# REAUTHORIZATION OF TEA-21

THURSDAY, JANUARY 24, 2002

U.S. SENATE,  
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,  
WASHINGTON, DC.

## PERSPECTIVES FROM THE FEDERAL, STATE, AND LOCAL LEVELS

The committee met, pursuant to notice, at 9:33 a.m. in room 406, Senate Dirksen Building, Hon. James M. Jeffords (chairman of the committee) presiding.

Present: Senators Jeffords, Smith, Campbell, Inhofe, Crapo, Chafee, Warner, Baucus, Corzine, and Reid.

### OPENING STATEMENT OF HON. JAMES M. JEFFORDS, U.S. SENATOR FROM THE STATE OF VERMONT

Senator JEFFORDS. The committee will come to order. Good morning and welcome to this the first in our series of hearings on reauthorization of the Nation's Surface Transportation Program.

Our nation's transportation system is one of the best in the world. Nearly every American relies upon our roads, bridges, highways, or mass transportation to get them where they need to go. But this reliance can also be a source of great frustration in the lives of our citizens.

As we open our first of 11 hearings on this matter, we begin a process that will examine what works and what does not work, and our nation will be better off for the exercise.

The Committee on Environment and Public Works has primary responsibility for the reauthorization process. EPW has a distinguished record of service in this regard; most recently and most importantly, through its work under Chairman Moynihan in 1991 and Chairman Chafee in 1997.

Their leadership unified the committee to produce the Intermodal Surface Transportation Efficiency Act, referred to as ISTEA, and the Transportation Equity Act for the 21st Century, TEA-21. I intend to continue this effective bi-partisan tradition during 2002, and on toward the reauthorization in 2003.

Our committee today includes many distinguished participants from those prior authorization efforts. Senators Warner, Smith, Inhofe, Bond, Baucus, Reid, Graham, Lieberman, Boxer, and Wyden have all been key contributors in the past, and I look forward to using their wisdom and experience during the coming months. I, too, had the honor to serve on the committee during the enactment of ISTEA.

In TEA-21, we have inherited a transportation policy and program that is basically sound. Our task this year will be to refine and evolve the program, based on the lessons learned over the past 10 years. We also examined the current and projected state of our transportation system, and the demands that it must meet.

Along with Ranking Member Smith and Subcommittee Chairmen Reid and Ranking Member Inhofe, I have announced an ambitious hearing agenda for the coming year. Hearings will be held at both the full and the subcommittee level.

This will be a year-long dialog with the many stakeholders in the transportation community. We will seek the best ideas from the brightest minds. We will hear from government, industry and system users. My goal is an inclusive process, open to all points of view from all parts of the nation.

With Senator Reid and Inhofe at the helm, members of our Transportation Infrastructure Subcommittee will examine the transportation program in detail. There will be technical brain trusts. We will also work very closely with other Senate committees' jurisdiction for reauthorization: Banking, Budget, Commerce and Finance.

EPW will be the workshop for crafting the next authorization language. I invite proposals from my many colleagues on the wide range of issues that will make up the final committee package. I offer this committee as the forum for blending these proposals. As chairman, I extend my good offices to achieve that blend.

A few common threads run through our upcoming hearing projects. These include safety and security, economic growth, community enhancement, and the balancing of interests. These are challenging matters, made more difficult by our nation's current financial uncertainties.

In fact, concern over future resources unites all the stakeholders in transportation. Success will require strength through unity. This committee will provide a common ground.

The nation's transportation program is a model of effective federalism. The program is de-centralized, collaborative and flexible. It draws on resources from Federal, State, local, and private sources. In recognition of this, we are joined today by our partners from the Cabinet, the States, and local government.

Our hearing today will begin with the Honorable Norman Mineta, Secretary of the U.S. Department of Transportation, and my close colleague in the House. Norm has taken a break from inspecting the baggage at BWI to join us this morning, and we appreciate that.

[Laughter.]

Senator Smith, Secretary Mineta will be followed by a panel of elected officials from around the country. Bob Wise, the Governor of West Virginia, unfortunately was scheduled to be here, but his plane is grounded. So he will not be here, but we will have his testimony.

Bob also served with me in the House, and served on the House Transportation Infrastructure Committee. So he knows a thing or two about the reauthorization.

Commissioner Chris Hart of Hillsborough County, FL, will represent the National Association of Counties. Chris chairs a NACo Transportation Committee.

Boise, Idaho Mayor H. Brent Coles will represent the U.S. Conference of Mayors. He is the immediate past president of the conference.

Finally, from my great State of Vermont, my friend, Burlington Mayor Peter Clavelle will represent the National League of Cities. I am especially pleased to welcome a fellow Green Mountain Boy to these proceedings. In Vermont, we put a high value on balancing our environmental concerns and our transportation needs. I pledge to move forward on the bill, which will encompass a balance in the years to come.

I am pleased to be joined by such very knowledgeable witnesses. We will need their wisdom when we reconsider the authorization here.

I want to know how our transportation policy works for Americans, for voters, for customers, users, citizens, and constituents. I want to know how the program is blended with other public objectives, social, environmental, and economic.

Finally, I want to explore the ways to best meet future challenges. I look forward to our distinguished witnesses coming forth. But let me now turn to my good friend, Bob Smith.

**OPENING STATEMENT OF HON. BOB SMITH, U.S. SENATOR  
FROM THE STATE OF NEW HAMPSHIRE**

Senator SMITH. Well, thank you very much, Mr. Chairman, and good morning, Mr. Secretary. It is always a pleasure to see you here.

I want to just point out, as you did, Mr. Chairman, that this is the first in a series of hearings that we are going to be having for the reauthorization of the so-called Transportation Equity Act, or TEA-21. It is a lot of work. We have a lot more to do.

I can remember 4 years ago, I was a member of the conference committee on the TEA-21 legislation. We worked hard. I think we did some good things, and there is always room for criticism, I guess. But I feel that overall, we did a good job with this legislation, and we made some significant changes.

Over the next year or so, as we prepare for this reauthorization, this is really one of the most significant things that Congress does. Virtually every American, in one way or another, is impacted by either a car or a road. Our economy is so closely linked with the capabilities of our transportation system, it just takes on huge importance. It is vital to each one of our States, as well as us, personally.

What you hear most often about TEA-21 is that it provided for about a 40 percent increase in transportation funding over the previous law, which was called ISTEA.

But another highly touted feature was that it provided funding guarantees, so that the tax revenues that came into the trust fund would be spent on transportation, which is the way it should be.

But some of the cornerstone achievements of TEA-21 unfortunately appear to be threatened by the shortfalls in the so-called RABA calculations revenue-aligned budget authority. There is a \$5

billion reduction predicted there from TEA-21's guaranteed levels, if you will, for fiscal year 2003.

We could not really anticipate, and I have never run into anybody yet, that could totally predict what the budget is going to be on a given year. But this issue has enormous unintended consequences, and I think you know, Mr. Secretary, that we are all going to have to deal with it.

But I appreciate your sharing these calculations with us in the past few days, in the interest of honesty here, so that we have some time to digest the impact before the release of the President's budget, and we really appreciate that. We will treat it in that spirit, as well.

We are going to be having a hearing very soon, after the budget is released, I know, Mr. Chairman, to explore in detail the revenue forecasts, the firewall principles, and the RABA mechanism. But for now, I have just asked my staff to thoroughly examine the provisions with the help of the documentation that you have provided us, Mr. Secretary, so we can adopt or develop a prudent course as we move forward on this bill.

I want to briefly bring three points to the attention of the chairman and my fellow committee members and the Secretary on some areas that I think we are going to have to focus a good deal of effort on, and it is something that I have been involved in.

First is environmental streamlining. It is a very important issue, because it oftentimes is unintended—sometimes intended, I suppose—and slows down and increases the costs of many of the highway projects in our country.

We are working on a pilot, if you will, in New Hampshire, on the I-93 corridor, where we have everybody sitting down periodically and talking and working together, so that we do not have to do this sequential business; but we can rather work together. It is working very well. It is just a widening project, but it is a little more than that. There are some other things that have to be involved there.

It is working, and I think with this streamlining, we are trying to make the streamlining language, which I helped to draft, work in a way that is productive. I think it is working. But if the project is consistent with environmental protection, then it should not be subject to excessive delays, and oftentimes, it is.

The second area that I will be focusing on is that of the freight movement in this country and the capacity. From 1990 to 1998, there was a 22½ increase in vehicle miles traveled. During that same period, there was only a 1 percent increase in the number of lane miles on the roadway.

So transportation is not just about accommodating commuters. It is also a very efficient system, vital to moving consuming goods from one part of our country to the other. If we neglect this issue, it is going to have even more of a negative impact on our economy.

Finally, let me mention briefly the issue of air quality. There are some loose ends that remain from some of the court decisions on this issue. Myself and other members of the committee want to work closely with the U.S. Department of Transportation and EPA on resolving these loose ends, so called, so that we can accomplish our air quality goals, without burdening the transportation community, or causing unnecessary delay.

I do not believe we have to burden or cause unnecessary delay to meet those standards. It is about cooperation and partnership, rather than confrontation.

So I look forward to working with you, Mr. Secretary, on those issues. Again, I thank you for coming here today, and thank you for your strong commitment to our nation's transportation system, and thank you for serving; and thank you, Mr. Chairman, for holding this hearing.

Senator JEFFORDS. Well, thank you for a good statement.  
Senator Reid.

**OPENING STATEMENT OF HON. HARRY REID, U.S. SENATOR  
FROM THE STATE OF NEVADA**

Senator REID. Thank you very much, Senator Jeffords. I appreciate your recognizing me. I have to get back to the floor by 10 o'clock.

This is the first in a series of hearings reauthorizing our Nation's Surface Transportation Program. I am happy to be able to chair the Transportation Subcommittee. I recognize that that was given to me by virtue of Senator Baucus, who is heavily engaged in other matters. I appreciate that very much.

I look forward to working with you, Mr. Chairman, Senator Smith, and of course, Senator Baucus, who has to be an integral part of anything that we do in this legislative session with this bill; not only because he has chaired this full committee in the past, but also because he is chairman of the Finance Committee.

As some of you will soon recognize, if we are going to be able to do the things that need to be done with transportation in this bill, we are going to have to get some help from the Finance Committee, because of the monetary shortfall that we have.

The problems in Nevada, I think, are representative, but to an exaggerate point, of the problems that we have in America today. We are a very large State; the sixth largest State in the Continental United States, seventh now with Alaska.

We have not only wide areas; the length of the State is some 700 miles long. We have growth in Southern Nevada that is 10,000 a month coming in to that area. We have really serious, serious problems that we need help with.

I recognize the budget shortfall that we are going to have unless something changes. In the State of Nevada, if things go the way they are, we will have a budget shortfall of about \$60 million in just highway transportation funds. That is a significant amount of money in a Highway Bill for a State like Nevada.

But having said that, it is our job to build upon the successes of ISTEA and TEA-21, and protect the gains, identify the weaknesses, and improve our transportation system.

Throughout this hearing process, we are going to look at ways to meet the transportation challenges of a new century. Chairman Jeffords and I have worked together so that we are going to have about one hearing a month, the full committee or the subcommittee.

We want to make sure that people who have concerns about transportation in this country have an opportunity to voice their opinions. We will investigate how multi-modal approaches can help

us address transportation problems and improve mobility. We will examine the physical condition of our highways; the bridge infrastructure.

We will study the transportation sector's impact on the economy and the environment. We will look for innovative approaches to transportation problems.

Last fall, I worked very hard in trying to come up with an infrastructure investment package for purposes of having a stimulative effect to this economy. There is nothing that stimulates the economy more than road building. It is very, very labor intensive.

Every billion dollars means 42,000 new jobs. Every person who has a job is paying taxes. They are buying homes, cars, refrigerators. We need to do whatever we can to stimulate that sector of our economy.

Having said all that, I hope that we have the resources that we need to meet the demands of Nevada and the rest of this country.

Mr. Chairman, I appreciate your courtesy, and I will ask unanimous consent that my full statement be made part of the record.

Senator JEFFORDS. It will be admitted.

[The prepared statement of Senator Reid follows.]

STATEMENT OF HON. HARRY REID, U.S. SENATOR FROM THE STATE OF NEVADA

Welcome to the first in a series of hearings on the reauthorization of our nation's surface transportation program. I am pleased to have the opportunity to chair the Subcommittee on Transportation, Infrastructure and Nuclear Safety and look forward to working closely with Senator Jeffords and other members of the committee to write the legislation reauthorizing the Transportation Equity Act for the 21st Century, known as TEA-21.

This legislation is critically important to each of our States and to the Nation as a whole. I represent Nevada, the fastest growing State in the country, and I have seen how such rapid growth has placed tremendous demands on our road system and our entire transportation infrastructure. I understand the problems and needs of Nevada, and that's why I will continue to provide leadership on this issue. I want to make sure that in my State and across America we have a transportation system that promotes economic growth, improves safety, enhances quality of life, and protects the environment.

Ten years ago, the Intermodal Surface Transportation Efficiency Act B ISTEA—revolutionized transportation policy. TEA-21, enacted in 1998, maintained the principles of ISTEA while bringing significant new resources to our highway and transit infrastructure. TEA-21 shifted 4.3 cents of the gas tax from the General Fund to the Highway Trust Fund and created the budgetary firewalls which ensure that all revenues into the trust fund are dedicated to transportation investments.

Now it is our job to build upon the successes of ISTEA and TEA-21—to protect the gains, identify the weaknesses, and improve our transportation system.

Throughout this hearing process we will look at ways to meet the transportation challenges of a new century.

- We will seek to use new technologies to improve operations, alleviate congestion and enhance security in metropolitan areas;
- We will investigate how multi-modal approaches can help us address transportation problems and improve mobility;
- We will examine the physical condition of our highway and bridge infrastructure;
- And we will study the transportation sector's impact on the economy and the environment;

As we look for innovative approaches to transportation problems, we must recognize that ensuring adequate funding will be perhaps our biggest challenge.

Last fall, I was the leading proponent of including infrastructure investment funds in the economic stimulus package. My view was, and still is, that investing in our infrastructure creates jobs and economic activity in the short-run and results in permanent improvements that also benefit our economy in the long run.

Unfortunately, in Fiscal Year 2003 we face a \$9 billion decrease in highway funding. This is just the opposite of an economic stimulus B it is more of an economic

depressant. This loss of funding is of great concern, especially during a recession, and in the long run will diminish the productivity of our transportation sector. I hope that the President's budget will somehow consider this important economic issue. It will continue to be a top priority for me.

The Transportation, Infrastructure, and Nuclear Safety Subcommittee that I chair will hold a hearing devoted to the fiscal year 2003 Federal Highway Administration budget proposal and TEA-21 reauthorization in February. I look forward to addressing funding issues in much greater detail at that hearing.

For now, I am very pleased with the excellent slate of witnesses we have on hand for this opening hearing to provide the committee with perspectives on reauthorization from the Federal, State, and local level. Mr. Secretary, I welcome you here today. We could ask for no better partner in this process and I am delighted at the opportunity to work with you again. I look forward to your testimony.

Senator JEFFORDS. Senator Campbell.

**OPENING STATEMENT OF HON. BEN NIGHTHORSE CAMPBELL,  
U.S. SENATOR FROM THE STATE OF COLORADO**

Senator CAMPBELL. Thank you, Mr. Chairman, and I apologize for being late. Has the Secretary made his statement yet?

You have not? We are still rattling around. I would rather listen to him speak than hear myself. I have been a friend of Norm Mineta for years and years, serving with him in the House. We also have a connection in San Jose, where we both spent an awful lot of years.

I would like to say that if you look at the numbers, Nevada, where Senator Reid hails from, is the fastest growing State; Arizona, second, and Colorado, third. Because we are such fast growing States, the importance of a new Highway Bill is going to take on huge proportions.

When we passed TEA-21 in 1998, the total overall funding represented a 40 percent increase over the previous authorization. But for Colorado, it meant a 52 percent increase over the money that we had received before that, to the tune of about \$100 million more than we had gotten.

Certainly, we were grateful for that and put it to good use. But it seems like in those fast growing western States, we are always behind the curve. No matter how much money we put into transportation, we still need more, because of the influx of people.

I personally believe, as Senator Reid does, that we need to concentrate a great deal on highway development. It seems to me that we ought to be learning more from those countries who have had such great success with moving people like Japan has, as an example, with light rail and fast rail and alternative ways of moving people.

Because I am beginning to think that you cannot simply build your way out in these high growth areas; just build your way out of things by adding more and more lanes, which just seems to increase more and more congestion. So I would hope as we move along, we put emphasis on alternative ways of moving people.

Last, Mr. Chairman, just let me say that I am particularly interested, and I do not know if the Secretary is going to say anything about this today, but we reached kind of a compromise agreement last year on the issue of Mexican trucks coming into America.

As we move along this year, I am going to be very interested in seeing how that is going to develop, and what kind of problems it has created and what kind of problems it has solved with that com-

promise. So with that, just let me say welcome, Norm. It is very nice to see you again, and I look forward to working with you.

[The prepared statement of Senator Campbell follows:]

STATEMENT OF HON. BEN NIGHTHORSE CAMPBELL, U.S. SENATOR FROM THE STATE OF COLORADO

Mr. Chairman, Senator Smith, I would like to thank you for scheduling this important hearing. I would also like to welcome these distinguished panels and thank them for taking the time meeting with us today.

As we begin this new year, the country faces many challenges. Among these includes the transportation crisis in this country.

Each year, traffic congestion costs the United States billions of dollars. As Mayor Coles will discuss in his testimony, the Western United States is booming. However, along with growth and progress come growing pains that many States have been dealing with for many years.

The passage of Transportation Equity Act for the 21st Century (TEA-21) in 1998 has helped solve many of the transportation problems across the country. The overall total funding in TEA-21 represents a 40 percent increase over the previous authorization Intermodal Surface Transportation Efficiency Act (ISTEA), which was enacted in 1991. Under TEA-21 Colorado saw a 52 percent increase over the State's ISTEA distribution. With the Federal funds that were authorized in TEA-21 by this committee and appropriated by the Senate Appropriations Committee, upon which I also serve, the Colorado Department of Transportation has moved from a \$200 million annual budget to more than a \$300 million annual budget.

This higher level of funding has allowed COOT to move forward with transportation projects that would not have been able to be completed without TEA-21. In fact, the COOT has been able to take advantage of innovative financing techniques, which were also authorized by this committee, to allow them to accelerate many projects.

For example, the Federal Grant Anticipation Revenue Vehicle (GARVEE) Program has allowed COOT to accelerate 28 key Strategic Projects statewide. Many of the projects would have taken 50 years to complete. What the Federal program has allowed COOT to do is accelerate completion of those projects to under 10 years, a substantial cost savings.

However, recent budget projections predict a \$4.9 billion shortfall from what was originally predicted in the fiscal year 2003 budget and over \$9 billion less than what was allocated in the fiscal year 2002 budget. This budget shortfall will be a challenge to all of us as we move forward on this first step to re-authorization. I look forward to working with this committee on a wide range of priority topics over the course of the year and welcome input from all levels of government, system users and private industry.

Thank you Mr. Chairman.

Senator JEFFORDS. Senator Baucus.

**OPENING STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR FROM THE STATE OF MONTANA**

Senator BAUCUS. Thank you very much, Mr. Chairman. It is a real pleasure to be with you today. I very much commend you and the leadership of this committee for setting out a very ambitious and aggressive hearing schedule.

It is my experience, frankly, that the more we begin early with hearings and deeply examine the various aspects of this issue, the more likely it is that we are going to have a good product when we reauthorize this bill, I might say with some bemusement, in another Congress. Nevertheless, it is very important this year to get all this out and have the hearings.

I would remind you that we did get a significant increase, as we all remember, last year from the previous Highway Bill, because of the diversion of the 4.3 cents from general revenue into the Highway Trust Fund.

That gave us a big shot in the arm. On average, each State got about a 40 percent annual increase in highway fund. At that time, we had the assistance of Senator Byrd, Senator Graham, and the others who were very helpful in making that change.

With the problems with so-called RABA, it is apparent that we are going to have to look for other ways to increase revenue to the trust fund. I have some ideas on how to do that.

In addition, we might look at potential greater use of the trust fund to get additional obligation authority, to make sure no State gets a cut or reduction in highway funds, and perhaps even may get an increase. Mr. Secretary, I hope at the appropriate time you can address the degree to which you think that is appropriate.

Highways are the life blood of my State, Montana. We have more Federal highway miles per capita than any other State in the nation. We have more than Alaska, but of course, Alaska does not have quite the number of people that we do, and not the number of highways, either, because you fly in Alaska; you do not travel the road. But nevertheless, we have more Federal highway miles per capita than any other State.

The program provides about 11,000 jobs in Montana. Those are high paying jobs. They say that because, regrettably, Montana has slid from about tenth in the nation in per capita income in 1946 to now, depending on how you calculate it, 50th, 49th, or 80th. So these are jobs that are good paying jobs. It makes a heck of a difference to say nothing about the greater ease of transportation in our State.

I look forward very much, Mr. Chairman, to working with you under your leadership on the committee. I plan to introduce a bill in the next period of time, but I am not exactly sure when it will be.

It will be some what of a western States' bill, but I want to underline here and emphasize that it is going to be a national bill, too. I do not want to introduce legislation that is going to work to the detriment of other parts of the nation.

In the last Highway Bill, TEA-21, essentially we worked very well. It was myself, representing primarily the western States, and our good friend, John Chafee, representing the northeastern States, and Senator Warner, the daughter States. We had meeting after meeting after meeting, with formula change after formula change after formula change.

But we finally worked it out, after lots of different meetings, and so on and so forth. There is no doubt in my mind that you are going to have the same approach, which worked very well.

I might say also that on the Finance Committee, I am going to be holding hearings on all the trust funds, looking at ways to, first of all, examine them taking stock, but also ways, particularly with respect to the Highway Trust Fund, to see if we can find additional dollars. Again, as I mentioned, I have some ideas how we can place more dollars into the trust fund.

I mentioned the RABA situation. We have got to address that. I want to commend my good friend from New Hampshire in mentioning environmental streamlining. I know members of this committee will remember a couple 3 years ago when we were quite concerned with the inadequate environmental streamlining.

We asked the department to come up with some streamlining of environmental regulations, and my gosh, they came back with a flow chart that would make the flow chart of the whole committee system in the Congress look like a grapevine.

It was so complicated that it made things more worse than better. I, therefore, think, Mr. Chairman, that the real answer to environmental streamlining is for us, in legislation, to be much more specific. I have some ideas there, which I will include in my legislation, on how to deal with environmental streamlining, because it is a huge problem particularly, I know, in western States.

But the main point, Mr. Chairman, is just I really commend you. You have got a great schedule outlined. You have got a reputation of really working together, and I pledge to work with you and also on the Finance Committee, to try to help this committee do its jobs with extra revenue.

[The prepared statement of Senator Baucus follows:]

STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR FROM THE STATE MONTANA

Thank you Mr. Chairman. It is my pleasure to be here today to discuss the reauthorization of a law that I am privileged to have helped write. Along with Senators Warner and Chafee and others on this committee and on other committees, we hammered out a bill that I believe was equitable to all States and that served this nation's transportation system well.

TEA-21 staked out new ground by putting into law the requirement that all gas tax revenues be devoted to highways. Some of the members in this room were instrumental in achieving that goal. Now I don't have to remind you of the difficult debates we had over funding formulas among the three main groups, northeast States, donor States, and western States. But in the end, we achieved a bill that was supported by the vast majority of Senators. So the final result, while not perfect, was a good compromise and was broadly supported.

I look forward to working with the leadership on this committee and other committees to develop a new highway bill that will help to continue many of the ideas that TEA-21 began—the integrity of the Trust Fund, the budget firewalls and an equitable distribution of formula dollars.

I plan to hold hearings on the Finance Committee addressing the balances in the Highway Trust Fund and on innovative ways of financing transportation projects.

I plan to use my role as chairman of the Finance Committee to gain more funding for the program and to protect the Highway Trust Fund. As always I am committed to highways and to the Highway Trust Fund.

I personally have several ideas about what I would like to see in a new bill and as I do for every reauthorization, I will be introducing a highway bill in the coming months. I have been working with the Montana DOT and other western States to develop ideas for the next several years of highway policy. I assure you that my bill will not serve the West to the detriment of other States. Quite the contrary. My bill will be a national bill and a decidedly pro highway bill.

Once again, I look forward to being very active and assisting the leadership of this committee as much as I can, as we embark on this new chapter in highway law. There is something of concern that I would like to mention here today, particularly in the presence of our distinguished Secretary of Transportation. It has come to my attention that because of various factors, the RABA for this year will be negative. In fact I have heard predictions that we are looking at a program that is \$9 billion less than the fiscal year 2002 program. We must do something about this. We cannot go into the next reauthorization with such a low baseline. If this is in fact the case and we are looking at a lower program over the next few years, I would support the influx of new obligation authority to the States for the next 2 years. This would prevent the base numbers for the next highway bill from going down too much. I hope that Secretary Mineta will address this in his remarks today and that this committee, the Finance Committee and the Administration can work together to alleviate this problem that will plague our reauthorization efforts if not addressed.

I look forward to today's hearing and future hearings as we prepare for the next reauthorization.

Senator JEFFORDS. Well, thank you, and I look forward to working with you.

Senator Inhofe.

**OPENING STATEMENT OF HON. JAMES M. INHOFE,  
U.S. SENATOR FROM THE STATE OF OKLAHOMA**

Senator INHOFE. Thank you, Mr. Chairman.

Between the comments from the Senator from Montana on RABA and the problem, and I was going to get into that, you have pretty much said what my feelings are. The announcement on January 18 that it could be a negative RABA is something that we are going to have to deal with, and we have some problems there.

I have to also say that I spent 8 years in the House, working under the supervision of and working for Secretary Mineta. We have always worked very closely together. Quite frankly, I was thrilled when I heard the announcement that you were going to be our Secretary of Transportation.

You will remember, the years that we spent trying to do the very thing that was accomplished in TEA-21, and that is to assure that all these highway dollars, the Highway Trust Fund, was going to go to highway projects.

We have accomplished a lot of that. We have accomplished a lot of the problems with donor States, that Oklahoma was certainly in an awkward situation on; and also for the flexibility to allow the States and the cities and local jurisdictions to participate in this process in a way, and I think this hearing shows that.

We are going to have input from people that are closer to the problem, back in the States. That has always been consistent with what you have stood for and what we have stood for, back in the 8 years that we have worked together.

So I am looking forward to continuing this, after this first hearing, and actively trying to do something to address the serious problems that we have, that we have talked about this morning.

Thank you, Mr. Chairman.

[The prepared statement of Senator Inhofe follows:]

STATEMENT OF HON. JAMES M. INHOFE, U.S. SENATOR FROM THE STATE OF OKLAHOMA

Thank you Mr. Chairman. As you have indicated, today is the first of series of hearings to prepare us for reauthorization of the Federal Highway Program. I look forward to working with you and our colleagues to further the progress made in TEA-21 for greater flexibility and allowing States to keep more of their gas tax dollars. As we begin the reauthorization process, I am anxious to hear from our State and local partners how we at the Federal level can assist them in meeting their unique transportation needs.

One such need that is universally felt is mobility. Not only is it important to increase mobility for personal travel, but we must also address the critical congestion choke points affecting freight movements. Continue economic growth depends on an efficient and cost effective transportation system, which includes the movement of people, goods and services.

The challenge before us will be to increase capacity without increasing costs by making better use of existing resources. Nothing better illustrates this point than the announcement on January 18th that the President's budget for fiscal year 2003 will report a negative RABA. [Revenue Aligned Budget Authority] As devised, RABA's purpose is to protect the principal that every dollar into the Highway Trust Fund is spent on highway transportation projects as opposed to accumulating large balances as was the practice prior to TEA-21. Up until this point, we have enjoyed a positive RABA which has meant more spending on transportation infrastructure

than estimated by TEA-21. Just as RABA provides for windfall it also means we could have a situation where TEA-21 estimates overstate actual revenues received. It would appear that is the case for fiscal year 2003.

Not surprisingly many questions have been asked about the calculations used to determine the fiscal year 2003 RABA number. These are legitimate questions that need serious examination and thought. Certainly if we can soften the extreme negative effect of RABA for fiscal year 2003, I would be supportive as long as we operate with the parameters of the existing statute and do not use funds outside of the trust fund to offset the loss. I am certain that several needed improvements to the RABA will be identified during this process which will be part of our reauthorization deliberations. My concern is that we proceed carefully and make sure that any immediate response contemplated to the fiscal year 2003 negative number does not tie our hands down the road.

Mr. Chairman I recognized that in an election year it will be tempting to ignore RABA and merely "fix" the problem through an infusion of cash from general revenue. However, I believe that would be a mistake because we need to protect the integrity of the Highway Trust Fund which means we should structure the program around the actual receipts of the fund, be they negative or positive.

I am anxious to hear from our witnesses representing State and local interests on how a negative RABA number will affect your highway program. Of course I am always pleased to hear from my good friend Norm Mineta. I doubt there is anyone who understands the current program better than Secretary Mineta. As one of the principle architects of ISTEA, he has a clear understanding of not only the policy embedded in the program, but also the politics of bringing diverse interests together in a final bill. In that light, Norm, I want to give you fair warning that the No. 1 issue for me in ISTEA, i.e., increasing donor State returns, will continue to be my No. 1 issue in reauthorization of TEA-21. I suspect we may have some spirited discussions on how to address this, but I look forward to working with you on writing a bill that we can all support.

Thank you Mr. Chairman and I look forward to working with you and Subcommittee Chairman Reid as we begin the reauthorization process.

Senator JEFFORDS. Thank you.

Senator Corzine.

**OPENING STATEMENT OF HON. JON S. CORZINE,  
U.S. SENATOR FROM THE STATE OF NEW JERSEY**

Senator CORZINE. Thank you, Mr. Chairman.

Secretary Mineta, it is good to see you, again, welcome.

I, too, join with all of you in congratulating and complimenting you on holding this series of hearings, Mr. Chairman. I look forward to both learning the intricacies of this, as a new member of the Senate, but also participating in trying to emphasize the importance of transportation broadly to all of our States, wherever we are.

New Jersey is a complicated State. It is the most densely populated one in the country. The general studies will show you that we spend about 15 hours a week, the average citizen, stuck in traffic. While we may not be building as many highways, we have got a lot of underpasses, overpasses, bridges, and unlocking choke points that are necessary.

That 15 hours a week, the way some people calculate it, is some place between \$7.5 billion and \$10 billion worth of lost economics from people not being on jobs, lost time at home, and has an obvious stress impact.

Being a 25-year commuter to New York City, I can promise you, it is real. It is not a figment of somebody's imagination or hyperbole. The gridlock problem is serious, and I think it needs to be combined, as Senator Campbell suggested, with an attention to mass transit. I am glad I am on the Banking Committee, which will be dealing with some of those issues as we go forward.

Then we have the donor/donee issue. While I know everyone, in their best interests, is trying to arrange all these things well, somehow or another, my State has ended up being in the donee position, in that 9.5 baseline.

So it is an issue that is very much on the minds of the people of our State. I know it is absolutely vital to the effective economic well being of all of our States and nation. So I think it is terrific that you are holding these hearings. I will place my full statement in the record, and I look forward to being an active participant.

[The prepared statement of Senator Corzine follows:]

STATEMENT OF HON. JON S. CORZINE, U.S. SENATOR FROM THE STATE OF NEW JERSEY

Thank you, Mr. Chairman, for holding this first in a series of hearings on reauthorization of the Transportation Equity Act for the 21st Century—TEA-21, and I'd like to join you in welcoming our witnesses.

As a member of the Environment and Public Works Committee as well as the Banking Committee, I look forward to being an active participant in drafting a bill that helps fund our highway and mass transit needs.

Mr. Chairman, drivers in New Jersey spend nearly 50 hours a year stuck in traffic, according to the New Jersey Institute for Technology. And, for many parts of our State, the total is significantly higher. For all this time stuck in traffic, that's an average cost of \$1255 per licensed driver in wasted gasoline and lost productivity—for a total cost of \$7.3 billion a year. A different study by the Texas Transportation Institute estimates a much higher cost—as much as \$10 billion a year.

All this gridlock is dramatically affecting New Jerseyans' quality of life, both economically and emotionally. It means lost time at work, lost time with family and friends, and more stress. It also means more air pollution. And it's one of the important reasons that much of New Jersey fails to meet Clean Air Act standards.

As a 25-year commuter to New York City from New Jersey, I can personally attest to the frustrations of the gridlock on our roadways. Figures from the 2000 Census back this up: our State has 8.4 million people, 3 percent of the nation's population. Yet those people drive over 67 million "vehicle miles" in our State. This leads to intense gridlock.

Solving this gridlock problem, Mr. Chairman, will require a comprehensive approach to transportation. Clearly, there is a need for more roads in many areas and the construction of overpasses, underpasses and bridges also will help unlock existing traffic chokepoints. But we'll never solve gridlock simply by pouring concrete. We also need to focus on other modes of transportation, including rail and transit. And we need to promote innovative approaches to traffic management that take advantage of emerging technologies, such as the EZ Pass system, and also promote tried-and-true approaches such as carpools and telecommuting.

As you might imagine, Mr. Chairman, I am especially focused on the needs of my State of New Jersey. And it is very disturbing to me that New Jersey receives so little in highway funding for all the gas tax and sales taxes on tires, trucks and buses that we send to Washington. Figures for the most recent year available show that our State now receives the minimum allowed for any State, 90.5 cents back for every dollar sent to Washington. This, Mr. Chairman, is an important reason that New Jersey ranks 49th out the 50 States in the amount of total tax dollars we receive back from Washington. In the case of highway funding that is especially not fair, considering our State's aging infrastructure and severe transportation needs.

I look forward to working with you, Mr. Chairman, on these and other issues as our deliberations move forward, especially what level of environmental review must exist before a project is begun. I am in favor in general of the efforts in TEA-21 to streamline our environmental review process in order to begin road and rail projects more quickly. However I strongly believe that we can only do so in a way that protects our quality of life.

In addition, I also expect to be active in the Banking Committee, as well, in efforts to promote transit, which also is critical to my State, and that effort in particular will be focused on building a critically needed tunnel under the Hudson River for rail transportation which will go a long way toward breaking down existing gridlock in our rail transit system.

In closing, Mr. Chairman, let me again thank you for your leadership in this area, and I look forward to working with you and hearing from our witnesses.

Senator JEFFORDS. Thank you very much, Senator, and I want to thank all of my colleagues for their excellent statements.

Mr. Secretary, it is a pleasure to have you here. We look forward to working with you.

**STATEMENT OF HON. NORMAN Y. MINETA, SECRETARY OF  
TRANSPORTATION**

Secretary MINETA. Thank you very much, Mr. Chairman. It really is a pleasure for me to have this opportunity to appear before you and the Senators of this committee. I want to thank you for this opportunity to share some thoughts with you about the lessons that we have learned from TEA-21, as well as the predecessor legislation, ISTEA, the Intermodal Surface Transportation Efficiency Act of 1991. Mr. Chairman, I want to thank you for your leadership in having this first hearing on the reauthorization of TEA-21.

All of us at the Department of Transportation and in the Bush Administration look forward to working with the Senators of this committee and with Congress as a whole in shaping proposals for the reauthorization of this very important legislation.

Today, America's transportation sector faces a period of not only extraordinary challenge, but also of extraordinary opportunity, as you are so very well aware.

On September 11, 2001, a determined and remorseless enemy attacked one of America's most cherished freedoms, the freedom of mobility. The horrific events of that day and the weeks and months that have followed have reaffirmed the critical importance of our nation's transportation system, both to the security of every American and to our economic well being. The committee wisely begins the reauthorization process by looking to the lessons of TEA-21 and its predecessor.

As many of you may know, I helped author ISTEA, working with all of you at that time during my tenure as chair of the Subcommittee on Surface Transportation of the House Committee on Public Works and Transportation.

This landmark legislation established several new principles for the nation's surface transportation programs, which have proven out over time the importance of building strategic partnerships with State and local officials and with private industry; a new commitment to intermodalism; and a heightened sensitivity to the impacts of transportation on the shape and character of America's communities, to name but three.

Building on this firm foundation, TEA-21 strengthened our transportation system in five distinct areas: No. 1, predictability, equity, and flexibility of funding; No. 2, safety; No. 3, mobility in system upgrading; No. 4, the application of innovative technologies; and No. 5, improving the quality of life.

Now I would like to touch very briefly on some lessons learned. My written testimony expands on each of these five areas. Mr. Chairman, I would like to request unanimous consent that my full testimony be made a part of the record.

TEA-21 revolutionized transportation funding and authorized record levels of investment for transportation. Minimum guarantees in the Highway Trust Fund firewalls created confidence among

grantees regarding Federal funding, which is an extremely important aspect of the program delivery for State and local officials.

Just as importantly, the funding flexibility that was first included in ISTEA, and then continued in TEA-21, enabled State and local decisionmakers to consider a variety of transportation options, and allows them to tailor their transportation choices to meet the unique needs of each of their local communities.

Increased TEA-21 funding also allowed the States to make needed safety improvements. Under TEA-21, States may use their Surface Transportation Program, inter-state maintenance, and National Highway System funds for safety improvements and, in fact, many do.

TEA-21 also enabled improved connectivity access across the modes, particularly in the area of freight movement. TEA-21 also authorized the job access and reverse commute program to address transportation gaps in the public transit system, and to reduce the barriers for those moving from welfare to work.

TEA-21 continued, and increased funding for several quality of life programs, originally authorized in ISTEA, broadened eligibility for others, and then established the new Transportation and Community and System Preservation Pilot Program, all of which continued to help States and communities improve the environment.

TEA-21 also directed us to streamline environmental reviews. As a result, the average time to process environmental documents for major projects has been cut by almost 8 months, and we are well positioned for significant future progress.

Now while we have begun the job of streamlining, more can and must be done. In short, the programmatic and financial initiatives of these two very historic surface transportation bills provided us a solid and balanced structure, around which we can shape this new reauthorization legislation. However, while we should build upon the best of ISTEA and TEA-21, we have an obligation or opportunity to do even better.

Now as we move forward, we ought to adhere to certain core principles and values. We must continue to assure adequate and predictable funding for investment in the nation's surface transportation system. We must preserve funding flexibility to allow the broadest application of funds to the best transportation solutions identified by our States and local partners.

We must also build on the intermodal approach that was found in ISTEA and TEA-21, and we must expand and improve the programs of innovative financing, in order to encourage private sector investments in the transportation system, and look for other incentives or other inventive means to augment existing revenue streams.

We must emphasize the security of the nation's surface transportation system, providing the means and the mechanisms to perform risk assessment and analysis, incident identification, responses, and when necessary, evacuation.

We must continue to focus on making substantial improvement in the safety of the nation's surface transportation system. None of us should consider it acceptable that we suffer 40,000 deaths and over 3 million injuries annually on our highway system.

Finally, we must continue to develop and deploy innovative technology with the ultimate goal of making “intelligent transportation system” an unnecessarily redundant phrase.

Mr. Chairman, you have proposed an ambitious hearing schedule that will allow us to explore all of these topics in detail, and I want to commend you for that. We, at the Department of Transportation, look forward to working with all of you, with both houses of the Congress, with State and local officials, and with stakeholders, in shaping the Surface Transportation Reauthorization legislation.

This is a moment of great opportunity, a moment that we must not let pass by. I am confident that by working together, we can build on the lessons learned from ISTEA and TEA-21, to develop reauthorization legislation that will best serve the American people.

Mr. Chairman, before I close, everyone has made mention of the provision in TEA-21 that I know is on the minds of all of you. That is the revenue-aligned budget authority, or RABA.

When TEA-21 passed, the goal was to ensure that the highway taxes paid by users be spent and not languish in the Highway Trust Fund as an unobligated balance. Now I agree with that philosophy. RABA was included in TEA-21 to annually adjust actual spending to tax receipts.

Now the RABA mechanism has provided over \$9 billion of additional highway spending over the past 3 years. Unfortunately, with the decline in the economy, combined with the overly optimistic revenue estimates in past years, the RABA calculation for 2003 is a negative \$4.965 billion. Even with this RABA over the past 4 years, it has provided a net gain of some \$4 billion.

Now the RABA calculation is based on two factors. One is a look back and a look forward; \$3.468 billion or 70 percent of the negative RABA is because the actual 2001 tax receipts are below the estimated tax receipts used in the fiscal year 2001 RABA calculation. This is the look back correction.

Now \$1.497 billion of the \$4.965 billion negative RABA is because the tax revenue estimate for fiscal year 2003 is below the level that was estimated in TEA-21 for fiscal year 2003, and this is a look ahead provision.

The RABA calculation is not a policy call or a policy interpretation. It is a simple budgetary, arithmetic calculation, based on law. As we discuss the reauthorization of TEA-21, we need to discuss the design of RABA, and how its current swings in positive and negative directions could be smoothed out over time.

So, again, Mr. Chairman and members of the committee, let me thank you for this opportunity to testify before you. I look forward now to responding to the questions that you might have.

Senator JEFFORDS. Thank you very much, Mr. Secretary. There seems to be a general support in the current program and universal support for its funding protections.

Unlike years past, where stakeholders and States were divided, this year, the parties seem to have much more in common. Do you concur with that statement?

Secretary MINETA. I am sorry, I did not hear the first part of that, Senator.

Senator JEFFORDS. There seems to be general support for the current program, and universal support for its funding protections. Unlike years past, when stakeholders and States were divided, this year the parties seem to have much more in common.

Secretary MINETA. I believe, Mr. Chairman, you are correct on that observation. I think, again, this deals with the kind of flexibility that is there in the legislation, in TEA-21, that allows, with the NHS and the STP pot, to be able to be used, to be able to respond to the needs that exist in States and localities. I think because of that flexibility, there is a great deal of acceptance about the major underlying provisions of TEA-21.

Senator JEFFORDS. Well, I look forward to working with you, and we all do. I thank you for a very excellent statement.

Senator Smith.

Senator SMITH. Mr. Secretary, this whole reauthorization process for coming up with another Transportation Bill, or you can call it whatever it is going to be called, TEA-21 plus or whatever, it is about as nonpartisan as anything we do. I mean, it basically is an issue where all of the States try to work together to make the formula as fair as possible.

I would just like to probe a little bit into how you will work with us on that, as we begin to have these hearings. Are you going to be providing us specific details on some of your core principles, or are you just going to give us general details? Can you tell us just a little bit in terms of how we might work with you, as we proceed along this process over the next year? I am not asking for a lot of detail here, but just conceptually, how you would work with us on the committee.

Secretary MINETA. First of all, I intend to work very closely with all of you, and with the members of the other body. What I have laid out is a very broad area in terms of principles. But during the course of this year, I will be becoming more specific about where we are going. I am hoping that when you reconvene in 2003 to have a legislative proposal ready for Congress' consideration.

But during the course of this year, I think with the give and take of our conversations back and forth, we will refine what we are hearing from the stakeholders, from State and local governments, from private sector organizations, contractors, and everyone involved, in order to refine where we will be going in terms of a specific legislative proposal, which I would like to have ready for presentation to the Congress in 2003, early right after we convene.

Senator SMITH. I commend you for that, because I think that is going to make it a lot easier to come up with a final product, if we are all working together on it along the course of the next year, rather than just simply dropping a proposal, "the Administration proposal," on the committee and on the Congress, essentially next year.

We both mentioned this. You mentioned in your testimony and I mentioned in my opening statement the issue of streamlining. When I was chairman last year, we had a couple of hearings on this with the previous Administration on the streamlining regulations.

The process and the result, I think, were flawed. I do not know if there was some misunderstanding or disagreement. We could not

seem to get a handle on what we actually meant. There was a difference of opinion as to what we actually meant in terms of these streamlining provisions. I think Senator Baucus mentioned that they were probably too general, not specific enough, and there was too much room for differences of opinion.

There has been no final action on those regulations. I would just ask you, what does DOT propose to do on those regulations; go back to the drawing board, or hold off until the next reauthorization?

Secretary MINETA. Well, I guess the debate that we are having is, should we just go ahead and withdraw those proposed regulations, to look at the reauthorization process as part of the way to incorporate any improvements we might make on streamlining.

I do not think that where we are with the proposed regulations out there that we will move forward with that at all. My feeling is that we should really be working toward improving the legislative or the environmental process right now, and look toward the reauthorization process to refine, again as I said earlier, all of these different elements that we have right now as general principals, but to refine that for legislative purposes.

Senator SMITH. I agree with you. I think that makes sense. We are learning a lot. I think some of us had different views as to how these streamlining provisions worked. I have a pilot project going in New Hampshire and others do too.

I think we are learning a lot about how to streamline and what the intent of the Congress was. Perhaps working together like this, rather than to go back and try to finalize something that there was a lot of concern about; let us try to work together and incorporate it into the next authorization. I think it is a good point. I appreciate you saying it.

Thank you, Mr. Chairman.

Senator JEFFORDS. Senator Baucus?

Senator BAUCUS. Thank you, Mr. Chairman.

Mr. Secretary, I was wondering whether we had the support of the Administration to give States additional obligation authority to alleviate the RABA problem.

Secretary MINETA. Well, I think it is too early. We have not gotten to that point yet of how we are going to solve or deal with the issue of the drop in RABA. I think my basic approach is how do we smooth out the peaks and valleys about RABA?

We have had the good fortune of having an increase since the inception of TEA-21; this year being the first year that are experiencing this kind of a negative RABA. How to deal with that, I have not looked at that.

It seems to me that part of the legislative response is going to have to be to try to smooth that out, so we do not have these peaks and valleys. Because I think from a State and local perspective, predictability of funding and the consistency of that funding is very important.

As I believe Senator Inhofe mentioned, or whoever might have mentioned it, about the fact that there are 42,000 jobs generated from \$1 billion being spent in transportation. This is a very significant economic stimulator, as well. So we are concerned about what this kind of a precipitous drop has.

Senator BAUCUS. I appreciate that. One way to even that out is to add the additional obligation authority for this year.

Secretary MINETA. It is. But the only problem there is, if I were to put on a budget hat, it would be looking at the increased deficits in the total budget. I know that this is something that the Administration will be looking at, in terms of what that deficit picture looks like. If you take more money out of the general fund, or more money out of the trust fund.

Senator BAUCUS. That is right but, of course, the trust fund surplus has amassed true deficits. It has been a budgeting gimmick.

Secretary MINETA. That is why RABA got there in the first place.

Senator BAUCUS. Those funds are dedicated to the highways, so they might as well be spent for highways.

Secretary MINETA. Absolutely, I am a believer in that.

Senator BAUCUS. Additional obligation authority.

Secretary MINETA. I will jot it down, and we will take a look at that.

[Laughter.]

Senator BAUCUS. You know, Mr. Secretary, clearly this is a very serious subject. You mentioned the economic stimulus. You mentioned the adverse yo-yo effect with the current RABA. So I urge you to very firmly look at ways to deal with that.

Will the Administration be sending up a bill?

Secretary MINETA. I am hoping to do that, as I mentioned earlier, within the first month in January of 2003.

Senator BAUCUS. I trust that that bill will preserve the firewalls.

Secretary MINETA. I am a very big supporter of firewalls. This is going to be something that we will still have to be, I think, arm wrestling within the Administration before we have a final answer. But I happen to be supportive of the treatment of the revenues, both in TEA-21 and AIR-21.

Senator BAUCUS. I further trust that the legislation that we will provide the Administration will protect the fund from invasion from other modes?

Secretary MINETA. Yes, I think that is where we will be. One of the basic principles, though, that we have always found in TEA-21 is the intermodal nature of it, especially as it relates now to freight movement, and the question as to how to make sure that we have that inter-connectivity between ports and onto our highway system.

But within the TEA-21 modes absolutely there will be some flexibility. But from other non-TEA-21 modes, I would say my personal opinion is, we should minimize or say no to any of those invasions.

Senator BAUCUS. Well, I appreciate that. We have got a lot of work ahead of us, and I thank you very much, Mr. Secretary.

Secretary MINETA. Thank you very much, Senator.

Senator JEFFORDS. Senator Inhofe?

Senator INHOFE. Thank you, Mr. Chairman.

Mr. Secretary, Section 1016 of the Patriot Act declares that it is the U.S. policy that for any physical or virtual disruption of critical infrastructure in the United States, that it be brief and minimally detrimental to the economy.

As you will recall, I have a background of some 45 years in aviation. I think right now I am the last active commercial pilot, certainly in the Senate, and maybe in the House, too.

Consequently, I got more of the calls than I think most of the other members did about the disastrous effect it had on the GA economy. The closing of Class B airspace for an extended period of time actually put people in Oklahoma and throughout the Nation out of business.

I felt that at that time, and I am not saying this critically, because everyone was hysterical and trying to do the right thing, that we did not have the right adequate input of the general aviation community in making those decisions insofar as airspace is concerned. Now I agree that we needed to do what we did. But I do not think we needed to do what we did in some areas of the country, as long as we did it.

Is there any step that you are going to propose to be taken to include more input from the general aviation community, so that we can be anticipating if something should happen in the future, and how to handle this differently than we did this last time?

Secretary MINETA. Well, I think what we have done since September 11th, right after the 11th, I set up what I referred to as National Infrastructure, a NISK, within the department, to deal with various modes and the security issues relating to each of those modes.

In the infrastructure committee that we set up, we have what we call direct action groups. Those direct action groups reach out to the user community. So in the instance of the DAG as relates to aviation, they reach out to general aviation to commuter airlines, the very user communities.

I know that here in the Maryland area, there has been a great deal of conversation about general aviation airports that still remain closed. Maybe by the end of next week, I am hoping to resolve an issue where we will have the three remaining airports in the Greater Washington D.C. area opened.

Senator INHOFE. Mr. Secretary, I know that there is a reason for that. This is the area that was the targeted area, and I understand that. But there are a lot of parts of the country that were not. So I think that the action that you are taking is going to help a great deal, and I would encourage you to use the general aviation community as that comes up.

I want to quickly touch on two other areas here before my time expires. The DOT Appropriations Bill of 2002, as sent to Senate of Congress regarding hours of service, and that is at Section 356, states that no action shall be taken that would diminish or revoke any exemption granted in Section 345 of the National Highway System designation, unless it is shown such exemptions create a public safety risk.

As you may know, there has been an ongoing concern that those exemptions that have been granted to certain types of drivers such as ag. drivers and oil services and this type of thing be changed. Can you update us at all on that?

Secretary MINETA. Last week, we had a discussion on the pilot on hours of service duty time as it relates to pilots. At that meeting, I also had Joe Clapp, who is the head of our Federal Motor

Carrier Service Administration and Safety Administration, taking a look at the whole issue of circadian balance or rhythm as it affects pilots and as it affects truck drivers.

So we are hoping that the Federal Motor Carriers Safety Administration will be able to come to a conclusion on the hours of service provision. Now as to when that would be, I would be guessing right now. But I would assume it would still take another four to 5 months before we finalize our thoughts on hours of service.

Senator INHOFE. I would request that you put me in the loop on this, so that as this progresses, we will be able to have some input.

I have one last question, and I know my time has expired. But I can remember when you and I and Congressman Oberstar and others, back after Pan Am 103, were concerned about the detection technology that has been used. We actually took some trips, and explored what technology is out there.

This is a similar problem that we have at DOD and in Customs, that we have used the same old technology. People are concerned, as far as airline traffic, more than any other single thing, on checked luggage, on what is out there.

I started, after the 1995 explosion in Oklahoma City, to look at this, and we found different technologies. One was PFNA, Pulsed-Fast Neutron Analysis, which would take a sealed container and get a three dimensional look at everything in there, along with also the chemical composition that might be in there.

We have put language in the Airline Security Act to encourage you to look at other technologies. Is there any update that you can give us on that?

Secretary MINETA. Absolutely; one of the things that we did as a result of the Aviation and Transportation Security Act passing, or actually prior to that, because there has been a great deal more work done on it, since the passage of ATSA, we have what we call rapid response teams. The one dealing with technologies is very, very ambitious in terms of what they want to do.

So we are looking, as the legislation talked about, at advanced technologies. We are looking at back scatter and a number of other technologies to look at how to meet the requirement of the law that all bags will be screened by an explosive detection system by December 31, 2002.

Senator INHOFE. That is very good news and it is welcome. We have been working on this for many, many years.

Secretary MINETA. Absolutely.

Senator INHOFE. There has been a resistance to change, as there always is. But we just need to have a more advanced technology. The technology is out there. We need to use it, and I appreciate your efforts in that.

Secretary MINETA. With the sophistication and the innovativeness of the terrorists, whether it be ceramic knives, whether it be, let us say, a Glock 17, a plastic gun, they are very, very difficult to detect with our x-ray technology and other systems that we have right now.

So that is why we are getting into these other areas that can detect explosives that are not based on nitrates, looking at back scatter radar, to be able to pick up objects that would not be able to be distinguished in an x-ray technology.

So we have a number of innovative approaches, using advanced technologies. Believe me, we have got every technology company that thinks they have the best thing since the invention of sliced bread to solve all of our problems. So we are examining all of them, sir.

Senator INHOFE. Thank you, Mr. Chairman.

Senator JEFFORDS. Senator Chafee?

Senator CHAFEE. Thank you, Mr. Chairman, especially for getting an early start on these hearings and scheduling frequent hearings. I look forward to working with the Secretary. Certainly, this has been one of the great success stories of the last decade, and I am sure it will be successful in the future, as we go through this reauthorization process.

I especially look forward to working with you as one of the original architects of ISTEA on the issues that you highlighted in your opening statement: safety, mobility, new technology, and especially quality of life.

I really do not have any questions, Mr. Chairman, thank you.

Senator JEFFORDS. Thank you. I would like to followup a little bit on one of your comments with Senator Baucus.

I want to make it very clear that I want to have a balance to the system. I was a little concerned, as I have a strong belief that railroads should play a more important role in trying to get a lot of the freight off the highways. I want to inquire as to what your attitude is with respect to rail, because you seem to be pretty pro-highway here.

Secretary MINETA. Well, the part that I was referring to earlier was the whole issue of inner-connectivity of the various modes. I think the Alameda Corridor is a good example of a project that is vitally needed. It will be completed in April of this year.

I think as we look at financing mechanisms in the new legislation, I think we have to look at new innovative methods of financing. Alameda Corridor utilizes, I believe, TFIA financing.

So it really deals with the inner-connectivity of railroads and highways, and yet it does not dip into the Highway Trust Fund to finance the project. There are some highway moneys in there. But the vast majority is non-highway moneys.

So I think that the kind of question that I believe Senator Baucus was alluding to is, do we use the trust fund to finance other modes that are not eligible for Highway Trust Fund moneys? I think in terms of protecting the integrity of the Highway Trust Funds, unless there are additional taxes that would be thought of by the Congress, I do not see any other way to finance those kinds of non-Highway Trust Fund modes of transportation.

Senator JEFFORDS. Then we would never get out of the mess.

Secretary MINETA. Well, no, I think there are ways of getting out of the mess. I think innovative financing is one of the those ways that we can do that. I think TFIA is a good example of where it has been used for various modes, and that it can be utilized.

I think what we ought to be doing is being able to say, if it is worth doing, than there ought to be some private sector investment interest, as well. Private sector bonds do that right now with highways. What about getting other kinds of bonding mechanism or

other approaches, in terms of one of our authorizing principles in reauthorization, intermodal?

So, again, I think there are distinct areas of financing that we have right now that have to be, I do not want to say maybe protected, but they have not to be assured that that funding is going to continue. I think these other kinds of approaches, unless the other non-Highway Trust Fund potential users would like to have additional taxes imposed on them, then there is no alternative.

I think the whole issue, we have moved over the 4.3 cents; and the question of, are there, let us see, what is it, 2.3 cents right now from the railroads? Is the railroads that pay? Let us see if I can get some help here.

I am sorry, all 4.3 goes to the general fund. I thought some portion of it was going to the trust fund. But in any event, I just feel that because of the continued needs, in terms of the national highway system, we just, I think, have to minimize who is going to be at the table, drawing on those funds; yet, recognizing the importance of the intermodal nature of TEA-21.

Senator JEFFORDS. Well, thank you, we will be talking about these issues as we go along.

Secretary MINETA. Absolutely.

Senator JEFFORDS. This is just the beginning.

Secretary MINETA. This is just the beginning; yes, sir.

Senator JEFFORDS. Right; thank you very much, and thank you for excellent testimony.

Secretary MINETA. Thank you very much.

Senator JEFFORDS. I have to tell you how much I look forward to working with you.

Secretary MINETA. Great; thank you.

Senator CRAPO. I would like welcome the second panel. I would like to use my time for that to introduce one of the witnesses, who is a very good personal friend of mine and a great leader in Idaho, Mayor Brent Coles from Boise.

Mayor Coles is the immediate past president of the U.S. Conference of Mayors, and I understand he now sits on the executive committee. He has been instrumental in Idaho in working on transportation issues, as well as many others.

I certainly look forward to his testimony. I suspect that he is going to talk to us about some of the issues of urban sprawl and the kinds of pressures we are facing, even in a broad big State like Idaho, and the fact that the transportation issues that this committee deals with are so critical.

I know that he has been working very aggressively on focusing the resources that he can in the area of Boise and the surrounding counties with which he works with as the Mayor of Boise, to address things like rail systems or bus systems or other types of approaches to help us reduce congestion and increase the quality of life.

So I, again, want to welcome Mayor Coles here, and we look forward to your testimony, Mayor.

Thank you, Mr. Chairman.

Senator JEFFORDS. Thank you very much.

I, of course, would like to welcome my Mayor from Burlington, Vermont, Mayor Clavelle. It is nice to have you with us and we look forward to your statement.

I understand we have Ray Scheppach as the Executive Director of the National Governor's Association. We are pleased to have you here; and Commissioner Hart, it is a pleasure to have you with us, also.

Mr. HART. Good morning.

Senator JEFFORDS. I will exercise my home State prerogative and introduce Mayor Clavelle. Mayor, it is wonderful to see you. You have done a fantastic job in the city of Burlington. I have enjoyed working with you in the past, and look forward to future collaborations in service to the citizens of Vermont. Please proceed.

**STATEMENT OF HON. PETER CLAVELLE, MAYOR, BURLINGTON, VERMONT, ON BEHALF OF THE NATIONAL LEAGUE OF CITIES**

Mr. CLAVELLE. Thank you, Chairman Jeffords. I very much welcome the opportunity to be with you today, and I thank the members of the committee for this opportunity to discuss such an important issue to the Nation's cities.

As was indicated, I am Peter Clavelle, Mayor of Burlington, Vermont. Today, I am pleased to be here, not only as a Vermonter, but also as a representative of the National League of Cities.

Mr. Chairman, I would like to make a short statement, and then would ask that my full testimony be included in the record.

Senator JEFFORDS. It will be.

Mr. CLAVELLE. The National League of Cities represents 18,000 cities and towns, and over 140,000 local elected officials. The NLC represents all cities, regardless of size. Our largest member is the great city of New York City, with a population of eight million people. Our smallest member is DeGraff, Minnesota, with a population of 149. As representative of the Nation's local leaders, NLC has a vital interest in the reauthorization of TEA-21.

NLC's Transportation Infrastructure and Services Committee appointed a special TEA-21 Reauthorization Task Force, which recently completed a year-long re-write of our transportation policy. Our new policy was adopted by NLC's full membership at our annual meeting in December of 2001.

Mr. Chairman, I also would like to submit NLC's 2002 transportation policy for the record.

In addition to representing NLC today, I am here on behalf of my city, Burlington, Vermont. With a population of 40,000, Burlington is Vermont's largest city. I am currently serving my sixth term of mayor; and just this Fall, I concluded a 2-year term as President of the Vermont League of Cities and Towns. I also serve on the Advisory Board of the United States Conference of Mayors.

Mr. Chairman, as we embark upon the reauthorization process, we must take into account the current climate in Washington, DC, and the Nation. As you know, these are tough economic times in the aftermath of September 11th, and local officials are shifting priorities.

Cities nationwide are moving valuable resources to public safety expenditures, which makes a continued Federal commitment to infrastructure even more important.

In several NLC surveys of municipal officials conducted after September 11, over half of the cities reported that they are increasing spending and public safety and security.

The majority of cities surveyed reported that they would reduce spending in other areas to meet the new public safety funding gap. This means that cities may have to postpone or cancel some needed transportation projects to shift funding to security.

The shifting of local revenue to a public safety and security-related budget is unavoidable. The question becomes, what will be the role of the next Federal Surface Transportation Program in Homeland Security? Will the Federal Government be able to offer greater assistance to cities to meet their needs?

As the committee considers these fundamental core concerns for the program, the Nation's local elected officials would also like to highlight some key priorities for the next Surface Transportation Bill.

NLC members identified congestion as a major concern when they created the TEA-21 task force to review NLC's policies. The themes of funding, flexibility and intermodalism permeated these discussions.

On funding, NLC supports the current budget mechanism developed in TEA-21, which directly linked transportation user fees to transportation spending. We call for all transportation taxes, including those levied on gasohol and alternative fuels, to be deposited into the Highway Trust Fund.

In addition, we support innovative financing programs and techniques such as tolls, State infrastructure banks, and the Transportation Infrastructure Financing and Innovation Act. These programs support the development of public/private partnerships, and provide creative ideas for meeting the infrastructure needs in our cities.

On flexibility, NLC supports local flexibility to design, manage, and operate transportation systems. ISTEA and TEA-21 embodied these themes, empowering local governments through the creation of the metropolitan planning process. We look to the committee to continue this Federal, State, local partnership through reauthorization.

To continue to provide the most options to local governments, NLC supports the continuation of the Congestion Mitigation Air Quality Program, as well as Transportation Enhancement Programs, and the Transportation and Community System Preservation Pilot Program, TCSP, and the Intelligent Transportation System Program.

These programs have made a huge impact on localities, and have had a positive effect on quality of life. In Burlington, as you know, Mr. Chairman, we have utilized the enhancements programs to launch the revitalization of a historic commercial center along North Street.

We have implemented street lighting upgrades and streetscape improvements. We have benefited from TCSP funds for improvements to the Church Street Marketplace. CMAQ funding has en-

abled us to try new approaches to solve downtown parking and transportation problems.

In addition, NLC urges the committee to consider the development of a new congestion program that recognizes that congestion is a local issue, and provides direct funding to cities and regions of all sizes to address related problems in their communities.

On intermodalism, NLC strongly supports Federal programs, which fund different transportation modes, such as the Federal Transit and Rail Programs. Commuter rail, inter-city rail, high speed rail, and MAGLEV provide communities with other options to consider as part of a transportation and smart growth plan.

In my small city, commuter rail service has been instituted. We support funding to both preserve existing transit systems and for new starts. In addition, we support a change in the law to allow States and localities to use TEA-21 dollars for inter-city passenger rail. We support the development of a national high speed rail network.

Last year, NLC joined our local and State partners in supporting the High Speed Rail Investment Act. In addition, NLC supports the development of intermodal facilities. In Burlington, we will break ground this Fall on an intermodal transit facility that will provide seamless connections for regional transit, passenger rail, bicycle, and lake ferry services.

This facility, and all of its inter-connected modes will make our waterfront accessible to a great number of visitors, without overwhelming it with automobiles.

In conclusion, the Nation's local elected officials stand ready to work with you throughout the reauthorization of TEA-21. We understand the delicate balance among the priority objectives, of all of the partners from the Federal, State, and local levels testifying before the committee today.

We value our seat at the table in this process, and accept the responsibility of planning and implementing innovative transportation strategies to meet the needs of our citizens.

It is clear to us that congestion remains one of the nation's top complaints, and is affecting the quality of life. In addition, safety and security have become top priorities in this new post-September 11th climate.

We believe the Federal Government can strike a balance between protecting our citizens and enhancing their quality of life. We will continue to strive for an innovative intermodal and multi-modal transportation system.

Mr. Chairman, this concludes my testimony. I would like to thank you and the members of the committee for this hearing today, and for the opportunity to appear before you. I will be happy to answer any questions. Thank you.

Senator JEFFORDS. Thank you. I am going to withhold questions until everyone has had a chance to give their speech here.

Mayor Coles?

**STATEMENT OF HON. H. BRENT COLES, MAYOR, BOISE IDAHO,  
ON BEHALF OF THE U.S. CONFERENCE OF MAYORS**

Mr. COLES. Thank you, Mr. Chairman. I appreciate the opportunity to be here today and represent the U.S. Conference of May-

ors, and the 1,000 cities that are over 30,000 in population that are represented at the Conference of Mayors. Senator Crapo, thank you very much. Senator Chafee, I appreciate the opportunity to be here to testify.

There is no question that ISTEA and TEA-21 have revolutionized the opportunities at the local level to provide for the transportation needs in our communities.

We have looked very carefully and worked very closely with Standard and Poor's DRI, and we have found that the metro economies of this Nation are what support this Nation's economy. As go the cities and neighborhoods and metro economies, so goes this Nation's economy. If we are to protect those metro economies, we must protect and enhance the quality of life that people and businesses have in their communities.

One way to do that, of course, is to provide for their transportation needs. For industries to grow in Boise, Idaho and the other metro economies across this Nation, our businesses and industries must have the transportation network for our employees to get to work, to enjoy their neighborhoods, to enjoy their educational opportunities and cultural opportunities, that enhance our communities.

To do that, TEA-21 and ISTEA have given us those opportunities to look at congestion mitigation, so that we can reduce air quality concerns in our community, so that our industries can grow, as opposed to having the numbers of cars grow in our communities.

The 10 years of this legislation has made a great impact on our cities and our metropolitan areas, and we must protect this legislation. We must move forward in reauthorization, enhance TEA-21 and ISTEA congestion mitigation opportunities, the flexibility for cities and metro economies to determine whether or not it is a rail system that they need; whether it is an enhanced bus system that they need; commuter van systems; bicycle pathways; the whole complex opportunities of a comprehensive transportation system.

Without ISTEA and TEA-21, we would not be where we are today. We believe that we can enhance what we do at the local level, given the flexibility that the Federal Government has offered us, through ISTEA and TEA-21.

It has, in fact, created, and I will use the word "forced," State governments to give us that flexibility, and to work more closely with local governments.

We work more closely with the Idaho Department of Transportation now than we ever have in the past. We are finding great leadership there, and desire to reduce the number of lanes and highways, or lanes to the highways, adding lanes to highways that they look at when there are projections, if there is an opportunity to enhance congestion mitigation; if there is an opportunity at the local level to get engaged with the overall regional transportation planning. With the partnerships at local government levels, through ISTEA and TEA-21, we were able to create what we call the Treasure Valley Partnership. It is where the Mayors meet together each month, and at a volunteer level, work to communicate, and land use planning is the No. 1 issue; and around land use planning is transportation.

Around transportation then comes your educational system and comes around your economic system. So to enhance our economy in this great Nation, to secure our economy, the quality of life is a very significant issue.

We received what we call the Treasure Valley Futures Grant through, again, TEA-21. That gave us the opportunity, ladies and gentlemen, to take our comprehensive plans, throughout the seven or eight cities and the two counties, and begin to compare those comprehensive plans, so that we know what the build-out will be in our region.

Instead of one city having their build-out and another city somewhere else, and a county over here planning their build-out, we took those together as a region. It happened because of TEA-21 legislation. Once we know a build-out, then we know our transportation needs, and then we, at a local level, can begin to make decisions about what kind of transportation do we want.

Is it going to be that in this Nation, and particularly in the West, that a teenager at age 16 must feel that they must own a car to have the independence that they so desire at that young age? Instead of emphasizing and focusing on their education and their gifts and their talents, they are out working some part-time job so that they can have a car, so that they can move around the West.

The West must be able to develop with train systems, with commuter rail systems, with light rail systems. Let us allow that opportunity as we grow in the West, as opposed to waiting until it is too late, and the land uses are gone, and we do not have the corridors in place.

So we support and appreciate the opportunity to work with Secretary Mineta. We find him to be a great leader, a great communicator, and a partner, as we plan the regions in the West and throughout the United States, to protect our metro economies and the economy of this great Nation.

Thank you, Mr. Chairman.

Senator JEFFORDS. Well, thank you, that was an excellent statement.

Commissioner Hart?

**STATEMENT OF HON. CHRIS HART, COMMISSIONER, HILLSBORO COUNTY, FLORIDA, ON BEHALF OF THE NATIONAL ASSOCIATION OF COUNTIES**

Mr. HART. Good morning, Mr. Chairman and members of the committee. I am Chris Hart, Commissioner of Hillsboro County, Florida. Today, I am here to represent the National Association of Counties, where I serve as chair of its Transportation Steering Committee.

On behalf of NACo, I want to thank you and the committee for inviting me to appear on the panel today. I am very delighted to join the National Governor's Association here in testimony, as well as Mayor Clavelle from Burlington, Vermont, and Mayor Coles of Boise, Idaho. In fact, we have worked together for many years on so many of these issues.

My personal county seat is in Tampa, Florida, where I directly represent over one million people on the Central West Coast of

Florida. It is an urban community of seven counties, with over 3.5 million people.

It is also the economic engine of the Tampa Bay Region, in great measure because of our focus on improving the transportation network, plus because of our major international air and sea ports that connect us to our global economy.

Senators on a lighter note, I cannot leave here today without getting something in return for Florida's Steve Spurrier.

[Laughter.]

Mr. HART. Also, if you have not had a call for the head coach position of the Tampa Bay Buccaneers, rest assured you will. Everyone else has. We do have a sense of humor in Florida.

Senator JEFFORDS. You have to have one.

Mr. HART. You have to, right.

[Laughter.]

Mr. HART. Mr. Chairman and committee members, NACo has a broad interest in obviously the transportation policy, and has been very active over its 50 years in assisting Congress and the Administration in developing legislation to benefit our member counties, as well as our partners in the cities and the States.

Much of our focus has been on the highway program for the simple reason that counties own 44 percent of the Nation's highway mileage, and 45 percent of the Nation's bridges. With 3,066 counties in our vast Nation, certainly our membership is diverse.

It is in 1,000 urban counties, where both economic and population is occurring. Metropolitan counties or in urban centers, like mine on Tampa Bay, account for 84 percent of the gross domestic product, and have over 125 million people living in just 100 of the most populated counties. Strong economic growth will occur only with a sound transportation system.

Of course, the downside of that growth has been increasing traffic congestion, which at times threatens our quality of life, and deprives citizens of their ability to move around in a safe and efficient manner.

Conversely, there are 2,000 rural counties with a dwindling tax base, that must maintain and improve their highway bridge system, if they are just to maintain competitive in today's economy, and retain their current population.

TEA-21 and its predecessor, ISTEA, have been very helpful to our members and to our Nation, as a whole. There is little doubt in my mind that these programs have contributed to the overall economic growth that our Nation has experienced over this last decade.

ISTEA, in 1991, began a trend of increasing the Federal investment in the highway program, and TEA-21 provided a 40 percent boost.

The increase was needed, and we have seen the benefits. For example, last year, the State of Florida was able to appropriate over \$1 billion for a combination of improvements to the local, State, and Federal transportation system in the Tampa Bay Region. This was a direct result of increased funding, because of TEA-21.

The leadership of NACo supported the funding increase for transportation in TEA-21, and fought hard to support the financing changes in TEA-21 that made this level of spending possible.

It would be an economic disaster if Congress were to eliminate the firewall established in TEA-21, or began to use the Highway Trust Fund, or either finance other programs, or mask the deficit. Mr. Chairman and members of the committee, the financing decisions made in 1998 were the right ones.

Let me also add that I believe our highway infrastructure performed well on September 11th and in its aftermath. We should all remember that the highway program was first begun to ensure our Nation's defense. While the tragic events of last September were never anticipated, the security function of our highway and bridge systems worked.

When NACo's Homeland Security Task Force met first in early October, in addition to the President, it was most specifically the Secretary of Transportation, Norman Mineta, along with Governor Tom Ridge, that the counties and people of our Nation wanted to hear from.

Aside from funding, the key change in highway legislation over the past 10 years has been the creation of a flexible program, that has relied on greater input from local elected officials. The result of this has been better planning, better decisionmaking on project selection, and better projects.

It is likely that the Federal Government will continue to spend substantial Federal resources each year on highways and bridges. That makes it essential that both local and State government leaders sit down together at the table when decisions are made. The reauthorization of TEA-21 should continue and accelerate this partnership.

ISTEA required the cooperative decisionmaking through the metropolitan planning organization, or MPO process, on how surface transportation funds are spent. This is the most flexible category and where they are spent the best.

TEA-21 has continued that requirement, and legislation also called for cooperation and consultation between States and local decisionmakers in other Federal highway programs.

TEA-21 expanded this to the rural areas and statutorily called for a consultation process in States for obtaining rural local officials' input in the statewide transportation plan.

I must add that while some States have a process, and the Federal Highway Administration did issue guidance on this change to the field offices, the U.S. Department of Transportation has yet to issue the final regulations on rural planning requirements.

Last Fall, I established NACo's TEA-21 Reauthorization Task Force under the able leadership of my colleague, Commissioner Glen Whitley from Tarrant County, Texas. I can State without reservation that environmental streamlining will be a top issue on that for our membership.

Also, I want to be very clear that we are not calling for any repeal of our Nation's important and strong environmental protection laws. Rather, we will be recommending that the reauthorization include provisions to ensure that projects are completed in a timely and efficient manner, and the delays in the current system that are unnecessary and create those slowdowns that are unjustified are eliminated.

Simply put, Mr. Chairman and committee members, I and the National Association of Counties, are asking for a concurrent process, rather than an uncoordinated sequential one. In the broadest sense, this means that we need to get all the players and projects involved at the outset. This means that local officials, State DOTs and other regulatory officials, and Federal agencies have a role to play, as well as our environmental community, and most especially, our affected citizens. No one should be ignored. No Federal agency should be allowed to operate independently without being there as a participant.

In my State of Florida, for example, this effort has been a work in progress, even since the legislation was passed. But it will not be successful without the collaboration from the Federal Government.

Congestion will be another key policy issue that you and Congress must address with this reauthorization. Urban counties, their citizens, tourists, and commerce, are all strangling in congestion. Time, money, and productivity are all sitting on the backs of commerce, and we can ill afford this for our businesses, for the American commuter, or our tourists, to be stuck in traffic. There is no one solution, except that we must apply common sense approaches to this challenge. Solutions must be found where close local, State, and Federal cooperation exists. Congestion occurs on county highways, not just on the State or Federal networks.

We must remember that we have a system of highways, and when one part, albiet local, State, or Federal, breaks down, the others are directly affected.

Any new legislation should provide those highways and bridges that we now have, and ensure that they are properly maintained by funding them, so that traffic moves safely.

We must invest money in highways to guarantee that our current system is maximized. We know that as much as 50 percent of congestion occurs due to breakdowns and accidents on our roadways. Therefore, we must be smart enough to establish simple, efficient methods of getting incidents resolved quickly.

Here again, Federal agencies and their resources can be partners with local and State governments, to save time, money, and most especially, lives.

We need to have the system of procedures in place that includes all the various agencies involved in incident management, from the highway departments, police, sheriffs, fire rescue and EMS, to wrecker services, all communicating with one another. We can do better, and I will quickly illustrate, Mr. Chairman.

How many times have we seen a break down or accident in one lane of traffic, and I do not even have to mention the Beltway, with emergency vehicles taking up the other lane or lanes; and if we are lucky, perhaps we are able to pass after an hour of waiting in traffic? This is very common, not just here, but in every community in America.

Systems and procedures in incident management could go a long way to relieving congestion, and it is much cheaper than building road systems, rail, and other things associated with this.

Another key to relieving congestion is moving traffic to signalization. We have all been on highways where signals are coordinated

and traffic flows. We have also been on roads where we are stopping at every red light. Many local governments need additional resources to modernize traffic signals.

The good news is that electronic signals and now the Intelligence Transportation System, or ITS as it is commonly called, give us a return of about eight to one, compared to other investments.

By the way, what we do not need are automatic signs saying, "congestion ahead," when we are already caught in traffic, and where there are no alternative routes that we can take.

Mr. Chairman, now in finishing my remarks, I would like to address one last major concern that we all share: rural roads. Rural roads are in need of substantial Federal investment. Safety is the primary reason.

According to the U.S. General Accounting Office Report from July, 2001, rural local roads have the highest accident and fatality rate per vehicle mile traveled on all types of roadways; over six times that of urban interstates.

In 1999, over 25,000 fatalities occurred on rural roads across the United States. That figure is two and-a-half times greater than the fatality rate from accidents on our urban highways in areas like Las Vegas, Miami, St. Louis, Cleveland; you pick it/name it, our communities.

If Congress wants to reduce auto fatalities, there is no better investment than in our roads in rural communities. Because rural roads are so dangerous, we, in NACo, will be proposing a new program to address this. Rest assured, Mr. Chairman, that we would work closely with your committee in developing this.

Mr. Chairman and committee members, this concludes my testimony. I thank you and the committee members for the opportunity to be here today. I would be pleased to answer your questions.

Senator JEFFORDS. Thank you, Commissioner.

Our final witness is the Executive Director of the National Governors' Association, Ray Scheppach. Please proceed.

**STATEMENT OF RAY SCHEPPACH, EXECUTIVE DIRECTOR, NATIONAL GOVERNORS' ASSOCIATION, ON BEHALF OF HON. ROBERT WISE, GOVERNOR, STATE OF WEST VIRGINIA**

Mr. SCHEPPACH. Thank you, Mr. Chairman. I appreciate being here today on behalf of the National Governors' Association. Let me first say that Governor Wise was supposed to be here, and he apologizes. Essentially, his aircraft was grounded for safety reasons, and so he was unable to be here.

I would appreciate it, however, if his full statement were submitted for the record.

Mr. SCHEPPACH. Mr. Chairman, I would like to start by mentioning a couple of comments about the fiscal situation of States, because I think it is relevant to this particular program.

The current shortfall in States is about \$40 billion. You are going to have to add to that about another \$6 billion for the State costs for homeland security. That currently is about 7.5 percent of State-only revenues, which is quite large, by historical standards.

However, because both unemployment and State revenues lag the economy, it is highly likely that this situation will continue to

deteriorate for another year to 18 months, probably peaking in excess of \$50 billion.

If you compare this current recession to that recession in the early part of this decade of 1990/1992, this one is far worse, even at this particular point in time. The total shortfall previously was about \$20 billion, which was 6.5 percent of revenues, and as I said, we are going up easily to \$50 billion, or 10 percent of revenues, over the next year to 18 months.

You might ask, why is it worse? The economic dip so far has been relatively small. The basic reason is that the phenomenal growth in the economy over the last half of the decade of the 1990's was so strong that it camouflaged a number of underlying problems.

Essentially, we have a deteriorating tax base, largely driven by the fact that we do not tax services; and Internet sales now are cutting dramatically into State sales tax revenues.

So on one hand, we have a deteriorating tax base, because it is essentially for a manufacturing economy of the 1950's, and not for a high tech service-oriented economy of the 21st Century.

On the other hand, health care costs are exploding. Medicaid, which represents about 20 percent of State budgets, is now growing 11 to 12 percent per year, with pharmaceuticals growing 18 percent.

If you add other health care, it represents another 7 percent of State budgets. We have 27 percent of our budgets growing at double digits, clearly at 11 to 12 percent. So it is a combination of these two major structural problems that is creating the State fiscal situation.

Unfortunately, this is not something that is going to be turned around in the next year or so. This is a two or three, or perhaps even 10 year problem, because of the structure.

Let us turn now and mention a couple comments about the highway program. First off, Governors were very satisfied and really supported the reauthorization last time, and we do believe that this program has worked quite successfully over this period.

We now, however, do see that in some of the preliminary estimates of the revenues coming into the trust fund, that it is possible the revenues are down quite dramatically; some people argue as much as 30 percent going forward.

And it is probably not just a one-time downward adjustment. But we are probably on a different baseline, because of a slower growth in the economy, even when we come out of this recession.

This is a problem in a program which is essentially a capital investment program. When you have levels of funding going up or down of that order of magnitude, it creates a lot of inefficiencies in capital programs, that have to run over a 7 or 8 year period.

I do not know what the answer is, in all honesty, but we hope to work with the committee in terms of, is there any way in which we can smooth the revenues and expenditures on this particular program?

I will just mention a couple of other issues. This problem in the funding level may play out, because a lot of States do float bonds to cover this. Of course, the interest rate that is on those bonds is

somewhat sensitive to the Federal funding level. So that is an issue that we are somewhat concerned about.

Finally, the other issues that we would like to work with the committee on are essentially insuring that we continue to move toward incentives, as opposed to mandates.

I agree with Commissioner Hart, in terms of the environmental streamlining concurrent processes. That is an issue for us, and also maintaining the flexibility of the program, so that there is a lot of State and local control on what those particular priorities are.

So with that, Mr. Chairman, we look forward to working with you over the next year, as you reauthorize this program. Thank you.

Senator JEFFORDS. Well, thank you, and thank all of you for very excellent statements. It is a pleasure to have you with us. As you know, we are going to be very busy over the next couple of years, trying to make sure that we do the best job possible here.

Senator Warner wanted to express his apologies. He had to leave. I asked for unanimous consent that his statement be made a part of the record. I do not hear anybody objection. I know that no one dare to object.

[Laughter.]

[The prepared statement of Senator Warner follows.]

Senator JEFFORDS. But thank you; Senator Warner has been a great member of this committee over many years, as you all know, I am sure.

I would like to turn to my good mayor, first. I am intrigued by the idea that local communities might manage certain aspects of the Federal Aid Transportation Program. Can you tell us a bit more about your experiences in that regard? Does the current program encourage the local role, or should we explore measures to extend local government's role in project management?

Mr. CLAVELLE. Well, I think anybody who has been a local government official understands that citizens will hold us accountable and responsible for transportation, as well as quality of life within our communities.

So from my perspective, it makes great sense to involve local government officials very intimately in the planning, the design, and the construction and management of transportation projects.

Now in the State of Vermont, we have had an excellent relationship with our State Transportation Agency. They have, in fact, delegated substantial responsibilities where local governments are willing and interested in managing those projects.

In my small city, we have taken on the responsibility of managing projects that range from bike paths, to multi-million dollar transportation centers, to major highway projects.

So I think it is a great idea. Our experience has been very positive for both the State agency, as well as the community. I would urge you, as you consider reauthorizing the legislation, to promote and encourage this practice.

Thank you.

Senator JEFFORDS. I share your view that presently, the intermodal investments are somewhat orphaned in the Federal program. The League has endorsed the idea of a specific intermodal program. Can you enlarge on the idea for us?

Mr. CLAVELLE. I believe that it is a good idea to have a separate intermodal program. I think that would help clarify Federal responsibilities, in terms of the management of such a program.

But I also think, from a local official's perspective, it would simplify the planning, the design, and the financing of intermodal facilities. Currently, with intermodal facilities, you need to bring together a hodgepodge of funding sources to make a project a dream, a reality.

I think a separate program would truly give some meaning to this word that we frequently use of "seamless." I think if we had a seamless Federal program, it would enhance our capability and capacity of creating within our communities intermodal projects that were truly seamless.

Senator JEFFORDS. Thank you, and I agree with you on these matters. I look forward to working with you.

Mayor Coles, I want to commend you on the fine work you have done in your part of the country to promote a balanced transportation system, and encourage smart growth, as well.

I, too, believe that we need all modes of transportation working together, to get the best out of our system. Do barriers exist now in the current Federal programs, to achieving your goals? If so, as I expect you will say, we would look forward to working with you, as we go along; but please, comment.

Mr. COLES. Thank you, Senator Jeffords.

Mr. Chairman, a major barrier out in the West and around Boise is that Amtrak does not come through Boise. It does not come through Idaho. We do not have that link, that national rail link, that we would like to have to make the intermodal system a vision, and one that people can believe in.

When a Mayor says, 1 day we will have a rail system here, and we will be able to link nationwide to a rail system, they say, well, Amtrak stopped service here 3 or 4 years ago. Our community, therefore, went out and purchased 18 miles of right-of-way, using property tax dollars.

That is 18 miles of Union Pacific Railroad, which links our city to at least the National Rail Network. Without that 18 miles, Amtrak could never have come back to us.

So the barriers certainly are funding. We are beginning now, because of TEA-21 and your vision, sir, and the vision of this committee and this Senate, to work more closely with State government.

But our State government has not given us a funding source for multi-modal transportation. They still only fund streets and roads and highways, and they will match any Federal grant that comes along.

But if we had a Federal grant system that would match and provide an incentive, I think for State governments to match a Federal grant system to put into place a multi-modal system, and maybe it is available, our State may not be using it. But it is that kind of leverage from the Federal Government to the State government that we believe would help the local government, also.

Senator JEFFORDS. Thank you. You have got a sympathetic voice here.

Mr. COLES. Sir, I have been in your office and appreciate your leadership.

Senator JEFFORDS. Mr. Hart, I believe that Tampa is the largest Metro area represented on the panel today. I know that urban congestion will be an important issue as we provide with the reauthorization.

You shared a few ideas with us for tackling the problem in your testimony. Are their shortcomings in the current Federal program that have limited your ability to address the problems in the Tampa area? In particular, you seem to suggest that major local and county roads were not receiving adequate attention? Is that so, and if it is, what do we do?

Mr. HART. Thank you, Mr. Chairman. I would have to preface it by saying, until TEA-21, it was not getting that type of attention. It has been a long struggle for all of us to try to raise the understanding of what it really meant to bring together all these programs, and that they are related.

As far as processes themselves, yes, we all have what we have, depending on our States or local communities, or whether you are part of an MPO network.

But in some communities that are 50,000 to say, 200,000, they do not currently have, as I understand it, the authority, and have the money allocation, as far as their funding process in those areas. Yet, if you hit a community of 50,000 to 200,000, you are probably going to find one of the largest groups of communities in America.

If that type of authority went to those communities in the MBO process, they could better put together those networks and make those allocations.

Some of the things, even though we are, in some part, talking about roads and bridges, I think in great measure, both the mayors addressed issues of the growth management or bringing land use and transportation together, and how it affects their quality of life; or the fact that I would have to agree that we need a national high speed rail system.

But these things have got a link. I think the question you are asking opens that dialog. Because ultimately, we, sitting in my community as a metropolitan planning organization, are making those decisions that put together local, State, and Federal programs; but this does not happen throughout our Nation.

In 100 urban counties it does, because we are of that size, but it is still a challenge. For example, I addressed just on the issue of what happens on the incident management, we do not have to build another road for that. We have to build in systems and procedures from the Federal to State to local level, that we can agree on, where we are all partners. Congestion is a great big part of that. Yet, some of that is the allocation of funding that goes in the areas like intelligence transportation or improved signalization; or the fact that where you have got a Federal interstate system, and now you have got a State road system, and a county or a city road network all there together. One cannot happen in isolation of the other. Too often, this has been in the case.

I think it has been a matter, in one part, of awareness. I think by asking the question, you raise that awareness. But until we also take a look, and I am not a heavy-handed guy that wants more reg-

ulations or legislation, but we have got to have more people at the table, so they all understand what we are dealing with together, and it is a Federal, State and local system.

That is why I was suggesting that we take a look at how we can build in systems and procedures, just like the streamlining planning process that we were addressing earlier. You have got to have all the partners at the table. You cannot have some people that are independent. I am not picking on the Corps. of Engineers or EPA or some other agencies. It is just that they are very easy targets for us.

But you cannot have somebody that is just operating on their own, and everyone else thinks they have got it together, and then they say, oh, we have got five questions here. You have got to stop everything. That is part of the dilemma.

So with your leadership and the committee's leadership here, we can broach the streamlining process like that, and we can look at questions of congestion.

We can look at things like incident management, because those will open the doors of how we establish those systems and procedures; some part in Federal legislation, and some things do no cost anything. Some things just give us guidance of how to do it smarter.

Senator JEFFORDS. Mr. Scheppach, do have anything you would like to share with us, in addition to your statement, now having heard the testimony across from you?

Mr. SCHEPPACH. No, I mean, I think we have got all the issues on the table. I think they are funding flexibility and environmental streamlining.

I think that the current law has been working quite effectively. The unfortunate part is that this was an economic boom period. There were substantial revenues available to do this. Now we have got a higher level of spending. We have got some jobs at stake, and we have got some efficiency issues, if we have to cut this program. So there are some tough issues that I think the committee needs to work on.

Senator JEFFORDS. Senator Crapo?

Senator CRAPO. Thank you, Mr. Chairman. I just have a question or two of Mayor Coles. Mayor, I kind of want to piggyback on the question that you were asked by the chairman.

I was interested in your written testimony, where you talked about a survey that was taken of the mayors. In the answers to that survey, it indicated that in response to their being asked what the single most important surface transportation priority was in their city or region, about 35 percent indicated system preservation; 20 percent, congestion relief; and new rail projects at 15 percent. I suspect that new rail projects was related to congestion relief. Then there were other areas that were listed, many of which also related back to congestion relief.

My question is, as we move forward to look at reauthorization of TEA-21, it appears to me from that and from the testimony that I have heard here today, that congestion relief is going to be one of the major focuses that we will need to be addressing.

In that context, first of all, could you tell me if I am correct in that context, and whether you see that the current system could be

improved, in terms of allowing us the added flexibility or streamlining efforts, or whatever may need to be worked into the law to help us more effectively focus on congestion relief?

Mr. COLES. Mr. Chairman, Senator Crapo, thank you very much. There is no question that our ability and our reliance upon working with the States, and every State Department of Transportation has their own philosophy about how they work with local government.

Now the MPO system, which requires States and local metropolitan areas to align their transportation plans, their intermodal systems, and their plans, requires that dialog.

But I think it also in the testimony indicates that only about 40 percent of the Mayors have been asked to participate with their States in making those decisions about where those dollars are spent.

So we have come a long way in 10 years. This legislation has created the dialog and the opportunity and the structure for that dialog, but we still have a ways to go. That is the requirement and responsibility for State government and local government to make decisions about where those dollars are spent.

Now the more flexibility, if you speak from the U.S. Conference of Mayors and the National League of Cities, we appreciate the opportunity to have funding sources that are similar to the Community Development Block Program, where metropolitan areas receive those dollars directly.

There is not a State agency that is making those decisions about how we are going to spend our money; but it comes straight from Federal Government to local government. It gives us timely resources and the flexibility to use them, and it shows them that we are trusted by the Federal Government to make decisions where necessary, in our local communities to allocate those resources and their funds.

It also then gives us the opportunity to manage, in some cases, even the construction of the process and project, which can also reduce costs. Often local government will have some flexibility built in. They can manage the project. They construct it. They can build it, and build it in a timely way and often save money. So there are those kinds of opportunities that we look forward to.

Senator CRAPO. Thank you. I have just one other question as a followup on this in a more specific sense. I appreciated your bringing up the Amtrak issue, as it relates to Idaho. I think that most people in the country, when they think of Amtrak, think of it in some of the more urban corridors. But its impact in Idaho is also critical.

As you know, Mayor, here in the Senate, Senator Wyden and I have been trying to get that line between Spokane and Boise open. In working with you out in Idaho and others, we have seen some serious road blocks put the way of getting that accomplished.

Do you believe that if we were to reorient or broaden the available use of TEA-21 funds, or if we were able to give the approach the Block Grant Program, like you were talking about, that resources at the State level, at the city and county level, could be more effectively utilized to encourage and incentivize those types of rail programs?

Mr. COLES. Mr. Chairman and Senator Crapo, yes; now let me give a little addition to that answer.

Senator CRAPO. That would be helpful, thank you.

[Laughter.]

Mr. COLES. Certainly, again, the flexibility to use those dollars where we see the resources are appropriate in our local communities. So we could link to Amtrak.

But truly, we also need to support the revenues for Amtrak. Amtrak needs to be supported just as our freeway interstate system is supported; just as currently the airline industry is being supported.

We need the vision in our country of a multi-modal national system, a national rail system, a national air system through our airports and the support of our airline industry and, of course, the interstate system. Why not have a vision that encompasses all of those, and at the Federal level they are supported, at the State level they would be supported, and at the local level there would be support for a national rail policy?

So doing that and having flexibility with TEA-21, then people would believe, particularly in our rural areas, that you could have a rail system that would link America together, so that commerce and industry and people can move throughout this country with alternatives; as opposed to right now, there are pretty much two alternatives. You are either going to fly or drive your car.

Senator CRAPO. Thank you, Mayor Coles. I, myself, found out when I got into the issue of Amtrak, how important the rail system is. It was just interesting to me that there is some feeling in this country that rail systems are sort of outdated and they are a thing of the past, and we have moved on to cars and planes and things like that.

It is very interested to me to see the importance of rail systems, not only in Idaho, but it was like the third highest response of the mayors of this Nation, when they responded to your survey, which I understand was an open-ended survey; just pick what you think is the most important thing. The third highest response was rail systems. This indicates how that form of transportation may need to be something better implemented in our approach to transportation in the Nation.

Anyway, thank you very much.

Senator JEFFORDS. Let me followup on that, since it gives me a good opportunity. This is something that I feel very strongly about.

Do you have concerns with respect to congestion in your cities, and also about the trucks, the 400 foot trucks or whatever we have now, when they wind through your places, as to whether that traffic could not be put on the rails, to some extent, Mr. Coles?

Mr. COLES. Mr. Chairman, absolutely, there is no question about it; the length of a truck, the weight of the vehicles. We know that they pay a lot of tax to support the highways. But there is no question that our ability to rely more on rail would reduce congestion in our communities, large and small.

Senator JEFFORDS. Are there any other comments, Mayor Clavelle?

Mr. CLAVELLE. I think whether you are a mayor of a city in Idaho or a city in Vermont, I think that we would welcome an in-

vestment in rail that would allow us to get the heavy freight traffic off our roads and onto the rail. I echo everything that Mayor Coles has said. We need more flexibility and we need additional resources in our rail infrastructure.

I hope that I will live to see the day that Amtrak will serve the city of Burlington. But in upgrading that rail infrastructure to provide that opportunity for Amtrak, we also will be enhancing an infrastructure that can better carry freight.

Senator JEFFORDS. Mr. Hart?

Mr. HART. Mr. Chairman, I have perhaps a little twist on that. As I previously stated, I think we ought to have a national system of high speed rail.

But throughout America, it is a building block. Transportation systems that are needed in a local community particularly are buses; a bus system where if we had the flexibility to put more into that, you will serve more people every day.

But one area that we have not even talked about, that I have worked very hard on, both at the national and county level, but in my State in community, is a the transportation to the disadvantaged community; people that cannot drive, should not drive, will never drive. It is a serious and growing problem in America. You have got to have local systems that solve that, because there are too many differences.

In our community, for example, and this is not an advertisement, we just call it Heartline. It is not my bus system, but it is the Hillsboro Area Regional Transit Authority. I sit on that.

But we also put together the Transportation Disadvantaged Program, for people who are need wheelchairs or kneeling or whatever. So you have got to tie sidewalks to buses or specialized transportation for people that have the dialysis or have critical needs. But then you have got young or older that cannot or should not drive, or you want to discourage; or as you get into larger urban communities, you want a robust transportation system like on buses, that would connect to a rail system.

So I think part of that base has got to be a sound transit system that also not only serves a great part of the population, but specifically also has the ability to serve the transportation disadvantages in America.

Mr. SCHEPPACH. We are a little bit split on policy with respect to that, so I will pass.

[Laughter.]

Senator JEFFORDS. I understand that.

Well, I want to thank you all. It has been very, very helpful testimony. You are the ones that we look to, to make sure that we do the things we should do when we are finished here. It was excellent testimony, and we were pleased to have you here.

With that, the hearing is adjourned.

[Whereupon, at 11:38 a.m., the committee was adjourned, to reconvene at the call of the chair.]

[Additional statements submitted for the record follow:]

STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR FROM THE STATE OF FLORIDA

Thank you for bringing us together today on the subject of the reauthorization of TEA-21. The policies that are decided during this debate will deeply affect each of

our States. You are to be commended as well for calling us together on January 24—our first week back in session this year.

This learning process and discussion is too important to rush through right before legislative drafting begins. You're wise to begin now, and explore this thoroughly.

I have looked at your proposal for 11 hearings this year, and agree with the topics chosen, and the pace of discussion.

This is the first of those proposed hearings, and as such, a great opportunity to look back on lessons learned, and lay out, in general, some priorities and challenges for the next authorization cycle.

You've assembled a great group of witnesses (and I am very pleased to see a Floridian, Commissioner Chris Hart from Hillsborough County, on the panel). Each of them brings perspective from different universe of government: Federal, State, county, and city.

This hearing emphasizes the level of coordination and cooperation that has developed in transportation policy since we emphasized this time of structure and planning in ISTEAs.

I'll be interested to learn of our successes, and where we must improve in this cooperative planning process.

I would like a quick moment to reflect on my A "lessons learned" from the last reauthorization process, and outline a few priorities.

#### *Lessons Learned*

- Follow the legislative process through to the final regulations. Members of this committee, and witnesses in this room, celebrated the environmental streamlining language that was incorporated into TEA-21. We are now frustrated by the slow progress in the development of regulations that reflect our intent. This next time, I want to work more closely with those who will interpret what we draft in this committee. Better lines of communication can only mean clearer, better public policy.

- Other committees can affect what we draft here. I have been frustrated by the fact that some of the programs that we developed in TEA-21 where grants should be awarded on a competitive basis, are not working that way in reality. As an example, the ITS money provided by TEA-21 is all earmarked and not awarded in the way we intended.

I'd like to work as a committee with our colleagues and find a solution that brings us closer to the intent of what we drafted and passed in TEA-21.

There are more lessons learned, but time is short.

I also hope the committee will seek "lessons learned" from those who have actually been on the front lines of our nation's transportation policy, much like the witnesses who have joined us here today.

Looking ahead, the world has changed in several ways since we finished enacted TEA-21.

There is a focus on homeland security.

We are heading into some tight budget years.

Traffic congestion is affecting quality of life.

We learned quickly after September 11 how difficult life can be if one mode of transportation, such as air travel, suddenly becomes difficult or impossible.

I look forward to working with our chairman, my colleagues here, and all interested parties in taking the next few months to expand our knowledge of transportation issues and challenges, and together drafting the next authorization bill to meet those challenges.

---

#### STATEMENT OF HON. TOM CARPER, U.S. SENATOR FROM THE STATE OF DELAWARE

I'm happy to be here today as this committee begins its work on the re-authorization of the Transportation Equity Act for the 21st Century (TEA-21). In the 10 years since that bill, and its predecessor, the Intermodal Surface Transportation Act (ISTEA) have been in place, I believe we have made strides in the way we fund and plan for our transportation needs.

ISTEA for the first time allowed State and local transportation officials to work together with their regional partners and with States to develop truly regional transportation systems. It also allowed these new regional transportation entities and to use Federal transportation dollars for the most pressing transportation projects in their region, regardless of whether those Federal dollars were originally designated for highway or transit. When ISTEA was up for re-authorization 5 years ago, I was Governor of Delaware and headed up a group called ISTEA Works along with John Rowland, my colleague from Connecticut. Our goal at the time was to urge Congress to preserve and build on what we were able to accomplish in ISTEA.

Our efforts, along with the work of a number of my new colleagues here in Congress, lead to TEA-21, which maintained the flexibility granted to State and local officials and greatly expanded the funding available for transportation improvements each year. Whereas, before TEA-21, congressional appropriators could set caps on the amount of the Highway Trust Fund that could be spent in a given year, States can now spend the full amount that users pay into the Fund every year.

As we sit down now to re-evaluate our national transportation policy, I again call on my colleagues to build on what has worked so well in the past. First, we should expand the flexibility built into ISTEA to allow States to spend their Trust Fund money on inter-city rail projects. Back in Delaware, commuters set out every day on Interstate 95 in Wilmington to head for jobs in Philadelphia, Baltimore and Washington. Commuters up and down the northeast corridor make similar commutes every day, tying up our highways in frustrating, wasteful gridlock. Delaware can spend as much as it wants to improve its piece of 95. It can't do much with its Trust Fund money to improve rail links to major northeast cities, however. I hope we can work this year to allow States to use their Federal Trust Fund dollars to create regional high-speed rail systems if they choose to do so.

Second, we should continue to improve the way we fund our transportation priorities and examine whether our current funding levels are adequate. TEA-21's budgetary firewalls, along with Revenue Aligned Budget Authority (RABA), have led to dramatic increases in transportation spending in recent years, but we could see reductions in 2003 for the first time. I hope we can work this year to fix RABA and also to look for other revenue sources so that we can effectively fund our transportation needs.

As we begin to take a closer look at what has and hasn't worked in ISTEA and TEA-21 over the years, I think we'll see that most of what we were able to accomplish has had a positive impact on our nation's transportation system. I hope we can build on that success in our re-authorization of TEA-21.

---

STATEMENT OF HON. JOHN WARNER, U.S. SENATOR FROM THE COMMONWEALTH OF VIRGINIA

Mr. Chairman, I join in welcoming Secretary Mineta to the committee and look forward to a valuable exchange of ideas over the next 2 years as we prepare to reauthorize our nation's highway and transit programs.

It was my privilege to be actively involved in the formulation of TEA-21 in 1997 and 1998 in my capacity as the subcommittee chairman. At that time, we saw a great need in this Nation to respond to many unmet transportation demands to improve mobility in our rural communities, to relieve congestion in our urban areas and to promote the efficient movement of American goods. We responded with an unprecedented increase of 40 percent in highway funding by enacting landmark budget provisions to free up the revenues in the Highway Trust Fund.

TEA-21's revolutionary financing and formula reforms built upon the program reforms of ISTEA, 1991. As we look to the next bill, how will we again provide the vision and tools to ensure that our surface transportation network—highways, transit and rail—will stimulate economic growth?

Our multi-year reauthorization bills have provided a unique opportunity to transform our national transportation system.

Most notably, President Eisenhower responded to the mobility needs with the vision of the Interstate Highway System. In 1991, at the end of the construction of the 40,000-mile Interstate System, President Bush responded with the National Highway System to ensure that an efficient road network reached 95 percent of all Americans.

Also in ISTEA 1991, Senator Moynihan had a keen vision of a seamless national transportation system that connected roads to transit and railroad stations to airports.

In 1997, President Clinton supported the efforts of this committee under the leadership of Chairman Chafee and our Ranking Member, Senator Baucus, to release funds from the Highway Trust Fund.

The budget reforms of TEA-21 were unprecedented. For the first time we fulfilled President Eisenhower's commitment that taxes American motorists pay at the gas pump will be used to build and upgrade our highways.

As we begin today, in partnership with the Administration, to reauthorize TEA-21, our overriding challenge is transportation gridlock.

Bold, new initiatives are needed and I hope that we all will strive for the standard of excellence set forth by President Eisenhower, President Bush, and Senators Moy-nihan and Chafee.

---

STATEMENT OF NORMAN Y. MINETA, SECRETARY, DEPARTMENT OF TRANSPORTATION

Mr. Chairman, members of the committee, thank you for the opportunity to speak about the lessons we have learned from the Transportation Equity Act for the 21st Century (TEA-21).

Through this committee's leadership, and with the active participation of our State, local and private sector partners, the Department of Transportation has worked to realize the purposes and objectives of TEA-21. I would like to commend the committee for continuing its leadership by scheduling this series of hearings on the reauthorization of TEA-21.

We are looking forward to working with the members of this committee and with Congress in shaping proposals for the reauthorization of this legislation. Working together, we need to establish the base of resources available for this important legislation in order to meet the transportation challenges facing the Nation.

Three decades ago, when I was Mayor of San Jose, California, I learned that the tool that made the most difference in my community was transportation. Nothing else had as great an impact on our economic development, growth patterns, and quality of life. What I have found in the years since is that this is true not just locally, but also nationally. A safe and efficient transportation system is essential to keeping people and goods moving and cities and communities prosperous.

As is true for many of you on this committee, I take great pride in the enactment of the predecessor of TEA-21, the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA), during my years in the House of Representatives. With that legislation we established new principles in the implementation of the nation's surface transportation programs—building partnerships with local and State officials to advance the strategic goals for transportation capital investment. They are flexibility in the use of funds; a commitment to strengthening the intermodal connections of the nation's transportation system; expanded investment in, and deployment of, new information technologies for transportation services; and a heightened sensitivity to the impacts which transportation has on our quality of life and on the shape and character of America's communities.

TEA-21 built upon the programmatic initiatives contained in the earlier legislation and through its financial provisions, provided State and local governments and other transportation providers with greater certainty and predictability in transportation funding. It achieved this by reforming the treatment of the Highway Trust Fund to ensure that, for the first time, spending from the Highway Trust Fund for infrastructure improvements would be linked to tax revenue. The financial mechanisms of TEA-21—firewalls, Revenue Aligned Budget Authority (RABA), and minimum guarantees—provided greater equity among States in Federal funding and record levels of transportation investment.

The programmatic and financial initiatives of these two historic surface transportation acts have provided us with a solid and balanced structure around which we can shape this reauthorization legislation.

While the legislation, which the Administration and Congress will work together to see enacted, should continue and build upon ISTEA and TEA-21, we have an opportunity and an obligation to do more than that. This is a time in the transportation sector of extraordinary challenge and opportunity. On September 11 a determined and remorseless enemy challenged one of America's most cherished freedoms, the freedom of movement. The events of that day demonstrated how critical the nation's transportation system is to the security of every American and to the nation's economic well-being.

In shaping this surface transportation reauthorization bill, we must maximize the safety and security of all Americans, even as we enhance their mobility, reduce congestion, and grow the economy. These are not incompatible goals; indeed, the lessons of TEA-21 demonstrate that all of these values are appropriate goals of national transportation policy and that they reinforce each other: it is possible to have a transportation system which is safe and secure, efficient and productive.

TEA-21'S RECORD

In five principal areas TEA-21 has strengthened the nation's transportation system: the predictability, equity and flexibility of funding; safety; mobility and system upgrading; the application of innovative technologies; and quality of life.

## FUNDING LEVELS AND PROGRAM EQUITY

TEA-21 revolutionized transportation funding and provided record amounts of spending for transportation, a 40 percent increase over the period of ISTEA. The minimum guarantees and the Highway Trust Fund firewalls created confidence among grantees regarding program funding. Predictability is one of the most important aspects of program delivery for State and local programs. States and local communities have increased their funding levels to match the commitments made in TEA-21. Importantly, TEA-21's minimum guarantees provided unprecedented equity between the States, ensuring that highway funds are distributed in the fairest manner to date.

Equally important is the funding flexibility, first allowed in ISTEA and continued in TEA-21. Flexible funding allows States and communities to tailor their transportation choices to meet their unique needs and enables State and local decision-makers to consider all transportation options and their impacts on traffic congestion, air pollution, urban sprawl, economic development, and quality of life.

TEA-21's innovative loan and grant programs further augmented the highway and transit programs. The Transportation Infrastructure Finance and Innovation Act (TIFIA) has provided almost \$3.6 billion in Federal credit assistance to 11 projects of national significance representing \$15 billion in infrastructure investment. These loans, loan guarantees, and lines of credit for highway, transit and rail projects have encouraged private investment in strengthening transportation infrastructure.

## SAFETY

The Department's paramount concern is to assure the American public that the Nation has the safest, most secure system possible as our transportation system works to meet the needs of the American economy. The United States has an enviable transportation safety record. However, the challenge of safety on the transportation system remains significant. While the number of highway fatalities in recent years has been relatively flat, despite significantly more vehicles on the nation's roads, more than a quarter million people have been killed on America's highways and roads in the past 6 years, 41,000 deaths each year. In addition, there are over three million injuries annually.

TEA-21 introduced new programs, greater flexibility and increased funding to meet this challenge. Increased TEA-21 funding enabled States to make needed safety improvements to the transportation infrastructure, and States may—and do—use their Surface Transportation Program (STP), Interstate Maintenance, and National Highway System (NHS) funds for safety improvements. Within the STP, funds are reserved under TEA-21 for highway and rail crossing improvements and hazard elimination. The FHWA works closely with States and others to improve our ability to analyze roadway safety challenges and to direct investments to specific projects and programs, which will deliver the most value in terms of lives saved and injuries minimized.

Since enactment of TEA-21, the Department of Transportation has awarded a total of \$729 million in highway safety grants. TEA-21 also authorized \$72 million annually for behavioral research to determine the causes of motor vehicle crashes, to identify target populations, to develop countermeasures, and to evaluate the effectiveness of programs in reducing traffic deaths and injuries. The Act also established several important, new, safety incentive grants. For example, between fiscal year 1999 and fiscal year 2002, the National Highway Traffic Safety Administration (NHTSA) awarded \$210 million in seat belt incentive grants and over \$113 million for innovative seat belt programs. Between June 1998 and June 2001, seat belt use had increased from 65 percent to 73 percent. Seat belt use, in total, saves an estimated 12,000 lives annually.

In motor carrier safety, TEA-21, along with the Motor Carrier Safety Improvement Act of 1999, created new programs and tools for the Department and States to improve safety. TEA-21 increased flexibility for grantees, strengthened Federal and State enforcement capacity, and provided flexibility to promote innovative approaches to improving motor carrier safety. TEA-21 placed greater emphasis on targeting unsafe carriers and improving information systems, and increased funding for commercial driver license programs.

## MOBILITY AND SYSTEM UPGRADING

ISTEA and TEA-21 placed an unprecedented emphasis on developing a seamless, intermodal transportation system that links highways, rail, transit, ports and airports. The dramatically increased funding under TEA-21 also enhanced mobility by

upgrading the condition of highways, particularly the National Highway System, and transit systems. As a direct result of the increased spending provided in TEA-21, overall highway system conditions—as measured by pavement condition, ride quality, alignment adequacy, bridge ratings, and the condition of rail transit assets—have improved.

As you know, Federal highway funds are used for a variety of system improvement and congestion relief purposes, depending on the priority needs and goals of each State. In recent years, for example, approximately 50 percent of Federal funds were obligated for system upgrading purposes, including reconstruction, widening, restoration and rehabilitation, and resurfacing. These investments have led to a steady improvement in pavement condition: in 2000, 90.9 percent of travel on the NHS occurred on pavements rated acceptable or better.

Moreover, under TEA-21, States continued to reduce the number of bridges rated structurally deficient. In 2001 the percentage of deficient NHS bridges had been reduced to 21.2 percent. In fiscal year 2001, the Federal Highway Administration (FHWA) provided \$3.5 billion in TEA-21 funding for approximately 3,000 bridge projects through the Highway Bridge Replacement and Rehabilitation program. Included in this program were 17 major replacement or rehabilitation projects and three seismic retrofit bridge projects that received almost \$88 million in funding.

TEA-21 established new programs that enabled improved connectivity across modes, particularly in the area of freight movements. The National Corridor Planning and Development/Coordinated Border Infrastructure Program (NCPD/CBI, also known as the Corridors and Borders Program) has funded numerous freight improvement projects as well as many economic development projects, pedestrian improvement projects, and multi-modal studies, while strengthening the focus on international corridors and gateways with America's NAFTA trading partners. The Alameda Corridor Project used a mix of private funds and public programs to improve rail and highway access and to reduce traffic delays in the critically important area of the Ports of Los Angeles and Long Beach.

As of 2001, the nation's urban rail transit assets comprised 10,427 miles of track, 2,776 rail stations, and 1,310 maintenance facilities. Under TEA-21, the substantial investment in the nation's transit systems has contributed to an improvement in the condition of transit assets and a resulting increase in transit ridership. Preliminary estimates indicate that public transit trips increased by 4.4 percent from 2000 to 2001 to 9.4 billion trips.

TEA-21 also authorized the Job Access and Reverse Commute (JARC) Program to address transportation gaps in the public transit system and to reduce barriers for those moving from welfare to work. This program has made transit services available to many who previously did not have access to adequate transportation and, thus, to jobs. As of fiscal year 2000, the JARC program had made new transit service available at more than 16,000 job sites.

#### NEW TECHNOLOGIES

Under TEA-21, the Department of Transportation has made strides in research. Research programs include development and deployment of Intelligent Transportation Systems (ITS), pavement improvement, congestion reduction, seismic hardening of highway infrastructure elements, strengthening of bridges, and new tunnel technology. The Highway Safety Research and Development program is the scientific underpinning for the Department's national leadership in highway safety programs, and includes behavioral research to reduce traffic deaths and injuries, crash avoidance research, roadway design and operational improvements, and vehicle safety performance standards. Rail related research and development has focused on the next generation of high speed rail equipment and train control, maglev systems, and innovative technologies to mitigate grade crossing hazards.

TEA-21 authorized a total of \$603 million for ITS research for fiscal year 1998 to 2003, and significant progress has been made in applying this technology to our surface transportation system. From 1997 to 2000, we have experienced a 37 percent increase in the number of freeway miles with real-time traffic data collection technologies, a 55 percent increase in the coverage of freeways by closed circuit television, a 35 percent increase in the number of buses equipped with automatic vehicle locations system, and an 83 percent increase in traveler information dissemination on our freeways. Through the Department's Intelligent Vehicle Initiative, research on driver performance, crash avoidance and warning system performance, and motor vehicle safety performance standards offer the promise of future reductions in highway deaths and injuries.

## QUALITY OF LIFE

TEA-21 has given States and communities across America additional tools and opportunities to enhance the environment and quality of life for their residents. It continued and increased funding for several programs originally authorized in ISTEA, broadened eligibility for others and established the new Transportation and Community and System Preservation Pilot program (TCSP).

The TCSP program was authorized for \$120 million in funding under TEA-21 as a discretionary grant program to strengthen the linkages between transportation and land use. The grants have provided funding for planning and implementation as well as technical assistance and research to investigate and address the relationship between transportation, community and system preservation, and private sector-based initiatives.

The Congestion Mitigation and Air Quality Improvement Program has focused on improving air quality. Under TEA-21, it provided more than \$8 billion in funding for use by State and local partners to support traffic flow projects, cleaner fuels, improved transit services and bicycle and pedestrian programs that reduce congestion and emissions and improve the quality of life.

The National Scenic Byways program and the Transportation Enhancements program have helped States and communities improve the environment. Since the enactment of TEA-21, more than \$1.4 billion in Transportation Enhancement funds have been obligated to local communities to implement community focused, non-motorized activities that enhance transportation. Many more activities have been programmed and are awaiting implementation.

TEA-21 directed us to streamline environmental reviews. This is a major priority for the Department in assisting States and communities build infrastructure more efficiently, while retaining important environmental protections that maintain our quality of life. Since the enactment of TEA-21 in 1998, streamlining of the planning and approval process for projects has taken root throughout the country: inter-agency personnel funding agreements that result in faster, concurrent reviews; a merged process for wetland permits with the Army Corps of Engineers; and delegated authority for historic resources. As a result of these actions, the mean time to process environmental documents for major highway projects has been cut by almost 8 months, the median time has been cut by 1 year, and the Department is well positioned for significant future progress. While we have begun the job, more can be done.

## BUILDING ON TEA-21

The Department of Transportation looks forward to working with both Houses of Congress, State and local officials, tribal governments, and stakeholders in shaping the surface transportation reauthorization legislation. The Department has established an intermodal process to develop surface transportation legislative proposals for reauthorization. A number of intermodal working groups have already identified key issues and programmatic options for consideration. In the next few months, the Department will work with stakeholders and congressional committees in shaping the reauthorization legislation.

In that effort, the Department will be motivated by certain core principles and values:

- Assuring adequate and predictable funding for investment in the nation's transportation system. This funding can contribute to the long term health of the economy and, by enhancing the mobility of people and goods, promote greater productivity and efficiency.
- Preserving funding flexibility to allow the broadest application of funds to transportation solutions, as identified by State and local governments.
- Building on the intermodal approaches of ISTEA and TEA-21.
- Expanding and improving innovative financing programs, in order to encourage greater private sector investment in the transportation system, and examining other means to augment existing trust funds and revenue streams.
- Emphasizing the security of the nation's surface transportation system by providing the means and the mechanisms to perform risk assessment and analysis, incident identification, response, and, when necessary, evacuation.
- Strengthening the efficiency and integration of the nation's system of goods movement by improving international gateways and points of intermodal connection.
- Making substantial improvements in the safety of the nation's surface transportation system. It is not acceptable that the Nation suffers 41,000 deaths and over 3 million injuries annually on the highway system.
- Simplifying Federal transportation programs and continuing efforts to streamline project approval and implementation.

- Developing the data and analyses critical to sound transportation decision-making.
- Fostering “intelligent everything” in the development and deployment of technology, such as pavement monitoring, message systems, remote sensing, and toll collection.
- Focusing more on the management and performance of the system as a whole rather than on “inputs” or the functional components such as planning, development, construction, operation and maintenance themselves.

This is a moment of great opportunity. As was true when Congress considered the landmark ISTEA and TEA-21 legislation, we have an opportunity to create our own legacy and to serve the needs of the American people. I am confident that, working together, the Department and Congress can preserve, enhance and establish surface transportation programs which will provide not only for a safer and more secure system, but one which is more efficient and productive and enhances the quality of life. One answer to the events of September 11 is to strengthen, not diminish, the right of all Americans to mobility and to grow the economy. These goals should characterize our work on reauthorizing TEA-21.

Again, Mr. Chairman, thank you for the opportunity to testify before you today. I look forward to responding to any questions you may have.

---

RESPONSES OF HON. NORMAN Y. MINETA TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question 1a.* Does the Administration support transfer of rail tax revenues into a trust fund dedicated to rail-related investment?

Response. The Administration has not yet developed a position on this issue. As I indicated in my oral testimony to the committee, Highway Trust Fund should only be available for modes currently financed by it. If new programs in rail infrastructure are to be addressed in TEA-21 reauthorization, non-Highway Trust fund sources of revenue will have to be identified. The rail fuel tax was originally enacted in 1990 as a deficit reduction tax. Similar taxes were also levied on fuel used by other modes of transportation. Deficit reduction taxes remain on rail diesel, fuel used by commercial vessels on inland waterways, motorboat gasoline and highway gasohol. I look forward to further discussion with the committee on financial mechanisms to support rail-related infrastructure investments.

*Question 1b.* If so, should those revenues go to the Highway Trust Fund, with broadened flexibility for rail investment, or should a new Rail Trust Fund be established?

Response. The Administration has not yet developed a position on this issue. I look forward to further discussion with the committee on financial mechanisms to support rail-related infrastructure investments.

*Question 2.* In general, how does the Administration propose to ensure adequate funding so that our nation can enjoy the benefits of world-class rail service for both passengers and freight?

Response. The Administration is committed to presenting proposals relating to inter-city passenger rail in connection with Amtrak reauthorization early this year. We expect to consider and work with Congress on issues relating to freight rail in the context of TEA-21 reauthorization. The Administration and the Congress need to work together to identify the structural reforms and develop solutions that will result in a financially stable rail system that can help this country meet our personal and economic mobility and national defense needs.

---

RESPONSES OF HON. NORMAN Y. MINETA TO ADDITIONAL QUESTIONS FROM SENATOR NIGHTHORSE CAMPBELL

*Question 1.* With the enormous responsibilities and requirements which have been placed upon the Department since 9/11, does the U.S. DOT have the time and resources to concentrate on this important TEA-21 Reauthorization or should a 1- or 2-year short extension be considered?

Response. It is our intention to send the Administration’s reauthorization bill to Congress right after it convenes early in 2003. The Department has established an intermodal process to develop proposals for surface transportation reauthorization. Over the next few months, the Department will work with stakeholders and congressional committees to shape its reauthorization proposals. To that end, we are currently proceeding under the assumption that the authorization period of this bill will be 6 years, comparable to those of ISTEA and TEA-21.

*Question 2.* Has there been any consideration of a special category for highway security funding in the next reauthorization?

Response. The Department has established an intermodal process for the surface transportation reauthorization but has not developed specific proposals. The events of 9/11 have demonstrated our need to address security issues and to ensure that America's transportation system emerges from this transformation even stronger and more efficient than before. One of the core principles of the Department's reauthorization effort is emphasizing the security of the nation's surface transportation system by providing the means and the mechanisms to perform risk assessment and analysis, incident identification, and response.

---

RESPONSES OF HON. NORMAN Y. MINETA TO ADDITIONAL QUESTIONS FROM SENATOR GRAHAM

*Question 1a.* How do you see the reauthorization of the surface transportation bill in relation to our new focus on homeland security?

Response. The events of September 11 have underscored the pivotal role transportation plays in the Nation's prosperity and quality of life. Our challenge is to create a seamless transportation system that will maximize not only the safety and efficiency, but also enhance the security of the movement of people and goods.

*Question 1b.* What are the homeland security issues we should have in mind when drafting this legislation?

Response. Following the September attacks, the Department took immediate steps to work with State and local officials to enhance security. Adding security personnel, emphasizing security awareness and response training, and hardening our transportation infrastructure against the threat of terrorism are critical security components. In this effort, we will work with the various modes of transportation to assess risks and to develop incident reporting and response systems. We look forward to working with Congress on these critical requirements as the reauthorization process continues.

*Question 1c.* Will U.S. DOT and the Office of Homeland Security be following the reauthorization process together?

Response. In developing its reauthorization proposals, the Department will be consulting with other Federal agencies including the Office of Homeland Security as appropriate.

*Question 2.* Under TEA-21 we created the "tapered match" program and other alternatives for State matching requirements so that projects did not have to be delayed. Has the "tapered match" or other alternatives been used by States during the past year? Do you know of any transportation projects that have stalled because a State could not meet its match requirement?

Response. "Tapered match" provides relief for any State experiencing a temporary shortage of State matching funds. The Department is aware of nine States that have used the tapered match provision. Also, 20 States are currently eligible to use non-cash toll credits to match Federal funds, which will also help ease a cash-flow shortage. While we have heard that some States are reprogramming funds to obtain sufficient matching funds, we are not aware of any Federal-aid projects being delayed because of insufficient matching funds.

---

STATEMENT OF HON. BOB WISE, GOVERNOR OF WEST VIRGINIA

Chairman Jeffords, Senator Smith, and members of the Senate Environment and Public Works Committee . . . it is my great pleasure to be with you today to offer my testimony as you begin to debate the reauthorization of the Transportation Equity Act for the 21st Century (TEA-21). I am especially pleased to be one of the lead Governors on transportation for the National Governors Association (NGA). I also appreciate the chance to follow United States Secretary of Transportation Norm Mineta. As you are aware, I was a member of the U.S. House of Representatives Transportation and Infrastructure Committee when Secretary Mineta was chair. I can assure you that there is no better person to guide our nation's transportation policy. I also wish to commend West Virginia's United States Senators and your colleagues, Senators Byrd and Rockefeller. Having two senators of their caliber makes my job as Governor much easier.

When I was a member of the U.S. House of Representatives, I was always a supporter of TEA-21 . . . because I firmly believed that investing in our nation's transportation infrastructure was a key ingredient to economic prosperity. After a year in office as the Governor of West Virginia, I am even more convinced that TEA-

21 is essential to the future of my State and this Nation. West Virginia is a wonderful State, but we have unique transportation challenges because of our beautiful, yet rugged terrain. One of my most important jobs is to continue to improve our road system so that we can take full advantage of the opportunities presented by having a modern transportation system. West Virginia has committed itself to doing that by maximizing our State gas tax to leverage as much local investment as possible.

The State-Federal partnership fostered under TEA-21 has been one that has greatly benefited the surface transportation system throughout the Nation as a whole. The Governors are committed to maintaining a safe and efficient transportation infrastructure, and we urge the reauthorization of TEA-21. To meet that goal, a number of important issues must be addressed and considered.

As this body debates the reauthorization of TEA-21, care should be taken to fortify and protect the Highway Trust Fund. This fund is the major financial mechanism that redistributes dedicated highway related revenue . . . such as fuel taxes and user fees to the States for maintaining and improving the nation's transportation infrastructure. It is critically important that Congress and the Administration take measures to ensure that the annual revenues to the Highway Trust Fund are used for their intended purpose. This has been achieved during TEA-21 through the workings of the Revenue and Aligned Budget Authority (RABA) Program. While this concept is commendable, we now see that it is not working as efficiently as it could. This program will provide a total of \$4.1 billion more for infrastructure investment than was anticipated when TEA-21 was first enacted; however, that figure represents the net effect of the very substantial increases the States enjoyed in fiscal years 2000, 2001, and 2002. Between 2002 and 2003, the States may see their apportionments of obligation authority from the Trust Fund drop by about 30 percent. This translates into a \$9.1 billion drop in Federal highway funding from the fiscal year 2002 level. These figures are projected by the U.S. Department of Transportation based upon new projections of the Revenue Aligned Budget Authority (RABA). The potential magnitude of a \$9.1 billion funding decrease has the result of nearly 144,000 jobs being lost over the next 2 years.

The longer term impact on the highway program could extend for a number of years for two reasons. First, the sharp reduction will affect the ability of States to use bond financing for construction. Second, the fiscal year 2003 funding numbers would serve as a baseline for the calculations of the next reauthorization legislation. These extreme peaks and valleys make it impossible to conduct a consistent, well-planned investment program. Going into 2003, commitments to several road projects around the country will have to be revisited, and contractors will be without work. Since the redistribution of RABA funds have been based largely on revenue estimates from year to year, I encourage the committee to pursue changes that ensure that all Trust Fund revenues continue to be distributed to the States but in a fashion that smoothes out the extreme peaks and valleys we will experience during the TEA-21 period. States are in the process of researching solutions to achieve a more stable and reliable distribution mechanism in light of new negative RABA projections. We would like to work with you and your committee to ensure a rapid and bipartisan action.

Our States are responsible for the vast majority of the maintenance of our nation's roads and finance more than one-half of all public investments in surface transportation. My fellow Governors are committed to maintaining a first-class transportation system and continuing the partnership with the Federal Government developed through TEA-21 . . . but in order to do that, it is important that each State be granted the flexibility and authority to make the key decisions that affect transportation.

The public transportation system is largely the responsibility of States and local governments. It is important that the next authorization should not weaken or preempt State authority. The Governors oppose unfunded mandates and urge Congress not to impose new standards without a Federal financial commitment to the States to offset any financial impact. Furthermore, the Governors urge the use of incentives rather than sanctions to encourage the achievement of national goals.

The nation's Governors strongly support sound environmental protection efforts. It is important that TEA-21 has a strong environmental component; however, it is important that States have the necessary flexibility to meet those environmental guidelines. Reasonable and sound environmental policy can be achieved without sacrificing improved transportation and economic development. One area of frustration for West Virginia that resulted in numerous major delays in important projects has been Section 4(f) of the Department of Transportation Act of 1966. This section was originally intended to protect certain highly valued recreational and natural resources from significant impacts, which is certainly something I agree with. How-

ever, over time the Section 4(f) requirements have been extended to cover historic properties which are also protected under Section 106 of the National Historic Preservation Act. A complicated and rigid “avoid at all costs” mentality has developed regardless of how insignificant the historical resource or impact. Eligibility has broadened to include many properties that are in fact unremarkable. This “broadening” at times includes very large districts surrounding the property. As you debate reauthorization of TEA–21, I think this is an area that also needs some consideration. This provision has led to many delays to vitally important projects and has hindered the process of making transportation more accessible and safe.

The safety of our citizens on the nation’s roads is a major concern for the Governors. While modern transportation systems have greatly helped reduce injuries and deaths on our nation’s highways, safety programs should be strengthened. States should be allowed to focus safety resources on their most pressing individual safety needs. Implementing any new national safety standards without State involvement will only complicate the process.

TEA–21 can be further strengthened through streamlining and eliminating administrative processes that are duplicative. The recent Notices of Proposed Rulemaking (NPRM) released by the Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) concerning streamlining regulations will complicate TEA–21 rather than simplify it. I urge you to carefully consider any new administrative guidelines that will only hinder the process. It is a waste of time and resources to delay projects for unnecessary and burdensome administrative processes.

In conclusion, I hope my statements today offer some insight into the policy positions of the nation’s Governors. It is very important for all the States that TEA–21 is reauthorized and the advice of the nation’s Governors is heeded in the process.

On behalf of the citizens of West Virginia, I urge you to take all that I have said into consideration as this process continues. I believe for West Virginia to prosper, we must have a modern transportation system. Many sound policies were put into place in TEA–21. One of them was the commitment of direct contract authority from the Trust Fund toward the completion of the long-promised Appalachian Highway System. The completion of this system was promised 37 years ago to the people of Appalachia. While the interstate system is now 100 percent complete, only 82 percent of the Appalachian System is complete. These incomplete portions represent some of the most dangerous segments of roads in the Trust Fund can the Appalachian States be able to make meaningful progress on transportation.

Once again, thank you for the opportunity to be with you today on behalf of the National Governors Association and the people of West Virginia. I would be happy to answer any questions.

---

RESPONSE OF HON. BOB WISE TO ADDITIONAL QUESTION FROM SENATOR JEFFORDS

*Question.* Governor, in your testimony, you said, “States should be allowed to focus safety resources on their most pressing individual needs. Implementing any new national safety standards without State involvement will only complicate the process.” During enactment of the National Highway System legislation a few years back, I worked to ensure that States had design flexibility so that roadways would remain compatible with their surroundings. Can I infer from your statements today that the Governors continue to favor such an approach?

*Response.* Senator Jeffords, the Governors appreciate the effort that you and others have made to allow for proper State flexibility. We continue to strongly support flexibility in roadway design. Every transportation situation is different and it is very important that design flexibility be retained. I would strongly urge that you continue to keep State flexibility in TEA–21. It is an important part of the process.

---

RESPONSES OF HON. BOB WISE TO ADDITIONAL QUESTION FROM SENATOR CAMPBELL

*Question 1.* Are there transportation related security projects in which your State could use Federal funding as a result of September 11?

*Response.* September 11th has forever changed the way this nation protects itself. After the attacks, I heightened security across the State including monitoring and patrolling of key transportation assets such as bridges, tunnels, and major interchanges. State Police and the West Virginia Department of Transportation, along with other State agencies, used considerable financial resources to meet that challenge. While it is unlikely that all transportation infrastructure can be protected at all times due to the length of roads, railroad, and pipelines, certain key assets and segments should be protected and watched. Without Federal financial assistance, it

is nearly impossible for the States to maintain that kind of security for any length of time. I believe that assisting the States financially on all aspects of homeland security is vitally important to the nation's national security.

*Question 2.* Would you support the creation of a specific highway security funding category in the next reauthorization?

Response. Governors would certainly welcome Federal funding to assist with homeland security costs related to transportation and other issues. However, it is important that the revenue for this purpose not be diverted from the Highway Trust Fund but come as a new revenue source. Simply creating a new security funding category may only get in the way of building our nation's roads if it does not include funds above what is being dedicated for the purpose of building and designing transportation projects. Frankly, there needs to be more focus on assisting the States financially with homeland security in all areas and not just transportation. Better security should not come at the expense of continuing to improve our transportation infrastructure. We need to find the financial resources to both continue transportation enhancements and improve homeland security.

---

RESPONSE OF HON. BOB WISE TO ADDITIONAL QUESTION FROM SENATOR GRAHAM

*Question.* You served in the House of Representatives during the development of ISTEA and TEA-21, and come before us today as a Governor. After being on both sides of the equation, what would be your top suggestion(s) on enhancing the coordination and cooperation between the Federal Government and State government?

Response. Efforts need to be continued to streamline the Federal review and approval process. Environmental concerns, air and water quality, historic issues, and other important areas of concern should be handled by the lead agencies in those areas. Without streamlining the process, duplication by multiple agencies will continue to unnecessarily delay important transportation projects. I alluded to an example of the need for streamlining in my testimony. West Virginia has suffered through numerous delays on very important highway projects because of the dual consideration of historical sites. Eliminating administrative duplication and streamlining the process would be a major step forward in improving the nation's transportation system.

---

RESPONSES OF RAY SCHEPPACH TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question 1.* Your comments on the current fiscal condition of the States are very informative and somewhat disconcerting. Please place those comments in context of the history and future of the Federal surface transportation program. Specifically, please address the following:

a) What share of the nation's highway and transit investment has been born by the States over the last 10 years?

Response. Transportation represents 8.8 percent of total State expenditures. In 2000, States spent \$83.1 billion on transportation, a 4.1 percent increase from the 1999 level of \$79.8 billion. Figures for capital spending on transportation by States show actual 2000 expenditures of \$37 billion. State transportation expenditures are primarily funded from earmarked revenues (major source is gasoline tax) placed in special transportation (highway) trust funds.

*Question 1b.* Has State spending on transportation as a percent of all State spending increased under ISTEA and/or TEA-21?

Response. State budgetary data indicates that States have increased transportation expenditures from fiscal year 1999 to fiscal year 2001. In fiscal year 1999, State transportation spending totaled \$79.85 billion; in fiscal year 2000, \$83.14 billion; and in fiscal year 2001, \$91.10 billion.

More specifically, in fiscal year 2002, State expenditures for transportation were funded as follows: 1) 62.2 percent from other State funds; 2) 27.4 percent from Federal funds; 3) 5.6 percent from bonds; and 4) 4.8 percent from general funds.

The landmark Intermodal Surface Transportation Efficiency Act (ISTEA) legislation passed nearly a decade ago was the beginning of a true State-Federal partnership in approaching the national transportation system. It acknowledged the growing need for integration across all levels of government and permitted States and localities to have more flexibility in the use of Federal funds and allowed decision-making authority at the State level. State flexibility was granted in determining project eligibility requirements, allocating the required 20 percent State funding match, and in leveraging Federal funding.

Since the enactment of the Transportation Equity Act for the 21st Century (TEA-21) in 1998, which increased Federal investment in highway and transit systems by 40 percent, States and localities have leveraged the guaranteed Federal funding to maximize State specific transportation priorities. The increased level of Federal investment has allowed States to: 1) increase highway preservation and performance; 2) obtain record-levels of transit rider-ship; 3) decrease highway fatalities; 4) provide transportation programs for Welfare-To-Work recipients; and 5) achieve a greater level of fairness in the distribution of funds.

*Question 1c.* Have States raised additional revenues for transportation to complement the increased Federal funding levels?

Response. Yes. Since fiscal year 1998, States have raised additional revenues by increasing the State motor fuel tax rate. In fiscal year 2000, an additional \$212.50 million was collected; in fiscal year 1999, \$22 million; and in fiscal year 1998, \$462 million.

Currently, 11 States have variable rate motor fuel taxes which are adjusted at specific intervals to sustain funding levels. Also, four States have provisions or "triggers" in statute that would enable them to increase their State motor fuel tax rate if the Federal tax rate should decrease. Other States would require State legislative action to adjust fuel taxes.

Because TEA-21 made it possible for States to aggressively plan out and secure State funding through innovative finance for new transportation projects, Governors continue to take measures to fully put into action newly available Federal funds and accelerate critical, but often-delayed projects. Such examples include:

- In Illinois, Governor George Ryan's "Illinois First" initiative makes \$10.5 billion available for highways and \$4.1 billion for transit over 5 years.
- In California, Governor Gray Davis and the State legislature authorized \$8 billion for a congestion mitigation program, which when matched with Federal and local funds will commit \$23 billion to 141 projects."

*Question 1d.* In light of their present fiscal difficulties, will the States be able to match the increased level of the Federal transportation program in FFY 2002?

Response. States are expected to match funding requirements for approved projects in fiscal year 2002. However, in 2002, States that pre-finance with Federal highway funding may need to reprogram, delay, and reconsider funding critical transportation projects in light of the Administration's fiscal year 2003 budget proposal. For example, a cut in FY2003 spending from the current level would deleteriously impact many States' construction planning. Most States begin to plan this time of year, enter into contracts near the beginning of the construction season, and implement their 2003 budgets on July 1, 2000. Numerous States that pre-finance with Federal funds expect a reimbursement very early in the Federal fiscal year to continue for the next year's planning. This means that a 27 percent fiscal year 2003 cut will have the effect of reducing expenditures well before July of this year.

*Question 1e.* Based on current forecasts, will the States be able to match a Federal program funded at or above the TEA-21 level (\$218 B) during the next reauthorization period?

Response. Yes. States will continue to be a sound partner in maintaining and developing an integrated national transportation system."

*Question 2.* Among the core principles of ISTEA and then extended in TEA-21 was a broad commitment to flexibility in meeting State and local surface transportation needs, ranging from highway and bridge improvements to pedestrian/bicycle and public transportation needs. At the same time, we note that two-thirds of the States have constitutional prohibitions on the use of State funds for intermodal investments, while TEA-21 emphasizes such flexibility in meeting transportation needs.

Is there something that Federal law could do to incentivize States to revamp their restrictions on the use of State funds to further promote flexibility in development of a more balanced mix of surface transportation investments?

Response. ISTEA made it national policy to "encourage and promote development of a national intermodal transportation system in the United States to move goods and people in an energy efficient manner . . ." TEA-21 continued this precept and directed that a study be conducted to review the condition of and improvements made since the designation of the National Highway System (NHS) connectors that serve seaports, airports, and other intermodal freight transportation facilities.

The evidence shows that despite the increased funding for intermodal connectors, interconnectivity between all the modes of transportation in the areas of passenger and freight mobility is still lagging.

Any future reauthorization legislation should recognize that States continue to overcome challenges in implementing intermodal passenger and freight connector

projects. Scarcity of funds, project eligibility and differing responsibilities and philosophies between States, Metropolitan Planning Organizations (MPOs), and localities creates a complex web in the decisionmaking process. An added dilemma is the lack of quantitative tools that would allow States and local governments to properly analyze and evaluate economic benefits of freight investment to the region and the country. States believe that optimal management of the intermodal connectors can be achieved when public, private and multi-jurisdiction elements are working collaboratively for a desired result.

I agree with the study's finding that "as an incentive to freight project development, additional funding for planning and coordination could be used to financially support States and MPOs who are identifying, conceptualizing and planning for freight projects . . ." and, such funding be made available via incentive grants to agencies and areas that have demonstrated a commitment to intermodalism and have meaningful private sector involvement.

The next surface reauthorization legislation should continue specific intermodal-related programs such as the Transportation Infrastructure Finance and Innovation Act of 1998 (TIFIA) credit assistance program for major transportation investments of critical national importance, Intermodal Connectors Program, and the Surface Transportation Program (STP).

---

STATEMENT OF HON. PETER CLAVELLE, MAYOR, BURLINGTON, VT

Thank you Chairman Jeffords, Ranking Member Smith, and members of the committee for the opportunity to appear before you today to discuss such an important issue to the nation's cities. I am Peter Clavelle, Mayor of Burlington, VT. Today I am pleased to be here not only as a Vermonter, but also as a representative of the National League of Cities.

The National League of Cities represents 18,000 cities and towns and over 140,000 local elected officials. NLC represents all cities, regardless of size—our largest member is New York City with a population of 8 million, our smallest member is De Graff, Minnesota with a population of 149. As the representative of the nation's local leaders, NLC has a vital interest in the reauthorization of the Transportation Equity Act for the 21st Century (TEA-21).

NLC's Transportation Infrastructure and Services committee, one of seven standing policy committees, appointed a special TEA-21 Reauthorization Task Force which recently completed a year-long rewrite of our surface transportation policy in preparation for reauthorization. Our new policy was adopted by NLC's full membership at our annual meeting in December 2001.

In addition, NLC has joined other groups representing local officials to comprise the Local Officials Transportation Working Group. The working group includes representatives of city and county elected officials, public works professionals, development organizations, and city/county managers. The working group was created to provide a unified voice of local government for the reauthorization of TEA-21. We look forward to working with the committee and our other Federal and State partners throughout the reauthorization process.

In addition to representing NLC today, I am here of behalf on my city of Burlington, Vermont. With a population of 40,000, Burlington is Vermont's largest city. I am currently serving my sixth term as Mayor, and just this fall I concluded a 2-year term as President of the Vermont League of Cities and Towns. I also serve on the Advisory Board of the United States Conference of Mayors.

PARTNERSHIPS

The title of today's hearing is "Partners for America's Transportation Future." The passage of the Intermodal Surface Transportation Efficiency Act (ISTEA) in 1991, and its successor, TEA-21, in 1998, shepherded a new era of transportation partnership in this country.

First, it forged a new partnership among Federal, State and local governments by empowering Metropolitan Planning Organizations (MPOs) in the transportation decisionmaking process. This elevation of the role of MPOs insured a more equal partnership between local and State governments in both the planning and funding decisions for transportation projects. This is a partnership that must be preserved and strengthened in the process of TEA-21 reauthorization.

The second category of partnerships created by these two landmark laws is among the modes of transportation to which the legislation allocates funding. The various modes—automobile, trucking, transit, rail, ferry, bicycle, and walking—were challenged to become truly intermodal. We began to pursue the vision of creating a

seamless, uninterrupted system to accommodate the need to efficiently and equitably serve our communities by transporting both people and goods.

In Burlington and Vermont, transportation partnerships facilitated by ISTEA and TEA-21 have allowed us to build on a strong tradition of local planning. Working through the Chittenden County MPO we have accessed funds to manage our planning activities on a local level, bringing transportation planning efforts to the front porch and the neighborhood school gymnasium. We have also worked closely with our Agency of Transportation in assuming management of many of our transportation projects. The city of Burlington today is managing the revitalization of a neglected commercial street (North Street), improvements to our pedestrian mall (the Church Street Marketplace), the design and construction of a major roadway (the Champlain Parkway), the development of an intermodal transit facility, and the design and construction of a bike path.

These partnerships, local, State, and Federal are vital to the success of the nation's surface transportation program. As we begin to work on the reauthorization of TEA-21, we must continue to work together to protect the program and ensure that all levels of government, no matter how small, play a part in the process.

#### BUDGET ISSUES

As we embark on the reauthorization process, we must take into account the current climate in Washington, DC and the Nation. These are tough economic times and in the aftermath of September 11th, local officials are shifting priorities.

One of the greatest successes of TEA-21 was the establishment of a direct link between gasoline taxes collected at the pump and Federal transportation spending. Because of that landmark change in law, funding for the program was increased to its highest levels in history. The Revenue Aligned Budget Authority (RABA) mechanism guaranteed that even additional, unanticipated gas tax revenue must be spent on the program. TEA-21 was a strong signal from Congress and the Administration to the traveling public that the nation's transportation system is an important priority.

Therefore, we find it very disturbing to hear reports that this year's RABA levels may be much less than anticipated in TEA-21. We look forward to the President's budget submission to Congress in the coming weeks and hope that a continued commitment to infrastructure investment is demonstrated.

NLC supports the current budgetary mechanism in TEA-21 and we pledge to work with you to protect the funding guarantees. We are, however, concerned about the trend in recent years to redirect transportation spending to specific projects through the appropriations process. NLC supports discretionary programs under TEA-21 and would advocate that the process remain open for all to apply and compete for those dollars.

#### TRANSPORTATION SECURITY

Following the tragic events of September 11th, the nation's local officials have been urgently reassessing priorities in their communities. In several NLC surveys of municipal officials conducted after September 11th, 52 percent were reevaluating their emergency preparedness plans. Respondents reported immediate shifts in city priorities to security issues, moving personnel to protecting transportation facilities, water supply facilities, nuclear power plants, schools, and government buildings. At the Burlington International Airport, we have more than doubled the number of police officers providing security.

In addition, the survey results show that fiscal conditions are worsening for many municipalities, with a 4 percent decline in revenue after September 11th and an over \$11 billion decline nationwide. 43 percent of cities say they are "less able" to meet their financial responsibilities after September 11th.

In my own city, revenues are projected to increase by a very modest 1 percent for the next fiscal year. Simply to maintain our current level of municipal services will require a 4-percent increase in expenditures.

Cities nationwide are shifting valuable resources to public safety expenditures; with over half (51 percent) of the cities reporting they are increasing spending on public safety and security. The majority of cities surveyed reported they would reduce spending in other areas to meet the new public safety funding gap. This means cities may have to postpone or cancel some needed transportation projects to shift funding to security. This March, Burlington voters are being asked to approve a 6-cent increase in their property taxes to maintain and improve fire and police services.

We want to highlight this trend to underscore the need for protecting the valuable gains of TEA-21, while considering how transportation security issues could be part

of the next reauthorization bill. The shifting of local revenue to a public safety related budget is unavoidable. The question becomes, what will be the role of the next Federal surface transportation program in homeland security? Will the Federal Government be able to offer greater assistance to cities to meet their needs?

#### LOCAL PRIORITIES FOR TEA-21 REAUTHORIZATION

A recent survey of local officials conducted by Public Technology, Incorporated, a non-profit technology organization supporting local governments, found that:

- 62 percent of respondents (local officials) indicated that congestion is a major political issue in their community; and
- 64 percent of respondents claim that transportation has a significant impact in their community and their citizens' quality of life.

NLC members identified congestion as a major concern when they created the TEA-21 Task Force to review NLC's surface transportation policy. The Task Force spent last year developing new policy priorities for the reauthorization of TEA-21. The themes of funding, flexibility, and intermodalism, permeated the discussions about congestion and the future of the surface transportation system.

#### FUNDING

As previously mentioned, NLC supports the current budget mechanism developed in TEA-21, which directly links transportation user fees to transportation spending. We call for all transportation taxes, including those levied on gasohol and alternative fuels, to be deposited into the highway trust fund. To that end, we are supportive of the Highway Trust Fund Recovery Act, (S. 1306), sponsored by Senate Finance Committee Chairman Baucus.

NLC supports the Federal—State financial matching relationships that currently exist and opposes any reduction of the Federal financial commitments. States and localities that want to provide greater financial resources than the minimum requirement, such as a transit new start project, should receive higher priority for Federal funding.

In addition, we support innovative financing programs and techniques such as tolls, State Infrastructure Banks (SIBs), and the Transportation Infrastructure Finance and Innovation Act (TIFIA). These programs support the development of public—private partnerships and provide creative ideas for meeting the infrastructure needs in our cities.

#### FLEXIBILITY

NLC supports local flexibility to design, manage, and operate cities' transportation systems. No "one size fits all" surface transportation program will be able to meet the needs of the traveling public in the diverse regions of the country. Local officials are on the front lines and therefore better able to develop strategies to deal with transportation challenges in their communities. ISTEA and TEA-21 embodied these themes and we look to the committee to continue this commitment through the reauthorization process.

Many programs in TEA-21 have supported localities' innovative solutions to congestion and gridlock. Whether a positive change in the system comes from an added lane on the highway, a new bus route, a bike path, a pedestrian walkway, a telecommuting program, or something as simple as better traffic signal timing, communities are thinking of new ways to increase quality of life by reducing daily commute times.

To continue to provide the most options to local governments, NLC supports the continuation of the Congestion Mitigation Air Quality program (CMAQ), Transportation Enhancements program, the Transportation and Community and System Preservation Pilot Program (TCSP), and the Intelligent Transportation System program. These programs have made a huge impact on localities and had a positive effect on quality of life.

In Vermont, the Transportation Enhancements program is so popular that we have programmed 133 percent of available funds. In Burlington, we have benefited from several of the programmatic innovations contained in ISTEA and TEA-21. We have utilized the Enhancements program to launch the revitalization of an historic commercial center along North Street. We've implemented street lighting upgrades and streetscape improvements. We've benefited from TCSP funds for improvements to the Church Street Marketplace. Congestion Mitigation Air Quality (CMAQ) funding has enabled us to try new approaches to solve downtown parking and transportation problems. We have also made key additions to our local and regional bicycle-pedestrian system, providing bike shelters and placing bike racks on buses.

In addition, NLC believes that to maintain economic viability, congestion mitigation programs must be available to cities and towns. A comprehensive, Federal funding program to address congestion would foster project innovation, enhance intermodal planning, promote savings in infrastructure investment, and increase the livability and economic viability of communities across the country. NLC urges the committee to consider the development of a congestion mitigation program that recognizes that congestion is a local issue and provides direct funding to cities and regions of all sizes to address related problems in their communities.

NLC believes that a congestion mitigation program may help alleviate future air quality issues in many areas. We recognize that many metropolitan areas are currently not in attainment under the Clean Air Act. In addition to a metropolitan congestion program, we remain strongly committed to a Federal funding program, like CMAQ, for non-attainment areas to address emissions from mobile sources.

Additionally, NLC supports streamlining the Federal transportation project delivery process to help reduce unnecessary delays in implementation, which will allow for more effective and efficient use of Federal funds. We look forward to working with the committee and the Administration to achieve a positive change without harming the environment or sacrificing citizen participation in the process.

#### INTERMODALISM/MULTI-MODALISM

It is essential that the nation's transportation system be seamless, with complementary and supportive relationships amongst all modes. Both freight and passenger transportation should be facilitated by the right mix of multi-modal connectors, minimizing the disruption associated with movement through high density areas, especially at peak times such as "rush hour".

NLC strongly supports Federal programs, which fund different transportation modes such as the Federal transit and rail programs. Passenger rail—commuter rail, inter-city rail, high-speed rail and MagLev—provides communities with other options to consider as part of a transportation and smart growth plan. In my small city, commuter rail service has been instituted.

We support funding to both preserve existing transit systems and for New Starts. In addition, we support a change in the law to allow States and localities to use TEA-21 dollars for inter-city passenger rail. We support the development of a national high-speed rail network. NLC joined our local and State partners in supporting the High Speed Rail Investment Act, (S. 250), which is pending before the Senate Finance committee.

Federal policies should encourage "closing the gap" of independent modal elements of the transportation system, with the goal of ensuring that efficient connections are available for the movement of people and goods. Accordingly, NLC supports the development of intermodal facilities and would recommend that projects shown to improve the efficiency of the connecting modes of intermodal facilities should be recognized as a matter of national significance. Specifically, we would ask the committee to examine the intermodal system and determine if a specific funding program may be needed to help alleviate congestion.

In Burlington we will break ground this fall on an intermodal transit facility that will provide seamless connections for regional transit, passenger rail, bicycle, and lake ferry services. This facility and all of its interconnected modes will make our waterfront accessible to greater a number of visitors-without overwhelming it with automobiles.

#### CONCLUSION

In conclusion, the nation's local elected officials stand ready to work with you throughout the reauthorization of TEA-21. We understand the delicate balance among the priority objectives all of the partners from the Federal, State, and local levels testifying before the committee today. The National League of Cities is committed to working with our partners to help develop the next surface transportation program. We value our seat at the table in this process and accept the responsibility of planning and implementing innovative transportation strategies to meet the needs of our citizens.

It is clear to us that congestion remains one of the nation's top complaints and is affecting quality of life. In addition, safety and security have become top priorities in this new post-September 11th climate. We believe the Federal Government can strike a balance between protecting our citizens and enhancing their quality of life. We continue to strive for an innovative, intermodal, and multi-modal transportation system.

RESPONSES OF PETER CLAVELLE TO ADDITIONAL QUESTIONS FROM SENATOR  
NIGHTHORSE CAMPBELL

*Question 1.* Are there transportation related security projects which your State or community could use Federal funding for as a result of 9/11?

Response. First, the most significant transportation related security challenge facing the city of Burlington as a result of 9/11 relates to airport security. The city of Burlington owns and operates the Burlington International Airport. The Burlington Police Department is responsible for policing this facility. A total of 1.1 million passengers utilized the airport in 2001.

After September 11, security at the Airport has been significantly increased. The number of police officers assigned to the airport has been increased from four to fourteen. Vermont National Guard personnel have been deployed to inspect vehicles at the entrance to the airport parking garage and to generally supplement existing security forces. Federal funding of the National Guard's presence at the Burlington International Airport is being terminated effective April 1, 2002. The additional security related expenses to be incurred by the City at this small airport are estimated to be \$650,000 per year. These costs will be passed on to the airlines and/or consumers. Additional Federal funding to offset these expenses would be most welcome.

Second, 9/11 has demonstrated the importance of offering a national transportation system that is multi-modal and diverse. Among the highest priorities of the city of Burlington is the improvement of both rail infrastructure and rail service to our community. We are committed to expanding commuter rail service, extending Amtrak service, and reducing freight-carrying truck traffic on our streets and highways. We also look forward to the creation of high-speed rail corridors servicing our city and connecting communities across our Nation.

Mayors across America, from cities large and small, believe a national rail policy is essential for our economy and our security. We cannot depend too heavily on any single mode of transportation. I urge Congress and the Senate EPW Committee to support the re-authorization of Amtrak and increased investment in our nation's rail system.

*Question 2.* Would you support the creation of a specific highway security-funding category in the next reauthorization?

Response. The National League of Cities established a Working Group on Homeland Security in January to be a front line resource on homeland security to help define the new role of local governments in national defense and what those new responsibilities require in terms of Federal support, intergovernmental partnerships and local budgets. Former Dallas, Texas Acting Mayor Mary Poss and Dearborn, Michigan Mayor Michael Guido are leading the Working Group.

NLC's Transportation Infrastructure and Services Committee will be deliberating throughout the summer with the Working Group to identify the needs of local governments for transportation security. Through multiple surveys, NLC has determined that cities are drastically increasing funding to public safety operations to protect vital city services including transportation. The most recent NLC survey revealed that cities expect an increase of 62 percent in first responder overtime costs and a 26 percent increase in new public safety equipment purchases and security upgrades.

Local emergency response and evacuation plans include a transportation system component. Surface transportation systems can be considered a potential target, like a transit system or bridge infrastructure and provide the tools for a successful evacuation of a downtown, such the Washington DC metro system did on 9/11. This underscores the importance of protecting these facilities. NLC believes that TEA-21 programs like the Intelligent Transportation System (ITS) program will be integral to increased transportation security in the nation's cities.

The ability of local government to use technology, through a program like ITS, to coordinate communications among local transportation agencies, public safety officials, and the public is vital to saving lives in an emergency.

We look forward to working with the EPW Committee throughout the year to determine whether a specific security-funding category will be needed in the next surface transportation law.

---

STATEMENT OF HON. BRENT COLES, MAYOR OF BOISE, ID

Mr. Chairman and members of the Senate Committee on Environmental and Public Works, I am Brent Coles, Mayor of Boise, Idaho.

I appear today on behalf of The U.S. Conference of Mayors where I serve as the Conference's immediate past president and member of the executive committee. The Conference of Mayors represents more than 1,000 cities with a population of more than 30,000.

Mr. Chairman, I want to thank you and other members of this panel for holding these hearings today, as we approach the next phase of "Transportation Equity Act for the 21st Century" or TEA-21.

On September 11 the world witnessed an attack on America that was unimaginable. The attacks instantly revealed the importance to our national security of a balanced, multi-modal, resilient, and secure transportation system. While our transportation agencies and businesses struggled heroically to deal with the tragedy, many travelers did not make it home for a week. Securing our transportation system is viewed as a prerequisite to eliminating the anxiety that has accelerated the nation's economic downturn and to achieving economic security for the Nation.

Fortunately, we have tools to deal with this crisis, provided by visionary Federal transportation laws known as ISTEA and TEA-21. TEA-21 provided the resources necessary to make investments in our transportation network that enabled immediate and quick emergency response.

In the weeks since that attack, mayors across the Nation have mobilized the local resources provided through TEA-21 to protect their citizens in the event of further terrorist activity. The national security benefits of ISTEA were hardly anticipated when the bill was passed 10 years ago, but the events of 2001 demonstrated the critical importance of this law. As they always have done in times of crisis, mayors assumed visible leadership roles, both in their cities and throughout their metropolitan regions. They have engaged in critical examinations of the local, State and Federal resources, as well as the security infrastructure that exist to do this.

Now, as the Nation recovers from the tragedy of September 11, America's mayors stand ready on the domestic front lines at assist in every way possible. We are the "domestic troops" in the war on terrorism, as Conference President Marc Morial of New Orleans has stated. The wealth of resources provided by TEA-21 has most certainly strengthened our ability to do this.

#### OVERVIEW

When Fort Worth Mayor Ken Barr, the Conference's Transportation and Communications chair, testified before the subcommittee last April, his statement highlighted a number of issues pertaining to TEA-21. I will speak to these issues and others in more detail in my testimony.

As a starting point, I want to emphasize a statement by Mayor Barr, which captures the Conference's broader view on TEA-21. He said, "TEA-21 certainly provides the tools and the laboratory, but it doesn't guarantee success. This is up to local elected officials working with the Governors and State transportation officials to use the tools you have provided."

We commend this committee and others in Congress and the Administration, for providing us with the opportunity under TEA-21 to meet our surface transportation challenges. Mr. Chairman, I know that in your capacity as Senator of Vermont, you are one of the pioneers of the concept of transportation-oriented development. Transportation touches every aspect of our modern lives. We thank you for your leadership in this area.

I am here to provide context for our views on where we are today with the implementation of TEA-21. Many of the issues highlight the importance of cities to the success of the TEA-21 partnership.

---

#### NEW IDEAS INFLUENCING TEA-21 DECISIONS

(By Mayor Ken Barr, Ft. Worth, TX)

First, I would like to call your attention to several emerging issues that have considerable bearing on the committee's review of TEA-21 implementation.

First, let me talk about the Conference's work on developing new information on the role of city/county metro economies in fueling U.S. economic growth. Since 1999, we have released annual data, prepared by Standard & Poor's DRI, which measures the Gross Metropolitan Product (GMP) figures for the nation's city/county metro areas.

As the focal points of economic activity, metropolitan areas are vital to the nation's continued economic development. The contribution of metro areas to the national economy has increased over the last decade, a trend that is expected to continue over the next 25 years.

If they were counted as a single country, the gross product of the five largest U.S. metropolitan areas (\$1.59 trillion) would rank fourth among the world's economies, trailing only the U.S. (\$9.96 trillion), Japan (\$4.6 trillion) and Germany (\$1.87 trillion). The importance of metro area economies can also be illustrated by their size relative to the output of U.S. States. The gross product of the 10 largest metro areas exceeds the combined output of the 31 smallest States. In the study, we found that 47 of the top 100 economies in the world are U.S. city/county metro areas.

The size of metro area economies illustrates their importance to the Nation. Mr. Chairman, the implications of this information for Federal and State policymakers are far-reaching. There is no doubt in my mind that the resources provided by ISTEA and TEA-21 have played a significant role in the economic vitality of cities and metro regions. The Conference stands ready to work with you and this committee as you craft future surface transportation policy.

#### MAYORS' VIEWS OF TEA-21 IMPLEMENTATION

In anticipation of this discussion, we recently surveyed a group of mayors, principally those serving on the Conference's transportation committee, to solicit their general views on how the TEA-21 is working. Let me provide a quick review of the responses from 40 mayors who completed the survey.

Nearly one-half of the mayors indicated that under TEA-21, their State had committed additional funding or planned to commit additional funds to local projects of particular priority to the city or region. When we asked if their metropolitan planning organizations (MPOs) had set any targets for fair share funding under TEA-21, one-half of the respondents said yes.

Based on the survey, it appears that States are reaching out to local governments under TEA-21. Seventy percent (70 percent) of the respondents indicated that their Governors or State transportation officials had contacted them about new funding available under TEA-21. However, only 40 percent of mayors have been asked to participate in a State process to decide funding priorities for TEA-21 dollars.

When asked to indicate the single most important surface transportation priority in their city or region, the mayors' top three responses were System Preservation at 35 percent, Congestion Relief at 20 percent and New Rail Projects at 15 percent. The remaining 30 percent of the responses included alternative transportation, new freeways, freeway expansion, transportation access to brownfield sites, safety, bridge repair and major road widening. Mayors were asked to write the response, rather than choosing from a list.

I do not think mayors can overstate the importance of infrastructure to the economic health of our cities and regions and transportation infrastructure is clearly one of our highest priorities.

#### TEA-21 IS WORKING

##### *Treasure Valley Partnership*

Though suburban sprawl may conjure up visions of LA or Phoenix, the rugged, southwest corner of Idaho also faces significant traffic and air quality problems stemming from rapid growth. During the past decade, Boise, Idaho had the second highest growth rate in the country.

For the first time, our residents began to think seriously about transportation issues. Our legendary "rush-minutes" lengthened and people began to experience longer, less tolerable commutes. Policy makers began to look at ways to protect our quality of life from the impacts of sprawl. Our highly conservative region began to discuss ideas like transit oriented development, protection of open space, and commuter rail.

Four years ago, we formed a working group called the Treasure Valley Partnership. The Partnership consists of mayors and commissioners from general purpose governments in two counties. This group embodies the collaborative principles set out in TEA-21. As a Partnership, we have brought together business, community groups, and local government to make new connections between transportation and land use. I believe that our entire process of governance in the region has been improved and policy decisions are made in more informed and strategic manner, so that all citizens are better served.

The Partnership began to look seriously at what our region will look like at full build-out. For the first time, we put our comprehensive plans side by side to see if they are consistent with each other. Our planning staffs have begun to talk more and cooperate more. Our transportation plans have more regional buy-in.

The Partnership has directly benefited from TEA-21. Working in collaboration with Idaho Smart Growth and our MPO, we obtained a \$500,000 grant for a visioning process that has engaged the entire region in a discussion of sprawl and

traffic, and their link to land use. The money has been leveraged with other grant funds to conduct pilot projects which model the conclusions of the broader study.

Based on the principles of TEA-21, the city of Boise purchased more than 18 miles of railroad track and right-of-way that was about to be abandoned by Union Pacific Railroad. We used general fund property tax dollars for this purchase, even though the track is located entirely outside our corporate city limits. We raised private funds to purchase Boise's historic train depot. We did this to preserve the infrastructure that will be needed someday for commuter and passenger rail service in our region.

The residents of our two-county area went to the Idaho Legislature for the authority to establish regional transit programs. Then, voters overwhelmingly approved creation of a regional transit authority. We have yet to be given a dedicated funding source by the Legislature, but Boise City has provided funding to hire an executive director and we are allowing the regional transit authority to assume operation of our bus system.

This is progress that would not have occurred without the guidance and encouragement provided by ISTEA and TEA-21. There is more to be done, but we believe we are on the right track.

#### CLOSING COMMENTS

Now, Mr. Chairman, last Friday I was informed of the potential \$9 billion shortfall in TEA-21 allocations to the States for fiscal year 2003. If the shortfall is passed onto States, the funds allocated under TEA-21 in fiscal year 03 would be less than the base amounts promised to States for highways and transit. As you might imagine, this would have serious repercussions. The State of Idaho, for example, would lose more than 25 percent of our Federal transportation funding. California would lose \$741 million dollars and Texas would lose \$626 million. It's estimated that nationwide we would lose an estimated 144,000 jobs by fiscal year 04.

I know that this is new information and that the impacts of the shortfall have yet to be fully explored. I pledge to you the assistance of the Conference of Mayors as you work toward resolution of this issue.

Mr. Chairman, the issues I have discussed today affect all of our cities. Our cities as neighborhoods—protecting quality of life—and our cities as regions—competing in a global economy—must have transportation funds as tools to carry out our responsibilities within the regional context. In our region, adequate funding and air quality constraints continue to hamper our potential success. You have the opportunity to permit us to respond better to both our responsibilities to enhance quality of life and increase competitiveness in a world economy.

The nation's mayors believe in the ISTEA partnership, and look forward to the opportunity to build upon this success under TEA-21.

Mr. Chairman, as you move forward on TEA-21 Reauthorization, you can count on the mayors' active participation and support. Thank you for this opportunity to present our views.

---

#### STATEMENT OF CHRIS HART, COUNTY COMMISSIONER, HILLSBOROUGH COUNTY, FL

Good morning Mr. Chairman and members of the committee, I am Commissioner Chris Hart, County Commissioner of Hillsborough County, Florida. Today I am representing the National Association of Counties (NACo)<sup>1</sup> where I serve as chairman of its transportation steering committee. On behalf of NACo, I want to thank the committee for inviting me to appear before you on the topic of TEA-21 reauthorization. I am delighted to share this panel with West Virginia's Governor Wise, Mayor Clavelle of Burlington, Vermont, and Mayor Coles of Boise, Idaho. My county seat is in Tampa, where I directly represent over 1 million citizens on the central West Coast of Florida. It is an urban center of seven counties with over 3.5 million people. It is also the economic engine of the Tampa Bay region, in great measure because of our focus on improving the transportation network, and our major international air and seaports that connect us to the global economy. On a lighter note Senators,

---

<sup>1</sup>NACo is the only national organization representing county government in the United States. Through its membership, urban, suburban and rural counties join together to build effective, responsive county government. The goals of the organization are to improve county government; serve as the national spokesman for county government; serve as a liaison between the nation's counties and other levels of government; achieve public understanding of the role of counties in the Federal system.

if you haven't had a call for the head coach position of the Tampa Bay Buccaneers, rest assured you will—everyone else has!

NACo has a broad interest in transportation policy. NACo has been very active over the past 50 years in assisting Congress in developing legislation that benefits our member counties, as well as our partners in the cities and States. Much of our focus has been on the highway program for the simple reason that counties own 44 percent of the nation's highway mileage and 45 percent of the nation's bridges. With 3,066 counties in our vast nation, NACo's membership is diverse. It's in America's thousand urban counties where both economic and population growth is occurring. Metropolitan counties, or in urban centers like my home on Tampa Bay, account for 84 percent of the gross domestic product, and have over 125 million people living in just 100 of the most populated counties. Strong economic growth will occur only with a sound transportation system. Of course, the downside of that growth has been increasing traffic congestion, which at times threatens our quality of life and deprives citizens of their ability to move around in a safe and efficient manner. Conversely, there are two thousand rural counties with a dwindling tax base that must maintain and improve their highway and bridge systems if they are just to remain competitive in today's economy and retain their current population.

TEA-21 and its predecessor, ISTEA, have been very helpful to our members and to our Nation as a whole. There is little doubt in my mind that these programs have contributed to the overall economic growth that our Nation experienced in the last decade. ISTEA, in 1991, began a trend to increase the Federal investment in the highway program, and TEA-21 provided a 40 percent boost. The increase was needed and we have seen the benefits. For example, last year the State of Florida appropriated over \$1 billion for a combination of improvements to the local, State, and Federal transportation system in the Tampa Bay region. This was a direct result of increased funding because of TEA-21. The leadership of NACo supported the funding increase for transportation in TEA-21, and fought hard to support the financing changes in TEA-21 that made this level of spending possible. It would be an economic disaster if Congress were to eliminate the firewall established in TEA-21 or began to use the Highway Trust Fund to either finance other programs or mask the deficit. Mr. Chairman and members of the committee, the financing decisions made in 1998 were the right ones!

Let me also add that I also believe that our highway infrastructure performed well on September 11 and in its aftermath. We should all remember that the Federal highway program was begun to ensure our nation's defense. While the tragic events of last September were never anticipated, the security function of our highway and bridge system worked. When NACo's Homeland Security Task Force met for the first time in October, it was Secretary of Transportation Norman Mineta, along with Governor Tom Ridge, that the task force wanted to hear from.

Aside from funding, the key change in highway legislation over the last 10 years has been the creation of a flexible program that has relied on greater input from local elected-government officials. The result has been better planning, better decisionmaking on project selection, and better projects. It is likely that the Federal Government will continue to spend substantial Federal resources each year on highways and bridges, and that makes it essential that both local and State government leaders sit together at the table when decisions are made. The reauthorization of TEA-21 should continue and accelerate that partnership. ISTEA required cooperative decisionmaking through the metropolitan planning organization (MPO) process on how surface transportation program funds, the most flexible category, were to be spent. TEA-21 continued that requirement; and that legislation also called for cooperation and consultation between State and local decisionmakers in other Federal highway programs. TEA-21 expanded this to rural areas and statutorily called for a consultation process in each State for obtaining rural local officials input in the statewide transportation plan. I must add that while some States have a process and the Federal Highway Administration did issue guidance on this change to its field offices, the U.S. Department of Transportation has yet to issue final regulations on rural planning requirements.

Last fall, I established NACo's TEA-21 Reauthorization Task Force under the able leadership of my colleague Commissioner Glen Whitley from Tarrant County, Texas. Mr. Chairman, he and our staff have been diligent in their efforts, have met several times with members throughout our country, and are now in the process of finalizing NACo's recommendations for TEA-21 reauthorization. However, I am confident that I can state without reservation that environmental streamlining will be a top issue for our members. Also, I want to be very clear that we will not be calling for the repeal of any of our nation's environmental protection laws. Rather, we will be recommending that the reauthorization include provisions that ensure projects are completed in a timely and efficient manner, and the delays in the current sys-

tem that unnecessarily slow down projects are eliminated! Simply put, Mr. Chairman and committee members, we are asking for a concurrent process, rather than an uncoordinated, sequential one. In the broadest sense, this means that we need to get all the players in a project involved at the outset. This means the local elected officials, State DOTs and its other regulatory officials, all Federal agencies having a role to play, as well as the environmental community, and most especially, the affected citizens. No one should be ignored, and no Federal agency should be allowed to operate independently of the other participants. In my State of Florida, for instance, this effort is a work-in-progress, but it will not be successful without collaboration from the Federal Government.

Congestion will be another key policy issue that Congress must address in the re-authorization. Urban counties, their citizens, tourists, and our commerce are strangling on congestion. Time, money, and productivity are all lost when commerce, the American commuter and tourist are stuck in traffic. There is no one solution, except that we must apply common sense to the challenge of congestion. Solutions must be found through very close State-local cooperation. Congestion occurs on county highways, not just on the State networks. We must remember that we have a system of highways, and when one part of the system breaks down, the others are affected too. Any new legislation should provide for those highways and streets we have now, to ensure they are properly maintained, so that they can move traffic safely. We must invest more money in highways to guarantee that our current system is maximized. We know that as much as 50 per cent of congestion occurs due to breakdowns and accidents on the roadways. Therefore, we must be smart enough to establish simple, efficient methods for getting these incidents resolved quickly. Here again, Federal agencies and their resources can partner with local and State government to save time, money, and lives. We need to have systems and procedures in place that include all the various agencies involved in incident management; from the highway departments, police, fire/rescue, to EMS and wrecker services, all communicating with one another. We can do better. Let me illustrate. How many times have you seen a breakdown or accident in one lane of traffic, with emergency vehicles taking up the other lane or lanes, and if we're really lucky, perhaps we are able to pass after an hour or so in morning and evening rush hour traffic. Systems and procedures for incident management could go a long way toward relieving congestion. Another key to relieving congestion and moving traffic is signalization. We have all been on highways where the signals are coordinated and traffic flows. We have also been on roads where we are stopping at every red light. Many local governments need additional resources to modernize traffic signals. The good news is that electronic signals, and now Intelligent Transportation Systems, or ITS as it's commonly called, are giving us an 8 to 1 return on our investment as compared to other alternatives. By the way, what we don't need are automatic signs that say "congestion ahead" when we are already caught in traffic, or where there are no alternative routes.

Now, Mr. Chairman, I would finish my remarks by addressing a major concern we all share, rural roads. Rural roads are in need of substantial Federal investment. Safety is the primary reason. According to a U.S. General Accounting Office report in July 2001, rural local roads had the highest rate of fatalities per vehicle mile traveled of all types of roadways-over six times that of urban interstates. In 1999, over 25,000 fatalities occurred on rural roads across the United States; and that figure was 2.5 times greater than the fatality rate from accidents on urban highways in areas like Las Vegas, Miami, St. Louis, and Cleveland. If Congress wants to reduce auto fatalities, there is no better investment than on roads in rural counties. Because rural roads are the most dangerous roads in America, and are the most costly in human lives, NACo will be proposing a new program to address rural road safety in the coming months. Rest assured, Mr. Chairman, that we would work closely with your committee in developing it.

Mr. Chairman, this concludes my testimony. I thank you and the committee for the opportunity to be here today, and would be pleased to answer your questions.

---

#### RESPONSES FROM CHRIS HART TO ADDITIONAL QUESTIONS FROM SENATOR GRAHAM

*Question 1.* I wholeheartedly agree with your assessment that Incident Management Agreements could help ease congestion. Could you offer examples of where they have been implemented and worked, or where congestion has worsened because of a lack of coordinated response to traffic accidents?

Response. The State of Florida has 10 freeway incident management teams and 52 community traffic safety teams. Florida also created a statewide Traffic Incident

Management Steering Committee to improve the management of incidents on our highway system.

Incident management also relates to the issue of highway security. Our awareness of ensuring the security of our highways and ability to prepare for and respond to unexpected catastrophic events has been heightened since 9/11. The same organizational arrangements, training, communication systems, and procedures that one would need to manage traffic incidents would be similar to those needed to address highway security. Intelligent Transportation System technology must be a key element in addressing this need.

*Question 2.* I share your concern that the environmental streamlining regulations are still not finalized, and I plan to encourage DOT to come forward, at the appropriate time, with regulations that reflect what we hoped to do in TEA-21. I hope, however, that we are moving toward an era of increased cooperation even without the regulations. What have been your recent experiences, either in Florida, or through your leadership with NACo, of infrastructure projects being stymied by lack of coordination between different agencies? Is the coordination effort improving, staying the same, or getting worse?

Response. Florida is a leading State for the area of environmental streamlining. Section 13098 of the TEA-21 reflected Congress' concerns about delays, unnecessary duplication of effort and added costs often associated with the current process for reviewing and approving transportation projects called "environmental streamlining". This legislation challenged the Florida Highway Administration and Federal Transit Administration to implement a more efficient transportation planning and review process. Florida was selected as a pilot State for developing and implementing a streamlined planning and project development process.

To date, Florida has developed a more efficient process, the Efficient Transportation Decision Making process, which uses available information starting at the long-range planning stage. It is also designed to encourage earlier and ongoing coordination among agencies to ensure the understanding and development of satisfactory approaches to addressing environmental issues with the goal to ensure timely permitting as early in the process as possible. Florida is attempting to make the National Environmental Protection Act (NEPA) and the environmental process a single process, and not create a situation where agencies review the environmental work during the NEPA process and then revisit the project again during the permit process.

With this process, Florida hopes to avoid the problems it has encountered in several major projects. One example that is very familiar to Senator Graham is the proposed expansion of US1, from Florida City into the Florida Keys. This project was challenged by the Army Corps of Engineers and still awaits resolution of the environmental issues. Another example is the extension of SR 7 in Palm Beach County. Planning for this four-mile extension of SR 7 that passes through sensitive environmental lands moved forward with the planning and project development with no resolution of the issues. In both of these cases, millions of dollars were spent only to have the projects stopped or withdrawn when environmental concerns could not be resolved. The Efficient Transportation Decision Making process would hopefully identify these issues much earlier in planning and the project development phases before expensive project development and design phases proceed.

---

RESPONSES OF CHRIS HART TO ADDITIONAL QUESTIONS FROM SENATOR CAMPBELL

*Question 1.* Are there transportation related security projects which your State or community could use Federal funding for as a result of 9/11?

Response. Florida's geographic location and extensive coastline presents security challenges to Florida's ports and communities. In addition, our State's reputation as a major tourist destination and commercial center generates significant air traffic. Florida's ports and airports are committed to providing the citizens of surrounding communities the utmost safety and security.

Specifically, the Florida statewide Ports Council submitted a statewide Port Security Issue projects list to the Florida Transportation Outreach Program Advisory Council. This project could be in turn submitted for Federal funding. All major airports have been actively working to meet and integrate new federally mandated security procedures. Part of these funds will come from the Federal Aviation Administration and U.S. Department of Transportation. Specific airports are seeking additional funding such as Tampa International Airport's new Passenger Facility Charge Application which will provide roughly \$9 million to accommodate modifications to existing facilities to implement 100 percent screening of checked baggage.

*Question 2.* Would you support the creation of specific highway security funding category in the next reauthorization?

Response. We need to prioritize and identify specific items within funding categories that either serve a direct security function, or have a dual purpose such as ITS signalization with cameras at intersections. Cooperative arrangements among different highway and public safety agencies, common “first-responder” communication frequencies, interlocal agreements, and standardized response procedures could all be used to deal with both transportation incidents and potential security threats. Such protocols could be required performance standards in the reauthorization legislation, and produce more effective response capabilities nationwide at a low-cost.

# REAUTHORIZATION OF TEA-21

---

MONDAY, FEBRUARY 11, 2002

U.S. SENATE,  
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,  
SUBCOMMITTEE ON TRANSPORTATION, INFRASTRUCTURE  
AND NUCLEAR SAFETY,  
WASHINGTON, DC.

## DEPARTMENT OF TRANSPORTATION'S FISCAL YEAR 2003 BUDGET

The committee met, pursuant to notice, at 1 p.m. in room 406, Senate Dirksen Building, the Hon. Harry Reid [chairman of the subcommittee] presiding.

Present: Senators Reid, Wyden, Baucus, Inhofe, Chafee, Jeffords, and Graham.

### OPENING STATEMENT OF HON. HARRY REID, U.S. SENATOR FROM THE STATE OF NEVADA

Senator REID. The Subcommittee on Transportation, Infrastructure, and Nuclear Safety will come to order.

We welcome everyone to today's hearing on the Federal Highway Administration's fiscal year 2003 budget proposal and budget issues related to the reauthorization of TEA-21, the Transportation Equity Act for the 21st Century.

The President's budget raises some important short- and long-term concerns, but I do very much welcome the opportunity to discuss these issues today with you, Administrator Peters, and other distinguished witnesses.

The present budget cannot be sustained. A 27 percent cut in highway funding is a move in the wrong direction, given our Nation's transportation needs. It would mean the elimination of hundreds of thousands of good jobs, and it would be a drag on our economic recovery.

I am pleased that Tom Stephens, our very fine Director of the Nevada Department of Transportation, is here to testify on behalf of State Departments of Transportation across the Nation. I am sure that Mr. Stephens will speak to the negative impact these cuts will have on Nevada.

Nevada is the fastest growing State in the Nation. We have huge needs for new road capacity, not to mention new transit and rail initiatives. A \$50 million-plus spending cut in Nevada next year would force the State to cut back on critical transportation projects. The results would be more congestion, reduced productivity, worsened air quality, and loss of jobs.

This is not an acceptable outcome. Nevada has significant unmet transportation needs, and these cuts cannot be allowed. Nevada is really the poster child for the rest of the country. Every State has these same problems.

The Revenue Aligned Budget Authority, or RABA, mechanism was created to ensure that spending from the Highway Trust Fund was tied to revenues in the Trust Fund. This is a goal that I support. However, the RABA mechanism clearly needs to be fixed so that we can avoid the dramatic swings in spending that we have seen over the past few years.

One of the first reasons that we authorized TEA-21 for 6 years and created the budget firewalls for highway and transit, was to provide States with some certainty as to the level of funding they would receive each year. A stable and dependable funding stream is essential for States to develop long-term transportation plans, and efficiently manage projects.

I agree with the philosophy behind RABA, that spending from Highway Trust Funds should be connected to revenues, but I do not think it is necessary for us to follow a broken mechanism off a spending cliff.

Regardless of the spending adjustment mandated during RABA, we cannot allow a 27 percent drop in highway funding next year. Adequate funding of our Nation's highways is important, not only for obvious, short-term economic stimulus and highway improvement needs, but for long-term reasons, as well.

This subcommittee will be working with the chairman and the ranking member of the full committee to put together a TEA-21 reauthorization proposal early next year. One of my priorities is to ensure that adequate funding is available to meet our Nation's significant transportation needs.

It is important to understand that the funding level that Congress enacts for 2003 will serve as the baseline from which our committee's reauthorization proposal will be scored.

Therefore, if we base reauthorization on the President's fiscal year 2003 budget proposal, we will have \$28 billion less available to us than fiscal year 2003 spending equals the amounts authorized in TEA-21. That is a tremendous burden for us to bear.

A spending baseline that is \$28 billion below TEA-21 baseline would spell disaster for the whole transportation system. In fact, my focus is on doing just the opposite, in finding a way to increase funding for all the components of our surface transportation systems: highway, transit, and rail.

This is why the leaders of the Senate Environment and Public Works Committee have worked on a bipartisan, bicameral basis with the House Transportation and Infrastructure Committee, to introduce the Highway Funding Restoration Act.

This legislation, which every member of this committee co-sponsored, will ensure that funding in fiscal year 2003 is at least at the level authorized in TEA-21. Rest assured that I will be advocating for the highest funding possible, but I cannot accept a penny less than the amount authorized in TEA-21.

I know that Administrator Peters shares some of my concerns about the impact of these proposed highway funding cuts. Administrator Peters, I welcome you to this hearing. Let me tell you how

pleased I am that someone so familiar with the transportation challenges faced by fast growing Western States is at the helm of the Federal Highway Administration. I look forward to working with you to develop a top-notch reauthorization bill.

[The prepared statement of Senator Reid follows:]

STATEMENT OF HON. HARRY REID, U.S. SENATOR FROM THE STATE OF NEVADA

Welcome to today's hearing on the Federal Highway Administration's fiscal year 2003 budget proposal and budget issues related to the reauthorization of TEA-21, the Transportation Equity Act for the 21st Century. The President's budget raises some important short and long-term concerns and I welcome the opportunity to discuss these issues today with Federal Highway Administrator Mary Peters and our other distinguished witnesses.

I will get right to the point—the President's budget cannot be sustained. A 27 percent cut in highway funding is a move in the wrong direction given our nation's transportation needs. It will also mean the elimination of hundreds of thousands of good jobs and be a drag on our economic recovery.

I am pleased that Tom Stephens, our fine Director of the Nevada Department of Transportation, is here to testify on behalf of State Departments of Transportation across the Nation. I am sure that Mr. Stephens will speak to the negative impact these cuts will have on Nevada. Nevada is the fastest growing State in the Nation and we have huge needs for new road capacity, not to mention new transit and rail initiatives. A \$50 million spending cut in Nevada next year will force my State to cut back on critical transportation projects. The result will be more congestion, reduced productivity, worsened air quality, and lost jobs. This is not an acceptable outcome. My State has significant unmet transportation needs and these cuts cannot be allowed.

The Revenue Aligned Budget Authority—or RABA—mechanism was created to ensure that spending from the Highway Trust Fund was tied to revenues into the trust fund. This is a goal that I fully support. However, the RABA mechanism clearly needs to be fixed so that we can avoid the dramatic swings in spending that we have seen over the past few years.

One of the reasons that we authorized TEA-21 for 6 years and created the budget firewalls for highways and transit was to provide States with some certainty as to the level of funding they would receive each year. A stable and dependable funding stream is essential for States to develop long-term transportation plans and efficiently manage projects. I agree with the philosophy behind RABA—that spending from the Highway Trust Fund should be connected to revenues, but I do not think it necessary for us to follow a broken mechanism off a spending cliff.

Regardless of the spending adjustment mandated by RABA, we cannot allow a 27 percent drop in highway funding next year. Adequate funding of our nation's highways is important not only for obvious short-term economic stimulus and highway improvement needs, but for long-term reasons as well. This subcommittee will be working with the chairman and ranking member of the full Environment and Public Works Committee to put together a TEA-21 reauthorization proposal early next year. One of my priorities is to ensure that adequate funding is available to meet our nation's significant transportation needs.

With this in mind, it is important to understand that the funding level Congress enacts for fiscal year 2003 will serve as the baseline from which our committee's reauthorization proposal will be scored. Therefore, if we base reauthorization on the President's fiscal year 2003 budget proposal, we will have \$28 billion less available to us than if fiscal year 2003 spending equals the amount authorized in TEA-21.

A spending baseline that is \$28 billion below the TEA-21 baseline would spell disaster for our transportation system. In fact, my focus is on doing just the opposite and finding a way to increase funding for all of the components of our surface transportation system—highways, transit, and rail. This is why the leaders of the Senate Environment and Public Works Committee have worked on a bipartisan and bicameral basis with the House Transportation and Infrastructure Committee to introduce the "Highway Funding Restoration Act."

This legislation, which every member of this committee cosponsored, will ensure that funding in fiscal year 2003 is at least at the level authorized in TEA-21. Rest assured that I will be advocating for the highest funding level possible, but I will not accept a penny less than the amount authorized in TEA-21.

I know that Administrator Peters shares some of my concerns about the impact of these proposed highway-funding cuts. Administrator Peters, welcome, and let me tell you how pleased I am that someone so familiar with the transportation chal-

allenges faced by fast growing western States is at the helm of the Federal Highway Administration. I look forward to working with you to develop a top-notch reauthorization bill.

I also welcome Assistant Secretary for Budget Donna McLean and look forward to further discussion on these important budget issues.

Senator Wyden.

**OPENING STATEMENT OF HON. RON WYDEN, U.S. SENATOR  
FROM THE STATE OF OREGON**

Senator WYDEN. Thank you, Mr. Chairman, and thank you very much for holding this important hearing. I think this is a critical issue, and I very much appreciate your leadership.

My view is that the Administration's budget for transportation is the equivalent of putting an automobile in reverse, when the country wants to move that car forward. It just seems to me that if you are serious about economic stimulus, you cannot propose such serious cuts in transportation projects.

The fact of the matter is, the projects that are being slashed are projects that are ready to go. These are projects that will put people to work immediately.

Oregon transportation officials calculate that the Administration's proposal to cut TEA-21 funding will mean the loss of \$80 million for Oregon's economy, and more than 1,600 family wage construction jobs. Now we have got the highest unemployment rate in the country. So these transportation cuts are draining the life blood out of Oregon's economy.

Now I support the committee's bipartisan's legislation to restore funding at least to the levels called for in TEA-21. But I also want to note that I think we need to look beyond the immediate budget crunch at what could be an even bigger problem that is ahead down the road.

Our country's transportation energy policies are on a collision course. Transportation projects are primarily funded by taxes on gas; the more gas we use, the more money to build roads. At the same time, there is a bipartisan agreement in Congress that we need to develop energy policies, and decrease our dependence on foreign oil.

Increased production can help, but the only way to truly reduce dependence on foreign oil is to reduce dependence on oil, period. Now in the coming years, these conflicting policies are going to bump up each other. Hybrid gas and electric powered cars that get 60 miles per gallon are already on the market and on the road.

Cafe standards will require more miles to the gallon for cars and light trucks. It is predicted that fuel cell technology and other alternatives will be prevalent by the end of this decade. As all of these things evolve, gas tax revenues will continue to decline, and transportation funding will feel the pinch, unless changes are made.

I am hopeful that we can continue, under Senator Reid's leadership, to explore new ways to fund transportation projects that do not depend solely on the gas tax.

My home State is already starting to look at this concept, with our Road User Fee Task Force. The Federal Government ought to be doing more to encourage this type of creative thinking.

As part of TEA-21 reauthorization, I am interested in working with the bipartisan leadership of this committee to create a pilot program, where States can develop and test their own home-grown approaches that best meet their needs.

The time to act is now. That is why it is so important that Senator Reid has convened this effort to deal with what I think are overly harsh cuts that will hurt communities across this country now. Then we need to work together on a bipartisan basis to find responsible alternatives for the future.

I thank you, Mr. Chairman.

Senator REID. Senator Wyden, thank you very much for your statement.

We are joining by the Ranking Member of this subcommittee, Senator Inhofe of Oklahoma, who has always been very diligent. I have come to a lot of these hearings. I do not stay as long as you do, normally, but you are very diligent in all the hearings, and I appreciate your being here today.

Senator Inhofe.

**OPENING STATEMENT OF HON. JAMES M. INHOFE, U.S.  
SENATOR FROM THE STATE OF OKLAHOMA**

Senator INHOFE. Thank you, Mr. Chairman. I am pleased to be with you here today in welcoming our witnesses. It is always a pleasure to hear from the Federal Highway Administrator, Mary Peters. We are very fortunate to have an Administrator at the Federal Highways that understands some of the problems that the States have.

Mary's background in the State of Arizona, which is not very unlike Oklahoma in some of the local problems that we have, puts you in a position, I think, to really understand these things very well.

And it is nice to have Ms. McLean here. We served together over on the House Public Works and Transportation Committee in a few different capacities, and I am sure it is going to work out really well.

I am anxious to hear from Thomas Stephens, Director of the Department of Transportation in the chairman's home of the State of Nevada. Again, I believe we can never hear too much from the State officials to show how some of the things we are doing might or might not be working at the State level.

It is always good to hear from Bill Fay. His group, the Highway User's Alliance, will play an important role in reauthorization.

Finally, I had hoped to be welcoming my friend and fellow Oklahoman, Jim Duit, to testify on behalf of the American Road and Transportation Builders Association. Unfortunately, Jim Duit—his company had a fire which virtually burned down everything that he had there. This was on Saturday evening. I did call him up and talk to him. So obviously, he could not join us today.

However, I do have the oral statement that he had planned on making. I would ask unanimous consent to submit it for the record, and at the same time, unanimous consent to have the written statement of Ken Wert, who is President of Haskill/Lemon Construction in Oklahoma City, made a part of the record, Mr. Chairman.

Senator REID. Both requests are granted.

Senator INHOFE. Thank you, Mr. Chairman.

We are fortunate that Mr. Tom Hill, Chief Executive for Oldcastle Materials, Inc., could join us today to present the industry's perspective on the proposed 2003 budget. I appreciate your re-arranging the schedule on such short notice, and look forward to hearing your testimony, today.

Thank you, Mr. Chairman.

Senator REID. We are joined today by the chairman of the Senate Finance Committee, Senator Max Baucus, who as most everyone knows, has been the ranking member and the chairman of this committee in the past.

We are expecting great things out of the Finance Committee to help us through the problems that we have with this bill, Mr. Chairman. Welcome to our committee, today.

**OPENING STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR  
FROM THE STATE OF MONTANA**

Senator BAUCUS. Thank you very much, Mr. Chairman. I was afraid you were going to mention something about helping with the whole budget that we are facing.

Administrator Peters, we are very happy to have you here. We had scheduled a meeting some time ago, but unfortunately, this country's greatest tragedy on our soil happened that day, and our meeting was canceled.

I want to just emphasize to you something which you already know; but I think it is important to reiterate: how important this program, the Highway Program, TEA-21, is to us all. It is the life blood of our country.

Certainly, in my State of Montana, you know, we are not a sea-port State, we are not a barge State. We do not have large international airports. We just have a lot of space, but not a lot of people. We depend almost totally on our roads and highways.

We have more Federal highways, per capita, than any other State in the Nation. That includes Alaska. That includes Wyoming, and every other State. We have more Federal miles of roads, per capita, than any other State. It is everything to us.

In many respects, too, it is our economic development program. As I walked in, I heard my good friend from Oregon talking about unemployment rates in the State of Oregon. We, in Montana, have the Nation's lowest, or second to lowest, per capita income rates. We are 50th or 49th.

So in many respects, the Highway Program is our jobs program. It is our economic development program. These are obviously great paying jobs, compared with some other jobs that we have in our country.

So I just cannot emphasize too much the importance of a very strong highway program. That includes the various components; you know, the bikeways and the various provisions which allow States, and correctly, to make their own determinations in towns and municipalities and so forth. But it is just critical that the program be strong.

Second, I understand that RABA, which is a bit of a question before us, is not a question at all to members of this committee. We

need to have at least the four and-a-half, or whatever the figure comes out to, restored.

Now I know Administrations will say, "In our budget request to the Congress, we just followed the law." Well, all Administrations submit budget requests that are sometimes inconsistent with the law, and that is their prerogative. Presidents make budget requests and sometimes conditions change. So they make requests which are, if not inconsistent with the law, at least Administrations have lots of flexibility.

So that is not an excuse in this case. Every member of this committee is a co-sponsor of that bill, which I frankly think it should be a full nine. That is, the RABA went up for a year, and then it came down. There was a net difference of about \$9 billion. Because if we restore the RABA loss for the most recent year, then the problem is, that is going to still mean lots of jobs lost; that is, jobs that are dependent upon the higher level that was provided for under RABA in the previous year. It is going to be job loss. Even with the restoration of roughly \$4.5 billion, it is still going to be job loss.

I think it should be \$9 billion. But most members of this committee, I think, have a contrary view. But the contrary view is still definitely an increase. I think we should just agree that we are going to do the increase, and just get on with it; because Congress will pass that increase. There is no doubt about that, in my judgment.

Also, while we are here, I want to just reemphasize the need for meaningful environmental streamlining. We have been wrapped around the axil on this issue for a long time, years, with no sufficient progress. The last Federal Highway Administrator, or maybe not quite the last, and I am not sure exactly when, submitted major streamlining to this Congress. They were steps backward; not forwards, but backward.

It was so frustrating to us, that I am thinking of the Highway Administration telling the Administration what the environmental streamlining is, in legislation. It was such an insult, the last steps backward. I just urge you very strongly, to appropriately and solidly figure out ways to get this done more quickly.

I might say, in one small respect, it is getting more fish and wildlife personnel in the States, so we can get ahead of the curve with these projects. If you can get ahead of the curve, you can design around environmental problems in advance.

But mostly, I am just urging you to streamline and just do it, so we are not wrestling with this issue anymore. It might take you a year. I do not know how long it is going to take you, but I urge you very strongly just to get on with it. I know you have a good background. I also want you to know that we, on the committee, will work very closely with you.

One final point, in the Finance Committee, we are going to be looking for ways to increase dollars into the Trust Fund. One is to take those few cents that go to the General Fund, ethanol provisions, and put those 2.5 cents into the Trust Fund. That is one idea I have, and I have got a couple of other ideas, to make sure that the Trust Fund is larger, to enforce the firewalls, to make sure the

dollars are spent on highway projects; because it is one program that Americans depend very much on.

You will work well with this committee, because you will find a lot of support on this committee for an even stronger TEA-21.

Thank you, Mr. Chairman.

[The prepared statement of Senator Baucus follows:]

STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR FROM THE STATE OF MONTANA

I am pleased that for the first time before the Transportation Subcommittee, since her nomination hearing, we will be hearing from our newest Federal Highway Administrator Mary Peters. Welcome Mrs. Peters, I look forward to your testimony and the testimony of the others.

I'd like to start off this morning by mentioning how much TEA-21 has helped our Nation address our infrastructure needs and our employment needs. This is especially true in my State of Montana. TEA-21 has been a crucial tool for us. The bill is not perfect, but it's a very good bill that an overwhelming majority agreed upon, at the end of the day. Along with Senators John Chafee and John Warner and others, I was directly involved in drafting TEA-21 in the Senate. I am proud of that work and I look forward to working closely with the leadership of this committee on the next bill.

My concern here today is held I'm sure, by all the committee members—the short-fall in highway funding for fiscal year 03. This is unacceptable. This country cannot afford a 27 percent decrease in highway funding.

For the past 6 months Congress has been discussing the best ways to stimulate the economy. Even though we are no longer working on an economic stimulus bill, we face a real crisis that will negatively affect our economy. We face unprecedented losses to our highway program. Every State will lose money.

If we want to create true stimulus and maintain jobs for our citizens then there is an easy solution. Highways. For every \$1 billion that goes into the highway program, 42,000 jobs are created. In an attempt to address unemployment concerns and immediate stimulus to the country's economy, I, along with others on the Environment and Public Works Committee, have introduced S. 1917. This bill would restore the authorized levels for fiscal year 2003. It doesn't get us all the way there, but it's a start.

This is about jobs. Skilled and unskilled jobs in highway construction are well-paid. These jobs provide employment opportunities for workers who have lost manufacturing jobs, with minimal training requirements. In addition, we need to ensure that current jobs will not be lost in many of the supplier and heavy equipment manufacturing industries. Without at least restoring TEA-21 levels, over 360,000 jobs will be lost.

For my State of Montana that means a \$71 million loss to our highway program. And in Montana, Highways are our lifeblood. We need the highways and we need the jobs created from new highway funding. Also, we can't afford to lose any highway-related jobs because of this under funding.

There is \$20.5 billion in the Highway Trust Fund. We can afford at least the \$4.369 billion from that balance to be distributed over the next year. We could afford more. In fact, we can't afford not to.

This extra \$4.369 billion only begins to take care of this huge problem that we face. I would like to see even more of an increase to the fiscal year 03 level.

Considering the President's focus on jobs in his 'State of the Union' address, I am dismayed that the President's budget did not take these concerns into consideration and propose these changes.

I am hopeful, however that given the State of the economy and our need for highway investment and jobs, he will support at least the fiscal year 03 authorized level if not more.

Given our limited highway resources, it is my intention as chairman of the Senate Finance Committee to take measures to increase the money in the Highway Trust Fund. I will be looking at the effect that the ethanol subsidy has on the Highway Trust Fund and also at Highway Fuel Tax Evasion. I am committed to the use of ethanol-blended fuels, but I am insistent that the Highway Trust Fund be held harmless to any costs. Resources are too scarce to tolerate losses.

Additionally, I will be working with the leadership of this committee to explore innovative ways to fund highway projects to supplement the Highway Trust Fund dollars.

The next issue I'd like to speak about is environmental streamlining. To your credit, Administrator Peters, you have made repeated statements regarding the

need to streamline the process by which environmental approvals are obtained to construct new transportation projects. Before you were nominated for this position, you were a strong advocate for streamlining the planning and environmental processes. It is my hope that your zealotness continues and you remain active on this front.

At present, the process for allowing highway projects to move forward is painfully long. The rule that was issued 2 years ago clearly missed the mark. It is my hope that you will go back to the drawing board, as they say, and issue a regulation that will help States expedite the project approval process without and I emphasize without weakening environmental protections.

Thank you for the time Mr. Chairman. I look forward to today's testimony.

Senator REID. I would say this, Senator Baucus. Having traveled the State of Montana mostly by air, I can imagine the vastness of that State, and how there would never be an end to the need of roads through that massive State.

Senator BAUCUS. Well, that is right, Mr. Chairman. That is one reason that for a long time, we did not have a highway speed limit, because we value our roads very much.

[Laughter.]

Senator REID. Well, we, in Nevada, had the same situation.

Senator BAUCUS. I know that. I remember going to school, I would drive through Nevada.

Senator REID. I bet it felt like home.

Senator BAUCUS. It felt just like home. I had a VW bug, and a friend had a VW bug, you know, and we would just put the pedal to the metal. We would go flat out, and we would see who could pass whom, streaming through Nevada.

Senator REID. Well, do not be admitting that, though.

[Laughter.]

Senator REID. And we go from Montana, and do they still need highways in Rhode Island, Senator Chafee?

[Laughter.]

Senator REID. We will be happy to hear your statement.

Senator CHAFEE. Route 95 comes right through Rhode Island.

And when you have the pedal to the metal in a Volkswagen, Senator Baucus, what are you at, 55/60?

[Laughter.]

Senator BAUCUS. Well, it depends on whether you are going uphill or downhill. Downhill is a lot faster than uphill.

[Laughter.]

**OPENING STATEMENT OF HON. LINCOLN CHAFEE, U.S.  
SENATOR FROM THE STATE OF RHODE ISLAND**

Senator CHAFEE. I just look forward to the statements of those giving the testimony today. It is a difficult budget year, and we want to make sure that we make good, responsible decisions, and at the same time, keep our highways and our employees, as Senator Baucus said, working; which is, of course, always the best stimulus that you can have for the economy.

I look forward to your testimony.

Senator REID. Thank you very much, Senator Chafee.

The witnesses today have been advised that we would like to hear from you for 5 minutes. What you cannot cover in that 5 minutes, we will make part of the record. Our staffs will pour over that, and bring to our attention what we did not bring out in the

hearing. Following your testimony, members of the committee will ask you questions.

Administrator Peters.

**STATEMENT OF HON. MARY E. PETERS, FEDERAL HIGHWAY ADMINISTRATOR, U.S. DEPARTMENT OF TRANSPORTATION; ACCOMPANIED BY: HON. DONNA MC LEAN, ASSISTANT SECRETARY FOR BUDGET AND PROGRAMS, U.S. DEPARTMENT OF TRANSPORTATION**

Ms. PETERS. Thank you, Mr. Chairman.

Mr. Chairman, I do appreciate your holding this hearing today on this very important topic. I also appreciate your consideration during my confirmation, and my pleased to testify before you today for the first time as Administrator of the Federal Highway Administration.

It is an honor, also, to be here today with the Assistant Secretary for Budget and Programs and the Chief Financial Officer of U.S. DOT, Donna McLean. With your permission, we will submit a joint written statement for the hearing record, as you indicated.

Our highways, as each of you have spoken to, are critical links in our Nation's multi-modal surface transportation system. The challenge is to maintain our high quality network, while increasing safety, improving mobility, and promoting environmentally responsible project decisions and, of course, efficient program delivery, as well.

Of course, our ability to accomplish these objectives is related to the adequacy and availability of transportation funding. TEA-21 provided a mechanism for ensuring the revenues into the Highway Trust Fund are spent, and that the funding level for the Highway Program is aligned with Trust Fund receipts.

Over the past 3 years, revenue-aligned budget authority has provided more than \$9 billion in additional highway spending, funding that is now working in our economy.

Due to the recent economic slow-down and current projections of future Highway Trust Fund receipts, a downward adjustment of the Highway Program occurred when the highway spending was aligned with revenues in the Highway Trust Fund for 2003. The calculation, as was mentioned, is not a policy call. It is a calculation based in law and reflected in the budget.

The \$24.1 billion funding level for highways proposed in the President's 2003 budget reflects the funding level enacted in TEA-21, as adjusted for the latest Highway Trust Fund revenue figures.

As we approach reauthorization, we need to look for ways to smooth out the current positive and negative swings that result from this adjustment. However, we should not abandon the adjustment concept.

Linking highway spending to receipts is a fundamental principle of TEA-21. Even with the negative calculation in 2003, over the life of TEA-21, RABA adjustments will provide a net gain of \$4.7 billion in highway spending.

The 2003 reduction can serve as a wake-up call for all of us. Current trends in fuel use, as well as technological advances, including the new fuel cell technology, will require us to consider new sources of revenue and leveraged funding, if we are going to have sufficient

funds for our highway system in the future. Reauthorization will give us the opportunity to consider these important factors.

The FHWA budget emphasizes four priority areas: safety, mobility, environmental stewardship and streamlining, and oversight. Safety remains our first priority and our greatest challenge, and we will work aggressively to improve the safety record on our Nation's highways.

We also can improve the operation of the system. We have made significant progress in the deployment of intelligent transportation systems (ITS), but need to complete that deployment in both urban and rural areas.

The 2003 budget provides almost \$360 million for research and technology funding that will support innovations in safety, system preservation, and congestion mitigation, including expanded deployment of ITS. Continued progress in streamlining the delivery of transportation improvements will also improve safety and congestion.

We must, at the same time, remain respectful stewards of the environment. However, meeting our Nation's mobility needs and environmental stewardship are not mutually exclusive goals.

I am happy to report that the median time it takes to complete an environmental impact statement and get to a record of decision has been cut by an entire year. While it is an excellent start, we are committed to accomplishing much, much more. The budget proposes \$6 million in additional funding for streamlining efforts.

We will continue to improve Federal oversight and accountability to ensure, as Secretary Mineta has said, that the public gets what it pays for.

We owe a good return on investment to the public for transportation funds that they entrust us with, and I like to call this the public value, in place of dividends.

We must keep our infrastructure secure, and we must strengthen our commitment to reducing highway injuries and fatalities, even as we obtain additional capacity from the system. Working together, we can provide the American people with a safe, efficient, affordable, and accessible transportation system.

Mr. Chairman and members of the committee, I thank you for the opportunity to make a brief opening statement. On behalf of Assistant Secretary McLean and myself, we will be pleased to answer any questions that you may have.

Senator REID. Madam Secretary, we will follow the same rule that we ask our witnesses to follow. Each member will get 5 minutes. Thereafter, if there is still a need for more questions, we will do a second round.

I was happy to hear in your statement, that it appears that you are willing to work with us to try to come up with some additional funding, recognizing that there are some new things happening out there to cut back on highway funds, in addition to the September 11th incident. Is that right?

Ms. PETERS. Mr. Chairman, that is correct. While the President's budget did follow the law, we certainly are willing to work with you. We are aware of the bill that has been proposed, and will be pleased to analyze that and provide any technical assistance we can.

Senator REID. You can imagine in Arizona, what would happen if they had a 27 percent cut in their Highway Construction Fund. It would cause a lot of problems, would it not?

Ms. PETERS. Mr. Chairman, it certainly would.

One of the things that I think is important for us to remember, Mr. Chairman, while as you said, a 27 percent reduction is important, this funding will not stop immediately. We believe that capital outlay will be down around 3 percent per year, based on the relatively slow spend-out. So we do have some time to look at this important topic, and take care to do it right.

Senator REID. Well, the problem is, it establishes a baseline that will make it almost impossible to work with. We have to have, for next year, a different baseline than the one that you have given us. Otherwise, programs are drastically affected in the so-called out years.

What initiatives has the Federal Highway Administration taken in regard to the security of our highway and bridge infrastructure since September 11th?

Ms. PETERS. Mr. Chairman, we have been actively working on security on our bridges and our infrastructure, across the entire system, and not just in aviation.

Senator REID. By doing what, though?

Ms. PETERS. In the days immediately following September 11, Secretary Mineta established within the Department of Transportation, a National Infrastructure Security Committee (NISC). We have undertaken a number of efforts related to security. I will pull a few notes here.

This is what we have done to date, in terms of surface transportation. We have assessed and addressed potential threats to the highway system. It is a challenge, given the openness of the system. We are looking at the redundant capacity, making sure that we have identified alternative routes and alternative modes of transportation.

We have worked with the States and local governments to identify high consequence, high value, high vulnerability facilities; and assisted in conducting vulnerability assessments, sharing best practices across the country. We are scheduling regional emergency management workshops to ensure that areas are prepared for evacuations, quarantines, and restoration of operations, should that become necessary.

We are performing cases studies on the transportation response to the September 11th incidents in both the Washington, D.C. area and New York, as well as the Howard Street tunnel fire in Baltimore and the Northridge earthquake in California. We have prepared an emergency preparedness checklist for State and local governments, and are assisting them in emergency planning and operations.

Further, we have just recently announced an ITS solicitation for projects that will be focused on improving security, using technology. A freight technology exposition is scheduled for April 27th, and we have under way ITS operations tests for security. Three are in progress and two more will be conducted. A national conference on incident and emergency management will be conducted in Irvine, California, March 11th through 13th.

We have assisted State and local governments in conducting tabletop exercises, such as what was done in the Ft. Worth area. We are working closely with the American Association for State High-

way Officials (AASHTO) task force on transportation security. Secretary Mineta has asked us, and we are all working closely together with NISC, to focus on intermodal security issues, and to coordinate U.S. DOT's security focus across all modes. NISC is also working very closely with the Office of Homeland Security.

Senator REID. There are concerns being raised about both the accuracy of Treasury's fiscal year Highway Trust Fund revenue figure, that is 2001, and the reasonableness of Treasury's future revenue projections. It appears to some of us that Treasury has based future revenue projections on fiscal year 2001 revenues, which may represent a low point, due to the recession.

Has your office taken a look at Treasury's numbers, and are you comfortable with the 2001 figures being accurate, and that future year projections are not under-estimated?

Ms. McLEAN. If I could take that one, sir, yes, we have looked at them. Treasury, actually, when they estimate future receipts, uses the same assumptions that are in the rest of the President's budget. So there are no unique estimates made just for the Highway Trust Fund beyond the obvious, the taxes. But those are based on assumptions on the economy's growth, which is the same for the rest of the President's budget.

So we believe that they are accurate, and we have walked through them with Treasury. I am sure that Treasury can go into more detail on that, if you would like to.

Senator REID. The 27 percent funding cut in your budget for 2003 will have a substantial impact on State programs. Has the Federal Highway Administration made any effort to assist the impact on State programs for the year 2003?

Ms. PETERS. Mr. Chairman, we have calculated the numbers and provided to each State what we believe will be the projected reductions in their program, as a result of the calculations.

Senator REID. I understand the dollar amounts, but the impact of what it will do to the highway and transportation systems in those States, have you taken a look at that?

Ms. PETERS. We have done some initial assessments, sir, and we are working with AASHTO to try determine whether there would be more significant impacts.

As a former State transportation official, as you and several other members of the committee have mentioned, I do understand what those impacts can be. I understand where I would be, had I been in the job that I was in just a year ago, and looking at those impacts. It is not good news. I will not attempt to whitewash that in any way. It is not good news at all.

There are some tools that the States can use, and we will help them in looking at those tools, to determine whether or not they can smooth out of the effects of this reduction in funding.

One of the tools is that this year, we have a positive RABA, a positive \$4.5 billion RABA. Next year, of course, RABA will be negative, based on the current projections. We will be able to smooth that out, using tools such as advanced construction and other methods of financing.

It is accurate that this does not bring more money to the table, but those are some of the methods that we have looked at in terms of being able to smooth this out over the period.

Senator REID. Senator Inhofe?

Senator INHOFE. Thank you, Mr. Chairman.

Madam Administrator, I know you are in an awkward situation with this budget and coming before us. You are facing a committee that is pretty much unanimous on a bipartisan basis, in feeling that this budget is not adequate.

For that reason, I believe every member of this committee, Democrat and Republican, have co-sponsored S. 1917, as well as almost all of them over on the House side.

I agree with Senator Baucus. I have served for 15 years on this committee, with eight of those years in the House. I can remember many Administrations coming forth with a budget that really was not adequate, and changes can be made.

Now in your statement, and I am quoting now, you say that the budget "honors the highway category guarantees in TEA-21." I think there is some disagreement on this point.

I would just like to ask you the question, does the Administration have a position on S. 1917, and do you believe that the Highway Trust Fund could accommodate the provisions of S. 1917? Maybe that would be Ms. McLean on the latter question.

Ms. PETERS. Mr. Chairman, in terms of taking a position on the proposed legislation, we have not yet taken a position on the legislation. But as I indicated earlier, we would be happy to look at that, and to work with you, in terms of doing a technical review. I will defer to the Assistant Secretary for the second question.

Ms. MCLEAN. I believe the bill would allow funding up to \$27.5 billion at the TEA-21 estimated level. Is that correct?

Senator INHOFE. And I might add that a lot of the people out there do not feel that S. 1917 is adequate. They would like to have a freeze of the 2002, which would be about \$4 billion more, I believe, than S. 1917 would provide for.

Ms. MCLEAN. I can answer both of those pieces.

Senator INHOFE. Yes.

Ms. MCLEAN. We believe that looking at the Trust Fund balance right now, that it can accommodate the \$27.5 billion, basically the original TEA-21 funding level.

But once you get above an obligation limitation level in 2003, above the \$30 billion and the \$31 billion range, the Trust Fund would not be able to support that level of obligation limitation in the out years. In the first couple of years, it would be able to, but in the out years, it would begin running a deficit.

Senator INHOFE. Do you feel that that is pretty conclusive in your thinking, when we have already experienced that we really cannot predict into the future what that is going to be? I can remember 3 years ago, when RABA first appeared, I thought, one of these days, this is going to happen; and, of course, it has happened. Anyway, that is something that you can take a look at. Real quickly, I have heard the statement that for every \$1 billion in transportation construction funding, it creates about 42,000 jobs. Does that sound unreasonable to either one of you?

Ms. PETERS. Mr. Chairman, it does not sound unreasonable. I do not have the basis for the number, but it does not sound unreasonable.

Senator INHOFE. Yes, well, I would think, as a former State administrator, you probably have seen the effect it could have. I would only ask that you keep that in mind,

Right now, we are doing everything we can for a stimulus package. I honestly cannot think of anything that would do more to stimulate the economy than to provide the jobs that will come with increased funding and construction.

I would ask you if that was one of the considerations that you made during your negotiations with the White House in coming up with this budget, and if it something that you should be looking at.

Ms. MCLEAN. The decision was made to follow the TEA-21 legislation, because we just did not believe that abandoning the concept of linking highway spending to receipts the fundamental concept and principle of TEA-21 was the position to take at this time.

We did consider, however, the fact that additional spending in highways is linked to jobs. But at the same time as Ms. Peters pointed out previously, the reduction in outlays for the first year is a reduction of less than 3 percent.

We believed that that was something that could be managed, balancing the fact that there was increase in funding in 2002 above anticipated levels.

Senator INHOFE. I have always felt very strongly about a very robust highway program. You know, back when Republicans were important, I chaired this committee. I have not changed my thinking since that time.

I have one last question, and my time has expired. Let me just ask one question, and they can answer it for the record, if they do not have a position on it.

Does the Administration have a position on a proposed change in the tax treatment of gasohol, with some of the things that are being discussed right now?

Ms. PETERS. Mr. Chairman, the Administration has not yet taken a position on that. We are reviewing several proposals, including that of Senator Baucus, with regard to the 2.5 cents, but have not yet taken a position.

Senator INHOFE. Thank you very much.

Thank you, Mr. Chairman.

Senator BAUCUS. Do you have any idea when you might take a position?

Ms. PETERS. I will defer to the Assistant Secretary for that one. [Laughter.]

Ms. MCLEAN. I do not have a timetable for you, sir, but I can get back to you.

Senator BAUCUS. I mean, the earlier the better, so we know where we all are.

Ms. MCLEAN. Sure, I understand.

Senator BAUCUS. Second, on the Treasury's estimates, could you just tell me how deeply you or your staff examined the assumptions and the data with Treasury.

Ms. MCLEAN. Well, we have looked at their estimates. They are all based on, as I have mentioned, the President's economic assumptions. But there is a level of detail that Treasury deals with on their own. They do not provide all of the details of their estimates, and that has been a policy that Treasury has had for years.

We can, again, provide you some additional information from Treasury on that. But, again, the estimates are based on the same assumptions that the President uses in the rest of the budget.

Senator BAUCUS. Have you asked Treasury for more details, and have they refused to give them, because of long-standing policy? I am just trying to determine this here.

Ms. MCLEAN. No, they have been very cooperative in sharing their estimates with us. We understand that the reduction in actuals for 2001 are based on primarily three phenomena: a reduction in the overall economy, a reduction in receipts from the retail tax on trucks, and increased substitution of gasohol for gasoline. So we are very aware of the differences in the look-back calculation.

Senator BAUCUS. Do you know whether Treasury uses only the estimates at the beginning of the year, or whether they are updated, as the economy changes?

I ask that question because, regrettably, there is a quiet disparity between OMB and CBO, with respect to tax matters, to the Joint Tax Committee. That is, whenever we, in the Congress, particularly near the end of the year, when generally tax legislation comes to the Floor, are asking the Joint Tax Committee for estimates. Of course, they look at the economy and look at lots of other facts.

But by tradition, they use the economic estimates made at the beginning of the year, in January. They do not update them; why, because OMB does not. So all this data is really dated. I am curious whether you know, in doing your RABA estimates, like I said, the January Administration estimates, or whether they are ever updated to more accurately reflect the state of the economy.

Ms. MCLEAN. The TEA-21 legislation requires that the adjustment for the revenue aligned budget authority and the other adjustments to the obligation limitations are done at the time of the President's budget release. So the law dictates that it is done at that time.

Senator BAUCUS. That is a legal requirement?

Ms. MCLEAN. Well, it specifically says in law that in the President's budget, the President shall submit these adjustments.

Senator BAUCUS. Well, there is another adjustment. I hope it does not reflect the Trust Fund balance. That is very interesting. There must be some meaning in that. I do not know what it is.

[Laughter.]

Senator BAUCUS. I urge all of us to go back and see if we are using the right criteria. I urge FHA, DOT, and all of us who are interested in this subject to do so. Perhaps we are not using the right criteria in making these estimates. For example, there may be some specific highway criteria that we are just not using, and should.

I have no further questions, Mr. Chairman, except to state that I urge the Administration to work very strongly for, as Senator Inhofe stated, a robust highway program.

Senator REID. Mr. Chairman, if they go back and find that is the correct, what were the words you used, "program numbers"?

Senator BAUCUS. Oh, the numbers.

Senator REID. Well, my point is, if they find that those are the right numbers, they should find some different ones, because we need to do something.

I would ask unanimous consent, if the committee has no objection, that statements by the Department of Treasury and the General Accounting Office be made a part of the record.

Without objection, so ordered.

Senator REID. Senator Wyden?

Senator WYDEN. Thank you, Mr. Chairman.

I want to go over the question of the implication of the cuts, Ms. Peters, because I am still not clear, in terms of your view on this.

What I am hearing from State transportation officials in my State, and I think this is true across the country, is that these cuts are going to mean significant delays for many urgently needed transportation projects. Do you disagree with that assessment?

Ms. PETERS. Mr. Chairman, Senator Wyden, no, I do not disagree that there will be delays. What I was saying, and perhaps I could and should clarify for the record, is that transportation construction projects that are underway today likely will not be delayed, because States will be able to use the higher level of RABA during the current year, and smooth that out over time.

Perhaps it would be best if I would frame it, if I were still a State administrator, would I cut existing transportation projects, those that are being built today? The answer to that would be no; that we would be able to work out funding for those projects.

In terms of the future program, the Highway Program does spend out at a slower pace than do many other programs. For example, capital outlay, on average, 27 percent of a project will spend out in the first year; approximately 41 percent the second year; 16 percent the third year; and 10 percent the following year.

Because States, and especially a State like Oregon, have a number of transportation projects ongoing at any given time, then you average that outlay over a period of time. So what I am saying is, I do not see any immediate transportation projects being stopped, or layoffs as a result of that.

However, you are correct, sir, in terms of the long-term program. People would generally take a 5-year program and perhaps spread that out over a longer period of time, given the projected downturn in revenue. So it will have an effect, but what I am saying is, it will be more of a delayed effect than an immediate effect.

Senator WYDEN. Could you provide me and other members of the committee your independent assessment of how you reached that judgment, because that is not in line with that I am hearing in Oregon, and I do not think it is in line with what the Congress is hearing.

If you think that somehow there can be some budgetary slight of hand, I would like to see your assessment, as to how you are going to limit the damage here, because it is not a view that I share. Could you provide that to us?

Ms. PETERS. Mr. Chairman, Senator Wyden, we would be happy to do that.

Senator WYDEN. Let me ask a question of your colleague, as well. Were you asked by the Administration about the consequences of these budget cuts? It seems to me that it runs completely contrary

to what the President said at the State of the Union Address. I am just wondering if you or anybody else in the Administration was asked about the consequences of cuts of these magnitude.

Ms. MCLEAN. We did discuss the details surrounding a funding level for highways at the amount proposed in the President's budget. It was a concern of the Administration.

The decision was made, again, not to abandon the concept of TEA-21, which is to have highway tax receipts reflected in the level of highway spending. Again, we believe that RABA has provided a total benefit of \$4.7 billion to highway spending, and that was something that we did support.

Senator WYDEN. But you made the judgment that this could cost jobs and that this would have regrettable economic consequences, and you went ahead anyway for the reasons that you described.

Ms. MCLEAN. Well, as you probably are aware, in TEA-21, any additional funding beyond what was proposed in the President's budget, because the President's budget complies with the current law, would be spending above and beyond what is allowed in the firewalls. Such spending would essentially either increase either the deficit, or would have to be balanced by reductions in spending in other domestic discretionary programs.

As the President also stated in his State of the Union Address, we have several priorities in the President's budget, including fighting the current war, and balancing those priorities are difficult choices.

Senator WYDEN. Let me ask one last question for you, Ms. Peters. In the last TEA-21, Senator Graham and I, under the leadership of then Chairman Baucus, worked on this streamlining issue. The history of how it has been implemented is certainly very different than the three of us envisioned.

We saw that the whole idea was to ensure that environmental requirements would move forward concurrently with the project development requirements; that you put the two of them on the same track. We are now 3 years plus into this, and it just seems like we are still moving backward.

Why is it so difficult to take a concept that Senator Graham and Senator Baucus and I thought was pretty straight forward—environmental track, project track, work together—why is it so difficult to get this implemented?

Ms. PETERS. Mr. Chairman, Senator Wyden, I share your frustration. In fact, I spent some time before Congress in my prior role, talking about environmental streamlining and how important it is. I do share your concerns.

In trying to process things concurrently, what I have found in the short time that I have been with the Federal Highway Administration is that there are as many reasons as there are projects out there.

But to summarize some of those reasons, the U.S. Department of Transportation, while it was tasked with environmental streamlining, does not have authority over a number of other environmental regulatory areas.

I believe, however, there are ways we can work through that. Certainly, the Secretary feels that we can work through that by working more closely with the other environmental resource agen-

cies and finding a way, as you indicated, to more concurrently process requests for project approval, rather than having them be sequentially processed and then have to loop back.

Further, we believe there are ways to allocate resources, as was mentioned earlier, to the U.S. Fish & Wildlife Service and other resource agencies, so that they can more timely move those process approvals forward.

We believe that states can process a number of environmental approvals. We believe that we ought to be able to delegate authority to the states to do a number of them, most specifically, categorical exclusions; so again, we can move the process much more quickly.

I believe, and the Secretary believes, that there are ways that we can, within the existing law, substantially decrease the time that it takes to get environmental approvals without compromising the environment, and we are very committed to doing so.

Senator WYDEN. Thank you, Mr. Chairman.

Senator REID. The chairman of the full committee, Senator Jeffords, has arrived. He has indicated he will not give a full statement.

I will call on Senator Chafee now for his questions.

Senator CHAFEE. Thank you very much, Senator Reid.

I believe, Ms. McLean, you mentioned several contributors to the fall-off in revenue to the Highway Trust Fund. From a chart I have here, it looks like the retail tax on trucks is the biggest culprit. Could you just describe what that tax is, and why it fell off so much? It is \$2 billion, from this write-up.

Ms. MCLEAN. Yes, it is a 12 percent tax on purchases of new heavy trucks, trailers, and similar pieces of equipment. Obviously, when the economy is good, companies are making large investments in capital in their businesses.

That is basically what was happening in 2000. In 2001, however, those sales declined, and as a result, our tax revenues into the Highway Trust Fund declined. If these pieces of equipment are resold, there is no tax that is deposited in the Trust Fund.

Senator CHAFEE. And is this up-to-date? If it is 2001, is it right through December, all those zero percent deals? At least in Rhode Island, my dealers are telling me, they had some of their best years ever, with some of the incentives that were offered.

So it is just such a surprisingly low number, from the previous year. I was just wondering as to the accuracy of it. Is it up-to-date, all through December?

Ms. MCLEAN. The figures are for the Federal fiscal year, ending in September.

Ms. PETERS. Mr. Chairman and Senator Chafee, our understanding in talking with Treasury is that it is. Apparently, there was quite a peak in the sale of new trucks in the 1998/1999 time-frame. Then, because the economy has cooled in more recent years, dealers, instead of buying new trucks, are keeping the trucks they have.

One of the things that the trucking industry, in my experience as a State administrator, was able to do, in lean times, is put the trucks idle for awhile, and not have to purchase new trucks or not

run those trucks. The variable cost component of their industry is rather large, so they have the ability to do that.

Initially, at least reading through with the Treasury, as we were aware of it, it appears that that indicator is now moving up. I believe that the last factor that I would mention is that, of course, the last quarter, the fourth quarter revenue figures, I believe, are not based on actuals, but on projected from the third quarter.

Ms. MCLEAN. Simply because those estimates are made right before the President's budget is released, which is right at the beginning of the year, those estimates just have not come up.

Senator CHAFEE. So theoretically, that number could change.

Ms. MCLEAN. It could. But once again, if you go back to the TEA-21 language, the adjustment that is made for both the obligation limitation and the revenue aligned budget authority, those are required to be made at the time the President's budget is released. So those new figures could come in, but TEA-21 requires that adjustment to be made at the time of the release of the President's budget.

Senator CHAFEE. OK, and last, what is the answer? You mentioned RABA is going to look better in the future in the next year, and hopefully you would work with us to maybe just smooth out some of the rough spots here, and the differences between the years. Maybe you could just expand on that, and how you can work with us to do that.

Ms. PETERS. Mr. Chairman, Senator Chafee, I would be glad to talk with you a little bit about that. We are looking at two concepts. One is the calculation of RABA, per se, and is there a way to perhaps smooth out the peaks and valleys?

The unfortunate circumstance that resulted in the number that we are looking at today is a double negative, if you will. In the look-back, as it was calculated, there were overly optimistic projections for 2001, based a few years back. Then when we calibrated those to what the actual receipts in 2001 were, that was a negative. The look forward was negative as well.

The look-forward, however, is not as negative, if that is not a redundant term, to say it is not as negative going forward. But nonetheless, it was not a positive number either. So the combination of the look-back, which was a negative \$3.5 billion, and the look-forward, which was a negative \$0.9 billion, resulted in what we have today.

I believe, and we have discussed this somewhat within the Department, and certainly the Secretary mentioned it in his testimony before this committee earlier, that there may be ways to smooth out the peaks and valleys, by looking at the method with which we calculate RABA.

But, as the Assistant Secretary said, and we do feel very strongly, that tying spending to receipts is an important concept to continue with in the future. So perhaps we can work with the way the formula is calculated, to smooth out those peak-and-valley effects in the future.

Senator REID. Chairman Jeffords is here. Chairman Jeffords is, I am sure, feeling good today. The first gold medal in the Winter Olympics was won by a person from Vermont. Her name was Clark, as I recall.

Senator BAUCUS. Kelly.

Senator REID. Was the last name Kelly?

Senator BAUCUS. The first name.

Senator REID. Yes, I thought Clark was right. But anyway, she is a real daredevil on that snowboard. She better be careful.

[Laughter.]

Senator JEFFORDS. It was not unexpected.

[Laughter.]

Senator REID. Which is true.

[Laughter.]

Senator JEFFORDS. Ms. Peters, I want to commend you on the leadership you are providing in the area of environmental stewardship in the so-called streamlining. You site New Hampshire as the leader in this regard, and of course, they probably stole everything they did from Vermont.

[Laughter.]

Senator JEFFORDS. But putting that aside, I encourage you to continue to highlight best practices around the country, and to work with your colleagues in the resource agencies.

I would like to see you make as much administrative progress as possible before we legislate further on this topic. Please comment on your plans in this regard.

Ms. PETERS. Mr. Chairman, Senator Jeffords, thank you.

We have a number of efforts underway, where we believe that we can make some inroads, using the administrative means that we have available to us today.

As I mentioned earlier, one of the things that we believe has prevented us from moving forward as aggressively as we would like is the working relationship between Federal resource agencies and U.S. DOT. Accordingly, our Deputy Secretary has met with his counterparts in other resource agencies, and we want to work very closely with the Council on Environmental Quality, as well, to move forward streamlining efforts.

We believe that we can do this by raising to a high level the issues where projects do get hung up and are in dispute, and by developing a dispute resolution process to move them through much more quickly, so that we are not delayed in moving projects forward when disputes do come about.

As I mentioned earlier, we need more concurrent processing, rather than sequential processing. I have to say, one of the really frustrating things for me, as a former State Administrator, was to finally get agreement, for example, with the U.S. Fish & Wildlife Service, and then have to go to the Corps of Engineers, and get a 404 permit from them.

They would make a change, and then I would have to go back to U.S. Fish & Wildlife Service, and take the change that I had to make to get the 404 permit back to them. I felt a little like a rat in a maze sometimes.

We think that we can change some of those processes so that we still are mindful stewards of the environment, but we are not playing this constant loopback game.

Further, there are a number of projects that require categorical exclusions. These are generally projects that are not taking new right-of-way, and are not major expansions, meaning that they

would not add capacity. Improvement projects such as safety and maintenance need to be able to move forward much more expeditiously than they are today.

These, again, are areas where we believe states can be given authority, when they have a good environmental record, to move forward with projects, without having to then come to Federal officials for another layer of approval. So those are some of the methods, sir, that we think we can use to expedite the process.

One more that I would mention is working with the AASHTO Center for Environmental Excellence. We are allocating some of the money that you made available to us for environmental streamlining to get that Center started. It will collect and share best practices, and send teams out to help people work through environmental issues when they do hit a roadblock in project processing.

Senator JEFFORDS. In your written testimony, you mention that FHWA has modified its bridge performance measures. In my State of Vermont, we have many historic bridges, both covered bridges and steel truss bridges. How will the new measures impact our ability to preserve those bridges?

Ms. PETERS. Mr. Chairman, we certainly want to be sure that we are preserving historic bridges.

If I am not speaking accurately, based on what my written testimony was, I will certainly get back to you. But this is one of the factors that we came up against, and this has to do with the bridge rehabilitation fund (BRF).

If a bridge had had a rehabilitation project in the past 10 years, they were not then able to use BRF funds for future repairs or maintenance on that bridge that would extend the life of the bridge. We felt it was important not to restrict that funding, because clearly we want to extend the life of bridges.

So we wanted to make available that funding category to use on bridges, so that we could do restorative work and continue to extend the life of the bridge.

Senator JEFFORDS. Thank you, that is helpful.

Thank you, Mr. Chairman, and thank you for calling the hearing.

Senator REID. Thank you for being here.

There is one last question that I have. You may have stated this in your opening statement, or it could have been in response to Senator Baucus, who asked you a number of questions about environmental streamlining.

You said that it had been improved by 1 year. Well, if 1 year is 1 year from seven, tell us what that means. Instead of 1 year, it is what?

Ms. PETERS. Mr. Chairman, I do not have the base data with me. But the median time that it takes to complete an environmental impact statement has been reduced by 1 year.

Senator REID. But you do not know what that means?

Ms. PETERS. I believe it was from 7 years, sir, but let me get the exact data, so that I do not misspeak to you today. I believe it was from 7 years. But, as I said, it is still too long.

Senator REID. Yes, people who are waiting to have something done, to tell them that it is multiple years, and we have increased it by 1 year, that is a big help. We appreciate that, but we are going to have to do much better than that.

Based on your experience in the State of Arizona, as you explained to us, you felt like a rat in a maze. That is how people explain this to us; that they are shuffled back and forth, from the Corps of Engineers, to the EPA, plus Fish & Wildlife, and all this. It just becomes a burden that makes us all look a little bit foolish.

So I think we should really follow the admonition of Senator Baucus, and do whatever we can to streamline this. If you need legislative help, we would be happy to take a look at that.

Ms. PETERS. Mr. Chairman, I appreciate that. I certainly will work with you on that. You have my commitment.

In fact, I will say, when I spoke to the Secretary about taking the job as Federal Highway Administrator, I mentioned to him how important this was, and I will continue to focus on it.

Senator REID. Senator Inhofe, or any other Senators?

Senator BAUCUS. Yes, I have just a couple of questions, very briefly.

Ms. McLean, I just want to make sure that I heard your statement correctly; that is, when Senator Wyden asked you about whether there will be job layoffs or not.

I want you to please clarify this, because there are many, particularly in the contracting industry, who say just the contrary. That is, there will definitely be jobs laid off, if the Administration's recommended budget is adopted by the Congress. In fact, I think a panelist on the next panel, my guess is, is going to testify very much to that point. So I just want to make sure we heard straight what you said.

Ms. MCLEAN. What I said, or at least what I meant to say, was that we were looking at all the factors and all of the details surrounding proposing a funding level at the level that is in the President's budget.

We are well aware of those suggestions that the reduction in funding, or an increase in funding, results in either a loss or a gain of jobs. So that was part of the discussion.

Senator BAUCUS. So is it your analysis that the swing of roughly \$8 or \$9 billion will result in lost jobs or not? I am just curious what your analysis shows and what your testimony is.

Ms. MCLEAN. I do not have today what a number would be. What the reduction in Federal-aid highway program outlays of 1.3 percent in 2003, that would be the reduction in funding level.

Senator BAUCUS. I am just asking the simple question, are there going to be jobs lost or not, based upon the Administration's budget submission?

Ms. MCLEAN. I would say that there would be a reduction in funding for highways, which would result in the level of construction in highways. But I could not tell you the number of jobs.

Senator BAUCUS. So the answer is yes, there would be loss, but you do not know the number.

Ms. MCLEAN. I do not know the number.

Senator BAUCUS. Thank you.

I have one other question, if I might. I have just some ideas on how to get at environmental streamlining. It is my thought that because of all the boxes and the rabbits running around the maze and so forth, and it somewhat legitimate, but I do not think en-

tirely, that DOT be made the lead agency, with respect to purposes and need and scope and alternatives.

You know, all agencies can be consulted, and should be, the appropriate agencies. But you need some lead agency; somebody that can organize all this.

It is my understanding that there really is not a well defined lead agency, at this point. So one thought might be and, in fact, in the bill that I will be introducing at the appropriate time, it will include such language.

I am also wondering if it might make sense to have sort of a deadline by which an agency has got to respond, at some date. It would be something that is reasonable and make sense, but at least some date.

I mean, the world is usually run by deadlines. For a lot of people in Government, it is not. I am not being critical, but I am just making an observation.

For example, all of us run by deadlines. You know, lots of you can think of all kinds of people in their daily lives who operate by deadlines, and the businesses have deadlines. You have quarterly reports in the business sector, and you can name it. But a lot of agencies do not seem to have deadlines within which to make their recommendations, their suggestions.

It just seems to me that the agencies should have deadlines. You know, it would force them to think a little bit. Frankly, they might find something pretty creative, if they have got a deadline, so long as it is reasonable. That, too, will be in the bill. Deadlines will be included in the bill that I intend to introduce.

But if you could just think about that, when you make your recommendations to us, as we further discuss the legislation, we would deeply appreciate it. Thank you.

Ms. PETERS. Mr. Chairman and Senator Baucus, I think those are good suggestions, and we will consider those.

Senator REID. Max, I think that is a great idea, because a lot of times, these agencies are waiting around for one of the other agencies to do something.

I think that that, combined with your idea to have a time, and as you have indicated, a reasonable time, we have got to do that, because there is no pressure for them to do anything. They can wait forever on this. So I think that is a great idea.

We have been joined by Senator Graham of Florida. Do you have a statement you want to give?

Senator GRAHAM. Mr. Chairman, I do not have a statement, but I do have a few questions, if this would be appropriate.

Senator REID. We would be happy to have you ask those. This is totally appropriate.

**OPENING STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR  
FROM THE STATE OF FLORIDA**

Senator GRAHAM. Now I am going to violate what I just said, to make a brief statement.

Senator REID. It does not matter. It is counting against your 5 minutes, anyway.

[Laughter.]

Senator GRAHAM. I heard the discussion about the number of jobs affected by this. I know, as a former Governor, during a period of economic downturn in the early 1980's, we analyzed all the things that the State Government could do to try to play a positive counter-cyclical role.

We concluded that one of the most significant things to do was to accelerate our highway maintenance programs; that they were quick starting, they were heavy employment-oriented, and they left behind a better community and a stronger economic infrastructure.

So I do not know how the States and other territories that are beneficiaries of these funds are allocating it, as between new construction and maintenance. But if a significant amount of that is in maintenance, as I know it is in my State, you are talking about very large number of job losses, if you cutoff those funds. So this is a real economic, as well as a transportation, issue.

Having said that, when did the DOT first begin to suspect that the RABA calculation would result in such a large negative number?

Ms. MCLEAN. Sir, during the mid-session review, which the White House puts out around August—

Senator GRAHAM. This was August of 2001?

Ms. MCLEAN. Correct, there was a release that showed a negative, and I believe it was around, I want to say, \$1.2 billion/\$1.3 billion at that time.

Senator GRAHAM. What steps were taken in August of 2001 to alert the States that they might be facing significantly reduced funds in the next year?

Ms. MCLEAN. We did notify them, and I think Administrator Peters can respond to that, as well. But I know that AASHTO was aware, and some of the other user groups were aware at that time, that a negative RABA or a negative adjustment was something that was very possible, due to the tax revenues.

Senator GRAHAM. What steps did the States take to take that into account?

Ms. PETERS. Mr. Chairman and Senator Graham, I could not tell you specifically what steps the States took. But we did know as early as mid-summer, that RABA would likely be negative.

In fact, in early July, we were hosting a Western States Symposium of State Transportation Officials in Phoenix, Arizona, shortly before I was able to come to Washington. We were talking about the probability that RABA would be negative at that point in time. By the fall, as we began to get more data together, it was more evident and we were having discussions with various interest groups.

I do know very specifically in early December of 2001, when I had an opportunity to speak to the AASHTO organization, which is the State Highway Transportation Officials, we talked very openly about negative RABA at that point in time.

I was not party to discussions among the members about what specifically they might do. Again, I can only look back and tell you what I would have done, had I still been a State administrator. I would have been looking at trying to even out the flow between 2 years, so that I could try to keep my programs intact, and then look at the out years of the program, at perhaps extending the date of projects out into the future.

One thing that is important, that we certainly have talked about, and I have talked about with some members of AASHTO is that this is news that is not good in the short term. But, as I mentioned earlier, because of the rather slow pay-out of highway spending, we are not going to fall off the "plateau," if you will, immediately.

But we do have reauthorization coming up and, as I think the chairman mentioned earlier, we are starting reauthorization at a lower level. In looking at the overall life of reauthorization of the transportation funding act, it is very important for us to look at this and try to provide more stability in funding over the long run.

Senator GRAHAM. My time is short, and I am going to make what may be more of a statement than a question. But I understand that you talked earlier about the Intelligent Transportation System Program.

I have been very concerned that the high level of earmarking of that program had undercut its basic objective, which was to learn something about how ITS programs worked in real world applications, so we would do a better job in the future of reducing highway congestion.

Toward that end, last year, I offered an amendment, which was adopted in the Senate, and stayed essentially in fact in the final bill, which said that the following sums shall be made available for ITS system projects, that are designed to achieve the goals and purposes set forth in Section 5203 of the ITS Act of 1998.

I encourage the Department of Transportation to look at these three pages of earmarked ITS projects, and evaluate them against that standard of, are they consistent with the purposes that led to this ITS Act in the first place; and if you find them not to be consistent, that you not disburse the funds. I will be interested in seeing which of these many, many projects you find not to be consistent with the statutory purpose.

Senator REID. Senator Graham, for those that are watching this, and members of the committee know, has done hundreds of jobs and put in full shifts over the years that he was Governor and the years he has been in the Senate.

My question is, Senator Graham, have you done anything dealing with highway construction?

Senator GRAHAM. Many, probably 10 or 15 highway construction jobs, from bridge building to asphalt pouring.

Senator BAUCUS. I might say to my good friend and chairman, I have followed Senator Graham's lead. I know that he has done that. I thought it was a great idea, so I have done the same thing, and I might say the same.

I have operated heavy equipment and raked gravel on highway jobs. I commend it to all of us on the committee, because it gives you a really good sense of, you know, what is going on here, as you talk to the guys and gals.

I do not know if this happened to you, Senator Graham. I was also a sign person 1 day, and I was trying to get the traffic to stop. I jumped out in front of this traffic to get them to stop, because equipment was on the road, and instead of flashing the stop sign, I flashed the slow sign.

[Laughter.]

Senator BAUCUS. A guy went through, but he knew more about what was going on than I did. He stopped, and he just read me the riot act, because I had flashed the wrong sign.

[Laughter.]

Senator BAUCUS. But he knew exactly what was going on.

So we all have had our great experiences on these jobs. I highly commend it.

Senator REID. Well, I could rake the gravel, and I think I could do the sign; but heavy equipment should be left for someone else.

Senator BAUCUS. Well, 1 day they put me out in any empty field for 3 hours by myself, to make sure I did not cause too much damage.

[Laughter.]

Senator REID. Thank you very much. We appreciate both of you being here.

Ms. PETERS. Thank you.

Ms. MCLEAN. Thank you.

Senator REID. The next panel of witnesses that we have today is the Honorable Tom Stephens, Director of the Nevada State Department of Transportation. He will testify on behalf of the American Association of State Highway and Transportation Officials.

We will also hear from Mr. William Fay, President and CEO, American Highway Users Alliance, Washington, D.C.; and Mr. Tom Hill, Chief Executive, Oldcastle Materials, Incorporated, on behalf of the American Road and Transportation Builders Association.

As has been indicated by Senator Inhofe, we were expecting Mr. Duit here today, but sadly, his business burned down Saturday night, and he is therefore unable to be here.

I have said this, Senator Baucus, to Senator Graham, but I hope the two of you do something in the form of putting together your experiences. I think that would be really entertaining and really rewarding.

Senator BAUCUS. We can do that.

Senator REID. But I think it is great that the two of you have done that. It is certainly a way to find out what is going on out there, and there is no other way.

I have done it on a very limited basis, and have to acknowledge that I have not spent full shifts out there. I will come and do a few things and then leave. But I know that you and Senator Graham have put in full shifts, which is very hard to do.

We are first going to hear today from Tom Stephens. Tom, please proceed. As each of you know, here is the little lamp. It will say "talk," and when you have 1 minute left, it says, "sum up," and then "quit." Please proceed.

**STATEMENT OF HON. THOMAS E. STEPHENS, DIRECTOR, NEVADA DEPARTMENT OF TRANSPORTATION, ON BEHALF OF THE AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS**

Mr. STEPHENS. Mr. Chairman and members of the committee, I am Tom Stephens, Director of the Nevada Department of Transportation. I greatly appreciate the opportunity to speak with you today on a topic of extreme concern to every member of the American Association of State Highway and Transportation Officials.

Mr. Chairman, we, in the States are stunned by the fiscal year 2003 budget proposal to slash \$8.6 billion from the current highway funding levels. In the midst of a recession, this would cut the Federal Highway Program by 27 percent, because of an apparent slow-down in Highway Trust Fund Revenues, which triggered a complex revenue aligned budget authority reduction.

Losses of this magnitude can wipe out much of what we have accomplished in the past 4 years to reduce the backlog of needed highway improvements. It would set the clock back to ISTEA.

We strongly support the bill you all introduced last week to restore highway funding to not less than the \$27.8 billion level authorized in TEA-21 for fiscal year 2003. We commend you for your appreciation of how important sustained highway investment is to the country, and thank you for your leadership in putting forth this legislation.

It is our emphatic view that the "not less than" for fiscal year 2003 should be no less than the \$31.8 billion level provided in fiscal year 2002.

With 36 State Governors and legislators already contending with severe budget shortfalls, it is vital to maintain current Federal funding. Otherwise, State and local officials will have to begin the task of cutting billions of dollars in highway projects from their fiscal year 2003 Transportation Improvement Programs.

Final decision on these cuts will be made public in September, affecting nearly every community in the Nation. Construction contractors throughout the country will cut back on equipment purchases, and lay off tens of thousands of well paid construction workers.

Stock prices of several heavy equipment companies and construction companies have already dropped. Engineering consulting firms, already hard hit by the recession, will almost immediately have to start laying off engineers and technicians, as design work for next year's projects is delayed or canceled.

Let me give you just a few State-specific examples, based upon a survey that AASHTO now has underway. In Nevada, a \$50 million cut in Federal funding will translate into a \$50 million reduction in construction contracts. Future year programs will be downsized, as well. This funding cut would jeopardize our progress on numerous projects to meet the demands of the Nation's fastest growing State.

In Oklahoma, a total of \$120 million in construction and right-of-way projects would be delayed or canceled, and the State's proposed \$1 billion GARVEE Bond Program would be jeopardized.

In Montana, a \$67 million reduction would result in the loss of 2,800 jobs, roughly equivalent to a quarter of the new jobs created in Montana in 2001.

In the longer term, we are concerned that the fiscal year 2003 cut, from \$32 billion down to \$23 billion, will be used as the baseline for the reauthorization of TEA-21. Over the next 7 years, the Highway Program would lose \$60 billion, the equivalent of 2 years funding under TEA-21, with the Highway Trust Fund locking up tens of billions of dollars by the end of the period.

Not only do we need to ensure that the fiscal year 2003 funding levels are restored, but also that the firewalls for the distribution of the Highway Trust Fund receipts are perpetuated.

This damage to our highway system and the Nation's economy need not occur. As the chart next to me shows, there is over \$19 billion in the Highway Trust Fund. By using only \$2.4 billion for outlays in fiscal year 2003, we can keep highway investments at the fiscal year 2002 level.

Now no matter what you think about the calculations, when you look at the numbers here, the fact is that the Highway Trust Fund has grown from \$8 billion in the last 4 years, up to \$19 billion. No matter how you calculate it, there is a lot more money in the Highway Trust Fund today than there was 4 years ago.

Clearly, the RABA mechanism needs to be refined, and calculations by the Treasury Department need scrutiny. But there are two principles adopted in TEA-21, which must be maintained.

The first is to provide funding guarantees to provide the reliability essential to multi-year investments. The second is to preserve the firewalls in the Budget Enforcement Act, to assure that all of the revenues which flow into the Highway Trust Fund are spent for transportation.

Let me conclude by saying that transportation has enabled the economic prosperity that America has enjoyed since the 1950's. It is a simple equation: better transportation equals productivity gains and economic growth.

As we struggle to regain our economic vitality, we dare not pull the plug on our transportation investments. America's fuel taxes collected for highways should be spent on highways.

Thank you, Mr. Chairman. I would be pleased to answer any questions.

Senator REID. Mr. Fay?

**STATEMENT OF WILLIAM FAY, PRESIDENT AND CEO,  
AMERICAN HIGHWAY USER'S ALLIANCE**

Mr. FAY. Mr. Chairman, thank you for inviting the Highway User's to testify at this important, very timely hearing on highway funding.

We are one of the most broad-based and diverse advocacy groups in the U.S. We are a consumer's group for America's motorists and truckers, buses and RVs. We represent vehicle manufacturers; the oil industry; the service stations that fuel them; 3-M, insurance and other safety interests; farmers; industries that produce concrete, stone, asphalt; and contractors and equipment manufacturers that turn those substances into highways.

It seems like yesterday that we were asking for \$5 billion to stimulate jobs in the economy. Now we are here on a far graver task, to avert the job and economic disruption that will result from the loss of \$9 billion in highway funding next year.

Simply stated, slashing 27 percent from our Nation's largest infrastructure program is too much. It will have serious economic repercussions for a Nation struggling to climb out of recession. Cuts ranging from \$28 million in Delaware, to \$618 million in California, will be nothing short of calamitous.

The mere announcement of these cuts has already cost Americans jobs. Appended to my statement is a Joint Economic Committee study, estimating the cost of losing one's job: the financial hardship, the loss of health care and health insurance, rising mortality, divorce, and suicide. Quoting from that study, the longer jobless endures, the more likely it becomes that frustrations will be vented on the family or on the rest of society.

Road investments not made also delay positive societal benefits: the safety benefits of reducing crashes, the air quality, time saving and fuel saving benefits of relieving gridlock, the productivity benefits of speedier deliveries. They are the reason that the highway tax is the tax Americans pay most willingly. But they are only realized if highway taxes are used as intended.

No where are these gains clearer than in our study evaluating the 20 year benefits of improving America's 167 worst bottlenecks, 287,000 fewer crashes, 1,150 fewer deaths, 141,000 fewer injuries, 45 percent less carbon monoxide, 44 less VOCs, 71 percent less CO<sub>2</sub>, 20 billion less gallons of fuel consumed, and 19 minutes knocked off the time it takes to drive through the bottleneck.

For commuters, that is 38 minutes a day that they can spend with their families, at work, at errand, or recreation. That is why this funding shortfall is so crucial to our 45 million members.

In the short term, we strongly support prompt enactment of S. 1917. We are mounting a nationwide media and grassroots campaign to enlist co-sponsors, and urge appropriators to do their part, once it is enacted.

We wish the funding levels were more, but we commend this committee for its unanimous support and leadership, and for its bill, that actually sets obligation levels at a little under the amount that the Administration's budget says is going to be collected in taxes in 2003.

America's highway users have an ironclad case that sets us apart from other interests asking for funding. We have already paid the \$19 billion in taxes, and they are just sitting here in Washington.

To make matters worse, even using the Administration's conservative revenue estimations, this surplus is going to double by the year 2008. The taxes we want released have already been paid. If they are not released, even more funds will languish in Washington, as our roads crumble.

Let me be clear. We knew that RABA could go both ways. We have enjoyed record funding, because receipts have exceeded expectations. If there was not a Trust Fund surplus, we would be just another interest group with its hand out. But we have already paid the taxes that S. 1917 will invest.

Turning to reauthorization, TEA-21 restored the concept of highway taxes paid equal highway investments made. While that concept must be preserved, we might make some minor adjustments that are going to eliminate future funding swings.

To us, the fact that Treasury has failed to predict the adverse impact of the recession on revenues from diesel fuel and truck and tire sales, their models fail to understate future revenues, particularly if the economy picks up.

To us, that suggests several clear priorities, and they are included in my statement. We need to enact S. 1306, which will shift

over \$400 million in ethanol tax receipts into the Highway Trust Fund. We need to further stop tax evasion. We need to invest the \$19 billion Trust Fund surplus.

Mr. Chairman, thank you for inviting me here to testify. We look forward to working with this committee to continue to support the vital role that our highway system plays in our economy and our every day lives.

Senator REID. We will now hear from Mr. Tom Hill from the private sector.

**STATEMENT OF TOM HILL, CHIEF EXECUTIVE, OLDCASTLE MATERIALS, INC., ON BEHALF OF THE AMERICAN ROAD AND TRANSPORTATION BUILDERS ASSOCIATION**

Mr. HILL. Mr. Chairman and members of the committee, my name is Tom Hill. I am the Chief Executive Officer of Oldcastle Materials. We are the largest material supplier and paving contractor in the United States, headquartered here in Washington, D.C.

I am here today on behalf of the American Road and Transportation Builders Association, where I am privileged to serve as Senior Vice Chairman. ARTBA has been representing the transportation construction industry here in Washington for over 100 years this week.

Oldcastle has operations in 25 states and employs over 15,000 people in the transportation construction industry. We are a federation of companies, and to help illustrate our reach, we have significant operations in several of your States.

In Montana, we have Jensen Construction in Missoula, and Maronic Construction in Helena, Montana. In Connecticut, we have Tilcon, a very major employer in the State. Tilcon also has a large presence in Rhode Island.

In Ohio, our Shelley Company is the largest paving contractor in the State, with well over 1,000 employees. Mr. Chairman, we also have a fairly small operation in Elko, Nevada.

I greatly appreciate the opportunity to appear before you today, because the proposals currently before Congress relating to Federal highway investment in 2003 will have a direct impact on our business and the hard working people we employ.

Our deep involvement in transportation improvement projects across the Nation provide me with a unique perspective on what the real world impacts of this will have today and in 2003.

Mr. Chairman, I can tell you that people like myself, contractors, material suppliers, equipment manufacturers, and State transportation officials across the Nation, are having a hard time understanding why we are suddenly looking at nearly a 30 percent cut in Federal Highway Program funding next year.

This is nothing but a crisis for our industry. Share prices dropped on the release of the President's budget. More importantly, our employees are deeply concerned about their jobs and their families.

This is not a 2003 problem, and let me reemphasize that. It is not just a 2003 problem. States are already delaying projects. Companies like mine are curtailing capital investment, and the impact is being felt right now.

Then we learn that the cut is being triggered because the program funding level is dictated by a truly convoluted mathematical formula, that hinges on the accuracy of economic forecasts that try to guess the future. It is confusing.

When we learn that since TEA-21 was enacted in 1998, that the Highway Trust Fund's account balance has grown to close to \$20 billion that includes billions in surplus revenue, we do not even know why there is a problem.

My understanding of TEA-21 was that it was based on the principle that, for the first time, all incoming highway user revenues to the Trust Fund would be spent in a timely manner on needed transportation improvements. If there is a \$20 billion balance in the Trust Fund, that clearly has not happened.

The RABA adjustment cut of \$8.6 billion is not just some academic exercise that takes place in a vacuum. I was out amongst our companies last week, meeting with employees on this issue. I can tell you, they are scared and energized to reverse this cut in any way they can.

The \$8.6 billion is already sustaining 360,000 American jobs in companies like mine. If you waive a magic wand and take it away, just because someone in Washington made a mistake in predicting the future of the economy, then those jobs will be lost. Real American workers and companies will be hurt.

Let us use that \$20 billion Trust Fund balance to maintain the program next year at this year's level, so that we are not creating unemployment, disrupting State highway programs, and delaying critical safety improvements.

I am not an economist, and I am not going to pretend to be able to explain all the nuances of Federal transportation funding that are contained in ARTBA's testimony. That is why I brought Dr. Buechner, who is the economist at ARTBA, along with me.

The ARTBA written statement outlines a number of ideas for improving the RABA mechanism and for meeting the Nation's transportation needs in the TEA-21 reauthorization bill. I ask that our statement and all attachments to it be included in the record of this hearing, so they can be studied and considered by Congress.

Senator REID. Hearing no objection, that will be ordered, and that is the American Road and Transportation Builders Association to which you refer.

Mr. HILL. Mr. Chairman and Senator Inhofe, we deeply appreciate your leadership, and that of your entire committee, in introducing S. 1917 last week, which would set a floor on fiscal year 2003 highway funding at the authorized guaranteed firewall level. That has got the ball rolling in Congress, and ARTBA supports your bill.

We also hope that over the next weeks, we can work with you and Congress to maintain funding next year at the current \$31.8 billion level. Cutting the program by \$4.1 billion makes no more sense than cutting it by \$8.6 billion.

Please use the Highway Trust Fund for its intended purpose, to fix this legislative glitch. The user fee revenues are coming in to do it.

I thank you for giving me the opportunity to share my views, the concerns of our employees, and the positions of my industry's associations with you and the committee.

Senator REID. Thank you for your testimony, Mr. Hill, and thank you for appearing here on such short notice.

The statement about which I am going to make has no partisan ramifications. But it does have ramifications to what I think is a bureaucracy that really prevents us from doing certain things here in Washington. I mean, this is just not right to have this in the budget. Some people should have advised the President of its ramifications.

Using the figures that Tom Stephens gave us, I did this on a calculator. I thought maybe I was wrong, so I did it by hand: \$60 billion is 2,520,000 jobs—2,520,000 jobs. These are high paying jobs. Each person that has one of those jobs is paying taxes, buying refrigerators and cars. I mean, we just cannot let this happen.

Now we have been talking about an economic stimulus package here for months. One of the things I talked about was having what I refer to as an American Marshall Plan, infrastructure.

In Nevada, we have problems that are different than in New York. They have things that are old. We have things that are new that need to be done. So we have different problems all over the country. But our infrastructure is in drastic need of help.

We did not have it, in the Democratic proposal, even though I tried, and it certainly did not have any support in the Republican proposal. I cannot imagine why we did not go with that.

I spoke at the National Mayor's Association. They went crazy. They know it is the right thing to do. I have gotten support from all over America, with State legislators. But here in Washington, the bureaucrats have stymied me. A simple program like building roads, I cannot get it through the bureaucracy.

So I just think that not only do the cutbacks hurt programs about which I just spoke, but the other thing that happens, and I say this to all the panelists, if you cut back on a project, it makes it more expensive before you finish it.

If on the road, we are going to build between search light and railroad passes, little local stuff, I mean, if we are going to do that over 3 years instead of 2 years, the project is more expensive.

So I am so glad that we have the support of the Republicans in the House and Republicans in the Senate. This is something that we are all joining together on. I mean, they are happy and the Democrats are supporting it. We have got to join together and get this done. This is more than just fluff.

So I have some questions that I will submit to all of you. Your testimony has been tremendous. Mr. Hill, we appreciate very much your coming on such short notice.

When anyone ever says that Government cannot create jobs, they are wrong. Government does create jobs with programs like this. As far as I am concerned, there are two major programs that really get people to work: building houses and doing things with roads and bridges and dams and things of that nature. That creates lots of jobs.

Senator Inhofe?

Senator INHOFE. Thank you, Mr. Chairman.

You know, I think most of you were here when the previous panel was here, and Senator Baucus said something that I recall also. That is that quite often, under different Administrations, Democratic or Republican Administrations, they start with a number that is lower than we end up. I think that has just become a reality.

Your economic analysis, all three of you, it is pretty stark, when you talk about some of the things that could happen. Now what would be helpful to me, for example, the \$1 billion and the 42,000, to see just how you came up with these figures.

You might remember, I asked the Administrator and Ms. McLean that question. They did not question it, but I think it would be helpful for us to actually, Mr. Stephens, come up with something where we can say, this is how this works.

I would make the same request for the fact that they have said that we could take the additional figure that is found in S. 1917. But the Trust Fund could not support the higher figure that you folks are talking about, and you say that they can.

So this would be helpful to us to have your analysis, so that we could look over and make our own determination, and we could be more persuasive in presenting our case. Are there any thoughts about that?

Mr. STEPHENS. To address your first point, that is published data. The Federal Highway Administration put it out in a pamphlet, in preparation for TEA-21, where they showed the number of jobs, direct, indirect, et cetera. I will be happy to send you a copy of that pamphlet.

At that time, I happened to be the chairman of the AASHTO Economic Committee, so the economic impact of highway expenditures was a big deal to us, and the Federal Highway Administration published that. So maybe it is only 40,000 per one billion now, because of inflation.

Senator REID. Or maybe it is 45,000.

Mr. STEPHENS. Or maybe it is 45,000; but that was published data by the Federal Highway Administration.

Senator INHOFE. Well, that is very helpful, Mr. Stephens, because I was not aware of that. When we can show that, that helps in establishing the case. Do not always assume, when you come up with a figure, that we have the background on that figure.

And do not put me in an adversarial relationship. I agree with you. I just want to be able to see it, so that we can present it with conviction; yes, sir?

Mr. HILL. If I could just comment on that. You know, the real world effects are, we invest in asphalt plants and quarries, crushing plants, for 20 and 30 years. When all of a sudden, there is a blip in what has been a fairly steady stream of Federal moneys for the last 30 years, it really puts doubt on whether you should invest for 20 and 30 years.

In fact, you know, we are reassessing our capital program for next year with this in mind. That just is where the real life effects of it are. Our equipment manufacturers are worried, and they should be.

You know, it is not just the jobs on the road. It is not just the guy on the back of the paver. It is the guy in the plant in Iowa

that manufacturers the crushing equipment and so on. It is very real.

Senator INHOFE. Go ahead, Mr. Fay.

Mr. FAY. Mr. Chairman, Senator Inhofe, what Mr. Hill said is exactly right. He just mentioned the words "capital budget." This is our Nation's capital budget, the infrastructure of this Nation. Yet, it is treated in much the same way as the pencil you are holding, you know, Mr. Chairman, in the way that it is accounted for.

Thankfully, TEA-21 actually brought some sanity to that process by setting it apart and having a connection between revenues received and the amount that is appropriated and budgeted. But this is a capital program. It is just not treated that way. A lot of States may treat it that way.

Senator INHOFE. No, I understand that, and believe me, I have had a lot of conversations with our people at Oklahoma. As you know, Mr. Duit was going to be here; and Mr. Hill, I appreciate your being here on such short notice.

Well, the other thing, and you can just give me this for the record, and that is that the numbers support S. 1917, but according to the Highway Administration, may not support the others; but you say they are supported. So we would just need to have your data to help us out.

Mr. Chairman, I have no more questions.

Senator REID. Senator Inhofe, I just advised my staff, just so you and Senator Chafee understand, as to the way I like to conduct the subcommittee hearings. Those people that get here first, they give their statements in the order that they show up. But after that, what I do is, I try to go on the basis of seniority.

So Senator Graham, questions?

Senator GRAHAM. Thank you very much, Mr. Chairman.

Mr. Stephens, when did your State Department first learn that there was going to be significant reduction in 2003 funding?

Mr. STEPHENS. I hate to quibble with words, but we were first officially notified of this in a letter of January 24th, 2002, signed by the Administrator, Mary Peters.

I will acknowledge that people had talked about RABA in various forums before then. But this is the letter which drove the point home, saying that we were only going to get \$146 million for the State of Nevada, instead of the \$203 million that we had gotten the previous year, and it talks about the adjustment.

I, frankly, had never looked at the adjustment in great detail, and I am not somebody who is shy about crunching numbers. I understand numbers. But when I got into the RABA adjustment, I was just amazed at how they did the look-back, the look-forward, estimates, authorizations, obligation authorities, and receipts.

The receipt estimates, those are actual receipts from 1998 through 2001, \$24 billion to \$33 billion, and then down to \$30 billion. The last year, they are saying, is \$27 billion.

We are not experiencing that kind of fluctuation on the State level in our revenues for diesel and fuel tax. We are not seeing where they are coming up with the figures from the truck tax. For example, they say the truck sales tax went down 55 percent. Well, the sales only went down 24 percent. So what is going on there?

I do not know that the GAO report had shed any light on that. Maybe people in the recession decided not to pay their taxes last year and are paying penalties. I have no idea. But we are not seeing the same data.

Now it has flattened out. Revenues have flattened out. They are not increasing, but they are not dropping the way that they have indicated on the State level. What they are doing on the Federal level, we do not run the Treasury.

Senator GRAHAM. It was indicated that the first signal that the Department had was in August of last year. They thought they had communicated it through AASHTO or other intermediaries; but apparently, the full impact had not reached the States affected until January.

Would it have been helpful if there had been a more formal method of early identification to you and other State highway administrators, as to what your budget was likely to be for 2003?

Mr. STEPHENS. It certainly would have been helpful, and I think probably in a going-forward basis, and I do not mean to be critical of the Federal Highway Administration. This has never happened before in this manner. So I do not want to be critical of Mary Peters and her tenure there. She is excellent.

But it would be helpful if, when they do this mid-year review, I guess, which comes out in August, if they would send that out in a letter to every Director, Secretary of State, DOT, indicating to them what was going on, so that we have really got it on our radar screen.

Somebody saying something in a meeting, in a national meeting, where there might be 25 percent of the Directors in the meeting, and maybe only two-thirds of the States represented, that does not hammer it home. What hammers it home is a letter like this, that I got from the Federal Highway Administration, dated January 24th.

Senator GRAHAM. As you know, this committee will soon be turning to the task of reauthorization of the Surface Transportation Act. I would appreciate, from all three of you and the members that you represent, your ideas as to how can we create a more predictable and stable funding level.

I recognize that there is the business cycle. It has not been repealed and, therefore, there are going to be ups and downs, over an extended period of time. I think it is important for people who have the responsibility of planning projects that take multiple years to complete, to have some degree of predictability within that up and down, as to what their resources are going to be.

Maybe some things like multi-year averaging or other steps that would help to knock down the peaks and valleys of funding would be helpful. But you could be very helpful to this committee, if you would give us the benefit of your suggestions as to how to try to build as much stability into this program as possible.

I mentioned in my opening statement that, at least from the Florida perspective, we found that expenditures on highway maintenance were some of the highest job creation activities.

These numbers are almost 20 years old in my mind now, but I think at the time, we were projecting that for every million dollars of expenditure, that you could create somewhere in the range of 40

to 50 annualized jobs. This was in early 1980 expenditure levels. It is probably a little bit less today.

But what is your estimate? What percentage of your funding is going into maintenance, and how many jobs does every million dollars of that maintenance expenditure generate?

Mr. STEPHENS. Well, on the National level, the \$1 million to 42,000 works out to about one job for \$25,000. So it works out into your range of figures: the 40,000 to 50,000 for \$1 million.

I do not have a study that shows this. But my feeling is that you are exactly correct, that maintenance work creates more jobs than construction work.

There are several reasons behind that. One, the lead time on design of a maintenance project is shorter, because you do not have all the complications of designing new bridges and whatever. You do not have to buy right-of-way. You do not have to get interrupted by long environmental delays.

So you can get the money out a lot quicker on the maintenance project. To some extent, maintenance projects are more labor intensive, like doing an asphalt overlay, than buying the steel for a bridge for example, and building a new bridge.

So you are exactly correct. To what extent maintenance versus new capacity projects and how that relates, I cannot tell you. But it is certainly my very strong feeling, after 7 years of experience as the Director, that that is exactly correct.

Mr. HILL. Senator, as the largest paving contractor, we think all the money should go to maintenance.

[Laughter.]

Senator INHOFE. Senator Chafee?

Senator INHOFE. Well, I want to say, Mr. Chairman, on your interest in my work days, one of my early work days was laying asphalt on a maintenance project. It happened to be on Graham Street in South Daytona Beach.

So if you want to come down to the big race in Daytona Beach this weekend, I will arrange for you to go to Graham Street and see what a good job maintenance I did.

[Laughter.]

Senator REID. Well, you do a good job of maintenance here. I am sure you did a good job on Graham Street.

Senator Chafee?

Senator CHAFEE. Thank you, Mr. Chairman.

Some of the comments here, I have to agree with, are calamitous cuts. I think Mr. Fay said that. I think just in hearing Mr. Stephens talk about what, a \$50 million cut in your budget, is that accurate?

Mr. STEPHENS. Yes.

Senator CHAFEE. Those would be just calamitous for all our States.

I also have to agree about the accuracy and, I think Mr. Stephens, in your testimony or at least your written testimony, you did question the accuracy. It just seems to me also that we have to get to the bottom of that.

So at least we are being responsible, using real dollars and making sure they are going toward the projects that they are designated toward. But if they are there, we want to use them, cer-

tainly. Other than that, I have no other questions, except for Mr. Hill. I was just wondering what does Oldcastle Materials make?

Mr. HILL. We are the fourth largest producer of construction aggregates, and we are the largest producer of asphalt in the United States.

Senator REID. You mentioned this, Mr. Fay, very briefly, and I want to elaborate on it, because of personal experience. I have talked to Tom Stephens many times about the road to my hometown of Searchlight, where I have a home.

After September 11th, and I have no complaint about that, and I am glad they did this, they took a lot of the truck traffic off of Hoover Dam. But that has created a road from what we call Railroad Pass to Searchlight, 36 miles, that is a death trap.

I do not want my children to come and visit me when I am in Searchlight, because I am afraid they are going to get killed on that road, and I am not exaggerating. Thousands and thousands of trucks, big trucks, come over that road every day that did not come before.

The one thing that you talked about, that I want to stress, this road construction saves lives. I mean, we have had scores of people killed on that Searchlight road. It is 36 miles. People do not know how to drive on a two lane road anymore, and they become anxious and they pull around. There is something facing them, and it is death for one or more.

People say, well, when I get money for home, they criticize and say, Reid brings pork home, you know. But I have never apologized for a single penny that I brought home for road building and other things. Because I believe I am bringing home things that make people more comfortable, it makes businesses more efficient, and saves injury and death.

Now would anybody disagree with that, that is on the panel today?

[Laughter.]

Mr. FAY. Mr. Chairman and members of the subcommittee, 117 Americans will die today on our roads, and 788 will die this week.

I am a Trustee on the Roadway Safety Foundation, which is a non-profit educational group that just puts out materials like the fact that adding one foot to the width of a lane reduces fatal crashes by 12 percent; adding two feet reduces them by 23 percent. Every time Mr. Hill improves a road, he does save lives.

When you take a look at safety experts, they have a lot of great data on this. They have calculated that 30 percent of all fatal crashes in the United States are due to outmoded road design.

These are roads that are carrying way too much traffic than they were designed to carry, or roads that area not in good condition or not well maintained. Those are roads that are killing people. It is a real travesty.

I just point people sometimes to our interstate highway system, because it is the safest road system in the world, in terms of fatality rates. What is that? It is because it is designed for that. The lanes are wider. The shoulders are wider. There is a gentle slope off the side of the road. The lanes are divided to prevent head-on collisions.

If you remember, we had two head-on collisions within a couple of weeks on George Washington Parkway out here. They just simply put up guardrails, and we have not had one since then. These investments really do save lives.

I had gotten into a tremendous argument with an NBC reporter that was talking about highways as the fleecing of America. I took great umbrage because I said, as a person that represents the taxpayers, we do not feel fleeced. What we feel is that not enough investments are being made to save our lives and to make our commutes easier.

The greatest personal problem that is facing Americans today, when you look at polls, that personal problem is time management. We do not have enough time in the day to do all the things that we need to do.

The investments that this committee puts through, and the investments that your bill is going to put through, are going to save people's lives. They are going to give us more time with our families, and we commend you for them.

Senator REID. Mr. Hill, I have one question. You have brought an economist with you, and I would like to have his information be made a part of this record. I am anxious to hear how he feels about this analysis of the Treasury's revenue estimates.

I am intrigued by what you said, that this organization that you are representing here today is 100 years old. Is that right?

Mr. HILL. That is correct. It is in 2 weeks, or is it this week?

Senator REID. Anyway, it is recently, and we want you to give us the benefit of your organization's information about what has happened with the Treasury Department.

Mr. Stephens, I would like you to do the same.

Mr. Fay, if you have anything, we will take that, too.

We will make this part of the record.

Senator REID. Senator Inhofe?

Senator INHOFE. I have nothing further.

Senator REID. This has been a very good hearing. I especially appreciate the members of the committee for being here and being so attentive.

This is an issue that is, and I repeat, of a bipartisan nature. We are going to work very hard to get more money. We recognize that we are in a fiscal downturn. But if you want to really get in a downturn, cut back road building the way that has been talked about.

The subcommittee stands in adjournment.

[Whereupon, at 2:53 p.m., the subcommittee was adjourned, to reconvene at the call of the chair.]

[Additional statements submitted for the record follow:]

STATEMENT OF HON. JAMES M. JEFFORDS, U.S. SENATOR FROM THE STATE OF VERMONT

Thank you, Senator Reid. First, let me say that I look forward to working closely with you as we proceed toward reauthorization of the Surface Transportation Program. This subcommittee will be our think tank in the months ahead.

Let me also thank all of our fellow EPW Committee members for joining me in sponsoring S. 1917, the Highway Funding Restoration Act. Through S. 1917, we have taken an important step toward ensuring that the nation's transportation program will be properly funded in fiscal year 2003.

We have borne many burdens as a Nation over the last few months. Now is not the time to backslide on our commitments to the traveling public. The construction season is just around the corner in my State of Vermont. Literally thousands of jobs are supported by our investment in transportation. We can't shortchange this sector if we expect to pull out of recession.

S. 1917 is fiscally responsible. It funds the highway program at the authorized levels. At those levels, the balance in the Highway Trust Fund can support the spending.

I look forward to hearing from our witnesses today about both the immediate budget outlook and the longer-term picture.

Good afternoon to Assistant Secretary McLean and to Administrator Peters. Your partnership and cooperation in our process is greatly appreciated.

I'm delighted also to see the outstanding panel of industry representatives and State officials. These folks understand the outcomes of our budget decisions. I am most concerned with outcomes.

I know that resources will be the heart of the matter as we craft the committee's reauthorization proposals. It is vital that we get spending right for the coming year. Fiscal year 2003 will set the base for the 6-year program we are about to authorize.

I want to achieve a balanced transportation system in this country. I want a system that provides choices to our citizens, that is secure and reliable.

As we proceed with the committee's hearing agenda, we will receive a detailed accounting of the transportation system's needs and opportunities for the future. I expect that the needs will be great and the opportunities breathtaking! We must ensure that the resources are there to be called on.

So again, I thank you Senator Reid.

---

STATEMENT OF HON. TOM CARPER, U.S. SENATOR FROM THE STATE OF DELAWARE

I'd like to thank the chairman for holding this important hearing today and for giving me the opportunity to make a statement before his subcommittee on an issue that is important to all of our States.

When President Bush released his Fiscal Year 2003 budget 1 week ago today, the budget for the Federal Highway Administration, particularly for the Federal-Aid Highway program, was one of the more attention-grabbing pieces. After 3 years in which States received more than \$9 billion in aid above the numbers projected in TEA-21, the program was cut by nearly \$9 billion. As we all know, this cut came as a result of Revenue Aligned Budget Authority (RABA), which, for the first time, was negative due to lower-than-expected revenue into the Highway Trust Fund. This means that, under the president's budget, Delaware, for example, will experience a nearly \$30 million cut in Federal highway aid in 2003, about 24 percent less than its 2002 allocation. Other States will see even more dramatic cuts. At a time when the economy is just beginning to recover from recession, when combined State budget shortfalls are at \$15 billion and many States are being forced to trim their budgets or raise taxes, Congress should act to restore some of these cuts. That's why I joined all of my colleagues on the full committee in co-sponsoring S. 1917, the Highway Funding Restoration Act, a bill that would raise Federal highway aid next year to the 2003 level called for in TEA-21.

In the coming year, I look forward to working with my colleagues to fix RABA to ensure that, in the future, States are provided with a steadier stream of highway funding. The Federal-Aid Highway program should not be as subject as it is now to the ups and downs of the economy and the Highway Trust Fund should not suffer from the nation's increased reliance on alternative fuels. At the same time we are addressing these issues, however, we must enhance the flexibility TEA-21 gave States in spending their Federal transportation dollars by allowing them the discretion to spend at least a portion of their highway and transit funding on inter-city rail projects. Just last month, in the first hearing the full committee held on TEA-21 re-authorization, we heard from representatives of the National Governors' Association, the National Association of Counties, the U.S. Conference of Mayors and the National League of Cities, all of whom expressed strong support for expanding the flexibility built into TEA-21 to cover inter-city rail. The mayors, in particular, released the results of a transportation survey showing that increased funding for new inter-city rail projects was one of their members' top priorities. I was pleased to hear several of my colleagues echoing the witnesses' testimony that day when they spoke about the desire among their constituents for passenger rail service that can connect them to our growing national system. Allowing States to spend at least a portion of their Federal highway and transit dollars on inter-city rail projects will signifi-

cantly improve Amtrak's ability to build on its existing long distance routes and begin serving cities and towns that currently have no passenger rail service at all.

In the last Congress, the full committee passed S. 1144, a bipartisan bill that would have allowed the funds TEA-21 granted States for the National Highway System, Surface Transportation and Congestion Mitigation and Air Quality Improvement Programs to be spent on inter-city rail projects. I hope to introduce similar legislation shortly.

As I'm sure you all know, Amtrak President George Warrington announced earlier this month that he would trim nearly 1,000 jobs and \$300 million from Amtrak's budget this year. He also announced that Amtrak will have to propose major route reductions if it does not receive the necessary funding from Congress to pay its operating and capital expenses. The most likely candidates for route reductions are those routes outside the Northeast Corridor that are not partially supported by States. In the coming year, I plan to work with my colleagues to see that Amtrak is re-authorized, that its budget requests are met and that a dedicated source of capital funding is created.

My bill will not solve Amtrak's capital funding dilemma. What my bill will do is help States retain critical service by increasing the tools they have available to them to spend their highway and transit dollars more flexibly to retain critical service. Increased flexibility will not cost the Federal Government anything and will not require any State to fund inter-city rail projects if it does not want to do so. It will, however, give States the ability to give our constituents the transportation services they need. It is my hope, then, that, when the committee considers S. 1917, we can also act to give States the kind of flexibility our constituents and their Governors, mayors and county administrators are asking for.

---

STATEMENT OF HON. JAMES M. INHOFE, U.S. SENATOR FROM THE STATE OF OKLAHOMA

Thank you Mr. Chairman: I am pleased to join you today in welcoming our witnesses. It is always a pleasure hear from Federal Highway Administrator Mary Peters. We are very fortunate to have an Administrator at Federal Highway that understands the tough choices our States have to make. Mary's background as the director of the Arizona Department of Transportation will be very beneficial to us as we balance the needs of our individual States with need the for a national transportation system because she will be able to tells us what works and what does not work. So I am looking forward to working with you as we begin deliberations on reauthorization.

I have had the pleasure of working with Donna McLean first as a fellow on the Water Resources Subcommittee on the then Public Works and Transportation Committee in the House. We were fortunate that she decided to stay as a permanent staffer on the Aviation Subcommittee. I have always found Donna to be very thorough and accurate in her analysis and I have no doubt that as we work through the varying interpretations of RABA, we will find that she will be most helpful in explaining the position of the Administration.

I am most anxious to hear from Thomas E. Stephens, Director of the Department of Transportation in the chairman's home State of Nevada. Again, I believe we can never hear too often from our State officials on how decisions we make in Washington effect how they to their jobs at home.

It is always good to hear from Bill Fay. His group, the Highway User's Alliance will play an important role in reauthorization.

Finally, I had hoped to be welcoming my friend and fellow Oklahoman Jim Duit to testify on behalf of the American Road and Transportation Builders Association. Unfortunately, Jim's suffered a devastating fire to his business Saturday evening. In talking with him it appears that the cause of the fire may have been arson. Needless to say, he is unable to join us today. However, I have the oral statement that he had planned on making and I would ask that it be submitted for the record. Also, I have a written statement of Kenneth K. Wert who is President has Haskell Lemon Construction Co. in Oklahoma that I would like to submit for the record.

We are fortunate that Mr. Tom Hill, Chief Executive of Oldcastle Materials, Inc. could join us today to present the industry's perspective on the proposed FY03 budget. I appreciate your rearranging your schedule on such short notice and look forward to hearing your testimony.

Thank you Mr. Chairman and welcome to our witnesses.

---

## STATEMENT OF HON. BOB SMITH, U.S. SENATOR FROM THE STATE OF NEW HAMPSHIRE

Mr. Chairman, I too would like to offer a warm welcome to our witnesses this afternoon. As I promised at our full committee hearing on TEA-21 reauthorization just a couple weeks ago, I have looked closely at the RABA mechanism and the highway funding level for fiscal year 2003, and I believe we have come up with a responsible solution. In reauthorization of TEA-21 we will need to re-examine the RABA calculation method so that it does not result in these amplified ups and downs in funding. I look forward to working with Administrator Peters and Assistant Secretary McLean on that issue.

More immediately, however, we need to address the drop of almost 30 percent in highway funding for fiscal year 2003. I do not believe that this is what Congress intended when we passed the RABA provision in TEA-21. What was intended was that Highway Trust Fund revenues would equal highway spending. There is no dispute that the country's economic growth produced revenues well above the levels predicted in TEA-21, and so RABA resulted in funding increases. However, now that revenues have dropped off, the RABA calculation would result in a spending level well below actual revenues. In fact, the President's budget proposes a highway spending level of \$23 billion when the latest Treasury Department projections put highway trust fund revenues at over \$28 billion for 2003. Congress did not intend for this discrepancy, regardless of the results of a complicated and obviously flawed calculation formula.

Our solution was to introduce S. 1917, the "Highway Funding Restoration Act," for which all 19 members of this committee are original cosponsors. I believe this bill clarifies congressional intent by clearly stating that highway funding for fiscal year 2003 will be no less than \$27.7 billion, the amount authorized in TEA-21. I will continue to work throughout the budget and appropriations process to make sure this funding is restored and distributed to the State programs, and not diverted to project earmarks.

Finally, I want to commend Administrator Peters for her leadership and commitment to the issue of environmental streamlining. As one of the authors of this provision in TEA-21, I have continued to focus attention on it at every opportunity. I also created a pilot project in New Hampshire to illustrate how State and Federal agencies are supposed to apply streamlining to an environmental impact statement process. These agencies committed to complete an EIS for the I-93 widening project in little more than 2 years, and they remain on schedule. I invite you, Administrator Peters, to come up to New Hampshire to attend this project's celebration of success later this year.

Thank you, Mr. Chairman, for holding this hearing.

## STATEMENT BY HON. BEN NIGHTHORSE CAMPBELL, U.S. SENATOR FROM THE STATE OF COLORADO

Mr. Chairman, I would like to thank you for scheduling this important hearing. This is an issue that I know is very important as it is to the rest of the West, including Colorado. I would also like to thank the distinguished panel for taking the time to meet with us today.

Transportation is the grease that makes our economic engine go. Traffic congestion only slows the engine and cost businesses and individuals billions of dollars a year due to extra fuel costs, late deliveries, and lost production. Traffic congestion is also taking a toll on our nation's families. Parents are now getting home to their children later and later.

The passage of the Transportation Equity Act for the 21st Century (TEA-21) has helped States start to solve many of these problems. The Colorado Department of Transportation (COOT) has been able to increase its budget from \$200 million to \$300 million a year. This has allowed COOT to undertake projects that help ease the stress on Colorado roads.

However, there are also problems with TEA-21. Current projects show a \$4.4 billion shortfall in the fiscal year 2003 budget, a more than \$8 billion drop from the total TEA-21 funding from fiscal year 2002 levels. This means that the State would lose \$59 million a 19 percent decrease from the year before. It is estimated that a budget decrease of this level would result in the loss of over 3,600 jobs in Colorado over the next 7 years and 287,000 nationally during that same length of time.

Now is not the time to decrease funding for our nation's highways. This higher level of funding has allowed COOT to move forward with transportation projects

that would not have been able to be completed without TEA-21 and now is not the time to slow the this progress.

In addition, Colorado, along with many other States, is experiencing State budget reductions. This "double whammy" will result in additional project reductions.

Now is not the time to decrease funding for our nation's highways. The higher level of funding has allowed COOT to move forward with transportation projects that would not have been able to be completed without TEA-21 and now is not the time to slow this progress.

Last week I signed on as an original cosponsor to the Highway Funding Restoration Act of 2002, which was introduced by leadership in this committee and fully supported in a bipartisan manner. This legislation would bring the FY2003 highway funding up to the level set in TEA-21.

In closing, transportation remains a top priority in Colorado. Having a transportation system that moves people and goods is important to our economic health and quality of life. I remain committed to working with this committee throughout the year and I look forward to these discussions today on this important issue.

Thank you Mr. Chairman.

---

STATEMENT OF MARY E. PETERS, ADMINISTRATOR, FEDERAL HIGHWAY ADMINISTRATION  
DONNA MCLEAN, ASSISTANT SECRETARY FOR BUDGET AND PROGRAMS AND  
CHIEF FINANCIAL OFFICER

Mr. Chairman and members of the subcommittee, thank you for the opportunity to testify today in support of the President's Fiscal Year (FY) 2003 Budget proposal for the Department of Transportation and to discuss the status of the Highway Trust Fund. We would also like to thank you for your leadership in scheduling a series of hearings in preparation for the reauthorization of the surface transportation program. We are looking forward to working with this subcommittee and with Congress to achieve the goals outlined in the fiscal year 2003 budget request and to shape reauthorization proposals. Working together, we can meet the transportation challenges facing our Nation and provide the American people with a transportation system that is safe, efficient, and accessible, while remaining respectful stewards of the environment.

#### OVERVIEW

As a whole, the strong but flexible multi-modal system developed under the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) and the Transportation Equity Act for the 21st Century (TEA-21) is working well in supporting our Nation's economic growth and improving the quality of life for all our citizens. Our Nation's highways and intermodal connectors are the critical link in the national intermodal transportation system. The challenge is to maintain our high-quality network while achieving our goals to increase safety, ensure national security, improve mobility, and promote environmentally responsible and efficient project delivery. The \$24.1 billion funding level, proposed by the President for the Federal Highway Administration (FHWA) for fiscal year 2003, provides funding essential to meet this challenge. This includes a Federal-aid Highway obligation limitation of \$23.2 billion. The fiscal year 2003 request reflects the funding levels enacted in TEA-21, as adjusted to reflect the latest Highway Trust Fund revenue figures, and honors the highway category guarantees in that Act.

The key to ensuring that highway-related receipts are spent is that the highway funding level is adjusted each year to reflect the latest information on Highway Trust Fund (HTF) receipts. At the time of the enactment of TEA-21, highway program funding levels were set based on estimates of HTF receipts. Each year, the level is adjusted using a formula specified in TEA-21. This adjustment ensures that highway spending remains aligned with HTF receipts.

In fiscal years 2000, 2001 and 2002, our Nation reaped the benefits of record-level funding for surface transportation as authorized in TEA-21. The guaranteed funding level, tied to HTF receipts, has provided the States with much needed resources to support the Nation's highway infrastructure, as Congress intended. In fiscal year 2003, however, declining HTF receipts will, for the first time, trigger a downward adjustment, in the amount of \$4.369 billion, in the highway program level, in order to keep highway spending aligned with the status of the Highway Trust Fund. Even with this negative calculation, over the life of TEA-21, these adjustments will provide a net gain of almost \$4.7 billion in highway spending.

The calculation of the adjustment is not a policy call—it is a calculation based in law and reflected in the budget. As we discuss the reauthorization of the surface transportation program, we need to look for ways to smooth out current positive and

negative swings that result from this adjustment. What we should not do is abandon this adjustment concept. Linking highway spending to receipts is a fundamental principle of TEA-21.

The budget proposes to fund most Federal-aid highway programs from within the obligation limitation, including our major programs: the Surface Transportation Program, the National Highway System, Interstate Maintenance, the Highway Bridge Replacement and Rehabilitation Program, and the Congestion Mitigation and Air Quality Improvement Program. Other TEA-21 programs include the National Corridor Planning and Border Infrastructure Improvement programs and the Transportation and Community and System Preservation Pilot Program. The Emergency Relief program and a portion of the Minimum Guarantee program will continue to be exempt from the limitation. The estimated obligation level for exempt programs in fiscal year 2003 is \$893 million.

In the face of declining revenues into the Highway Trust Fund, we continue to strongly support creative financing solutions. Consequently, the 2003 budget includes \$99 million to leverage our Federal investment in transportation infrastructure under the Transportation Infrastructure Finance and Innovation Act Program (TIFIA). This investment will translate into over \$6 billion in nationally significant surface transportation projects.

As the events of September 11 so graphically demonstrated, a safe and secure surface transportation system is vital to all Americans. We must keep our infrastructure secure and we must strengthen our commitment to reducing highway injuries and fatalities, even as we squeeze additional capacity from the system. To meet this challenge, the fiscal year 2003 Budget for FHWA emphasizes four priority areas: safety, mobility, environmental stewardship and streamlining, and oversight.

#### SAFETY

Safety continues to be the Department of Transportation's most important priority. While the number of highway fatalities in recent years has been held relatively flat, despite significantly rising numbers of vehicles on our roads, more than a quarter of a million people have been killed on America's roadways in the past 6 years, 41,000 deaths each year. There are also more than 3 million police-reported injuries annually. Highway safety improvements are critical to improving these numbers. Success will depend on a balanced approach that addresses the behavioral, vehicular, and roadway infrastructure and operations safety problems. We can, we must, and we will strive to do better.

FHWA works closely with States and other partners to improve our ability to analyze roadway safety challenges and to direct investments to specific projects and programs, which will deliver the most value in terms of lives saved and injuries minimized. For example, construction programs continue to contribute to safety by correcting unsafe roadway design and removing roadway hazards. States may also use their Surface Transportation (STP), Interstate Maintenance, and National Highway System (NHS) funds for safety improvements. Safety can be built into every interchange upgrade, intersection redesign and new facility through safety conscious planning and design. Signing and pavement improvements can enhance the safety of existing and new facilities for all users of the highway system.

Within the STP, 10 percent of funds are reserved under TEA-21 for highway-rail crossing improvements and hazard elimination. The Hazard Elimination program supports efforts to resolve safety problems at hazardous highway locations. Since the enactment of TEA-21, States have obligated \$489.3 million in Hazard Elimination funds, and another \$707.4 million in optional safety funds have been obligated primarily for Hazard Elimination purposes. These Hazard Elimination expenditures are estimated to have saved 7,200 lives since 1998. The Highway-Rail Grade Crossing Safety program is designed to reduce crashes at public grade crossings, and \$499 million in Highway-Rail Grade Crossing funds have been obligated. The grade crossing safety program is estimated to have saved 2,000 lives since 1998.

To meet its highway safety goal, FHWA will focus its safety programs on reducing the most frequent types of fatal crashes through technical assistance, research, training, data analysis, and public information.

From the \$359.8 million requested for research and technology programs for fiscal year 2003 budget, significant resources will be invested in improving safety. Part of the research funding will support innovations, such as brighter traffic signal lights which are more visible to drivers, to improve safety at or near intersections. Research funding also supports speed management techniques, which are designed to reduce the 30 percent of fatal crashes in which speed is a factor. Rumble strips help prevent run-off-the-road crashes, which account for 38 percent of all fatal

crashes. FHWA provides technical assistance to States like Maryland, whose 1999 data show a \$182 safety benefit for every dollar spent on rumble strip installation.

National deployment of wireless enhanced 9-1-1 (E-9-1-1) will be accelerated this year. E-9-1-1 is an emergency cellular telephone service that automatically routes calls to the closest public safety answering point and informs the dispatcher of the caller's location. It will save lives. About 25 percent of 9-1-1 calls come from wireless phones.

Without automatic location, when callers are unable to describe their location, response times dramatically increase. Response time is a critical factor in determining the survivability of a crash. Also, more timely and accurate information will aid police, fire, and other emergency responders in protecting victims and property and in reducing traffic congestion surrounding the scene.

Recent events have focused attention on the need to ensure the security of our Nation's transportation system and ITS technologies offer many opportunities to significantly improve transportation security. The ITS program is developing and deploying technologies to help States and localities improve traffic flow and safety on streets and highways and address the need for emergency notification and response. This budget proposes to focus the fiscal year 2003 ITS Deployment Program resources of \$93 million on ITS technologies that enhance the security of our surface transportation systems.

A major emphasis in ITS will continue to be in the area of intermodal freight. The Department is conducting several ITS operational tests that are designed to improve the efficiency and security of the intermodal movement of freight. The Chicago O'Hare cargo project, which is an operational test, uses a "smart card" and biometric identifiers to identify the shipment, vehicle, and driver during transportation from the shipper to and through the air cargo terminal. Another project, Cargo-Mate, has particular applicability to port and container security, in addition to enhancing efficiency of freight movement. The system is designed to perform real-time processing of asset and cargo transactions, provide for the surveillance of cargo movement to and from ports, and provide an integrated incident and emergency response capability.

To improve safety of motor carriers operating on our highways, as well as national security, a total of \$47 million is requested for construction of motor carrier safety inspection facilities on the Southern Border within the Coordinated Border Infrastructure Program. This builds on funding provided in fiscal year 2002 and supports infrastructure improvements necessary to accommodate permanent facilities.

#### MOBILITY

Congestion is one of the most obvious results of the mismatch between the growing demands for transportation and the capacity of our systems, particularly in metropolitan areas. Congestion is a complex problem involving many factors. This budget works to address the causes of frustrating delays that face travelers and shippers and impact the Nation's economic efficiency. Funding will support the identification and implementation of a mix of locally preferred investments, including selective additions of new capacity, to improve traffic flow and system reliability. Our progress toward our goal of supporting mobility is tracked by measures such as improvement in pavement and bridge condition and by reduction in the growth of traffic congestion.

States may direct 2003 Federal-aid highway funds, according to their priority needs and goals, to a variety of system improvement and congestion relief purposes. In recent years, approximately 50 percent of Federal funds were obligated for system upgrading purposes, including reconstruction, widening, restoration and rehabilitation, and resurfacing. Consequently, overall highway system conditions, as measured by pavement condition, ride quality, alignment adequacy, and bridge ratings, have steadily improved. In 2001, 91 percent of travel on the NHS occurred on pavements rated acceptable or better. In fiscal year 2003, the Department's goal is to increase this to 92 percent.

For fiscal year 2002 and beyond, the FHWA has modified its bridge performance measures in order to take into account the actual area and average daily traffic on the bridge. This measure more accurately reflects progress toward meeting our mobility goal. The previous measure of reducing the number of deficient bridges considered all bridges as equal, therefore large bridges with higher average daily traffic were considered the same as smaller bridges with lower average daily traffic. Since the enactment of TEA-21, the condition of NHS and non-NHS bridges has improved significantly. In 1998, the percentage of the Nation's total bridge deck area that was on deficient NHS bridges was 32.6 percent and 32.5 percent on non-NHS bridges. In 2001, the percentage of deck area on deficient NHS bridges was 30.6 percent and

32.3 percent on non-NHS bridges. Our goal for fiscal year 2003 is to improve the condition of bridges so that the percentage of deck area on deficient bridges is reduced to 27.5 percent for the NHS and 29.8 percent for the non-NHS.

The development and deployment of longer lasting materials will mean that facilities will need repair or improvement less often, thereby reducing congestion and safety problems associated with work zones. Research and Technology program funds support multi-year initiatives in pavements, structures, and asset management.

Along with improved condition and strategic expansion of infrastructure, we must address congestion through improved operation of the highway system. In the last year we developed and tested a system reliability index in 10 cities that we call the "buffer index," the amount of time you have to add to your trip because of system unreliability. It will help cities gauge how well they are doing in responding to incidents, managing their work zones, and responding to weather. The measure will be applied in 22 cities this year.

In the area of congestion mitigation, we have a number of other initiatives underway that will continue in 2003, including three that have great potential for long term impact:

We will be piloting a national campaign to rethink the way we look at work zones. The focus will be on managing the work zone from the perspective of the highway user, emphasizing the concept of getting in, getting out, and staying out.

We are sponsoring a national conference on incident and emergency management that brings together transportation and public safety communities to focus on ways to improve traffic incident response time and traffic incident management methods.

We are working with our State partners to help each make use of the roadway operations self assessment diagnostic tool at least once during the year. The purpose of this tool is to help the operating agencies to identify ways that they can improve the operation and management of their roadway networks.

Other strategies to improve operations include the deployment of ITS to provide more information to drivers faster, enabling them to take the most efficient route of travel. Significant progress has been made in ITS deployment since the enactment of TEA-21. We have seen a 37 percent increase in the number of freeway miles with real-time traffic data collection technologies, a 55 percent increase in the coverage of freeways by closed circuit television, a 35 percent increase in the number of buses equipped with automatic vehicle location systems, and an 83 percent increase in traveler information dissemination on our freeways. However, only 22 percent of the freeways in major metropolitan areas are instrumented for real time monitoring. Therefore, ITS deployment must continue to be a high priority for the Department. The search for new technological and innovative solutions to our mobility challenges will be supported by the 2003 budget request for \$359.8 million for research and technology.

We are committed, along with our partners at the State and local levels, to maintain, operate, and improve transportation systems to reduce congestion and improve mobility, thus allowing our Nation to compete globally and Americans to enjoy a higher standard of living.

#### ENVIRONMENTAL STEWARDSHIP AND STREAMLINING

Implementation of environmentally responsible transportation improvements, delivered on time and within budget, is an important component of the Department's vision for all its programs. TEA-21 gave States and communities additional tools and opportunities to enhance the environment and quality of life for their residents, while directing us to streamline the environmental review process. Within the Federal-aid highway program, NHS and STP funds support programs that also protect the environment. There is also a mandatory 10 percent set-aside from each State's STP apportionment for Transportation Enhancement projects that support historic preservation, bicycle/pedestrian travel, scenic easements, and other enhancements. The CMAQ program supports projects to reduce emissions, that often reduce traffic congestion. To minimize the impact of transportation on air quality, FHWA will continue to work with the Environmental Protection Agency and other partners to continue to reduce on-road mobile source emissions.

Continued progress in streamlining the delivery of transportation improvements will also improve safety and ease congestion, but must be balanced against the need to protect communities and the environment. Successful environmental streamlining requires fostering good working relationships across a number of organizational lines. These relationships allow for the development and establishment of reasonable and realistic schedules for advancing major projects. It is important for the Department to facilitate agreement by Federal agencies on timeframes for conducting

reviews and granting approvals. Working together in partnerships, combining a full range of Federal, State, and local officials and interest groups, will lead to reasonable ways to meet the Nation's transportation needs, while being good stewards of the environment.

The Department's streamlining approach has resulted in:

Reinvention of the environmental review process, through interagency training, development of national programmatic agreements, and guidance that encourages flexible mitigation practices.

Development of a system for dispute resolution that includes draft national procedures, guidance for managing conflict during the project development process, and assistance by qualified dispute resolution specialists to States and project sponsors.

Research conducted to evaluate project timeframes, identify reasons for project delays, and assess the effectiveness of implementation efforts.

Assistance, support, and encouragement to develop numerous best practices and pilot projects to catalyze change and lead to even better streamlining outcomes.

Since the enactment of TEA-21 in 1998, progress has been made in streamlining the planning and approval process for projects throughout the country: 33 States have interagency agreements for funding additional personnel necessary for faster, concurrent reviews; 23 States have adopted a merged process for wetland permits with the Army Corps of Engineers; 15 States have adopted context sensitive design approaches; and 31 States have some level of delegated authority for historic resources. As a result of these actions, the mean time to process environmental documents for major highway projects has been cut by almost 8 months, the median time has been cut by 1 year, and the Department is well positioned for significant future progress.

We have begun the job, but more can be done. Only a couple of States, most notably New Hampshire, have attempted to define timeframes for concurrent reviews. New Hampshire's model for setting project timeframes for I-93, using a partnering approach, has been publicized as an effective streamlining tool on the FHWA website and at a national streamlining workshop.

FHWA continues to work with other agencies to advance the Environmental Streamlining National Memorandum of Understanding (MOU). Efforts to cooperatively establish realistic project development timeframes among the full range of transportation and environmental agencies will be advanced by this budget. For example, in 2003 we propose to fund \$6 million from the FHWA administrative take-down for FHWA support of Federal and State initiatives to identify new, more efficient business processes that will result in more timely project delivery. Working cooperatively to adhere to those timeframes is resource intensive, but it is critical to our success. With the additional proposed funding, we will be able to intensify efforts currently underway within DOT that focus on solidifying the interagency partnerships, such as pilot efforts and process reinvention.

#### OVERSIGHT

We must continue to improve Federal oversight and accountability for the expenditure of public funds. Increased emphasis on FHWA's oversight responsibilities must accompany the significant increases that have occurred in the Federal-aid Highway program in recent years if our Nation is to make the "best buys" in safety and congestion relief.

FHWA oversight policies were updated and clarified in fiscal year 2001 and their implementation will continue into the requested budget year. Even as legislation has directed FHWA to delegate many project-level authorities to the States, the responsibility for program oversight to ensure the effective delivery of all programs remains with FHWA. Additional resources deployed in this area will enable FHWA to work with the States to improve its management of the Federal-aid highway program, including cost containment, while allowing States maximum delegated authority and flexibility, as appropriate. FHWA will continue to advance asset management and system preservation initiatives to foster more systematic and strategic thinking and investment choices by the State and local governments. Timely investments in the size and makeup of the Federal work force itself are also crucial with the aging of both the Interstate Highway System and the work forces of our partner agencies in States and localities. We are focusing new attention on work force development issues and will keep the subcommittee advised of our efforts. As larger and more complex projects are contemplated, a balance must be achieved between addressing the needs of major projects and the vast majority of the program vested in smaller projects.

In 1998-1999, FHWA undertook a major restructuring in order to move program decision authorities closer to our primary customers, the States, and to focus high-

level technical expertise in our Resource Centers. Through this redeployment of existing resources we have also been able to fulfill FHWA's commitment to add an additional position in respective Division Offices for the oversight of each major project.

The fiscal year 2003 budget requests a funding level of \$318 million for the necessary salaries and benefits for our employees and for ongoing administrative expenses in support of our Federal-aid program. The budget request reflects modest adjustments for mandatory salary and benefit increases and other adjustments for current service levels.

#### STATUS OF THE HIGHWAY TRUST FUND

The cash balance in the Highway Trust Fund (HTF) at the end of fiscal year 2001 was \$27.740 billion, of which \$20.372 billion was located in the Highway Account and \$7.369 billion in the Mass Transit Account. Based on the latest projections of income to the HTF reported by the Department of the Treasury, the Department of Transportation estimates that the Highway Account of the HTF has sufficient revenues to support the levels of authorizations throughout the life of TEA-21.

Balances in the Highway Account of the HTF should not be considered as surplus funds. Current commitments of HTF revenues for prior year obligations, as well as unobligated balances of prior year apportionments, exceed \$67 billion. However, as reimbursing cash is made available from the HTF, revenues from excise taxes are coming into the HTF. Any consideration of HTF balances must take into account not only current levels of revenue, but also commitments made against that revenue, and projected levels of future income.

#### CONCLUSION

The funding requested in 2003 will help improve transportation safety; enhance national security; maintain and expand our transportation infrastructure, and increase its capacity; reduce environmental degradation; and improve the quality of life for all our citizens. We look forward to working with Congress to enact the President's fiscal year 2003 budget in order to provide a viable transportation system to support a strong America.

Once again, thank you for this opportunity to testify today. We will be pleased to address any questions you may have.

---

#### RESPONSES OF HON. MARY E. PETERS TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question 1.* One of the most important accomplishments of TEA-21 was the creation of the highway and transit budgetary firewalls. These firewalls provide the States with some degree of certainty as to the expected level of highway and transit funding and allow transportation leaders to better plan projects and manage budgets. In addition, without these budgetary protections, we would have never been able to enact the funding increases envisioned in TEA-21.

Unfortunately, the Administration's budget request does not appear to establish any continuing connection between Highway Trust Fund revenues and highway spending. Can we expect the Administration's reauthorization proposal to maintain the existing transportation firewalls?

Response. Yes. The Federal Highway Administration (FHWA) agrees that the budgetary firewalls contained in the TEA-21 legislation not only protect highway and transit budgetary spending amounts from incursions by other discretionary programs, but also provide a direct relationship between revenues accruing to the Highway Account of the Highway Trust Fund and spending allowed in the Federal-aid Highway Program. The budget amounts for fiscal years 2004-2012, the years for which no authorization act is in place, do not reflect the Administration's reauthorization proposal. Rather they assume the continuation of the program level from the last year of TEA-21 with modest growth each year. The fiscal year 2004 President's Budget will reflect the Administration's reauthorization proposal.

The Administration's fiscal year 2003 budget was based on the legislated mechanism known as Revenue Aligned Budget Authority (RABA). Even though the RABA calculation for fiscal year 2003 produced a negative result, over the prior three fiscal years, it provided over \$9 billion in additional spending authority. RABA was established with the possibility of being either positive or negative. The negative RABA result of fiscal year 2003 is as much a part of the promise of tying spending to available revenues, as were the positive RABA results of prior fiscal years. However, the FHWA would like to work with Congress during reauthorization of the Federal-aid

Highway Program to consider adjustments to the RABA mechanism that may somewhat reduce the magnitude of swings in its calculations from one fiscal year to another.

*Question 2.* I have heard concerns raised about both the accuracy of Treasury's fiscal year 2001 Highway Trust Fund revenue figure and the reasonableness of Treasury's future revenue projections. It appears that Treasury has based future year revenue projections on the fiscal year 2001 revenues, which may represent a low point due to the recession. Has the Federal Highway Administration taken a close look at Treasury's numbers and are you comfortable that the 2001 figures are accurate and that future year projections are not underestimated?

Response. Over the years, the Federal Highway Administration (FHWA) has met frequently with Treasury and understands the process used by Treasury to administer the Highway Trust Fund (HTF). We are satisfied that the process is complete, fair, and objective, and results in the HTF being credited with the appropriate taxes. However, FHWA does not have the information to independently assess the absolute accuracy of fiscal year 2001 HTF revenues. Based on the information available to FHWA and on discussions with Treasury, the fiscal year 2001 revenues reported appear to be reasonable.

Future HTF projections are based largely on Administration estimates of the pace at which the economy will recover from the recession. It will take some time before economic conditions return to the levels forecast prior to the recession. The same is true for HTF revenues. Again, based on the information available to FHWA and on our understanding of Treasury procedures, we do not believe that future HTF revenues are underestimated.

*Question 3.* The 27 percent cut in your budget for fiscal year 2003 will have a substantial effect on State programs. Has the Federal Highway Administration made any effort to assess the impact on State programs in fiscal year 2003?

Response. FHWA has released tables that estimate the State-by-State impact of the fiscal 2003 RABA calculation (See Attachment). States then will have to make programmatic adjustments to reflect the revised funding totals. States need time to analyze and evaluate options before the impact of these adjustments on State programs can be evaluated.

To mitigate the impact of these reductions from anticipated funding, one option available to all States is advance construction. The primary purpose of advance construction is to allow projects to go forward when Federal funds are not available while having those projects retain eligibility for future Federal funds. This strategy requires the availability of non-Federal funds until additional Federal funds are provided.

If State/local funds are not available, a second option is to issue transportation bonds. The bonds could be backed by State and/ or Federal funds.

States may also consider utilizing some of their unobligated minimum guarantee special limitation from prior years, along with the minimum guarantee funds that are exempt from the obligation limitation. In the aggregate, there is currently almost \$3 billion in obligation authority available to the States.

*Question 4.* We have heard several references to the Aperformance@ of our transportation system. While I agree that performance is the critical standard by which we judge our system, I am concerned that we have not developed adequate ways to measure and track performance. The U.S. Department of Transportation puts out a biennial Conditions and Performance report, but focuses almost exclusively on conditions. Do you have any suggestions as to how we might better measure performance?

Response. Yes. The Federal Highway Administration (FHWA) is examining approaches to measuring performance that go beyond the traditional measures of congestion used in the biennial Conditions and Performance report. Since the 1999 Status of the Nation=s Highways, Bridges, and Transit; Conditions and Performance report to Congress was published, the annual FHWA Performance Plans have adopted new procedures developed by the Texas Transportation Institute (TTI) for measuring the operational performance of the Nation's highway system. These measures include the percentage of travel under congested conditions, the percentage of additional travel time caused by congestion, and the annual hours of delay experienced by drivers. These measures are calculated annually, using data collected from 400 urban areas in the United States, according to a fixed set of formulas that facilitate measuring historical congestion trends. The discussion of current highway operational performance in the 2002 C&P report will focus on these measures.

In research on customer needs and better ways to measure highway performance, the FHWA has determined that reliability is the most important aspect of perform-

ance for highway users. Unexpected delay costs significantly more in late arrivals at work or childcare for commuters, late appointments for businesses, and missed deliveries, than predictable delay for which the traveler or trucker can adjust. The FHWA has recently adopted a new measure of reliability, the buffer index, calculated as the percentage increase in the amount of travel time allowed for a trip to ensure on-time arrival on all but one working day per month. The FHWA has calculated the buffer index with data from intelligent transportation systems for 10 cities last year, and will calculate the measure for 22 cities this year. Collection of the measure will expand to other cities as the deployment of intelligent transportation systems allows.

The biennial C&P report has been steadily increasing its focus on the operational performance of the highway system, and on measuring the impacts that the condition and performance of the system has on highway users. The analytical tools used by FHWA to estimate future highway investment requirements have been modified to recognize the costs of incident delay, and the benefits that can be derived from improving system reliability. The 2002 C&P report will incorporate these analytical enhancements, and will include new information on the impacts that alternative investments could be expected to have on the operational performance of the highway system. This change in emphasis has been discussed with a variety of groups with an interest in the C&P report, including majority and minority staff from the Senate Environment and Public Works Committee.

Adequately assessing the overall performance of the Nation's transportation system will require additional measures beyond those outlined above. Aspects such as transit, bicycling, and pedestrian access should also be considered. This is an ongoing research process.

*Question 5.* I am intrigued by the American Road and Transportation Builders Association's suggestion that we enact a maintenance of effort requirement for the States. Certainly our goal in providing additional transportation funding at the Federal level is to increase the total level of infrastructure investment rather than to have States simply substitute Federal funds for State funds. Have you studied how States have reacted to the Federal funding increases since TEA-21?

Response. Combined State and local governments' highway capital investment actually grew more quickly from 1997 to 2000 than Federal highway capital investment. The Federal share of highway capital funding fell from 41.6 percent in 1997 to 39.9 percent in 2000. The latest available data strongly suggest that States have not been substituting Federal funds for State funds.

---

RESPONSES OF HON. MARY E. PETERS TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* In your written testimony, you state that "The calculation of the ["negative RABA"] adjustment is not a policy call-it is a calculation based in law . . . ." In addition, Ms. McLean stated in her oral testimony, in response to a question from Senator Inhofe, that in reducing the baseline obligation limitation for 2003 by over \$4 billion, the Administration was "just following the legislation". Accordingly, please state, with as much particularity as possible, the analysis of the law that leads the Department of Transportation to that conclusion.

Response. The Transportation Equity Act for the 21st Century (TEA-21) included several provisions intended to tie highway spending to available revenues. Sections 8101 and 8103 of TEA-21 establish funding levels for the highway budget category in terms of outlays and obligations, respectively. Section 1105 of TEA-21 amended title 23, United States Code (U.S.C.), by providing a new section 110 to establish the basic framework for Revenue Aligned Budget Authority (RABA), the related adjustment to contract authority.

As part of the annual budget submission, section 8101(d) of TEA-21, which amends section 251(b)(1) of the Balanced Budget and Emergency Deficit Control Act of 1985 (BBEDCA), requires the agency to look at actual receipts from 2 years prior to the budget year, plus revised receipt projections for the budget year. The adjustment is calculated in two parts, one looking ahead to the coming budget year and the other looking back at the prior year.

For the look-ahead adjustment, pursuant to Section 251(b)(1)(B)(ii)(I)(bb) of the BBEDCA, the latest estimate for the budget year is compared with the estimated level (provided in BBEDCA, as amended by section 8101(d) of TEA-21), and the difference is added to the amount of obligations set forth in Section 8103 of TEA-21. For the look-back adjustment, pursuant to Section 251(b)(1)(B)(ii)(I)(aa) of the BBEDCA the estimate for the prior year, adjusted for the look ahead calculation for that year, is compared to the actual receipts to the Highway Account for the prior

year. This difference is also added to the level of obligation limitation for the budget year set forth in section 8103 of TEA-21. The sum of these differences is also converted to the outlay effect and the highway category discretionary outlay caps are adjusted for the budget year and the out years.

Section 110 of title 23, U.S.C., specifies actions that the Secretary shall undertake in the event of positive (subsection (a)(1)) or negative (subsection (a)(2)) RABA adjustments. Specifically, section 110 provides for the distribution of RABA (contract authority) equal to the amount calculated pursuant to Section 251(b)(1)(B)(ii)(I)(cc) of the BBEDCA, as amended by section 8101(d) of TEA-21.

If RABA for a fiscal year is greater than zero, section 110(a)(1) of title 23, U.S.C., requires that the additional contract authority be distributed on October 15 of that fiscal year.

If RABA for a fiscal year is less than zero, 23 U.S.C.' 110(a)(2) requires that, on October 1 of the succeeding year, amounts authorized to be appropriated from the Highway Trust Fund (HTF) to carry out each of the Federal-aid highway programs (other than emergency relief) and the motor carrier safety grant program shall be reduced by an aggregate amount equal to the amount calculated pursuant to Section 251(b)(1)(B)(ii)(I)(cc) of the BBEDCA. Therefore, negative RABA calculated for fiscal year 2003 requires a reduction in contract authority to be made available in fiscal year 2004, i.e., the fiscal year succeeding the year for which negative RABA is determined. Also, when such sum is calculated and the obligation limitation in section 8103 of TEA-21 is adjusted under section 8101 (see section 251(b)(1)(B)(ii)(I)(cc), as amended by section 8101(d) of TEA-21), an equal adjustment is made to the level of obligation limitations under section 1102 of TEA-21 for the fiscal year affected by the adjustment.

Thus, adjustments in the obligation limit will occur in fiscal year 2003 for the negative RABA amount calculated this budget year, and the reduction in contract authority will occur in fiscal year 2004.

*Question 2.* There was testimony at the hearing that the receipts into the highway trust fund for fiscal year 2003 will, even with the diminished expectations under which you are now operating, exceed the statutory distribution of obligation limit for fiscal year 2003. Do you agree?

Response. Yes, we agree. Revenue aligned budget authority (RABA) is a major reason why fiscal year 2003 obligation limits will be less than estimated fiscal year 2003 revenues to the Highway Account of the Highway Trust Fund. In particular, the "look back" portion of RABA will require significant downward adjustments to obligation authority based on prior year differences between forecast and actual revenues. These adjustments will result in obligation limits being lower than revenues. Having revenues exceed obligation limits is not unusual. From 1998 to 2000 revenues exceeded obligation limits.

*Question 3.* In your written testimony, you state that "Linking highway spending to receipts is a fundamental principle of TEA-21." Given that, and also given that receipts for 2003 are expected to exceed the TEA-21 baseline, do you agree that S. 1917's restoration of obligation limit for fiscal year 2003 to \$27.746 billion is consistent with "linking highway spending to receipt"?

Response. No. Receipts to the Highway Account of the Highway Trust Fund (HTF) often exceed expenditures from the Highway Account in a fiscal year. The opposite is also true. These facts alone, however, do not determine if the legislatively mandated mechanism to tie Federal-aid Highway Program spending to receipts to the Highway Account of the HTF known as Revenue Aligned Budget Authority (RABA) is positive or negative in a given fiscal year.

Instead, the RABA calculation relies upon a look ahead to the coming fiscal year and a look back at the fiscal year just ended. For fiscal year 2003, the look-back calculation compares the actual taxes deposited in the Highway Account of the Highway Trust Fund in fiscal year 2001 to the estimate of fiscal year 2001 tax receipts used to calculate the fiscal year 2001 RABA. The fiscal year 2001 estimate, made in December 1999, was too optimistic. Thus, a downward adjustment to the fiscal year 2003 highway program of \$3.468 billion is needed to offset the overly optimistic estimate made earlier.

The look-ahead calculation compares the latest estimate for fiscal year 2003 to the estimate made at the time TEA-21 was enacted. The current economy is less robust than expected in the TEA-21 estimate and, therefore, the latest estimate for fiscal year 2003 Highway Account receipts is lower than the TEA-21 estimate. As a result, a downward adjustment to the fiscal year 2003 highway program of \$901 million is required in addition to the look-back adjustment.

*Question 4.* If you do not support passage of S. 1917, please state your reasons, with as much particularity as possible?

Response. We are working on ways to mitigate the effects of RABA that are consistent with the principles of TEA-21 while still maintaining fiscally responsible solutions. We hope to come to Congress with a proposal in the near future.

We believe that the forthcoming reauthorization of the Federal-aid highway program presents an excellent forum and a unique opportunity to consider possible modification to RABA, and we look forward to working with the Congress during TEA-21 reauthorization to address this issue.

*Question 5.* As to the issue of reauthorization, what would be the implications, both negative and positive, of restoring the collection of interest on the funds on hand in the Highway Trust Fund?

Response. Resuming the prior practice of crediting interest earned on HTF balances to the HTF could increase HTF revenues substantially, depending on HTF balances and prevailing interest rates. Before being discontinued in TEA-21, total interest payments to the highway and transit accounts of the HTF had been as high as \$2 billion. Since interest would be paid from the General Fund, resumption of interest payments to the HTF would mean that like amounts would not be available for expenditure on programs financed from the General Fund.

*Question 6.* Administrator Peters stated in her oral testimony regarding the environmental streamlining provision of TEA-21 that one of the difficulties with implementation is that the U.S. Department of Transportation, while it was tasked with environmental streamlining, does not have the authority over a number of other environmental regulatory areas. Please describe with specificity the additional authority that is needed for US DOT to more effectively implement these provisions, including any statutory or regulatory changes that would be needed to establish the necessary authority.

Response:

#### *Statutory Authority*

FHWA is not advocating any statutory or regulatory changes to environmental laws to achieve more authority. However, there are statutory constraints under Section 1309 of TEA-21 and other laws that restrict the degree of flexibility that FHWA and/or the other agencies can exercise in achieving streamlining. To protect the environment, Congress has enacted over 60 laws, including the Clean Air Act (CAA), Clean Water Act (CWA), Endangered Species Act (ESA), National Historic Preservation Act, Section 4(f) of the DOT Act of 1966 (Section 4(f)), Wild and Scenic Rivers Act, National Environmental Policy Act (NEPA), and the Coastal Zone Management Act. Many of these laws, notably the ESA, Section 4(f), and the CAA, establish stringent environmental protections, including both substantive and procedural requirements. Over 12 different agencies implement these laws through regulations, guidance, and standards developed based on their specific environmental missions. The courts have rigorously upheld the laws and agency regulations, creating an extensive and complex body of case law. Congress did not grant the U.S. Department of Transportation (USDOT) authority to collectively interpret laws administered by other agencies, to override other Federal agencies, or to compel their cooperation in environmental streamlining.

USDOT's statutory authority to administer the Federal-Aid Program stems from title 23 U.S.C. Section 4(f) is the only environmental law under USDOT domain. USDOT ensures that transportation projects, which use Federal funds or require Federal approval, have implemented the Federal requirements associated with the expenditure of those funds. For transportation projects, NEPA is the umbrella under which all environmental laws are coordinated. NEPA requires agencies to prepare a statement on the impact of each proposed "major Federal action significantly affecting the quality of the human environment." NEPA also defines the procedures regarding how USDOT meets its Federal action approval. Some observers believe that if a project does not require an EIS, then the project is exempt from all Federal environmental laws and requirements. This is not correct. Even categorically excluded projects may require coordination or Federal approvals under laws other than NEPA.

#### *Agency Requirements Under NEPA*

As Lead Agency under NEPA, the Federal Highway Administration (FHWA) affirms that all of the related environmental requirements have been addressed before granting approval for the expenditure of funds or when a Federal approval is required. FHWA does this by approving one of the following environmental documents: a "Record of Decision" for an Environmental Impact Statement; a "Finding of No Significant Impact" for an Environmental Assessment; or a "Categorical Exclusion." Any number of Federal agencies will be involved. Each Federal agency has a distinct mission and specific role in the NEPA process. The Environmental Protec-

tion Agency (EPA), Army Corps of Engineers (USACE), Fish and Wildlife Service (FWS), National Marine Fisheries Service (NMFS), and Advisory Council on Historic Preservation (ACHP) are the Federal resource agencies most frequently engaged in reviews of transportation projects.

Resource agencies meet their statutory obligations by reviewing project proposals, identifying the potential concerns, and evaluating the impacts proposed projects would have on specific resources. For example, USACE must issue a Section 404 permit for the dredge and fill of waters of the United States, primarily wetlands. USACE bases its decision to grant a permit for a transportation project, in accordance with Section 404(b)(1) of the CWA, on whether the issuance of the permit, not the project itself, is in the best interest of the public. USACE must base its permit decision on the "Least Environmentally Damaging Practicable Alternative." Certain conditions or modifications may have to be made to a project to satisfy the USACE or another permitting agency. In addition to Section 404, Section 7 of the ESA and Section 106 of the NHPA are the most common laws impacting transportation projects. These statutes and others define and impose conditions that drive the environmental review analysis or approval by resource and permitting agencies.

Under the leadership of the Bush Administration and with the full commitment of the Secretary, we will be working with the other agencies at the highest level to make the collaborative process more efficient and effective.

---

RESPONSE BY HON. MARY E. PETERS TO ADDITIONAL QUESTION FROM SENATOR  
INHOFE

*Question.* What effect will the proposed excise tax credit for ETBE-blended gasohol have on revenue into the Highway Trust Fund?

*Response.* The proposed excise tax credit for ETBE-blended gasohol will have a negligible effect on revenues into the Highway Trust Fund. At this time, because of market economics, very little ethanol is being used to manufacture ETBE.

---

STATEMENT OF THOMAS E. STEPHENS, P.E., DIRECTOR, NEVADA DEPARTMENT OF  
TRANSPORTATION ON BEHALF OF THE AMERICAN ASSOCIATION OF STATE HIGHWAY  
AND TRANSPORTATION OFFICIALS<sup>1</sup>

Mr. Chairman and members of the committee, my name is Tom Stephens. For the past 7 years I have been the Director of the Nevada Department of Transportation, and I am here today to testify on behalf of the American Association of State Highway and Transportation Officials (AASHTO). I also am President of the 18-State Western Association of State Highway and Transportation Officials.

I want to thank you for your leadership in scheduling a series of hearings over the coming year to address key policy, program and funding issues in preparation for the reauthorization of the Transportation Equity Act for the 21st Century (TEA-21). I am also honored that you invited me to testify before your subcommittee. I believe that I can offer some real world experience from the field, especially on the subject of today's hearing—funding the Federal-aid highway program.

Mr. Chairman, I would like to start by giving your colleagues a brief picture of the great Silver State. Nevada is the fastest growing State in the Nation. Since 1970, the State's population has quadrupled from 500,000 to more than 2 million residents. A majority of this growth has taken place in just five urbanized areas—Las Vegas, Reno, Sparks, Carson City and Elko. In Clark County alone, where Las Vegas is located, we estimate that by 2010 we will have 400,000 additional residents. Along with this population growth, we have seen a steady increase in the number of miles of congested highways.

We are also a large State—with roughly the same land area as all the New England States combined. Our State-maintained highways and bridges spread out across many rural miles as well as in the metro areas. Twenty-six percent of all Nevada's improved roads are on the State-maintained system. However, this 26 percent carries 61 percent of the total vehicle miles of travel. The remaining 39 percent is on systems maintained by county, city or other governmental agencies. Vehicle miles of travel on all Nevada roads more than quadrupled from 3.5 billion in 1970 to 17.4 billion in 2000. The State-maintained system also carries 84 percent of all

---

<sup>1</sup>Founded in 1914, AASHTO represents the departments concerned with highway and transportation in the 50 States, the District of Columbia and Puerto Rico. Its mission is a transportation system for the Nation that balances mobility, economic prosperity, safety and the environment

truck traffic. With more cars, additional heavy trucks, and more vehicle miles of travel, our biggest challenge is preservation of our highways.

However, as the fastest growing State in the Nation, and with much of that growth concentrated in just two counties—Washoe and Clark, we have an added capacity challenge. In our metropolitan areas, we are working with our local

officials to try to keep pace with our population growth and new demands on the system. In Nevada, we are investing in new multi-modal strategies. These include a privately funded \$600 million monorail people mover system and a bus rapid transit system in Las Vegas which will feature low-floor, electric powered buses with an optical guidance system. We will invest in innovative ITS technologies such as dynamic message signs, ramp meters, closed circuit television and traffic detection systems. Other efforts include “low-tech” car-pooling, telecommuting and new bike and pedestrian facilities.

We will still need substantial additional highway capacity.

With the growth in the Federal-aid highway program provided by TEA-21, we have been able to make progress in our preservation and highway capacity needs. At the beginning of fiscal year 2001, there was a \$483 million backlog of highway and bridge preservation work. This is significantly lower than the \$670 million backlog we had at the beginning of fiscal year 1999. We were able to reduce the backlog by investing significantly greater amounts in pavement preservation. During fiscal years 1999 and 2000, our department spent \$329 million on overlay and reconstruction work—our biggest pavement preservation program ever.

TEA-21’s highway program increases have also enabled us to undertake an aggressive effort to keep pace with our growing population and make a real difference in addressing congestion. For example, the \$99 million “Spaghetti Bowl” I-15/U.S. 95 interchange in Las Vegas opened in March, 2000, 6 months ahead of schedule. The revamped interchange will reduce the congestion caused by the 330,000 vehicles using it each day. It is now capable of accommodating 500,000 vehicles per day.

Mr. Chairman and members of the committee, let me now address how the funding of the Federal aid highway program for fiscal year 2003, and beyond, can be sustained at levels required to meet this nation’s needs.

Mr. Chairman, we in the States are stunned by the fiscal year 2003 budget proposal which, in the midst of a recession, would cut the Federal aid highway program by \$8.6 billion because apparent reductions in revenues to the Highway Trust Fund have triggered a Revenue Aligned Budgetary Authority (RABA) reduction. To avoid a disastrous cutback in highway improvements, reducing our ability to meet basic highway needs, and to avoid the loss of thousands of jobs, we strongly support the bill you introduced last week to restore highway assistance to no less than the \$27.8 billion level for fiscal year 2003 authorized in TEA-21. We commend you for your appreciation of how important sustained highway investment is to the country and thank you for your leadership in putting this legislation forward.

We also want to share with you our emphatic view that it is vital to sustain Federal highway investment in fiscal year 2003, at no less than the \$31.8 billion level provided in fiscal year 2002. With 36 State Governors and legislatures already contending with severe budget shortfalls, and the Nation in an economic downturn, cutting the program by \$4.3 billion makes no more sense than cutting it by \$8.6 billion. This is especially so when there are more than sufficient reserves in the Highway Trust Fund to provide funding for fiscal year 2003. Let me outline what we believe the consequences would be unless current levels of funding are sustained.

As early as next month, State and local officials will begin the task of cutting billions of dollars in highway projects from their fiscal year 2003 Transportation Improvement Programs. Final decisions will be made public in September affecting nearly every community in the Nation.

Construction contractors throughout the country will start making business plans on how to cut back their equipment purchases and lay off tens of thousands of well-paid construction workers. The stock prices of several heavy equipment manufacturers and construction companies have already dropped. Engineering consulting firms, already hard hit by the recession, will almost immediately have to start laying off engineers and technicians as design work for next year’s projects is delayed or canceled.

Yet since the tragic events of September 11, traffic is up all over the country. The most recent data shows a dramatic increase in annual traffic growth of nearly 3 percent. For example on I-15 at the California-Nevada border, our vehicle count for the last 3 months is up nearly 10 percent. This highway is really bottlenecked, especially in California where Interstate 15 and 40 converge into a single four-lane Interstate carrying the traffic from Arizona and Nevada to Los Angeles. While this bottleneck is scheduled to be widened, the cut in TEA-21 funding could cause project delays resulting in hundreds of millions of dollars in congestion-related costs.

Numerous other projects will be delayed in every State. This cut is proposed at a time of increasing need for highway preservation projects in every part of the country and capacity projects in rapidly growing States like Nevada.

STATE IMPACTS

AASHTO last week initiated a survey of State departments of transportation to assess the direct and indirect dollar and project impacts across all 50 States. While that survey is still in progress, here is an example of what we found:

- In Ohio, approximately \$187 million worth of construction projects would be delayed or canceled. \$47 million in preconstruction, right-of-way and/or environmental activities would be impacted.
- In Oklahoma, a total of \$120 million in construction and right-of-way projects would be delayed or canceled. This could also impact the State’s proposed \$1 billion GARVEE Bond Program, with the construction let dates for the proposed projects being delayed.
- In Montana, \$66.8 million reduction would result in a loss of 2,805 jobs—roughly equal to 25 percent of the new jobs created in Montana in 2001. This drastic reduction will have significant impact on the many small construction and design firms in Montana.
- In Alaska, even if the program recovers in 2004, the reduction in design efforts in fiscal year 2003 will translate into future delays in construction contracting of nearly \$50 million.
- In Florida, a reduction of \$324 million is equivalent to approximately 24 percent of the fiscal year 2003 capacity construction program. Implementation of these reductions would negate gains in jobs and transportation improvements achieved from recent transportation initiatives of the Governor and legislature.

One serious concern that must be addressed is the accuracy of the process used by the Department of the Treasury to determine the revenue estimates used in calculating RABA. The correction of a \$600 million error by the Department of Treasury has already reduced the proposed highway cutback to \$8.6 billion. Recent information on fiscal year 2001 truck sales and fuel tax revenues at the State level call into question the Treasury forecasts, and leads us to believe that other adjustments in RABA could occur.

The public policy questions Congress needs to address are these. First, to assist in the nation’s economic recovery does it not make sense to sustain highway funding at \$31.8 billion? Second, are there reserves and cash-flow in the Highway Trust Fund to make this possible in fiscal year 2003? The answers are “Yes” and “Yes!”

FUNDS ARE AVAILABLE TO SUSTAIN FISCAL YEAR 2002 LEVELS

Four years ago we agreed to the fundamental principle that all the receipts going into the Highway Account would be fully used for transportation purpose, and not be used to offset other government expenditures. But today there is a \$20.3 billion cash balance in the Highway Trust Fund. We seek to provide \$8.6 billion in obligations which will restore the highway funding to the fiscal year 2002 level. The budget impact of this increase will only require \$2.3 billion in outlays for fiscal year 2003. Because highway funds are spent over a period of about 7 years, \$2.3 billion in additional outlays in fiscal year 2003 will allow us to continue the momentum we have achieved in fiscal year 2002.

The table displayed below shows receipts and expenditures for the Highway Account of the Highway Trust Fund for Fiscal Year 1998 thorough Fiscal Year 2003. Even accounting for unpaid obligations, it is clear that there is a substantial balance in the Highway Account with receipts exceeding outlays over the 6-year period. Mr. Chairman, we respectfully urge the Congress and the Administration to honor their commitment to spend all the receipts going into the Trust Fund, unlock the balances that have built up and make a positive contribution to the current economic recession.

Highway Account Receipts and Outlays<sup>1</sup>

| Fiscal year | Receipts | Outlays | Difference |
|-------------|----------|---------|------------|
| 1998 .....  | 24.3     | 20.3    | 4.0        |
| 1999 .....  | 33.8     | 23.1    | 10.7       |
| 2000 .....  | 30.3     | 27.0    | 3.3        |
| 2001 .....  | 26.9     | 29.1    | -2.2       |
| *2002 ..... | 27.7     | 30.2    | -2.5       |

\*Estimated  
 Note: The Highway account balance was \$8 billion at the beginning of TEA-21. Therefore, the cash balance at the close of fiscal year 2001 is \$20.3 billion.  
 Source: Federal Highway Administration Long-term Impacts

In addition to the immediate impacts of reducing highway spending by more than a quarter, the RABA downward adjustment has longer-term consequences for the Federal-aid highway program. If the obligation level for Fiscal Year 2003 is adjusted downward from \$31.7 to \$23.2 billion, then the \$23 billion level will become the baseline for reauthorization of TEA-21. That would leave us at a starting point \$8.6 billion below where we are today, and considerably lower than the \$27.8 billion obligation level for fiscal year 2003 contained in TEA-21. Starting in such a deep hole, would make it much more difficult to maintain the Federal-aid highway program at current levels, and perhaps impossible to expand it.

TEA-21 REAUTHORIZATION

As we look to reauthorization of TEA-21 and the future of the Federal-aid highway program, we believe that, first, it is essential to preserve and reaffirm the principle of a user-based transportation financing system in which all receipts are guaranteed to be used for the purposes for which they were intended.

To accomplish this, TEA-21 set highway obligations at levels based on then-current estimates of gasoline and related tax receipts, and established a new mechanism, Revenue Aligned Budget Authority (RABA), to annually adjust them based on updated revenue estimates.

To ensure that domestic discretionary caps would not prevent the use of all available revenues, a “firewall” provision was included in the Budget Enforcement Act to increase or decrease highway spending each year so that it would align itself with Highway Trust Fund receipts. This provision provides for a “spending guarantee.” Congress also guaranteed an annual funding level for transit programs, which are funded with a combination of highway tax receipts accruing to the Mass Transit Account of the Trust Fund and a general fund contribution. I should add that we are pleased that in the just released Fiscal Year 2003 budget, the Administration honors the transit funding guarantee.

Mr. Chairman, this year the spending caps expire. If and when Congress considers new caps, we urge you and the members of the subcommittee to lead the way in ensuring that the “firewall” provision is maintained.

These tools—RABA and the “firewall” provisions—were designed to provide the long-term fiscal stability needed for State and local highway and transit agencies to finance, design and execute multi-year construction programs.

Recent experience has demonstrated, however, that there are unintended flaws in the RABA mechanism. Changes in economic conditions that result in minor adjustments to estimated receipts cause wide swings in highway funding levels. In reauthorizing TEA-21, we must carefully examine and refine the RABA mechanism, including its calculation methods and revenue estimating procedures. We recommend that you consider replacing the current calculation method with one that simply compares actual previous year receipts to the assumptions made at the time the bill passed, with the difference becoming the RABA adjustment.

We also recommend that you consider instituting reforms to the Department of Treasury’s process for estimating tax receipts to the Highway Account. This is not the first time that the Department of Treasury has made costly errors. In 1994, a \$1.3 billion error eventually cost \$3.6 billion to correct. This most recent \$600 million error leaves us with absolutely no confidence in their accounting methods. We are not alone in our concerns. In June 2000, the U.S. General Accounting Office released a report<sup>2</sup> in which they indicated that “Treasury’s process for allocating tax receipts to the Highway Account of the Highway Trust Fund is complex and error

<sup>2</sup>Highway Funding: Problems with Highway Trust Fund Information Can Affect State Highway Funds(GAO/RCED/AIMD-00-148, June, 2000)

prone.” At the request of House Transportation and Infrastructure Chairman Don Young and Ranking Member James Oberstar, GAO is now engaged in a new review of Treasury’s methods for estimating receipts to the Highway Account. We urge you carefully consider the results of GAO’s review, and consider appropriate reforms during reauthorization.

#### REVENUES

Near term: Changes regarding gasohol revenues need to be addressed during TEA–21 reauthorization. A significant portion of the unanticipated downturn in fiscal year 2001 revenues was due to increased gasohol sales, which grew by nearly 30 percent. This accounted for a significant portion of the revenue reduction. Now that the use of MTBE is to be discontinued in several States, the only fuel additive approved to address the oxygenate requirements in the Clean Air Act is gasohol. Prior to the change regarding MTBE, the most heavily affected State due to the lower tax rate charged for gasohol was Ohio, which lost over \$175 million in fiscal year 2001. A recent study by the State of Wisconsin indicates that the impact may grow significantly worse in the near future, with the impact on California for example increasing to \$450 million next year. Areas such as New York and New England are expected to be hard hit as well. This will become a priority issue to be addressed during reauthorization. The Baucus Bill, for example, which would shift revenue from the 2.5 cents on gasohol now going to the General Fund to the Highway Trust Fund beginning in fiscal year 2004, is a step in the right direction. Still more may be required.

Long Term: The second revenue issue is longer term in nature. It is a concern for the future ability of gas tax revenues to sustain highway funding as increases in fuel efficiency reduce revenues relative to travel, and other technological changes occur such as a move to greater reliance on alternative fueled vehicles including fuel cells, compressed natural gas, and electricity. We believe the time has come for Congress to mandate a study of this issue by GAO or the National Academy of Science and the development of alternatives for consideration during reauthorization deliberations in 2009.

#### CONCLUSIONS

In conclusion, I would like to state that the Federal-aid highway program has been one of the most successful Federal-State partnerships ever created. It has contributed to the nation’s mobility and to the unprecedented economic growth that the Nation has experienced since the 1950’s.

TEA–21 is a major step forward in providing much-needed funding to the nation’s highway and transit program. It is essential that the RABA principle of fully spending Highway Trust Fund receipts and guaranteeing that spending be maintained. However, it is also essential that in a time of recession, the consequences of the RABA mechanism not be permitted to eliminate hundreds of thousands of jobs while setting back much-needed transportation projects nationwide.

We clearly have sufficient receipts in the Highway Trust Fund to sustain a higher program level. Authorizing a higher level is consistent with TEA–21, which provided more contract authority to the States to assure the Congresses could increase the program above the guarantee. We urge the Congress to make this investment in America.

---

#### RESPONSES BY THOMAS STEPHENS TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question 1.* Please walk us through the impact that an In February AASHTO conducted a survey of the State departments of transportation on the impacts to their programs from an \$8.6 billion funding cut. The results of the survey are included in the report *Shortchanging America: Impacts on States from an \$8.6 billion Reduction in Federal Highway Funding*. A copy of the report is attached, and we request that it be included as part of the record for the hearing.

*Response.* In February AASHTO conducted a survey of the State departments of transportation on the impacts to their programs from an \$8.6 billion funding cut. The results of the survey are included in the report *Shortchanging America: Impacts on States from an \$8.6 billion Reduction in Federal Highway Funding*. A copy of the report is attached, and we request that it be included as part of the record for the hearing.

*Question 2.* In your written testimony you express concern about the accuracy of the Treasury revenue estimates. Can you tell the committee what specifically gives rise to your concern?

Response. First, we were disturbed to learn that just before the President's Budget was issued the Treasury advised that they had determined that almost \$600 million in revenue had been credited to the Transit Account of the Trust Fund when in fact it was Highway Account revenue. This represents a serious accounting error.

In addition The Treasury in explaining the sharp drop in revenue attributed a substantial amount of the change to truck sales tax declines citing a 55 percent drop in truck sales tax collections. This is in contrast to sales figures from the trucking industry, which reported only a 24.2 percent drop in sales. Even allowing for adjustments the industry sales data doesn't correlate with the Treasury figures.

Also Treasury's data assumes that gasoline tax revenues drop 6 percent from 1 year to the next. However, FHWA's Traffic Volume Trends Report issued monthly shows VMT increasing 2.07 percent for the first 9 months of 2000. In comparing the data to that for fiscal year 2001 the data seem to be flat.

*Question 3.* We have heard several references to the "performance" of our transportation system. While I agree that performance is the critical standard by which we should judge our system, I am concerned that we have not developed adequate ways to measure and track performance. The U.S. Department of Transportation puts out a biannual Conditions and Performance report, but focuses almost exclusively on conditions. Do you have any suggestions as to how we might better measure performance?

Response. This question recognizes the serious weaknesses we have today in measuring performance. Much of the concern for better measurement is a product of increasing congestion. We have not really developed effective ways of transmitting the scope and character of congestion to the public in terms of its breadth depth and duration in an understandable way. Another reason for our need to better measure performance is the growing value of time to both travelers and of freight. Both will demand more exacting levels of service in the future.

System performance is about:

- Speed
- Cost
- Convenience
- Safety and Security
- Reliability

All of these factors are things that we presently measure badly, or not at all. Most particularly measures of cost and reliability are very weak. We are working with FHWA to construct better ways to introduce the measurement of reliability into the description of the system's functioning and to produce a more comprehensive condition and performance report that truly reports condition and performance.

AASHTO is currently undertaking a major research effort to quantify highway and transit needs, including incorporating a measurement of reliability for the highway component. The results will be presented in the AASHTO Bottom Line Report, which is scheduled to be released in September 2002.

*Question 4.* I am intrigued by the American Road and Transportation Builders Association's suggestion that we enact a maintenance of effort requirement for the States. Certainly our goal in providing additional transportation funding at the Federal level is to increase the total level of infrastructure investment rather than to have States simply substitute Federal funds for State funds. Have you studied how States have reacted to the Federal funding increases since TEA-21?

Response. While AASHTO has not surveyed the States to get a quantitative assessment of the total Federal, State and local percentages of total highway expenditures, anecdotal information suggests that the States have effectively leveraged TEA-21's Federal contribution to increase the overall State contribution.

For example:

- In Illinois, Governor George Ryan's 5-year "Illinois First" initiative makes available \$10.5 billion for highways and \$4.1 billion for transit;
- Kansas has enacted a 10-year Comprehensive Transportation Program funded from increases in the State gas and sales taxes and additional bonding authority;
- In California, Governor Gray Davis and the State legislature enacted a \$15 billion congestion relief program that combines Federal, State and local funds; and
- Rhode Island voters passed a \$62.5 million transportation bond issue for new transit equipment and work on I-95; and,

Another indicator is the number of bids let:

- Colorado let \$491 million in bids in 1999, up from \$229 million in 1995;
- Tennessee let \$694 million in bids in 1999, up from \$597 million in 1995;
- Texas let more than \$3 billion in bids in 1999, up from \$1.7 billion in 1996; and,
- Wisconsin let \$597 million in bids in 1999, up from \$414 million in 1995.

In addition, when you examine FHWA's most recent statistics for Federal, State and local percentages of total highway expenditures over the past 5 years, the Federal, State and local percentage shares of expenditures have remained relatively constant. Attached a table based on information from FHWA

---

RESPONSES BY THOMAS STEPHENS TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* Mr. Stephens testified that States have not experienced a drop in State revenues due to motor fuel taxes that may have served as an indicator for the Federal Highway Trust Fund revenue fluctuations. What has been the trend over the last several years in State motor fuel tax collections?

Response. AASHTO asked States to provide actual State transportation revenues for 1999–2001 from State gasoline, gasohol and diesel taxes. We also asked States to provide forecasted State transportation revenues from 2002 and 2003 from State gasoline, gasohol and diesel taxes. The results from 36 States is included in a table showing actual and projected revenues, along with percentage difference from the prior year. A copy of the table is attached.

State fuel tax revenues increased by 2.7 percent between 1999 and 2000, and increased 1.5 percent between 2000 and 2001.

---

STATEMENT WILLIAM D. FAY, PRESIDENT AND CEO, AMERICAN HIGHWAY USERS ALLIANCE

Mr. Chairman and members of the subcommittee, I am Bill Fay, president and CEO of the American Highway Users Alliance. Thank you for inviting us to testify at this very important and timely hearing on highway funding for 2003 and future years.

The Highway Users is one of the most broad-based and diverse advocacy groups in the Nation. We are like a consumers' group for motorists and businesses who pay the taxes that support the Federal highway program. Our vast membership includes the most visible user groups—AAA and the nation's truckers, buses, and recreational vehicles—but also those who ensure their safety—3M, insurance companies and the traffic service industry. It includes businesses that rely on efficient roads to ease the flow of raw materials, supplies, and finished products—such as farmers, auto and auto parts makers and dealers. And our members include those who build roads and mine, drill, and refine the products essential to highway travel—petroleum, asphalt, cement, and aggregates producers, and many others. Our 45 million members have a strong interest in how much the government collects from motorists and how that money is invested after it gets to Washington.

The subject of today's hearing includes both short-and longer-term issues: the Administration's fiscal year 2003 budget proposal and the major funding issues pertaining to next year's reauthorization legislation. Putting first things first, I will begin with the 2003 budget and then discuss funding for reauthorization.

*Fiscal Year 2003 Highway Funding*

Transportation Secretary Mineta foretold the drop in guaranteed highway funding when he testified before this committee nearly 3 weeks ago. Last week, the President's fiscal year 2003 budget confirmed that the guaranteed obligation limitation for next year will be approximately \$8.6 billion less than the \$31.799 billion provided in 2002. That's more than a quarter of the program (a 27 percent cut) in 1 year.

According to the Administration, the cut is a straight-forward calculation based on a substantial reduction in fiscal year 2001 tax receipts relative to previous estimates combined with revised, lower estimates of fiscal year 2003 tax receipts. Questions, of course, remain regarding the accuracy of the Treasury Department's accounting of those receipts, and I understand the General Accounting Office (GAO) is reviewing Treasury's calculations for a report due in May. Apparently, one error was found after the principal budget documents were sent to the printer but in time for the more accurate figures to be reflected in the Department of Transportation's own budget documents. Correcting that error resulted in a \$600 million increase in trust fund tax receipts and a corresponding increase in the fiscal year 2003 guaranteed highway funding.

The possibility of further errors in the calculation of trust fund receipts is important, and we look forward to reading GAO's final report. Assuming, however, that the current figures are generally correct, we have a simple point to make about the fiscal year 2003 budget: a 27 percent cut in 1 year in the nation's largest infrastructure program is too much.

It would have serious economic repercussions just at a time when the country is struggling to get out of a recession, and it would be a devastating blow to our national transportation system.

Mr. Chairman, a week ago, when initial expectations were for a \$9.1 billion cut in guaranteed funding for highways (rather than \$8.6 billion), we obtained a Federal Highway Administration chart showing the potential impact on each State's obligation limitation. The losses spread across the States are nothing short of calamitous. Nevada, for example, would lose over \$53 million of the \$200 million it received this year. Similarly, Oklahoma would lose \$118 million out of its \$428 million in 2002 receipts. While the \$600 million downward revision in lost funding will mitigate those reductions slightly, the cuts, as a percentage of the States' total Federal funds, are still dramatic.

*The Cost of Losing One's Job to Families and Society*

As you have heard from others, funding cuts of this magnitude will result in lost jobs, perhaps hundreds of thousands of jobs over time. Far too many of those jobs will be lost before the fiscal year even begins as contractors begin laying off workers in anticipation of the project delays that will inevitably follow. These are high-paying jobs that induce many other jobs. Such dramatic changes in employment would increase the call of Federal unemployment compensation funds and other social programs, as well as cut the flow of tax dollars from those affected families and individuals. Attached to my testimony is a 1984 study released by the Joint Economic Committee on the social effects of losing one's job. It paints a dire picture of personal financial hardships, loss of health insurance, and rising mortality, divorce, criminal activity, and suicide. Quoting from that study, "The longer [joblessness] endures, the more likely it becomes that frustrations will be vented on the family—or on the rest of society." While I wish the study were more recent, it is unlikely the torment of losing one's job today is any less consequential than it was in 1984.

*The Life-Saving, Time-Saving, Fuel-Saving, Economic and Environmental Benefits of Road Investments*

Equally important from the perspective of motorists, a 27 percent reduction in funds will delay the important benefits of roadway improvements—the safety benefits of reducing crashes, injuries, and fatalities; the air quality, time-saving, and fuel-saving benefits of relieving traffic congestion; the economic and productivity benefits of speedier deliveries. These are the primary reasons that fuel taxes are the taxes that Americans pay most willingly. They realize the benefits of a safe, uncongested, and accessible highway system to themselves, their families, and their businesses. But those benefits are only realized if their tax dollars are used as intended.

In 1999, The Highway Users published a study identifying the worst traffic bottlenecks in the country and the benefits that could be realized by improving traffic flow at those sites. Unclogging America's Arteries: Prescriptions for Healthier Highways showed that very modest traffic flow improvements at each of our 167 worst bottlenecks would result in 287,000 fewer crashes over 20 years, including 1,150 fewer fatalities and 141,000 fewer injuries; they would reduce carbon monoxide emissions by 45 percent and volatile organic compound emissions by 44 percent, while carbon dioxide emissions would fall by 71 percent at those sites; they would slash fuel consumption by nearly 20 billion gallons; and of course, they would reduce travel time by an average of 19 minutes per trip. With polls showing that time management is one of the greatest challenges facing American families today—38 minutes less for a commuter driving to and from work represents more time for family, work, errands, and recreation.

That's an example of the "big bang for the buck" that this program has the potential to deliver, but too little funding will delay these large, critically important projects for years. That's why this debate over 2003 funding is so important to us.

*We Must Preserve The Fundamental Premise of RABA and TEA-21's Firewalls: Highway Taxes Received Equals Highway Investments Made*

Let me be clear about our view of the funding predicament we face in 2003. We do not believe there is anything fundamentally wrong with either the RABA provisions or the budgetary firewall provisions of TEA-21. It is clear that Treasury's models did not foresee the recession (resulting in a large "look back" adjustment) and that those same models will likely understate the economic recovery that most economists predict to begin in upcoming months. As such, some minor adjustments to the method of calculating tax receipts and guaranteed funding levels may help eliminate dramatic changes in funding from 1 year to another, but the link established in TEA-21 between tax receipts and guaranteed funding for the program has been critical. It is, in fact, the reason that TEA-21 was so warmly embraced by

America's highway users—it restored the “trust” in the Highway Trust Fund. The chart appended to my testimony illustrates the impact that RABA and the firewalls have had on funding for highways during the TEA–21 years compared to the previous 6 years.

The fact that revenues have fallen short of previous estimates simply puts all of us back in the annual budget and appropriations game that we used to play every year before TEA–21 tied highway funding to trust fund receipts.

The Highway Users looks forward to being back in the game this year and working with all of you, your House counterparts, and members of the Appropriations committees to see that this vital infrastructure program is not cut by 27 percent in 1 year.

We commend the members of this committee for your recent introduction of “The Highway Funding Restoration Act,” legislation to raise the fiscal year 2003 obligation limitation to \$27.7 billion, the amount anticipated when TEA–21 was enacted. By adding \$4.4 billion to the amount guaranteed for 2003, your legislation will soften the blow of negative RABA in these difficult economic times. The Highway Users strongly supports this legislation, and we are already working hard, through our grassroots contacts, to build political support and enlist additional cosponsors for the bill. We have a similar campaign underway to support the identical legislation introduced by your counterparts on the House Transportation and Infrastructure Committee.

#### *\$18 Billion in Motorist Taxes Just Sitting in Washington*

Although funding will be tight because of the war on terrorism and renewed deficit spending, I believe America's highway users have a strong case to make for additional highway funding above the guaranteed amount. In addition to describing the very serious impact of this cut on State highway funding, jobs, safety, congestion, and the environment, we can also cite a key distinction between our cause and the argument Members of Congress will hear from other interest groups: the money for highways has been collected in advance.

Before TEA–21, interest was accrued on surpluses in the Highway Trust Fund. This interest was ridiculed by some Members of Congress as “funny money” that wasn't really owed to highway users. As a condition for establishing a link between revenues and investments, TEA–21's framers agreed to eliminate all but \$8 billion of the previously existing cash balance in the Highway Account and to stop any further interest payments to the account. As a result, since TEA–21's enactment, not one penny of that \$8 billion or subsequent additions to the trust fund surplus is attributable to interest payment transfers from the General Fund.

According to the Administration's budget, the Highway Account of the Highway Trust Fund will have a cash balance of more than \$18 billion at the end of this fiscal year. All of today's cash balance—every dime—is money previously paid by motorists and intended for improvements to our nation's roads and bridges.

If Congress were to increase the 2003 obligation limitation by a full \$8.6 billion to bring us up to this year's level, the cash balance in the Highway Account would only be reduced by approximately \$2.3 billion in fiscal year 2003. That would leave more than \$15 billion in the account as you consider funding levels and other issues in the reauthorization legislation.

#### *Funding Issues in Highway Reauthorization*

That leads me to the longer-term highway funding issues that you asked us to address in connection with next year's reauthorization legislation. Let me begin again with the basic facts.

Tax receipts to the Highway Account of the Highway Trust Fund will be just over \$28 billion next year, according to the President's budget documents. The Administration projects conservatively that those receipts will grow by almost \$1 billion a year through 2007. The truth is, we collected more than \$30 billion in both 1999 and 2000, so if the economy picks up, we can expect trust fund receipts to rise significantly above the Administration's projections. Still, the need for additional highway investment is substantially greater than those Highway Account tax receipts can support, according to the FHWA biennial report on road and bridge conditions and performance. To us, that suggests several clear funding priorities. The first priority, and by far the most important, is to continue the direct link between annual highway funding and the taxes paid by motorists. Whether that link is accomplished through RABA and the budgetary firewalls, a modified version of them, or some other mechanism entirely, the point is to provide as much assurance as possible that highway funding will not be less than the taxes paid by motorists and deposited in the Highway Account.

Second, the reauthorization legislation should ensure that all taxes paid by highway users are used for their intended purpose. Here, there are several opportunities to improve upon current law.

*Support S. 1306, Which Will Shift Ethanol Tax Receipts into the Highway Trust Fund*

Last year, Senator Baucus introduced S. 1306, a bill to transfer into the Highway Trust Fund that portion of the tax on ethanol-blended fuels that currently is diverted to the General Fund. We strongly support the Baucus legislation, and we appreciate the fact that four other members of this subcommittee, including you, Mr. Chairman, are cosponsors of it. If enacted, the bill would increase annual trust fund deposits by more than \$400 million, and it would ensure that the trust fund receives virtually all taxes currently imposed on motor fuels.

*End Fuel Tax Evasion*

Another step toward ensuring the integrity of highway use taxes would be to close the remaining loopholes in the tax collection system that allow unscrupulous individuals to evade the Federal taxes they should be paying. Former Federal Highway Administrator Ray Barnhart originally brought this issue to Congress' attention years ago. His efforts resulted in a change in the tax collection system for motor fuels, closing the books on tax evasion schemes that robbed the Highway Trust Fund of hundreds of millions of dollars in revenue. Administrator Barnhart believes, however, that other substantial tax evasion schemes still exist, and I urge the subcommittee to review the report on this subject, prepared by kpmg Consulting Inc., which is appended to my testimony.

We understand that efforts are underway to draft legislation closing these loopholes. We expect to support this legislation, and we will report back to the committee once a bill is introduced.

*Reduce the Highway Trust Fund Surplus Over Time*

Our final recommendation for ensuring the integrity of highway use taxes is to spend down the Highway Account balance over time. As I indicated previously, the cash balance in the account will be \$18 billion at the end of fiscal year 2002, slightly less than that by the end of 2003, depending on how much funding is ultimately appropriated for next year.

All of that money has been paid by motorists. All of it was intended to be used for road and bridge improvements. It ought to be used for its intended purpose.

After protecting the integrity of highway use taxes, we ought to guard against proposals that will reduce the revenue available for the highway program.

*Don't Triple Ethanol Mandate*

For instance, the renewable fuels mandate proposed in S. 1766, the "Energy Policy Act of 2002," would require that large amounts of renewable fuels, primarily ethanol, be sold in the U.S. If enacted, that provision would nearly triple the current demand for ethanol, which, because of the tax subsidy for ethanol-blended fuels, would have a severe impact on revenues to the Highway Trust Fund. The trust fund currently loses more than \$1 billion per year because of the tax treatment of gasoline. When fully implemented, the ethanol mandate of S. 1766 would result in an annual revenue loss greater than the obligation limitation distributed this year to the States of Nevada, Oklahoma, Montana, Virginia, Connecticut, Oregon, and Rhode Island combined.

We strongly urge you to oppose the expansion of the ethanol mandate in S. 1766 or, if you support mandated ethanol use, to bring equity to ethanol taxation . . . in other words, levy the same tax on ethanol that you do on gasoline.

*Stem Diversions of Highway Funding*

We also urge the committee to oppose any new diversions of highway funding away from road and bridge improvements. In particular, I know that you, Mr. Chairman, and other members of the full committee have previously indicated your strong interest in finding additional funds to support passenger rail development in the U.S. While Congress considers whether and to what extent public financial support for passenger rail service makes sense, we urge the subcommittee to resist attempts to divert Highway Trust Fund dollars to rail. The needs are simply too great on our primary transportation system—highways—to justify the expenditure of limited financial resources to build or operate a passenger rail system.

Finally, Mr. Chairman, some have also suggested a fuel tax increase as a means to increase highway funding. Given the current state of the economy and the President's general opposition to tax increases, I suspect there is little possibility that Congress will approve a tax increase as part of the reauthorization bill. In any case,

I expect taxpaying motorists are unlikely to support a rate increase unless it is clear that the funding guarantees of TEA-21 will be continued, that the enormous existing balance in the Highway Account will be spent down, and that highway users are not subsidizing other Federal programs that have little or no direct benefit to motorists.

I also have one final observation about the President's budget. Rather than spending down the balance in the Highway Trust Fund, the Administration projects a dramatically growing balance beginning in fiscal year 2004, the first year of a reauthorized highway program. Over 4 years, the balance is projected to grow by a whopping \$17.4 billion despite using very conservative estimates of annual tax receipts.

*Urge President Bush to Support Continuation of TEA-21's Funding Guarantees*

We are told by Administration sources that those projections are simply based on the extraordinarily low 2003 spending as a baseline adjusted for inflation in future years. Unfortunately, however, it also indicates at the very least that the Administration has not yet made the policy decision to support continued budgetary firewalls and a RABA-like mechanism tying highway funding to tax receipts. There is still time for the President to make that policy decision before submitting his reauthorization proposal to the Congress, but I believe the recent budget documents are an ominous warning that members of this subcommittee, State and local public officials, and we in the private sector need to work very hard to convince top Administration officials that the TEA-21 funding guarantees must be continued in the next bill.

Former Transportation Secretary Rodney Slater used to say that highways are about more than concrete, asphalt, and steel; they're about new opportunities and quality of life. We at The Highway Users understand the value of a good transportation system, centered on our road network. It isn't an end in itself; it's a tool to move us, our families, our customers and employees, and our products where they need to go as safely and with as little delay as possible.

As Federal Highway Administrator Mary Peters is quick to point out, however, it takes a lot of concrete, asphalt, and steel to realize those benefits. That's the central point of this hearing and much of the coming debate on 2003 funding and the reauthorization bill: we need a well-funded Federal highway program to improve safety, reduce congestion, enhance air quality, and keep our manufacturers and producers competitive in the marketplace.

We look forward to working with all of you to see that your colleagues, journalists, and the general public understand the unique and vital role that our highway system plays in our overall economy and our quality of life.

**MOTOR FUEL EXCISE TAX REVENUE LEAKAGE ANALYSIS**

**MOTOR FUEL EXCISE TAX REVENUE LEAKAGE ANALYSIS****Executive Summary**

Motor fuels excise tax evasion is a continuing problem. Constant monitoring and continued diligence are required in making and enforcing statutory and regulatory changes so that tax administration is more effective, efficient, and fair, while minimizing compliance costs to the greatest extent possible. This discussion document prepared by KPMG Consulting, Inc. for the Center for Balanced Public Policy describes various tax evasion techniques and makes a rough estimate of the potential scope of the problem. Documented evasion techniques include daisy chains, bootlegging, cocktailing/blending, fraudulent exemption claims, failure to file or filing false information returns, and the use of jet fuel in highway vehicles. We particularly focus on jet fuel because it is the only major transportation fuel supply not currently subject to federal excise tax at the terminal rack.

Using several federal data sources and supported by recent Florida experience, we estimate the federal revenue shortfall from jet fuel diversion alone may range between \$1.7 billion and \$9.2 billion over the next 10 years. State transportation tax collections may be suffering similar losses. As with most estimates of tax evasion, this estimate is necessarily approximate and based on certain assumptions that cannot be fully documented. It does indicate that ongoing revenue losses are a significant problem for tax administrators and honest business taxpayers facing competition from tax evaders.

We describe some of the many tax evasion techniques found in the literature, court cases, and press articles. While there have been significant revenue losses in the court cases we have identified, it is quite likely that much more evasion occurs than the amount caught and documented. We have not been able to develop enough information to prepare independent revenue estimates of losses resulting from these techniques, but the information that is available indicates that substantial losses continue to occur.

Florida began taxing aviation fuels at the rack on July 1, 1996, along with other changes. During the first year under the new system, Florida experienced a 21.4-percent increase in aviation fuels taxes. While it might be necessary to fine-tune Florida's approach if implemented at the national level to avoid any unintended consequences that could harm cash flows and affect compliance costs of commercial airlines and business aircraft users, such a policy has the potential to mitigate revenue losses and simplify fuel tax administration. In addition, while evidence suggests that taxing jet fuel at the rack could eliminate much of the ongoing federal revenue drain, the kinds of policy actions required to reduce or eliminate other forms of evasion are less clear.

## Introduction

Motor fuel excise taxes are an important source of federal and state revenues and finance a large share of improvements in the nation's transportation system. Most federal motor fuel excise taxes are deposited in trust funds for this purpose. Some collections have gone into general revenues and a small portion is deposited in the Leaking Underground Storage Tank (LUST) Trust Fund. Federal and state tax rate increases over the years have correspondingly increased incentives for tax evasion with the 18.4-cents per gallon federal gasoline tax and 24.4-cents per gallon diesel fuel tax greatly exceeding profit margins on fuel sales at any point in the distribution system. While numerous legislative and regulatory steps have been taken by the federal and state governments, evasion remains a problem.

Monitoring federal excise tax collections and evasion is complicated by the variety and lack of coordination between federal data collection systems. The Energy Information Administration (EIA) tracks gallons produced, imported, exported, changes in stocks, and consumption. Using reports from the states, the Federal Highway Administration (FHWA) tracks gallons consumed in taxable and nontaxable use and tax collections. The Federal Aviation Administration (FAA) collects survey data on jet fuel costs and consumption of U.S. carriers, but not foreign carriers going to and from the U.S. The FAA also does not separately report U.S. carrier purchases within the U.S. and purchases overseas. IRS tracks federal excise tax collections, but not gallons consumed. IRS tables reporting excise tax refunds are inadequate for accurately determining the specific excise tax to which refunds are attributable or the quarter to which refunds apply. This difficulty is particularly acute when there is a tax rate change. Table 1 shows selected fuel excise tax collections reported on IRS Form 720 for fiscal years 1999 and 2000.<sup>1</sup>

<sup>1</sup> The federal fiscal year runs from October 1 to September 30.

<sup>2</sup> SOI Bulletin, Spring 2001, Table 21, Internal Revenue Service, (Washington, DC: Department of the Treasury).

In FY 1999, \$35 billion of motor fuel excise taxes was deposited in the Federal Highway Trust Fund.<sup>3</sup> This fund is used for developing and maintaining U.S. highways, mass transit, and other transportation related purposes. In FY 1999, excise taxes on the sale of gasoline, diesel and special fuels, and gasohol were about 90 percent of Federal Highway Trust Fund receipts.<sup>4</sup> Gasoline excise taxes account for about 60 percent of Federal Highway Trust Fund receipts.

**Motor Fuel Excise Taxes Deposited in the Federal Highway Trust Fund,  
FY 1990-1999**

Policy makers became aware of widespread motor fuel excise tax evasion schemes soon after the 1983 federal excise tax rate increase from 4 cents to 9 cents per gallon, and a further increase on diesel fuel to 15 cents in 1984. Since the mid-1980s, Congress and the states have enacted numerous statutory changes in attempts to reduce motor fuel tax evasion. Evasion was once estimated to be between 3 and 7 percent of all fuel taxes, and between 15 and 25 percent of diesel taxes alone.<sup>5</sup> Widespread motor fuel's excise tax evasion in the early 1980s led to a series of federal statutory changes beginning with the Tax Reform Act of 1986 (see Appendix II). One

<sup>3</sup> FY 1998 trust fund deposits are understated and FY 1999 deposits overstated relative to historical experience because there was a one-time delay in transferring deposits.

<sup>4</sup> Federal Highway Administration, Status of the Federal Highway Trust Fund 1998-1999 (Table FE-250, available from <http://www.fhwa.dot.gov/ohm/0999/fuel.htm>). FHWA defines special fuels as "diesel fuel and, to the extent they can be quantified, liquefied petroleum gases such as propane." In addition to motor fuels, certain other excise taxes are also transferred to the Highway Trust Fund, including \$3.3 billion in FY 1998 and \$4.0 billion in FY 1999.

<sup>5</sup> Federal Highway Administration, Department of Transportation. *Fuel Tax Evasion: The Joint Federal/State Motor Fuel Tax Compliance Project*. Report No. FHWA-PL-91-028. (Washington, DC: The Federal Highway Administration, June 1991), 18.

key change has been to generally impose federal fuels excise taxes upon removal from the terminal rack, including gasoline, undyed diesel, kerosene, and gasohol.

### Motor Fuel Excise Tax Evasion Schemes

Various schemes have been used for evading excise taxes, including "daisy chains," bootlegging, cocktail/blending, fraudulent exemption claims, failure to file or filing false information returns, and the use of jet fuel in highway vehicles.

**Daisy Chains.** The "daisy chain" creates a paper trail that makes it difficult for auditors to track the sale and taxation of the fuel. Typically, the paper trail shows that the motor fuel is taxed at some point in the chain and sold to the retailer tax-paid, but the tax is never remitted to the government. The entity in the chain with liability for the tax often disappears. The taxation of diesel fuel at the rack, dyeing, and expanded enforcement have reduced the use of daisy chains<sup>6</sup>, but this progress is instructive in demonstrating how evaders have been able to move on to other techniques. Indeed, fuel tax evasion history is characterized by a series of policy changes and enforcement activities resulting in some evasion opportunities being curtailed only to be replaced, at least in part, by others. While evasion may never be eliminated as long as taxes are imposed on fuels, excise tax analysts generally believe evasion can be significantly reduced by taxing as much fuel as possible at the rack.

**Bootlegging.** Like other smuggling, motor fuels bootlegging occurs when a low tax jurisdiction is near a high tax jurisdiction. Such smuggling frequently occurs between states, costing states tax revenues and their share of the Federal Highway Trust Fund; however, bootlegging may also occur when motor fuels enter the country over the border. Similar problems may occur with fuel sold on Indian reservations.

**Fraudulent Exemption Claims.** Evaders frequently make fraudulent claims for the nontaxable fuel use, such as for home heating oil or off-road farming, to avoid excise taxes or to resell fuel at a tax inclusive price without remitting tax to the government.

For example, in April 1997, *US Oil Week* reported that prosecutors in Riverside County, California, charged two individuals in the motor fuel distribution business with multiple counts of state excise and sales tax evasion for supposedly forging farm exemption certificates for the purchase of tax-free clear diesel fuel. The defendants allegedly sold the tax-free diesel fuel to customers as tax paid.<sup>7</sup>

**Failure to File or Filing False Information.** Failure to file an excise tax return or filing a false excise tax return are common techniques used by evaders.

<sup>6</sup> There have been a number of successful prosecutions of daisy chains since the 1980s. The IRS recently reported successes in prosecuting individuals in relation to operation "Red Daisy." More than two-dozen defendants have been convicted for their roles in a motor fuel distribution evasion scheme operating in the New York metropolitan area in the 1990s. One transaction defrauded the federal government and the State of New Jersey of more than \$140 million of tax revenue on the sale of 500 million gallons of gasoline. The courts sentenced the eight defendants named in the report to a variety of terms of imprisonment and to restitution totaling over \$2 million. See Criminal Investigation, "Excise Tax," *FY 2000 National Operations Annual Report*, (Internal Revenue Service, Department of the U.S. Treasury).

<sup>7</sup> "In the News," *Fuel Tax Evasion Highlights*, Volume 6, December 1997, Federal Highway Administration, Department of Transportation. (Available from <http://www.fhwa.dot.gov/policy/bf97dec.htm>.)

- On March 24, 1999, Delbert Delmar Clark III was indicted on 11 counts of excise tax evasion, totaling \$205,764.23, for selling untaxed diesel fuel at a tax inclusive rate, without remitting the tax to the government. Clark pleaded guilty, and was sentenced to 15 months imprisonment and ordered to pay all taxes, penalties, and interest due.<sup>8</sup>
- On June 23, 2000, Keith A. Parry, operating out of Phoenix, Arizona, pled guilty to income tax evasion and was sentenced to 15 months imprisonment and ordered to pay the underreported taxes (over \$800,000) relating to the preparation of false federal excise tax returns in an effort to defraud the federal government of taxes on the sale of jet fuel, diesel fuel, and gasoline.<sup>9</sup>

**Cocktailing/Blending.** This technique increases profits by extending diesel fuel with used motor oil and other distillates including pollutants, cleaning agents, and unfinished refinery products. There are two reasons in particular why this technique is attractive:

*the substances used to extend the fuel were often not regulated so those quantities were not in any fuel tax reporting system; and ... in some cases the substances were regulated as waste materials so an unscrupulous person could get paid to dispose of the products and then blend them into gasoline and get paid again by the public.<sup>10</sup>*

A 1981 exposé on gasoline bootlegging by the Long Island newspaper, *Newsday*, recounted an incident where a cab driver pointed "...a gun at a station operator when the mixture caused the cab to stop running while still in the station."<sup>11</sup>

We understand that cocktailing/blending, also referred to as "below the rack blending" continues to the present and not only results in an ongoing revenue loss, but is also dangerous to society at large when hazardous waste is blended with taxable fuels. IRS' ExStax program is studying ways to prevent untaxed below the rack blending.<sup>12</sup> "Fingerprinting" is a method for tracing fuel from the retail outlet, back to the distributor and the terminal system, so that authorities may be able to learn where in the distribution chain the fuel was blended.

The following table originally published in *U.S. Oil Week* in 1996 illustrates various schemes used to evade taxes that are largely focused on cocktailing/blending.

<sup>13</sup> The above table has been reproduced, in-full, from U.S. Oil Week (Bob Gough, "Fuel tax cons rampant," U.S. Oil Week, (June 10, 1996): 18.)

**Jet Fuel Use in Highway Vehicles.** Unlike the federal taxation of gasoline and diesel fuel, excise tax is generally imposed on non-gasoline aviation fuel ("jet fuel") when sold by registered producers. Jet fuel is essentially the same as kerosene<sup>14</sup> (which is taxed at the diesel rate), but under current law is taxed at either 4.4 cents a gallon, in the case of commercial use, or 21.9 cents for non-commercial use.<sup>15</sup> Exempt removal of undyed jet fuel from the rack creates tax evasion incentives and opportunities that may result in the loss of not only federal and state aviation taxes, but more importantly diesel fuel excise taxes, because so-described "jet fuel" can readily be used in on-road diesel trucks.

While somewhat dated, a 1983 case illustrates jet fuel tax evasion opportunities. On August 17, 1983, the New York State Tax Commissioner issued Tenneco Oil Company a Notice of Determination of Tax Due Under Motor Fuel Tax Law alleging that Tenneco owed tax on jet fuel it sold untaxed to Doug-Long, Inc. An audit of Doug-Long, a registered distributor of diesel motor fuels, had revealed that from September 1981 to February 1983, of the 317,816 gallons of jet fuel Tenneco sold untaxed to Doug-Long, 116,367 gallons were sold at a truck stop operated by Doug-Long, or sold to heating oil jobbers. However, the Notice of Determination against Tenneco was canceled because the court ruled that Tenneco's sale to Doug-Long was not a retail sale, and therefore not subject to the taxes imposed on motor fuel. The court did conclude that tax was due on the sale of jet fuel as motor fuel from a registered motor fuel distributor. The finding did not directly result in the assessment of Doug-Long, and we have been unable to determine whether the state ultimately collected the tax.<sup>16</sup>

In a similar case, after a year-long investigation ending in August 1995, 23 defendants were charged with participating in an evasion scheme that involved purchase and blending of jet fuel with diesel fuel. This blended mixture was sold at service stations and truck stops in Southern California. As of December 15, 1995, six defendants had pleaded guilty.<sup>17</sup>

Jet fuel may leak into the motor fuel distribution system through a combination of the following events.

1. **Jet fuel taxed as jet fuel and used as diesel fuel.** When tax is paid on jet fuel but the fuel is used as diesel fuel for an on-road use, the Airport and Airway Trust Fund receives the benefit of the 4.3-cents per gallon tax (for fuel sold for commercial use), or the 21.8-cents per gallon tax (for non-commercial use), while the Federal Highway Trust Fund loses the 24.3-cents per gallon on-road diesel fuel tax. The 0.1-cent per gallon LUST Trust Fund is not affected.
2. **Jet fuel not taxed and used as diesel fuel.** When tax is never paid on jet fuel but it is used as on-road diesel fuel, the Airport and Airway Trust Fund receives no benefit and the Federal Highway Trust Fund and the LUST Trust Fund lose the 24.4-cents per gallon on-road diesel fuel tax.

<sup>14</sup> Jet fuel must meet certain additional specifications, but these do not affect its suitability for highway use.

<sup>15</sup> Jet fuel can be taxed at the 24.4-cents per gallon kerosene rate when removed at the rack, but is not taxed at the rack if certification is provided that it will be used as fuel in an aircraft. Commercial aviation users may register with the IRS and either pay a 4.4-cents per gallon tax when they purchase jet fuel from a producer (the commercial aviation tax rate) or purchase it tax free and self-assess tax when the fuel is used. Commercial aviation users paying the full tax rate are allowed to claim a refund or credit for tax in excess of 4.4 cents when the jet fuel is used.

<sup>16</sup> New York State Tax Commission. "In the Matter of the Petition of Tenneco Oil Company." *New York State Tax Reporter*, (CCH Incorporated: February 18, 1986.)

<sup>17</sup> "3 Plead Guilty to Bilking Government Out of Fuel Taxes," *The Los Angeles Times*, B4.

3. Diesel fuel is described and sold as exempt jet fuel, but does not meet jet fuel specifications and is used as highway diesel fuel. Here, the Highway Trust Fund loses the 24.3-cents per gallon diesel tax, and the LUST Trust Fund loses 0.1 cents per gallon.

Taxing aviation fuel at the rack would bring it into conformity with federal gasoline and diesel fuel taxes and would remove major tax evasion opportunities. As described above, the diversion of jet fuel for on-road use is only one of a number of fuel tax evasion schemes, but it is one where it may be possible to develop rough estimates of the current revenue drain and the corresponding revenue increases that could result from taxing it at the rack.

Using data from the Energy Information Administration (EIA), the Federal Aviation Administration (FAA), and IRS' SOI Division, we have estimated the national tax gap potentially attributable to jet fuel diverted for highway use. Because these tax gap estimates are based on differences in the fuel volumes reported in several federal data systems, these estimates may be understated or overstated due to sampling error and other inconsistencies and inaccuracies between data collection systems. These estimates assume jet fuel volumes reported by air carriers to the FAA are consistent with those reported to the IRS. To the extent this is not the case, it would contribute to a further revenue shortfall. In addition, we do not attempt to estimate any shifting of fuel to the 4.4-cent commercial tax from the 21.9-cent noncommercial aviation tax. Such transfers would also increase the revenue loss and these effects could be mitigated by taxing jet fuel at the rack.

The first section of Table 2 begins with EIA data on jet fuel supplied for domestic consumption expressed in thousands of barrels per day and removes tax-free military jet fuel production. These net figures are then converted into annual gallons supplied for commercial jet aircraft use.

The second section shows FAA jet fuel consumption data for domestic and international flights of U.S. carriers, which are reported on a fiscal year basis. These data are adjusted in the third section of Table 2 to approximate calendar years. General aviation data are collected in surveys on a calendar year basis and we had to estimate fiscal year effects.

Jet fuel used in commercial international travel is not taxable and must be removed. Domestic jet fuel purchases by foreign flag carriers are not available, but this is largely offset by foreign fuel purchases of U.S. carriers that are included in the data.<sup>18</sup> The difference between EIA data on net jet fuel gallons supplied and FAA data on jet fuel consumed represents a portion of the potential tax gap.

Because EIA measures product supplied as being equal to domestic production plus net imports (imports less exports), less the net increase in primary stocks, there may be small timing differences between when jet fuel leaves the refinery and when it is reported to the FAA as consumed. We understand a small amount of total jet fuel production is used in electric generation to meet air quality requirements and for fueling certain turbine generators. This will reduce the gap between EIA-reported jet fuel production and FAA-reported jet fuel consumption. Some jet fuel consumption reported by commercial carriers to the FAA is reported by refineries to EIA as kerosene or as No. 1 distillate production. This will increase the gap. It is also likely

<sup>18</sup> U.S. carriers report their total fuel consumption to the FAA, but foreign carriers do not. On net, there are slightly more arrivals on U.S. carriers from foreign destinations (using fuel purchased abroad) than U.S. departures on foreign carriers (using fuel purchased domestically). As a result, by subtracting FAA-reported international fuel consumption of U.S. carriers we may overstate domestic use and understate the estimated tax gap. Statistics collected by the Department of Transportation from domestic and foreign air carriers show that for the 1996-1998 period, 5.5 percent more passengers arrived from foreign destinations on U.S. carriers than departed from the U.S. on foreign carriers. See tables 1-37 and 1-38 in "National Transportation Statistics 2000," Department of Transportation.

that some jet fuel is lost between the refinery and aircraft fuel tanks, which could result in an overstatement of the tax gap.<sup>29</sup> On net, we do not know whether the potential tax gap is actually somewhat smaller or somewhat larger due to these reporting inconsistencies; however, we believe that any net adjustment would not affect our conclusion that significant volumes of jet fuel are being diverted for on-road use.<sup>30</sup>

<sup>29</sup> For example, if 8.25 percent of the EIA-reported 23,501 million gallons of jet fuel in 1999 were to have been lost before reaching the aircraft tank, the tax gap would be reduced by 59 million gallons, or 2 percent of the estimated 2,901 million gallon gap. If jet fuel were taxed at the tank, it is likely that these losses would be subject to federal excise tax.

<sup>30</sup> The EIA also collects data on jet fuel delivered to ultimate customers using Form EIA-782C. These data, which are collected from approximately 190 prime suppliers representing producers, importers, and inter-State resellers and retailers, show a gap averaging about 2.8 billion gallons per year over the 1995-2000 period and of about 3.3 billion gallons in 2000. Conversations with EIA staff indicate that they are not certain of the reasons for this reporting difference. They suggest that a portion of the gap could be attributable to direct importation of jet fuel by commercial airlines, which are not included in EIA's sample frame. They also cite a May 1996 Boeing Corporation paper indicating that part of the gap between jet fuel supplied by refineries and through imports and jet fuel consumption implied by annual seat miles (ASM) reported to the FAA exhibits a seasonal pattern. The Boeing paper reports that EIA-based demand is "the highest from the late fall through the middle of the winter, while the ASMs show that it should be the highest during the summer." See "Jet Fuel Data Status & Importance," Monestly, A.M., Boeing Commercial Airplane Group, IATA Fuel Trade Forum, Johannesburg, May 1996, p. 3. Because much of the data used in the Boeing report reflects years before the dyeing regulations took effect, the extent of any jet fuel diversion into use as heating fuel, as implied by the report, is uncertain. EIA staff have not considered any issues associated with the potential diversion of jet fuel for on-road use.

| Percent gallons missing (gap/EIA)                                    | 16.2%  | 16.8%  | 14.8%  | 13.3%  | 13.6%  | 13.2%  |

<sup>a</sup> Thousands of barrels per day are converted to million of gallons per year using 42 gallons per barrel and 365 days per year, except in 1996 and 2000 when there are 366 days per year.

Over the 6-year period from 1995 through 2000, this gap averaged 14.6 percent of domestic supply. By growing the 2000 gap of approximately 3.2 billion gallons with the growth in real GDP as projected by the Congressional Budget Office, and by assuming an October 1, 2001 effective date for shifting the point of taxation to the rack, we can make a projection of the potential shortfall in Federal Highway Trust Fund and LUST Trust Fund deposits. The potential shortfall in Federal Highway Trust Fund deposits for the FY 2002 to FY 2011 period is \$9.2 billion and the LUST Trust Fund deposit shortfall is \$38 million. It is not necessarily the case that 100 percent of this shortfall could be recovered by taxing jet fuel at the rack.

Table 3 illustrates revenue loss projections assuming that diesel fuel taxes are being evaded at 24.4 cents per gallon. It is possible that only a 4.4-cent commercial aviation tax is being evaded. If that were to be the case, the net 10-year revenue shortfall would be reduced from \$9.2 billion to

<sup>21</sup> Table 22. "FAA Aerospace Forecasts Fiscal Years 2001 - 2012," Federal Aviation Administration, FAA Plans and Policy, March 2001. <http://opi.hq.faa.gov/foreca01/Table22.htm>.

\$1.7 billion. Similarly, to the extent the 21.9-cent per gallon noncommercial aviation tax is being evaded, the net revenue shortfall would be \$8.3 billion.

Florida recently moved the point of taxation for aviation fuel to the terminal rack, along with other changes. In 1997, one year after Florida started taxing gasoline, diesel, and aviation fuel at the rack, the State's Department of Revenue analyzed excise tax collection data and found that the state experienced the largest gain in tax collections for aviation fuel. While no published analysis has directly linked the increase in tax collections with the change in treatment of aviation fuel, over the one-year period beginning July 1, 1996, when aviation fuel was first taxed at the rack, aviation fuel tax collections increased by 21.4 percent.<sup>23</sup>

This dramatic increase could be attributed to a number of factors. There could be a decrease in illegal blending with diesel fuel. It may also be that moving the tax collection point upstream decreases the potential for evasion simply because fewer and larger businesses are responsible for remitting tax to the government. Another portion of the dramatic increase in Florida could be due to kerosene being reported as aviation fuel in Florida. It could also be that previously unreported on-road fuel use is now being reported as taxable at the lesser aviation fuel tax rate, and is still used on the road.

<sup>22</sup> Estimates of diesel tax lost is the amount that would go to the trust funds if the entire gap between EIA reported volumes and FAA reported volumes is currently being diverted for on-road use. This loss could be significantly reduced by moving the collection point to the rack. The calculations assume this change would be effective on October 1, 2001. These estimates are before any offsets for income and payroll taxes used in computing net federal revenue effects. In making these estimates we assume these taxes will be extended at current rates, which is consistent with congressional score-keeping requirements. Under current law, the LUST Trust Fund financing rate goes to zero after March 31, 2005 and the diesel tax rate goes to 4.3 cents after September 30, 2005.

<sup>23</sup> State DOR analysis adjusted the data to remove the effect of tax rate changes and other features of the legislation that were unrelated to shifting the point of taxation. Florida defines aviation fuel as "...fuel used in aircraft, and includes aviation gasoline and aviation turbine fuels and kerosene." (The 2006 Florida Statutes, Title XIV, 206.5815.)

While the 21.4 percent gap experienced by Florida is significantly more than the 14.6 percent gap observed in the national data, other factors may have contributed to Florida's aviation fuel uplift, and not just the capture of aviation fuel previously diverted for on-road use. Nevertheless, the Florida experience indicates that large percentage fuels tax increases are possible.

**Jet Fuel Use in Nonhighway Vehicles.** Another opportunity for jet fuel-source highway tax evasion is via off-road use refunds.<sup>14</sup> While jet fuel can be taxed at the 24.4 cents a gallon diesel/kerosene highway tax rate when removed at the rack, it will not be taxed at the rack if certification is provided that it will be used as fuel in an aircraft. Clear jet fuel may be removed tax-free from the rack and certified for use in an aircraft, but resold through one or more below the rack brokers in a daisy-chain like scheme to honest ultimate vendors and described on resale documentation as clear, tax-paid diesel fuel. Ultimate vendors or off-road purchasers may subsequently file refund claims resulting in a federal revenue loss of up to 24.4 cents per gallon and comparable state losses without knowing that federal and state highway tax had never been paid thereon in the first place. Because ultimate vendors and off-road users may not be aware that what they believe is clear, tax-paid diesel fuel is actually untaxed jet fuel, and the ultimate vendor and end user invoices will describe the product as tax-paid diesel fuel. It would be very difficult for IRS to identify the abuse. This simple process may also be used simultaneously by unscrupulous intermediary resellers to avoid EPA prohibitions on distribution of high sulfur fuel for highway use. Jet fuel ASTM specifications for jet fuel sulfur content can be as high as 3,000 PPM - six times the sulfur level allowed by EPA for highway use. The use of comparatively lower viscosity jet fuel can result in damage to highway user vehicles' engines if too high a percentage of the jet fuel is used continuously in lieu of #2 diesel in a hot weather environment.

## Conclusion

Motor fuels excise tax evasion is an ongoing problem requiring continual monitoring. As each new opportunity for abuse arises, revenue losses will be reduced if evasion is addressed through ongoing legislation, regulation, or increased enforcement activity. Based on our analysis, it appears that the diversion of jet fuel for highway use could be the cause of a significant, ongoing revenue shortfall.

Florida began taxing aviation fuels at the rack on July 1, 1996, along with other changes. During the first year under the new system, Florida experienced a 21.4-percent increase in aviation fuels taxes. While it might be necessary to fine-tune Florida's approach if implemented at the national level to avoid any unintended consequences that could harm cash flows and affect compliance costs of commercial airlines and business aircraft users, such a policy has the potential to mitigate revenue losses and simplify fuel tax administration. In addition, while evidence suggests that taxing jet fuel at the rack could eliminate much of the ongoing federal revenue drain, the kinds of policy actions required to reduce or eliminate other forms of evasion are less clear.

While the experience of Florida may or may not be representative of the revenue increase that would result from moving the point of jet fuel taxation to the rack, national statistics from the EIA and the FAA strongly suggest the existence of a large revenue drain today.

<sup>14</sup> Because we have no data on off-road vehicle use of jet fuel, the resulting revenue shortfall is not separated from the previously discussed evasion figures for on-road vehicle use of jet fuel.

In addition to reducing tax evasion resulting from jet fuel diversion, opportunities exist to increase tax revenues by addressing other schemes for evading federal and state excise tax collections.

### Appendix I: Review of Evasion Literature

Public and private organizations have attempted to determine the extent of motor fuel excise tax evasion over the years. Indeed, the fuel tax evasion literature is extensive and this overview is not intended to capture all the work that has been done. While most estimates were prepared before federal regulations governing the current tax system were finalized, many of the tax evasion techniques described continue to be used.

#### National Economic Research Associates, Inc., February 1985

In 1985, the New York State Petroleum Council asked National Economic Research Associates, Inc. (NERA) to estimate the extent of gasoline excise tax evasion in the State of New York. In October 1992, New York moved the point of gasoline excise tax collection from the retailer to the distributor, but this move greatly increased the incentive to evade tax collection. NERA estimated gasoline excise tax evasion by comparing gasoline consumption to reported sales. NERA's first method extrapolated U.S. gasoline sales growth from 1982 to 1984 to New York. Their second method compared New York gasoline consumption with New York Department of Transportation traffic information and gasoline prices. Using the first method, NERA estimated that unreported gasoline sales were equal to 11.7 percent of reported sales in 1984, and 18.0 percent of reported sales in 1985. Using the second method, NERA estimated that unreported gasoline sales were equal to 14.5 percent of reported sales in 1984, and 20.9 percent of reported sales in 1985.<sup>25</sup>

#### National Economic Research Associates, Inc., January 1987

In 1987, another NERA study reported that federal gasoline tax evasion increased dramatically after 1983, and that evasion from 1984 to 1986 was approximately \$500 million per year. NERA arrived at this evasion figure using two separate estimating methodologies. The first compared national consumption estimates to volumes upon which tax was collected to measure the tax gap. Using this method, NERA found little evasion from 1979 to 1982, but that evasion increased dramatically following the 1983 gasoline tax rate increase.<sup>26</sup>

*The average difference between consumption and volume taxed over 1979-1982 was about 1.8 billion gallons (which could be attributable partly to exemptions), but the average annualized difference over 1984-1986 was in excess of 7.1 billion gallons. Thus the gap between (annual) consumption and taxed gallonage rose by over 5.3 billion gallons after the rate increase, strongly suggesting a sharp rise in evasion.<sup>27</sup>*

NERA'S second methodology regressed figures of taxed gasoline gallons on two consumption series (Energy Information Administration and the Federal Highway Administration) and compared these data to data on taxed gasoline gallons to measure the tax gap. Using both

<sup>25</sup> Dunbar, Frederick C. *Gasoline Tax Evasion in New York: Statewide Estimates*. (Washington, DC: National Economic Research Associates, Inc., February 25, 1985.)

<sup>26</sup> Adlaski, Sanaath, Yuval Cohen, and Frederick C. Dunbar. *Gasoline Tax Evasion*. (Washington, DC: National Economic Research Associates, Inc., January 21, 1987), 2.

<sup>27</sup> *Ibid.*, 5.

methodologies, NERA estimated that approximately \$500 million of gasoline tax revenue was evaded annually.

NERA also evaluated previous state gasoline tax law changes to determine whether moving the incidence of taxation affected state revenue collections. NERA reported that when New York State moved the incident of taxation from the wholesaler to the point of importation, taxable gallonage increased 18 percent above the 1.6 percent nationwide average increase for the same period (1995 and 1996.)<sup>28</sup>

#### The Joint Federal/State Motor Fuel Tax Compliance Project, 1992

This comprehensive 1992 report discussed motor fuel tax evasion problems, and concluded, based upon prior studies, congressional testimony, and investigations, that "...the current level of gasoline tax evasion is between 3 and 7 percent of gallons consumed, and that the level of diesel fuel tax evasion is between 15 and 25 percent of gallons consumed."<sup>29</sup> This study was the first comprehensive discussion of the issues surrounding fuel excise tax evasion.

#### General Accounting Office, 1996

In *Diesel Fuel Excise Tax Change*, the GAO reported that diesel tax collections increased by \$1.2 billion, following the Omnibus Budget Reconciliation Act of 1993 change that moved the diesel tax collection point to the terminal.

*IRS' preliminary data indicate that diesel excise tax collections increased about \$1.2 billion, or 22.5 percent, in calendar year 1994 as compared with 1993. This increase does not include additional revenues due to the OBRA 1993 increase of 4.3 cents per gallon in the tax rate. After adjusting for increased refund and credit amounts, and for a portion of the increase that may be due to economic growth, the Treasury Department estimated that an increase of \$600 million to \$700 million was solely the result of increased compliance.*<sup>30</sup>

This represented an increase of diesel fuel excise tax collections of 17.5 to 20.4 percent.<sup>31</sup>

<sup>28</sup> *Ibid.*, 13.

<sup>29</sup> Federal Highway Administration, Department of Transportation. *Fuel Tax Evasion: The Joint Federal/State Motor Fuel Tax Compliance Project*. Report No. FHWA-PL-92-028 (Washington, DC: The Federal Highway Administration, June 1992), 18.

<sup>30</sup> General Accounting Office. *Diesel Fuel Excise Tax Change*. GAO/GGD-96-53. (Washington, DC: U.S. General Accounting Office, 1996), 4.

<sup>31</sup> Using FY 1993 and numbers from the Federal Highway Administration, Table FE-210, we calculated the evasion loss range as a percentage of FY 1993 excise tax collections.

### Council on State Governments and the Council of Governors' Policy Advisors, 1996

In addition to reviewing the literature on previous attempts to quantify fuel excise tax evasion, *Road Fund Tax Evasion: A State Perspective* estimated the loss of motor fuels taxes using two methods. First, the authors created three surveys to measure the perception of evasion and the magnitude of the problem, and to collect information on strategies states are discussing and implementing.

*Principal revenue administrators estimated that the revenue from motor fuels taxes (gasoline and diesel fuels) would be increased by 6.53 percent, on average. The state-by-state percentage revenue gain as provided in the survey was multiplied by the motor fuel taxes currently collected, to derive the \$1.2 billion estimate provided...<sup>32</sup>*

Unfortunately, supporting information in the report is limited in that it does not separate the evasion estimate into the gasoline and diesel components or the state-by-state components.

The authors' second method developed a statistical model comparing the estimated demand for motor fuels to excise tax revenue collections. The step-wise regression model estimated demand for each state using three equations with the following inputs: gallons of fuel per resident; gallons of fuel per driver; and gallons of fuel per vehicle. This approach yielded a revenue loss of \$952 million.<sup>33</sup> The study did not provide the state-by-state estimates, the gasoline and diesel components of the revenue loss, or the percent of evasion that \$952 million represents (on an U.S. aggregate or a state-by-state basis).

To check their two estimates, the authors used estimated fuel evasion percentages from prior studies:

- The Federal/State Motor Fuel Tax Compliance Project – 3 to 7 percent of all fuel taxes; 15 to 25 percent of diesel taxes.
- Congressional Testimony – \$1.1 billion lost to the Federal Highway Trust Fund.
- Virginia Study – New York equals 18 to 40 percent; California equals 1.3 to 2.2 percent; Virginia equals less than 10 percent.

This method resulting in a fuel excise tax evasion loss of approximately 7.8 percent of collections (\$1.5 billion).<sup>34,35</sup> However, the authors do not indicate how they derived their \$1.5 billion figure or the gasoline and diesel shares.

<sup>32</sup> Council of State Governments and the Council of Governors' Policy Advisors. *Road Fund Tax Evasion: A State Perspective*. (Lexington, KY: Council of State Governments & Council of Governors' Policy Advisors, 1996), 55.

<sup>33</sup> The report did not state the percent of excise tax collections that \$952 million represents, but using the relationship between the revenue loss and percentages of the first method described, this estimate would equal approximately 4.9 percent of excise tax collections.

<sup>34</sup> Council of State Governments and the Council of Governors' Policy Advisors. *Road Fund Tax Evasion: A State Perspective*. (Lexington, KY: Council of State Governments & Council of Governors' Policy Advisors, 1996), 55-56.

<sup>35</sup> The report did not state the percent of excise tax collections that \$1.5 billion represents, but using the relationship between the revenue loss and percentages of the first method described, this estimate would equal approximately 7.8 percent of excise tax collections.

**Steve Baluch, Federal Highway Administration, 1996**

Stephen Baluch's 1996 study describes how the effectiveness of enforcement activities can be measured. For example, taxes assessed upon audit and the examination of returns, or the losses associated with criminal investigations can provide quantifiable data on evasion activities. For example, after Pennsylvania conducted a series of truck stop raids beginning in 1992, officials observed that taxable gallons increased by 4.2 percent in the first year.<sup>26</sup> In addition, the impacts of legislative changes can be observed, although it is difficult to separate the types of legislative changes.<sup>27</sup> Baluch stated that although federal statutory changes in the last 15 years have decreased the evasion levels, the potential for large revenue losses still exists.

*Since enactment of the dyed fuel program, at least 60 percent of the estimated evasion losses are now being recovered, an extremely favorable result considering that the FHWA fuel dye and marking report to Congress concluded that recovering 50 percent of the estimated losses would be optimistic. And yet, even if diesel fuel tax evasion has been reduced from a range of 15 to 25 percent of the taxable product to a range of 3 to 7 percent, that still represents several hundred million dollars of revenue yet to be recovered. And with a comparable range for gasoline, where evasion may actually be increasing again because of the greater difficulty of evading diesel fuel taxes, the total federal evasion losses may still amount to nearly \$1 billion, which leaves a substantial potential revenue target for future compliance efforts, although the relative cost and effort to recover it would likely increase.<sup>28</sup>*

**Raven, Ronald E., Ph.D., Federation of Tax Administrators, 1999**

Ronald Raven's work is a comprehensive compilation of the events surrounding the changes in the taxation of motor fuels. He chronicles attempts by state and federal officials to address motor fuel tax evasion, as well as various schemes used by evaders. Raven reviews prior motor fuel evasion literature, and describes a number of court cases and investigations of the more notorious fuel tax evaders. This detail illustrates the magnitude of the evasion problem, as well as the necessity for governments to attack the creativity of the fuel tax evaders. His analysis focuses on the actions of Congress, the states, the Department of Justice, the Internal Revenue Service, and the Federation of Tax Administrators, as well as private parties, to combat the evasion of motor fuel excise taxes. After describing tax systems developed by federal and state governments to date, Raven describes an excise tax collection model that would meet the requirements of the main actors. This model, the *Federal "Sponge" Model*, would establish a uniform tax rate at the federal level that would apply to all states and Native American reservations and would be allocated to states in the same manner as the International Fuel Tax Agreement (IFTA). State governments would collect taxes and conduct audits, while the federal government would gather information and provide refunds.

Appendix II: Post-1986 Gasoline and Diesel Excise Tax Legislative Changes<sup>39</sup>

| Major Motor Fuels Excise Tax Legislative Changes Since 1986 |  |
|---|--|
| Gasoline  |  |
| 1987  | Effective January 1, 1987, the tax rate increased by 0.1 cent per gallon [to 9.1 cents per gallon.] [Enactment of the LUST tax.]   |
| 1988  | The Tax Reform Act of 1986 moved the taxing point upstream from the wholesale level to the terminal or refinery level. This was intended to reduce the tax administration burdens on fuels outlets and IRS tax collection and enforcement costs. [Effective January 1, 1988]   |
| 1989  | The Technical and Miscellaneous Revenue Act of 1988 permitted wholesale distributors to sell gasoline on a tax-exempt basis and to claim the refunds for sales for (1) export, (2) use by state and local government, (3) use in [foreign trade in] aircraft or vessels, or (4) certain nonprofit educational organizations. This provision was intended to lessen administrative burdens of excise tax refund procedures for exempt users.  |
| 1990  | Effective September 1, 1990, the tax rate decreased by 0.1 cent per gallon [to 9.0 cents per gallon.] [Expiration of the LUST tax.]  |
| 1990  | The Revenue Reconciliation Act of 1990 raised taxes by 5.1 cents per gallon [to 14.1 cents per gallon] to raise revenue for the Highway Trust Fund and for deficit reduction. [Effective December 1, 1990]. [LUST tax was not in effect from September 1, 1990 to December 1, 1990]  |
| 1991  | The Revenue Reconciliation Act of 1990 imposed tax upon (1) removal from any refinery or terminal, (2) entry into the United States, or (3) sale to any unregistered person (unless there has been a prior taxable removal or entry), whether or not taxes have been previously paid. Removals or entries are not taxed for bulk transfers to terminals. A refund (without interest) may be obtained if a taxpayer establishes that the gasoline was previously taxed. This was intended to discourage selling of tax-paid gasoline within a terminal and to collect excise tax on all fuel when it is dispensed over the terminal rack. [Effective July 1, 1991.] |
| 1992  | No legislative changes took effect.  |
| 1993  | Effective October 1, 1993, the tax rate increased by 4.3 cents per gallon [to 18.4 cents per gallon].  |
| 1994-5  | No legislative changes took effect.  |
| 1996  | Effective January 1, 1996, the tax rate decreased by 0.1 cents per gallon [to 18.3 cents per gallon]. [Expiration of the LUST tax.]  |
| 1997  | Effective October 1, 1997, the tax rate increased by 0.1 cents per gallon [to 18.4 cents per gallon]. [Reinstitution of the LUST tax.]   |
| 1998-2000   | No legislative changes took effect.  |

<sup>39</sup> Legislative changes (except for bracketed text) from 1987 to 1991 are reproduced from "Table IV.1: Major Motor Fuels Excise Tax Legislative Changes Since 1986," General Accounting Office, *Status of Events to Curb Motor Fuel Tax Evasion*, GAO/IGD-92-67, (Washington, DC: U.S. General Accounting Office, 1992), 26.

## STATEMENT OF MR. JAMES DUIT, PRESIDENT, DUIT CONSTRUCTION COMPANY

Mr. Chairman and members of the subcommittee, on behalf of the American Road and Transportation Builders Association I would like to thank you for inviting us to be here this afternoon to discuss highway funding issues, particularly the impact of the unprecedented \$8.6 billion cut in Federal highway investment that is on the table for fiscal year 2003 and what can be done to prevent a recurrence in the future.

I am James Duit, President of Duit Construction Company, a highway construction firm based in Edmond, Oklahoma. I am here representing ARTBA, which on Wednesday will mark its 100th anniversary representing the transportation construction industry here in Washington. ARTBA's more than 5,000 members come from all sectors of our industry both public and private. Our industry generated \$200 billion annually in U.S. economic activity and sustains the employment of more than 2.2 million Americans.

My company was founded in 1969 and now provides good jobs for 300 permanent employees. Duit Construction specializes in paving, aggregates and quarries. I am a member of the Transportation Research Board's pavement research committee.

It was also my privilege to serve last year as chairman of the American Concrete Pavement Association.

I am accompanied by Dr. William Buechner, ARTBA's Vice President for Economics and Research, who will be available to respond to any technical questions you may have. Dr. Buechner is a Harvard-trained economist who spent more than two decades as an economist for the Joint Economic Committee of the U.S. Congress.

## REASON FOR NEGATIVE RABA FOR FISCAL YEAR 2003

The reason for the proposed \$8.6 billion cut in the Federal highway program in fiscal year 2003 is well known. Since fiscal year 2000, the "revenue-aligned budget authority" or RABA provision of TEA-21 (Transportation Equity Act for the 21st Century) adjusts the annual firewall guarantee for highways if revenues into the Highway Account of the Highway Trust Fund are above or below the initial TEA-21 baseline revenue estimate. For fiscal year 2003, the RABA adjustment was determined to be negative \$4.369 billion—the first negative RABA adjustment ever.

Subtracting the negative \$4.4 billion from the original TEA-21 highway guarantee of \$27.7 billion gives the \$23.2 billion Federal highway investment proposed in the President's budget for fiscal year 2003.

This is \$8.6 billion less than the \$31.8 billion enacted for Federal highway investment during the current fiscal year.

Senator, we greatly appreciate your leadership in addressing this issue by introducing legislation to provide fiscal year 2003 funding of at least \$27.7 billion, the original TEA-21 guarantee. We believe this is an excellent start and look forward to working with you to restore the highway funding this year.

Before I discuss the consequences of an \$8.6 billion cut in Federal highway investment, I want to point out that the negative RABA was not the result of a reduction in gas tax revenues into the Highway Trust Fund. It is easy to misunderstand what happened, and the assertion that the proposed cut in highway funding was due to declining gas tax revenues has appeared in a number of newspaper articles. But it is not an accurate statement.

According to data provided to ARTBA by the U.S. Department of the Treasury, motor fuel excise taxes collected by the Treasury during fiscal year 2001—the "look-back" year for the fiscal year 2003 RABA computation—were just about even with the amount collected during fiscal year 2000. There was a small decline in total revenues but virtually all of it was due to a reduction in excise taxes paid by heavy trucks.

The overriding reason for negative RABA is that Treasury made a forecasting error in computing the fiscal year 2001 RABA adjustment and another forecasting error in crediting revenues to the Highway Account in fiscal year 2000. Treasury corrected both of those errors when computing the fiscal year 2003 RABA adjustment. These were technical corrections to past forecasting errors, caused to some extent by the recession, but they account for almost \$3 billion of the negative RABA adjustment that concerns us today.

In addition, we believe Treasury has underestimated projected incoming Highway Account revenues for fiscal year 2003. This underestimate, we believe, added another \$900 million to the negative RABA. The fiscal year 2003 revenue projection does not appear consistent with the administration's overall economic assumptions and does not appear to take into account historical data showing that highway travel and truck excise tax receipts recover sharply after a recession ends.

The Treasury gas tax data and an explanation of how the fiscal year 2003 RABA adjustment was computed are attached to my prepared statement and I ask that they be included in the record.

#### CONSEQUENCES OF PROPOSED \$8.6 BILLION CUT IN HIGHWAY FUNDING

Now I want to discuss the consequences of a \$8.6 billion cut in Federal highway investment.

**Job Loss.** An \$8.6 billion cut in Federal highway investment in fiscal year 2003 would reduce employment in America by more than 360,000 jobs over the next 7 years, with roughly 70 percent of the job loss occurring in 2003 and the election year 2004. This works out to more than 825 jobs per congressional district. A State-by-State breakdown of the job loss is included as an attachment to my testimony. If highway investment in fiscal year 2003 is provided at the TEA-21 baseline level of \$27.7 billion (a \$5 billion increase from the proposed RABA-adjusted level), the job loss would still be almost 170,000. Neither figure is acceptable at a time when the economy is struggling to emerge from recession. Much of the job loss will affect minorities, especially Hispanic workers who make up almost a third of the transportation construction work force. A legislative solution that would restore only \$5 billion would concede that jobs will be lost.

**TEA-21 Reauthorization Baseline.** The fiscal year 2003 obligation limitation will be the major determinant of the baseline funding levels for the fiscal years covered by TEA-21 reauthorization legislation. As the attached chart shows, the \$8.6 billion cut would lower future baseline highway funding by more than \$10 billion each year from the levels included in the fiscal year 2002 budget submitted just a year ago.

Starting from this baseline will make it much more difficult for Congress to increase Federal highway investment after TEA-21 expires. Providing \$27.7 billion for fiscal year 2003 would eliminate about half the shortfall, but restoring the full \$8.6 billion is the only way to provide a realistic baseline for reauthorization.

**Cancellation of Highway Improvements.** Based on reports from State DOTs, a number of States have already started to terminate or postpone projects on the basis of the expected cut in fiscal year 2003 Federal highway funding. The chaos caused by the proposed cut in Federal highway funding will continue until Federal funding for fiscal year 2003 has been resolved. This needs to be addressed quickly to allow State construction programs to proceed unimpeded for the 2002 construction season.

**Cannibalization of State Highway Budgets.** The States rely on Federal highway funds to finance, on average, almost half of their highway capital improvement programs. A cut in Federal highway funds in fiscal year 2003 would exacerbate their budget problems and likely force many to cannibalize their own highway improvement programs to complete construction on Federal-aid projects.

#### HOW THE \$8.6 BILLION COULD BE FINANCED

Highway funding for fiscal year 2003 could be maintained at the fiscal year 2002 level of \$31.8 billion-and we believe should be-by utilizing the existing balance in the Highway Trust Fund's Highway Account. According to the Treasury Department that balance stands today at about \$20.5 billion.

This balance is not needed to reimburse States for already committed projects and programs. Approximately \$7 billion of the balance is a cash surplus that occurred because TEA-21 did not require the RABA adjustment until fiscal year 2000. More highway user fee revenues came into the trust fund in fiscal year 1998 and fiscal year 1999 than were spent.

An additional \$14 billion or so in the balance is to cover the unobligated contract authority that TEA-21 has provided to the States to date above the guaranteed firewall (You'll recall that TEA-21 authorized \$177 billion for highway investment, but only guaranteed \$162 billion under the budget firewall).

That contract authority is worthless to the States unless this money is appropriated from the trust fund. Otherwise, they cannot commit it to projects.

It is time to free these surplus funds to save American jobs.

#### PURPOSE OF THE RABA MECHANISM

I would now like to turn to the second issue being addressed today-how to improve the RABA mechanism.

Let me begin by pointing out that our overriding concern with Federal highway funding is not only that it be adequate to meeting our nation's transportation needs but also that it be predictable and reliable.

Highway and bridge investments often take a long time to plan and construct. To schedule projects efficiently, State Departments of Transportation need stable fund-

ing sources and predictable revenues. That is why the Federal highway program has a 6-year, rather than annual, authorization cycle.

The RABA adjustment process was not expected by the Congress, the States or the industry to inject the kind of instability in Federal highway funding that we are currently facing.

The purpose of RABA was to help implement the TEA-21 goal of using all revenues into the Highway Trust Fund for their intended purpose—investment in transportation improvements—in a timely manner.

To accomplish this, TEA-21 set up a two-part process to determine the annual funding for the Federal highway program.

First are the firewall amounts guaranteed in TEA-21, which from fiscal year 2000 on were directly linked to Highway Account revenues collected during the previous fiscal year. These guaranteed amounts were based on revenue projections made at the time TEA-21 was enacted in June 1998.

The second is the RABA adjustment, which automatically increases or decreases the firewall guarantee whenever actual revenues into the Highway Account exceed or fall short of the TEA-21 baseline estimates.

Attached to my testimony is a detailed explanation of how the fiscal year 2003 RABA adjustment was computed.

The major problem with the computation process appears to be in the “look forward” forecasting provision. Although annual highway funding under TEA-21 is supposed to be tied to previous-year revenues, part of the RABA calculation requires making a forecast of Highway Account revenues during the budget year itself and comparing that forecast to the initial TEA-21 baseline.

This “look forward” forecast has proven to be a major source of instability in the RABA computation because the projections have been off each year, as forecasts always are. For example, Treasury overestimated fiscal year 2001 Highway Account revenues by \$1.8 billion when computing the fiscal year 2001 RABA adjustment and corrected its mistake in the fiscal year 2003 RABA adjustment.

This problem must be corrected when TEA-21 is reauthorized.

#### POSSIBLE RABA IMPROVEMENTS

There are a number of ways this could be done. One is to eliminate the “look forward” forecast part of the RABA formula. Basing RABA solely on the “look back” part of the formula might yield smaller RABA adjustments, but provide more predictability and stability to Federal highway investment.

Another option might be to establish a reserve that would automatically be drawn down whenever RABA is negative. In fact, such a reserve exists today in the Highway Trust Fund as I have previously explained.

I would like to suggest a third, more fundamental, reform that would change the nature of the RABA mechanism in the TEA-21 reauthorization legislation.

Under ISTEA and previous authorizations, the annual level of highway funding was budget-driven. Highway funding was determined by the overall budget cap and the level of the deficit, regardless of the amount of user fees paid into the Highway Trust Fund. As a result, the balance in the Highway Trust Fund kept growing, breaking trust with highway users who thought all their gas taxes were being invested in highway improvements.

TEA-21 addressed this problem by making highway funding revenue-driven, by linking each year’s funding to the previous year’s revenues. RABA helped accomplish this but, as we have seen, introduced the potential for unanticipated instability into Federal highway investment.

For reauthorization, ARTBA urges that Congress go the next step and make annual highway funding performance-driven. While TEA-21 has succeeded in increasing highway investment, the level at present is barely sufficient to maintain the physical condition of the nation’s highways and bridges.

Under current funding, however, system performance—particularly congestion—is getting worse. In our TEA-21 reauthorization report, which has been supplied for the hearing record, ARTBA recommends that Federal highway investment from fiscal year 2004 through fiscal year 2009 be set at a level that maintains not only the physical condition of highways and bridges, but mobility conditions as well.

Based on data from the latest Conditions and Performance report submitted to Congress just over a year ago by the U.S. Department of Transportation, this goal would require an average annual Federal highway investment of \$50 billion during the next 6 years, rising from \$48 billion in fiscal year 2004 to \$54 billion in fiscal year 2009.

Funding this investment could be achieved by modifying the RABA provision. The modification would require setting guaranteed annual funding levels, as rec-

ommended in the ARTBA reauthorization report, computing the resulting outlays from the Highway Trust Fund, which OMB and CBO already do, and automatically setting highway user fees at the beginning for each fiscal year to raise the required revenues.

This is exactly what the U.S. Postal Service does. It determines the cost of delivering the mail and sets postal rates at the level necessary to cover its costs. If the postal service followed the highway model, it would instead set postal rates at some arbitrary level and then deliver whatever mail its budget would permit.

#### BUDGET RELATED REAUTHORIZATION ISSUES

Before ending, I want to briefly mention some additional budget-related issues for TEA-21 reauthorization.

First, and most important, preserve the budget firewalls that apply to the highway and mass transit categories and the guaranteed obligation limitation for highways.

These two TEA-21 innovations have been instrumental in moving toward the goal of using all Highway Trust Fund revenues for surface transportation investment in a timely manner. The budget firewalls have removed the incentive to cut funding for the highway and transit programs, because the "savings" of doing so cannot be diverted to other uses. The guaranteed funding has, at least until fiscal year 2003, provided predictability to Federal funding for State DOT planning.

Second, we suggest enactment of a maintenance-of-effort requirement for the States. An increase in Federal highway funding creates a temptation for State legislatures to divert State-derived highway funds to other uses. A maintenance-of-effort requirement to receive Federal highway funds would eliminate that temptation.

Third, we recommend a significant increase in funding for the mass transit program and, in conjunction with that, elimination or a cap on the ability of State DOTs to transfer highway program funds to transit. Each year, more than \$1 billion of Federal highway funds are diverted by the States to transit operating and capital expenses, as permitted under the Surface Transportation Program (STP) and Congestion Mitigation and Air Quality (CMAQ) programs. This is in addition to the funding made available through the Federal mass transit program. Adequate funding for the mass transit program should go hand in hand with dedicating highway program funds solely to highway improvements.

Mr. Chairman, again I want to thank you very much for inviting me to testify on behalf of the American Road and Transportation Builders Association.

## Cutting FY 03 Funding Will Lower Baseline for TEA-21 Reauthorization

<sup>1</sup> Includes \$20 million reduction due to proposed transfer to Federal Motor Carrier Safety Administration  
<sup>2</sup> Source: FHWA 2492 Comparison of Estimated FY 2002 Distribution of Obligation Limitation and ... President's Budget  
<sup>3</sup> Employment loss is spread over 7 years, with most loss occurring in 2003 and 2004.

**Current Balance in Highway Account of the Highway Trust Fund: \$18,855,822,135**

**There is no reason to cut federal highway investment by \$8.6 billion when the Highway Trust Fund's Highway Account balance stands at almost \$19 billion!**

RESPONSES BY TOM HILL, FROM ARTBA, TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question 1.* Your organization has done quite a bit of analysis of Treasury's revenue estimates and I would ask you to expand upon your testimony that Treasury has underestimated future Highway Trust Fund revenues.

Response. As part of the annual preparation of the president's proposed Budget of the U.S. Government, the Office of Tax Analysis of the U.S. Treasury prepares a forecast of revenues for the Highway Account of the Highway Trust Fund. A copy of the forecast used for preparation of the fiscal year 2003 budget is provided as Attachment 1.

ARTBA's analysis of these Treasury revenue estimates indicates that Treasury may have underestimated future Highway Account revenues.

Treasury uses a complex model to forecast Highway Account revenues. Each of the six main revenue sources—the Federal gasoline, diesel and gasohol excises plus the taxes on truck sales, tire sales and truck use—is projected separately and the results are added together to provide an overall revenue forecast.

The Treasury revenue forecast raises three concerns:

- The forecast projects that revenues from the retail tax on trucks will not recover to the fiscal year 2000 pre-recession level until fiscal year 2008, 7 years after the trough of the current recession (see the 4th line of Attachment 1). This is completely at odds with every past recession, where truck tax revenues equaled or surpassed the pre-recession peak within 2 years of the recession trough. This includes the 1981–82 recession, which was the worst in the post-war period and far more severe than the current recession. Assuming that it will take 7 years to reach a level attained within 2 years after previous recessions means the Treasury forecast may be significantly understating future Highway Account revenues. For example, if truck excise taxes return to the pre-recession peak in three rather than 7 years, annual Highway Account revenues would be \$1.1 billion higher than the Treasury baseline. If it takes 4 years, annual revenues would still be more than \$800 million higher than the baseline.

- On February 28, the Bureau of Economic Analysis of the U.S. Department of Commerce reported that real Gross Domestic Product (GDP) rose 1.4 percent during the 4th quarter of 2001 rather than the previous estimate of 0.2 percent. The economy appears to be stronger than originally thought and the GDP estimates used by Treasury to prepare the Highway Account revenue forecast thus may have been too low. Adopting a higher GDP forecast should also raise projections of Highway Account revenues.

- The Treasury Department credited the Highway Account with \$26.9 billion of revenues in fiscal year 2001, even though just under \$28 billion of revenues were actually collected. The difference was a bookkeeping correction to make up for the fact that \$1.089 billion too much was credited to the Highway Account in fiscal year 2000. This is explained in more detail in Attachment 2. For fiscal year 2002, Treasury estimates that Highway Account revenues will be \$27.7 billion, which is a reasonable increase over the \$26.9 billion credited to the account for fiscal year 2001 given the forecast for economic recovery this year. But it is \$300 million less than was actually collected in fiscal year 2001. Treasury says its revenue forecast models are independent of the amount of revenues collected in fiscal year 2001. But if the full \$28 billion had been credited to the Highway Account in fiscal year 2001, would Treasury have projected a revenue decline in fiscal year 2002 in contrast to a forecast of economic recovery and growth? It seems more likely that a higher starting point would have resulted in higher revenue forecasts for fiscal year 2002 and all subsequent years.

These concerns suggest Treasury's January revenue estimates may be too pessimistic and will be revised upward when the estimates are recomputed with more recent data for the August budget review and the fiscal year 2004 budget.

Given the strong upward 4th quarter GDP revision and the other issues raised in this response, the committee may wish to ask Treasury for new revenue estimates prior to the August budget review.

A corollary issue has been raised: what level of cash balance should be maintained in the Highway Account? The Federal Highway Administration has said informally that a prudent balance would be \$8 billion.

There is no statutory reason for this. The only benefit of a cash balance is that it serves as a back-up source of funds in the event that outlays from the Highway Account exceed revenues into the account. ARTBA has found that, under reasonable assumptions about annual Highway Account revenues and obligation limitations, a positive cash balance will be maintained throughout the forecast period even if Congress provides \$31.8 billion for the Federal highway program in fiscal year 2003.

More fundamentally, however, the cash balance is not the appropriate measure of the level of spending supportable by the Highway Account.

A better measure is the statutorily required Byrd test, which asks whether all anticipated revenues into the Highway Account over a 3-year period are sufficient to cover all anticipated bills that must be paid from the account during that time. This

recognizes that the highway funds distributed to the States each fiscal year actually spend out from the Highway Account over a seven to 9 year period, with most of the bills coming due during the first 3 years.

The Byrd test begins by adding together all outstanding obligations that have not yet been paid plus all outstanding balances that have not yet been obligated. This gives the maximum amount that might have to be paid from the Highway Account. The current cash balance is subtracted to determine how much additional cash would be needed to pay all potential bills. This figure is then subtracted from projected Highway Account revenues for the next 2 years. The result is the headroom in the Highway Account. If it is positive-projected revenues exceed anticipated bills-there is room for additional funding. If it is negative, the Byrd amendment requires an across-the-board cut in highway funding sufficient to restore the difference.

Under the CBO baseline, the Byrd test is consistently positive throughout the forecast period and, in fact, grows throughout the period. This holds true whether the highway program is funded at \$31.8 billion in fiscal year 2003 or \$23.2 billion or anywhere in between.

In summary, whether looking at the cash balance in the Highway Account or the Byrd test, ARTBA believes the Highway Account could support a \$31.8 billion highway program in fiscal year 2003.

*Question 2.* I am intrigued by the American Road and Transportation Builders Association's suggestion that we enact a maintenance-of-effort requirement for the States. Certainly our goal in providing additional transportation funding at the Federal level is to increase the total level of infrastructure investment rather than to have the States simply substitute Federal funds for State funds. Have you studied how States have reacted to the Federal funding increases since TEA-21?

Response. ARTBA's analysis of Federal Highway Administration (FHWA) data for 1998 through 2000 show that 26 States invested less of their own State funds in highway capital improvements during at least one of those years than during 1997, the last year of funding under the Intermodal Surface Transportation Efficiency Act (ISTEA). Four States invested less all 3 years than during 1997. Had a maintenance-of-effort provision been in effect during those years, it would have added approximately \$2 billion to highway capital improvements.

ARTBA based its analysis on data from the annual Highway Statistics volumes published by FHWA. We began with total capital outlays for highways by State Departments of Transportation (from Table SF-2) and subtracted the payment of funds by FHWA to each State (from Table SF-3) to arrive at the annual amount of own-State funds invested in highways by each State. We did this for 1997, 1998, 1999 and 2000. The results are shown in the first four columns of Attachment 3.

We then compared the amount of own-State funds invested in highway capital improvements during 1998, 1999 and 2000 to the 1997 baseline. These results are shown in the next three columns. A negative figure means the State invested less in highway capital improvements during that year than in 1997.

The final two columns summarize the results. The first summary column shows the number of years each State's capital investment fell short of the 1997 baseline. The second shows the total shortfall during all negative years.

The table yields two important results.

First, own-State expenditures for highway capital investment fell below the 1997 baseline in 47 instances during the first 3 years of TEA-21, an average of just under one instance per State. Since this was spread over 3 years, it means that one-third of the States spent less on highways during each of the first 3 years under TEA-21 than they did in 1997.

Second, if TEA-21 had included a maintenance-of-effort provision, the result would have been an additional \$2 billion of capital investment in highways during those 3 years.

If Congress were to include a maintenance-of-effort provision in TEA-21 reauthorization legislation, two issues need to be addressed:

While ARTBA's analysis used 1997 as the baseline, the baseline for a maintenance-of-effort provision should be multi-year. This would prevent States from manipulating the baseline.

The maintenance-of-effort provision should apply to obligations. ARTBA's analysis was based on actual expenditures from the U.S. and State treasuries, since these were the only consistent data available. But expenditures are the result of obligations in previous years and are thus only a second-best measure of State maintenance of effort.

## RESPONSE BY TOM HILL TO ADDITIONAL QUESTION FROM SENATOR SMITH

*Question.* As to the issue of reauthorization, what would be the implications, both negative and positive, of restoring the collection of interest on the funds on hand in the Highway Trust Fund?

*Response.* Prior to October 1, 1998, the cash balance in the Highway Trust Fund earned interest from the U.S. Treasury. While interest added resources to the Highway Trust Fund, it did not necessarily increase Federal investment in highways and mass transit because there was no mechanism to assure that all Highway Trust Fund receipts were actually spent on the nation's transportation needs.

TEA-21 took one step forward and one step back. It provided guaranteed funding for highways and mass transit and established the revenue-aligned budget authority (RABA) mechanism to assure that all Highway Account revenues were spent solely on the Federal highway program.

But under TEA-21, the cash balance in the Highway Trust Fund no longer earns interest.

According to the latest data from the U.S. Department of the Treasury, the cash balance in the Highway Trust Fund is just over \$22 billion. At current interest rates, the foregone interest on this is slightly less than \$1 billion. During the 6-year life of TEA-21, the total foregone interest will total well over \$6 billion, since both interest rates and the size of the balance were higher at times earlier in the period.

Restoring the collection of interest on funds in the Highway Trust Fund would increase the resources available for Federal highway and mass transit investment. ARTBA supports this proposal.

It will increase Federal highway investment, however, only if Congress continues to guarantee that all Highway Trust Fund revenues be spent only for highways and mass transit. This means preserving the budgetary firewalls and the annual RABA adjustment mechanism for the highway program. Without these guarantees, restoring interest to the Highway Trust Fund could have no effect on annual investment levels.

The sole "cost" of this proposal is that it would increase Federal outlays for computing the annual budget surplus or deficit. But it would not reduce spending for other domestic discretionary categories. This is because the additional Highway Trust Fund revenues would raise the highway budget category directly and thus would not require any offsets in other domestic discretionary programs.

ARTBA has proposed additional ways of increasing Highway Trust Fund revenues, including indexing the Federal motor fuels excise taxes for inflation, depositing all receipts from the excise on gasohol into the Highway Trust Fund including the 2.5 cents per gallon currently deposited into the general fund, financing the ethanol subsidy from the general fund rather than the Highway Trust Fund, and spending down the cash balance in the Highway Trust Fund.

Ultimately, however, we believe the Federal user fee excise taxes on motor fuels and trucks will have to be increased or a new dedicated revenue source developed in order to provide adequate funding for the Federal highway and mass transit programs.

---

STATEMENT OF THE JAYETTA Z. HECKER, DIRECTOR, PHYSICAL INFRASTRUCTURE  
ISSUES U.S. GENERAL ACCOUNTING OFFICE

Mr. Chairman and members of the subcommittee: We appreciate the opportunity to provide testimony on the Highway Trust Fund. Our statement today is based on our June 2000 report on problems with Highway Trust Fund information,<sup>1</sup> work we performed as the principal auditor of the annual financial statements of the Department of Treasury's Internal Revenue Service (IRS), and other work we do to assist the Department of Transportation Office of Inspector General in its annual audits of the Highway Trust Fund and Department of Transportation financial statements. The Highway Trust Fund is the principle mechanism for funding Federal highway programs authorized by the Transportation Equity Act for the 21st Century (TEA-21). Under TEA-21, the funding levels for Federal highway programs are adjusted annually upward or downward based on actual and projected receipts of the Highway Trust Fund. These adjustments are referred to as the Revenue Aligned Budget Authority (RABA). We are currently reviewing the fiscal year 2003 RABA adjustment. We can provide you the results of that work at a later time.

<sup>1</sup>U.S. General Accounting Office, Highway Funding: Problems with Highway Trust Fund Information Can Affect State Highway Funds, GAO/RCED/AIMD-00-148 (Washington, DC.: June 2002).

This statement will provide a description of (1) how the Transportation Equity Act for the 21st Century (TEA-21) changed the budgetary treatment of programs financed by the Highway Trust Fund, (2) the Revenue Aligned Budget Authority (RABA) calculation process, and (3) the results of our review of the Department of the Treasury's excise tax distributions to the Highway Trust Fund for fiscal year 2001.

In summary: TEA-21 made significant changes to the budgetary treatment of Federal highway and transit programs financed by the Highway Trust Fund. In particular, TEA-21 guaranteed annual funding levels for most highway and transit programs and more closely linked highway user tax receipts, such as those from motor fuel and truck tire taxes, to the annual guaranteed funding levels for highway programs.

RABA adjustments ensure that highway program funding levels will change as Highway Account receipt levels change. For the first time, the RABA adjustment for fiscal year 2003 is negative-decreasing highway funding by \$4.37 billion.

Our work shows that the amounts distributed to the Highway Trust Fund for the first 9 months of fiscal year 2001, as adjusted based on IRS' certifications, were reasonable and adequately supported based on available information.

TEA-21 AND THE HIGHWAY TRUST FUND

TEA-21 authorized \$217.9 billion for highway, mass transit, and other surface transportation programs for fiscal years 1998 through 2003. TEA-21 n " the use of the Highway Trust Fund-which is divided into a Highway Account and a Mass Transit Account-as the mechanism to account for Federal highway user tax receipts that fund various surface transportation programs. Prior to TEA-21, these programs competed for budgetary resources through the annual appropriations process with other domestic discretionary programs. In a major change to Federal budget rules, TEA-21 guaranteed a minimum level of spending for these programs. New budget categories were established for highway and transit spending, effectively establishing a budgetary "firewall" between those programs and other domestic discretionary spending programs. Of the \$217.9 billion authorized for surface transportation programs over the 6-year life of TEA-21, about \$198 billion is protected by the budgetary firewall-about \$162 billion for highway programs and \$36 billion for transit programs. TEA-21 also enhanced the linkage between highway user tax receipts in the Fund's Highway Account and Federal highway program funding levels in several ways, including (1) guaranteeing specific annual funding levels for most highway programs over a 6-year period on the basis of the projected receipts in the Highway Account, and (2) adjusting the guaranteed spending level for each fiscal year upward or downward if the receipt levels in the Highway Account increased or decreased from those projected in TEA-21.

Federal highway user taxes directed to the Highway Trust Fund include excise taxes on motor fuels (gasoline, gasohol, diesel, and special fuels); and truck-related taxes on truck tires, sales of trucks and trailers, and the use of heavy vehicles (see fig. 1). Someone other than the consumer generally pays the motor fuel taxes into the Highway Trust Fund. Oil companies typically pay a per-gallon tax on the motor fuels at the point where their fuel is loaded into tanker trucks or rail cars at a terminal. Tire manufacturers pay taxes on truck tires, by weight; and retailers pay taxes on the sales price of new trucks and trailers. Owners of heavy highway vehicles pay taxes on the use of these vehicles, making this the only highway tax directly paid by the highway user.

Table 1: Highway User Taxes (Cents per gallon)

| Type of tax                    | Tax rate | Distribution of tax |                 |  |              |
|--------------------------------|----------|---------------------|-----------------|--|--------------|
|                                |          | Highway Trust Fund  |                 | Leaking under-ground storage tank trust fund | General fund |
|                                |          | Highway Account     | Transit Account |  |              |
| <b>Motor fuels taxes</b>       |          |                     |                 |  |              |
| Gasoline .....                 | 18.40    | 15.44               | 2.86            | 0.10   |              |
| Diesel .....                   | 24.40    | 21.44               | 2.86            | 0.10   |              |
| <b>Alternative fuels taxes</b> |          |                     |                 |  |              |
| Gasohol (10% ethanol) .....    | 13.10    | 7.64                | 2.86            | 0.10   | 2.5          |

| Tires   | 0-40 lbs., no tax<br>Over 40 lbs - 70 lbs, 15 cents per pound in excess of 40<br>Over 70 lbs - 90 lbs, \$4.50 plus 30 per pound in excess of 70<br>Over 90 lbs, \$10.50 plus 50 cents per pound in excess of 90 |                     |                 |  |              |
| Truck and trailer sales tax                               | 12 percent of retailer's sales price for tractors and trucks over 33,000 lbs gross vehicle weight (GVW) and trailers over 26,000 GVW  |                     |                 |  |              |
| Heavy vehicle use tax                                     | Annual tax: Trucks 55,000 lbs and over GVW, \$100 plus \$22 for each 1,000 lbs (or fraction thereof) in excess of 55,000 lbs (maximum of \$550)   |                     |                 |  |              |

Note: Tax rates as of July 1, 2001.  
Source: Federal Highway Administration (FHWA) and the Office of Tax Analysis, Department of the Treasury.

Twice a month, business taxpayers make deposits of excise taxes-including highway user taxes-generally through Treasury's Electronic Federal Tax Payment System. Excise taxes are deposited into Treasury's General Fund as received.

Treasury uses a complex and lengthy process-involving four organizations within the department-for distributing excise tax receipts to the various trust funds, including the Highway Trust Fund. The department uses this process, in part, because it does not obtain data from business taxpayers (when they make semimonthly deposits) on the types of excise taxes that these deposits are intended to cover.

Because businesses, rather than consumers generally pay highway user taxes, most of the Federal motor fuel and truck taxes come from only the handful of States where those businesses have their corporate headquarters and pay their taxes.

As a result, the Treasury Department does not provide the Federal Highway Administration (FHWA) with State-level data on highway tax receipts, and FHWA must therefore estimate these data in order to distribute Highway Account funds to the States under various highway programs. FHWA estimates State-level contributions through what it refers to as its "attribution process." Through this process, it determines each State's share of highway motor fuel usage on the basis of data provided by the States, and it uses that information to estimate the amount of contributions to the Highway Account attributable to each State's highway users. The information developed by Treasury and FHWA is used to determine the amounts of funds distributed to each State under several major highway programs.

**The Revenue Aligned Budget Authority Calculation**

TEA-21 used projections of Highway Account receipts to develop guaranteed highway funding levels for fiscal years 1999 through 2003. Beginning in fiscal year 2000, these guaranteed levels were to be adjusted upward or downward each year on the basis of actual Highway Account receipts and new projections of these receipts. If this RABA adjustment lowers the guaranteed funding level for a given fiscal year, TEA-21 requires that the Department of Transportation reduce the amount of funding authorized on October 1 of the next fiscal year. RABA adjustments ensure, for the first time, that highway program funding levels will change as Highway Account receipt levels change.

The RABA adjustment to the funding levels authorized in TEA-21 is based on actual receipts from 2 years prior to the fiscal year, as reported by Treasury, plus revised Treasury receipt projections for the fiscal year in question. For example, for fiscal year 2000, TEA-21 requires that this adjustment be calculated by comparing (1) actual Highway Account receipts for fiscal year 1998 with the TEA-21 projection of these receipts (the "look back" portion of the calculation) and (2) revised projections of Highway Account receipts for fiscal year 2000 with the TEA-21 projection of these receipts (the "look forward" portion of the calculation). The sum of these differences becomes the RABA adjustment. To determine the amount of the RABA adjustment, the Office of Management and Budget relies on information on Highway Account receipts supplied by Treasury. Specifically, the Bureau of Public Debt provides the actual Highway Account receipts for the prior fiscal year, and the Office of Tax Analysis (OTA) provides a projection of Highway Account receipts for the next fiscal year.

Figure 2 shows the RABA calculations and resulting adjustments for fiscal years 2000 through 2003. As shown, the RABA adjustments for fiscal years 2000 through fiscal year 2002 were positive-increasing highway funding levels by a total of over \$9 billion.<sup>2</sup> However, in fiscal year 2003, actual Highway Account receipts for fiscal year 2001 were less than the TEA-21 estimate for fiscal year 2001, and Treasury's projection of Highway Account receipts for fiscal year 2003 was less than the TEA-21 estimate for that year. As a result, the RABA adjustment for fiscal year 2003 is negative \$4.37 billion.

Table 2: RABA Calculation for Fiscal Years 2000 through 2003

(In millions of dollars)

| Fiscal Year   | Look Back                                |         | Look Ahead                               |        | RABA    |
|---------------|--|---------|--|--------|---------|

|               | less 2000 TEA-21 est. Hwy/Acct receipts. | 28,066  | less 2002 TEA-21 est Hwy/Acct receipts.  | 28,972 |         |
|               | less look-ahead result for 2000          | 485     |  |        |         |
|               | subtotal .....                           | 1,738   | subtotal .....                           | 2,760  |         |
| FY 2003 ..... | 2001 actual Hwy/Acct receipts .....      | 26,900  | 2003 est. Hwy/Acct receipts .....        | 28,570 | (4,369) |
|               | less 2001 TEA-21 est. Hwy/Acct receipts. | 28,506  | less 2003 TEA-21 est Hwy/Acct receipts.  | 29,471 |         |
|               | less look-ahead result for 2001          | 1,862   |  |        |         |
|               | subtotal .....                           | (3,468) | subtotal .....                           | (901)  |         |

Note: Actual receipts are net tax receipts (excluding fines and penalties) after deduction of transfers and refunds. OTA prepares forecasts of tax receipts to the Highway Account of the Highway Trust Fund for the President's Budget and other analyses. References to TEA-21 estimates are to the estimates of Highway Account receipts in TEA-21. The Congressional Budget Office prepared these estimates.

Source: Department of Transportation

We are currently reviewing the fiscal year 2003 RABA calculation and will report our results at a later date. We have, however, completed our annual review of the Treasury's distribution of excise taxes to the Highway Trust Fund for fiscal year 2001—which accounts for about 80 percent of the total negative RABA of \$4.37 billion.

#### Treasury's Excise Tax Distributions to the Highway Trust Fund for the First Nine Months of Fiscal Year 2001 Are Reasonable

The Federal Government levies excise taxes on entities and individuals to finance general Federal activities and specific government programs. Several different bureaus and offices within Treasury collected about \$69 billion of net excise taxes in fiscal year 2000. However, IRS accounted for the majority of excise taxes in fiscal year 2000, with about \$54 billion in net excise tax collections on the purchase, use, or inventory of various types of goods or services, such as gasoline and tobacco. The various excise tax receipts accounted for by IRS are initially deposited into the General Fund of the Treasury as they are paid by the business taxpayer; subsequently, a portion of these deposits are distributed to nine excise tax-related trust funds,

<sup>2</sup>FHWA apportions any additional RABA funds to the States on October 15 of each fiscal year—about 2 weeks after apportioning the amount of highway program funds for the fiscal year that was authorized in TEA-21.

which are administered by six Federal agencies. More than 63 percent of these funds are ultimately distributed to the Highway Trust Fund.

Under section 9601 of the Internal Revenue Code, the Secretary of Treasury is required to transfer applicable excise tax receipts from the General Fund to trust funds on a monthly basis. These transfers are based on estimates because data is not available to attribute excise taxes to the appropriate trust funds when the deposits are initially made. Treasury's OTA prepares these semi-monthly estimates based on historical IRS certification data and actual current excise tax revenue collections. The estimates are used to prepare accounting entries for the initial distributions to the trust funds.

Subsequently, IRS certifies the actual excise tax revenue collections that should have been distributed to the trust funds based on the payments and tax returns IRS receives from taxpayers.<sup>3</sup> Using the IRS certifications, Treasury then adjusts the initial trust fund distributions. For example, in March 2001, Treasury made an adjustment to decrease the Highway Trust Fund's fiscal year 2001 excise tax distributions by about \$1.2 billion. This adjustment was to correct for actual collections for the fourth quarter of fiscal year 2000 being less than what was initially distributed based on OTA's estimates for the quarter ended September 30, 2000. According to an official from OTA, the original estimated transfer amounts for the quarter had been calculated using an economic model that assumed a higher rate of economic growth through calendar year 2000 than was actually the case.<sup>4</sup> As a result, the downward adjustment was made, effectively reducing fiscal year 2001 distributions to the Highway Trust Fund by the \$1.2 billion.

We are issuing today results of a report on the procedures we performed related to the distributions of excise taxes to the Highway Trust Fund in fiscal year 2001.<sup>5</sup> Based on this work, we believe the amounts distributed to the Highway Trust Fund for the first 9 months of fiscal year 2001, which were subject to the IRS' quarterly excise tax certification process and which were adjusted based on this process, were reasonable and were adequately supported based on available information. Additionally, we believe the March 2001 adjustment made by Treasury to reduce fiscal year 2001 Highway Trust Fund excise tax distributions by \$1.26 billion was reasonable and appropriately supported. The certifications for distributions of excise tax revenue collected during the period July 1, 2001, through September 30, 2001, will not be completed by IRS until March 2002. Consequently, the distributions of fourth quarter fiscal year 2001 excise tax revenue were based solely on estimates prepared by OTA. While we reviewed certain procedures associated with OTA's estimates, we did not audit the estimation process nor did we audit the estimates themselves. Therefore, we cannot conclude on the reasonableness of the distributions made to the Highway Trust Fund for the fourth quarter of fiscal year 2001.

#### STATEMENT OF ANDREW LYON, DEPUTY ASSISTANT SECRETARY FOR TAX ANALYSIS, U.S. DEPARTMENT OF THE TREASURY

Mr. Chairman and members of the subcommittee, I appreciate the opportunity to describe recent trends in actual highway-related excise taxes and discuss the Administration's fiscal year 2003 Budget forecast of excise taxes dedicated to the Highway Account of the Highway Trust Fund.

The Office of Tax Analysis in the Department of the Treasury forecasts most future tax receipts for the President's Budget. These forecasts are made using economic models that are constantly updated to incorporate the most current information on tax collections and reported tax liabilities. The forecast for Fiscal Years 2002 through 2012 incorporates the Administration's economic assumptions formulated for the Budget by the Troika, which consists of the Council of Economic Advisors,

<sup>3</sup>Typically IRS certifies quarterly excise tax distributions 6 months after the end of the quarter. This is to allow sufficient time for receipt and processing of the tax returns, including returns filed late. Even though IRS certifies collections 6 months after the end of a quarter, certifications for any given quarter routinely contain some amounts related to prior quarters.

<sup>4</sup>Prior to December of 2000, this process used economic models and was linked to OTA's receipt estimates for inclusion in the President's Budget.

<sup>5</sup>Report on Applying Agreed-Upon Procedures: Highway Trust Fund Excise Taxes (GAO-02-379R).

the Office of Management and Budget, and the Department of the Treasury.<sup>1</sup> Each of the six dedicated Highway Account excise tax sources are separately forecast: (i) Gasoline, (ii) Gasohol fuels, (iii) Diesel and other fuels, (iv) Retail tax on trucks, (v) Highway-type tires, and (vi) Heavy vehicle use tax. In Table 1, fiscal year receipts for 2000 through 2012 are reported for these six excise tax sources. The 2000 and 2001 figures are actual receipts drawn from the Highway Account Income Statement, while the 2002 through 2012 figures are projections from the President's fiscal year 2003 Budget.<sup>2</sup>

#### RECENT EXCISE TAX RECEIPTS

There has been a rapid downturn in highway-related excise taxes as the economy weakened over the past year and a half. Actual tax receipts dedicated to the Highway Account fell \$3.4 billion from Fiscal Year 2000 to Fiscal Year

2001, dropping from \$30.3 billion to \$26.9 billion, an 11.3 percent decline. As shown in Table 1, five of the six receipt sources were lower in 2001 than in 2000. Only taxes on gasohol fuels show an increase.

Although the growth in the tax on gasohol fuels might initially appear to be a bright spot in an otherwise disappointing year, the growth is actually a significant factor in the overall reduction in dedicated Highway Account tax receipts. The increase in taxes on gasohol fuels is evidence of an ongoing substitution of gasohol fuels for gasoline, which may be used interchangeably in cars and light trucks. We anticipate that there will be an increasing use of gasohol fuels, and corresponding reductions in gasoline consumption as States ban the use of MTBE (methyl tertiary-butyl ether) as a fuel additive. Since the Highway Account receives 15.44 cents per gallon of gasoline but only about 8 cents per gallon of gasohol, increases in gasohol use at the expense of gasoline consumption will result in a net reduction in Highway Account receipts. On net, for every billion gallons of gasohol sold in place of gasoline, Highway Account receipts are approximately \$78 million lower. Approximately two-thirds of this negative effect on Highway Account receipts from the substitution of gasohol for gasoline is due to the ethanol tax incentive (currently 53 cents per gallon of ethanol, which at a 10 percent blend is 5.3 cents per gallon of gasohol). The remainder is attributable to the fact that the law dedicates a portion of gasohol tax receipts (typically 2.5 cents per gallon) to the General Fund.

The most dramatic declines between fiscal year 2000 and fiscal year 2001, both in percentage terms and in dollars, occurred in excise taxes related to the sales and operations of trucks. The retail tax on trucks, a 12 percent tax on the first retail sale of heavy trucks, buses, truck tractors, and trailers, was down 55.2 percent, a decline of more than \$1.8 billion. Tax receipts from the tax on truck tires fell 22.5 percent, and truck use tax receipts fell 33.8 percent. The reductions in retail truck taxes were particularly large because this tax is levied as an ad valorem tax on the first retail sale. During the investment boom of 1998 and 1999, a large volume of new trucks was purchased at premium prices. As the economy weakened, large numbers of these slightly used trucks were placed on the market. This greatly depressed prices and sales in the new heavy truck market, and tax revenues from retail truck taxes declined accordingly.

The first quarterly report to show weakness in total collections was for July through September of 2000. This Highway Trust Fund certification of excise tax receipts was issued in March of 2001.<sup>3</sup> This certification shows a 4.8 percent drop compared with the same quarter in the prior year. The subsequent quarterly certification for October through December 2000, issued in late June, showed a 5.6 percent reduction in receipts compared to the prior year. Based on this weakness, the Mid-Session Review of the fiscal year 2002 Budget reported that Highway Trust Fund revenues would be lower than previously forecast.

New data for the first two quarters of calendar year 2001 have shown further weakness in tax receipts. The certification for January through March of 2001 showed receipts declining 3.5 percent compared with the prior year, and the certifi-

<sup>1</sup>The economic assumptions are described in Chapter 2 of the Analytical Perspectives volume of the fiscal year 2003 Budget.

<sup>2</sup>The Income Statement for 2001 includes three quarters of actual tax receipts certified by the IRS. Receipts for the last quarter of the year are based on an estimated allocation of total excise tax receipts. Any differences between estimated and actual receipts for the last quarter is adjusted in March and reflected in the Income Statement of the subsequent year.

<sup>3</sup>The Highway Account Certification is issued by the IRS as the final statement of excise tax collections dedicated to the account. The

Certification for a given quarter is issued approximately five and half months after the end of the quarter due to the time required to process the excise tax returns. This report, based on filed excise tax returns, provides the first detail of tax receipts by specific tax item.

cation for April through June of 2001 was 5.5 percent lower than the prior year. These two quarterly certifications also reflected accelerating increases in gasohol use as gasohol taxes grew by 25.8 percent and 23.7 percent compared with the same quarters in 2000. This series of weak Highway Account receipt certifications explains why fiscal year 2001 total tax revenues fell to \$26.9 billion.<sup>4</sup>

#### FORECAST OF FUTURE EXCISE TAX RECEIPTS

Looking forward, the Administration projects steady growth in highway-related excise tax receipts. Net receipts in fiscal year 2003 are projected to be 6.2 percent higher than fiscal year 2001 and 2.9 percent higher than fiscal year 2002. Average annual growth is forecast to be more than 3 percent per year over the remainder of the budget period. The fiscal year 2003 Budget forecasts a faster long-run growth in receipts than last year's Budget; however, this faster rate of growth is relative to a smaller base, so the fiscal year 2003 levels are lower than previously projected. In the current budget, the Administration forecasts net Highway Account excise tax receipts to be \$28.57 billion in fiscal year 2003.

During the first 5 years of the forecast period, gallons of gasoline and gasohol fuels are projected to grow at an average of 2.3 percent per year. Gasohol fuels grow faster than gasoline due to the increasing reliance on ethanol as an oxygenate to meet clean air requirements. Because of the difference in the amount per gallon dedicated to the Highway Account, total gasoline and gasohol receipts grow at about 2 percent per year during the first 5 years of the forecast.

The truck related excise tax receipts are projected to grow quickly as the economy recovers. For fiscal year 2003 compared to fiscal year 2001, retail tax on trucks receipts are projected to grow 22.1 percent and tire tax receipts are projected to grow by 10.6 percent. Between fiscal year 2003 and fiscal year 2002 retail tax on truck receipts are projected to grow 15.6 percent and tire tax receipts are projected to grow 6.5 percent. This growth reflects the recovery of the heavy truck market and more generally increased investment in equipment. Diesel fuel receipts are forecast to decline slightly between fiscal year 2001 and fiscal year 2002 before resuming growth averaging more than 3.5 percent per year.

In summary, the Administration's forecast of highway-related excise taxes reflects the most recent tax collection and liability data available, and the Administration's economic forecast. The data reflect the weakness in the economy during 2000 and 2001. The forecast for future years is based on the expectation that the recession will end in early 2002 and a strong recovery will be underway later in the year.

#### CONCLUSION

I appreciate this opportunity to describe recent trends and present our current forecast to you.

#### STATEMENT OF KENNETH K. WERT, ASSOCIATED GENERAL CONTRACTORS OF AMERICA

On behalf of the Associated General Contractors of America (AGC), I am pleased to submit testimony on the critical issue of how the recommended dramatic reduction in Federal-aid highway funding for fiscal year 2003 will hurt the nation's economy, the construction industry and my company. My name is Kenneth Wert, President of Haskell Lemon Construction Co. in Oklahoma City, Oklahoma.

AGC is extremely concerned with the recommended cut in highway funding in the President's fiscal year 2003 budget proposal. Toward that end, AGC strongly supports S. 1917, the Highway Restoration Act and the companion legislation, H.R. 3694. These bills call for increasing obligations for the Federal-aid highway program by \$4.4 billion over the President's budget request. If included in this year's Transportation Appropriation's (FY 2003), it would fund the highway program at \$27.75 billion in obligation authority, which is the minimum funding level included in the Transportation Equity Act for the 21st Century (TEA-21). While supportive of this legislation, AGC supports increasing funding to the level in this year's fiscal year 2002 appropriation's bill, an obligation limitation of at least \$31.8 billion.

AGC is urging Congress to raise the funding for highways from the surplus that has accumulated in the Highway Trust Fund since the adoption of TEA-21. The money was collected with the express intent that it be spent on transportation improvements. Our proposal will accomplish this objective, spur the economy and save jobs.

<sup>4</sup> Total Highway Account receipts including fines and penalties were \$29.917 billion in fiscal year 2001.

The recommended cut in funding would be devastating to State Departments of Transportation across the Nation. In Oklahoma, our State Department of Transportation (ODOT) would experience a reduction of approximately \$110 million

for fiscal year 2003, if the Federal program is cut by the proposed \$8.5 billion. Construction of new vital highway projects will be the first to be cut. The Road Information Program's (TRIP) analysis states that Oklahoma would lose 4,600 jobs just from the Federal cut. Additional jobs will be lost if Oklahoma cuts its State highway funding as well. TRIP's report states that the cut in funding could result in the loss of \$627 million in economic benefits in Oklahoma. These lost economic benefits are based on the USDOT's estimate that each \$1 invested in transportation funding results in \$5.70 in economic benefits that improve safety, reduce traffic congestion and reduce vehicle-operating costs paid by motorists.

Make no mistake about it, Oklahoma cannot afford any cut in funding, certainly not one of this magnitude. In Oklahoma, vehicle miles traveled increased by 31 percent between 1990 and 2000. Traffic fatalities average 737 annually. Many of these fatalities could be avoided with a variety of safety improvements to our State's transportation system. Furthermore, 83 percent of the \$58 billion worth of commodities delivered annually from sites in Oklahoma are transported on the State's highways.

Reducing Oklahoma's highway program by \$110 million would be devastating for family owned businesses such as mine, Haskell Lemon Construction Co. For our company, the cut in highway funding will reduce bidding opportunities for new construction, which would result in a reduction in personnel, a reduction in plant and equipment, and the need to develop a revised business plan.

Let me be more specific as to the impact on Haskell Lemon Construction Co. We currently have a combined employment of approximately 225 employees. Our company has the present capability to progress multiple large-scale (\$10–20 million) projects simultaneously. Typical project duration is 9 to 18 months. Multiple crews within each construction discipline (i.e. grading, drainage, paving, etc.) allows for multiple construction operations to be in process in both urban and rural settings.

The proposed reduction in ODOT's funding will result in the elimination of several construction crews within the company. It is conceivable that an entire construction segment within the company could be laid off—one grading crew (7 employees), one drainage crew (8 employees), one concrete paving/structures crew (10 employees) one asphalt paving crew (6 employees), one plant crew (4 employees), and shop support personnel (3 mechanics). In addition to the construction division employment effected by a reduction in ODOT's program, several peripheral operations would also lose employees. The reduction in construction projects would eliminate demand for hauling construction materials (7 drivers), truck mechanics (2), and demand for aggregate production (3 plant employees). The initial loss in personnel would total over 50 employees—a reduction of 22 percent of total employment representing over \$1 million in annual payroll.

It is important to consider that along with the lost jobs documented above, is the loss of benefits for the employees—health and dental insurance. While the insurance is portable for a limited duration at the individual's cost, it is becoming more expensive in an increasingly difficult insurance market. Many laid-off employees are forced to tap their profit sharing benefits at a substantial penalty to survive in today's lean job market. These benefits are intended for retirement after years of service.

Finally, Haskell Lemon Construction Co. would be forced to evaluate its current plant and equipment operations. Our company operates four asphalt plants, one concrete plant, and two sand and gravel operations. Rolling stock and construction equipment are in the hundreds with a replacement cost in excess of \$20 million. A reduction in Oklahoma's construction program would require the company to evaluate its plant and equipment and liquidate those assets that would not have the opportunity to produce as a result of a reduced construction market.

This is the dramatic impact a highway funding cut of this magnitude would have on our company. There are hundreds of other family owned construction companies that would react the same way and be forced to lay off tens or hundreds of valued employees.

Mr. Chairman, on behalf of AGC, I thank you and every member of this committee for introducing and cosponsoring S. 1917 and attempting to mitigate some of the impact of this proposed highway funding cut. AGC and I stand ready to assist you. Thank you for the opportunity to submit testimony.

## **TEA-21 REAUTHORIZATION**

---

**TUESDAY, MARCH 19, 2002**

U.S. SENATE,  
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,  
*Washington, DC.*

### **TRANSPORTATION MOBILITY, CONGESTION AND INTERMODALISM**

The committee met, pursuant to recess, at 2:30 p.m. in room 406, Senate Dirksen Building, Hon. James M. Jeffords [chairman of the committee] presiding.

Present: Senators Jeffords, Graham, and Chafee.

Also present: Senator Murray.

#### **OPENING STATEMENT OF HON. JAMES M. JEFFORDS, U.S. SENATOR FROM THE STATE OF VERMONT**

Senator JEFFORDS. Good afternoon, everyone. Thank you all for joining us for third in our series of hearings on reauthorization of the Nation's Surface Transportation Program.

I also want to extend a warm welcome to our witnesses who have traveled from near and far to be with us today. I look forward to hearing your testimony.

The subject of today's hearing is congestion, a nuisance that every person in this room has experienced at one time or another. Congestion is one of the Nation's most vexing problems, particularly in our metropolitan areas and on the highway system in those areas. Beyond the general frustration that congestion imposes on commerce every day, it has significant negative impacts on our economy, delaying freight delivery and creating inefficiencies. Congestion also harms the environment and as such presents a threat to human health as well.

In today's hearing, we hope to uncover some of the fresh ideas on transportation demand, access, mobility and program flexibility. These new ideas may become part of our contribution to the 10-year legacy of the Intermodal Surface Transportation Efficiency Act, ISTEA, and the Transportation Equity Act for the Twenty-First Century, TEA-21. With the passage of ISTEA and TEA-21, our transportation program shifted its emphasis from building the interstate highway system to a new focus, the movement of people and goods. In metropolitan areas where congestion is of the greatest concern, this new, post-interstate program empowered citizens and local officials to develop transportation improvement strategy tailored to the unique needs of the metro region.

The law also provides spending flexibility so that funds could be targeted in ways that will carry out local strategies. Gone for the most part are the rigid funding categories. Funds can now be moved among programs to meet local needs.

In today's hearing, we will explore lessons learned about our transportation program over the last 10 years. We will look at trends in travel and congestion. Our witnesses will forecast future conditions to give us the context for reauthorization and based on those lessons learned and changing conditions, our experts will share their ideas for improving our transportation program.

Now to our witnesses. Tim Lomax is a Research Engineer for the Texas Transportation Institute at Texas A&M University. Dr. Lomax's most recent study, the "2001 Urban Mobility Study," uses a variety of measures to illustrate the Nation's growing traffic problems. Our second panel will present ideas to address access and mobility. The Honorable Ron Sims was elected King County Executive in 1997, home to the city of Seattle, King County, Washington State's largest county. Mr. Sims is founder and organizer of the Metropolitan Congestion Coalition, bringing together metropolitan elected officials and business leaders nationally. Anthony Downs is a Senior Fellow at the Brookings Institute in Washington, DC. His 1992 book, "Stuck in Traffic," is among the most widely read on the subject of metro congestion. C. Kenneth Orski is the Director of MIT's International Mobility Observatory and Editor and Publisher of "Innovation Briefs," a newsletter on transportation. He also heads the Urban Mobility Corporation, a Washington, DC.-based consulting firm. We will have Frederick P. Salvucci also from MIT, a civil engineer and senior lecturer specializing in transportation. Mr. Salvucci is the former Secretary of Transportation of the Commonwealth of Massachusetts and presently serves as senior advisor to a number of urban transportation programs. Alan Pisarski is chairman of the Transportation Research Board Committee on National Transportation Data requirements and the Committee on Transportation History. He has worked in transportation policy for over 30 years.

Now we are ready to proceed. Mr. Pisarski, I will ask you to start.

**STATEMENT OF ALAN PISARSKI, CHAIRMAN, TRANSPORTATION RESEARCH BOARD COMMITTEE ON NATIONAL TRANSPORTATION DATA**

Mr. PISARSKI. Thank you, Mr. Chairman.

My name is Alan Pisarski and I am honored to be invited to speak before you once again to address the outlook for American travel. I recall with pleasure that I participated in these hearings in 1997 in the advent of TEA-21 and also in the first hearing for ISTE. It is a responsibility that I take very seriously.

We need to look at the next reauthorization period through the lens of the changes likely to occur between now and the end of the coming cycle. We will have seen dramatic changes since the first decade of this new century. We will have crossed 300 million in population at some point during this reauthorization period. Our rural population will have reached 60 million people, as large as many countries. We will have added more than 25 million people

during this period, perhaps as many cars as people, another ten million households, perhaps 10 million immigrants.

As the reauthorization comes to a close, the first of the babyboomers will be reaching 65. We will have added probably \$4 trillion to our economy. The point is I think we will be a very different country at the close of the next reauthorization than we are today and we must consider both the passenger and the freight travel activities in both our metropolitan and non-metropolitan forms. Many of our issues of the future will be centered in freight passenger conflicts and the intercity and local interactions.

My focus today will be on taking the long view on the Nation's travel behavior and its demographic future. I am going to be talking quite a bit about our demography and where it is taking us in the future. There is a document called, "Notes to the Testimony," that has some notes that you might choose to refer to.

One of the key points I wanted to make is the current data coming out of the Census Bureau now shows the nature of the trends that are happening with American commuting. I will skip over the major points other than to say that when I testified last, I thought the single occupancy vehicle had about stopped its growth. I was wrong, it continues to grow from 73 to 76 percent. Car pooling continues to decline. The good news is transit is holding its share at 5 percent of total commuting.

With respect to travel times and congestion in the country, I think there is something very positive we can say about our system. Over 20 years we have added over 35 million new riders in our road system and we have only grown 2 minutes in average travel time. That is a period that is getting worse but still I think it is very positive.

One of the phenomena that is happening which needs to be addressed is the fact that many more rural States, States without large metro areas where you would expect congestion, are now seeing the largest increases in commuting problems. West Virginia was the largest increase, and Vermont and New Hampshire for example.

The major forces that were acting in the past, I think, for the most part, are behind us. I won't pursue those. I do want to identify new forces of change that I think will be acting over the next years during the reauthorization period. The first is the evident one, the aging population. I think it is going to be a key factor. A stagnating labor force is going to be a key question, just the numbers of people available. If we worried about too many commuters in the past, we may be worrying about too few in the future.

Continuing immigration waves will change the nature of our commuting patterns. An important influence will be what I call the democratization of mobility. Many of our minority populations, which are very close to being back in the 1960's and the 1970's in regard to current mobility levels, as they achieve the mainstream, mobility will be an important influence on travel growth.

Finally, the increasing affluent nature of our society I think will have an immense influence on most of our forces. High income people will typically make twice as many trips as low income people in a metro area. In long distance, they will make four times as many auto trips, seven times as many air trips. So as the society

is more affluent and as people's value of time increases, both the activity and the pressures for the quality of the system will increase.

I would ask you to look for the following prospects. For commuting, who and where the immigrants are will be central. Expect appeals to older workers and women to join the labor force even more actively than they have simply to meet the dearth of skilled workers. For local travel, a generally more affluent society, new minorities being able to travel more, expect very active daytime and weekend travel. For long distance, expect a new era of tourism in America, both foreign visitors and domestic tourism, minorities being able to travel extensively. In geography, the conflicting between intercity and local travel forces will be significant. The pressures of time for both goods and for people and the high value that each has in terms of time are going to put tremendous pressures on the system. Transportation is always about overcoming the tyranny of distance and today I think although we have achieved great successes in that, the pressures of time are going to be the dominant force in the future and that we will have to respond to in this legislation.

I think I should stop. I would be happy to answer questions.

Thank you, Mr. Chairman.

Senator JEFFORDS. Dr. Lomax?

**STATEMENT OF TIM LOMAX, RESEARCH ENGINEER, TEXAS  
TRANSPORTATION INSTITUTE, TEXAS A&M UNIVERSITY**

Dr. LOMAX. I really want to thank you for the opportunity to testify today. I have not had an opportunity to testify, so maybe you can't blame all of this on me like you can on Alan. The current situation is Alan's fault. I am going to help you understand some of the future.

I have been asked to summarize a few trends that we have identified in a report we prepare each year on urban traffic and congestion. I will also offer a few observations about congestion in U.S. cities over the next few years. I would like to build on the excellent information that Mr. Pisarski has prepared. Please keep in mind that summary of how travel has grown and how it is going to grow in the future.

Over the last 20 years, our cities have not been able to keep pace with demand increases brought on by population and job growth. Congestion has increased as a result of that imbalance. Our data shows that during the peak travel periods in the 76 urban areas that we studied, the travel time penalty, the amount of extra time it takes to travel during rush hour, has increased 185 percent since 1982. The penalty in areas of population between 500,000 and 3 million has increased over 300 percent over this time. This indicates that while most of the problem is in the large metropolitan areas, the congestion problem is growing in areas of all sizes. The total hours that travelers in these 76 areas were delayed increased from 750 million in 1982 to 3.6 billion in 2000. I have a couple of charts on a handout that I will be referring to over the next couple of minutes.

The congestion growth was the result of the trends Alan referenced. In our 76 areas the travel demand increased 86 percent

but the road capacity, the amount of road added was only 37 percent. Real capacity increases were probably less than that because that includes areas that were previously rural areas that were put into urban boundaries as they grew.

I think the imbalance is a result of several truths and maybe a few myths about what can be accomplished. First, a truth. Road construction can help reduce the growth of traffic congestion. Figure 1 in my handout shows the dramatic difference in travel time, penalty growth between areas that added roads at a rate close to that travel growth, the green line on top, and those areas that added few roads in relation to travel growth, the dark blue line toward the bottom. The cities in that group where traffic volume and road growth grew at about the same rate, the time penalty only increased 57 percent. In areas that lagged behind sort of lesser aggressive road building areas, the time penalties increased 245 percent.

A myth that is related to that is we should invest all our money and effort to adding roadways. My characterization of this as a myth is not based on ideology but on the fact that since 1982 urban areas have only added about half the roads need to stop the growth of traffic delay. Figure 2 shows this percentage is about the same for all areas, about 50 percent no matter what size urban area you are in. This is due to a combination of factors ranging from lack of funding, lack of land, public support, environmentally supportable alternatives. I would suggest that roads can definitely help but realistically they aren't the wonder drug prescription that will solve all the problems because the city has not been able or willing to build them quickly enough.

A similar truth can be stated about transit improvements. They can help but they cannot solve the problem themselves. Figure 3 illustrates the amount of transit system that would have to be added essentially every year to keep pace with travel demands. We would be looking at adding the equivalent of a transit system worth a ridership between every year and every 4 years depending on what population category you are in. I would suggest that is very unlikely.

Let me point out also a somewhat discouraging note that the sort of regular traffic congestion we see is only part of the problem. The variations in travel time caused by crashes, vehicle breakdowns, special events, construction, maintenance, weather and a variety of other factors are a source of frustration and economic loss that you spoke about in your opening remarks. Part of the problem is that we don't have long term, systemwide, very detailed data that we need to fully describe these reliability issues but the emphasis on operational improvements over the last several years does allow us to analyze this data for a few cities.

Figure 4 shows the kind of information we can develop and how we can use it to identify some problem areas and the success of improvements. It shows a graph of how congestion varies across the year and how reliability varies across the year in Minneapolis-St. Paul in the year 2000. Congestion is measured by the travel time index, the dark blue line near the middle of the graph; the buffer index is the line toward the bottom. This is the amount of extra

time travelers need to allow because of the unpredictability and system conditions.

We can see the effect of the big snowstorms in January and December, more congestion and very unreliable travel times. We can also see the effect of the summer tourist season, more variation but about the same amount of congestion. We can also see the effect of turning off the traffic signals that control access to the freeway system. This experiment began in October and the freeway effects were dramatic.

The unfortunate part of this story is the monitoring and data collection system does not extend to the entire roadway system, so we don't know what happened on the rest of the system. The limited data we have suggests that operational improvements can play a significant role in providing a more reliable transportation system for people and freight. It appears unless something changes, we will continue to see a growth in congested travel and congested transportation systems in the future. Projected population increases mean more travel. Our cities have not been able to stop congestion growth over the last two decades and travel and population growth will continue to stress our systems.

If we are fortunate enough to have enough funds, select projects wisely and implement them using techniques that do not result in significant delay from construction and maintenance activities, we might be able to slow down the growth of congestion and make the system more reliable than it is now but reliably congested is not a very high standard of achievement in my view.

If cities are going to have a different future than this, we will have to pursue all types of improvements and implement more projects rather than fewer and manage both the demand patterns and the system more efficiently.

Senator JEFFORDS. I would like to turn to my good friend, Senator Murray. Please proceed.

**STATEMENT OF HON. PATTY MURRAY, U.S. SENATOR FROM  
THE STATE OF WASHINGTON**

Senator MURRAY. I appreciate your giving me the opportunity to make a quick introduction of someone who is here for the second panel. I appreciate your having this hearing on this critical issue.

Unfortunately, I have to leave to attend a joint hearing but I wanted to come by and let you know that Ron Sims who is here for your second panel really understands the critical transportation problems we are facing in my home State of Washington. Ron Sims serves as the Executive of King County which is the 11th largest county in the Nation. When he talks to you today about traffic congestion, he speaks with authority.

The Seattle-Tacoma corridor has the second worse traffic in the country and he has been working to address that in his role as a board member and now as chairman of Sound Transit which is the major transit authority in central Puget Sound. For the past couple of months he has been working very hard to bring business leaders, local elected officials, and the community together to reduce traffic congestion so that King County can continue to grow economically.

Ron has led the way on smart strategies for moving people and products in our State that is the most trade dependent State in the

entire country. He is a real national leader on metropolitan issues. He is a member of the Advisory Board of the Brookings Center on Urban and Metropolitan Policy.

Ron was born in Spokane, Washington and spent 11 years on the King County Council and for the past 5 years, served as County Executive. He has dealt with every issue from recovering endangered salmon to using technology to bring government closer to his constituents.

He is a proud father of three sons but he is a passionate advocate and a gifted leader. I think we are very fortunate to have him come all the way across the country to give us his expertise on this very important issue.

Thank you for having him and thank you for allowing me to make a quick opening remark.

Senator JEFFORDS. Thank you and we will look forward to his testimony.

This will be addressed to both of you. How will the rate of growth in vehicle miles traveled change over the next 10 years?

Mr. PISARSKI. I should probably leave this to Tim but let me suggest to you that I think the rates of growth we have seen in the past, I don't think we are going to see in the future. We have seen a tapering in the last few years from the ranges of 3–3.5 percent a year down more to 2 percent. I would expect given the kinds of dramatic bubbles that we have lived through in the last 15 years that are now behind us, I would expect those growth rates to be more moderate in the future. I think it will be a more operable future, something we can address rather than the rather dramatic things we have been through in the last 20 years.

Dr. LOMAX. I think I would agree with that. I think the down side of that slower growth is that congestion will continue to grow, VMT will continue to grow, population and putting that on top of many systems that are already very stressed leads to an exponential growth in congestion. Congestion growth is not necessarily linear when you add 1 percent of vehicles. You don't necessarily get just a 1-percent increase in congestion depending on where that 1 percent gets added. That is part of the trend we have seen, that the population has grown at  $x$ , vehicle travel has grown at  $2x$  or  $3x$ , we may get that traffic volume growth down but it's still going to continue to grow. We have had a very difficult time adding system, transit, highway, any kind of system at any kind of rate that we need to.

Senator JEFFORDS. Dr. Lomax, in your testimony, you state we don't fully understand many congestion issues because we lack the data to draw correct conclusions. What type of data is needed to better understand the congestion situation and to begin to address the problem in appropriate ways?

Dr. LOMAX. We are beginning to get some of that data. The operations centers that are set up to monitor the activities of the freeway systems, principally, that dispatch vehicles during crashes or severe weather events or create alerts for motorists, those are the kinds of systems that are collecting the sort of minute to minute condition information about the transportation system. Some transit systems have had a very good monitoring system as well.

The issue is if we don't know what's happening out on the roadway system sort of every 5 minutes of the day; it is very difficult to predict what we should be doing in terms of operational improvements. In the past, our technology solutions were do we build a freeway, do we not build a freeway, do we add a lane, do we not add a lane. Those sorts of very large increments of capacity don't need to be informed by very good data, but if we're trying to figure out if we should meter the freeway system with five cars per minute or four cars per minute and need to put out a tow truck to relieve a crash, or if that crash is going to be able to relieve itself, those are the kinds of systems that need a lot more information.

We need better information about what has happened over time, better information about what's happened over space. We don't need to just monitor the freeway system; we need to try to extend that to the arterial streets. That is a trend we have seen over the last five to 10 years. I expect we will continue to see that growth in monitoring, but whether or not we can amass that data into usable formats that people such as yourself or Executive Sims can use is one of the challenges of my profession.

Mr. PISARSKI. Some of the data I was showing you was from the decennial census. We were living with 1990 data until just recently when some of the new data became available. We still don't have the final tabulations and the final work on the year 2000 data. In effect, in many instances we are still operating with 10 year old information. That is from the travel demand side. From the consumer side, we need far superior information.

Senator JEFFORDS. Mr. Pisarski, in your written statement, you indicate "The future demographics of non-immigrant Americans will help to cap the growth in urban congestion." You then state, "The new immigrants to this country are at the 1960's level of transportation use and this group will increase the demand on the system much as non-immigrant Americans did over the past 30 years."

My question is, where will this increased immigrant demand on transportation occur, both in terms of areas of the country and whether it will be urban or rural demand?

Mr. PISARSKI. This is an area where really I think I'm speculating but let me speculate and put some caveats on that. The first point is that when you add one person by child birth, you have a commuter 20 years later. If you add to a population by an immigrant, you have a commuter in 6 weeks. So the whole shift to immigration where we have 40 to 50 percent of our population growth coming from immigrants, these people come at the labor stages, many immediately enter the labor force, so they have an immediate impact on the system. That is point one.

Second is the fact that they very frequently start off as heavy transit users. You can see the impact of immigration on some of our metro areas and how it affects the travel ownership, the auto ownership, et cetera but over time, they transition to a more typical pattern of the mainstream if you will. I think one of the things transit does for us in these areas, it acts as a socialization tool, gets people into the system, gets them into the job markets, gets them participating in the system and maybe over time, transitioning to

an automobile in the more typical patterns, but I think it provides a very valuable function.

There is still an area where the immigrant population and the minority population largely because of income are still lagging behind the rest of the population. Many of the characteristics of the immigrant populations and our ethnic minorities, racial minorities, look exactly like the mainstream population of 1970, 1965, the number of women without driver's licenses, the number of households without vehicles is the same as the population was in 1960. Many of those things I think will change with growing affluence. The minorities in America will be an important part of our growth in travel in the future.

Senator JEFFORDS. Senator Graham is here. Would you have some questions?

**OPENING STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR  
FROM THE STATE OF FLORIDA**

Senator GRAHAM. I would, Mr. Chairman, and if I could, also make a short statement.

One of the issues I am very interested in because I think it has significant potential for dealing with congestion is the expanded application of intelligent transportation systems. I define intelligent transportation system as being a system of integrated technologies, communications and procedures which is directed toward enhancing the efficiency of our existing investment in highways.

The Federal Government has attempted to play a role in accelerating the process of intelligent transportation systems. As an example, in our last Surface Transportation Act, TEA-21, between the fiscal years 1998-2003, there was \$1.28 billion authorized for intelligent transportation systems. The principal objective of that \$1.28 billion was to accelerate the pace of development of new technologies, communications and procedures and then to field test them in situations where we would go through an accelerated learning curve of which of these systems individually and in conjunction had the greatest impact on remediating congestion. That is the theory.

The reality is what has happened is this money has largely been earmarked and it has been earmarked in some very, in my opinion, detrimental ways. According to the University of Texas study annually of where the greatest congestion exists in the United States, it's almost an inverse allocation of ITS money. If you are on the list as having a lot of congestion, you could pretty much count on the fact that you wouldn't get any ITS money.

Two, the projects tended to be, although the numbers are not small by most peoples' standards, they are small in terms of what it takes to fund a reasonable ITS. That is, they were in the numbers of \$500,000, \$1 million, \$2 million.

My concern is that we have now been three-and-a-half fiscal years into this program and I am going to ask you the question, and I have asked other knowledgeable people, what did we learn for the first part of the \$1.28 billion we have invested? Not much because we haven't used it in a serious, scientific learning process.

I am sorry that Senator Murray had to leave because she is chairman of the Appropriations Committee for Transportation in

the Senate and I know she shares my feelings. She has indicated to me that she hopes to see some reversal of this. I think it is incumbent on our authorizing committee to try to see what steps we might take, and I have some ideas, to assure if we are going to continue to spend \$1.2 billion that we get something for it. I think we ought to either recommend to our colleagues that we cancel the ITS Program or make it what it is supposed to be because today it is just another source of transportation funding directed primarily at those congressional districts which have members of the right appropriations subcommittees on them and we're not accomplishing the purpose of advancing the knowledge of intelligent transportation and its application to critically congested areas of the country. That is the end of my editorial.

Let me ask you to give me your assessment of how well the congressional authorization TEA-21 has been used? Have we significantly increased our knowledge of and demonstrated capabilities of ITS as a result of this expenditure?

Dr. LOMAX. Let me take a shot at that. I am from Texas A&M University and while I like my esteemed colleagues at the University of Texas, I do want to make clear that it goes on the record that the study is from Texas A&M University.

Senator GRAHAM. I have been giving Texas A&M the credit. You just assume anything that is as common sense as that comes out of Texas A&M.

Dr. LOMAX. Thank you, Senator. I very much appreciate that being on the record.

I think we have learned an awful lot. I think there have undoubtedly been programs that have spent money and not gotten the kind of impact, the kind of effect that we like. I share your concern about investments in transportation in areas that are important to the economy. As much as I like transportation, I really think transportation is supposed to serve the interests of the people, the freight and things that move on the system. So investing in the big drivers of our economy I think is supporting the improvement of transportation. To help that is something I think our programs ought to be oriented toward.

I think investing in a lot of different ideas, a lot of different places has allowed us to find places that either don't work or a particular technology or procedure didn't work in one place and it did in another. I think it is important that we have failures, otherwise we are not going to learn what doesn't work. Hopefully we cannot do the things that fail again but learn from them. Typically, it is not a fault of technology that doesn't work, it is a fault of planners that don't talk to operations people, or designers that don't talk to operations people, or operations folks that aren't able to communicate their message to the folks who are the appointed and elected officials making the funding decisions to invest in particular elements. Maintenance is always held up as the element that doesn't get any funding because you can't cut a ribbon on a pothole project.

The same kind of approach works with an ITS program. They are depending on data collection technologies that need to be maintained but there is not as much money in maintaining the data collection effort and the information gathering pieces as there is in deploying them initially. I think part of that is just sort of a natural

cycle that you put the equipment out and see what works and what doesn't work and try to fix it as it goes forward.

Mr. PISARSKI. I guess I would only add that there are so many disparate parts to this process, I think what we need to do now is take some of the experience we have gained and do some syntheses and bring these things together in looking at the successes and the failure and tell people more about what has happened and the results. I think the potentials are there. We just haven't examined it enough and described enough what it is we have learned.

Senator GRAHAM. Last year the Congress earmarked something on the order of a couple of hundred projects as ITS. Does anybody do follow-up studies to determine what we learned from those 200 plus or minus projects and the applicability of that learning in future efforts to reduce congestion?

Dr. LOMAX. I would say that record is uneven. I think there are some places doing a better job of monitoring what happens and at least as important, are putting that message out there, getting the information into the hands of people who make decisions. There are some definitely not doing a good job of that.

Senator GRAHAM. I wanted to add one final question.

If you were to direct this committee to what you consider to be the state-of-the-art in the application of intelligent transportation systems in the United States or elsewhere, where would you send us?

Mr. PISARSKI. Which metropolitan area?

Senator GRAHAM. In the United States or elsewhere, the state-of-the-art of intelligent transportation?

Mr. PISARSKI. I guess one of the things I would suggest is you address that question to Ken Orski who is going to be on the second panel. I know he has been looking at that around the world as well as in the U.S.

Dr. LOMAX. I have the opportunity to make one person happy and a whole bunch of people angry. I think that the Japanese and the Germans are doing a very good job on some of the technology stuff. Whether or not their administrative or institutional relationships are anything like ours is something someone else has to figure out. I don't know that.

Within the U.S., I think there are places doing very good jobs of particular elements with which I am familiar. Seattle and Minneapolis-St. Paul with ramp metering, LA with ramp metering, Minneapolis-St. Paul and Chicago with incident management. Chicago actually has tow trucks out on the freeway system and if there is an accident, they go pick up the wrecked vehicle and get it off the road. Houston has a motorist assistance program operated by the State and off-duty sheriffs man the patrol vans. They go out and fix flat tires, get stranded motorists off the road.

The objective of a lot of the ITS Program and the main benefit is to make the system operate reliably bad. So if you can take out the really bad days, we have a chance to make the system more predictable. I think there are different elements depending on which piece of the ITS world you want to talk about. Some places are doing well. I know I have left out a bunch.

Mr. PISARSKI. I can't think of one place that has integrated all those pieces which would be a wonderful thing to see.

Senator JEFFORDS. Senator Chafee.

Senator CHAFEE. Thank you, Mr. Chairman, for having this hearing as we prepare for the second reauthorization of ISTEA.

Mr. Pisarski, some of the statistics in your testimony are very interesting, particularly car pooling being down and drive alone being up, walking alone being down over the 1990's. I am sure a lot of that has to do with low gas prices. I saw it was down south of here about 91 cents a gallon. I think it is starting to creep up now.

As we prepare for this 5 year reauthorization, how much should we, as best we can, factor in the cost of gas? Obvious that has an enormous impact on transportation behavior, particularly with cars?

Mr. PISARSKI. In the short term, the price fluctuations in gasoline don't have much of an effect. In the longer term, they very well may, but the biggest effect they have is on the kinds of vehicles people own. The tendency is to go down size to a smaller vehicle to a more fuel efficient vehicle. The American public today in almost the majority of households have more vehicles than workers. So people can mix and match. What happens is if you double the price of gasoline tomorrow, everybody parks the SUV and takes the Saturn to work. The fuel efficiency of the country would jump 40 percent overnight. That is what happened in 1974, exactly the same thing.

One of the immense factors that needs to be recognized in all this is probably the biggest change in our Nation's transportation system in the last 20 years is the continued reliability and longevity of the automobile. The average age of our fleet is now 8 years old and rising. That has made an immense number of vehicles available, very serviceable vehicles available to low income people to gain access to the automobile fleet. Out into the future, I think that is going to permeate everybody's approach to the opportunities. With high prices, people will simply shift to more efficient vehicles. The hybrids are coming.

Senator CHAFEE. My wife drives one. I don't know in particular if I agree with you that the price of gas, by itself, would change just the type of vehicle people drive. I would tend to think they might double up in cars, perhaps take mass transit. It's just a budget issue at home. You stick by what you said earlier though?

Mr. PISARSKI. I think there is also a tradeoff. Clearly what has been going on between both car pooling and transit, transit and car pool riders look a lot alike demographically but there is also sliding back and forth between the single occupant vehicle and the carpoolers. Car pooling today has almost evaporated. It is basically family pooling as if a husband and wife work and go in the same direction. But the traditional let's save money and car pool together just doesn't happen. People do it because of saving time in an HOV lane. They will do it because they are traveling very long distances but for the most part, car pools are a much narrower concept than they were 10 or 15 years ago.

Senator CHAFEE. Dr. Lomax, any comment?

Dr. LOMAX. No.

Senator CHAFEE. Thank you.

Senator JEFFORDS. Thank you for your helpful testimony. We appreciate your participation.

Senator JEFFORDS. Our next panel is Ron Sims, Anthony Downs, C. Kenneth Orski, and Frederick P. Salvucci. We appreciate you all being with us. We will start with you, Mr. Sims and work on down the line. Please proceed.

**STATEMENT OF HON. RON SIMS, KING COUNTY EXECUTIVE,  
SEATTLE, WASHINGTON**

Mr. SIMS. Good afternoon. I am glad to be here today.

I submitted remarks and go on to the general things in the remarks I submitted to the committee.

I am the elected head of King County Government which is the 11th largest county in the United States. We operate every mode of transportation, buses, van pools, car pools, airport. What I have seen and want to discuss a little is what my peers talk about when we are in a room together, normally the large cities, large metropolitan areas, we talk about our frustrations at the smokestacks, the pipes, the categories or the straight jackets that were inserted in dealing with transportation issues within our regions.

We cannot unfortunately develop a coherent transportation system in major metropolitan areas because we chase the categories of funding that is available to us. Because we chase, it is the funding available that moves us so if we have roads money available, we chase roads money; if it is rail money, we chase rail money. We chase the funds. I have a number of staff whose job it is to chase the funds in order to build our transit system. I chair another transit agency called Sound Transit and we chase the funds.

The frustration is if we were allowed to design a system to have it integrated, we wouldn't spend as much money chasing the funds. We would have a ration approach to building a transportation system. We would integrate all of the modes, rail, commuter rail or light rail, highway expansion, bus, use of new technologies, but because of the method by which we receive it at the local level, because it is in so many defined statutory categories, we simply are unable to build the systems we would like. There isn't a policy that requires the major metropolitan areas to build a system of transportation. We can plan for it, but it is one thing to plan and another thing to implement, so we don't see that.

I would hope that in this round of authorization, we can begin to move to two things. One, we can require major metropolitan areas to come back with definitive plans that are transportation systems and there can be a category of funding to fund those systems. If you look at the top 21 areas in the United States, you find several things in common. One, they are all congested, every one of them. The top 21 areas of the United States that are congested account for 37 percent of this Nation's payroll, 50 percent of this Nation's GNP, 50 percent of this Nation's population and they are all congested.

I don't know how we compete in the 21st Century with other countries and other cities if we have goods and people tied up in congestion, where it adds an additional expense. We have Boeing in our community and we found Boeing is moving the same tonnage north to south in my county as they were moving 5 years ago. The difference is it costs them 22,000 more payroll hours to move it. It is a hidden tax.

If you use Dr. Lomax's data, we have a hidden tax of about \$78 million in this country and in my community it is \$2 billion of hidden tax. We are hoping we can get away from the categories that in dealing with our areas we can create a transit system that is integrated, that responds to the interests of business, and to our citizens, and that we can get a grant to fund them, that we don't always have to have 90 people writing 90 different grants trying to find out the rules for all 90 different grants.

When I spoke to the Washington State Legislature, I told them we were concerned about arterials. They said, we give money for arterials. I said, yes, you give money to each city but we have found people have left the interstate systems and were using arterials as an alternative to the interstate and that they needed to look at those arterials as corridors. After a great deal of discussion they decided to create corridor projects, minor systems that we would have synchronized traffic signals in that entire corridor, similar designs where we would focus on how we built that out, whether we can meet bus needs and trucks needs, whether we could get over and under rail tracks. We looked at a corridor. It has worked effectively for us in my county.

The important thing now is to expand that to a regional level, to have all of the funds the Federal Government makes available in transportation given to us as a grant so we can develop a coherent and rational transportation system so that we can integrate these pieces into a single system of movement. We don't do that now. It doesn't happen now. We simply chase the money, chase the funds that are available.

I love my job. Dr. Lomax makes my job difficult every year. He announces congestion in our region and we always rank second or third and the newspapers say, Mr. Sims, what are you going to do about it and I say, we can hire more staff, we can write more grants but what we really miss is the ability sit down with cities, counties, businesses, environmentalists, and labor unions to prioritize what we are going to fund as a system. So it isn't just roads and a roads discussion, not just transit and a transit discussion, not just ferries and a ferry discussion, not just new technology and a new technology discussion but we are able to weave these into a single, coherent, rational system in order to move forward.

Thank you, Mr. Chairman.

Senator JEFFORDS. Thank you.

Mr. Downs?

**STATEMENT OF ANTHONY DOWNS, SENIOR FELLOW,  
BROOKINGS INSTITUTION**

Mr. DOWNS. My name is Anthony Downs, and I am a Senior Fellow at the Brookings Institution. I am the author of the 1992 book "Stuck in Traffic" which deals with the causes and possible remedies for peak hour congestion for which I am now preparing a second edition. I am required to say by the Brookings Institution that the views I state here solely are my own and not those of the Brookings Institution, its trustees or other staff members.

I will confine my oral testimony to making seven main points and I will use proof by assertion, a well known Washington tech-

nique. It means my points are conclusions presented without benefit of any evidence or data whatsoever.

Senator JEFFORDS. It just confuses you when you put stuff in like that. So go right ahead.

Mr. DOWNS. I assure you that these conclusions are absolutely correct.

My first point is that peak hour traffic congestion is erroneously considered to be a wholly negative and undesirable condition when in fact it produces huge benefits for the country and even for the people stuck in it. Congestion is the primary balancing mechanism we use to ration scarce highway space during peak hours so we can pursue certain other major goals we desire. Those goals include having a wide variety of choices about where to live and where to work, working during similar hours so we can interact with each other efficiently, living in low density settlements and enjoying highly flexible means of movement, that is private vehicles.

There are only two other possible means of rationing the highway space when too many people want to use it. One is charging high tolls to keep many people off the road, but we reject that method politically because it would unduly favor the wealthy. Second, we could spend enormously more money to build enough roads to handle peak hour traffic without any delays at all, but no society can afford to do that.

Since we wisely reject these means of rationing road space, we must use delays from overcrowding in order to pursue those other goals we want to achieve. In other words, congestion is bad but it is better than the alternatives.

The first conclusion implies the second one. Peak hour traffic congestion is an inescapable result of living in any large modern or modernizing metropolitan area anywhere in the world. Moreover, it is bound to become worse in the future in all of those metropolitan areas as long as their populations keep rising. There is no such thing as a remedy to peak hour congestion in a large and growing metropolitan area once such congestion has appeared on its major roads. There are many tactics that might slow down the worsening of future congestion, but none will eliminate it or even stop it from intensifying.

The biggest challenge to future ground transportation in America will be dealing with the many added vehicles generated by future population growth. Since 1980, the United States has added 1.2 cars, trucks or buses to our vehicle population for every one person added to our human population. Since our human population rose by 32 million in the 1990's, if it rises by similar totals in each of the next two decades, we will have to cope with as many as 64 million more vehicles capable of being on our roads by the year 2020.

As the Texas Transportation Institute has already said, "We cannot build our way out of peak-hour congestion." It appears on our major roads by adding more lanes to those roads. After a road's capacity rises, traffic initially speeds up, and more vehicles will converge on that road during peak hours from other routes, other times and even other modes until it is just as crowded during the peak hour as before the road was expanded, although the peak hour might be shorter.

That does not mean, however, that there is no point in building more roads. In fact, we will need enormous future spending on roads and bridges for two reasons. The most important is to repair and maintain the road network we already have, much of which is in bad shape. Also important will be creating new roads to serve population growth areas. They will continue to be mainly low density settlements at the edge of existing metropolitan areas.

We also need to spend a lot of money on public transit in the future, even though there is no chance whatsoever that we can shift any very large share of future ground movement from private vehicles to mass transit. In 1995, public transit accounted for about 3.7 percent of all daily commuting but only 2.2 percent outside of New York City.

The vast majority of Americans prefer moving in private vehicles because doing so is faster, more comfortable, more convenient in timing, more flexible in choice of routes and use of multiple destinations, more private and often cheaper than public transit. If we spend more on public transit, it should be mainly on more flexible, smaller scale, and less regulated forms that can provide convenient service to people living in low density settlements, which will remain the predominant form of our future growth. Also, a higher fraction of our elderly population will be unable to drive and that population is growing rapidly.

My written testimony presents a more complete version of these points, plus a number of other aspects of these subjects, including suggestions for possible improvements in slowing down the rate of congestion.

I thank you for inviting me and I will be happy to answer any questions.

Senator JEFFORDS. Thank you for an excellent statement.

Mr. Orski?

**STATEMENT OF C. KENNETH ORSKI, URBAN MOBILITY CORPORATION**

Mr. ORSKI. Thank you, Mr. Chairman.

I am Editor and Publisher of Innovation Briefs, a bi-monthly publication which has been reporting and interpreting developments in the transportation sector for the past 13 years. My testimony today is based on observations acquired in the course of gathering and analyzing information for our publication. These observations draw on recent briefings and conference presentations and on interviews and personal communications with members of the transportation community in Washington, in State governments and local officials across the country.

I shall confine my remarks to a very brief summary of my prepared testimony, copies of which I believe have been made available to committee members.

My overall conclusion is that we enter this reauthorization cycle with fewer issues than might divide the transportation community and with a larger measure of a consensus among major stakeholders than at any other time in recent history. Unlike the last reauthorization cycle when interest groups jockeyed for position and floated a number of competing proposals, this time around I find near universal agreement that we ought to build upon the com-

bined legacy of ISTEA and TEA-21 rather than engage in a bruising fight to reinvent the Federal Surface Transportation Program. To be sure, there will be some proposals for changes, but these I think are likely to be refinements to program delivery rather than radical changes in the structure of the program itself.

Turning to specifics, I discern a large degree of consensus within the transportation industry and among major stakeholders on several policy directions and new initiatives.

They are, first, the need to protect the Highway Trust Fund by preserving the budgetary firewall protections and the principle of guaranteed minimum levels of annual spending. Second, the need for increased program flexibility, something Mr. Sims spoke very eloquently about. Third is the need to mitigate traffic congestion. This is regarded by all I think as a serious national problem requiring a national response.

There appears to be a large measure of consensus within the transportation community that this response should include both capacity expansion and improvements in the operation of existing facilities, although I might add opinions do differ among stakeholders as to the proper balance to be accorded to these two major traffic mitigation strategies. A comprehensive Federal attack on the problem of traffic congestion might take the form of a specific bottleneck elimination program, something along the line suggested by the American Highway Users Alliance. This would be supplemented by a program of operational improvements designed to squeeze more capacity out of existing facilities.

The fourth point is the need for environmental streamlining. This is considered a critical priority by large segments of the transportation community. Indeed, there is almost a unanimous agreement that something has to be done about streamlining of our decision process. While the current efforts of the Federal Highway Administration to streamline procedures through administrative action are commendable, the transportation community, I believe, is looking to Congress to provide more explicit legislative direction to reduce the delays that have plagued the project implementation process.

Fifth is the need to advance the intelligent transportation system program, something Senator Graham was talking about. The continued Federal support of this program remains a high priority for large segments of the transportation community. A frequently mentioned idea is the creation of a national "infostructure" which I put in quotation marks because it is not yet an accepted term but one that I think you are going to hear more about in the future.

This network would be capable of collecting and sharing transportation system conditions and performance information covering the entire national highway system. Such a national communication network, I believe, could become an integral part of a homeland security infrastructure, available in times of national emergency for evacuation and mobilization purposes.

My sixth point is the need for increased transit funding, especially for new starts. Funding is likely to dominate the transit industry's reauthorization agenda. According to the latest annual report on new starts, there are some 50 rail projects in preliminary engineering or final design which represent a potential demand of

\$30 to \$35 billion. Carving out a bigger role for “bus rapid transit,” which is now undergoing a series of demonstrations, could significantly reduce the need for transit capital funding. Indeed, many transit experts, including myself, believe that bus rapid transit could lead to a new generation of more flexible, less expensive new starts.

This leads me to the next subject, a related initiative, which is to convert and expand the existing stretches of HOV lanes, high occupancy vehicle lanes, into seamless networks of high occupancy/toll lanes in major metropolitan areas. These networks would be dedicated to express bus service and car pools but would also be open to individual drivers for a fee. By varying the fee according to demand, the number of single occupant cars seeking entry to those hot lanes could be restrained to maintain free-flowing traffic conditions at all times.

In my judgment, a congressionally authorized program of HOT lane networks, built as enabling infrastructure for bus rapid transit, but also available as a paying option to individual users, would be an eloquent expression of the increasingly intermodal nature of our Federal Surface Transportation Program.

Finally, I sense a growing concern within the transportation community, as well as among stakeholders, about the long-term capacity of the Highway Trust Fund to finance the Nation’s future transportation needs. The majority view, I believe, is that the growth in gasoline tax revenue will not keep pace with the rising demand and cost of highway reconstruction and rehabilitation. Looking beyond the next reauthorization cycle, we may need to consider entirely new approaches to financing the Federal Transportation Program. Hence, I join other transportation leaders in urging a congressionally mandated study to explore alternative financing mechanisms that would offer a stable and adequate source of transportation financing beyond the next reauthorization cycle.

This concludes my testimony. Thank you very much for the opportunity to present my views.

Senator JEFFORDS. Thank you.

Mr. Salvucci?

**STATEMENT OF FREDERICK SALVUCCI, MASSACHUSETTS  
INSTITUTE OF TECHNOLOGY**

Mr. SALVUCCI. Thank you very much. It is really an honor to be able to share some views with this committee.

I am at MIT and have been in an academic environment on and off for 15 years but my primary experience in this area is as a State transportation official when I was Secretary of Transportation for Massachusetts, so my views reflect that background as well as the more recent academic experience. I would like to speak to the three points you gave as a title for this conference and add a fourth which is money. You have my written comments, so I will try to make this brief.

On mobility for the poor, the automobile and access to the automobile I think is increasingly solving the problem of access to jobs for poor people. If you have a job, you can afford at least a cheap car. For urban jobs, bus fares I believe are too high and continue to be an obstacle for poor people, is taking too big a piece of their

private household, in particular, the lack of free transfers in many systems is a serious problem for the urban poor seeking urban jobs. I think as a mobility issue, mobility for poor people is getting better and I expect will continue to do so, I think we all hope.

I don't think the same is true for disabled and elderly. The disabled and elderly access has improved because of the paratransit systems which have been required of public transit systems and I think it was an important strategic step to move in that direction but that really limits improvements in mobility for the disabled and elderly people to those areas that have transit systems. It is sort of an unfunded mandate on the transit systems to provide the paratransit service. As the systems become fully accessible, which is the hook that got public transit into this, there is some argument they can lessen the quality of the paratransit service that is out there. I think that would substantially disadvantage the elderly and disabled populations who are not well served, better the paratransit that is out there than nothing which is what was there before but I think there is a lot of need for improvement.

I think we need to change our view of disabled and elderly access as a responsibility of the transit system to a responsibility of the transportation system which includes everyone, including people outside those areas served by fixed route transit systems. I think the Federal Government needs to step up to the plate and partially fund it, possibly at low funding ratios, one-third Federal I think would leverage a lot of State participation. You could require a maintenance of effort so you didn't get hit with a big jump. I think this is a big problem about to erupt. The aging population is growing, as mentioned, and I think that is a big one.

There is also a teen mobility problem, particularly in the suburbs. Soccer moms are basically chauffeurs and if we were creative about the way we dealt with paratransit, we might find better ways of dealing with both elderly, disabled and teen populations rather than having mom drive. I also think there is a cultural advantage in shifting in this manner. I am not denigrating public employees or civil engineers, I am a civil engineer. Civil engineers love to build things. I am a civil engineer and I love to build things. If we want to see mobility being the focus of these institutions, we need to focus on that. So I think Federal funding specifically for mobility for important constituencies, disabled and elderly, would be a big step in the right direction.

Second, congestion, it is politically attractive to say we are going to fix it but I would agree that it is not going to go away, in many cases it is not even desirable to go away, and that to do something effective about congestion requires some peculiar situations. I had a lot to do with the Central Artery Tunnel Project in Boston and I think it will improve congestion at enormous cost. I think it is worth it but it is important to remember there is a huge investment in public transportation and a limit on the number of parking spaces in downtown Boston which complement that very large endeavor.

I think if you are serious about getting at congestion, you can only manage it in critical points, you can move it around some and that is useful. Better to not have the traffic jam at the entrance to the hospital, better to manage things so that the critical points

work. So I think it makes sense to focus on congestion but I think we shouldn't mislead ourselves and lose our credibility by pretending we are going to make it go away because I don't think that is the case. The methods used in Singapore are very interesting but they don't seem to be applicable anywhere else in the world so far. We have to study them but I think we shouldn't promise any early end to congestion.

I would urge that in this area, we recognize that the metropolitan area process I believe tends to make it difficult to do large projects. It is easier in the metropolitan process to do a whole bunch of little things that are too small to matter. If you are trying to something major, the problem in my view is not the environmental process. The environmental process helps to structure a very complicated conversation about how you are going to restructure old urban infrastructure. I don't think our cities should become petrified wood, doomed to continually repeat their old patterns. I think we ought to rethink urban infrastructure as we face the need to rebuild it but if we are going to expect people to get at that job, I think there should be dedicated funds so I will disagree with this flexibility argument to some degree.

As a State official, in my experience the problem was not the environmental process, the problem was not enough money. There is only a certain amount of money. At the end of the day you are going to spend it all. The real problem is that the more complex projects take longer to process, so in order to satisfy the contractor constituency, you spread more asphalt around the State. If you want to see attention focused where it is most needed, I believe it would be highly desirable to target at relatively high matching ratios, I am usually an advocate for low matching ratios, here I think they should be high, on critical corridors, particularly airport access.

We all talk about trucks but we never give them priority. I think we ought to be looking at airports in particular as a location where the congestion is particularly difficult and worthy of attention but I think we need some categorization in order to enable officials to focus on the most critical issues. You can't expect I believe a local official under the same political pressure to spread things around to be able to focus on the more complicated ones if there is not some higher level of dedication in that area.

Finally, on money, I am suggesting a bunch of places that I think the program should be expanded. We all know the pot is smaller and you have an extremely difficult job just getting reauthorization with the smaller pot. I believe the key to being able to get a bigger tent is not to take on the environmentalists but to embrace them. Two, I believe we should be revisiting the pay as you go philosophy inherent in the 1956 decision to proceed with the interstate and at least for some of these projects, begin to go to a capital budget approach as every State and every city in the country and as Americans use to buy their own homes.

If we use the existing revenue streams but dedicate a portion to debt service, we could get at some of these problems earlier and quicker than otherwise we will be able to do. I think that would be worth doing. Eventually, we will face the issue of if we like it, we have to raise the tax to continue. I don't think that would be

so bad either. Even if we never increase the tax, I would much rather see serious investment done over the next 8 years than spread out over the next 30 so we can get the economic benefit of those critical investments.

I appreciate your attention. I have gone over my time. I would be happy to answer any questions you might have.

Senator JEFFORDS. Thank you.

I will read my question and then I will start at the other end of the table.

One key issue in the debate over congestion is whether we can build our way out of the problem. I wonder whether we can afford to build our way out. In 2000, while new capacity projects represented only 17 percent of the mileage involved in all Federal aid projects, it required 48 percent of the money spent that year. Isn't a build strategy prohibitively expensive? Mr. Sims?

Mr. SIMS. You can manage congestion. We will never build our way out of it. You can manage it. The key is not to let it continue to get worse. That is why I want to go back to the issue of we do not have a coherent, rational policy in metropolitan areas on transportation. We tend to like big projects because we believe they will deliver the capacity we want.

I always smile at what we see in our area, we will build big projects and arterials get crowded. We will not explore van pools because we like more what we call sexy, ribbon-cutting things like BRTs. BRTs work in some corridors, clearly. The key is to have a system in place and to have a discussion of a transportation system in metropolitan areas so you can manage the congestion, so you can find out what tools you can put in place.

I agree with every speaker here, if anybody thinks we are going to end congestion and build our way out of it, that is an absolute impossibility today. It won't happen. In our State, we have discussed saying that highway speed during peak hour are up to 35 miles per hour. People say wow, 35 miles per hour but the posted speed is 60. We say, yeah, but if you are moving at 35 miles per hour you are moving faster than you are moving right now.

What we would like to do is have tools to manage them but you are going to have to have a transportation system that everyone has agreed to fund, big projects, small projects, a variety of different modes of transportation and we can do it. Right now, we don't have it.

My biggest fear is Seattle Times will report that Ron Sims says we do not have a coherent transportation system in the central Puget Sound but people know that already because they are sitting in congestion, so they know it is not coherent. The Federal Government can stimulate that by insisting on it and then providing funds to give us, and fund a system. I keep saying that. I am a person that connects dots. When I was a kid, everyone else got puzzles; I got the thing that said connect the dots. As the County Executive, I can't connect the dots because all the funds coming out of the Federal Government are in these categories. The categories don't talk to each other, so we chase the money and whatever we can get we are satisfied with but it doesn't create a rational, sensible, thoughtful, traffic system in the metropolitan areas and the in-

creased congestion in every one of those areas is an evidence that it is not rational and thoughtful at this time.

Senator JEFFORDS. Mr. Downs?

Mr. DOWNS. I am sorry, but I don't agree with you, Mr. Sims. There is no system on earth that is going to prevent congestion from getting worse. I am not opposed to having a better system; I think that is probably a good idea, but if you think it is going to prevent increasing congestion, you are living in a fantasy world. As everybody here says, if you look at the population increase, rising congestion is likely to occur in the Seattle metropolitan area even if we don't add 1.2 vehicles for every human being. In the 1990's, that ratio dropped to one vehicle added for every additional human being. We are still going to add a lot of vehicles on our roads. Not only that, but because of the other goals we want to pursue that I described—for example, everyone working about the same hours so we can interact with each other—those vehicles always converge on the roads at certain peak hours. No matter what system you have, the roads are going to be overloaded at peak hours unless you turn the whole metropolitan area into one concrete slab, and you are not going to do that. That would be an environmental disaster and we couldn't afford it. So rising congestion is inescapable. It is a part of living in any modern metropolitan area, and it is going to get worse as long as the population of that area keeps going up. Sorry about that.

There are things you can do to slow down congestion's rate of increase. But don't think if you get a great system, the most perfect system you could imagine, that is going to solve the congestion problem because it isn't.

Mr. ORSKI. We may not be able to build our way out of traffic congestion but I don't think that should be used as an argument for not increasing highway capacity because increased highway capacity is needed to accommodate growth in population and economic activity.

Mr. DOWNS. I agree.

Mr. ORSKI. I would like to draw the analogy with schools and hospitals. Schools and hospitals in fast growing areas also eventually fill up with students and patients and yet this has never stopped us from building more schools and more hospitals.

Mr. SALVUCCI. I would agree that congestion is not going to go away. I think we do have some choices in how we spend money that could stretch out capacity a bit, particularly in rural and suburban areas. My experience is that capacity goes backwards as people add curb cuts and new land development sprawled along the side of the road, we lose safety, we lose capacity and when we try to maintain high speeds the whole mix gets fairly lethal.

The same amount of money spent on a small road widening stretched out to acquire development rights and access rights and some environmental betterment easements would maintain the capacity for a longer time on these roadways and then eventually when you do get the money to widen, you have already acquired the property rights.

We do something very foolish, we focus on a very short piece of road, spend a lot of money and create a lot of disruption in widening that piece of road while the Burger Kings open 24 more

joints in the next mile and we say, we'll have to do that one too and then have to pay to relocate the Burger Kings. We would be better off looking at it sequentially and saying if this is a corridor that looks like it is going to change over time, not suggesting the change is always bad, I would get control of the curbs so that we retain the capacity we have and if new economic development happens, and we may want that development to happen, let it happen in an orderly fashion off the roadway. We could achieve a pro-environmental outcome, improve safety and preserve capacity somewhat longer than we would otherwise.

I agree though that as cars go up, congestion will increase but I think there is a more effective way to deal with suburban congestion than trying to build our way out of it. I would make an exception in the case of the critical piece next to the hospital, so to speak. There are critical links where I think we should be managing congestion by letting it take place away from the sensitive location, but I would agree with Mr. Downs that eventually congestion is going to be there. He wrote a great book; I am using it for my students. I look forward to the new version.

Senator JEFFORDS. Mr. Sims, Seattle is a natural bottleneck with the additional problem of crossing Lake Washington, so it would seem the construction of additional roadways is not a practical solution to your congestion problems. If additional funding were provided to the metropolitan areas for congestion relief, how would you utilize that funding?

Mr. SIMS. In my heart of hearts, obviously we are very concerned and want to continue to buildup our light rail system and our commuter rail systems. There is need for road expansion and we can see that on the Interstate 405 corridor which needs to be expanded. We have an incredible bottleneck that ties up everything, including every arterial. So there are road capacity needs that remain in the area.

Our area is a prime example that there is never a silver bullet that fixes anything. We look at a variety of tools that could be made available to us because we believe it is going to require a multi-modal approach. Whether it is van pools, car pools, buses, BRT, light rail, commuter rail, road expansion, the synchronization of traffic signals, all can play at moving people but we are limited.

We are not unique. When I travel to other communities, I see the same kinds of patterns. I don't see any single metropolitan area in the United States that can sit here and tell me that there is one solution that should be available to them to move people and commerce. It is going to have to be multimodal, no matter where we are.

Senator JEFFORDS. For you, Mr. Sims, let me wish you well in your efforts to organize the Metropolitan Congestion Coalition. I hope you will keep us apprised of your progress and pass along the group's thinking on reauthorization. It is a pleasure having you with us.

Mr. SIMS. Thank you very much.

Senator JEFFORDS. Mr. Downs, in your written testimony, you make a brief reference to the cost of parking as a factor in the comparative commute cost of transit to driving. You seem to suggest that free parking can make the difference in a commuter's decision

to drive rather than to ride share or take transit. If so, how should parking factor into our policies? Should we look to parking pricing to reduce congestion; should we tax employers differently if they provide parking rather than transit allowances?

Mr. DOWNS. It depends on how strongly you want to attack the problem. If you are trying to raise the cost of driving, the best way to do it is to raise the gasoline tax. Congress has consistently avoided that. The single most effective thing you could do to reduce driving is to put a \$3 a gallon tax on gasoline. Of course none of you would be in office after the next election, so you are not going to do that. That is the most effective way to raise costs.

What you are talking about concerning parking is: could you raise the cost of parking in theory? We could put a tax on parking or else force employers to charge their employees for parking. But I don't think that has anymore popularity politically speaking than a gasoline tax. I think parking is a relatively minor factor in people's decisions on whether to use transit or to drive. As I pointed out, the fraction of people who use transit is so small, even if it doubles or triples, it will not take enough people off the roads to cause much congestion to change at a peak hours. That is one of the weaknesses of the argument that improving transit is going to reduce congestion.

There may be reasons to adopt light rail systems, but one of them is not to reduce congestion. That won't happen.

Senator JEFFORDS. Mr. Orski, your statement that only additional lane miles of roadway can decrease or eliminate bottlenecks and congestion is an interesting one. That may very well be true in the western portions of the country where building additional roads will also improve the redundancy of the highway system. What can be done in densely built up urban areas like New York, Philadelphia, and the District of Columbia? How can we build additional roadways in a socially and fiscally responsible way?

Mr. ORSKI. First, I would probably modify my sweeping statement that only roadway widenings or new road construction can decrease congestion. The kind of congestion caused by accidents and incidents can be effectively mitigated by intelligent transportation systems technology by providing more effective emergency response and clearance of accidents.

Having said this, there are many situations that intelligent transportation systems technology cannot solve because it is simply a matter of too many cars trying to squeeze into too few lanes. What can be done about that? We can use simple engineering improvements, such as eliminating three lanes of traffic squeezing into two lanes of traffic, as is the case with the Wilson Bridge. In other words, we could do a lot to smooth out traffic without spending billions of dollars on brand new highways, through incremental design and engineering improvements to existing roadways.

This is where the bottleneck elimination program comes in, something that I have already referred to in my testimony. It is a recommendation of the Highway Users Federation to identify a finite number of highly congested arteries in densely urbanized areas and try to attack those specific bottlenecks. This does not require building new highways. It simply calls for engineering and design improvements to existing highways.

Senator JEFFORDS. Mr. Salvucci, you emphasized the importance of maintenance, repairing, rebuilding and redeveloping deteriorating transportation infrastructure. Do you feel that proper maintenance and repair can reduce or alleviate the congestion problem?

Mr. SALVUCCI. Yes, but I think given where we are, it has to be approached with a two pronged effort. One, I advocate that the Federal Government should get into the maintenance business with some funding. The management systems of ISTEA, which I was very excited to see in 1991, have not affected behavior at the State or bureaucratic level. I think if the Government wants to see greater emphasis on maintenance, a stitch in time saves nine, it is the prudent thing to do, putting perhaps one-third Federal match on the table with a maintenance of effort so you don't get hit in the head with a big jump, but prospectively getting into the maintenance business and requiring the States to become more professional about the way things are maintained is necessary so we stop sliding backwards.

That being said, there is a huge backlog of infrastructure that is in terrible shape that has to be dealt with at this point. I would fund those reconstructions at very high matching ratios because they are very tough projects to take on. In the local politics, the easiest thing to do is nurse it along to the next administration because rebuilding old infrastructure that is already heavily used is very tough politically because you create traffic disruption while you are doing it. So you have a built in tendency to avoid dealing with some of our worst structural problems at the local level. I have a great respect for the people at the local level. I was one for a long time but I think we should recognize the pressures on them and provide some high matching ratio, categorical funds that must be spent dealing with old infrastructure to give local officials the incentive to take on a very, very difficult political problem which is absolutely necessary. We see over and over again those issues pushed off and dealt with by the next administration maybe and then once in a while, we get a bridge that collapses.

Senator JEFFORDS. Senator Chafee?

Senator CHAFEE. Thank you.

It seems as though Mr. Downs summed it up in his last paragraph when he said "No matter what public policies are adopted in response to future traffic congestion, it is likely to get worse in nearly all parts of the world. My final advice is get accustomed to it. Commute in an air conditioned car with a stereo, tape deck and a CD player and a hands-free telephone and a microwave oven and realize that congestion is providing benefits to you by rationing the roads you use and letting you pursue other goals. So just get used to it."

Mr. Sims said here is no silver bullet. I guess the options are high priced tolls or \$3 a gallon gas tax per his testimony, so the solutions to congestion are going to be very difficult is what we hear in the testimony this afternoon. I guess I do agree with that.

Mr. DOWNS. There are no solutions, but there could be improvements. Examples are the hot lanes that Ken Orski suggested; or the systems for picking up accidents and getting them off the road faster; the metering access to expressways as you do in Seattle; or

building some additional capacity at bottlenecks. These are things that can be done to slow the rate of increase in congestion.

Although you might consider me to be a pessimist, I am not a 100 percent pessimist.

Mr. SIMS. If you will indulge me a second, when I was a kid my father was directing a mass choir, I was a member. He stopped the choir and rehearsal and said to me, Bud, lip sync, which is what I did through the concert. The reason I want to use that analogy is that at the regional level or talking about metropolitan areas, there are several things wrong. One is a cacophony, not a symphony because people are not on the same page. Everybody has a different song sheet and until the Federal Government provides the incentives to give us all the same song sheets so that we have an agreed to level of congestion, then we will not have a rational and thoughtful process.

My middle son told me I was irrelevant the other day. He is in college, so I guess there is a time to be irrelevant. I told him when I was in college, I had a 'fro, I had a hair growth period, my beard, my sunglasses, my dashiki and I told my dad that he was irrelevant too. I did it after the tuition check but not before as my son did.

The issues that he cited were very interesting which was all the national and local problems. I was very impressed. We can look at what we have done over the last several decades and say that is acceptable or we can embark on something that is bold, next century and of a new generation. That requires us to get out of our comfort zones. I am telling you, unless you require metropolitan areas to have an agreed to level of congestion and system in place, we will be doing what we have been doing for the last decade, and it simply won't work. It will diminish our quality of life significantly.

Senator CHAFEE. Thank you for coming all this way.

Mr. ORSKI. Tony Downs gave me an opening to say a good word for HOT lanes, the so-called high occupancy toll lanes. While admittedly we will not be able to get rid of traffic congestion for everyone, we can create conditions where people who have reason to be somewhere on time, whose time is valued in terms of money, have an option of faster travel. Those are the so-called high occupancy toll lanes that have been created in several jurisdictions, including in California that allow buses and single occupant vehicles to travel in unobstructed traffic, in free flowing traffic at a fee.

Some people call these lanes "Lexus lanes" implying they used only by highly paid professionals but I can assure you a utility van and a pick-up truck are a far more common sight on those HOT lanes in California than Lexuses or BMWs. There are many people who, from time to time, find the need for a quicker trip and are willing to pay for this. A classic example is the parent who is racing to the day care center to beat the \$1 per minute fine that is assessed for parents that are late. For that parent, paying a toll of 55 cents or even \$1 may be money well spent in order to avoid the fine. So there should be ways of improving travel conditions for people who are willing to pay for it.

Senator CHAFEE. Thank you.

Senator JEFFORDS. Senator Graham?

Senator GRAHAM. Thank you. I apologize for having to leave for another committee meeting. As I was leaving, Mr. Orski was making his opening statement. He was listing a number of numerical points we needed to pursue. Several of them, including the streamlining of the permitting process, ITS and innovative financing were all provisions included in TEA-21. Some of them were new, such as the streamlining of permitting, some were continuations such as the innovative financing.

This is a question to any panel member. Has there been an analysis of these types of programs which are intended to make our resources and our highway facilities more effective and efficient by managing them in non-traditional ways? Has there been any analysis of the success of these efforts, and from that analysis, recommendations that we might utilize as we reauthorize TEA-21?

Mr. ORSKI. Senator Graham, there have been a number of evaluations of intelligent transportation system projects. I have in mind specifically the model deployments that have been carried out in several urban areas. These provide quite a bit of evidence of effectiveness of ITS.

As far as innovative financing is concerned, I cannot really think of any good examples but State and Federal environmental streamlining and intelligent transportation initiatives provide a number of evaluations that would be very valuable to the committee as you proceed with the reauthorization.

Mr. DOWNS. I am not aware of any systematic evaluation of ITS, but there is one particular project in ITS that I can evaluate on my own as ridiculous: That is the high speed highway on which cars controlled by computer travel at 120 miles per hour 6 feet apart. We are spending a lot of money on this project. I believe there is an test road built outside of San Diego. If we developed this, since the cars are only 6 or so feet apart, there will be 10 times as many cars arriving each hour in the downtown area, what are you going to do with them? The real bottleneck is the downtown street system with its limited capacity.

Even if this project were to work, which I don't think it would, it is extremely expensive. Also the liability cost if there is an accident would be colossal and no one knows who would pay the cost. The whole idea is ludicrous and yet we are spending around \$100 million on this idea, so there is an evaluation for you.

Senator GRAHAM. One of the things I hear you saying is maybe in our next reauthorization of the Surface Transportation Act, we need to put in some stronger evaluation components so that we will achieve what we had hoped which is to learn something through this process and be able to have incremental improvements from year to year.

It was mentioned that the attempt to streamline permitting has pretty much failed, that there was a set of regulations developed by the U.S. Department of Transportation which many States felt actually made the system more cumbersome than it had been before. Are there any models within the States where there has been some effective effort at streamlining the permitting process for transportation projects, examples that we might look to for some ideas as to what the Federal Government should be doing?

Mr. ORSKI. Senator, I wish that Brad Mallory, chairman of the AASHTO was here because I think he could speak to this subject with a great deal of authority. I believe there are examples. I cannot cite to you chapter and verse but I believe that Mr. Mallory and the staff of AASHTO would be the best source of information on that question.

Senator JEFFORDS. We have a whole hearing planned on that issue.

Mr. SALVUCCI. Let me give a slightly different point of view on the environmental streamlining. I say this as a former State official who dealt in excruciating detail with some of the environmental requirements.

Basically, at the end of the day at the State level, you are going to spend all the money you have coming. The real damage in delay in environmental process is that it may slow down, and in my judgment it sometimes does slow down, the most important initiatives and some that are too small to matter move quickly because there is no opposition.

I don't believe that is a problem that we will get at by streamlining the environmental process. The tough projects are tough to do because they are complex and other constituencies may not agree. In my view, the environmental process actually gives us a structure with a beginning and an end to sort out the issues that must be sorted out.

I think what would help the process is, one, if there were more money on the table because with an existing amount of money, you are going to do a certain amount and you are just rearranging the order. Two, I know this contrary to the direction people are going but have a category for high priority, large projects which tend to attract more attention, much more opposition and are more difficult to do, so provide an incentive to State officials to take those on because right now the incentive is hope the bridge doesn't fall down on your watch and let the next guy take care of it. I think you put some money on the line, provide the incentive to deal with it, but I would leave the environmental regulation in place.

I have made several recommendations that would add money and you have less money on the table. I think the central issue to make timely reauthorization work is to find some way to get more money on the table, and if I understand the political constraint, without increasing the gasoline tax. I believe the only significant way to do that is to shift a portion of the program to a capital funding approach as every State uses so you use some of the revenue stream for debt service and you can expand the pie. You need something to get through the next authorization in a timely fashion if you want to deal with these issues which every idea presented is going to cost more money someplace or other and you have less to deal with. We are not being very helpful unless we can suggest ways to expand the pie. I think a look at the capital budget is the one idea I can think of that can give you that flexibility.

Senator GRAHAM. I think he had a very intriguing idea. Many States, including my own, have a concept called DRIs, development of regional impact where large scale projects are treated differently in the land use review process than more traditional scale projects. Maybe that is an idea that has some seeds to explore for large

transportation projects where you would recognize their complexity and the need for some special provisions. I would like to discuss that with you further.

I was very interested in this environmental permitting issue primarily as a matter of sequencing. What I found in my experience as Governor was that too often a big project didn't have red flags raised about it until you were many millions of dollars and years into land acquisition, planning, et cetera and then you find there is going to be a problem. One of the goals was to try to move those decisions to the beginning of the process so if you were going to get a no go decision, at least you got it in the year 2002, not 2012. We haven't achieved that yet. I hope we might be able to make some progress the next time we look at environmental streamlining.

Mr. SIMS. In our State, we are the agency that enforces a lot of the regulations. We are fascinated that there has been a lot of discussion over regulatory reform. In our road building, I only ask that we build according to the existing law and not all the layers of discussion we have had. What happens is permit processes and environmental processes are pushed a lot by the prospect of litigation. Doug McDonald, our Secretary of Transportation, and I agreed that how we would pursue our projects is to interpret the law that was written and not all of the processes on top of it that combine community hearings with the permit process, that are designed to lower your risk and go ahead and defend ourselves as necessary as meeting the intent.

As a result, we are building faster now than we have ever before. I don't know what they are doing in other States but we have what we call large project processes as well but in those projects, we say we will abide by the existing law.

On the technology side, I know you like evaluations of whether technologies work. We try to avoid actually going to someone to finance them because it is so difficult to figure out whether or not the source of funding justifies the technology you are buying. In order to have, as we have, a smart card technology that allows you to use a single pass on any public mode of transportation in our county, we basically avoided trying to go to the Federal Government to finance it, whether it is having signal synchronization that can be overridden by the buses to move more quickly. We went to the voters and asked them to tax themselves for it.

Evaluation can be productive but the implementation of it is incredibly cumbersome and there is an avoidance by major jurisdictions like ours at going down that path until it is made more simple.

Senator JEFFORDS. Thank you all for your very helpful testimony. We appreciate your time and effort in preparing for it and preparing for us. Thank you.

[Whereupon, at 3:13 p.m., committee was adjourned, to reconvene at the call of the chair.]

[Additional statements submitted for the record follow:]

STATEMENT OF ALAN E. PISARSKI, INDEPENDENT CONSULTANT

Mr. Chairman, Distinguished members of the committee, ladies and gentlemen, my name is Alan E. Pisarski, and I am honored to be invited to speak before you once again to address the outlook for American travel. I recall with pleasure that

I participated in your hearings in 1997 in the advent to TEA-21, and also in the first hearing for ISTEA. It is a responsibility that I take very seriously.

I recall in that first hearing that Senator Moynihan spoke of seeing the New York World's Fair in 1937 as a youngster and how it affected his sense of the future of transportation. I related then that I had been there also, my parents had wheeled me thru that fair as a newborn, and I must have acquired some of the same flavor he did.

We need to look at the next reauthorization period through the lens of the changes likely to occur between now and the end of the cycle. As the next reauthorized period concludes, delivering us to the doorstep of the year 2010, we will have seen dramatic changes in the first decade of the new century:

- We will have crossed 300 million in population at some point midway in the period
- Our rural population alone will be over 60 million, more than many nations
- We will have added more than 25 million people
- And perhaps as many cars as people
- Another 10 million households
- More than 10 million more immigrants
- The first of the baby boomers will be at retirement age.
- 13 percent of the population will be over 65 years of age
- We will have added four trillion dollars or so to our economy

In many respects our world and the transportation system that serves it will be a different place.

In reviewing travel trends and their social and economic determinants I like to use the following list of eight elements of transportation. Now more than ever it is critical to keep them in mind.

- Commuting
- Other local travel
- Tourism
- Service vehicles
- Public vehicles
- Urban goods movement
- Thru passenger travel
- Thru freight travel

Too often we say we are going to talk about transportation and then we forget freight and talk only about passenger travel; then we say we will talk about passenger travel and end up talking about metropolitan commuting. Then we get into an argument about highways versus transit and get lost in the thickets of advocacy.

We must consider both freight and passenger travel, in both their metropolitan and non-metropolitan forms as the list indicates. Many of our issues of the future will be centered in freight-passenger conflicts; and intercity-local interactions.

*The Metaphor of the Wilson Bridge*

One of the difficult problems addressed by the Congress in the recent past has been the Wilson Bridge. It is the perfect symbol of our challenges:

- It is a critical commuter corridor in the morning and evening
- A major all day regional connector for passengers and freight
- A major route for buses and private vehicles from Maine to Florida
- A critical freight link in the I-95 corridor—main street of the Northeast

It is an aging, heavily used facility suffering from both functional and physical deficiencies operating in a complex inter-governmental environment. There are many Wilson bridges in our future.

My focus today will be on taking the long view on the nation's travel activity trends and demographic future and its implications for future travel.

*A Report on Recent Trends*

First a report on where we are with respect to commuting and other travel trends. I made the mistake of going back and reviewing my testimony 5 years ago and some of the thoughts I expressed then have been borne out, others need some modifying in the light of the new census data.

The changes between 1990 and preliminary 2000 data from the statistics of the Census Bureau are shown in the accompanying table.

| Journey to Work Mode Choice Trends |            |            |
|------------------------------------|------------|------------|
|                                    | 1990       | 2000       |
| Drive alone .....                  | 73 percent | 76 percent |

## Journey to Work Mode Choice Trends—Continued

|                      | 1990       | 2000       |
|----------------------|------------|------------|
| Carpool .....        | 13 percent | 11 percent |
| Transit .....        | 5 percent  | 5 percent  |
| Taxi .....           | 0 percent  | 0 percent  |
| Motorcycle .....     | 0 percent  | 0 percent  |
| Bicycle .....        | 0 percent  | 0 percent  |
| Other .....          | 1 percent  | 1 percent  |
| Walked only .....    | 4 percent  | 3 percent  |
| Worked at home ..... | 3 percent  | 3 percent  |

In my testimony 5 years ago I felt that the decline in transit and carpooling had about reached their limits—right on transit—it has just about held share; but carpooling has continued to decline—it is fundamentally now an intra-household activity today—a fampool. Detailed data from the decennial census coming later this year will help establish the why and how of the decline.

I also stated then I expected the single occupant vehicle to have reached a share of commuting about as high as it was going to go—Wrong!—as you can see, by 3 percentage points, rising from 73 percent to 76 percent—most of it coming out of walking and carpooling.

And surprisingly working at home did not grow enough to increase its share. These rates of growth are shown below compared to total workers. Effectively, those modes of travel that grew faster than total workers gained share and those that grew less lost share. In the 1980 to 1990 period the only modes that showed growth greater than worker growth were driving alone and working at home. In these data it appears that in addition bicycling actually grew the fastest, although from a very small base.

The growth in activity for all modes in the nineties appear in the table below:

## Net Change

|                     | 1990–2000 | (000's) | percent chg   |
|---------------------|-----------|---------|---------------|
| Total workers ..... |           | 12367   | 10.7 percent  |
| Drive alone .....   |           | 13032   | 15.5 percent  |
| Carpool .....       |           | -1071   | -7.0 percent  |
| Transit .....       |           | 492     | 8.4 percent   |
| Taxi .....          |           | 15      | 8.3 percent   |
| Motorcycle .....    |           | -79     | -33.3 percent |
| Bicycle .....       |           | 96      | 20.7 percent  |
| Other .....         |           | 290     | 35.9 percent  |
| Walked only .....   |           | -1076   | -24.0 percent |
| Work at home .....  |           | 669     | 19.6 percent  |

The extraordinary fact continues to be that in the nineties, as in the eighties, the increase in the number of single occupant vehicle users was greater than the increase in total workers. In effect all new commuters went to the SOV and additional commuters switched from carpooling, walking etc. The significant difference is that transit did actually gain in numbers of commuters in the nineties, though at a rate less than the growth rate for workers overall thus reducing its overall share, but a positive trend nonetheless.

Some may see cause for disappointment in that transit shares have not increased. There are reasons to be somewhat more sanguine. Transit served about 4 percent of the new commuters, less than its traditional overall share of 5 percent, but its gain of about a half million users certainly is a far superior performance than its actual decline of several hundred thousand in the 1980–1990 period. If we can say that the decline of transit has been arrested we will have accomplished a great deal. When the final census data are available it could show gains for transit sufficient to hold share at 5 percent. Transit reports show gains since the census was conducted. The more important share questions for transit are in metropolitan areas rather than national figures.

*Congestion and Travel Times*

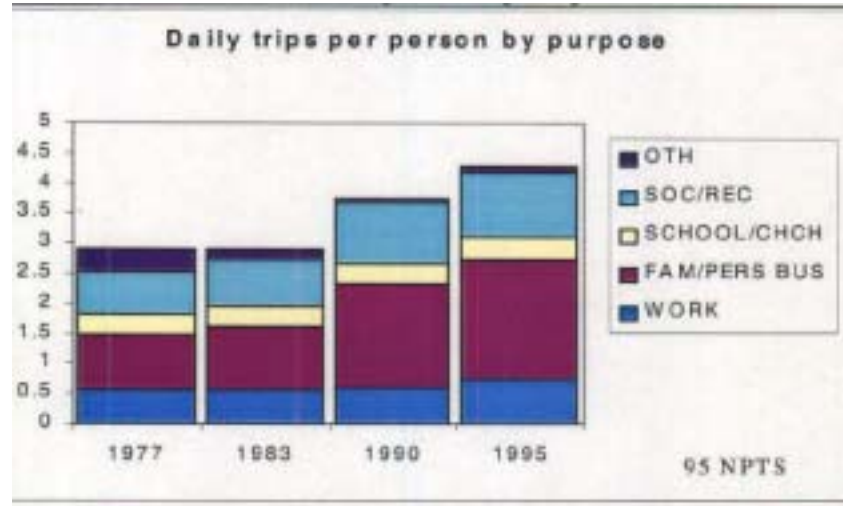

The new census data are preliminary and indicate that average travel times to work increased to about 24.3 minutes, up from 22.4 minutes in 1990 and 21.7 minutes in 1980. When adjusted to correct for definitional changes and given the ex-

traordinary increases in travel activity adding approximately 30 million new commuters and 35 million new vehicles out there a travel time increase of around 2 minutes in 20 years is a really positive point, however the increase of about 1 and a half minutes from 90 to 2000 was more than double the increase in the previous decade. Often in these hearings you only hear problems—in this case there can be some real pride in a system that has absorbed tremendous travel loads and by and large functioned very well.

Travel time is not about averages however. Some States have seen dramatic increases in travel times—especially those with already high densities or absorbing great growth such as Georgia 4 minutes, New York, New Jersey and Massachusetts all around 3+ minutes. But a new phenomenon arose with more rural States showing very high increases as workers commute to large metro areas beyond the State borders. West Virginia led all States with a 4.5 minute increase, Vermont grew 3.1 minutes and New Hampshire also saw large gains at 2.5 minutes. About 9 million commuters nation-wide are now commuting more than 60 minutes.

More detailed data will be arriving from the census and the US DOT later this year that will expand our knowledge appreciably. One of the trends that is clear from other data sources is that commuting is now a relatively small and declining share of total passenger travel—roughly 20–25 percent of local travel. We must remember not to focus on commuting to the exclusion of other important trips.

- While commuting has grown rapidly in the last 20 years, trips for personal business, shopping, etc. have grown even faster.
- Total trip-making per household has grown 66 percent since 1970 despite a 17 percent decline in household size.
- Today the average person makes more than 4 one-way trips per day as the figure below indicates.
- Moreover the average person makes about 4 trips greater than 100 miles from home each year with a round trip distance per trip of over 800 miles.

*Challenges and Great Opportunities Lie Ahead*

In the past I have called transportation “the collision of demography and geography.” The following examines each in turn.

*The Challenge of Geography*

Few nations have been challenged by what Australians have labeled “the tyranny of distance” as greatly as America, and fewer still have reduced its influence on their economic future as we have. We have succeeded through a combination of timely investments in infrastructure and benign public policies that served to permit market forces to work in very positive ways. We have been blessed with great potential endowments and have responded well to those endowments. In the eighteenth century transportation knitted together a nation; in the nineteenth century it welded together great internal mass markets; and the twentieth has seen us inte-

grate our nation into the world economy helping to define and support that world economy.

Transportation is all about reducing the time and cost penalties of distance on economic and social interactions. To the extent that nations succeed in that function they enable tremendous forces of economic opportunity, social cohesion and national unity.

What do geographic trends have in store for us in the coming period.

- We now have 50 metropolitan areas over a million in population accounting for about 60 percent of the US population. This is where most of the congestion and air quality issues will occur.

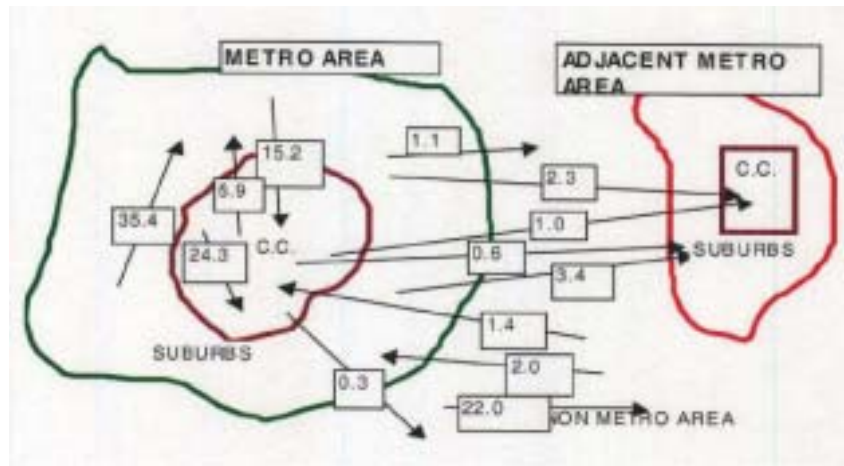

- The remainder of the population is roughly 20 percent in metropolitan areas below a million and 20 percent in non-metropolitan areas.

- The net flow today is from metro areas to rural areas. We will have close to 60 million people in rural areas interacting more and more with metropolitan areas every day.

- Suburbanization continues to extend the scale and extent of suburbs

- Metropolitan areas are growing together—the fastest growing travel pattern geographically will be inter-metropolitan flows—from the suburbs of one area to the suburbs of another.

- A key question will be the balance within suburbs of jobs and workers so that average trip lengths to job opportunities do not grow inordinately.

COMMUTING TRIPS IN MILLIONS

#### *The Challenges of the New Demography*

All of our professional life times have been dominated by the baby boom. That and the dramatic increases in involvement of women in the labor force have defined our age. As we approach 2010 many of the strong forces of the past will be less potent as the list below delineates:

- Lower population growth
- Lower household growth
- Lower labor force growth
- Saturation of driver's licenses
- Saturation of car ownership
- Lower domestic migration rates

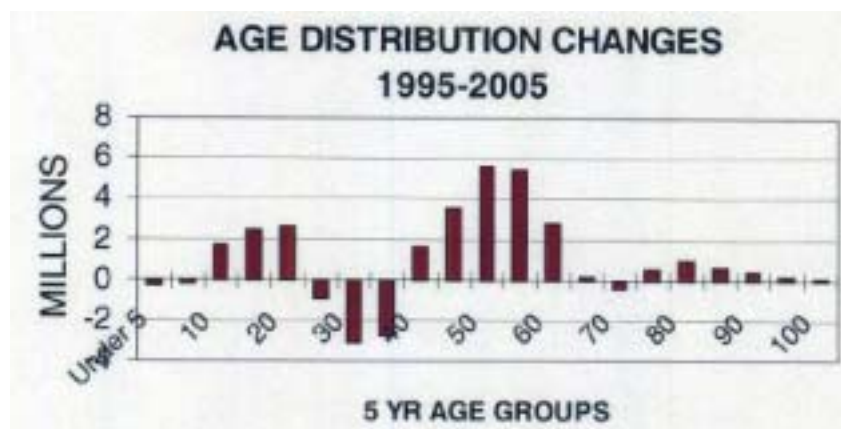

Again, we have absorbed the massive impacts of prodigious growth in these areas over the last 40 years and done it rather well. These elements, which have been the drivers of travel demand since World War II, will not be pursued here other than to say that they will not be as dominant an influence on travel growth and character as they have in the past, although their influence will still be substantial in specific areas of the Nation, especially those still receiving dramatic levels of domestic and foreign migration growth.

We will have new forces of change to address. One sign of the more balanced growth is that the 2000 census recorded growth in every State in the Union.

There are just a few demographic factors that will be the key forces of change in the coming period of reauthorization and beyond. These are:

- An aging population
- A stagnating labor force
- Changing household composition
- A continuing immigrant wave
- Mainstreaming minorities—the Democratization of Mobility
- An increasingly affluent society

Of these one might say that the first three are inexorable—they will happen; and the last three are strong likelihoods but more open to question.

#### *An Aging Population*

There are many facets to the challenges raised by our aging society. A sharp image is portrayed in the graphic below showing the crucial role played by the aging of the baby boom. The combinations of that boom with greater health among the older population and declining birth rates will sharply shift the relationships between our population groups.

Present estimates place the population over 65 at about 35 million, only slightly increased from 1990. The small increase was a product of limited increase among the depression babies generation, those now between 65 and 75, but we also saw extraordinary growth in those between 75 and 85, rising 23 percent. There are roughly 70 men for each 100 women in the group. Persons over 65 composed 12.4 percent of the population with 29 States with equal or higher percentages.

By the end of the coming cycle of reauthorization those over 65 will rise to 13.2 percent by 2010 and reach 20 percent by 2030 as the last of the baby boomer surge reaches 65. At that point we will have reached a stage where there will be more than 31 older citizens per 100 working age adults contrasted to about 20 today. During this period the working age population is actually projected to decline by 5 percent. At the same time the dependent young will remain about the same level. As a result the number and kinds of trips made by and for the elder population will increase sharply. By 2025 there will be 27 States with 20 percent of their population over 65 or more, higher than Florida today.

A number of factors will have bearing on how that population will meet its travel needs:

1. The coming older population grew to maturity in an auto oriented world—95 percent of those, men and women, who will be reaching 65 after 2010 now have licenses.

2. Disability rates among older persons have been declining in the US, and the developed world, suggesting an active older population in the future.

3. At present older citizens are retiring sooner and are more likely to have the means for an active retirement.

4. Retired citizens make almost as many trips of non-work purposes as the general population.

5. Given that the trips most oriented to transit (work and school) are the trips not taken by elder populations it should not be a surprise that their travel is heavily auto oriented.

#### *Stagnating Labor Force*

The chart above that showed the growth in the older population also showed the diminishing growth in worker-age groups. The graphic provides both the history and the future of American age and labor force relationships. From the 70's on we see the sharp rise of the working age population as baby boomers joined the labor force age group, compounded further by women joining the labor force in extraordinary numbers, doubling the labor force by 2010. But as 2010 approaches, the size of the labor force age group stops growing and remains effectively constant out into the future. Some projections have indicated that the group actually slightly declines in numbers. The implications of this for retirement programs have been discussed extensively in the public press around the world. In fact the US is less extreme than many western nations in this regard.

The working age population responding to those job developments will be sharply changed from the past. While the entire working age population is projected to grow by about 12 percent the number of members of the labor force over 55 years of age will grow by almost 47 percent. Workers over 55 will be responsible for half of the growth in labor force from 2000 to 2010. Although these changes need to be of concern we should note that the average age of the labor force in 2010 will be about the same as in the sixties just as the baby-boomers began to join the labor force.

From a transportation view, however, an additional and perhaps more significant factor will be shortages of workers, particularly in skilled jobs, which may lead to important potential changes in travel behavior, such as:

- attempts to keep older workers in the work force longer;
- attempts to recruit even more women into the work force;
- greater use of part-time-like work arrangements;
- greater competition among employers for workers;
- the increased role of immigrant workers.

If the last decade was one of too many commuters the next may be the decade of too few. There will be a severe lack of skilled workers in the future—apparent already. We will have to employ everyone who is employable. Transportation will be central to making that happen. Connecting rural populations and inner city residents to suburban job centers will be one need. The great demand for workers means that workers will be more free to choose where they wish to live and employers will follow. This may mean greater dispersion of jobs and home sites, but it need not; workers may opt for center city living as well as rural life styles. It will mean an amenity-driven development process where areas that can attract and retain workers will be highly advantaged.

Much of this suggests greater freedom for workers to define the when and where of their work. It will mean more flexible work hours for older workers and parents. Jobs in the future will be flexible in a more humanized work place—women in the work force have seen to that. The jobs of the future will look to us from this vantage point like part-time jobs. The implications for travel are a more dispersed and balanced travel pattern throughout the day.

### *Changing Household Composition*

The number of households increased by almost 14 millions between 1990 and 2000, growing faster than population, yielding smaller average household sizes. Households are key generators of travel—more so often than individuals. Had households remained at their 1960 levels we would have 20 million fewer households today. Households have declined to less than 2.6 persons in size, and family based households are down to 3.14.

Households without children have grown more rapidly than those with children. In 1970 40 percent of all households were those of married couples with children, today they account for less than 25 percent of households. They are now outnumbered by married couples without children.

A notable facet of our future is that we have more than 33 million non-family households, about a third of all households, more than 27 million of which consist of persons living alone. We now have 10 million persons over 65 living alone, most of them women. Their transportation needs are likely to be significantly different than the general population.

### *The Continuing Immigrant Wave*

America is once again a nation of immigrants as it was at the start of the last century, as shown graphically below—however the extent to which that is true is unclear. Census estimates have ranged from 8 to 11 million immigrants arriving in the 1990's with some estimates reaching as high as 14 millions. This would place immigration somewhere around 40 percent of the sources of population growth in the nineties and an even greater share of the labor force age group. Of the roughly 28 million foreign born in the US today 40 percent arrived between 1990 and 2000.

From a transportation view it must be noted that additions to the population by natural increase generate a new worker in 18 or so years; whereas immigrants, heavily distributed in the working age years, are often instantaneous additions to the work force and the traveling population. Of those immigrants arriving between 1990 and 2000 the census estimates that two-thirds are in the age group from 16 to 45, and more than 80 percent of men and 50 percent of women are presently in the labor force.

The flow of immigrants nationally is toward the South and West; tending to locate where other Americans are, in the largest metro areas, where the jobs are. Although they have been a significant factor in replacing residents who have been leaving center cities, the current immigrant wave is far more likely to arrive directly at suburban locations contrasted to center cities as in past migrations.

### *Mainstreaming Minorities—the Democratization of Mobility*

Many of the aspects of the questions regarding immigrant travel behavior are interrelated with a discussion of the travel behavior of racial and ethnic minorities. For example, their arrivals in the many large metro areas of the south and west actually had the effect of reversing declining trends in the number of households without vehicles. Not surprisingly there are indications that new immigrants use transit more than current residents, but that over time their travel choices echo the general population. Immigrants constitute a significant element of transit ridership today in many metropolitan areas. A distinct role for the transit systems of the Nation may well be in the socialization process of immigrant populations.

It is often the case that immigrants and resident minorities constitute that group in our society with limited mobility. Their growing access to vehicles will be one of the major factors in travel growth in the future. The figure below shows the long term trend in vehicle ownership among households. The key observations here are that one vehicle households having been stable for almost 40 years at about 30 million households have jumped by 5 million in the last decade, and a related move of households without vehicles to below 10 million for the first time. Both of these moves are strongly related to immigrant and minority trends. We have moved from more than 25 percent of households without vehicles in 1960 to less than 10 percent today even with the surge in immigrants in the last decade.

The relative saturation in drivers' licenses and vehicles has been noted earlier. These apparent national patterns mask the reality that such saturation has a long way to go before it is a fact among minorities and immigrants. While the White Non-Hispanic population tends to be saturated in ownership of drivers licenses, with both men and women having above 92 percent with licenses, these values are more like 80 percent among Hispanic and African American men and in the range of 70 percent among women of those groups.

Auto ownership has similar patterns with households without vehicles at about 7 percent among White Non-Hispanics and closer to 30 percent for African-American households and half that for Hispanic households. Even rural African-American households have 17 percent of households without vehicles.

An important facet of national mobility regarding minorities is the longevity of the vehicle fleet and the resultant affordability of serviceable vehicles for lower income households. The average age of the vehicle fleet today exceeds 8 years.

In many respects our minority populations are somewhere back in the sixties or seventies in terms of transportation and mobility

- They are at 25 percent of households without vehicles, as the general population was in 1960
- Minority women are at 70 percent with drivers licenses; white women probably were at that level in the 60's.
- Long distance travel rates by minorities are less than the general population rates of the seventies.

#### *Rising Affluence and Aspirations*

Many of the aspirations we have for our society are closed connected with rising affluence, either in establishing the means for families to act on their own economic and social goals or to create the resources to assist those that do not have those resources.

Among these goals are:

- Home ownership and adequate housing—2/3 of households today own homes
- Greater access to opportunity and social services
- Greater participation in the mainstream of society by minorities
- Increased freedom for all to act on their social and economic goals

All of these very desirable goals are tied to mobility and the interaction between mobility and rising incomes is strong. Some key attributes:

- Minority households are reaching the income levels where vehicle ownership is an increasing probability and near certainty.

- There will continue to be a close linkage between workers and vehicle ownership. Most households without vehicles will also be without workers
- Trip making and trip lengths will increase with increasing incomes
- Long distance travel for business and recreation is strongly correlated with income.

Households spending going to transportation is about \$7,400 per year, about 19 percent of all household spending, second only to housing—not surprisingly most of it oriented to the acquisition and use of personal vehicles. Transportation, like other household expenditures, clothing, housing and food for example, is both a necessity and a discretionary good. The amount of spending rises substantially, even in percentage of income terms, with rising household incomes as documented in the figure below.

Note: Those with low incomes may have other assets

Increased spending is closely associated with greater auto ownership, more trip making and with trips of greater length. In part this is attributable to the fact that higher income households often have more household members and more workers, but it is also attributable to the fact that higher income households have more discretionary income for travel including recreation, visiting friends and relatives, eating out, etc. Auto trips over one hundred miles increase 4 fold between low income and high income households and air trips more than 7 fold. In local travel trip-making by high-income households roughly doubles that of low income households. Much of the growth in travel we have seen in recent years is a product of this affluence.

Long distance travel also means important international interactions, as not just we, but also our neighbors, rise in affluence. Despite 9/11 it is expected that foreign visitors to the US will rise to 60 million per year by sometime after 2005, a delayed growth but with no long term effects—a tremendous force for economic health and social understanding—but a challenge for our transportation systems. Foreign visitors, especially our North American neighbors, are heavy users of all aspects of our transportation systems.

Perhaps the most illuminating variation in transportation spending is that between rural populations and their urban counterparts. Rural households have the highest share of income going to transportation expenditures (23.5 percent) contrasted to only 19 percent for urban residents. In fact they spend more in total dollars, about \$7460 than their urban counterparts despite earnings about 80 percent of urban households. It is tremendously significant, however, that rural residents have the lowest housing costs share and have the lowest total costs share for the housing-transportation combination. Housing and transportation are tightly linked in cost and character with transportation representing the tradeoff in terms of home cost and size. The fact that two-thirds of American households own their own homes is a crucial factor in our understanding of transportation budgets.

At 2000 with about 1.72 vehicles per household, on average, the majority of American households have two or more private vehicles; vehicles available equal or exceed workers in the majority of households regardless of the number of workers in the household. Perhaps the most significant event in auto ownership, as noted earlier has been that households without vehicles have dropped below 10 percent of all households for the first time.

One of the things that this says is that congestion is one of the prices we pay for a high degree of affluence and vehicle affordability.

In my view congestion is: People with the economic means to act on their social and economic interests—getting in the way of other people with the means to act on theirs!

Another thing the reality of rising national affluence produces is that the value of time will be increasing for most people. As incomes rise the value of time rises accordingly. Particularly, the pressures of time will be acute for working women, seeking to balance multiple goals and tasks.

We must also recognize that rising in parallel with that value of personal time is the rising value of the goods and products we move. These too are a product of our increasingly affluent society. It suggests that many products will be intensely time sensitive with a tolerance for high cost transportation if it provides high speed, reliable transport; this will often mean the air freight-truck combination.

#### *Implications*

In summary, America will be:

- A stable “older” population
- Operating in a global economy
- Where “high cost” transport is OK
- Where skilled workers are at a premium
- Where many workers can live and work anywhere
- Who, where are the immigrants will be a key question
- Where mainstreaming minorities will be a key factor of growth

We will be a challenge affluent society where transportation will have immense importance in helping us remain competitive and to realize our economic and social aspirations.

To me transportation is about society building—not just economy building—society building ! It ties people together across distances—especially today when families are dispersed over the entire nation.

The greatest strength of our economy is the nationwide mobility of workers in a highly specialized division of labor. Transportation knits families back together.

Many planners still think in terms of “community” as the people physically next door—our communities today are a product of multiple voluntary links across vast distances supported by two pillars—communications and transportation—virtual communities.

Transportation’s goals are all about speed, cost and reliability and those are the three things we are just terrible at measuring in transportation! We must do better.

#### *Summary*

In summary the factors that will matter most in the future are these:

For commuting—the lack of workers, skilled workers especially, creating a sellers market in jobs—greater freedom of location through technology and greater flexibility about work schedules (more part-time-like jobs) in the work place. Who and where the immigrants are will be central. Expect appeals to older workers and even more women to join the work force.

For Local travel—an aging population with more freedom and discretionary resources for recreation and other travel. A more mobile minority and immigrant population. A generally more affluent society able to act on its social and economic interests. Expect very active day-time, evening and week-end travel patterns.

For Long Distance Travel—many people in the peak long distance travel age groups; more people able to participate in long distance travel; more foreign visitors. Expect a peak period in American tourism.

For Geography—the flows between local elements of the Nation will expand faster than the internal travel within those elements. Expect interaction conflicts between long distance and local travel.

A higher value of time for people and goods means greater emphasis on time-saving technologies and modes of transportation for both. Expect interaction conflicts between freight and passenger travel.

Transportation will always be about distance and time. I have said in the past that transportation’s goal must be to reduce the impact of distance on the ability of society to act on its social and economic interests. Today in many respects America through its transportation system has largely overcome the challenges of distance and reduced its costs to our society. This is a large part of our success as a Nation. We are now at the stage where it is the pressures of time that should be the great driver of transportation goals and issues for the future.

---

#### RESPONSES OF ALAN PISARSKI TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* Would you please discuss, in greater detail, your thoughts on hot lanes? What I am most interested in are your thoughts as to how such a concept can be employed on a nation-wide scale in our bill next year re-authorizing the Highway Trust Fund and surface transportation program?

Response. I prefer to think of hot lanes as “premium service lanes”—that captures the essence of the service they provide. My thoughts regarding their development nationally follow:

a. They must be additional lanes not conversions of existing lanes—the public has demonstrated again and again their antagonism for taking existing lanes for any purpose.

b. The public, at all levels of income, will accept the idea of paying for better service, as long as the non-tolled option continues to exist.

c. They should be tied in with bus rapid transit and carpooling preferably in a network of routes. We desperately need to find ways to resuscitate car-pooling and to provide lower cost transit services.

d. The private sector can be a major source of development and funding thru revenue bonding of these facilities.

*Question 2.* As you know, ISTEA created various programs and policies to increase transportation options, and reduce people’s dependence on single occupancy vehicle trips, yet as your testimony showed, driving alone has increased over the last 10 years, and vehicle miles traveled also experienced substantial growth. What are the mobility benefits and constraints associated with such policies, and what segments of the population bear the burden of such policies?

Response. We have seen a tremendous focus on the value of time in our society, particularly among women who are maintaining careers, households, etc. As our population becomes more affluent their value of time increases and the standards by which they judge the transportation system become higher than before. It is my belief that as long as fuel costs remain anywhere near reasonable and vehicles are relatively affordable that the public will react to their time pressures through the use of the single occupant vehicle. The only suitable way to make headway against that trend is to improve the competitiveness in speed and quality of transit and carpooling services. Efforts to push workers out of their cars by making things worse for them—consciously abetting congestion or increasing the costs of travel are antagonistic to society’s best interests and to our faith in our citizens’ ability to make sound judgments about how to lead their lives. Perhaps more significantly, I would argue that there are critical needs for transportation services regarding getting low income populations to jobs and services, assisting our rural populations and serving the aging population everywhere that should be the focus of our resources, taking precedence over spending money trying to attract high income commuters out of their cars.

*Question 3.* You define congestion in terms of economic and social interests. How would you define mobility? Is there a way to measure or assign value to increased mobility (due to greater transportation choices and capacity) or decreased mobility (due to increased congestion)?

Response. This is a wonderful question that unfortunately goes to the heart of our ignorance about transportation and its benefits. At least part of it is that we have always taken our mobility for granted and have not needed to rigorously defend or justify its value to ourselves personally or to society in general. Mobility of course is closely linked to my sense of economic and social interests. I think of mobility in terms of choice—expanded opportunity for choices which means selection, service and perhaps most important—price. Recent data show that the ranges of choices of products and services available to the public has exploded. Among the most important of these opportunities are job opportunities whether seen from the workers point of view—jobs within a half hour of home—or from the employer’s—potential employees within a half hour of my office.

Perhaps the most telling way to appreciate its value is to consider its absence. Center city populations lacking mobility are often subjected to low quality services and monopoly prices because they do not have the mobility to take advantage of alternatives. Rural isolation has similar attributes.

It is interesting that we measure fuel efficiencies in miles per gallon to two decimal places and air quality in parts per million in legislation but have no metric for the benefits of travel activity—mobility. This has clearly distorted our tradeoffs and the policy decisions that support them. Perhaps we should think of it in terms of “opportunities provided per minute”. A major research effort to quantify, understand and relate the value of mobility to us as a society would be very valuable to public policy. The question is important and needs to be pursued. The more we know about mobility and its interactions in a healthy society the better will be our public policies.

## RESPONSE OF ALAN PISARSKI TO ADDITIONAL QUESTION FROM SENATOR GRAHAM

*Question 1.* You mention the growing tension between movement of people and movement of goods. Both are becoming gridlocked. Will this tension escalate in the face of new security measures screening cargo, perhaps several times, along its route? Can you offer advice on ways to ensure movement of goods with minimal impact to passenger travel, and timely screening for national security?

Response. We have used “time-separation” as a way to reduce conflicts between cars and trucks in the past. The Interstate belonged to cars by day and trucks by night—that is now failing us. Trucks used to get off the road in our metro areas during peak hours until traffic subsided—that is now failing us. All of these failures are due to increasing congestion and the need of truckers to get through in something like a timely manner.

Ultimately I believe it will lead us to some form of separation of the vehicle streams—separate truck lanes for large, through vehicles—as both a safety and a driving ease matter. Sections of the New Jersey Turnpike are the example I am thinking of. Such separation would facilitate truck screening and monitoring as well, as in weigh stations. The need for security inspections will only add to our conflicts. The air-truck combination will grow in significance in the future with the increases in value of goods. Inspections at the airport inbound and out may become a critical factor in travel conflicts.

Perhaps we need to consider a wholly separate set of national parkways designed for personal vehicles, accepting the fact that trucks will dominate permanently on certain Interstate routes.

## RESPONSES OF ALAN PISARSKI TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question 1.* Mr. Pisarski, you mention in your testimony that transit ridership increased slightly in the last 10 years (500,000 net increase) while remaining at 5 percent of the work commute trips. However, I understand from FTA data that transit ridership declined in the first 5 years of that period (1991–1996), and then rose dramatically, by 21 percent, in the last 5 years (1997–2001). If you focus on the most recent 5 years, you get a different picture of where transit is going, don't you?

Response. Yes, I would like to think so. There were some indications from other census surveys that transit may have dropped below its current 5 percent share during the 90's and got back to that figure by decades end at least in part due to new services, new fare policies, and new worker populations, etc. It is important to recognize that these data sets portray very different snapshots of the activity. The census data I base my work on counts workers and the way they travel to work. The FTA data on the other hand are effectively turnstile counts. If a worker passes through a turnstile (or equivalent) four times in a day that would be a big jump in FTA data but still just one worker as counted by census. This would not really change the 5 percent figure share I mentioned in my testimony. There are just a few metro areas at 10 percent shares for transit across the country today New York, Chicago, and Washington for sure; maybe Boston, Philadelphia, and San Francisco—a very worthy goal to examine would be to see how many more areas we could bring up to that level. Shifts in transit use for non-work activities could add to the differences but I do not expect that they have grown enough to change transit's 2 percent share in overall travel. It is important to keep a sense of scale in interpreting these measures.

*Question 2.* Mr. Pisarski, your testimony touches on the aging population and their transportation needs in terms of the need to continue driving. However, many Americans lose their ability to drive as they age. For example, in 2000, only 68 percent of women over the age of 65 had licenses. How will we meet the needs of older Americans unable or unwilling to drive?

Response. I wish there were easy answers here. In the early stages of the aging scenario we face, roughly the next 15 years, the numbers of elderly drives will increase strongly—for instance with women's licensing rising to over 90 percent for those over 65—as the first real age group that grew up with the car ages. Most of their travel demand will be met by their own driving and then secondarily by family and friends, which is a major factor in the mobility of aging populations typically. For those unable or unwilling to drive and for most of those who reach the higher age groups where infirmity begins to be a critical factor something new in the forms of present community transportation services needs to be developed. While, there are many willing people and organizations trying to serve the aging community well, from what I have seen in my work the present systems of services need careful review and rationalization. They are often times confusing and expensive. In many

cases these older citizens cannot use traditional transit or even curb side delivery but need door to door assistance. We will need a national summit-like discussion of how to respond to these dramatic social challenges. Costs and pricing are critical. A role for the private sector and for community institutions is crucial. It must be an important focus for reauthorization planning.

*Question 3.* Mr. Pisarski, you discuss the mobility needs of immigrants and resident minorities. Do the data sources mentioned have a good rate of return from these communities. What is your confidence level in these data?

Response. In the census I am convinced that they have done a successful job of accessing minorities and obtaining the necessary information. There are certainly response problems with undercount that we all are concerned about but by and large they have been very effective. I am much more concerned about travel surveys by local governments, MPO's etc., and even our national sources, the NPTS now NHTS. While those survey's managers are doing a great job trying to address these challenges, the weaknesses in phone interviewing techniques are critical in causing concern about the representativeness of the returns. I had similar problems 30 years ago in surveying in face to face interviewing, so this is nothing new but the changes in people's life styles and means of communications have not been balanced by new approaches in surveying methods. We might consider matching census data with survey data to evaluate gaps and weaknesses. We need a national commitment to better data to support transportation decisions—this means more money, of course, but also research on innovative methods, employing new technologies to respond to these growing challenges.

*Question 4.* Mr. Pisarski, you emphasize demographic factors behind travel patterns. However, the data shows that the growth in driving itself is far outstripping the growth in population. In fact, an FHWA analysis found that population growth is responsible for only 13 percent of the increase in driving, and TTI data show that the distance driven rises every year. Can you speak more about how travel demand management can be an effective congestion-fighting strategy.

Response. Senator Moynihan was fond of saying that "demography is destiny"—and so it is—certainly in transportation. But these demographic factors go far beyond population growth. I was responsible for the FHWA study mentioned in your question and concur that population growth itself is typically a relatively minor factor in growth—except in metro areas and States seeing dramatic shifts in population—Nevada, Georgia to name just two. More to the point areas losing population are still seeing growth in travel. Clearly it is the per-capita growth rates that are significant. Growing affluence, changes in family composition and life styles, the availability of relatively low cost transportation automobile services are the really significant drivers of change. A central factor in the changes we have seen has been the same aging factor referred to in an earlier question. We have many more people of working age; many more at the peak travel age group.

Given these factors it is not clear what the role of demand management should be. I would certainly argue that suppressing trips is both undesirable and unwarranted. Trips have economic and social transactions at their end of value to each citizen. This suggests that reducing the time and cost penalties of trip-making is a highly desirable public goal—I see such "induced" travel as a major social benefit—to be applauded not condemned. We may think of others' trips as unnecessary, but which of us examining his or her own travel would judge them to have been meaningless. Almost 30 years a congressional committee asked me what percent of trips were frivolous—a question I could not answer.

There may be opportunities in getting people to combine trips in what we call "trip chains," linking purposes together in a time and energy efficient pattern. People tend to do that under the pressures of time.

Land use solutions, where people might find opportunities at shorter distances travel might have limited potential, but I would not overstate it. Many of the changes we are seeing are the product of shifts in trip purposes and their lengths. Going out to eat for instance instead of preparing meals at home; taking laundry out rather than doing it at home. This is often accompanied by increases in trip length as distant opportunities become accessible. One of the not-so obvious factors is just the growing size of our metro areas. About 60 percent of our population lives in the 50 areas of more than a million—substantially up from the past ( there were 39 such areas in 1990). Such areas make possible the prospect of work trips of 20 miles or even trips to a restaurant or to visit friends and relatives of that distance that do not exist in a smaller metro area. The most significant factor there will be travel times and the effects of congestion.

---

STATEMENT OF TIM LOMAX, RESEARCH ENGINEER, TEXAS TRANSPORTATION INSTITUTE<sup>1</sup>

Mr. Chairman, distinguished members of the committee, thank you for the opportunity to testify before you today. I have been asked to summarize a few trends that we have identified in a report we prepare each year on urban traffic congestion. I will also offer a few observations about congestion in U.S. cities in the next few years. I would like to build on the excellent information that Mr. Pisarski has prepared. Please keep in mind his summary of how travel demand has grown and how it will continue to grow in the future.

Over the last 20 years our cities have not been able to keep pace with the demand increases brought on by population and job growth. Congestion has increased as a result of that imbalance. Our data shows that during peak travel periods in 76 urban areas we studied, the travel time penalty—the extra time it takes to travel during the “rush hours”—has increased 185 percent since 1982. The penalty in areas with populations between 500,000 and 3 million increased by 300 percent over this same time. This indicates that while most of the problem is in the large metropolitan areas, the congestion problem is growing in areas of all sizes. Total hours that travelers in these 76 areas were delayed increased from 750 million in 1982 to 3.6 billion in 2000.

This congestion growth was the result of the trends that Alan referenced. In just our 76 areas, travel demand increased 86 percent, but road capacity only increased 37 percent. The real capacity increases were much less; the 37 percent value includes many roads that were incorporated as a result of growing urban area boundaries, rather than newly constructed roads. The imbalance is the result of several truths and myths about what can be accomplished. I would like to emphasize just a few important elements.

First, a truth. Road construction can help reduce the growth of traffic congestion. Figure 1 shows the dramatic difference in travel time penalty growth between areas that added roads at a rate close to the rate of travel growth—the green line at the top—and those areas that added few roads in relation to their travel growth—the dark blue line at the bottom. The cities in the bottom group added roads at a rate close to travel growth—for example, a 4 percent annual growth in the traffic might be accompanied by a 3.5 percent growth in major roads. The time penalty only increased 57 percent in the areas that were able to add roads. Time penalties increased 245 percent for the “least aggressive” roadway adding areas.

Second, a myth. We should invest all our money and effort in adding roadways. My characterization of this as a myth is not based on ideology. It is based on the fact that since 1982, urban areas have added only about half of the roads needed to stop the growth in travel delay. Figure 2 shows that this percentage is about the same for all four urban population ranges we track in our annual report. This is due to a combination of factors ranging from lack of funding, land, public support, and environmentally supportable alternatives. Roads can definitely help, but realistically they aren't the “wonder drug” prescription because cities have not been able or willing to add them quickly enough.

A similar truth can be stated about transit improvements—they can help, but cannot solve the problem themselves. Figure 3 illustrates the amount of new transit riders and carpoolers that would have to be added each year to keep pace with travel demand growth. We are looking at adding the equivalent ridership of a current transit system between every year and every 4 years. This is very unlikely.

Let me point out a somewhat discouraging note that “regular” traffic congestion is only part of the problem. The variations in travel time caused by crashes, vehicle breakdowns, special events, construction, maintenance, weather and a variety of other factors are a source of frustration and economic loss to person travel and freight movements. Part of our problem is that we don't have the long-term, system-wide, detailed data we need to fully describe the issues. The emphasis on operational improvements over the last several years allows us to analyze a few years in a few cities, but these improvements need to cover more of the nation's transportation system.

Figure 4 shows the kind of information that can be developed and how we can use it to identify problem areas and the success of improvements. This graph is for some of the Minneapolis-St. Paul freeway system in 2000. Congestion is measured by the Travel Time Index—the peak period travel time penalty shown in the dark blue line. Unreliable travel conditions are measured by the Buffer Index—a measure of the amount of extra time travelers need to allow because of the unpredictability

<sup>1</sup>The views in this testimony are those of Tim Lomax and do not necessarily represent those of the Texas Transportation Institute, or The Texas A&M University System

in system conditions. We can see the effect of the big snowstorms in January and December—more congestion and very unreliable travel times. The summer tourist season is also the cause for greater variation in travel time, although not a substantial increase in average travel time penalty. We can also see the effect of turning off the traffic signals that controlled access to the freeway system. This experiment began in October, and the freeway effects were immediate and dramatic. The unfortunate part of this story is that the monitoring and data collection system does not extend to the entire system of freeways and streets so we cannot completely analyze the experiment from this data. But the limited data we have suggests that operational improvements can play a significant role in providing a more reliable transportation system for people and freight.

It appears that unless something changes we will continue to see a growth in congested travel and congested transportation systems. Projected population increases mean more travel; our cities have not been able to stop congestion growth over the last two decades and travel and population growth will continue to stress our transportation systems. If we are fortunate to have enough funds, select projects wisely, and implement them using techniques that do not result in significant delay from construction and maintenance activities, we may be able to slow down the growth of congestion, and make the system more reliable than it is now. But “reliably congested” is not really a high standard of achievement in my view. If our cities are going to have a different future than this, we will have to pursue all types of improvements and implement more projects, rather than fewer and manage both the demand patterns and the system more efficiently.

More information on Texas Transportation Institute’s urban mobility studies can be found at: <http://mobility.tamu.edu>

Congestion and Reliability

RESPONSES BY DR. TIM LOMAX TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* In your testimony, you point out that the “congestion penalty” in areas with over 300,000 population has increased over 300 percent since 1982. You also mention these travelers were delayed a combined 3.6 billion man-hours by congestion. I have two questions about this part of your testimony:

i. Could you please explain, in as much detail as possible the calculations and assumptions you made that brought you to those two conclusions?

ii. Most of the figures I have seen putting a value on the cost of the “congestion penalty” are a bit outdated. For example, in my opening statement at the hearing, I referred to figures dating from 1998. In your opinion, in 2002 dollars, what is the average cost of this penalty to rush-hour commuters in those same metropolitan areas you referred to?

Response. i) I have attached a copy of the analysis methodology used in our study. Some additional notes on our results:

- I think my testimony refers to areas with population between 500,000 and 3 million, rather than 300,000.
- Our study only covers 75 of the approximately 400 urban areas in the United States. The study includes all of the largest 40 urban areas and most of the U.S. urban travel delay.
- The 3.6 billion person-hours are only for the year 2000, not 1982 to 2000.

Response. ii) To estimate congestion in future years, I would use the following trends.

- The Consumer Price Index has increased 6.8 percent since 1999.
- Travel delay, the main component of the congestion cost, has increased 6.2 percent per year over the last 5 years.
- Using these values, I estimate the average congestion cost has risen from \$505 per person in 2000 dollars to \$590 per person in 2002 dollars.

*Question 2.* With regard to your answer to the previous question, do you have an opinion as to whether that figure would likely materially vary from one part of the country to another, and if so, can you offer an explanation for such a phenomenon?

Response. The congestion cost generally varies by population of an area—larger cities are more congested, have more people and, thus, have higher congestion costs.

The value of time (measured in dollars per hour) is a constant in our study. That value probably varies from one part of the country to another, but I do not have an estimate of that. I do believe the research on value of time also shows that it varies by trip purpose, activities on each end of the trip, whether the traveler believes they will be on time, as well as the personal value of time.

*Question 3.* Do you agree with Alan Pisarski and Ken Orski who testified in favor of what they term “hot lanes” as one way to reduce traffic congestion?

Response. I think high-occupancy/toll (HOT) lanes can provide an option that does not currently exist for most trips. The “option” aspect of HOT lanes seems to be the

most important element in my opinion, rather than congestion reduction. There may be some congestion reduction benefit if enough trips use the lanes, and if the “before” congestion level is not too high. Most corridors that I know of where the HOT lane concept is being studied, however, are very congested. The likely effect will be to shorten the period of slow traffic speeds and to provide a high-speed option for some trips, rather than to significantly improve overall average speeds.

---

RESPONSE OF DR. TIM LOMAX TO ADDITIONAL QUESTION FROM SENATOR GRAHAM

*Question.* Your testimony discusses the difference between “regular” traffic congestion that occurs in bottlenecks, and congestion caused by accidents, breakdowns, and other non-recurring events. Have you or TTI researched the best approach to dealing with the day to day breakdowns, accidents and other incidents that lengthen commutes?

Response. Incident management programs are the general term for the problem you identify. The elements might be separated into the following categories:

- Detection (finding the problem)-The wire loops in the pavement, radar speed sensors, toll tag reading devices and other automated devices can identify problems using comparisons between nearby sensors and comparisons to historic averages. Motorists using cell phones to report accidents are becoming the quickest way to identify accidents. Cameras can be used to confirm the incident location and proper response vehicles and personnel.

- Clearance (removing the problem)-“Highway helper” programs have been developed in many areas and consist of many different elements. The basics include a roving set of vehicles that assist motorists with disabled vehicles or with minor crashes. More advanced programs might include tow trucks that are assigned to clear crashes and disabled vehicles from important sections of road. Communicating the incident location and expected duration of road blockages—such as the National 511 traveler information telephone number program—is also an important element.

- Prevention (reducing the problem)-Some of the incident delay problems might be addressed most appropriately by driver education or design changes. The delay that occurs when motorists in the opposite direction of an incident slow down (so called “rubbernecking”), for example, does not have an easy solution other than to educate drivers as to the delay and safety problems this causes. Some sort of visual screen mounted on top of the median barrier might also reduce the problem. Teaching motorists to maintain their vehicles and monitor fuel level, tire condition, etc., would also pay significant benefits in reduced vehicle breakdown rates.

---

RESPONSE OF DR. TIM LOMAX TO ADDITIONAL QUESTION FROM SENATOR JEFFORDS

*Question.* Mr. Lomax, over the last few years, the Texas Transportation Institute Mobility Study has moved away from calculating the number of lane miles of roadway needed to ‘solve’ congestion to bring free-flow conditions to highways. In recent years, the report has begun to discuss increasing transit capacity and managing travel demand. Can you talk about your shift in thinking on the approach to solutions?

Response. We have attempted to broaden the set of improvements we refer to, rather than to move away from any solution. We have also chosen to look at achievable or realistic options. The number of lane-miles needed to keep pace with annual traffic growth are still presented along with the transit riders or carpoolers needed.

Building hundreds of lane-miles to solve congestion problems, however, is not a realistic option in almost all urban areas. Slowing the growth of congestion, however, is probably achievable and relevant in many urban areas. Our studies show that this will take a full range of construction, operational improvements, transit and carpool enhancements, and demand management alternatives in larger cities.

Smaller cities, however, have not been any more successful at adding roads in sufficient amounts to keep pace with traffic growth. This suggests that a broader view of the solution set might be appropriate for more than the largest and most congested cities.

---

STATEMENT OF HON. RON SIMS, EXECUTIVE OF KING COUNTY, WASHINGTON

Mr. Chairman, Ranking Member Smith, and members of the committee, I appreciate the opportunity to testify before you today regarding new ideas for the reauthorization of the Transportation Equity Act for the 21st Century (TEA-21.) Your reauthorization of these vital transportation funds can better help communities ad-

dress the public's need for greater mobility in the face of growing congestion that threatens the quality of life in our metropolitan areas.

I applaud the dramatic changes Congress has instituted in the last two surface transportation reauthorization bills, particularly those that have helped address congestion problems in America's major urban areas. The Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) strengthened the role of metropolitan planning organizations (MPOs) and encouraged the use of Federal-aid highway moneys for high-occupancy vehicle lanes, transit systems and other projects designed to meet congestion problems. TEA-21 established "firewalls" that ensured that the funds collected from the public for transportation purposes will be spent on transportation, restoring trust to the Highway Trust Fund, and freeing up billions of dollars for congestion relief programs.

I believe that next year's reauthorization bill should take what I view to be an essential next step. By targeting transportation investments into metropolitan areas that are competing in the global economy, we can help these areas and our country retain our competitive edge. If we don't, companies will leave our area, and, in some cases, our country. Infrastructure investment in our metropolitan areas will not only bring much needed congestion relief, it will help secure the stability and health of these metropolitan areas that are the economic engines of this country.

Despite the efforts of programs like TEA-21, we must do more to ensure congestion relief infrastructure investments are targeted to key major metropolitan areas. Clogged roadways delay people, goods and services from moving freely to their destinations. Metropolitan congestion relief will have a tremendous impact on the quality of life for business, industry and the residents. More and more people are living in urban areas. Through very successful Smart Growth strategies aimed at managing growth in urban areas, many cities are seeing a revitalization of their cores as people move back into cities. In King County, we know that over 50 percent of all daily trips are still by single-occupancy vehicles despite great strides being made in increasing transit trips and carpool rides. Our long-term goal is to get people to live, work and shop in the same community—to use public transportation and to cut down on driving alone. But it is imperative we create and invest in the infrastructure to help make this goal a reality.

The viability of urban areas is increasingly dependent on reliable transportation networks of all kinds—from major freeways to regional arterial networks and public transportation, inter-city rail, and all other efforts aimed at congestion relief. And we're moving in the right direction. In 2002, transit ridership in King County grew by almost 4 percent, boarding 100 million riders given on buses, trolleys, and streetcar. We have dozens of programs aimed at getting more people out of their cars, like our Transit Oriented Development projects that combine housing and local retail with a transit station or a park-and-ride lot to locate people and services near transit to discourage auto use. We are creating better pedestrian linkages to bus service. Further, ongoing national health studies show that some urban development, especially sprawl, limits physical activity causing obesity and related illnesses. We have an obligation to give our citizens the transportation choices they need to make their lives easier and more healthful.

Therefore, included in whatever is done with the reauthorization of TEA-21, metropolitan congestion relief is a must. A successful comprehensive plan will include transportation infrastructure that helps our metropolitan areas to thrive as both economic engines and as wonderful places to live.

#### *Economic Importance of the Major Metropolitan Areas*

As the United States economy grew and prospered in recent years, we have witnessed significant growth in major metropolitan areas and business centers across our Nation. The major metropolitan areas are significant major contributors to the economic viability of our nation as a whole. The 20 most congested metropolitan areas in the United States together have more than one-third of the entire economy of the Nation. Using 1999 payroll data as an indicator for economic activity (payroll is the largest share of GDP), these top 20 metropolitan areas had a combined payroll total of more than \$1.7 trillion—37 percent of the total national payroll of \$4.6 trillion. Further, these 20 metropolitan areas contain nearly 50 percent of the population and economic activity of the total metropolitan areas combined.

Let me talk about our economy and its importance to the region, State and Pacific Northwest. Based on 2000 economic data, this metropolitan area ranked as the nation's 13th largest metropolitan economy, generating about \$115 billion in economic output. Compared to nations of the world during the same period, the area out-produced Greece or Venezuela and nearly out-produced Finland. Further, King County represents 43 percent of Washington State jobs and 55 percent of the State's dollar payroll.

This region is also a port community, largely dependent on the increasing pace of global trade. International trade supports one of every three jobs in Washington State, and we serve as an important export and import gateway for the northern tier of States. I want to thank this committee for including the National Borders and Trade Corridors program in the last authorization bill. We are using funds from that program in our region to help construct a series of railroad grade separation projects that are increasingly important as mile long container trains move slowly off the docks at the Ports of Seattle and Tacoma.

*Costs of Congestion*

The total cost of traffic congestion in the metropolitan areas studied by the Texas Transportation Institute amounts to almost \$74 billion. TTI has calculated that significant amounts of fuel are wasted as a result of congestion, noting that drivers stuck in traffic used more than six billion gallons of fuel in 1996.

Now, congestion remains the primary threat to the long-term health of the economies of many different regions. Traffic congestion deeply affects our nation's ability to move goods and services. Corporations and businesses in these congested areas have experienced significant financial losses as a result of increased traffic. The Boeing Corporation, the nation's No. 1 exporter, estimates that while they move the same amount of freight up and down the Puget Sound region as they did 5 years ago, it takes them 22,000 more payroll hours to do it. Boeing shocked our region last year when they announced they were moving their corporate headquarters, partly because of our State's failure to keep up on transportation spending. The added costs associated with traffic congestion are causing many businesses to search for other, less congested areas, just to meet their freight mobility needs.

*Infrastructure Investment Has Not Kept Pace with Growth*

Decaying and outdated roads are having a severe impact on all aspects of residents' daily lives, from how they get to work to when they return home to spend time with family and friends. Road rage and other congestion-related ills are affecting the quality of life for many Americans.

As this committee knows, the overall level of public investment in transportation has declined from a peak in the 1960's to levels that now threaten the economic vitality and the livability of our communities. Recent polls taken in the Seattle-Tacoma metropolitan area, for example, consistently indicate that solving congestion is the highest policy priority of residents. They consistently rank transportation congestion as their No. 1 problem, far ahead of concerns over crime, education, taxes, or the environment.

The Washington Legislature has struggled, as many other State legislatures have, to craft statewide and regional packages to fund much-needed transportation projects. The Washington State Legislature voted late last week to increase statewide spending for transportation. This will be financed through a combination of gas tax, truck weight fee, and vehicle sales tax increases. A regional transportation finance mechanism was also authorized. Our transportation problems can only be addressed through bold cooperative actions, not just at the State level, but at all levels of government.

*Development Patterns Have Contributed to Congestion*

Urban sprawl has been a major contributor to our growing traffic congestion problems. From 1970–1990, population in the Seattle Metropolitan Area grew by 38 percent while the development of land increased by 87 percent. This represents a doubling of land needed for each person over the previous period. Related to this statistic, there has been a 30 percent drop in residential densities since 1970 while we have seen new jobs locate in sprawling low-density employment centers.

Communities comprised of housing exclusively combined with low-density development randomly scattered around a region, have created land use patterns that are difficult for transportation to serve. People have no choice but to drive everywhere. Alternate forms of transportation such as public transit, walking, bicycling, carpooling don't work as well in a pattern of sprawl development because travel trips are too long and too scattered. It is more difficult for government to respond to the growing needs created by these inefficient development patterns. Housing, jobs and shopping become more distant from each other, resulting in greater vehicle miles traveled.

I challenge us to look for ways to meet our current transportation needs, while at the same time, we support efforts to steer new development into smart growth land use patterns. New funding plays an important role in fixing transportation problems in our major metropolitan areas. We need to leverage these new resources by making changes to the development patterns the transportation system serves to get the most efficient use of our money.

### Smart Growth Is Part of the Solution

Smart growth is a major factor in reversing the trends resulting from typical development patterns and traffic congestion. Smart growth provides for “common sense” development by encouraging growth where facilities and services already exist, bringing jobs and housing closer, and limiting development into farm lands and low density rural areas. I support the testimony of Don Chen, Executive Director of Smart Growth America, who spoke to your committee 2 weeks ago about the role the Federal Government can play in supporting smart growth policies and actions by local governments. The reauthorization of TEA-21 can become a mechanism to support smart growth initiatives. This committee can help local governments solve transportation problems by encouraging smart growth policies leading to fewer cars on the road.

In King County, we’ve been working diligently to make Smart Growth work. In 2000, only 4 percent of all of our new housing units went into our designated Rural Area. We’re revitalizing our older urban areas as evidenced by the nearly 10 percent growth in the city of Seattle from 1990–2000. Growth in the centers of the close-in suburbs is also rising. Over the last 10 years, the population in King County grew by 15 percent and the city of Seattle grew by 9 percent. This data demonstrates a reverse in the declining growth trend in the city of Seattle during previous decades. This is not just happening in Seattle, but in other metropolitan areas as well. Future transportation investments need to support these recent trends.

The viability of our urban areas is increasingly dependent on reliable transportation networks. If we are successful in creating more Smart Growth communities, where people use their cars less, then we are actually preserving road capacity for those that really need it—like for the movement of freight. A clear example of how land use and transportation are being used together is in a Transit Oriented Development Project, which typically combines housing and local retail with a transit station or a park-and-ride lot.

We need to create better pedestrian linkages to bus service, encourage greater densities and mixed-use developments around transit centers, and simply provide connections within our communities. Ongoing studies are demonstrating that many forms of urban development, especially sprawl, can work against physical activity such as walking and other forms of exercising. We have an obligation to give our citizens the transportation choices they need to make their lives easier and more healthful.

### Increases in Vehicle Miles Traveled

People drive more and they own more cars. In King County, there are more registered vehicles than there are registered drivers for those vehicles. Vehicle miles traveled (VMT) has also increased, so traffic congestion continues to worsen.

In the Seattle region, from 1980 to 1990, VMT increased nearly three times faster than population and employment growth. However, from 1990 to 2000, VMT grew at approximately the same pace as population and employment. Although the trend is in the right direction, the transportation system needs to catch-up from the rapid growth in vmt from the past 20 years. Also, through strategic investments, we can ensure that this trend continues and does not revert back to the rapid rise of the 80’s.

While traffic congestion is the most evident sign of increasing VMT, other important impacts are significant to our quality of life. Increasing VMTs correlate to worsening air quality and higher energy consumption rates.

### *Increase in Transit Ridership*

As we look to solutions to address our traffic congestion problems, we need to keep in mind that there is no quick fix to eliminate congestion. Instead, we will need broad solutions to address different facets of congestion and to give metropolitan areas the flexibility and choices they need.

Often, we turn first to adding highway lanes. While this is an important part of the solution, alone it will not alleviate the traffic congestion problems we currently face. Additional congestion-fighting tools include improved transit service and other actions.

In King County, we have one of the best transit operations in the Nation. Last year we exceeded 100 million annual riders for the first time. Transit’s share of daily travel is also going up. In the Seattle Metropolitan Area, commute trips on public transportation, as a percentage of all work trips, has increased from 6.3 percent in 1990 to 7.1 percent in 2000. I believe strategic investments will help us maintain this trend in transit ridership. However, we know that increasing traffic congestion is having a negative effect on our ability to operate transit efficiently. More congestion makes it harder for buses to maintain schedules, leading to more

buses providing the same level of service. Clearly, this is not a very efficient way to operate.

Transit can and should be one of the key tools to address traffic congestion, especially in metropolitan areas and centers where there are concentrations of people and jobs. To do this, we need to make sure transit becomes a viable alternative. Transit can compete with the car for commute trips if appropriate funding and operating incentives are provided. Many inter-city rail routes, for example, have proven this and incredible progress in ridership has been realized.

*Revenue Sharing Formulas May Not Be the Answer*

Almost all highway assistance is provided to States based on a formula. Exceptions include the recently enacted trade corridor/border crossing, intelligent transportation system deployment, and transportation community and system preservation programs that are allocated on a national discretionary basis each year. Other exceptions are the regional Surface Transportation Program and Congestion Mitigation/Air Quality programs where project selection is the responsibility of metropolitan planning organizations. About two-thirds of transit assistance is provided to transit operators on a formula basis through their metropolitan planning organizations. About one-third is allocated on a national discretionary basis annually to start new and bus capital projects. Federal assistance must be directed toward solving problems in proportion to their severity.

RECOMMENDATIONS

*Encourage and Promote Flexible Funding Approaches*

Most Federal transportation programs pay for specific solutions; e.g., new highway lanes or transit new starts, rather than the best overall transportation solution for a given corridor. While ISTEA and TEA-21 included flexible funding programs like the surface transportation program and Congestion Mitigation/Air Quality programs with broad program eligibility, most Federal assistance is still provided on a mode-specific basis to existing road and transit providers. Furthermore in the first 4 years of the CMAQ program, it has managed a mere 57 percent obligation rate. This rate is troubling and is the worst of any of the core programs in TEA-21 suggesting that even when Congress provides tools to the States for metropolitan needs it has not merited enough attention to address the problem.

It is my belief that addressing congestion in the most strategic and effective way demands a comprehensive approach encompassing everything from improving operations to managing growth. Federal, State and local governments can no longer afford to view investments in metropolitan infrastructure in separate, distinct elements particularly when transportation infrastructure at the metropolitan level is far more complex and inter-modal than at the State or Federal levels. The very nature of a global economy and the need for our nation's metropolitan economies to stand up against their competitors around the world by definition necessitates comprehensive, strategic planning and ultimately targeted investments. Funding must be predicated on the notion that metropolitan governments in partnership with their constituents are most familiar with residential growth patterns, commercial development needs, freight mobility and the many other demands on local metropolitan areas. These demands must be dealt with in a cohesive fashion that allows for optimum flow and efficiency.

*Creation of a Metropolitan Transportation System*

Mr. Lomax's research has consistently shown that roadway congestion can be quantified through various research indexes to identify our nation's significant problem areas. According to his research, rush-hour travel in five regions—Los Angeles, San Francisco-Oakland, Seattle-Everett, the Washington DC Metro Area and Las Vegas—takes 50 percent more time than non-rush hour travel. Additionally, he indicates that drivers in the largest metropolitan areas spend about half of their driving time stuck in traffic, far more than drivers in medium and smaller sized metropolitan areas. This work of identifying our nation's significant problem areas must be advanced further.

I believe Congress should take the next step of calling for in the upcoming reauthorization the creation of a metropolitan transportation system that geographically defines the boundaries of metropolitan areas within which Federal transportation funds will be targeted. Similar in concept to the Federal Highway System or Interstate systems, planning and investments for major highways, regional arterials, bus and subway routes, local and inter-city rail, freight corridors, ferries, and other transportation modes such as air travel must be carried out as part of a comprehensive metropolitan transportation system. Congestion relief is of such an urgent and immediate nature, that a step of this magnitude is necessary and warranted. Some

of this work has already been accomplished through the work of Metropolitan Planning Organizations. We must find ways of furthering this work and aggressively infusing such metropolitan systems with the kind of strategic resource allocation that is needed.

*Creation of a Metropolitan Congestion Program*

Finally, it is time for Congress to create a Metropolitan Congestion Program that would funnel Federal dollars directly to the metropolitan transportation system. This Metropolitan Congestion Program should be sized at a minimum equal to the National Highway System Program which this year received nearly \$5 billion under TEA-21. I acknowledge the need for the next reauthorization bill to be crafted in a way that does not perpetuate a multiplicity of programs and perhaps this metropolitan program would encompass other programs in the current reauthorization bill originally intended to address congestion. However, at the local level, metropolitan organizations and governments in major urbanized areas are suffering from the lack of tools at their discretion. In fact metropolitan sub-allocations under TEA-21 are smaller as a percentage of total funding as compared to levels under ISTEA.

While land use, permitting and many other functions that involve growth planning, residential and commercial development are primarily the responsibility of these governments we are handcuffed by the lack of balance in matching infrastructure investments to support development planning. Transportation dollars that are funneled ultimately to local areas lack the clarity, transparency and precision in investment decisions that metropolitan governments are most appropriately situated to provide. I strongly advocate that the right and ideal place is in the metropolitan areas.

Over the past several months, I have begun to partner with colleagues around the country to form a metropolitan congestion coalition. The magnitude of these changes require the kind of bold, decisive leadership that our citizens deserve. The purpose of this coalition is to bring together metropolitan elected officials and business leaders in metropolitan areas to address these ideas for the reauthorization of TEA-21. We have to date been successful in our initial discussions around the country because the need is so evident. I have no doubt that you also recognize this need and I am hoping to partner with you during this reauthorization cycle.

I respectfully urge this committee to consider where transportation problems are most severe and the associated socio-economic consequences then to direct available Federal assistance to those areas proactively. In metropolitan areas and at all levels of government public resources are scarce. This only emphasizes the importance of greater discretion in funding decisions. We have strong decisionmakers in every metropolitan area who are first responders and are on the frontline helping to lead the economic engines of this Nation. The depth of this leadership capacity must be further utilized to propose and implement solutions that enhance vitality and energy in these regions. Congestion cannot be allowed to stand in the way.

Thank you, Mr. Chairman and members of the committee, for giving me this opportunity to share with you my views on the reauthorization of the Federal Surface Transportation Program.

---

STATEMENT OF ANTHONY DOWNS, SENIOR FELLOW, THE BROOKINGS INSTITUTION

My name is Anthony Downs, and I am a Senior Fellow at the Brookings Institution. I am the author of the 1992 book *STUCK IN TRAFFIC*, which deals with the causes of and possible remedies for peak-hour traffic congestion, and which I am now revising for a second edition. The views I state here are solely my own, and not those of the Brookings Institution, its Trustees, or its other staff members.

My comments will consist of a series of major points, with some supporting discussion of each. These points are focused on a realistic view of the nature of traffic congestion, both present and future, and what actions might be taken to relieve it.

*The Positive Social Function of Traffic Congestion*

Most people regard peak-hour traffic congestion as an unmitigated evil, but that viewpoint is incorrect. Congestion is a vital *de facto* device we use to ration the scarce space on our roads during periods when too many people want to use that space at once. In effect, congestion is a balancing mechanism that enables us to pursue many other goals besides rapid movement—goals American society values highly. Those goals include having a wide variety of choices about where to live and where to work, working during similar hours so we can interact with each other efficiently, living in low-density settlement patterns, and enjoying highly flexible means of movement—that is, private vehicles. The only other possible means of rationing

highway space when too many people want to use it would be (1) charging high tolls to keep many people off the roads then, which most Americans decisively reject because it would unduly favor the wealthy, or (2) spending enormously more money to build enough roads to handle all peak-hour traffic without delays. But that would require turning metropolitan areas into virtual cement slabs—which would be environmentally undesirable and prohibitively costly. Since we wisely reject those means of allocating road space, we must use delays from overcrowding in order to pursue the other goals we want to achieve. So congestion makes possible large-scale social benefits as well as the costs of delay on which most people focus when they think about it.

*Peak-Hour Congestion Is Inevitably Going to Get Worse All Over the World*

Because it performs a critical rationing function, traffic congestion is inescapable in large modern and modernizing metropolitan areas all over the world. In fact, it is certain to get worse in almost all of those areas, because populations are growing, and higher fractions of those increased populations will be using private vehicles for movement. So the biggest future ground transportation problem everywhere in the world will be coping with immense increases in the number of vehicles in use. In the United States, since 1980, we have added 1.2 cars, trucks, or buses to our registered vehicle population for every one person added to our human population. (This ratio was 1.49 to 1 in the 1980's, but declined to 1 to 1 in the 1990's.) In addition, we have increased the average number of miles each vehicle is driven each year. Hence total vehicle miles traveled increased by 72 percent from 1980 to 1998; whereas our total population increased by less than 20 percent.

In the 1990's, we added 32 million persons to our human population, and we may do so again in each of the next two decades. Unless American behavior changes radically, that means we will add as many as 64 million more vehicles to our registered vehicle population by 2020. Coping with the added traffic generated by this increase will be the main challenge to our ground transportation policy in the next two decades. Without doubt, traffic congestion will get worse because of these population dynamics.

*Peak-Hour Congestion Is Almost Impossible to Eliminate Once It has Appeared*

Once peak-hour congestion appears on a major roadway, it cannot be entirely eliminated by expanding the capacity of that road, though its duration can be reduced. That is because of the operation of the Principle of Triple Convergence. If the road's capacity is expanded, traffic at first moves faster on that road. But soon people realize this, and start altering their behavior. Drivers converge on the expanded road from other routes they have been using to escape congestion, from other times they have been using to avoid it, and even from other modes like buses or trains. Soon the increase in vehicles overloads the expanded road once again until traffic at the peak hour is moving no faster than before. True, the peak period may be shorter and the number of vehicles carried by the road each hour may be larger, since the road's capacity has been expanded. But traffic during the peak period will move no faster than before the road's capacity was increased. This means we cannot "build our way out of congestion" by expanding road capacity on crowded expressways or other key routes, once peak-hour congestion has appeared on them.

Another obstacle to "building our way out of congestion" is that expanded roads may attract more new development along their routes, generating more traffic than before the roads were expanded. This is particularly likely in fast-growing metropolitan areas.

*Yet American Society Will Need to Spend Heavily on Road Construction in the Future*

Though we cannot build our way out of existing congestion, large future spending on road capacity will certainly be needed for two reasons. The first is to maintain existing roads and bridges, many of which are in serious need of repairs. Existing roadways are almost certain to carry much more traffic in the future than any new roads built, since the former serve large already-existing population centers; whereas new roads will mainly serve lower-density growth areas. That makes improving existing roads a very high priority goal.

The second reason is to provide mobility for new-growth areas, most of which will be located on the peripheries of existing metropolitan regions. As settlements expand outward, new roads will be necessary to create mobility for their residents. Some advocates of "smart growth" argue that most future population increases should be accommodated by raising densities in already-built-up areas, rather than by expanding outward in more "sprawl." Some increases in density will probably occur. But residents of most American neighborhoods do not want higher densities and will resist them vehemently, as experience clearly shows. Therefore, the chance

that even a majority of future growth will occur through higher densities rather than through more outward development is very small. A lot more roads will be needed to provide mobility for residents of those new outlying areas.

*Emphasis on Measuring the Aggregate Costs of Congestion Tend to Exaggerate Its Pain*

The Texas Transportation Institute (TTI) has developed useful measures of traffic congestion, and changes in it over time, for a large number of major metropolitan areas. But the way these measures are expressed tends to exaggerate the amount of pain inflicted upon the American driving public. TTI estimates that the greatest annual delay from congestion in 1999 per person occurred in the Los Angeles region and equaled 56 hours; the average annual delay per person for 68 regions was 36 hours. 56 hours is a whole week of 8-hour days, and that certainly seems like a lot of wasted time. But when divided by 240 working days, and then by 2 for two trips per day, the average delay per person was 7.0 minutes per one-way commuting trip in the worst case (Los Angeles) and only 4.5 minutes for all 68 regions. When viewed this way, the “excess” time spent commuting does not seem so immense, though we all tend to remember the worst delays as being close to the average. This is the price we pay for rationing the scarce space on our roadways during peak hours so we can pursue all those other goals I mentioned at the outset of this testimony.

*Americans Strongly Prefer Moving in Private Vehicles to Using Public Transit*

Most Americans prefer using private vehicles for mobility instead of public transit because private vehicles have many superior traits. These include greater comfort, more flexibility as to timing, ability to perform several tasks on one trip, greater speed, more privacy, and—if parking is free—possibly lower costs. The average automobile commuting trip in 1990 was about 22 minutes; whereas the average bus commuting trip was 36 minutes and the average rail commuting trip was 45 minutes. Thus, any major shift from private vehicles to transit would increase the average amount of time spent commuting.

The strong preference among Americans for moving in private vehicles is shown by data from the 1995 nationwide Personal Transportation Survey. Over 90 percent of all work trips were in private vehicles, vs. 3.7 percent on public transit. (Since a large fraction of all public transit work trips are in New York City, if that city’s trips are removed, only about 2.2 percent of commuters outside New York City use public transit.) Counting all types of trips, 86.1 percent were in private vehicles, and only 1.8 percent on public transit.

Transit advocates have pointed out that transit usage has recently grown faster in percentage terms than miles driven in private vehicles. Therefore, in December 2000, the Surface Transportation Policy Project (STPP) claimed that “Growth in public transit exceeds growth in driving.” But transit usage is so tiny compared to driving that even very small percentage gains in highway travel involve vastly larger absolute increases miles traveled than much larger percentage gains in transit travel. In 1999, the year about which STPP said that “Growth in public transit exceeds growth in driving,” total transit travel grew by about 1.7 billion passenger miles. But car passenger travel grew at least 51 billion miles, and travel in all small private vehicles (excluding motorcycles and buses) increased at least 80 billion miles. Thus, the annual increases in highway passenger miles traveled in 1999 exceeded those in transit passenger miles by ratios of either 31 or 48 to 1. That hardly indicates that growth in transit was exceeding growth in driving!

*More Spending Is Needed for Public Transit Too—But Much of It Should Be for a Different Kind of Transit*

The nation’s public transit systems also need major future investments, but they should aim at making significant changes in the way public transit is provided. Future public transit expansion should focus on smaller-scale, more flexible, and less heavily regulated means of movement that are feasible for serving relatively low-density settlement patterns, which will remain dominant. Improving such forms of public transit will be vital in serving portions of the population unable to drive, especially the rapidly rising very elderly population. Major spending on fixed-rail systems, including light rail, is not likely to be very efficient at meeting our most pressing public transit needs. Moreover, expanding public transit is also not likely to reduce future traffic congestion much, if any. Some of the regions with very extensive public transit systems also have among the most intensive traffic congestion, including Washington, Boston, St. Louis, and San Francisco.

*How Could Future Traffic Congestion Be Reduced?*

What devices exist for improving future congestion levels—even though some worsening of congestion probably cannot be prevented? There are no total remedies, and not even many approaches that might slow down increases in future congestion. However, the following tactics seem the most promising:

- **Coping with Accidents and Incidents as Causes of Congestion Delays.** Many experts—including the TTI—believe accidents and incidents are the single most important cause of traffic congestion. Accident rates per 100 million miles driven have been steadily declining, partly because a higher fraction of traffic is occurring on better designed roads, especially interstate highways. But the absolute number of accidents has stabilized because of increased driving. Probably the most effective way of reducing accident-caused congestion on major roadways consists of faster removal of accidents from traffic lanes using roving teams of specialists controlled by traffic management centers. Many States already have created such centers, but their effectiveness could be improved with more sensors and more roving teams of obstacle removing specialists. This requires intensive coordination of police, fire, health-care, towing, and communications agencies in each jurisdiction.

- **Shifting Some Future Growth to Smaller Regions.** Multiple regressions based on TTI congestion measures show that congestion is most serious in the largest metropolitan areas, and those experiencing absolutely large amounts of population growth. Smaller areas are not as seriously affected by congestion even if they have high percentage growth rates. Hence one long-range offset to congestion would be shifting more population growth to smaller metropolitan areas. True, that is difficult to do through public policies. Most larger areas want to keep on growing, and they have important advantages of scale to attract future development. Yet any individual or organization extremely frustrated by congestion can greatly improve his, her, or its mobility by moving to a much smaller metropolitan area.

- **Using HOT Lanes to Provide Drivers on Congested Roads with a Fast Choice.** On already-heavily congested expressways, HOT lanes (High-Occupancy-Toll lanes) can offer a high-speed peak-hour mobility alternative to those drivers willing to pay tolls, without forcing all those not willing to pay tolls to drive at other times. HOT lanes accept both High Occupancy Vehicles (HOVs) and Single Occupancy Vehicles (SOVs) if the latter pay a toll during peak hours. The toll is variable, and it is set high enough to keep traffic on such lanes low enough to permit rapid traffic flow. This arrangement does not eliminate all congestion on such roads, but offers drivers a choice of rapid movement through paying high tolls or congested movement without tolls. Hence HOT lanes are politically superior to putting tolls on all the lanes in the roadway, which eliminates the choice of traveling without tolls on that roadway during peak hours. However, HOT lanes should be created only by adding new lanes to the roadway or converting HOV lanes, not by converting existing non-toll lanes to HOT lane use.

- **Metering Access to Expressways.** Metering entry-points onto expressways so as to slow entering flows appears to have some potential for increasing the average speed during peak hours, according to experience in Seattle. However, it may shift some previous congestion to lines of people waiting to get onto the expressways through the meters.

- **Adding Capacity at Specific Bottlenecks.** Where traffic flows suffer from definite bottlenecks, expanding the capacity of those bottlenecks might speed flows over the whole network of which they are a part. However, doing this is often difficult technically, and may be controversial as well. An example of both problems is the major traffic bottleneck created by the San Francisco Bay Bridge.

- **Moving Home and Job Closer Together.** One tactic an individual can use to cut commuting time is moving either home or job so they are closer together. This can be quite effective for one person, but may be difficult for a household in which more than one person works outside the home. It is also difficult in regions with very high housing costs, such as the San Jose and San Francisco areas.

*Get Used to Traffic Congestion*

No matter what public policies are adopted in response to future traffic congestion, it is likely to get worse in nearly all parts of the world. So my final advice is: Get accustomed to it. Commute in an air-conditioned car with a stereo radio, a tape deck and CD player, a hands-free telephone, a micro-wave oven, and a fellow passenger whose company you enjoy. Realize that congestion is providing benefits to you by rationing the roads you use and letting you pursue other goals besides rapid movement. In short, learn to treat being stuck in traffic as part of your normal leisure life, because it's here to stay.

 RESPONSES OF ANTHONY DOWNS TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* In your testimony, you restate in different terms the TTI estimate of delay from congestion, based on 1999 figures. At the hearing, Dr. Lomax of TTI gave updated numbers. Specifically, he testified that "The penalty [from congestion] in areas with populations between 500,000 and 3 million increased by 300 percent [since 1982] . . . Total hours in travelers in the[se] 76 [largest metropolitan] areas were delayed increased from 750 million in 1982 to 3.6 billion in 2000. Do you have any dispute with that testimony?"

Response. I have not analyzed the Texas Transportation Institute's (TTI's) method of computing hourly and dollar costs of congestion in detail, and I have great respect for Tim Lomax. So I have no reason to dispute his assertions about these costs.

*Question 2.* You testified that "the 'excess' time spent commuting does not seem so immense". In light of Dr. Lomax' testimony, what is your opinion of the real dollar cost in lost time and productivity, increased insurance premiums, auto maintenance, and collision repair for the average rush hour commuter in these 76 areas?"

Response. The reason I said that "the time spent commuting does not seem so immense" involves dividing TTI's estimates down to their daily impact upon individual commuters. For example, he says that "total hours of delay in the 76 largest metropolitan areas amounted to 3.6 billion in 2000." In 2000, the 76 largest metropolitan areas (MSAs only) contained 160,288,549 residents. In 2000, 46.8 percent of the population was employed. If that ratio were true in these 76 areas, that would be 75.015 million workers living there. If 90 percent drove to work, which is the national average, that would be 67.514 million auto commuters (not counting those on buses who would also experience congestion). Thus, 3.6 billion hours divided by 67.514 million commuters is 51.8 hours per commuter per year in 2000. But there are 240 working days each year, and 2 commuting trips per day. That is 480 trips for each commuter. 51.8 hours equals 3,108 minutes. That number divided by 480 equals an average of 6.48 minutes of delay per commuting trip. That does not seem nearly as immense a figure as 3.6 billion hours for the whole year, but it is the same number.

Furthermore, because people experience commuting delays a little bit at a time, it is not clear to me that they could make as productive use of this lost time as the totals might imply. 51.8 hours per commuter per year is more than an entire work week. But if you saved 6.48 minutes per trip each day, you would not have one block of more time equal to 51.8 hours to use—you would have 480 blocks of 6.48 minutes each. That is why I believe aggregating these numbers into totals exaggerates the real loss that people experience, and the alternate uses to which they could in theory put that time.

I cannot compute the "real dollar cost in lost time and productivity, increased insurance premiums, auto maintenance, and collision repair for the average rush hour commuter." However, I can tell you that the absolute number of automobile accidents in the United States has not risen much in recent years, in spite of large increases in vehicle miles driven. Thus, from 1990 to 2000, when vehicle miles driven in the entire United States rose by 28.6 percent, the absolute number of vehicles of all types involved in accidents increased by only 0.5 percent, and the number involved in fatal accidents declined by 3.7 percent. So I see no reason that commuting

has caused more collisions (since there aren't many more collisions) or higher insurance premiums or repair costs in the period from 1990 to 2000.

*Question 3.* Please quantify, with as much particularity as you are able, the detrimental impact on our environment (in terms of air quality in the nation's 76 largest metropolitan areas) of traffic congestion.

Response. It is impossible to quantify the detrimental impact of traffic congestion in air quality in the 76 largest metropolitan areas because that impact varies immensely from one region to another, and from one place to another within each region. Air quality is greatly influenced by local topography, local wind currents, and other factors that make any large generalizations about its overall reaction to commuting suspect. No doubt congestion does add to the pollutants in the air by keeping people in their cars with their motors running longer than they would be if there were no congestion.

But no large metropolitan area in the world can function efficiently without traffic congestion during peak periods. Traffic congestion is a necessary balancing mechanism in the efficient operation of modern life, which requires most people to work during the same hours so they can interact easily. Therefore, we need some way to ration the limited space on our roads among the many people who want to use them at the same time—far more people than they can hold simultaneously. There are only two other ways to ration that space: by charging money to enter it, and by building so many roads that everyone who wants to travel in peak periods can do so without delay. The latter is impossible as long as we all work the same hours, because it would be immensely costly and turn each region into one giant concrete slab. The former is not politically acceptable to Americans. Therefore, we have to have congestion to function efficiently, since that requires most people in each region to work about the same hours each day.

*Question 4.* Please describe, with as much particularity as you are able, what you believe to be an acceptable level of environmental impact, in terms of air quality, resulting from traffic congestion in the nation's 76 largest metropolitan areas.

Response. I am not an air quality specialist, so I cannot describe what is "an acceptable level of air quality" resulting from traffic congestion. However, I believe the current method of measuring air quality in individual regions is not reliable. As I understand it, a region's air is considered polluted if it violates pollution standards for a tiny percentage of all the observations made in that region during an entire year. But I leave this esoteric subject to specialists in the relevant regulatory agencies—especially the Environmental Protection Agency—who understand it better than I do.

*Question 5.* For those of us not so sanguine about traffic congestion as the view expressed in your testimony that "in effect, congestion is a balancing mechanism that enables us to pursue many other goals beside rapid movement", would you please describe, with as much particularity as you are able, all of the detrimental/deleterious effects to our society from traffic congestion?

Response. Congestion does cost people time lost sitting in traffic, but that is the price they are willing to pay for being able to pursue other goals they prefer over getting to work sooner. Those goals include having a wide choice of places to live and work, being able to perform more than one purpose on a single trip, working at the same time as other people for the efficient operation of the economy, buying lower-cost homes that are located far out, living in low-density settlements, and working in scattered low-density workplaces. If many people really placed a huge value on minimizing the time they spent commuting, they would move closer to their jobs, or take jobs closer to where they work, or move to smaller regions where congestion is low. Some do, but most do not because they still prefer pursuing other goals over minimizing their commuting time.

Congestion also increases air pollution and consumes more fuel than would be the case if there were no congestion. But we cannot live in large-scale settlements without peak-hour congestion, for reasons set forth above. If Congress were really interested in conserving fuel and reducing air pollution, it would substantially raise gasoline taxes, as most other developed nations have done. But Congress is clearly not very interested in reducing fuel consumption or air pollution if doing so would incur political costs, which it would because the members know that many Americans would object. Most Americans are not interested in reducing national fuel consumption or air pollution either—if doing so would cost them more, which it would.

Long congestion also makes people irritable and increases tension. This is more likely on days when congestion is unexpectedly long because of some unusual incident than on typical days, because people get used to their "normal" delays.

*Question 6.* In your testimony, you assert that we cannot "build our way out of congestion" because drivers will divert to newly expanded roads with better travel

times, or expanded roads may attract new development, thus generating more traffic. This phenomenon is often referred to as “induced traffic.” How would you describe the positive social benefit of “induced traffic” in terms of increased mobility or congestion?

Response. “Induced traffic” usually means that, if more roads are built, more development will take place along those roads, increasing the traffic flows on them. That is different from the “Principle of Triple Convergence,” which states that expanding the capacity of a freeway that is already experiencing peak-hour overloading will cause people who are already traveling in some other manner to shift onto the expanded freeway during peak hours from (1) other routes, (2) other times, and (3) other modes, such as transit. Such shifting will continue until the freeway is just as overloaded as it was before the capacity gain, although the peak period may be shorter and more cars will be able to move on the freeway during that period. Thus, “induced traffic” refers to the creation of additional traffic from people who are not present today; whereas the “Principle of Triple Convergence” refers to people who are already commuting but would rearrange their behavior in response to more freeway capacity.

“Induced traffic” is one way of looking at the result of building roads out into vacant land around a metropolitan area. The existence of the roads makes living in those now-vacant areas more convenient, thereby encouraging developers to build housing and other improvements along those roads. This provides a social benefit to the people who occupy that housing or use those other improvements. In fact, it is impossible to avoid creating “induced traffic” in areas experiencing rapid population growth, which usually occurs at the edge of each region. As more people occupy homes there, a need arises for more roads to serve them—as will surely be the case in the next 20 years in the U.S. But when those roads are built, that encourages still more people to move there. But, after all, those more people will have to live somewhere. “Induced traffic” is thus an almost inescapable accompaniment to population growth. Stopping “induced traffic” would require stopping most future growth, or at least growth in outlying areas. But that is not consistent with the likely future growth of the United States at over 1 percent per year.

Senator Smith’s questions display some frustration about the idea that congestion is a necessary and inescapable part of modern life in large metropolitan areas. But it performs a vital social function—that of rationing road space during peak hours. I sympathize with that frustration, which is only natural in light of increasing congestion. But alternatives to rising traffic congestion—such as road pricing or raising gasoline taxes sky high—are understandably unpalatable to Congress.

As our society gets more populous, our traffic congestion is going to get worse because we are not willing to adopt those measures that would prevent it from doing so. Most Americans accept rising congestion as better than those alternative measures, although they like to complain about the resulting congestion. But it is futile to rage against rising congestion if we are not willing to pay the price of adopting those policies that would prevent congestion from rising. The only other alternative is to halt the nation’s population growth. But we cannot stop babies from being born or people from crossing our border into the United States without also adopting policies that we do not regard as acceptable. So rising congestion is inescapable under present political and economic conditions. That is why I urge people to get used to it, and learn to enjoy it as best they can!

---

STATEMENT OF C. KENNETH ORSKI, EDITOR/PUBLISHER, INNOVATION BRIEFS

Mr. Chairman, members of the committee: My name is C. Kenneth Orski. I am editor and publisher of *Innovation Briefs*, a bi-monthly publication which has been reporting and interpreting developments in the transportation sector for the past 13 years. *Innovation Briefs*, I am pleased to say, has a wide and influential audience that includes congressional staffs, Federal, State and local transportation officials, newspaper editors, business leaders, association executives, and transportation professionals. My testimony today is based on observations acquired in the course of gathering and analyzing information for our publication. These observations draw on recent briefings and conference presentations, and on interviews and personal communications with members of the transportation community in Washington, and with State and local transportation officials across the country.

My overall conclusion is that we enter this reauthorization cycle with fewer issues that might divide the transportation community, and with a larger measure of a consensus among major stakeholders than at any other time in recent history. Unlike the last reauthorization cycle, when interest groups jockeyed for position and floated a number of competing proposals, this time around I find near-universal sen-

time that we ought to build upon the combined legacy of ISTEA and TEA-21 rather than engage in a bruising fight to reinvent the Federal surface transportation program. To be sure, there will be some proposals for changes, but these are likely to be refinements to program delivery rather than radical changes in the program structure itself.

Turning to specifics, I discern a large degree of consensus within the transportation industry and among major stakeholder groups on several policy directions:

*Protecting the Highway Trust Fund*

There is unanimous agreement, I believe, that the budgetary “firewall” protections and the principle of guaranteed minimum levels of annual spending should be preserved. At the same time, everyone recognizes that some refinements in the RABA formula will be necessary in order to prevent dramatic year-to-year swings in highway funding, such as occurred this year.

*Increasing Program Flexibility*

Similarly, there appears to be much support for greater program flexibility, i.e. giving Federal-aid recipients greater freedom to transfer funds between major programs and between sub-categories within programs. While a good deal of flexibility already exists, there is support for clarifying and enhancing this flexibility, perhaps by reducing the number of existing set-asides and sub-allocations.

*Congestion Mitigation*

Traffic congestion is viewed by all as a serious national problem that requires a national response. There appears to be a large measure of consensus within the transportation community that the response should include both capacity expansion and improvements in the operation of existing facilities—although opinions among stakeholders differ as to the proper balance to be accorded to these two major traffic mitigation strategies. My own belief is that, while operational strategies can help to some extent to reduce congestion due to accidents and vehicle breakdowns (the so-called “non-recurrent” congestion), only additional highway capacity, in the form of new lanes and design changes, can decrease or eliminate recurrent bottlenecks caused by too many vehicles trying to squeeze into too few highway lanes. Proponents of the “you-can’t-build-your-way-out-of-traffic-congestion” school of thought seem to ignore the fact that additional highway lanes, even if eventually they do fill up with traffic, help to accommodate increased population growth and economic development. After all, schools and hospitals in areas of rapid growth also eventually fill up with students and patients, yet this never has stopped us from building more schools and more hospitals to fill growing demand.

A comprehensive Federal attack on the problem of traffic congestion might take the form of a specific “bottleneck reduction” program (along the lines suggested by the American Highway Users Alliance), supplemented by a program of operational improvements designed to squeeze more capacity out of existing facilities. Bottleneck reduction can often be achieved without major new construction by eliminating the sources of traffic flow instability, such as inadequate acceleration and deceleration lanes, and lane constriction (e.g., three lanes of traffic funneling into two lanes.) Operational improvements would rely heavily on the application of advanced intelligent transportation system (ITS) technologies, to strengthen emergency response, improve detection and clearance of accidents (incident management), promote wider dissemination of real-time weather and traffic information to the traveling public, improve work zone management and establish more regional Traffic Management Centers.

*Environmental Streamlining*

Simplifying and accelerating the process of highway project review and approval is viewed as a critical priority by large segments of the transportation community. While current efforts of the Federal Highway Administration to streamline procedures through administrative action are commendable, the transportation community, I believe, is looking to Congress to provide more explicit legislative directions to reduce the delays that have plagued the project implementation process. Issues that call for congressional resolution include establishing uniform ground rules and timelines for dispute resolution; further reducing or eliminating the Federal review process for minor projects; setting maximum time limits for federally required reviews for major projects; clarifying responsibilities and requirements under NEPA in Section 4(f); and giving States and localities greater authority to sign off on environmental reviews through self-certification.

The environmental community’s position on environmental streamlining reforms is not clear at this time. To my knowledge, no overt opposition to expediting the project approval process has been expressed by environmental groups so far, per-

haps because transportation officials have been careful to stress that advocacy of environmental streamlining should not be construed as an attack on environmental values, and that project delivery can be streamlined without hurting the environment.

*Intelligent Transportation Systems (ITS) Program*

Continued Federal support of the ITS program remains a high priority for large segments of the transportation community. Specific objectives advocated by the ITS community include initiatives to encourage regional partnerships for coordinated ITS operations; deployment of ITS technology to enhance highway operations and to increase the efficiency and security of intermodal freight movement; and programs to expand freeway and arterial monitoring instrumentation in metropolitan areas (currently, only 22 percent of the urban freeway network and virtually no arterials are instrumented). Another frequently mentioned idea is the creation of a national "infostructure" network, capable of collecting and sharing transportation system condition and performance information covering the entire national highway system. Such a national communication network could become an integral and vital part of a homeland security infrastructure, available in times of national emergency for evacuation and mobilization purposes.

*Transit Issues: Bus Rapid Transit (BRT)*

Increased funding, especially for New Starts, is likely to dominate the transit industry's reauthorization agenda. According to the latest Annual Report on New Starts published by the Federal Transit Administration, there are some 50 rail projects in preliminary engineering or final design. These projects represent a potential demand of \$30–35 billion. Another several dozen projects, worth \$70–75 billion, are in the alternatives analysis stage. While the transit industry is not expected to seek funding for all these projects, this begins to define the level of future demand for new starts projects in the eyes of the transit community.

Carving out a bigger role for Bus Rapid Transit (BRT), which is now undergoing a series of demonstrations, could significantly reduce the need for transit capital funding. According to the General Accounting Office, Bus Rapid Transit shows promise of offering a level of service comparable to that of light rail transit (LRT) at a fraction of their cost (an average of \$9 million/mile for BRT vs \$34.8 million/mile for LRT—Report GAO-01-984). Many transit experts believe that Bus Rapid Transit could lead to a new generation of more flexible, less expensive New Starts.

*High Occupancy/Toll (HOT) Lane Networks*

However, for Bus Rapid Transit to offer service quality comparable to that of rail (and to make it eligible for New Starts funding) the buses must be able to run in reserved lanes that are congestion-free even in peak periods. This has led to proposals to convert and expand existing stretches of HOV lanes into seamless networks of high occupancy/toll (HOT) lanes in major metropolitan areas. The HOT lanes would be open to buses and carpools without charge and to single-occupant cars for a fee. By varying the fee according to demand with the help of electronic transponders (as is already being done on the I-15 HOT lanes in San Diego), the number of single-occupant cars seeking entry to the HOT lanes could be restrained to maintain free-flowing traffic conditions at all times, thus ensuring the integrity of the Bus Rapid Transit concept. Funds to develop and operate the HOT lane networks could come from a combination of existing Federal-aid highway funds, a New Starts BRT set-aside, and tolls collected from single-occupant vehicles using the reserved lanes.

Surveys of motorists on the SR 91 Express Lanes in Orange County show that people of all income levels choose to use the toll lanes when saving time is really important to them. Indeed, a utility van or a pickup truck is a far common sight on California's HOT lanes than a Lexus. A recent study of the High Occupancy/Toll lanes on I-15 north of San Diego indicates that public opinion strongly favors priced lanes that offer the option of a faster and more reliable trip. As existing urban freeways become more and more congested and as travel on them becomes increasingly slower and less reliable, I believe there will be plenty of people and businesses willing to pay for the privilege of traveling in congestion-free lanes. Such HOT networks would benefit not only individual travelers, freight movers and goods deliverers who need a fast and reliable way to reach their destination, but also users of general purpose lanes, which would become less congested as some traffic switched to the toll lanes. In my judgment, a congressionally authorized program of HOT Lane networks—built as enabling infrastructure for Bus Rapid Transit but also available as a paying option to individual drivers who seek a faster and more reliable trip—would be an eloquent expression of the increasingly intermodal nature of our Federal surface transportation program.

*“Essential Intercity Bus Services”*

While the subject of Amtrak and intercity transportation falls outside the scope of this hearing, there is one aspect of it that may be of potential concern to this committee. The restructuring of Amtrak and the potential abandonment of some of its unprofitable intercity rail corridors, may create serious mobility deficiencies in many communities across America. One solution would be to establish a network of intercity buses to take the place of the discontinued train services. The bus network would connect small towns and rural communities to regional airports and to transportation hubs in larger cities. The bus services could be run by private carriers and, where necessary, supported by Federal subsidy payments modeled after the congressionally authorized “essential air services” program (49 U.S.C. 41731). Essential air services have been maintained with Federal subsidy support at approximately 100 communities affected by airline deregulation. I believe a similar approach could restore mobility to hundreds of communities threatened by possible cutbacks in intercity rail service.

*Long Term Viability of the Trust Fund*

Finally, I detect a growing concern within the transportation community about the long term capacity of the Highway Trust Fund to finance the nation’s future transportation needs. The preponderance of opinion is that the growth in gasoline tax revenue will not keep pace with the rising demand and cost of highway preservation, reconstruction and rehabilitation. A growing use of ethanol-based fuels (its use jumped 28 percent in 2001) and the long range impact of hybrid and fuel cell vehicles is expected to further diminish the prospects for gas tax revenue sufficiency. In the short run, shifting ethanol tax receipts from the general fund to the Highway Trust Fund might ease the situation somewhat. But looking beyond the next reauthorization cycle, we may have to consider entirely new approaches to Federal transportation program financing. Hence, I join other transportation leaders in urging a congressionally mandated study to explore alternative financing mechanisms that would offer a stable and adequate long-term source of transportation financing.

This concludes my testimony. Thank you for the opportunity to present my views.

---

 RESPONSE OF C. KENNETH ORSKI TO ADDITIONAL QUESTION FROM SENATOR SMITH

*Question.* Would you please discuss in greater detail your thoughts on HOT lanes. What I am most interested in are your thoughts as to how such a concept can be employed on a nation-wide scale in our bill next year reauthorizing the Highway Trust Fund and surface transportation programs.

Response. HOT Lanes and Bus Rapid Transit are two key ideas on which we should build a new urban transport policy for the 21st century. The first offers urban motorists an option of faster, congestion-free travel, while the second promises effective mass transit service at a fraction of the cost of new rail starts. Combined, they offer a powerful new approach to improving urban mobility.

*HOT Lanes*

High-Occupancy/Toll (HOT) lanes are limited-access lane which high-occupancy vehicles (carpools and buses) are allowed to use for free while other vehicles gain access to them by paying a variable toll. The lanes are “managed” through pricing so as to maintain free-flow conditions even during the height of rush hours. HOT lanes have been in operation for several years in Orange County (the SR91 Express Lanes) and San Diego County (converted HOV lanes on I-15). More than a dozen other HOT lane projects are in the planning process in places like Dallas, Denver, Houston, Miami and Silicon Valley. HOT lanes have been endorsed by the Environmental Defense Fund and other environmental groups as an innovative transportation concept that offers benefits to all users of a congested corridor—carpoolers and transit riders as well as automobile users.

*Bus Rapid Transit*

Bus Rapid Transit (BRT) refers to high-capacity bus transit along major corridors, aiming to match the capacity and level of service of rail transit while adding the inherent flexibility of buses. For Bus Rapid Transit to offer service quality comparable to that of rail, buses must be able to operate in limited access, congestion-free lanes. The best examples of high capacity BRT systems are Curitiba, Brazil and Ottawa’s Transpo where buses travel on separate dedicated busways. In the U.S., bus rapid transit, as currently promoted by the Federal Transit Administration, includes express-bus service on major streets with traffic-signal preemption, on exclu-

sive bus lanes on arterials, and on freeway HOV lanes. The metro area that has done the best job marrying express buses with HOV lanes is Houston.

Carving out a bigger role for Bus Rapid Transit (BRT), which is now undergoing a series of demonstrations, could significantly reduce the need for transit capital funding. According to the General Accounting Office, Bus Rapid Transit shows promise of offering a level of service comparable to that of light rail transit (LRT) at a fraction of their cost (an average of \$9 million/mile for BRT vs \$34.8 million/mile for LRT—Report GAO-01-984).

BRT is rapidly picking up support within the transit community, which realizes that only a small number of communities have the fiscal capacity to support costly rail projects and that the Federal New Starts program can only fund a small fraction of the rail candidate projects. Bus Rapid Transit is seen as ushering in a new generation of less costly New Starts and extending the benefits of rapid transit to a much larger number of communities. In the San Francisco Bay Area, both the Metropolitan Transportation Commission and the grass-roots Bay Area Transportation and Land Use Coalition have been advocating much greater use of express buses as an alternative to multi-billion dollar rail-transit expansion.

#### *HOT Networks*

Instead of building isolated HOV or HOT lanes on a handful of freeway segments, the new strategy would involve creating seamless, region-wide networks of HOT lanes, including connectors at major freeway interchanges. A metro-area-wide HOT Network could remain congestion-free at all times thanks to variable pricing. The HOT network would become, in effect, a system of fixed guideways for high-speed BRT, giving express buses a speed advantage over buses using congested freeway lanes. At the same time, the HOT network would provide a faster travel option for motorists for whom time savings are really important. Tolls would be debited electronically from the users' smart cards, thus doing away with toll booths and cash transactions. Funds to develop and operate the HOT lane networks could come from a combination of existing Federal-aid highway funds, a New Starts BRT set-aside, and local funds in the form of tolls collected from single-occupant vehicles using the reserved lanes.

#### *Equity Issues*

Some people have questioned whether solo motorists should be allowed, as a matter of public policy, to "buy their way out" of congestion. Surely, the answer must be "yes". There is nothing intrinsically unfair about paying for access to a higher level of service in our market-based economy. After all, money buys better service in every other aspect of our lives, including transportation. We pay higher prices for first class travel in planes. Door-to-door taxi service costs more than slower and less convenient public transportation. Even Amtrak, a publicly supported carrier, offers different classes of service. Why, then, should we insist on having a one-size-fits-all level of highway service?

Nor is it just the highly paid professionals that would benefit from priced lanes, but anyone for whom time is a precious commodity. That includes many ordinary people, such as workers whose job depends on always being on time, parents racing to get to a daycare center before the late fee kicks in, and repairmen anxious to fit in one last appointment in a busy day. Surveys of motorists on the SR 91 Express Lanes in Orange County, CA show that people of all income levels choose to use priced lanes when saving time is really important to them. Indeed, a utility van and a pickup truck are a far more common sight on California's HOT lanes than a Lexus or a BMW.

A new study of the High Occupancy/Toll lanes on I-15 north of San Diego indicates that public opinion strongly favors priced lanes that offer an option of a faster and more reliable trip. A survey conducted by Wilbur Smith Associates in the fall of 2001 found that, by a 91 percent to 7 percent margin, I-15 users think it's a good idea to have a timesaving travel option. Surveys in Washington State have reached similar conclusions.

This suggests that paying for the use of lanes (or roads) that offer a premium level of service may become an accepted practice in the years ahead. As existing urban roads become ever more congested and as highway travel becomes increasingly slower and less reliable, there will be more and more people and businesses willing to pay for a chance to travel on congestion-free lanes.

In sum, the HOT Networks approach presents a situation where everyone wins. Transit riders would win because many cities that could not justify or would not qualify for new rail starts, would be able to implement effective region-wide express bus service. Individual motorists would benefit by having the option of faster and more reliable travel on a network of congestion-free lanes when saving time is really

of importance to them. Users of regular lanes would gain because regular lanes would become less congested as some motorists switched to the toll lanes. And, importantly, HOT lanes would provide a revenue stream that could be used to finance the local share of the cost of new lanes.

A congressionally authorized program of High Occupancy/Toll (HOT) networks—built to benefit motorists and transit users alike—would constitute an eloquent expression of the increasingly intermodal nature of our Federal surface transportation program.

Note: an in-depth study of HOT Network feasibility is currently underway at the Reason Policy Institute under the direction of Robert Poole, the Institute's Transportation Director. The study is expected to be completed in early autumn.

---

RESPONSES OF C. KENNETH ORSKI TO ADDITIONAL QUESTIONS FROM SENATOR GRAHAM

*Question 1.* Constituents are frustrated with ITS Message Boards that merely flash the news “Congestion Ahead.” What have been the best examples you’ve seen of information sharing to commuters that was time—sensitive and meaningful?

Response. I share your constituents’ frustration with meaningless (“Have a Nice Day”) or obvious (“Congestion Ahead”) messages on electronic variable message boards. In partial defense, let it be noted that, because of their relatively small size, there is not enough room for detailed, informative messages. However, a far better job of informing the traveling public is done on the Internet, where web sites run by State and local transportation agencies display color-coded maps indicating up-to-the-minute levels of congestion on the highway network. Many such web sites also provide camera images of congestion “hot spots,” alert motorists about work zones and lane closures, and give estimated trip time between origin-destination pairs on the highway network. Good examples of effective traveler information web sites are those of the city of Houston ([traffic.tamu.edu](http://traffic.tamu.edu)), the Washington State DOT ([www.wsdot.wa.gov/traveler](http://www.wsdot.wa.gov/traveler)) and the Arizona State DOT ([www.azfms.org](http://www.azfms.org)).

The obvious weakness of the Internet as a medium of time-sensitive traveler information is that the information can only be accessed before getting into the car. Since traffic conditions can change rapidly, such “pre-trip” information is often out of date by the time the motorist reaches a reported scene of an accident or congestion bottleneck. This explains the continued popularity of “drive-time” traffic reports on the radio. Despite their alleged shortcomings (spotty, not frequent enough, covering only key corridors) commercial broadcasters still do the best job of keeping drivers currently informed of traffic conditions and incidents. This may change in the years ahead, as cars become equipped with wireless telematic terminals that can display Internet-based messages and congestion maps. A widespread use of in-vehicle telematics, however, is still 5–10 years away, according to industry estimates.

*Question 2.* I have been concerned that the ITS deployment money in Transportation Appropriations has recently been focused on areas that are not identified in TTT’s list of most congested cities. Your testimony mentions that only 22 percent of the urban freeway network is instrumented—do you share the concern that we have a lot more research to do in urban use of ITS?

Response. The fact that only 22 percent of the urban freeway network (and hardly any urban arterials) has been instrumented can be attributed to several factors: the high cost of installing electronic detection equipment (loop detectors, optical sensors, “radio cameras”, closed circuit video cameras, etc); the tendency to spend available Federal money on elaborate Transportation Management Centers rather than on roadway instrumentation; the desire to promote rural as well as urban applications of ITS; and a reluctance by local and State governments to give priority to ITS implementation given the many other demands on their highway resources. I agree that highly congested urban areas deserve priority attention in the allocation of scarce Federal ITS deployment funds—because that’s where the potential payoff for ITS clearly is the greatest.

---

RESPONSES OF C. KENNETH ORSKI TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question.* In your oral testimony, in summarizing the “policy directions and new initiatives” for reauthorization that enjoy widespread consensus among stakeholders, you include “the need for increased flexibility.” Would you elaborate on this. In what respects is the current program insufficiently flexible? How would increased flexibility influence outcomes?

Response. While there already is considerable freedom to move funds within the Federal-aid highway program and between highways and transit, we do continue to hear calls for more flexibility. The calls come primarily from those who would like to see an end to most categorical set-asides and congressional earmarks, on the theory that set-asides and earmarks deprive State and local decisionmakers of the flexibility and discretion to allocate resources according to their own notions as to where the resources can do the most good. While one can take issue with this position, the fact remains that calls for “greater program flexibility” can be found in a number of reauthorization-related position statements, among them, those of APTA (“preserve and enhance the flexibility for highway and transit programs . . .”); AASHTO (“encourage greater flexibility in transferring Federal funds”); ARTBA (increase flexibility within the Surface Transportation Program); and STPP.

*Question 2.* Your analogy between hospitals and roads assumes that the objective is both health care and transportation is to meet an ever-increasing demand that is based solely on population growth. The trouble with this analogy is that the need for hospital beds, or roads, is not primarily based on population growth, but depends on many other factors. In health care, the level of general public health determine how many people need hospitalization.

Response. In transportation, the general accessibility level of the community helps determine whether people need to drive to reach every destination. In fact, what we are seeing is a growth in driving that is far outpacing population growth. For example, Texas Transportation Institute figures show that in Atlanta, the population grew 36 percent between 1990 and 1999, while the amount of driving grew by 64 percent. The distance driven by the average American in that time period increased by 24 percent. If more roads are not inducing more travel, what is the cause of this impressive increase in driving?

In my testimony I stated that “proponents of the ‘you-can’t-build-your-way—out-of-traffic-congestion’ school of thought seem to ignore the fact that additional highway lanes, even if eventually they do fill up with traffic, help to accommodate increased population growth and economic development.” There are, of course, other factors, besides population growth, that have contributed to the rapid increase in vehicle-miles-of-travel (VMT) in recent times. For example, according to the 2000 Census, metropolitan densities have dropped by more than 20 percent nationwide between 1982 and 1997 and this has led to a greater dispersal of homes and jobs, and longer commutes. Of the 281 metropolitan areas in the Nation only 17 have become more dense during the decade of the 1990’s; all the other 264 metro areas have decentralized, according to the 2000 Census. Another factor responsible for a rapid increase in VMTs is the growth of two-worker households. Today, chances are that both the husband and the wife drive to work, thus doubling the work-related VMTs of “traditional” households of an earlier era.

However, work trips are not solely responsible for the dramatic increase in VMTs. After all, they only constitute about 25 percent of total daily travel. Personal business trips, shopping and social/recreational trips have actually experienced a more rapid growth. Both types of trips are a reflection of a higher rate of economic activity, a rising standard of living and their high contribution to VMTs is a function of the dispersed housing location which cannot be easily served by public transit.

Like hospital beds and school classrooms, roads fill up because of many other factors besides population growth. But, while we are not reluctant to meet growing demand for hospital beds and classrooms, we seem to apply a different standard to meeting highway demand.

---

STATEMENT OF FREDERICK SALVUCCI, CIVIL ENGINEER SPECIALIZING IN TRANSPORTATION, WITH PARTICULAR INTEREST IN INFRASTRUCTURE, URBAN TRANSPORTATION, PUBLIC TRANSPORTATION, AND INSTITUTIONAL DEVELOPMENT IN DECISIONMAKING.

*Biographical Sketch*

Most of his career has been in the public sector, having served as transportation advisor to Boston Mayor Kevin White between 1970 and 1974, and then as Secretary of Transportation of the Commonwealth of Massachusetts under Governor Michael Dukakis between 1975 and 1978 and again from 1983 to 1990. In those roles he has participated in much of the transportation planning and policy formulation in the Boston urbanized area and the Commonwealth of Massachusetts over the past 20 years, with particular emphasis on the expansion of the transit system, the development of the financial and political support for the Central Artery/Tunnel Project, and the design of implementation strategies to comply with the Clean Air Act consistent with economic growth. Other efforts include the extension of the Red Line in South Quincy and Alewife, the relocation of the Orange Line in Boston’s

Southwest Corridor, the acquisition and modernization of the Commuter Rail Network, the restructuring of the MBTA, the formulation of noise rules to halt the increase in aircraft noise at Logan Airport, the development of strategies to achieve high speed rail service between Boston and New York, and the planning for the redevelopment of the Park Square section of Boston through the location and construction of the State Transportation Building there.

More recent activities have included participation in a restructuring of commuter and rapid transit services in Buenos Aires, Argentina, using concession contracts with private-sector companies (the new system has improved both efficiency and effectiveness); participation with the Volpe Center in a review of the transportation planning process in US metropolitan areas of over 1 million people, and participation in an innovative research and educational collaboration with the University of Puerto Rico and the Puerto Rico Highway and Transportation Authority, focused on the development of a new transit system for San Juan, Puerto Rico. The project, called *Tren Urbano*, is the first design-build-operate system in the United States. Mr. Salvucci is also a key participant in a new major MIT research project with the Chicago Transit Authority, patterned on the *Tren Urbano* program.

Mr. Salvucci teaches courses in Urban Transportation Planning, Institutional and Policy Analysis, and Public Transportation. He attended MIT as both an undergraduate and graduate student of Civil Engineering, earning his Bachelor of Science in 1961 and his Master of Science in 1962. International education includes a year at the University of Naples as a Fulbright Scholar from 1964 to 1965, studying the use of transportation investment to stimulate economic development in high poverty regions of Southern Italy.

#### *Introduction*

First, let me thank the committee for the extraordinary opportunity to participate in your consideration of the needs to be addressed in the process of reauthorization of Federal Surface Transportation Funding. Let me share with you my views on some key emerging issues, based on my experience as a City and State transportation official in Boston, Massachusetts, and more recently as an academic researcher at the Massachusetts Institute of Technology.

#### *A. Emerging issues*

As we anticipate the reauthorization process for the surface transportation bill, I believe this is a useful time to step back and re-examine the evolution of the Federal program since 1956, and the changing needs of the Nation.

The initial impetus of the program, to create a national highway infrastructure, has substantially been accomplished. The mechanism of high Federal matching ratios for capital investment, stable and reliable funding, clear Federal policy guidelines, and implementation decentralized to the State government level, has been very successful at creating an ubiquitous high-quality highway network. As this primary objective has been substantially achieved, the program has evolved to include funding for complementary modes such as transit and the urban system, and to issues of management of operations and maintenance (ITS). These shifts have required more complicated planning and environmental procedures and institutional requirements, with transit authorities, metropolitan areas and cities, and sister agencies with environmental and public health responsibilities, playing important roles, in addition to State highway departments. Persistent issues of congestion, especially in suburban areas, continue to generate intractable problems at the interface of transportation performance, economic growth, land use, and environmental quality. Moreover, as the system ages, deteriorating physical condition of old infrastructure gives rise to the need for reconstruction, or redevelopment of old urban infrastructure in complex urban environments. The Big Dig in Boston is perhaps an extreme example of the cost and complexity of this challenge, and is indicative of challenges ahead in a very large number of urban areas. The need to renew and expand the bridges and tunnels that serve Manhattan, compounded by the tragedy of September 11, is perhaps the most vivid example, but dealing with the earthquake damaged infrastructure in West Coast cities such as Seattle is likely to be similarly challenging. The vulnerability of the air traffic system exposed by the September 11 tragedy was already becoming obvious because of the growing airport congestion, and poses the question of the need for complementary intercity rail services and improved "ground access" to airports.

Finally, the unglamorous question of proper maintenance of the existing highway network is perhaps becoming more important to the national interest than the further expansion of the network.

I believe that our democratic political system will and should translate these emerging problems into a demand to be as innovative and creative with new national initiatives as were the founders of the Interstate system.

My suggestions to anticipate and deal with these emerging issues are these:

(1) Establish a new program to federally fund the cost of operating and maintaining the existing national highway system, with clear Federal guidelines and policies for planning, but a decentralized structure to allow local flexibility for implementation. A pay-as-you-go incentive of 1/3 Federal, 2/3 State funding would, in my judgment, be adequate to create substantially more attention and sophistication to this unglamorous but vital activity.

(2) Develop a new category of funding for the rebuilding and redevelopment of old infrastructure and mega-projects. This will be a very expensive undertaking, but one that is essential to the economic health of the Nation. It will require high Federal matching ratios to be affordable at the State and local levels, and will require planning and financial mechanisms similar to those of the Interstate program. Early costs are likely to be modest because of the long lead times often involved, and some national planning will be required to even develop realistic national cost estimates.

(3) Develop a new initiative to prioritize access to airports, particularly for truck movements which are increasingly trapped in congestion, with severe economic consequences. Again, the early costs are likely to be modest because of lead time, but eventual costs will be high, and require high Federal matching ratios.

(4) Develop a new program to provide Federal funding for improved paratransit services. The dramatic growth in the aging population is creating a mobility demand far in excess of the "interim" services for the elderly and disabled provided by transit authorities for systems which are not fully accessible. The growing need extends well beyond the extent of many transit providers, and as transit systems become physically accessible they could theoretically withdraw the current limited services. To deal with this emerging issue at an adequate level requires that it be viewed as a responsibility of the entire transportation system (not just inaccessible public transportation systems) and that it receive reliable Federal funding, not be imposed as an unfunded Federal mandate. A 50-50 Federal share of costs is probably adequate to motivate the level of effort required, but the unserved need is great and growing, so the (Federal and State) funding needs will grow substantially as organizational capacity to serve the need improves.

(5) Understand and anticipate increased funding requirements for complementary systems such as transit, intercity rail, elderly and disabled access, and recognize that aviation funding authorizations will be considered in the same timeframe as surface transportation reauthorization.

#### *(B) Implementation Considerations*

For all of these emerging needs, an expanded and restructured financial base will be required, and it is important to consider the political and financial context of reauthorization.

The Federal role in transportation has been evolving based on a combination of three factors:

- (1) the changing needs of the Nation as a whole,
- (2) The narrower needs of the transportation public agencies at the State, metropolitan, and local level, and
- (3) the needs of the transportation construction industry whose economic viability is strongly affected by Federal transportation authorizations and appropriations.

In many ways the evolution of the Federal program has been shaped by these three forces, particularly in the recent history of the program (1990 to the present), and the challenge facing the re-authorization process of 2003. In order to balance these three considerations, the Congress has periodically increased Federal funding through increases in the gasoline tax so that "new" issues can be addressed without weakening existing programs, but the President appears unlikely to support this approach in 2003.

I believe that the successful balancing of these three considerations in 2003 could best be achieved by reconsidering three major features of the Federal program:

- (1) If the pay-as-you-go philosophy, established by Eisenhower, were partially replaced by a capital budget bonding approach, similar to that used by every State government, the existing tax revenue streams could support a major expansion of program to meet changing national needs and allow expansion for all transportation agencies and the transportation construction industry, while deferring the need to increase gasoline taxes. If one-third of the existing revenue streams were to be used for debt service, the program size could expand, so that over the next 6 years, instead of approximately \$145 billion it would be possible to invest approximately \$175 billion, approximately a 20 percent increase. While OMB would oppose this

possible change (as it has in the past) it would have major economic benefits to the Nation by allowing increased investment now, producing both short-term economic stimulus, and long-term economic growth, within the existing tax constraints.

(2) If the State and local matching ratios were increased beyond the 20 percent ratio now favored, national program size would increase, and State and local accountability would grow, easing the burden on Federal oversight somewhat. Traditional thinking has favored very low State and local matching ratios based on the precedent of the 90/10 ratios of the Interstate highway program and the strength and popularity of that program, and the very simple political task of building State and local political will to raise 10¢ to attract 90¢. But it is still a bargain to raise 33¢ at the local and State level and get 67¢ from the Feds, and you “leverage” a somewhat larger program, with more fiscal discipline at the State and local level.

(3) If the focus of the Federal role were shifted from capital investment to include a larger component for operation and maintenance, the effectiveness and efficiency of the overall program would increase. An extremely large and extensive highway network has now been created, but the operation and maintenance of that system is often inadequate and inefficient. The “new” capital needs are increasingly to rebuild older parts of the system which have deteriorated from decades of inadequate attention to operation and maintenance.

Modification of any one of these three features alone is very difficult, but a combination of the three could make it possible to deal with both pressing “new” initiatives such as elderly and disabled needs, environmental concerns, very expensive reinvestment and renewal needs, and increased levels of funding for operation and maintenance as well as continuing existing programs, allowing all major players to “win” without a tax increase during the near-term future.

The current situation, with gasoline tax revenue estimates low, has created multiple political problems. Highway appropriations have been cut, and the beginning point for the reauthorization is lower. In a policy area with increasing claims, a “growing pie” is essential to accommodate new interests without damage to long-standing constituencies. A “shrinking pie” is a disaster. This political problem could produce the political will to partially shift to a capital budget approach, which could produce growth rather than shrinkage, and allow the Congress to better deal with emerging issues.

ISTEA began a process of introducing operation and maintenance themes into the program through its management reporting systems and “flexibility”, but these have not been fully embraced by the States because the management reporting requirements were often treated as perfunctory paperwork, and flexibility requires shifting money away from some traditional activities. This proposed new combination would allow introduction of funded operation and maintenance activities (perhaps at “low” 30 percent match) that would produce the carrot for real operation and maintenance reform, without sacrifice of capital investment, and could really continue, deepen and consolidate the new initiatives of ISTEA while respecting the continuing need for new investment (and the economic and political importance of the construction industry). It could also prepare the capacity to deal with major national infrastructure rebuild issues such as Manhattan Post-9/11 and (to extrapolate to the aviation re-authorization process) large reinvestment projects like the proposed restructuring of O’Hare Airport.

*(c) Some additional clarification of conceptual proposals*

Let me provide a little more explanation of the new program initiatives I proposed earlier.

(1) Operations and/or Maintenance Funding

Such an extensive highway and transit system has now been built that the use of what we have, and its proper maintenance, is more important to performance of the overall system than the addition of a new link. Yet in spite of the importance of maintenance and operations, and the system management requirements of ISTEA, maintenance and operations continue to be treated as afterthoughts, with sporadic attention and funding. Most State transportation systems continue to focus on facilities, not the operation of the system, and new construction continues to be the most visible activity. This is partly institutional; these agencies tend to be dominated and led by civil engineers (like myself) who like to build things, especially new things. New construction is exciting, highly visible, expensive, and federally funded, so there is a lot of attention to doing the job right (and less attention to asking if we are doing the right job). In these organizations there is often high capacity to design and manage the construction of new facilities coexisting with underfunded and poorly managed maintenance, so that facilities require reconstruction because of deferred maintenance. Traffic operations is often viewed as less exciting, or important, and is reactive. Very little attention is given to protecting existing ca-

capacity and safety through acquisition of development rights, so we see sprawl development eroding highway capacity, as well as environmental quality. In order to transform this institutional landscape into one where improved mobility and accessibility are the primary objectives, and sophisticated management of facility maintenance is available to serve the accessibility mission (while retaining capacity for excellence in the design and construction of new facilities or the redevelopment of obsolete facilities), it is necessary for Federal leadership to adequately fund maintenance and operations activities and provide support for research and management improvement. Steady reliable Federal funding, even at modest ratios such as 30 percent, will serve to protect O&M budgets from the vagaries of local budget fluctuation, and allow this transformation to occur.

(2) Rebuilding, redevelopment of old infrastructure and mega-projects.

I believe that there is a large backlog of aging infrastructure in most metropolitan areas which badly need to be renewed, replaced, redeveloped, or augmented, but which are systematically under prioritized in the planning and procurement systems in metropolitan areas. Often these facilities are seen as lower priority because they already exist. In addition, they are often intensively utilized, creating dramatic problems of maintenance of traffic during construction, so agencies may tend to postpone projects that will be very difficult to manage and politically unpopular. The environmental processing of redeveloping and/or replacing old, heavily used facilities can be complex and time-consuming, and the high cost and "lumpiness" of these can be very difficult to deal with in an MPO process, because they often require a large share of available funds on one project in a small geographic areas over multiple years. The combination of competition for resources from other projects, the difficulty and potential political unpopularity, and large funding requirements make these difficult to achieve, yet they are crucial to the future viability of many of our major metropolitan areas.

I believe that some protection from competition, through dedication of Federal funds at high Federal ratios, is essential to mitigate a tendency to avoid these challenges, with long-term destructive impact on accessibility and economic performance.

There are often suggestions that simplification of environmental procedures would expedite these and other "mega-projects." I believe this is a dramatically mistaken view. First of all, the complexity of the environmental process is a reflection of the real impacts that redeveloping our infrastructure will have, on both traffic and the environment. Moreover, old infrastructure problems are often seen as the occasion to reconceptualize the facility and its relationship to the environment, not simply "rebuild" it. Indeed, if we do not want our regions to become a form of "petrified wood," locked into hundred-year-old patterns, reconceptualization is an appropriate and essential activity. Developing public understanding and participation in this process is desirable and necessary, and I believe the environmental process is a useful way to organize this essential participation. Given the political importance of the environmentalists rather than picking a fight, I propose that we should strengthen the enforceability of environmental commitments. More fundamentally, the real delays in implementation do not come from legitimate environmental process so much as from lack of available funding, "predatory" competition for funds, and agency reluctance to implement these difficult projects. Attempting to reduce environmental process is likely to simply increase the political unpopularity of these projects and exacerbate the real problem, which is competition for limited funds. Creating an adequately funded, high Federal matching ratio, dedicated funds for these "mega-projects" would deal directly with the real problem which inhibits dealing with this category of issues. In addition, increased Federal capacity for technical support and oversight of these projects is needed. I believe that the FTA Project Management Oversight program which uses expert consultants responsible to FTA to help oversee these unique projects is a good model. New York's West Side Highway collapsing without real replacement, and the redevelopment of Boston's Central Artery as a depressed highway, at very high cost, are good examples of the range of possibilities, and the importance of this issue.

(3) Airport Access

This represents another category of accessibility likely to be very important to the economy, but underprioritized in the metropolitan area process. Airports and the aviation industry zealously oppose any idea of responsibility to deal with landside access. Additionally, port authorities tend to make money from parking and rent-a-car revenues, leading to a lack of advocacy or even support for improved public transportation access to airports. Truck access to airports, presumably very important for high-value goods, generally receives no particular attention. In the competition for scarce funds at the metropolitan area level, airport and other intermodal access is often a bit of an orphan (similar to rebuild and mega-projects). Again, a

separate high Federal matching ratio dedicated fund for airport and intermodal facilities could help ensure adequate attention to this important area. Since the reauthorization of aviation funding is under consideration by Congress at the same time as the surface transportation authorization, it should be possible to introduce symmetrical provisions in the aviation reauthorization to create some responsibility and funding to prioritize landside access. If some matching share from the airport proprietor were required to access dedicated surface transportation funds for airport and inter-terminal access, an incentive could be created to encourage a more proactive attitude by airport operators.

(4) Elderly and disabled paratransit services.

Currently, most paratransit services for the elderly and/or disabled population are provided by public transportation providers whose fixed-route services have not yet achieved full ADA accessibility. There are several problems inherent in this situation:

a) Funding the paratransit service competes directly with funds to operate fixed-route bus and rail services, and weakens fare recovery ratios. (Paratransit fares typically cover only 5–10 percent of operating costs.)

b) This leads transit providers to consider the paratransit an “unfunded Federal mandate,” and provide paratransit service of lower than desirable quality, and (because of budget and fare-recovery ratio constraints) reduce fixed-route service.

c) As fixed-route service comes into compliance with ADA, the legal obligation to provide paratransit service is removed, but approximately 50 percent of the clients cannot really use “accessible” fixed-route service, creating a potential crisis.

d) Outside of fixed-route transit districts, paratransit services are less available.

e) The aging population, some of whom should not drive but still need mobility, is growing dramatically.

For all of these reasons I believe we should recognize that we are dealing with a problem of access to society, not access to fixed-route systems, for growing numbers of people, and that this is a transportation system responsibility, to be funded (at a 50–50 level) by Federal funds with Federal planning and service characteristics, in order to provide reasonable access and mobility to the full population. This could be a building block toward creating institutions focused on mobility and accessibility rather than exclusively on facilities.

(5) Intercity rail and bus services to complement aviation in the aftermath of 9/11.

Partly because of the ongoing fiscal problems of Amtrak, partly because of the increased aviation travel times caused by the increased security in the aftermath of 9/11, intercity rail and bus facilities are likely to be seen as increasingly legitimate claimants for a share of transportation funding. While this will raise complex institutional issues which neither States nor MPOs are perfectly suited to encompass, I believe there is legitimacy to the public claim and that it would be prudent to anticipate a need for a new funding initiative here, at least for capital.

(6) Implementation of reauthorization.

Again, given the combination of legitimate increased public claims for participation, the reduced level of gasoline tax receipts, and the likelihood of great resistance to increasing the gasoline tax before the next election, and that the historic reality has been that the surface transportation act reauthorization require “all winners,” I believe that re-opening the question of a capital budget approach to surface transportation is the best hope to create adequate room to go forward with a broad consensus.

To be sure, using part of the current revenue streams for bonding allows increased investment in the short run, but requires either ending some capital investment or increasing the gasoline tax at some point in the future. But either of those outcomes is better than the status quo. Bonding costs are at or lower than the rate of inflation in the construction industry, so dealing with investment needs sooner through bonding does not cost more. On the contrary, it provides both short-term economic stimulus and long-term economic growth, both of which are desirable. It is the way every homeowner in America buys a house, most private investment is financed, and every State and City government invests. If, in 6 years new investments are curtailed, we’re better off to have had the investment early. If, on the other hand a unified constituency successfully lobbies to increase the gasoline tax so investment can continue, that’s even better.

In the short term, we need a strategy to incorporate “new” claimants and environmentalists in support of an expanded surface transportation authorization, and I believe these suggestions can help us get there.

Thank you again for the opportunity to testify.

RESPONSES OF FREDERICK SALVUCCI TO ADDITIONAL QUESTIONS FROM SENATOR  
GRAHAM

*Question 1.* You raise an important point about highway maintenance. It is as important, or more so, than new construction. Do you feel that poorly maintained roads and bridges cause congestion?

Response. Senator Graham, I support your view that maintenance is as important as new construction, if not more so. I believe there is a complex interrelationship between poor maintenance of roads and bridges, and congestion, and that increased Federal attention and funding could produce improved management of maintenance with beneficial effect in reducing congestion. When poor maintenance leads to closure or load limits on bridges there can be dramatic impact on congestion as vehicles are forced to re-route to other route where they may cause congestion. Generally, maintenance and operations are under-funded at the local level. Consequently, responsible officials tend to carry out maintenance in the "cheapest" manner for the agency budget, even if that means causing congestion and shifting costs to motorists. Carrying out some maintenance activities at night may lower congestion impacts to motorists, but will cost the agency more money from an already inadequate maintenance budget, so the agency is likely to use higher cost/lower congestion methods only when forced to do so by political pressure on very high-traffic routes. Moreover, reconceptualizing maintenance activities in coordination with operations of traffic systems, and maintenance of the more sophisticated ITS methods increasingly available requires a commitment of management attention and money, when agencies are usually under-funded for maintenance, and management attention is usually focused on more visible, and better funded construction activities. As a result you are more likely to see sophisticated traffic management techniques applied in ad hoc application to reasonably well-funded reconstruction projects, to minimize congestion impact of reconstruction, than as part of ongoing maintenance activities. ISTEA mandated the development of improved maintenance and management systems, but provided no dedicated funding, so the results have been modest. If the Federal requirement to develop maintenance and operations management systems is strengthened, but accompanied by Federal funding to facilitate not only the development of management systems but also the more expensive techniques which can reduce congestion, then I believe we will see much more significant utilization of techniques to reduce congestion, as well as a better level of ongoing maintenance to reduce the need for very costly and expensive reconstruction which current policies encourage.

*Question 2.* You also raise the issue of truck and cargo access to airports in your testimony—and possibly a new Federal revenue stream to make access improvements. Do you feel the same re: access to seaports?

Response. Yes, I believe that a new Federal revenue stream, to prioritize access to airports, should include access to seaports and other intermodal terminals. Again, ISTEA encouraged more planning attention to cargo and intermodal issues, but provided no dedicated funding to facilitate implementation. Developing ways to improve intermodal connections, and prioritize truck access generally is very difficult conceptually, can be unpopular with the general motoring public if not done very carefully, and often receives little support from the terminals who fear they maybe asked to provide financial support to any potential solutions. If the ISTEA mandates are strengthened and supported with dedicated funding streams, I believe we will see better results.

---

RESPONSES OF FREDERICK SALVUCCI TO ADDITIONAL QUESTIONS FROM SENATOR  
JEFFORDS

*Question 1.* Your testimony provides many important insights on some of the key areas that needed to be addressed by this committee. I wanted to focus on your comment that "if one-third of the existing revenue streams were to be used for debt service, the program could expand . . . by approximately 20 percent."

How would you structure this new approach? Would this new approach conform with your view that "proper maintenance of the existing system is perhaps becoming more important to the national interest than further expansion of the network?"

Response. I am suggesting that a portion of the existing Federal funding streams be used to support debt service on bonds, so that a somewhat larger capital program can be feasible along with a new program for Federal funding of a portion of operation and maintenance costs. Another candidate for new Federal operating funds should be Federal funding for the growth cost of elderly and disabled paratransit services. Without bonding, any appreciable expansion of the capital program, and

any new operation and maintenance program would require an increase in dedicated taxes (presumably gasoline taxes). I have suggested partial bonding because it facilitates program expansion without a gas tax increase in the near term. Even if a gas tax increase were politically feasible, I believe partial bonding would be desirable to get a larger program expansion. Bonding could be done at the Federal level directly. Alternately, USDOT agencies could enter into long-term (25-year contracts) for contract assistance with State and regional entities, for long-term maintenance assistance and/or debt service on State or local bonds. These could be similar to "T.I.F.I.A." loans or "G.A.R.V.E.E." bonds, except with Federal support. Either approach could work, as long as there is equitable access to the expanded funding among States and regional entities.

*Question 2.* I noted your interest in providing more coordination of resources between TEA-21 and AIR-21. You noted some attention to freight needs. Do you also see some need to address intercity passenger travel as well, linking airports to city centers along corridors?

*Response.* As part of coordinating TEA-2 and AIR-21 reauthorization bills, I agree that it would make sense to look at intercity passenger travel across air, rail, bus, and auto modes, particularly for trips within 300 miles, and move toward better integrated passenger systems, as the Europeans are achieving. On the cargo side, while we need a new emphasis on intermodal coordination supported by Federal funding, I emphasized the cargo issue because it can be developed more rapidly, as there are advantages to most parties whereas passenger services, particularly involving rail, will likely conflict with both rail cargo needs and air passenger suppliers, and may be less amenable to resolution in TEA-21 and AIR-21 reauthorization processes.

---

STATEMENT OF ELIZABETH STUTTS, GRANT PROGRAMS ADMINISTRATOR, FLORIDA DEPARTMENT OF TRANSPORTATION ON BEHALF OF THE ASSOCIATION FOR COMMUTER TRANSPORTATION

*Introduction*

Mr. Chairman, members of the committee, thank you very much for the opportunity to participate in the dialog on the reauthorization of the Transportation Equity Act for the 21st Century, or TEA-21. My name is Elizabeth Stutts, Grants Program Administrator for the Florida Department of Transportation in Tallahassee, Florida. I am pleased to be here today representing the Association for Commuter Transportation—or ACT.

The members of ACT represent a broad coalition of organizations—from major private-sector businesses and institutions to transportation agencies—but we all have one thing in common . . . We are all working cooperatively to make transportation work better by making it more efficient and less costly.

ACT members are working together in public-private partnerships to make transportation work better for business. Major employers recognize that transportation issues impact the bottom-line. Workers are facing commutes that get longer each day—under more stressful and less predictable travel conditions. This situation has a direct impact on employee recruitment, retention, and productivity—increasing labor-related costs and affecting competitiveness.

Our testimony today will focus on creative approaches to making our transportation system work better by investing in a more comprehensive approach—not just to the way we build our transportation systems, but to the way we use our transportation systems.

In communities around the country, ACT members are working closely with the people who use transportation on a daily basis. We have a customer-driven approach. After all, transportation is really about the people who use it—and the individual decisions they make everyday about where they need to go, when they need to leave, and how they're going to get there. Unfortunately, all too often, everyone tries to go the same place, at the same time, using the same route and the same mode of travel. The result is congestion and inefficiency, which greatly impacts our business productivity and our quality of life. Our members include public-sector entities working in partnership with businesses and residents to make transportation more efficient; private-sector employers, working with their employees to improve the commute; and schools working with their students to improve connections to the campus and the classroom.

The reauthorization of TEA-21 presents a clear opportunity to support America's businesses, workers, and citizens by supporting transportation programs and partnerships that can make a difference. In our testimony today, we are asking the committee to:

- Build upon the foundations of flexibility and partnership established under ISTEA and TEA-21,
- Recognize the important balance between the way we build transportation and the way we use transportation,
- Increase support for partnerships that engage the private sector, and
- Enhance travel choices and provide incentives for smart choices.

*ISTEA and TEA-21: Building the Foundation*

The enactment of the Intermodal Surface Transportation Efficiency Act (ISTEA) in 1991, and its successor, TEA-21, in 1998, signaled a new era in the development of our nation's transportation system. By the early 1990's, the construction of the original interstate highway network was complete, and a growing number of business and community leaders were looking to broaden their approach to meeting the transportation needs of their workers and citizens. ISTEA and TEA-21 responded. By giving communities new flexibility to use Federal funds to invest in a variety of travel modes—from highways, to rail lines, to bike paths—ISTEA and TEA-21 recognized the benefits of allowing communities to invest in transportation that gives people more choices in how they get around. These bills recognized the significant power of transportation investments—not simply as an end in themselves—but as an effective tool to achieve a wide range of community goals.

Throughout the 1990's, transportation agencies, metropolitan planning organizations, and local jurisdictions responded to increasingly diverse travel needs by investing in multi-modal transportation improvements. The results of this shift were significant. Annual Federal investments in public transportation systems doubled from just over \$3 billion in 1990 to nearly \$6 billion in 1999, and Federal funding for bicycle and pedestrian projects grew from only \$7 million in 1990 to \$220 million in 1999.

In addition to enhancing funding flexibility, ISTEA and TEA-21 stressed the importance of partnerships between Federal, State and local agencies—empowering metropolitan planning organizations (MPOs) to facilitate intergovernmental partnerships in the transportation decisionmaking process. This focus on partnerships allowed Federal transportation investment decisions to better respond to the unique transportation goals of States and communities—and led to an overall increase in State and local funding for projects that provide citizens with enhanced travel choices. For example, between 1990 and 1999, local and State funding for public transportation grew by 34 percent.

As we move toward the reauthorization of TEA-21, we must build on these foundations of flexibility and partnership. We must continue to strengthen our national transportation infrastructure, including road and bridge networks, bus and rail transportation lines, ferry services, and bicycle and pedestrian trails. We must continue to prioritize investments in preserving the quality of existing roads and bridges and improvements in transportation safety. And we must continue to support the expansion of rail and bus transit services to meet the ever-growing demand for these services.

*TEA-21 Reauthorization: Making It All Work*

While ISTEA and TEA-21 were remarkable steps forward, many challenges remain. Across the country, traffic congestion is a serious and pervasive problem for both businesses and communities. In 1999, congestion cost the United States over \$78 billion dollars in wasted time and wasted fuel. People are spending more and more time stuck in traffic and less time with families. More frustrating and less predictable commute times are impeding the ability of employers to recruit and retain valued employees, and congestion is impeding the efficient movement of goods. Air quality continues to endanger public health and degrade community livability. Finally, as the tragic events of September 11th revealed, the functionality of transportation systems affect a wide range of security and emergency preparedness issues, from the movement of response vehicles to the evacuation and protection of citizens.

To tackle these critical challenges, the reauthorization of TEA-21 must build on the foundations of flexibility and partnership first established by ISTEA. Reauthorization must take the next step forward by integrating programs and partnerships that can make the transportation system work better—by not simply focusing on the way we build transportation, but on the way we use transportation. This is a critical distinction, as it recognizes that how well the transportation system works depends on the balance between the availability of transportation infrastructure—from roads to bridges to transit lines—and the way that people use this available infrastructure.

Focusing on the way that people use transportation means focusing on where they need to go, when they need to leave, and what choices they have in how to get there.

It means providing people more transportation choices and real-time travel information about these choices. It means recognizing that people make travel decisions based on a variety of factors like time, cost, convenience, safety and reliability—and developing incentives to encourage smart travel choices. And it means forging partnerships between the people that depend on transportation every day—partnerships between transportation organizations and private employers, between employers and their employees, between educational institutions and their students, and between developers and their tenants.

To address the significant transportation challenges facing our businesses and communities, the reauthorization of TEA–21 must recognize the importance of this balance between the way we build transportation and the way we use transportation. The following sections highlight the need to integrate programs and partnerships designed to achieve this balance.

#### *Partnerships with Employers*

Reauthorization represents a key opportunity to enhance the spirit of partnerships developed in ISTEA and TEA–21 by supporting win-win public-private partnerships between employers and transportation organizations. Through commuter benefits like monthly transit passes, onsite commute information, and flexible work schedules, employers play a significant role in the travel decisions of their employees. A 2001 national survey called the Zyllo Report found that, on average, employers that provide commuter benefits have 15 percent fewer employees driving to work alone (86 percent vs. 71 percent). Employers offer commute programs because they make good business sense. Employer commute programs allow businesses to address employee recruitment and retention problems, increase employee productivity, and lower facility construction and maintenance costs related to employee parking. For example, a commute assistance program saved a company in San Antonio, Texas, over \$2.5 million by eliminating the need to build and maintain 1,000 extra parking spaces.

Employer partnerships are an important source of additional funding for transportation—as businesses invest in employee transit passes, invest in the development and operation of shuttle programs, and invest in other commute resources for their employees. As a powerful example, in 2000–2001, every \$1 that the public sector invested in supporting employer commute programs in the State of Washington resulted in \$12 of additional investment from employers.

Employers and the organizations that support employer partnerships are also a critical resource in emergency preparedness planning and response. On September 11th, ACT members worked with employers and employees to get people home safely—providing critical information on the availability of transportation alternatives. In the weeks following September 11th, our members worked in partnerships to keep businesses productive by supporting commute alternatives like telecommuting and ridesharing.

The reauthorization of TEA–21 should strengthen support for organizations that facilitate employer partnerships. These organizations integrate one of the sectors most impacted by transportation challenges—America’s businesses—into the fold as partners in developing effective solutions. For example, innovative programs spurred by the Congestion Mitigation and Air Quality Improvement Program (CMAQ)—including public-private organizations called Transportation Management Associations, or TMAs—are responsible for many employer-partnership success stories. To further promote these programs, the next transportation bill should maintain support for the CMAQ program with an enhanced emphasis on partnerships and innovation. Reauthorization should further recognize the value of employer partnerships by supporting a tax credit for businesses that offer commuter benefits to their employees. A commute benefit tax credit would provide a powerful tool to leverage additional private-sector investments in transportation solutions that work.

#### *Choices, Incentives and Information*

On a daily basis, people make a variety of transportation decisions. These decisions begin with the travel choices available to them—where to go, when to leave, what mode to use, what route to take—but they also include a variety of other influencing factors, like travel time, trip cost, convenience, safety, and reliability.

The reauthorization of TEA–21 should support the continued enhancement of travel choices. A strong and balanced transportation system provides travelers with a variety of choices—rather than limiting choices—allowing each traveler to choose the best travel alternatives to meet their needs. The next transportation bill should continue to support a multi-modal approach to building transportation by continuing to encourage flexibility in the use of Federal funds and by maintaining the Transportation Enhancements program.

In addition, the bill should also support smart travel choices that make more efficient use of existing facilities—including smart mode choices like transit, ride-sharing, bicycling, and walking; smart time choices like traveling during off-peak hours, smart route choices based on real-time traveler information; and smart location choices like living near your place of employment, living near public transit services, or utilizing travel-free alternatives like telecommuting and e-commerce. Supporting smart travel choices can reduce the overall “demand” for transportation—improve the efficiency, operation, and performance of the existing system—and produce broad-based benefits.

We must also work to make smart travel choices truly viable. We must create an environment where the other key decision criteria—like travel time and travel cost—are equitable between travel choices. As an example, commuters can currently receive up to \$185/month in tax-free benefits from their employer to park their cars at work all day, yet they can only receive a maximum of \$100/month for the same trip via transit or vanpool. This inequity does not encourage smart travel choices and should be addressed during reauthorization. In addition, other travel choices like carpooling, bicycling, walking, and telecommuting should be made eligible for this transportation benefit, creating equity between all travel choices.

Finally, people cannot make smart travel choices without increased awareness and real-time information on the alternatives available, how to use them, and even when to use them. The development of Intelligent Transportation Systems (ITS) should continue, especially development of real-time traveler information services. At the same time, the development of ITS infrastructure must be supported by programs and services that can get real-time transportation information into the hands of the people that need it, when they need it, and where they need it—so that they have ample opportunity to make the smart travel choices that can make a difference.

#### *Integration with Operations and Major Investment Planning*

The programs and services developed and implemented by ACT members to forge partnerships with major employers and enhance travel choices are a critical tool in the effort to make transportation more efficient and less costly. As a compliment to major capital improvements, these customer-driven programs and services (often called transportation demand management, or TDM) can provide near-term benefits which improve transportation operations and make the most of existing resources by improving the way we use transportation. The reauthorization of TEA-21 should recognize the role of TDM organizations by supporting improved coordination between these and other organizations that manage and improve the daily operation of the transportation system.

Finally, the reauthorization of TEA-21 must strengthen the integration of TDM programs and services in major investment and corridor planning efforts. Too often, TDM programs are compared to other major investment alternatives in a “no-build” versus “build” analysis, setting up an illogical either-or evaluation. Instead, reauthorization should require the integration of TDM programs and strategies as a complement to major capital investments. TDM programs have proved effective as construction mitigation measures, and offer near-term implementation advantages to address transportation challenges before the construction of the major investment is complete.

#### CONCLUSION

Again, the reauthorization of TEA-21 presents a clear opportunity to support America’s businesses, workers, and citizens by supporting programs and partnerships that make transportation more efficient and less costly. Reauthorization should:

- Build upon the foundations of flexibility and partnership established under ISTEA and TEA-21,
- Recognize the important balance between the way we build transportation and the way we use transportation,
- Increase support for partnerships that engage the private sector, and
- Enhance travel choices and provide incentives for smart choices.

We appreciate the opportunity to present testimony before the committee and offer the Association for Commuter Transportation as a resource on these important issues. If you have any questions, or would like to discuss these matters further, please contact Kevin Lutten, ACT Assistant Director, by phone: (202) 546-5478, or by email: kevin@act-hq.com. You may also contact ACT’s Washington, DC, representative Thomas J. Bulger, Government Relations, Inc., by phone: (202) 775-0079, or by email: tbulger825@aol.com.

## STATEMENT OF ELISSA MARGOLIN, EXECUTIVE DIRECTOR, LEAGUE OF AMERICAN BICYCLISTS

Mr. Chairman, Senator Smith and members of the committee, thank you for holding these hearings regarding the reauthorization of the Transportation and Equity Act for the 21st Century. On behalf of the League of American Bicyclists, I am pleased to have this opportunity to address the benefits associated with the use of the bicycle as it relates to mobility, congestion and intermodalism.

The League of American Bicyclists was founded in 1880 as the League of American Wheelmen when cyclists from across the United States joined together to advocate for paved roads. Their efforts ultimately led to our national highway system.

Today, the League promotes bicycling for fun, fitness and transportation and works through advocacy and education for a bicycle-friendly America. We represent the interests of the nation's 42.5 million cyclists. With a current membership of 300,000 affiliated cyclists, including 40,000 individuals and 600 affiliated organizations, the League works to bring better bicycling to communities across the country.

We recognize that bicyclists are not going to completely solve our nation's congestion problems. However, they are certainly a key piece of the puzzle and cannot be overlooked. It is important that Congress recognize the important role bicycling plays in transportation during this reauthorization process.

Aside from creating gridlock, traffic congestion wastes time and energy and creates pollution and driver frustration. Those who use their bike as a mode of transportation will be the first to tell you that their bicycling commuting experience is far more pleasant than sitting in a car. The typical bike commute takes less time than driving, particularly in urban areas such as Washington, DC; is less expensive; certainly uses less gasoline and emits no air pollution. Generally, the bicyclist arrives at work less stressed and invigorated for a productive day.

According to the Federal Highway Administration, 40 percent of all automobile trips are less than 2 miles. Turning even a small percentage of those trips into bicycle trips would ease congestion tremendously. Many of those trips are made by parents dropping their children off at school, creating dangerous congestion near and around schools. If we help make those school routes become safer for children to travel by bike or by foot, think of the congestion that would be eliminated, not to mention improving their health by promoting physical activity. Mr. Chairman, the physical benefits of bicycling for all Americans is an important topic that deserves its own hearing, as does the environmental benefits.

Not only will getting more people to take trips on their bicycle decrease the amount of vehicles on our roads, it will also substantially decrease air pollution.

At the present, 80 percent of carbon monoxide and 50 percent of nitrogen oxide emissions in the United States are a result of our transportation system. 60 percent of automobile emissions pollution occurs at the very beginning of vehicle operation when the engine is cold and the pollution control devices have not begun to work effectively. Therefore, the shorter automobile trips are producing more pollution on a per-mile basis than shorter trips.

With regard to intermodalism, the bicycle plays a vital role. All over this country, in addition to bicycling all the way to work, people are biking to their local bus stop or train station and then taking mass transit. In some cases, they keep a bicycle at the other end to finish their commute. The Federal Transit Administration estimates that at least one-in-five transit buses nationwide are equipped with bike racks.

Buses in Seattle carry over 60,000 bicyclists a month, or 60,000 single-occupancy vehicle drivers. More and more of our nation's subways and trains are encouraging bicycle access, making it easier for bicyclists to use mass transit and reducing the number of cars on our roads and highways, especially during rush hours.

Mr. Chairman, it is critical that Congress continue to recognize the contributions that bicyclists make with regard to mobility, congestion and intermodalism. Even a small percentage increase in bicycling will go a long way in making a positive change and improve mobility for all.

Thank you once again for the opportunity to testify before this distinguished committee. We look forward to working with you throughout this important reauthorization process, as we collectively strive to improve the transportation system in the United States for all Americans.

---

March 19, 2002.

U.S. Senate,  
Committee on Environment and Public Works,  
410 Dirksen Senate Office Building,  
Washington, DC 20510-6175.

For submission to hearing record: "Mobility, Congestion and Intermodalism" Tuesday, March 19, 2002, 2:30 p.m. Hearing Room (SD-406)

Defenders of Wildlife is a national nonprofit conservation organization with over 400,000 members, committed to preserving the integrity and diversity of natural ecosystems, preventing the decline of native species and restoration of threatened habitats and wildlife populations. We have been involved with transportation and environment issues for nearly a decade, recognizing the importance of this often overlooked segment of our nation's continued growth. Recently, Defenders launched a new campaign to address the conflicts between transportation and wildlife. Our objective is to reduce the impact of surface transportation on wildlife and habitat, and to incorporate conservation into transportation planning to avoid or minimize the negative effects on wildlife and habitat.

In your attempt to examine fresh ideas on transportation demand, access, mobility and program flexibility, we remind you that mobility is not always best served via the single occupant vehicle and that additional roadbuilding and lane miles are not always the most efficient answer to traffic congestion. We submit the following information for the record:

1. \*A Taxonomy for Induced Demand in Transportation. 2001. Hunt, J.D. United Nations Commission on Sustainable Development.
2. Highways and Induced Travel Demand. 2000. Marshall, Norm. Resource Systems Group.
3. Estimating Induced Travel, Emissions and Benefits in Highway Corridor Analysis. 1998. DeCorla-Souza, Patrick. Federal Highway Administration.
4. \*A Framework for Understanding the Demand Inducing Effects of Highway Capacity. 1994. Dowling, Richard G. Transportation Research Board.
5. \*Trunk Roads and the Generation of Traffic. 1994. Wood, D.A. Great Britain Department of Transport.
6. \*Effects of Increased Highway Capacity on Travel Behavior. 1993. Dowling Associates. California Air Resources Board.
7. \*The Air Quality Impacts of Urban Highway Capacity Expansion: Traffic Generation and Land-Use Impacts. 1993. Dobbins, Allison. California Air Resources Board.
8. \*Portland's Livable Downtown. 1992. Corbett, Judith. Surface Transportation Policy Project.
9. \*User Response to New Road Capacity: A Review of Published Evidence. 1989. Pells, S.R. Institute for Transport Studies.
10. \*The Relationship of Changes in Urban Highway Supply to Vehicle Miles of Travel. 1979. Cambridge Systematics, Inc. National Cooperative Highway Research Program, Transportation Research Board, National Research Council.

\*Regrettably, most of these reports are available in hardcopy only, copies provided.

Sincerely,

PATRICIA A. WHITE, *Transportation Associate.*

## REATHORIZATION OF TEA-21

---

WEDNESDAY, MAY 15, 2002

U.S. SENATE,  
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,  
*Washington, DC.*

The committee met, pursuant to notice, at 10:05 a.m. in room 406, Dirksen Senate Office Building, Hon. James M. Jeffords [chairman of the committee] presiding.

### TRANSPORTATION PLANNING AND SMART GROWTH

Present: Senators Jeffords, Reid, Corzine, Chafee, and Wyden.

### OPENING STATEMENT OF HON. JAMES M. JEFFORDS, U.S. SENATOR FROM THE STATE OF VERMONT

Senator JEFFORDS. The hearing will come to order.

Welcome to today's hearing on transportation planning and smart growth. We are joined this morning by a number of fine witnesses from around the Nation. I appreciate their willingness to lend us a hand as we proceed with our examination of the Nation's surface transportation program.

Our topic this morning, transportation planning, is one of the lynch pins of the new thinking introduced by the Intermodal Surface Transportation Efficiency Act of 1991, or ISTEA, as it has become known. In passing ISTEA, Congress inaugurated the post-interstate era. With its enactment, our transportation program moved from a focus on new highway construction to a recognition that transportation is the means to the end. We recognize that our investments in transportation and other infrastructure mold and shape our communities. Beyond community form, we saw transportation's influence on people's daily lives, on the time they spent away from their families, and on their health and well-being.

Because of transportation's broad ramifications, ISTEA provided States and, for the first time, local officials, wide latitude in the use of Federal aid dollars. ISTEA had provided flexibility, the freedom to move Federal money from category to category as best fit the needs of a given State or metropolitan area.

I had the honor to serve on this committee during the enactment of ISTEA. At the time, we recognized that with the freedom of flexibility came enormous responsibility. The highway program, alone, has provided \$300 billion in taxpayers' dollars to State and local officials. Stewardship of these funds demands great care. The transportation planning provisions of ISTEA were intended to ensure that would be working.

The idea is simple. Let's think before we act. Before spending Federal aid dollars, State and metro officials would first assess needs, communicate with citizens, coordinate with stakeholders, and realistically forecast financial resources. This basic planning process would guide and inform the investments to follow.

TEA-21, the Transportation Equity Act for the 21st Century of 1998, refined the ISTEA planning provisions but retained its basic thrust. As a result, we now have 10 years of experience in this new way of doing the Nation's transportation business. Today we will explore lessons learned over the past 10 years. We will also examine a range of ideas for the future of the planning program.

I will turn now to my good friend, Senator Reid.

**OPENING STATEMENT OF HON. HARRY REID, U.S. SENATOR  
FROM THE STATE OF NEVADA**

Senator REID. Thank you very much, Mr. Chairman. I appreciate your holding this very important hearing. Let me say, to the witnesses, that while there might not be many Senators—Senators will come in and out during the day—that we have everything taken down, and this, of course, is shared with the other committee members. And, of course, every person that is a member of this committee is represented here by staff, so these are extremely important hearings.

One of our goals in writing transportation policy is to maximize the mobility of people and freight while minimizing air pollution and other environmental impacts. This isn't easy, and success requires a thorough planning process. Planning is especially important in areas that are experiencing high rates of population growth—for example, Las Vegas metropolitan area in the State of Nevada.

The Las Vegas region is the fastest-growing area in this country. Its population doubled over the past decade. So the challenges are especially acute, but almost every metropolitan region in the Nation is growing.

I think people sometimes don't realize how difficult in a relatively small State growth is. We have as many as 10,000 people each month moving into the Las Vegas area. Just to keep up, for example—and I've used this illustration before—to keep up with the growth in schools, we've had to build as many as 18 new schools every year, just in the Clark County School District. Think of that—18 new schools. It's very difficult.

And from a transportation perspective we always seem to be trying to catch up to growth after traffic congestion begins to choke our roads. We'd be better off if we could stay one step ahead of growth and make the important connection between land use and transportation before growth accelerates rapidly, rather than as an afterthought.

The Federal Government must give States and metropolitan regions the tools necessary to ensure that transportation planning and population growth go hand in hand, and planners need the maximum flexibility within the transportation program to address growth in the way that best suits each region's needs.

Many transportation options are available: road construction, mass transit, high-speed rail, improved management of transpor-

tation system, upgraded pedestrian access, new bike routes, carpooling, high occupancy lanes, to name a few. I'm sure many of you will talk about these things I've spoken of in more detail. Good planning can ensure that the best mix of these options is chosen.

Our challenge in Las Vegas is to address the needs of a booming population while maintaining the high quality of life that attracts so many to move west, but transportation is a key to this challenge.

The Regional Transportation Commission of Southern Nevada is using almost every transportation option that I just mentioned to address traffic congestion. In addition, Las Vegas is trying to promote transit use through some smart growth initiative of its own—for example, planning transit-based development around the construction of a new monorail system, also tied to new bus rapid transit system. The monorail will eventually connect the airport to the strip to downtown to the rapid transit buses to population centers to park and ride lots and to an eventual high-speed train connection with southern California.

I have made no secret of my belief that we need to invest more money in our transportation infrastructure nationally, and I was happy to take the House take action, Mr. Chairman, yesterday. That's not as much as we need, but it is a step in the right direction.

As chairman of this committee's transportation subcommittee, I'll make increasing the level of investment in transportation a top priority. However, with more money comes more responsibility. We need to make sure this funding is put to its best use, and a robust and open planning process is the best way to ensure that transportation stays one step ahead of growth.

Mr. Chairman, let me again congratulate you for having this meeting, and also we start activity on the floor at 10:30, so I'll have to be over there to referee some of the fights.

Senator JEFFORDS. Thank you. It's a pleasure having you here, and you're doing a great job as chairman of the subcommittee.

Our first panel consists of practitioners from across the Federal, State, and local spectrum. They include: Ms. Cynthia Burbank of the Federal Highway Administration; Mr. Kenneth J. Leonard of the Wisconsin Department of Transportation, on behalf of the American Association of State Highway and Transportation Officials; Mr. Ronald Kirby from the Metropolitan Washington Council of Governments, on behalf of the Association of Metropolitan Planning Organizations; Mr. Peter Gregory from the Two Rivers Ottauguechee Regional Commission in Woodstock, Vermont, on behalf of the National Association of Regional Councils.

Let us start with Ms. Burbank.

**STATEMENT OF CYNTHIA BURBANK, PROGRAM MANAGER,  
PLANNING AND ENVIRONMENT, FEDERAL HIGHWAY ADMINISTRATION, WASHINGTON, DC**

Ms. BURBANK. Mr. Chairman and Senator Reid, thank you very much for the opportunity to report to you today on the status of transportation planning and what FHWA has been doing to assist States and MPOs to meet the planning goals of ISTEA and TEA-21. I wanted to note it is a particular pleasure, Mr. Chairman, for

me as a long-time Vermonter, a ninth-generation Vermonter who goes back to a family history when it was an independent nation, to appear before you.

I ask that my written statement be made part of the record for this hearing.

Senator JEFFORDS. It will be.

Ms. BURBANK. Thank you.

Transportation planning identifies transportation problems and solutions that fulfill multiple national, State, and local goals. Planning must do more than merely list highway and transit capital investments. It must advance a State's or an area's long-term goals, as you have noted, through strategies for operating, managing, maintaining, and financing the transportation system.

ISTEA and TEA-21 made significant changes in planning requirements for highways and transit. These changes require greater attention to public involvement, fiscal prudence, and environmental impacts.

States continue to have the primary responsibility and authority, but the role of MPOs and local governments in transportation planning and programming has been strengthened. The States, in consultation and cooperation with MPOs, local governments, and transit operators, choose which projects will advance.

To assist in making the best transportation choices for these areas and States, FHWA and FTA have launched a major initiative that we call "capacity building," and by this I mean institutional capacity building, not necessarily transit and highway capacity building.

Our first effort in this institutional capacity building has focused on metropolitan planning needs through developing training courses, providing and preparing models and case studies. More recently, we have developed a rural capacity building initiative because there are unique needs in rural areas. Through this effort we are also providing training, technical assistance, and information exchange targeted to the needs of the rural areas.

The rural capacity building initiative is a partnership with the National Association of Regional Councils, the National Association of Counties, and the National Association of Development Organizations.

Now let me address for a moment an issue of concern to both metropolitan and rural areas, smart growth. Smart growth means different things to different people. FHWA has looked at this very carefully and our perspective on smart growth is that it is a set of State and local policies and programs designed to protect and preserve natural and cultural resources and make efficient use of existing infrastructure while accommodating economic development and population growth, as Senator Reid described in Las Vegas.

Smart growth often means expanding transportation choices and providing a balanced intermodal transportation system to allow for efficient and economical movement of both people and goods. In some areas that may mean more transit, in other areas it may entail significant roadway improvements, and in most areas it probably means both, as well as bicycle and pedestrian improvements and meeting the needs of freight transportation.

We want to stress that it is up to State and local officials to decide how best to address their unique circumstances and serve their smart growth interests, and it is U.S. DOT's role to help areas best implement their decisions within the funding available.

We believe that all of the programs in TEA-21 can be effective tools to serve smart growth, but one that I know is of particular interest to the members of this committee is the TCSP program—Transportation and Community, and System Preservation Pilot Program. It is a small program authorized at just \$25 million per year, but it is an opportunity to provide innovative funding to areas to involve their citizens more in making these important decisions and to achieving their economic growth and environmental interests.

While FHWA strongly believes that land use decisions are State and local in nature and should remain that way, we believe there is much to be gained from more coordination among State and local planning, zoning, and housing authorities, and, as well, environmental and transportation officials, to reach good decisions.

The changes in planning under ISTEA and TEA-21 have enhanced and improved the transportation decisionmaking process, but we are well aware that continued progress is needed. In reauthorization, we look forward to working with this committee and with our partners to find additional means of assisting States and local governments in strengthening the transportation planning process.

Mr. Chairman, thank you again for the opportunity to testify. I look forward to answering your questions.

Senator JEFFORDS. Thank you for your excellent statement.

Mr. Leonard?

**STATEMENT OF KENNETH J. LEONARD, DIRECTOR, DIVISION OF TRANSPORTATION INVESTMENT MANAGEMENT, WISCONSIN DEPARTMENT OF TRANSPORTATION, MADISON, WISCONSIN, ON BEHALF OF THE AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS**

Mr. LEONARD. Mr. Chairman, members of the committee, I'm Ken Leonard. I'm director of planning with the Wisconsin Department of Transportation. I'm also the vice chair of the Standing Committee on Planning for the American Association of State Highway and Transportation Officials.

Transportation planning today is a complicated process, and an overriding recommendation we have is simplify, simplify, simplify. ISTEA and TEA-21 made some positive changes in the planning process, first by shifting decisionmaking in many areas from Federal to the State level and by emphasizing a broad planning process that includes all stakeholders, as well as all modes of transportation, but there's still room for improvement. Among these areas are: freight planning, financial constraint provisions, local consultation, and the role of States in regard to land use.

First, in regard to freight planning, freight movement is growing faster than capacity. Over the next 20 years, international trade is expected to triple and domestic freight is expected to double. It is critical that we upgrade our freight planning efforts.

AASHTO is recommending an increase in freight training and capacity building for States and for local agencies, and we're recommending an increase in freight transportation research, and also the creation of a National Freight Advisory Council.

In Wisconsin, as well as in a number of other States, we already have advisory committees represented by freight providers and shippers that advise us on our State planning process, and we are recommending something like that at the national level.

In regard to financially constrained plans, the intent was to avoid the creation of transportation wish lists where funds were not available. I think, as a whole, we've accomplished that intent. Our programs, in terms of a total level, stay within what we expect in terms of financial resources, but the actual day-to-day application is still difficult for States in terms of making adjustments when projects are delayed or when there's additional resources. AASHTO believes that reauthorization should increase flexibility related to financial constraints for both States and MPOs.

Congress attempted in TEA-21 to eliminate major investment studies as a separate requirement and to integrate that within the planning process and the NEPA process, but that has really not occurred. In fact, the proposed USDOT regulations really expanded the applicability of MISes.

We would urge that in reauthorization you direct USDOT to eliminate the MIS requirement effective immediately and not contingent upon new regulations.

State DOTs and MPOs should develop options to ensure that decisions reached in the statewide and the metropolitan planning process regarding purpose and need and the range of alternatives would then be binding in the NEPA process, therefore eliminating duplication.

In regard to State long-range plans and timelines, Congress should continue to provide flexibility to States in terms of performance measures and planning horizons as long as we keep the minimum 20-year planning horizon. To improve the planning process and public involvement within that, AASHTO also advocates that Congress change the update cycle for long-range metropolitan plans from 3 years to 5 years.

In the area of smart growth, most States defer land use decision-making to local governments, believing that it reflects a number of local circumstances and that local officials should have the responsibility to determine land use for their particular area.

Federal statutes should continue to defer to local and State governments in whether and how to consider land use. That being said, AASHTO and the State DOTs are doing a number of things in the area of smart growth. Wisconsin has smart growth legislation, and we're working cooperatively with our local units of government. We've developed a transportation guide to help local units of government, and we're encouraging them to plan land use and transportation together once they develop what the vision is for their community.

AASHTO is also developing a guide and contact-sensitive design that's going to be published later this year. AASHTO is sponsoring a smart growth competition between States to highlight best practices in the States. AASHTO also has an environmental steward-

ship initiative and has launched the creation of a Center for Environmental Excellence. All of these things will deal with land use and smart growth.

In regard to the roles and the tools of the various parties, the existing balance of decisionmaking authority between the MPO, the State, and the local officials has worked well for a decade and that should continue. We think that Congress should maintain this balance and reaffirm the leadership role and the authority of States as TEA-21 is reauthorized.

AASHTO is working closely with others in developing tools to assist transportation planners and is identifying needed research.

Finally, States and MPOs need flexibility to adapt their planning provisions to the many diverse parts of the country.

I look forward to answering any questions you have.

Senator JEFFORDS. Thank you for an excellent statement.

Mr. Kirby, please proceed.

**STATEMENT OF RONALD KIRBY, TRANSPORTATION DIRECTOR, METROPOLITAN WASHINGTON COUNCIL OF GOVERNMENTS, WASHINGTON, DC, ON BEHALF OF THE ASSOCIATION OF METROPOLITAN PLANNING ORGANIZATIONS**

Mr. KIRBY. Thank you, Mr. Chairman, members of the committee. I'm Ronald Kirby, director of transportation planning for the National Capital Region Transportation Planning Board, which is the metropolitan planning organization for the Washington, DC, metropolitan area. I am appearing today at your invitation on behalf of the Association of Metropolitan Planning Organizations.

TEA-21 and its predecessor, ISTEA, rightfully recognize the importance of planning a metropolitan transportation system and gave the Nation's 340 MPOs increased responsibility to develop effective, strategic, long-range plans and comprehensive multimodal transportation improvement programs. With the 2000 census, we expect that additional MPOs will be designated, perhaps as many as 60, to establish newly designated urbanized areas, and that the geographic areas and populations served by existing MPOs will grow significantly.

While we've got new responsibilities such as management and operations required by TEA-21, the percentage of the highway program funding for metropolitan planning has remained at the 1 percent level set in ISTEA. AMPO believes that it is time to increase this takedown from the highway program, and also the amount allocated from the transit program for metropolitan planning to reflect the almost 20 percent increase in MPOs that we expect the growth in population and increased responsibilities, and we suggest that we look at a level of 2 percent of the overall program for metropolitan planning.

I'd like to mention three different categories of tools for metropolitan planning: those the we believe are working effectively and that we should retain, those that are effective and that we should expand, and some new tools that we need.

First, with regard to those that are working effectively, we believe the that requirement for a financially realistic plan in a fiscally constrained program is the most effective tool provided by ISTEA and TEA-21. This requirement eliminated the possibility of

wish list plans and programs which did not identify enough funds for implementation. The financial restraint requirement gave credibility to the MPO plans and programs and presented the public with a realistic view of what can be delivered in the way of transportation projects and services. It is imperative that this requirement be retained.

In addition to this, two ancillary requirements need by retained—the requirement for cooperative revenue forecasting among MPOs, States, and transit authorities; and the requirement for an annual listing of obligated projects to be prepared by the MPO.

Along with the financial tools, the overall planning approach established in ISTEA and TEA-21 should be retained. The requirement that long-range plans be strategic in nature with broad community goals and specific objectives places the transportation agenda in a broader context, encouraging the linkage between transportation, land use, the economy, and the environment in a metropolitan area, and the MPO provides a forum to bring together State and local groups and agencies that have to deal with smart growth initiatives. We feel we have the opportunity to do that.

With this approach, with extensive and early involvement of the community, the MPO has a solid basis for developing its long-range plan and transportation improvement program. The proactive public involvement requirements in ISTEA and TEA-21 have been particularly important in enhancing the effectiveness of the MPO process and should be retained.

In the Washington metropolitan area these ISTEA and TEA-21 tools have, in the words of one of our elected officials and board members, “forced us to ask the right questions.” Application of the financial constraint in the early 1990’s resulted in a rather stressful prioritization of transportation improvements for inclusion in our long-range plan and the initiative of a visioning process aimed at developing a broad community consensus on regional goals and addressing the critical funding needs that we had identified as a result of applying the financial constraint requirement.

The transportation, community, and system preservation pilot program has allowed us to pursue previously unaddressed goals and a new vision regarding a new system of regional greenways and circulation systems within regional activity centers and allowed us to focus increased attention on those areas in project selection.

With regard to existing tools that work effectively that we should expand, we are particularly interested in, obviously, the planning resources to MPOs, which I mentioned earlier, and then, with regard to funds for building projects, ISTEA and TEA-21 for the first time put funds in the hands of local elected officials to assign to projects developed cooperatively through the MPO process. Each MPO with more than 200,000 in population receives a portion of the STP funds allocated to its State to expend on specific projects. These funds could be program based on the MPOs best judgment of the transportation needs of their areas. The funds are made available by the States through sub-allocation. The availability of these funds not only provides funding for vital local projects, but also encourages local officials to get involved in the transportation

decisionmaking process for their region, since there is real money on the table.

Sub-allocation of STP funds has been a great success for the one-third of the MPOs that have populations over 200,000 and needs to be expanded to the remaining two-thirds of small areas that still have pressing needs.

AMPO suggests restoring the suballocation of the STP minimum guarantee funds that was in ISTEA but disappeared in TEA-21, and extending the sub-allocation of STP funds to all MPOs. Second, that we should sub-allocate CMAQ funds to MPOs in air quality nonattainment and maintenance areas.

With regard to new tools, in order to complement the financial restraint requirement and sub-allocation proposal, we would like to see that the States account annually for expenditures of NHS and other programs so that we know what we have done, as opposed to what we plan to do.

Once facilities have been built, it is important that we manage and operate them effectively and monitor their performance. We would like to put more resources into monitoring devices to track the operations of existing facilities, the so-called “infostructure,” and to encourage the development of performance-based management and operation elements within MPO plans and programs, and we’d like to have NHS, STP, and CMAQ funds eligible for use on projects that manage and operate the system, in addition to building new facilities.

In the area of planning, freight planning needs some new tools. We are concerned about this area, as well. We have it as a planning factor, but we have limited eligibility of funding for freight projects, particularly in our port areas, which has been a problem for a number of our members. We’d like to see port access and gateways be eligible for the corridors and borders program in the reauthorization.

We’re also concerned about streamlining project delivery and air quality conformity processes. There are opportunities within the MPO process, we believe, to identify environmental issues and incorporate them into the planning process before we get down to specific project alternatives in the EIS process.

We’d like to have Federal project sponsoring and resource agencies engaged at the MPO level prior to the development of specific EIS projects.

We’d like concurrent reviews and also incentives for innovative streamlining techniques.

With regard to air quality conformity requirements, we would recommend that the new law add two tools. First, put the State air quality implementation plan and transportation conformity plans on the same timeframes—they are quite different at the present time—and to focus conformity on the plan, as opposed to the 6-year program or 3-year program.

In summary, I’d like to emphasize the importance of planning in producing effective transportation systems. In the planning, designing, and building of transportation facilities, the most important leadership must come in the planning phase. If we do a good job of planning, the implementation will follow. If we shortchange the planning process, we often end up having to go back and start over

when project development comes to grief. With that kind of planning, we can assure you, we hope, that we will have a transportation system that works.

Thank you for the time and opportunity.

Senator JEFFORDS. Thank you, Mr. Kirby. Excellent statement.

Mr. Gregory, we are pleased to have you here. Please proceed.

**STATEMENT OF PETER GREGORY, EXECUTIVE DIRECTOR,  
TWO RIVERS OTTAUGUECHEE REGIONAL COMMISSION,  
WOODSTOCK, VERMONT, ON BEHALF OF THE NATIONAL AS-  
SOCIATION OF REGIONAL COUNCILS**

Mr. GREGORY. Thank you, Mr. Jeffords and committee members, for inviting me to appear before the committee and speak on transportation planning.

Transportation planning, the resources necessary to carry it out, and the role of the local elected officials is key to my commission, to the National Association of Regional Councils—NARC—and all my colleagues across the region and the country.

My name is Peter Gregory. I am director of the Two Rivers Ottauguechee Regional Commission in Woodstock, Vermont. I'm also a member of the Executive Directors Committee of NARC, and I serve on the NARC Transportation Working Group and advise rural transportation interests to the association. I am here in multiple capacities today, as an executive director representing 27 rural towns, most with populations of less than 1,000 residents, their elected officials; as spokesman for NARC on transportation issues; and on transportation issues for all councils and MPOs across the country.

NARC is a full-service, nonprofit organization serving the interests of urban and rural regional councils, councils of government, and MPOs. Regional councils and MPOs are created by compact, enabling legislation as consortia of local governments. As such, regional councils and MPOs represent locally elected officials from cities, towns, counties, and villages. As such, RPCs and COGs are uniquely positioned to address issues across jurisdictional lines.

In my jurisdiction and across the State of Vermont, for example, councils have a strong voice in transportation planning. Each regional planning commission's work is guided by a Transportation Advisory Committee made up of locally elected officials. These officials provide the Vermont Agency of Transportation, VTRANS, with a regional transportation plan and a list of prioritized projects across all modes. This comprehensive program to document local interest has served VTRANS well since 1992. Successive Governors and secretaries of the Vermont Agency of Transportation have all strongly supported the processes that regional planning commissions use to identify and support projects. However, Vermont's regional planning commissions need a consistent and predictable funding source to provide these services. Although they have close working relationships with VTRANS today, it is imperative that the process my council has undertaken over the last 10 years does not falter due to changing economic or political situations. Therefore, guaranteed funding for rural areas to carry out this planning is essential.

As in Vermont, councils need funding to plan the best transportation systems possible. To help achieve this, NARC is proposing new funding opportunities and a net set-aside for rural transportation planning.

NARC proposes changes in TEA-21 to allow States and regions to replicate the success in Vermont. We will ask Congress to smooth inconsistencies among the States by adopting clear and concise law incorporating local governments into the transportation decisionmaking and planning process.

Urban areas are being held hostage to congestion, delay, and loss of productivity while workers and freight sit in traffic. This is a symptom manifest beyond any local jurisdiction. It is a national problem and needs a national solution, and NARC pledges to work cooperatively with this committee to address that.

We need to not only guarantee States the flexibility to spend funds, plan and program projects based on their priorities, but also extend the same responsibility and authority to all locally elected officials. Furthermore, we need to reexamine the process we use to achieve clean air goals. The current process opens regions to poorly defined legal challenges, faulty science, and consigns many of them to a bureaucratic quagmire. While conformity is well intended and necessary, its application should be modified. As others have mentioned, conformity and plans should be timed together to achieve maximum results.

NARC will also urge Congress for this in the coming year to consider greater emphasis in safety in rural and urban communities, a balanced and intermodal approach to Federal funding, comprehensive review and consideration of technology deployment, and greater consideration of freight movement as an essential part of the transportation planning process. Of particular concern to NARC members and its citizens they represent are the tens of thousands of lives lost on our rural roads each year. Coupled with increasing safety concerns in urban areas, this presents a sobering picture of travel in America. NARC is urging Congress to apply resources in new and innovative ways to lessen this tragedy.

NARC is asking Congress to consider ways to streamline project delivery, while ensuring the health of our natural environment. The ability to move projects quickly, especially those that make our roads safer, is of key concern. Given the fact that many regional councils are currently involved in emergency management activities, NARC will ask Congress also to consider regional councils and MPOs as primary recipients for homeland security funding.

When completed, NARC will submit to you its position and policies for reauthorization of TEA-21. We hope you will consider them as part of your ongoing process.

Thank you, Mr. Chairman, for this opportunity. Further comments have been submitted to this committee and I will be happy to answer any questions. Thank you very much.

Senator JEFFORDS. Well, thank you for an excellent statement.

Peter, I am very proud of the work that you and your colleagues have done in Vermont. Can you summarize for us the value to any State in providing funding for rural transportation planning?

Mr. GREGORY. Well, as you know, Mr. Chairman, many of the areas are not served by MPOs, and engaging in a process that in-

cludes the rurals ensures that all citizens throughout the country have the same access to decisionmaking and project prioritization. Many of these decisions are made elsewhere and directly affect the lives and the quality of life of our rural citizens, so it is imperative that we provide the same benefits and opportunities to rural America as we do currently to urban America.

Senator JEFFORDS. Ms. Burbank, how many applications do you receive for the TCSP program?

Ms. BURBANK. We've received 1,332 applications for discretionary funding under the TCSP program over the period since it started under TEA-21, so there has been significant interest.

Senator JEFFORDS. And how many do you accept?

Ms. BURBANK. Pardon?

Senator JEFFORDS. How many do you accept?

Ms. BURBANK. Of those, we awarded 80, given the \$25 million in funding that was available. Several hundred additional projects have been earmarked.

Senator JEFFORDS. What is the ratio of need to desire for TCSP?

Ms. BURBANK. I think the ratio is roughly 10 to 12 times the funds authorized. Beyond the authorized funds in TEA-21, additional funds were made available through the appropriations process.

Senator JEFFORDS. What does that tell you about community desire to plan proactively?

Ms. BURBANK. There is a tremendous interest in more community-level planning. It certainly indicates the strength of that interest from all across the country.

Senator JEFFORDS. Thank you.

Let me go back to Mr. Gregory. This is for all of you, but I'll go down the line. While consideration of land use trends is not specifically referenced among the planning factors in Title 23, it seems to me to be a basic element in planning for transportation needs. How do each of you incorporate considerations of land use trends in your work? We'll start with Mr. Gregory.

Mr. GREGORY. Thank you, Mr. Chairman. The regional planning commissions, of course, deal with all kinds of issues, not just transportation, so, again, they are qualified to work and bring in all these different issues.

In our area of the country, we integrate land use planning, local development decisions, access management, demand side management to a great extent. It is clear that we could never build our way out of congestion, and although "congestion" is a relative term, we do have it in Vermont. But managing the demand, controlling access, and things like that can preserve the functionality of our system.

Senator JEFFORDS. Mr. Kirby?

Mr. KIRBY. Mr. Chairman, as part of the committee structure at the Metropolitan Washington Council of Governments, we have the local planning directors from the local governments who report up to our board of directors, and we work closely with them in developing forecasts of population and employment by small area zones for our travel forecasting process. We've also developed a comprehensive regional map showing the location of development centers and linking them to where the transportation facilities are,

and it has given us the ability to look at where we have transportation and not enough development, where we have development and not enough transportation, so those linkages exist within our organization.

Senator JEFFORDS. Mr. Leonard?

Mr. LEONARD. Mr. Chairman, in Wisconsin, when we develop our State-wide, long-range transportation plan, we work with our local regional planning commissions and our metropolitan planning organizations and develop that transportation plan based upon their land use plans.

Also, in addressing the smart growth legislation in Wisconsin, we've worked with all the local communities and we've put together a transportation guide to help them do their transportation element of their comprehensive plan. In that guide, we recommend that they develop land use and transportation plans together, but that they first think about what the vision is for their community, what they would like that community to be, and then develop their land use plan and transportation plan based on that. So it gets a very high level of emphasis.

Senator JEFFORDS. Ms. Burbank, would you like to make a comment?

Ms. BURBANK. Sure. I want to emphasize that by statute the transportation plans are required to look forward 20 years, and in doing so it is essential that the 20-year look-ahead considers how land use is going to evolve, how it will affect transportation, and how various transportation investments will affect land use. That needs to be part of that planning process. Land use is further brought in through the conformity requirements, where you have to examine the air quality impacts of those long-range plans in the interplay of land use and transportation. So we work closely with the State and local governments to make sure that their plans are doing this and to provide them tools.

Senator JEFFORDS. Thank you.

Next question is there appears to be some disagreement over the application of fiscal constraint in your planning work. I'd like to hear your thoughts on that issue, and I'd also like to ask you your perspective of organizations—how your organizations work together over the next few months to seek common ground on the issue. In general, I would prefer to receive solutions rather than problems, and from those interested in the reauthorization.

Mr. Gregory?

Mr. GREGORY. We look forward to continuing our dialog with all of the organizations that have a role to play in transportation planning, be it urban or rural or State organizations, and look forward to continuing that dialog with the committee.

The fiscally constrained issue is something that we work closely with our MPO on and the MPO works closely with the State of Vermont on. In fact, the State of Vermont developed a way to pare down its capital program, a little bit of truth in advertising so citizens understand that not everything that had been on a capital plan would ever get built, and regional commissions were key in working with local governments to ensure those programs and projects that were on the list were realistic, were fully supportive,

and were likely to be built in our lifetime, so we continue to work in that direction.

Senator JEFFORDS. Mr. Kirby?

Mr. KIRBY. Mr. Chairman, we believe that the law in ISTEA and TEA-21 and the regulations that were developed following ISTEA were really appropriate for metropolitan planning. We've found them to be very workable from the regional level. They have been very important to us in developing our plans. The development of revenue forecasts and cost forecasts and matching these over time over our 25-year period is probably the most important activity that we undertake as an MPO. We update these every 3 years and our board members and technical staff are very focused on that exercise. It has also had an impact back through our State DOTs and our transit agency. They work closely with us on this.

I think it is a provision that is working well. I think the fact that we are updating our plans regularly does provide the flexibility to update revenues and costs as new information comes along, so overall I think it is a very good requirement.

Mr. LEONARD. AASHTO plans to, over the next few months, work with all the various organizations addressing what are our draft policy positions, working with AMPO and NARC and Federal Highway Administration, as well as the other organizations. I think that, as a whole, we certainly understand and support financial constraint, having our plans and programs live within expected revenues. Our problems are probably more on a day-to-day basis. For instance, when we run into a complex project in contaminated soil, things like that, that extend the life of the project, change the cost, then we have to go back and change our program, go back through the review and approval process, so it is more on a day-to-day basis where it causes us problems, but we'll certainly work with the organizations on this issue.

Senator JEFFORDS. Ms. Burbank, do you have a comment?

Ms. BURBANK. First, I want to emphasize the Department's very strong commitment to fiscal constraint. It is essential to a good planning process, and we are committed to fiscal constraint.

Having said that, however, it requires flexibility, good judgment, and reason in judging what fiscal constraint is in any particular program or plan. I think the greatest need is for good administration of fiscal constraint. I haven't heard a lot of specific ideas for statutory changes to fiscal constraint in reauthorization, but we'll certainly be willing to look at that and discuss it with our partners and with the Congress.

Senator JEFFORDS. Senator Chafee?

**OPENING STATEMENT OF HON. LINCOLN CHAFEE,  
U.S. SENATOR FROM THE STATE OF RHODE ISLAND**

Senator CHAFEE. Thank you very much, Mr. Chairman, for having the hearing. I'm just struck that, as we have these various hearings on the reauthorization, you don't hear too many dissenting notes about the reauthorization. I think that's different from the last time it was reauthorized. There were a lot of questions about it. I don't think this panel is any different from the others we've heard in the last number of weeks.

I don't have any other further questions.

Senator JEFFORDS. Thank you, Senator.

The traditional planning process begins with a problem statement, develops information, weighs alternatives, and then sets a course of action. To be effective, it must be a continuing process. In the classic planning model, the mechanism for regenerating the process is evaluation. Did this strategy work? And what were the outcomes?

My question is: do we have an evaluation step in our transportation planning process? And are we measuring outcomes? And can we become more effective in this regard?

Mr. Gregory, I'll pick on you first again.

Mr. GREGORY. By the nature of planning, planning is iterative, so we are constantly reevaluating our situations, taking into account new circumstances. But you are absolutely correct that evaluation and measurable progress toward our goals is key. We can always do more. We are always looking at ways to further integrating data that we collect, whether it be natural resource or economic development data, to ensure that the transportation goals that we have set out in our local, regional, and State-wide plans are met.

Mr. KIRBY. Mr. Chairman, this is a question we are often asked as MPOs is, "How accurate has your planning been?" The MPO process has been in place now for some 30 years, and we are able to look back in the Washington region to plans in the 1960's and see how well they turned out, how the forecast turned out. We have not always projected population and employment growth on target. We under-estimated the growth of labor force participation by women. We didn't anticipate the growth in telecommuting. We didn't anticipate people buying SUVs as much as they have. So there are changes that occur in lifestyles that we have to keep up with, but the continuing updating nature of the process is what gives us the ability to check on our progress, to look backward as well as forward.

Mr. Chairman, you mentioned the word "continuing." That's the critical component, I think, to evaluation and keeping up with changes as they occur.

Senator JEFFORDS. Mr. Leonard?

Mr. LEONARD. Mr. Chairman, State DOTs use performance measures in their State-wide plans, and one of the things AASHTO is doing is supporting increased research and training in the use of performance measures so we can always continue to evaluate how well we are doing, what's the condition of our transportation system.

You've also probably heard the term "asset management." That is a large emphasis area within AASHTO so that we are continuing to evaluate how well we are doing at preserving the existing system, as well as improvements in that system. So between performance measures and asset management, we are doing a good job of evaluating the outcomes and what have been the changes.

Senator JEFFORDS. Comments, Ms. Burbank?

Ms. BURBANK. Yes. Starting at the Federal level, we do establish performance measures for ourselves and track them under The Government Performance and Results Act (GPRA), and I think we are getting better at doing that. However, it is certainly not easy

to track those outcomes and to identify what they should be. They range from mobility measures to productivity measures to environmental measures and safety measures.

Shifting to the State and local level, we have noticed increasing emphasis by both MPOs and State DOTs on establishing performance measures and doing performance planning.

Senator JEFFORDS. Well, I want to thank you all for your excellent answers, and hopefully we will all work together.

Ms. Burbank, I understand that other members who have been delayed in attending today's hearing were looking forward to discussing the issues with you. I wonder if you would mind staying on a little bit after the next panel?

Ms. BURBANK. I would be happy to.

Senator JEFFORDS. Thank you very much.

Well, thank you all. We're going to be back in touch and depending upon you to help us keep going in the right direction, so thank you very much.

Our second panel will offer a range of views on the effectiveness of the planning program and on the scope going forward. The second panel will include: Mr. Andrew Cotugno of the Portland Oregon MTO known as METRO; Ms. Judith Espinosa from the University of New Mexico on behalf of the Surface Transportation Policy Project; Ms. Jennifer Joy Wilson on behalf of the National Stone, Sand and Gravel Association; Wendell Cox from Belleville, Illinois; and Mr. Tom Downs of the University of Maryland.

Again, thanks to the panelists for coming. We look forward to your testimony.

Mr. Cotugno?

**STATEMENT OF ANDREW COTUGNO, PLANNING DIRECTOR,  
METRO, PORTLAND, OREGON**

Mr. COTUGNO. Thank you. Mr. Chairman, I want to thank you for holding this series of hearings on reauthorization of TEA-21 and inviting me. I'm Andy Cotugno, planning director for METRO. We're the regional government of the Portland, Oregon, metropolitan area. METRO is the only elected regional government in the U.S. We also serve as the MPO and are active members of the Association of MPOs.

Portland is often cited as the smart growth capital of the world. Whether that's true or not, we are certainly scrutinized for our smart growth programs and they are closely tracked from across the country. It is from this unique base of experience linking land use and transportation that I offer my comments this morning.

I'd first like to speak on the principles of making the smart growth connection to transportation and then relate that to recommendations for how the next authorization bill could recognize these principles. The linkage between smart growth and transportation is about understanding how developing land use patterns impact the effectiveness of the transportation system and, in turn, how new transportation projects affect these development patterns.

METRO and the Portland region have implemented a number of integrated land use and transportation strategies. We have an urban growth boundary in place for now more than 20 years, which has effectively stopped the sprawling development pattern leap-

frogging onto farmland. We've used zoning to reinforce a higher-density development pattern in locations that can be well served by transit, producing six consecutive years of ridership increases. We have protected industrial areas and intermodal freight terminals from conversion to big box retail, preserving this land and highway capacity for more important economic uses.

We've adopted parking limitations to ensure new development does not over-build parking. We've adopted a requirement for greater local street connectivity to ensure that a system of cul-de-sacs does not simply shift local traffic onto the regional system.

We have restricted development near streams and purchased open space to ensure a balance between growth and access to nature.

We have adopted revised street design guidelines to ensure highways intended for through traffic are built to emphasize moving cars and trucks, while streets in downtowns and neighborhoods support a strong pedestrian environment.

We've used the flexibility provided by ISTEA and TEA-21 to fund a broad mix of highways, light rail, bike trails, sidewalks, and transportation development projects. We've put to good use funding made available through the new starts program to build a successful light rail system that helps to focus growth and has ridership 7 years ahead of forecast.

We've leveraged the requirement for an MPO into a coordinated regional growth management and environmental protection program.

With this framework, my focus on smart growth and the next authorization bill is going to emphasize three programs—the Federal new starts program, FTA new starts program; the Federal highway national trade corridor, so-called “borders and corridors” program; and the Federal Highway TCSP program.

First, the new starts, which I believe can be a model for the other two programs. It has been successful in constructing light rail projects. As a result of high competition for these funds, there is a long line waiting for funding, and to manage that demand, Congress has set clear criteria to distinguish the most meritorious projects. The Federal Transit Administration requires local areas to go through a rigorous process, producing the best projects.

The Federal Transit Administration makes a recommendation to Congress on projects that are recommended, highly recommended, or not recommended for funding, and based upon that the congressional authorizing and appropriating committees authorize execution of a multi-year funding contract.

This program produces a limited number of good projects that stand up to scrutiny from a large, competitive field, and produce projects that actually make a difference. For the Portland region, the new starts program has provided the means to build an essential part of the region's infrastructure and shape growth of the region in the process. It has had a profound impact on our ability to reign in sprawl and hold tight an urban growth boundary. It has helped produced a terrific downtown Portland, and is now shaping the future of downtowns in Gresham, Beaverton, and Hillsboro, and has been possible to leverage State and local funds that would otherwise not have been spent on transportation into the projects.

So what might be the equivalent on the highway side? You might think the national highway system program would be that because it is intended for modernization of the most significant part of the Nation's highway system, but that system is large and the use of those funds is quite varied.

I would follow the new starts model with a national trade corridor program to make that smart growth connection to build a strong economic base with a trade and freight emphasis. Like new starts, I would suggest it be authorized at over \$1 billion, allowing Congress to make multi-year commitments to large construction projects; however, with those funds Congress should set a high standard on how those funds are spent to ensure high-quality projects are funded that produce the greatest impact on global economic competitiveness. Federal Highway Administration, like the new starts, should make sure that the local areas go through a rigorous process so that there can be a recommend, highly recommend, or not recommend recommendation to Congress, providing the basis for executing a full funding contract.

In Portland, the case study is I-5 through the middle of town connecting Oregon and Washington and California. It is a national trade corridor. It is one of the national trade corridors. But the I-5 bridge across the Columbia River is the bottleneck. It was built in 1917, well before the interstate system was conceived, and represents the bottleneck right where the port of Portland, the intermodal railroad terminals, access to the Portland International Airport, and access to 80 percent of the region's truck terminals are all concentrated.

We've developed a fragile consensus on how to fix this problem, but a consensus faces many difficulties because of the high impact of further widening in a low income minority area, because of the Endangered Species Act affecting construction across the Columbia River, and because that 1917 bridge is on the National Register of Historic Places.

But we've come to a conclusion that that bridge needs to be expanded from six lanes to ten lanes, light rail needs to be expanded from Portland into Clark County, Washington. We need an aggressive program to minimize demand. And we've reached an agreement that land uses need to be controlled to avoid simply more sprawl in response to a bigger freeway resulting in simply a bigger traffic jam in the future.

The third program is the Federal TCSP program. It was really founded to make the land use connection to transportation system and was based upon the principle of having transportation projects support good local and regional growth decisions. In the first year, I believe Federal Highway did a good job of setting guidance and selecting competitive projects; however, since then it has been earmarked to a potpourri of different projects and I believe could also benefit from the rigor of the new starts model, not the build the major elements like freeways and light rail, but to build good communities that support the transportation system around that.

Again, Federal Highway should continue its guidance to development to identify what are the best types of projects to fund and publish these as best practices. I would consider increasing the authorization level to that that was earmarked in 2002, but tighten

up the statutory language to ensure grants cannot be awarded unless they demonstrate a supportive land use connection, and base those earmarks on a Federal Highway recommendation of recommend, highly recommend, or not recommended, the same for all three programs. The areas go through a rigorous process, therefore justifying a substantial funding commitment to a project that actually makes a difference.

The final comment I would like to make, in addition to support of Ron Kirby's comments about the MPOs' planning funds and STP funds, is a suggestion that there be a better connection between the Clean Water Act and the Endangered Species Act with TEA-21 reauthorization. There's already a strong connection with the Clean Air Act, and similar kinds of linkages would be appropriate for Clean Water and Endangered Species.

Thank you, Mr. Chair.

Senator JEFFORDS. Thank you.

Ms. Espinosa?

**STATEMENT OF JUDITH ESPINOSA, DIRECTOR, ALLIANCE FOR TRANSPORTATION RESEARCH, ALBUQUERQUE, NEW MEXICO, ON BEHALF OF THE SURFACE TRANSPORTATION POLICY PROJECT**

Ms. ESPINOSA. Thank you, Mr. Chairman, and thank you for allowing me to be here to testify. I am Judith Espinosa, director for the Alliance for Transportation Research Institute at the University of New Mexico. I appear here today on behalf of the Surface Transportation Policy Project, where I serve as a member of the board of directors.

I thank you, Mr. Chairman. STPP has just celebrated 10 years of progress since ISTEA and TEA-21 reauthorization, and I believe, Mr. Chairman, you and Senator Chafee were there to celebrate with us.

I also bring greetings from New Mexico and to say that we are very pleased to see that Senator Domenici has rejoined the committee again, and we look forward to working with the committee and with him on all of these issues.

New Mexico has had 400 years of cultural diversity, and with that has brought 400 years of the oldest commercial trade route in this country founded by the Spanish called the Camino Real, so we think we know a little bit about pedestrian and horse cart and now ultimately automobile and transit through our State. Like Vermont, we are a rural State, and so I was pleased to hear panelists earlier talk about the need for rural planning and for the engagement of the public not only in our large urban centers, but also in rural America, as well. We find that to be very important, and I believe that my written testimony, which I would ask to be put into the record, speaks to that.

STPP and its coalition of national, regional, and local organizations—of which we now number many hundreds due to a new charter that we have engaged many hundreds of organizations and individuals around the country—believe that the transportation policy and planning concepts and the structure in the current law is fundamentally sound and should be preserved. However, despite the progress that we have made over 10 years, we also want to

make sure that we can fully capitalize on the many opportunities that TEA-21 has intended to make available, and we still feel that there need to be improvements. Like my mother almost always told me, Mr. Chairman, "Improvements is what life is all about," and so we cannot stop on the progress that we've made.

The public has an appetite now for transportation improvements. It has been stimulated over the last decade, and I think that is due to the public input provisions in ISTEA and TEA-21. The public wants choice and balance and transportation with options that add value to their lives.

STPP views TEA-21 reauthorization as the ability for this committee and for Congress to continue to renew the public's concerns with transportation investments, but to do good planning, Mr. Chairman, we need good data and good research. I believe that Cindy Burbank and I have talked about this on some of the Transportation Research Board committees we have been on. We need to continue to develop that.

You will see, Mr. Chairman, on this panel and other panels that you hear from the discrepancies in data. Some will argue that smart growth is very difficult to achieve and that what smart growth plans and what transportation planning does now does not achieve what we are looking for. I would say to you, Mr. Chairman, that that is why we need to present ourselves with good data, and this governing body and the Federal Government can help do that for the States and the local MPOs.

We need funding transparency. You've already heard about investments and looking at that. The public wants to know where their money is going. This is a taxpayer issue. This is an issue for the public taxpayers. The public does not want to continue paying for incremental increases in capacity and in infrastructure without knowing exactly whether things can be done differently, how they can be done differently, and alternatives to that planning.

We need to know what the budgets are from the States. They change. The MPOs do not always know. MPOs do not know from only year to year what kind of budget they will have to spend in their areas.

Those are all very important and critical needs that we have in order to effect and enhance our planning process in this country.

I might also mention, Mr. Chairman, just to know and to say last that this Congress this year and next year and this committee has the opportunity to look at transportation in an integrated fashion. You, Mr. Chairman, on this committee and Members of Congress will be looking in 2003 at air, rail, highway, and transit reauthorizations. We would urge the Congress and this committee to look at an integrated transportation system for this country that looks at not just surface transportation but integrating our airports with our cities and also our cities with our rural areas. That will bring a diversity of bus, light rail, high-speed rail, aviation, and highways to our population, and that we can start planning for that in this millennium so that we have a truly integrated opportunity to provide benefits and quality of life to our communities.

Thank you.

Senator JEFFORDS. I thank you for an excellent statement.

Mr. Cox?

**STATEMENT OF WENDELL COX, WENDELL COX  
CONSULTANCY, BELLEVILLE, ILLINOIS**

Mr. Cox. Thank you, Mr. Chairman. You surprised me. I am a consultant. I live in Belleville, Illinois. I was appointed to three terms on the Los Angeles County Transportation Commission by Mayor Tom Bradley and to the Amtrak Reform Council by Speaker Gingrich. I have just returned from 2 months as a visiting professor at a French national university, and I am visiting fellow at Heritage Foundation, though I don't speak for them today. I speak for myself.

What I will suggest to you today are things probably you've not heard before, things that are very controversial, things that will probably disagree with most everything else you hear today. But recognize that in the 1950's urban renewal and ripping up our cities was what planners thought we needed to have, and I'm here to suggest to you today that the whole smart growth agenda in many ways is a step in the wrong direction.

First of all, if you look at my slide No. 2, you see what's happened to Paris in the last 50 years. Urban Sprawl is not an American problem. Urban sprawl occurs all over. It occurs where there is affluence and it occurs where there is population growth. And, of course, we have great amounts of land in this country. Only about 3 percent of it is urbanized at this point, according to USDA data.

Now, smart growth seeks to control sprawl, to reduce sprawl, and, in attempting to do so, claims that it will reduce traffic congestion, that it will reduce air pollution, it will lower overall costs, and so on.

The key to smart growth is density. If you do not increase density, you can accomplish nothing of what smart growth seeks to accomplish. But the claims don't hold up. International and national evidence proves that traffic congestion is greater where densities are higher. That's not surprising. Federal research indicates that at the present densities of our urban areas, if you have 100 percent increase in density you will have about an 80 percent increase in traffic. Now, granted, that means the per capita driving drops, but the overall increase in traffic continues, and that creates another problem. Traffic slows down, commute times are longer. In addition to that, because traffic slows down and because there is more stop-and-go driving, you have worse air pollution. All the data internationally and nationally shows that density is associated with worst traffic congestion.

By the way, we've made great progress, and I want to make sure you are aware of the progress we've made in this country. This chart in my presentation from the EPA indicates great progress in reducing the three criteria pollutants or two of the three criteria pollutants in this country at the same time that vehicle miles traveled have gone up very much.

You've also probably been told that sprawl is costly, and I don't come here with a brief for sprawl, I come here with a brief for freedom. I believe we ought to allow people to live and work where they like, and we ought not to interfere with that unless there's a good reason. The fact is that the overall consumer expenditure data of the U.S. Department of Labor shows that, where densities are

lower, costs are lower overall. Yes, transportation costs are higher, but housing costs are lower.

But worst of all is the impact of the anti-sprawl efforts and the densification efforts on minorities and low-income people. Sprawl is associated with higher levels of home ownership. The data is very clear on that. There's all sorts of research on that. There's a raging debate between people like me—and there are other people like me in the academic community—and those on the other side who say, “Well, how much is sprawl increasing? How much is the anti-sprawl movement increasing the price of housing?” Well, the problem is this—it's an intellectual discussion. Any increase in the price of housing hurts people. Smart growth rations lands and development. When you ration, you raise prices. As prices go up, you hurt the lower part of the income spectrum, and that means in this country that minorities and low-income people will pay the greatest price for the anti-sprawl measures that will inevitably increase the price of housing relative to income.

Now, the normal answer to that is to hear people say, “Well, we'll increase the housing affordability program, the affordable housing programs.” The problem with that is in this country today we only support one-third of the eligible recipients of housing assistance with our programs as they are, so before we even start with the anti-sprawl strategies we've got two-thirds of the people who are eligible who aren't even getting money.

Finally, we should remember that this country is the richest country in the world. It is the most prosperous country per capita in the world except for countries smaller than Fresno, for example, and we need to recognize the role that land plays in wealth creation and we need to be very careful about limiting land and regulating land.

Now, a couple of quick notes on transit. Transit is very concentrated in this country. I am not here to be anti-transit or pro-transit or anti-roads or pro-roads. The fact is transit works very well. Transit carries 75 percent of the people who work in New York. Transit carries 60 percent of the people who work in the loop in Chicago. But it carries virtually no one to work who has a car outside our central business districts, and, unfortunately, our central business districts now represent only 10 percent of employment. What that says is that transit is in no position to reduce traffic congestion except in those corridors going to central business districts.

I take a bit of evidence—a recent study by the Union of International Public Transport. The International American Public Transit Association was quoted thusly: “In the United States, with the exception of New York, public transit is unable to compete with the automobile. Its speed is half as fast, which means that door-to-door travel times incorporating terminal distance times, waiting and transfer times are three to four times longer than public transport.” I think that's an over-statement. It isn't that bad. The fact is, however, that transit, unfortunately, has no potential because of our dispersion to reduce traffic congestion except in those downtown corridors.

Now, in conclusion I would suggest to you that no problem has been identified of sufficient magnitude to justify the coercive smart

growth strategies; two, that there is little potential for reducing traffic congestion or increasing transportation choice for all but a few, mainly those going downtown through transit. There are no material successes. You will not find any successes in this regard anywhere in the developed world. And, finally, smart growth strategies tend to intensify the very problems they are purported to solve. Therefore, I would suggest new Federal mandates with respect to planning on local agencies based upon a philosophy of smart growth are inappropriate.

Finally, I won't read the quotation from Adlai Stevenson, but I think it is well to remember that we are a country that is very prosperous and we have led the world in economic progress and a whole bunch of other things through history, and the Stevenson quotation from the 1952 campaign basically concludes with, "Who shall say the American dream has ended? I think we need to look forward to the future with confidence, recognizing the great success we have had and not go back and start regulating land and reduce the affluence of this country and, frankly, make minorities pay the price."

Thank you, Mr. Chairman.

Senator JEFFORDS. Thank you, Mr. Cox.

Ms. Wilson?

**STATEMENT OF JENNIFER JOY WILSON, PRESIDENT, NATIONAL STONE, SAND AND GRAVEL ASSOCIATION, ARLINGTON, VIRGINIA**

Ms. WILSON. Good morning. I'm Joy Wilson, president and CEO of the National Stone, Sand and Gravel Association located in Arlington, Virginia.

Mr. Chairman, as someone once confirmed by former membership of this committee and as a former Senate staffer, it is a pleasure to be here.

NSSGA represents the Nation's crushed stone, sand, and gravel industries, and our membership represents 90 percent of the crushed stone and 70 percent of the sand and gravel produced annually in the United States. Nearly three billion tons of aggregate valued at approximately \$14.5 billion were produced in this country in 2001. There are about 10,000 construction aggregate operations nationwide in virtually every congressional District, and construction aggregates are used primarily in asphalt and concrete. Of asphalt pavement, 94 percent is aggregate, 80 percent of concrete is aggregate.

While I appear this morning representing the aggregates industry, I also appear as a member of the Partnership for Quality Growth, which is 13 labor and industry organizations that share a common interest and concern for the future of our country's growth management and its impact on transportation infrastructure. I know this is something we share with the members of this committee, so we particularly appreciate this, Mr. Chairman, and your initiative in holding this hearing.

Our industry labor coalition adheres to the basic concept that Americans should be allowed the freedom of mobility and the freedom of choice in where we live and when and how we travel. We recognize that as our population continues to grow, all planning,

whether it is Federal or local, must accommodate that continued growth, plus the collateral increase and transport of freight that will be needed to support that population. We hope to ensure that Federal policies respect local planning power to meet growth needs, especially with regard to infrastructure improvements.

Use of Federal transportation law to drive local planning decisions should be approached with extreme caution lest local and State land use decisions become usurped by Federal determinations.

Since 1975, the U.S. population has increased more than 30 percent, passenger car traffic has more than doubled, and truck traffic has increased six-fold. At the same time, highway capacity rose just 6 percent. There is no wonder we are experiencing congestion. We haven't, as a Nation, kept up with our needs.

Traffic congestion in and around our cities costs our economy \$78 billion annually in added time, wasted fuel, and labor costs.

Economic growth is not the only cost to society. Each year 14,500 people die in traffic accidents attributable to unsafe road and bridge conditions. Safety improvements and maintenance of our current system will take \$50 billion a year. We're about \$20 billion a year short of that investment, even with TEA-21, and we need to understand and support what additionally it will take to solve the capacity issues.

One in eight traffic fatalities results from a collision involving a large truck. That's about 5,000 deaths a year. This last figure warrants some thinking about the benefits of separate truck lanes, or HVLs—heavy vehicle lanes. This idea merits consideration because such separation of heavy vehicles from passenger vehicles could enhance motorist safety, relieve congestion, and reduce wear and tear on lanes used by lighter vehicles.

Even though our country is blessed with the best transportation system in the world, transportation planners can fail society if they refuse to acknowledge the data that is critically important to decisions when they are made about when and where to add capacity. Consider this: suburbanites or rural residents who move to an urban area are estimated to drive 90 percent as much as they did before, but if the urban population doubles, then even with the reduced per person driving pattern the city will see a tremendous increase in vehicle miles traveled.

How then are cities going to reduce congestion and still offer Americans freedom of mobility? Capacity increases will need original thinking and some creative, tough, practical know-how. Everything should be on the table, from adding turn lanes and smart signals to considering additional land miles or new roads, as well as public transportation, HOV lanes, maybe heavy vehicle lanes, tunnels, elevated streets, and so forth.

Americans view as fundamental their freedom of choice in where they live and work and how they travel. In 2000, when the voting public in Arizona and Colorado came to fully understand the ramifications of State-wide ballot initiatives on smart growth, the initiatives failed. They failed because the proponents misread how strongly the vast majority of Americans hold to the values of home ownership, safe neighborhoods, and the freedom to travel and to choose where to live.

Consider these statistics: by 2025 the U.S. population is expected to reach 337 million people, an increase of 60 million over 2000. Annual passenger miles traveled are predicted to increase from 5 trillion miles in 2000 to 8.4 trillion miles in 2025. By 2025, freight transportation will expand to just over 5 billion ton miles, a 29 percent expansion. Rail ton miles is also projected to grow by 2 percent per year between 2000 and 2025. Capacity needs are real and present for all modes of transportation—air, waterways, ports, rail, transit, and road. That’s why we must increase our investment in transportation infrastructure.

Mr. Chairman, I know I’m getting to the end of my time. I’ve got just about one more page of summary, if that’s all right.

Senator JEFFORDS. Keep on going.

Ms. WILSON. Thank you.

The reality is that goods will need to continue to be shipped, primarily in trucks on our Nation’s highways. People will still want to go to work and have the freedom to be fuel efficient and timewise by practicing trip chaining, or going to multiple destinations in one trip. The decisions made in the reauthorization of TEA-21 and the successor legislation will have significant impact on this Nation 21 years from now when the U.S. population will have increased by 60 million people.

I thank you for this opportunity to testify.

Senator JEFFORDS. Thank you for your testimony.

Mr. Downs?

**STATEMENT OF TOM DOWNS, DIRECTOR, NATIONAL CENTER FOR SMART GROWTH EDUCATION AND RESEARCH, UNIVERSITY OF MARYLAND, BALTIMORE, MARYLAND**

Mr. DOWNS. Thank you, Mr. Chairman and Senator Chafee. I’m Tom Downs, and I’m the director of the National Center for Smart Growth Research and Education at the University of Maryland, created by a consortium of schools of engineering, agriculture, public affairs, and architecture and planning.

Instead of giving you the kind of executive summary of my comments, I was struck by a couple of things that maybe I can summarize and perhaps reinforce. One is that smart growth is about growth. That’s why the “growth” word is part of that. And you can quibble about whether or not it is smart, quality, efficient, effective growth. It is a framework that questions how we will respond to the demographics that Ms. Wilson just laid out—the demographics which, by the way, are about 64 million people additional in the United States in the next 20 years, not 25 years. Demographics are destiny. That’s two Californias. The question is how this country will choose, with hundreds of billions of dollars worth of transportation investment, to cope with eight trillion miles of travel in the United States in the next two decades.

If the frustration with the existing system at its current population levels and travel levels is high enough to be ranked at the top of almost every public attitude survey in the United States about local issues, then we have to be accountable in this reauthorization for how we begin to answer some of those questions about how we absorb that growth.

The Center received a grant from the Packard Foundation to look at some of the issues in data and modeling to see where we were in this. An incredible gap between assumptions about how the planning process works in America, about transportation funding, and what we know it actually produces. There is relatively little research of a national level that shows the impact of highway investments, transit investments, or any other modal investment over the long haul about density, suburbanization, growth, land use patterns. The research that is there suggests that there are little economic development impacts of the construction of a highway corridor; that, in effect, that highway corridor is simply a moving of the economic chairs within a region. There's no net gain or loss from that from an economic development standpoint for the region. There are winners and losers within the region.

It suggests that urban areas with beltways sprawl faster than areas without beltways, but it is inconclusive.

It shows some linkages between highway capacity, expansion, and growth in VMT, but the correlation, the actual growth in VMT is less than popular literature would suggest.

The literature also suggests strongly that not building highways does not change VMT growth within an urban area. So if you don't build it, they come. If you build it, some of them come. But the research doesn't help us enough to understand why we are making hundreds and hundreds of billions of dollars worth of national investment in transportation systems.

The question that the planning process and the framing of TEA-21 in its purpose chapter needs to be looked at again, expanded, and put in the planning chapters of the next bill. It posited that the Nation had an interest in safe, efficient movement of goods, intermodalism, social justice, social equity, clean air, environmental mitigation, and all of those were expectations about the use of those Federal funds. If we say that they are simply block grants to be passed along to the rest of the inter-governmental system, we miss an important point about our national responsibilities.

I'd like to hit two points, one that was raised by Mr. Cox about the question about whether or not the suburbanization or smart growth impacts minorities adversely or positively. To show you the lack of data, there is an additional study that shows that the poorest of families, the lower 25 percent of families in terms of income in the United States, are severely disadvantaged from a transportation cost standpoint about a move to the suburbs, and that those costs more than offset the gains in housing so that there are no easy answers.

The answer is that the poor and the disadvantaged have always been disadvantaged by transportation investments. We simply don't have that as a focus in our transportation systems.

One of the points that Ms. Wilson made about how many roads within the Washington region were drawn, only one was built, failing to mention that, of those, just one envisioned the removal of 15,000 individuals from that corridor, alone; that our transportation system has always made assumptions about what is best for communities, and the strength of this last bill was in mandating more direct involvement in the planning process by counties and local communities.

The last is that one of the major assumptions that people make is that density increases traffic. We don't actually know that because we don't count one of the important methods of transportation in most urban areas, and that is pedestrians. Unless you are carrying around 2,000 pounds of sheet metal, you don't get counted in the transportation process. There's some data that suggests, for instance, that there are more pedestrian trips in New York City than there are transit and automobile trips combined, but we don't know that because pedestrians obviously don't count. They don't pay a gas tax.

What we don't need is a lot of ideology struggling over the outcome of this bill. What we don't need are opinions. What we need is a funded set of research objectives beyond materials and road construction that lets us understand how we have affected the land, our jobs, and how we live in America, and I think that there is an emerging consensus among a lot of people about the purpose of transportation investments, at least at this level, and that is to help Americans choose how they want to live and travel—something that for a lot of Americans is very difficult to do. In this democratic society, we hope it is about choice and freedom.

Thank you, Mr. Chairman.

Senator JEFFORDS. Thank you, Mr. Downs.

I now will ask a question for the panel, and I'll go down and start at the opposite end again.

Our committee has jurisdiction over the highway title, while the Banking Committee handles transit. I look forward to working closely with Senator Sarbanes on the reauthorization. One element in the transit title that appears very promising to the transit-oriented development using TOD, transit properties can enter into partnerships with the private sector to generate new land uses that both support and benefit from the availability of transit facilities, and the Federal Transit Administrations encourage and support these partnerships. In so doing, TOD can return revenues to the transit property and the transportation system.

I would like to explore the transferability of the TOD concept to highways, and I would like your thoughts on this.

Mr. COTUGNO. Mr. Chairman, we use the flexible dollars now to support transit-oriented development projects. We use it by transferring STP or CMAQ funds from Federal Highway to Federal Transit, which is available under TEA-21, and thereby access the Title 49 eligibility for TODs that's not available under Title 23, but the transferability of funds is available to do that.

If it were more directly included in the Title 23 side, I think that would be useful. Certainly, the TCSP category explicitly incorporates that eligibility, whereas the other categories require this transfer to the FTA site. It works, and we've used it effectively.

Senator JEFFORDS. Ms. Burbank, do you have any comment?

Ms. BURBANK. Were you asking whether highway programs could be revised to be more supportive of transit-oriented development? Is that the thrust your question?

Senator JEFFORDS. I believe so, yes.

Ms. BURBANK. Well, as Andy noted, there is considerable flexibility now, and yes, I'm sure there are opportunities to take that further. It's something we could take a look at and comment on.

Senator JEFFORDS. Ms. Espinosa?

Ms. ESPINOSA. Yes, Mr. Chairman. I agree with what Mr. Cotugno said, and also I believe that looking at transit-oriented design and where highways come into play, you're looking at a node and a place where people want to be and where they come from. To be able to increase the funding on the TCSP side would be, I think, one of the more opportune available methods for this body to use, perhaps looking at minimum amounts. I know that is sometimes difficult with earmarks, but it is quite important. It has been a very popular program and one that can be flexed to look at transit-oriented design, and also how that is designed around streets and around roadways in communities. I know in Albuquerque one of the mayors is doing that in a small community because he doesn't have available transit. He's looking at how pedestrians interact and bicyclists interact with the roadways.

Flexing the money is certainly important, but there is also the ability to get that money into the local areas so that the flexibility comes within the MPOs and within the local government areas. They know best where some of that, if you will, transit-oriented, highway-oriented design should be placed and how that might be able to be worked. They're the ones that work within their community, I believe, and they also can provide the transparency and the public input to be able to make those plans realistic. We would like to see that more in a local type setting, whether it's a rural planning or whether it's a local MPO planning area, rather than sitting at the State side where those decisions would be made at that level.

Mr. COX. Mr. Chairman, as you know, these programs need to be effective. I mean, we, as we've heard from two of the witnesses today, are looking at a situation where we're going to have eight trillion vehicle miles in this country in 20 years, and I fully agree with Mr. Downs with the view that we need a whole lot better research than we have at this particular moment.

What we do with TOD with respect to the Federal program I think should, to some extent, have to do with how effective that program is with respect to other alternatives that we have, and I would really urge you, Mr. Chairman, and the committee and the Congress to be thinking very seriously about some new ways to think about transportation planning in this country and some new indicators.

One that strikes me—and there may very well be much better indicators than this, but, I mean, think about eight trillion miles in the next 25 years. I mean, we are going to spend a lot more time sitting in traffic. There is just simply no way that that's not going to be the case. And so maybe we ought to be looking at trying to restructure the Federal program to encourage those kinds of strategies that reduce hours of delays for people the most, and maybe the indicator ought to become, with respect to all these programs and whether they survive in an overall package, whether this year or next reauthorization, perhaps we ought to be looking at something like cost per reduced hour of delay.

Senator JEFFORDS. Thank you.

Ms. WILSON. Mr. Chairman, the only thing I might add to that discussion is I think the flexibility is important, but I think it is

important that it be at the ability of the local level to flex either way. It may be in a particular community that a combination of some sort of HOV bus lanes would be the proper thing. It may not be transit in the rail sense, and it may be adding turn lanes, it may be traffic signalization. There are all sorts of things that I think need to be looked at in the flexibility, and would propose that when you look at flexibility and adding enhancing options that the flexibility be able to go in and out of the road program both ways.

Mr. DOWNS. Mr. Chairman, only an editorial comment that if we're going to talk about a future we probably ought to start talking about people miles of travel rather than vehicle. Vehicle miles of travel always proposes that vehicles count more than people.

The recent research about transit-oriented development suggests that the key factor is not the investment, it is the local land use set of relationships if you link in the transportation plan, a set of expectations about the development that local jurisdictions ought to be required to show how their local land use and zoning is compatible with that set of investments. It is not a Federal predisposition to say that a set of local land use requirements are better than others, but it should be that, if there is a Federal investment that is based on a series of expectations at the local level about an outcome, that the local jurisdiction show how it is going to make that outcome happen.

My guess is that transportation-oriented development will suffer the same lack of linkage to local land use decisions that transit-oriented development does now.

Senator JEFFORDS. Thank you all.

A second concept that seems promising is the safe path to schools initiative. I know that my colleague in the House, Congressman Oberstar, shares my interest. How can transportation planning most effectively advance the safe routes to school idea?

Mr. COTUGNO. Maybe just to start, the focus of transportation tends to emphasize moving adults a lot more than it does moving kids—getting to work, moving freight. Safe routes to schools is the younger population that is just as important and ought to be just as much attention as getting to work or getting to shopping or getting to the warehouse for trucks.

Senator JEFFORDS. Ms. Burbank?

Ms. BURBANK. Yes. One way it can do that is greater attention to pedestrian and bicycle facilities in neighborhoods. Through our bike/ped activities and fulfilling some of the mandates in TEA-21, we have been working on that, providing curricula on bicycle design and safety which kids can use to get to school, as well as promoting better design of sidewalks to accommodate children and disabled adults. And so there are many ways to support safe routes to schools through greater attention to bicycle and pedestrian design, incorporating bike/ped needs into the design of highways, and context-sensitive design that can make a difference and are taking place now.

Senator JEFFORDS. Thank you.

Ms. ESPINOSA. Mr. Chairman, I'm proud to say that the Surface Transportation Policy Project was a sponsor of safe routes to school in California. That program has shown what will happen with good flexibility when a State and local governments come together to be

able to flex money to get it out to local planning, particularly for schools and for children getting to schools.

While in places other than California there's different ways of doing this, but I think the concept is very appropriate and the concept is very appropriate for consideration and reauthorization.

Safe routes to school allows for what we're talking about, which is public input and public decisionmaking and a place where the public can see where their investment is going.

Let me give you an example. Outside of Albuquerque, New Mexico, we were working on planning a contact-sensitive design project. Actually, the community stopped a five-lane roadway through there because they wanted to see smaller lanes. One of the chief areas of interest was that going right past this roadway or right by this roadway were two schools, a middle school and a first-grade-through-fifth-grade school. Neither the Highway Department in the State nor the local public works agencies had ever talked to the schools or the children or their parents to see what kind of walkways we needed, what kind of pedestrian walkways, what kind of bicycle routes, how people would cross this proposed five-lane highway.

Safe routes should be put into planning where new models can be developed for planning where you can talk about the disadvantaged communities which in this community were disadvantaged children, how they are going to get to school, and what is the safest route to go.

That brings the entire circle in. It also allows for new challenges in modeling. How do we get research? How do we get data? And how do we do new models that are going to include our younger generation—which, by the way, is very fast-growing in this country. So we would hope that this body would look at a safe routes to school provision in TEA-21 reauthorization, do it in a broad fashion that allows local governments that kind of planning with their communities.

Senator JEFFORDS. Thank you.

Mr. Cox?

Mr. COX. Mr. Chairman, I would only urge some caution, because oftentimes the beginning of Federal regulation and the beginning of Federal programs brings us into a situation where local prerogatives are interfered with in the long run. I'm not saying that's what is happening here, but we need to be concerned with that.

I'm real pleased to have the opportunity—I know that you here don't spend a lot of time on school buses because school buses tend to be a local and a State issue, for the most part, but the school bus systems in our local school districts around the country are one of the real transportation successes of this country. Every school day they carry 45 million rides. That's almost double the number of rides that are carried by all of the buses and subways in this country. So it is quite a transportation resource, and obviously we ought to do whatever we can to make that ride and that walk to school the safest possible.

Senator JEFFORDS. Thank you.

Ms. Wilson?

Ms. WILSON. Mr. Chairman, I'm not familiar with this specific legislation, and I may need to expand this answer for the record, if that would be all right.

Senator JEFFORDS. It would be.

Ms. WILSON. But I would simply say that I'm delighted that you're focusing on some of the safety aspects, whether it is for school children getting to school on foot or on bike or on bus. The safety situation with our transportation system is one of the saddest but also one of the most motivational things we can do in the reauthorization. We're trying to correct that in this country, and I applaud you for going in this direction. Thank you.

Senator JEFFORDS. Thank you.

Mr. Downs?

Mr. DOWNS. Mr. Chairman, I think it goes without saying that the transportation system should not kill or maim children. We don't count them. If they don't count, they don't count. We don't understand any of the relationships between the spiraling out of control of childhood obesity, childhood asthma, and transportation or how children move. None of the local planning processes that I know do any kind of accurate update about how children move through their transportation system. It is perceived to be recreational, and it just doesn't count.

If this is a comprehensive transportation planning process and we think that children count in this process, it should start with them literally counting children and how they behave and move within the system, but we do not, and you could address that in this legislation.

Senator JEFFORDS. Now I'd like to welcome Senator Wyden here. You could have the last word.

Senator WYDEN. Thank you, Mr. Chairman. I apologize for the bad manners. As you know, we've got Enron hearings and that's of special importance to the Pacific Northwest. But I very much want to thank you for holding this important hearing. I look forward very much to working with you as we go forward on the next significant transportation initiative in this area. As you know, I was a principal author of the transportation community system preservation program, and we're especially proud because so much of what the Federal Government is now doing under that legislation really stems from the efforts that began at home with METRO, its predecessor, and we're very glad Mr. Cotugno is here and is in a position to talk to us about these issues. Let me, if I might, just begin with him for a question or two.

Andy, what has been METRO's experience with applying for grants under the program? Obviously, what we want to do is we want to increase the funding. We want to try to get the Congress away from earmarks, which has been almost a biological imperative around here. Come up with a good program, and somebody says, "Well, let's hijack the money. Let's hijack it." And what we had sought to do—and Senator Moynihan and Senator Chafee were especially helpful to me as a new member of the Senate in putting together the program. They said, "Let's make this something done on merit and we'll have a competitive bidding process so as to encourage people all across the country to come forward with innova-

tive ideas for linking smart growth and transportation at the local level.”

So tell us, if you would, what your experience has been with the program.

Mr. COTUGNO. Thank you, Mr. Chairman. Senator Wyden, we applied the first year for two grants, and, as I indicated in my remarks earlier, the first year was run as a competitive process by merit by the Federal Highway Administration, and we succeeded in getting one of those two grants.

The next year we applied for one grant, decided we should pick our own priorities and not submit two, so we submitted one, and we thought we had that grant award because we were receiving calls from the Secretary’s office indicating that it was going to be announced, but it was withdrawn because the funds were earmarked.

The third year we applied and I don’t think it ever went through a review process because it was also earmarked again the third time.

So we were successful that first year, but have not been able to obtain a grant since then.

Senator WYDEN. Well, I want you to know, and all of you, that I’m going to pull out all the stops to go back to what was originally produced in this legislation. We do have the good fortune—Chairman Jeffords, of course, has a long record and history of support for smart growth, and his State, as well as Oregon, are really considered the pioneers in terms of the smart growth area, so we are very fortunate in this crusade to get back to making these calls on the merits, to have a leader with a gavel in his hand who can help us and, of course, has the State experience that is very much in sync with Oregon.

Let me wrap up by asking you a couple of questions about what model we might choose in terms of trying to get this program back to what it was intended.

Andy, as I understand it, what you all are suggesting is that something along the lines of the new starts program for transit projects would be a sensible foundation for improving the program. Would something like this allow the Vermonts and the Oregons and the States that have really been leaders in smart growth to get this program back to what we envisaged, which is one where the calls are made on competition and the merit?

Mr. COTUGNO. Mr. Chairman, yes. Senator Wyden, I think that’s an approach you could take. I think it would entail including in the authorizing language a restriction that requires that funding only be awarded based upon a recommendation that recognizes that smart growth connection.

Like the new starts program, if the Federal Highway Administration comes forward with a recommendation, a high recommendation, or a not recommended, then it is still up to the appropriations and authorizing committee to award that project. You can choose to take and fund a not-recommended project, but your own peer pressure amongst each other would tend to pick the highly recommended projects because those are the ones that are shown to stand up on a merit basis.

Senator WYDEN. Ms. Burbank, I appreciate your staying, as well, given how hectic the schedule is. I understand that you all had applications many, many times over the amount of the available funding, and to me, as we go forward in this effort—and Chairman Jeffords and others have been involved with the Smart Growth Caucus and we've had a lot of exciting developments since our first effort with the last ISTEA legislation, but all of it is going to be hard to achieve unless the Administration will support additional funding for this program.

Is this something that you can discuss this morning and talk about the designs of the Administration? I mean, what I like about this—and, you know, Mitch Daniels has always been very open in terms of dealing with me, and I'm going to make this case to him. This is something that's locally driven and home grown, and the idea of having a program with competitive grants, with the opportunity to try different approaches at the local level strikes me to be very much consistent with the Administration's philosophy.

I don't think I've ever told Chairman Jeffords, but Scoop Jackson, interestingly enough, put in the first Federal bill to promote smart growth. He, of course, was a legend in our part of the world. And when Scoop put this bill in they said this is a monster plot, it's going to lead to Federal zoning and the Federal Government is going to confiscate private property. I think that what we were able to do in the last ISTEA bill was just the opposite of Federal zoning. We have basically said, "Let's let folks do their thing at the local level, and the Vermonts and Oregons play up their innovative approaches in growth, and we'll encourage the other States to catch up." So I would see this as very much consistent with the Administration's philosophy.

Make my day, Ms. Burbank, and tell us, by god, we're going to find some additional dollars for this important effort.

Ms. BURBANK. I'm not sure I can make your day, but I do want to be as positive as possible because certainly that program has been one of the most popular programs. TCSP is exciting because it does generate local initiatives and innovative ideas. We do feel that the competitive process of reviewing and ranking them at the Department through a multimodal group of evaluators has yielded some really good projects, but the projects that have been identified through earmarking are quite different. They don't tend to put as much emphasis on efforts to involve the local citizens in planning and anticipating needs. The earmarked projects tend to be oriented more toward a specific, pre-ordained solution, and we think that has some limitations to it. So we certainly would like to see a competitive program. We think a competitive application process has a lot of benefits.

In terms of funding level and reauthorization, it goes without saying that we are all going to face some tough choices with funding because there are a lot of needs in transportation. So I can't quite make your day in going so far as to say what the Administration's position will be. It is too early to say. But we do see a lot of benefit in TCSP.

Senator WYDEN. I've imposed on the chairman's time, but I hope that you will really be a passionate advocate for this, both for additional funding and for returning to something along the lines of a

competitive model. I mean, you have been very diplomatic here this morning by saying, "Gee, Senator, the earmarked projects are a little different." The idea is that, well, maybe they have something foreordained. I mean, to me that just defeats the whole idea. I mean, when I went to Senator Moynihan and Senator Chafee as a brand new Senator, Senator Moynihan said, "Look, we know Oregon is a leader in this, but they're going to have to compete with everybody else." That's the whole point. I mean, it seems to me that we have got an opportunity to really catalyze all across this country in communities from one end of the country to another a wave of innovative thinking in this area if we have the dollars, if we make the calls on the merits.

Mr. Chairman, I feel badly about imposing on you. Just know that I am very glad that you've got the gavel in your hand on this, because the Vermont/Oregon smart growth axis has an opportunity, in my view, to show the rest of the country how to do the job right, while at the same time giving them all the freedom and all the flexibility to carve out their own approaches that are consistent with their needs. I really look forward to working with you.

Senator JEFFORDS. Well, I certainly look forward to working with you. Oregon and Vermont are almost peas in the same pod. We do everything the innovative—

Senator WYDEN. The enlightened way.

Senator JEFFORDS. Right, the enlightened way. We could go on. [Laughter.]

Senator JEFFORDS. Ms. Burbank, I want to thank you for spending the extra time to be with us during both panels. I look forward to working with you.

This has been a very wonderful experience this morning, my first time in this area. I have a number of first times in store for me, my new responsibilities, but you have been very helpful and enjoyable and innovative and, wow, you're great. Thank you.

[Whereupon, at 11:54 a.m., the committee was adjourned, to reconvene at the call of the chair.]

[Additional statements submitted for the record follow:]

STATEMENT OF CYNTHIA BURBANK, PROGRAM MANAGER, PLANNING AND ENVIRONMENT CORE BUSINESS UNIT, FEDERAL HIGHWAY ADMINISTRATION, U.S. DEPARTMENT OF TRANSPORTATION

Mr. Chairman, members of the committee, thank you for this opportunity to provide testimony on the important subject of transportation planning. Today, I would like to report to you on the status of transportation planning, and what FHWA is doing to assist States and Metropolitan Planning Organizations (MPOs) in fulfilling the planning goals of the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) and the Transportation Equity Act for the 21st Century (TEA-21).

#### OVERVIEW: THE ESSENTIAL ROLE OF PLANNING

Transportation planning is the process of identifying transportation problems and looking for solutions that fulfill multiple national, State, and local goals. Statewide and metropolitan transportation planning processes, governed by Federal law (23 United States Code (USC) sections 134 and 135; 49 USC sections 5303-5305) and applicable State and local laws, are required if Federal highway or transit funds are to be used for transportation investments in the State or metropolitan area. The planning process must do more than merely list highway and transit capital investments. It must provide strategies for operating, managing, maintaining, and financing an area's transportation system in such a way as to best advance that area's long-term goals. The Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) rely on the transportation planning process as the pri-

mary mechanism for cooperative decisionmaking at the State and local level. This means that local officials and others who anticipate using Federal transportation funds must be involved in planning. Transportation planning must be attentive to the public's needs and include sufficient opportunities for public input.

The planning process produces the information on which elected officials and policymakers will base their decisions regarding transportation improvements, and helps ensure better, more informed decisionmaking. Transportation planners undertake comprehensive analyses and evaluation of the potential impact of transportation plans and programs and, at the same time, address the aspirations and concerns of the community that these plans and programs serve. Planners examine past, present, and prospective trends, and issues associated with the demand for the movement of people and goods at local, rural, metropolitan, statewide, national, and international levels. Public officials equipped with this information can make decisions that address key community objectives and tradeoffs, while reducing unanticipated consequences.

Transportation planning must reflect the desires of communities and take into account the impacts on both the natural and human environments. Transportation plans should help regions and communities set and achieve their goals. A comprehensive planning process that considers land use, development, safety, and security, also helps ensure that transportation decisions will be made in an environmentally sensitive way. The States, MPOs, and transit operators choose which projects will advance. The Federal role is to provide funds, standards, technical assistance, and planning models so that State and local decisionmakers are able to make the best transportation choices for their area within the funding available.

#### PLANNING UNDER ISTEA AND TEA-21

ISTEA made significant changes in the metropolitan and statewide planning requirements for highways and transit, requiring greater attention to public involvement, fiscal prudence, and multimodal transportation systems planning. In addition, ISTEA provided State and local governments more flexibility in determining transportation solutions, whether transit or highways. ISTEA instituted statewide planning and continued the metropolitan planning processes as the framework for making these decisions. As a result, much of the past 10 years has been devoted to adjusting to these changes and applying the new requirements. In most cases, the MPOs, State Departments of Transportation (DOTs), and transit operators have worked together in a cooperative way to implement the changes. The ISTEA reforms have resulted in more attention to developing financially sound transportation plans and programs and to involving the public and stakeholder interest groups in developing the plans and programs. The changes have enhanced and improved the integrity and effectiveness of the transportation decisionmaking process, but continued progress is needed.

To assist the MPOs, State DOTs, and transit operators in implementing the ISTEA changes, FHWA and FTA have focused on conducting training courses, providing technical assistance, supporting peer exchanges, identifying best practices, and preparing case studies.

The changes initiated by ISTEA were carried forward by TEA-21 with some further refinements. The financial discipline in the development of plans and programs introduced in ISTEA was continued, with an added requirement that financial estimates be developed cooperatively between the State and MPO.

By statute, metropolitan transportation plans must address a minimum of a twenty-year planning horizon and be updated on a schedule identified by the Secretary (currently 3 years in non-attainment areas and 5 years in attainment areas). By statute, Transportation Improvement Programs (TIPs) address a 3-year horizon and must be updated at least every 2 years at the State and metropolitan level. State plans are updated on a cycle identified by the State. In non-attainment areas, under the Clean Air Act, FHWA and FTA have sought, in cooperation with the Environmental Protection Agency (EPA), to develop approaches to more effectively integrate air quality and transportation planning timeframes and processes. This is a continuing challenge, which will arise in reauthorization.

Section 1308 of TEA-21 directed the Secretary to eliminate the separate requirement for a Major Investment Study (MIS) and integrate the remainder of the process into the environment and planning processes. Although regulatory changes have not been completed, FHWA and FTA have fostered and supported experimentation with alternative approaches, as mutually developed at the State and local level.

While ISTEA and TEA-21 strengthened the role of MPOs and local governments in transportation planning and programming, States continue to have the primary

role, responsibility, and authority-albeit in a framework of consultation and cooperation with MPOs, local governments, and transit operators.

Since the passage of ISTEA and TEA-21, States have become more involved in comprehensive transportation planning, including the development of multi-modal transportation plans. As a result, many States are now engaged in activities, such as rural freight issues, which previously received little attention. Because the state-wide planning process is continuing to evolve, many States are looking at ways to restructure their transportation planning and programming processes. They are determining which decisions should be made at the State level and which can be decided at the rural or metropolitan level.

#### INSTITUTIONAL CAPACITY BUILDING

FHWA and FTA have jointly developed specialized training courses and new tools and procedures that address the emerging needs. Also, FHWA and FTA have sponsored peer exchanges that have allowed States, MPOs, and transit operators to share best practices.

FHWA and FTA, in a collaborative effort with the American Association of State Highway and Transportation Officials (AASHTO), the American Public Transportation Association (APTA), the Association of Metropolitan Planning Organizations (AMPO), and the National Association of Regional Councils (NARC), have launched the Metropolitan Capacity Building (MCB) Program-an initiative to strengthen MPOs. The program is targeted not only for transportation professionals, but also the elected officials who make transportation decisions. Collecting, synthesizing, and disseminating examples of successful innovations by States, MPOs, and transit operators, the Capacity Building initiative provides multiple mechanisms for getting critical information to decisionmakers. Moreover, it helps spread innovation in decisionmaking by publicizing the new techniques and strategies developed by State and local officials. This initiative has supported peer exchanges focusing on transportation modeling and fiscal constraint. A new course on metropolitan planning has been developed to provide public officials and staff with an overview of planning process expectations and options. A public officials briefing book has been prepared, directed specifically to helping elected officials understand their role and responsibilities, as well as the overall planning process. Additional activities are in development and will be disseminated over the coming year.

In addition to the involvement of the MPO, State DOT, and transit operators, TEA-21 made it very clear that new parties should be coming to the planning table at both the metropolitan and statewide levels. TEA-21 added a requirement that freight shippers and users of public transit be provided a reasonable opportunity to comment on transportation plans and programs. Among the most important parties to come to the planning table are local officials, and TEA-21 emphasized the importance of bringing non-metropolitan officials into the process. Most States have procedures for engaging local officials throughout their planning and programming processes. FHWA and FTA are working hard with States and MPOs to improve or otherwise enhance their efforts to bring non-metropolitan local officials, freight shippers, and users of public transit to the table and involve them in planning and programming.

FHWA and FTA have advanced several initiatives, including safety conscious planning, implementation of the Intelligent Transportation Systems (ITS) Architecture requirements, freight planning, work zone safety, and operational improvements. These efforts have contributed to congestion mitigation and enhanced safety consideration.

#### TRANSPORTATION PLANNING AND SMART GROWTH

Today, we frequently hear the term "smart growth"-a term that means different things to different people. FHWA views "smart growth" as a set of State and local policies and programs designed to protect and preserve valuable natural and cultural resources and make efficient use of existing infrastructure, while accommodating economic development and population growth. "Smart growth" policies link transportation projects with desired land use patterns in order to make more efficient use of infrastructure and reduce environmental impact. Land use and transportation have a symbiotic relationship. How development occurs can greatly influence regional travel patterns and, in turn, the degree of access provided by the transportation system can influence land use distribution. Transportation affects land use just as do affordable housing, good schools, and low crime rates.

State and local governments have the responsibility for establishing growth policies. Transportation agencies respect those policies and work with the State and local requirements. Smart growth can mean State and local land use strategies to

increase population and housing densities and make transit more viable, and it can also mean managing and operating existing highway, transit, and other transportation modes to maintain or improve performance for each mode without adversely affecting neighborhoods or urban centers. The goals for smart growth include knitting transportation improvement projects and public/private investments so that they merge as seamlessly as possible into the community; supporting the provision of mixed use development, where feasible, so that transit, bicycle and pedestrian facilities, and ferry boats are viable options to driving; and accommodating the flow of freight and passengers throughout the country so that the economy can continue to grow.

Smart growth does not mean pitting transit or any other mode against highways. We recognize that it is impractical to completely build our way out of congestion in our most congested metropolitan areas. But that does not mean that we think that new roads and improvements to the existing road network should be eliminated. It is not an issue of highways versus transit. It is an issue of expanding transportation choices and providing a balanced intermodal transportation system that allows for the efficient and economical movement of people and goods. In some areas that may mean more transit and in other areas it may entail significant roadway improvements, and in most areas it probably means both. It is up to State and local officials to decide how best to address their unique set of circumstances, and it is the Department of Transportation's role to help them best implement their decision.

While FHWA and FTA strongly believe that land use decisions are State and local decisions, and should remain that way, we do believe that there is much to be gained from more coordination among State and local planning, zoning, and housing authorities, and environmental and transportation officials, in reaching those decisions. We also believe that there should be more dialog between local decision-makers and transportation professionals on the connections between land use and surface transportation—including, for example, more dialog between airport sponsors and metropolitan planning organizations. Such dialogs would allow us to learn from each other and produce better transportation outcomes.

FHWA's role in promoting "smart growth" is to provide technical assistance and training to our State and local customers concerning the linkages between transportation and land use. Along with FTA, we will work cooperatively with other Federal agencies such as the Department of Housing and Urban Development (HUD) and the EPA, to assist us with transportation-related issues, such as affordable housing or brownfields, to provide as much assistance as possible in the form of research, technical expertise, and training to local and State governments. At the same time, we will be mindful that the people of this country hold freedom of mobility as a cherished individual right.

In addition to the Metropolitan and statewide Capacity Building Program mentioned above, our efforts to help State and local governments make smart decisions about growth include support for the Transportation Enhancements Program, the Congestion Mitigation and Air Quality Improvement Program (CMAQ), the Transportation and Community and System Preservation Pilot Program (TCSP), and research in areas such as value pricing, modeling, and land use.

#### TRANSPORTATION AND COMMUNITY AND SYSTEM PRESERVATION PILOT PROGRAM (TCSP)

The TCSP program was created by section 1221 of TEA-21, as a competitive discretionary program to stimulate innovative strategies for using transportation investments to achieve economic growth, while simultaneously protecting the environment and ensuring a high quality of life. TCSP projects funded in fiscal year (FY) 1999 and fiscal year 2000 are demonstrating results that include: developing new analytical tools to assess the impacts of transportation and land use alternatives on mobility and economic development; expanding the range of partners involved in transportation and land use planning; and demonstrating design practices that increase travel options and improve the character of local communities. For example, TCSP grants are being used in Mono County, California; Centreville, Delaware; and Cleveland, Ohio to investigate design changes that can improve safety and pedestrian access, while still maintaining traffic flow, where high-traffic roads run through community centers. A TCSP project in Oregon will survey the impact on travel patterns of telecommuting centers being developed in rural Oregon by the Oregon Department of Energy.

TCSP was authorized in TEA-21 at \$25 million per year. The response to the program has been positive—between fiscal year 1999 and fiscal year 2002, we received approximately 1,332 applications totaling \$906 million in response to Federal Reg-

ister Notices. With the pending announcement of fiscal year 2002 TCSP awards, there will be a total of 420 TCSP grant awards.

A significant number of TCSP projects in fiscal year 2001 and 2002 were designated in congressional committee reports. While many of these projects might not have been selected in a competitive process similar to the one used to recommend the fiscal year 1999 and 2000 TCSP discretionary awards, we can state that all projects that have received funds are statutorily eligible.

Although FHWA believes that a truly discretionary program, administered through a competitive merit-based process, would allow us to better maximize the benefits of the TCSP program, we are working aggressively to ensure that the funds provided for TCSP projects are used to advance the program's goals as established in TEA-21.

TCSP outreach efforts by FHWA, including a comprehensive report on the first 3 years of implementation based in part on interviews with grantees, have elicited suggestions for improving TCSP in reauthorization. Suggestions include: award future TCSP grants through a competitive process; continue to emphasize learning and knowledge transfer; and maintain a focus on both planning and implementation.

#### CONCLUSION

ISTEA and TEA-21 have provided us a solid and balanced structure around which to shape reauthorization legislation and we will build on the programmatic and financial initiatives of these two historic surface transportation acts. To this end, we will apply the core principles enunciated by Secretary Mineta in testimony before this committee in January, including:

- Building on the intermodal approaches of ISTEA and TEA-21; \* Preserving funding flexibility to allow the broadest application of funds to transportation solutions, as identified by State and local governments; and
- Simplifying Federal transportation programs and continuing efforts to streamline project approval and implementation.

In reauthorization, we want to work with this committee and with our partners in the transportation community to find additional means of assisting States to strengthen and improve their transportation planning processes to better achieve not only their transportation goals but their other societal goals as well.

Mr. Chairman, thank you again for the opportunity to testify. I look forward to responding to any questions you may have.

---

#### RESPONSES OF CYNTHIA BURBANK TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

##### *Transportation Planning and Smart Growth*

*Question 1.* A recent report by the Transportation Research Board on long-term research needs states, "Research on transportation and the environment has only recently begun to explore in any significant depth the complex relationships among land development patterns, transportation investments, travel behavior and consequent environmental impacts." Please comment on the practicalities of implementing a "smart growth" program given our limited understanding of these relationships.

*Response.* FHWA's approach to Smart Growth recognizes the limits of our knowledge of the complex relationships among land use, transportation, and environment. Our approach relies on (a) research into these relationships, often via case study approaches and through research partnering with other organizations; and (b) deference to State and local governments in establishing and carrying out land use and Smart Growth policies, based on the circumstances and community values on issues such as economic growth and environmental quality in each State or area.

*Question 2.* How can we develop a more outcome-oriented transportation planning process that relies less on mandatory planning processes?

*Response.* FHWA has initiated Planning "Capacity Building" programs to improve the planning process through best practices, case studies, training, peer-to-peer exchanges, and technical assistance tools. This is a cooperative effort with Federal Transit Administration (FTA), the American Public Transit Association (APTA), the Association of Metropolitan Planning Organizations (AMPO), the National Association of Regional Councils (NARC), and the American Association of Highway and Transportation Officials (AASHTO).

As part of this Capacity Building initiative, we are focusing on "performance-based planning," which several States and metropolitan planning organizations (MPOs) have undertaken. We will disseminate information and case studies on per-

formance-based planning and will encourage all States and MPOs to adopt performance-based planning, which focuses on establishing outcome goals, tracking progress, and making adjustments as needed to achieve those outcome goals.

---

STATEMENT OF KENNETH J. LEONARD, DIRECTOR, BUREAU OF PLANNING, WISCONSIN DEPARTMENT OF TRANSPORTATION, ON BEHALF OF THE AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS

Founded in 1914, AASHTO represents the departments concerned with highway and transportation in the 50 States, the District of Columbia and Puerto Rico. Its mission is a transportation system for the Nation that balances mobility, economic prosperity, safety and the environment.

TEA-21 REAUTHORIZATION—STATEWIDE TRANSPORTATION PLANNING

AASHTO Recommends that Congress Consider the following:

*Freight*

- Provide funding to support the development and implementation of a training and capacity-building program to strengthen the ability of State and local transportation agencies to effectively address freight transportation issues.
- Provide funding for the FHWA research program to support freight transportation research that includes the private sector, and allows the pooling of U.S. DOT modal agency funds.
- Establish and fund a Freight Transportation Cooperative Research Program.
- Strengthen the transportation data programs and link them to national, State and local planning for freight transportation.
- Authorize a Freight Advisory Council that will communicate to U.S. DOT, State DOTs, and others the industry's needs and issues.

*Financial Constraint*

- Calculate financial constraint based on total dollars in the program compared to total revenue available, including both Federal and State funds.
- Allow flexibility in the documentation requirements used by States to demonstrate financial constraint.
- Revise financial planning and financial constraint requirements for mega-projects to get away from the "one size fits all approach" that impacts all projects over a certain cost level.
- Permit the States and implementing agencies to cooperatively develop definitions of "anticipated full funding" and "reasonably available."
- Permit projects for which discretionary funding is being sought to be included in financially constrained TIPs.
- Permit a 10-year fiscal constraint time horizon for purposes of the metropolitan long range transportation plan.

*Major Investment Studies*

- Direct U.S. DOT to eliminate the MIS requirements effective immediately and not make elimination of the MIS contingent on the issuance of new regulations.
- Authorize State DOTs and MPOs to develop optional procedures (with public transit operators, as appropriate) through which decisions reached in the statewide and metropolitan planning process regarding purpose-and-need and range of alternatives would be binding in the NEPA process.

*Planning Timeline*

- Continue to provide flexibility to States as to the content of statewide Long Range Transportation Plans, performance measures and planning horizons so long as a minimum 20-year horizon is maintained.
- Change the update cycle for Long Range Metropolitan Transportation Plans from 3 years to 5 years.

*Land Use and Smart Growth*

- Continue to defer to local and State governments on whether and how to consider land use in the course of transportation planning.

*Consultation*

- Continue the existing balance of decisionmaking authority between the MPO, the State and local officials.

*Planning Roles and Responsibilities*

- Maintain the current balance of responsibility for the development of highway transit and intermodal projects, and reaffirm the leadership role and authority of the States.
- Retain the current definitions of planning “consultation, cooperation and coordination.”
- Retain the existing program structure rather than authorizing new set-asides or program categories.

Mr. Chairman, my name is Ken Leonard. I am the Director of the Bureau of Planning at the Wisconsin Department of Transportation. I am speaking today on behalf of the American Association of State Highway and Transportation Officials (AASHTO) in my role as vice chairman of the AASHTO Standing Committee on Planning.

Mr. Chairman, thank you on behalf of the State transportation officials across the country for inviting AASHTO to participate in this hearing to examine the State of the transportation planning process. My testimony today will address a number of specific planning issues that have drawn attention, including freight planning capacity, financial constraint provisions, local consultation, performance-based planning and the role of State department of transportation (DOTs) with respect to land use. First, I want preface my remarks with the observation that the statewide transportation planning process is very complicated, in part because of the very complex set of transportation challenges that the transportation planning process must address, but also because of the many layers of Federal and State transportation and environmental statutes and directives that guide the process. From our perspective, the goal should be to simplify the process and not add further complexity.

Federal law has long established that the Federal-aid highway program is a “federally assisted State program”. The program has evolved through the years and, in addition to providing roles for Federal and State officials, provides roles for local governments and Metropolitan Planning Organizations (MPOs).

The Intermodal Surface Transportation Efficiency Act (ISTEA) was important as the first piece of transportation legislation in the post-Interstate era. ISTEA set in motion a positive effort toward implementation of a responsive transportation program designed to meet a diversity of national transportation needs.

ISTEA placed a strong emphasis on the transportation planning process, including much more emphasis on public involvement. In addition, ISTEA included 23 planning factors for use in statewide planning, and 16 planning factors for use in Metropolitan Planning. While much of this type of analysis and public involvement was already being done by many State DOTs, ISTEA placed stronger emphasis on these matters.

The successor to ISTEA, the Transportation Equity Act for the 21st Century (TEA-21) consolidated the planning factors into seven, including:

- Support the economic vitality of the Nation, the States and MPOs.
- Increase the safety and security of the transportation system for motorized and non-motorized users.
- Increase the accessibility and mobility options for people and freight.
- Protect and enhance the environment, promote energy conservation and quality of life.
- Enhance the integration and connectivity of the transportation system, across and between modes throughout the State for people and freight.
- Promote efficient system management and operation; and
- Emphasize the preservation of the existing transportation system.

TEA-21 also included a provision that failure to consider any one of the planning factors is not actionable in a court of law. In part, this recognizes the need to allow diverse approaches that reflect the unique conditions in each State—i.e., State constitutional and statutory requirements, geographic size and population, institutional history, political environments and differing transportation challenges, needs and priorities. Despite its complexity, the post-Interstate transportation planning process has evolved effectively because of support for innovation, understanding of the need for flexible approaches and emphasis on training, technical assistance and information sharing rather than command and control oversight.

*Current Transportation Planning Practices and Innovative Approaches*

The current framework for statewide and metropolitan transportation planning was established in TEA-21 and its predecessor ISTEA. In the past decade, we have seen significant changes in the transportation planning process. We have strengthened the stakeholder and public involvement, and established multi-modal planning processes that take into account a broad array of factors, including community input

and goals, economic development, improved access to transportation facilities and services for all, and enhanced environmental quality and protection.

In addition, there has been a renewed focus on attainment of the Federal clean air standards, and with that we have incorporated transportation conformity requirements into the planning process. The objective of transportation conformity is to better harmonize transportation and air quality planning and to ensure that transportation investments do not thwart clean air goals.

While the transportation planning processes within the States and metropolitan areas are generally sound and should be retained, some improvements can be made to simplify and improve the efficiency and effectiveness of the process. However, in doing so, we need to ensure that new requirements are not added that will encumber the processes that have evolved over the past decade. In addition, the U.S. DOT should continue and enhance its training, technical assistance, capacity building and information sharing efforts.

#### *Greater Focus on Freight in the Transportation Planning Process*

Both ISTEA and TEA-21 emphasize the need for increased attention to freight movement in their planning factors. States have been including the freight system in their statewide multimodal transportation plans as required first by ISTEA. As part of this effort, Wisconsin, and a number of other States, include a freight advisory committee as part of their planning process that engages both freight transportation providers and shippers.

Recognizing the increased importance of freight transportation, AASHTO has created a new committee to focus on freight, the Special Committee on Intermodal Transportation and Economic Expansion.

AASHTO has also been putting increased emphasis on freight planning in its tools development and capacity building for States and MPOs. Currently we are funding a research project on "Best practices in statewide Freight Planning" which will examine planning in States where efforts have been made to better understand goods movement. The lessons learned in this project will then be passed on to other States and MPOs. We will also be conducting a workshop this year on the need for better intermodal freight connections. The objective of this workshop will be to improve the awareness within States and MPOs of intermodal freight needs.

In addition, AASHTO is sponsoring an increasing amount of freight research through the National Cooperative Highway Research Program administered by the Transportation Research Board (TRB). I am personally chairing a research project for \$500,000 to develop "Methods for Forecasting statewide Freight Movements and Related Performance Measures". The results of this research should improve our ability to predict future freight movements so we can plan and construct facilities accordingly. Another research project is entitled "Freight Movement by Rail—Impacts and Opportunities". This project will examine the relationships between rail and other freight modes to identify opportunities for rail as part of an optimum mix.

To facilitate freight consideration in the planning process, AASHTO recommends the following actions:

- \$10 million annually should be provided to support an initiative through which the U.S. DOT and the State DOTs will jointly develop and implement a training and capacity-building program to strengthen the ability of State and local transportation agencies to effectively address freight transportation issues.
- Congress should increase funding for the FHWA research program to support freight transportation research that includes the private sector, and allows the pooling of U.S. DOT modal agency funds. A Freight Transportation Cooperative Research Program should be created and funded in the range of \$5 million to \$7.5 million annually. The transportation data programs should be strengthened and linked effectively to national, State and local planning for freight transportation.

AASHTO's recommendations to Congress also include support for authorizing a Freight Advisory Council that would communicate to U.S. DOT, State DOTs and others with one voice the industry's needs and issues.

#### *Financially Constrained Plans*

ISTEA included a provision for a financially constrained Transportation Improvement Program (TIP) and State Transportation Improvement Program (STIP). Subsequent FHWA regulations defined this requirement to mean fiscal constraint by type of fund and year, with no over-programming.

TEA-21 continued requirements for financial constraint for State Transportation Improvement Programs (STIPs) and urban Transportation Improvement Programs (TIPs). The intent of these requirements was to match program-level project commitments to overall resources at the planning and program development stage in order to avoid the creation of wish lists of projects for which funds might not be

realistically available for the foreseeable future under any circumstances. While the expectation for a fiscally constrained planning and programming process is both reasonable and beneficial, in practice it is sometimes being applied to cash-flow and project management.

From the State DOT perspective, the financial constraint requirement makes it difficult for States to make adjustments needed as to which projects can move forward to obligation and letting. States need flexibility in managing their programs to be able to make adjustments should a project become delayed. The financial constraint provision makes it difficult to move forward another ready project for funding should a project in the STIP be delayed for any reason. It is equally difficult to move forward with projects when unanticipated State initiatives make additional funds available.

The TEA-21 reauthorization legislation needs to provide sufficient flexibility in financial constraint and timing to allow States to deal with unexpected delays in project development and in working with their State legislatures to obtain adequate funding. State DOTs and MPOs need flexibility and discretion in the development of their STIPs and TIPs to enable them to deal with the realities of cash-flow, uncertainties in project schedules, and fluctuating funding levels. Moreover, when air quality and other environmental laws are paired with financial constraint requirements, it creates a bureaucratic maze that delays needed projects and prevents States from concluding the NEPA process on large, multi-phase projects whose costs are spread over a long time period.

AASHTO believes that the TEA-21 reauthorization legislation should increase flexibility related to financial constraint in State and Metropolitan Transportation Improvement Programs. AASHTO recommends legislative changes that:

1. Calculate financial constraint based on total dollars in the program compared to total revenue available, including both Federal and State funds.
2. Allow flexibility in the documentation requirements used by States to demonstrate financial constraint.
3. Revise financial planning and financial constraint requirements for mega-projects to get away from the "one size fits all approach" that impacts all projects over a certain cost level.
4. Permit the States and implementing agencies to cooperatively develop definitions of "anticipated full funding" and "reasonably available".
5. Permit projects for which discretionary funding is being sought to be included in financially constrained TIPs.
6. Permit a 10-year fiscal constraint time horizon for purposes of the metropolitan long range transportation plan.

In practice, the problem with the Financially Constrained Plan is that it is too strictly applied, and has become more of a cash-flow financial management instrument.

#### *Major Investment Studies*

In October, 1993, FHWA issued revised regulations implementing the planning provisions of ISTEA. These revised regulations included a new concept—the major investment study or MIS, which was not specifically required in ISTEA itself.

The regulations required an MIS for any "major metropolitan transportation investment" where "Federal funds are potentially involved". The regulations defined a major investment as a "high-type highway or transit improvement of substantial cost that is expected to have a significant effect on capacity, traffic flow, level of service, or mode share at the transportation corridor or subarea level".

Two options were allowed for preparing an MIS. Under "Option 1", the MIS was prepared as a stand-alone study prior to the NEPA process. Under "Option 2", the MIS was combined with the EIS into a single document.

The two options for the MIS raised significant concerns:

- Option 1 MIS (prepare MIS, then EIS): When Option 1 was used, the "decisions" made in the MIS process were often discarded when the NEPA process began. In effect, it became necessary to start over again in the NEPA process, which caused the MIS process to lose credibility among agencies and the public.

- Option 2 MIS (prepare MIS and EIS together): While the Option 2 MIS avoided the problems with Option 1, it also provided less flexibility. The Option 2 MIS was, in fact, an expanded EIS; it did not provide a vehicle for conducting a corridor-level planning study before making a commitment to prepare a full EIS for a specific project.

In reaction to the experience with the MIS, Congress enacted Section 1308 of TEA-21 which directed U.S. DOT to "eliminate the major investment study . . . as a separate requirement and promulgate regulations to integrate such requirement, as appropriate, as part of the analysis required under the planning and NEPA processes for highway and transit projects.

Section 1308 also provided that "the scope of the applicability of such regulations shall be no broader than the scope of such section".

In May, 2000, FHWA and FTA issued a notice of proposed rulemaking (NPRM) for new statewide and metropolitan planning regulations. Pursuant to Section 1308 of TEA-21, the proposed regulations would have eliminated the MIS as a stand-alone requirement. However, the proposed regulations also would have created a new requirement with broader application.

In its comments on the NPRM, AASHTO strongly opposed the MIS integration provisions in the FHWA's proposed planning regulations. AASHTO raised several objections, including:

- The proposal created a new requirement that applied to all projects, not just major investments. Because the new requirement was broader in its applicability than the original MIS regulation, it directly contradicted Section 1308 of TEA-21.
- \* The new requirement created a mandatory process, which had the potential to become extremely resource-intensive.
- \* The new process did nothing to ensure that decisions made in the planning stage would be accepted in the NEPA process.

AASHTO's recommendation regarding the MIS issue when it is considered in the reauthorization of TEA-21 is that Congress direct U.S. DOT to eliminate the MIS requirement effective immediately, and not make elimination of the MIS contingent on the issuance of new regulations.

AASHTO also recommends that Congress authorize State DOTs and MPOs to develop optional procedures (with public transit operators, as appropriate) through which decisions reached in the statewide and metropolitan planning process regarding purpose-and-need and range of alternatives would be binding in the NEPA process.

#### *Planning Timelines*

With regard to State Long Range Transportation Plans, Congress should continue to provide flexibility to States as to content of Long Range Plans, performance measures and planning horizons so long as a minimum 20-year horizon is maintained.

TEA-21 required that each MPO develop a Metropolitan Long Range Transportation Plan with a minimum 20-year forecast period. Metropolitan planning provisions in TEA-21 establish general guidelines for State DOTs, MPOs and transit agencies to follow in updating MPO plans, which FHWA requires every 3 years.

However, in a 3-year update cycle, MPOs don't have adequate time to improve their data collection and modeling processes. Further, the 3 year update cycle makes it difficult to involve the public since the planning agency is always in a continuous update cycle. If the update cycle was changed to 5 years, MPOs would be able to strengthen the planning process by improving the data and updating their modeling tools.

To overcome the problems listed above, AASHTO advocates that Congress change the update cycle for Long Range Metropolitan Transportation Plans from 3 years to 5 years.

#### *Land Use and Smart Growth*

TEA-21 requires consideration of projects and strategies that will, among other things, "increase accessibility and mobility options" and "enhance the integration of the transportation system." These parallel considerations are often included in land use planning activities. TEA-21 correctly eliminated any specific reference to State-level responsibility for land use planning in recognition that States only rarely have authority to directly make land use decisions.

Land use has historically been considered to be a local government function. Most States, as a matter of State law or practice, defer most or all land use decision-making to local units of government. Land use reflects a number of local circumstances, and local officials should have the responsibility to determine land use for their particular area. Trying to legislate one particular approach to land use—a "one size fits all" approach—simply would not be workable from an interjurisdictional perspective.

Congress should ensure that Federal statutes continue to defer to local and State governments on whether and how to consider land use in the course of transportation planning.

With regard to Smart Growth, Wisconsin has "Smart Growth" legislation, and has worked cooperatively with local units of government and developed a "Transportation Guide" for the local communities to use in developing their comprehensive plans. This stresses the importance of planning for land use and transportation together once the community has determined its vision.

AASHTO has several Smart Growth related activities underway, including:

- Sponsoring meetings and working with State DOTs, U.S. DOT and other organizations on Context Sensitive Design. AASHTO supports Context Sensitive Design, and attention to the way streets and highways are routed or redesigned through liv-

ing areas to lessen any negative effects they may have on the livability of an area. AASHTO is developing a guide on context sensitive design, which is slated for publication later this year. \* Through a grant from FHWA and EPA, AASHTO is sponsoring a Smart Growth competition to highlight new and innovative Smart Growth initiatives being tried around the country.

- AASHTO has launched an Environmental Stewardship initiative to assist State DOTs in capacity building efforts to deliver needed transportation projects in a manner that preserves and enhances our environment.

Under this Environmental Stewardship initiative, AASHTO is working with FHWA, other Federal agencies, and environmental organizations in the establishment of a Center for Environmental Excellence,

AASHTO is also sponsoring an Environmental Stewardship pilot program to again disseminate information about best practices in working with the environment.

Several State DOTs, such as New York, have incorporated environmental stewardship into all facets of their operations, whether planning and designing new facilities, or maintenance activities such as grass cutting.

*Are the appropriate parties being included in the process?*

Congress should continue the existing balance of decisionmaking authority between the MPO, the State and local officials. This would continue already proven arrangements that have worked well for a decade and been agreed to by transportation officials and professionals nationwide.

In particular, the current relationships in rural areas should remain unchanged. Rural transportation planning already is fully encompassed by the statewide planning provisions of 23 USC section 135, which have been institutionalized nationally since ISTEA. Indeed, in most States a comparable rural/statewide transportation planning process was in place before ISTEA.

Much has been said about the changes that TEA-21 made to consultation with rural officials. In fact, a review of the language in both statutes reveals that the net effect of the changes is that, with respect to nonmetropolitan areas, States are to consult not only with certain "elected officials", but also with affected local officials "with responsibility for transportation."

There is no question that there must be consultation, and we believe that in most States this is taking place. Where local officials are being left out of planning discussions, we believe that FHWA should consider some type of case-by-case action to ensure consultation. However, failure by one State or area to consult should not become the basis for imposing broad regulations that dictate how the States should consult with their local officials.

In Wisconsin, rural planning is a collaborative effort between the States, regional planning commissions and local government. This arrangement goes back to the 1960's. These parties coordinate their planning activities utilizing advisory committees, intergovernmental committees, guidance documents, association meetings, public involvement, etc. In addition, Wisconsin has a Local Roads and Streets Council composed of all levels of government: counties, towns, villages, cities and State. This council develops and evaluates local road data and develops policy initiatives based on that data as well as evaluates policy and program options on funding. Other States have similar arrangements for their local planning depending on their unique institutional and statutory authority.

*Have the planning partners been given the proper roles and mandate?*

In recognizing statutorily that the Federal-aid highway program is a "federally assisted State program", TEA-21 acknowledges two centuries of federalism. Implicit in this recognition is an appreciation of the central role that the States perform in the development of our surface transportation system, even as other jurisdictions and institutions—local government, MPOs, tribal governments and Federal agencies—have come to play important parts. The nation is well-served by the current balance of responsibility for the development of highway, transit and intermodal projects, and AASHTO recommends that Congress maintain this balance and reaffirm the leadership role and authority of the States as TEA-21 is reauthorized.

Congress should continue TEA-21's decisionmaking responsibilities, processes, and procedures for planning, programming and project selection. This means retaining the balance of decisionmaking between States and MPOs, and State and rural officials; retaining the current definitions of planning "consultation, cooperation and coordination," and meeting needs through the existing program structure, rather than through new set-asides.

*Do planning organizations have adequate capacity, tools and resources to carry out their assigned role and responsibilities?*

AASHTO is working closely with the Federal Highway Administration, the Federal Transit Administration, the Association of Metropolitan Planning Organizations, and the National Association of Regional Councils to develop and deploy various capacity building tools to assist transportation planners. Several initiatives are included in this activity, including a web site where transportation planning assistance can be disseminated.

In addition, AASHTO has been working closely with the Transportation Research Board (TRB) to continue to improve planning tools. There are on-going projects related to safety, freight planning, rural planning, public involvement, economic benefits, and innovative financing. There are additional needs for techniques to deal with capacity needs to support the nations' economy, accelerating the renewal of our highways, providing reliable travel times, and making improvements in highway safety. In fact, in these four areas, AASHTO is working cooperatively with FHWA to identify research needed to address these problems. These research proposals will be completed in time to be considered during reauthorization of TEA-21.

However, if there are increases in requirements through the Federal legislative or regulatory process, it will be difficult to meet them through the planning process. Currently, planning and research for States and their localities is supported by 2 per cent of certain Federal aid categories. If the overall Federal program grows, planning funds should be sufficient. But if the program does not grow, there will not be enough planning funds to keep up with new challenges let alone any new requirements. For years, Wisconsin has shared its planning funds with the MPOs, regional planning commissions and local government. This is becoming much more difficult. In addition, research at the national level is critically under funded.

#### *Summary*

As statewide and Metropolitan planning issues are considered in the reauthorization of TEA-21, it is important to recognize the differences among States and provide adequate flexibility. The reauthorization legislation needs to include flexibility that allows States and MPOs to adapt it to different parts of the country based on government structure, geography, population and a number of other important factors.

In addition to legislative changes, AASHTO is particularly concerned about any Federal planning regulations that may come forward after the reauthorization legislation is passed. AASHTO strongly believes that such regulations should be consistent with congressional intent.

Thank you for allowing me to present AASHTO's perspective on these issues. AASHTO is available to work with you and your staff on these important issues that will be considered in the reauthorization of TEA-21. I would be happy to answer any questions here, or in writing.

---

#### RESPONSES OF KENNETH LEONARD TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question.* Do you feel that computer simulations, an example of which would be TRANSIMS, are (or could be) valuable in the planning process? Are, or could they be, effective in the examination of various planning options?

*Response.* A computer simulation approach to estimating and analyzing travel in a metropolitan area holds great potential for evaluating a number of issues currently of concern to policymakers at the Federal, State, metropolitan and local level. The principal development effort for a computer simulation approach has been through the TRANSIMS project under the sponsorship of the U.S. Department of Transportation and Environmental Protection Agency. Because TRANSIMS models the travel of individual travelers and vehicles as opposed to predicting aggregate travel for entire zones, it has the potential to more accurately estimate travel as well as to address a number of issues that current travel demand models are unable to address. These issues include, for example, analysis of travel by various segments of the population, differences in travel characteristics by time of day, the effects of a number of traffic operations and Intelligent Transportation System (ITS) measures, the effects of priority treatments for transit and/or high occupancy vehicles, as well as the effects of changes in the amount of transit or highway capacity provided. The potential value of TRANSIMS lies with its simulation which has significant advantages over the traditional 4-step traffic models. Transportation planners, in particular, have long sought the capability to simulate travel on roadway net-

works, but have only recently been given the software and hardware needed to apply simulation.

TRANSIMS gives planners the ability to see how traffic actually moves through the network, demonstrating how traffic responds to network and other conditions that affect traffic. It also provides information on how individual vehicles and groups of vehicles function in their surroundings. This capability is important because it permits the planner to work with the traffic engineer to understand and use simulation results to improve traffic flow conditions and thereby help both to better deal with actual conditions. The simulation in TRANSIMS also permits a better understanding of traffic congestion by forecasting when vehicle travel will be initiated, thereby demonstrating how congestion propagates.

Probably equally important is the information that simulation provides on the operating conditions of motor vehicles, thereby permitting better understanding of how travel patterns and traffic conditions affect motor vehicle engine performance and the resulting air quality in the vicinity of roadways. Second-by-second simulation of vehicle movements for every vehicle on the transportation system will allow for much more accurate estimates of vehicle emissions, taking into account vehicle acceleration, deceleration and idling characteristics, as well as cold start and evaporative characteristics after the vehicle has been turned off. This offers the potential for much more accurate and detailed analysis of the effects of proposed Transportation Control Measures for air quality.

Because of the level of complexity of the computer simulation approach used by TRANSIMS, the development of the model has proven to be more complicated and time consuming than originally anticipated. Until the model is operational and used in an actual metropolitan area (the first application is expected to be in Portland, Oregon), the full potential, benefits and costs of the model will not be known. Of specific concern is the amount of data that may be required to make the model an effective analysis tool in any particular metropolitan area. Because TRANSIMS is a radical departure from current travel demand modeling approaches, there will be special challenges in educating the transportation planning community in how to use it and in acquiring the necessary computer hardware to operate such a complex, computer resource intensive model. AASHTO is supportive of the continued development of TRANSIMS due to its potential as an analysis tool, but cautions that it is still too early to understand all the issues that are associated with its use throughout the transportation planning community.

---

#### RESPONSES OF KENNETH LEONARD TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* What would be the impact of a legislative mandate for greater consistency in the incorporation of local governments into the transportation decision-making process, as has been suggested by the National Association of Regional Councils?

Response. The States have greatly varied needs, resources and environments that call for flexibility in order to give each State the ability to adapt its process to its unique social, political, geographical, legislative and constitutional circumstances. Each State has developed its own process for consulting with local officials that reflects and conforms to these unique factors.

The AASHTO interim position on TEA-21 Reauthorization, in speaking to this issue, states:

Recognizing that the Federal-aid highway program is a "federally assisted State program," Congress should continue TEA-21's decisionmaking responsibilities, processes and procedures for transportation planning, programming and project selection. This means retaining the balance of decisionmaking between the States and MPOs, and States and rural officials; retaining the current definitions of planning "consultation, cooperation and coordination," and meeting needs through the existing program structure.

While preserving State leadership and authority in the development of transportation plans, programs and projects, the TEA-21 Reauthorization should also respect the roles of other jurisdictions, institutions and the public and their involvement in the transportation planning process.

*Question 2.* Is there a shortage of qualified transportation engineers and planners, and if so, how has it contributed to the challenges faced by the transportation planning process, and what can be done to solve this problem?

Response. According to a May, 2001 NCHRP report titled *Managing Change in State Departments of Transportation*, issued May 2001, "State departments of transportation face severe challenges in recruiting and maintaining their

workforces". State DOTs are looking for innovative ways to recruit and retain the necessary workforce.

State DOTs are facing shortages of not only transportation engineers and planners, but also of personnel who are able to use new technology.

The growing complexity of the transportation planning process makes it difficult for State DOTs to handle the growing range of issues that are considered. This complex transportation planning process that includes such challenging items as travel modeling, economic analysis, financial planning, public involvement and additional items make it difficult for State DOTs to recruit and train sufficient staff with the broad range of needed skill sets.

States DOTs are addressing this workforce issue by increasing their efforts in recruitment and retention. As a longer term solution, they are strengthening professional development programs and establishing succession programs and processes. In the shorter term, many State DOTs are using private consultants to help keep projects moving.

In Wisconsin, the department provides support to the university transportation center to promote the education of transportation professionals and regularly participates in university job fairs and class lectures promoting careers in transportation engineering and planning.

Again, I appreciate the opportunity to testify before your committee on May 15, and I am available should you or your staff have additional questions or need additional information.

---

STATEMENT OF DR. RONALD KIRBY, DIRECTOR OF TRANSPORTATION PLANNING, NATIONAL CAPITAL REGION, TRANSPORTATION PLANNING BOARD, METROPOLITAN WASHINGTON COUNCIL OF GOVERNMENTS

Mr. Chairman and members of the committee, I am Ronald Kirby, Director of Transportation Planning for the National Capital Region Transportation Planning Board, the Metropolitan Planning Organization for the Washington, DC region. I am appearing today at your invitation on behalf of the Association of Metropolitan Planning Organizations (AMPO) of which I am an active member, serving as vice chairman of its Management Committee and a member of its Policy Committee.

I want to thank you and the members of the committee for holding this series of hearings to review critical issues surrounding the reauthorization of the Transportation Equity Act for the 21st Century (TEA-21).

This act and its predecessor, ISTEA, rightfully recognized the importance of planning a metropolitan transportation system and gave me and my colleagues at 340 other MPOs increased responsibility to develop effective strategic long-range plans and comprehensive, multi-modal transportation improvement programs. With the 2000 census we expect that an additional 61 MPOs will be established to serve newly designated urbanized areas, and that the geographic areas and populations served by existing MPOs will grow significantly.

While new responsibilities such as management and operations have been added to MPO requirements by TEA-21, the percentage of highway program funding for metropolitan planning has remained at the 1 percent level set in ISTEA. It is time to increase the takedown from the highway program and the amount allocated from the transit program. This will reflect a) the almost 20 percent increase in MPOs resulting from the 2000 census, b) the increasingly urbanized U. S. population coming under the rubric of existing MPOs, and c) the increased MPO responsibilities created by enhanced planning provisions and requirements. AMPO suggests the takedown be increased to 2 percent of the overall program.

I understand your interest is in exploring the lessons learned from the 10 years of experience with metropolitan planning since the enactment of ISTEA in 1991, the adequacy of the planning tools available, the adequacy of resources to perform metropolitan transportation planning, and whether the right groups have been at the table during the development of plans and programs. I would like to provide you with a few initial thoughts: we need to retain key provisions in the planning process, increase the resources for plans and projects, and venture into new areas to improve planning and implementation of our metropolitan transportation systems.

I classify the tools for planning in three categories: 1) tools that are working effectively and we should retain, 2) tools that work effectively and we should expand, and 3) new tools we need to continue effective planning.

First, we should retain tools that are working effectively. The requirement for a financially realistic plan and a fiscally constrained program is the most effective tool provided by ISTEA and TEA-21. This requirement eliminated "wish list" plans and programs which did not identify enough funds for implementation. This financial

constraint requirement gave credibility to the MPO plans and programs and presented the public with a realistic view of what can be delivered in the way of transportation projects and services. It is imperative that this requirement be retained.

Any dilution of the fiscal constraint requirement may find us over-promising transportation improvements and losing our credibility with our customers. Citizens and users of our metropolitan transportation systems who rightfully complain about congestion and unreliability in parts of our system will not countenance papering over the problem with wishes for projects that cannot be delivered.

In addition to financial constraint, two ancillary tools in TEA-21 should also be retained: 1) the requirement for cooperative revenue forecasting among MPOs, States and transit authorities and 2) the requirement for an annual listing of obligated projects to be prepared by the MPO.

Along with financial tools, the overall planning approach established in ISTEA and TEA-21 should be retained. The requirement that long range plans be strategic in nature with broad community goals and specific objectives places the transportation agenda in a broader context, encouraging the linkage between transportation, land use, the economy and the environment in a metropolitan area.

When this approach is combined with early and extensive involvement of the community, the MPO has a solid basis for developing its long-range plan and transportation improvement program. ISTEA and TEA-21 transformed the long range plan from a twenty-year listing of transportation projects to a blueprint for community development which indicates the appropriate contribution transportation investment can make to that development.

In the Washington metropolitan area, these ISTEA and TEA-21 tools have, in the words of one of our elected officials, "forced us to ask the right questions." Application of the financial constraint in the early-1990's resulted in a rather stressful prioritization of transportation improvements for inclusion in the long-range plan, and the initiation of a visioning process aimed at developing a broad consensus on regional transportation goals and addressing the critical funding needs we had identified. The Transportation and Community and System Preservation Program (TCSP) has allowed us to pursue previously unaddressed goals in our new vision regarding a system of regional greenways and circulation systems within regional activity centers, and to focus increased attention on these areas in the project selection process.

Second, we believe we should expand some of the existing tools that work effectively. Two tools have been effective and should be expanded: 1) ensuring that adequate planning resources are available to MPOs, and 2) making project funds available directly to MPOs.

As you may know, MPOs receive planning funds via a small percentage take-down from the Federal highway authorization and a line item amount from the transit authorization. ISTEA set the percentage for the highway program at 1 percent, a reasonable figure given the increased responsibilities asked of MPOs and the understanding that involving the public in transportation decisionmaking would require appropriate additional resources. With the increased urbanization of America, AMPO believes that it is time to increase the takedown to 2 percent to serve an increasing number of MPOs and a growing percentage of our population in existing MPO areas.

Regarding funds to build projects, ISTEA and TEA-21 for the first time put funds in the hands of local elected officials to assign to projects developed cooperatively through the MPO process. Each MPO with more than 200,000 in population receives a portion of the Surface Transportation Program (STP) funds allocated to its State to expend on specific projects. These funds can be programmed based on the MPOs' best judgment on the transportation needs of their metropolitan areas. The funds are made available by the States through "suballocation."

The availability of these funds not only provides funding for vital local projects, but also encourages local officials to get involved in the transportation decision-making for their region, since, as they say, there is "real money" on the table. Sub-allocation of STP funds has been an outstanding success for the one-third of the MPOs that have populations over 200,000, and needs to be expanded to the remaining two-thirds of smaller areas that still have pressing needs for their regions. AMPO suggests: 1) restoring the suballocation of the STP minimum guarantee funds and extending the suballocation of urbanized STP funds to all MPOs, and 2) suballocating CMAQ funds to MPOs in air quality non-attainment and maintenance areas.

Third, let us look at possible new tools to improve the effectiveness of metropolitan transportation planning.

In order to complement the financial constraint requirement and suballocation proposal, it would be helpful to require States to account annually for expenditures

of NHS and other programs. This would allow for a clear and comprehensive assessment of the effectiveness of plan implementation. In other words, "did we build what we planned?"

Once we have built facilities, and managed and operated the system, we should determine how effective we have been. MPOs need better data on the use of the metropolitan transportation system. AMPO suggests two tools to measure effectiveness: 1) invest resources in monitoring devices to track use of our transportation facilities, the so-called "Infostructure," and 2) encourage the development of a performance-based management and operation element within MPO plans and programs. To give local officials the greatest flexibility in applying solutions to our metropolitan transportation needs, we recommend that the law make clear that NHS, STP and CMAQ funds may and should be used for projects that manage and operate the system.

Another area of transportation planning, freight planning, needs some new tools. While consideration of freight is a planning factor, it is time to give MPOs greater capability to develop and apply solutions to freight needs. AMPO proposes that the reauthorization bill broaden the eligibility of freight project funding, provide incentives to attract private investment, and allow port access and gateways to be eligible for the "corridors and borders" program.

Finally, we feel new tools are needed to streamline project delivery and air quality conformity processes. The MPO planning process offers untapped opportunities to identify environmental issues and incorporate them into the process of defining project alternatives. To take advantage of these opportunities, we propose that the reauthorization bill 1) require that both Federal project-sponsoring and resource agencies participate in the MPO corridor planning process, 2) allow concurrent review processes, and 3) provide incentives for demonstrating innovative streamlining techniques.

Regarding air quality conformity requirements, we recommend that the law add two tools: 1) put the State air quality implementation plan (SIP) and metropolitan transportation conformity plans on the same timeframe, and 2) focus the conformity process on the metropolitan transportation plan, not the transportation improvement program (TIP). We will have more specific proposals regarding air quality conformity in the near future.

In summary, I would like to emphasize the importance of planning in producing effective transportation systems for our metropolitan areas. In the planning, designing, building and operation of transportation facilities the most important leadership must come in the planning phase. With a solid plan developed through consensus you may be assured that we will have a transportation system that works.

Thank you for your time and the opportunity to speak before this committee.

---

RESPONSES OF RON KIRBY TO ADDITIONAL QUESTION FROM SENATOR JEFFORDS

*Question 1.* Do you feel that computer simulations, an example of which would be TRANSIMS, are (or could be) valuable in the planning process? Are, or could they be, effective in the examination of various planning options?

Response. Computer simulations have been successfully applied in a variety of fields and industries, including transportation. One type of simulation—small area micro-simulation—has been used by transportation engineers for years to help study traffic across bridges, complex interchanges, toll plazas, etc. Computer hardware and software has reached the performance level that allows simulation technology to be applied on a larger scale: a city or even a large metropolitan area. TRANSIMS is a developmental effort in this class of transportation planning tools, aimed at simulating travel of every individual and every vehicle in a large metropolitan area. Once fully developed, simulations like TRANSIMS could allow transportation planners to build a significantly more precise model at the regional level. In the shorter term, TRANSIMS could be applied on a more limited geographic scale to help with certain projects like new transit stations. Additionally, the visual component in TRANSIMS could be helpful to citizens and decisionmakers, such as local elected officials on MPO Boards, because it allows non-experts the opportunity to see various simulations.

---

RESPONSES OF RON KIRBY TO ADDITIONAL QUESTION FROM SENATOR SMITH

*Question 1.* How would you modify the conformity process to focus on results, instead of process?

Response. We believe the intent of the law dictating the conformity process focuses on results but that the true measure of success is found when a region is able

to attain the clean air standard. We feel that conformity is an important link between mobility and clean air. Additionally, we believe that the process can produce useful results if there is good communication and cooperation between all stakeholders. At this time, we defer on making specific recommendations for change to the process itself in hopes of providing more information in the fall after our policy committee has fully addressed this issue.

*Question 2.* What percent of an MPO's budget is typically spent on the conformity process?

Response. In Chicago, the Chicago Area Transportation Study (CATS) spends about 7.5 percent of a total budget of \$4.7 million on conformity. A representative from the MPO stated that they have spent less on conformity over the years because they have "gotten better at it." In Dallas-Ft. Worth, the North Central Texas Council of Governments spends about 10 percent of a total \$5 million budget, or \$500,000, on conformity. In the Washington metropolitan region, we spend about 7.7 percent of a \$7.8 million budget or \$600,000.

*Question 2a.* What percent of an MPO's budget is typically spent on the transportation planning process? Please provide some examples for specific MPOs.

Response. MPOs are charged solely with transportation planning. The MPO spends 100 percent of its budget on this.

*Question 3.* What percent of current MPO budgets are covered by the State and local governments? What percent of the MPOs responsibilities relate to Federal transportation investment, and what percent of their work relates to State and local responsibilities?

Response. The standard for funding is 80 percent Federal with a 20 percent local match (a portion of this may be provided by the State as well as by the local governments). Local match may exceed 20 percent in some cases. Planning responsibilities mirror this.

*Question 4.* Is there a shortage of qualified transportation engineers and planners, and if so, how has it contributed to the challenges faced by the transportation planning process, and what can be done to solve this problem?

Response. We can only offer anecdotal information. According to Institute of Transportation Engineers:

The Federal Highway Administration has indicated that 40 percent of the State and local transportation workforce is between the ages of 45–64. In the next 5–15 years, 40–50 percent of all transportation workers will begin to retire. Graduate school enrollment in transportation programs is on a decline as is undergraduate enrollment in civil engineering. Although not exclusive sources of professionals to the workforce, they are significant.

For additional information on this, please contact Aliyah Horton, Senior Director of Government Affairs at (202) 289–0222.

---

STATEMENT OF PETER GREGORY, EXECUTIVE DIRECTOR, TWO RIVERS-OTTAUQUECHEE REGIONAL COMMISSION, WOODSTOCK, VERMONT, ON BEHALF OF THE NATIONAL ASSOCIATION OF REGIONAL COUNCILS (NARC)

Thank you Chairman Jeffords and members of the committee for the opportunity to testify before you today. My name is Peter Gregory; I am the Executive Director of the Two Rivers-Ottawquechee Regional Commission (TRORC), in Woodstock, Vermont. I am here today representing the National Association of Regional Councils (NARC), our members, and the local elected officials and citizens we represent. I am providing testimony on behalf of NARC on the importance of transportation planning to regional councils and Metropolitan Planning Organizations (MPOs). I would like to discuss the success of the Transportation Equity Act for the 21st Century, and changes necessary in its reauthorization to strengthen planning, the role of local elected officials, and specifically, how to better integrate rural areas into the process. The topic of transportation planning and the processes MPOs and councils use to achieve it is important to my commission, NARC, and all of my colleagues across the country. In these processes transportation systems are first developed and discussed so I am glad to see this issue is important to the committee as well.

The National Association of Regional Councils is a 32-year-old organization serving the interests of regional councils, and Metropolitan Planning Organizations. NARC is an umbrella organization comprised of planning commissions and development districts made up of large urban and small rural councils, and MPOs from across the country. NARC provides advocacy and technical assistance in and for environmental issues, economic and community development, emergency management,

and transportation. NARC emphasizes regional intergovernmental cooperation to resolve common problems in all of these important areas.

Regional councils and MPOs are created by compact and enabling legislation as consortia of local governments. As such, regional councils and MPOs represent local elected officials from cities, counties, townships, and villages. Their mission is regional planning and coordination across multiple jurisdictions. Regional Councils and MPOs deliver a wide-range of programs and services such as, economic development, first responder and 911, health care, infrastructure development, aging services, air and water quality, land-use planning, work force development, emergency management and homeland security, and transportation.

Among all of these programs, transportation is key to the continued prosperity and health of all regions across the country. Access to employment and recreation, and the movement of goods and services, drive regional economies and serves to bridge communities otherwise separated. An excellent example of regional coordination and service delivery is the Two Rivers-Ottawaquechee Regional Commission (TRORC), which is one of 12 regional planning commissions in the State of Vermont. TRORC has planning responsibilities for 27 rural towns, most with populations of less than 1000 residents. TRORC performs emergency management, natural resource, land use and transportation planning across its jurisdictions.

Since 1992 when the Intermodal Surface Transportation Efficiency Act (ISTEA) was enacted, the State of Vermont has elected to obtain local input on transportation investment decisions by contracting with Vermont's regional planning commissions. Each regional planning commission's work is guided by a transportation advisory committee (TAC) comprised primarily of locally elected officials. These local officials provide the Vermont Agency of Transportation (VTrans) with a regional transportation plan and prioritized projects in all modes. In Vermont, local and regional transportation policy is developed locally and feeds into the statewide plan, thereby creating a seamless philosophy on transportation investment.

This comprehensive program to document local interests has served VTrans well since 1992. Successive Governors and Secretaries of the Vermont Agency of Transportation have all strongly supported the processes that regional planning commissions use to identify and support projects. In addition, the Vermont Legislature has demonstrated strong bi-partisan support for the inclusiveness of the process. They have understood that regional planning commissions are closer to the communities and bring a comprehensive and trusted approach to their constituents. This innovative approach to public participation has now been used by most of the agencies of State government as a cost effective means to obtain an accurate assessment of local desires. The regional planning commission relationship with the State of Vermont is strong and is serving Vermonters well. It has evolved and matured and has reacted to changing circumstances whether they be freight movement or homeland security.

As an example of this relationship and as enabled by ISTEA and TEA-21, Vermont took advantage of the opportunity to revisit highway design standards used by VTrans engineers. In the mid-1990's, Vermont adopted new, context sensitive standards that replaced the previously used AASHTO standards. Highway, bridge and pedestrian and bicycle facilities now attain their purpose and need while enhancing the built environment and protecting more historic, social and environmental resources. Vermont's regional planning commissions played the decisive role in ensuring adoption of these new standards.

Vermont's citizens have also benefited by the formal involvement by regional planning commissions in transportation planning. Through the 10-year period, the level of understanding by the general public in transportation issues has grown steadily and dramatically. This, in turn, enables more meaningful input for VTrans on project scope, and allows the public greater understanding as to the constraints that are faced when developing transportation infrastructure.

Vermont's regional planning commissions bring many unique talents to the process, not the least of which is the expertise in all the other disciplines that is needed when contemplating the rehabilitation or construction of infrastructure. Vermont's regional planning commissions all bring years of experience in computerized mapping which delineates everything from sewer infrastructure to wetlands and wildlife habitat. Integrating the extensive knowledge base we have with the locally elected officials' input enables projects to be designed and constructed substantially sooner than would have occurred in previous decades. This preserves the environment and saves tax dollars while meeting the mobility needs of the New England economy. Vermont is clearly a "best practice" in rural transportation planning.

Vermont's regional planning commissions need a consistent and predictable funding source to provide the services that we provide. Although they all have close working relationships with VTrans today, it is imperative that the process TRORC

has undertaken over the last 10 years does not falter due to changing economic or political situations.

Guaranteed funding for rural areas to carry out planning is essential. As in Vermont, councils need funding to plan the best transportation systems possible. NARC will ask Congress to provide States with meaningful incentives to move toward the Vermont example of seeking rural officials' involvement. NARC is proposing new funding streams in the next Bill, to make this a reality—including a Rural Set-Aside for planning and projects.

This committee can appreciate a system that works well. Vermont is an example of where ISTEA and TEA-21 were implemented successfully. This success, however, is not replicated in all regions across the country. Local elected officials, councils, and MPOs, in many cases and in many places, have less say in the transportation planning and decisionmaking process, than those in Vermont.

NARC proposes changes in TEA-21 to allow all States and regions to replicate the success of Vermont. The association asks Congress to smooth inconsistencies among States by adopting clear and concise law incorporating local governments into the transportation decisionmaking process. Local elected officials, cities, counties, and regions, should not be left out of the system because, at the Federal level, there are not clear voices sounding on their importance in the process. For example, in many rural areas across the country, there is no Federal statute that requires States to formally engage local elected officials in the planning process. NARC would like to see law and regulation requiring this process. Congress did ask the United States Department of Transportation to promulgate their proposed regulation on local official consultation. NARC asks this committee to reemphasize the importance of this regulation and urge the Department of Transportation, in the strongest sense possible, to move forward on its release.

NARC is urging Congress to consider all its partners, not just rural councils as important to building and maintaining the best transportation system in the world. NARC seeks more funding for MPOs, better coordination within State and Federal programs, and new and innovative programs aimed at alleviating urban transportation problems such as congestion, funding flexibility, and air quality. Congress should guarantee States the flexibility to spend funds and program projects based on their priorities and extend that same responsibility and authority to all local elected officials.

Air quality, planning coordination, and finance and fiscal constraint are of particular interest given new directions in air quality regulations, the need to better coordinate planning cycles, and fewer resources at the regional and local level. These new regulations will impact urban and rural areas in ways not yet understood. First and foremost, Congress should consider air quality conformity as a tool to achieve clean air quality goals.

The conformity process as currently legislated neither readily achieves air quality nor facilitates an easy solution. The current process opens regions to poorly defined legal challenges, faulty science, and consigns many of them to a bureaucratic quagmire. While conformity is well intended, and necessary, its application should be reexamined. Of no less importance to regions is the assurance of well-timed plans.

Both conformity and transportation plans should be timed together to achieve maximum results. Required plan updates, plan lifetimes, and conformity checks should be synchronized, and required less often. By doing these two things MPOs and regional councils can conserve planning resources and make plans more meaningful to the public and their elected officials. To ensure MPOs and regional councils have the ability to plan in the first place they need concise revenue forecasts and tight internal control of their resources.

Fiscal constraint on MPOs and councils is absolutely necessary, as long as revenue forecasts are precise and fiscal standards consistent. MPOs and regional councils are held to higher fiscal standards in their planning and programming processes than the States that fund them. Congress should require States to provide accurate revenue forecasts to MPOs and councils and engage them in calculating these forecasts as well.

NARC will also urge Congress throughout this and the coming year to consider greater emphasis on safety in rural and urban communities, a balanced and intermodal approach to Federal funding, comprehensive review and consideration of technology deployment, and greater consideration of freight movement as an essential part of the transportation planning process.

Of particular concern to NARC members and the citizens they represent are the tens of thousands of accidents and deaths on rural roads each year. Coupled with increasing safety concerns in urban areas, this presents a sobering picture of travel on America's roads. NARC is urging Congress to apply resources in new and innovative ways to lessen this tragedy.

NARC is urging Congress to consider ways to streamline the project delivery process, while ensuring the health of our natural environment. The ability to move projects quickly, especially those that will make our roads safer, is of key concern. Bound intimately with safety are new concerns for security.

Given the fact that many regional councils are currently involved in emergency management planning, NARC will also urge Congress to consider regional councils and MPOs as primary recipients of homeland and surface transportation security funding.

NARC would like to help all councils achieve the same success as those in Vermont, and in other places, through a balanced, intermodal, comprehensive, and locally and regionally led process of planning, programming, and project selection.

NARC will be happy to elaborate at any time and assist Congress in any way. Thank you, Mr. Chairman and committee members for allowing the National Association of Regional Councils time to present its views.

---

STATEMENT OF ANDREW C. COTUGNO, METRO PLANNING DIRECTOR, PORTLAND,  
OREGON

Mr. Chairman I want to thank you and the committee for holding this series of hearings on reauthorization of the Transportation Equity Act for the 21st Century (TEA-21) and inviting me to testify. I am Andy Cotugno, Planning Director for Metro, the regional government covering the 24 cities and three counties of the Portland, Oregon metropolitan area. Metro is the only directly elected regional government in the U.S. Metro has a home-rule charter approved by the voters, establishing a Metro "that undertakes, as its most important service, planning and policymaking to preserve and enhance the quality of life and the environment for ourselves and future generations." We also serve as the Metropolitan Planning Organization (MPO) under the Federal transportation planning statutes. Metro is an active member in our national organization located here in Washington, the Association of Metropolitan Planning Organizations (AMPO). I am pleased to be joined today by my colleague, Ron Kirby from the MPO for the Washington, DC. region.

The Portland region is often cited as the Smart Growth capital of the world. Whether that is true or not, Metro's programs have been closely scrutinized throughout their 23 year life. It is from that unique base of experience, transportation integrated with Smart Growth, that I offer these recommendations.

This morning, I would like to speak to you first on the principles of making the Smart Growth connection to transportation and then relate that to recommendations for how the next transportation authorization bill could recognize these principles. The linkage between Smart Growth and Transportation is about understanding how developing land use patterns impact the effectiveness of the transportation system and, in turn, how a new transportation project affects those development patterns. The key to the successful integration is to recognize what land use goals are being pursued and how a planned transportation project will either lead the region closer to the goals or conflict or undermine the goals.

Metro and the Portland region have implemented a number of integrated land use and transportation strategies through something we call the Region 2040 Growth Concept:

- We have had an urban growth boundary in place for 20+ years, which has effectively stopped the sprawling development pattern leapfrogging out onto farmland. As a result, all aspects of urban infrastructure, including roads, transit, sewer, water, schools, police stations, libraries and parks are focused within a compact urbanizing area, reducing the need for expensive extensions.
- We have used land use plans and zoning to reinforce a higher density development pattern in locations that can be well served by light rail and bus transit, producing six consecutive years of transit ridership increases.
- We have protected industrial areas and areas intended for intermodal freight terminals from conversion to big box retail, preserving this land and highway capacity for more important economic purposes. In this manner, key highway expansion projects are retained for their function to move freight rather than being overloaded with shoppers.
- We have adopted parking limitations, not just parking minimums to ensure new development does not overbuild parking.
- We have adopted a requirement for greater local street connectivity to ensure a system of cul-de-sacs does not simply shift local traffic onto the regional system.
- We have restricted development near streams and acquired open space to ensure a balance between growth and access to nature.

- We have adopted revised street design guidelines to ensure highways intended for through traffic are built to emphasize moving cars and trucks while streets in downtowns and neighborhoods support a strong pedestrian environment and access to transit.

- We have taken advantage of the flexibility provided by ISTEA and TEA-21 to target funds to a broad mix of highways, light rail, arterials, buses, bike trails, sidewalks, transportation demand management programs and transit-oriented development projects.

- We have put to good use funding made available through the New Starts Program to build a successful light rail system that helps to focus growth and has ridership 7 years ahead of forecast.

- We have leveraged the planning framework provided by the Federal requirement for a metropolitan planning organization into a broad-based intergovernmental program to coordinate regional land use and environmental protection plans.

In summary, we have used transportation investments to influence desired land use plans and we have used land use controls to produce a more effective transportation system. The premise of the Metro 2040 Growth Concept is that integrating our land use and transportation plans produces both better communities and better mobility.

With this Smart Growth framework, I would like to focus on three transportation programs that can serve as the framework for the Smart Growth direction in the next transportation bill:

1. Title 49, Section 5309—Major Capital Investment Grants for New Fixed Guideway Systems (Which I will refer to as the New Starts Program);

2. Title 23, Section 1118—National Corridor Planning and Development Program (which I will refer to as the National Trade Corridor Program); and

3. Section 1221—Transportation and Community and System Preservation Pilot Program (which I will refer to as the TCSP Program).

#### FTA NEW STARTS PROGRAM

All of these programs could follow the model established by the New Starts program. The New Starts Program has been a sustained program for over 25 years providing discretionary grants to construct light rail projects. Since these are expensive projects, local areas have a significant incentive to pursue 50–80 percent Federal funds. As a result, competition is high and many projects from all over the country are waiting in line. To manage the demand:

- Congress has set clear criteria to distinguish the most meritorious projects;
- The legislation provides for seed money to develop a project with the expectation that the best projects will be in line for construction funding;
- The Federal Transit Administration requires local areas to go through a rigorous process to prove the merits of their projects;
- New Start regions collaborate on what constitutes a good project and hold each other to a high standard;
- The Federal Transit Administration makes a recommendation of projects that are “Highly Recommended,” “Recommended” or “Not Recommended” to Congress;
- With the approval of the congressional authorizing and appropriating committees, a multi-year funding contract is executed for the best projects subject to annual appropriations to fulfill this commitment.

This is a very successful program. It produces good projects that stand up to scrutiny. It is administered in a manner that results in selection of a limited number of good projects from a large competitive field. The funding is significant enough to hold local areas and the projects they seek to a high standard. The projects make a significant difference when they are built.

For the Portland region, the New Starts program has provided the means to build an essential part of the region’s transportation infrastructure and, in the process, shape the growth of the region to be supportive of Smart Growth goals. It has had a profound impact on the ability of the region to reign in sprawl and hold tight it’s Urban Growth Boundary, thereby eliminating the need to build public infrastructure in an ever-expanding urban area. It has helped produce a terrific downtown Portland and is now shaping the future of downtown Gresham, downtown Beaverton and downtown Hillsboro, as well as new communities sprouting up around light rail stations. And, because the Federal New Start funds make a significant contribution, it has been possible to leverage State and local funds into the projects that would not have been spent on the transportation system. In addition, decisions have been made to target various Federal formula funds into the New Start projects (through STP, CMAQ and FTA Section 5307).

## B. FHWA NATIONAL TRADE CORRIDOR PROGRAM

If the New Starts Program is the transit component of a Smart Growth strategy, what is the equivalent for the Federal Highway Administration? You would think the complementary program would be the NHS system. It is a significant funding category available to all the States. It is intended for modernization and expansion of the most important part of the nation's highway system. However, the NHS system is so large and the eligible uses of these funds across this system are so varied, their use is not focused. In the case of Oregon, these funds are used primarily to rehabilitate the system that already exists. That's a prudent asset management decision to make but doesn't deal with the needs to expand and modernize that system in targeted areas of national economic importance.

The National Trade Corridor Program could follow the New Starts model and be the strategic Federal investment in the National Highway System. Through the National Trade Corridor Program, there can be a Smart Growth connection to building a strong economic base, not just livable, walkable neighborhoods. To do this, the "Borders" and "Corridor" funding categories should be separated because they are distinctly different. With that, the "Corridors" component should be revised to mirror the New Starts program but with a Freight and Trade emphasis, as follows:

- It should be authorized at a funding level sufficient to allow Congress and the FHWA to make multi-year funding commitments to significant construction projects. Like New Starts, that means \$1+ billion per year, not the current \$140 million per year (split with the Section 1119—Coordinated Border Infrastructure Program), allowing commitments to projects of \$300–500 million.

- It can provide the funding for the seed money to develop projects, leading to a later request to fund construction (at the present, the National Corridors Program can only fund these studies or very small scale construction projects);

- Congress should set a high standard on how the funds are spent to ensure high quality projects are funded to produce the greatest impact on global economic competitiveness rather than spreading the funds across a list of projects of unknown merit.

- The Federal Highway Administration should ensure localities go through a rigorous process to establish the basis for their recommendation to Congress to "Highly Recommend," "Recommend" or "Not Recommend" projects for a multi-year funding contract.

- With the approval of the congressional authorizing and appropriating committees, a multi-year funding contract can be executed, subject to annual appropriations.

- Through this process and the high degree of national competition, State and local governments should be encouraged to leverage their NHS, Interstate-4R and STP funds, not to mention State and local funds into the project.

This approach would provide the means for implementing significant highway projects needed to move freight and support the nation's economy.

Let's look at a Portland case study as an example. Interstate 5 is a designated National Trade Corridor from Canada to Mexico through Washington, Oregon and California. The segment connecting Oregon and Washington in the Portland/Vancouver region is a significant bottleneck and the most congested corridor in the region. The I-5 bridges across the Columbia River are an antiquated pair of draw bridges (three lanes each northbound and southbound), the first one built in 1917, well before the Interstate system was imagined, and the second in 1958. These old bridges represent the critical bottleneck where access to the Ports of Portland and Vancouver provide U.S. connections to the Pacific Rim (the only west coast ports with a positive balance of international trade). This is the same corridor that accesses the intermodal terminals for the two transcontinental railroads (BN/SF and UP/SP). This is the same corridor that accesses the Portland International Airport to ship high value products such as the source of Intel's Pentium 4 chip. And, this is the same corridor where 80 percent of the region's truck terminals are located.

Finally, I-5 is located in a fragile social and environmental setting making construction of any improvements difficult. I-5 was built by displacing a 3–4 block wide swath through the low income/minority area of the region making further widening difficult. In addition, construction of any new bridge across the Columbia River will be regulated by the Endangered Species Act due to listing of salmon and steelhead as endangered. And to top it off, the 1917 bridge is on the National Register of Historic Places.

With the tremendous benefit of a \$2 million "Borders and Corridors" grant from FHWA (thank you), we have now completed an extensive community-based process to develop a solution to the "bottleneck" and have succeeded in coming up with a fragile multi-modal consensus on how to proceed, including:

- Upgrading the existing bridge from 6 lanes to 10 lanes across the Columbia River at a cost of \$1.2 billion +;
- Extension of the two existing light rail lines in Portland north to connect as a loop in Vancouver at a cost of \$1.2 billion +;
- Implementation of aggressive measures to reduce demand, increase transit service and encourage the use of alternatives to auto commuting; and most revolutionary;
- An agreement to control land uses to avoid inducing more sprawl in response to a bigger freeway to simply result in a bigger traffic jam in the future.

So, you say, what is the problem. TEA-21 provides significant help through the NHS, Interstate-4R and Bridge programs that the States of Oregon and Washington can choose to commit to this corridor. Well, Oregon has prioritized these funds to take care of over 7,500 miles of existing highways statewide and expansion comes after taking care of the existing system. Washington State priorities are focused on its major population center of Seattle. This corridor is currently unfunded. But, because of its critical trade characteristics it would be a good candidate for a revised "National Corridors Program" in the manner described.

Ironically, the LRT components of the plan have a better chance of being implemented through the New Starts program than the I-5 freeway components. The economic implications spread far beyond this corridor because freight that is shipped through the marine, rail, truck and air cargo terminals moves to and from points throughout the Pacific Northwest, the entire U.S. and the Pacific Rim.

#### C. FHWA TRANSPORTATION AND COMMUNITY AND SYSTEM PRESERVATION PILOT PROGRAM

Let's move to the third component: the Transportation and Community and System Preservation Pilot Program. If the New Starts Program is intended to build the backbone to move people in a Smart Growth context and the National Trade Corridor Program is the means to build significant highways for moving commerce, TCSP is the model for building strong communities around the transportation system. Whether it's Transit-Oriented Development around Light Rail or an Interchange Management Plan to avoid incompatible development from overloading a new interchange, the TCSP Program was designed to make the land use connection to the transportation system.

The program was conceived with all good intentions. It was founded on the principles of Smart Growth, based on the premise of building transportation projects that support good local and regional growth decisions. It was intended to support such concepts as urban growth boundaries, transit-oriented development, interchange land use management plans and green corridors separating metropolitan areas.

In the first year of TEA-21, FHWA did an admirable job of setting guidance for the program and selecting competitive projects (in fact, the Portland region is now finishing a TCSP grant to do the master planning for a major expansion of the region's urban growth boundary). However, since then, Congress has earmarked the funds to a potpourri of projects. In the most recent appropriations bill the program originally authorized at \$25 million was earmarked with \$250 million of projects. This program could benefit from the rigor of the New Starts model. And it could be the third pillar of the national program, not to build the major elements of the system, like light rail and freeways, but to build strong communities taking advantage of and supporting the major elements of the transportation system:

- The Federal Highway Administration, in partnership with the Federal Transit Administration should continue to develop guidance for projects to be funded through the TCSP Program. The initial effort to define the principles for selecting the projects was a good start and should continue to ensure funding is targeted to best support good land use decisions rather than ignore or undermine land use decisions.
- The Federal Highway Administration should publish information to highlight the characteristics of successful projects and disseminate these "Best Practices."
- Congress should increase the authorized level of the program to \$250 million, comparable to the fiscal year 2003 appropriations.
- Congress should tighten up statutory language to ensure grants cannot be awarded unless they demonstrate a supportive land use benefit.
- Congress should require an evaluation of the merits of the proposed projects by the Federal Highway Administration and approve funding based upon a recommendation of "Highly Recommended," "Recommended" or "Not Recommended." This should be designed to ensure good projects are recommended for funding, al-

though in a more streamlined manner than the large multi-year contracts under the New Starts and National Trade Corridor Programs.

The theme for all three of these programs is the same. The Federal Government ensures localities go through a rigorous process, thereby justifying a substantial funding commitment to a project that really makes a difference. With this focused undertaking, other funding sources and programs also are leveraged.

In sum, I encourage you to consider what I call the three pillars of the Smart Growth connection to the next transportation bill: 1) New Starts to focus housing and jobs, 2) National Trade Corridors for global economic competitiveness and 3) TCSP to build strong communities around transportation.

Let me turn now to a few other issues:

1. Title 23, Section 104(f)—Metropolitan Planning Funds/Title 49, Section 5303—Transit Planning Funds: With the 2000 Census, there will be more MPOs created, potentially reducing the level of planning funds to existing MPOs.

To avoid this reduction, Federal Highway Planning funds should be increased from a 1 percent take-down on categorical funds to a 2 percent take-down. FTA Transit Planning funds should be increased from their FFY 2003 authorized level of \$58.6 million consistent with the increase in MPO population.

2. Title 23, Section 133(d)(3)—Surface Transportation Program funds to Transportation Management Areas: A portion of STP funds is suballocated to MPOs designated Transportation Management Areas in excess of 200,000 population. Again, with the 2000 Census, there will be more TMAs formed and an increase in population in the existing TMAs. To recognize this, the formula for splitting STP funds between these TMAs and the balance of the State should be revised accordingly.

3. Clean Water Act—There has long been a connection between the Clean Air Act and transportation legislation. Planning and funding decisions between the two Federal acts are well integrated because vehicle emissions are a major contributor to air pollution problems.

In the same manner, the road, street and highway system is a major contributor of polluted stormwater runoff. As such, there could be a tighter connection to the Clean Water Act to ensure transportation projects can employ more environmentally friendly stormwater handling methods.

4. Endangered Species Act—State and local governments in the Northwest are working closely with the National Marine Fisheries Service to recover the salmon and steelhead listed as endangered. Past transportation projects have contributed to this listing by blocking access to important upstream habitat. There should be clear eligibility to use Federal transportation funds to retrofit previously installed culverts to restore access to this habitat.

---

RESPONSES OF ANDREW COTUGNO TO ADDITIONAL QUESTIONS FROM SENATOR  
JEFFORDS

*Question 1.* Do you feel that computer simulations, an example of which would be TRANSIMS, are (or could be) valuable in the planning process? Are, or could they be, effective in the examination of various planning options?

Response. Computer simulation tools are a valuable asset to have in the planning process. Depending upon the degree of sophistication of these tools, transport and land use allocation models can be linked to provide a comprehensive analysis of regional growth strategies. Specifically, the allocation of population and employment is subject not only to the land availability, but also to the degree of accessibility provided by the transportation infrastructure. This capability is essential if the allocation is seen as a means to reduce travel demand and the corresponding expense to provide infrastructure.

A well-specified simulation tool can aid the decisionmaker in quantifying the travel impacts from localized urban design alternatives. For example, the consequences of developing a high-density mixed-use center around a light rail station can be quantified in terms of the effect on auto ownership, origin and destination patterns, and mode choice (including walk and bicycle) decisions.

Multi-modal accessibility is a key consideration in the development of a balanced transport system. Options must be available to minimize the reliance on single occupant vehicles. Simulation models are used to analyze the effectiveness of proposed system improvements. For example, the tools can be used to quantify new transit riders, vehicle-miles-traveled impacts, roadway delay, and air quality consequences for a particular project or system plan. The measured benefits can be compared to costs to provide assessment measures.

## RESPONSES OF ANDREW COTUGNO TO ADDITIONAL QUESTIONS SENATOR SMITH

*Question 1.* In the current marketplace, what are the Federal obstacles to transit-oriented development?

Response. In the current marketplace there are actually very few Federal obstacles to transit-oriented development. In fact, Metro operates a transit-oriented development implementation program that has used Federal funds for TOD projects since 1998, the first of its kind in the United States. The Federal processes for TODs are not well known and are difficult, but Metro has several outstanding TODs completed. Other areas of the country have studied Metro's program and Maryland appears ready to launch a similar but more ambitious program. The Metro TOD Program was made possible through Section 5309 of TEA-21 (carried forward from Sec.3 (a)(1)(d) of the Transportation Act of 1978) and the Federal Transit Administration Joint Development policies issued March 14, 1997. Three other key elements of the FTA policy that significantly facilitate TODs are use of a "highest and best transit use" appraisal for real estate sale, the "Exception to the Common Grant Rule" for return of the revenue to subsequent eligible transit expenses, and the use of a two step process to meet requirements of the National Environmental Protection Act (NEPA). It is important that favorable use of Section 5309 including acquisition of real estate for TOD purposes based upon the standard "highest and best use" appraisal with subsequent sale to a TOD developer based upon a "highest and best transit use" appraisal and the exception to the common grant rule be continued in new legislation. Metro's current TOD Program operates under a "programmatic environmental assessment" that allows it to evaluate potential TOD opportunities within any station area of the light rail transit system. Once a project is selected, a detailed NEPA analysis is conducted through a "documented categorical exclusion." This process allows the TOD Program to forge public private partnerships that can respect and function within the fast-paced environment of private sector real estate development, and this interpretation of NEPA must also be retained.

The main obstacles to TODs within the private sector include developers and builders who are unfamiliar with the product type, banking practices that do not recognize TOD as a standard financial product, and suburban real estate economics that favor land consumptive sprawl patterns over high quality, more compact, walkable environments. Obstacles that may exist within the public sector include local zoning codes that do not allow mixed-use project and minimum parking ratios that preclude developing projects at higher transit-supportive densities.

Despite these problems, facilitating TODs is good public policy. They reap a ten-fold increase in transit use and nearly 2 1/2 times increase in biking and walking compared to standard suburban development.

Improvements to FTA regulations could be made in the way TOD projects are analyzed. Current policy requires a "greater economic benefit to transit," relying on capitalized value of added transit fare box revenue as the measure of Federal financial investment in a TOD project. This should be broadened so that a TOD project simply be more cost effective in time saved/transit ridership gained than the transit system it is enhancing.

---

STATEMENT OF JUDITH ESPINOSA ON BEHALF OF THE SURFACE TRANSPORTATION POLICY PROJECT

Mr. Chairman, I am Judith Espinosa, Director of the Alliance for Transportation Research Institute at the University of New Mexico. I appear today on behalf of the Surface Transportation Policy Project (STPP) where I serve as a member of the Board of Directors. I would like to thank you, Mr. Chairman, and the members of this committee for inviting me to testify and for structuring your hearings so that you may hear from a diverse representation of views on reauthorization of TEA-21.

The STPP coalition has taken an active role in the debate on Federal transportation policy since its inception in 1990, helping provide policy support for what became ISTEA and later TEA-21.

As we begin the debate on the renewal of TEA-21, I wanted to describe briefly STPP's process for identifying specific recommendations to support further progress on a national transportation reform agenda. We have embarked on a broad national outreach effort, called the Alliance for a New Transportation Charter (ANTC), to support consensus proposals, based on input from hundreds of national, regional and local organizations as well as State and local elected leaders. To support this, our Charter focuses on seeking reforms in the following key areas: 1) enhancing health, safety and security; 2) conserving energy and enhancing the environment; 3) promoting social equity and livable communities; and 4) advancing economic pros-

perity. STPP's recommendations on reauthorization will reflect our Charter's focus areas and a broad perspective on improvements to current law as made by those groups and organizations that advocate the principles in the Charter. ISTE/TEA-21

I would like to offer a few observations to guide this panel's efforts as you prepare to renew TEA-21 next year. First, the STPP coalition strongly believes that the basic structure of the TEA-21 law is fundamentally sound and should be preserved. It is our belief that transportation policy in America has been fundamentally reshaped as a result of the 1991 ISTEA law. If there is a single shortcoming, it is that the law has not been fully implemented. As a result, we do not see the Federal, State and local partnership developed to the point where it is promoting the full intent of ISTEA and TEA-21. In short, despite much progress, we have failed to fully capitalize on the many opportunities this law has intended to make available to our States, regions and communities. We see renewal of TEA-21 as another step in the continuum of the transportation reform process that will span longer than simply the last decade.

In December, STPP along with other key partners celebrated "Ten Years of Progress" at a special event where we had an opportunity to take stock of the many transportation changes that the ISTEA legislation fostered. In celebrating this record of progress, we were particularly pleased to recognize Senator Daniel Patrick Moynihan with a special award, named after the late Senator John H. Chafee. Senators Chafee and Moynihan were longstanding members of this panel whose efforts helped this panel, the Senate and the Congress move forward on a national transportation policy reform agenda.

What particularly impresses me, a person who has worked extensively with local and regional transportation advocates, is the depth of the public's awareness about the role of transportation infrastructure investment and how they see its power to influence their lives, their neighborhoods, and their communities within the context of their broader regions and States. ISTEA and TEA-21 have stimulated the public's appetite for transportation improvements that offer more choice and balance in their transportation options and that add value to their lives and to their communities. At the same time, I would note that implementation of the law has been a struggle in many places and it is certain that the law has not been implemented equitably across States and within areas of individual States. We believe that U.S. DOT and its modal agencies can now provide renewed leadership to ensure the public they are engaged in the full implementation of this law. States, MPOs and local governments must likewise renew their stewardship to improvements in implementation.

#### *A Decade of Milestones*

To frame some of my perspectives on the issues before the panel today—"Transportation Planning and Smart Growth"—I have highlighted some key policy developments of the last 10 years, suggesting areas for further review as this committee crafts legislation renewing TEA-21.

- ADA: ISTEA was crafted immediately following the enactment of the Americans with Disabilities Act. While we have not seen a level of progress in implementing this law relative to the transportation sector, we now know and have come to appreciate that efforts to address the mobility needs of persons with disabilities can simultaneously deliver broader societal benefits, be it increased emphasis on pedestrian safety benefiting children, seniors and the broader public or a stronger emphasis on bicycle/pedestrian infrastructure that anticipates the aging of our nation's population and the market push toward investment in existing places.

- Brownfields: When ISTEA was being developed, its authors recognized the potential of underdeveloped or underutilized lands in proximity to major highway, rail and port infrastructures and their desirability for reuse. No one could have anticipated the national debate that would follow on the reuse of vacant lands. This debate recently culminated in the enactment of Public Law 107-118. Mr. Chairman, Senator Chafee and others on this panel who played such an important role in moving this legislation forward after years of disagreement, we thank you. A broad national commitment to recycling America's land is an important policy thrust and we encourage you to look for additional ways in the TEA-21 renewal bill to prompt broader reuse—both planning and investment policies—of these many thousands of brownfields throughout the Nation. We see this focus on the reclamation of brownfields and others vacant lands as a significant new community development priority.

- Census: The 2000 Census challenges the upcoming debate on TEA-21 renewal in a number of ways. It underscores the need to accelerate our policy efforts to prepare for the aging of the nation's population. At a recent committee hearing, we

learned that the demographics of Florida, which were once thought to be unique to that State, will be found in other States in the near future. We also see that, as the Nation is getting older, there is also a boomlet of the very young, giving rise to initiatives, like Safe Routes to School and others, which focus transportation dollars on facility improvements to offer more protection for our most vulnerable. The new Census also shows us the changing racial composition of our cities, suburbs and rural areas as a result of immigration and other trends of the last decade. This calls attention to the need to further strengthen our efforts on environmental justice and Title VI of the Civil Rights Act. Finally, we continue to see changes in the population and land areas of our nation's urbanized areas. A recent DOT notice shows that there will be 61 new MPOs, with many others whose boundaries are being redrawn and in other cases urbanized areas will be renamed. We see the new Census data as informing our policy reform discussions on TEA-21 renewal just as the 1990 Census helped support review of the Federal transportation law that became ISTEA in 1991. Specifically on the MPO issues, this new data should prompt us to review the range of issues surrounding the MPO structures of current law to modernize these agencies, reforms that were not pursued in TEA-21 or ISTEA. The 2000 Census, along with the many new challenges and expectations now before MPOs, necessitates a new look at how MPOs are funded, structured and supported.

- **Clean Air:** Like ADA, ISTEA followed the enactment of amendments to the Clean Air Act. At that time, the relationship between transportation sector investments and clean air objectives was not fully understood. Since that time, we have come to realize that attainment of clean air standards would prove more difficult than expected, even with the commitment of new resources under ISTEA and its Congestion Mitigation and Air Quality (CMAQ) program. We now understand that mobile sources would become more dominant, not less, as the key determinant for most regional efforts to achieve attainment with national standards. More recently, the Supreme Court's decision affirming EPA's stance on the need to move forward with new air standards further amplifies the need to preserve, and further expand our resource commitments here, be it an expanded CMAQ program or other means to further local efforts to achieve attainment of national air quality standards.

- **Environmental Justice:** Over the last 10 years, we have seen the emergence of a broad movement to examine the linkages between social justice and our public investment decisions. ISTEA with its emphasis on "early and continuous" public involvement, and its broader data collection and research efforts, opened up the public dialog on many social equity concerns which too often were overlooked or ill-informed in transportation decisionmaking. This is a significant area of public debate that continues to challenge our planning and other processes under TEA-21 to ensure that EJ concerns are addressed in a much more systematic manner. Research is needed, data systems must be updated and further capacity should be built at the State and MPO level if we are to effectively address the difficult challenges in this area. I am pleased to have been recently appointed by EPA Administrator Whitman to serve on the National Environmental Justice Advisory Council (NEJAC) to work with other interested parties to assist Federal agencies in efforts which relate to environmental justice. I would be pleased to provide any support to this committee's review of these issues that are very much a part of our national views on transportation equity.

- **Metropolitan Economics:** This committee previously has heard testimony from the mayors and others on the importance of the nation's metropolitan economies in driving the economic prosperity of this Nation. This is new data that wasn't available prior to ISTEA. We know that these areas account for a disproportionate share of U.S. economic output. These economic studies also project that the nation's 300+ metropolitan areas, largely represented by MPOs under the TEA-21 law, will warehouse virtually all of the key sectors—high technology and financial and business services—that will drive the nation's future economic output. As we look at the issues of planning and smart growth, improvements to TEA-21 are crucial in ensuring the broader health and vitality of these economic engines. Among the issues that we would ask the committee to examine is the relative funding commitment to these areas. For example, the current law provides certainty to only the largest MPOs, those serving areas of 200,000 or more in population and representing about 54 percent of the nation's population. And, they are only certain that about 6 cents of every dollar (i.e. STP suballocated funds) will be made available each year from TEA-21, a modest commitment to areas that collectively account for a substantial share of the nation's economic output, a large majority of all transit use, aviation passengers and port tonnage as well as critical elements of the nation's freight rail and passenger rail capacities. We suggest that increased local control over TEA-21 funds be seriously considered in the new law.

- **Rural Economies:** In contrast to metropolitan areas, we know that rural areas face a whole set of other challenges. In the last decade, we continue to see the erosion of rural economies despite many transportation infrastructure upgrades to State highway facilities. At the same time, these areas are impacted by the sustained urbanization of our metropolitan areas, which push outward and place enormous pressure on rural communities and land resources. More recently, we have seen new information that documents the significant safety needs of our rural road systems. We have looked at data that shows that there has been a sustained investment in rural areas within many States, investments that are generally disproportionate to the population of these areas. There is a need to rethink the investment patterns in our rural areas and look at alternatives, which will improve safety, promote sustained economic advancements, and give people choices for travel. Many State highway investments in these areas are pursued in the name of economic development or safety but many may simply be missing the mark.

We have seen great success with a relatively small investment that has been made in the National Scenic Byways Program. Here is a program that creates a strong linkage among rural communities along a large corridor, creating an opportunity to leverage other public resources and capturing new private sector investment in areas that would otherwise have been overlooked. We have seen how modest commitments of Transportation Enhancement funds have stimulated tourism and other economic activity through improvements to main streets, trails, historic train stations and other projects. Many of these same projects could be funded with State STP funds but, instead, are usually committed to other investments in State highway facilities.

There has been reluctance by many States to commit safety funds to areas where signage, markings and shoulders would make a difference at much less cost. In my State, our rural agencies, known as rural planning organizations or RPOs, have worked hard to plan and develop a transportation investment agenda for their areas utilizing a broad scope of public input. Their recommendations and plans are largely ignored by our State's transportation department or set aside as a low priority agenda. When these rural planning organizations are viewed as advisory only, true regional transportation planning becomes flawed. To have effective planning, there has to be a connection between resources and the local areas that are planning and seeking the improvements. In New Mexico, our RPOs plan projects but never will receive any resources to implement them.

Failure to implement TEA-21 and use its flexibilities, we are talking about the many opportunities that are lost when State transportation officials ignore the potential of these more modest projects and the impetus they can provide in stimulating rural economies. Likewise, U.S. DOT must become more aggressive in addressing rural transportation planning needs. Despite directives in TEA-21 to address rural planning issues, U.S. DOT regulations have yet to be issued.

- **Stewardship Movement:** Increasingly, we see that ISTEA's reforms have played a significant role in helping revive an interest in stewardship of our systems, with the public and State and local elected leaders engaged in trying to look at transportation in a more comprehensive manner. At its core, ISTEA's transportation planning process was the first effort at ensuring that transportation investments are considered in a multi-disciplinary manner, considering impacts on air quality, communities, energy use, and so on. As we approach TEA-21 renewal, this engagement of the public and elected leaders envisions a broader stewardship agenda, be it habitat protection, biodiversity, air and water quality, or the preservation of cultural, historic and land resources. We see this move toward stewardship as a very positive development, but we must ensure that the resource commitments are there to move it forward. Our coalition is now reviewing how an environmental stewardship initiative could support this broader vision.

- **Taxpayer Engagement:** ISTEA was designed to encourage a broader public discourse on transportation investment. This week The Washington Post is calling for reader ideas on "things that could be done quickly and cheaply to alleviate traffic congestion." We now see a level of engagement of the taxpayer in this debate which is unprecedented. Whether you accept the rubric of smart growth or smart planning, these issues resonate with taxpayers who are increasingly pressing public decision-makers to get more return from their public investments, particularly return from existing investments. The public now understands that the outward development of their regions, and the road improvements that are needed to develop these outlying areas, are stressing public capital resources and diminishing what is available to places where most of them now live and work. In rural areas, there is a growing recognition that funds are generally available for major new State highway projects, but not for other transportation needs. The message from the public increasingly is that they want a better return on the use of their tax dollars, not just moving

money out to undeveloped or underdeveloped areas. This is real and is growing broadly throughout the Nation. The public's renewed appreciation of these issues is challenging our planning processes which historically have not accounted for an engaged public, many of whom may not always participate in each step of the process but certainly are increasingly aware of and vocal about the outcomes.

- **Transit Use:** The growth in transit use, particularly in later part of the ISTEA decade, reversed a multi-decade decline in public transportation. In fact, over the last 5 years, transit use has grown at about twice the rate of auto use (as measured by VMT), with transit trips today reaching levels not achieved since 1960. In the wake of ISTEA and its emphasis on local decisionmaking, we have seen a dramatic increase in demand for transit investment, particularly rail transit, in the nation's larger urban areas. When local areas are empowered to shape future investment plans for their regions, it is clear that local areas are often making different decisions and ones that emphasize broader transportation choices for their regions. There has been a virtual explosion in demand for rail transit, for example, since MPOs were empowered to share future transportation decisions for their regions.

It is interesting to note that of the top 50 metropolitan areas, which represent a substantial share of the nation's economy and population, 48 of these areas are planning new rail transit projects, expanding existing rail systems or constructing new rail systems. The emergence of rail transit and the broader push for increased transit investment overall is an important development as we look to renewal of TEA-21.

- **Water Quality:** During the last 10 years, we have a better understanding of the implications of the "Water Quality Act of 1987" and its emphasis to move beyond point sources to control of urban runoff through municipal and other stormwater discharges. Today, hundreds of communities hold permits, requiring water quality monitoring, best management practices and even structural improvements. We have assembled a substantial record that documents how highway runoff and other transportation-related uses are contributing to the degradation of our nation's water quality. When ISTEA was first enacted, stormwater regulatory efforts were in their infancy, which is certainly not the case today. We see this as a substantial new development that should be more fully considered as the TEA-21 renewal moves forward, both in the planning process and in the allocation of resources.

- **Welfare Reform:** The 1996 welfare reform legislation was particularly important in reminding transportation professionals and system operators that existing planning efforts did not fully account for the new demands of a large number of Americans who would be making the transition from welfare to work. In TEA-21, the Job Access and Reverse Commute (JARC) program followed immediately in the wake of the welfare reform legislation, helping transit and other providers fill the many gaps resulting from the spatial mismatch of workers and job centers. This program was also deployed to help workers in rural areas get to jobs in other parts of their region. This area will continue to challenge us to use JARC funds and find other resources under TEA-21 to further refine these strategies, be it adding routes where transit services are now offered, supporting new services in areas where services are unavailable, or incentives to plan and support the location of training and support services at key transit and transportation facilities. We see the renewal of the TANF law this year as one part of a broader effort to coordinate and establish new linkages between TEA-21 and TANF to further the transition of thousands of Americans from welfare to work.

- **9/11:** Finally, I would note that we closed out the ISTEA decade with the catastrophic events of September 11. We are still grappling with the implications of this attack and its subsequent threats, with most of the Federal policy efforts focused on redesigning our aviation and port security capabilities. We do know that the surface transportation systems of New York and Washington, DC were diversified to a level that allowed them to absorb these shocks without further disruption to these major regional economies and the broader U.S. economy. In fact, New York and Washington are the top two rail transit systems in the Nation and are also linked to the nation's only high-speed passenger rail corridor. We see the need to carefully consider how we can use available transportation resources to further diversify our transportation systems. With this disruption to the nation's aviation system and subsequent realignments in service, there is a compelling case to be made for moving swiftly on expanding the nation's intercity passenger rail capacities, providing more economic stability over the longer term and providing intercity rail options to communities, some of which have lost or have reduced air service.

*Specific Recommendations on Planning and Smart Growth*

As I noted in the opening of my statement, STPP's coalition partners are now developing a detailed set of recommendations on TEA-21 renewal that we will share these with the committee at a later date. I do, however, offer several suggestions on areas where STPP has previously recommended action or where our coalition has identified initial recommendations.

- **Can't Plan Without Good Data**—STPP urges immediate action on a broader investment plans that will immediately move toward a modernization of our data sets, an effort that is crucial to effective State, regional and local planning efforts. We must move to upgrade key transportation surveys and others data systems to correct for limitations (i.e. exclusions of population groups, failure to account for pedestrian trips, etc.) that undermine effective policy choices at the State and local levels. Investment in this area should be frontloaded in the new bill, even in advance of new funding for research commitments. Research funding could be ramped up in later years after key data sets are improved.

- **Can't Plan or Invest Effectively Without Funding Transparency**—One of the real deficiencies of TEA-21 is the lack of transparency about where funds are invested, by project, program and place within the States. It frustrates the public's confidence in the system, it diminishes the value of other public and private sector investments, and erodes the partnership that was envisioned under ISTEIA. In an era of the Internet, GIS mapping and GPS locators, we currently have a system in place that can't readily account for the expenditure this year of about \$32 billion of the public's money. This is extraordinary by any measure. Like modernizing the data sets, it is also crucial that we modernize the reporting systems on the use of TEA-21 so that State and local funding decisions are fully accessible to all governmental partners and to the public.

- **Can't Plan Without Certainty About the Budget**—As noted earlier in my statement, the larger MPOs (i.e. those serving areas with a population of 200,000 or more) are the only substate agencies who have any certainty about annual funding, and it is only that portion of TEA-21 highway funds that are suballocated in the law, funding that nationwide represents about six cents of every dollar that is made available to the States. To put the Federal commitment to these areas in a local context, consider that local governments and their agencies are the largest single investors in transportation—air, transit and highways. The suballocated funds to the nation's largest MPOs, similarly, represent a small fraction of total local transportation spending. The level of commitment to these and other MPOs and rural areas is an area that should be examined more thoroughly in preparing legislation renewing TEA-21. If you want local elected officials, the private sector and the public more engaged in building a meaningful planning at the local level, there must be real resources on the table that are subject to the process. STPP believes that more resources should be moved from State decisionmakers to local areas, and we expect to provide further suggestions in this area when we submit our broader recommendations for TEA-21 renewal.

Under current law, MPOs serving areas of 50,000–200,000 have no idea from year to year what funds will be made available to their areas, a circumstance that is generally shared with rural areas of the States. Among the immediate reforms that would increase certainty to selected local areas is change how funds are delivered through the Congestion Mitigation and Air Quality program. We would urge that CMAQ funding be proportionately obligated and then suballocated (based on the formula that delivers funds to the States in the first instance) to non-attainment and maintenance areas so they can more effectively budget funding for air quality projects.

Among the existing budget tools in TEA-21, we strongly support the position of AMPO and others about the need to preserve the fiscal constraint provisions of current law. On a related issue, we were disappointed that there was no apparent commitment to implement current provisions on cooperative revenue forecasting which were intended to bring MPOs together with their State transportation departments and transit providers to develop shared estimates of future TEA-21 funding. This is about the enhancing the ability of the MPO to plan and budget beyond a 1-year horizon. By contrast, the funding guarantees of the TEA-21 delivered considerable funding certainty to the States, allowing State transportation departments to readily forecast their revenue flow over the 6-year period of the law.

- **Can't Plan Without Capacity**—We agree with suggestions that there should be a broader commitment to MPOs and capacity-building. Given the many developments directly affecting regional and local agencies—air and water quality, broader environmental stewardship, integration of air, rail and highway networks, smart growth, welfare reform, urban congestion, etc.—it is clear that additional Federal commitments are needed to help MPOs absorb the growing demands on these agen-

cies. However, we do suggest that as part of an expanded commitment to capacity-building at the MPO level, it be coupled with a more complete review of these structures to modernize their operations in light of the Census and other considerations.

On a related issue, STPP will be recommending a new initiative to focus financial and other resources to help develop broader State and MPO capacity for environmental stewardship. We are concerned that the continuing calls for environmental streamlining have overshadowed the real and substantial needs that now exist for capacity-building within State transportation departments and MPOs to reasonably address the many environmental challenges before them. We believe that investing in stewardship is where we should be focusing our attention if we are serious about improving the pace and quality of environmental reviews. It is our hope that we could share these recommendations with you at your upcoming hearing on this subject.

- **Can't Plan Without Good Research**—I had the opportunity to serve on TRB's Committee for the Surface Transportation Environmental Cooperative Research Program Advisory Board that was charged with developing a long-term strategy for environmental research. This panel's findings were just released in Special Report 268. I would like to excerpt from this report's recommendations about the state of our current research efforts. "The effectiveness of current transportation planning and decisionmaking methods and tools is limited by the fact that they are based in engineering principles, facility standards, and an emphasis on mobility defined as travel time and cost . . . Too often, planners and other interested parties become frustrated with the inadequacy of these old methods and tools for dealing with current problems." STPP is now developing a set of recommendations on the research agenda to further inform the committee's specific consideration of funding commitments to a broader research agenda. This excerpt simply illustrates the importance of solid research in supporting the many State and local planning efforts in addressing the operations and management challenges before communities, regions and States. I would also note that this panel concluded that a long-term, coordinated research strategy with sufficient funding is the only way of adequately preparing transportation policymakers to confront the substantial challenges of an increasing population and expanding economy.

- **Can't Plan Effectively Without Anticipating New Challenges**—There remain a whole set of new challenges before MPOs and State transportation planning officials. We see a very strong push from the public and elected leaders to address lessons learned as a result of 9/11. We think that means taking a fresh look at the potential of intercity passenger rail and to consider how transportation investment plans at the State and regional levels can accelerate efforts to move toward more balanced and integrated surface transportation systems.

Another example of a new challenge is the new research that documents the growing epidemic of obesity, particularly among America's youth, and other health concerns like rising rates of diabetes, which are particularly linked to lack of exercise and fitness. At the same time, we have developed a transportation infrastructure that too often frustrates pedestrian activities and even discourages unplanned pedestrian trips as we continue to design systems that focus on auto trips and auto dependency. This is an area where MPOs and State planning efforts need to lead by taking additional steps to help reengineer our transportation systems in ways that promote non-motorized travel, principally pedestrian activities, that can provide new avenues to combat these negative health trends over the longer term. \*

**Can't Plan Smarter without the Tools**—How to plan smarter is an area where the STPP coalition is focusing considerable attention as move toward renewal of TEA-21. In my testimony, I have identified several issues that link directly to a broader emphasis on smart growth. The expansion of suballocated funding would give local decisionmakers more control over transportation funds, moving resources closer to the officials who are in the best position to align land use decisions with transportation investments. A stronger emphasis on modernizing the data, research and transparency features of the law will contribute substantially to local planning efforts as local officials work to calibrate their transportation decisions with local land use plans. I talked about the increased emphasis on brownfield/vacant land reuse. I see this policy emphasis as a powerful ally in helping local areas grow smarter, by restoring sites where existing transportation and other infrastructures are already in place. Here is a case where more modest investments to improve existing facilities can directly benefit taxpayers, in contrast to greenfield development which relies on substantially more public investment to build-out new infrastructures. We particularly want to underscore our strong support for continuation of TEA-21's TCSP program. While we have been challenged by a rash of congressional earmarks, the original intent of the program is very sound and stimulated a broad range of

initiatives in local areas all across the country that is making a real difference in these communities in connecting transportation to other community priorities.

We know that there is a need to modernize the models that are used to support State and MPO planning efforts. A new idea is to look for ways to replace some of our modeling structures with visioning exercises that, through a broadly participatory process, allows communities to decide for themselves how they want to design their own communities and then how to construct transportation facilities that serve these goals. In Chicago, planners are already using a modified version of the SimCity computer game to look at development and transportation to simulate a different future. There are some modest investments that could be supported under TEA-21 that could facilitate such efforts.

A broader agenda on smart growth will be among the areas that the STPP coalition members will be bringing back to the committee as you continue your deliberations on TEA-21 renewal.

*Closing Comments*

Mr. Chairman, let me conclude by emphasizing that democracy means paying attention. ISTEA and TEA-21 provide the policy framework for developing transportation systems serve our nation's need for access and mobility, while also promoting community health, wealth and quality of life. But we must pay attention to the details, promoting the means that make our transportation agencies accountable, transparent and participatory.

I thank you, Mr. Chairman, and member of the committee for this opportunity to share the views of STPP on these important issues.

---

RESPONSES OF JUDITH ESPINOSA TO ADDITIONAL QUESTIONS FROM SENATOR  
JEFFORDS

*Question 1.* Do you feel that computer simulations, an example of which would be TRANSIMS, are (or could be) valuable in the planning process? Are, or could they be, effective in the examination of various planning options?

Response. The short answer to these questions is, "yes". These computer simulations are a valuable part of the planning process and will become even more so in the future. There are many efforts to deploy these technologies, ranging from the more complicated systems such as TRANSIMS to the use of visioning software techniques that can dramatically strengthen the public's understanding of various transportation and development scenarios.

Let me explain further. As with all models and computer analysis tools, the data input and intended application are critical to the quality of the outcomes, as is the efficiency of the model itself. Therefore, if the data is not well developed or lacking in integrity, the outcome of the computer model is faulty and will not represent a true picture.

TRANSIMS is an example of a new model for analyzing travel patterns in large urban settings. However, as with many other travel models developed over the last 50 years, it does not include variables that are critical to analyzing how we travel and how that travel impacts our land use patterns and social and environmental needs. While we do not expect TRANSIMS to be broadly deployed given its cost and complexity, its use will help further inform and instruct transportation policymakers as we continue to develop, and refine these and other predictive models.

We would also note that some agencies have invested their efforts in fine-tuning traditional four-step models, showing some promising results, such as those in San Francisco County. But perhaps the most important application of modeling and simulations has been in the area of community design and decisionmaking. Such tools, which range from public involvement technologies (e.g. the Electronic Town Hall) to computer-based graphic simulation programs (e.g. Community Viz), can help facilitate the democratic process in community planning, enable people to visualize how proposed changes might affect their communities, and more accurately forecast fiscal, environmental, economic and social impacts. The predictive ability of this emerging set of technologies has enabled communities to develop better estimates for everything from traffic impacts to infrastructure costs. And, the ability to graphically depict potential changes makes it easier for the public to be engaged in making informed choices.

Overall, we see great potential in these technologies and would encourage this committee to examine ways to support such efforts where relatively modest investments now can result in substantial returns in the future, as communities, regions and States seek to foster broader public input into better informed transportation

planning efforts, helping the public more fully anticipate and understand the outcomes of the various options before them.

---

RESPONSES OF JUDITH ESPINOSA TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* Please explain how “smart growth” would address the increased traffic congestion from densification of urban and suburban areas.

Response. The weight of academic research reveals that denser development actually reduces traffic because compactness results in greater travel choices, including walking, cycling and transit. One recent study by the U.S. EPA found that dense “infill development” sites were projected to generate 48 to 61 percent less traffic than comparable sprawling “greenfield” sites. (Allen, E., Anderson, G., and Schroer, W., “The Impacts of Infill vs. Greenfield Development: A Comparative Case Study Analysis,” US EPA, Office of Policy, EPA Publication #231-R-99-005, September 2, 1999.) In another recent study of the benefits of location efficiency, a number of studies were reviewed, showing significant reductions in driving associated with higher residential density. In one of the studies of world’s largest cities, it was noted that driving is reduced 30 percent every time density doubles. (John Holtzclaw, Robert Clear, Hank Dittmar, David Goldstein, and Peter Haas, “Location Efficiency: Neighborhood and Socio-Economic Characteristics Determine Auto Ownership and Use—Studies in Chicago, Los Angeles and San Francisco,” *Journal of Transportation Planning and Technology*, Volume 25, 2002.)

While less of an academic review, but nonetheless part of the committee’s record, is testimony by The U.S. Conference of Mayors on brownfields and related policy reforms. The statement of Elizabeth Mayor, J. Christian Bollwage, for the committee’s February 27, 2001 hearing on S. 350, reviewed findings of the Conference’s survey on brownfields. He states, “One of the very interesting findings came from survey respondents who were asked to quantify how many people their communities could absorb without adding appreciably to their existing infrastructure. 118 cities estimated they could support an additional 5.8 million people, a capacity that is nearly equivalent to the population of Los Angeles and Chicago. This capacity is more than 2 years of U.S. population growth.” In this survey, a relatively small number of U.S. cities reported on their capacity to absorb additional population, with these cities indicating that their infrastructures could meet traffic and other effects of increased density. Among the cities in the sample were those where substantial population losses had occurred over the last several decades, and which have latent transportation and other capacities in place to handle much larger populations. It follows that increased traffic, and potentially even increased congestion associated with densification, is more about tapping the considerable capacity and infrastructure that now exists in the cities described by Mayor Bollwage and which are capable of handling larger populations.

*Question 2.* A recent report by the Transportation Research Board on long-term research needs states, “Research on transportation and the environment has only recently begun to explore in any significant depth the complex relationships among land development patterns, transportation investments, travel behavior and consequent environmental impacts.” Please comment on the practicalities of implementing a “smart growth” program given our limited understanding of these relationships.

Response. I am a member of the Transportation Research Board’s, Committee for the Surface Transportation Environmental Cooperative Research Program Advisory Board, which wrote the report that is quoted. That statement is certainly factual, but the Report further goes on to detail and cite research currently proceeding that explores and begins to explain these very relationships and issues of “smart growth.” The Report from the TRB Advisory Committee further calls for a strong national research program that will support increased funding to public agencies, academic institutions, NGO’s and others to bolster our knowledge and science of “smart growth,” and the relationships between land use, transportation, travel, environment, and other social needs.

Many States and local governments have already instituted “smart growth” initiatives, plans and legislation to address how their communities grow in the 21st century. The State of Oregon, a representative from which was on the Transportation Planning and “smart growth” Panel, has certainly been a leader. But there are other examples of broad-based initiatives and many other targeted efforts among States and local governments. The many programs in States and in hundreds of communities to recycle brownfield sites are one example of a targeted effort, which at its core is about “smart growth.” Growing interest in brownfields comes from environmental justice representatives in communities, such as, Atlanta, Chicago, Austin

and the San Francisco Bay Area. They continue to note that “smart growth” programs coupled with brownfields development and transportation access is key to community revitalization and job opportunities.

The public debate within urban centers, rural areas of the Nation, communities of color, suburban commuters, and business and industry has begun to inform policymakers. It is about how we, as a people, expect to grow and prosper through environmentally sound transportation choices and land use and planning initiatives that promote our quality of life. The TRB Advisory Board Report takes note of how transportation and environment initiatives are linked, and further expands by illustrating where we currently have gaps in knowledge, data collection, and planning tools to address our national “smart growth” needs in an environmentally sound, efficient and socially responsible fashion. I believe, along with local and State agencies and communities across this Nation, that a strong Federal role is needed in support of current “smart growth” initiatives and expansion of the research base. A well reasoned Federal approach to and support for a “smart growth” agenda will lead to better program planning and implementation and is a must if we are to compete in a technologically advanced global economy.

---

STATEMENT OF THOMAS M. DOWNS, PROFESSOR, UNIVERSITY OF MARYLAND, DIRECTOR, NATIONAL CENTER FOR SMART GROWTH, RESEARCH, EDUCATION AND TRAINING

Mr. Chairman and Members of the Environmental and Public Works Committee: It is a pleasure to appear before you this morning to address the role of the planning process and its linkages to transportation planning, land use planning, economic development and growth management.

I will lean heavily on the recent work of Dr. Susan Handy, a professor at the University of Texas, who is both an engineer and a planner.

Dr. Handy did a comprehensive review of all of the literature that has focused on the transportation and land use connections.

It turns out that there are few major studies at the national level that have looked at the connections between transportation and land use patterns. While we as a nation have spent hundreds of millions of dollars on developing better pot-hole material, better cement, and better bridge steel; we have spent almost nothing on the most important aspect of transportation—how it has changed the way we live and work.

Dr. Handy found that in a study in 1999 by Hartgen and Curly that regions without beltways grew faster and that population densities declined faster in regions with beltways. She also learned that a 1980 study by Payne and Maxie found beltways had no impact, positive or negative, on economic growth. This study also found that office and apartment development locates near a beltway, but at the expense of other parts of the region.

After Dr. Handy looked at beltways, she then examined the research on the effects of highway corridors. She found that a 1998 study by Hansen concluded that highway capacity expansion stimulates development activity, both residential and non-residential, in the expanded corridor. A 2002 study by Ten Siethol and Kockelman demonstrated dramatic increases in property valuations most proximate to the freeway corridor. A large review study by Boarnet and Houghwout in 2000 suggests that highways influence land prices, population, and employment changes near the project, and that the land use effects are likely at the expense of losses elsewhere. Dr. Handy’s conclusions from these studies is “Building new highways will not increase the rate of growth, but will influence where in a region growth occurs and what kind of growth occurs. Not building highways will not necessarily prevent continued decentralization.” The research seems to suggest that highway capacity expansion serves to move the economic chairs around a region, but does not create a new net growth in a regions economy.

Dr. Handy then looked at the issue of increasing highway capacity and induced demand (or build it and they will come). She found that there does seem to be some correlation between capacity expansion and vehicle miles of travel (VMT), but that the elasticities are lower than suggested by popular literature. She concludes that simply not building new highways will not significantly slow the growth in VMT.

The conclusions about highways impact on land use only serves to show us how little we know about the real outcomes of these large scale national investments. We, in part, do not know because we are not funding the research that would give us better answers.

On the transit side, Dr. Handy looked at the research on the effects of light rail transit (LRT) investments on land use and development. She found a TCRP report

in 1995 that shows that transit investments and services are incapable by themselves of bringing about significant and lasting land use and urban form changes. A 1996 study by Vesalli showed that transit system's impacts on land use are limited to rapidly growing regions with a healthy underlying demand for high-density development.

The research on transit impacts shows us what we all intuitively know, that outcomes really depend on the local governments land use decisions and on the health of the regional economy. The research suggests that the real accountability for outcomes in transit development rests squarely on local land use decisionmakers. A close look at the Washington region's success or failure in capturing the enormous Federal investment in METRO proves this point.

Lastly, Dr. Handy looks at assumptions that changing development patterns will effect travel behavior and she comes to the conclusion that "land use and design strategies may reduce automobile use a small amount", Kitamura, et al. 1997.

The conclusions of her review of research findings over the last 15 years is:

1. New highway capacity will influence where new growth goes, but not the overall growth within a region.
2. New highway capacity probably increases travel a little.
3. LRT can encourage density with the right help.
4. New Urbanist design strategies make it easier for those who want to drive less to do so.

Dr. Handy then asks why the data does not yield more, and answers that the interactions between transportation investments, land use patterns and travel patterns are much more complicated than we have assumed. We are not collecting data on those complex interactions in part because we have traditionally looked only at the movement of people and goods as the outcomes of transportation investments.

Dr. Handy suggests that we must be able to use increasingly sophisticated statistical techniques to handle the complex web of connections and the limitations of the data. She strongly suggests that we invest in better and more sophisticated data collection and that the focus after that should be on the translation of empirical results into planning and forecasting tools.

While Dr. Handy's work looks at the actual outcomes of investments in highways and transit within a region, there are several areas that are not reviewed, because the issues are mostly ignored.

The first area that has almost no data available is the relationship of regional health to transportation investment. If childhood asthma is increasing at catastrophic rates, is it related to air quality, VMT, or land use patterns; and if so, how? If the Nation is now in a spiral of obesity, is there a relationship to the type and quality of transportation investments in a region?

Recent research also suggests that auto mobility comes at a very high price for the poor, exceeding expenditures on health, education, and food. Do we know if these impacts on the poorest 25 percent of families varies by region, and do we know what strategies work to relieve the strain of that cost burden?

We can now ask even more ambitious questions. How do these health costs and family transportation costs effect the economic health of a region? We do not now know the answer, but it is clear we now have the tools to begin to understand those relationships, we just have to make the effort.

We have not, as a Nation, looked at the results of our investments. The creation of the Bureau of Transportation Statistics was supposed to help with research on data quality and integrity, as well as how to use the data in complex regional models. It is unclear how BTS lost its way, but it has, until recently, been either a hobby shop where research focused on what was of interest to the researcher; or it became a job shop for the Office of the Secretary, doing small scale projects. BTS is also limited by the fact that it receives most of its funding from FHWA.

Several suggestions to strengthen our understanding of the complex relations between transportation, land use, and behavior:

1. Take mandatory set asides out of Transit, Highway, and Aviation to fund an independent BTS.
2. Require BTS to not only report annually to the Congress on its funding agenda, but also its findings, with recommendations on the relationship of those findings to the regional planning and forecasting process.
3. Given the real and understandable Federal reluctance to engage in any local land use decisions, the next step in the accountability chain would be to take the introductory purpose statements of TEA-21 and place those objectives in the planning language section of the new bill. It would then provide a framework for developing accountability for outcomes at the regional level. Because there are no expect-

tations of outcome, beyond clean air, there is little we can do as a country to measure the results of our investments.

4. If there is going to be a research chapter in this reauthorization, do not let it be totally dominated by one mode or one profession. If we could establish, through research, better data, better models, and better frameworks for decisionmaking, we could become more accountable for the results of our transportation expenditures as a Nation.

5. Incorporate requirements into the planning process to address issues of health, pedestrian trips, and land use impacts. It is important to have the planning process address these areas, not to make judgments about the outcomes, but to make sure they are part of the factors considered in planning.

While this may seem a long digression there are several key points to be made in summary:

1. There is little real relationship between the transportation planning processes and its impact on land use and travel.

2. The planning process is primarily a way to move a capital program into the pipeline, and not a series of complex competing goals needing resolution.

3. Unless we begin to measure and compare actual outcomes of our investments, we will be exactly in this same spot for the next reauthorization.

4. Unless there are outcome requirements for the MPO planning process and some direct, non-modal funds to meet those requirements, MPO planning will not change.

5. We need to actually look at what we want as outcomes of our national investments in transportation. It looks increasingly like it should mean making it easier for Americans to make a wide variety of choices in transportation.

---

STATEMENT OF JOY WILSON, PRESIDENT AND CEO, NATIONAL STONE, SAND & GRAVEL ASSOCIATION

Good morning. I am Joy Wilson, president and chief executive officer of the National Stone, Sand and Gravel Association-NSSGA-located in Arlington, Virginia.

NSSGA represents the nation's aggregate industries-producers of crushed stone, sand and gravel, as well as suppliers of equipment and services to aggregate producers. Our 850 member companies turn out 90 percent of the crushed stone and 70 percent of the sand and gravel consumed annually in the United States. Nearly three billion tons of aggregate valued at approximately \$14.5 billion were produced in this country in 2001, according to the U.S. Geological Survey (USGS). The aggregate industry workforce is made up of about 120,000 men and women across America.

Just to provide some perspective, there are 10,000 construction aggregate operations nationwide. Virtually every congressional district is home to a crushed stone, sand or gravel operation. Proximity to market is critical due to high transportation costs, so 70 percent of our nation's counties include an aggregate operation.

Construction aggregates are used primarily in asphalt and concrete. Ninety-four percent of asphalt pavement is aggregate; 80 percent of concrete is aggregate, whether used in pavement, buildings, dams, sewage treatment plants and the like. About 10 tons of aggregate per person are used annually in America. Every lane-mile of interstate consumes 38,000 tons of aggregate; about 400 tons of aggregate are used in construction of the average home.

While I appear this morning representing the aggregates industry, I also appear as a representative of the Partnership for Quality Growth that includes 13 labor and industry organizations that share a common interest and concern for the future of our country's transportation systems and infrastructure and how they relate to our national quality of life.

I know this is something we share with the members of the Environment and Public Works Committee, so we particularly appreciate Chairman Jefford's and Senator Smith's initiative in holding this hearing to examine the issues surrounding "Transportation Planning and Smart Growth."

*Our industry-labor coalition has a significant interest in "smart growth"*

Among other things, this diverse group adheres to the basic concept that Americans should continue to be allowed the freedom to live and travel where and when they please.

We also recognize that, as our population continues to grow, all planning-Federal or local-must accommodate that continued growth, plus the collateral increase in the transport of freight that will be needed to support that population.

We hope to insure that Federal policies respect as much planning power as possible in local communities to meet growth needs-especially with regard to transpor-

tation and other infrastructure improvements. Use of Federal transportation law to drive local planning decisions should be approached with extreme caution, lest local and State land use decisions become usurped by Federal determinations.

It is essential that local planners have the ability and flexibility to formulate their plans with a sound basis of knowledge about where and what the aggregate resources around them are. While those resources are plentiful across the United States, they vary in quantity and quality from location to location. It's important for planners to know if their local resources are suitable for multiple uses, including construction, erosion control, water quality protection and the like. And they must know how long their supply of the resource will be available.

Geological mapping is a key tool for planners in pinpointing resources. The placement of a school, a shopping mall or a hospital, for example, atop a rich aggregate deposit would indefinitely eliminate that deposit's beneficial use by the community.

That is another reason why our industry is attuned to discussions about land use planning and concerned about the potential impacts of the "smart growth" movement on Americans' mobility, our industry, on transportation planning and construction and on the reauthorization of TEA-21.

I will begin by discussing these points and then I will offer some observations on how we have an opportunity in the reauthorization process to promote "quality growth."

Let me define some terms.

"Quality growth," as defined by the Quality Growth Coalition, is planned growth that respects the fundamental freedom of Americans to choose where they live, their choice of housing and how they travel.

It promotes quality urban development and growth management by improving the entire transportation network-including additional road capacity, better management of traffic flow and more efficient public transit.

Defining "smart growth" is more challenging.

Generically, "smart growth" principles are motherhood and apple pie: preserving green spaces, easing traffic congestion, restoring sense of community, promoting regional growth strategies and nurturing a high quality of life.

Leaders in the major political parties and at all levels of government have embraced these basic principles.

However, others interpret "smart growth" to mean no expansion of suburban development; the imposition of urban growth boundaries; increased housing density; getting people away from individual car use; reduced emphasis on road improvement-especially road capacity-and disproportionate investment in rail and mass transit.

Others see a strong Federal land-use planning role to combat what some call unorganized spreading out, or "sprawl," prodding Americans to infill within urban areas.

We do not believe that the vast majority of Americans want restrictions on their freedom of mobility. And air pollution from mobile sources has declined so much that today, while still a concern, it's not even the primary source of air pollution in most areas of the United States.

Over the past 30 years we've seen more than more than a 30 percent increase in population, the number of licensed drivers increase by 64 percent, a 125 percent increase in vehicle miles traveled and 87 percent increase in licensed vehicles, according to the U.S. Department of Transportation.

Air pollution reductions from mobile sources have been dramatic. According to a January 2002 U.S. Department of Transportation report,

- Carbon monoxide is down 43 percent over this same 30-year period; volatile organic compounds are down 59 percent;
- Particulate matter is down 42 percent;
- NOx is holding nearly steady and
- Lead has been virtually eliminated from our air.

There are many interpretations of "smart growth," but we and our industry colleagues believe the focus should be on "quality growth."

After all, as one of the greatest friends of the environment this country has ever known-President Theodore Roosevelt-once said: "Conservation means development as much as it does protection."

We have facts and studies, and we must put the debate more fully in the sunshine-with decisionmakers at all levels of government.

We found that with two statewide ballot initiatives in Arizona and Colorado in 2000 that the citizens-once apprised of the true impacts of the "smart growth" initiatives-did not agree at all with such extreme measures that took away personal freedoms, property rights and ability to plan for future growth.

Both these ballot initiatives were defeated by majorities of more than 70 percent with the support of coalitions of business, labor and government.

Let's look in our own backyard. Many of you are familiar with the 1960's National Capitol Transportation Plan for the Washington area that called for 14 new roads, mass transit and high-occupancy vehicle lanes.

Well, we got Metro and the HOV lanes-but only one of the 14 roads. And look at our congestion now-second worst in the entire nation. Road capacity did not increase in parallel to population increases and the desire of people to make multiple stops on the way to and from work and throughout the day.

So, one impact of "smart growth" on transportation planning is the misunderstanding, or even misinterpretation of how much congestion relief mass transit can assume.

In fact, a growing body of evidence suggests that Americans will choose to drive and that government policies will not change their behavior.

In his book, *Commuting in America*, noted transportation expert Alan Pisarski observes that, over the past three decades and despite billions of dollars invested in alternatives to driving, every means of commuting, except lone drivers who can't use HOV lanes, has lost market share from 1980 levels.

Year 2000 census data released this past August showed the trend continuing and confirmed Pisarski's findings.

We are concerned about claims in the name of "smart growth," that putting what's tantamount to a moat around a city-an urban boundary-will maximize the use of our resources and prevent open spaces from being developed.

Matthew Kahn of Tufts University and others at the University of Illinois and the University of Southern California who've studied the phenomenon find growth in suburbs to be a pattern resulting essentially from increased prosperity.

Rocky Moretti of The Road Information Program recently unearthed a fascinating nugget of research that tells us much about human behavior.

What he found is that the human race has been "sprawling" for some time.

He located a city in Central America with an urban corridor connected to suburbs by series of roads. Research showed that, as the core of the city expanded and filled with commercial and other activity, inner city residents moved to the suburbs. The town is called Caracol and the movement to the suburbs predated the automobile by 1200 years. This suggests a strong human propensity to seek space when possible.

We agree with Alan Pisarski's recommendation that transportation policies should facilitate Americans' lifestyle choices, not thwart them.

Another factor where "smart growth" interacts with transportation planning is in the myth that proponents of better roads want to pave America over-and that if you build, widen or improve a road, more cars will be attracted to it as if it were a magnet. The data and surveys contradict this hyperbole.

We do not have a shortage of land, a shortage of farmland or a shortage of forests. What we have is a desire by most people to live in certain core areas, and those areas, not surprisingly, are densely populated-generally characterized by urban centers and suburban growth.

As the National Center for Policy Analysis in Dallas reports:

- Less than 5 percent of the nation's land is developed and three-quarters of the population lives on 3.5 percent of the land.
- Only about one-quarter of the farmland lost since 1945 is attributable to urbanization.
- Predictions of future farmland loss based on past trends are misleading because farmland loss has been moderating since the 1960's, falling from a 6.2 percent decline in farmland per decade in the 1960's to a 2.7 percent decline in the 1990's. Other factors, such as crop yield and market conditions, have had a greater impact.

And freedom of choice is the fundamental issue here. The freedom to choose where to live and how to travel to work, to recreation and to two working parents' unending errands.

Americans continue to choose to buy and drive cars, SUV's and trucks.

They choose lifestyles-including ordering goods by e-commerce-that put ever more trucks on the road to deliver consumer products to their stores and homes.

Their lifestyle choices have relegated commuting to a scant 20 percent-one-fifth of all trips. America's highway travel is growing and will continue to grow in the future.

So, Americans are choosing to drive, but they're also choosing the suburbs over the cities.

Some indict government-sponsored infrastructure investments-like sewer and water lines and highways-for suburban migration. The logic goes, "stop the infra-

structure investments, stop the sprawl.” But is that true? Studies have shown that Americans move from cities to suburbs because of prosperity. As we become more successful and prosperous, we want a better quality of life-and many find it by moving out of cities.

Public opinion polls further buttress these conclusions. When asked, Americans list quality public schools, affordable housing, good jobs and low traffic congestion as their top priorities in choosing where to live. Secondary priorities are open space and low-density.

And the principal factors used in deciding where to live aren’t compatible with high-density living and limited highway capacity.

In a nationwide survey by National Association of Homebuilders in the late 1990’s, 83 percent of respondents said they would prefer a detached, single family home in the suburbs over an equally priced urban townhouse near transit, even though the suburban home would entail longer distances to work and shopping.

Today, more than half of Americans live in suburbs. Forty percent of our jobs are located there, and more jobs are being created in suburban communities than anywhere else.

When the public’s clear choice to drive and to live in the suburbs is suppressed, or if policy decisions try to change behavior by reducing or stopping highway investments, decisionmakers will allow traffic congestion to worsen.

With nearly all Americans choosing to drive, public policies that ignore that vast majority will fail.

In contrast, relieving traffic congestion will reap very real benefits to our communities and our quality of life.

Two years ago, NSSGA supported American Highway Users Alliance’s definitive study on the benefits of congestion mitigation.

The study found that improving America’s 167 worst traffic bottlenecks would produce dramatic safety, environmental, fuel economy and time-saving improvements over the next 20 years:

First, safety: \* 290,000 fewer crashes, 141,000 fewer injuries, 1,100 fewer fatalities;

Second, environmental improvement:

- 45 percent reduction in carbon monoxide,
- 44 percent reduction in smog-causing volatile organic compounds,
- 71 percent less CO<sub>2</sub>, and

Finally, economic productivity:

- A reduction of 19 minutes for each vehicle driving through the bottlenecks.

Road investments enhance our freedom of mobility and democratized mobility for all Americans. With more than 90 percent of American households having access to automobiles, mobility reaches through all classes and incomes.

Road investments have made it possible for lower income workers to live in areas they can afford yet commute to higher paying jobs in areas where they cannot afford to live.

Road investments have increased the opportunity for more Americans to buy their dream homes and boosted leisure time.

Road investments create jobs. The U.S. Department of Transportation estimates that 42,100 total full-time jobs are created with every \$1 billion that is invested in Federal-aid highways: 27,600 in highway construction and related industries and 14,500 that are induced in other industries as the 27,600 spend the wages they’ve earned. Highway dollars create construction jobs, which create supplier jobs, which create jobs for businesses that provide the goods and services they want.

Last but not least, road improvements reduce commute times. In its 2001 Urban Mobility Report, the Texas Transportation Institute (TTI) concluded that traffic congestion in 68 major cities wastes 4.5 billion commuter hours annually costing \$78 billion in lost time and productivity.

The last time a rush hour was really an hour was in the late 1960’s. The rush hour grew into the “rush period” of 3 hours daily by 1982. And in 1999, the rush period was almost 6 hours (about 3 hours each way).

The TTI study also showed about 6.8 billion gallons of excess fuel is consumed annually in what they call a “congestion tax.”

And pollution is reduced when you can reduce emissions from idling traffic to smooth-flowing traffic.

This leads me to my final point: how the reauthorization of TEA-21 can promote quality growth.

We are faced with challenge after challenge in our nation’s courts to highway projects authorized by TEA-21 and approved through the local, State and Federal environmental permitting processes and are needed by commuters.

The challenges have come in the guise of protecting air quality under the Clean Air Act. But, occasionally, you find an admission by opponents that they just don't want these projects built in Atlanta, Sacramento, Baltimore, Salt Lake City or in other key urban areas because they fear the projects will enable growth.

The reauthorized highway bill must anticipate harassment litigation on projects prioritized by the States and approved by the Federal Government. These are projects that have passed through all the environmental hoops and local planning processes.

They're projects that communities want for capacity, for gridlock reduction, for relieving traffic congestion and for improving air quality and the quality of their lives. They're projects that can reduce the loss of life, time, money and fuel.

The Partnership for Quality Growth firmly believes that such anti-road litigation is one facet of "smart growth" that isn't and doesn't contribute to "quality."

We want to be positive about the contribution of sound planning to our quality of life. Some opponents would paint us as "anti-planning." But that's not true; let's look at planning recommendations our industries propose for local consideration at the community level:

- Well-designed suburban communities
- Flexible planning and zoning regulations
- Protection of key open space
- Comprehensive transportation systems with adequate road capacity
- Improved road design, and
- Preservation and redevelopment of previously occupied sites.

Over the past 30 years, our roads have increased capacity only by 6 percent when our population has grown by more than 30 percent.

And, our population is expected to grow by 100 million people by the year 2050.

TEA-21—the largest infrastructure bill ever passed by any Congress—is going to make a dent in that, but the need is so immense that the challenge for the next transportation bill is even more formidable.

Quality growth principles can help frame the debate during reauthorization. These principles are:

- Acknowledging our freedom to choose how to live and travel,
- Acknowledging that growth is good if managed properly,
- Sharing the benefits of improved mobility as broadly as possible—mobility is a major factor in the quality of our democracy,
- Advocating that decisions should be made locally and involve local citizens, and
- Believing that our policies should facilitate American culture and choices, not thwart them.

Investment and use of mass transit and public transportation—whether buses or rail—are necessary and important tools in our battle to solve congestion. But these tools need to be in some proportion to Americans' interest in using them, and should not be used as weapons against roads and vehicle use. HOV lanes, Heavy Vehicle or Dedicated Truck Lanes, and other gridlock-busting alternatives also must be examined to lift our nation out of congestion.

TEA-21 is being impacted by "no growth" litigation over highway projects, projects already approved through the local, State and Federal transportation, community and environmental processes.

The successor legislation must make and embody a critical philosophical choice—are we as a nation trying to dictate cultural change in America, or are we trying to serve and facilitate the freedom of movement that has characterized this nation from its beginning?

In embracing the beneficial planning goals of quality growth, the new legislation should support the local, State and Federal decisionmaking processes that, once completed, should not be subject to delay by interminable court battles due to legal loopholes.

Our industries are committed to ensuring that America continues to grow and that it will be quality growth.

Mr. Chairman, I respectfully wish to submit for the hearing record a copy of the Quality Growth Coalition's publication, *Building Better Communities: A Toolkit for Quality Growth*, which expands on some of the points I touched on today.

Thank you for your consideration.

---

## STATEMENT OF RICHARD STOLZ, DEPUTY DIRECTOR OF PUBLIC POLICY, CENTER FOR COMMUNITY CHANGE

On behalf of the Center for Community Change and the Transportation Equity Network, I am pleased to submit testimony to the Senate Environment and Public Works Committee on the topic of Smart Growth and Transportation Planning. I commend the chairman and the committee on its decision to hold a hearing on this important topic.

The Center for Community Change is a 30-year old national non-profit organization deeply rooted in low-income and minority communities in both urban and rural areas. Our mission is to help grassroots organizations build and improve their capacity to effect the policies that impact the day-to-day lives of their membership.

The Transportation Equity Network (TEN) is a national coalition of grassroots organizations based in low-income and minority communities organizing to reform transportation policies at the local, regional, statewide and national level. TEN's membership includes faith-based networks of congregations, community organizing projects, community development corporations, social service organizations, civil rights groups, organizations of transit riders and other low-income people, and progressive transportation agencies. TEN groups are active in more than 30 States and TEN includes dozens of organizational members and affiliates.

In 1997—1998, the Center and TEN worked closely with Members of Congress and a coalition of allies in Washington, DC to include several provisions related to transportation planning in the Transportation Equity Act for the 21st Century (TEA-21):

- A requirement that Metropolitan Planning Organizations (MPO) provide to the public an annual list of projects for which Federal funds have been obligated.
- A public involvement requirement in the statute in the MPO certification process.
- A provision that ensures that transit users are consulted in the statewide and metropolitan transportation planning process.
- The newly created Job Access and Reverse Commute competitive grant program.

As Congress renews TEA-21, the Center and TEN urge Congress to pay particular attention to the impact of transportation planning and investment on low-income and minority communities, and to establish strategies for using surface transportation legislation to support the revitalization of rural and urban communities and regional economies. The Center also reminds Congress that more work is needed to ensure that the nation's transportation planning system is fully accountable and transparent to taxpayers.

*Sprawl is neither Class nor Race Neutral, and the same can be said for Smart Growth*

From the perspective of low-income and minority communities, particularly in metropolitan urban areas, sprawl has a particularly pernicious and deleterious impact. A growing body of research, and an emerging consensus among researchers and advocates, asserts that in metropolitan areas, the relationship between the concentrated poverty of central city communities and the relative affluence of suburban enclaves is not coincidental.

According to John A. Powell of the Institute on Race and Poverty at the University of Minnesota, "Sprawl and regional fragmentation on the one hand, and concentrated poverty and social inequity on the other hand, are flip sides of the same dynamic."<sup>1</sup> The same factors that push and pull families away from urban centers and to the suburbs trap the families left behind. Those able to leave have the human and financial capital to do so. They leave for better jobs, better schools and they invest their financial capital in property likely to increase in value. Those left behind must deal with struggling schools, less human capital and fewer financial resources.

Powell goes on to explain that the Federal Government defines concentrated poverty as a census tract with 40 percent or greater of its residents living below the poverty level. This is significant because joblessness, blight, crime, and other circumstances destructive to families characterize concentrated poverty. Central city communities, which are more likely to hold areas of concentrated poverty, therefore carry the burden of having to address more social problems, which serve to push out more families that can afford to leave. As a result, these communities often lack the tax base necessary to address the social ills that plague them.

<sup>1</sup>"How Sprawl Makes Us Poor" by John A. Powell in The Albuquerque Journal, March 22, 2002.

There is a further layer to concentrated poverty—race. Of those living in concentrated poverty, more than half are African American (note that African Americans make up only 12 percent of the national population), and a quarter are Hispanic. While the reasons behind the stark residential race and class segregation in America's metropolitan regions are complex, the reality is unavoidable. Paul Jargowski, as he writes in *Poverty and Place: Ghettos, Barrios, and the American City*, is on solid ground when he explains that “neighborhood poverty is not primarily the product of the people who live there or a ghetto culture that discourages upward mobility, but the predictable result of the economic status of minority communities and the degree to which minorities are residentially segregated from whites and from each other by income.”<sup>2</sup> Sprawl both contributes to and facilitates this residential segregation.

Since sprawl and its counterpart, concentrated poverty, must be analyzed in tandem in order to more fully understand the impact of willy nilly suburban growth, it stands to reason that Smart Growth also has a counterpart: equal access to economic opportunity. The Transportation Equity Network believes that any effort undertaken in the name of Smart Growth that fails to address concentrated poverty and does not advance equal access to economic opportunity is inadequate. For example, Smart Growth strategies that encourage economic development in central city communities should be mindful on the impact of such development on the availability of affordable housing. And strategies that seek to protect environmental treasures on the edges of suburban growth should also be mindful of the need to improve access to economic opportunity in areas of concentrated poverty.

#### *The Role of Transportation Planning*

In metropolitan regions across the country, experience has shown that suburban development often follows road and highway construction. As Dr. Susan Handy of the University of Texas concluded in 1999 (also quoted in testimony by Tom Downs from the University of Maryland) “Building new highways will not increase the rate of growth [in metropolitan regions], but will influence where in a region growth occurs and what kind of growth occurs.” While she goes on to say that not building highways will not necessarily prevent decentralization, her conclusion does suggest that growth follows highway development, and may do so at the expense of other areas within a metropolitan region.

In the Intermodal Surface Transportation Efficiency Act (ISTEA) Congress laid the groundwork for significant reform in the transportation planning process by establishing the metropolitan planning process. As such, Metropolitan Planning Organizations, which are often the only governmental entities in a particular place with regional jurisdiction, can play a very significant role with respect to Smart Growth. Furthermore, because transportation investments play such a large role in determining the nature of growth in metropolitan regions, the choices made by MPOs have lasting impacts on the growth patterns of metropolitan regions.

In 1999, the issue of Smart Growth and equal access to economic opportunity came to a head in northwest Indiana. That was when a coalition of African-American, White and Latino congregations named the Interfaith Federation publicly challenged the planning practices of the Northwest Indiana Regional Planning Commission (NIRPC) on both moral and legal grounds.

Northwest Indiana, which includes the cities of Gary, Hammond and East Chicago, is one of the most racially segregated metropolitan regions in the country. It is also a region characterized by both sprawl and concentrated poverty. Gary, Hammond and East Chicago have all three experienced declines in population following the collapse of the manufacturing and steel industries over the last three decades. These cities are largely low-income, have relatively high property taxes, and share symptoms of urban decay, including failing schools and high rates of unemployment. Around these cities lies an extensive network of suburban communities of varying degrees of affluence, and they grow in affluence the further away they get.

The Interfaith Federation complained that NIRPC had contributed to the decline of the region's central cities by placing undue emphasis on the construction and expansion of roads and highways, while neglecting the needs of residents living in areas of concentrated poverty. All three cities are located in the northern half of Lake County, Indiana. Over the last decade, the region's job growth has taken place in the southern half of Lake County. The transit-dependent residents of Gary, Hammond, and East Chicago had no way of accessing areas of high job growth in south county by public transportation.

While some may contend that the Interfaith Federation had challenged NIRPC on grounds that were beyond the MPO's control, it was certainly clear that NIRPC had

<sup>2</sup>Poverty and Place: Ghettos, Barrios and the American City. Paul Jargowski. 1997.

entirely neglected the region's neediest residents and had failed its neediest jurisdictions. In response to the Interfaith Federation's concerns, NIRPC contended that it had done nothing wrong. The Interfaith Federation, undeterred, pointed to several regulations and provisions of Federal law that the MPO had ignored. The Federal Highway Administration and the Federal Transit Administration, after lengthy deliberation, concurred with the Interfaith Federation, and conditionally certified NIRPC's planning process. The FHWA also provided NIRPC with a discretionary grant to help it better plan for the needs of low-income and minority communities under its jurisdiction.

*Examining Transportation Equity and Inequity*

Though ISTEA and TEA-21 both represent enormous improvements in the national transportation planning landscape compared to what existed before, from the perspective of low-income and minority communities, ISTEA and TEA-21 represent a mixed bag.

A case in point is Miami, Florida. In the late 1960's portions of unincorporated Dade County were vibrant African American communities with strong local economies and solid middle class families. The State tragically steam-rolled these communities at the end of that decade when the State built Interstate 95 right through many of these neighborhoods. Not only were families and business displaced, but also over the ensuing decades declining property values and other symptoms of social decay took hold. This is a story not unique to Miami-Dade County. Similar stories can be found in Montgomery, Alabama; Los Angeles, California; Atlanta, Georgia, and other cities across the country.

In the 1990's the State further stripped these communities of their dignity by widening the I-95 corridor to within feet of people's homes and erecting wire meshed fencing to protect these households from highway noise and traffic. Residents endured years of house-rattling noise, cars rolling into their back yards, shrapnel from exploding tires and fear, and constant phone calls to State transportation and locally elected officials led to no improvements.

Finally in 2001, an organization of local residents named Neighborhoods in Action (NIA) organized to get the attention of the State's regional Department of Transportation office. Only after NIA invoked the term "environmental justice" did the DOT act in a responsive manner. In a matter of months, the State of Florida constructed a mitigation wall to protect residents of unincorporated Miami-Dade County from both noise and physical harm.

Ironically, NIA discovered at about that time that the mitigation wall had been written into the MPO's TIP for years, but had simply been skipped over every year. They also discovered that similar sound walls had long since been built along I-95 to protect other more affluent communities. Though in the end the structure of ISTEA and TEA-21 helped to encourage the State DOT to do the right thing, clearly the State had not made the needs of these communities a priority.

But this is not an atypical situation. Robert Bullard and Glenn Johnson of the Environmental Justice Resource Center (EJRC) have written extensively of the impact of transportation planning that fails to consider the needs of low-income and minority communities.

For instance, the EJRC reports that the pedestrian fatality rate for people of color is higher than that for whites. One explanation for the difference in rates is the difference in walking patterns among different racial groups. For example, African Americans walk 82 percent more than whites, while Hispanics walk 58 percent more than non-Hispanic whites (US Department of Transportation, 1997).

Also consider that asthma, which is a leading cause of disability among children in the United States, is more likely to strike inner city, and therefore, minority children. The hospitalization rate due to asthma is three to four times higher among black children than white children. Pollution from automobiles, and the proximity of roads and congestion to low-income communities is believed to be a factor in asthma prevalence among minority children.

But transportation inequity is not only about race, though race is a significant factor. In *Driven To Spend*, a report released by the Surface Transportation Policy Project and the Center for Neighborhood Technology in 2000, researchers found that transportation (the cost of an automobile, its maintenance and other costs) often rivaled the cost of housing for low-income families. The report also found that the greater degree of sprawl in a metropolitan area, the greater the cost of owning and maintaining an automobile.

Then there are those households that lack automobiles. According to the 2000 census, more than 10 percent of the American public does not own an automobile, and are dependent on transit or other sources of transportation besides a personal automobile to get around. This number is likely to increase as the nation's population

continues to age, and more and more of us eventually succumb to various physical and mental disabilities and impairments.

Transportation equity, in contrast, is about ensuring that all communities enjoy access to economic opportunity, and that no community is unfairly burdened with negative economic and environmental impacts. Transportation equity is also about ensuring that planning processes are fully transparent, accountable and accessible to the general public. Congress should strive to ensure that every Federal dollar spent on transportation carries with it the principle of transportation equity.

*Access to Jobs: What We Learned from Welfare Reform*

Transportation is a daily struggle for many Americans. This challenge is particular acute for low-income people and working families that lack access to safe, reliable and timely public transportation and cannot afford private car ownership. The low wage labor market is often unforgiving for hard-working breadwinners unable to get to work on time, if at all. For families on welfare who face federally imposed work requirements and time limits, the inability to get to jobs due to transportation, could render these families ineligible for public assistance as well as leave them unemployed.<sup>3</sup>

An example of an innovative Job Access and Reverse Commute (JARC) program is in Columbus, Ohio. The project was driven by a coalition of churches called Building Responsibility Equality And Dignity (BREAD), which realized early on the potential of the JARC program enacted in TEA-21.

BREAD partnered with the Central Ohio Transit Authority and the Mid-Ohio Regional Planning Commission, the city of Columbus, the Federal Transit Administration, and the county welfare office to establish a new transit hub in a low-income community in Columbus that is home to a large public housing project. The transit hub, which drew funds from a number of sources, featured express bus service to areas of high job growth in the suburbs, including feeder bus service that could take riders closer to their work sites. The transit hub itself also co-located child care services and job referral and training support services so that it could simultaneously meet the multiple needs of this community.

As demonstrated by the Columbus example, one of the JARC program's most innovative features is its emphasis on collaboration among various stakeholders, including transportation, welfare, and housing agencies and the affected community.

Although most low-income people may want cars, the reality of car-ownership can undermine the aspirations of families seeking to make a better life for themselves and their children. For many poor families trying to work their way out of poverty, car ownership is expensive and does little to generate equity over time, and the cost of owning a car can place other important wealth-generating assets, like homes, out of reach. But if a family is without a reliable vehicle and beyond the range of mass transportation—whether publicly or privately operated—that family will be economically, socially and culturally isolated. In rural communities, the circumstances are even worse. Forty percent of rural counties lack public transit, and 36 percent of all rural residents are considered transit dependent.<sup>4</sup>

Residents of large cities often forget that in smaller communities public transportation systems tend to be less well funded and receive fewer planning resources. But even in large cities, bus service may not accommodate the needs of second or third shift workers, or be able to accommodate the multiple trips mothers may need to take to get their children to childcare on the way to work.

*Considering Metropolitan Planning Organizations*

The Center for Community Change and the Transportation Equity Network have developed a great deal of experience working with and in some instances pressuring MPOs to reform their planning practices. Over the last 6 years, the Center has gathered a good deal of information about MPOs. The nearly 400 MPOs across the Nation represent a very mixed bag of both good and bad practice. Certainly, experience has shown that though MPOs—as all layers of government—often request less oversight from the Federal Government, some oversight is inevitably necessary. The transportation planning process is one example of where lack of accountability and standard minimum expectations has harmed the public interest.

In 1998, Congress enacted several provisions in TEA-21 related to the metropolitan transportation planning process. The Transportation Equity Network focused on three:

<sup>3</sup>This material is covered in greater detail in Policy Brief: Transportation and Access to Jobs. Center for Community Change & STPP. 2002. [Draft]

<sup>4</sup>Status of Rural Public Transportation. Federal Transit Administration. 2000-2001

1) The first was an annual listing of projects for which Federal funds had been obligated in the prior year. The intent of this provision is to increase the degree of transparency in the transportation planning process by creating a tool by which the public can ascertain how Federal funds are spent in their metropolitan region, and thereby determine funding patterns in metropolitan regions over time. A survey conducted of a diverse sample of MPOs found that 5 years after the law was enacted:

- Approximately 80 percent of MPOs surveyed had an annual list of projects;
- Many MPOs were still having difficulty gathering data on project obligations because a) States were not willingly sharing the data; or b) non-compatible data collection or coding systems within States made this a very time consuming process;
- Some MPOs felt that additional information would make the list a more useful planning tool.

The survey and experience has also revealed that MPOs vary significantly with respect to capacity. Many MPOs lack necessary staffing resources and expertise in various kinds of data collection. Furthermore, many MPOs had staff who were unaware of various TEA-21 requirements, including the annual listing of projects.

Having said that, there are a number of items that would make the annual list of projects a more effective planning tool. The first would be to geographically code projects in both the TIP and the annual list; this would allow these projects to be readily mapped using Geographic Information Systems (GIS) technology. The second would be to include more project data, including the point at which the project is in the project development and construction process. The list should also be more clearly marked within the TIP, or separated from the TIP as a distinct document so that it might be more visible and easy to find.

2) The second provision added the term “transit user” to the list of stakeholder groups that must be consulted in the metropolitan and statewide transportation planning process.

Over the last 5 years, the Center has examined the public involvement programs of a broad range of MPOs. In too many instances, the MPO has been found lacking.

- During a certification review conducted by the Federal Highway Administration and the Federal Transit Administration in 2001, the Montgomery, Alabama MPO deliberately misled Federal officials and the public by claiming that it had a Citizen Advisory Council (CAC). In fact, while the MPO had a provision for a CAC on the books, it had never convened one. While Federal law does not mandate CACs, the FTA and FHWA do consider them a recommended planning practice. Months later, after the MPO did convene a CAC, the MPO refused to provide it with any resources making it impossible for the CAC to conduct business.

- When community representatives from Jackson, Mississippi approached their MPO in person to request a copy of their TIP, several MPO officials refused to provide it.<sup>5</sup> Similarly, when residents of Baton Rouge, Louisiana approached their State DOT to request a copy of the State Transportation Improvement Program, DOT officials unblinkingly informed them that there was no such document.

These are three particularly egregious examples of how MPOs, as well as States, have failed to take the public involvement provisions of TEA-21 seriously. On the other hand, many MPOs are very responsive to requests for information, and have invested a great deal of time in building public trust in their planning activities.

- The Birmingham, Alabama Metropolitan Planning Organization is admired by communities across the South for the role it has established for its Citizen Advisory Council, and its efforts to provide the public with opportunities to participate in alternative transportation analyses. The MPO also has a Public Involvement Plan, another FHWA/FTA recommended practice, with which it may be held accountable by the CAC and the general public.

Over the last several years, the Center and TEN have learned that MPOs tend to have better public involvement processes when a strong community presence is there willing to agitate them to improve. Experience has also shown that early and broad-based community outreach and public involvement can ease the transportation planning process, and greatly improve it, over both the short and long term.

3) A third provision established a statutory requirement for public involvement in the certification process, by which the FHWA and FTA review the planning processes of MPOs.

Though this provision applies to metropolitan planning, in some ways it provides some insight into the role of the FHWA and FTA in the metropolitan planning process. In the certification process, the FHWA and FTA are required to examine an MPO's planning practices every 3 years to determine whether or not the MPO is appropriately addressing planning factors and requirements in Federal regulations,

<sup>5</sup>Getting on Track. Center for Community Change. 2000.

TEA-21, civil rights law, air quality requirements, and other Federal law. As a digression, the Center and TEN have found a number of shortcomings at both FTA and FHWA.

- In 1999 the Center for Community Change submitted a Freedom of Information Act request to the FTA to provide recently filed certification reports. At the time, there was no central depository for certification reports at FTA or FHWA. Neither agency had any way of standardizing how it approached implementation of the various planning requirements in TEA-21. Nor could FTA and FHWA make any effort to assess its own effectiveness with respect to implementing this provision of Federal law.

- The FTA and FHWA, for their own part, tend to be rather obscure institutions. Advocacy organizations, researchers and community residents seeking information on the status of projects, trends in State funding behavior, levels of unobligated balances, and other information are likely to be given reams of hard copy print outs of indecipherable tables. As such, unless an outsider—let alone a DOT employee—intends to spend an inordinate amount of time pouring through numbers, there is no reasonable way to accurately compare the behavior of a State with other States, and it is often overly taxing to even make simple judgments on how much money States have spent on particular projects. That same researcher may or may not have an easier time gathering similar data at the State level, where some data collection systems almost seem designed to create confusion and obscure accountability.

With respect to the certification process, there are a number of factors that can be improved in order to improve FHWA and FTA performance, as well as MPO planning performance.

- MPOs are consistently uncertain about what they should be expected to do to conduct an appropriate examination of social equity or environmental justice impact on low-income and minority communities. The FHWA and FTA allow a great deal of ambiguity, and as a result have no set standard against which to judge effective planning with respect to low-income and minority communities. This has led to greater tension between transportation planners and community residents frustrated with moving targets and confusing messages.

- Since FHWA and FTA are primarily responsible for conducting certification reviews, there should be a minimum expectation laid upon FHWA and FTA for what should be considered an appropriate public involvement process in certification reviews. Such consistency will serve to improve public confidence in the metropolitan transportation planning process and serve to model best practices for MPOs.

4) In addition to these issues, there are governance-related questions that need clarification in Federal law.

- The relationship between tribal governments and State DOTs and MPOs. In all circumstances, tribal governments should be treated as sovereign entities, but they should also be consulted early and often in all decisionmaking processes that may impact on their land, population or infrastructure.

- The matter of one person-one vote. It seems unreasonable that in some metropolitan areas, a community 1/10th the size of the largest city in a metropolitan region has voting power equal to the largest city. While some MPOs have implemented a number of schemes to weight voting power, the Federal Government should clarify the principle that larger jurisdictions should have more say in the transportation planning process.

#### *Environmental Justice*

The principle of environmental justice is vitally important in Federal transportation law and transportation planning. Environmental justice, which is grounded in Federal Civil Rights Law, is important not only because it establishes a coherent vision that seeks to protect low-income and minority communities from environmental harms, but also because it fully acknowledges the role of income as well as race in unjust planning practices. Furthermore, environmental justice does not simply apply to public involvement processes. The goal of environmental justice, as articulated by the Center and by TEN, is the commitment that those communities that have suffered most will soon get the resources they need to revitalize themselves. Environmental Justice must be seen as a tool or criteria by which planning agencies prioritize the importance of projects or the need to re-examine them.

#### *Recommendations*

The Center for Community Change and the Transportation Equity Network urge the committee to consider the following recommendations. A more detailed set of legislative proposals is forthcoming. In the interim, the following are intended to create dialog.

### 1) *Public Involvement*

- Congress should set aside a fund for community involvement by grassroots organization stakeholders in the transportation planning process. These resources would help pay for the cost of programs for MPOs and States to train interested parties in the transportation planning process, and would be re-granted to community-based organizations to support community outreach efforts. Such a fund would help MPOs and States meet their public involvement and environmental justice obligations.

- Congress should earmark some funds for a planning initiative to create a “Best of the Best” reserve fund. FHWA and FTA would use such a fund to provide financial incentives for innovative and effective community outreach.

- Congress should establish a minimum set of expectations for all MPOs and States with respect to their public involvement practices. For example, all MPOs should have a Citizen Advisory Council, a Public Involvement Plan, and a requirement that comments formally submitted by interested parties must be fully addressed by MPOs or States prior to the publishing of key decision documents. The latter is a process already utilized by the Atlanta Regional Council and commonly used in public comment processes related to important public documents at both the Federal, State and local level.

### 2) *Research, Data & Accountability*

- MPOs should be required to maintain demographic profiles (age, race, income) of the metropolitan planning area. This information would be used to identify locations of socioeconomic groups, including low-income and minority populations. These profiles should be used to develop base maps and other planning and modeling tools to assess the impact of current transportation services and programs on low-income and minority communities.

- Congress should establish a multi-year process by which surveys, data gathering tools and other measurement tools will be modified to more accurately reflect the populations that both use and are impacted by various kinds of transportation investments. Similarly, Congress should require a greater degree of consistency across data sets held at both the local, metropolitan, State and Federal levels to ensure better coordination among layers of government. Furthermore, all projects in new TIPs, Annual Lists and related documents should be geographically coded to facilitate GIS mapping.

- Congress should exercise its role as the steward of Federal resources by strengthening public accountability in the transportation planning process. While the drive to streamline transportation planning and project delivery processes may be difficult to resist, regionally significant and controversial transportation projects must be justified against economic and environmental criteria in a thorough manner.

### 3) *Smart Growth & Access to Economic Opportunity*

- Congress should create a new Transit Oriented Development & Economic Revitalization Incentive Fund that provides local communities with a monetary incentive for locating mixed-income housing, business, and retail developments near public transportation centers.

- Congress should create various incentives for encouraging cooperation—shared data, coordinated planning, and project implementation—among transportation agencies, welfare agencies, work force investment boards, and housing agencies to most effectively meet the needs of low-income families.

- Congress should establish goals, performance measures, and benchmarks for employment transportation in the metropolitan and statewide transportation planning processes with public input. There should also be stronger mechanisms for accountability and transparency to evaluate the responsiveness of State DOTs to community input and these economic objectives.

In conclusion, I hope that the committee will find these comments to be helpful as it develops its own proposals for reauthorization. Though the issues confronting low-income and minority communities are often not seen as transportation issues per se, such prejudices are inaccurate. Research and experience place poverty and race clearly at the center, rather than the margins, of transportation planning and project delivery. On behalf of the Transportation Equity Network, I urge the committee to view transportation reauthorization in this light.

## REAUTHORIZATION OF TEA-21

---

TUESDAY, JULY 30, 2002

U.S. SENATE,  
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,  
*Washington, DC.*

The committee met, pursuant to notice, at 9:32 a.m. in room 406, Senate Dirksen Building, Hon. James M. Jeffords [chairman of the committee] presiding.

### TRANSPORTATION AND AIR QUALITY

Present: Senators Jeffords, Clinton, Carper, Inhofe, Bond, Voinovich, Smith, and Chafee.

#### OPENING STATEMENT OF HON. JAMES M. JEFFORDS, U.S. SENATOR FROM THE STATE OF VERMONT

Senator JEFFORDS. The hearing will come to order.

Good morning, everyone, and welcome to our hearing on transportation and air quality. In particular, I want to thank our witnesses, many of whom have traveled great distances to lend a hand as we consider renewal of the Nation's surface transportation program. Today's topic, transportation and air quality, is particularly appropriate for the Committee on Environment and Public Works. Since 1837, this committee has guided Federal investments to enhance the Nation. In early history, as the committee on Public Buildings and Grounds, featured stewardship of the growing Federal city of Washington, DC. In 1956, the then Committee on Public Works reported the Federal Aid Highway Act, creating the modern interstate highway system in 1963. The committee took on the challenge of air and water pollution control. And in 1977, the committee was given responsibility for wildlife resources and given its current full name.

In 1991, the members of the committee were the driving force behind the Intermodal Surface Transportation Efficiency Act, ISTEA, which brought a new approach to transportation. With completion of the interstate highway system, our focus shifted toward integration of the various modes of transportation: highway, transit, aviation and rail. ISTEA also brought greater attention to transportation's influence on our communities and the lives of our citizens. We recognized investment in transportation is not an end in itself, it is a means to an end. I was a member of the committee in 1991. I believed then and I believe today that the needs and ends that we seek should be a strong community, healthy communities, strong economy, healthy communities and a clean environment. And clean air is essential to each of these aspects.

Over the past year, this committee has spent considerable time on air pollution. We have focused on emissions from stationary sources, power plants in particular. This included marking up the Clean Air Power Act, a bill which significantly reduces emissions of sulfur dioxide, nitrogen oxides, mercury and carbon dioxide. I am pleased that the Administration has finally, after much delay, sent us up a three pollutant bill. Unfortunately, it is much too late in the Congress for it to be considered. From a quick review, it appears that the legislation provides too little in the way of reductions and they come much too late.

The bill also ignores the dire warnings in the Administration's own report about global warming, which is caused in part by U.S. power plant emissions of carbon dioxide. Last August, the committee held a general hearing on the impact of the emissions from the transportation sector on public health and the environment. We found that statutory and regulatory limits on individual mobile sources and technology improvements will reduce both total emission of conventional pollutants from the sector. But we also found that transportation will continue to be a significant source of our non-attainment problem, not to mention a major contributor to air urban toxics exposure and to global warming.

Today, we will hear more testimony about the progress that has been made to control air pollution from transportation. We will hear the good news that today's motor vehicles are cleaner burning than earlier models, so that each car or truck pollutes less. But we will hear that Americans are driving so much more, that many of the technology gains have been offset.

We will hear that the low emitting transportation control measures encouraged in our most polluted cities and regions have so far produced modest results. As cars get cleaner, some will suggest that investment in transit or bicycle lanes or more workable and developmental patterns may not be worthwhile. But we know that a pedestrian or a transit rider generates far less pollution per passenger mile than a motorist in even the cleanest of today's cars.

We will hear that the process used to manage transportation pollution conformity is not always the most efficient. Achieving the twin goals of clean air and improved mobility is complicated and relies on the coordination of many people and resources. It takes cooperation and sound information.

In summary, we will hear that our campaign to clean up the transportation sector is well underway, but has a long way to go. And as we renew the overall surface transportation program, we can and should refine air quality linkage to build success and make improvements. Today's hearing is the eighth in our reauthorization series. We began in January, and we'll wrap up later this fall. Through these hearings, we have explored a wide range of topics, but with a consistent theme. We have called upon experts from around the Nation to share the lessons they have learned over the past 10 years, and we have asked them to cite any changing conditions that they foresee. They set upon lessons learned and changing conditions.

We have sought fresh ideas for improving our current national transportation program. We have assembled a fine panel of witnesses today, and I look forward to their insights. Our first panel

will represent the Administration. I am pleased to welcome Administrator Mary Peters of the Federal Highway Administration and Assistant Administrator, Jeffrey Holmstead, of the U.S. Environmental Protection Agency.

Our second panel brings perspectives from around the Nation. First and foremost, I am delighted to be joined this morning by Scott Johnstone, the Secretary of the Agency of Natural Resources from the State of Vermont. Welcome, Scott. We'll be getting to you later, an I'm guessing it will be a bit cooler in the Green Mountain State than it is here, and hope you can survive.

Also on our second panel is the Honorable Ron Harris, County Judge from Collin County, Texas. Ron serves on the board of the North Central Texas Council of Governments and the Metropolitan Planning organization of the Dallas-Fort Worth. He is also the chair of the North Texas Clean Air Steering Committee. And Lynn Terry is the Deputy Executive Officer of the California Air Resources Board. Lynn will tell us about recent developments in the Golden State.

James Stephenson wears many hats. He is President of the Yancy Brothers Company, a construction equipment supplier. He is also on the board of the Georgia Regional Transportation Authority in the Atlanta area. Today James represents the American Road and Transportation Builders Association, on whose board he also sits. And finally, Michael Replogle is with us here today. Michael is the Transportation Director for the non-profit group, Environmental Defense Fund, and a frequent witness before the committees of Congress.

I want to welcome all the witnesses, and I now turn to Senator Smith.

**OPENING STATEMENT OF HON. BOB SMITH, U.S. SENATOR  
FROM THE STATE OF NEW HAMPSHIRE**

Senator SMITH. Thank you very much, Mr. Chairman, and good morning, Ms. Peters and Mr. Holmstead. Good to have you here.

This is an especially significant hearing, because we're the only committee that has jurisdiction over both the Clean Air Act and the Transportation authorization bill. With over 10 years of experience of implementing the so-called ISTEA and TEA-21, and related Clean Air Act amendments of 1990, I think we have to take a hard look at how well the transportation conformity program is working to improve air quality, indeed, is it working to improve air quality.

In New Hampshire, the southern and the sea coast areas are designated non-attainment for ozone, and the region has background ambient air quality problems primarily from out of State sources, not our own State. The region's 3 year conformity update is due in October of this year, and on this Friday, the Federal and State agencies will be meeting to discuss how to avoid a conformity lapse and the funding penalties associated with it. Their discussion will be about data and models concerning those funding penalties and penalty lapses, but they're not going to be about transportation projects. They cannot significantly change the air quality model's emission projections with changes to transportation projects. But they can change the emission projections with adjustments to the data for vehicle fleet mix and truck percentages.

I'm frankly baffled that New Hampshire's highway funds could be diverted and projects delayed, not as a penalty for failing to properly consider the air quality impacts of transportation projects, but as a result of data flaws in an air quality model that is attempting to predict a precise emission level 20 years into the future. And like many areas of the country, the air quality in southern New Hampshire is getting better, the congestion is getting worse, and the conformity program threatens to further delay badly needed highway projects. It doesn't seem to make sense to me.

There are a couple of major issues with transportation conformity that need to be addressed in the reauthorization of TEA-21, whatever we wind up calling it, Mr. Chairman. First, we must address the CMAQ program funding levels and the apportionment formulas. Second, we need to take a hard look at the air quality benefits and cost effectiveness of transportation control measures, TCMs, aimed at reducing vehicle travel. When the Senate debated the 1990 Clean Air Act amendments, expectations were very high that transportation controls were cost effective in a simple way to make large reductions in vehicle emissions. One reason for the role of these transportation control measures in the conformity program is that historically, the growth in the amount of vehicle travel was anticipated to offset much of the gains from EPA vehicle emission standards.

More recently, vehicle travel is having a smaller and smaller impact on emissions, however, believe it or not. I would call your attention to the chart behind Senators Bond and Inhofe. And the impact of cleaner cars and trucks on future vehicle emissions is shown by the EPA data on chart one. It's significant because current projections show that the emission levels continue to decline, which is the blue and the green line, yet vehicle miles traveled continue to increase. So in spite of the fact that we're traveling more, we're still putting less and less pollutants in the air. As you can see, by the year 2040, it drops substantially.

So this steep decline in NOX and VOC emissions suggests that the impact of vehicle travel on emissions is substantially less than it was in the 1970's and 1990's, through that period from 1970 to 1990. In TEA-21, Congress expressed its strong support for the CMAQ program, increasing budget authority from \$1 billion to \$1.6 billion. At the same time, congressional debate raised questions concerning the efficacy of the program.

This study came to several conclusions regarding CMAQ and the cost effectiveness of transportation control measures. First, the report concluded that CMAQ was an extremely popular program and should be continued potentially at an increased level of funding. Second, emission reduction from TCMs are generally small and more expensive than the technological advances. Last, technology and regulations, like new vehicle emission and fuel standards in vehicle scrappage programs generally have been more successful than most CMAQ strategies relying on changes in travel behavior.

So as TEA-21 reauthorization proceeds, we're going to need to talk a lot more and understand the effectiveness and cost effectiveness and role of TCMs and conformity in meeting these transportation and clean air goals.

Finally, transportation and air quality officials have raised concerns that conformity is becoming increasingly process driven and that as a result, clean air is becoming a secondary factor. Drive the process, and clean air is a secondary factor. Moreover, there are ambiguities in the statute and regulations being resolved in the litigation which increasingly indicates a lack of clarity that Congress should address, Mr. Chairman.

But I want to thank, in conclusion, 15 cities that responded to your and my request for information on their experiences with the conformity program. These responses are very helpful, and I would just ask unanimous consent that those responses be made part of the record.

Thank you, Mr. Chairman.

Senator JEFFORDS. They will be made so.

[The prepared statement of Senator Smith and the information referred to follows:]

STATEMENT OF HON. BOB SMITH, U.S. SENATOR FROM THE STATE OF NEW HAMPSHIRE

Thank you, Mr. Chairman, and welcome to our Administration witnesses, Mary Peters and Jeff Holmstead. This hearing is especially significant because this is the only Congressional committee that has jurisdiction over both the Clean Air Act and the transportation authorization bill.

With over 10 years of experience implementing ISTEA, TEA-21 and the related Clean Air Act Amendments of 1990, I think we need to take a hard look at how well the transportation conformity program is working to improve air quality.

In New Hampshire the southern and seacoast areas are designated non-attainment for ozone. The region has background ambient air quality problems primarily from out of state sources.

The region's 3-year conformity update is due in October of this year, and on this Friday, the Federal and state agencies will be meeting to discuss how to avoid a conformity lapse and the funding penalties associated with it.

Their discussion will be about data and models, not about transportation projects. They cannot significantly change the air quality model's emission projections with changes to transportation projects. They can, however, change the emission projections with adjustments to the data for vehicle fleet mix and truck percentages.

I'm baffled that my state's highway funds could be diverted and projects delayed—not as a penalty for failing to properly consider the air quality impacts of transportation projects, but as a result of data flaws in an air quality model that is attempting to predict a precise emission level 20 years into the future.

Like many areas of the country, the air quality in southern New Hampshire is getting better, the congestion is getting worse, and the conformity program threatens to further delay badly needed highway projects.

There are a couple of major issues with transportation conformity that need to be addressed in reauthorization of TEA-21. First, we must address the CMAQ program funding levels and apportionment formula. Second, we need to take a hard look at the air quality benefits and cost effectiveness of transportation control measures (TCMs) aimed at reducing vehicle travel.

When the Senate was debating the 1990 CAA amendments, expectations were very high that transportation controls were a cost-effective and simple way to make large reduction in vehicle emissions.

One reason for the role of TCMs in the conformity program is that historically the growth in the amount of vehicle travel was anticipated to offset much of the gains from EPA vehicle emission standards.

More recently, vehicle travel is having a smaller and smaller impact on emissions.

—The impact of cleaner cars and trucks on future vehicle emissions is shown by the EPA data on Chart 1.

—This chart is significant because current projections show that emission levels continue to decline, even as VMT (vehicle miles traveled) increase.

The steep decline in NOx and VOC emissions suggests that the impact of vehicle travel on emissions is substantially less than it was in the 1970's–1990's. In TEA-21, Congress expressed its strong support for the CMAQ (SEE-MACK) program, increasing budget authority from \$1 billion per year to \$1.6 billion per year. At the

same time, however, the Congressional debates raised questions concerning the program's efficacy.

In response, Congress directed the National Academy of Sciences' Transportation Research Board (TRB) to evaluate the program's benefits and cost-effectiveness. This study came to several conclusions regarding the CMAQ program and the cost-effectiveness of transportation control measures. First, the report concluded that CMAQ was an extremely popular program and should be continued, potentially at an increased level of funding. Second, emission reductions from TCMs are "generally small" and more expensive than technological approaches.

Lastly, technology and regulations like new-vehicle emission and fuel standards and vehicle scrappage programs "generally have been more successful than most CMAQ strategies relying on changes in travel behavior."

As the TEA-21 reauthorization proceeds, further discussion is needed to better understand the effectiveness, cost-effectiveness and role of TCMs and conformity in meeting our transportation and clean air goals.

Another concern to be addressed is the need for more information and tools to deal with particulate matter (PM 2.5) pollution, and to prepare for the new PM 2.5 NAAQS. While it is known that PM2.5 represents a serious health risk, and that most transportation related PM 2.5 emissions come from diesel engines, more information and research is needed on the effectiveness and cost-effectiveness for different PM 2.5 control strategies.

Finally, transportation and air quality officials have raised concerns that conformity is becoming increasingly process driven, and that the result, cleaner air, is becoming a secondary factor. Moreover, there are ambiguities in the statute and regulations being resolved in litigation, which increasingly indicates a lack of clarity that Congress should address.

Let me conclude by thanking the 15 cities that responded to the chairman's and my request for information on their experiences with the conformity program. Your responses are very helpful and will certainly help inform the reauthorization process. I ask unanimous consent to include these responses in the record of this hearing.

---

ATLANTA REGIONAL COMMISSION

40 COURTLAND STREET, NE

ATLANTA, GEORGIA 30303

(By Tracy Clymer)

Updated: June 25, 2002

*Conformity History for the Atlanta Non-Attainment Region*

November 15, 1993—Georgia Environmental Protection Division (EPD) submits 15 percent Rate of Progress (ROP) Plan to Environmental Protection Agency (EPA) for approval. Provides for at least 15 percent reductions of VOC from 1990–1996.

November 15, 1994—EPD submits 9 percent ROP Plan to EPA for approval. Provides for at least a 3 percent per year reduction of NOx for 1997, 1998 and 1999.

June 28, 1995—Atlanta Regional Commission (ARC) adopts conforming 2010 Regional Transportation Plan (RTP) and Fiscal Year (FY) 1996–2001 Transportation Improvement Program (TIP)—six-year TIP, two 3-year tiers. Conformity based on VOC budget established in the 15 percent ROP Plan. ARC Resolution 18–95.

August 7, 1995—United States Department of Transportation (USDOT) conformity determination for 2010 RTP and fiscal year 1996–2001 TIP.

June 17, 1996—EPD submits revisions to the 15 percent ROP Plan and 9 percent ROP Plan. NOx budget established, 214.77 tpd.

Note: ARC was unable to develop a fiscal year 1997–1999 TIP that conformed to the NOx emission budget established in the 9 percent ROP Plan. Fiscal year 1997–1999 TIP was 21.93 tpd over budget.

September 25, 1996—ARC amends the fiscal year 1996–2001 TIP. ARC Resolution 22–96.

June 25, 1997—ARC amends the fiscal year 1996–2001 TIP. ARC Resolution 17–97.

Note: Amendments were limited to projects considered exempt from transportation conformity requirements.

December 30, 1997—ARC adopts Interim TIP (ITIP), fiscal year 1998–2000 with contingencies (several project removals). ARC Resolution 32–97.

January 17, 1998—Conformity lapse begins due to failure to redetermine conformity of RTP within 18 months of the State's most recent State Implementation Plan (SIP) revision that establishes Motor Vehicle Emission Budgets (MVEB), as required by 93.104(e) of transportation conformity rule.

Note: fiscal year 1996–2001 TIP, approved in August 1995 by USDOT, valid for 2 years. TIP was to expire in August 1997. However, on February 21, 1997 the Federal Highway Administration (FHWA) Georgia Division office extended the expiration of the TIP until December 31, 1997, due to previous extenuating circumstances of the 1996 Olympic Games (which concluded in early August 1996) and contingent upon ARC having a new, conforming RTP by December 31, 1997. As of December 1997, ARC was not expected to have a conforming RTP until April 1998, at the earliest. On December 22, 1997, FHWA and Federal Transit Administration (FTA) again extended expiration of the TIP, upon request of headquarters and in consultation with EPA, until January 17, 1998.

January 28, 1998—ARC adopts fiscal year 1998–2000 ITIP, contingencies met. ARC Resolution 2–98.

April 22, 1998—ARC amends fiscal year 1998–2000 ITIP. ARC Resolution 12–98.

July 22, 1998—ARC adopts Interim 2020 RTP and ITIP amended to add fiscal year 2001, fiscal year 1999–2001. ARC Resolution 25–98.

December 2, 1998—fiscal year 1999–2001 ITIP amended. ARC Resolution 38–98.

January 20, 1999—Georgians for Transportation Alternatives (GTA) v. Shackelford<sup>1</sup> filed. Plaintiffs challenge decisions made to adopt, approve or fund certain highway projects on the grounds that decisions violate Clean Air Act (CAA) provisions, the Transportation Equity Act for the 21st Century (TEA-21), the National Environmental Policy Act, and the Administrative Procedure Act.

March 18, 1999—9 percent ROP Plan Approved (64 FR 13348).

April 26, 1999—15 percent ROP Plan Approved (64 FR 20186).

June 18, 1999—GTA v. Shackelford settled. Settlement agreement requires extensive Peer Review of transportation modeling process within 90 days of Board adoption of conforming TIP and RTP.

June 23, 1999—ARC adopts fiscal year 2000–2002 ITIP. ARC Resolution 17–99.

1999—Development/refinement of new draft plan for 2025 RTP and fiscal year 2001–2003 TIP.

October 27, 1999—ARC amends fiscal year 2000–2002 ITIP. ARC Resolution 25–99.

October 28, 1999—EPD submits Attainment SIP to EPA for approval. MVEB established, NO<sub>x</sub> = 224.13 tpd, VOC = 132.21 tpd.

February 28, 2000—MVEB adequacy announced in Federal Register (65 FR 10490).

March 22, 2000—ARC adopts conforming 2025 RTP and fiscal year 2001–2003 TIP. Conformity based on MVEB established in Attainment SIP submittal.

April 28, 2000—Petition for Review filed by GTA, et al.<sup>2</sup> with USEPA in US Court of Appeals for the Eleventh Circuit. Petitioners seek review of MVEB adequacy determination.

June 8, 2000—Petition to EPA for Reconsideration of MVEB Adequacy Determination filed by Southern Environmental Law Center (SELC) on behalf of GTA et. al.<sup>3</sup>

June 14–16, 2000—Peer Review of ARC transportation modeling process. Peer Review found transportation and emission models “state of the practice.”

June 29, 2000—Final written request to EPA for a stay of the MVEB adequacy determination, pending review by 11th Circuit Court.

July 5, 2000—60-day notice of intent to sue sent by SELC to EPA Administrator.

July 10, 2000—EPA counsel denies stay.

July 11, 2000—Motion to Stay on Expedited Basis, pending Courts ruling on merits of April 28 Petition, filed by GTA et. al.<sup>4</sup> in 11th Circuit Court of Appeals. Peti-

<sup>1</sup>Plaintiffs: GTA, Georgia Conservancy, and Sierra Club. Defendants: Wayne Shackelford—Commissioner of Georgia Department of Transportation (GDOT), GDOT, Secretary USDOT, FHWA Administrator, FTA Administrator, Georgia Division FHWA and FTA Regional Administrators, ARC.

<sup>2</sup>Petitioners: GTA, Sierra Club, Southern Organizing Committee for Economic and Social Justice and Georgia Coalition for the People's Agenda. Respondent: USEPA.

<sup>3</sup>GTA, Sierra Club, Southern Organizing Committee for Economic and Social Justice, Georgia Coalition for the People's Agenda and Environmental Defense.

<sup>4</sup>Petitioners: GTA, Sierra Club, Southern Organizing Committee for Economic and Social Justice and Georgia Coalition for the People's Agenda. Respondent: USEPA. Intervening Respondent: Georgia EPD.

tioners request that the order state the MVEB may not be used by USDOT for purposes of transportation conformity or TIP approval/implementation.

July 18, 2000—Motion to Stay granted by 11th Circuit Court of Appeals, pending the Court's decision on the merits of the petition. Expedited schedule issued for further proceedings.

July 18, 2000—EPA concurs with positive conformity determination.

July 25, 2000—USDOT makes positive conformity determination for 2025 RTP and fiscal year 2001–2003 TIP.

Note: Because the MVEB established in the October 1999 SIP submittal could not be used due to litigation, the positive conformity determination was based on the MVEB established in the 9 percent ROP Plan (last legally approved budgets).

August 8, 2000—EPD requests that EPA rescind the positive adequacy determination.

August 10, 2000—Motion for Voluntary Remand filed by EPA in 11th Circuit Court of Appeals. EPA requests that the Court remand the matter back to the Agency so that the positive MVEB adequacy determination could be withdrawn. EPA argues that the MVEB adequacy determination is no longer relevant for any purpose considering the conformity determination was made using previously established budgets.

August 24, 2000—Motion for Voluntary Remand refused by 11th Circuit Court of Appeals.

August 30, 2000—US Court of Appeals for the District of Columbia decides that implementation of NOx SIP Call cannot be required before May 31, 2004

December 21, 2000—EPD sends letter to EPA withdrawing MVEB contained in the October 28, 1999 SIP submittal. EPD asks EPA to not consider budgets further until State concludes work needed to submit a revised budget (speed study, updated registration data, etc).

December 22, 2000—Joint motion (EPD/EPA) filed with 11th Circuit Court to stay further proceedings for review of MVEB adequacy determination. Motion based on agreement that MVEB established in October 28, 1999 SIP submittal are no longer appropriate for purposes of making a transportation conformity decision. Joint motion also requests permission for EPA to withdraw finding of adequacy.

January 12, 2001—11th Circuit Court grants EPA motion to withdraw adequacy determination.

January 26, 2001—MVEB adequacy determination withdrawn by EPA. Withdrawal based upon EPD's request that EPA not consider budgets until further work is completed for budget revisions and NOx SIP Call Implementation delay until 2004. (66 FR 7904)

January 17, 2001—Sierra Club et. al.<sup>5</sup> file suit in US District Court of Northern District of Georgia against EPA Administrator for failure to reclassify Atlanta from "serious" to "severe". BUMP-UP SUIT. Petitioners seek to require that EPA perform mandatory finding as to whether Atlanta attained the ozone standard by Nov 15, 1999 under Section 181/182 of the CAA.

February 13, 2001—Sierra Club et. al. v. ARC et. al.<sup>6</sup> filed in US District Court of Northern District of Georgia. Suit seeks declaratory judgment based on alleged violations of CAA conformity requirements, violations of TEA-21 Transportation Law, and public participation requirements for the 2025 RTP and fiscal year 2001–2003 TIP. In addition to declaratory relief, plaintiffs enjoin advancement of 2025 RTP and fiscal year 2001–2003 TIP.

April 5, 2001—Sierra Club et. al. request preliminary injunction to stop advancement of any projects in the 2025 RTP or fiscal year 2001–2003 TIP until Federal lawsuit is heard.

May 28, 2001—Declaration of Michael A. Repogle for plaintiffs

May 29, 2001—Declaration of Robert A Johnston for plaintiffs

June 5 and June 6, 2001—Injunction Hearing

June 15, 2001—Judge Beverly Martin, U.S. District Judge, denies request for injunction. Directs parties to file preliminary planning report and scheduling order.

July 25, 2001—Request for Production of Documents and Interrogatories from plaintiffs.

July 31, 2001—Sierra Club et.al. file Motion for Partial Summary Judgement

<sup>5</sup>Plaintiffs: Sierra Club, Southern Organizing Committee for Economic and Social Justice, Georgia Coalition for the People's Agenda and Environmental Defense. Defendant: EPA Administrator.

<sup>6</sup>Plaintiffs: Sierra Club, Southern Organizing Committee for Economic and Social Justice, Georgia Coalition for the People's Agenda and Environmental Defense. Defendants: ARC, GDOT, Georgia State Transportation Board, UDOT, FHWA, FTA, and directors of these agencies.

August 27, 2001—Defendants object to Request for Production of Documents and Interrogatories.

January 8, 2002—USEPA publishes approval of MVEBs submitted with July 17, 2001 SIP submittal in FR (67 FR 887).

January 18, 2002—Judge Beverly Martin rules in favor of defendants for February 2001 lawsuit. She finds that State and Federal agencies did not violate the Clean Air Act when they approved the 2025 RTP and fiscal year 2001–2003 TIP in 2000. (*Sierra Club v. Atlanta Regional Commission*, N.D. Ga., No. 1:01-CV-0428, 1/18/02).

January 23, 2002—MVEBs become effective.

March 1, 2002—Petitioners (see case below) submitted to EPA a written request for a stay of MVEB adequacy determination.

March 7, 2002—*Sierra Club et. al v. USEPA*<sup>7</sup> filed in 11th Circuit Court of Appeals. MVEB CHALLENGE. Petitioners ask that the Court vacate the Final Rule approving the MVEBs submitted with the July 17, 2001 SIP submittal. Argument based on extension policy to 2004. Petitioner's also file Petition for Review and accompanying Motion to Stay on an Expedited Basis.

March 13, 2002—Affadavit of Charles Krautler, ARC re: Petitioners Petition for Review and accompanying Motion to Stay on an Expedited Basis filed in 11th Circuit Court.

March 14, 2002—Response of the State of Georgia in Opposition to Petitioners' Motion for Stay on an Expedited Basis and Cross-Motion by the State to Stay all Further Proceedings filed in 11th Circuit Court.

March 14, 2002—Respondent's (EPA) Opposition to Petitioners' Motion for Stay and Cross-Motion for a Stay of the Proceeding filed in 11th Circuit Court.

April 17, 2002—11th Circuit Court grants Motion for Stay of MVEB.

May 7, 2002—USEPA Approval and Promulgation of Georgia 1-Hour Ozone Attainment Demonstration, Motor Vehicle Emissions Budgets,

Reasonably Available Control Measures, Contingency Measures and Attainment Date Extension (67 FR 30574)

Note: Trigger clock was halted 21 days—from date of MVEB stay (April 17) to date of SIP approval (May 7).

Note: In May 2002, EPA also filed a Motion to Dismiss as Moot in regards to the Bump-Up lawsuit; the argument being that the approval of the Atlanta Attainment SIP authorized the extension of the attainment date from 1999 to 2004. More specifically, under Section 307 of the CAA the US District Court does not have jurisdiction to review EPA SIP determinations, only Circuit Court of Appeals have this authority. Sierra Club has requested that the District Court retain jurisdiction over this case in the event that the 11th Circuit Court overturns EPA's approval of the SIP (assuming that a petition challenging EPA's approval of the SIP will be filed, on an expedited basis, between June 18 and July 8, 2002 with the 11th Circuit Court—see comment below).

May 22, 2002—Petition for Review of the MVEB dismissed—clerk's dismissal only (EPA's Motion to Dismiss as Moot never docketed). Case already dismissed for want of prosecution as a result of Sierra Club failure to file abstracts of the administrative record.

June ? 2002—11th Circuit Court reinstates the MVEB lawsuit, orders EPA to file brief on the merits of the case by June 26, 2002. EPA will refile its Motion to Dismiss as Moot.

Note: The MVEB stay is back in place as a result of 11th Circuit Court reinstating the MVEB lawsuit. The MVEB cannot be used for conformity analysis until the stay is lifted.

June 7, 2002—Sierra Club asks EPA Regional Administrator to withdraw or stay EPA's SIP approval.

June 13, 2002—Regional Administrator denies request to stay or withdraw EPA's SIP approval. EPA, therefore, expects that a petition challenging EPA's approval of the SIP will be filed, with Motion for an Expedited Stay, between June 18 and July 8, 2002 (challenge must be filed within 60 days of publication of approval of the SIP in the Federal Register, deadline is July 8). Petition will challenge the extension of the attainment date to 2004.

June 26, 2002—SELC for Southern Organizing Committee, Georgia Coalition for Peoples Agenda vs EPA. Petition filed for Review of EPA's Approval of the Georgia Attainment SIP. Motion filed for Expedited Stay of EPA's Approval with 11th Circuit Court

<sup>7</sup>Plaintiffs: Sierra Club, Southern Organizing Committee for Economic and Social Justice, Georgia Committee for the People's Agenda and Environmental Defense. Defendant: USEPA.

July 2, 2002—Sierra et al vs ARC, GDOT, USDOT. Appeal of 2/28/02 Final Judgment. Oral arguments to be rescheduled after August with 11th Circuit Court.

July 2, 2002—Sierra vs EPA. DC Court vacated (removed approval of) revised SIPs for DC area. Basis of argument—EPA not authorized to approve revised SIPs that extend area's attainment date.

NORTH CENTRAL TEXAS COUNCIL OF GOVERNMENTS,  
Arlington, TX, July 30, 2002.

The Honorable JIM JEFFORDS, *Chairman*  
*Committee on Environment and Public Works*  
*U.S. Senate*  
*Washington, DC 20510-6175*

DEAR CHAIRMAN JEFFORDS: This letter is in response to a request made by the Committee on Environment and Public Works of the U.S. Senate, dated July 3, 2002, regarding our experience with the Clean Air Act conformity program and transportation control measures, and the impact these have had on our transportation and air quality efforts. Attached you will find responses to the series of specific questions that were transmitted to us.

We appreciate the opportunity to provide input on the reauthorization of the Transportation Equity Act for the 21st Century process. If I can be of further assistance on this subject matter, I can be reached at (817) 695-9240.

Sincerely,

MICHAEL MORRIS, P.E.,  
*Director of Transportation*

DIFFERENCE IN TIMING OF SCHEDULES

*Question.* Describe how the different schedules for the SIP, TIP, conformity, etc. and the impacts of data changes on out year emissions affect your ability to develop effective and timely transportation and air quality plans. Provide a time-line or narrative description of your various schedules.

*Response.* The differences of the schedules for the SIP, TIP, Metropolitan Transportation Plan (MTP), and Conformity are varied and can come without warning. For the Dallas-Fort Worth Metropolitan Planning Organization (MPO), the MTP is usually prepared every 3 years, consistent with Federal rules. However, SIP or TIP influences could trigger a new MTP out of sequence. As a result, a new conformity analysis is required. As highlighted in Table 1, the MPO decided a MTP Update was required in 2001 (less than a year after receiving Federal approval on a similar effort) to ensure a 3-year MTP cycle due to a SIP schedule that would establish new motor vehicle emission budgets (MVEBs) and conformity.

A new TIP is developed every year due to the number of transportation projects being planned. This is above the typical 2-year cycle. As a result, a new conformity analysis is required. However, due to Tier II regulatory language contained in our applicable SIP, the region is unable to perform a necessary conformity analysis on the TIP in 2003, therefore our TIP schedule, and associative conformity analysis, changed to make TIP modifications prior and after our freeze (see Table 1).

TABLE 1: DALLAS-FORT WORTH METROPOLITAN PLANNING ORGANIZATION  
TRANSPORTATION PLANNING DOCUMENT SCHEDULES  
Current Schedules

| Year       | SIP (as needed or attainment date) | MTP (every 3 years) | TIP (every 2 years) | Conformity (used to measure SIP, TIP and MTP) |
|------------|------------------------------------|---------------------|---------------------|---|
| 1997 ..... |                                    | X                   | X                   | X   |
| 1998 ..... |                                    |                     | X                   | X   |
| 1999 ..... | X                                  |                     | X                   | X   |
| 2000 ..... |                                    | X                   |                     | X   |
| 2001 ..... |                                    | *X                  | X                   | X   |
| 2002 ..... |                                    |                     | X                   | X   |
| 2003 ..... |                                    |                     |                     |   |
| 2004 ..... | X                                  | X                   | X                   | X   |
| 2005 ..... |                                    |                     | X                   | X   |
| 2006 ..... |                                    |                     |                     |   |

TABLE 1: DALLAS-FORT WORTH METROPOLITAN PLANNING ORGANIZATION—Continued  
 TRANSPORTATION PLANNING DOCUMENT SCHEDULES  
 Current Schedules

| Year | SIP (as needed or attainment date) | MTP (every 3 years) | TIP (every 2 years) | Conformity (used to measure SIP, TIP and MTP) |
|------|------------------------------------|---------------------|---------------------|---|
| 2007 |                                    | X                   | X                   | X   |

MTP Update required to ensure 3-year cycle maintained as result of new SIP 2004

These conflicting schedules hinder a region's ability to appropriately implement policies, programs, and projects in a Plan or TIP as planning documents continue to be the focus. In addition, differences in timing of schedules and premature adjustments to schedules impede development of an out year strategic milestone calendar, sending confusion to our regional partners and resource agencies as they try to incorporate their planning activities to these Federal obligations.

*Question.* What impact have these schedules had on investments in highway and safety projects, construction costs, and air quality projects and activities?

*Response.* The timely implementation of transportation projects and programs are of high priority. Therefore, to avoid impacts, schedules of the TIP and MTP are often adjusted, within the limits allowed by regulations, to ensure that projects and programs that are ready for implementation can proceed. However, SIP-related requirements are often out of sync with the TIP and MTP and have the potential to cause TIP and MTP modification freezes due to the inability to perform an air quality conformity analysis. This could cause recommended projects from being able to proceed because they may be inconsistent with TIP or MTP. Unnecessary delays could cause construction costs to increase and have a negative impact on air quality if projects cannot be implemented as expected. Generally, more time is spent on re-planning already approved plans than working on the implementation of specific projects. Greater focus on mobility and air quality project delivery is necessary.

*Question.* What has been your experience coordinating your SIP and conformity processes with SIP submittals or updates?

*Response.* Keeping in mind the varying schedules with SIPs and conformity associated to a MTP and TIP, experiences in coordinating among these elements have been a challenging process in the Dallas-Fort Worth Metropolitan Area. This can be attributed to coordinating a MTP that has a 3-year update cycle, a TIP that has a 2-year update cycle, and a SIP submittal process influenced by real-time observed air quality data.

As experienced in the DFW area, a SIP submittal can introduce regulatory language that would require changing air quality conformity schedules of a MTP and TIP. An example is the Environmental Protection Agency's (EPA) position with regards to use of Tier II automobile standards in the MOBILE5 emission factor model. This situation required the region to take a step back in its implementation of policies, programs, and projects and reissue multiple planning activities.

#### MOBILE6 VERSUS MOBILE5 PROJECTIONS

*Question.* Compare and contrast your MOBILE5 and MOBILE6 emission projections.

*Response.* In the fall of 2001, the EPA sponsored a study to evaluate the differences of MOBILE5 and MOBILE6 using local data from the Dallas-Fort Worth region. Although a final report has not yet been published, draft reports indicate an increase in MOBILE6 projected Volatile Organic Compounds (VOC) and Nitrogen Oxides (NOx) of up to 50 percent over MOBILE5. After approximately 2008, projected emissions are similar between MOBILE6 and MOBILE5. This significant trend continues to occur into the future where we see MOBILE6 emissions well below those of MOBILE5 emissions. These trends are consistent with national research performed on MOBILE6 versus MOBILE5.

*Question.* How does the increase in near term emissions (through 2010) from MOBILE6 affect your conformity status?

Due to the significant differences in near term emissions between the two emission factor models, it would be extremely difficult for a region to pass a conformity analysis using MOBILE6 against SIP motor vehicle emissions budgets previously developed with MOBILE5. Since this is an obvious analysis mismatch, the Dallas-Fort Worth nonattainment area has planned its schedules accordingly to avoid such an evaluation (as noted in the Differences in Timing of Schedules responses above). The proper method, which is included in our mid-course review, is to recalibrate the air chemistry model with the new MOBILE6 emission software and reforecast the

emissions permitted in a demonstration of attainment (i.e., higher emission do not necessarily mean a SIP or conformity analysis would not be successful.)

*Question.* How will your air quality planning process take the new MOBILE6 into account, and will the SIP be updated before or after the new MOBILE6 projections?

*Response.* As part of the Dallas-Fort Worth SIP submittal in April 2000, a mid-course SIP review is committed to EPA by May 2004. Within this process, MOBILE6 emission projections will be incorporated into an air chemistry model through new on-road mobile source emission inventories. This modeling process will establish MOBILE6 derived motor vehicle emissions budgets for the nonattainment area for use in an air quality conformity analysis scheduled in 2004.

*Question.* Will the new 8-hour NAAQS likely lead to an increase or decrease in your vehicle emissions budget?

*Response.* As an example, if more on-road mobile emission reductions are necessary to ultimately meet the 8-hour standard, then it could be assumed the resulting motor vehicle emissions budgets will decrease. More information will be available through a comprehensive emissions analysis following final rules. A different mix of controls may be necessary to meet an 8-hour standard, which are not well understood today (e.g. role of VOC emissions.)

#### ADDITIONAL VEHICLE EMISSION CONTROLS

*Question.* What additional existing controls could be implemented in your area to significantly reduce vehicle emissions, e.g., inspection and maintenance, reformulated fuels, diesel retrofit, TCMs?

*Response.* Having just completed a comprehensive and technical review of on-road mobile control strategies for the Dallas-Fort Worth SIP, there is no other existing control strategy to significantly reduce vehicle emissions that could be feasibly implemented in the region. As we continue to seek or develop additional controls, we keep in mind the main elements of on-road mobile emissions; cold starts, pre 10 a.m. emissions, hard acceleration, excessive idling, high emitting vehicles, diesel engines, low speeds, excessive speeds. Another approach to reduce vehicular emissions is to advance already existing Federal gasoline, diesel, and engine standards earlier than required. One has to remember that Dallas-Fort Worth is already implementing an aggressive high-emitting vehicle program, freeway management curriculum for fire and police, vehicle speed reduction with enforcement, and sustainable development projects.

*Question.* Would these controls be sufficient to address the potential increase in emissions projected under MOBILE6?

*Response.* One cannot conclusively state that the above-mentioned measures would counter all the potential increases in emissions projected in MOBILE6, since the model is yet to be tested under Dallas-Fort Worth specific conditions and the appropriate methodology is to recalibrate the air chemistry models to determine needed emission budgets.

#### ROLE OF TRANSPORTATION CONTROL MEASURES

*Question.* What role do TCM's plan in helping to meet attainment? Please list the TCMs and CMAQ projects in your plan, and the associated "off" or "on" model emission reduction credits for each.

*Response.* Conformity could not be certified without CMAQ funds and Transportation Control Measures (TCMs). TCMs, along with other pollution reduction strategies, have assisted the Dallas-Fort Worth region in working toward attainment by continually reducing the number of ozone exceedance days recorded in the region from 15 in 1995 to 2 in 2001. Currently, the Dallas-Fort Worth region is under a conforming MTP that includes Intersection Improvements, Rail Projects, Bicycle and Pedestrian Facilities, High Occupancy Vehicle Lanes, Vanpools, Park and Ride Lots, and Grade Separations. Table 2 outlines the emission reduction estimates associated with each TCM category. Most TCMs in the plan are funded through the CMAQ Program. Although not classified as TCMs, additional strategies utilizing CMAQ funds and included in the region's SIP include clean vehicles, Intelligent Transportation Systems, vehicle retirement, sustainable development, and traffic signal improvements.

Table 2

| Transportation Control Measures     | Commitments        | Emission Reduction Estimates (lbs/day) |       |       |                 |       |       |
|-------------------------------------|--------------------|--|-------|-------|-----------------|-------|-------|
|                                     |                    | Volatile Organic Compounds             |       |       | Nitrogen Oxides |       |       |
|                                     |                    | 2007                                   | 2015  | 2025  | 2007            | 2015  | 2025  |
| Intersection Improvements .....     | 775 Locations .... | 2,306                                  | 1,450 | 1,293 | 4,635           | 2,420 | 2,150 |
| Grade Separations (1) .....         | 15 Locations ..... | —                                      | —     | —     | —               | —     | —     |
| HOV Lanes (1) .....                 | 76 Miles .....     | —                                      | —     | —     | —               | —     | —     |

(1) Emission reduction benefits have been included directly in the Dallas/Fort Worth Regional Travel Model (DFWRM).  
(2) Emission reduction benefits are both post-processed and included directly in the DFWRM.

*Question.* What percentage of total emission reductions do they represent?

*Response.* TCMs amount to approximately 5 percent of on-road NO<sub>x</sub> emission reductions in 2007 and 4 percent of on-road VOC emission reductions. Without CMAQ funding, conformity could not have been certified.

*Question.* Are there CMAQ projects in your plan for which you have not applied any on or off model emissions reductions?

*Response.* No. All CMAQ projects have identified emission reduction credits as requested by the Texas Department of Transportation for a CMAQ Annual Report. It should be noted that the CMAQ program has encouraged a great deal of planning and funding creativity due to different regulations impacting CMAQ and the Surface Transportation Program. This creativity has shaped air quality policies, programs, and projects for the benefit of reaching attainment and better quality of life for each citizen. Without innovative programming, a less aggressive air quality program would have resulted.

#### IMPACTS OF CONFORMITY LAPSE

*Question.* If your area has experienced a conformity lapse, describe the effect this has had on transportation and air quality planning, funding process, preconstruction, and construction.

*Response.* The Dallas-Fort Worth region has not experienced a conformity lapse.

*Question.* When projects were reactivated, after U.S. DOT approved your conformity determination, what impact did this have on funding, project completion dates, personnel, renegotiation of contracts, updating old information, etc.

*Response.* This question does not apply to the Dallas-Fort Worth region.

*Question.* What impact did the March 1999 U.S. Court of Appeals decision to eliminate the EPA "grandfather" provision from the conformity regulations have on your transportation investments?

*Response.* The March 1999 U.S. Court of Appeals decision did not have any noticeable impact on transportation investments in the Dallas-Fort Worth region.

#### ROLE OF MOTOR VEHICLE EMISSION ESTIMATES AND MODELS

*Question.* How has conformity analysis helped improve the quality of estimates of motor vehicle emissions for SIPs to better protect public health?

*Response.* The procedure for estimating on-road mobile emissions is consistent for both the SIP and the Air Quality Conformity Analysis. However, conducting a conformity analysis on a more frequent time scale allows for the use of latest planning assumptions and tools to better quantify vehicle emissions. Many parameters involved in the quantification of emissions change over time such as roadway and transit networks, vehicle mix, and demographic data. As a result, new emission estimates are actually created with each conformity analysis. In addition, the effectiveness of control strategies, including TCMs are evaluated based upon implementation schedule and before/after studies. The regular study of a region's dynamics and the consequential effect on emissions better prepare an agency when it is time to develop a new SIP. Better knowledge of vehicle emission estimates ultimately leads to better protection of public health. This replanning effect is offset by less time actually implementing aggressive air quality strategies.

*Question.* How accurate and consistent have estimates of regional motor vehicle emissions been when compared with each other over time and with actual experience?

Response. Regional on-road motor vehicle emissions estimates in the Dallas-Fort Worth nonattainment area have been consistently following a decreasing trend due to the region implementing many control strategies over the past 10 years. Specifically, significant emissions reductions are attributed to inspection and maintenance, reformulated fuels, transportation control measures, continual advances in vehicle technology, and associated vehicle fleet turnover. Table 3 lists the official on-road mobile emission estimates for the Dallas-Fort Worth ozone nonattainment area.

TABLE 3  
Dallas-Fort Worth Ozone Nonattainment Area  
Motor Vehicle Emission Estimates

| YEAR       | VOC (tpd)    | NOx (tpd)  |
|------------|--------------|------------|
| 1990 ..... | 306.60 ..... | 293.03     |
| 1996 ..... | 235.00 ..... | NOx Waiver |
| 1999 ..... | 125.25 ..... | NOx Waiver |
| 2007 ..... | 75.34 .....  | 149.72     |

*Question.* How have official estimates of motor vehicle emissions in your metropolitan region changed over the past 10–20 years and how well have they tracked actual emissions in years past?

Response. The overall decrease in modeled motor vehicle estimates compare well with monitor data from 1990 to 2001. During this time period, the extents to which the monitors violate the 1-hour ozone standard have steadily decreased indicating a concurrent decrease in precursor pollutants released into the atmosphere. In comparison to observed monitored data, the highest number of exceedances recorded at any given monitor over a 3-year averaging period has decreased from 12 exceedances in the 1994 to 1996 timeframe to 3 exceedances in the 1999 to 2001 timeframe.

#### ROLE OF TRANSPORTATION MODELS

*Question.* Has conformity analysis been supported by adequate regional transportation analysis models that accurately reflect how changes in highway capacity affect total travel and air pollution emissions?

Response. Yes and no. Transportation analysis models in use today were originally developed for macroscale level planning, not micro-scale level planning required in air chemistry modeling. Issues include time-of-day, speeds, functional classification, vehicle miles of travel, etc. For more information on concerns regarding existing transportation analysis models and recommendations for future models, please refer to a report published by the National Research Council; Modeling Mobile Source Emissions, 2000, National Academy of Science. However, transportation models are more accurate than emission models (e.g., MOBILE5 vs. MOBILE6) and air chemistry models (e.g., for 20 years urban areas were told to reduce VOC emissions instead of NOx emissions.)

*Question.* How well have your region's travel models tracked actual experience with growth in vehicle miles of travel (VMT)?

Response. The Dallas-Fort Worth Regional Travel Demand Model tracks vehicle miles of travel very well. The roadway travel model calibration and validation process are major steps prior to the forecasting process to ensure the travel model replicates observed human travel behavior in the region adequately. In the Dallas-Fort Worth region, models project 20 years backward before they are asked to project 20 years forward.

*Question.* Please include an indication of how sensitive your/these models are to effects of induced traffic.

Response. The travel model is sensitive to the effects of induced traffic. It depends on your definition of induced travel. Induced travel includes population and employment relocation, and trip length increases with freeway investments. This travel model does this. Route choice and time of day travel is not classified as induced travel although most models successfully address this. The better question is how well does EPA forecast emissions and air quality models forecast ambient ozone levels accurately. A review of the previously cited NAS document is suggested.

DENVER REGIONAL COUNCIL OF GOVERNMENTS,  
*July 24, 2002.*

*Committee on Environment and Public Works*  
*U.S. Senate*  
*Washington, DC 20510-6175*

DEAR MR. CHAIRMAN: Thank you for the opportunity to provide for your consideration our experience with the Clean Air Act conformity program and transportation control measures and the impact these have had on our transportation planning efforts. We are pleased to hear that the committee will evaluate the conformity program as part of the reauthorization of TEA-21.

As the Metropolitan Planning Organization (MPO) for the Denver region, the Denver Regional Council of Governments (DRCOG) has had extensive experience with the conformity requirements of the Clean Air Act. In response to your letter we have attached a document, "Denver, Colorado Conformity Case Study," which addresses in some detail the seven issue areas you identified, including an assessment of the impact on our ability to perform our responsibilities under TEA-21.

Our overall characterization of the conformity program is that it is an important and largely successful Federal program that could be improved both with the addition of some flexibility that would allow transportation and air quality agencies to adapt the requirements to local circumstances and with some funding to better enable transportation and air quality agencies to meet this mandate.

Our experience in Denver in particular points out the need for some flexibility in the State Implementation Plan (SIP) process to allow for updating mobile source budgets to incorporate current information and models and to achieve consistency between the transportation and air quality planning processes and resulting documents. Similarly, consistency between the transportation and air quality planning processes and documents, both in the timing of the schedules for their adoption and amendment and in the timeframes used in the transportation and air quality analyses, would greatly assist our efforts to meet the national goals of clean air and efficient transportation.

Our other recommendations regarding the conformity program relate to our experience with the conformity analysis process. The process for determining conformity is very complex and time consuming. We have had to assign significant funding and staff resources from other projects to perform the mandated conformity analyses. It would be very helpful if reauthorization would provide resources for conformity determination efforts.

The law also should provide some flexibility in the use of the transportation models for conformity determinations to better account for the inherent limitations of these models. The regional transportation analysis models only produce relative levels of impacts but under the existing conformity program have been required to provide "hard" estimates that become legally binding. It makes more sense to us that the law allow the use of estimates in ranges, rather than absolute numbers. Also, further study of the amount of "induced travel demand" is necessary to better account for it in the transportation modeling process. This could be a useful addition to the transportation modeling process provided agreement could be reached as to how to account for it.

The attached document provides additional detail and background for these policy recommendations, as well as summarizing our experience with the other issue areas you have identified. We hope that you find our experience and recommendations useful in your efforts to improve the conformity program and its role in achieving the national priorities of clean air and efficient transportation. If you would like further information, please do not hesitate to contact Jeff May at 303-480-6746 or <mailto:jmay@drcog.org>.

Sincerely,

KARIN MCGOWAN,  
*Director, Policy and Legislative Division.*

DENVER COLORADO CONFORMITY CASE STUDY

(Submitted by The Denver Regional Council of Governments on July 23, 2002)

This paper is organized according to the issues identified in the above referenced letter and questionnaire.

*Difference in Timing of Schedules*

The difference in timing of schedules for adopting and amending transportation and air quality plans and for adopting conformity findings has created a situation where transportation and air quality agencies have had to expend an enormous amount of resources to coordinate the inconsistent federally mandated schedules.

The air quality planning process and the transportation planning process in the Denver region have accommodated conflicting Federal requirements in terms of schedules for the State implementation process (SIP), Regional Transportation Plan (RTP), Transportation Improvement Program (TIP), and conformity requirements. Over the last 12 years, the process has worked only because of cooperative and collaborative efforts by the Regional Air Quality Council (RAQC), which is the lead air quality agency for the Denver area, the Air Pollution Control Division (APCD) of the Colorado Department of Health and Public Environment, the regional office of the United States Environmental Protection Agency (EPA), local project implementation agencies, including the Colorado Department of Transportation (CDOT) and the Denver Regional Council of Governments (DRCOG) as Metropolitan Planning Organization (MPO). The SIP documents for Denver are now all maintenance plans, which have been developed by the air quality planning agencies and approved or found adequate by the USEPA. Both the RAQC and the APCD as well as the EPA regional office have been very cognizant of the impact of the adoption of their documents on the transportation planning process and have modified their schedules for development and adoption of air quality planning documents so as not to negatively impact the transportation planning process.

In addition, local efforts have had to overcome inconsistent federally mandated timeframes. Even though Federal regulations only call for short term analysis of air quality problems, the RAQC developed a non-regulatory long-range air quality plan (Blue Print for Clean Air) which bridges the gap between the federally SIP mandated 3–10 year planning horizon on SIP documents, and the federally mandated longer range, 6 to 20 year planning timeframe of the transportation planning process documents. In addition the development of each mobile source budget has been accompanied by an informal review of long-range impacts to ensure that the Transportation Planning Process in conformity determinations can logically meet the proposed budget.

The problems encountered in the Denver area could be reduced by providing more flexibility in the SIP process for updating mobile source budgets, using more current information and models than was available when these SIP documents were prepared, and also by creating consistency between the analysis timelines for all the various documents in the air quality and transportation planning process.

The lack of congruity between the transportation and air quality schedules has had impacts on the cost of investments in highway and safety projects. At one point early in the conformity process, the Denver region was unable to proceed with new capacity projects for approximately 18 months, during which time only projects exempt from the conformity process were moved forward. During the 1-year period in which we could not move forward with new capacity projects, the Colorado construction costs index increased approximately 4 percent percent.

The conformity process has had a larger impact on transportation funded air quality projects and activities. The process has reinforced the need for transportation projects that aid in finding conformity. An example of these projects are PM-10 programs which use local, State and Federal highway funds for street de-icing and anti-icing programs and street sweeping.

The Transportation Planning Process works cooperatively with the Air Quality Planning process to develop logical air quality emissions budgets that protect public health and allow necessary transportation projects to proceed.

Experience in the Denver region has led us not to include many items as Transportation Control Measures (TCM's) in the SIP-documents. The combination of logical budgets and few legally mandated TCMs has allowed the region to process ten conformity findings in the last 12 years. Only in 1993 was the Transportation Planning Process unable to find conformity and a list of projects was adopted rather than a Transportation Improvement Program. Our inability to meet the emission budgets in 1993 was resolved by the Air Quality Planning process agreeing to make changes to the vehicle inspection and maintenance program sufficient to reduce mobile source emissions below the adopted budget and allow a conformity finding.

*MOBILE6 Versus MOBILE5 Projections*

There is a need for recognition in the Air Quality Planning Process of the impacts of applying Mobile6 projections in the conformity determination as compared to Mobile5 projections. The emissions budgets adopted through the Air Quality Plan-

ning Process will have to be changed to ensure conformity of the RTP in the new 2030 horizon year.

Mobile6 significantly changes estimated emissions from those estimated using Mobile5. The most significant problem for the Denver region is in terms of carbon monoxide. Our current budget is 800 tons per day. Using Mobile5 we have met this budget for all years out to our long-range planning horizon of 2025. In contrast Mobile6 emissions exceed the current budget in all future horizon years. In 2010 Mobile6 estimates approximately 1200 tons per day, 400 tons higher than the existing budget. Note that the Mobile6 rate of decrease in emissions over time is greater than that projected by Mobile5 out to all horizon years. This will greatly simplify our ability to demonstrate that a higher CO budget can be allowed while still protecting the CO National Ambient Air Quality standard (NAAQS). For other pollutants such as VOC and NOx associated with ozone and NOx associated with PM10, this problem will not exist. The emissions are less than the current budgets in all future horizon years out to 2025. In all cases the Mobile6 rate of decrease in emissions is greater than that found in Mobile5 for all horizon years.

The carbon monoxide budget will have to be changed in order for Denver to find conformity using Mobile6. This includes the budget not only through 2010 but through all horizon years. The Air Quality Planning process, with assistance from DRCOG and CDOT is moving to implement Mobile6. This will necessitate legal actions to change the budget that are currently planning for mid 2003. This should allow conformity processes to move forward for adoption of our 2030 RTP and the related sub-documents. These conformity findings are expected late in 2003 and in 2004.

It is unknown whether the new 8 hour ozone standard will lead to an increase or decrease in vehicle emissions budget. The Denver region has been very close to the standard, but has not yet violated the NAAQS. If a violation of the NAAQS occurs, the Air Quality and Transportation Planning processes will have to deal with the development of new vehicle emissions budgets.

#### *Additional Vehicle Emission Controls*

Denver currently has a centralized I&M 240 program in place. It has been proposed to replace some of the centralized operation with a clean screen remote device-sensing program. The negative impact of a clean screen program versus a centralized program has already been accounted for in the maintenance plan. Implementation of clean screen is unsure, as State legislative authority has not yet been obtained.

The Denver area led the way nationally in terms of oxygenated fuel programs aimed at carbon monoxide emission reduction in wintertime. During the summer, local refineries and dealers voluntarily change fuel specifications to reduce the danger of an ozone violation. It seems unlikely that additional vehicle emission controls which can be implemented independently within the State of Colorado would be sufficient to offset the increase in emissions projected under Mobile6 for carbon monoxide.

#### *Role of Transportation Control Measures*

Adopted Transportation Control Measures play a part in attainment demonstration. Today there is only one outstanding Transportation Control Measure (TCM) not fully implemented. That project is the construction of a light rail line in the southeast (I-25) corridor. This project is included in the RTP and funded in the TIP. It has a Full Funding Grant Agreement and is projected to be completed in 2007. Credit for this is taken as an 'on' model emission reduction. As such, the emission reduction is not separately calculated.

The effect is CMAQ projects funded through the TIP are included in the air quality conformity documentation. These emission reduction credits are calculated 'off' model, with the exception of a few transit projects that are included 'on' model. The 'off' credits are not used in the conformity finding directly, but instead are considered a safety margin in meeting the emissions budgets. In past conformity findings the emission credits for such 'off' model projects have typically been on the order of 3 to 5 percent of total emissions.

#### *Impacts of Conformity Lapse*

Immediately after the adoption of ISTEA, and the promulgation of conformity regulations and guidelines, the Denver region was unable to show conformity for approximately 18 months. During this time period in 1993, the Denver region adopted a list of projects (LOP) in place of a TIP. During this period of time only safety and other exempt projects could proceed forward. Other projects could not move forward if they resulted in additional highway capacity. During this year the Colorado con-

struction index went up 3.6 percent. The project completion dates were pushed back by approximately 1 year because of this delay.

The impact of the March 1999 U.S. Court of Appeals decision to eliminate the EPA "grandfather" provisions from the conformity regulations was to increase the level of uncertainty concerning the Denver region's ability to implement projects. No longer could implementing agencies assume that a project could move forward after a certain point in the planning and implementation process. This may have led to early implementation of preliminary phases of projects to get them underway and effectively grandfathered for implementation.

#### *Role of Motor Vehicle Emission Estimates and Models*

The Air Quality conformity analysis is heavily dependant upon accurate and precise estimates of motor vehicle emissions. The effect of this has been to increase the resources dedicated to development of motor vehicle emissions estimates. The emission estimates have much improved through the agency coordination and inter-agency cross checking of data and information. As the Federal Government did not provide additional resources for the conformity process, the dollar and manpower resources use in this analysis had to be taken from other planning efforts.

The factor that has led to the largest changes in estimates of regional motor vehicle emissions has been changes in the MOBILE models. As each generation of mobile model has been released, the estimates of emissions increased or decreased, often significantly (See Mobile5 vs. Mobile6 discussion earlier). In addition trends through time have changed with various Mobile models having more pessimistic or more optimistic views of the future. That said, the tie between emissions estimates and base year air quality monitored data, has led to comparatively accurate estimates of the air quality situation over the last 10 years. As projected the Denver region has met and protected the NAAQS for public health. Monitored air quality has tended to be better than modeled air quality, but this is to be expected as the model situation was meant to represent a worse case situation.

#### *Role of Transportation Models*

The regional transportation analysis models were originally developed as planning tools. The tools were meant to project such items such as number of lanes that will be needed, transit patronage on future rapid transit lines, and the impact of major land uses on transportation. These models are now being used to develop legally binding estimates of motor vehicle emissions. The effect was to lead the environmental community to nationally question such items as how changes in highway capacity effect total travel and hence air pollution emissions. In the Denver area this resulted in changes to the highway assignment algorithm to (1) estimate 10 time periods of the day to more accurately develop air pollution estimates, and to (2) effectively match highway demand and capacity provided. It also led to a direct tie between highway speeds used in the distribution phase of the model and those estimated at the end of the model, to accurately reflect the effect of congestion on trip making.

The region's travel models' estimates of VMT have been checked through the Carbon Monoxide Monitoring Program, which was mandated by the 1991 Clean Act Amendment. This monitoring program continued for approximately 5 years and recorded deviations of approximately 1 to 4 percent in estimated vs. actual VMT.

Induced travel demand is a controversial subject over which there continues to be much debate as to its magnitude and cause. The Denver Travel Demand Model accounts for the following portions of induced traffic. First congested speeds are used in the trip distribution model. The Denver Model has a mode share model that moves travelers in highway traffic off of congested facilities and onto alternative modes such as rapid transit lines or available carpool lanes. Testing indicates that the Denver model estimates these model features lead to changes in VMT as large as 10 percent. This difference is between extreme cases of combined land use and transportation strategies contrasting centralized growth and disbursed growth and their impact on congestion. The Denver model uses steep traffic diversion curves to simulate the impact of congested roadways. This means that the introduction of additional lanes in areas where the highway network is near saturation, results in those lanes being fully utilized through additional VMT that effectively represents induced demand.

---

TO: U.S. Senate, Committee on Environment and Public Works  
 FROM: Metropolitan Planning Organization of the Houston Galveston Area Houston-Galveston Area Council of Governments

*1) Differences in Timing of Schedules*

There are a variety of problems resulting from the various schedules of the State Implementation Plan (SIP), Transportation Improvement Plan (TIP), and conformity, etc. The Clean Air Act requires a conformity demonstration once every 3 years, yet numerous other triggers render this requirement irrelevant, for all practical purposes. Under the Environmental Protection Agency's (EPA) rules, non-attainment areas must demonstrate conformity each time EPA proposes or approves an initial SIP submittal, each time the EPA modifies a control measure that impacts the motor vehicle emissions budget (MVEB), and each time a transportation control measure is added, modified, or deleted. Conformity demonstrations are also needed each time the metropolitan planning organization needs to add or modify a project in its transportation plan (since a road or transit project cannot move forward unless it is specifically included in a conforming transportation plan). This overabundance of conformity triggers means that planning organizations are frequently performing conformity demonstrations, with limited corresponding benefit.

- Question: Describe how the different schedules for the SIP, TIP, conformity, etc. and the impacts of data changes on out year emissions affect your ability to develop effective and timely transportation and air quality plans.

Response. An "initial" SIP has been submitted to the EPA from the State of Texas for the Houston-Galveston Area approximately every 12 to 18 months for the past 5 years. An initial SIP submittal contains a MVEB requiring new conformity analyses and documentation. These frequent submissions have caused H-GAC to spend a considerable amount of time over the past 5 years conducting analyses and preparing conformity documentation. The time and resources required to prepare detailed conformity determinations has come at the expense of planning and implementing new transportation and air quality strategies. The latest conformity finding received Federal approval in May 2002. In order to complete this finding, work was suspended on the more fundamental re-evaluation of the region's transportation plan due to the time and resource constraints of conformity. Many of the new areas of investigation intended to further reduce vehicle emissions (including major expansion of high capacity transit corridors and exploration of more travel efficient land use development) were delayed.

- Question: What impact have these schedules had on investments in highway and highway and safety projects, construction costs, and air quality projects and activities.

Response. For the most part, the region has managed to move its transportation and air quality improvements forward under the current conformity regime. However, as discussed in other sections, the current conformity process has taken away from the time that is needed to update the metropolitan transportation plan (MTP), delayed some projects due to a conformity lapse, and adversely impacted resources needed to plan and implement air quality projects.

- Question: What has been your experience coordinating your SIP and conformity processes with SIP submittals and updates?

The development of the SIP, Metropolitan Transportation Plan (MTP) and TIP are seldom in alignment. The SIP process is conducted on an independent schedule (with the timing of actions often dictated by the EPA or the courts) without regard to the timing of MTP or TIP development. For example, the Houston-Galveston non-attainment area is now working to develop its new MTP based on soon-to-be completed corridor studies. Because the State does not plan to incorporate the EPA required MOBILE6 emissions budget until late 2003 or 2004, the region's Transportation Policy Council (MPO governing body) may not be able to formally act on locally preferred alternatives developed in these corridor studies, due to the MOBILE6 conformity black-out period. The MOBILE6 blackout refers to the period of time that MPOs have to use MOBILE5, 1 year post-release of the new model or January 29, 2003. However, States have 2 years from the release of the new model to develop a new MVEB creating a 1-year window where MPOs may not be able to develop a new plan and required conformity demonstration.

These coordination and scheduling issues could be addressed, in part, through more formally required coordination processes between the States and MPOs.

*2) MOBILE6 Versus MOBILE5 Projections*

- Question: Compare and contrast your MOBILE5 and MOBILE6 emission projections.

Response. For this section, we are using the Houston-Galveston area (HGA) attainment date of 2007 as the point of comparison for MOBILE5b and MOBILE6. The HGA 2007 MVEB using MOBILE5b was adjusted downward when the NOx budget was set to 156.6 tpd. The adjustments to the modeled results were due to off-model calculations beyond the capabilities of MOBILE5, as well as to programs such as the Voluntary Emissions Reductions Program (VMEPs). Please note that none of the numbers in Table 1 reflect the impacts of the VMEPs. The VOC budget was set at 79.5 tons per day.

- Table 1 is a comparison of the MOBILE5b results used by the Texas Natural Resource Conservation Commission (TNRCC) to establish the motor vehicle emissions budget for the attainment year 2007 and the results produced by MOBILE6 using the same regulatory programs. The change in vehicle miles traveled (VMT) is the result of more recent planning data, rather than a change in the MOBILE model. Although there is some consistency in the overall total budgets between MOBILE5 and MOBILE6, there is a significant difference in where the emissions are being generated. MOBILE6 more accurately reflects diesel emissions and better incorporates engine and fuel improvements which result in lower emissions from light-duty vehicles than MOBILE5.

Table 1: Impacts of MOBILE6 on the HGA Attainment Year 2007

| Model          | VMT             | VOC (tpd)   | NOx (tpd) |
|----------------|-----------------|-------------|-----------|
| MOBILE5b ..... | 129362378 ..... | 74.24 ..... | 167.12    |
| MOBILE6 .....  | 133274706 ..... | 82.94 ..... | 140.17    |

- Question: How does the increase in near term emissions (through 2010) from MOBILE6 affect your conformity status?

Response. The focus of the current HGA SIP is on reducing NOx emissions. MOBILE6 leads to lower calculated NOx emissions when compared to MOBILE5b, in spite of a 3 percent increase in VMT. The new emissions model facilitates meeting the NOx budget in 2007. The same cannot be said for the VOC emissions. Although the VMT is 3 percent higher, VOC emissions are roughly 8 percent higher. The current 2007 VOC budget is 79.5 tpd. This number, like the NOx number, is based on MOBILE5b modeling and off-model calculations. Using the MOBILE6 model and the measures currently in the SIP, the HGA could not make the established MOBILE5b VOC budget for the attainment date 2007.

- Question: How will your air quality planning process take the new MOBILE6 into account and will the SIP be updated before or after the new MOBILE6 projections?

Currently the State is planning to do a major, mid-course revision to the SIP in 2004. It plans to incorporate MOBILE6 into this revision. This schedule for an updated SIP with a new budget using MOBILE6 is not consistent with the current schedule for updating the MTP.

- Question: Will the new 8-hour NAAQS likely lead to an increase or decrease in your vehicle emissions budget?

Response. At this time H-GAC is unaware of any analysis done on the 8-hour standard or budget for the HGA. The assumption is that the budget will be lower than under the 1-hour standard. Modeling has not yet been conducted to verify this statement.

### 3) Additional Vehicle Emission Controls

- Question: What additional existing controls could be implemented in your area to significantly reduce vehicle emissions, e.g., inspection maintenance, reformulated fuels, diesel retrofit, TCM?

Response. In the HGA, the on-road mobile sector currently has been required to reduce emissions in a greater proportion than the sector contributes in comparison to other nonattainment areas. The on-road mobile portion of the emissions inventory is under great pressure as a result of the region being a severe nonattainment area for ozone, uncertainties regarding precursor contributions from NOx and VOCs in the photochemical model, and additional issues related to the emissions inventory. The HGA has employed every conceivable on-road emission reduction strategy currently available, except for no-drive days.

- Question: Would these controls be sufficient to address the potential increase in emissions projected under MOBILE6?

Response. As mentioned above, the focus of the HGA SIP has been on NOx reductions. The biggest problems anticipated in the utilization of MOBILE6 are as follows:

- Light duty vehicles will yield less NOx emission reductions under MOBILE6 than MOBILE5, making current emission reduction strategies (those that target light-duty vehicles), exceedingly more expensive for limited emission reduction benefits.
- Measures that target the reduction of VMT under the current plan may have congestion mitigation benefits but limited NOx emission reduction benefits.
- Efforts and programming plans for emission reduction strategies may change in priority and focus under MOBILE6, creating uncertainties in implementing the programs.

4) *Role of Transportation Control Measures*

• TCMs play a very small role in helping to meet HGA’s attainment. The total reductions from the HGA TCMs under MOBILE5 are slightly more than 1 tpd for NOx with roughly 2 tpd for VOC. Using MOBILE6, the HGA TCM reductions for NOx emissions are less than 1 tpd and are roughly 1 tpd for VOCs. TCMs represent 0.1 percent of the SIP’s total reductions. The region is implementing a number of transportation projects that address congestion and also have air quality benefits, but have not been formally committed as TCMs. The cost through TIP year 2004 for these TCMs and other related projects is in the hundreds of millions of dollars. A summary of TCM commitments for the region is listed below.

|  |               |
|--|---------------|
| Signalization .....                          | 52.2 miles    |
| High Occupancy Vehicle lanes .....           | 18.2 miles    |
|  | 225 vans      |
| Park and ride lots .....                     | 15,098 spaces |
| Arterial Traffic Management System .....     | 343.48 miles  |
| Computerized Traffic Management System ..... | 387.37 miles  |
| Bicycle lanes .....                          | 435,998 miles |
| Accident investigationsites .....            | 3.2 miles     |

5) *Impacts of Conformity Lapse*

From November 1999 until June 2000, the Houston-Galveston region experienced a conformity lapse due to the time required to evaluate its MTP against a new budget for NOx. This lapse delayed design and right-of-way acquisition for several significant transportation projects, including the widening and reconstruction of US 59 South and Interstate 10 West. The lapse occurred because of a change in the interpretation of a post-NOx waiver SIP submittal from a ‘revision’ to an ‘initial’ SIP with an MVEB. The MVEB was submitted a month after the SIP and had been interpreted by the conformity consultation committee as a revision. EPA staff made an interpretation that the budget was an “initial” submittal in the Rate of Progress SIP submission by the State of Texas to the EPA. Notification of this interpretation was not received in time for the MPO staff to conduct a new conformity determination prior to the November lapse deadline.

6) *Role of Motor Vehicle Emissions Estimates and Models*

• Question: How has conformity analysis helped improve the quality of estimates of motor vehicle emissions for SIPs to better protect public health?

Response. Both the development of MVEBs and transportation conformity require a level of detail and precision that is inconsistent with real world experience, and the capabilities of travel demand estimation and mobile emission models. However, the on-road emissions estimates are probably the best evaluated portion of the total emissions inventory. Due to the requirements of ozone models, much more data has been collected and evaluated to determine hourly VMT, vehicle speed, vehicle type and age distribution. The value of this information to public health must be tempered by the fact that other significant portions of the ozone forming emissions inventory are poorly measured, particularly emissions for aircraft and most off-road and marine vehicles. The EPA’s new MOBILE6 emissions model suggests that heavy-duty trucks play a disproportionate role in NOx emissions production. The analysis and measurement of freight travel is traditionally one of the weakest areas of urban travel forecasting. HGAC has attempted to develop specific data for truck origins and destinations for major generators, such as its ports and airports.

- Question: How accurate and consistent have estimates of regional motor vehicle emissions been when compared with each other over time and with actual experience?

Response. Although the primary travel inputs to motor vehicle emissions estimates (vehicle miles of travel, vehicle speed and vehicle mix) have been relatively consistent over time, the estimate of motor vehicle emissions has been radically altered by revisions to EPA's mobile source models and modeling procedures for control strategies such as vehicle inspection/maintenance programs. Because of the revisions to EPA's MOBILE models, it is unlikely that any area's emissions estimates from the early 1990's for 2005 or 2007 would resemble those made today.

- Question: How have official estimates of motor vehicle emissions in your metropolitan region changed over the past 10–20 years and how well have they tracked actual emissions in years past?

Response. They have increased mostly because of changes between MOBILE models. On-road emissions have increased on a gram/mile basis with the release of each model since MOBILE4 (VOC nearly doubled between MOBILE4.1 and MOBILE5a-h). Economic cycles also play a major role in changing on-road budgets, since fleet ages change rapidly in strong economic cycles.

#### 7) Roles of Transportation Models

Adequate regional transportation analysis models have supported the conformity analysis. These models accurately reflect how changes in highway capacity affect total travel, travel speeds, travel paths and resultant air pollution emissions (to the extent the EPA emissions models have revised emissions rates, the emissions estimates may vary).

The region's travel models have tracked reasonably well the growth in VMT. As compared to forecasts made in the late 1980's or early 1990's, the sustained economic growth of the 1990's has required upward revisions in future year population and employment estimates, which subsequently have increased future year travel estimates.

The regional travel models are sensitive to traffic changes that are induced by changes in travel patterns in the region.

#### Recommendations

Transportation conformity determinations should only be required once every 5 years. Currently, full transportation conformity determinations are required each time the EPA or the State proposes or approves an initial SIP, each time the EPA or State modifies a control measure that impacts the motor vehicle emissions budget, and each time a transportation control measure is added, modified, or deleted. Conformity determinations are also currently required if the planning organization needs to add to or revise a transportation project in the transportation plan (since road and transit projects cannot generally proceed unless they are specifically included in the plan).

Amend TEA-21 to require MTP, TIP, and SIP updates not less than every 5 years with the transportation conformity rule applying after each 5-year SIP update requirement is met. If a more frequent update of the TIP is needed, as is often the case today, this would be allowed using the same assumptions used in the most recent transportation plan and SIP.

The newly released MOBILE6 emissions factor model further exacerbates this situation. MOBILE6 has not been used at all in SIP development and there is no requirement to update SIPs using MOBILE6 prior to using it for conformity determinations. Regardless, transportation conformity determinations must use this model within 24 months.

Planning organizations should have the ability to add or modify a road or transit project and TCMs (to some degree) without the need for a full conformity demonstration. Currently, planning organizations must go through a full conformity analysis to make minor changes. This exercise is unnecessary and a waste of valuable local, State, and Federal resources.

Encourage TCM substitution without a SIP revision, so long as equivalent emission reductions are forthcoming from other measures. Such a substitution would not trigger a new conformity determination. A model for such a process might be the Emission Budget Adequacy process used by the U. S. EPA, if expanded to address outdated, but currently approved, SIP budgets.

METRO AND OREGON DEPARTMENT OF ENVIRONMENTAL QUALITY,  
Portland, OR 97232-2736, July 23, 2002.

*Committee on Environment and Public Works,  
U.S. Senate,  
Washington, DC. 20510-6175.*

DEAR MR. CHAIRMAN: The following are Metro and Oregon Department of Environmental Quality (DEQ) responses to the conformity case study questions raised in the July 3, 2002 letter from the Senate Committee on Environment and Public Works:

*Differences in Timing of Schedules*

*Question:* Describe how the different schedules for the SIP, TIP, Conformity, etc. and the impacts of data changes on out year emissions affect your ability to develop effective and timely transportation and air quality plans. Provide a timeline or narrative description of your various schedules.

*Response:* The SIP mobile source element is updated infrequently. The last SIP included the "Maintenance Plans for CO and Ozone" and was acknowledged by the State EQC in 1996. It will not have to be updated until 2006. The MTIP is updated every 2 years and occasionally is amended such that it requires a conformity determination. The RTP is updated every 3 years, and includes a conformity determination. The major issue we deal with regarding timing is trying to align, to the degree possible, any required conformity actions. To the extent that the action occurs on schedule, we are experienced enough that we can adequately manage conformity determinations. It does become problematic (time consuming and expensive) when we conform our long-range plan 6 months prior to a TIP conformity, which can occur due to schedules, project needs.

*Question:* What impacts have these schedules had on investments in highway and safety projects, construction costs, and air quality projects and activities.

*Response:* Required conformity has caused slight three to 4 month delays in projects, which may or may not affect project cost and schedule (dependent on construction season, interest rates that apply to bond financing, etc). The schedules have no impact on project selection.

*Question:* What has been your experience coordinating your SIP and conformity processes with SIP submittals or updates?

*Response:* Since the Clean Air Act Amendments of 1990 and ISTEA, requiring air quality conformity in its current state, we have had only a single SIP submittal and update. It followed the completion of our 1995 long-range plan and the associated travel networks and forecasts were used both for the SIP and long-range plan. In other words, our timing was fortunate and we were able to use "off the shelf" analysis for SIP conformity.

*MOBILE6 versus MOBILE5 Projections*

*Question:* Compare and contrast your MOBILE5 and MOBILE6 emission projections.

*Response:* Metro has not used MOBILE6 for any conformity estimates to date. To this point, Metro has only used MOBILE6.2 for estimating emission rates for air toxics work. Furthermore, we have added detail to the stratifications of emission rate categories such as county-specific vehicle fleet age characteristics, separated emission rates by roadway functional class, updates to fuel type, ambient temperatures, and I/M programs. Therefore, even if we had MOBILE6 emission rates (or resulting total motor vehicle emissions) for CO, NOx, and VOC, we would not be able to make apples to apples comparisons between the results without rerunning MOBILE5 with the updated stratifications. Oregon DEQ has not determined exactly how they will be applying the new Mobile 6 model, but initial runs appear to be consistent with what EPA anticipated. More specifically, Mobile 6 emissions to be higher than Mobile 5 emission prior to 2005 (approximately) then progressively lower thereafter.

*Question:* How does the increase in near term emissions (through 2010) from MOBILE6 affect your conformity status?

*Response:* Metro has not done any conformity work using MOBILE6, thus we have no basis to make an evaluation of how it affects our conformity status. However, Oregon DEQ expects that increased emissions in the near term should not jeopardize conformity if the last Mobile 5 conformity determination is timed occur near the end of the 2 year phase in period for Mobile 6.

*Question:* How will your air quality planning process take the new MOBILE6 into account, and will the SIP be updated before or after the new MOBILE6 projections?

*Response:* The Portland Metropolitan area is still working with budgets that were established using MOBILE5. The Oregon Department of Environmental Quality is

planning to update the budgets using MOBILE6 sometime later this year. At that time, Metro will begin using MOBILE6 for subsequent conformity work. Portland's Carbon Monoxide and Ozone maintenance plans must be reworked and resubmitted to EPA by the end of 2004. Those plans will include new, lower emission budgets based on Mobile 6, but those budgets are not likely to take effect until approximately 2006.

*Question:* Will the new 8-hour NAAQS likely lead to an increase or decrease in your vehicle emissions budget?

*Response:* The new 8-hour ozone standard will probably not affect the motor vehicle emissions budgets by much.

#### *Additional Vehicle Emission Controls*

*Question:* What additional existing controls could be implemented in your area to significantly reduce vehicle emissions, e.g., inspection and maintenance, reformulated fuels, diesel retrofit, TCMs?

*Response:* Additional existing controls that could be implemented include diesel retrofits and elimination of an emissions allowance set aside for industrial growth.

*Question:* Would these controls be sufficient to address the potential increase in emissions projected under MOBILE6?

*Response:* The available controls would probably not be adequate to avert a conformity crisis if we had to immediately demonstrate conformity using Mobile 6.

#### *Role of Transportation Control Measures*

*Question:* What role do TCMs play in helping to meet attainment? Please list the TCMs and CMAQ projects in your plan, and the associated "off" or "on" model emissions reductions credits for each.

*Response:* The Metro 240 Growth Concept. Metro has adopted integrated land use and transportation system plans that modeling predicts will decrease reliance on single occupant vehicle travel. A 5.0 percent VMT reduction credit is associated with inclusion of Metro's code-based Growth Concept enforcement mechanisms in the Maintenance Plan (code provisions related to Requirements for "Accommodation of Growth"; "Regional Parking" ratios (minimum and maximum permitted amounts); and "Retail in Employment and Industrial Areas"). The actual emissions reductions vary by pollutant and year but in 2010, a 5 percent VMT reduction equated to HC, NOx and VOC reductions of approximately 6.4, 5.4 and 6.6 percent, respectively.

- DEQ Employee Commute Options (ECO) Rule. Employers of 50 persons or more must submit plans showing mechanisms for achieving 10 percent VMT reductions from employees. The credit was originally pegged at a 1.0 percent reduction of emission in 2010 but was reduced to 0.5 percent based on realized mode shift indicated in annual surveys administered by ECO program staff.

*Question:* What percentage of total emission reductions do they represent?

*Response:* The region must provide annual transit system service increases averaging 1.5 percent annually, and an equal increase of service in the Downtown core. There is no emission credit associated with this requirement. Additionally, the South/North Light Rail Concept, or an equivalent transit system enhancement must be operational by 2007. (The Westside MAX extension was completed, as required.)

The region must add no less than 28.0 miles of regionally significant bikeways by 2006. Reasonable progress on this task is defined as funding no less than 5.0 miles of improvements each biennium. There is no emissions credit associated with this requirement.

The region must add no less than 9.0 miles of regionally significant pedestrian facilities by 2006. Reasonable progress on this task is defined as funding no less than 1.5 miles of improvements each biennium. There is no emissions credit associated with this requirement.

*Question:* Are there CMAQ projects in your plan for which you have not applied any on or off model emissions reductions?

*Response:* CMAQ funds have been used to meet the funding based TCMs noted above, though other sources have also been used and not all CMAQ funds have been dedicated to these purposes. No on or off model credit is taken for any CMAQ funded projects, although emissions reductions attributable to CMAQ projects are calculated to demonstrate CMAQ program eligibility.

#### *Impacts of Conformity Lapse*

*Question:* If your areas has experiences a conformity lapse, describe the effect this has had on transportation and air quality planning, funding process, preconstruction and construction.

*Response:* Our area has not experienced a lapse.

*Role of Motor Vehicle Emission Estimates and Models*

*Question:* How has conformity analysis helped improve the quality of estimates of motor vehicle emissions for SIPs to better protect public health?

*Response:* Conformity analysis requirements have caused Metro to implement a more rigorous process (programs to continually implement demand model improvements and strive to ensure that functions used for speed estimation reflect observed data) by which VMT, speed, and resulting motor vehicle emissions are estimated. Conformity requirements have not affected the way motor vehicle emissions factors are generated for SIPs.

*Question:* How accurate and consistent have estimates of regional motor vehicle emissions been when compared with each other over time and with actual experience?

*Response:* Regional motor vehicle emissions seem to be valid, reliable and consistent. The following table illustrates the historical profile and consistency of emissions estimates of recent conformity runs:

TIP Conformity Emissions Estimates—Historical Summary

|                      | 1990 Budget (est.<br>1995) | 1990 | 1998 | 2000 |
|----------------------|----------------------------|------|------|------|
| CO (000's lbs) ..... | 1812                       | 1795 | 814  | 828  |
| VOC (tons) .....     | 92                         | 88   | 41   | 42   |
| NOx (tons) .....     | 75                         | 64.5 | 52.3 | 51   |

*Question:* How have official estimates of motor vehicle emissions in your metropolitan region changed over the past 10–20 years, and how well have they tracked actual emissions in years past?

*Response:* Estimates of motor vehicle emissions have generally decreased as Federal and State regulations have become progressively more stringent. Because we do not monitor mobile source emissions separately from other sources, there is no way to accurately compare projected emissions with actual emissions. A subjective impression, however is that the two are not inconsistent. The following tables illustrate the consistency of future year model projections for emissions estimates of recent conformity runs:

TIP Conformity Emissions Estimates—2010 Model Year

|                      | 2010 Budget (est.<br>1995) | 2000 | 2002 |
|----------------------|----------------------------|------|------|
| CO (000's lbs) ..... | 760                        | 645  | 644  |
| VOC (tons) .....     | 40                         | 32   | 32   |
| NOx (tons) .....     | 52                         | 50.9 | 50.9 |

TIP Conformity Emissions Estimates—2020 Model Year

|                      | 2020 Budget (est.<br>1995) | 1999 | 2000 | 2002 |
|----------------------|----------------------------|------|------|------|
| CO (000's lbs) ..... | 842                        | 740  | 728  | 713  |
| VOC (tons) .....     | 40                         | 37.6 | 37   | 36   |
| NOx (tons) .....     | 59                         | 58.7 | 58.2 | 57.6 |

Metro does not have the data to demonstrate the comparisons between modeled and actual observed emissions.

*Role of Transportation Models*

*Question:* Has conformity analysis been supported by adequate regional transportation analysis models that accurately reflect how changes in highway capacity affect total travel and air pollution emissions?

*Response:* Metro's transportation demand modeling process includes many features that take into account changes in, among many other things, highway capacity and its effects on total travel and air pollution emissions.

- Metro's demand model is multi-modal. This means that any changes in highway capacity which result in changes in travel time, relative to other modal at-

tributes, affects the choice of both destination and mode of transportation. For example, adding a new lane on a freeway improves travel time through that corridor. All else being equal, the auto mode becomes relatively more desirable than other modes. In addition, the improvement in accessibility to areas served by that freeway attracts more trips to those areas.

- The model is sensitive to the urban environment. The mix of households and employment opportunities influence the choice of destination and mode.

- We use the EMME/2 software for assignment of trips onto the highway network. It uses an equilibrium capacity restrained assignment algorithm to determine path choice for trips. An iterative process is used to reach equilibrium travel times among path choices between TAZ (Transportation Analysis Zone) pairs.

- In addition, we maintain a comprehensive region-wide count data base for validation and calibration purposes to ensure that the model is producing accurate and reasonable outputs.

*Question:* How well have your region's travel models tracked actual experience with growth in vehicle miles of travel (VMT)?

*Response:* The following shows how VMT estimated using Metro's travel demand model has tracked actual growth in VMT between 1985 and 2000.

#### Region's Model Estimated VMT vs. Regional HPMS Derived ("actual") VMT

|            | Model*           |                       | HPMS             |                |
|------------|------------------|-----------------------|------------------|----------------|
|            | Urbanized Area   | Total Modeling Region | Urbanized Area   | Total Region** |
| 1985 ..... | 14,922,127 ..... | n/a .....             | 14,140,000 ..... | n/a            |
| 1990 ..... | 17,970,876 ..... | 19,282,419 .....      | 17,970,000 ..... | 22,400,000     |
| 1994 ..... | n/a .....        | 24,685,960 .....      | n/a .....        | 26,500,000     |
| 2000 ..... | n/a .....        | 28,485,076 .....      | n/a .....        | 31,500,000     |

\* Model does not include truck trips or external trips

\*\* HPMS Total Region is the Portland-Vancouver, OR-WA Urbanized Area (UZA 27)

*Question:* Please include an indication of how sensitive your/these models are to effects of induced traffic.

*Response:* Comparing local survey data through time has shown that trip generation rates generally remain stable with changes in travel times. So, it is assumed that induced demand refers to additional trips choosing a certain destination or mode based on improvements in accessibility resulting from increases in highway capacity, but not necessarily an increase in the total universe of trips in the system. Our model responds to changes in infrastructure in destination choice and mode choice by an iterative process of feeding output travel times back to the beginning of the model, and rerunning until equilibrium is reached.

For example, we use generic existing travel times for input into an initial model run. Let's assume a new development with households and employment is added to the region. The new opportunities presented by this development will attract more trips to the area. Given the additional trips, the resulting travel times in this area will show increased congestion. These more congested travel times are then fed back to the beginning of the model and the model is rerun. This time, the increased congestion (or slowed travel times) will reduce the attractiveness of the destination and may also make non-auto modes more desirable for this destination. If capacity is added to the highway network serving this development (improving travel times), then more iterations of the model will show additional trips attracted to this area and changes in mode share chosen by people who travel there.

Thank you for the opportunity to participate in this survey. Please feel free to contact Mike Høglund at 503-797-1743 if you have any questions, or require further assistance.

Sincerely,

ANDREW C. COTUGNO,  
Planning Director, Metro.

METROPOLITAN WASHINGTON COUNCIL OF GOVERNMENTS,  
 NATIONAL CAPITAL REGION TRANSPORTATION PLANNING BOARD,  
 777 NORTH CAPITOL STREET, NE,  
 Washington, DC 20002-4226, July 17, 2002.

Honorable JIM JEFFORDS, *Chairman,*  
*Committee on Environment and Public Works,*  
*U.S. Senate,*  
*Washington, DC 20510-6175.*

Honorable BOB SMITH, *Ranking Member,*  
*Committee on Environment and Public Works,*  
*U.S. Senate,*  
*Washington, DC 20510-6175.*

DEAR SENATOR JEFFORDS AND SENATOR SMITH: Thank you for your letter of July 3, 2002 requesting information about transportation and air quality planning efforts in the metropolitan Washington region. I appreciate the opportunity to contribute to the deliberations of the Senate Environment and Public Works Committee on this subject in the context of the TEA-21 reauthorization process.

Air quality planning for the metropolitan Washington non-attainment area is conducted by the Metropolitan Washington Air Quality Committee (MWAQC), which includes representatives of the local governments in the non-attainment area, the State air agencies, and the State transportation agencies. Air quality plans developed by MWAQC are incorporated into the State Implementation Plans (SIPs) submitted to the Environmental Protection Agency (EPA) by the District of Columbia, the State of Maryland, and the Commonwealth of Virginia. Transportation planning in the metropolitan Washington region is conducted by the National Capital Region Transportation Planning Board (TPB), the Metropolitan Planning Organization (MPO) for the area, which includes representatives of the local governments in the metropolitan area, the State transportation agencies, the Washington Metropolitan Area Transit Authority (WMATA), the Metropolitan Washington Airports Authority (MWAA), and Federal agencies.

MWAQC and TPB are staffed respectively by the Department of Environmental Programs and the Department of Transportation Planning of the Metropolitan Washington Council of Governments (MWCOG), and several policy officials serve on both bodies. Close policy and staff coordination between MWAQC and TPB provided within the MWCOG structure has been critical in helping the Washington region to address linkages between air quality and transportation planning, and in particular to meet the transportation conformity requirements of the Clean Air Act. Despite this close coordination, however, we have experienced some significant challenges in carrying out our transportation and air quality planning activities, and we welcome the in-depth interest of the Senate Environment and Public Works Committee that is reflected in the questions you have posed. The responses I have provided to your questions have been coordinated with local government officials on MWAQC and TPB as well as with representatives of the State transportation and air agencies.

*Difference in Timing of Schedules*

? Describe how the different schedules for the SIP, TIP, conformity, etc. and the impacts of data changes on out year emissions affect your ability to develop effective and timely transportation and air quality plans. Provide a time-line or narrative description of your various schedules.

*Question:* What impact have these schedules had on investments in highway and safety projects, construction costs, and air quality projects and activities.

*Question:* What has been your experience coordinating your SIP and conformity processes with SIP submittals or updates?

*Response:* State SIPs are developed to meet a current attainment year of 2005, the regional constrained long range transportation plan (CLRP) has a horizon year of 2025, and the current 6-year TIP is for fiscal years 2003-2008. Mobile emissions budgets for VOC and NOx are set for 2005 as part of the attainment plan. Higher VOC and lower NOx budgets have been developed for 2015 and 2020 using VOC/NOx substitution procedures approved by EPA. The CLRP is updated every 3 years (1997, 2000, 2003, etc.), the 6-year TIP is typically updated every year, and the SIPs are updated as needed to meet EPA and regional air quality requirements.

Changes in input data on vehicle registration and vehicles miles of travel by vehicle type in the FY2002-2007 TIP update cycle caused projected mobile NOx emissions to increase by 8 tons per day in 2005. No updates were undertaken to the State SIPs to reflect these changes in vehicle registration and vehicle miles of travel

input data. Consequently, the entire 8 ton per day increase in NO<sub>x</sub> emissions had to be addressed within the transportation conformity process, using mobile emissions budgets which had been set in the SIPs using earlier input data. In order to provide time to address this difficult issue, proposed TIP updates had to be deferred for a year and were subsequently included in the FY2003–2008 TIP cycle. While there has not yet been a TIP lapse (since the approved FY2001–2006 TIP continues to be valid until January of 2003), there have been some delays in incorporating new projects into the CLRP and TIP.

Synchronizing SIP updates with CLRP/TIP and conformity schedules requires extensive communication, coordination, and cooperation between MWAQC, TPB, EPA, and the Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA). CLRP/TIP conformity and SIP update schedules as currently prescribed in Federal regulations and as administered by FHWA, FTA, and EPA do not in themselves ensure synchronized processes. Regulatory changes are needed to improve coordination between these schedules; to place SIP planning and conformity on the same timeframes (with out-years of, say, 10 years beyond the attainment date); and to require that key input data used in the SIP to establish mobile budgets continue to be used for conformity until the SIP is revised.

#### *MOBILE 6 Versus MOBILE5 Projections*

*Question:* Compare and contrast your MOBILE5 and MOBILE6 emission projections.

*Question:* How does the increase in near term emissions (though 2010) from MOBILE6 affect your conformity status?

*Question:* How will your air quality planning process take the new MOBILE6 into account, and will the SIP be updated before or after the new MOBILE6 projections?

*Question:* Will the new 8 hour NAAQS likely lead to an increase or decrease in your vehicle emissions budget?

*Response:* The Washington metropolitan area has been working on preparing inputs for the Mobile6 model, but has not yet developed emissions projections using the model. Consequently, we are unable to provide any comparisons to Mobile 5 projections.

We do not yet know how emissions projections from Mobile 6 will affect our conformity status.

We are planning to update our regional air quality plan and our State SIPs to reflect Mobile6 emissions projections.

We do not yet know what the effect of the new 8 hour NAAQS will be on our vehicle emissions budgets.

#### *Additional Vehicle Emission Controls*

*Question:* What additional existing controls could be implemented in your area to significantly reduce vehicle emissions, e.g., inspection and maintenance, reformulated fuels, diesel retrofit, TCMS?

*Question:* Would these controls be sufficient to address the potential increase in emissions projected under MOBILE6?

*Response:* In seeking measures to mitigate projected excess NO<sub>x</sub> emissions from mobile sources in 2005, the TPB has developed and analyzed an extensive list of Transportation Emission Reduction Measures (TERMs) which could provide additional reductions in mobile emissions. These measures and associated analyses of potential costs and effectiveness in terms of emissions reductions are documented in a report entitled "Transportation Emissions Reduction Measures (TERMs) Under Consideration for Conformity of the 2002 Constrained Long Range Plan (CLRP) and FY2003–2008 Transportation Improvement Program (TIP)," June 28, 2002. In terms of cost-effectiveness, the most promising additional measures for NO<sub>x</sub> reductions appear to be diesel fuel additives, diesel engine replacements, and other potential diesel retrofit measures. These measures appear to be in the range of \$2,000 to \$10,000 per ton in cost-effectiveness, and have the added advantage of providing substantial reductions in particulates. Since it will be several years before the EPA heavy-duty diesel regulations will result in significant changes in the diesel fleet, measures aimed at reducing emissions from existing diesel engines appear to be very promising in the short time-frames addressed in air quality attainment plans. Measures aimed at promoting more telecommuting and more effective enforcement of speed limits on freeways and other high speed facilities might also have significant short-term benefits.

As noted earlier, the metropolitan Washington region is still developing inputs for the Mobile 6 model, and we do not yet know how Mobile 6 will affect our emissions projections.

*Role of Transportation Control Measures*

*Question:* What role do TCMs play in helping to meet attainment? Please list the TCMs and CMAQ projects in your plan, and the associated “off” or “on” model emission reduction credits for each.

*Question:* What percentage of total emission reductions do they represent?

*Question:* Are there CMAQ projects in your plan for which you have not applied any on or off model emissions reductions?

*Response:* Transportation Control Measures (TCMs) play a very small role in the regional air quality attainment plan, accounting for only 0.2 tons per day of VOC reductions and 0.4 tons per day of NOx reductions in 2005. As you know, once TCMs are included in SIPs they can be changed only through a lengthy SIP amendment process. Because of this lack of flexibility, the only TCMs included in the Washington area SIPs are TCMs associated with capital projects that have already been completed. Such measures include park-and-ride lots, bus and rail transit vehicle replacements, and bicycle facilities. By comparison, emissions reductions of around 4.5 tons per day of VOC and 7.7 tons per day of NOx are being achieved through Transportation Emission Reductions Measures (TERMs) which are incorporated into the CLRP and annual TIP updates as they are needed to meet conformity requirements. These latter measures include employer outreach programs to promote increased carpooling and van pooling, transit use and telecommuting, CNG buses, and bicycle facilities. Should any of these “TERMs” not meet anticipated emissions reductions goals, new or revised TERMS can be developed and implemented through the CLRP and TIP update process, without requiring amendments to the SIPs.

TCMs and TERMS collectively provide 4.7 tons per day of VOC reductions and 8.1 tons per day of NOx reductions in 2005. Of these totals, TCMs account for 4.3 percent of the VOC reductions and 4.9 percent of the NOx reductions.

Emissions reductions credits are taken for all CMAQ projects included in the CLRP and TIP as part of meeting conformity requirements.

*Impacts of Conformity Lapse*

*Question:* If your area has experienced a conformity lapse, describe the effect this has had on transportation and air quality planning, funding process, preconstruction, and construction.

- When projects were reactivated, after USDOT approved your conformity determination, what impact did this have on funding, project completion dates, personnel, renegotiation of contracts, updating old information, etc.

*Question:* What impact did the March 1999 U.S. Court of Appeals decision to eliminate the EPA “grandfather” provision from the conformity regulations have on your transportation investments?

*Response:* The metropolitan Washington area has not experienced a conformity lapse, and consequently has not had to address any of the three issues raised above.

*Role of Motor Vehicle Emission Estimates and Models*

*Question:* How has conformity analysis helped improve the quality of estimates of motor vehicle emissions for SIPs to better protect public health?

*Question:* How accurate and consistent have estimates of regional motor vehicle emissions been when compared with each other over time and with actual experience?

*Question:* How have official estimates of motor vehicle emissions in your metropolitan region changed over the past 10–20 years and how well have they tracked actual emissions in years past?

*Response:* Conformity analysis requirements have focused attention on key transportation and land use variables that can significantly affect the levels of motor vehicle emissions, and provided a better understanding of the relative importance of these variables for policymakers and the general public. In particular, the increase of 8 tons per day of NOx emissions resulting from changes in input data on vehicle registrations and vehicle miles of travel by vehicle type in metropolitan Washington has highlighted the importance of obtaining accurate data on these vehicle inputs, and on how these inputs may be changing through time.

Substantially increased planning resources need to be devoted to improving data collection procedures for these vehicle fleet variables, and to analyzing measures such as diesel fuel additives that can produce significant reductions in emissions from high-emitting vehicle classes.

The greatest challenges in maintaining consistency in estimates of motor vehicle emissions over time have been related to the vehicle fleet mix inputs discussed above. While land use and transportation system inputs generally change relatively slowly over time and are relatively easy to track, changes in fleet mix have been

occurring rather rapidly and have been difficult to track accurately with current data collection procedures. Changes in these data collection procedures have resulted in significant changes to fleet mix estimates and to regional emissions estimates, creating challenges in demonstrating conformity to mobile emissions budgets developed using earlier procedures and data. Forecasting changes in vehicle fleet mix and vehicle miles of travel into the future is an additional challenge for planners and policymakers. With ever-changing vehicle technologies, emissions and fuel economy standards, and consumer preferences, estimating motor vehicle emissions even a few years into the future is subject to considerable uncertainty. This uncertainty compounds as the out-years stretch to 2015, 2020, and 2020.

Official estimates of motor vehicle emissions have shown steady declines in overall emissions over the past 10–20 years, despite steady growth in vehicle travel in the Washington region. Improvements in emission control and fuel technologies have been largely responsible for these declines. Further substantial reductions in mobile emissions are projected to result from EPA's TIER II/low sulfur rule and heavy-duty diesel standards over the next 10 to 15 years. While current conformity procedures do not permit anticipation of new technology in emissions calculations, further technological advances such as hydrogen fuel cells are likely to produce additional mobile emissions reductions over the longer term.

*Role of Transportation Models*

*Question:* Has conformity analysis been supported by adequate regional transportation analysis models that accurately reflect how changes in highway capacity affect total travel and air pollution emissions?

*Question:* How well have your region's travel models tracked actual experience with growth in vehicle miles of travel (VMT)?

*Question:* Please include an indication of how sensitive your/these models are to effects of induced traffic.

Response: Conformity analysis requirements have placed new demands on regional transportation analysis tools, and prompted us to invest a significant portion of our MPO planning funds into upgrading these models to address emerging conformity issues. The Washington region is currently introducing a new "Version 2" set of travel models which will significantly enhance our current "Version 1" model capabilities. Continuing development and upgrading of these models is anticipated over the coming years, placing continuing demands on our planning resources. We believe that we have been keeping pace with the "state-of-the-practice" in regional travel modeling, and we are continuing to introduce "state-of-the-art" improvements as they are developed and validated. The models have been used to assess the impacts on travel and air emissions of changes in highway, transit, telecommuting and other transportation programs, and have produced results that policymakers find useful and credible.

We regularly compare vehicle miles of travel (VMT) estimates produced by our regional travel models with observed VMT collected through FHWA's Highway Performance Monitoring System (HPMS), and provide reports to EPA on these comparisons. My most recent letter to EPA, dated April 23, 2002, transmitted regional comparisons of estimated versus observed data for 1997, 1998, 1999 and partial data for 2000. These comparisons showed that the results of the regional travel modeling process track quite well with observed VMT data.

In response to a request by the TPB, we recently conducted an extensive study of the concept of induced travel and how it is addressed by our regional travel models. The study, which is available on our web site at [www.mwcog.org](http://www.mwcog.org), concluded that all of the significant aspects of induced travel are captured in our modeling process, although induced travel is not generally broken out from other changes in travel behavior (such as travel that is diverted from one route to another by a highway improvement.)

I hope these responses will be helpful to the committee as it continues its deliberations on these important issues. I would be pleased to provide any additional information you may require. I can be reached at 202-962-3310 or by e-mail at [rkirby@mwcog.org](mailto:rkirby@mwcog.org).

Sincerely,

RONALD F. KIRBY, *Director,*  
*Department of Transportation Planning.*

OKI RESPONSE TO QUESTIONS ABOUT THE TRANSPORTATION CONFORMITY PROCESS

*Difference in Timing of Schedules*

*Question:* Describe how the different schedules for the SIP, TIP, conformity, etc. and the impacts of data changes on out year emissions affect your ability to develop effective and timely transportation and air quality plans. Provide a time-line or narrative description of your various schedules.

*Response.* The Transportation Plan, and SIP must use the latest planning assumptions at the time of each update. Because these documents are updated at different frequencies, we commonly encounter several mismatch issues in regards to planning assumptions. For example, the SIP budget for Northern Kentucky and the SIP budget for Southwest Ohio were last revised in 1999. Since then, OKI has incorporated new advancements in our travel forecasting model and revised our vehicle fleet mix. Our most recent Transportation Plan, the 2030 Plan adopted in September 2001, included these new assumptions. We were able to pass conformity, but only due to off-model CMAQ credits. Since then, we anticipate three major new assumptions on the horizon; 1) new population projections based on the 2000 Census, 2) further enhancements to the travel forecasting model, and 3) MOBILE6. We have several rapid growth counties in the region, resulting in a significant increase in the population projections and hence VMT through 2030. Improvements in our travel forecasting model have also resulted in higher VMT's. Without the ability to modify the SIP budget, OKI anticipates serious difficulties in passing future conformity tests. Any future unforeseen changes in several projects' scope and schedule we cause us to amend our Plan, and conformity will be in jeopardy. Aligning the update schedules for the SIP, TIP and Plan would allow us to make quality traffic forecasts while being able to more accurately determine whether our transportation decisions are improving air quality.

*Question:* What impact have these schedules had on investments in highway and safety projects, construction costs, and air quality projects and activities?

*Response.* Making air quality conformity determinations is a complex task requiring significant staff resources, and allowance for adequate opportunity for public comment. This leads to some reluctance to amend the TIP/Plan for changes or additions of non-exempt projects. Major amendments are frequently delayed so that we may analyze a combination of several changes to non-exempt projects at the same time.

*Question:* What has been your experience coordinating your SIP and conformity processes with SIP submittals or updates?

*Response.* Coordination is difficult when dealing with two States and two Federal regions. The SIP update process is the responsibility of the State air quality agencies. Coordination among the State air agencies and the Federal regions is difficult. We are working the States, FHWA-Kentucky Division, FHWA-Ohio Division, EPA Region 4 and EPA Region 5 to try to reach a better understanding of coordination procedures.

We were pleased that the two States were able to have concurrent SIP update processes in 1999. Due to differing legal constraints and priorities, it is not likely that both States will have a concurrent process for the next SIP update. Ohio EPA is revising their SIP to address certain area source deficiencies. OKI is currently working to provide Ohio EPA with a revised mobile source budget that can be included in the SIP revision. We will be using the latest planning assumptions to develop that budget. There is no requirement for Kentucky to revise their SIP or mobile source budget. The result for the region will be two separate budgets created with two different sets of planning assumptions. This will likely increase the difficulty in making conformity determinations.

*MOBILE6 Versus MOBILE5 Projections*

*Question:* Compare and contrast your MOBILE5 and MOBILE6 projections. How does the increase in near term emissions (through 2010) from MOBILE6 affect your conformity status?

|                   | VOC         | NOx         |
|-------------------|-------------|-------------|
| 2010 Region ..... | -6 percent  | +18 percent |
| 2030 Region ..... | -40 percent | -40 percent |

Preliminary results for the OKI region have shown that MOBILE6 causes NOx projections to increase by 18 percent for 2010 (our maintenance year). VOC projec-

tions for 2010 decrease 6 percent. For 2030, VOC and NOx projections decrease by 40 percent with MOBILE6. We will not be able to pass conformity with MOBILE6 if the existing budgets are maintained.

*Question:* How will your air quality planning process take the new MOBILE6 into account, and will the SIP be updated before or after the new MOBILE6 projections?

Response. Not sure when SIP budgets will be updated with MOBILE6. Ohio is currently in the process of revising SIP, with new mobile source budgets, using MOBILE5.

*Question:* Will the new 8-hour NAAQS likely lead to an increase or decrease in your vehicle emissions budget?

Response. It is likely that the new 8-hour NAAQS would lead to a decrease in our vehicle emissions budget.

#### *Additional Vehicle Emission Controls*

*Question:* What additional existing controls could be implemented in your area to significantly reduce vehicle emissions, e.g., inspection and maintenance, reformulated fuels, diesel retrofit, TCMs?

Response. Nearly all of the controls with the most significant impact have already been implemented in the OKI region. Currently we have an inspection and maintenance program in Northern Kentucky and Southwest Ohio. Reformulated gas is used in Northern Kentucky, oxygenated fuels in Southwest Ohio. We have also implemented a region-wide Intelligent Transportation System called ARTIMIS that has significantly reduced vehicle delays due to traffic incidents. Upcoming Federal requirements for cleaner heavy-duty diesel engines and cleaner gasoline will help. We don't anticipate any additional controls to be implemented locally.

Our 2030 Plan recommends the adoption and implementation of comprehensive land-use and transportation policies that support SOV alternatives, such as transit use, biking and walking.

*Question:* Would these controls be sufficient to address the potential increase in emissions projected under MOBILE6?

Response. Not sure.

#### *Role of Transportation Control Measures*

*Question:* What role do TCMs play in helping to meet attainment? Please list the TCMs and CMAQ projects in your plan, and the associated "off" or "on" model emission reduction credits for each.

Response. TCM and CMAQ type projects play a role in helping us meet conformity targets. However, there are no required TCMs in our SIP.

We have taken "off-model" credit for three CMAQ projects and one STP project in our Transportation Plan. The projects include the Kentucky and Ohio elements of ARTIMIS (Advanced Regional Traffic Interactive Management and Information System) and continuation of OKI's efforts to promote ridesharing. Details of off-model credits are provided in the table below.

| Project                  | Funding Source | 2010 Daily VOC reduction (tons) | 2010 Daily NOx reduction (tons) | 2020 and 2030 Daily VOC reduction (tons) | 2020 and 2030 Daily NOx reduction (tons) |
|--------------------------|----------------|---------------------------------|---------------------------------|--|--|
| Ohio ARTIMIS .....       | STP            | 0.54                            | 1.14                            | 0.27                                     | 0.45                                     |
| Ohio RideShare ....      | CMAQ           | 0.20                            | 0.17                            | 0.10                                     | 0.07                                     |
| Kentucky ARTIMIS         | CMAQ           | 0.14                            | 0.30                            | 0.07                                     | 0.12                                     |
| Kentucky RideShare ..... | CMAQ           | 0.05                            | 0.05                            | 0.03                                     | 0.02                                     |

*Question.* What percentage of total emission reductions do they represent?

Response. The emission reductions from the four projects represent 2 percent of regional VOC emissions and 3 percent of regional NOx emissions in 2010.

*Question.* Are there CMAQ projects in your plan for which you have not applied any on or off model emission reductions?

Response. There are at least 6 other CMAQ projects in our TIP/Plan for which we have not taken off-model credit. We estimate that the total VOC and NOx emissions of these projects represent less than 1/2 of 1 percent of regional emissions.

#### *Impacts of Conformity Lapse*

*Question.* If your area has experienced a conformity lapse, describe the affect this has had on transportation and air quality planning, funding process, preconstruction, and construction.

Response. The region experienced a 9-day conformity lapse in October 2001. Because of the short duration of the lapse, only one project was impacted. The design phase of a bridge project in Middletown, OH was delayed approximately 2 weeks.

*Question.* When projects were reactivated, after USDOT approved your conformity determination, what impact did this have on funding, project completion dates, personnel, renegotiation of contracts, updating old information, etc?

Response. No impact.

*Question.* What impact did the March 1999 US Court of Appeals decision to eliminate the EPA "grandfather" provision from the conformity regulations have on your transportation investments?

Response. The March 1999 decision has not impacted any projects in our region.

#### *Role of Motor Vehicle Emission Estimates and Models*

*Question.* How has conformity analysis helped improve the quality of estimates of motor vehicle emissions for SIPs to better protect public health?

Response. The conformity requirement has prompted us to continually update certain planning assumptions such as VMT mix and vehicle age distributions.

*Question.* How accurate and consistent have estimates of regional motor vehicle emissions been when compared with each other over time and with actual experience?

Response. How have official estimates of motor vehicle emissions in your metropolitan region changed over the past 10–20 years and how well have they tracked actual emissions in years past?

Estimates of regional motor vehicle emissions have changed over time due to changes in planning assumptions including demographic and socioeconomic conditions, changes in the analysis years, and new updates to the MOBILE model. Output from the travel and emission models provides our best estimate of the actual regional motor vehicle emissions. The Ohio EPA and the Kentucky Division of Air Quality maintain detailed records of monitored pollutant concentrations.

#### *Role of Transportation Models*

*Question.* Has conformity analysis been supported by adequate regional transportation analysis models that accurately reflect how changes in highway capacity affect total travel and air pollution emissions?

Response. The OKI Travel Demand Model is a traditional 4-phase sequential model (trip generation, trip distribution, modal choice and trip assignment) with a feedback process from trip assignment phase to trip distribution phase. In this model, the capacity constrained algorithm is utilized in the trip assignment phase. The assignment algorithm considers the effect of changes in roadway capacity on the degree of congestion and thus the travel speed of the roadways, which in turn affect the distribution of the traffic loads among the roadways in the roadway network. In addition, the feedback process allows the impact of change in roadway capacity on trip distribution (where trips should be sent) and modal choice (which transportation should be used) to be properly considered. The speeds and traffic loads determine the amount of emission. With the speed and traffic load reflecting the impact of the changes in roadway capacity, the impact of capacity changes on emissions is properly reflected as well. In summary, OKI's model adequately reflects how changes in highway capacity will affect total travel and emissions.

*Question.* How well have your region's travel models tracked actual experience with growth in vehicle miles of travel (VMT)?

Response. The growth in vehicle miles of travel is mainly due to the growth and distribution in population as well as the increase in automobile ownership. In the OKI Travel Demand Model, the estimation of population and its distribution closely follow the building permits issued and land development plans. The auto ownership trend is tracked and forecasted into the future. Thus the amount of trips and distance traveled are properly simulated in the model.

*Question.* Please include an indication of how sensitive your/these models are to effects of induced traffic.

Response. Highway improvements that add capacity to a specific corridor or a regional transportation network will attract increased levels of vehicle traffic. The model is very sensitive to the effects of added roadway capacity. The model will divert the traffic to the roadways with new and/or added capacity. In addition, changes in the transportation system (highway or transit) cause travelers to change their transportation mode (drive-alone, share-ride or transit) and/or destination. OKI's model simulates these effects too.

## SUBMISSION OF THE SACRAMENTO AREA COUNCIL OF GOVERNMENTS

## CONFORMITY QUESTIONNAIRE

*Difference in Timing Schedules*

The Metropolitan Transportation Plan (MTP) is updated every 3 years. The SACOG Board adopted the most recent MTP on July 18, 2002. The Metropolitan Transportation Improvement Program (MTIP) is updated every 2 years. The SACOG Board adopted the most recent MTIP on July 18, 2002.

The State Implementation Plan (SIP) for the Sacramento Federal ozone non-attainment area was last updated in 1994. The Sacramento region is currently discussing the need for an update to the 1994 SIP due to conformity implications. The Sacramento region faces a conformity "lockdown" after December 31, 2002. A conformity "lockdown" is a term coined by SACOG staff and means that we will be unable to make any changes, additions, or deletions to non-exempt projects in either the MTP or MTIP until a new SIP is approved by the EPA with new conformity budgets. If a new SIP is not approved by July 2005, the SACOG region will lapse conformity until a new SIP is approved and we can make a positive conformity determination.

Coordinating SIP updates and the conformity process has been difficult at times. This is because the Sacramento Federal ozone nonattainment area covers five air districts, each with its own Board of Directors. It is sometimes difficult to get all five air districts together to discuss issues of mutual interest. There is a real concern by some air districts that they do not want conformity to drive their air quality programs (i.e., a SIP update).

*MOBILE6 Versus MOBILE5 Projections*

In California we use an emissions model called EMFAC, but the same issues that you raise about MOBILE5 versus MOBILE 6 apply to EMFAC7F/7G versus EMFAC 2001. The difference between EMFAC7F, which was used to prepare Sacramento's 1994 SIP, and the new EMFAC2001 emissions model is dramatic. If the Sacramento region were required to use EMFAC2001 when preparing conformity determinations the region would fail. This is because EMFAC 2001 is projecting far greater on-road mobile source emissions than EMFAC7F did for the 1994 SIP and out years.

The region is currently discussing the need for a new SIP that would incorporate the use of EMFAC 2001. It has not been decided if the region will update its SIP before 2005, which is when the current plan projects that the Sacramento region will attain the Federal 1-hour ozone standard. There is considerable discussion occurring over whether the region will attain the standard in 2005 and whether the region should be embarking on a new SIP. We are anticipating that the requirement to use the EMFAC 2001, or its successor, will occur before our mandated attainment date of 2005. We anticipate that the 2-year grace period on EMFAC 2001 will start sometime early next year (Feb/March 2003). This would mean that all nonattainment areas in California will have to use EMFAC 2001 to prepare conformity determinations once the 2-year grace period is up (Feb/Mar 2005). Unless the Sacramento region has a new SIP in place at that time, we will be unable to make a positive conformity determination and the region will go into a conformity lapse for an unknown period of time.

It is unknown whether or not the new 8-hour NAAQS will lead to an increase or decrease in our vehicle emissions budget. Our best guess would be that it would lead to higher budgets initially (i.e., 2005). It is also unclear whether or not the SACOG region would be able to pass future conformity tests with these new budgets.

*Additional Vehicle Emission Controls*

The SACOG region is currently implementing the Sacramento Emergency Clean Air and Transportation (SECAT) program. The SECAT program was created as a way to help truck owners and fleet operators reduce their vehicles' emissions in a business-friendly manner. There are two options available to truck owners: diesel engine retrofits or replacement of their older truck with a cleaner-burning newer truck. The goal of the SECAT program is to reduce NOx emissions from heavy-duty vehicles by two tons per day by 2002 and a total of three tons per day by 2005 within the Sacramento Federal 1-hour ozone nonattainment area. The current program is funded with \$70 million in state and local funds. If this program were to be continued after the moneys are expended, additional NOx emissions reductions could be achieved. We do not believe it would be sufficient to make up the projected increase in on-road emissions associated with EMFAC 2001.

*Role of Transportation Control Measures (TCMs)*

TCMs do not play a big role in helping the Sacramento region achieve attainment of the ozone standard. The 1994 SIP calls for reductions of 26 tons per day of NO<sub>x</sub> and 35 tons per day of ROG emissions from proposed new measures. The 1994 SIP shows a 1 ton reduction in both ROG and NO<sub>x</sub> from "TCMs/Land Use" measures. These measures have never been defined. This 1 ton represents approximately 4 percent of the NO<sub>x</sub> reductions needed and approximately 3 percent of the ROG reductions needed to achieve attainment.

The SACOG region does not take any credit for CMAQ projects in its conformity determinations. This is because CMAQ projects are difficult to quantify.

*Impacts of Conformity Lapse*

The SACOG region has not experienced a conformity lapse within the last couple of years. The SACOG region, however, intentionally let conformity lapse several years ago because the schedule for updating the MTP and conformity didn't mesh and the SACOG Board of Directors did not want to accelerate the MTP development for conformity reasons. The SACOG region lapsed for several months and it had no impact on project deliveries.

The SACOG region is facing a lapse in October 2004 that could last quite a while, depending on when a new SIP is approved. As indicate above, the SACOG region is currently discussing the need for a new SIP and, depending on the outcome of those discussions, the region could face a conformity lapse that could last anywhere from several months to several years.

The March 1999 U.S. Court of appeals decision had no effect on SACOG's transportation investments.

*Role of motor vehicle emission estimates and models*

The conformity analysis has not helped the motor vehicle emissions inventory for SIPs because there has not been a SIP update since 1994. The motor vehicle emissions inventory is prepared by ARB. We have not done a systematic analysis of changes in each update of the inventory.

*Role of Transportation Models*

Yes it has. The transportation demand models have met or exceeded the guidelines in the CAAA and include full feedback from traffic assignments to trip generation and all travel modes including walking and bicycling.

The travel model has been updated several times since 1994. The base year of the model has changed from 1990 to 1994 to 1997 to 2000. Each update has shown at least the same and generally better validation of the models traffic assignment to actual traffic counts. We have a data base of 2000+ traffic counts for each calibration year.

If you define "induced traffic" as the traveler's response to changes in congestion, the model we use has accessibility measures in auto ownership, trip generation, trip distribution, and mode choice steps.

The inclusion of the accessibility measures means that as congestion increases over time, or given higher congestion levels in one area of the model area versus another, auto travel (both trip and VMT) are reduced. The amount of reduction is generally small, but measurable in the order of a few percentage points.

---

SAN JOAQUIN COUNCIL OF GOVERNMENTS, STOCKTON, CALIFORNIA AIR QUALITY  
CONFORMITY CASE STUDY RESPONSE

(Prepared by Julia E. Greene, Executive Director, San Joaquin COG)

July 19, 2002

Air quality conformity has had a positive impact over the past 6 years in merging transportation investments with the objectives of achieving air quality standards in this region. The Congestion Mitigation and Air Quality (CMAQ) program is an excellent example of how transportation objectives and air quality objectives can be integrated. Great progress has been made. Nevertheless there are challenges that still need to be met. The timing of air quality attainment plans, the conformity process, and regional transportation plans has led to confusion and unnecessary work. To a large extent the timing of conformity drives the transportation planning process rather than the other way around. Also, the transportation modeling tools that have been accurate for assessing regional impacts of transportation improvements have had a greater set of expectations placed on them with air quality require-

ments. These tools have not always proven up to the task, and the investment required for staffing and upgrading of these tools has been inadequate.

In the San Joaquin Valley of California the task of achieving Federal and state air quality attainment standards is daunting. The requirement to reduce emissions by 30 percent by 2005 is not achievable. As a result this valley will join the Los Angeles air basin within the next year under the "Extreme" air quality designation. Merging the efforts of technology improvements, transportation control measures and capital and operating transportation investments will be a large challenge for this region, and attainment of air quality standards will still be an uncertain thing. We need the ability to use all these tools in our effort to bring acceptable clean air to the San Joaquin Valley.

#### POINT BY POINT RESPONSES

##### *Difference in Timing Schedules*

California's State Implementation Plan (SIP) process in the San Joaquin Valley Air Basin has been driven by Environmental Protection Agency (EPA) findings of inadequacies, rather than by a regular schedule for SIP updates. Our Regional Transportation Plan and Federal Transportation Improvement Program are updated on schedules determined by our transportation planning requirements, and by the ever-changing nature of our conformity and the San Joaquin Valley's attainment status.

To date the SIP process has not yet impacted our highway investments. The San Joaquin Valley Air Basin experienced a lapse of 7 weeks due to an inadequate SIP. The impact was minimal in San Joaquin County, only due to the time of year in which it occurred. Had it occurred during early spring there would have been a project delivery impact.

The entire eight county San Joaquin Valley Air basin faces a constant threat of highway funding sanctions that could halt over \$3 billion in transportation projects valley-wide. SJCOG has always voluntarily placed a high priority on clean air projects, independent of the SIP planning process.

SJCOG has prepared four air quality conformity certifications in the past 12 months. This has been the result of both the requirements of the transportation planning process and our SIP status.

##### *MOBILE6 Versus MOBILE 6 Projections*

California uses the EMFAC air quality model, rather than the MOBILE air quality model. We face the same problem as the rest of the Nation as the new EMFAC 2001 model reportedly projects higher emissions levels than the older EMFAC 7F and EMFAC 7G models it will replace.

In California, the challenge is even greater in that EPA and the California Air Resources Board (CARB) have not sanctioned EMFAC 2001 for use in most of the state's non-attainment areas. (The reason is somewhat arcane but is based upon the assumptions for vehicle fleet mix that are used in California and their adequacy.) Federal Highway Administration has made it known that if this is not achieved by December of 2002, a conformity freeze will be in effect. This will mean that no Regional Transportation Plan, Federal Transportation Improvement Program or amendment to either will be approved by FHWA unless the modified projects fall into the exempt category. It is almost a surety that most of California's regions will suffer an air quality conformity "lockdown" or "freeze" as a result of this modeling issue.

The impact of the new model is still unclear as a new SIP is pending for our air basin. MPOs in the San Joaquin Valley believe that from the results of tests at the University of California at Davis, there will be great difficulty in meeting conformity and that emissions budgets will go up due to changes in the new EMFAC model.

The new EMFAC 2001 model, or an updated version, will be used to prepare our next SIP. At this point it is still uncertain what air quality status the SIP will address. The San Joaquin Valley is currently designated as Severe, but the San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) has declared "an intent" to voluntarily designate the air basin as Extreme.

Technical staffs in the San Joaquin Valley estimate that the new 8-hour standard will be more difficult to attain, than the previous 1-hour standards. We also are given to understand that the 1-hour standard will remain in place until it has been attained.

##### *Additional Vehicle Emissions Controls*

San Joaquin COG already is subject to inspection and maintenance, reformulated fuels, the standard TCMs (i.e. ridesharing, transit alternatives etc.), and is even involved in funding an Air District sponsored diesel retrofit program as well as our

own CNG fueled school bus replacement program (removes older diesel powered school buses from California) here in San Joaquin County.

New Federal Vehicle Emission Controls scheduled for 2007 are estimated to have a significant impact in our air basin. The effectiveness of Transportation Control Measures varies by region. SJCOG has placed a very high priority on ride-sharing, vanpool, and commuter rail projects that have been very successful in our region due to a very large percentage of long distance commuters to the San Francisco Bay Area that reside in our region.

The new Vehicle Emissions Controls will not be implemented in time to assist in attainment of the Severe area deadline of 2005. They may allow for development of a SIP to meet an Extreme area designation by the 2010 deadline, though this is highly uncertain.

#### *Role of Transportation Control Measures*

Transportation Control Measures alone cannot attain air quality standards, but does have the following effect:

- Encourage public agencies to invest in alternative transportation modes (other than street and roads) that improve air quality. For example, the city of Lodi has an aggressive program to purchase CNG powered public vehicles (buses, police cars, trucks).
- Result in incremental (phase by phase) implementation of large-scale, air quality beneficial projects, wherein the ultimate project will have the largest air quality gains. (Example: citywide traffic signal coordination/synchronization; clean air bus acquisition/fleet conversion)
- Provide multiple transportation options for the general public, resulting in reduced vehicle trips and vehicle idling. An example is our vanpool program that has 90 vans leaving our region every workday morning for the Bay Area.

#### TCMS AND ESTIMATED EMISSION REDUCTIONS

|   | ROG | NOx | CO  | PM-10 |
|---|-----|-----|-----|-------|
| Traffic synchronization and signal installation (Not quantifiable). |     |     |     |       |
| Intercity and interregional bus transit                             |     |     |     |       |
| Total Reduced Emissions (kg/day) .....                              | 60  | 30  | n/a | 25    |
| Rideshare Programs  |     |     |     |       |
| Total Reduced Emissions (kg/day) .....                              | 36  | 61  | n/a | 26    |
| Bicycle Programs (Not quantifiable)                                 |     |     |     |       |
| Alternative Fuel Fleet Conversion Programs                          |     |     |     |       |
| Total Reduced Emissions (kg/day) .....                              | 10  | 2   | 0   | 3     |
| Rail transit  |     |     |     |       |
| Total Reduced Emissions (kg/day) .....                              | 21  | 39  | n/a | 25    |

TCMs represent between 4 and 5 percent of total emission reductions in our region. The SJCOG Model projects that it will be as much as 10 percent by 2020. The effectiveness of TCMs varies greatly by region. In San Joaquin County rideshare, vanpool, and commuter rail provide significant emissions reductions. Again, this is due to the large percentage of San Joaquin County residents that have long distance commutes into the San Francisco Bay Area. These TCMs have an even greater value in the San Francisco Bay Area where the VMT reduced is even greater than in our own county.

CMAQ projects are considered in an overall qualitative analysis of air quality improvements and are performed off model. CMAQ money and CMAQ projects are a key component of our strategy to demonstrate air quality conformity.

Emissions reductions are the major criteria for selection of CMAQ projects, and are quantified in our project selection process. See the attached list of CMAQ projects and their air quality impact.

#### *Impacts of Conformity Lapse:*

As mentioned earlier, the entire San Joaquin Valley Air Basin experienced a conformity lapse of less than 2 months that did not significantly impact any project delivery. We were fortunate that the conformity lapse occurred during the off peak period of project contract awards.

We are unaware in our region of any costs to project due to the conformity lapse, but there are five other MPOs in the Central Valley of California that may have experienced a more serious issue during these 7 weeks.

The lapse was brief but did result in some project schedules slipping. We had enough lead-time to avoid any major re-startup costs or problems.

The March 1999 U.S. Court of Appeals decisions to eliminate the “grandfather” clause did not have a significant impact during our brief lapse. It certainly would have a major impact during an extended lapse of conformity. Bringing a multi-million dollar project to a halt during the middle of construction would cause millions in re-startup costs and contractor penalties. Even a halt during project design would result in the loss of hundreds of thousands of dollars.

It should be pointed out that any delay is fraught with concern. Even a short delay at the wrong time could greatly impact project schedules. For instance, a 2-month delay during a USFWS permitted time for pile driving piers into a river would result in reapplying for the permit, and could add 6 to 18 months to the project schedule if the Service requires even more mitigation than was identified under the original permit.

*Role of Motor Vehicle Emissions Estimates and Models:*

The conformity process has put a greater burden on transportation models to accurately represent the regional picture in transportation planning. As a result, there has been a higher level of expectation put on model outputs, and therefore a more rigorous set of calibration requirements. Our models are marginally better today as a result of conformity. These models are the basis for estimating emissions budgets for each region, and have been beneficial in assessing the full impact of mobile sources on the air quality picture.

The bigger challenge has been with increased expectations there is a greater demand for more comprehensive and better performing modeling tools. This translates into cost. Not so much for the tools themselves (though the promise of better tools has not matched actual performance in the real world), but for the data to be input into the model, and the skill needed to produce the model itself, run it effectively and maintain it.

In San Joaquin County the results have been consistent over the past 10 years. Where differences have occurred it has been the result of changes in planning assumptions such as population and employment projections. These did change in San Joaquin County in future years and had a proportional impact on Vehicle Miles of Travel and therefore emission projections.

There has been some variation over the 20-year period of time. With the introduction of new technology for emissions reductions, modeling assumptions changed substantially in the late 1980's, and emission reductions were substantial. In the past 10 years we have captured this impact well, and produced a more consistent and we believe more accurate picture of emissions.

*Role of Transportation Models:*

Impacts of individual highway capacity projects are difficult to determine in a regional air quality conformity process because of the accepted level of accuracy of a region project. However, when assessing the impacts of a larger number of capacity projects the effectiveness of the modeling tool is better. The size of the regional modeling tool means that it is relatively insensitive to a few small capacity increasing projects. However, as the number of projects increase, the impact is better captured on the regional system.

The Federal planning regulations require that models be “calibrated,” or adjusted, to reflect current vehicle miles traveled as reported in the Federal Highway Performance Monitoring System (HPMS) every 10 years. Estimates during interim periods from existing conditions varied. The primary reason was that population and employment projections for the region proved too high. Actual emissions were likely lower than those predicted.

None of the models in the San Joaquin Valley produce a specific estimate of the impacts of induced travel. Using manual techniques an estimate of induced trips can be made, but the level of accuracy is highly uncertain.

## CMAQ Air Quality Analysis

### Traffic Signal Installation and Coordination Projects

| Caltrans District | County MPO/RTPA | Project Name & Description  | CMAQ Funding Amount | Emissions Reductions   |                    |                   |                   |                   |                   |

| 10                | SJCOG           | CNG Fueling Station in Ripon and 5 CNG Vehicles                                     | \$500,000           | 16                   | 31                 | 1                    |                   |                   |                     |   |
| 10                | SJCOG           | CNG Fueling Facility in Tracy and 2 CNG Buses                                       | \$480,000           |                      | 2,788              |                      |                   |                   |                     |   |
| 10                | SJCOG           | CNG Fueling Station in Stockton and 10 Vehicles                                     | \$170,000           |                      |                    |                      |                   |                   |                     |   |
| 10                | SJCOG           | CNG Fueling Station in Lodi   | \$498,000           |                      |                    |                      |                   |                   |                     |   |

The San Joaquin Council of Governments is committed to funding air quality projects that have beneficial emissions reduction. CNG Fueling Facilities, however, cannot adequately be measured for emissions reduction using this current model since these projects combine both CNG vehicles and Fueling Stations. Please see the project description for accurate emissions reduction data.

## SOUTHERN CALIFORNIA COUNCIL OF GOVERNMENTS

*Difference in Timing of Schedules*

*Question:* Describe how the different schedules for the SIP, TIP-conformity, etc., and the impacts of date changes on out year emissions affect your ability to develop effective and timely transportation and air quality plans.

*Response.* Southern California is one of many areas in the Nation that is facing a mismatch between air quality planning and transportation planning schedules. This mismatch is important because it could interrupt the flow of millions of Federal transportation dollars to the region. The question posed has been answered in the following two parts; mismatch in the schedules and frequency of Regional Transportation Plan (RTP) and State Implementation Plan (SIP) updates; and mismatch between the RTP and SIP planning horizon requirements and its affect on out-year emissions.

*Mismatch in the Schedule and Frequency of RTP and SIP Updates*

In non-attainment and maintenance areas, the conformity of the RTPs must be re-determined at least every 3 years. However, there is no Federal requirement for a regular or frequent SIP update. This has created a situation where RTPs are updated regularly while SIPs are updated on a discretionary basis inconsistent with the RTP process.

An RTP provides inputs (planning assumptions, i.e. socio-economic data and transportation activity data) to the SIP development process. While a SIP provides the set of constraints (e.g., emissions budgets and TCMs) for the RTP. The development of these two documents should be sequential and cumulative, not concurrent and independent.

Both the RTP and the SIP are required to use the Latest Planning Assumptions, as stipulated by the Federal agencies, whenever they are updated. The Latest Planning Assumptions include the most recent sociodemographic and vehicle activity data (e.g., population distributions, vehicle age and fleet mix). Since the SIPs are updated much less frequently than the RTPs, the planning assumptions in the SIPs tend to be much older than those in the RTPs.

In the SCAG region, there are 11 non-attainment areas, with 13 associated SIPs stipulating emissions budgets for transportation conformity. At the present time, there are only five applicable ozone SIPs and one applicable NOx SIP in place. However, all of them were developed and based on planning assumptions that are now seven to 10 years old. As such, they are too obsolete for pertinent conformity analysis.

A related factor is the Federal requirement that any update of a SIP, with its associated new emissions budgets, triggers an 18-month clock within which all relevant RTPs must re-demonstrate conformity using these new emission budgets. This requirement, together with the mismatch in frequency of RTP and SIP updates discussed above, results in debilitating procedural inconsistencies.

*Mismatch Between the RTP and SIP Planning Horizon Requirements and Impacts on Out Year Emissions*

Federal regulations require at least a 20-year planning horizon for the development of any RTP. However, SIPs are only required to address the time period up to the attainment or maintenance date for the relevant area. Thus, SCAG's 2001 RTP extends up to the year 2025, and the upcoming 2004 RTP will extend up to the year 2030. However, and as one example, the 1-hour Ozone SIP for the South Coast Air Basin (SCAB) in the SCAG region is only required to consider the period preceding its stipulated attainment year of 2010. As a consequence, there is always a gap of about 15 to 20 years between SIP and RTP planning horizons. The complex interplay of socio-demographic projections and emission budgets between the SIP and the RTP processes means that there is almost always the potential of a procedural conformity lapse.

Additionally, under the current conformity rule, all transportation agencies must demonstrate conformity up to the last year of the RTP. However, the applicable emissions budgets contained in the relevant SIP, and which are only required to extend up to the attainment year or last year of maintenance, establish a ceiling for conformity analysis. Thus, the RTP and Regional Transportation Improvement Program (RTIP) emission budgets for these future years-i.e., beyond the attainment year or the last maintenance year-cannot exceed this SIP-established ceiling. As a result, demonstrating attainment for the out-years beyond the attainment year of the last year of maintenance becomes problematic for all MPOs.

This is particularly a problem for PM10 non-attainment or maintenance areas, as there is a direct relationship between population growth, increases in annual vehicle

miles traveled (VMT), and annual PM10 (particulate matter) emissions. Generally, and because both of these metrics trend upward through time, both VMT and PM10 emissions tend to increase into these future years. For example, the current PM10 attainment year for the SCAB and for the Coachella Valley portion of the Salton Sea Air Basin (SSAB) is 2006. The gap between this PM10 attainment year and the stipulated planning horizon year ranges from 19 to 24 years (for the 2001 RTP and the 2004 RTP, respectively). In the absence of realistic PM10 emissions budgets for these future years, it is difficult, if not impossible, to demonstrate conformity beyond the attainment year of 2006.

*Question:* Provide a time-line or narrative description of your various schedules.

*Response.* A timeline, which incorporates both the air quality and transportation planning schedules for the SCAG region, is attached to the end of this document for your review. SCAG's next RTIP comes due on October 6, 2002 and the next RTP comes due on June 8, 2004. In order to avoid an adverse impact on conformity, SCAG is working closely with the local, state and Federal air agencies to ensure the timely approval of an adequate emissions budget.

*Question:* What impact have these schedules had on investments in highway and safety projects, construction costs, and air quality projects and activities?

*Response.* As mentioned, a real potential exists for a conformity lapse due to the mismatch of air quality and transportation planning schedules, and the SCAG region will continue to face this constant threat. However, so far, the mismatch in schedules has not had an impact on investments in highway and safety projects, construction costs and air quality projects and activities. During a conformity lapse only certain projects can be implemented, such as: safety-related projects; those which are regional emission-neutral (known as exempt projects); and TCM projects. Generally, no capacity enhancement projects (such as all-purpose-lane highways) can be implemented during a conformity lapse. (The SCAG region experienced short-term, mild conformity lapses due to reasons beyond the mismatch of schedules during 1998 and 2001. These lapses are described in the last section of this document).

*Question:* What has been your experience coordinating your SIP and conformity processes with SIP submittals or updates?

*Response.* A few months ago, in California, all MPOs and the State were facing a potential conformity lapse for all RTIPs and some RTPs. The transportation agencies were asked to use the most recent vehicle data to demonstrate conformity for the RTP and RTIPs. However, the Federal regulations also require that the RTPs and RTIPs conform to the applicable SIPs, which are currently based on old data.

The California situation has been temporarily resolved through inter-agency cooperation. The California Air Resources Board (CARB) and the local air agencies have committed to update all SIPs between late this year and late 2003, and, in return, the United States Environmental Protection Agency (USEPA) has agreed to process the emissions budgets based on this provisional schedule. In addition, the Federal Highway Administration (FHWA) has issued a letter permitting a limited use of the old version of the mobile source emissions inventory model, EMFAC7F and 7G, and its associated data through the end of the current calendar year of 2002. Therefore, the six-county SCAG region will be in what amounts to a conformity lockdown from January 1, 2003 until June 8, 2004, when the 2004 RTP should be in place as the region's federally approved and conforming RTP. This conformity lockdown means that no changes requiring conformity analysis and finding can be made to any transportation plans during this period. For a region as economically dynamic as Southern California, this is an unreasonable constraint.

To illustrate this SIP-related problem, the conformity lockdown situation described above will begin to have effects in the SCAB portion of the SCAG region as early as November 2002. With SCAG's concurrence, the air agencies have had to re-submit their 1997 PM10 SIP in order to request a needed extension of the attainment year from 2001 to 2006. To extend the attainment date, USEPA will approve this PM10 SIP in mid-November, at which time the associated emission budget becomes the mandatory basis for all conformity analyses. However, this PM10 SIP is based on obsolete emission budgets that cannot, realistically, be used for present-year conformity determinations.

In the SCAG region, the situation is further complicated by the fact that some air basins have been designated non-attainment for more than one criteria pollutant. For instance, the SCAB is non-attainment for four pollutants: ozone (O3), carbon monoxide (CO), nitrogen dioxide (NO2), and particulate matter less than 10 microns in aerodynamic diameter (PM10). Therefore, all pertinent SIPs for this air basin must be prepared on the same schedule, otherwise risking a conformity lapse.

## EMFAC2000/EMFAC2001 VERSUS EMFAC7F/7G PROJECTIONS

The state of California utilizes its own mobile source emissions inventory model, known as EMFAC, rather than USEPA's model, Mobile. CARB has long maintained a California specific model, which represents conditions unique to California. Therefore we have addressed the questions specifically to EMFAC. However, we do face a similar situation as the rest of the Nation, as there is a projected emissions increase between model versions, as described below.

*Question:* Compare and contrast your EMFAC7F/7G and EMFAC2000/2001 emission projections.

*Response.* EMFAC2001 (Version 2.08) will soon be the working version of the motor vehicle emissions inventory model. USEPA intends to approve this model for new SIP development purposes on a statewide basis in the near future. This new EMFAC version replaces the previous model versions: EMFAC2000 (which was approved on a limited basis for SIP development in the San Francisco Bay area only) and EMFAC7F and 7G. In California, most of the current SIPs and their associated emission budgets are based on EMFAC7F or 7G, which use seven to 10 year old data. As previously mentioned, Federal agencies require that conformity determinations be based on the Latest Planning Assumptions, which includes the most recent socio-demographic and vehicle activity data (e.g., population distributions, vehicle age, and fleet mix). Effective January 1, 2003, all RTPs and RTIPs in the State of California will be required to be based on the most recent EMFAC2001 model, which incorporates these Latest Planning Assumptions.

EMFAC2000 was under development for 5 years and represented a complete rewrite of computer code and algorithms. EMFAC2000 represents a significant change to the existing on-road motor vehicle emissions inventory as compared to EMFAC7F and 7G. Emission inventories based on EMFAC2000 increase substantially for nearly every category of motor vehicle fleet and for all pollutants, with NOx being somewhat less impacted than reactive organic gases (ROG) and CO. NOx emissions from heavy-duty diesel vehicles have doubled for this vehicle class in year 2000. For light-duty cars and trucks, the calendar year 2000 ROG inventory has increased by 192 percent, the CO inventory has increased by 204 percent, while the NOx inventory has increased by a modest 3 percent. Much of the light-duty vehicle ROG increase is related to the way EMFAC2000 handles evaporative emissions, which increase threefold when compared to EMFAC7G.

EMFAC2001 (Version 2.08) is one of a series of minor updates planned for the on-road model, and reflects clean-up items and incorporation of the impacts of new emission standards (e.g., Federal Tier 2 standards) and new data (e.g., travel activity data); there are no major changes to algorithms or structure. It is unclear how the proposed changes will impact overall inventory estimates, but it appears that EMFAC2001 will have lower emissions when compared to EMFAC2000, especially for calendar years 2010 and beyond. However, EMFAC2001 will certainly have higher emissions than the current EMFAC7F and 7G models.

*Question:* How does the increase in near term emissions (through 2010) from EMFAC2001 affect your conformity status?

*Response.* It is unclear how the increase in near term emissions from EMFAC2001 will affect the conformity status of the SCAG region. There have been considerable delays in the development of the SIPs for the SCAG region, and hence there are no emission budgets established at this time.

*Question:* How will your air quality planning process take the new EMFAC2001 into account, and will the SIP be updated before or after the new EMFAC2001 projections?

*Response.* The 2003 SIPs for the SCAG region will be updated subsequent to the finalization of EMFAC2001. As mentioned previously, USEPA intends to approve EMFAC2001 for SIP development purposes on a statewide basis in the near future. The emission budgets of the SIPs for the SCAG region will be based on EMFAC2001, which are scheduled to be approved by EPA in mid-2003. Subsequently, SCAG's 2004 Regional Transportation Plan (RTP), which comes due June 8, 2004, will be based on budgets generated from EMFAC2001. SCAG is working with the respective air agencies to maintain consistency between the SIP and 2004 RTP schedules.

*Question:* Will the new 8 hour NAAQS likely lead to an increase or decrease in your vehicle emissions budget?

*Response.* It is unclear if the new 8 hour NAAQS standards will increase or decrease SCAG's vehicle emissions budget. Implications of the new 8-hour Ozone NAAQS are currently being assessed by the CARB. USEPA plans to implement the new 8-hour ozone standard and the new PM2.5 standard over the next few years. Implementation of the 8-hour ozone standard will occur in the early part of the

TEA-21 reauthorization period, while that of the PM<sub>2.5</sub> standard may occur somewhat later. The impacts will probably include conformity requirements for the existing RTPs and RTIPs, and some new areas will need adequate time to prepare to meet these new requirements.

Congress provided a 1-year grace period for new areas to demonstrate conformity after the new 8-hour ozone or PM<sub>2.5</sub> non-attainment designations are made. One year is not sufficient for transportation agencies to address conformity issues.

#### *Additional Vehicle Emission Controls*

*Question:* What additional existing controls could be implemented in your area to significantly reduce vehicle emissions, e.g., inspection and maintenance, reformulated fuels, diesel retrofit, TCMs?

*Response.* SCAG has no regulatory authority, and, therefore, does not formulate or administer rules and regulations pertaining to vehicular emission controls. However, a number of additional vehicle emission control measures and related actions which promise air quality benefits are being considered or implemented by regulatory agencies within the region. These include the following measures.

- Improved implementation of Air Quality Investment Program, under the South Coast Air Quality Management District's (SCAQMD's) Ridesharing Rule 2202
- Improved implementation of SCAQMD's Fleet Rules 1186.1/1191-96—These fleet rules require new garbage trucks, sweepers, buses and airport vehicles to switch to alternative fuels such as natural gas.
  - Incentivize use of reformulated fuels (such as biodiesel)
  - Controls on truck-idling at goods movement centers (such as the Ports of Los Angeles and Long Beach)
  - Urban forestry for heat island mitigation (tree plantation in open-to-sky parking lots and thoroughfares-reduction in evaporative emissions and indirect benefits of evapo-transpiration)
  - Use of innovative technologies (e.g., fuel cells, personal transportation devices, photocatalytic VOC-and NO<sub>x</sub>-reducing chemical coatings such as titanium dioxide, which can be applied to wall surfaces in semi-enclosed areas which see high volumes of vehicular emissions such as parking garages)

*Question:* Would these controls be sufficient to address the potential increase in emissions projected under EMFAC2001?

*Response.* As mentioned previously, emission budgets based on EMFAC2001 have not been established at this time. Therefore, it is unclear if the control measures described above are adequate to offset a potential increase projected under EMFAC2001.

#### *Role of Transportation Control Measures*

*Question:* What role do TCMs play in helping to meet attainment? Please list the TCMs and CMAQ projects in your plan, and the associated "off" or "on" model emission reduction credits for each.

*Response.* There are 11 non-attainment areas in SCAG's six-county region, with 13 SIPs associated with them. Only two of the six applicable SIPs contain Transportation Control Measures (TCMs)-the South Coast Air Basin's 1997 Ozone SIP, and the Ventura County portion of the South Central Coast Air Basin's 1994 Ozone SIP.

#### *TCMs in the South Coast 1997 Ozone SIP/AQMP (as amended in 1999):*

1. High Occupancy Vehicle (HOV) Improvements  
HOV projects and related pricing alternatives and park and ride lots/intermodal facilities.

2. Transit/System Management

The following system management measures improve congestion and reduce emissions:

- Bus, rail, and shuttle transit improvements.
- Bicycle and pedestrian facilities.
- Urban freeway system management improvements.
- Smart Corridors system management programs.
- Railroad consolidation programs (e.g., Alameda Corridor).
- Congestion Management Plan-based demand management strategies.
- County/corridor-wide vanpool programs.
- Telecommunication facilities/satellite work centers.
- Seed money for transportation management associations.
- Transportation Demand Management (TDM) demonstration programs/projects eligible for programming in the RTIP.

3. Information Services

By targeting individuals who travel to and from employment sites and other activity centers (e.g., airports, schools, shopping centers, and special event centers) and providing them with information specifically tailored to facilitate use of alternative travel modes, vehicle travel and the associated emissions can be significantly reduced. Providing information services offers an innovative way of reducing vehicle emissions when combined with facility improvements, service enhancements, product development, extensive education, marketing, and promotion.

Potential actions to reduce congestion and emissions through individual efforts include:

- Promoting multi-modal strategies to maximize all options available to commuters.
- Targeting peak period trips for reduction.
- Marketing and promoting the use of HOV lanes to the general public.
- Marketing and promoting rail lines to the general public.
- Educating the public regarding cost, locations, accessibility, and services available at park and ride lots.
- Promoting and marketing vanpool formation, incentive programs promoting ride-matching through the Internet, and other means of making alternative travel option information more accessible to the general public.

TCM strategies in the Ventura County portion of the South Central Coast Air Basin's 1994 Ozone SIP:

1. Clean Fuel Bus Fleets & Support Facilities
2. Improved Public Transit
3. Bicycle & Pedestrian Facilities
4. Traffic Flow Improvements

SCAG's Regional Transportation Model generates the vehicle miles traveled (VMT) based on all projects in the system. The regional emissions estimates are the product of the collective action of all strategies (HOV lanes, transit, mixed flow, etc), not just an aggregation of the individual projects and programs, including the TCM projects. It is not possible to allocate specific emission credits for individual TCMs.

*CMAQ Projects Associated with Regional Transportation Plans*

All CMAQ program funds are allocated to a variety of projects that meet the CMAQ eligibility criteria (such as HOV lanes, purchase on the alternative fuel buses, signal synchronization, rideshare program, etc.). Some of these projects are regionally significant, e.g., HOV lanes, while some are not, e.g., bicycle parking racks.

All regionally significant projects and programs were included in SCAG's Regional Transportation Model (RTM) and their regional emissions were calculated directly through the model. No off-model emission reduction credits were claimed.

*Question:* What percentage of total emission reductions do they represent?

Response. TCMS for the South Coast 1997 Ozone SIP/AQMP (as amended in 1999)

Emission reductions resulted from the major TCM categories and were calculated for the year 2010 for the SCAB area. They are reflected in the applicable SIP as follows.

| TCM                             | percent Reduction VOC | percent Reduction NOx |
|---------------------------------|-----------------------|-----------------------|
| HOV Lanes .....                 | 19 percent .....      | 19 percent            |
| Transit/System Management ..... | 16 percent .....      | 18 percent            |
| Information Services .....      | 10 percent .....      | 13 percent            |

No emission reduction benefits were claimed for any of the TCM strategies in the Ventura County portion of the South Central Coast Air Basin's 1994 Ozone SIP:

*Question:* Are there CMAQ projects in your plan for which you have not applied any on-or off-model emissions reductions?

Response. Yes. There are two types of CMAQ projects for which no emission reduction credits were applied: 1) small projects, which are not regionally significant and which are not included in SCAG's RTM (e.g. bike racks), and 2) some technology-based projects, such as alternative fuel infrastructure and the replacement of old buses with new, clean fuel ones. No off-model emission reduction credits were taken for any type of project.

*Impacts of Conformity Lapse*

*Question:* If your area has experienced a conformity lapse, describe the effect this has had on transportation and air quality planning, funding process, preconstruction, and construction.

*Response.* Since the publication of the Transportation Conformity Rule in November 1993, SCAG has experienced a conformity lapse three times. However, because none of these lapses in conformity extended for more than 2 months, in no case was SCAG required to prepare an Interim RTP/RTIP. Each conformity lapse is described below.

- The first conformity lapse occurred in 1998, because SCAG did not complete its 1998 RTP on time. Due to the size and complexity of the Federal non-attainment areas contained within the SCAG region, preparation of the RTP-including the required conformity analysis-sometimes took more time than other MPOs. Presently, the completion of one RTP marks the beginning of the next one. It takes more than 2 years, from the beginning to the Federal approval, to complete an RTP in the SCAG region. However, from the Draft RTP stage-i.e., once most of the RTP's projects, programs, and policies are set-the associated regional emissions analysis, publication of the Draft, public review and comment, public hearing, through SCAG's submission for Federal approval takes at least 9 months.

- The next conformity lapse was caused by a non-transportation related development. The U.S. Court of Appeals' March 2, 1999, ruling invalidated the use of submitted emission budgets in conformity findings. SCAG revisited the 1998 RTP and 1998 RTIP in the PM10 non-attainment areas in the region and re-affirmed their original conformity finding by using the build/no-build method for conformity determination.

- The most recent conformity lapse was caused by the USEPA's interpretation of the PM10 construction-related emission analysis. This occurred during the 2001 RTP process; only two PM10 non-attainment areas were affected and the lapse lasted for less than 2 months.

Due to the short duration of each lapse, SCAG did not survey the transportation project sponsors to determine which projects were halted. However, all constituents were informed of the lapse and its resolution.

*Question:* When projects were reactivated, after USDOT approved your conformity determination: what impact did this have on funding, project completion dates, personnel, renegotiation of contracts, updating old information, etc.

*Response.* SCAG's RTIP has a 6-year planning horizon, in compliance with California requirements, and is valued at about \$22-24 billion. However, only the first and second fiscal years of each TIP are used in estimating the cost of a conformity lapse. Therefore, between \$0.5 and \$2 billion of all transportation projects were subject to postponement during the 1998 and the 2001 conformity lapses, respectively. All projects were fully implemented, once the conformity status was reinstated.

*Question:* What impact did the March 1999 U.S. Court of Appeals decision to eliminate the EPA "grandfather" provision from the conformity regulations have on your transportation investments?

*Response.* Due to the fact that, in each instance of conformity lapse, the SCAG region was out of conformity for less than 2 months, and, hence, no interim RTP was required, the implications of the above decision were not evaluated.

Re: Transportation and Air Quality Conformity Case Study

Dear Senators Jeffords and Smith:

Please find the following responses in reference to your request for information. Thank you for the opportunity to comment on the Baltimore region's experience with transportation conformity. Additionally, it is important to note that while the Baltimore region progresses in coordinating transportation and air quality planning, stationary source and inter-regional transported pollution continue to be a major challenge in achieving attainment of national air quality standards.

For expediency, the enclosed information was formulated by staff of the Metropolitan Planning Organization for the Baltimore region and does not necessarily reflect the view of the MPO members. Responses were coordinated with the state air and transportation agencies, the Maryland Departments of Transportation and the Environment.

Please contact me with any questions or requests for additional information.

Sincerely,

Harvey S. Bloom, Director  
Transportation Planning Division

**Conformity Case Studies****— BALTIMORE —**

*Please find the following responses in reference to your request. For expediency, this information was formulated by staff of the Metropolitan Planning Organization for the Baltimore region and does not necessarily reflect the views of the MPO Board members. For more information, please contact Harvey S. Bloom, Director of Transportation Planning, at 410-732-9566 or [hbloom@baltometro.org](mailto:hbloom@baltometro.org).*

**Difference in Timing of Schedules**

In the Baltimore region, the attainment date is 2005. Currently, transportation plans and programs are tested against the SIP budget for 2005, 2015, and 2025. Due to advancements in vehicle technology and federal and state regulations, the requirement to demonstrate conformity for out-years is not currently an issue affecting the implementation of the transportation plan or program for the Baltimore metropolitan nonattainment area.

In general, the difference in requirements for update schedules for the SIP, transportation plans, transportation programs, and conformity presents a challenge. Air quality plans are under various timelines for submittal (both required and court-ordered). Transportation plans and programs operate under a different timeline for update as well as conformity determinations that are updated under a third set of timelines. These various schedules trigger different work tasks, update timelines and/or sanctions clocks. Ultimately, timing work activities, project solicitation, and final conformity determinations demand effective coordination with a wide array of entities engaged in these various activities. A sample schedule of transportation and air quality activities is attached.

The Baltimore region experienced a delay in the 2001-2005 TIP submittal/approval due to timing issues in updating data assumptions between the transportation program and the SIP. Using 1999 vehicle registration data in the development of the 2001-2005 TIP, emissions estimates were significantly greater than those in the SIP mobile source emissions budgets created using 1990 vehicle registration data. Although not required, the SIP mobile source emissions budgets were updated to address the new vehicle data, ultimately resolving the situation. Additional emission reductions strategies were also initiated at the time. This delay did not result in the cancellation of any transportation investments or economic development opportunities.

As a result of this delay, the region's state transportation and air quality agencies now work consistently with the MPO as well as federal officials to anticipate timing and coordination issues in advance. Nonetheless, the complexity of the transportation and air quality models as well as transportation and air quality regulations and planning practices does not allow for perfect, consistent harmony between the two planning areas.

**MOBILE6 Verses MOBILE5 Projections**

The Baltimore region has begun the process of developing estimates of mobile source emissions using MOBILE6. Preliminary, unapproved estimates indicate a substantial increase in VOC and NOx emissions. These estimated emissions are the result of changes in heavy-duty truck percentages (which have changed in recent transportation conformity emissions work compared to the analysis completed for the approved SIP budget), greater gram per mile emission factors

### Conformity Case Studies

#### — BALTIMORE —

for vehicle classes contained in MOBILE6, and reductions in credits for programs such as Inspection and Maintenance.

The Baltimore region is developing a methodology to estimate mobile source emissions using MOBILE6 for a January 23, 2003 SIP submittal. Working cooperatively with the Maryland Departments of the Environment and Transportation, conformity of plans and programs using MOBILE6 will most likely wait until new SIP budgets have been developed for a January 2003 SIP submittal to and approval by EPA. It is unclear at this time the effect of MOBILE6 budgets on the ability to determine conformity of the region's transportation plans and programs.

It is our understanding that when EPA classifies areas using the 8 hour NAAQS standards, non-attainment areas will develop new budgets. It is anticipated that the budgets will change with the new standard, since a rolling 8 hour concentration will be used as opposed to a one hour concentration.

#### Additional Vehicle Emission Controls

Major vehicle emissions controls have already been instituted in Maryland. Additional controls could include alternative fuels and TCM-like measures. It is most likely that these measures would not be sufficient to address the shortfall created by MOBILE6, particularly in the timeframe to reach attainment in 2005.

#### Role of Transportation Control Measures

The Attainment Plan for the Baltimore region does not formally include any TCMs, such as those listed in Section 108(f) of the CAA. TCM-like initiatives and CMAQ-funded strategies are included in the latest transportation plan and capital program, with associated credits used for conformity.

#### Impacts of Conformity Lapses

The Baltimore region has not experienced a conformity lapse to date.

#### Role of Motor Vehicle Emission Estimates and Models

The quality of estimates of mobile source emissions has dramatically changed due to the conformity process. The conformity requirement mandates a more precise understanding of motor vehicle operation conditions and their associated impact on emissions. This improvement has promoted refinements in transportation models to produce estimates for variables for which the MOBILE model is sensitive. Together, these improvements should lead to more accurate estimates of mobile source emissions. It is hoped that the better understanding of mobile source emissions production allows for politically acceptable and cost effective programs to be developed, ultimately resulting in emission reductions and cleaner air.

*mandates a more precise understanding - changed quality of estimating*

Estimates of regional mobile source emissions have increased and decreased over time. As federal and state regulations have been promulgated, such as the TIER II standards, estimates of future mobile source emissions have decreased compared to early year estimates. Conversely, emissions estimates have increased as updated assumptions on inputs such as vehicle registration and vehicle miles of travel (VMT) mix have changed. Methodological changes in versions of the

**Conformity Case Studies****— BALTIMORE —**

MOBILE emission model have also caused inconsistencies between what was projected and experienced. The reliability of the impacts of technology changes, input assumptions regarding fleet characteristics, and the reliance of estimations of mobile source emissions from models determines the accuracy and consistency between estimates and what is experienced over time.

Over the past 10-20 year period, mobile emissions estimates in the Baltimore metropolitan area have been decreasing. As vehicle technology has become increasingly advanced, inspection and maintenance programs have expanded and become more stringent, and fuel volatility has decreased, regional mobile emissions have also decreased. Recently promulgated Tier II regulations and the Heavy-Duty Engine Rule should help to continue this trend.

It is difficult to tell how well our estimates of mobile source emissions have been with actual emissions. Monitoring data shows emissions of all sources, including transport. Overall, ozone violations from 1990 to present have decreased. Our inventory estimates from all sources show decreasing emissions, which does agree with the monitoring data of decreasing ozone violation data.

**Role of Transportation Models**

At the present time, the best professional tool available to estimate regional travel, and potentially motor vehicle emissions, are travel demand forecasting models. Travel models were originally designed to assist transportation planners and elected officials in the development of the interstate and transit systems. The models have done an adequate job in performing analyses for this goal. Travel models have been developed to be sensitive to changes in transportation supply improvements (new roadways, additional lanes, and transit improvements) and changes in demand (location of households and employment) used in the planning and implementation of the transportation network.

More recently, travel demand models have been used for the estimation of mobile source emissions. This task is different from the original intent of travel demand modeling, but planners have adapted travel models to include variables sensitive to emissions analysis. This adaptation effort is not all-encompassing at this time; therefore, the output from the travel model is at times being used for levels of calculation that are beyond the travel model's intended level of accuracy.

Travel models have mixed results in their ability to track changes in VMT. In short range planning applications (5 year period), travel models perform reasonably well, since near term estimates are extrapolation of existing trends. For longer range planning purposes, the accuracy of growth in VMT is more questionable. Travel models, built on the observation of current conditions, use variables that influence travel in the base year to estimate future conditions.

Given the ever-changing influence of national and regional economic conditions, local public policy initiatives and individual choices and preferences on travel demand and behavior, the expectation that travel models will be able to capture and predict the real world experience some 20 years "down the road" is unreasonable.

**Conformity Case Studies****— BALTIMORE —**

Many forms of induced travel exist. Induced demand resulting from a new transportation improvement, a location change of employment or a regional activity center are captured in our regional travel model. However, more complex issues associated with induced demand are not captured. An increase in the number of trips that a household makes as a result of reduced congestion is not estimated. Increases in the concentration of new households and employment resulting in additional access with transportation network improvements are also not captured. The Baltimore Metropolitan Council is currently working on a method to integrate a land use model into the transportation planning process to forge a better understanding and ultimate decision-making process in capturing the potential impacts of transportation investments.

The Honorable Robert C. Smith  
Committee on Environment and Public Works  
United States Senate  
Washington, DC 20510-6175

Dear Chairman Jeffords and Senator Smith,

I am responding to your July 3, 2002 request to provide information about the Metropolitan Transportation Commission's experience with Clean Air Act transportation conformity requirements. We have endeavored to answer your list of questions to the best of our ability in the attached responses.

Please do not hesitate to have your staff contact us if they seek additional information either before or after your July 30, 2002 hearing on Transportation and Air Quality.

Sincerely,

Steve Hanning  
Executive Director

**Responses to Questions from the Senate Committee on Environment and Public  
Works on the Transportation Conformity Process**

**General Context**

There have been both positive and negative consequences of the conformity regulations flowing from the 1990 Clean Air Act. On the positive side, there has been better integration of planning requirements under the Intermodal Surface Transportation Efficiency Act (ISTEA) and TEA 21 and the 1990 Clean Air Act Amendments (CAA). The conformity process and analysis has established a connection between these two pieces of federal legislation. In particular the Interagency Consultation process has provided a strong mechanism for building helpful working relationships between the U.S. Department of Transportation (DOT- Federal Highway Administration and Federal Transit Administration), the U.S. Environmental Protection Agency (EPA), metropolitan planning organizations (MPOs), as well as State and local transportation and air quality agencies. This collaborative process has generally been open to the public and environmental advocacy organizations.

On the negative side, the conformity process is a procedural morass, with multiple opportunities for legal challenge and delays in providing needed transportation improvements. The process is extremely resource intensive for MPOs and diverts these resources from the real air quality planning that is necessary to develop additional control strategies for future SIP updates. Challenges to TCMs, which deliver emission reductions in the order of tenths of a ton, can adversely affect approval of TIPs that involve billions of dollars of highway and transit improvements. Further it is difficult to ensure that planning assumptions in SIPs and Plans are compatible and kept current, leading to disconnects in the assumptions used to develop SIPs and in the conformity determinations for transportation Plans and TIPs that rely on these SIPs. As a result, transportation plans and programs are increasingly vulnerable to legal challenge.

**Differences in Timing of Schedule**

**Schedule Compatibility.** There is no federal requirement for compatible schedules between SIP updates and adoption of long-range regional transportation plans or TIPs. SIP updates are typically initiated by EPA actions, such as a SIP disapproval or SIP call. Transportation plans and TIPs are required by metropolitan planning regulations to be updated at least every three years. Because MPOs must use the latest planning assumptions in the conformity process, differences between SIP assumptions and conformity assumptions will have greater divergence over time. In general, changes in assumptions beyond the attainment year (2006 for the Bay Area) are not as important as changes that affect the attainment year, as even the slightest change in motor vehicle emission estimates for the attainment year could create problems conforming a Plan or TIP to the motor vehicle emission budget established in the SIP if the projections exceed the budget by as little as a tenth of a ton.

**Impact of Schedules on Projects.** MTC has been able to make timely conformity findings for Plans and TIPs and maintain an orderly project delivery process in the Bay Area up until 2001/2002. The 2001 Ozone Attainment Plan was intended to provide a more current motor vehicle emissions budget for transportation conformity, but delays arose in submitting the SIP and approving the budget leading to a short conformity lapse. The delays were caused by: 1) the California Air Resources Board which sent the draft 2001 Ozone Attainment Plan back to the local air agency for more public review, and 2) a delay by the EPA in finding the new motor vehicle emission budget to be adequate (EPA's action exceeded the 90 day review period that was agreed to in 1999 litigation over the grandfather clause). As a result, there was a conformity lapse in the Bay Area, which lasted about 8 weeks. The timeline of events leading up to the lapse is shown in Attachment A.

Prior to the conformity lapse, the Bay Area was under a conformity "freeze" due to EPA's disapproval of the 1999 Ozone Attainment Plan and the applicable conformity provisions therein. While Bay Area project sponsors could continue to work on projects in the adopted TIP, no projects could be added or modified. This freeze affected a small number of projects which were ready to be amended into the TIP.

**Experience in Coordinating SIP and conformity process.** Since the mid-90's, the Bay Area has been in a virtually continuous state of updating the Ozone Attainment Plan due to a series of EPA actions. These updates have generally provided timely information for the transportation planning decisions, and the coordination with the local and state air resource agencies has been excellent. As an example, the schedule for the most recent SIP update-the 2001 Ozone Attainment Plan-was accelerated to provide a conformity budget in time for MTC's adoption of the new 2001 Regional Transportation Plan in December 2001.

#### **MOBILE6 Versus MOBILE5 Projections**

**EMFAC 2001.** In California, the equivalent set of motor vehicle emission factors is called EMFAC. Metropolitan Planning Organizations in California will be required to use EMFAC 2001 for all conformity determinations after December 2002. While some MPOs may be able to demonstrate conformity with an older motor vehicle emission budget using EMFAC 2001, a number of others will not. Therefore, a number of metropolitan areas will require SIP revisions in order to incorporate new mobile source emissions calculations and the associated motor vehicle emission budgets for conformity determinations. Since the Bay Area is already required to update its currently submitted SIP by April 2004, the new conformity budgets will be available prior to MTC's next Plan update in 2004.

**Mobile 6 versus Mobile 5.** It is our understanding that MOBILE6 emission projections will be lower than MOBILE 5 for future years.

**8-Hour Ozone Standard.** We are currently unable to determine if the new 8 hour NAAQS will likely lead to an increase or decrease in the vehicle emissions budget for the Bay Area.

#### **Additional Motor Vehicle Emission Controls**

**Additional Existing Controls.** Existing measures that directly address tailpipe emissions and excess vapors from gasoline station nozzles will have a far greater impact on reducing ozone than any new TCMs that MTC may be able to identify and implement under its existing legal authority. Enhancements to the existing motor vehicle inspection program in the Bay Area could reduce smog-forming emissions by over 10 tons a day (although these improvements would, due to the region's air chemistry, provide larger benefits to downwind areas in the Central Valley than the Bay Area). Replacement of selected gasoline station fuel dispensing nozzles could reduce smog-forming chemicals by over 6 tons per day.

**Additional TCMs.** MTC has repeatedly undertaken efforts to identify new TCMs that could provide significant emission reductions but has been unsuccessful. More stringent TCM type measures would require authority which MTC does not presently have (e.g., raising bridge tolls significantly, charging for parking at work sites, or taxing gasoline at very high levels). In addition to the emission reduction considerations, it has been our experience that TCMs that are not directly implemented by MPOs and depend on actions by other agencies will create future legal problems and can affect an MPO's ability to make conformity findings on Plans and TIPs.

MTC has experienced continued legal challenges with TCMs generally and with disputes over one TCM in particular. Many TCMs were drafted over 20 years ago, but are still enforceable today although conditions have changed considerably. The arguments over the particular disputed TCM are unrelated to the air quality reductions that the TCM was intended to achieve and have led to expensive and protracted legal proceedings. In addition, there is a constant risk that legal disputes with this TCM, which provides only minor emission reductions, may eventually affect the conformity process, stalling the region's much needed transit and highway investment program. The dispute over this TCM further highlights the issue of the difficult process that is necessary to go through to even attempt to amend an existing TCM or substitute a new TCM into the SIP.

**Episodic Controls.** In addition to various existing controls, the Bay Area is increasingly interested in a set of control measures that are episodic, that is, are in effect only when needed to address an ozone episode. Episodic controls may involve more stringent regulatory controls coupled with significant incentives to change behavior, but for very short periods of time. These short-term measures may be more acceptable to the regulated community and the public if they are applied during the few very hot days when obvious ozone problems exist.

**Sufficient Controls to Offset New EMFAC 2001 Emissions.** The MTC region is the only area in California that has a submitted SIP based on the latest version of EMFAC

(EMFAC 2000). Since EMFAC 2001 may be similar to EMFAC 2000, the changeover to the newest set of emission factors may not have a significant impact on the need for additional motor vehicle emission controls beyond those in the submitted SIP. However, the answer to this question will not be fully known until further work is completed on the next SIP update in 2004.

#### **Role of Transportation Control Measures**

**Impact of TCMs on Attainment.** In general, traditional categories of TCMs play a relatively minor role in reducing total regional emissions. This is because they affect a small portion of daily travel and largely rely on indirect inducements for changing travel behavior, such as providing more convenient transit or carpooling options. This is not a new conclusion and is well documented in a number of past studies of TCM effectiveness, including studies jointly prepared by US DOT and EPA. TCMs that directly affect the operations of motor vehicles, such as signal timing coordination and freeway incident management, can have more significant air quality benefits, but are often viewed by environmental advocates as encouraging auto travel. The TCMs that have been adopted by MTC fall into three categories: 1) those in the 1982 Plan (one of which is under litigation), 2) a Contingency set of TCMs adopted in response to a SIP lawsuit in the early 90's, and 3) new TCMs adopted for the recently submitted 2001 Ozone Plan. The attached table (Attachment B) lists all these TCMs and the percentage reduction from the on road mobile source inventory associated with each. (Also note that many of the older TCMs have no direct impact on the "Baseline" emission reductions in the SIP but still have legal implications simply because they were once included in the SIP and remain in the SIP).

**Emission Reductions from TCMs.** While the current level of emission reductions is small, there are other issues with adopting new TCMs. First as the vehicle fleet becomes cleaner over time, the impact of TCMs becomes smaller and smaller. Secondly, TCMs often reduce the two smog precursors (Volatile Organic Compounds and Nitrogen Oxides) in nearly equal amounts. Because of the Bay Area's air chemistry, these equal reductions have limited impact on ozone reduction compared to strategies which focus on VOC reductions. Finally, the newer TCMs are progressively less cost effective. As an example one of MTC's newest TCMs, an expanded regional express bus program, will cost \$40 million dollars and produce emission reductions of less than half a ton per day.

**CMAQ Projects and Emission Reductions.** Most of the CMAQ projects and programs in MTC's long range Plan, while having some air quality benefits, are also important for mobility reasons and would be implemented with or without conformity requirements. This is also true in a larger sense, in that the current Regional Transportation Plan invests 77% of the region's transportation funding over the next 25 years in maintenance, operation, and expansion of the Bay Area's extensive public transit system. This investment in maintaining and improving the region's transit system is seen as an essential strategy to protect and improve mobility and quality of life in the Bay Area independent of any impetus from the Clean Air Act. Specifically in reference to CMAQ

funding, there are a number of projects funded by CMAQ, which are part of the regional toolkit to enhance mobility, but do not have specific emission credits in the SIP.

- Regional ridesharing program (starting in 2003)
- Translink universal transit fare card
- Traveler information systems (both highway and transit)
- Transit trip planning systems
- The Air District's Spare the Air program
- Freeway Service Patrol (start up service)
- Transportation for Livable Communities
- Certain transit improvements (e.g., transit signal priority systems and ITS strategies)
- Traffic Engineers Technical Assistance Program (signal timing coordination plans)
- Smart Arterial Projects (ITS applications at the arterial level)

#### **Impacts of a Conformity Lapse**

**Effect of Recent Conformity Lapse on Bay Area projects.** When it became apparent in 2001 that a conformity lapse was imminent (despite the best efforts of MTC and the local air agency to avoid a lapse), MTC developed a comprehensive list of transportation projects that would be "at risk" during the projected period of the lapse—essentially projects that were in the TIP and would need a federal approval between January and April of 2002. This list (Attachment C) was widely distributed to the Bay Area transportation project sponsors, the state DOT, FHWA, and Bay Area Congressional delegation. Because of the early identification of these at risk projects, many projects were able to obtain needed federal approvals prior to the lapse taking effect. The number of projects adversely affected during the 8 week lapse was about 5. The lapse was officially lifted after EPA found the motor vehicle emission budget in the 2001 Ozone Attainment Plan adequate for conformity purposes and FHWA/FTA approved MTC's conformity finding on March 18, 2002. Had MTC not focused political attention on the impact of a lapse on delivery of Bay Area projects, the lapse could have been longer and adversely affected a larger number of projects.

A second set of projects that was also affected included projects that were adopted as part of the 2001 RTP but were not yet in the TIP. These projects included local and state funded projects that were ready to go, but were prevented from being added to the TIP due to the combination Freeze/Lapse. This list of projects and the associated dollar amount is also shown in Attachment C (pages 2 and 3).

A conformity lapse or freeze has two deleterious impacts of project delivery. First delays can increase project costs due to normal cost escalation factors. Costs can also increase due to contractors needing to reschedule planned work. Second, the delays have indirect impacts on the regional economy when the construction dollars and other indirect spin off benefits of construction work are not realized in the planned timeframe.

**Elimination of the "grandfather" provision.** This action had no effect on MTC's long range Plan or specific projects as MTC was able to make conformity findings for amendments to the TIP up until the Freeze/Lapse starting in October of 2001.

#### **Role of Motor Vehicle Emission Estimates and Models**

**Quality of estimates of motor vehicle emissions.** The conformity analysis has focused attention on how well regional travel demand models forecast current and future vehicle activity which then can be translated into estimates of on road motor vehicle emissions. While the interagency consultation process has, over time, resulted in various improvements to MTC's travel forecasting model that are believed to improve its general predictive powers, it is not clear how these changes alone have improved the more global air quality planning process. This is because the larger air quality process depends on numerous additional inputs such as inventory estimates for stationary and biogenic sources and the calibration of complex photochemical models to estimate ozone concentrations. Calibrating photochemical models to accurately replicate ozone episodes and estimate emission reductions needed for attainment is perhaps the most challenging of tasks. Thus there is a continuing concern among the transportation planning community that the travel models are inappropriately being taxed to levels of accuracy (e.g. the pass/fail conformity budget test, where even a tenth of a ton of auto emissions over the budget can throw a Plan or TIP out of conformity) that are higher than required for other models used in the air quality planning process and well within the accepted margin of error for these types of analytical tools.

**Consistency of Motor Vehicle Emission Estimates over Time.** Differences in regional motor vehicle emission estimates for similar years (current or future) are largely a function of new/revised motor vehicle emission factors (MOBILE/EMFAC) as opposed to changes produced in the regional vehicle activity forecasts that are derived from regional travel models. The extent to which motor vehicle emission rates can change from model version to model version is illustrated in Attachment D which compares two recent California EMFAC series and shows changes of 30% to 200%, depending on the year (data are from the California Air Resources Board). In comparison, changes in vehicle activity forecasts for a similar future year would typically vary by 5% or less (these changes would be due to model refinements, new travel behavior data from surveys or the Census, new demographic projections, updated assumptions for bridge tolls, transit fares, parking charges, etc). Thus significant variations in mobile source emissions from forecast to later forecast are the norm rather than the exception given the often dramatic advances in the understanding of on road emission characteristics. Other than professional consensus on the best modeling protocol there is little that can be done to confirm that total vehicle emissions that are occurring in the real environment. This is because air quality monitors cannot separate motor vehicle emissions from other stationary and biogenic (plant) emissions that the monitor is recording.

**Changes in Official Estimates of Emissions.** Two recent SIP submittals highlight the change that can occur between regional emission estimates. The ozone attainment plan prepared in 1999 estimated on road motor vehicle emissions for volatile organic

compounds to be 175 tons per day in the year 2001, while the 2001 ozone attainment plan, prepared a short time later with more recent vehicle emission factors, estimated on road motor vehicle emissions to be 238 tons per day in 2000, a 36% increase. Although estimates of regional VMT and the amount of VMT in different speed ranges were adjusted between plan updates, the bulk of the increase is due to the new emission factors developed by the state air resource agency (EMFAC 2000). In general there are extensive difficulties in separating out the effects of multiple factors that lead to different motor vehicle emission estimates for the same year, but they would tend to be more related to the on road emission factors used at the time of the estimate. Going back 10 or 20 years and comparing emissions today is very problematic for this reason. For example an estimate of emissions made in the early 80's for the year 1987 is identical to what the current ozone plan is projecting for 2006. In reality the earlier emission estimates probably underestimated significantly the actual emission levels of motor vehicles in that era.

#### **Role of Transportation Models**

**Adequacy of Transportation Models.** MTC maintains a highly advanced travel demand forecasting model system that is supported by a major survey of regional travel behavior every 10 years. The model is extremely capable of assessing how changes in highway and transit capacity affect travel behavior and the resulting amount of daily vehicle activity at a regional scale (this model is routinely validated against traffic counts -where such information exists- and transit ridership counts). However, the travel demand models are only one part in a chain of models and estimates necessary to accurately assess motor vehicle emissions. The adequacy of downstream adjustments to the model outputs is just as important as the capability of the model itself. Differences in how the model output is treated can have large impacts on the end calculations of total emissions. As an example, whether motor vehicle emission calculations should be trip-based, meaning that they use average vehicle emission rates for a complete door-to-door driving cycle, or facility-based, meaning that the emission rates should relate to traffic characteristics on specific types of facilities (such as freeways, major arterials, and other local roads) will greatly influence the final regional emission calculation. Similarly, procedures for dividing model estimated travel into speed ranges and distributing vehicle trips by time of day are critical to the overall attainment assessment. Therefore the question concerning the adequacy of existing planning tools, cannot be related to the travel models alone, but must be extended to the post processing assumptions of model outputs, to vehicle emission factor models, and to the complex photochemical models which predict emission concentrations in the atmosphere.

**VMT Growth.** Despite what may seem to be an easy question to answer, there is no universally accepted way to measure or track "actual" vehicle miles of travel (VMT), particularly in a large region such as the Bay Area with 1,500 miles of state highways and 19,000 miles of local roads. Estimates of present year VMT depend on which method is used to measure it, and each approach has inherent limitations, whether it is: federal Highway Performance Monitoring System (HPMS)-based VMT, odometer-based VMT, or travel model-based VMT. Estimated VMT from these various approaches can differ by much as 15 to 20%. A protocol for estimating base year VMT is still under discussion.

The story is somewhat better in terms of being able to forecast future growth rates in VMT, at least for the VMT on freeways. This is because travel model projections can be more directly compared to freeway traffic counts and the growth that they are registering at different freeway locations. In terms of comparing projected VMT from travel models with actual growth rates for VMT, there is a much greater ability to make reasonable comparisons, at least for freeway VMT (a number of Bay Area freeways have permanent traffic counting devices, whereas time series count data are more limited for local arterials). In general we have found that regional travel models do fairly well in estimating future VMT growth, which is highly correlated to the underlying growth rates for population and jobs. Thus, looking at past model projections, say for the last 5 or 10 year period, the model's projected growth rates will generally come close to actual growth rates, except to the extent that unanticipated economic events or fluctuations in gas prices fundamentally change the inputs to the travel model (e.g., population, jobs, auto operating costs, etc).

**Induced traffic.** Traditional MPO travel models address "induced" traffic to the extent that the traffic on any new road facility represents traffic shifted from another route, travel mode, or time of day. The question as to whether new transit or highway facilities actually stimulate a net increase in discretionary trips is a much harder one to answer. While some evidence suggests that these types of trips do exist, their impact over the long term is likely to be inconsequential. For example, in Bay Area demographic projections show that population will grow 14 % over the next 25 years, and jobs will grow 30%. This contrasts to a 5% increase in road miles, which is all the capacity that is funded given the financial constraints and policy choices in the current long range Regional Transportation Plan for the same period. It is therefore likely that as the overall road system becomes increasingly congested due to regional growth, the net effect would be to discourage trips rather than create new trips. In the near term, this same balancing effect would also be expected to occur, which is that any new discretionary trips attracted to a road facility would exist up until the point that the facility becomes heavily used and traffic levels would discourage such trips.

ATTACHMENT A  
**Timeline of Recent RTP and SIP Actions**

- 1999 SIP disapproved (by EPA)
- Conformity "freeze" (TIP)
- Initial 2001 SIP completion (local action)
- Revised SIP completion (local action)
- SIP transmittal to EPA by CARB
- EPA review of budget adequacy
- Conformity "tagout"
- 2001 RTP completion
- RTP conformity finding
- US DOT conformity approval

## Attachment B

## Transportation Control Measures

- 1982 Plan -

| Name   | Tons/Day Reduction and (%)* | Can be Modeled? | Emissions in Baseline? |
|--|-----------------------------|-----------------|------------------------|
| TCM 1: Reaffirm commitment to 28% transit ridership increase between 1978 and 1983   | N/A                         | Yes             | Yes                    |
| TCM 2: Support post-1983 improvements identified in transit operator's five year plans and, after consultation with the operators, adopt ridership increase targets for the period 1983 through 1987 | .72 (.43%)                  | Yes             | Yes                    |
| TCM 3: Seek to expand and improve public transit beyond committed levels   | .37 (.22)                   | Yes             | Yes                    |
| TCM 4: Continue to support development of HOV lanes  | N/A                         | Yes             | Yes                    |
| TCM 5: Support RIDES' efforts  | N/A                         | No              | No                     |
| TCM 6: Continue efforts to obtain funding to support long-range transit improvements   | N/A                         | No              | No                     |

\*Percent relates to on-road mobile source emissions

July 23,

The Honorable James M. Jeffords, Chairman  
The Honorable Robert C. Smith, Ranking  
United States  
Committee on Environment and Public  
Works  
Dirksen Senate Office Building

Dear Senators Smith and

We appreciate your interest in the Clean Air Act conformity program, the impact that program has on transportation planning and the opportunity to provide information from the perspective of a small Metropolitan Planning Organization (MPO). Responses to issues listed in the attachment to your July 3, 2002 correspondence follow.

**Difference in Timing of**

Timing of required studies and reports for the state implementation (SIP), long range transportation plan (LRTP), improvement program (TIP) and the process for conformity analysis is, we agree, complicated at best. A graph accompanies this letter, which illustrates our MPO's recent history of general due dates for each transportation planning document and the effective duration of the document. The four year span of the TIP, for example, stops in two years when the update is due and a new document is developed. That is the most logical of the schedules, because it establishes reasonable time span for viewing the TIP and requires updates on a regular basis. An exception to the timing of the TIP is that a new one must be prepared each time that a LRTP is due. Very important, is the mismatch of the LRTP (20 year horizon) and SIP (10 year horizon), which results in ten years of the LRTP being discounted. There is

and cooperation of state and federal agencies, we have been able to meet required due dates. Because of the different frequencies, one considerable problem is that data and planning assumptions at the time of each update are different in the LRTP and TIP than those used in the SIP. The outcome of modeling projected emissions is affected.

Differences in timing posed delay for a major local FTA investment year, which threatened to increase project costs. The excellent cooperation and effort of the West Virginia Office of Air Quality, and

federal agencies involved, resulted in timely resolution.

Kyova Interstate Planning Commission's experience last year in coordinating SIP and conformity processes with SIP submittals and updates resulted in a conformity lapse. The MPO began the air quality conformity process in February of 2001 that led to conformity analysis not meeting the SIP emission budget. With MOBILE6 on the horizon, the choices were to wait for its release (January 2002) or to request a SIP revision to avoid conformity lapse. The latter was chosen. The lapse occurred in September 2001. A model for interagency cooperation took place among the Environment Protection Agency (EPA), Federal Highway Administration (FHWA),

Federal Transit Administration (FTA), West Virginia Department of Transportation (WVDOT), the local transit authority (TTA) and the West Virginia Division of Air Quality (WVDAQ), which resulted in expediting the approval of a revision to the WV SIP.

#### **MOBILE6 Versus MOBILE5 Projections**

The West Virginia SIP was developed using MOBILE5. Neither Kyova nor the state of West Virginia has practical experience with the use of MOBILE6, however it will be used to produce the WWSIP next year.

Kyova's conformity status is maintenance. To meet EPA requirements for use of latest planning assumptions, even though we use MOBILE5, it was necessary to use MOBILE6 default data for motor vehicle registration. That process generated excess emission data.

The new eight hour National Ambient Air Quality Standards is not expected to change the emissions budget.

#### **Additional Vehicle Emission Controls**

The Kyova Interstate Planning Commission urban area is less than 200,000 in population and is, therefore, not a Transportation Management Area (TMA). West Virginia, which is the lead state for the MPO, federal vehicle emission control program.

#### **Role of Transportation Control Measures**

TCMs are not required in the planning area. CMAQ projects in the plan are associated with model reduction credits. In planning, Kyova has taken into account a planned extensive bicycle path, an intermodal facility and traffic signal system optimization to reduce vehicle trips, travel time/delays and emissions.

**Impacts of Conformity Lapse**

When the conformity lapse occurred in September 2001, consequences were immediate as expected. Our greatest concern at the time were projects that would suffer increased costs and delays that could threaten project development. As mentioned previously, an extraordinary spirit of cooperation among all concerned agencies averted that problem.

**Role of Motor Vehicle Emission Estimates and Models**

For a small MPO, where presumed data is used, it is difficult to quantify results. The conformity analysis is expected to maintain attainment status for the area for all plan years.

The conformity process does help focus public attention on air quality concerns. MOBILE5a mobile source emission models are used to estimate VOC and NOX. Different methods and levels of analysis, as well official estimates of motor vehicle emissions have changed over the past 10-20 years making comparisons unrealistic.

**Role of Transportation Models**

Conformity analysis has not been supported by adequate regional transportation analysis models that reflect how changes in highway capacity affect total travel and air pollution emissions.

The transportation model accounts for only two-thirds of the actual vehicle miles of travel (VMT) since the travel forecasting model is limited to the urbanized area. Remaining VMTs are projected.

We are grateful, that in the course of the reauthorization proceedings, the Committee has recognized this important air quality process and the opportunity to improve its outcome. Thank you for the opportunity to provide information for your deliberations.

Sincerely,

Michele P. Craig  
Executive Director

Dear Mr. Jeffords

PINEVILLE  
STALLINGS  
UNION  
COUNTY  
WEDDINGTON

As part of the reauthorization of the Transportation Equity Act for the 21<sup>st</sup> Century (TEA-21), the Senate Committee on Environment and Public Works has requested that the City of Charlotte participate in providing information concerning our experience with the Clean Air Act conformity program and transportation control measures. I have attached our response for your review.

Please feel free to contact me at 704.336.8643, if you desire any additional information.

Sincerely,

Danny Rogers, P.E.  
MPO Secretary

### Conformity Case Studies

#### Difference in Timing of Schedules:

- What impact have these schedules had on investments in highway and safety projects, construction costs, and air quality projects and activities? Mismatch between the Transportation rules and Air Quality rules require the MPO to provide twenty-year transportation plans, but air quality budgets are only given for ten-year periods. Updates to the Transportation Plan are required every three-years, however, the SIP is not required to be updated that often.

*(Example): The MPO's 2025 Plan had to be compared to one year budget of 2005, which is a twenty-year mismatch.*

- What has been your experience coordinating your SIP and conformity processes with SIP submittals or updates? The requirement to update Transportation Plans and Conformity Determinations every three-years provides only enough time to do the bare minimum of planning work. (more detailed planning, migration of models and testing of new technology is prohibited under the current time constraints). It is desirable to extend Transportation Plan updates and Conformity Determinations to every five-years.

#### MOBILE6 Versus MOBILE5 Projections:

- Will the new 8-hour NAAQS likely lead to an increase or decrease in your vehicle emissions budget? Will probably lead to a decrease in our vehicle emissions budget.

#### Additional Vehicle Emission Controls:

- What additional existing controls could be implemented in your area to significantly reduce vehicle emissions, e.g., inspection and maintenance, reformulated fuels, diesel retrofit, TCMs? Early introduction of low sulfur gasoline and diesel fuels. Accelerate diesel fleet turnover or retrofits by including requirement in Federal and State contracts for clean diesel technology.
- Would these controls be sufficient to address the potential increase in emissions projected under MOBILE6? Not enough modeling has been completed to accurately answer this question; however, the non-road mobile sources will be an increasing percent of the mobile inventory as approved measures are implemented in the on-road sector.

**Role of Transportation Control Measures:**

- What role do TCMs play in helping to meet attainment? Please list the TCMs and CMAQ projects in your plan, and the associated "off" or "on" model emission reduction credits for each. We do not have TCM's. CMAQ projects are currently limited to bus replacement and expansion of transit service and limited intersection and ITS projects.
- Are there CMAQ projects in your plan for which you have not applied any on or off model emissions reductions? We have not claimed emission reductions from those projects.

**Impacts of Conformity Lapse:**

- What impact did the March 1999 U.S. Court of Appeals decision to eliminate the EPA "grandfather" provision from the conformity regulations have on your transportation investments? The loss of the grandfather provision has brought the need for completing a conformity plan to a much higher priority. This has placed considerable stress of limited federal funding available to complete the planning task.

**Role of Transportation Models:**

- Has conformity analysis been supported by adequate regional transportation analysis models that accurately reflect how changes in highway capacity affect total travel and air pollution emissions? Our transportation model does not represent the entire nonattainment area for which we have sub-allocated budgets.

Committee on Environment and Public Works  
Washington, DC 20510-6175

Dear Senator Smith and Senator Jeffords:

We are pleased to respond to your recent questionnaire on Conformity Case Studies related to the upcoming Senate Committee on Environment and Public Works hearing on Transportation and Air Quality. We appreciate the opportunity to provide you with input on the experience of our large Metropolitan Planning Organization with the Clean Air Act conformity program as well as our transportation and air quality planning efforts overall.

Our responses to the specific items on the questionnaire are enclosed. If you have any further questions, please don't hesitate to contact me or David Heller, our Air Quality Planner, at: (973) 639-8429.

Thank you again for this opportunity. We look forward to hearing from you on the findings of the Transportation and Air Quality hearing.

Sincerely,

  
Joel Weiner  
Executive Director

David Heller, NJTPA

## US Senate—Committee on Environment and Public Works—Conformity Case Studies

### Difference in Timing of Schedules

• Describe how the different schedules for the SIP, TIP, Conformity, etc. and the impacts of data changes on out year emissions affect your ability to develop effective and timely transportation and air quality plans. Provide a time-line or narrative description of your various schedules.

*In principle, differences in the SIP/Plan/TIP schedules can cause some difficulty. In the past, we have sought better coordination of these schedules. However, in recent experience, as illustrated by the timelines below, there has been sufficient coordination so as not to delay or hamper transportation and air quality plans.*

#### TIP/Conformity Schedule (Typical) (2001)

#### Sample SIP Schedule (2002)

• What impact have these schedules had on investments in highway and safety projects, construction costs, and air quality projects and activities?

*As noted above, the difference in SIP/Plan/TIP schedules have not impacted investments in highway and safety projects, construction costs, and air quality projects and activities.*

• What has been your experience coordinating your SIP and conformity processes with SIP submittals or updates?

*The timing of a SIP submittal can pose somewhat of a challenge. For example, while preparing the emissions budgets for use with Mobile 6.0, we were working on our conformity analysis for this year's TIP and RTP using Mobile 3.0 emissions budgets.*

#### MOBILE5 Versus MOBILE6 Projections

• Compare and contrast your MOBILE5 and MOBILE6 emission projections.

*The preliminary runs in producing Mobile 6 estimates show that Mobile 6 generates higher emissions for both VOC and NOx than Mobile 3. There is also a greater percentage reduction in 2007 (the out-year) than 1996 for both pollutants.*

- How does the increase in near term emissions (through 2010) from Mobile 6 affect your conformity status?

*Since new budgets using Mobile 6 are currently being generated now, (which will be higher than the current Mobile 5.0 budgets), and we will be using these new budgets when we run the conformity analysis next year; it will likely not affect our conformity status.*

- How will your air quality planning process take the new MOBILE6 into account, and will the SIP be updated before or after the new MOBILE6 projections?

*The SIP is currently being updated now with Mobile 6, but for this year's conformity analysis, we are running Mobile 5.0. Next year, we will be running Mobile 6.*

- Will the new 8 hour NAAQS likely lead to an increase or decrease in your vehicle emissions budget?

*Since the new standard is more stringent than the old one-hour standard (i.e. from 0.08 parts per million measured over eight hours vs. 0.12 parts per million measured over one hour), it will likely lead to a decrease in our vehicle emissions budget. However, this is more likely due to technology changes as opposed to the stricter standard. However, at this point, no budgets using the 8-hour Ozone standard have been calculated.*

- What additional existing controls could be implemented in your area to significantly reduce vehicle emissions, e.g. inspection and maintenance, reformulated fuels, diesel retrofit, TCM's?

*Inspection and maintenance, reformulated fuels, and diesel retrofits are all being done to some extent in the Northern New Jersey region. Transportation Control Measures (TCM's) could certainly be implemented in our area. Currently, there are no TCM's in the SIP. Also, more widespread use of Alternative Fuels (e.g. natural gas, electric, etc.) by all types of vehicles (both private and commercial) in our region could probably also significantly reduce vehicle emissions.*

- Would these controls be sufficient to address the potential increase in emissions projected under MOBILE6?

*It is difficult to say at this point, without having used Mobile 6 emissions in an official conformity analysis. In the past, we took large credits from the implementation of the Inspection and Maintenance Program in New Jersey. We are also currently taking large credits from the implementation of the Tier 2 low-sulfur fuel program. But alternative fuel vehicle programs or even some TCM's (i.e. employer-sponsored flexible work schedules), may not be all that significant in reducing overall regional emissions.*

#### **Role of Transportation Control Measures**

- What role do TCM's play in helping to meet attainment? Please list the TCM's and CMAQ projects in your plan, and the associated "off" or "on" model emission reduction credits for each.

*There are currently no TCM's in our SIP, so they play no role in helping to meet attainment. The following list is the CMAQ projects scheduled for inclusion in the upcoming FY 2003-2005 TIP. The DBNUM is the unique identifier for each project.*

```
DBNUM ProjectName
01316 Transportation Demand Management/Transit Village Program
02347 Rte. 80 Sec. Howard Boulevard NJ TRANSIT Park & Ride Mile posts:
30.61 -
99357 Bicycle Projects, Local System
99358 Pedestrian Projects, Local System
```

T07 Emission Control/Rebuilt Engines  
 T106 Private Carrier Equipment Program  
 T111 Bus Acquisition PROGRAM  
 T112 Rail Rolling Stock Procurement  
 T120 Clean Air Programs  
 T87 Hudson/Bergen LRT System MOD 1  
 X063 Local CMAQ Initiatives  
 X095 Enhanced Vehicle Inspection and Maintenance  
 X185 Bicycle & Pedestrian Facilities/Accommodations  
 X32 Project Development, Preliminary Engineering  
 X34 Freight Program  
 X43 Transportation Management Association Program Support--This program supports the evaluation of the impact of TMA/TDM strategies on air quality, traffic congestion, and the statewide transportation system.  
 X43X TMA-MITPA-This program will provide funding of Keep Middlesex Moving (KMM), Hudson, Meadowlink, McRides, Ridewise, and Hunterdon Rural, Transportation Management Associations (TMA).

**\* What percentage of total emission reductions do they represent? (for TCM's) at the current time. At the present time, our regional model measures aggregate emissions, so it is difficult to determine emissions from specific projects.**

**\* Are there CMAQ projects in your plan for which you have not applied any on or off model emissions reductions?**

*There are some CMAQ funded projects, such as Clean Air Programs (T120 above) or Pedestrian Projects (DBNUM 99358), which are exempt under conformity regulations. But there are others, such as the Enhanced Vehicle Inspection and Maintenance Program, for which we receive a significant credit.*

#### **Impacts of Conformity Lapse**

**\* If your area has experienced a conformity lapse, describe the effect this has had on transportation and air quality planning, funding process, preconstruction, and construction.**

*In 1998, we experienced a conformity freeze, because of improper implementation of the enhanced inspection and maintenance program. It delayed the implementation of some projects, but because a new SIP was put in place, and the State promised to expedite the implementation of the I&M program, the "effect" was not quite as severe as originally expected.*

**\* When projects were reactivated, after USDOT approved your conformity determination, what impact did this have on funding, project completion dates, personnel, renegotiation of contracts, updating old information, etc.?**

*Some projects that were previously delayed could not be rescheduled.*

**\* What impact did the March 1999 U.S. Court of Appeals decision to eliminate the EPA "grandfather" provision from the conformity regulations have on your transportation investments?**

*This decision just made it more difficult for some projects to advance during a conformity lapse, because only exempt or Non-Regionally significant Non-Federal projects are able to advance in a lapse. Those projects from a previously conforming plan/TIP, which have received funding commitments for*

construction, Plans, Specifications & Estimates (PS&E) approval, Full Funding Grant Agreements (FFGA), or equivalent approvals may also advance.<sup>1</sup>

#### Role of Motor Vehicle Emission Estimates and Models

- How has conformity analysis helped improve the quality of estimates of motor vehicle emissions for SIPs to better protect public health?

*As the models have gotten more sophisticated, more comprehensive and realistic estimates of emissions are generated. The conformity process itself draws clear requirements for planning, stressing the importance of environmentally beneficial projects to decision-makers. At the NJTPA, the planning and project selection process have systematically incorporated methods (e.g. Sustainability Performance Goals and Project Prioritization Criteria) to favor such beneficial projects.*

- How accurate and consistent have estimates of regional motor vehicle emissions been when compared with each other over time and with actual experience?

*When compared with each other over time, estimates of regional motor vehicle emissions have decreased gradually. There has been a decrease in overall emissions in the entire region as well.*

- How have official estimates of motor vehicle emissions in your metropolitan region changed over the past 10-20 years and how well have they tracked actual emissions in years past?

*Generally, in the North Jersey region, motor vehicle emissions have gone down over the past 20 years. It is difficult to track actual emissions, because even though there is monitoring of pollutants, it is difficult to differentiate between the ozone precursors (i.e. NOx, VOC's), as well as the different categories of sources: (mobile, stationary, point).*

#### Role of Transportation Models

- Has conformity analysis been supported by adequate regional transportation analysis models that accurately reflect how changes in highway capacity affect total travel and air pollution emissions?

*Yes. The NJTPA uses an elaborate regional transportation model which follows the advanced four-step travel demand process, and has a "capacity-sensitive" assignment algorithm, as specified in §93.122 (iv) of the Transportation Conformity Rule. The model is linked to a sophisticated Post-Processor for Air Quality (PPAQ), which can actually calculate emissions based on changes in link capacity.*

- How well have your region's travel models tracked actual experience with growth in vehicle miles of travel (VMT)?

*It is calibrated to replicate observed traffic with an error of +/- 1%.*

*Our region's travel model has captured the increase in vehicle miles of travel which has been the actual case. Over time, the NJRTM (North Regional Transportation Model) has followed "actual" urban VMT within a range of +/- 10%.*

<sup>1</sup> US DOT, Transportation Conformity Reference Guide. May 2000. p. C-4-4.

NEW YORK METROPOLITAN TRANSPORTATION COUNCIL

Tom Schulze  
Executive Director

July 25, 2002

Hon. James M. Jeffords, Chairman  
Committee on Environment and Public Works  
United States Senate  
Washington, DC 20510-6175

Dear Senator Jeffords:

Please see the attached response to the specific air quality questions you have forwarded.  
I trust this is the information you are seeking as you proceed with the TEA-21 reauthorization.

As you requested, I am e-mailing my response to Chris Miller.

Sincerely,

Tom Schulze  
Executive Director

### Conformity Case Studies

#### I. Difference in Timing of Schedules

- a) **Describe how the different schedules for the SIP, TIP, Conformity, etc. and the impacts of data changes on out year emissions affect your ability to develop effective and timely transportation and air quality plans. Provide a time-line or narrative description of your various schedules.**

It would be helpful if the schedules for updating the SIP, TIP, conformity, and the supporting databases were coordinated on a rational basis so that all schedules are synchronized to the greatest extent possible.

Currently, we must update our Regional Transportation Plan on a three-year cycle and our Transportation Improvement Program (TIP) a minimum of once every two years. The TIP is amended outside of this update cycle on an as needed basis. Conformity analyses are required whenever updates to these products add, subtract or change non-exempt projects included in the fiscally constrained plan or TIP.

- b) **What impact have these schedules had on investments in highway and safety projects, construction costs, and air quality projects and activities?**

The difference in schedules has not significantly impacted to date investments in highway and safety projects, construction costs, and air quality projects and activities. However, we anticipate significant impacts in coming years as we approach the region's attainment data under the clean air act.

- c) **What has been your experience coordinating your SIP and conformity process with SIP submittals or updates?**

The number of intervening years since the last SIP submittal and the need to perform a conformity determination in the near future present a problem because the original planning assumptions used in the SIP have changed in the interval.

#### 2. MOBILE6 Versus MOBILE5 Projections

- a) **Compare and contrast your MOBILE5 and MOBILE6 emission projections.**

At this time no official projections have been issued, as the process for using Mobile6 for both the SIP and for future conformity determinations nears completion. Nevertheless, preliminary indications are that Mobile6 will give higher emission rates for the milestone years of 2005 and 2007, in line with national trends.

- b) **How does the increase in near term emissions (through 2010) from MOBILE6 affect your conformity status?**

A potential increase in near term emissions (through 2010) from Mobile6 will increase the need to develop effective emission reduction strategies.

- c) **How will your air quality planning process take the new MOBILE6 into account, and will the SIP be updated before or after the new MOBILE6 projections?**

Currently we are working on using Mobile6 with our new transportation model. The SIP will be updated using Mobile6 first.

- d) **Will the new 8 hour NAAQS likely lead to an increase or decrease in your vehicle emissions budget?**

The new standard is more stringent than the current one-hour standard (i.e. from 0.08 parts per million measured over eight hours vs 0.12 parts per million measured over one hour); therefore it will probably result in a decrease in our vehicle emissions budget.

### 3. Additional Vehicle Emission Controls

- a) **What additional existing controls could be implemented in your area to significantly reduce vehicle emissions, e.g., inspection and maintenance, reformulated fuels, diesel retrofit, TCMS?**

Our organization has consultant studies underway to determine which proposed emission reduction measures are most effective for reducing air pollution in this area. Inspection and maintenance and reformulated fuel programs are already in place.

- b) **Would these controls be sufficient to address the potential increase in emissions projected under MOBILE6?**

We will know the answer to this question when the consultant efforts are complete. One important consideration is the potential cost-effectiveness of the measures.

### 4. Role of Transportation Control Measures

- a) **What role do TCMS play in helping to meet attainment? Please list the TCMS and CMAQ projects in your plan, and the associated "off" or "on" model emission reduction credits for each?**

There are no active TCM's in our SIP at this time. The current TIP contains a number of projects that help reduce emissions; including park and ride facilities. Intelligent transportation systems, and CMAQ projects that produce beneficial impacts on air quality. Please refer to the list of CMAQ projects in 4c with positive air quality impacts.

**b) What percentage of total emission reductions do they represent?**

Currently, we are looking at calculations to determine the proper level of emission reductions due to these projects.

**c) Are there CMAQ projects in your plan for which you have not applied any on or off model emissions reductions?**

To date we have not yet applied any credit for these projects pending further analysis of their benefits.

**REGIONAL PROJECT:**

Electrical Vehicle Demo – A three year demonstration of deploying 100 electric vehicles.

**5. Impacts of Conformity Lapse**

- a) **If your area has experienced a conformity lapse, describe the effect this has had on transportation and air quality planning, funding process, preconstruction, and construction?**

This area has not experienced a conformity lapse to date.

- b) **When projects were reactivated, after USDOT approved your conformity determination, what impact did this have on funding, project completion dates, personnel, renegotiation of contracts, updating old information, etc.**

See response to 5(a)

- c) **What impact did the March 1999 U.S. Court of Appeals decision to eliminate the EPA "grandfather" provision from the conformity regulations have on your transportation investments?**

There has been no impact to date since there has never been a conformity lapse. However, it is understood that this decision would no longer allow projects that had been previously found to conform and had completed the NIEPA process to advance in the event of a lapse.

**6. Role of Motor Vehicle Emission Estimates and Models**

- a) **How has conformity analysis helped improve the quality of estimates of motor vehicle emissions for SIPs to better protect public health?**

In the time period before the introduction of the Clean Air Act amendments in 1990, sketch planning tools and early Mobile models were used to develop rough estimates of the impact of the TIP on air quality. Today, comprehensive and realistic estimates are generated.

- b) **How accurate and consistent have estimates of regional motor vehicle emissions been when compared with each other over time and with actual experience?**

Generally speaking, the emission estimates have proven to be reasonably accurate. For example a recent unanticipated rise in the number of SUVs resulted in an increased level of emissions predicted by the models and MOBILE5.

- c) **How have official estimates of motor vehicle emissions in your metropolitan region changed over the past 10-20 years and how well have they tracked actual emissions in years past?**

Generally, in the New York metro area, motor vehicle emissions have declined over the past 20 years in line with national trends and in accordance with the rate of progress towards attainment required by the Clean Air Act 1990. The model estimates of the emissions have tracked these changes in actual emissions fairly well.

7. **Role of Transportation Models**

- a) **Has conformity analysis been supported by adequate regional transportation analysis models that accurately reflect how changes in highway capacity affect total travel and air pollution emissions?**

Yes, this metro area uses a regional transportation model, which follows the four step travel demand process and has a 'capacity sensitive' assignment algorithm. This model is linked to a sophisticated post-processor for air quality which calculates emissions based on changes in link capacity.

- b) **How well have your region's travel models tracked actual experience with growth in vehicle miles of travel (VMT)?**

It appears that our travel models are able to track actual experience with growth in VMT very well. The network based travel models are reconciled with HPMS on a regular basis, and factors are developed to calibrate the network. These factors are then applied to model estimates of future VMT.

- c) **Please include an indication of how sensitive your/these models are to effects of induced traffic?**

The new model is properly sensitive to the effects of induced traffic on a regional and corridor level. The new model has not yet been used for a conformity analyses.

Senator JEFFORDS. Senator Inhofe.

**OPENING STATEMENT OF HON. JAMES M. INHOFE,  
U.S. SENATOR FROM THE STATE OF OKLAHOMA**

Senator INHOFE. Thank you, Mr. Chairman.  
Today's hearing is a subject I've spent a good deal of time on, back when we were in the majority I chaired the Subcommittee on

Clean Air. We addressed some of the problems, we worked to make sure the States had tools necessary to meet Clean Air requirements. Title VI of TEA-21 is a result of the subcommittee's efforts. Following passage of TEA-21, there was concern with the effects of conformity on newly designated areas of non-attainment. Specifically, we were concerned that these new areas had adequate time to bring their communities back into attainment before we lost critical highway dollars. Every time I think about one of these programs where holding back highway dollars reminds me of 1966, Mr. Chairman, when I, as a newly elected State legislator, came to Washington to testify before this very committee. At that time, Jennings Randolph was the chairman. And here we are right now, we lost the fight then, now we're going to try to win it again after all these years.

As a result of our efforts, and working with other members, we were successful in attaching language to the fiscal year 2001 VA-HUD appropriation bill, of which Senator Bond was the chairman and was very helpful to us. That established a 1 year grace period before an area newly designated as non-attainment must demonstrate conformity. As the Ranking Member of the Transportation Infrastructure Subcommittee, I now have the opportunity to work more closely on making sure that the Clean Air requirements and transportation needs do not conflict.

I believe there is still much that needs to be done. For instance, the recent data shows, as Senator Smith pointed out, that the impact of increased vehicle travel is having a smaller and smaller impact on emissions, because of the improvements in emissions control technology. I want to explore with our witnesses what practical effect this has on choices States can make, given that many of the emission goals are based on old data.

I will be interested to hear if our witnesses believe we should re-examine how the current congestion mitigation air quality programs, CMAQ programs, work and what changes if any need to be made in the program to make it more usable for the States. Additionally, I have concerns with the new rule on diesel engine nitrogen oxide, which is scheduled to go into effect on October 1st of 2002. While I understand this is consistent with the provisions of a consent decree entered into with engine manufacturers, my concern is that the trucking community has raised several valid issues, not the least of which is that there has not been sufficient time to thoroughly test new engines. And given the presence of Mr. Holmstead from the Air Office of the EPA, I hope we can spend a little time exploring that issue further, which we have talked about privately.

Finally, and most importantly, I want to thank Mary Peters. We had a disaster in Oklahoma that was similar to the one that happened down in Texas, in Port Isabelle, Texas. It didn't get much publicity down there, because it happened at the same time that the September 11th tragedy took place, and that is, a barge running into a bridge and then the cars going over and several people falling to their deaths. That happened in Oklahoma. Mary, it's kind of funny, because most people in this room don't even know that we're navigable in Oklahoma, we have a navigation lane. But sure enough, we do.

Well, this happened, you were there just a matter of days afterwards. We put together a very aggressive repair schedule. We actually ended up yesterday opening it up 30 days earlier than we would have otherwise. While there are some penalties in the provision for us, it was certainly to the benefit of everyone, particularly those in Oklahoma, for not having to go that long route to circumvent the disaster area.

So I just want to thank you for coming out, not just when this first happened, not just when we started the project, but also yesterday when we dedicated it, and all the work that you have done. Because it couldn't have been done without your personal attention, and I thank you very much for that.

Thank you, Mr. Chairman.

Senator JEFFORDS. Senator Bond.

**OPENING STATEMENT OF HON. CHRISTOPHER S. BOND,  
U.S. SENATOR FROM THE STATE OF MISSOURI**

Senator BOND. Thank you very much, Mr. Chairman, for holding this hearing on transportation and air quality issues. We all depend upon and expect clean, healthy air for our families, our children and our elderly to breathe. We also all depend upon safe, affordable and accessible transportation to get our breadwinners to work, take our family to buy groceries, get to the hospital in an emergency or visit our relatives. We must succeed at providing both air quality and transportation solutions.

I'm very pleased to have been working with my colleagues on this committee in the Congress, as well as colleagues when I was in the Governor's Conference, to make sure we're on that path. Congress, as part of its debate to reauthorize the next transportation program, will reconsider congestion mitigation and air quality programs in ways to ensure conformity between transportation plans and air qualities. I support the goals of these programs and plans.

However, 10 years of CMAQ and conformity requirements have shown us that many of our original assumptions in the way we set up the programs are outdated, mistaken or in need of reform. The transportation sector, as Senator Smith has demonstrated, has made great progress, improving air quality over the last 30 years. Between 1970 and 1999, carbon monoxide emissions from on-road vehicles were reduced by 43 percent. Volatile organic compounds, a precursor to ozone, were reduced by 59 percent. Particulate matter, PM10 emissions, have been reduced by 33 percent. NOX emissions from automobiles have been down 31 percent since 1970.

As we review the CMAQ and conformity programs, we should remember that most of the air quality improvements in the transportation sector came from new vehicle emission and fuel standards, not transportation control measures or blocked transportation projects. Indeed, a recent National Academy of Science transportation research board study, which has already been cited, evaluating the effectiveness of the CMAQ program, raised some serious questions that ought to be considered, and concluded that approaches aimed directly at emissions reductions generally have been more successful than CMAQ strategies relying on changes in travel behavior.

Furthermore, as we see greater and greater benefits from vehicle emission reductions, the CMAQ strategies have less and less relevance in terms of further reduction of pollutants. These results shouldn't be surprising. No matter how well intentioned the proposals, most Americans just don't want to live in dense urban areas serviced by mass transit. Nor do we want to ride our bikes to work. Some of our most disadvantaged depend upon cars. Single mothers need cars to drive their children to day care. Low income workers need workers to get from their affordable housing to oftentimes distant jobs in suburbs.

Likewise, by 2004, cars will be 100 times cleaner than they were in 1970, 100 times. That means that a ride share program to reduce vehicle miles traveled will be 100 times less effective in 2004 as it was in 1970 in reducing air pollution. As the Transportation Research Board states, transportation control measures, such as public transit, HOV lanes, traffic flow and bicycle lanes may help air quality on the margins, but they are becoming increasingly less relevant. I believe the solution to air quality lies in programs aimed directly at emissions reductions. We must continue to develop the next generation of vehicles with low emission or no emission technology and I think it is vitally important that we must also preserve alternative modes of transportation like barge traffic. We in Missouri, St. Louis, are at the heart of the heaviest truck transportation lanes in the Nation. The Federal Highway has come out with a study that shows the red lines, and the brightest red lines all converge in St. Louis. And we have a choice, a single 15 barge tow will carry the cargo of 870 semi-trucks. That means 870 trucks come off our congested highways and 870 fewer trucks polluting the air as they go through that critical area.

Transporting one ton of cargo by barge produces 85 percent less hydrocarbon than by truck. We cannot close off these other forms of transportation, like some are trying to do on the Missouri River. A sidebar, but an important one.

Senator JEFFORDS. I got you.

[Laughter.]

Senator BOND. In the meantime, we must aggressively pursue clean burning renewable fuels, such as bio-diesel. And you knew that was coming, too. Bio-diesel reduces particulate matter and the harmful air toxics that can cause cancer. Bio-diesel reduces sulfur dioxide emissions, unburned hydrocarbons and life cycle CO2 emissions. At my urging, and by strong request, the St. Louis transportation authority has committed to begin burning the B-20 bio-diesel blend in its vehicles, and we expect that Kansas City will follow suit. Instead of being engulfed by the noxious fumes of diesel as you follow a bus in our major cities, you will think of stopping for french fries, and you'll be getting cleaner air.

Last year, I introduced legislation with Senator Johnson, S. 1071, to expand the CMAQ program to address additional air pollutants and make eligible for funding technologies such as bio-diesel that improve air quality in these areas. The recent National Research Board report supports expanding the CMAQ program to include particulate matter, air toxics, sulfur dioxide and CO2. I hope we will take a hard look at this proposal. This is one area where I think CMAQ funds can make a very significant reduction in air

pollution by making it economically affordable for more cities to burn the B-20 blend.

As for transportation improvements, the current process unfortunately leaves highway construction bogged down and overlapping and conflicting deadlines, planning processes out of sync, litigation tying the hands of planners and construction workers, and congestion mitigation measures which don't work. The result is gridlock, congestion and traffic jams. Unfortunately, traffic jams do not clean the air. Bumper to bumper slow moving or idling cars do not reduce asthma. In fact, they increase it. That's why when I was Governor of Missouri, I was proud to sign a right turn on red light measure, to get idling cars off the road. A small measure, but one of the things that can make a difference. All the bike racks in the world and nice bike trails won't make that much difference.

Transportation opponents follow the reverse of the old adage, if you build it, they will come. They believe if you don't build it, then they won't come. Well, not only are they coming, but they're here. Meanwhile, congestion costs to the economy have more than tripled from \$21 billion to \$72 billion from 1982 to 1997.

Transportation opponents have the right to oppose cars. I support funding for their innovative transportation programs to help where they can. But the remaining 99 percent of us must also have transportation capacity to allow for safe and vibrant communities, not only cleaning up the environment, but saving lives. Taking away transportation money is not the solution. We shouldn't punish commuters struck in traffic trying to get home to their families. How can we look these people in the face and say, we're making their lives miserable in the name of air quality when this committee just doomed any hope of passing this year additional SOX-NOX and mercury air pollution reductions from electric utilities in order to make a political point about carbon dioxide?

We have the chance to make real improvements in the transportation and air quality planning process. We have the chance to give metropolitan planning organizations flexibility and certainty. We have the chance to give our families cleaner air. We have the chance to give our communities, our workers and our families safe and accessible transportation. I look forward to working with my colleagues to pursue all of these noble objectives.

I thank the chair.

[The prepared statement of Senator Bond follows:]

STATEMENT OF HON. CHRISTOPHER S. BOND, U.S. SENATOR FROM THE STATE OF MISSOURI

Mr. Chairman, thank you for holding this hearing on transportation and air quality issues. We all depend upon clean, healthy air for our families, our children and our elderly to breathe. We also all depend upon safe, affordable and accessible transportation to get our breadwinners to work, take our family to buy groceries, get to the hospital in an emergency, or visit our relatives. We must succeed at providing both air quality and transportation solutions.

Congress, as part of its debate to reauthorize the next transportation bill, will reconsider congestion mitigation and air quality programs, and ways to ensure conformity between transportation plans and air quality plans. I support the goals of these programs and plans.

However, 10 years of CMAQ and conformity requirements have shown us that many of our original assumptions and the way we set up the programs are outdated, mistaken, or need reform.

The transportation sector has made great progress improving air quality over the last 30 years. Between 1970 and 1999, carbon monoxide emissions from on-road vehicles were reduced by 43 percent. Volatile organic compounds, a precursor to ozone—were reduced 59 percent. Particulate matter (PM-10) emissions have been reduced 33 percent. NOx emissions from automobiles are down 31 percent since 1970.

As we review the CMAQ and conformity programs, we should remember that most of these air quality improvements in the transportation sector came from new-vehicle emission and fuel standards, not transportation control measures or blocked transportation projects. Indeed, a recent National Research Council study evaluating the effectiveness of the CMAQ program concluded that approaches aimed directly at emissions reductions generally have been more successful than most CMAQ strategies relying on changes in travel behavior.

These results shouldn't surprise anyone. No matter how wellintentioned the proposals, most Americans just don't want to live in dense urban areas serviced by mass transit. Nor do we want to ride our bikes to work. Some of our most disadvantaged depend upon cars. Single mothers need cars to drive their children to daycare. Low-income workers need cars to get from their affordable housing to often-times distant jobs in suburbs.

Likewise, by 2004, cars will be one hundred times cleaner than they were in 1970. That means that a ride share program to reduce vehicle miles traveled will be one hundred times less effective in 2004 as it was in 1970 in reducing air pollution. As the NRC states, transportation control measures such as public transit, HOV lanes, traffic flow, and bicycle lanes may help air quality on the "margins," but are becoming increasingly irrelevant.

I believe the solution to air quality lies in programs aimed directly at emission reductions. We must continue to develop the next generation of vehicles with low-emission or no-emission technology.

In the meantime, we must aggressively pursue clean-burning, renewable fuels such as biodiesel. Biodiesel reduces particulate matter and the harmful air toxics that can cause cancer. Biodiesel reduces sulfur dioxide emissions, unburned hydrocarbons, and lifecycle CO2 emissions.

Last year, I introduced legislation with Sen. Johnson, S. 1071, to expand the CMAQ program to address additional air pollutants, and make eligible for funding technologies such as biodiesel that improve air quality in these areas. The recent NRC report supports expanding the CMAQ program to include particulate matter, air toxics, sulfur dioxide and CO2. I hope we will take a hard look at this proposal.

As for transportation improvements, the current process leaves us bogged down in overlapping and conflicting deadlines, planning processes out of sync, litigation tying our hands, and congestion mitigation measures which don't work. The result is gridlock, congestion and traffic jams.

Unfortunately, traffic jams do not clean the air. Bumper-to-bumper, slow moving or idling cars do not reduce asthma. All the bike racks in the world will not ease congestion.

Transportation opponents follow the reverse of the old adage "if you build it they will come." They believe that "if you don't build it, then they won't come." Well, not only are they coming, but they're already here.

Transportation opponents have the right to oppose cars. I support funding for their innovative transportation programs to help where they can. But the remaining 99 percent of us must also have the transportation capacity to allow for safe and vibrant communities.

Taking away transportation money is not the solution. We shouldn't punish commuters stuck in traffic trying to get home to their families. How can we look these people in the face and say we are making their lives miserable in the name of air quality when this committee just doomed any hope of passing this year additional SOx, NOx and mercury air pollution reductions from electric utilities in order to make a political point about carbon dioxide?

We have the chance to make real improvements in the transportation and air quality planning process. We have the chance to give metropolitan planning organizations flexibility and certainty. We have the chance to give our families cleaner air. We have the chance to give our communities, our workers and our families safe and accessible transportation. I look forward to working with my colleagues on all of these issues. Thank you.

Senator JEFFORDS. Senator Voinovich.

**OPENING STATEMENT OF HON. GEORGE V. VOINOVICH,  
U.S. SENATOR FROM THE STATE OF OHIO**

Senator VOINOVICH. Thank you, Mr. Chairman. I thank you for calling today's hearing on transportation and air quality. I think it's important to examine the effectiveness of the congestion mitigation and air quality program and conformity.

As a past chairman and current Ranking Member of the Clean Air Subcommittee, and the past chairman of the Transportation Subcommittee, I understand full well the importance and the significance of the overlap between highway planning and air quality. When I began my term as Governor, 28 Ohio counties were in non-attainment for ozone. I spent considerable time to get them in attainment.

In addition, working with the utilities to reduce their emissions, I implemented an automobile emissions testing program called EJECT to help bring Ohio counties into compliance. At that time, Ohio was one of only few States that had enhanced auto emissions testing in urban areas. The program was a success, according to the 1997 EPA report. Volatile organic compounds and nitrogen oxides, which are major components in the formation of ozone and are emitted by cars and trucks, have been dramatically reduced between 1970 and 1996.

Emissions of VOCs were reduced by 49 percent and NOx by 26 percent. Additionally, air toxins in Ohio were reduced from approximately 381 million pounds in 1987 to 144 million pounds in 1996. Due to these reductions, all of Ohio's 88 counties have met the national air quality standard. But this, Mr. Chairman, was not an easy battle. The EJECT project was criticized because it required vehicle owners in smoggy areas to pay for annual emissions testing and to make their necessary repairs when they found that the emissions needed to be repaired on the automobile. And due to its unpopularity, Ohio's general assembly passed a bill revoking the program. However, I stood up for the program and vetoed the bill, because I believe it was important and a necessary step to clean up Ohio's air.

I believe hard choices like these are important. The conformity program has helped encourage cleaner air and transportation planning and has benefited from coordination with the air quality planners. As we move forward with the reauthorization of the Highway Bill, we must reevaluate the conformity and CMAQ programs and be willing to make those hard choices if we're not getting the benefits that we should be getting, or if the program should take on a new dimension.

Mr. Chairman, as you know, the National Academy of Sciences issued a good assessment of CMAQ. They have made some good recommendations and some constructive criticisms and we should take their advice. In fact, I wish we would have a witness from them here today.

I hope the committee will use this time for a good, hard evaluation of the program and I would like to outline a few areas which I think deserve attention today and in the coming months. First, we need to examine the timing issues between the SIP process and the transportation improvement plan process. We need to see if

there is room for improvement between the two processes. Too many times they are not coordinated.

Are the CMAQ projects getting us the best air quality reductions for the money we are spending? The National Academy of Sciences study indicated that first of all, with the limited evidence available, approaches aimed directly at emissions reductions, new vehicle emission and fuel standards, well structured inspection and maintenance programs, vehicle scrappage programs generally have been more successful than most CMAQ strategies relying on changes in travel behavior.

For example, in Chicago an inspection and maintenance program provided a 30 ton per day credit for emission reductions. By comparison, several hundred CMAQ funded TCMs provided a 2 ton per day credit. We ought to look at where is this money going and can we get a bigger bang for our dollar.

So often we spend money on pet projects to make us feel better or make some group feel better. I always say that we need to work harder and smarter, we need to do more with less. I think it's time we reevaluate some of the projects we've been funding and shift the focus to deal more with existing air quality problems. I look forward today to hearing from our witnesses.

[The prepared statement of Senator Voinovich follows:]

STATEMENT OF HON. GEORGE VOINOVICH, U.S. SENATOR FROM THE STATE OF OHIO

Mr. Chairman, thank you for calling today's hearing on Transportation and Air Quality. I believe it is important to examine the effectiveness of the Congestion Mitigation and Air Quality Program (CMAQ) and conformity.

As the past chairman and current ranking member of the Clean Air Subcommittee, and the past chairman of the Transportation Subcommittee, I understand full well the importance and significance of the overlap between highway planning and air quality.

When I began my term as Governor, 28 Ohio counties were in non-attainment for ozone. I spent considerable effort to get them into attainment. In addition to working with utilities to reduce their emissions, I implemented an automobile emissions testing program, called E-check, to help bring Ohio counties into compliance. At that time, Ohio was one of only a few states to have an enhanced auto emissions test in its urban areas.

This program was a success. According to a 1997 EPA report, volatile organic compounds and nitrogen oxides, which are major components in the formation of ozone and are emitted by cars and trucks, have been dramatically reduced between 1970 and 1996 in Ohio. Emissions of VOCs were reduced by 49 percent and NOx by 26 percent. Additionally, air toxins in Ohio were reduced from approximately 381 million pounds in 1987 to 144 million pounds in 1996. Due to these reductions, all 88 Ohio counties have met the national air quality standards. But this was not an easy battle.

The E-Check program was criticized because it required vehicle owners in smoggy areas to pay for annual emissions testing and to make the necessary repairs. Due to its unpopularity, Ohio's General Assembly passed a bill revoking the program. However, I stood up for the program and vetoed the bill because I believed it was an important and necessary step to cleaning up Ohio's air.

I believe hard choices like these are important. The conformity program has helped encourage cleaner air and transportation planning has benefited from coordination with the air quality planners.

As we move forward with the reauthorization of the Highway Bill we must reevaluate the conformity and CMAQ programs and be willing to make hard choices if we are not getting the benefits that we should be getting, or if the program should take on a new dimension.

Mr. Chairman, the National Academy of Sciences issued a good assessment on CMAQ. They have made some good recommendations and some constructive criticism and we should take their advice. In fact I wish they were testifying today.

I hope the committee will use this time for a good hard evaluation of the program and I would like to outline a few areas in which deserve attention today and in the coming months.

- First, we need to examine the timing issues between the Air Quality SIP (State Implementation Plan) process and the transportation TIP (Transportation Improvement Plan) process. We need to see if there is room for improvement between the two processes.

- Are the CMAQ projects getting us the best air quality reductions for the money we are spending, in other words are they cost-effective? The NAS study has recommended that we broaden the pollutants covered to include for example particulate matter and to allow more cost-effective programs such as vehicle scrappage programs be funded at the local level.

- If the typical CMAQ project is not cost-effective, are there more cost-effective measures such as using the funds to retro-fit diesel engines? So often we spend money on projects to make us all feel better. I always say we need to work harder and smarter and do more with less. Maybe its time we re-evaluate the types of projects we have been funding and shift the focus to deal more with existing air quality problems.

These are just a few of the topics I hope we can address before we move forward with the reauthorization of the highway program next year.

Senator JEFFORDS. Senator Clinton.

**OPENING STATEMENT OF HON. HILLARY RODHAM CLINTON,  
U.S. SENATOR FROM THE STATE OF NEW YORK**

Senator CLINTON. Thank you, Mr. Chairman. And thank you for holding this important hearing.

I'm glad that we're going to be looking at transportation as well as other sources of pollution that are stationary, so that as we gear up for the TEA-21 reauthorization we have a better idea of how to proceed. I'm also pleased we're going to be looking at some additional technological ways to deal with emissions. For example, in New York, Corning's environmental technology products and services are offering some leading, cutting edge solutions for emissions control changes.

I have a particular interest in today's hearing because of the terrorist attacks on the World Trade Center. Once again, we are dealing with consequences of the horror of September 11th. As some of you may be aware, as a result of the terrorist attacks on the World Trade Center, the State of New York and the New York Metropolitan Transportation Council are seeking a 3-year waiver from conformity in metropolitan planning requirements. The New York Metropolitan Transportation Council, commonly known as NYMTC, is responsible for preparing the area's conformity analysis.

Now, NYMTC's offices were located on the 82d floor of One World Trade Center. Obviously their offices, their equipment and their records, as well, sadly as the life of several staff members, were lost. While NYMTC is up and running again, they are faced with the challenge of establishing baseline regional travel patterns in emission conditions in the aftermath of September 11th without the records that they had compiled over many years.

Now, with everything that New York is facing, one might ask, why worry about a conformity determination? But concerns have been raised that a possible conformity lapse could hinder the rebuilding efforts in lower Manhattan, which are ahead of schedule and below budget at this point. And I think every one of us wants to do everything we possibly can to help in the rebuilding process. And I thank the members of this committee, particularly the chairman and the ranking member, for everything that they've done to

help New York. I especially appreciate the support of legislation that I sought to waive limitations on the use of the emergency highway funds to pay the cost of projects needed as a result of the September 11th attack.

I think we have a dilemma, though. We want to do everything we possibly can to help New York rebuild, but we also have to make sure that the health of New Yorkers is protected, particularly those who live and work in lower Manhattan. Now, I'm confident that with the leadership of this committee, we can strike the right balance to ensure that the rebuilding efforts move forward unimpeded, while at the same time ensuring that the air quality in the New York Metropolitan area improves. I am concerned, however, that a bill currently moving through the House has not yet achieved quite that right balance.

So I look forward to working with the committee, particularly again with the chairman and the ranking member, as we not only learn more about conformity in transportation and air quality issues in general, but in trying to address New York's ongoing needs because of the horrible, destructive attacks by the terrorists on September 11th.

I apologize, Mr. Chairman, I have to leave early to preside. But I have the testimony and I will, with consent, be submitting questions for the record as well.

Senator JEFFORDS. Thank you. And your questions will certainly be accepted.

Senator CHAFEE.

**OPENING STATEMENT OF HON. LINCOLN CHAFEE,  
U.S. SENATOR FROM THE STATE OF RHODE ISLAND**

Senator CHAFEE. Thank you, Mr. Chairman, for holding this hearing. As many people have testified earlier, Senator Smith said earlier, we're making a great deal of progress since the 1970's. And Senator Inhofe said that he came here as a municipal official in 1966 talking about air quality issues. So we are making great progress, and I think we should continue to be aggressive on this issue. It's my belief not only for our own health, obviously, but also it's an industry that we can export, as we travel around the world and see some of the developing cities, as the world evolves from more of a rural population to an urban population, Mexico City, Beijing, Lagos, these are all issues that if we keep here in the United States aggressive on this, it's going to be an industry and an economy unto itself that will help us prosper here in the United States.

Thank you.

Senator JEFFORDS. Thank you. Thank you all for excellent statements.

We now will turn to our witnesses. Our first witness is Mary Peters. Thank you for coming, and we look forward to listening to you. Please proceed.

**STATEMENT OF MARY E. PETERS, ADMINISTRATOR, FEDERAL HIGHWAY ADMINISTRATION, UNITED STATES DEPARTMENT OF TRANSPORTATION**

Ms. PETERS. Thank you, Mr. Chairman, members of the committee.

I appreciate the opportunity to discuss, this morning, transportation and air quality, two vitally important topics. I would ask that my written statement be entered into the record in its entirety, and I will confine my remarks to a few high points this morning.

Meeting the dual challenges of congestion relief and air quality improvement is a high priority for the Department of Transportation, as I know it is for members of this committee. Secretary Mineta has noted that one of the core principles of the Department's efforts to reauthorize TEA-21 will be to ensure an efficient infrastructure while retaining environmental protections that enhance our quality of life.

As indicated in the chart attached to my written statement, and as several members have referred to this morning, we have made remarkable progress over the last 30 years in reducing air pollution, especially from transportation sources. Since 1970, carbon monoxide emissions have been reduced by 43 percent, coarse particulate matter, or PM-10 emissions, by 33 percent, and volatile organic compound emissions by 59 percent, despite substantial increases in population, gross domestic product and vehicle miles traveled.

While this downward trend in emissions is expected to continue, some of the Nation's largest metropolitan areas still face challenges in meeting the current 1 hour ozone standard. TDM and TCM programs have not performed as expected in terms of air quality benefits. As we prepare to meet the challenges of implementing new air quality standards, we need to develop new strategies for dealing with these more stringent requirements.

We have gained considerable knowledge about the linkages between transportation and air quality, including that there is no one right way for the entire Nation to reduce congestion and improve air quality. The problem requires flexible, multi-level solutions. The CMAQ program provides State flexibility to fund transportation improvements that cross traditional Federal-aid program boundaries, including transit, ride sharing, bicycle and pedestrian, alternative fuels in vehicles, emission inspection and maintenance, and ITS implementation programs. In addition, CMAQ supports experimentation by States and MPOs to meet travel demand in the most environmentally sensitive ways, and has encouraged cooperation between transportation and air quality agencies.

As we approach reauthorization, I believe we must consider stakeholder concerns about the CMAQ program. One issue relates to the statutory apportionment formula. The current formula does not take into account areas that would be designated under the new air quality standards.

We now have almost a decade of experience in implementing the Clean Air Act's transportation conformity provisions. Stronger institutional links between transportation and air quality planning agencies have been created. While conformity provisions have been

very instrumental in fostering improvements to the modeling processes, models that lack precision are being used to predict precise emission levels to determine conformity.

We have heard concerns that transportation and air quality plans are not synchronized, and that this mismatch can cause unwarranted lapses in conformity and disruption to the transportation funding and planning processes. While transportation plans have very long planning horizons and are updated frequently, most air quality plans have very short planning horizons and are updated less frequently.

Important planning considerations and public participation may not get the needed emphasis because transportation planners must devote considerable time and resources to avoid conformity lapses.

Mr. Chairman and members of the committee, I assure you that the Department is committed to continue the collective progress that we have made in reducing motor vehicle emissions. Continued progress will require improved coordination of the transportation and air quality planning processes. The American public demands and deserves both mobility and healthy air. I believe that these are not mutually exclusive goals.

Mr. Chairman and members of the committee, that concludes my oral statement. I look forward to working with you as we prepare for reauthorization of the surface transportation programs, and would be pleased to address any questions that you may have. Thank you.

Senator JEFFORDS. Thank you very much for an excellent statement.

Next witness is the Honorable Jeffrey Holmstead, Assistant Administrator for the Office of Air and Radiation, U.S. Environmental Protection Agency. Please proceed.

**STATEMENT OF JEFFREY HOLMSTEAD, ASSISTANT ADMINISTRATOR, OFFICE OF AIR AND RADIATION, UNITED STATES ENVIRONMENTAL PROTECTION AGENCY**

Mr. HOLMSTEAD. Good morning, thank you, Chairman Jeffords and members of the committee.

The innovative programs and funding provided by ISTEA and TEA-21 have established really for the first time a strong link between transportation planning and air quality planning. Congressional reauthorization of TEA-21, I believe, is an opportunity to reaffirm this connection.

It is also an important opportunity to improve parts of the program. I think we all recognize that, and I would like to thank you, Chairman Jeffords and the members of the committee, for initiating this discussion. At your request, I will briefly offer my thoughts on the two programs that deal with the link between transportation and air quality, as you have already mentioned, transportation conformity and the CMAQ program.

First, though, I would like to also take the opportunity to remind all of us about the enormous progress we have made as a Nation to reduce the air quality problems that arise from the transportation sector. As several of you have mentioned, since the passage of the Clean Air Act in 1970, we have been extremely successful in reducing emissions from what we refer to as mobile sources. For

example, new cars that we purchase today are more than 95 percent cleaner than cars purchased 30 years ago. Concentrations of the four criteria pollutants that are most affected by the transportation sector, carbon monoxide, nitrogen dioxide, ozone and particulate matter, have all declined substantially since 1970. These reductions help to protect public health by reducing incidents of premature mortality, asthma attacks and other health problems caused by air pollution. The other thing I would like to remind people is that cars, trucks and buses, and in fact virtually every type of engine used in this country will be substantially cleaner still within the next few years. Beginning in 2004, cars, light trucks, minivans and SUVs will all have to meet the same stringent new emission standards. Then beginning in 2007, heavy duty diesel trucks and buses will be required to reduce their emissions of particulates and NOX by 90 percent and 95 percent respectively. These dramatic improvements are made possible in large part because of new requirements for cleaner gasoline and diesel fuel.

Within the next 2 years, EPA will also be setting the same type of standards for non-road diesel engines, such as construction equipment, which are significant sources of air pollution that today are still largely uncontrolled. In the meantime, our voluntary diesel retrofit program encourages owners of diesel trucks, buses and non-road engines to install modern pollution controls. Last year, we received commitments for about 70,000 diesel retrofits and by the end of this year, we plan to increase this number to 130,000 diesel retrofits.

Unfortunately, however, cleaner cars and cleaner fuels alone are not sufficient to achieve the kind of air quality improvements we need, in large part, as you've noted, because Americans today are driving more than ever. In 1970, collectively we drove about 1 trillion vehicle miles per year. By the year 2000, that number had jumped to almost 2.8 trillion, and as we all know, even much cleaner cars can contribute to air pollution.

Fortunately, Congress has recognized that a successful strategy for reducing emissions from mobile sources must include the vehicles we drive, the fuels we use, and the roads on which we travel. The two programs that have been created, conformity and CMAQ, are things that I think we believe should be looked at and improved if possible. But we think it's especially important to recognize that Congress created transportation conformity in order to coordinate transportation activity with air quality goals, there by requiring for the first time that State and local transportation and air quality officials work together.

There is widespread agreement among State and Federal officials that conformity has helped to maintain progress toward meeting air quality goals without compromising improvements in our transportation network. After over a decade of working with conformity issues, however, we recognize that the merging of two complex and lengthy processes, transportation planning and air quality planning, has created some concerns. And we are now working with the Department of Transportation to make conformity work better without weakening its contribution to air quality.

CMAQ, as you've mentioned, is another important tool for reducing mobile source emissions. CMAQ funds have helped to bring

bike lanes, transit systems and car pooling programs to communities struggling to meet air quality goals. Many of these projects have the added benefit of making communities more livable.

Despite CMAQ's benefits, there are some elements of the program that ought to be improved. Currently, CMAQ funding is allocated according to three factors: the number of carbon monoxide and 1-hour ozone non-attainment areas in the State, the severity of the pollution problem and the population within those areas. This system doesn't reflect the improvements we have made in reducing carbon monoxide pollution. Today, for example, there are only 13 areas in the country that are still in non-attainment for carbon monoxide.

It also does not reflect the importance of achieving new health based ozone and particulate matter standards. Although fine particulate matter is clearly the biggest health concern posed by air pollution, and is also clearly linked to motor vehicles, the current system does not specifically allocate CMAQ funding to address particulate matter improvement. In addition, regions that are able to make the leap from non-attainment to attainment receive considerably less funding from CMAQ. While it makes sense to provide less money to clean areas, the way in which this change currently occurs serves as a disincentive to cleaning up the air.

Our stakeholders have suggested a number of changes that may improve the CMAQ allocation process. For example, we've been asked to consider including the new fine particulate matter non-attainment areas and the new 8-hour ozone non-attainment areas in the funding formula. We've also been asked to consider changes to provide more stable funding for areas redesignated to attainment.

There are other improvements I know that we all ought to be talking about, and I look forward to working with this committee and with Mary Peters and her agency as we continue to work on how we can improve these important programs. Thank you.

Senator JEFFORDS. Thank you both for excellent statements. I want to assure you that we're going to be working very closely with you through the period of time when we prepare our bill.

Despite our progress on vehicle emissions technology, we are still having trouble attaining our national air quality standards. Estimates indicate that about 150 million people are currently breathing unhealthy air that's polluted by ozone and fine particulates. What is transportation's percentage contribute to the non-attainment problem? Either one or both.

Mr. HOLMSTEAD. I don't have the numbers at my fingertips. I do know that it's still significant. I believe the transportation sector accounts for roughly 50 percent of the NOX emissions and probably something upward of 50 percent of the carbon monoxide emissions. Its contribution to other problems is less than that, and its share of the pie is decreasing over time as the new standards come into place. But it certainly is fair to say that for many of the pollution problems that we face, the transportation sector is still a large portion of the problem, and in some cases, the biggest portion of the problem.

Senator JEFFORDS. I would appreciate if either or both of you would see if you can help us with answering that question.

Mr. HOLMSTEAD. We can provide exact numbers for you, yes.

Senator JEFFORDS. I would appreciate that. Thank you.

Ms. PETERS. Mr. Chairman, again, as Mr. Holmstead said, it varies depending on the type of pollutant. Approximately one-third of the ozone precursors on a regional scale are attributable to transportation sources, about 51 percent on CO. So it varies by the particular issue that we're dealing with. We would be happy, as Mr. Holmstead said, to follow up with you with specific details.

I would also take this opportunity to commend to you a very excellent book that was put together by staff on transportation and air quality that contains a number of selected facts and findings. We have worked very closely with EPA in producing this book.

Senator JEFFORDS. Of course, we'd be interested in the impact of the non-attainment, not just the emissions also, if you have data on that, we'd appreciate it.

According to a recent study by the Brookings Institution, public transportation produces a fraction of the pollution of private vehicles on a passenger per traveled mile basis. The study says it's about 95 percent less for carbon monoxide, 92 percent less for VOCs and 50 percent less for carbon dioxide. Have your agencies looked at the effectiveness of transit and other transportation control measures in reducing pollution?

Ms. PETERS. Mr. Chairman, yes, we have. And, as indicated earlier in my testimony, we've looked at both transportation control measures and demand management measures. While they have had some effectiveness in certain areas, and we absolutely want to continue to pursue transit as part of our transportation solutions, the benefits we get from some of those measures aren't as great as was mentioned in terms of overall emissions reductions. But clearly, they are important measures and ones, and considerations that we would suggest be considered.

Senator JEFFORDS. Mr. Holmstead, how important do you think transportation control measures will be in the future for achieving air quality goals?

Mr. HOLMSTEAD. Our sense is that they will continue to be important in certain areas of the country. As I think all of you have acknowledged, the contribution per vehicle mile traveled is much lower than it was even a few years ago, and will continue to get lower over time. The studies that we've seen, however, suggest that in specific areas transportation control measures will continue to be an important strategy for improving air quality. And collectively over time, they can make a significant difference.

Senator JEFFORDS. One of the problems we have heard about seems to be that States are not regularly revising or updating their SIPs. Is that truly a problem with the conformity process, and what should be done to correct it?

Mr. HOLMSTEAD. I think we all recognize that a better harmonization between the SIP process and the transportation planning process would be better. I think I agree with you that one of the things we ought to be considering is perhaps a more efficient way in which we update SIPs. SIPs, as you mentioned, tend to be a very long and cumbersome process, even more than transportation plans. And if there were ways that we could improve that process and make it happen more often, I think that would be an effective way to address some of these concerns.

Ms. PETERS. Mr. Chairman, I agree. I think the mismatch of the cycles sometimes causes planners to be focused more on process than on the outcome. The outcome ought to be good transportation plans that ensure good, healthy air quality in areas. I do commend the committee for conducting the survey that you did of the MPOs on a very bipartisan basis. I think it was important. The input that you got, as well as input that we received when we polled our district offices, indicates that getting those two cycles more in sync with each other can have benefits both in the quality of air quality plans and the quality of transportation plans.

Senator JEFFORDS. Thank you both. Senator Smith.

Senator SMITH. Thank you, Mr. Chairman.

I think this would be better for Administrator Peters, this question, but Mr. Holmstead, feel free to respond as well if you wish.

I talked about in the opening statement about the mismatch between the State implementation plans, conformity and transportation plans. It's a mess. I cited some of the letters. Let me just take a couple of excerpts from four cities, just to give you a feel for it, then I'd ask you to respond to it. This is Dallas. Generally more time is spent on replanning already approved plans than working on the implementation of specific projects. Denver, transportation and air quality agencies have had to expend an enormous amount of resources to coordinate the inconsistent federally mandated schedules. Houston, the overabundance of conformity triggers means that planning organizations are frequently performing conformity demonstrations with limited corresponding benefit. And L.A., a real potential exists for conformity lapse due to the mismatch of air quality and transportation planning schedules.

Just address for me if you would your concerns about this rigid conformity process and the effect it's having on transportation planning.

Ms. PETERS. I will, Mr. Chairman, and Senator, I will do that. As indicated in your survey and also a survey that we conducted of our division offices, we believed that we could do a much better job of transportation planning if those two processes were in sync. To share with you one of the comments that I received from our division offices, MPOs are forced to produce updates that simply push the planning horizon out and determine conformity to avoid a lapse, but don't address, as fully as we would like, other planning issues. They attribute this to simply chasing a conformity clock. Planners want to do a good job of ensuring that a region's transportation plans are comprehensive and deal with that area's needs on a very substantial basis. Of course, needs can differ from one area of the country to another. Or their desires can differ from one area of the country to another.

But clearly, healthy air is equally important. Having those two processes more in sync would allow, for example, very substantive public comment to be taken into account and incorporated into planning revisions. Whereas today, sometimes there simply isn't time to do that, because the conformity lapse would kick in. So, there again, chasing a conformity clock was the phrase that was used by some of the respondents.

Senator SMITH. Specifically, what flexibility do you have in invoking the penalty, if you will, of a conformity lapse?

Ms. PETERS. Sir, we do not have flexibility in invoking the penalty for a conformity lapse.

Senator SMITH. None whatsoever?

Ms. PETERS. No, sir.

Senator SMITH. Mr. Holmstead, you saw the chart that I put up in my opening remarks. Would you agree that the projections that I put up there are significant change that should warrant some adjustment in the transportation conformity framework?

Mr. HOLMSTEAD. I do agree with that.

Senator SMITH. As we move into the out years, the decline is even sharper.

Mr. HOLMSTEAD. Yes, I do agree with that. As I said, I think that that chart is quite striking. We ought to be acknowledging that the contribution of the transportation sector to air quality problems is decreasing over time.

I think it's important, and I think virtually everyone agrees, that the transportation conformity program has been a good thing, and that really for the first time, it required transportation planners and air quality planners to work together. I think what we all want to do is preserve the benefits of that sort of coordinated process while eliminating some of the problems that have been identified by you and Chairman Jeffords and others.

Senator SMITH. Could either of you give me an indication, as a follow-up to the previous question to you, Administrator Peters, what flexibility would you like to have, if we could do it legislatively, what would you like to have?

Ms. PETERS. Mr. Chairman and Senator Smith, and please know that I haven't discussed this with Secretary Mineta, but I think the flexibility that we would like to have goes to the point that you made, and I spoke to earlier as well. Models are very good, but they simply predict future results. Today's models require us to use something that can't be precise, because we're projecting into the future, to determine very precise levels of emissions into the future, and therefore conformity. I think some latitude in making that determination that would recognize the variability in the models might be beneficial, and that's certainly something some of our customers have related to.

Senator SMITH. Thank you very much. Thank you, Mr. Chairman.

Senator JEFFORDS. Senator Voinovich.

Senator VOINOVICH. Ms. Peters, the Transportation Research Board's assessed that the CMAQ program concluded that projects designed to change travel behavior may have been less successful than other CMAQ programs, such as inspection and maintenance. Can you comment at all on that, or some of the conclusions that came out of that report?

Ms. PETERS. Senator, I can. As the report indicated, while these measures were not ineffective, they were less effective on a cost benefit analysis, if you will, than programs that deal with emissions issues in a larger sense. Emissions control programs seem to be where we have achieved the best benefit. Some of those, such as emissions inspection programs, have been very, very effective in reducing emissions.

As Mr. Holmstead indicated, and the data shows, the fleet has become much cleaner, the fuels have become much cleaner. So transportation demand management programs or control measures have been less effective, not ineffective, but less effective than wider spread emission control programs.

Senator VOINOVICH. With the crisis that we have with our Federal budget, I would really be interested in having you folks come back and look at these programs in terms of their cost effectiveness, to give us some direction in terms of what we ought to be doing with this next budget that we're putting together. Everybody's calling for more money. And I'm not going to go into details with some of the CMAQ projects I know about. But a lot of them have helped subsidize some projects that one has to really question as to what impact are they really having on reducing the emissions that we're concerned about.

So I think that somebody ought to really look at those. As I say, too often, some of them get pulled off into other areas where they end up being, helping a project to be undertaken rather than having, the impact that it's having on reducing emissions is very little.

In reading the testimony of Mr. Stephenson, we learned that a study by the American Road and Transportation Builders Association estimates that \$1.3 billion worth of highway projects were canceled or delayed in 2000 due to transportation conformity problems. Do you think that figure is accurate?

Ms. PETERS. Mr. Chairman, Senator, I don't know the basis for the figure, but it would seem to be reasonable to me.

Senator VOINOVICH. We had a real problem here about 2 years ago, I think, in terms of with the new emission standards coming out and the conformity. There were many projects that, well, a lawsuit was filed, and because States' SIPs were not in conformity, many projects were delayed. Do you have any information on where we are with that today? I guess the EPA did not come out with the new, with a map of the non-attainment areas based on the proposed ozone and particulate standards, and that that may have had something to do with changing that situation.

But I think it was a year or 2 years ago, there was widespread concern all over the country that many highway projects were going to be held in abeyance because of the fact that the State's SIP was not in conformity with what it should be, or their transportation was not in conformity with their SIP. Could you tell us where we're at?

Mr. HOLMSTEAD. I know that there were some concerns expressed about that. I think that those were largely, in fact, I think they were completely addressed by the agency. There is some concern in the future about the implications for conformity. As you know, Senator, we have not yet designated areas as either attainment or non-attainment under the new standards. We expect to do that fairly soon. But once that happens, then there is a need to do a conformity analysis, I think within a year afterwards. That's something that we're working on internally, we think it's something we can probably address administratively, to provide newly designated areas with the kind of flexibility that they'll want. But I do think that that continues to be an issue, once we newly designate these non-attainment areas.

Senator VOINOVICH. I'd like to be updated on it. Because if we're going to have the problem forthcoming, there may be something we can do in drafting this reauthorization that would respond to that particular problem. I understand that you're going to be designating more of your rural areas, in your testimony, small urban and rural areas may be designated non-attainment for the first time. What do you anticipate in terms of their compliance and the impact it's going to have on those areas?

Ms. PETERS. Senator, we do realize that when the new standards take effect, and as Mr. Holmstead indicated, the areas would then have 1 year to demonstrate conformity. We are working with, and look forward to continue working with, EPA as we approach reauthorization, and hope to jointly bring you some solutions or some suggestions in terms of the Administration's reauthorization proposal.

Senator VOINOVICH. The last thing I'd like to say is, I go to these hearings and in my opening statement, I mentioned that there are some significant reductions that we've had in Ohio as a result of our efforts. I might just mention for the benefit of the chairman that, we always just talk about our power plants. But we've made significant reduction in other things that contribute to ozone that, you know, some contend float in the direction of the Senator's State and others.

But I'd like to, and maybe, Mr. Holmstead, you can provide us with a big picture about where are we in the country in terms of reducing pollution from various sources, and what challenges remain? What basically are the sources of those challenges? I think we have something about transportation is contributing about 50 percent of the NOX problem that we have in the country. Obviously we've made some real progress, I guess, in transportation and NOX reductions, haven't we? And in other areas we haven't done as well. And the same way with carbon monoxide.

I think too often we just talk about that we have a major problem. But I think it's important that we know where we are, kind of a benchmark figure that I'd like to have, and I think it would be very, very helpful to this committee to really get a sense of where are we today in terms of the issue, what progress have we made and where are the areas that really need to continue to be addressed. So often, again, we have this tendency to, an issue comes up and you go in that direction, and then you're over here. When you look over here, you say, gee, that's even a much worse problem, but we're spending all of our time dealing with this one.

Mr. HOLMSTEAD. If I can just quickly address that, and we'll provide something for the record that I think will be of more use to you, every year the Agency does what we call an emissions trends report that provides in some detail information about the progress that we've made. And it gets relatively little attention, because it's good news. And it shows that air quality has improved in the country pretty dramatically since 1970. And we've had enormous economic growth, we've had a significant increase in population, we've had almost a threefold increase in vehicle miles traveled. And over that same time period, we have reduced aggregate emissions of the major pollutants, and we can say definitively that air quality is

better in virtually all parts of the country. We're trying to do a better job of helping people to understand that.

I think, and this is not meant to be a criticism of the media, but they tend to pay more attention to problems than they do to things that have gotten better over the years. But I think your point is very well taken.

I would say, though, that there are some major challenges that still lie ahead. As you and I have discussed, and the chairman and I have discussed, notwithstanding the improvements that have been made, pollution from power plants continues to be the biggest single source of air pollution in the country. Probably the second most important contribution has to do with emissions from non-road diesel engines, something that we also are going to be addressing with a regulatory proposal in the next, probably in the next 6 months or so.

I think as you mentioned, NOX emissions from the transportation sector in particular, and diesel emissions, I'm sorry, particulate emissions from diesels, continues to be an issue. And the CMAQ program, in particular, I think, has been very helpful and can be helpful in addressing those problems. Everyone has examples of CMAQ programs that may be somewhat questionable. One of the things I think we've found is that it funds a wide variety of programs and allows people to look for innovative ideas. Some of the funding that has been used, for instance, for diesel retrofits, has been enormously successful and I think in terms of cost benefit analysis, would be very cost beneficial compared to many, many other strategies. So I think there is an important role for that program in helping us to address the continuing issues that we face.

Ms. PETERS. Mr. Chairman and Senator, if I could just briefly add, and I think Mr. Holmstead did a good job of outlining the issue, but really, using data I think helps us tremendously. Our collective challenge is not to let drop any of the progress that we have made in a number of areas, but let the data drive us where we have the best opportunity to make significant improvements. One of those areas that was mentioned was off-road mobile sources.

As you know, I was the director of the Arizona Department of Transportation prior to having the opportunity to have this job. It was very important to me, particularly in the urban area, because we had a number of projects ongoing, not transportation projects only, but a lot of building projects. Off-road mobile source was of particular importance to me in that area in trying to reach conformity. I think that using the data to drive us where we have the best opportunity for solutions is important.

Senator JEFFORDS. Thank you, Senator. Excellent questions. We appreciate it very much.

Ms. Peters, has any area lost their transportation funding due to conformity lapse?

Ms. PETERS. Sir, they have not lost their funding, Mr. Chairman, per se. They have, however, had to divert funding to different sources. States are very ingenious and very infrequently do they let funds lapse. But they have had to divert funds from planned projects to different projects because of conformity lapses.

Senator JEFFORDS. Mr. Holmstead, what is the Agency's schedule for making the new designations under the revised ozone and the fine particulate matter standards?

Mr. HOLMSTEAD. At present, we face a bit of a quandary. And it's related to the issue that we've been talking about here where there's not harmonization between the transportation planning process and the SIP planning process. Even within our own SIP planning process we have a challenge, and that is, because of the way the Clean Air Act works, we are under an obligation to do non-attainment designations for the new 8-hour ozone standard in the fairly near future. We have to go through a rulemaking, we hope to be able to do that and begin designations perhaps in 2003. But then we're not even allowed to do designations for the new PM-2.5 standard until 2004. And one of the things that we may be approaching the committee about is seeing whether there is a way that we can harmonize the designation dates, so that air quality planners can look at both ozone and PM-2.5 at the same time.

So the short answer to your question is, we are required to begin doing designations for 8-hour ozone in the very near future. There is still some debate about exactly when that is, perhaps as early as 2003. And yet we're not even allowed to do designations for PM-2.5 until 2004 and perhaps later. If we could figure out a way to make those designations all at the same time, so that State air quality planners could plan for both at the same time, we think that would be a useful thing.

Senator JEFFORDS. We will work with you on that. Thank you.

Ms. Peters, the average CMAQ obligation rate for States has been under 80 percent over the course of ISTEA and TEA-21. How can we expand the rate so that States are making better use of it? Like Connecticut with its laudable 94 percent obligation rate, should we sub-allocate these directly to MPOs in non-attainment areas to make sure that these funds are spent expeditiously? And should we protect the CMAQ program during the annual obligation limit distribution through proportional obligations?

Ms. PETERS. Senator, I think that our data indicates, at least in terms of TEA-21, that the CMAQ program has a slightly lower rate of usage than conventional Federal aid. Our data indicates that through 2001, approximately 80 percent of all CMAQ program funds were obligated. This is versus the total rate for the entire Federal-aid program of approximately 90 percent. And we are seeing the obligation rate for the CMAQ program continue to increase and, importantly, no CMAQ funds have lapsed. I think that's a very important consideration in the program.

In terms of sub-allocation, sir, as I have testified to before you on various occasions, my preference is to have less strings attached to the Federal dollars that go back to the States and local governments and more flexibility to use those dollars. So, while I would prefer to defer to our reauthorization proposal in terms of any further sub-allocation, let me say that I think the best transportation plans are developed in concert with State and local governments.

Senator JEFFORDS. To both of you, as you know, greenhouse gas emissions from the transportation sector account for about one-third of the U.S. total, or close to 8 percent of the world's total.

What are your agencies projecting for these emissions into the future, and how are we going to control them?

Mr. HOLMSTEAD. I'll have to respond to that question for the record. I know that we do have estimates of that, of what we're projecting over time those emissions will be. I can tell you that we are actually doing a number of things to address those. Within our transportation office, we have a number of programs that have been quite successful in trying to encourage things like commuter choice. We have a program that we work with Mary Peters' office on that encourages companies to provide a full range of commuter benefits to their employees to encourage things like mass transit and ride share and a number of other voluntary, non-regulatory programs that we think can help in that area. I would be happy to provide you with a more detailed list of all of those programs. But it's actually quite a substantial sweep of non-regulatory programs that we're implementing right now.

Ms. PETERS. Mr. Chairman, I would also prefer to respond in more detail in a question for the record. But, we are very actively working with EPA on programs about commuter choice and encouraging, through public education programs, things like trip chaining and other things. We are trying to get people to understand that cold starts are more detrimental than if they are able to chain trips together, so that they're making a consistent set of trips and then coming back home, as opposed to going home, stopping, coming back again. But again, we would provide a more comprehensive answer for the record.

Senator JEFFORDS. Thank you. Senator Voinovich?

Senator VOINOVICH. Getting back to this issue of the reductions that have occurred, it would be interesting also to know what contributed most to the reductions. And that is, for example, we're anticipating some significant reductions because you required that sulfur be removed from gasoline. And it looks like a big thing. The auto industry has done some great things with catalytic converters and all the other stuff that they have.

Then as we look down the road, we talk about fuel cells and the impact that they're going to have. I think that kind of information also would be valuable to us as decisionmakers on where we're going and what we're requiring to be done, and again, where we're going to be allocating our resources. I have to believe that my grandchildren, maybe my children, we may not be using oil, we may be using other sources of—I know we will, because it's coming, it's coming down the pike. It's like we have this Bjorn Lomborg, who's done a big book on the whole issue of greenhouse gases, and talking about allocation of resources and if we put all the money to comply with, say, Kyoto, going back to 1990 in terms of what Kyoto would require, that the cost of that would be astronomical, and that money would be better spent in the area of technology, for example, clean coal technology, that could be used to reduce pollutants and be sold overseas or given away. Then he talks about the money that could be made available also for Third World nations that are going to be most impacted negatively by greenhouse gases in terms of water and sewage and education and health care.

I think we don't do enough of that in terms of big picture things. And I'd really be interested, what made the big differences in terms

of reducing pollution? The Clean Air Act, obviously, and I know the acid rain provisions of the Clean Air Act, other things. Where have we really been getting the biggest bang for our buck or getting the biggest return on legislation that we've passed around here?

Mr. HOLMSTEAD. I can address, I think, that general question. And I think the first thing to say is, we all just need to recognize the remarkable technological advances that have been made over the last 30 years, spurred in large part by the Clean Air Act. Senator Bond I think wasn't quite right when he said cars are 100 percent cleaner than they were in the 1970's, but by the time this next round of emissions standards comes into place, cars will be 99 percent cleaner for hydrocarbons and 98 percent cleaner for NOX. And that sort of advance is just pretty remarkable.

Then if you look beginning in 2007, diesel engines will be 95 percent cleaner for NOX and 90 percent cleaner for particles. Probably the biggest advances that we've made in improving air quality have been from improvements in technology. And I, like you, am optimistic that we will continue to see those advances, whether fuel cells will be the answer or something else. But I'm convinced, and I think all of us who work in this area have been just really impressed at the innovation that can be spurred by legislative changes and regulatory changes, and in the transportation sector. I mean, if you look at the significant improvements that we've gotten over time in cleaning up our air, most of that is attributable to the transportation sector, and most of that is attributable to advances in things like catalytic converters, cleaner fuels. The fuel industry has done its part by initially getting lead out of gasoline to enable the use of catalytic converters, and more recently by reducing the sulfur levels.

But it really is quite a success story, and we'd be happy to provide you more information on that.

Senator VOINOVICH. One last thing, and that is the issue of diesel fuel. The Europeans really use a lot of diesel fuel. It's my understanding that in terms of miles per gallon you get a tremendous amount more out of diesel than you do out of our gasoline. The tradeoffs that are there, I understand if you use diesel you've got more pollutants, but you get better gas mileage. I still can't understand why more of our auto companies aren't producing more diesel powered vehicles, especially since there has been some significant improvement in diesel fuel.

Any comment on that?

Mr. HOLMSTEAD. I think the people who have looked at this issue believe that the biggest reason the Europeans have so much more usage than we do of diesel fuel is the differential in the price of fuel. The fact that the taxes are so much higher on fuel in Europe means that, I believe that fuel prices are about twice as high. So they have a very strong economic incentive to use more fuel efficient vehicles. And as you mentioned, diesel is much more efficient in terms of providing power for transportation.

We believe at EPA that we will see significant increases in diesel fueled vehicles over the coming years. I've mentioned a couple of times the Tier 2 rule, it will actually for the first time require diesel powered vehicles and gasoline powered vehicles to meet the same emissions standards. So beginning in model year 2004, the

technology will be available, partly because of the cleaner fuel and partly because of advances in hardware on cars and trucks. But there will be technology available to allow diesels to be basically as clean as cars, or as gasoline powered vehicles.

Our hope is that the combination, once people understand that diesels are not dirtier, that they can be as environmentally clean as other vehicles, that we will see significant increases in the amount of diesel used, and again largely because of the fact that you can get increased fuel efficiency from diesels as compared to gasoline powered vehicles.

Senator JEFFORDS. It sounds very interesting. Thank you. Good question.

Thank you. I have some additional questions for you in writing, as you know, but we want to get on to the next panel. Thank you very much for very helpful testimony, and we look forward to working with you.

Thank you. I want to welcome the next panel. We have a very interesting group of individuals who will help us understand better the problems that we face.

We have the Honorable Scott Johnstone, Secretary of the Vermont Agency of Natural Resources. We're pleased to have you here from Waterbury, Vermont. The Honorable Ron Harris, the County Judge from Collin County, Texas. Lynn Terry, the Deputy Executive Officer of the California Air Resources Board from Sacramento, California. James Stephenson, President of Yancy Brothers Company, Atlanta, Georgia, on behalf of the American Road and Transportation Builders Association. And Michael Replogle, the Transportation Director of the Environmental Defense Fund, Washington, DC. Good to see you as well.

Scott, please proceed.

**STATEMENT OF HON. SCOTT JOHNSTONE, SECRETARY,  
VERMONT AGENCY OF NATURAL RESOURCES**

Mr. JOHNSTONE. Thank you for this opportunity to appear before this committee to offer comments on the relationship between transportation and air quality, and particularly on the congestion mitigation and air quality program.

Vermont, the Green Mountain State, is known for its lush green hills, maple syrup, autumn colors and beautiful lakes. Less known is the fact that Vermont does suffer adverse effects from air pollution. While we are the only State in the northeast which is in attainment for all of the health based criteria pollutants regulated under the Federal Clean Air Act, the health of Vermont citizens and our environment are adversely affected by air pollution. Indeed, Vermont has long suffered disproportionately from the impacts of acid rain and regional haze.

We are also concerned about public exposure to toxic emissions and about global issues such as the depletion of the ozone layer and climate change. Many of these threats have a direct link to vehicular emissions that can be addressed through reauthorization.

Surface transportation remains the largest in-State source of air pollution in Vermont. On a per capita basis, Vermonters drive more miles in a year than residents in 39 other U.S. States. Besides the criteria pollutants, such as ozone, that CMAQ has focused on in the

past, other air pollution problems need to be addressed, such as fine particulate matter, toxics and greenhouse gases. Air toxics contribute significantly to the formation of ground level ozone, and in Vermont, represent the area of air quality where we do not meet some of our own air quality standards. Greenhouse gases contribute significantly to overall air pollution problems and to climate change.

The importance that our State places on the control of dangerous motor vehicle emissions is reflected in the number of control programs we have put in place over the past decade that go beyond the Federal minimum requirements. For example, Vermont is one of only four States in the U.S. to voluntarily adopt the California low emission vehicle program in lieu of the Federal Motor Vehicle Standards, including the zero emission vehicle sales mandate. To support this regulatory program the State created E-Vermont to promote the development and deployment of advanced electric vehicles.

CMAQ funds have been of great assistance to Vermont and other States in the region. Over the life of TEA-21, CMAQ has been funded at approximately 4 percent of the total Federal surface transportation program. Given the air quality impacts of surface transportation and the fact that it is the only transportation program designed to reduce air pollution, CMAQ should not only be reauthorized, it should be expanded to represent a larger percentage of the overall transportation budget.

While the CMAQ program was conceived to address both congestion and air quality, great weight has been and should continue to be given to air quality improvement goals. The transfer of CMAQ funds to non-air quality uses as currently allowed should be examined so that the air quality improvement goal may be met. Further, the CMAQ allotment scheme should be modified to provide weight to factors such as high per capita vehicle miles traveled, areas that are in attainment but at risk of slipping into non-attainment due to mobile source emissions, and areas with disproportionately high percentage of emissions from mobile sources.

A reauthorization bill should require CMAQ to consider fine particulate matter, air toxics and greenhouse gases in both allocation and eligibility. Greenhouse gas reduction goals and incentives could also be incorporated into reauthorization by tracking the vehicle miles traveled of all major transportation projects and by providing incentives for transportation projects which promote smart growth and reductions of greenhouse gas emissions and vehicle miles traveled.

The committee should also consider the inclusion of programs to reduce particulate and toxic pollution from diesel powered vehicles in the CMAQ program. Reducing diesel emissions is of critical importance to protect public health. Diesel school buses, non-road equipment, trucks and transit buses emit particulates and other toxics in close proximity to children, workers and the public. As these engines last as long as 30 years, progress in cleanup that relies on normal fleet transition will be slow. Thus, consideration should be given to include a mechanism in CMAQ that encourages transit agencies and school districts to replace or retrofit their bus fleets with clean buses.

I suggest the committee also look at the broader funding system for transportation projects. Much of our air quality and congestion problems come from the very poor use of land that has come to pass over the past decades, the practice we now call sprawl. I suggest to you that in part, it has come about due to our method of funding transportation projects. Communities do look at funding sources in designing their land use systems. We ought not be surprised that strip zoning and sprawling development is most often associated with the highways eligible for State and Federal funding. What occurs is sprawl, and the transportation cure, little to no local cost to fix the problem by increasing lanes or building new highways.

I suggest you consider what would occur if we provide incentives instead for grid patterns and public transit. I believe the result would be better land use, less congestion, better air quality and ultimately smarter growth. The use of CMAQ funds should be encouraged for programs which simply make sense, regardless of an area's attainment status. One such program is vehicle onboard diagnostic system inspection and maintenance. Such a program is cost effective and relatively simply to implement as it relies on technology already installed in the vehicle, as opposed to requiring expensive investments in emissions testing and equipment.

In closing, in Vermont as elsewhere, CMAQ has encouraged environmental and transportation agencies to talk, to plan and to work with each other. It is a program that has helped achieve important progress in the fight against air pollution. But much remains to be done and CMAQ must be updated to reflect our evolving understanding of the real risks society faces from vehicle related air pollution. Vermont's environmental future and the health of our citizens requires such attention.

Thank you for this opportunity to testify.  
 Senator JEFFORDS. Thank you very much.  
 Ron?

**STATEMENT HON. RON HARRIS, COUNTY JUDGE, COLLIN COUNTY, TEXAS**

Judge HARRIS. Thank you. I am very pleased, quite frankly, to sit in and listen to some of the comments that have been made this morning from an elected official's viewpoint. Because we sometimes feel that we're abandoned out there at the local level, because things get too weighty and bureaucratic in trying to accomplish these goals. But it sounds like this committee, and certainly from the testimony we've heard this morning, are headed in our direction to clean up the air and provide good mobility.

And with that, a lot of my speech was taken away, which should be good news. But certainly, what Mr. Holmstead indicated this morning, as well as Ms. Peters, pretty well reflects the concerns of North Texas, and indeed, the State of Texas, as we attempt to clean up our air. We are very aggressively working as a result certainly of the leadership of our last legislature group of individual cities and counties that represent 37 of our counties, which indeed represents 67 percent of the population, 71 percent of the jobs in Texas, called the Texas Clean Air Working Group, where we brought people in from TexDOT, the EPA and the Texas Natural

Resources Conservation Commission, to study how we're all working toward using congestion mitigation air quality funds, and how we can learn from each other and through partnerships. It is really with the lead of Greg Cook, who's our regional EPA administrator, that has encouraged a lot of us to work on these.

I would encourage you, as you put this together, to find ways to create these partnerships. Because people tend to like to work together more than they do to feel someone up on high is pushing something, and the natural urge, I think, not being a psychologist, but only as an individual is to react, to push back. I think the efforts of CMAQ have really been a significant help to us in the north Texas area in particular with our HOV lanes, which are some of the highest used in the State, and I think even in the Nation. Signalization, which is one of my pet peeves and I'm sure yours too, sitting what is really probably a matter of 45 seconds at a stop light, but to you and me, that's 10 to 15 minutes of our lives that we feel is wasted.

Certainly in working with free right turns, bus lanes, these are pieces that really can continue to help in air quality performance. We've also, with the CMAQ funds, used them in what certainly we've seen in visiting California and some of their really good programs as well as Atlanta, Georgia, on motorist assistance. Truly 80 percent of our incidents on the roads that cause tremendous rubberneckers and slowdowns are secondary incidents to the first accident or overheated vehicle. In our area, again, the North Texas Turnpike Authority, the Dallas Area Regional Transit Authority, TexDOT, and our MPO have worked together to make this work.

Another piece that would really be of significant help in technology would be encouraging intelligent transportation systems on our roadways and coordinating multiple jurisdictions. We have, like many cities and counties across the Nation, multiple cities who, as I refer to when I talk about the courthouse, are like herding butterflies, that they're all beautiful in their own sight. But it's very difficult to control them as they go.

The EDS commercial on cats during the Super Bowl is a very good example, sometimes, of coordinating local government. They're all trying to serve their citizens, but they have some difficulty in working together, which we're very fortunate, certainly, in Collin County, that we have these partnerships and that they do move us forward without that. North Texas would not have been able to come up with our State implementation plan that we indeed came up with.

We would encourage whatever you can do to focus more assistance on cleaning up the off-road equipment. I think that will be through technology and I think it will be through lower sulfur diesel, if you can move that forward. We would also suggest an assistance, and maybe through CMAQ funds, to do what the Texas legislature has started, and we have to come back for more funding, because their source got ruled unconstitutional, as it has in five States, for incentives to retrofit diesels. I know my own brother-in-law is in the diesel business in dirt moving, and I daresay his equipment is probably approaching 20 or 30 years old. When it breaks down, he simply goes in and does a lot of work that I don't think I would care to do, but that's his company. And I think if we

can make incentives to the small business people, I think the big ones will turn over their fleets, and certainly if these new equipment standards come down, they will hit that.

Conformity, as you have heard, is a very big issue. It's consistent with the testimony you've already heard.

With that, I do appreciate being invited to come down, I consider it an honor and hope that we can work together with you and your staffs to continue to clean up the air and provide mobility. Thank you.

Senator JEFFORDS. Thank you. We appreciate your being here and working with you.

Lynn?

**STATEMENT OF LYNN TERRY, DEPUTY EXECUTIVE OFFICER,  
CALIFORNIA AIR RESOURCES BOARD**

Ms. TERRY. Good morning. And it really is morning in California.

Thank you for the opportunity to comment on California's experience in integrating air quality and transportation planning. Over the years, we have been able to meet the Clean Air Act transportation conformity requirements through a cooperative effort with local, State, Federal agencies. At the same time, we are encountering some process challenges that do need to be addressed. We look at this issue in the context of our overall air quality program in California, which now includes global warming gases due to some recent legislation signed by the Governor.

The concept of transportation conformity is a simple one. Air pollutant emissions from the transportation sector must be consistent with air quality plans. This is critical to ensure that health based standards are met in the required timeframes. The process itself requires looking at emissions today as well as in the future. This is necessary to make sure that we continue clean air progress into the future as our population and economy grows.

Over the last 20 years, reducing air pollution from the transportation sector has been essential to California's dramatic process in improving air quality in the Los Angeles region, historically the Nation's smoggiest region. As discussed earlier, for transportation that progress has been largely due to cleaner vehicle technology. A new car in 2010 will omit only one-tenth the ozone forming pollution of even a 1990 model vehicle. As a result, transportation control measures that reduce travel have shown less benefit than anticipated.

Also, there is little flexibility for transportation agencies in terms of implementing transportation control measures once they are in an air quality plan. This discourages innovation because new, more effective measures can't replace a measure that appears to be infeasible. In terms of complying with the conformity requirements, we believe the focus should be on emission reduction goals, rather than the implementation of specific transportation control measures.

In addition to TCMs, another important mechanism to address air pollution is CMAQ. We strongly support these funds as a way for transportation agencies to provide significant emission reductions in a cost effective way. There are many cleaner technologies,

diesel has been widely discussed that can be funded to reduce both ozone and particulate pollution from the transportation sector.

For us, the most difficult problem with the current conformity process is the inability to take new information into account in a workable way. SIPs must define the emission target needed to achieve clean air as defined by the national ambient air quality standards. That emission target is based on the state of the science at the time the air quality plan is done. Once approved by EPA, the SIP is the federally enforceable benchmark for conformity.

There is no requirement to update a SIP prior to the deadline for meeting air quality standards. On the other hand, transportation plans are routinely updated and as a practical matter, changes in individual transportation projects in major urban areas are frequently proposed. These changes typically trigger a process that requires new information to be used in the conformity analysis. When the SIP has not been updated with that same information, the inherent consistency can derail the process.

In California, we face this issue virtually statewide in urban areas. As a result, we will be revising 23 SIPs over the next year or so. And while this will put us back on a consistent process track in the near term, it's a major undertaking that in itself doesn't provide air quality benefits. What we want to avoid in the future is the triggering of comprehensive SIP revisions each time new information becomes available. Under today's rules, this is the only way to avoid conformity problems as the science improves.

We believe it is more appropriate to comprehensively revise air quality plans when the underlying facts have changed so substantially that the approach to meeting air quality standards needs to be revised. Otherwise, we need an option of a streamlined mechanism to respond to new information.

For example, a streamlined mechanism could make sense when a region is close to meeting a standard, when emissions are declining and when all the measures in the SIP are being implemented. In this type of transitional situation, a reconciliation of old and new vehicle emission estimates would make more sense than a comprehensive plan update.

For regions that have a long way to go to meet air quality standards, more frequent SIP updates are clearly needed. For example, we recognize the air quality plan for the Los Angeles region needs a comprehensive update, and that is in progress. A number of new studies are available, including improved data related to motor vehicle emissions and travel. From a process standpoint, what these situations demand is an ability to link timing and transportation plans and conformity with the completion of new SIPs.

In conclusion, California is pursuing statewide SIP revisions as a means to provide the necessary consistency between air quality and transportation plans. But we want to use our resources effectively to protect both our Federal transportation dollars and the integrity of our clean air plans. We believe that with some focused process changes, we can accomplish both.

Thank you for the opportunity to be here today.

Senator JEFFORDS. Thank you.

James?

**STATEMENT OF JAMES STEPHENSON, PRESIDENT, YANCY  
BROTHERS COMPANY**

Mr. STEPHENSON. Thank you, Mr. Chairman.

Conformity is an issue I have taken a very personal role in as a board member of the Georgia Regional Transportation Authority, which was established in 1999 to tackle Georgia's massive conformity problems. Our current regional transportation plan calls for congestion to get 30 percent worse as we invest \$36 billion over the next 25 years. We're going to spend \$36 billion to lose that game.

This conformity issue is of utmost importance to ARTBA, which has spent significant resources over the past 3 years helping Government agencies to defend their planning process in court. As you know, the transportation sector is really the only sector that pays a price when an area is not meeting air quality standards. Mr. Chairman, there is no doubt that we've made great progress over the past 30 years in improving the Nation's air quality. Most of the success has been achieved from the transportation sector in spite of a very large increase in vehicle miles traveled. This came not from transportation control measures, but through technology advancements in better engines and better fuels.

In Atlanta alone, we added a million people in the last 10 years with their cars. We went from 3 million to 4 million people. Yet we reduced air pollution over that time.

Mr. Chairman, when the Clean Air Act amendments of 1990 were enacted, they were based on a mistaken premise that increases in vehicle miles traveled would overwhelm the emissions reduction capacity of technology advances. Quite the opposite has happened. One of the programs that was based on this mistaken premise is CMAQ. Most CMAQ funded programs have not yielded significant emissions reductions. We need accountability built into this program. Please spent the money on activities that produce quantifiable results.

The conformity process was based on the same mistaken premise. There are two things I hope you take from this hearing today, one, that Government agencies must have more flexibility in administering the conformity process; and two, the public needs more predictability in the planning process. One of the major problems with the conformity process is that people have tried to turn it into an exact science when it is anything but. Conformity lapses don't occur due to severe clean air problems. They occur because of missed deadlines and paperwork problems. The conformity process has become more of a game of "gotcha" rather than engaging the public in true transportation planning.

One court decision striking down the longstanding practice of grandfathering had a devastating impact in my home town of Atlanta. At the time of the decision, Atlanta was in a conformity lapse, and 54 of 71 major priority projects that had been vetted through years of planning were put on hold.

Mr. Chairman, while many of the professional environmental groups talk about wanting a more inclusive transportation planning process, the facts are really quite different. Since ARTBA started its litigation alliance to help defend the planning process, the Sierra Club and many of its colleague organizations have fought relentlessly to keep ARTBA out of the process. The truth is

that these organizations do not want an inclusive process. They want to trump the planning process through court proceedings where they and they alone can drive the process. When the planning process is allowed to be hijacked by any one individual viewpoint, bad decisions result.

Please don't forget, delays in transportation improvement projects have tragic consequences. Forty-two thousand people are killed each year on our Nation's highways, 15,000 of these due to substandard roadway conditions, obsolete designs, or roadway hazards. Delay is not harmless, delay kills.

Delays also have other costs as well. Besides increased congestion, when an area is in a conformity lapse, it can be sanctioned with a loss of Federal highway and transit moneys. This happened in Atlanta for about a year and a half. Rather than penalizing areas that failed to meet air quality standards, Congress should consider rewarding those communities that make the greatest progress in cleaning their air. Using sanctions that cutoff badly needed transportation improvement funds only exacerbates the problem, resulting in increased congestion and worsened air quality. Couldn't we try using a carrot instead of a stick?

Finally, Mr. Chairman, we are headed for another conformity train wreck when EPA implements its new, tighter standards for ozone and particulate matter. Several hundred counties are going to get an expensive education in court in the conformity process.

Mr. Chairman, I have included more detailed comments, as well as some proposed legislative fixes in my written testimony. I look forward to any questions you may have.

Senator JEFFORDS. Thank you.  
Michael?

**STATEMENT OF MICHAEL REPLOGLE, TRANSPORTATION  
DIRECTOR, ENVIRONMENTAL DEFENSE**

Mr. REPLOGLE. Good morning, Mr. Chairman and members of the committee. Thank you for the opportunity to appear today. I'm Michael Replogle, Transportation Director of Environmental Defense. I'm testifying today also on behalf of Sierra Club and the Surface Transportation Policy Project.

Vehicles account for a large share of the air pollution that kills tens of thousands of Americans each year and injures millions. Pollution cuts from cleaner cars have been in part offset by growth in driving. Over 160 million Americans still live in areas with poor air quality, 14 million with asthma gasp for air when ozone levels rise. Those living near big roads can face cancer risks as high as 1 in 500 from air toxics. And transportation greenhouse emissions are up 9 percent since 1990.

DOT estimates the health effects of air pollution costs us \$40 billion to \$65 billion a year, dwarfing the \$27 billion in Federal transportation spending. This hidden tax of over \$600 a year per household falls most heavily on our children, elders and infirm. Responding to the failures of air quality controls between 1970 and 1990, Congress required transportation decisions to conform with SIPs. This has improved air quality accounting and spurred investments in cleaner fuels, vehicles and maintenance, transportation choices and smart growth that cuts traffic and pollution.

But conformity has only just gotten into gear since many ozone attainment SIPs were adopted only last year. Failure of transportation plans to comply with SIPs is why most areas failed to meet ozone standards in 1987. Many areas again failed to attain by 1999, because vehicle emissions weren't cut to levels needed for attainment. While conformity is working, it faces challenges that could again cause SIPs to fail. Congress should require the use of best modeling practices to estimate future travel and emissions with clear DOT and EPA responsibilities to identify best practices, audit regional models and when timely, correction of deficiencies in these accounting systems.

Congress should fund enhanced data collection, evaluation and analysis methods and create a transportation environmental research program. CMAQ should be reauthorized at a much higher level, recognizing the larger population in non-attainment areas. States have failed to spend one in four out of all CMAQ dollars, almost \$3 billion. Let's sub-allocate these funds to MPOs and get them spent.

Congress must ensure priority funding for transit and economic incentive programs needed to attain air quality. Barriers to planning and implementing facilities and services needed for attainment should be lowered. Non-attainment areas should get priority access to funds, such as projects to fund such projects using unprogrammed minimum guarantee funds and funds proposed for flex between funding categories by the States.

Before 1990, some States cooked their books with unfunded promises of transit to offset pollution from new roads. The roads got built, the transit didn't, and vehicle emissions soared, contributing to the failure of SIPs in the 1970's and 1980's. Today conformity and SIPs are undermined by lack of local match funds for transit, weak accounting for funds, lax Federal oversight of planning requirements. Project costs are widely underestimated. FHWA's failure to lapse fund balances unspent by the States as required by law exacerbates a growing fiscal mess.

Congress should assure the frequency of conformity supports timely attainment. Less frequent analysis means bigger surprises and less timely model updates. A 3- or 5-year cycle may fail to catch and correct fast growth in traffic or emissions. Schedule coordination must flow from good interagency coordination, not from less frequent checks and balances.

EPA is already obligated by law to track and report non-attainment area emissions every 3 years, and assure remedial measures in SIPs are implemented when emission reduction targets aren't met. SIPs will again fail if areas don't consider long term impacts of major projects.

Congress should ensure conformity lapses don't block conformity exempt or emission reducing transportation projects from being added to non-conforming TIPs and transportation plans. FHWA should mitigate the adverse health impacts suffered by communities exposed to air toxics caused by expansion of major highways. Congress should boost incentives for employer paid transit benefits, road pricing and use based car insurance, and investments in rail, bus, rapid transit, pedestrian, bicycle and intermodal travel, which can cut traffic and emissions growth by a quarter from trends and

boost transportation system performance in a very cost effective way.

During the Atlanta Olympics, Georgia brought in a thousand more buses, promoted travel alternatives and incentives, and cut morning traffic and ozone by a quarter, cutting asthma incidents by 42 percent. We can replicate that success story elsewhere.

I close by presenting you with letters from 16 national health and environmental leaders, asking Congress and the Administration to enhance accounting for the effects of transportation on health, air quality and the environment. We look forward to working with you on the reauthorization of TEA-21. I have more detail in my written testimony. Thank you.

Senator JEFFORDS. I believe you.

[Laughter.]

Senator JEFFORDS. Thank you all for very excellent statements. This is obviously an extremely important area that we're looking at for the future of this Nation. So I will have some questions.

Given the challenges posed by implementation of the revised ozone and fine particulate standards, should we increase the funding for CMAQ and if so, by how much?

We'll start with Scott and move on down.

Mr. JOHNSTONE. As I said in my testimony, I certainly think that CMAQ funding should be increased. I think it goes with the widening range of issues that we need to deal with, whether it's ozone, particulate matter, greenhouse gases, air toxics. There's more to do. Obviously it should be spent in ways that are thoughtful, in ways that will produce results. But there is real need to get our air clean. And this is a great program and a great way to make progress on that front.

So I think we certainly should see an increase in the percentage of the transportation budget going to this work.

Judge HARRIS. Mr. Chairman, we would concur, but there are uses that increases could allow more participation in. As you've heard and all of you know, particularly in our area, 80 percent of the problem on mobile is caused by about 10 percent of cars, which works out to be 40 percent, running through all those numbers, of our emission problems. And we've started something called the LIARP, which is low income assistance and repair or replacement program that the legislature authorized and will be kicking off September 1st. It's funded through some fees on inspections of vehicles. And it's to help those who really are the backbone of all of our cities and areas in this country that do the very physical work most times of brick laying, of various construction projects, servers are McDonald's, Wendy's, wherever. They are the least able, again, to help themselves when faced with a \$300 repair bill to get their vehicle into compliance. And our inspection stations are even worse, a vehicle that's diagnosed as costing too much, which could be in excess of \$600 to \$1,000, to be repaired.

So they need assistance, you know, \$1,000 won't buy a vehicle. But we feel this is a way to help address some of the most polluting, and certainly we could have the ability to then use some of the CMAQ funds, again, not all of them, I think, back into partnerships. Certainly the State of Texas has put forward an effort, and

if some moneys could be put together to help that, I think it would really benefit the entire country to get those cars off the road.

Ms. TERRY. We certainly agree that we need more CMAQ dollars. Given the health effects of particulate pollution an increased emphasis there is absolutely essential. As we look at the health effects, we see from the studies that the "safe levels" continue to be even more difficult to achieve than we had thought previously. So combining additional CMAQ moneys with that focus, and with a really long term vision for continuing the declining emissions, while progress has been tremendous, we still have a very long way to go.

Mr. STEPHENSON. My view would be that an increase would be appropriate to the extent that you have an increase in the overall investment in transportation in the country. And further, to the extent that you have quantifiable results and measurable accountable programs that you're funding with it.

Mr. REPLOGLE. I think the CMAQ program is a very effective program and one that should be increased proportionate to the increase in population in non-attainment areas. In 1999, there were about 54 million people living in areas that didn't meet the 1 hour ozone standard, which is the basis for allocating CMAQ dollars today. According to EPA's latest data, 123 million people live in the 333 counties that violate the 8-hour ozone standard, and 82 million live in 173 counties that violate the PM fine standards.

So together, when EPA makes its designations, there's likely to be somewhere between 150 and 165 million people living in non-attainment areas that ought to be fully eligible for those CMAQ dollars. So we really need a several fold increase in this program, simply to avoid diluting the level of effort in current non-attainment areas.

Senator JEFFORDS. Thank you. Scott, thank you for taking the time to come down and be with us today. Assuming that we can get power plant pollution under control at some point soon, what else can Vermont do to address the other air quality problems of vehicles?

Mr. JOHNSTONE. First let's hope we get the former taken care of, and we'll continue on the work to get that done through the lawsuits we're a party to. There are other sources in Vermont, and clearly, surface transportation is where we have to start. It's almost half of our in-State sources come from vehicles. So that's where we've got to start. And whether it's continuing with the California low emission program, whether it's promoting the light rail and various train service that we've got, even in a rural State like Vermont. Park and rides most people think don't work in rural areas. But look around Vermont. Every place we've got one, it's full.

So we can make great progress. And I would add too that I am more convinced every day that critical to solving the air quality problem is finally addressing the issue of how we grow. It's not a question of do we grow or don't we grow from my perspective. It is how we grow. If the sprawl that we face is what creates this increased mileage that everyone is talking about that we travel in our cars, it's how we grow. And that really comes back to how we fund projects, from my perspective. In Vermont, we're using up our

land at a rate that's two or three times that which our population growth is growing. That's not sustainable, and it's really an issue we've got to address if we're going to meet our air quality goals. And frankly, have a sustainable Vermont that people want to live in.

So those are the primary sources. Then after surface transportation, we've got to meet our residential heating and our business sector needs by replacing energy sources that are fossil fuel today with cleaner technology and different technology.

Senator JEFFORDS. Thank you. Lynn, unfortunately, the Administration and Congress are not in a rush to take any steps to significantly reduce greenhouse gases from the transportation sector. So I'm glad to see that California has stepped up to the plate. Can you please tell us about the California program to reduce greenhouse gas emissions from mobile sources?

Ms. TERRY. Certainly. Governor Davis just signed a bill that will require the Air Resources Board to adopt regulations by January 1st of 2005 to reduce greenhouse gas emissions to the maximum extent feasible in a cost effective manner. It requires the board to look at passenger cars and that includes everything that people typically drive, from small sedans, sports cars, to SUVs, and look at ways to reduce greenhouse gas pollutants. We're required to look at alternatives, to provide flexibility, to look at consumer costs. But other than that, we're free to look at the gamut of technological solutions.

We also have clear directions from the legislature not to prohibit certain vehicle types, not to address speed limits, gasoline pricing, those kinds of strategies. It is very much a technology focus.

So we will be integrating those kinds of regulations with our technology assessments that we're doing to address those on a particulate pollution. So it will be looked at in that context. The legislature, recognizing the innovative approaches that were possible, has asked us to provide a year for formal review by the legislature, including legislative hearings. They do not have veto power over the regulations, but certainly they have the opportunity to consider legislation if they want to go to different directions.

But we see this whole approach as very compatible with our longstanding history of technology advancement in the vehicle sector. So we have a lot of work to do.

Senator JEFFORDS. We appreciate the work you are doing.

Michael, your in-depth knowledge on the topic has been of great assistance to the committee in the past, and we look forward to your help in the future. How can we get better resources to the States and the planners, to ensure that the successes continue to outnumber the failures in the area?

Mr. REPLOGLE. I think it's important to increase the setasides for planning, for metropolitan planning, and perhaps to create a new setaside for State planning, to create integrated transportation natural resource and growth management plans. A lot of the problems that I think we see in the disconnect between air quality and transportation come because for decades transportation was a world of its own that developed a system to meet the externally developed forecasts for growth of land use.

Today, over the last decade, we have begun to change that, so the transportation planners and air quality planners are sitting down routinely, coordinating their activities. I think we can extend that to other areas of water planning, greenhouse gas emission reduction planning, protection of sensitive habitats and other natural resources and historic resources, so that we can make sure that transportation projects, as they move into the environmental review process, are the right projects that have avoided adverse impacts by recognizing where sensitive resources were, and by recognizing what kinds of things we ought to be investing in to minimize damage to our environment and to maximize benefits for our society and cost effectiveness in our spending of transportation dollars.

In that way, we can minimize the costs of pollution cleanup, because we won't have to clean up as much pollution. This is where markets make real sense and information makes real sense. Integrating the activities of our agencies to meet broader societal goals beyond just mobility is a key part of making sure that we get the right intelligence.

We also need some help at the national level. I think creating a national program for transportation environmental research as the National Academy of Sciences committee just recently recommended would be an excellent step in the right direction. It's a program that needs \$15 million to get started.

We need to be investing in a clearinghouse for better transportation modeling and emission modeling practices. The U.S. DOT today still spends a fraction of what was spent even 20 years ago on developing appropriate modeling techniques to evaluate travel behavior changes as a result of transportation. We need a new generation of models that help us to do better decisionmaking and support elected officials and the public with good information.

Finally, I'd say we need to make sure that the transportation planning process at all levels is looking at alternative scenarios, instead of just looking at one size fits all, one approach, business as usual track, we need to make sure that transportation plans and programs also consider system management strategies that can help meet our needs for mobility with less vehicle miles of travel, less land consumption for urbanization and less emissions.

Senator JEFFORDS. Thank you. Ron, your testimony was that there should be consistent, submitted frequencies for SIPs and TIPs. Do you have any specific solutions in mind?

Judge HARRIS. I think we would be working these out purely with the technicians that understand this. But I do know in our area that it has become increasingly difficult to map out transportation projects that ultimately will reduce congestion, which I believe does reduce air emissions for cars running versus stop and start. And we've been working very hard to be in conformity and to clean up the air. With this movement around, for instance, right now we're facing, and I think the legislature will fix this funding shortfall, which has jeopardized our current proposed SIP.

And if that should happen, then 60 to 90 days later, we would be in a conformity freeze, even though we are doing just about everything we can do, and the citizens are behind us, businesses are behind us. We wouldn't even have time to rearrange those plans to make it work. And yet we've been working on these conformity

plans diligently for years. Just this little blip could throw us out of conformity. I think this is not untrue across the Nation, as you've heard this morning. But that's our imminent piece, and of course, we're working to not get to that point.

But still, beyond that, for consistency in planning, it would help if we could marry up those dates.

Senator JEFFORDS. James, you said that one of the best ways to achieve the goals of better air quality and reduce congestion is by reducing bottlenecks on the Nation's roads. Are you aware of any recent studies which show that those kinds of projects would improve the quality in the short and long term?

Mr. STEPHENSON. It would improve air quality?

Senator JEFFORDS. Air quality.

Mr. STEPHENSON. Reducing bottlenecks, you mean a study as opposed to just using common sense and understanding that cars going through an intersection instead of stopping and starting produce more pollution?

Senator JEFFORDS. Yes.

Mr. STEPHENSON. I'm not aware of one. I'll see if I can get one and send it to you. I know there are studies that show that cars produce less pollution at about 40 or 50 miles an hour than they do either idling or when they're accelerating or from a stop.

Senator JEFFORDS. Scott, as you said, Vermont is lucky to be an attainment State. You suggested some changes to the CMAQ formula, so that Vermont could stay in attainment. Does this change become increasingly necessary as the revised standards go into effect?

Mr. JOHNSTONE. I think it does, because we will have more and more challenges in Vermont, both as standards get harder over time, which ought to happen, and as we face continued problems of other air pollution sources. We've got a hard job to stay in attainment. We are there, and I'm proud to say that. We're not there by much. And I don't want Vermont to be facing non-attainment.

So we need to take this issue on, that's why we take it so seriously. I sometimes get folks in Vermont saying, why do you guys work so hard on air quality? We are in attainment. Well, that's exactly the point. We want to stay there. And there are major challenges. As our vehicle miles traveled just continue to balloon, we are in danger of falling out of attainment. So it's really important for us to face that challenge and stay where we're at, because it's a lot better to be in attainment than non, from my perspective.

Senator JEFFORDS. We're ready to help in any way we can, without cheating.

Mr. JOHNSTONE. Of course.

[Laughter.]

Senator JEFFORDS. Michael, what should Congress do while EPA considers revising its rule on mobile source air toxics?

Mr. REPLOGLE. I think one of the important steps to take is to first of all, make CMAQ dollars available to communities to help deal with air toxics problems. Second, make sure that the Federal Highway Administration is considering and avoiding or mitigating the impact, the health impacts of air toxics on communities affected by increased air toxics caused by expansion of highways.

This is an issue that's coming up in Las Vegas and a number of other places around the country.

Third, I think make sure that there is continued timely progress to implement cleaner diesel technologies and no backsliding on the programs that have been put in place for that. I think fourth, do everything possible to encourage early adoption and availability of low sulfur diesel fuel, and the provision of incentives and programs for States to adopt to reduce the off-road diesel emissions, which are a significant contributor to air toxics. There are a lot of things that need to be done.

Senator JEFFORDS. Thank you. Lynn, you mentioned that California will be revising 23 SIPs over the next year. What kinds of resources does it take to manage that kind of effort? And do you think it will all be done in time to avoid a conformity lapse?

Ms. TERRY. It will be done in time to avoid a conformity lapse. It will be a long year. Fortunately, some of those SIPs are for carbon monoxide, and it really does amount to a reconciling of emission inventories. But the sort of technical aspects aside, the reality is we still have to go through, in California, a local level process of public comment hearings, again at the State level, and then EPA has to approve those plans. So it's a workload at all three levels. And U.S. EPA Region IX has been terrific in sitting down with us and trying to prioritize and work through the timeframes. But it's a huge resource burden for all of those levels of Government. And what we'd really like to do is focus on those areas that are far from meeting the standards, have a long way to go and we really need to come up with new, innovative control strategies.

So that was really the heart of our comments about a streamlining mechanism, and we're going to try to develop one as we go through this process in the next few months. I think that will give us some very specific recommendations that we'd like to put into the record in terms of when streamlining makes sense and when a comprehensive revision is really unnecessary, so that this fundamental concept of conformity does work.

Senator JEFFORDS. I want to welcome Senator Carper here. The questions are yours now.

**OPENING STATEMENT OF HON. THOMAS R. CARPER,  
U.S. SENATOR FROM THE STATE OF DELAWARE**

Senator CARPER. Thanks, Mr. Chairman.

I apologize for not being here earlier. We have, as you know, a number of hearings that are going on in this building, and I've been trying to get to all of them. I'm just glad that you're still here.

The question I have relates to the use, providing States and local governments with some discretion in using congestion mitigation funding from the Federal Government for passenger rail purposes. Have any of you discussed this in any of your comments? Has it been raised at all in your comments today?

[Witnesses respond in the negative.]

Senator CARPER. Before I joined Senator Jeffords, I was Governor of Delaware for 8 years, and involved in the National Governors Association. I always thought it was peculiar that we in the States could use our congestion mitigation money for bicycle paths, we could use it for freight railroads, we could use it for roads, high-

ways, bridges, but we could not use it, didn't have the discretion to use any of our congestion mitigation money for inter-city passenger rail, even if that made sense in terms of reducing congestion.

The Senate has passed, I suspect with the vote of our chairman on a couple of occasions, legislation providing flexibility to Governors and others in States to use their congestion mitigation money and some other Federal transportation moneys more flexibly to support not only bicycle paths, freight railroads, building roads, highways, bridges, but also provide some additional funding for passenger rail service, if that made sense in the discretion of chief executives in our States. I would just ask if any of you care to comment on that notion. Is that a good idea, bad idea? Is that an idea whose time has come, has gone?

Mr. REPLOGLE. I think it's an artificial restriction. I think the funds should be available for passenger rail, and I think States should also be looking at opportunities for more widespread use of the national highway system funds to support passenger rail services. Because usually passenger rail is in fact operating to serve the same markets that are served by the national highway system.

Ms. TERRY. And we certainly support flexibility in the use of CMAQ funds. A lot of the discussion this morning has been about cost effectiveness. But certainly in California, air quality is a very long term problem. So passenger rail in our view really needs to be part of the long term future.

Mr. JOHNSTONE. I certainly would support that flexibility from Vermont's perspective. But with the notion, and I think it would be an easy test, for any passenger rail service I can think of. I just don't want it to come back to some nexus with improvement in air quality, which I think would be an easy test to accomplish.

Judge HARRIS. I think, Senator, any time you can allow the local folks to focus on issues that are specific to their areas, we're all better off. Certainly trains, we've got a couple moving between cities in Texas that do take a lot of people off, I've watched them and been at those stations. But again, the word flexibility is always an outstanding attribute for any legislation.

Senator CARPER. Mr. Stephenson, I see you're with the American Road and Transportation Builders Association.

Mr. STEPHENSON. Yes, sir.

Senator CARPER. I would welcome any comments that you have, pro or con.

Mr. STEPHENSON. My perspective is, I think, similar to Judge Harris's, that flexibility is good. I would urge that any restrictions that were placed on that flexibility be in the nature of calling for quantifiable and measurable results in terms of not just emissions, but that first word that the C stands for, which is congestion.

Senator CARPER. Mr. Chairman, I'm glad you and the witnesses were still here, and I appreciate very much the chance to raise some questions.

Senator JEFFORDS. Well, we were waiting for your arrival.

[Laughter.]

Senator CARPER. Why didn't that first panel wait, too? No, I'm just kidding. Thank you. Thank you all.

Can I ask a question of Mr. Johnstone? Are you from Vermont?

Mr. JOHNSTONE. I am.

Senator CARPER. My recollection is that Vermont uses its local and State moneys to fund some passenger rail services. Is that correct?

Mr. JOHNSTONE. I believe that's true, yes.

Senator CARPER. President Bush, in his recommendations to Congress with respect to Amtrak, deals with the use of States, the ability of States to use their own money. In fact, I think there's an expectation that the present Bush Administration has, as we go forward with passenger rail service in the 21st century, to the extent that the Federal Government continues to play a role, the States should play a role, too. I would just note for the record that Vermont is one of the States that's been very active in providing its own funds to help support inter-city passenger rail service. I think it may go on to Canada, as I recall. I'm not sure.

Mr. JOHNSTONE. I don't think it does through rail at this time. The rail connects to bus service. But the direct rail connection is something that over the past few years hasn't been able to be continued.

Senator CARPER. I think part and parcel, if we're going to act on that aspect of the President's recommendation, in which we would expect States to do more to support train service, it may not make money, it may not be finished. In my own judgment, it simply makes sense to give States some additional flexibility with respect, for example, to their congestion mitigation money to help make ends meet. But not to require that, but to give States and Governors that flexibility and those tools.

Thank you, Mr. Chairman.

Senator JEFFORDS. I agree with you on that. Vermont used to have a direct train service to Montreal, but union problems made it impossible. So they bus them up from the end in Vermont.

Senator CARPER. We even had a name for that train. It's called the Montrealer.

Senator JEFFORDS. Yes, those were the good old days. Maybe some day it will come back.

Well, thank you. This has been a very exciting time for me to talk with people that really are involved and knowledgeable and enthusiastic. Thanks. It made my day. I hope it helped yours. Thank you.

[Whereupon, at 11:55 a.m., the committee was adjourned, to reconvene at the call of the chair.]

[Additional statements submitted for the record follow:]

STATEMENT OF HON. JON S. CORZINE, U.S. SENATOR FROM THE STATE OF NEW JERSEY

Thank you, Mr. Chairman, for holding these continuing hearings on the reauthorization of the Transportation Equity Act for the 21st Century—TEA-21, and I'd like to join you in welcoming our witnesses.

The issue of air quality is very important to me. Most of the state I represent—New Jersey—is designated as a “non-attainment area” for the Clean Air Act criteria pollutants. This degree of air pollution affects the health and well-being of our residents, especially the young, the elderly and the infirm. While much of our air pollution comes from out-of-state sources, there is no doubt that the cars on our roads contribute as well.

To its credit, New Jersey has taken steps to help itself. We've instituted such congestion reducing measures as EZ-Pass. We've invested heavily in new rail systems

to help get more drivers off the roads. And we've revamped our motor vehicle inspection system to help ensure that cars meet tougher Federal air quality standards.

But New Jersey and states like it need more help, Mr. Chairman. We need assistance from the Federal Government in programs like the Congestion Mitigation and Air Quality Program. I look forward to an ongoing dialog in the committee as to how to make this good program even better as we re-authorize TEA-21. And we need to look into other measures that will help states help themselves.

But we also need to do more to reduce vehicle emissions by requiring automakers to raise gasoline efficiency standards. I was disappointed when Congress failed to include an increase in CAFE standards as it considered the Energy bill. I hope we get the chance to do so again.

Thank you again, Mr. Chairman, for holding this hearing and I look forward to hearing from our witnesses.

---

STATEMENT OF MARY E. PETERS, ADMINISTRATOR, FEDERAL HIGHWAY  
ADMINISTRATION, DEPARTMENT OF TRANSPORTATION

Mr. Chairman and members of the committee, thank you for this opportunity to discuss implementation of the transportation and air quality provisions of the Clean Air Act (CAA) and the Transportation Equity Act for the 21st Century (TEA-21).

Meeting the dual challenges of congestion relief and air quality improvement is a high priority for all of us at the Department of Transportation, as I know it is for members of this committee. In TEA-21, you gave us new tools and authorities to assist us in achieving this goal, and we are proud of the progress that has been made. In reauthorization, the Department wants to continue to build upon the successes of TEA-21 and the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA). Yet, as Secretary Mineta stated at a hearing before you earlier this year, we have an obligation to do much more to address surface transportation concerns. Secretary Mineta has also noted that one of the core principles of the Department's reauthorization efforts is ensuring an efficient infrastructure while retaining environmental protections that enhance our quality of life.

In my testimony today, I will address three main points. First, I want to assure you that progress has been made in reducing transportation-related emissions of pollutants, and that the Department of Transportation is committed to doing its part to ensure progress continues. Second, I will describe how the Congestion Mitigation and Air Quality Improvement Program (CMAQ) has assisted States and localities in addressing their mobility, air quality, and quality of life concerns. Finally, I want to restate the commitment of the Federal Highway Administration and the Department to work with our transportation planning and air quality planning partners for effective coordination of the transportation and air quality planning processes.

CONTINUED FOCUS ON AIR QUALITY IMPROVEMENTS

As a Nation, we have made remarkable improvements in reducing air pollution, especially pollution that comes from transportation sources. Where transportation is a significant source of pollutants, the Environmental Protection Agency (EPA) reports that ozone (formed by the reaction of volatile organic compounds (VOC) and oxides of nitrogen (NOx)), carbon monoxide (CO), and particulate matter (PM), have all decreased substantially since 1970. A majority of the areas designated as non-attainment since 1990 now meet national air quality standards. Air quality monitoring data through 2000 shows that 76 out of 78 carbon monoxide nonattainment areas, 69 out of 85 coarse particulate matter (PM<sub>10</sub>) areas, and 81 out of 101 ozone areas no longer show air pollution levels that exceed the national ambient air quality standards. And, while the CAA has led to reduced pollutant emissions from all air pollution sources, the greatest success can be found in the reduction of motor vehicle emissions: CO emissions have been reduced by 43 percent since 1970, PM<sub>10</sub> emissions reduced by 33 percent, and VOC emissions by 59 percent from motor vehicles (see Attachment). While NOx emissions increased by 16 percent over the period, the rate of increase was less than the increase from all sources (21 percent). And, NOx emissions from automobiles (excluding sport utility vehicles (SUVs) and light trucks) decreased by 31 percent. For VOC and CO, motor vehicle emission reductions were greater than the reductions from all other sources. Thus, motor vehicle emissions now make up a smaller percentage of total emissions. In 1970, motor vehicles contributed 59 percent of total emissions of carbon monoxide, NOx, VOCs, and PM<sub>10</sub>, when compared to stationary, area, and non-road mobile sources. However, by 1999, the motor vehicle portion of emissions of these pollutants dropped to

48 percent. Most of these emissions reductions have resulted from stricter emissions standards, improved engine technology, and cleaner fuels.

It is especially important to note that these reductions in emissions were accomplished during a period of 33 percent increase in population, 147 percent growth in gross domestic product (GDP), and 143 percent increase in vehicle miles traveled. The automotive, fuels, highway, and transit communities have managed to achieve this success in improving air quality while at the same time working to address increasing demands to improve mobility.

The downward trend achieved in emissions is expected to continue into the future. Engines and fuels are to become even cleaner under recent EPA-issued regulations for emissions standards and cleaner fuel requirements. Between 2004 and 2007, more protective tailpipe emissions standards will be phased in for all passenger vehicles, including SUVs, minivans, vans, and pick-up trucks. This regulation marks the first time that larger SUVs and other light-duty trucks will be subject to the same national pollution standards as cars. In addition, the EPA tightened standards for sulfur in gasoline, which will ensure the effectiveness of low-emission control technologies in vehicles and reduce harmful air pollution. When the new tailpipe and sulfur standards are implemented, Americans will benefit from the clean-air equivalent of removing 164 million cars from the road. These new standards require all passenger vehicles sold after the phase-in period to be 77 to 95 percent cleaner than those on the road today, and will reduce the sulfur content of gasoline by up to 90 percent.

We expect that motor vehicle emissions will be reduced as new heavy-duty vehicles that meet the 2004 emissions standards for heavy-duty engine standards enter the fleet. Beginning with the 2007 model, heavy-duty engines for trucks and buses must meet even tighter emissions standards, and the level of sulfur in diesel fuel must be reduced by 97 percent by mid-2006. As a result, after a phase-in period, each new truck and bus will be more than 90 percent cleaner than current models. In addition to tighter standards, the Federal Transit Administration (FTA) has been working with industry to develop and demonstrate low- and zero-emissions advanced propulsion technologies for transit buses, including hybrid-electric, battery electric, and fuel cell-powered buses. Under FTA/DOT leadership, a national program is underway to accelerate the development and commercial viability of these advanced technologies.

However, despite dramatic improvements in air quality, some of the nation's largest metropolitan areas still face challenges in meeting the current ozone standard (also known as the 1-hour standard due to the averaging time for the ozone concentration levels). Furthermore, the Nation as a whole, and the transportation community in particular, face additional challenges as new air quality standards are implemented. The new 8-hour ozone and fine particulate (PM<sub>2.5</sub>) standards will be more stringent, and many areas across the eastern U.S. and in California have pollution levels now exceeding these standards. Some of these areas, including small urban and rural areas, may be designated nonattainment for the first time. Other existing nonattainment areas may become larger and involve more jurisdictions under the new standards. The Department and EPA are working with these areas to increase their capacity to deal with new nonattainment designations.

#### CONGESTION MITIGATION AND AIR QUALITY IMPROVEMENT PROGRAM

We have learned a great deal about transportation and air quality over the last 30 years, and over the last 10 years in particular. One thing we have learned is that there is no one "right way" to address transportation needs that meets the requirements of the entire nation. The transportation needs of Houston differ markedly from those of Chicago. This is doubly true when trying to reduce congestion and improve air quality. We have also learned that if we are to address our mobility and air quality needs simultaneously, we must incorporate national approaches, State and local planning, and project-level investments.

The CMAQ Program was established in 1992 by ISTEA as one of the programs designed to provide States and metropolitan areas flexibility to better address their particular needs. The CMAQ program is the only Federal transportation program specifically targeted at air quality improvements. Through this program, we have provided \$6 billion during the life of ISTEA and \$8 billion under TEA-21 (1998-2003) to States and local governments for innovative programs and projects that demonstrate an air quality benefit and contribute to attainment of a national ambient air quality standard.

The concept of the CMAQ program is to provide needed flexibility to fund transportation improvements, whether they be highway, transit, shared ride, bicycle and pedestrian or other types of projects. This flexible approach allows for investments

that cross traditional boundaries of the Federal-aid program to support projects focused on transit systems, alternative fuels and vehicles, intermodal highway facilities, emissions inspection and maintenance (I&M) programs, and a host of other projects.

The CMAQ program has also supported more highway and systems management improvements that contribute to emissions reductions through traffic flow enhancements or other means, and has been an important funding source in the implementation of Intelligent Transportation Systems (ITS). In Arizona, for example, CMAQ funding accounted for 87 percent of the Federal funds used for ITS investments.

#### *Overview of CMAQ-Funded Projects*

Through fiscal year 2001, about \$9.5 billion had been obligated under the CMAQ program. According to the latest data, the majority of CMAQ funding goes for new and enhanced transit services and traffic flow improvements that ease congestion, reduce starts and stops, and reduce emissions. These two categories are the backbone of any metropolitan area's transportation system, but they are also the most capital-intensive of the types of projects eligible under the program.

A breakdown of CMAQ funding is provided in the table below.

CMAQ Funding by Type of Project  
1992-1999

| Type of Project   | Amount Obligated (\$<br>Millions) | Percent    |
|---|-----------------------------------|------------|
| Transit .....   | \$2,700                           | 43 percent |

In recent years, there has been a significant increase in the amount of CMAQ funding used for emissions I&M programs. Both Illinois and New Jersey have used CMAQ funding extensively for this purpose. In fact, 75 percent of New Jersey's recent CMAQ funding has been used for its I&M program. This is noteworthy because I&M programs have proven to be important strategies for meeting Federal air quality standards, demonstrating relatively large emission reductions, especially in acute ozone nonattainment areas.

#### *The Benefits of the CMAQ Program*

Some CMAQ projects and programs, for example those supporting vehicle I&M programs, have registered notable emissions reductions. According to the States' annual CMAQ reports, I&M programs can yield about 5 tons per day in VOC in Illinois to over 40 tons per day in New Jersey. Regional projects, like traffic management centers and other projects that contribute to a modern, intelligent transportation system, also demonstrate larger emissions reductions than local or corridor level projects. Finally, we foresee greater potential for projects that advance new vehicle and fuel technologies. On the transit side, funding for bus replacement, removing older higher polluting vehicles from city streets in favor of newer models, has shown results, as have heavy-duty diesel retrofit programs and the introduction of alternative fuels.

Further, even the more traditional transportation control measures (TCMs), such as High Occupancy Vehicle Lanes (HOV), turn lanes, and new buses, funded under the CMAQ program can help our State and local partners achieve other goals in addition to improving air quality. They improve our quality of life, by reducing pollution, by relieving congestion, and by allowing us to walk or bike in a more pleasant environment.

Finally, the flexibility of the CMAQ program supports experimentation by our partners in the States and metropolitan planning organizations (MPOs) to meet travel demand in the most environmentally sensitive ways. In addition to ITS services, intermodal projects, and I&M programs, the CMAQ program has funded:

- Station cars and car-sharing programs
- Telecommuting
- Parking cash-out programs
- New vehicle technologies, including fuel cell vehicles
- Alternative fuels

- Public-private partnerships
- Transit-oriented development

The National Academy of Sciences (NAS) recently released a comprehensive assessment of the CMAQ program. A number of findings and recommendations were offered, with the study concluding the program is valuable to State and local governments and should be continued. The assessment highlighted in particular the importance of the program's flexibility, encouragement of innovative approaches to reduce emissions, and support for new partnerships across jurisdictions.

#### *Recent Issues*

In recent discussions, our stakeholders have raised several issues about the CMAQ program and its role in the overall surface transportation program. The first involves concerns about the CMAQ funding formula. The statutory formula apportions funds to the States based on the population living in nonattainment and maintenance areas and the severity of the ozone and CO pollution problem. However, the statutory formula does not include factors for the EPA's new air quality standards. Thus, a State whose nonattainment population will grow under the new EPA standards will receive no comparable increase in CMAQ funding. The NAS report and others in the air quality community have also pointed out the importance of addressing the new fine particulate matter standard, because of the mortality impacts associated with this type of pollution.

Expanding the eligible use of CMAQ funding for operating assistance constitutes a second issue. One of the current strengths of the program is the focus on improvement projects, which could be diminished by providing assistance for routine operations. Currently, we provide operating assistance for up to 3 years under the CMAQ program for new services to help them get established.

A third issue that has been raised is whether to expand CMAQ funding to areas outside of existing nonattainment and maintenance areas. In January of this year, we published a Federal Register notice maintaining our current policy of limiting funding to nonattainment and maintenance areas, but allowing projects to be funded that are in close proximity to, and primarily benefiting, a nonattainment or maintenance area. Comments to the docket revealed that our stakeholders are divided on the issue of funding outside of existing nonattainment and maintenance areas, although the majority of States and MPOs favored retention of our current policy.

We will consider these issues as we develop our reauthorization recommendations.

#### THE TRANSPORTATION CONFORMITY PROCESS: COORDINATING TRANSPORTATION AND AIR QUALITY PLANNING

Conformity refers to a requirement of the CAA that is designed to ensure that federally funded or approved highway and transit projects conform to the air quality goals and priorities established in a State's implementation plan (SIP). For programs administered by the Federal Highway Administration and the Federal Transit Administration, we determine whether highway and transit projects conform to a State's SIP by comparing the total expected air quality emissions from the whole transportation system within the nonattainment or maintenance area, including the expected emissions that would result from projects contained in the transportation plan and transportation improvement program (TIP), with the emissions budget for motor vehicles in the SIP.

A failure or inability to make a conformity determination by the required deadline is referred to as a "conformity lapse." During a conformity lapse, the use of Federal highway and transit funds is restricted. Currently, most areas of the country are in conformity. But, as of July 22, 2002, five areas are in a conformity lapse.

Fulfilling the transportation conformity requirements has created stronger institutional links between two sets of agencies—transportation and air quality—that operated quite independently of each other prior to enactment of the Clean Air Act Amendments of 1990 (CAAA). This interagency consultation has played a crucial role in the development of more realistic and achievable transportation and air quality plans. In addition, the transportation conformity provisions have been instrumental in fostering improvements to the travel demand and emissions modeling processes, because of the specificity of data necessary to meet conformity requirements.

We now have almost a decade of experience in implementing the transportation conformity provisions of the CAAA and, despite successes, our stakeholders indicate that there remain opportunities to improve the transportation conformity process. Transportation conformity was intended to form strong linkages between the transportation and air quality planning processes. However, there is a concern among

transportation agencies-and even some air quality agencies-that transportation plans and SIPs are not synchronized with one another due to different planning horizons and update frequencies. This sometimes causes "lapses" in conformity, often disrupting the transportation funding process. While transportation plans have very long planning horizons and have to be updated frequently, most air quality plans have comparatively shorter planning horizons and are updated less frequently.

TEA-21 and the CAA require that transportation plans must cover at least 20 years and be found conforming for that entire time period. However, air quality plans have much shorter planning horizons, often only 5-10 years, resulting in a "mismatch" in which transportation plans must consider emissions controls in the absence of comprehensive air quality planning. Without comprehensive air quality planning, there is no analysis of the most cost-effective emissions controls across all sources beyond the end of the SIP timeframe. If an MPO has a conformity problem in the timeframe beyond that covered by the SIP, it has limited options for achieving substantive emissions reductions with programs over which the transportation agencies have control. Traditional TCMs have little impact on regional emissions levels, and such strategies will provide even fewer reductions in the future, as technology continues to reduce total mobile source emissions. Although MPOs bear the responsibility of assuring that plans conform to air quality budgets, they do not have the authority under current law to establish more effective measures, like I&M programs or reformulated fuels. That process of identifying future control strategies is the intended purpose of the SIP.

This "mismatch" can be further aggravated by differences in the frequency with which transportation plans and air quality plans are updated. Conformity determinations for transportation plans must be made at least every 3 years, must be based on the latest demographic and travel information, and must use the latest emissions estimation model. However, air quality plans are not updated on a regular cycle, and may reflect out-of-date assumptions or may have been developed using an outdated emissions estimation model. When a conformity analysis is performed in such a situation, it is impossible to determine whether the emissions associated with the transportation plan are truly consistent with the emissions budget in the air quality plan. This may be because the transportation plan emissions were estimated under one set of assumptions and model, while the emissions budget was developed under another. Our stakeholders have reported that such situations have occurred and are likely to happen again with the recent release of a new emissions estimation model.

EPA, in coordination with U.S. DOT, has allowed a 2-year grace period before States have to use the new emission model, MOBILE6, for conformity. EPA also requires that SIPs that are started after the official release use MOBILE6. While the Clean Air Act does not require SIP updates in all cases, EPA guidance encourages States to evaluate the effects of MOBILE6 early to plan for any needed SIP updates to accommodate change.

Our stakeholders indicate that conformity lapses have occurred because areas could not complete the complex, comprehensive transportation planning and conformity processes within the required timeframes, even though they met their emissions budgets. Data collection, model development, public outreach, and consensus building can all take a considerable amount of time and resources. MPOs also face other daily challenges of ever-increasing congestion, transportation needs due to economic growth, protection of water quality and other environmental resources, efficient freight management, safety, and security.

Many of our stakeholders have suggested bringing the planning horizons and frequency of updates of both the transportation plans and air quality plans much closer together. Some have suggested a shorter planning horizon, and less frequent updates, while others have suggested a longer air quality planning horizon. We note that some area have opted to voluntarily extend their air quality planning horizons.

In any case, some stakeholders have suggested it is in the best interests of an effective, integrated process that the air quality plans and the transportation plans are both using the latest, and most consistent, set of planning assumptions, and that the air quality plans include the necessary control measures to ensure timely attainment of the standards. Stakeholders have stated that this would also help us anticipate air quality problems and correct them in a more proactive and coordinated transportation and air quality planning process.

The "mismatch" issue also extends to the consequences associated with an area's failure to demonstrate conformity versus an area's failure to submit or implement an adequate SIP. When an area is unable to demonstrate conformity and enters into a conformity lapse, the consequences of the lapse on federally funded or approved highway and transit projects, as well as regionally significant non-Federal projects, can be immediate. Alternatively, under the CAA, if an area fails to submit or imple-

ment an adequate SIP, there is a range of time, a minimum of 18 to 24 months, before sanctions are imposed, during which the State can remedy any problems. Some of our stakeholders suggest that a similar delay in impacts should be considered for the conformity process.

The Department recognizes the value of transportation conformity, and is committed to reducing motor vehicle emissions. Over the years, we have worked closely with EPA and our State and local stakeholders to improve the transportation conformity process. We are committed to better coordinating the transportation and air quality planning processes and will continue to work with EPA and our stakeholders to identify ways to remedy the mismatch issues, including consideration of possible remedies in the development of our reauthorization proposal.

#### CONCLUSION

In conclusion, the Department of Transportation is committed to continuing the progress made over the last 30 years in reducing motor vehicle emissions and strongly supports the goals of the Clean Air Act's transportation conformity provisions. Improving transportation safety and mobility, while protecting the environment and enhancing the quality of life for all of our communities, are compatible goals. I am proud of the successes we have achieved under the CMAQ program by providing flexible funding for innovative transportation projects that improve air quality and by improving interagency cooperation between transportation and air quality agencies. However, I also recognize that additional improvement in the coordination of the transportation and the air quality planning processes can be achieved.

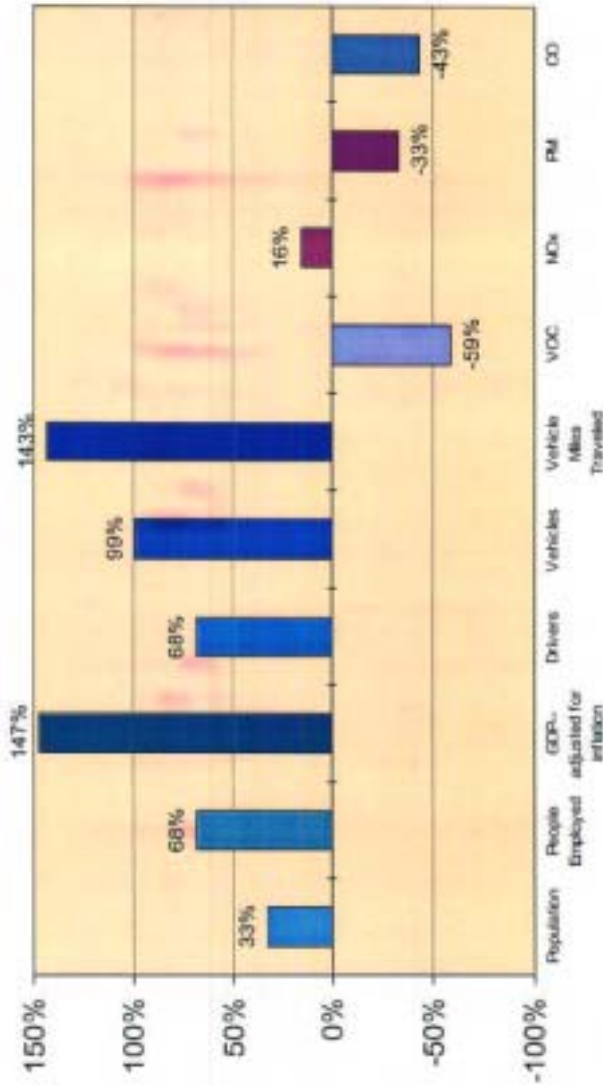

Integrating transportation and environmental decisionmaking can effectively advance environmental stewardship and improve our efficiency in meeting our nation's mobility needs.

The American public demands and deserves both mobility and clean air, and we must remain focused on providing the highest level of service and environmental protection that we can provide.

Mr. Chairman and members of the committee, this concludes my statement. I again thank you for the opportunity to testify today and I look forward to working with you as we prepare for reauthorization of the surface transportation programs.

I will be pleased to answer any questions you may have.

**Percentage of Change in Motor Vehicle Emissions, Demographics, and Travel (1970-99)**

**RESPONSES OF MARY PETERS TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS**

*Question 1a.* Questions were raised at the hearing by Mr. Replogle about the quality of traffic and emission forecasts for SIPs and conformity analysis. Please identify how well the estimated regional VMT related to each conformity determination made since January 1, 1995 has corresponded to the estimated observed regional VMT to date.

Have forecasts of 1999/2000/2001 traffic made in 1994/1995/1996 been modified as time went on?

Response. Yes. Metropolitan Planning Organizations (MPOs) in designated non-attainment and maintenance areas are required to determine conformity of their

long-range transportation plans and transportation improvement programs (TIPs) no less frequently than every 3 years, but often do so more frequently. When metropolitan areas update their long-range plans, they incorporate updated information on population and employment forecasts, changes in the transportation network, and other factors. In metropolitan nonattainment and maintenance areas, conformity determinations on transportation plans and TIPs must be based on the latest planning assumptions which include estimated regional vehicle miles of travel (VMT). The travel models use these updated data to produce revised forecasts that better reflect changes that have occurred since the last plan update. The transportation planning and conformity processes are iterative processes that are continually being updated with the latest information. This represents good planning practice, and the Federal Highway Administration (FHWA) strongly encourages such updates. In January 2001, FHWA issued joint guidance with the Federal Transit Administration (FTA) and the Environmental Protection Agency (EPA) clarifying the requirements for use of the latest planning assumptions in transportation conformity determinations. The guidance strongly encourages areas to review, and strive toward, regular 5-year updates of planning assumptions. This guidance can be accessed at: <http://www.fhwa.dot.gov/environment/cnflngg.htm>.

*Question 1b.* Please provide copies of submitted conformity analyses and a summary of the pattern in the quality of forecast versus observed VMT growth.

Response. We conservatively estimate that well over 700 individual conformity analyses have been conducted since the transportation conformity rule was promulgated in November 1993. Many of the conformity reports and their related technical documents are very voluminous and in a wide variety of formats. In addition, these analyses may be incorporated into the transportation plan or TIP. Also, even if they are separate documents from the plan and TIP, it may be necessary to review the plan and TIP as well to perform any analysis. For example, the documents supporting the most recent conformity determination on Houston's Plan and TIP conformity determination totaled about 790 pages, with MOBILE6 input files and associated tables (e.g., project tables) used to run the emissions analyses comprising much of this documentation. The plan and TIP themselves account for approximately 292 and 455 additional pages. (Source: <http://www.hgac.cog.tx.us/transportation/pubs.html>.) Below is a list of some MPO websites where conformity documents are available.

Other MPOs with conformity documents on their websites include:

- Maricopa Association of Governments: <http://www.mag.maricopa.gov/project.cms?item=131>
- Southern California Association of Governments: <http://www.scag.ca.gov/rtp/webpdfs/appendix—H.pdf>
- Metropolitan Washington Council of Governments: <http://www.mwcog.org/trans/aqcsummaryrpt.html>
- Miami-Dade MPO: <http://www.co.miami-dade.fl.us/mpo/docs/MPO—2025—mdtp—aq—20011206.pdf>
- Atlanta Regional Commission: <http://www.atlreg.com/mobilityair/PlansPrograms/cdr.html>

FHWA does not centrally collect conformity analyses. Our 52 Division Offices act on these analyses, and documents are filed locally. However, even the current conformity analyses are not sufficient to do an analysis of forecast versus observed VMT growth. To do this sort of analysis, previous and archived technical analyses would need to be retrieved, and would require a substantial amount of effort, not only by FHWA, but most likely also by the MPOs and the State Departments of Transportation, as FHWA may not have archived technical data in its files. Even if we could collect the data, a national pattern would be difficult to establish or justify, as the factors affecting forecasts vary significantly from one urban area to another (see our response to the next question for more details). A precise comparison of forecasted versus observed VMT on a national level is not possible due to limited data. At least in some instances, forecast VMT as used in SIPs and reported in transportation planning documents may underestimate observed VMT. Finally, it should also be noted that even though areas collect travel data, this "observed" data is based on sampling; it must be expanded, through estimation and modeling, to reflect total VMT for an area.

*Question 1c.* How much of the difference in forecasts has been due to changes in estimated population and employment, changes in motor vehicle use, changes in transit fares and transportation costs, improvements in transportation models or other factors?

Response. Differences in forecasts can be attributed to a variety of factors, including changes in estimated population and employment and their distribution within

a metropolitan area, changes in service availability and transportation costs (i.e., fuel prices, transit fares, parking costs, etc.), and improvements in travel models, to name a few. In addition, changes in how VMT is measured can also impact the difference in forecast vs. "observed" VMT. Because these factors can vary significantly from one urban area to another and the difference in forecasts, to a large extent, is due to the interaction among all these factors, there are no simple quantitative measures relating the proportional contribution of each factor to the overall difference between forecast and observed VMT. However, as a general rule, differences in the regional distribution of population and employment can have a significant impact on forecasts of regional travel behavior. In most areas across the Nation, population and employment location are influenced by larger societal trends over which transportation agencies have limited or no regulatory authority. The time-span of data used for developing a trend—i.e. the number of years of estimated observed VMT used to estimate VMT growth—also has a noteworthy and significant effect on forecasting VMT.

In most cases, regional travel demand forecasting models simply may not adequately account for shifts in population and employment resulting from the addition of new transportation facilities, and subsequently the increase in travel activity due to these shifts. While the exact amount of travel growth resulting from induced demand is uncertain, there is growing consensus in the transportation planning profession that the induced travel is a reality.

*Question 2.* Recent peer-reviewed research papers published by TRB showed an average observed elasticity of regional vehicle miles traveled (VMT) with respect to regional lane miles of capacity of 0.83. Has FHWA reviewed and evaluated the adequacy of regional travel models used for conformity analysis with respect to this important measure of induced traffic, which can have a profound impact on forecast traffic and motor vehicle emissions? If not, what steps will FHWA take in the next months to assure timely progress in assessing regional travel models against this scientific benchmark and to assure timely correction of MPO models that do not now adequately reflect induced traffic effects?

*Response.* We are very aware of the issue, its complexity, and potential impact on travel demand analysis. A comprehensive study on the relationship between highway capacity expansion and mobile source emissions is contained in the Transportation Research Board (TRB) report entitled, "Expanding Metropolitan Highways; Implications for Air Quality and Energy Use" (Special Report 245 (1995), TRB/National Research Council (NRC)). This report states that:

"The complex and indirect relationship between highway capacity additions, air quality, and energy use, which is heavily dependent on local conditions, makes it impossible to generalize about the effects of added highway capacity on air quality and energy use, even with improved models. On the basis of current knowledge, it cannot be said that highway capacity projects are always effective measures for reducing emissions and energy use. Neither can it be said that they necessarily increase emissions and energy use in all cases and under all conditions."

Later studies have considered the issue of induced demand. Using data sources and applying them to a dataset from the Milwaukee area, Kevin Heanue, in an article entitled "Highway Capacity and Induced Travel: Issues, Evidence and Implications," concluded that 78 percent to 94 percent of VMT increases are caused by social, and economic factors such as population, employment, and household sizes. (Highway Capacity Expansion and Induced Travel, Transportation Research Circular, No. 481 (1998), TRB/NRC.) Noland and Cowart (1999) found that, depending on the metropolitan area, there was a range of between 15 and 45 percent of increase in VMT attributable to induced travel. From a statewide analyses, Noland (1999) found approximately 21–29 percent of VMT growth attributable to induced travel, while Cowart (2001) comparably found approximately 26–31 percent of VMT growth attributable to induced travel for urban areas over 1 million. The TRB has also published numerous papers that have attempted to develop elasticity measures of induced travel. These elasticity measures have varied depending on the location, time period of analysis, and data sources used. While these more recent examples do find that induced travel has the potential to be a factor in some cases, we still believe that current modeling practice is inadequate to fully address the complex questions regarding induced demand.

In February 2001, FHWA, EPA, and the Eno Foundation co-sponsored a national symposium of experts to discuss induced travel. The findings of this symposium are summarized in a forthcoming publication from the Eno Foundation. In addition, nearly all participants agreed that changes in transportation services that reduce travel time or costs will (and should) result in increased use of that service. This increased use resulting from improved service is generally defined as "induced de-

mand.” While participants agreed on some aspects of induced demand, other issues remain unresolved, such as the magnitude and the effect of this increase. There was also disagreement about what methodologies are applicable where, and consequently about which elasticity values are appropriate in different contexts. Furthermore, there is substantial disagreement about whether a capacity elasticity that has no time component is a meaningful indicator.

The relationship between changes in highway service (capacity) and increases in vehicle miles traveled and “induced travel” is very complex. The analyses cited above employed different approaches and definitions making their interpretation and comparison challenging. Induced travel may include longer routes, change in travel mode, changes in trip destination and an increase in trip making. New highway capacity may also shift the time of day of travel, though such a shift should not be interpreted as induced travel. Regional growth may occur, accompanied by a corresponding increase in travel. This may also be interpreted as induced travel but many in the transportation community would disagree.

Induced travel may also occur across modes, that is changes in one mode may induce travel in another. For example, commuter rail service into areas previously unserved by transit may support new residential development which in turn brings increased use of the highway system. Or, a new highway that connects to a rail station may promote increased use of the transit system.

Some induced demand may be accounted for in forecasts made by regional travel models. The extent to which travel models account for induced demand depends on many factors, including the size of the transportation improvement, the timeframe of the forecast, the accuracy of the assumptions on population and employment growth, and the sophistication of the travel models themselves. As such, concerted effort and considerable sophistication is needed to both develop the data and operate the models for this purpose. Even under the best of circumstances, accurately assessing induced demand is a difficult process.

FHWA is a strong advocate for improving travel models to better address transportation planning issues, including induced demand. FHWA’s Travel Model Improvement Program (TMIP) conducts research, and provides training and technical assistance to State DOTs and MPOs to improve the current state-of-the-practice in travel modeling. Current research projects are investigating methods for incorporating commercial vehicle movements and departure time considerations in current travel models. The TMIP Program also oversees the development of a new generation travel model, the Transportation Analysis and Simulation System or TRANSIMS, which uses microsimulation techniques to better represent the travel activity behavior of individuals in response to the capacity and system characteristics of the regional transportation system. The microsimulation can also represent vehicle operational characteristics that may lead to more precise estimates of emissions. TRANSIMS is currently being tested in Portland, Oregon, with additional deployments to other metropolitan areas beginning in 2003. When fully implemented, we expect that TRANSIMS will make the incorporation of induced demand impacts easier to model.

*Question 3.* For each metropolitan area classified as a serious, severe or extreme ozone nonattainment area or serious PM–10 nonattainment area, please identify the dates when conformity determinations have been made for the regional transportation plans and/or transportation improvement programs adopted by any MPO, and where conformity has lapsed for any period of time within any such nonattainment areas, and identify the dates when the conformity lapse commenced and when a new conformity determination was made. Also, please identify the dates when current conformity determination lapse.

Response. Table 1 presents the most recent conformity determinations on Plans and TIPs in MPOs that are located in nonattainment areas classified as serious and above for ozone or serious for particulate matter of under 10 microns (PM–10). Conformity determinations must be updated no less frequently than every 3 years.

Table 1: Metropolitan Areas, Serious and Above for Ozone and PM–10

Conformity lapse information was not collected on a regular basis before 1999, but it was collected on an ad-hoc basis. Therefore, we are providing lapse information for serious and above ozone and PM-10 areas since that time. Table 2 shows a record of transportation conformity lapses in serious and above ozone and PM-10 areas since July 1999 (as of September 17, 2002).

Table 2: Conformity Lapses in Serious and Above Ozone and PM-10 Nonattainment Areas Since July 1999

| Location   | Dates of Lapse    |
|--|-------------------|
| Atlanta, GA  | 01/17/98–07/25/00 |
| Baton Rouge, LA  | 10/30/00–04/09/01 |
| Coachella Valley and Mohave portions of LA Metro Area (SCAG), CA | 06/09/01–08/03/01 |
| Dover (Kent County), DE  | 07/05/99–08/12/99 |
| Greater Bridgeport & Valley, CT                                  | 03/03/01–03/15/01 |
| Houston-Galveston, TX  | 11/99–04/00       |
| Manchester, NH   | 10/01/00–11/27/00 |
| Nashua, NH   | 10/01/00–11/27/00 |
| Philadelphia (DVRPC), NJ portion                                 | 04/10/01–05/21/01 |
| Reno, NV   | 10/01/01–11/29/01 |
| Santa Barbara County, CA   | 01/18/99–10/21/99 |
| South Central, CT  | 03/03/01–03/15/01 |
| South Jersey (SJTPD), NJ   | 04/10/01–06/18/01 |

Although only information on serious and above ozone and PM-10 areas was requested, it is important to note that transportation conformity applies to all areas that are designated nonattainment or maintenance for the criteria pollutants: ozone, carbon monoxide, nitrogen dioxide and PM-10. Therefore a failure to demonstrate conformity of a metropolitan plan or TIP in any of these areas also results in a conformity lapse. Since the implementation of the conformity program under the 1990 Clean Air Act Amendments, a number of lapses with various lengths and degrees of impacts have occurred in these other nonattainment and maintenance areas.

*Question 4.* Despite our progress on vehicle emissions technology, we are still having trouble attaining our national air quality standards. Estimates indicate that about 150 million people are currently breathing unhealthy air that's polluted by

ozone and fine particles. What is transportation's percentage contribution to this non-attainment problem?

Response. FHWA's "Transportation Air Quality Selected Facts and Figures," (see: <http://www.fhwa.dot.gov/environment/aqfactbk/index.htm>) as referenced by Administrator Peters in her testimony, notes that in 1999 on-road mobile emissions nationally accounted for 29 percent of volatile organic compound (VOC) emissions, 34 percent of the nitrogen oxide (NO<sub>x</sub>) emissions, 51 percent of the carbon monoxide (CO) emissions, and 10 percent of the PM-10 emissions.

These are national estimates, and percentages for specific nonattainment areas could be higher or lower. For example, in the Atlanta serious ozone nonattainment area, on-road mobile source emissions contribute approximately 47.3 percent of VOCs and 62.5 percent of NO<sub>x</sub> as compared to other sources, according to air quality modeling data from 1999. This data, as well as data for all other counties, is available on the EPA Air Data web page, located at <http://www.epa.gov/air/data>. Also, it is important to note that emissions do not have a direct linear relationship with actual pollutant concentrations in the air. Other factors, including meteorology and topography, can have a great influence on nonattainment.

Where transportation is a significant source of pollutants, the EPA reports that ozone (formed by the reaction of VOC and NO<sub>x</sub>), CO, and PM-10, have all decreased substantially since 1970. (Presented by Jeff Clark, Director, Policy Analysis and Communications Staff, Office of Air Quality, Planning and Standards, U.S. EPA at the "National Energy, Environment and Transportation Summit", May 15-17, 2002, New York City.) A majority of the areas designated as nonattainment since 1990 now meet national air quality standards. Air quality monitoring data through 2000 shows that:

- 76 out of 78 CO nonattainment areas,
- 69 out of 85 PM-10 areas, and
- 81 out of 101 1-hour ozone areas

no longer show air pollution levels that exceed the current national ambient air quality standards. And, while the Clean Air Act (CAA) has reduced emissions from all air pollution sources, the greatest success can be found in the reduction of motor vehicle emissions: CO emissions have been reduced by 43 percent since 1970, PM-10 emissions reduced by 33 percent, and VOC emissions by 59 percent from motor vehicles.

The one exception to this consistent, downward trend in criteria pollutants from motor vehicles since 1970 is a 16 percent increase in NO<sub>x</sub> emissions, even though emission rates per vehicle have decreased due to increasingly cleaner technology. Looking across vehicle types, total NO<sub>x</sub> emissions from light-duty passenger cars decreased 31 percent since 1970, while NO<sub>x</sub> emissions from light-duty trucks and SUVs increased 28 percent, NO<sub>x</sub> emissions from heavy-duty gas trucks increased 65 percent, and NO<sub>x</sub> emissions from heavy-duty diesel trucks increased 116 percent.

It is significant to note that all of these changes in emissions from transportation sources have occurred during a time period where population increased 33 percent, gross domestic product increased 147 percent, and vehicle miles traveled increased 143 percent.

To establish what impact transportation sources will have on future air quality trends, it is important to understand how mobile source emissions are determined. EPA recently released its new motor vehicle emissions model, MOBILE6, that in simplest terms calculates total emissions from transportation sources by multiplying vehicle miles traveled by a relevant emission factor. Such emission factors take into account emission reductions achieved from technological and Federal measures, as well as some local control measures. On a national basis, emissions estimates calculated from MOBILE6 show that all emissions, including NO<sub>x</sub>, will decrease significantly through 2020 based on the emission reductions achieved primarily from existing Federal regulations.

Specifically, engines and fuels are to become even cleaner under recent EPA-issued regulations for emissions standards and cleaner fuel requirements. These new standards require all passenger vehicles, including higher emitting SUVs, sold after the phase-in period to be 77 to 95 percent cleaner than those on the road today, and will reduce the sulfur content of gasoline by up to 90 percent. Also, after a phase-in period, each new truck and bus will be more than 90 percent cleaner than current models. This will lead to substantial emissions reductions, not just per vehicle, but also in total. For example, NO<sub>x</sub> emissions from passenger vehicles are projected to decrease 61 percent by 2030, and NO<sub>x</sub> emissions from heavy-duty trucks are projected to decrease 88 percent by 2030. (The passenger vehicle projection assumes a VMT growth rate of 1.7 percent per year from 2007 to 2030. Source: Cleaner Vehicles and Cleaner Gasoline Tier 2 / Gasoline Sulfur Rule, December 22,

1999, Regulatory Impact Analysis, <http://www.epa.gov/otaq/regs/ld-hwy/tier-2/frm/ria/chiii.pdf>. The heavy-duty truck projection assumes a variable growth rate for VMT by Heavy-Duty Diesel Engines that averages 2.5 percent per year. Source: Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements, Regulatory Impact Analysis (EPA420-R-00-026), <http://www.epa.gov/otaq/regs/hd2007/frm/ria-ii.pdf>.)

It should be noted that although information is presented above for the current national ambient air quality standards, similar information is not yet fully developed for the new PM and ozone standards. Corresponding information will be developed for the new standards as part of the implementation process associated with those standards.

*Question 5.* Does the Administration plan to propose any substantial changes to either the CMAQ program or to conformity, as we go forward with reauthorization? If you do, I hope you'll get all the major stakeholders on board first.

Response. The Administration is still in the process of formulating its legislative proposal. As part of the development process, FHWA has met with literally dozens of organizations and groups representing a wide range of interests in the highway and transit programs. We are evaluating this diverse stakeholder input as we develop the legislative proposal. We are also evaluating the recommendations of the National Academies of Science (NAS) study of the Congestion Mitigation and Air Quality program (CMAQ).

The major stakeholders have raised a significant number of issues affecting the air quality aspects of the transportation program and there is a great diversity of opinion on what changes should be implemented. Some of the more significant issues include:

CMAQ's air quality benefit analysis requirement—Some find it burdensome and would replace it with categorical listings, while others endorse technical analysis and would prefer that it be used to rate and rank projects as well as to find them eligible.

Suballocation of CMAQ funds—Some stakeholders would require that CMAQ funds be suballocated to metropolitan areas, but others wish States to have greater authority in deciding where the funds should be used.

Congestion mitigation—Some stakeholders believe that congestion mitigation and bottleneck relief would be air quality beneficial and would use CMAQ to fund some limited amount of single occupant vehicle capacity expansion, which conflicts with those who believe that any congestion relief leads to induced travel demand and should not be funded at all.

CMAQ apportionment formula—A number of stakeholders believe that the CMAQ funding formula should be revised to support the nonattainment areas that EPA is expected to designate for the new air quality standards; but they are also concerned about diluting the available funds.

CMAQ authorization levels and project priority—Various stakeholders have requested more funding for transit, for freight, for bicycle projects, for clean fuels, and for congestion mitigation, among other proposals, or that such activities be given priority for funding. Others cite the program's flexibility as one of its greatest assets and argue against a "one size fits all" approach.

Coordination of the planning and conformity processes—Some stakeholders indicate that there remain opportunities to improve the transportation conformity process. They cite the fact that transportation plans and SIPs are not synchronized with one another due to different planning horizons and update frequencies. Others are concerned that any changes may eventually create additional problems for achieving air quality goals.

Although final decisions have not been made on approaches to address the air quality aspects of the transportation program, to the greatest extent possible, we will address these stakeholder concerns in the final Administration reauthorization proposal.

*Question 6.* According to the recent report from the Transportation Research Board, it seems that air quality agencies don't have a big role in making decisions about State expenditures of CMAQ funding. What incentives can we provide so that State DOTs open this process up more?

Response. In our experience, the extent to which air quality agencies have input into the CMAQ project selection process varies. The CMAQ program apportions funds to States to provide support to over 100 nonattainment and maintenance areas for ozone and/or carbon monoxide. State and local officials may develop their own project selection processes, as long as they keep within the statutory require-

ments. Some employ very open and decentralized processes while others maintain tighter control over the funds.

While there is no standard model, some States and MPOs have air quality committees that serve a number of functions including assisting with SIP development, coordinating conformity determinations, and reviewing CMAQ proposals. State and local air quality officials, as well as Federal personnel, are routinely represented on these committees. How big a role is played by the air quality officials depends on many local factors such as the size and membership of the committee, the importance of air quality issues in the metropolitan area, and the project selection procedures set up by the MPO Board of Directors.

As noted in the NAS report, the CMAQ Program Guidance has consistently promoted close collaboration with air quality agencies. On page 162, the panel concluded, "Program regulations encourage consultation with State and local air quality agencies in the development of appropriate project selection criteria and the agencies' involvement in project selection and program funding decisions." We agree that greater participation would likely enhance the process and may improve the effectiveness of some projects funded under the program. When we commented back to the NAS panel on this point, they made it clear that their recommendation did not extend to a process of reaching consensus with air agencies over projects selected for funding. Nonetheless, we intend to reinforce the need for consultation with air quality agencies in our future communications with State Departments of Transportation (DOTs) and MPOs, consistent with the NAS recommendation.

*Question 7.* Since many surface transportation projects are already targeted at congestion mitigation, should we split off that purpose from the CMAQ program and focus more on air quality?

*Response.* The CMAQ program is already targeted at air quality improvement. Only projects that demonstrate an air quality benefit may be funded. This is evidenced by the statutory requirements tying eligibility for funding to direct air quality benefits or to inclusion in a strategy to reduce air pollution. A demonstration of such benefits is required under the program before funding is authorized. Congestion mitigation in the CMAQ program is addressed primarily by the recognition that many transportation control measures (TCMs) aimed at reducing emissions will also have congestion reduction benefits by either reducing vehicle use or improving the efficiency of the transportation system. Congestion relief is an ancillary benefit that can enhance the attractiveness of such projects. For many projects-including traffic flow improvements, transit, ridesharing, pricing strategies, and even bicycle and pedestrian projects-emission reduction and congestion relief can be closely related, but not all congestion relief projects will reduce emissions.

The need for TCMs has been legislatively recognized for a long time. The CAA and title 23 of the United States Code (USC) include provisions promoting TCMs for both their air quality and congestion relief benefits, especially traffic flow improvements. Section 108(f)(1)(A)(v) of the CAA identifies, "traffic flow improvement programs that achieve emissions reductions" as one of the transportation control measures, and the Intermodal Transportation Efficiency Act of 1991 (ISTEA) required that they be given priority for funding. The 108(f) TCMs are eligible for funding not only under the CMAQ program but also under the Surface Transportation Program. And the CAA makes TCMs one of the few project categories exempt from highway funding sanctions. Finally, Section 149(b)(5) of title 23 makes traffic flow improvements explicitly eligible under the CMAQ program.

The greatest potential for air quality gains is through cleaner fuels and vehicles (especially diesel powered vehicles), faster fleet turnover of older vehicles, and maximally effective inspection and maintenance (I/M) programs. Some of these activities are eligible for CMAQ funding and some States, like New Jersey, Illinois, California and Connecticut have used their CMAQ funding to good advantage for I/M and diesel retro-fit programs. Some, like scrappage programs, are legislatively prohibited. But the largest impact, that of new vehicle standards and mandated cleaner fuels, is largely outside the realm of Federal transportation funding.

Traditional TCMs like transit and traffic flow improvements have small air quality impacts because their benefits are realized at the corridor level and are much less significant at the regional level. Based on the CMAQ annual reports, no category of traditional TCMs shows significantly greater emissions reductions over any of the others. The emissions impacts of traffic flow improvements, for example, are no worse than the other types. At least for regional pollutants like ozone, what appears to be an important determinant is the size of the project. This is not obviously true for PM-10 due to the localized nature of the pollutant. Larger, more regionally focused projects, like traffic management control centers, have concomitantly larger benefits.

Smaller projects can have some decided advantages. Some congestion relief projects that also demonstrate emission reductions can be implemented quickly. This can be crucial to a nonattainment area facing a short term CAA deadline of 2005 or 2007 and is even more important to those whose deadlines have passed. And CMAQ-funded projects that reduce emissions and relieve congestion have been important to meeting conformity determinations in several areas.

*Question 8.* In general, would you agree that conformity is spurring investments in transportation strategies and technologies that reduce air pollution and create better interagency cooperation?

*Response.* The purpose of transportation conformity is to ensure that transportation activities that receive Federal funding and approval are consistent with air quality goals. It ensures that transportation activities in nonattainment and maintenance areas will not create new violations of the Federal air quality standards, will not increase the frequency or severity of existing violations of the standards, or will not delay attainment of the standards. It is not, however, the purpose of conformity to serve as an emission reduction program. It is actually the role of the State air quality implementation plan (SIP) process to develop control measures that will be needed to reduce emissions and meet the National Ambient Air Quality Standards (NAAQS).

Transportation conformity was intended to form strong linkages between the transportation and air quality planning processes. Fulfilling the transportation conformity requirements has created stronger institutional links between two sets of agencies—transportation and air quality—that operated quite independently of each other prior to enactment of the Clean Air Act Amendments of 1990 (CAAA). This interagency consultation has played an important role in the development of more realistic and achievable transportation and air quality plans.

The vast majority of emissions reductions from motor vehicles have come from and will continue to come from technological advances: engine emissions standards and cleaner fuels that are the direct result of other requirements of the Clean Air Act. Thus, these emission reduction programs cannot be directly attributable to transportation conformity. However, the benefits of these regulations are accounted for in the SIP's mobile source budgets used for conformity and/or in the conformity determinations for transportation plans and TIPs.

Although it is difficult to segregate the impacts of potential changes in the transportation-air quality linkage, FHWA believes that funding flexibility—especially the CMAQ program-initiated under ISTEA and continued in the Transportation Equity Act for the 21st Century (TEA-21) has been a major factor in spurring investments in transportation strategies that reduce motor vehicle emissions. To date, over \$11 billion in CMAQ funding has been invested to reduce transportation emissions, about \$4.8 billion of which has been used for transit. An additional \$3.1 billion in Surface Transportation Program (STP) funding has been used for transit purposes as well.

*Question 9.* In general, what is the general ratio of spending on planning in the States for air quality versus transportation planning?

*Response.* For fiscal year 2002, FHWA and FTA apportioned \$836 million to the States for metropolitan and statewide transportation planning and research. In addition, National Highway System (NHS), STP, and Minimum Guarantee funds may also be utilized for transportation planning. FHWA does not collect information regarding expenditures of State and local funding on transportation planning. However, it can be assumed that these expenditures will vary widely from State to State, and city to city. The portion of transportation planning dollars spent on conformity analysis varies from area to area. But in some areas it can be a significant portion.

The costs of air quality planning accrue from both the overall air quality planning by State and local air agencies as well as costs incurred by MPOs and State Departments of Transportation in the development of the mobile source portion of air quality plans. FHWA does not collect any information regarding funding for air quality planning. We defer to the individual States and metropolitan areas to provide this information.

*Question 10.* As you noted, emissions per vehicle mile traveled have dropped. But it seems to be taking longer on average for a car to travel a mile because of congestion. Does this increase in "idling time" offset the emissions reductions from control technologies?

*Response.* The relationship between congestion and air quality is complex. But generally, if we reduce congestion in the lower speed ranges, which is where congestion typically occurs, vehicle emission rates will be reduced. For example, NOx and CO emission rates per vehicle will generally decrease as speeds are increased up

to approximately 35mph, at that point these emission rates will start to slightly increase.

VOC emissions, on the other hand, appear to uniformly decrease as speed is increased and congestion is reduced.

The above is based on current models. However, current models do not adequately assess the full benefits of reducing the number of stops and starts and idling emissions. Rather, they tend to use average speeds. Recent research, funded by EPA and FHWA, indicates that reducing the number of accelerations, a byproduct of reducing congestion, can reduce emissions at the corridor level. Reports from the Georgia Institute of Technology and University of California at Riverside show that emissions increase greatly under hard accelerations and thus can be reduced by smoothing traffic flow. On a regional basis, the emissions reductions will be smaller, as has been our experience with most TCM-type projects.

Retrospectively, it has been correct to say that generally as speeds increase, and as the smoothness of flow of traffic improves, the rate of emissions attributable to an average in-use vehicle will decrease, albeit with different profiles for the different pollutants. But as speeds increase and likelihood of congestion delay decreases, there will also be some measurable increase in the total number of vehicles using the system at those places and at those times where the flow/speed improvement have occurred. Whether the reduction in the specific rate of emissions caused by the speed/flow increase is offset by the increase in volume of vehicles producing emissions is an open question that can only be answered by studying the particular conditions of specific instances (and even there, many question whether current modeling capabilities can adequately address such a question). These points are fundamental to understanding whether or not increases in idling time or congestion will offset improved emission rates from emission control technology. At any rate, it cannot always be asserted that increases in speeds or improvements in flow of traffic reduce overall emissions of local pollutants or contribute to an improvement in air quality.

There is a particularly significant reason why the air quality benefit from congestion relief measures, including traffic flow, transit and other types of improvements, will decline in the future. As a result of EPA's Tier II emissions performance regulations, new passenger cars and light trucks will need to meet stringent emission standards. EPA reports that not only will the average emission rates be much lower, we will also not see significant differences in emission rates versus speed. As such, emission rates for vehicles under all driving conditions, including heavy stop and go traffic, are expected to be significantly cleaner. The difference between emission rates for congested conditions and free flow traffic will decline.

---

#### RESPONSES OF MARY PETERS TO ADDITIONAL QUESTIONS FROM SENATOR VOINOVICH

*Question 1.* During the hearing, I asked about the small urban and rural areas that may be designated as non-attainment for the first time. I have a few more questions about this matter. What particular challenges do these areas face in terms of transportation and air quality planning and the conformity process? Are there going to be massive conformity problems resulting in delays or highway projects because of new designations? What can specifically be done to help these communities?

Response. The new 8-hour ozone and fine particulate matter (PM-2.5) standards will be more stringent, and many areas across the eastern U.S. and in California have pollution levels now exceeding these standards. Some of these areas, including small urban and rural areas, may be designated nonattainment for the first time. Other existing nonattainment areas may become larger and involve more jurisdictions under the new standards. The Department and EPA are working with these areas to increase their capacity to deal with new nonattainment designations.

Some of the challenges these areas face include a lack of resources (i.e., funding and staff), a lack of technical expertise, a lack of knowledge and experience, and the fact that many are the more complex nonattainment areas such as those that encompass multiple States and multiple MPOs.

It is too early to tell the magnitude of transportation and air quality planning and conformity issues that might surface following implementation of the new standards. However, based on our experience when the 1990 Clean Air Act amendments were implemented, we would expect these areas to face challenges in the early years. Therefore, DOT and EPA will be considering ways to make the integration of the two planning processes as workable as possible.

DOT and EPA have worked closely in providing technical assistance to areas to address conformity and transportation air quality issues. In anticipation of the num-

ber of new areas designated nonattainment for the first time, DOT has embarked on a number of activities to prepare the areas for this challenge:

1. FTA worked closely with FHWA and EPA in developing a basic transportation conformity training course. The course was offered six times during fiscal year 2002 and was attended by about 230 people representing both public (Federal, State, and local governments) and private sectors of both transportation and air quality disciplines.

2. FHWA and EPA co-funded 6 MOBILE6 training courses after the release of the model in January 2002. All the training courses were well attended. In addition, FHWA Resource Center staff was in great demand in providing MOBILE6 training.

3. FHWA and EPA field staff have held numerous workshops across the country on conformity, CMAQ and other topics in transportation and air quality.

4. In May 2002, FHWA launched a Transportation Conformity Community of Practice website to allow for free exchange and discussions on topics related to conformity among practitioners.

5. FHWA and FTA are working on the development of three different training courses which will be available through National Highway Institute next year:

- Estimating Regional Mobile Source Emissions,
- CMAQ Program: Purpose and Practice, and
- The Implication of Air Quality Planning on Transportation.

6. FHWA, FTA, and EPA have implemented a public education and partnership-building initiative, "It All Adds Up to Cleaner Air," in response to State and local governments' requests for help in meeting their traffic congestion and air quality goals under TEA-21 and the Clean Air Act. The program is instrumental to the formation of The Alliance for Clean Air and Transportation (ACAT or the Alliance), a national coalition of public and private organizations working together to advance solutions for the nation's traffic congestion and air pollution challenges.

"It All Adds Up" is designed to inform the public about the connection between their transportation choices, traffic congestion, and air pollution. The program emphasizes simple and convenient actions that people can take to improve air quality and reduce traffic congestion, while saving themselves time, money, and stress. During the demonstration phase of the initiative, 14 communities implemented the initiative locally and more than 60 others requested materials and information for use in their regions.

7. EPA and DOT jointly funded a cooperative agreement with the National Association of Regional Councils that includes a number of outreach efforts (newsletter, website, workshops) aimed at transferring knowledge about integrating transportation and air quality planning from experienced MPOs to those MPOs that will be facing the challenges for the first time.

*Question 2.* As I mentioned during the hearing, the current Federal budget crisis demands that we look at the cost-effectiveness of our government's programs. Could you provide detailed information to put in perspective how cost effective transportation and air quality projects have been?

Response. The NAS report refrained from making statements concerning the cost-effectiveness of CMAQ projects because the basic data needed to carry out such an analysis are not available. The lack of data is primarily due to the wide variety of projects funded with CMAQ dollars, and the fact that evaluations are based on projected rather than actual outcomes.

Even with similar projects it is difficult to make meaningful comparisons across projects because of differences in assumptions and methods, as well as background conditions. Therefore, there is a wide range of cost-effectiveness results for TCMs, even for the same type of CMAQ strategy, which suggests that performance depends largely on context, that is, on where and how the projects are executed. The report reviewed previous studies on cost-effectiveness. It showed a huge range, from costs of about \$1,000 per ton of hydrocarbon removed for a ridesharing project to almost \$10,000,000 for a telework project. To lesser extents, each TCM category studied showed broad but less dramatic ranges, usually from about \$10,000 a ton to several hundred thousand dollars per ton of VOC reduced.

The NAS noted that "the limited evidence available suggests that, when compared on the sole criterion of emissions reduced per dollar spent, approaches aimed directly at emission reductions (e.g., new-vehicle emission fuel standards, well-structured inspection and maintenance (I/M) programs, vehicle scrappage programs) generally have been more successful than most CMAQ strategies relying on changes in travel behavior." We concur with this conclusion. Fuel standards will affect every new vehicle purchased, and all vehicles over time will conform to these standards. Similarly I/M programs typically affect nearly all of the vehicles in the region. And, based on our experience, I/M programs are more effective than other projects. For

example, the I/M program in New Jersey is funded in large part by the CMAQ program and is estimated to reduce volatile organic compounds (VOCs) by 40 tons per day. States like New Jersey, Illinois, and Connecticut have devoted large sums of CMAQ funding to their I/M programs. By contrast, many investments (transit, traffic flow) may be limited to corridor level improvements whose benefits will have a limited impact on the region as a whole. These may be very effective projects, but their small size limits their regional impact.

There are two other types of projects that appear to be more cost-effective in comparison to other projects. Advancing new technology in the vehicle fleet through the use of alternative fuels, diesel retrofits, and the purchase of new buses (both clean-diesel and alternative fuel) appears to be a cost-effective strategy. In fact, a 1998 California Air Resources Board (CARB) study estimated that buses fueled by compressed natural gas (CNG) have a cost effectiveness of \$10,000 to \$12,000 per ton of NOx reduced, much better than many traditional transportation investments.

Also, regional programs, such as ridesharing, tend to show more cost-effective benefits. For example, the cost-effectiveness of a ridesharing program can range from a low of \$1,200 to a high of \$16,000 per ton of VOC, due both to the relatively low cost and regional focus of such programs. And, while not a part of the NAS study, there is reason to believe that Intelligent Transportation systems (ITS) improvements when implemented on a regional scale, like a traffic management center, can have relatively larger benefits. Some regional freight projects, like those funded in Ohio, might also fall into this category.

Cost effectiveness numbers have not been collected in a rigorous way for CMAQ-funded projects. FHWA/FTA have allowed and even occasionally required the use of program funds for evaluation in the case of experimental pilot projects, but this is the exception rather than the rule. As such every dollar used for evaluation purposes is employed at the expense of additional transportation investments, and transportation and air quality agencies have shown a reluctance to redirect investment funding for evaluation purposes.

One alternative would be to use Federal research funds for evaluation purposes, but this is currently infeasible. The costs of rigorously evaluating transportation projects can be quite high. The National Highway Cooperative Research Program Report 462, "Quantifying Air Quality and Other Impacts of Transportation Control Measures" noted that, in some cases, the costs of evaluation could exceed the costs of the project itself. The costs of the evaluation, which would need to account not only for the changes in usage to the transportation network, but also for local and regional changes in the economy, opening/closing of activity centers, wind patterns and other changes in emission rates from stationary and area sources, could overwhelm the surface transportation research budget, leaving little or no funding for the many other environmental needs. Report 462 from the National Highway Cooperative Research Program found that, "[the evaluation costs] may be comparable to or even greater than the costs of the TCMs themselves."

Methods for measuring the effects of many CMAQ-funded projects on emissions and air quality are limited at present, and few evaluations have been conducted following the completion of transportation projects to determine whether modeled estimates have been realized. In addition, virtually all strategies are affected by modeling uncertainties. These uncertainties are magnified for TCMs, which require predicting the travel as well as the emission effects of projects.

We are continuing to evaluate the NAS report, the last two recommendations of which concern project evaluation and national program evaluation, both leading to development of more information on the effectiveness and cost-effectiveness of CMAQ-funded projects.

---

#### RESPONSES OF MARY PETERS TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* While the National Academy of Sciences did a good job on the CMAQ report, they did not answer one fundamental question: What is the effectiveness of the CMAQ program? In other words, what has been the emission reduction from projects funded by CMAQ?

Response. In its report, the NAS noted how difficult it would be to identify the effects of numerous small projects. One of the findings of the report is that it is not possible to undertake a credible scientific quantitative evaluation of the cost-effectiveness of the CMAQ program at the national level. The lack of data is primarily due to the wide variety of projects funded with CMAQ dollars and the fact that evaluations are based on projected rather than actual outcomes.

Even with similar projects it is difficult to make meaningful comparisons across projects because of differences in assumptions and methods as well as background

conditions. Therefore, there is a wide range of cost-effectiveness results for TCMs, even for the same type of CMAQ strategy, which suggests that performance depends largely on context, that is, on where and how the projects are executed. The report reviewed previous studies on cost-effectiveness. It showed a huge range, from costs of about \$1,000 per ton of hydrocarbon removed for a ridesharing project to almost \$10,000,000 for a telework project. To lesser extents, each TCM category studied showed broad but less dramatic ranges, usually from about \$10,000 a ton to several hundred thousand dollars per ton of VOC reduced.

The NAS noted that “the limited evidence available suggests that, when compared on the sole criterion of emissions reduced per dollar spent, approaches aimed directly at emission reductions (e.g., new-vehicle emission fuel standards, well-structured inspection and maintenance (I/M) programs, vehicle scrappage programs) generally have been more successful than most CMAQ strategies relying on changes in travel behavior.” We concur with this conclusion. Fuel standards will affect every new vehicle purchased and all vehicles over time will conform to these standards. Similarly, I/M programs typically affect nearly all of the vehicles in the region. Based on our experience, I/M programs are more effective than other projects. For example, the I/M program in New Jersey is funded in large part by the CMAQ program and is estimated to reduce volatile organic compounds (VOCs) by 40 tons per day. States like New Jersey, Illinois and Connecticut have devoted large sums of CMAQ funding to their I/M programs. By contrast, many investments (transit, traffic flow) will be limited to corridor level improvements whose benefits will have a limited impact on the region as a whole. These may be very effective projects, but their small size limits their regional impact.

There are two other types of projects that appear to be more cost-effective in comparison to other CMAQ projects. Advancing new technology in the vehicle fleet through the use of alternative fuels, diesel retrofits, and the purchase of new buses (both clean-diesel and alternative fuel) appears to be a cost-effective strategy. In fact, a 1998 California Air Resources Board (CARB) study estimated that CNG-fueled buses have a cost effectiveness of \$10,000 to \$12,000 per ton of NO<sub>x</sub> reduced, much lower than many traditional transportation investments.

Also, regional programs, such as ridesharing, tend to show more cost-effective benefits. For example, the cost-effectiveness of a ridesharing program according to the NAS study can range from a low of \$1,200 to a high of \$16,000 per ton of VOC, due both to the relatively low cost and regional focus of such programs. And, while not a part of the NAS study, there is reason to believe that Intelligent Transportation systems (ITS) improvements when implemented on a regional scale, like a traffic management center, can have relatively larger benefits.

Cost-effectiveness is not the only measure that is relevant to transportation investments. For CMAQ-funded projects, an additional indicator is the extent to which a strategy might be significant in achieving the air quality standards. For example, a strategy to promote cleaner fuels can be very cost-effective, but to employ this strategy in the broad vehicle fleet requires that a substantial number of vehicles in any given metropolitan area run on clean fuels. While such projects are an important element in our efforts to clean the air, alternative fuel vehicles represent a small share of the total vehicle fleet. Nationally, there are just 400,000 of them out of a fleet of about 200 million.

Cost effectiveness numbers have not been collected in a rigorous way for CMAQ-funded projects. FHWA/FTA have allowed, and even occasionally required, the use of program funds for evaluation in the case of experimental pilot projects, but this is the exception rather than the rule. Because every dollar used for evaluation purposes is used at the expense of additional transportation investments, transportation and air quality agencies have shown a reluctance to redirect investment funding for evaluation purposes.

One alternative would be to use Federal research funds for evaluation purposes, but this is currently infeasible. The costs of rigorously evaluating transportation projects can be quite high. The National Highway Cooperative Research Program Report 462, “Quantifying Air Quality and Other Impacts of Transportation Control Measures” noted that, in some cases, the costs of evaluation could exceed the costs of the project itself. The evaluation costs would overwhelm the surface transportation research budget, leaving little or no funding for the many other environmental needs.

Methods for measuring the effects of many CMAQ-funded projects on emissions and air quality are limited at present, and few evaluations have been conducted following the completion of CMAQ projects to determine whether modeled estimates have been realized. In addition, virtually all CMAQ strategies are affected by modeling uncertainties. These uncertainties are magnified for TCMs, which require predicting the travel as well as the emission effects of projects.

We are continuing to evaluate the NAS report, the last two recommendations of which concern project evaluation and national program evaluation, both leading to development of more information on the effectiveness and cost-effectiveness of CMAQ-funded projects.

*Question 2.* Based on the CMAQ data from Federal Highway's web site, which I understand has some limitations, CMAQ projects were estimated to reduce emissions by around one-half million tons of VOCs from 1992–1999. During this same time, EPA reports that total emissions of VOC from vehicles decreased by about 1.8 million tons. It would appear that CMAQ reductions equaled about 28 percent of the total reductions. This sounds impressive, but these reductions are primarily from inspection and maintenance programs and signalization.

Would you agree that efforts to reduce vehicle miles of travel have not been as effective as these technology-based programs?

Response. We cannot reproduce the numbers cited in the question.

But, we would point out that the emissions estimates contained in the CMAQ annual reports have, as you note, serious limitations for this kind of analysis. First, they are predicted estimates, rather than results from before and after studies that must be evaluated carefully. There are many possible sources of error, including the assumptions employed about service utilization and emission rates. Second, in many cases individual project sponsors develop these estimates, and may have a tendency to overstate some estimates. While these estimates may individually fall within reasonable parameters, collectively they may project higher emission reductions than are likely to occur. Third, and perhaps most significant, the data base contains many instances of double counting which would require a substantial effort to eliminate. This double counting occurs when a project is funded over multiple years. Since emission reductions are realized only when the project is completed, current program guidance requires that any request for funding carry an emission reduction estimate for the whole project. Thus, each request for funding over multiple years will carry the same emissions estimate and is likely to be double counted.

Nonetheless, we would agree with your overall conclusion. In our experience, projects that accelerate the introduction of cleaner technologies or maintain the operating condition and emissions characteristics of the current fleet, such as I/M programs, have been much more successful than efforts to reduce vehicle miles of travel. I/M programs are estimated to reduce VOC emissions by as much as 40 tons per day, while most transportation control measures, including traffic signalization projects, yield but kilograms per day.

Demand for travel has grown as population and economic prosperity have increased. Most traditional transportation investments, including those designed to reduce emissions or relieve congestion, are small in comparison to the total network and carry concomitantly small benefits when viewed regionally, even if these projects may be important for individual corridors. However, it should be noted that larger, more regional projects could also have larger impacts since they affect a greater portion of the existing transportation network.

*Question 3.* As you know, Congress established a 1-year grace period before newly designated non-attainment areas must demonstrate conformity. However, EPA will give these areas from three to 4 years to develop a SIP with an emissions budget. Since the goal of conformity is to encourage better coordination between transportation and air quality plans, would it make more sense to coordinate the conformity demonstration grace period with development of the SIP motor vehicle emissions budget?

Response. We have heard this comment from some of our stakeholders, including the American Association of State Highway and Transportation Officials, as well as during the comment period on EPA's August 6, 2002, rulemaking that incorporated the 1-year grace period into the conformity rule (67 FR 50808). When considering these comments on the rulemaking, both DOT and EPA agreed at that time that the statutory language precludes EPA from extending the conformity grace period, as the October 2000 Clean Air Act amendment specifically provides newly designated areas with a 1-year grace period, after which conformity applies.

However, the Administration has not yet taken a position on the suggestion that the Clean Air Act be amended to allow for a longer grace period. That said, FHWA does support simplifying Federal transportation programs and continuing efforts to streamline project approval and implementation when such efforts provide for environmental stewardship. It is the policy of the Administration, as noted in the recent Executive Order on Environmental Stewardship and Transportation Infrastructure Project Reviews, that the development and implementation of transportation infra-

structure projects in an efficient and environmentally sound manner is essential to the well-being of the American people and a strong American economy.

STATEMENT OF JEFFREY HOLMSTEAD, ASSISTANT ADMINISTRATOR, OFFICE OF AIR AND RADIATION, ENVIRONMENTAL PROTECTION AGENCY

Thank you, Mr. Chairman and members of the committee, for the invitation to appear here today to discuss the Congestion Mitigation and Air Quality Improvement (CMAQ) program and the transportation conformity program in the context of reauthorization of the Transportation Equity Act for the 21st Century (TEA-21). There has been considerable progress in achieving better air quality for Americans since the passage of the Clean Air Act Amendments in 1990. In addition, building on the fundamental structure of ISTEA, TEA-21 further emphasized the importance of transportation in fulfilling environmental goals, as well as significantly contributing to the social and economic well-being of our Nation.

Achieving and maintaining healthy air quality remains an important national priority. EPA sees the reauthorization of TEA-21 as an opportunity to employ all tools available to improve air quality, including transportation, in ways that could help cities across the country make progress toward attainment under both the pre-1997 and the new health-based standards for ozone and fine particulate matter.

Air quality monitoring data show that in the period from 1991 to 2000, concentrations of all six criteria pollutants have declined, including the four criteria pollutants that are most affected by the transportation sector: carbon monoxide, nitrogen dioxide, ozone (smog), and particulate matter (soot). For example, air quality concentrations of carbon monoxide declined 41 percent and concentrations of coarse particulate matter declined 5 percent.

These air pollution data are good news, and are attributable to the transportation and air quality programs currently in place. However, there are approximately 35 million Americans living in 46 counties that are not achieving the old 1-hour ozone ambient air quality standard, and 8.3 million people living in 10 counties that are not achieving the old standard for coarse particulate matter. Furthermore, when we begin to implement the new, more health-protective standards for ozone and particulate matter and designate the areas that are not attaining the standards, the number of people living in areas with air quality considered unhealthy will dramatically increase. Although EPA has not formally identified areas that fail to meet these standards, it appears that more than 80 million people live in 233 counties not meeting the new 8-hour ozone standard, and 75 million people live in 144 counties not meeting the new fine particulate matter standard.

The Criteria pollutant emissions from transportation sources have a significant impact on the health of Americans. Particulate matter is linked to aggravation of pre-existing respiratory ailments, reductions in lung capacity, and a significant number of premature deaths. Ozone can impair lung function, cause chest pain and coughing, and worsen respiratory diseases and asthma. Carbon monoxide can aggravate angina (heart pain).

Even though emissions have been dramatically reduced, on-road mobile sources continue to be a major portion of some of our pollution problems. In 1999, motor vehicles accounted for 51 percent of the total carbon monoxide emissions, 29 percent of the ozone precursor of volatile organic compounds (VOCs), 34 percent of the ozone precursor nitrogen oxides (NOx), and 10 percent of the traditionally inventoried direct emissions of particulate matter nationwide. On a regional scale, motor vehicles can be an even larger portion of an area's inventory. For example, in 1999, on-road vehicles accounted for 48 percent of NOx in Atlanta, Georgia. According State air quality plans for these areas, on-road vehicles account for 63 percent of the area's total NOx in Springfield, Massachusetts; 56 percent of the area's total NOx in the Los Angeles region in California; and 80 percent of the area's total carbon monoxide and 53 percent of the area's total coarse particulate matter in Las Vegas, Nevada. Although emissions reductions from stationary sources are important in many areas throughout the country, these data demonstrate the continuing need to reduce air pollution from motor vehicles. As a Nation, our techniques for reducing motor vehicle emissions have to encompass both technology improvements to vehicles and fuels, as well as programs that encourage other, less polluting, transportation choices.

Technology has provided significant air quality benefits in the past and will continue to do so into the future. Emissions from today's new cars have been reduced by more than 95 percent relative to new cars 30 years ago. EPA's new Tier 2 vehicle standards program is designed to reduce the emissions of new passenger cars and light trucks even further. The rule combines these requirements with requirements

for much lower levels of sulfur in gasoline. By 2020, NO<sub>x</sub> produced by vehicles will be approximately 70 percent lower as compared to what the levels of NO<sub>x</sub> would have been without the Tier 2 program in place.

EPA's new clean diesel program for large trucks and buses is another technology-based program. It will achieve emissions reductions based on the use of high-efficiency exhaust emissions control devices coupled with changes in diesel fuel sulfur levels. This program will result in particulate matter and NO<sub>x</sub> emissions levels that are 90 and 95 percent below the current standards for heavy duty engine emissions in effect today.

A third example of emissions reducing technologies is EPA's Voluntary Diesel Retrofit Program, which is designed to help owners of trucks, buses, and off-road equipment install innovative and cost-effective emission control technology on their diesel engines. These technologies can result in significant reductions of particulate matter and volatile organic compounds (which are a precursor to ozone).

But technology cannot do it alone. Although emissions per vehicle have declined dramatically, the number of miles Americans are driving continues to increase. In 1970, Americans traveled just over one trillion vehicle miles per year; in 2000 it was almost 2.8 trillion. Growth in vehicle miles traveled (VMT) has far outpaced population growth. From 1970 to 1999, population grew 33 percent, but VMT grew 143 percent. These trends are continuing. A conservative national estimate of VMT growth is approximately 2 percent per year. However, in many cities, particularly in the southern and western States, VMT is growing much faster than this average. For example, in the early 1990's, Charlotte's VMT grew about 4.9 percent per year, Denver's VMT grew 4.5 percent per year, and Salt Lake City's VMT grew by 4.3 percent per year. Las Vegas projects that its VMT will increase more than 4 percent per year through the year 2020. The integration of transportation planning and air quality planning is the means to preserve and continue the progress we have made in ensuring that Americans breathe healthy air.

The growth in vehicle traffic also leads to congestion. Traffic congestion cannot be relieved only by adding more road capacity—either building more roads or widening the existing ones. Recent studies have estimated a wide range of VMT growth that is attributed to increases in roadway capacity. In areas with poor air quality, decisions about how to reduce congestion and improve mobility in a way that will not worsen air pollution must be addressed proactively.

Programs that are based on providing travel choices are also important in achieving better air quality. For example, the Commuter Choice Leadership Initiative is a new and successful non-regulatory approach to achieving emission reductions. Built around the tax-free commuter benefits in TEA-21 and modeled after the Energy Star partnership programs, the Commuter Choice Leadership Initiative is an EPA and DOT voluntary partnership with business to reduce traffic and traffic-related emissions. In just 1 year, 300 companies from 25 States have signed voluntary agreements to offer 500,000 employees commuter benefits meeting a national standard of excellence. EPA projects that if half of U.S. employees worked for employers that offered commuter benefits at the national standard of excellence promoted by the Commuter Choice Leadership Initiative, air pollution and traffic would be cut by the equivalent of taking 15 million cars off the road every year.

#### *The Congestion Mitigation and Air Quality Improvement Program*

The CMAQ program, initially begun under ISTEA, provides funding for transportation projects to improve air quality and reduce congestion. The CMAQ program is a valuable transportation funding tool for air quality improvement because the pool of potential projects is largely restricted to areas with poor air quality, (non-attainment areas), or those that had poor air quality in the past (maintenance areas). Unlike many other Federal-aid transportation programs, it is not limited to traditional highway uses, and can fund Travel Demand Management (TDM) programs such as park and ride lots, car and van pool programs and public education. CMAQ also funds unique Transportation Control Measures (TCMs) and other measures such as alternative fuel vehicles and facilities, diesel engine retrofit programs through public/private partnerships, and certain costs for vehicle Inspection and Maintenance programs. If TCMs are included in a State's air quality plan, those projects are given funding priority.

An EPA analysis of the benefits of TCMs, such as those funded by the CMAQ program, documents the range of emission reductions from 22 different shared ride, bicycle and pedestrian, traffic flow, transit and demand management programs. While the projects individually produce relatively small emission reductions, cumulatively these projects can add up to larger reductions over the life of an air quality plan. CMAQ projects can be important for helping a State to meet air quality planning and conformity requirements. The benefits of the CMAQ program, and particularly

projects that reduce VMT or manage system capacity, extend beyond emissions reductions. Other benefits include roadway congestion relief, energy conservation, greenhouse gas emission reductions, as well as economic development and community livability. By requiring the project to be implemented in nonattainment areas, more local government and public involvement in transportation investment decisions has been encouraged.

EPA and DOT have documented CMAQ's numerous benefits in reports, brochures and fact sheets available to transportation and air quality planners. From EPA's perspective, there is little doubt that the program is beneficial for air quality and is an important program for nonattainment areas that want to address transportation emissions. As directed by Congress, a National Academy of Science study undertaken by the Transportation Research Board, draws similar conclusions. The findings of "Special Report 264. The Congestion Mitigation and Air Quality Improvement Program: Assessing 10 Years of Experience" were generally favorable, but the report did make recommendations to Congress on how to improve the program. In particular, the report emphasized the need to focus CMAQ expenditures on projects that improve air quality.

While EPA generally agrees with the NAS recommendations, there are two additional important issues to which I will direct the committee's attention. These considerations fall into two main categories—apportionment and project eligibility.

According to some stakeholders an important apportionment issue is that the amount of available CMAQ funds may decrease when air quality improves and they are redesignated to attainment status. Although originally intended for use in nonattainment areas, CMAQ funds now continue to be available to areas that have been redesignated to attainment status and have an approved maintenance plan. However, an area's redesignation to maintenance could also result in a reduction in CMAQ funding which has been used to reach attainment. Many TDM strategies are long term initiatives that must maintain small but steady levels of funding over a longer term than capital investment types of projects.

For example, Illinois estimates their apportionment of CMAQ funds would decrease by approximately \$32 million if the Chicago area were redesignated from severe nonattainment for ozone to attainment. It is not clear that Chicago would have adequate funding for its continuing needs after such a loss. Illinois included many of the CMAQ funded projects in its State Implementation Plan as transportation control measures. These projects now total 5–6 tons per day or over 1500 tons per year of reductions in VOCs. Consideration should be given to an apportionment formula that recognizes the need for an adequate source of funding for air quality beneficial transportation projects after a nonattainment area redesignates to maintenance.

As EPA begins implementation of the new 8-hour ozone standard, several changes regarding nonattainment areas are anticipated. A change in the classification of nonattainment areas, or the number of areas, will likely change the amount of CMAQ funds apportioned to each State and available to nonattainment areas. Given the current statutory language in TEA-21, nonattainment areas designated under the 8-hour ozone standard would be eligible for CMAQ funding, but the funds apportioned to the States would not account for the new areas and would not be available to help reduce transportation emissions. The issue needs to be addressed in the apportionment formula.

Strategies to reduce the very small but hazardous particulates known as PM<sub>2.5</sub> will increase in importance. Generally, both diesel and gasoline powered vehicles emit fine particulate matter as well as NO<sub>x</sub> and VOCs that lead to its formation. Both near and long-term emission reduction programs need to be planned. The focus of most TCM strategies has been the reduction of VOCs and NO<sub>x</sub>, and the effectiveness of TCMs for reducing PM<sub>2.5</sub> is less understood. However, there is optimism that some travel demand strategies, new technologies and cleaner fuels can produce reductions in concentrations of PM<sub>2.5</sub>. The CMAQ program offers the opportunity for regions to explore innovative strategies to address this pollutant. Consideration should be given to amending the apportionment formula to target some of the CMAQ funds to this emerging air quality issue.

CMAQ funding can be useful to all nonattainment areas and maintenance areas, classified in accordance with the 1990 Clean Air Act amendments. All ozone, carbon monoxide and particulate matter nonattainment areas should be considered for inclusion in an apportionment formula that directs CMAQ funds to nonattainment areas based on the greatest air quality need. EPA is working with DOT to assess how the apportionment formula could be adjusted to fund projects equitably in all these areas.

TEA-21's flexible guidelines allow DOT to issue project eligibility guidance that cuts across traditional modal boundaries and makes the funds available for high-

way, transit and non-traditional program areas. The overarching criteria for eligibility are that the transportation project be implemented in an area designated non-attainment or maintenance for ozone, carbon monoxide, or particulate matter, and that the project reduce emissions. An examination of CMAQ program spending reveals that two project categories, traffic flow and transit, account for over 75 percent of the obligated funds.

These traditional transportation projects have historically been funded under transportation funding programs other than CMAQ. EPA and DOT need to continue our collaborative work with areas to encourage that projects selected for CMAQ funding will be tailored to the area's particular air quality needs.

Operating expenses for new CMAQ projects are currently limited to 3 years of eligibility. As the CMAQ program has grown and evolved, there has been more interest in extending the eligibility period or eliminating the restriction altogether. Local transit agencies have long expressed concern over the shortage of funding to sustain existing transit services. These agencies argue that as long as the project is producing emission reductions, it should be eligible for CMAQ funds. State DOT's have expressed interest in expanded use of CMAQ funds for operating ITS to facilitate traffic monitoring, management and control. However, the operating expense restriction was included in the program for the express purpose of stimulating innovation and to avoid obligating all the available funds to existing programs. The benefit of testing new ideas, especially in light of the changing air quality context under the 8-hr ozone and fine particulate standards, needs to be weighed against the benefit of maintaining the operating costs of ongoing projects for which other transportation funds are designated.

#### *Transportation Conformity*

Transportation conformity was established by Congress in the Clean Air Act Amendments of 1990 and was designed to help ensure that an area's transportation activities are consistent with its air quality goals. EPA is responsible for writing the conformity regulations and the Department of Transportation (DOT) must concur with all conformity rules, as DOT is our Federal partner in the implementation of the program. EPA first published the conformity rule in November 1993. We subsequently streamlined and clarified the rule in August 1997, based on extensive discussions with State and local air pollution officials, transportation planners, and other stakeholders, as well as the experience of both DOT and EPA in the field. In March 1999, however, a decision from the D.C. Circuit Court of Appeals changed several aspects of the 1997 conformity rule. In response to that decision, we have proposed, and will soon finalize, a modification improving flexibility consistent with the court decision. We also plan to incorporate EPA and DOT's existing guidance implementing the court decision into the conformity regulations.

The transportation conformity program requires that the impact of new transportation activities on air quality is evaluated on a regular basis. Areas that have air quality worse than the national standards (nonattainment areas) or that have violated the standards in the past (maintenance areas), are required to examine the long-term air quality impacts of their transportation system to ensure that such systems are compatible with clean air goals. In the simplest terms, conformity serves as an "accounting check" to assure that a nonattainment or maintenance area's future transportation network conforms to the area's air pollution reduction plan.

The benefit of conformity accounting is that it requires State and local governments, and the public, to consider the air quality impacts of the planned transportation system as a whole and over the long term—before transportation plans are adopted and projects are built. Billions of dollars every year are spent on developing and maintaining our transportation system. Conformity helps ensure that these dollars are not spent in a manner that would worsen air quality, as that outcome would only necessitate spending additional money to reverse the air quality impact. Certainly it makes sense to examine future impacts of what are essentially permanent decisions.

Prior to the 1990 Clean Air Act, transportation planners and air quality planners often did not consult with one another or even use consistent information regarding future estimates of growth. As a result of this disconnect, the 1990 Clean Air Act Amendments explicitly linked the air quality planning and transportation planning processes in a manner that had not previously existed. Above all, transportation conformity has compelled the two planning agencies to work together through the interagency consultation process to find creative and workable solutions to air quality issues. Most everyone agrees, that consultation is an important benefit of conformity. A 1999 Harvard study on the conformity program that was jointly funded by DOT and EPA confirmed this benefit.

Consultation is meaningful because air quality and transportation planners have a common goal: transportation activities that conform with the State's air quality goals. A State's air quality plan (a State implementation plan, or SIP) establishes emissions ceilings, or budgets, for the various types of sources that contribute to air pollution problems. Conformity makes State and local agencies accountable for keeping the total motor vehicle emissions from an area's current and future transportation activities within these air quality plan budgets.

Communities have choices about how to address their transportation and air quality needs. When a transportation plan's emissions are greater than the allowable budgets in the air quality plan, areas can decide whether to revise the transportation plan or revise the air quality plan. For example, some areas have added transit programs to reduce the emissions of their transportation plan, while others have gone back to the State air quality plan to see if other sources of pollution could be further controlled to allow the transportation sector's emissions budget to grow. An area can choose to build transportation projects that increase emissions, as long as the net effect of the total system is consistent with the State air quality plan. Most areas have been able to continue adding to their transportation network and still stay within their clean air budgets.

At the heart of the conformity accounting process are computer models of an area's transportation system that estimate the emissions that are produced. In many areas, modeling begins with the area's own travel demand model that calculates the number of vehicle miles traveled on the area's transportation network, and at what speeds vehicles are traveling. This information is then used in EPA's MOBILE model to determine how much pollution will result from the on-road transportation sector.

Some of the conformity stakeholders have said that the uncertainty in both the transportation and air quality emissions models should be taken into account in the conformity process. I would like to address this comment. Although there is no way to know exactly how emissions will change as a result of changes to the transportation system and travel patterns, models help planners make reasonable estimates. All the models used in this effort are surrogates of reality, and like all predictions, some degree of uncertainty will always be inherent. Because sound transportation and emissions modeling is essential to support planning, the challenge lies in developing models that use current and accurate data and can consistently represent how changes in travel activity and vehicle operational dynamics affect emissions. EPA and DOT work together continuously to upgrade our models to meet this challenge.

While modeling will always have inherent uncertainty, the appropriate response to this fact is not to abandon modeling, but to continue to improve it. The 1999 Harvard study, "Linking Transportation and Air Quality Planning: Implementation of the Transportation Conformity Regulation in 15 Nonattainment Areas," funded jointly by DOT and EPA, found that conformity has encouraged improvement in modeling and the necessary data collection. The better the information going into the modeling, the more reliable the results. Transportation and air quality modeling has improved in the few years that conformity has been in place. For example, Charlotte, NC, is collecting new data about travel patterns of households in the area. New York, New Jersey, and Connecticut also have recently partnered to collect new household travel data. Portland, OR, is working on a new method of modeling their transportation system that relies on simulating actual vehicle trips.

Furthermore, EPA's MOBILE model was updated this year. The current version of the model, MOBILE6, incorporates our recent knowledge about how cars and trucks function, as well as the effects of new air quality programs that will be in effect in the future, such as Tier 2 vehicle standards. These improvements in data collection as well as in the models themselves yield progressively better results both in States' air quality plans and in conformity determinations.

The new air quality standards for ozone and particulate matter may necessitate changes in the conformity program. EPA plans to propose rules and guidance for implementing the 8-hour ozone standard by the end of the year, and we anticipate that it will then take us about eight to 10 months to respond to comments and finalize the rules and guidance. For the fine particulate matter standard, we plan to propose implementation rules and guidance in spring of 2003 and finalize them in 2004. EPA intends to designate areas as attainment, nonattainment, or unclassifiable with respect to the 8-hour ozone standard in late 2004. EPA expects to designate areas with respect to fine particles starting in 2004.

Areas designated under the new standards will have to prepare a conforming transportation plan after a 1-year grace period that was recently added to the Clean Air Act. A few issues related to the new standards will have to be resolved for implementing conformity. For example, some areas that will be designated as nonattainment for the 8-hour standard are currently nonattainment with respect to the

1-hour standard. EPA intends to address the process and basis for determining the 1-hour standard no longer applies in an area in its implementation rules and guidance, considering input from stakeholders and the public. This will occur prior to designating areas so that the conformity requirements as well as impacts of such a change on CMAQ apportionments will be clear well before areas are subject to them. EPA and DOT, as well as stakeholders across the U.S., have a wealth of experience in implementing conformity. Newly designated areas will benefit from our collective experience, and EPA and DOT will provide timely guidance to these areas before and as they implement the program under the new standards.

We understand that there are two aspects of the conformity process that some transportation planning stakeholders would like to change via the TEA-21 reauthorization process. The first is how often conformity is required. The Clean Air Act requires that conformity be determined when a transportation plan or transportation improvement program (TIP) is adopted, and no less frequently than every 3 years. In addition, EPA's conformity rule requires conformity within 18 months of certain "SIP triggers." If an area cannot meet a conformity deadline, then only certain types of activities can proceed (e.g., projects necessary to improve safety).

An added requirement to determine conformity is derived from the transportation requirements. The Clean Air Act requires transportation plans and TIPs to conform before they are adopted. Transportation plans must be updated every 3 years, but TIPs must be updated every 2 years. Adopting a new TIP every 2 years means that conformity determinations must be done at least this often.

According to some transportation planners, conformity is required too often, leaving them with little time to focus on planning. Some air quality planners, however, are concerned that changing the minimum frequency of conformity would delay the use of new information in modeling. Model inputs that affect total emissions, such as population growth, and the percentage of sport utility vehicles, trucks, and minivans in an area's vehicle fleet, have been rapidly changing in the last decade. Some air quality planners think that a frequency of every 3 years is important for introducing new information into the conformity process, so that trends can be seen early before their impact is great and to leave time to accommodate new information in the process. Additionally, some air quality planners also appreciate the benefits of updating their SIP and emission inventories to reflect latest planning assumptions or other new information in a timely manner.

EPA intends to eliminate some of the 18-month "SIP triggers" in the conformity rule in an upcoming rulemaking. Though further discussion must occur on the issue of how often conformity must be done, amending the rule would simplify the process and address some of the concern.

The second aspect of conformity that some transportation planners would like to see changed is the timeframe over which conformity must be demonstrated. Currently, the conformity process examines the amount of pollution that is projected to occur over the entire life—20 years—of a transportation plan. Therefore, in conformity, emissions from the last year (in most cases, the 20th year) are examined and compared to the motor vehicle emissions budgets in an area's air quality plan. However, air quality plans cover a period of 10 years or less.

Transportation planners suggest it is unfair to determine conformity for the 20 year life of the plan when the air quality plan is at best, only half as long. They explain that since the air quality plan ends before the transportation plan, the burden of growth that occurs in the years that make up the remainder of the transportation plan solely rests with the transportation sector.

On the other hand, air quality planners are concerned that if transportation plans are 20 years, but conformity is done for a shorter period, the responsibility for mitigating transportation pollution in the future will rest on their shoulders alone. That is, if transportation projects are approved and built today without regard to their long-term impacts on air quality, the transportation planners will be dictating the size of the budget in future years to the air quality planners. Air quality planners feel they would be left to figure out how to accommodate a predetermined budget within the overall air quality reductions from transportation as well as from other sources that will be necessary to attain or maintain the air quality standards in years to come.

Several air quality planners and environmental groups also point to the time scale of land use decisions as a reason for retaining the 20 year conformity analysis. They indicate that land use decisions take many years to have an effect on air quality, and only when examining air quality 20 years into the future can the effects of different plans for land use be seen. They point to areas across the country that have examined long term implications of land use, including Portland, Oregon; Charlotte, North Carolina; Sacramento, California; and Denver, Colorado. For example, as a result of conformity, Charlotte, North Carolina, realized that their air quality would

be jeopardized in the future. During the period of time where they could not meet conformity, Charlotte focused on developing a coordinated land use and transit plan, and Charlotte's citizens voted for a sales tax to help fund the new transit system. Charlotte realized that in order to stay a competitive city for business, it needs to remain an attractive place for people to want to work and live. Another example where the impact of land use decisions have been recognized is Atlanta, GA. Atlanta has made decisions about land use and investing in transit that will have long term benefits for the area.

In conclusion, EPA is committed to partnering with DOT to continue our progress in meeting both transportation and air quality goals as the nation's transportation system is developed. CMAQ, conformity, and our programs for new vehicle standards and fuels are all important tools in achieving clean air. Thank you again for this opportunity to testify today and discuss our programs with you. I would be happy to respond to any questions that you may have.

---

RESPONSES BY JEFFREY HOLMSTEAD TO ADDITIONAL QUESTIONS FROM SENATOR  
JEFFORDS

*Question 1.* The Northeast States are not happy with the Mobile Source Air Toxics rule. They believe it is not sufficiently protective of public health. As Mr. Johnstone's testimony points out—air toxics from mobile sources are expected to exceed Vermont's standards for the next three decades. What is the current status of the review of this rule?

Response. EPA estimates that its programs will reduce mobile source air toxics by over one million tons by 2007. However, because of the continuing concern about the potential health impacts of public exposure to air toxics, EPA also committed in the 2001 air toxics rule to prepare a Technical Analysis Plan designed to improve our understanding of the risk posed by air toxics to public health and welfare, and evaluate potential control strategies to further reduce risk. Based on the information developed through this Technical Analysis Plan, we will evaluate the need for additional control.

EPA is currently following through on our commitment to carry out this Technical Analysis Plan, and we are in the process of collecting and analyzing the data that will help us address specific data gaps identified in the plan. We recently briefed States on our progress in carrying out this plan. We are evaluating additional controls and will continue to work with our stakeholders on completing this reevaluation.

*Question 2.* Does the Administration plan to propose any substantial changes to either the CMAQ program or to the conformity [rule], as we go forward with reauthorization? If you do, I hope you'll get all the major stakeholders on board first.

Response. CMAQ: The Administration has not finished developing a final proposal. EPA and DOT are currently discussing whether refinements to the program would be appropriate. We are also reviewing the recommendations of the National Academy of Sciences CMAQ study to determine whether to propose changes in response to these recommendations. Since CMAQ eligibility and apportionment are tied to the air quality status of an area, we are concerned about how to account for States' need to implement the new 8-hour ozone and PM<sub>2.5</sub> air quality standards. Under active consideration is a proposal that maintains a balance between making the program available to new nonattainment areas and continuing to provide support to the existing nonattainment and maintenance areas.

EPA is in the process of reaching out to our stakeholders to get their views on the issues. Air quality agencies support the program and desire a more definitive and consistent role in project evaluation and selection.

Transportation Conformity—: The Administration has not yet finished developing a final proposal. EPA believes that transportation conformity continues to serve its purpose of ensuring that new transportation activities are consistent with areas' clean air goals. However, some stakeholders believe that targeted improvements, perhaps through TEA-21 reauthorization, may be warranted. While we have heard some views and recommendations for changing the conformity program, EPA is still reviewing information from the full spectrum of stakeholders. EPA is committed to considering options and recommendations from the full range of conformity stakeholders prior to forming final positions on specific issues.

*Question 3.* Since many surface transportation projects are already targeted at congestion mitigation, should we split off that purpose from the CMAQ program and focus more on air quality?

Response. We believe no additional benefit would be gained from eliminating congestion mitigation from the program in the law. Statutory language and the program guidance developed jointly by DOT and EPA clearly establish emission reductions as a requirement for project eligibility. Congestion mitigation projects are eligible, but only if they produce emission reductions in addition to their effect on traffic flow. While there may be disagreement as to the efficacy and permanence of traffic flow improvement projects, there is wide agreement that some traffic flow improvement projects, if designed and implemented with air quality improvement as a primary purpose, can produce emission reductions.

Those who oppose using CMAQ funds for congestion mitigation projects have focused most of their attention on what they perceive to be a bias toward funding traffic flow projects. This category of projects accounts for approximately 33 percent of CMAQ funds and 43 percent of the CMAQ projects, and is second to the largest category of funding which is transit. Multiple goals for a regional transportation system and the complexity of transportation funding can, in some cases, create a tendency to propose projects and then match the project to eligible funding programs. In that case, air quality improvement may be viewed as a secondary benefit of the project. Critics argue that projects should be developed with emphasis on effectiveness in achieving the purpose of the funding program as the priority.

EPA recognizes the need to balance multiple transportation goals, including both air quality and congestion relief, and that the flexibility of CMAQ eligibility is of great value for regional planning. Restricting congestion mitigation projects from CMAQ funding would remove a potential transportation tool for State and local agencies to address their air quality problem. EPA believes that sharpening the focus on air quality improvement could be done administratively through revised guidance while preserving the flexibility for areas to fund congestion mitigation projects with air quality benefits.

*Question 4.* Last August, Mr. Brenner told us that the Agency would soon be issuing a determination on a petition to regulate greenhouse gas emissions from vehicles as pollutants. What's the status of that petition?

Response. On October 29, 1999, the International Center for Technology Assessment and a coalition of 18 environmental and energy organizations petitioned EPA to regulate certain greenhouse gas emissions from new motor vehicles. The petition asks EPA to carry out what petitioners assert to be a mandatory duty under Clean Air Act section 202(a)(1).

EPA opened a public docket for the petition in January 2000 and published a request for public comment in the Federal Register on January 23, 2001. The public comment period closed on May 23, 2001. EPA received about 50,000 comments on the petition. EPA is currently preparing a response to the petition. We expect to publish the response in the Federal Register after it completes internal management review and is signed by Administrator Whitman.

*Question 5.* In general, would you agree that conformity is spurring investments in transportation strategies and technologies that reduce air pollution and create better interagency cooperation?

Response. Yes. By its very nature, the conformity process ensures that only transportation strategies and technologies as a whole that are consistent with clean air goals are invested in. When areas have found that preliminary projections from planned transportation projects exceed the emissions budgets established in the SIP, they have several options from which to choose for resolving the air quality issue and finalizing a transportation plan and TIP that conforms. For example, some areas have chosen to revise their SIP and emissions budgets by updating planning assumptions or investing in additional control measures in the SIP to allow for additional growth in transportation. Alternatively, other areas have changed the mix of projects and/or invested in projects that have an emissions benefit to their plan and TIP so that conformity could be demonstrated. In particular, some of these areas have invested in transit and land-use strategies that could potentially provide air quality benefits. (See below for a list of examples that have utilized these various approaches to resolve conformity issues.)

We also believe that transportation conformity has been very successful at integrating transportation and air quality planning through the interagency consultation process. We routinely hear from both transportation and air quality agencies that conformity has markedly improved the interagency consultation and working relationships between the two agencies. This interaction between transportation and air quality planners has become particularly critical to the timely resolution of conformity issues in high growth areas where emissions from cars and trucks are a major contributor to the air quality problem. Specific examples of where positive air

quality results and interagency consultation have occurred via the conformity and/or SIP processes include the following:

- Baltimore, MD: Revised SIP and added transit and other control measures to plan/TIP (1999/2000).
- Kent and New Castle Counties, DE: Added new control measures, including OBD and expanded transit, to the TIP (2001).
- Hampton Road, VA: Revised SIP by adding local controls and added CMAQ projects (2001).
- Washington DC: Revised SIP to incorporate a NO<sub>x</sub> substitution mechanism (1999/2000).
- Atlanta, GA: Altered land-use strategies and added control measures (2000).
- Dayton / Springfield, OH: Revised SIP to incorporate a safety margin and therefore enlarge the motor vehicle emissions budgets (1999).
- Salt Lake City, UT: Revised SIP to incorporate a PM-10/NO<sub>x</sub> trading mechanism (2002).
- Las Vegas, NV: Revised SIP to add/extend control measures to ensure conformity in future years (2000).
- Sacramento, CA: SIP and conformity issues lead to investment of \$70 million in a diesel retrofit program (2000).
- Charlotte, NC: Conformity issue prompted voters to pass a \$50 million tax referendum to support a long-term transit/land-use plan (1998).

*Question 6.* In general, what's the general ratio of spending on planning in the States for air quality versus transportation planning?

Response. EPA does not maintain information related to individual State funding on air quality planning versus transportation planning, but suspects the amount of funding for each activity will vary from State to State depending on the extent of air quality problems and growth that exists in each State. To gain a comprehensive comparison of funding for transportation and air quality planning, the respective agencies in each State should be queried.

*Question 7.* Why did it take so long to finalize the MOBILE6 model and when does EPA plan to update that model?

Response. The scope of MOBILE6 was unprecedented both in terms of the science that went into the model, and the review process under which the model was developed and released. In terms of the science of the model, many significant changes were made to reflect new data in several areas, including in-use deterioration, "real-world" driving, fuel sulfur content, and "off-cycle" heavy-duty vehicle emissions. In terms of the review process, all of the technical aspects of MOBILE6 underwent public review as well as formal peer review—a process which was conducted for over 50 technical documents. Following the development and review of these technical inputs, once the model was complete in draft form it underwent a "preview" period for State and local agencies at the request of STAPPA/ALAPCO, which lasted over 1 year. The length of time to finalize MOBILE6 was directly related to the effort needed to update the broad range of science incorporated in the model, and to ensure the model underwent sufficient review in the scientific, stakeholder and user communities.

EPA is planning to update MOBILE6 with MOVES (Multi-scale Motor Vehicle & Equipment Emission System). A primary impetus for this effort is the National Research Council's review of EPA's mobile source modeling program, published in 2000, which recommended a) the development of a modeling system more capable of supporting smaller-scale analyses; b) improved characterization of emissions from high-emitting vehicles, heavy-duty vehicles, and offroad sources; c) improved characterization of particulate matter and toxic emissions; d) improved model evaluation and uncertainty assessments; and e) a long-term planning effort coordinated with other governmental entities engaged in emissions modeling. EPA is planning to replace the current MOBILE6 model with the new MOVES model by the fall of 2005.

*Question 8.* As the Congress moves forward with a renewable fuels standard and ban MTBE, what affect will that have on areas ability to attain the 8-hour ozone standard and develop new vehicle emissions budgets to use in conformity?

Response. The version of the energy bill passed by the Senate in 2002 would have required EPA to maintain the emission benefits derived from the reformulated gasoline (RFG) program. The RFG program contains minimum emission reduction requirements that must be achieved regardless of the type of oxygenate that may be used in RFG. Therefore, we would not have expected the Senate energy bill to have any significant effect on areas' ability to attain the new ozone standard or their ability to develop new motor vehicle emissions budgets for use in conformity. EPA is currently developing its proposed rule designed to implement the new 8 hour ozone standard. We expect the RFG program to continue to be an integral part of our na-

tional strategy in assisting areas to reach attainment under the new standard. The Administration looks forward to working with the 108<sup>th</sup> Congress on a comprehensive energy bill that will enhance our energy security, protect our environment and support our economy.

*Question 9.* When will EPA and DOT promulgate changes to the regulations to implement the 1999 court decision on conformity?

Response. EPA is currently working on a proposed rulemaking to incorporate into the conformity rule EPA's May 14, 1999, and DOT's January 2, 2002, revised guidance implementing the court decision; we anticipate publication of this proposed rule in early 2003. Specifically, this proposal will address two major issues affected by the court regarding projects during a conformity lapse and EPA's process for finding newly submitted budgets appropriate to use in a conformity determination (i.e., the "adequacy process"). EPA's May 14, 1999, guidance and DOT's revised January 2, 2002, guidance describe how the conformity program is to be implemented in a manner that is consistent with the court decision. Nonattainment and maintenance areas have been operating under this existing guidance since the court decision was made on March 2, 1999.

EPA also published a final rulemaking on August 6, 2002 (67 FR 50808) that revised the timing for redetermining conformity after a State submits an air quality plan for the first time (i.e., an "initial" SIP submission). This rule change was necessary as a result of the court's decision that EPA must first find newly submitted budgets appropriate for conformity purposes (i.e., "adequate") before such budgets could be used. An effect of the combination of the court decision and EPA's previous rule was that a significant portion of the 18-month time period given to demonstrate conformity to an initial SIP could elapse prior to the time EPA made a determination that the submitted budgets were adequate. This final rule corrects the disconnect that existed between the previous rule and court decision, and as a result, gives areas the full 18 months to determine conformity to budgets from an initial SIP.

*Question 10.* Please submit to the committee information on the share of emissions of VOC, NO, PM, and CO that comes from motor vehicles today, in 2005, and in any future SIP attainment years for the 50 largest cities in the U.S. (Or for all non-attainment areas).

Response. In January 2001, EPA promulgated 2007 heavy-duty engine and vehicle standards and highway diesel fuel sulfur control requirements. For this rulemaking, EPA developed emission estimates for metropolitan areas in 1996, 2007, 2020 and 2030 for the following pollutants—volatile organic compounds (VOCs), nitrogen oxides (NO<sub>x</sub>), particulate matter (PM) and carbon monoxide (CO). Table 1 presents the share of emissions in the above three calendar years for each of the following source categories—area, electrical generation, on-road mobile sources and non-road mobile sources—in the 50 most populous metropolitan areas in the U.S.

EPA does not routinely prepare emissions projections for future years. Rather, projections are made for particular projects or actions which require them. The most recent such project that has reached completion is the January 2001 rulemaking on emissions from highway heavy-duty diesel vehicles/engines and sulfur content of highway diesel fuel. For that rulemaking, projections were based on the 1996 base year and included only 2007, 2020, and 2030. We are therefore unable to provide projections at the requested SIP attainment year intervals (e.g., 2005).

It is also necessary to explain that having been created by EPA during the year or so prior to the January 2001 promulgation of the diesel rule, these estimates are now somewhat dated. Emissions estimation approaches evolve continually, and the last several years have been a time of considerable change for mobile source methodologies in particular. For example, the projections presented in the attached tables are based on a modified version of the MOBILE5 emissions model, while MOBILE6 is now the current method. We will soon be publishing on our website emission estimates for the 1970 through 2001 period based on MOBILE6 and other recent improvements in data and methods. These new estimates will not exactly match the information for 1996 presented in the tables provided here, and it would be inappropriate to compare them to the 2007, 2020, or 2030 projections. Also, these estimates cannot be expected to exactly match estimates prepared and published by individual State or local air pollution or transportation planning agencies. Generally, State and local agencies are more able than EPA to incorporate more detailed data on local conditions, which improves the quality of the emission estimates they prepare.

*Question 11.* EPA has released for the first time in 10 years a new National Air Toxics Assessment, which provides estimates by zip code, of hazardous air pollutants by source. A very high share of these is from motor vehicles. Based on this new data, please submit to the committee estimates for the maximum exposures

from hazardous air toxics and the share of these emissions that come from mobile sources, for each of the 50 largest cities in the U.S.

Response. EPA's National Air Toxics Assessment (NATA) assesses emissions, ambient concentrations, inhalation exposure, and inhalation risk from 33 hazardous air pollutants emitted by outdoor sources in 1996. While results of the assessment were determined at the census tract level, because of inventory limitations, they are most meaningful when viewed at the National, State, or County level.

The assessment estimates upper-bound lifetime cancer risks to an average exposed individual at each census tract in the country. That means that actual risks are likely to be either equal to or less than the risks estimated by this study, but some risks may be greater. It also estimates hazard quotients for adverse health effects other than cancer. A hazard quotient is the ratio between the potential exposure to the substance and the highest level of exposure at which the risk of adverse effects is considered to be negligible. If a hazard quotient is calculated to be less than 1, then no adverse health effects are expected as a result of exposure. If a hazard quotient is greater than 1, then adverse health effects are possible. While the hazard quotient cannot be directly translated to a probability that adverse health effects will occur, increasing the value of the hazard quotient above 1 corresponds to increasing risk of adverse health effects. It is especially important to note that a hazard quotient greater than 1 does not necessarily mean that adverse effects will occur, just that they are possible.

Table 2 presents cumulative upper bound lifetime (70 year) inhalation cancer risks for a typical person in each of the 100 largest counties in the United States. On average, mobile sources, including highway motor vehicles and non-road equipment (e.g., lawnmowers, construction equipment, boats, planes, locomotives) are predicted to account for 40 percent of the cumulative upper bound cancer risk and about 80 percent of the non-cancer effects. Although EPA has concluded that diesel exhaust is a likely human carcinogen, cancer risks are not quantified for this pollutant. This is because data are not sufficient to develop a numerical estimate of carcinogenic potency. However, EPA has concluded that diesel exhaust ranks with the other substances that the national-scale assessment suggests pose the greatest relative risk.

*Question 12.* Recent peer-reviewed research papers published by TRB showed an average observed elasticity of regional vehicle miles traveled (VMT) with respect to regional lane miles of capacity of 0.83. Has EPA reviewed and evaluated the adequacy of regional travel models used to prepare SIP motor vehicle emissions inventories and attainment plans with respect to this important measure of induced traffic, which can have a profound effect on forecast traffic and motor vehicle emissions? If not, what steps will EPA take in the next months to assure timely progress in assessing regional travel models against this scientific benchmark and to assure correction of MPO models that do not now adequately reflect induced traffic effects?

Response. EPA recognizes the importance of this issue and the effect it can have on travel demand forecasting, but the Agency does not have a direct role in reviewing regional travel models. DOT is responsible for evaluating regional travel forecasting models as part of the Metropolitan Planning Organization (MPO) certification process. EPA regional offices participate in the certification process and have established consultative agreements with DOT and the State and local transportation planning agencies. EPA has guidance on the use of travel models and the forecasting process, especially regarding the travel activity data and growth assumptions that are used in the analysis, but we generally defer to the travel model experts at DOT when we have questions about the adequacy of the models themselves.

The complex nature of induced travel demand is the subject of several recent and highly regarded studies, yet definitive conclusions about the relationship between added capacity and air quality have not been drawn. Current thinking by travel forecasting and travel modeling experts generally support the conclusion that reduced travel costs (usually measured in terms of reduced travel time and increased convenience) result in additional travel. There is a wide range of estimates about the amount of travel induced. Whether or not the induced travel translates into degradation of air quality is highly dependant on local transportation, economic, and meteorological conditions.

EPA's Office of Transportation and Air Quality (OTAQ) has jointly sponsored travel model research, training and technical assistance to transportation and air quality agencies through the Federal Highway Administration's Travel Model Improvement Program. For the longer term, the best potential for accurately representing induced travel effects of added capacity is through a new transportation analysis tool known as the Transportation Analysis Simulation System (TRANSIMS). TRANSIMS is a suite of data bases, models, and simulations being

developed by DOT with the participation and support of OTAQ's transportation and emissions modeling staff.

*Question 13. Part 1:* Various comments at the hearing pertained to coordination of the timing of SIPS, TIPs, and transportation plans. It would be helpful to this review of facts to understand EPA's administration of SIP revisions and how motor vehicle emissions budgets (MVEB's) have been modified over time, and how frequently conformity determination have been updated.

Response. Review of Facts: Timing of Conformity Frequency and Updates for Plans, TIPs and SIPS Transportation conformity is implemented to achieve its purpose as defined by the Clean Air Act under the following air quality and transportation schedules: Clean Air Act Requirements

Transportation Conformity: According to the Clean Air Act, transportation plans and TIPs in nonattainment and maintenance areas must conform to the SIP before they are adopted by an MPO. Under DOT's transportation planning regulation, metropolitan nonattainment and maintenance areas must develop a new transportation plan that covers at least a 20 year timeframe every 3 years. In addition, Title 23 requires these areas to update their TIPs every 2 years. TIPs cover a shorter timeframe (at least 3 years) and consist of a subset of projects from the transportation plan. Since TIPs are required to be updated every 2 years, metropolitan nonattainment and maintenance areas are required to demonstrate conformity at a minimum of every 2 years. An option that has been suggested to eliminate the mismatch between frequency of plan and TIP updates via TEA-21 reauthorization is to streamline the plan and TIP into one planning document. EPA recognizes the advantages of aligning the frequency of TIP updates with transportation plan updates.

The Clean Air Act also requires conformity to be determined at least every 3 years. In nonattainment and maintenance areas, both the metropolitan transportation plan update cycle and the conformity determination cycle start at the time FHWA and FTA make the conformity determination on the plan; thus, both plan and conformity updates occur on the same 3 year cycle.

SIPS: Once a SIP is submitted for a particular Clean Air Act purpose, and approved by EPA, the motor vehicle emissions budgets in the approved SIP remain in effect until the State decides to update the SIP. The SIP's motor vehicle emissions budgets, in effect, estimate the amount of emissions from the transportation sector that the air could absorb and still allow the area to attain the National Ambient Air Quality Standards. There is no statutory or administrative requirement to update approved SIPs on a regular basis, with few exceptions. For example, rate of progress and attainment SIPs, as well as regular emissions inventory updates that could trigger a SIP revision, are required in serious and above ozone areas. See EPA's response to Senator Jeffords questions #14-18 for more information on SIPs in serious and above ozone areas. The types of SIPs that must be submitted by an area are dictated by the Clean Air Act and vary according to the pollutant and classification of the area.

Although the CAA does not mandate regular SIP updates, some areas have updated or are in the process of updating their SIPs and as a result, may have more recent mobile source emissions budgets available for conformity purposes. In particular, areas that have had conformity difficulties have often addressed such issues by revising their SIPs to incorporate new planning assumptions and data and/or additional control measures to allow for growth in transportation (e.g., Baltimore MD, New Jersey, Salt Lake City UT, Albuquerque NM). In addition, under EPA's MOBILE6 policy, all States that took MOBILE5-based preliminary estimates of credit for Tier 2 vehicle emission regulation benefits in their current SIPs are committed to revise their mobile source budgets with MOBILE6 within 1-2 years after MOBILE6's release on January 29, 2002 (e.g., New York City, Philadelphia PA, Baltimore MD, Washington DC, Houston TX, Dallas TX, St. Louis MO). Also, States typically update their SIPs after a change in attainment status, for example, when an area requests redesignation and develops a maintenance plan with new motor vehicle emissions budgets (e.g., Denver CO, Louisville KY, Pittsburgh PA, Cincinnati OH, Richmond VA, Nashville TN). In these cases, however, once areas develop a maintenance plan such budgets can be in place for up to 10 years because maintenance plans cover a 10-year timeframe.

#### *Transportation Conformity Rule Requirements*

In addition to the statutory requirements, there are specific triggers in the conformity regulation that warrant a new conformity determination within 18-months of certain SIP actions. For instance, EPA's conformity rule requires conformity to be done within 18 months of EPA's adequacy finding for an initial SIP and within 18 months of EPA's approval of a SIP. This 18 month requirement is intended to ensure that when an area has a new SIP that establishes a new budget, the new

air quality information is, integrated into the conformity process in a timely manner (otherwise, areas could wait up to 3 years before that new, relevant air quality information is incorporated). EPA is currently working on a proposed rulemaking to eliminate some of these 18-month triggers and streamline others to reduce redundancy and unnecessary burden on conformity implementers.

*Question 13. Part 2:* Please identify each MVEB that has been approved, found to be adequate or submitted with a determination pending for NO<sub>x</sub>, VOCs, primary PM, and PM precursors, if any, for each nonattainment area. This should be submitted for each metropolitan area or region of a State that at any time following November 15, 1990, has been classified as a serious, severe or extreme ozone nonattainment area or a serious PM-10 nonattainment area, based on approved or submitted ozone and PM-10 SIPs, or the documents containing such information. This should include MVEB's that applied in the past and MVEB's that apply to future milestone, attainment and maintenance deadlines.

This should include for each WEB the date such MVEB was submitted to EPA, the date it became effective for transportation conformity purposes, the numerical limitation on motor vehicle emissions within the nonattainment area established by the MVEB for each of the pollutants listed in this require; the dates when conformity determinations were made by the MPO, and/or US DOT with respect to each such MVEB; and copies of any such conformity determinations received by EPA.

Response. Please see Table 3. Also, note that this table includes information on when conformity determinations have been made using any adequate or approved budgets. In addition, we have attached to our responses to the Senate EPW Committee EPA's written comments on these conformity determinations where available. However, several of the EPA Regional Offices' comments are typically expressed verbally via the interagency consultation process, and therefore, specific dates and comments could not be provided.

Considering the volume of information/documentation (e.g., MOBTLF, input tables; tables of link listing) that is contained within a transportation plan and TIP and its respective conformity determination, we have only provided this specific information for conformity determinations as agreed to by your staff. Although not exhaustive, this table, accompanying materials and our preceding review of facts, should provide you with a general understanding of the SIP and transportation planning schedules and availability of SIP budgets for conformity purposes.

*Question 14.* For each serious, severe or extreme ozone nonattainment area, please state the total allowable emissions, or "target value," for each ozone precursor pollutant that has been established for the 1996 VOC reduction milestone, and each post-1996 3-year milestone deadline that EPA has approved as part of a SIP revision submitted to meet the reasonable further progress (rate of progress) requirements of section 182(c)(2)(B) and (C) of the Act.

Table 1: Target VOC emissions and target NO<sub>x</sub> emission substitutions for ROP milestone in Ozone SIPs in tons per day

| Extreme Area          |      |                 |      |                 |      |                 |      |                 |      |                 |      |                 |
|-----------------------|------|-----------------|------|-----------------|------|-----------------|------|-----------------|------|-----------------|------|-----------------|
| Area                  | 1996 |                 | 1999 |                 | 2002 |                 | 2005 |                 | 2008 |                 | 2010 |                 |
|                       | VOC  | NO <sub>x</sub> | VOC  | NO <sub>x</sub> | VOC  | NO <sub>x</sub> | VOC  | NO <sub>x</sub> | VOC  | NO <sub>x</sub> | VOC  | NO <sub>x</sub> |
| South Coast, CA ..... | 1144 | NR              | 1161 | NR              | 1012 | NR              | 876  | 1419            | 739  | 1294            | 414  | 530             |

| Severe Areas  |      |                 |      |                 |      |                 |      |                 |      |                 |

NR: Not required

NOx reductions are substitutes for some VOC reductions.

Milestones not required for attainment years. The attainment dates for the ozone area classifications are as follows:

Serious . . . . 1999 f      Severe . . . 2005 or 2007

Extreme . . . . 2010

IP: Not required because rate of progress not required due to international transport. NA: EPA has not acted on proposed target(s).

**Question 15.** Please identify any nonattainment area for which a rate-of-progress allowable emission target has not been established for any precursor pollutant, for any milestone period; and identify the specific milestone period(s) defined by section 182(c)(2)(B) and (g) for which no rate-of-progress target has been established. Also, please provide copies of each milestone compliance demonstration required by section 182(g) that has been submitted by the State for each nonattainment area included within the scope of this request, copies of each determination or other action the Administrator or EPA regional office has made with regard to each submitted milestone compliance demonstration, and with regard to each milestone compliance demonstration not filed, and copies of any submissions made by any State to satisfy the obligations prescribed by Clean Air Act section 182(g)(3).

Response. "Rate-of-Progress" milestones were established for all nonattainment areas except:

1. Southeast Desert Nonattainment Area in California. A major cause of the area's nonattainment is transport of pollutant from the Los Angeles area (South Coast Air Quality Management District).

2. El Paso, Texas did not have a 1999 ROP target because a major portion of its pollution is caused by international transport of pollutant from Mexico.

3. Sacramento, California: 1996 ROP target.

Table 2: List of Requested Documents Relating to Milestone Compliance Demonstrations

| Area                                      | Documents/comment  |
|---|--|
| <b>Extreme Areas</b>                      |  |
| South Coast, CA .....                     | See Document No. 32 through 36 Attachment.   |
| <b>Severe Areas</b>                       |  |
| DE portion of PA-NJ-DE-MD .....           | See document Nos 47—56 Attachment  |
| IL portion of Chicago/ Northwest IN ..... | See Document No. 17, 20 and 21 Attachment.   |
| IN portion of Chicago/ Northwest IN ..... | See Document No. 19.   |
| Milwaukee/ Racine, WI .....               | See Document No. 18.   |
| Southeast Desert, CA .....                | See Document No. 32 through 36, 41 and 42 Attachment. A major cause of the area's nonattainment is transport of pollutant from the Los Angeles area (South Coast Air Quality Management District). |
| Sacramento, CA .....                      | See Document No. 32 through 36 and 39 and 40 Attachment  |
| San Joaquin Valley, CA .....              | See Document No. 32 through 36 and 38 Attachment   |
| Ventura, CA .....                         | See Document No. 32 through 36 Attachment  |
| <b>Serious Areas</b>                      |  |
| Atlanta, GA .....                         | See Documents No. 9 through 16 Attachment  |
| El Paso, TX .....                         | See Document No. 25 Attachment. El Paso not required to have a plan for 3 percent per year after 1996 because the ozone concentrations caused by international transport.                          |
| East Kern, CA .....                       | See Document No. 32 through 36 Attachment. Eastern Kern County Nonattainment area was previously a part of the San Joaquin Valley Nonattainment Area.  |
| Phoenix, AZ .....                         | See Document No. 46 Attachment   |
| San Diego, CA .....                       | See Document No. 32 through 37 and 43 Attachment   |

In the late 1990's, EPA began to draft a rule outlining two possible approaches that States could use to perform milestone compliance demonstrations called for under section 182(g): (1) emission inventory updates (where possible) and/or (2) indicators of compliance such as growth rates, VMT change information, regulations planned and adopted, etc. As it analyzed the issue, EPA recognized that technical problems, centering upon the timeliness of State emission inventory updates and associated growth projections, would arise in many States when the control agencies would attempt to develop complete milestone demonstrations. In other words, many States would have problems with getting the periodic inventories synchronized with the milestone compliance time period. For States with this problem, the cost would have been prohibitive to implement a revised emissions inventory program, or a separate new inventory program, that matched the compliance milestone demonstration period. EPA found that it would have been prohibitively costly (if not impossible) to condense the process of collecting and quality assuring emissions data, which could take from 12 to 18 months, into a 90-day period. For these reasons, and because we did not find reliable, readily available methods to evaluate milestone compliance demonstrations, EPA did not finalize a rule requiring such demonstrations. However,

EPA has issued the following guidance documents that outline how to calculate the many different inventories and how to prepare rate-of-progress SIP revisions:

1. Guidance on the Adjusted Base Year Inventory and the 1996 Target for the 15 Percent Rate-of-Progress Plans, EPA-452/R-92-005, October 1992. (Document No. 1 Attachment)

2. Guidance for Growth Factors, Projections, and Control Strategies for the 15 Percent Rate-of-Progress Plans, EPA-452/R-93-002, March 1993. (Document No. 2 Attachment)

3. Guidance on the Relationship Between the 15 Percent Rate-of-Progress Plans and Other Provisions of the Clean Air Act Amendments, EPA-452/R-93-007, May 1993. (Document No. 3 Attachment)

4. Guidance on Preparing Enforceable Regulations and Compliance Programs for the 15 Percent Rate-of-Progress Plans, EPA-452/R-93-005, June 1993. (Document No. 4 Attachment)

5. Guidance on the Post-1996 Rate-of-Progress Plan and Attainment Demonstration, EPA-452/R-93-015, January 1994. (Errata 2-18-94) (Document No. 5 Attachment)

*Question 16.* For any nonattainment area that has not demonstrated compliance with section 182(g) either based on a submission that demonstrates noncompliance or the failure to submit a demonstration, please provide copies of any documents to or from the State that discuss or include information regarding actions that have

been taken, are to be taken or that are under consideration to correct the failure to achieve the emissions reductions required for such milestone.

Response. For the reasons explained in the response to question 15, we sent no correspondence to States on the topic of failure to submit milestone compliance demonstrations. We did, however, send some States letters concerning methods of demonstrating compliance.

In May 1997, letters were sent to Connecticut, Massachusetts, and New Hampshire regarding actions the States could take to document that their ROP plans were on track. (See Documents Nos. 6, 7, and 8.) In response to our letter, Connecticut submitted rule effectiveness studies for their cutback asphalt and gasoline loading racks rules, and Massachusetts evaluated compliance rates with its gasoline station vapor recovery systems and eventually submitted a revised regulation to address compliance problems it discovered with this rule. (These State studies and regulations are not included with this response.)

*Question 17.* For each ozone nonattainment area classified as “serious” prior to 1999, please provide copies of (i) any determination made by EPA pursuant to Clean Air Act section 181(b)(2)(A) with regard to determining whether such area attained the NAAQS on or before November 1999, and (ii) any notice published pursuant to section 181(b)(2)(B).

| Milwaukee/ Racine, WI .....  | See <a href="http://www.epa.gov/fedrgstr/EPA-AIR/2002/June/Day-25/a15870.htm">http://www.epa.gov/fedrgstr/EPA-AIR/2002/June/Day-25/a15870.htm</a> . See Documents No. 22-24 Attachment.  |
| San Joaquin Valley, CA ..... | See Documents No. 27-31 and 58-62 Attachment. San Joaquin Valley APCD Rule 3170 (Document 61) is also available at: <a href="http://www.valleyair.org/rules/currnrules/r3170.dpf">http://www.valleyair.org/rules/currnrules/r3170.dpf</a> .<br>The provision was adopted on May 16, 2002 and submitted to EPA on August 6, 2002. EPA is reviewing the submitted materials and plans to propose its action in March 2003 and complete action in September 2003. |

Note: We are aware of one State, Pennsylvania, that has adopted State regulations with an emissions fee provision in response to the section 185 requirement. The fee would apply in the Pennsylvania portion of the Philadelphia nonattainment area. See Section 4006.4 in Document 57.

## LIST OF ATTACHED DOCUMENTS

1. Guidance on the Adjusted Base Year Inventory and the 1996 Target for the 15 Percent Rate-of-Progress Plans, EPA-452/R-92-005, October 1992
2. Guidance for Growth Factors, Projections, and Control Strategies for the 15 Percent Rate-of-Progress Plans, EPA-452/R-93-002, March 1993
3. Guidance on the Relationship Between the at Percent Rate-of-Progress Plans and Other Provisions of the Clean Air Act Amendments, EPA-452/R-93-007, May 1993
4. Guidance on Preparing Enforceable Regulations and Compliance Programs for the 15 Percent Rate-of-Progress Plans, EPA-452/R-93-005, June 1993
5. Guidance on the Post-1996 Rate-of-Progress Plan and Attainment Demonstration, EPA452/R-93-015, January 1994. (Errata 2-18-94)
6. Letter dated May 30, 1997, to Thomas Noel, Deputy Director, Department of Environmental Services, Concord, New Hampshire from David B. Conroy, Chief, Air Quality Planning Unit, Region I, Boston, Massachusetts
7. Letter dated May 30, 1997, to Joseph Belanger, Department of Environmental Protection, Hartford, Connecticut from David B. Conroy, Chief, Air Quality Planning Unit, Region I, Boston, Massachusetts
8. Letter dated May 30, 1997, to Nancy Seidman, Department of Environmental Protection, Boston, Massachusetts from David B. Conroy, Chief, Air Quality Planning Unit, Region I, Boston, Massachusetts
9. Letter dated February 14, 1997, to Winston A. Smith, Division Director, Region IV, Atlanta, Georgia from Ron Methier, Chief, Air Protection Branch, Department of Natural Resources, Atlanta, Georgia
10. 62 PR 48027, Friday, September 12, 1997, Proposed Conditional Interim Approval—Approval and Promulgation of Implementation Plans; Georgia: Approval of Revisions to the Georgia State Implementation Plan
11. 63 FR 45172, Tuesday, August 25, 1998, Direct Final Rule—Approval and Promulgation of Implementation Plans Georgia: Approval of Revisions to the Georgia State Implementation Plan
12. 67 FR 30574, Tuesday, May 7, 2002, Final Rule—Approval and Promulgation of Implementation Plans; Georgia: 1-Hour Ozone Attainment Demonstration, Motor Vehicle Emissions Budgets, Reasonably Available Control Measures, Contingency Measures and Attainment Date Extension
13. 66 FR 63972, Tuesday, December 11, 2001, Supplemental Proposed Rule—Potential Clean Air Reclassification and Notice of Potential Eligibility for Attainment Date Extension and Approval of Attainment Demonstration, Georgia: Atlanta Non-attainment Area; Ozone
14. Table of Regulations and Rule Improvements Implemented in the 15 percent Plan with Associated Emission Reductions
15. List of 15 percent Plan Codified Regulations
16. List of 15 percent Plan Rule Improvements
17. Letter dated January 15, 2002, to Bharat Mathur, Director, Region V, Chicago, Illinois from David J. Kolaz, Chief, Bureau of Air, Environmental Protection Agency, Springfield, Illinois
18. Letter dated May 2, 1997, to David Kee, Director, Region V, Chicago, Illinois from Donald F. Theiler, Director, Department of Natural Resources, Madison, Wisconsin
19. Letter dated February 13, 1997, to David Kee, Director, Region V, Chicago, Illinois from Felicia George, Acting Assistant Commissioner, Department of Environmental Management, Indianapolis, Indiana

20. Letter dated February 13, 1997, to David Kee, Director, Region V, Chicago, Illinois from Bharat Mathur, Chief, Bureau of Air, Environmental Protection Agency, Springfield, IL

21. Table 4, Chicago 15 percent ROP Plan Measures, August 29, 1996

22. Letter dated December 22, 2000, to Frank Lyons, Administrator, Region V, Chicago, Illinois from Tommy G. Thompson, Governor, State of Wisconsin, Madison, Wisconsin

23. 67 FR 10116, Wednesday, March 6, 2002, Proposed Rule—Approval and Promulgation of Air Quality Implementation Plans; Wisconsin; Excess Volatile Organic Compound Emissions Fee Rule

24. 67 FR 42729, Tuesday, June 25, 2002, Final Rule—Approval and Promulgation of Air quality Implementation Plans; Wisconsin; Excess Volatile Organic Compound Emissions Fee Rule

25. Letter dated August 9, 1994, to Ms. Beverly Hartsock, Deputy Executive Director, Texas Natural Resource Conservation Commission, Austin, Texas from A. Stanley Meiburg, Director, Region VI, Dallas, Texas

26. Letter dated September 6, 1994, to Ms. Jodena Henneke, Director, Air Quality Planning Division, Texas Natural Resource Conservation Commission, Austin, Texas from Gerald W. Fontenot, Chief, Region VI, Dallas, Texas

27. Letter dated May 1, 2002, to Scott Nester, San Joaquin Valley Unified Air Pollution Control District, Fresno, California from Andrew Steckel, Chief, Region IX, San Francisco, California

28. E-mail dated January 30, 2002, to Andrew Steckel, Chief, Region IX, San Francisco, California from Scott Nester, San Joaquin Valley Unified Air Pollution Control District, Fresno, California

29. E-mail dated January 4, 2001, to Chris Frank, Ventura County APCD from Dave Jesson, Region IX, San Francisco, California

30. E-mail dated December 12, 2000 to David Jesson, Region IX, San Francisco, California from Chris Frank, Ventura County APCD

31. E-mail dated December 12, 2000 to Chris Frank, Ventura County APCD from David Jesson, Region IX, San Francisco, California

32. Letter dated December 28, 2001, to Mr. Jack Broadbent, Director, Region IX, San Francisco, California from Michael P. Kenny, Executive Officer, Air Resources Board, Sacramento, California

33. Enclosure A to December 28, 2001 letter to Mr. Jack Broadbent—1999 Milestone Compliance Demonstration: Background

34. Enclosure B to December 28, 2001 letter to Mr. Jack Broadbent—1999 Milestone Compliance Demonstration: Summary Tables for California Nonattainment Areas Southeast Desert: Mojave Desert Portion

35. Enclosure C to December 28, 2001 letter to Mr. Jack Broadbent—1999 Milestone Compliance Demonstration: Status of State and Federal Measures

36. Enclosure D to December 28, 2001 letter to Mr. Jack Broadbent—1999 Milestone Compliance Demonstration: Status of Local Measures

37. San Diego County Air Pollution Control District Measures—Changes Since the 1996 Milestone Compliance Demonstration

38. San Joaquin Valley Unified Air Pollution Control District—2000 Ozone Rate of Progress Report, April 20, 2000 (Revised April 27, 2000)

39. Letter dated May 17, 2000 to Michael Kenny, Executive Officer, Air Resources Board, Sacramento, CA from Norm Covell, Air Pollution Control Officer, Sacramento Metropolitan AQMD, Sacramento, CA—Sacramento Area Regional 1999 Milestone Report, April 2000

40. Sacramento Area Regional 1999 Milestone Report—technical Appendices, April 2000

41. Letter dated April 6, 2000 to Michael Kenny, Executive Officer, California Air Resources Board, Sacramento, CA from Charles L. Fryxell, Air Pollution Control Officer, Lancaster, CA—Final Draft Antelope Valley APCD 1999 Milestone Compliance Demonstration

42. Letter dated April 6, 2000 to Michael P. Kenny, Executive Officer, California Air Resources Board, Sacramento, CA from Charles L. Fryxell, Air Pollution Control Officer, Lancaster, CA—Final Draft Mojave Desert AQMD 1999 Milestone Compliance Demonstration

43. Letter dated February 18, 1997 to Felicia Marcus, Regional Administrator, Region IX, San Francisco, CA from Michael P. Kenny, Executive Officer, California Air Resources Board, Sacramento, CA—1996 Milestone Compliance Demonstration for the San Diego County Portion of the 1994 California Ozone State Implementation Plan

44. Letter dated May 19, 1997 to Felicia Marcus, Regional Administrator, Region IX, San Francisco, CA from Michael P. Kenny, Executive Officer, California Air Re-

- sources Board, Sacramento, CA—1996 Milestone Compliance Demonstration for the Ventura County Portion of the 1994 California Ozone State Implementation Plan
45. Letter dated February 14, 2000 to Richard Grow, Region IX, San Francisco, CA from Scott Johnson, Planning Manager, Ventura County Air Pollution Control District—Ventura County 1999 Milestone Compliance Demonstration
46. Letter dated September 11, 1997 to David Howekamp, Director, Region IX, San Francisco, CA from Nancy C. Wrona, Director, Air Quality Division, Department of Environmental Quality, Phoenix, AZ
47. Letter dated February 18, 1997 to W. Michael McCabe, Regional Administrator, Region III, Philadelphia, PA from Christophe A.G. Tulou, Secretary, Department of Natural Resources & Environmental Control, Dover, DE
48. Letter dated March 13, 1997 to Darryl Tyler, Director, Department of Natural Resources & Environmental Control, Dover, DE from David L. Arnold, Chief, Region III, Philadelphia, PA
49. Letter dated March 24, 2000 to Nicholas A. DiPasquale, Secretary, Department of Natural Resources & Environmental Control, Dover, DE from Bradley M. Campbell, Regional Administrator, Region III, Philadelphia, PA
50. Letter dated February 25, 2000 to Bradley M. Campbell, Regional Administrator, Region III, Philadelphia, PA from Nicholas A. DePasquale, Secretary, Department of Natural Resources & Environmental Control, Dover, DE
51. Certification that public hearing was held January 4, 2000 to consider a proposed revision to the State of Delaware Implementation Plan for Achieving and Maintaining the National Ambient Air Quality Standard for Ozone
52. Secretary's Order No. 2000-A-0006—Re: SIP Revision—Delaware 1996 Milestone Demonstration for Kent and New Castle Counties
53. Memorandum dated February 2, 2000 to Nicholas A. DePasquale, Secretary from Valerie Satterfield, Hearing Officer re: SIP Revision—Delaware 1996 Milestone Demonstration for Kent and New Castle Counties
54. Affidavit of Publication in the News Journal for New Castle County
55. Affidavit of Publication in the Delaware State News for Kent County
56. Final Submittal—Delaware 1996 Milestone Demonstration for Kent and New Castle Counties, February 2000
57. Purdon's Pennsylvania Statutes Annotated—Title 35 Health and Safety, Sections 1151 to 6200
58. Transmittal documents for California SIP revisions including Rule 3170 (ozone nonattainment fee) for San Joaquin Valley Unified Air Pollution Control District.
59. Resolution No. 02-05-05, Governing Board of the San Joaquin Valley Unified Air Pollution Control District, adopting rule 3170 (ozone nonattainment fee).
60. Certification of publication of notice of public hearing on Rule 3170 (ozone nonattainment fee) for San Joaquin Valley Unified Air Pollution Control District.
61. Rule 3170 (ozone nonattainment fee) for San Joaquin Valley Unified Air Pollution Control District, adopted May 16, 2002.
62. May 16, 2002, Memo to San Joaquin Valley Unified Air Pollution Control District Governing Board, from David L. Crow, Executive Director/Air Pollution Control Officer, and Scott Nester, Project Coordinator, regarding adoption of proposed rule 3170 (ozone nonattainment fee)

---

RESPONSES OF JEFFREY HOLMSTED TO ADDITIONAL QUESTIONS FROM SENATOR VOINOVICH

*Question 1.* The recently released National Academy of Sciences report, which assesses the CMAQ program, recommends that the “program should be broadened to include, at a minimum, all pollutants regulated under the Clean Air Act.” Do you agree with this recommendation? What do you think would be the effect of broadening the CMAQ program?

Response. The full text of the NAS report recommended: “At a minimum, the eligibility criteria and allocation formula should include all pollutants regulated under the Clean Air Act, which would cover PM<sub>10</sub>, as well as sulfur dioxide and air toxics.” Without regard to CMAQ funding constraints, EPA would agree with the recommendation. However, in light of the CMAQ funding levels established by Congress, extending geographic eligibility, the apportionment of funds, and project eligibility to all Clean Air Act pollutants could dilute the amount of funds available to any given area to such an extent as to render the program less effective. The NAS study recognized this limitation as well.

EPA believes it is prudent to consider extending eligibility only to those pollutants for which we have ambient standards and to which mobile sources are a significant contributor. In light of the evidence on the health effects of fine particulate matter,

and the relationship between travel activity and PM emissions, the administration is considering recommending inclusion of PM nonattainment areas in the apportionment formula. Sulfur dioxide emissions come primarily from fuel combustion processes at point sources, with transportation sources accounting for only a minor fraction of the inventory. The absence of ambient standards for air toxics, together with limitations on the information relating travel activity to human health effects from exposure to air toxics, would make it difficult to develop a funding formula and direct money to useful mitigation projects. Given these limitations, EPA would not, at this time, recommend extending eligibility and allocation of CMAQ funds for sulfur dioxide and air toxic pollutants.

*Question 2.* As I mentioned during the hearing, the current Federal budget crises demands that we look at the cost-effectiveness of our government's programs. Could you provide detailed information to put in perspective how cost effective transportation and air quality projects have been?

Response. The National Academy of Sciences CMAQ report concluded that "It is not possible to undertake a credible scientific quantitative evaluation of the cost-effectiveness of the CMAQ program at the national level." A limited number of studies have been done to quantify the actual effectiveness of transportation control measures (TCMs) as defined by the Clean Air Act, Section 108(f), for improving air quality. Most estimates of effectiveness are not derived from observed changes in travel activity, but are estimated through the use of models. Most models are not designed to estimate the emission impacts of individual small scale projects within the context of the much larger regional transportation system.

Even if the data and models were available, the regional variation in physical, social and

economic conditions, as well as the project selection criteria which is external to the air quality considerations, would render a generalization about the cost-effectiveness of TCMs highly speculative for any specific area. It is important to recognize that transportation projects, including those funded by CMAQ and intended to reduce emissions, are considered for implementation within the context of multiple societal goals that transportation planners seek to address. Assigning a portion of the cost of any TCM to each of the individual goals, including air quality, introduces a bias that could skew cost-effectiveness analyses.

Given the caveats above, TCM cost-effectiveness estimates in the current literature range approximately from \$1,000 to several million dollars per ton of hydrocarbon reduced. These estimates are limited in usefulness because there is no reference point for the temporal effects (the timeframe over which the project produces emission reductions) nor the cost-effectiveness of the control strategies that have already been implemented in an area. For example, evaluation of a well designed commuter rail project would indicate different annual cost-effectiveness figures if it were evaluated over the first 5 years of operation, versus a 20 to 30 year timeframe. Additionally, if an area has already implemented a substantial set of the most cost-effective controls, but still needs additional emission reduction to achieve healthy air quality, it may choose to implement more costly transportation control measures than to place more controls on its industry and power generation sources. We should note, however, that these cost-effective estimates assign all of the cost of a particular measure to its pollution reduction instead of apportioning it between the pollution reduction benefits and other societal benefits (e.g., less time spent in traffic).

The CMAQ study concluded, with significant qualifications, that technology based strategies appear to be more cost effective than strategies designed to reduce travel activity. The study also noted several exceptions where travel demand management projects appear to be at a similar costeffectiveness level as technology based measures.

EPA supports the CMAQ study recommendation for a significant national program of evaluation of transportation control measures, which would provide State and local transportation and air quality agencies with up to date information on cost-effectiveness.

*Question 3.* In the past, transportation projects across the country have experienced delays due to new emissions standards and conformity. As we discussed during the hearing these project delays need to be considered prior to EPA's new nonattainment designations. Could you please provide an update on the steps EPA has taken since the conformity problems were identified? How is EPA preparing to deal with problems that may arise after the new designations? Additionally, should, and if so how, this matter be addressed during the reauthorization of the transportation bill to prevent or alleviate some of the delays?

Response. Under the Clean Air Act section 176(c)(6), transportation conformity will apply to nonattainment areas designated under new air quality standards 1

year after the effective date of an area's designation. Since the 8-hour ozone and PM-2.5 standards are different standards from the 1-hour ozone and PM-10 standards, respectively, every area that is designated nonattainment for the new ozone and PM standards will have a 1-year grace period before conformity applies for those standards, regardless of whether or not an area was previously designated nonattainment for the 1-hour ozone or PM-10 standards.

EPA is currently developing an overall implementation strategy for the new air quality standards; we plan to propose an implementation strategy for the 8-hour ozone standards in the very near future. EPA's strategy will include a proposal for how areas will be classified and when the one-hour standard will be revoked. Some areas or part of areas that will be designated as nonattainment for the 8-hour standard are currently nonattainment for the 1-hour standard. To transition areas from the 1-hour to the 8-hour ozone standard, a key option that EPA is considering is to revoke the 1-hour ozone standard 1 year after the effective date of designations made under the 8-hour standard. While this is only one option for transitioning to the new ozone standard, this option would allow the revocation of the 1-hour standard to coincide with the end of the 1-year conformity grace period, and therefore, conformity would only be required for one ozone standard at any given time.

Once the implementation strategy has been proposed, EPA will have to update the conformity rule to make it consistent with the new standards. EPA has ideas for simplifying the process that we can consider in this rulemaking. Stakeholders will also have the opportunity to express their view and ideas in this process.

EPA and U.S. DOT, as well as stakeholders across the U.S., have a wealth of experience in implementing conformity. Newly designated areas will benefit from our collective experience; EPA and DOT will provide timely guidance to these areas before and as they implement the program to make the transition to the new standards as smooth as possible and to avoid any unnecessary delays in transportation projects. We recognize that additional assistance to States and local areas will likely be necessary and we plan on extending ourselves to help with this transition to new air quality standards.

*Question 4.* Too often we talk only about the major problems with our air quality and forget to assess how far we have come. Please provide for the committee a big picture analysis with benchmark figures to get a sense of where we are today, what progress we have made, what areas remain as challenges, and what are the sources of these challenges. Do you have any State-specific numbers for air quality improvements (specifically Ohio)? What has contributed most to the country's reductions in air pollution? Where has our Nation been getting the biggest returns on legislation and investments to reduce air pollution? What emerging new issues need to be addressed and how?

*Response.* We agree with the sentiment expressed in this question. There has in fact been very substantial progress made in improving air quality in this country. Since 1970, aggregate emissions of the six principal pollutants tracked nationally have been cut 25 percent. During that same time period,

U.S. gross domestic product has increased 161 percent, energy consumption increased 42 percent, and vehicle miles traveled increased 149 percent. National air quality levels measured at thousands of monitoring stations across the country have shown improvements over the past 20 years for all six principal pollutants. Despite this progress, almost 170 million tons of pollution are still emitted air each year in the United States, and approximately 133 million people live in counties where monitored air in 2001 was unhealthy because of high levels of at least one of the six principal air pollutants.

With respect to State-specific trends, we do not track or publish State-specific statistics; normally this is done by the State itself. (The Division of Air Pollution Control in the State of Ohio's Environmental Protection Agency produces a trends analysis that can be found at <http://www.epa.state.oh.us/dapc/ams/data.html>.) However, we can supply the following regarding air quality improvements in Ohio's metropolitan areas:

- In 1991, seven Ohio metropolitan areas were designated as nonattainment areas for the 1-hour ozone standard. Today, all have air quality meeting the 1-hour ozone standard.

Cleveland-Akron-Lorain, Dayton-Springfield, Toledo, Canton, and Columbus, and Youngstown-Warren all were redesignated as meeting the standard in 1995 or 1996. The seventh area, Cincinnati-Hamilton, OH-KY, also has air quality meeting the standard; the Kentucky portion is redesignated and the State of Ohio is working to satisfy requirements necessary for redesignation of the Ohio portion.

- EPA trends data for major Metropolitan Statistical Areas in Ohio during the 1990-1999 period shows downward trends in six of seven areas where carbon monoxide is monitored, 10 of 12 areas where PM-10 is monitored, and 10 of 13 areas

where SO<sub>2</sub> is monitored. The progress on SO<sub>2</sub> occurred primarily as a result of the Acid Rain Program. Today, all areas in Ohio meet the national air quality standards for carbon monoxide and coarse particulate matter (PM-10). All areas have air quality that meets the air quality standard for sulfur dioxide with the possible exception of one county near Toledo; the State is currently examining whether levels there now meet the standard.

Regarding your question concerning where we have gotten the greatest returns on legislation, we believe that one of the greatest successes has been the market-based Acid Rain Program which the Congress authorized in 1990. As you know, this program established overall goals, but allowed industry to find the cost-effective ways to comply with those goals. As noted above, the success of this program guided us in the design of the proposed Clear Skies Act.

Regarding your question concerning the remaining challenges, we believe that the challenge of attaining the ozone and particulate matter (PM) standards is undoubtedly the greatest we face today. Along with many others, we believe that region-wide emissions of sulfur dioxide (SO<sub>x</sub>) and nitrogen dioxide (NO<sub>x</sub>) are the major precursors contributing to the high levels of ozone and PM. Based on the success of the Acid Rain program, we believe that any effort to attain the ozone and PM standards should include cost-effective, region-wide reductions of these precursors. As you know, we have submitted to Congress the Administration's Clear Skies legislation which, if enacted, would reduce emissions of these precursor pollutants from the utility industry by some 70 percent through a nationwide cap and trade program. I believe that this is the greatest issue we currently face and that passage of strong multi-pollutant legislation is an important first step. Under the current Act we are focusing on the development of rules to reduce emissions from on-road transportation and also non-road diesels. These rules will bring reductions in emissions over the next few years. Additional reductions beyond those provided by legislative initiatives and national rules will be needed to provide clean air in the future.

Finally, for more than 25 years we have documented air quality progress in the annual National Air Quality Trends and Emissions Report. More recently we also began publishing a summary report on Latest Findings on National Air Quality. We also have a website ([www.epa.gov/AIRTRENDS](http://www.epa.gov/AIRTRENDS)) that presents information on the nation's air quality, where the many "trends" reports and summary report can be found, respectively, at <http://www.epa.gov/airtrends/reports.html>, and <http://www.epa.gov/oar/agtrnd01/sununarv.pdf>.

*Question 5.* The Europeans use a lot more diesel fuel in their cars than we do because they get more mileage out of each gallon. However, this is at the cost of higher emissions. While I understand that Europeans use more diesel fuel due in part to their higher gas tax, in your opinion, why have U.S. car companies not made this transition? How is technology progressing and what is the time line to reduce the emissions associated with the use of diesel fuel?

Response. The higher retail prices of motor vehicle fuels in Europe relative to prices in the United States has influence on car buying habits. Diesel vehicles tend to be more fuel-efficient than gasoline vehicles and so European car buyers, for whom fuel costs are a very large consideration, are more likely to buy them, even though cars powered by diesel engines may be higher priced. In addition, there is a perception among some Americans that diesel cars may be unreliable, due to problems encountered in past attempts to introduce diesels here. These problems have been largely overcome over the years and several manufacturers are now considering plans to market new diesel models in the U.S. Rapid progress is being made in equipping diesels with high-efficiency catalytic exhaust controls that will meet the same stringent Tier 2 emission standards required of gasoline vehicles over the next several years. Key to the introduction of very low-emission diesel vehicles is EPA's requirement, for desulfurized highway diesel fuel in 2006.

---

RESPONSES OF JEFFREY HOLMSTEAD TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* In 1990, Congress' Office of Technology Assessment concluded that transportation control measures are a cost-effective and technologically simple way to lower emissions, which can result in very large improvements. Yet the CMAQ report cites an example in Chicago where several hundred TCMs only produced a 2 tons per day reduction in emissions, and that many TCMs cost above \$50,000 per ton. Is it fair to say that the transportation conformity program was based on a set of assumptions that are disputed by experience?

Response. Under the 1990 Clean Air Act, the current conformity program was established to better integrate the transportation and air quality planning processes.

Prior to 1990, some believed that this lack of integration contributed to some areas failing to meet the air quality standards. In an attempt to correct this situation Congress established a transportation conformity process that would integrate transportation and air quality planning, that would be dynamic and iterative, and that would require areas to consider the impact of their transportation decisions before such projects have been built.

The purpose of conformity as intended under the 1990 Clean Air Act, however, had little to do with ensuring that TCM's are cost-effective. In general, EPA does not have sufficient data to adequately assess the cost effectiveness of transportation control measures. However, we do recognize that some TCMs are estimated to have small regional emissions impact and, based upon these estimates, some projects would have high costs per ton of emissions reduced. Please see our answer to Senator Voinovich question #2 for further discussion on this issue.

Under the current Clean Air Act, areas may choose how to achieve conformity as they deem most appropriate. For example, if emissions reductions are needed to demonstrate conformity, areas may choose to include projects with emissions reduction benefits in the plan/TIP. Alternatively, some areas have resolved conformity issues by revising their SIP to add new control measures and/or adjust upward the motor vehicle emissions budgets to accommodate emissions that exceed the motor vehicle emissions budget initially established in the SIP.

Regardless of the situation, however, EPA does not decide for areas how to resolve their transportation and air quality issues. Under the current Clean Air Act areas have the choice as to how they will approach and resolve conformity difficulties via the interagency consultation process. Therefore, we regard such conformity issues and their respective solutions as evidence that the conformity program is serving its purpose of ensuring that Federal dollars are spent in a manner that is consistent with both mobility and clean air goals.

*Question 2.* I understand that this chart accounts for existing EPA regulations and standards for vehicle emissions. Do these projections account for hybrid and fuel cell vehicles? Do you think these new technologies will play an important role in reducing vehicle emissions, and if so, when?

*Response.* As the auto industry continues its progress toward bringing the costs down for hybrid technologies (electric and hydraulic hybrids) and well as fuel cell and hydrogen technologies, we are optimistic that the future will include increasing numbers of these more fuel efficient and often cleaner vehicle designs. As this future takes shape, we will be evaluating the benefits of the entry of large numbers of these vehicles into the U.S. vehicle fleet.

*Question 3.* The TRB CMAQ report says TCM effectiveness will decline as cars get cleaner. For example, a carpool program in 1970 that reduced 100 miles of driving would abate 1000 grams of VOC. In 1990 a 1000 gram reduction would require drive 1250 miles less, and in 2009 this number would be 14000 miles less driving. What does this say about the future effectiveness of projects and programs aimed at reducing vehicle use?

*Response.* We were unable to substantiate the numerical comparison between 1990 and 2009. As indicated elsewhere in the record (see Senator Voinovich question #2), direct cost-effectiveness of an individual project is not necessarily the most relevant factor in which to evaluate the CMAQ program. These estimates are limited in usefulness because there is no reference point for the temporal effects (the time-frame over which the project produces emission reductions) nor the cost-effectiveness of the control strategies that have already been implemented in an area.

However, we do agree that our new vehicle emission performance standards have been very effective in reducing vehicle emission rates. As a result of the emission regulations EPA has already promulgated, future passenger vehicles and light duty trucks will be approximately 98 percent cleaner than uncontrolled cars and trucks. As a natural consequence of reducing the emissions per vehicle mile traveled, the benefit of reducing vehicle miles traveled by a fixed amount with today's vehicles will be greater than the benefit of reducing the same amount of vehicle miles traveled with vehicles of the future.

While emission rates per vehicle mile traveled will continue to decrease, total emissions from a growing vehicle fleet and increased travel will still contribute to air pollution in metropolitan areas. Absent additional technological advances and assuming the continuation of current growth trends into the future, additional control measures may be needed. Therefore, we expect air quality and transportation planners to continue to consider TCMs, as defined by the Clean Air Act, Section 108(f), for air quality, mobility and quality of life purposes. EPA supports investment in TCMs, especially those that are focused on air quality, but recognize that

decisions on which TCMs, if any, to pursue are best made at the State and local level.

*Question 4.* I'm concerned about the cost-effectiveness of the CMAQ projects. According to the CMAQ report, only 21 percent of the CMAQ money is spent on projects that cost less than \$10,000 per ton, and almost 80 percent is spent on projects that exceed \$10,000 per ton, and many are well above \$100,000 per ton. These more cost-effective projects are producing ten times the emission reductions of the \$100,000 per ton projects. Isn't it more important that we focus CMAQ funds on the selection of the most cost-effective pollution-reducing projects?

Response. EPA doesn't collect information on cost-effectiveness of CMAQ projects, so we cannot confirm these figures. We would rely on DOT for verification of the percentages. Measuring the costeffectiveness of CMAQ projects solely on the basis of emission reductions can sometimes be misleading. Transportation planners tell us that CMAQ project selection often involves consideration of other important societal benefits of the project. For example, traffic signal upgrades and transit projects, which account for the majority of CMAQ funds, may have the added benefit of relieving traffic congestion.

EPA encourages CMAQ projects that focus on air quality, but just as different non attainment areas have various strategies for controlling air pollution, they also have different strategies for using their CMAQ funds. When considering potential changes to the program it is important to consider flexibility for areas wanting to address air quality and transportation needs. Thus, decisions on which projects to fund are best made by local and State planning officials. Nevertheless, the CMAQ report suggested the need for better information and accounting of the air quality impacts of funded projects. To the extent this would allow a more informed decision-making process, EPA would support improvement in the estimation and assessment of the emission impacts of CMAQ projects.

*Question 5.* I am very concerned that some MPO's, through no fault of their own, may suffer a conformity lapse due to the new higher emissions predicted by EPA's new MOBILE6 model. For example, using these new models the Dallas MPO is reporting a 50 percent increase in VOC and NOx emissions, Cincinnati is reporting an 18 percent increase in NOx emissions, and LA is reporting a doubling of NOx emissions from heavy-duty trucks. MPOs are saying that their toolbox is empty, and the CMAQ report seems to support that opinion. Where are we going to get the necessary reductions? What can we do to make sure that needless lapses in highway spending are prevented?

Response. To assist areas with the transition to the new MOBILE model, EPA and U.S. DOT have established the regulatory maximum, 2-year grace period before MOBILE6 is required for new conformity determinations in most cases. During this 2-year grace period areas may continue to use MOBILE5 for conformity determinations based on their current MOBILE5 budgets. This 2-year grace period became effective on January 29, 2002, the date MOBILE6 was officially released; however, MPO's were generally informed of this schedule before January 2002, and therefore, have had more than 2 years to reflect this requirement in their plans.

Areas should use the time provided by the grace period to examine how MOBILE6 will impact their future conformity determinations. When using MOBILE6, some areas may find that emissions estimates are higher than those estimates previously made to establish the motor vehicle emissions budgets using MOBILE5. As a result of these potential emissions increases using MOBILE6, some areas can choose to revise their SIP and thus the motor vehicle emissions budgets with MOBILE6 before the end of the grace period, since doing so may be necessary to ensure that conformity can be demonstrated after the 2-year grace period has expired and MOBILE6 is required. Currently, we are aware of a number of areas that have begun or plan to begin in the near future a MOBILE6 SIP revision including, Washington DC, Baltimore, Dallas, Houston, Chicago, St. Louis, and Philadelphia.

Compared to MOBILE5, MOBILE6 provides a much better tool for estimating emissions from motor vehicles. The outputs from MOBILE6 allow a more accurate assessment of transportation's contribution to air pollution and the actions necessary to assure clean air. Thus, it is the best tool available and should be used in all subsequent conformity updates or SIP revisions after a reasonable grace period. EPA and DOT concur on this and are jointly working to facilitate the use of MOBILE6 in future SIPs and conformity determinations.

As an alternative or in parallel to SIP revisions, areas can adopt additional control measures or modify their current plan/TIP (e.g., modify specific projects) to offset any increases in emissions that are projected with MOBILE6, particularly in the near term. Such measures could include TCM's; however, areas could also explore

I/M enhancements, voluntary programs (e.g., a voluntary diesel retrofit program), or fuels programs to obtain the necessary reductions.

EPA recognizes that in some cases finding adequate control measures may be difficult, as the magnitude and complexity of air quality issues can vary from area to area. Therefore, we have been and will continue to work with individual States/areas on a case-by-case basis to explore potential emissions reductions controls to achieve and maintain clean air.

*Question 6.* MPOs and Air Quality Agencies have been raising serious concerns about the mismatch in the SIP and conformity schedules. For example, the Atlanta MPO stated, “. . . the differences in the timing and scheduling of SIPs, RTPs, TIPs and associated conformity analysis create a very confusing regulatory environment.” In Sacramento, the MPO reports, “the Sacramento region faces a conformity “lockdown” . . . [which] means that we will be unable to make any changes, additions, or deletions to non-exempt projects . . . until a new SIP is approved by EPA.” What steps is EPA taking to clarify its SIP and conformity regulations, and prevent needless conformity lapses from occurring?

Response. From the two examples provided above, there appears to be two separate issues that need to be addressed. First, the statements made by the Atlanta MPO suggest that the current SIP, plan/TIP and conformity schedules have caused some difficulties and unnecessary burdens on conformity implementers. Second, the comments made by the Sacramento MPO appear to refer to conformity issues that have surfaced as a result of the SIP being based on a set of older planning assumptions than a conformity analysis that is based on newer, more up-to-date planning assumptions. Because we have interpreted the statements you have quoted here as referring to two distinct issues, we have provided below a thorough discussion and response for each issue: Conformity Frequency and Latest Planning Assumptions.

*Conformity Frequency: Current Requirements*

Transportation conformity is implemented to achieve its purpose as defined by the Clean Air Act under the following air quality and transportation schedules:

*Clean Air Act Requirements*

Transportation Conformity: According to the Clean Air Act, transportation plans and TIPs in nonattainment and maintenance areas must conform before they are adopted by an MPO. Under DOT’s transportation planning regulation, metropolitan nonattainment and maintenance areas must develop a new transportation plan that covers at least a 20-year timeframe every 3 years. In addition, Title 23 requires these areas to update their TIPs every 2 years. TIPs cover a shorter timeframe (at least 3 years) and consist of a subset of projects from the transportation plan. Since TIPs are required to be updated every 2 years, metropolitan nonattainment and maintenance areas are required to demonstrate conformity at a minimum of every 2 years. An option that has been suggested to eliminate the mismatch between frequency of plan and TIP updates via TEA-21 reauthorization is to streamline the plan and TIP into one planning document. EPA recognizes the advantages of aligning the frequency of TIP updates with transportation plan updates.

The Clean Air Act also requires conformity to be determined at least every 3 years. In nonattainment and maintenance areas, both the metropolitan transportation plan update cycle and the conformity determination cycle start at the time FHWA and FTA make the conformity determination on the plan; thus, both plan and conformity updates occur on the same 3-year cycle.

SIPs: Once a SIP is submitted for a particular Clean Air Act purpose, and approved by EPA, the motor vehicle emissions budgets in the approved SIP remain in effect until the State decides to update the SIP. The SIP’s motor vehicle emissions budgets, in effect, estimate the amount of emissions from the transportation sector that the air could absorb and still allow the area to attain the National Ambient Air Quality Standards. There is no statutory or administrative requirement to update approved SIPs on a regular basis, with few exceptions. For example, rate of progress and attainment SIPs, as well as regular emissions inventory updates that could trigger a SIP revision are required in serious and above ozone areas. See EPA’s response to Senator Jeffords questions #14–18 for more information on SIPs in serious and above ozone areas. The types of SIPs that must be submitted by an area are dictated by the Clean Air Act and vary according to the pollutant and classification of the area.

Although the CAA does not mandate regular SIP updates, some areas have updated or are in the process of updating their SIPs and as a result, may have more recent mobile source emissions budgets available for conformity purposes. In particular, areas that have had conformity difficulties have often addressed such issues by revising their SIPs to incorporate new planning assumptions and data and/or ad-

ditional control measures to allow for growth in transportation (e.g., Baltimore MD, New Jersey, Salt Lake City UT, Albuquerque NM). In addition, under EPA's MOBILE6 policy all States that took MOB1T .5-based preliminary estimates of credit for Tier 2 vehicle emission regulation benefits in their current SIPs are committed to revise their mobile source budgets with MOBILE6 within 1–2 years after MOBILE6's release on January 29, 2002 (e.g., New York City, Philadelphia PA, Baltimore MD, Washington DC, Houston TX, Dallas TX, St. Louis MO). States also typically update their SIPs after a change in attainment status, for example, when an area requests redesignation and develops a maintenance plan with new motor vehicle emissions budgets (e.g., Denver CO, Louisville KY, Pittsburgh PA, Cincinnati OH, Richmond VA, Nashville TN). In these cases, however, once areas develop a maintenance plan such budgets can be in place for up to 10 years because maintenance plans cover a 10-year timeframe.

#### *Transportation Conformity Rule Requirements*

In addition to the statutory requirements, there are specific triggers in the conformity regulation that warrant a new conformity determination within 18-months of certain SIP actions. For instance, EPA's conformity rule requires conformity to be done within 18 months of EPA's adequacy finding for an initial SIP and within 18 months of EPA's approval of a SIP. This 18 month requirement is intended to ensure that when an area has a new SIP that establishes a new budget, the new air quality information is integrated into the conformity process in a timely manner (otherwise, areas could wait up to 3 years before that new, relevant air quality information is incorporated). EPA is currently working on a proposed rulemaking to eliminate some of these 18-month triggers and streamline others to reduce redundancy and unnecessary burden on conformity implementers.

#### *EPA Action to Relieve Burden of Conformity Frequency*

First, EPA is currently working on a proposal to revise the conformity rule to streamline the 18month conformity triggers for certain SIP actions. Specifically, we are considering a proposal that would only require a conformity determination if a new motor vehicle emissions budget becomes available for conformity purposes. In addition, we would propose to limit an 18-month conformity trigger to only those budgets that have not previously been used in a conformity determination. In other words, if an area satisfies the conformity requirement for an initial SIP submission, it would not be subject again to another conformity trigger when EPA approves that same SIP with the same motor vehicle emissions budgets.

Second, another option that has been suggested is to streamline the plan and TIP into one planning document to eliminate the mismatch between frequency of plan and TIP updates. As described above, the timing mismatch between the plan and TIP under the current transportation planning requirements results in areas having to demonstrate conformity at a minimum every 2 years.

EPA believes that implementing these two options would reduce the burden currently experienced by transportation agencies with regard to conformity frequency.

#### *Latest Planning Assumptions: Current Requirements*

The Clean Air Act requires that SIPs use the most recent data and planning assumptions available at the time a SIP is developed. However, the Act does not require SIPs to be subsequently updated for conformity purposes. For transportation conformity, the Act requires that conformity of the plan and TIP be demonstrated at a minimum of every 3 years, and that such conformity determinations also include the most recent available data. This provision recognizes the importance of using the best available (i.e., the most recent or up-to-date) information in making conformity determinations.

Therefore, given the current statutory requirements, some areas have approved SIPs and motor vehicle emissions budgets that are based on data and planning assumptions that may no longer be the "most recent available" and may indicate that the SIP projections underestimate the anticipated emissions contribution from motor vehicles. For example, new VMT information that accounts for unexpected growth, more recent vehicle registration data or new emissions models may result in significant increases in motor vehicle emissions projections. As envisioned by the Clean Air Act, it would be inappropriate to ignore the latest information and emissions estimates when making conformity determinations.

In these situations areas have several options from which to chose to resolve the increase in emissions from the introduction of new data; the area can revise its SIP to incorporate new data and possibly enlarge the motor vehicle emissions budget, alter/modify its plan and TIP, and/or add new control measures either via the SIP or transportation planning processes, as appropriate.

*EPA Action to Alleviate Burden of Latest Planning Assumptions Requirement*

EPA and DOT have concurred that by incorporating new data and information into the transportation and conformity processes, better decisions—both transportation and air quality—can be made. However, EPA is aware of the conformity difficulties that can arise due to the introduction of new information, especially when the new information indicates unanticipated growth in VMT of vehicles with higher rates of pollution (e.g., increases in truck freight traffic). Therefore, we are currently working on a proposal to revise the conformity rule to provide areas with additional time to address and incorporate new data into the planning process and, as a result, reduce some of the difficulties that have been associated with the current requirements.

Specifically, we are considering a proposal that would allow conformity determinations to use the most current planning assumptions that are available at the time the conformity analysis begins (i.e., those assumptions available at the beginning of the conformity process). This rule revision would differ from our current policy that requires the use of planning assumptions that are available at the time that the FHWA and FTA make their conformity determination (i.e., those assumptions available at the end of the conformity process). This proposed rule change would provide certainty to transportation agencies that they will not have to re-start the conformity process if new data becomes available shortly before FHWA and PTA make the conformity determination. This rule change would also give areas adequate time and flexibility to incorporate new data when it becomes available prior to the beginning of the planning process, so that air quality issues can be addressed without undue delays in the implementation of transportation projects.

*Question 7.* One source of confusion and unnecessary paperwork is the number of triggers that can require areas to re-demonstrate conformity. For example, SCAG in Southern California, reports that these various triggers, “together with the mismatch in frequency of RTP and SIP updates . . . results in debilitating procedural inconsistencies.” In San Joaquin, California, the MPO “has prepared four air quality conformity certifications in the past 12 months.” While I can understand the importance of redemonstrating conformity for major new highway projects, how can we reduce the number of triggers and make sure conformity determinations are done on a reasonable and predictable schedule?

Response. As we have discussed above in our response to your question #6, EPA recognizes that the current conformity triggers created by both air quality and transportation requirements may be placing an unnecessary burden on transportation agencies. Therefore, we are currently working on a proposed rulemaking to eliminate and streamline the 18-month conformity SIP triggers; we also support combining the transportation plan and TIP into one document, thus eliminating the twoyear TIP requirement that is currently included in Title 23. EPA believes that these two possible actions could alleviate the concerns of transportation agencies, as well as maintain a meaningful, iterative process that ensures air quality goals are being achieved.

---

RESPONSES OF JEFFREY HOLMSTEAD TO ADDITIONAL QUESTION FROM SENATOR  
BAUCUS

*Question.* I am concerned with the Consent Decrees between EPA and certain engine manufacturers with respect to the requirement that all new diesel engines by these manufacturers sold after October 1 of this year meet the January 1, 2004 NOx emission standard, the so-called “pull ahead” provisions.

EPA chose to punish some, but not all, manufacturers of diesel engines. Today we have a situation under which all of the United States manufacturers must meet the standard this October while certain foreign manufacturers are not going to be required to meet the new standard until the original January 1, 2004 date. I am aware that one foreign engine manufacturer in particular has begun an aggressive marketing campaign to exploit this competitive advantage granted to it by our government through your agency. What can be done to address this troubling condition?

Response. The October 1, 2002, emission limits agreed to between several of the largest engine manufacturers and Environmental Protection Agency (EPA) are a result of an EPA enforcement investigation. In 1998 EPA announced a settlement agreement which resolved charges that the companies—Caterpillar Inc., Cummins Engine Company, Detroit Diesel Corporation, Mack Trucks, Inc., Navistar International Transportation Corporation, Renault, and Volvo Truck Corporation—violated the Clean Air Act by installing devices that defeat emission controls. The im-

pacts of the emission control strategies used by these companies have resulted in enormous increases in pollution which have a serious adverse impact on human health. Between 1988 and 1998 the companies are alleged to have sold an estimated 1.3 million of the affected engines, which range from the type used in tractor trailers to large pick-up trucks. The affected engines emitted more than 1.3 million tons of excess NOx in 1998 alone, which is 6 percent of all NOx emissions from cars, trucks and industrial sources this year. This is equivalent to the NOx emissions from an additional 65 million cars being on the road. If the companies' use of defeat devices had not been detected and eliminated, more than 20 million tons of excess NOx would have been emitted by the year 2005. In addition, as a condition of the consent decrees, the companies have been allowed to continue to sell diesel engines used in the largest on-highway trucks (i.e., class 8 trucks) which do not meet EPA's emission requirements. The consent decrees allow the manufacturers to continue to produce the largest heavy-duty diesel engines without meeting EPA emission requirements until October of 2002. In exchange for the right to produce engines that pollute above the existing standards, the companies agreed to pull-ahead the new emission standards which otherwise were not required until 2004.

EPA did not choose to punish some companies and not others. The companies listed above are those companies which violated the Clean Air Act prohibition of defeat devices, and the list includes both domestic and foreign engine manufacturers.

During the time that these companies used defeat devices, they had an unfair competitive advantage over all other heavy-duty diesel engine manufacturers in the U.S. marketplace, including both domestic and foreign engine companies. In fact, this competitive advantage continued for the largest heavy-duty diesel engines until October 1, 2002, at which time the companies agreed to eliminate the use of defeat devices and comply with the January 1, 2004, emission standards.

The consent decrees were voluntarily entered into by the seven diesel engine manufacturers. The manufacturers had full knowledge that the decrees would extend the competitive advantage they had illegally maintained over their competitors for more than a decade until October 1, 2002, at which time they would be required to comply with the January 1, 2004, emission standards. Nevertheless, the Administration is aware of the concerns raised by the trucking industry about the potential economic impact of the pull-ahead of truck emission standards, particularly on truck purchases. EPA is working with the Department of Transportation and others to determine whether there are ways to minimize the adverse impacts.

---

STATEMENT OF SCOTT JOHNSTONE, SECRETARY, AGENCY OF NATURAL RESOURCES,  
STATE OF VERMONT

*Reauthorization of TEA-3*

Thank you for the opportunity to appear before this committee to offer comments on the re-authorization of the Transportation Equity Act of 2003.

Vermont, the Green Mountain State, is known for its lush green hills, maple syrup, autumn colors and beautiful lakes. Less known is the fact that Vermont does suffer adverse effects from air pollution. While we are the only State in the Northeast which is in attainment for all of the health-based criteria pollutants regulated under the Federal Clean Air Act, the health of Vermont's citizens and our environment are adversely affected by air pollution. Even though we do not violate the 8-hr ozone standard or the newly adopted fine particulate standard, we are perilously close to those standards. Indeed, Vermont has long suffered disproportionately from the impacts of acid rain and regional haze. We are also concerned about public exposure to toxic emissions and about global issues such as the depletion of the ozone layer and climate change. Many of these threats have a direct link to vehicular emissions that can be addressed through TEA-III.

Congestion Mitigation and Air Quality Improvement (CMAQ) funding has been part of the Federal transportation bills since 1991. CMAQ funds are a critical component of Northeast States' efforts to improve air quality; States in our region have benefited from the use of CMAQ funding for air quality improvement projects. Today, I want to give you my perspective from a State that has had limited access to these CMAQ funds due of our status as a NAAQS attainment area.

EPA's recent investigation of the science regarding both ozone and fine particulate pollution, and accepted by the Courts in the American Trucking case, has determined that, even though health based standards could be set for these pollutants, there was no "bright line" minimum that would ensure the protection of public health. In other words, pollution reductions translate to health benefits even in attainment States. In Vermont and New England, much of our air pollution problems can be directly attributed to the grandfathered Midwestern coal plants. At the same

time, the Northeast has localized sources that contribute to these problems and each State has attempted to craft regulations to deal with these localized sources.

Surface Transportation remains the largest in-State source of air pollution in Vermont. On a per capita basis, Vermonters drive more miles in a year than residents in 39 other U.S. States. Besides the criteria pollutants such as ozone that CMAQ has focused in the past, other air pollution problems need to be addressed such as toxics and greenhouse gases. Air Toxics<sup>1</sup> contribute significantly to the formation of ground level ozone and in Vermont represent the area of air quality where we do not meet some of Vermont's own air quality standards. Greenhouse gases<sup>2</sup> contribute significantly to overall air pollution problems and to climate change.

The importance that our State places on the control of dangerous motor vehicle emissions is reflected in the number of control programs that we have put in place over the past decade that go beyond the Federal minimum requirements. For example, Vermont is one of only four States in the U.S. to voluntarily adopt the California low emission vehicle program in-lieu of the Federal motor vehicle standards—including the Zero Emission Vehicle sales mandate. To support this regulatory program, the State created EVermont to promote the development and deployment of advanced electric vehicles. We have also coordinated with other Northeast and Mid-Atlantic States in developing a regional roadside testing program to identify and repair smoking trucks.

CMAQ funds have been of great assistance to Vermont and to other States in the region. Over the life of TEA-21, CMAQ has been funded at approximately 4 percent of the total Federal surface transportation program.<sup>3</sup> Given the air quality impacts of surface transportation and the fact that it is the only transportation program designed to reduce air pollution,<sup>4</sup> CMAQ should not only be reauthorized—it should be expanded to represent a larger percentage of the overall transportation budget. While the CMAQ program was conceived to address both congestion and air quality, greater weight has been—and should continue to be—given to air quality improvement goals.

The transferral of CMAQ funds to non-air quality uses, as is currently allowed, should be examined so that the air quality improvement goal may be met. Further, the CMAQ allotment scheme should be modified to provide weight to factors such as: (1) high per capita VMT; (2) areas that are in attainment but at risk of slipping into non-attainment due to mobile source emissions; and (3) and disproportionately high percentage of emissions from mobile source. To ensure effective prioritization and better quantification of the air quality benefits consideration should be given to requiring that local air quality agencies be more directly involved in the evaluation of proposals for CMAQ funds and in conformity determinations when needed.

Historically, CMAQ has focused primarily on ozone, carbon monoxide and PM<sub>10</sub> non-attainment. Given the breadth of real health risks caused by other motor vehicle-related emissions, a reauthorization bill should require CMAQ to consider fine particulate matter, air toxics and GHG's, in both allocation and eligibility. GHG reduction goals and incentives could also be incorporated into TEA-3 by tracking the Vehicle Miles Traveled (VMT) of all major transportation projects and by providing

<sup>1</sup>Air Toxics: In Vermont, mobile sources account for between 80–90 percent of the primary emissions of Acetaldehyde, Benzene, 1,3-Butadiene, & Formaldehyde. All are Federal Hazardous Air Pollutants (HAPs) and all are known or suspected carcinogens. Non-road vehicles contribute significantly to air toxic emissions in the State with approximately 60 to 70 percent of Acetaldehyde and Formaldehyde emissions which contribute significantly to ground level ozone formation. While Vermont is a so-called attainment State, ambient concentrations of Acetaldehyde, Benzene, 1,3-butadiene, and Formaldehyde currently each exceed their respective Vermont Hazardous Ambient Air Standard (HAAS) in all areas of the State and computer modeling, while predicting decreases in concentrations for these pollutants over the next 28 years, indicate that concentrations will still exceed the Vermont health standards for these pollutants in 2030. Finally, according to the U.S. EPA's National-scale Air Toxics Assessment (NATA) median ambient concentrations of mobile source air toxics in Chittenden County, Vermont's most populous county, consistently rank in the most polluted 25th percentile. For 1,3-butadiene and Benzene, EPA modeling indicates that Chittenden County is in the worst 5 percent and 10 percent polluted areas in the U.S., respectively.

<sup>2</sup>A Greenhouse Gas (GHG) inventory done in 1990 shows that approx. 45 percent of all GHGs emitted in Vermont are from motor vehicles while, according to the U.S. Dept. of Transportation and the U.S. EPA, motor vehicles contributed only 27 percent of the GHGs emitted nationally in 1999. [Note: Regarding GHGs, GHG reduction goals and incentives could be incorporated into TEA-3 by tracking the Vehicle Miles Traveled (VMT) of all major transportation projects, establishing a goal for the ratio of VMT/GHG's and by providing incentives for transportation projects which promote smart growth and reductions of GHG emissions and VMT.

<sup>3</sup>The National Academies, *The Congestion Mitigation and Air Quality Improvement Program: Assessing 10 years of Experience—Special Report 264*, <http://www.nap.edu/catalog/10350.html>, page 1

<sup>4</sup>Id. p. 11

incentives for transportation projects which promote smart growth and reductions of GHG emissions and VMT.

The committee should also consider the inclusion of programs to reduce particulate and toxic pollution from diesel powered vehicles in the CMAQ program. Reducing diesel emissions is of critical importance to protect public health. Diesel particulate has been labeled a carcinogen by the State of California and diesel exhaust has been classified as a probable human carcinogen by many respected organizations.<sup>5</sup> In addition to cancer health effects of fine particles and diesel exhaust, significant non-cancer health effects have been demonstrated in the scientific literature. Diesel school buses, non-road equipment such as construction and agricultural machines, and trucks and transit buses emit particulates and other toxics in close proximity to children, workers, and the public. As these engines last as long as 30 years, progress in cleanup that relies on normal fleet transition will be slow. Thus, consideration should be given to include a mechanism in CMAQ that encourages transit agencies and school districts to replace or retrofit their bus fleets with clean buses.

To succeed in addressing our particulate, greenhouse gas, and toxic emissions challenges and the associated health and environmental risks that are associated with them, will require much work and new approaches to problem solving. Fortunately, many programs are underway throughout the northeast to reduce these emissions. These programs demonstrate the potential of emission reduction projects. However, funding through CMAQ is needed to support these programs. I encourage you to look at the initiatives and recommendations provided by the New England Governors Conference Climate Plan<sup>6</sup> and the Vermont Governor's Committee to Ensure Clean Air<sup>7</sup> as examples of how progress can be made if these projects were all eligible for and received CMAQ funding. Examples from these reports for the transportation sector include:

- Programs designed to manage and reduce transportation demand in communities (e.g., "smart-growth" projects which reduce sprawl and encourage local communities to consider the energy impacts of development and infrastructure construction).
- Promote the shift to higher efficiency vehicles (including hybrids and advanced technology vehicles), lower carbon fuels and advanced technologies through the use of incentives and education.
- Diesel retrofits and conversions to alternative fuels which greatly reduce or eliminate particulate and toxic hydrocarbons.
- Opportunities in freight transportation that would improve the energy efficiency of the movement of goods across the region.

In considering the purpose of CMAQ, I would suggest the committee look also at the broader funding system for transportation projects. Much of our air quality and congestion problems come from the very poor use of land that has come to pass over the past decades, the practice we now call sprawl. I suggest to you that in part it has come about due to our method of funding transportation projects. Communities look at funding sources in designing their land use systems. We ought not be surprised that strip zoning and sprawling development is most often associated with highways eligible for State and Federal funding. What occurs is sprawl and the cure—little to no local cost to "fix" the problem, by increasing lanes or building new highways. I suggest you consider what would occur if we provided incentives instead for grid patterns and public transit. I believe the result would be better land use, less congestion, better air quality and ultimately smarter growth.

The use of CMAQ funds should also be encouraged for programs which simply make sense, regardless of an area's attainment status. One such program is vehicle On-board diagnostic (OBD) system inspection and maintenance. 1996 and newer vehicles are equipped with sophisticated OBD systems which identify malfunctions that increase emissions, alert drivers through a warning light on the instrument panel, and store specific information which is used by repair technicians to accurately diagnose and repair the malfunction. Such a program is cost effective and relatively simple to implement, as it relies on technology already installed on the vehicle, as opposed to requiring expensive investments in emissions testing equipment. Vermont has operated such a program on a statewide basis for over 3 years, with much success and with very little public opposition to the program. Currently, a pilot project is underway, using CMAQ funds to evaluate systems for automating

<sup>7</sup>Committee to Ensure Clean Air, Phase II Report to Vermont General Assembly, January 28, 2002, <http://www.anr.state.vt.us/dec/air/docs/CECAPPhaseII.pdf>.

OBD data collection and management, hopefully leading to an even more effective program in Vermont.

In summary, a State, such as Vermont, which is in attainment, can use some or all of the minimum allotment of CMAQ funds for any project in the State Transportation Plan or for a CMAQ-eligible project. However, attainment of the ozone and CO NAAQS alone provides an incomplete picture of the success of air quality control initiatives. Clearly, mobile source-related emissions of criteria pollutants, air toxics and GHG's all need to be included to address the actual risk from air pollution. While the current CMAQ Guidance published by the Federal Highway Administration encourages attainment States to "give priority to use of CMAQ program funds for projects that will relieve congestion or improve air quality in areas that are at risks of being designated as non-attainment," I suggest that "attainment"/"non-attainment" may not be a particularly relevant criterion to use in deciding how limited CMAQ moneys are to be used. Even in attainment States, transportation-related air quality issues need to be addressed. I believe that overall it would benefit Vermont and other attainment areas, for Congress to establish that, even in attainment States, CMAQ funds must be used in a way that retains the overall focus of air quality improvement.

In closing, in Vermont, as elsewhere, CMAQ has encouraged environmental and transportation agencies to talk, plan and work with each other. It is a program that has helped achieve important progress in the fight against air pollution—but much remains to be done and CMAQ must be updated to reflect our evolving understanding of the real risks society faces from vehicle-related air pollution. Vermont's environmental future, our green hills, our maple syrup industry our autumn colors, our lake quality and the health of our citizens requires our attention.

Thank you for this opportunity to testify.

---

STATEMENT OF COUNTY JUDGE RON HARRIS, COLLIN COUNTY, TEXAS, NORTH CENTRAL TEXAS COUNCIL OF GOVERNMENTS AND METROPOLITAN PLANNING ORGANIZATION FOR THE DALLAS-FORT WORTH REGION

Mr. Chairman and members of the committee, I am Ron Harris, County Judge of Collin County. Our county is located within the five-million-person Dallas-Fort Worth Metropolitan Area. Today, my remarks represent the view of the policy officials from our region, specifically the Metropolitan Planning Organization of the North Central Texas Council of Governments. I am a former Council of Governments President, City Council member, 12 years as County Judge, and serve as chair of the North Texas Clean Air Steering Committee, co-chair Texas Clear Air Working Group and member of the Local Government Advisory Committee to the director of EPA. Our region has benefited from participation in partnerships with EPA's Regional Administrator Cook and Texas Natural Resources Conservation Commission. I am appearing today at your invitation and hope that we will be able to strengthen our partnerships through your leadership in fine tuning environmental and transportation laws to more effectively result in cleaning of the air.

I want to thank you and the members of the committee for holding this series of hearings to review the critical issues surrounding air quality and reauthorization of the Transportation Equity Act for the 21st Century.

Metropolitan areas account for 75 percent of the nation's population and 83 percent of its economic output. They are centers of social and economic activity, and are the hubs of the national transportation system. As these centers grow, congestion frequently follows, and unfortunately, all too often associated air pollution. We think with the implementation of sustainable land use; rail transit; management and operations improvements; freeway improvements; toll road construction; and aggressive air quality policies, programs, and projects, urban regions can exhibit economic vitality, mobility, and air quality attainment.

As you know, our agency prepared a response to questions from the committee. I applaud your format of requesting real world feedback from users around the country. I ask that you refer to that response for specific details to your questions. What I would like to do is address five of the more important policy questions.

1. Congestion Mitigation and Air Quality Improvement Program (CMAQ). The Clean Air Act Amendments of 1990 and the Intermodal Surface Transportation Efficiency Act of 1991 permanently fused transportation and air quality planning and programming. The CMAQ Program is one mechanism to aggressively fund control measures to reduce mobile source Volatile Organic Compound (VOC) and Nitrogen Oxide (NOx) emissions. This funding and these measures are intended to lower exceedances of the 1-hour and soon to be 8-hour ozone standard. We anticipate that the CMAQ funding Program will also be eligible to reduce emissions in the soon-

to-be implemented Particulate Matter (PM) 2.5 standard. The National Academy of Sciences Committee on this topic, of which our Transportation Director was asked to serve, recommends continuation of the CMAQ Program. In addition, the committee proposed a more flexible and more effective program by permitting eligibility for high emitting vehicles and assistance in reducing further emissions from diesel emission sources.

2. Additional Technology, Vehicle Emission Controls, and Transportation Control Measures or TCMs. TCMs are important components to reduce emissions and greatly assist with air quality conformity. They often meet mobility and air quality objectives. Non-traditional TCMs are some of the most innovative and cost-effective programs in reducing vehicular emissions by way of altering emission rates or reducing vehicle miles of travel.

We ask the Congress to continue its past leadership in establishing Federal technology programs that would otherwise be legally difficult to implement at a state-wide or local level. Congress is encouraged to explore ways to reduce the growing off-road mobile source emissions. Another approach to reduce vehicular emissions is to advance already existing Federal gasoline, diesel, and engine standards earlier than required.

3. Plan Submittal Frequencies. Coordination between the State Implementation Plan (SIP), the Transportation Plan, Transportation Improvement Program (TIP), and associated air quality conformity analysis proves to be difficult due to varied schedule requirements. Currently, the SIP submittal process is infrequent, but influenced by real-time, observed air quality data. The Transportation Plan has a 3-year update cycle, and the TIP has at least a 2-year update cycle. It would be much more efficient to have consistent submittal frequencies and to streamline the implementation of specific policies, programs, and projects with less emphasis on repeating the planning process for already approved plans. In addition, it would lessen the confusion to our citizens, local governments, transportation authorities, regional partners, and resource agencies as they try to coordinate their planning activities with these Federal requirements.

4. Conformity. The air quality conformity process is a good mechanism to demonstrate that sound transportation planning is occurring. There are three predominate concerns. First, SIP and emission budgets have a relatively short-term horizon, while conformity of the Transportation Plan may be 25 years in the future with little unknown out-year emission technology benefits. Second, The Environmental Protection Agency (EPA) can establish new emission rate software at irregular intervals. This creates a conflict on how to include new information or the often suggested inconsistency of comparing transportation air quality impacts between two very different EPA software versions. Third, conformity is often used as a litigation mechanism instead of the transportation assessment Congress established.

5. Planning Horizons. Existing planning horizons for the SIP and the Transportation Plan is an issue that Congress should consider making more consistent. The Transportation Plan is required to maintain a staged 20-year horizon and the SIP to contain a near-term attainment date.

Again, more detailed information is contained in our eight page response to your questions. Thank you for your invitation to be here today.

---

STATEMENT OF LYNN M. TERRY, DEPUTY EXECUTIVE OFFICER, AIR RESOURCES BOARD, CALIFORNIA ENVIRONMENTAL PROTECTION AGENCY

Thank you for the opportunity to comment on California's experience integrating air quality and transportation planning as required by the Clean Air Act. Over the years, we have been able to meet the Act's transportation conformity requirements through the cooperative efforts of agencies at the local, State, and Federal level. At the same time, we are encountering some process challenges that need to be addressed. We are looking at this issue in the context of California's longstanding and successful air pollution control program—a program that will now address global warming as a result of the passage of State legislation recently signed by Governor Davis.

The concept of transportation conformity is a simple one—the air pollutant emissions from the transportation sector must be consistent with air quality plans for a region. This is critical to ensure that we meet health-based air quality standards in the required timeframe. The process itself requires looking at today's emissions and well as those in the future. This is necessary to ensure that we continue to make clean air progress as our population and economy grows.

Over the last 20 years, reducing air pollution from the transportation sector has been essential to California's dramatic progress in improving air quality in the Los

Angeles area—historically the nation’s smoggiest region. For transportation, that progress is largely due to cleaner vehicle technology. A new car in 2010 will emit only one tenth the ozone forming pollution of a 1990 model. As a result, transportation control measures that reduce travel have shown less benefit than anticipated.

Also, there is little flexibility for transportation agencies in terms of implementing transportation control measures once they are in the air quality plan. This discourages innovation because new, more effective measures cannot replace a measure that proves to be infeasible. In terms of complying with the conformity requirements, we believe the focus should be on the emission reduction goal rather than the implementation of a specific transportation control measure.

In addition to transportation control measures, there is another important mechanism to address air pollution from the transportation sector—the Federal Congestion Mitigation and Air Quality program. We strongly support these funds as a means for transportation agencies to provide significant emission reductions in a cost-effective way. There are many cleaner technologies that can be funded to reduce both ozone and particulate pollution from the transportation sector.

The most difficult problem with the current conformity process is the inability to take new information into account in a workable way. Air quality plans or “SIPs” must define the emission target needed to achieve clean air as defined by national air quality standards. That emission target is based on the State of the science at the time the air quality plan is done. Once approved by the U.S. Environmental Protection Agency, the SIP is the federally enforceable benchmark for transportation conformity purposes. There is no requirement to update a SIP prior to the deadline for meeting the air quality standard.

On the other hand, transportation plans must be updated routinely. And, as a practical matter, changes in individual transportation projects are proposed often monthly in major urban areas. These changes typically trigger a process that requires new information to be used in the conformity analysis. When the SIPs have not been updated with the same information, the inherent inconsistency may derail the process.

In California, we face this issue virtually statewide. As a result, we will be revising 23 SIPs over the next year or so. And while this will put us back on a consistent process track in the near-term, it is a major undertaking that will not in itself provide air quality benefits. What we want to avoid in the future is the triggering of a comprehensive SIP update each time new information becomes available. Under today’s rules, this is the only way to avoid conformity problems as the science improves.

We believe it is more appropriate to comprehensively revise air quality plans when the underlying facts have changed so substantially that the approach to meeting the air quality standard must be revised. Otherwise, we need the option of a streamlined mechanism to respond to new information. For example, a streamlined mechanism could be appropriate when a region is close to meeting the standard, emissions are declining, and the strategies in the air quality plans are all being implemented. In this type of transitional situation, a reconciliation of “old” and “new” vehicle emission estimates would make more sense than a comprehensive plan revision.

For regions that have a long way to go to meet the air quality standards, more frequent plan updates will be needed. For example, we recognize that the air quality plan for the Los Angeles region needs a comprehensive update. A number of new studies are available, including improved data related to motor vehicle emissions and travel. From a process standpoint, what these situations demand is the ability to link the timing of transportation plans and conformity with the completion of new air quality plans.

In conclusion, California is pursuing statewide SIP revisions as a means to provide the necessary consistency between air quality and transportation plans. But we want to use our resources more effectively to protect both our Federal transportation dollars and the integrity of our clean air plans. We believe that with some focused process changes we can accomplish both.

Thank you again for the opportunity to be here. I would be pleased to answer any questions you may have.

---

STATEMENT OF JAMES E. STEPHENSON, PRESIDENT, YANCEY BROTHERS COMPANY, ATLANTA, GEORGIA, ON BEHALF OF THE AMERICAN ROAD & TRANSPORTATION BUILDERS ASSOCIATION

Mr. Chairman, Senator Smith, members of the committee, thank you very much for providing the American Road and Transportation Builders Association (ARTBA)

an opportunity to present its views on the transportation conformity process, the Congestion Mitigation and Air Quality (CMAQ) improvement program and new technologies before this committee today. I would like to say at the outset that ARTBA shares your interest in assuring that all Americans breathe clean air. We are not here today to suggest a radical overhaul of the conformity process. We would, however, like to suggest some badly needed “fine-tuning” of Federal law that will not only improve public health from a clean air perspective, but also improve the efficiency of making environmentally sound and needed transportation investments.

I would also, at the start, like to thank each member of this committee for everything you have done this year to prevent a severe year-on-year cut in Federal highway investment for Fiscal Year 2003 that potentially could occur through strict enforcement of the Revenue-Aligned Budget Authority (RABA) provision of the Transportation Equity Act for the 21st Century (TEA-21). We truly appreciate the leadership that each member of this committee has shown on this issue.

I am Jim Stephenson, president of Yancey Brothers Company in Atlanta, Georgia. We are the Caterpillar dealer for the northern half of the State of Georgia. As you know, Atlanta has had its share of problems with the conformity process over the past several years. I have personally taken a very active role in trying to solve these problems. I serve on the Board of Directors of the Georgia Regional Transportation Authority (GRTA), which was established by the Governor of Georgia in 1999 to tackle Georgia’s conformity problems. I am also a member of the ARTBA Board of Directors.

ARTBA celebrates its 100th anniversary this year. Based in Washington, DC, ARTBA was organized in 1902 by a visionary Michigan public official, Horatio S. Earle, for the purpose of advocating Federal legislation to create a “National Capital Connecting Highway System.” That vision was realized with the enactment of the Interstate Highway construction program and Highway Trust Fund in 1956. ARTBA has more than 5,000 members and provides a consensus voice representing all sectors of the transportation construction industry—public and private—before Congress, the White House and the Federal agencies. The industry ARTBA represents generates \$200 billion annually to the nation’s Gross Domestic Product and generates more than 2.5 million jobs for American workers.

#### *General Background on the Clean Air Act*

Under the Federal Clean Air Act, the U.S. Environmental Protection Agency (EPA) regulates six criteria pollutants: ozone, carbon monoxide, nitrogen dioxide, sulfur dioxide, particulate matter (also known as soot and dust) and lead. For each pollutant, EPA has established minimal targets that must be met known as the National Ambient Air Quality Standards (NAAQS).

If an area exceeds EPA’s standards for any one of these “criteria” pollutants, it is designated a nonattainment area, triggering a series of steps that must be taken to come into compliance with the standards. In addition, for ozone, carbon monoxide and some particulate matter nonattainment areas, the EPA further classifies the area based on the magnitude of the nonattainment. These classifications are used to specify what pollution reduction measures must be adopted for the area and what deadlines must be met to bring the area into attainment.

Currently, the most pervasive problem for transportation planning purposes is ozone, followed by carbon monoxide and particulate matter. For ozone, the EPA utilizes the following classifications of attainment depending on the magnitude of the problem: Extreme, Severe, Serious, Moderate and Marginal. These classifications dictate when an area must achieve attainment status for ozone<sup>1</sup> and what measures must be taken to achieve attainment.

Ozone is formed through a complex chemical reaction between volatile organic compounds (VOCs) and oxides of nitrogen (NOx) in the presence of sunlight. To reduce ozone, one must reduce one or both of the precursor pollutants. VOCs are best described as fumes emitted from sources such as automobiles, chemical manufacturing plants, dry cleaners, paint shops and others that uses solvents. NOx is formed when combustion occurs at high temperatures. It is primarily emitted from electric utilities, industrial boilers and transportation sources. Since sunlight and warmer temperatures cause these reactions, ozone violations typically occur during the late afternoon hours on hot summer days.

<sup>1</sup>Marginal ozone nonattainment areas had to meet compliance in 1993, Moderate in 1996, Serious in 1999, Severe in 2005–2007, and Extreme in 2010.

*Transportation Sector Successes in Achieving Cleaner Air*

Mr. Chairman, there's no doubt that we have made great progress over the past 30 years in improving the nation's air quality. Much of this progress has been achieved through technology advancements spurred by motor vehicle emissions standards and controls and cleaner fuels. Between 1970 and 1999, carbon monoxide emissions from on-road vehicles were reduced by 43 percent. Volatile organic compounds—a precursor to ozone—were reduced 59 percent. Particulate matter (PM<sub>10</sub>) emissions have been reduced 33 percent.

In fact, Mr. Chairman, the only pollutant that has increased since 1970 has been Nitrous Oxides (NOx)—the other precursor of ozone—which is up 16 percent. However, despite the increase in overall NOx emissions, the amount of NOx being emitted from automobiles is down 31 percent since 1970.

EPA's monitoring data are also encouraging. Exceedances of EPA's ozone standards are down 80 percent since 1990. Exceedances of the carbon monoxide standard are down 97 percent and exceedances of the PM standards are down 81 percent since 1990. These numbers are even more remarkable given that since 1970, the U.S. population has grown over 30 percent, the number of licensed vehicles has increased about 90 percent and the number of vehicle miles traveled has increased 143 percent.

Progress has also been made with the other pollutants. For instance, on-road sulfur dioxide emissions have been reduced nearly 60 percent since 1970, although transportation is not considered a significant source of sulfur (97 percent is not transportation related). In addition, lead has been virtually eliminated from our air with the introduction of unleaded gasoline.

Mr. Chairman, while great progress has been made all around in improving the nation's air quality, I want to emphasize that most of that progress has come from the transportation sector. For example, carbon monoxide emissions from on-road vehicles have been reduced 45 percent since 1970. The reduction from non-transportation sources, over the same period, however, is just over 10 percent. We hope the committee will keep this in mind as it moves forward with reforms in the future.

I would also like to point out to the committee that reforms being discussed in the stationary source arena could have unintended consequences for transportation. As you know, for each criteria pollutant for which an area fails to meet EPA's standards, the Clean Air Act requires the State to prepare a State Implementation Plan (SIP) to show how it will "attain" the air quality standard over a designated period of time. A SIP typically contains restrictions on stationary sources (e.g., factories), area sources (e.g., landfills) and mobile sources (e.g., off road equipment, yard equipment, and motor vehicles). From a transportation planning perspective, this exercise is a "zero-sum" game. If emissions from area sources and stationary sources are given more leeway in the SIP, fewer emissions can come from transportation sources. "Emissions reductions inequity" can put severe constraints on the construction of future transportation improvement projects, since a region's transportation plan must "conform" to the emissions budget for motor vehicles in the SIP.

Please do not forget about the transportation sector when looking at approaches like emissions credits trading program for power plants, since it is primarily the transportation sector that is penalized when an area is not meeting air quality standards. If a power plant is allowed to emit greater emissions in the Atlanta area because of credits they bought from a cleaner plant in Illinois, that does nothing to help Atlanta solve its transportation conformity problems. It only puts greater pressure on the transportation emissions budget. While we applaud the committee's desire to think "outside-the-box" and use incentive-type systems, please do not forget that transportation planning is very regional and can often conflict with the commercial interests of large stationary polluters.

*Congestion Mitigation and Air Quality Program*

Mr. Chairman, as I already stated, huge gains have been made in emissions reductions from automobiles. And in the future, advanced engine and fuel technologies such as alternative fueled vehicles, hybrids and fuel cells and the tighter Tier II standards—which the transportation construction industry actively support—will continue to have major, positive impacts on air quality without reducing the mobility of the American public. As in the past, air quality gains from the transportation sector will likely rely on technology advances, not transportation control measures.

When the Clean Air Act Amendments of 1990 were enacted, they were based on a false premise or assumption—that increases in vehicle miles traveled (VMT) would overwhelm the emissions-reduction capacity of technological advances. Quite the opposite has happened. Despite an increase in VMT of 39 percent since 1990, vehicles have become much cleaner. They will be "squeaky" clean by 2020. With new standards for truck engines and diesel fuels in place, there will likely be many more

gains from the transportation sector in improving the nation's air quality in the coming years.

These facts should lead Congress to seriously examine and question many of the transportation-related programs that were developed in conjunction with the Clean Air Act Amendments of 1990. These programs all operate under the assumption that the only way to get meaningful reductions in emissions is by reducing VMT, largely by shifting people to non-auto modes of transportation. The conformity process is based on this false assumption, as is the Congestion Mitigation and Air Quality (CMAQ) improvement program, which was first implemented under the Intermodal Surface Transportation Efficiency Act (ISTEA) and then extended under TEA-21.

CMAQ was authorized to spend \$14.1 billion over the life of ISTEA and TEA-21 on programs in ozone and carbon monoxide nonattainment areas that primarily constitute transportation control measures, such as HOV lanes, mass transit, carpool/vanpool programs, etc. However, some programs that could prove most effective in actually reducing pollution, have always been excluded from receiving CMAQ funds, such as vehicle scrappage programs. According to EPA, less than 10 percent of the nation's motor vehicle fleet emits over 40 percent of mobile generated hydrocarbon pollution and the "dirtiest" 1 percent of vehicles emit over 25 percent. With the money that has been spent on CMAQ during its life, almost all of these dirtiest cars could have been replaced with new cars, resulting in real quantifiable reductions in air pollution.

A recent report by the Transportation Research Board (TRB), "Assessing 10 Years of Experience" of the CMAQ program recently concluded that most CMAQ-funded programs have not yielded significant emissions reductions and will provide even less in the future because the auto fleet has become so "clean" when it comes to emissions. TRB could not find any quantifiable benefits from how the CMAQ funds are being spent.

Despite this conclusion, however, the committee that authored the report recommended that the CMAQ program be continued. The committee further said that "existing restrictions on projects involving construction of new highway capacity should be maintained."

Mr. Chairman, I would suggest that if, indeed, the goal of the CMAQ program is to (1) reduce congestion, and (2) promote better air quality, that one of the best ways to achieve both goals at the same time is by reducing bottlenecks on the nation's roads. It is estimated by the Texas Transportation Institute that congestion in the nation's largest metropolitan areas costs Americans \$78 billion per year. That means less time with your family and more fuel wasted. Also, cars perform at their worst from a pollution standpoint in stop and go traffic. Depending on the pollutant, car engines run most efficiently around 45-50 miles per hour.

The CMAQ committee also recommended that the program be expanded to cover all pollutants and air toxics, not simply limiting CMAQ funds to those areas out of attainment for carbon monoxide and ozone. Mr. Chairman, as I already discussed, the main source of many of these other pollutants, such as sulfur dioxide, come not from transportation, but elsewhere. To apply CMAQ funds to these additional areas would only dilute the program even more and turn a not very effective program into a very ineffective program.

We think some accountability needs to be built into the CMAQ program so that money is only being spent on activities that produce real, quantifiable emissions-reduction results.

Mr. Chairman, many have also called for substantially increasing the funding for CMAQ during the reauthorization of TEA-21. Such a goal could be accomplished by substantially increasing funding for the entire highway program.

#### *Problems with the Conformity Process*

Mr. Chairman, that leads me to my comments about the conformity process itself. There are two things I hope you take from this hearing today, (1) that government agencies and planning bodies need more flexibility on conformity and (2) the public—especially those who contract with government agencies to build transportation improvement projects—need more predictability in the transportation conformity process.

One of the major problems with the conformity process is that people have tried to turn it into an exact science, when it is anything but. All you have to do is to look back at the predictions made during the enactment of the Clean Air Act Amendments of 1990 to understand that "modeling of future events" often does not reflect reality.

An example of this is EPA's transition from the current Mobile V model to the Mobile VI model for predicting future on-road emissions. In applying the new Mobile

VI model to current data, regions will experience a substantial short-term increase in predicted emissions as compared to the Mobile V model. While over the long term, the Mobile VI model shows decreasing emissions, this could cause substantial problems for many areas and threaten a potential conformity lapse in the short term. Even though the data being entered into the models is the same, each shows very different outputs.

This problem is amplified by the fact that quite often transportation plans and the SIPs they are supposed to conform with are often out of sync with one another. This is largely due to the fact that transportation plans have very long planning horizons and have to be updated frequently, while most air quality plans have very short planning horizons and are updated infrequently. As a result, many of the planning assumptions that must be used for conformity determinations of transportation plans are not consistent with the assumptions that were used in the air quality planning process to establish emissions budgets and to determine appropriate control measures. In other words, because the most recent planning data must always be used, an increase in emissions and possible conformity lapse can occur simply because the numbers or models relied on in the transportation plan are not the same numbers relied upon in the air quality plan.

Part of this is due to the fact that the priority of various transportation projects often changes and every time this occurs, the plan needs to be updated. While many have suggested that the planning horizons should be brought more in sync with one another, another option would be to simply allow greater flexibility in the process, recognizing the inexact science involved. Rather than requiring plans to conform to the "nth-degree," perhaps a 10 percent "cushion" should be allowed so that transportation planners would not have to amend their plans every time they want to add or subtract even a relatively insignificant project. In addition, such a cushion would permit some differences in planning data or models and would allow a margin of error for modeling assumptions planning organizations make but have no real way of predicting with precision—such as economic growth or the current price of gasoline—even though such things have a substantial impact on future travel or the use of larger vehicles like SUVs.

Very few conformity lapses occur because a region has a major clean air problem. They occur because one of the parties involved cannot meet a particular deadline. As a result, the conformity process has become a top-heavy bureaucratic exercise that puts more emphasis on "crossing the t's and dotting the i's" rather than engaging the public in true transportation planning that is good for the environment and the mobility of a region's population.

#### *Litigation*

Mr. Chairman, flexibility in the conformity process has also been constrained by litigation initiated over the past several years by parties opposed to individual transportation projects and/or the concept of increasing highway capacity. In 1997, in *Sierra Club v. EPA*, the court said EPA could not continue the practice of allowing areas that are new non-attainment areas to have a 1-year grace period before they need to perform a conformity test. This could have had a devastating impact on communities when EPA implements its new ozone and PM<sub>2.5</sub> standards, now slated for 2004. However, seeing the unfairness of this, Congress acted and reinstated this grace period through the legislative process.

In yet another court case in 1999, in *Environmental Defense Fund v. EPA*, the court struck down EPA's practice of "grandfathering" projects when a conformity lapse occurs. Up to this point, when an area went into a conformity lapse, projects could proceed if they had already met all of the necessary environmental requirements and were part of a conforming transportation plan at the time of the lapse. In defending its own rule before the court, EPA stated:

- "EPA's rule reflects its rational judgment that Congress intended a more reasoned approach to transportation planning during periods in which there is no applicable SIP, that Congress intended that there be an attempt to balance the general pollution-reduction requirements of the Act with the needs of State and local planning organizations for certainty and finality in their transportation planning process. 42 U.S.C. 7506(c)(2). [EDF v. EPA, Case No. 97-1637, Respondent's Brief, June 10, 1998, p. 30.]

- "EPA explained that it has always believed that there should only be one point in the transportation planning process at which a project-level conformity determination is necessary. This maintains stability and efficiency in the transportation planning process." [EDF v. EPA, Case No. 97-1637, Respondent's Brief, June 10, 1998, p. 36.]

This decision had a devastating impact in my own hometown of Atlanta. At the time of the decision, Atlanta was in a conformity lapse. As a result of the decision,

54 of 71 major priority projects that had been vetted through years of planning were put on hold, even though they had already passed all of the necessary environmental tests.

During the last Congress, Senator Bond introduced legislation that would have restored the practice of grandfathering. While his legislation passed this committee, it never made it to the Senate floor. We would strongly urge this committee to take this issue up once again.

Two other long-standing practices have also been struck down by the courts, which has reduced flexibility in the conformity process and deserve this committee's attention:

- EPA is often not able to approve a State's motor vehicle emissions budget in time for a conformity determination to be made. Prior to the *EDF v. EPA* case mentioned above, these budgets were assumed to be automatically approved if EPA did not act within a certain period of time. That decision, however, struck down this long-standing practice.

- Many States have not been able to meet their ozone compliance deadlines since much of their clean air problem is the result of ozone drifting in from other areas, known as ozone transport. In the past, EPA has granted extensions to the deadline in some of these areas. However, in *Sierra Club v. EPA* (D.C. Cir. 2002), the court ruled that EPA does not have the authority to grant these extensions and must, instead, "bump" these areas into the next higher classification of nonattainment, which would trigger several additional mandatory control measures.

Without the flexibility option of "grandfathering" projects, we have seen a significant increase in conformity-related litigation. Those opposed to an individual project-or the mix of projects or modal funding in a transportation plan-have been given tremendous leverage by the *EDF v. EPA* decision. They can now use conformity-related litigation as a sure way to temporarily, if not permanently, stop previously approved, environmentally sound projects and plans. Threatened with such litigation-or actually sued over conformity process-related issues-State and local planning agencies are put under enormous pressure to either give into the demands of the dissenting minority, or face endless rounds of litigation.

In response to this reality, ARTBA joined with several other industry groups in 1999 to form Advocates for Safe and Efficient Transportation (ASET), a litigation group aimed at assisting governmental entities in defending the transportation planning and delivery process. While many of the professional environmental groups talk a lot about wanting a more "inclusive" transportation planning process, the fact of the matter is really quite different. Since ASET was formed, it has spent hundreds of thousands of dollars, not in arguing the merits of many of these cases, but in battling with environmental groups over simply trying to get a seat at the table. I could provide you a pile of court briefs where groups like the Sierra Club argue adamantly that the construction labor organizations and industry should not have a say in the final decision about transportation plans. The truth is the Sierra Club and many of their colleague organizations do not want an inclusive planning process. They want a process where they and they alone make the decisions.

When the planning process is allowed to be hijacked by any one individual group, bad decisions are made. The truth is that America needs a dynamic transportation network to meet the needs of a growing population and economy. Such a network should include improving public transit, increased utilization of synchronized traffic signalization and other "smart road" technologies, improving local management of traffic incidents to clear roadways quickly and adding road capacity where appropriate and desired by a majority of local citizens. This is key to reducing traffic congestion and the unnecessary auto, truck and bus emissions it causes. It is also essential to maintaining time sensitive ambulance, police and fire emergency response service.

Mr. Chairman, I believe very strongly in the transportation planning process—a process that involves public involvement by all stakeholders and final decisions that are made by public officials. However, we have come to a point where the planning process is breaking down under a mound of litigation. In Atlanta alone, there have been no fewer than seven lawsuits over the past three-and-a-half years challenging the conformity process in some way. I would urge this committee to reform the conformity process so we can get away from all of this litigation and return the planning process to the people through our elected public officials, not a few special interest groups.

#### *Delay Kills and Costs*

Unfortunately, Mr. Chairman, the main purpose of many of these obstructionist lawsuits brought by the environmental groups is to delay badly needed transportation improvement projects. One witness from the environmental community put

it best before this very committee during testimony in 1999. He said, "In the struggle between proponents and opponents of a . . . [highway] project, the best an opponent can hope for is to delay things until the proponents change their minds or tire of the fight." According to an ARTBA study last year of State departments of transportation, an estimated \$1.3 billion worth of highway projects were canceled or delayed in 2000 due to transportation conformity problems.

Sadly though, such delay can have tragic consequences. According to the U.S. Department of Transportation (DOT), almost 42,000 people are killed each year on our nation's highways. One third more people in the U.S. die of traffic crashes each year than from bronchitis and asthma combined. One person in the U.S. dies from a traffic crash every 13 minutes and there is one crash-related injury every 10 seconds. Traffic crashes are the leading cause of death in the U.S. for people ages 6–33, and their economic cost is estimated to be \$230.6 billion each year in added medical costs, insurance costs, etc. That's about 2.3 percent of the U.S. gross domestic product. To put this figure in perspective, the total annual public and private health care expenditures caused by tobacco use have been estimated at \$93 billion annually!

Indeed, Mr. Chairman, roadway safety is a huge public health crisis! The sad part is that, according to U.S. DOT, approximately 15,000 of these deaths annually—are in crashes in which substandard roadway conditions, obsolete designs or roadside hazards are a factor. According to a Federal Highway Administration (FHWA) study, for every \$100 million we spend on highway safety improvements, we can save over 145 lives over a 10-year period.

Delays, however, also have other costs associated with them. Besides the costs associated with increased congestion, when an area is out of conformity, it can be sanctioned with the loss of Federal highway and transit moneys. This happened in Atlanta for about a year-and-a-half. It's true that when sanctions are put in place that the money isn't completely cutoff. Instead, States are forced to choose between redirecting the money to other transportation improvement projects in the State or forfeiting it back to Washington, DC, at the end of the year to be sent to another State. In our case, however, this led to some very fast and rash decisions, since we either had to spend the money or lose it.

As you know, transportation improvement projects simply cannot be created overnight. As a result, the money was spent on a lot of simple projects that were definitely not a priority in the State prior to the sanctions kicking in. In addition, since design and right-of-way acquisition were cutoff on several priority projects at the time, it has taken a long time to get these projects back up-and-running, since the money that would have been spent on them was spent on lower priority projects. Sanctions were lifted in Georgia about 2 years ago, but over half of the projects that were put on hold at the time are still lingering.

Because of the inefficiencies involved in highway sanctions, I would urge Congress to rethink how this entire process works. Rather than penalizing areas that fail to meet air quality standards, perhaps Congress should consider rewarding those communities that make the greatest progress in cleaning their air. Using sanctions that cutoff badly needed transportation improvement funds only exacerbates the problem resulting in increased congestion and worsened air quality. However, incentive-based systems have been very successful in other arenas and perhaps this would also work in transportation planning.

#### *The Future of Conformity—Implementation of the New Ozone and PM<sub>2.5</sub> Standards*

Mr. Chairman, the most troubling part about all of this is that we are headed for a potential train wreck in a few years when EPA implements its new tighter standards for ozone and fine particulate matter. According to preliminary numbers obtained from the U.S. DOT, the number of counties that will be out of attainments for the ozone standard alone will rise from 414 counties presently to 656. Many more will be out of attainment for particulate matter.

As you know, these new standards were first proposed in 1997 and have been held up by the courts until just recently. EPA currently plans to designate the new non-attainment areas in 2004 and State implementation plans (SIPs) will be due in 2007–2008 for these new areas.

According to U.S. DOT, the new standards will result in much larger nonattainment areas that will be more complex, covering a lot of multi-State areas and rural areas. Rural areas, especially, will have a difficult time meeting the conformity requirements since they lack the resources and expertise to properly deal with all of the requirements under conformity. Many of these areas will not be able to develop air-tight plans right off the bat, thus, opening the door to lawsuits. These areas must be given adequate time (at least 2 years) and resources to develop the detailed data bases that are needed to demonstrate conformity.

Congress should also examine closely how the new standards will be implemented. As I said, EPA plans to designate the new nonattainment areas in 2004. As a result of the 1-year grace period passed by Congress a couple of years ago, conformity determinations will have to be made in these areas starting in 2005. However, it is highly unlikely that States will have emissions budgets in place at that time since the SIPs will not be due until 2007–2008. Without an emissions budget to conform to, how will these determinations be made? In the past, EPA has used what it calls a “build—no build” test. However, under this test it is very hard to demonstrate that various transportation projects fall into conformity. The test is also an easy target for those who would rather litigate.

#### *Conclusion*

Mr. Chairman, Senator Smith, and other members of the committee, I truly appreciate your willingness to hear from me today on behalf of ARTBA. If I could just summarize my comments:

- 1) We are making huge progress on cleaning up the air, but almost all of this progress can be attributed to technology gains, not transportation control measures;
- 2) In changing how stationary sources of pollution are regulated, please keep in mind the unintended consequences it can have on transportation planning;
- 3) In reauthorizing TEA–21, results-based accountability should be built into the CMAQ improvement program;
- 4) Greater flexibility and predictability is needed in the transportation planning and conformity process;
- 5) We need to do something to put a stop to the endless litigation that is tying our planning process into knots;
- 6) Congress should consider rewarding those communities that make the greatest progress in cleaning their air rather than simply relying on sanctions to enforce the Clean Air Act, and;
- 7) Delaying transportation improvement projects results in deaths and other costs to society.

I have attached a list of proposed legislative reforms as Appendix A to my written testimony. Thank you for listening and I look forward to any questions the committee might have.

#### APPENDIX A—POSSIBLE LEGISLATIVE SOLUTIONS

1. Recognize the imprecision of data inputs. Modeling is an inexact science at best. Requiring conformity to be demonstrated to the *n*th decimal point makes little sense from a public policy standpoint. As a result, conformity should be allowed to be demonstrated if the emissions from the transportation plan are at least within 10 percent of the emissions budget and SIPs should contain an adequate “margin of safety” to avoid conformity lapses due to marginal changes in expectations. For example, MPOs have no control over economic growth or the price of gasoline, yet these are the primary factors in determining increased travel or the use of larger vehicles like SUVs.

2. Transportation emissions are treated much differently in a SIP than emissions from other sources, such as area or stationary sources. While transportation emissions are essentially treated as a sectoral “cap,” other sectors only have to meet source-by-source regulations. Transportation emissions regulations should be re-focused to SIP elements that can actually make a difference in achieving emission reductions, such as inspection/maintenance programs, different fuels, etc.

3. Clean up ambiguities in the statute and the regulations. Over the years, there have remained several “holes” in the conformity process and many more have been produced through adverse court decisions and legislative action, making it difficult for planning bodies to ascertain clear guidance. This often leads to confusion and, ultimately, litigation. These ambiguities need to be cleaned up to restore predictability and stability to the transportation planning process.

4. Restore grandfathering or create other safe harbors for projects. Conformity must be forward-looking. Retroactive invalidation of projects after funding approval is disruptive and equally bad for smart growth and mobility. A conformity lapse stops all projects, transit and highway alike, and puts construction crews out of work without notice. EPA previously permitted limited grandfathering until a 1999 court ruling invalidated it. Once a transportation project is in a conforming plan, it should be permanently grandfathered until built or removed from the plan.

5. A new conformity determination should not be required if one or several projects are added to the transportation plan, as long as the net emissions from their inclusion will not add more than 3 percent to projected transportation emissions in the plan. In reality, added emissions from a single highway project are minuscule and this will avoid what is largely a paperwork exercise.

6. Provide Motor Vehicle Emissions Budget (MVEB) adequacy and regulatory flexibility. A 1999 court ruling struck down an EPA rule that conferred automatic MVEB approval if EPA did not act promptly and called into question EPA's overall process for approving MVEBs in submitted-but-not-yet-approved SIPs. Conformity obligations often arise with short notice due to changes in attainment status or failure of EPA to timely approve MVEBs or SIPs. Without an approved MVEB, conformity determinations cannot be found and transportation projects cannot be approved.

7. Prohibit MVEB judicial review. Under existing regulations, EPA can declare a MVEB adequate for transportation planning purposes prior to approval of the entire SIP. This approval process is not as comprehensive as full SIP approval and EPA reserves the right to withdraw its approval at anytime (therefore, it is not a final agency action). Environmental groups have filed lawsuits alleging that preliminary MVEB approval must be as rigorous as final SIP approval and EPA has not contested jurisdiction in these lawsuits. (Example: 1000 Friends of Maryland suit against EPA.)

8. Further protection from lawsuits. Planners have to rely on good faith and current state-of-the-art modeling and estimates to develop air quality and transportation plans. Environmental groups are attacking the estimates and demanding exactitude that doesn't exist. There has to be protection from disruptive lawsuits that paralyze the process, perhaps by requiring plaintiffs to make an initial showing of bad faith before filing suit. In absence of that, agreement by the MPO, State air quality agency, EPA and U.S. DOT should be per se evidence of the validity of emissions estimates. (Example: Sierra Club sued Sacramento for using EPA's own numbers.) Almost 200 counties will face conformity for the first time under the revised ozone and particulate matter standards. They will not be able to develop airtight plans right off the bat, thus opening the door to lawsuits. These areas must be given adequate time (at least 2 years) and adequate resources to develop the detailed data bases needed to demonstrate conformity. Smaller MPOs, in particular, are ill-prepared to fulfill all of the conformity requirements.

9. Equal intervention rights. Environmental groups are using lawsuits to pressure policymakers and exclude other stakeholders. Contractors and transportation users should have the right to participate in lawsuits as equals to environmental groups. A double standard leads to duplicative lawsuits and moves the planning process out of the public forum and into the courtroom.

10. Adequate funding. Smart growth planning depends on interconnectivity and multi-modal options, i.e., a mix of integrated transit and highway. No one wants to ride a bus to a metro station if the bus is stuck in traffic. Congress should provide both highway and transit funding and recognize that highway capacity projects that connect to transit systems are beneficial. (Example: Sierra is opposing HOV lanes in Atlanta that access MARTA and provide emergency vehicle access.)

11. Try to develop a system where areas that make progress to clean air quality receive an incentive for doing so, rather than relying on sanctions to enforce the Clean Air Act. One possible option would be to divert additional CMAQ funding to these areas.

---

RESPONSES OF JAMES STEPHENSON TO ADDITIONAL QUESTIONS FROM SENATOR  
JEFFORDS

*Question 1.* In general, would you agree that conformity is spurring investments in transportation strategies and technologies that reduce air pollution and create better interagency cooperation?

Response. I do not think conformity has been very effective in reducing air pollution. While the exercise of conformity has been somewhat effective in getting the different agencies to work together, virtually all of the reductions in air pollution from the transportation sector have been caused by engine and fuel technology advances, not the conformity process. Conformity was based on a false assumption that a large increase in vehicle miles traveled would outstrip technology advances. Conformity was also intended by its proponents to tilt the local decisionmaking process toward mass transit rather than highway capacity options. That has happened. But transit ridership has not risen—nor will it—to the point that it will have anything but marginal impacts on emission reductions. With cleaner air technologies and cleaner fuels expected to continue to come online, the transportation sector will continue to dramatically reduce its emissions share. None of this is the result of conformity, but rather direct mandates from Congress and the U.S. Environmental Protection Agency (EPA). If Congress is really interested in reducing pol-

lution rather than just creating more paperwork, it should focus on programs that have been proven to work.
