Washington, DC 20548**

July 16, 2001

The Honorable Frank R. Wolf
House of Representatives

Dear Mr. Wolf:

Subject: Federal Highway Funding by Program and Type of Roadway, With Related Safety Data

The National Association of Counties has raised concerns about the safety of rural roads and contends that these roads do not receive an adequate level of federal funding that could be used to make these roads safer. Rural local roads,¹ which account for more than half of the 8.2 million miles of roadways in the United States, had the highest rate of fatalities per vehicle mile traveled of all types of roadways—over six times that of urban interstates. As a result of these concerns, you asked us to examine federal highway funding on a state-by-state basis for fiscal years 1992 through 2000, by (1) individual federal highway program and (2) type of roadway. We have also provided relevant highway fatality data by type of roadway. All of the information presented in this letter was developed from Department of Transportation (DOT) data. We did not contact any states to determine how they decide to spend their federal highway funds nor did we determine how and where states spend their own highway funds. Furthermore, we did not analyze the relationship between the federal highway funding and fatality data presented in this report.

Results in Brief

From fiscal years 1992 through 2000, the Federal Highway Administration (FHWA) provided over \$201 billion (or an average of over \$22 billion per year) to the 50 states and other entities for roadway construction and improvement. Over these 9 years, 13 distinct federal highway programs and 3 related funding adjustment accounts administered by FHWA provided states and other entities with most of these federal highway funds. In fiscal year 1999, for example, these programs and related adjustment accounts provided about 80 percent of the federal highway funds that FHWA distributed to the states. The four largest of these programs—the Surface Transportation, National Highway System, Interstate Maintenance, and Bridge Replacement Programs—provided on average about 61 percent of this funding. For the most part, state highway departments have considerable discretion in selecting specific highway projects for funding under these programs and determining how to allocate these funds among the various construction and improvement projects they have identified. In many cases, states also have the flexibility to transfer funds made available through one program to another program. Nevertheless, there are limitations on the types of roadways that can be funded by certain programs. For example, Interstate Maintenance funds cannot be spent on local roads.

¹Local roads primarily serve traffic over short distances and provide access to adjacent land.

FHWA classifies roadways according to their use. It has defined 12 functional highway classifications, consisting of types of interstates, arterials, and local roads under two broad categories—urban roads and rural roads. Urban roads represent about 23 percent of all lane miles in the United States and rural roadways about 77 percent of all lane miles. For fiscal years 1992 through 2000, states spent about 59 percent of the federal highway program funds distributed by FHWA on urban roads and the remaining 41 percent on rural roads. States generally spent the largest portion of their federal highway dollars on interstates, freeways, expressways, and principal arterials and the smallest portion on minor and local roads in both urban and rural areas. On a per-mile basis, states spent the highest amounts on urban freeways, about \$80,900 in fiscal year 1999 and the lowest on rural local roads about \$100 in fiscal year 1999.

Although only about 40 percent of all vehicle miles are traveled on rural roads, about 60 percent (25,107 of 41,611) of the traffic accident fatalities that occurred in 1999 took place on rural roads. When adjusted for miles traveled, the fatality rate from traffic accidents on rural roads was nearly 2.5 times greater than the fatality rate from accidents on urban roads.

Background

FHWA provides funding to states, territories, and other entities for roadway construction and improvement projects through various programs and related adjustment accounts. Most of the funding for these programs is derived from highway user taxes such as excise taxes on motor fuels (gasoline, gasohol, diesel, and special fuels), tires and the sales of trucks and trailers, and taxes on the use of heavy vehicles. These highway user tax receipts are accounted for through the Highway Trust Fund. The Highway Trust Fund was established in 1956 and was divided into the highway account and the mass transit account in 1983.

Most highway program funds are distributed to states through annual apportionments according to statutory formulas. Once apportioned, funds are available to each state for eligible projects in its transportation improvement program, subject to statutory provisions requiring that specified amounts be applied to particular purposes or further distributed within the state. For example, ten percent of the funds apportioned to each state under the Surface Transportation Program are to be used for the elimination of hazards, including hazards at railway-highway crossings on any public road. Other funds are allocated among the states for qualifying projects under criteria provided in law. For example, under the discretionary bridge program, funds are provided for rehabilitation or replacement projects with costs exceeding specified amounts. In some cases, the Congress directs how certain allocated funds are to be distributed by requiring that particular projects receive specific amounts of funding. In addition, FHWA implements statutory adjustments to overall state funding levels to ensure an equitable distribution of funds to the states. For example, FHWA implements the minimum guarantee provisions of the Transportation Equity Act for the 21st Century (TEA-21) to ensure that each state receives at least 90.5 percent of its percentage share of contributions to the highway account of the Highway Trust Fund. Similar provisions, including the donor state bonus and the 90-percent minimum allocation programs were used under prior authorizing legislation to adjust funding levels. We refer to these three allocation adjustment programs as adjustment accounts.

Funds provided under each of the various programs may be obligated for eligible activities during their periods of availability. For example, states may use Interstate Maintenance Program

funds for resurfacing, restoring, rehabilitating, and reconstructing routes on the Interstate system during a 4-year period of availability. Nevertheless, states have considerable discretion in selecting specific highway projects for funding and determining how to allocate available federal funds among the various construction and improvement projects they have selected. In many cases, states also have the flexibility to transfer funds made available through one federal program to another federal program. The responsibility for choosing the projects to fund generally rests with the state departments of transportation and local metropolitan planning organizations (MPO).² States and MPOs undertake wide-ranging planning initiatives to rank highway construction projects and determine the amount of federal funding each project should receive, subject to statutory limitations on the federal share payable. Federal planning requirements provide for states and MPOs to carry out a process for considering projects and strategies to increase the safety and security of the transportation system, among other things.

FHWA has developed criteria for classifying all roadways into 12 functional classifications according to use that include two broad categories—urban roads and rural roads. Urban roads consist of roads that are located near densely populated urban areas, defined as having total populations of 5,000 or more. Rural roads are roads that are located in areas not considered urban. Functional categories include interstate, arterial, collector, and local roads. Interstates and arterials allow the highest traffic speeds and often have multiple lanes and a degree of access control. Collector roads are designed for lower speeds and shorter trips. They are typically two-lane roads that extend into residential neighborhoods. Local roads are any roads below the collector system.

The 12 functional classifications of roadways are

- urban interstates;
- urban freeways/expressways;
- urban other principal arterials;
- urban minor arterials;
- urban collectors;
- urban local roads;
- rural interstates;
- rural other principal arterials;
- rural minor arterials;
- rural major collectors;
- rural minor collectors; and
- rural local roads.

Federal Funding by Highway Program

FHWA is responsible for distributing funds to states and other entities for highway construction and improvement projects through various programs collectively referred to as the Federal-aid Highway Program. Thirteen of these programs plus the three adjustment accounts mentioned previously accounted for the majority of the federal funds obligated during fiscal years 1992 through 2000. For example, in fiscal year 1999, 80 percent of such funds were provided through

²For further information on MPOs and the planning process, see GAO's report: *Urban Transportation: Metropolitan Planning Organization's Efforts to Meet Federal Planning Requirements*, (GAO/RCED-96-200, Sept. 17, 1996.)

these 16 programs and adjustment accounts. The amount of funding derived from any one source varies from year to year, but the relative magnitude of each source has generally remained the same. Most notably, four programs—the Surface Transportation, National Highway System, Interstate Maintenance, and Bridge Replacement Programs—provided states with more funding than all other funding categories combined. From fiscal years 1992 through fiscal year 2000, 52 to 65 percent (or an average of 61 percent) of the federal highway funding was obligated through these four programs alone. Table 1 shows the percentage of funding obligated through each of these 16 programs for fiscal years 1992 through 2000.

Table 1: Percentage of Federal Highway Funding Obligated Through Federal Highway Programs and Funding Adjustment Accounts, Fiscal Years 1999 through 2000^a

Notes: (1) This analysis includes only highway funds obligated for state projects. It does not include funds that were obligated for projects in U.S. territories or for other purposes, or funding provided by state and local governments. The fiscal year represents the year that projects were authorized. (2) Zero values include values where funds were obligated, but have been rounded to zero.

^aThese categories include projects often referred to as "exempt," "demo," "high priority" and other similar projects.

^bThis category includes federal highway funds that were not obligated under one of the other categories, such as funds for Indian reservations, a state infrastructure bank pilot program, and advance construction. None of these programs individually provided greater than 1 percent of available federal highway funds.

Source: FHWA's Fiscal Management Information System and *Highway Statistics*, 1992-2000

Our complete analysis of federal funding provided through major highway programs to the 50 states and the District of Columbia appears in Enclosure 1.

Federal Funding by Type of Roadway

For fiscal years 1992 through 2000, states spent 59 percent of all federal funds on urban roads and the remaining 41 percent on rural roads. States generally spent the largest portion of their federal highway program funding on interstates and principal arterials and the smallest portion on minor and local roads in both urban and rural areas. Interstates, urban freeways and expressways, and principal arterials generally received the highest levels of funding. Minor roads—minor collectors, minor arterials, and local roads—typically received the lowest levels of funding. Table 2 shows the percentage of funding obligated for each functional class of roadway for fiscal years 1992 through 2000.

Table 2: Percentage of Federal Highway Funding Obligated by Functional Class

Functional class	1992	1993	1994	1995	1996	1997	1998	1999	2000	Average
Urban roads										
Urban interstates	26%	25%	26%	19%	24%	23%	18%	16%	16%	21%
Urban principal arterials	15%	15%	16%	16%	16%	16%	17%	18%	19%	16%
Urban freeways and expressways	7%	7%	7%	10%	11%	8%	10%	13%	10%	9%

Total urban	57%	57%	61%	60%	63%	60%	55%	58%	55%	59%
Rural roads										
Rural principal arterials	16%	16%	14%	17%	15%	18%	21%	19%	21%	17%
Rural interstates	11%	11%	11%	8%	7%	8%	8%	8%	9%	9%
Rural minor arterials	7%	7%	6%	6%	6%	7%	8%	7%	8%	7%
Rural major collectors	6%	5%	5%	6%	6%	5%	5%	6%	5%	5%
Rural local roads	2%	3%	3%	3%	3%	2%	2%	2%	2%	3%
Rural minor collectors	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%
Total rural	43%	43%	39%	40%	37%	40%	45%	42%	45%	41%

Note: Numbers may not add precisely due to rounding. This analysis includes only highway funds obligated for state projects. It does not include funds that were obligated for projects in U.S. territories or for other purposes, or funding provided by state and local governments. The fiscal year represents the year that projects were authorized.

Source: FHWA's Fiscal Management Information System.

The levels of funding obligated varied during fiscal years 1992 through 2000. The difference between urban and rural road obligations was largest during 1996, when urban roads received 63 percent of funding and rural roads received 37 percent. The gap has narrowed since that time and was smallest (55 percent to 45 percent) during fiscal years 1998 and 2000. Enclosure 2 provides a detailed analysis of highway program funding on a state-by-state basis by functional classification of roadway.

In addition to tracking funding for highway construction and improvement projects, FHWA also collects data on highway characteristics and usage, including information on the length of the nation's highways. Lane miles are computed by multiplying roadway length by the number of lanes in the roadway. For example, one mile of four-lane highway equals four lane miles. Table 3 shows highway program funding per lane mile by functional classification during fiscal year 1999.

Table 3: Comparison of Average Federal Highway Funding to Lane Miles by Functional Class, Fiscal Year 1999

Functional class	Fiscal Year 1999 (millions)	Lane miles (thousands)	Dollars per lane mile
Urban roads			
Urban freeways and expressways	\$3,358.4	41.5	\$80,900
Urban interstates	4,051.3	73.3	55,300
Urban principal arterials	4,547.8	184.9	24,600
Urban minor arterials	1,508.8	224.0	6,700
Urban collectors	836.9	186.3	4,500
Urban local roads	430.0	1,186.0	400
Total urban	\$14,733.2	1,895.9	\$7,800
Rural roads			
Rural principal arterials	\$4,711.7	252.5	\$18,700
Rural interstates	2,002.8	134.2	14,900
Rural minor arterials	1,692.8	286.9	5,900
Rural major collectors	1,410.1	870.6	1,600
Rural minor collectors	216.0	543.4	400
Rural local roads	537.2	4,194.5	100
Total rural	\$10,570.6	6,282.0	\$1,700
Total	\$25,303.8	8,178.0	\$3,100

Note: This analysis includes only funding administered by FHWA and does not include funding from other federal agencies, state and local governments, or other sources. Fiscal year 1999 is the most current published data available from FHWA. Figures may not total precisely due to rounding.

Source: FHWA's Fiscal Management Information System and *Highway Statistics*, 1999.

Overall, urban roads received over 4.5 times more funding per lane mile than rural roads during 1999. On average, urban freeways and expressways received the highest level of funding per lane mile in fiscal year 1999, about \$80,900 per lane mile of roadway, followed by urban interstates, which received about \$55,300 per lane mile. Rural principal arterials received the highest level of funding of all rural roads—about \$18,700 per lane mile on average. Rural local roads received

the lowest level of funding overall, about \$100 per lane mile. Rural local roads also account for the relatively low overall average of \$1,700 per rural lane mile because these roads account for about two-thirds of all rural lane miles—and received by far the lowest level of federal funding per lane mile.

The National Highway Traffic Safety Administration (NHTSA) maintains data on fatal traffic accidents in its Fatality Analysis Reporting System (FARS), and FHWA maintains information on vehicle miles traveled (VMT) in its Highway Performance Monitoring System (HPMS). Table 4 shows the vehicle miles traveled and the fatality rates for each functional class of roadway for fiscal year 1999.

Table 4: Fatalities and Fatality Rates by Highway Functional Classification, Fiscal Year 1999

Functional classification	VMT (millions)	Fatalities	Fatalities per 100 million VMT
Urban roads			
Urban other principal arterial	392,721	5,003	1.27
Urban local road	234,886	2,917	1.24
Urban minor arterial	313,936	3,172	1.01
Urban freeway/expressway	171,563	1,354	0.79
Urban collector	131,613	1,023	0.78
Urban interstate	382,986	2,347	0.61
Total urban	1,627,705	15,816	0.97
Rural roads			
Rural local road	125,545	4,758	3.79
Rural minor collector	57,617	1,754	3.04
Rural major collector	206,936	5,816	2.81
Rural minor arterial	169,378	4,263	2.52
Rural other principal arterial	243,950	5,280	2.16
Rural interstate	260,204	3,236	1.24
Total rural	1,063,630	25,107	2.36
Unknown		688	
Total	2,691,335	41,611	1.55

Sources: FARS, 1999, NHTSA; *Highway Statistics*, 1999, FHWA.

Although only about 40 percent of all vehicle miles are traveled on rural roads, about 60 percent (25,107 of 41,611) of the traffic accident fatalities that occurred in 1999 occurred on rural roads. When adjusted for miles traveled, the fatality rate from traffic accidents on rural roads was nearly 2.5 times greater than the rate on urban roads. In particular, all rural roads other than interstates had a relatively high number of accident fatalities when adjusted for miles traveled. Conversely, urban interstates had the lowest fatality rate of all of the functional classes of roads. While more than three times more miles were traveled on urban interstate highways than on rural local roads, rural local roads had a fatality rate over six times greater than that of urban interstates.

Conclusions

About 59 percent of all federal highway funds available to states during fiscal years 1992 through 2000 were spent on urban roads. Although about 60 percent of all vehicle miles are traveled on urban roads, there are about three times more lane miles in rural areas. Furthermore, about 60 percent of all traffic fatalities occur on rural roads and the fatality rate per mile traveled is almost 2.5 times higher for rural roads than for urban roads.

Agency Comments

We provided a draft of this letter to DOT for review and comment. We met with FHWA officials who suggested several technical changes throughout the report, which we incorporated as appropriate. In addition, these officials also emphasized that, although state officials have considerable discretion over where federal highway dollars are spent, some federal highway programs place limits on what types of roads may be funded. For example, Interstate Maintenance program funds cannot be spent on local roads. They also noted that federal law requires that 10 percent of the funds apportioned under the Surface Transportation Program be spent on safety-related improvements that can be made on any public road.

Scope and Methodology

In order to identify data sources and to gather background information, we met with officials from FHWA and the National Association of Counties. We obtained a copy of FHWA's Fiscal Management Information System (FMIS) database for all highway projects that received funding during fiscal years 1992 through 2000. We also obtained a description of the FMIS data and a record layout of the database. We coordinated with FHWA officials as we conducted our analysis of the data to ensure that our analysis was accurate and complete. We shared the results of our analysis with FHWA officials for their review and comment and incorporated their comments into our methodology and the letter where appropriate.

In order to analyze federal funding by highway program, we used information from the FMIS database. We used information on obligations by fiscal year and arrayed them on a state-by-state basis and by highway program. Values were assigned to the fiscal year that the construction projects were authorized. Because you asked us to analyze funding by state, we excluded obligations to U.S. territories and other entities from our analysis. We selected 16 major highway programs and adjustment accounts by using those programs routinely reported in FHWA's *Highway Statistics* report. We calculated the funding obligated for each state and computed the percentage of each state's funding that was derived from each highway program and adjustment account. In addition, we developed an average percentage that represents a comparison of all 50 states and the District of Columbia. Data arrayed state by state appear in enclosure 1.

In order to analyze funding by functional classification of roadway, we used information from the FMIS database. We used information on obligations by fiscal year and arrayed them state-by-state and by functional classification of roadway. Values were assigned to the fiscal years during which project construction began. For the purposes of this analysis, we again excluded funding provided to U.S. territories and other entities. We calculated the funding obligated for each state and computed the amount of funding applied to each functional class. In addition, we developed

an average percentage that represents a comparison of all 50 states and the District of Columbia. Data arrayed state by state appear in enclosure 2.

We did not perform a data reliability assessment of FHWA's data primarily due to time constraints. The FMIS database contained nearly 450,000 records for fiscal years 1992 through 2000. While we did not perform a reliability assessment of the entire data set, we performed several validity checks for the data that we used in our analysis. Where records were not valid, we excluded them from our analysis. Enclosures 1 and 2 show the results of our analysis and include a discussion of the data that were excluded.

There are certain limitations to the analyses presented in this report. It is not possible to compare the data arrayed by program with those arrayed by functional classification. Our analysis attempted to include the maximum number of valid records; however, some data were missing or incomplete. Each enclosure includes information on the number of records that we were unable to classify. Depending on the availability of data, a project may be included in one analysis and excluded from another. For example, in some instances, data on a project's functional classification were missing or invalid while data on the source of funding were valid. Each enclosure contains further detailed information on data limitations, missing or incomplete data, and our analysis methods. In addition, we did not contact any states to determine how they decide to spend their federal highway funds nor did we determine how and where states spend their own highway funds. Furthermore, we did not analyze the relationship between the federal highway funding and fatality data presented in this report.

It is not possible to make direct comparisons between the data presented here and the data published in FHWA's annual report, *Highway Statistics*. FHWA publishes *Highway Statistics* using the most current data available at the time the report is published. However, over time, the information contained in FMIS may change as a result of construction project scope changes or because funds may be deobligated.

We performed our work from March 2001 through July 2001 in accordance with generally accepted government auditing standards.

We are sending copies of this letter to congressional committees with responsibilities for the activities discussed in this report; the Honorable Norman Y. Mineta, Secretary of Transportation; the Honorable Mitchell Daniels, Director of the Office of Management and the Budget; and Vincent F. Schimmoller, Deputy Executive Director, Federal Highway Administration. We will make copies available to others upon request.

If you or your staff have any questions regarding the contents of this letter, please call me or Ron Stouffer on (202) 512-2834. Other key contributors to this report were Helen Desaulniers and David Lehrer.

Sincerely yours,

A handwritten signature in black ink, appearing to read "JayEtta Hecker".

Enclosures

Obligation of Federal Funds by Highway Program

To analyze federal funding by highway program on a state-by-state basis, we analyzed FHWA's Fiscal Management Information System (FMIS) for fiscal years 1992 through 2000. Our resulting data sample included all project records that had federal funds obligated by FHWA. The data were divided by state, program and fiscal year. Some data, however, did not include sufficient information to determine the associated highway program, and were included in the "other highway programs" category for reporting purposes. Therefore, the following tables list funding levels for all projects listed in the FMIS data sample for fiscal years 1992 through 2000.

Our analysis cannot be directly compared to data published in FHWA's annual report, *Highway Statistics* because the data contained in FMIS are dynamic—our analysis used the most recent data available at the time of our request. The data used for prior *Highway Statistics* reports represents data that were current at the time the reports were published.

Tables 5a through 13b show the results of our analysis. Each fiscal year is separated into two tables for clarity.

Abbreviations Used

The following abbreviations for federal highway programs are used in tables 5a through 13b.

90%	Ninety Percent Minimum Allocation
CMAQ	Congestion Mitigation and Air Quality
Donor	Donor State Bonus
IM	Interstate Maintenance
IHS	Interstate Highway Substitute
IVHS	Intelligent Vehicle Highway System
NHS	National Highway System
STP	Surface Transportation Program

Obligation of Federal Funds by Functional Classification

To analyze highway funding on a state-by-state basis by functional classification of roadway, we analyzed FHWA's Fiscal Management Information System (FMIS) for fiscal years 1992 through 2000. We excluded projects listed as planning and statewide projects, enhancement, and other nonhighway projects. Our resulting data sample included 388,406 project records. The data were divided by state, functional classification, and fiscal year. Some data, however, did not include sufficient information to determine the appropriate category of functional classification and were therefore not included in our final analysis. In total, 1,322 records could not be classified. This represents about 0.3 percent of the 388,406 projects we analyzed. Our analysis of federal funding by functional classification of roadway, therefore, is drawn from a sample of 387,084 project records.

Our analysis cannot be directly compared to data published in FHWA's *Highway Statistics* report because the data contained in FMIS are dynamic. Our analysis used the most recent data available at the time of our request. The data used for prior *Highway Statistics* reports represent data that were current at the time the reports were published.

Tables 14a through 22b show the results of our analysis. Data for each fiscal year are separated into two tables—urban roads (a) and rural roads (b).
