## Executive Summary

An assessment of the potential radiation dose that residents offsite of the Nevada Test Site (NTS) might receive from the proposed Divine Strake experiment was made to determine compliance with Subpart H of Part 61 of Title 40 of the Code of Federal Regulations, *National Emission Standards for Emissions of Radionuclides Other than Radon from Department of Energy Facilities*. The Divine Strake experiment, proposed by the Defense Threat Reduction Agency, consists of a detonation of 700 tons of heavy ammonium nitrate fuel oil-emulsion above the U16b Tunnel complex in Area 16 of the NTS. Both natural radionuclides suspended, and historic fallout radionuclides resuspended from the detonation, have potential to be transported outside the NTS boundary by wind. They may, therefore, contribute radiological dose to the public. Subpart H states “Emissions of radionuclides to the ambient air from Department of Energy facilities shall not exceed those amounts that would cause any member of the public to receive in any year an effective dose equivalent of 10 mrem/yr” (Title 40 of the Code of Federal Regulations [CFR] §61.92) where mrem/yr is millirem per year. Furthermore, application for U.S. Environmental Protection Agency (EPA) approval of construction of a new source or modification of an existing source is required if the effective dose equivalent, caused by all emissions from the new construction or modification, is greater than or equal to 0.1 mrem/yr (40 CFR §61.96).

In accordance with Section 61.93, a dose assessment was conducted with the computer model CAP88-PC, Version 3.0. In addition to this model, a dose assessment was also conducted by the National Atmospheric Release Advisory Center (NARAC) at the Lawrence Livermore National Laboratory. This modeling was conducted to obtain dose estimates from a model designed for acute releases and which addresses terrain effects and uses meteorology from multiple locations.

Potential radiation dose to a hypothetical maximally exposed individual at the closest NTS boundary to the proposed Divine Strake experiment, as estimated by the CAP88-PC model, was 0.005 mrem with wind blowing directly towards that location. Boundary dose, as modeled by NARAC, ranged from about 0.006 to 0.007 mrem. Potential doses to actual offsite populated locations were generally two to five times lower still, or about 40 to 100 times lower than the 0.1 mrem level at which EPA approval is required pursuant to Section 61.96.

## 1 INTRODUCTION

The Defense Threat Reduction Agency (DTRA) plans to conduct an experiment at the U16b Tunnel in Area 16 of the Nevada Test Site (NTS). The experiment, called Divine Strake, will consist of a single detonation of 700 tons (English) of heavy ammonium nitrate fuel oil-emulsion (ANFO) (593 tons trinitrotoluene equivalent) (U.S. Department of Energy [DOE], 2006a). Though no nuclear testing activities of any type were conducted within one mile of the U16b Tunnel (DOE, 2000), the area was subject to fallout from global and NTS nuclear tests. Resuspension of this fallout could travel beyond the NTS boundary where it might contribute to the radiological dose of the public. In addition to man-made radionuclides, the U.S. Environmental Protection Agency (EPA) suggested that the assessment of potential radiological dose also include naturally occurring radionuclides in soils suspended as a result of the explosion (Rosenblum, 2006). This report describes how DOE and DTRA calculated the potential radiological dose to persons residing outside the NTS boundary from radionuclides suspended by the proposed Divine Strake experiment.

Under the Clean Air Act, the National Emission Standards for Hazardous Air Pollutants (NESHAP) were established to control certain pollutants. Subpart H of Part 61 of Title 40 of the Code of Federal Regulations (CFR) states, "Emissions of radionuclides to the ambient air from Department of Energy facilities shall not exceed those amounts that would cause any member of the public to receive in any year an effective dose equivalent of 10 mrem/yr" (40 CFR §61.92). It is also required that an application for EPA approval of construction of a new source or modification of an existing source be submitted if the effective dose equivalent caused by all emissions from the new construction or modification is equal to or greater than 1 percent of the 10 millirem per year (rem/yr) standard ( $\geq 0.1$  mrem/yr) set in 40 CFR §61.96. Potential dose from the proposed Divine Strake experiment estimated from models are compared with the limit of 10 mrem/yr and to the 0.1-mrem/yr level at which an application for EPA approval is required. Releases of radionuclides to the air from the NTS have been reported annually to the EPA since 1992 in NESHAP reports.

## 2 METHODS

### 2.1 Clean Air Act Assessment Package – 1988 (CAP88-PC)

As specified by Section 61.93, compliance with NESHAP shall be determined and effective dose equivalent values to members of the public calculated using the computer model CAP88-PC, AIRDOS-PC, or other procedures for which EPA has granted prior approval. The use of CAP88-PC has been the most widely used model at facilities within the DOE complex. On February 21, 2006, the EPA announced acceptance of Version 3.0 of the CAP88-PC model for use in demonstrating compliance with the requirements of Subpart H of Part 61 (Federal Register, Vol. 71, pages 8854 - 8856). Version 3.0 of CAP88-PC was one of the models used here to calculate the potential dose to the public from the proposed Divine Strake experiment.

CAPP88-PC uses a modified Gaussian plume equation to estimate dispersal of radionuclide releases. This Gaussian plume model is one of the most commonly used models in government guidebooks, and results have been shown to agree well with experimental data (Shroff, 2006). Since the model was designed for chronic low-level releases, external dose and intake

assumptions in the model result in a higher, and therefore more conservative, estimate of potential dose to offsite residents when applied to a sudden release like that from the proposed Divine Strake experiment. CAP88-PC does not consider the effects of complex terrain; however, impacts from terrain are expected to be negligible because the size of the proposed Divine Strake experiment release area is small compared with the distances to offsite individuals (Shroff, 2006). Also, potential terrain effects are diminished due to the high release momentum, and therefore, plume height. The National Atmospheric Release Advisory Center (NARAC) modeling described in Section 2.2 of this report addresses issues of the acute release and terrain effects.

Two CAP88-PC runs are described in this report. The only difference between the two is the wind directional speeds used. Wind data are described in the following section. An earlier CAP88-PC run is described in Appendix C. This was based on literature values from historic data for source term whereas the CAP88-PC modeling described in the body of this report is based on site characterization data collected specifically for this purpose (DOE, 2006c). Results from the modeling presented in Appendix C fall between the modeled results based on the site characterization data.

Prior to modeling potential dose from the proposed Divine Strake experiment, the Modtest sample case described in the CAP88-PC Version 3.0 User Guide, was run on the same computer and software installation used for dose estimations from the proposed Divine Strake experiment. Results of this test were identical to those from the published example (Shroff, 2006), thereby providing an additional measure of quality assurance. The *Synopsis* and *Dose and Risk Equivalent Summary* Reports from the Modtest run are provided in Appendix D for comparison with those given in Appendix G of the CAP88-PC Version 3.0 Users Guide (Shroff, 2006).

### 2.1.1 CAP88-PC Inputs

#### Source Term Area

The crater created by the proposed Divine Strake experiment is predicted to be 98 feet (ft) (30 meters [m]) in radius (DOE, 2006a). However, particulates are expected to be suspended from the blast over a much larger area. The source term area used in the CAP88-PC modeling was the same as that used for sampling during site characterization (DOE, 2006b), specifically an area of 292,000 square meters (m<sup>2</sup>) (circle with radius of 1,000 ft or about 300 m). The release height above ground level was set to the minimum allowed by CAP88-PC (0.01 m) since the release is from ground level.

#### Source Term

The source term used in modeling is listed in Table 1. Radionuclide concentrations (in picocuries per gram [pCi/g]) in material suspended from the proposed Divine Strake experiment were taken as the maximum upper confidence interval (UCI) for each radionuclide listed in the *Site Characterization Report of the Divine Strake Experiment at the Nevada Test Site* (DOE, 2006c). These concentrations were multiplied by the total amount of particulate matter less than 10 micrometers in diameter (PM10) predicted to be suspended from the proposed Divine Strake explosion [17.55 tons (English)] (DOE, 2006a). For radionuclides that are part of a decay chain, secular equilibrium was assumed and the maximum UCI within the chain was assumed for the entire decay chain. All specific radionuclides listed in Section 4 of the site characterization

report (DOE, 2006c) were used as source term regardless of the number of samples that had non-detections.

### **Buildup**

Because the CAP88-PC model is designed for continuous chronic releases, the default buildup value is 100 years. This means the model allows 100 years for the buildup of short-lived progeny in the environment before potential doses are calculated. While the proposed Divine Strake experiment would be a short-term release, the 100 year buildup value was used as it is the approach specified in the basis model for CAP88-PC (the NUREG 1.109 approach [U.S. Nuclear Regulatory Commission, 1977]) and therefore the approach accepted for demonstrating compliance. The 100 year buildup time is conservative (increases potential dose). In this case, changes in buildup time make a small difference in the calculated dose because progeny within decay chains were assumed to be in equilibrium for the source term for the proposed Divine Strake experiment.

### **Meteorology**

Ambient temperature = 13.2 degrees Celsius (°C) (2005 average temperature in Area 16)

Humidity = 3.4 grams per cubic meter (average moisture concentration measured by atmospheric moisture samplers on the NTS 2000 – 2002)

Precipitation = 3 centimeters (cm)

Wind: Because it was not known when the proposed Divine Strake experiment would occur, two wind data sets were used. The first represented the worse case scenario with the average actual wind speed and stability class (Class E) observed on the NTS for January 1999 – 2005 (6 knots or 3.1 meters per second [m/s]) going in a single direction 100 percent of the time. The second data set used actual stability classes, wind speed, and wind directions in Area 16 of the NTS for all of 2005. The single direction wind file with the relatively low wind speed experienced in January results in a higher (more conservative) dose estimate while the 2005 wind conditions result in a low estimate due to portions of the wind going in all directions over the release period. These two estimates bound the wind conditions expected.

### **Momentum**

The initial upward momentum of the dust cloud used with CAP88-PC was 4000 m/s (13,000 feet per second [fps]). This is an approximation for very large quantities of blasting agents which is accepted in the commercial industry (GlobalSecurity.org, 2006).

### **Mixing Height**

The mixing height used was 3,000 m. This represents the 2,510 m cloud top obtained from Lawrence Livermore National Laboratory's (LLNL's) Hotspot model which was then rounded off to one significant figure.

Tl-208	6.70E-01	1.07E-05			

<sup>a</sup> pCi/g = pico Curie per gram: Maximum UCI for each radionuclide listed in the site characterization report (DOE, 2006c) were used. For radionuclides that are part of a decay chain, secular equilibrium was assumed and the maximum UCI within the chain was assumed for the entire decay chain.

<sup>b</sup> Ci = Curie: Concentration for source term multiplied by mass of PM10 material (15,921,093 g).

<sup>c</sup> Tritium associated with soil moisture. Assumed 10 percent moisture (gravimetric).

## Distances

Distances entered into CAP88-PC are listed in Table 2 and correspond with distances in kilometers (km) to populated locations outside the NTS boundary. The exception to this is at the closest NTS boundary which is due east of the proposed Divine Strake experiment. There is no public access there due to the U.S. Air Force's Nevada Test and Training Range, but the location was used as a worst case for a hypothetical offsite resident.

## Food Source Scenario

The food source scenario selected for the CAP88-PC modeling was the rural scenario. EPA default values for this scenario were used. The rural scenario results in the highest dose calculation due to the assumption that all food (vegetable, milk, and meat) were produced within the assessment area (i.e., no food was imported).

## 2.2 NARAC Modeling

NARAC provides tools and services that map the spread of hazardous material accidentally or intentionally released into the atmosphere. Located at the University of California's LLNL, NARAC is a national support and resource center for planning, preparedness, real-time emergency response, and threat assessments involving nuclear, radiological, chemical, biological, or natural emissions. NARAC predictions provide information on affected areas and populations (NARAC.llnl.gov, 2006).

The NARAC emergency response system consists of a coupled suite of meteorological and dispersion models. The data assimilation model, Atmospheric Data Assimilation and Parametrization Techniques, constructs variables such as mean winds, pressure, precipitation, temperature, and turbulence, using a variety of interpolation methods and atmospheric parameterizations. Non-divergent wind fields are produced by an adjustment procedure based on the variational principle and a finite-element discretization. The dispersion model, Lagrangian Operational Dispersion Integrator, solves the three-dimensional advection-diffusion equation using a Lagrangian stochastic, Monte Carlo method. LODI includes methods for simulating the processes of mean wind advection, turbulent diffusion, radioactive decay and production, wet deposition, gravitational settling, dry deposition, and buoyant/momentum plume rise. The models are coupled to NARAC databases providing topography, geographical data, and health risk levels. Real-time meteorological observational data, and global and mesoscale forecast model predictions are available. For more information on NARAC, models, and their testing and evaluation see <http://narac.llnl.gov/modeling.php> (NARAC.llnl.gov, 2006).

Radionuclide transport and potential dose to persons from the proposed Divine Strake experiment were modeled by NARAC for releases beginning on two representative days in January, one during 2005 and one during 2006 (see Meteorology below).

### 2.2.1 NARAC Inputs

#### Source Term Area

The source term area used was the same as that described above: a circle with radius rounded to the nearest hundred meters (radius = 300 m).

#### Source Term

The source term used was the same as described above and listed in Table 1.

#### Meteorology

Since it is not known when the proposed Divine Strake experiment will be conducted, meteorology was used from the month of January because, in general, it would provide a higher (more conservative) dose estimate due to average winds blowing in a more northerly direction, lower average wind speeds, and more stable conditions. Specific meteorological data used were from two days in January. The first was January 15, 2005; the second was January 20, 2006. The time of day the models started was 1600 Universal Coordinated Time (UTC), or 0800

Pacific Standard Time (PST). Data from all available meteorological stations on the NTS plus many off of the NTS were used (see Appendix B for figures showing meteorological stations).

### **Population Estimates**

Population within estimated plume areas was provided using a database from Los Alamos National Laboratory. The database includes U.S. Census Bureau residential data and business population data (from the State Business Directory). It includes estimates of day-night worker migration, thereby providing a population density database that accounts for time-of-day population variation for the entire United States on a 250-m resolution grid (McPherson and Brown, 2003).

### **Terrain Source**

The National Imagery and Mapping Agency has developed standard digital datasets, known as Digital Terrain Elevation Data (DTED). DTED are a uniform matrix of terrain elevation values that provide basic quantitative data for systems and applications that require terrain elevation, slope, and/or surface roughness information.

## **3 RESULTS**

### **3.1 CAP88-PC**

Model results from CAP88-PC are provided in Appendix A and summarized in Table 3. The worst case scenario (wind blowing directly at a hypothetical resident at the closest distance along the east NTS boundary) would result in a dose of 0.005 mrem or 20 times lower than the level at which EPA approval is required. Though the closest NTS boundary was the eastern boundary, potential dose would be very similar at the western boundary (assuming wind blowing towards that direction) given the proposed Divine Strake experiment is nearly centered between the eastern (22.6 km away) and western (23.5 km away) NTS boundaries. The closest offsite population is Amargosa Valley, 46.7 km to the south-southwest of the proposed Divine Strake experiment. Based on this modeling, wind blowing directly towards Amargosa Valley during the proposed Divine Strake experiment would result in a potential dose of 0.002 mrem, about 50 times lower than the level at which EPA approval is required. Release requirements set for the experiment call for surface wind to be blowing from the southwest (240 degrees) through the southeast (120 degrees) at less than 25 miles per hour (DOE, 2006a). In this direction, Medlin's Ranch, Penoyer Farm, and Rachel are the closest populated locations potentially downwind from the experiment. CAP88-PC predicted potential doses of 0.0011, 0.0010, and 0.00096 mrem, respectively, at these locations with wind blowing directly at them.

Over 67 percent of the potential dose predicted by CAPP88-PC was from nuclides in the  $^{235}\text{U}$  chain. Dose from radionuclides in the  $^{232}\text{Th}$  and  $^{238}\text{U}$  chains accounted for 11 and 8 percent, of the total dose, respectively. Average concentrations of  $^{238}\text{U}$  and  $^{235}\text{U}$  reported in the site characterization report for the proposed Divine Strake experiment (DOE, 2006c) are within the range expected for natural uranium (EPA, 1994) and concentration ratios of these averages also suggest natural uranium. The highest contributor to dose from a purely man-made radionuclide was  $^{239}\text{Pu}$  which accounted for 9 percent of the total.

**Table 3. Potential dose (mrem) to offsite residents from the proposed Divine Strake experiment based on CAP88-PC Version 3.0 predictions**

### 3.2 NARAC

Input to and output from the NARAC models are provided in Appendix B. Because of meteorological conditions on days modeled, plume movement generally moved southwest. This was due to mid-level wind conditions. Potential dose from the proposed experiment are displayed in Figure 1 for conditions on January 15, 2005, and in Figure 2 for conditions on January 20, 2006. The modeled dose area extended from the release point out to 60 km but the edge of the 0.01 mrem dose area extended to less than 25 km from the release point and was inside the NTS boundaries. The approximate predicted dose value at the NTS boundary for January 15, 2005, was 0.006 mrem and on January 20, 2006, was 0.007 mrem. In both cases, potential dose was well below the 0.1-mrem level at which EPA approval is required. Though meteorological conditions on days modeled resulted in the plume moving towards the NTS south and western boundary, potential dose would be very similar at the eastern boundary (assuming similar wind blowing towards that direction) given the proposed Divine Strake experiment is nearly centered between the eastern (22.6 km away) and western (23.5 km away) boundaries.

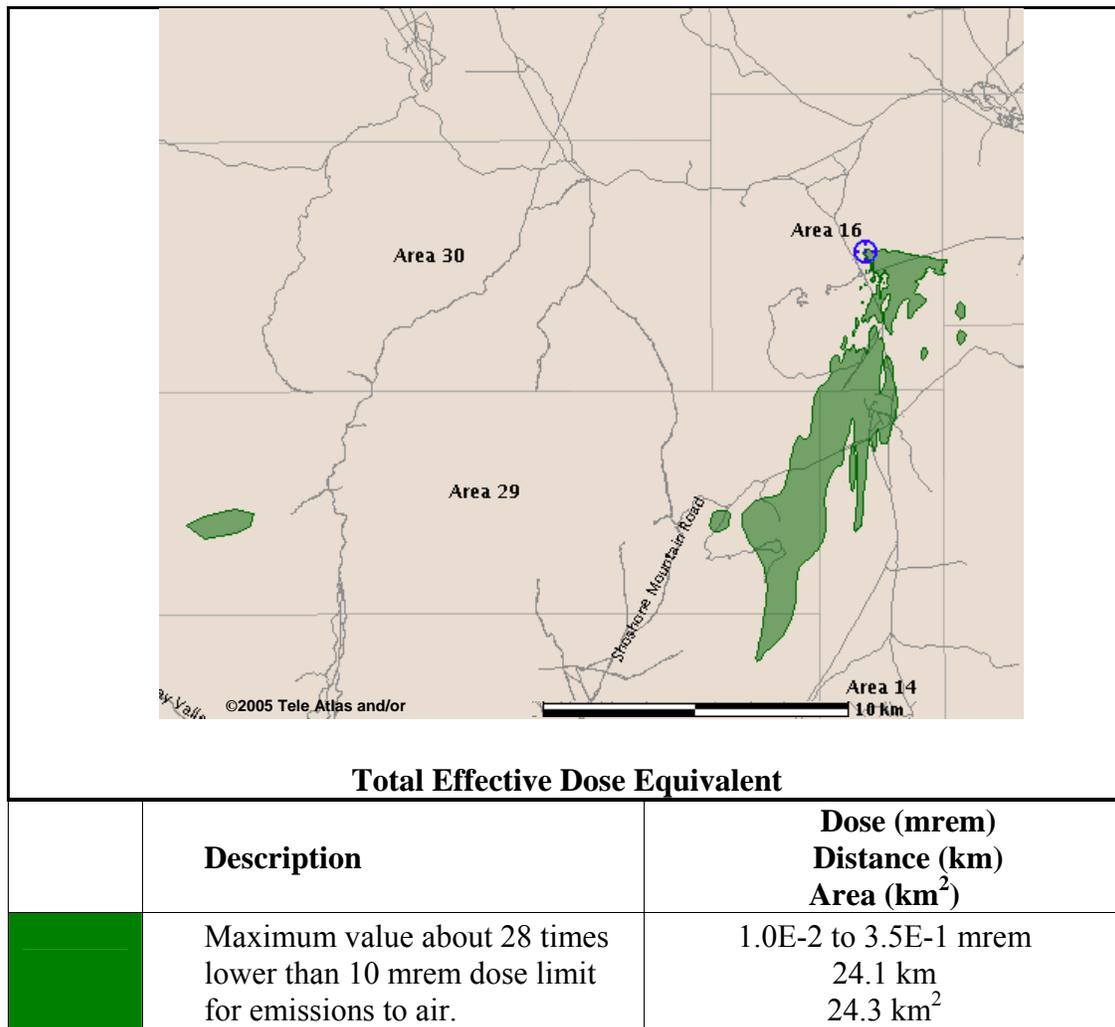

## **4 CONCLUSION**

Potential radiation dose to a hypothetical maximally exposed individual at the closest NTS boundary to the proposed Divine Strake experiment as estimated by the CAP88-PC model was 0.005 mrem with wind blowing directly towards that location. Boundary dose as modeled by NARAC ranged from 0.006 to 0.007 mrem. Potential doses to actual offsite populated locations were generally two to five times lower still, or about 40 to 100 times lower than the 0.1-mrem level at which EPA approval is required per 40 CFR §61.96.

	Description	Dose (mrem) Distance (km) Area (km <sup>2</sup> )
	Maximum value about 18 times lower than 10 mrem dose limit for emissions to air.	1.0E-02 to 5.6E-01 mrem 16.3 km 31.7 km <sup>2</sup>

**Figure 1. NARAC modeled release using meteorology from January 15, 2005. Potential dose within the range displayed is completely within the NTS boundaries. Boundary dose based on this modeling was about 0.006 mrem.**

**Figure 2. NARAC modeled release using meteorology from January 20, 2006. Potential dose within the range displayed is completely within the NTS boundaries. Boundary dose based on this modeling was about 0.007 mrem.**

## ADDITIONAL WEATHER INFORMATION

Average Air Temperature: 13.2 degrees C  
286.36 K  
Precipitation: 3.0 cm/y  
Humidity: 3.0 g/cu m  
Lid Height: 3000 meters  
Surface Roughness Length: 0.010 meters  
Height Of Wind Measurements: 10.0 meters  
Average Wind Speed: 3.089 m/s

## Vertical Temperature Gradients:

STABILITY E 0.073 k/m  
STABILITY F 0.109 k/m  
STABILITY G 0.146 k/m

## VALUES FOR RADIONUCLIDE-INDEPENDENT PARAMETERS

---

HUMAN INHALATION RATE	
Cubic centimeters/hr	9.17E+05
SOIL PARAMETERS	
Effective surface density (kg/sq m, dry weight) (Assumes 15 cm plow layer)	2.15E+02
BUILDUP TIMES	
For activity in soil (years)	1.00E+02
For radionuclides deposited on ground/water (days)	3.65E+04
DELAY TIMES	
Ingestion of pasture grass by animals (hr)	0.00E+00
Ingestion of stored feed by animals (hr)	2.16E+03
Ingestion of leafy vegetables by man (hr)	3.36E+02
Ingestion of produce by man (hr)	3.36E+02
Transport time from animal feed-milk-man (day)	2.00E+00
Time from slaughter to consumption (day)	2.00E+01
WEATHERING	
Removal rate constant for physical loss (per hr)	2.90E-03
CROP EXPOSURE DURATION	
Pasture grass (hr)	7.20E+02
Crops/leafy vegetables (hr)	1.44E+03
AGRICULTURAL PRODUCTIVITY	
Grass-cow-milk-man pathway (kg/sq m)	2.80E-01
Produce/leafy veg for human consumption (kg/sq m)	7.16E-01
FALLOUT INTERCEPTION FRACTIONS	
Vegetables	2.00E-01
Pasture	5.70E-01
GRAZING PARAMETERS	
Fraction of year animals graze on pasture	4.00E-01
Fraction of daily feed that is pasture grass when animal grazes on pasture	4.30E-01

---

GENERAL

Page 6

## VALUES FOR RADIONUCLIDE-INDEPENDENT PARAMETERS

---

ANIMAL FEED CONSUMPTION FACTORS	
Contaminated feed/forage (kg/day, dry weight)	1.56E+01
DAIRY PRODUCTIVITY	
Milk production of cow (L/day)	1.10E+01
MEAT ANIMAL SLAUGHTER PARAMETERS	
Muscle mass of animal at slaughter (kg)	2.00E+02
Fraction of herd slaughtered (per day)	3.81E-03
DECONTAMINATION	
Fraction of radioactivity retained after washing for leafy vegetables and produce	5.00E-01
FRACTIONS GROWN IN GARDEN OF INTEREST	
Produce ingested	1.00E+00
Leafy vegetables ingested	1.00E+00
INGESTION RATIOS:	
IMMEDIATE SURROUNDING AREA/TOTAL WITHIN AREA	
Vegetables	7.00E-01
Meat	4.40E-01
Milk	4.00E-01
MINIMUM INGESTION FRACTIONS FROM OUTSIDE AREA	
(Minimum fractions of food types from outside area listed below are actual fixed values.)	
Vegetables	0.00E+00
Meat	0.00E+00
Milk	0.00E+00
HUMAN FOOD UTILIZATION FACTORS	
Produce ingestion (kg/y)	1.76E+02
Milk ingestion (L/y)	1.12E+02
Meat ingestion (kg/y)	8.50E+01
Leafy vegetable ingestion (kg/y)	1.80E+01
SWIMMING PARAMETERS	
Fraction of time spent swimming	0.00E+00
Dilution factor for water (cm)	1.00E+00

## ADDITIONAL WEATHER INFORMATION

Average Air Temperature: 13.2 degrees C  
 286.36 K  
 Precipitation: 3.0 cm/y  
 Humidity: 3.0 g/cu m  
 Lid Height: 3000 meters  
 Surface Roughness Length: 0.010 meters  
 Height Of Wind Measurements: 10.0 meters  
 Average Wind Speed: 3.230 m/s

## Vertical Temperature Gradients:

STABILITY E 0.073 k/m  
 STABILITY F 0.109 k/m  
 STABILITY G 0.146 k/m

## VALUES FOR RADIONUCLIDE-DEPENDENT PARAMETERS

## VALUES FOR RADIONUCLIDE-INDEPENDENT PARAMETERS

---

HUMAN INHALATION RATE	
Cubic centimeters/hr	9.17E+05
SOIL PARAMETERS	
Effective surface density (kg/sq m, dry weight) (Assumes 15 cm plow layer)	2.15E+02
BUILDUP TIMES	
For activity in soil (years)	1.00E+02
For radionuclides deposited on ground/water (days)	3.65E+04
DELAY TIMES	
Ingestion of pasture grass by animals (hr)	0.00E+00
Ingestion of stored feed by animals (hr)	2.16E+03
Ingestion of leafy vegetables by man (hr)	3.36E+02
Ingestion of produce by man (hr)	3.36E+02
Transport time from animal feed-milk-man (day)	2.00E+00
Time from slaughter to consumption (day)	2.00E+01
WEATHERING	
Removal rate constant for physical loss (per hr)	2.90E-03
CROP EXPOSURE DURATION	
Pasture grass (hr)	7.20E+02
Crops/leafy vegetables (hr)	1.44E+03
AGRICULTURAL PRODUCTIVITY	
Grass-cow-milk-man pathway (kg/sq m)	2.80E-01
Produce/leafy veg for human consumption (kg/sq m)	7.16E-01
FALLOUT INTERCEPTION FRACTIONS	
Vegetables	2.00E-01
Pasture	5.70E-01
GRAZING PARAMETERS	
Fraction of year animals graze on pasture	4.00E-01
Fraction of daily feed that is pasture grass when animal grazes on pasture	4.30E-01

GENERAL

Page 6

## VALUES FOR RADIONUCLIDE-INDEPENDENT PARAMETERS

---

ANIMAL FEED CONSUMPTION FACTORS	
Contaminated feed/forage (kg/day, dry weight)	1.56E+01
DAIRY PRODUCTIVITY	
Milk production of cow (L/day)	1.10E+01
MEAT ANIMAL SLAUGHTER PARAMETERS	
Muscle mass of animal at slaughter (kg)	2.00E+02
Fraction of herd slaughtered (per day)	3.81E-03
DECONTAMINATION	
Fraction of radioactivity retained after washing for leafy vegetables and produce	5.00E-01
FRACTIONS GROWN IN GARDEN OF INTEREST	
Produce ingested	1.00E+00
Leafy vegetables ingested	1.00E+00
INGESTION RATIOS:	
IMMEDIATE SURROUNDING AREA/TOTAL WITHIN AREA	
Vegetables	7.00E-01
Meat	4.40E-01
Milk	4.00E-01
MINIMUM INGESTION FRACTIONS FROM OUTSIDE AREA	
(Minimum fractions of food types from outside area listed below are actual fixed values.)	
Vegetables	0.00E+00
Meat	0.00E+00
Milk	0.00E+00
HUMAN FOOD UTILIZATION FACTORS	
Produce ingestion (kg/y)	1.76E+02
Milk ingestion (L/y)	1.12E+02
Meat ingestion (kg/y)	8.50E+01
Leafy vegetable ingestion (kg/y)	1.80E+01
SWIMMING PARAMETERS	
Fraction of time spent swimming	0.00E+00
Dilution factor for water (cm)	1.00E+00

## **Appendix B**

# **NARAC Modeling Input and Output for the Proposed Divine Strake Experiment**

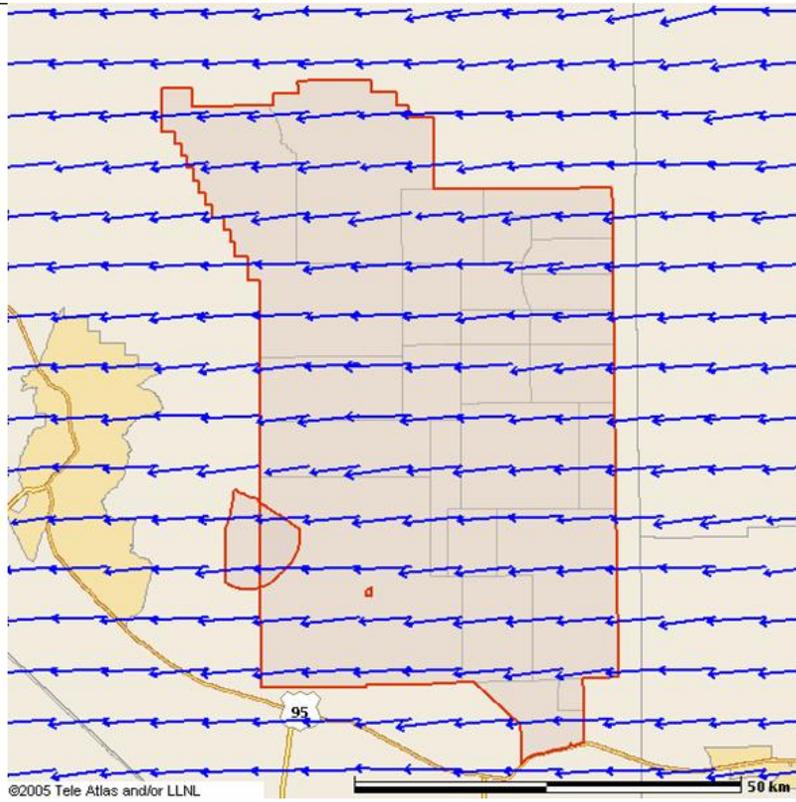

## Example Scenario Assumptions

- **Explosive Geometry:** *provided by requestor*
  - 1000 m height, 300 m radius
- **Release Times:** 1600 UTC, 15 Jan 2005 and 20 Jan 2006
- **Source Amount:** *provided by requestor*
  - All material released in respirable sized particles
- **Location:** *provided by requestor*
  - 37.02348 N 116.181963 W
- **Weather: Meteorological observations**
  - NTS and WMO stations beginning 1600 UTC 15 Jan 2005
  - NTS and WMO stations beginning 1600 UTC 20 Jan 2006
- **Population Estimates:** LANL Day/Night Population
- **Terrain Source:** DTED (Digital Terrain Elevation Data)
- **Models used:** LLNL/NARAC

Jan 15, 2005 – surface winds at release start

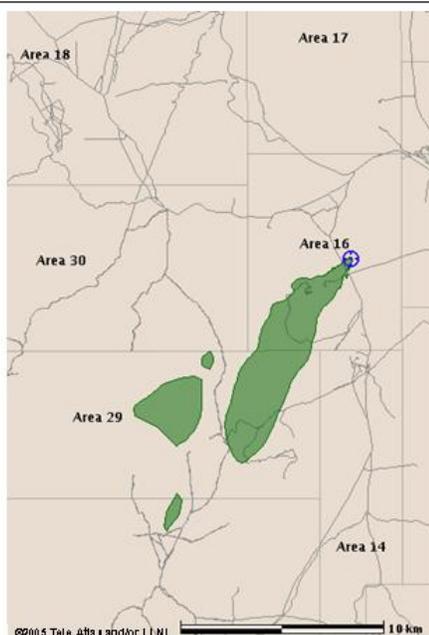

Jan 15, 2005 – midlevel winds at release start

Jan 15, 2005 Example Assessment

Total Effective Dose Equivalent

Map Size: 31.1 km by 31.1 km Id: Production\EVENT\_12117\wvs\_0\prodexec\_8\mrem  
 NARAC Operations: ( NARAC Staff ); narac@llnl.gov; 925-424-6465  
 Not approved for further distribution

Effects and Actions		
Description	(mrem) Extent Area	Population
10% of the 0.1 mrem level at which EPA approval is required.	>0.01 16.3km 31.7 km2	0

Areas and counts in the table are cumulative.

Effects or contamination from January 15, 2006 16:00 UTC to January 19, 2006 16:00 UTC at 10.0 m.

**June 2006**

**Literature Values (Pre-site Characterization) Used for  
Source term**

## ANALYSIS/CALCULATION (A/C) COVER SHEET

Project Title: Divine Strake	Project/Tracking No.:	Analysis/Calculation No.: NESH-55	
Subject: Divine Strake Experiment			Functional Class:
Analysis/Calculation Status Designation: <input checked="" type="checkbox"/> Preliminary <input type="checkbox"/> Confirmed <input type="checkbox"/> Superseded			
Computer Program/Title	Mainframe/PC	Program No.	Version/Release No.
CAP88-PC	PC		3.0
Hotspot	PC		2.06
Bearing and Distance Program	PC		1.0

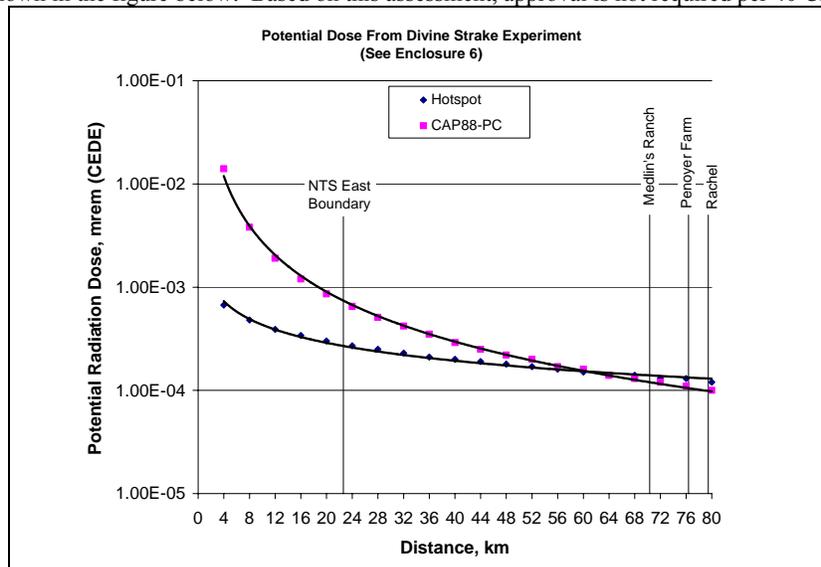

**Purpose and Objective:**

An assessment of the radiation doses that could occur to offsite residents from the dust created by the Divine Strake experiment was conducted to determine whether the experiment would be in conformance with the National Emission Standards for Air Pollutants (NESHAP), Title 40 of Code of Federal Regulations, Part 61, Subpart H. During the Divine Strake experiment, 700 tons of ammonium nitrate fuel oil (ANFO) emulsion will be detonated over the U-16b tunnel complex. Conservative assumptions were used for estimating the air emissions (Enclosure 2) to determine the potential dose with CAP88-PC software and whether EPA approval would be required. If the dose (CEDE) is  $\geq 0.1$  mrem/yr, EPA approval is required.

Since the CAP88-PC model is normally used for chronic continuous radioactive releases, the dose assessment was also made with Hotspot, a model designed by LLNL for explosions and releases occurring over a period less than a few hours.

**Summary of Conclusion:**

Based upon the radiation doses estimated by the CAP88-PC and Hotspot atmospheric diffusion models, the committed effective dose equivalent (CEDE) to the hypothetical maximally exposed individual (MEI) at the eastern NTS boundary, would be less than 1  $\mu$ rem. Other off-site locations are also shown in the figure below. Based on this assessment, approval is not required per 40 CFR 61.96.

## Enclosure 2

### Source term used for modeling potential radionuclide release from the Divine Strake experiment

#### Soil Emissions

Soil expected to be emitted was expressed in two ways to obtain a radionuclide source term. The first was the PM10 value of 17.55 tons predicted for the Divine Strake experiment and listed in Table 2 of Appendix C of the *Environmental Assessment for the Divine Strake Experiment* (U.S. Department of Energy, 2006). The second was the surface area of the crater predicted for the Divine Strake experiment (30 m diameter = 2,827 m<sup>2</sup>) (U.S. Department of Energy, 2006). The application of radionuclide concentrations to these values is described below.

#### Radionuclides

It was the intention of this assessment to assemble published data on man-made radionuclide concentrations in soil from samples either collected in Area 16 of the NTS or that were analogous to soil in the area of the Divine Strake experiment. Also, concentrations of naturally occurring radionuclides were taken from values listed by the EPA for background levels in soil (U.S. Environmental Protection Agency, 1994). From this compilation of concentrations, maximum values (not including nuclear test locations) were selected for use in modeling potential dose to persons from emissions from the Divine Strake experiment. Radionuclide concentration data and references are listed in **Table 1** with shaded emission values being those selected for use in modeling. Radionuclide concentrations expressed as pCi/g soil were multiplied by the predicted mass of PM10 to obtain the total potential radionuclide emission. Radionuclide concentrations expressed as nCi/m<sup>2</sup> were multiplied by the predicted surface area of the crater to obtain the total potential radionuclide emission.

In addition to using the highest radionuclide concentrations reported, potential radionuclide emissions from Divine Strake were further maximized by assuming 100% of the activity associated with soil was emitted to air for transport offsite and no adjustments were made for the physical decay of radionuclides (values taken as reported). This is especially conservative for <sup>60</sup>Co with its 5.26 year half-life (data ranging from 1983 to 2002) and, to a lesser extent, for <sup>137</sup>Cs (30 year half-life) and <sup>90</sup>Sr (27.7 year half-life).

Three samples of soil and limestone from the Divine Strake excavation were collected on May 24, 2006 by Bechtel Nevada Environmental Technical Services. These samples were screened with a Canberra XtRa coaxial germanium detector (Model GX5520, SN 4945016) to provide some data (Table 2) supporting the assertion that values listed in Table 1 are conservatively high.

**Table 1. Radionuclide emission assumed from the Divine Strake experiment. Shaded emission values were used to model potential dose.**

## ADDITIONAL WEATHER INFORMATION

Average Air Temperature: 30.0 degrees C  
 303.16 K  
 Precipitation: 1.0 cm/y  
 Humidity: 6.0 g/cu m  
 Lid Height: 3000 meters  
 Surface Roughness Length: 0.010 meters  
 Height Of Wind Measurements: 10.0 meters  
 Average Wind Speed: 4.373 m/s

## Vertical Temperature Gradients:

STABILITY E 0.073 k/m  
 STABILITY F 0.109 k/m  
 STABILITY G 0.146 k/m

---

**ENCLOSURE 5**

Hotspot Version 2.06 General Explosion  
Jun 15, 2006 07:05 AM

Source Term : DS UserMix Sourceterm Co max.mix (Mixture Scale  
Factor = 1.0000E+00)

Wind Speed (h=10 m) : 4.4 m/s  
Distance Coordinates : All distances are on the Plume Centerline  
High Explosive : 1.19E+06 Pounds of TNT  
Debris Cloud Top : 2510 m

**UNMITIGATED BLAST DAMAGE**

IABTI safe distance : 9445 m (30987 ft)  
Eardrum ruptures and incapacitation ( 5 psi) : 460 m - 730 m (1511 ft -  
2396 ft)  
Lung damage and complete incapacitation (10 psi) : 317 m - 485 m (1040 ft -  
1590 ft)  
Onset of lethality (25 psi) : 205 m - 319 m (672 ft -  
1045 ft)

Note: minimum range corresponds to side-on pressure and maximum range  
corresponds to reflected overpressure generated using  
Sandia National Laboratories BLAST model.

Stability Class : C  
Receptor Height : 1.5 m  
Inversion Layer Height : None  
Sample Time : 10.000 min  
Breathing Rate : 3.33E-04 m3/sec

TEDE includes : Inhalation dose + Submersion  
Maximum Dose Distance : 0.010 km  
MAXIMUM TEDE : 1.44E-06 rem  
Inner Contour Dose : 1.0 rem  
Middle Contour Dose : 0.500 rem  
Outer Contour Dose : 0.100 rem  
Exceeds Inner Dose Out To : Not Exceeded  
Exceeds Middle Dose Out To : Not Exceeded  
Exceeds Outer Dose Out To : Not Exceeded

## **Appendix D**

### **Output from CAP88-PC Version 3.0 Modtest Sample Case Run October 2006**

Prior to modeling potential dose from the Divine Strake experiment the Modtest sample case, described in the CAP88-PC Version 3.0 Users Guide, was run on the same computer and software installation as was used for dose estimations from the Divine Strake experiment. Results of this test were identical to those from the published example (Shroff, 2006). The *Synopsis* and *Dose and Risk Equivalent Summary* Reports from our run of Modtest are provided in this Appendix for comparison with those given in Appendix G of the CAP88-PC Version 3.0 Users Guide (Shroff, 2006).

## ORGAN DOSE EQUIVALENT SUMMARY

Organ	Selected Individual (mrem/y)	Collective Population (person-rem/y)
Adrenals	1.70E+01	2.99E+01
B Surfac	1.82E+01	3.21E+01
Breasts	8.43E+01	1.47E+02
St Wall	1.75E+01	3.08E+01
ULI Wall	2.28E+01	4.02E+01
Kidneys	1.56E+01	2.76E+01
Lungs	1.82E+01	3.22E+01
Ovaries	1.71E+01	3.03E+01
R Marrow	1.79E+01	3.19E+01
Spleen	1.85E+01	3.34E+01
Thymus	3.19E+01	5.54E+01
Uterus	2.24E+01	3.93E+01
Bld Wall	2.03E+02	2.57E+02
Brain	2.18E+01	3.85E+01
Esophagu	1.71E+01	3.02E+01
SI Wall	1.65E+01	2.92E+01
LLI Wall	2.17E+01	3.82E+01
Liver	7.69E+02	1.36E+03
Muscle	1.83E+01	3.24E+01
Pancreas	2.26E+01	3.99E+01
Skin	1.77E+01	3.12E+01
Testes	1.97E+01	3.47E+01
Thyroid	1.72E+01	3.03E+01
EFFEC	5.19E+02	6.68E+02

## PATHWAY EFFECTIVE DOSE EQUIVALENT SUMMARY

Pathway	Selected Individual (mrem/y)	Collective Population (person-rem/y)
INGESTION	1.74E+01	4.73E+01
INHALATION	4.75E+02	5.75E+02
AIR IMMERSION	1.39E-03	1.68E-03
GROUND SURFACE	2.58E+01	4.58E+01
INTERNAL	4.93E+02	6.23E+02
EXTERNAL	2.58E+01	4.58E+01
TOTAL	5.19E+02	6.68E+02
