

⁸The poverty rate based on income definition 7 for Whites in married-couple families with children (9.3 percent) was not statistically different from the poverty rate based on definition 13 for Blacks in similar family types (10.2 percent). The poverty rate based on definition 7 for Blacks in married-couple families with children (18.6 percent)

¹Persons of Hispanic origin may be of any race.

families with a female householder, no husband present had much higher pre-transfer and post-transfer poverty rates. The effect of government transfers was to reduce the poverty rate of Whites in this family category from 44.0 to 28.5 percent. Among Blacks and Hispanics in this family category, government transfers reduced the poverty rate from 60.8 percent to 44.2 percent and from 64.5 percent to 44.7 percent, respectively.⁹

was not statistically different from the poverty rate based on definition 13 for persons of Hispanic origin in similar family types (17.6 percent). In addition, the 35.5 percent reduction in the poverty rates for Whites was not statistically different from the 45.2 percent reduction in poverty rates for Blacks in married-couple families with children.

⁹For persons in families with a female householder, no husband present, with related children under 18 years of age, the poverty rate for Whites based on pre-transfer income (44.0 percent) and the

Poverty estimates based on poverty thresholds adjusted over time for inflation by the CPI-U-X1 series are shown in table J and tables 8 through 13. Since the poverty thresholds based on the CPI-U-X1 are approximately 8 percent lower than the official thresholds based on the CPI-U, the poverty estimates shown are lower than estimates based on the CPI-U. The section on measurement issues in this report noted that which CPI index is most appropriate to use is only one of many issues surrounding the current poverty definitions. The resolution of these issues could have considerably more

poverty rates for Blacks (44.2 percent) and persons of Hispanic origin (44.7 percent) based on post-transfer income were not statistically different.

* Significant at the 90-percent confidence level

impact on the number of poor and poverty rate. Nonetheless, poverty estimates based on the CPI-U-X1 are presented in this report for reasons of completeness.

On average, the poverty rates based on the CPI-U-X1 are approximately 1.3 percentage points and 3.3 million persons lower than estimates based on the official thresholds. Figure 2 presents a time series of the poverty rate based on the CPI-U and the CPI-U-X1. Using the official definition of income (definition 1), the 1989 poverty rate based on the CPI-U-X1 was 11.4 percent, compared with 12.8 percent based on the CPI-U. Using definition 13 (which includes the effect of taxes, cash and noncash benefits, capital gains, employee health benefits) the poverty rate under the CPI-U-X1 was 8.9 percent, compared with 10.4 percent based on the CPI-U. Adding net equity in own home to the income definition (definition 14) resulted in a poverty rate based on the CPI-U-X1 of 7.6 percent compared with 8.9 percent based on the CPI-U.¹⁰

The poverty estimates based on the CPI-U-X1 and the CPI-U show the same general patterns as the income definition changes. Nonmeans-tested government cash transfers (primarily Social Security) had the largest effect on the CPI-U-X1 based poverty estimates. The addition of this income component reduced the estimate of the number of persons in poverty by 15.4 million (from 46.3 to 30.9 million) and reduced the

estimated poverty rate by 6.2 percentage points (from 18.8 to 12.6 percent). Other types of government transfers had smaller incremental effects. The addition of means-tested cash transfers reduced the estimate of the number of persons in poverty by 2.6 million and the poverty rate by 1.1 percentage points and means-tested noncash transfers reduced the number of poor by 5.4 million and the poverty rate by 2.2 percentage points. As with the poverty estimates based on the official poverty thresholds, most of the definitions (1 through 11) did not show a statistically significant change between 1988 and 1989 in the number of persons below poverty or the poverty rate. The more comprehensive measures of income that include the effect of taxes, cash and noncash benefits, capital gains, employee health benefits, and net return on home equity (definitions 12, 13, and 14), however, did show a significant decline in the poverty estimates from 1988 to 1989.

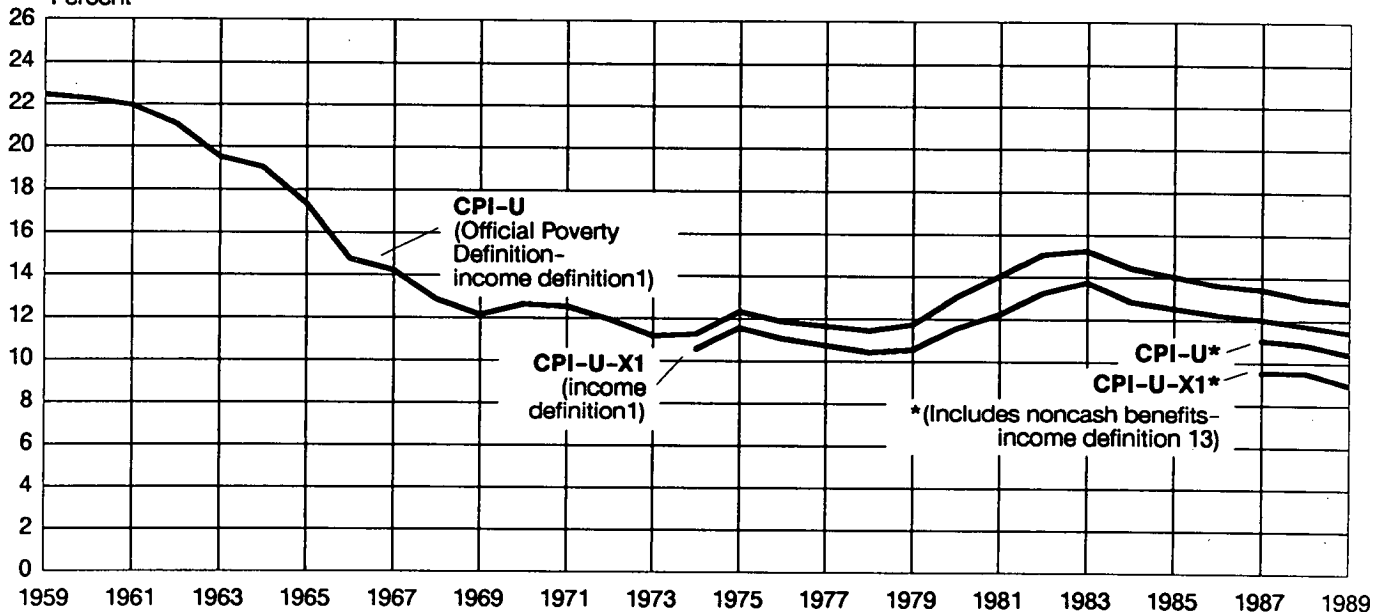

USER COMMENTS

The Census Bureau welcomes the comments and advice of data users. We are particularly interested in receiving comments about this report because of its experimental nature. If you have suggestions or comments, please write to:

Appendix A. Definitions and Explanations

Population coverage. This report includes the civilian noninstitutional population of the United States (the 50 States and the District of Columbia) and members of the Armed Forces living off post or with their families on post, but excludes all other members of the Armed Forces. The poverty data also exclude unrelated individuals under 15 years of age. Poverty rates exclude inmates of institutions, Armed Forces members in barracks, and unrelated individuals under 15 years from the denominator as well as numerator.

Money income. Income distributions and income summary measures (such as medians and means) shown in definition 1 of this report are limited to money income before payments of Federal, State, local, or Social Security (FICA) taxes and before any other types of deductions, such as union dues and Medicare premiums. Total money income is the sum of the amounts received from wages and salaries, self-employment income (including losses), Social Security, Supplemental Security Income, public assistance, interest, dividends, rent, royalties, estates or trusts, Veterans' payments, unemployment and workers' compensations, private and government retirement and disability pensions, alimony, child support, and any other source of money income which was regularly received. Capital gains (or losses) and lump-sum or one-time payments such as life insurance settlements are excluded.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group.

Per capita income. Per capita income is the mean income computed for every man, woman, and child in a particular group. It is derived by dividing the total income of a particular group by the total population (excluding patients or inmates in institutional quarters) in that group.

Gini ratio. The Gini ratio (or index of income concentration) is a statistical measure of income equality ranging from 0 to 1. A measure of 1 indicates perfect

inequality, i.e., one person has all the income and the rest have none. A measure of 0 indicates perfect equality, i.e., all persons having equal shares of income. All Gini ratios appearing in this report were computed using grouped data. For a more detailed discussion, see Current Population Reports, Series P-60, No. 123.

Constant dollars. Some of the income figures for previous years have been converted to 1989 constant dollars in order to discount for changes in consumer prices. These adjustments were made based on changes in the average annual Consumer Price Index for All Urban Consumers (CPI-U). These indexes are shown in table A-1.

Nonresponse. Nonresponse in household surveys has two main components. The first, often termed noninterview, consists of those occupied sample housing units for which no interview was obtained. In the March CPS, about 4 to 5 percent of all sample households are determined to be noninterviews. Noninterviews result because the household members refuse to participate in the survey or because the occupants could not be found at home at any time during the survey week. The survey weights of the interviewed households are adjusted to reflect the loss of these noninterviews. The second component of nonresponse, usually referred to as item nonresponse, represents failure to obtain answers to specific questions for households that do participate in the survey. Item nonresponse occurs because individuals may refuse to answer some questions or because the answers to some of the questions are not known and cannot be accurately estimated by the respondent. The magnitude of item nonresponse for amounts of income received varies considerably by the type of income. For example, the item nonresponse rate for wage and salary amounts was about 17 percent, compared with 19 percent for Social Security income and 28 percent of interest income. The data processing system used for the March CPS makes assignments (imputes) of values when survey responses are missing. These imputations are made on a case-by-case basis using the respondent's reported information to develop an appropriate substitute value.

Poverty definition. Families and unrelated individuals are classified as being above or below the poverty level using the poverty index originated at the Social Security

Administration in 1964 and revised by Federal Interagency Committees in 1969 and 1980. The poverty index is based solely on money income and does not reflect the fact that many low-income persons receive noncash benefits such as food stamps, Medicaid, and public housing. The index is based on the Department of Agriculture's 1961 Economy Food Plan and reflects the different consumption requirements of families based on their size and composition. It was determined from the Department of Agriculture's 1955 Survey of Food Consumption that families of three or more persons spend approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the Economy Food Plan. For smaller families and persons living alone, the cost of the Economy Food Plan was multiplied by factors that were

slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. The poverty thresholds are updated every year to reflect changes in the Consumer Price Index (CPI-U). The average poverty threshold for a family of four was \$12,675 in 1989, about 4.8 percent higher than the comparable 1988 cutoff of \$12,092. Weighted average poverty thresholds by size of family are shown in table A-2.

Poverty thresholds versus administrative poverty income guidelines. The poverty thresholds in table A-2 are averages of the 48 different thresholds (which vary by family size, number of children and age of householder for one- and two-person families) which are used by the Census Bureau in determining the poverty status of persons from income data furnished by respondent surveys and the decennial census. Our average poverty thresholds are similar but not identical to the "administrative poverty income guidelines" which are issued by the Department of Health and Human Services (HHS). The HHS poverty guidelines are used for administrative purposes such as determining eligibility for a particular assistance program rather than for determining poverty status in surveys. The guidelines are usually applied in combination with other eligibility criteria, such as asset limits, and may be used as multiples (e.g., children in families with income below 185 percent of their appropriate income guidelines may be eligible for the reduced-price school lunch program).

The HHS guidelines represent rounded versions of the average weighted poverty thresholds adjusted to provide equal differences between each family size (rather than using the equivalency scale inherent in the poverty thresholds). The 1990 poverty guidelines issued in the Federal Register (see Federal Register, Volume 55, No. 33, Feb. 16, 1990, pp. 5664-5665) are based on the 1989 poverty thresholds in table A-2. The guidelines use the reference year "1990" since they are applied

Table A-2. **Weighted Average Poverty Thresholds in 1989**

Size of family unit	Threshold
One person (unrelated individual)	\$6,311
15 to 64 years	6,452
65 years and over	5,947
Two persons	8,076
Householder 15 to 64 years	8,343
Householder 65 years and over	7,501
Three persons	9,885
Four persons	12,675
Five persons	14,990
Six persons	16,921
Seven persons	19,162
Eight persons	21,328
Nine persons or more	25,480

for eligibility purposes in that year. The poverty thresholds are called "1989" because in our March 1990 CPS we ask income information for the previous calendar year (1989).

For further information on the poverty guidelines, contact the Office of the Assistant Secretary for Planning and Evaluation, Department of Health and Human Services, Washington, DC.

Household. A household consists of all persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards or employees who share the housing unit. A person living alone in a housing unit or a group of unrelated persons sharing a housing unit as partners is also counted as a household. The count of households excludes group quarters.

Family. The term "family" refers to a group of two or more persons (one of whom is the householder) related

by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered members of the same family. Thus, if the son of the householder and the son's wife are in the household, they are treated as part of the householder's family. However, a lodger and his wife not related to the householder or an unrelated servant and his wife are considered as additional families not a part of the householder's family. These unrelated subfamilies are not included in the count of total families.

Unrelated individuals. The term "unrelated individuals" refers to persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the householder or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Appendix B. Description of Methods Used to Value Noncash Benefits

Food stamps. The March supplement to the CPS collects information on the face value of food stamps received by households during the calendar year and on the number of persons in each household who were in a food stamp reciprocity unit. This information was used to determine the face value of food stamps received by families and unrelated individuals during the calendar year. The income value of food stamps was set equal to their face value.

School lunches. The March supplement collects information on the number of children in each household who usually ate a complete hot lunch offered at school and the number who received free or reduced-price lunches because they qualified for the Federal School Lunch program. The income value of the school lunch program for each participant family was calculated by determining the annual subsidy received by each child depending on whether the lunches were regular price, reduced price, or free. Information on subsidies per meal was obtained from the Department of Agriculture.

Housing subsidies. The March supplement collects information on the number of households living in public or subsidized housing units, but a rather complex procedure is required to estimate the income value of these housing subsidies.

Because the CPS does not collect data on housing costs, the basis for the calculation of the value of housing subsidies was the 1985 American Housing Survey. This data file was used to calculate the actual gross rent (rent plus utilities) paid by families in subsidized housing and the rent these families would have been expected to pay had their units not been subsidized. The calculation of actual rent was taken directly from survey responses. The calculation of the rent the family would have expected to pay if the unit was not subsidized required the development of a statistical model that measured the effect of certain housing characteristics on gross rent.

For each of the four major regions, a model was estimated from the universe of two bedroom nonsubsidized units that related gross rent to (a) number of bathrooms, (b) number of appliances, (c) number of housing flaws, and (d) presence of satisfactory neighborhood services. The coefficients of the model were then used with the universe of subsidized units to determine the amount these units would have rented for had they not been subsidized.

The two items of information—actual rent and predicted rent—provide a measure of the income value of the housing subsidy.

The complete model contained two additional features not described above. First, the relative subsidies observed for two bedroom units were assumed to apply as well to smaller and larger units (there were insufficient observations to perform separate analyses for these units). Second, because the required rent payment in some subsidized housing is dependent on the income of the family, subsidies were estimated for families with incomes under \$6,000, \$6,000 to \$9,999, and \$10,000 and over.

The estimated subsidies shown in table B-1 are the 1985 estimates updated to reflect changes in shelter costs. These estimates were used as measures of the income value of housing subsidies.

Medicare and Medicaid. The March supplement collects information on the number of persons who were covered by Medicare and/or Medicaid at any time during the previous calendar year. For the purpose of preparing income estimates it was assumed that anyone who was covered at any time during the year was covered for the entire year. For reasons described in the front text of this report, the income value of benefits from Medicare and Medicaid was defined as the fungible value of the benefits. The principle that was followed in determining fungible value can be summarized as follows:

Medicare and Medicaid benefits are counted as income to the extent that they free up resources that could have been spent on medical care.

The model used to measure fungible value has the following elements:

1. Medicare and/or Medicaid benefits have no income value if the family is unable to meet basic food and housing requirements or if the family has no remaining resources after meeting basic food and housing requirements. The cost of basic food requirements is determined by the cost of the Department of Agriculture's Thrifty Food Plan (the lowest cost of several food plans). The cost of basic housing is taken from the Department of Housing and Urban Development's Fair Market Rent series that measures market rent levels for standard quality housing in each U.S. county.

Table B-1. Estimates of Monthly Rent Subsidies, by Number of Bedrooms, Region, and Income Level: 1989

Region and income level of family	One bedroom	Two bedrooms	Three or more bedrooms
Northeast:			
Income under \$6,000.....	\$207	\$243	\$273
Income \$6,000 to \$9,999.....	189	224	251
Income \$10,000 and over.....	79	93	104
Midwest:			
Income under \$6,000.....	125	160	182
Income \$6,000 to \$9,999.....	115	147	168
Income \$10,000 and over.....	48	62	69
South:			
Income under \$6,000.....	144	173	218
Income \$6,000 to \$9,999.....	133	159	201
Income \$10,000 and over.....	55	66	83
West:			
Income under \$6,000.....	173	217	287
Income \$6,000 to \$9,999.....	159	200	263
Income \$10,000 and over.....	66	83	109

Note: Data from the American Housing Survey were used to determine how much families in subsidized (or public) housing pay and how much families living in nonsubsidized units with characteristics similar to the subsidized unit pay. The difference is the rent subsidy.

2. Medicare and/or Medicaid benefits have full income value (defined to be the mean government outlay for families in a given risk class) if the resources of the family after deducting amounts required for basic food and housing costs were as great or greater than the mean Medicare and/or Medicaid outlays for families in the same risk class.

3. Medicare and/or Medicaid benefits have partial income value if the resources of the family are higher than the level specified in element 1 but lower than the level specified in element 2.

The actual calculation involves the following steps:

For a given family, determine:

A = Cost of basic food and housing.

B = Amount of resources (includes money income, food stamps, and housing subsidies).

C₁ = Mean Medicare outlays for families in the risk class to which this family belongs.

C₂ = Mean Medicaid outlays for families in the risk class to which this family belongs.

Then, the income value of Medicare and/or Medicaid = \$0 if B is less than or equal to A

= C₁ + C₂ if (B-A) is greater than or equal to C₁ + C₂

= X if B is greater than A and (B-A) is less than C₁ + C₂

where $X = (r \cdot C_1) + (r \cdot C_2)$ and

$$r = \frac{B - A}{C_1 + C_2}$$

Table B-2 shows the cost of the Thrifty Food Plan for 1989, table B-3 shows mean outlays per enrollee for the Medicare program, and table B-4 shows mean outlays per beneficiary for the Medicaid program.

Employer contributions to health insurance. The March supplement collects information on the number of persons who were covered at any time during the previous calendar year by a health insurance plan obtained through an employer or union. The supplement also collects information on whether the employer paid for all, part, or none of the cost of the plan.

For the purpose of this report, employer contributions to health insurance plans are treated as a form of wages and the entire estimated value of the employer contribution is counted as income.

The best data source available for measuring the amount employers contribute to health plans was the 1977 National Medical Care Expenditures Survey (NMCES).

Table B-2. Cost of Thrifty Food Plan: 1989

Sex and age	Annual amount
Child:	
1 and 2 years.....	\$599
3 to 5 years.....	647
6 to 8 years.....	794
9 to 11 years.....	943
Male:	
12 to 14 years.....	984
15 to 19 years.....	1,020
20 to 50 years.....	1,093
51 years and over.....	993
Female:	
12 to 19 years.....	981
20 to 50 years.....	988
51 years and over.....	977

Note: Annual amounts are adjusted according to family size:

1 person—add 20 percent

2 persons—add 10 percent

3 persons—add 5 percent

4 persons—no adjustment

5 or 6 persons—subtract 5 percent

7 persons or more—subtract 10 percent

NOTE: Medicare payments per enrollee for 1989 were estimated by applying factors to actual data for 1988. The factors were based on benefit per enrollee data published in the 1990 *Green Book* (Committee on Ways and Means, U.S. House of Representatives)

That survey had a relatively large sample size and included data on contributions that were obtained by conducting interviews with the employers of persons who were in the household portion of the NMCES sample.

The procedure for estimating the value of employer contributions for persons and families on the March 1990 CPS data file involved the following steps:

1. An enhanced NMCES data file was prepared by adding two variables not on the original file. The two variables were total earnings during the year and usual hours worked per week. The variables were created by statistically matching NMCES and CPS using the appropriate demographic and economic variables that were available from both sources. The match made it possible to assign the earnings and full-time/part-time variables to the NMCES file.
2. The enhanced NMCES file was used to estimate a model that related employer contributions to a set of explanatory variables. The variables chosen were ones that are also available on the CPS file. The list of variables included (1) type of plan (family or individual), (2) proportion of cost paid for by employer (part or all), (3) level of earnings, (4) type of worker (full time or part time), (5) industry, (6) occupation, (7) sector (private or government), (8) region, (9) residence, (10) personal characteristics such as age, race, marital status, and education.
3. The model was run on the March 1990 CPS file to obtain estimates of the amount of employer contributions for each worker whose employer paid all or part of the cost of his or her health plan. The model was run after deflating 1989 earnings to 1977 dollars. The estimates produced by this model were then inflated to 1989 estimates by multiplying the 1977 level estimates by the 1977 to 1989 change in employer contributions per covered employer.
4. For those persons who worked for the Federal government in 1989, the amount of employer contribution was calculated using administrative data. Separate calculations were made for postal and non-postal employees.

Net imputed return on equity in own home. Homeowners with a positive amount of home equity receive income in the form of housing services but that income is usually omitted from estimates of the distribution of income. There are two possible approaches to measuring this income. The net rental income approach begins with an estimate of the amount the home would rent for in the market and subtracts expenses related to home ownership such as mortgage interest, property taxes, maintenance costs, depreciation, and insurance. The net rental approach presents very serious measurement difficulties and was not used for this report. The approach that was chosen applies a rate of return to the estimated amount of home equity.

The March supplement collects information on whether the housing unit is owned or rented, but does not collect information on home equity. The rate of return approach was implemented by preparing an enhanced CPS file that used information on the 1987 American Housing Survey (AHS) file to assign values of home equity and amounts of property taxes to CPS households. The file was created by statistically matching each CPS household to an AHS household with similar characteristics.

Table B-4. Mean Medicaid Outlays Per Beneficiary Excluding Institutionalized Persons, by State and Risk Class: 1989

(The procedures used in matching the two files are described in appendix C.)

The estimate of the amount of income derived from home equity is dependent on the rate of return that is chosen. The rate chosen for this report was the average

rate of return on high-grade municipal bonds (from the Standard and Poor's series). This rate was 7.24 percent in 1989. Because homeowners pay property taxes, the final estimate of the amount of income derived from home equity is made equal to the imputed return less the amount of property taxes paid.

Appendix C. Description of Methods Used to Estimate Taxes and Capital Gains

INTRODUCTION

This section describes the methodology and procedures which were developed to estimate taxes associated with the income information on the March 1990 CPS microdata file. In all, four types of taxes were simulated: 1) Federal individual income taxes, 2) State individual income taxes, 3) property taxes on owner-occupied housing, and 4) payroll taxes.

Development of the after-tax simulation procedures began with the March CPS annual demographic supplement. This microdata file contains demographic and economic information for approximately 58,000 sample households and the persons living in these households. It includes detailed information on household and family relationship; age; marital status; race and ethnicity; educational attainment; weeks and hours worked during the calendar year; occupation, industry, and class of worker of the job held longest during the calendar year; and income amounts for wages and salary, nonfarm and farm self-employment income, interest, dividends, rental income, estates and trusts, royalties, pension income, unemployment compensation, and sources of nontaxable income.

The second major element in the simulation system was statistical summaries of individual income tax returns compiled by the Internal Revenue Service. These statistics are made available in the IRS publication series, Statistics of Income (SOI). Some unpublished statistical summaries from the IRS were also used to develop these procedures.

A third element was the 1987 American Housing Survey microdata file. This element was used to assign property taxes paid to the March CPS sample households residing in owner-occupied housing.

The system for estimating taxes paid and after-tax income created a modified March CPS microdata file. This file was formed by expanding the March CPS format to include variables relevant to the simulation of taxes paid. The detailed tables contained in this report were derived from this modified March CPS data file.

Federal Income Taxes

Simulation of Federal income taxes required up to four separate operations. First was the formation and classification of tax filing units using household relationship, marital status, and dependency rules. Second,

was the calculation of adjusted gross income for each of those units. Third was the simulation of amount of Federal income taxes paid. Finally, the calculation of earned income tax credits was made, when applicable.

Formation and classification of Federal income tax filing units. A Federal tax filing "unit" was defined as any individual (or married couple) with either \$400 in self-employment income, \$1,000 in wages or salary, or a total of \$1,000 in interest, dividends, rents and royalties, estates and trusts, or pension income in 1989. These income levels were chosen because they either corresponded to tax laws or helped bring the estimated number of filing units on the CPS in line with IRS Statistics of Income (SOI) data.

The next step in the formation of Federal tax filing units was the assignment of dependency status. The algorithm for assigning dependency for each tax unit used the following rules:

- All filing primary family householders and spouses were included as dependents on their own tax returns.
- All children under age 15 who were members of the primary family were counted as dependents on the return of the family householder. Children aged 15 and over (except related subfamily members) with a total taxable income of less than \$1,000 were assigned dependency to the tax return of the primary family householder. Children aged 15 and over who were students were assigned dependency to the primary family householder regardless of income level.
- All other primary family members (except related subfamily members) with taxable income of less than \$1,000 were assigned as dependents on the tax return of the primary family householder.
- Related subfamilies having at least one Federal tax filing unit were treated separately in the same manner as primary families. Members of a related subfamily containing no Federal tax filing unit were assigned dependency to the tax return of the primary family householder.
- All unrelated subfamilies were treated in the same manner as primary families.
- Primary and secondary unrelated individuals age 15 and over were treated as dependents only on their own tax returns.

All simulated filing units were classified into one of three return types. Married couples and persons whose marital status was "married, spouse absent in Armed Forces" were assumed to file joint returns. Unmarried family householders with dependents were assumed to file head of household returns. All other persons classified as Federal tax filing units were assumed to file as single individuals.

Computation of adjusted gross income and capital gains. Adjusted gross income (AGI) for each simulated tax filing unit was calculated by summing the income amounts from all taxable sources and an imputed amount for capital gains. The sources of CPS income included in AGI were wages and salaries, net farm and nonfarm self-employment income, net rental and royalty income, dividends, interest, estates and trusts, income from private and government pensions, unemployment compensation, and alimony.

Capital gains were imputed to tax filing units based on data obtained from a Statistics of Income (SOI) public use file and reports summarizing information reported on 1988 Federal tax returns. These data provide estimates of the probability that a filing unit in a given matrix cell reported capital gains and the mean amount of capital gains for that cell. The variables in this probability matrix were: level of AGI, type of return, and age of tax filer. A Monte Carlo technique was used to randomly assign capital gains: a random number (between 0 and 1) was generated for each filing unit; if that number was less than or equal to the probability of filing units in that matrix cell reporting capital gains, the mean amount of capital gains, as computed above, was added to that unit's AGI. This procedure does not control on other characteristics that might affect the allocation of this source of income. As a result of the fact that capital losses can be greater than capital gains for some groups, the net effect of capital gains (definition 3) in table 1 of this report can be negative.

In 1989, a portion of Social Security income was included in AGI if the sum of AGI and half of the total Social Security amount exceeded \$25,000 (\$32,000 for joint returns). In these cases, the lesser of 1) one-half of the Social Security payments or 2) one-half of the difference between the modified AGI and the income limit was included in AGI.

Payments to Individual Retirement Accounts (IRA's) were simulated for the 1989 tax model. The May 1983 CPS pension supplement (updated to reflect changes in IRA regulations) was used to estimate probabilities of tax-filing units contributing to IRA's and the average amounts contributed. Average IRA contributions are updated annually based on SOI data. These probabilities were then used to assign IRA contributions to

individual tax-filing units on the CPS file. The IRA payments were deducted from the total income received by the tax-filing units in order to compute adjusted gross income.

Computation of taxable income and taxes paid.

Taxable income was computed by subtracting the estimated allowable deductions from AGI. The first step in this process consisted of predicting which filing units itemized deductions.

Homeownership was determined to be the most important variable available from the CPS for assigning itemization status to tax filers. Outlined below is a step-by-step description of the procedures used to assign itemization status.

1. A statistical match was made of the March CPS and American Housing Survey (AHS) data files in order to assign a monthly mortgage amount and a property tax amount to each owner-occupied unit on the March CPS file.
2. Probabilities of itemizing for homeowner, tax-filing units were computed by size of monthly mortgage payment from the 1979 Income Survey Development Program (ISDP) test panel. Probabilities for renters were computed by AGI level.
3. The probabilities described in step 2 were used to randomly assign itemization status within monthly mortgage (or AGI) intervals using the same Monte Carlo technique used in the assignment of capital gains.
4. The amount of itemized deductions for tax filing units was computed using a matrix showing the ratio of itemized deductions to AGI for all units by AGI interval, type of tax return, and presence of a home mortgage. The ratios of itemized deductions to AGI were computed using a 1984 SOI public use file and 1988 SOI data.

Next, a standard deduction was estimated for each tax filing unit by multiplying the number of exemptions by \$2,000. Taxable income was then estimated by subtracting the itemized and standard deductions from AGI. Tax liability was then computed using the appropriate tax schedule for that simulated return type.

The dependent child care credit was simulated for the 1989 Federal tax model and subtracted from the total tax liability. This credit allows tax filers to deduct a portion of child care expenses while they work or look for work. Data from the June 1982 CPS supplement were used to estimate probabilities of tax filers paying for child care. These estimates are updated annually from SOI data.

The earned income tax credit was simulated for the 1989 tax model. These tax credits were used in the calculation of net Federal tax liability and computation

of after-tax household income for filing units with one or more dependent children, less than \$19,340 in AGI, and earnings between \$1 and \$19,340. Since the earned income tax credit can be larger than Federal tax liability, the net effect of Federal income taxes (definition 6) in table 1 of this report can be negative.

The simulation procedures do not capture variations in proportions of income paid in taxes within AGI intervals. The proportion of income paid in taxes for households with similar AGI amounts may differ relative to factors such as race, age of household members, number of household members, and marital status. The extent to which these variations exist has not been measured, therefore, caution should be used when interpreting relatively small differences between the incomes of various subgroups of the population.

The lack of variation in proportions of income paid in taxes within AGI intervals is due in large part to the use of aggregate-level IRS data in the simulation process, as described previously in the appendix. The use of aggregate-level IRS data was necessary because the detailed information needed to simulate tax liability are not currently available on an individual-level basis (i.e., from a matched CPS-IRS microdata file).

Published IRS estimates play a significant role in the simulation of Federal income taxes. Proportions of tax filers claiming capital gains, average capital gains, itemized deductions as a percentage of AGI, and average IRA and child care credit amounts are the major IRS-based components in the CPS Federal tax simulation procedure. In the preparation of 1989 Federal tax estimates, IRS data were not available. As a result, 1988 IRS data were used in the simulation. Though it is not expected that the use of 1988 IRS data seriously biases the 1989 CPS estimates, the Federal tax data in this report should be considered as preliminary. In the preparation of next year's report, the 1989 Federal tax estimates will be recomputed based on 1989 IRS data.

State Individual Income Taxes

There were 44 States that required payment of individual income taxes in 1989. For the purpose of this model, the definitions of tax filing units and AGI used for the estimation of Federal income taxes were also used for the simulation of State income taxes.

The amounts of State individual income taxes paid were computed by developing a model of each State's income tax regulations. Information on the State tax systems was obtained from a publication entitled, *State Tax Handbook*, October 1, 1986. State tax rates and brackets are updated annually to reflect changes in State tax regulations. While every detail of each State's income tax system was not simulated, most of the important aspects were accounted for.

Property Taxes on Owner-Occupied Housing

In order to simulate property taxes for owner-occupied housing units, the March 1990 CPS simulation file was statistically matched to a file from the 1987 American Housing Survey (AHS). Since the AHS file contained responses to questions on annual property tax expenses the statistical match allowed the transfer of property tax amounts to CPS records when a CPS and AHS household were found to have similar characteristics. The group of variables used to match the two files were: age of householder, State, SMSA and central-city status of the household, household income, household size, number of living quarters, and the race, sex, and educational attainment of the householder. Using a very detailed combination of recodes based on the above variables, the two files were matched. If there was no AHS household with the exact combination of characteristics as a particular CPS household, a match was then attempted at a new level that did not have quite as much detail. This was repeated until a match was found for every CPS household.

Households on the AHS file that did not answer the question dealing with property tax expenses were ineligible for the match. Since monthly mortgage expenses, which were used to simulate itemization status for Federal taxpayers, were also assigned to CPS households using this match, households that did not answer the AHS questions on that subject were similarly excluded from the match.

Property taxes paid on secondary residences, such as vacation homes, could not be simulated. Also, the proportion of rent that pays the property taxes on renter-occupied housing units was not estimated.

The estimation procedures for property taxes paid by homeowners produces estimates that do not correspond precisely with those available from the AHS. These differences are mainly the result of differing universes and use of the statistical matching procedure.

Payroll Taxes

The Social Security payroll tax (FICA) was simulated using occupation of longest job and earnings data reported on the CPS.¹ Social Security payroll taxes were calculated directly from the reported CPS earnings using the Social Security payroll tax formula for 1989. For wages and salary, the tax rate used was 7.51 percent up to a maximum of \$48,000.

¹According to the National Income and Product Accounts published by the Bureau of Economic Analysis (BEA), Social Security (FICA) payments are not treated as taxes. Instead, they are included under Federal Government receipts as "Contributions for Social Insurance." We have included them under the broad heading of taxes as they are mandatory deductions from gross earnings.

The tax rate for self-employment was 15.02 percent of the amount between \$400 and \$48,000. Not all workers were assigned coverage under Social Security and, therefore, a small number were not subject to

Social Security taxes. All Federal employees and specific proportions of workers in certain occupation groups were assigned noncovered status. Unpublished statistics supplied by the Social Security Administration were used to make these assignments.

Appendix D. Source and Accuracy of Estimates

SOURCES OF DATA

Data from the American Housing Survey (AHS), the Income Survey Development Program (ISDP), and the Internal Revenue Service (IRS) were combined with Current Population Survey (CPS) data to create simulations of taxes paid, number of tax filing units, adjusted gross income, and other tax characteristics for the March 1990 CPS. Data from the AHS and the Consumer Expenditure Survey (CE) were used with the CPS data to evaluate the number and condition of persons in poverty.

In addition, this report uses unpublished data from the Social Security Administration (SSA); administrative data from the Office of Personal Management (OPM); data from the National Income Accounts prepared by the Bureau of Economic Analysis (BEA); and the *State Tax Handbook* from Commerce Clearing House as information sources for tax data. For noncash valuation estimates, this report uses administrative records from the Department of Agriculture (USDA) and the Health Care Financing Administration (HCFA).

A description of sources of data from which these estimates were derived follows. Except for the CPS, these descriptions are brief. See the other appendices of this report and publications on the appropriate surveys for more details.

American Housing Survey. The Bureau of the Census collects housing data for the Department of Housing and Urban Development. The population covered by the sample for the AHS, which was called the Annual Housing Survey before 1984, includes all housing units in the United States. A structure must meet specific criteria developed by the Bureau of the Census before it is termed a housing unit. For a more detailed description of the sample design see the report, Current Housing Reports, Series H150-87, *The American Housing Survey for the United States in 1987*, U.S. Department of Commerce.

The AHS is no longer conducted in even-numbered years, so property tax estimates in this report are based on the 1987 AHS. Also, for the noncash estimates, 1985 AHS data were used in a model to estimate the value of public housing. For more details on the AHS model used to estimate public and subsidized housing values, please see Appendix B of this report.

Income Survey Development Program. The ISDP was the research and development phase for the Survey of Income and Program Participation (SIPP). The ISDP was used to examine and resolve design, operational, and technical issues for SIPP. The household sample for the 1979 ISDP was a nationwide multiple frame sample. The majority of sample households in the ISDP came from addresses contacted in the 1976 Survey of Income and Education. The remainder of sample households were selected from a reserve file of sample cases maintained by the Bureau of the Census. For a more detailed description of this sample design see the report *Wage and Salary Data from the Income Survey Development Program: 1979 (Preliminary Data from Interview Period One)*, Current Population Reports Special Studies Series P-23, No. 118.

Internal Revenue Service Data. Much of the IRS data in this report comes from the Statistics of Income (SOI) series, in particular the SOI Bulletin, *Individual Income Tax Returns, Preliminary Data: 1988*, Spring 1990. This report, based on a sample drawn from all tax returns filed through September 1989, presents information on taxpayers' incomes, exemptions, deductions, credits, and taxes.

Data from other sources. Administrative statistics on Federal retirement taxes from the OPM and on Social Security taxes from the SSA are from unpublished records kept by those agencies. Data on property taxes are from administrative statistics published by the BEA in the *Survey of Current Business*. Information on State tax systems is published in *State Tax Handbook, October 1, 1986*, from Commerce Clearing House, and has been updated to reflect changes in state income tax rates.

Much of the data on cash and noncash benefits are from administrative records. Values of school lunches and food stamps are from USDA unpublished data. Medicaid and Medicare data come from HCFA unpublished records.

CURRENT POPULATION SURVEY

The CPS estimates in this report come from the March CPS and from supplementary questions to the March CPS. The Bureau of the Census conducts the survey every month, although this report uses only March data for its estimates.

Basic CPS. The monthly CPS collects primarily labor force data about the civilian noninstitutional population. Interviewers ask questions concerning labor force participation about each member 15 years old and over in every sample household.

The present CPS sample was selected from the 1980 Decennial Census files with coverage in all 50 states and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 sample areas comprising 1,973 counties, independent cities, and minor civil divisions. About 56,100 occupied housing units are eligible for interview every month. Interviewers are unable to obtain interviews at about 2,500 of these units because the occupants are not found at home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented in July 1985.

The following table summarizes changes in the CPS designs for the years for which data appear in this report.

Design of the Basic Current Population Survey

Interview period	Number of sample areas	Housing units eligible ¹	
		Interviewed	Not interviewed
1989	729	53,600	2,500
1986-88	729	57,000	2,500
1985	² 629/729	57,000	2,500
1982-84	629	59,000	2,500
1980-1981	629	65,500	3,000

¹Eligible housing units excludes about 2,500 Hispanic households added from the previous November sample. (See "March Supplement.")

²The CPS was redesigned after the 1980 Census of Population and Housing. During the phase-in of the new design in 1984-85, housing units from the old and new designs were in the sample.

March Supplement. In addition to the basic CPS questions, interviewers ask supplementary questions every March about money income and work experience for the previous year. To obtain more reliable data for the Hispanic population, the March CPS sample is increased by about 2,500 eligible housing units, interviewed in the previous November CPS, that contain at least one sample person of Hispanic origin. Also, for this report, the Bureau of the Census interviews only those Armed Forces members who live with civilian adults.

Because the CPS is designed primarily to provide labor force estimates, it is not an optimal design for the types of information covered in the supplements. Therefore, estimates from the supplements may vary more than estimates from a sample designed specifically to

produce estimates of the items covered in the supplement such as income. See the section on accuracy below for a more detailed discussion.

CPS estimation procedure. This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, sex, and Hispanic origin. These independent estimates are based on statistics from decennial censuses of population; statistics on births, deaths, immigration, and emigration; and statistics on the size of the Armed Forces. The independent population estimates used for 1980 (March 1981 CPS) to present were based on updates to controls established by the 1980 decennial census. For more details on the change in independent estimates, see the section entitled "Introduction of 1980 Census Population Controls" in an earlier report (Series P-60, No. 133). The estimation procedure for the March supplement included an additional adjustment so that the husband and wife in a household receive the same sample weight.

Simulation techniques are used to obtain estimates of after-tax income based on CPS data. For more details on this procedure, see the pertinent sections of this report.

ACCURACY OF ESTIMATES

Because the CPS estimates come from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two types of error: sampling and nonsampling. The accuracy of an estimate depends on both types of errors, but the full effect of the nonsampling error is unknown. Exercise care when interpreting results based on a relatively small number of cases or on small differences between estimates.

The standard errors provided here primarily measure the CPS sampling error. They also partially measure the effect of some of the CPS nonsampling errors in responses and enumeration, but they do not include any systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

These standard errors, computed from CPS data alone, do not reflect any sampling or nonsampling errors present in data from other sources. In addition, these standard errors do not entirely apply to estimates from the CPS simulation. No data are available on the size of these additional error sources, so use caution when interpreting such estimates.

Nonsampling variability. Nonsampling variability, or nonsampling error, is variation that would occur whether a sample or a complete census was taken. Nonsampling

error is present in both the CPS and other data sources mentioned in this report. The interaction of nonsampling errors when combining data from many surveys may result in an additional component of error. The CPS simulation introduces still another error component. The total extent of these additional errors is unknown.

Nonsampling error arises from many sources. For example, respondents may be unable or unwilling to provide correct information, may have trouble recalling information, or may interpret questions or define terms differently from what was intended. The data are subject to several potential sources of error: collection errors in recording or coding data, processing errors, and errors in estimating values for missing data. Additionally, the Bureau of the Census may be unable to obtain information about all cases in the sample, or may fail to represent all units with the sample (undercoverage).

CPS undercoverage results from missed housing units and missed persons within sample housing units. CPS coverage is about 7% lower than the 1980 decennial census. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias from survey undercoverage. However, biases exist in the estimates to the extent that missed persons are different from interviewed persons in the same age-sex-race-Hispanic group. Also, the independent population controls are not adjusted for 1980 census undercoverage.

Answers to questions about income or noncash benefits often depend on the memory or knowledge of one person in a household, usually the wife. For this reason, recall problems can cause underestimates of income in survey data, because people can easily forget minor or irregular sources of income. Respondents may also misunderstand what the Bureau of the Census considers income or noncash benefits, or may simply be unwilling to answer these questions correctly because they think the questions are too personal. For more discussion, see the section on underreporting of income.

For additional information on nonsampling error including the possible effect on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

Sampling variability. Sampling variability is variation that occurs by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described later in the section on

"Standard Errors and Their Use," are primarily measures of sampling variability, although they also include some of the effect of nonsampling error.

Standard errors are used to determine the reliability of survey estimates and to evaluate the statistical validity of conclusions made about the data. For example, a conclusion that the difference between two estimates is statistically significant can be verified using standard errors.

Two procedures, confidence interval estimation and hypothesis testing, are commonly used to test for statistical validity. The confidence interval is a range that would include the average result of all possible samples with a known probability. For example, suppose the survey was repeated a large number of times under the same general conditions and using the same sample design. Suppose also that an estimate and its standard error were calculated from each sample. Then approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. But one can say with specified confidence (90 percent confidence in the above example) that it does.

Some statements in the report may contain estimates followed by another number. For such statements, simply add that number to and subtract it from the estimate to calculate the upper and lower bounds of the 90 percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (± 1.0)," then the 90 percent confidence interval for the estimate, 1.7 percent, is from 0.7 to 2.7 percent.

Hypothesis testing is the other method used to test statistical validity. Hypothesis testing uses sample estimates to distinguish between true population values. One common type of hypothesis is that two population values are different. Comparing the Black poverty rate to that of Whites is an example.

Tests may be performed at various levels of significance. The significance level of a test is the probability of concluding that two parameters are different when, in fact, they are the same. For example, for a statement of difference to pass at the 0.10 significance level, the absolute value of the difference between the estimates must be greater than or equal to 1.6 times the standard error of the difference.

All statements of comparison in the text of this report have passed a hypothesis test at the 0.10 level of significance or better. The Bureau of the Census uses as standard statistical testing criteria 90 percent confidence intervals and 0.10 significance levels. Past reports in this series have used 95 percent confidence intervals and 0.05 significance levels, which require differences of at least 2.0 times the standard error. Consult standard textbooks on statistics for alternative criteria.

Comparability with other data. As described earlier, data obtained from the CPS are not fully comparable with sample data from other sources, mostly because of differences in interviewer training and experience and different survey procedures. This is another component of error not reflected in the standard error tables.

Also, because the CPS simulations described in this report include sample data from other government agencies, the standard error tables do not reflect all sources of error in the CPS simulations. Therefore, exercise caution when using the standard error tables to compare data from the CPS or CPS simulation with data from other agencies.

Note when using small estimates. Summary measures (such as means, medians, and percentage distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, estimated numbers are shown even though the relative standard errors of these numbers are larger than those for the corresponding percentages. These smaller estimates permit the data user to combine categories as needed.

Take care when interpreting small differences: even a small amount of nonsampling error can distort a seemingly valid hypothesis test if it involves a borderline difference.

Standard errors for data from surveys other than CPS. To compute standard errors of data obtained from the SOI reports, see the SOI Bulletin *Individual Income Tax Returns, Preliminary Data: 1988*, Spring 1990. To compute standard errors of AHS data, see the report Current Housing Reports, Series H150-87, *The American Housing Survey for the United States in 1987*. Data from other sources are from administrative records and as such are not subject to sampling error.

STANDARD ERROR TABLES

Standard errors for data from the CPS sample. A number of approximations were required to derive standard errors applicable to all estimates in this report at a moderate cost. Instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. Thus, the tables of standard errors provided here show levels of magnitude of standard errors rather than precise standard errors.

Standard error tables and their use. There are two ways to estimate standard errors from the tables provided. The first way is to use the figures presented in tables D-1 through D-10 to approximate the standard

Table D-1. Standard Errors of Estimated Numbers of Households, Families, Unrelated Individuals, and Persons for 1989 CPS and CPS Tax Simulations: Total or White

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75.....	13	7,500.....	123
100.....	15	10,000.....	141
250.....	23	15,000.....	170
500.....	32	25,000.....	213
1,000.....	46	50,000.....	275
2,000.....	65	100,000.....	302
3,000.....	79	125,000.....	276
5,000.....	101	160,000.....	174

Note: Standard errors in this table are calculated using a = -0.000012 and b = 2,110 from table D-11.

Multiply these standard errors by the appropriate factor from table D-11 to obtain the correct standard error.

errors of various estimates for households, families, unrelated individuals, and persons. To approximate the standard error for a specific characteristic, multiply the appropriate standard error in tables D-1 through D-10 by the factor for that characteristic given in tables D-11 through D-13. These factors adjust the generalized standard errors for the combined effect of sample design and the estimating procedure on the value of the characteristic.

Use linear interpolation to approximate standard errors for intermediate values not shown in the generalized tables of standard errors.

The second method uses the parameters, a and b, presented in tables D-11 through D-13. Each type of characteristic has its own set of parameters. These parameters were used to calculate the standard errors in tables D-1 through D-10 and the factors in tables D-11 through D-13. They also may be used to calculate the standard errors for estimated numbers and percentages directly. Computing the standard errors directly

Table D-2. Standard Errors of Estimated Numbers of Households, Families, Unrelated Individuals, and Persons for 1989 CPS and CPS Tax Simulations: Black and/or Other Races

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75.....	13	3,000.....	77
100.....	15	5,000.....	94
250.....	24	7,500.....	105
500.....	34	10,000.....	110
1,000.....	47	15,000.....	100
2,000.....	65	20,000.....	49

Note: Standard errors in this table are calculated using a = -0.000109 and b = 2,300 from table D-11.

Multiply these standard errors by the appropriate factor from table D-11 to obtain the correct standard error.

from the parameters gives more accurate results than using the standard error tables. Methods for computation follow.

Standard errors of estimated means and medians are provided in the detailed tables.

Standard errors of estimated numbers. To approximate the standard error, s_x , of an estimated number shown in this report from the standard error tables, use the formula

$$s_x = fs \quad (1)$$

where f is the appropriate factor from table D-11, D-12, or D-13, and s is the standard error of the estimate obtained by interpolating in tables D-1 through D-7.

Table D-3. **Standard Errors of Estimated Numbers of Households, Families, Unrelated Individuals, and Persons for 1989 CPS and CPS Tax Simulations: Hispanic**

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75	13	3,000	82
100	15	5,000	105
250	24	7,500	128
500	34	10,000	146
1,000	48	15,000	175
2,000	67	20,000	198

Note: Standard errors in this table are calculated using $a = -0.000017$ and $b = 2,300$ from table D-11.

Multiply these standard errors by the appropriate factor from table D-11 to obtain the correct standard error.

Use this table also to estimate the standard error of the number of Hispanic families below the poverty level.

For a more accurate approximation, use the formula

$$s_x = \sqrt{ax^2 + bx} \quad (2)$$

from which the standard errors in tables D-1 through D-7 were calculated. Here x is the size of the estimate and a and b are the parameters from table D-11, D-12, or D-13 for the particular characteristic.

When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters which gives the largest standard error.

Illustration 1. There were 4,332,000 households with before-tax incomes between \$25,000 and \$27,499 in 1989. Using formula (1), the appropriate factor from table D-11 (1.0), and interpolation from table D-1, the approximate standard error is

$$s_x = (1.0)(94,000) = 94,000$$

Alternatively, using formula (2), with $a = -0.000012$ and $b = 2,110$ from table D-11, the approximate standard

Table D-4. **Standard Errors of Estimated Numbers of Families Below the Poverty Level: 1989**

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75	13	5,000	118
100	15	7,500	150
250	24	10,000	180
500	34	15,000	235
1,000	49	25,000	340
2,000	71	50,000	589
3,000	88	100,000	1,077

Note: Standard errors in this table are calculated using $a = -0.000093$ and $b = 2,300$ from table D-12.

Multiply these standard errors by the appropriate factor from table D-12 or D-13 to obtain the correct standard error.

error is

$$s_x = \sqrt{(-0.000012)(4,332,000)^2 + 2,110(4,332,000)} = 94,000$$

So the 90-percent confidence interval for the number of households with incomes between \$25,000 and \$27,499 before taxes is from 4,182,000 to 4,482,000, i.e., $4,332,000 \pm 1.6(94,000)$. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard errors of estimated percentages. The reliability of an estimated percentage, whose numerator and denominator are both sample estimates, depends on the size of the percentage and on the size of its base (i.e., the total on which it is based). An estimated percentage is relatively more reliable than the corresponding estimate of its numerator, particularly if the percentage is 50 percent or greater.

To compute a standard error for a poverty rate, use the procedure for an estimated ratio. Otherwise, when the numerator and denominator are in different categories, use the factor or parameters from table D-11, D-12, or D-13 for the numerator.

Table D-5. **Standard Errors of Estimated Numbers of Persons Below the Poverty Level: 1989, Total or White**

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75	27	5,000	219
100	31	7,500	266
250	49	10,000	306
500	70	15,000	371
1,000	99	25,000	469
2,000	139	50,000	626
3,000	170	100,000	771

Note: Standard errors in this table are calculated using $a = -0.000038$ and $b = 9,742$ from table D-12.

Multiply these standard errors by the appropriate factor from table D-12 or D-13 to obtain the correct standard error.

Table D-6. Standard Errors of Estimated Numbers of Persons Below the Poverty Level: 1989, Black and/or Other Races

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75.....	27	3,000.....	162
100.....	31	5,000.....	201
250.....	49	7,500.....	233
500.....	69	10,000.....	254
1,000.....	97	15,000.....	268
2,000.....	135	20,000.....	250

Note: Standard errors in this table are calculated using a = -0.000331 and b = 9,742 from table D-12.

Multiply these standard errors by the appropriate factor from table D-12 or D-13 to obtain the correct standard error.

Again, there are two ways to estimate the standard error of a percentage, $s_{x,p}$. To approximate the standard error using the standard error tables (tables D-8 through D-10), use the formula

$$s_{x,p} = fs \tag{3}$$

In this formula, f is the appropriate factor from table D-11, D-12, or D-13 and s is the standard error of the estimate obtained by interpolation from tables D-8 through D-10.

For a more accurate approximation, use

$$s_{x,p} = \sqrt{(b/x)p(100-p)} \tag{4}$$

from which the standard errors in tables D-8 through D-10 were calculated. Here x is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter from table D-11, D-12, or D-13 for the characteristic in the numerator of the percentage.

Illustration 2. In 1989, 4.6 percent of the 93,347,000 households had before-tax incomes between \$25,000 and \$27,499. Using formula (3), the appropriate factor from table D-11 (1.0), and $s = 0.1$ (interpolating from table D-8), the standard error of 4.6 percent is approximately

$$s_{x,p} = (1.0)(0.1) = 0.1$$

Using formula (4) and $b = 2,110$ from table D-11, the standard error of 4.7 percent is approximately

$$s_{x,p} = \sqrt{(2,110/93,347,000)4.6(100.0-4.6)} = 0.1$$

So, rounded to one decimal place, the 90-percent confidence interval for the estimated percentage of households with before-tax incomes of \$25,000 to \$27,499 is from about 4.4 to about 4.8 percent, i.e., 4.6 percent \pm 1.6(0.1%).

Standard errors of estimated differences. For a difference between two sample estimates, the standard

error is approximately

$$s_{x-y} = \sqrt{s_x^2 + s_y^2 - 2rs_x s_y} \tag{5}$$

where s_x and s_y are the standard errors of the estimates x and y, and r represents the correlation between the two estimates. The estimates can be numbers, percentages, ratios, etc. For differences between before- and after-tax estimates, and for other alternate income definitions, assume a value of 0.7 for r. For all other differences, assume that r is equal to zero.

Illustration 3. The median before-tax 1989 income of White households was \$30,406 and the median before-tax 1989 income of Black households was \$16,453. The published estimates of the standard errors of these medians are \$149 and \$287, respectively. Therefore, the standard error of the estimated difference of \$13,953 is about

$$s_{x-y} = \sqrt{(149)^2 + (287)^2} = 323$$

This means that the 90-percent confidence interval around the difference is from \$13,440 to \$14,470. Because this interval does not contain zero, we can conclude with 90-percent confidence that 1989 median before-tax income for White households was higher than 1989 median before-tax income for Black households.

Standard errors of estimated ratios. Certain estimates, such as mean values for persons in families or households shown in the tables, were calculated as the ratio of two numbers. For example, the mean number of persons per family or household is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families or households}}{\text{total number of families or households}}$$

Ratios of before- to after-tax estimates are also discussed in this report. For example, the ratio of mean

Table D-7. Standard Errors of Estimated Numbers of Persons Below the Poverty Level: 1989, Hispanic

(Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
75.....	27	3,000.....	169
100.....	31	5,000.....	216
250.....	49	7,500.....	262
500.....	70	10,000.....	300
1,000.....	98	15,000.....	359
2,000.....	138	20,000.....	405

Note: Standard errors in this table are calculated using a = -0.000077 and b = 9,742 from table D-12.

Multiply these standard errors by the appropriate factor from table D-12 or D-13 to obtain the correct standard error.

Table D-8. Standard Errors of Estimated Percentages of Households, Families, Unrelated Individuals, and Persons for 1989 CPS and CPS Tax Simulations: Total or White

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.3	3.7	5.0	7.3	8.4
100	2.0	3.2	4.4	6.3	7.3
250	1.3	2.0	2.8	4.0	4.6
500	0.9	1.4	1.9	2.8	3.2
1,000	0.6	1.0	1.4	2.0	2.3

160,000	0.05	0.08	0.1	0.2	0.2

Note: Standard errors in this table are calculated using $b = 2,110$ from table D-11.

Multiply these standard errors by the appropriate factor from table D-11 to obtain the correct standard error.

household income before and after taxes is calculated as

$$\frac{x}{y} = \frac{\text{mean household income before taxes}}{\text{mean household income after taxes}}$$

Standard errors for these ratios may be approximated as shown below. There are four cases to consider. In the first two cases, the denominator y represents a count of families or households of a certain class, and the numerator x represents a count of persons with the characteristic of interest who are members of these families or households. In the third case, the numerator x and denominator y represent before- and after-tax estimates, and the fourth case represents different definitions of income to measure poverty.

Case 1: There is at least one person having the characteristic in every family or household of the class: for example, the mean number of persons per family or the mean number of persons per family with a male householder. For ratios of this kind, approximate the standard errors using the following formula:

$$s_{x/y} = (x/y) \sqrt{(s_x/x)^2 + (s_y/y)^2 - 2r(s_x/x)(s_y/y)} \quad (6)$$

The standard error of the estimated number of families or households, s_y , and the standard error of the estimated number of persons with the characteristics in those families or households, s_x , may be calculated by methods described earlier. In formula (6), r represents the coefficient of correlation between the numerator

Table D-9. Standard Errors of Estimated Percentages of Households, Families, Unrelated Individuals, and Persons for 1989 CPS and CPS Tax Simulations: Black or Hispanic

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.5	3.8	5.3	7.6	8.8

Note: Standard errors in this table are calculated using $b = 2,300$ from table D-11.

Multiply these standard errors by the appropriate factor from table D-11, D-12, or D-13 to obtain the correct standard error.

Table D-10. Standard Errors of Estimated Percentages of Persons Below the Poverty Level: 1989

Base of estimated percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
75	5.0	7.9	10.8	15.6	18.0
100	4.4	6.8	9.4	13.5	15.6
250	2.8	4.3	5.9	8.5	9.9
500	2.0	3.0	4.2	6.0	7.0
1,000.....	1.4	2.2	3.0	4.3	4.9
2,000.....	1.0	1.5	2.1	3.0	3.5
3,000.....	0.8	1.2	1.7	2.5	2.8
5,000.....	0.6	1.0	1.3	1.9	2.2
7,500.....	0.5	0.8	1.1	1.6	1.8
10,000	0.4	0.7	0.9	1.4	1.6
15,000	0.4	0.6	0.8	1.1	1.3
20,000	0.3	0.5	0.7	1.0	1.1
25,000	0.3	0.4	0.6	0.9	1.0
50,000	0.2	0.3	0.4	0.6	0.7
100,000	0.1	0.2	0.3	0.4	0.5

Note: Standard errors in this table are calculated using $b = 9,742$ from table D-12.

Multiply these standard errors by the appropriate factor from table D-12 or D-13 to obtain the correct standard error.

and the denominator of the estimate. In the above examples, and for other ratios of this kind, use 0.7 as an estimate of r .

Case 2: The number of persons having the characteristic in a given family or household may be 0, 1, 2, 3, or more; for example, the mean number of persons under 18 years of age per household. For this kind of ratio, use formula (6), but assume r is equal to zero. If r is actually positive (negative), then this will overestimate (underestimate) the standard error of the ratio.

Case 3: The numerator and denominator represent before- and after-tax estimates. For example, the numerator may be the mean income of families or households of a certain type before taxes, and the denominator may be the mean income for the same category of families or households after taxes. For such ratios, s_x and s_y represent the standard errors of before- and after-tax estimates, respectively. Assume that r is equal to .7 for before- and after-tax estimates.

Case 4: The numerator and denominator are different definitions of income to measure poverty. See the sections below on poverty estimates for more detail.

Standard errors of within-year differences in poverty estimates using different income measures.

Estimate the standard error for the difference of two poverty estimates (numbers or percentages), using different definitions of income to evaluate poverty, for a given year with the formula

$$s_{x,y} = s_d \quad (7)$$

The value $d = x - y$, is the absolute difference between the two estimates x and y . Estimate s_d from formula (1) or (2) where d is the size of the estimate, or from formula (3) or (4) where d is the estimated percentage.

Standard errors of ratios of two poverty estimates using different income measures. Estimate the standard error of the ratio of the number of persons in poverty using two different definitions of income with the formula

$$s_{x/y} = (x/y) \sqrt{(s_x/x)^2 - (s_y/y)^2} \quad (8)$$

where s_x and s_y are the estimates of the standard errors of the estimates x and y (poverty estimates using different methods of estimating income) as determined by formula (1) or (2).

Standard errors of estimated means and medians.

Estimated standard errors are provided for the means and medians of the published income distributions and need not be calculated. However, the methods for calculating these standard errors are provided below in case some users want to combine two or more income distributions.

Standard errors of estimated means for grouped data. Use the formula

$$s_x = \sqrt{(b/y)S^2} \quad (9)$$

to approximate the standard error of a mean, where y is the size of the base and b is the appropriate b parameter for the characteristic from table D-11, D-12, or D-13. The variance, S^2 , is equal to

$$S^2 = \sum_{i=1}^c p_i \bar{x}_i^2 - \bar{x}^2 \quad (10)$$

where

\bar{x} = the mean of the distribution, defined by $\sum_{i=1}^c p_i \bar{x}_i$;

c = the number of groups: i indicates a specific group,

Table D-11. a and b Parameters and Factors for Calculating Approximate Standard Errors of Estimated Numbers and Percentages of Households, Families, Unrelated Individuals, and Persons for 1989 CPS and CPS Tax Simulations

Characteristic	Parameter		Factor

Hispanic origin	-0.000077	9,742	1.00

¹These factors are to be applied to table D-9 only. For estimated numbers use formula (2).

Note: For nonmetropolitan residence categories multiply the a and b parameters by 1.5 and the factor by 1.22.

taking on values 1 through c;
 p_i = the estimated proportion of households, families or persons whose values for the characteristic (x-values) fall in group i; and
 $\bar{x}_i = (A_{i-1} + A_i) / 2$ where A_{i-1} and A_i are the lower and upper interval boundaries, respectively, for group i.

The value \bar{x}_i is assumed to be the most representative value of the characteristic for households, families or persons in group i. Group c is open-ended, i.e., no upper interval boundary exists. For this group an approximate average value is

$$\bar{x}_c = (3/2)A_{c-1} \quad (11)$$

Contact Statistical Methods Division of the Bureau of the Census for the method to compute the standard error of a mean for two or more combined distributions.

Note that because the formula for the standard error of a mean involves several approximations, this statistic will generally be different from the tabled value.

Confidence intervals and standard errors of estimated medians. The sampling variability of an estimated median depends upon the form of the distribution

and the size of its base. One way to approximate the standard error of an estimated median is to determine a 68 percent confidence interval around the median and then compute the standard error from the confidence interval. (See the section on sampling variability for a general discussion of confidence intervals.) The steps below describe this method.

1. Determine the standard error on 50% using either formula (3) or formula (4).
2. Add to and subtract from 50% the standard error determined in step 1.
3. Using the distribution of the characteristic, determine the upper and lower limits of the 68% confidence interval for the median by calculating the values corresponding to the two points computed in step 2. Call the resultant values U and L, for the upper and lower limits of the interval, respectively.

Use Pareto interpolation for any point on an income interval greater than \$2,500 in width, and linear interpolation otherwise. The formulas for interpolation are:

Table D-13. **Parameters for Estimated Numbers and Percentages of Persons in Poverty, by Age, Sex, Race, and Hispanic Origin: 1989**

HISPANIC ORIGIN			
Persons 18 and over	-0.000077	9,742	1.00
Male 18 and over	-0.000168	9,742	1.00
Female 18 and over	-0.000165	9,742	1.00
Under 18 years	-0.000880	6,742	0.83
18 to 24	-0.000619	3,358	0.59
25 to 44	-0.001137	3,358	0.59
45 to 64	-0.000471	3,358	0.59
65 and over	-0.001313	3,358	0.59

$$\text{Pareto: } x_{pN} = \exp \left[\frac{\text{Ln}(pN/N_1)}{\text{Ln}(N_2/N_1)} \text{Ln}(A_2/A_1) \right] x A_1 \quad (12)$$

$$\text{Linear: } x_{pN} = \frac{pN - N_1}{N_2 - N_1} (A_2 - A_1) + A_1 \quad (13)$$

where

x_{pN} = estimated value (e.g., income) for which the number of households, families, or persons, pN ($0 \leq p \leq 1$), in the distribution has larger or equal values. When calculating the confidence interval, x_{pN} is equal to U and L for the upper and lower limits, respectively. Note that x_{pN} estimates the median when $p = 0.50$.

N = for *distribution of numbers*: the total number of units (households, families, persons, etc.) for the characteristic in the distribution.

= for *distribution of percentages*: the value 1.0.

p = the values obtained in step 2.

A_1, A_2 = the lower and upper bounds, respectively, of the interval containing x_{pN} .

N_1, N_2 = for *distribution of numbers*: the estimated number of units (households, families, persons, etc.) with values of the characteristic greater than or equal to A_1 and A_2 , respectively.

= for *distribution of percentages*: the estimated percentage of units (households, families, persons, etc.) having values of the characteristic greater than or equal to A_1 and A_2 , respectively.

\exp is the exponential function.

Ln is the natural logarithm function.

Note that logarithms and antilogarithms using base 10 or any other base produce a mathematically equivalent result.

4. After the limits of the 68 percent confidence interval are computed, compute the standard error with the formula

$$s_{\text{median}} = (U-L)/2 \quad (14)$$

This procedure can also be used to estimate standard errors for quintiles or other percentiles: simply substitute the proper percentage value for p and follow the steps outlined above.

Pareto interpolation should only be used when computing standard errors for income, and the median (or percentile) of the income distribution falls in an interval

wider than \$2,500. This report includes standard errors for most medians in the detailed tables. Therefore, no illustration of the use of Pareto interpolation is given here. If one is needed, see the source and accuracy section of *Current Population Reports, Series P-60, No. 123*. See any of the reports in this series for an illustration of the use of linear interpolation.

Use of the above procedure could result in standard errors which differ from those given in the detailed tables. The standard errors in the tables are computed with more detailed distributions than those provided in the tables, and the published numbers are rounded to the nearest thousand. Linear interpolation is almost always used to compute the published medians and standard errors.

Note that when combining distributions the resulting median or percentile may lie in an open-ended interval. To calculate such standard errors, call Housing and Household Economic Statistics Division of the Bureau of the Census to obtain the detailed distribution.

Standard error of estimated per capita income.

Certain mean values in this report represent the per capita income for households of a certain class. The mean per capita income is approximately equal to

$$x = hm/p \quad (15)$$

where

h = number of households in the class,

m = mean income for households in the class,

p = number of persons in households in the class, and

x = mean per capita income of persons in households in the class.

To approximate standard errors for these means, use the formula

$$s_x = (hm/p) \sqrt{(s_m/m)^2 + (s_p/p)^2 + (s_h/h)^2 - 2r(s_p/p)(s_h/h)} \quad (16)$$

In this formula, r represents the correlation between p and h . There are two cases to consider, depending on the nature of the class:

Case 1: The class represents households containing a fixed number of persons. For example, h could be the number of 3-person households. In this case, there is an exact correlation between the number of persons in households and the number of households. Therefore, $r = 1$ for such households.

Case 2: The class represents households of other demographic types, for example, households in distinct regions, households in which the householder is of a certain age group, and owner-occupied and tenant-occupied households. In this and other cases in which the correlation between p and h is not perfect, use .7 as an estimate of r .

Standard error of an estimated aggregate cash value. Aggregates such as adjusted gross income or aggregate taxes paid as described in "Methodology and Procedures" are computed by multiplying the mean cash value per household or tax filing unit, \bar{x} , by the number of households or tax filing units, y :

$$T = \bar{x}y \quad (17)$$

where T is the aggregate to be computed.

Both \bar{x} and y have a standard error, so the standard error of a product must be computed. Approximate the standard error of an aggregate with the formula

$$s_T = \sqrt{\bar{x}^2 s_y^2 + y^2 s_x^2} \quad (18)$$

where s_x is computed using formula (9) and s_y is computed using formula (2). In the above formula, the correlation r between \bar{x} and y is assumed to be zero. If r is actually positive (negative), then this formula will underestimate (overestimate) the standard error of the product. To compute standard errors of mean taxes paid, call Housing and Household Economic Statistics Division of the Bureau of the Census to obtain detailed distributions.

Standard error of an index of income concentration.

Please contact Statistical Methods Division of the Bureau of the Census for the method of estimating the standard error of an index of income concentration.

Appendix E. Program Descriptions and Data Collection

This appendix contains brief descriptions of each public in-kind transfer program covered in the March CPS, a description of the questions used to collect the data, and an evaluation of the data quality. The description of each program begins with a statement of program objectives and is followed by general comments regarding program characteristics, eligibility, and so forth. Next is a review of the survey questions and the limitations associated with the question wording and design.

FOOD STAMPS

The Food Stamp Act of 1977 defines this Federally funded program as one intended to "permit low-income households to obtain a more nutritious diet." (From title XIII of P.L. 95-113, The Food Stamp Act of 1977, declaration of policy.) Food purchasing power is increased by providing eligible households with coupons which can be used to purchase food. The Food and Nutrition Service (FNS) of the U.S. Department of Agriculture (USDA) administers the Food Stamp program through State and local welfare offices. The Food Stamp program is the major national income support program to which all low-income and low-resource households, regardless of household characteristics, are eligible.

The Food Stamp Act was amended by the 1981 Omnibus Budget Reconciliation Act which changed the criteria used to determine food stamp eligibility (P.L. 97-35, title I, subtitle A). As of October 1, 1981, households without an elderly or disabled member must have gross monthly income below 130 percent of the Federal poverty level. Previously, eligibility was based on "countable" income (gross income less specified deductions for shelter, medical expenses, child care, etc.) so, e.g., a household with a gross income of twice the poverty guideline and substantial specified deductions could have been eligible for food stamps. Households meeting the income requirement may be ruled ineligible for the program on the basis of their holdings of assets (resources). The current limit for assets is \$2,000 for households with no elderly persons and \$3,000 for households with at least one elderly person. The questions on participation in the Food Stamp Program in the March CPS were designed to identify households in which one or more of the current members received food stamps during the calendar year. Once a food

stamp household was identified, a question was asked to determine the number of current household members covered by food stamps during the year. Questions were also asked about the number of months food stamps were received and the total face value of all food stamps received during that period.

SCHOOL LUNCHES

The National School Lunch Program is designed "to help safeguard the health and well-being of the Nation's children by assisting the States in providing an adequate supply of foods" (P.L. 79-396, the National School Lunch Act of 1946) for all children at moderate cost. Additional assistance is provided for children determined by local school officials to be unable to pay the "full established" price for lunches. Like the Food Stamp program, the National School Lunch Program is administered by the Food and Nutrition Service of the U.S. Department of Agriculture through State educational agencies or through regional USDA nutrition services for some nonprofit private schools.

All students eating lunches prepared at participating schools pay less than the total cost of the lunches. Some students pay the "full established" price for lunch (which itself is subsidized), while others pay a "reduced" price for lunch, and still others receive a "free" lunch. Until January 1981, children were eligible for free school lunches if their household's income was below 125 percent of the poverty guidelines or reduced-price lunches if their household's income was between 125 and 195 percent of the poverty guidelines. The term "income" basically followed the Census Bureau definition but excluded certain Federal benefits and specified "hardship" expenses. Effective January 1, 1981, the hardship exclusion was replaced by a standard deduction. (Ref. Federal Register, Vol. 46, No. 11, January 16, 1981.) Beginning August 13, 1981, the income definition was amended to a gross income concept with the standard deduction being eliminated. At the same time, the income eligibility criteria were changed to 130 percent for free lunches and to 185 percent for reduced-price lunches. (Ref. Omnibus Budget Reconciliation Act of 1981, P.L. 97-35, title VIII.)

The questions on the March CPS provide a limited amount of data for the School Lunch program. Questions concerning the program were designed to identify

the number of household members 5 to 18 years old who "usually" ate hot lunches during the year. This defined the universe of household members receiving this noncash benefit. This approach was necessary because the majority of children benefit indirectly; i.e., they pay full-established price but are not aware that these lunches are subsidized. A second question identified the number of members receiving free or reduced-price lunches.

PUBLIC OR OTHER SUBSIDIZED HOUSING

There are numerous programs designed to "remedy the unsafe and unsanitary housing conditions and the acute shortage of decent, safe, and sanitary dwellings for low-income families" (U.S. Housing Act of 1937, declaration of policy). Several Federal, State, and local agencies administer these programs. Some are funded by USDA (for rural families) or State-local agencies, but most are administered by the Department of Housing and Urban Development (HUD). Among the most important HUD rental housing programs are Low Rent Public Housing and Sections 8, 236, and 101 (rent supplements) of various U.S. Housing Acts.

Low Rent Public Housing projects are owned, managed, and administered by a local housing authority. Partial financing may be provided by the State or HUD. Participation in public housing is determined by two factors: program eligibility and the availability of housing. Income standards for initial and continuing occupancy vary by local housing authority, although the limits are constrained by Federal guidelines. Rental charges, which, in turn, define net benefits, are set by a Federal statute not to exceed 30 percent of adjusted monthly money income. A recipient household can be a family or two or more related persons or an individual who is handicapped, elderly, or displaced by urban renewal or natural disaster. Other HUD programs provide similar types of housing assistance to low-income families and individuals.

Two of the more common types of programs in which Federal, State, and local funds are used to subsidize private sector rental housing are rent supplement and interest reduction plans. Under a rent supplement plan (e.g., Sections 8 and 101), the difference between the "fair market" rent and the rent charged to the tenant is paid to the owner by a government agency. Under an interest reduction program (e.g., Section 236), the amount of interest paid on the mortgage by the owner is reduced so that subsequent savings can be passed along to low-income tenants in the form of lower rent changes.

There were two questions dealing with public and low-cost rental housing on the March CPS supplement questionnaire. The first question identified residence in a housing unit owned by a public agency. The second

question identified beneficiaries who were not living in public housing projects but who were paying lower rent because of a government subsidy.

MEDICAID

The Medicaid program is designed to furnish medical assistance for needy families with dependent children and for aged, blind, or disabled individuals whose incomes and resources are insufficient to meet the costs of necessary medical services.¹ The program is administered by State agencies through grants from the Health Care Financing Administration (HCFA) of the Department of Health and Human Services.

Medicaid is, for the most part, a categorical program with complex eligibility rules which vary from State to State. There are two basic groups of eligible individuals: the categorically eligible and the medically needy. The major categorically eligible groups are all Aid to Families with Dependent Children (AFDC) recipients and most Supplemental Security Income (SSI) recipients.² Other categorically eligible groups are (1) those who meet basic State cash assistance eligibility rules (the aged, blind, or disabled; needy single parents with children; and, in some States, needy unemployed parents with children who are not currently receiving money payments) and (2) needy persons meeting categorical eligibility standards who are institutionalized for medical reasons (e.g., low-income elderly persons in nursing homes). Institutionalized persons are not included in the CPS universe and, therefore, are not reflected in the CPS reciprocity statistics.

In many States, Medicaid coverage is also extended to the medically needy: persons meeting categorical age, sex, or disability criteria and having money incomes and assets which exceed eligibility levels for cash assistance but are not sufficient to meet the cost of medical care. Families with large medical expenses relative to their incomes and assets may also meet medically needy eligibility standards by "spending down" (i.e., having high enough medical expenses) to obtain eligibility.

The Medicaid question on the March CPS attempted to identify all persons 15 years old and over who were covered by Medicaid at any time during the year. In March 1988, a question on childrens' Medicaid coverage was added to the CPS questionnaire. The term

¹Taken from Title XIX of the 1965 Amendments to P.L. 89-97, *The Social Security Act*, "Grants to States for Medical Assistance Programs," declaration of policy.

²In 1981, Public Law 97-35 made several changes in AFDC eligibility determinations under the Medicaid program. Changes in treatment of earnings and other income and resources have resulted in some persons being dropped not only from the AFDC rolls but also off of automatic Medicaid coverage. Some of these individuals may be able to regain coverage if their State offers medically needy protection; however, the range of available benefits may be less.

"covered" means enrolled in the Medicaid program, i.e., had a Medicaid medical assistance card or incurred medical bills which were paid for by Medicaid. In order to be counted, the person did not necessarily have to receive medical care paid for by Medicaid.

After data collection and creation of an initial micro-data file, further refinements were made to assign Medicaid coverage to children. In this procedure, all children under 21 years old in families were assumed to be covered by Medicaid if either the householder or spouse reported being covered by Medicaid. AFDC recipients in all States and SSI recipients living in the 36 States which legally require Medicaid coverage of all SSI recipients were also assigned coverage.

MEDICARE

The Medicare program consists of two separate but complementary health plans to provide adequate medical care for the aged and disabled. The Hospital Insurance Plan (Part A) is designed to provide basic protection against the costs of hospital and related post-hospital services. In addition to the elderly, this plan also covers virtually all persons under 65 years old

who receive Social Security or Railroad Retirement benefits based on long-term disability. Part A is financed jointly by employers and employees through Social Security payroll deductions. Qualified persons 65 years old and over who are not otherwise eligible for Part A benefits may pay premiums directly to obtain this coverage. The Supplemental Medical Insurance Plan (Part B) is a voluntary plan which builds upon the hospital insurance protection provided by the basic plan and is available to all Medicare Part A beneficiaries. It provides insurance protection covering physicians' and surgeons' services and a variety of medical and other health services received either in hospitals or on an ambulatory basis. It is financed through monthly premium payments (\$31.90 per month in 1989) by each enrollee and further subsidized by Federal general revenue funds.

The Medicare question on the March CPS attempted to identify all persons 15 years old and over who were covered by Medicare at any time during the year. The term "covered" means enrolled in the Medicare program. In order to be counted, the persons did not necessarily have to receive medical care paid for by Medicare.

Appendix F. Underreporting of Cash Income and Noncash Benefits

This appendix discusses some important aspects of underreporting and its measurement and presents some estimates of underreporting for 1983 and 1984. The general survey phenomenon that is commonly termed underreporting actually refers to the tendency of household surveys to underestimate the number of income or noncash benefit recipients and/ or the amount of income or benefits received. There are three main causes for underreporting. These are failure to report receipt of the income type, underreporting of the amount received, and misclassification of the income type received.

Accurately measuring the extent of underreporting of cash income and noncash benefits is difficult for many of the income types and noncash benefit programs. There are two main components of measuring underreporting: the number of income or noncash benefit recipients and the total amount of income or benefits received. Measuring the survey undercount of recipients for the March CPS is extremely difficult because independent estimates (benchmarks or controls) for the CPS noninstitutional, "ever-received during the year" recipient concept are difficult to validate. In addition, some of the administrative sources required for the derivation of independent estimates have significant errors themselves.

The data in table F-1 show comparisons of CPS aggregate money income in 1983 with independent estimates. Comparisons of the CPS estimates with the independent totals reveal that overall income in the survey after allocation is underreported by about 10 percent. However, wide variations are found in the amount of underreporting by source of income. Underreporting tends to be more pronounced for public assistance, unemployment and workers' compensation, and property income. The apparent survey overestimation for self-employment income reflects the difficulty in developing comparable independent figures.

Various population subgroups receive a higher proportion of their total income from certain income sources, such as interest and dividends for the elderly and public assistance for female family householders. The differential underreporting between income types, therefore, affect the estimates of some population subgroups more than others.

Estimates of the extent of underreporting for most noncash benefits are less well defined. Following are discussions of the underreporting for each benefit type.

Food stamps. The March CPS estimate for the face value of food stamps received in 1984 was about \$7.6 billion, 71 percent of the independent estimate derived for that year. The 20.1-million recipient (persons covered) estimate for 1984 compares to a 26.1-million independent estimate of recipients. Since this independent estimate was developed using USDA monthly person reciprocity counts and average months of participation as reported in the CPS, it is difficult to validate its accuracy.

School lunches. The March CPS data for 1984 show 10.8 million children usually eating free or reduced-price school lunches and 17.5 million usually eating full-price school lunches. Since independent estimates on the "ever-participated" universe are not available for this group, comparisons of the CPS estimates with peak monthly average daily participation have been made. These peak figures were 11.6 million for free or reduced-price lunches and 11.4 million for full-price lunches. The CPS estimate is 93 percent of the peak monthly average for free or reduced-price. The CPS estimate of full-price lunch participants was about 54 percent higher than the peak monthly figure. The obvious conceptual differences between the CPS and USDA figures make these comparisons difficult to interpret.

Public or other subsidized housing. In 1984 the March CPS estimate for the number of households residing in public or other subsidized rental housing was 3.6 million. An independent estimate was derived by summing housing units in (1) low-income public housing, (2) Section 8 (including Section 202), (3) rent supplements (Section 101), and (4) Section 236. This summing yielded a figure of 3.3 million. While the CPS estimate was about 9 percent higher than the independent figure, it is likely that the survey estimate contains some units, such as student or military housing, that were not intended to be counted. The magnitude of this problem is probably small, but unknown.

Medicare. The independent estimate for persons covered by Medicare is probably the most reliable of all independent estimates. In 1984, this figure was 28.4 million persons. This compares to a survey estimate of 28.2 million, 0.9 percent higher than the control. The

Table F-1. Comparisons of CPS Aggregate Money Income in 1983 with Independently Derived Estimates, by Income Type

(Billions of dollars)

Source of income	Independent estimate	CPS estimate	CPS as a percent of independent
Total	2,402.5	2164.9	90.1
Wages and salaries	1,632.3	1616.3	99.0
Self-employment	112.6	130.1	115.5
Social Security ¹	155.2	142.3	91.7

Workers' compensation	14.1	6.6	47.0
Private, government, and military pensions	110.1	79.7	72.4

¹Includes Railroad Retirement benefits.

survey count probably contains some persons covered by Medicaid that report coverage under Medicare by mistake. The magnitude of this misreporting problem is not known.

Medicaid. The CPS estimate of 19.3 million for 1984 was about 3 percent higher than the "unduplicated"

administrative figure of 18.7 million persons "ever receiving" benefits available from the Health Care Financing Administration (HCFA). This HCFA figure has not been adjusted for decedents or the institutionalized population and does not include persons who were covered by Medicaid but did not receive benefits in 1984.

Appendix G. U.S. Senate Statement, "Data Collection and Poverty Level"

Official poverty statistics published by the Bureau of the Census currently ignore billions of dollars of Government in-kind benefits, such as food stamps, public housing rental subsidies, and medical care. The Congressional Budget Office has estimated that including in-kind benefits in the income statistics would cause the number of people in poverty to decline to about 9 million as compared with official statistics showing nearly 25 million people in poverty. The official statistics show no significant reduction in recent years in the incidence of poverty, although in-kind benefit programs have expanded greatly.

The Committee considers it essential that official poverty statistics reflect, at the earliest possible date, the effects of in-kind benefits. Without such information, Congress and the Executive Branch cannot be certain that Government transfer programs are properly targeted.

The Census Bureau has recognized the need for better data on in-kind benefits. The most recent March Current Population Survey has collected data on some types of in-kind program benefits. In addition, Census has under way an experimental survey—known as the Survey of Income and Program Participation—which collects more extensive data. However, Census has not yet published the data collected thus far and has no current plans for integrating such data with cash income data now reported routinely.

The Committee has inscribed language in the bill directing the Secretary of Commerce to expedite the program of collecting, through surveys, data on benefits received and data on participation in federally funded,

in-kind benefit programs. Programs on which data are to be reported include, but are not necessarily limited to, food stamps, Medicaid, Medicare and subsidies in areas such as housing, nutrition, child care, and transportation. The Secretary of Commerce is further directed to continue research and testing of techniques for assigning monetary values to in-kind benefits and for calculating the impact of such benefits on income and poverty estimates. The Secretary of Commerce is also directed to include in survey reports, beginning no later than October 1, 1981, appropriate summaries of data on in-kind benefits and estimates of the effect of in-kind benefits on the number of families and individuals below the poverty level.¹

Note: The above language was modified in conference but the substance of the new language was similar and included the statement "the Secretary should include in survey reports beginning no later than October 1, 1981, appropriate summaries of data on in-kind benefits and estimates of the effect of in-kind benefits on the number of families and individuals below the poverty level."²

²Making Appropriations for the Departments of State, Justice, and Commerce, the Judiciary, and Related Agencies; U.S. House of Representatives Report No. 96-1472, 96th Congress, 2d Session, November 20, 1980: 8-9.

Appendix H. Bureau of Labor Statistics' Statement on the Use of the CPI-U-X1

The Bureau of Labor Statistics (BLS) developed an experimental Consumer Price Index (CPI-U-X1) for researchers who wish to make historical comparisons with the current Consumer Price Index for All Urban Consumers (CPI-U) which uses the rental equivalence approach to measuring shelter services. Prior to 1983, the measurement of homeowner costs included changes in the asset value of homes. Recognizing that this approach mixed the investment and consumption aspects of homeownership, the BLS initiated an extensive research effort in the early 1970's to develop a better methodology. Following extensive study and testing, the CPI-U was officially converted to a rental equivalence measure in 1983. This rental equivalent approach is a methodology that isolates the shelter services component and, therefore, is a superior measure.

When the new methodology was introduced, the historical series were not revised. Price indexes are used for escalation and other contractual purposes that

require the parties to agree on one official series. Moreover, the BLS did not have the basic data or the resources to convert all of its historical series (including local area indexes) to the new methodology. The refinements that were ultimately developed before the methodology was officially introduced into the CPI—notably a larger sample of renters and a reweighting of the shelter component—could not be incorporated into the CPI-U-X1. Nonetheless, for many purposes the CPI-U-X1 can serve as an adequate proxy for what the national index would have been using the rental equivalence measure. Therefore, BLS recommends the use of the CPI-U-X1 to those who need to use a CPI series that treats homeowner costs consistently over time.

21. (If in 19, skip to 21A.) Did ... have a job or business from which he/she was temporarily absent or on layoff LAST WEEK?

Yes No (Go to 22)

21A. Why was ... absent from work LAST WEEK?

- Own illness
- On vacation
- Bad weather
- Labor dispute
- New job to begin within 30 days (Skip to 22B and 22C2)
- Temporary layoff (Under 30 days)
- Indefinite layoff (30 days or more or no def. recall date) (Skip to 22C3)
- Other (Specify) ...

21B. Is ... receiving wages or salary from his/her employer for any of the time off LAST WEEK?

Yes No

21C. Does ... usually work 35 hours or more a week at this job?

Yes No

(Skip to 23 and enter job held last week)

22. (If LK in 19, skip to 22A.) Has ... been looking for work during the past 4 weeks?

Yes No (Go to 24)

22A. What has ... been doing in the last 4 weeks to find work? (Mark all methods used; do not read list.)

- Checked pub. employ. agency with-
- pvt. employ. agency
- employer directly
- friends or relatives
- Placed or answered ads.
- Nothing (Skip to 24)
- Other (Specify in notes, e.g., JTPA, union or prof. register, etc.)

22B. At the time ... started looking for work, was it because he/she lost or quit a job or was there some other reason?

- Last job
- Quit job
- Left school
- Wanted temporary work
- Change in home or family responsibilities
- Left military service
- Other (Specify in notes)

22C. 1) How many weeks has ... been looking for work?

2) How many weeks ago did ... start looking for work?

3) How many weeks ago was ... laid off?

22D. Has ... been looking for full-time or part-time work?

Full Part

22E. Could ... have taken a job LAST WEEK if one had been offered?

Yes No Why not?

- Already has a job
- Temporary illness
- Going to school
- Other (Specify in notes)

22F. When did ... last work at a full-time job or business lasting 2 consecutive weeks or more? Within last 12 months (Specify) ...

(Month)

- One to five years ago
- More than 5 years ago
- Never worked full-time 2 wks. or more
- Never worked at all

(SKIP to 23. If layoff entered in 21A, enter job, either full or part time, from which laid off. Else enter last full time job lasting 2 weeks or more, or "never worked.")

23. DESCRIPTION OF JOB OR BUSINESS

23A. For whom did ... work? (Name of company, business, organization or other employer.)

23B. What kind of business or industry is this? (For example: TV and radio mfg., retail shoe store, State Labor Dept.)

23C. What kind of work was ... doing? (For example: electrical engineer, stock clerk, typist, farmer.)

23D. What were ...'s most important activities or duties at this job? (For example: types, keeps account books, files, sells cars, operates printing press, finishes concrete.)

23E. Was this person an employee of a PRIVATE Co., bus., or individual for wages, salary or comm. ... P

- A FEDERAL government employee ... F (Go to 23F)
- A STATE government employee ... S
- A LOCAL government employee ... L
- Self-empl. in OWN bus., prof. practice, or farm
- Is the business incorporated? { Yes ... I No ... SE } (Skip to 26)
- Working WITHOUT PAY in fam. bus. or farm ... WP
- NEVER WORKED ... NEV

23F. CHECK ITEM

Entry (or NA) in item 20A (Go to 25 at top of page)

Entry (or NA) in item 21B

All other cases (Skip to 26)

24. CHECK ITEM (Rotation number)

First digit of SEGMENT number is:

- 0 2, 3, 4, 6, 7 or 8 (Skip to 26)
- 1 or 5 (Go to 24A)

24A. When did ... last work for pay at a regular job or business, either full- or part-time?

- Within past 12 months
- 1 up to 2 years ago
- 2 up to 3 years ago (Go to 24B)
- 3 up to 4 years ago
- 4 up to 5 years ago
- 5 or more years ago (Skip to 24C)
- Never worked

24B. Why did ... leave that job?

- Personal, family (incl. pregnancy) or school
- Health
- Retirement or old age
- Seasonal job completed
- Slack work or business conditions
- Temporary nonseasonal job completed
- Unsatisfactory work arrangements (Hours, pay, etc.)
- Other

24C. Does ... want a regular job now, either full- or part-time?

Yes (Go to 24D)

Maybe - it depends (Specify in notes)

No (Skip to 24E)

Don't know

24D. What are the reasons ... is not looking for work? (Mark each reason mentioned)

- Believes no work available in line of work or area
- Couldn't find any work
- Lacks nec. schooling, training, skills or experience
- Employers think too young or too old
- Other pers. handicap in finding job
- Can't arrange child care
- Family responsibilities
- In school or other training
- Ill health, physical disability
- Other (Specify in notes)
- Don't know

24E. Does ... intend to look for work of any kind in the next 12 months?

Yes

It depends (Specify in notes)

No

Don't know (If entry in 24B, describe job in 23, otherwise, skip to 26)

25. CHECK ITEM (Rotation number)

First digit of SEGMENT number is:

- 0 2, 3, 4, 6, 7 or 8 (Skip to 26)
- 1 or 5 (Go to 25A)

25A. How many hours per week does ... USUALLY work at this job?

FOLLOW-UP INFORMATION – TRANSCRIBE THIS INFORMATION FROM THE CPS-1 AND CONTROL CARD BEFORE SENDING THEM TO THE R.O.

ALL CPS-1s AND CONTROL CARDS MUST BE SENT TO THE R.O. BY SATURDAY, MARCH 24

ALL 655s MUST BE MAILED TO R.O. BY SATURDAY, MARCH 31

- (1) Complete items 3, 6-8, 77, 79, 82 and 84 on page 1.
- (2) Complete items 18A, 18B, 18D, and 18G1 for each 15+ person, (p. 3, 4, 5, 6).
- (3) Record below the industry and occupation description from CPS-1 items 23A-23E as applicable. You will need to refer to it when filling item 45 in your followup interview.
- (4) Complete items 56D and 58, (p. 7 and 8, respectively).
- (5) Note below Names and Line No.'s of persons (and item numbers, if necessary) needing followup. Also, as necessary note address, telephone, and "best time to call" information from control card.

NOTES:

A series of horizontal dashed lines for taking notes.
