

**ORONOGO-
DUENWEG MINING BELT
MISSOURI
EPA ID# MOD980686281**

**EPA Region 7
City: Joplin, MO and vicinity
County: Jasper County
Other Names: Jasper County,
Tri-State Mining Area**

12/23/2008

SITE DESCRIPTION

The Oronogo-Duenweg Mining Belt Site is an inactive lead and zinc mining and smelting area in the southwestern portion of Jasper County, Missouri. Operations began in the mid 1800s, and included hundreds of mines and 17 smelters. One smelter in the city of Joplin operated until the 1970s, which resulted in air emissions and fugitive dust contaminating soil in a large area. In addition, about 7,000 acres are contaminated with over 10 million tons of surface mining wastes. These waste piles are uncovered and unstable. Leachate and run-off from the piles enter ground water and surface streams. Sample results show that soil, ground water, and surface water are contaminated with lead, zinc, and cadmium (hazardous substances) from the mining and smelting activities. Risks include ingestion of contaminated ground water, soil, or mine wastes. About 2,600 residential homes located within the smelter and mining waste areas had yard soil above the established site action level for lead. EPA identified approximately 200 homes that were supplied bottled water due to contaminated private wells. A 1994 human health exposure study by the Missouri Department of Health (MDOH) showed that 14 percent of the children under seven years old had blood-lead concentrations exceeding the health-based standard of ten micrograms per deciliter. The risk assessment for the residual mine waste areas identified a current risk for people living on or near mine wastes and a future risk for people building new homes on mining waste areas where surface soil or the mining wastes contain contaminants that exceed the action levels. Contaminant concentrations in surface water exceed the Federal Ambient Water Quality Criteria, and the concentrations in some stream sediments exceed severe effect sediment toxicity criteria, indicating significant aquatic risk at the Site. Risks to terrestrial vertebrate populations and communities were evaluated by comparing the average daily dose to selected toxicity reference values and concluded that terrestrial vertebrates that consume earthworms in soils with elevated contaminant of concern concentrations may experience adverse chronic effects.

Site Responsibility:

This site is being addressed through Federal and potentially responsible parties' (PRPs) actions.

NPL LISTING HISTORY

Proposed Date: 06/24/88

Final Date: 08/30/90

Deleted Date:

THREATS AND CONTAMINANTS

The wastes from the mining, milling, and smelting of the ore has resulted in the significant contamination of ground water, surface water, and surface soil with cadmium, lead and zinc. Approximately 500 homes at the site rely on private shallow ground water wells. EPA has identified at least 200 of these wells that exceed action levels for lead and cadmium. At least 2,300 residential yards have been contaminated with lead above acceptable levels from smelting activities at the Eagle-Picher facility in northeast Joplin. Additionally, EPA has identified approximately 300 homes built on or near milling waste piles where the yard soils exceed acceptable levels of lead.

CLEANUP APPROACH

Response Action Status

Initial Actions: The EPA and the PRPs provided bottled water to residences affected by contaminated ground water. In addition, six day-care centers and 300 contaminated residential yards were cleaned up in the smelter areas under a time-critical removal action.

Mine and Mill Wastes: Investigations into the nature and extent of contamination of the mining wastes were completed in 1995. EPA completed human health and ecological risk assessments for the site. A Record of Decision, which identifies sub-aqueous disposal as the primary approach for cleanup of mine wastes, was completed in September 2004. The EPA completed the cleanup of the mine waste piles and mine waste contaminated lands on 75 acres in Carterville in 2008 and began work on an additional 300 acres in a adjacent area. Cleanup of the entire 7,000 acre area in approximately 300 acre increments, in addition to RPP actions, is expected to take 10 years.

Residential Yards: Investigations of homes in the smelter area showed several thousand yards had high lead levels. EPA signed a Record of Decision on August 1, 1996 for remediation of residential yards. Remedial action of the yard soil was initiated in November 1996 and was completed in September of 2001. Approximately 2,300 residential yards were cleaned up in addition to those cleaned in the initial action.

Permanent Water Supply: EPA signed a Record of Decision on July 29, 1998 to supply approximately 350 homes with public water supplies. EPA provided funding to the Public Water Supply District #3, Missouri American Water Company, Webb City, and the City of Duenweg to install public water supply lines into the contaminated area. Public water lines throughout the site were completed in 2006.

Site Facts: In 1991, the EPA signed an Administrative Order on Consent (AOC) with the PRPs to investigate the mining wastes. A Unilateral Administrative Order was issued to the PRPs to provide bottled water to residents in 1994. A second Unilateral Administrative Order was issued to the PRPs in 1994 to conduct additional private water well sampling and provide bottled water where exceedances of action levels were found. EPA signed an AOC with the PRPs in 1995 to sample residential yard soil and prioritize areas for a time-critical removal. EPA expanded the yard sampling activities, and completed the cleanup at 2,600 properties. A Consent Decree was completed in 1999 for the PRPs to install public water supply systems. The systems were completed in 2006. A Consent Decree is in the process of being finalized by the court to cleanup portions of the mine waste area totaling about 1,800 acres or about 25% of the site.

ENVIRONMENTAL PROGRESS

Installation of public water supplies is complete. Approximately 500 homes have been connected to public water supplies, and no longer rely on contaminated private water wells. Residential yards soils contaminated with lead have been cleaned up. The yard soil cleanup activities have resulted in a 78 percent reduction in the number of children with elevated blood-lead levels. A decision on cleanup of the mining wastes was made in 2004. Remedial action for cleanup of the mining wastes in high priority areas is underway on the first 375 acres and is expected to be completed in 2016. A County building ordinance has been implemented to prevent improper construction of residences in contaminated areas until the cleanup is completed and a state groundwater well drilling rule has been passed to prevent use of shallow groundwater in contaminated areas of Jasper and Newton counties.

COMMUNITY INVOLVEMENT

Efforts to involve the community at this site have been extensive and have resulted in improved community relations and decision making. EPA has worked with two separate citizens groups at the site: the Environmental Task Force of Jasper and Newton Counties which was originally formed by the Joplin City Council as a Community Advisory Group (CAG), and the Jasper County Superfund Site Coalition, to which EPA provided a Technical Assistance Grant (TAG). Through the CAG and TAG, the EPA seeks to achieve direct, regular, and meaningful consultation with citizens throughout all stages of site activities. The citizens groups' membership consists of local citizens, bankers, realtors, business owners, county commissioners, county and city health department employees, local health care providers, state legislative representatives, city council members, school district representatives, and a planning and zoning board member. In general, the EPA provides documents generated from site activities including the remedial investigation report, risk assessments and feasibility study, to name a few, for review and comment by the groups. EPA, as well as the Missouri Department of Natural Resources, the Missouri Department of Health, and the Agency for Toxic Substances and Disease Registry have met over the years with the groups in a public forum to update the members on site activities and discuss site issues.

A County building ordinance has been implemented to prevent improper construction of residences in contaminated areas until the cleanup is completed. The second five-year review was completed in 2007.
