# HOME EQUITY, WEALTH, AND FINANCIAL ASSETS OF U.S. HOUSEHOLDS IN 1995 

## HOME EQUITY, WEALTH, AND FINANCIAL ASSETS OF U.S. HOUSEHOLDS IN 1995

## EXECUTIVE SUMMARY

This report describes patterns of homeownership, home equity, and other assets and debts of U.S. households in 1995. The report presents the results of analysis of data on the homeownership, wealth, income, and socioeconomic characteristics of U.S. households in 1995. These data were collected by the U.S. Bureau of the Census in the Survey of Income and Program Participation (SIPP). The SIPP provides data on the income, assets, and demographic characteristics of large representative samples of the non-institutionalized population of the United States.

In 199564 percent of all U.S. households owned homes, about 63.7 million households. 36.6 million homeowners were in the age range 25-54 ( 58 percent of the total), and 19.3 million were 55-74 ( 30 percent). 36.8 million homeowners had incomes of $\$ 10,000-50,000$ ( 58 percent), and 22.7 million had incomes greater than $\$ 50,000$ ( 35.6 percent).

Median home equity of homeowners in 1995 was $\$ 50,000$ and mean home equity was $\$ 68,000$. Median home value was $\$ 85,000$ and mean value was $\$ 106,500$. Overall, home equity equals about 64 percent of home values.

Homeownership and home equity increase with age of head of household up to age 65-74, then decline. Among households with heads age 55-74, 80 percent are homeowners. Median home equity for homeowners ages 55-74 exceeds $\$ 70,000$.

Homeownership and home equity increase with household income. 80 percent of households with incomes of $\$ 50,000-75,000$ own homes, and 90 percent of households with incomes of $\$ 75,000$ or more. Median home equity for homeowners with incomes of $\$ 75,000-100,000$ is $\$ 70,000$, and for homeowners with incomes of $\$ 100,000$ or more, median is $\$ 112,000$.

Home ownership and home equity vary by race and ethnicity. 69 percent of white households are homeowners, while 49 percent of black households own homes. Median home equity of white homeowners is $\$ 52,600$ and of black homeowners, $\$ 32,500$. White non-Hispanic homeowners median home equity is $\$ 54,400$, while Hispanic homeowners median is $\$ 35,000$.

Married couple households have greater home equity than households headed by singles, either living alone or with others. Median home equity for married couples is $\$ 53,600$; for singles living alone median home equity is $\$ 48,000$; and for single persons living with others it is $\$ 44,000$. For single females with minor children it is $\$ 26,100$.

Median net worth of homeowners is $\$ 85,800$, and mean net worth is $\$ 141,400$. Overall, home equity accounts for about 49 percent of the net worth of homeowners. Median net financial assets of homeowners is $\$ 5,300$ and mean net financial assets is $\$ 40,000$. Median net financial assets of homeowners with incomes of $\$ 75,000-100,000$ is $\$ 26,700$, and for incomes of $\$ 100,000$ or more, median net financial assets is $\$ 50,000$.

## HOME EQUITY, WEALTH, AND FINANCIAL ASSETS OF U.S. HOUSEHOLDS IN 1995

## OVERVIEW

This report describes patterns of homeownership, home equity, and other assets and debts of U.S. households in 1995. The report presents the results of analysis of data on the homeownership, wealth, income, and socioeconomic characteristics of U.S. households in 1995. These data were collected by the U.S. Bureau of the Census in the Survey of Income and Program Participation (SIPP). The SIPP provides data on the income, assets, and demographic characteristics of large representative samples of the non-institutionalized population of the United States.

The results of the analysis are shown in the 193 tables at the end of this report. There are 19 sets of tables. Each set of tables presents estimates of a set of homeownership, home equity, or household wealth variables for socioeconomic groups classified in 11 socioeconomic classification schemes:

1. Age of head of household
2. Household total income
3. Age-income classes
4. Gender of head of household
5. Race of head
6. Ethnicity of head
7. Race-ethnicity of head
8. Household income and race of head
9. Age-race of head
10. Educational attainment of head
11. Household and family structure.

Table A provides a description of the contents of the tables.
Tables 1-11 show housing tenure for each of the 11 socioeconomic classification schemes. The tables report households that own houses, rent, or occupy without payment.

Tables 12-22 and Tables 23-33 show average home equity for U.S. households in 11 socioeconomic classifications, including the market value of the house, balance of all mortgages on the house, and equity in the house. Tables 12-22 report averages over all U.S. households. Tables 23-33 report averages for homeowner households.

Tables 34-44 report the numbers of homeowners with mortgages on their homes. The tables report the number and percentage of homeowners in each particular socioeconomic group that have no mortgage, one mortgage, and two or more mortgages.

Tables 45-55 report the mortgage balances of homeowners. They show the average mortgage balance for homeowners with one mortgage, two or more mortgages, and for all homeowners, including homeowners with no mortgage.

Tables 56-66 and Tables 67-77 report average home equity, total wealth, and net worth of U.S. households. Tables 56-66 show these wealth variables over all U.S. households, including households which do not own homes, and Tables 67-77 show these average wealth variables for homeowners only.

Tables 78-88 report average levels of several types of assets for homeowner households: home equity, equity in other real estate, vehicle equity, equity in own businesses, net financial assets, and total wealth of homeowners. Because the focus of this report is homeowners, these tables include only homeowners.

Tables 89-99 report average levels of various types of debts for homeowner households: mortgage balance, other secured debt, total secured debt, unsecured debt, and total debt.

Tables 100-121 report direct ownership of stocks and mutual funds of all households and of homeowner households by each of the 11 socioeconomic classifications. Tables 122-143 report ownership of IRA and Keogh accounts of all households and of homeowner households. Tables 144165 report ownership of $401(\mathrm{k})$ accounts of all households and of homeowner households. Each set of tables show the number and percent of households and of homeowners which own the stocks, IRA/Keoghs, or $401(\mathrm{k}) \mathrm{s}$, and the average balance held.

Tables 166-187 report direct and indirect ownership of stocks and mutual fund shares by all households and by homeowner households, classified in the 11 socioeconomic classifications. Direct ownership refers to all stock and mutual funds held by members of the household other than those in IRAs, Keogh Accounts or $401(\mathrm{k})$ plans. Indirect ownership refers to stock and mutual fund shares held in IRAs and Keogh accounts. Each table shows the number and percentage of households in each group owning stock directly, the number and percentage of households holding stock in IRAs or Keoghs, and the number and percentage of households reporting direct and/or indirect ownership of stock.

Tables 188-193 show the average market value of stocks held directly by households that own stocks, the average margin debt on those stocks, and the average equity in stocks. These estimates are shown for all households and for homeowners classified by age of head, total household income, and cross-classified by age and income.

## DATA SOURCES

The data analyzed in this report were collected by the U.S. Bureau of the Census in the Survey of Income and Program Participation (SIPP) for the period of October 1992 through December 1995. The homeownership and wealth data analyzed were collected during January through April of 1995. The SIPP provides data on the income, assets, and demographic characteristics of large representative samples of the non-institutionalized population of the United States. ${ }^{1}$

The SIPP is the largest and most comprehensive database with information for persons, families, and households on all the economic, demographic, and social variables relevant to analysis of individual household economic conditions, including homeownership, home equity, and household assets. The SIPP sample is selected to be representative of the U.S. civilian, noninstitutional population. The 1995 data used for this study include about 17,900 households, with about 49,000 persons ${ }^{2}$. The 1995 sample includes about 12,800 households with income less than $\$ 50,000$ and about 5,100 households with income greater than $\$ 50,000$. It also includes over 2,000 households with income greater than $\$ 75,000$. The SIPP is described in Annex A.

[^0]
## SUMMARY OF RESULTS

## Housing Tenure

Tables 1-11 show housing tenure for each of the 11 socioeconomic classification schemes. The tables report households that own houses, rent, or occupy without payment. Homeowners include all households that own their housing, including detached houses, units in multi-family structures, and mobile homes. Renters are divided into unsubsidized and subsidized. Subsidized renters generally live in public housing or benefit from other public housing assistance programs. Households that occupy houses without payment are primarily in two groups - those living in public housing, and those living in quarters provided by employers.

Table 1 shows housing tenure by age of head of household. In 1995, 64 percent of all households owned their home. Homeownership rates increase with age up to age group 65-74, then decline in the oldest group. Among households with heads age 35 or older, 65 percent or more own a home. The highest homeownership rate is for ages 55-74, about 80 percent. Among households with heads age $18-24$, only 20 percent own homes. In that age group about 74 percent rent, of which about eight percent live in subsidized rental housing. In the 25-34 year age group over half live in rental housing, about six percent subsidized. About 44 percent of all homeowners are age $35-54$, and about 41 percent are ages 55 and older.

Table 2 shows housing tenure by income. Homeownership increases with income. Among households with incomes of $\$ 25,000-50,000$, two-thirds own homes. Eighty percent of households with incomes of $\$ 50,000-75,000$ own homes, and about 90 percent of those with incomes of $\$ 75,000$ or more. Among households with incomes of $\$ 10,000$ or less, 37 percent own, 30 percent live in unsubsidized rental housing, and 25 percent live in subsidized rentals. Of all homeowner households, 58 percent have incomes of $\$ 10,000-50,000$, and 36 percent have incomes greater than $\$ 50,000$.

Table 3 shows tenure for households cross-classified by age and income. Within each age group, homeownership increases with income. For households with heads age 35-54, more than 82 percent of those with incomes greater than $\$ 50,000$ own homes. For ages 55 and older, over 84 percent of those with incomes greater than $\$ 25,000$ own homes. Two broad groups account for a relatively large share of all homeowners: ages $35-54$ with incomes $\$ 25,000-75,000$ account for 28 percent, and ages 65 and older with incomes of $\$ 10,000-50,000$ account for 19 percent of all homeowners.

Tables 4-9 show housing tenure by gender of head, race, ethnicity, and cross-classifications of these variables and of age and income. Table 4 shows that 71 percent of male-headed households own houses, while 53 percent of female-headed households are owners. Nine percent of female-headed households live in subsidized rental housing. About 69 percent of white households are homeowners, while less than half of black households are, and only 40 percent of native American households own
their homes (Table 5). ${ }^{3}$ About 57 percent of Asian and Pacific islander households are homeowners. About 45 percent of Hispanic households own homes, and about 66 percent of non-Hispanic households own homes (Tables 6 and 7). The homeownership rate for white households exceeds that for non-whites for all income groups lower than $\$ 100,000$, although the relative difference narrows slightly as income rises (Table 8). For the group with incomes greater than $\$ 100,000$, the homeownership rate is slightly greater for nonwhites ( 94 percent) than whites ( 92 percent). 36 percent of nonwhite households with incomes less than $\$ 10,000$ live in subsidized rental housing, and another seven percent occupy housing without payment. In every age group the homeownership rate of white households exceeds that of black households, although the relative difference narrows as age increases (Table 9).

Table 10 shows tenure by educational attainment of the head of household. Homeownership increases with years of education, from 60 percent for those who did not complete high school to 74 percent for those with more than four years of college.

Table 11 shows tenure by family structure. More than half of U.S. households are headed by married couples ( 53.9 million households) ${ }^{4}$. Homeownership is greater among married couple households than households headed by single persons. The homeownership rate is about 76 percent for married couples with minor children and 83-84 percent among married couple households without minor children. While married couple households are about 54 percent of all households, they account for about 66 percent of homeowners. About one-quarter of U.S. households consist of a single person living alone ( 25.9 million). About 53 percent of single individuals living alone own homes, about 49 percent for single males ( 5.0 million) and about 56 percent for single females ( 8.0 million). About onefifth of all households are multi-person households headed by an unmarried person ( 19.5 million). Among multi-person households headed by single persons, about 47 percent of both male- and femaleheaded households own homes. This similar percentage masks differences between male-headed and female-headed households by family type. Among males with minor children, 62 percent own homes, while only 35 percent of females with minor children own homes. Among households headed by single males with other members but no minor children, 46 percent own homes, while 56 percent of such households headed by females own homes. There are more single female headed households (13.8 million) than single male headed households ( 5.7 million) and many more single female households with minor children ( 6.2 million) than single male households with minor children ( 0.8 million).
${ }^{3}$ This report in does not highlight information about native American households because they are a relatively small part of the population (less than one percent of all households) and a small part of the sample analyzed for this study (118 households, of which 48 are homeowners).
${ }^{4}$ The sample of households included in this study excluded households headed by persons younger than age 18 .

## Home Equity

Tables 12-22 and Tables 23-33 show average home equity for U.S. households in 11 socioeconomic classifications. Each set of tables shows the mean and median ${ }^{5}$ estimated market value of the house, balance of all mortgages on the house, and equity in the house. Tables 12-22 report averages over all U.S. households, including households that do not own houses, which have home equity of zero. Tables 23-33 report averages for homeowner households. They report mean and median house market values, mortgages, and home equity including only households that own houses (including detached houses, mobile homes, units in multi-family structures).

The mean home equity for all U.S. households, including those that do not own homes, is about $\$ 44,000$, and the median home equity is about $\$ 18,000$ (Table 12). The mean home equity among homeowners is about $\$ 68,600$, and the median is about $\$ 50,000$ (Table 23). House value and home equity vary by age of head, but the patterns differ somewhat. Average house values increase with age up to age group 45-54 years then decrease as age increases beyond that. The mean house value of homeowners is about $\$ 120,300$ for the age group $45-54$, and it exceeds $\$ 111,000$ for the age groups in the range 35-64. On the other hand, home equity increases with age up to age group 65-74 before decreasing for ages 75 and older. Median home equity of homeowners exceeds $\$ 70,000$ for age groups 55-64 and 65-74, and mean home equity exceeds $\$ 85,000$ for all age groups above 55 . The difference between house value patterns and home equity patterns reflects the pattern of mortgage balances by age. Mean and median mortgage balances of homeowners increase between age groups $18-24$ and 25-34, then decrease as age increases ${ }^{6}$. While the ratio of home equity to house value is about 34 percent for ages 25-34, this ratio increases to about 97 percent for ages 75 and older.

House values, mortgages, and home equity increase with household income. Mean home equity of all households increases from about $\$ 19,200$ for households with income less than $\$ 10,000$ to over $\$ 112,000$ for households with income greater than $\$ 100,000$ (Table 13). Mean home equity of homeowner households increases from $\$ 52,200$ for households with income less than $\$ 10,000$ to $\$ 121,600$ for households with incomes of $\$ 100,000$ or more (Table 24). Mean home equity for homeowners with income $\$ 75,000-100,000$ is about $\$ 90,300$, and median home equity is about $\$ 69,800$. The ratios of mean and median home equity to home value decline as income rises from the
${ }^{5}$ The median is the level of assets held by the households at the mid-point of the distribution i.e., half of the households have more and half have less. The mean is the arithmetic average - it equals the total level of assets held by all households, divided by the number of households.
${ }^{6}$ Mean and median mortgage balances of all households, including non-homeowners, increase with age up to age group 35-44, then decrease (Table 12). This reflects the fact that the homeownership rate increases significantly between ages 25-34 and 35-44, so that, although the average mortgage balance of homeowners decreases between those ages, the average mortgage balance of all households increases.
lowest group to groups with income of $\$ 50,000$ and greater. For groups with income $\$ 50,000$ or greater, the ratio of mean home equity to value is about 57 percent. The ratio of median home equity to median house value increases from .50 for income of $\$ 50,000-75,000$ to .56 for income of $\$ 100,000$ or more.

Tables 14 and 25 show house value and home equity by age and income. Significant home equity (median of $\$ 90,000$ or greater) is held by homeowners age $35-44$ with incomes of $\$ 100,000$ or more, homeowners age 45-54 with incomes of $\$ 100,000$ or more, homeowners age 55-64 with incomes of $\$ 75,000$ or more, homeowners age 65-74 with incomes of $\$ 50,000$ or more, and homeowners age 75 and older with incomes of $\$ 50,000$ or greater. In each of these age-income groups, half or more of the homeowners have home equity of $\$ 90,000$ or more.

Male homeowners have greater average house values and home equity than female homeowners, but the difference between the two is not great (Table 26). When households are classified by race of head, Asian homeowners have significantly the highest home values and home equity, followed by white homeowners (Table 27). Asian homeowners have mean home values and home equity of $\$ 177,800$ and $\$ 95,200$ respectively. White homeowners have mean home values and home equity of $\$ 108,400$ and 70,600 , black homeowners, $\$ 69,000$ and $\$ 41,900$, respectively. White homeowners have the highest ratios of home equity to value, although the ratios for black homeowners is close to that of white. The ratio of mean home equity to mean house value for whites is 65 percent, and the ratio of median home equity to median house value is .58 . White Hispanic homeowners have considerably lower home equity than white non-Hispanic homeowners (Tables 18 and 29). White Hispanic homeowners have mean and median home equity of $\$ 52,400$ and $\$ 33,700$, respectively, while white non-Hispanic homeowners have mean and median home equity of $\$ 71,500$ and $\$ 54,400$. Among black homeowners, the ethnic pattern is reversed. Black Hispanic homeowners have mean and median home equity of $\$ 50,700$ and $\$ 35,100$ respectively, while black non-Hispanic homeowners have mean and median home equity of $\$ 40,100$ and $\$ 31,100$.

When households are classified by income and race (Tables 19 and 30), whites have greater home equity than nonwhites at every income level, but the gap narrows as income increases. For income groups above $\$ 75,000$, the mean value of the home is greater for nonwhite homeowners than whites. The mean mortgage balance for nonwhite homeowners is greater than that of whites for all income groups above $\$ 25,000$, with the result that home equity of whites exceeds that of nonwhites and the ratio of home equity to house value for whites is greater than for nonwhites.

When households are classified by age and race (Tables 20 and 31), whites have greater home equity than nonwhites in every age group except ages $18-24 .^{7}$ The relative gap in home equity between whites and nonwhites increases as age increases. Whereas white homeowners have about 20 percent

[^1]greater mean home equity than nonwhite homeowners in the age groups $25-44$, whites have about 40 percent greater mean home equity in ages 45 and older. This reflects differing patterns in housing values and mortgages with age. The ratio of mean house value of whites to that of nonwhites increases with age. Mean house values of whites are 16 percent greater than those of nonwhites in ages 25-44 and 33 percent greater for ages 55 and older. On the other hand, the ratio of mean mortgage balances of whites to that of nonwhites falls with age. Mean mortgage balances of white homeowners are 13 percent greater than those of nonwhites for ages $25-44$ but are 17 percent less on average for ages 45 and older, and 46 percent less for ages 65 and older. There are two potential explanations for this pattern. It could be that there has been some convergence with time in home equity accumulation, so that younger nonwhite households, whose home purchases reflect more recent experience, are more similar to white households in home equity values than among older households. Or, it could be that, as households age, white homeowners are more successful at increasing home equity than nonwhite homeowners, both by purchasing more expensive homes and by paying off mortgages. ${ }^{8}$

Tables 21 and 32 show home equity by educational attainment of the head of household. While homeownership rates increase moderately with education (Table 10), home equity increases significantly. Mean home equity of homeowner households headed by persons with only a high school education exceeds that of households whose head did not complete high school by 16 percent (Table 32). Home equity of homeowner households headed by persons with four years of college exceeds that of high school graduate homeowners by 17 percent, and home equity of homeowners with more than four years of college exceeds that of homeowners with four years of college by 26 percent. These differences in home equity by education are accounted for by even greater differences in house values. The ratio of home equity to house value actually declines as education increases, up to four years of college.

By family composition, average house values and home equity for married couple households are considerably greater than that of single person households or households headed by single persons with other household members ( Tables 22 and 33). Mean home equity of married couple homeowners is $\$ 71,600$, while mean home equity is $\$ 65,200$ for single persons living alone ( $\$ 67,800$ for females, $\$ 61,000$ for males), $\$ 58,700$ for single female headed homeowner households and $\$ 61,000$ for single male headed homeowner households. Within married couple households there is a big difference between those with minor children only and other married couple households. Mean and median home equity of married couples with minor children only who are homeowners is $\$ 56,700$ and
${ }^{8}$ The first type of effect is referred to as a cohort effect - different cohorts may face different circumstances or exhibit different behaviors at the same ages in different time periods (for example, in the case discussed here, perhaps because of changes in discrimination in housing markets over time affecting home purchases, changes in mortgage lending patterns, or changes in the demographic composition of the nonwhite population). The second type of effect is referred to as an age effect circumstances or behaviors may differ at different ages for the same cohorts. Investigating the underlying reasons for these patterns is beyond the scope of this report.
$\$ 39,600$ respectively, while mean home equity of other married couple homeowners is $\$ 81,200$ 82,700 and median home equity is $\$ 62,500-63,800$. The lowest home equity among homeowners is for single parents with minor children, $\$ 45,700$ for single male parents and $\$ 43,800$ for single female parents.

The difference in home equity between married couple homeowners with and without children is accounted for entirely by differences in mortgage balances. In fact, married couples with minor children have higher average house values $(\$ 118,500)$ than married couples with no other persons in the household $(\$ 112,700)$. However, married couples with minor children have mean mortgage balances $(\$ 61,800)$ more than twice as high as those with no other household members $(\$ 29,900)$. The median mortgage balance for married couples with minor children is $\$ 52,100$, while the median for married couples with no other household members is zero (i.e., less than half such household have any mortgage). These differences may be related to the average age of the different types of households. It is likely that married couple households with no other household members are on average older than married couples with minor children, and have paid down mortgages. These two types of households are about equal in number and account for the largest share of all homeowners. 17.7 million married couples with minor children own homes ( 27.9 percent of all homeowners), and 17.4 million married couples with no other household members own homes (27.3 percent) (Table 11).

## Mortgages

Tables 34-44 report the numbers and percent of homeowners with mortgages on their homes in 11 socioeconomic classifications. The tables report the number and percentage of homeowners in each particular socioeconomic group that have no mortgage, one mortgage, and two or more mortgages. Tables $45-55$ report the mortgage balances of homeowners. They show the mean and median mortgage balance for homeowners with one mortgage, two or more mortgages, and for all homeowners, including homeowners with no mortgage.

39 percent of homeowners have no mortgage (Table 34). Of those with mortgages, 89 percent have only one mortgage ( 55 percent of all homeowners). Only 6.5 percent of homeowners have two or more mortgages. The mean and median mortgage balance for homeowners with one mortgage are $\$ 60,900$ and $\$ 49,800$, respectively. The mean and median mortgage balances of homeowners with more than one mortgage are $\$ 71,900$ and $\$ 60,100$, respectively (Table 45).

Among age groups, both the percentage of homeowners with mortgages and the average mortgage balances are highest for households headed by persons age 25-34, with a mean of $\$ 71,400$ for those with one mortgage and $\$ 87,600$ for two or more mortgages (Tables 34 and 45). About 88 percent of homeowners in that age group have mortgages, and about 86 percent of those age 35-44. The proportion of homeowners with mortgages and the average mortgage balances decline with age for older age groups. Only 50 percent of homeowners age 55-64 have any mortgage. In that age group the mean and median mortgage balance for homeowners with a single mortgage are $\$ 45,300$ and $\$ 32,300$, respectively, while the mean and median balance for those with more than one mortgage are
$\$ 64,600$ and $\$ 47,800$. The proportion of homeowners with more than one mortgage increases with age up to age group 45-54, where 11 percent of homeowners have more than one mortgage, then declines at older ages. Less than one percent of homeowners age 75 or older have more than one mortgage, and only nine percent of that age group have one mortgage.

The share of households with mortgages and the average mortgage balance increase with income (Tables 35 and 46). Only 24 percent of homeowners with incomes less than $\$ 10,000$ have one mortgage, and only about one percent have more than one mortgage. The mean balance for homeowners in this income group with one mortgage is $\$ 30,000$. Among homeowners with incomes of $\$ 100,000$ or more, 83 percent have mortgages - 68 percent have one mortgage and 15 percent have two or more. The mean mortgage balance for those with one mortgage is $\$ 105,900$, and the mean for those with more than one is $\$ 99,200$. The largest share of all homeowners are in the $\$ 25,000-50,000$ income group - 36 percent (Table 2). In this group 58 percent have one mortgage, with a mean balance of $\$ 50,700$, and six percent have two or more mortgages with a mean balance of $\$ 59,100$. The age-income groups with the largest mortgage balance are age 25-34 with incomes of $\$ 75,000$ or more and age $35-44$ with incomes of $\$ 100,000$ or more (Tables 36 and 47). The mean and median mortgage balances for those groups exceed $\$ 100,000$.

Somewhat more male-headed households have mortgages (66 percent) than female (51 percent) (Table 37). The mean mortgage balance for male-headed households with mortgages is $\$ 63,800$, and for female-headed households $\$ 56,800$ (Table 48). White, black, and native American homeowners show approximately the same proportion of households with mortgages, about 60 percent (Table 38). Of those, a larger share of white (7 percent) than black (4 percent) homeowners have more than one mortgage. ${ }^{9}$ The mean balance for white homeowners with one mortgage is $\$ 61,100$ and two mortgages is $\$ 72,700$. The mean balance for black homeowners with one mortgage and with two mortgages is about $\$ 45,000$ (Table 49). While homeowners identified as Asian or Pacific islander represent only about two percent of total homeowners, about 82 percent have mortgages, and their average balances are considerable higher than those of other homeowners - mean and median for one mortgage of \$100,400 and \$97,000, respectively, and mean and median for two or more of \$113,700 and $\$ \$ 115,400$ respectively. 89.3 percent of homeowners are white, 8.3 percent black, 0.4 percent native American, and 2.1 percent Asian/Pacific islander.

A greater proportion of Hispanic than non-Hispanic homeowners have mortgages - about 69 percent of Hispanics vs. 61 percent of non-Hispanics (Tables 39, 40). Within each major racial group, there are not significant differences in average mortgage balances between Hispanic and non-Hispanic homeowners. Among white homeowners with one mortgage, Hispanics have a mean balance of $\$ 61,600$ and non-Hispanics have a mean balance of $\$ 61,100$. Among blacks with one mortgage, Hispanics have a mean balance of $\$ 43,400$ and non-Hispanics have a mean of $\$ 45,600$ (Table 51).

[^2]When homeowners are classified by income and race (Table 41) the same pattern of the proportion of homeowners with mortgages increasing with income (Table 35) is observed for both white and nonwhite homeowners. Within each income group, a greater proportion of nonwhite homeowners have mortgages than white homeowners. In each income group above $\$ 10,000$ a greater proportion of white homeowners have two or more mortgages than nonwhite homeowners. In income groups below $\$ 50,000$ whites have larger average mortgage balances than nonwhites, but above $\$ 50,000$, for homeowners with one mortgage, the average balances of nonwhites exceeds that of whites, and above $\$ 100,000$, for homeowners with more than one mortgage, the average balances of nonwhites exceeds that of whites (Table 52). The mean and median mortgage balance for nonwhite homeowners with incomes of $\$ 100,000$ or more and two or more mortgages is about $\$ 142,000 .{ }^{10}$

Table 42 shows homeowners with mortgages classified by age and race. For both white and nonwhite homeowners the proportion with mortgages peaks at age group 25-34 (88 percent for whites and 83 percent for nonwhites) then declines with age. The relative shares of the two racial groups with mortgages changes with age. For ages 25-44 the proportion of white homeowners with mortgages exceeds that of nonwhites. In ages 45-64 the proportions with mortgages in the two groups are essentially equal. For age groups 65 and older the proportion of nonwhite homeowners with mortgages exceeds that of whites. Much larger numbers and proportions of white homeowners than nonwhites have two or more mortgages. About 79 percent of all homeowners with two or more mortgages are white households ages 35-64. Table 53 shows average mortgage balances of homeowners by age and race. For homeowners with one mortgage there are not large differences in average mortgage balances by race. For homeowners with more than one mortgage the average balances of whites exceed nonwhites for all ages greater than $35 .{ }^{11}$

Both the proportion of homeowners with mortgages and the average mortgage balances increase with education up to four years of college (Tables 43 and 54). Only 38 percent of homeowners with no high school degree have any mortgage. The proportion increases to 77 percent for homeowners who completed four years of college and 76 percent for homeowners with more than four years. The proportion of homeowners with more than one mortgage also increases with education from two percent for those with no high school degree to ten percent for those with more than four

[^3]years of college. Average mortgage balances also increase with education. For homeowners with no high school degree, the mean balance for one mortgage is $\$ 38,200$ and for two or more mortgages is $\$ 45,000$. For homeowners who completed high school only, the mean balances are $\$ 47,300$ and $\$ 55,900$ respectively. For homeowners with more than four years of college, the mean balance for one mortgage is $\$ 82,900$ and for two or more mortgages is $\$ 87,600$.

Table 44 shows homeowners with mortgages by family structure, and Table 55 shows mortgage balances by family structure. Households most likely to have mortgages are those with minor children. Among married couple homeowner households with minor children, 87 percent have mortgages, 76 percent have one mortgage, and another 11 percent have two or more mortgages. 71 percent of single male head homeowner households with minor children have mortgages, and 74 percent of such households headed by single females have mortgages. Overall, 68 percent of married couple homeowners have mortgages, 62 percent of multi-person single male head homeowners and 57 percent of multi-person single female head homeowners have mortgages. Among single individual homeowners, 40 percent have mortgages.

The largest average mortgage balances are held by married couples with minor children - mean balances are $\$ 70,000$ for those with one mortgage and $\$ 78,400$ for those with two or more mortgages. Among all married couples, mean mortgage balances are $\$ 64,800$ for those with one mortgage and $\$ 74,000$ for those with two or more. Single male headed households with minor children have mean mortgage balances of $\$ 66,500$, and single female headed households with minor children have mean balances of $\$ 48,000$. The mean mortgage balance for single individual homeowners is $\$ 48,700$ for one mortgage and $\$ 51,400$ for two or more.

## Home Equity, Total Wealth, and Net Worth

Tables 56-66 and tables 67-77 report average home equity, total wealth, and net worth of U.S. households. Tables 56-66 show means and medians of these wealth variables over all U.S. households, including households which do not own homes. Tables 67-77 show these average wealth variables for homeowners only.

The mean net worth of all U.S. households in 1995 is about $\$ 97,000$, and the median net worth is about $\$ 41,000 .{ }^{12}$ Mean home equity for all households is $\$ 44,000$, accounting for about 45 percent
${ }^{12}$ The distribution of wealth is highly skewed, in that a relatively small proportion of households hold a large proportion of total wealth, with the net worth of households with the greatest wealth being many times greater than the median. The means of asset variables are sensitive to "outliers" or extreme values. That is, the presence of one or a small number of households in the sample with very high wealth may influence the value of the mean. The median is not sensitive to extreme values. The mean of net worth is significantly greater than the median for the population as a whole and for many socioeconomic groups. The mean may not reflect the asset holdings of typical households. The
of average net worth of all households. Median home equity is $\$ 18,000$. The ratio of median home equity to median net worth is about 0.44 . Mean net worth of all homeowner households is about $\$ 141,400$, considerably greater than that of all households, and median net worth of homeowners is $\$ 85,800$. For all homeowners mean home equity equals about 49 percent of net worth. For all homeowners the ratio of median home equity to median net worth is 0.58 . Mean total wealth, which equals net worth plus unsecured debt, for all households is $\$ 100,600$, and median total wealth is $\$ 44,500$. For homeowners mean total wealth is $\$ 145,600$ and median total wealth is $\$ 89,000$.

Average net worth for homeowners exceeds average net worth of all households not only because homeowners own homes, which are a large component of net worth, but because their non-home-equity wealth is greater as well. Mean net worth less home equity for all households is $\$ 52,800$, and mean net worth less home equity for homeowners is $\$ 72,700 .{ }^{13}$ This section focuses on the net worth of homeowners, referring to all households for comparison.

Average net worth increases with age, peaking in the age range 55-74 (Tables 56 and 67). Mean net worth is $\$ 10,600$ for all households with head age 18-24 and $\$ 31,500$ for ages $25-34$, rising to $\$ 156,500$ for ages $55-64$ and $\$ 160,600$ for ages $65-74$, then decreasing to $\$ 129,700$ for 75 and older. For homeowners, net worth rises from $\$ 30,600$ for ages 18-24 and \$60,900 for ages 25-34 to over $\$ 192,000$ for ages 55-64 and 65-74, then declines to $\$ 165,800$ for age 75 and older.

For homeowners the ratio of mean home equity to mean net worth has a $U$ shape as age increases, decreasing from 72 percent for ages 18-24, to 53 percent for ages 25-34 and 35-44, to about 45-47 percent for ages 45-74, then increasing to 52 percent for age 75 and older (Table 67). The ratio of median home equity to median net worth is fairly flat for ages 25 and older, varying between 0.53 and 0.59 . This suggests that for higher net worth households (which tend to influence the mean more than the median), home equity initially is a declining share of net worth as households age, up to age group 55-64, then increases as a share of net worth for older ages. This indicates that such homeowners accumulate non-housing wealth somewhat more than housing wealth after ages 35-44, then draw down their non-housing wealth more than their housing wealth after ages 65-74. Between ages 65-74 and ages 75 and older, mean net worth declines about $\$ 26,300$, and median net worth
divergence between the mean and the median is an indication of the skewness of the distribution of values of a variable.

Mean values of individual asset variables may be distorted by "top-coding", a limit on the values of selected asset and income variables that are reported in the public use database imposed to protect confidentiality. Top-coding will tend to reduce (bias downward) the estimated value of means. Topcoding does not affect the median for the total population or for most groups .
${ }^{13}$ The wealth of homeowners is included in the averages for all households. About two-thirds of all households are homeowners. If homeowners were to be compared to non-homeowners, the differences would be much greater.
declines about $\$ 20,000$, whereas mean home equity declines $\$ 5,000$ and median home equity declines $\$ 6,000$. For all households the ratio of mean home equity to mean net worth is fairly flat over the age groups, increasing slightly from 42-43 percent for younger ages to $44-48$ percent for middle to older ages (Table 56).

Home equity, net worth, and total wealth increase with income for all households (Table 57) and for homeowners (Table 68). Median net worth is $\$ 46,500$ and mean net worth is $\$ 72,100$ for homeowners with household income less than $\$ 10,000$ ( 6.5 percent of all homeowners), and median net worth is $\$ 67,200$ and mean net worth is $\$ 98,200$ for homeowners with income of $\$ 10,000-25,000$ (22.1 percent of homeowners). Median net worth is $\$ 152,300$ and mean net worth is $\$ 223,500$ for homeowners with incomes of $\$ 75,000-100,000$ ( 8.9 percent of homeowners) and median net worth is $\$ 250,000$ and mean net worth is $\$ 356,000$ for homeowners with incomes of $\$ 100,000$ or more (5.9 percent of homeowners). For all households with incomes less than $\$ 10,000$ median and mean net worth are $\$ 3,000$ and $\$ 28,900$, respectively. For all households with incomes of $\$ 100,000$ or more median and mean net worth are $\$ 233,500$ and $\$ 338,000$, respectively.

The ratio of mean home equity to mean net worth and the ratio of median home equity to median net worth both decline as income increases. Mean home equity equals 73 percent of mean net worth for homeowners with income less than $\$ 10,000$ and 61 percent for incomes of $\$ 10,000-25,000$, falling to 40 percent for incomes of $\$ 75,000-100,000$ and 34 percent for incomes of $\$ 100,000$ or more. The ratio of median home equity to median net worth for homeowners decreases from 0.86 for incomes less than $\$ 10,000$ and 0.68 for incomes of $\$ 10,000-25,000$ to 0.45 for incomes of $\$ 100,000$ or more. As income increases, other forms of wealth become an increasingly more important share of total wealth than home equity.

Net worth less home equity increases significantly as income increases. Mean net worth less home equity for homeowners rises from $\$ 19,800$ for homeowners with incomes less than $\$ 10,000$ to $\$ 38,300$ for incomes of $\$ 10,000-25,000, \$ 54,800$ for incomes $\$ 25,000-50,000, \$ 85,300$ for incomes $\$ 50,000-75,000, \$ 133,100$ for incomes $\$ 75,000-100,000$, and $\$ 234,100$ for incomes of $\$ 100,000$ or more (Table 68). As shown in Table 57, for all households mean net worth less home equity is smaller than for homeowners alone, but the proportional change as income increases is even greater.

Tables 58 and 69 show home equity, total wealth, and net worth by age and income. Among homeowners, age-income groups with median net worth greater than $\$ 100,000$ include age 25-34 with incomes of $\$ 100,000$ or more, age 35-44 with incomes of $\$ 75,000$ or more, age 45-54 with incomes of $\$ 50,000$ or more, age $55-74$ with incomes of $\$ 25,000$ or more, and age 75 and older with incomes of $\$ 10,000$ or more. ${ }^{14}$ Each of these age-income groups has median home equity of almost $\$ 60,000$ or more.

[^4]Homeowner households headed by males have greater net worth and somewhat greater home equity than those headed by females. Median net worth of male-headed homeowner households is $\$ 91,300$ vs. $\$ 73,800$ for female-headed homeowner households (Table 70). Home equity comprises a larger share of net worth of female-headed homeowners - the ratio of mean home equity to mean net worth is 54 percent for female-headed homeowners and 47 percent for male-headed homeowners. The ratio of median home equity to median net worth is 0.68 for female homeowners vs 0.57 for male homeowners. For all households the differences in net worth and home equity between male-headed households and female-headed households is much greater (Table 59), because far fewer femaleheaded households own homes (Table 4).

There are large differences in home equity and net worth by race (Tables 60 and 71). The mean net worth of white homeowners is about 2.5 times greater than that of black homeowners ( $\$ 148,000$ for white homeowners vs. $\$ 58,500$ for black homeowners). The median net worth of white homeowners is more than twice that of black homeowners ( $\$ 91,900$ vs. $\$ 44,200$ ). Home equity comprises a significantly larger share of net worth of black homeowners, about 72 percent, than of other racial groups. Mean net worth less home equity of white homeowners $(\$ 77,500)$ is almost five time greater than that of black homeowners $(\$ 16,600)$. For all households the proportional difference in net worth between white households and black households is even greater than for homeowners. For all households, the mean net worth of white households $(\$ 106,200)$ is 3.7 times greater than that of black households ( $\$ 28,800$ ). Among racial groups identified in the survey, the greatest net worth is reported for homeowner households headed by persons who identified themselves as Asian or Pacific islander - mean net worth is $\$ 195,000$ and median net worth is $\$ 138,000$.

By race and ethnicity (Tables 62 and 73), homeowner households headed by white nonHispanics have considerably greater home equity and net worth than those headed by white Hispanics. Mean net worth of white non-Hispanic homeowners is 1.8 times that of white Hispanic homeowners (Table 73). Home equity is a greater share of net worth for white Hispanic homeowners than for white non-Hispanic homeowners, so the difference in net worth less home equity between white non-Hispanic and Hispanic homeowners is even greater than the differences in net worth. There are not significant differences in home equity and net worth between white Hispanic homeowners and black Hispanic homeowners. For both home equity and net worth, the mean of white Hispanic homeowners is greater than that of black Hispanic homeowners, but the median of white Hispanics is less than that of black Hispanics. This suggests that both home equity and net worth are more equally distributed among black Hispanic homeowner households than they are among white Hispanic homeowner households. Black Hispanic homeowners have greater home equity and net worth than black non-Hispanic homeowners. For black non-Hispanic homeowners home equity is a greater share of net worth than for black Hispanic homeowners. Hispanic homeowner households have much greater mean and median home equity and net worth than all Hispanic households (Table 62), and the differences in home
equity and net worth between white non-Hispanic and white Hispanic households is greater for all households than it is for homeowner households. ${ }^{15}$

Tables 63 and 74 show home equity and wealth by household income and race of head of household. For all white and all nonwhite headed households and for white and nonwhite homeowners, home equity and net worth increase with income. The proportional changes in both home equity and net worth from the lower income groups to the higher income groups are greater for nonwhite homeowners than for white. The differences between lower and higher income households - both white and nonwhite - are much greater for all households than for homeowners. For all income groups, and for all households and homeowner households, households headed by whites have significantly greater home equity and wealth than those headed by nonwhites. In terms of home equity and net worth, nonwhite homeowners with incomes of $\$ 50,000-75,000$ are similar to white homeowners with incomes of $\$ 10,000-25,000$. For every income group home equity is a larger share of net worth for nonwhite homeowners than for whites.

Tables 64 and 75 show home equity and wealth by age and race of household head. For all age groups older than 24 years, home equity and wealth of white headed households exceeds that of nonwhites. ${ }^{16}$ The differences between whites and nonwhites are much greater for all households (Table 64) than for homeowners (Table 75). As was indicated for house values and home equity (Tables 20 and 31), the differences in wealth between white and nonwhite homeowners are smaller for younger age groups. Median net worth for nonwhite homeowners ages 65 and older is about 43 percent that of white homeowners, while for ages $35-44$ it is 69 percent and for ages $25-34$ it is 77 percent. For both white and nonwhite homeowners, home equity and net worth increase with age, peak in age groups 5574 , then decline for age 75 and older. Mean net worth for white homeowners age 55-74 is about $\$ 200,000$, and median net worth is $\$ 135,00-139,000$. Mean net worth for nonwhite homeowners in those ages is over $\$ 100,000$, and the median is $\$ 59,000-67,000$.

Home equity and wealth increase with education of household head (Tables 65 and 76). Net worth for homeowners with more than four years of college is twice that of homeowners with only a high school degree. Net worth and total wealth increase relatively more with educational attainment than home equity, so home equity comprises a smaller share of net worth for homeowners with greater education. Mean net worth less home equity is $\$ 37,500$ for homeowners with no high school degree and $\$ 54,200$ for those with a high school degree only and $\$ 141,300$ for those with more than four years of college.

[^5]Tables 66 and 77 show home equity and wealth by family structure of the household. Married couple households have the greatest home equity and wealth, but married couples with minor children only have significantly less home equity and wealth than other married couples. Married couple homeowners with no other household members have median net worth of about $\$ 123,000$, while married couple homeowners with minor children have median net worth of $\$ 69,400$. Median net worth of single person homeowners living alone is $\$ 73,100$, for single male household heads, $\$ 71,400$, and for single female household heads, $\$ 61,900$. Single female-headed households with minor children have the lowest wealth. Median net worth of single female homeowners with minor children is $\$ 32,800$, and median net worth for all single female-headed households with minor children is $\$ 2,900$. Median net worth of all single females living alone is about $\$ 28,800$, and median net worth of all single males living alone is $\$ 16,000$.

## Assets

Tables 78-88 report average levels of several types of assets for homeowner households. The tables report mean and median home equity, equity in other real estate, vehicle equity, equity in own businesses, net financial assets ${ }^{17}$, and total wealth of homeowners. Because the focus of this report is homeowners, these tables include only homeowners.

The means and medians for each type of asset reported in these tables are means and medians over all homeowners. For each type of asset, other than home equity, the means and medians include many households which do not own that asset (i.e., whose holdings are zero). Equity in some assets for some households is negative, when the debt secured by that asset exceeds the asset's market value. Net financial assets are negative for many households whose unsecured debts exceed the gross value of their financial assets.

For most homeowners the home is the largest asset they own. Median home equity of homeowners is $\$ 50,000$, and mean home equity is $\$ 68,600$. Mean equity in other real estate for all

[^6]homeowners is $\$ 15,000$. Fewer than half of homeowner households own other real estate, so the median equity is zero. ${ }^{18}$ Mean equity in vehicles is $\$ 10,100$, and median equity is $\$ 7,800$. Mean equity in own businesses is $\$ 7,600$, while median own business equity is zero. ${ }^{19}$ Mean net financial assets is about $\$ 40,000$, and median net financial assets is $\$ 5,300$. Equity in other real estate, own businesses, and net financial assets is much more unevenly distributed than equity in a home or vehicles.

Table 78 shows assets of homeowner households by age of household head. Most asset values increase with age, peak in the age range 45-74, then decline. Home equity is greatest in ages 55-74, with means of $\$ 87,000-91,000$ and medians of $\$ 70,000-71,000$. Other real estate peaks at ages 55-64 with mean of $\$ 27,700$. Vehicle equity is relatively flat across ages $25-74$, with means of $\$ 9,600-11,800$ and medians of $\$ 6,800-9,300$. Equity in an own business peaks at ages $45-54$ with mean of $\$ 12,400$. Net financial assets are greatest for the age group 65-74, with mean of $\$ 69,400$ and median of $\$ 20,400$. Mean net financial assets exceed $\$ 40,000$ for all age groups 45 and older, and median net financial assets exceed $\$ 13,000$ for age groups 55 and older. Mean net financial assets are negative for the youngest age group, indicating that on average their unsecured debts exceed their gross financial assets. Median net financial assets for this group are zero. ${ }^{20}$ Total wealth is highest in ages 55-74, with means of $\$ 194,000-196,000$ and medians of $\$ 126,000-131,000$.

Table 79 reports assets of homeowner households by total household income. Each asset class increases substantially with income. The mean value of other real estate is $\$ 29,100$ for homeowners with incomes of $\$ 75-000-100,000$, and $\$ 51,200$ for incomes of $\$ 100,000$ or greater. Mean own business equity is $\$ 26,600$ for homeowners with incomes of $\$ 100,000$ or more. Mean net financial assets are $\$ 45,600$ for homeowners with incomes of $\$ 50,000-75,000, \$ 75,400$ for incomes of $\$ 75,000-100,000$, and $\$ 138,800$ for incomes of $\$ 100,000$ or more. ${ }^{21}$ Median net financial assets are $\$ 26,700$ for incomes of $\$ 75,000-100,000$ and $\$ 50,000$ for homeowners in the top income range. Median total wealth is $\$ 105,800$ for homeowners with incomes of $\$ 50,000-75,000, \$ 158,000$ for incomes of $\$ 75,000-100,000$, and $\$ 255,300$ for incomes of $\$ 100,000$ or more.

[^7]Table 80 shows average asset values of homeowners by age and income. Most asset types increase with age, and within age groups, increase with income. The discussion above of home equity identified 10 age-income groups with median home equity greater than $\$ 90,000$ : age $35-44$ with incomes of $\$ 100,000$ or more, age $45-54$ with incomes of $\$ 100,000$ or more, age 55-64 with incomes of $\$ 75,000$ or more, age 65-74 with incomes of $\$ 50,000$ or more, and age 75 and older with incomes of $\$ 50,000$ or greater. All but one of these also has median net financial assets of $\$ 51,000$ or more and mean net financial assets of $\$ 100,000$ or more ( most have median net financial assets of $\$ 70,000$ or more). The exception, homeowners age $35-44$ with income of $\$ 100,000$ or more, has median net financial assets of about $\$ 35,000$ and mean of about $\$ 74,000 .{ }^{22}$ The highest net financial assets (median greater than $\$ 100,000$ ) are held by ages $65-74$ with incomes greater than $\$ 75,000$ and ages 75 and older with incomes greater than $\$ 50,000$.

Table 81 shows asset types by gender of head of household. Male-headed homeowner households have greater assets of each type. Male-headed households have median net financial assets of $\$ 6,200$ and mean assets of $\$ 42,900$, while female-headed households have median of $\$ 3,500$ and mean of $\$ 33,500$. The greatest proportional difference between the two is for equity in own businesses.

Table 82 shows that there are large disparities in assets by race. White-headed households and Asian-headed households have similar levels of vehicle equity and net financial assets. White homeowners have median net financial assets of $\$ 7,100$ and mean of $\$ 43,400$. Black homeowners have median net financial assets of zero, that is, fewer than half of black homeowners have any net financial assets, and have mean net financial assets of $\$ 3,400$. Black homeowners have mean equity in own businesses of $\$ 1,100$, in contrast to white homeowners, which have $\$ 8,100$. The highest equity in own businesses is held by Asian homeowners, which have mean equity of $\$ 13,500$. Asian homeowners also have the highest equity in other real estate, with mean of $\$ 27,000$.

Table 83 shows assets by ethnicity of household head, and Table 84 shows assets by race and ethnicity. Non-Hispanic homeowners have greater average assets of all types than Hispanic homeowners (Table 84). All non-Hispanic homeowners have median net financial assets of $\$ 6,000$ and mean of $\$ 41,700$, while Hispanic homeowners have median of $\$ 200$ and mean of $\$ 11,300$. White Non-Hispanic homeowners have median net financial assets of $\$ 8,100$ and mean of $\$ 45,000$. Among black homeowners, Hispanics have greater assets of all types than non-Hispanics. Black Hispanic homeowners have mean net financial assets of $\$ 7,900$, while black non-Hispanic homeowners have mean net financial assets of $\$ 3,000$.

[^8]Table 85 shows assets by income and race. In every income group, whites have significantly greater assets of every type, except vehicles and other real estate among higher income groups. Even in the highest income groups, white homeowners have about twice the average levels of net financial assets than nonwhite homeowners and about three times the mean equity in own businesses.

Table 86 shows assets by age and race. For ages older than 24, white homeowners have larger assets of every type in every age group, except other real estate for ages 25-34 and vehicles for ages $18-24 .{ }^{23}$ The apparent narrowing of the gap in average home equity at younger age groups noted earlier, does not appear for other asset types except vehicles. Median net financial assets of nonwhite homeowners are quite low in every age group.

Table 87 shows assets of homeowner households by educational attainment of head. All asset types increase with education. There is a large disparity in net financial assets by education. Median net financial assets of homeowner households headed by persons without a high school diploma is $\$ 1,000$, with only a high school education is less than $\$ 3,000$, and with less than four years of college is $\$ 5,000$. Median net financial assets for homeowners with four years of college is almost $\$ 17,000$ and for those with more than four years of college almost $\$ 29,000$. There are also large disparities in equity in own businesses by education. Median total wealth of homeowners with four years of college is $\$ 119,000$ and of those with more than four years of college, $\$ 160,000$.

Table 88 shows assets by family structure of homeowner households. In general, married couple households have greater assets than other types of households, except that married couples with minor children have lower net financial assets than single individuals. Households with minor children, whether headed by married couples or single persons, have lower net financial assets than other types of households. Single-female-headed households with minor children have median net financial assets of zero and mean net financial assets of \$9,800. In general, homeowner households of all family types have greater average assets than all households of the same type. For example, median net financial assets for all individual male households is $\$ 700$, for all individual females, $\$ 1,100$, and for all married couples with minor children, $\$ 600$.

## Debts

Tables 89-99 report average amounts of various types of debts for homeowner households. They show mean and median mortgage balance, other secured debt, total secured debt, unsecured debt, and total debt. ${ }^{24}$ These tables also show mean and median total household income for each group

[^9]of homeowner households, and the mean and median of the ratios of household total debt to total income.

The median mortgage balance for all homeowner households is $\$ 18,000$ and the mean mortgage is $\$ 37,900$. Median other secured debt of homeowners is almost zero, and mean other secured debt is $\$ 8,900$. Total secured debt, which is the sum of the mortgage balance and other secured debt, has a median of $\$ 25,000$ and a mean of $\$ 46,800 .{ }^{25}$ Median unsecured debt is $\$ 500$ and mean unsecured debt is $\$ 4,200$. Homeowners have median total debt of $\$ 28,700$ and mean total debt of $\$ 51,000$. The median household income of homeowner households is almost $\$ 39,000$ and the mean income is $\$ 45,300$. For all homeowner households the median of the ratios of total debt to income is 0.7 , but the mean of the ratios of debt to income is 1.3. ${ }^{26}$

Table 89 shows debts of homeowner households by age of head. Mortgage debt is the largest debt of most homeowners and accounts for about three-fourths of the total debt of all homeowners and more than half the debt of each age group as well. Mortgage debt is greatest for age group 25-35, and total debt is greatest for this age group, with mean total debt of $\$ 77,500$ and median of $\$ 69,400$. After ages 25-34 mortgage debt declines with age, and total debt does as well. However, mean other secured debt increases with age up to ages 45-54, then declines at older ages, and mean unsecured debt is relatively flat over ages $25-54$, then declines. So, total debt decreases relatively less with age than mortgage debt alone. Therefore, the ratio of average mortgage debt to average total debt declines for ages older than 25-34. Mean mortgage debt equals about 82 percent of mean total debt for ages $25-34$, then declines to 77 percent for ages $35-44,71$ percent for ages $45-54$, and down to 56 percent for ages 75 and older. The ratio of median mortgage debt to median total debt is .84 for ages 25-34 and also declines with age.

Total household income of homeowners increases with age, peaking in age group 45-54, then decreases with age for older groups. Mean household income is $\$ 32,200$ for homeowner households age $18-24$, increasing to $\$ 57,500$ for homeowners age $45-54$, then decreasing to $\$ 23,800$ for homeowners age 75 and older. ${ }^{27}$ Median income is $\$ 28,400$ for ages $18-24$, increasing to $\$ 51,400$ for
includes unpaid bills, unsecured bank or credit union loans, credit card balances, medical bills not covered by insurance, money owed to private individuals, and all other unsecured debts.
${ }^{25}$ The mean of the sum of two variables equals the sum of the means, but the median of the sum does not in general equal the sum of the medians.
${ }^{26}$ The median of the ratios of debt to income of each household is not the same as the ratio of median debt to median income, and the mean of the ratios of debt to income is not the same as the ratio of mean debt to mean income.
${ }^{27}$ Average household income for all households is lower than that of homeowner households for virtually every socioeconomic group.
ages 45-54, then decreasing to $\$ 18,200$ for age 75 and older. The average ratios of debt to income initially increase then decline from younger to older ages. The mean of the ratios of debt to income is 1.6 for ages $18-24$, increasing to 1.8 for $25-34$ and 1.9 for $35-44$, than declining to 0.2 for 75 and older. The median of the ratios of debt to income follows a slightly different pattern, increasing from 1.3 for ages 18-24 to 1.6 for ages 25-34, then declining to zero for ages 65 and older.

As shown in Table 90, total debt of homeowner households and each of its components increase with income. Homeowners with incomes less than $\$ 10,000$ have mean mortgage debt of $\$ 7,900$ and mean total debt of $\$ 11,600$. Homeowners in this income group have median mortgage and median total debt of zero (less than half of the homeowners in each of the lowest two income groups have mortgage debt). Those with incomes of $\$ 100,000$ or more have mean mortgage debt of $\$ 86,300$ and mean total debt of $\$ 124,800$, median mortgage debt of $\$ 80,500$ and median total debt of $\$ 108,100$. While all forms of debt increase with income, there is no clear pattern in the relationships among the various components of debt and between debt and income as income increases. The mean of the ratios of debt to income declines as income increases from the group with incomes of $\$ 10,000$ or less, to the group with incomes of $\$ 10,000-25,000$. The mean of the ratios of debt to income then increases with income up to incomes of $\$ 50,000-75,000$, where it is 1.21 , then declines at higher incomes. There is also no clear pattern in the ratio of mortgage debt to total debt. Mean mortgage debt accounts for about 74 percent of mean total debt for all homeowners. The ratio does not vary significantly across the income classes, first increasing from 0.68 for the income group with less than $\$ 10,000$ to 0.74 for the group $\$ 10,000-25,000$. It then varies little as income increases up to the group of incomes of $\$ 100,000$ or more, where it declines to 0.69 . The ratio of median mortgage debt to median total debt for all homeowners is 0.63 .

Table 91 shows debts of homeowners by age of head and household income. It reveals the same patterns shown in Tables 89 and 90. For virtually every age-income group mortgage debt is the largest component of total household debt. For all groups, except age 75 and older with incomes of $\$ 50,000-100,000$, mortgage debt is over half of total debt. For those two groups, other secured debt exceeds mortgage debt. Within each age group, mortgage debt rises with income. Although not pronounced, there is perhaps a slight pattern in the ratio of mean mortgage debt to mean total debt for age-income groups. For younger groups (ages 18-54) mean mortgage debt as a proportion of mean total debt rises with income and peaks at incomes of $\$ 75,000-100,000$, then declines. For older groups ( 55 and older) mean mortgage debt as a proportion of mean total debt declines as income increases.

Tables 92-95 show homeowners debt by gender, race, and ethnicity of head of household. Male-headed households have larger debt of all forms than female-headed households (Table 92). Male-headed households also have greater home equity and other assets, and greater average incomes. The average ratios of total debt to income are larger for male homeowners. The median of the ratios of debt to income for male homeowners is 0.8 , while the median ratio for females is 0.4 . The mean debt-to-income ratio for males is 1.4 , while the mean for females is 1.2

Mortgage debt accounts for more than three-quarters of total debt for each racial group (Table 93). Asian homeowners have somewhat higher ratios of mortgage debt to total debt than other races and higher average ratios of debt to income. Hispanic homeowners have somewhat higher average ratios of debt to income than non-Hispanic homeowners and slightly higher ratios of mortgage debt to total debt (Tables 94 and 95). Among blacks, Hispanic homeowners have a lower ratio of debt to income and lower ratio of mortgage debt to total debt than black non-Hispanic homeowners.

Table 96 shows homeowners debts by income and race. For incomes less than $\$ 25,000$, white homeowners appear to have higher mean ratios of total debt to income, but above $\$ 25,000$ nonwhite homeowners have higher ratios. For all homeowners and for all income groups except $\$ 50,000-75,000$ mortgage debt is a larger share of total debt for nonwhite homeowners than for whites.

Table 97 shows debts by age and race of homeowners. Mortgage debt is over half of total debt for every age-race group and is a greater proportion of debt for younger groups of both races than older. For younger ages, ratios of total debt to income are greater for white homeowners than nonwhite, while for older ages, especially over 65 , total debt to income is greater for nonwhites.

Table 98 shows debts by education of homeowners. For each education group mortgage debt accounts for about three-quarters of total debt. The average ratios of debt to income increase with education up to four years of college, then decline beyond that.

Table 99 shows debts of homeowners by family structure of the household. Married couple households have the highest average mortgage debt and highest total debt. Married couples with no other persons in the household have significantly lower levels of debt and lower debt-to-income ratios than other married couples. Homeowners with minor children have the highest levels of mortgage debt and of total debt and the highest debt-to-income ratios. The mean debt-to-income ratio for each group of homeowners with minor children is greater than two, and the median for each group with children is greater than one. The mean debt-to-income ratio for single female homeowners with minor children is 2.6 , and the median debt-to-income ratio is 1.4.

## Ownership of Stocks and Mutual Funds, IRAs and Keogh Accounts, and 401(k) Accounts

Tables 100-121 report direct ownership of stocks and mutual funds of all households and of homeowner households by each of the 11 socioeconomic classifications. The tables show the number of households which directly own stock or mutual funds ${ }^{28}$, the percentage of households in each particular socioeconomic group that own stock directly, and the mean and median equity in stock or

[^10]mutual funds for households owning stock. The tables also show the mean and median stock equity over all households in the group, including households that own no stock. To permit easy comparisons, in this set of tables, for each socioeconomic group, the first table shows stock ownership for all households, both homeowners and non-homeowners (all households that own stock and all households), and the following table shows stock ownership for homeowner households alone (homeowner households that own stock and all homeowner households). This permits analysis of how the stock ownership patterns of homeowners compares to that of the population as a whole.

Tables 122-143 report ownership of IRA and Keogh accounts of all households and of homeowner households by each of the 11 socioeconomic classifications. The tables show the number of households which hold IRAs and/or Keoghs, the percentage of households in each particular socioeconomic group that hold IRAs or Keoghs, and the mean and median balance in IRAs and Keoghs for households with IRAs or Keoghs. The tables also show the mean and median IRA/Keogh balance over all households in the group, including households that have no IRAs or Keoghs. This set of tables also presents, for each socioeconomic classification, first a table showing IRA/Keogh ownership for all households, both homeowners and non-homeowners (all households that hold IRA/Keoghs and all households), followed by a table showing IRA/Keogh ownership for homeowner households alone (homeowner households that hold IRAs or Keoghs and all homeowner households).

Tables 144-165 report ownership of $401(\mathrm{k})$ accounts of all households and of homeowner households by each of the 11 socioeconomic classifications. The tables show the number of households which hold $401(\mathrm{k}) \mathrm{s}$, the percentage of households in each particular socioeconomic group that hold $401(\mathrm{k}) \mathrm{s}$, and the mean and median balance in $401(\mathrm{k}) \mathrm{s}$ for households with $401(\mathrm{k}) \mathrm{s}$. The tables also show the mean and median 401(k) balance over all households in the group, including households that have no $401(\mathrm{k}) \mathrm{s}$. This set of tables also shows, for each socioeconomic classification, first 401(k) ownership for all households, both homeowners and non-homeowners (all households that hold 401(k)s and all households), and then 401(k) ownership for homeowner households alone (homeowner households that hold 401(k)s and all homeowner households).

Tables 166-187 report direct and indirect ownership of stocks and mutual fund shares by all households and by homeowner households, classified in the 11 socioeconomic classifications. Direct ownership refers to all stock and mutual funds held by members of the household other than those in IRAs, Keogh Accounts or $401(\mathrm{k})$ plans. ${ }^{29}$ Indirect ownership refers to stock and mutual fund shares held in IRAs and Keogh accounts. ${ }^{30}$ Each table shows the number of households in each group reporting direct ownership of stock, the percentage of all households in that socioeconomic group that own stock directly, the number of households in each group reporting holding stock in IRAs or Keoghs,

[^11]the percentage of all households in that socioeconomic group holding stock in IRAs or Keoghs, the number of households in each group reporting direct and/or indirect ownership of stock, and the percentage of all households in that socioeconomic group that own stock directly or indirectly. This set of tables also shows, for each socioeconomic classification, first direct and indirect stock ownership for all households, both homeowners and non-homeowners, and then direct and indirect stock ownership for homeowner households alone.

Tables 188-193 show the average (mean and median) reported market value of stocks held directly by households that own stocks, the average reported margin debt on those stocks, and the average equity in stocks. These estimates are shown for households classified by age of head (Tables 188-189), total household income (Tables 190-191), and cross-classified by the age-income classes (Tables 192-193). For each of these groups, there is a table for all households that own stock and a table for homeowner households. Most households that own stock have no margin debt, so the average margin debt over all households is small for most groups. (There were only 77 households in the sample that reported margin debt.)

Tables B and C bring together data for all households and for all homeowners on ownership of stocks and mutual funds, IRAs and Keoghs, and 401(k) accounts. In 1995, 18.4 million households owned stocks or mutual funds directly, 18.6 percent of all households (Table B). ${ }^{31}$ For households holding stocks or mutual funds, median holdings are $\$ 12,000$, and mean holdings are $\$ 46,000$. Averaged over all households, mean direct stock and mutual fund holdings are $\$ 8,500$ per household. A greater number of households have IRAs or Keogh accounts, 23.3 million in 1995, 24 percent of all households. The median holdings of households with IRAs or Keoghs is $\$ 15,000$, and mean holdings is $\$ 29,300$. 22.6 million households have $401(\mathrm{k})$ accounts in 1995, 22.6 percent of all households. Their median holdings are $\$ 12,000$, and mean holdings are $\$ 23,200$. While median holdings of stocks, IRA/Keoghs, and 401(k)s are similar, mean holdings of stocks is significantly greater than mean values for IRA/Keoghs or $401(\mathrm{k}) \mathrm{s}$, indicating that the distribution of the value of stock equity is much more skewed (uneven) than the values of IRA/Keoghs or $401(\mathrm{k}) \mathrm{s}$.

A larger proportion of homeowners hold stocks, IRA/Keoghs, and 401(k)s than of all households, and their average holdings are greater. 15.3 million homeowners own stocks and mutual funds, 24 percent of all homeowners (Table C). For homeowners owning stocks and mutual funds, the median equity owned is $\$ 14,000$ and the mean is about $\$ 50,000$. Averaged over all homeowners, mean stock equity is $\$ 12,000$. (Since fewer than half own stock, the median over all homeowners is zero.) 20 million homeowners have IRAs or Keoghs, 31.5 percent of all homeowners. For homeowners who own IRAs or Keoghs, median holdings are $\$ 16,500$, and mean holdings are $\$ 31,600.16 .8$ million homeowners have $401(\mathrm{k}) \mathrm{s}, 26$ percent of homeowners. Their median holdings are $\$ 14,000$ and mean holdings are $\$ 26,000$. Comparison of median and mean values of the three

[^12]assets for homeowners indicates that stock values are more unevenly distributed over stock holders than IRA/Keoghs or 401(k)s are distributed over holders of IRA/Keoghs or 401(k)s.

TABLE B

DIRECT OWNERSHIP OF STOCKS AND MUTUAL FUNDS, IRA/KEOGHS, AND 401(K)S OF ALL HOUSEHOLDS

|  | Households Which Own the Asset |  |  |  | All Households <br> Average Equity of All Households |  |

Source: Capital Research Associates analysis of 1995 Survey of Income and Program Participation (SIPP) data
Table D shows direct ownership and indirect ownership in IRAs and Keogh accounts of stocks and mutual funds for all households and for homeowners. In addition to the 18.4 million households which own stock directly, 13.1 million hold stock in IRAs or Keoghs. Many households hold stock both directly and in IRA/Keoghs. Altogether, 25.9 million households own stock directly and/or in IRA/Keoghs. ${ }^{32} 15.3$ million homeowners ( 24.1 percent of all homeowners) own stock directly and
${ }^{32}$ Households also hold stock in $401(\mathrm{k})$ accounts. The database analyzed for this study did not include data on the asset allocation of $401(\mathrm{k}) \mathrm{s}$. Analysis by the Employee Benefit Research Institute (EBRI) and the Investment Company Institute (ICI) of data on $401(\mathrm{k})$ participants, contributions, plan balances, and asset allocation in a database they collected from some of their members indicates that in 1996 about two-thirds of $401(\mathrm{k})$ plan balances were invested directly or indirectly in equity securities, and in 1998 about three-fourths of plan balances where invested directly or indirectly in equities. The 1996 database covered about 6.6 million participants in 27,762 plans, and the 1998 database covered about 7.9 million participants in 30,102 plans. See Jack VanDerhei, Russell Galer, Carol Quick, and John Rea, "401(k) Plan Asset Allocation, Account Balances, and Loan Activity," Investment Company Institute Perspective, Vol. 5 No. 1, January 1999; and Sarah Holden, Jack VanDerhei, and Carol Quick, "401(k) Plan Asset Allocation, Account Balances, and Loan Activity in 1998," Investment Company Institute Perspective, Vol. 6 No. 1, January 2000.

Based on analysis of the Survey of Consumer Finances, collected by the Federal Reserve Board, Federal Reserve staff estimated that 40 percent of all families held stock directly or indirectly in 1995 and 49 percent in 1998. Arthur B. Kennickell, Martha Starr-McCluer, and Brian J. Surette,
11.2 million homeowners (17.6 percent) hold stock in IRAs or Keoghs. 21.5 million homeowners (33.7 percent) hold stock directly and/or indirectly.

Tables 100 and 101 show direct stock ownership and equity by age of head of households for all households and for homeowners. The proportion of an age group owning stock increases with age up to age group 45-54, then is relatively constant before declining for ages 75 and older. In the age groups 45-74, 25 to 28 percent of homeowners own stock. The largest average stock values are held by ages $65-74$, with median of $\$ 22,400$ for homeowners, and ages 75 and older, with median of $\$ 28,000$.

Tables 122 and 123 show IRA and Keogh account holdings by age of household head for all households and for homeowners. The proportion of households with IRAs or Keoghs also increases with age, peaking in age group 55-64. In age groups 45-74, 36 to 43 percent of homeowners have IRAs or Keoghs. The highest IRA/Keogh balances of homeowners are in ages 55-64, median of $\$ 22,000$, and ages $65-74$, median of $\$ 27,000$.

1. Percent of all households of that group that hold stock or mutual fund shares.

Source: Capital Research Associates analysis of 1995 Survey of Income and Program Participation (SIPP)

The age distribution of $401(\mathrm{k})$ accounts differs somewhat from that of stocks and IRA/Keoghs (Tables 144, 145). $401(\mathrm{k})$ ownership is highest in ages $25-54$, where $37-38$ percent of homeowners have $401(\mathrm{k})$ s. (27-32 percent of all households). The largest average $401(\mathrm{k})$ balances of homeowners are for ages $45-54$ (median of $\$ 18,000$ ), ages 55-64 (median of $\$ 20,000$ ), and ages 75 and older (median of $\$ 28,000$ ), but only two percent of homeowners age 75 and older have $401(\mathrm{k})$ s.

Tables 166 and 167 show direct and indirect stock ownership by age of household head. Direct stock ownership of homeowners is highest in ages 45-74 (25-28 percent). Ownership of stocks in IRA/Keoghs is highest for ages 45-64 (22-25 percent). Altogether, one-third or more of homeowners in age groups 35-74 own stocks directly or indirectly in IRA/Keoghs. 41 percent of homeowners age 45-54 own stock directly or indirectly.

Tables 102 and 103 show direct stock ownership by household income for all households and for homeowners. Stock ownership is closely associated with income. The percent of households owning stock and average stock equity increase with income. Only seven percent of homeowners with incomes less than $\$ 10,000$ own stocks, and the median equity holdings are $\$ 5,000$. Thirty percent or more of all households and of homeowners in income groups over $\$ 50,000$ own stock. Over 50 percent of all households and of homeowners with incomes of $\$ 100,000$ or more own stocks. The
median stock holdings in this income group are $\$ 20,000$, and the mean stock equity of homeowners in this income group is $\$ 89,000$.

Tables 124 and 125 show IRA and Keogh holdings by household income. IRA/Keogh ownership is closely related to income, increasing from six percent of homeowners with incomes of $\$ 10,000$ or less to 68 percent with incomes of $\$ 100,000$ or more. Median balances of homeowners are $\$ 13,000$ to $\$ 16,000$ for income groups up to $\$ 75,000$, then increase to $\$ 26,000$ for incomes of $\$ 100,000$ or more.

Tables 146 and 147 report 401(k) participation and balances by income group. 401(k) participation and balances also are closely associated with income. 401(k) participation increases from two percent of homeowners with incomes of $\$ 10,000$ or less to 24 percent of those with $\$ 25,000$ $50,000,42$ percent for those with $\$ 50,000-75,000$, and over 49 percent for incomes greater than $\$ 75,000$. The median $401(\mathrm{k})$ balances of homeowners range from $\$ 6,500$ for incomes less than $\$ 10,000$ to $\$ 37,500$ for incomes of $\$ 100,000$ or more.

Direct and indirect stock ownership also increases with household income (Tables 168 and 169). Only five percent of all households and nine percent of homeowners with incomes of $\$ 10,000$ or less own stock directly and/or indirectly in IRA/Keoghs, while 70 percent of all households and 71 percent of homeowners with incomes of $\$ 100,000$ or more own stock directly or indirectly.

Tables 100-187 also show stock and mutual fund, IRA and Keogh accounts, and 401(k) plan ownership and balances for households and homeowners cross-classified by age and income, by gender, race, ethnicity, and education of household head, and by family structure of the household. Some aspects of the distribution of stock, IRA/Keogh, and 401(k) ownership include the following:

- There are large disparities by race in stock ownership (Tables 108, 109) and IRA/Keogh holdings (Tables 130, 131). A much larger proportion of whites own stock ( 26 percent of homeowners) than blacks ( 7 percent), and their mean and median equity holdings are three times as great. For 401(k)s racial disparities exist but are less (Tables 152, 153).
- There are similarly large disparities by ethnicity in stock ownership (Tables 110-113) and IRA/Keogh holdings (Tables 132-135). For 401(k)s ethnic differences are less pronounced (Tables 154-157).
- Differences in stock ownership and average balances and in IRA/Keogh holdings and balances by race are significant at every income level (Tables $114,115,136,137$ ). The differences are less pronounced at higher income levels and are somewhat less for homeowners than all households.
- For $401(\mathrm{k}) \mathrm{s}$ there are not significant differences by race when households are stratified by income (Tables 158,159 ). Overall racial differences can be explained almost entirely by differences in income class distribution between whites and nonwhites.
- By education there are big differences in stock ownership (Tables 118, 119), IRA/Keogh holdings (Tables 140, 141) and 401(k) participation (Tables 162, 163). Ownership proportions and equity values are significantly larger for households and homeowners with more education. For example, 18 percent of homeowners with only a high school education own stock, while 40 percent of those with four years of college and 44 percent of those with more than four years own stock.
- There are differences by family structure in ownership of stocks (Tables 120, 121) IRA/Keoghs (Tables 142, 143), and 401(k)s (Tables 164, 165). Married couples are more likely to own stock and have larger average balances than single person households, except that married couples with minor children are less likely to own stock and own less than other married couples. Single females with children have the lowest ownership rates and smallest amounts.
- Differences in stock ownership by family structure are greater for all households than for homeowners. Differences between married couple households and those headed by single persons are even greater for IRA/Keoghs (Tables 142, 143) than for stocks.
- For $401(\mathrm{k}) \mathrm{s}$, married couples with minor children have higher participation rates than other married couples, and single males with minor children have higher participation rates than other single-male-headed households. This is particularly true for homeowners, for which single females with minor children also have higher participation rates than other single-female-headed homeowners.

## POTENTIAL ADDITIONAL RESEARCH

One purpose of the proposed products is to assist homeowners to invest in stock markets. To better understand how to achieve this objective, it may be useful to refine the analysis of the economic characteristics of households and focus on households with particular relevant economic characteristics. Two sets of economic characteristics of households of particular interest are levels of home equity and stock ownership. As follow-up to the analysis described in this report, it may be useful to focus on homeowners with specified levels of home equity and homeowners with specified levels of stock equity.

## Home Equity

The target market for the products are households with sufficient home equity and with an inclination to invest. It would be useful to know how many homeowners there are with home equity above specified levels and what the characteristics of those homeowners are, in terms of location, employment, income, demographic characteristics, stock ownership, and other characteristics. The data set developed for this project could be used to identify and characterize such households. This could be done by stratifying the sample of households by levels of home equity and then analyzing the characteristics of households in various home equity classes. For example, homeowners in the sample could be stratified by levels of home equity in specified ranges, such as:
\$0-50,000
\$50,000-99,999
$\$ 100,000$ and greater.

As an alternative, homeowners could be stratified by quintiles of home equity: lowest fifth to highest fifth.

For each class of homeowner, classified by levels or quintiles of home equity, we could analyze their socioeconomic characteristics, including the following:

## Socio-demographic characteristics

- age of head
- sex of head
- race of head
- ethnicity
- size of household
- family structure of household
- region of country

## Economic characteristics

- household income
- employment
- occupation
- net worth
- value of house
- number of mortgages
- mortgage balance
- types and values of assets
- types and levels of debts
- net financial assets
- ownership and value of stocks and mutual funds
- ownership and value of IRAs and Keogh accounts
- ownership and value of $401(\mathrm{k})$ accounts

## Stock Ownership and Value

It would be useful to know how many homeowners own stock or mutual funds greater than specified values and what the characteristics of those homeowners are. Homeowners could be classified by the levels of stock equity they own. All households or homeowners could be classified by value of stock equity in ranges such as $\$ 0-49,999, \$ 50,000-99,999, \$ 100,000$ or greater.
Households could also be sorted by quintiles of stock equity. For each stock equity class or quintile, we could analyze socioeconomic characteristics such as those listed above.

The analysis could be refined by cross-classifying households by home equity and stock equity. For example, the three home equity classes and the three stock equity classes identified would generate nine home equity-stock equity classes: households with \$0-49,999 of home equity and \$0-49,999 of stock equity, $\$ 0-49,999$ of home equity and $\$ 50,000-99,999$ of stock equity, etc.. We could then analyze the socioeconomic characteristics of households in each of the nine home equity-stock equity classes.

## ANNEX A

## SURVEY OF INCOME AND PROGRAM PARTICIPATION (SIPP)

The SIPP is an ongoing panel survey of adults age 15 and older in the civilian, noninstitutionalized population, sponsored by the Bureau of the Census. The first panel began in fall 1983 and completed 9 interviews (waves) at 4-month intervals with an initial sample of about 20,000 households, following all adults in these households and also interviewing children and other adults who resided with original sample members. Subsequent panels began in February of each year except 1994 and 1995, with initial household sample sizes of about 13,500 (1985); 12,000 (1986, 1987, 1988, 1989); 21,900 (1990); 14,300 (1991); 19,600 (1992); 19,900 (1993); and 36,800 (1996). Interviews for these panels were completed of 8 waves (1985); 7 waves (1986, 1987); 6 waves (1988); 3 waves (1989); 8 waves (1990, 1991); and 9 waves (1992, 1993, 1996).

Data collected each interview include demographic characteristics; monthly information on labor force participation, job characteristics, and earnings; monthly information on detailed sources and amounts of income from public and private transfer payments, noncash benefits (such as food stamps, Medicaid, Medicare, and health insurance coverage); and information for the 4-month period on income from assets. Data collected in topical modules asked once or twice in one or more panels cover a wide range of subjects, including: annual income and income taxes; child care and child support; educational financing and enrollment; eligibility for selected programs; employee benefits; health and disability; housing costs and finance; individual retirement accounts; personal history (fertility, marital status, migration, welfare recipiency, and other topics); and wealth (property, retirement expectations and pension plan coverage, assets and liabilities). In addition, each panel includes a topical module with variable content designed to respond to the needs of policy analysis agencies.

Topical modules covering information on assets and liabilities and on retirement expectations and pension plan coverage were collected in the 1984, 1985, 1986, 1987, 1990, 1991, 1992, 1993, and 1996 panels. After the April 1993 Current Population Survey (CPS) Employee Benefit Supplement, the Employee Benefit Supplement is no longer collected in the CPS and has been replaced by the SIPP topical module. The most recent household asset and liability information to be released was collected in the SIPP 1993 panel, Wave 7, during February-May 1995. The most recent pension coverage and participation information to be released was collected in the SIPP 1993 panel, Wave 9, during October 1995-January 1996. The sample size is about 18,000 households with about 36,000 persons age 15 and older. The 1990, 1991, 1992, and 1993 SIPP Panels have been matched to social security earnings records. However, the matched files are not available to the public. The data elements in the Topical Module on assets and liabilities are listed in Table A-1. For this study a database was created by merging data from the longitudinal core data file, the Wave 7 Topical Module, and some items from the Wave 9 Topical Module.

* Fewer than five observations for households that own stock directly in the sample.
** Fewer than five observations for households that hold stock in IRAs or Keoghs in the sample.
*** No observations for households that own stock in this category in the sample.
${ }^{1}$ Percent of all households of that age-income group that hold stock or mutual fund shares.

[^84]Source: Capital Research Associates analysis of 1995 Survey of Income and Program Participation (SIPP) data.

[^0]:    ${ }^{1}$ The 1995 household homeownership, wealth, and income data are from the Survey of Income and Program Participation (SIPP) 1993 Panel Wave 7 and Wave 9 Topical Modules and from the core interviews contained in the 1993 SIPP Longitudinal Microdata File. The households in the SIPP sample are randomly selected to be representative of the entire U.S. non-institutional population. The merged database used for this study included 17,908 households headed by persons age 18 or older, which responded to the Wave 7 Topical Module.

    Most of the homeownership and asset and liability data are from the 1993 Panel Wave 7 Topical Module. The Wave 7 data on assets and liabilities were collected in detailed interviews conducted in February, March, April, and May 1995, and refer to asset and liability balances on the last day of the month that preceded the interview. Thus, the assets data in this report are averages of balances held and owed at the end of January, February, March, and April 1995. Each person's income was calculated by summing the income from all sources over each of the 12 months ending with the reference month for the assets data. Household income was calculated as the sum of the incomes of all of the persons in the household. The data on $401(\mathrm{k})$ participation and balances are from the Wave 9 Topical Module.

    The unit of analysis of this study is the household. A household is a person or group of persons living at the same address. A household may consist of one person living by himself or herself, a group of unrelated individuals, or one or more families.
    ${ }^{2}$ Only households headed by persons age 18 or older are included in this study.

[^1]:    ${ }^{7}$ The results for that age group for nonwhite households are not reliable because there are only nine households in the sample.

[^2]:    ${ }^{9}$ The sample of native American households with more than one mortgage in the data set is too small to be reliable.

[^3]:    ${ }^{10}$ It is likely that average mortgage balances of nonwhite homeowners exceed those of whites in higher income groups because of the role played by Asian homeowners, which have higher average mortgage balances than other racial groups (Table 49). Asian households in this survey also have higher average household income than other racial groups (Table 93). Asians were classified as nonwhite for this analysis.
    ${ }^{11}$ There are no observations in the sample for nonwhite homeowners with more than one mortgage in age group 18-24. There are fewer than five observations for nonwhite homeowners with more than one mortgage in age groups 25-34 and 75 and older, so the data for those groups are not reliable.

[^4]:    ${ }^{14}$ Data for age $18-24$ with income of $\$ 100,000$ or more are not reliable because there are only two observations in the sample.

[^5]:    ${ }^{15}$ The numbers of native American and Asian Hispanic households in the database is too small to provide reliable results.
    ${ }^{16}$ There are fewer than 10 observations for nonwhite-headed homeowner households for ages 18-24, so the results for that group are not reliable.

[^6]:    ${ }^{17}$ Household gross financial assets include checking accounts, savings accounts, money market deposit accounts, certificates of deposit, money market funds, government securities, corporate and municipal bonds, stocks and mutual fund shares, IRA and Keogh accounts, mortgages held from sale of real estate, money owed to members of the household by others, unit trusts, and other financial investments, less debt secured by financial assets (such as stock margin debt). Net financial assets equal gross financial assets less unsecured debt. Unsecured debt includes unpaid bills, unsecured bank or credit union loans, credit card balances, medical bills not covered by insurance, money owed to private individuals, and all other unsecured debts. Employer pension fund and other benefit accruals, including defined contribution pension balances and $401(\mathrm{k})$ account balances, defined benefit pension accruals, and ESOPs, are not included in family net financial assets data defined by the Census Bureau. 401(k) participation and balances are reported separately in this report

[^7]:    ${ }^{18} 8.2$ percent of all households own rental property, and 7.5 percent own other non-rental real estate (such as a vacation home or other residential property).
    ${ }^{19}$ Ownership and equity in own businesses is very unequally distributed. Only 10 percent of all households have equity in their own business, but in many cases that equity is substantial.
    ${ }^{20}$ Although average assets of all types are significantly greater for virtually every group of homeowners compared to that group of all households, mean net financial assets of homeowners age 18-24 are smaller than mean net financial assets of all households age 18-24.
    ${ }^{21}$ Top-coding may significantly affect the estimated mean values of net financial assets for higher income groups. Top-coding will not affect medians. See footnote 18.

[^8]:    ${ }^{22}$ It may be interesting that the two groups with the highest vehicle equity are age 18-24 and age 65-74 with incomes of $\$ 100,000$ or more. (The data for age $18-24$ with incomes of $\$ 100,000$ are not reliable because there are too few observations.)

[^9]:    ${ }^{23}$ There are fewer than 10 observations for nonwhite homeowners age $18-24$, so results for this group are not reliable.
    ${ }^{24}$ Other secured debt includes debt secured by automobiles and other vehicles, other real estate, own businesses, and margin debt secured by stock and mutual fund shares. Unsecured debt

[^10]:    ${ }^{28}$ Direct ownership of stock and mutual fund shares refers to all stocks and mutual funds owned by persons in households other than those held in IRAs, Keogh Accounts, or 401(k) or other employer retirement plans. These include shares held in brokerage accounts, direct purchases through mutual fund companies, and shares held in dividend reinvestment plans.

[^11]:    ${ }^{29}$ See footnote 28.
    ${ }^{30}$ The allocation of assets held in 401(k) plans by type of investment is not reported in the database. Consequently, it was not possible to identify stocks and mutual funds held in $401(\mathrm{k}) \mathrm{s}$.

[^12]:    ${ }^{31}$ There were 99.3 million households headed by persons age 18 or older in the U.S. civilian non-institutional population in the first quarter of 1995 , when these data were collected.
