

2007 Kentucky Soybean Performance Tests

Eugene Lacefield and Todd Pfeiffer, Plant and Soil Sciences

The Kentucky Soybean Performance Tests are conducted to provide an unbiased, objective estimate of the relative performance of soybean varieties in Kentucky. This information may be used by growers and seed producers to aid in selecting varieties that will give the highest total production in a specific situation. Soybean cultivars were entered by soybean growers, commercial companies, and state and federal institutions.

Five soybean tests were planted in 2007 in Kentucky. The WKU and MSU sites were dropped due to severe drought. The five test locations are shown below. Soil types, planting dates, and other information are shown in Table 1.

2007 Soybean Test Web Site Features:

- Column header sorting feature for Summary Table 4.
- Nomination form, cover letter, and instructions for 2008 tests entries.

Location of the 2007 Kentucky Soybean Tests

1. Caldwell County
2. Fayette County—UK
3. Hancock County
4. Calloway County—MSU
5. Warren County—WKU

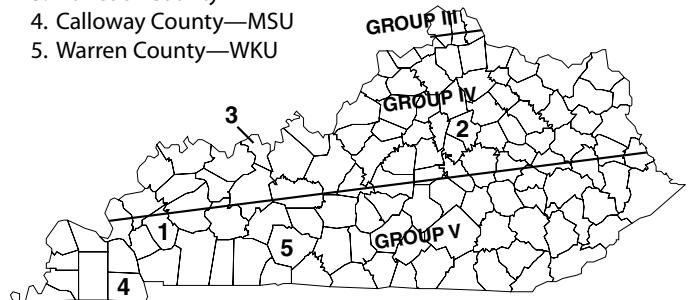

Table 1. Location, Planting, and Climatic Data for the 2007 Soybean Performance Tests

Test	Site		Soil Type	Date of Planting	Soil Test	Fertilizer Applied ¹	50% Chance of Killing Frost ²
Caldwell County Full Season	Princeton Exp. Station University of Kentucky		Crider Silt Loam	5/14	P 100 K 345 pH 6.2	None	10/21
Warren County Full Season ³	Western Kentucky University		Pembroke Silt Loam	5/15	P 208 K 379 pH 6.0	None	10/21
Fayette County Full Season	Lexington Exp. Station University of Kentucky		Woolper Silt Loam	5/09	P 369 K 304 pH 6.2	None	10/25
Calloway County Full Season ³	Murray State University	Dr. Ferguson Agronomist	Waverly Silt Loam	5/08	P 132 K 111 pH 6.9	40 lb P205 300 lb K20	10/27
Hancock County Full Season	Shelby Emmick Farm	Diane Perkins Extension Agent	Otwell Silt Loam	5/07	P 207 K 352 pH 6.3	None	10/22

¹ Amount per acre.

² Based on 30-year average.

³ Location was not harvested due to drought.

Methods

All tests were planted in a randomized complete block design by maturity group. The tests (Tables 5-7) had two replications (plots) of each variety. The individual plots were 20 feet long and six rows wide with 16 inches between rows (seeding rate: five to six viable seeds per foot of row). All plots were treated with herbicides and maintained as weed-free as possible. All plots were chemically end-trimmed to 16 feet approximately one month after planting. Companies could choose to treat their seed with fungicides, but insecticide treated seed was not accepted.

Harvesting was done with a small plot combine according to maturity; thus, several harvests were made at each location. Sixteen feet of the four center rows were harvested from the plots. No allowances were made for soybeans that may have been lost because of combining or shattering.

Yield—Yield is reported in bushels (60 pounds) per acre adjusted to 13% moisture. An electronic moisture monitor located on the combine was used for moisture readings for each plot.

Lodging—Lodging is rated on a scale of 1 to 5, where 1 = almost all plants erect; 2 = all plants over slightly or a few down; 3 = all plants over moderately or 25% down; 4 = all plants over considerably or 50% to 80% down; 5 = all plants over badly.

Maturity date—A variety is considered mature when 99% of the pods have turned their normal mature color. One to two weeks of good drying weather may be needed beyond the date given before the beans will be ready to combine. Maturity dates were recorded at the Fayette County location.

Plant height—Plant height was measured in inches from the soil surface to the tip of the main stem. Plant height was recorded at the Fayette County location.

Protein, Oil—2006 and 2007 variety protein and oil concentration was determined at the Hancock County location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County.

Summary Table 4 is the recommended table for variety performance.

Interpretation

An important step in profitable soybean production is selecting good quality seed of the best varieties for your management system. The Kentucky Soybean Performance Tests are conducted to provide information useful in making this selection.

Performance of soybean varieties is affected by many factors, including year, location, soil type, and time of planting. A particular soybean variety is adapted for full-season growth in a band approximately 100 miles wide from north to south (see map, page 1). Thus, the best variety in northern Kentucky may not be the best in southern areas. For this reason, the Kentucky Soybean Performance Tests are conducted at several locations in the major soybean-producing areas of the state. The yields as reported in this publication should be used for relative comparisons; actual yields on a grower's farm may be different.

Performance of soybean varieties will vary from year to year and location to location, depending on adaptability, weather conditions, and management. The data presented in the Table 4 summary have been averaged across years and locations, and it is recommended as the table to use for evaluating variety

performance. **Performance of a variety across a period of years and at several locations in the state is the best indicator of its production potential.** (See Agronomy Notes, Volume 21, No. 3, "Using Performance Test Results in Soybean Variety Selection in Kentucky.")

Small differences in yield are usually of little importance. The yield of two varieties at a single location can differ because of chance factors (difference in soil characteristics, fertility, or availability of moisture), although the inherent yielding ability is the same. To decide if an observed yield difference is real, use the least significant difference (LSD) values cited at the bottom of each maturity group. The significance level used in the tables is 0.10. If the difference in yield between two varieties is greater than the LSD value, you can be reasonably certain that the varieties actually do differ in yielding ability. Shaded yields in the tables represent top yielding varieties that are not significantly different from the top yielding variety (bold data) of the maturity group and year in which the bold data are located.

Yield is only one factor to consider in selecting a variety for your production system. Maturity, lodging resistance, disease resistance, and time and equipment availability are other factors that need to be considered. The economic management and control of weeds are additional factors to consider.

Varieties with oil and protein levels that are eligible for premium prices are available in some markets. Oil and protein levels are influenced by variety and weather, primarily temperature, during seed filling. (See the Corn & Soybean Science Newsletter, Volume 6, Issue 1, "Soybean Oil and Protein.") Our recommendation is that you create a list of varieties that meet your needs for agronomic characteristics: yield, maturity group, SCN resistance, etc. Then, using the protein and oil data from Table 4, remove from consideration those varieties with below average oil percentages. Select from the remaining varieties those that have the highest average protein concentration. This approach should give a variety that has the best chance at producing acceptable yield and meeting the oil and protein standards.

The data provided have been divided into maturity groups. Due to weather patterns at a location, maturity alone can affect yield; this impact will be reflected by large differences in the maturity group averages. Selecting varieties from several maturity groups can reduce the impact of these maturity group fluctuations. (See Agronomy Notes, Volume 25, No. 3, "Growing Soybean Varieties from Multiple Maturity Groups Can Reduce Yearly Yield Volatility.")

The date of a 50% chance of a fall killing frost is important in determining which variety you select to plant. The dates presented in Table 1 are average dates over a long term. Actual dates will vary from year to year. For the date of a one-year-out-of-10 chance of a fall killing frost, subtract 13 to 18 days from the dates in Table 1. For maximum yield, a variety must mature before the first killing frost in the fall. The relative maturity for each variety is found in Table 3.

If you have soybean cyst nematode (SCN) problems, a resistant variety (indicated by a "*"prefix) should be used in your production system with a recommended crop rotation program. (See Kentucky Cooperative Extension Service publication PPA-42: Soybean Cyst Nematode, available at both your county Extension office, and on the Grain Crops Web site.) The level of SCN infestation as well as the SCN race can be determined through the SCN laboratory at Princeton. Test your fields. Contact your county Extension office for more information on collecting and

submitting samples. The importance of resistant varieties has increased as the number of acres affected by SCN has increased. SCN occurs in 32 western Kentucky counties, representing 90% of the state's soybean acreage. Low levels of SCN show few visible symptoms but can cause yield losses of up to 25%.

Soybean mosaic virus (SMV) may cause yield loss if soybean plants are infected prior to flowering. Due to the timing of insect populations that transmit the disease, double-cropped soybeans are more likely to be affected in Kentucky. Planting SMV-resistant varieties will avoid this possible yield loss. However, only a few varieties have been evaluated for SMV resistance. Check Table 3, "Company Disease-Resistance Specifications," for SMV resistance ratings.

Table 4, consisting of a summary of the five full-season tests, is recommended for selecting varieties for maximum yield in double crop systems and for full-season systems. Better yielding full-season varieties are also the better-yielding double crop varieties (Todd Pfeiffer 1987. Applied Agricultural Research, Vol. 2, No. 3, pp.141-145). The full-season environment that maximizes gain is a better indicator of performance than late planted soybeans that have reduced yields. The data from five full-season tests, analyzed across years and locations, predict performance of a variety more accurately than a single test, full-season, or double crop.

Nineteen novel soybean varieties (indicated by a "NS" prefix) are being tested this year. These are just a few of the many that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches; others may be of a much broader market value. Novel soybeans generally yield less, so testing them will enable soybean producers to determine whether premiums for a given trait offset possible yield lag/drag. Examples are triple null soybeans, designed for edible soy products (this variety lacks three enzymes that produce off-flavors); natto soybeans, a small-seeded soybean used for food and export; and tofu, a big-seed/high-protein soybean also used for food and export. Other big-seed/high-protein types are used for animal food and potentially have a large U.S. market. Oil and protein data are provided in Table 4. Low linolenic acid (18:3) varieties which entered commercial production in 2006 are another example of a novel special-trait soybean of current interest. Labeling for trans-fat as required by the Food and Drug Administration of the United States began Jan. 1, 2006. Trans-fats, which are undesirable for human health, result from the hydrogenation of vegetable oils. Low linolenic acid (18:3) varieties does not require this process.

Growing Conditions and Special Circumstances

Kentucky's weather during the 2007 soybean growing season depressed soybean productivity. The season started warm and dry with the April through June period being the fifth driest in 113 years. It continued hot and dry; West Kentucky rainfall in July was $\frac{1}{4}$ - $\frac{1}{2}$ of normal, and August was the hottest and third driest on record for Kentucky. (<http://wwwagwx.ca.uky.edu/public/annual07.txt>). As a result Kentucky soybean production was forecast at 30.1 million bushels, down 50% from last year's crop; yield was estimated at 28 bu/a (http://www.nass.usda.gov/Statistics_by_State/Kentucky/Publications/Agri-News/oct226.pdf).

Soybean Production Information

The Kentucky Cooperative Extension Service has a series of publications, Soybean Production in Kentucky, which contains a more detailed discussion of soybean production practices:

- AGR-128: Status, Uses, and Planning (Part I)
- AGR-129: Seed Selection, Variety Selection, and Fertilization (Part II)
- AGR-130: Planting Practices and Double Cropping (Part III)
- AGR-131: Weed, Disease, and Insect Control (Part IV)
- AGR-132: Harvesting, Drying, Storage, and Marketing (Part V)

These publications, including PPA-42, Soybean Cyst Nematode, and the Corn & Soybean Science Newsletter are available online at the Grain Crops Web site. (URL on first page.) The planting guide from this series is reproduced below for your convenience (Table 2). For additional research on seeding rates, see the Corn & Soybean Science Newsletter, Volume 6, Issue 2, "Soybean Seeding Rates" and Volume 7, Issue 4, "Soybean Seed Rates."

Kentucky State Seed Law

The Kentucky State Seed Law requires all seed exposed, offered for sale, or sold in Kentucky to be labeled as to kind and variety for each agricultural seed component present in excess of 5% of the whole and the percentage by weight of each component. All soybean seed blends should be labeled as to the percentage of each variety that makes up the mixture. The term "variety unknown" may no longer be used in place of a variety designation for soybeans, as all soybean seed must be labeled by variety name.

TABLE 2. SOYBEAN PLANTING GUIDE.

Viable Seeds Per Pound	Row Spacing (Inches)				
	Seeding Rate (Seeds Per Ft of Row)				
	7 2-3	15 5-6	20 6-8	30 8-10	36 9-11

Acknowledgments

In addition to the county agents and farm cooperators mentioned in Table 1, Chris Damron, technicians Roger Rhodes and Richard Green, and students Daniela Garcia Penha Sarti, Parker Bradley, Nathan Hamilton, and Ranjana have contributed to the production of this publication. Thanks go to Western Kentucky University and Murray State University for supporting the soybean variety test project by providing test sites. The testing of novel soybean varieties is funded by the New Crop Opportunities Center at the University of Kentucky through a USDA Special Grant. Inoculant for the MSU site was provided by EMD Crop BioScience, Inc.

~ Variety is not Roundup Ready. All varieties without a tilde (~) prefix are Roundup Ready.

P Entries with a P prefix are public varieties.

NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.

EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.

A This information is provided by the companies and has not been checked by the soybean variety test project.

B All races of Phytophthora sojae so far identified in Kentucky can be controlled with varieties with Rps 1c or 1k. Race-specific resistance is highly effective, but a proper match between pathogen race and variety is essential. Field tolerance is a lower level of protection to the fungus that will provide good, (not excellent) control against all races. Seed and young seedlings of tolerant varieties must be protected with an appropriate fungicide since field tolerance develops after the early seedling growth stage.

C blank spaces=no data provided by seed company or data unknown. S=susceptible, MS=moderately susceptible, MR=moderately resistant, R=resistant, T=tolerant, MT=moderately tolerant

~ Variety is not Roundup Ready. All varieties without a tilde (~) prefix are Roundup Ready.

* Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.

P Entries with a P prefix are public varieties.

NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.

EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.

A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.

B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.

*

Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.

P Entries with a P prefix are public varieties.

NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.

EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.

A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.

~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.

* Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.

P Entries with a P prefix are public varieties.

NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.

EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.

A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.

~ Variety is not Roundup Ready. All varieties without a tilde (~) prefix are Roundup Ready.

* Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.

P Entries with a P prefix are public varieties.

NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.

EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.

^A 2007 and 2006 data are from Hancock County, and the 2005 data are from Henderson County.

^B Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.

Notes

Notes

Mention or display of a trademark, proprietary product, or firm in text or figures does not constitute an endorsement and does not imply approval to the exclusion of other suitable products or firms.

The following pages are not part of the printed PR-553 publication.

The first few pages are a web site feature for the sorting of Table 4. Summary.

The nomination form, cover letter and instructions are for seed companies and others interested in entering varieties in the KY 2008 Soybean Performance Tests.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

- ~ Variety is not Roundup Ready. All varieties without a tilda (~) prefix are Roundup Ready.
- * Resistant to soybean cyst nematode. See Table 3. Company Disease Resistance Specifications for details.
- P Entries with a P prefix are public varieties.
- NS Entries with a NS prefix are novel soybean varieties that are emerging from both the public and private sectors. Some of these value-added soybean types will supply relatively small market niches, while others may be of much broader market value. Testing novel soybeans will enable producers to assess whether premiums for a given trait offset possible yield lag/drag.
- EXP Entries with an EXP prefix are varieties that are still under development or soon to be released.
- A Within a maturity group, shaded yields are not significantly different (0.10 level) from the highest yielding cultivar (bold data) of that maturity group and year column.
- B 2006 and 2007 variety protein and oil concentration was determined at the Hancock Co. location (all test locations for NS entries) and expressed on the basis of 13% moisture. 2005 protein-oil data are from Caldwell County. These data were provided by the Iowa State University Grain Quality Analysis Services using near-infrared (NIR) analysis.

Memorandum

Date: November, 2007
TO: Soybean Seed Producers
FROM: Eugene Lacefield, Research Specialist
SUBJECT: 2008 Kentucky Soybean Performance Tests

The Kentucky Soybean Performance Tests are conducted to provide an unbiased, objective estimate of the relative performance of soybean varieties in Kentucky. If you have soybean varieties for sale in Kentucky and would like to enter them in the state trials, please read the following pages carefully. Fill out the nomination form completely (typing prevents errors) and note that it is due back by February 20. You will be notified in early March which entries are accepted for testing (usually all entries). Instructions will then be sent for shipping seed. After all tests have been planted, a statement of fees will be sent along with instructions for remittance of fees.

DO NOT SEND CHECK FOR FEE UNTIL YOU HAVE BEEN BILLED.

This publication web site is <http://www.uky.edu/Ag/GrainCrops/varietytesting.htm> Pages 1–28 are the printed publication. 5000 copies are distributed across Kentucky annually in December or late November. Pages after page 28 comprise web site additions which feature column headers that will sort the summary table by each column header---for example, by variety name. Also available is this cover memo, an interactive nomination form, and instructions for entering soybean varieties in the 2008 tests. The publication web site which was accessed 14,000+ times for the 2004 , publication, more than 32,000 times for the 2005 publication, and about 22,000 for the 2006 publication.

If, due to rapid changes in the agriculture industry, this memorandum has not reached the correct contact person please forward or e-mail me the correct information. Thank you for participating in the Soybean Variety Test Program and for being interested in marketing tested varieties in Kentucky. Your involvement helps all the soybean producers of Kentucky.

If you have any questions or would like additional information, call, write, or e-mail:

KENTUCKY SOYBEAN PERFORMANCE TESTS

Purpose

The soybean performance tests are conducted annually by the Kentucky Agricultural Experiment Station and are designed as a direct service and benefit to agriculture in the state of Kentucky. Results of these tests are published to provide information to producers and seedsmen on the relative performance of soybean varieties offered for sale in the state of Kentucky.

Eligibility for variety nomination

Seed companies and producers of soybean seed to be sold or offered for sale in Kentucky and the Kentucky Agricultural Experiment Station may nominate varieties for the soybean testing program. Exceptions will be made for novel soybeans and experimental entries.

Requirements for nomination and testing

1. Named soybean varieties within maturity groups late II, III, IV and V will be tested.
2. Named varieties offered for sale or sold in the state of Kentucky during the test year or following year are eligible for nomination for testing as indicated by specifying the market outlet in Kentucky. Some experimental lines will be tested and the data will be published. The experimental data will enable 2 and 3 year data to be provided for new named varieties offered for sale in Kentucky the following year.
3. Entries must meet the standards for a variety as defined by the U S Federal Seed Act and the Plant Variety Protection Act if it is a protected variety.
4. Entries must comply with the Kentucky State Seed Law.

All entries (except experimental and novel soybeans) in the Kentucky soybean performance test must be identified by the name(s) required to be on the seed tag or label by the Kentucky Seed Law, i.e., listed in the manner by which the seed will be sold or offered for sale in Kentucky. The law requires the variety designation whether name, or number, or combination of both. Use of a brand name or trademark is not acceptable unless it is clearly identified as being other than a part of the variety designation. A brand name or trademark can never be used instead of the variety.

Examples of proper identification of entries on the nomination form are:

- A. Without a brand name - Bountiful (Soybean)
- B. With a brand name - Ajax Brand Bountiful (Soybean)

This complete designation, brand and variety name will be published in the performance bulletin. Experimental (not published) will have an EXP prefix – example: EXP Ajax Brand etc. Novel entries will have a NS prefix.

5. Brands representing a single variety are not eligible for testing if the variety in question is already represented.
6. Nomination forms must be completely filled out.

LIST OF TABLES
PAGE 1

Requirements for nomination and testing (continued)

7. All nominations accepted for testing will be placed in the conventional full season tests and evaluated at five locations.
8. A fee of \$420 per entry will be required for each entry accepted for testing. Selected novel soybeans such as high protein, high oil, natto, tofu, and other value-added types will be tested for free (please provide a description on a separate sheet of paper).
9. The nominating organization will supply 10 pounds of seed of entries accepted for testing by March 15 (shipping address at bottom of page). **No insecticide treated seed will be accepted.**
10. Nominated entries that are dropped by the nominating company after March 15 will be charged the full entry fee for non-used space in the test. A replacement variety may be provided after March 15 by special request.

Selection Procedure

1. The size of the conventional tests will be approximately 200 entries. Approximately 20 test slots will be used for standard public varieties, experimentals, and new public releases, 20 test slots will be used for novel soybean varieties, and 160 test slots for private entries.
2. Organizations will nominate entries. List the entries on the nomination form in order of priority with the highest priority first and the lowest priority last. Experimental entries will have the lowest priority and should have a "EXP" prefix – example: EXP AJAX BRAND ZTQ 445RR.
3. Nominations of equal priority from each organization will be entered in the test until all test slots are filled. If more eligible nominations are received than the size limit of the test, a random drawing of equal priority nominations may be used to select the entries to fill the test slots. In the past all nominations have been accepted except experimental and novel soybeans.
4. Standard public varieties and new publicly released varieties will be entered by the Kentucky Agricultural Experiment Station.
5. To assure that the needs of agriculture in the state of Kentucky are met, the Kentucky Agricultural Experiment Station may revise the list of entries to compensate for obvious deficiencies of varieties of soybeans being grown by farmers in Kentucky.

Important dates

Nominating forms and instructions (available at publication web site-see below: **Pub. of results**) will be mailed in mid-January. The nomination forms must be returned by February 20. Notification of nominations accepted for testing and instructions for seed shipment will be mailed the first week of March. Ten pounds of seed of nominations accepted for testing must be sent to the University of Kentucky by March 15. The Kentucky Agricultural Experiment Station reserves the right to sample seed for testing from marketing outlets in Kentucky. Failure to meet the stated deadlines may eliminate a nomination from the test. Instructions for the remittance of fees and a statement of fees will be sent in early July after all tests have been planted. Payment will be due ten days after receipt of the billing. Mail forms and ship seed to:

Eugene Lacefield
 Department of Plant and Soil Sciences
 N-122 Ag. Science Center North
 University of Kentucky
 Lexington, KY 40546-0091

Phone & Fax: (859) 257-2993
 E-mail: elace0@uky.edu

Testing methods

The tests will sample a range of environments of the soybean producing areas of the state of Kentucky. The number of tests, type, and specific locations may vary from year to year. In 2008 there will be five full season conventional tests. Entries will be replicated 2 times in each test.

Six row plots will be 20 feet long with a row spacing of 16 inches. All entries will be planted at a seeding rate of 5-6 viable seeds per foot of row unless specific requests are attached to the nominating form. Correction for germination will be made provided the percent germination is listed on the nomination form. If no germination percentage is listed, it will be assumed to be 85%.

Cultural practices recommended by the University of Kentucky will be used. Procedures used for planting, weed control and harvesting will be similar to those used in actual commercial production of conventional soybeans. Plots will be end-trimmed to 16 feet. A small combine will be used for harvesting the center 4 rows from the 6-row plots.

Data to be collected at all tests will be grain yield and lodging score. Maturity date and plant height will be taken at the Fayette County (Lexington) location. Other observations (such as seed shattering scores, hail damage, pest information, % protein/oil etc.) may be taken if warranted.

For detailed information see the University of Kentucky progress report 553, "Kentucky Soybean Performance Tests - 2007".

Publication of results

Data for all entries in the Kentucky Soybean Performance Test will be published according to the policies established by the Kentucky Agricultural Experiment Station. If for any reason the results of the tests are judged to be unreliable or possibly misleading the results will not be published. Results will be published annually in the University of Kentucky progress report "Kentucky Soybean Performance Tests - 200x". The bulletin will be made available in limited quantities to all interested concerns at no charge. It can also be found at the Web site shown below.

<http://www.uky.edu/Ag/GrainCrop/varietytesting.htm>

Disclaimer

Every possible effort will be made to plant, harvest and tabulate results for each entry accepted for testing. Certain conditions such as weather, floods, hail damage, herbicide carry-over and drift, insect and disease problems, plot availability, etc. may make this impossible. Therefore, the Kentucky Agricultural Experiment Station assumes absolutely no responsibility for any damages resulting from these tests. If for any reason the tests cannot be completed, test fees will not be refunded. Trade names of products mentioned or similar products not named is neither intended as an endorsement nor criticism of such products by the Kentucky Agricultural Experiment Station.

E-mail: elace0@uky.edu

List nominations with top priority for testing first. Any number of nominations may be made but we cannot guarantee that all will be tested. Information listed below may be used in the performance bulletin publication. Experimental entries should have a "EXP" prefix. Novel soybeans should have a "NS" prefix. **PLEASE TYPE**

Entry: type name exactly as it will appear in the publication	New this year¹	Maturity Group example 4.7	Roundup Ready	Percent Germ²	Race (s) of Soybean Cyst Nematode Resistance	Check the appropriate race & resistance³					
						Phytophtora sojae				Sudden Death Syndrome	Sybean Mosaic Virus
						Resistance Gene Rps	Field tolerance	S MS	MR R		
					1 3 4 5 9 14	1a 1b 1c 1d 1k 3a 6 7	S MS MT T	S MS MR R	S MR R	S MR R	
					1 3 4 5 9 14	1a 1b 1c 1d 1k 3a 6 7	S MS MT T	S MS MR R	S MR R	S MR R

					1 3 4 5 9 14	1a 1b 1c 1d 1k 3a 6 7	S MS MT T	S MS MR R	S MR R	S MR R	
					1 3 4 5 9 14	1a 1b 1c 1d 1k 3a 6 7	S MS MT T	S MS MR R	S MR R	S MR R	

¹ Check if the entry was not in the KY test in 2007. If entry was in last years test as an experimental or the name has been changed please add a note to this effect.

² If not specified, 85% will be assumed.

³ Use provided choices: S=susceptible, MS=moderately susceptible, MR=moderately resistant, R=resistant, T=tolerant MT=moderately tolerant

DO NOT SEND MONEY WITH THIS FORM. You will be notified at a later date which nominations have been accepted for testing and procedures for remittance of all fees.

I affirm that I have carefully studied the plans, rules, and procedures for the Kentucky Soybean Performance Tests and I will comply with all rules and procedures. Remittance of the fees will be made within 10 days after receiving the statement of fees from the Kentucky Agricultural Experiment Station.
