Premature Mortality

Years of potential life lost before age 75 (YPLL-75)

- For each county, calculate 3-yr. avg. deaths (1990-92) in each age group (Area Resource File)
- Multiply deaths in age group by 75 minus the mid-point of age group
- Divide by age-adjustment factor (US Standard Million)
- Sum adjusted YLL in each age group to get total YPLL-75 for county

Years of Potential Life Lost before Age 75

1990-1992 Average per 10,000 Population
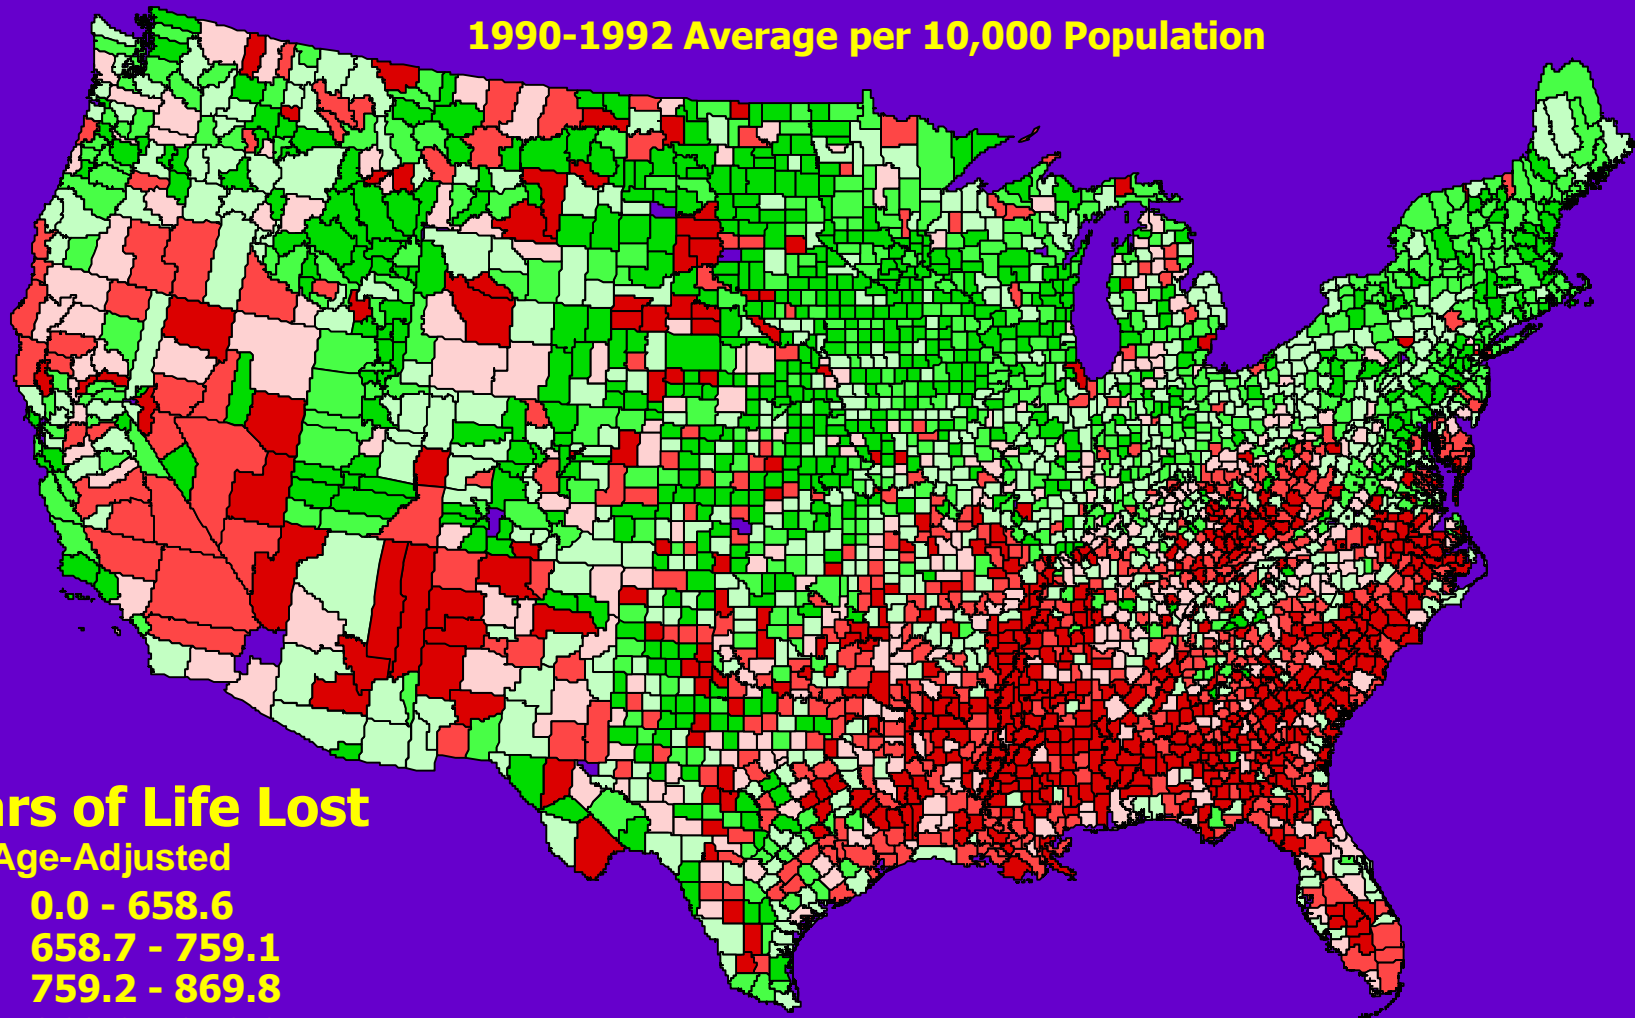

Years of Life Lost
Age-Adjusted

- 0.0 – 658.6
- 658.7 – 759.1
- 759.2 – 869.8
- 869.9 – 942.2
- 942.3 – 1086.5
- 1086.6 – 2792.9

Age-adjusted to U.S. 1940 Standard Million Population. U.S. YPLL mean = 869.8.
Counties categorized according to their value relative to this mean.
Data: Area Resource File 1996

Data source: Area Resource File 1996
Utility of YPLL-75

- **Summary measure of the first overarching goal but objective for YPLL-75 was dropped from the draft *HP2010***

- **Has not been calculated for race but could be**

- **Calculation of YPLL-75 for all US counties available at our website**

Coronary Heart Disease Mortality Objective

Reduction Necessary
to meet Objective

☐	meets objective
☐	0 to 10.0%
☐	10.1 to 20.0%
☐	20.1% or more

Reduce coronary heart disease deaths to no more than 166.0 per 100,000 population

Projections are by linear regression with a 2-standard error estimate at 2010 (90% confidence interval)

ICD-9 Codes: 402, 410-414, 429.2   Age-Adjusted to US 2000 Standard Million

$R^2 = 0.40$

$R^2 = 0.20$

CHSR&D
Stroke Mortality and Racial Disparity, Eastern North Carolina

Mortality

As compared to the U.S. crude rate (60.3)

- less than 25% higher; small numbers
- 26% to 50% higher
- more than 50% higher

Disparity

25 percent or greater racial disparity in elevated counties

Purchasing population health requires a quantifiable measure;

"Population health is defined as the aggregate health outcome of health adjusted life expectancy (quantity and quality) of a group of individuals, in an economic framework that balances the relative marginal return from the multiple determinants of health." Kindig 1997

Existing measures

- Mortality rates
  - Crude
  - Age-adjusted (race & sex-adjusted too?)
  - Cause- and age-specific
- Life expectancy
- Premature death (YPLL)
- Morbidity
- Disability (ADLs, IADLs)
- Functional Status (SF-36)
- Self-reported health status
- Provider report cards (HEDIS, JCAHO)

Potential measures

- Gross National Health Product ?
- Health Adjusted Life Years
  - Quality Adjusted Life Years (QALYs)
  - Disability Adjusted Life Years (DALYs)
  - Years of Healthy Life (YHL) - combines ypls with self-reported health status by age cohorts

Necessary conditions for perfect competition:

- No seller has any influence over market price
- Homogenous products (substitutability)
- Large number of buyers and sellers
- **Each has complete knowledge of the market**
- No restraints on market entry
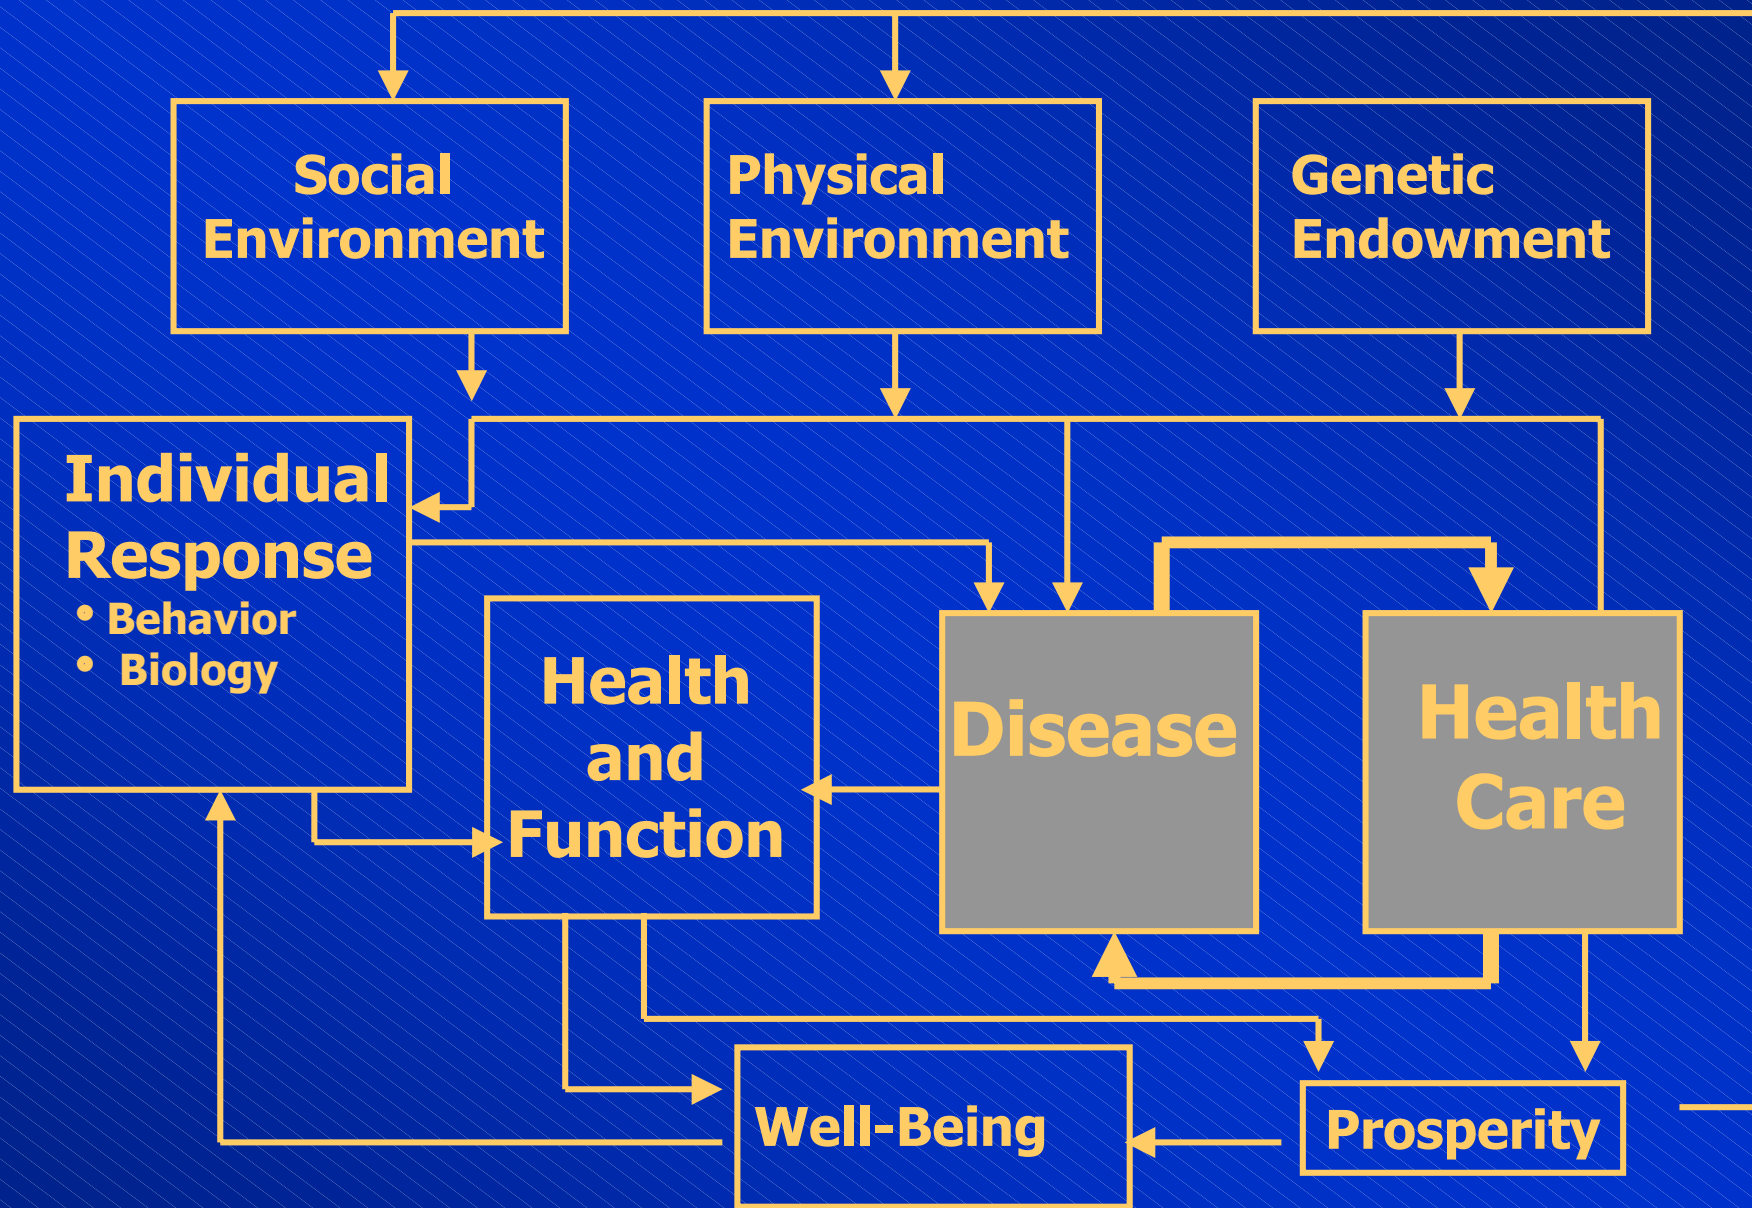

Model of the determinants of health. Evans and Stoddart, 1990.
