Re: GE-Pittsfield/Housatonic River Site
Newell Street Area I (GECD440)
Final Completion Report for the Newell Street Area I Removal Action

Dear Mr. Tagliaferro:

Paragraph 88 of the Consent Decree (CD) for the GE-Pittsfield/Housatonic River Site provides for the submittal of a Final Completion Report and issuance of a Certification of Completion following the completion of a Removal Action which satisfies the Performance Standards provided in the CD. The enclosed *Final Completion Report for the Newell Street Area I Removal Action* (Final Completion Report) demonstrates that the Removal Action for this area required by the CD (excluding Post-Removal Site Control activities) has been completed in full satisfaction of the pertinent requirements of the CD and that the Performance Standards for that Removal Action have been achieved. Therefore, in accordance with Paragraph 88.a of the CD, the General Electric Company (GE) requests that EPA provide a Certification of Completion for the Newell Street Area I Removal Action.

Please contact me with any questions or comments regarding the enclosed Final Completion Report.

Sincerely,

Richard W. Gates/at

Richard W. Gates
GE Project Coordinator
Newell Street Area I Removal Action

Statement and Certification by GE's Project Coordinator

I am the General Electric Company's (GE's) Project Coordinator for certain activities conducted by GE pursuant to the Consent Decree for the GE-Pittsfield/Housatonic River Site, which was entered by the United States District Court for the District of Massachusetts on October 27, 2000. These activities include the Newell Street Area I Removal Action.

As described in this *Final Completion Report for the Newell Street Area I Removal Action*, the Newell Street Area I Removal Action required by the Consent Decree (excluding Post-Removal Site Control activities) has been completed in full satisfaction of the requirements of the Consent Decree relating to that Removal Action.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Richard W. Gates
GE Project Coordinator
Newell Street Area I Removal Action

Date: July 31, 2008

Statement by Supervising Contractor

I am a registered Professional Engineer and represent ARCADIS (formerly Blasland, Bouck & Lee, Inc.) as the Supervising Contractor for work conducted by the General Electric Company (GE) pursuant to the Consent Decree for the GE-Pittsfield/Housatonic River Site, which was entered by the United States District Court for the District of Massachusetts on October 27, 2000.

Based on my inquiry of those individuals responsible for preparing this *Final Completion Report for the Newell Street Area I Removal Action*, the information contained in this report is, to the best of my knowledge and belief, true, accurate and complete. As summarized in this report, the Newell Street Area I Removal Action required by the Consent Decree (excluding Post-Removal Site Control activities) has been completed in full satisfaction of the requirements of the Consent Decree relating to that Removal Action, and the applicable Performance Standards set forth in the Consent Decree have been attained for each of the properties (or portions thereof) comprising the Newell Street Area I Removal Action Area.

James M. Nuss, P.E.
Supervising Contractor
ARCADIS

Date: July 31, 2008

1. Introduction

1.1 General

This *Final Completion Report for the Newell Street Area I Removal Action* (Final Completion Report) is submitted by the General Electric Company (GE), pursuant to the requirements of Paragraph 88.a of the October 2000 Consent Decree (CD) for the GE-Pittsfield/ Housatonic River Site (the Site), to request that the U.S. Environmental Protection Agency (EPA) issue a Certification of Completion for the Newell Street Area I Removal Action at the Site.

The submittal of this Final Completion Report represents the culmination of efforts conducted by GE to investigate, evaluate, and remediate soils within each of the properties (or portions thereof) comprising the Newell Street Area I Removal Action Area (RAA). As documented in this Final Completion Report, the necessary response actions required by the CD to address soils at the properties (or portions thereof) comprising this RAA have been completed, and the applicable soil-related Performance Standards set forth in the CD have been attained for each of those properties. As a result, consistent with the requirements of Paragraph 88.a of the CD, GE and its Supervising Contractor, ARCADIS (formerly Blasland, Bouck & Lee, Inc. [BBL], then ARCADIS BBL), have prepared statements indicating that the Newell Street Area I Removal Action has been completed in full satisfaction of the applicable requirements under the CD. Such statements are included as part of this Final Completion Report.

1.2 Site Description

The Newell Street Area I RAA measures approximately 11 acres and is generally bounded to the north by the Housatonic River, to the south by Newell Street, to the west by the Ontario Street Extension and the Newell Street Area II RAA, and to the east by the Lakewood Playground (Figure 1). The area including and surrounding Newell Street Area I originally consisted of land within or adjoining several oxbows or low-lying areas associated with the Housatonic River. Rechannelization and straightening of the Housatonic River in the early 1940s by the City of Pittsfield and the U.S. Army Corps of Engineers separated these oxbows and low-lying areas from the active course of the river. The oxbows and low-lying areas were subsequently filled with various materials from a variety of sources. Newell Street Area I is considered one of the Former Oxbow Areas under the CD and the accompanying *Statement of Work for Removal Actions Outside the River* (SOW).

As shown on Figure 2, Newell Street Area I is composed of 10 commercial/industrial parcels (three of which have the same owner) and three recreational parcels (or portions thereof) as follows:

Commercial/Industrial

- Parcel J9-23-13 (187 Newell Street);
- Parcel J9-23-16 (191 Newell Street);
- Parcel J9-23-18 (217 Newell Street);
- Parcels J9-23-19, -20, and -21 (221, 229, and 230 Newell Street);
- Parcel J9-23-22 (247/249 Newell Street);
- Parcel J9-23-23 (261 Newell Street);
- Parcel J9-23-24 (269 Newell Street); and
- Parcel J9-23-25 (273 Newell Street);

Recreational

- Riparian Strip of Land between the Housatonic River and most of the other parcels at this RAA (referred to herein as the Riparian Strip)[1];
- Parcel J9-23-17 (203 Newell Street); and
- A portion of Parcel J9-23-26 (Lakewood Playground – northwest portion only).

Three of these parcels are currently owned by GE (the Riparian Strip and Parcels J9-23-16 and J9-23-23), one is owned by the City of Pittsfield (Parcel J9-23-26), and the remaining properties are owned by private individuals or organizations.

---

[1] This Riparian Strip, which was identified in prior reports on Newell Street Area I as part of Parcel J9-23-12, is in fact made up of portions of three other parcels (Lot A on Land Court Plan 8372-B and Lots 3 and 4 on Land Court Plan 8372-K). Only the non-riverbank portion of this Riparian Strip is included in the Newell Street Area I RAA. The riverbank portion of the Riparian Strip was subject to a separate Removal Action under the CD – the Upper ½-Mile Reach Removal Action.

1.3 Overview of Response Actions

The activities completed by GE related to Newell Street Area I over the last several years were consistent with the requirements of the CD and the SOW. These activities were documented in various reports and other submittals to the EPA, and have included the following:

- Sampling and analysis of soils throughout Newell Street Area I were conducted to assess the presence of polychlorinated biphenyls (PCBs) and other constituents listed in Appendix IX of 40 CFR Part 264 (excluding pesticides and herbicides), plus three additional constituents: benzidine, 2-chloroethyl vinyl ether, and 1,2-diphenylhydrazine (Appendix IX+3). These activities included sampling conducted prior to the CD, pre-design investigations performed in accordance with the CD and SOW, and additional data collected following GE's technical evaluations concerning the need for soil-related response actions.

- GE has performed Removal Design/Removal Action (RD/RA) evaluations to determine the need for and scope of remediation to achieve the soil-related Performance Standards in the CD and SOW for the properties (or portions thereof) comprising Newell Street Area I. The results of these evaluations were provided to EPA in a number of reports, most notably the *Conceptual RD/RA Work Plan Addendum for Newell Street Area I* (Conceptual Work Plan Addendum; BBL, April 2003).

- GE has demolished previously existing structures on Parcels J9-23-16 and J9-23-23. The actual demolition activities were not subject to the CD and SOW. However, since certain of the demolition debris was placed within the On-Plant Consolidation Areas (OPCAs) located at the GE facility, the disposition of the demolition debris was subject to the CD and SOW. Also, since the demolition activities occurred within the 100-year floodplain, the demolition of these structures was factored into the flood storage evaluations performed as part of the response actions for Newell Street Area I.

- GE performed remediation activities between September 2003 and June 2006 in accordance with a document titled *Final RD/RA Work Plan for Newell Street Area I* (Final Work Plan; BBL, August 2003). These activities generally consisted of the excavation of impacted material, disposal of excavated material at the appropriate OPCA located at the GE Pittsfield facility, backfilling of excavations with clean material, placement of engineered barriers over specific areas, and general site restoration.

- Grants of Environmental Restrictions and Easements (EREs) have been executed and registered for the Riparian Strip and Parcels J9-23-16, J9-23-23, J9-23-24, and J9-23-26. These EREs establish allowable and prohibited future uses of and activities on the properties, as well as related reporting, protocols, and documentation associated with future site activities. The EREs for the Riparian Strip and Parcels J9-23-16 and J9-23-23 were executed by GE, the ERE for Parcel J9-23-24 was executed by the private owner, and the ERE for Parcel J9-23-26 was executed by the City of Pittsfield. These EREs have been approved by EPA and accepted by the Massachusetts Department of Environmental Protection (MDEP) as the Grantee, and have been registered in the Land Court Records of the Berkshire Middle District Registry of Deeds, as described further in Section 6.2 below.

- GE has provided notices to the owners of the properties where EREs have not been executed that a Conditional Solution was implemented at their properties. GE has also provided notices of these Conditional Solutions to the holders of encumbrances on those properties.

- A formal Pre-Certification Inspection of the Newell Street Area I RAA was conducted on December 6, 2007, in accordance with Paragraph 88.a of the CD, and was attended by representatives of EPA, MDEP, and GE. Representatives from the City of Pittsfield were invited to attend the inspection for the portion of City-owned Parcel J9-23-26 (Lakewood Playground) included in the RAA; however, no City representatives attended the inspection. No issues were identified during that inspection regarding the completed response actions.

Additional information concerning each of the above activities is presented in subsequent sections of this report.

1.4 Scope and Format of Final Report

The scope of soil investigations, investigation results, RD/RA evaluations, and proposed remediation activities related to Newell Street Area I have been summarized in various documents submitted to EPA. EPA has provided approval or conditional approval of each such GE submittal. This Final Completion Report provides a general overview of the above-referenced topics and includes references to more detailed reports and other correspondence submitted to EPA. In combination with the materials presented in previous documents submitted to EPA, this Final Completion Report (describing the completed response actions) serves as the basis for GE's conclusion that the applicable soil-related Performance Standards for the Newell Street Area I Removal Action have been achieved.

Section 3.6 of the SOW states that the following information is to be presented in the Final Completion Report:

- Description of the response activities performed;
- Any deviations from the design submittals as approved by EPA;
- A listing of response action quantities, including soil volumes, capping areas, etc.;
- Results of QA/QC testing performed during response actions;
- As-built construction drawings (including post-response action topographic surveys);
- Representative project photographs;
- Records of off-site waste disposal, if any; and
- A summary of Post-Removal Site Control activities.

To satisfy the above-listed requirements, the remainder of this Final Completion Report is presented in six sections. The title and a brief overview of each of the subsequent sections are presented below.

Section 2 – **Summary of Completed Investigation Activities,** provides a summary of the historical, pre-design, and supplemental soil investigations performed at Newell Street Area I, the results of which were used to determine the need for and extent of remediation actions to address PCBs and other Appendix IX+3 constituents at each of the properties (or portions thereof) comprising this RAA.

Section 3 – Summary of Applicable Performance Standards and RD/RA Evaluations, describes the Performance Standards for PCBs and other Appendix IX+3 constituents applicable to the properties within Newell Street Area I and provides a brief summary of the RD/RA evaluations performed for these properties.

Section 4 – Summary of Remediation Activities, presents a summary of the remediation actions that were performed at Newell Street Area I.

Section 5 – Achievement of Performance Standards, demonstrates that current (post-remediation) site conditions satisfy the applicable soil-related Performance Standards at each property (or portion thereof) comprising Newell Street Area I.

Section 6 – Post-RD/RA Activities, provides a summary of the post-remediation, pre-certification activities performed at the RAA, including the execution and recording of EREs, the property owner notifications relating to Conditional Solutions, and the formal Pre-Certification Inspection under the CD.

Section 7 – Post-Removal Site Control Activities, sets forth GE's Post-Removal Site Control Plan for Newell Street Area I, including a discussion of the required periodic inspections and maintenance of engineered barriers and other restored areas, as well as a discussion of future inspections of non-GE-owned properties at which EREs have been executed and those at which Conditional Solutions have been implemented.

Several appendices are included herein to supplement the contents of this report and related documents previously submitted to EPA. These appendices are primarily related to the implementation of the soil-related response actions and related construction activities.

Finally, it should be noted that this Final Completion Report describes the remediation activities performed to achieve the soil-related Performance Standards set forth in the CD and SOW. Groundwater at Newell Street Area I is being addressed separately as part of GE's groundwater-related activities for the Plant Site 1 Groundwater Management Area (GMA 1), pursuant to the CD and the SOW.

2. Summary of Completed Investigation Activities

2.1 General

GE and EPA performed a number of sampling and analysis activities at Newell Street Area I as part of pre-design soil investigations required pursuant to the CD and SOW. The data generated by these activities (as well as certain sampling data obtained from historical investigations conducted by GE dating back to 1987) were used to characterize existing conditions with respect to PCBs and other Appendix IX+3 constituents and to support the performance of RD/RA evaluations to assess the need for soil-related response actions to achieve the applicable Performance Standards. In addition to these investigation activities, GE performed additional investigation activities for a portion of Parcel J9-23-26, which lies outside the boundaries of the CD Site. This section provides an overview of the various investigation activities conducted in support of the RD/RA evaluations for Newell Street Area I. All soil sampling data considered in the RD/RA evaluations for this RAA are included in tables in Appendix A, along with a figure showing the soil sampling locations.

2.2 Summary of Pre-2002 Pre-Design Activities

Prior to 2002, the pre-design investigation activities for Newell Street Area I consisted of the following:

- Historical soil investigations conducted prior to January 2000 and not associated with the pre-design investigations under the CD;

- Pre-design investigation activities conducted by GE between January 2000 and May 2001, as proposed in documents titled *Pre-Design Investigation Work Plan for the Newell Street Area I Removal Action* (PDI Work Plan; BBL, March 2000) and *Newell Street Area I Pre-Design Investigation Work Plan Addendum* (PDI Work Plan Addendum; BBL, December 2000), generally including the collection and analysis of soil samples for analysis of PCBs and, for a portion of those samples, other Appendix IX+3 constituents;

- Investigation activities performed by EPA at Newell Street Area I concurrently with GE's pre-design investigations, as well as historical EPA data collected on prior occasions – the validated results of which were provided to GE as part of a data exchange agreement between GE and EPA and were also considered in the RD/RA evaluations for this RAA;

- Submittal of a document titled *Pre-Design Investigation Report for Newell Street Area I Removal Action* (BBL, May 2001), which presented the results of the historical and pre-design sampling performed by GE and EPA at Newell Street Area I;

- Submittal of a document titled *Newell Street Area I - Supplemental Data Validation/Assessment Report* (Supplemental Data Validation Report; BBL, July 25, 2001), which included: (1) a report on the data validation performed for the pre-design soil investigation sample results in accordance with GE's *Field Sampling Plan/Quality Assurance Project Plan* (FSP/QAPP); and (2) a report on a more general data quality assessment for prior (i.e., historical) soil sampling data; and

- Performance of a detailed site survey, including existing buildings, paved and unpaved areas, surface elevations and topography, property boundaries and easements, certain utilities (e.g., manholes, catch basins, etc.), soil sample locations, and other site features.

The results of the above-listed pre-design activities were the basis for the preliminary PCB and Appendix IX+3 evaluations presented in GE's *Conceptual RD/RA Work Plan for Newell Street Area I* (Conceptual Work Plan; BBL, January 2002). However, in developing and reviewing those preliminary evaluations, GE and EPA determined that supplemental investigation activities were necessary at certain properties to determine the scope of the remediation activities necessary to achieve the applicable Performance Standards at those properties. Additional details regarding those supplemental investigation activities are presented in the following section.

2.3 Summary of Supplemental Soil Sampling Activities

GE's Conceptual Work Plan presented preliminary evaluations of the need for and scope of remediation activities to address PCBs and other Appendix IX+3 constituents in soil at the properties (or portions thereof) comprising Newell Street Area I. Those preliminary evaluations indicated that supplemental investigations were necessary to determine the scope of remediation necessary at several properties. Therefore, the Conceptual Work Plan included a proposal for such supplemental soil investigations. Further, in its May 24, 2002 comment letter on the Conceptual Work Plan and subsequent discussions with GE, EPA indicated the need for additional investigations beyond those proposed in the Conceptual Work Plan. GE submitted a *Proposal for Supplemental Pre-Design Investigations* on July 3, 2002. EPA provided conditional approval of that document in a letter dated August 5, 2002. GE subsequently submitted a *Revised Proposal for Supplemental Pre-Design Investigations* to EPA on August 20, 2002, which was approved by EPA in a letter dated August 26, 2002. The supplemental pre-design activities included the following:

- Supplemental sampling activities performed by GE, including the collection of the approximately 26 soil samples for analysis of PCBs and approximately 108 samples for analysis of other Appendix IX+3 constituents (or, in some cases, select non-PCB constituents) between August 2002 and February 2003;

- Supplemental sampling activities performed by EPA, including the collection of approximately 26 additional soil samples at several locations within Newell Street Area I between July and September 2002 for analysis of PCBs or, in some cases, certain Appendix IX+3 constituents;

- Submittal of the Conceptual Work Plan Addendum in April 2003, which: (1) presented the results from the supplemental sampling activities; (2) provided revised RD/RA evaluations for the properties (or portions thereof) comprising Newell Street Area I; and (3) included a Data Validation Report for GE's supplemental investigation data.

2.4 Miscellaneous Investigation Activities

Separate from the pre-design investigation activities performed by GE and EPA under the CD and SOW for Newell Street Area I, GE performed additional investigation activities for a portion of Parcel J9-23-26 (Lakewood Playground) that was outside of (but adjacent to) the boundaries of this RAA. Specifically, based on a review of initial pre-design investigation data for samples collected on the portion of Parcel J9-23-26 located within Newell Street Area I, GE proposed to collect additional soil samples to further assess the presence of arsenic in that portion of Lakewood Playground, as well as an adjacent portion of the parcel located outside the boundaries of the RAA. Those data were subsequently included in evaluations to determine the need for remedial actions within both portions of Lakewood Playground utilizing the applicable Performance Standards presented in the CD and SOW for the portion of Parcel J9-23-26 included in the RAA.

3. Summary of Applicable Performance Standards and RD/RA Evaluations

3.1 General

This section provides an overview of the Performance Standards established in the CD and SOW for PCBs and non-PCB Appendix IX+3 constituents in soil for Newell Street Area I. The Performance Standards for this RAA are set forth in Paragraph 26 of the CD and Section 2.3.2 of the SOW. This section also summarizes the outcome of the RD/RA evaluations conducted by GE to demonstrate and/or achieve compliance with the applicable Performance Standards.

3.2 Performance Standards for PCBs

For the Former Oxbow Areas at the CD Site, which include Newell Street Area I, the Performance Standards related to the presence of PCBs in soil are set forth in Paragraph 26 of the CD and Section 2.3.2 of the SOW. An overview of the pertinent Performance Standards related to the presence of PCBs in soil at Newell Street Area I is presented below:

- GE must execute and record EREs for properties owned by GE at Newell Street Area I, and must make "best efforts" (as defined in the CD) to obtain EREs at private properties not owned by GE at this RAA. In addition, the City of Pittsfield must execute and record an ERE on its property at this RAA (Lakewood Playground). If an ERE cannot be obtained at a non-GE-owned private property, GE must implement a Conditional Solution. The scope of soil-related response actions at a property is dependent upon whether an ERE is obtained or a Conditional Solution will be implemented, as discussed below.

- For the 10 commercial/industrial parcels (Parcels J9-23-13, J9-23-16, J9-23-18, J9-23-19, J9-23-20, J9-23-21, J9-23-22, J9-23-23, J9-23-24, and J9-23-25), the following standards must be achieved at each parcel:

    - For properties where an ERE is obtained, if the spatial average PCB concentration in the top foot of soil in the unpaved portion of the property exceeds 25 ppm, GE must remove and replace soils as necessary to achieve that average concentration in such portion. For the paved portion of the property, if the spatial average PCB concentration exceeds 25 ppm in the top foot of soil, GE must either remove and replace soils as necessary to achieve that spatial average concentration or enhance the pavement in such portion in accordance with the specifications for pavement enhancement in the SOW. In addition, considering both paved and

unpaved portions together, GE must remove/replace soils as necessary to achieve a spatial average PCB concentration of 200 ppm in the 1- to 6-foot depth increment and must install an engineered barrier if the remaining spatial average PCB concentration in the 0- to 15-foot depth increment exceeds 100 ppm.

- For properties where an ERE cannot be obtained, GE must implement a Conditional Solution, which includes soil removal/replacement as necessary to achieve spatial average PCB concentrations of 25 ppm in both the top foot of soil (considering paved and unpaved portions together) and the top 3 feet of soil and 200 ppm in the 1- to 6-foot depth increment, and installation of an engineered barrier if the remaining spatial average PCB concentration in the 0- to 15-foot depth increment exceeds 100 ppm.

- For two recreational properties (Parcels J9-23-17 and J9-23-26), the following standards must be achieved:

  - For properties where an ERE is obtained, GE must remove/replace soils as necessary to achieve spatial average PCB concentrations of 10 ppm in the top foot and 15 ppm in the 1- to 3-foot depth increment, and must install an engineered barrier if the remaining spatial average PCB concentration in the 0- to 15-foot depth increment exceeds 100 ppm.

  - For properties where an ERE cannot be obtained, GE must implement a Conditional Solution, which includes soil removal/replacement to achieve a spatial average PCB concentration of 10 ppm in both the top foot and the top 3 feet of soil, and installation of an engineered barrier if the remaining spatial average PCB concentration in the 0- to 15-foot depth increment exceeds 100 ppm.

- For the GE-owned Riparian Strip (excluding the riverbank portion), GE has the option of either: (a) removing and replacing soils as necessary to achieve spatial average PCB concentrations at or below 10 ppm in the top foot and 15 ppm in the 1- to 3-foot depth increment; or (b) removing the top foot of soil and installing a vegetative engineered barrier over portions of the strip until the spatial average PCB concentrations in the remainder of the strip do not exceed the above concentrations. In either case, if the remaining spatial average PCB concentration in the 0- to 15-foot depth increment exceeds 100 ppm, GE must install a vegetative engineered barrier.

- Further, at each of the above properties that exceeds 0.5 acre in size, if GE elects to consider the entire property as an averaging area, GE must ensure the removal of all soils in the top foot in unpaved portions of the property that contain PCB concentrations greater than 125 ppm at commercial/industrial properties and 50 ppm at recreational properties – the "not-to-exceed" (NTE) levels. Alternatively, GE may establish averaging areas that do not exceed 0.5 acre in size or may propose other specific averaging areas to EPA for approval, in which case the above NTE PCB levels will not apply.

- In addition, at all properties where utilities potentially subject to emergency repair requirements are present, if the spatial average PCB concentration in the utility corridor exceeds 200 ppm, GE must evaluate whether any additional response actions are necessary. Further, if utilities are installed, repaired, or replaced, GE must ensure that the spatial average PCB concentration in the backfill material is less than 25 ppm at commercial/industrial properties, and less than 10 ppm in the top 3 feet, and 25 ppm at greater depths for recreational properties.

3.3 Performance Standards for Non-PCB Appendix IX+3 Constituents

The applicable Performance Standards for non-PCB constituents in soil at Newell Street Area I are included in Section 2.3.2 of the SOW. These standards apply to the same averaging areas and depth increments as the PCB Performance Standards and consist of the following:

- For dioxins and furans, a total toxicity equivalency quotient (TEQ) concentration must be calculated for each sample using the Toxicity Equivalency Factors (TEFs) published by the World Health Organization (WHO) in 1998 (Van den Berg et al., *Environ. Health Perspectives*, Vol. 106, No. 12, Dec. 1998). For each averaging area and relevant depth increment, either the maximum TEQ concentration or the 95% upper confidence limit on the mean (95% UCL) of the TEQ data must be below certain Preliminary Remediation Goals (PRGs) developed or approved by EPA for dioxin/furan TEQs. These PRGs are: for commercial properties, 5 parts per billion (ppb) in the top foot of soil and 20 ppb in deeper soil; and for recreational properties, 1 ppb in the top foot and 1.5 ppb in the 1- to 3-foot depth increment. In addition, EPA requested, in its May 24, 2002 comment letter on the Conceptual RD/RA Work Plan, that GE also compare the maximum or 95% UCL TEQ concentrations to the following TEQ criteria (although these are not Performance Standards specified in the CD or SOW): 5 ppb for the 0- to 3-foot depth increment at commercial properties that will not have EREs; 1 ppb for the 0- to 3-foot depth increment at recreational properties that will not have EREs; and 20 ppb for soils below 3 feet at all recreational properties.

- For other non-PCB constituents, the following steps must be followed:

  - As a screening step, the maximum concentrations of all detected constituents must be compared to the EPA Region 9 PRGs specified in Exhibit F-1 to Attachment F to the SOW or surrogate PRGs approved by EPA (jointly referred to as Screening PRGs), using residential PRGs for recreational areas and industrial PRGs for commercial areas. Constituents whose maximum concentration exceeds the Screening PRG must be retained for further evaluation.

  - For all constituents that are retained after the above screening step, their average concentrations for each relevant depth increment must either: (1) not exceed the pertinent Method 1 soil standards specified in the Massachusetts Contingency Plan (MCP); or (2) be shown through a parcel-specific risk evaluation to have cumulative risk levels that do not (after rounding) exceed an excess lifetime cancer risk (ELCR) of 1×10^{-5} and a non-cancer Hazard Index (HI) of 1. In addition, EPA agreed to the following for parcel-specific risk evaluations at this RAA: (a) for the 0- to 15-foot depth increment, since the CD does not contain any specific exposure scenario, the average concentrations were to be compared to the Upper Concentration Limits (UCLs) set forth in the MCP; and (b) since EPA has not established any toxicity values for lead, the average lead concentrations were to be evaluated through comparison to certain criteria approved by EPA. These lead criteria are: for commercial properties, a Risk-Based Concentration (RBC) of 2,008 ppm for the 0- to 1-foot and (where applicable) 0- to 3-foot depth increments and a default concentration of 6,000 ppm (equivalent to the then-applicable MCP UCL for lead) for the 1- to 6-foot depth increment; and for recreational properties, an RBC of 1,313 ppm for the 0- to 1-foot and 1- to 3-foot or 0- to 3-foot depth increments (as applicable).

3.4 Summary of RD/RA Evaluations

Based on the results of the soil investigations summarized in Section 2, GE conducted RD/RA evaluations for each of the 13 properties (or portions thereof) comprising Newell Street Area I to assess the need for remediation activities to achieve the applicable soil-related Performance Standards described above. The results of these soil RD/RA evaluations were initially presented in the Conceptual Work Plan and revised in the Conceptual Work Plan Addendum, which was conditionally approved by EPA in a letter to GE dated May 13, 2003. The evaluations presented in the Conceptual Work Plan Addendum showed that remediation, consisting of soil removal/replacement and/or the installation of an engineered barrier, would be necessary at 11 of the 13 properties (or portions of properties) comprising this RAA – i.e., all parcels within this RAA except Parcels

J9-23-25 and J9-23-26 – to meet the applicable Performance Standards for PCBs and/or certain non-PCB constituents.

In addition to the evaluations presented in the Conceptual Work Plan Addendum, GE performed several additional evaluations based on modifications to the soil removal limits that were necessary to ensure the structural stability of buildings, subsurface utilities, and/or underground storage tanks (USTs) at Parcels J9-23-22 and J9-23-24. The first such evaluations were summarized in Section 5.4 of the Final Work Plan, with supporting documentation included in Appendix C thereto. As discussed in that document, GE elected not to excavate certain soils from deeper (i.e., six foot) excavations adjacent to certain buildings located on Parcels J9-23-22 and J9-23-24, but to leave in place a "wedge" of soil in those areas, to ensure that the structural stability of those buildings was not impacted by the remediation activities. The Final Work Plan included a demonstration that leaving such soils in place would not impact the achievement of the applicable PCB Performance Standards on these properties. The Final Work Plan was conditionally approved by EPA on September 15, 2003, and finally approved by EPA by letter of October 9, 2003.

During subsequent excavation activities at Parcel J9-23-22, GE's excavation contractor discovered additional conditions that required leaving additional soil in place. These included the discovery of a 4-inch asbestos-containing utility pipe and the lack of a foundation footer for one of the buildings (as previously assumed). GE wrote letters to EPA (dated May 25, 2004 and May 28, 2004) proposing to leave additional soil in place to avoid disturbance to these items and demonstrating that doing so would not impact the achievement of the applicable Performance Standards for this property. EPA provided verbal approval of these proposed modifications.

The results of the RD/RA evaluations for the properties (or portions thereof) comprising Newell Street Area I are described on a property-by-property basis in Section 5 below. That section demonstrates that current, post-remediation conditions at each property (or portion thereof) meet the applicable soil-related Performance Standards under the CD and SOW.

4. Summary of Remediation Activities

4.1 General

This section of the Final Completion Report describes the activities performed by GE and its contractors related to the implementation of remediation activities at Newell Street Area I. As further described in this section, remediation activities (including site preparation, soil removal, engineered barrier installation, and property restoration) were implemented in four phases between September 2003 and June 2006. The first group of properties to be remediated (known as the Phase II properties) consisted of Parcels J9-23-16 through J9-23-18 and the adjoining portion of the Riparian Strip. The second group (the Phase IV properties) consisted of Parcels J9-23-22 through J9-23-24 and the adjoining portion of the Riparian Strip. The third group (the Phase I property) consisted of Parcel J9-23-13. The fourth group (the Phase III properties) consisted of Parcels J9-23-19 through J9-23-21 and the adjoining portion of the Riparian Strip.

The remediation was primarily conducted on behalf of GE by Maxymillian Technologies, Inc. (MTI). In addition, other contractors performed certain roles in connection with the remediation activities. Specifically, BBL assisted with daily on-site observation and documentation of the remediation activities; Hill Engineers, Architects & Planners (Hill Engineers) performed pre- and post-excavation survey control, as well as survey control following installation of the engineered barriers, as a subcontractor to MTI; Berkshire Environmental Consultants, Inc. (BEC) performed ambient air monitoring during the performance of excavation activities; and White Engineering, Inc. (White) provided assistance related to certain site restoration features. A description of the key components of the remediation activities conducted at Newell Street Area I is presented in the remainder of this section. Representative site photographs taken during and after completion of the remediation activities are provided in Appendix B.

4.2 Building Demolition

Separate from the remediation performed by GE at Newell Street Area I, GE performed building demolition activities for three buildings on GE-owned Parcels J9-23-16 and J9-23-23. As indicated in Section 5.9 of the Final Work Plan, these activities involved the demolition of one building on Parcel J9-23-16 and two buildings on Parcel J9-23-23. Demolition activities for each of the buildings were performed in September 2003. The building demolition activities were performed in accordance with GE's *Protocols for Building Demolition and Associated Characterization Activities* (Exhibit A-1 to GE's *Waste Characterization Plan*, which is Attachment A to GE's *Project Operations Plan*).

All demolition materials from the demolished buildings (except for specific items that were prohibited from disposition at the OPCAs under the CD and SOW) were subsequently consolidated at the Building 71 OPCA, which is authorized to receive such materials regardless of whether they are regulated under the Toxic Substances Control Act (TSCA) or constitute hazardous waste under the Resource Conservation and Recovery Act (RCRA).

4.3 Pre-Construction Activities

Several pre-construction activities were performed by GE and its subcontractors in preparation for the remediation activities at Newell Street Area I. Such activities generally included the following:

- Pre-mobilization submittals: Prior to initiating the remediation activities, MTI prepared several required submittals including a Health & Safety Plan, a Contingency Plan, and an Operations Plan. These submittals were provided to EPA in the *Final RD/RA Work Plan - Supplemental Information Package for Newell Street Area I* (SIP; BBL, September 26, 2003). MTI also provided information regarding the identification and testing of backfill materials for use following the performance of remediation activities. The sources of backfill materials used within Newell Street Area I were as follows:

  - General fill - Pittsfield Sand & Gravel, Browns Pit, Dalton, Massachusetts;

  - Gravel borrow - Valley Materials "Goodermotes," Stephentown, New York; and

  - Topsoil - Burgner's Farm, Dalton, Massachusetts.

  As stated in the SIP, analytical data for these fill sources had been provided to EPA in a May 8, 2003 letter from GE to the MDEP, with copy to EPA (for the Browns Pit and Burgner's Farm sources) and GE's July 31, 2003 Future City Recreational Area Supplemental Information Package (for all three sources). EPA's October 9, 2003 approval letter for the Final Work Plan included approval for GE's SIP for Newell Street Area I.

  In addition to the above-listed submittals, MTI was required to make certain other submittals associated with the materials of construction that MTI proposed to use during performance of the remediation activities at Newell Street Area I. Certain of these submittals dealt with the engineered barrier components applicable to certain properties, while other submittals dealt with restoration materials for select properties. Those submittals are included in Appendix C.

- Pre-construction meeting: An initial pre-construction meeting was held at the site on October 2, 2003, prior to the initiation of remediation activities at the first group of properties (i.e., the Phase II properties, as described above). Additional pre-construction meetings were held as appropriate prior to the initiation of remediation activities for the remaining groups of properties (i.e., the Phase IV, I, and III properties).

- Pre-construction survey: Prior to the initiation of remediation activities, Hill Engineers performed a pre-construction survey of Newell Street Area I. The purpose of that survey was to document existing conditions at each of the properties (or portions thereof) subject to the performance of remediation activities and to delineate the soil removal and engineered barrier areas, as well as other components of the project.

- Utility marking: Prior to initiating each phase of the remediation activities, DIGSAFE was contacted to demarcate subsurface utilities within the project area. In addition, certain above-ground utilities (i.e., utility poles and/or above-ground electrical lines on Parcels J9-23-19 through J9-23-22) were relocated prior to the initiation of the remediation activities.

- Tree survey/inventory: Prior to the start of vegetation clearing activities (described below), a tree survey/inventory was performed by White Engineering under subcontract to MTI. The tree survey focused mostly on the riverbank portion of the Riparian Strip which had previously been restored during the Removal Action for the Upper ½-Mile Reach of the Housatonic River. The purpose of the survey was to ensure that any trees removed during the performance of the remediation activities at that strip would be replaced with trees of similar size and quantities. Although these activities were focused mainly on the Riparian Strip, similar survey/inventory activities were performed at all of the properties to assist with restoration at each of the properties subject to remediation.

- Site controls: Site controls and access control measures (e.g., orange fencing) were established prior to the start of remediation activities to prevent access to the work areas by unauthorized personnel or vehicles.

- Erosion controls: Erosion control measures including hay bales and silt fencing were placed around the limits of soil excavation and/or engineered barrier installation areas prior to the start of remediation activities.

- Clearing of Vegetation: The above-grade portions of all trees, shrubs, or other vegetation which would have interfered with soil excavation and/or installation of engineered barriers were cleared prior to the initiation of remediation activities.

- Baseline air monitoring and air monitoring during remediation: BEC developed an air monitoring plan for use at Newell Street Area I that included the performance of baseline air monitoring activities prior to the initiation of remediation activities, followed by performance of air monitoring activities during active remediation within the RAA. The baseline air monitoring activities were performed to establish a baseline airborne PCB concentration for the RAA prior to initiation of earthwork activities. To accomplish this objective, BEC established air monitoring stations in the vicinity of the Phase II properties (i.e., Parcels J9-23-16 through J9-23-18 and the adjoining portion of the Riparian Strip, which were the first properties subject to remediation) at the locations specified in its work plan. An additional air monitoring station was established at the corner of Woodlawn Avenue and Tyler Street to measure background conditions during remediation activities. (That location was utilized for remediation conducted prior to July 18, 2005. After July 18, 2005, the background monitoring location was moved to a location between Building 9B on the GE Plant site and New York Avenue.) Following establishment of the air monitoring stations and prior to the commencement of significant excavation or construction activities, BEC performed two 24-hour-duration PCB monitoring events in September 2003. The results of these two air monitoring tests are included in a document titled *Ambient Air Monitoring for Polychlorinated Biphenyls and Particulate Matter, Newell Street Area I, Calendar Years 2003-2005* (Ambient Air Monitoring Report; BEC, August 2006), a copy of which is included in Appendix D. The air monitoring activities for PCBs and particulate matter during performance of the remediation activities at Newell Street Area I are further discussed later in this section.

- Mobilization of contractor equipment: The final pre-construction activity involved the mobilization of the contractor equipment necessary to perform the remediation activities to the project area.

Following performance of each of the pre-mobilization activities described above, the remedial contractor initiated performance of the remediation activities for each phase of the construction at Newell Street Area I. Those activities are described in the following sections.

4.4 Monitoring Well Decommissioning

Consistent with the Final Work Plan, seven of the 11 monitoring wells previously within Newell Street Area I were decommissioned prior to the performance of the remediation activities. The other four monitoring wells are part of ongoing groundwater monitoring activities associated with the GMA 1 monitoring well network, and therefore were protected during the performance of the remediation activities. The following table presents a summary of the wells that were either protected or decommissioned during the performance of the remediation activities:

Parcel	Decommissioned Wells	Protected Wells
J9-23-13	MM-2 MM-3	MM-1
J9-23-16	MW-1R MW2R MW-3R QP-27	--
J9-23-17	--	IA-9R
J9-23-19	SZ-3R	SZ-1
J9-23-23	--	FW-16R

Note:

-- = Not applicable.

The decommissioning of monitoring wells was performed in accordance with the general procedures described in Appendix GG of GE's approved FSP/QAPP. That Standard Operating Procedure was developed in accordance with Section 4.6 of the MDEP's *Standard References for Monitoring Wells* (April 19, 1991).

4.5 Soil Removal and Disposition Activities

Except at Parcel J9-23-22, the soil removal activities performed at each property were generally performed to the limits specified on the Technical Drawings provided in the Final Work Plan, using tracked excavators. As previously indicated in Section 3.4 and further discussed in Section 5.10, soil removal activities at Parcel J9-23-22 resulted in the identification of conditions requiring that certain additional soil be left in place. Specifically, one of the buildings on the property was built on a concrete slab and did not have a foundation footer (as previously assumed) and a 4-inch asbestos containing pipe was discovered in the 6-foot excavations on this property. As a result, the soil removal limits were modified in the field.

Prior to loading, the bed of each transport vehicle was lined with either polyethylene sheeting or another appropriate bed liner. After each vehicle was loaded, a tarpaulin was secured over the top of the bed, and the wheels and undercarriage of each transport vehicle were inspected to identify (and remove, if necessary) any accumulated soil prior to off-site transportation of the excavated soils. Before any soils were transported from the work site, a bill of lading was prepared and signed by GE or GE's representative for each vehicle transporting soils from the area. In accordance with provisions specified in the Final Work Plan, excavated non-TSCA/non-RCRA soils were loaded directly into trucks for transportation to the Hill 78 OPCA, while the remaining soils were loaded into trucks for transportation to the Building 71 OPCA. Excavated soils were sent to the appropriate OPCA either directly or after temporary placement in stockpile areas located within Buildings 63, 65, and/or 68 at GE's Pittsfield facility. Stockpiled materials sent to Buildings 63, 65, and 68 were placed on and covered with high density polyethylene (HDPE) until they were transferred to the OPCAs.

During the course of these removal activities, GE discovered buried drums and capacitors within certain portions of Newell Street Area I (i.e., Parcels J9-23-16, J9-23-17, and J9-23-19 through J9-23-21). All removed intact drums and capacitors were placed into drum overpacks and temporarily staged within GE's on-plant hazardous waste storage facility (i.e., Building 78). Once at Building 78, the drummed materials were appropriately characterized and the overpacks were transported to Waste Management's facilities in Model City, New York or Port Arthur, Texas for incineration/disposal. Fifteen drum overpacks containing capacitors and three drum overpacks containing drums or drum pieces were sent to the appropriate Waste Management facility.

In addition, during the performance of the soil removal activities at Parcel J9-23-24, a small UST was discovered adjacent to the building on this property. After several discussions with the property owner and EPA, it was determined that the UST would be removed from service and replaced with an above-ground storage tank inside the building. Prior to removal, the heating oil within the UST was pumped to containers provided by the property owner. Following transfer of these liquids, the UST, including certain associated piping, was drained and the collected liquids were drummed for subsequent transportation to GE's Pittsfield facility for waste characterization sampling prior to off-site disposal. Upon removal of the UST liquids and residuals, the UST and certain associated piping were excavated and crushed for transportation to the Building 71 OPCA along with excavated TSCA soils from this property.

As previously indicated, the remediation activities were performed in four phases in the following order: Phase II properties (Parcels J9-23-16 through J9-23-18 and adjoining portion of the Riparian Strip); Phase IV properties (Parcels J9-23-22 through J9-23-24 and adjoining portion of the Riparian Strip); Phase I property (Parcel J9-23-13); and Phase III

properties (Parcels J9-23-19 through J9-23-21 and adjoining portion of the Riparian Strip). The soil removal activities were performed to the limits shown on the as-built survey drawings provided in Appendix E. In addition to these soil removals, although not required to achieve a specific PCB Performance Standard, three soil piles (and two debris piles) located on Parcels J9-23-19 and J9-23-20 were removed during the course of the remediation. Based on the final survey measurements, approximately 14,810 cubic yards (cy) of soil were removed from Newell Street Area I, including approximately 13,960 cy of material transported to the Building 71 OPCA and approximately 850 cy of material transported to the Hill 78 OPCA. The following table presents a summary of the duration of soil removal activities and approximate soil removal volume associated with the remedial excavations at each property subject to remediation.

Parcel ID	Construction Duration	Approximate Soil Removal Volume (cy)
J9-23-13	August – September 2005	1,250
J9-23-16	October – December 2003; April – July 2004	2,200
J9-23-17	October – December 2003; April – July 2004	2,120
J9-23-18	October – December 2003; April – July 2004	325
J9-23-19	September – December 2005; June 2006	1,585[1]
J9-23-20	September – December 2005; June 2006	400[1]
J9-23-21	September – December 2005; June 2006	405
J9-23-22	May – September 2004	2,505
J9-23-23	May – September 2004	1,130
J9-23-24	May – September 2004	1,435
Riparian Strip	See Note 2	1,455
TOTAL	**--**	**14,810**

Notes:

1. These volumes include the soil piles removed from Parcels J9-23-19 and J9-23-20.
2. Remediation activities at the Riparian Strip were conducted in three phases: one with Parcels J9-23-16 through J9-23-18; one with Parcels J9-23-19 through J9-23-21; and one with Parcels J9-23-22 through J9-23-24.

Copies of the bills of lading for the excavated soils transported from Newell Street Area I to the applicable OPCAs or temporary stockpile areas located at the GE Pittsfield facility are provided in Appendix F. Copies of the bills of lading for materials placed in overpack drums (i.e., intact drums and capacitors) at Newell Street Area I for transportation to the GE's on-plant hazardous waste storage facility (i.e., Building 78) and copies of the waste manifests for the off-site transportation of those drum overpacks to the appropriate Waste Management facility (i.e., Model City, New York or Port Arthur, Texas) are provided in Appendix G.

4.6 Ambient Air Monitoring

As indicated in Section 4.3, baseline monitoring for PCBs was performed during two 24-hour monitoring events conducted on September 9-10 and September 11-12, 2003. In addition to the baseline air monitoring activities, ambient air monitoring for PCBs and particulate matter was performed by BEC during active excavation activities. Air monitoring for particulate matter was typically conducted from approximately 7 a.m. to 5 p.m. each day for the duration of the soil removal activities unless adverse weather conditions or equipment failures occurred. Particulate monitoring occurred at various locations within Newell Street Area I depending on the phase of remediation activities. Air monitoring activities for PCBs were performed on certain specific occasions during remediation activities in each of the four phases, as indicated in the following table:

Parcels Subject to Remediation	Date PCB Monitoring Was Performed
J9-23-16 J9-23-17 J9-23-18 Adjacent Portion of Riparian Strip	November 4-5, 2003
J9-23-22 J9-23-23 J9-23-24 Adjacent Portion of Riparian Strip	June 3-4, 2004
J9-23-13	August 18-19, 2005
J9-23-19 J9-23-20 J9-23-21 Adjacent Portion of Riparian Strip	October 12-13, 2005 and November 10-11, 2005

The air monitoring locations that were used during the performance of remediation activities at Newell Street Area I are presented on Figure 1 of Ambient Air Monitoring Report (Appendix D).

As discussed in the Ambient Air Monitoring Report, the airborne PCB notification level of 0.05 micrograms per cubic meter ($\mu g/m^3$) was not exceeded during any of the sampling events associated with the remediation activities for Newell Street Area I. Similarly, the airborne particulate notification level of 0.120 mg/m^3 for PM_{10} (small-diameter particles), which is 80% of the National Ambient Air Quality Standard (NAAQS) for PM_{10}, was not exceeded during any of the sampling events associated with the remediation activities.

4.7 Engineered Barrier Installation

As part of the remediation implemented to achieve the applicable Performance Standards, engineered barriers were installed over portions of certain properties within Newell Street Area I. Specifically, engineered barriers were installed on portions of Parcels J9-23-13, J9-23-16 through J9-23-20, J9-23-22, and J9-23-23. As established in Technical Attachment G to the SOW, the minimum thickness for the engineered barriers is 1 foot. As a result, the minimum thickness of the engineered barriers installed within Newell Street Area I was 1 foot. However, the engineered barriers installed on Parcels J9-23-19 and J9-23-20 were a minimum of 18 inches in thickness. Further, the installed thickness of the engineered barriers was greater than 1 foot in several areas to: 1) establish the proposed final barrier grades appropriate to direct infiltrating precipitation to collection pipes and away from the engineered barrier areas; and/or 2) accommodate the variability in site topography while maintaining a restored surface that promotes drainage of rainfall runoff away from the engineered barrier areas. The engineered barriers were constructed as shown on the as-built survey drawings and engineered barrier plan provided in Appendix E.

The total extent of the engineered barriers installed within Newell Street Area I encompasses approximately 67,000 square feet (sq. ft.). The following table presents a summary of the square footage of engineered barrier installed at each property subject to remediation:

Parcel ID	Approximate Engineered Barrier Area (sq. ft.)
J9-23-13	6,000
J9-23-16	12,120
J9-23-17	14,600
J9-23-18	5,500
J9-23-19	11,865
J9-23-20	1,000
J9-23-21	0
J9-23-22	7,035
J9-23-23	8,720
J9-23-24	0
Riparian Strip	0
TOTAL	**66,840**

The engineered barriers described in the remainder of this section were constructed in accordance with Attachments A (Technical Drawings) and B (Technical Specifications) of the Final Work Plan. The engineered barriers installed at each property were constructed of a geomembrane liner, a geosynthetic drainage composite, and a suitable cover consisting of soil fill and/or vegetation, asphalt (or in one case concrete), or gravel. The type of cover used on each property, or portion thereof, depended on the uses of the specific area/property at which the barrier was installed. Additional details regarding each type of barrier are provided below.

Vegetative Engineered Barriers

Vegetative engineered barriers were installed on portions of Parcels J9-23-16, J9-23-17, and J9-23-23. The final cover for vegetative engineered barriers consisted of soil fill (minimum of 12 inches on Parcels J9-23-16 and J9-23-17, and 9 inches on Parcel J9-23-23) and a topsoil layer (6 inches on Parcels J9-23-16 and J9-23-17, and 3 inches on Parcel J9-23-23), followed by placement of sod or grass seed, depending on the property. The vegetative layer on Parcels J9-23-16 and J9-23-23 consisted of grass seed, while the vegetative layer on Parcel J9-23-17 consisted of sod. The engineered barriers at Parcels J9-23-16 and J9-23-17 were constructed to match existing grade and direct precipitation

away from the engineered barrier areas. The engineered barrier at Parcel J9-23-23 was constructed above existing grade and contoured to direct precipitation away from the barrier area.

Asphalt/Concrete-Covered Engineered Barriers

Asphalt/concrete-covered engineered barriers were installed on portions of Parcels J9-23-13, J9-23-16, J9-23-17, J9-23-18, J9-23-22, and J9-23-23. As discussed in Section 4.8.4 below, the portion of the engineered barrier installed over the bocce courts at Parcel J9-23-17 included a concrete portion for the sidewalks around the bocce courts. This barrier over the sidewalks was constructed with a minimum of 6 inches of soil fill, covered with 8 inches of gravel subbase course and 4 inches of concrete. The remaining properties listed above were subject to installation of asphalt-covered engineered barriers. The cover for these barriers consisted of 12 inches of gravel subbase course and 6 inches of pavement that were contoured to match existing grade and direct precipitation away from the barrier areas.

Gravel-Covered Engineered Barriers

Gravel-covered engineered barriers were installed at Parcels J9-23-17, J9-23-19, J9-23-20, and J9-23-22 (in lieu of the engineered barrier types described in Attachment G to the SOW) in accordance with Section 5.7 of the Final Work Plan. At Parcels J9-23-19 and J9-23-20, the gravel-covered engineered barrier was constructed with 18 inches of gravel cover. This was necessary since the owner uses heavy construction equipment (e.g., excavators, cranes, etc.) on these parcels, which would otherwise damage a 12-inch vegetative or asphalt cover system. Similarly, at Parcel J9-23-22, the barrier was a minimum of 18 inches thick, with a cover of at least 12 inches of gravel material. At Parcel J9-23-17, the gravel-covered barrier included a minimum of 4 inches of soil fill, covered with 9 inches of stone/gravel subbase material and 3 inches of airport mix on the playing surface of the bocce courts. Since gravel cover material may become displaced over time (as a result of vehicular traffic, snow plowing, etc.), an additional layer of geotextile fabric was placed approximately 6 inches below the surface and within the cover materials to serve as an indication that 6 inches of gravel has been displaced and restoration of gravel cover materials was required.

4.8 Site Restoration and Demobilization

Following completion of the required soil removal activities, site restoration activities were performed as necessary. Upon completion of the site restoration activities, all debris was collected and disposed of at an appropriate disposal facility and all contractor equipment was demobilized from the work site. Additional details regarding each of these activities are provided below.

4.8.1 Completion of Engineered Barriers

Engineered barriers were installed on several properties within Newell Street Area I, as described in Section 4.7. Conventional construction equipment was used to spread and compact the various layers/materials of construction associated with each particular type of barrier. The geotextile cushion, geomembrane liner, and geocomposite were laid out by hand and anchored with sand bags until the remaining overlying cover materials were placed. As also described in Section 4.7, surface covers for the various engineered barriers consisted of topsoil and grass seed/sod for vegetative engineered barriers, gravel for gravel-covered engineered barriers, and a gravel subbase paved with asphalt or concrete for asphalt/concrete-covered engineered barriers.[2] The specific materials used and procedures followed during installation of the sublayers for the engineered barriers were provided in detail in Attachment B (Technical Specifications) of the Final Work Plan.

4.8.2 Restoration of Disturbed Vegetation

As indicated in Section 4.3, MTI subcontracted with White to perform an inventory of all existing trees and shrubs (e.g., type, quantity, size, etc.) located within the limits of the remediation activities prior to the initiation of those activities. In accordance with the Final Work Plan, excavation areas that originally contained vegetated surfaces (e.g., lawns, vegetated areas, etc.) were restored to within 6 inches of the original grade using compacted soil fill materials. In areas requiring the placement of grass seed, a 6-inch layer of topsoil was placed to restore pre-excavation grades, followed by placement of grass seed and mulch. In areas requiring the placement of sod, 4 inches of topsoil and a layer of sod were placed to restore pre-excavation grades. As part of the site restoration activities, the contractor restored removed trees and shrubs as appropriate in consultation with the property owners. At properties where engineered barriers were installed, all restored trees and shrubs were installed a minimum of 10 feet outside the limits of the engineered barriers to ensure that the barrier components are not impacted in the future by the root structures of such restored vegetation. Finally, the tree inventory was used to ensure that any trees which had been planted along the riverbank of the Housatonic River as part of the previous restoration activities associated with the Upper ½-Mile Reach Removal Action and which were then removed to perform the remediation actions for Newell Street Area I were restored in like quantity.

[2] During a fall 2007 inspection, it was noted that a portion of Parcel J9-23-16 where the Technical Drawings called for installation of an asphalt-covered engineered barrier and other re-paving with asphalt was restored with vegetation instead. As discussed below in Section 4.10, this situation was subsequently corrected.

4.8.3 Asphalt/Concrete/Gravel Areas

The portions of each property that were not subject to installation of engineered barriers or vegetative restoration were restored with asphalt, gravel, or concrete, to match pre-remediation conditions, as modified through discussions with the property owners. Specifically, driveways were restored with asphalt or gravel and sidewalks and various pads were restored with concrete. Restoration of the asphalt/concrete areas began with the placement and compaction of backfill. The backfill was placed as previously described to within 10 to 12 inches of final grade. A total of approximately 4 to 6 inches of gravel sub-base material was then placed on top of the backfill and compacted. In areas requiring the placement of asphalt, the final 4 to 6 inches of the excavation were restored with layers of binder and top/wearing course asphalt. The asphalt material was placed and compacted to generally match the surrounding surface contours and to promote positive drainage. In areas requiring the restoration of concrete, the final 4 to 6 inches of the excavation were restored with a layer of concrete and steel reinforcing mesh, which was poured to match the surrounding surface contours and to promote positive drainage. Areas requiring the restoration of gravel materials were backfilled to within 12 inches of final grade and backfilled with gravel material to surface grade. Similar to other restoration activities, the gravel material was placed to match the surrounding surface contours and to promote positive drainage.

4.8.4 Installation of Bocce Courts on Parcel J9-23-17

Based on discussions with the owner of Parcel J9-23-17, surface restoration activities performed at that parcel included the installation of three new bocce courts to replace the previous courts. The bocce courts were constructed as shown on the as-built survey drawing provided in Appendix E.

4.8.5 Installation of Concrete Floor in Building on Parcel J9-23-20

Restoration activities performed at Parcel J9-23-20 included the installation of a concrete floor inside the northern portion of the building on this parcel. Specifically, a 10-inch thick reinforced concrete floor measuring approximately 3,100 square feet was installed over the portion of the building which previously had a dirt floor. Installation of the concrete floor was performed in June 2006.

4.8.6 Other Miscellaneous Restoration

Miscellaneous restoration activities were performed at several properties based on discussions with the property owners or to assist with the designed operation of certain engineered barrier components. Such miscellaneous restoration activities included, but were not limited to, the following:

- Revised fencing configurations on several properties;
- Modifications to the surface restoration for certain areas of the properties (i.e., the limits of asphalt/concrete pavement or gravel areas);
- Installation of a concrete floor and enclosure of the building on the rear portion of Parcel J9-23-19;
- Installation of an asphalt drainage swale along the border between Parcels J9-23-22 and J9-23-23 to assist with surface drainage;
- Installation of a new catch basin and drain lines on Parcel J9-23-23 to assist with surface drainage; and
- Installation of new, or repair of existing, riprap drainage swales along the riverbank on the Riparian Strip.

4.9 Contractor Demobilization

At the completion of site restoration activities, contractor equipment, excess materials, temporary erosion and sedimentation control measures were removed from the site. Demobilization was completed as appropriate following completion of each phase of the remediation activities. Following demobilization, all restored vegetation was watered until adequately established.

4.10 Pavement Replacement at Parcel J9-23-16

During a fall 2007 inspection at Newell Street Area I, it was noted that the final surface restoration for a portion of Parcel J9-23-16 was not performed in accordance with the Technical Drawings. Specifically, the Technical Drawings called for the removal of a paved area measuring approximately 25 feet by 50 feet within the northern part of the driveway on that property, followed by installation of an asphalt-covered engineered barrier within a portion of that area and restoration of the remaining area with asphalt. During the remediation, MTI removed the specified 25-foot by 50-foot section of pavement and

installed the engineered barrier in the location specified in the Technical Drawings; however, this portion of the driveway was restored with a vegetative cover rather than pavement. To correct this situation, MTI returned to Parcel J9-23-16 on November 7, 2007, and conducted limited additional excavation and restoration activities at this area in accordance with the requirements of the Technical Drawings. Specifically, approximately 18 inches of soil were hand excavated from the area over the engineered barrier and 6 inches of soil were removed from the adjacent areas subject to pavement restoration. Soil samples were collected from the materials subject to excavation and submitted for PCB and Toxicity Characteristic Leaching Procedure (TCLP) analyses. Based on the results of those samples, approximately 70 cy of excavated materials were transported to Building 68 at the GE Pittsfield facility for ultimate disposition at the Hill 78 OPCA. Copies of the bills of lading for the excavated soils transported from Parcel J9-23-16 to the GE Pittsfield facility are provided in Appendix F. Following excavation, the area over the engineered barrier was restored with 12 inches of subbase material and 6 inches of asphalt pavement (including a 4-inch base course and a 2-inch wearing course), while the remainder of the 25-foot by 50-foot area was restored with 6 inches of asphalt pavement (4-inch base course and 2-inch wearing course).

4.11 Impacts to Flood Storage Capacity

Since the entire Newell Street Area I RAA is located within the 100-year floodplain of the Housatonic River, potential impacts to the flood storage capacity caused by the proposed remediation activities within this area were evaluated in the Final Work Plan. The proposed soil removal/replacement, soil grading, building demolition, and installation of engineered barriers were included in that initial assessment in the Final Work Plan.

Since that time, GE has conducted a revised flood storage volume assessment for Newell Street Area I as part of its overall flood storage volume assessment for the portion of the Housatonic River 100-year floodplain between Newell Street and Lyman Street (which incorporated the overall changes to the flood storage capacity associated with the completed and anticipated performance of several remediation/demolition activities within this stretch of the floodplain). That revised assessment for Newell Street Area I is presented in Appendix H, which includes a table (Table H-1) showing flood storage losses and gains from the activities at Newell Street Area I on a foot-by-foot basis, as well as a figure (Figure H-1) depicting the areas described in that table. The calculations shown in Appendix H are based on the Technical Drawings contained in the Final Work Plan. As discussed above, the remediation and restoration activities at Newell Street Area I were performed in accordance with the Technical Drawings (with the correction discussed in Section 4.10). As a result, the flood storage calculations presented in Appendix H represent the flood storage losses and gains resulting from the activities actually performed, as reflected on the as-built survey drawings and engineered barrier plan.

As shown in Appendix H, the remediation activities at Newell Street Area I, as shown on the as-built survey drawings and engineered barrier plan in Appendix E, resulted in gains in flood storage capacity at some elevation increments (due to building demolitions and soil grading) and losses at other elevation increments (due to installation of engineered barriers as well as the bocce courts on Parcel J9-23-17). The loss of flood storage capacity at any elevation increment in this RAA will be offset by gains in flood storage capacity resulting from other remediation/demolition activities in other areas within the 100-year floodplain. GE's overall flood storage capacity analysis, including details regarding these offsets, will be presented to EPA for approval in the Second Addendum to the Conceptual RD/RA Work Plan for the East Street Area 2-South RAA.

5. Achievement of Performance Standards

5.1 General

This section demonstrates that the implementation of the remediation actions described in Section 4, for those properties where remediation was conducted, achieved the applicable soil-related Performance Standards described in Section 3 for PCBs and other Appendix IX+3 constituents for each such property. It further demonstrates that, at the two properties where remediation was not required, the existing conditions at those properties meet the applicable Performance Standards. The discussion in this section is presented on a parcel-by-parcel basis. It relies principally on the RD/RA evaluations presented in the Conceptual Work Plan Addendum, as modified by the subsequent evaluations described in Section 3.4.

5.2 GE-Owned Riparian Strip

As shown on Figure 2, the Riparian Strip located within Newell Street Area I is a GE-owned strip of land that runs behind Parcels J9-23-16 through J9-23-25, along the northwestern boundary of the RAA and adjacent to the Housatonic River. This property was evaluated as an unpaved riparian recreational property. GE has executed an ERE for this property in accordance with the CD and SOW, as discussed further in Section 6.2 below.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this property indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1', 1-3', and 0-15'), remediation was required to achieve the PCB Performance Standard for each such depth increment. Since the Riparian Strip located within Newell Street Area I is less than 0.5 acre in size, the NTE criterion does not apply to this property. For non-PCB constituents, the Conceptual Work Plan Addendum indicated that remediation was necessary to meet the Performance Standards for certain such constituents in certain depth increments.

The remediation performed at the Riparian Strip involved the removal and replacement of approximately 1,455 cy of soil. Based on the evaluations presented in the Conceptual Work Plan Addendum, this remediation resulted in achievement of the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration (ppm)
0 – 1’	10	1.6
1 – 3’	15	11.57
0 – 15’	100	72.54

In addition, although the NTE criterion does not apply to the Riparian Strip, the performance of this remediation resulted in the removal of all unpaved surface soils containing PCBs at concentrations greater than the 50 ppm NTE level applicable to recreational properties.

With respect to non-PCB constituents, as indicated in the Conceptual Work Plan Addendum, all dioxin/furan TEQ concentrations were below the applicable comparison criteria under then-existing conditions. For the other constituents that were retained after comparison to the Screening PRGs, certain constituents had pre-remediation average concentrations greater than their corresponding Method 1 soil standards. Although the remediation lowered the post-remediation concentrations for the retained constituents in each depth increment, certain of those constituents still had post-remediation average concentrations slightly greater than the corresponding Method 1 soil standards. Therefore, a parcel-specific risk evaluation was performed for this property in its post-remediation condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under post-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents are below the benchmarks specified in the SOW (ELCR of 1 x 10^{-5} and non-cancer HI of 1.0) and, for lead, are below the applicable RBC. Further, GE’s evaluation showed that, for the 0- to 15-foot depth increment, the average post-remediation concentrations of all retained non-PCB constituents are less than their MCP UCLs. Thus, the post-remediation conditions at the Riparian Strip satisfy the applicable Performance Standards for non-PCB constituents.

5.3 Parcel J9-23-13

As shown on Figure 2, Parcel J9-23-13 is bordered by the Newell Street Area II RAA to the north and west, Parcel J9-23-16 to the east, and Newell Street to the south. This property is a non-GE-owned commercial property and the owner elected not to execute an ERE for the property. Therefore, in accordance with the CD and SOW, GE implemented a Conditional Solution at this property.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this property indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1', 0-3', 1-6', and 0-15'), remediation was required to achieve the PCB Performance Standards for the 0- to 1-foot and 0- to 3-foot depth increments. Further, since this property is greater than 0.5 acre in size, the NTE concentration of 125 ppm in the top foot of unpaved soils at commercial properties applies; and there were five surface soil sample locations at this property with PCB concentrations exceeding that level. In addition, the Conceptual Work Plan Addendum indicated that remediation was necessary to meet the Performance Standards for certain non-PCB constituents in certain depth increments.

The remediation performed at Parcel J9-23-13 involved the removal/replacement of approximately 1,250 cy of soil and installation of approximately 6,000 square feet (sq. ft.) of engineered barrier. This remediation resulted in the removal of all unpaved surface soils associated with the five sample locations containing PCB concentrations in excess of the NTE level. Further, based on the evaluations presented in the Conceptual Work Plan Addendum, this remediation resulted in average post-remediation PCB concentrations that achieved the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration (ppm)
0 – 1'	25	1.33
0 – 3'	25	3.43
1 – 6'	200	21.85
0 – 15'	100	31.50

With respect to non-PCB constituents, as shown in the Conceptual Work Plan Addendum, the post-remediation concentrations of dioxin/furan TEQs are below the applicable comparison criteria. For the other constituents that were retained after comparison to the Screening PRGs, the evaluation of post-remediation conditions indicated that a couple of constituents were still present at post-remediation average concentrations slightly greater than their corresponding Method 1 soil standards. Therefore, a parcel-specific risk evaluation was performed for this property in its post-remediation condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under post-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents are below the benchmarks specified in the SOW (ELCR of 1 x 10^{-5} and non-cancer HI of 1.0) and, for lead, are below the applicable

comparison criteria. Further, GE's evaluation showed that, for the 0- to 15-foot depth increment, the average post-remediation concentrations of all retained non-PCB constituents are less than their MCP UCLs. Thus, the post-remediation conditions at Parcel J9-23-13 satisfy the applicable Performance Standards for non-PCB constituents.

5.4 Parcel J9-23-16

As shown on Figure 2, Parcel J9-23-16 is bordered by Parcel J9-23-13 to the west, the Riparian Strip to the north, Parcel J9-23-17 to the east, and Newell Street to the south. Parcel J9-23-16 is a GE-owned commercial property. As such, GE has executed an ERE for this property in accordance with the CD and SOW, as discussed in Section 6.2.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this property indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1', 1-6', and 0-15'), remediation was required to achieve the PCB Performance Standards for all depth increments. Further, since this property is greater than 0.5 acre in size, the NTE concentration of 125 ppm in the top foot of unpaved soils at commercial properties applies; and there were 21 surface soil sample locations at this property with PCB concentrations exceeding that level. In addition, the Conceptual Work Plan Addendum indicated that remediation was necessary to meet the Performance Standards for certain non-PCB constituents.

The remediation performed at Parcel J9-23-16 involved the removal/replacement of approximately 2,200 cy of soil and the installation of approximately 12,120 sq. ft. of engineered barrier. This remediation resulted in the removal of all unpaved surface soils associated with the 21 sample locations containing PCB concentrations in excess of the NTE level. Further, based on the evaluations presented in the Conceptual Work Plan Addendum, this remediation resulted in average post-remediation PCB concentrations that achieved the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration(ppm)
0 – 1' (Unpaved)	25	1.06
0 – 1' (Paved)	25	10.72
1 – 6'	200	78.03
0 – 15'	100	95.18

With respect to non-PCB constituents, as shown in the Conceptual Work Plan Addendum, the post-remediation concentrations of dioxin/furan TEQs are below the applicable comparison criteria. For the other constituents that were retained after comparison to the Screening PRGs, the evaluation of post-remediation conditions indicated that some constituents were still present at post-remediation average concentrations slightly greater than their corresponding Method 1 soil standards. Therefore, a parcel-specific risk evaluation was performed for this property in its post-remediation condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under post-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents are below the benchmarks specified in the SOW (ELCR of 1 x 10^{-5} and non-cancer HI of 1.0) and, for lead, are below the applicable comparison criteria. Further, GE's evaluation showed that, for the 0- to 15-foot depth increment, the average post-remediation concentrations of all retained non-PCB constituents are less than their MCP UCLs. Thus, the post-remediation conditions at Parcel J9-23-16 satisfy the applicable Performance Standards for non-PCB constituents.

5.5 Parcel J9-23-17

As shown on Figure 2, Parcel J9-23-17 is bordered by Parcel J9-23-16 to the west, the Riparian Strip to the north, Parcel J9-23-18 to the east, and Newell Street to the south. This property is a non-GE-owned recreational property, and the owner elected not to execute an ERE for the property. Therefore, in accordance with the CD and SOW, GE implemented a Conditional Solution at this property.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this property indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1', 0-3', and 0-15'), remediation was required to achieve the PCB Performance Standards for all those depth increments. Further, since this property is greater than 0.5 acre in size, the NTE concentration of 50 ppm in the top foot of unpaved soils at recreational properties applies; and there were 11 surface soil sample locations at this property with PCB concentrations exceeding that level. For this property, the Conceptual Work Plan Addendum concluded that remediation was not necessary to meet the Performance Standards for non-PCB constituents.

The remediation performed at Parcel J9-23-17 involved the removal/replacement of approximately 2,120 cy of soil and the installation of approximately 14,600 sq. ft. of engineered barrier. This remediation resulted in the removal of all unpaved surface soils associated with the 11 sample locations containing PCB concentrations in excess of the NTE level. Further, based on the evaluations presented in the Conceptual Work Plan Addendum, this remediation resulted in average post-remediation PCB concentrations that achieved the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration (ppm)
0 – 1’	10	7.55
0 – 3’	10	9.90
0 – 15’	100	41.55

With respect to non-PCB constituents, as indicated in the Conceptual Work Plan Addendum, two samples (one from the top foot and one from the 3- to 6-foot depth increment) had dioxin/furan TEQ concentrations greater than the applicable PRG. Therefore, the 95% UCL was calculated for the TEQ concentrations in the 0- to 1-foot and 3- to 15-foot depth increments. These calculated values were both less than the applicable comparison criteria. However, certain other constituents that were retained after comparison to the Screening PRGs had existing average concentrations slightly greater than their corresponding Method 1 standards. As a result, a parcel-specific risk evaluation was performed for this property in its then-existing condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under pre-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents were below the benchmarks specified in the SOW (ELCR of 1×10^{-5} and non-cancer HI of 1.0) and, for lead, were below the applicable RBC. Further, GE’s evaluation showed that, for the 0- to 15-foot depth increment, the average pre-remediation concentrations of all retained non-PCB constituents were less than their MCP UCLs. For these reasons, Parcel J9-23-17 satisfies the applicable Performance Standards for non-PCB constituents without considering the remediation performed.

5.6 Parcel J9-23-18

As shown on Figure 2, Parcel J9-23-18 is bordered by Parcel J9-23-17 to the west, the Riparian Strip to the north, Parcel J9-23-19 to the east, and Newell Street to the south. This parcel is a non-GE-owned commercial property, and the owner elected not to execute an ERE for the property. Therefore, in accordance with the CD and SOW, GE implemented a Conditional Solution at this property.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this property indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1', 0-3', 1-6', and 0-15'), remediation was required to achieve the PCB Performance Standards for the 0- to 3-foot and 0- to 15-foot depth increments. Since this property is less than 0.5 acre in size, the NTE criterion does not apply to this property. Further, the Conceptual Work Plan Addendum indicated that remediation was not necessary to meet the Performance Standards for non-PCB constituents at this property.

The remediation performed at Parcel J9-23-18 involved the removal/replacement of approximately 325 cy of soil and the installation of approximately 5,500 sq. ft. of engineered barrier. Based on the evaluations presented in the Conceptual Work Plan Addendum, this remediation resulted in achievement of the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration (ppm)
0 – 1'	25	5.18
0 – 3'	25	22.75
1 – 6'	200	86.25
0 – 15'	100	77.11

In addition, although the NTE criterion does not apply at this property, the remediation also resulted in the removal of the unpaved surface soil associated with the single sample location containing a PCB concentration in excess of the NTE concentration of 125 ppm applicable to commercial properties.

With respect to non-PCB constituents, as shown in the Conceptual Work Plan Addendum, all dioxin/furan TEQ concentrations were below the applicable comparison criteria under then-existing conditions. However, certain other constituents that were retained after comparison to the Screening PRGs had existing average concentrations slightly greater than their corresponding Method 1 standards. Therefore, a parcel-specific risk evaluation was performed for the soils in the 0- to 1-foot, 0- to 3-foot, and 1- to 6-foot depth increments at this property in its then-existing condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under pre-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents were below the benchmarks specified in the SOW (ELCR of 1×10^{-5} and non-cancer HI of 1.0) and, for lead, were below the applicable comparison criteria. Further, GE's evaluation showed that, for the 0- to 15-foot depth increment, the average pre-remediation concentrations of all retained non-PCB constituents were less than their MCP UCLs. For these reasons, Parcel J9-23-18 satisfies the applicable Performance Standards for non-PCB constituents without considering the remediation performed.

5.7 Parcel J9-23-19

As shown on Figure 2, Parcel J9-23-19 is bordered by J9-23-18 to the west, the Riparian Strip to the north, Parcel J9-23-20 to the east, and Newell Street to the south. This parcel is one of three contiguous commercial parcels owned by the same private owner, who decided not to execute an ERE. Therefore, in accordance with the CD and SOW, GE implemented a Conditional Solution at this property.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this parcel indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1', 0-3', 1-6', and 0-15'), remediation was required to achieve the PCB Performance Standard for the 0- to 15-foot depth increment. Since this parcel is greater than 0.5 acre in size, the NTE concentration of 125 ppm in the top foot of unpaved soils at commercial properties applies. However, there were no surface soil samples in unpaved areas with PCB concentrations exceeding that level. For non-PCB constituents, the Conceptual Work Plan Addendum indicated that remediation was necessary to meet the Performance Standards for some such constituents.

The remediation performed at Parcel J9-23-19 involved the removal/replacement of approximately 1,585 cy of soil (including the removal of soil piles that was not required to achieve a specific PCB Performance Standard) and the installation of approximately 11,865 sq. ft. of engineered barrier. Based on the evaluations presented in the Conceptual Work Plan Addendum, the remediation at this parcel resulted in achievement of the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration (ppm)
0 – 1’	25	1.51
0 – 3’	25	13.11
1 – 6’	200	89.89
0 – 15’	100	33.77

With respect to non-PCB constituents, as shown in the Conceptual Work Plan Addendum, all dioxin/furan TEQ concentrations were below the applicable comparison criteria under then-existing conditions. However, certain other constituents that were retained after comparison to the Screening PRGs had existing average concentrations greater than their corresponding Method 1 standards in several depth increments. Although the remediation lowered post-remediation concentrations for the retained constituents in each depth increment, certain of those constituents still had average post-remediation concentrations slightly greater than the corresponding Method 1 soil standards. Therefore, a parcel-specific risk evaluation was performed for this parcel in its post-remediation condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under post-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents are below the benchmarks specified in the SOW (ELCR of 1×10^{-5} and non-cancer HI of 1.0) and, for lead, are below the applicable comparison criteria. Further, GE’s evaluation showed that, for the 0- to 15-foot depth increment, the average post-remediation concentrations of all retained non-PCB constituents are less than their MCP UCLs. Thus, the post-remediation conditions at Parcel J9-23-19 satisfy the applicable Performance Standards for non-PCB constituents.

5.8 Parcel J9-23-20

As shown on Figure 2, Parcel J9-23-20 is bordered by J9-23-19 to the west, the Riparian Strip to the north, Parcel J9-23-21 to the east, and Newell Street to the south. This parcel is the second of three contiguous commercial parcels owned by the same private owner, who decided not to execute an ERE. Therefore, in accordance with the CD and SOW, GE implemented a Conditional Solution at this property.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this parcel indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1’, 0-3’, 1-6’, and 0-15’), remediation was required to achieve the PCB Performance Standard for the 0- to 15-foot depth increment. Since this parcel is less than 0.5 acre in size, the NTE concentration of 125 ppm in the top foot of unpaved soils

at commercial properties does not apply. Nevertheless, GE determined that there were no surface soil samples in unpaved areas with PCB concentrations exceeding that level. For non-PCB constituents, the Conceptual Work Plan Addendum concluded that no remediation was necessary at this parcel to meet the Performance Standards for such constituents.

The remediation performed at Parcel J9-23-20 involved the removal/replacement of approximately 400 cy of soil (including the removal of soil piles that was not required to achieve a specific PCB Performance Standard) and the installation of approximately 1,000 sq. ft. of engineered barrier. In addition, a new concrete floor was installed over a dirt floor inside the building at this parcel. Based on the evaluations presented in the Conceptual Work Plan Addendum, the remediation at this parcel resulted in resulted in achievement of the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration (ppm)
0 – 1’	25	1.92
0 – 3’	25	11.04
1 – 6’	200	55.40
0 – 15’	100	69.79

With respect to non-PCB constituents, as indicated in the Conceptual Work Plan Addendum, all dioxin/furan TEQ concentrations were below the applicable comparison criteria under then-existing conditions. However, certain other constituents that were retained after comparison to the Screening PRGs had existing average concentrations slightly greater than their corresponding Method 1 standards. As a result, a parcel-specific risk evaluation was performed for this parcel in its then-existing condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under pre-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents were below the benchmarks specified in the SOW (ELCR of 1×10^{-5} and non-cancer HI of 1.0) and, for lead, were below the applicable comparison criteria. Further, GE’s evaluation showed that, for the 0- to 15-foot depth increment, the average pre-remediation concentrations of all retained non-PCB constituents were less than their MCP UCLs. For these reasons, Parcel J9-23-20 satisfies the applicable Performance Standards for non-PCB constituents without considering the remediation performed.

5.9 Parcel J9-23-21

As shown on Figure 2, Parcel J9-23-21 is bordered by J9-23-20 to the west, the Riparian Strip to the north, Parcel J9-23-22 to the east, and Newell Street to the south. This parcel is the third of three contiguous commercial parcels owned by the same private owner, who decided not to execute an ERE. Therefore, in accordance with the CD and SOW, GE implemented a Conditional Solution at this property.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this parcel indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1', 0-3', 1-6', and 0-15'), remediation was required to achieve the PCB Performance Standard for the 0- to 3-foot depth increment. Further, since this property is greater than 0.5 acre in size, the NTE concentration of 125 ppm in the top foot of unpaved soils at commercial properties applies; and there were two surface soil sample locations at this property with PCB concentrations exceeding that level. In addition, the Conceptual Work Plan Addendum indicated that remediation was necessary to meet the Performance Standards for certain non-PCB constituents.

The remediation performed at Parcel J9-23-21 involved the removal/replacement of approximately 405 cy of soil. This remediation resulted in the removal of the unpaved surface soils associated with the two sample locations containing PCB concentrations in excess of the NTE level. Further, based on the evaluations presented in the Conceptual Work Plan Addendum, this remediation resulted in average post-remediation PCB concentrations that achieved the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration (ppm)
0 – 1'	25	3.12
0 – 3'	25	20.70
1 – 6'	200	71.62
0 – 15'	100	34.69

With respect to non-PCB constituents, as indicated in the Conceptual Work Plan Addendum, one sample, collected from the 3- to 6-foot depth, had a dioxin/furan TEQ concentration greater than the applicable PRG. As a result, the 95% UCL of the TEQ data was calculated for the 1- to 15-foot depth increment. That calculated 95% UCL value was less than the applicable PRG for this depth increment. However, certain other constituents that were retained after the comparison to the Screening PRGs had then-existing average

concentrations greater than their corresponding Method 1 soil standards in all depth increments. Although the remediation lowered post-remediation concentrations for the retained constituents in the 0- to 1-foot, 0- to 3-foot, and 0- to 15-foot depth increments, certain of those constituents still had post-remediation average concentrations slightly greater than their corresponding Method 1 soil standards in two depth increments. Therefore, a parcel-specific risk evaluation was performed for this parcel in its post-remediation condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under post-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents are below the benchmarks specified in the SOW (ELCR of 1 x 10^{-5} and non-cancer HI of 1.0). (Lead was not a retained constituent at this parcel.) Further, GE's evaluation showed that, for the 0- to 15-foot depth increment, the average post-remediation concentrations of all retained non-PCB constituents are less than their MCP UCLs. Thus, the post-remediation conditions at Parcel J9-23-21 satisfy the applicable Performance Standards for non-PCB constituents.

5.10 Parcel J9-23-22

As shown on Figure 2, Parcel J9-23-22 is bordered by J9-23-21 to the west, the Riparian Strip to the north, Parcel J9-23-23 to the east, and Newell Street to the south. This parcel is a non-GE-owned commercial property, and the property owner elected not to execute an ERE for the property. Therefore, in accordance with the CD and SOW, GE implemented a Conditional Solution at this property.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this property indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1', 0-3', 1-6', and 0-15'), remediation was required to achieve the PCB Performance Standards for all depth increments. Further, since this property is greater than 0.5 acre in size, the NTE concentration of 125 ppm in the top foot of unpaved soils at commercial properties applies; and there were six surface soil sample locations at this property with PCB concentrations exceeding that level. For non-PCB constituents, the Conceptual Work Plan Addendum concluded that no remediation was necessary at this property to meet the Performance Standards for such constituents.

As previously noted in Section 3.4, several subsequent evaluations were performed for this property based on modifications to the soil removal limits to ensure the structural stability of buildings and subsurface utilities:

- As discussed in the Final Work Plan, GE elected not to excavate certain soils from deeper (i.e., six foot) excavations adjacent to a building on Parcel J9-23-22, which were shown to extend below the foundation/frost wall of this structure, to ensure the structural stability of the building during the excavation. Instead, GE elected to leave in place a wedge of soil extending from the bottom of the building foundation/footer on a 1:1 slope (1 foot horizontal to 1 foot vertical) to the bottom of the proposed excavation. Attachment C of the Final Work Plan demonstrated that leaving such soils in place would not impact the achievement of the applicable PCB Performance Standards for this property.

- During the subsequent excavation activities at this property, a 4-inch asbestos-containing pipe (running from the rear building to Newell Street) was discovered in the six-foot excavation areas on this property. To avoid interruption of utility service to this building and since the pipe was constructed of asbestos-containing material, GE elected not to disturb the pipe or a wedge of soil underlying the pipe. In a letter to EPA dated May 25, 2004, GE presented an evaluation demonstrating that leaving a wedge of soils in place to support the 4-inch pipe would not impact the achievement of the applicable Performance Standards for this property.

- Later that same week, GE's excavation contractor discovered during activities adjacent to the rear building on Parcel J9-23-22 that the building was not constructed with a foundation footer, as previously assumed in the evaluations presented in the Conceptual Work Plan Addendum. As a result, GE elected to increase the size of the wedge of soil that would remain unexcavated adjacent to the building. In a letter to EPA dated May 28, 2004, GE presented an evaluation demonstrating that the proposed expansion of the soil wedge adjacent to the rear building would not impact the achievement of the applicable Performance Standards for this property.

The remediation performed at this property involved the removal/replacement of approximately 2,505 cy of soil and installation of approximately 7,035 sq. ft of engineered barrier. This remediation resulted in the removal of all unpaved surface soils associated with the six sample locations containing PCB concentrations in excess of the NTE level. Further, based on the evaluations presented in the Conceptual Work Plan Addendum, as modified by the subsequent evaluations relating to leaving the soil wedges in place, this remediation resulted in average post-remediation PCB concentrations that achieved the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration (ppm)
0 – 1’	25	2.88
0 – 3’	25	16.66
1 – 6’	200	159.54
0 – 15’	100	69.97

With respect to non-PCB constituents, as indicated in the Conceptual Work Plan Addendum, two samples (one from the 1- to 3-foot depth and one from the 3- to 6-foot depth) had dioxin/furan TEQ concentrations greater than the applicable comparison criteria. Therefore, the 95% UCL was calculated for the TEQ concentrations in the 0- to 3-foot and 1- to 15-foot depth increments. These calculated values were both less than the applicable comparison criteria. However, certain other constituents that were retained after comparison to the Screening PRGs had existing average concentrations slightly greater than their corresponding Method 1 standards. As a result, a parcel-specific risk evaluation was performed for this property in its then-existing condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under pre-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents were below the benchmarks specified in the SOW (ELCR of 1×10^{-5} and non-cancer HI of 1.0) and, for lead, were below the applicable comparison criteria. Further, GE’s evaluation showed that, for the 0- to 15-foot depth increment, the average pre-remediation concentrations of all retained non-PCB constituents were less than their MCP UCLs. For these reasons, Parcel J9-23-22 satisfies the applicable Performance Standards for non-PCB constituents without considering the remediation performed.

5.11 Parcel J9-23-23

As shown on Figure 2, Parcel J9-23-23 is bordered by Parcel J9-23-22 to the west, the Riparian Strip to the north, Parcels J9-23-24 and J9-23-25 to the east, and Newell Street to the south. Parcel J9-23-22 is a GE-owned commercial property. As such, GE has executed an ERE for this property in accordance with the CD and SOW, as discussed in Section 6.2.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this property indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1’, 1-6’, and 0-15’), remediation was required to achieve the PCB Performance Standards for all depth increments. Further, since this property is greater than 0.5 acre in size, the NTE concentration of 125 ppm in the top foot of unpaved

soils at commercial properties applies; and there were seven surface soil sample locations at this property with PCB concentrations exceeding that level. For non-PCB constituents, the Conceptual Work Plan Addendum concluded that no remediation was necessary at this property to meet the Performance Standards for such constituents.

The remediation performed at Parcel J9-23-23 involved the removal/replacement of approximately 1,130 cy of soil and installation of approximately 8,720 sq. ft of engineered barrier. This remediation resulted in the removal of all unpaved surface soils associated with the seven sample locations containing PCB concentrations in excess of the NTE level. Further, based on the evaluations presented in the Conceptual Work Plan Addendum, this remediation resulted in average post-remediation PCB concentrations that achieved the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration (ppm)
0 – 1' (Unpaved)	25	14.37
0 – 1' (Paved)	25	2.08
1 – 6'	200	146.73
0 – 15'	100	91.48

With respect to non-PCB constituents, as indicated in the Conceptual Work Plan Addendum, all dioxin/furan TEQ concentrations were below the applicable comparison criteria under then-existing conditions. However, certain other constituents that were retained after comparison to the Screening PRGs had existing average concentrations slightly greater than their corresponding Method 1 standards. As a result, a parcel-specific risk evaluation was performed for this property in its then-existing condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under pre-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents were below the benchmarks specified in the SOW (ELCR of 1×10^{-5} and non-cancer HI of 1.0) and, for lead, were below the applicable comparison criteria. Further, GE's evaluation showed that, for the 0- to 15-foot depth increment, the average pre-remediation concentrations of all retained non-PCB constituents were less than their MCP UCLs. For these reasons, Parcel J9-23-23 satisfies the applicable Performance Standards for non-PCB constituents without considering the remediation performed.

5.12 Parcel J9-23-24

As shown on Figure 2, Parcel J9-23-24 is bordered by Parcel J9-23-23 to the west and north, Parcel J9-23-25 to the east, and Newell Street to the south. This parcel is a non-GE-owned commercial property, and the owner has executed an ERE for this property, as discussed in Section 6.2.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this property indicated that, based on the calculated pre-remediation average PCB concentrations in the relevant depth increments (0-1', 1-6', and 0-15'), remediation was required to achieve the PCB Performance Standards for all depth increments. Since this property is less than 0.5 acre in size, the NTE concentration of 125 ppm in the top foot of unpaved soils does not apply. For non-PCB constituents, the Conceptual Work Plan Addendum indicated that no remediation was necessary at this property to meet the Performance Standards for such constituents.

Similar to Parcel J9-23-22, an evaluation was subsequently performed for this property based on a modification to the soil removal limits to ensure the stability of the building located at this property. Specifically, as discussed in the Final Work Plan, GE elected to leave a wedge of soil in place extending from the bottom of the building foundation/footer on a 1:1 slope to the bottom of the proposed excavation; and it demonstrated that leaving such soils in place would not impact the achievement of the applicable PCB Performance Standards for this property.

The remediation performed at Parcel J9-23-24 involved the removal and replacement of approximately 1,435 cy of soil. As noted in Section 4.5 above, during excavation activities at this property, GE's excavation contractor discovered a small UST adjacent to the building. After discussions with the property owner and EPA, this UST was removed from service, drained, excavated, crushed, and sent to the Building 71 OPCA, as described in Section 4.5. Based on the evaluations presented in the Conceptual Work Plan Addendum, as modified by the subsequent evaluation relating to leaving a soil wedge in place, the remediation at this property resulted in achievement of the applicable PCB Performance Standards, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Post-Remediation Average PCB Concentration (ppm)
0 – 1' (Unpaved)	25	6.98
0 – 1' (Paved)	25	0.25
1 – 6'	200	111.65
0 – 15'	100	91.21

With respect to non-PCB constituents, as indicated in the Conceptual Work Plan Addendum, all dioxin/furan TEQ concentrations were below the applicable comparison criteria under then-existing conditions. However, certain other constituents that were retained after comparison to the Screening PRGs had existing average concentrations slightly greater than their corresponding Method 1 standards. As a result, a parcel-specific risk evaluation was performed for this property in its then-existing condition.

That risk evaluation, included in Appendix F of the Conceptual Work Plan Addendum, indicates that, under pre-remediation conditions, both cancer risks and non-cancer hazards due to the retained constituents were below the benchmarks specified in the SOW (ELCR of 1×10^{-5} and non-cancer HI of 1.0). (Lead was not a retained constituent at this property.) Further, GE's evaluation showed that, for the 0- to 15-foot depth increment, the average pre-remediation concentrations of all retained non-PCB constituents were less than their MCP UCLs. For these reasons, Parcel J9-23-24 satisfies the applicable Performance Standards for non-PCB constituents without considering the remediation performed.

5.13 Parcel J9-23-25

As shown on Figure 2, Parcel J9-23-25 is bordered by Parcels J9-23-23 and J9-23-24 to the west, the Riparian Strip to the north, Parcel J9-23-26 to the east, and Newell Street to the south. This parcel is a non-GE-owned commercial property, and the property owner elected not to execute an ERE for the property. Therefore, in accordance with the CD and SOW, GE implemented a Conditional Solution at this property.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this property demonstrated that, based on the calculated average PCB concentrations in the relevant depth increments (0-1', 0-3', 1-6', and 0-15'), existing PCB concentrations were already below the applicable PCB Performance Standards for all those depth increments, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Existing Average PCB Concentration (ppm)
0 – 1’	25	2.07
0 – 3’	25	3.77
1 – 6’	200	9.91
0 – 15’	100	21.13

In addition, although this property is greater than 0.5 acre and thus subject to the NTE concentration of 125 ppm for the top foot of unpaved soils at commercial properties, no surface soil samples in unpaved areas at this property contained PCBs in excess of that NTE level. Hence, no remediation was necessary at this property to address PCBs.

With respect to non-PCB constituents, the Conceptual Work Plan Addendum showed that all dioxin/furan TEQ concentrations were below the applicable comparison criteria, and that no other constituents that were retained after comparison to the Screening PRGs had existing average concentrations exceeding their corresponding Method 1 standard in any of the evaluated depth increments. Thus, remediation was not required at this property to address non-PCB constituents.

Those evaluations demonstrated that Parcel J9-23-25 in its existing condition meets the applicable Performance Standards for both PCBs and non-PCB constituents.

5.14 Parcel J9-23-26

As shown on Figure 2, Parcel J9-23-26 is bordered by Parcel J9-23-25 to the west, the riverbank of the Housatonic River to the north, and Newell Street to the east and south. Parcel J9-23-26 is a recreational property (Lakewood Playground) owned by the City of Pittsfield. As previously indicated in this Final Completion Report, only a portion of this City-owned property is included within Newell Street Area I. The City of Pittsfield has executed an ERE for this property, as discussed in Section 6.2.

The RD/RA evaluation presented in the Conceptual Work Plan Addendum for this property demonstrated that, based on the calculated average PCB concentrations in the relevant depth increments (0-1’, 1-3’, and 0-15’), existing PCB concentrations were already below the applicable PCB Performance Standards for all those depth increments, as shown in the following table:

Depth Increment	PCB Performance Standard (ppm)	Existing Average PCB Concentration (ppm)
0 – 1’	10	1.04
1 – 3’	15	4.06
0 – 15’	100	6.99

In addition, although the portion of this property within Newell Street Area I is greater than 0.5 acre and thus subject to the NTE concentration of 50 ppm for the top foot of unpaved soils at recreational properties, no surface soil samples in unpaved areas at this property contained PCBs in excess of that NTE level. Hence, no remediation was necessary at this portion of Parcel J9-23-26 to address PCBs.

With respect to non-PCB constituents, the Conceptual Work Plan Addendum showed that all dioxin/furan TEQ concentrations were below the applicable comparison criteria, and that no other constituents that were retained after comparison to the Screening PRGs had existing average concentrations exceeding their corresponding Method 1 standard in any of the evaluated depth increments. Thus, remediation was not required at this property to address non-PCB constituents.

These evaluations demonstrate that the portion of Parcel J9-23-26 within Newell Street Area I, in its existing condition, meets the applicable Performance Standards for both PCBs and non-PCB constituents.

As also noted in the Conceptual Work Plan Addendum, additional sampling was conducted for arsenic in the soil at Parcel J9-23-26, including in some areas located outside the boundaries of the Newell Street Area I RAA. The arsenic data collected within the portion of Parcel J9-23-26 included in the RAA were included in the evaluations summarized above. In addition, based on all the arsenic data from this property, average arsenic concentrations were separately calculated for the 0- to 1-foot, 0- to 3-foot, and 0- to 15-foot depth increments for the overall property (i.e., the portions located both inside and outside the boundaries of the Newell Street Area I RAA). As shown in the Conceptual Work Plan Addendum, the average arsenic concentrations for each of those depth increments at the overall property (which are in the range of 1415 ppm) were below the applicable Method 1 soil standard for arsenic. As a result, no remediation was necessary to address arsenic at this property.

5.15 Utility Corridor Evaluations

As noted in Section 3.2 above, under the CD and SOW, where utilities potentially subject to emergency repair requirements are present and the spatial average PCB concentration for the soils in the utility corridor exceeds 200 ppm, GE is required to evaluate the need for additional response actions. Section 4.15 of the Conceptual Work Plan Addendum provided a summary of the utility corridor evaluations performed at Newell Street Area I. As indicated there, the utility lines present in this RAA include dedicated subsurface utility connections from the main utility lines along Newell Street to the buildings on the developed parcels, as well as two large utility lines (a sanitary sewer line and a stormwater sewer line) impacting multiple properties.

For the individual utility connections, the Conceptual Work Plan Addendum explained that, after the proposed property-specific remediation activities, there would be no remaining PCB sample locations within the top 15 feet with discrete PCB concentrations greater than 200 ppm, except in the 6- to 10-foot sample at one location, where the vertical average PCB concentration is less than 200 ppm.

The large utility corridors affecting multiple parcels were divided into three corridors for evaluation, and the average PCB concentration for each of those utility corridors was calculated (to the maximum depth of the utility trench bedding or 15 feet in depth) after taking into account the soil removal activities necessary to achieve the property-specific PCB Performance Standards, but not the installation of engineered barriers. The calculated average PCB concentration for each corridor was then compared to the applicable Performance Standard of 200 ppm, as summarized in the following table.

Utility Corridor	Performance Standard (ppm)	Average PCB Concentration (ppm)
West Branch of Sanitary Sewer (0 – 15')	200	83.33
East Branch of Sanitary Sewer (0 – 15')	200	112.21
Storm Sewer (0 – 11')	200	82.48

The above-described evaluations showed that the average PCB concentration in each utility corridor or section evaluated is less than 200 ppm, and thus no additional evaluations or response actions were required for those corridors. Based on these evaluations, the PCB concentrations in the utility corridors at Newell Street Area I satisfy the applicable Performance Standard for such corridors.

5.16 Conclusion

As shown in the above sections, following completion of the remediation described in Section 4, the applicable soil-related Performance Standards set forth in the CD and SOW have been achieved at each of the properties (or portions thereof) comprising Newell Street Area I.

6. Post-RD/RA Activities

6.1 General

This section describes the activities performed, following completion of the RD/RA evaluations and the soil-related remediation and restoration actions at Newell Street Area I, to achieve the remaining Performance Standards and complete the activities necessary to request from EPA a Certification of Completion. These activities include the execution and registration of EREs on five properties at this RAA, the notifications to other property owners of the implementation of Conditional Solutions at their properties, and the performance of a pre-Certification Inspection under the CD.

6.2 Grants of Environmental Restrictions and Easements

Parcel J9-23-24

One private non-GE property owner, the owner of Parcel J9-23-24, agreed to execute an ERE for his property. That owner executed the ERE on July 2, 2003, and executed an amendment to it on March 7, 2006. Subsequently, as required by the CD, GE executed a Notice of Completion for this property, dated June 27, 2006. The ERE for Parcel J9-23-24 includes two current types of restricted areas, referred to as the "Open Soil/Vegetated Area" and the "Other Ground-Covering Feature Area," which are depicted on a Plan of Restricted Areas attached to the ERE and a surveyed Revised Plan of Restricted Area attached to the Notice of Completion. The Other Ground-Covering Feature Area consists of the area covered by an existing building and the paved area of the property, and the Open Soil/Vegetated Area consists of the remainder of the property. The ERE imposes certain restrictions and requirements on future uses and activities (e.g., excavations) in these areas.

The fully executed ERE and Notice of Completion for this property, together with associated documentation (including the Revised Plan of Restricted Area, a certificate of title, and a subordination agreement by GE as the sole encumbrance holder), were submitted to MDEP, with a copy to EPA, on June 28, 2006. The ERE was again amended by the property owner, at MDEP's request, on September 22, 2006. The ERE and the Notice of Completion were approved by EPA, and were subsequently approved and signed by MDEP as Grantee in early November 2006. The ERE was registered in the Land Court Records of the Berkshire Middle District Registry of Deeds (the Berkshire County Land Registration Office) on November 29, 2006 as Land Court Document No. 34518, noted on Certificate of Title No. 4898 in Book 22, Page 93, of said Land Court Records. The Notice of Completion was registered in said Land Court Records on November 30, 2006 as Land Court Document No. 34521, noted on Certificate of Title No. 4898 in Book 22, Page 93, of said

Land Court Records. In addition, the Revised Plan of Restricted Area was separately recorded in the Berkshire Middle District Registry of Deeds on November 30, 2006, in Plat H, No. 218. Copies of the final ERE, subordination agreement, Notice of Completion, certificate of title, and Revised Plan of Restricted Area for this property are included in Appendix I (as Appendix I-1).

GE-Owned Parcels

As required by the CD, GE executed EREs for the three GE-owned properties located within Newell Street Area I – Parcels J9-23-16 and J9-23 23 and the Riparian Strip – on July 12, 2007. The EREs for Parcels J9-23-16 and J9-23-23 each include three current types of restricted areas, referred to as the "Engineered Barrier Area," the "Open Soil/Vegetated Area" and the "Other Ground-Covering Feature Area," which are depicted on a Plan of Restricted Area attached to the ERE. For each property, the Engineered Barrier Area consists of the area where the engineered barrier was installed; the Other Ground-Covering Feature Area consists of other areas covered by building foundations, slabs, paving, or concrete; and the Open Soil/Vegetated Area consists of the remainder of the property. The ERE for the Riparian Strip includes only one type of restricted area – an Open Soil/Vegetated Area. All three EREs impose certain restrictions and requirements on future uses and activities (e.g., excavations) in the restricted areas, with the most restrictive provisions applicable to the Engineered Barrier Areas.

The fully executed EREs for these properties, together with associated documentation (including the Plans of Restricted Area, title insurance commitments, and subordination agreements by encumbrance holders), were submitted to MDEP and EPA on July 18, 2007. The EREs were approved by EPA, and were subsequently re-submitted to MDEP for signature on August 16, 2007. The EREs were approved and signed by MDEP as Grantee on September 11, 2007. These EREs were registered in the Land Court Records of the Berkshire Middle District Registry of Deeds (the Berkshire County Land Registration Office) on September 26, 2007, as follows:

- the ERE for Parcel J9-23-16 as Land Court Document No. 35065, noted on Certificate of Title No. 5955 in Book 27, Page 59, of said Land Court Records;

- the ERE for Parcel J9-23-23 as Land Court Document No. 35067, noted on Certificate of Title No. 6187 in Book 28, Page 125, of said Land Court Records; and

- the ERE for the Riparian Strip as Land Court Document No. 35072, noted on Certificate of Title No. 1105 in Book 6, Page 417, Certificate of Title No. 3699 in Book 17, Page 767, and Certificate of Title No. 4558 in Book 20, Page 605, of said Land Court Records.

In addition, each Plan of Restricted Area was separately recorded in the Berkshire Middle District Registry of Deeds on September 26, 2007, as follows: in Plat H, No. 311 (for Parcel J9-23-16); in Plat H, No. 312 (for Parcel J9-23-23); and in Plat H, No. 313 (for the Riparian Strip). Copies of the final EREs (which include the Plans of Restricted Areas), subordination agreements, and title insurance policies for these properties are included in Appendix I (as Appendices I-2, I-3, and I-4 for these three properties, respectively).

Due to the pavement replacement conducted in November 2007 at Parcel J9-23-16, as discussed in Section 4.10 above, the ERE and Plan of Restricted Area for that parcel were amended, with approval of MDEP, to reflect that change. This ERE amendment, titled *First Amendment to Grant of Environmental Restriction and Easement*, was executed by GE on December 20, 2007. It was subsequently signed by MDEP as Grantee and registered in the Land Court Records of the Berkshire Middle District Registry of Deeds on February 1, 2008, as Land Court Document No. 35333, noted on Certificate of Title No. 5955 in Book 27, Page 59, of said Land Court Records. In addition, a plan titled *Revised Sketch Plan Showing Lot 2 on Land Court Plan No. 8372-J*, which was attached to this First Amendment, was separately recorded in the Berkshire Middle District Registry of Deeds on February 1, 2008 in Plat H, No. 351. A copy of the First Amendment to the ERE for this property is included in Appendix I (as Appendix I-5).

City-Owned Parcel (J9-23-26)

As also required by the Consent Decree, the City of Pittsfield has executed an ERE for Parcel J9-23-26 (Lakewood Playground), a portion of which is located within the Newell Street Area I RAA. This ERE includes only one type of restricted area, an Open Soil/Vegetated Area, which encompasses only a portion of the overall property; and it imposes certain restrictions on future uses and activities (e.g., excavations) in that area.

The fully executed ERE for this property, together with associated documentation (including a title insurance commitment and EPA letter indicating approval of the ERE and title insurance commitment), were submitted to MDEP and EPA, on November 6, 2007. (No subordination agreements were necessary for this property.) The ERE was signed by MDEP as Grantee on December 5, 2007. The ERE was registered in the Land Court Records of the Berkshire Middle District Registry of Deeds on January 14, 2008 as Land Court Document No. 35294, noted on Certificate of Title No. 2560 in Book 13, Page 737, of said Land Court Records. In addition, the Plan of Restricted Area was separately recorded in the Berkshire Middle District Registry of Deeds on January 14, 2008 in Plat H, No. 344. Copies of the final ERE (which includes a Plan of Restricted Area) and title insurance policy for this property are included in Appendix I (as Appendix I-6).

6.3 Notifications Related to Conditional Solutions

As discussed previously, the CD requires that, for non-GE-owned private properties that do not meet the Performance Standards for residential use, GE must make "best efforts" (as defined in the CD) to obtain an ERE from the property owners, and that where the owners do not agree to an ERE, GE must implement a Conditional Solution in accordance with the CD. For the non-GE-owned properties located within Newell Street Area I, GE offered each property owner the compensation required by the CD in exchange for an ERE. However, apart from the owner of Parcel J9-23-24, each such property owner at this RAA decided not to execute an ERE.

Accordingly, as also described above, since none of these properties met the Performance Standards for residential use, a Conditional Solution has been implemented at each of these properties. These consist of Parcels J9-23-13, J9-23-17, J9-23-18, J9-23-19, -20, & -21, J9-23-22, and J9-23-25. On September 6, 2006, GE provided notices to each of these owners that a Conditional Solution had been implemented at their properties. Subsequent to sending those letters, it came to GE's attention that Parcel J9-23-18 had been sold to a new property owner. In accordance with the requirements of the CD, a Conditional Solution notification letter was provided to the new property owner on December 14, 2007. As required by the CD, each of these notices described the terms of the Conditional Solution, including the requirements applicable to GE and the owner regarding future remediation activities at the property, and described the levels of PCBs and other constituents remaining at the property. Each such notice letter was accompanied by a Fact Sheet prepared by EPA relating to future uses and activities at the property. Copies of these notice letters are included in Appendix J (as Appendix J-1). In addition, by letters dated September 20, 2006, GE provided notices of the Conditional Solution on each such property to the holders of encumbrances on that property. Copies of these notice letters are also included in Appendix J (as Appendix J-2).

6.4 Pre-Certification Inspection

Since the performance of the remediation actions at Newell Street Area I, GE has conducted a number of periodic inspections of the remediated and restored properties. These inspections are described in Section 7.2 below under Post-Removal Site Control activities.

In addition, following achievement of all Performance Standards for the Newell Street Area I Removal Action, including the registration of all required EREs, a formal Pre-Certification Inspection of the Newell Street Area I RAA was conducted in accordance with Paragraph 88.a of the CD on December 6, 2007. That inspection was attended by representatives of EPA, MDEP, and GE. No issues were identified during that inspection regarding the completed response actions.

Based on the outcome of that inspection and the registration of the EREs, GE has concluded that the Newell Street Area I Removal Action is complete and that the applicable Performance Standards for that Removal Action have been achieved. Therefore, in accordance with Paragraph 88.a of the CD, GE has prepared this report requesting EPA to provide a Certification of Completion for the Newell Street Area I Removal Action.

7. Post-Removal Site Control Activities

7.1 General

This section presents GE's Post-Removal Site Control Plan for Newell Street Area I. Such activities include periodic inspections, maintenance, and repair (if required) of the engineered barriers installed at this RAA, as well as the other backfilled, restored, and revegetated areas. As discussed in Section 7.2, GE has already performed six such periodic inspections, and will continue to do so. In addition, as also discussed in Section 7.2, GE will conduct periodic inspections, maintenance, and repair (if necessary) of areas that were evaluated as paved and that contain PCB concentrations in the top foot of soil under the pavement that would exceed the NTE levels for the particular type of property. Further, as required by the CD, GE will conduct annual post-remediation review and inspection activities for the non-GE-owned properties subject to EREs and those at which Conditional Solutions have been implemented. These activities are discussed in Section 7.3.

GE will provide EPA with a minimum 14-day notification prior to conducting any inspections required under Section 7. In addition, following each inspection, GE will submit an inspection report to EPA within 30 days of the inspection. These reports will include the name and contact phone number for the person(s) conducting the inspections. Any deficiencies identified during the inspections described in Section 7.2 will be corrected within 90 days of the inspection date, unless otherwise agreed to by EPA.

7.2 Inspection, Monitoring, Maintenance, and Reporting Activities for the Removal Action Area

Attachment J to the SOW requires the performance of periodic inspections for the response actions implemented at the properties comprising Newell Street Area I. In accordance with those requirements and the requirements of Section 8 of the Final Work Plan, as well as discussions between GE and EPA, such inspections are to be performed for the engineered barriers installed at certain properties within the RAA, for the other areas that were backfilled and restored, and for areas that were characterized as paved and contain PCB concentrations in the top foot of soil in excess of the NTE levels. The engineered barriers, backfilled/restored areas, drainage components, and other areas subject to the inspection activities described herein are shown on Figure 3.

The engineered barriers installed at certain properties are required to be inspected two times per year, as described below:

- Vegetative engineered barriers are to be visually inspected for the following conditions as they would affect the integrity of the barrier: (a) evidence of topsoil erosion; (b) establishment and coverage of vegetation (e.g., bare or sparsely vegetated areas); (c) deficiencies in the soil layer overlying the synthetic cover components (e.g., excessive erosion, surface water ponding, depressions, exposed synthetic cover components, vehicle ruts, or other abnormalities); (d) damage to synthetic cover components; (e) uneven settlement relative to surrounding areas; (f) the proper functioning of any associated surface water diversions; and (g) any evidence of animal burrows, unauthorized excavation, or other conditions that could jeopardize the integrity of the engineered barrier.

- Gravel-covered engineered barriers are to be visually inspected for the following conditions as they would affect the integrity of the barrier: (a) evidence of gravel erosion/displacement of gravel cover; (b) establishment of vegetation (e.g., weeds); (c) evidence of depressions and/or surface water ponding; (d) exposure of the geotextile indicator material (indicating that 6 inches of gravel cover material has been displaced); (e) damage to synthetic cover components; (f) uneven settlement relative to surrounding areas; (g) the proper functioning of any associated surface water diversions; and (h) overall integrity (unauthorized excavation or other conditions that could jeopardize the integrity of the barriers).

- Asphalt/concrete-covered engineered barriers are to be visually inspected for the following conditions as they would affect the integrity of such barriers: (a) excessive cracking, fissures, spalling, or potholes; (b) evidence of depressions and/or surface water ponding, excessive rutting, or exposed subbase materials; (c) the condition of perimeter drainage system discharge locations (e.g., evidence of blockage).

For other backfilled/restored areas, the inspections are required to consist of visual observations focusing on the following: (a) the effectiveness of erosion controls in areas where vegetation is not yet established; (b) any areas where excessive settlement has occurred relative to the surrounding areas; (c) any drainage or growth problems; and (d) other conditions that could jeopardize the performance of the completed remediation activities. The inspections will include an evaluation of areas susceptible to erosion as a result of the remediation, including (but not limited to) the drainage pipe outfalls behind Parcels J9-23-16, J9-23-17, J9-23-18, J9-23-22, and J9-23-23, as well as edges of paved areas and swales. For the drainage outlets, these inspections will verify the integrity of the structures and will verify that drainage through or discharges from the outlets are not causing erosion. The inspections of the backfilled/restored areas were required to be

conducted two times per year for the first year after implementation and annually thereafter. In addition to these scheduled inspections, the backfilled/restored areas are required to be inspected following severe storm events to ensure that those areas have not sustained significant damage. For this purpose, a severe storm event is defined as a storm event in which a 15-minute instantaneous peak of 3,500 cubic feet per second (cfs) or greater is measured on the Housatonic River at the United States Geological Survey (USGS) gauging station at Coltsville, Massachusetts.

Additionally, GE was required to inspect all revegetated areas two times per year for a two-year period after the planting of the vegetation to assess the condition of the vegetation, including any evidence of stressed vegetation or sparse cover, and to ensure that the vegetation is growing as anticipated and providing the desired degree of erosion control. As discussed below, these inspections have been completed at Newell Street Area I.

In addition to the above inspections, GE will conduct annual inspections of areas that (a) are not covered by an engineered barrier, (b) were evaluated as paved, and (c) contain PCB concentrations in the top foot of soil under the pavement that would exceed the NTE levels for the particular type of property. There are two such areas at Newell Street Area I – both located on Parcel J9-23-16. These areas are identified in pink on Figure 3.

It should be noted that the inspections described above will include the driveway portion of Parcel J9-23-16 that was re-paved in 2007 as described in Section 4.10 above. Specifically, the portion of that area that constitutes an asphalt engineered barrier will be inspected as part of the engineered barrier inspections, and the paved portions that cover soil containing PCB concentrations that would exceed the NTE level will be inspected as part of the pavement inspections described in the preceding paragraph.

GE is required to conduct maintenance and repair of site conditions and features as necessary to address any problematic conditions noted during the above-described inspections (or otherwise observed by GE or by EPA or MDEP, and communicated to GE). Examples of such maintenance/repair activities that may be identified and conducted include, but are not limited to, placement of additional topsoil or fill materials in areas of erosion or settlement, pavement repair, and repair or replacement of any components of the engineered barriers exhibiting deficiencies or potential problems.[3] In addition, to prevent tree and shrub growth that could threaten the integrity of the

[3] During the two-year inspection period for the restored vegetation, GE was also required to perform additional seeding or planting as needed to replace dead or dying vegetation. As noted above and discussed below, the required vegetation inspections have been completed at this RAA.

engineered barrier components, GE will, on an annual basis, mow the vegetative engineered barriers and remove any trees and shrubs that are observed during inspection of the gravel-covered engineered barriers. To minimize the potential that such trees and/or shrubs become established during the growing season, these activities will be completed no earlier than August of each calendar year. For the paved areas subject to inspection (identified in pink on Figure 3), GE will repair areas where, based on the visual inspection, pavement is clearly broken up and/or missing and soil is clearly visible. Typically, pavement repairs will be made at discrete areas where more than one square foot of soil is exposed.

GE conducted the first four periodic inspections of the properties within Newell Street Area I on December 6, 2005, May 30, 2006, November 30, 2006, and May 31, 2007 (excluding inspections of the non-engineered-barrier paved areas on Parcel J9-23-16 identified in pink on Figure 3, which were not required at those times). The results of these inspections were presented in letters from GE to EPA dated February 10 and July 6, 2006, and January 3 and July 11, 2007. Those letters indicated that the inspected properties within Newell Street Area I were in good overall condition and identified certain maintenance activities. These activities included:

- Re-seeding of certain areas where vegetation was not established (identified in December 2005 inspection);
- Replacement of fallen dead trees on the Riparian Strip (identified in May 2006 inspection);
- Removal of fallen tree limbs, section of silt fencing, and woody growth in certain areas (identified in November 2006 inspection); and
- Removal of saplings within certain areas adjacent to engineered barriers (identified in May 2007 inspection).

These maintenance activities were subsequently performed.

GE conducted additional inspections of properties within Newell Street Area I on October 17, October 22, and November 29, 2007 (excluding Parcels J9-23-19, -20, and 21, to which GE did not have access permission at the time) and on May 16, 2008. The results of these inspections were presented in letters to EPA dated December 5, 2007 and June 12, 2008. Those letters indicated the need for certain additional maintenance activities, including:

- Monitoring of areas that were re-seeded as part of the riverbank restoration work on the Riparian Strip and Parcel J9-23-23 (identified in October/November 2007 inspection and, for the Riparian Strip, May 2008 inspection);

- Removal of seedlings/saplings in certain areas within or adjacent to engineered barriers on Parcels J9-23-13, J9-23-17, J9-23-18, J9-23-19, J9-23-20, and J9-23-22 (identified in October/November 2007 and May 2008 inspections);

- Removal of an eight-foot cottonwood tree along the western fence line at Parcel J9-23-18 (identified in October/November 2007 inspection);

- Repair of a gap in pavement at Parcel J9-23-16 (identified in October/November 2007 inspection); and

- Removal of haybales on Parcel J9-23-16 (identified in May 2008 inspection).

The maintenance activities identified in the October/November 2007 inspection (including removal of seedlings/saplings that could have affected the barriers on several properties, removal of the cottonwood tree on Parcel J9-23-18, and repair of the gap in pavement at Parcel J9-23016) were subsequently completed. The maintenance activities identified during the May 2008 inspection will be performed prior to the next inspection in August or September 2008.

Future periodic inspection activities for the properties within Newell Street Area I will involve the following:

- GE will conduct inspections of the engineered barrier areas twice per year (unless and until EPA approves an alternate frequency) in May and August or September, with the next such inspection scheduled to be performed in August or September 2008.

- GE will conduct annual inspections of the backfilled/restored areas (unless and until EPA approves an alternate frequency) in August or September, with the next such inspection scheduled to be performed in August or September 2008. GE will conduct additional such inspections after severe storm events (as defined above).

- GE will conduct annual inspections of the paved areas identified in pink on Figure 3 (unless and until EPA approves an alternate frequency) in August or September, with the next such inspection scheduled to be performed in August or September 2008.

GE has completed the required twice-yearly inspections of restored vegetation (including the trees replaced on the Riparian Strip after the May 2006 inspection) for a two-year period. As indicated in GE's June 12, 2008 inspection summary letter, the May 2008 inspection represented the last required inspection of the restored vegetation at Newell Street Area I. As such, no further inspections of restored vegetation will be performed at this RAA. However, as noted in its June 12, 2008 letter, GE will continue to monitor the areas that were re-seeded as part of the riverbank restoration work on the Riparian Strip through at least August/September 2008.

These future inspection activities will be performed in accordance with the procedures specified above, will include review of this Section 7.2 and Figure 3 of this Final Completion Report (as well as the as-built survey drawings and engineered barrier plan provided in Appendix E), and will use the Inspection Summary and Checklist provided in Appendix K. After each inspection, a report will be prepared and submitted to EPA within 30 days of the completion of the inspection. These reports will include copies of the completed inspection checklists and will document the inspection and maintenance activities performed since the submittal of the previous report, as well as future inspection and maintenance activities. In the event that GE is denied access to perform the inspection or maintenance activities described herein at a specific property, GE will notify EPA within 14 days of the date on which access was denied.

7.3 ERE and Conditional Solution Inspections and Reporting

In addition to the inspections for the remediation activities performed at Newell Street Area I, additional inspection activities are required by the CD for the non-GE-owned properties at which EREs have been executed and registered (namely, Parcels J9-23-24 and J9-23-26) and for the properties at which Conditional Solutions have been implemented (namely, Parcels J9-23-13, J9-23-17, J9-23-18, J9-23-19, J9-23-20, J9-23-21, J9-23-22, and J9-23-25). These activities are described below.

7.3.1 Annual ERE Inspections

Paragraph 57.o. of the CD requires annual inspections at non-GE-owned properties at which EREs have been recorded or registered to assess compliance with the applicable EREs during the preceding year. Such inspections will be conducted at the two non-GE-owned properties at Newell Street Area I that are subject to EREs (i.e., Parcel J9-23-24 and the City-owned Parcel J9-23-26). The information related to the EREs at these properties is provided in Section 6.2 above. The annual ERE inspections of these properties will be conducted in accordance with the requirements set forth in Appendix Q of the CD and will include a document review and visual site inspection as further described below.

For each such property, prior to the visual site inspection, the documents pertinent to the ERE and the use of the property will be reviewed. These documents will include the ERE, the Plan of Restricted Area (as revised if appropriate), this Final Completion Report, the as-built survey drawings and engineered barrier plan provided in Appendix E herein (and any alternative, more recent plan that GE proposes to use for evaluating surface grade changes), any conditional exceptions approved under the ERE (if known), any recorded amendments to and/or releases from the ERE, and any other documents in GE's possession relevant to the ERE or the use of the property. In addition, the most recent topographic map of the property that is available to GE, as well as any Post-Work Notification Forms (Exhibit E to the ERE) that have been submitted by the Grantor under the ERE and of which GE has a copy, will be reviewed for background information and reference. Except for documents created by GE, GE will not be responsible for verifying the accuracy or completeness of any aspect of or information in the foregoing documents, either as of the time they were prepared or as compared to conditions at the time of the inspection.

After reviewing these documents, a visual on-site inspection of the property will be performed to determine whether there is evidence that any of the following have occurred since the last annual inspection:

- Activities at or uses that are potentially contrary to the restrictions stated in the ERE;
- Utility work or any building construction, modification, addition, and/or demolition;
- Soil excavations that involved more than 10 cy of soil;
- Significant soil erosion; and
- Significant pavement construction, disturbance, and/or removal/excavation.

If the inspection indicates that any of the above conditions has altered the surface grade of the property since the prior inspection, the new surface grade(s) will be compared to the as-built survey drawings and engineered barrier plan provided in (Appendix E to this Final Completion Report), unless GE proposes, and EPA approves, the use of an alternative plan showing more recent conditions. The approximate area/location of any such surface grade change will be identified on a plan.

GE conducted ERE inspections of Parcel J9-23-24 on May 31, 2007 and May 20, 2008, and submitted reports thereon to EPA on June 29, 2007 and June 13, 2008. Those inspections revealed no evidence of any of the above-listed conditions.

GE will continue to conduct ERE inspections of Parcel J9-23-24, and will conduct ERE inspections of the portion of Parcel J9-23-26 within Newell Street Area I, in accordance with the procedures specified above. The first inspection of the latter is anticipated to occur in November 2008, and the next inspection of Parcel J9-23-24 is anticipated to be conducted in May 2009. After all observations have been made, the ERE Annual Inspection Check List provided in Appendix L will be completed. Within 30 days of completion of the inspection, a summary ERE inspection report will be submitted to EPA and MDEP. This report will include a summary of the findings of the inspection, a description and the basis for the identification (based on the visual inspection in conjunction with the document review) of any instances of potential non-compliance with the ERE, and a copy of the completed ERE Annual Inspection Check List. Any determination of whether activities and uses that have occurred are in fact contrary to the restrictions stated in the ERE will be made by EPA and/or MDEP.

7.3.2 Annual Conditional Solution Inspections

In addition to the ERE inspections, GE will perform annual inspections of the properties subject to Conditional Solutions (identified above) using the procedures outlined in Paragraphs 36 and 38, and Appendix Q of the CD, with modifications on which GE and EPA have agreed in this report for such inspections. These activities will include a document review and a visual site inspection, as described below.

Prior to the visual site inspection, GE will review the most recent property records at the Pittsfield Tax Assessor's Office and the property deeds at the Berkshire Middle District Registry of Deeds to determine if there has been a change in ownership of any of these parcels. If there has been a change in ownership, GE will provide notice to the new owner of the Conditional Solution implemented at the property. In addition, GE will review this Final Completion Report, including the as-built survey drawings/engineered barrier plan included in Appendix E, which depict current site features and topography (and any alternative, more recent plan that GE proposes to use for evaluating surface grade changes), and any subsequent work plan(s) approved and implemented pursuant to Paragraph 35 of the CD.

GE will then conduct a visual site inspection of each property (to the extent possible given any access limitations) to evaluate whether there is evidence that any of the following have occurred since the prior inspection:

- Any change in activities or uses of the property that would be potentially inconsistent with the land use for which the Conditional Solution was implemented (i.e., recreational use at Parcel J9-23-17 and commercial/industrial use at the other above-listed properties);

- Installation of a new utility or repair or replacement of an existing utility that involved disturbance of soil;

- Any excavations, construction, or other activities or conditions that resulted in the disturbance of 10 cy of soil or greater, regardless of depth; and

- If any of the activities in the two preceding bullets are noted, any alteration of the surface grade, compared to that shown in the as-built survey drawings/engineered barrier plan included in Appendix E (or any more recent plan that GE proposes and EPA approves).

After all observations have been made, GE will complete, for each property, the Conditional Solution Annual Inspection Checklist provided in Appendix M, and will prepare and submit a written inspection report to EPA and MDEP, as described further below.

GE conducted the first two of these Conditional Solution inspections for the applicable properties on November 30, 2006, and November 29, 2007. For those inspections, since the as-built drawings/engineered barrier plan included in this Final Completion Report were not available, GE reviewed the Final Work Plan, which described the Conditional Solutions, as well as Technical Drawings 3, 4, 5, 6, and 8 from the Final Work Plan, which depicted the anticipated post-remediation site features and topography at each property. That inspection also included a visual inspection of each property subject to a Conditional Solution to evaluate whether there was any evidence (based on visual observations) that any of the above-listed conditions had occurred since completion of the remediation activities and implementation of the Conditional Solutions. GE submitted letter reports on these Conditional Solution inspections at Newell Street Area I to EPA on January 4, 2007, and December 21, 2007, respectively. As indicated in the latter letter, the property record reviews indicated that there had been a change in ownership at Parcel J9-23-16 (as noted in Section 6.3 above), but not at any of the other properties in question. In addition, as indicated in these letters, the inspections showed no visual evidence of any of the above-listed activities at the properties subject to inspection since the implementation of the Conditional Solutions.

GE will continue to conduct annual inspections of the properties at which Conditional Solutions have been implemented. The next such inspection is anticipated to occur in November 2008. These inspection activities will be performed in accordance with the procedures specified above and will use the Conditional Solution Annual Inspection Checklist provided in Appendix M. A report will be prepared and submitted to EPA and MDEP within 30 days of completion of each such future inspection. That report will include a description of the current ownership of each property, a summary of the findings for each

property (including a description and the basis for the identification, based on visual inspection in conjunction with the document review, of any known or suspected changes in the activities or uses that would involve any of the activities or uses listed above), and copies of the completed Annual Inspection Checklists indicating that the inspections included all required criteria. Any determination of whether changes in activities and uses that have occurred at a property would in fact be inconsistent with the land uses for which the Conditional Solution was implemented or would involve unacceptable exposure conditions will be made by EPA and/or MDEP.

	10-15	9/17/2002	ND(0.036)	0.033 J	ND(0.036)	0.033 J

Notes:
1. Samples were collected by Blasland, Bouck & Lee, Inc., and were submitted to CT&E Environmental Services, Inc. for analysis of PCBs.
2. Samples have been validated as per Field Sampling Plan/Quality Assurance Project Plan, General Electric Company, Pittsfield, Massachusetts, Blasland Bouck & Lee, Inc. (approved November 4, 2002 and resubmitted December 10, 2002).
3. ND - Analyte was not detected. The number in parentheses is the associated detection limit.
4. Duplicate sample results are presented in brackets.

Data Qualifiers:
J - The associated numerical value is an estimated concentration.

TABLE A-2
PRE-DESIGN INVESTIGATION SOIL SAMPLING RESULTS APPENDIX IX + 3 CONSTITUENTS

FINAL COMPLETION REPORT FOR THE NEWELL STREET AREA I REMOVAL ACTION
GENERAL ELECTRIC COMPANY - PITTSFIELD, MASSACHUSETTS
(Results are presented in dry weight parts per million, ppm)

Notes:
1. Samples were collected by Blasland, Bouck & Lee, Inc., and were submitted to CT&E Environmental Services, Inc. and Columbia Analytical Services, Inc. for analysis of Appendix IX+3 constituents.
2. Samples have been validated as per Field Sampling Plan/Quality Assurance Project Plan, General Electric Company, Pittsfield, Massachusetts, Blasland Bouck & Lee, Inc. (approved November 4, 2002 and resubmitted December 10, 2002).
3. ND - Analyte was not detected. The number in parentheses is the associated detection limit.
4. NA - Not Analyzed - Laboratory did not report results for this analyte.
5. Total 2,3,7,8-TCDD toxicity equivalents (TEQs) were calculated using Toxicity Equivalency Factors (TEFs) derived by the World Health Organization (WHO) and published by Van den Berg et al. in Environmental Health Perspectives 106(2), December 1998.
6. NC - Not Calculated. Insufficient data to calculate TEQs.
7. Duplicate sample results are presented in brackets.

Data Qualifiers:

Organics (volatiles, semivolatiles, dioxin/furans)

B - Analyte was also detected in the associated method blank.
D - Compound quantitated using a secondary dilution.
E - Analyte exceeded calibration range.
I - Polychlorinated Diphenyl Ether (PCDPE) Interference.
J - Indicates that the associated numerical value is an estimated concentration.
R - Data was rejected due to a deficiency in the data generation process.
X - Estimated maximum possible concentration.
Y - 2,3,7,8-TCDF results have been confirmed on a DB-225 column.

Inorganics

B - Indicates an estimated value between the instrument detection limit (IDL) and practical quantitation limit (PQL).
E - Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J - Indicates that the associated numerical value is an estimated concentration.
R - Data was rejected due to a deficiency in the data generation process.
* - Indicates laboratory duplicate analysis was outside control limits.

Notes:
1. Sample collection and analysis performed by United States Environmental Protection Agency (EPA) Subcontractors. Results provided to GE under the Supplement to the Data Exchange Agreement letter, dated November 2, 1999.
2. Field duplicate sample results are presented in brackets.
3. ND - Analyte was not detected. The value in parentheses is the associated detection limit.
4. N/A - Not Applicable.
5. -- EPA did not analyze sample for Aroclor-1016, -1221, -1232, and -1242.

Data Qualifiers:
J - Estimated Value.

TABLE A-4
EPA SOIL SAMPLING RESULTS FOR APPENDIX IX + 3 CONSTITUENTS

FINAL COMPLETION REPORT FOR THE NEWELL STREET AREA I REMOVAL ACTION
GENERAL ELECTRIC COMPANY - PITTSFIELD, MASSACHUSETTS
(Results are presented in dry weight parts per million, ppm)

Notes:
1. Sample collection and analysis performed by United States Environmental Protection Agency (EPA) Subcontractors. Results provided to GE under a Data Exchange Agreement between GE and EPA.
2. ND - Analyte was not detected. The number in parentheses is the associated detection limit.
3. NA - Not Analyzed - Results were not reported for this analyte.
4. Total 2,3,7,8-TCDD toxicity equivalents (TEQs) were calculated using Toxicity Equivalency Factors (TEFs) derived by the World Health Organization (WHO) and published by Van den Berg et al. in Environmental Health Perspectives 106(2), December 1998.
5. N/A - Not Applicable.

Data Qualifiers:
J - Estimated Value.
R - Rejected.

Notes:
1. ND - Analyte was not detected. The value in parentheses is the associated detection limit.
2. NA - Not Analyzed - Laboratory did not report results for this analyte.
3. Duplicate results are presented in brackets.
4. NR - Not Reported. PCB data was entered from summary data tables and not the laboratory report form.

TABLE A-6
HISTORICAL SOIL SAMPLING RESULTS FOR APPENDIX IX + 3 CONSTITUENTS

FINAL COMPLETION REPORT FOR THE NEWELL STREET AREA I REMOVAL ACTION
GENERAL ELECTRIC COMPANY - PITTSFIELD, MASSACHUSETTS
(Results are presented in dry weight parts per million, ppm)

Notes:
1. Samples were collected by Blasland Bouck & Lee, Inc., and were submitted to CT&E Environmental Services, Inc. for analysis of Appendix IX + 3 constituents.
2. NC - Not Calculated - Insufficient data to calculate WHO TEQs.
3. NA - Not Analyzed - Laboratory did not report results for this analyte.
4. ND - Analyte was not detected. The number in parentheses is the associated detection limit.
5. Duplicate results are presented in brackets.
6. Total 2,3,7,8-TCDD toxicity equivalents (TEQs) were calculated using Toxicity Equivalency Factors (TEFs) derived by the World Health Organization (WHO) and published by Van den Berg et al. in Environmental Health Perspectives 106(2), December 1998.

Data Qualifiers:

Organics (volatiles, PCBs, semivolatiles, pesticides dioxin/furans)

B - Analyte was also detected in the associated method blank.
E - Analyte exceeded calibration range.
J - Indicates that the associated numerical value is an estimated concentration.
X - Estimated Maximum Possible Concentration
Y - 2,3,7,8-TCDF results have been confirmed on a DB-225 column.

Inorganics

A - Analyte determination determined by the method of standard additions (MSA).
B - Indicates an estimated value between the instrument detection limit (IDL) and practical quantitation limit (PQL).
N - Indicates sample matrix spike analysis was outside control limits.
S - Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
W - GFAA Analytical spike recovery outside of range of 85% to 115% in a sample which exhibits a low concentration of analyte. Unspiked response must be < 50% of spiked sample response.

Submittal No.: 4

TO: General Electric Co. 100 Woodlawn Ave Pittsfield MA 01201	**JOB NO.** 03083	**Date:** 10/15/03
	ATTENTION: Richard Gates, Project Manager	
	RE: General Electric Company; Pittsfield MA Remedial Action; Newell Street Area 1 Removal Action Area [RAA] Contract No. **Spec. Section:** 02219.1.04.A	

WE ARE SENDING YOU ☒ **Attached** ☐ Under separate cover via the following items:

☐ Shop drawings ☐ Prints ☐ Plans ☐ Specifications ☐ Samples

☐ Copy of letter ☐ Change order ☒ **Other: As Below**

COPIES	DATE	NO.	DESCRIPTION
3			**Geocomposite: GSE FabriNet UF** ▪ Certificate of Transmissivity ▪ Product Data for Geonet ▪ Product Data for 12-oz. Geotextile used in Geocomposite ▪ GSE Manufacturing Quality Assurance Manual ▪ GSE Installation Quality Assurance Manual

THESE ARE TRANSMITTED as checked below:

☒ For approval ☐ Approved as submitted ☐ Resubmit _____copies for approval

☒ For your use ☐ Approved as noted ☐ Submit _____copies for distribution

☒ As requested ☐ Returned for corrections ☐ Return _____corrected prints

☐ For review and comment ☐ Other

REMARKS: Notes:

1. Certified test results to follow upon approval of this submittal and upon manufacture of the geocomposite.
2. Samples shall be on-site approximately 4-5 weeks from approval of this submittal. At that time, GE may take conformance samples. If GE/BBL so chooses, and to expedite approval of this submittal, they may send an independent sampler to the plant in Kingstree SC and send samples directly to their testing agency.

Ref. Transmissivity Requirement
Pittsfield, MA; Newell Street

To Whom It May Concern:

This is to certify that GSE 300 mil drainage geocomposite with 12 oz. nonwoven needlepunched geotextile on both sides – FabriNet UF – will meet of exceed a transmissivity value of 1.13×10^{-3} m^2/sec at the following test conditions:

Gradient = 0.1
Time = 100 hours
Load = 5000 psf
Boundary conditions = 60 mil HDPE/Geocomposite/Soil

GSE

Product Data Sheet

GSE STANDARD PRODUCTS

GSE Nonwoven Geotextiles

GSE Nonwoven Geotextiles is a family of polypropylene, staple fiber, nonwoven needle punched geotextiles. Manufactured using an advanced manufacturing and quality system, these products are the most uniform and consistent nonwoven needle punched geotextile currently available in the industry. GSE combines a fiber selection and approval system with in-line quality control and a state-of-the-art laboratory to ensure that every roll shipped meets customer specifications. The company has performed extensive performance testing to evaluate suitability of its nonwovens for various applications. GSE Nonwoven Geotextiles are available in a range of weights to meet your specific project needs. *These product specifications meet or exceed GRI GT12.*

Manufacturing Quality Assurance Manual

www.gseworld.com

Foreword

This manual contains proprietary information belonging to GSE Lining Technology, Inc. This information is intended to provide a summary of standard quality procedures practiced by GSE's Manufacturing Quality Assurance Laboratories in Houston, Texas; and Kingstree, South Carolina. These procedures apply to standard drainage materials only and do not explicitly address non-conforming materials.

This manual replaces in its entirety and supersedes all earlier versions issued by GSE Lining Technology, Inc. We suggest you maintain contact with your GSE representative to confirm the validity of this version at future dates.

GSE Lining Technology, Inc. reserves the right to change, modify, or discontinue the use of the policies and procedures described herein without notice or prior consent except as contractually obligated otherwise.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

I. QUALITY MANIFEST

GSE Lining Technology, Inc. is committed to providing the highest quality products and services to our customers. This requires a firm, total quality commitment from all individuals within our organization that we will only supply materials that meet or exceed the requirements and specifications of GSE and our customers.

GSE's commitment to quality starts with the highest quality raw materials. The quality of incoming raw materials is controlled at the supplier level with a complete vendor evaluation program in place. This means purchasing only from suppliers who are committed to statistical process control thereby providing a consistent, high level of quality assurance of their products.

II. MANUFACTURING QUALITY ASSURANCE

GSE Lining Technology, Inc. has an on-site Manufacturing Quality Assurance Laboratory at each manufacturing plant. Having a fully equipped, well staffed, dedicated laboratory at each of the manufacturing facilities allows GSE to maintain a high level of quality and up-to-the-minute results on finished products. Each facility follows the same guidelines for evaluating the quality of GSE products and is capable of adapting to market-driven requirements.

A. Objective

The objective of the GSE Quality Assurance program is to define implementation of basic manufacturing quality assurance (MQA) procedures necessary to ensure consistent production of quality products supplied to the geosynthetic market. Note that at this time, these procedures are limited to polyethylene drainage products including geonets and geocomposites.

B. Scope

In order to achieve GSE's stated purpose, a rigorous set of minimum standards and an effective test program to assure compliance has been established. These procedures and requirements are frequently reviewed and adjusted to assure compliance with current market demands and/or predetermined project specifications. These procedures assure that raw materials and process parameters are controlled to provide products complying with GSE's pre-defined minimum characteristics.

III. MANUFACTURING QUALITY ASSURANCE ORGANIZATION

This organization consists of the Manufacturing Quality Assurance Laboratories as well as the manufacturing personnel. The combination of expertise and experience from these groups provides GSE with the proper tools to maintain the highest level of quality and customer service in the industry.

The Quality Assurance Department at GSE is charged by the President to assure that only products meeting both GSE's and the customer's requirements are released for shipment. The Quality Assurance personnel are directly responsible for monitoring testing and providing feedback to the manufacturing department to ensure the production of the specified product quality. Each member of the Quality Assurance team must participate in detailed training that includes factory exposure.

IV. STAFF AND SCHEDULING

The Quality Assurance Laboratories are staffed whenever manufacturing is occurring; this is usually 24 hours per day, 365 days per year. This minimizes the amount of potentially inferior product produced before a manufacturing problem is identified.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

V. PRODUCT IDENTIFICATION AND DOCUMENTATION

A. Roll Numbering

Each roll of geonet and geocomposite is assigned a unique roll number. The Quality Assurance Laboratory maintains records documenting the raw materials and resulting product quality information.

B. Approval Procedure

Results for each tested roll of product are checked against both GSE and customer specifications for compliance. The Quality Assurance Laboratory approves those materials that meet both of these requirements for shipment.

C. Non-Conformance

Material that does not meet GSE minimum standards is given a roll number but is rejected and not placed into inventory. The material is identified as scrap and will not be utilized.

Material that meets GSE minimum standards but does not meet a stricter customer specification is not allocated to that customer but is placed into inventory as GSE standard material.

D. Documentation

Individual Quality Assurance Certificates are generated and supplied for each roll of geonet and geocomposite product to include all relevant quality assurance information about the material(s). The geotextile components of the drainage geocomposite materials are tracked throughout the manufacturing process. Therefore, "traceability reports" are available.

VI. RECORDS RETENTION

GSE maintains reports and/or samples for products produced and sold. Records and/or samples are maintained according to GSE's standard retention policy according to the item.

MATERIAL	ITEM	YEARS
Raw materials	Resin Supplier Test Reports and Certifications	≥2
	GSE Resin Test Reports	≥2
	Resin Sample Retain (Archive)	≥2
Geonet and Geocomposite	Raw Test Data (in computer database)	≥5
	Quality Control Certificates (in computer database)	≥5
	Sample Retain (approximately one square foot)	≥5

VII. TESTING CAPABILITIES

GSE maintains high capacity, state-of-the-art laboratory equipment suitable for performing the procedures listed in Appendix A and B. GSE's Houston and Kingstree laboratories are accredited by the GAI-LAP program. GSE's Houston and Kingstree Quality Assurance Laboratories, as part of GSE's Product Division, also hold ISO certification. The appropriate certificates are maintained for review upon request by authorized parties.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

A. Routine Testing

Through careful investigation, GSE has developed a strict and thorough Quality Assurance program that exceeds the vast majority of customer specifications. The testing program covers raw materials (see Appendix A) and finished goods (see Appendix B) and is adhered to at all GSE laboratories. The laboratory equipment used by GSE represents the most modern equipment available and meets or exceeds the requirements of all the test standards used. Test frequencies and number of test specimen per sample are established based on statistical analysis and complexity of procedures.

B. Other Testing Capabilities

In addition to routine testing, GSE laboratories are equipped to perform a wide variety of other tests as required for unusual requests or product development. Further, although the GSE Quality Assurance Laboratories are fully equipped and able to perform most routinely specified tests in the industry, there are some tests that are more economically performed by a dedicated testing facility. GSE believes requirements for such testing should be carefully considered and defined in terms of specific design requirements if they are found to be necessary.

VIII. MATERIAL QUALITY ASSURANCE

GSE Lining Technology, Inc. has established strict specifications for all raw materials and finished products. Test results must fall within the acceptable limits of GSE and customer specifications.

A. Raw Material

GSE primarily uses two types of raw materials, "natural resin" and "masterbatch" in the manufacture of geonet products. Natural resin is the base material that is used to make a geonet. It contains stabilizers to prevent degradation from occurring during and after extrusion. "Masterbatch" is the term referring to the concentrated carbon black material used with the natural resin to produce the finished product. The natural resin and masterbatch are blended at the appropriate ratio at the manufacturing stage. The masterbatch can contain other additives depending upon the geonet product to be produced. GSE verifies the properties of each lot of raw material prior to their utilization.

When natural resin is received, samples are taken and subjected to the tests outlined in Appendix A. All test data are entered into the computer database and checked for accuracy, consistency and compliance with GSE specifications. The material is not accepted unless all standard test requirements are met and the GSE test values meet the requirements set forth in the raw material specifications.

Copies of the supplier's certificate of analysis (COA) for each lot of resin utilized in the production of the materials supplied to a specific project are supplied as standard documentation. In addition, the GSE test results for each lot of resin are provided in a separate report upon request.

Virgin resin is normally received in rail car lots. If resin is received by other transport and/or in other quantities, an equivalent suitable sampling procedure is provided (i.e. not less than one sample per shipment or one sample for each 50,000 lb., 23,000 kg)

B. Geonet Products

Geonet drainage products with bi-planar geometry are produced. Tables containing GSE properties and test frequencies for all GSE geonet and geocomposite products are located in Appendix B.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

1. Sampling

A one-foot by roll width sample is cut for Quality Assurance testing from every tenth roll produced. An archive sample is cut from each tested roll. This sample is taken from a random location then labeled and stored for future reference (see Section VI). Test frequencies and number of test specimen per sample are established based on statistical analysis of the available data and complexity of the test procedures.

2. Evaluation of Results

All data are entered into a computer database for calculation and comparison to established order specifications. If materials do not meet the required GSE standards and/or the customer specifications the manufacturing personnel are immediately notified in order for the appropriate adjustments to be made. Only products meeting GSE standards and customer specifications will be approved for shipment.

3. Reporting

A Quality Assurance Certificate is issued for every roll of finished product. This report identifies the standards on which the GSE approval is based along with the actual test results demonstrated by the material.

C. Geocomposite Products

Geocomposite products are produced with a geonet and a nonwoven geotextile(s). This product is manufactured by heat bonding a geotextile to one or both sides of a geonet product. Sampling, evaluation of results and reporting practices are the same as for geonet products (Section B. above).

D. Third Party Conformance Sampling

Some specifications require independent Quality Assurance and/or conformance testing. GSE can provide assistance with the sampling of products by arranging for the conformance samples to be taken during production. By taking samples during production rather than on site, the customer can be assured that the samples are clean and available for conformance testing in a timely manner.

GSE encourages customers to audit GSE manufacturing and manufacturing quality assurance operations and/or to collect samples and conduct independent conformance testing prior to shipment of materials.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

Appendix A - Minimum Testing Frequencies and Properties for GSE Raw Materials

MINIMUM TESTING FREQUENCIES FOR GSE RAW MATERIALS

Property	Test Method[1]	Natural Resin
Density	ASTM D 1505	once per rail car compartment
Melt Flow Index	ASTM D 1238 (190/2.16)	once per rail car compartment
Carbon Black Content	ASTM D 1603, modified	N/A
Carbon Black Dispersion	ASTM D 5596	NA

[1] GSE utilizes test equipment and procedures that enable effective and economical confirmation that the product will conform to specifications based on the noted procedures. Some test procedures have been modified for application to geosynthetics. All procedures and values are subject to change without prior notification.

MINIMUM PROPERTIES FOR GSE RAW MATERIALS

Property	Test Method[1]	HDPE
Density [g/cm³]	ASTM D 1505	≥ 0.932
Melt Flow Index [g/10 min]	ASTM D 1238 (190/2.16)	≤ 1.0

[1] GSE utilizes test equipment and procedures that enable effective and economical confirmation that the product will conform to specifications based on the noted procedures. Some test procedures have been modified for application to geosynthetics. All procedures and values are subject to change without prior notification.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

Subject: Geocomposite Double Twelve oz. /300 mil Net
Ply-adhesion and Melt Flow Index
GE Newell Street, Pittsfield, MA

Certificate

This is to certify that GSE 300 mil drainage geonet HyperNet UF will meet a melt flow index value of less than or equal to 1 grams/10 minutes when tested according to ASTM procedure 1238.

The geocomposite product FabriNet UF will meet or exceed a ply-adhesion value of 0.5 lbs/inch when tested according to GRI procedure GC7.

Please feel free to contact GSE should you have any questions.

GSE asks that this section be amended with the following statement:

- In the event that a sample does not pass conformance testing, GSE requests that an additional sample of the roll in question be taken and tested at an independent laboratory agreed upon by both the Owner and GSE. If the second sample passes conformance testing, then the results of the first test are agreed to be in error, the Owner will pay for the testing, and the material accepted for use on the project. If the second sample does not pass conformance testing, GSE will pay for the cost of testing and repair or replace the non-conforming material at no cost to the Owner. GSE asks that this be acceptable.

Joseph A. Aberdale, Chief Engineer

AEF Nonwoven Geotextiles

- 100% staple polyester and polypropylene needle-punched fabrics designed for multi-purpose engineered use.
- Provide tensile reinforcement, filtration, and separation for roads, roofs, railroads, ponds, dams, trenches, landfills and many other civil engineering and construction uses.
- Resistant to tears, soil chemicals, puncture, ultra violet light exposure, and are virtually unaffected by hydrocarbons, mildew, rot and freeze-thaw.

AMERICAN ENGINEERING FABRICS, Inc.

MANUFACTURERS of GEOTEXTILES

American Engineering Fabrics

Quality Assurance/Quality Control Manual

March 1, 1999

AEF manufactures polyester and polypropylene needle punched geotextiles, 4 - 18 oz. per syd.

Quality Control Program:

We test as follows:
Weight oz/syd - ASTM D - 5261
Thickness (mils) - ASTM D - 1777
Grab Strength (lbs.) - ASTM D - 4632-86
Elongation (%) - ASTM D - 4632-86
Puncture Strength - ASTM D - 4833
Mullen Burst Strength (PSI) - ASTM D - 3786-87
Trapezoid Tear Strength (lbs.) - ASTM D - 4533-85
AOS - ASTM D - 4751
Water Flow Rate (GPM/ft2) - ASTM D - 4491
Permittivity - ASTM D - 4491 (Sec -1)
UV Resistance - ASTM D - 4355-84

Procedure:

Each new production run from 10-40,000 pounds of fiber is blended and assigned a lot number. Rolls are produced and assigned a non-repeating number with the following information:

Roll #
Lot #
Style
Size
Operator
Production Line #

From every roll, a full-width sample is taken. From this, two 18" x 36" samples are cut, weighed and labeled with assigned roll number. Record is kept by operator of every roll produced during that shift.

Samples are taken to our on-site laboratory and tested for above ASTM tests per ASTM D-35 Committee on Geosynthetics. Procedures are followed per scope for each test. Grab Strength, Elongation, Mullen Burst, Trapezoid, Tear and Puncture are performed on every roll. Frequency of other tests are performed per requirements of specific run.

Tests are recorded in hard bound, permanent book. MARVS are calculated. Computer analysis of standard deviation can be done per requirements of job.

Shipping:

Every roll maintains ticket of original assigned number (as described previously). In process of shipping, duplicate ticket (yellow) is pulled and maintained by with factory packing list. White ticket accompanies roll in secure shipping envelope placed on each roll. Identification is therefore assured in the field.

D4491-89 STANDARD TEST METHODS FOR WATER PERMEABILITY OF GEOTEXTILES BY PERMITTIVITY

1.SCOPE

1.1 These test methods provide procedures for determining the hydraulic conductivity (water permeability) of geotextiles in terms of permittivity under standard testing conditions, in the uncompressed state. Included are two procedures: the constant head method and the falling head method.
1.2 The values stated in SI units are to be regarded as the standard. The inch-pound (United States) are provided for information only.

D4632-86 STANDARD TEST METHOD FOR BREAKING LOAD AND ELONGATION OF GEOTEXTILES (GRAB METHOD)

1.SCOPE

1.1 This test method covers a procedure for determining the breaking load (grab tensile) and elongation (grab elongation)
of geotextile fabrics using the grab method.
1.2 Procedures for measuring the breaking load and elongation by the grab method in both the dry and wet state are included; however, testing is normally done in the dry condition unless specified otherwise in an agreement or specification.
1.3 The values stated in SI units are to be regarded as standard. The values stated in inch-pound units are provided for information only.

D4751-87 STANDARD TEST METHOD FOR DETERMINING APPARENT OPENING SIZE OF A GEOTEXTILE

1. SCOPE

1.1 This test method is used to determine the apparent opening size (AOS) of a geotextile by sieving glass beads through a geotextile.
1.2 This test method shows the values in both SI units and inch-pound units. "SI" units is the technically correct name for the system of metric units known as the International System of Units. "Inch-pound" units is the technically correct name for the customary units used in the United States. The values in inch-pound units are provided for information only.

D4833-88 STANDARD TEST METHOD FOR INDEX PUNCTURE RESISTANCE OF GEOTEXTILES,GEOMEMBRANES, AND RELATED PRODUCTS

1. SCOPE

1.1This test method is used to measure the index puncture resistance of geotextiles, geomembranes, and related products.

1.3 The values stated in SI units are to be regarded as the standard. The values provided in inch-pound units are for information only.

D4533-85 STANDARD TEST METHOD FOR TRAPEZOID TEARING STRENGTH OF GEOTEXTILES

1. SCOPE

1.1 This test method is used to measure the tearing strength of woven or nonwoven geotextiles by the trapezoid method.
1.2 This test method is applicable to most geotextiles that include woven fabrics, nonwoven fabrics, layered fabrics, knit fabrics, and felts that are used for geotextile applications.
1.3 The values stated in SI units are to be regarded as the standard.

D4355-84 STANDARD TEST METHOD FOR DETERIORATION OF GEOTEXTILES FROM EXPOSURE TO ULTRAVIOLET LIGHT AND WATER (XENON-ARC TYPE APPARATUS)

1. SCOPE

1.1 This test method covers the determination of the deterioration in tensile strength of geotextiles by exposure to ultraviolet light and water.
1.2 The light and water exposure apparatus employs a xenon-arc light source.

D5261-92 STANDARD TEST METHOD FOR MEASURING MASS PER UNIT AREA OF GEOTEXTILES

1. SCOPE

1.1 This test method can be used as an index to the determination of mass per unit area of all geotextiles
1.2 The values stated in SI units or other units shall be regarded separately as standard. The values stated in parentheses are provided for information only.

1.3 This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

D5199-95 STANDARD TEST METHOD FOR MEASURING NOMINAL THICKNESS OF GEOTEXTILES AND GEOMEMBRANES

1. SCOPE

1.1 This test method is used to measure the nominal thickness of geotextiles and geomembranes.
1.2 The values stated in SI units are to be regarded as the standard. The values are provided in inch-pound units for information only.
1.3 This test method does not provide thickness values for geomembranes under variable normal compressive stresses. This test method determines nominal thickness, not necessarily minimum thickness.
1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

D3786-87 STANDARD METHOD TEST FOR MULLEN BURST

1. SCOPE

1.1 A sample of the material to be tested is clamped between two horizontal, flat circular plates in the appropriate unit. Fluid displaced from a chamber by a piston moving at a constant rate forces a heavy rubber diaphragm to expand through the lower plate opening and exert a constantly increasing pressure against the unsupported area of the sample.
1.2 The fabric burst test tells instantly the fiber bond in nonwoven fabrics.

RE: GE Pittsfield, MA

Packaging of AEF Geotextiles is as follows;

Fabric is wound on a cardboard core and wrapped with 4 mil polypropylene for Ultraviolet protection. Rolls can be stored outside, although tarping and raising rolls off the ground on 2x6 timber is recommended to maintain dryness.

Installation instructions depend on specific job use. We are attaching some standard instructions.

Sincerely,

Reuben Weinstein
Principal

VII. *AEF* GEOTEXTILE INSTALLATION

AEF geotextiles should be installed only after the underlying material or subgrade has been properly inspected and approved. The geotextiles should be installed to the grade and location specified in project construction specifications. The project construction quality assurance / construction quality control (CQA/CQC) guidelines must be followed during the installation. An additional important resource for construction guidelines for all Geosynthetics is "Technical Guidance Document: Quality Assurance and Quality Control for Waste Containment Facilities" by United States Environmental Protection Agency (Ref. EPA/600/R-93/182).

Care should be taken not to entrap stones, excessive dust, or moisture in the geotextile during placement. In the presence of wind, all geotextiles should be weighed with temporary ballasting such as sandbags. On slopes, the geotextile should be securely anchored and then rolled down the slope in such a manner as indicated by good construction practices, and safety considerations.

All overlying materials on the geotextile should be placed such that:

- The geotextile and the underlying material are not damaged.
- Any slippage or movement of the geotextile is kept to a minimum.
- Excess stresses in the geotextile are kept to a minimum.

SECTION 1: PRODUCT IDENTIFICATION

PRODUCT NAME: FIBERVISIONS™ POLYOLEFIN FIBER

CHEMICAL DESCRIPTION: polypropylene/polyethylene based fibers

CASRN: proprietary mixture

HMIS RATINGS

Health hazard: 0 MINIMAL

Flammability hazard: 0 MINIMAL

Reactivity hazard: 0 MINIMAL

SECTION 2: HAZARDOUS COMPONENT INFORMATION

This product is not a health hazard according to the OSHA Hazard Communication Standard 29 CFR 1910.1200.

SECTION 3: HAZARDS INDENTIFICATION

No hazard anticipated under conditions of foreseeable use or exposure.

Refer to Section 5 for Hazardous Combustion Products and Section 10 for Hazardous Decomposition/Hazardous Polymerization Products.

SECTION 4: FIRST AID PROCEDURES

FIRST AID PROCEDURES:

No adverse health effects are expected from exposure to this product. However, as with many materials, a very small percentage of the population may be allergic to one or more of the components that make up these products.

Employees, who have a history of skin disease or allergy, should receive medical clearance prior to employment involving direct contact.

SECTION 5: FIRE HAZARDS

FIRE FIGHTING PROCEDURES:

Standard procedures for Class A fires

Wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH approved (or equivalent) and full protective gear when fighting fires involving this product.

EXTINGUISHING MEDIA:

Water spray, dry chemical, foam, carbon dioxide or halon may be used on fires involving this product.

CONDITIONS TO AVOID:

None known.

HAZARDOUS COMBUSTION PRODUCTS:

If heated to combustion, the following substances may be formed: carbon monoxide, carbon dioxide, hydrocarbons, aldehydes, ketones, and fatty acids. Temperature, air supply, and materials present will affect the amount formed of any of the potential combustion products.

FLASH POINT: > 625 °F > 329 °C

Method: Setaflash

AUTOIGNITION TEMPERATURE: > 675 °F > 357 °C

SECTION 6: ACCIDENTAL RELEASE MEASURES

If product is not contaminated, scoop into clean containers for use. If product is contaminated, scoop into containers, and dispose appropriately.

In case of accidental spill or release, refer to Section 8, Personal Protective Equipment and General Hygiene Practices.

SECTION 7: HANDLING AND STORAGE

GENERAL MEASURES:

Removal of soap without proper protection can cause injury. See Personal Protective Equipment, MSDS Section 8.

Use caution when stacking to avoid unstable conditions.

Store in a sprinklered warehouse.

Store at temperatures below 60 °C (140 °F).

MATERIALS OR CONDITIONS TO AVOID:

Avoid storing product near incompatible materials. See MSDS Section 10.

SECTION 8: EXPOSURE CONTROLS/PERSONAL PROTECTION

GENERAL HYGIENIC PRACTICES:

Avoid breathing fiber and dust.

Wash thoroughly after handling, and before eating, drinking or smoking.

RECOMMENDED EXPOSURE LIMITS:

This product is not considered to present an inhalation health hazard under reasonably anticipated conditions of use.

PERSONAL PROTECTIVE EQUIPMENT:

Safety glasses

Use face shield and leather gloves when removing and disposing scrap.

Use shielding blanket over bales to reduce danger of flying bands or wires.

WORK PRACTICES AND ENGINEERING CONTROLS:

Eyewash fountains and safety showers should be easily accessible.

Provide adequate ventilation.

PROTECTIVE MEASURES DURING REPAIR AND MAINTENANCE:

Keep area clean. Product will burn.

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

Volatile (Wt.), %:	< 2 % (water)
Solubility in Water:	negligible, below 1%
Specific Gravity:	0.93 g/cm3
Melting Point:	162 °C 320 °F
Evaporation Rate:	negligible
pH:	7.3 +/- 0.5 at a concentration of 10% (made on the spin finish)

Appearance:	texturized and soft fibers
Odor:	has a slight odor of spin finish
Color:	various

SECTION 10: STABILITY AND REACTIVITY

GENERAL STABILITY CONSIDERATIONS:

Stable under recommended handling and storage conditions.

INCOMPATIBLE MATERIALS:

Incompatible with: strong acids, bases, and oxidizing materials

CONDITIONS TO AVOID:

Excessive heat shall be avoided. Small quantities of fumes are evolved at about 225° C (435° F) – these gradually increase until at above 300° C (572° F) decomposition and oxidative pyrolysis take place. Above 300° C the heat of oxidation may produce a rapid rise in temperature which accelerates the pyrolysis. Under these circumstances hazardous substances such as carbon mono-oxide, formaldehyde and acrolein can be evolved.

HAZARDOUS DECOMPOSITION PRODUCTS:

None anticipated under normal recommended handling and storage conditions.

HAZARDOUS POLYMERIAZTION:

Not anticipated under normal or recommended handling and storage conditions.

SECTION 11: TOXICOLOGICAL INFORMATION

REPORTED EFFECTS:

The skin and eye irritation effects of the spin finish have been examined with no harmful effects (according to OECD-guidelines no. 404 and 405).

CARCINOGENICITY INFORMATION:

Not listed as a carcinogen by NTP. Not regulated as a carcinogen by OSHA. Not evaluated by IARC.

SECTION 12: ECOLOGICAL INFORMATION

ECOTOXICITY:

The fibers are not associated with any ecological problems.

The fibers are not biodegradable.

SECTION 13: DISPOSAL CONSIDERATIONS

WASTE DISPOSAL METHOD:

Incineration in accordance with applicable regulations is the recommended disposal method. Mix waste with wood or paper waste aids to assure complete combustion. Landfilling in a permitted solid or hazardous waste facility, meeting technical regulatory requirements, is a suitable alternative.

SECTION 14: TRANSPORTATION INFORMATION

Does not belong to dangerous goods according to transport regulations.

SECTION 15: REGULATORY INFORMATION

CHEMICAL INVENTORIES:

U.S. TSCA Status:

This product is considered to be an article by TSCA definition.

SARA TITLE III

Sections 302 and 304:

This product is not an Extremely Hazardous Substance subject to reporting under 40 CFR 355.

Sections 311 and 312:

NHH: Not a health hazard

NPH: Not a physical hazard

Section 313:

This product does not contain any chemicals subject to reporting under Section 313 of Title III of the Superfund Amendments and Reauthorization Act and 40 CFR 372.

CERCLA

This product does not contain any chemicals subject to reporting as a CERCLA Hazardous Substance under 40 CFR 302.4.

RCRA

This product is not a hazardous waste as listed in 40 CFR 261.33. It does not exhibit any of the hazardous characteristics listed in 40 CFR 261, Subpart C.

Re: **Maxymillian Technologies, Pittsfield, MA**

This is to certify that AEF Style 1680 nonwoven polypropylene geotextile shipped to the above job meets the following minimum average roll values:

ROLL #: PER ATTACHED PACKING LIST

Properties	Units	Specified Values	Test Method
Mass per unit area	oz/yd^2	16	ASTM D5261
Grab Tensile	lbs	203	ASTM D4632
Elongation	%	50	ASTM D4632
Puncture	lbs	79	ASTM D4833
Mullen Burst	psi	247	ASTM D3786
Trapezoid Tear	lbs	79	ASTM D4533

David,

CERTIFICATION

This is to certify that Samleen is an approved and authorized Dealer and installer of GSE products. As an authorized Dealer of GSE, Samleen has been provided with a copy of GSE's proprietary product manual containing the data sheets of all GSE's products, and the GSE Field Installation quality assurance manual. As an authorized Dealer of GSE, Samleen has access to GSE's Technical Department representatives who can respond to questions on specifications and installation techniques. Individual employees of authorized GSE Dealer may have participated in training programs sponsored by GSE at its headquarters in Houston, Texas.

This also certifies that Samleen and its employees as an approved installer of GSE Lining Technology, Inc. geosynthetic products for this project.

Yours truly,

Gary Joachim
VP of North American Sales and Marketing

SAMLEEN, LLC

BACKGROUND HISTORY AND CAPABILITIES

David Ignatuk formed SAMLEEN, LLC in 1996 as a result of the acquisition of L. A. Salomon's liner division. Mr. Ignatuk operated L. A. Salomon's geomembrane construction division since 1991 and was then responsible for approximately 3,000,000 square feet of geomembrane installations annually. SAMLEEN now installs in excess of 15,000,000 square feet of geosynthetics annually in the Northeast.

SAMLEEN employs twelve technicians full time with seasonal peak requirements totaling 18-24 technicians during the summer and fall construction periods.

Equipment required to accomplish peak seasonal opportunities include: ten generators, fourteen wedge welders, nine extrusion welders, four tensiometers, six ATV's, two miles of 110 and 220 cords and many more pieces to fully complete all specified QA/QC and welding requirements as set forth by the Northeast's toughest engineers and owners.

A more detailed overview of the company's capabilities and strengths can be obtained by calling Mr. David Ignatuk (Owner) directly at (973) 664-9877 at the main office.

Anticipated daily production will exceed on average one acre per day of either liner or geocomposite with a company goal of one and one half acres per day at the Port Washington site.

2001 Projects

Project Name:	Brooks Landfill	
Site Location:	Wichita, KS	GSE No.: 500412
Application:	Sanitary Landfill Cap	11
Owner:	City of Wichita, Dept. of Public Works	316 722-0601
General Contractor:	Herzog Environmental	
GC Address:	P.O. Box 1089	
	St. Joseph, MO 64502	
GC Contact:	Kevin Barnet	816 233-8216
Engineering Firm:	GZA GeoEnvironmental, Inc.	
Engineer Contact:	Bart Klettke	716 685-3629
Products:	GSE HD 40 mil	3,632,175 sq. ft.
	GSE FabriCap	3,613,680 sq. ft.
Amount:	$ 1,591,630	
Date completed:	Dec-01	

Project Name:	Lanchester Landfill Cells 3C & 4	
Site Location:	Honey Brook, PA	GSE No.: 502410
Application:	Sanitary Landfill	10
Owner:	Chester County	
General Contractor:	Pavex, Inc.	
GC Address:	4400 Gettysburg Road	
	Camp Hill, PA 17011	
GC Contact:	Brent Gallager	717 761-1502
Engineering Firm:	Geosyntec Consultants	
Engineer Contact:	Jim Lyon	410 381-4333
Products:	GSE HD Textured 40 mil	110,250 sq. ft.
	GSE HD Textured 60 mil	1,614,600 sq. ft.
	GSE FabriNet	863,650 sq. ft.
	GSE FabriCap	863,650 sq. ft.
	GSE HyperNet	29,400 sq. ft.
Amount:	$ 630,130	
Date completed:	May-01	

Project Name:	River Birch Landfill Phase 5-Cells 13,15,17,19	
Site Location:	Avondale, LA	GSE No.: 504076
Application:	Sanitary Landfill Cap	11
Owner:	River Birch, Inc.	
Owner Contact:	Jim Ward	504 366-2355
Engineering Firm:	Mader-Miers Engineering	
Engineer Contact:	Paul Miers	318 989-8047
Products:	GSE HD 60 mil	1,390,350 sq. ft.
	GSE FabriNet Single Sided	1,389,675 sq. ft.
	GSE FabriNet	404,850 sq. ft.
	GSE FabriCap	184,550 sq. ft.
	GSE FabriNet HF	316,650 sq. ft.
Amount:	$ 1,942,425	
Date completed:	Aug-01	

Project Name:	Republic E.A.F. Dust Dump Closure	
Site Location:	Canton, OH	GSE No.: 504473
Application:	Sanitary Landfill Cap	11
Owner:	Republic Technologies, Inc.	
Owner Contact:	Pat Monnot	
General Contractor:	Envirocon	

GC Address:	600 Industrial, Suite 302 Naperville, IL 60563	
GC Contact:	Larry Johnston	630 527-4715
Engineering Firm:	Baker and Associates, Inc.	
Products:	GSE HD Textured 40 mil	204,750 sq. ft.
	GSE FabriCap	209,300 sq. ft.
Amount:	$ 127,680	
Date completed:	Oct-01	

Project Name:	Allied Waste/Jefferson City Phase 1A Cell	
Site Location:	Jefferson City, MO	GSE No.: 504749
Application:	Sanitary Landfill	10
Owner:	Allied Waste Industries	
Owner Contact:	Rod Bloese	314 739-5099
Engineering Firm:	Midwest Environmental Consultants	
Engineer Contact:	Lindsey Henry	573 636-9454
Products:	GSE HD Textured 60 mil	444,600 sq. ft.
Amount:	$ 136,840	
Date completed:	Mar-01	

Project Name:	Allied Waste/Fall River Cell D	
Site Location:	Fall River, MA	GSE No.: 504763
Application:	Sanitary Landfill	10
Owner:	Allied Waste Industries	
Owner Contact:	Rob DeRosa	508 678-8860
Engineering Firm:	SITEC Environmental, Inc.	
Engineer Contact:	Mike Quatromoni	781 740-3101
Products:	GSE HD Textured 60 mil	561,600 sq. ft.

Products:	GSE GundSeal	184,450 sq. ft.
Amount:	$ 113,950	

Date completed:	Nov-01

Project Name:	Black Mountain Reservoir Lining	
Site Location:	Sonoma, CA	**GSE No.:** 508784
Application:	Run-off	29
Owner:	Alexander Mountain Estates	
Owner Contact:	Tony Viramontes	707 431-1884
Engineering Firm:	James C. Hanson	
Engineer Contact:	James C. Hanson	916 448-2821
Products:	GSE HD 60 mil	246,325 sq. ft.
Amount:	$ 107,400	
Date completed:	Nov-01	

Project Name:	Superior/J & J Landfill Area 4A Cell	
Site Location:	McClellandtown, PA	**GSE No.:** 508812
Application:	Sanitary Landfill	10
Owner:	Superior Services, Inc.	
Owner Contact:	Bill Binnie	814 265-1744
Engineering Firm:	Civil & Environmental Consultants, Inc.	
Engineer Contact:	Ellis M. Boury	724 327-5200
Products:	GSE HD 60 mil	18,900 sq. ft.
	GSE HD Textured 100 mil	147,600 sq. ft.
	GSE HyperNet	100,800 sq. ft.
	Geotextile	13,000 sq. ft.
Amount:	$ 108,375	
Date completed:	Dec-01

GSE Manufacturing Quality Assurance Manual

Forword

This manual contains proprietary information belonging to GSE Lining Technology, Inc. This information is intended to provide a summary of standard quality procedures practiced by GSE's Manufacturing Quality Assurance Laboratories in Houston, Texas. These procedures apply to standard geomembrane and drainage materials only and do not explicitly address non-conforming materials.

This manual replaces in its entirety and supersedes all earlier versions issued by GSE Lining Technology, Inc. We suggest you maintain contact with your GSE representative to confirm the validity of this version at future dates.

GSE Lining Technology, Inc. reserves the right to change, modify, or discontinue the use of the policies and procedures described herein without notice or prior consent except as contractually obligated otherwise.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

Appendix D - Minimum Testing Frequencies and Average Properties for GSE Geonet and Geocomposite Products		20

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

I. GSE QUALITY MANIFEST

GSE Lining Technology, Inc. is committed to providing the highest quality products and services to our customers. This requires a firm, total quality commitment from all individuals within our organization that we will only supply materials that meet or exceed the requirements and specifications of GSE and our customers.

GSE's commitment to quality starts with the highest quality raw materials. The quality of incoming raw materials is controlled at the supplier level with a complete vendor evaluation program in place. This means purchasing only from suppliers who are committed to statistical process control thereby providing a consistent, high level of quality assurance of their products.

II. GSE MANUFACTURING QUALITY ASSURANCE

GSE Lining Technology, Inc. has an on-site Manufacturing Quality Assurance Laboratory at each manufacturing plant. Having a fully equipped, well staffed, dedicated laboratory at each of the manufacturing facilities allows GSE to maintain a high level of quality and up-to-the-minute results on finished products. Each facility follows the same guidelines for evaluating the quality of GSE products and is capable of adapting to market-driven requirements.

A. Objective

The objective of the GSE Quality Assurance program is to define implementation of basic manufacturing quality assurance (MQA) procedures necessary to insure consistent production of quality products supplied to the geosynthetic market. Note that at this time, these procedures are limited to polyethylene and polypropylene geomembranes and drainage products including geonets and geocomposites.

B. Scope

In order to achieve GSE's stated purpose, a rigorous set of minimum standards and an effective test program to assure compliance has been established. These procedures and requirements are frequently reviewed and adjusted to assure compliance with current market demands and/or predetermined project specifications. These procedures assure that raw materials and process parameters are controlled to provide products complying with GSE's pre-defined minimum characteristics.

III. GSE MANUFACTURING QUALITY ASSURANCE ORGANIZATION

This organization consists of the Manufacturing Quality Assurance Laboratories as well as the manufacturing personnel. The combination of expertise and experience from these groups provides GSE with the proper tools to maintain the highest level of quality and customer service in the industry.

The Quality Assurance Department at GSE is charged by the President to assure that only products meeting both GSE's and the customer's requirements are released for shipment. The Quality Assurance personnel are directly responsible for monitoring testing and providing feedback to the manufacturing department to ensure the production of the specified product quality. Each member of the Quality Assurance team must participate in detailed training that includes factory exposure.

IV. STAFF AND SCHEDULING

The Quality Assurance Laboratories are staffed whenever manufacturing is occurring; this is usually 24 hours per day, 365 days per year. This minimizes the amount of potentially inferior product produced before a manufacturing problem is identified.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

V. PRODUCT IDENTIFICATION AND DOCUMENTATION

A. Roll Numbering

Each roll of geomembrane, geonet and geocomposite is assigned a unique roll number. The Quality Assurance Laboratory maintains records documenting the raw materials and resulting product quality information.

B. Approval Procedure

Results for each tested roll of product is checked against both GSE and customer specifications for compliance. The Quality Assurance Laboratory approves those materials that meet both of these requirements for shipment.

C. Non-Conformance

Material that does not meet GSE minimum standards is given a roll number but is rejected and not placed into inventory. The material is identified as scrap and will not be utilized.

Material that meets GSE minimum standards but does not meet a stricter customer specification is not allocated to that customer but is placed into inventory as GSE standard material.

D. Documentation

Individual Quality Assurance Certificates are generated and supplied for each roll of geomembrane, geonet and geocomposite products to include all relevant quality assurance information about the material(s). The geotextile components (not manufactured by GSE) of the drainage geocomposite materials are tracked throughout the manufacturing process. Therefore, "traceability reports" are available.

VI. RECORDS RETENTION

GSE maintains reports and/or samples for products produced and sold. Records and/or samples are maintained according to GSE's standard retention policy according to the item.

MATERIAL	ITEM	YEARS
Raw materials	Resin Supplier Test Reports and Certifications	≥2
	GSE Resin Test Reports	≥2
	Resin Sample Retain (Archive)	≥2
Geomembrane, geonet and geocomposite	Raw Test Data (in computer database)	≥5
	Quality Control Certificates	≥5
	Sample Retain (approximately one square foot)	≥5

VII. TESTING CAPABILITIES

GSE maintains high capacity, state-of-the-art laboratory equipment suitable for performing the procedures listed in Appendices A-D. GSE's Houston, Kingstree and Calgary laboratories are accredited by the GAI-LAP program. GSE's Houston and Kingstree quality assurance laboratories, as part of GSE's Product Division, also hold certification to ISO 9001. The appropriate certificates are maintained for review upon request by authorized parties.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

A. Routine Testing

Through careful investigation, GSE has developed a strict and thorough Quality Assurance program that exceeds the vast majority of customer specifications including GRI GM13, "Test Properties, Testing Frequency and Recommended Warranty for High Density polyethylene (HDPE) Smooth and Textured Geomembranes" and GRI GM17 "Test Properties, Testing Frequency and Recommended Warranty for Linear Low Density Polyethylene (LLDPE) Smooth and Textured Geomembranes". The testing program covers raw materials (see Appendix A) and finished goods (see Appendix B & D) and is adhered to at all GSE laboratories. The laboratory equipment used by GSE represents the most modern equipment available and meets or exceeds the requirements of all the test standards used.

B. Other Testing Capabilities

In addition to routine testing, GSE laboratories are equipped to perform a wide variety of other tests as required for unusual requests or product development. Further, although the GSE Quality Assurance Laboratories are fully equipped and able to perform most routinely specified tests in the industry, there are some tests that are more economically performed by a dedicated testing facility. GSE believes requirements for such testing should be carefully considered and defined in terms of specific design requirements if they are found to be necessary.

VIII. MATERIAL QUALITY ASSURANCE

GSE Lining Technology, Inc. has established strict specifications for all raw materials and finished products. Test results must fall within the acceptable limits of GSE and customer specifications.

A. Raw Material

GSE primarily uses two types of raw materials, "natural resin" and "masterbatch" in the manufacture of geomembrane and geonet products. Natural resin is the base material (most commonly polyethylene) that is used to make a geomembrane or geonet. It contains stabilizers to prevent degradation from occurring before and after extrusion. "Masterbatch" is the term referring to the concentrated carbon black material used with the natural resin to produce the finished product. The natural resin and masterbatch are blended at the appropriate ratio at the manufacturing stage. The masterbatch can contain other additives depending upon the geomembrane or geonet product to be produced. GSE verifies the properties of each lot of raw materials prior to their utilization.

When natural resin is received, samples are taken and subjected to the tests outlined in Appendix A. All test data are entered into the computer database and checked for accuracy, consistency and compliance with GSE specifications. The material is not accepted unless all standard test requirements are met and the GSE test values meet the requirements set forth in the raw material specifications.

Copies of the supplier's certificate of analysis (COA) for each lot of resin utilized in the production of the materials supplied to a specific project are supplied as standard documentation. In addition, the GSE test results for each lot of resin are provided in a separate report upon request.

Masterbatch (carbon black concentrate) is normally received in rail car lots. If resin is received by other transport and/or in other quantities, an equivalent suitable sampling procedure is provided (i.e. not less than one sample per shipment or one sample for each 50,000 lb., 23,000 kg)

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

B. Geomembrane Products

GSE has implemented a strict and thorough Quality Assurance program for all geomembrane products. The geomembrane product line can be broken into two primary categories: smooth and textured products. Tables containing GSE minimum properties and test frequencies for all GSE geomembrane products including specialty products such as GSE White (light-reflective geomembrane) and GSE Conductive (field spark-testable geomembrane) are in Appendix B.

1. On-Line Manufacturing Quality Assurance

The Quality Assurance program for finished product begins during the manufacturing process. Each manufacturing line is equipped with state-of-the-art monitoring devices that provide feedback on the physical quality of the materials being produced. Each geomembrane production line is equipped with both a thickness gage and spark-testing device.

a) Thickness Measurement

As geomembrane is being produced, thickness readings are taken continuously over the length and width of the roll. These data are used to establish the minimum, maximum and average thickness values for each roll and are verified by thickness testing upon sampling of the finished goods.

b) Spark Testing

An electrical spark detector is in place on each manufacturing sheet line. This apparatus provides immediate notification of holes in the finished product. If a hole is detected, an alarm is triggered and the hole is identified. Rolls containing holes are rejected from standard product inventory.

2. Smooth Geomembrane Materials

Smooth geomembrane products available include high density, linear low density polyethylene and polypropylene materials with 2-3% carbon black. Specialty materials include light-reflective and electrically conductive geomembranes.

a) Sampling

Every roll of geomembrane is sampled for QA testing. An approximate one-foot by roll width sample is cut for Quality Assurance testing as each roll is completed. Specimens for testing are taken from two of five predetermined positions across the width of the roll. The five specimen positions are defined as a constantly repeating set of locations determined by the roll number. This enables the position from which any specimen was taken to be determined for future reference. Specimens for testing the machine direction are cut from one test sample and transverse direction specimens cut from the other. A "retain" or archive sample approximately 12 x 12 inch (30 x 30 cm) in size taken from the corresponding transverse direction position from the laboratory sample. The retain is labeled and kept for future reference (see Section VI).

b) Evaluation of Results

All data are entered into a computer database for calculation and comparison to GSE and customer-specific specifications. If materials do not meet GSE minimums and/or the customer specifications, the manufacturing personnel are immediately notified in order for the appropriate adjustments to be made. Only products meeting GSE minimums and customer specifications will be approved for shipment.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

c) Reporting

Every roll of material has a quality assurance roll certificate or Roll Test Data Report (RTDR). This report identifies the standards on which the GSE approval is based along with the actual test results demonstrated by the material. QA personnel then review each report.

3. Coextruded Textured Geomembranes

This type of textured geomembrane is produced utilizing a round die with coextrusion technology. The texture is produced in a process in which one or two of the outer layers of a three-layer extrusion are blended with nitrogen gas. Nitrogen bubbles form in the molten resin and escape upon exiting the die, creating a rough, textured surface. Regular, light-reflective and conductive geomembranes are available with coextruded texturing.

a) Sampling

Every roll of geomembrane is sampled for QA testing. An approximate one-foot by roll width sample is cut for Quality Assurance testing as each roll is completed. Specimens for testing are taken from five predetermined positions across the width of the roll. Specimens for testing the machine and cross direction tensile are cut from each of the five positions. Tear and puncture are tested on one of the five positions of every roll. A "retain" or archive sample approximately 12 x 12 inch (30 x 30 cm) in size taken from the corresponding transverse direction position from the laboratory sample. The retain is labeled and kept for future reference (see Section VI).

Evaluation of results and reporting practices are the same as for smooth geomembranes

C. Geonet Products

Geonet drainage products with bi-planar or tri-planer geometry are produced. Tables containing GSE properties and test frequencies for all GSE geonet and geocomposite products are located in Appendix D.

1. Sampling

A one-foot by roll width sample is cut for Quality Assurance testing from every fifth roll produced. An archive sample is cut from each tested roll. This sample is taken from a random location then it is labeled and stored for future reference (see Section VI).

2. Evaluation of Results

All data are entered into a computer database for calculation and comparison to established order specifications. If materials do not meet the required GSE standards and/or the customer specifications the manufacturing personnel are immediately notified in order for the appropriate adjustments to be made. Only products meeting GSE standards and customer specifications will be approved for shipment.

3. Reporting

A Quality Assurance Certificate is issued for every tested roll of finished product. This report identifies the standards on which the GSE approval is based along with the actual test results demonstrated by the material. QA personnel review each report.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

D. Geocomposite Products

Geocomposite products are produced with a geonet and a nonwoven geotextile(s). This product is manufactured by heat bonding a geotextile to one or both sides of a geonet product. Sampling, evaluation of results and reporting practices are the same as for geonet products (Section B. above).

E. Third Party Conformance Sampling

Some specifications require independent Quality Assurance and/or conformance testing. GSE can provide assistance with the sampling of products by arranging for the conformance samples to be taken during production. By taking samples during production rather than on site, the customer can be assured that the samples are clean and available for conformance testing in a timely manner.

GSE encourages customers to audit GSE manufacturing and manufacturing quality assurance operations and/or to collect samples and conduct independent conformance testing prior to shipment of materials.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

Notched Constant Tensile Load, hours	ASTM D 5397, appendix	400	400	400	400
Oxidative Induction Time[4], min	ASTM D 3895	100	100	100	100

[1] GSE utilizes test equipment and procedures that enable effective and economical confirmation that the product will conform to specifications based on the noted procedures. Some test procedures have been modified for application to geosynthetics. All procedures and values are subject to change without prior notification.

[2] GSE Conductive and GSE Conductive White may have an overall ash content of greater than 3.0% due to the conductive and, when applicable, the white layer.

[3] Due to surface effects caused by the conductive layer, these tensile properties are minimum average values.

[4] The OIT values apply to the non-conductive black layer only.

[5] Dispersion only applies to near spherical agglomerates. 9 of 10 views shall be Category 1 or 2. No more than 1 view from Category 3.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

MINIMUM WELD PROPERTIES FOR STANDARD SMOOTH HDPE GEOMEMBRANES[1]

Property	Test Method	30 (0.75)	40 (1.0)	60 (1.5)	80 (2.0)	100 (2.5)	120 (3.0)
Peel Strength (fusion), ppi (kN/m)	ASTM D 6392	49 (8.6)	65 (12)	98 (17)	130 (23)	162 (29)	196 (35)
Peel Strength (extrusion), ppi (kN/m)	ASTM D 6392	39 (6.9)	52 (9)	78 (14)	104 (18)	130 (23)	157 (28)
Shear Strength (fusion & ext), ppi (kN/m)	ASTM D 6392	61 (11)	81 (14)	121 (21)	162 (29)	203 (36)	242 (43)

[1] These values apply to both coextruded and flat cast produced geomembranes and white-surfaced and conductive products.

MINIMUM WELD PROPERTIES FOR STANDARD COEXTRUDED TEXTURED HDPE GEOMEMBRANES[1]

Property	Test Method	30 (0.75)	40 (1.0)	60 (1.5)	80 (2.0)	100 (2.5)
Peel Strength (fusion), ppi (kN/m)	ASTM D 6392	49 (8.6)	65 (12)	98 (17)	130 (23)	162 (29)
Peel Strength (extrusion), ppi (kN/m)	ASTM D 6392	39 (6.9)	52 (9)	78 (14)	104 (18)	130 (23)
Shear Strength (fusion & ext), ppi (kN/m)	ASTM D 6392	61 (11)	81 (14)	121 (21)	162 (29)	203 (36)

[1] These values also apply to both white-surfaced and conductive geomembrane products.

MINIMUM WELD PROPERTIES FOR STANDARD SMOOTH LLDPE GEOMEMBRANES[1]

Property	Test Method	30 (0.75)	40 (1.0)	60 (1.5)	80 (2.0)	100 (2.5)
Peel Strength (fusion & ext), ppi (kN/m)	ASTM D 6392	36 (6.3)	48 (8.4)	72 (13)	96 (17)	120 (21)
Shear Strength (fusion & ext), ppi (kN/m)	ASTM D 6392	40 (7.0)	56 (9.8)	84 (15)	112 (20)	140 (25)

[1] These values apply to both coextruded and flat cast produced geomembranes to include white-surfaced products. GSE UltraFlex White is available in thicknesses of 40 and 60 mil at this time. Therefore, values for other thicknesses in this table do not apply to white-surfaced products.

MINIMUM WELD PROPERTIES FOR STANDARD COEXTRUDED TEXTURED LLDPE GEOMEMBRANES[1]

Property	Test Method	40 (1.0)	60 (1.5)
Peel Strength (fusion & ext), ppi (kN/m)	ASTM D 6392	40 (7.0)	60 (11)
Shear Strength (fusion & ext), ppi (kN/m)	ASTM D 6392	48 (8.4)	72 (13)

[1] These values also apply to coextruded textured white-surfaced geomembrane products.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

MINIMUM TESTING FREQUENCIES FOR GSE GEONET & GEOCOMPOSITE PRODUCTS

Property	Test Method[1]	Geonet	Geocomposite[2]
Transmissivity[3]	ASTM D 4716-99	every 240 rolls of production[4]	every 240 rolls of production[4]
Thickness	ASTM D 5199	every 5th roll	Note 5
Density	ASTM D 1505	every 5th roll	Note 5
Tensile Strength (MD)	ASTM D 5035	every 5th roll	Note 5
Carbon Black Content	ASTM D 1603, modified	every 5th roll	Note 5
Ply Adhesion	GRI GC7	N/A	every 5th roll

[1] GSE utilizes test equipment and procedures that enable effective and economical confirmation that the product will conform to specifications based on the noted procedures. Some test procedures have been modified for application to geosynthetics. All procedures and values are subject to change without prior notification.

[2] The geonet portion of the geocomposite is tested according to the procedure specified for GSE standard geonet testing. Ply adhesion is the only test that is unique to the geocomposite product.

[3] Routine transmissivity tests on geonet and geocomposite are performed at normal loads of 500, 5000, 10000 and 15000 psf and gradients of 0.1 and 1.0 between stainless steel plates and a 15 minute seat time. The routine frequency covers approximately one test per week per product (approximately every 240 rolls). Special transmissivity tests must be approved by the Technical Support Department of the GSE Products Division prior to commitment. Results can be furnished upon request.

[4] The noted test frequency and test conditions do not include project specific design transmissivity testing as required by the projects. This routine Quality Assurance testing is designed to monitor the consistency of production and to verify that the produced material complies with GSE minimum requirements. Additional testing is conducted as deemed necessary by the Technical Support Department and as approved by the Quality Assurance Manager. At a minimum, a sample will be taken from each product change for verification. This frequency represents one sample per week per product.

[5] These properties apply only to the geonet portion of the geocomposite.

MINIMUM AVERAGE PROPERTIES FOR GSE HYPERNET

TESTED PROPERTY	TEST METHOD	MINIMUM AVERAGE VALUES[e]		
		HyperNet	HyperNet HF	HyperNet CP
Transmissivity, m^2/sec	ASTM D 4716-00	2×10^{-3}[a]	3×10^{-3}[b]	8×10^{-4}[c]
Thickness, mil (mm)	ASTM D 5199	200 (5)	250 (6.3)	160 (4.0)
Density, g/cm^3	ASTM D 1505	0.94	0.94	0.94
Tensile Strength (MD), lb/in (N/mm)	ASTM D 5035	45 (7.9)	55 (9.6)	30 (5.3)
Carbon Black Content, %	ASTM D 1603, modified	2.0	2.0	2.0
Roll Width, ft (m)		15 (4.6)	15 (4.6)	15 (4.6)
Roll Length[d] ft (m)		300 (90)	250 (76)	300 (90)

NOTES:

(a) Gradient of 0.1, normal load of 10,000 psf, water at 70° F between steel plates for 15 minutes.

(b) Gradient of 0.1, normal load of 10,000 psf, water at 70° F between steel plates for 15 minutes.

(c) Gradient of 0.1, normal load of 1,000 psf, water at 70° F between steel plates for 15 minutes.

(d) Please check with GSE for other available roll lengths.

(e) These are MARV values that are based on the cumulative results of specimens tested and determined by GSE.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

MINIMUM AVERAGE PROPERTIES FOR GSE FABRICAP

TESTED PROPERTY	TEST METHOD	MINIMUM AVERAGE VALUES[d]	
Geocomposite		6 oz/yd²	8 oz/yd²
Transmissivity[a], m²/sec	ASTM D 4716-00	1×10^{-4}	1×10^{-4}
Ply Adhesion, lb/in minimum	GRI GC-7	0.5	0.5
Ply Adhesion, lb/in average	GRI GC-7	1.0	1.0
Roll Width, ft (m)		14.5 (4.4)	14.5 (4.4)
Roll Length, ft (m)		230 (70:1)	200 (60.9)
Geonet core[b]			
Transmissivity[a], m²/sec	ASTM D 4716-00	8×10^{-4}	8×10^{-4}
Thickness, mil (mm)	ASTM D 5199	160 (4.0)	160 (4.0)
Density, g/cm³	ASTM D 1505	0.94	0.94
Tensile Strength (MD), lb/in (N/mm)	ASTM D 5035	30 (5.3)	30 (5.3)
Carbon Black Content, %	ASTM D 1603	2.0	2.0
Geotextile (prior to lamination)[b,c]			
Thickness, mil (mm)	ASTM D 5199	80 (2.0)	90 (2.2)
Grab Tensile, lb (N)	ASTM D 4632	170 (755)	220 (975)
Puncture Strength, lb (N)	ASTM D 4833	110 (485)	135 (600)
AOS, US sieve (mm)	ASTM D 4751	70 (0.212)	80 (0.180)
Flow Rate, gpm/ft² (lpm/m²)	ASTM D 4491	110 (4480)	110 (4480)
UV Resistance, % retained	ASTM D 4355 (after 500 hours)	70	70

NOTES:

(a) Gradient of 0.1, normal load of 1,000 psf, water at 70° F between steel plates for 15 minutes.

(b) Component properties prior to lamination.

(c) Several geotextiles are available and may be supplied as determined by GSE.

(d) These are MARV values that are based on the cumulative results of specimens tested and determined by GSE.

IV. Introduction To AutoCad 105

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

1.0 Overview

This manual is a guide of the duties and responsibilities for a GSE QA technician.

ASTM Practices that this guide lists include the following and are included separately:

ASTM D-6392 Standard Test Methods For Determining The Integrity Of NonReinforced Geomembrane Seams Produced Using Thermo Fusion Methods

ASTM D-5820 Standard Practice For Pressurized Air Channel Evaluation of Dual Seamed Geomembranes

ASTM D-5641 Standard Practice For Geomembrane Seam Evaluation By Vacuum Chamber

ASTM D-6497 Standard Guide For Mechanical Attachment of Geomembrane to Penetrations or Structures

GRI Standard GM13 Test Properties, Testing Frequency and Recommended Warranty for High Density Polyethylene (HDPE) Smooth and Textured Geomembranes

GRI Standard GM14 Selecting Variable Intervals for Taking Geomembrane Destructive Seam Samples Using the Method of Attributes

GRI Standard GM17 Test Properties, Testing Frequency and Recommended Warranty for Linear Low Density Polyethylene (LLDPE) Smooth and Textured Geomembranes

2.0 Material Delivery

2.01 Upon arrival on site, the GSE QA will do an inventory of materials on the job site.

2.02 Roll numbers of liner, textile, geonet and composite will be logged on the Inventory Check List and cross-referenced with bills of lading (Materials Supplied by GSE).

2.03 Copies of the Inventory Check List and signed Bill of Ladings should be sent to the home office with the QA retaining the originals.

2.04 Any visible damage to roll materials should be noted on the roll and Inventory Check List.

3.0 Earthwork

3.01 The General Contractor is responsible for preparing and maintaining the subgrade. The subgrade should be prepared and maintained per the individual job specifications.

3.02 Subgrade Surface Acceptance Certificate - The GSE Site Manager shall be responsible for assuring that the subgrade surface has been properly prepared for deployment of geosynthetics. If GSE is required to sign a Subgrade Surface Acceptance Certificate, please use the form provided by GSE. Under no circumstances sign off on subgrade that is not suitable for deployment of geosynthetics. Sign the Subgrade Acceptance Certificate only on areas to be covered in one day, preferably after deployment.

3.03 If the subgrade is unacceptable and the GC/Owner directs GSE to deploy over, the GSE Site Manager must have the Owner's representative sign the Deployment by Owner's Direction Over

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

Unsuitable Subgrade Certificate which will take the place of the Subgrade acceptance Certificate for the particular area being covered.

3.04 Prior to material installation, whenever possible, the QA should measure the area to be covered and compare it to the area used for the bid. An outline of the area including anchor trenches, top of slopes and toe of slopes will be provided by GSE's Drafting department. Use this outline to log actual on-site conditions, i.e....distances between anchor trenches, length of anchor trenches, top of berms, length of slopes and/or any other relevant distances.

Note: Whenever possible distances will be included on the blank outlines. If actual field dimensions have changed or do not match the GSE outline the QA should notify their Supervisor and then the Project Manager, so that quantities can be reassessed to determine the proper amount of material needed for installation. It is important to establish the limits of deployment with all parties. Any changes must be noted and signed off by the Customer's Representative.

4.0 Panel Placement

4.01 Each panel will be assigned a number as detailed below.

4.01a When there is only one layer, panels may be designated with a number only, i.e.... 1, 2, 3, 4 etc.

4.01b When two or more layers are required use a letter and number, i.e....
Secondary Liner S1, S2, S3, S4 etc...
Primary Liner P1, P2, P3, P4 etc...
Tertiary Liner T1, T2, T3, T4 etc...

4.02 This numbering system should be used whenever possible. Agreement to a panel numbering system should be made at the pre-construction meeting if possible. However, it is essential that GSE's system and the Owner's Representative/Third Party QA agree. Do not use different systems.

4.03 Panel numbers shall be written in large block letters in the center of each deployed panel. The roll number, date of deployment and length (gross) should be noted below the panel number. All noting should be made so that they are easily visible from a distance. On long panels it is beneficial to write information at both ends.

4.04 Panel Numbers shall be logged on the GSE Panel Placement Log along with the roll number and gross length.

4.05 If there is a partial roll left after deployment it is important to write the last four digits of the roll number several times for future identification, along with the estimated length.

5.0 Trial Welds

5.01 Seaming apparatus shall be allowed to warm up a minimum of 15 minutes before performing trial welds.

5.02 Each seaming apparatus along with GSE Welding Tech will pass a trial weld prior to use. Trial welds to be performed in the morning and afternoon, as a minimum, as well as whenever there is a power shutdown.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

5.03 Fusion or wedge welds will always be performed or conducted on samples at least 6' long. Extrusion welds will be done on samples at least 3' long.

Note: Always perform trial welds in the same conditions that exist on the job. Run the trial welds on the ground, not the installed liner. Do not use a wind break unless you are using one on the job.

5.04 Sampling Procedure

5.04a Cut 4 - 1" wide specimens from the trial weld sample. Operating temperatures should be monitored while welding.

5.04b Specimens will always be cut using a 1" die cutter so the peel values may be used for qualitative analysis.

5.04c When cutting coupons from the trial weld samples, the inside and outside tracks on the coupon should be identified to assist in troubleshooting problems in case the weld fails. The outside track will be defined as the track which would be peeled if pulling the overlap exposed in a typical installation, or the seam which is closest to the edge of the top sheet. The inside track is the seam closest to the edge of the bottom sheet.

5.04d Place a small mark on the exposed (Top) overlap to denote the outside track prior to testing trial welds.

5.05 Die Cutter

5.05a Only cut one sample at a time to avoid damaging the die cutter.

5.05b Samples should be free of sand and grit prior to cutting sample.

5.05c Inspect the die edge weekly for nicks, dents or signs of dullness. Dullness of the cutting edge may damage the units.

5.05d Remove die when edge has been dulled and lightly reshape it with a medium hand file. When wear is excessive return it for a replacement die.

5.05e When the cutting board becomes deeply scored and/or interferes with coupon cutting it should be replaced.

5.05d To adjust the depth of the die cut into the cutting board, after replacing the cutting board or sharpening the die, 0.015" washer shims can be added or removed between the cutting ram and the ram extension. Only add shims when cutting is difficult due to lack of depth of cut.

5.06 Trial Weld Testing

5.06a Allow coupons to cool prior to testing. Avoid separating the coupons while hot as failure of the sheet may be initiated and false readings indicated.

5.06b In extreme heat the coupons may need to be cooled, using water or an insulated

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

cooler prior to peel testing. Lab conditions specify 70 degrees (plus or minus 4 degrees) Fahrenheit. Coupon temperatures greater than 70 degrees may result in lowered strengths.

5.06c Visually inspect the coupons for squeeze-out, footprint, pressure and general appearance.

5.06d Each of the 4 coupons will be tested in peel on the field tensiometer at a separation rate of 2" per minute (for HDPE). Shear tests, in addition to the peel tests, will be performed if required by a site-specific QA. Plan.

5.07 Pass/Fail Criteria

5.07a Criteria for passing trial welds will be as follows:

1) Seam must exhibit film tear bond (FTB). Trial welds should have no incursion into the weld.
2) Peel and shear values shall meet or exceed the values listed below for HDPE smooth or textured sheet (@ 2"/min.):

Material (Mil)	Shear Strength (PPI)	Fusion Peel (PPI)	Extrusion Peel (PPI)
40	81	65	52
60	121	98	78
80	162	130	104
100	203	162	130

3) Peel and shear values shall meet or exceed the values listed below for LLDPE smooth or textured sheet (@ 20"/min.):

Material (Mil)	Shear Strength (PPI)	Fusion Peel (PPI)	Extrusion Peel (PPI)
40	60	50	48
60	90	75	72
80	120	100	96
100	150	125	120

5.07b Both tracks of fusion welded samples must pass for the trial weld to be considered acceptable. If any of the four coupons fail either due to seam incursion (no FTB) or low strength values, the trial weld must be re-done.

5.07c The GSE QA will give approval to proceed with welding after observing and recording all trial welds.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

5.08 Trial Weld Documentation

5.08a All trial weld data will be logged on the GSE Trial Weld log

5.08b When logging fusion welded peel values on the GSE Trial Weld log indicate the values for the outside track first, followed by the inside track

5.08c Speed and temperature settings will be recorded for each machine's trial weld

6.0 Geomembrane Field Seaming

6.01 The seam number takes the identity of the panels on each side. The seam between panels 1 & 2 becomes Seam 1/2. These lengths and seam numbers shall be recorded in the GSE Seam Log.

6.02 Welding Technicians will mark their initials/employee number, machine number, date and time at the start of every seam. Technician should also periodically mark temperatures along the seam and at the end of the seam.

6.03 Approved processes for field seaming and repairing are extrusion welding and fusion welding. All welding equipment shall have accurate temperature monitoring devices installed and working to ensure proper measurement.

6.04 Extrusion welding shall be used primarily for repairs, patching and special detail fabricating and may be used for seaming. The GSE Site Manager shall verify that:

1) equipment in use is functioning properly
2) welding personnel are purging the machine of heat degraded extrudate prior to actual use
3) all work is performed on clean surfaces and done in a professional manner
4) no seaming will be performed in adverse weather conditions

6.05 Fusion welding, shall be used for seaming panels together and is not used for patching or detail work. The GSE Site Manager shall verify that:

1) the equipment used is functioning properly
2) seaming personnel are working in a professional manner and are attentive to their duties
3) no seaming will be performed in adverse weather conditions

6.06 Seam preparation, the welding technician shall verify that:

1) prior to seaming, the seaming area is free of moisture, dust, dirt, sand or debris of any nature
2) the seam is overlapped properly for fusion welding
3) the seam is overlapped or extended beyond damaged areas at least 4" when extrusion welding
4) the seam is properly heat tacked and abraded when extrusion welding
5) seams are welded with fewest number of unmatched wrinkles or "fishmouths"

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

6.07 No seaming will be performed in ambient air temperatures or adverse weather conditions that would jeopardize the integrity of the liner installation.

7.0 Field Destructive Testing

7.01 Destructive seam tests shall be performed to evaluate bonded seam strength. The frequency of sample removal shall be one sample per 500' of seam, unless specific site specifications differ. Location of the destructive samples will be selected and marked by the QA Technician or third party QA. Field testing should take place as soon as possible after seam is completed.

7.02 Samples should be labeled in numerical order, I.e. DS-1, DS-2 etc....This should carry thru any layers and or multiple ponds, do not start numbering from 1 again. (This is the preferred method)

7.03 The size of samples and distribution should be approximately 12" x 39"(size may vary dependent on Job requirements) and distributed as follows:

7.03a 12" x 12" piece given to QA Technician for field testing.
7.03b 12" x 12" piece sent to Home Office for testing, if required.
7.03c 12" x 12" piece given to third party for independent testing, or archiving.

NOTE: All samples will be labeled showing test number, seam number, machine number, job number, date welded and welding tech number.

7.04 The sample given to the QA Technician in the field shall have ten coupons cut and be tested with a tensiometer adjusted to a pull rate as shown below. All tests shall meet or be greater than the values listed below.

1) Seam must exhibit film tear bond (FTB). Trial welds should have no incursion into the weld.
2) Peel and shear values shall meet or exceed the values listed below for HDPE smooth or textured sheet (@ 2"/min.):

Material (Mil)	Shear Strength (PPI)	Fusion Peel (PPI)	Extrusion Peel (PPI)
40	81	65	52
60	121	98	78
80	162	130	104
100	203	162	130

3) Peel and shear values shall meet or exceed the values listed below for LLDPE smooth or textured sheet (@ 20"/min.):

Material (Mil)	Shear Strength (PPI)	Fusion Peel (PPI)	Extrusion Peel (PPI)
40	60	50	48
60	90	75	72
80	120	100	96
100	150	125	120

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

7.05 All trial weld destructive test data will be logged on the GSE Destructive test log.

7.06 When logging fusion welded peel values on the GSE Destructive Test Log, indicate the values for the outside track first, followed by the inside track.

7.08 Test results will be noted in the GSE Destructive Test Log as P (pass) or F (fail).

7.09 If test fails, additional samples will be cut, approximately 10' on each side of the failed test, and retested. These will be labeled A (after) & B (before). This procedure will repeat itself until a sample passes. Then the area of failed seam between the two tests that pass will be capped or reconstructed.

7.10 In lieu of taking an excessive number of samples, the GSE Site Manager may opt to extrusion weld the flap or cap the entire seam and then non-destructively test according to Section 8.0.

8.0 Non-Destructive Testing

8.01 GSE shall non-destructively test all seams their full length using an air pressure or vacuum test. The purpose of this test is to check the continuity of the seam.

8.02 Air testing; the following procedures are applicable to those seams welded with a double-seam fusion welder.

8.02a The equipment used shall consist of an air tank or pump capable of producing a minimum 35 psi and a sharp needle with a pressure gauge attached to insert into the air chamber.

8.02b Seal both ends of the seam by heating and then squeezing together. Insert the needle with the gauge into the air channel, it may be necessary to heat the liner to make this easier. Pressurize the air channel to 30psi. Note time test starts and wait a minimum of 5 minutes to check. If pressure after five minutes has dropped less than 2 psi then the test is successful (Thickness of material may cause variance).

8.02c Cut opposite seam end and listen for pressure release to verify full seam has been tested.

8.02d If the test fails, follow these procedures.

a) While channel is under pressure walk the length of the seam listening for a leak.
b) While channel is under pressure apply a soapy solution to the seam edge and look for bubbles formed by air escaping.
c) Re-test the seam in smaller increments until the leak is found.

8.02e Once the leak is found using one of the proceedures above, cut out the leak area and retest the portions of the seams between the leak areas as per 8.02a to 8.02c above. Continue this proceedure until all sections of the seam pass the pressure test.

8.02f Repair the leak with a patch and vacuum test again.

8.02g All non-destructive tests will be noted in the GSE Non-Destructive Test/Repair log.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

8.03 Vacuum testing; the following procedures are applicable to those seams welded with a extrusion welder.

8.03a The equipment used shall consist of an vacuum pumping device, a vacuum box and a foaming agent in solution.

8.03b Wet a section with the foaming agent, place vacuum box over wetted area. Evacuate air from the vacuum box to a pressure suitable to affect a seal between the box and geomembrane. Observe the seam through the viewing window for the presence of soap bubbles emitting from the seam.

8.03c If no bubbles are observed, move box to the next area for testing. If bubbles are observed, mark the area of the leak for repair as per Section 10.0 and retest as per Section 8.03.

Note: If vacuum testing fusion welded seams, the overlap flap must be cut off to perform the tests.

9.0 Defects and Repairs

9.01 Identification; all seams and non-seam areas of the geomembrane lining system shall be examined for defects in the seam and sheet.

9.02 Identification of the defect should be made using the following procedures:

9.02a For any defect in the seam or sheet that is an actual breach (hole) in the liner, installation personnel shall circle the defect and mark with the letter "P" along side the circle. The letter "P" indicates a patch is required.

9.02b For any defect that is not an actual hole, installation personnel shall only circle the defect indicating that the repair method may be only an extruded bead and that a patch is not required.

9.02c Each suspect area that has been identified as needing repair shall be repaired in accordance with this section and Non-Destructively tested as per Section 8.0. After all work is complete, the GSE Site Manager will conduct a final walk-through to confirm all repairs have been completed and debris removed. Only after this final evaluation by GSE's Site Manager and Owner/Agent shall any material be placed over the installed liner.

10.0 Repair Procedures

10.01 Any Portion of the Geomembrane liner system exhibiting a defect which has been marked for repair may be repaired with any one or combination of the following procedures:

1) Patching - used to repair holes, tears, undispersed raw materials in the sheet and dented areas.
2) Grind and Reweld - used to repair small sections of extruded seams.
3) Spot Welding - Used to repair small minor, localized flaws.
4) Flap Welding - Used to extrusion weld the flap of a fusion weld in lieu of a full cap.
5) Capping - Used to repair failed seams.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

6) Topping - Application of extrudate bead directly to existing seams.

10.02 The following conditions shall apply to the above methods:

1) surfaces of the geomembrane which are to be repaired shall be roughened
2) all surfaces must be clean and dry at the time of the repair
3) all seaming equipment used in repairing procedures shall be qualified
4) all patches and caps shall extend at least 4" beyond the edge of the defect, and all patches must have rounded corners
5) all cut out holes in liner must have rounded corners, 3" min. radius

11.0 As-Built Drawing Procedures

11.01 Liner Layout

11.01a Submitted As-built Drawings should always be on blank outlines supplied by GSE's Drafting Department. (Phone 281-230-2518 Don Sharkey). When outlines are not available plain paper may be used, but only after permission from GSE's Drafting Department.

11.01b Accuracy to the way seams fit or join.

11.01c Using different colors makes information easier to see. Drawings may be done in ink or pencil, but writing must be neat.

11.01d Do not write so small that it is hard to read.

11.01e Suggested scale is 1" = 40' (Other scales may be used if required).

11.02 Anchor Trenches

11.02a The amount of liner actually in the trench should be noted on the drawing. If amount differs, show all differences and approximate locations.

11.02b If anchor trench is larger than shown on GSE's construction drawings then a written approval should be obtained from the Owner/Agent representative. This should be included in the as-built package.

11.03 Panel & Roll Numbers

11.03a Each panel will be assigned a number as detailed below. When there is only one layer panels may be designate with a number only, i.e.... 1, 2, 3, 4 etc.

11.03b When two or more layers are required use a letter and number, i.e....

Secondary Liner S1, S2, S3, S4 etc...
Primary Liner P1, P2, P3, P4 etc...
Tertiary Liner T1, T2, T3, T4 etc...

11.03c This numbering system should be used whenever possible. Agreement to a panel

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

numbering system should be made at the pre-construction meeting if possible. However, it is essential that GSE's system and the Owner's Representative/Third Party QA agree. Do not use different systems.

11.03d Panel numbers shall be written in large block letters in the center of each deployed panel. The roll number, date of deployment and gross length should be noted below the panel number. All notations should be made so that they are easily visible from a distance. On long panels it is beneficial to write information at both ends.

11.03e Panel Numbers shall be logged on the Daily Report Forms along with the roll number and gross length.

11.03f Whenever possible, roll numbers should be placed next to panel numbers on the field copies of the as-built drawing.

11.04 Seam Lengths

11.04a Every seam length that is not a cross-seam must be noted. This includes rectangles, squares, pies and any other shape (See Fig. A).

11.04b GSE assumes that all regular cross-seams are either 22' or 34' wide, unless they are not full width panels they do not have to be noted on the drawing. Panel widths are measured perpendicularly across the panels.

11.04c All dimensions should be called out in tenths of a foot.

11.05 Tests

11.05a All test markings should conform to the "Legend" on the blank outline.

11.05b It can be assumed that all seam junctions will have a patch, therefore, it is only necessary to note if they don't.

11.06 Seam Numbers

11.06a Since the seam number is drawn from the adjoining panels (I.e. 1/2, 10/11 etc.) there is no need to call out seam numbers on the drawings.

11.06b Each seam must be logged in the Daily Report.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

Fig A

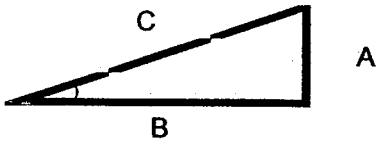
11.07 Miscellaneous

11.07a QA's name should be on all drawings and paperwork.

11.07b Any questions arising in the field about reporting issues may be handled by calling Don Sharkey at 800-435-2008, ext 2518 or 281-230-2518.

12.0 Formulas

12.01 Here are some procedures using trig formulas to enable you to deal with slope corrections concerning seam lengths on as-built drawings in order to do these calculations you will need a calculator that performs trigonomic functions.



A = Rise
B = Base
C = Slope

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

12.02 Useful Formulas

12.02a rise divided by base = Tangent of the angle

12.02b base divided by cosign of the angle = slope

12.02c slope multiplied by cosign of the angle = base

12.02d rise divided by Tangent of the angle = base

12.03 Slope factors

12.03a Slope factors can be used as a quick method of calculating seam lengths in a flat plan, such as an as-built drawing. Most of the time when field drawings do not fit the outline provided by the Drafting Department it is because actual seam lengths were used instead of lengths calculated with a slope factor. Once you determine the slope factor (a percentage of the actual length) it will probably make field drawings fit the outlines better. As usual, there are always exceptions to this theory.

12.03b To determine a slope factor simply divide the base length by the slope length. Lets use a 3:1 slope as an example. With a base of 100' and a rise of 33.34' the angle of the slope becomes 18.435 degrees. 100' divided by the cosign of 18.435 degrees equals 105.41'. Thus, if you divide 100' by 105.41' you get a slope factor of .9487 or rounded to the nearest one hundredth 0.95.

Now, if you multiply your slope lengths by .95 you will get the actual plan view or paper view length of a seam.

12.04 Typical Slope factors

Slope	Slope Factor	Degrees
2 to 1	0.895	26.565
3 to 1	0.949	18.435
4 to 1	0.970	14.036
5 to1	0.981	11.310
2.5 to 1	0.928	21.802

2.1 ASTM Standards:

D 638	Test Method for Tensile Properties of Plastics
D 882	Test Methods for Tensile Properties of Thin Plastic Sheeting
D 4439	Terminology for Geotextiles
D 5199	Test Method for Measuring the Nominal Thickness of Geotextiles and geomembranes
D 5994	Test Method for Measuring the Core Thickness of Textured Geomembranes

2.2 EPA Standards:

EPA/600/2-88/052 Lining waste containment and other containment facilities; Appendix N, Locus of break codes for various types of FML seams.

3. Terminology

3.1 Definitions of terms specific to this Standard:

3.1.1 geomembrane, n–an essentially impermeable geosynthetic composed of one or more synthetic sheets.

3.1.2 quality assurance, n–all planned and systematic actions necessary to provide adequate confidence that an item or a facility will perform satisfactorily in service.

3.1.3 quality control, n–The operational techniques and the activities, which sustain a quality of material, product, system, or service that will satisfy given needs; also the use of such techniques and activities.

4. Significance and Use

4.1 The use of geomembranes as a barrier material to restrict liquid migration from one location to another in soil and rock has created a need for a standard test method to evaluate the quality of geomembrane seams produced by thermo-fusion methods. In the case of geomembranes, it has become evident that geomembrane seams can exhibit separation in the field under certain conditions. Although this is an index type test method used for quality assurance and quality control purposes, it is also intended to provide the quality assurance engineer with sufficient seam peel and shear data to evaluate seam quality. Recording and reporting data, such as separation that occurs during the peel test and elongation during the shear test, will allow the quality assurance engineer to take measures necessary to ensure the repair of inferior seams during facility construction, and therefore, minimize the potential for seam separation in service.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

Apparatus

5.1 Tensile instrumentation shall meet the requirements outlined in Test Method D 638.

5.2 Grip Faces – Grip faces shall be 25mm (1") wide and a minimum of 25mm (1") in length. Smooth rubber, fine serrated or coarse serrated grip faces have all been found to be suitable for testing geomembrane seams.

Sample and Specimen Preparation

6.1 Seam Samples – Cut a portion of the fabricated seam sample from the installed liner in accordance with the project specifications. It is recommended that the cutout sample be 0.3m (1') wide and 0.45m (1.5') in length with the seam centered in the middle.

6.2 Specimen Preparation – Ten specimens shall be cut from the sample submittal. The specimens shall be die cut using a 25mm (Nominal 1") wide by a minimum of 150mm (nominal 6") long die. Specimens that will be subjected to peel and shear tests shall be selected alternately from the sample and labeled as shown in Fig. 1. Specimens shall be cut such that the seam is perpendicular to the longer dimension of the strip specimen.

6.3 Conditioning – samples should be conditioned for 40 h in a standard laboratory environment that conforms to the requirements for testing geosysnthetics as stated in Terminology D 4439. Long sample conditioning times typically are not possible for most applications that require seam testing. Prior to testing, samples should be conditioned for a minimum of 1 h at 23 + or - 2° C and a relative humidity between 50 and 70 %.

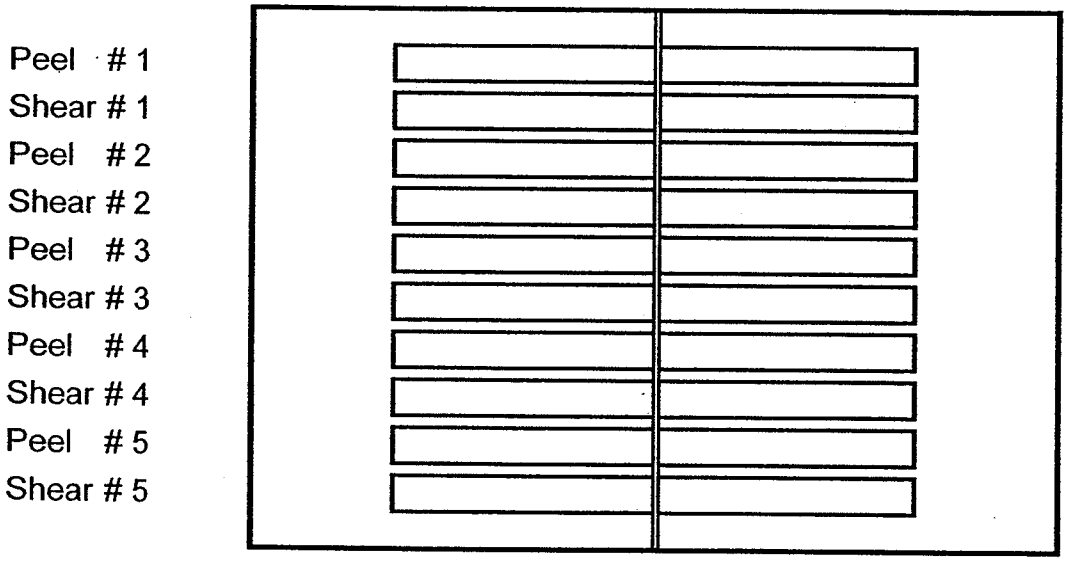

Figure 1 – Seam Sample

and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

7. Destructive Test Methods

7.1 Peel Testing – Subject five specimens to the 90° "T-Peel" test (see Fig. 2). If the tested sample is a dual hot wedge seam, five specimens must be examined for each horizontal track of the seam. Maintaining the specimen in a horizontal position throughout the test is not required. Fully grip the test specimen across the width of the specimen. Grip the peel specimen by securing grips 25mm (1") on each side of the start of the seam bond, a constant machine cross head speed of 50mm (2")/min. for HDPE, LMDPE, and PVC< 500mm (20")/min for LLDPE, VLDPE, VFPE, and fPP. The test is complete when the specimen ruptures.

7.2 Shear Testing – Subject five specimens to the shear test (see Fig. 2). Fully support the test specimen within the grips across the width of the specimen. Secure the grips 25mm (1") on each side of the start of the seam bond, a constant machine cross head speed of 50mm (2")/min. For LMDPE and HDPE, 500mm (20")/min. for fPP, LLDPE, VFPE, VLDPE, and PVC. The test is complete for HDPE and LMDPE once the specimen has elongated 50%. PVC, fPP, LLDPE, VFPE and VLDPE geomembranes should be tested to rupture.

Note 2 – Both peel and shear tests for fPP, LLDPE, VLDPE, and PVC geomembranes have been tested routinely at both 2" and 20" per minute. When conducting seem peel or shear testing for quality control, or quality assurance purposes, or both, it may be necessary to select the manufacturer's recommended testing speed. In the absence of explicit testing speed requirements, follow those recommended in 7.1 and 7.2.

8. Calculations and Observations

8.1 Estimate of Seam Peel Separation – Visually estimate the seam separation demonstrated prior to rupture for peel specimens. The estimate shall be based upon the proportion of linear length of separated bond in the direction of the test, to the length of original bonding to the nearest 25%.

Note 3 – During the thermo-fusion welding process, some of the melted polymer may be shifted to the outside of the weld during the pressing of the geomembrane panels together. This melted polymer is sometimes called "squeeze-out" or "Bleed-out" and is not considered part of the bond. Care must be exercised during estimation of the seam peel separation to segregate the squeeze or bleed out length from the peeled bond length. The reported peel separation shall include the peeled bond length only.

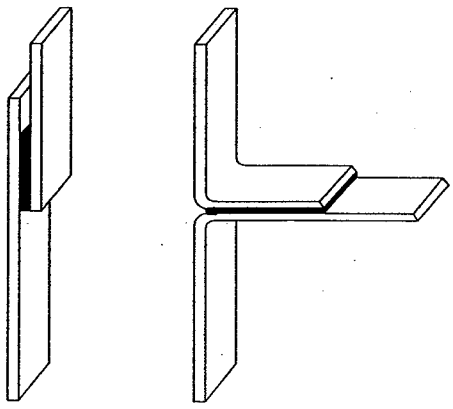

FIG. 2 shear and T-Peel Specimens

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

8.2 Rupture Mode selection – Determine the locus of break for both the peel and shear specimens as shown in Figs. 3 and 4. The locus of break for shear specimens that do not rupture prior to test end (50% elongation) shall be interpreted as occurring in the membrane that exhibits yielding.

8.3 Shear Percent Elongation – Calculate the percent elongation on shear specimens according to Eq 1. Divide the extension at test end by the original gage length of 25mm (1" and multiply by 100).

$$\text{Elongation} = \frac{L}{L'} \times 100 \qquad \text{(Equation 1)}$$

where: L = extension at test end, and
L' = original gage length

Note 4 – The intent of measuring elongations using this test method is to identify relatively large reductions in typical break elongation values of seam samples. Length is defined as the distance from one grip to the seam edge. Using this definition implies that all strain experienced by the specimen during the shear test occurs on one side of the seam. Of course this assumption is inaccurate, since some strain will occur on each side of the seam, and in the seam area itself, however, it is difficult to make an accurate measurement of the strain distribution which occurs in the specimen during testing. Further, it is not critical to know the exact location of all the strain which occurs during testing but rather to simply identify when significant reductions in elongation (when compared with the typical elongation of a new material) have occurred.

9. Reports

9.1 The report shall include the following information.

9.1.1 Report the individual peel and shear maximum unit tension values in N/mm of width (lb/in.).

Note 5 – If requested, report maximum peel or shear stress. This calculation will require an accurate measurement of thickness for each specimen. These measurements should be made in accordance with Test Method D 5994 for textured geomembranes.

9.1.2 Report the cross head speed used during peel and shear testing.

9.1.3 Report the average of the individual peel and shear sample values recorded.

9.1.4 If the peel or shear specimen does not rupture, report the elongation at the maximum cross-head travel limitation. If the gage length is reduced to less than 25mm (1"), this must be noted in the report.

9.1.5 Report the mode of specimen rupture for peel and shear specimens according to Fig. 3 or Fig. 4.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

ASTM D-5641-94[E1]

STANDARD PRACTICE FOR GEOMEMBRANE SEAM EVALUATION BY VACUUM CHAMBER[1]

This standard is issued under the fixed designation D5641: the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (E) indicates an editorial change since the last revision or reapproval

[E1]Note – The title was corrected editorially in June 1995.

1. Scope

1.1 This practice covers procedures to perform nondestructive quality control testing described in Practice D 4437 and D 4545 for evaluating the continuity of all types of geomembrane seams using the bubble emission or vacuum chamber method.

1.2 The technique described in this practice is intended for use on geomembrane seams, patches, and defects.

1.3 The values stated in SI units are to be regarded as the standard. The inch-pound units in parentheses are provided for information only.
geomembrane, forcing together the two surfaces to form a continuous bond,

1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:

D 4437 Practice for Determining the Integrity of Field Seams Used in Joining Polymeric Flexible Sheet Geomembranes[2]
D 4439 Terminology for Geotextiles
D 4545 Practice for Determining The integrity of Factory Seams Used in Joining Flexible Sheet Geomembranes[2]
E 515 Test Method for Leaks Using Bubble Emission Techniques[3]

2.2 EPA Standards:

EPA/600/2-88/052 Lining waste containment and other containment facilities, NTIS PB89-129-670[4]
EPA/530/SW-91/051 Inspection Techniques for the Fabrication of Geomembrane Field Seams.

3. Terminology

3.1 Definitions of terms specific to this Standard:

3.1.1 geomembrane, n–an essentially impermeable geosynthetic composed of one or more synthetic sheets. (See Terminology D4439)

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

3.1.2 seam, n–the connection of two or more pieces of material by mechanical, chemical, or fusion methods to provide the integrity of a single piece of material.

3.1.3 Vacuum chamber, n–a device that allows a vacuum to be applied to a surface.

3.1.3.1 Discussion–In geomembranes, typical seams would include adhesive bonded; bodied chemical fusion welds; chemical fusion welds; dielectric; dual hot wedge; fillet extrusion; flat extrusion; hot air; single hot wedge; and ultrasonic. (See EPA/530/SW-91/051.)

4. Summary of Practice

4.1 The basic principle of this practice consists of creating a pressure differential across a seam and observing for bubbles in a film of foaming solution over the low pressure side, within the vacuum chamber. The vacuum chamber has a viewing port that allows observation of the seal area being tested. The foaming solution is applied to the surface to be tested and the vacuum chamber is placed over the test area. As the chamber is held firmly in place, vacuum is applied. Air leakage through flaws in the test area cause bubbles in the foaming solution that may be observed.

5. Significance and USE

5.1 This Practice is a nondestructive evaluation intended to be used for quality control purposes during factory or field seaming of geomembranes.

5.2 This Practice may also be used to evaluate geomembrane panels for holes that penetrate the entire thickness of material. Limitations on the test practice are that it may not be suitable for uneven or curved surfaces, thick seams in corners, and thin extensible geomembranes.

6. Apparatus

6.1 Vacuum Pump – The vacuum pump shall be fuel or electric powered and capable of sustaining the required vacuum for the duration of the test.

6.2 Vacuum Gage – The vacuum gage shall be capable of registering, as a minimum, to 70 kPa (10psi) in increments of 5 kPa (3/4 psi).

6.3 Calibration and Adjustment–The calibration of the vacuum gage shall be checked and adjusted periodically, and routinely at a minimum of once every twelve months.

6.4 Foaming Solution – The foaming solution shall be pre-mixed with water at a ratio conductive to the formation of bubbles. It shall be dispensed by spray, brush, or any other convenient means. The foaming solution shall be compatible with the geomembrane.

Note 2 – If the component to be tested has parts made of polyethylene or structural plastics, the test fluid must not promote environmental stress cracking (E.S.C.) (See Test Method E 515).

6.5 Vacuum Chamber – The vacuum chamber shall have an open bottom and a clear viewing panel on top. It shall be an appropriate and convenient size and shape, made of rigid materials and equipped with a vacuum gage, valve, and soft pliable gasket around the periphery of the open bottom (See Fig. 1).

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

the vacuum cannot be held for the minimum10 seconds, the test area should be marked as untested. It is essential that the viewing port remain clean at all times to facilitate unobstructed viewing.

7.8 If bubbles appear on the geomembrane seam, turn the three-way vacuum valve to vent the chamber and remove the vacuum chamber from the seam. The defective area should then be marked for repair.

7.9 If bubbles do not appear through the geomembrane seam or test area within the specified dwell time, turn the vacuum valve to vent the chamber from the seam.

7.10 Move the vacuum chamber to the adjoining portion of the seam or test area overlapping the previously tested area by a distance no less that 10% of the minimum chamber length or at least 50 mm (2"), whichever is the greater and repeat the procedure until the entire seam has been tested.

8. Report

8.1 Report the following information:

8.1.1 Identification of the geomembrane material, including type of polymer, source, thickness, reinforced or nonreinforced sheeting, seaming system used, ambient temperature, seam tested, seam width, date of seam fabrication, and date of seam evaluation, and the results of seam evaluation,

Note 4 – The intent of the form is not to imply that each VCT is to be recorded on said form.

8.1.2 Documentation of the typical vacuum pressure and hold duration and latest pressure gage calibrations.

8.1.3 Identification of the location and approximate size of all defective areas, and

8.1.4 Identification of foaming solution used for the test and if different types were used, the location of use for each type.

9. Keywords

9.1 bubble emission testing; geomembrane; nondestructive testing; seam; testing; vacuum; vacuum chamber.

ASTM D-5820-95

STANDARD PRACTICE FOR PRESSURIZED AIR CHANNEL EVALUATION OF DUAL SEAMED GEOMEMBRANES

This standard is issued under the fixed designation D5820: the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (E) indicates an editorial change since the last revision or reapproval

[E1]Note – The title was corrected editorially in June 1995.

1. Scope

1.1 This practice covers a nondestructive evaluation of the continuity of parallel geomembrane seams separated by an unwelded air channel. The unwelded air channel between the two distinct seamed regions is sealed and inflated with air to a predetermined pressure. Long length of seam can be evaluated more quickly than by other common nondestructive tests.

1.2 This practice should not be used as a substitute for destructive testing. Used in conjunction with destructive testing, this method can provide additional information regarding the seams undergoing testing.

1.3 This practice supercedes Practice D 4437 for geomembrane seams that include an air channel. Practice D 4437 may continue to be used for other types of seams. The user is referred to the referenced standards, or to EPA/530/SW-91/051 for additional information regarding geomembrane seaming techniques and construction quality assurance.

1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standard:

D 4437 Practice for Determining the Integrity of Field Seams Used in Joining Polymeric Flexible Sheet Geomembranes[2]

D 4439 Terminology for Geotextiles[2]

D 4491 Test Methods for Water Permeability of Geotextiles by Permittivity[2]

2.2 Other Standard:

CGSB 148.1 #112 Dual Seam Non-Destructive Pressure Testing Method for Geomembranes[3]

EPA/530/SW-91/051 Technical Guidance Document: Inspection Techniques for the Fabrication of Geomembrane Field seams[4]

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

3. Terminology

3.1 Definitions:

3.1.1 dual seam, n–a geomembrane seam with two parallel welded zones separated by an unwelded air space.

3.1.1.1 Discussion – The dual seam itself can be made by a number of methods, the most common being the hot wedge technique. Other possible methods include hot air and ultrasonic bonding techniques.

3.1.2 geomembrane, – n an essentially impermeable geosynthetic composed of one or more synthetic sheets.

3.1.2.1 Discussion – In geotechnical engineering, impermeable essentially means that no measurable liquid flows through a geosynthetic when tested in accordance with Test Method D 4491.

3.1.3 seam, n – a permanent joining of two or more materials.

3.2 For definitions of other terms, see Terminology D 4439.

4. Summary of Practice

4.1 This practice utilizes a dual seam where an air channel exists between the two welded zones. Both ends of the air channel are sealed and then a pressure gage is attached to the air space. Air pressure is applied and the gage monitored for excessive gage air pressure drop.

4.2 Air pressures used in this practice are related to the thickness, stiffness and material type of the geomembrane.

4.3 The minimum monitoring time is recommended to be 2 minutes following the stabilization of the pressure.

4.4 Maximum allowable loss of air pressure varies depending upon thickness, stiffness and type of material of the geomembrane.

5. Significance and USE

5.1 The increased use of geomembranes as barrier materials to restrict liquid or gas movement, and the common use of dual track seams in joining these sheets, has created a need for a standard nondestructive test by which the quality of the seams can be assessed for continuity and water tightness. The test is not intended to provide any indication of the physical strength of the seam.

5.2 This practice recommends an air pressure test within the channel created between dual seamed tracks whereby the presence of unbonded sections or channels, voids, nonhomogenities, discontinuities, foreign objects, and the like, in the seamed region can be identified.

5.3 This technique is intended for use on seams between geomembrane sheets formulated from the appropriate polymers and compounding ingredients to form a plastic of elastomer sheet material that meets all specified requirements for the end use of the product.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

6. Equipment

6.1 Sealing Equipment – appropriate to seal the two ends of the air channel.

6.2 A device is necessary to insert air into the open channel and to allow monitoring its pressure

Note 1 – a sharp hollow needle attached to a properly functioning pressure gage has been used successfully. Other devices may provide equivalent functions.

6.3 Air Pump, either manual or motor driven, capable of generating up to 350 kPa (50 lb/in.2) pressure is necessary. It must be placed on adequate cushion to preclude damage to the geomembrane. A flexible hose is used to connect the pump to the air pressure device. This hose should have a quick connect on its end for disengagement after pressure is supplied to its desired value, that is, the pump is not to be attached while the air pressure is being monitored.

6.4 Knife, capable of cutting or trimming the liner material.

Note 2 - A hook blade knife is recommended. Straight bladed knifes may damage the geomembrane by cutting through the material being trimmed and into the underlying geomembrane.

6.5 Pressure gage, capable of indicating the air pressure in 7 kPa (1 lb/in.2) within the test range.

Note 3 - The gage should be calibrated as specified by the manufacturer, or at a frequency of at least once per year.

7. Procedure

7.1 After the dual track seam is fabricated and the length of seam that is to be evaluated is determined, seal off the two ends of the continuous air channel.

7.2 Connect the pressure gage directly to the air channel.

7.3 Connect an air pump to the pressure gage with a flexible hose via a quick connect and pressurize the air channel to the pressure appropriate for the geomembrane type.

7.4 Remove the flexible hose that connects the air channel to the pressure gage. Following pressure stabilization, observe the air pressure gage for the desired test time. The test time should be a minimum of 2 minutes. Mark the time and pressure of the beginning and end of the test on the geomembrane with a visible marker. The maximum allowable pressure drop may be compared to the maximum allowable value.

7.5 If the pressure does not drop below the maximum allowable value after the specified test period, open the air channel at the end away from the pressure gage. Air should rush out and the pressure gage should register an immediate drop in pressure, indicating that the entire length of the seam has been tested. If this does not happen, either the air channel is blocked or the equipment is faulty, and the test is not valid. Attempt to locate the problem and retest the seam in accordance with the project specifications.

7.6 If the pressure drop is greater than the maximum allowable value after the test period, check the seals of the air channel. Reseal these areas if a leak is noticed and then repeat the entire test.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

Note 4 – Leaks around the end seals and air pressure device can usually be located by putting moisture around the suspect area and looking for bubbles.

7.7 If significant changes in the geomembrane temperature occur during pressure testing (for example, cloud cover or other shading), a variation in channel pressure may be recorded due to expansion or contraction of the air channel. If an increase or decrease in temperature is suspected of having caused a pressure variation, repeat the test after the geomembrane temperature has stabilized.

7.8 Any dual seam that cannot be successfully tested using this practice should be marked and tested using another nondestructive testing practice when possible.

8. Report

8.1 The report of a pressurized dual seam test is usually given in the form of a completed form of a completed chart. It should include the following information as a minimum:

8.1.1 Date of test,

8.1.2 Time of test,

8.1.3 Temperature at time of test

8.1.4 Location of test with respect to panel layout plan,

8.1.5 Stabilized air channel pressure,

8.1.6 Duration of test time,

8.1.7 Gage pressure drop during test,

8.1.8 Outcome of test (pass/fail/retest), an

8.1.9 If fail–remedial action is described in detail.

8.2 A form as shown in Fig. 1 includes the above information and may be used for such reporting.

9. Precision and bias

9.1 The precision of this test has not been established.

9.2 The threshold value for accepting seam quality is that value agreed upon by all parties overseeing the installation of the project and is thus the source of bias in this procedure.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GRI Standard ASTM D 6497-02

STANDARD GUIDE FOR FOR MECHANICAL ATTACHMENTS OF GEOMEMBRANES TO PENETRATIONS OR STRUCTURES[1]

This standard is issued under the fixed designation D 6497; the number immediately folloing the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A nmber in parentheses indicates the year of last reapproval. A superscript epsilon (ε) Indicates an editorial change since the last revision.

1. Scope

1.1 This guide covers procedures that can be employed to mechanically attach fabricated geomembranes to structures, pipes, etc.

1.2 This guide does not address all problems or situations a geomembrane installer or design engineer may face in the attachment of geomembranes to structures, pipes, etc. The sole purpose of this standard guide is to point out typical problems with geomembrane attachments and clearly state objectives of each component of the geomembrane attachments).

1.3 This guide has been generated for geomembrane applications); however, a geomembrane installer or design engineer, or both, may find portions of this guide applicable to other geosynthetics.

1.4 The values stated in SI units are to be regarded as standard, unless other units are specifically given.

1.5 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 EPA Document:

Quality Assurance and Quality Control for Waste Containment Facilities, Technical Guidance Document, United States Environmental Protection Agency, EPA/600/R-93/182, September 19932

3. Terminology

3.1 Definitions:

3.1.1 banding strap, n – a flexible narrow strip of metal, plastic or other material, which compresses the geomembrane around a penetration by acting as a clamp around the penetration.

3.1.2 batten,n – a rigid narrow strip of metal, wood, plastic or other material which distributes the forces to compress the geomembrane against a penetration or structure.

3.1.3 boot, n – a factory or field fabricated geomembrane wrap used to seal around a pipe penetration prior to attachment (see Fig. 1).

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

3.1.4 clamp, n – a flexible narrow strip of metal, plastic or other material, which compresses the geomembrane against a penetration by tightening the bolt(s) or screw(s) of the clamp (see Fig. 2).

3.1.5 concrete, n – a homogeneous mixture of portland cement, aggregates, and water which may contain admixtures. (C 822)

3.1.6 gaskets, n – a material, which may be clamped between contact surfaces that acts as a static seal. Gaskets are cut, formed, or molded into the desired configuration. They may consist of any of the following construction: one or more plies of a sheet material; composites of dissimilar materials; and materials applied as a bead or other form to one or both mating faces prior to assembly. (F 118)

3.1.7 geomembrane, n – an essentially impermeable geo- synthetic composed of one or more synthetic sheets. (D 4439)

3.1.8 rondel, n – a strip of polymeric material formed to a geometry, which is embedded and secured to a penetration or structure (for example, concrete structure) (see Fig. 3).

3.1.9 sealant – in building construction, a material that has the adhesive and cohesive properties to form a seal. (C 717)

3.1.10 torque, n – a movement (offerees) which produces or tends to produce rotation or torsion. (D 4848)

3.1.11 void space, n – in engineered structures, space(s) between the geomembrane and penetration or structure, which allow liquid or vapor migration, or allow the geomembrane to deform into the space(s) due to overburden pressure. (New, to be balloted under Terminology Committee.

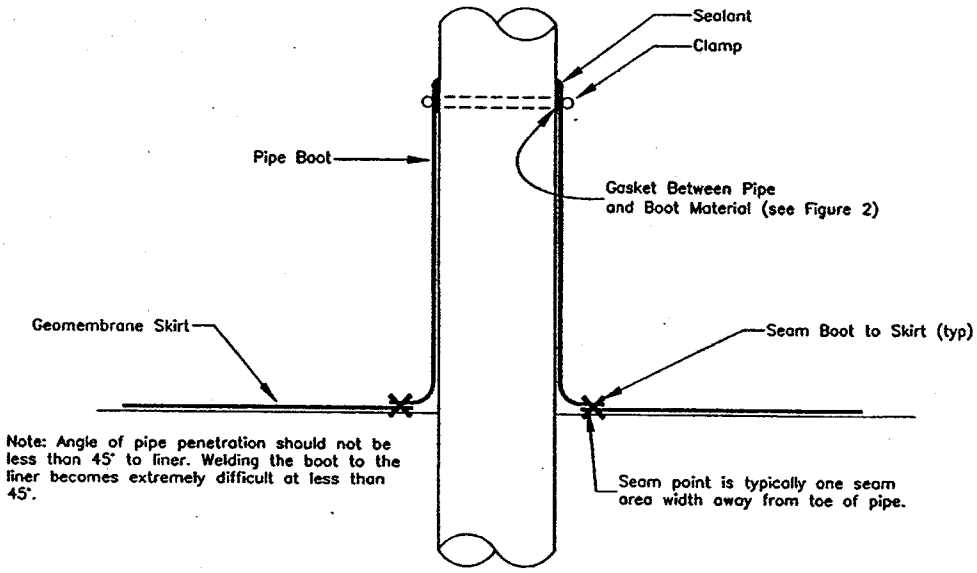

Figure 1 – Pipe Penetration - Perpendicular Face

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

4. Significance and Use

4.1 This guide attempts to detail specific areas of concern regarding the attachment of geomembranes to structures. Components of the geomembrane attachment are addressed as to the type and use of each component.

4.2 Although this guide does not address all aspects of geomembrane attachments, the user of this guide may note important objectives and design issues of each component of the geomembrane. All these objectives and design issues may or may not be required to obtain an appropriate geoinembranc attachment. By describing these areas of concern, it is hoped that the user of this guide will be able to design geomembrane attachments, develop specifications or construct geomembrane attachments, or both, which fulfill the requirements of its design intent.

5. Types of Connection

5.1 Batten(s) – Battens are commonly used to attach a geomembrane to a smooth, flat surface. Anchor bolts are embedded into the penetration or structure at set locations. A gasket is placed in-line with the bolts to form a seal between the geomembrane and structure. Geomembrane is pushed or forced over the bolts to insure a tight in and then placed against the penetration or structure. The batten, which has holes in it that are in alignment with the bolts, is placed over the geomembrane. Nuts are placed on the bolts and tightened with sufficient torque to compress the geomembrane against the penetration or structure. The geomembrane is held in place by the friction generated by the compression effect of the batten (see Fig. 4).

5.1.1 A compression sealant or gasket can be used between the geomembrane and the penetration or structure or batten, or both. The compression sealant or gasket will limit the migration of liquid or vapor through the batten connection.

5.2 Clamp(s) or Banding Stap(s) – Clamps or banding straps are commonly used to attach a geomembrane to a smooth, round penetration or structure (for example, pipe). The geomembrane is placed around the penetration or structure and welded as close as possible to the circumference of the penetration or structure. A gasket is placed around the penetration or structure at the location of the clamp placement to form a seal between the geomembrane and penetration or structure. The geomembrane is then put in-place and over the gasket. The clamp or banding strap is commonly tightened by applying a torque to a bolt or bolts, a screw or screws, or other mechanical device, which applies a pulling force that decreases the length of the clamp, or banding strap, thereby compressing the geomembrane and gasket to the penetration or structure. The geomembrane is held in place by the friction generated by tightening the clamp or banding strap and compressing the geomembrane against the penetration or structure.

5.2.1 A compression sealant or gasket can be used between the geomembrane and the penetration or structure or clamp, or both. The compression sealant or gasket will limit the migration of liquid or vapor through the clamp connection.

5.3 Welded – Welded connections can be either a solvent weld or heat weld. Heat welding of dissimilar materials can be accomplished as long as both materials are thermoplastic. It is recommended that welding criteria for dissimilar materials be reviewed with the material manufacturer before constructing the attachment.

5.3.1 The welded connections are commonly made to a rondel or pipe (see Fig. 5) composed of similar polymeric material as the geomembrane. The rondel is embedded

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

into the penetration or structure during its construction. For example, rondels are commonly embedded into a concrete structure. The material used for the penetration or structure is allowed to cure before attachment of the geomembrane. The curing time allows the rondel to become secured in the penetration or structure. Once the material used for the penetration or structure has cured sufficiently to reduce the risk of pulling the rondel from the penetration or structure, the geomembrane can be welded to the rondel (see Fig. 3).

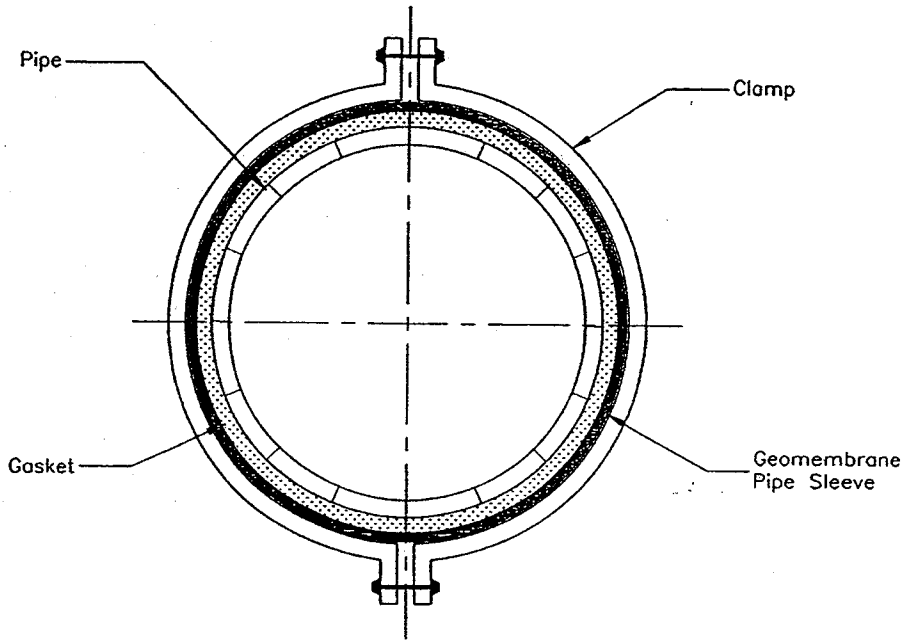

Figure 2 – Clamp Detail

5.3.2 Welding geomembranes to rondels and pipes is similar to welding geomembrane panels together. The geomembrane must be placed flush against the rondel or pipe during the welding process. The geomembrane and rondel or pipe must be clean or prepared, or both, according to the prescribed geomembrane manufacturer's procedure before welding.

5.3.3 Welding the geomembrane to the penetration or structure may provide an attachment that has a lower possibility of leakage. Since the geomembrane is attached directly to the structure, sealants are usually not required. However, special attention should be noted for rondels used for attachment of geomembranes to concrete structures. If several sections or pieces of rondels are required to construct an attachment, spaces or gaps between the individual sections or pieces could occur during their embedment and during the curing of the concrete. This would especially occur for rondels made of polymeric material that expands and contracts according to the temperature of the concrete during the curing process. Sealants may be required to fill the spaces or gaps between the rondels to further limit the migration of liquid or vapor through the batten connection.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

5.3.4 Pro-fabrication of the complete rondel attachment before placement into the concrete is recommended. The pre-fabricated rondel is composed of welded sections or pieces of rondels, thereby eliminating the possibility of gaps between sections or pieces on rondels after the concrete cures.

5.4 Bonded – Bonded connections commonly require the use of an adhesive to construct the attachment. The use of an adhesive allows the geomembrane to be attached to dis-similar material. The adhesive used must be compatible with both the geomembrane and the surface material of the penetration or structure. The application and curing of the adhesive should not significantly deteriorate the strength of the geomembrane or the material surface of the penetration or structure beyond the design requirements of the attachment.

5.4.1 The geomembrane and the surface of the penetration or structure should be clean and prepared according the adhesive manufacturer's and geomembrane manufacturer's recommendation.

5.4.2 Bonding the geomembrane to the penetration or structure may provide an attachment, which has a lower possibility of leakage. Since the geomembrane is attached directly to the structure, sealants are usually not required.

6. Types of Structures

6.1 Concrete – Concrete structures that require attachment of geomembranes include, but are not limited to, pads, floors, walls, tanks, manholes, and pylons. The use of battens, clamps or banding strips, or boning can attach a geomembrane to concrete structures. When attaching a geomembrane to any concrete structure, consider each critical concern detailed in Section 7.

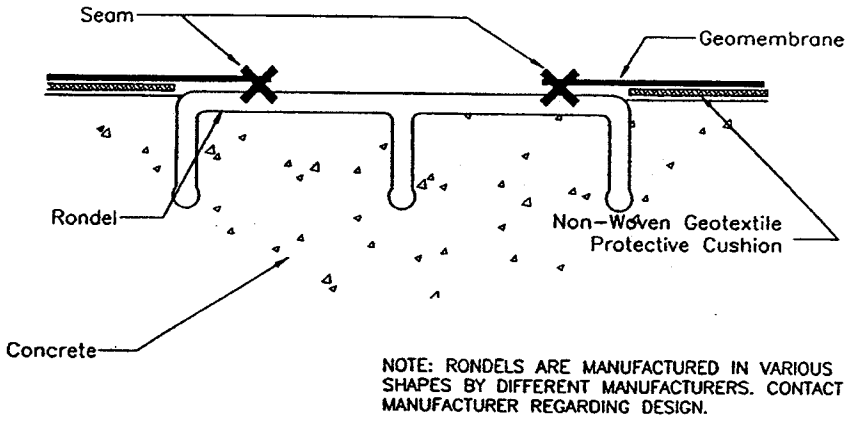

Figure 3 – Rondel Connection

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

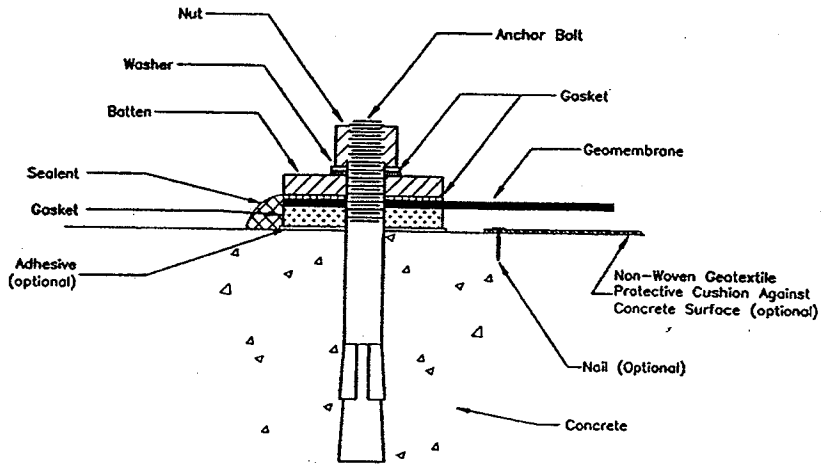

Figure 4 – Anchor Bolt Geomembrane Connection

6.2 Metal – Metal structures that require attachment of geomembranes include, but are not limited to, pads, floors, walls, pipes, and tanks. The use of battens, clamps or banding strips, can attach a geomembrane to metal structures. When attaching a geomembrane to any metal structure, consider each critical concern detailed in Section 7.

6.3 Pipe – Pipe structues can be composed of concrete, metal or polymer. Clamps, banding strips, solvent weld, or heat weld can attach a geomembrane to pipe structures. The attachment of a geomembrane to a pipe structure should consider critical concerns detailed in Section 7.1, 7.3, 7.4, 7.5, and 7.6..

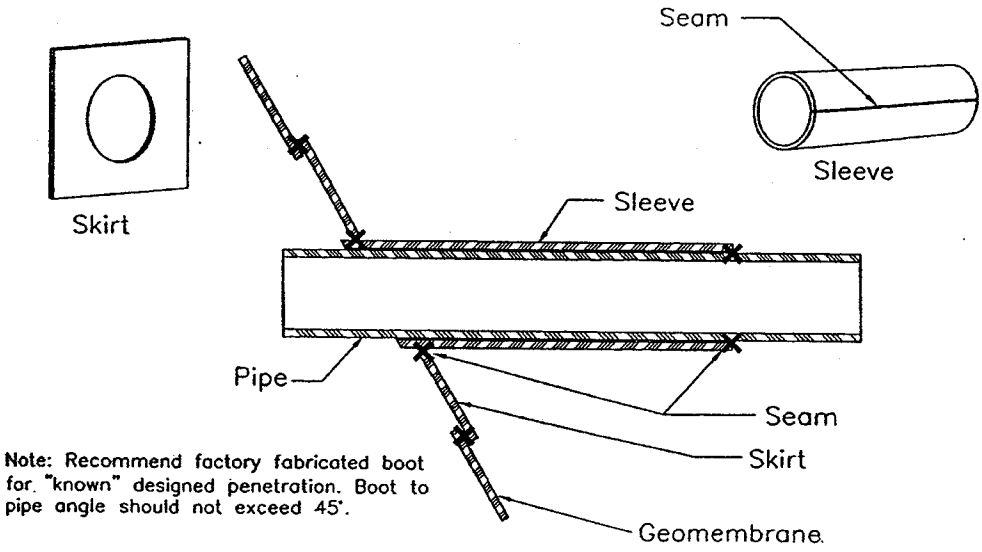

Figure 5 – Pipe Boot

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

7. Critical Areas for the Protection of the Geomembrane

7.1 Surface Characteristics – The surface of the structure for which the geomembrane is to be attached should be constructed or formed to limit damage to the geomembrane. This is particularly important in cases where the geomembrane will be pressed against the structure. Irregularities in the structure surface could cause stress points in the geomembrane, thereby, allowing portion(s) of the geomembrane to yield at a lower load than its design application. If a structure cannot be constructed or formed without irregularities, then a protective layer should be placed between the structure and the geomembrane (see Fig. 4).

7.2 Edges of Structures—Edges or corners of structures should be rounded to limit possible damage to the geomembrane. A protective layer can be constructed or placed over the edge or corner to protect the geomembrane.

7.3 Large Voids Under Geomembrane – Large voids under the geomembrane can cause deformation and stress in the geomembrane and geomembrane seams if, under pressure or load, the geomembrane is forced into the void(s). Large voids should be filled or bridged to stop the geomembrane and geomembrane seams from becoming overly stressed (see Figs. 6 and 7).

7.4 Settlement Around Structures— If a geomembrane is to be connected to a structure and placed over an area which may settle at a greater or lesser rate than the structure, the design engineer or geomembrane installer should take precautions to limit settlement around the structure. If settlement around the structure cannot be avoided, then the design engineer should design a flexible connection to the structure that considers settlement and alleviates the stresses, which could occur due to settlement.

7.5 In-Plane Attachment – The geomembrane should be placed in parallel or "in-plane" with the structure or penetration to be attached. The geomembrane should lie flat against the surface of the structure or penetration for a sufficient distance prior to the geomembrane being placed "out of plane" of the structure or penetration. This is to avoid bridging within attachment, pulling away from the structure, or stresses within the geomembrane during the placement of the batten or clamp, or both.The attached figures show the geomembrane being parallel or "in-plane" to the structure or penetration as part of the attachment.

7.6 Protection from Bolts, Battens, Clamps – The installation of geomembrane over bolts, battens or clamps should be done with a protective layer placed between the geomembrane and these items to prevent damage to the geomembrane by these items (sec Fig. 8).

7.7 Cushion/Sealant Between Geomembrane and Structure, Geomembrane and Battens, Geomembrane and Clamps/Bands – A cushion/sealant should be placed between the geomcmbrane and the structure, between the geomembrane and the batten or geomembrane and the clamps/band to protect the geomembrane and allow for a seal between the geomembrane and the structure, batten, or clamp/band.

8. Critical Items for Strength of Attachment

8.1 Cleanliness – The area of the attachment should be cleaned to remove loose debris, dirt, oils, or other foreign material(s), or all of these, that could hinder the ability to develop a strong attachment of the geomembrane to the structure. It is recommended that the only materials in the area

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

of the attachment should be the clean geomembrane, structure, and type of connection used to perform the attachment.

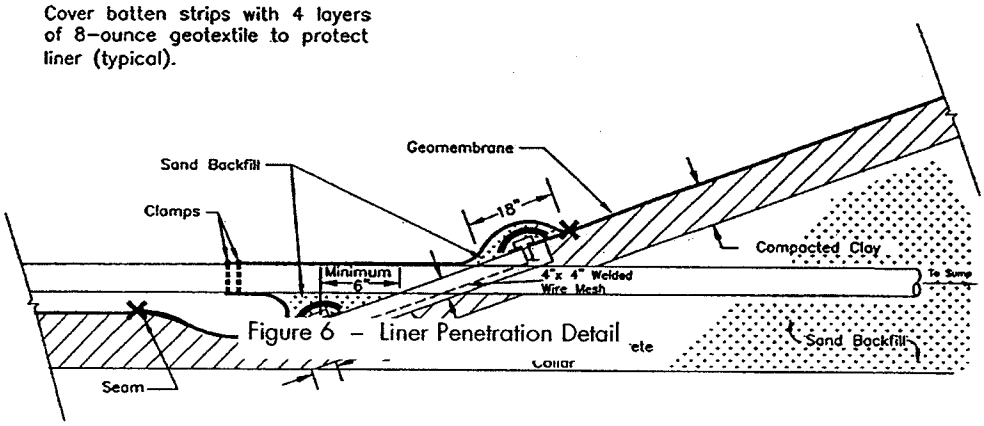

Figure 6 – Liner Penetration Detail

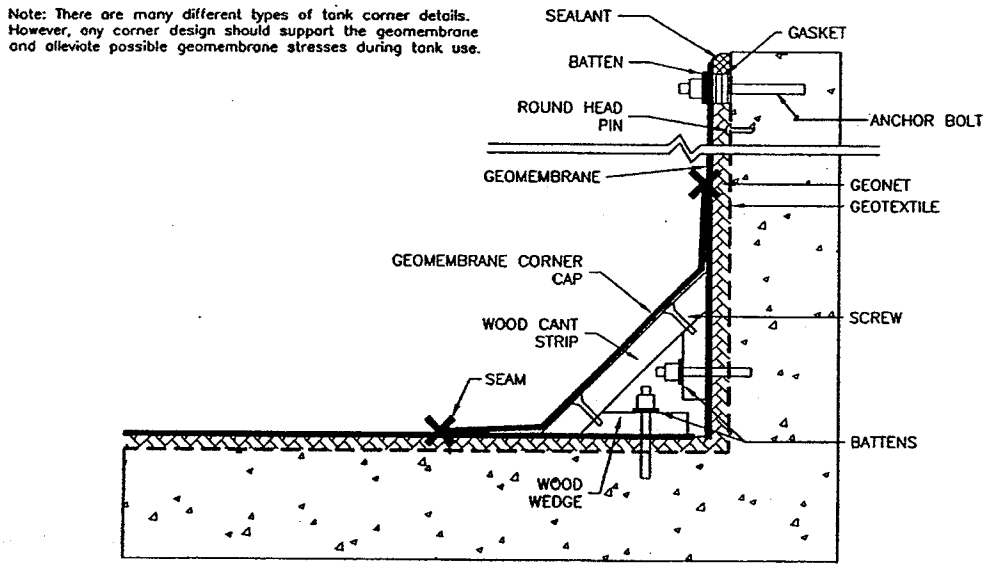

Figure 7 – Tank Corner Detail

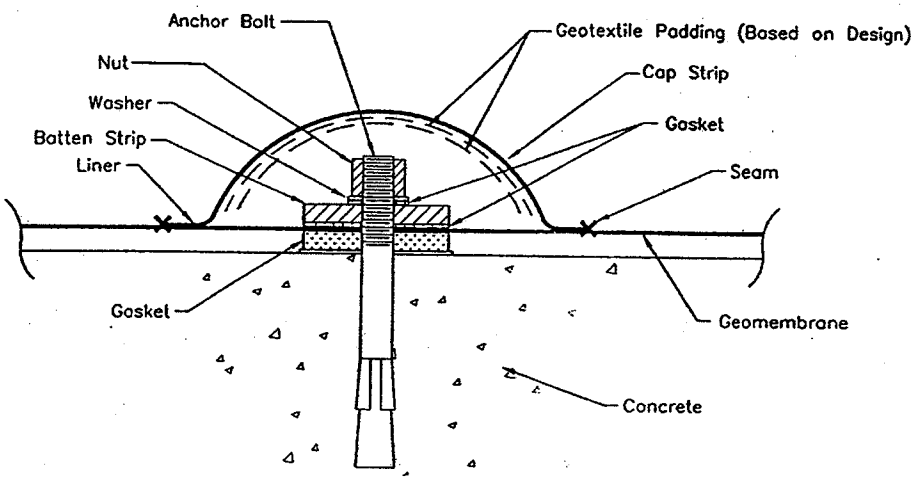
8.2 Type of Attachment:

8.2.1 Battens:

8.2.1.1 Type of Batten Material – Battens can be made of wood, metal, or polymer. The batten must remain functional for the design life of the attachment and be chemically resistant with the fluids or vapors to which it will be exposed. The batten should also be made of a material that will not crack, fracture, break or warp during or after the batten has been fastened to the structure. If a hydraulic seal is a mandatory requirement of the attachment, the batten should have sufficient rigidity to maintain a seal between the designed spacing of the bolts.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.



NOTE:

1. A length of bolt extending above the clamping nut must be limited to 2-3 threads exposed when tightening or torquing is finished.
2. An "Acorn" can be used to round off top of bolt. However, the number of threads exposed above the batten strip is critical to assure tightening of the nut.

Figure 8 – Batten Attachment with Cap Strip

8.2.1.2 Type of Bolts – The bolts should be made of a material capable of fulfilling the design life of the attachment. The bolts should be made of a material capable of withstanding the torque required to secure the batten to the structure. Wedge anchors holes must be carefully drilled to assure the grip necessary to develop the pullout resistance required for sealing the gasket and geomembrane to the structure. Adhesive (epoxy) anchors, properly installed, may provide a more reliable alternative to wedge anchors.

8.2.1.3 Number of Bolts, – The battens should have a sufficient number of bolts to secure the batten and geomembrane to the structure without damaging the sealants and geomembrane. If the batten is used to attach the geomembrane to a vertical wall, the number of bolts should be sufficient to develop sufficient strength to support the geomembrane.

8.2.1.4 Bolt Spacing – a seal is a mandatory requirement of the attachment, the bolt spacing should be sufficient to allow the batten and geomembrane to be secured to the structure without warping of the batten and limiting the functionality of the sealant or geomembrane between bolts, or both.

8.2.1.5 Torque – Sufficient torsional force should be applied to the bolt to secure the batten and geomembrane to the structure without damaging the batten, geomembrane, sealant, or structure.

Note – The amount of torque applied to the bolt can be compromised by the bolt thread condition, cleanliness (dirt in threads), nicks in the threads and calibration of the torque wrench. If a gasket of known thickness and hardness (for example, durometer value) is used as a sealant, a predetermined reduction of thickness of (the gasket (10 to 15%) may provide a reliable method of applying the required compression force on the clamps or battens.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

8.2.2 Clamps – Clamps can be made of polymer or steel. The clamp must remain functional for the design life of the attachment. The clamp should have sufficient strength and rigidity to fasten the geomembrane to the structure by applying sufficient torque to the bolts or force on the clamps. The clamp should not be capable of elongating over time and, thereby, weakening the attachment. If a seal is a mandatory requirement of the attachment, the clamp should not be over tightened to (the extent of damaging the sealant.

8.2.3 Gaskets – The chemical compatibility of the gasket material should be considered.

8.2.4 Rondels – The rondel should be embedded into the concrete to a depth to allow a smooth transition between the concrete surface and top of the rondel. The concrete should be allowed to cure to the design requirements or according to the specifications before attaching of the gcomembrane to the rondel.

Note- 2 – The user should contact the rondel manufacturer regarding specific rondel designs and installation procedures.

8.3 Void Space – The size and number of voids around or near the attachment should be limited. If voids cannot be eliminated, it is recommended that the voids be filled to limit the ability of the geomembrane to deform into the void(s). Deformation into the voids by the geomembrane may increase the possibility of weakening and damaging the attachment.

9. Factory Pro-Fabricated Boots, Corners and Edyes

9.1 Many manufacturers or installers, or both, produce factory pre-fabricated boots, corners and edges that ease the geomembrane installation process and, thereby, increase the quality of the finished project. Boots, corners, and edges pre-fabricated in a controlled factory environment are considered to be of higher quality than the field fabricated, which are subject to ambient field conditions. Some manufacturer's factory pre-fabricated boots are designed to allow for field testing for increased construction quality control/assurance or reduce void space within the boot attachment, or both. Factory pre-fabricated corners and edges can reduce the overlapping of geomembrane and increase the integrity of the geomembrane attachment. Edges and corners can also be pre-fabricated of thicker stronger geomembrane material for these critical areas.

10. Shape, Size, and Proximity of Penetrations

10.1 Shape – The shape of the penetration should be considered in the design and/or installation of the geomembrane attachment. For example the design to use a geomembrane under a building constructed on top of pilings or within a reservoir with support columns, many pilings or columns have a square or odd shape. The attachment of the geomembrane to one or more of these pilings or columns could be a difficult installation that requires excessive labor and materials to complete. The difficulty of the attachment may also decrease the ability to obtain a sufficient liquid/vapor barrier. Changing the shape of the penetration may alleviate this problem. By requiring the pilings or columns to be round is a solution. Another alternative is to pour a concrete collar around the piling or column a the location of the attachment. Clamps or banding straps (see 5.2) can then be used to achieve a quick and sufficient attachment.

10.2 Size – Thc size of the penetration can create significant difficulty constructing a geomembrane attachment. Usually penetrations smaller than 50 mm (2 in.) in diam-

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

eter are difficult to construct. It is recommended that the designer or installer review alternatives that will allow the size of the penetration to increase and reduce the difficulty of the attachment. Fig. 9 is an example of such an alternative. In this figure, several small pipes and/or wires are brought through a larger pipe, which allows a less difficult attachment. The annular space between the pipes and/or wires is grouted, thus creating a liquid/vapor barrier.

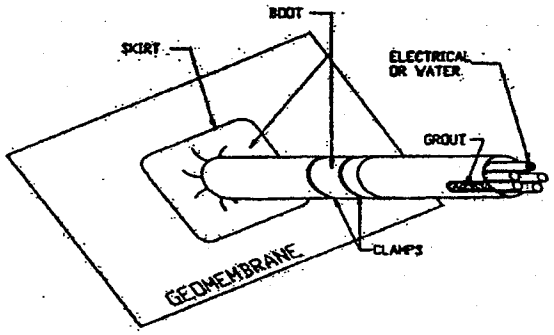


Figure 9 – Pipe Penetration Detail

10.3 Proximity – The proximity of each penetration should be considered in developing a geomembrane attachment. Penetrations in close proximity to each other can be difficult to construct an attachment. The flexibility of the geomembrane, the working environment, size of penetration, and type of attachment should be reviewed as part of the design and installation. If possible, it is recommended that penetrations should be spaced a minimum of 1 m (3 ft) a part from each other. If this is not possible other alternatives should be investigated. Fig. 9 shows how several penetrations were brought together to make one penetration.

11. Examples of Attachments

11.1 This guide includes Figs. 10-15 that show examples of various geomembrane attachments to penetrations or structures. These figures do not address all problems or situations a geomembrane installer or design engineer may face in the attachment of geomembranes to structures, pipes, etc. The purpose of the figures is to illustrate typical attachments. It is the geomembrane installer or the design engineer or both, that must determine the design intent of the geomembrane attachment and design/construct the attachment to meet that design intent. Additions or deletions of various items noted within the figures may be required to meet the design intent. It is the responsibility of the geomembrane installer or design engineer, or both, to make that determination. See Appendix XI.

GRI Standard GM 13*

STANDARD SPECIFICATION FOR TEST PROPERTIES, TESTING FREQUENCY AND RECOMMENDED WARRANTY FOR HIGH DENSITY POLYETHYLENE (HDPE) SMOOTH AND TEXTURED GEOMEMBRANES

This specification was developed by the Geosynthetic Research Institute (GRI), with the cooperation of the member organizations for general use by the public. It is completely optional in this regard and can be superseded by other existing or new specifications on the subject matter in whole or in part. Neither GRI, the Geosynthetic Institute, nor any of its related institutes, warrant or indemnifies any materials produced according to this specification either at this time or in the future.

1.0 Scope

1.1 This specification covers high density polyethylene (HDPE) geomembranes with a formulated sheet density of 0.940 g/ml, or higher, in the thickness range of 0.75 mm (30 mils) to 3.0 mm (120 mils). Both smooth and textured geomembrane surfaces are included.

1.2 This specification sets forth a set of minimum, physical, mechanical and chemical properties that must be met, or exceeded by the geomembrane being manufactured. In a few cases a range is specified.

1.3 In the context of quality systems and management, this specification represents manufacturing quality control (MQC).

Note 1: Manufacturing quality control represents those actions taken by a manufacturer to ensure that the product represents the stated objective and properties set forth in this specification.

1.4 This standard specification is intended to ensure good quality and performance of HDPE geomembranes in general applications, but is possibly not adequate for the complete specification in a specific situation. Additional tests, or more restrictive values for test indicated, may be necessary under conditions of a particular application.

1.5 This specification also presents a recommended warrant which is focused on the geomembrane material itself.

1.6 The recommended warrant attached to this specification does not cover installation considerations which is independent of the manufacturing of the geomembrane.

Note 2: For information on installation techniques, users of this standard are referred to the geosynthetics literature, which is abundant on the subject.

*This GRI standard is developed by the Geosynthetic Research Institute through consultation and review by the member organizations. This specification will be reviewed at least every 2-years, or on an as-required basis. In this regard it is subject to change at any time. The most recent revision date is the effective version.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

3.0 Definitions

Manufacturing Quality Control (MQC) – A planned system of inspections that is used to directly monitor and control the manufacture of a material which is factory originated. MQC is normally performed by the manufacturer of geosynthetic materials and is necessary to ensure minimum (or maximum) specified values in the manufactured product. MQC refers to measures taken by the manufacturer to determine compliance with the requirements for materials and work-

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

manship as stated in certification documents and contract specifications. ret. EPA/600/R-93/182

Manufacturing Quality Assurance (MQA) – A planned system of activities that provides assurance that the materials were constructed as specified in the certification documents and contract specifications. MQA includes manufacturing facility inspections, verifications, audits and evaluation of the raw materials (resins and additives) and geosynthetic products to assess the quality of the manufactured materials. MQA refers to measures taken by the MQA organization to determine if the manufacturer is in compliance with the product certification and contract specifications for the project. ref. EPA/600/R-93/182

Formulation, n – The mixture of a unique combination of ingredients identified by type, properties and quantity. For HDPE polyethylene geomembranes, a formulation is defined as the exact percentages and types ofresin(s), additives and carbon black.

4.0 Material Classification and Formulation

4.1 This specification covers high density polyethylene geomembranes with a formulated sheet density of 0.940 g/ml, or higher. Density can be measured by ASTM D1505 or ASTM D792. If the latter. Method B is recommended.

4.2 The polyethylene resin from which the geomembrane is made will generally be in the density range of 0.932 g/ml or higher, and have a melt index value per ASTM D1238 of less than 1.0 g/10 min.

4.3 The resin shall be virgin material with no more than 10% rework. If rework is used, it must be a similar HDPE as the parent material.

4.4 No post consumer resin (PCR) of any type shall be added to the formulation.

5.0 Physical, Mechanical and Chemical Property Requirements

5.1 The geomembrane shall conform to the test property requirements prescribed in Tables 1 and 2. Table 1 is for smooth HOPE geomembranes and Table 2 is for single and double sided textured HDPE geomembranes. Each of the tables are given in English and SI (metric) units. The conversion from English to SI (metric) is soft.

Note 3: There are several tests often included in other HDPE specifications which are omitted from this standard because they are outdated, irrelevant or generate information that is not necessary to evaluate on a routine MQC basis. The following tests have been purposely omitted:

- Volatile Loss
- Dimensional Stability
- Coeff. of Linear Expansion
- Resistance to Soil Burial
- Low Temperature Impact
- ESCR Test (D 1693)
- Wide Width Tensile
- Water Vapor Transmission
- Water Absorption
- Ozone Resistance
- Modulus of Elasticity
- Hydrostatic Resistance
- Tensile Impact
- Field Seam Strength
- Multi-Axial Burst
- Various Toxicity Tests

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

Note 4: There are several tests which are included in this standard (that are not customarily required in other HDPE specifications) because they are relevant and important in the context of current manufacturing processes. The following tests have been purposely added:

- Oxidative Induction Time
- Oven Aging
- Ultraviolet Resistance
- Asperity Height ofTextured Sheet

Note 5: There are other tests in this standard, focused on a particular property, which are updated to current standards. The following are in this category:

- Thickness of Textured Sheet
- Puncture Resistance
- Stress Crack Resistance
- Carbon Black Dispersion (In the viewing and subsequent quantitative interpretation of ASTM D 5596 only near spherical agglomerates shall be included in the assessment).

Note 6: There are several GRI tests currently included in this standard. Since these topics are not covered in ASTM standards, this is necessary. They are the following:

- UV Fluorescent Light Exposure
- Asperity Height Measurement

5.2 The values listed in the tables of this specification are to be interpreted according to the designated test method. In this respect they are neither minimum average roll values (MARV) nor maximum average roll values (MaxARV).

5.3 The properties of the HDPE geomembrane shall be tested at the minimum frequencies shown in Tables 1 and 2. If the specific manufacturer's quality control guide is more stringent and is certified accordingly, it must be followed in like manner.

Note 7: This specification is focused on manufacturing quality control (MQC). Conformance testing and manufacturing quality assurance (MQA) testing are at the discretion of the purchaser and/or quality assurance engineer, respectively.

6. Workmanship and Appearance

6.1 Smooth geomembrane shall have good appearance qualities. It shall be free from such defects that would affect the specified properties of the geomembrane.

6.2 Textured geomembrane shall generally have uniform texturing appearance. It shall be free from agglomerated texturing material and such defects that would affect the specified properties of the geomembrane.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

6.3 General manufacturing procedures shall be performed in accordance with the manufacturer's internal quality control guide and/or documents.

7. MQC Sampling

7.1 Sampling shall be in accordance with the specific test methods listed in Tables 1 and 2. If no sampling protocol is stipulated in the particular test method, then test specimens shall be taken evenly spaced across the entire roll width.

7.2 The number of tests shall be in accordance with the appropriate test methods listed in Tables 1 and 2.

7.3 The average of the test results should be calculated per the particular standard cited and compared to the minimum value listed in these tables, hence the values listed are the minimum average values and are designated as "min. ave."

8. MQC Retest and Rejection

8.1 If the results of any test do not conform to the requirements of this specification, retesting to determine conformance or rejection should be done in accordance with the manufacturing protocol as set forth in the manufacturer's quality manual.

9. Packaging and Marketing

9.1 The geomembrane shall be rolled onto a substantial core or core segments and held firm by dedicated straps/slings, or other suitable means. The rolls must be adequate for safe transportation to the point of delivery, unless otherwise specified in the contract or order.

10. Certification

10.1 Upon request of the purchaser in the contract or order, a manufacturer's certification that the material was manufactured and tested in accordance with this specification, together with a report of the test results, shall be furnished at the time of shipment.

11. Warranty

11.1 Upon request of the purchaser in the contract or order, a manufacturer's warrant of the quality of the material shall be furnished at the completion of the terms of the contract.

11.2 A recommended warranty for smooth and textured HDPE geomembranes manufactured and tested in accordance with this specification is given in Appendix A.

11.3 The warranty in Appendix A is for the geomembrane itself. It does not cover subgrade preparation, installation, seaming, or backfilling. These are separate operations that are often beyond the control, or sphere of influence, of the geomembrane manufacturer.

Note 8: If a warrant is required for installation, it is to be developed between the installation contractor and the party requesting such a document.

(1) Machine direction (MD) and cross machine direction (XMD) average values should be on the basis of 5 test specimens each direction.
Yield elongation is calculated using a gage length of 1.3 inches
Break elongation is calculated using a gage length of 2.0 in.

(2) The yield stress used to calculate the applied load for the SP-NCTL test should be the manufacturer's mean value via MQC testing.

(3) Other methods such as D 4218 (muffle furnace) or microwave methods are acceptable if an appropriate correlation to D 1603 (tube furnace) can be established.

(4) Carbon black dispersion (only near spherical agglomerates) for 10 different views:
9 in Categories 1 or 2 and 1 in Category 3

(5) The manufacturer has the option to select either one of the OIT methods listed to evaluate the antioxidant content in the geomembrane.

(6) It is also recommended to evaluate samples at 30 and 60 days to compare with the 90 day response.

(7) The condition of the test should be 20 hr. UV cycle at 75°C followed by 4 hr. condensation at 60°C.

(8) Not recommended since the high temperature of the Std-OIT test produces an unrealistic result for some of the antioxidants in the UV exposed samples.

(9) UV resistance is based on percent retained value regardless of the original HP-OIT value.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

(1) Machine direction (MD) and cross machine direction (XMD) average values should be on the basis of 5 test specimens each direction
Yield elongation is calculated using a gage length of 33 mm
Break elongation is calculated using a gage length of 50 mm

(2) The yield stress used to calculate the applied load for the SP-NCTL test should be the manufacturer's mean value via MQC testing.

(3) Other methods such as D 4218 (muffle furnace) or microwave methods are acceptable if an appropriate correlation to D 1603 (tube furnace) can be established.

(4) Carbon black dispersion (only near spherical agglomerates) for 10 different views:
9 in Categories 1 or 2 and 1 in Category 3

(5) The manufacturer has the option to select either one of the OIT methods listed to evaluate the antioxidant content in the geomembrane.

(6) It is also recommended to evaluate samples at 30 and 60 days to compare with the 90 day response.

(7) The condition of the test should be 20 hr. UV cycle at 75°C followed by 4 hr. condensation at 60°C.

(8) Not recommended since the high temperature of the Std-OIT test produces an unrealistic result for some of the antioxidants in the UV exposed samples.

(9) UV resistance is based on percent retained value regardless of the original HP-OIT value.

ADOPTION AND REVISION SCHEDULE FOR HDPE SPECIFICATION PER GRI-GM13

"Test Properties, Testing Frequency and Recommended Warrant for High Density Polyethylene (HDPE) Smooth and Textured Geomembranes"

Adopted: June 17, 1997

Revision 1: November 20, 1998; changed CB dispersion from allowing 2 views to be in Category 3 to requiring all 10 views to be in Category 1 or 2. Also reduced UV percent retained from 60% to 50%.

Revision 2: April 29, 1999: added to Note 5 after the listing of Carbon Black Dispersion the following: "(In the viewing and subsequent quantitative interpretation of ASTM D5596 only near spherical agglomerates shall be included in the assessment)" and to Note (4) in the property tables.

Revision 3: June 28, 2000: added a new Section 5.2 that the numeric table values are neither MARV or MaxARV. They are to be interpreted per the the designated test method.

Revision 4: December 13, 2000: added one Category 3 is allowed for carbon black dispersion. Also, unified terminology to "strength" and "elongation".

Revision 5: May 15, 2003: Increased minimum acceptable stress crack resistance time from 200 hrs to 300 hrs.

Revision 6: June 23, 2003: Adopted ASTM D 6693, in place of ASTM D 638, for tensile strength testing. Also, added Note 2.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GRI Standard GM14

SELECTING VARIABLE INTERVALS FOR TAKING GEOMEMBRANE DESTRUCTIVE SEAM SAMPLES

1. Scope

1.1 This guide is focused on selecting the spacing interval for taking destructive seam samples of field deployed geomembranes as a particular job progresses based on an installers ongoing record of pass - or - fail testing.

Note 1 - While subjective at this time, the guide is most applicable to large geomembrane seaming projects, which require more than 100 destructive seam samples based upon the typical sampling strategy of 1 destructive sample per 150 m (500 ft).

1.2 This guide is essentially applicable to production seams. Caution should be exercised in using the guide for projects that involve complex geometries, multiple penetrations, or extreme weather conditions.

1.3 The primary target audiences for this guide are construction quality assurance (CQA) organizations, construction quality control (CQC) organizations, facility owner/operators and agency regulators having permitting authority.

1.4 The outcome of using the guide rewards good seaming performance resulting from a record of passing destructive seam tests. It also penalizes poor seaming performance resulting from a record of excessively failing seam tests.

1.5 This guide does not address the actual seam testing procedures that are used for acceptance or failure of the geomembrane seam test specimens themselves. Depending on the type of geomembrane being deployed one should use ASTM D4437, D3083, D751 and D413 for testing details in this regard. The project-specific CQA plan should define the particular criteria used in acceptance or failure.

1.6 An appendix is offered using control charts, which is intended to be of assistance to geomembrane installers, i.e., construction quality control (CQC) organizations, to identify salient aspects of good and poor seaming performance.

2. Referenced Documents

2.1 ASTM Standards:

D4437 Practice for Determining the Integrity of Field Seams Used in Joining Flexible Polymeric Sheet Geomembranes

D3083 Specification for Flexible Poly (Vinyl Chloride) Plastic Sheeting for Pond, Canal, and Reservoir Lining

D751 Method of Testing Coated Fabrics

D413 Test Methods for Rubber Property - Adhesion to Flexible Substrate

2.2 Other Standards:

ANSI/ASQC Z1.4 [1993]

Sampling Procedures and Tables for Inspection by Attributes

3. Summary of Guide

3.1 Use of this guide requires the establishment of an anticipated geomembrane seam failure percentage (ranging from 1 to 8%) and an initial, or start-up, sampling interval.

Note 2 - The value of anticipated failure percentage is an important consideration. It dictates each decision as to a possible increase or decrease in interval spacing from the preceding value. The percentage itself comes from historical data of the construction quality assurance (CQA) organization or regulatory agency. It is related to a number of factors including criticality of installation, type of geomembrane, type of seaming method and local ambient conditions.

The actual value is admittedly subjective and should be made known in advance to the geomembrane installer before bidding the project. Use of an unrealistically low value of anticipated failure percentage, e.g., < 1.0%, will likely result in field difficulties insofar as decreased sampling intervals are concerned. Conversely, use of an unrealistically high value of anticipated failure percentage, e.g., > 8.0%, will likely result in very large sampling intervals and quite possibly sacrifice the overall quality of the seaming effort.

3.2 The guide then gives the procedure for establishing the initial number of samples needed for a possible modification to the start-up sampling interval. This is called the initial batch. Based upon the number of failed samples in the initial batch, the spacing is increased (for good seaming), kept the same, or decreased (for poor seaming).

3.3 A second batch size is then determined and the process is continued. Depending on the project size, i.e., the total length of seaming, a number of decision cycles can occur until the project is finished.

3.4 It is seen that the number of samples required for the entire project is either fewer than the start-up frequency (for good seaming); the same as the start-up frequency (for matching the initial anticipated failure percentage); or more than the start-up frequency (for poor seaming).

4. Significance and Use

4.1 Construction quality assurance (CQA) and construction quality control (CQC) organizations, as well as owner/operators and agency regulators can use this guide to vary the sampling interval of geomembrane seam samples (i.e., the taking of field samples for destructive shear and peel testing) from an initial, or start-up, interval. This initial interval is often 1 destructive seam sample in every 150 m (500 ft) of seam length.

4.2 The guide leads to increasing the sampling interval for good seaming practice (hence fewer destructive samples) and to decreasing the sampling interval for poor seaming practice (hence additional destructive samples).

4.3 Use of the guide should provide an incentive for geomembrane installers to upgrade the quality

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

and performance of their field seaming activities. In so doing, the cutting of fewer destructive samples will lead to overall better quality of the entire liner project, since the patching of previously taken destructive samples is invariably of poorer quality than the original seam itself.

Note 3 - It is generally accepted that field patching of areas where destructive samples had been taken using extrusion fillet seaming is less desirable than the original seam, which was made by hot wedge welding.

4.4 Control charts are illustrated in Appendix A, which can be used by geomembrane installers and their construction quality control (CQC) personnel for improvement in overall job quality and identification of poorly performing seaming personnel and/or equipment.

5. Suggested Methodology

Using the concepts embodied in the method of attributes, the following procedure is based on adjustments to sequential sampling.

5.1 Typical Field Situation - In order to begin the process, a project-specific total seam length must be obtained from the installers panel (roll) layout plan. Also, an initial, or start-up, sampling interval must be decided upon. From this information the total number of samples that are required based on the start-up sampling interval can be obtained.

Example 1 - A given project has 54,000 m (180,000 ft) of field seaming. The start-up sampling frequency is 1 sample per 150 m (500 ft). Therefore, the total number of samples required if the start-up interval is kept constant will be:

$$\frac{54{,}000}{150} = 360 \text{ Samples}$$

5.2 Determination of Initial Batch Size - Using the table shown below, the initial batch size from which to possibly modify the start-up sampling interval is obtained.

501-1200	80
1201-3200	125

Example 1 (cont.) - For 360 samples, a batch size of 50 is necessary. As production seaming progresses, these 50 samples are tested (either as they are taken or in a batch) and the number of failures is determined.

5.3 Verification of Start-Up Sampling Interval - A sampling table is now used which separates the number of failures within this initial batch size into three categories: a relatively low number of failures (where the sampling interval can be increased), the anticipated number of failures (where the sampling interval is maintained), or a relatively high number of failures (where the sampling interval should be decreased). Table 2 provides this information that is based upon the operation characteristic (OC) curves of Appendix B.

Example 1 (cont.) - Assuming an anticipated failure percentage of 2% (recall Note - 2), Table 2 results in the three categories shown below:

- 0 or 1 failure out of 50; the sampling interval can be increased
- 2 or 3 failures out of 50; the sampling frequency should remain at 1 sample per 150 m (500 ft)
- 4 or more failures out of 50; the sampling interval should be decreased

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

the start-up sampling interval may be modified to a new value which will then require a new batch size to verify the modification. The process is then continued until the project is finished. Two examples will be provided using the above sampling tables both with anticipated failure percentages of 2.0%: Example 2 illustrates good seaming, and Example 3 illustrates poor seaming.

Example 2 - Using the same project seam length and start-up sampling frequency as in the previous example assume that the start-up batch of 50 samples in the previous example had 2-failures. The decision is then to continue at a 1 destructive sample in 150 m (500 ft) sampling interval. Thus the second batch size from Table 1 is again 50 samples, see Table 3. Table 3(a) is in S.I. units and Table 3(b) is in English units. Now assume in the second batch there are no failures. This allows the sampling interval to be increased, e.g., to 1 sample in 180 m (600 ft). From Table 1, the third batch size is then decreased to 32 samples. The process is continued in this manner until the project is concluded. For this hypothetical situation Table 3(a) illustrates that 265 samples (or 266 samples when using the English units in Table 3(b)) are necessary. Note that by using a constant interval of 1 sample in 150 m (500 ft), 360 samples would have been necessary. Also note that the maximum sampling interval was fixed at 310 m (1000 ft).

Note 4 - This example, and the following one, use a changing sampling interval of +/- 20% from the previous value. That is, when good seaming allows for an increase in sampling interval; the progression being from 150, 180, 215, 260 to 310 m (500, 600, 720, 850 to 1000 ft), respectively. A maximum interval of 310 m (1000 ft) is recommended, but clearly this value is at the discretion of the organizations involved. Conversely, poor seaming requires a decrease in sampling interval, the progression being from 150, 120, 100, 80 to 65 m (500, 400, 320, 250 to 200 ft), respectively. A minimum interval of 65 m (200 ft) is recommended, but clearly this decision is also at the discretion of the organizations involved

Table 3(a) - Results of Example 2 (in S.I. Units) Illustrating the Variation of the Sampling Interval Based on a 2.0% Anticipated Failure Percentage With a "Good" Quality Installer

Total Number of tests per 180,000 ft of seam project = 266

Example 3 - Using the same project seam length and start-up sampling frequency as Example 1, assume that the start-up batch of 50 samples had 3- failures. The decision is then to continue at a 1 destructive sample in 150 m (500 ft) sampling interval. Thus the second batch size is again 50 samples as it was with Example 2, see Table 4. Table 4(a) is in S.I. units and Table 4(b) is in English units. Now assume in the second batch there are 2-failures. The decision is to again continue at a 1 destructive sample in 150 m (500 ft) sampling interval. From Table 1, the third batch size is then decreased to 32 samples. The process is continued in this manner until the project is concluded. For this hypothetical situation Table 4 illustrates that 412 samples are necessary. Note that by a constant interval of 1 sample in 150 m (500 ft), 360 samples would have been necessary. Furthermore, a good seamer (as illustrated in Example 2) would only have had to take 265 samples.

5.5 Summary

This guide illustrates by means of hypothetical examples how a CQA and/or CQC organization can modify the sampling interval for taking destructive samples from a geomembrane-seaming project. It is based on the method of attributes that are common to statistical control methods. The methodology uses sequential sampling to proceed from one decision to the next until the project is complete.

The result in using this guide for the above purpose is to reward good seaming performance by taking fewer destructive samples, and to penalize poor seaming performance by taking additional destructive samples. In the example illustrations, good seaming resulted in taking 265 samples (versus 360), or a decrease of 26% from the originally set constant interval of 1 sample per 150 m (500 ft). Conversely, poor seaming resulted in taking 412 samples (versus 360), or a 14% increase in the originally set constant interval of 1 sample per 150 m (500 ft.) of seam length.

Appendix A - General Principles of Control Charts

In order to control a production process, like the field seaming of geomembranes, it is necessary to identify and quantify characteristics that reflect the quality of the product. Such quality characteristics can be either discrete or continuous variables. For example, the number of pinholes in a sheet of geomembrane is a discrete variable. Variation in the thickness of a sheet of geomembrane, however, is considered to be a continuous variable.

Whether quality characteristics are discrete or continuous, variability in the observed values is unavoidable. In the theory of control charts, this variation is considered due to either random (common) or assignable (special) causes, Wadsworth (1989) and Deming (1982). Random causes are generally smaller, uncontrollable influences that cannot be removed from the process without fundamental changes in the process itself. An assignable cause, however, is an influence considered to be significant, unusual, and capable of being removed form the process. Such causes may be due to human error, variation in raw materials, or the need for machine adjustment.

An important tool used to reduce process variation is the use of control charts. When using control charts, control limits are used to determine whether the variability of the statistic over time appears to be due to random variation only, or if an assignable cause is present. In other words, the purpose of control charts is to establish a "statistical control" of the assignable causes of variation within of a process.

The control chart generally used to monitor conforming or non-conforming data, called attributes, is the p-chart, where "p" stands for the proportion of non-conforming items in the entire population. In the case of inspecting the quality of the seams of field-deployed geomembranes, the p-value would be the historic failure percentage of the installer.

Suppose we have m subgroups (e.g., m different operators, or m different welding machines, or m working days, etc.) of varying sample sizes n_1, n_2, ..., nm. The number of non-conforming (failed) samples in the ith subgroup is Di, i =1, 2, ..., m, so the proportion of non-conforming items (failure rate) in the ith subgroup is as follows:

$$\hat{P}_i = \frac{D_i}{n_i} \quad 1 = 1,2,...,m$$

(A1)

For the p-chart, the values of pi are plotted against the subgroup number with a control limit, CL, set at the following:

$$CL = p + 3\left[\frac{p(1-p)}{n}\right]^{1/2}$$

(A2)

Where $\bar{n} = \frac{1}{m}\sum_{i=1}^{m} n_i$ = average sample size.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

Two examples follow:

Example A1 - Assume that a seaming project is expected to take 25-days for completion, i.e., m=25. The installer has a historic data indicating that the company's average failure percentage is 2.0%. As the work progresses, the number of destructive seam samples and the respective numbers of failures are listed in tabular form as shown in the following table. Note that the daily failure rates, i.e., , are also shown in the table. The control chart of this project can now be developed.

Subgroup No. (days)	No. Of destructive samples	No. Of failures in subgroup	Failure Percentage P
1	12	0	0.000
2	14	0	0.000
3	9	0	0.000
4	7	0	0.000
5	13	1	0.077
6	15	0	0.000
7	19	1	0.053
8	13	0	0.000
9	14	1	0.071
10	9	0	0.000
11	17	1	0.059
12	16	0	0.000
13	7	0	0.000
14	22	1	0.045
15	18	0	0.000
16	16	0	0.000
17	15	0	0.000
18	16	0	0.000
19	14	0	0.000
20	16	0	0.000
21	22	1	0.045
22	18	0	0.000
23	16	0	0.000
24	9	0	0.000
25	13	1	0.077

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

Solution: From Equation (B2), the control limit is calculated as follows:

$$CL=0.02+3\left[\frac{0.02(1-0.02)}{360/25}\right]^{1/2}=0.13$$

The control chart can now be obtained by plotting the subgroup failure rate against the subgroup number (i.e., days) along with the control limit, CL = 0.13. The results are shown in the following figure, note that the 2.0% historic failure rate is also shown.

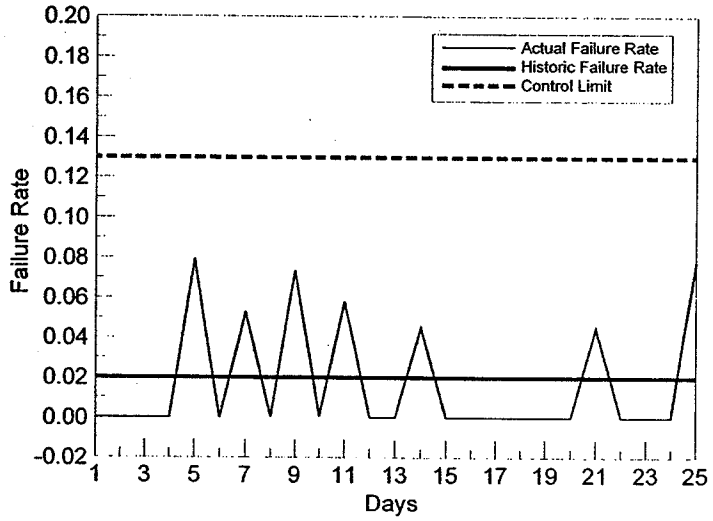

Figure A1 – The Resulted Control Chart of Example A-1.

As seen in the above control chart, the entire 25-day record of the failure rate of this project falls below the control limit set on the basis of the installer's 2.0% historic failure rate. That is to say, the variations in the daily failure record were due to random causes only and no assignable cause was identified. The above control chart indicates that no corrective action is necessary. This is an example of good seaming control.

Example A2 - For a similar size seaming project and historic record (i.e., 2% failure rate) as presented in Example A-1, a second installer has a poorer destructive seam record as shown in the following table. The control chart of this particular situation can also be developed.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

Subgroup No. (days)	No. Of destructive samples	No. Of failures in subgroup	Failure Percentage
1	12	1	0.083
2	14	0	0.000
3	9	1	0.111
4	7	0	0.000
5	13	1	0.077
6	15	1	0.067
7	19	3	0.158
8	13	2	0.154
9	14	1	0.071
10	9	0	0.000
11	17	0	0.000
12	16	1	0.063
13	7	1	0.143
14	22	2	0.091
15	18	1	0.056
16	16	2	0.125
17	15	0	0.000
18	16	1	0.063
19	14	0	0.000
20	16	1	0.063
21	22	2	0.091
22	18	1	0.056
23	16	3	0.188
24	9	0	0.000
25	13	1	0.077

Solution: Since the historic failure rate is the same as shown in Example A-1.A new control chart can now be obtained by plotting the subgroup failure rate against the subgroup number (i.e., days) along with the control limit, CL = 0.13. The results are shown in the following figure. Again, the 2.0% historic failure rate is also shown.

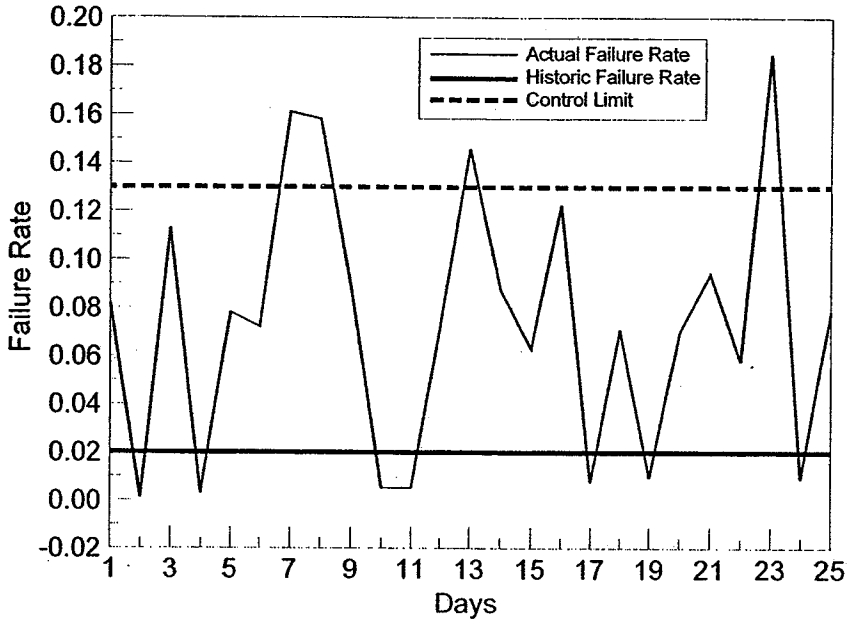

Figure A2 - The Resulted Control Chart of Example A-2.

As seen in the above control chart, the daily failure rates at day 7, 8, 13 and 23 exceed the control limit set on the basis of the installer's 2.0% historic failure rate. That is to say, there are possible assignable causes on those days. From the standpoint of construction quality control, the installer should check the record on those days, identify the cause(s) of such variations, and take necessary corrective actions. This is an example of poor seaming.

GM 14 - Appendix B - The Selection of the "I" and "D" Values

In this appendix, the procedure used for selecting the "I" and "D" values listed in Table 2 is presented. The required background, e.g., the concept of sampling risk and the operating characteristics (OC) curves, are briefly discussed.

Sampling Risk

Sampling involves a degree of risk that the actual samples do not adequately reflect the conditions of the lot. For example, when using the sampling plan recommended in this guide, there are two common risks [see Juran and Gryna (1980) and Juran el. al (1974) for details]:

1. A good seaming practice might be penalized. This is generally referred as the installer's risk and denoted as the risk.
2. A poor seaming practice might go undetected. This is generally referred as an owner/regulators risk and denoted as the risk.

The effects (impacts) of the relative degree of these two risks are summarized in Table B1.

TABLE B1 - THE EFFECTS OF THE RELATIVE DEGREE OF AND RISKS.

Relative	Types of Risks	
Degree	Installers (α) Risk	Owner/Regulators (β) Risk
Low	Loose CQA control; low testing cost	Tight CQA control; high testing cost
High	Tight CQA control; high testing cost	Loose CQA control; low testing cost

Operating Characteristics (OC) Curves

Both of the risks can be quantified by sampling-plan-specific operating characteristics (OC) curves. The OC curve for a sampling plan is a graph that plots the probability that the sampling plan will accept a lot (i.e., the Pa value) versus the percent defective samples in that particular lot. Note that the term "sampling plan" used here corresponds to a batch of "n" destructive testing samples and the criteria for adjusting the sampling interval. Recall Table 2 in the main body of this guide. Figure B1 illustrates the concept of OC curves. In Figure B1, the dashed curve represents an "ideal" OC curve. Here it is desired to accept all lots having less or equal than 2% and reject all lots having greater than 2% failures. In reality, all sampling plans have risks that a "good" lot will be rejected or a "bad" lot will be accepted. This is illustrated by the solid S-shaped curve shown in Figure B1. It is seen that this particular sampling plan will have a 5% risk (100% - 95%) of rejecting a lot having only 1% defects (i.e., a "good" lot) and a 10% risk of accepting a lot having 5% defects (i.e., a "bad" lot).

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

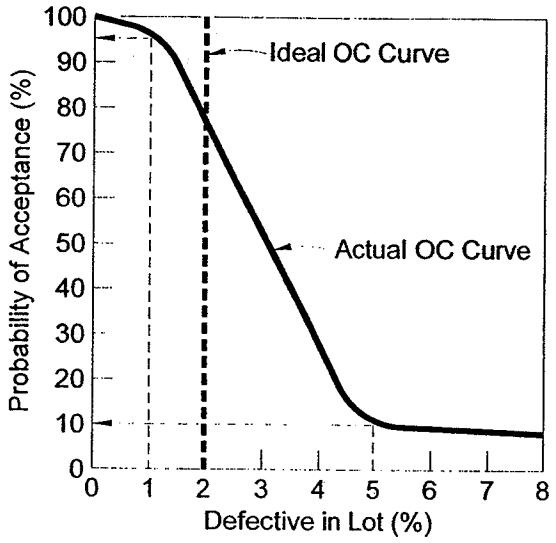

Figure B1 - Ideal and Actual Operating Characteristics Curves for a Sampling Plan

An OC curve can be developed by determining the probability of acceptance for several values of the percent defects. To do so, a statistical distribution of the acceptance probability has to be assumed first. There are three distributions that can be used: hypergeometric, binomial and Poisson distribution. The Poisson distribution is generally preferable due to the ease of calculation. It is used in this guide. The Poisson distribution function to be applied to an acceptance-sampling plan is as follows:

$$P\begin{pmatrix}\text{exactly "c" defects}\\ \text{in a batch of size "n"}\end{pmatrix} = \frac{e^{-np}(np)^c}{c!} \qquad \text{(B1)}$$

Most statistics books provide Poisson distribution tables that give the probability of "c" or fewer defects in a batch of size "n" from a lot having a fraction of defect "p".

The Selection of the "I" and "D" Values Listed in Table 2

As mentioned earlier, each of the sampling plans recommended in this guide consists of three variables: the batch size "n", the values of "I" and "D". Note that the values of "I" and "D" are specific values of "c" mentioned in Equation B1. The "I" value corresponds to the judgment criterion of rewarding good seaming practice, i.e., increasing the sampling interval if the number of failed samples does not exceed this particular value. The "D" value, on the other hand, corresponds to the judgment criterion of penalizing poor seaming practice, i.e., decreasing the sampling interval if the number of failed samples equals or exceeds this particular value.

The concept of the OC curves is used to determine the actual values of I's and D's for different sampling plans. The criteria used are as follows:

- For a batch of size "n", the "I" value should yield a 80~90% probability of rewarding good seaming practice, i.e., 80% < Pa < 90%.
- For a batch of size "n", the "D" value should yield a risk of 0.5% or less of penalizing

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

good seaming practice, i.e., Pa >99.5%. In other words, the probability for good seaming practice to be penalized is extremely small, i.e., less than 0.5%.

The above criteria are subjective. Nevertheless, it is felt to be adequate since the rights of both the installer and the owner/regulator are protected. Recognize that a sampling plan with tighter control (i.e., smaller values of "I" and "D") might seem to be more ideal at first glance, but it may result in a significant increase in the required number of destructive tests, i.e., it may be counter productive.

As an illustration, Figure B2 shows the graphic procedure of obtaining the "I" and "D" values for a batch of 50 samples (n=50) and an anticipated failure percentage of 4%. [In other words, it illustrates the procedure of obtaining one particular pair of numbers listed in Table 2, namely, "I" and "D" equal to 3 and 6, respectively.] Note that each OC curve shown in Figure B2 corresponds to a specific "c" value and is obtained via a Poisson distribution table.

Figure B2 can also used to determine the values of "I" and "D" for sampling plans with the same batch size (i.e., n = 50) but different anticipated failure percentage. The rest of the values listed in Table 2 can be verified in a similar manner using OC curves corresponding to different batch sizes.

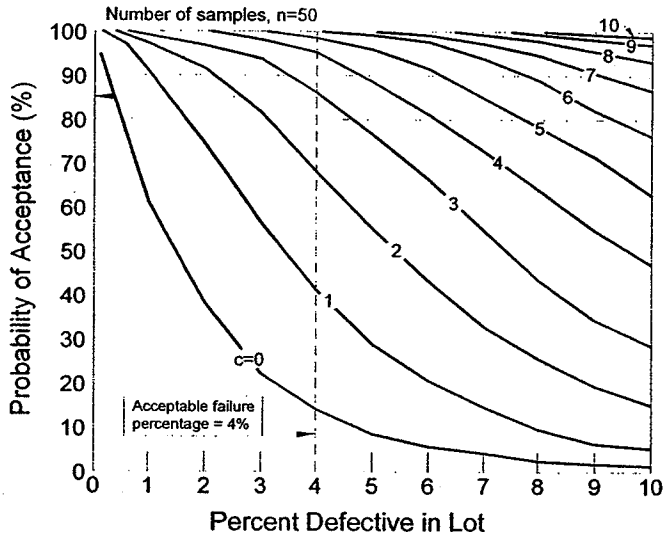

Figure B2 - The Determination of the Values of "I" and "D" for a Batch with 50 Samples and an Anticipated Failure Percentage of 4.0%.

Revision Schedule:

Adopted: March 27,1998

GRI Standard GM17

STANDARD SPECIFICATION FOR TEST PROPERTIES, TESTING FREQUENCY AND RECOMMENDED WARRANTY FOR LINEAR LOW DENSITY POLYETHYLENE (LLDPE) SMOOTH AND TEXTURED GEOMEMBRANES

This specification was developed by the Geosynthetic Research Institute (GRI), with the cooperation of the member organizations for general use by the public. It is completely optional in this regard and can be superseded by other existing or new specifications on the subject matter in whole or in part. Neither GRI, the Geosynthetic Institute, nor any of its related institutes, warrant or indemnifies any materials produced according to this specification either at this time or in the future.

1. Scope

1.1 This specification covers linear low density polyethylene (LLDPE) geomembranes with a formulated sheet density of 0.939 g/ml, or lower, in the thickness range of 0.50 mm (20 mils) to 3.0 mm (120 mils). Both smooth and textured geomembrane surfaces are included.

1.2 This specification sets forth a set of minimum, maximum, or range of physical, mechanical and endurance properties that must be met, or exceeded by the geomembrane being manufactured.

1.3 In the context of quality systems and management, this specification represents manufacturing quality control (MQC).

Note 1: Manufacturing quality control represents those actions taken by a manufacturer to ensure that the product represents the stated objective and properties set forth in this specification.

1.4 This standard specification is intended to ensure good uniform quality LLDPE geomembranes for use in general applications.

Note 2: Additional tests, or more restrictive values for the tests indicated, may be necessary under conditions of a particular application. In this situation, interactions with the manufacturers are required.

1.5 This specification also presents a recommended warranty which is focused on the geomembrane material itself.

1.6 The recommended warranty attached to this specification does not cover installation considerations which are independent of the manufacturing of the geomembrane.

Note 3: For information on installation techniques, users of this standard are referred to the geosynthetics literature, which is abundant on the subject.

*This GRI standard is developed by the Geosynthetic Research Institute through consultation and review by the member organizations. This specification will be reviewed at least every 2-years, or on an as-required basis. In this regard it is subject to change at any time. The most recent revision date is the effective version.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GM 12 Measurement of the Asperity Height of Textured Geomembranes Using a Depth Gage

2.3 U. S. Environmental Protection Agency Technical Guidance Document "Quality Control Assurance and Quality Control for Waste Containment Facilities," EPA/600/R-93/182, September 1993, 305 pages.

3. Definitions

Manufacturing Quality Control (MQC) - A planned system of inspections that is used to directly monitor and control the manufacture of a material which is factory originated. MQC is normally performed by the manufacturer of geosynthetic materials and is necessary to ensure minimum (or maximum) specified values in the manufactured product. MQC refers to measures taken by the manufacturer to determine compliance with the requirements for materials and workmanship as stated in certification documents and contract specifications ref. EPA/600/R-93/182.

Manufacturing Quality Assurance (MQA) - A planned system of activities that provides assurance that the materials were

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

constructed as specified in the certification documents and contract specifications. MQA includes manufacturing facility inspections, verifications, audits and evaluation of the raw materials (resins and additives) and geosynthetic products to assess the quality of the manufactured materials. MQA refers to measures taken by the MQA organization to determine if the manufacturer is in compliance with the product certification and contract specifications for the project ref. EPA/600/R-93/182.

Linear Low Density Polyethylene (LLDPE), n - A ethylene/ -olefin copolymer having a linear molecular structure. The comonomers used to produce the resin can include hexane, octane, or methyl pentene. LLDPE resins have a natural density in the range of 0.915 to 0.926 g/ml (ref. Pate, T. J. Chapter 29 in Handbook of Plastic Materials and Technology, I.I. Rubin Ed., Wiley,1990).

Formulation, n - The mixture of a unique combination of ingredients identified by type, properties and quantity. For linear low density polyethylene geomembranes, a formulation is defined as the exact percentages and types of resin(s), additives and carbon black.

4. Material Classification and Formulation

4.1 This specification covers linear low density polyethylene geomembranes with a formulated sheet density of 0.939 g/ml, or lower. Density can be measured by ASTM D1505 or ASTM D792. If the latter, Method B is recommended.

4.2 The polyethylene resin from which the geomembrane is made will generally be in the density range of 0.926 g/ml or lower, and have a melt index value per ASTM D1238 of less than 1.0 g/10 min. This refers to the natural, i.e., nonformulated, resin.

4.3 The resin shall be virgin material with no more than 10% rework. If rework is used, it must be of the same formulation (or other approved formulation) as the parent material.

4.4 No post consumer resin (PCR) of any type shall be added to the formulation.

5. Physical, Mechanical and Chemical Property Requirements

5.1 The geomembrane shall conform to the test property requirements prescribed in Tables 1 and 2. Table 1 is for smooth LLDPE geomembranes and Table 2 is for single and double sided textured LLDPE geomembranes. Each of the tables are given in English and SI (metric) units. The conversion from English to SI (metric) is "soft". It is to be understood that the tables refer to the latest revision of the referenced test methods and practices.

Note 4: There are several tests sometimes included in other LLDPE geomembrane specifications which are omitted from this standard because they are outdated, irrelevant or generate information that is not necessary to evaluate on a routine MQC basis. The following tests have been purposely omitted:

- Volatile Loss
- Dimensional Stability
- Coeff. of Linear Expansion
- Resistance to Soil Burial
- Low Temperature Impact
- ESCR Test (D 1693 and D 5397)
- Solvent Vapor Transmission
- Water Absorption
- Ozone Resistance
- Hydrostatic Resistance
- Tensile Impact
- Small Scale Burst

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

- Wide Width Tensile
- Water Vapor Transmission
- Various Toxicity Tests
- Field Seam Strength

Note 5: There are several tests which are included in this standard (that are not customarily required in other LLDPE geomembrane specifications) because they are relevant and important in the context of current manufacturing processes. The following tests have been purposely added:

- Oxidative Induction Time
- Oven Aging
- Ultraviolet Resistance
- Asperity Height of Textured Sheet

Note 6: There are other tests in this standard, focused on a particular property, which are updated to current standards. The following are in this category:

- Thickness of Textured Sheet
- Tensile Properties, incl. 2% Secant Modulus
- Puncture Resistance
- Axi-Symmetric Break Resistance Strain
- Carbon Black Dispersion (In the viewing and subsequent quantitative interpretation of ASTM D 5596 only near spherical agglomerates shall be included in the assessment).

Note 7: There are several GRI tests currently included in this standard. Since these topics are not covered in ASTM standards, this is necessary. They are the following:

- UV Fluorescent Light Exposure
- Asperity Height Measurement

5.2 The values listed in the tables of this specification are to be interpreted according to the designated test method. In this respect they are neither minimum average roll values (MARV) nor maximum average roll values (MaxARV).

5.3 The various properties of the LLDPE geomembrane shall be tested at the minimum frequencies shown in Tables 1 and 2. If the specific manufacturer's quality control guide is more stringent, it must be followed in like manner.

Note 8: This specification is focused on manufacturing quality control (MQC). Conformance testing and manufacturing quality assurance (MQA) testing are at the discretion of the purchaser and/or quality assurance engineer, respectively. Communication and interaction with the manufacturer is strongly suggested.

6. Workmanship and Appearance

6.1 Smooth geomembrane shall have good appearance qualities. It shall be free from such defects that would affect the specified properties and hydraulic integrity of the geomembrane.

6.2 Textured geomembrane shall generally have uniform texturing appearance. It shall be free from

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

such defects that would affect the specified properties and hydraulic integrity of the geomembrane.

6.3 General manufacturing procedures shall be performed in accordance with the manufacturer's internal quality control guide and/or documents.

7. MQC Sampling

7.1 Sampling shall be in accordance with the specific test methods listed in Tables 1 and 2. If no sampling protocol is stipulated in the particular test method, then test specimens shall be taken evenly spaced across the entire roll width.

7.2 The number of tests shall be in accordance with the appropriate test methods listed in Tables 1 and 2.

7.3 The average of the test results should be calculated per the particular standard cited and compared to the minimum value listed in these tables, hence the values listed are the minimum average values and are designated as "minimum average."

8. MQC Retest and Rejection

8.1 If the results of any test do not conform to the requirements of this specification, retesting to determine conformance or rejection should be done in accordance with the manufacturing protocol as set forth in the manufacturer's quality manual.

9. Packaging and Marketing

9.1 The geomembrane shall be rolled onto a substantial core or core segments and held firm by dedicated straps/slings, or other suitable means. The rolls must be adequate for safe transportation to the point of delivery, unless otherwise specified in the contract or order.

9.2 Marking of the geomembrane rolls shall be done in accordance with the manufacturers accepted procedure as set forth in their quality manual.

10. Certification

10.1 Upon request of the purchaser in the contract or order, a manufacturer's certification that the material was manufactured and tested in accordance with this specification, together with a report of the test results, shall be furnished at the time of shipment.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

(1) Machine direction (MD) and cross machine direction (XMD) average values should be on the basis of 5 test specimens each direction.
- Break elongation is calculated using a gage length of 2.0 in. at 2.0 in./min.

(2) Other methods such as D 4218 (muffle furnace) or microwave methods are acceptable if an appropriate correlation to D 1603 (tube furnace) can be established.
(3) Carbon black dispersion (only near spherical agglomerates) for 10 different views:
- 9 in Categories 1 or 2 and 1 in Category 3

(4) The manufacturer has the option to select either one of the OIT methods listed to evaluate the antioxidant content in the geomembrane.
(5) It is also recommended to evaluate samples at 30 and 60 days to compare with the 90 day response.
(6) The condition of the test should be 20 hr. UV cycle at 75°C followed by 4 hr. condensation at 60°C.
(7) Not recommended since the high temperature of the Std-OIT test produces an unrealistic result for some of the antioxidants in the UV exposed samples.
(8) UV resistance is based on percent retained value regardless of the original HP-OIT value.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

UV Resistance *(8)* (a) Standard OIT (min. ave.) — or — (b) High Pressure OIT (min. ave.) - % retained after 1600 hrs *(10)*	D 3895 D 5885	N. R. *(9)* 35	N.R. *(9)* 35	N.R. *(9)* 35	N.R. *(9)* 35	N.R. *(9)* 35	N.R. *(9)* 35	N.R. *(9)* 35	N.R. *(9)* 35	per formulation

(1) Of 10 readings; 8 out of 10 must be ≥ 7 mils, and lowest individual reading must be ≥ 5 mils
(2) Alternate the measurement side for double sided textured sheet
(3) Machine direction (MD) and cross machine direction (XMD) average values should be on the basis of 5 test specimens each direction.
• Break elongation is calculated using a gage length of 2.0 in. at 2.0 in./min.
(4) Other methods such as D 4218 (muffle furnace) or microwave methods are acceptable if an appropriate correlation to D 1603 (tube furnace) can be established.
(5) Carbon black dispersion (only near spherical agglomerates) for 10 different views:
• 9 in Categories 1 or 2 and 1 in Category 3
(6) The manufacturer has the option to select either one of the OIT methods listed to evaluate the antioxidant content in the geomembrane.
(7) It is also recommended to evaluate samples at 30 and 60 days to compare with the 90 day response.
(8) The condition of the test should be 20 hr. UV cycle at 75°C followed by 4 hr. condensation at 60°C.
(9) Not recommended since the high temperature of the Std-OIT test produces an unrealistic result for some of the antioxidants in the UV exposed samples.
(10) UV resistance is based on percent retained value regardless of the original HP-OIT value.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

11. Warranty

11.1 Upon request of the purchaser in the contract or order, a manufacturer's warranty of the quality of the material shall be furnished at the completion of the terms of the contract.

11.2 A recommended warranty for smooth and textured LLDPE geomembranes manufactured and tested in accordance with this specification is given in Appendix A.

11.3 The warranty in Appendix A is for the geomembrane itself. It does not cover subgrade preparation, installation, seaming, or backfilling. These are separate operations that are often beyond the control, or sphere of influence, of the geomembrane manufacturer.

Note 9: If a warranty is required for installation, it is to be developed between the installation contractor and the party requesting such a document.

Adoption and Revision Schedule for GRI Test Method GM17

"Test Properties, Testing Frequency and Recommended Warranted for Linear Low Density Polyethylene (LLDPE) Smooth and Textured Geomembranes"

Adopted: April 3, 2000

Revision 1: June 28, 2000: added a new Section 5.2 that the numeric tables values are neither MARV nor MaxARV. They are to be interpreted per the designated test method. Also, corrected typographical error of textured sheet thickness test method designation from D5199 to D5994.

Revision 2: December 13, 2000: added one Category 3 is allowed for carbon black dispersion. Also, unified terminology to "strength" and "elongation".

Revision 3: June 23, 2003: Adopted ASTM D 6693, in place of ASTM D 638, for tensile strength testing. Also, added Note 4.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GRI Test Method GM19*

STANDARD SPECIFICATION FOR SEAM STRENGTH AND RELATED PROPERTIES OF THERMALLY BONDED POLYOLEFIN GEOMEMBRANES

This specification was developed by the Geosynthetic Research Institute (GRI), with the cooperation of the member organizations for general use by the public. It is completely optional in this regard and can be superseded by other existing or new specifications on the subject matter in whole or in part. Neither GRI, the Geosynthetic Institute, nor any of its related institutes, warrant or indemnifies any materials produced according to this specification either at this time or in the future.

1. Scope

1.1 This specification addresses the required seam strength and related properties of thermally bonded polyolefin geomembranes; in particular, high density polyethylene (HDPE), linear low density polyethylene (LLDPE) and flexible polypropylene both nonreinforced (fPP) and scrim reinforced (fPP-R).

1.2 Numeric values of seam strength and related properties are specified in both shear and peel modes.

Note 1: This specification does not address the test method details or specific testing procedures. It refers to the relevant ASTM test methods where applicable.

1.3 The thermal bonding methods focused upon are hot wedge (single and dual track) and extrusion fillet.

Note 2: Other acceptable, but less frequently used, methods of seaming are hot air and ultrasonic methods. They are inferred as being a subcategory of hot wedge seaming.

1.4 This specification also suggests the distance between destructive seam samples to be taken in the field, i.e., the sampling interval. However, project-specific conditions will always prevail in this regard.

1.5 This specification is only applicable to laboratory testing.

1.6 This specification does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

GM14 Selecting Variable Intervals for Taking Geomembrane Destructive Seam Samples Using the Method of Attributes

GM17 Test Properties, Testing Frequency and Recommended Warranty for Linear Low Density Polyethylene (LLDPE) Smooth and Textured Geomembranes

GM18 Test Properties, Testing Frequency and Recommended Warranty for Flexible Polypropylene (fPP and fPP-R) Geomembranes

3. Definition

3.1 Geomembrane, n – An essentially impermeable geosynthetic composed of one or more synthetic sheets used for the purpose of liquid, gas or solid containment.

3.2 Hot Wedge Seaming – A thermal technique which melts the two opposing geomembrane surfaces to be seamed by running a hot metal wedge or knife between them. Pressure is applied to the top or bottom geomembrane, or both, to form a continuous bond. Seams of this type can be made with dual bond tracks separated by a nonbonded gap. These seams are referred to as dual hot wedge seams or double-track seams.

3.3 Hot Air Seaming – This seaming technique introduces high-temperature air or gas between two geomembrane surfaces to facilitate localized surface melting. Pressure is applied to the top or bottom geomembrane, forcing together the two surfaces to form a continuous bond.

3.4 Ultrasonic Seaming - A thermal technique which melts the two opposing geomembrane surfaces to be seamed by running a ultrasonically vibrated metal wedge or knife between them. Pressure is applied to the top or bottom geomembrane, or both, to form a continuous bond. Some seams of this type are made with dual bond tracks separated by a nonbonded gap. These seams are referred to as dual-track seams or double-track seams.

3.5 Extrusion Fillet Seaming – This seaming technique involves extruding molten resin at the edge of an overlapped geomembrane on another to form a continuous bond. A depreciated method called "extrusion flat" seaming extrudes the molten resin between the two overlapped sheets. In all types of extrusion seaming the surfaces upon which the molten resin is applied must be suitably prepared, usually by a slight grinding or buffing.

4. Significance and Use

4.1 The various methods of field fabrication of seams in polyolefin geomembranes are covered in existing ASTM standards mentioned in the referenced document section. What is not covered in

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

those documents is the numeric values of strength and related properties that the completed seam must meet, or exceed. This specification provides this information insofar as minimum, or maximum, property values are concerned when the field fabricated seams are sampled and laboratory tested in shear and peel. The specification also provides guidance as to what spacing intervals the samples should be taken at typical field installation projects.

5. Sample and Specimen Preparation

5.1 The spacing for taking field seam samples for destructive testing is to be 1 per 500 feet (1 per 150 m) of seam length, or as by directed by the construction quality assurance inspector. As the project continues and data is accumulated, however, this sampling interval should be varied according to the procedure set forth in GRI GM14. Following this procedure three different situations can result.

5.1.1 Good seaming with fewer rejected test results than the preset historic average can result in a sequential increase in the spacing interval, i.e., one per greater than 500 ft. (one per greater than 150 m).

5.1.2 Poor seaming with more rejected test results than the preset historic average can result in a sequential decrease in the spacing interval, i.e., one per less than 500 ft. (one per less than 150 m).

5.1.3 Average seaming with approximately the same test results as the preset historic average will result in the spacing interval remaining the same, i.e., one per 500 ft. (one per 150 m).

Note 3: The method of attributes referred to in GRI GM14 is only one of several statistical strategies that might be used to vary sampling frequency. The use of control charts should also be considered in this regard.

5.2 The size of field seam samples is to be according to the referenced test method, e.g., ASTM D6392 or site-specific CQA plan.

5.3 The individual test specimens taken from the field seam samples are to be tested according to the referenced test method, i.e., ASTM D6392 for HDPE, LLDPE and fPP, and ASTM D751 (as modified by NSF 54) for fPP-R. The specimens are to be conditioned prior to testing according to these same test methods and evaluated accordingly.

6. Assessment of Seam Test Results

6.1 HDPE seams – For HDPE seams (both smooth and textured), the strength of four out of five 1.0 inch (25 mm) wide strip specimens in shear should meet or exceed the values given in Tables 1(a) and 1(b). The fifth must meet or exceed 80% of the given values. In addition, the shear percent elongation, calculated as follows, should exceed the values given in Tables 1(a) and 1(b):

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

(1)

$$E = \frac{L}{L_O}(100)$$

where

E = elongation (%)
L = extension at end of test (in. or mm)
Lo = original average length (usually 1.0 in. or 25 mm)

Note 4: The assumed gage length is considered to be the unseamed sheet material on either side of the welded area. It generally will be 1.0 in. (25 mm) from the edge of the seam to the grip face.

For HDPE seams (both smooth and textured), the strength of four out of five 1.0 in. (25 mm) wide strip specimens tested in peel should meet or exceed the values given in Tables 1(a) and 1(b). The fifth must meet or exceed 80% of the given values.

In addition, the peel separation (or incursion) should not exceed the values given in Tables 1(a) and 1(b). The value shall be based on the proportion of area of separated bond to the area of the original bonding as follows:

(2)

$$S = \frac{A}{A_O}(100)$$

where

S = separation (%)
A = average area of separation, or incursion (in^2 or mm^2)
A0 = original bonding area (in^2 or mm^2)

Note 5: The area of peel separation can occur in a number of nonuniform patterns across the seam width. The estimated dimensions of this separated area is visual and must be done with care and concern. The area must not include squeeze-out which is part of the welding process.

Regarding the locus-of-break patterns of the different seaming methods in shear and peel, the following are unacceptable break codes per their description in ASTM D6392 (in this regard, SIP is an acceptable break code);

Hot Wedge: AD and AD-Brk > 25%

Extrusion Fillet: AD1, AD2 and AD-WLD (unless strength is achieved)

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

Hot Wedge: AD and AD-Brk > 25%

Extrusion Fillet: AD1, AD2, AD-WLD (unless strength is achieved)

6.3 fPP Seams – For fPP seams (both nonreinforced and scrim reinforced), the strength of four out of five specimens in shear should meet or exceed the values given in Tables 3(a) and 3(b). The fifth must meet or exceed 80% of the given values. Note that the unreinforced specimens are 1.0 in. (25 mm) wide strips and the scrim reinforced specimens are 4.0 in. (100 mm) wide grab tests. In addition, the shear percent elongation on the unreinforced specimens, calculated as follows, should exceed the values given in Tables 3(a) and 3(b).

(1)

$$E = \frac{L}{L_O}(100)$$

where

E = elongation (%)
L = extension at end of test (in. or mm)
L_O = original gauge length (usually 1.0 in. or 25 mm)

Note 4: The assumed gage length is considered to be the unseamed sheet material on either side of the welded area. It generally will be 1.0 in. (25 mm) from the edge of the seam to the grip face.

Shear elongation is not relevant to scrim reinforced geomembranes and as such is listed as "not applicable" in Table 3(a) and 3(b).

For fPP seams (both nonreinforced and scrim reinforced), the strength of four out of five specimens in peel should meet or exceed the values given in Tables 3(a) and 3(b). The fifth must meet or exceed 80% of the given values. Note that the unreinforced specimens are 1.0 in. (25 mm) wide strips and the scrim reinforced specimens are grab tests. In addition, the peel percent separation (or incursion) should not exceed the values given in Tables 3(a) and 3(b). The values should be based on the proportion of area of separated bond to the area of the original bonding as follows.

(2)

$$S = \frac{A}{A_O}(100)$$

where

S = separation in (%)
A = average depth of separation, or incursion ($in.^2$ or mm^2)
A_O = original bonding distance ($in.^2$ or mm^2)

Note 5: The area of peel separation can occur in a number of nonuniform patterns across the seam width. The estimated dimensions of this separated area is visual and must be done with care and concern. The area must not include squeeze-out which is part of the welding process.

Regarding the locus-of-break patterns of the different seaming methods in shear and peel, the following are unacceptable break codes per their description in ASTM D6392 (in this regard, SIP is an acceptable break code);

Hot Wedge: AD and AD-Brk > 25%

Extrusion Fillet: AD1, AD2 and AD-WLD (unless strength is achieved)

Retest and Rejection

7.1 If the results of the testing of a sample do not conform to the requirements of this specification, retesting to determine conformance or rejection should be done in accordance with the construction quality control or construction quality assurance plan for the particular site under construction.

Certification

8.1 Upon request of the construction quality assurance officer or certification engineer, an installer's certification that the geomembrane was installed and tested in accordance with this specification, together with a report of the test results, shall be furnished at the completion of the installation.

ıation is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with ırrent, standard minimum quality assurance procedures and specifications.

1.0 Basic Drawing Tools

1.01	**Line**	A straight line from one point to another
1.02	**Pline**	A line that can be modified to have width and/or be joined to other lines or polylines.
1.03	**Arc**	A curved line, usually with a starting point, middle point and an end point
1.04	**Circle**	A perfect circle. Can be defined by radius, diameter, two points or three points.
1.05	**Ellipse**	An egg shape, sort of.
1.06	**Polygon**	A shape, such as a triangle, that can be made with as many sides as desired.
1.07	**Donut**	A thick circle defined with an inner diameter and an outer diameter.

2.0 Basic Modification Tools

2.01	**Move**	Command line: move Select objects you want to move, press enter, select a base point, select the point you want to move to.
2.02	**Trim**	Command line: trim Select line or object you want to trim to, hit enter, then trim the lines or objects that are to be trimmed.
2.03	**Extend**	Command line: extend Select line or object you want to extend to, hit enter, then pick the lines you want extended
2.04	**Hatch**	Command line: hatch Pick the hatch you want, look at rotation and scale, associated or not, and then pick how you want to select the area to be hatched. You will need to play with these commands to learn.
2.05	**Explode**	Command line: explode This command is used to separate a block or break up a pline. Select the items you want to explode then hit enter.
2.06	**Stretch**	Command line: stretch This command must be started with a crossing window, window the objects you want to stretch, hit enter, provide a base point then stretch to a new point. It is sometimes helpful to use "snap" setting when using this command.
2.07	**Scale**	Command line: scale Select objects, pick a base point, type in how you want to scale the object. You can also do a reference scaling, Say you have a line in an object that is 6" long and you want it to be 24" long, you input the first dimension and then input the new dimension.
2.08	**Break**	Command break: Select the line you want to break, and then pick the two points you want to open.

This information is provided for reference purposes only and is not intended as a warranty or guarantee. GSE assumes no liability in connection with the use of this information. Please check with GSE for current, standard minimum quality assurance procedures and specifications.

GSE and other marks used in this document are trademarks and service marks of GSE Lining Technology, Inc; certain of which are registered in the U.S.A. and other countries.

2.09 **Break at**

Similar to Break, but you only break at one point.

2.10 **Fillet** Command line: Fillet

Create a fillet by picking two lines. Requires input of the two distances.

2.11 **Radius** Command line: Radius

Creates a radius by picking two lines. Requires inputting a radius. You can radius all corners of a polylines by picking 'polylines' from the side menu.

2.12 **Rotate** Command line: rotate

Pick object to rotate, hit enter, pick a base point, then the angle of rotation.angles are clockwise unless you use a negative, ie.. -90o

2.13 **Mirror** Command Line: mirror

Mirror places an mirror image around a reference line. Pick objects to be mirrored, hit enter, thin pick two points along reference line.

2.14 **Array** Command line: array

Pick objects to array, hit enter, enter number of times you wish to array, then pick the distances between arrays.

2.15 **Polar array** Command line: array p

Same as array but this arrays around a center point. Pick objects, then pick center point, then number of arrays, then the amount of angle, 0 to 360.

3.0 Drawing Commands

3.01 **Offset** Command Line: Offset

Offsets line to a defined distance entered by user.

3.02 **Draw Line w/ Typed Command** Command Line: line

Lines drawn from specific point with typed distance and rotation, ie... @24<45 this draws a line 24" long from a given point at a 45° angle

3.03 **Drawing Lines with Coordinates**

Command Line: line

Lines drawn from two points using given coordinates such are found on customer's drawings. You may enter coordinates in feet or inches. East coordinate goes first. Inches = 10",10" (enter) 20",20" always put a comma between east and north

Feet = 10',10' (enter) 20',20'

GSE

HANDLING AND STORAGE PROCEDURES

1. **PROJECT** _____
2. **MATERIAL** _____
3. **HANDLING**

   a. GSE geomembranes are manufactured in flat wound rolls which are 22.5 ft. (6.75 m) wide. No external packaging is required.

   b. Approximate weight of each roll is 3800 lbs.

   c. To assist in handling, two (2) lifting straps are supplied with each roll. For effective handling, a lifting bar (not supplied) 2.5 meters long must be used to lift the rolls for loading and unloading.

   d. Extreme care must be used in crane handling so that damage to the edges of the rolls does not occur during handling.

   e. If other handling equipment such as forklifts are used, which could come into direct contact with the material, care should be exercised to assure the material is not damaged or punctured.

4. **STORAGE**

   a. The material is manufactured to be suitable for outdoor installation; therefore, covered storage is not required. CAUTION: If high winds, hail or other adverse environmental conditions are expected, covered storage may be considered to assure the material is not damaged. Also, where local conditions warrant protection from theft or vandalism, consideration should be given to storage in a secured area.

   b. The ground surface on which the material is stored should be similar in character to the impoundment to be lined. It should be free of all debris, rocks and other protrusions which could damage the liner material.

   c. Rolls can be stored by stacking one on top of the other. The recommended maximum number of rolls which can be stacked on top of one another is five (5) rolls.

   d. Boxes of welding rod and hyperstick tape should not be left outside but stored in a secure, dry, covered area.

Geotextile Product Description Sheet

Style TNS R042

TNS R042 is a superior quality, nonwoven geotextile produced by needlepunching together 100% polypropylene staple fibers in a random network to form a high strength dimensionally stable fabric. The polypropylene fibers are specially formulated to resist ultraviolet light deterioration, and are inert to commonly encountered soil chemicals. The fabric will not rot or mildew, is non-biodegradable, and is resistant to damage from insects and rodents. Polypropylene is stable within a ph range of 2 to 13. TNS R042 conforms to the physical property values listed below:

Fabric Property	Test Method	Units	Minimum Average Roll Value
Weight (typical)	ASTM D 3776	oz/sq.yd.	4.5 (153 g/sm)
Grab Tensile	ASTM D 4632	lbs.	120 (.54 kN)
Grab Elongation	ASTM D 4632	%	50
Trap Tear	ASTM D 4533	lbs.	50 (.22 kN)
Puncture	ASTM D 4833	lbs	70 (.31 kPa)
Mullen Burst	ASTM D 3786	psi	240 (1654 kPa)
Permitivity*	ASTM D 4491	1/sec	1.8
Water Flow*	ASTM D 4491	gpm/sqft	120 (4887 l/min/sm)
AOS	ASTM D 4751	U.S. Sieve	70 (.212 mm)
UV Resistance after 500 hrs.	ASTM D 4355	% Strength Retained	70

Packaging	
Roll Dimensions-Feet (Meters)	12.5/15 x 360
Square Yards (Square Meters) Per Roll	500/600
Estimated Roll Weight-Lbs. (Kg)	152/180

- At time of manufacturing, handling may change these properties.

GSE®

GSE STANDARD PRODUCTS

Product Data Sheet

GSE Nonwoven Geotextiles

GSE Nonwoven Geotextiles is a family of polypropylene, staple fiber, nonwoven needle punched geotextiles. Manufactured using an advanced manufacturing and quality system, these products are the most uniform and consistent nonwoven needle punched geotextile currently available in the industry. GSE combines a fiber selection and approval system with in-line quality control and a state-of-the-art laboratory to ensure that every roll shipped meets customer specifications. The company has performed extensive performance testing to evaluate suitability of its nonwovens for various applications. GSE Nonwoven Geotextiles are available in a range of weights to meet your specific project needs. *These product specifications meet or exceed GRI GT12, GRI GT13 and AASHTO M288 .*

MIRAFI® TECHNICAL DATA SHEET

Mirafi® 140N

Mirafi® 140N is a nonwoven geotextile composed of polypropylene fibers, which are formed into a a stable network such that the fibers retain their relative position. 140N is inert to biological degradation and resists naturally encountered chemicals, alkalis, and acids.

Mechanical Properties	Test Method	Unit	Minimum Average Roll Value	
			MD	CD
Grab Tensile Strength	ASTM D 4632-91	kN (lbs)	0.53 (120)	0.53 (120)

PROJECT SUMMARY

Berkshire Environmental Consultants, Inc. (BEC) conducted an ambient air sampling program for polychlorinated biphenyls (PCB) and particulate matter during soil remediation and building demolition activities at Newell Street Area I in Pittsfield, Massachusetts. The on-site activities performed at Newell Street Area I included the demolition of existing buildings located on Parcels J9-23-16 and J9-23-23 and the performance of soil remediation activities at 11 parcels within Area I. The remediation work was divided in four non-sequential phases (Phases I - IV). Ambient air monitoring was conducted during each of the four phases. Sampling at Phase II was conducted from October 20 through December 8, 2003. Phase IV followed, from May 12 through June 16, 2004. Phase I was conducted from August 15 through September 8, 2005. Sampling at Phase III from September 28 through November 17, 2005, completed the project. The ambient air sampling program was conducted in accordance with the Scope of Work for Ambient Air PCB and Particulate Monitoring at Newell Street Area I, General Electric Company, prepared by Berkshire Environmental Consultants, Inc., August 2003.

Prior to site work at the Newell Street Area I locations, high-volume sampling for PCBs was conducted at four on-site locations and one background location from September 9-10, 2003 and from September 11-12, 2003. During each phase of the site work, high-volume sampling for PCBs was conducted at four on-site locations and one background location. Sampling was conducted during the following periods: November 4-5, 2003, June 3-4, 2004, August 18-19, 2005, October 12-13, 2005 and November 10-11, 2005. Each PCB ambient air sample was collected over a 24-hour period. Sampling and analytical procedures generally followed those described in EPA Compendium Method TO-4A, Determination of Pesticides and Polychlorinated Biphenyls in Ambient Air Using High Volume Polyurethane Foam (PUF) Sampling Followed by Gas Chromatographic/Multi-Detector Detection (GC/MD), January 1999. This method employs a modified high-volume sampler consisting of a glass fiber filter with a polyurethane foam backup adsorbent cartridge. Samples were sent to SGS Environmental Services, Inc., Charleston, West Virginia for analysis. The PCB sampling periods, results and concentration averages are presented in Appendix I. The highest PCB ambient air concentration measured for any of the 24-hour sampling periods was 0.0219 $\mu g/m^3$ for the period June 3-4, 2004, at monitoring location (L), located at the south side of J9-23-24. This concentration was measured during Phase IV of the project. The PCB notification level of 0.05 $\mu g/m^3$ was not reached during any monitoring event for the duration of the project.

Particulate monitoring was conducted daily for approximately ten hours per day on those days when site work was occurring during the period from October 20 - December 8, 2003 (Phase II), May 12 - June 16, 2004 (Phase IV), August 15 - September 8, 2005 (Phase I), and September 28 - November 17, 2005 (Phase III). Particulate monitoring was conducted using three or four (depending on the phase) real-time particulate monitors. The monitors used were a combination of MIE dataRAM Model DR-2000/4000s and MIE dataRAM Model pDR-1000s. Particulate monitoring results are contained in Appendix II. The highest average daily particulate concentration recorded during site activities was 0.109 mg/m^3 on October 5, 2005 at monitoring location (E), located at the southeast corner of J9-23-17. At no time did the average

daily particulate concentration exceed the notification level for particulate matter of 0.120 mg/m^3 at any of the monitored sites.

1.0 INTRODUCTION

Berkshire Environmental Consultants, Inc. (BEC) was retained by General Electric Company to conduct ambient air sampling for polychlorinated biphenyls (PCB) and particulate matter during soil remediation and building demolition activities at Newell Street Area I. The on-site activities performed at Newell Street Area I included the demolition of existing buildings located on Parcels J9-23-16 and J9-23-23 and the performance of soil remediation activities at 11 parcels within Newell Street Area I. The demolition and remediation work was divided in four non-sequential phases (Phases I - IV). Ambient air monitoring was conducted during each of the four phases. Sampling at Phase II was conducted from October 20 through December 8, 2003. Phase IV followed, from May 12 through June 16, 2004. Phase I was conducted from August 15 through September 8, 2005. Finally, Phase III was completed from September 28 through November 17, 2005.

The purpose of the sampling program was to obtain valid and representative data on ambient levels of PCB and particulate matter during soil remediation and building demolition activities to ensure that the activities were not causing an increase in ambient concentrations of total PCB or particulates. The ambient air sampling program was conducted in accordance with the Scope of Work for Ambient Air PCB and Particulate Monitoring at Newell Street Area I, General Electric Company, prepared by Berkshire Environmental Consultants, Inc., August 2003. The Scope of Work is presented in Appendix III of this report.

All field work, sample collection, sample shipment, and record keeping were completed by BEC, Pittsfield, Massachusetts. The collected PCB samples were analyzed by SGS Environmental Services, Inc., Charleston, West Virginia. This final report for the ambient air sampling program presents a summary of all sampling activities, analytical results, and quality assurance/quality control measures.

2.0 PCB SAMPLING

2.1 Sampling Program

A summary of the PCB ambient air sampling program for Newell Street Area I follows:

High-Volume Monitoring Locations	4 (Phases II, III, IV) 3 (Phase I)
Co-located Sites	1
Background Sites	1
Sampling Time	24 hours per sampling event
Sampling Period	Sept. 9-10, 2003 (prior to activity) Sept. 11-12, 2003 (prior to activity) Nov. 4-5, 2003 (Phase II) June 3-4, 2004 (Phase IV) August 18-19, 2005 (Phase I) October 12-13, 2005 (Phase III) November 10-11, 2005 (Phase III)
Number of Sampling Events	7
Number of Samples	41
Number of Blanks	1 per sampling event
Sampling Method	EPA Compendium Method TO-4A
Analytical Method	GC/ECD or GC/MS as described in EPA Method TO-4A
Written Notification Level	0.05 $\mu g/m^3$
Action Level	0.10 $\mu g/m^3$

2.2 Sampler Locations

The site demolition and excavation work was accomplished through a phased approach; however the phases did not occur sequentially. Table 1 details the PCB sampling locations and event dates as they correspond to the four phases and the locations where site activities occurred. PCB background monitoring was conducted prior to on-site work at four locations on the perimeter of Newell Street Area I.

In addition to the on-site sampling locations detailed below, an additional sampler was operated to provide background data. Prior to July 18, 2005, the background location was located inside GE Gate 31 on the corner of Woodlawn Avenue and Tyler Street. On July 18, 2005, the background location was relocated to East of Building 9B, between Building 9B and New York Avenue. The locations of the monitoring stations are presented in the site map presented in Figure 1.

During all events, an additional co-located monitor was placed at one of the monitoring stations. The co-located monitor ran concurrent with the primary monitor and provided a

precision check on collected data. The co-located monitoring location is identified on Table 1 with an asterisk (*).

Table 1

2.3 Sampling Procedures

The Newell Street Area I PCB sampling program consisted of a total of seven 24-hour sampling events as detailed in Table 1 above. The samples were collected according to the U.S. EPA Compendium Method TO-4A, Determination of Pesticides and Polychlorinated Biphenyls in Ambient Air Using High Volume Polyurethane Foam (PUF) Sampling Followed by Gas Chromatographic/Multi-Detector Detection (GC/MD), (Appendix IV). This method employs a General Metal Works GPS-1 modified high-volume sampler consisting of a glass fiber filter with a polyurethane foam (PUF) backup adsorbent cartridge. The GPS-1 Operator's Manual is included in Appendix VI. Ambient air was drawn through the cartridge at a rate of approximately 0.225 m^3/min for 24 hours. The total air volume collected for each sample was approximately 324 cubic meters.

The samplers were monitored at six-hour intervals over each 24-hour sampling period. During these six-hour checks, barometric pressure, temperature, and magnehelic pressure readings were taken and the air flow adjusted to the target flow rate, as necessary. At the end of the sampling period, the sampling modules containing the fiber filters and PUF adsorbents were removed from the samplers. Each glass fiber filter was folded and

placed on the PUF adsorbent for that sample. Each sample consisting of a fiber filter and PUF adsorbent (inside a glass cartridge) was wrapped in hexane rinsed aluminum foil. Each fiber filter and PUF adsorbent set was labeled as one sample. The samples were wrapped, packaged in ice and sent under chain-of-custody to the laboratory for analysis.

2.4 Analytical Procedures

The PCB in the samples was recovered by extraction methods in accordance with procedures contained in Method TO-4A. The extracts were reduced in volume using Kuderna-Danish (K-D) concentration techniques and subjected to column chromatograph cleanup. The extracts were analyzed for PCB using gas chromatography with electron capture detection (GC-ECD).

SGS Environmental Services, Inc. analyzed the samples for the following individual PCB Aroclors:

PCB Aroclor 1016	PCB Aroclor 1248
PCB Aroclor 1221	PCB Aroclor 1254
PCB Aroclor 1232	PCB Aroclor 1260
PCB Aroclor 1242	

The quantities of PCB in each sample were reported by SGS Environmental Services, Inc. in µg/PUF above the analytical detection limit of 0.1 µg/PUF. These quantities were divided by the standard air volume sampled to provide ambient concentrations in $\mu g/m^3$.

Average Sampling Rate	0.225 m^3/min
Average Sample Volume	324 m^3/PUF
Analytical Detection Limit	0.1 µg/PUF
Project Detection Limit	0.0003 $\mu g/m^3$

2.5 Ambient PCB Concentrations

Ambient 24-hour concentrations of total PCB in $\mu g/m^3$ from samples taken during the sampling events at Newell Street Area I are contained in Appendix I. The laboratory analytical results are provided in Appendix V and flow calculations are provided in Appendix VIII. The highest PCB concentration analyzed for any of the 24-hour sampling periods was 0.0219 $\mu g/m^3$ for the period June 3-4, 2004, at the monitoring location (L), located at the south side of J9-23-24. This concentration was measured during Phase IV of the project. The PCB notification level of 0.05 $\mu g/m^3$ was not reached during any monitoring event for the duration of the project.

3.0 PARTICULATE MONITORING

3.1 Monitor Locations

BEC conducted particulate monitoring at three (Phase I) or four (Phases II-IV) on-site monitoring locations at or around the Newell Street Area I sites. Additionally, one background location was monitored during site activity. The locations of the particulate monitors are identified on Figure 1 and are described in Table 2. The inlets of the monitors were placed approximately 3-6 feet above ground level, depending on the type of monitor.

3.2 Monitoring Procedures

Monitoring for particulate matter was completed each day while soil excavation or demolition activity was being performed and when there was no threat of significant precipitation. Monitoring was conducted from approximately 7:00 a.m. to 5:00 p.m. for the duration of the project.

3.3 Analytical Procedures

During Phase II, Phase III and Phase IV, three MIE dataRAM Model pDR-1000 real-time particulate monitors and two MIE dataRAM Model DR-2000/4000 real-time particulate monitors were used during site activities. During Phase I, two MIE dataRAM Model pDR-1000 real-time particulate monitors and two MIE dataRAM Model DR-2000/4000 real-time particulate monitors were used. Both types of monitors use a light scattering photometer to determine particulate concentrations and have a measurement range of 0.001 to 400 mg/m^3. The pDR-1000 uses a passive sampling technique and the DR-2000/4000 pumps sampled air through a sensing chamber and also has a heated inlet probe to evaporate water that is absorbed by particles under conditions of high humidity.

Data were logged by the instruments' dataloggers, averaged and recorded for each 10-hour day. A written notification was provided to the GE Project Manager when the average daily particulate concentration exceeded 0.120 mg/m^3. This level is 80 percent of the 24-hour National Ambient Air Quality Standard (NAAQS) for particulate matter of 0.150 mg/m^3 (as PM_{10}).

3.4 Analytical Results

The tables contained in Appendix II summarize the monitoring location, average daily particulate concentration, average monitoring period, the predominant wind direction during the sampling period and the overall site average concentration for each Phase. Table 2 summarizes the average particulate concentrations at each monitoring site during the work phases. The highest average daily particulate concentration recorded during site work at Newell Street Area I was 0.109 mg/m^3 on October 5, 2005 at monitoring location (E), located at the southeast corner of J9-23-17. At no time did the average daily

particulate concentration exceed the notification level for particulate matter of 0.120 mg/m^3.

Table 2

4.0 PCB QUALITY ASSURANCE ASSESSMENT

4.1 Project Quality Assurance/Quality Control (QA/QC)

The objective of the quality assurance program was to ensure that the data collected on ambient levels of PCB are adequate to meet the purpose of the monitoring program and the intended uses of the data. Standard QA/QC procedures outlined in the Scope of Work were followed during sampling.

The following objectives were used as guidelines to assuring quality in the design and implementation of the monitoring program.

- The sampling and analytical procedures were conducted in accordance with EPA Compendium Method TO-4A and EPA recommended guidelines, as applicable.

- All phases of the sampling program were adequately documented. Documentation was maintained to evidence the validity of calibrations, sample collection, flow calculations, sample custody, analytical performance, data reduction and audit procedures. Field notes were maintained to identify and reconstruct sampling events, calibration procedures, maintenance and repair activity, and other related information.

- The analytical laboratory performed standard QA/QC procedures.

- Sampling and analytical data quality were measured and reported, where applicable, in terms of completeness, precision, accuracy (bias), representativeness, and comparability.

4.1.1 Validity

A valid PCB sample is defined as an air sample that was collected over 24 hours, ± 30 minutes at a rate of approximately 0.225 m^3/min. Additionally, a valid sample must represent a minimum total collected volume of air of 288 m^3.

4.1.2 Representativeness

All PCB samples were collected at the locations and during the time period identified as being representative for the purpose of this study.

4.1.3 Comparability

All measured PCB concentrations were converted to $\mu g/m^3$ for comparison with the standard.

4.1.4 Completeness

Sample completeness criteria are based on obtaining valid samples at each sample site for the duration of the project. Based on the scope of sampling, there were a possible total of 41 PCB samples. All 41 samples met the QA/QC criteria of 24 hours ± 30 minutes. Completeness for the project was measured at 100%.

4.1.5 Precision

Field sampling precision was measured by samples taken at the co-located sampler. The co-located sampler location is identified with an asterisk (*) on Table 1 for each phase of the project.

During each event, the co-located sampler was located 2-4 meters apart from the primary sampler. The calibration, sampling, and analytical procedures for the co-located sampler were the same as for all samplers. The co-located sampler operated whenever the primary sampler operated. The average percent difference between the primary sampler concentration and the co-locator sampler concentration for all Newell Street Area I events was 36.3 %. The average percent difference calculations are included in Appendix XI.

4.1.6 Sampling Accuracy

One-point calibration checks were conducted before and after each sampling event and were used as a check of flow measurements. The one-point calibration checks on all samplers were within ± 10% deviation of calculated flow values.

4.2 Calibrations and Audit Activity

Calibrations for all sampling equipment were conducted in accordance with the schedules and procedures specified in EPA Method TO-4A as applicable. All data and calculations for the calibrations have been maintained in a calibration log file. Summary calibration sheets are contained in Appendix VII.

The following internal quality control checks were performed on each sampler:

- A one-point audit of the calibrated flow rate versus sampler magnehelic pressure indication was performed on each high-volume sampler before and after each sampling event (Appendix VIII).

- A zero check on the samplers' pressure gauges or flow meters was verified before and after each sampling event (Appendix VIII).

- A leak check was performed on each sampler before and after each sampling event (Appendix VIII).

- A record and/or adjustment of the sampler pressure or flow indicator was undertaken to maintain a constant rate flow at six-hour intervals during the sampling event (Appendix VIII).

- One co-located sampler was installed during each sampling event, at locations described in Section 4.1.5, as a sampling precision check on the field samplers. The ambient PCB data from the co-located samples were used to verify the precision of the primary samplers.

4.3 Sample Quality Assurance

The following quality control measures were performed to insure the integrity of the high volume air samplers:

- One PUF blank was transported with the samples to and from the field without having air drawn through it. The PUF was shipped along with the samples to the laboratory for analysis. All samples were labeled and transported under chain-of-custody to the contract laboratory (Appendix IX). The samples were recorded and handled according to strict chain-of-custody procedures.

5.0 PARTICULATE QUALITY ASSURANCE ASSESSMENT

5.1 Project Quality Assurance/Quality Control (QA/QC)

The objective of the quality assurance program was to ensure that the data collected on ambient levels of particulate are adequate to meet the purpose of the monitoring program and the intended uses of the data. Standard QA/QC procedures outlined in the Scope of Work were followed during sampling.

The following objectives were used as guidelines to assuring quality in the design and implementation of the monitoring program.

- All MIE dataRAM Model pDR-1000 particulate monitors are zeroed weekly, before starting a new project, and whenever maintenance is performed on the monitor.

- All MIE dataRAM Model DR-2000/4000 particulate monitors are calibrated daily before use.

- Both the MIE pDR-1000 particulate monitors and the MIE DR-2000/4000 particulate monitors have an inherent inaccuracy of 5%.

- Because the particulate monitors have an inherent sensitivity to humid conditions, the monitors are carefully monitored during humid or rainy weather. In accordance with the Scope of Work for this project, BEC used its professional engineering judgment to determine the reliability of data collected during very high humidity conditions. Any such judgments are noted appropriately on the data summary table.

- All monitoring problems were immediately brought to the attention of the GE Project Manager.

* Measured with DR-2000 or DR-4000. All others measured with pDR-1000.

Background monitoring station is located east of Building 9B, between Building 9B and New York Avenue.

Predominant wind direction determined using hourly wind direction data from the Pittsfield Municipal Airport Weather Station.

[1] Monitoring was performed only on days when site activities occurred and there were no precipitation events or threat of significant precipitation.

[2] The particulate monitors obtain real-time data. The sampling data were obtained by BEC on the sampling date.

[3] Sampling period was shortened due to precipitation/threat of precipitation.

[4] Sampling period was shortened due to instrument malfunction (dead battery).

* Measured with DR-2000 or DR-4000. All others measured with pDR-1000.

Background monitoring location located inside GE Gate 31 on the corner of Woodlawn Avenue and Tyler Street.

Predominant wind direction determined using wind data from the Climatronics Electronic Weather Station located at the GE Facility.

[1] Monitoring was performed only on days when site activities occurred and there were no precipitation events or threat of significant precipitation.

[2] The particulate monitors obtain real-time data. The sampling data were obtained by BEC on the sampling date.

[3] Sampling period was shortened due to precipitation/threat of precipitation.

[4] Sampling period was shortened due to instrument malfunction (dead battery).

[5] Sampling data is not available due to equipment failure.

[6] Sampling period was shortened due to precipitation (snow) and instrument's inherent sensitivity to moisture.

NA = Not Available

* Measured with DR-2000 or DR-4000. All others measured with pDR-1000.

Background monitoring station is located east of Building 9B, between Building 9B and New York Avenue.

Predominant wind direction determined using hourly wind direction data from the Pittsfield Municipal Airport Weather Station.

[1] Monitoring was performed only on days when site activities occurred and there were no precipitation events or threat of significant precipitation.

[2] The particulate monitors obtain real-time data. The sampling data were obtained by BEC on the sampling date.

[3] Sampling period was shortened due to dense morning fog.

[4] Sampling period was shortened due to precipitation/threat of precipitation.

[5] Reading reflects average concentration manually recorded at the end of the day. Unable to download data due to equipment failure.

[6] Sampling data are not available due to equipment failure.

[7] Reading reflects average concentration manually recorded from the monitor at the end of the day. The instrument was stolen from the site on 11/09/05 before the datalog file was downloaded.

[8] Estimated time of operation. The instrument was stolen from the site on 11/09/05 before the datalog file was downloaded.

[9] Data not available. The instrument was stolen from the site on 11/09/05.

* Measured with DR-2000 or DR-4000. All others measured with pDR-1000.

Background monitoring location located inside GE Gate 31 on the corner of Woodlawn Avenue and Tyler Street.

Predominant wind direction determined using wind data from the Climatronics Electronic Weather Station located at the GE Facility.

[1] Monitoring was performed only on days when site activities occurred and there were no precipitation events or threat of significant precipitation.

[2] The particulate monitors obtain real-time data. The sampling data were obtained by BEC on the sampling date.

[3] Sampling period was shortened due to precipitation/threat of precipitation.

[4] The DR-2000 monitor was moved to the North location due to site constraints at the Northwest location. The Northwest location was monitored using a pDR-1000.

APPENDIX III

SCOPE OF WORK

SCOPE OF WORK
for
Ambient Air PCB & Particulate Monitoring
at Newell Street Area I

General Electric Company
Pittsfield, Massachusetts

Prepared by

Berkshire Environmental Consultants, Inc.
152 North Street, Suite 250
Pittsfield, MA 01201

August 2003

TABLE OF CONTENTS

1.0 Introduction

2.0 Sampling Objective

3.0 Site Activity

4.0 PCB Monitoring Program
- 4.1 High Volume PCB Sampling
- 4.2 Analytical Procedures

5.0 Particulate Monitoring

6.0 Quality Assurance and Quality Control Procedures

7.0 PCB Sample Documentation, Handling and Shipment

8.0 Meteorological Monitoring

9.0 Documentation and Reporting

10.0 Action Levels
- 10.1 PCBs
- 10.2 Particulate Matter

1.0 INTRODUCTION

This Scope of Work (SOW) describes the ambient air monitoring for polychlorinated biphenyls (PCBs) and particulate matter which will be conducted during remediation actions at the properties included in the Newell Street Area I Final Removal Design/Removal Action Work Plan (Final Work Plan). This area includes properties from 187-269 Newell Street on the north side of Newell Street along the Housatonic River, in Pittsfield, Massachusetts.

2.0 SAMPLING OBJECTIVE

The objectives of this sampling program are two-fold:

1. To obtain valid and representative data on ambient levels of PCBs around the remedial site before and during remedial activities to insure that the activities are not causing an unacceptable increase in ambient air concentrations of PCB.

2. To obtain valid and representative data on ambient levels of particulate around the remedial site before and during construction activities to insure that the remedial activities are not causing an unacceptable increase in ambient air concentrations of particulate.

3.0 SITE ACTIVITY

As described in the Final Work Plan, the on-site activities to be performed at Newell Street Area I include the demolition of existing buildings located on Parcels J9-23-16 and J9-23-23 and the performance of soil remediation activities (including soil removal/replacement and/or the installation of engineered barriers) at 11 parcels within Newell Street Area I. Performance of the remediation work presented in the Final Work Plan is subject to review and approval by the United States Environmental Protection Agency (EPA) and the Massachusetts Department of Environmental Protection (MDEP) (together, the Agencies), as well as execution of owner access agreements. As a result, the remediation work proposed in the Final Work Plan has been divided in four phases (Phases I – IV), as illustrated on the Technical Drawings provided in Attachment A of the Final Work Plan. At this time, it is anticipated that the remediation work will be performed (in no particular order) utilizing this phased approach (e.g., Phase IV could be performed prior to Phase II). In addition, multiple phases could be performed concurrently.

This ambient air monitoring program includes particulate monitoring during the demolition activity and both PCB and particulate monitoring during the phased remediation activities. The building demolition will occur prior to any remediation activity. As the remediation will occur in phases, the air monitoring program will progress in step with the remediation activities. The monitor locations will be moved as remediation proceeds along Newell Street.

4.0 PCB MONITORING PROGRAM

4.1 *High Volume PCB Sampling*

The high volume PCB sampling program will include the following elements:

High-Volume Monitoring Locations	4 (3 for Phase I)
Background Sites	1
Co-Located Sites (Field Duplicates)	1
Sampling Time	24 hours per sampling event
Sampling Period	Duration of construction activity
Frequency of Sampling	Twice prior to the onset of construction activity and once every four weeks during construction activity*
No. of Blanks Per Sampling Event	1
Sampling Method	EPA Compendium Method TO-4A
Analytical Method	GC/ECD or GC/MS as described in EPA Method TO-4A

* Sampling frequency may be increased if either PCB or particulate monitoring levels exceed threshold values.

Ambient air monitoring for PCBs will be conducted during construction activities that are part of the remediation (referred to in this section as "construction"). Sampling will be conducted for two 24-hour periods prior to the initiation of construction and will proceed once every 4 weeks during construction. The ambient air monitoring frequency for PCBs may be increased to bi-weekly in the event that ambient particulate concentrations at any one location consistently exceed the proposed particulate notification level (i.e. 120 $\mu g/m^3$). "Consistently exceeding" will be defined as concentrations greater than 120 $\mu g/m^3$ on three consecutive 10-hour days or 5 days in any two-week period. Once PCB concentrations are below PCB action levels (see Section 10 of this Scope of Work) for two consecutive bi-weekly events, then PCB sampling frequency will revert to once every 4 weeks.

PCB background monitoring will be conducted prior to any on-site construction activity at four locations on the perimeter of Newell Street Area I. During construction activity, PCB monitoring will be conducted at four (three for Phase I) locations surrounding each phase of activity. A background monitor will be operated inside GE Gate 31 on the corner of Woodlawn Avenue and Tyler Street. Preliminary monitoring sites have been identified for each phase of construction (as shown on Figure 1). The specific sampling locations for monitors will be selected based on the location and nature of the construction activity, predominant wind direction, the location of potential

receptors, physical obstructions (i.e. trees, buildings), etc., the availability of power, site security, and site accessibility.

The detection limit (DL) for PCB analysis of the high volume samples will be 0.0003 $\mu g/m^3$, in consideration of the following:

Avg. Sampling Rate	0.225 m^3/min.
Avg. Sample Volume	324 m^3/PUF
Analytical DL	0.1 μg/PUF
Project DL	0.0003 $\mu g/m^3$

The sampling method to be used for PCBs in the high volume samples is US EPA Compendium Method TO-4A, Determination of Pesticides and Polychlorinated Biphenyls in Ambient Air Using High Volume Polyurethane Foam (PUF) Sampling Followed by Gas Chromatographic/Multi-Detector Detection (GC/MD. This method employs a modified high volume sampler consisting of a glass fiber filter with a polyurethane foam (PUF) backup absorbent cartridge to sample ambient air at a rate of 0.225 m^3/min). A General Metal Works Model GPS-1 Sampler or equivalent will be used. The filter and cartridge will be placed in clean, sealed containers and returned to the laboratory for analysis.

Procedures for sample media preparation and calibration of the sampling system are specified in Method TO-4A. TO-4A further specifies procedures for calculation and data reporting, and the assessment of data for accuracy and precision.

The samplers will be monitored at six-hour intervals over the 24-hour sampling period. During these six-hour checks, instrument magnehelic pressure readings (an indicator of air flow) will be taken. As necessary, the air flow may be adjusted to meet the target flow rate. At the end of the sampling period, the PUF cartridges will be removed from the sampling train. Each PUF cartridge (inside a glass holder) will be wrapped in hexane rinsed aluminum foil. The PUF samples will be labeled, wrapped, packaged in blue ice and sent under chain-of-custody to the contract laboratory for analysis.

The PCB sampling probe height for all high volume monitors will be approximately 2.0 meters above the ground. This height is adequate to represent the breathing zone and to be above the influence of ground activity around the monitor. The location of the samplers will be in conformance, to the extent practical, with the siting requirements for ambient monitors in Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD), U.S. EPA. May, 1987.

4.2 *Analytical Procedures*

In the high volume samples, the PCBs will be recovered by Soxhlet extraction with 10% diethyl ether in hexane. The extracts will be reduced in volume using Kuderna-Danish (K-D) concentration techniques and subjected to column chromatographic cleanup. The extracts will be analyzed for PCBs using gas chromatography with either electron capture detection (GC/ECD) or mass spectrometry detection (GC/MS) as described TO-4A.

The samples will be analyzed for the following PCB Aroclors:

PCB-1016	PCB-1221
PCB-1232	PCB-1242
PCB-1248	PCB-1254
PCB-1260	

5.0 PARTICULATE MONITORING

Ambient air monitoring for particulate matter will be conducted during all construction activities. Specifically, real-time ambient particulate monitoring will be performed during all active on-site activities, including both building demolition and soil remediation. Such monitoring will be conducted at four locations (which will vary as the phased site activities progress) and at one appropriate background location inside GE Gate 31 on the corner of Woodlawn Avenue and Tyler Street. Preliminary monitoring sites have been identified (Figure 1). The specific locations for stations will be selected based on the location and nature of the construction activities, predominant wind direction, location of potential receptors, availability of power, site accessibility, and site security.

At the background and one on-site location, real-time particulate monitoring will be performed using a MIE dataRAM Model DR-2000 real time particulate monitor. Each monitor Model DR-2000 is equipped with a temperature conditioning heater and in-line impactor head to monitor and record particulate concentrations with a mean diameter less than 10 micrometers (PM_{10}). At the remaining three on-site locations, real-time particulate monitoring will be performed using a MIE dataRAM Model pDR-1000. Particulate monitoring will typically be conducted at all sites for approximately 10 hours daily, from 7 a.m. to 5 p.m., during construction activities. Additional site activities may warrant a longer monitoring period. Particulate data will be recorded and averaged by the instruments' dataloggers every 15 minutes.

Calibrations and maintenance will be conducted at the frequency and in accordance with the procedures recommended by the manufacturer. All calibrations will be recorded.

6.0 QUALITY ASSURANCE AND QUALITY CONTROL PROCEDURES

Quality assurance and quality control (QA/QC) procedures for the PCB air sampling program follow those described in GE's *Field Sampling Plan/Quality Assurance Project Plan* (FSP/QAPP) and Method TO-4A. Quality assurance and quality control for the particulate sampling will be based on manufacturer's recommendations.

7.0 PCB SAMPLE DOCUMENTATION, HANDLING AND SHIPMENT

Each filter holder and PUF cartridge holder will be pre-marked with a permanent identification number. As each sample is collected, it will be recorded on a field data form along with the date, time and location of collection.

All samples will be securely wrapped for shipment. PCB samples will be preserved at 4°C and shipped on blue ice. Samples will be shipped under chain-of-custody by commercial overnight carrier or courier to the analytical laboratory. Complete details on the PCB sample shipment procedures are contained in the FSP/QAPP.

8.0 METEOROLOGICAL MONITORING

Meteorological data from the Climatronics Electronic Weather Station (EWS) operated at the GE facility in Pittsfield, Massachusetts will be included with the sampling results. This EWS has been operating continuously since 1991 at the GE facility in East Street Area 2 providing data to support other GE activities under the MCP. The EWS measures and records wind speed, wind direction, precipitation, temperature, relative humidity and integrated solar radiation. The siting of the meteorological station was established with the approval of DEP. The station was installed and continues to operate in accordance with EPA On-site Meteorological Program Guidance for Regulatory Modeling Applications and a Site Specific Meteorological Monitoring Quality Assurance Project Plan. The operation of the EWS has been successfully audited by Massachusetts Department of Environmental Protection (DEP).

Barometric pressure will be measured and recorded on each sampling day. In addition, a portable relativity humidity indicator will be used for field verification of humidity conditions.

9.0 DOCUMENTATION AND REPORTING

Particulate data will be summarized and reported to the GE Project Manager and the Blasland, Bouck & Lee (BBL) Project Manager. If there is an exceedance of a reporting threshold, GE will be notified as soon as possible. All field and laboratory data recorded during ambient monitoring will be documented according to the procedures in the FSP/QAPP. A written report summarizing the results will be provided to GE and BBL within one month after the conclusion of sampling and will include the following:

Date and Time of Sampling
Sampling Locations
Calibration and Maintenance Activities
Pollutants Monitored
Number of Samples Collected
Analytical Results
Quality Assurance Assessment
Meteorological Data Summary
Discussion of Problems or Disruptions
Signature of Individual Responsible For Monitoring Program

10.0 ACTION LEVELS

10.1 *PCBs*

The notification and action levels for PCB concentrations in ambient air are 0.05 $\mu g/m^3$ (24-hour average) and 0.1 $\mu g/m^3$ (24-hour average), respectively. These are the same levels established by EPA for the other remediation activities in Pittsfield. Any exceedance of the notification level will be immediately reported to the GE Project Manager.

10.2 *Particulate Matter*

For each day of monitoring, the particulate data from the on-site monitors will initially be compared with the data from the background monitor. If the average 10-hour PM_{10} concentration at any on-site monitor exceeds the average concentration at the background monitor, the on-site concentrations will then be compared with the notification level of 120 $\mu g/m^3$ (micrograms per cubic meter) -- which represents 80 percent of the current 24-hour National Ambient Air Quality Standard (NAAQS) for PM_{10} (150 $\mu g/m^3$). This level has been selected to allow notice to GE before concentrations reach the level of the 24-hour NAAQS. Any exceedances of the notification level or the NAAQS will be immediately reported to the GE Project Manager.

Acknowledgements

This Method was prepared for publication in the *Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Second Edition* (EPA/625/R-96/010b), which was prepared under Contract No. 68-C3-0315, WA No. 3-10, by Midwest Research Institute (MRI), as a subcontractor to Eastern Research Group, Inc. (ERG), and under the sponsorship of the U.S. Environmental Protection Agency (EPA). Justice A. Manning, John O. Burckle, and Scott R. Hedges, Center for Environmental Research Information (CERI), and Frank F. McElroy, National Exposure Research Laboratory (NERL), all in the EPA Office of Research and Development (ORD), were responsible for overseeing the preparation of this method. Additional support was provided by other members of the Compendia Workgroup, which include:

- John O. Burckle, U.S. EPA, ORD, Cincinnati, OH
- James L. Cheney, Corps of Engineers, Omaha, NB
- Michael Davis, U.S. EPA, Region 7, KC, KS
- Joseph B. Elkins Jr., U.S. EPA, OAQPS, RTP, NC
- Robert G. Lewis, U.S. EPA, NERL, RTP, NC
- Justice A. Manning, U.S. EPA, ORD, Cincinnati, OH

Method TO-4 was originally published in April of 1984 as one of a series of peer reviewed methods in *"Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air,"* EPA 600/4-89-018. In an effort to keep these methods consistent with current technology, Method TO-4 has been revised and updated as Method TO-4A in this Compendium to incorporate new or improved sampling and analytical technologies. In addition, this method incorporates ASTM Method D 4861-94, *Standard Practice for Sampling and Analysis of Pesticides and Polychlorinated Biphenyls in Air*.

This Method is the result of the efforts of many individuals. Gratitude goes to each person involved in the preparation and review of this methodology.

METHOD TO-4A

Determination of Pesticides and Polychlorinated Biphenyls in Ambient Air Using High Volume Polyurethane Foam (PUF) Sampling Followed by Gas Chromatographic/Multi-Detector Detection (GC/MD)

1. Scope

1.1 This document describes a method for sampling and analysis of a variety of common pesticides and for polychlorinated biphenyls (PCBs) in ambient air. The procedure is based on the adsorption of chemicals from ambient air on polyurethane foam (PUF) using a high volume sampler.

1.2 The high volume PUF sampling procedure is applicable to multicomponent atmospheres containing common pesticide concentrations from 0.001 to 50 $\mu g/m^3$ over 4- to 24-hour sampling periods. The limits of detection will depend on the nature of the analyte and the length of the sampling period.

1.3 Specific compounds for which the method has been employed are listed in Table 1. The analytical methodology described in Compendium Method TO-4A is currently employed by laboratories throughout the U.S. The sampling methodology has been formulated to meet the needs of common pesticide and PCB sampling in ambient air.

1.4 Compendium Method TO-4 was originally published in 1989 (1). Further updates of the sampling protocol were published as part of Compendium Method TO-13 (2). The method was further modified for indoor air application in 1990 (3). In an effort to keep the method consistent with current technology, Compendium Method TO-4 has incorporated the sampling and analytical procedures in ASTM Method D4861-94 (4) and is published here as Compendium Method TO-4A.

2. Summary of Method

2.1 A high-volume (~8 cfm) sampler is used to collect common pesticides and PCBs on a sorbent cartridge containing PUF. Airborne particles may also be collected, but the sampling efficiency is not known (5). The sampler is operated for 24-hours, after which the sorbent is returned to the laboratory for analysis.

2.2 Pesticides and PCBs are extracted from the sorbent cartridge with 10 percent diethyl ether in hexane and determined by gas chromatography coupled with an electron capture detector (ECD), nitrogen-phosphorus detector (NPD), flame photometric detector (FPD), Hall electrolytic conductivity detector (HECD), or a mass spectrometer (MS). For common pesticides, high performance liquid chromatography (HPLC) coupled with an ultraviolet (UV) detector or electrochemical detector may be preferable.

2.3 Interferences resulting from analytes having similar retention times during GC analysis are resolved by improving the resolution or separation, such as by changing the chromatographic column or operating parameters, or by fractionating the sample by column chromatography.

3. Significance

3.1 Pesticide usage and environmental distribution are common to rural and urban areas of the United States. The application of pesticides can cause adverse health effects to humans by contaminating soil, water, air, plants, and animal life. PCBs are less widely used, due to extensive restrictions placed on their manufacturer. However, human exposure to PCBs continues to be a problem because of their presence in various electrical products.

3.2 Many pesticides and PCBs exhibit bioaccumulative, chronic health effects; therefore, monitoring the presence of these compounds in ambient air is of great importance.

3.3 The relatively low levels of such compounds in the environment requires the use of high volume sampling techniques to acquire sufficient sample for analysis. However, the volatility of these compounds prevents efficient collection on filter media. Consequently, Compendium Method TO-4A utilizes both a filter and a PUF backup cartridge which provides for efficient collection of most common pesticides, PCBs, and many other organics within the same volatility range.

3.4 Moreover, modifications to this method has been successfully applied to measurement of common pesticides and PCBs in outdoor air (6), indoor air (3) and for personal respiratory exposure monitoring (3).

5. Definitions

[Note: Definitions used in this document and in any user-prepared Standard operating procedures (SOPs) should be consistent with ASTM D1356, E260, and E355. All abbreviations and symbols are defined within this document at point of use.]

5.1 Sampling efficiency (SE)-ability of the sampling medium to trap analytes of interest. The percentage of the analyte of interest collected and retained by the sampling medium when it is introduced as a vapor in air or nitrogen into the air sampler and the sampler is operated under normal conditions for a period of time equal to or greater than that required for the intended use is indicated by %SE.

5.2 Retention efficiency (RE)-ability of sampling medium to retain a compound added (spiked) to it in liquid solution.

5.3 Retention time (RT)-time to elute a specific chemical from a chromatographic column, for a specific carrier gas flow rate, measured from the time the chemical is injected into the gas stream until it appears at the detector.

5.4 Relative retention time (RRT)-a rate of RTs for two chemicals for the same chromatographic column and carrier gas flow rate, where the denominator represents a reference chemical.

5.5 Method detection limit (MDL)-the minimum concentration of a substance that can be measured and reported with confidence and that the value is above zero.

5.6 Kuderna-Danish apparatus-the Kuderna-Danish (K-D) apparatus is a system for concentrating materials dissolved in volatile solvents.

5.7 MS-SIM-the GC is coupled to a mass spectrometer where the instrument is programmed to acquire data for only the target compounds and to disregard all others, thus operating in the select ion monitoring mode (SIM). This is performed using SIM coupled to retention time discriminators. The SIM analysis procedure provides quantitative results.

5.8 Sublimation-the direct passage of a substance from the solid state to the gaseous state and back into the solid form without any time appearing in the liquid state. Also applied to the conversion of solid to vapor without the later return to solid state, and to a conversion directly from the vapor phase to the solid state.

5.9 Surrogate standard-a chemically compound (not expected to occur in the environmental sample) which is added to each sample, blank and matrix spiked sample before extraction and analysis. The recovery of the surrogate standard is used to monitor unusual matrix effects, gross sample processing errors, etc. Surrogate recovery is evaluated for acceptance by determining whether the measured concentration falls within acceptable limits.

6. Interferences

6.1 Any gas or liquid chromatographic separation of complex mixtures of organic chemicals is subject to serious interference problems due to coelution of two or more compounds. The use of capillary or microbore columns with superior resolution or two or more columns of different polarity will frequently eliminate these problems. In addition, selectivity may be further enhanced by use of a MS operated in the selected ion monitoring (SIM) mode as the GC detector. In this mode, co-eluting compounds can often be determined.

6.2 The ECD responds to a wide variety of organic compounds. It is likely that such compounds will be encountered as interferences during GC/ECD analysis. The NPD, FPD, and HECD detectors are element specific, but are still subject to interferences. UV detectors for HPLC are nearly universal, and the electrochemical detector may also respond to a variety of chemicals. Mass spectrometric analyses will generally provide positive identification of specific compounds.

6.3 PCBs and certain common pesticides (e.g., chlordane) are complex mixtures of individual compounds which can cause difficulty in accurately quantifying a particular formulation in a multiple component mixture. PCBs may interfere with the determination of pesticides.

6.4 Contamination of glassware and sampling apparatus with traces of pesticides or PCBs can be a major source of error, particularly at lower analyte concentrations. Careful attention to cleaning and handling procedures is required during all steps of sampling and analysis to minimize this source of error.

6.5 The general approaches listed below should be followed to minimize interferences.

6.5.1 Polar compounds, including certain pesticides (e.g., organophosphorus and carbamate classes) can be removed by column chromatography on alumina. Alumina clean-up will permit analysis of most common pesticides and PCBs (7).

6.5.2 PCBs may be separated from other common pesticides by column chromatography on silicic acid (8,9).

6.5.3 Many pesticides can be fractionated into groups by column chromatography on Florisil (9).

7. Safety

7.1 The toxicity or carcinogencity of each reagent used in this method has not been precisely defined; however, each chemical compound should be treated as a potential health hazard. From this viewpoint, exposure to these chemicals must be reduced to the lowest possible level by whatever means available. The laboratory is responsible for maintaining a current awareness file of Occupational Safety and Health Administration (OSHA) regulations regarding the safe handling of the chemicals specified in this method. A reference file of material data handling sheets should also be made available to all personnel involved in the chemical analysis. Additional references to laboratory safety are available and have been identified for the analyst (10-12).

7.2 PCBs have been classified as a known or suspected, human or mammalian carcinogen. Many of the other common pesticides have been classified as carcinogens. Care must be exercised when working with these substances. This method does not purport to address all safety problems associated with its use. It is the responsibility of whoever uses this method to consult and establish appropriate safety and health practices and

determine the applicability of regulatory limitations prior to use. The user should be thoroughly familiar with the chemical and physical properties of targeted substances.

7.3 Treat all target analytes as carcinogens. Neat compounds should be weighed in a glove box. Spent samples and unused standards are toxic waste and should be disposed according to regulations. Regularly check counter tops and equipment with "black light" for fluorescence as an indicator of contamination.

7.4 The collection efficiency for common pesticides and PCBs has been demonstrated to be greater than 95 percent for the sampling configuration described in the method (filter and backup adsorbent). Therefore, no field recovery evaluation will occur as part of this procedure.

8. Apparatus

[Note: This method was developed using the PS-1 semi-volatile sampler provided by General Metal Works, Village of Cleves, OH as a guideline. EPA has experience in use of this equipment during various field monitoring programs over the last several years. Other manufacturers' equipment should work as well. However, modifications to these procedures may be necessary if another commercially available sampler is selected.]

8.1 Sampling

8.1.1 High-volume sampler (see Figure 1). Capable of pulling ambient air through the filter/adsorbent cartridge at a flow rate of approximately 8 standard cubic feet per minute (scfm) (0.225 std m^3/min) to obtain a total sample volume of greater than 300 scm over a 24-hour period. Major manufacturers are:

- Tisch Environmental, Village of Cleves, OH
- Andersen Instruments Inc., 500 Technology Ct., Smyrna, GA
- Thermo Environmental Instruments, Inc., 8 West Forge Parkway, Franklin, MA

8.1.2 Sampling module (see Figure 2). Metal filter holder (Part 2) capable of holding a 102-mm circular particle filter supported by a 16-mesh stainless-steel screen and attaching to a metal cylinder (Part 1) capable of holding a 65-mm O.D. (60-mm I.D.) x 125-mm borosilicate glass sorbent cartridge containing PUF. The filter holder is equipped with inert sealing gaskets (e.g., polytetrafluorethylene) placed on either side of the filter. Likewise, inert, pliable gaskets (e.g., silicone rubber) are used to provide an air-tight seal at each end of the glass sorbent cartridge. The glass sorbent cartridge is indented 20 mm from the lower end to provide a support for a 16-mesh stainless-steel screen that holds the sorbent. The glass sorbent cartridge fits into Part 1, which is screwed onto Part 2 until the sorbent cartridge is sealed between the silicone gaskets. Major manufacturers are:

- Tisch Environmental, Village of Cleves, OH
- Andersen Instruments Inc., 500 Technology Ct., Smyrna, GA
- Thermo Environmental Instruments, Inc., 8 West Forge Parkway, Franklin, MA

A field portable unit has been developed by EPA (see Figure 3).

8.1.3 High-volume sampler calibrator. Capable of providing multipoint resistance for the high-volume sampler. Major manufacturers are:

- Tisch Environmental, Village of Cleves, OH
- Andersen Instruments Inc., 500 Technology Ct., Smyrna, GA
- Thermo Environmental Instruments, Inc., 8 West Forge Parkway, Franklin, MA

8.1.4 Ice chest. To hold samples at <4°C or below during shipment to the laboratory after collection.

8.1.5 Data sheets. For each sample for recording the location and sample time, duration of sample, starting time, and volume of air sampled.

8.2 Sample Clean-up and Concentration (see Figure 4).

8.2.1 Soxhlet apparatus extractor (see Figure 4a). Capable of extracting filter and adsorbent cartridges (2.3" x 5" length), 1,000 mL flask, and condenser, best source.

8.2.2 Pyrex glass tube furnace system. For activating silica gel at 180°C under purified nitrogen gas purge for an hour, with capability of raising temperature gradually, best source.

8.2.3 Glass vial. 40 mL, best source.

8.2.4 Erlenmeyer flask. 50 mL, best source.

[Note: Reuse of glassware should be minimized to avoid the risk of cross contamination. All glassware that is used, especially glassware that is reused, must be scrupulously cleaned as soon as possible after use. Rinse glassware with the last solvent used in it and then with high-purity acetone and hexane. Wash with hot water containing detergent. Rinse with copious amount of tap water and several portions of distilled water. Drain, dry, and heat in a muffle furnace at 400°C for 4 hours. Volumetric glassware must not be heated in a muffle furnace; rather, it should be rinsed with high-purity acetone and hexane. After the glassware is dry and cool, rinse it with hexane, and store it inverted or capped with solvent-rinsed aluminum foil in a clean environment.]

8.2.5 White cotton gloves. For handling cartridges and filters, best source.

8.2.6 Minivials. 2 mL, borosilicate glass, with conical reservoir and screw caps lined with Teflon®-faced silicone disks, and a vial holder, best source.

8.2.7 Teflon®-coated stainless steel spatulas and spoons. Best source.

8.2.8 Kuderna-Danish (K-D) apparatus (see Figure 4b). 500 mL evaporation flask (Kontes K-570001-500 or equivalent), 10 mL graduated concentrator tubes (Kontes K570050-1025 or equivalent) with ground-glass stoppers, and 3-ball macro Snyder Column (Kontes K-570010500, K-50300-0121, and K-569001-219, or equivalent), best source.

8.2.9 Adsorption column for column chromatography (see Figure 4c). 1-cm x 10-cm with stands.

8.2.10 Glove box. For working with extremely toxic standards and reagents with explosion-proof hood for venting fumes from solvents, reagents, etc.

8.2.11 Vacuum oven. Vacuum drying oven system capable of maintaining a vacuum at 240 torr (flushed with nitrogen) overnight.

8.2.12 Concentrator tubes and a nitrogen evaporation apparatus with variable flow rate. Best source.

8.2.13 Laboratory refrigerator. Best source.

8.2.14 Boiling chips. Solvent extracted, 10/40 mesh silicon carbide or equivalent, best source.

8.2.15 Water bath. Heated, with concentric ring cover, capable of ±5°C temperature control, best source.

8.2.16 Nitrogen evaporation apparatus. Best source.

8.2.17 Glass wool. High purity grade, best source.

8.3 Sample Analysis

8.3.1 Gas chromatograph (GC). The GC system should be equipped with appropriate detector(s) and either an isothermally controlled or temperature programmed heating oven. Improved detection limits may be obtained with a GC equipped with a cool on-column or splitless injector.

8.3.2 Gas chromatographic column. As an example, a 0.32-mm (I.D.) x 3-mm DB-5, DB-17, DB-608, DB-1701 are available. Other columns may also provide acceptable results.

8.3.3 HPLC column. As an example, a 4.6-mm x 25-cm Zorbax SIL or μBondpak C-18. Other columns may also provide acceptable results.

8.3.4 Microsyringes. 5 μL volume or other appropriate sizes.

8.3.5 Balance. Mettler balance or equivalent.

8.3.6 All required syringes, gases, and other pertinent supplies. To operate the GC/MS system.

8.3.7 Pipettes, micropipettes, syringes, burets, etc. To make calibration and spiking solutions, dilute samples if necessary, etc., including syringes for accurately measuring volumes such as 25 μL and 100 μL.

9. Equipment and Materials

9.1 Materials for Sample Collection (see Figure 5)

9.1.1 Quartz fiber filter. 102-millimeter bindless quartz microfiber filter, Whatman Inc., 6 Just Road, Fairfield, NJ 07004, Filter Type QMA-4.

9.1.2 Polyurethane foam (PUF) plugs (see Figure 5a). 3-inch thick sheet stock polyurethane type (density .022 g/cm^3). The PUF should be of the polyether type used for furniture upholstery, pillows, and mattresses. The PUF cylinders (plugs) should be slightly larger in diameter than the internal diameter of the cartridge. Sources of equipment are Tisch Environmental, Village of Cleves, OH; University Research Glassware, 116 S. Merritt Mill Road, Chapel Hill, NC; Thermo Environmental Instruments, Inc., 8 West Forge Parkway, Franklin, MA; Supelco, Supelco Park, Bellefonte, PA; and SKC Inc., 334 Valley View Road, Eighty Four, PA.

9.1.3 Teflon® end caps (see Figure 5a). For sample cartridge. Sources of equipment are Tisch Environmental, Village of Cleves, OH and University Research Glassware, Chapel Hill, NC.

9.1.4 Sample cartridge aluminum shipping containers (see Figure 5b). For sample cartridge shipping. Sources of equipment are Tisch Environmental, Village of Cleves, OH and University Research Glassware, Chapel Hill, NC.

9.1.5 Glass sample cartridge (see Figure 5a). For sample collection. Sources of equipment are Tisch Environmental, Village of Cleves, OH; Thermo Environmental Instruments, Inc., 8 West Forge Parkway, Franklin, MA; University Research Glassware, 116 S. Merritt Mill Road, Chapel Hill, NC; and Supelco, Supelco Park, Bellefonte, PA.

9.1.6 Aluminum foil. Best source.

9.1.7 Hexane, reagent grade. Best source.

9.2 Sample Extraction and Concentration

9.2.1 Methylene chloride. Chromatographic grade, glass-distilled, best source.

9.2.2 Sodium sulfate-anhydrous (ACS). Granular (purified by washing with methylene chloride followed by heating at 400°C for 4 hours in a shallow tray).

9.2.3 Boiling chips. Solvent extracted or heated in a muffle furnace at 450°C for 2 hours, approximately 10/40 mesh (silicon carbide or equivalent).

9.2.4 Nitrogen. High purity grade, best source.
9.2.5 Ether. Chromatographic grade, glass-distilled, best source.
9.2.6 Hexane. Chromatographic grade, glass-distilled, best source.
9.2.7 Dibromobiphenyl. Chromatographic grade, best source. Used for internal standard.
9.2.8 Decafluorobiphenyl. Chromatographic grade, best source. Used for internal standard.
9.2.9 Glass wool. Silanized, extracted with methylene chloride and hexane, and dried.
9.2.10 Diethyl ether. High purity, glass distilled.
9.2.11 Hexane. High purity, glass distilled.
9.2.12 Silica gel. High purity, type 60, 70-230 mesh.
9.2.13 Round bottom evaporative flask. 500 mL, ₸ 24/40 joints, best source.
9.2.14 Capacity soxhlet extractors. 500 mL, with reflux condensers, best source.
9.2.15 Kuderna-Danish concentrator. 500 mL, with Snyder columns, best source.
9.2.16 Graduated concentrator tubes. 10 mL, with 19/22 stoppers, best source.
9.2.17 Graduated concentrator tubes. 1 mL, with 14/20 stoppers, best source.
9.2.18 TFE fluorocarbon tape. 1/2 in., best source.
9.2.19 Filter tubes. Size 40-mm (I.D.) x 80-mm.
9.2.20 Serum vials. 1 mL and 5 mL, fitted with caps lined with TFE fluorocarbon.
9.2.21 Pasteur pipetter. 9 in., best source.
9.2.22 Glass wool. Fired at 500°C, best source.
9.2.23 Alumina. Activity Grade IV, 100/200 mesh.
9.2.24 Glass chromatographic column. 2-mm I.D. x 15-cm long.
9.2.25 Vacuum oven. Connected to water aspirator, best source.
9.2.26 Die. Best source.
9.2.27 Ice chest. Best source.
9.2.28 Silicic Acid. Pesticide quality, best source.
9.2.29 Octachloronaphthalene (OCN). Research grade, best source.
9.2.30 Florisil. Pesticide quality, best source.

9.3 GC Sample Analysis

9.3.1 Gas cylinders of hydrogen, nitrogen, argon/methane, and helium. Ultra high purity, best source.
9.3.2 Combustion air. Ultra high purity, best source.
9.3.3 Zero air. Zero air may be obtained from a cylinder or zero-grade compressed air scrubbed with Drierite® or silica gel and 5A molecular sieve or activated charcoal, or by catalytic cleanup of ambient air. All zero air should be passed through a liquid argon cold trap for final cleanup.
9.3.4 Chromatographic-grade stainless steel tubing and stainless steel fitting. For interconnections, Alltech Applied Science, 2051 Waukegan Road, Deerfield, IL 60015, 312-948-8600, or equivalent.

[Note: All such materials in contact with the sample, analyte, or support gases prior to analysis should be stainless steel or other inert metal. Do not use plastic or Teflon® tubing or fittings.]

10. Preparation of PUF Sampling Cartridge

[Note: This method was developed using the PS-1 sample cartridge provider by General Metal Works, Village of Cleves, OH as a guideline. EPA has experience in use of this equipment during various field monitoring

programs over the last several years. Other manufacturers' equipment should work as well. However, modifications to these procedures may be necessary if another commercially available sampler is selected.]

10.1 Summary of Method

10.1.1 This part of Compendium Method TO-4A discusses pertinent information regarding the preparation and cleaning of the filter, adsorbent, and filter/adsorbent cartridge assembly. The separate batches of filters and adsorbents are extracted with the appropriate solvent.

10.1.2 At least one PUF cartridge assembly and one filter from each batch, or 10 percent of the batch, whichever is greater, should be tested and certified clean before the batch is considered for field use.

10.2 Preparation of Sampling Cartridge

10.2.1 Bake the Whatman QMA-4 quartz filters at 400°C for 5 hours before use.

10.2.2 Set aside the filters in a clean container for shipment to the field or prior to combining with the PUF glass cartridge assembly for certification prior to field deployment.

10.2.3 The PUF plugs are 6.0-cm diameter cylindrical plugs cut from 3-inch sheet stock and should fit, with slight compression, in the glass cartridge, supported by the wire screen (see Figure 2). During cutting, rotate the die at high speed (e.g., in a drill press) and continuously lubricate with deionized or distilled water. Pre-cleaned PUF plugs can be obtained from many of the commercial sources identified in Section 9.1.2.

10.2.4 For initial cleanup, place the PUF plugs in a Soxhlet apparatus and extract with acetone for 16 hours at approximately 4 cycles per hour. When cartridges are reused, use diethyl ether/hexane (10 percent volume/volume [v/v]) as the cleanup solvent.

[Note: A modified PUF cleanup procedure can be used to remove unknown interference components of the PUF blank. This method consists of rinsing 50 times with toluene, acetone, and diethyl ether/hexane (5 to 10 percent v/v), followed by Soxhlet extraction. The extracted PUF is placed in a vacuum oven connected to a water aspirator and dried at room temperature for approximately 2 to 4 hours (until no solvent odor is detected). Alternatively, they may be dried at room temperature in an air-tight container with circulating nitrogen (zero grade). Place the clean PUF plug into a labeled glass sampling cartridge using gloves and forceps. Wrap the cartridge with hexane-rinsed aluminum foil and placed in a jar fitted with TFE fluorocarbon-lined caps. The foil wrapping may also be marked for identification using a blunt probe. The extract from the Soxhlet extraction procedure from each batch may be analyzed to determine initial cleanliness prior to certification.]

10.2.5 Fit a nickel or stainless steel screen (mesh size 200/200) to the bottom of a hexane-rinsed glass sampling cartridge to retain the PUF adsorbents, as illustrated in Figure 2. Place the Soxhlet-extracted, vacuum-dried PUF (2.5-cm thick by 6.5-cm diameter) on top of the screen in the glass sampling cartridge using polyester gloves.

10.2.6 Wrap the sampling cartridge with hexane-rinsed aluminum foil, cap with the Teflon® end caps, place in a cleaned labeled aluminum shipping container, and seal with Teflon® tape. Analyze at least 1 PUF plug from each batch of PUF plugs using the procedure described in Section 10.3, before the batch is considered acceptable for field use. A blank level of <10 ng/plug and filter for single component compounds is considered to be acceptable. For multiple component mixtures (e.g., PCBs), the blank level should be <100 ng/plug and filter. Cartridges are considered clean for up to 30 days from date of certification when stored in their sealed containers.

10.3 Procedure for Certification of PUF Cartridge Assembly

10.3.1 Extract 1 filter and PUF adsorbent cartridge by Soxhlet extraction and concentrate using a Kuderna-Danish (K-D) evaporator for each lot of filters and cartridges sent to the field.

10.3.2 Assemble the Soxhlet apparatus. Charge the Soxhlet apparatus (see Figure 4a) with 300 mL of the extraction solvent [10 percent (v/v) diethyl ether/hexane] and reflux for 2 hours. Let the apparatus cool, disassemble it, and discard the used extraction solvent. Transfer the filter and PUF glass cartridge to the Soxhlet apparatus (the use of an extraction thimble is optional).

[Note: The filter and adsorbent assembly are extracted together in order to reach detection limits, to minimize cost and to prevent misinterpretation of the data. Separate analyses of the filter and PUF would not yield useful information about the physical state of most of the common pesticides and PCBs at the time of sampling due to evaporative losses of the analyte from the filter during sampling.]

10.3.3 Add between 300 and 350 mL of diethyl ether/hexane (10 percent v/v) to the Soxhlet apparatus. Reflux the sample for 18 hours at a rate of at least 3 cycles per hour. Allow to cool, then disassemble the apparatus.

10.3.4 Assemble a K-D concentrator (see Figure 4b) by attaching a 10-mL concentrator tube to a 500-mL evaporative flask.

10.3.5 Transfer the extract by pouring it through a drying column containing about 10 cm of anhydrous granular sodium sulfate (see Figure 4c) and collect the extract in the K-D concentrator. Rinse the Erlenmeyer flask and column with 20 to 30 mL of 10 percent diethyl ether/hexane to complete the quantitative transfer.

10.3.6 Add 1 or 2 clean boiling chips and attach a 3-ball Snyder column to the evaporative flask. Pre-wet the Snyder column by adding about 1 mL of the extraction solvent to the top of the column. Place the K-D apparatus on a hot water bath (50°C) so that the concentrator tube is partially immersed in the hot water, and the entire lower rounded surface of the flask is bathed with hot vapor. Adjust the vertical position of the apparatus and the water temperature as required to complete the concentration in one hour. At the proper rate of distillation, the balls of the column will actively chatter but the chambers will not flood with condensed solvent. When the apparent volume of liquid reaches approximately 5 mL, remove the K-D apparatus from the water bath and allow it to drain and cool for at least 5 minutes. Remove the Snyder column and rinse the flask and its lower joint into the concentrator tube with 5 mL of hexane. A 5-mL syringe is recommended for this operation.

[Note: The solvent may have to be exchanged to another solvent to meet the requirements of the analytical procedure selected for the target analytes.]

10.3.7 Concentrate the extract to 1 mL and analyze according to Section 13.

10.3.8 Acceptable levels of common pesticides must be less than 10 ng for each pair of filter and adsorbent assembly analyzed. For multiple component mixtures (e.g., PCBs), the blank level should be less than 100 ng for each pair of filter and adsorbent. Once certified clean, the cartridges can be shipped to the field without being chilled.

11. Assembly, Calibration and Collection Using High-Volume Sampling System

[Note: This method was developed using the PS-1 semi-volatile sampler provided by General Metal Works, Village of Cleves, OH as a guideline. EPA has experience in use of this equipment during various field monitoring programs over the last several years. Other manufacturers' equipment should work as well.

However, modifications to these procedures may be necessary if another commercially available sampler is selected.]

11.1 Description of Sampling Apparatus

The entire sampling system is diagrammed in Figure 1. This apparatus was developed to operate at a rate of 4 to 10 scfm (0.114 to 0.285 std m^3/min) and is used by EPA for high-volume sampling of ambient air. The method write-up presents the use of this device.

The sampling module (see Figure 2) consists of a filter and a glass sampling cartridge containing the PUF utilized to concentrate common pesticides and PCBs from the air. A field portable unit has been developed by EPA (see Figure 3).

11.2 Calibration of Sampling System

Each sampler should be calibrated (1) when new, (2) after major repairs or maintenance, (3) whenever any audit point deviates from the calibration curve by more than 7 percent, (4) before/after each sampling event, and (5) when a different sample collection media, other than that which the sampler was originally calibrated to, will be used for sampling.

11.2.1 Calibration of Orifice Transfer Standard. Calibrate the modified high volume air sampler in the field using a calibrated orifice flow rate transfer standard. Certify the orifice transfer standard in the laboratory against a positive displacement rootsmeter (see Figure 6). Once certified, the recertification is performed rather infrequently if the orifice is protected from damage. Recertify the orifice transfer standard performed once per year utilizing a set of five multiple resistance plates.

[Note: The set of five multihole resistance plates are used to change the flow through the orifice so that several points can be obtained for the orifice calibration curve. The following procedure outlines the steps to calibrate the orifice transfer standard in the laboratory.]

11.2.1.1 Record the room temperature (T_1 in °C) and barometric pressure (P_b in mm Hg) on the Orifice Calibration Data Sheet (see Figure 7). Calculate the room temperature in K (absolute temperature) and record on Orifice Calibration Data Sheet.

$$T_1 \text{ in K} = 273° + T_1 \text{ in °C}$$

11.2.1.2 Set up laboratory orifice calibration equipment as illustrated in Figure 6. Check the oil level of the rootsmeter prior to starting. There are 3 oil level indicators, 1 at the clear plastic end and 2 site glasses, 1 at each end of the measuring chamber.

11.2.1.3 Check for leaks by clamping both manometer lines, blocking the orifice with cellophane tape, turning on the high volume motor, and noting any change in the rootsmeter's reading. If the rootsmeter's reading changes, there is a leak in the system. Eliminate the leak before proceeding. If the rootsmeter's reading remains constant, turn off the hi-vol motor, remove the cellophane tape, and unclamp both manometer lines.

11.2.1.4 Install the 5-hole resistance plate between the orifice and the filter adapter.

11.2.1.5 Turn manometer tubing connectors 1 turn counter-clockwise. Make sure all connectors are open.

11.2.1.6 Adjust both manometer midpoints by sliding their movable scales until the zero point corresponds with the meniscus. Gently shake or tap to remove any air bubbles and/or liquid remaining on tubing connectors. (If additional liquid is required for the water manometer, remove tubing connector and add clean water.)

11.2.1.7 Turn on the high volume motor and let it run for 5 minutes to set the motor brushes. Turn the motor off. Insure manometers are set to zero. Turn the high volume motor on.

11.2.1.8 Record the time, in minutes, required to pass a known volume of air (approximately 200 to 300 ft^3 of air for each resistance plate) through the rootsmeter by using the rootsmeter's digital volume dial and a stopwatch.

11.2.1.9 Record both manometer readings-orifice water manometer (ΔH) and rootsmeter mercury manometer (ΔP) on Orifice Calibration Data Sheet (see Figure 7).

[Note: ΔH is the sum of the difference from zero (0) of the two column heights.]

11.2.1.10 Turn off the high volume motor.

11.2.1.11 Replace the 5-hole resistance plate with the 7-hole resistance plate.

11.2.1.12 Repeat Sections 11.2.1.3 through 11.2.1.11.

11.2.1.13 Repeat for each resistance plate. Note results on Orifice Calibration Data Sheet (see Figure 7). Only a minute is needed for warm-up of the motor. Be sure to tighten the orifice enough to eliminate any leaks. Also check the gaskets for cracks.

[Note: The placement of the orifice prior to the rootsmeter causes the pressure at the inlet of the rootsmeter to be reduced below atmospheric conditions, thus causing the measured volume to be incorrect. The volume measured by the rootsmeter must be corrected.]

11.2.1.14 Correct the measured volumes on the Orifice Calibration Data Sheet:

$$V_{std} = V_m \left(\frac{P_a - \Delta P}{P_{std}}\right)\left(\frac{T_{std}}{T_a}\right)$$

where:

V_{std} = standard volume, std m^3
V_m = actual volume measured by the rootsmeter, m^3
P_a = barometric pressure during calibration, mm Hg
ΔP = differential pressure at inlet to volume meter, mm Hg
P_{std} = 760 mm Hg
T_{std} = 273 + 25 °C = 298 K
T_a = ambient temperature during calibration, K.

11.2.1.15 Record standard volume on Orifice Calibration Data Sheet.

11.2.1.16 The standard flow rate as measured by the rootsmeter can now be calculated using the following formula:

$$Q_{std} = \frac{V_{std}}{\theta}$$

where:

Q_{std} = standard volumetric flow rate, std m^3/min
θ = elapsed time, min

11.2.1.17 Record the standard flow rates to the nearest 0.01 std m^3/min.

11.2.1.18 Calculate and record $\sqrt{\Delta H\ (P_1/P_{std})(298/T_1)}$ value for each standard flow rate.

11.2.1.19 Plot each $\sqrt{\Delta H\ (P_1/P_{std})(298/T_1)}$ value (y-axis) versus its associated standard flow rate (x-axis) on arithmetic graph paper and draw a line of best fit between the individual plotted points.

[Note: This graph will be used in the field to determine standard flow rate.]

11.2.2 Calibration of the High Volume Sampling System Utilizing Calibrated Orifice Transfer Standard

For this calibration procedure, the following conditions are assumed in the field:

- The sampler is equipped with a valve to control sample flow rate.
- The sample flow rate is determined by measuring the orifice pressure differential, using a Magnehelic gauge.
- The sampler is designed to operate at a standardized volumetric flow rate of 8 ft^3/min (0.225 m^3/min), with an acceptable flow rate range within 10 percent of this value.
- The transfer standard for the flow rate calibration is an orifice device. The flow rate through the orifice is determined by the pressure drop caused by the orifice and is measured using a "U" tube water manometer or equivalent.
- The sampler and the orifice transfer standard are calibrated to standard volumetric flow rate units (scfm or scmm).
- An orifice transfer standard with calibration traceable to NIST is used.
- A "U" tube water manometer or equivalent, with a 0- to 16-inch range and a maximum scale division of 0.1 inch, will be used to measure the pressure in the orifice transfer standard.
- A Magnehelic gauge or equivalent, with a 9- to 100-inch range and a minimum scale division of 2 inches for measurements of the differential pressure across the sampler's orifice is used.
- A thermometer capable of measuring temperature over the range of 32° to 122°F (0° to 50°C) to ±2°F (±1°C) and referenced annually to a calibrated mercury thermometer is used.
- A portable aneroid barometer (or equivalent) capable of measuring ambient barometric pressure between 500 and 800 mm Hg (19.5 and 31.5 in. Hg) to the nearest mm Hg and referenced annually to a barometer of known accuracy is used.
- Miscellaneous handtools, calibration data sheets or station log book, and wide duct tape are available.

11.2.2.1 Set up the calibration system as illustrated in Figure 8. Monitor the airflow through the sampling system with a venturi/Magnehelic assembly, as illustrated in Figure 8. Audit the field sampling system once per quarter using a flow rate transfer standard, as described in the EPA *High Volume-Sampling Method, 40 CVR 50, Appendix B*. Perform a single-point calibration before and after each sample collection, using the procedures described in Section 11.2.3.

11.2.2.2 Prior to initial multi-point calibration, place an empty glass cartridge in the sampling head and activate the sampling motor. Fully open the flow control valve and adjust the voltage variator so that a sample flow rate corresponding to 110 percent of the desired flow rate (typically 0.20 to 0.28 m^3/min) is indicated on the Magnehelic gauge (based on the previously obtained multipoint calibration curve). Allow the motor to warm up for 10 minutes and then adjust the flow control valve to achieve the desire flow rate. Turn off the sampler. Record the ambient temperature and barometric pressure on the Field Calibration Data Sheet (see Figure 9).

11.2.2.3 Place the orifice transfer standard on the sampling head and attach a manometer to the tap on the transfer standard, as illustrated in Figure 8. Properly align the retaining rings with the filter holder and secure

by tightening the three screw clamps. Connect the orifice transfer standard by way of the pressure tap to a manometer using a length of tubing. Set the zero level of the manometer or Magnehelic. Attach the Magnehelic gauge to the sampler venturi quick release connections. Adjust the zero (if needed) using the zero adjust screw on face of the gauge.

11.2.2.4 To leak test, block the orifice with a rubber stopper, wide duct tape, or other suitable means. Seal the pressure port with a rubber cap or similar device. Turn on the sampler.

Caution: Avoid running the sampler for too long a time with the orifice blocked. This precaution will reduce the chance that the motor will be overheated due to the lack of cooling air. Such overheating can shorten the life of the motor.

11.2.2.5 Gently rock the orifice transfer standard and listen for a whistling sound that would indicate a leak in the system. A leak-free system will not produce an upscale response on the sampler's Magnehelic. Leaks are usually caused either by damaged or missing gaskets by cross-threading and/or not screwing sample cartridge together tightly. All leaks must be eliminated before proceeding with the calibration. When the sample is determined to be leak-free, turn off the sampler and unblock the orifice. Now remove the rubber stopper or plug from the calibrator orifice.

11.2.2.6 Turn the flow control valve to the fully open position and turn the sampler on. Adjust the flow control valve until a Magnehelic reading of approximately 70 in. is obtained. Allow the Magnehelic and manometer readings to stabilize and record these values on the orifice transfer Field Calibration Data Sheet (see Figure 9).

11.2.2.7 Record the manometer reading under Y1 and the Magnehelic reading under Y2 on the Field Calibration Data Sheet. For the first reading, the Magnehelic should still be at 70 inches as set above.

11.2.2.8 Set the Magnehelic to 60 inches by using the sampler's flow control valve. Record the manometer (Y1) and Magnehelic (Y2) readings on the Field Calibration Data Sheet (see Figure 9).

11.2.2.9 Repeat the above steps using Magnehelic settings of 50, 40, 30, 20, and 10 inches.

11.2.2.10 Turn the voltage variator to maximum power, open the flow control valve, and confirm that the Magnehelic reads at least 100 inches. Turn off the sampler and confirm that the Magnehelic reads zero.

11.2.2.11 Read and record the following parameters on the Field Calibration Data Sheet. Record the following on the calibration data sheet:

Data, job number, and operator's signature;

- Sampler serial number;
- Ambient barometric pressure; and
- Ambient temperature.

11.2.2.12 Remove the "dummy" cartridge and replace with a sample cartridge.

11.2.2.13 Obtain the Manufacturer High Volume Orifice Calibration Certificate.

11.2.2.14 If not performed by the manufacturer, calculate values for each calibrator orifice static pressure (Column 6, inches of water) on the manufacturer's calibration certificate using the following equation:

$$\sqrt{\Delta H(P_a/760)(298/[T_a + 273])}$$

where:

P_a = the barometric pressure (mm Hg) at time of manufacturer calibration, mm Hg

T_a = temperature at time of calibration, °C

11.2.2.15 Perform a linear regression analysis using the values in Column 7 of the manufacturer High Volume Orifice Calibration Certificate for flow rate (Q_{std}) as the "X" values and the calculated values as the Y

values. From this relationship, determine the correlation (CC1), intercept (B1), and slope (M1) for the Orifice Transfer Standard.

11.2.2.16 Record these values on the Field Calibration Data Sheet (see Figure 9).

11.2.2.17 Using the Field Calibration Data Sheet values (see Figure 9), calculate the Orifice Manometer Calculated Values (Y3) for each orifice manometer reading using the following equation:

Y3 Calculation

$$Y3 = [Y1(P_a/760)(298/\{T_a + 273\})]^{½}$$

11.2.2.18 Record the values obtained in Column Y3 on the Field Calibration Data Sheet (see Figure 9).

11.2.2.19 Calculate the Sampler Magnehelic Calculate Values (Y4) using the following equation:

Y4 Calculation

$$Y4 = [Y2(P_a/760)(298/\{T_a + 273\})]^{½}$$

11.2.2.20 Record the value obtained in Column Y4 on the Field Calibration Data Sheet (see Figure 9).

11.2.2.21 Calculate the Orifice Flow Rate (X1) in scm, using the following equation:

X1 Calculation

$$X1 = \frac{Y3 - B1}{M1}$$

11.2.2.22 Record the values obtained in Column X1, on the Field Calibration Data Sheet (see Figure 9).

11.2.2.23 Perform a linear regression of the values in Column X1 (as X) and the values in Column Y4 (as Y). Record the relationship for correlation (CC2), intercept (B2), and slope (M2) on the Field Calibration Data Sheet.

11.2.2.24 Using the following equation, calculate a set point (SP) for the manometer to represent a desired flow rate:

$$\text{Set point (SP)} = [(\text{Expected } P_a)/(\text{Expected } T_a)(T_{std}/P_{std})][M2\ (\text{Desired flow rate}) + B2]^2$$

where:

P_a = Expected atmospheric pressure (P_a), mm Hg
T_a = Expected atmospheric temperature (T_a), °C
M2 = Slope of developed relationship
B2 = Intercept of developed relationship
T_{std} = Temperature standard, 25°C
P_{std} = Pressure standard, 760 mm Hg

11.2.2.25 During monitoring, calculate a flow rate from the observed Magnehelic reading using the following equations:

$$Y5 = [\text{Average Magnehelic Reading } (\Delta H)\ (P_a/T_a)(T_{std}/P_{std})]^{1/2}$$

$$X2 = \frac{Y5 - B2}{M2}$$

where:

Y5 = Corrected Magnehelic reading
X2 = Instant calculated flow rate, scm

11.2.2.26 The relationship in calibration of a sampling system between Orifice Transfer Standard and flow rate through the sampler is illustrated in Figure 10.

11.2.3 Single-Point Audit of the High Volume Sampling System Utilizing Calibrated Orifice Transfer Standard

Single point calibration checks are required as follows:

- Prior to the start of each 24-hour test period.
- After each 24-hour test period. The post-test calibration check may serve as the pre-test calibration check for the next sampling period if the sampler is not moved.
- Prior to sampling after a sample is moved.

For samplers, perform a calibration check for the operational flow rate before each 24-hour sampling event and when required as outlined in the user quality assurance program. The purpose of this check is to track the sampler's calibration stability. Maintain a control chart presenting the percentage difference between a sampler's indicated and measured flow rates. This chart provides a quick reference of sampler flow-rate drift problems and is useful for tracking the performance of the sampler. Either the sampler log book or a data sheet will be used to document flowcheck information. This information includes, but is not limited to, sampler and orifice transfer standard serial number, ambient temperature, pressure conditions, and collected flow-check data.

In this subsection, the following is assumed:

- The flow rate through a sampler is indicated by the orifice differential pressure;
- Samplers are designed to operate at an actual flow rate of 8 scfm, with a maximum acceptable flow-rate fluctuation range of ±10 percent of this value;
- The transfer standard will be an orifice device equipped with a pressure tap. The pressure is measured using a manometer; and
- The orifice transfer standard's calibration relationship is in terms of standard volumetric flow rate (Q_{std}).

11.2.3.1 Perform a single point flow audit check before and after each sampling period utilizing the Calibrated Orifice Transfer Standard (see Section 11.2.1).

11.2.3.2 Prior to single point audit, place a "dummy" glass cartridge in the sampling head and activate the sampling motor. Fully open the flow control valve and adjust the voltage variator so that a sample flow rate corresponding to 110 percent of the desired flow rate (typically 0.19 to 0.28 m^3/min) is indicated on the Magnehelic gauge (based on the previously obtained multipoint calibration curve). Allow the motor to warm up for 10 minutes and then adjust the flow control valve to achieve the desired flow rate. Turn off the sampler. Record the ambient temperature and barometric pressure on the Field Test Data Sheet (see Figure 11).

11.2.3.3 Place the flow rate transfer standard on the sampling head.

11.2.3.4 Properly align the retaining rings with the filter holder and secure by tightening the 3 screw clamps. Connect the flow rate transfer standard to the manometer using a length of tubing.

11.2.3.5 Using tubing, attach 1 manometer connector to the pressure tap of the transfer standard. Leave the other connector open to the atmosphere.

11.2.3.6 Adjust the manometer midpoint by sliding the movable scale until the zero point corresponds with the water meniscus. Gently shake or tap to remove any air bubbles and/or liquid remaining on tubing connectors. (If additional liquid is required, remove tubing connector and add clean water.)

11.2.3.7 Turn on high-volume motor and let run for 5 minutes.

11.2.3.8 Record the pressure differential indicated, ΔH, in inches of water, on the Field Test Data Sheet. Be sure stable ΔH has been established.

11.2.3.9 Record the observed Magnahelic gauge reading, in inches of water, on the Field Test Data Sheet. Be sure stable ΔM has been established.

11.2.3.10 Using previous established Orifice Transfer Standard curve, calculate Q_{xs} (see Section 11.2.2.23).

11.2.3.11 This flow should be within ±10 percent of the sampler set point, normally, 8 ft^3. If not, perform a new multipoint calibration of the sampler.

11.2.3.12 Remove flow rate transfer standard and dummy adsorbent cartridge.

11.3 Sample Collection

11.3.1 General Requirements

11.3.1.1 The sampler should be located in an unobstructed area, at least 2 meters from any obstacle to air flow. The exhaust hose should be stretched out in the downwind direction to prevent recycling of air into the sample head.

11.3.1.2 All cleaning and sample module loading and unloading should be conducted in a controlled environment, to minimize any chance of potential contamination.

11.3.1.3 When new or when using the sampler at a different location, all sample contact areas need to be cleared. Use triple rinses of reagent grade hexane contained in Teflon® rinse bottles. Allow the solvent to evaporate before loading the PUF modules.

11.3.2 Preparing Cartridge for Sampling

11.3.2.1 Detach the lower chamber of the cleaned sample head. While wearing disposable, clean, lint-free nylon, or powder-free surgical gloves, remove a clean glass adsorbent module from its shipping container. Remove the Teflon® end caps. Replace the end caps in the sample container to be reused after the sample has been collected.

11.3.2.2 Insert the glass module into the lower chamber and tightly reattach the lower chambers to the module.

11.3.2.3 Using clean rinsed (with hexane) Teflon-tipped forceps, carefully place a clean conditioned fiber filter atop the filter holder and secure in place by clamping the filter holder ring over the filter. Place the aluminum protective cover on top of the cartridge head. Tighten the 3 screw clamps. Ensure that all module connections are tightly assembled. Place a small piece of aluminum foil on the ball-joint of the sample cartridge to protect from back-diffusion of semi-volatile into the cartridge during transporting to the site.

[Note: Failure to do so could result in air flow leaks at poorly sealed locations which could affect sample representativeness.]

11.3.2.4 Place in a carrying bag to take to the sampler.

11.3.3 Collection

11.3.3.1 After the sampling system has been assembled, perform a single point flow check as described in Sections 11.2.3.

11.3.3.2 With the empty sample module removed from the sampler, rinse all sample contact areas using reagent grade hexane in a Teflon® squeeze bottle. Allow the hexane to evaporate from the module before loading the samples.

11.3.3.3 With the sample cartridge removed from the sampler and the flow control valve fully open, turn the pump on and allow it to warm-up for approximately 5 minutes.

11.3.3.4 Attach a "dummy" sampling cartridge loaded with the exact same type of filter and PUF media to be used for sample collection.

11.3.3.5 Turn the sampler on and adjust the flow control valve to the desired flow as indicated by the Magnehelic gauge reading determined in Section 11.2.2.24. Once the flow is properly adjusted, take extreme care not to inadvertently alter its setting.

11.3.3.6 Turn the sampler off and remove the "dummy" module. The sampler is now ready for field use.

11.3.3.7 Check the zero reading of the sampler Magnehelic. Record the ambient temperature, barometric pressure, elapsed time meter setting, sampler serial number, filter number, and PUF cartridge number on the Field Test Data Sheet (see Figure 11). Attach the loaded sampler cartridge to the sampler.

11.3.3.8 Place the voltage variator and flow control valve at the settings used in Section 11.3.2, and the power switch. Activate the elapsed time meter and record the start time. Adjust the flow (Magnehelic setting), if necessary, using the flow control valve.

11.3.3.9 Record the Magnehelic reading every 6 hours during the sampling period. Use the calibration factors (see Section 11.2.2.24) to calculate the desired flow rate. Record the ambient temperature, barometric pressure, and Magnehelic reading at the beginning and during sampling period.

11.3.4 Sample Recovery

11.3.4.1 At the end of the desired sampling period, turn the power off. Carefully remove the sampling head containing the filter and adsorbent cartridge. Place the protective "plate" over the filter to protect cartridge during transport to clean recovery area. Also, place a piece of aluminum foil around the bottom of adsorbent sampler head.

11.3.4.2 Perform a final calculated sampler flow check using the calibration orifice, as described in Section 11.3.2. If calibration deviates by more than 10 percent from initial reading, mark the flow data for that sample as suspect and inspect and/or remove from service, record results on Field Test Data Sheet, Figure 11.

11.3.4.3 Transport adsorbent sampler head to a clean recovery area.

11.3.4.4 While wearing disposable lint free nylon or powder-free surgical gloves, remove the PUF cartridge from the lower module chamber and lay it on the retained aluminum foil in which the sample was originally wrapped.

11.3.4.5 Carefully remove the glass fiber filter from the upper chamber using clean Teflon®-tipped forceps.

11.3.4.6 Fold the filter in half twice (sample side inward) and place it in the glass cartridge atop the PUF.

11.3.4.7 Wrap the combined samples in the original hexane rinsed aluminum foil, attached Teflon® end caps and place them in their *original* aluminum sample container. Complete a sample label and affix it to the aluminum shipping container.

11.3.4.8 Chain-of-custody should be maintained for all samples. Store the containers under dry ice and protect from UV light to prevent possibly photo-decomposition of collected analytes. If the time span between sample collection and laboratory analysis is to exceed 24 hours, refrigerate sample at 4°C.

11.3.4.9 Return at least 1 field filter/PUF blank to the laboratory with each group of samples. Treat a field blank exactly as the sample except that no air is drawn through the filter/adsorbent cartridge assembly.

11.3.4.10 Ship and store field samples chilled (<4°) (blue ice is acceptable) until receipt at the analytical laboratory, after which they should be refrigerated at less than or equal to 4°C. Extraction must be performed within 7 days of sampling and analysis within 40 days of extraction.

12. Sample Extraction Procedure

[Note: Sample extraction should be performed under a properly ventilated hood.]

12.1 Sample Extraction

12.1.1 All samples should be extracted within 1 week after collection. All samples should be stored at <4°C until extracted.

12.1.2 All glassware should be washed with a suitable detergent; rinsed with deionized water, acetone, and hexane; rinsed again with deionized water; and fired in an oven (500°C).

12.1.3 Prepare a spiking solution for determination of extraction efficiency. The spiking solution should contain one or more surrogate compounds that have chemical structures and properties similar to those of the analytes of interest. Octachloronaphthalene (OCN) and dibutylchlorendate have been used as surrogates for determination of organochlorine pesticides by GC with an ECD. Tetrachloro-m-xylene and decachlorobiphenyl can also be used together to insure recovery of early and late eluting compounds. For organophosphate pesticides, tributylphosphate or triphenylphosphate may be employed as surrogates. The surrogate solution should be prepared so that addition of 100 μL into the PUF plug results in an extract containing the surrogate compound at the high end of the instrument's calibration range. As an example, the spiking solution for OCN is prepared by dissolving 10 mg of OCN in 10 mL of 10% acetone in n-hexane, followed by serial dilution n-hexane to achieve a final spiking solution of OCN is 1 μg/mL.

[Note: Use the recoveries of the surrogate compounds to monitor for unusual matrix effects and gross sample processing errors. Evaluate surrogate recovery for acceptance by determining whether the measured concentration falls within the acceptance limits of 60-120 percent.]

12.1.4 The extracting solution (10% diethyl ether/hexane) is prepared by mixing 1800 mL of freshly opened hexane and 200 mL of freshly opened diethyl ether (preserved with ethanol) to a flask.

12.1.5 All clean glassware, forceps, and other equipment to be used should be rinsed with 10% diethyl ether/hexane and placed on rinsed (10% diethyl ether/hexane) aluminum foil until use. The condensing towers should also be rinsed with 10% diethyl ether/hexane. Then add 700 mL of 10% diethyl ether/hexane to the 1,000 mL round bottom flask and add up to three boiling granules.

12.1.6 Using precleaned (i.e., 10% diethyl ether/hexane Soxhlet extracted) cotton gloves, the filter/PUF cartridge is removed from the sealed container, the PUF removed from the glass cartridge, and the filter/PUF together are placed into the 300 mL Soxhlet extractor using prerinsed forceps.

12.1.7 Before extraction begins, add 100 µL of the OCN solution directly to the top of the PUF plug.

[Note: Incorporating a known concentration of the solution onto the sample provides a quality assurance check to determine recovery efficiency of the extraction and analytical processes.]

12.1.8 Connect the Soxhlet extractor to the 1,000 mL boiling flask and condenser. Wet the glass joints with 10% diethyl ether/hexane to ensure a tight seal between the fittings. If necessary, the PUF plug can be adjusted

using forceps to wedge it midway along the length of the siphon. The above procedure should be followed for all samples, with the inclusion of a blank control sample.

12.1.9 The water flow to the condenser towers of the Soxhlet extraction assembly should be checked and the heating unit turned on. As the samples boil, the Soxhlet extractors should be inspected to ensure that they are filling and siphoning properly (4 to 6 cycles/hour). Samples should cycle for a minimum of 16 hours.

12.1.10 At the end of the extracting process (minimum of 16 hours), the heating unit is turned off and the sample cooled to room temperature.

12.1.11 The extracts are then concentrated to 5 mL using a Kuderna-Danish (K-D) apparatus. The K-D is set up, assembled with concentrator tubes, and rinsed. The lower end of the filter tube is packed with glass wool and filled with sodium sulfate to a depth of 40 mm. The filter tube is then placed in the neck of the K-D. The Soxhlet extractors and boiling flasks are carefully removed from the condenser towers and the remaining solvent is drained into each boiling flask. Sample extract is carefully poured through the filter tube into the K-D. Each boiling flask is rinsed three times by swirling hexane along the sides. Once the sample has drained, the filter tube is rinsed down with hexane. Each Snyder column is attached to the K-D and rinsed to wet the joint for a tight seal. The complete K-D apparatus is placed on a steam bath and the sample is evaporated to approximately 5 mL.

[Note: Do not allow samples to evaporate to dryness.]

Remove sample from the steam bath, rinse the Snyder column with a minimum of hexane, and allow to cool. Adjust sample volume to 10 mL in a concentrator tube, close with a glass stopper, and seal with TFE fluorocarbon tape. Alternatively, the sample may be quantitatively transferred (with concentrator tube rinsing) to prescored vials and brought up to final volume. Concentrated extracts are stored at <4°C until analyzed. Analysis should occur no later than 40 days after sample extraction.

12.2 Sample Cleanup

12.2.1 If only polar compounds are sought, an alumina cleanup procedure is appropriate. Before cleanup, the sample extract is carefully reduced to 1 mL using a gentle stream of clean nitrogen.

12.2.2 A glass chromatographic column (2-mm I.D. x 15-cm long) is packed with alumina (7), activity grade IV, and rinsed with approximately 20 mL of n-hexane. The concentrated sample extract is placed on the column and eluted with 10 mL of n-hexane at a rate of 0.5 mL/minute. The eluate volume is adjusted to exactly 10 mL and analyzed as per Section 13.

12.2.3 If both PCBs and common pesticides are sought, alternate cleanup procedures (8,9) may be required (i.e., silicic acid).

12.2.4 Finally, class separation and improved specificity can be achieved by column clean-up and separation on Florisil (9).

13. Analytical Procedure

13.1 Analysis of Organochlorine Pesticides by Capillary Gas Chromatography with Electron Capture Detector (GC/ECD)

[Note: Organochlorine pesticides, PCBs and many nonchlorinated pesticides are responsive to electron capture detection (see Table 1). Most of these compounds can be analyzed at concentration of 1 to 50 ng/mL by GC/ECD. The following procedure is appropriate. Sampling and analytical methods that have been used to determine pesticides and PCBs collected from air using a modification of this methodology have been published (14-22).]

13.1.1 Select GC column (e.g., 0.3-mm by 30-m DB-5 column) and appropriate GC conditions to separate the target analytes. Typical operating parameters for this column with splitless injection are: Carrier gas-chromatography grade helium at a flow rate of 1 to 2 mL/min and a column head pressure of 7 to 9 psi (48 to 60 kPa); injector temperature of 250°C; detector temperature of 350°C; initial oven temperature of 50°C held for 2.0 min., ramped at 15°C/min to 150°C for 8 min, ramped at 10°C/min to 295°C then held for 5 min; purge time of 1.0 min. A typical injection volume is 2 to 3 μL.

13.1.2 Remove sample extract from refrigerator and allow to warm to room temperature.

13.1.3 Prepare standard solution from reference materials of known purity. Analytically pure standards of organochlorine pesticides and PCBs are available from several commercial sources.

13.1.4 Use the standard solutions of the various compounds of interest to determine relative retention times (RRTs) to an internal standard such as p,p'-DDE, aldrin or octachloronaphthalene. Use 1 to 3-μL injections or other appropriate volumes.

13.1.5 Determine detector linearity by injecting standard solutions of three different concentrations (amounts) that bracket the range of analyses. The calibration is considered linear if the relative standard deviation (RSD) of the three response factors for the three standards is 20 percent or less.

13.1.6 Calibrate the system with a minimum of three levels of calibration standards in the linear range. The low standard should be near the analytical method detection limit. The calibration is considered linear if the relative standard deviation (RSD) of the three response factors for the three standards is 20 percent or less. The initial calibration should be verified by the analysis of a standard from an independent source. Recovery of 85 to 115 percent is acceptable. The initial calibration curve should be verified at the begining of each day and after every ten samples by the analysis of the midpoint standard; an RPD of 15% or less is acceptable for continuing use of the initial calibration curve.

13.1.7 Inject 1 to 3 μL of sample extract. Record volume injected to the nearest 0.05 μL.

13.1.8 A typical ECD response for a mixture of single component pesticides using a capillary column is illustrated in Figure 12. If the response (peak height or area) exceeds the calibration range, dilute the extract and reanalyze.

13.1.9 Quantify PCB mixtures by comparison of the total heights or areas of GC peaks (minimum of five) with the corresponding peaks in the best-matching standard. Use Aroclor 1242 for early-eluting PCBs and either Aroclor 1254 or Aroclor 1260 as appropriate for late-eluting PCBs.

13.1.10 If both PCBs and organochlorine pesticides are present in the same sample, use column chromatographic separation on silicic acid (8,9) prior to GC analysis.

13.1.11 If polar compounds are present that interfere with GC/ECD analysis, use column chromatographic cleanup or alumina (7), activity grade IV, in accordance with Section 12.2.

13.1.12 For confirmation use a second GC column such as DB-608. All GC procedures except GC/MS require second column confirmation.

13.1.13 For improved resolution use a capillary column such as an 0.25-mm I.D. x 30-m DB-5 with 0.25 μm film thickness. The following conditions are appropriate.

- Helium carrier gas at 1 mL/min.
- Column temperature program, 90°C (4 min)/16°C/min to 154°C/4°C/min to 270°C.
- Detector, ^{63}Ni ECD at 350°C.
- Make up gas, nitrogen, or 5% methane/95% argon at 60 mL/min.
- Splitless injection, 2 μL maximum.
- Injector temperature, 220°C.

13.1.14 Class separation and improved specificity can be achieved by column chromatographic separation on Florisil (9).

13.1.15 A Hall electrolytic conductivity detector (HECD) operated in the reductive mode may be substituted for the ECD for improved specificity. Sensitivity, however, will be reduced by at least an order of magnitude.

13.2 Analysis of Organophosphorus Pesticides by Capillary Gas Chromatography with Flame Photometric or Nitrogen-Phosphorus Detectors (GC/FPD/NPD)

[Note: Organophosphorus pesticides are responsive to flame photometric and nitrogen-phosphorus (alkali flame ionization) detection. Most of these compounds can be analyzed at concentrations of 50 to 500 ng/mL using either of these detectors.]

13.2.1 Procedures given in Section 13.1.1 through 13.1.9 and Section 13.1.13 through 13.1.14 apply, except for the selection of surrogates.

13.2.2 Use tributylphosphate, triphenylphosphate, or other suitable compound(s) as surrogates to verify extraction efficiency and to determine RRTs.

13.3 Analysis of Carbamate and Urea Pesticides by Capillary Gas Chromatography with Nitrogen-Phosphorus Detector

13.3.1 Trazine, carbamate, and urea pesticides may be determined by capillary GC (DB-5, DB-17, or DB-1701 stationary phase) using nitrogen-phosphorus detection or MS-SIM with detection limits in the 0.05 to 0.2 μL/mL range. Procedures given in Section 13.1.1 through 13.1.9 and Section 13.1.13 through 13.1.14 apply, except for the selection of surrogates, detector, and make up gas.

13.3.2 Thermal degradation may be minimized by reducing the injector temperature to 200°C. HPLC may also be used, but detection limits will be higher (1 to 5 μg/mL).

13.3.3 N-methyl carbamates may be determined using reverse-phase high performance liquid chromatography (HPLC) (C-18) (Section 13.4) and post-column derivization with o-phthaldehyde and fluorescence detection (EPA Method 531). Detection limits of 0.01 to 0.1 μg/mL can be achieved.

13.4 Analysis of Carbamate, Urea, Pyrethroid, and Phenolic Pesticides by High Performance Liquid Chromatography (HPLC)

[Note: Many carbamate pesticides, urea pesticides, pyrethrins, phenols, and other polar pesticides may be analyzed by high HPLC with fixed or variable wavelength UV detection. Either reversed-phase or normal phase chromatography may be used. Detection limits are 0.2 to 10 μg/mL of extract.]

13.4.1 Select HPLC column (i.e., Zorbax-SIL, 46-mm I.D. x 25-cm, or μ-Bondapak C18, 3.9-mm x 30-cm, or equivalent).

13.4.2 Select solvent system (i.e., mixtures of methanol or acetonitrile with water or mixtures of heptane or hexane with isopropanol).

13.4.3 Follow analytical procedures given in Sections 13.1.2 through 13.1.9.

13.4.4 If interferences are present, adjust the HPLC solvent system composition or use column chromatographic clean-up with silica gel, alumina, or Florisil (9).

13.4.5 An electrochemical detector may be used to improve sensitivity for some ureas, carbonates, and phenolics. Much more care is required in using this detector, particularly in removing dissolved oxygen from the mobile phase and sample extracts.

13.4.6 Chlorophenol (di- through penta-) may be analyzed by GC/ECD or GC/MS after derivatization with pentafluorobenzylbromide (EPA Method 604).

13.4.7 Chlorinated phenoxyacetic acid herbicides and pentachlorophenol can be analyzed by GC/ECD or GC/MS after derivatization with diazomethane (EPA Method 515). DB-5 and DBJ-1701 columns (0.25-mm I.D. x 30-m) at 60 to 300°C/4°C per min have been found to perform well.

13.5 Analysis of Pesticides and PCBs by Gas Chromatography with Mass Spectrometry Detection (GC/MS)

[Note: A mass spectrometer operating in the selected ion monitoring mode is useful for confirmation and identification of pesticides.]

13.5.1 A mass spectrometer operating in select ion monitoring (SIM) mode can be used as a sensitive detector for multi-residue determination of a wide variety of pesticides. Mass spectrometers are now available that provide detection limits comparable to nitrogen-phosphorus and electron capture detectors.

13.5.2 Most of the pesticides shown in Table 1 have been successfully determined by GC/MS-SIM. Typical GC operating parameters are as described in Section 13.1.1.

13.5.3 The mass spectrometer is typically operated using positive ion electron impact ionization (70 eV). Other instrumental parameters are instrument specific.

13.5.4 p-Terphenyl-d_{14} is commonly used as a surrogate for GC/MS analysis.

13.5.5 Quantification is typically performed using an internal standard method. 1,4-Dichlorobenzene, naphthalene-d_8, acenaphthene-d_{10}, phenanthrene-d_{10}, chrysene-d_{12} and perylene-d_{12} are commonly used as internal standards. Procedures given in Section 13.1.1 through 13.1.9 and Section 13.1.13 through 13.1.14 apply, except for the selection of surrogates, detector, and make up gas.

13.5.6 See ASTM Practice D 3687 for injection technique, determination of relative retention times, and other procedures pertinent to GC and HPLC analyses.

13.6 Sample Concentration

13.6.1 If concentrations are too low to detect by the analytical procedure of choice, the extract may be concentrated to 1 mL or 0.5 mL by carefully controlled evaporation under an inert atmosphere. The following procedure is appropriate.

13.6.2 Place K-D concentrator tube in a water bath and analytical evaporator (nitrogen blow-down) apparatus. The water bath temperature should be from 25°C to 50°C.

13.6.3 Adjust nitrogen flow through hypodermic needle to provide a gentle stream.

13.6.4 Carefully lower hypodermic needle into the concentrator tube to a distance of about 1 cm above the liquid level.

13.6.5 Continue to adjust needle placement as liquid level decreases.

13.6.6 Reduce volume to slightly below desired level.

13.6.7 Adjust to final volume by carefully rinsing needle tip and concentrator tube well with solvent (usually n-hexane).

14. Calculations

14.1 Determination of Concentration

14.1.1 The concentration of the analyte in the extract solution can be taken from a standard curve where peak height or area is plotted linearly against concentration in nanograms per milliliter (ng/mL). If the detector response is known to be linear, a single point is used as a calculation constant.

14.1.2 From the standard curve, determine the nanograms of analyte standard equivalent to the peak height or area for a particular compound.

14.1.3 Ascertain whether the field blank is contaminated. Blank levels should not exceed 10 ng/sample for organochlorine pesticides or 100 ng/sample for PCBs and other pesticides. If the blank has been contaminated, the sampling series must be held suspect.

14.2 Equations

14.2.1 Quantity of the compound in the sample (A) is calculated using the following equation:

$$A = 1000 \left(\frac{A_s \times V_e}{V_i} \right)$$

where:

A = total amount of analyte in the sample, ng.

A_s = calculated amount of material injected onto the chromatograph based on calibration curve for injected standards, ng.

V_e = final volume of extract, mL.

V_i = volume of extract injected, μL.

1000 = factor for converting microliters to milliliters.

14.2.2 The extraction efficiency (EE) is determined from the recovery of surrogate spike as follows:

$$EE(\%) = \left|\frac{S}{S_a}\right|[100]$$

where:

EE = extraction efficiency, %
S = amount of spike recovered, ng.
S_a = amount of spike added to plug, ng.

The extraction efficiency (surrogate recovery) must fall between 60-120% to be acceptable.

14.2.3 The total volume of air sampled under ambient conditions is determined using the following equation:

$$V_a = \frac{\sum_{i=1}^{n} (T_i \times F_i)}{1000\ L/m^3}$$

where:

V_a = total volume of air sampled, m^3.
T_i = length of sampling segment between flow checks, min.
F_i = average flow during sampling segment, L/min.

14.2.4 The air volume is corrected to EPA standard temperature (25°C) and standard pressure (760 mm Hg) as follows:

$$V_s = V_a \left(\frac{P_b - P_w}{760\ mm\ Hg}\right)\left(\frac{298K}{t_A}\right)$$

where:

V_s = volume of air at standard conditions (25°C and 760 mm Hg), std. m^3.
V_a = total volume of air sampled, m^3.
P_b = average ambient barometric pressure, mm Hg.
P_w = vapor pressure of water at calibration temperature, mm Hg.
t_A = average ambient temperature, °C + 273.

14.2.5 If the proper criteria for a sample have been met, concentration of the compound in a standard cubic meter of air sampled is calculated as follows:

$$C_a(ng/std.\ m^3) = \left[\frac{(A)}{(V_s)}\right]$$

If it is desired to convert the air concentration value to parts per trillion (ppt) in dry air at standard temperature and pressure (STP), the following conversion is used:

$$ppt = 0.844\ (C_a)$$

The air concentration can be converted to parts per trillion (v/v) in air at STP as follows:

$$pptv = \left[\frac{(24.45)\ (C_a)}{(MW)}\right]$$

where:

MW = molecular weight of the compound of interest, g/g-mole.

14.2.6 If quantification is performed using an internal standard, a relative response factor (RRF) is calculated by the equation:

$$RRF = \left[\frac{(I_s)(C_{is})}{(I_{is})(C_s)}\right]$$

where:

I_s = integrated area of the target analyte peak, counts.
I_{is} = integrated area of the internal standard peak, counts.
C_{is} = concentration of the internal standard, ng/μL.
C_s = concentration of the analyte, ng/µL.

14.2.7 The concentration of the analyte (C_a) in the sample is then calculated as follows:

$$C_a = \frac{(I_s)(C_{is})}{(RRF)(I_{is})}$$

where:

I_s = integrated area of the target analyte peak, counts.
RRF = relative response factor (see Section 14.2.7).

15. Performance Criteria and Quality Assurance

[Note: This section summarizes required quality assurance (QA) measures and provides guidance concerning performance criteria that should be achieved within each laboratory.]

15.1 Standard Operating Procedures (SOPs)

15.1.1 Users should generate SOPs describing the following activities accomplished in their laboratory: (1) assembly, calibration, and operation of the sampling system, with make and model of equipment used; (2) preparation, purification, storage, and handling of sampling cartridges, (3) assembly, calibration, and operation of the analytical system, with make and model of equipment used; and (4) all aspects of data recording and processing, including lists of computer hardware and software used.

15.1.2 SOPs should provide specific stepwise instructions and should be readily available to, and understood by, the laboratory personnel conducting the work.

15.2 Process, Field, and Solvent Blanks

15.2.1 One filter/PUF cartridge from each batch of approximately twenty should be analyzed, without shipment to the field, for the compounds of interest to serve as a process blank.

15.2.2 During each sampling episode, at least one filter/PUF cartridge should be shipped to the field and returned, without drawing air through the sampler, to serve as a field blank.

15.2.3 Before each sampling episode, one PUF plug from each batch of approximately twenty should be spiked with a known amount of the standard solution. The spiked plug will remain in a sealed container and will not be used during the sampling period. The spiked plug is extracted and analyzed with the other samples. This field spike acts as a quality assurance check to determine matrix spike recoveries and to indicate sample degradation.

15.2.4 During the analysis of each batch of samples, at least one solvent process blank (all steps conducted but no filter/PUF cartridge included) should be carried through the procedure and analyzed.

15.2.5 Levels for process, field and solvent blanks should not exceed 10 ng/sample for single components or 100 ng/sample for multiple component mixtures (i.e., for organochlorine pesticides and PCBs).

15.3 Method Precision and Bias

15.3.1 Precision and bias in this type of analytical procedure are dependent upon the precision and bias of the analytical procedure for each compound of concern, and the precision and bias of the sampling process.

15.3.2 Several different parameters involved in both the sampling and analysis steps of this method collectively determine the precision and bias with which each compound is detected. As the volume of air sampled is increased, the sensitivity of detection increases proportionately within limits set by: (a) the retention efficiency for each specific component trapped on the polyurethane foam plug, and (b) the background interference associated with the analysis of each specific component at a given site sampled. The sensitivity of detection of samples recovered by extraction depends on: (a) the inherent response of the particular GC detector used in the determinative step, and (b) the extent to which the sample is concentrated for analysis. It is the responsibility of the analyst(s) performing the sampling and analysis steps to adjust parameters so that the required detection limits can be obtained.

15.3.3 The reproducibility of this method for most compounds for which it has been evaluated has been determined to range from ±5 to ±30% (measured as the relative standard deviation) when replicate sampling cartridges are used (N>5). Sample recoveries for individual compounds generally fall within the range of 90 to 110%, but recoveries ranging from 65 to 125% are considered acceptable.

15.4 Method Safety

15.4.1 This procedure may involve hazardous materials, operations, and equipment. This method does not purport to address all of the safety problems associated with its use.

15.4.2 It is the users responsibility to consult and establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to the implementation of this procedure. This should be part of the users SOP manual.

Laboratory Analysis Report

BERKSHIRE ENVIRONMENTAL CONSULTANTS
AREA 1 NEWELL STREET
CT&E Laboratory Delivery Group Number: TA3-K0-P183 Page 1

COC: 018997

DATE: 01/19/04

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed in an attached case narrative. Release of the data contained in the hard copy data package has been authorized by the Laboratory Manager or designee, as verified by the following signature.

A case narrative is not required.

Laboratory Analysis Report

BERKSHIRE ENVIRONMENTAL CONSULTANTS
AREA I PHASE 3
SGS Laboratory Delivery Group Number: TA5-J0-P304 Page 1

COC: 043475

DATE: 10/19/05

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed in an attached case narrative. Release of the data contained in the hard copy data package has been authorized by the Laboratory Manager or designee, as verified by the following signature.

A case narrative is not required.

APPENDIX VI

GPS-1 OPERATOR'S MANUAL

GRASEBY GMW

INSTRUCTION AND OPERATION MANUAL

MODEL PS-1 PUF SAMPLER

Pesticide Particulate and Vapor Collection System

145 SOUTH MIAMI AVENUE
VILLAGE OF CLEVES, OHIO 45002

Toll-Free 800-543-7412
513-941-2229 in OH
Fax: 513-941-1977

OPERATING INSTRUCTIONS

MODEL PS-1

A. UNIT PREPARATION.

1. Remove the PS-1 Puf Sampler from the shipping carton.

2. Locate the shelter lid and install on the aluminum shelter as follows:
   a. Align the hinges of the lid to the rear of the shelter and fasten with four (4) 10-24 x 1/2" pan head screws.
   b. Secure the front catch,(see figure A), to the shelter front using two (2) 10-24 x 1/2" flat head screws.
   c. Secure the rear catch to the shelter back panel using one (1) 10-24 x 1/2" pan head screw.
   d. Secure the rear lid hasp to the shelter lid using two (2) 10-24 x 1/2" pan head screws. (note: These three catches may need readjustment to operate the shelter lid properly.)
   e. Adjust the front and rear catches to be sure that the lid slot lowers over the front catch when closing the lid and aligns with the rear catch when the lid is in the open position.
   f. The lid can now be secured in an open or closed position with the aluminum strip or a padlock.

3. Find one (1) sampling module in the packing container and install on the inlet port. The inlet port has a 1/2" threaded male fitting. Place the module over the male fitting and screw it on until snug.

4. Pull the exhaust hose from out of the shelter bottom and extend it away from the shelter on the ground.

5. Open the shelter door and timer.

6. Prepare the timer for the desired start and stop times.

B. Unit Calibration.

1. Calibration of the Puf Sampler is performed <u>without</u> a foam slug or filter paper in the sampling module. However the empty glass cartridge must remain in the module to insure a good seal through the module.

2. Install the GMW-40 Calibrator on top of the 4" filter holder.

3. Connect an 8" water manometer to the Calibrator.

4. Open the ball valve fully.

5. Turn the system on by tripping the manual switch on the timer. Allow a few minutes for warm-up.

6. Adjust the voltage control screw to obtain a reading of 70 inches on the dial gage, (Magnehelic Gage).

7. With 70 inches on the dial gage as your first calibration point, record it and the manometer reading on the data sheet.

8. Close the ball valve slightly to readjust the dial gage down to 60 inches. Record this figure and manometer reading on the data sheet.

9. Using the above procedure, adjust the ball valve for readings at 50, 40, and 30 inches and record on the data sheet.

10. Using these two sets of readings, plot a cuvre on the data sheet. This curve will be used for determining the actual flow rate in the field.

11. Readjust the voltage control fully clockwise to it's maximum setting. Open ball valve fully.

C. Unit Operation.

1. The Puf Sampler may be operated at ground level or on roof tops. In urban or congested areas, it is recommended that the sampler be placed on the roof of a single story building. The sampler should be located in an unobstructed area, at least two meters from any obstacle to air flow. The exhaust hose should be stretched out in a down wind direction if possible.

2. The sampler should be operated for 24 hours in order to obtain average daily levels of airborne pesticides.

3. On and off times and weather conditions during sampling periods should be recorded. Air concentrations may fluctuate with time of day, temperature, humidity, wind direction and velocity and other climatological conditions.

4. Air flow readings should be taken (dial gage) at the beginning and end of each sampling period. Differences between the beginning and ending flow rates should be averaged out to obtain an overall flow rate. (The Puf Sampler can be fitted with a gas meter which would give a direct reading of the total flow.)

5. Blower motor brushes should be inspected frequently and replaced before expending.

6. An electrical source of 110 volts, 15 amps is required.

D. Descriptions of Sampling Media (Sorbents)

1. Two types of sampling media are recommended for use with the Puf Sampler: polyurethane foams and granular solid sorbents. Foams may be used separately or in combination with granular solids. The sorbent may be extracted and reused (after drying) without unloading the cartridge.

2. Polyurethane Foam (PUF):
   a. Use polyether-type polyurethane foam (density No. 3014, 0.0225 grams/cm^3, or equivalent). This is the type of foam generally used for furniture upholstery, pillows, and mattresses.(General Metal Works' part number PS1-16 is recommended. It is a 3" PUF plug. Also available are two and one inch pieces.) This type of foam is white and yellows on exposure to light.

3. Granular Solids:
   a. Porous (macroreticular) chromatography sorbents recommended. Pore sizes and mesh sizes must be selected to permit air flow rates of at least 200 liters/minute. Approximately 25 cm^3 of sorbent is recommended. The granular solids may be sandwiched between two layers of foam to prevent loss during sampling and extraction.

E. Sampling Module.

1. Release the three (3) swing bolts on the 4" filter holder (FH-2104) and remove the hold down ring.

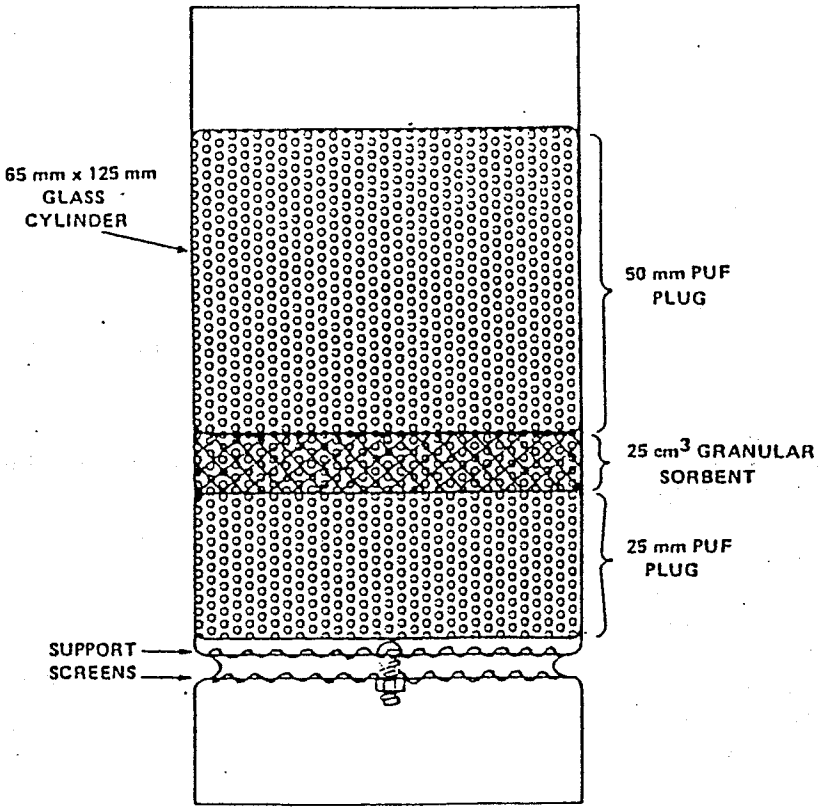
2. Install a clean 102mm dia. glass fiber filter (GMW-0232) on the support screen and secure it with the hold down ring and swing bolts.

3. Unscrew together the 4" filter holder and the sampling module cap leaving the module tube in place with the glass cartridge exposed.

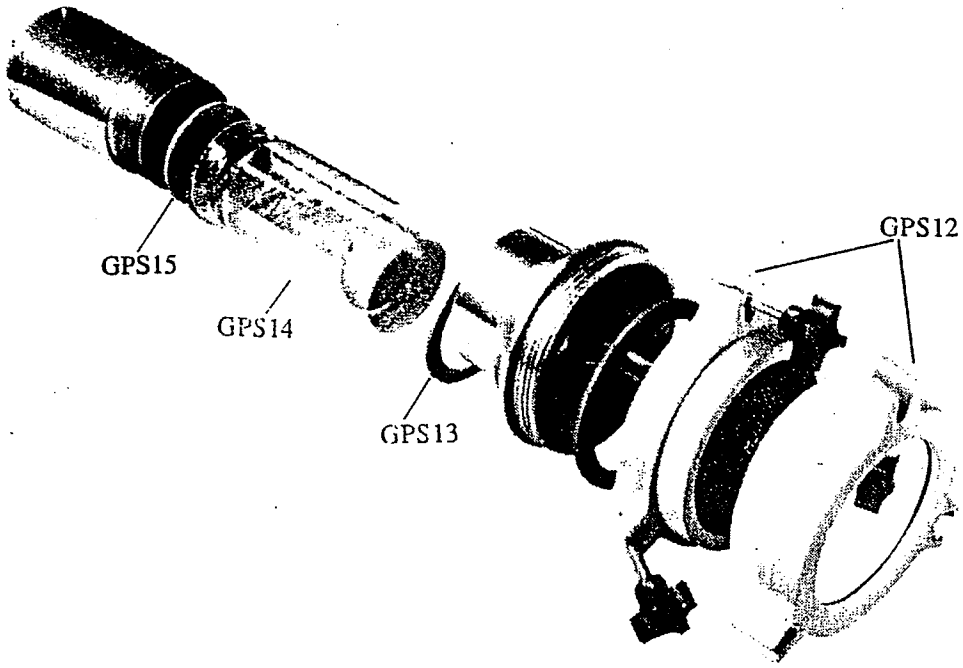
4. Load the glass cartridge with foam and or foam/granular solids and replace in the module tube. Fasten the glass cartridge with the module cap and 4" filter holder assembly while making sure that the module assembly, 4" filter holder and all fittings are snug and not over-tighten.

5. The glass cartridge and glass fiber filter should be removed from the sampler with forceps and clean gloved hands and immediately placed in a sealed container for transport to the laboratory. Similar care should be taken to prevent contamination of the filter paper and vapor trap (foam) when loading the sampler.

6. It is recommended to have two (2) sampling modules for each sampling system so that filter and foam exchange can take place in the laboratory.



DUAL SORBENT VAPOR TRAP



DUAL SAMPLING MODULE WITH 4" FILTER HOLDER

Model GPS1 Complete Sampling System

GPS11 ..... Dual Sampling module with GFH2104 4" filter holder, less glass cartridge
GPS12 ..... 4" round Filter Holder (GFH-2104)
GPS13 ..... Silicone Gasket (Top Module)
GPS14 ..... Glass Cartridge with support screens

MOTOR BRUSH SEATING PROCEDURE

On reassembly and handling, the lead wires must be kept away from rotating parts and motor frame.

To achieve best performance, the new brushes should be seated on the commutator before full voltage is applied.

After brush change apply approximately 50% voltage for thirty minutes to accomplish this seating. The motor will return to full performance after thirty to forty-five minutes running at full voltage.

(Caution) – Direct application of full voltage after changing brush will cause arcing, commutator pitting, and reduce overall life.

Use of the Model GMW - 900 Voltage Variator provides the reduced voltage needed for brush seating.

If reduced voltage is unavailable, connect two motors of similar rating in series for thirty minutes to accomplish the brush seating.

WARNING – THE BRUSHES SHOULD BE CHANGED BEFORE THE BRUSH SHUNT TOUCHES THE COMMUTATOR.

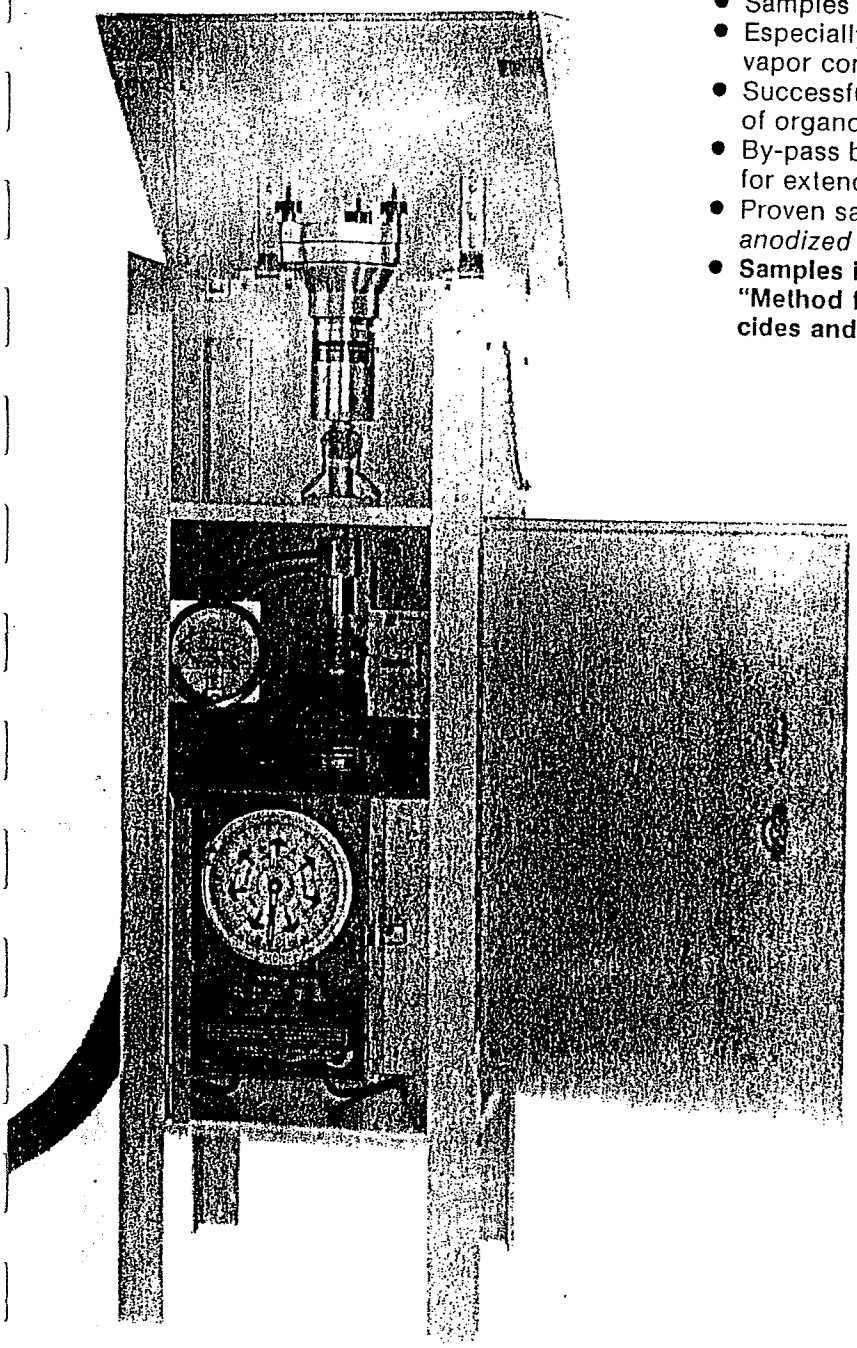
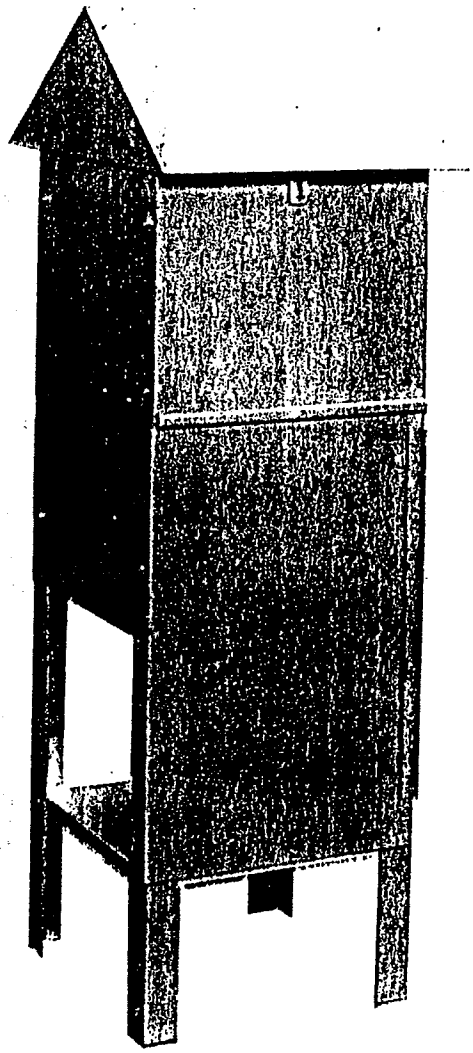
MODEL GPS1 PUF SAMPLER

Pesticide Particulate and Vapor Collection System

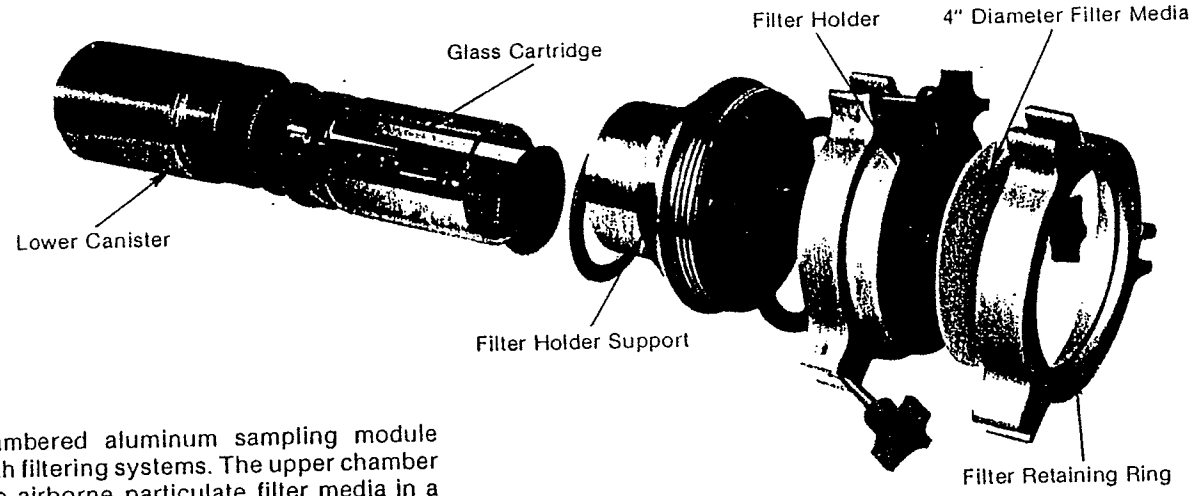


- Samples semivolatile organic compounds.
- Especially designed for sampling airborne particulates and vapor contamination from pesticide compounds.
- Successfully demonstrated to efficiently collect a number of organochlorine and organophosphate pesticides.
- By-pass blower motor design permits continuous sampling for extended periods at rates to 280 liters per minute.
- Proven sampler compounds housed in aluminum shelter *anodized* for outdoor service.
- **Samples in accordance with U.S. EPA Method TO4, "Method for the Determination of Organochlorine Pesticides and Polychlorinated Biphenyls in Ambient Air."**



General Metal Works' **PUF** (PolyUrethane Foam) Sampler is a complete air sampling system designed to simultaneously collect suspended airborne particulates as well as trap airborne pesticide vapors at flow rates up to 280 liters per minute. The Model GPS1 features the latest in technological advances for accurately measuring airborne particulates and vapors.

The GMW **PUF** Sampler is equipped with a by-pass blower motor arranged with an independent cooling fan. This feature permits the motor to operate at low sampling flow rates for periods of long duration without motor failure from overheating.



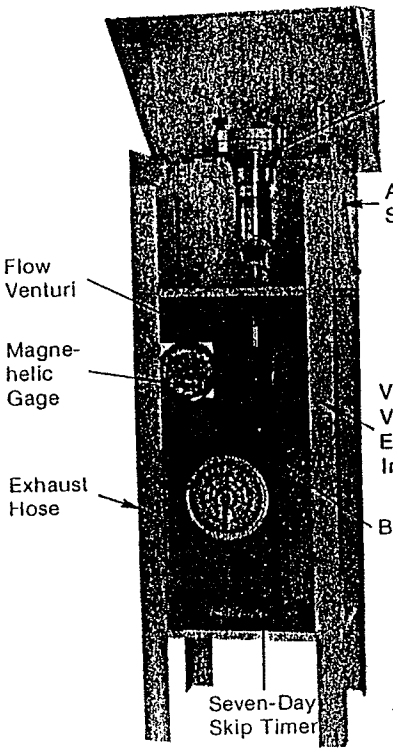
A dual chambered aluminum sampling module contains both filtering systems. The upper chamber supports the airborne particulate filter media in a circular filter holder. The lower chamber encapsulates a glass cartridge which contains the PolyUrethane Foam for vapor entrapment.

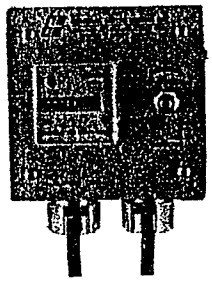
A wide variety of sorbents can be used in a manner that permits their continual use. Polyurethane foam or wet/dry granular solid media can be used individually or in combination.

The dual chambered sampling module is designed for easy access to both upper and lower media. Swing-away bolts simplify changing the 4" diameter particulate filter media. The threaded lower canister is removed with the cartridge intact for immediate exchange. Filter support screens and module components are equipped with gaskets providing a leak proof seal during the sampling process.

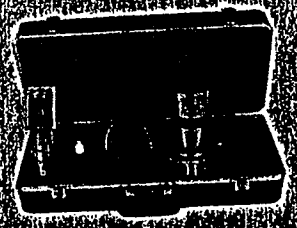
Air flow rates are infinitely variable up to 280 liters per minute. The voltage variator adjusting screw alters the blower motor speed to achieve the flow rate desired. The air flow rate is measured through the flow venturi utilizing a 0-100" Magnehelic Gage. Periodic calibration is necessary to maintain on-site sampling accuracy.

A 7-day skip timer is included as standard and permits weekly scheduling with individual settings for each day and 14 trippers to turn the sampler on and off as desired. Any day or days may be omitted. Day and night periods are distinctly marked. Other timers and timer/programmers are available optionally to suit any sampling requirement.





A nonresettable, elapsed time indicator verifies accumulative intermittent sampling time periods as well as total elapsed time of operation. Calibrated in hundredths of an hour, the unit has a total register of 99,999.99 hours.



Priced separately, the calibration kit includes a manometer, calibrator and calibration curve nested in a carrying case. The calibrator attaches directly to the top of the filter holder eliminating the need to disassemble the sampling unit. It affords precise calibration of the sampler and is especially recommended for calibrating the Model GPS1 **PUF** Sampler.

The GMW Model GPS1 **PUF** Sampler is shipped completely wired and assembled ready for operation. All components are housed within the anodized aluminum shelter for maximum protection.

SPECIFICATIONS:

Amperage—8.0
Wattage—960
Max. Flow Rate—280 liters per minute
Power Source—115V, 1 phase, 60 Hertz (other electrical characteristics available on request)
Net Weight—65 lbs.
Shipping Weight—75 lbs.

NOTES:

1. AS-BUILT TOPOGRAPHIC SURVEY WITHIN REMEDIATION LIMITS COMPLETED ON AUGUST 8 - SEPTEMBER 6, 2005 BY HILL-ENGINEERS, ARCHITECTS, PLANNERS, INC.

2. THE HORIZONTAL COORDINATE SYSTEM USED FOR THIS SURVEY IS NAD27 AND THE ELEVATIONS SHOWN HEREON ARE NGVD29 BASED UPON CONTROL POINTS SUPPLIED BY BLASLAND, BOUCK & LEE, INC.

3. REMEDIATION LIMITS AND DEPTHS PROVIDED BY BLASLAND, BOUCK & LEE, INC. ON THEIR DRAWING ENTITLED "PHASE 1 EXCAVATION LIMITS", DRAWING 10112G06 DATED JULY, 2003.

4. SEE PLAN ENTITLED "SITE PLAN J9-23-13 & 16 THRU 25" AND DATED AUGUST 15, 2001 BY HILL-ENGINEERS, ARCHITECTS, PLANNERS, INC. FOR EXISTING CONDITIONS PRIOR TO REMEDIATION.

NOTES:

1. AS-BUILT TOPOGRAPHIC SURVEY WITHIN REMEDIATION LIMITS COMPLETED BETWEEN OCTOBER - DECEMBER 2003 & ON AUGUST 1, 2006 BY HILL-ENGINEERS, ARCHITECTS, PLANNERS, INC.

2. THE HORIZONTAL COORDINATE SYSTEM USED FOR THIS SURVEY IS NAD27 AND THE ELEVATIONS SHOWN HEREON ARE NGVD29 BASED UPON CONTROL POINTS SUPPLIED BY BLASLAND, BOUCK & LEE, INC.

3. REMEDIATION LIMITS AND DEPTHS PROVIDED BY BLASLAND, BOUCK & LEE, INC. ON THEIR DRAWING ENTITLED "PHASE II EXCAVATION LIMITS", DRAWING 10112G07 DATED JULY, 2003.

4. SEE PLAN ENTITLED "SITE PLAN J9-23-13 & 16 THRU 25" AND DATED AUGUST 15, 2001 BY HILL-ENGINEERS, ARCHITECTS, PLANNERS, INC. FOR EXISTING CONDITIONS PRIOR TO REMEDIATION.

5. SEE POINT TABLES ON MX-56-2 DRAWING C-102 FOR ORIGINAL, EXC & AS-BUILT ELEVATIONS AND REMOVAL DEPTHS.

6. SOILS REMOVED FROM THIS AREA (NEW BITUMINOUS) AS PART OF REMEDIATION ACTIVITIES IN 2003/2004 WERE MANAGED AS TSCA MATERIAL; SOILS REMOVED AS PART OF THE NOVEMBER 2007 PAVEMENT RESTORATION ACTIVITIES WERE MANAGED AS NON-TSCA MATERIAL

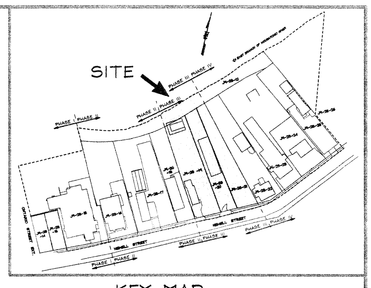
LEGEND

2023 X	POINT OF EXCAVATION MONITORING
	EDGE OF PAVEMENT
—o—	CHAINLINK FENCE
985	AS BUILT CONTOUR
	UTILITY POLE
P.L.	PROPERTY LINE
(W)	MONITORING WELL
1' EXC	DEPTH OF CUT
	DENOTES AREAS REMEDIATED AS TSCA
	DENOTES NEW BARRIER AREA
	DENOTES BARRIER INSTALLED IN PREVIOUS PHASE OF REMEDIAL ACTION.



KEY MAP
N.T.S.

NOTES:

1. AS-BUILT TOPOGRAPHIC SURVEY WITHIN REMEDIATION LIMITS COMPLETED BETWEEN OCTOBER - DECEMBER 2005 & ON AUGUST 1, 2006 BY HILL-ENGINEERS, ARCHITECTS, PLANNERS, INC.

2. THE HORIZONTAL COORDINATE SYSTEM USED FOR THIS SURVEY IS NAD27 AND THE ELEVATIONS SHOWN HEREON ARE NGVD29 BASED UPON CONTROL POINTS SUPPLIED BY BLASLAND, BOUCK & LEE, INC.

3. REMEDIATION LIMITS AND DEPTHS PROVIDED BY BLASLAND, BOUCK & LEE, INC. ON THEIR DRAWING ENTITLED "PHASE III EXCAVATION LIMITS", DRAWING 10112G08 DATED JULY, 2003.

4. SEE PLAN ENTITLED "SITE PLAN J9-23-13 & 16 THRU 25" AND DATED AUGUST 15, 2001 BY HILL-ENGINEERS, ARCHITECTS, PLANNERS, INC. FOR EXISTING CONDITIONS PRIOR TO REMEDIATION.

5. SEE POINT TABLES ON MX-56-3 DRAWING C-102 FOR ORIGINAL, EXC & AS-BUILT ELEVATIONS AND REMOVAL DEPTHS.
