

**INTEGRATED MODELING
AND DECISION SUPPORT
FOR WATER- AND
ENVIRONMENTAL-
RESOURCES MANAGEMENT**

George Leavesley

USGS

National Research Program

Denver, CO

OVERVIEW

- Review integrated modeling and DSS issues
- Describe modeling-framework components and applications
- Live demonstration of framework components
- Technical discussion of selected tools used to improve water supply forecasts
- Related modeling-framework applications

Components of Water Availability in the West

Water Supply

- Snow accumulation and melt
- Rainfall distribution
- Storage volume / distribution

Water Demand

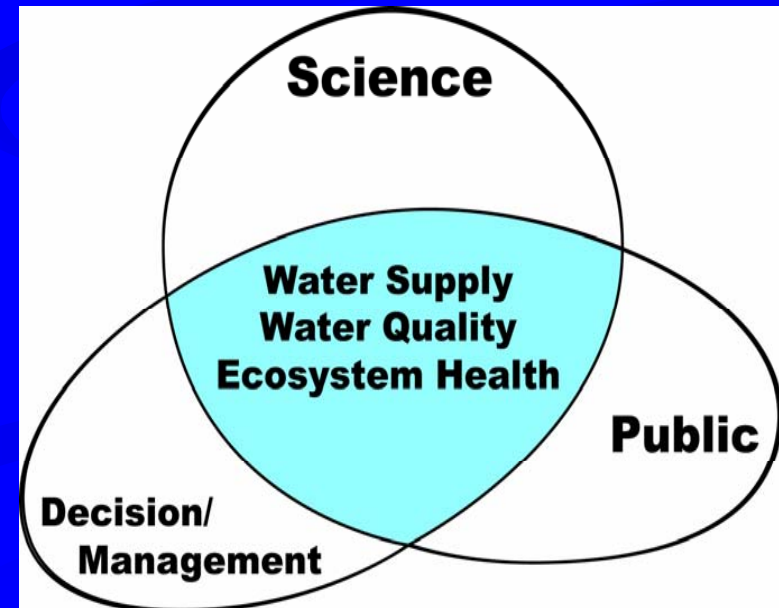

- Environmental
- Agricultural
- Municipal / Industrial / Hydropower
- Recreation
- ...

Technical Issues

- A framework in which to integrate models and tools and provide decision support.
- Accurate forecasts of meteorological variables.
- Knowledge of how water moves through a basin.
- Knowledge of the socio-economic processes controlling water supply and demand.
- Dealing with uncertainty.

Integrated Modeling and Decision-Support Systems

- Facilitates multi-disciplinary integration of models and tools to address the issues of water- and environmental-resources management.
- Allows rapid evaluation of the effects of decision and management scenarios.
- Allows incorporation of continuing advances in physical, social, and economic sciences.
- Provides an effective means for sharing scientific understanding with stakeholders and decision makers.

THE USGS MODULAR MODELING SYSTEM (MMS)

Multi-step Calibration

Step	Calibration data set associated with PRMS state	PRMS parameters sensitive to model state	Parameter Description
1	Mean monthly Solar Radiation	dday_intcp	Intercept in temperature degree-day relationship
		dday_slope	Slope in temperature degree-day relationship
		tmax_index	Index temperature used to determine precipitation adjustments to solar radiation
2	Mean monthly PET	jh_coef	Air temperature coefficient used in Jensen-Haise PET computations
3	Annual water balance	adjust_rain	Precipitation adjust factor for rain days
		adjust_snow	Precipitation adjust factor for snow days
		psta_nuse	Binary indicator for using station in precipitation distribution calculations
		psta_freq_nuse	Binary indicator for using station in precipitation frequency calculations
4	Daily flow components: 1. peak flows 2. low flows 3. all daily flows	adjmix_rain	Factor to adjust rain proportion in mixed rain/snow event
		tmax_allrain	If HRU maximum temperature exceed this value, precipitation assumed rain
		tmax_allsnow	If HRU maximum temperature is below this value, precipitation assumed snow
		tsta_nuse	Binary indicator for using station in temperature distribution calculations
		cecn_coef	Convection condensation energy coefficient
		emis_noppt	Emissivity of air on days without precipitation
		freeh2o_cap	Free-water holding capacity of snowpack
		potet_sublim	Proportion of PET that is sublimated from snow surface
		smidx_coef	Coefficient in non-linear contributing area algorithm
		smidx_exp	Exponent in non-linear contribution area algorithm
		gwflow_coef	Groundwater routing coefficient
		ssrcoef_sq	Coefficient to route subsurface storage to streamflow
		soil2gw_max	Maximum amount of soil water excess
		soil_moist_max	Maximum available water holding capacity of soil profile
soil_rechr_max	Maximum value for soil recharge zone

OBJECT USER INTERFACE (OUI)

The screenshot displays the OUI software interface, which is divided into several main sections:

- File Browser:** A tree view on the left shows the project structure under "Upper Rio Grande Project". It includes folders for "Basin Maps" (Subbasins, Streams, Cities, States, DEM, Slope, Aspect) and "Models & Data" (Input, Update MMS D, MMS Parameters, ESP Run, Animation Demo). A table below the tree lists the loaded themes.
- Map Mode:** A large window on the right shows a 2D map of the basin. The map features a dark grey terrain, blue stream networks, and red subbasin outlines. A "Tracking" box at the bottom of the map window shows coordinates: [x = -1233475.1, y = 1406700.1].
- 3D Animator:** A smaller window in the bottom-left corner shows a 3D perspective view of the terrain. It includes a color key for elevation, a playback control bar, and a timeline for the animation.

Name	Description	Theme	Type

Integrating Water-Resource and Socio-Economic Models

- Population and Demand Forecasts
- Water Markets
 - (change in ownership in perpetuity)
- Water Banking
 - (lease options over some period of time)

Issue: The better the prediction of the spatial and temporal distribution of water, the better the markets can perform.

Being done collaboratively with U. of Arizona,
U. of New Mexico, Desert Research Institute

Adding Water Banking to a Water Resources Decision-Support System

OUI DEMO

Integrated Tools to Improve Water Supply Forecasts

- Distributing point precipitation measurements spatially and with elevation
- Improved forecasting methods
- Using remotely sensed measures of snow cover and snowpack water equivalent to update models
- Using ensembles of different hydrologic models to predict streamflow

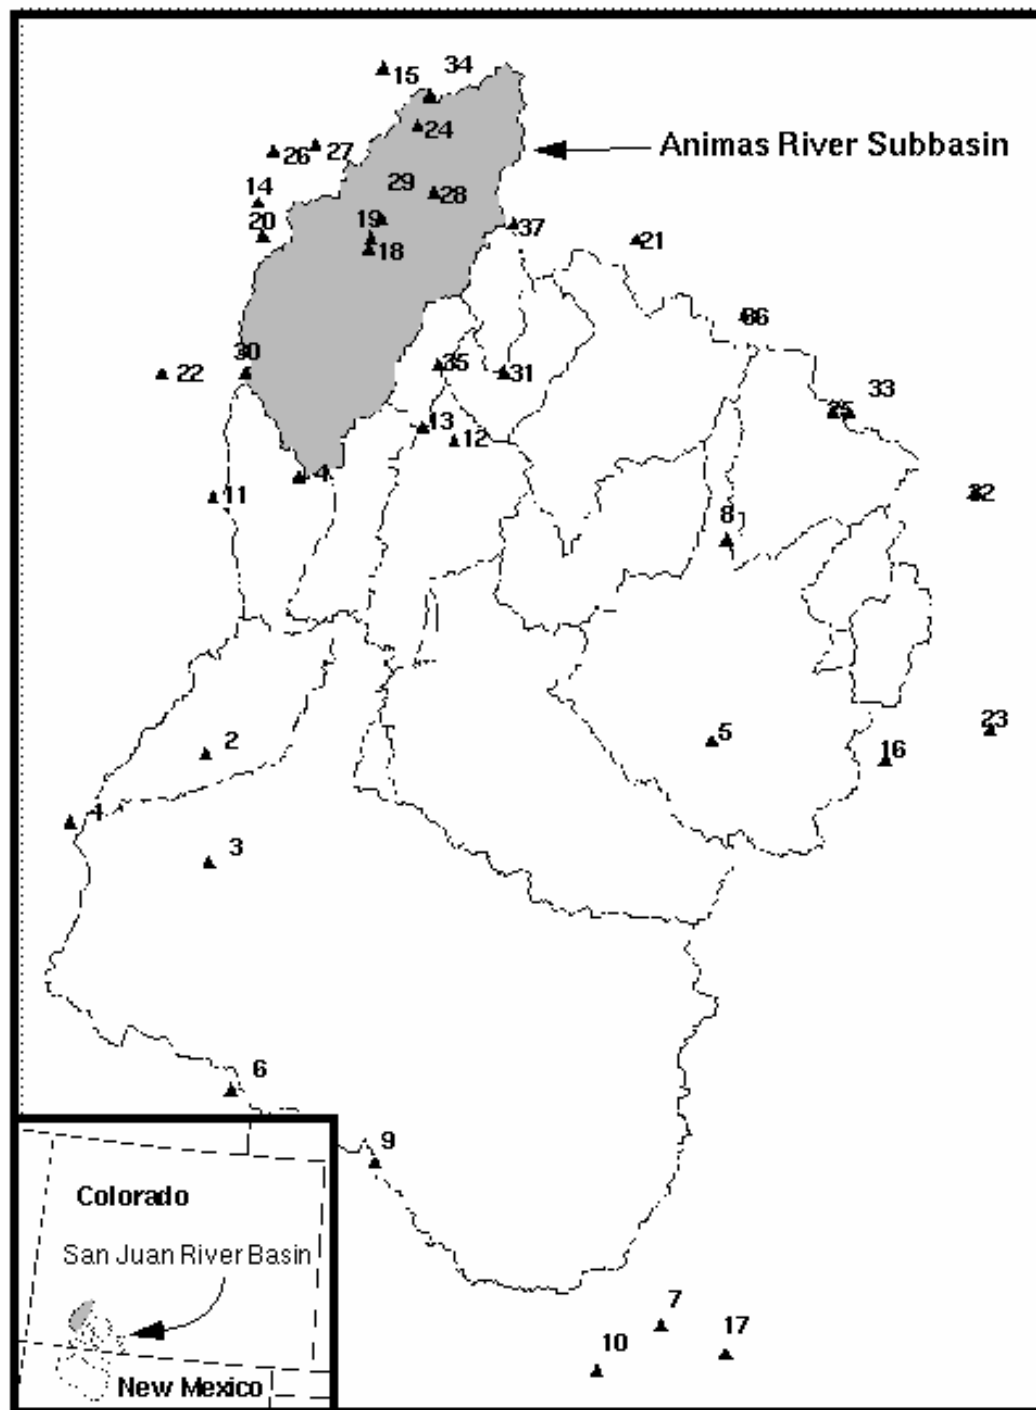

Conducted in collaboration with NWS, NASA, NRCS,
U. of Colorado, Colorado State U., U. of Arizona,
Scripps Institution of Oceanography

XYZ Spatial Redistribution of Precip and Temperature

1. Develop Multiple Linear Regression (MLR) equations (in XYZ) for PRCP, TMAX, and TMIN by month using all appropriate regional observation stations.

San Juan Basin

Observation Stations 37

XYZ Spatial Redistribution

2. Daily mean PRCP, TMAX, and TMIN computed for a subset of stations (3) determined by Monte Carlo analysis to be best stations

3. Daily station means from (2) used with monthly MLR xyz relations to estimate daily PRCP, TMAX, and TMIN on each HRU according to the XYZ of each HRU

Forecast Methodologies

- Historic data as analog for the future

Multiple Linear Regression Seasonal Forecast

Ensemble Streamflow Prediction (ESP)

904 km²

Upper San Joaquin
4,086 km²

Animas 1,805 km²

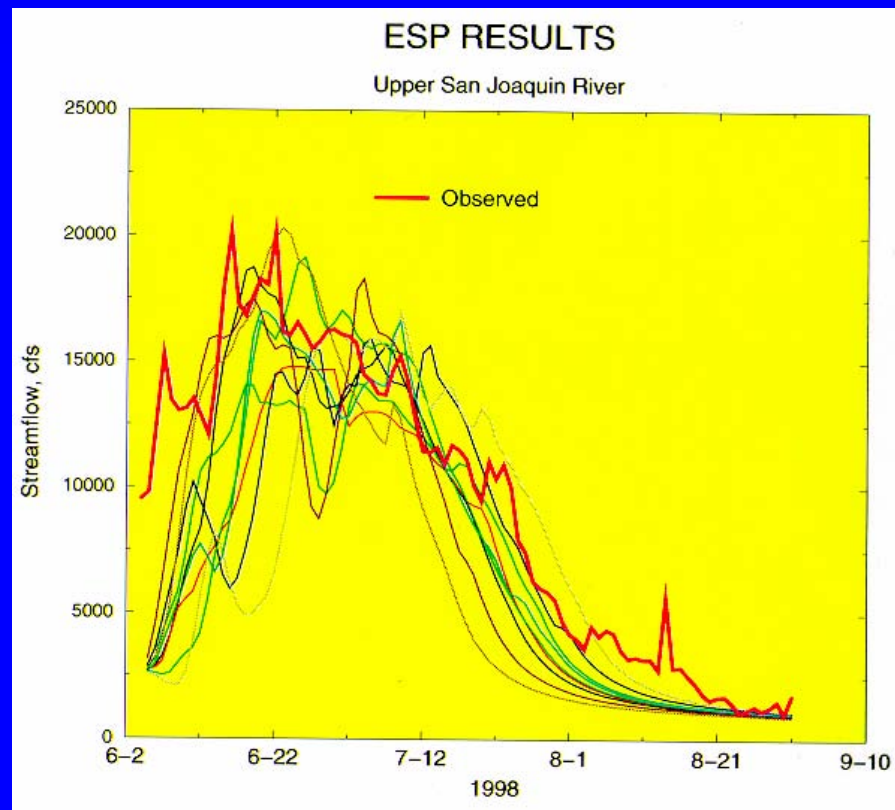

Upper San Joaquin

Ensemble Streamflow Prediction -- ESP

uses current basin conditions with historical meteorological data

Weather Generator

- Develop synthetic time-series of precipitation and temperature
 - Long-term planning or policy analysis
 - Climate change scenarios

Statistical Downscaling Atmospheric Models

- Multiple linear regression equations developed for selected climate stations
- Predictors chosen from over 300 NCEP variables (< 8 chosen for given equation)
- Predictands are maximum and minimum temperature, precipitation occurrence, and precipitation amounts
- Stochastic modeling of the residuals in the regression equations to provide ensemble time series

11,000 Climate Station Locations

Ranked Probability Skill Score (RPSS) for each forecast day and month using measured runoff and simulated runoff (Animas River, CO) produced using: (1) SDS output and (2) ESP technique

RPSS

Perfect Forecast: RPSS=1

Month
SDS

Month
ESP

Given current uncertainty in long-term atmospheric-model forecasts, seasonal to annual forecasts may be better with ESP

SUMMARY

- Integrated toolbox approach to model development and application for water- and environmental-resources management
- Easily configured and/or enhanced for user-specific needs
- Supports multi-disciplinary model integration for decision support systems
- Flexible framework approach enables the incorporation of continuing advances in science, databases, and computer technology as well as changes in management objectives
- Open source software design allows many to share resources, expertise, knowledge, and costs
