

#### National Assessment of Oil and Gas Fact Sheet

# 2005 Assessment of Undiscovered Oil and Gas Resources in Hanna, Laramie, Shirley Basins Province, Wyoming

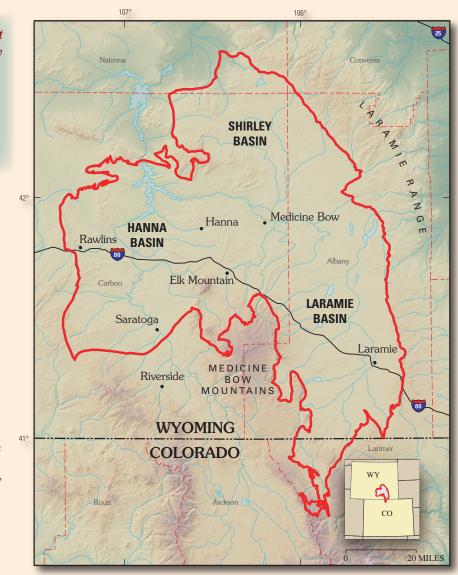

Application of a geology-based assessment methodology by the U.S. Geological Survey resulted in estimated means of 298 billion cubic feet of undiscovered natural gas, 94 million barrels of undiscovered oil, and 14 million barrels of undiscovered natural gas liquids in the Hanna, Laramie, Shirley Basins Province, Wyoming.

## Introduction

The U.S. Geological Survey (USGS) recently completed an assessment of the undiscovered oil and gas potential of the Hanna, Laramie, Shirley Basins Province of the Rocky Mountain region (fig. 1) as part of a national oil and gas assessment effort. The assessment of the petroleum potential of the province was based on the general geologic elements used to define a total petroleum system (TPS)—hydrocarbon source rocks (source rock maturation, hydrocarbon generation and migration), reservoir rocks (sequence stratigraphy and petrophysical properties), and hydrocarbon traps (trap formation and timing). By using this geologic framework, the USGS defined five TPSs containing seven assessment units (AUs) and quantitatively estimated the undiscovered resources for three of the seven AUs (table 1).

## **Resource Summary**

Assessment of the undiscovered oil and gas resources for the three AUs—Tensleep-Casper Oil and Gas AU, Mesozoic—Cenozoic Conventional Oil and Gas AU, and Niobrara Continuous Oil AU—resulted in estimated means of 298 billion cubic feet of nonassociated gas and associated gas in oil fields, 94 million barrels of oil, and 14 million barrels of natural gas liquids (table 1). All of

**Figure 1.** Map of the Hanna, Laramie, Shirley Basins Province (Province 5030) of the Rocky Mountain region (outlined in red).

the undiscovered gas is conventional. The Mesozoic–Cenozoic Conventional Oil and Gas AU contains an estimated mean of 207 billion cubic feet of gas, representing nearly 70 percent of the total mean undiscovered gas resource (298 billion cubic feet) for the province. Two continuous gas and two coalbed gas AUs were not quantitatively assessed owing to a lack of data.

Table 1. Hanna, Laramie, Shirley Basins Province assessment results.

[MMBO, million barrels of oil; BCFG, billion cubic feet of gas; MBNGL, thousand barrels of natural gas liquids; MAS, minimum accumulation size assessed (MMBO or BCFG); Prob., probability (including both geologic and accessibility probabilities) of at least one accumulation equal to or greater than the MAS or, for continuous-type resources, at least one additional cell of equal to or greater than the minimum estimated ultimate recovery; Accums., accumulations. Results shown are fully risked estimates. For gas accumulations, all liquids are included as NGL (natural gas liquids). F95 represents a 95 percent chance of at least the amount tabulated; other fractiles are defined similarly. A single major commodity and its coproducts were assessed for continuous-type assessment units. Fractiles are additive under the assumption of perfect positive correlation. Totals reflect rounding to nearest whole number. Shading indicates not applicable
