*Question 2.* If Congress does make any changes in the conformity process as part of the next transportation bill, what would be your No. 1 suggestion and please be specific?

Response. My No. 1 priority is to restore the grandfathering of projects when a conformity lapse occurs. Grandfathering would allow projects that were part of a previously conforming transportation plan to proceed even though an area has entered a lapse. As I noted in my written testimony, most conformity lapses occur because of slow moving paperwork and missed deadlines not because an area has worsening air pollution. Grandfathering would return some stability to the transportation planning process so that projects that have already been vetted through the lengthy planning process cannot be shut down at the last minute simply because someone missed a deadline. Shutting down highway and transit projects only exacerbates clean air problems since many of these projects are designed to reduce congestion and reduce air pollution. The Clinton Administration's EPA recognized this as an important concept and as a result, it allowed the grandfathering of projects under the original conformity regulations. However, this part of the regulation was struck down by the courts in 1999 in *Environmental Defense Fund v. EPA* (D.C. Circuit). I strongly urge Congress to make the needed statutory changes so that EPA can once again allow for the grandfathering of projects.

---

RESPONSES OF JAMES STEPHENSON TO ADDITIONAL QUESTIONS FROM SENATOR VOINOVICH

*Question 1.* Like you, I think Congress should rethink the entire process. With our current Federal budget crisis, I think we should be looking at the cost-effectiveness of these transportation and air quality projects. In your opinion, what projects have been the most cost-effective, achieving the greatest air quality improvements for the least cost? Do you think there are more cost-effective options for achieving air quality improvements in the transportation sector than through the current programs?

Response. According to the recent Transportation Research Board study on CMAQ, vehicle inspection and maintenance programs achieve the greatest air quality improvements for the least cost. According to EPA, less than 10 percent of the nation's motor vehicle fleet emits over 40 percent of mobile generated pollution and the "dirtiest" 1 percent of vehicles contribute over 25 percent. As a result, the government's focus should be on getting these very high polluting vehicles off the road. As I stated in my written testimony, CMAQ funds should be made available for auto salvage programs, which would help achieve the ends desired. Through Fiscal Year 2001, we have spent about \$9.5 billion on marginally, or completely ineffective programs in terms of achieving measurable emissions reductions. With that same investment, we could have bought new, cleaner burning automobiles for every person driving a car in the "dirtiest" 1 percent category, resulting in demonstrable air quality benefits!

I would also suggest that technology can be better utilized to reduce the number of gross emitters of pollution on the road. One example is the mobile roadside emissions tester, which is being tested by the Georgia Institute of Technology. This device allows one to identify high polluting trucks and automobiles in traffic with a laser beam, similar to a speed radar gun.

*Question 2.* Additionally, you specifically suggest an incentive based system that rewards "those communities that make the greatest progress in cleaning the air," rather than "penalizing areas that fail to meet air quality standards." How would you propose such a system work?

Response. When the conformity lapse occurred in Atlanta, several high priority highway and transit projects were put on hold due to sanctions placed on the metropolitan area by the Federal Government. The purpose of many of these projects was to reduce congestion and improve air quality in the region. Because of the sanctions though, many of these projects still have not been built and Atlanta continues to suffer through increased congestion and worsened air quality. As the Atlanta situation clearly demonstrates, sanctions are counterproductive—they make a bad situation even worse. On top of that, sanctions only penalize the transportation sector, even though power plants or refineries might be the biggest contributor to an area's air pollution problems. I find it amazing that the transportation sector has provided the largest gains in improving the nation's air quality, yet it is the only sector that is penalized when overall air quality goals are not met. Instead, the Federal Government should provide an incentive to areas that are making improvements to air

quality. Each year, EPA publishes the Latest Findings on National Air Quality that shows the status and trends in air quality around the Nation. If an area is making substantial progress in air quality, Congress should consider exempting these areas from the conformity process, as long as progress continues in the future. That would create a tremendous incentive for communities to make air quality progress. This suggestion is just a starting point for Congress to consider in creating a carrot in its air quality improvements, rather than just a stick.

*Question 3.* As you state in your testimony, the EPA planned designation of new nonattainment areas in 2004 will presumably lead to an increase in the number of nonattainment areas. Given your experiences in Atlanta, how will this affect smaller communities that have not had to deal with conformity in the past?

Response. The new designations are going to have a tremendous impact on smaller communities and rural areas. Many of these smaller areas simply do not have the professional resources to do all of the modeling and collect all of the data that is necessary to perform an adequate conformity determination. Even in large urban areas where we have a number of resources to tap into, conformity determinations have proven to be a real challenge. For smaller communities that do not have these resources, it will prove to be even a greater challenge. When areas fail to have adequate conformity determinations in place, it makes them susceptible to lawsuits from environmental groups. This causes an even a greater drain on limited resources and often forces these smaller communities to settle the lawsuits out of court, often on terms that are not favorable to the traveling public.

---

RESPONSES OF JAMES STEPHENSON TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* As you are aware, Atlanta experienced one of the longest and most dramatic conformity lapses in the country. Even though each city has unique challenges, I believe what occurred in Atlanta could repeat itself in other high growth areas of the country. What happens to highway construction companies during a conformity lapse? Do workers get laid-off? What was the funding impact on Atlanta's transportation program and project decisions?

Response. Different companies were affected differently by the lapse. Even though there was a very long conformity lapse in Atlanta, the State still spent as many Federal transportation dollars as they would have if there had not been a lapse. Some of these funds were shifted to projects outside of the Atlanta area or to projects that were exempt from the conformity process. For instance, simple resurfacing projects and replacement of hazardous bridges are the type of projects that can continue even during a lapse. It was largely capacity adding projects, such as adding new traffic lanes or building new roads that were put on hold. As a result, simple road paving contractors were probably not largely impacted by the lapse. However, heavy construction contractors who specialize in earth moving and other activities associated with new construction were very adversely affected. Several of my customers indicated they laid off workers because of the lack of work. And the negative impact did not stop at the end of the lapse. Because the practice of grandfathering had been struck down by a Federal court in 1999, activities such as completing the design or purchasing the right of way for these new projects was also put on hold. As a result, when the lapse ended, many of these priority projects were still not at the stage of being able to be let for construction. While the Federal Highway Administration (FHWA) has since slightly relaxed its rules on what activities can take place during a lapse, that was not the case in Atlanta. At the time, nothing could proceed on a project during a lapse unless Federal funding had already been signed off on the project and it was essentially already under construction. Also many of these priority projects cannot proceed because funding for them is no longer available. Because a State must either spend its Federal transportation dollars or forfeit them, several projects funded during the lapse were not high priority projects. As a result, that money is now gone and Georgia is facing many challenges to find adequate funding for the high priority projects once again. My wife, children, and I have all been directly impacted by the conformity lapse in Atlanta since we live in an area that was slated to have one of these canceled projects built. Almost 4 years later, the project still has not been built and as a result, we have wasted time, money and energy stuck in traffic and gridlock.

*Question 2.* A number of areas have successfully employed voluntary programs to reduce emissions from off-road heavy-duty diesel construction equipment, and credited the emissions reductions to the conformity budget. Do you believe CMAQ money should be used to support this type of voluntary programs?

Response. I am generally opposed to any program that uses Federal highway funds for non-construction activities. I believe that all of the money in the Conges-

tion Mitigation and Air Quality (CMAQ) Improvement Program should be used for activities such as building high occupancy vehicle (HOV) lanes or building new capacity that will reduce bottlenecks on the nation's roadways. That being said, since the inception of CMAQ in 1990, most CMAQ money has been spent on transit operations and transportation control measures that the Transportation Research Board said in a recent report have no quantifiable benefits. If money is going to continue to be spent in this manner, I believe it should be spent on activities that can produce quantifiable results. We know that many of these voluntary retrofit programs for off-road construction equipment have produced quantifiable results. As a result, I would support the use of CMAQ funds for these programs if CMAQ funds must continue to be spent on non-construction related activities.

*Question 3.* I understand that the new EPA diesel engine regulations may increase diesel engine prices higher than anticipated. What impact, if any, would this have in your dealership?

Response. Since I do not sell engines for on-highway trucks, it will probably not have a significant impact on my dealership. However, Caterpillar is the world's leader in the production of diesel, natural gas and gas turbine engines used for both stationary and mobile applications. The debate over the 2002 diesel engine emissions reduction requirements sheds some interesting light on the government's often misguided desire to regulate and the over-reaction and falsehoods spread by the extreme factions of the environmental community. As you probably know, certain heavy-duty engine manufacturers are required to have new emissions reducing technologies in place by October 2002. To meet this challenge, Caterpillar has opted to develop a breakthrough, which still demands more testing. Competitor's technologies require forced air to operate. As a result, they only work on trucks moving down the road at a substantial rate of speed. Caterpillar elected to develop a more sophisticated technology that does not rely on forced air. Thus, Caterpillar's new cleaner burning diesel engine technology can be used on stationary and off-road machinery—such as generators and construction equipment—as well as trucks. Caterpillar requested a temporary waiver from the Federal Government to permit complete testing of this new technology. The waiver was denied. Once again, this is a perfect example of government policy encouraging the business community to do enough to get by the minimal standards, while discouraging an approach that will have much broader and longer term benefits.

---

STATEMENT OF MICHAEL REPLOGLE, TRANSPORTATION DIRECTOR, ENVIRONMENTAL DEFENSE

Mr. Chairman, I am Michael Replogle, Transportation Director of Environmental Defense. I am pleased to appear here this morning to present testimony on behalf of both Environmental Defense and the Surface Transportation Policy Project where I serve as chairman of the Energy and Environment Task Force of the Alliance for a New Transportation Charter and a member of the STPP steering committee.

The Environmental Defense, a leading, national, NY-based nonprofit organization, represents 300,000 members. Environmental Defense links science, economics, and law to create innovative, economically viable solutions to today's environmental problems. The Surface Transportation Policy Project or STPP is a nationwide network of hundreds of organizations, including planners, community development organizations, and advocacy groups, devoted to improving the nation's transportation system.

I am pleased to have this opportunity to discuss transportation and air quality, especially focusing on transportation conformity and the Congestion Mitigation and Air Quality Program and to offer our views on how the reauthorization of TEA-21 can enhance these programs.

I would like to highlight the following recommendations for congressional action:

- Clean Air Act transportation conformity is working increasingly well to hold transportation plans accountable to air quality control strategies, but steps should be taken to assure better modeling of traffic and emissions and better compliance by the Department of Transportation and States to assure that transportation plans and programs are fiscally constrained. Poor accounting threatens underestimation of motor vehicle emissions and the failure of SIP control strategies to deliver on the promise of clean air for all Americans.
- Congress should assure that areas in a conformity lapse will be able to add new emission-reducing transportation projects to non-conforming short-term Transportation Improvement Programs (TIP) and long-range transportation plans, even if those projects were not previously contained in a conforming, fiscally constrained TIP or plan.

- Congress should reject proposals to reduce the frequency of conformity analyses, which are now required at least once every 2 years for TIPs and once every 3 years for transportation plans. Such proposals threaten to introduce more surprises and conformity problems and to reduce the timely improvement of motor vehicle emissions estimates to protect the integrity of SIP control strategies. When transportation conformity is done more frequently, it results in timely updates to modeling assumptions that improve accountability.
- Congress should require all State and metropolitan areas to develop and periodically update, with public involvement, integrated transportation, natural resource protection, and growth management plans that consider at least one alternative scenario that considerably reduces traffic growth and enhances environmental performance through better system management. Agencies should annually report on the current and projected performance of their transportation system management, investment, and proposed programs and plans, accounting for cumulative and secondary impacts on growth patterns, public health, greenhouse gas emissions, the achievement of natural resource planning goals for air, water, and habitat protection, and the provision of equal access to jobs and public facilities for all residents, including those without cars, without undue time and cost burdens.
- The Congestion Mitigation Air Quality Program (CMAQ), which helps local communities and States reduce traffic and transportation pollution, should be reauthorized at a substantially higher level, recognizing the much larger population living in non-attainment areas and exposed to hazardous air pollutants. CMAQ funds should be targeted to innovative strategies that produce lasting traffic and pollution reduction, rather than to short-term one-time emission reduction strategies or traffic flow improvements.
- Congress should establish and fund a Transportation Accounting Standards Board to assure timely progress toward honest accounting for how transportation funds are spent, including oversight of innovative finance programs, to assure compliance with transportation planning fiscal constraint requirements, and assure the integrity and timely improvement of transportation agency environmental management systems, including travel and emissions analysis models, which should be required to demonstrate adequate sensitivity to induced traffic and land use effects of expanded road capacity.
- Congress should strengthen national transportation data collection, spatial data analysis, and evaluation, to support performance-based funding and decision-making.
- Congress should assure timely EPA action to regulate air toxics and assure that FHWA accounts for and avoids or mitigates the adverse health impacts of exposure of communities to hazardous air pollutants caused by expansion of major highways.
- Congress should strengthen incentives for employers to pay for transit benefits and offer cash incentives in lieu of parking, promote other market-incentive transportation strategies such as road pricing and use-based car insurance, and encourage increased investment in rail, bus rapid transit, pedestrian, bicycle, and intermodal travel options.

#### *I. Accounting for Transportation Air Pollution: A Hidden Tax Burden on Americans*

While motor vehicles and expanded highways have offered many Americans unprecedented levels of mobility, the costs of that system on public health, the environment, and social equity have been poorly accounted for. Motor vehicles account for a major share of harmful air pollution emissions that cause shortness of breath, respiratory disease, cancer, death, structural deterioration, crop damage, and decreased visibility affecting cities, national parks, and rural areas, and global climate change, constituting a hidden tax on our health and well being. Since 1970, our Nation has tried to reduce this pollution problem through the Federal Clean Air Act. While we have made remarkable progress in reducing many kinds of pollution, growth in motor vehicle use has offset a large share of emission reductions gained through cleaner technologies, especially for nitrogen oxides (NO<sub>x</sub>) and particulate matter (PM).

Three decades after the 1970 Clean Air Act, more than 125 million Americans—including 70 percent of the people most vulnerable to air pollution—live in areas that exceed the National Ambient Air Quality Standards (NAAQS)<sup>1</sup>, and this number may increase by as much or more than 40 million once EPA completes the new designations for the 8-hour ozone and fine particle NAAQS. Ozone causes asthma, lung damage, and illness in children, and increases the risk of stroke mortality.

<sup>1</sup>Environmental Protection Agency, Latest Findings on National Air Quality: 1999 Status and Trends, Washington, DC, August 2000, page 5.

More than 14 million Americans with asthma—a record number—gasped for air when ozone levels rise and more than 5,000 Americans die each year from exposure to high ozone levels. The number of high ozone days increased 19 percent between 2000 and 2002 in U.S. counties with air quality monitors.

Particulate matter causes cancer, including childhood leukemia, as well as respiratory disease and death. New research shows that people living proximate to high traffic volume highways breathe traffic-related air toxics that expose them to cancer risks at times greater than 1 in 500.<sup>2</sup>

The U.S. accounts for vastly disproportionate greenhouse emissions. Although Americans account for 5 percent of the world's population, we account for almost a third of greenhouse emissions worldwide. In 1996, mobile sources counted for more than 30 percent of CO<sub>2</sub>, more than 40 percent of VOC, 50 percent of NO<sub>x</sub> and 80 percent of CO emitted in the U.S.<sup>3</sup> Between 1990 and 1999 U.S. greenhouse gas emissions from transportation rose almost 9 percent.

A U.S. DOT report, included in this testimony as Attachment 1, estimates the annual cost to the public in 2000 of the adverse health effects attributable to air pollution from motor vehicles at \$40 billion to \$65 billion, depending on the value ascribed to a human life.<sup>4</sup> A disproportionate share of these costs are imposed on the most vulnerable—those with respiratory diseases, children, and the elderly. So while taxpayers bore a cost of \$27 billion in 2000 for direct Federal transportation investments, all face far greater true costs. Moreover, this DOT cost accounting does not even consider the costs of health effects of air toxics or fine particles, which DOT now admits is the biggest air quality health issue to be dealt with; nor does it include the costs for agricultural losses, impaired visibility, damage to buildings, acid rain, impairment of various terrestrial and aquatic ecosystems from excess nitrogen, and other adverse impacts of air pollution. Nor does it include the costs of global climate change or traffic accidents. New research from the Centers for Disease Control associates rising obesity levels with declining physical activity and impaired mental health with reduced social interactions, both associated with car-dependent mobility and development patterns. These add further to the hidden burden of true transportation system costs on Americans.

The toll exacted by these adverse health and other impacts continue because 32 years after passage of the 1970 Clean Air Act (CAA) most non-attainment areas have still not attained the long-standing 1-hour ozone or PM National Ambient Air Quality Standards (NAAQS). Health research has shown that additional controls on 8-hour ozone and fine particulate matter (PM 2.5) are needed to protect public health, but EPA is moving only slowly to designate related non-attainment areas and timetables for States to adopt related pollution control strategies.

## *II. Transportation Conformity: Accounting for Motor Vehicle Air Pollution in State Air Quality Control Plans*

Why Conformity? The 1990, Clean Air Act amendments strengthened the transportation conformity provision to assure that transportation infrastructure spending and poor accounting for mobile source emissions would not continue to unwittingly undermine progress toward healthful air quality. Expansion of highways and resultant growth in traffic and pollution led to widespread, systematic underestimation of motor vehicle air pollution in State air pollution control plans between 1970 and 1990, causing those plans to fail.

Transportation conformity is a straightforward concept, at times made complex by overly lengthy transition rules designed to undermine its simple operation. Conformity requires the regional transportation system to contribute to timely attainment of healthful air quality and to be designed so that emissions from transportation sources in a non-attainment area are less than the levels established by the State's adopted plan for attaining healthful air quality.

The CAA requires that SIPs for achieving healthful air quality in polluted areas establish emission budgets for mobile sources (cars and trucks), stationary sources (powerplants and factories), and area sources (paints, agriculture), including control strategies limiting emissions from each. Trade-offs can be negotiated between control of various sources, encouraging exploration of the lowest cost means for timely attainment. The CAA and Federal transportation laws passed since 1990, ISTEA

<sup>2</sup>South Coast Air Quality Management District, Multiple Air Toxics Exposure Study-II, March 2000, Los Angeles, CA.

<sup>3</sup>State and Territorial Air Pollution Program Administrators/Association of Local Air Pollution Control Officials, Reducing Greenhouse Gases & Air Pollution: A Menu of Harmonized Options, Executive Summary, Washington, DC, October 1999, page 5.

<sup>4</sup>U.S. Department of Transportation, Addendum to the 1997 Federal Highway Cost Allocation Study Final Report, May 2000, Washington, DC. Page 11. Available at: [www.fhwa.dot.gov/policy/hcas/addendum.html](http://www.fhwa.dot.gov/policy/hcas/addendum.html).

and TEA-21, require short-term (1–6 year) fiscally constrained funding programs—called Transportation Improvement Programs (TIPs)—and long-term (20-year) fiscally constrained Regional Transportation Plans (RTPs) to conform to SIP emission budgets so that new transportation approval, acceptance, and funding decisions will not violate emission limits or delay timely air quality attainment.

By requiring TIPs and RTPs to be fiscally constrained, Congress sought to address a problem that had caused the failure of an ineffectual earlier, weaker version of CAA conformity: many States and regions demonstrated conformity relying on a hefty, expensive, fantasy wish list of emission-reducing projects that could not be built on the schedule identified in the transportation program. This false accounting for transportation projects contributed to the underestimation of motor vehicle emissions and the failure of SIP control strategies in the 1970's and 1980's.

Bad State and Federal accounting for transportation funds, lax Federal oversight of transportation and air quality planning requirements for fiscal constraint of TIPs and RTPs, and abuse of TEA-21 funding flexibility and innovative financing provisions undermine conformity and threaten to undermine SIP control strategies in the coming decade. Many State and local project sponsors grossly underestimate project costs so they can adopt fiscally unconstrained transportation plans and programs. Many States are increasing their reliance on Federal dollars and reducing State commitments to fund transportation while running up large debts that sacrifice future fiscal capacity. This is further exacerbated by the recent failure of the Federal Highway Administration to lapse unspent fund obligations to the States as required by TEA-21. Environmental accountability is further undermined by under-forecasting of motor vehicle traffic and air pollution in SIPs, TIPs, and plans due to use of travel models that discount induced traffic. Together, these problems amount to another national accounting scandal affecting not just the \$217 billion, 6-year Federal TEA-21 authorization, but hundreds of billions more in State and local transportation spending.

*Conformity Is Increasingly Successful: Better Accounting, Coordination, Support for Emission Reduction Strategies*

By fostering cooperation between transportation and air quality agencies over the past decade, conformity has improved accounting for transportation air pollution in State Implementation Plans (SIPs) for air quality attainment and it has increased consideration of air quality as a factor in transportation decisionmaking, as intended by Congress.

- Since 1990, transportation conformity has increasingly ensured that State and local air quality planners account for the growth in vehicle driving activity and other sources of vehicular emissions, helping assure progress on clean air goals in the past decade.

- Conformity has assured that transportation agencies coordinate with State and regional environmental agencies through interagency consultation procedures to evaluate the emissions impacts of major transportation investments before funding decisions are final. Where conformity lapses have occurred because of problems in coordination, they have been generally of only a few months duration and have led to improved local administration and governance to coordinate air quality, transportation, and growth management.

- Conformity has almost invisibly led to increased investments in cost-effective pollution-reducing transportation strategies that support more diverse travel choices, equitable access to jobs and public facilities, smarter growth, improved traffic safety, safer and more attractive opportunities for walking and bicycling. Conformity has expanded the base of political support for control strategies to reduce air pollution emissions through more stringent emission controls on vehicles, cleaner fuels, and more effective inspection and maintenance. Local and State transportation agencies and real estate development interests and the highway construction industry are motivated to support such strategies to avert transportation conformity constraints on highway construction funding.

- Conformity has fostered continuing improvement in transportation forecasting and emissions models used to appraise the implications of transportation and land use alternatives, providing a more sound basis for air quality and transportation plans.

- Conformity has enhanced the public's right-to-know about air quality and transportation impacts before decisions have been made.

*Full Implementation of Conformity Was Delayed in Many Regions Until 2000–2001*

These successes have come about even though transportation conformity has been until recently only partially implemented in many regions. Full implementation of the 1990 conformity amendment has always been dependent on the establishment

of motor vehicle emissions budgets in attainment SIPs. Delays by the States in the development of air quality attainment plans for most of the nation's largest cities delayed the setting of emissions budgets to be met by metropolitan transportation systems, forcing reliance on earlier complex transition rules. The first motor vehicle budgets designed to attain the 1-hour ozone standard in most large cities were first submitted in 2000 in response to litigation enforcing Congress's deadlines for SIPs. EPA has approved most of these SIPs only in the past year. Additional revisions to many of these SIPs are anticipated in the coming year to reflect updated motor vehicle emissions estimates using EPA's Mobile 6 computer model.

These new mobile source emission budgets took effect in 2000 as interim budgets while EPA continued to review the adequacy of the overall attainment plans for the more polluted metropolitan areas. These budgets provide a standard against which to measure the emissions produced by regional transportation plans. Metropolitan areas have 18 months from the submission of the interim budgets to revise their transportation plans to meet the new emissions targets for motor vehicles in each air shed. Thus, many cities are adopting revisions to their transportation plans to meet the 1990 Act's conformity requirements only within the past year, after a decade of delay.

For most of the 1990's, conformity in most regions relied on a weak, widely criticized, and often gamed 'build/no-build' test established by EPA as an interim stop-gap measure while States were developing the attainment plans with emissions budgets that are required by the CAA. The result was a system that required extensive modeling and planning, some upgrade to analysis methods, but in most cases produced relatively little change in transportation plans or investments beyond a few new ridesharing and transit projects. But now that attainment motor vehicle emission budgets are finally in place in non-attainment areas, conformity is operating as intended: holding TIPs and RTPs accountable to attainment SIP motor vehicle emission budgets.

#### *Conformity Remains Critical to Clean Air Progress*

Conformity remains critical to clean air progress because motor vehicles account for roughly half of all ozone precursor emissions in most large metropolitan areas. But even in those areas where the motor vehicle pollution share is less, such as Houston, where heavy industry accounts for a much larger contribution of pollution, steps to curb motor vehicle pollution are critical to attaining healthful air quality.

New, cleaner motor vehicle technologies mandated under the CAA Tier II standards will do a lot to clean up motor vehicle pollution over the next 15 years. But at the same time, EPA's NOx SIP call will curb emissions from large stationary sources such as power plants, so that the share of total emissions of ozone precursors and PM from motor vehicles may actually grow, despite cleaner vehicle technologies. And meeting the 8-hour ozone and PM fine pollution standards will require far more substantial reductions in emissions. Routine compliance of fiscally constrained TIPs and RTPs with motor vehicle emissions budgets through a strong and continuous transportation conformity program is essential to the success of the Clean Air Act in delivering healthful air quality for all Americans.

The failure of transportation plans to comply with SIP budgets is the reason why most metropolitan areas failed to meet the ozone NAAQS in 1987. Many serious ozone non-attainment areas again failed to attain by 1999 (including Atlanta, Washington, DC, Baton Rouge, Dallas-Ft.Worth, Connecticut, Springfield) is that motor vehicle emissions have not been reduced to the levels required for attainment. If Congress were to weaken conformity by reducing its frequency or analysis time horizon, or if conformity analyses continue to be further undermined by weak enforcement and oversight of fiscal constraint, traffic analysis, and emissions accounting methods by US DOT, the Clean Air Act is at risk of failing once again in the coming decade to deliver long-promised clean air for millions of Americans.

#### *III. Growth in Motor Vehicle Use Threatens Air Quality Progress*

Growth of motor vehicle use is one of the most stubborn obstacles to lasting progress in cutting NOx, particulate matter, and cancer-causing air toxics from the transportation sector. National and State programs to control air pollution from transportation through cleaner vehicle and fuel technologies and inspection and maintenance have significantly reduced motor vehicle pollution rates. But because of steep increases in the number of vehicle miles, cuts in the amount of pollutant emitted per mile, particularly for NOx and small particulates (PM<sub>2.5</sub>), have been offset by growth in miles driven.

Growth in motor vehicle use stems from many factors. Large investments in highway system expansion, subsidies for driving and sprawl, and policies favoring increased car-dependence over the past half-century have contributed to growth in trip

distances and the number of vehicle trips for most Americans. More than three-fourths of all job and housing growth since 1970 has been in suburban areas that have been designed to promote automobile access as the only convenient or available means of travel for most trips. From 1970 to 1998, vehicle miles traveled (VMT) has increased by 136 percent, or more than three times the rate of population growth. Other indicators of driving activity—vehicle trips per person, average vehicle trip length, and number of motor vehicles per person—have also risen sharply. Traffic growth not only threatens air quality progress, but it adds to traffic congestion and travel times, greenhouse gas emissions, dependence on imported petroleum, and degradation of water quality and community livability.

*Inadequate Regional Transportation Models Threaten SIPs*

One of the major causes of the failure of ozone SIPs to produce attainment during the 1980's was the systematic failure of the transportation models to account for the very significant increase in motor vehicle emissions that resulted from induced travel demand caused by new highway construction. The best evidence from the Transportation Research Board (TRB) studies reported during the last 5 years indicates that about 25 percent of total VMT growth in metropolitan areas is attributable to induced demand. The failure to account for that magnitude of motor vehicle emissions increases in the 1980's would have caused virtually all ozone SIPs to fail. Indeed, almost all metropolitan areas failed to attain even when they implemented SIPs EPA thought were adequate for attainment. The need for Congress in 1990 to enact an entire new program for ozone control in America's urban areas can be attributed, in significant part, to the deficiencies in the transportation models that failed to account for VMT growth trends of the last two decades.

A large number of recent TRB peer-reviewed scientific studies, summarized in Attachment 4, show that increasing road capacity in an area by 10 percent will cause a growth of 8 percent (with ranges found to vary from 3–10 percent depending on context) in total area traffic. Yet most regional travel models used for conformity analysis—even after the improvements of the 1990's—fail to properly account for this fact.

The most serious consequence of large errors in these transportation and emission models is the failure to reduce motor vehicle emissions enough to meet the NAAQS. In the case of Particulate Matter (PM) insufficient emissions reductions means hundreds or thousands of people will die in a non-attainment area, and for ozone it means tens of thousands may require hospitalization, emergency care or other medical treatment for debilitating conditions if the models under-predict emissions. While such end effects of a flawed traffic and emissions model are not as easily dramatized as the use of a flawed engineering model for design of a building that later fails and collapses, killing those inside and around it, the net effect of bad traffic models are in fact injurious to far more people over a longer period of time.

When metropolitan areas first began to undertake transportation conformity analysis a decade ago, regional transportation planning and emission models were barely up to the task. Many of these analysis tools were estimated on old data, insensitive to induced traffic and land use changes caused by changes in transportation system capacity and user costs, and unable to represent walking, bicycling, public transportation, or travel choices other than driving. Typical traffic models used by metropolitan planning organizations (MPOs) in 1990 were simple highway engineering models ill suited for public policy or environmental analysis.

*Inadequate Federal Actions to Improve Travel and Emissions Models*

To address this problem, following passage of the 1990 CAA amendments, the 1991 ISTEA law provided a 1.5 percent set-aside from several Federal transportation funding categories to support MPO planning, data collection, modeling, and related activities required to implement the conformity and transportation planning process. Congress also authorized the use of Congestion Mitigation Air Quality (CMAQ) funds and other Federal transportation funds to support such activities. In 1993, US DOT and EPA established a Federal Travel Model Improvement Program (TMIP) to help foster needed changes to MPO traffic models and EPA invested in further improvements to its MOBILE emissions factor models. TMIP provides useful training to MPOs and documents and disseminates current best practices in transportation and land use modeling, but has invested the bulk of its resources since 1995 in a multi-million dollar program based at Los Alamos National Lab to develop TRANSIMS, a supercomputer-based traffic simulation model that will be available for somewhat more general use by agencies over the next several years. MPOs in non-attainment areas increased their spending to update their travel models and data collection throughout the 1990's in response to EPA conformity regulations that established minimum modeling standards, but few MPOs flexed STP or NHS

funds to support an expanded data collection and planning effort to improve their travel and emissions modeling capabilities. EPA's conformity regulations were streamlined in 1995, reducing the specificity of modeling requirements. FHWA in the mid-1990's issued some weak, limited guidance on transportation modeling practices that failed to promote best practices and encouraged MPOs to be satisfied with adopting "standard practice" models instead. Interagency consultation established as part of transportation and air quality planning and every 3-year MPO certification reviews have been the principal source of oversight of the adequacy and integrity of the transportation modeling process.

While most of these measures have been of value and have encouraged some improvement of MPO transportation modeling for conformity and SIP analysis, they have been grossly inadequate to effect timely MPO adoption of best practices.

As TRB Special Report 245 (1995) concluded: "The four-step process, as it is conventionally applied, will generally understate the amount of induced travel." And most MPOs persist in conventional standard-practice application of four-step process traffic models in 2002, falling well short of best practices, meaning that most MPOs seriously underestimate induced traffic and related air pollution emissions. Unless addressed, this poses a major continuing threat to the success of SIP control strategies, which are likely to be inadequate to produce healthful air quality.

The question that needs to be answered is: How can we make sure that the modeling tools are improved so that they can more reliably serve the purposes that the public or the Congress will abandon the goal of making the air safe to breathe. Therefore, TRB, DOT, EPA, MPOs, and the transportation agencies need to invest the resources to refine the modeling tools to ensure that they become more effective at identifying the factors that most reliably predict vehicle use, and the strategies most likely to be effective in reducing VMT growth and motor vehicle emissions. And MPOs need to apply those tools to evaluate alternative TIP, RTP, and SIP control strategies that can reduce traffic growth and motor vehicle emissions, so these can be considered effectively in the interagency decisionmaking process.

EPA last year released guidance allowing emissions reduction credit for land use strategies. The effectiveness of those strategies is linked to the quality and effectiveness of transit facilities and services offered to people in corridors where land use is planned to minimize travel demand. However, most MPO travel models have limited capacity to represent the travel behavior effects of transit-oriented development, walkable neighborhoods, new intelligent transportation system technologies supporting Bus Rapid Transit and ridesharing, or changes in parking policies and commuter travel incentives. As a result, the environmental and energy benefits of these strategies are not reliably reflected in the outputs to the traffic models.

An excellent recent GAO report noted that "the Federal requirement to demonstrate that transportation plans and programs conform to an emissions budget serve as the primary incentive to assessing the emissions impacts of different land uses. Furthermore, such estimates had some effect on transportation and land use decisions. For examples, almost half of planners who reported conducting such estimates revised their transportation plans as a result, and about a third reported that local land use plans were revised . . . In the future more of the transportation and air quality officials may need to consider land use as a means to control emissions and improve air quality if EPA implements, as planned, two more stringent air quality standards. These officials face several barriers to further considering different land uses and their emission impacts, however, including a lack of required technical tools."<sup>5</sup>

This GAO report notes that, "DOT and EPA efforts to improve travel-demand-forecasting models may help MPOs and communities determine the effects of transportation improvements on congestion and air quality. However . . . these efforts currently do not call for integrating land use or environmental components into the travel demand model . . . Without such integrated models, communities cannot consider the likely effects that their transportation decisions will have on land use, future growth and development, and air quality."<sup>6</sup>

Most MPO travel models need updating and refinement. Recent independent audits of computer travel models in Washington, DC, and other regions have exposed serious flaws in official Metropolitan Planning Organization models that bias their findings strongly against transit investments and smart growth strategies and strongly in favor of expanded highway investments. Attachment 7, a recent critique

<sup>5</sup>U.S. General Accounting Office, Environmental Protection: Federal Incentives Could Help Promote Land Use That Protects Air and Water Quality, Washington, DC, October 2001, GAO-02-12, page 6.

<sup>6</sup>U.S. GAO-02-12, op. cite, page 95.

of the Metropolitan Washington, DC travel models that found significant underestimation of motor vehicle emissions of both NOx and VOC, illustrates this problem, which, if uncorrected, puts SIP control strategies at risk of failing once again.

And much greater investment is needed in national travel, land use, employment, demographic, and environmental monitoring data to properly support environmental management systems integrated with better decision-support for transportation planning. But this is not an argument to weaken conformity or to stop holding regional planning agencies accountable for the air quality consequences of the investment choices they make, or local governments accountable for the land use choices they make. The public health costs, and the harm to the personal well-being of too many Americans are too important to consider weakening the process. The only reason why there is any debate at all about the reliability and accuracy of transportation models is because the law requires accountability and imposes consequences. There have been major refinements in the planning process and the modeling tools used in that process since 1990. MPOs and transportation agencies are no longer using the overly simplistic unidimensional travel models that were the foundation for the grossly inadequate SIPs on the 1980's. Those improvements are some of the best evidence that the law is not broken; it is working.

With the enactment of the 1990 Clean Air Act Amendments, for the first time the law required the transportation agencies to be directly accountable for emissions effects of their decisions. This has created the need for and the incentive to advance the modeling science. Some MPOs, such as Portland, Oregon, and Sacramento, California, have invested in data collection, analysis tools, and staff development, enabling them to demonstrate best practices in their applied analysis work. These best practices need to be more widely replicated. Portland's models are now being adapted to improve statewide models used by Oregon DOT and used to advance a transportation planning process that is integrated with environmental resource and growth management. Such integration is the key to improving project delivery and the environmental stewardship of transportation agencies. Best practice transportation models have multiple ways of reflecting induced demand and land use impacts of transportation policies and investments and lead to better emission estimates.

Other regional models still are far from the mark when it comes to accounting for induced demand, land use effects, and the potential benefits of smart growth transit oriented development, pedestrian and bicycle enhancements, and transportation pricing strategies. As a result they typically continue to underestimate future VMT and motor vehicle emissions. In turn, this error leads to insufficient emissions reductions in SIPs, and to motor vehicle emissions budgets in SIPs that understate expected future emissions. This poses a problem for the transportation agencies when future actual vehicle counts show that VMT and emissions exceed the budget. The remedy to this problem is not to dispense with or make highly infrequent conformity determinations, as some in the transportation industry would wish. The appropriate remedy is to improve the models so that they honestly and routinely account for what are now generally well-characterized phenomena in the world of transportation planning.

#### SEVERAL ACTIONS ARE NEEDED TO BRING ABOUT MORE TIMELY IMPROVEMENT OF REGIONAL TRAVEL MODELS

- MPOs and transportation agencies should be required to make available at no cost to interested stakeholders all travel and emission model assumptions, data, documentation, and software driver files to allow routine independent oversight by outside parties. Such access varies now between MPOs, with some retaining a much more closed culture that resists disclosure or puts up barriers such as charging thousands of dollars for the copying of a few CD ROMs of data.
- MPOs and transportation agencies should be required to test their models for their sensitivity to induced demand as illustrated in Attachment 4. Agencies should also evaluate model capacity to evaluate changes in travel costs and travel times by time-of-day, changes in pedestrian and bicycle friendliness, urban design factors, and other key elements, comparing model performance with best practice models and scientific findings. EPA and DOT should require independent evaluation of travel model and emissions model adequacy as part of conformity and planning certification reviews and approvals.
- Where models are noted to have shortcomings against best practices, MPOs should be required to identify through their Unified Planning Work Program a schedule and budget for addressing these shortcomings in a timely way over the course of each 3-year planning cycle for regional transportation plans and SIP updates.

- Congress should establish and fund a Transportation Accounting Standards Board. This new independent entity is needed to assure timely progress toward honest accounting for how transportation funds are spent, including oversight of innovative finance programs such as GARVEE and TIFIA bonds, to assure compliance with transportation planning fiscal constraint requirements, and to assure the integrity and timely improvement of transportation agency environmental management systems, including travel and emissions analysis models.
- America needs a new much stronger national transportation data center to replace the Bureau of Transportation Statistics. This center should help set a core set of uniform standards for travel survey data collection, transportation network coding, spatial data analysis, and evaluation, developing a new generation of scientifically valid methods for local, regional, and national travel behavior analysis to support performance-based funding and decisionmaking. Local innovation should be encouraged to augment this core set of measurement systems.

#### *IV. Transportation Conformity at Work in Atlanta*

In most U.S. metropolitan areas, agencies have successfully managed their transportation plans and programs to stay within the limits of adopted air quality plans. When these have come into conflict, resulting in conformity lapses, these have been brief. Most have been resolved in a matter of several months or less after working out administrative problems or by adding new emission-reducing transportation projects to TIPs and RTPs to offset excess pollution.

In several instances, most notably in metropolitan Atlanta, conformity lapses have persisted longer, thanks to ongoing interagency conflict and resistance from transportation and sprawl development interests who would prefer to ignore adopted SIP emission budgets. Throughout the 1970's and 1980's Georgia DOT invested heavily in freeway expansions, spurring massive low-density car-dependent sprawl development. By the mid-1990's, Atlanta area residents drove 34 miles per day per person, more than in any other metro area in the world. This came at a high price in regional air quality. The 1979 ozone NAAQS has been exceeded each year in Atlanta since 1980, continues to be violated many days each year, and exceeds the national standard by 30 percent to 50 percent. In 1999, the year when Atlanta was required by the Clean Air Act to attain healthful air quality, the region had the highest number of unhealthy days in the decade, with 22 days above the 1-hour health standard for ozone air pollution.

In December 1998, Georgia Power and Southern Company completed a \$3 million scientific study to identify the primary sources contributing to Atlanta's ozone problem. Scientific analysis showed that power plant emissions caused about 15 percent of the Atlanta area's ground-level ozone, while mobile sources—including off-road—accounted for 70 percent, and emissions from other sources accounted for 15 percent. Shortly after this study, the State finalized its first plan to reduce smog-causing emissions in metro Atlanta. This plan is resulting in investment of \$850 million in new pollution control technologies on power plants by May 2003, reducing Georgia Power's contribution to ground-level ozone in the Atlanta area to 6 percent. In fact, power plant controls represent 86 percent of the reductions that will be achieved in the State plan. With these Georgia Power reductions, mobile sources, including on-and off-road, will be responsible for about 83 percent of the Atlanta area's ozone problem.<sup>7</sup>

Routine conformity analysis of the TIP and RTP has been vital to making progress on clean air in Atlanta. In 1996, the region's MPO submitted a SIP stating that the region would meet a motor vehicle emission budget of 214 tons per day (tpd) by 1999, when they were required to attain the ozone NAAQS. In 1998, the MPO wrote to EPA saying that its 1999 NOx emissions would actually be 238 tpd in 1999, reflecting the use of a refined travel model and updated growth forecasts. In 1999, the MPO found that real-time NOx emissions were 264 tpd. In 2001, the MPO admitted that it would not reach the 214 tpd motor vehicle NOx budget until 2005.

Conformity requirements led the Atlanta MPO to admit in September 1996 that its proposed new TIP would exceed the SIP emission budget submitted in June 1996. In response, the region deferred plans to add even more road expansion projects to the TIP and began to limit changes to its TIP to conformity-exempt projects. However, various proposals to adopt more stringent motor vehicle inspection and maintenance programs, cleaner fuel standards, and expanded transit services and emission reduction strategies proposed by local agencies and the regional transit agency were blocked by Georgia officials, although together these local actions could have resolved the conformity lapse.

<sup>7</sup>The Telegraph, Jun. 15, 2002, Atlanta, GA.

In late 1997, just prior to the expiration of the TIP, Georgia DOT, with FHWA concurrence and opposition from EPA, sought to exempt nearly \$1 billion in highway capacity expansion projects from transportation conformity so they could continue building these sprawl, traffic, and pollution inducing new roads through what many expected to be a lengthy conformity lapse.

After the conformity lapse began in January 1998, the MPO adopted several interim TIPs and RTPs. In response to a suit filed by Environmental Defense, the DC Court of Appeals found invalid in March 1999 certain EPA conformity regulations that had been the basis for ultimately exempting over \$700 million in Atlanta area road projects from compliance with transportation conformity. As a result, the Atlanta region lost no Federal funds, but did end up shifting over \$300 million in spending during the conformity lapse from sprawl-inducing, pollution-boosting road projects to instead fund transit, sidewalks, bikepaths, HOV lanes, transit-oriented brownfields infill redevelopment, traffic signalization, intersection improvements, highway safety, bridge reconstruction, maintenance, and other conformity-exempt projects and Transportation Control Measures.

Atlanta's conformity problems also prompted intense engagement of business, civic, and community leaders to address the failures of their governance structures to agree on strategies to clean the air, manage sprawl, and provide the region's citizens with travel choices other than driving. It allowed Gov. Roy Barnes to get legislative approval in 1999 to create a potentially powerful Georgia Regional Transportation Authority (GRTA), with authority to fund transit expansions, review and approve transportation and development plans, and manage growth in non-attainment areas.

But soon after its creation, GRTA was pressed by Georgia officials to approve a new Atlanta RTP that would renew massive sprawl and pollution inducing road system expansions, while adding new transit and commuter rail investments. The new Atlanta RTP supports a lot of road investment and sprawl, including outer beltway development, in the early years of the plan and promises largely unfunded major transit investments farther in the future. As a result, the MPO's own analysis shows that under the \$35 billion Atlanta RTP, the share of regional employment reachable by those without cars will decline from 2000 to 2005 and not return to year 2000 levels until after 2015. This raises serious questions about compliance of the Federal approval of this plan with Title VI of the Civil Rights Act, which requires consideration of disparate impacts of Federal spending on protected minorities, and it bodes ill for the region's ability to meet Clean Air Act requirements. Attachment 3 provides tables illustrating, with data from the Atlanta MPO, these troubling trends of declining access to job opportunities for people without cars, who are disproportionately minority populations and lower income residents.

Indeed, conformity of the new RTP was dependent on an EPA attainment date extension policy that the U.S. Court of Appeals for the D.C. Circuit recently invalidated in connection to a lawsuit challenging approval of a SIP for the Washington, DC metropolitan area, which similarly depended on this policy. It also relied on a SIP revision to increase the motor vehicle emission budget to allow greater pollution, although the region was experiencing record levels of health-harming ozone violations in the year it was by statute required to come into attainment.

FHWA, EPA, and environmental and civil rights groups all raised serious questions about the legal compliance of the new RTP with TEA-21 fiscal constraint requirements; local elected officials raised questions about who would pay for the new transit investments and the costs of expanded transit operations; the regional transit agency was simultaneously in a severe fiscal crisis that led to a general fare increase and substantial bus service cutbacks, harming low income minority transit-dependent riders.

In the past year, Georgia officials have sought to accelerate spending for their massive road program under this RTP through new "innovative financing" bond issues. How to pay for transit operations assumed in the RTP remains a critical and unresolved problem. Should it later be revealed that Georgia's current transportation investments were imprudent from an air quality perspective, it will be too late to redirect this spending, and the fiscal capacity of the State to fund emission-reducing projects will be impaired.<sup>8</sup>

<sup>8</sup>Unfortunately, a number of other States are following this approach, using GARVEE bonds and other leveraged finance methods to evade fiscal constraint requirements. New Mexico, for example, several years ago did an end run around opposition in the State legislature to a 140-mile road expansion project by issuing GARVEE bonds that obligate transportation receipts for the next generation to the project and adopted a repayment scheme that avoided any payments on the bonds for the first several years. As a result, a large share of the State's transportation budget will be eaten up by debt repayment.

Adding to these concerns, an independent audit of the Atlanta MPO traffic model by a nationally recognized modeling expert found that the MPO seriously underestimated motor vehicle emissions by misrepresenting travel speeds on freeways. A later speed study commissioned by GRTA affirmed these findings, but was suppressed by Georgia officials until after approval of the RTP and TIP conformity analysis that relied on the seriously flawed model. The mis-accounting for nearly 12 tpd NO<sub>x</sub>, which contributes to continuing health impairment of hundreds of thousands of people in the Atlanta area, was simply swept under the carpet by regional agencies, FHWA, and EPA. Attachment 2, "Emissions Effects of Atlanta Speed Study," provides additional documentation.

Unfortunately, my two decades of experience as a transportation engineer and modeling expert, working with many regional travel forecasting models across America, allows me to state with confidence that the kinds of problems observed in the Atlanta model with poor estimation of speeds are widespread elsewhere. Until independent critiques of regional travel models become commonplace, the integrity of the traffic and emissions forecasting process in most non-attainment areas will remain suspect, casting doubt on the success of SIP control strategies to deliver healthful air to all Americans.

Following lengthy settlement negotiations that led to a tentative agreement in December 2000 for additional emission reductions, Georgia officials balked at making the agreement enforceable and withdrew from talks in January 2001, moving forward with new road projects in the TIP and RTP. This led environmental and civil rights groups to challenge approval of the Atlanta RTP and SIP revisions in several suits. These legal actions are still in process. One of the key questions, now before the Court of Appeals in the 11th Circuit, is whether the TIP must demonstrate conformity to the EPA-approved 1999 SIP motor vehicle emission budget at the time the TIP is approved and while the funds in the TIP are being spent. Georgia Governor Barnes and FHWA convinced the District Court that the Atlanta fiscal year 2001–2003 TIP does not need to demonstrate conformity until 2004, despite the CAA statutory requirement for Atlanta to attain healthful air quality by 1999. If this stands, it will represent an unfortunate weakening of the accountability of transportation programs to SIP emission budgets.

While Atlanta has made progress in its governance structures, planning, and emission control strategy development, thanks to conformity, these reforms continue to encounter resistance from interests in the State that seek continued sprawl and road system expansion regardless of the consequences for air quality. The price of this resistance is degraded health and a tarnished quality of life, and likely higher future pollution cleanup costs to compensate for the irretrievable commitment of resources today to investments that will spur higher pollution for decades to come. Without conformity, there would be even less accountability.

#### *V. Recent Transportation Conformity Action in Washington, DC*

Conformity has also been valuable in helping to win new emission reduction strategies in the metropolitan Washington, DC region and bringing about better accountability for transportation decisions. In July 2001, the MPO updated its modeling assumptions to reflect the growing use of sport utility vehicles (SUVs) and light trucks, which produce more pollution per mile driven than standard cars. As a result, they observed that they could no longer add new road projects to their TIP and RTP and still conform with the NO<sub>x</sub> motor vehicle emission budget in their adopted SIP. Officials formed a task force to consider reopening the SIP to allow for more motor vehicle pollution by finding offsets from other emission sources or fixing the conformity problem by adopting added emission reduction measures. With adjustments for some refinements to their model estimates and for emission reducing measures already being implemented but not previously credited, the MPO found that the 8 tpd NO<sub>x</sub> excess emissions over budget was reduced to about 3 tpd.

Following further meetings and analysis, Maryland Governor Glendening proposed a \$42 million package of transportation emission reduction strategies, including buying clean buses, improving pedestrian and bicycle access to transit, and supporting transit oriented development. The MPO is confident that this package, along with measures advanced by other jurisdictions, provides sufficient reductions to offset this emission budget shortfall and the region is moving to adopt them as part of a new TIP and RTP at the end of July 2002. If proposals to lengthen the duration of conformity findings to 5 years had been in effect, this \$42 million package of emission reduction measures would not likely have been funded.

Because of dramatic underestimation of transportation project costs by Virginia DOT, the region recently cut back its proposed short-term road program for 2005 by 100 lane miles of new road capacity. The MPO estimated this would result in

a 1.9 tpd reduction in NOx, along with a 0.6 percent reduction in daily VMT, a 1.3 percent increase in daily transit trips, a 0.1 percent decrease in VOC.

#### *VI. Cancer Risk Must Be Accounted For In Decision-Making*

Compelling new scientific evidence suggests that people living in communities located near heavily traveled highway facilities are being exposed to concentrations of toxic and hazardous air pollutants emitted by motor vehicles that cause an extremely high and unacceptable risk of cancer including childhood leukemia, and other respiratory and cardiovascular disease.

Research by California's South Coast Air Quality Management District demonstrates that toxic pollutants emitted by motor vehicles account for an unacceptably high cancer risk in the range of approximately 1 in 1,000 exposed individuals to 1 in 650. See, Multiple Air Toxics Exposure Study-II (MATES-II), March 2000. The study found that the total cancer risk in the Los Angeles Basin from toxic air pollutants measured at 8 monitoring sites ranges from 1,100 in 1 million (or 1 in 900) to 1,700 in 1 million (or 1 in 670), and that 90 percent of the total cancer risk is attributable to toxic air pollutants emitted by mobile sources. Most of the mobile source cancer risk is associated with exposure to the toxic pollutants benzene, 1,3 butadiene, formaldehyde and diesel particulate matter ("DPM"). In addition, concentrations of toxic pollutants estimated by a regional air quality model show that neighborhood exposures near heavily traveled highways is significantly higher than exposures monitored at the regional monitoring stations, producing a cancer risk as high as 1 in 130 (5800 in 1 million) in some receptor areas.

The estimates of increased cancer risk predicted in MATES-II are supported by recent epidemiology data. Evidence of the incidence of childhood leukemia in Denver during the late 1970's and early 80's, Pearson and colleagues (2000), shows an association between residential location within 750 feet of a major traffic corridor and an elevated incidence of childhood leukemia. These data suggest that exposure to higher than regional urban background concentrations of motor vehicle emissions is a significant risk factor for childhood leukemia. Other research provides evidence of increased incidence of other adverse health outcomes for residents of neighborhoods near heavily traveled highways. Brunekreef and colleagues (1997) show that adverse health outcomes including premature mortality and increased morbidity through increased respiratory and cardiovascular effects are associated with the increase in ambient fine particulate matter, e.g., particles less than 2.5 microns in diameter ("PM<sub>2.5</sub>") from roadway sources.

Taken together, this evidence requires FHWA to prepare comprehensive risk assessments to determine the health risks for neighborhoods located near heavily traveled roadways that are proposed to be built or expanded in densely populated metropolitan areas, and that alternatives to the development of high cancer risk travel corridors be chosen as the preferred alternative or that mitigation be adopted to prevent the incremental health risk attributable to toxic air pollutants emitted from these projects.

Attachment 5, *A Preliminary Toxicological Review of Roadway Traffic Pollution*, provides additional information on the need for better monitoring and mitigation or remediation to reduce exposure of people to air toxics from roadway traffic. It finds that

Analysis of published data for traffic emission factors and the resulting exposure estimates demonstrates that uncontrolled expansion of roadways will significantly increase exposures to both fine particulate matter and air toxins by the population in the contiguous residential corridor. This is significant because several epidemiological studies have shown that levels of fine particulate matter typically found adjacent to heavily trafficked roadways are comparable to levels that can exacerbate both acute and chronic respiratory disease symptoms and cause premature death among sensitive populations. This finding applies to short-term exposures of a few hours to one or several days. With regard to air toxins, exposures experienced by roadway corridor residents are likely to equal and probably exceed the air toxins levels measured at monitoring sites located near heavily traveled highways and reported in the Multiple Air Toxics Emissions Study II Study. Risk estimates based on the levels reported in the Multiple Air Toxics Emissions Study II resulted in an unacceptably high cancer risk of approximately 1 in 1,000 to 1 in 650 that was attributed to diesel exhaust and other motor vehicle emissions. The relative impact on other roadway corridor populations could be commensurate with the increased exposures to motor vehicle pollution that would result from their proximity to the large numbers of additional vehicles traveling the expanded highway.

The study notes that "Many current environmental assessments have not properly accounted for the differential impact that could be imposed on the nearby the popu-

lation adjacent to expanded highways. This analysis of available data demonstrates that a detailed program of pollutant monitoring and modeling that are specific for the planned expansion should be undertaken to properly quantify the potential adverse health impacts associated with projects of this type.”

Another study, *Review of Exposure to Toxic Air Pollutants From Mobile Sources and the Impact of Expansion of US 95 in Las Vegas, Nevada*, is included as Attachment 6. It relates the traffic increase caused by expansion of a major highway to the increased exposure of people in the corridor to traffic related air toxics. FHWA needs to assure that this kind of analysis will be routinely made a part of the review of major highway capacity expansion project approvals if these agencies are to fulfill their legal mandate to avoid adverse health impacts in decisions about project approvals.

Control of mobile toxics has not been adequately addressed by EPA and DOT. Conformity does not currently apply to air toxic pollutants. Although EPA has identified 21 air toxic pollutants emitted by mobile sources, it has not adopted an urban air toxics strategy as required by section 112(k) and 202(l) to reduce mobile source toxic emissions.

#### *VII. Prospects for Reducing Traffic Growth to Reduce Pollution and Harms from Traffic*

While technology based emission control strategies have been vital to progress toward cleaner air, strategies that reduce VMT growth can make low cost contributions to timely attainment and maintenance of healthful air quality, offering substantial benefits beyond clean air. These strategies include smart growth that renews existing communities and incentives and investments that improve transit, walking, bicycling, ridesharing, and telecommuting. Together these can provide reductions of 15 to 25 percent in VMT, hours of vehicle travel, and emissions relative to trend-line automobile-dependent sprawl development forecast over the 20 year horizon of regional transportation plans.

Recent changes in the tax code, make it more attractive for employers to provide transit, vanpool, and cash-in-lieu-of-parking benefits for their employees, which if widely implemented could reduce motor vehicle commute trips by 26–30 percent. These and other innovative strategies—such as intelligent transportation systems, value pricing of roads and transit, usage-based car insurance, traffic calming for pedestrian and bicycle safety, smart growth and telework can expand equitable access to jobs and public facilities and reduce growth in traffic, congestion, and air pollution. Regions can cap and reduce per capita VMT in coming years with such strategies, producing diverse short and long term benefits.

Georgia officials illustrated their capacity to achieve short term reduction in traffic, pollution, and health hazards from traffic during the Atlanta Olympics. By expanding their transit system with roughly 1000 leased buses, promoting travel alternatives, telecommuting, and other travel incentives, they cut morning peak traffic levels by almost one-fourth during the Olympics while the region accommodated one million visitors over a 3-week period. This led to a 28 percent drop in ozone levels and a reduction by 42 percent in the number of people seeking hospital treatment for asthma.

Several State studies have illustrated rail’s benefits for energy conservation, air pollution and global warming. For example, in California, a recent State study concluded that the State-supported intercity train network will prevent 265 million motor-vehicle-miles from being driven in 2002. While the resulting reduction in gasoline consumption is offset by increased diesel consumption by trains, the State projects a net saving of 7.3 million gallons of gasoline in 2002, helping to reduce both air pollutant emissions and the demand for imported oil (California Department of Transportation, *California State Rail Plan 2001–02 to 2010–11*, 2001, p. 6). A gasoline saving of this magnitude would reduce carbon dioxide emissions by about 140 million pounds, which is the equivalent of taking 12,000 cars off the road for a year. A study done for the Coalition of Northeast Governors in 1990 estimated that the introduction of high-speed rail service between Boston and New York would save 20 million gallons of jet fuel and 4.5 million gallons of gasoline per year. Although some pollution is generated from the electricity that powers the trains, the net effect of high-speed rail between Boston and New York would be to eliminate almost 2,700 tons of smog-forming pollutants each year.

Public transportation has been estimated to cut gasoline use by more than 1.5 billion gallons a year and to prevent the emission of 63,000 tons of hydrocarbons and 78,000 tons of nitrogen oxides. These numbers don’t even consider the much greater indirect energy and environmental benefits of the efficient housing and work environments made possible only by the availability of rich transit networks in places like New York City, San Francisco, and Washington, DC. And vital new economic

centers, such as San Jose, Denver, and Portland, Oregon, could not sustain and manage their growth without having invested heavily in transit.

When high quality transit services are consistently developed and sustained over the long-term, they transform community patterns of travel, commerce, and urban development, producing much larger pollution reductions. A recent study by the National Transit Cooperative Research Program of the National Academy of Sciences found that transit-supported compact developments yield 10–30 percent less overall community energy use and pollution compared to low density, car-dependent sprawled development, as well as lower total social and infrastructure costs. Many regional and sub regional studies using best practice analysis tools to compare alternative investment strategies and related policies, e.g., in Denver, Portland (OR), Sacramento, and Washington, DC, have found that transit supported strategies can accommodate equivalent amounts of new development with significantly less traffic and pollution while automobile-oriented strategies induce added traffic and pollution.

Indeed, by focusing growth around an expanded transit system, reducing expenditures on roads, and adopting an urban growth boundary and pedestrian-friendly urban design standards, Portland, Oregon has pursued a path different from most other U.S. metropolitan areas. Since the adoption of the 235,000-acre growth boundary in 1979, Portland has urbanized just 39,000 acres. At the same time the population inside the boundary has increased by more than a third. No new road capacity has been added to the downtown for nearly a quarter century although employment has nearly doubled in that time to 1,500. Transit carries the equivalent of two lanes of traffic on every major thoroughfare to downtown. Portland tore out a six-lane expressway to create a downtown river front park, traded in the money for two new freeways and invested in transit. Between 1990 and 1996, transit ridership grew 20 percent faster than the growth in vehicle miles traveled, 41 percent faster than the growth in transit service and nearly 150 percent faster than the growth in population. Portland's adopted regional plan envisions a 40 percent increase in population and just a 2 percent increase in land area by 2017. The experience of most cities with less consistently transit-focused policies has been that urban land consumed per person has skyrocketed, exacerbating car dependence. Seattle's experience is typical, with a 38 percent population increase accompanied by an 87 percent increase in urban land area between 1970 and 1990.

Portland has been a leader in adopting effective SIPs and Maintenance Plans that include high-performance Transportation Control Measures (TCMs). Portland expects to achieve a 5 percent cut in vehicle miles traveled by 2010 thanks to changes to its zoning and parking codes that reduce the over-supply of parking and encourage mixed-use development. It has previously adopted SIP TCMs that required local governments to modify local zoning to support transit oriented development, consistent with Federal Transit Full Funding Agreements that were predicated upon such zoning changes to assure a sound market for transit use.

Another region facing sprawl pressures that are being countered with better transit is Denver, which anticipates accommodating a million new residents in the coming 20 years. A recent survey by the Downtown Denver Partnership shows that before the new Southwest light rail line opened, one in four downtown commuters used transit; since the new line opened, one in three do. It is estimated that it would take 175 additional miles of highway in the Denver metro region to carry all the people who use transit today. Recent public transit investments have been very successful; both light rail and the bus and carpool lanes on north I-25 have exceeded projections for ridership. The 14-mile light rail system takes 525 bus trips off city streets each day. One light rail train can replace over 200 single occupant vehicles. More than 33,000 people ride the light rail daily about 30 percent above the original ridership projections. New transit investments are not only alleviating traffic congestion and cutting pollution, they are revitalizing communities by serving as infrastructure for creating new town centers and livable, walkable communities. The once dead Englewood mall has been reborn in the past 2 years as a mixed-use city center with homes, offices, stores, cultural, and civic uses, thanks to Denver's Southwest light rail line that now serves it. And the growth attracted to this center otherwise would likely have taken a much more polluting, car-dependent form at the periphery of the metro area, but for Denver's transit-supportive policies.

#### *Strengthen Commuter Choice: Boost Employer Support for Transit*

Federal and State tax policies are a key factor driving increased dependence on motor vehicles. For the vast majority of working Americans, a free parking space at work has for decades been the sole commuter benefit offered by employers because that was until recently the only tax-free commute benefit worth speaking of. So if you drive alone to work you gain the benefit. If you take transit, carpool, walk,

or bike, you lose the benefit and likely pay your own daily transit fare. With this kind of incentive, it's no surprise that on any given day nine out of ten American commuters drive to work and nine out of ten of the cars driven to work have one occupant. Yet the 85 million "free" or subsidized employer parking spaces actually cost American business more than \$36 billion per year. By spurring more driving, these subsidies exacerbate traffic congestion and air pollution. A congressional study found that "free" parking of all kinds costs our society over \$250 billion per year.

In 1998, Congress took steps to make tax policies more equal for all commuters, allowing employers to offer tax-free transit and vanpool benefits of up to \$100 a month, with taxable cash-in-lieu-of-parking benefits allowable for the first time. Tax-free benefit limits for employer-provided parking were set at \$175 per month—a practice which still leaves solo drivers at an advantage. Allowing employee-paid pre-tax transit benefits saves transit-using employees over \$400 a year while saving employers a smaller amount on withholding. Having employers pay for transit is a bigger incentive for employees. Offering such a benefit to Federal executive agency employees in the national capital region induced 11 percent of employees who used to drive to work to switch to transit, taking 12,500 cars off the region's crowded roads every workday. At firms in California and Minnesota offering a \$2 a day incentive instead of free parking, one out of eight who used to drive are finding another way to get to work. Such benefits help employers attract and retain employees and provide the greatest help to low and moderate wage workers who spend the largest share of their incomes commuting and often ride transit, carpool, bike, or walk to work.

The cost of such employer provided transit benefit programs to employers is very small and can easily be fit within the scope of ordinary cost-of-living increases offered by most employers to their employees on a periodic basis. State tax credits can make this cost even smaller. For example, in Maryland, if an employer offers an employee a cost of living increase, for each \$1 in after-tax cost to the employer, the employee typically receives \$0.53 in after-tax income. If that same \$1 in after-tax employer expense is instead devoted to an employer-paid qualified transit benefit of \$60 a month, the typical Maryland employee who receives it ends up gaining \$1.76 in after-tax benefits, thanks to the leveraging effect of Federal and State tax provisions.

The savings for employees offered by the Federal tax law changes are significant and make a high level of employer and employee participation in the next several years realistic across America. For example, an employee earning \$50,000 per year who spends \$780 annually on transit (\$65/month) could realize a tax savings (at 42 percent) of \$328 as a result of paying their transit cost using pre-tax dollars, exercising one of the new Commuter Choice options, while their employer would gain payroll tax savings (at 7.65 percent) of \$60 per employee (Arthur Andersen). Even if the cost to set up and administer the program equals 2 percent of the transit benefit, the employer will still enjoy payroll savings of \$44. Employers are likely to face new costs to offer transit passes or added cash income in lieu of parking, but these can also translate into substantial cost savings of several types. It is much cheaper for an employer to boost non-taxable employee benefits than to offer added taxable income to retain or attract workers, which is an increasing issue in a tight labor market. If the employer is able to expand employment without adding more parking spaces or to otherwise avoid the cost of building, leasing, or maintaining parking spaces for workers, capital cost savings can amount to \$5,000 to \$20,000 per avoided space and operating costs can amount to \$750 to \$3,000 or more per year per avoided space. Such savings are often significant enough to more than pay for a cash in lieu of parking or transit pass benefit.

Commuter Choice programs have been shown to unite the diverse interests of environmentalists, business, labor and transit and highway advocates. Most realize that Commuter Choice is good for business and for communities. Commuter Choice is a voluntary incentive that boosts travel options and supports more efficient use of the roads and transit we already have. It can provide quick relief to traffic-strained communities and will expand market opportunities for new forms of access to suburban jobs. Low- and moderate-income workers benefit particularly, since commuting costs represent a larger relative burden on them, and they tend to be more reliant on ridesharing and transit. The Alliance for Clean Air and Transportation, a national group representing a diverse array of sectors, including the road builders, automobile industry, environmentalist and health groups, the American Association of State Highway and Transportation Officials, Highway User Federation, American Automobile Association, the National Association of Regional Councils, and the US DOT and EPA, in February 2000 adopted a consensus goal of making Commuter Choice benefit programs a standard part of the American worker benefit program over the next 5 years.

However, Commuter Choice will have an effect on air pollution only if people know about it and use it, and if the opportunities for cost savings offered by aggressive implementation of these incentives are made evident and available to developers, building owners and tenants, and commuters. Marketing alone has been shown to be inadequate to win widespread adoption of Commuter Choice incentives. There are many strategies that can be taken by States, regional bodies, and local municipalities to foster rapid and widespread adoption of Commuter Choice incentives so these might become available to the average commuter. Additional financial incentives and support by transportation agencies and other government bodies are essential to rapid adoption of Commuter Choice voluntary incentives and can be highly cost-effective in reducing congestion and pollution.

DOT and EPA are promoting Commuter Choice, but congressional action is needed to further expand efforts to foster widespread adoption of these voluntary incentives. EPA estimates that if half of all U.S. employees were covered under these commuter benefits, traffic and air pollution could be cut by the equivalent of taking 15 million cars off the road every year, saving American workers about \$12 billion in fuel costs. For every 10 percent of U.S. employees participating, commute VMT would be cut by 3.2 percent, or 20 billion miles, with emission reductions of 54,000 tons VOC, 480,000 tons CO, 33,600 tons NOx, and 2.36 million tons CO<sub>2</sub>. In SIP Development Guidance: Using Emission Reductions from Commuter Choice Programs to Meet Clean Air Act Requirements, EPA estimates reductions of 26–30 percent in commute vehicle trips for a full Commuter Choice program. Los Angeles research shows that those who receive free parking at work drive 72 cars per 100 employees, while those who paid for parking at work drove 53 cars per 100 employees, or 26 percent less (D. Shoup, “An Opportunity to Reduce Minimum Parking Requirements,” *Journal of the American Planning Association*, Winter 1995, pp. 14–28.).

Congress should take further steps to encourage employer support for such ‘Commuter Choice’ initiatives. Congress should support for the following bills that would do this:

- The Commuter Benefits Equity Act of 2001 (H.B.318) would provide equal tax-treatment for parking and transit benefits.
- The Bike Commuter Act (H.R. 1265) would allow employees who bike to work the same financial incentives as transit users.
- The Mass Transit Tax Credit Act of 2001 (H.R. 906) would provide a 25 percent tax credit to employers for the cost of providing transit benefits to their employees. This is modeled after measures adopted by several States—including Maryland, Minnesota, Oregon, Washington, Georgia, New Jersey—that have begun offering tax credits of up to 50 percent and up to \$50 per employee per month for employer-paid non-driving commuter benefits.

TEA-3 should also require that local and State officials do more to consider integrating Commuter Choice into their transportation plan and program development. In all non-attainment areas, transportation programs should assure that potential air pollution reduction benefits from Commuter Choice will be realized in a timely manner. These would include provision of these benefits to State and local government employees, aggressive marketing of these benefits to employers and employees, inclusion of Commuter Choice programs in local planning, development review, and other decisionmaking procedures and favorable local and State tax treatment. Such new travel demand management activities and incentives should be given priority by including them in air quality SIPs as Transportation Control Measures.

This promotion should include marketing, technical and administrative assistance, new transit fare products, such as deep-discount bulk purchase transit and vanpool benefits for 100 percent of an employer’s work force in the region, and new financial incentives for employers and employees that are adjusted annually in an effort to meet Stated performance targets. State Implementation Plans should include targets, timetables, and expanded funding commitments for (a) providing different segments of the labor force with Commuter Choice options of various types and (b) achieving increased levels of use of various Commuter Choice incentives by various portions of the labor force. These targets could be used as the basis for estimating SIP credits if accompanied by commitments to reasonably linked funding and policy commitments that could be anticipated to meet these targets.

#### *Financing Transit With Automated Road Pricing*

Another promising option for curbing traffic and emissions growth while enhancing mobility is automated time-of-day tolls and High Occupancy Toll (HOT) lanes, which allow solo drivers to pay to use High Occupancy Vehicle (HOV) lanes, while giving a free ride to buses, vans, and sometimes carpools. These can put to work unused capacity in HOV lanes and help pay for expanded transit services. A net-

work of HOT lanes on existing highways is likely to provide more effective congestion relief than building new roads. New outer beltway toll roads are likely to bring more sprawl and put more jobs out of reach for those without cars, hurting the poor and the environment. Why not instead give time-stressed travelers a way to buy relief from growing congestion delays in existing freeway corridors and finance better transit?

HOT lanes in existing road corridors can expand both travel choices and equity. HOT lane critics unfairly bash them as “Lexus Lanes,” serving only the rich. Real-world HOT lanes look more like “Lumina Lanes,” used by people of widely varying incomes who occasionally need to bypass traffic delays that disrupt their social, family, or work life. A working class mom who is facing a \$1 a minute penalty for picking her kids up late at day care is happy to pay \$4 to save 20 minutes by using the HOT lane on those several days a month when she needs it. The typical users in California spend less than \$20 a month on HOT lane tolls, using them on days they are in a real rush. If HOT lane revenues fund new bus services, as on San Diego’s I-15 HOT lane, everyone wins. Lower income transit users and carpoolers get access to otherwise inaccessible suburban jobs. Drivers benefit from reduced road congestion and better services and choices. If HOT lane revenues help pay for the road, those who drive most are paying more of their fair share, helping all taxpayers win. Road user fees don’t nearly cover the full cost of building and operating America’s roads, which remain subsidized by broader taxes. And with new accounting rules forcing fuller disclosure of deferred maintenance, transportation providers need new sources of revenue to maintain systems, expand choices, and cope with growing travel demand.

New non-stop electronic toll technology means motorists don’t need to slow down to pay tolls. And HOT lane fees—higher in rush hour and discounted at other times—keep traffic flowing without wasting scarce road capacity like HOV lanes do. This makes it possible to contemplate future conversion of some existing general-purpose lanes to HOT lanes, particularly where new capacity is being added to existing roads. HOT lane experience indicates this strategy can garner popular support. On California’s Route 91, diversion of traffic onto HOT lanes has reduced congestion on the entire road and increased the number of passengers per car to 1.6, compared to the average of 1.2. Similar incentives have been implemented or are being considered in Texas, Florida, Colorado, Georgia, New Jersey, New York, and other States.

The Port Authority of NY-NJ in March 2001 introduced time-of-day tolls on Hudson River bridges and tunnels and Staten Island bridges, giving discounts for electronic toll payers who avoid rush hours and charging a premium in the time of most concentrated demand, just like movie theaters and many other services. This helps reduce congestion by shifting the time of day of traffic. Toll revenues support better PATH transit and regional transportation infrastructure and services. The NJ Turnpike, NY Thruway Authority, and other tolling agencies have implemented time-of-day tolls to manage traffic.

Congress should encourage States and transportation facility operators to replace obsolete toll booths that cause congestion and pollution with new barrier-free customer-friendly tolling systems using toll transponders and image processing and billing systems. Congress should encourage State motor vehicle agencies to issue toll transponders with motor vehicle registrations to encourage their widespread availability in States where tolls are used. Congress should eliminate restrictions on tolling highways that were constructed with Federal aid, which can now only be tolled under limited pilot projects authorized by TEA-21.

#### *Promote Smart Transit Fare Payment Systems for Productivity Gains*

New information technologies and smart management strategies are vital to making America’s transit systems more efficient and attractive for users while controlling costs. There are many things that should be done in this regard, including improving fare collection systems and giving buses and trolleys greater priority in traffic. Enhancing priority for buses and trolleys in traffic can increase average transit travel speeds, schedule adherence, and the number of passenger seat-miles per hour that can be carried by existing transit vehicles. A key part of this strategy involves upgrading traffic signals to support greater priority in traffic for buses, so they can hold a green signal green for a few extra seconds, or advance a red signal to green to avoid an extra stop. The strategy can also include building or configuring bus queue jumper lanes at key traffic bottlenecks to speed bus traffic past congestion, creating dedicated bus lanes, and bus boarding stations. These are often combined to provide “Bus Rapid Transit,” which can often provide many of the benefits of fixed guideway rail services quickly at a lower cost.

Across America, buses are slowed by passengers who must file through the vehicle's narrow front door to board and pay an exact cash fare. Encouraging near universal use of pre-paid transit fare instruments and other high efficiency transit payment options, as in Europe and Japan, enhances productivity of existing and new transit services by reducing delays related to fare payment at time of boarding. Instead of having people pay cash on boarding, require that passengers carry a pre-paid transit pass, or other fare media that must be validated before or immediately after boarding a transit vehicle, and which at a premium cost could be purchased on board the vehicle. Greater use of daily, weekly, monthly, and annual transit passes helps accomplish this. Fare inspectors roaming transit systems and spot checking to verify that passengers are carrying a valid proof of fare payment or a pass, with large fines for fare evasion assure broad compliance. This enables boarding of buses through both front and rear doors, which boosts transit vehicle productivity.

*Provide Safe Routes to Schools and Transit by Foot and Bike*

Walking and biking are pollution free modes of transportation that millions of Americans enjoy where street and community design allows them to be done safely. and public transit is only as useful when people can get to and from its stops, which usually requires walking at one or both ends of the trip. A key part of the transit success story of recent years—with U.S. transit ridership growing faster than vehicle miles driven for the past 5 years—is attributable to TEA-21's increased support for investments in walking and bicycling. TEA-21 reauthorization should take further actions to assure a safe route to schools and transit stops across America, adapting successful strategies from the most bicycle and pedestrian friendly communities. This should include requiring transit agencies to develop least-cost transit access plans that consider and compare walk, bike, and automobile access opportunities to expand the market reach along all their transit lines. It should include accelerated funding to local governments to enable the build-out of the 20 year bike and pedestrian plans in the next 3 years, planning funds to engage in local area pedestrian and bicycle planning to identify key barriers and safety problems, and delay of some road projects to provide funds to retrofit sidewalks, bike paths, and traffic calming measures within a half-mile of all transit stops and schools. Such measures should be required as reasonably available control measures in all non-attainment areas.

About 40 percent of Americans own bicycles, and many of these people live one-quarter mile to two miles away from express transit stops. Few of these people now use transit to get to work, in part because of the lack of an inexpensive, convenient, safe, and fast transit access system suited to trips of this distance. In the Silicon Valley of California, 40 percent of those using bicycle lockers at rail stations leave bicycles in them overnight and use them to get from the station each morning to their nearby schools and employment, just as in the Netherlands.

Another means of reducing traffic is to implement neighborhood traffic calming to reduce motor vehicle speeds on many streets to improve safety for pedestrians, bicyclists, and motorists, and reduce emissions from car travel. Traffic calming has been shown by research to reduce idle times by 15 percent, gear changing by 12 percent, brake use by 14 percent, and gasoline use by 12 percent, injuries by 60 percent, fatalities by 53 percent, and air pollution by 10 to 50 percent. The majority of all urban and suburban streets and roads are already quite suitable for bicycling, with relatively low traffic speeds and low traffic volumes. However, such residential streets usually lead to bicycle-hostile major roads before reaching major activity centers and schools. Frequently, development of small missing links can make the difference between safe bicycle access and lack of access.

Experience shows that high levels of bicycle use only occur where the street system is bicycle-friendly. Where well-connected networks of bicycle friendly streets, bicycle paths, and bicycle lanes have been provided—such as Davis, Palo Alto, and Santa Barbara, California, Madison, Wisconsin, and Gainesville, Florida—bicycle mode shares of 10–25 percent are common. Where such networks are not available, only the hardiest of cyclists take to the roads for purposeful travel, leading to bicycle mode shares of 2 percent or less. (Michael Replogle, *Bicycle and Pedestrian Policies and Programs in Asia, Australia, and New Zealand*, U.S. Federal Highway Administration, Washington, DC 1993). Marketing, education, and promotion programs are also needed to encourage greater and safer use of bicycles for short utilitarian trips, including transit access, particularly in conjunction with initiatives that reduce the current barriers of theft, security, safety, and legitimacy which impede non-recreational bicycle use in America.

*Build Guarded Bike Parking at Major Transit Stops*

U.S. metro areas have invested in costly park-and-ride systems that have made transit increasingly dependent on the automobile. Other regions, especially in Europe but also in some U.S. communities, have been strengthening the potential for people to walk and bicycle to and from transit, boosting ridership at a far lower cost. In much of Europe, the fastest growing and often predominant access mode to suburban express transit services is the bicycle. Bike-and-ride services expand the potential market area of express public transportation at low cost without the very high air pollution emission and energy use rates per VMT, excessive space requirements, and high capital costs of automobile park-and-ride systems. While park-and-ride enables those living in lower density areas to travel from home-to-transit stop, bike-and-ride systems providing secure overnight bicycle parking can facilitate both access and egress to transit, enabling travelers to get from transit stops to nearby workplaces and schools which are otherwise unreachable by transit. Bicycle access can be invaluable in adapting transit to serve 21st century suburban development patterns.

In many U.S. communities, transit access planning looks only at automobile access. Yet many people don't use transit because they can't find affordable or available parking nearby when they want it. It costs \$5,000-\$20,000 to build a single additional parking space, and \$750-3,000 a year to operate a park-and-ride space. Providing bike lockers, bike racks, and guarded bicycle parking at transit stops can free up car parking spaces for those who can't bike or who live too far to bike to transit, while offering a low cost healthy way for those 1/2 mile to 2 miles from the transit station or stop get to and from transit. Guarded bike parking at transit is a predominant part of transit access in European and Japanese suburbs, where it costs 1/10 to 1/100 as much as auto parking at transit to provide and operate. And secure overnight bike parking at transit allows people to get from transit to nearby schools and jobs that are beyond walking distance of the transit stop.

In 1996 the city of Long Beach implemented the nation's first attended bicycle parking facility, or "Bikestation." These facilities provide a range of clean transportation options—including secure, bicycle parking, bicycle repairs and accessory sales, changing and restrooms, and bicycle rentals. Bikestations have since opened in the communities of Palo Alto and Berkeley and are under development in San Francisco, Denver, Seattle, Santa Barbara, Los Angeles and Pittsburgh, Pennsylvania. (see [www.bikestation.org](http://www.bikestation.org))

*Congestion Mitigation Air Quality Funding: Vital For Clean Air*

All of the traffic reduction strategies discussed above are eligible for funding under the \$8.1 billion 6-year Congestion Mitigation Air Quality Program (CMAQ) and under most other flexible TEA-21 programs. However, spending by State DOTs of CMAQ projects have gone disproportionately toward more traditional investments, such as buying conventional fuel transit vehicles and making conventional improvements to facilitate traffic flow. States have flexed little STP or NHS funding to the kinds of traffic reduction programs described above.

CMAQ was first established in the 1991 ISTEA law to assure that regions and States would have funds to help cleanup pollution from transportation and to meet the conformity and planning requirements of the 1990 Clean Air Act. While funds could have been better spent in many cases on more innovative traffic reduction activities, the CMAQ program has proven its value and earned wide support.

Funding for CMAQ should be substantially expanded in TEA-21 reauthorization in recognition of the increased problem of air quality non-attainment. Traffic flow enhancement projects should have reduced eligibility for funding under CMAQ, as there are more than ample other sources of Federal and State funds available for these types of projects. CMAQ should not be opened up to become a general operating assistance program for transit, but should focus on funding innovative air pollution reducing initiatives and a wide array of strategies and programs to reduce or managing travel demand, including incentives for smart growth; revision of local zoning, parking, and design codes; creation of accessory apartments near jobs and transit; freight and goods movement management strategy planning; traffic calming; and much better data collection and analysis to support and evaluate these initiatives before and after implementation.

State and local air quality agencies should be given authority to allocate CMAQ funds in consultation with transportation agencies to foster more cost-effective and innovative investments. More funding for public-private partnerships working to reduce traffic and pollution growth should be funded with CMAQ. Projects producing reductions in greenhouse gas emissions and air toxics should be recognized and funded. And CMAQ project approvals should be simplified to facilitate innovation and timely response, with a stronger emphasis on program evaluation to facilitate

organizational learning. The obligation rate for CMAQ funds has been a major problem, with many State DOTs overspending other fund accounts and short-changing CMAQ eligible projects that could have delivered more timely progress on clean air. A significant portion of CMAQ funds should be sub-allocated to metropolitan areas and counties to assure a stronger local voice in project selection.

U.S. EPA has promulgated new health-standard based National Ambient Air Quality Standards (NAAQS) under the Clean Air Act in recognition that the old NAAQS were insufficiently protective of public health. The Supreme Court has upheld this new standard following an industry challenge, and new designations are now overdue. According to the latest available monitoring data from EPA, 123 million people live in the 333 counties violating the 8-hour ozone standard and 82 million live in 173 counties that violate the PM fine NAAQS. There is some overlap but it is reasonable to expect that the total population living in areas with unhealthy air will be approximately 150 to 165 million. In 1999, nearly 54 million people live in areas that do not meet the 1-hour ozone standard. Currently only ozone non-attainment area population is recognized in TEA-21's CMAQ obligation formula.

It would be equitable to allocate CMAQ funds to help counties, cities, and States deal with fine particulates and air toxics in addition to ozone. Reauthorization appropriations should recognize the expanded scope of funding needs by proportionate expansion of CMAQ funding based on both population and the degree of pollution remediation needed. Otherwise existing non-attainment areas will suffer crippling cut-backs in funds for air pollution reduction programs even while being asked to take additional steps to further cut pollution to protect public health. An increase from the 54 million population in ozone non-attainment areas to 150 million in new non-attainment areas would imply far more than a doubling of funds is needed just to assure maintenance of effort in older non-attainment areas.

Some argue that CMAQ projects and TCMs are not cost-effective, but a recent TRB study concluded that it was not possible to undertake a credible scientific evaluation of the cost-effectiveness of the CMAQ program at the national level. Lack of data collection, deficiencies in regional travel analysis models, and the wide ranging nature and small scale of many CMAQ funded TCMs, which affect only a small segment of a large regional transportation system limits the ability of anyone to evaluate this program's cost-effectiveness.

The more answerable and important question to pose may be: What is the cost-effectiveness of overall regional transportation and growth plans vs. smart growth and transportation-choice-enhancing alternatives? This is a vital query that could be answered over the course of the next transportation reauthorization if Congress requires States and metropolitan areas to develop integrated transportation, environmental resource management, and growth management plans, with public involvement and consideration of alternatives.

#### *VIII. Accountability and Stewardship: Key to Clean Air and Sustainable Mobility*

Public support for transportation funding will be sustained only if Federal, State and local agencies improve transparency about how they spend money and can be held more accountable for the long-term effects of transportation projects, programs, and plans.

Some State DOTs are carrying through on the mandate of TEA-21 to integrate the Major Investment Study requirements into NEPA project reviews and the transportation planning process, despite the absence of DOT regulations, and by doing so are considering smart system management, pricing, partial build scenarios, and smart growth strategies as they consider major new investments. Some States are pursuing stewardship initiatives to change the culture of State DOTs and to foster closer planning and operational partnerships with State resource agencies and key stakeholders. Most States have improved interagency cooperation so that their transportation plans conform with their adopted air pollution control plans. To accomplish this, some regions, like Charlotte, NC, are adopting SIP TCM air pollution control strategies, such as new regional transit with supportive growth management to help offset future emission increases from highway transportation. Congress should encourage these best practices.

Other transportation agencies and road builders are trying to scapegoat environmental laws for their own administrative failures which are manifested in a lack of local consensus on proposed projects, insufficient State and local funding match dollars, and stalled reviews due to inadequate consideration of alternatives, inadequate mitigation and avoidance of adverse impacts, and efforts to end-run Federal requirements. These interests want to expedite transportation project delivery by weakening Clean Air Act conformity requirements, setting deadlines for project reviews, diminishing consideration of alternatives and indirect impacts, limiting op-

portunities for stakeholders and resource agencies to influence decisions, and limiting judicial review. Congress should reject these proposals that would undermine core environmental protections, spur greater conflict, erode public support for transportation funding, and make it less likely that communities will consider and implement investments and policies that improve and support transit.

In reauthorizing TEA-21, Congress should require all State and metropolitan areas to develop and periodically update, with public involvement, integrated transportation, natural resource protection, and growth management plans that consider at least one alternative scenario that considerably reduces traffic growth and enhances environmental performance through better system management. Agencies should annually report on the current and projected performance of their transportation system management, investment, and proposed programs and plans, accounting for cumulative and secondary impacts on growth patterns, public health, greenhouse gas emissions, the achievement of natural resource planning goals for air, water, and habitat protection, and the provision of equal access to jobs and public facilities for all residents, including those without cars, without undue time and cost burdens.

The GAO recently noted, “Those MPOs in areas without air quality problems that anticipate rapid growth in the future might benefit the most from conducting emissions assessments and considering land use because their areas still have the opportunity to shape growth in ways that will also protect against future air quality degradation. However, because so few of them conduct assessments and are not required to do so, they may not realize these benefits.”<sup>9</sup>

California’s recently enacted AB 2140 law provides a model for this, (1) establishing a standardized set of basic transportation performance indicators related to safety, congestion, road repair needs and public transit that each region must begin to track; (2) establishing a standard method of financial reporting to help the public and local officials know what their money’s being spent on; and (3) requiring an “alternative planning scenario” in the development of each region’s 20 year transportation plan in order to provide a clear alternative to present growth patterns that could minimize future demand on transportation infrastructure while reducing congestion, protecting open space, and saving taxpayers money. Adopting a Federal version of AB 2140 in TEA-3 would give the public and local elected officials expanded transportation investment choices including options to better support transit and manage both traffic and land development, supporting an environmentally sound approach to expediting project delivery.

Proposals to weaken transportation conformity by having it apply less frequently to combined 5-year TIPs and RTPs threaten to put this accountability system into a deep freeze where it can be ignored except during periodic conformity crises that occur each time conformity analysis is performed. Rather than helping transportation agencies make accountability for air quality an ordinary part of doing business, less frequent conformity analysis requirements would allow much greater pressures to build in the system between analyses, causing more frequent failure of SIP control strategies and more frequent conformity lapse surprises. By demonstrating conformity of TIP amendments routinely, transportation agencies get early warning of problems with ‘conformity lockdowns’ that prevent new traffic and pollution inducing projects from being added to RTPs and TIPs until resolved. Most agencies are thus able to act in a timely manner to avoid conformity lapses, which more seriously limit them to advancing projects that already have funding agreements, exempt projects, and TCMs.

Proposals to weaken conformity by having it apply only to the first 10 years of the RTP or to the last horizon year in the SIP also threaten to cause a renewed widespread failure of SIP control strategies. This proposal would allow major projects, such as new outer beltways, to advance far into planning, development, and construction before accounting more fully for their profound long-term impacts on regional growth and traffic patterns, and related air pollution. Regional traffic models are already too insensitive to induced traffic and land use effects. This proposal would exacerbate this problem. Some State DOTs complain that they must make up for pollution growth from traffic in the out years of their 20 year transportation plans, without help from SIP control strategies after the attainment year. While SIPs are not required to adopt control strategies beyond the attainment year until the attainment year is reached and requirements for a 10 year maintenance plan are triggered, at least a half dozen States have adopted SIP control strategies that extend beyond or begin after the attainment year, to help transportation agencies deal with this problem.

<sup>9</sup>U.S.GAO-02-12, op. cite, page 45.

For example, Denver was faced with a terrible PM problem in the 1980's. Agencies began taking action against wood burning. There was progress made during this period, but PM was still measuring 185 g/m<sup>3</sup> compared to the NAAQS of 150 g/m<sup>3</sup>. Conformity made transportation planning and air quality agencies look at other sources of PM. They started looking at street maintenance practices and implemented street sanding and sweeping strategies in the mid 1990's. Strategies have been implemented beyond what is legally required by the CAA. Within 2 years PM level dropped to 80 g/m<sup>3</sup>. Conformity really woke everyone up. Denver legally has enough measures in maintenance plan to meet health standards through 2015. Conformity provided additional incentive for developing light rail in Denver since it would help mitigate the PM problem. Conformity also led to the development of Metro Vision 2020 which recommends limiting growth to a 700 square mile area and is committed the region to transportation alternatives to support this goal. Denver also has a number of TDM strategies in their long range plan such as a RideArrangers program and a telework program. They do not take credit for TDM system management in the 2025 conformity finding, but they recognized the potential for reduction and retain them as a safety margin in meeting the emissions budget.

TCMs represent nearly 5 percent of total emission reductions in the San Joaquin region of California. The SJCOG Model projects that TCMs will deliver as much as 10 percent reduction in emissions by 2020. In San Joaquin County rideshare, van-pool, and commuter rail provide significant emissions reductions, with a large percentage of San Joaquin County residents facing long distance commutes into the San Francisco Bay Area.

Charlotte, North Carolina's struggle with conformity in the out years of its RTP has helped it to recognize the importance of making careful land use and transit decision to avoid losing jobs and housing to areas outside the center city, and becoming overburdened by congestion, problems that other cities are currently facing. The 2025 Transit Land/Use plan for Charlotte-Mecklenburg proposes a rapid transit system to support the five major transportation and development corridors identified in the 1994 Centers and Corridors Plan as well as connections to key development hubs between these corridors. The plan includes proposals to:

- Concentrate jobs around stations
- Provide residential multi-family housing at stations
- Develop rail technology
- Establish Bus Rapid Transit

Capital costs, plus operation, maintenance and other expenditures will cost \$1.085 billion over 25 years and quantifiable benefits such as travel time savings and vehicle operating cost savings total \$72 million a year, generating a benefit cost ratio of 1.6. There are also numerous benefits of the plan that are not quantifiable such as improved access to jobs and revitalization of the core center. Funding for the plan will come from a combination of local, State, and Federal funding. Mecklenburg County Voters approved a half cent local sales tax in 1998 to fund expansion of bus service and rapid transit improvements in major corridors. The requirement that the RTP conform 20 years into the future was a vital element in motivating this regional progress and action. Limiting conformity determinations to a 10-year time horizon might reduce the incentive for other regions to take the kind of leadership initiatives seen in Charlotte.

States and local governments have the opportunity to use their SIP process to establish caps on pollution from the transportation sector that will make conformity a meaningful performance objective for progress in attaining more healthful air quality by reducing traffic growth. If they choose, by law they may increase technology-based emission controls on transportation vehicles and fuels and non-transportation sources to allow extra room for growth in motor vehicle use while still meeting deadlines for timely attainment of healthful air quality. If States relax emission controls or allow increased emissions from power plants, new energy development, airport expansions, or other activities, States may need to further curb motor vehicle emissions to offset these other sources of pollution and protect public health.

Conformity will help assure progress toward timely attainment of newly revised National Ambient Air Quality Standards (NAAQS). Proposed and potential emission controls on diesel engines and fuels and off-road mobile emissions will create considerable new room for growth in motor vehicle use within conforming 1-hour ozone transportation plans until new 8-hour ozone SIPs are put in place unless the on-road SIP motor vehicle emission budgets are reduced to assure more timely attainment of healthful air quality. Many transportation agencies will seek to use such near-term emission controls to make irretrievable commitments to sprawl-inducing

outer beltways and other traffic and pollution generating investments in advance of the setting of new more stringent motor vehicle emission budgets that are part of attainment demonstrations to the new NAAQS. If this occurs, the public, utilities, and industry alike will face higher costs and greater delay to attain healthful air quality.

Congress should resist pressure from the road builders to weaken or rework conformity before it has had opportunity to operate under the framework of adopted emission budgets demonstrating attainment, which have only taken effect during the last year in most seriously polluted regions. Conformity is working. We need to strengthen its accountability to help reinforce the trend that is evident in some States for stronger environmental stewardship by transportation agencies.

The concerns I raise today are shared by hundreds of thousands of members of diverse environmental and public health groups, represented by the two letters, Attachments 9 and 10, enclosed for the record.

---

ADDENDUM TO THE 1997 FEDERAL HIGHWAY COST ALLOCATION STUDY

FINAL REPORT—U.S. DEPARTMENT OF TRANSPORTATION

FEDERAL HIGHWAY ADMINISTRATION

MAY 2000

*Introduction*

When the 1997 Federal Highway Cost Allocation Study (HCAS) was sent to Congress in August 1997, estimates of air pollution-related costs of highway use were not included. Research by the Environmental Protection Agency (EPA) on social costs associated with air pollution was being completed and the Department of Transportation wanted estimates of air pollution costs attributable to highway use by motor vehicles to reflect the new EPA research. This addendum to the 1997 Federal HCAS presents estimates of air pollution-related costs of highway use and summarizes how these costs relate to other costs analyzed in the 1997 Federal HCAS. In this addendum, as in the 1997 HCAS report, costs of air pollution, congestion, and other impacts of highway use not borne by transportation agencies represent social and economic costs incurred by affected individuals, not engineering costs to comply with standards or to mitigate adverse impacts as the term "costs" is often used in the environmental literature.

Two changes relevant for highway cost allocation have occurred since the 1997 Federal HCAS was submitted to Congress. First, proceeds of 4.3 cents per gallon of motor fuel tax that had been dedicated for deficit reduction by the Omnibus Budget Reconciliation Act of 1993 (P.L. 103-66) were directed to the Federal Highway Trust Fund beginning October 1, 1997 by the Taxpayer Relief Act of 1997 (P.L. 105-34). This not only increased total highway user revenues available for highway and related improvements, but it also changed the relative shares of Federal user fees paid by different vehicle classes. Ratios of user fee payments to highway cost responsibility for different vehicles (so-called equity ratios) were affected by this change.

The second change was passage of the Transportation Equity Act for the 21st Century (TEA-21) (P.L. 105-178). While this watershed legislation builds upon initiatives established in the Intermodal Surface Transportation Assistance Act of 1991 (ISTEA) (P.L. 102-240), it significantly increases overall surface transportation funding levels and has new initiatives to meet challenges of improving safety, enhancing the natural and human environment, and advancing America's economic growth and competitiveness. Changes in authorization levels for different program areas have affected the relative cost responsibility of different vehicle classes and ratios of user fee payments to cost responsibility for different vehicles. These changes are analyzed in this report.

For ease of comparison, this report is organized similarly to the Summary Report of the 1997 Federal HCAS. The analysis year continues to be 2000, and the same vehicle classes, vehicle miles of travel, and other vehicle characteristics are used. This not only facilitates comparison with the earlier report, but is essential if results are to be directly useful for the Department's Comprehensive Truck Size and Weight (TS&W) Study which uses travel characteristics developed for the 1997 Federal HCAS in its base case.

*Summary of Findings*

Total social costs of air pollution associated with motor vehicle use are estimated to range from \$30 billion to \$349 billion per year.<sup>(1)</sup> Most of those costs are associ-

ated with premature death and illness caused by particulate matter, including both direct particulate emissions and the secondary formation of particulates from other emissions. The wide range of air pollution cost estimates is indicative of the many uncertainties surrounding costs of motor-vehicle-related air pollution.

The 1997 HCAS discussed four main costs of highway use not borne directly by transportation agencies—crash costs, air pollution, congestion, and noise. Based on mid-range estimates, crash costs are the largest of those costs, accounting for about 75 percent of total costs for those four impacts. Congestion costs represent the next highest cost (14 percent), followed by air pollution (9 percent) and finally noise (1 percent). Most crash and congestion costs are borne directly by motorists, but impacts of air pollution and noise are not directly tied to an individual's use of the highway.

As noted above, the Omnibus Budget Reconciliation Act of 1993 imposed a 4.3 cents per gallon tax on transportation fuels to be used for deficit reduction. Proceeds of this tax were not considered to be highway user fees—they were deposited in the General Fund rather than the Highway Trust Fund, and were not available to finance highway, transit, or other transportation improvements. Since proceeds of the 4.3 cents per gallon deficit reduction tax were not highway user fees, they were not included in the 1997 Federal Highway Cost Allocation Study.

The Taxpayer Relief Act of 1997 directed that proceeds of the 4.3 cents per gallon tax on highway motor fuels that had been dedicated for deficit reduction should be deposited in the Highway Trust Fund beginning October 1, 1997 and be available for transportation purposes. This made the 4.3 cents per gallon tax a highway user fee which should be included with other fuel tax revenues in highway cost allocation. The change affects the relative equity of the Federal highway user fee structure. The share of total Federal highway user revenues paid by heavy trucks declines, thereby reducing the share of highway cost responsibility that heavy trucks pay through user fees.

In the 1997 HCAS combination trucks were found, on average, to pay 90 percent of their Federal highway cost responsibility through user fees, but with changes in the fuel tax they now pay only 80 percent of their cost responsibility. The heaviest combinations, those over 80,000 pounds, pay only half of their cost responsibility.

Programmatic changes enacted in the recent TEA-21 are anticipated to have virtually no effect on user fee equity.

The Department plans to update the 1997 HCAS before the next surface transportation reauthorization. Potential options to improve overall user fee equity will be examined in greater depth in that study.

#### *Vehicle Travel Characteristics and Population by Different Vehicle Classes*

Table 1 shows total 2000 vehicle miles of travel (VMT) by different groups of vehicles. Travel for single unit and combination truck classes is broken down by registered weight groups. Passenger vehicles account for about 93 percent of total VMT in the United States. Single unit trucks and combination trucks account for 3 and 4 percent of total travel, respectively. Over two-thirds of single unit truck travel is by vehicles registered below 25,000 pounds while among combination vehicles, 75 percent of travel is by vehicles registered between 75,000 and 80,000 pounds.

Table 1. Total 2000 Travel and Number of Vehicles by Class and Registered Weights

| Vehicle Class/Registered Weight | Vehicle Miles of Travel (millions) |             | Number of Vehicles |             |
|---------------------------------|------------------------------------|-------------|--------------------|-------------|
|                                 | Total                              | Percent     | Total              | Percent     |
| <b>Passenger Vehicles</b>       |                                    |             |                    |             |
| Autos .....                     | 1,818,461                          | 67.5        | 167,697,897        | 70.0        |

|                                 | Total                              | Percent | Total              | Percent |
| 80,001—100,000 pounds .....     | 3,879                              | 0.1     | 64,365             | 0.0     |
| <100,001 pounds .....           | 2,279                              | 0.1     | 37,788             | 0.0     |
| Total .....                     | 115,689                            | 4.3     | 1,971,004          | 0.8     |

In Chapter II of the main 1997 HCAS report, VMT, operating weight, and registered weight distributions for 20 different vehicle classes were presented. Vehicle classes include automobiles, pickups and vans, buses, three types of single unit trucks, six types of single trailer combinations, three types of truck-trailer combinations, four types of twin-trailer combinations, and a triple trailer combination. Truck travel and operating weight distributions on each of 12 highway functional classes are also estimated for each vehicle configuration. Data needs of the Department's Comprehensive TS&W Study were important considerations in selecting configurations to be included in the 1997 Federal HCAS.

Figure 1 shows VMT for different vehicle classes in rural and urban areas. Almost two-thirds of total automobile travel is in urban areas, a much higher percentage than for other vehicle classes. Over half of the annual travel by pickups, vans, buses, and single unit trucks is in urban areas, but only 40 percent of combination truck travel is in urban areas.

Figure 1. Distribution of VMT in Rural and Urban Areas

*Federal-aid Highway Program Costs*

The distribution of Federal obligations by improvement type and highway functional class has a strong influence on the relative cost responsibility of different vehicle classes. Estimates of the 2000 distribution of Highway Trust Fund (HTF) obligations by improvement type in the 1997 HCAS were based on the actual distribution of obligations during the 1993 to 1995 base period. For analysis purposes total 2000 obligations were assumed to equal total revenues to the HTF in Calendar Year 2000 which were estimated to be \$27,174 million including \$3,380 million for the Mass Transit Account (MTA) of the HTF.

As noted above two laws passed since the 1997 HCAS have affected the level and distribution of Federal obligations for highway-related purposes. First, the Taxpayer Relief Act of 1997 transferred proceeds of 4.3 cents per gallon of Federal motor fuel taxes that had been dedicated for deficit reduction to the HTF, thereby increasing overall funds available for highway-related purposes. Second, TEA-21 reauthorized surface transportation programs for 6 years, raising most program levels with some changes in the distribution of funds among the various programs. TEA-21 also guarantees that highway and transit program funding will be aligned with actual

and projected HTF receipts. The most recent estimate of calendar year 2000 HTF receipts, including proceeds of the 4.3 cents per gallon that previously had been dedicated for deficit reduction, is \$33,233 million.

Table 2 compares the relative authorizations for major program areas under TEA-21 with those under ISTEA. In most cases the distribution of funds is quite similar. One notable exception is the elimination of a separate Interstate Construction program in TEA-21. All remaining work to complete the Interstate System was fully funded under prior legislation. Certain improvements to the Interstate System are eligible under the Interstate Maintenance program and Interstate System lane additions are eligible from National Highway System funds.

Table 2. Comparison of TEA-21 and Major ISTEA Program Authorizations

| Program Area                                | TEA-21 (percent) | ISTEA (percent) |
|---|------------------|-----------------|
| Interstate Maintenance .....                | 13.8             | 13.8            |
| Interstate Construction .....               | 0                | 5.9             |
| National Highway System .....               | 16.5             | 17.1            |
| Bridge .....                                | 11.8             | 13.1            |
| Surface Transportation Program .....        | 19.2             | 19.4            |
| Congestion Mitigation and Air Quality ..... | 4.7              | 4.9             |
| Minimum Allocation .....                    | 13.7             | 9.3             |
| Other .....                                 | 20.3             | 16.5            |
| Total .....                                 | 100.0            | 100.0           |

Translating changes in authorization levels for different programs into changes in the distribution of obligations by improvement type and highway functional class is difficult. TEA-21, like ISTEA, provides States considerable flexibility to shift funds among program categories. In this analysis, the distribution of funds by improvement type for each program area in 2000 is assumed to be the same as the distribution for that program area in 1997.

Table 3 compares 2000 Federal obligations by improvement type estimated for the 1997 HCAS with revised estimates based on the TEA-21 program composition. Assuming that funds from each program area are spent in the same manner as they were in 1997, the TEA-21 program composition would be expected to have slightly more capacity expansion, and slightly less system preservation than was estimated for the 1997 HCAS based on the overall 1993-1995 distribution of obligations by improvement type.

Table 3. 2000 Distribution of Federal Highway Program Costs

Estimated in 1997 HCAS and Under TEA-21 (\$ Millions)

| Category                  | Improvement Type                  | 1997 HCAS |         | TEA-21   |         |
|---------------------------|-----------------------------------|-----------|---------|----------|---------|
|                           |                                   | Amount    | Percent | Amount   | Percent |
| New Capacity .....        | New Construction .....            | \$2,941   | 10.8    | \$2,879  | 8.7     |
|                           | Reconstruction—Added Lanes .....  | \$937     | 3.4     | \$2,864  | 8.6     |
|                           | Major Widening .....              | \$1,836   | 6.8     | \$2,007  | 6.0     |
| Total .....               |                                   | \$5,713   | 21.0    | \$7,750  | 23.3    |
| System Preservation ..... | 3R Preservation .....             | \$7,250   | 26.7    | \$7,934  | 23.9    |
|                           | Minor Widening .....              | \$484     | 1.8     | \$651    | 2.0     |
|                           | Bridge Replacement .....          | \$2,114   | 7.8     | \$2,480  | 7.5     |
|                           | Major Bridge Rehabilitation ..... | \$1,198   | 4.4     | \$1,110  | 3.3     |
|                           | Minor Bridge Rehabilitation ..... | \$445     | 1.6     | \$643    | 1.9     |
| Total .....               |                                   | \$11,490  | 42.3    | \$12,819 | 38.6    |
| System Enhancement .....  | Safety/TSM .....                  | \$2,542   | 9.4     | \$3,112  | 9.4     |
|                           | Environmentally Related .....     | \$530     | 2.0     | \$1,064  | 3.2     |
|                           | Other Projects .....              | \$1,113   | 4.1     | \$590    | 1.8     |
| Total .....               |                                   | \$4,184   | 15.4    | \$4,766  | 14.3    |
| MTA .....                 |                                   | \$3,380   | 12.4    | \$4,597  | 13.8    |
| Other .....               |                                   | \$2,407   | 8.9     | \$3,302  | 9.9     |
| Total .....               |                                   | \$27,175  | 100.0   | \$33,233 | 100.0   |

Again, for analysis purposes, the distribution of obligations by highway functional class is assumed to be the same in 2000 as in the 1993-1995 base period. Two-thirds of Federal obligations are on urban highways and one-third on rural highways. In both urban and rural areas more Federal moneys are obligated for im-

improvements on higher order highway systems (Interstate and other principal arterial highways) than on lower order systems

The distribution of program expenditures by highway type can significantly influence the relative cost responsibilities of different vehicle classes. The distribution of travel on different types of highways varies substantially by vehicle class, and other physical and operational characteristics of highways that can affect cost responsibility also vary by highway type.

*Allocation of 2000 Federal Highway Program Costs*

In this analysis, procedures for allocating various highway improvement costs among vehicle classes are the same as used in the 1997 HCAS. Table 4 summarizes the cost responsibility of different vehicles for anticipated obligations under the TEA-21 program structure, assuming that funds for each program element under TEA-21 are obligated in the same way they were obligated under ISTEA.

Table 4. 2000 Federal Cost Responsibility by Vehicle Class Under TEA-21 Program Structure  
(\$ Millions)

| Vehicle Class/ Registered Weight | Total Program Costs | Cents per Mile | Shares of Total |
|----------------------------------|---------------------|----------------|-----------------|
| Autos .....                      | \$14,501            | 0.80           | 43.6            |
| Pickups/Vans .....               | \$5,103             | 0.76           | 15.4            |
| Buses .....                      | \$237               | 3.20           | 0.7             |
| All Passenger Vehicles .....     | \$19,841            | 0.80           | 59.7            |
| Single Unit Trucks               |                     |                |                 |
| <25,000 pounds .....             | \$1,245             | 2.20           | 3.7             |
| 25,001—50,000 pounds .....       | \$1,049             | 5.46           | 3.2             |
| >50,000 pounds .....             | \$1,344             | 18.12          | 4.0             |
| All Single Units .....           | \$3,638             | 4.38           | 10.9            |

| All Revenues .....               | \$33,233            | 1.23           | 100.0           |

Figure 2 compares shares of cost responsibility under the TEA-21 program structure with cost responsibility estimated in the 1997 HCAS based upon the distribution of program costs during the 1994-1995 period. The small differences in program structure between TEA-21 and ISTEA are not large enough to substantially affect the relative cost responsibilities of different vehicle classes. Passenger vehicles have a slightly higher share of cost responsibility under TEA-21 while combinations have a slightly lower share.

*Highway User Fee Payments*

Highway user charges are fees upon owners and operators of motor vehicles for their use of public highways.

Historically, the primary purpose for imposing highway user fees at both the Federal and State levels has been to raise revenues to finance highway improvement programs. This direct relationship between highway user fees and highway program funding is highlighted by the fact that the Federal Government and many States deposit large parts of their highway user fees in dedicated highway or transportation trust funds rather than in the general fund. The linkage between highway user fees and highway program financing is central to HCASs which seek to determine whether fees paid by each vehicle class cover costs occasioned by those vehicles.

Current Federal highway user fees and rates are shown in Table 5. Federal highway user taxes include taxes on various highway fuels, an excise tax on the sale of heavy trucks, a tax on tires weighing over 40 pounds, and a heavy vehicle use tax (HVUT) on trucks with registered weights over 55,000 pounds. Each of these taxes has been in place for many years, although rates and the specific equipment that is taxed have changed from time to time.

Table 5. Current Federal Highway User Tax Rates

| Current Tax  | Tax Rate Under Current Law  |
|--|---|
| Fuel   |   |
| Gasoline .....   | 18.3 cents per gallon <sup>1</sup>  |
| Diesel .....   | 24.3 cents per gallon <sup>1</sup>  |
| Alternative Fuels .....                                  | 0—18.3 cents per gallon <sup>1</sup>  |
| Vehicle Excise Tax                                       |   |
| Heavy Trucks >33,000 pounds, trailers >26,000pounds GVV. | 12 percent of retail sales for new vehicles (trucks, tractors, or trailers) |
| Tire Tax   |   |
| 41 to 70 pounds .....                                    | 15 cents per pound over 40 pounds   |
| 71 to 90 pounds .....                                    | \$4.50 plus 30 cents per pound over 70 pounds                               |
| Over 90 pounds .....                                     | \$10.50 plus 50 cents per pound over 90 pounds                              |

Table 5. Current Federal Highway User Tax Rates—Continued

| Current Tax  | Tax Rate Under Current Law   |
|--|--|
| HVUT   |  |
| Annual tax on vehicles 55,000 pounds gross weight or more. | \$100 plus \$22 per 1,000 pounds over 55,000 with an annual cap of \$550 |

<sup>1</sup>excludes 0.1 cents per gallon to Leaking Underground Storage Tank Fund

#### Federal User Fee Payments by Vehicle Class

When the 1997 HCAS was conducted, 4.3 cents per gallon of Federal fuel tax was dedicated for deficit reduction and was not considered a highway user fee. Proceeds of the 4.3 cents per gallon are now deposited in the HTF to be used for purposes eligible under TEA-21, and are now considered highway user fees. This change affects the relative shares of highway user fees paid by different vehicle classes. Table 6 shows Federal highway user revenues (HURs) projected to be paid by different vehicle classes in 2000 under the current user fee structure. Passenger vehicles, which account for 93 percent of total highway travel, pay 68 percent of total Federal highway user fees. Combination trucks, on the other hand, pay 23 percent of total highway user fees even though they travel less than 5 percent of total mileage. Among the truck classes, user fees vary substantially by vehicle weight. Single unit trucks registered at 50,000 pounds or more pay 2.2 times as much per mile in Federal user fees as single unit trucks registered at 25,000 pounds or less. User fees paid by combination trucks do not vary as much with weight as for single unit trucks, but the variation is still substantial.

Table 6. 2000 Federal User Fee Payments by Vehicle Class Under the Current Federal User Charge Structure  
(\$ Millions)

| Vehicle Class/ Registered Weight        | Total User Fee Payments | Cents per Mile | Shares of Total (percent) |
|---|-------------------------|----------------|---------------------------|
| Autos .....                             | \$14,819                | 0.81           | 44.6                      |
| Pickups/Vans .....                      | \$7,416                 | 1.11           | 22.3                      |
| Buses .....                             | \$50                    | 0.67           | 0.1                       |
| All Passenger Vehicles .....            | \$22,285                | 0.89           | 67.1                      |
| Single Unit Trucks <25,000 pounds ..... | \$1,853                 | 3.28           | 5.6                       |
| 25,001—50,000 pounds .....              | \$746                   | 3.88           | 2.2                       |
| >50,000 pounds .....                    | \$543                   | 7.32           | 1.6                       |
| All Single Units .....                  | \$3,142                 | 3.78           | 9.5                       |
| Combination Trucks <50,000 pounds ..... | \$332                   | 4.92           | 1.0                       |
| 50,001—70,000 pounds .....              | \$561                   | 5.25           | 1.6                       |
| 70,001—75,000 pounds .....              | \$402                   | 6.78           | 1.2                       |
| 75,001—80,000 pounds .....              | \$6,006                 | 6.97           | 18.1                      |
| 80,001—100,000 pounds .....             | \$300                   | 7.74           | 0.9                       |
| >100,001 pounds .....                   | \$205                   | 9.01           | 0.6                       |
| All Combinations .....                  | \$7,806                 | 6.75           | 23.5                      |
| All Trucks .....                        | \$10,948                | 5.51           | 32.9                      |
| All Revenues .....                      | \$33,233                | 1.23           | 100.0                     |

Figure 3 summarizes the average Federal user fees paid per mile of travel by different vehicle classes.

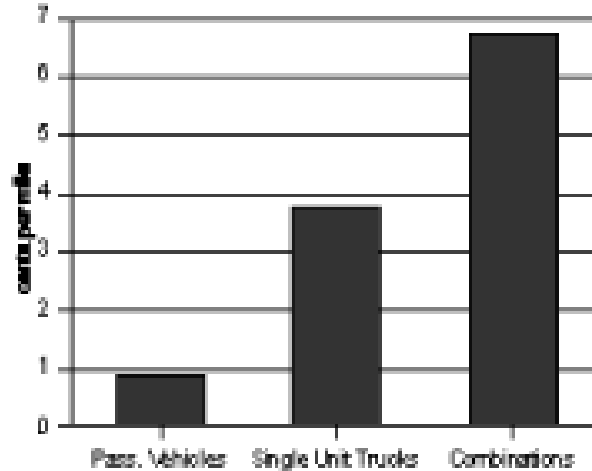

Figure 3.

Figure 4 compares shares of Federal highway user fees paid by passenger vehicles, single unit trucks, and combination trucks under the current user fee structure with shares estimated in the 1997 HCAS when proceeds of the 4.3 cents per gallon were dedicated for deficit reduction and not considered highway user fees. The share of Federal user fees estimated to be contributed by passenger vehicles in 2000 has increased by almost 4 percentage points while the share of total user fees paid by combination vehicles decreased by almost the same amount. This difference arises because combination vehicles also pay other Federal user charges that have not changed since 1997 except for a minor technical change in the taxation of tires on new vehicles. The higher fuel taxes thus have a relatively smaller effect on total user fees paid by combination vehicles than they have on total fees paid by passenger vehicles.

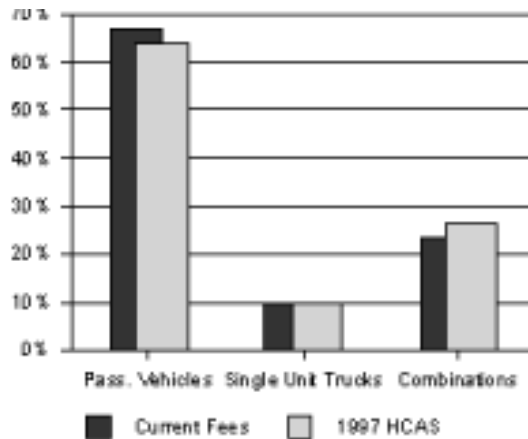

Figure 4. Shares of User fees for Different Vehicle Classes Under Current and 1997 User Fee Structures

*2000 Federal Highway User Fee Equity Ratios*

The equity of highway user charges typically is measured in HCASs as the ratio of the shares of revenues contributed by each vehicle class to the shares of highway

costs that vehicle class occasions. This ratio is often called a revenue/cost ratio or an "equity ratio." As discussed in the 1997 HCAS, highway agency costs are different from the economic costs associated with the operation of different vehicle classes. Analyses of economic costs occasioned by each vehicle class, which include environmental, safety, and delay costs imposed on others as well as pavement, bridge, and other infrastructure costs, are important in considering the economic efficiency of highway user fees. However, HCASs traditionally have focused primarily on the equity of highway user fees as measured by the extent to which each vehicle class pays the share of highway agency costs for which it is responsible. Agency costs considered in HCASs do not reflect what transportation agencies should spend in various areas, but are estimates of how obligations actually are being distributed. The Department's Surface Transportation Conditions and Performance report provides overall estimates of investment requirements to meet system performance and condition objectives, although it does not suggest how much of those costs should be borne by Federal, State, and local transportation agencies.

Table 7 shows estimated Federal equity ratios in 2000 under the current highway user charge structure and the TEA-21 program structure. Equity ratios estimated in the 1997 HCAS are shown for comparison. As a class, automobiles continue to pay about the same share of Federal highway user fees as their share of highway costs, and pickups and vans continue to pay substantially more than their share of highway costs. Differences in equity ratios between automobiles and other passenger vehicles are primarily attributable to the automobiles' better fuel economy (higher miles per gallon) which means they pay less fuel tax per mile of travel than pickups and vans.

Table 7. Ratios of 2000 Federal User Charges to Allocated Costs by Vehicle Class

| Vehicle Class/Registered Weight | 1997 HCAS Ratios | Updated Ratios |
|---------------------------------|------------------|----------------|
| Autos .....                     | 1.0              | 1.0            |
| Pickups/Vans .....              | 1.4              | 1.5            |
| Buses .....                     | 0.1              | 0.2            |
| Passenger Vehicles .....        | 1.1              | 1.1            |
| Single Unit Trucks              |                  |                |
| <25,000 pounds .....            | 1.5              | 1.5            |
| 25,001—50,000 pounds .....      | 0.7              | 0.7            |
| > 50,001 pounds .....           | 0.5              | 0.4            |
| Total Single Unit .....         | 0.9              | 0.9            |
| Combination Trucks              |                  |                |
| <50,000 pounds .....            | 1.6              | 1.4            |
| 50,001—70,000 pounds .....      | 1.1              | 1.0            |
| 70,001—75,000 pounds .....      | 1.0              | 0.9            |
| 75,001—80,000 pounds .....      | 0.9              | 0.8            |
| 80,001—100,000 pounds .....     | 0.6              | 0.5            |
| >100,001 pounds .....           | 0.5              | 0.4            |
| Total Combinations .....        | 0.9              | 0.8            |
| Total All Vehicles .....        | 1.0              | 1.0            |

User fee equity for single unit and combination trucks is highly dependent on the weight of the vehicles. As a class single units continue to pay about 90 percent of their Federal highway cost responsibility under the new user fee and TEA-21 program structure. In the 1997 HCAS combination trucks as a group were estimated to pay 90 percent of their highway cost responsibility in 2000, but under the new user fee and program structure, combinations will pay only about 80 percent of their cost responsibility. This reduction in the equity ratio for combination trucks primarily arises because combination trucks will pay a smaller share of Federal user fees under the new user fee structure than they did under the former fee structure while their share of cost responsibility remains virtually the same. For both single unit and combination trucks, there continue to be large differences in equity ratios for vehicles in different weight groups.

#### *Other Highway-Related Costs*

The 1997 HCAS included extensive discussions of highway-related costs that are not borne by transportation agencies, but by motorists or society at large. These costs include environmental, safety, congestion, and other costs associated with highway use. While transportation agencies do not bear these costs directly, their concern about such costs is evidenced by a broad range of regulatory and programmatic initiatives to reduce crashes, emissions, and other consequences of high-

way use that create costs for society. Significant progress has been made in reducing many of these social costs of highway use, but substantial costs remain. As discussed in the 1997 HCAS, crashes, congestion, air pollution, and noise are generally acknowledged to be the most significant social costs that can be quantified.

As noted in the Introduction to this Addendum, the 1997 HCAS did not include estimates of air pollution costs. Work on a major EPA study on Benefits and Costs of the Clean Air Act was still underway which was relevant to estimates of air pollution costs associated with motor vehicle use. The Department postponed estimating highway-related air pollution costs until that work was completed and the same methods could be used for the Department's highway cost allocation study.

One point emphasized in the 1997 HCAS is the uncertainty surrounding estimates of most social costs of highway use. Differences between high and low cost estimates may vary by one or more orders of magnitude. Many factors contribute to this uncertainty including (1) the difficulty in isolating effects of highway-related factors from other factors that contribute to health and other social costs; (2) the site-specific nature of many social costs of highways; and (3) uncertainties in valuing costs of premature deaths attributable to highway crashes and motor vehicle emissions.

#### *Highway-Related Air Pollution Costs*

Motor vehicles produce emissions that in sufficient pollutant concentrations can cause a variety of health and other impacts including shortness of breath, respiratory and other disease, death, structural deterioration, crop damage, and decreased visibility. Since 1970, the Federal Clean Air Act (CAA) and 1977 and 1990 Clean Air Act Amendments (CAAA) have provided a framework for nationwide efforts to reduce motor vehicle and other sources of air pollution. Important provisions of those laws include establishment of National Ambient Air Quality Standards for key pollutants, requirements that States develop implementation plans for attaining those standards, and limits on allowable motor vehicle tailpipe emissions. The ISTEA and TEA-21 complement the CAA by providing funding to implement balanced transportation programs that will reduce emissions.

In 1997, EPA developed a report, *The Benefits and Costs of the Clean Air Act, 1970-1990*. This report reflects EPA's findings and not necessarily those of other agencies in the Administration. Other agency's concerns included, among other things, the methods used to estimate the number of premature deaths and illnesses avoided due to the CAA, and the methods used to value non-health related benefits. Part of these concerns arise from the no-control baseline EPA uses to estimate reductions that have been achieved in emissions since passage of the CAA. Mindful of other agencies concerns, this Addendum uses EPA's estimates as an illustrative bounding case example of the impact of motor vehicle emissions.

Table 8, based on data in EPA's 1998 report, shows the estimated contribution of on-highway motor vehicles to total emissions for key air pollutants in 1990. The EPA estimates that in 1990 motor vehicles accounted for only 2 percent of total sulfur dioxide emissions and 11 percent of total suspended particulate emissions. Conversely, motor vehicles accounted for 70 percent of total carbon monoxide and 2/3 of lead emissions.

Table 8. Major Highway-Related Air Pollutants

| Pollutant                          | Percent of Total 1990 Emissions from Highway Motor Vehicles (percent) |
|------------------------------------|---|
| Total Suspended Particulates ..... | 11.1  |
| Sulfur Dioxide .....               | 2.4   |
| Nitrous Oxides .....               | 36.0  |
| Volatile Organic Compounds .....   | 37.1  |
| Carbon Monoxide .....              | 70.4  |
| Lead .....                         | 66.7  |

Despite the progress that has been made to date in reducing harmful motor vehicle emissions, air pollution remains a concern in many parts of the country. In its report, *The Benefits and Costs of the Clean Air Act, 1970-1990*, EPA estimates the economic benefits of air pollution reductions achieved under the CAA. Methods used by EPA in its 1998 study are the primary bases of air pollution cost estimates in this report. As noted in the Introduction, costs of air pollution estimated in this Addendum are social and economic costs of air pollution, not the engineering costs to comply with standards or to mitigate adverse impacts as the term "costs" is often used in the environmental literature.

Table 9 shows estimates of economic costs associated with highway-related air pollution based upon data and methods used by EPA in its study. Almost all costs are attributable to mortality, chronic bronchitis, and other respiratory and heart diseases caused by inhalation of particulate matter, but some costs also arise from ozone, sulfur dioxide, nitrogen dioxide, and carbon monoxide. Other effects of air pollution including infant mortality, changes in pulmonary function, lung inflammation, and reduced crop yields are known to arise from air pollution but are not included in these costs because researchers have not yet quantified those effects. Future research should allow a more complete accounting of air pollution costs arising from motor vehicles and other sources.

Table 9. Estimated Economic Costs of Motor Vehicle-Related Air Pollution in 2000<sup>1</sup>

| Pollutant  | Impact                       | Costs of Rural Motor Vehicle Travel \$1990 (millions) | Costs of Urban Motor Vehicle Travel \$1990 (millions) | Costs of All Motor Vehicle Travel \$1990 (millions) |
|--|------------------------------|---|---|---|
| Particulate Matter .....                           | Mortality <sup>2</sup> ..... | 12,695  | 21,558  | 31,162  |
| Particulate Matter .....                           | Non-fatal Illness .....      | 3,683   | 6,232   | 9,183   |
| Sulfur dioxide, nitrogen dioxide, carbon monoxide. | Non-fatal Illness .....      | 0   | 51  | 51  |
| Ozone .....  | Non-fatal Illness .....      | 28  | 16  | 47 <sup>3</sup>                                     |
| Total .....  | 16,406 .....                 | 27,857  | 40,443 <sup>4</sup>                                   |   |

<sup>1</sup>Costs for "criteria" pollutants only (does not include toxic pollutant costs). Excludes certain health-related costs and costs of reduced visibility, crop damage, and material damage not quantified by EPA.

<sup>2</sup>Mortality costs based on DOT's \$2.7 million estimated cost of a premature death.

<sup>3</sup> Does not include ozone mortality costs, which are highly uncertain.

<sup>4</sup> Comparable estimate using EPA's value of life is \$64,681.

Source: Abt Associates, 1998, pages 9-11.

Even costs quantified in Table 9 are highly uncertain due to data and methodological limitations and should be viewed as indicative only of the order of magnitude of costs. Chemical processes that transform emissions into ozone, particulate matter, and other pollutants are very complex, as is the transport of pollutants from their source to where they ultimately affect human health. Sources of some pollutant types are not well understood, nor are some aspects of the health impacts due to motor vehicle emissions. Scientific data on relationships between air pollution and premature death also are weak in many cases. This Addendum does not fully discuss these limitations and uncertainties. Technical reports by Systems Applications International(2) and Abt Associates,(3) from which air pollution cost estimates shown in Table 9 and subsequent tables are derived, discuss many of those factors and indicate areas where further research is needed. They also discuss the various empirical studies that have attempted to estimate economic costs for different pollutants and issues involved in extrapolating results of those case-specific studies to nationwide cost estimates.

There is considerable debate about valuing economic costs of premature deaths associated with air pollution. This debate is important because costs associated with premature deaths from particulate matter account for over three-quarters of total air pollution-related costs.

In policy and regulatory analyses, EPA uses a value of \$4.8 million to represent the cost of a premature death. This value is the mean of estimates from 26 studies dating back to the mid 1970's that have attempted to place a value on the cost of premature deaths. Estimates from those studies range from \$0.6 million to \$13.5 million, reflecting the large uncertainties in trying to estimate the public's willingness to pay to avoid premature death.

The Department of Transportation has adopted a value of \$2.7 million per premature death, based on a comprehensive 1991 study by the Urban Institute. While that study focused on the costs of premature deaths associated with highway crashes, it drew upon many of the same studies that EPA used, and the results apply to premature deaths attributable to factors other than highway crashes. Both DOT and EPA have devoted significant efforts in developing these cost estimates, and while their costs differ somewhat, they fall within a much broader range of costs that have been estimated by others.

The EPA's study, The Benefits and Costs of the Clean Air Act, notes that the Science Advisory Board charged with reviewing the study recommended comparing cost estimates based upon EPA's traditional value of life estimates with costs using an alternative approach for valuing costs of air pollution-related deaths. That approach explicitly considers the number of years by which lives may be shortened as

a result of exposure to air pollution. Under this life-years lost approach, costs of premature death are estimated to be about 55 percent of EPA's value of \$4.8 million per premature death. This translates into an average value of about \$2.6 million per premature death, which coincidentally, is very close to the value DOT uses for the cost of premature deaths. The EPA has additional research underway in this area. Figure 5 compares total motor vehicle-related air pollution costs estimated using DOT's cost of premature death with costs estimated using EPA's value. As noted above, preliminary estimates using an alternative life-years lost approach would be slightly less than costs using the DOT cost estimates, but more work needs to be done to develop a consensus on the advisability and applicability of a life-years approach to valuing costs of premature death associated with air pollution and to refine those cost estimates. It is also important to note that data and methods used by EPA that were the basis for these cost estimates continue to be improved.

Figure 5. Comparison of Social Costs of Highway Related Air Pollution in 2000 Based on DOT and EPA Costs of Premature Death

Source: Abt Associates for EPA and FHWA.

Air pollution costs attributable to motor vehicles were estimated by comparing levels of air pollution when all sources of pollution were present with air pollution when motor vehicle emissions were eliminated. Costs attributable to rural motor vehicle travel were estimated by eliminating all urban motor vehicle travel, and urban costs were estimated by eliminating rural travel. These methods were necessary to eliminate interactions between emissions in rural and urban areas that would make it impossible to estimate whether there are significant differences in costs associated with travel in rural and urban areas.

About two-thirds of motor vehicle-related air pollution costs are attributable to urban travel and one-third to rural travel. As can be seen in Table 9, the sum of these costs for urban and rural travel individually is slightly greater than costs for all motor vehicle travel. This is explained by regional transport of both precursor emissions and air pollutants and the complex chemistry leading to the production of ozone and particulate matter. Figure 6 shows overall average air pollution costs per mile of travel in rural and urban areas. Average costs for rural travel are about 1.5 cents per mile compared to 1.75 cents per mile for urban travel. Average costs for all motor vehicle travel are about 1.5 cents per mile. Costs for all travel are lower than would be expected based on costs for urban and rural travel alone because, as noted above, total costs for all motor vehicle travel are less than the sum of costs of rural and urban travel when those costs are estimated individually.

Figure 6. Average Air Pollution Costs per Mile in Rural and Urban Areas

Source: FHWA estimates based on SAI and Abt Associates data.

The average costs shown in Figure 6 mask large differences in highway-related air pollution costs in various parts of the country. They also do not reflect differences in costs associated with travel by different vehicle classes.

While the uncertainty of cost estimates was emphasized in technical reports submitted by consultants for this study, no explicit range of high, medium, and low estimates of motor vehicle-related air pollution costs was developed. A recent study of air pollution costs attributable to motor vehicles by Mark Delucchi and Donald McCubbin estimated that costs range from 0.9 to 14 cents per mile.<sup>(4)</sup> This is a wide range, but it is consistent with ranges estimated for other social costs of highway use.

A major source of variation in estimates of air pollution costs attributable to motor vehicles is whether or not road dust is included. The EPA does not classify road dust as a pollutant attributable to motor vehicles, but others have included road dust in cost estimates.

Table 10 shows high, medium, and low estimates of the costs of air pollution attributable to motor vehicle use along with the costs of crashes, congestion, and noise that were included in the 1997 HCAS. The mid-range air pollution cost estimate is taken from costs shown in Table 9. The EPA did not develop ranges of motor-vehicle-related air pollution costs; high and low cost estimates shown in Table 10 are taken from McCubbin and Delucchi's estimates of total social costs of motor vehicle use. None of the air pollution cost estimates include costs associated with road dust stirred up by the passage of motor vehicles.

Table 10. 2000 High, Mid-Range, and Low Estimates for Social Costs of Motor Vehicle Use  
(\$ Millions)

|                     | High        | Mid-Range | Low       |
|---------------------|-------------|-----------|-----------|
| Congestion .....    | \$181,635   | \$61,761  | \$16,352  |
| Crash Costs .....   | \$839,463   | \$339,886 | \$120,580 |
| Air Pollution ..... | \$349,100   | \$40,443  | \$30,300  |
| Noise .....         | \$11,446    | \$4,336   | \$1,214   |
| Total .....         | \$1,533,344 | \$446,319 | \$170,246 |

Crash costs represent the largest social cost of motor vehicle use shown in Table 10 across all cost ranges. The high estimate of air pollution costs ranks second

among high cost estimates, but mid-range estimates of congestion costs are 50 percent higher than corresponding estimates of air pollution costs.

For each of the impact areas shown in Table 10 the mid-range estimate is closer to the low than to the high estimate. This is another reflection of uncertainties surrounding economic costs of highway use. The high cost estimates often include costs which some analysts do not believe should be attributed to highway use, costs that are difficult to quantify, or costs for which only limited evidence exists. Also, the high range costs generally include the highest values that have been estimated for key cost components from among the various studies that have been done whereas mid-range costs typically use values that approximately reflect mean values estimated in other studies. Mid-range cost estimates rely on the soundest evidence available to date for each impact area, but are subject to change over time as new research results become available.

Figure 7 compares highway agency costs with social costs of highway use. Social costs are broken into costs borne by highway users (congestion costs and most crash costs) and costs borne by non-users (air pollution, noise, and a small share of crash costs). While most social costs of highways included in Figure 7 are borne by highway users, the \$90 billion borne by society in general is significant.

Figure 7. Total 2000 Highway Program Costs and Social Costs Borne by Users and Non-Users

*Air Pollution Costs Attributable to Different Vehicle Classes*

Table 11 shows percentages of different types of emissions attributable to the vehicle classes included in EPA models. These vehicle classes do not correspond well with vehicle classes used by the Department for highway cost allocation and truck size and weight analyses. In particular, most of the trucks with three or more axles are all grouped in the EPA class of heavy duty diesel vehicles. Thus, it is difficult to directly use the EPA models to estimate air pollution costs attributable to the different highway cost allocation study vehicle classes.

LD Gas Vehicle—gas-powered automobile  
 LD Gas Truck 1—gas-powered trucks weighing 6,000 pounds or less (pickups, vans, etc.)  
 LD Gas Truck 2—gas powered trucks weighing between 6,001 and 8,500 pounds  
 HD Gas Vehicles—gas powered trucks and buses weighing more than 8,500 pounds  
 LD Diesel Vehicle—Diesel-powered automobiles  
 LD Diesel Trucks—diesel-powered trucks weighing 8,500 pounds or less  
 HD Diesel Vehicles—diesel-powered vehicles weighing more than 8,500  
 SOA—secondary organic aerosols  
 SO<sub>2</sub>—sulfur dioxide  
 NO<sub>x</sub>—nitrogen oxide  
 VOC—Volatile organic compounds  
 PM<sub>10</sub>—directly emitted particulate matter less than 10 microns  
 PM, coarse—directly emitted particulate matter between 10 and 2.5 microns  
 PM<sub>2.5</sub>—directly emitted particulate matter less than 2.5 microns  
 Group 1—VOC and NO<sub>x</sub>, the primary precursor emissions for ozone  
 Group 2—Group 1 plus PM<sub>2.5</sub>, SO<sub>x</sub>, and SOA, precursors for both ozone and PM formation  
 Group 3—Group 2 plus ammonia, a precursor for both ozone and PM formation

Except for PM<sub>10</sub> and PM<sub>2.5</sub>, automobiles account for the largest share of various motor vehicle emissions. Because of the complex chemical processes by which emissions are transformed into particulate matter, ozone, and other secondary pollutants, and variations in the transport of pollutants in different regions of the country, relative emissions attributable to different vehicle classes cannot be directly translated into relative air pollution costs without detailed air quality modeling that was beyond the scope of this project. For instance, while heavy trucks account for a large share of particulate emissions, they account for a smaller share of costs because significant portions of particulate matter are formed through chemical reactions involving other compounds emitted predominantly by light trucks and passenger vehicles.

Four vehicle classes are responsible for 99 percent of all emissions: automobiles; pickups, vans, and sport utility vehicles; heavy duty gas vehicles; and heavy duty diesel vehicles. Other vehicle classes have much less VMT, and thus their total emissions are lower, although emissions per mile of travel would be comparable. The emissions modeling approach used in this study did not differentiate emissions more finely than the eight vehicle classes shown in Table 11. While the relative emissions shown in Table 11 do not directly correspond to the relative contribution to pollution and pollution-related costs for different vehicle classes, they do indicate the relative order of magnitude of the contribution by different vehicle classes. Further work is underway to improve estimates of emissions by different vehicle classes under a variety of operating conditions. This work should improve the ability to estimate the relative contribution to air pollution costs by different vehicle classes.

Table 12 uses the percentages from Table 11 to estimate total costs attributable to the four EPA vehicle classes that account for the majority of costs along with the average costs per mile of travel for each vehicle class. Costs are estimated by taking proportions of total precursor emissions for each vehicle class, based upon the Group 3 set of emissions shown in Table 11, and multiplying by total air pollution costs. Costs per mile are estimated by dividing total costs for each vehicle class by the VMT for that class. Passenger vehicles (automobiles, pickups and vans) account for about three-quarters of total estimated costs. Costs per mile for pickups and vans are closer to those of trucks than they are to costs per mile for automobiles because pickups and vans are not subject to the same tailpipe emissions standards as automobiles and because they get poorer fuel economy than automobiles.

Table 12. Air Pollution Costs Attributable to Different Vehicle Classes

| Vehicle Class                          | Total Estimated Cost<br>(\$1990 millions) | Cents Per Mile of<br>Travel |
|--|---|-----------------------------|
| Automobiles .....                      | \$20,343                                  | 1.1                         |
| Pickups, Vans .....                    | \$11,324                                  | 2.6                         |
| Gasoline Vehicles > 8,500 pounds ..... | \$1,699                                   | 3.0                         |
| Diesel Vehicles > 8,500 pounds .....   | \$6,794                                   | 3.9                         |
| Overall .....                          | \$40,443                                  | 1.5                         |

## MARGINAL COSTS OF HIGHWAY USE

Marginal costs of highway use reflect changes in total costs associated with an additional increment of travel. Marginal costs include incremental costs to the highway user (e.g., added vehicle operating cost and travel time), costs to public agencies (added use-related rehabilitation and maintenance costs), and external costs such as air pollution and congestion costs imposed on others. Many marginal costs vary by either location of travel or time-of-day. For instance, incremental pavement deterioration associated with an extra mile of travel by particular vehicle classes depends on the design and condition of the pavement upon which they travel, temperature, and other local characteristics. Congestion costs associated with an additional mile of travel on low-volume rural Interstate highways are negligible, but costs on urban Interstate highways may be high, particularly during peak periods when traffic volumes are greatest.

With the exception of their own travel time, vehicle operating costs, and perhaps risks of having a crash, highway users normally do not consider many of these marginal costs when deciding whether to make a trip. In general, economic efficiency would be enhanced if users had to pay those marginal costs they do not consider in trip-making decisions.

Since many marginal costs vary according to when or where a trip is made, charges based on average costs will not necessarily promote improved economic efficiency. To achieve the greatest degree of efficiency, fees reflecting the marginal costs of trips made in various locations at various times of the day should be charged. Then, only trips whose benefits equal or exceed the full cost of the trip would be made.

Table 13 shows estimates of marginal pavement, congestion, crash, air pollution, and noise costs in 2000 for selected vehicles operating under different conditions. Costs reflect typical or average conditions; in certain locations, costs could be expected to vary from values shown. The relative costs of pavement damage, congestion, crashes, air pollution, and noise for different vehicle classes operating in rural and urban areas are as important as the individual costs themselves.

Table 13. 2000 Pavement, Congestion, Crash, Air Pollution, and Noise Costs for Illustrative Vehicles Under Specific Conditions

| Vehicle Class/Highway Class                      | Cents per Mile |                 |       |                    |       | Total |
|--|----------------|-----------------|-------|--------------------|-------|-------|
|  | Pave-<br>ment  | Con-<br>gestion | Crash | Air Pol-<br>lution | Noise |       |
| Autos/Rural Interstate .....                     | 0              | 0.78            | 0.98  | 1.14               | 0.01  | 2.91  |

NOTE: S.U. = Single Unit, Comb. = Combination; Air pollution costs are averages of costs of travel on all rural and urban highway classes, not just Interstate. Available data do not allow differences in air pollution costs for heavy truck classes to be distinguished.

Pavement costs represent the contribution of a mile of travel by different vehicles to pavement deterioration and the costs of repairing the damage. Congestion costs reflect the value of added travel time due to additional small increments of traffic. Crash costs include medical costs, property damage, lost productivity, pain and suffering, and other costs associated with highway crashes. Air pollution costs are

measured in terms of the cost of premature death, illness, and other effects of various highway-related emissions. Noise costs reflect changes in the value of adjacent properties caused by motor vehicle-related noise.

Marginal air pollution costs are particularly difficult to estimate because they are influenced by other sources of pollution in an area, climatic and atmospheric conditions, the complex chemistry of secondary pollutant formation, and other factors that vary over time and location. Not only do emissions per mile of travel vary depending on local conditions, but more importantly, contributions of those emissions to changes in pollutant concentrations and to health and other air pollution-related costs vary widely.

Marginal air pollution costs were estimated for this study by first estimating differences in air pollution concentrations with and without highway traffic. Costs of the air pollution attributable to motor vehicle use were then estimated based on marginal costs of changes in pollutant concentrations estimated in other recent studies and used by EPA in its study, *The Benefits and Costs of the Clean Air Act, 1970—1990*. Finally, per-mile costs were estimated by dividing total costs by VMT. While strictly speaking these are average rather than marginal costs with respect to VMT, they are derived from estimates of the marginal costs of changes in air pollution concentrations. Furthermore changes in air pollution concentrations with and without motor vehicle emissions were less than 10 percent at most locations where changes were estimated. Since resource constraints did not allow direct estimation of marginal air pollution costs of motor vehicle use, the average cost estimates are used to approximate marginal costs.

Separate estimates were made of costs of rural and urban travel but those estimates do not show the large variations that occur in specific rural or urban locations. No separate estimates were made for travel on different highway functional classes. Costs for different vehicle classes are estimated simply on the basis of relative emissions. Considerable work remains to improve estimates of marginal air pollution costs by different vehicle classes.

While marginal pavement, safety, congestion, and noise costs more closely represent true marginal costs than do marginal air pollution costs, they all represent average or typical marginal costs estimated for a broad cross section of Interstate highways. Costs at specific locations could vary considerably from costs shown, especially for noise costs which, like air pollution costs, are subject to many external factors.

Variations in marginal costs among vehicles and locations are not uniform; they are highly dependent on the type of cost being considered. Pavement, congestion, air pollution, and noise costs are higher in urban areas than rural areas, but marginal crash costs are higher in rural areas, reflecting the higher fatality rates for travel in rural areas. Cost differences among vehicle classes also vary widely. The 80,000 pound 5-axle combination truck operating in urban areas, has marginal costs many times greater than those of autos operating in rural areas, but marginal costs for 60,000 pound combination trucks operating in rural areas are less than marginal costs of automobiles operating on congested urban Interstate highways.

Figure 8 shows high and low ranges of air pollution, noise, congestion, and crash cost estimates along with best estimates (middle range) of those costs based upon the best research in each area. The large uncertainty surrounding these estimates suggests that caution should be exercised in making decisions that could significantly influence either user costs or highway investment based upon these social costs.

Figure 8. 2000 Estimated Ranges of Marginal Costs of Highway Travel

Highway marginal costs cannot directly be separated into Federal and non-Federal costs. Costs result from travel on all highways and to one extent or another affect all segments of society and all geographic areas. All units of government working together have joint responsibilities to take appropriate steps to reduce these costs. These steps may include mitigating costs through regulatory means, making investment decisions that contribute toward reducing highway marginal costs, or using pricing mechanisms to more nearly reflect marginal costs in the prices that motorists pay for highway transportation.

While highway marginal costs cannot be assigned to one level of government or another, there is an interest in how close current Federal user fees are to efficient fees. To compare cost allocations based on efficiency criteria with Federal user fee payments by different vehicles, marginal costs must be distributed among different levels of government. The 1982 Federal HCAS distributed marginal costs in proportion to the shares of total highway user revenues produced at each level of government on the grounds that this would leave the relative roles of each level of government for financing and charging for highways unchanged. The same approach is used in this study.

Table 14 compares the estimated Federal shares of marginal costs from Table 13 to Federal highway cost responsibility estimated in the equity analysis and to Federal user fees paid by different vehicle classes. Comparing Federal user fees with the Federal share of marginal costs reflects the efficiency of the user fee structure while comparing user fees to program cost responsibility is a measure of equity. Marginal costs and program costs are estimated by different methods for completely different purposes and cannot be added together.

Table 14. 2000 Comparison of Assumed Federal Share of Marginal Highway Costs to Federal Agency Costs and Federal User Fees  
(cents per mile)

| Vehicle Class/Highway Class                     | Marginal Costs | Federal Program Costs | Federal User Fees |
|---|----------------|-----------------------|-------------------|
| Autos/Rural Interstate .....                    | 0.9            | 0.4                   | 0.8               |
| Autos/Urban Interstate .....                    | 3.1            | 1.8                   | 0.8               |
| 40 kip 4-axle S.U. Truck/Rural Interstate ..... | 2.4            | 2.1                   | 12.4              |
| 40 kip 4-axle S.U. Truck/Urban Interstate ..... | 10.3           | 4.6                   | 12.4              |
| 60 kip 4-axle S.U. Truck/Rural Interstate ..... | 4.0            | 8.6                   | 14.0              |
| 60 kip 4-axle S.U. Truck/Urban Interstate ..... | 17.3           | 15.3                  | 14.0              |

Table 14. 2000 Comparison of Assumed Federal Share of Marginal Highway Costs to Federal Agency Costs and Federal User Fees—Continued  
(cents per mile)

| Vehicle Class/Highway Class                | Marginal Costs | Federal Program Costs | Federal User Fees |
|--|----------------|-----------------------|-------------------|
| 60 kip 5-axle Comb*/Rural Interstate ..... | 3.0            | 3.3                   | 6.9               |
| 60 kip 5-axle Comb*/Urban Interstate ..... | 11.2           | 8.1                   | 6.9               |
| 80 kip 5-axle Comb*/Rural Interstate ..... | 5.9            | 9.5                   | 7.4               |
| 80 kip 5-axle Comb*/Urban Interstate ..... | 20.9           | 21.2                  | 7.4               |

Federal program costs are greater than the estimated Federal share of marginal costs for rural travel by heavy single unit trucks and combinations, but less than marginal costs for automobiles and light single unit trucks. Marginal costs of congestion, noise, and safety are relatively low in rural areas, and overall agency cost responsibility in rural areas exceeds marginal costs for all but the lightest vehicle classes. In urban areas the opposite is true. Not only are costs of congestion, air pollution, and noise higher in urban than rural areas, but marginal pavement costs also are higher, reflecting among other things the higher construction costs in urban areas and the delay incurred by users when pavements are being rehabilitated. Federal user fees per mile of travel exceed marginal costs of rural travel for all vehicle classes except automobiles. Marginal costs of urban travel exceed Federal user fees per mile for all vehicle classes except the light single unit truck.

There currently are no Federal, State, or local user fees imposed that directly reflect congestion, air pollution, noise, or other external costs of highway use. There is interest, however, among some State and local agencies in exploring the feasibility of variable or time-of-day pricing to help manage highway travel in certain corridors. For instance on State Route 91 in California, four additional lanes were constructed with private funds on which tolls are charged that vary by time of day. A project is underway in San Diego under the Value Pricing Pilot Program that has tolls which vary according to the level of congestion.

Fees on "gross emitters," the most polluting of vehicles that are responsible for large percentages of total pollutants, have been suggested as a way to charge the worst polluters for air pollution costs they impose, and general increases in fuel taxes have also been suggested to address air pollution costs. A gross emitter tax could directly reflect air pollution costs, but questions of equity and other implementation issues have prevented such a tax from being implemented to date. General fuel tax increases implemented at the local level would not be as sensitive to factors affecting air pollution as the gross emitter tax, but could reflect regional differences in air pollution costs.

While there are opportunities at the local level to develop user fees that could reflect congestion, air pollution, and other external costs, implementing charges that could reflect the locational and temporal variability or most such costs would be difficult.

#### SUMMARY AND CONCLUSIONS

Since the 1997 HCAS was completed, several changes affecting conclusions about the equity and economic efficiency of Federal highway user fees have occurred. First and most importantly, proceeds of 4.3 cents per gallon of Federal fuel taxes have been shifted from the General Fund where they were dedicated to deficit reduction to the Highway Trust Fund where they may be used for highway-related purposes under the new TEA-21 legislation. Second, TEA-21 significantly increased total authorizations for highway, transit and related purposes and shifted the distribution of funding among different program areas. Third, additional information has been developed concerning air pollution-related costs of highway use which fills a large gap in estimates of social and marginal costs of highway travel.

From an equity perspective, the most significant change is an increased spread in ratios of user fee payments to highway cost responsibility between lighter vehicles and heavier vehicles. Table 7 showed that equity ratios for the heaviest single unit trucks and all the weight groups of combination trucks went down. Now only the very lightest combination trucks pay their share of Federal highway cost responsibility. The most common combination vehicles, those registered at weights between 75,000 and 80,000 pounds, now pay only 80 percent of their share of Federal highway costs and combinations registered between 80,000 and 100,000 pounds pay only half their share of Federal highway costs. Any future increase in Federal fuel

taxes without corresponding increases in taxes on the heaviest trucks will further exacerbate the underpayment of Federal user fees by heavy trucks.

Changes in program composition and funding levels between ISTEA and TEA-21 did not have a large effect on the relative cost responsibility of different vehicle classes. Much larger changes in relative program funding levels would be required to substantially affect cost responsibility, and the flexibility for States to shift funds from one program to another would temper even large changes in program composition.

Economic costs of motor vehicle-related air pollution remain large, even though substantial progress has been made in abating emissions through a variety of initiatives. While average air pollution costs per mile of travel in rural areas are not much lower than average costs of urban travel—1.5 cents per mile in rural areas compared to 1.75 cents per mile in urban areas—care must be exercised in interpreting these results because they mask real differences in air pollution-related costs of motor vehicle use in different areas. Air pollution costs of travel in very rural areas away from population centers would be lower than the average rural costs shown in this report, and likewise, costs of travel in urban areas with the highest ambient air pollution levels would be higher than average costs of urban travel shown in this report. Air pollution is one of the most difficult social costs of highway use to evaluate from a policy perspective because effects vary geographically and spill over to other areas in ways that vary from region to region. More research will be needed to further refine estimates of marginal air pollution costs in various locations.

The Department plans to update the 1997 HCAS before the next surface transportation reauthorization. Potential options to improve overall user fee equity will be examined in greater depth in that study and additional research to improve estimates of air pollution and other social costs of highway travel will be conducted.

## ATTACHMENT 2: EMISSIONS EFFECTS OF ATLANTA SPEED STUDY

### MEMORANDUM

To: Southern Environmental Law Center  
 From: Brian Grady and Norm Marshall  
 Subject: Atlanta Non-Attainment Area Speed Study  
 Date: 20 July 2001

#### *Introduction*

In February 2000, we were retained by the Southern Environmental Law Center (SELC) to review the 2001-2003 Transportation Improvement Program (TIP), the 2025 Regional Transportation Plan (RTP), and the Conformity Determination Report (CDR) prepared by the Atlanta Regional Commission (ARC). In our initial critique, we demonstrated that observed freeway speeds were much higher than the speeds in the ARC travel demand model using data from the Georgia Navigator Intelligent Transportation System (ITS). Furthermore, we demonstrated that the major discrepancy between observed and modeled freeway speeds resulted in a significant underestimation of mobile source nitrogen oxide (NO<sub>x</sub>) emissions.

In October 2000, the Georgia Regional Transportation Authority (GRTA) commissioned a speed study to examine and update the parameters used in developing peak and off-peak speeds in the ARC regional travel demand model. The final draft of the study conducted by Wilbur Smith Associates (WSA) was released in January 2001. The findings of the Atlanta Non-Attainment Area Speed Study substantiate and validate our earlier findings and conclusions. Specifically, that observed freeway speeds in the Atlanta non-attainment area are higher than the freeway speeds modeled in the ARC travel demand model, and produce much higher NO<sub>x</sub> emissions

than calculated in the conformity process. After correcting for this error, the NOx emissions exceed the allowable amount by a wide margin.

*Speed Study Findings*

The Final Draft of the Atlanta Non-Attainment Area Speed Study was prepared by Wilbur Smith Associates on behalf of the Georgia Regional Transportation Authority. After analyzing the speed data collected for the region’s freeways, three trends were evident when comparing the observed speeds against the modeled ARC speeds. These findings are presented on page 35 of the speed study.

(With exception of the central business district (CBD) area, off peak observed weighted speeds are higher than the peak speeds and fairly constant across area types at close to 60 miles per hour (MPH).

(The observed peak-period speeds vary considerably without a discernable pattern: from 31.9 MPH during the AM peak to 57.7 MPH during the PM peak in the CBD area and from 36.7 MPH in the Suburban area during the PM peak to 57.0 MPH in the Exurban/Rural area during the PM peak.

(Observed speeds are consistently higher than modeled speeds (9 out of 12 averages are higher) and in some cases the difference is relatively large (5 averages are more than 10 MPH higher).

Table 10.2.1 on page 35 of the speed study contains the observed weighted average speeds and weighted ARC modeled speeds for freeways. The same data is presented here in Table 1.

Table 1: Observed Weighted Average Freeway Speeds

| Area Type     | Period   | Observed Weighted Avg. Speed (MPH) | Weighted ARC Modeled Speed (MPH) |
|---------------|----------|------------------------------------|----------------------------------|
| CBD           | AM Peak  | 31.9                               | 21.1                             |
|               | Off Peak | 40.0                               | 22.8                             |
|               | PM Peak  | 57.7                               | 20.7                             |
| Urban         | AM Peak  | 40.1                               | 41.3                             |
|               | Off Peak | 59.8                               | 50.2                             |
|               | PM Peak  | 50.4                               | 43.9                             |
| Suburban      | AM Peak  | 54.4                               | 47.2                             |
|               | Off Peak | 59.9                               | 43.9                             |
|               | PM Peak  | 36.7                               | 37.7                             |
| Exurban/Rural | AM Peak  | 40.9                               | 53.5                             |
|               | Off Peak | 58.8                               | 45.1                             |
|               | PM Peak  | 57.0                               | 51.9                             |

The authors of the speed study concluded the following about the Volume Delay Functions (VDF) and resulting model freeway speeds used in the ARC regional travel demand model:

In conclusion, it appears that the existing shape of the existing ARC regional travel demand model VDF freeway curves is not supported by the observed speed data and additional samples are required at higher V/C ratios to better estimate the shape at the higher V/C ratios. Further with many observed speeds generally higher than what the VDF curve would estimate, it is likely that the overall freeway average speed is underestimated.

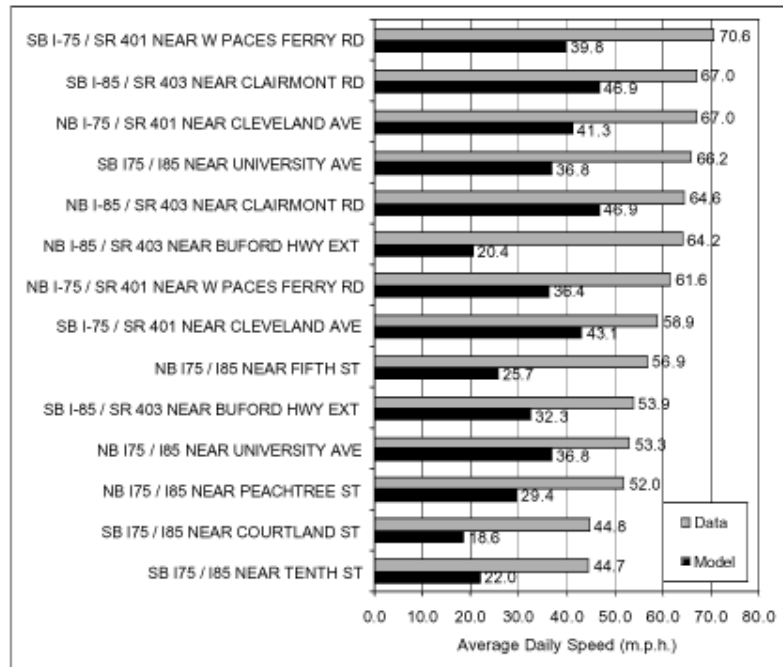

We are in complete agreement with this conclusion, as we drew the same conclusion about the ARC model freeway speeds after examining data collected by the Georgia Navigator ITS. Prior to the speed study, the most comprehensive speed data available in the region were those collected by the Georgia Navigator ITS. In particular, there are 14 Autoscope stations located on I-75 and I-85 that are judged by the Georgia Department of Transportation (GDOT) to be the most accurate in the system. These installations include advanced video equipment that measure speed within each travel lane continuously.

Data for 1 weekday per month were obtained from GDOT for the previous 13 months (January 1999—January 2000), with data summarized for each of 24 hours by each lane. Average daily speeds were calculated from these summaries.1 Figure 1 on the next page shows these speeds by location compared to final adjusted travel speeds for the 2000 ARC model.

The ARC dismissed our initial comments regarding the discrepancy between observed and modeled freeway speeds. ARC claimed we had relied on data from a sample that was not only small but also inaccurate. However, the data from the Georgia Navigator ITS and the findings in the speed study, which collected speed data for hundreds of roadway segments, tell the same story. The VDF freeway

curves used in the ARC model yield speeds that are much lower than observed speeds.

Figure 1: ARC Model Speeds Compared with Georgia Navigator ITS Speed Data

#### Impact on Mobile Source Emissions

As a short-term improvement, the study recommends the development of a post-processor to predict speeds based on data in the study for use in the State Implementation Plan and Conformity Determination. This post-processor would estimate speeds based on enhanced VDF curves and volume output from the ARC regional travel demand model. The authors of the study recognize the importance of post-processing the ARC model speeds because the MOBILE5b emission factor model is extremely sensitive to speed inputs.

Despite recognizing the problem with ARC modeled freeway speeds, enhanced VDF curves were not generated by WSA to facilitate development of a post-processor. Citing insufficient data, new enhanced VDF curves were not developed. The speed study identifies a problem, but does not provide any practical means of fixing it. The study is therefore incomplete. This is particularly disturbing because the development of new VDF curves was an explicit part of GRITA's speed study project when the Request For Qualifications (RFQ) was issued.

The discrepancy between observed and modeled freeway speeds has a significant impact on mobile source nitrogen oxide emissions. This fact may partially explain why the authors don't suggest implementing many of the recommended improvements until 2006 and beyond. To quantify the emission impacts from underestimation of freeway speeds, we have calculated 2003 nitrogen oxide emissions from freeways using both sets of speeds presented in Table 1 of this memorandum (Table 10.2.1 in the speed study). Table 2 contains NO<sub>x</sub> emissions from freeways using the observed weighted average speeds by time period and area type. Table 3 contains NO<sub>x</sub> emissions from freeways using the weighted ARC modeled speeds by time period and area type.

Table 2: NOx Emissions From Freeways Using Observed Weighted Average Speeds

| Area                                | Time Period | 2003 ARC Vehicle Miles | Observed Weighted Avg. Speed (MPH) | 2003 MOBILE5b Emission Factor (grams/mile) | Total Emissions (grams) |
|-------------------------------------|-------------|------------------------|------------------------------------|--|-------------------------|
| CBD                                 | AM          | 230,407                | 31.9                               | 1.595                                      | 367,498                 |
|                                     | Off         | 245,594                | 40.0                               | 1.631                                      | 400,564                 |
|                                     | PM          | 782,192                | 57.7                               | 2.236                                      | 1,748,982               |
| Urban                               | AM          | 1,639,888              | 40.1                               | 1.631                                      | 2,674,657               |

| Total Daily Emissions (tons/day) .. |             |                        |                                  |  | 95.1                    |

Total daily NOx emissions from freeways are estimated as 106.9 tons/day when observed weighted average freeway speeds from the speed study are used in the emissions calculation. Total daily NOx emissions from freeways are only estimated as 95.1 tons/day when weighted ARC modeled freeway speeds are used in the emissions calculation. Therefore, by using incorrect freeway speeds which are less than actual observed speeds in the emissions analysis, NOx emissions are underestimated by 11.8 tons/day. This represents 11 percent of the total freeway emissions.

The speed study also presented speed data for Class I, Class II and Class III Arterials as well as Class I Collectors. Observed weighted average and weighted ARC modeled speeds by time period and area type for these facilities were also tabulated. We conducted an emissions analysis for each of these facilities using the observed and modeled speeds as was done previously for freeways. Table 4 contains the results of this emissions analysis. Despite some inconsistencies between observed and modeled speeds on these facilities, the impact on emissions is slight given the nature of the NOx emission curve. The NOx curve is relatively flat between 20 and 40 MPH, so speed variations in this speed range do not produce drastic changes in total emissions.

Table 4: NOx Emissions Analysis for Class I,II, III Arterials and Class I Collectors

| Facility Type             | Daily NOx Emissions Using Observed Weighted Average Speeds (tons/day) | Daily NOx Emissions Using Weighted ARC Modeled Speeds (tons/day) | Difference [Observed—Modeled] (tons/day) |
|---------------------------|---|--|--|
| Class I Arterials .....   | 21.32   | 21.82  | -0.51                                    |
| Class II Arterials .....  | 20.44   | 20.51  | -0.07                                    |
| Class III Arterials ..... | 29.45   | 29.43  | 0.02                                     |
| Class I Collectors .....  | 26.92   | 27.74  | -0.83                                    |

#### Impact on Conformity Determination

The ARC does not satisfy the 2003 SIP NOx budget when the correct freeway speeds are used in the emissions analysis. The year 2003 SIP budget without off-model adjustments is 245.88 tons/day. In the CDR, the ARC estimated 2003 NOx emissions are reported as 241.60 tons/day. However, we have shown that emissions are underestimated by 11.8 tons/day because incorrect ARC model freeway speeds were used in the emissions analysis. The 2003 SIP budget is exceeded when this underestimation is considered. The conformity data is presented in Table 5 below.

Table 5: ARC 2003 NOx Emissions

| Year       | SIP Budget (tons/day) | ARC Projection (tons/day) | New Projection [ARC + 11.80] (tons/day) | New Projection < Budget |
|------------|-----------------------|---------------------------|---|-------------------------|
| 2003 ..... | 245.88                | 241.60                    | 253.40                                  | No                      |

The 2003 NOx emissions projection increases to 253.40 tons/day when the correct observed freeway speeds are used in the emissions analysis. This emission rate exceeds the 2003 NOx emissions budget established in the SIP by 7.52 tons/day.

#### Conclusion

In February 2000, we were retained by the Southern Environmental Law Center (SELC) to review the 2001–2003 Transportation Improvement Program (TIP), the 2025 Regional Transportation Plan (RTP), and the Conformity Determination Report (CDR) prepared by the Atlanta Regional Commission (ARC). In our initial critique, we demonstrated that observed freeway speeds were much higher than the speeds in the ARC travel demand model using data from the Georgia Navigator Intelligent Transportation System (ITS). Furthermore, we demonstrated that the major discrepancy between observed and modeled freeway speeds resulted in a significant underestimation of mobile source nitrogen oxide emissions.

In October 2000, the Georgia Regional Transportation Authority (GRTA) commissioned a speed study to examine and update the parameters used in developing peak and off-peak speeds in the ARC regional travel demand model. The final draft of the study conducted by Wilbur Smith Associates (WSA) was released in January 2001. The findings of the Atlanta Non-Attainment Area Speed Study substantiate and validate our earlier findings and conclusions. Specifically, that observed freeway speeds in the Atlanta non-attainment area are higher than the freeway speeds modeled in the ARC travel demand model.

When the correct observed freeway speeds are used in the emissions analysis, 2003 NOx freeway emissions increase by 11.8 tons/day. This increase is significant because the 2003 SIP budget is exceeded when the additional freeway emissions are included in the emission projections. 2003 NOx emission projections increase to 253.40 tons/day, which exceeds the 245.88 tons/day budget established in the SIP. Accounting for the underestimation resulting from the use of incorrect freeway speeds, the ARC conformity determination is invalid.

## ATTACHMENT 4: INDUCED DEMAND AND REGIONAL TRANSPORTATION MODELS:

SUMMARY OF RECENT STUDIES AND APPLICATION TO EVALUATE A REGIONAL  
TRANSPORTATION PLANNING MODEL

(By Norm Marshall, Smart Mobility, Inc.)

PREPARED FOR ENVIRONMENTAL DEFENSE

JULY 2002

Transportation investments and policies have many impacts and these are often examined using regional transportation planning models. Among the key impacts is induced traffic, which can have a profound impact on air pollution, congestion, and transportation system performance. This paper summarizes recent studies of induced traffic and shows how induced traffic can be measured in a regional travel models to evaluate their adequacy to evaluate the likely future performance of regional transportation systems under different investment and policy scenarios.

DeCorla-Souza and Cohen define “induced demand” as an: “increase in daily vehicle miles of travel (VMT), with reference to a specific geographic context, resulting from expansion of highway capacity.” This definition includes both short-term effects and long-term effects. The short-term effects include more trips, longer trips, more auto trips, and auto trips with lower occupancies. The long-term effects follow land use changes caused by expanded roadway capacity.

Over the past several years, a series of national studies have been published quantifying the induced travel effect. The measure used in most studies is elasticity, a basic concept of economics. When the supply of a good or service increases, its price drops. When the price drops, consumption of the product increases. For the majority of Americans, the incremental cost of operating cars is low enough that the

perceived cost is primarily travel time. An increase in lane miles of road capacity (supply) causes a near-term decrease in travel time (price), which in turn leads to an increase in vehicle miles traveled (consumption).

Elasticity is calculated as the ratio of the change in consumption divided by the change in supply. For example, if a 10 percent increase in vehicle miles traveled is caused by a 10 percent increase in lane miles, the elasticity is:

$$10 \text{ percent} / 10 \text{ percent} = 1.0.$$

Alternatively, if a 5 percent increase in vehicle miles traveled is caused by a 10 percent increase in lane miles, the elasticity is:

$$5 \text{ percent} / 10 \text{ percent} = 0.5.$$

Research findings from five studies presented at recent Transportation Research Board Annual Meetings are directly comparable and are summarized in Table 7.

Table 7: Long-Term Regional Elasticity of Vehicle Miles Traveled to Lane Miles

| Study                                    | Long-term regional elasticity |

*Analysis of Regional Travel Model Sensitivity to Induced Traffic*

To illustrate how regional travel model performance in measuring induced traffic can be evaluated, we examine the model used in 2001 by the Baltimore Metropolitan Council and compare it to a similar regional sketch model developed in early 2002 for the Vision 2030 initiative in Baltimore.

To determine the sensitivity of the BMC model to induced travel demand effects, two separate model runs were performed using the BMC regional travel demand model. First, the model was run using the BMC 2025 land use scenario and the 1996 highway network. The model was then run again using the BMC 2025 land use scenario with the 2025 highway network. By using the same land use inputs, we can determine the effect of the transportation capacity improvements in the 2025 highway network. Table 8 contains the results of the two BMC model runs.

To determine the sensitivity of the sketch model to induced demand effects, two separate model runs were again performed this time using the sketch travel demand model. First, the model was run using the 2030 land use inputs developed for the Vision 2030 Highway scenario and the 1996 highway network. The model was then run again using the 2030 Highway land use scenario with the 2025 highway network. Table 9 contains the results of the two sketch model runs.

Table 8: Induced Demand Sensitivity of the BMC Model

|  | Vehicle Miles of Travel (VMT) | Lane Miles (LM) |
|--|-------------------------------|-----------------|
| 2025 BMC land use with 1996 network .....    | 19,323,453                    | 8,514           |
| 2025 BMC land use with 2025 network .....    | 19,469,459                    | 9,283           |
| percent Change .....                         | 0.76 percent                  | 9.03 percent    |
| percent Change VMT / percent Change LM ..... | 0.08                          |                 |

Table 9: Induced Demand Sensitivity of the Sketch Model

|  | Vehicle Miles of Travel (VMT) | Lane Miles (LM) |
|--|-------------------------------|-----------------|
| 2030 Highway Scenario land use with 1996 network ..... | 18,757,041                    | 8,514           |
| 2030 Highway Scenario land use with 2025 network ..... | 19,306,043                    | 9,283           |
| percent Change .....                                   | 2.93 percent                  | 9.03 percent    |
| percent Change VMT / percent Change LM .....           | 0.32                          |                 |

The elasticity of vehicle miles of travel with respect to lane miles for the BMC model is only 0.08. The elasticity of vehicle miles of travel with respect to lane miles for the improved sketch model is 0.32. Although the sketch model does not capture induced demand to the same degree as the published research, the sketch model gives a much more realistic induced travel demand response than does the BMC travel demand model.

This is important that induced demand is properly accounted within the Vision 2030 process, so that the benefits of new roadways are not overestimated. This is also critical in roadway planning, and in estimating air emissions.

ATTACHMENT 5: PRELIMINARY TOXICOLOGICAL REVIEW OF ROADWAY TRAFFIC  
POLLUTION

PREPARED FOR: JOANNE SPALDING, STAFF ATTORNEY, SIERRA CLUB

(Prepared By: Environmental Health & Engineering, Inc.)

May 11, 2001

*1.0 EXECUTIVE SUMMARY*

Roadway traffic generates a complex mixture of particles and gases. In particular, diesel exhaust continues to be a major focus of research and public health concern, both in the United States and internationally, due to the large amounts of ultrafine particulate matter and known carcinogens such as benzene, formaldehyde, 1,3 butadiene and polycyclic aromatic hydrocarbons including benzo(a)pyrene that are released. The constituents of roadway traffic emissions, either singularly or in combination, have demonstrated toxicological properties that are either known to cause or are suspected of causing a variety of health effects in individuals that are exposed to them.

From an acute exposure standpoint, diesel exhaust is a strong irritant and may cause a variety of inflammation related symptoms including respiratory irritation, asthma-like reactions, eye irritation, headaches and nausea. The primary chronic health concerns include nonmalignant respiratory and cardiovascular disease, exacerbation or initiation of allergic hypersensitivity and lung cancer.

An ever-growing body of research reported in the literature demonstrates excessive morbidity and mortality in populations that are in close proximity to heavily trafficked roadways. Our understanding of the magnitude of these adverse health impacts has increased as improved scientific methods for spatial and temporal resolution have refined the exposure estimates for roadway traffic emissions for nearby residents.

Analysis of published data for traffic emission factors and the resulting exposure estimates demonstrates that uncontrolled expansion of roadways will significantly increase exposures to both fine particulate matter and air toxins by the population in the contiguous residential corridor. This is significant because several epidemiological studies have shown that levels of fine particulate matter typically found adjacent to heavily trafficked roadways are comparable to levels that can exacerbate both acute and chronic respiratory disease symptoms and cause premature death among sensitive populations. This finding applies to short-term exposures of a few hours to one or several days. With regard to air toxins, exposures experienced by roadway corridor residents are likely to equal and probably exceed the air toxins levels measured at monitoring sites located near heavily traveled highways and reported in the Multiple Air Toxics Emissions Study II Study. Risk estimates based on the levels reported in the Multiple Air Toxics Emissions Study II resulted in an unacceptably high cancer risk of approximately 1 in 1,000 to 1 in 650 that was attributed to diesel exhaust and other motor vehicle emissions. The relative impact

on other roadway corridor populations could be commensurate with the increased exposures to motor vehicle pollution that would result from their proximity to the large numbers of additional vehicles traveling the expanded highway.

Many current environmental assessments have not properly accounted for the differential impact that could be imposed on the nearby the population adjacent to expanded highways. This analysis of available data demonstrates that a detailed program of pollutant monitoring and modeling that are specific for the planned expansion should be undertaken to properly quantify the potential adverse health impacts associated with projects of this type.

## 2.0 INTRODUCTION

Roadway traffic generates a complex mixture of particles and gases. The constituents, either singly or in combination, have demonstrated toxicological properties. Some compounds are known to cause a variety of health effects and others are suspected of causing a variety of health effects in individuals exposed to them. Table 2.1 presents a list of compounds commonly released from motor vehicles and their primary expected adverse health effects. Many of these compounds are related to diesel exhaust while others are also associated with gasoline powered vehicles.

B: Listed as "Reasonable Estimate" by California Air Resources Board (Range = 1.3E-4 to 1.5E-3 [(mg/m<sup>3</sup>)]

Evidence from Pearson and colleagues (2000) shows an association between an elevated incidence of childhood leukemia and children's exposure to higher than regional urban background concentrations of motor vehicle emissions. Brunekreef and colleagues (1997) show that adverse health outcomes, including premature mortality and increased morbidity from increased respiratory and cardiovascular effects, are associated with the increase in ambient fine particulate matter, e.g., particles less

than 2.5 microns in diameter (PM<sub>2.5</sub>) from roadway sources. The recent Multiple Air Toxics Emissions Study II (MATES II) performed by the South Coast Air Quality Management District for the Los Angeles air basin (SCAQMD 1999) also shows increases in cancer risk due to the presence of known carcinogens such as benzene, formaldehyde, 1,3 butadiene, benzo(a)pyrene and other chemical species found in diesel particulate matter. Furthermore, there is increasingly strong evidence that diesel exhaust may be a significant factor in initiating or exacerbating allergic hypersensitivity. Diesel exhaust is also a likely factor for increasing airway reactivity in those with asthma.

A number of uncertainties are involved in determining the magnitude of health hazards associated with pollutants generated by motor vehicles. However, sufficient information is available from both human studies and animal studies showing adverse health effects, including cancer, respiratory disease, and premature death among populations exposed to motor vehicle emissions at levels found in the urban atmosphere. The magnitude of these effects will be determined by several factors, including the frequency and duration of exposure, health status, interactions with other pollutants, and the differential impact on those individuals that have "hot spot" exposures or those found in heavily traveled freeway corridors. This evidence demonstrates that populations exposed to air pollutants from motor vehicles in excess of average regional urban concentrations are likely to experience a significantly elevated risk of adverse health effects, and that such risks are well above the levels of public health concern.

These factors argue for conduct of detailed, carefully considered analyses to ensure that an excessive exposure burden is not placed unjustly on a subset of the population.

### 3.0 CARCINOGENIC RISK

Roadway traffic generates many pollutants categorized as known or suspected human carcinogens or considered as potential carcinogens. Table 3.1 summarizes the current categorization of diesel exhaust as a carcinogen of by a variety of State, Federal, and international organizations. These organizations are consistent in finding that experimental studies demonstrate that diesel exhaust is carcinogenic in rats and that the epidemiological data demonstrate that diesel exhaust, which is a mixture of many organic and inorganic compounds, is a potential or a probable human carcinogen. Table 3.2, developed from the MATES II Study (SCAQMD 1999), shows that diesel particulate is the overwhelming contributor to cancer risk in diesel exhaust.

Table 3.2 Unit Risk Factor (URF) Weighted Emissions from MATES II Draft Report—Continued

| Species                        | Emissions (lbs/day) | URF (x10 <sup>-6</sup> ) | URF Weighted Emissions |
|--------------------------------|---------------------|--------------------------|------------------------|
| "Diesel particulate" emissions |                     |                          |                        |
| Diesel Particulate .....       | 22,890              | 300                      | 6,867,000              |

The Diesel Exhaust Report by the Health Effects Institute (1995) reported that a 20 percent to 40 percent greater incidence in lung cancer was found in certain occupations, such as railroad workers and truck drivers, that involved repeated exposures to diesel exhaust. Of particular relevance is the study of exposure to diesel particulate in long haul and city truckers reported by Steenland et al. (1998) where an exposure-response relationship was found. The personal, 8-hour exposures of these truck drivers were found to be similar to the ambient exposures of the general population and the "highway background" exposure (Zaebst et al. 1991). The health implications of such exposures for the general population remain to be determined.

#### 4.0 NON-CANCER HEALTH EFFECTS OF DIESEL EXHAUST

##### 4.1 Respiratory Effects

Several epidemiological studies published in peer reviewed journals by researchers both in the U.S. and Europe point to significant respiratory and cardiovascular health effects with short-term exposure to airborne particulate air pollution.

Brunekreef and colleagues (1997, 1999) found reduced lung function and increased respiratory symptoms in children living near roadways and linked it to air pollutants from motor vehicle emissions, particularly diesel exhaust. The six communities they analyzed were near roadways that carried between 80,000 and 152,000 vehicles per day. The truck traffic density over a 24-hour period ranged from 8,000 to approximately 17,000. Their findings showed a greater association between decrements in lung function and truck traffic density than that with automobile traffic density. Furthermore, they found a strong association with exposure and symptoms in children who lived less than 300 meters from the roadways.

Measured concentrations of black smoke, which is used as an indicator of diesel exhaust particles, and nitrogen dioxide were strongly correlated with distance of the monitoring station from the roadway. They found that impaired lung function was closely associated with the concentration of black smoke and proximity to the highway.

Several epidemiological studies (Dockery et al. 1993; Pope et al. 1995; Zmirou et al. 1998; Pope and Dockery 1999) have shown that short-term exposures to urban air pollution can play a significant role in both acute and chronic respiratory and cardiovascular disease. These studies show that episodes of particulate air pollution are associated with increased hospital admissions for patients with underlying heart disease. These effects have been shown to be significant at concentrations of PM<sub>2.5</sub> that are likely to be routinely exceeded by emissions from motor vehicles within 300 meters of heavily trafficked roadways.

Mar et al. (2000) found that elemental carbon was significantly associated with cardiovascular mortality in Phoenix, Arizona. They attributed the elemental carbon fraction primarily to diesel exhaust.

##### 4.2 Allergenic Responses

Components of diesel exhaust can act synergistically with bioaerosols, such as pollen, to initiate and increase the incidence of allergic airway disease in individuals (Diaz-Sanches et al. 1997). Diesel exhaust components at levels typically found in urban background hotspots can also exacerbate the onset of symptoms in an allergic individual (Ishizaki et al. 1987; Miyamoto 1997; Braun-Fahrlander et al. 1999).

##### 4.3 Ambient Exposures

Various studies have attempted to provide estimates for the contribution to fine particle mass concentrations made by diesel exhaust. Although direct comparison is hampered due to differences in analytical techniques and averaging times used, there is an overwhelming consistency in the trends observed, which adds further impetus for including a more careful evaluation of environmental impacts on populations located in close proximity to heavily trafficked roadways.

Of particular concern is the impact so-called "hot spots" can have on exposure. Although ambient diesel concentrations in urban and suburban areas are generally reported to range from approximately 1 to 5 µg/m<sup>3</sup>, "hotspots," such as heavily traveled roadways and bus stops with a high density of diesel vehicles, can have concentrations ranging from 11 to 46 µg/m<sup>3</sup>. Table 4.1 is adapted from EPA's Draft Report (1999).

<sup>1</sup>PM<sub>10</sub>  
NA Not available

Other studies have shown that diesel PM in enclosed vehicles driving on Los Angeles roadways range from nearly 3 µg/m<sup>3</sup> to 36 µg/m<sup>3</sup> (California EPA 1998b). Samples collected near the Long Beach Freeway (California EPA 1998a) indicate that diesel contributions range from daily averages of nearly 1 µg/m<sup>3</sup> to 7.5 µg/m<sup>3</sup>.

Brunekreef and colleagues (1997) found that adverse health effects were associated with diesel particulate levels near roadways in the Netherlands between 7 µg/m<sup>3</sup> and 21 µg/m<sup>3</sup> of diesel particulate matter (measured with black smoke). Such concentrations were measured at monitoring stations within 300 meters of roadways.

### 5.0 CONCLUSION

The wide range of particulate matter concentrations, a large fraction of which can attributed to diesel exhaust, obtained in the studies referred above indicate adverse health effects can reasonably be anticipated among populations exposed to motor vehicle emissions. However, site specific analysis would be required to appropriately assess and quantify the expected health impacts for any specific exposed population. “Hotspots” such as heavily traveled roadways, bus stops and train stations, have an extraordinary impact on localized exposures. Utilizing data from studies such as Brunekreef and colleagues (1997) and modeling studies evaluated as part of this review, it is likely that a significantly increased risk of experiencing the adverse impacts associated with motor vehicle emissions would extend 300 to 400 meters from the roadway for populations exposed in that area for a significant period of time. These populations would include persons residing, attending school and working in such areas, and persons traveling for extended periods in highway corridors.

In summary, both the epidemiological data and toxicological evidence reviewed indicate there would be a significantly increased risk of adverse health outcomes through increased carcinogenic risk and effects on the respiratory and cardiovascular systems among populations exposed to concentrations of motor vehicle emissions expected to be found in the vicinity of heavily traveled highways. The data support that under conditions typically reported in monitoring and modeling studies of motor vehicle emissions in the vicinity of heavily traveled highways, concentrations of diesel-related air pollutants alone are high enough to trigger unacceptable health risks. The risk of adverse health effects is further increased when concentrations of gasoline-related air pollutants are added.

ATTACHMENT 6: REVIEW OF EXPOSURE TO TOXIC AIR POLLUTANTS FROM MOBILE SOURCES AND THE IMPACT OF EXPANSION OF US 95 IN LAS VEGAS, NEVADA

*Introduction*

An Environmental Impact Statement (EIS) has been prepared by the Nevada Department of Transportation for improvement and expansion of US-95 in Las Vegas. These improvements will include the widening of US 95 to 10 lanes from Rainbow to I-15 (5 miles) and widening to 6 lanes from Craig to Rainbow (5 miles) plus other traffic expansion measures. The result will be to increase average annual vehicle trips in the widened area and facilitate additional traffic flows on adjoining highways and arterials. As a result vehicle travel in the US 95 corridor near the I-15 interchange would be expected to increase from 200,000 average annual daily vehicle trips (AADT) in 2000 to 230,300 by 2020, and north of Summerlin the increase will be from 122,000 in 2000 to 212,500 in 2020. The EIS provides a brief evaluation of the impact of additional traffic-generated carbon monoxide, but it does not deal with a wide range of other air pollutants emitted from motor vehicles. This omission includes the 21 air contaminants from motor vehicles that are classified by EPA as toxic or hazardous air pollutants<sup>10</sup>. These pollutants are listed in Table 1 below.

The importance of these hazardous pollutants to public health has increasingly been recognized in recent literature as the result of comprehensive emission and exposure studies<sup>11</sup>, as well as by additional public health evidence reviewed by EPA as summarized in the Technical Support Document issued in support of the MSAT list published pursuant to 201(l) of the Clean Air Act, and in a report prepared on the US 95 project by Dr. Jack McCarthy of Environmental Health and Engineering. Based on results in studies from major US cities, there is ample basis to conclude that the levels of exposure to air toxics from motor vehicles present a significant risk of adverse health effects in human populations. These adverse health risks should be thoroughly reviewed in a Supplemental EIS for the US 95 project. This conclusion is derived from the application of studies of other cities to the specific situation along US 95 in Las Vegas. An evaluation of the applicability of studies from Los Angeles and elsewhere follows.

Table 1: List of toxic air emissions from motor vehicles

Acetaldehyde  
 Acrolein  
 Arsenic compounds  
 Benzene  
 1,3-Butadiene  
 Chromium  
 Dioxins/ Furans  
 Diesel Particulate Matter and Diesel Exhaust Organic Gases  
 Ethyl benzene  
 Formaldehyde  
 n-Hexane  
 Lead compounds  
 Manganese compounds  
 Mercury compounds  
 Methyl tert-butyl ether MTBE  
 Naphthalene  
 Nickel compounds  
 Polycyclic Organic Matter  
 Styrene  
 Toluene  
 Xylenes

*Estimation of Present and Future Motor Vehicle Air Toxic Levels*

The present exposure to air toxics from motor vehicles can be estimated for the Las Vegas area and for areas adjacent to major highways by extrapolation from the results of the Multiple Air Toxics Exposure Study (South Coast Air Quality Management District, 2000) ("MATES II") 12. The MATES II study showed that regional exposures to toxic air pollutants are high enough to cause a significant risk of cancer to exposed populations, that the risk is higher for populations exposed within 2 kilometers of major freeway corridors, and that mobile source emissions account for 90 percent of the cancer risk attributable to all sources of toxic air pollutants.

The MATES II study did not estimate other adverse health outcomes in addition to cancer risk. The toxic air pollutants emitted by mobile sources are also associated with other adverse health effects in addition to cancer, including respiratory, cardiovascular and allergenic effects. These effects should also be characterized in a Supplementary EIS for the project.

The MATES II study carried out by California's South Coast Air Quality Management District used an air dispersion model to estimate the regional concentration of air toxics emissions from motor vehicles and other sources in the Greater Los Angeles Basin. As part of the MATES II study, these air contaminants also were measured in the ambient air at 10 regional sites and 14 microscale sites in the Los Angeles Basin. Thirty one air toxics were considered, including the mobile source derived emissions considered most significant to human health, such as benzene, 1,3, butadiene, formaldehyde, acetaldehyde, polycyclic organic matter and diesel particulate matter (DPM). Most of these air toxics are carcinogens. The results of the MATES II study showed that the air quality model underestimated actual measured concentrations at most of the 10 regional monitoring sites, but showed consistently close correlations among predicted and measured values to validate the modeling results.

The emission rates for the regional fleet of vehicles in the MATES II study was derived from the State of California EMFAC model and from air toxics speciation provided by the California Air Resources Board (CARB). The air dispersion model used the inventory of mobile source and industrial air toxics emissions for the Los Angeles area. The model was regional in scale and it produced estimates of the average concentrations in two kilometer square areas throughout the region. The model was able to distinguish between ambient concentrations derived from mobile sources and other sources.

The conclusion of the study was that the aggregate cancer risk for all air toxics in the Los Angeles basin was 1,400 in a million (1 in 710). The range of risk is between 1,120 in a million (1 in 890) and 1,740 in a million (1 in 570). Of the total cancer risk 90 percent was contributed by emissions from all mobile sources and 50 percent by on-road vehicles<sup>13</sup>. Therefore the cancer risk attributable to on-road vehicles is approximately 700 in a million (1 in 1400). The MATES II study also concludes that the differences in risk levels between sites within the Los Angeles Basin is primarily related to mobile sources and concentrations are especially high in proximity to major highway corridors.

When the concentrations of the toxic air pollutants measured at the various monitoring sites are plotted on maps as given in the California MATES II study it becomes apparent that the highest concentrations of motor vehicle derived air toxics are concentrated along the major high traffic freeway corridors, such as US 101, I-10, I-405, I-110 and I-710. These highways AADT levels are between approximately 100,000 and 330,000 with AADT levels in the 200,000 range being most common in the central urban areas<sup>14</sup>. The AADT on impacted sections of US 95 in Las Vegas in 2000 was between 122,000 and 200,000 vehicles<sup>15</sup>. After widening, plus estimated growth in the corridor, the Regional Transportation Commission (RTC) projects that the AADT will range from 212,500 to 230,300<sup>16</sup> an average increase of approximately 38 percent. AADT levels in Las Vegas at present and after the expansion will fall within the range of AADTs found in the Los Angeles Basin that was the subject of the MATES II study.

The percentage of diesel truck traffic of the total AADT on Las Vegas freeways, based on Nevada urban freeways data, is 7 percent and on urban interstate highways is 9 percent.<sup>17</sup> This is close but slightly higher than the percentage of trucks on the major freeways and interstates of Los Angeles, which is 6 percent<sup>18</sup>.

Based on comparable AADTs, diesel truck percentages and toxics air emission rates from the highway vehicle fleet in the Las Vegas area, comparable ambient air concentrations for toxic air pollutants in the US 95 corridor are to be expected after discounting the contribution of non-road mobile source emissions. Estimates of regional motor vehicle related air toxics concentrations for the Las Vegas area are given in Table 2.

Table 2: Estimated Air Toxics Exposure Concentrations from On-Road Motor Vehicle Derived Sources for the expanded section of US 95 in Las Vegas. Based on High Impact Highway Corridors in the MATES II Study

| Pollutant                | Ambient Concentration micrograms per cubic meter |
|--------------------------|--|
| Benzene .....            | 4.4  |
| 1,3 Butadiene .....      | 1.7  |
| Diesel Particulate ..... | 3.1  |

#### *Assumptions and Reliability of the Exposure Estimates*

The exposure estimates discussed here are derived from the MATES II study in California. For a number of reasons, exposure estimates derived from the MATES II study will most likely underestimate maximum exposures in other locations. These include:

1) The MATES II study uses regional computer models and estimates exposures to air toxics at average levels within two kilometer squares, not at hot spot locations. Therefore, the estimates are not worst case nor do they represent the exposure levels for residences close to major highways. Exposure levels close to major highways will be higher, and depending on distance, wind direction and other factors, may be considerably higher. Modeling conducted by Resource Systems Group for several highway projects shows that exposures to both gaseous and particulate pollution emitted from highways is much greater close to the highway. The results of the modeling showed that air toxics concentrations derived from motor vehicles on the highway were approximately ten times higher at 40 meters from the highway than at 300 meters from the highway.

2) These estimates represent only a limited number of motor vehicle air toxics. The total exposure for all motor vehicle air toxics, and the total cancer risk, is greater.

3) The MATES II study is supported by monitoring data that shows the model tends to underestimate ambient exposure levels for air toxics by about 16 percent.

4) The MATES II study uses California motor vehicle air emission rates that in general, are lower for all vehicle types than the national emission rates that apply to the Las Vegas metropolitan area.

5) Diesel particulate, which is the largest single risk factor from motor vehicles, is measured and defined in slightly different ways in modeling and monitoring studies cited, and in the epidemiological literature used to assess the impact on public health. Although there are differences of opinion among experts in the field as to the most appropriate measure of diesel PM, it seems most probable that because of the way diesel particulate is defined in the MATES II study, the result is that total air toxics exposure is, if anything, underestimated rather than overestimated.

Overall the exposure estimates used in this report to estimate current cancer risk in the US 95 corridor are conservative, and likely underestimate actual exposures and the magnitude of the health hazard to nearby populations.

In the future there may be reductions in air toxics emissions rates as increasingly more stringent air emissions standards are applied to motor vehicles. However, the emissions reduction strategies for heavy-duty vehicles do not apply until 2007, are under judicial challenge, and are under review by the current Administration. If retained, they will not be implemented until late this decade and will not significantly reduce emissions from vehicles now on the road until those vehicles are replaced. Heavy-duty diesel trucks and buses may remain in use for 15 to 25 years with engine rebuilds.

In the short to intermediate term there will also be improved traffic flows on US 95 during peak hours that will increase average speeds and reduce the level of some non toxic air emissions. However, there is not any clear evidence that increased vehicle speeds during peak hours will significantly reduce overall emissions of air toxics.

#### *Conclusions*

Based on the data provided by the RTC and discussed above the proposed expansion of US 95 is projected to increase to AADT levels 38 percent above 2000 levels. Because toxic air pollution is proportional to traffic levels we may expect a corresponding increase in air toxics levels in the areas close to the US 95 highway corridor. The US 95 expansion would increase traffic levels to volumes comparable to those in the Los Angeles Basin that were the subject of the MATES II study.

This brief evaluation demonstrates that the proposed expansion of the highway will significantly increase the exposure of the public to air toxics in the neighbor-

hoods along the US 95 corridor. The present and future levels of air toxics are probably at least comparable to levels in parts of Los Angeles adjacent to major freeways. These levels are associated with elevated cancer risk and other health problems as described in the separate report of Dr. Jack McCarthy. The present EIS ignores these significant public health risks. Because these emissions have a significant impact on the human environment, a Supplemental EIS is required to evaluate the health risks in the corridor and identify alternatives that can mitigate the health risk attributable to vehicle travel in the corridor.

## Executive Summary

Metropolitan areas where air pollution levels seriously threaten public health are required by federal law to establish pollution control plans to limit emissions and then make sure that both short- and long-range transportation plans and decisions conform to those emission limits. If transportation plans are anticipated to exceed adopted pollution limits, state and local officials must adopt additional pollution controls or redirect their transportation spending away from projects that will increase pollution, traffic and sprawl. Computer models are a key foundation for this traffic and pollution analysis. They determine whether billions of dollars in transportation investments will lead to healthful air quality that protects public health, or whether those plans will degrade air quality and force higher pollution clean-up costs onto business and the public. These models also underlie critical state and local decisions about whether it makes sense to build new roads and bridges, to expand highways, and support new sprawl development, or to invest in better transit, sidewalks, and transit-oriented development.

The key body of state and local officials that carries out such activities in the national capital region is the Metropolitan Washington Council of Governments and its National Capital Region Transportation Planning Board ("TPB"), which serves as the region's Metropolitan Planning Organization ("MPO"). Under Federal laws and regulations, MPOs are responsible for a set of regional planning activities including developing long-range transportation plans and demonstrating air quality conformity. Until recently, by margins that at times have been less than one percent, the TPB has claimed that its transportation plans and programs conform to adopted air quality plans. In mid-2001, TPB staff adjusted its emission estimates to recognize the much higher than previously assumed use of sport utility vehicles and light trucks in the region, revealing that the adopted transportation plan exceeds the adopted and legally binding regional motor vehicle air pollution limits. As a result the region cannot add new regionally significant highway projects to its transportation plan without offsetting the excess air pollution.

Our new, detailed review of the TPB traffic and emissions model has revealed additional deficiencies in assumptions and methods which have serious implications for air quality planning, the traffic projections for an additional Potomac River bridge, and other transportation project evaluations. Most notably:

- The computer model, and the way that its data have been manipulated, significantly overestimates future traffic growth and congestion, especially on major roads and bridges. This overestimation of future traffic demand can be falsely used to support the need for additional highway capacity, overestimating future congestion in no-build scenarios and overstating the benefits of constructing new roadway capacity.
- The model significantly underestimates expected air pollution from the region's cars and trucks especially for scenarios with increased roadway capacity. Correcting one key identified deficiency in the TPB model, for example, would result in an increase in the estimate of motor vehicle emissions of smog-producing volatile organic compounds by 12% compared with TPB's estimate for 2005.
- The model fails to account properly for induced traffic that will be attracted to new roads and fails to reflect how people will shift travel in response to congestion. This biases the model against investment strategies favoring transit, walking, bicycling, and transit-oriented development.
- The model fails to account for the quality of conditions in neighborhoods for walking and bicycling, ignoring how these travel options affect transit use, car use, and trip-

making and ignoring how support for these travel modes could help curb congestion and air pollution.

The TPB has been working on an improved model version for several years, but the version reviewed here is the one that has been used in developing the current long-range transportation plan and air quality conformity analysis, as well as in the preparation of many recent highway planning studies.

#### **Model Fails to Reflect Congested Travel Speeds**

MPOs rely on computer models in these planning efforts. The models include separate but linked travel demand models and air quality models. Modeling activities are regulated by federal guidelines. TPB documentation states: "The feed back of congestion speeds resulting from the traffic assignment step is a federally mandated requirement for acceptable modeling practice."

This requirement is not being adequately met by the TPB model. The documentation describes a congestion speed feedback step, but this step is too weak, and has little effect on the results. For non-work trips, there is no feedback at all. Without strong enough feedback, forecast traffic volumes in the model grow in an unrealistic unconstrained manner. This overestimation of future traffic demand can be falsely used to support the need for additional highway capacity.

#### **Irregularities in Calculations Lead to Underestimated Emissions**

Air pollution is a function of vehicle miles of travel (VMT) and speed. The most serious air pollutant for transportation emissions in the Washington region is nitrogen oxide (NOx), a precursor of smog, which is harmful to public health. Vehicular emissions are high at low travel speeds, but it is less well known that NOx emissions increase at speeds greater than 40 m.p.h. Increasing speeds beyond this point increases NOx emissions. NOx emissions per mile at 65 m.p.h. are greater than at 2.5 m.p.h. The region cannot solve its NOx problem by building roads to increase travel speeds.

Several improper techniques are used to make the model results appear to maintain air quality conformity by lowering calculated NOx emissions. The TPB model invalidly shifts traffic from congested links to less congested travel periods on a link by link basis. This shift does not represent "peak spreading" because the shifts are done at a relatively high level of service, 30-35 m.p.h. for a large share of freeways, and because in some cases the afternoon peak hour is spread beyond midnight. This speed range of 30-35 m.p.h. is associated with minimum emissions per VMT for NOx, the region's most critical pollutant. Calculated emissions for the most congested periods are reduced by shifting the traffic from one period to another while simultaneously lowering the travel speed to 30-35 m.p.h. for adjacent time periods.

Without these invalid assumptions about the speed characteristics of traffic on road links congested above a 1.6 V/C ratio for emissions analysis, calculated NOx emissions in 2005 would be 1.4 percent greater. This increase of 2.2 tons per day would cause the region to exceed the maximum allowed under the adopted state air quality control plans by 1.7 tons per day. In addition, calculated VOC emissions in 2005 would be 12.4 percent greater. This increase of 12.6 tons per day would also cause the region to exceed significantly the maximum allowed in the air quality control plans. Other deficiencies in the MWCOG modeling methods, such as the use of a sharply dampened travel time feedback for

congested road links in the travel demand analysis process, contribute to additional underestimation of emissions. This makes it likely that unless steps are taken to correct the M/WCOG models and their emission estimates, the Washington metropolitan area will find itself continuing to violate existing Clean Air Act air quality standards even after 2005, threatening public health.

### Conclusions

The weakness of the TPB model's treatment of congestion speed feedback on travel demand makes it one of the poorest of large metropolitan travel demand models in capturing the effects of induced travel demand resulting from new highway construction. With these problems, the TPB travel demand model overestimates travel demand in the future, and overestimates the benefits of proposed highway improvements.

These problems are especially acute in past studies of potential new Potomac River bridge crossings, all of which were based on this model or previous versions of the model. The American Legion Bridge on I-495 highlights these problems. This bridge is the closest existing Potomac River crossing to any of the proposed "Techway" routes. In 2025, the forecast traffic volume on the bridge is 77,000 vehicles per day higher (30 percent) assuming the same capacity as in 2001. The speed being fed back to the trip distribution model declines by 15 percent. If parameters recommended in the research literature were applied, the reduction in speed would be either by 60 percent (Speiss function) or 90 percent (BPR function). However, this great an increase would not occur. A proper model would produce an intermediate result – an increase in peak hour/peak direction travel due to growth in population and employment, but much less of an increase than assumed in the TPB model. The TPB model includes only very weak feedback for work trips and no feedback at all for no-work trips. Therefore, it does not accurately model shifts in destination, mode, and travel time in response to increased congestion.

As the TPB model can not properly forecast reductions in VMT as a result of congestion, it can not properly forecast increases in VMT that will result from increases in roadway capacity. In the context of Potomac River crossings, future traffic volumes on the existing bridges, including the American Legion Bridge, are surely overestimated in scenarios with no new bridges.

Any forecast travel time savings with a new bridge would be at least partially offset by increased congestion caused by induced travel, including congestion at roadways leading to and from any new bridges. The TPB model overstates the benefits of new roadway capacity, and underestimates the costs, including the effects of increased traffic in other areas.

The TPB and the Metropolitan Washington Air Quality Committee (MWAQC) have recently appointed a task force to recommend strategies to reduce air pollution to compensate for the excess emissions from increased use of sport utility vehicles and light trucks in the region. There are a number of strategies that could be used to solve this emission budget shortfall within the transportation planning process, for example by delaying some traffic-inducing road projects to accelerate funding of new bus and railcar purchases, promoting employer-paid commuter transit benefits, and investing in bicycle and pedestrian access to schools and transit stops.

The TPB has recommended that about half of this emission budget shortfall be eliminated – on paper – simply by adjusting what it believes to be faulty model assumptions about the composition of traffic on local roads and accessing park-and-ride lots in the region. Any modification of the TPB models to refine the analysis of traffic and its emissions should also correct the deficiencies noted in this report. Failure to do so would raise

serious questions about compliance of the region's planning process with the Clean Air Act regulations guiding modeling and use of the latest and best planning assumptions.

## Deficiencies in TPB Model and Application

### Overview

The Metropolitan Washington Council of Governments National Capital Region Transportation Planning Board ("TPB") is the region's Metropolitan Planning Organization ("MPO"). Under Federal laws and regulations, MPOs are responsible for a set of regional planning activities including developing long-range transportation plans and demonstrating air quality conformity.

MPOs rely on computer models in these planning efforts. The models include separate but linked travel demand models and air quality models.

### Travel Demand Modeling

The TPB travel demand model is a "four-step" model similar to those in use in other regions in the United States. The four steps are:

- 1) Trip Generation – Origins and destinations are calculated for each transportation analysis zone (TAZ), for each trip type, for each time period. A single origin or destination is called a "trip end."
- 2) Trip Distribution – The trip ends calculated in step 1 are connected to form complete trips. These are "person trips" and include both auto and transit trips.
- 3) Mode Choice – The person trips are divided among transit trips, auto drive alone trips, and auto shared ride trips. (The TPB model does not model nonmotorized trips.)
- 4) Assignment – The auto trips are assigned to each link of the highway network.

The purpose of the travel demand model is to approximate human behavior. While the four steps are processed individually and usually are calculated sequentially, they must always be thought of as parts of a complex process. People make their decisions simultaneously, i.e. they decide where they are going, and how they are going to get there at the same time.

Consider a potential traveler who anticipates severe congestion in traveling to a specific destination at a particular time. This information is only available to the travel demand model after assignment (the fourth step). However, this expectation of congestion certainly affects where the trip is destined (trip distribution), how the trip will be made (mode choice), and possibly whether the trip will be made at all (trip generation).

The TPB travel demand model attempts to address this problem by introducing feedback between the four steps. The model documentation shows that congested model output from the assignment step feeds back to influence trip distribution and mode choice decisions.

This is acceptable in principle, but there are two major problems with the implementation. First, only work trips are affected at all. This represents a fairly small and decreasing share of all trips. Second, the feedback process for work trips is weakened to the point that it has little effect.

The assignment step of the travel demand model calculates a travel speed for each one-way link in the network. This speed is calculated as a function of the model volume, the link capacity, and the link free-flow speed.

For example, most freeway links are coded in the TPB model with capacities of 1182 vehicles per lane per hour and 69 m.p.h. speed. More information must be given for these values to be fully understood. The capacity number is for "level of service C", where level of service (LOS) is a scale running from "A" to "F", with A indicating free flow traffic, and F representing severe congestion. Therefore, 1182 does not represent the ultimate capacity, but rather a volume at a fairly good level of service. Similarly, the speed represents conditions at level-of-service C. At free-flow conditions, the speed is assumed to be 15 percent higher or 69 m.p.h. (This typical example is for Ring 8 freeways).

The model speed is calculated using a relationship published by the Bureau of Public Roads many years ago (before there was a Federal Highway Administration), and is generally known as the "BPR curve." Figure 1 below illustrates the forecast model speed as a function of vehicles per lane per hour, using the freeway case as described above.

**Figure 1: BPR Volume-to-Delay Function for Freeways Using TPB Assumptions**

As shown in Figure 1, the BPR function calculates high average speeds at small volumes, up to 69 m.p.h., and decreasing speeds at higher volumes, 22 m.p.h. at 2400 vehicles per lane per hour. The value of 2400 vehicles represents the upper end of accepted values for ultimate capacity.

As shown in Figure 2, the TPB model modifies the BPR function for volumes exceeding two times level-of-service C. The result is higher calculated speeds for volumes far in excess of ultimate capacity than if the standard BPR curve were applied.

**Figure 2: Comparison of BPR and TPB Volume-to-Delay Functions**

There is a corresponding assumption made in the air emissions analysis process. In this case, the delay curve is not damped but actually clipped at 1.6 times LOS C capacity.

There are two major impacts of these assumptions, which are discussed in more detail in later sections:

- 1) The feedback from travel delay is weakened significantly.
- 2) Calculated air emissions are minimized.

There are five other related problems in the TPB modeling process.

First, use of LOS C capacity, also called design capacity, is no longer considered to be the best practice. In work done for the U.S. Department of Transportation and published in 1991, Alan J. Horowitz outlines the reasons for using LOS E/F capacity, or "ultimate capacity."

- Ultimate capacity has a consistent meaning across all facility types, while design capacity does not. For example, it is a relatively simple matter to relate the capacity of an intersection to the capacity of the street approaching that intersection.
- Ultimate capacity is always easier to compute than design capacity. Finding the design capacity of a signalized intersection is especially difficult.
- Ultimate capacity can be more easily related to traffic counts than design capacity, which would also require estimates of density, percent time delay, reserve capacity or stopped delay.
- Ultimate capacity is the maximum volume that should be assigned to a link by the forecasting model. Design capacity does not give such firm guidance during calibration and forecasting. (Horowitz, Alan J. Delay-Volume Relations for Travel Forecasting: Based on the 1985 Highway Capacity Manual, 1991, <http://trmp.fhwa.dot.gov/clarings/hoase/dos/general/dvrc/cb4.stm>)

Second, the implicit assumption in the TPB model concerning the ultimate capacity for freeways is wrong. By limiting traffic volume to 1.6 times the LOS C capacity in the air emissions estimation process (or 1981 vehicles per lane per hour), the TPB model, in effect, sets this as the ultimate capacity. As shown in Figure 3 below taken from the

*Highway Capacity Manual* (Transportation Research Board, 2000), level of service for freeway links is defined for volumes as high as 2,400 vehicles per hour per lane.

**Figure 3: Speed-Flow Relationships for Freeways**

Source: *Highway Capacity Manual*, Washington DC: Transportation Research Board, 2000.

The *Highway Capacity Model* also identifies freeway segments in the Washington DC area among their lists of the highest observed traffic volumes. These include I-66 in Fairfax, carrying 2,650 vehicles per lane per hour for a 4-lane freeway, and I-495 in Montgomery County carrying 2,498 vehicles per lane per hour on a 6-lane section (Exhibit 8-19, p. 8-19).<sup>1</sup>

Third, the TPB model operates as a daily model. Most other larger U.S. regions now have travel demand models that divide the day into several time periods. This provides the basis for more accurate travel forecasts and air emissions estimates. As will be discussed below, the time-of-day post processing done in the air emissions calculations cannot overcome the weaknesses inherent in a daily travel model.

Fourth, the TPB model uses a discredited incremental assignment technique instead of the almost universally applied equilibrium method. Again, we will describe the correct practice first, and then discuss why the TPB practice is unacceptable.

Travel times over the roads of the network increase in relation to traffic flows. Therefore, trips shift from more congested routes to less congested routes until all routes are equally congested, as measured by a weighted sum of travel time and vehicle operating cost from

<sup>1</sup> Conditions at these high volumes represent unstable flow. If traffic flow breaks down for any reason, and traffic is slowed, it is impossible to sustain these high traffic volumes at lower speeds, and it can take significant time for the higher speeds to be regained.

origin to destination. A good assignment model seeks to assign each vehicle to the "shortest route", the route with the least generalized travel cost. In a complex urban system, more than one route may offer the least generalized cost. The assignment has achieved equilibrium conditions when no vehicle can reduce its cost by switching routes. This is defined as a "user optimal" condition.

Equilibrium assignment algorithms in use at most large MPOs reassign traffic in a series of iterations until this equilibrium condition is approached. After each iteration, the travel times between transportation analysis zones are recalculated and refined.

In contrast, the TPB model uses an incremental assignment process that very poorly matches the desired equilibrium condition. Four increments of traffic are assigned, each representing 25 percent of the total traffic volume. At the beginning of each increment, travel times are recalculated. Therefore, the travel times for the first increment are based on 0 percent of the traffic, the times for the second increment are based on 25 percent of the traffic, and the times for the third increment are based on 50 percent of the traffic. The travel times calculated for the fourth and final increment of traffic loading are based on the results of the previous increment, and therefore include only 75 percent of the traffic.

This is critical because traffic will generally operate very smoothly at 75 percent of the peak period traffic volumes, yet break down completely at 100 percent. This is another way in which the TPB model short circuits an important feedback between congestion and traffic volume.

The MINUTP travel demand modeling software used by TPB includes an equilibrium assignment option. However, if incremental assignment techniques are unavoidable, the standard BPR coefficients should be replaced with coefficients that cause reductions in modeled speed equivalent to 100 percent of traffic when only 75 percent of the model traffic is loaded. In this way, at least the fourth and final increment will reflect appropriate levels of congestion, even if the first three do not. In the current TPB implementation, none of the assignment increments reflect proper levels of congestion.

Fifth, the old BPR coefficients do not calculate speeds that are consistent with more modern research. The primary focus of the 1991 Horowitz report quoted earlier was to develop improved coefficients. Figure 4 below shows the TPB function (in this example, for Ring 8 freeways) as compared with two alternatives that better fit observed speeds.

**Figure 4: Comparison of TPB Volume-to-Delay Function to Best Practice (Horowitz Prepared for U.S. D.O.T. 1991)**

We have calculated the two Horowitz recommended functions assuming a free flow speed of 70 m.p.h. and a capacity of 2200 vehicles per lane per hour.

The curve labeled "H-BPR" is of the BPR functional form, but with more updated coefficients. The curve labeled "H-Speiss" fits observed data even better. It is notable how very different these volume-delay relationships are as compared to the one built into the TPB model. The TPB model underestimates speeds in the very prevalent range of 1400 - 2200 vehicles per lane per hour, and then overestimates speeds at the highest volumes. At the point where ultimate capacity is approached and exceeded, and the congestion feedback should be strongest, the TPB model provides only very weak feedback.

This discussion has focused on freeways because of their importance in travel demand modeling and emissions modeling. However, the problems described are not limited to freeways, but are present for all types of roadway links.

#### **Air Emissions Modeling**

This section of the report critiques the Air Quality Conformity Determination of the 2000 Constrained Long Range Plan and the FY2001-2006 Transportation Improvement Plan for the Washington Metropolitan Region, dated October 18, 2000, conducted by the Metropolitan Washington Council of Governments (MWCOC), the Metropolitan Planning Organization (MPO) for the Washington, D.C. urban area.

Serious technical deficiencies are present in the Conformity Analysis documentation. The MWCOC has failed to use commonly accepted practices, and instead has used practices that are not consistent with EPA requirements. These technical deficiencies seriously undermine the credibility of the emissions estimates reported in the conformity determination report.

Four major errors and inconsistencies in the MWCOC conformity analysis have been identified.

1. The vehicle miles of travel (VMT) mix used in the MOBILE5b emissions modeling conducted by the MWCOC is inconsistent with EPA default values (values used unless there is more accurate local information), as well as national

trends being observed in cities around the country. While TFS is now addressing this problem in its proposed conformity analysis released on December 19, 2001 for public comment, it is not a new problem. There has been a major problem even without the increase in SUV purchases.

2. MWCOC only generated emission factors for 13 different speeds despite the fact that link speeds in the model vary from less than 2.5 mph to more than 65 mph. This is not only unnecessary because MOBILE5b can calculate emission factors for all speeds between 2.5 and 65 mph, but is also inaccurate.
3. MWCOC also uses a clipped BPR equation to calculate congested speeds for use in the emissions analysis. In the clipped BPR equation, the Volume to Capacity (V/C) ratio is restricted to values less than or equal to 1.6 which maintains unrealistically high speeds during congested time periods and reduces speeds during uncongested time periods. Use of a restricted BPR equation and subsequent MWCOC implementation results in a relatively large number of links having speeds in the middle range of the pollutant emissions curves, where emission factors are maximized.
4. Excess traffic volume is shifted between time periods to accommodate the V/C ratio restriction. Excess volume remaining after the tenth and final time period represents 1,570,000 vehicle miles of travel in the 2025 emissions analysis. Since this volume cannot be moved into another time period, more than 1,500 links in the 2025 network are still over capacity at midnight. This result is totally unreasonable. In addition, the V/C ratio used to calculate congested speeds on these links is inconsistent with the actual volume in the tenth time period.

### MOBILE5b Emissions Modeling Assumptions

#### VMT Distribution by Vehicle Type - VMT Mix

The vehicle miles of travel (VMT) distribution by vehicle type, also known as the VMT mix, is a very important user input into the Environmental Protection Agency's MOBILE5b vehicle emissions model. The VMT mix specifies the fraction of total highway VMT that is accumulated by each of the eight vehicle types. The eight vehicle types in the MOBILE are listed below:

- LDGV = light-duty gasoline vehicles
- LDGT1 = light-duty gasoline trucks, I
- LDGT2 = light-duty gasoline trucks, II
- HdGV = heavy-duty gasoline trucks
- LDDV = light-duty diesel vehicles
- LDDT = light-duty diesel trucks
- HDDV = heavy-duty diesel vehicles
- MC = motorcycles

The VMT mix used in the MOBILE5b emissions modeling conducted by MWCOC for the adopted conformity analysis of the 2000 Constrained Long Range Transportation Plan is inconsistent with EPA default values as well as national trends being observed in cities around the country. The default VMT mix in MOBILE5b is based on national averages and changes over time (calendar years). There are three main trends driving the shifts in VMT. The first is a shift in sales from light duty passenger cars to light duty trucks. The next two have to do with the dieselization of trucks in general. Light duty

diesel trucks are increasing in sales over time as compared to light duty gasoline trucks. The same trend can be seen even more noticeably, with heavy duty diesel trucks replacing heavy duty gasoline trucks. The VMT mix used by MWCOC did not reflect these documented national trends. MWCOC has redefined the VMT mix using new local data for the 2001 Constrained Long Range Plan (CLRP) update for the 2002-07 Transportation Improvement Program. It would be of value to compare this new data with the EPA default values and national trends.

Table 1 shows the urban and rural VMT mix used by MWCOC for the 2000 CLRP update and the 2005 MOBILE5b national default values.

**Table 1: MWCOC and MOBILE5b Default VMT Mix**

| MOBILE5b         | LDGV  | LDGT1 | LDGT2 | HLDGV | LDDV  | LDDT  | HDDV  | MC    |
|------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| MWCOC Urban      | 0.820 | 0.091 | 0.014 | 0.016 | 0.014 | 0.000 | 0.029 | 0.016 |
| MWCOC Rural      | 0.750 | 0.150 | 0.013 | 0.021 | 0.012 | 0.000 | 0.038 | 0.016 |
| 2005 EPA Default | 0.600 | 0.197 | 0.087 | 0.051 | 0.002 | 0.002 | 0.075 | 0.006 |

MWCOG VMT from light-duty gasoline vehicles (LDGVs) is 37 percent and 25 percent higher than the EPA default for urban and rural areas respectively. In addition, the VMT from light-duty gasoline trucks (LDGTs) I and II is 63 percent and 43 percent lower than the EPA default for urban and rural areas respectively. Only 16.5 percent of the urban MWCOG VMT is from LDGTs, while the national default is 28.4 percent. Finally, the VMT fraction for light-duty diesel trucks is zero in both urban and rural areas. These are very peculiar assumptions for VMT mix. No documentation about the MWCOG VMT mix assumptions for the 2000 CLRP have been provided beyond the fractions themselves, so it is difficult to comment further about the basis for these assumptions.

Not only were the fractions used by MWCOG for the 2000 CLRP inconsistent with the EPA defaults, but they are likewise inconsistent with the emission modeling being conducted by other urban areas around the county. Table 2 shows VMT mix assumptions being employed in other cities in the United States.

**Table 2: VMT Mix Assumptions from Other U.S. Cities**

| MOBILEs                          | LDGV  | LDGT1 | LDGT2 | DDGV  | LDIV  | LDOT  | DDOV  | MC    |
|----------------------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| MWCOG Urban                      | 0.820 | 0.091 | 0.014 | 0.016 | 0.014 | 0.000 | 0.029 | 0.016 |
| Atlanta, GA                      | 0.655 | 0.168 | 0.082 | 0.028 | 0.009 | 0.002 | 0.062 | 0.002 |
| Houston, TX                      | 0.699 | 0.171 | 0.076 | 0.018 | 0.002 | 0.001 | 0.031 | 0.002 |
| Las Vegas, NV                    | 0.545 | 0.387 | 0.025 | 0.002 | 0.003 | 0.003 | 0.006 | 0.029 |
| New Haven, CT                    | 0.624 | 0.193 | 0.089 | 0.033 | 0.002 | 0.001 | 0.057 | 0.001 |
| Tempe, AZ (EPA default)          | 0.600 | 0.197 | 0.087 | 0.031 | 0.002 | 0.002 | 0.075 | 0.006 |
| Salt Lake City, UT (EPA default) | 0.600 | 0.197 | 0.087 | 0.031 | 0.002 | 0.002 | 0.075 | 0.006 |

In comparing the MWCOG 2000 CLRP VMT fractions against the data from other urban areas, two things are immediately evident. The MWCOG fraction of VMT from light-duty gasoline vehicles is much higher, while the fraction of VMT from light-duty gasoline trucks is much lower. Not only is this modeling assumption inconsistent with national trends, it is completely contrary to what is actually happening in the Washington metropolitan area.

A July 8, 2001 article in *The Washington Post* entitled "SUVs Drive Area to Pollution Violations" reported on the growing number of sport utility vehicles (SUVs) on the city's highways:

"Ronald Kirby, a transportation specialist for the Metropolitan Washington Council of Governments, said his staff concluded what it first suspected last month: The number of SUVs had risen far more rapidly than predicted, increasing the amount of pollution sent into the air.

"Five years ago, SUVs were thought to represent about 15 percent of personal vehicles on area roads, Kirby said. Now the figure is pegged at 25 percent. With SUVs accounting for half of new purchases, he said, the larger vehicles are bound to become an even greater percentage of the mix."

If one in four vehicles on the road in metropolitan Washington is indeed a SUV, and 50 percent of new purchases are SUVs, the VMT mix used by the MWCOG in their MOBILE emissions modeling is completely wrong. Light-duty gasoline trucks I (LDGT1) are trucks less than 6,000 pounds. LDGT2 are trucks between 6,000 and 8,500 pounds. Therefore, VMT from SUVs should be accounted for in one of these two vehicle types. Despite the report that 25 percent of all personal vehicles in the metropolitan

Washington area are SUV's, the MWCOG had assumed that only 10.5 percent of the total VMT was from light-duty gasoline trucks in their MOBILE emissions modeling.

The VMT mix input has a dramatic effect on the nitrogen oxide (NOx) emission factors produced by MOBILE5b. Increasing the fraction of VMT from trucks significantly increases the total regional NOx emissions.

To demonstrate the impact of different VMT mix assumptions, we ran MOBILE5b using the EPA 2005 defaults and the urban VMT mix used by MWCOG for the 2000 CLRP. All other MOBILE5b inputs were held constant. Figure 5 is an emissions profile for 2005 nitrogen oxide emission factors using the EPA default and MWCOG VMT mix.

**Figure 5: NOx Emission Profile using Default and MWCOG VMT Mix**

The NOx emission factors based on the default VMT mix are significantly higher than the 2000 CLRP MWCOG emission factors. On average, the percent difference between the default and MWCOG emission factors is 27 percent. Therefore, using the default VMT mix would produce total emissions 27 percent higher than those calculated originally by MWCOG. MWCOG has acknowledged that NOx emissions were significantly underestimated in the 2000 CLRP by using an invalid VMT mix, with too much VMT from light-duty gasoline vehicles and not enough VMT from light-duty gasoline trucks.

If the emissions had been estimated using EPA defaults, the motor vehicle emission budget (MVEB) for the MWCOG metropolitan statistical area (MSA) would be exceeded by almost 43 tons per day. In the 2005 horizon year, the margin between calculated emissions and the MVEB is only 0.8 tons per day. MWCOG has developed new VMT mix fractions that it says reflect actual conditions in the Washington area and this resulted in significantly higher emissions estimates for the 2001 CLRP update conformity analysis. A closer examination of how these new VMT mix fraction assumptions vary from the EPA defaults is warranted.

#### **Modeled Average Speeds**

Emission factors vary considerably with the average speed assumed. The values input for average speed in MOBILE5 have a significant impact on the resulting emission factors for exhaust and running loss emissions. MOBILE5 will calculate emission factors for average speeds of 2.5 to 65.0 mph, in increments of 0.1 mph. It is important to note here

that the emission factors produced by the MOBILE5 model are not a linear function of average speed. See Figure 5 for a NOx emission profile.

MWCOG ran the MOBILE5 model for 13 different speeds at 5 mph increments (5, 10, 15, and so on up to 65). MWCOG performs a link-based emissions calculation. Specifically, an emission factor corresponding to the speed on a link in the network is multiplied by the VMT on that particular link. The emissions on all links in the network are then summed to produce the total regional emissions. MWCOG only generated emission factors for 13 different speeds despite the fact that link speeds in the model vary from less than 2.5 mph to more than 65 mph. In performing the emissions calculation, the 5 mph emission factor generated by the MOBILE model was used for all links with congested speeds between 2.5 and 7.5 mph. The 10 mph emission factor was used for speeds between 7.5 and 12.5 mph and so on. This is not only unnecessary because MOBILE5b can calculate emission factors for all speeds between 2.5 and 65 mph, but is also inaccurate. The following sample calculations will illustrate how emissions are underestimated by the MWCOG methodology.

The sample network below consists of 5 links with congested speeds of 53, 54, 55, 56, and 57 mph. The MWCOG methodology would use the 55 mph emission factor for each link despite the variance in link speed and the fact that each speed has a distinct emission factor. The results of the sample calculation following the MWCOG methodology are presented in Table 3.

**Table 3: Sample Emissions Calculation Using MWCOG Methodology**

| Link | Speed | 55 mph NOX Emission Factor (grams/mile) | VMT | Total Emissions |
|------|-------|---|-----|-----------------|
| 1    | 53    | 2,321                                   | 50  | 116.05          |
| 2    | 54    | 2,321                                   | 75  | 174.08          |
| 3    | 55    | 2,321                                   | 150 | 348.15          |
| 4    | 56    | 2,321                                   | 175 | 406.18          |
| 5    | 57    | 2,321                                   | 325 | 754.33          |
|      |       | <b>TOTAL</b>                            | 775 | 1798.78         |

Now we will repeat the analysis by correctly applying unique MOBILE5b emission factors for each distinct link speed. The results of the sample calculation following the correct methodology are presented in Table 4.

**Table 4: Sample Emissions Calculation Using Correct Methodology**

| Link | Speed | NOX Emission Factor (grams/mile) | VMT | Total Emissions |
|------|-------|----------------------------------|-----|-----------------|
| 1    | 53    | 2,201                            | 50  | 110.05          |
| 2    | 54    | 2,260                            | 75  | 169.50          |
| 3    | 55    | 2,321                            | 150 | 348.15          |
| 4    | 56    | 2,384                            | 175 | 417.20          |
| 5    | 57    | 2,448                            | 325 | 795.60          |
|      |       | <b>TOTAL</b>                     | 775 | 1840.50         |

The MWCOG methodology produces total NOx emissions of 1798.78 grams. However, correctly applying unique emission factors for each link yields total emissions equal to 1840.50 grams. Therefore, the MWCOG methodology has underestimated total emissions in this sample calculation by 2.3 percent. Given the narrow margin by which MWCOG reportedly meets the 2005 MVEB for NOx (by less than 1 ton per day) this potential underestimation is very significant. The emissions reported in the MWCOG Air Quality Conformity Determination dated October 18, 2000 are at the very least incorrect and may have been underestimated by their calculation methodology. MWCOG should repeat their emissions analysis by generating unique emission factors for speeds between 2.5 and 65 mph instead of only running the MOBILE model for 13 different speeds at 5 mph increments. This same methodological problem leads to some underestimation of emissions in the revised MWCOG conformity analysis for the 2001 CLRP.

#### **Restrained Speed Equation**

MWCOG post-processes model free-flow speed in order to calculate congested (restrained) speeds for use in the emissions analysis. MWCOG uses the following adapted Bureau of Public Roads (BPR) equation to calculate congested speeds by time period:

$$S_r = (S_f * 1.15) / (1 + 0.15 * (V/C)^4)$$

Where:

$S_r$  = Restrained speed

$S_f$  = LOS "C" Speed

V/C = Volume to capacity ratio

In post-processing, this equation is subjected to an additional constraint. The V/C ratio is not allowed to exceed 1.6. If the V/C ratio exceeds 1.6, the excess volume is displaced into the following time period. There are ten time periods in total.

Under heavily congested conditions, the BPR equation is reduced to the following by restricting the V/C ratio to a maximum of 1.6:

$$S_r = 0.58 * S_f$$

Therefore, regardless of link volume, the free-flow speed can only be reduced by 42 percent during congested conditions. In the MWCOG travel demand model, typical freeway speeds at LOS C are 60 mph (these speeds vary somewhat depending on the road's location, which is coded by "ring codes" which radiate out from the Central Business District of the District of Columbia). Due to the V/C constraint implemented by MWCOG, the lowest possible congested freeway speed for Ring 8 is 35 mph ( $60 * 0.58 = 35$ ). Figure 6 shows the full set of restrained freeway speed equations used by MWCOG for all rings. The conformity report indicates, "The results of this process were validated with observed speed data conducted in the District of Columbia and Beltway data." However, no other documentation has been provided which validates the use of this V/C restrained BPR equation. This aspect of the MWCOG post-processing has implications in the emissions analysis because the NOx emission curve is relatively flat between 30 and 40 mph (See Figure 5). However, the emissions curve increases as speeds fall below 30 mph. If congested speeds were allowed to continue falling below the levels at which the MWCOG model freezes them (e.g., 35 mph in ring 8, 33 mph in ring 7, 30 mph in ring 5, etc.), which they likely do in reality during peak hours, the NOx emissions from freeways would increase. This is particularly significant in this area where about 40 percent of total 2005 VMT is from freeways.

Figure 6: Restrained Freeway Speed Equation Used by MWCOG

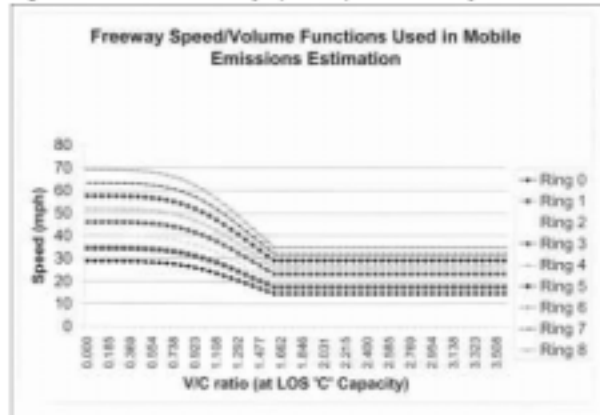

Figure 7 shows a typical volume-delay function used by TPB to translate hourly traffic volumes into traffic speeds to estimate emissions (in this case for Ring 8) as well as the Horowitz BPR volume-delay function presented earlier in this report. During the most prevalent highway conditions (1000 to 2000 vehicles per lane per hour), the TPB curve yields freeway speeds slower than the Horowitz BPR curve. Due to the nature of the NOx emissions curve, the total NOx emissions resulting from the TPB volume delay function will be less than the emissions calculated from speeds based on the Horowitz formulation. During congested conditions (greater than 2200 vehicles per lane per hour) the TPB curve yields speeds greater than the Horowitz BPR curve. Congested speeds are limited to a minimum of 35 mph because of the V/C constraint. NOx emissions are also underestimated in this region because NOx emission factors increase below 30 mph. The TPB volume-delay curve implemented with a V/C constraint minimizes NOx emissions both by relying on low speeds during uncongested periods and then by assuming a minimum speed of 35 mph during times of heavy congestion.

Figure 7: NOx Emissions Underestimated

#### Hourly Traffic Shifting

Excess traffic volumes during congested time periods are moved into less congested time periods in order to restrict the V/C ratio to values less than 1.6. Therefore, less congested periods such as 9:00 to 10:00 AM become more congested as excess volume from the morning peak hours are moved into this shoulder period. Speeds which would have been relatively high are reduced by the additional excess volume from the previous time periods. This strategy maintains speed in times of heavy congestion (AM and PM peak hours) while reducing speed in times of little congestion (midday and evening hours). The restricted BPR equation and MWCOG implementation push speeds to the middle of the emissions curve by moving volume out of congested periods into uncongested periods. Due to the parabolic shape of the emissions curves (Figure 5), this effectively minimizes total regional emissions.

We reproduced the emissions analysis conducted by MWCOG in a series of spreadsheets to quantify the impact of the V/C ratio constraint. First, we implemented the MWCOG methodology which restricts the V/C ratio to 1.6. Then, total emissions were recalculated

without the V/C restriction. Use of the V/C constraint underestimates 2005 total regional NO<sub>x</sub> emissions by 1.4 percent, and total regional VOC emissions by 12.4 percent. The V/C constraint effectively minimizes emissions by pushing speeds towards the middle of the pollutant curves, allowing the 2005 motor vehicle emissions budget to be met by a very narrow margin. Therefore, it is not surprising that total emissions for 2005 exceed the MVEIB when the V/C constraint is removed from the MWCOG emissions analysis.

#### Effect of V/C Constraint on Hourly Traffic Distributions

Traffic distributions for ten discrete time periods of the day were used to process the 24-hour model link volumes and speeds from the MWCOG travel demand model. Hourly capacities and converted hourly volumes were then used in the restrained BPR formula to calculate speeds for use in the emissions analysis. However, if the V/C ratio exceeded 1.6, the excess volume was displaced into the following time period. For example, if there was too much volume on a particular link in the 3:00 to 4:00 PM time period to satisfy the V/C restriction, the excess volume was moved into the next time period, 4:00 to 5:00 PM. This shift does not represent "peak spreading" because the shifts are done at a relatively high level of service (e.g., 35 mph for ring 8 freeways) and because in some cases the afternoon peak hour is spread beyond midnight. Moving excess volume into the following time period can continue in this fashion until the last time period is reached (7:00 PM to 12:00 AM). What happens to excess volume that remains after the tenth and final time period?

This was obviously a concern for the programmer of the SAS code in the file "HRLKc101.sas" provided to us by MWCOG. After the section of code that performs the V/C check and moves excess volume when necessary, the following comment was included in the SAS file.

```
* NOTE: FOR NOW, EVEN IF PERIOD 10 VOLUME EXCEEDS MAX VOLUME ;
* PERIOD 10 VOLUME WILL NOT BE RESET AS IN PREVIOUS TIME PERD;
* (WHERE THE BELL IS IT SUPPOSED TO GO, ANYWAY?);
* BUT VC IS SET TO 1.6
* PER10VOL=PER10VOL;
```

We performed the same V/C constraint and time period analysis in Excel, and found that the excess volume remaining after the tenth time period for 2005 represents 448,765 vehicle miles of travel. Some of the links with excess volume remaining after the tenth time period in 2005 have been identified in the network. The model link, roadway description, and VMT are presented in Table 5.

without the V/C restriction. Use of the V/C constraint underestimates 2005 total regional NO<sub>x</sub> emissions by 1.4 percent, and total regional VOC emissions by 12.4 percent. The V/C constraint effectively minimizes emissions by pushing speeds towards the middle of the pollutant curves, allowing the 2005 motor vehicle emissions budget to be met by a very narrow margin. Therefore, it is not surprising that total emissions for 2005 exceed the MVEB when the V/C constraint is removed from the MWCOC emissions analysis.

#### Effect of V/C Constraint on Hourly Traffic Distributions

Traffic distributions for ten discrete time periods of the day were used to process the 24-hour model link volumes and speeds from the MWCOC travel demand model. Hourly capacities and converted hourly volumes were then used in the restrained BPR formula to calculate speeds for use in the emissions analysis. However, if the V/C ratio exceeded 1.6, the excess volume was displaced into the following time period. For example, if there was too much volume on a particular link in the 3:00 to 4:00 PM time period to satisfy the V/C restriction, the excess volume was moved into the next time period, 4:00 to 5:00 PM. This shift does not represent "peak spreading" because the shifts are done at a relatively high level of service (e.g., 35 mph for ring 8 freeways) and because in some cases the afternoon peak hour is spread beyond midnight. Moving excess volume into the following time period can continue in this fashion until the last time period is reached (7:00 PM to 12:00 AM). What happens to excess volume that remains after the tenth and final time period?

This was obviously a concern for the programmer of the SAS code in the file "HRLKc101.sas" provided to us by MWCOC. After the section of code that performs the V/C check and moves excess volume when necessary, the following comment was included in the SAS file.

```
* NOTE: FOR NOW, EVEN IF PERIOD 10 VOLUME EXCEEDS MAX VOLUME ;
* PERIOD 10 VOLUME WILL NOT BE RESET AS IN PREVIOUS TIME PERD;
* (WHERE THE BELL IS IT SUPPOSED TO GO, ANYWAY?);
* BUT VC IS SET TO 1.6
* PER10VOL=PER10VOL;
```

We performed the same V/C constraint and time period analysis in Excel, and found that the excess volume remaining after the tenth time period for 2005 represents 448,765 vehicle miles of travel. Some of the links with excess volume remaining after the tenth time period in 2005 have been identified in the network. The model link, roadway description, and VMT are presented in Table 5.

Congestion is more severe in future analysis years 2015, 2020, and 2025. As congestion increases and the V/C restriction is maintained, more and more excess volume will remain after the tenth time period. We once again performed the same V/C constraint and time period analysis in Excel, and found that the excess volume remaining after the tenth time period for 2025 increases to 1,372,311 vehicle miles of travel. This volume cannot be moved into another time period since the tenth and final time period represents 7:00PM to 12:00AM. Therefore, the volume is maintained within the tenth time period and as a result, there are more than 1,500 links in the 2025 network that are considered over capacity at midnight. This result is completely unreasonable. In essence, the amount of daily traffic assigned to certain links in the model does not fit within a 24-hour period.

In the nine periods prior to the 7:00PM to 12:00AM time period, the time period volume is tested against the V/C constraint. If the time period volume is less than the maximum allowable volume, the V/C ratio is calculated according to the link volume. If the time period volume exceeds the maximum allowable volume, the excess volume is displaced into the next time period and the V/C ratio is set equal to 1.6. However, if the tenth time period volume exceeds the maximum allowable volume it cannot be displaced into another time period. Despite this limitation, the V/C ratio is still set to 1.6 when the tenth time period volume exceeds the allowed maximum. This V/C ratio is then used to calculate congested speed for input into the MOBILE emissions model. Therefore, in 2025 there are more than 1,500 links that have calculated congested speeds based on a V/C ratio equal to 1.6, which is inconsistent with the actual tenth time period volume that exceeds the allowed maximum. The net result is that the MWCOG model produces forecasts of hourly volumes that underestimate traffic volumes especially on high-traffic flow congested links during peak hours while overestimating traffic volumes on those same links during non-peak hours. In both cases this likely leads to underestimation of motor vehicle NO<sub>x</sub> and VOC emissions.

### Implications of Model Deficiencies on Travel Forecasts

It is clear that land development and traffic growth follows highway construction. The Interstate highway system was originally conceived and funded as a civil defense measure, as a means to evacuate cities in case of nuclear war. Instead, Interstate and other highway interchanges have become the centers of development in cities throughout the United States. When highway capacity is increased, generally it has quickly filled with increased traffic flow.

DeCorla-Souza and Cohen define this "induced demand" as an: "increase in daily vehicle miles of travel (VMT), with reference to a specific geographic context, resulting from expansion of highway capacity." This definition includes both short-term effects and long-term effects. The short-term effects include more trips, longer trips, more auto trips, and auto trips with lower occupancies. The long-term effects follow land use changes caused by expanded roadway capacity.

Induced demand effects are well known both to planners and lay people, but until recently they were not quantified. Now there is a rapidly-growing research literature quantifying the effects of induced demand. The Annual Meeting of the Transportation Research Board, held in January in Washington D.C., is the premiere transportation conference in the United States, and papers presented at these meetings are approved through a peer review process. In the 1997, 1999, and 2000 meetings, seven papers have been presented that quantify induced demand.

The measure used in most studies is elasticity, a basic concept of economics. When the supply of a good or service increases, its price drops. When the price drops, consumption of the product increases. For the majority of Americans, the incremental cost of operating cars is low enough that the perceived cost is primarily travel time. An increase in lane

miles of road capacity (supply) causes a near-term decrease in travel time (price), which in turn leads to an increase in vehicle miles traveled (consumption).

Elasticity is calculated as the ratio of the change in consumption divided by the change in supply. For example, if a 10 percent increase in vehicle miles traveled is caused by a 10 percent increase in lane miles, the elasticity is:

$$10 \text{ percent} / 10 \text{ percent} = 1.0.$$

Alternatively, if a 5 percent increase in vehicle miles traveled is caused by a 10 percent increase in lane miles, the elasticity is:

$$5 \text{ percent} / 10 \text{ percent} = 0.5.$$

Research findings from five of the studies presented at the Transportation Research Board Annual Meetings are directly comparable and are summarized in Table 6.

**Table 6: Long-Term Regional Elasticity of Vehicle Miles Traveled to Lane Miles**

| Study                              | Long-term regional elasticity |
|------------------------------------|-------------------------------|
| Hansen <sup>11</sup>               | 0.9                           |
| Noland <sup>12</sup>               | 0.7 - 1.0                     |
| Fulton et. al. <sup>13</sup>       | 0.5 - 0.8                     |
| Noland and Cowart <sup>14</sup>    | 0.904                         |
| Marshall <sup>15</sup>             | 0.76 arterials, 0.85 highways |
| Average of five studies (highways) | 0.83                          |

The other two studies use different measures but results are consistent with the five studies summarized in Table 6. One of the studies (Cha) focuses on the response of VMT to congestion. It states: "... an expansion of 1 percent to an existing capacity of 1,000 lane miles, for example, congestion would reduce by one-eleventh of a percent on freeways."<sup>16</sup> Cha defines "congestion" as vehicle miles traveled divided by lane miles. Therefore, vehicle miles traveled must increase by 10/11 percent in Cha's example. This implies an elasticity of vehicle miles traveled to freeway capacity of 0.91.

In the final study, Barr found elasticities of vehicle miles traveled to travel time of -0.3 to -0.5.<sup>17</sup> The negative sign means that the change in travel is in the opposite direction from the change in travel time. For example, if travel time decreased by 10 percent, VMT would increase by 3-5 percent. Although the absolute values of 0.3 - 0.5 are lower than the 0.5 - 1.0 values presented in the other studies, they are not inconsistent. In most cases, added capacity is on highways and relatively high-speed arterials. The new capacity has higher average speeds than the old capacity, and the percentage change in travel time generally is greater than the percentage change in lane miles. Therefore, the calculated elasticity values will have the reverse relationship: elasticity to travel time will appear smaller than the elasticity to lane miles.

For highways, the average from the five most comparable studies is an elasticity of 0.83. This implies that adding a new lane of capacity adds, on average, traffic equal to 83 percent of what is currently on the adjacent lane of traffic. Some of this traffic will be on the widened, and less congested, road and some will be on extensions of the widened link or intersecting roads that have not been widened and are now more congested roads.

### The Induced Travel Demand Debate

The statistical case presented above is rather abstract, and it is easy to get confused by how these numbers are the same as or different than other numbers that have been published. For example, Kevin Heanue made a presentation at the 1997 TRB Annual Meeting where he concluded that only 6.0 - 22.1 percent of the VMT growth in the Milwaukee metropolitan area between 1960 and 1990 was attributable to induced demand.<sup>9</sup> Heanue attributed the rest of VMT growth to increased population, households, labor force participation, income, auto availability, and licensed drivers, as well as increases in single home ownership, lower development densities, and low real costs of gasoline.

While Heanue's conclusions may appear to contradict the induced demand literature, there is really no conflict at all. Heanue does not calculate an elasticity of induced travel demand himself. Rather, he simply assumes a range of 0.3 - 1.0 taken from studies available at that time. The 22 percent number is not a much smaller number than an elasticity of 1.0; it is another way of expressing an elasticity of 1.0 in the context of Milwaukee between 1960 and 1990.

Heanue did not claim that induced travel growth was insignificant in this 1997 report, only that it was less important in Milwaukee than the great socioeconomic changes during that period. Nevertheless, Milwaukee was a poor choice for the case study, as it constructed much less road capacity per capita during this period than most American urban areas. While Milwaukee demonstrates that VMT increased during that historic period without much roadway construction, it can not really address the question of what happened with significant roadway construction.

The rapid socioeconomic changes between 1960 and 2000 have resulted in a great increase in labor force participation among women, almost universal auto availability, and much smaller households. While these have been important engines for VMT growth during this historical period, they have run their course and will be much less important over the coming decades.

The study recently done for TPB on induced travel demand<sup>10</sup> concludes that it is unimportant, without contradicting any of the evidence of induced travel demand. This study focuses on the I-270 corridor, where the study acknowledges that traffic growth has been much more rapid following construction than anticipated. The study shows that population and employment growth has also been much more rapid than anticipated, and attributes the traffic growth to this rather than the capacity expansion.

But, this is a pure case of induced traffic. The study states: "Other induced travel may result from longer-term location decisions by households, employers and other facilities." The study shows that the earlier forecasts greatly underestimated population and employment in the suburban areas in the I-270 corridor, and greatly overestimated population and employment in the more urbanized areas in and around Washington D.C. In effect, jobs and housing shifted to the I-270 corridor and away from Washington D.C. and the inner suburbs including Prince George's County. As VMT per capita is much higher in the I-270 corridor than in the central Washington D.C. area, this land use shift has resulted in a large increase in regional VMT.

Furthermore, in the data presented in the study for TPB, the land use effects do not account for all of the growth in VMT. While 2000 population for the corridor area was 25 percent greater than assumed in studies, the daily traffic volumes in 1999 in the three most traveled sections of I-270 were 40-51 percent higher than the 2000 forecasts. This is also strong evidence of the non-land-use induced travel effects at work.

### **Incorporating Induced Demand for More Realistic Modeling**

In order to develop realistic future transportation scenario results, the metropolitan transportation planning process must incorporate induced demand into modeling activities. This is critical in: 1) the development of long-range transportation plans, 2) analyzing motor vehicle emissions, 3) project planning, and 4) providing a reliable assessment of the costs and benefits of alternative regional and corridor-level investment strategies.

All of these processes are predicated on a region having and applying a sophisticated and valid regional travel demand model. However, induced demand generally is not fully treated in regional models. In a review of how well regional models capture induced demand, DeCorla-Souza and Cohen conclude that elements of induced demand that can be modeled within the four-step process include:

- increased trip distance (distribution),
- increased LOV share (mode choice), and
- shift to improved facilities (assignment).<sup>6</sup>

The extent to which these aspects are modeled in practice depends on the model implementation.

They suggest induced demand elements generally not modeled in four-step process include:

- land use effects, and
- trips per unit of development (trip generation).

Land use effects are of two types. Micro-scale land use effects related to pedestrian and other non-auto accessibility are closely related to trip generation effects. These effects include the number of trips made by type and time of day, and the mode used. Macro-scale land use effects are the allocation of new residences and employment throughout the region, based in part on the relative accessibility of different land.

Micro-scale land use effects have been neglected in travel demand models because computing and data requirements required large transportation analysis zones (TAZs) which were poorly suited for microscale analysis. Advanced modeling procedures that include smaller transportation analysis zones (TAZs) or do away with TAZs altogether make capturing these effects in travel demand models feasible. In addition, advances in Geographical Information Systems (GIS) and the synthetic population methods developed as part of TRANSIMS are making socioeconomic data available at the point or small grid cell level. These trends are paralleled by much research focused on understanding and quantifying these microscale effects. Therefore, we anticipate that micro-scale land use effects (which are already captured partially in some MPO models) will become a standard feature of travel demand modeling.

Macro-scale effects of different land use allocations with different transportation scenarios can be captured with land use allocation models. A number of regions have used land use allocation models in special studies in order to evaluate alternative futures. For example, the Chicago region has evaluated alternative highway/transit and airport land use scenarios as part of its long-range planning process. The

Burlington Vermont and New Hampshire Seacoast regions routinely run land use allocation models as in both long-term planning and major project planning. However, many regions with land use allocation models develop only a single land use scenario, and therefore ignore these effects.

The Second Oregon Symposium on Integrating Land Use and Transport Models held this July disseminated information on the latest research and application to a large number of enthusiastic attendees. Oregon is out ahead of the pack as usual, with a statewide model under development and planned for completion in 2001. However, we expect others to catch up. The important observation is that tools to account for land use allocation are now available to planners and should become a standard feature of travel demand modeling for application to both long-term planning and analyzing major projects.

Another important area (not mentioned by DeCorla-Souza and Cohen) which is generally not modeled is travel by time of day. An important behavioral response to congestion is to shift travel into less congested times. These shifts have public benefits because they allow the transportation system to be more fully utilized.

In general, regional travel demand models treat the proportion of travel within different periods as fixed. As regions have become more congested, the peak periods modeled have grown from a single hour to two-hour or three-hour periods, based on historical observations. However, future peak proportions are considered to be the same as the past, regardless as to whether the future will be more or less capacity constrained than the past. This overestimates the benefits of adding roadway capacity on peak hour delay. Advanced models are addressing this deficiency by assigning trips dynamically by time of day. This capability is present especially in the new generation of activity-based models.

In reviewing recent long-range transportation plans and conformity analyses for Chicago, Atlanta, Houston, and Phoenix, along with this current review of the TPB model, we conclude that none of the long-range plans considers induced demand completely. Nevertheless, the TPB model performs the worst. The table below summarizes which components of induced demand are included in those four regional travel demand models. While many of the elements needed to evaluate induced demand are found in the models, more analysis is needed to determine how well the models analyze induced demand effects.

**Table 7: Elements of Induced Demand Included in Travel Demand Models for Selected Large U.S. Metropolitan Areas**

|                               | Chicago                             | Atlanta               | Houston               | Phoenix   | Portland              | Washington D.C.       |
|-------------------------------|-------------------------------------|-----------------------|-----------------------|---|-----------------------|-----------------------|
| Macro-scale land use          | Partially, base and build scenarios | No, only one scenario | No, only one scenario | Confusing documentation as to how land use allocation model was applied | No, only one scenario | No, only one scenario |
| Micro-scale land use and trip | Partially                           | Partially             | Partially             | Partially   | Yes                   | No                    |

| generation        |   |     |     |     |     |           |

| Assignment        | Yes   | Yes | Yes | Yes | Yes | Incentive |

The flip side of induced travel demand is reduced travel demand. If planned roadway capacity increases are insufficient to maintain congestion at current levels, travel demand should decrease. Components of the reduction would include changes in destination, mode, time of travel. Over the longer term, residential and business location choices would be affected by accessibility including the effects of congestion. As demonstrated in the table above, the TPB model is least able to account for this reduced travel demand of any of the models reviewed.

With these problems, the current TPB travel demand model will overestimate travel demand in the future, overestimate the benefits of proposed highway improvements, and will miscalculate both current and future air emissions.

### Effects of These Deficiencies on Past Analyses of Potential Potomac Bridge Crossings

As shown in Table 7 above, the TPB model includes almost none of the travel demand features that would support modeling induced travel demand. Therefore, it is not surprising that the model does not realistically represent induced travel demand.

There is one area that TPB identifies as critical and then fails to follow through on its promise. TPB documentation describes the importance of model feedback:

Another key distinguishing feature of the Version 1 model linkage of traffic assignment-based speeds to the HBW trip distribution model. The feeding back of congestion speeds resulting from the traffic assignment step is a federally mandated requirement for acceptable modeling practice, and allows for greater consistency of congested highway speed assumptions used throughout the modeling process. (Transportation Planning Board: *FT-88 Models Development Program for CDG/TPB Travel Models*, June 30, 1998)

The TPB model has such weak feedback that it does not meet the intent of the requirement. Consider the case of the American Legion Bridge on I-495. This bridge is the closest existing Potomac River crossing to any of the proposed "Techway" routes. Figure 8 illustrates the bridge speeds calculated by the TPB model for the period 2001-2025. In 2025, the forecast traffic volume on the bridge is 77,000 vehicles per day higher (30 percent) assuming the same capacity as in 2001. The speed being fed back to the trip distribution model declines by 15 percent. If the Horowitz recommended parameters described above were applied, the reduction in speed would be either 60 percent (Spetsis function) or 90 percent (BPR function). These more realistic feedback functions would better reflect the real world response of travelers to changing traffic conditions. Motorists would find that work travel across the bridge would be increasingly less attractive as traffic volumes increase, and would reduce such trip making as people chose instead to use transit or carpool, to travel at different times of day, chose different destinations, or decided to telecommute.

An increase of 30 percent in traffic volume would be accompanied by a reduction in speed of 70 - 90 percent. However, this great an increase in traffic would not occur. A proper model would produce an intermediate result -- an increase in peak hour/peak direction travel due to growth in population and employment, but much less of an increase than assumed in the TPB model. The TPB model lacks adequate feedback which causes shifts in destination, mode, and travel time in response to increased congestion.

This problem is not limited to the American Legion Bridge. It affects almost half of total regional VMT in 2001 and 2005 (46.7 percent and 49.5 percent, respectively) increasing to 63.9 percent of regional VMT in 2025. The impact of not including realistic feedback from congested travel speeds is substantial.

**Figure 8: American Legion Bridge – TPB Assumed Speed vs. Properly Modeled Speed**

Note: H-Spotts and H-BPR are two formulations recommended by Horowitz in 1991 in work done for the U.S. Department of Transportation. This work is described in greater detail in an earlier section of this report.

Most trips are non-work trips, and the TPB model does not even attempt feedback for non-work trips. The rationale appears to be that these are made during off-peak times, when there is little if any congestion. This rationale is contradictory to the other assumptions of TPB – that excess traffic from the peak traffic periods will spill over to the following periods, creating long periods of what they call “forced flow.” As the majority of trips even in the peak hours are non-work, this lack of considering feedback for those trips as well is unacceptable.

As the TPB model can not properly forecast reductions in VMT as a result of congestion, it can not properly forecast increases in VMT that will result from increases in roadway capacity. In the context of Potomac River crossings, future traffic volumes on the existing bridges, including the American Legion Bridge, are surely overestimated in scenarios with no new bridges.

Time savings with a new bridge would be at least partially offset by increased congestion caused by induced travel, including congestion at roadways leading to and from any new bridges. The TPB model overstates the benefits of new roadway capacity, and underestimates the costs, including the effects of increased traffic in other areas.

## Methods That Address These Deficiencies

### Short-Term

In the short term, the TPB model should be upgraded to the state of the practice. While the Version 2 model that TPB is developing will address some of these, other areas for action are likely to remain outstanding. Critically needed improvements include:

- 1) using equilibrium assignment,
- 2) substituting ultimate capacity values for the current LOS C capacity values.

- 3) substituting realistic speed-delay functions for the outdated BPR function. TPB's preliminary Version 2 model does not currently address this issue.
- 4) modeling multiple times of day, with time-of-day of travel sensitive to changes in travel times and costs between origins and destinations and changes in the heterogeneity and mix of local land uses. TPB's preliminary Version 2 model does not currently address these factors.
- 5) making the model sensitive to changes in pedestrian/bicycle friendliness that are independent of job or household density and the location of an area in the region. TPB's preliminary Version 2 model does not currently address these factors, which include the average size of street blocks, availability and continuity of sidewalks, difficulty of crossing streets, implementation of traffic calming measures and pedestrian- and bicycle-friendly intersection and street designs, urban design standards such as maximum building setback requirements, restriction of 'blank wall' developments, and provision of bus shelters and bicycle parking facilities.

#### **Intermediate Term**

Implementation of these short-term improvements would completely change the model results. Therefore, it is difficult to anticipate what further improvements may be warranted. Over the intermediate term, a thorough investigation should be made as to how well the upgraded model accounts for land use/transportation interactions and the other components of induced travel demand. These types of improvements could be advanced as needed to address any deficiencies found.

#### **Conclusions**

The Metropolitan Washington Council of Governments National Capital Region Transportation Planning Board ("TPB") is the region's Metropolitan Planning Organization ("MPO"). Under Federal laws and regulations, MPOs are responsible for a set of regional planning activities including developing long-range transportation plans and demonstrating air quality conformity.

MPOs rely on computer models in these planning efforts. The models include separate but linked travel demand models and air quality models. Modeling activities are regulated by federal guidelines. TPB documentation states: "The feedback of congestion speeds resulting from the traffic assignment step is a federally mandated requirement for acceptable modeling practice."

This requirement is not being adequately met by the TPB model. While going through the motions of a feedback step, this step is extremely weak for work trips. For non-work trips, there is no feedback at all. Forecast traffic volumes in the model grow in an unrealistic unconstrained manner. This overestimation of future traffic demand can be falsely used to support the need for additional highway capacity.

In general, modeling such high traffic volumes with such high levels of congestion would present problems to TPB in demonstrating air quality conformity in future years. Air pollution is a function of vehicle miles of travel (VMT) and speed. Emission rates for all pollutants governed by federal standards are higher for low travel speeds associated with congestion.

However, TPB avoids the air conformity problem by invalidly shifting the traffic into less congested travel periods on a link by link basis, and maintaining unrealistic assumptions about travel speeds during congested periods. For freeways in the middle and outer part of the region, for example, TPB assumes that the minimum congested speed is 30-35

m.p.h., which is a range of speed with the minimum emissions for NOx, the region's most critical pollutant. By shifting the traffic from one period to another, calculated emissions for the most congested periods are reduced while simultaneously reducing travel speeds, and therefore calculated emissions, for adjacent time periods to 30-35 m.p.h. in the middle and outer rings of the region.

Without these invalid assumptions, calculated NOx emissions in 2005 would be 1.4 percent greater. This increase of 2.2 tons per day would cause the region to exceed the maximum allowed by 1.7 tons per day. In addition, calculated VOC emissions in 2005 would be 12.4 percent greater. This increase of 12.6 tons per day would cause the region to exceed the maximum allowed by 11.9 tons per day.

The TPB model is one of the poorest of large metropolitan travel demand models in capturing the effects of induced travel demand. With these problems, the TPB travel demand model overestimates travel demand in the future, overestimates the benefits of proposed highway improvements, and miscalculates air emissions.

These problems are especially acute in past studies of potential new Potomac River bridge crossings, all of which were based on this model or previous versions of the model. The American Legion Bridge on I-495 highlights these problems. This bridge is the closest existing Potomac River crossing to any of the proposed "Techway" routes. Despite a modeled increase in traffic volume of 30 percent or 77,000 vehicles per day, the TPB modeled speed declines by only 15 percent. This small decrease in speed effects only work trips. There is no effect on non-work trips at all.

Recommended speed delay functions indicate that this increase of 30 percent in traffic volume would be accompanied by a reduction in speed of 70 - 90 percent. However, this great an increase would not occur. A proper model would produce an intermediate result - an increase in peak hour/peak direction travel due to growth in population and employment, but much less of an increase than assumed in the TPB model. The TPB model lacks the realistic feedback which causes shifts in destination, mode, and travel time in response to increased congestion.

As the TPB model can not properly forecast reductions in VMT as a result of congestion, it can not properly forecast increases in VMT that will result from increases in roadway capacity. In the context of Potomac River crossings, future traffic volumes on the existing bridges, including the American Legion Bridge, are surely overestimated in scenarios with no new bridges.

Any forecast travel time savings with a new bridge would be at least partially offset by increased congestion caused by induced travel, including congestion at roadways leading to and from any new bridges. The TPB model overstates the benefits of new roadway capacity, and underestimates the costs, including the effects of increased traffic in other areas.

The TPB and the Metropolitan Washington Air Quality Committee (MWAQC) have recently appointed a task force to recommend strategies to reduce air pollution to compensate for the excess emissions from increased use of sport utility vehicles and light trucks in the region. There are a number of strategies that could be used to solve this emission budget shortfall within the transportation planning process, for example by delaying some traffic-inducing road projects to accelerate funding of new bus and railcar purchases, promoting employer-paid commuter transit benefits, and investing in bicycle and pedestrian access to schools and transit stops.

The TPB has recommended that about half of this emission budget shortfall be eliminated - on paper - simply by adjusting what it believes to be faulty model assumptions about the composition of traffic on local roads and accessing park-and-ride lots in the region. Any modification of the TPB models to refine the analysis of traffic and its emissions

should also correct the deficiencies noted in this report. Failure to do so would raise serious questions about compliance of the region's planning process with the Clean Air Act regulations guiding modeling and use of the latest and best planning assumptions.

The Honorable NORMAN Y. MINETA  
Secretary, U.S. Department of Transportation  
400 7th Street SW  
Room 10200  
Washington, DC 20590

DEAR SECRETARY MINETA: We represent a diverse array of groups dedicated to supporting and improving public health. We are writing to request that the Administra-

tion's proposal for reauthorization of the Transportation Equity Act for the 21st Century (TEA-21) contain measures that protect that public's health from unintended consequences of transportation initiatives.

A transportation system that encourages or supports increased use of personal automobiles can impair human health by a variety of means, including:

- Increased injuries and deaths from motor vehicle crashes (including pedestrians and bicyclists);
- Increased respiratory illness, infant mortality and other health damage connected with exposure to air pollutants;
- Impaired water quality related to runoff from paved land; and
- Decreased physical activity, contributing to the nation's epidemic of obesity and diabetes

We therefore call on the Administration to take the following steps in their reauthorization proposal:

- Require new road projects to meet the same criteria and local funding match as required for new transit projects.
- Require health impact statements for all new transportation plans and major projects. These statements must address the potential impact of the proposed plan on public health, including fitness, community cancer risk, health effects related to air quality, and transportation-related injuries and fatalities, as well as consideration of disparate impacts on minorities.
- Oppose environmental streamlining, which threatens to promote failed policies of trying to build our way out of congestion. Instead, we should require integrated State, regional, and local transportation, natural resource, and growth plans.
- Defend requirements that all updates to 20-year transportation plans and short-term programs conform with Clean Air Act State Implementation Plans.
- Expand and strengthen the Congestion Mitigation Air Quality Program (CMAQ), which provides \$1.3 billion a year for non-highway widening projects that reduce pollution in non-attainment areas. Seek funding growth proportionate to the population of all newly designated non-attainment areas.
- Boost tax incentives for employers to offer employees tax-free transit benefits.

Changes in how we manage and operate transportation can save money and lives, cut congestion, and improve environmental quality. But to achieve this we need better planning, better accountability for the effects of decisions, and fuller consideration of alternatives to building more and bigger highways. We strongly urge you to move this country in the direction of transportation systems that benefit, rather than harm, the health and well-being of our residents and communities. We look forward to working closely with you in this effort.

Sincerely,

RE: STREAMLINING AND TEA-21 REAUTHORIZATION

DEAR SENATOR JEFFORDS: Reauthorization of the Transportation Equity Act for the 21st Century (TEA-21) is a key opportunity to promote transportation environmental stewardship, renewing the promise of the ISTEA reforms. We urge the Administration to pursue such opportunities and resist "environmental streamlining" proposals for highways, aviation, pipelines, and energy which threaten to impair core environmental laws such as the National Environmental Policy Act (NEPA) and clean air, clean water, parks, and historic resources protection statutes.

Some States have begun to embrace environmental stewardship, forge partnerships with resource agencies and stakeholders, and use TEA-21's flexibility to support smart growth, resource protection, system management and incentives, and expanded travel choices as a core part of transportation plans and programs. Other States continue to pursue a failed strategy of trying to build their way out of congestion. Some scapegoat environmental laws for their own administrative failures, manifested in a lack of consensus on proposed projects; insufficient local matching funds; and projects delayed by inadequate consideration of alternatives, inadequate mitigation, avoidance of adverse impacts, and efforts to end-run Federal requirements.

This has led to 'environmental streamlining' proposals with arbitrary review deadlines, time limits on judicial review of transportation decisions, limitations on the determination of purpose and need for transportation projects and lead agency designations, circumscribed public involvement, mandatory concurrent processing of reviews and permits, and the elimination rather than integration of the Major Investment Study requirements of ISTEA into NEPA and the planning process. We urge you to oppose such anti-environmental measures threatening core environmental laws that assure the public's right-to-know about the effects of decisions before actions are taken.

We urge your support for efforts to expedite transportation project delivery by improving integration of project reviews with a planning process designed to minimize adverse impacts; strengthen accountability; and consider opportunities for improved transportation system management and stewardship. Such approaches can produce timely consensus to build good projects that protect public health, curbing delays and conflict that arise when agencies advance harmful projects without broad public support.

Transportation planning which considers communities and protected resources such as public parks, wildlife habitat and historic sites will produce better projects less likely to incur opposition and delay. Taking protected resources into account at the beginning, and planning accordingly will both protect resources and facilitate project approvals.

TEA-3 should require coordination of transportation, environmental, resource and land use plans with effective public involvement and more funding for resource agencies for their early and continuous engagement. Transportation data and analysis must be improved for sound evaluation of secondary, induced and cumulative impacts and the effects of smart growth and transportation management alternatives on air quality, equity, and other goals. Many delays arise when agencies have failed to effectively consider impacts on specific populations or neighborhoods, or the effects of transportation infrastructure projects on land use, travel behavior and public health.

Better classification of transportation projects for environmental review could cut delays. Some major highway widening projects evade environmental analysis while small, no-impact projects sometimes endure needless processing delays. The more rigorous New Starts review procedures applied to new transit projects should be equally applied to new highways. All federally funded projects should be planned and designed under the principles of context-sensitive highway design. Improved inter-city rail service and congestion pricing strategies should be considered as alternatives to new airport capacity.

Health impact assessments should be made part of all transportation plans. We urge you to oppose weakening of transportation conformity, which assures transportation plans do not cause a failure of State air pollution control strategies. Public health would be threatened if plans and programs could be amended without considering air quality implications or if conformity applied only to short-term programs, rather than to both 20-year transportation plans and short-term programs. Conformity is spurring investments in transportation strategies and technologies that reduce air pollution and better interagency cooperation. A few areas like Atlanta have faced short-term limits on their flexibility to build new roads because their transportation plans conflicted with their air quality plans, motivating timely action for interagency cooperation. The \$1.3 billion a year CMAQ program, which funds clean air programs, should be expanded by at least 50 percent, proportionate to the number of people living in new non-attainment areas.

Finally, TEA-3 should also require regional transportation plans and programs to contribute to timely attainment of clean water goals, and require stormwater management strategies for all new transportation facilities in watersheds not meeting standards, and application of best retrofit technologies for any highway undergoing significant reconstruction.

We would welcome the opportunity to meet with you during September to discuss these critical environmental issues with you. Felicia Lopez, Green Group Coordinator, will be in touch with your office in the near future to identify a convenient meeting time for you.

Sincerely,

KEITH LAUGHLIN,

## ENVIRONMENTAL PROTECTION

# The Federal Government Could Help Communities Better Plan for Transportation That Protects Air Quality

Statement for the Record by John B. Stephenson  
Director, Natural Resources and Environment

---

GAO-02-988T

Mr. Chairman and Members of the Committee:

We are pleased to have the opportunity to comment on how transportation can affect a community's air quality. My statement is based primarily on our October 2001 report on these issues.<sup>1</sup> As you know, since World War II, cities and suburbs grew, more roads were built, and more people had to rely on cars and buses for work, shopping, and business. In fact, in the last 30 years, the total number of vehicle miles driven grew 4 times faster than the rate of population growth, increasing to 2.6 trillion miles per year. The fuel these cars, buses, and other vehicles burn emits substances into the air that harm human health and the environment. Despite regulations limiting these emissions and improved vehicle and fuel technologies, the air in numerous cities and towns still does not meet air quality standards. Therefore, communities may look to change their future transportation and land use plans as a means to curb emissions.

Recognizing that transportation can affect the nation's efforts to improve air quality, the Congress has provided funds for projects that protect air quality. Now, as the Congress begins the work of reauthorizing the surface transportation programs,<sup>2</sup> it will have to consider whether to continue or revise these initiatives. To help inform this work, we are commenting on (1) the impacts of surface transportation on air quality; (2) the benefits and limits of key federal surface transportation and clean air requirements and programs designed to mitigate these impacts; and (3) ways the federal government can use these requirements and programs to further reduce these impacts. Our findings and recommendations are based to a large extent on the results of a survey we conducted in 2001 of all of the 341 metropolitan planning organizations in existence at that time (295, or 87 percent, responded). These organizations are responsible for developing transportation plans and ensuring that they do not worsen air quality. We surveyed these planners on their views about the types of transportation projects undertaken in their areas, how concerns about air quality impact their plans, and how the federal

<sup>1</sup>U.S. General Accounting Office, *Environmental Protection: Federal Incentives Could Help Promote Land Use that Protects Air and Water Quality*, GAO/02-12 (Washington, D.C.: October 26, 2001).

<sup>2</sup>The Transportation Equity Act for the 21<sup>st</sup> Century (TEA-21), the successor to the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA), is due to be reauthorized in 2003.

government could help them further assess alternative land use strategies when developing their transportation plans, among other things.

In summary, we found the following:

- Vehicle emissions contain substances, including carbon monoxide, nitrogen oxides, and volatile organic compounds, that degrade air quality, thereby threatening public health and the environment. Vehicles currently account for about one-third to one-half of these pollutants, and the risk they pose to public health is substantial. Epidemiological and other studies have consistently found that breathing emissions containing these compounds contributes to respiratory and other health problems, including the possibility of cancer and increased incidence of childhood asthma. Vehicle emissions can also pose risks to the environment by, for example, harming vegetation and causing crop damage. Regulatory limits on emissions, as well as cleaner fuels and engines, have significantly decreased these harmful substances since 1970, despite the increase in the number of vehicles and in the time they spend on the roads. But EPA estimates that better technology alone will not fully compensate for the increasing vehicle travel and emissions expected in the future.
- Provisions in the clean air and surface transportation laws have helped encourage transportation planners to look for ways to curb harmful emissions, but predominantly in areas that already suffer pollution problems. The provisions have not encouraged those areas with little pollution that still expect significant growth—and that may have the greatest potential to influence it—to grow in ways that preserve clean air. For instance, the Clean Air Act requires transportation planners to demonstrate that their plans and programs will not worsen air quality, but only in areas with current or prior air quality problems. Few planners in areas with clean air try to assess how changing land use or transportation plans can help them maintain the healthy air quality in their communities, according to our survey. Many of those planners that have to demonstrate to the Department of Transportation (DOT) that their plans will protect air quality have had difficulty

doing so, potentially limiting conformity's effectiveness. Provisions of the surface transportation laws, in particular the Congestion Mitigation and Air Quality Improvement Program, also primarily help areas with air quality problems to avoid further degradation, but do less to help areas with clean air to prevent the pollution in the first place. In addition to these statutory provisions, DOT and the Environmental Protection Agency (EPA) have implemented a number of funding, technical assistance, and public education programs aimed at minimizing transportation's effects on air quality. But some initiatives have had limited funding, or were only implemented in a few communities.

- The Congress and federal agencies have opportunities to provide transportation planners and communities more help in considering the environmental impacts of their transportation and land use decisions. For example, the transportation planners responding to our survey identified several areas in which financial and technical assistance would help them assess these impacts. In addition, in our 2001 report, we made a number of recommendations on ways to leverage the benefits of current laws and programs designed to help limit or prevent the impacts of land use and transportation on air quality or to consider new programs to achieve this outcome. We have summarized some of these recommendations in our statement today.

**Air Pollution from Vehicle Emissions Will Continue to Pose Health and Environmental Risks to Some Communities, Despite New Technology and Emissions Limits**

Vehicles emissions contribute to air quality degradation and, as a result, threaten public health and the environment. For example, in 1999, emissions from vehicles contributed about 51 percent of the carbon monoxide, 34 percent of the nitrogen oxides, and 29 percent of the volatile organic compounds in the nation's air, according to EPA (see fig. 1).<sup>3</sup>

<sup>3</sup>U.S. Environmental Protection Agency, Office of Air Quality Planning and Standards, *National Air Quality Assessment Trends Report, 1999* (Washington, D.C.: March 2001).

Figure 1: Proportion of 1999 Motor Vehicle Emissions for Carbon Monoxide, Nitrogen Oxides, and Volatile Organic Compounds

Source: EPA.

Note: The most current data available are for 1999.

In addition, the Department of Energy estimates that in 1999 alone, vehicle emissions, primarily from automobiles and light trucks, contributed about 60 percent of the total carbon emitted by the transportation sector.

Over the past 50 years, epidemiological and other studies have consistently found that these types of pollutants from vehicle emissions pose health risks. Carbon monoxide can damage cardiovascular and nervous systems. Nitrogen oxides and volatile organic compounds react with sunlight to form ozone, which, along with particulate matter, can damage lung tissue, aggravate respiratory disease, and lead to premature deaths. These pollutants also increase susceptibility to respiratory infection, compromise immune systems, and in some cases, increase the risks of cancer, according to EPA.

In addition to health problems, vehicle emissions adversely affect the environment by harming vegetation, damaging water resources, and contributing to global climate

change. Emissions increase plant vulnerability to disease, potentially causing long-term damage to forests. According to EPA, air pollution from motor vehicle emissions annually causes about \$2.5 billion to about \$4.5 billion in crop damage. Air pollutants also damage sensitive waters, such as bays and estuaries. For example, nitrogen oxides from vehicle emissions deposited into the Chesapeake Bay have caused algae blooms that threaten the fish hatchery and degrade spawning habitat. Furthermore, motor vehicles emit carbon dioxide, a greenhouse gas and a factor in global climate change, according to the National Research Council.<sup>1</sup> Although the effect of this change on human health and the environment is uncertain, it is believed to be significant.

The good news is that harmful vehicle emissions have declined significantly since 1970 and are expected to continue downwards because of cleaner fuels and better regulatory and technological controls. For example, stricter emissions limits for sport utility vehicles and light-duty trucks are scheduled to go into effect in 2004. EPA estimates that over the next 30 years these new standards will significantly reduce emissions of nitrogen oxides from vehicles by about 74 percent. Nevertheless, EPA also estimates that by 2005, the benefits gained from technological advances may not be enough to compensate for the increases in vehicle use. A study of emissions in Tennessee also predicts that stricter emissions limits would not be sufficient to offset the increased vehicle use and resulting nitrogen oxide and volatile organic compound emissions in its major cities of Memphis, Nashville, and Knoxville.<sup>2</sup>

It is not only communities with current pollution problems that need to be concerned. A significant number of new communities will soon face pollution problems when EPA implements stricter limits on ozone and particulate matter around the end of 2004, as

<sup>1</sup> National Research Council, Transportation Research Board, *Surface Transportation Environmental Research: A Long-Term Strategy* (Washington, D.C.: 2002).

<sup>2</sup> See Wayne T. Davis, Terry L. Miller, Gregory D. Reed, Prakash Doniswamy, Anna Tang, and Pedro Sanches, "VMT Growth Rates in the U.S. and Their Effects on NO<sub>x</sub> and VOC Emissions" (Proceedings of the 94<sup>th</sup> Annual Conference of the Air and Waste Management Association (Orlando, Florida, June 27-27, 2001).

planned, in order to better protect public health from these harmful substances.<sup>7</sup> EPA estimates that approximately 334 of the 3,141 counties nationwide will not meet the new ozone limit, as figure 2 shows.<sup>8</sup>

Figure 2: Areas with Current and Potential Ozone Problems

Source: GAO analysis of EPA data.

While the number of counties not meeting the standard may be relatively small, the number of people that will be living with these air quality problems is significant. For example, in 1999, EPA estimated that twice as many people live in areas that are expected to violate the new standard as compared to the number that live in areas violating the current standard—123 million people, or 44 percent of the nation's

<sup>7</sup> The limits have been upheld by the courts, but the United States Supreme Court has found EPA's ozone National Ambient Air Quality Standard implementation policy to be unlawful and has instructed EPA to develop a plan consistent with the Court's opinion. *Whitman v. American Trucking Ass'n, Inc.*, 531 U.S. 457 (2001); *on remand sub nom. American Trucking Ass'n, Inc. v. EPA*, 283 F.3d 355 (D.C. Cir. 2002).

<sup>8</sup> EPA's estimate is based on 8-hour monitoring during 1997 through 1999; these data will change from year to year, and the most current data will be used to make final designations of ozone nonattainment areas when the standard is implemented. The data on the 1-hour ozone areas are as of January 29, 2001.

population, compared with 54 million. This development, coupled with the fact that the technological solutions needed to achieve relatively smaller emissions reductions may become too costly, will require communities to look for other ways to reduce emissions. These alternatives could include altering their future transportation and land use plans.

**Federal Laws and Programs Linking Transportation to Improved Air Quality Have Helped Targeted Communities Control Pollution but Could Be More Comprehensive**

Both the clean air and surface transportation laws established requirements and programs that have helped to reduce harmful vehicle emissions, but these have focused on managing existing pollution and do not provide areas with clean air an incentive to preserve it. DOT and EPA also have initiatives underway, including joint projects, that encourage transportation planners and communities to consider how their anticipated transportation systems and projects will affect air quality. However, DOT has limited discretion over one of its grant programs, thereby raising questions about whether funds are used most effectively, and EPA has limited funding for its initiatives and therefore has supported only a small number of communities.

**The Clean Air Act Requires Planners to Ensure Transportation Designs Will Not Worsen Air Quality, but Only in Areas that Already Have Pollution Problems**

A provision in the Clean Air Act addresses the link between transportation and air quality—the conformity demonstration requirement. Generally speaking, under this requirement, transportation planners in an area with air quality problems must estimate the emissions resulting from their transportation plans and programs and demonstrate that they do not exceed the vehicle emissions ceiling, or budget, approved for that area in the state implementation plan for achieving air quality standards.<sup>6</sup> If they cannot do so, they must adjust their transportation plans or their area cannot, with limited

<sup>6</sup> Areas that exceed the standards—“nonattainment” areas—or are maintaining the standards after prior violations—“maintenance” areas—for ozone, carbon monoxide, particulate matter, and nitrogen dioxide are subject to the conformity requirement.

exceptions, spend federal funds on highway or transit projects that will exacerbate or create air quality problems.<sup>7</sup>

In our 2001 survey, 56 percent of the 134 transportation planners in areas of poor air quality, and thereby required to demonstrate conformity, said that they made at least moderate changes to their transportation plans and programs to reduce emissions. These changes could include, for example, adding more transit projects, bike and pedestrian facilities, or intelligent transportation systems like electronic toll collection systems on highways. Furthermore, the conformity requirement provided an incentive for planners in areas with air quality problems to go beyond just looking for ways to make changes in their transportation plan to reduce emissions. Some of these planners also assessed whether changing local land use plans could have an even more dramatic effect on transportation plans and prevent pollution by reducing reliance on cars. In fact, 46 percent of the 134 planners said that they evaluated the emissions from the mix of transportation projects generated from alternative land uses, as shown in figure 3.

---

<sup>7</sup> Projects related to highway safety, transportation control measures included in an approved state implementation plan, or transportation projects approved or funded by the federal government can move forward.

Figure 3: MPOs in Areas with Air Quality Problems That Have Modeled Emissions from Different Land Uses

Note: The boundaries covered by the planning organizations are based on survey data and may not reflect exact borders. We designated an organization's entire boundary as being an area with air quality problems if any one county within the borders has problems. The results from Alaska are not included.

Source: GAO analysis of survey data.

In contrast, transportation planners in areas with good air quality that did not have to meet the conformity requirement seemed to have little incentive to assess emissions from alternative land uses as a means to preserve their air quality. In fact, only 8 percent of these 155 planners reported assessing emissions from the mix of transportation projects generated from alternative land uses, as shown in figure 4, compared with the 46 percent of planners in areas with air quality problems. By not conducting these assessments, the localities—many of which could be facing rapid growth in the future—may have missed an opportunity to plan their growth—and the transportation systems to support it—in ways that preserve clean air.

Figure 4: MPOs in Areas Without Air Quality Problems that Have Modeled Emissions from Different Land Uses

Note: The boundaries covered by the planning organizations are based on survey data and may not reflect exact borders. We designated an organization's entire boundary as being an area with air quality problems if any one county within the borders has problems. The results from Alaska are not included.

Source: GAO analysis of survey data.

While recognizing that the conformity requirement has encouraged certain communities to look for ways to reduce emissions, only 31 percent of the planners responding to our survey found the process of demonstrating conformity to be effective in helping their areas achieve air quality goals (40 percent found it to be ineffective). Managers of state air quality programs, who we surveyed separately, expressed similar views about the effectiveness of the process. Planners, managers, and DOT officials identified several difficulties in executing the various steps needed to demonstrate conformity. These include the following:

- The required time frames for updating transportation plans and testing conformity do not match those for updating an area's vehicle emissions budget in the air quality plan, and this difference can further complicate efforts to meet the conformity requirement, according to DOT officials. For example, when planners

in the Washington, D.C., metropolitan area had to update their transportation plans and test for conformity, they had to use the most current data on the types of vehicles driven in the area. That data showed an unexpected increase in the number of sport-utility vehicles on the roads and, consequently, projected emissions were higher. To ensure conformity did not lapse, the planners had to try to find additional ways to alter their transportation plans to achieve the necessary emissions offsets. Because the area's air quality plan was not updated at the same time, it was not possible to assess whether the emission budgets needed to be revised to reflect the increased vehicle emissions.

- Planners responded in the survey that they could use additional technical assistance and training to help them better understand the models used to compute emissions expected from their transportation plans, thereby helping them better demonstrate conformity.
- Planners furthermore reported that the public lacks knowledge about the air quality impacts of their transportation choices. This may make it less likely that they will support transportation changes that better protect air quality.
- Planners responded that land use decisionmakers are not systematically involved in the conformity process, despite the belief that certain land uses can impact regional air quality. Therefore, land use decisionmakers may be less likely to support changes that better protect air quality, such as denser housing and development in older, urban areas rather than scattered development on undeveloped land.
- According to DOT program managers, some planners have found the requirement to update their transportation plans and meet the conformity test at least every 3 years to be too burdensome. Because of the complexity and time involved in preparing the plan and demonstrating conformity, it can take some areas more time than 3 years to complete their plan updates, after which time they need to begin the update process all over again. The tight time frame inhibits them from devoting their attention or resources to developing more strategic transportation solutions or adopting new and better models for assessing emissions and analyzing transportation plans, among other things.

Resolving these issues and improving the effectiveness of the conformity process could be even more important because of the new counties that are expected not to meet the new ozone and particulate matter standards. Having to demonstrate conformity will be among the challenges these counties will have to face. At the chairman's request, we are initiating a more comprehensive review of the conformity requirement's effectiveness, impact on transportation planning, and possible improvements.

Federal Surface Transportation Laws Created Programs to Protect Air Quality but Some Are Not Comprehensive Enough to Prevent Pollution

ISTEA, and its successor, TEA-21, included provisions to promote transportation plans and programs that better protect air quality. The largest of these is the Congestion Mitigation and Air Quality Improvement program (CMAQ), receiving \$8.1 billion through 2003. This program provides federal funds for transportation projects to reduce emissions and congestion in areas with poor air quality. For example, Boulder, Colorado, used CMAQ to partially fund a transit service that helps connect residents to employment centers and retail districts. Because this service transports nearly 10,000 riders per day, it has helped the city meet its clean air and congestion relief goals.

Although CMAQ encourages projects that reduce emissions, it targets areas with existing air quality problems, and provides less of an incentive to areas with clean air that may have emerging air quality problems.<sup>27</sup> This is important because implementation of EPA's new limits on ozone and fine particulate matter will increase the number of communities with air quality problems and may increase demand for the program's limited funding (see fig. 2). Furthermore, DOT program managers observed that communities tend to use their funds on "tried and true" projects, such as carpool lanes, and overlook other, more innovative projects, such as cleaner diesel engines, that could potentially achieve greater emissions reductions per dollar. In addition, the formula used to distribute CMAQ funds takes into account whether an area has an ozone or

<sup>27</sup> Funds are distributed to states according to a formula based on attainment status for ozone and carbon monoxide and the population living in the affected area. States without air quality problems receive a minimum amount of funds and can spend some of them on projects not prescribed under the program.

Resolving these issues and improving the effectiveness of the conformity process could be even more important because of the new counties that are expected not to meet the new ozone and particulate matter standards. Having to demonstrate conformity will be among the challenges these counties will have to face. At the chairman's request, we are initiating a more comprehensive review of the conformity requirement's effectiveness, impact on transportation planning, and possible improvements.

Federal Surface Transportation Laws Created Programs to Protect Air Quality but Some Are Not Comprehensive Enough to Prevent Pollution

ISTEA, and its successor, TEA-21, included provisions to promote transportation plans and programs that better protect air quality. The largest of these is the Congestion Mitigation and Air Quality Improvement program (CMAQ), receiving \$8.1 billion through 2003. This program provides federal funds for transportation projects to reduce emissions and congestion in areas with poor air quality. For example, Boulder, Colorado, used CMAQ to partially fund a transit service that helps connect residents to employment centers and retail districts. Because this service transports nearly 10,000 riders per day, it has helped the city meet its clean air and congestion relief goals.

Although CMAQ encourages projects that reduce emissions, it targets areas with existing air quality problems, and provides less of an incentive to areas with clean air that may have emerging air quality problems.<sup>27</sup> This is important because implementation of EPA's new limits on ozone and fine particulate matter will increase the number of communities with air quality problems and may increase demand for the program's limited funding (see fig. 2). Furthermore, DOT program managers observed that communities tend to use their funds on "tried and true" projects, such as carpool lanes, and overlook other, more innovative projects, such as cleaner diesel engines, that could potentially achieve greater emissions reductions per dollar. In addition, the formula used to distribute CMAQ funds takes into account whether an area has an ozone or

<sup>27</sup> Funds are distributed to states according to a formula based on attainment status for ozone and carbon monoxide and the population living in the affected area. States without air quality problems receive a minimum amount of funds and can spend some of them on projects not prescribed under the program.

carbon monoxide problem, but not a particulate matter problem, even though this pollutant can pose similar health risks.

TEA-21 also created the Transportation and Community and System Preservation Pilot program to help planners and localities improve the efficiency of the transportation system and reduce the environmental impacts of transportation, among other objectives. However, program managers may not be able to ensure funds are used most effectively on projects that could best demonstrate the linkages between transportation, air quality, and land use because most of the funds were already designated, or "earmarked," to projects before they were reviewed using the competitive selection factors.

Other DOT and EPA Initiatives Show Promise, but Scope and Funding Are Limited

In addition to the programs authorized under TEA-21, a number of funding, technical assistance, and outreach initiatives have helped localities minimize the impacts of transportation on air quality. For example:

- **Funding.** EPA has programs to encourage transportation projects that are more protective of air quality. The agency's Clean Air Transportation Communities grants program, implemented in 2001, provided \$1.27 million in seed money, technical assistance, and recognition for transportation projects that reduce emissions. For example, one project will encourage a car-sharing program to introduce new low-emissions vehicles. EPA also created the Mobile Source Outreach Assistance program, funded at \$770,000 in fiscal year 2001, to help educate communities about transportation choices that reduce vehicle miles and emissions.
- **Technical assistance.** DOT and EPA have a number of joint technical assistance efforts underway to help transportation planners consider air quality impacts. For example, the agencies (1) are issuing guidance to better clarify the modeling needed to comply with the conformity requirement and (2) initiated the Travel Model Improvement Program to update transportation models so that they help planners better perform travel-related technical analyses.

- **Outreach.** EPA has several initiatives aimed at encouraging planners and communities to think about alternative land uses as a way to better protect the environment, initiatives sometimes referred to as "smart growth." In particular, EPA has (1) information networks, Web sites, guidance on best practices, and training programs for local officials, among other things and (2) is issuing guidance on ways to calculate the potential emissions reductions from alternative land uses, such as redeveloping old industrial sites in an urban area rather than building on a new site in the suburbs, in order to discourage and reduce sprawl and reduce vehicle miles.

While these efforts have met with success, the available resources and scope of impact has been limited. For example, EPA has been able to award Clean Air Transportation Communities grants to only 10 state, local, or tribal governments, for a total of about \$1.27 million to date, but has discontinued funding for fiscal year 2002 because of budget constraints. In addition, efforts to improve travel models are not focused on creating models that fully integrate transportation, the environment, and land use, which would help planners consider the effects that their transportation decision will have on land use, future growth, and air quality. Furthermore, at the time of our survey, few planners were aware of EPA's guidance on how to obtain credit in their emissions budgets for reductions from alternative land uses, and EPA had conducted only a limited number of workshops and did not plan to offer additional training. We also found that the level of support across EPA's regions for these types of initiatives varied and that unless EPA better coordinated its efforts through a more comprehensive strategic plan, it would not be able to effectively leverage its resources and achieve more widespread results. We recommended that EPA devise such a strategy, and the agency expects to have this completed by the fall of this year.

**Planners Identified Additional Ways the Federal Government Could Help Them Further Limit Transportation's Impacts on Air Quality**

The planners responding to our survey identified the following actions the Congress and the federal government could take to remove some of the barriers to assessing and limiting the adverse impacts of land use on air quality.

- **Financial incentives.** Federal funding could be allocated to help promote a more collaborative working relationship among transportation, environmental, and land use planners so that they can develop ways to improve air quality. For example, federal funding could be targeted more to those transportation projects that were designed through a collaborative effort.
- **Technical assistance.** Federal agencies could provide additional tools to promote greater consideration of how transportation, air quality, and land use interact, including (1) access to technical staff, (2) examples of communities or regions that successfully demonstrated how changes in land use have affected vehicle miles traveled, and (3) improved models, such as those that can measure the emissions of small projects, like bicycle and pedestrian facilities.
- **Public outreach.** Federal agencies could undertake additional efforts to educate the public and local officials on how their land use and transportation decisions affect air quality, which could help to promote collaboration among all of these parties on ways to limit these effects.

**Conclusions**

Using the federal clean air and transportation laws, the nation has significantly reduced harmful vehicle emissions, thereby helping to protect public health and the environment. Technological advances will also continue to produce cleaner vehicles and fuels, further reducing harmful emissions. But for some communities, these advances may not be enough to compensate for rapid growth and the associated growth in miles driven. These communities may still need help to guide their growth and design their future transportation systems to limit pollution. However, the current clean air and surface transportation requirements and programs do not directly encourage communities to

consider more innovative transportation projects or alternative land development strategies as a means to reduce emissions. Nor do they encourage communities to take action that will preserve the clean air that they still enjoy.

With the upcoming reauthorization of surface transportation programs, the Congress has an opportunity to strengthen its past efforts and create new initiatives to promote transportation and growth that protects public health and the environment. We would like to bring to your attention to, as well as reaffirm, a number of recommendations we made in our 2001 report to help transportation planners and communities in assessing, preventing, or limiting harmful vehicle emissions. These recommendations included the following:

- The Secretary of Transportation should request all transportation planners to assess the emissions impacts of their proposals and use the results of these assessments to help educate local decisionmakers about the consequences of their transportation and land use decisions. This would encourage all parties to collaborate and take a broader, more regional approach to solving air quality concerns.
- The Administrator, EPA, should target available financial incentives in ways that encourage transportation planners, environmental officials, and local decisionmakers to collaboratively consider the impacts of transportation and land use on air quality.
- Both the Secretary and Administrator should provide more access to technical tools, such as staff and user-friendly models that integrate transportation, environmental protection, and land use, and better market these tools to transportation and local decisionmakers.
- The Administrator, EPA, should take more action to educate the public and local decisionmakers about the air quality impacts of their transportation and land use choices.

Our report also suggested ways that the Congress, as it reauthorizes the surface transportation laws, could help assist those states and localities that want to limit the air quality impacts of their land use and transportation decisions by

- adding the requirement that planners consider the environmental impacts of different land use strategies as a step in the transportation planning process;
- continuing but modifying funding programs designed to link transportation and air quality so that they also take into consideration alternative land uses, where appropriate, or create new programs to make this link;
- providing funding to states and localities, when possible, to help them obtain technical expertise, data, and analyses to assess land use impacts and mitigate adverse effects; and
- providing federal agencies with greater discretion over a portion of their transportation or environmental funds to encourage assessment and mitigation of land use impacts on the environment.

#### RESPONSES OF MICHAEL REPLOGLE TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question 1.* In general would you agree that conformity is spurring investments in transportation strategies and technologies that reduce air pollution and create better interagency cooperation?

Response. Yes. Since the 1990 Clean Air Act Amendments, conformity has been a significant factor fostering local, regional, and national political support for cleaner fuels and vehicles and inspection and maintenance programs that have helped produce more timely progress toward attainment of healthful air quality. In that period, conformity has been the single greatest factor promoting interagency cooperation between transportation and air quality agencies at the State, local, and Federal levels. Prior to 1990, transportation agencies paid no attention to the air quality consequences of transportation investments and plans. But in recent years, many

metropolitan areas have adopted changes to their transportation plans and programs to help reduce traffic growth and emissions. Consideration of air quality impacts of investments has become a routine matter in many metropolitan areas where pollution problems are more severe. In most regions with serious air quality problems, officials and staff of air agencies and transportation agencies routinely meet and work together to help foster effective program administration that delivers progress on both mobility and air quality goals.

Atlanta's conformity problems led the Governor to create a new regional authority responsible for better planning and funding transportation, air quality, and growth management in Georgia's non-attainment areas in an effort to fix a broken inter-agency cooperation process. While road builders have often raised the spectre of transportation conformity causing major disruptions to transportation programs, there have been no such disruptions. Even in Atlanta, where the longest conformity lapse of consequence to date took place, the region lost no transportation funding but instead redirected several hundred million dollars of funds from sprawl-inducing, pollution-generating roads into projects that would reduce pollution and into safety and system improvements that would not increase emissions.

After conformity analysis led Charlotte, North Carolina, to see that its transportation plan would lead to emission problems 20 years in the future, local officials developed, considered, and adopted a new 2025 Transit Land/Use plan for Charlotte-Mecklenburg with a new rapid transit system to support the five major transportation and development corridors identified in the 1994 Centers and Corridors Plan as well as connections to key development hubs between these corridors. The plan seeks to concentrate jobs around stations, provide residential multi-family housing at stations, and develop rail and bus rapid transit. Capital costs, plus operation, maintenance and other expenditures will cost \$1.085 billion over 25 years and quantifiable benefits such as travel time savings and vehicle operating cost savings total \$72 million a year, generating a benefit cost ratio of 1.6. There are also numerous benefits of the plan that are not quantifiable such as improved access to jobs and revitalization of the core center. Funding for the plan will come from a combination of local, State, and Federal funding. Mecklenburg County Voters approved a half-cent local sales tax in 1998 to fund expansion of bus service and rapid transit improvements in major corridors. The requirement that the RTP conform 20 years into the future was a vital element in motivating this regional progress and action. Limiting conformity determinations to a 10-year time horizon—as some propose—might reduce the incentive for other regions to take the kind of leadership initiatives seen in Charlotte.

Conformity helped Denver develop cost-effective strategies to reduce particulate matter (PM) problems. Agencies began taking action against wood burning in the 1980's, but PM was still measuring 185  $\mu\text{g}/\text{m}^3$  compared to the NAAQS of 150  $\mu\text{g}/\text{m}^3$ . Conformity made transportation planning and air quality agencies look at other sources of PM. They found that street sanding and sweeping strategies was a very effective measure and implemented controls beyond what was federally mandated, reducing PM levels to 80  $\mu\text{g}/\text{m}^3$ . Conformity also provided an incentive for developing light rail in Denver and the Metro Vision 2020 Plan, which seeks to limit growth to a 700 square mile area with supportive transportation strategies. Denver also has a number of travel demand management (TDM) strategies in their long-range plan such as a Ride Arrangers program and a telework program. While Denver does not take credit for TDM system management in the 2025 conformity finding, the region recognizes TDM emission benefits as a safety margin in meeting their emissions budget.

To deal with emissions problems recognized through the conformity process, many other regions have adopted transportation control measures (TCMs). These represent nearly 5 percent of total emission reductions, for example, in the San Joaquin region of California. The San Joaquin Council of Governments projects that TCMs, including rideshare, vanpool, and commuter rail, will deliver as much as a 10 percent reduction in emissions by 2020.

Conformity has also been valuable in helping to win adoption of new short-term emission reduction strategies in the metropolitan Washington, DC region. In July 2001, the DC metropolitan planning organization updated its modeling assumptions to reflect the growing use of sport utility vehicles (SUVs) and light trucks, which produce more pollution per mile driven than standard cars. As a result, they observed that they could no longer add new road projects to their transportation improvement program (TIP) and regional transportation plan (RTP) and still conform with the NO<sub>x</sub> motor vehicle emission budget in their adopted SIP. Officials formed a task force to consider reopening the SIP to allow for more motor vehicle pollution by finding offsets from other emission sources or fixing the conformity problem by adopting added emission reduction measures. With adjustments for

some refinements to their model estimates and for emission reducing measures already being implemented but not previously credited, the MPO found that the 8 tpd NOx excess emissions over budget was reduced to about 3 tpd.

Following further meetings and analysis, Maryland proposed a \$42 million package of transportation emission reduction strategies, including buying clean buses, improving pedestrian and bicycle access to transit, and supporting transit oriented development. Along with measures advanced by other jurisdictions, this package provides sufficient reductions to offset this emission budget shortfall and the region in July 2002 adopted them as part of a new TIP and RTP. If proposals made by some parties to lengthen the life of TIP conformity findings to 3 or 5 years had been in effect, this \$42 million package of emission reduction measures would almost certainly not have been funded.

*Question 2.* If Congress does make any changes in the conformity process as part of the next transportation bill, what would be your No. 1 suggestion and please be specific?

*Response.* Congress should make one change to the conformity process as part of the next transportation bill. It should adopt the bill introduced in the 106th Congress, 2d Session as H.R. 3686, the "Road Back to Clean Air Act," by Rep. John Lewis and as S. 2088 by Senator Max Cleland. This bill would put into law the EPA and DOT guidance that helped get Atlanta more focused on solving the city's transportation and air quality problems. It would increase flexibility so other areas of the country could continue to receive Federal funds for transit, safety improvements, road rehabilitation, and other projects even during a lapse in the conformity of their transportation plans. Without this legislative change, because of the way that DOT has at times in the past administered conformity and planning requirements, regions in a conformity lapse can face difficulty adding air quality improving projects to their transportation spending plans unless those projects had been part of a previously conforming fiscally constrained TIP and regional transportation plan.

The text of this bill follows:

A BILL

To amend the Clean Air Act and titles 23 and 49, United States Code, to provide for continued authorization of funding of transportation projects after a lapse in transportation conformity.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

Section 1. Continued Authorization of Funding of Transportation Projects After Lapse in Transportation Conformity

Section 176(c)(2) of the Clean Air Act (42 U.S.C 7506(c)(2)) is amended by adding at the end the following:

"(E) Notwithstanding subparagraphs (C) and (D), any transportation project identified for funding in a transportation plan and transportation improvement program adopted under section 134 of title 23 or sections 5303 through 5306 of title 49, United States Code, shall remain eligible for funding under title 23 or chapter 53 of title 49, United States Code, as applicable, after the long-range transportation plan or transportation improvement program no longer conforms as required by subparagraphs (2)(C)(i) or (2)(D), if—

"(i) the long-range transportation plan and transportation program met the requirements of subsection (c) at the time at which a project agreement for the transportation project was approved under section 106 (a)(2) of title 23 United States Code, or the project was otherwise approved for assistance under chapter 53 of title 49, United States Code, as applicable; "(ii) the transportation project is a transportation control measure (as defined in section 93.101 of title 40 of the Code of Federal Regulations (as in effect on March 1, 1999); "(iii) the transportation project qualifies for an exemption from the requirement that the transportation project come from a conforming metropolitan long range transportation plan and transportation improvement program under section 93.126 or 93.127 of title 40, Code of Federal Regulations (as in effect on March 1, 1999); or "(iv) the transportation project is exempt from a prohibition on approval under section 179(b)(1), except that this paragraph shall not apply to a transportation project described in section 179(b)(1)(B)(iv)."

Section 2. Amendment of Long-Range Transportation Plans and Transportation Improvement Programs Not Conforming to Applicable Implementation Plans.

(a) Transportation Plans—Section 134 of title 23, United States Code, is amended by adding at the end of the following: "(p) Amendments to Plans and Programs Not Conforming to Applicable Implementation Plans—Notwithstanding any other provi-

sions of law, a long-range transportation plan or transportation improvement program under this section that no longer conforms to the applicable implementation plan under section 176(c) of the Clean Air Act (42 U.S.C. 7506(c)) and part 93 of title 40, Code of Federal Regulations (or a successor regulation), may be amended without a demonstration of conformity if the amendment is solely for the purpose of adding transportation project—“(1) for which that State submits a revision of the applicable implementation plan to the Administrator of the Environmental Protection Agency requesting approval of the project as a transportation control measure (as defined in section 93.101 of title 40, Code of Federal Regulations (as in effect on March 1, 1999)); or “(2) that qualifies for an exemption from the requirement that the transportation project come from a conforming metropolitan long-range transportation improvement program under section 93.126 or 93.127 of title 40, Code of Federal Regulations (as in effect on March 1, 1999)”

(b) Mass Transportation Plans—Section 5303 of title 49, United States Code, is amended by adding at the end the following:

“(i) Amendments of Plans and Programs not Conforming to Applicable Implementation Plans—Notwithstanding any other provision of law, a long-range transportation plan under this section or a transportation improvement program under section 5304 that no longer conforms to the applicable implementation plan under section 176(c) of the Clean Air Act (42 U.S.C. 7506(c)) and part 93 of title 40, Code of Federal Regulations (or a successor regulation), may be amended without a demonstration of conformity if the amendment is solely for the purpose of adding a transportation project—“(1) for which the State submits to the Administrator of the Environmental Protection Agency a request for approval as a transportation control measure (as defined in section 93.101 of title 40, Code of Federal Regulations (as in effect on March 1, 1999)) under section 110 of the Clean Air Act (42 U.S.C. 7410); or “(2) that qualifies for an exemption from the requirement that the transportation project come from a conforming metropolitan long-range transportation plan under and transportation improvement program under section 93.126 and 93.127 of title 40, Code of Federal Regulations (as in effect on March 1, 1999).”

---

RESPONSES OF MICHAEL REPLOGLE TO ADDITIONAL QUESTIONS FROM SENATOR VOINOVICH

*Question 1.* During the hearing, several witnesses talked about how the coordination of the frequency of submittals for the State Implementation Plan (SIP), the Transportation Plan, and the Transportation Improvement Program (TIP) is an important and necessary reform. Among other things, such a reform would lessen the confusion of those involved, reduce costs, and help States meet air quality goals. In your testimony, you reject any proposal to reduce the frequency of conformity analyses. Do you see value in better coordinating the transportation and air quality planning processes?

Response. Environmental Defense and other environmental groups strongly support better coordination of transportation and air quality planning processes. However, we strongly object to proposals currently being put forward under the misleading name of “streamlining.” By extending deadlines and creating overly long gaps between conformity analyses, these proposals will threaten air quality, threaten public health and reduce information available to the public about the air they breathe.

Equally important, these proposals won’t make the system work better—they’ll make the system more inefficient. They reduce incentives for agency coordination. Conformity works well when transportation and air quality experts work closely together on a routine basis, to plan and implement highway and transit investments. Conformity, and the current schedule of deadlines, gives these agencies a powerful incentive to work together. The deadlines are also spaced just far enough apart to allow problems to be identified early—before they become crises that threaten air quality targets.

But reducing the frequency of required conformity analysis—currently 2 years for TIPs and 3 years for regional transportation plans (RTPs)—is likely to reduce rather than enhance such coordination. Conformity analysis is rather like balancing one’s checkbook. If done routinely and frequently, problems will be detected when they are small and correctable. If done infrequently, the costs of errors is likely to soar, as unrecorded transactions or errors go undetected, with their impacts compounded over time.

If the minimum frequency of conformity determinations is set at 3 or 5 years, this will likely be too far apart to detect and correct the rapid growth in VMT in fast-

growing metropolitan areas. Across the country, this rapid growth is causing those areas to fail to attain on time. At a time when our transportation investments are proving to threaten air quality and health, it makes no sense to relax deadlines.

Instead of statutory changes, schedule coordination (if any is needed) should come from better interagency coordination, not through relaxing the frequency of accounting system checks and balances. With wider gaps between reporting deadlines, opportunities for abuses and poor accounting grow larger. Uncertainty about true air quality impacts and benefits would increase.

Today, most metropolitan areas update their TIPs annually and redo their conformity analysis as they do so. Analysis of conformity as TIPs undergo changes to regionally significant projects provides opportunities for timely improvement of what have often proven to be out-of-date or previously incorrect model assumptions.

Many regions, such as Washington, DC, have recently updated motor vehicle fleet data assumptions to reflect the growing use of SUVs and light trucks, which produce more pollution per mile traveled than light duty cars, with a resulting increase in the estimates of motor vehicle emissions in the attainment year. In the case of Washington, DC, this conformity re-analysis led to increased attention by transportation and air officials and staff to the need for improved interstate and interagency coordination and collaborative data collection to upgrade the regional inventories of motor vehicle pollution factors. It also led local and State officials to add \$42 million in new emission-reducing transportation projects to the region's TIP in July 2002 to offset the increased pollution observed through the conformity re-analysis. This investment would not likely have occurred had the 2-year life of the TIP conformity finding been relaxed to 3 or 5 years. These investments will benefit not just air quality, but they will increase mobility in the region, increase access to jobs, foster better quality of life, and promote economic growth.

Conformity helped catch this problem sooner rather than later, when it was still a manageable problem that could be addressed through transportation measures, without needing to reopen the SIP. Had the problem been left to fester, it is more likely that the region's officials would simply have said the problem was too big to manage, and sought to make it someone else's problem. In fact, fear of this kind of crisis is what may motivate concerns about conformity. But by having tight deadlines and careful coordination among agencies, the challenges can be addressed with incremental measures before they escalate to crisis. The beneficiaries of tight deadlines are the millions of children, elderly people, and other individuals who suffer respiratory distress, premature death, injury, and other impairments every year when Federal air quality health standards continue to be unmet. The beneficiaries of relaxed conformity deadlines are primarily polluting industries and other special interests that profit at our society's expense.

In fact, States already have flexibility and discretion in the current system. The current tiered schedule for reappraising TIP and RTP conformity provides appropriate advance notice of conformity problems in a way to encourage timely solutions. For example, many regions first uncover conformity challenges when updating their TIPs to incorporate new projects. Updating these planning factors uncovers previous underestimates in regional vehicle emissions and allows timely corrective measures to be adopted—as they have been in Washington, DC, in the example described above.

At times, this may create what some call a “conformity lockdown,” during which the current 2-year TIP conformity finding remains valid, but no new regionally significant transportation projects can be added to the TIP until the region adopts new emissions-reducing measures to offset the incremental increase. At this point, the increment of emissions imbalance is usually still relatively small and manageable, and measures can be taken reasonably easily to offset the impacts of the new projects. In essence, the system provides “early warning” that provides the time to adopt new emission reduction measures to ensure that the TIP stays in conformity.

If the region fails to offset motor vehicle emissions that exceed the adopted SIP motor vehicle emission budget before the expiration of the 2-year TIP conformity finding, the region would likely enter a conformity lapse. In a lapse, there is yet another safety valve: the region can adopt an Interim TIP composed of projects with funding agreements, exempt projects, and transportation control measures drawn from the conforming long-range RTP, relying on its 3-year conformity finding. At any time, a State can choose to reopen its SIP to identify additional emission reduction measures from mobile or non-mobile sources to offset excess emissions from mobile sources that are in violation of the motor vehicle emission budget.

In short, States have discretion at every stage to align the schedule for updating their transportation and air quality plans and where they choose to seek emission reductions. The system works and should be sustained. If any change is warranted, it would be toward more frequent reviews of SIPs—but not less.

Better coordination of air quality and transportation planning should take several forms:

- **Interim Milestone Reports.** First, Congress should enhance this interagency coordination by ensuring that EPA adopts regulations to govern State submissions of SIP milestone compliance reports. These reports would track and report regional emissions every 3 years in nonattainment areas and ensure that remedial measures are implemented immediately when emission reduction targets are not met, as required by Clean Air Act Sections 182(c)(5) and (g). EPA has failed to issue these sorts of regulations, and that failure must be remedied. By ensuring that States meet this required 3 year cycle of SIP reappraisal, Congress could address the concerns of transportation agencies that SIPs are too infrequently updated, while transportation plans are subject to more frequent updates.
- **Prompt Upgrade of Models.** Second, transportation agencies should be required to promptly upgrade their computer models to effectively consider air quality, induced traffic, and fully up-to-date planning factors. Congress should provide EPA and DOT with a strong mandate to establish best-practice planning model standards and to require timely action by MPOs and other agencies to meet these standards for conformity and SIP planning. A recent report (U.S. General Accounting Office, Environmental Protection: Federal Incentives Could Help Promote Land Use That Protects Air and Water Quality, Washington, DC, October 2001, GAO-02-12, page 95) notes that, "DOT and EPA efforts to improve travel-demand-forecasting models may help MPOs and communities determine the effects of transportation improvements on congestion and air quality. However . . . these efforts currently do not call for integrating land use or environmental components into the travel demand model . . . Without such integrated models, communities cannot consider the likely effects that their transportation decisions will have on land use, future growth and development, and air quality." U.S. GAO-02-12, op. cite, page 95.

In regions where transportation models used for conformity and air quality planning have not been upgraded to integrate land use and environmental components, including full sensitivity to induced traffic and growth effects of transportation investments, urban design, and pricing policies, less frequent conformity analysis is likely to impair timely upgrading of analyses.

*Question 2.* Do you think there are more cost effective options for achieving air quality improvements in the transportation sector than through the current program?

Response. Transportation conformity is not an air quality improvement strategy in and of itself. It is a highly cost effective accounting mechanism that assures the integrity of adopted air quality attainment plans by preventing adoption of transportation plans and programs likely to cause pollution in excess of the levels determined to endanger public health. The Clean Air Act allows States great flexibility in determining how to achieve health-based air quality standards—whether through controls on stationary sources, area sources, or transportation sources, and whether through adoption of cleaner technologies, management and pricing strategies, or growth and demand management.

Without a strong and well-enforced transportation conformity program, experience shows that transportation emissions tend to be underestimated, leading to the failure of air pollution control strategies. That failure—more than three decades after the 1970 Clean Air Act—continues to impose huge costs on our society, with the adverse health costs of motor vehicle air pollution estimated by US DOT in 2000 at \$40 billion to \$65 billion, which pales beside the \$27 billion in annual Federal transportation expenditures.

Transportation conformity has played a significant behind-the-scenes role fostering cost-effective air pollution improvements in the transportation sector, including adoption of cleaner vehicle and fuel standards by States and Federal agencies, adoption of inspection and maintenance programs, and reallocation of transportation investments from sprawl-inducing, pollution-generating roads into transit, walking, bicycling, and Smart Growth strategies that meet economic and social needs for mobility with less need for travel by single-occupant vehicles.

EPA's own recent analysis shows that proposed air pollution reduction strategies and technology fixes alone are insufficient to deliver healthful air quality for all Americans over the next decade or even two (<http://www.epa.gov/clearskies/maps.pdf>). Thus, conformity is vital to assuring that motor vehicle emissions are properly accounted for as States and regions strive to achieve emission reductions from various sources and avoid having uncontrolled traffic growth undo progress toward healthful air quality.

## RESPONSES OF MICHAEL REPLOGLE TO ADDITIONAL QUESTIONS FROM SENATOR SMITH

*Question 1.* You testified that before State SIP's had established motor vehicle emission budgets, the transportation agencies were forced to rely on complex and widely criticized transition rules. EPA and DOT may be proposing a return of these transition rules in new non-attainment areas that will have a 1-year grace period to make a conformity determination. Would you agree that our air quality goals are better served by coordinating conformity with motor vehicle emissions budgets, rather than returning to these transition rules?

Response. As designed by Congress in the 1990 Clean Air Act, conformity is intended to focus on comparing forecast motor vehicle emissions in a transportation plan and program with an adopted motor vehicle emission budget (MVEB) established in a SIP designed to enable a region to attain the National Ambient Air Quality Standards (NAAQS) by deadlines established by law. Where such MVEBs exist, they should be used as the fundamental yard-stick to measure conformity of transportation plans and programs with air quality plans.

The problem we see with the "build/no-build" transition rule is principally in how it has been applied, and in the length of the transition to conformity against adopted SIP MVEBs, not in the underlying principal of the build/no-build transition rule. The build/no-build rule, first issued by EPA and DOT in 1991, compares emissions in a base-case no-build future scenario vs. emissions in a build scenario, adding or subtracting the applicable transportation projects changes proposed in any given TIP or RTP amendment. This is a desirable and acceptable conformity test to use in the absence of an adopted SIP MVEB when the evaluation uses analysis methods that properly account for induced land use and traffic effects of transportation investments and policies. However, as applied in many regions, build/no-build analyses have assumed no induced land use change or shift in the time-of-day of traffic caused by transportation system changes. Numerous peer-reviewed studies have demonstrated that induced traffic effects are profound and the addition of 10 percent more lane miles of roadways can be expected to induce an additional 6 to 10 percent vehicle miles traveled in a region in a few years time. If induced traffic is unaccounted for, the build/no-build analysis is invalid, and will underestimate motor vehicle emissions growth associated with major highway system expansions, working against the CAA statutory mandate that transportation plans and programs must contribute to timely attainment of the NAAQS.

It is vital that areas expected to be designated as new non-attainment areas should now begin to take steps to prepare to meet conformity analysis requirements. The TEA-21 Federal transportation law provides flexible funding to States and regions in the Surface Transportation Program and other funding categories that can be used for planning and data collection. Such funds should be used now to establish sound, up-to-date, local inventories of jobs, housing, highways, transit resources, and travel behavior, to develop locally applicable transportation planning models that meet best practice standards for appraising travel behavior and induced traffic, to code information on planned transportation investments and forecast job and housing growth expectations, and other information. Outside consultants should be retained to help cultivate local expertise to sustain these analysis systems, which have many cost-effective applications beyond conformity analysis in supporting sound capital program planning, traffic and transit operations planning, transportation equity analysis, growth management, cost-allocation evaluation, and other activities. The cost of establishing such planning and analysis systems is but a tiny fraction of the annual capital facilities investment costs of most States and regions, but can have a payoff far in excess of these costs by assuring more sound decision-making, investment planning, and identification of lower-cost and more optimal strategies for meeting local and national mobility, environmental, economic development, and equity goals. Establishing these planning and analysis tools in a metropolitan area can be accomplished in less than a year, but does require agency commitment and ongoing support.

EPA and DOT should promptly issue long-promised additional model guidance and regulations to assure that non-attainment areas properly account for induced land use and traffic effects in conformity analysis and SIP transportation modeling.

There are no valid reasons why any newly designated non-attainment area cannot establish the requisite transportation and emissions analysis systems well in advance of the expiration of the 1-year grace period following designation. Until adopted SIP MVEBs are available to provide a basis for conformity, the build/no-build test (with appropriate consideration of induced land use and traffic effects), along with the Reasonable Further Progress requirements of the CAA, should be the basis for evaluating conformity in non-attainment areas.

*Question 2.* If I am interpreting your testimony correctly, you appear to suggest that one way to judge the success of conformity is by how much it redirects transportation spending away from new highway construction. In Northern Virginia, however, they have delayed over \$800 million in highway projects generating a total of 2 tons reduction in emissions, or \$400 million per ton reduced. By comparison, EPA's vehicle emission standards cost below \$1600 per ton. Stopping new highways does not sound like a very cost-effective strategy to reduce emissions, wouldn't you agree?

Response. I'm sorry, but you have misinterpreted my testimony and data and I must disagree with your assertion. I noted that a recent analysis by the Metropolitan Washington Transportation Planning Board showed that by deferring 100 lane miles of highway expansion projects in 2002—a 0.5 percent reduction in lane-miles of road capacity—Virginia saves \$800 million in capital costs while cutting NOx emissions by more than 1 percent, or nearly 2 tons per day, and reducing vehicle miles of traffic by 0.6 percent. This illustrates how the very expensive expansion of new highways typically produces a growth in air pollution emissions by spurring more traffic, rather than a reduction in emissions as often claimed by the road lobby. It illustrates how reducing expenditures on new roads is often the most cost-effective emission reduction strategy, because it avoids generating both costs and air pollution. By not building additional traffic, sprawl, and pollution-inducing highways, regions like Northern Virginia can avoid the need for additional expenditures of up to \$1600 per ton to reduce emissions because they can prevent the pollution from being emitted in the first place.

A savings of nearly \$400 million per ton of NOx reduction for cutting highway expansions is highly competitive when compared to alternative emission reduction costs of \$1600 per ton for pollution-control technology investments! More regions faced with missed deadlines for clean air attainment should be protecting public health and the taxpayer's wallet by redirecting public investments from road expansions into other more productive forms of investment, such as transit, the revitalization of walkable neighborhoods, education, affordable housing close to jobs, and public health services.

*Question 3.* You have been an advocate of using land use and other "Smart Growth" strategies to reduce air pollution. Yet, we all know that these strategies take a decade or more to change transportation patterns. How do you expect to generate substantial pollution reductions from these projects when the emission levels from these vehicles will be 95–99 percent cleaner than their 1970's counterparts?

Response. Even with significantly cleaner cars and truck technologies, Smart Growth strategies offer the promise of avoiding—at essentially no cost—as much as one-quarter of the potential motor vehicle emissions in 2020, thus helping to achieve more timely attainment at less cost. If Smart Growth strategies are ignored and sprawl and highway building advance without any accountability for impacts on emissions, society will need to invest billions of dollars more in pollution abatement technologies to clean up mobile and non-mobile sources so we can achieve healthful air quality.

The amount of motor vehicle pollution emitted per mile driven has fallen by more than 90 percent since 1970, but today motor vehicles still account for a major share of pollution—from one fourth to three fourths of the NOx and VOC emissions—in most non-attainment areas. Adopted or submitted SIPs show that in the attainment year and in future years going out as far as 2020, motor vehicle emissions are expected to continue to account for a large share of emissions in many metropolitan areas, as Graph 1 shows. For example, despite adoption of cleaner technologies, motor vehicles are estimated to account for 28 percent of VOC and 39 percent of NOx emissions in Washington, DC (in 2005), 31 percent of NOx emissions in Connecticut/NY (in 2007), 45 percent of VOC and 61 percent of NOx emissions in Chicago/Illinois (in 2007), 67 percent of NOx emissions for Portland, Maine (in 2012), 30 percent of VOC and 39 percent of NOx emissions in Denver (in 2013), 79 percent of CO emissions and 71 percent of PM emissions in Las Vegas (in 2020), and 38 percent of VOC and 44 percent of NOx emissions in Salt Lake City (in 2020). And despite the fact that California leads the Nation in adopting cleaner vehicles and fuels, the Bay Area expects motor vehicles to contribute 42 percent of VOC emissions and 52 percent of NOx emissions (in 2006), and the South Coast non-attainment area expects motor vehicles to contribute 59 percent of PM emissions and 49 percent of NOx emissions (in 2020).

The magnitude of emission reductions needed to reach healthful air quality is considerably greater than that now identified through submitted and approved SIPs. EPA's recent posting of maps of estimated effects of the proposed "Clean Skies" initiative (<http://www.epa.gov/clearskies/maps.pdf>) shows that adopted and proposed measures are together inadequate to bring many of the nation's largest metropolitan

areas into full attainment of the NAAQS even by 2020. Significant further emission controls will be needed also to deal with hazardous air pollutants, greenhouse gas emissions, and other environmental pollution, even with the cleaner motor vehicles produced under the Tier II and heavy-duty diesel engine rules.

A conservative estimate is that Smart Growth strategies have the potential to reduce traffic growth and emissions over the timeframe of 20-year regional transportation plans by 15 to 25 percent compared to forecast trends in most metropolitan areas. Over the shorter timeframe of a 2-year TIP conformity cycle or the several years prior to reaching ozone attainment deadlines, many regions could accomplish reductions in traffic growth and related pollution well of several percent a year relative to trends with a concerted effort combining Smart Growth, pricing, and demand management strategies.

The degree to which Smart Growth can affect emissions and traffic growth is closely related to the pace of job and housing growth in a community. In slow growth communities, the opportunities for Smart Growth to change travel patterns are modest compared to fast-growing communities. Smart Growth is very pro-growth in the areas where it is being implemented while seeking to discourage job and housing growth in other locations where people lack non-driving travel choices. Where fast growth is occurring, there tend to be more opportunities for growth to become smarter.

The effectiveness of Smart Growth strategies in reducing traffic and pollution is also closely linked to how comprehensively these strategies are implemented. Effective Smart Growth means transit-oriented (not just transit proximate) development that is attractive for walking and cycling, includes a vibrant mix of land uses for various income groups, and highly attractive non-automobile access to other parts of the metropolitan area. It includes pricing policies and incentives that favor transit, walking, bicycling, and alternatives to driving while curbing subsidies for driving. Even in slow growth areas, Smart Growth transportation pricing and urban design incentives, such as Commuter Choice programs where employers pay for transit benefits and offer cash-in-lieu-of-parking benefits can produce substantial shifts in travel behavior and pollution reductions in the span of a year or two, with concerted marketing, promotions, demonstrations, and incentives for rapid adoption of Smart Growth changes. Research and experience cited in my most recent testimony to the committee shows the magnitude of near-term travel behavior and emission changes that have been achieved in a number of communities with these sorts of strategies.

*Question 4.* In your written testimony you state, "Because of steep increases in the number of vehicle miles, cuts in the amount of pollutant emitted per mile, particularly for NOx, and small particulates, have been offset by growth in miles driven." While this has been true in the past, doesn't EPA's data clearly show that future vehicle emissions are decreasing, even as vehicle travel increases?

Response. Since the 1970 Clean Air Act, increasingly stringent motor vehicle and fuel standards have significantly reduced vehicle emissions per mile. Federal light duty Tier 1 vehicle emission standards today allow only 4 percent as much VOC pollution per mile as vehicles emitted in 1969, and 10 percent as much NOx. Despite this sharp reduction, in 1999 motor vehicles still accounted for 29 percent of VOC and 34 percent of NOx emissions nationwide according to EPA. VOC emissions from highway vehicles declined 18 percent during the past decade, but NOx emissions increased by 19 percent during the same period. And as a 2002 TRB study, *The CMAQ Program: Assessing 10 Years of Experience*, noted (page 70), "Although tailpipe emissions from highway vehicles are only a small share of directly emitted PM on a national basis, they account for a substantially higher proportion of longer-lived atmospheric concentrations of fine particles in urban areas, for example, up to 40 to 50 percent in the Denver and Los Angeles metropolitan areas."

With the full phase-in of Tier 2 standards beginning in 2009, light duty vehicle emission standards will allow only 22 percent as much VOC pollution per mile as Tier 1 standards, and 18 percent as much NOx. But the slow pace of motor vehicle fleet turnover means that the full benefits of these emission reductions will not take effect until 2020 or later. In the meantime, unless regions adopt strategies to better manage travel demand, sprawl, and subsidies that encourage driving, motor vehicle travel will continue to grow and offset much of these emission reduction benefits. Between 1980 and 1999, vehicle miles traveled grew by 87 percent. If a similar pattern continues through 2020, NOx and VOC emissions from motor vehicles will decline by 2020 by only little more than half. But much deeper reductions than this will be needed to achieve healthful air quality for all Americans. In other words, technology alone will not make the amount of driving irrelevant to considerations of pollution control in the foreseeable future.

The recent adoption of more stringent motor vehicle emissions and fuel standards for light duty trucks and heavy-duty diesel engines will offer important additional contributions toward clean air. Nonetheless, progress toward timely attainment will for the next several decades be dependent on continued and improved measurement and monitoring of the amount and pattern of motor vehicle use, and greater efforts to avoid pollution by shaping motor vehicle use and travel behavior.

*Question 5.* In your written testimony, you state, based on the MATES-II study, “that 90 percent of the total cancer risk is attributable to toxic air pollutants emitted by mobile sources.” But you fail to mention that 70 percent of that risk is from diesel emissions, and the EPA heavy duty diesel rule will substantially reduce these emissions. Moreover, you also fail to mention that the same study shows that cancer risk has been declining from 700 per million in 1990 to 300 per million in 1997, which suggests progress is being made on non-diesel related toxic emissions. You suggest that less highway construction and more programs to reduce vehicle travel are needed to reduce these risks, yet isn’t technology and better fuels the real answer to reduce most of these risks?

*Response.* Less highway construction and improved programs to reduce vehicle travel should indeed be evaluated through the planning and project review process to appraise their capacity to avoid or mitigate adverse health risks caused by transportation related air toxics emissions. Travel demand and growth management strategies, pricing incentives, and other actions related to the operation, management, investment in transportation systems and related community systems can often provide very cost-effective approaches to reduce exposure of communities to air toxics and the cancer and other health risks associated with these exposures. Indeed, expansion of highways where unacceptably high air toxic exposure problems already exist will likely increase the scope of the problem by inducing traffic growth and exposures to air toxics. Cleaner technology and better fuels are not the only or best way to reduce most of these health risks, although these are an important part of the solution. While a reduction in cancer risk from 1990 to 1997 is documented in the MATES-II study, the cancer risk in 1997 is many times higher than the level at which EPA and FHWA are required to take actions to safeguard public health from such documented risks.

Diesel emissions are indeed the largest source of toxic air pollutants emitted from mobile sources and the EPA heavy duty diesel rule will eventually reduce those emissions substantially. But because of the long-delayed timeframe for implementation of the heavy-duty diesel rule and the very long lifetime of diesel engine equipment, barring major new pollution control initiatives, it will take decades to achieve the substantial emission reductions required to protect public health from toxic air pollutants from these motor vehicles. While technology and fuels will do a lot to reduce these risks, public health will be best protected by a program that combines such initiatives with better strategies to manage the demand and use patterns of motor vehicles—both diesel and non-diesel—and to manage exposure of the public to these emissions. This must include consideration of how changes in transportation investments—such as highway expansions—will affect the amount of traffic emitting toxic air pollutants, and whether alternative investments might better satisfy mobility objectives while avoiding or mitigating these adverse health impacts. As the example in Washington, DC, cited above shows, reducing highway system expansions can—at least at times—produce both cost savings and substantial reductions in pollution. There are many ways to better manage the system to minimize air toxics while meeting mobility needs, including promotion of faster adoption of cleaner technologies and alternative transportation investment and management strategies. But FHWA is refusing to face core issues related to health impact assessment in its project approval and transportation plan and program approval process.

The health risks from transportation related air toxics remaining after the emission reductions of the last decade far exceed Federal criteria for unacceptable health risks, and will continue to be unacceptably high even if further reductions in per-vehicle emissions are achieved in the foreseeable future. The future risks expected due to the traffic volume anticipated in many major highway corridors are not acceptable to the families who are exposed to toxic emissions. Furthermore, proper consideration of strategies that serve mobility needs without increasing single occupant vehicle travel can minimize these risks. FHWA has not given adequate consideration of these harmful health effects and the alternatives that could mitigate them in its process for reviewing and approving transportation plans, programs, highway funding agreements, and project environmental and design documentation.

The National Environmental Policy Act (NEPA), 42 U.S.C. § 4321 et seq., requires a review of the harmful effects of exposure to these motor vehicle pollutants generated by highways. FHWA has violated both NEPA and the requirements imposed by 23 USC §109(a) and (h) and 23 CFR §771.105 to assess and mitigate the adverse

effects of air pollution from highway projects in a number of cases, such as the proposed widening of US 95 in Las Vegas.

It is not acceptable to dismiss the substantial cancer risks that are exacerbated by highway expansions simply because cleaner technologies are likely to be introduced into the marketplace at some future time without considering the health impacts on several generations of children and adults who we know will be harmed by these effects in the decades prior to these cleaner technologies coming into wider use. The evidence of serious health risks is compelling. California's South Coast Air Quality Management District published a study entitled Multiple Air Toxics Exposure Study (MATES-II) in March 2000. In February 2000, the Journal of the Air and Waste Management Association published a study entitled "Distance Weighted Traffic Density in Proximity to Home is a Risk Factor for Leukemia and Other Childhood Cancers" (JAWMA Study). But FHWA routinely fails to even attempt to estimate the concentrations of toxic vehicular emissions likely to result from vehicle travel in high volume traffic corridors proposed for major expansion, or to assess the health risks of public exposure to pollutant concentrations identified by these recent scientific studies as the source of elevated cancer risks and rates. Not performing such an assessment is arbitrary and capricious and inconsistent with NEPA.

EPA has listed 21 toxic air contaminants from mobile sources, including diesel particulate and diesel exhaust organic gases. The EPA concluded that "[t]he current EPA position is that diesel exhaust is a likely human lung carcinogen and that this cancer hazard exists for occupational and environmental levels of exposure." 65 Fed. Reg. 35, 446 (June 2, 2000). The EPA premised this position on findings by the World Health Organization, National Institute for Occupational Safety and Health, and International Agency for Research on Cancer. Id. Other Federal health agencies have listed diesel emissions as containing carcinogens. The National Toxicology Program at NEIHS on May 15, 2000, 2 months before your letter, listed diesel particulate as a "known human carcinogen." EPA has published a list of "Mobile Source Air Toxics (MSAT)" which "includes various volatile organic compounds (VOCs) and metals, as well as diesel particulate matter and diesel exhaust organic gases (collectively DPM + DEOG)." 66 FR 17,229 (March 29, 2001). This list clearly defines the hazardous air pollutants from motor vehicles that FHWA should consider in assessing the health effects of air toxic emissions from the major highway expansion projects.

In refusing to prepare environmental analyses, FHWA has cited evidence that toxic emissions from individual automobiles and overall emissions in urban areas had declined from 1990-97. FHWA has failed to explain, however, why this decline justifies a refusal to consider the public health significance of ongoing cancer risks identified in studies that relied on monitored ambient concentrations of toxic contaminants near major highways and other information gathered after 1997. Indeed, the toxic pollutant concentrations reported in MATES-II reflect lower per-vehicle emissions than are occurring in most States, because California vehicles are subject to stricter emission standards.

FHWA's response to environmental critics does not address the information showing that the health risks remaining after the emission reductions of the last decade far exceed Federal criteria for unacceptable health risks, and will continue to be unacceptably high even if further reductions in per-vehicle emissions are achieved in the foreseeable future. The future risks expected due to the traffic volume anticipated in the US-95 Las Vegas corridor and many other areas of the Nation subject to highway expansion are not acceptable to the families who are exposed to toxic emissions. Furthermore, proper consideration of strategies that serve mobility needs without increasing single occupant vehicle travel can minimize these risks. Congress should reaffirm FHWA's obligation to consider as part of project reviews these harmful health effects and the alternatives that could mitigate them.

Emissions per vehicle mile traveled are not relevant to assessing the magnitude of the public health risk associated with motor vehicle emissions. The key issue is total emissions from highway corridors and the impacts total emissions are expected to have on the health of nearby populations. When highway expansion increases the vehicle-carrying capacity of the highway it induces additional traffic volumes, which in turn will contribute to increased total emissions from the highway and exposure to higher concentrations in the ambient air of hazardous pollutants in nearby neighborhoods. Risks to human health increase in proportion to human exposure to pollutants in the ambient air, not emissions per vehicle. These increased exposures create significant public health hazards that must be addressed in environmental reviews, the regional planning process, and the air quality conformity process.

At least one reasonable estimate of the cancer risk attributable to diesel emissions is the estimate developed by the California environmental agencies presented in the MATES-II study. Even if a careful review of the evidence suggests a better estimate

of the cancer risk is only one-half or one-quarter of the risk estimated by California, the risk would still be very high.

Estimates that regional concentrations of criteria pollutants may improve are simply not relevant to assessing the likely public health impacts of toxic contaminants from motor vehicles. The regional modeling assessments performed to satisfy the "conformity" requirements of the CAA address only the direct emissions of CO, PM-10 and ozone precursors from motor vehicles. These pollutants are subject to emissions limitations established by EPA for new motor vehicles, and are expected to decline in the future because future vehicles are required to meet more stringent emissions standards. But no such standards have been established for toxic air contaminants. There is no basis for assuming that comparable reductions will be achieved for toxic air contaminants. Even if emissions from future vehicles are reduced, that reduction would not obviate the need to assess future emissions levels and whether total emissions in a heavily trafficked corridor will cause or contribute to unacceptable health hazards.

In considering whether technology cleanup vs. demand management and improved transportation system planning should be preferred strategies for avoiding or mitigating health impacts of transportation, it is vital to consider the health costs of highways. The Department of Transportation has estimated the national aggregate health costs of criteria air pollutants from highways at \$40 to \$68 billion per year. Table 9, Addendum to the 1997 Federal Highway Cost Allocation Study Final Report, U.S. Dep't of Transportation, Federal Highway Administration (May 2000). The methodology developed in the Addendum to the Highway Cost Allocation Study to estimate the costs of adverse health effects from air pollution provides a basis for estimating the adverse health effects, and costs, attributable to emissions from specific highway corridors. The Addendum assessed only the health effects attributable to pre-1997 criteria pollutants, and did not include the health effects attributable to toxic air contaminants emitted from motor vehicles. If FHWA intends to justify highway expansions by comparing the value of increased travel against the costs of providing that capacity, a fair assessment of the health costs to the community must be part of the calculus. In addition, that kind of cost-benefit calculus must be applied to both the highway option and reasonably available alternatives that can reduce or mitigate the adverse impacts on health.

Recent studies have significantly improved understanding of the linkage between vehicle emissions and the risk and incidence of cancer among people living near major highways. The MATES-II and JAWMA studies demonstrate that projects like the US-95 expansion in Las Vegas will increase cancer risks among exposed populations, a highly significant impact on the human environment that warrants environmental impact review. The most important new information derived from these studies is 1) the magnitude of the cancer risk caused by motor vehicle emissions from a highway corridor of the size of the US-95 project, and 2) the demonstrated increased incidence of cancer among children exposed to higher traffic volumes.

It has been known for nearly two decades that motor vehicles emit toxic pollutants that include known or suspected carcinogens. What had not been firmly established by sound scientific research prior to the MATES-II results is that these pollutants reach concentrations in the ambient air in the vicinity of heavily traveled highways that present cancer risks of at least 1 in 1,000 to 1 in 650, i.e., levels far greater than the threshold for mitigation established by EPA's cancer risk policy and Federal agency policies generally.

EPA's cancer risk policy requires that pollutants be reduced when risks exceed 1 in 10,000 for the maximally exposed individual. These high cancer risks for nearby residents, and even higher risks for those living adjacent to roadways, far exceed the risk levels adopted by EPA and Congress in setting national health standards, and are unacceptable to the residents of these neighborhoods. EPA has summarized the consensus cancer risk policy of Federal agencies as requiring careful assessment of measures to reduce cancer risks when the population risk is greater than 1 in 1 million.

Where the entire U.S. population is exposed to a chemical classified as a probable human carcinogen, the agency consensus appears to be that risks less than 1 in 1 million generally can be found acceptable without consideration of other factors while risks greater than that level require further analysis as to their acceptability.

56 Fed. Reg. 7757 (February 25, 1991). On the other hand, EPA and other Federal agencies have generally acted to reduce cancer risks greater than 1 in 10,000. Here, the evidence from MATES-II shows that communities near corridors such as US-95 with traffic volumes in excess of 220,000 vehicles per day will be exposed to cancer risks well above 1 in 10,000.

The MATES-II study derived its estimates of community cancer risks from ambient air monitoring of toxic pollutants in 12 residential neighborhoods during 1998

and 1999. MATES-II also included regional toxic emission data for the Los Angeles Basin and a computer modeling program to estimate exposures for areas of the region where monitors were not located. The conclusions of the MATES-II study are startling: the regional average risk of cancer for residents of the Basin is 1400 in one million (1 cancer for each 714 residents), and 90 percent of this heightened cancer risk is attributable to air pollution from mobile sources. (MATES-II at ES-3).

MATES-II determined that exposure to diesel particulate emissions and other toxics from mobile sources combine to cause 90 percent of the elevated risks. Id. at E-3. Areas with concentrated traffic suffered from increased risks of cancer above the regional average. Id. at ES-5. The study found that the highest cancer risk is in neighborhoods nearest highways where modeled risks were as high as 5800 in one million, meaning that one person out of 170 is likely to suffer cancer. Id. at Fig. 5-3a, p. 5-10.

The JAWMA study of cancer rates in Denver, also published in 2000, is consistent with the MATES-II findings. That study focused on rates of childhood leukemia among children under 12 living very near highways (within 750 feet). The study found that children with leukemia were 12 times more likely to live close to highways than children without leukemia, and concluded that a "strong association" exists between proximity to high traffic streets and childhood leukemia. JAWMA Study at 2. The study built on established research connecting childhood cancers to benzene and other volatile organic compounds found in automobile emissions. Id. Both the MATES-II and JAWMA studies have broad applicability. While MATES-II examined the L.A. Basin specifically, the general findings establish a clear link between automobile emissions and cancer risk. Even if the relative magnitude of emissions of cancer causing agents differs somewhat between locales, the underlying conclusion remains irrefutable: highways are the largest source of carcinogens emitted into the ambient air in the urban environments, and the pollutant concentrations are highest in neighborhoods near highways. The size of the cancer risk is proportional to daily traffic loads in the corridor. When traffic loads are known, approximations of ambient concentrations of mobile source toxics can be made for neighborhoods located next to highways in other States by comparing the daily traffic loads on those highways with the daily traffic loads on highways for which emissions are modeled in the MATES-II study.

Except for diesel particulate, these risk estimates are derived from well-established risk factors that have been the subject of intensive scrutiny for many years. Although the MATES-II cancer risks are derived from risk factors adopted by the California environmental agencies, those factors do not differ significantly from those reported by EPA. See Integrated Risk Information System (EPA, Cincinnati, OH)[<http://www.epa.gov/iris>]. In addition, these risk estimates are not for the maximally exposed individual living adjacent to heavily traveled highway corridors, but rather for regional populations. Nearby neighborhood exposures are substantially higher, and may be as much as an order of magnitude higher for the maximally exposed individuals.

With regard to diesel particulate, the cancer risks in MATES-II are estimated based on unit risk factors adopted by California, but not yet by EPA. "The current EPA position is that diesel exhaust is a likely human lung carcinogen and that this cancer hazard exists for occupational and environmental levels of exposure." 65 FR 35,446 (June 2, 2000). This characterization of DPM as a carcinogen is supported by the National Institute for Occupational Safety and Health (NIOSH), the International Agency for Research on Cancer, and the World Health Organization (WHO). Id. The National Toxicology Program at NEIHS on May 15, 2000, also listed diesel particulate as a "known human carcinogen." Although a risk factor for DPM has not yet been adopted by a Federal agency, more than enough data has been accumulated from numerous epidemiological studies to allow a risk factor to be determined for risk assessment purposes. Further, California's more stringent emissions standards mean that other jurisdictions, like Las Vegas, may suffer from higher concentrations of toxic emissions from mobile sources. The JAWMA study emphasized the relationship between proximity to highways and childhood cancers. As such, this study has broad application. Nothing in the study indicates that the areas examined were in any way exceptional. Based on the findings in the JAWMA study, one would predict higher rates of childhood leukemia among those living near major highways such as the expanded US-95 in Las Vegas. In response to this new information, Sierra Club and local civic and environmental interests have sought action by FHWA to assure a Supplemental Environmental Impact Study (SEIS) for the US-95 corridor expansion project in Las Vegas. Similar issues are presented in other corridors around the country where extremely high traffic volumes would be increased by road expansions in an area close to thousands of residents. But FHWA has refused to consider the issues being raised by environmental and health groups. These

issues go to the underlying questions posed by Senator Smith—should such requests for analysis be dismissed because of cleaner technologies are expected to become available in coming years and because emissions are decreasing somewhat in some areas? And are facility investment and transportation system management strategies worth considering as control strategies related to these public health problems?

A significant purpose of an EIS is the involvement and education of the public that the process entails. The United States Supreme Court has held that SEISs are necessary to ensure that this purpose is furthered. *Marsh*, 490 U.S. at 371 (1989). The cancer studies raise an issue that clearly warrants such public involvement. The US-95 expansion may look dramatically different to residents alerted to the heretofore unconsidered link between highways and cancer. An SEIS would provide an opportunity to inform the public about the issue and the degree of risk involved. The public has an obvious, critical interest in providing input on this issue.

Public involvement in the consideration of alternative modes of meeting travel demand in the US-95 corridor is critical. NEPA not only serves as a vehicle for informing the public of impacts, it also requires that alternatives be considered. Taken together with the requirement of 23 U.S.C. §109(h) to mitigate the adverse impacts of air pollution from highways, an SEIS should identify the alternatives that can mitigate or eliminate the cancer risk while at the same time meeting the mobility needs of people who live and work in the US-95 corridor or other similar corridors around the U.S.

Federal law requires assessment, reporting, and mitigation of health risks attributable to highway projects. FHWA's failure to assess the adverse health effects, the costs of these health effects, and the alternative transportation facilities and/or services that could prevent or minimize the adverse effects of the project violates NEPA, section 109 of the Federal transportation code and the Department of Transportation's ("DOT") environmental regulation at 23 CFR §771.105.

The United States Supreme Court has affirmed the position adopted by the Council on Environmental Quality (CEQ) that the purpose of the National Environmental Protection Act would be thwarted without an SEIS requirement. 40 C.F.R. § 1502.9(c); *Marsh v. Oregon Natural Resources Council*, 490 U.S. 360, 370 (1989). Accordingly, CEQ regulations implementing NEPA impose a duty on Federal agencies to prepare an SEIS when "[t]here are significant new circumstances or information relevant to environmental concerns and bearing on the proposed actions or its impacts." 40 C.F.R. § 1502.9(c)(ii). As noted above, the CEQ defines "significantly" according to context and intensity. Context includes effects on society generally and the locality in particular, and intensity includes the magnitude of the impacts on public health and the nature of the risks. 40 C.F.R. § 1508.27.

When deciding whether to prepare an SEIS, the agency must apply a "rule of reason," while taking a "hard look" at new information. *Marsh*, 490 U.S. at 373-74. In weighing the value of new information, the agency must make the decision according to the same NEPA guidelines governing the decision whether to prepare an EIS in the first instance. *Id.* If new information shows that the proposed action will affect the environment in "a significant manner or to a significant extent not already considered, a supplemental EIS must be prepared." *Id.* When new scientific data raise environmental concerns that have not been addressed in a previous EIS, an SEIS is required. *Portland Audubon Society v. Babbitt*, 998 F.2d 705, 708 (9th Cir. 1993). New concerns that require an SEIS can be either quantitative or qualitative. *Environmental Defense Fund v. Marsh*, 651 F.2d 983, 996 (5th Cir. 1981).

In addition to NEPA, Federal highway law requires the consideration of the adverse effects of air pollution prior to approval of the plans and specifications for a highway, 23 U.S.C §109(a), and the adoption of measures that "eliminate or minimize" the adverse effects of "air pollution." 23 U.S.C. §109(h).

In a case challenging DOT's approval of a highway project without assessing its impact on air pollution, the court in *D.C. Federation of Civic Associations v. Volpe*, 459 F.2d 1231 (D.C. Cir. 1971), held that 23 U.S.C. § 109(a) required such an analysis:

We can find no basis in the statute's language or purpose for the conclusion that certain hazards are, as a matter of law, immaterial to the Secretary's evaluation of a project's safety. The District Court would surely agree that Congress did not intend to permit construction of a bridge in a situation, however rare, where air pollution would be a significant threat to safety. It does not follow, of course, that air pollution will be a significant hazard in all-or even any-highway projects. And the District Court apparently concluded that no extraordinary dangers are likely to arise from the Three Sisters Bridge. Still, the gathering and evaluation of evidence on potential pollution hazards is the responsibility of the Secretary of Transportation, and he undertook no study of the problem.

DOT's approval of the highway bridge was remanded.

Federal highway law goes beyond NEPA by requiring that the decision to approve a highway be—

“made in the best overall public interest taking into consideration the need for fast, safe and efficient transportation, public services, and the costs of eliminating or minimizing such adverse effects and the following: (1) air, noise, and water pollution; (2) destruction or disruption of man-made and natural resources, aesthetic values, community cohesion and the availability of public facilities and services; (3) adverse employment effects, and tax and property value losses; (4) injurious displacement of people, businesses and farms; and (5) disruption of desirable community and regional growth. Such guidelines shall apply to all proposed projects with respect to which plans, specifications, and estimates are approved by the Secretary after the issuance of such guidelines.”

23 USC §109(h). At a minimum, this provision requires DOT to determine the costs of eliminating or minimizing the adverse health effects attributable to air pollution, and then requiring mitigation in the “best overall public interest.”

DOT’s 1987 regulations implementing this requirement and NEPA provide that the analyses required by §109(a) and (h) are to be performed as part of the NEPA review of the project. 23 CFR Part 771. Thus because both §109(a) and (h) require an analysis of the adverse effects of air pollution and the costs of eliminating or minimizing such effects, a supplemental EIS is required.

Section 109(h) also requires DOT to “eliminate or minimize” the adverse effects attributable to a new or expanded highway. This provision is implemented through DOT regulations in 23 CFR §771.105, but has not been applied by FHWA with regard to the adverse health affects associated with toxic and fine particle air pollutants emitted from this highway project. DOT’s regulation adopts as—

the policy of the [Federal Highway] Administration that:

(b) Alternative courses of action be evaluated and decisions be made in the best overall public interest based upon a balanced consideration of the need for safe and efficient transportation; of the social, economic, and environmental impacts of the proposed transportation improvement; and of national, State, and local environmental protection goals.

(c) Public involvement and a systematic interdisciplinary approach be essential parts of the development process for proposed actions.

(d) Measures necessary to mitigate adverse impacts be incorporated into the action. Measures necessary to mitigate adverse impacts are eligible for Federal funding when the Administration determines that:

(1) The impacts for which the mitigation is proposed actually result from the Administration action; and

(2) The proposed mitigation represents a reasonable public expenditure after considering the impacts of the action and the benefits of the proposed mitigation measures. In making this determination, the Administration will consider, among other factors, the extent to which the proposed measures would assist in complying with a Federal statute, Executive Order, or Administration regulation or policy.

On its face, paragraph (d) requires that measures necessary to mitigate the adverse health effects of hazardous air pollutants and fine particles be incorporated into the plans and specifications for the project. Subparagraphs (1) and (2) then establish criteria for determining whether the costs of mitigation are eligible for Federal funding. The rule does not contemplate the approval of a project that would have significant adverse effects on human health without requiring that those effects be mitigated. The project must either include measures to eliminate long-term human exposure to the levels of hazardous air contaminants that are associated with significant risks of adverse health effects, or alternatives must be developed that can prevent these adverse health effects. None of these requirements of DOT’s rule have been addressed in the review of the US-95 project in Las Vegas.

For all of the above reasons, less highway construction and more programs to reduce vehicle travel should indeed be evaluated through the planning and project review process to appraise their capacity to avoid or mitigate adverse health risks caused by transportation related air toxics emissions. While cleaner technology and better fuels are an important part of the solution, they are not the only way or necessarily the best way to reduce most of these risks.

Proposals to streamline NEPA reviews through such actions as imposition of arbitrary deadlines for agency action, limits on public involvement, curbs on the engagement of resource agencies and the public in determinations of project purpose and need or available reasonable alternatives, limitations on judicial review of NEPA decisions threaten to reduce compliance with these important legal requirements and

public health safeguards. We urge Congress to oppose such efforts as fundamental assaults on America's core environmental and public health laws.

#### STATEMENT OF THE NATIONAL ASSOCIATION OF HOME BUILDERS

Thank you for the opportunity to submit a statement for the record presenting the views of the National Association of Home Builders (NAHB) on the issue of transportation conformity and its impact on the home building industry.

NAHB represents more than 205,000 member firms involved in home building, remodeling, multifamily construction, property management, housing finance, building product manufacturing and other aspects of residential and light commercial construction. The members of NAHB recognize the importance and value of a safe, easily accessible and reliable transportation system. Homeowners and potential homebuyers depend upon transportation systems to move them from their homes, to their places of employment, to shopping and to their schools. Homeowners also demand communities with clean air. The transportation conformity process creates the nexus between the need for safe, effective transportation with the desire for maintaining clean air. Unfortunately, the conformity process can be confusing, bureaucratic and burdensome. The transportation conformity program's goals and processes must be reevaluated and reforms need to be made. NAHB's members believe the building industry can play a constructive role in addressing this issue.

#### *Background*

Transportation conformity is a requirement under the Clean Air Act (CAA) and the Transportation Equity Act for the 21st Century (TEA-21) that mandates States with impaired air quality to conduct air quality assessments prior to Federal approval, or the expenditure of Federal funds, for construction of any major transportation project that may have an impact on regional air quality (e.g., highway expansion, bridge construction, new freeway construction, or transit project). In short, it is a Federal requirement that local transportation plans must "conform" to the State air quality plan.

Transportation conformity applies to counties with impaired air quality—today there are approximately 107 areas (generally an area is a conglomeration of contingent counties in a metropolitan area, called a "nonattainment" area) in 34 States that the U.S. Environmental Protection Agency (EPA) has designated as having excessive amounts of ozone (smog), particulate matter (soot), carbon monoxide, and/or nitrogen dioxide. In addition, EPA is in the process of implementing new, more stringent standards for ozone and particulate matter. With the implementation of these new standards, the number of nonattainment areas considered to have impaired air quality and subject to transportation conformity requirements could double by 2007.

Transportation conformity determinations are set up as an all-or-nothing proposition. The projects in the local transportation plan are taken in the aggregate. If local planners are unable to show conformity of both a 20-year transportation plan and a 3-year transportation plan (including the funding to back the projects contained in those plans) with the State air quality plan, the area experiences a "conformity lapse." The result of a conformity lapse is that all Federal transportation funding for the area is cutoff until the transportation plans are approved. With Federal funding suspended due to a conformity lapse, badly needed transportation projects are delayed or even canceled, leaving the population of these areas with continued traffic congestion.

#### *Impacts on the Home Building Industry*

By all measures, the housing industry, which accounts for 14 percent of the nation's Gross Domestic Product, has been a bellwether during the recent difficult economic times. Fortunately, to date, transportation conformity requirements have not hindered the industry's ability to continue producing safe, affordable housing in most cities. The construction component (residential fixed investment) has outperformed the overall economy in four of the last five calendar quarters. In recent economic data for the first quarter of 2002, housing grew 14.6 percent while the economy grew 6.1 percent. Over the past year, low interest rates and strong underlying demographic demand has kept housing strong while the rest of the economy has struggled to regain its footing.

The construction of 1,000 single family homes generates 2,448 jobs in construction and construction-related industries, approximately \$79.4 million in wages and more than \$42.5 million in Federal, State, and local revenues. The construction of 1,000 multifamily homes generates 1,030 jobs in construction and related industries, approximately \$33.5 million in wages, and more than \$17.8 million in Federal, State

and local revenues and fees. NAHB members will construct approximately 80 percent of the almost 1.6 million new housing units projected for 2002.

In 2001, forty-one of the largest 50 housing markets in the United States were either nonattainment or maintenance areas subject to transportation conformity requirements. As these population centers grow, the demand for affordable housing must be coupled with the need for a safe, efficient and modern transportation system. Unfortunately, driven by consumer demand, land developers and builders often plan their own projects according to local transportation and growth plans. Since many consumers factor transportation into their decisions about home location, delayed or canceled transportation projects change the demands of the homebuyer after development projects are planned or even completed. If a metropolitan area is unable to appropriately wade through the red-tape of the Federal conformity requirements so that it can keep transportation project funding flowing, previously approved transportation projects are halted, the congestion continues, and homebuyers are left idling in traffic.

In 1999, a NAHB survey showed that 83 percent of the survey's respondents favored a detached single-family home in a suburban setting with a longer commute to work and farther distances to public transportation and shopping. Overwhelmingly, the survey showed that the greatest concern to respondents was traffic congestion. Respondents chose road widening (44 percent), new road construction (27 percent) and greater availability to public transportation (33 percent) as solutions to traffic problems. Though a substantial number of respondents advocated the use of public transportation, 92 percent owned automobiles and 85 percent said that they use them for commuting.

The survey highlights the tradeoff Americans are willing to make: greater traffic congestion in return for the home of their own choice, in the setting of their own choice. Further, while Americans support public transportation, they rely on the automobile as their primary means of transportation and support transportation improvements to ease traffic congestion. It is clear that transportation, whether by automobile or by transit, is a vital component of the decisionmaking process for homebuyers. This point is not lost on home builders. Home builders depend on a safe, efficient, modern transportation system because it is an important selling point for the homebuyers they serve.

#### *NAHB Activity*

NAHB began to focus on transportation conformity in 1999 when environmental advocates in Atlanta, Georgia decided that an effective way to influence local land use planning was to oppose transportation plans in court. Atlanta proved to be only the beginning of a larger strategy: hold a nonattainment metropolitan area's transportation plan hostage while seeking a settlement that favors their particular land use objectives. Throughout the country, environmental groups have petitioned Federal courts to have transportation plans frozen and then stricken by the court because they are "flawed" in some way. If a transportation plan is stricken, essentially there is no plan and, therefore, no conformity. Without conformity, Federal funding would be frozen until a "better" plan is approved.

In response, NAHB formed a coalition with other transportation construction interests to intervene on a national level in transportation conformity lawsuits. NAHB has participated in transportation-related litigation in Sacramento, Atlanta, Baltimore, and Salt Lake City. NAHB is of the opinion that Congress did not intend for environmental groups to have standing to challenge transportation planning decisions under the Federal Aid to Highways Act and that the courts should not resort to picking and choosing specific transportation projects for a region. We believe that Congress envisioned a dynamic process where transportation documents are continuously reviewed and updated on a regular basis in an effort to account for new data, technology improvements, and shifts in transportation growth. The conformity process is not static, and by necessity, is dependent on estimates and predictions based on ever-changing data and projections regarding future transportation trends. However, while this litigation continues in absence of clarification by Congress, it is imperative for parties with an economic interest or those parties who are reasonably affected by an ultimate decision have the opportunity to intervene in those lawsuits. Efforts to keep transportation planning flowing without court-selection of specific transportation projects were very successful in 2001, and these efforts continue through 2002.

NAHB has also recognized that a conformity lapse can result from a poorly coordinated administrative process as much as any court decision. For example, Houston was days away from lapse in the summer of 2001, and San Francisco did experience a conformity lapse in early 2002. Both of these areas became bogged down in underlying challenges to State air quality planning, such as modeling issues, that over-

lapped with upcoming deadlines for approval of transportation plans. It was not that the transportation plan itself was flawed, but that the air quality plan approval process was not synchronized with the transportation plan approval process. The transportation planning process itself can be unnecessarily burdensome on local planners, and changes should be made to the requirements to facilitate better air quality and transportation planning.

*Concerns about the Current Transportation Conformity Requirements*

In reconsidering transportation conformity while reauthorizing TEA-21, NAHB urges Congress to carefully weigh the air quality benefits gained by implementing the complicated transportation conformity requirements against the economic impacts of the current transportation conformity system. NAHB supports air quality planning aimed at reaching the goals of the CAA and understands the need for future motor vehicle emissions to be factored into transportation planning. As reauthorization progresses, Congress should consider whether transportation conformity is achieving its intended goals.

NAHB would like to work with Congress to address what we see as the major problems with the transportation conformity process. Through several meetings and conversations with industry stakeholders and transportation and environmental officials, NAHB has identified several areas of concern:

- Under the current transportation conformity system, the introduction of “new” air or transportation data triggers the need for a new air quality plan and, in turn, a new conformity determination. Unfortunately, it is difficult to find a balance between introducing new air and transportation data into the system while still maximizing the time available to State and local transportation planners to make conformity determinations prior to statutory deadlines. Transportation planners are confused by current EPA and U.S. Department of Transportation (DOT) guidance about what procedures should be followed and which data should be used in planning.

- The Federal agencies have not concluded properly or consistently what kind of project can move forward during a transportation conformity lapse situation. As EPA and DOT attempt to interpret a court decision from 1999 that interprets the statute, once a project is approved by a local government and well on its way to becoming a reality, conformity lapse can leave a partially completed project unfinished.

- Organizations representing environmental interests are attempting to manipulate the judicial process to force Metropolitan Planning Organizations (MPOs) to adopt favored local transportation projects. Environmental groups have developed a legal strategy to challenge modeling, pollution estimates and emissions forecasts with which they disagree—even though these challenges should be made during the public participation phase of the planning process. Environmentalists are petitioning the courts to freeze and invalidate transportation plans and transportation projects such that an area could be thrown into conformity lapse if the case were successful. Abusing the court system in this manner enables environmental groups to hijack the collaborative stakeholder process that develops both the short and long-term transportation plans.

- The way that EPA implements its new 8-hour ozone and fine particulate matter standards will have significant impact on the transportation conformity process. As stated earlier, the number of nonattainment areas may double, limiting State and Federal resources. Further, the newly designated nonattainment areas will have little experience with the implementation of an already complicated conformity process.

NAHB looks forward to working with Congress to seek solutions to these problems as reauthorization of TEA-21 continues.

Thank you for allowing NAHB the opportunity to share its views on the transportation conformity process. NAHB applauds the efforts of the Senate Environment and Public Works Committee to tackle this difficult issue. We look forward to working with members of the committee on this issue and other issues of concern to the home building industry during the reauthorization of TEA-21.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS  
(AASHTO)

August 9, 2002.

The Honorable JAMES M. JEFFORDS,  
Committee on Environment and Public Works,  
U.S. Senate,  
Washington, DC 20510.

DEAR MR. CHAIRMAN: I am writing on behalf of the American Association of State Highway and Transportation Officials (AASHTO), which represents the departments of transportation in the 50 States, the District of Columbia and Puerto Rico. We want to thank you and the members of your committee for convening a hearing on July 30, 2002 to address transportation and air quality issues.

With the enactment of the Clean Air Act Amendments (CAAA) in 1990 and the Intermodal Surface Transportation Efficiency Act (ISTEA) in 1991, transportation planning and air quality planning became more closely linked through transportation conformity. The policy objective of the transportation conformity process is to coordinate air quality and transportation planning by ensuring that transportation plans are consistent with planning for attaining Federal air quality standards. The results have been positive—coordination between air quality and transportation planning has improved and cooperation between air quality and transportation planning officials has increased. The process has resulted in greater awareness of decisionmakers of the linkages between transportation and air quality and has encouraged broader involvement in transportation planning by stakeholders. We support and applaud these improvements.

Nevertheless, after more than 10 years of experience, we believe the transportation conformity process is still not working as effectively as it could. For example, under the existing requirements, the transportation and air quality planning processes are still misaligned:

- Different Planning horizons: U.S. DOT's metropolitan planning regulations require that metropolitan transportation plans have a minimum of a 20-year planning horizon, while the Clean Air Act requires State Implementation Plans (SIPs) to cover a period that extends only to the attainment date, typically a five to 10 year period, resulting in a mismatch. The result is a defacto "cap" on future emissions through the end of the 20-year transportation plan period. Travel growth and associated emission increases can be offset only with transportation measures—new fuel and vehicle technologies that may be coming online cannot be considered. This puts the transportation sector at a distinct disadvantage and does not allow for analyses of potential measures from all sectors.

*Recommendation:* Amend TEA-21 to require conformity determination on first 10 years of the transportation plan or the attainment date, whichever is later.

- Different Frequency Requirements for Transportation and Air Quality Plan Updates: Transportation plans and their conformity demonstrations must be updated every 3 years; TEA-21 requires TIPs to be updated every 2 years; and there is no requirement to update attainment SIPs once approved by EPA. Maintenance plans need to be updated after 8 years with a new 10-year plan developed.

These requirements have created a situation where transportation plans are updated regularly while SIPs are updated only on a discretionary basis. Because transportation plans, TIPs and SIPs must use the latest planning assumptions each time they are updated, the assumptions in SIPs tend to be older than those in plans and TIPs, creating an inconsistency in the process. This is important, as these differences in assumptions are critical to projecting on-road mobile source emissions. A current example is Sacramento, California, where the most recent SIP was developed in 1994—eight years ago—while the transportation conformity analysis must use the most recent planning assumptions and data.

*Recommendation:* Amend TEA-21 to require metropolitan plan updates every 5 years in nonattainment and maintenance areas, and reaffirm that TIPs must continue to be consistent with plans.

- Different Emission Estimating Techniques: The conformity rule requires that the latest planning assumptions and emissions models be used in transportation plans, TIPs, and SIPs when they are updated. Under these requirements, regional emissions analysis are being performed using the latest emissions model and are being compared against SIPs that frequently were developed using older models (see discussion above on different frequency for transportation and air quality plan updates). The result is an uneven comparison as different estimating techniques and parameters produce significantly different estimates of current and future emissions levels. For example, in 2002, EPA released MOBILE6 model. Non-attainment areas

have 2 years to begin using the model for conformity determinations. There is no corresponding requirement that SIPs be updated using the new model.

*Recommendation:* Amend TEA-21 to require that SIP budgets and conformity demonstrations be based on the same mobile-source emissions factors model and/or same vehicle fleet mix data.

- Different Lead Times for Sanctions and Conformity Lapses: If a conformity lapse occurs, consequences on the transportation plan and/or TIP are immediate. If there is a SIP failure, however, penalties are not invoked until at least 18 months after EPA sites an area with a SIP violation.

*Recommendation:* Amend TEA-21 to align conformity lapse with highway sanctions time clocks.

- After 20-years of maintenance, areas still need to meet conformity requirements: Conformity requirements currently apply to all nonattainment and maintenance areas. This means that even if an area has completed the 20-year maintenance period, if the 20th year is anytime within the transportation planning horizon, the area still must meet conformity requirements until the last year of the transportation plan (e.g., end of 20-year maintenance period 2006, transportation plan horizon 2025). This is increasingly becoming an issue as more areas are reaching the end of their 20-year maintenance period.

*Recommendation:* Amend TEA-21 to clarify that conformity applies only during the maintenance period.

In conclusion, we believe it would be useful and appropriate to consider process improvements that could enhance integration of transportation and air quality plans and strengthen the transportation-air quality linkage. Moreover, we believe it is essential to consider and establish an orderly process for implementing the upcoming designation of more than 200 new areas for non-attainment under the 8-hour ozone or PM<sub>2.5</sub> air quality standards.

Attached is a complete set of AASHTO's recommendations regarding transportation conformity that were approved by the Board of Directors on April 21, 2002. We respectfully request that this letter and the attachment be made a part of the official record of the Senate Environment and Public Works Committee's July 30, 2002 hearing on Transportation and Air Quality.

AASHTO appreciates the opportunity to work with you and your committee, and looks forward to continuing to explore approaches with you for improving transportation and air quality planning coordination through the transportation conformity process.

Respectfully yours,

JOHN HORSLEY, *Executive Director.*

## TEA-21 REAUTHORIZATION

---

MONDAY, SEPTEMBER 9, 2002

U.S. SENATE,  
COMMITTEE ON COMMERCE, SCIENCE, AND TRANSPORTATION,  
SUBCOMMITTEE ON SURFACE TRANSPORTATION AND  
MERCHANT MARINE,  
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,  
SUBCOMMITTEE ON TRANSPORTATION, INFRASTRUCTURE, AND  
NUCLEAR SAFETY,  
*Washington, DC.*

The subcommittees jointly met, pursuant to notice, at 2:38 p.m. in room SR-253, Russell Senate Office Building, Senator Breaux [chairman of the Subcommittee on Surface Transportation and Merchant Marine] presiding.

### FREIGHT ISSUES

Present for the Committee on Commerce, Science, and Transportation: Senator Breaux.

Present for the Committee on Environment and Public Works: Senators Reid, Jeffords, and Inhofe.

### OPENING STATEMENT OF HON. JOHN BREAUX, U.S. SENATOR FROM THE STATE OF LOUISIANA

Senator BREAUX. The committee will please come to order. I would like to welcome our colleagues from the Environment and Public Works Committee who are with us this afternoon for this very important hearing, particularly Senator Reid and Senator Inhofe and also Senator Jeffords and others who I know will be attending. This is a joint hearing of the Subcommittee on Surface Transportation and Merchant Marine and the Subcommittee on Transportation, Infrastructure, and Nuclear Safety. I also thank all of our witnesses for being with us.

I would just make a brief comment to point out that one of our fastest-growing segments of our economy, and our gross domestic product for this country, is international trade. This segment of our economy is completely dependent on our transportation sectors and on the intermodal transportation of the goods that are engaged in commerce.

Today we are going to look at what has become one of the backbones of our entire Nation's economy, the infrastructure for the intermodal transportation system of the United States. I think all of us who represent port areas are familiar with the importance of an intermodal, interconnected, transportation system, that without

it we will not continue to be one of the great trading nations of the world.

Intermodal containers, for instance, in the ocean shipping area, are increasing dramatically. It used to be that a ship that had 2,000 containers on it was considered one of the largest in the world. Today we have ships carrying 7,000-plus containers. If those containers were lined up one behind the other on rail cars, it could extend over 35 miles, just from the containers on one large container ship.

So we want to look at the problems associated with intermodal transportation. I am delighted that our leader on the Democratic side, Senator Reid, who has been so active in these transportation measures from an appropriations standpoint and others, is with us to help with this hearing this afternoon. Senator Reid, any comments?

**OPENING STATEMENT OF HON. HARRY REID, U.S. SENATOR  
FROM THE STATE OF NEVADA**

Senator REID. Thank you very much, Mr. Chairman. I am very happy that we have here with us the chairman of the full committee, Senator Jeffords, who has been so good at allowing us to do things on the committee. As chairman of this subcommittee, I appreciate his allowing us to do this joint hearing.

Senator Breaux, you being from a State where you see these ships come in all the time, you are used to them. But for me, every time I go to a place where we have freight that comes by ship I am stunned how big these are. I cannot imagine a ship could stay afloat with 35 miles of railroad cars in it. It is just hard for me to comprehend that we have vessels that can do all of that.

I am happy to co-chair this hearing with you, Senator Breaux. The subcommittee that you chair, Surface Transportation and Merchant Marine, is extremely important and, even for those of us who are not in ports, we all understand or should understand that solving America's freight and passenger transportation problems will require a comprehensive intermodal and flexible approach.

Jurisdiction over surface transportation programs is divided between our committee and your committee. We have to do everything we can to coordinate our efforts. You and I have been around long enough that it is a question of what we can get done and do it as quickly as we can. Once we get something done, there is a lot of credit to pass out. We do nothing, and I think we'll get discredit for that.

We need to work not only with our committees, but we have to work in Finance, Budget, and Appropriations. So we have to do a lot to set the policy agenda. We can do that. We cannot begin to address the significant problems facing our Nation's transportation system unless we have adequate funding. Each of these committees I have mentioned will be an important partner in our efforts to secure the additional funding and budget protection necessary to write a transportation bill that addresses our Nation's significant highway, transit, and rail infrastructure needs.

Funding problems—today we will deal with freight transportation. Efficient transportation of freight is essential to our Nation's economic growth and global competitiveness. Nearly \$10 tril-

lion worth of freight is transported each year on our roads, railroads and waterways. We depend on our transportation system to get everything from food and other agricultural products to consumer goods to construction materials to coal to their destinations.

Freight transportation will double in the next 20 years. This growth in freight will vastly outpace the growth of our road and rail system and it can simply overwhelm our transportation infrastructure. Already, bottlenecks exist at border crossings with Canada and Mexico and in metropolitan areas. The next transportation bill will have to address these capacity issues and improve access to intermodal facilities.

In addition, we have to address operational issues that impact the reliability of our transportation system. Intelligent transportation systems will play a critical role.

We are fortunate to have a number of distinguished witnesses today. I especially look forward to Katie Dusenberry, who chairs the Arizona State Transportation Board, to talk about the traffic bottleneck at Hoover Dam. As a result of the closure of Hoover Dam, we have had to divert traffic—2,100 trucks a day now are detoured 23 miles or more.

Senator Breaux, you have heard me talk about my home town of Searchlight. That is where they go, 2,300 trucks every day. It is dangerous. It is the busiest two-lane highway in Nevada and it is extremely dangerous and it is only going to get worse. This bridge is essential to freight movements on the Cana-Mex corridor and is a top priority for our entire region of the country.

Senator Breaux, one of the things that we have to keep in mind also is if you look at a chart, on numbers, trucks haul most of the stuff and we want to do what we can to make sure that our highways get the attention they need. But it is kind of a misleading figure to look simply at numbers, because the trucks cannot haul most of the stuff until it gets to them and most of that comes with rail or through ocean traffic, barge traffic. So we have a lot to do to make sure that we better understand the freight system. If there were ever an area where we cannot be provincial, that is, we in Nevada have to care about Louisiana even though we do not have—in Las Vegas, four inches of rain a year. You get that much in a couple of hours—we have to be concerned because if we are going to keep Las Vegas economically sound, we are going to have to figure a way to get the traffic from Long Beach, New Orleans, and other places.

[The prepared statement of Senator Reid follows:]

STATEMENT OF HON. HARRY REID, U.S. SENATOR FROM THE STATE OF NEVADA

Welcome to today's hearing on freight transportation issues. I am pleased to co-chair this hearing with Senator Breaux and the Commerce Subcommittee on Surface Transportation and Merchant Marine he chairs. Solving America's freight and passenger transportation problems will require a comprehensive, intermodal, and flexible approach. Jurisdiction over surface transportation programs is divided between the Environment and Public Works Committee, the Banking Committee, and the Commerce Committee, and we will have to closely coordinate our efforts. This joint hearing is an important example of that cooperation, and I look forward to working closely with Senator Breaux and our other partners throughout the TEA-21 reauthorization process.

In addition to working with the Commerce and Banking Committees on policy issues, I intend to work closely with the Finance, Budget, and Appropriations Committees on funding issues. While we have a lot of important policy work ahead of

us, we cannot begin to address the significant problems facing our nation's surface transportation system without adequate funding. Each of these committees will be an important partner in our efforts to secure the additional funding and budget protection necessary to write a transportation bill that addresses our nation's significant highway, transit, and rail infrastructure needs.

One particular funding need that we will address at our hearing today is freight transportation. The efficient transportation of freight is essential to our nation's economic growth and global competitiveness. Nearly 10 trillion dollars worth of freight is transported each year on our roads, railroads, and waterways. We depend on our transportation system to get everything—from food and other agricultural products to consumer goods to construction materials to coal—to its destination.

Freight transportation is expected to double in the next 20 years, as the economy grows and international trade increases. This growth in freight traffic will vastly outpace the growth of our road and rail systems and threatens to overwhelm our transportation infrastructure.

Already, key bottlenecks exist at road and rail connections to major U.S. seaports, at border crossings with Canada and Mexico, and in metropolitan areas where roads and rail infrastructures are stretched beyond their capacity.

This next transportation bill will have to address these capacity issues and improve access to intermodal facilities if we are to keep our economy moving and maintain our leadership in international trade.

In addition, we must address operational issues that impact the reliability of our transportation system. Intelligent Transportation Systems will play a crucial role in improving the reliability of our transportation infrastructure and ensuring the flow of up-to-the-minute information to users and managers.

We are fortunate to have a number of distinguished witnesses with us today to provide our committees with insights into the freight challenges we face and, we hope, some proposed solutions to these problems.

One witness I would like to particularly thank for making the trip to be here is Katie Dusenberry, who chairs the Arizona State Transportation Board. Ms. Dusenberry will be testifying on an issue that is of vital importance to my State and the entire Southwestern region—the closure of the Hoover Dam to truck traffic due to post-September 11th security concerns.

As a result of the closure of the Hoover Dam bridge to freight traffic, over 2,100 trucks per day are now detoured 23 miles or more. To address this problem, the States of Arizona and Nevada are working together, and with the Federal Government, to build a Hoover Dam Bypass Bridge. This bridge is essential to freight movements on the CANAMEX corridor and is a top priority for my State. The Department of Interior has identified the Hoover Dam bypass project as its No. 1 national security priority.

I am pleased that Ms. Dusenberry has joined us to provide her expert testimony on this project.

Again, thank you to all of our witnesses for your participation today. Our first panel will consist of Associate Deputy Transportation Secretary Jeffrey Shane, who is also the Director of the Office of Intermodalism, and Jay Etta Hecker from the U.S. General Accounting Office. Thank you for agreeing to be with us today and I look forward to your testimony.

Senator BREAUX. Thank you very much, Senator Reid.

In order of appearance, I recognize the chairman of the full Environment and Public Works Committee, our friend Jim Jeffords.

**OPENING STATEMENT OF HON. JIM JEFFORDS, U.S. SENATOR  
FROM THE STATE OF VERMONT**

Senator JEFFORDS. Thank you, Senator, I appreciate all the work you have done along with Senator Reid in putting this hearing together. Coordinating two committees is not an easy task. It is so essential, and I applaud your efforts.

Today's hearing lays important groundwork for the TEA-21 reauthorization next year. The proper and efficient handling of freight is absolutely critical to the American economy. It is that simple. Without this, consumer prices would skyrocket, factories would have temporary shutdowns, businesses could not function, and families would even worry about food shortages in the land of plenty.

I care about freight issues. They are important to me in Vermont and to every county and every State in the Union. Chairmen Reid and Breaux have highlighted some important facts. I will repeat one: The U.S. transportation system carried over 15 billion tons of freight valued at over \$10 trillion during 1998. Trucks carry about 80 percent of that value.

Now for the most critical point: The volume of freight that needs to be carried in the United States will more than double by the year 2020. Thus, the transportation bill for the next generation of Americans, which we are currently crafting and will pass next year, must address this issue in a positive manner.

America needs to invest in vital intermodal freight infrastructure so that American businesses have competitive choices and more opportunities. For example, our international ports should offer multiple options, such as train and truck, to move incoming freight or to efficiently load ships with American products. Careful strategic investments near urban areas, factories, border crossings, ports or elsewhere can greatly help. Of course, I understand that regional needs vary, which is why the new law must embrace flexibility and local decisionmaking. For example, Vermont has a strong tradition of moving heavy freight by rail to the St. Lawrence Seaway. Freight moves through Vermont north to the Province of Quebec and south to the Eastern Seaboard. Vermont's granite and marble quarries, its dairy farms and its timber industries produce relatively heavy products, and its high-tech industries such as IBM produce high value but low weight products. Allowing flexibility, local decisionmaking, and competitive choices will provide for efficient intermodal freight movement.

Those who ship and receive freight in America are concerned with efficiency and timeliness. We need intelligent freight systems in addition to intelligent transportation systems. The buyer's cry is: I want it on time and unbroken. Yet this week's New Yorker magazine, in an article entitled "Stuck in Traffic," explains how congestion threatens efficiency on our highways. The article wonders if the world will end, not with a bang, but with a traffic jam.

America has spent hundreds of billions of dollars building, improving, and repairing our massive highway transportation systems. I will push for a similar revitalization of our rail system. We need a modern rail equivalent to our highways.

Rail will yield strong benefits throughout our Nation. First, movement of goods onto rail can usually reduce congestion on our roads and permit truck freight to move faster and safer. Second, it will make our highways last longer as the heavy freight is moved by rail. Truck shipments exert a tremendous toll on our Nation's highways.

Third, more targeted, strategic, less costly investments can help move huge volumes of freight while offering businesses another viable option. For example, much of the truck traffic on Route 7 in Vermont could be handled by rail through precisely targeted strategic investments in rail corridors, instead of through expensive road-building projects. Each Senator in this room probably has similar examples for their States.

In closing, let me again emphasize my interest in working with everyone in this room on these critical freight issues. I look forward to hearing the testimony here today. Thank you, Mr. Chairman.

Senator BREAUX. Thank you, Senator Jeffords. Senator Inhofe.

**OPENING STATEMENT OF HON. JAMES M. INHOFE,  
U.S. SENATOR FROM THE STATE OF OKLAHOMA**

Senator INHOFE. Thank you, Mr. Chairman. I think you are aware that this committee is having a scheduling conflict with Senator Armed Services. So I will not be able to stay.

I did want to come down and express myself on a couple of things. The significance of a reliable freight transportation system is always imperative, although it is more so now in times of war. As the ranking member of the Transportation and Infrastructure Subcommittee, I now have the opportunity to work more closely on making sure that transportation needs are met.

I believe there is still much that needs to be done in accomplishing our goals. I am pleased to be meeting today in conjunction with the Commerce Subcommittee and discussing the matters at hand. We face many challenges with our current transportation system concerning the consequences on our economy and our environment. While I understand the focus on improving our important border infrastructures to handle increasing traffic volumes in the future, my concern is committing to the enhanced safety and security of commercial vehicle operations at our borders.

Mr. Chairman, when you and Senator Reid talked about the ports, a lot of people are not aware that Oklahoma is a port. We are the home of America's most inland port. So we have extensive operations there.

I am certain it is possible to have a transportation system that is safe and secure, as well as efficient and productive. The past two reauthorization acts developed and promoted by this committee have been instrumental in stimulating surface transportation policy. As the committee considers reauthorization proposals, it is necessary to review whether changes need to be made. I would be interested to hear our witnesses. I believe it is necessary to define what program changes might need to be implemented in reauthorization to aid the improvement of intermodal connections surrounding ports, railheads, and other intermodal transfer facilities.

Mr. Chairman, I ask unanimous consent to insert testimony for Mr. Jim Fisk of MagTube Incorporated and Charlotte Thorton on innovative approaches for freight transportation issues, if I might.

Senator BREAUX. Without objection, it will be made a part of the record.

Senator INHOFE. Thank you, Mr. Chairman.

[The prepared statement of Senator Inhofe follows:]

STATEMENT OF HON. JAMES M. INHOFE, U.S. SENATOR FROM THE STATE OF  
OKLAHOMA

Thank you Mr. Chairman. Today's hearing on freight and intermodal transportation is exceptionally important to me. A reliable freight transportation system is always imperative, although it is particularly important these days during times of war.

As the ranking member of the Transportation and Infrastructure Subcommittee, I now have the opportunity to work more closely on making sure that transportation

needs are met. I believe there is still much that needs to be done in accomplishing our goals.

We face many challenges with our current transportation system that causes concerning consequences on our economy and environment.

While I understand the focus on improving our port and border infrastructures to handle increasing traffic volumes in the future, my concern is committing to the enhanced safety and security of commercial vehicle operations at our borders. I am certain it is possible to have a transportation system that is safe and secure, efficient and productive.

A better understanding of freight demands and similar issues helps us to analyze the increasing demand for freight transportation, assessments of the implications of freight demands for the entire surface transportation system and improvements in freight efficiency and security.

The past two reauthorization acts developed and promoted by this committee have been instrumental in stimulating surface transportation policy. As the committee considers reauthorization proposals, it is essential to review whether changes need to be made.

I will be interested to hear if our witnesses believe it is necessary to define what program changes might need to be implemented in reauthorization to aid the improvement of intermodal connections surrounding ports, railheads and other intermodal transfer facilities near our ports and borders.

Mr. Chairman, I ask for unanimous consent to insert testimony from Jim Fiske, from Magtube, Inc. and Charlotte Thornton on innovative approaches for freight transportation issues.

Mr. Chairman, I look forward to today's hearing and want to welcome all of our witnesses.

Senator BREAU. Thank you. We have that waterway all the way up to Oklahoma from Louisiana.

Senator INHOFE. We do, we do.

Senator BREAU. Thank you very much, colleagues.

I would like to welcome and am pleased to have Mr. Jeffrey Shane, who is Deputy Secretary for Policy at the Department of Transportation, back before the committee; also, Ms. JayEtta Hecker, who is with the General Accounting Office and has just done an extensive report on some of these issues, particularly in the marine transportation area, to present testimony.

Mr. Shane, Mr. Secretary, we have your testimony. We note it is an extensive document. If you could help us summarize it, we will proceed to questions. Ms. Hecker, the same for you.

**STATEMENT OF JEFFREY N. SHANE, ASSOCIATE DEPUTY SECRETARY AND DIRECTOR, OFFICE OF INTERMODALISM, UNITED STATES DEPARTMENT OF TRANSPORTATION**

Mr. SHANE. Chairman Breau, Chairman Reid, Chairman Jeffords, and Ranking Member Inhofe: Thank you very much for allowing me to represent Secretary Mineta today and testify on freight transportation intermodalism. These are issues that affect our economy, as we have just heard, in profound ways and both committees are to be commended for the leadership you have shown in this area.

Mr. Chairman, you referred to my longer statement. I assume it will be placed in the record. I would appreciate that.

Senator BREAU. Without objection, it will be.

Mr. SHANE. Thank you very much, and I will try to summarize within the time allotted.

With the possible exception of our obligation to ensure for our citizens a safe and secure transportation system, DOT has no higher priority than facilitating the seamless transportation of goods throughout our country and in international trade flows. Conges-

tion, bottlenecks, choke points, and all the consequences of insufficient capacity and inefficient intermodal connections impede that growth, raise costs to consumers, and impair our economic well being in ways that are simply too often overlooked.

Ensuring smooth global supply chains has become of even greater importance as companies increasingly shift to just-in-time manufacturing techniques, and ability to move freight and cargo quickly across the different modes of our transportation system serves as the linchpin of that manufacturing revolution.

The growth of international trade, particularly as the world moves toward a far more liberal framework for trade, represents another key challenge to our transportation system. While we have included a wide range of trade and transportation statistics in the longer statement that I have submitted for the record, I would like to draw your attention again to just one, the one cited by both Chairman Reid and Chairman Jeffords: that the volume of shipments into and out of the United States is expected to double between now and 2020.

It is essential that our ports and our airports and border entry points have the capacity to accommodate these increases, especially with the more aggressive security procedures that will have been put in place in response to September 11.

ISTEA and TEA-21 have created a solid framework for addressing the transportation and logistics needs of our country. As we move forward with the reauthorization of TEA-21, however, one thing is clear. The demand on our Nation's transportation system is growing faster than supply. Statistics show that population growth combined with substantial increases in vehicle miles traveled and freight tonnage moved have resulted in rising levels of congestion on our Nation's highways, despite increased Federal investments under ISTEA and especially under TEA-21. Projected future growth in all of these areas will only worsen congestion without a strong commitment to make our infrastructure far more robust and far more efficient than it is today.

Imagine, if you will, what travel on our highway system would be like today if our freight rail system were suddenly shut down. By the year 2010, you will not have to imagine it, because expected increases in truck traffic over current levels will be equal to the entire volume of freight that is carried on our Nation's rail system today. That is why Secretary Mineta believes that the administration and Congress have to work together to make increasing the efficiency of freight transportation a central feature of our surface transportation reauthorization legislation next year. Coordination between the modes and enhanced private involvement in the system are two themes that need to be emphasized in that effort because, although much has been accomplished over the last decade based on improvements put in place by ISTEA and TEA-21, the promise of intermodalism, more efficient movement of passengers and freight throughout all parts of our transportation system, and the potential for private sector participation in infrastructure expansion have yet to be fully realized.

In conclusion, it is clear that the commercial movement of freight was successfully woven into a number of TEA-21's programs, especially in the areas of funding flexibility, border and corridor plan-

ning, and the application of new technologies. We will need to think carefully about all of these issues as we build on TEA-21 by enhancing existing programs and, where appropriate, developing new ideas to ensure that our freight transportation system can meet future challenges.

As you know, earlier this year Secretary Mineta outlined a series of principles that will guide us through the reauthorization process. Using those principles as our base, we have been carefully examining proposals put forward by stakeholders as we develop our reauthorization proposal. For example, we will work with our partners in the States and in metropolitan planning organizations to achieve wider application of innovative financing programs.

We will consider changes to the Borders and Corridors program that will encourage broader transportation planning and integrate infrastructure investments with national and international business developments. We will continue to apply innovative technologies through the ITS program and in collecting data on freight movements and trade flows, and we will work closely with the private sector to formulate innovative transportation solutions that develop new ways to utilize public-private partnerships that leverage scarce Federal funds.

I am confident that, working together, the administration, Congress, and our stakeholders can expand our transportation infrastructure to ensure increased mobility, security, and prosperity for years to come.

Thank you very much again for the opportunity to appear here today. I look forward to answering any questions you may have.

Senator BREAUX. Thank you, Mr. Secretary.

Next, from the General Accounting Office, Ms. Hecker.

**STATEMENT OF JAYETTA HECKER, DIRECTOR, PHYSICAL INFRASTRUCTURE GROUP, UNITED STATES GENERAL ACCOUNTING OFFICE**

Ms. HECKER. Thank you, Mr. Chairman, Senator Reid, and Senator Jeffords. We are really honored to be here today. We, as you noted, are releasing the report on marine transportation financing and a framework for infrastructure investments today. But because of the focus on the freight issue, I will broaden my remarks to focus more on the broader context of freight issues.

I will cover four areas: first, the background, which will include this review of the growth that people have talked about; the new data that we collected for you on expenditure and direct receipts from users of the different modes; some data on Customs fees that you particularly wanted us to gather; and finally, the framework for review of critical decision points in evaluating investments in transportation.

The scope of our work, in addition to this work on maritime, is focused on a long body of work on capital budgeting, needs estimates, and, Federal highway R&D. We have work, not yet released, in response to requests from the Environment and Public Works Committee on mobility challenges, innovative finance, State capacity and project delivery. In addition, there is a wide range of expert studies that date back to 1994, a major commission on inter-

modal freight challenges, the TRB report, the intermodal freight connectors report, and many other technical reports.

The background issue that I would just like to cover is really putting the issue on the table that you have all stated, and that is, the enormous increase in projected freight tonnage. According to the Federal Highway Administration's updated figures, freight tonnage by all modes will increase by 41 percent in the next 10 years and 76 percent by 2020.

[Chart.]

This shows the different growth rates for the different modes. As can be seen in the chart, it is estimated that there will be a 43 percent increase in the 20-year period for freight transported by water, a 55 percent increase by rail and an 84 percent increase by truck.

Now, this really obscures the new challenges, because the key of intermodal transportation is really figuring out ways that the intersection and connections between these modes are addressed as well.

[Chart.]

The second point is the history of the funding approaches and receipts from the different modes. This chart depicts the average amounts collected and expended by mode for fiscal years 1999-2001. As can be seen, the maritime users, or the expenditures in the maritime sector, are about \$4 billion a year, with user assessments covering about \$1 billion. The aviation expenditures are about \$10 billion a year, with \$11 billion of user assessments and the highway area has about \$25 billion of expenditures, with the average for the same period being \$34 billion in user assessments.

The key difference here is that the marine system largely relies on general revenues, whereas the aviation and highway systems have historically relied almost exclusively on collections from users.

[Chart.]

I turn now quickly to the third area that you asked us to address and that is the amount of duties that are collected on imported goods transported by the different modes. This basically is in pie chart form and shows that a little over 75 percent of the import fees are collected on goods that come in through the maritime sector. As you see, almost \$4 billion comes in through aviation Customs fees and less than \$1 billion comes over the land borders of Canada and Mexico.

Now, what is important about the Customs duties is that clearly these are duties or taxes on the value of selected imported goods. This, of course, is a traditional source of revenue for the general fund. It is paid by importers of the taxed goods and varies based on where our trade agreements are and the type of commodity.

Therefore, it is not really a good proxy as a tax on users of the marine system. Although we recognize there is a proposal and discussions to designate Customs duties for the marine transportation system, this is clearly a policy call by the Congress. However, some funds, actually about 30 percent of Customs fees, are already designated for specific uses by the Government, and that includes such areas as agriculture and food programs, migratory land conservation, aquatic resources, reforestation. So some of those duties are already earmarked.

The other thing about the potential for designating Customs duties is that they really are not a new source of capital for the Federal Government. It is money that is already coming in, already accounted for, already spent, and therefore, the notion or the proposal that somehow you can draw on that would amount to a draw on the general fund of the U.S. Treasury.

The fourth area—and I am sorry to see the yellow light go on because this is the most interesting contribution that we are trying to make—is a framework for developing national freight policy for consideration of transportation investment decisions. As you see, we basically outline four key steps: defining national goals, defining the roles of the different levels of Government, developing approaches and tools that promote cost-sharing and efficiency, and finally, evaluating performance.

The key thing about the goals issue is that it needs to be intermodal and it has not been. This other whole issue of the so-called “orphan” status of the intermodal freight connectors. We still have a very stove-piped system and we need a conception of national goals for transportation that are integrated, intermodal, and freight-oriented.

Another element about the goals involves developing Government commitment to performance and results. Therefore, another key indicator of the goals is having performance-oriented measures for system performance and efficiency.

Defining roles, as I said earlier, is about the relative roles of the different levels of Government. The role of MPOs is a key thing here. They have not really paid attention or placed priority on freight. It is rational on their part to do so because while they do not benefit, they bear most of the costs. So there are some structural issues about the relative roles of Government.

The third area, on determining appropriate tools, really is driven by the roles issues. As you define the relative roles, you implement and effectuate those by using the appropriate tools that leverage Federal funding and promote accountability and efficiency. A key thing that I think several of you already alluded to is that in appropriate tools, we also have non-investment and non-capital tools to improve the efficient use of the existing system. That would involve tools such as demand management and congestion pricing; technology improvements which include the ITS area that several of you mentioned; enhanced maintenance and rehabilitation, and improved management and operations.

Quickly, the final area is basically evaluation. We need to understand how current policies work and we need to track the performance of proposed policies. The more it is framed as performance of the efficiency of the system, the more likely we will be able to determine whether we are really getting the improved efficiency in the performance of the transportation system instead of focusing on capital or completed projects. Evaluations allow us to determine the outcome we want to achieve.

That concludes—I am sorry about the red light—my remarks. The key is that the freight intermodal focus is clearly a cornerstone of the next generation of transportation legislation.

Senator BREAU. Thank you, Ms. Hecker and Mr. Secretary.

I take it, Ms. Hecker, to start with you—and I want Mr. Shane to comment on it—the fact that you are proposing what you have labeled a framework for developing an effective Federal investment strategy indicates that in GAO's opinion we do not have that now?

Ms. HECKER. We continue to have policies and legislation specific to different modes. Certainly the maritime legislation has never been integrated in a systematic way with highway authorization. Furthermore, the whole issue of freight has not been systematically examined. For example, our railroad policies and the effect of some of those policies on the freight infrastructure and the tradeoffs between different modes has not been systematically explored.

So yes, I think there is real value in moving toward a more systematic view of transportation requirements.

Senator BREAUX. Mr. Secretary, we have an office over in DOT that is an Intermodal Office. Is that not what they should be doing?

Mr. SHANE. That is right, and as a matter of fact, Mr. Chairman, I head that office. So that I like to think that we are doing some of that.

I do not disagree, however, with Ms. Hecker that there is certainly more room for further integration. We all know that. To some extent there is an element of stovepiping in the legislation that we have and that we continue to work on. But it would be unfair to characterize ISTEA, for example, the Intermodal Surface Transportation Efficiency Act, and the Transportation Efficiency Act for the Twenty First Century, TEA-21, as completely oblivious to the importance of further integration and intermodal planning.

I think there has been an awful lot of that and there have been some very powerful results as a result. Programs like the CMAQ program, the congestion mitigation program, TIFIA, an assortment of other elements of TEA-21, have indeed funded more integrated approaches to transportation and encouraged intermodal planning at the State and local and regional level.

So I am interested in what GAO has been doing and we would certainly look forward to consulting more and finding out, particularly as we move through the reauthorization process with Congress, where there might be further opportunities for improvement. But I do not think it is fair to characterize the system as totally stove-piped even today.

Senator BREAUX. Are you all working on the reauthorization from a conceptual standpoint as far as recommendations to the Congress?

Mr. SHANE. We are, Mr. Chairman, and I would go further and to say we are beyond the conceptual standpoint. We have been organized—we have got 200 people at the Department of Transportation organized into functional groups, cross-modal, cross-cutting, working with stakeholders in all elements of the transportation sector, working with each other, and thinking great thoughts, if I might say, about the future of these programs, such that by early next year, once we have gone through an exercise with OMB—as you know, that is always required as the administration puts a proposal together for the Congress—we hope to transmit a bill which will be, I think, hopefully, the center of gravity for Congress's deliberations over the reauthorization of TEA-21.

Senator BREAUX. Are we likely to see from those recommendations any type of thinking outside of the box, so to speak? Or are we talking about pretty much the same type of planning and recommendations that we have had in the past?

Mr. SHANE. I hope you are going to see some out-of-the-box thinking, Mr. Chairman. I have been impressed probably more than any other aspect of TEA-21 with the effectiveness of those parts of the program which have been able to leverage Federal money, that is to say to encourage private sector participation, to encourage State governments and other levels of Government to really step up to the plate in a more important way.

In an era of scarce resources—I mean, the era of cheap money is all over and we all know that—it is critical that we find even more effective ways of doing that. Programs like TIFIA, the intermodal connectors program, a variety of others, have produced I think disproportionate gains for relatively small expenditures, and we need to pursue as many opportunities of that sort as we can going forward or we are simply not going to have the resources solely at the Federal level to really meet the demands that we all have acknowledged here this afternoon. Senator Breaux: My final question is in what timeframe are we likely to have a completed package of recommendations from a conceptual standpoint?

Mr. SHANE. Our intention, of course subject to OMB's process, but I cannot imagine that that is going to be an impediment because we have been working with OMB already, is to get the bill, the administration bill, to the Congress very shortly after it returns in January or February of next year.

Senator BREAUX. Senator Reid.

Senator REID. Would both of you give me your thoughts on what we can do when we reauthorize TEA-21 to get the most efficient use out of the transportation infrastructure? Not theory; I mean actual things that we can do.

Ms. HECKER. I think the four areas that I mentioned in terms of focusing on operations and not just construction—

Senator REID. Give me specific things, because all this theory is good, but we have to do something specific.

Ms. HECKER. ITS and the lack of integration of ITS is a specific example. We have not really taken full advantage of the technology to streamline the flow of traffic to have a single standard for ITS. There is a lot more research that is promising about the role of technology.

The focus on operations is another area. It goes precisely to your point.

Senator REID. Tell me what you mean by that? "Focus on operations," what does that mean?

Ms. HECKER. The efficient performance and utilization of the existing system, that it is underutilized—

Senator REID. How do we legislate that?

Ms. HECKER. Well, there has been a comprehensive study that I would rather defer to, that has talked about their permeating all aspects of the Federal relationship—

Senator REID. Ms. Hecker, the only reason I pin you down a little bit is it is easy to get all these theories, that we should evaluate performance, establish goals, develop approaches, but when it

comes down to it, this subcommittee that I am responsible for, next year we have to do real specific things and we are not going to sit around and say, "We are going to evaluate these goals and evaluate performance."

We do not have the benefit of doing that and that is why we need experts like you and Mr. Shane to tell us specifically what we can do to make this new transportation bill meet the modern needs of this clogged transportation system we have.

Ms. HECKER. Well, I think the programs that we talked about, the Border and Corridor programs and the connector programs, it shows that they have not received adequate attention. So some shift of either the funding available or the restrictions will be missing to bring attention to these intermodal links.

Senator REID. You have the time to think about some of the things that we should do. This is your opportunity to give us some specific ideas of things that we could do in the next bill.

You have mentioned the intelligent transportation system, but be more specific. This does not mean we are going to follow everything that you are recommending, but at least it will give us some direction and insight as to what you think we could do to improve the intelligent transportation system.

An example of that is the new Amber Alert that works so well. People really look up on those road signs to get some idea what is going on. So we will leave the record open for a couple weeks for you to give us some specific ideas as to what we can do to improve TEA-21.

Senator REID. Mr. Shane, do you have any ideas?

Mr. SHANE. Yes, Senator, I have a few ideas. I think what I said before is my main—one of my main ideas, the notion that we need to leverage our Federal funds much more effectively. That is not a theory; that is something that we need to find ways of doing along the lines that were explored in TEA-21, I think quite successfully. By leverage, I mean—if you look at the national highway system intermodal connectors, that is a tiny fraction of the mileage on the national highway system. Yet, according to the report that we submitted to Congress that was requested in TEA-21, in the year 2000 the physical quality of those portions of the national highway system is far inferior to the national highway system generally, and the consequences of that inferior quality have a disproportionate negative impact on the efficiency of our whole freight transportation system.

So by attacking a tiny little fraction of the overall mileage on the national highway system through a program of that kind, we extract disproportionately huge benefits. It is that sort of opportunity that we need to pursue.

I mentioned the CMAQ program. You have got real intermodal success stories coming out of CMAQ, including rail success stories, because States have been able to use that money in very creative ways. The TIFIA program, which is a loan guarantee program, it actually requires the expenditure—

Senator REID. I am very familiar with that.

Mr. SHANE [continuing]. Of relatively little money. Again, it stimulates private sector interest in infrastructure expansion in ways

that we have not seen before. We need to find more ways to exploit tools like that.

Finally—and I do not mean by any means, last or least; it is not the least; it may be the most important—the Corridors and Borders program. There is so much interest in trying to facilitate the movement of freight through regional planning, including sometimes very complicated assemblages of Government entities and private sector entities, in order to really streamline the flow of freight in our system, that if the Borders and Corridors program is not big enough we need to figure out ways of either making it bigger or making it more creative such that it has the effect.

Senator REID. It has not worked very well. In theory it should have worked better than it has worked. I think we have to do some things to change it, because I think theoretically it is a great program.

Mr. SHANE. I agree, and there is a huge amount of pent-up interest in it; and the results of solving that problem in the reauthorized program I think will be huge and of enormous benefit to the economy.

Let me just add one last thing if I may, and that is that working with all of these programs one thing that continues to impress me—and I am not just talking about the surface transportation programs; I am talking about all of our programs—when the private sector comes in and wants to do business with us, whether it is to expand highway infrastructure or airport infrastructure or anything else, particularly if it is a program that actually makes some Federal money available, they find themselves in a Faustian bargain. Even when there is enormous interest in trying to build infrastructure in ways that will respond to the demands that we have in the system today, sometimes our procedures can be counterproductive.

One of the things I would like to see us do in the reauthorization process—and I am not here to make any announcements of bright new ideas; these are in process now—is to find ways of really streamlining our own clearance process for these projects. I am talking about all of the transportation projects that are funded or stimulated in any way by the Federal level.

If I may go on for a second, I can give you an example of the sort of thing I mean. We have a security program which has been a huge success. It actually began, Senator Jeffords, in Vermont, called Operation Safe Commerce—a public-private partnership emerging more or less spontaneously in order to test the security of container transportation in our system in international transportation.

Nobody at the Federal level suggested it, nobody approved it. It just happened. Well, we began to think that it was a good idea and we set up an executive steering committee. In fact, I co-chair the executive steering committee with the Deputy Commissioner of Customs, Don Browning. It is an example of how much interest there is in Washington in something that really works.

But now I am noticing something that worries me. Now that we have an executive steering committee, suddenly it has become a Government program. In a funny way, one of the worst things that happened was that they got an appropriation of \$28 million. Now

we have to be really responsible. Now we have to have procedures and accountability and we have to have, you know, the Inspector General looking at things, and all of a sudden a spontaneous effort to set up a test bed for container security could, unless we are very careful—and I want to assure you that we are trying to be very careful—if we are not very careful, we will stymie it. It'll grind to a halt just by virtue of the fact that the Federal Government has now applied all of its usual procedures and safeguards and everything else.

We need to get past that mentality in our transportation infrastructure programs or we will not meet the demand that our country will face in 2020 for sure.

Senator BREAUX. Senator Jeffords.

Senator JEFFORDS. Well, thank you very much. I appreciate your testimony. Thank you for your comprehensive testimony, I should say. I look forward to working with you in the TEA-21 reauthorization effort.

Later in this hearing Mr. Huerta on behalf of the Coalition for America's Gateways and Trade Corridors will ask for funding of \$2 billion annually for the Borders and Corridors program. You may have just referred to that. But Mr. Wickham of the American Trucking Associations will explain that the congestion at the 7 busiest border crossings costs the trucking industry about 2.6 million hours in delay time per year. Also, Mr. Larrabee of the Port Authority of New York and New Jersey will explain the estimate that trade in all types of cargo will not double, but triple, by the year 2020. Just this weekend, as I rode to New York I enjoyed a visit from Amtrak, letting us know how they feel about the importance of moving more and more of the cars off the highways and onto the railroads and to work in that direction.

So we have a tremendous need here to understand exactly how all of this is going to happen. I hope that you are working in a way that you can assist us in finding the means and the ways that we can accommodate all these changes that are needed. It is going to be huge in the sense of the cost to be able to orderly transfer our transportation systems between the freight and airways and all of that, to do the best job we can do.

So I just believe you will be doing that, but would like for you to tell me you will. Mr. Shane?

Mr. SHANE. I will, Senator.

[Laughter.]

Senator JEFFORDS. Thank you. I thought that might smooth things down a little bit.

Also, Ms. Hecker, I appreciate the detailed report the GAO submitted to our two committees.

You point out the need for significant improvements to our marine transportation system and note that the marine transportation system is generating billions of dollars of revenue. The report discusses aging infrastructure, changes in the shipping industry, and increased concerns about security.

It has been said that the footnotes often contain either the most boring or the most intriguing points in the study. Footnote 12 of your report notes that under current law 30 percent of the gross receipts from Customs duties, about \$15 billion per year, is re-

served for agricultural and food programs. Your report further notes that congestion challenges often occur where transportation modes connect, such as in ports.

You also note that if there is an enhanced Federal role, you recommend that the enhanced Federal participation supplement participation by others rather than just replacing it.

Your report has drawn a picture for us, but you have not connected the dots, which indeed may be our job. But can you give us a rough estimate of the cost of addressing the aging infrastructure and the new security concerns?

Ms. HECKER. I will try to answer directly, but the direct answer is, "No, I cannot give you the number." We have actually done some of this work, and I think there was testimony before you, Senator Reid, on reviewing all of the estimates of the needs of the different modes. They cannot be added up. They are done with inconsistent assessments. Most of these assessments do not assume capacity constraints. Therefore, if they are not capacity-constrained, these assessments cannot tell you whether it can grow that much and many of these studies do focus on opportunities for more efficient management and utilization of the system.

So there really is not a single estimate of the cost of addressing the aging infrastructure and security concerns. It is a comprehensive challenge of the whole performance of the system, that we need some initiatives to build, but we need efficient, leveraging financing methods that, as you said precisely, do not supplant or replace State, local, private funds, but supplement entice, and trigger additional expenditures by other parties. Then we need some of those efficiency-inducing operations.

So there really is not a single number. I apologize; I like to answer questions directly, but the answer is no, there is not one single number.

Senator JEFFORDS. Thank you.

Thank you, Mr. Chairman.

Senator BREAUX. I would like to ask one final question on this. They tell me that 75 percent of goods that enter and exit the United States, imports and exports, by volume, and about 60 percent I guess by value, come through the ports around the country. But to get to the ports, a lot of it is coming by truck, by rail, and what have you. So it really is all interrelated.

The report from Ms. Hecker points out that about 80 percent of the funding for the ports comes from the general treasury; and the opposite is true, almost 100 percent of the aviation, trucks, and highways is really coming from user fees.

The question is is the administration talking or looking at ways to increase the funding for the ports? The ports as I have traveled around the country are horribly congested. The trucks cannot get in, the railroads cannot. It is very difficult to coordinate because of the volume and the congestion at the ports. These are very expensive propositions.

Is the administration looking at any different recommendations on how we raise the money for ports, which are going to affect rail and trucks as well?

Mr. SHANE. Yes, Mr. Chairman, we are. Captain Bill Shubert of the Maritime Administration has certainly been speaking with me

and with Secretary Mineta at some length about the possibility of coming back to Congress with some proposals. Unfortunately, I cannot suggest any detailed programs right now, but I am hoping that in the not too distant future we will engage in a more specific discussion of that very important issue.

Senator BREAUX. I hope this discussion is going on, because if we have intermodalism each mode is being financed in a different fashion and yet they are all totally interrelated. To the extent that you can think outside of the box in trying to figure out ways that all of these fees can be coordinated for all methods of transportation, I think that that is going to be very, very helpful.

The Customs duties for the ports are not going to the ports; they are going to the general treasury and they finance agriculture and other good things out of the general treasury. But I think that most of the users like to see the users' fees targeted to the services that they are getting. Now, if that happened we may have a little less funding out of the general treasury for the ports, if it is offset by user fees. But I think we really need some in-depth thinking about how we are going to be financing the intermodalism forms of transportation. I hope you would address that specifically.

Senator REID. Mr. Chairman, would you yield?

Senator BREAUX. Absolutely.

Senator REID. People go to the gas pump and that goes to highways. We get all kinds of user fees to take care of our airports. But as you say—and that money goes directly to the airports and to the highways, whereas the problem you have with ports, as you indicated, that money can be used for anything else.

So I think we need some help on that.

Senator BREAUX. Then we have got the 4.3 cent gas tax and we know all the debate on that, with the railroads still, I take it, still, and barges as well, still paying it for deficit reduction; trucks, highways are not paying it. I mean, is there a consistency here or is there an inconsistency here?

Do you envision any recommendation on that?

Mr. SHANE. All of this is being examined. I know this is a waffle, Mr. Chairman, but it is all being examined. We have to get on top of these issues, and I am hoping that we will come back to you very shortly.

Senator BREAUX. That is important, because I think what I am hearing from GAO is, when we are talking about trying to coordinate all of this, that it has to be better coordinated if we are going to have an intermodal transportation system. How we help finance it, how we address the problems associated with each one of them has to be interconnected. I think there is room for improvement in that particular regard, and that is what we hope we see in the new recommendations.

Senator REID. Mr. Chairman, the other problem we have is that typically, even though you say you think you have things worked out with the Office of Management and Budget, you do not, believe me. The problem we have is they are focused on a 1-year plan. All they care about is what this year looks like. They do not care about what it looks like next year or the year after or the year after.

We have got to pass a 5-year bill here. So we have to do something that takes into consideration more than 1 year. That is why

the suggestion of Senator Breaux is so important. We need somebody to help us on this. Otherwise we are going to do some things that they really may not like. We could use some help. That is why I was so direct with Ms. Hecker. We need more than generalities and we need more than theories. We need some real specific things that we can do to make this 5-year program we are going to promote and pass next year one that is good for 5 years.

Mr. SHANE. If I could just comment very briefly, the reason I said what I said about OMB was that typically—

Senator REID. Do not worry. We will cover for you.

[Laughter.]

Senator BREAUX. We will not tell them you said it.

Mr. SHANE. I am not going to even go there.

[Laughter.]

Mr. SHANE. Typically we have a procedure whereby the bill is submitted to OMB, it is all wrapped up tidily, and that will be sometime later in the fall, and then we find out what they think about it and then we have a big argument with them. What we determined to do this time at DOT was to actually give them a fairly detailed preview of the direction of some of our thinking, because we did not want to be surprised. We did not want to do a lot of work and then have it just “offed” by OMB at some late stage.

They for their part were interested in knowing whether we really were doing something. So we had a reciprocal reason for wanting to meet. I have to say it was a very positive meeting. I think there was a lot of mutuality in terms of the way both OMB and DOT were looking at the importance of being creative about these programs going forward.

So it is not a political statement when I say I think we will do OK with OMB. Funding levels are obviously going to be a struggle. They always are. That is the game. But in terms of the actual shape of the programs, the content, and thinking out of the box and that sort of thing, OMB is prepared to be quite creative and they have been quite cooperative.

We would be prepared to even sit down with staff and provide the same kind of preview, so that you do not just receive a black box sometime early next year and open it and see for the first time what it is we have in mind. We really do want to work cooperatively and creatively as we move forward. That is the only process that is going to produce the kind of benefits we need.

So I offer that and we are prepared to come up.

Senator BREAUX. And do not be afraid of new ideas.

Gentlemen, thank you. Ms. Hecker, thank you very much. Both of you are excused.

We would like to welcome up the next panel of witnesses and thank them for being with us: Ms. Katie Dusenberry, who is chairman of the Arizona Department of Transportation Board; Ms. Michael Wickham—Mr. Michael Wickham, chairman and CEO of Roadway Express; Mr. Ed Hamberger, who is President of the Association of American Railroads; Mr. Rick Larrabee, the Director of Port Commerce for the Port Authority of New York and New Jersey; Mr. Michael Huerta, Coalition for America’s Gateways and Trade Corridors; and Mr. John D. Caruthers, who is chairman of

the I-69 Mid-Continent Highway Coalition and one of my constituents from Shreveport.

We thank all of you for being with us and are anxious to receive your testimony. Ms. Dusenberry, we have you listed first and we would love to hear from you first.

**STATEMENT OF KATIE DUSENBERRY, CHAIRMAN, ARIZONA  
DEPARTMENT OF TRANSPORTATION BOARD**

Ms. DUSENBERRY. Good afternoon, Senator Reid, Senator Breaux, and the other members of the committee. Thank you for the opportunity to present to you the views of the Arizona Department of Transportation Board and the freight industry regarding the Hoover Dam Bypass Bridge.

I am Katie Dusenberry, as you said, chairman of the Arizona Department of Transportation Board and chairman also of Arizona's CanaMex Task Force Subcommittee on Transportation. You probably are wondering why I am testifying before you in dealing with concerns of commercial vehicles. You see, I am in the trucking business. My husband, our son, and I own and operate a 78-year-old family owned trucking company with offices and warehouses in five Arizona cities. We employ over 250 hardworking people and have almost 300 pieces of commercial vehicles. So I have a keen understanding of hauling issues.

As has been mentioned before, the freight business is rapidly changing, from distribution of farm-to-market and domestic products to delivery of export and import goods to and from entry ports to consumers everywhere in our country and in the world. If you live in the city, everything you wear, everything you eat, even what you are sitting on, comes to you by truck.

One of those important port-to-port transportation corridors is the CanaMex corridor which runs from Mexico City, Mexico, through five U.S. States and into Edmonton, Alberta, Canada. This is an essential north-south trade route for commercial vehicles and their products. The biggest functional failure in this north-south corridor is the restriction of commercial vehicles across Hoover Dam.

This brings me to sharing with you the importance of completing full Federal funding for the Hoover Dam Bypass Bridge across the Colorado River. Prior to the terrorist attacks on September 11th, 2001, the only highway for freight and passenger vehicles to go between two large metropolitan areas, the cities of Phoenix, Arizona, and Las Vegas, Nevada, an important link in the CanaMex corridor, was to cross the Colorado River on a two-lane road, one in each direction, atop the Hoover Dam.

This dam, built almost 60 years ago, reached its road capacity more than 10 years ago. Envision the steep grades of the approach roads, with their sharp hairpin turns, turns so sharp that freight trucks could not pass on the turns and would come to a complete stop before entering the turn to allow any oncoming truck to navigate that turn. Speeds on those approach roads ranged from 5 to 18 miles per hour. If accidents occurred, delays of 2 to 5 hours were very common, and one accident a few years ago resulted in an 18-hour delay. Cars and trucks would be backed up for miles.

So planning for the bridge began long before September 11. But since then, commercial vehicles are restricted from crossing the dam. They are now diverted 23 miles at a cost of \$30 million per year in fuel costs alone, to another inadequate river crossing, down a winding mountain road where some trucks in the last few months have lost control, resulting in serious accidents.

The Hoover Dam crossing is the only highway in the country that has not been reopened to commercial traffic since 9–11. This is not surprising since the dam is a high security risk and any breach of the dam would flood more than 250,000 people and cutoff electric power to over 1.3 million in California, Nevada, and Arizona.

The project to build the dam and its approaches in Nevada and Arizona will cost \$234 million. Through commitments from the States of Nevada and Arizona, together with Federal moneys from the TEA–21 Borders and Corridors discretionary funds, we have pieced together \$126 million. The environmental impact statement is finalized. The record of decision for the project approval is in hand. With the money we have, design and construction of the approach roads in Nevada and Arizona are under way.

\$108 million is needed to complete this nationally needed project. We are asking you to give this project your highest priority in discretionary funding to ensure full funding of this bypass bridge and meet our anticipated completion date of 2007.

Thank you for allowing me to testify this afternoon. If you have any questions I would be pleased to answer them.

Senator BREAUX. Thank you very much.

Senator REID.

Senator REID. Mr. Chairman, thank you.

I am going to ask Ms. Dusenberry, have you ever been to Searchlight?

Ms. DUSENBERRY. No.

Senator REID. You have never been to Searchlight, Nevada?

Ms. DUSENBERRY. No.

Senator REID. Oh, boy.

Ms. DUSENBERRY. Where is Searchlight, Nevada? I travel a lot in Arizona, but I am sorry I have not been to Searchlight.

Senator REID. Have you been to Laughlin?

Ms. DUSENBERRY. Yes.

Senator REID. Just a few miles from Searchlight. You should get up there sometime.

Ms. DUSENBERRY. I need to get up there.

Senator REID. Yes.

Ms. DUSENBERRY. Do they have gambling—no.

[Laughter.]

Senator REID. You realize that is where all the traffic is going, is through Searchlight?

Ms. DUSENBERRY. Ah, the traffic now, the truck traffic now.

Senator REID. Mr. Chairman, I have a series of questions that I would like to submit to each of these witnesses. I would ask if they within a couple weeks would get back to us with responses to those questions. Is that OK with you?

Senator BREAUX. Without objection. I know that Senator Reid, because of his other duties, is going to have to be departing before

perhaps everyone finishes. But that would be totally acceptable. He has worked very hard on getting these witnesses here and I know he is going to look forward to your responses.

Senator REID. Thanks, Mr. Chairman.

Senator BREAUX. With that, our next, Mr. Wickham.

**STATEMENT OF MICHAEL W. WICKHAM, CHAIRMAN AND  
CHIEF EXECUTIVE OFFICER, ROADWAY EXPRESS, INC., ON  
BEHALF OF AMERICAN TRUCKING ASSOCIATIONS**

Mr. WICKHAM. Chairman Reid, Chairman Breaux, thank you for the opportunity to testify on behalf of the American Trucking Association and Roadway Corporation. Having spent my entire career at Roadway, I am most proud of the fact that we continue to improve our safety record year after year, mile after mile, and today our trucks and drivers are the safest on the road.

When moving freight, whether modally or intermodally, safety is the No. 1 priority. The trucking industry, ATA, and Roadway believe the one thing that we can and must do to improve the efficient movement of freight is to refocus our traffic laws to prevent excessive speeding. Excessive speed simply is a factor in nearly one-third of all fatal accidents and more than one-fifth of accidents involving trucks. We ask Congress to provide specific funding for speed enforcement for both truckers and motorists and section 402 and the MCSAPS program.

Trucks move 67 percent of the freight tonnage, 86 percent measured by value. This is freight that moves by trucks alone. It does not touch any other mode. While the intermodal movement of freight can and does play an important part and should be encouraged, the potential for rail intermodal transportation to slow the growth of truck traffic is limited by market forces beyond the control of Congress, the States, and to some extent the modes themselves. Today, just 1.2 percent of the freight moves in rail intermodal shipments. Despite anticipated growth in this sector, which will exceed trucking growth, by 2014 rail intermodal shipments will capture only 1.5 percent of the freight market, while trucking's market share as measured by tonnage will expand to 69 percent.

It is not constructive to assume that the business logistics trends of the past half century, which have made trucks the dominant mover of freight, will somehow reverse themselves and that our Nation's reliance on trucks will subside. Congress should focus its attention and resources where they are needed most and will pay the greatest dividends for our country, and that is on improving the efficiency of the highway system and the productivity of the trucking industry.

Efficient highways have allowed trucks to deliver freight on time. This has allowed manufacturers to substantially reduce their inventories through the use of just-in-time logistics, saving the U.S. economy hundreds of billions of dollars and creating thousands of jobs. Unfortunately, congested and unreliable highways threaten to reverse these gains. Congress should not allow the performance of critical highway corridors to continue to deteriorate, nor should highway money be further diverted under the false notion that investing in other modes will negate the need for highway investments.

The national highway system carries 75 percent of all truck traffic. Yet 40 percent of travel on urban national highway system routes takes place under such congested conditions that even a minor incident can cause severe traffic disruptions. We strongly urge Congress to make improving the national highway system its priority during highway reauthorization through significantly higher dedicated funding. Congress should also consider innovative ideas such as the construction of voluntary truck-only highways.

Improving the national highway system connections to intermodal terminals is of primary concern to all freight modes, including the trucking industry. They should receive dedicated funding. However, if we focus our attention on the 2,000 miles of connector highways and ignore the 160,000 miles of other national highway system highways that tie the intermodal facilities together, the efforts at the ports and points will be pointless.

ATA supports the expansion of the Borders and Corridors program. Along with representatives of other freight modes, we are a member of the Coalition for America's Gateways and Trade Corridors and we associate ourselves with the Coalition's remarks. We hope that Congress will ensure that in the future the program focuses on the most critical corridors and border crossings and that funding eligibility is not expanded.

While infrastructure improvements are essential, we recognize that highway capacity expansion cannot itself solve all of our problems. Nor is there sufficient funding available to address our many needs. Fortunately, there are ways to improve the freight system's efficiency beyond adding highway capacity. Congress can take a significant step by granting States the authority they need to reform their truck size and weight regulation. Using fewer trucks to move goods would reduce congestion significantly and would improve important safety, air quality, and economic benefits and lower pavement costs.

Congress and the States should achieve—could achieve for free what they would otherwise have to invest billions of dollars in expanding transportation capacity to accomplish. Missing or ignoring such opportunities would be shortsighted.

I realize that there are misgivings about the safety implications of reforming size and weight regulations. However, the best available evidence indicates that increasing trucks' capacity can actually produce safer highways. A DOT study found that triples and other longer combinations have an accident rate which is half that of other trucks.

This evidence reflects our company's own experience with triples. Since 1990, Roadway triples have been involved in exactly one fatality. That is one fatality over 155 million miles of travel. Triples are the safest trucks in our fleet by far and there is no practical or scientific basis for the Federal law that restricts States from determining where they should operate.

Neither ATA nor any of us in the industry is interested in seeing these trucks operate except where they can be run safely and where their operation does not produce additional infrastructure costs. ATA strongly recommends that Congress look to the recently completed TRB study on truck size and weight as a guide toward responsible implementation of size and weight reform. Next year

Congress has the opportunity to decide whether the American people will share the road with a safer, more productive truck or a lot more trucks. That choice is critical.

Thank you for the opportunity to share the industry's ideas.

Senator BREAUX. Thank you, Mr. Wickham.

From the railroads' perspective, Mr. Hamberger.

**STATEMENT OF EDWARD R. HAMBERGER, PRESIDENT AND  
CHIEF EXECUTIVE OFFICER, ASSOCIATION OF AMERICAN  
RAILROADS**

Mr. HAMBERGER. Thank you, Mr. Chairman, for the opportunity to be here today. I am particularly pleased to participate in this unprecedented joint committee hearing. I think it is appropriate that the committees recognize the importance to coordinate transportation public policy, much as carriers coordinate the transportation of America's goods outside of the Beltway.

Rail intermodal freight transportation has been the fastest growing segment of traffic for the U.S. freight rail industry over the past 2 decades, growing from 3.1 million trailers and containers in 1980 to nearly 9 million in 2001. It now accounts for approximately 20 percent of revenue for class 1 carriers and moves seamlessly throughout the North American rail network.

There are numerous reasons why rail intermodal transportation has become such a vital part of the U.S. and indeed North American freight transportation mix. One, it saves shippers and customers money by combining the door to door convenience of trucks with the long haul efficiency and cost effectiveness of rail.

Two, it saves fuel. In fact, on average a railroad can carry a single ton of freight 400 miles on one gallon of fuel, the equivalent of Baltimore to Boston.

Rail intermodal improves air quality. According to the EPA, for every ton-mile, a typical locomotive emits roughly three times less nitrogen oxide and particulate matter than a typical truck.

Four, rail intermodal reduces highway congestion. An intermodal train can take approximately 280 trucks from the highways or the equivalent of 1,100 automobiles.

We have heard a lot about the increased demand that is going to be out there for freight transportation, and clearly to meet that demand freight railroads will have to invest heavily in projects that increase efficiency and capacity. Railroads are incredibly capital-intensive, as you know, Mr. Chairman. In the year 2000, railroads put almost 18 percent of their revenues into capital expenditures, more than four times as much as the average for manufacturing.

In terms that Congress often deals with, if that had been translated into a per-gallon excise tax it would have equaled \$2.05 for every gallon of fuel burned by the industry reinvested back into that industry, our industry, the freight railroads.

Unlike my good friend Jeff Shane, let me not waffle, Mr. Chairman. We need that 4.3 cents back. It is \$170 million a year, \$2 billion since it was enacted, that would go back into the industry and back into the infrastructure.

We have joined the Freight Stakeholders Coalition and in my testimony we have outlined nine specific recommendations. Let me

just highlight four of those: one, dedicate funds for the NHS connectors to the intermodal freight facilities.

Two, develop ways to increase available funds without new user fees and taxes, through innovative financing options. We have identified two of those. One would be to institute tax incentives and tax-exempt financing for companies that invest in intermodal freight infrastructure. Examples of qualified assets would include track and roadbed located on intermodal corridors and intermodal transfer facilities and related equipment. The second option would allow the funding of rail infrastructure through tax-exempt indebtedness, which would include track, bridges, tunnels, terminal facilities, signals, and computer systems.

Let me just digress for 1 second because I cannot let Mr. Wickham's statement go unanswered when he said that it would not cost the Government anything to increase the size and weight of trucks. You realize, of course, that the Secretary, the Department of Transportation, has issued a report that indicates that at 80,000 pounds trucks pay approximately 60 percent of the damage that they do to roads and bridges. At 100,000 pounds that number falls below 50 percent. So indeed it is not at no cost at all and in fact it would merely exacerbate the already uneven playing field on which we find ourselves competing.

Three, significantly increase funds for an expanded corridor, border, and gateway program. We belong to Mr. Huerta's coalition and he will talk about that.

Four, increase funding and promote the use of the CMAQ program to reduce congestion and improve air quality.

In addition to the Freight Stakeholders Coalition agenda items, we have two additional others: one which we discussed at length with the Environment and Public Works Committee some time ago, to increase funding of the section 130 grade crossing program and clarify that the funds may be used for maintenance; and two, expand the rail rehabilitation and financing program and remove the restrictive program requirements. This committee has already endorsed that by a vote of 17 to 3.

As you mentioned in your opening comments, Mr. Chairman, our Nation's global supremacy is derived in large part from a transportation system that is second to none. Freight railroads are an indispensable part of that system. We are confident that we can continue to play a major role in meeting our Nation's future transportation needs. As you know, we move 40 percent of the Nation's goods by ton-mile right now.

But for those needs to be met efficiently, it is imperative that the intermodal push initiated by ISTEA and TEA-21 be developed further. We look forward to working with both these committees, others in Congress and others in the private sector to see that this can occur.

Thank you.

Senator BREAUX. Thank you, Mr. Hamberger.

Next we have Admiral Larrabee. I am particularly glad to have you with us today, Admiral. I know that a year ago tomorrow you were in the World Trade Center in obviously extreme difficult circumstances and situation. We are very delighted to have you with us today and look forward to hearing your testimony.

**STATEMENT OF RICK LARRABEE, DIRECTOR OF PORT COMMERCE, PORT AUTHORITY OF NEW YORK AND NEW JERSEY**

Mr. LARRABEE. Thank you, Mr. Chairman. Mr. Chairman, thank you for the invitation to be here today to testify on matters of intermodal transportation and port access. The work of your committees demonstrates the importance of considering how separate modes of transportation operate as part of a total system. My hope is that this hearing will heighten your interest in this subject, further your understanding of how the efficient movement of intermodal cargo is a matter of national interest, and convince you that improvements in the Federal policy and the level of assistance are warranted.

The Port Authority of New York and New Jersey is a bi-State public authority whose mission on behalf of the States is to identify and meet the critical transportation infrastructure needs of our region and provide access to the rest of the Nation and to the world. We operate the region's major aviation and marine facilities, as well as PATH, the commuter transit system, ferry and bus terminals, the interstate tunnels and bridges, and other facilities.

Our airports are responsible for roughly 20 percent of all U.S. international cargo, which, combined with domestic cargo, totaled nearly 2.9 million tons in 2000 and a value of \$150 billion.

The seaport serves 35 percent of the U.S. population and over 200 nations. The terminals in New York and New Jersey handled over 3 million containers last year and \$80 billion of general bulk and breakbulk cargo moved through the port in 2001. Another 1 million containers arrive in our region via rail from the West Coast.

Meanwhile, 250 million vehicles traveled annually over our bridges and through our tunnels and 2.5 million buses used our two bus terminals in New York City.

These statistics attest to the vitality of the trade and the economic activity of the Nation and our region. But it also hints at a major challenge we and other regions face: to make sure American gateways and freight corridors have the capacity to keep up with the growth in trade and a larger economy. To be clear, this is not a case of "build it and they will come." It is a matter of build it because the cargo is already coming. In fact, it is already here, resulting in even greater congestion.

Addressing these challenges will require investing in the infrastructure and adjusting policies to foster smart solutions for long terms. Partnerships are coming together locally and regionally to support projects and we need a strong Federal partner to accelerate these activities.

The Port Authority is coordinating with the States of New York and New Jersey and is in the process of developing specific recommendations for future legislation. Therefore, I will devote the remainder of my statement to some general observations for your consideration. These are in no particular order.

First, we and other ports greatly appreciate the attention that Congress and the administration are giving the maritime transportation system. It is our hope that the Federal Government will act affirmatively on identifying MTS infrastructure requirements.

Second, congestion can be found throughout the country, but it is especially severe in major gateways and metropolitan areas that are essential elements of the Nation's economic infrastructure and security. These areas, including the New York-New Jersey region, deserve special attention and face unique challenges to upgrade aging facilities, new, modern standards to accommodate larger and heavier container freight movements.

Third, expanding capacity should not mean that trucking alone will have to bear the brunt of the growth. Clearly, trucking will be an essential part of the transport strategy in the decades to come, carrying more and more freight, but in our region and others trucking and the highways on which they depend are not expected to have the capacity to handle the growing population and anticipated doubling and tripling of domestic and international cargo. Therefore, a greater share of our future transportation needs needs to be addressed by other modes, which leads me to my fourth point.

Your committee should consider to foster the development of other modes to accelerate increased demand. Rail certainly is one part of the answer. We are building three new intermodal rail yards at our maritime terminals in order to dramatically expand our capacity to move containers on rail. In addition, the Port Authority is working with the railroads and public agencies to identify specific rail regional projects that will improve line and terminal capacity.

Another answer can be found off our shores. We are undertaking a program to encourage intermodal cargo to move by water wherever possible. There is tremendous underutilization of capacity on the water that can bring new capacity to intermodal transportation along major corridors with less investment. It is not the solution, but if examined for associated capital, energy, and environmental costs, it can be part of a solution with Federal support.

Fifth, innovations approved by Congress in TEA-21, such as Congestion Mitigation Air Quality and national corridor planning and development programs, were very worthwhile policy steps to take. These innovative programs could be improved and expanded even further, especially to add to the capacity of major gateways.

Sixth, investments in freight movements could also benefit passenger services. These include TEA-21 projects intended to divert freight from heavily traveled automobile routes to dedicated freight corridors, whether on land or water. We have undertaken a comprehensive look at how intermodal freight improvements can be strategically planned and implemented to stitch together freight corridors. Already underway is a project to bring intermodal rail to Howland Hook Marine Terminal on Staten Island, a significant step to improving direct rail service to New York City.

Another project referred to is the Port Authority's Port Inland Distribution Network, PIDN, which would mitigate against growing congestion at marine terminals and highways by transshipping cargo via railroads and barges destined for Northeast locations. There is a strong interest in PIDN among Northeast States as alternatives to congested corridors like I-95.

Federal interest and support could help such initiatives demonstrate how water transportation can manage part of the freight

growth. Flexibility in Federal programs can be a way to support these initiatives.

Last, the use of intelligent technology has proved very worthwhile in our region for managing the flow of our busy highways and crossings.

I think your committee can benefit greatly by the thoughtful attention that has been given to these issues by my counterparts here today as well as in Government and the private sector, including a number of transportation and freight-related associations identified in my written testimony. Federal freight transportation policy is still in its adolescent stage, which means there is great opportunity for improvement to meet the challenges I have described.

Thank you again for allowing the Port Authority of New York and New Jersey to participate.

Senator BREAUX. Thank you very much, Admiral.

Mr. MICHAEL HUERTA.

**STATEMENT OF MICHAEL P. HUERTA, SENIOR VICE PRESIDENT AND MANAGING DIRECTOR, ACS STATE AND LOCAL SOLUTIONS, ON BEHALF OF THE COALITION FOR AMERICA'S GATEWAYS AND TRADE CORRIDORS**

Mr. HUERTA. Good afternoon, Chairman Breaux. It is my pleasure to be with you today to review our Nation's freight transportation system and needs. I would like to briefly summarize my formal statement and would welcome the opportunity to respond to any questions that you might have.

As you know, my name is Michael Huerta. I am a Senior Vice President and Managing Director of ACS State and Local Solutions. ACS is a premier provider of business process and information technology outsourcing solutions to world-class commercial and Government clients. We provide travelers with time and money-saving transportation technologies, including the operation on behalf of several agencies of EasyPass, the electronic toll collection system in the Northeast, which is actually fully interoperable from Maryland to Massachusetts, and the PrePass waste station preclearance system at more than 200 locations in 24 States coast to coast.

From 1993 to 1997, I served as Associate Deputy Secretary of Transportation and was the Director of the Office of Intermodalism.

I appear today on behalf of the 23 groups that comprise the Coalition of America's Gateways and Trade Corridors. The coalition's sole interest is to encourage adequate Federal investment in our Nation's intermodal freight infrastructure. Our members include motor carriers, railroads, ports, and freight corridors—in short, the men and women that move America's freight.

International trade is the key to America's economic future. The imports and exports that fuel our economy are doubling every 10 years and freight traffic within the U.S. borders will increase 100 percent by 2020. You have heard from all the witnesses about the tremendous growth in international trade. Any way you cut it, freight transportation is growing dramatically.

This growth in freight is good for all of us, in fact very good. Rapidly accelerating trade, combined with domestic growth, have cre-

ated a \$10 trillion U.S. commodity flow that produced millions of new job opportunities and a higher standard of living for Americans.

However, these benefits will only last as long as we can keep the freight moving. As part of the reauthorization process, we must rethink the portion of TEA-21 that was devoted to freight-related projects. The facts are the current port and trade corridor system is at the present time very pressed to accommodate the traffic we have today. That infrastructure is failing. Intermodal connectors currently have up to twice as many engineering deficiencies and pavement deterioration issues as the national highway system routes, and at the same time demands on intermodal connectors are expected to double by 2020.

Recognizing the growing freight needs, as part of TEA-21 Congress established the National Corridor Planning and Development Program and the Coordinated Border Infrastructure Program, commonly referred to as the Borders and Corridors programs. The legislation also provided \$140 million annually for these programs combined.

Unfortunately, the current Borders and Corridors programs have fallen short of the intended goals for two reasons. First, the programs were funded at levels far less than necessary to meet freight transportation and intermodal connector needs. As witness to that, since the beginning of the programs, requests from the States and metropolitan planning organizations have exceeded Federal funds available by a ratio of 15 to 1.

Second, the Borders and Corridors programs have been extensively earmarked in the annual appropriations process, frequently allocating funds to projects that may or may not have been those with the greatest national significance to the movement of freight.

With respect to the reauthorization of TEA-21, the coalition strongly recommends that the programs be continued, but bolstered to ensure that the original goals are met. The coalition respectfully commends several recommendations to the committee for your consideration.

First, to meet the high level of demand, funding for the Borders and Corridors programs must be increased and increased dramatically. The coalition believes that a minimum of \$2 billion is needed annually. The distribution of funds should be freight-specific. There should be a qualification threshold based on freight volumes and freight-related congestion to ensure that the limited dollars that are received reach the corridors, the borders, and the gateways of the greatest significance to trade.

Third, the designation of entities eligible should be expanded to include other public and quasi-public organizations that may not today be qualified to receive funds under the program.

Fourth, the Borders and Corridors program should be redefined to address the needs of all trade gateways, not only the land corridors and gateway-connected trade corridors. Many gateways that handle huge volumes of freight are not eligible for funding because they may not be at so-called borders. For example, we do not think of Illinois as being a border State, but one-third of the Nation's freight passes through Chicago and it is the largest intermodal hub in the Nation. Similarly, inland ports are also important gateways

that enable the efficient movement of goods throughout the entire country.

The designated high priority corridors available for funding under the Borders and Corridors programs need to be reexamined to ensure freight-intensive areas can apply for funding. Currently there are many important projects in need of funding that do not fall in one of the 43 priority corridors designated under TEA-21. In conclusion, I would like to say that America's freight is America's future. We must keep the infrastructure that underpins the movement of freight strong. That means additional Federal investment. Every dollar invested in the highway system yields \$5.70 in economic benefits to the Nation, but at the same time investment in the freight infrastructure is also critical for national defense. Ports and their connectors have always been the point of embarkation for defense material and this role is even more important in the wake of the terrorist attacks of a year ago.

Thank you for the opportunity to offer the coalition's views and I look forward to responding to your questions.

Senator BREAUX. Thank you very much, Mr. Huerta.

Next we will hear from my friend John Caruthers, who is chairman of the I-69 Highway Coalition. I kind of use the names "Caruthers" and "I-69" interchangeably now. It is like you are one and the same thing. So we are delighted to have you with us, John, and pleased to receive your testimony.

**STATEMENT OF JOHN D. CARUTHERS, JR., CHAIRMAN, I-69  
MID-CONTINENT HIGHWAY COALITION**

Mr. CARUTHERS. Thank you, Mr. Chairman, and thank you for the compliment, and thank you for the opportunity to discuss with you the importance of I-69 to the efficient movement of the Nation's freight.

I-69 when finished will span the Nation's heartland from the Canadian border to the Mexican border, traversing 9 States—Michigan, Illinois, Indiana, Kentucky, Tennessee, Mississippi, Arkansas, Louisiana, and Texas. Two sections of this system are already existing and open to traffic. The first one starts at Port Huron, Michigan, on the Canadian border and extends to Indianapolis. The second, Interstate 94, extends from Port Huron southwest to Detroit and west to Chicago.

The rest of I-69 is under development, from Indianapolis south to Memphis, Tennessee; Shreveport; Bossier City, Louisiana; and Houston, Texas; to the Lower Rio Grande Valley and Laredo at the Mexican border. Completion of I-69 will not require an entirely new facility. In some areas it will link existing interstates or upgrade and link other existing highways. Work is under way along the entire I-69 corridor.

While I-69 traverses 9 States, it is important to the Nation as a whole. Trade has shifted, particularly since NAFTA, from an east-west to a north-south trend. Canada and Mexico are now our two largest trading partners. Last year, 2001, 80 percent of the U.S. trade with Mexico and 67 percent of U.S. trade with Canada went by truck and I-69 corridor accounted for 63 percent of the Nation's truck-borne trade with both Canada and Mexico.

The Michigan border points of Detroit and Port Huron account for 48 percent of our truck-borne trade with Canada and the Texas border between Laredo and the Lower Rio Grande, Brownsville and McAllen, accounts for over 49 percent of our truck-borne trade with Mexico.

Looking at freight flows nationwide, not just with Canada and Mexico, approximately half of the total freight shipped in the United States in 1997, over 5 billion tons, passed through, originated, or terminated in the I-69 corridor. Freight is entering and leaving the I-69 corridor by truck, rail, air, and water. 17 of the Nation's top 25 seaports are in this corridor. 13 inland waterway ports and 15 of the Nation's top 25 air cargo airports are directly served by I-69.

Every major eastern and western rail carrier and both Canadian carriers have terminal operations on the I-69 corridor. There are truck-rail intermodal facilities in every major city along the corridor. I-69's port of Houston leads the Nation in foreign waterborne tonnage, and container traffic in the Gulf of Mexico ports served by I-69 is growing faster than the national average or faster than traffic at Atlantic or Pacific ports.

Trade entering I-69 from all modes of transportation is growing faster than in the rest of the Nation. Trade tonnage moving through I-69 points of entry from 1990 to 1999, including land, sea, and air, grew 18.3 percent, or more than twice as fast as the national average of 8.3 percent.

A Federal Highway Administration study suggests that the recent growth in freight traffic will continue through the year 2020. The vast majority of the new growth will be in the trucking industry, with the dominant movement on the Southwest to Northeast direction, a movement ideally suited for the I-69 corridor.

Yet there is no direct interstate-level highway from Indianapolis to the Mexican border. When the interstate system was initially designed, it was laid out generally east-west, reflecting the demographics, trade patterns, and defense needs at the time. When the interstate was completed in 1995, some of the newer north-south sections like I-69 were left unfinished. The premise of the Corridors and Borders program was the recognition that within the 160,000 mile National Highway System there were unfinished corridors essential to the Nation's trade and economic growth that needed to be completed and merited a separate program. The program, however was only funded at \$140 million a year nationwide and many of the projects that qualified or were earmarked for funding were of local, not national, interest.

Despite insufficient funding, the I-69 corridor made such significant progress that all of I-69 can go to construction during the period of the TEA-21 reauthorization. Much of it can be completed if dedicated funds are available to do so.

Having built the interstate system, we cannot rest on our laurels. We must invest our resources in those unfinished corridors that serve today's and tomorrow's 21st century trade flows, such as I-69. There are a number of mechanisms to accomplish this: limiting the Borders and Corridors program to major trade corridors and increasing its funding, dedicating program funds to complete unfin-

ished interstate links, or funding freight corridors. Any of these options would work, whether alone or in combination.

The point is we must recognize the need for and build the infrastructure to serve our Nation's freight flows. The traffic is there. The intermodal connections, rail, water, and air, are also there. The trade is surging at Houston, Detroit, and Laredo. Yet the interstate-level facility to transport these products safely, efficiently, and economically, I-69, remains unfinished.

Thank you very much.

Senator BREAUX. Perfect timing, John. Thank you very much, and thank all of the witnesses for being here. I think the discussion today has been good. It is going to give a lot of our professional staff some ideas and thoughts as we approach the reauthorization of TEA-21.

Obviously, I heard my questions to the Assistant Secretary to start thinking outside the box about what we need to be doing in these areas. I realize that in the private sector it is awfully difficult to bring about a great deal of cooperation because all of you—not all of you at the table, but railroads and truckers and ocean-bearing traffic and aviation—are all financially competitors. So it is hard for you to sit down and figure out what is good for the whole country when you have a responsibility to your independent modes of transportation, with railroads and the trucking industry and aviation industry and ocean-bearing traffic for the ports.

Mr. Huerta, in the coalition that you have, how difficult is it to get these various competitive modes to sit down and say, all right, what are we going to do to make it work? I mean, we have got congestion at the ports. We do not have enough railroads coming into the ports, we cannot get enough trucks in to pick up the containers. We are going to double the amount of containers coming in and going out in the foreseeable future.

How difficult is it to try and bring about cooperation? What needs to be done in that area? I am sure each one of these segments would like to do it all by themselves, and that is not going to happen. So how do we get them to work together to come up with some recommendations that can make sense for the Congress?

Mr. HUERTA. Mr. Chairman, one thing that we hear in our coalition meetings and that I think you heard today is that there is unanimity among all the modes of surface transportation that we are not doing enough about freight transportation. The discussions that we have had at the coalition focus on the fact that, while there are many ways that you can fund freight programs under the current categories through which the surface program is reauthorized, generally it is very hard to build the level of support for freight programs, because they may extend beyond the borders of a particular State or a particular metropolitan area.

These are national needs that are out there and when you are looking at something from the point of view of a particular region, it is sometimes hard to put that national lens on and look at the world that way. What you have heard from all of us is that international trade is extremely important, the growth of the economy domestically is extremely important, and moving the freight through the system is going to be essential in the coming years.

So we all agree on things like the Borders and Corridors program. It was a terrific concept. It has worked very well. There just is not enough money.

Likewise, there are many other ways that you can get freight projects identified. What we would like to see is how do you give them the priority. We are looking for more than just, yeah, you can spend money on a freight project. We would actually like to see some funds designated for freight projects. Senator Breaux: Address a question that is a concern to me about the congestion at the ports of our Nation. We have got 75 percent of the traffic by volume either going out or coming into ports internationally, and of course NAFTA has brought a lot more by trucks through Canada and through Mexico. But that traffic coming in and out of the ports which are so congested is going to be coming by rail, it is going to be coming by trucks, and if we do not have a system in these ports to make it work better, we are just going to have some ports that are so congested you are not going to get railroads coming in or trucks coming in or anything going in and out, in the timeframe that we need it, to be effective and to be efficient in the world community.

So I mean, tell me a little bit about what they did to the Alameda corridor? Is that helpful in looking at possible solutions, what they were doing out there?

Mr. HUERTA. It is helpful and it in fact has been used as a model for many other port access projects around the country. But let us step back and look at Alameda in terms of what it involved. The project had something like a 13-year history before it actually got into construction and it was an extremely complicated thing to try to move through the traditional funding process.

Ultimately, it was funded through a combination of user fees and local funds that were generated by the two port authorities in Los Angeles and Long Beach. Then the Federal portion, the largest piece of the Federal portion, was actually a Federal loan. But we did not have the authority to do that project when the loan idea was first proposed. It required special legislation that was enacted by Congress as part of the national highway system designation.

That success at Alameda, though, became the model for the TIFIA program, which works for large infrastructure projects such as this, where there is a user fee that can perhaps repay the costs of the loan and other funds that might be in place. However, a loan program is not going to work all the time. There are major corridor and access projects at rail terminals, at trucking terminals, and at ports around the country that might not be able to support a user fee, and that does not make them any less important in terms of elevating their profile for funding.

But they have the added complexity that a port access project, for example, in the State of Washington or in the State of New York, benefits people far into the interior of the country. Under the current planning and funding framework, it really falls to the State or the metropolitan area where that project is located to lead that project through the overall funding mechanism and to make it a priority in that region.

What we need is a way for these big mega-projects to assume the national profile that they really have, such that they are not the

responsibility of a single State or a single metropolitan area to carry them out and fund them.

Senator BREAUX. Maybe, Admiral, you can get in on this. But if we have needs at all of the ports—and I am talking about ports, but I am really talking about making it more efficient for railroads to serve ports, for the trucking industry to serve the ports, as well as the ships taking the goods and services in and the containers in and out of the ports to operate more efficiently.

So give me some discussion on the concept of port user fees. I know there is all this, all right, we are going to be noncompetitive if we have to have user fees. Well, user fees are paid by the ultimate consumers of the product. I have always had the concept that if they are the same across the board no one has an unfair advantage, if everybody is paying the same user fee that is dedicated for port development and infrastructure in those seaports around the country.

Is that concept a viable concept as a means of getting extra funds for fixing the ports and eliminating some of the congestion, or is it a bad idea? We have got to find out where we have the money and it is not going to be easy and somebody is going to be unhappy. Talking about taxes, they are unhappy. Talking about fuel taxes, they are unhappy. Talking about user fees, they are unhappy. Do we need more money? Yes.

Admiral

[Laughter.]

Senator BREAUX. The shippers are behind you.

Mr. LARRABEE. There are a lot of people behind me, Senator.

I do not know. To me it goes back to I think the testimony given for GAO today, and that is what are our real needs, what are the benefits that we can look at, and then I think the question of where do we get our funding. For us, as we spend—in my particular port over the next 3 years, we will spend nearly \$2 billion on improving channels, on improving terminals, and on improving rail infrastructure. We are going to spend about \$290 million just to create a greater capacity to handle cargo by rail. We think that in the next 10 years we can shift, at least in our port, what now constitutes about 14 percent of our cargo going out by rail to about 24 percent. We can shift barge traffic by from 2 percent to about 21 percent. I am not suggesting that we are going to change the fact that trucks are still going to be a predominant feature in our region, but the notion that there is great public benefit by looking at this system in a smarter way to me has value, and I think the issue of who pays for it can be a lot easier when you have figured out a better way to handle this.

The issue of who pays for this right now, of course, and things like the harbor maintenance tax, there is a great deal of controversy over that and I do not know that you can get anybody to agree on a rational approach. That is a decision the Federal Government is going to have to make.

Senator BREAUX. We cannot even decide whether it is a fee or a tax.

What about the concept of moving some of the traffic in the ports to staging areas away from the ports? I mean, most of our ports are right in the urbanized areas. The port of New Orleans is right

downtown. The port of Houston is right downtown. Your ports in New Jersey and New York are right in the middle of the greatest urban area probably in the world. Los Angeles, they all have it.

We all have the same problem, which is the port is right in the middle of urbanized areas. That was fine 100 years ago, but today how do you get the trains in, how do you get the trucks in, how do you handle all that volume going right down in the middle of an urbanized area in order to pick it up or to take it there? It does not work anymore.

So the concept by some is to move, I guess, the staging area further away from the actual port facility in an urbanized area, so you can get the stuff to an area and put it on the rails and put it on the trucks, instead of having to do it right in the middle of New Orleans or right in the middle of New York City, for instance. Does that make any sense?

Mr. LARRABEE. We have over the last couple of years looked at where all of our freight goes. I can tell you by zip code where every container that comes into the port ultimately is destined for. We know that about 90 percent of the cargo that goes outside the immediate New York-New Jersey region goes to one of 7 or 8 load centers, places like Albany, New York, and Buffalo, New York, places like Camden, New Jersey, and Providence, Rhode Island. Once we have identified the fact that a lot of that cargo goes to those places, the next thing we have looked at is how do you get it there in a more efficient way. Dedicated rail and dedicated barge service has become the way that we have begun to look at it. We think that we can move cargo more efficiently, at a cheaper price, in about the same amount of time, with a greater degree of reliability, by using dedicated rail and barge.

As I suggested before, we think we can improve the intermodal split from what now is an 85 to 87 percent truck-only operation to something that closely approaches 50 percent by truck and the rest by other modes. That is an approach that is gaining interest in all the Northeast States. It reduces traffic and congestion and air quality problems. It reduces maintenance on the roads, and in our mind is going to dramatically increase the productivity of the Port of New York and New Jersey.

Senator BREAU. Mr. Wickham, let me have your comments and thoughts about that? I am not suggesting this is a way of lessening traffic overall, but only in the immediate vicinity of the downtown urban ports around the country, to have a staging area, I would take it, where trucks would come in away from the actual port sites. Do these ideas have any merit or what are your thoughts?

Mr. WICKHAM. I think they do. That freight ends up on a truck sooner or later anyway. When it goes to Albany, the container is unstuffed and it becomes a trucking shipment at that time.

When I look at the national transportation system that we have, I think some of the fights that modes have over productivity are silly, because at the end of the day the whole system is more productive if every element of the system is as productive as it can be safely. So some of the debate that goes on I think does not serve any good purpose.

I think the way to look at this system is to maximize the productivity of every participant in the transportation system. That takes

away the need for more capacity in a lot of cases. Productivity is capacity. So that concept that you are talking about, consolidating farther away from the port to reduce the transportation out of the port, does not bother me at all.

Senator BREAUX. I am glad to hear you say that. It seems to me—I am just thinking offhand, which is what I normally do—is the fact that these ports around the country are trying to build all these staging areas where you come in with your trucks, and it is like—how you do it I will never understand. You have got this big yard of containers and the trucks are coming in, picking them up, taking them out, and trying to do all of this in the middle of a city.

It seems to me that if you had a dedicated rail line leaving that port facility and just running these container cars out further away from the port outside the city, and then having their trucks come in, because all these containers cannot go to every little town and destination in America by rail because they are not there. But you could have the dedicated rail line taking it outside of the port to a central staging area where the trucks could come in.

It seems to me that that certainly helps the congestion and makes it more efficient as far as the ports are concerned.

Mr. WICKHAM. Well, it is one of the reasons that you have as many containers in Chicago as you do. They originated in Alameda and came through on a rail leg to be distributed in the Midwest. That I think is maximizing the efficiency of the whole system.

Senator BREAUX. I was interested in your comments, Mr. Wickham, on safety and speed and also the recommendations on the States having greater authority again on the size and weights. All of these are arguments we have been through on will continue, and I appreciate your recommendations on those areas.

On speed, I thought in the old days all the trucks had Governors on them that would restrict the amount of speed. They do not do that anymore, or do they?

Mr. WICKHAM. Oh, yes, we do. Our fleet does. Most big fleets do. But my point was not just the truck speed; it is the automobile speed as well. The statistics indicated that in a large percentage of the accidents involving trucks the other vehicle was speeding. We want to see very strict enforcement of speed for cars and trucks, because I think that is the lowest-hanging fruit we have in the safety area right now.

Senator BREAUX. Well, those are things that we are going to be discussing, I know, in the reauthorization and they are good suggestions.

Mr. Hamberger, on the question about rails in the ports, I take it, am I correct, that the cost of the rails serving the ports is a port cost, not a railroad cost? And if you are building something to do business, should not the rails be picking up the costs of the equipment?

Mr. HAMBERGER. I am not precisely sure what you are asking. It is my understanding that the intermodal yards that are built, for example just 18 miles outside of L.A., are those built, maintained, and run by the railroad companies. I know that each of our members has spent hundreds of millions of dollars in the last 2 years building intermodal yards, in some cases, establishing partnerships with ports on facility improvements. Two of them right outside of

Chicago, both UP and BN-SF; down in Georgia, Norfolk Southern. I know they have done some work in Harrisburg to take intermodal shipments from New York-New Jersey as well.

Senator BREAUX. Admiral, is that your understanding about who bears the costs of the rails within the port system? Is that the port or is that the railroads?

Mr. LARRABEE. Senator, typically the formula that I am familiar with is that the port builds the intermodal rail facility inside the port. But as you build capacity in a port like New York and New Jersey, you have to look down that system to make sure that you are not creating a bottleneck someplace else.

So we have been working very closely with all of our railroads to make sure that as we build the capacity in the Port of New York and New Jersey that their systems are able to handle that increase in activity. So I think that there is a balance as you get further away from the port.

Senator BREAUX. So the current system, I take it, from a port perspective is working all right as far as the intermodal railroads? I mean, you would like the railroads to pick it all up, I am sure.

Mr. LARRABEE. My agency is unique in that we are required to be financially self-sufficient. So when I propose a project like "ExpressRail," which will grow our rail capacity in one terminal from about 25,000 lifts to a million lifts in the next 5 years, I have got to find a way to get a return on that investment. And I will charge a user fee or a tariff for those movements. We have used that formula very successfully.

Senator BREAUX. Do you have the authority to do that as the port?

Mr. LARRABEE. Yes. We have bonding authority that covers all of our lines, and that is where all of our capital money comes from, paid back to investors. But I have got a responsibility as a business line to make sure that that money is recovered.

Senator BREAUX. Ms. Dusenberry, thank you. I know that Senator Reid was very much wanting to hear what you had to say and was very aware of the project that you spoke to. With regard to that project, what does Congress need to do to help in getting it implemented? Is it a funding question or is it—what is it?

Ms. DUSENBERRY. It is a very definite funding question. The shortfall in the amount of funds we have been able to accumulate is \$108 million and we feel this needs to come in a stream from the Federal Government, either a stream that we can borrow against, or one lump sum would be very nice if you wanted to give it to us in one lump sum.

Senator BREAUX. But I take it your people say that under the existing highway formulas that you do not get adequate funding to do the type of project that you suggested?

Ms. DUSENBERRY. That is true. Both Nevada and Arizona have contributed \$20 million, each State, toward this project out of our regular flow of HRF funds that come into our State, and we feel from this point on that it is a Federal highway, it is on Federal land, it is going to be run by FHWA, and we feel our contribution cannot be any more.

Senator BREAUX. Well, I think you have made a good point. I think Senator Reid has been a big supporter of this project. My

only suggestion is that I think you ought to go visit Searchlight, Nevada.

Ms. DUSENBERRY. I will need to go to Searchlight.

Senator BREAU. If you could just drive through Searchlight, I think it would make—

Ms. DUSENBERRY. I think I can drive through it very quickly.

Senator BREAU. Oh, yes, it will not take a lot of time.

[Laughter.]

Ms. DUSENBERRY. We would like to invite you to the groundbreaking of our bypass bridge approaches.

Senator BREAU. Well, I would like to come.

Ms. DUSENBERRY. On October 21st, if you can. It is going to be on the top of Hoover Dam, so you can see what the congestion is.

Senator BREAU. I will go there right after—

Ms. DUSENBERRY. We will go to Searchlight.

Senator BREAU. I will go there right after I go to the I-69 groundbreaking.

[Laughter.]

Senator BREAU. Mr. Caruthers, thanks, John, for being with us. I've never seen—I have been in this business almost 30 years this month and I do not think I have ever seen a coalition nationally on a project like this that you have been able to put together. I think that is what really has made it successful, because it has really involved not just one State, but all the States along the route, and that is not easy because everybody has different ideas about how to do it. But it has been really important.

I guess one of the things that—I do not know why, but when we built the interstates back starting in the Fifties it really was an east-west bias, was it not? We were building highways east and west, but north-south sort of to a large part of the country really got left out.

How much more important is that north-south highway now since NAFTA was passed? It seems like you talked about we have had huge numbers of increase in amount of trade from Canada and from Mexico going north-south.

Mr. CARUTHERS. That is right. I believe I mentioned that Louisiana exports to Mexico have tripled. Texas has doubled. Truckborne freight I am talking about, travel, now. Even as far north as Indiana—and for example, Illinois' trade exports to Mexico by truck have tripled. Their trade with Canada has doubled. So this is going on in every State in the I-69 corridor.

Senator BREAU. Mr. Wickham, how important is that type of a corridor? It seems to me when you are going north-south through the central part of the country you are really on—you do not have a lot of interstates that you can travel over.

Mr. WICKHAM. That is correct, and it is becoming more important. You can obviously see the east-west bias. I think it was done for the defense reasons, that the highway system was put in place. But it is apparent that the north-south direction was lacking and it is becoming more and more important.

We have subsidiaries in Canada and in Mexico and we can connect ourselves operationally and information systems-wise, but the crossings become problematic and then transportation north and south after you make the crossing is a little more difficult than it

is east and west. But it is obviously becoming more and more important because of NAFTA and the growth.

Senator BREAUX. Thank you.

Mr. CARUTHERS, what is the most important priority that we should be doing from a congressional standpoint? I guess maybe the reauthorization for I-69. Where are we in terms of—what are the priorities now? Where are we now?

Mr. CARUTHERS. Well, it seems to me—and I am thinking like you, from off the cuff right now—the freight bottlenecks are at the borders and in the corridors, and the Borders and Corridors program seems to me to be the simple structure already in effect that needs only one thing, and that is funding.

Senator BREAUX. I-69, if we had more funding in it, would be able to benefit directly from that.

Mr. CARUTHERS. That is right. That is right. We can finish it almost within the TEA-21 reauthorization of 6 years if the funding is provided.

Senator BREAUX. Ms. Dusenberry, you had a comment?

Ms. DUSENBERRY. I mentioned in my testimony that the Hoover Dam Bypass Bridge was a part of the CanaMex corridor. Mexico is a—the western part of Mexico, west of the Sierra Nevada mountains, which are hard to traverse across in Mexico, is the largest producer of produce that comes into the United States. That border crossing—those border crossings in Arizona are extremely important.

We are working on a study now, we are calling it “The CyperPort,” in Nogales, Arizona, where we are looking at electronically serving all of the trucking so there is no paper exchanged. We are working on a uniform bill of lading so that the trucking across the border can run paperless and seamless across the border.

We hope that this technology that we are developing will transfer to other border crossings, both in Canada—Canada has been interested in what we are doing—in Canada and the other Mexican ports when we get this seamless system developed.

Senator BREAUX. Well, I think the committee has had some good ideas and some good suggestions. I think it is good that we were able to start talking about this before the fact. We have TEA-21 coming up, but I think with Senator Reid and Senator Jeffords and Senator Inhofe all wanted, and our staffs, to get some discussion now so we get these ideas being thought about as to what we need to be doing. I think that your points are all well taken.

Admiral, good luck to you and all the people at the port for the rest of the week. I know it is a particularly trying time, but we appreciate your service and being with us today.

With that, the committees will stand adjourned.

Whereupon, at 4:37 p.m., the hearing was adjourned.]

[Additional statements submitted for the record follow:]

STATEMENT OF HON. JEFFREY N. SHANE, ASSOCIATE DEPUTY SECRETARY AND DIRECTOR, OFFICE OF INTERMODALISM, U.S. DEPARTMENT OF TRANSPORTATION

Chairman BreauX, Chairman Reid, Ranking Members Smith and Inhofe, and members of the committee: Thank you for inviting me to testify today on the topic of “Freight and Intermodalism.” I would like to commend your committees for their continued leadership on these important issues and in supporting our efforts to ensure the seamless transportation of goods throughout our country. I believe that

ISTEA and TEA-21 have created a solid framework for addressing the transportation and logistics policy issues currently facing our Nation, and the lessons we have learned will serve as important guideposts during the upcoming reauthorization debate.

Demands on our nation's transportation system are growing faster than supply. While statistics show that since 1970 our population has grown 40 percent and vehicle miles traveled have doubled, the Federal Highway Administration's Highway Statistics Manual indicates that our highway physical infrastructure has increased by only 6 percent during that timeframe. In fact, according to the Texas Transportation Institute, the costs associated with congestion in the 68 urban areas they studied totaled \$67.5 billion for 2000, including 3.6 billion hours of extra travel time and 5.7 billion gallons of fuel burned by vehicles sitting in traffic. Even after the significant investments in surface transportation infrastructure under ISTEA and TEA-21, our transportation system is still experiencing rising levels of congestion that adversely impacts the free movement of freight on our nation's roadways.

In 1998 (the latest year for which data are available), the U.S. transportation system carried nearly 4 trillion ton-miles of freight valued at over \$9 trillion. Of this, shipments totaling \$7.8 trillion were primarily domestic movements, with an additional \$1 trillion representing international merchandise. By the year 2020, forecasts predict that the U.S. transportation system will handle cargo valued at over \$28 trillion, of which \$24 trillion will be domestic movements and over \$4 trillion will pass through our nation's gateways.

Truck shipments accounted for 71 percent of total tonnage and 83 percent of the value of U.S. shipments based on the 1998 data. Trucks also make the vast majority of local deliveries, although the industry also carries large volumes of freight between regional and national markets. Water and rail also carry significant shares of total U.S. tonnage, but much smaller shares when measured on a value basis. Air cargo shipments, on the other hand, moved less than 1 percent of total tonnage but carried 12 percent of the value of freight shipments during 1998.

To put these figures into a broader context and provide a better sense of the challenges we must face, the increase in the volume of freight being shipped on our nation's highways will, by the year 2010, equal the total volume of freight currently carried on our entire rail system in the average year.

One of Congress' principal goals in establishing a unified, Federal Department of Transportation (DOT) in 1967 was to facilitate coordinated transportation services across all modes while encouraging these services to be provided by private enterprise whenever possible. Another goal was to ensure that the connections between and among the transportation modes function smoothly while facilitating international trade and economic development. The Department provides a common framework that meets the various needs of our highway, marine, aviation and rail systems by ensuring greater coordination among programs affecting different modes of transportation while increasing the connectivity of these modes.

The landmark Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) increased funding flexibility and emphasized intermodal planning. The financial reforms of the Transportation Equity Act for the 21st Century (TEA-21) gave States and local governments vastly greater resources and the flexibility with which to implement the intermodal solutions fostered by ISTEA. Together, they have laid a sound framework for future Federal surface transportation programs and the intermodal strategies needed to leverage and improve system management and utilization.

Although much has been done over the past decade, the promise of intermodalism—the efficient movement of freight and passengers through all modes of our transportation system—has not yet been fully realized. As bottlenecks grow and system congestion worsens, the Department increasingly will be asked to facilitate projects that enhance freight transportation efficiency. Also, in the aftermath of 9/11 participants in the transportation system have been called upon to integrate security measures into their operations, and the Department has initiated several programs to encourage that integration. For the freight industry, this will require strong private sector involvement with the Federal Government empowered to foster cooperation across all modes through new public/private partnerships.

#### *Freight Movement and International Trade*

Understanding future freight activity, both foreign and domestic, is important for matching infrastructure supply to demand and for assessing investment and operational strategies. The U.S. economy depends upon a wide variety of products that move within State boundaries, through interstate commerce, and to and from various parts to the world. Using data from its Freight Analysis Framework (FAF), the

Department has developed information on current and projected freight flows, including a forecast of activity through the year 2020.

FAF projects annual domestic freight volumes will nearly double between 1998 and 2020, increasing from 13.4 billion tons to over 22.5 billion, which raises the question of which modes will carry these new shipments. The FAF forecast assumes that growth in freight activity will be captured largely by increases in air and truck shipments. Domestic air cargo tonnages are projected to double, although its share of total tonnage would remain fairly small. Movements by truck are expected to almost double over the 1998 to 2020 period, capturing a larger share of total traffic. Finally, while both rail and domestic water shipments are projected to increase, their volumes are not expected to grow as dramatically over the forecast period, mainly because of slower demand growth in many of the key commodities carried by these modes.

Since the 1970's, international trade has emerged as a major component of the U.S. economy, as imports of consumer goods, petroleum, and manufactured products have increased along with exports of raw materials, agricultural products, and manufactured goods. This trend toward increased international trade is expected to continue, as suggested by DRI/WEFA's projection that over 30 percent of the U.S. economy will be tied to international trade in goods and services by the year 2020, up from 23 percent in 1998.

This projected growth in trade has led to concerns over congestion at U.S. ports, airports, and borders entry points. International trade, expressed in tons, is forecasted to grow at an annual rate of 2.8 percent and more than double by 2020. While increases are expected for all regions of the world, the largest growth will likely come in our trade with Mexico, Canada, Asia and South America. Cargo trade with our NAFTA partners moves primarily by truck and/or rail, and most international shipments of water and air cargo are transferred to or from trucks, rail cars or barges after arriving in the United States or before heading to export markets. Given the importance of trade to our nation's economy, identifying ways to more efficiently move freight across our borders will be critical in the years ahead.

#### *NHS Intermodal Connectors*

The condition of the existing transportation system and its connections directly affects the efficient movement of cargo. When Congress created the National Highway System (NHS), it recognized the need to provide adequate highway access to intermodal freight terminals. Intermodal passenger terminals are generally well served by NHS connectors but infrastructure connecting freight terminals to primary NHS routes is often in need of improvement.

NHS connectors are typically short, averaging less than two miles in length, and are usually local, county or city streets that have lower design standards than mainline NHS routes. They typically serve heavy truck volumes moving between intermodal freight terminals and mainline NHS routes, primarily in major metropolitan areas. Despite the fact that connectors are less than 1 percent of total NHS mileage, they are the "front door" to the freight community for a broad array of intermodal transport services and options.

TEA-21 directed the Secretary of Transportation to conduct a review of the NHS connectors that serve intermodal freight terminals and submit a report to Congress. The objectives of the review were to: (1) evaluate the condition of NHS connector highway infrastructure to major intermodal freight terminals; (2) review improvements and investments made or programmed for these connectors; and (3) identify impediments and options to making improvements to the intermodal freight connectors.

The findings of our report to Congress, dated July 2000, are especially relevant as we consider reauthorization of TEA-21:

- Intermodal connectors that primarily serve freight terminals have significant mileage with pavement deficiencies and generally exhibit inferior physical and operational performance than other similar NHS facilities;
- An analysis of investment practices shows a general lack of awareness and coordination for freight improvements within the State departments of transportation and metropolitan planning organizations (MPO) planning and programming process; and
- Given the pressing needs for passenger-related projects and the fact that many of the benefits from an increased freight investment are received outside of the investing jurisdiction, there is little incentive for local investment in freight projects.

The ability to recognize and effectively address connector needs within the context of our overall intermodal freight system are important elements in preserving and promoting the substantial productivity gains we have witnessed as a result of better supply chain management.

### *Multi-State and Cross-Border Transportation Planning*

End-to-end movements of commercial freight must be viewed within the context of a transportation system that is not bounded by State or international borders. A regional perspective and decisionmaking capability is required to provide effective coordination for the infrastructure planning and investments that support these commercial activities. Recognizing that the health of their economies depends upon efficient movement of goods along regional transportation system segments that often lie beyond their immediate responsibility, several State and Provincial Departments of Transportation have joined together to promote regional transportation consortia. The following examples illustrate this coordinated and complementary approach to regional transportation planning and infrastructure development:

- **I-95 Corridor Coalition (I-95CC):** The geographic region represented by the I-95CC consists of 12 States (ME, VT, NH, MA, CT, RI, NY, NJ, PA, DE, MD, VA) and the District of Columbia. With a population of just over 67 million people, it is home to nearly a quarter of the nation's inhabitants and a quarter of the nation's jobs, but contains only 6 percent of the landmass of the Nation. The population density of the region makes efficient goods movements both essential and extremely challenging in this largely urbanized environment. DOT representatives from the 12 States and the District of Columbia have developed an intermodal strategic plan for the I-95CC that is addressing freight transportation needs within the context of the region's social, economic, and environmental goals.

- **Gulf/Rivers Intermodal Partnership (G/RIP):** In a cooperative effort of seven southeastern and Gulf State departments of transportation, regional planning entities and four public port authorities, G/RIP works to improve waterside/landside infrastructure investments through education programs for public planners. The partnership uses the region's ports as classrooms in addition to periodic forums with senior regional public and private sector policymakers to discuss topical infrastructure issues.

- **International Mobility and Trade Corridor (IMTC):** The IMTC is a coalition of over 60 U.S. and Canadian business and government entities whose mission is to identify and pursue improvements to cross-border mobility in the "Cascade Gateway", which includes four land border crossings between British Columbia and Washington State. Two-way trade at the Blaine, WA, border crossing alone was valued at more than \$35 million per day in 2000. Congestion and processing delays at the Blaine border crossing result in over \$40 million in additional operating costs annually—losses that exceed 1 day's revenue generated by this commercial traffic. IMTC-sponsored projects are funded through bi-national financial partnerships at Federal, regional, and local levels.

#### *TEA-21's Record*

congressional support for the commercial movement of freight was woven into many parts of TEA-21, helping to strengthen the nation's transportation system through: enhanced stability and flexibility of funding; the borders and corridors programs; and increased application of new information technologies.

#### *Stability and Flexibility of Funding*

TEA-21 revolutionized transportation funding through its budgetary firewalls and innovative financing provisions as well as by providing record amounts for surface transportation programs. The budgetary firewalls that were introduced created confidence among grantees regarding program funding. As a result, States and localities have relied upon these assurances and increased their funding levels to match or even exceed Federal commitments made in TEA-21. The Department sees its role as one of exercising leadership in convening public and private sector parties to undertake innovative financing of major transportation projects.

One of the most impressive intermodal success stories is the Alameda Corridor freight project. The Alameda Corridor is a multi-modal project that uses a mix of private funds and public programs, including a \$400 million loan from the Department of Transportation, to improve rail and highway access and to reduce traffic delays in the critically important area of the Ports of Los Angeles and Long Beach. The recently completed \$2.4 billion project, which opened for revenue service on April 15, 2002—on time and within budget—will have far-reaching economic benefits that extend well beyond Southern California.

The funding flexibility created under ISTEA and continued in TEA-21 allows States and communities to tailor their transportation choices to meet their unique needs. It enables State and local decisionmakers to consider all transportation options and their impacts on traffic congestion, air pollution, urban sprawl, economic development, and quality of life.

TEA-21's innovative credit program has further augmented both the highway and transit programs. The Transportation Infrastructure Finance and Innovation Act (TIFIA) has provided almost \$3.6 billion in Federal credit assistance to 11 projects of national significance, representing \$15 billion in infrastructure improvements. These loans, loan guarantees, and lines of credit for highway, transit, rail, and intermodal projects have encouraged private investment to strengthen transportation infrastructure.

Despite these successes, there are still areas where we can improve. For example, while freight transportation projects are often regional or multi-State in scope, funding is typically distributed through States and localities. Also, conventional financing programs have provided funding for a wide variety of projects focused on individual modes of transportation, but when dealing with major intermodal projects these programs have often proven insufficient. Finally, because TEA-21's programs are oriented toward the public sector, it can be difficult to truly incorporate the needs of private sector transportation carriers and shippers in the planning process.

#### *The Borders & Corridors Program*

TEA-21 established the National Corridor Planning and Development and Coordinated Border Infrastructure Program (also known as the "Borders and Corridors" program). Both programs are financed by one funding source, which is authorized at \$140 million annually from fiscal year 1999-2003. Due to the obligation limitation provisions of TEA-21, awards the first 3 years averaged about \$123 million, but based on the law's RABA provisions and congressional direction awards for the fourth year (FY 2002) will be nearly \$480 million.

congressional designation (or "earmarking") of projects in the Borders and Corridors program increased from 0 percent in fiscal year 1999 to about 50 percent in fiscal year 2000 and 65 percent in fiscal year 2001. Given this trend and the cost of preparing full applications, in May 2001 the FHWA solicited 'Intent to Apply' for fiscal year 2002 in place of full applications with a provision that full applications would only be requested if warranted based on that year's DOT Appropriations Act. When Congress designated 100 percent of the funding for fiscal year 2002, FHWA did not solicit full applications and instead requested abbreviated applications for projects designated by Congress. As a result, congressional earmarking has prevented the Department from taking a strategic approach and using the program to facilitate trade through targeted transportation investments that maximize system efficiency.

Awards under the Borders and Corridors program have been as follows:

FY 1999—\$123.1 million  
 FY 2000—\$121.8 million  
 FY 2001—\$123.6 million  
 FY 2002—\$478.0 million

For some projects construction is nearly complete or underway. One project that has essentially been completed is near the World Trade Bridge between Laredo, Texas and Nuevo Laredo, Mexico. Before this bridge was opened, traffic queues up to 4 miles long were common on an existing bridge and traffic was grid locked for several miles along I-35. Subsequent to its opening, trucks were diverted to the new bridge leaving the existing bridge to serve autos, buses and pedestrians. The gridlock has now disappeared and travel time has been reduced dramatically for trucks, autos and pedestrians while improving safety and creating jobs.

Some construction projects currently underway that are likely to be completed in the next 2 or 3 years include the FAST (Freight Action Strategies) corridor in Washington State and the Bridge of the Americas and the Paso del Norte Bridge between El Paso, Texas and Ciudad Juarez, Mexico. In the FAST project, replacing a number of highway/rail grade crossings with grade separations will improve safety, relieve congestion and improve operation of the water ports and the rail lines. In El Paso, a modest expenditure (about \$3 million for each bridge) will improve physical inspection capacity on each bridge by as much as 40 percent.

Other projects are at least three or more years from completion including such important bottleneck relief projects as: the Ambassador Bridge Gateway in Detroit, Michigan; the SR 905 connector to the border crossing south of San Diego, California; and the Hoover Dam Bypass between Arizona and Nevada. Finally, the future I-69 between Michigan and the Texas lower Rio Grande Valley, which is more of a new access and economic development project, is probably more than a decade from completion.

*Application of New Information Technologies*

Any seamless transportation system—present or future—relies heavily on information technology. The same information revolution that has swept through the private sector and increased our nation's productivity must also be applied to our transportation systems. "Smarter" systems have the potential to dramatically reduce the barriers and costs that currently limit the ability of passengers and freight carriers to operate across modes. They also will help us to ensure safer and more secure freight transportation networks.

TEA-21 authorized a total of \$603 million for Intelligent Transportation Systems (ITS) research for fiscal years 1998 through 2003, which has funded important research projects that support freight movements by focusing on system optimization and more effective use of existing infrastructure. These efforts also facilitate the integration of the operational aspects of all of our transportation systems, while system construction projects address their physical connectivity. Intermodal freight is a major emphasis of DOT's ITS efforts, and the Department is currently conducting several ITS operational tests designed to improve the efficiency and security of the inter-modal movement of freight.

For example, the Chicago O'Hare cargo project uses a "smart card" and biometric identifiers to identify the shipment, vehicle and driver during transportation from the shipper to and through the air cargo terminal. Another project, Cargo-Mate, has particular applicability to port and container security, in addition to enhancing the efficiency of freight movement. This system is designed to perform real-time processing of asset and cargo transactions, provide for the surveillance of cargo movement to and from ports, and provide an integrated incident and emergency response capability.

In a cooperative venture between Washington State and British Columbia, under the auspices of the International Mobility and Trade Corridor (IMTC), electronic cargo seals are being deployed to demonstrate the use of low cost disposable technology to track cargo movements and monitor the security of containerized freight. This test will examine the use of a Congestion Notification System to improve truck access to the Port of Tacoma. When these and related projects are completed and the technologies deployed, the IMTC will have the first fully operational bi-national electronic commercial vehicle operations (CVO) border crossing system in North America.

The Department also is participating in the International Trade Data System (ITDS), which will create a single Federal data base for all international trade and transportation transactions. Expected to become operational in FY2004 at the nation's busiest land borders, and at all land, sea and air ports of entry by 2006, ITDS will extend the benefits of customs modernization across the entire Federal Government. The ITDS and Customs' Automated Commercial Environment (ACE) are being jointly developed so that taxpayers and Federal agencies will have a single system for processing international trade and transportation information that will also serve as an important tool in facilitating the transport of cargo.

Continued Federal, State and local investment in the development of new transportation technology has the potential to yield enormous operational benefits and give transportation professionals much greater capacity to manage increasingly complex systems.

*Security Issues*

The events of 9/11 have made us all realize that transportation planning must also make the security of freight shipments a top priority, in addition to the system's safety and efficiency. As freight moves from one mode to another, from ship to rail to truck for example, we must ensure that these modes and the public are protected from terrorist attacks. The Transportation Security Administration (TSA) now oversees transportation security across all modes, with the most prominent of course being the new requirements for aviation. However, TSA is also concentrating on sea, rail and land shipments and the links between these modes when assessing possible security threats. Intermodal connectivity is critical for national security, and TSA is coordinating with the other modes in DOT, other Federal agencies, and industry to achieve the highest possible security levels for the transport of goods.

Operation Safe Commerce (OSC) is an innovative public-private partnership dedicated to enhancing security throughout international and domestic supply chains while facilitating the efficient movement of legitimate commerce. The overall objective is to provide valid recommendations and workable solutions to legislators, regulatory agencies, the International Maritime Organization and the World Customs Organization on how best to address the critical issue of international cargo security. I serve as co-chairman of the Executive Steering Committee that directs the

OSC initiative along with the Deputy Commissioner of the U.S. Customs Service, and have been very pleased with the substantial progress we have made so far.

A recently completed initial pilot test applied available technology to analyze the supply chain security of a shipment from Eastern Europe to New Hampshire by equipping a cargo container with onboard tracking, sensor and container door seals. This shipment was monitored as it was transported through numerous countries, and the jurisdictions of several Customs administrations, using various transportation modes. IIOOSC proposes to develop and test security practices to govern the packing, loading and movement of cargo throughout several international supply chains. This effort will seek to prototype various solution sets in order to test combinations of physical, technological and logistical security practices that will best secure domestic and international supply chains.

Operation Safe Commerce will attempt to do this by addressing three key components to secure supply chain management. First, it will demonstrate what is needed to ensure that a shipper exerts reasonable care and due diligence in properly packing, securing and manifesting the contents of a shipment of goods. Second, it will demonstrate various methods to ensure that the electronic documentation accompanying a cargo shipment is complete, accurate and secure from unauthorized access. Third, it will test supply chain security procedures and practices, and implement enhanced manifest data elements and container sealing procedures, to determine which applications of information and technology are most effective in securing international and domestic shipments.

Operation Safe Commerce will serve as a technology and business practice “laboratory” to vet innovative solution sets that support the objectives of other Federal initiatives such as the Department of Transportation Container Working Group, the U.S. Customs Container Security Initiative and Customs—Trade Partnership Against Terrorism, and the Department’s Intelligent Transportation System and the Borders and Corridors Programs.

These efforts will continue once TSA and the United States Coast Guard transfer their missions and functions to the proposed Department of Homeland Security. Secretary Mineta fully supports these efforts to improve our Nation’s homeland security, and if approved by Congress the Secretary has pledged to fully cooperate with the new Department to ensure that security over all modes of transportation is enhanced.

#### *Building on TEA-21*

As we consider the reauthorization of TEA-21, we continue to face many of the same challenges that confronted the authors of ISTEA and TEA-21. Applying an intermodal approach to these challenges enables us to extract the maximum amount of capacity from our existing infrastructure through creative programs and wise investments.

Accordingly, intermodalism plays a large role in the core principles and values that motivate the Department’s preparation for TEA-21’s reauthorization. We will seek to do the following:

- Preserve funding flexibility to allow the broadest application of funds to transportation solutions, as identified by States and local communities.
- Strengthen the efficiency and integration of the Nation’s system of goods movement by improving international gateways and points of intermodal connection.
- Focus more on the management and performance of the system as a whole rather than on “inputs” or functional components.
- Develop the data and analyses critical to sound transportation decisionmaking.
- Foster the development and deployment of technology, to support intermodal freight security, productivity, and safety.
- Expand and improve innovative financing programs, in order to encourage greater private sector investment in the transportation system, and examining other means to augment existing trust funds and revenue streams.

Supporting the efficiency of commercial freight transportation continues to be a cornerstone of the Department’s vision for America’s transportation system. ISTEA and TEA-21 legislation gave us many tools to bring this vision to reality, and our experience has given us new ideas for programs that will get us even closer to our goal of a seamless transportation network. Greater investments in transportation infrastructure and wider use of information technology will certainly be required to achieve this goal.

The Department looks forward to working with our partners in State DOTs, metropolitan planning organizations, and private industry to apply innovative funding strategies such as TIFIA and State Infrastructure Banks to develop large-scale projects that might otherwise be beyond the financial means of the individual stakeholders.

We will also consider possible changes to the Borders and Corridors Program that would encourage broader transportation planning on the basis of economic regions and export markets to ensure that our infrastructure investments are truly integrated with regional and national business developments.

Private industry has made it clear to the Department that reliable information on product shipments is of critical importance to them. If our transportation system is to provide adequate levels of service for the freight industry and their customers, we must continue to apply innovative technologies through the ITS Program and collect information on commodity movements to provide a firm foundation for transportation planning.

The Department will also work with the private sector to formulate innovative approaches to providing transportation solutions and develop the professional capacity to apply these solutions to the challenges that confront us. We will consider new ways to develop public-private partnerships that can leverage public infrastructure investments and ensure that the private sector is more engaged in our planning processes.

I am confident that working together, the Administration, Congress, States and localities, and the private sector can preserve, enhance, and establish surface transportation programs that will result in increased mobility, security and prosperity, as well as more transportation choices for all Americans.

Mr. Chairman and members of the committee, thank you again for the opportunity to testify before you today. I look forward to responding to any questions you may have.

---

RESPONSES BY JEFFREY N. SHANE TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question 1.* Freight transportation is expected to double in the next 20 years. This increase in freight traffic will occur at the same time that congestion on our roads is already at levels many of us consider unacceptable. Clearly capacity issues have to be at the top of our list as we begin to reauthorize our surface transportation programs. However, in addition to building new physical capacity, we will need to seek ways to squeeze more out of our existing transportation infrastructure through intelligent transportation systems, better operations, and perhaps a more efficient mix of transportation choices. For example, to move passengers and freight from congested roads to rail. Please give your thoughts on what we can do when we reauthorize TEA-21 to get the most efficient use out of our transportation infrastructure.

Response. Improving intermodal freight efficiency will involve both public agencies and private freight companies. In particular, we must focus on:

- (1) improvements to the NHS freight connectors, providing for greater opportunities to use truck/water and truck/rail options to move freight in and out of terminals;
- (2) greater deployment of Intelligent Transportation Systems to improve system operations and to ensure intermodal conveyance of critical freight information for efficiency and security-this should include not only an ITS backbone for information exchange between the roadside and vehicles, but should also include other transport modes, and agencies involved in trade facilitation and security;
- (3) continued development of international standards for cargo security, to enable efficient and secure trade among NAFTA partners, and with other international trading partners;
- (4) enhanced use of innovative finance to leverage additional investment for freight transportation improvements; and
- (5) additional emphasis on intermodalism to make better use of all modes for freight transport.

*Question 2.* We clearly have significant freight transportation needs across our Nation. How do we determine what our freight priorities should be? Do we have sufficient information to determine which freight corridors, border crossings, port, intermodal facilities and connector should be our top funding priorities? Where is our freight infrastructure least efficient and where is the growth expected to occur?

Response. Since 2000, the Department has engaged in a comprehensive effort to (1) improve our understanding of freight flows; (2) define and analyze trends that might affect the demand, supply, and distribution of future freight transport requirements; and (3) work with State and local governments, other Federal agencies, and the private sector to define public policy strategies to enhance the planning, finance, and operation of the Nation's intermodal freight network. As part of this effort, we continue to work with major trade associations and governmental organiza-

tions to devise strategies that appropriately address freight efficiency, along with the national objectives of safety, security, and environmental awareness.

As part of this effort, we have developed the Freight Analysis Framework (FAF), a multimodal analytical system that enables us to map domestic and international freight movements and, when linked with transport network information systems, to match and compare systems demands with supply, both under current conditions and under future scenarios. When combined with other information systems developed to track maritime and rail movements and cross border freight flows, the FAF provides a powerful data/analytical system to determine the relative importance of corridors, gateways and border crossings, and regional freight movements.

The FAF, validated by extensive meetings with State and local officials and the private sector, suggests that major freight transport challenges form around: (1) major trade transport gateways, including certain maritime ports of entry, land crossings with Canada and Mexico, and significant trade hubs; (2) long distance multistate and international trade corridors; and (3) State and local freight concerns. Future trade forecasts suggest that volumes will increase at all major gateways and along trade corridors. This growth is likely to vary by region, however, as population and economic growth continues to shift and international trading patterns change in response to variations in market conditions.

Domestic freight demand is expected to increase by approximately 67 percent from 1998–2020 while international freight is expected to increase by approximately 85 percent. For example, US-Canada trade is expected to double over that time period, and US-Mexico trade is expected to increase by more than 200 percent. These increases in trade will require an emphasis on gateways, hubs, border crossings, and long distance trade corridors as we prepare to reauthorize our nation's surface transportation programs next year.

The FAF, in combination with stakeholder documentation of need, can be used to quantify the relative magnitude of growth along major corridors, and has been used extensively as we define the Department's surface transportation reauthorization initiatives. Mapping current and future freight flows is a valuable first step in defining the geography and magnitude of freight movement but is not, in itself, sufficient to define where our resources and attention should be focused. When overlaid on system condition information, however, the combination of demand and supply provides valuable insight into the freight bottlenecks that we need to address in this reauthorization package.

With freight transportation primarily the responsibility of the private sector, Federal transportation policies offering near term solutions to these problems are limited in their effectiveness. Longer term, federally led strategies to identify and deal with these problems, however, can have significant effects on future efficiencies. Advanced Federal policies and programs to strengthen intermodal capacity at gateways and along major trade corridors can result in important improvements to the Nation's trade transport network.

As we look to the future, we are evaluating institutional, financial, and technology enhancements that would enable State and local governments, in partnership with the Federal Government, to identify bottlenecks, establish priorities, and develop comprehensive funding strategies to mitigate the freight bottlenecks that can threaten our economic well-being if they are not properly addressed.

*Question 3.* The Borders and Corridors Program has not worked very well. One improvement we should consider is to revise this program to encourage public-private partnerships through a greater emphasis on innovative finance and other creative incentives. How else can we improve the Borders and Corridors program to target the highest priority freight corridors and intermodal facilities.

*Response.* It is difficult to judge exactly how well the National Corridor Planning and Development and Coordinated Border Infrastructure (NCPD/CBI) discretionary grant program, as set forth under the Transportation Equity Act for the 21st Century (TEA-21), has performed. This is due, in part, to the fact that projects funded under the program have increasingly been earmarked during the appropriations process rather than selected through a competitive application process as originally intended by Congress. From fiscal year 1999 to fiscal year 2002, over two thirds of all NCPD/CBI funds went to projects identified in appropriation act report language (the percentage was 100 percent in fiscal year 2002), thereby severely limiting the Department of Transportation's ability to administer these programs in a strategic way. Moreover, the amounts made available often are not sufficient to fund an entire project, further limiting the program's usefulness in enhancing our nation's primary border crossings and trade corridors.

With respect to your suggestion "to encourage public-private partnerships through a greater emphasis on innovative finance and other creative incentives", the Depart-

ment agrees that a greater emphasis on innovative finance should be a part of any future program.

The Department also agrees that projects should “target the highest priority freight corridors and intermodal facilities.” One way to accomplish this is to emphasize the importance of having proposed projects be consistent with the continuing, cooperative, and comprehensive transportation planning process required by sections 134 and 135 of title 23 United States Code.

*Question 4.* One way to squeeze more capacity out of existing infrastructure is through more rapid deployment of ITS and an increased focus on the operations and management of regional transportation systems. How much potential do ITS initiatives have for improving the efficiency of freight operations and what can we do to promote the development of a freight-friendly ITS infrastructure?

Response. Freight oriented ITS provides a direct benefit by linking improvements in systems operations to supply chain logistics and domestic and international cargo security. Following 9/11, various Federal agencies have developed cooperative agendas designed to promote more secure domestic and international cargo movement, combining the resources of ITS with trade facilitation functions (Customs, INS, USDA, etc.), and our international trade partners. Cooperative efforts with the private sector, through the Intermodal Freight Technology Working Group (IFTWG) have identified opportunities, currently deployed and under evaluation, to use ITS to enhance “end to end” supply chains. Programs like Operation Safe Commerce and the Container Working Group are identifying best practices in technology deployment, standards, and interoperability, and the lessons being learned will provide valuable guidance on the use of ITS to better integrate improvements in safety, security, and freight productivity.

ITS and systems operations strategies have enormous potential to effect capacity improvements and enhance freight flow. Whether the ITS initiative is focused on passenger movement or transportation more generally, freight movement can be enhanced. For example, advanced traveler information systems or incident management systems provide for better system utilization through improvements in real time information and the management of recurring and non-recurring types of delay. While passenger transportation clearly benefits from such ITS initiatives, trucking—both long distance shipments through metropolitan areas and local runs handling pick up and deliveries, also benefit from improved network utilization.

Advanced technology through the expanded use of ITS is widely regarded, both within government and by the private sector, as perhaps the most cost-effective strategy to improve both trade transport efficiency and security.

*Question 5.* What can we do to promote better regional freight planning and how do we ensure that planning agencies take a comprehensive, intermodal approach to infrastructure planning and development? In particular, when it comes to freight, how do we bring the private sector into the public planning process?

Response. Traditionally, the metropolitan planning process has primarily focused on the movement of passengers, with the movement of freight generally treated as secondary. The general public typically views freight as a necessary evil, with people complaining about waiting at rail crossings or sharing roads with trucks and public agencies complaining about the damage trucks cause to a region’s roadways. While existing Federal regulations stipulate that freight is to be considered in local transportation planning, relatively few regions have successfully implemented freight projects through traditional planning approaches.

Development of a better regional freight planning process requires both a mutual understanding of public and private sector perspectives and outreach by State and local transportation planners to the freight industry. Freight operators generally believe that the transportation planning process is too slow to address their short-term, bottom-line needs, and therefore not worth their time and effort. Local transportation planners can help overcome this perception by soliciting the involvement of local freight operators in planning operational changes as part of Congestion Management System (CMS) initiatives. They can also do so through timely implementation of small, non-controversial improvements like turning radii or signal timing at key intersections identified by local freight operators.

In addition, there is a need to provide strategic data, analysis, and information for decisionmakers in both the public and private sectors. In this regard, the work of the Freight Analysis Framework (FAF) serves as a bridge between the two groups. The private sector, which may be unwilling to share detailed commodity information or operational strategies, can use the FAF to highlight the need for increased focus on freight, while the public sector can use the FAF to understand the growth of freight movements and its potential impact on both the local economy and its infrastructure. Maps generated using the FAF have been very useful in re-

directing the discussion from an “Us versus Them” mentality to a “We” based on a shared perception of the need to improve freight productivity.

---

RESPONSES BY JEFFREY N. SHANE TO ADDITIONAL QUESTIONS FROM SENATOR  
JEFFORDS

*Question 1.* Mr. Shane, in your testimony you mention a project involving the monitoring of containers from overseas as they travel to, and in, the United States.

I assume that this relates to putting electronic devices which can be tracked by satellite onto sealed containers coming into the U.S. either by water, rail, or on trucks. These devices could be placed on the containers overseas or in other countries, or at entry into the United States after inspection of the contents. Under this approach a container packed anywhere in the world and certified safe at that point can be tracked and delivered to a consignee in the U.S. with assurance it has not been tampered with enroute.

The objective is to have a “real-time solution” that can be monitored in the appropriate marine, rail, or other intermodal terminal. At first, this approach could be integrated into an overall regional approach where marine and rail terminals are interconnected and where appropriate governmental agencies such as Customs can also be connected. As other regions come on line this could expand to national coverage. These devices could be built into the locking device and could also indicate whether the container was opened prior to intended delivery.

From a security standpoint the idea is, if an emergency situation arises, that law enforcement would be able to obtain a history of how containers were moved within the U.S., or to be able to locate a particular container in the U.S. In addition, this information could be very useful to the shipper and the intended recipient if there were unexpected delays.

Would you explain your views on this approach? What would be the cost and lead time necessary to implement this concept to all containers entering or leaving the U.S.?

Response. DOT has co-chaired with U.S. Customs two significant efforts to address the vulnerability posed by marine containers and other freight, also pulling together the expertise of other governmental and private sector stakeholders. Most notably have been our joint efforts on the Container Working Group (CWG) and Operation Safe Commerce (OSC), two important efforts that support the President’s National Strategy for Homeland Security.

The Container Working Group has been an ongoing effort since December 2001. The working group explored the problem of improving container security through solutions offered by business practices, security technology, information technology, and international activities. They produced a report with a number of recommendations in March, and they continue to pursue these recommendations. Key to these efforts will be the continued development of Intelligent Transportation Systems, the International Trade Data System, the U.S. Customs Automated Commercial Environment (ACE) System, and the implementation of G-7/WCO standardized messages and data sets.

Operation Safe Commerce will complement the CWG by testing technology or process solutions offered by the private sector to improve supply chain security. OSC was initiated by a test of off-the-shelf technology to seal, track, and monitor a single container shipped from Slovakia to New Hampshire. This is the test I mentioned during my testimony. It would be premature to assume, however, that this approach is the best answer since we haven’t yet embarked upon the more comprehensive set of OSC tests that we hope to fund in the coming months.

We intend to continue rapid progress on both the CWG and OSC, and wherever possible, encourage multi-use systems that improve service quality for the transportation system as well as security and safety.

The costs for developing and implementing a secure container regime have yet to be determined given that we must first test what does or doesn’t work in real operating environments. By encouraging the private sector to test out solution sets for container security through the OSC initiative, we will be able to identify what in fact works and what is cost effective to the government and the industry. Accordingly, the lead-time must be viewed as a series of incremental steps over a period of time as we incorporate security proven solutions into the world fleet of over 14 million containers in active use today.

*Question 2.* Since 9/11 there have been numerous studies and articles that have been written on the lack of knowledge we have on the contents and travel paths of goods in our country. Do you see this as a problem that needs to be rectified?

What can be done to make sure, at the very least, hazardous materials are being tracked?

Response. Judicious application of emerging technology for certain high-risk hazardous materials, including technology designed to track and monitor shipments, can be an important security tool. Indeed, we have encouraged hazardous materials shippers and transporters to investigate the use of tracking or monitoring systems for enhancing hazardous materials transportation security.

In a Security Advisory published in the Federal Register on February 14, 2002, DOT's Research and Special Programs Administration (RSPA) identified a number of actions that persons involved in the transportation of hazardous materials could take to enhance security and recommended actions commensurate with the level of threat posed by the specific hazardous material being transported. To improve en route security, RSPA recommended that shippers and carriers consider utilizing advanced technology to track or protect shipments en route to their destinations. Such tracking technology could include satellite tracking or surveillance systems or could be as simple as frequent checks with drivers by cell phone to ensure everything is in order.

In a May 2, 2002 NPRM RSPA proposed that shippers and carriers develop and implement security plans for certain high-risk shipments of hazardous materials. The security plan would be based on a risk assessment performed by the shipper or carrier to identify security risks and develop appropriate measures to reduce or eliminate risk. As proposed, a security plan must include measures to improve en route security, and such measures could include shipment tracking or monitoring systems. In addition, we proposed revisions to current shipping documentation requirements to assist law enforcement personnel to promptly ascertain the legitimacy of hazardous materials shipments during routine or random roadside inspections and to identify suspicious or questionable situations where additional investigation may be necessary.

On July 16, 2002, RSPA and DOT's Federal Motor Carrier Safety Administration (FMCSA) issued a joint ANPRM inviting comments on the feasibility of specific security enhancements and the potential costs and benefits of deploying such enhancements. Security measures being considered include: escorts, vehicle tracking and monitoring systems, remote vehicle shut-offs, direct short-range communications, and notifications to State and local authorities.

Finally, DOT has also undertaken an operational evaluation of cutting-edge communications and tracking technology, electronic seals, and biometric identification to evaluate their potential for enhancing security.

If we find tracking or other methods to be effective, we will consider initiating appropriate regulatory actions.

*Question 3.* Has the Department undertaken, or do you know of any studies that could be provided to the committee that discuss the benefits of improving rail corridors to freight movement?

Response. There has been growing interest in the possibility of alleviating regional transportation problems by improving rail corridors and eliminating critical rail bottlenecks.

- AASHTO has prepared a "Freight Bottom Line" report that considers the national implications of such an approach and finds that the benefits of public sector investment in rail corridors could be substantial. The report should be available from AASHTO soon.

- The city of Chicago, all the major railroads and several other groups are developing a plan to alleviate rail congestion in Chicago while also reducing highway congestion due to blocked grade crossings. This study is expected to identify a number of critical projects that will establish several high volume corridors through Chicago.

- The Mid-Atlantic Rail Operations Study identified a \$6.2 billion program of public and private investments to address choke points limiting the capacity of the rail system between Virginia and New York.

- The State of Virginia has done a study of the potential for upgrading the rail lines that parallel I-81 to alleviate the need to rebuild and expand that highway that is now very congested with trucks. In cooperation with the Federal Railroad Administration and the State of Tennessee, that study is being expanded to consider marketing issues so as to better estimate the service requirements and diversion potential from a rail improvement program.

*Question 4.* We have heard that the Department does not have sufficient personnel to effectively handle important issues of the freight community. I would be willing to work with DOT on this important matter. How can Congress assist the Department in ensuring that the mission and personnel of DOT are suited not only to providing mobility to the general public but to the freight community as well?

Response. The Department is committed to ensuring that freight has a “voice” in policy deliberations, legislative initiatives, and in resource commitments. Congress can further assist the Department in effectively handling issues important to the freight community by acting on the Administration’s request to establish an Under Secretary of Transportation Policy position as part of an overall restructuring of the Department’s policy apparatus. Within this new and elevated structure, we would be able to combine and enhance resources to ensure that freight issues are accorded their rightful attention and visibility, and are addressed on an even par with passenger issues.

---

STATEMENT OF JAYETTA HECKER, DIRECTOR, PHYSICAL INFRASTRUCTURE ISSUES,  
GENERAL ACCOUNTING OFFICE

Mr. Chairmen and members: We are pleased to be here today to discuss challenges in defining the Federal role with respect to freight transportation issues. There are concerns that the projected increases in freight tonnage for all transportation modes will place pressures on the marine, aviation, and highway transportation systems. As a result, there is growing awareness of the need to view various transportation modes, and freight movement in particular, from an integrated standpoint, particularly for the purposes of developing and implementing a Federal investment strategy and considering alternative funding approaches. An intermodal perspective appears especially important as the Nation reacts to the increased security needs for transportation networks and as it plans for better, more efficient transportation for the future. At your request, we have done work focusing on the marine component of the national transportation system.

My testimony today, which is based on our report<sup>1</sup> that is being issued today, addresses three topics: (1) the Federal funding approaches used for the marine transportation system as compared with the aviation and highway systems, (2) the amount of customs duties on imported goods shipped through the marine, aviation, and highway systems, and (3) a framework to assist the Congress as it considers future Federal investment decisions. Our recently completed work on marine transportation is based on our analysis of data collected from 15 Federal agencies that expended revenue on the various transportation systems and/or collected funds from users of the systems during fiscal years 1999 through 2001. We also collected data from the U.S. Customs Service on the amount of duty collected on commodities imported by the various transportation modes. We applied the estimates developed by the U.S. Census Bureau on the percent of collections attributable to water, sea, and land transportation modes to total customs duties collected by the U.S. Customs Service during fiscal years 1999 through 2001. To develop a framework to assist the Congress in making decisions about the Federal role in financing the marine transportation system, we built on prior GAO work on Federal investment approaches and managerial best practices and interviewed U.S. Army Corps of Engineers and Department of Transportation officials. See appendix I for a more detailed explanation of our scope and methodology.

In summary:

- The Federal approach for funding the marine transportation system relies heavily on general revenues, while the approach for funding the aviation and highway systems relies almost exclusively on collections from users of the systems. During fiscal years 1999 through 2001, funding for about 80 percent of the average \$3.9 billion expended each year on the marine transportation system came from the U.S. Treasury’s general fund. During the same period, nearly all of the \$10 billion in Federal funds expended each year for the aviation system and the \$25 billion in Federal funds expended each year for the highway system came from revenues generated by users of those two systems.

- During fiscal years 1999 through 2001, customs duties on imported goods transported through the transportation systems averaged \$15 billion each year for the marine transportation system, \$4 billion each year for the aviation system, and \$900 million each year for the highway system. Customs duties are taxes on the value of imported goods and have traditionally been viewed as revenues to be used for the support of the general activities of the Federal Government. Unlike the collections based on the use of the highway and aviation systems, customs duties are paid by the importers of the taxed goods. Revenues from these duties are deposited into the U.S. Treasury’s general fund, and the majority of these revenues are used for the general support of Federal activities. To help finance improvements to the

---

<sup>1</sup>U.S. General Accounting Office, Marine Transportation: Federal Financing and a Framework for Infrastructure Investments, GAO-02-1033 (Washington, DC: Sept. 9, 2002).

marine transportation system, some maritime stakeholders, such as port authorities, have suggested earmarking a portion of revenues generated from customs duties. Some customs duties are currently earmarked for specific purposes, such as agriculture and food programs. However, in that case, a portion of the duties on imports must be used to encourage the export and the domestic consumption of farm products and to reestablish farmers' purchasing power—that is, for assisting markets that are arguably adversely affected by the importation of goods. Further earmarking of customs duties for new spending would have significant budget ramifications in an already constrained Federal budget environment.

- Diverse industry stakeholders believe that substantial new investments in the maritime infrastructure may be required from public and private sources because of an aging infrastructure, changes in the shipping industry, and increased concerns about security.<sup>2</sup> A systematic framework would be helpful to decisionmakers as they consider the Federal Government's purpose and role in providing funding for the system and as they develop a sound investment approach to guide Federal participation. In examining Federal investment approaches across many national activities, we have identified four key components of such a framework—establishing national goals, defining the Federal role, determining appropriate funding tools, and evaluating performance—could potentially be applied to all transportation systems.

- The first component—establishing national goals for the system—requires an in-depth understanding of the needs of the system and the relationship of the system to other transportation modes. For example, the efficient movement of freight often involves using several different transportation modes, making investment decisions, and developing coherent freight policies would logically need to occur while focusing on the entire transportation system rather than a single mode.

- The second component—clearly defining the Federal role relative to other stakeholders—is important to help facilitate the planning and implementation of improvements across modes and to better ensure that Federal participation supplements and enhances participation by others, rather than simply replacing their participation.

- A third component—determining the funding tools and other approaches that will maximize the impact of any Federal investment—is important to help expand the capacity to leverage funding resources and to promote shared responsibilities. For example, in the \$2.4 billion Alameda Corridor Program, State and local stakeholders had both a financial incentive to relieve congestion and the commitment and ability to bring financial resources to bear.

- The final component ensures that a process is in place for evaluating performance and accountability periodically so that defined goals, roles, and approaches can be reexamined and modified, as necessary.

#### *Background*

The nation's surface transportation systems facilitate mobility through an extensive network of infrastructure and operators, as well as through the vehicles and vessels that permit passengers and freight to move within the system. Maintaining the systems is critical to sustaining America's economic growth. This is especially important given that projected increases in freight tonnage will likely place pressures on these systems. According to the Federal Highway Administration, domestic and international freight tonnage across all surface modes will increase 41 percent, from 14.4 billion tons in 1998 to 20.3 billion tons in 2010. According to the forecasts, by 2010, 15.6 billion tons are projected to move by truck, a 44 percent increase; 3 billion tons by rail, a 32 percent increase; and 1.5 billion tons by water, a 27 percent increase.<sup>3</sup> Some freight may be moved by more than one mode before reaching its destination, such as moving by ship for one segment of the trip, then by truck to its final destination.

Over 95 percent of the U.S. overseas freight tonnage is shipped by sea. The United States accounts for 1 billion metric tons, or nearly 20 percent of the world's oceanborne trade. As the world's leading maritime trading nation, the United States depends on a vast marine transportation system. In addition to the economic role it plays, the system also has an important role in national defense; serves as an alternative transportation mode to roads and rails; and provides recreational value through boating, fishing, and cruises.

<sup>2</sup>We did not systematically evaluate the claims regarding new infrastructure investments. Recent work has recognized the as yet undefined financial requirements for enhancing the security of ports. See U.S. General Accounting Office, *Port Security: Nation Faces Formidable Challenges in Making New Initiatives Successful*, GAO-02-993T (Washington, DC: Aug. 5, 2002).

<sup>3</sup>The Federal Highway Administration's maritime freight projections do not include international trade of bulk products and some inland domestic bulk shipments.

Traditionally, Federal participation in the maritime industry has been directed mainly at projects related to “waterside” issues, such as keeping navigation channels open by dredging, icebreaking, or improving the system of locks and dams; maintaining navigational aids such as lighthouses or radio systems; and monitoring the movement of ships in and out of the nation’s coastal waters. Federal participation has generally not extended to “landside” projects related to ports’ capabilities, such as building terminals or piers and purchasing cranes or other equipment to unload cargo.<sup>4</sup>

These traditional areas of Federal assistance are under pressure, according to a congressionally mandated report issued by the Department of Transportation in 1999,<sup>5</sup> which cites calls to modernize aging structures and dredge channels to new depths to accommodate larger ships. Since this report, and in the aftermath of September 11, the funding focus has further expanded to include greater emphasis on port security. Many of the security improvements will require costly outlays for infrastructure, technology, and personnel. For example, when the Congress recently made \$92.3 million in Federal funding available for port security as part of a supplemental appropriations bill,<sup>6</sup> the Transportation Security Administration received grant applications totaling almost \$700 million.<sup>7</sup>

With growing system demands and increased security concerns, some stakeholders have suggested a different source of funding for the marine transportation system. For example, U.S. public port authorities have advocated increased Federal funding for harbor dredging. Currently, funding for such maintenance is derived from a fee on passengers and the value of imported and domestic cargo loaded and unloaded in U.S. ports. Ports and shippers would like to see funding for maintenance dredging come from the general fund instead, and there was legislation introduced in 1999 to do so.<sup>8</sup> Regarding funding for security, ports are seeking substantial Federal assistance to enhance security in the aftermath of the events of September 11. In other work we have conducted on port security,<sup>9</sup> port and private-sector officials have said that they believe combating terrorism is the Federal Government’s responsibility and that, if additional security is needed, the Federal Government should provide or pay for it.

*Federal Approach to Financing the Marine Transportation System as Compared with the Aviation and Highway Systems*

Unlike the funding approach used for the aviation and highway transportation systems, which are primarily funded by collections from users of the systems, the commercial marine transportation system relies heavily on general tax revenue. For all three transportation systems, most of the revenue collected from users of the systems was deposited into trust fund accounts. Figure 1 summarizes the expenditure and assessment comparisons across the three transportation systems.

During fiscal years 1999 through 2001, Federal agencies expended an average of \$3.9 billion each year on the marine transportation system with about 80 percent of the funding coming from the general revenues. During the same period, Federal agencies expended an average of \$10 billion each year on the aviation system and \$25 billion each year on the highway system. The vast majority of the funding for these expenditures came from trust fund accounts. (See app. II.):

<sup>4</sup>One exception has been intermodal connections, such as rail or highway connections. The Federal Government has traditionally participated in funding such projects.

<sup>5</sup>U.S. Department of Transportation, *An Assessment of the U.S. Marine Transportation System: A Report to Congress* (Washington, DC.: September 1999). GAO did not verify the accuracy of the information contained in this report.

<sup>6</sup>Although \$93.3 million was made available in the supplemental appropriations bill, \$1 million was authorized for administrative expenses. As of June 17, 2002, 77 grants for 144 ports security projects were awarded.

<sup>7</sup>The Transportation Security Administration, the Coast Guard, and the Maritime Administration reviewed applications under the Port Security Grants Program, which is based on the seaport security provisions contained in the Department of Defense and Emergency Supplemental Appropriations for Recovery from and Response to Terrorist Attacks on the United States Act of 2002 (Pub. L. No. 107–117, H.R. Conference Report 107–350). An additional \$105 million was appropriated for the Port Security Grant Program as part of another supplemental appropriation act passed August 2, 2002 (Pub. L. No. 107–206).

<sup>8</sup>H.R. 1260 was introduced, but not enacted, in the 106th Congress to repeal the Harbor Maintenance Tax and return to funding the costs of operating and maintaining Federal navigation channels from general revenues.

<sup>9</sup>U.S. General Accounting office, *Port Security: Nation Faces Formidable Challenges in Making New Initiatives Successful*, GAO–02–993T (Washington, DC.: Aug. 5, 2002).

Federal agencies collected revenue from assessments on users of all three transportation systems during fiscal years 1999 through 2001.<sup>10</sup> Collections from assessments on system users during this period amounted to an average of \$1 billion each year from marine transportation system users, \$11 billion each year from aviation system users, and \$34 billion each year from highway system users. Most of the collections for the three systems were deposited into trust funds that support the marine, aviation, and highway transportation systems.<sup>11</sup> (See app. III.) Trust funds that support the marine transportation system include the Harbor Maintenance Trust Fund and the Inland Waterways Trust Fund. Trust funds that support the aviation and highway transportation systems include the Airport and Airway Trust Fund and the Highway Trust Fund.

*Comparison by Transportation Modes of the Amount of Customs Duties Collected*

The Federal Government assesses customs duties on goods imported into the United States and the majority of these collections are deposited into the U.S. Treasury's general fund to be used for the support of Federal activities. As can be seen in figure 2, the amounts from customs duties levied on imported goods carried through the marine transportation system are more than triple the combined amounts collected from customs duties levied on the goods carried through the aviation and highway systems. During fiscal years 1999 through 2001, customs duties on imported goods shipped through the transportation systems averaged \$15.2 billion each year for the marine transportation system, \$3.7 billion for the aviation system, and \$928 million for the highway system. (See app. IV for details on customs duty collections by year.):

Some maritime stakeholders, particularly port owners and operators, have proposed using a portion of the customs duties for infrastructure improvements to the marine transportation system. They point out that the marine transportation system is generating billions of dollars in revenue, and some of these funds should be returned to maintain and enhance the system. However, unlike transportation excise taxes, customs duties are taxes on the value of imported goods paid by importers and ultimately their consumers—not on the users of the system—and have traditionally been viewed as revenues to be used for the support of the general activities of the Federal Government.

Notwithstanding the general trend, a portion of revenues from customs duties are currently earmarked for agriculture and food programs, migratory bird conservation, aquatic resources, and reforestation.<sup>12</sup> It should be noted, however, that in these cases, some relationship exists between the goods being taxed and the uses for which the taxes are earmarked. Designating a portion of the remaining customs fees for maritime uses would not represent a new source of capital for the Federal Government, but rather it would be a draw on the general fund of the U.S. Treasury. This could lead to additional deficit financing, unless other spending were cut or taxes were increased.

*Systematic Framework Could Help Guide Decisions When Making Investment Choices for the Marine Transportation System*

Some maritime industry stakeholders have suggested that substantial new investments in the maritime infrastructure by Federal, State, and local governments and by the private sector may be required because of an aging infrastructure, changes

<sup>10</sup>Such assessments include both user fees and excise taxes. User fees are charged to users for goods or services provided by, or activities regulated by, the Federal Government. User fees generally apply to activities that provide benefits to identifiable recipients and are normally related to the cost of the goods or services provided. They may be paid into the general fund or, under specific statutory authority, may be made available to an agency carrying out the activity. User fees may also be collected through a tax such as an excise tax. Since these collections result from the government's sovereign powers, the proceeds are generally recorded as budget receipts, not as offsetting collections. Excise taxes can also be dedicated to specific programs and agencies.

<sup>11</sup>Collections are deposited into the U.S. Treasury and can be used for the general support of Federal activities or may be earmarked by law for specific purposes and credited to a trust fund. A Federal trust fund is an accounting mechanism used to link earmarked receipts with the expenditures of those receipts. It is designated in law as a "trust" fund.

<sup>12</sup>Under Section 612c of Title 7, 30 percent of the gross receipts from customs duties are designated for agricultural and food programs. Pursuant to 16 U.S.C. 3912, all duties on guns and ammunitions are credited to the Migratory Bird Conservation Fund and pursuant to 26 U.S.C. 9504, duties on fishing tackle and yachts and pleasure craft are credited to the Sports Fish Restoration Account of the Aquatic Resources Trust Fund. In addition, tariffs from wood and certain wood products are credited to the Reforestation Trust Fund up to a total of \$30 million (16 U.S.C. 1606(a)).

in the shipping industry, and increased concerns about security.<sup>13</sup> These growing and varied demands for increased investments in the maritime transportation system heighten the need for a clear understanding about the Federal Government's purpose and role in providing funding for the system and for a sound investment approach to guide Federal participation. In examining Federal investment approaches across many national activities, we have found that issues such as these are best addressed through a systematic framework. As shown in figure 2, this framework has the following four components that potentially could be applied to all transportation systems:

- Set national goals for the system. These goals, which would establish what Federal participation in the system is designed to accomplish, should be specific and measurable.
- Define clearly what the Federal role should be relative to other stakeholders. This step is important to help ensure that Federal participation supplements and enhances participation by others, rather than simply replacing their participation.
- Determine which funding tools and other approaches, such as alternatives to investment in new infrastructure, will maximize the impact of any Federal investment. This step can help expand the capacity to leverage funding resources and promote shared responsibilities.
- Ensure that a process is in place for evaluating performance periodically so that defined goals, roles, and approaches can be reexamined and modified, as necessary.

#### *Establish National Goals to Guide Federal Participation*

An initial decision for Congress when evaluating Federal investments concerns the goals of the marine transportation system. Clearly defined national goals can serve as a basis for guiding Federal participation by charting a clear direction, establishing priorities among competing issues, specifying the desired results, and laying the foundation for such other decisions as determining how assistance will be provided. At the Federal level, measuring results for Federal programs has been a longstanding objective of the Congress. The Government Performance and Results Act of 1993<sup>14</sup> has become the primary legislative framework through which agencies are required to set strategic and annual goals that are based on national goals, measure performance, and report on the degree to which goals are met and on what actions are needed to achieve or modify goals that have not been met. Establishing clear goals and performance measures for the marine transportation system is critical to ensuring both a successful and a fiscally responsible effort.

Before national goals for the system can be established, however, an in-depth understanding of the relationship of the system to other transportation modes is required. Transportation experts highlight the need to view the system in the context of the entire transportation system in addressing congestion, mobility, and other challenges and, ultimately, investment decisions. For example, congestion challenges often occur where modes connect or should connect, such as ports where freight is transferred from one mode to another. The connections require coordination of more than one mode of transportation and cooperation among multiple transportation providers and planners. A systemwide approach to transportation planning and funding, as opposed to focus on a single mode or type of travel, could improve the focus on outcomes related to customer or community needs.

Meaningful goal setting also requires a comprehensive understanding of the scope and extent of issues and priorities facing the marine transportation system. However, there are clear signs that certain key issues and priorities are not yet understood well enough to establish meaningful goals for the system. For example, a comprehensive analysis of the issues and problems facing the marine transportation system has not yet been completed.<sup>15</sup> In setting goals for investment decisions, lead-

<sup>13</sup>We did not systematically evaluate these claims regarding new infrastructure investments. Recent work has recognized the as yet undefined financial requirements for enhancing the security of ports. See U.S. General Accounting Office, *Port Security: Nation Faces Formidable Challenges in Making New Initiatives Successful*, GAO-02-993T (Washington, DC.: Aug. 5, 2002).

<sup>14</sup>Pub. L. No. 103-62.

<sup>15</sup>The 1999 marine transportation system report identified a number of issues and problems facing the marine transportation system. These included increased dredging requirements to accommodate larger container ships, aging and limited capacity of lock and dam systems on inland waterways, and congestion due to ineffective intermodal connections. In January 2000, the Secretary of Transportation chartered the Marine Transportation System National Advisory Council to help implement the recommendations contained in a report issued by the Department of Transportation entitled *An Assessment of the U.S. Marine Transportation System: A Report to Congress*. An interagency committee was also established to facilitate implementation of the rec-

ing organizations usually perform comprehensive needs assessments to obtain a clear understanding of the extent and scope of their issues, problems, and needs and, ultimately, to identify resources needed. These assessments should be results-oriented in that they determine what is needed to obtain specific outcomes rather than what is needed to maintain or expand existing capital stock.<sup>16</sup> Developing such information is important for ensuring that goals are framed in an adequate context. The call by many ports for Federal assistance in dredging channels or harbors to 50 feet is an example. Dredging to 50 feet allows a port to accommodate the largest of the container ships currently being constructed and placed in service. However, developing the capacity to serve such ships is no guarantee that companies with such ships will actually choose to use a port. Every port's desire to be competitive by having a 50-foot channel could thus lead to a situation in which the Nation as a whole has an overcapacity for accommodating larger ships. The result, at least for the excess capacity, would signal an inefficient use of Federal resources that might have been put to better use in other ways.

*Define the Federal Role Relative to Other Stakeholders*

Establishing the roles of the Federal, State, and local governments and private entities will help to ensure that goals can be achieved. The Federal Government is only one of many stakeholders in the marine transportation system. While these various stakeholders may all be able to share a general vision of the system, they are likely to diverge in the priorities and emphasis they place on specific goals. For example, the Federal Government, with its national point of view, is in a much different position than a local port intensely involved in head-to-head competition with other ports for the business of shipping companies or other businesses. For a port, its own infrastructure is paramount, while the Federal Government's perspective is focused on the national and broader public interest.

Since there are so many stakeholders involved with the marine transportation system, achieving national goals for the system hinges on the ability of the Federal Government to forge effective partnerships with non-Federal entities. Decision makers have to balance national goals with the unique needs and interests of all non-Federal stakeholders in order to leverage the resources and capabilities that reside within State and local governments and the private sector. Future partnering among key maritime stakeholders may take on a different form as transportation planners begin focusing across transportation modes in making investment decisions instead of making investment decisions for each mode separately. The Alameda Corridor Program in the Los Angeles area provides an example of how effective partnering allowed the capabilities of the various stakeholders to be more fully utilized. Called the Alameda Corridor because of the street it parallels, the program created a 20-mile, \$2.4 billion railroad express line connecting the ports of Los Angeles and Long Beach to the transcontinental rail network east of downtown Los Angeles. The express line eliminates approximately 200 street-level railroad crossings, relieving congestion and improving freight mobility for cargo. This project made substantial use of local stakeholders' ability to raise funds. While the Federal Government participated in the cost, its share was only about 20 percent of the total cost, most of which was in the form of a loan rather than a grant.

Just as partnerships offer opportunities, they also pose risks based upon the different interests reflected by each stakeholder. While gaining the opportunity to leverage the resources and capabilities of partners, each of these non-Federal entities has goals and priorities that are independent of the Federal Government. For the Federal Government, there is concern that State and local governments may not share the same priorities for use of the Federal funds. This may result in non-Federal entities replacing or "supplanting" their previous levels of commitment in areas with new Federal resources. For example, in the area of port security, there is a significant funding need at the local level for overtime pay for police and security guards. Given the degree of need, if more Federal funding was made available, local interests might push to apply Federal funding in this way, thereby transferring a previously local function to the Federal arena. In moving toward Federal coverage of basic public services, the Congress and Federal officials would be substantially expanding the Federal role.

---

ommendations in the report. Recognizing the need to thoroughly analyze the issues and problems facing the marine transportation system, the interagency committee is in the process of seeking contract support for a comprehensive analysis assessing the future needs and funding of the marine transportation system.

<sup>16</sup>U.S. General Accounting Office, U.S. Infrastructure: Funding Trends and Federal Agencies' Investment Estimates, GAO-01-986T (Washington, DC.: July 23, 2001).

*Develop Funding Tools and Other Approaches That Maximize the Federal Return*

When evaluating Federal investments, a careful choice of the approaches and funding tools that would best leverage Federal funds in meeting identified goals should be made. A well-designed funding approach can help encourage investment by other stakeholders and maximize the application of limited Federal dollars. An important step in selecting the appropriate approach is to effectively harness the financial capabilities of local, State, and private stakeholders. The Alameda Corridor Program is a good example. In this program, State and local stakeholders had both a financial incentive to relieve congestion and the commitment and ability to bring financial resources to bear. Some other ports may not have the same level of financial incentives or capabilities to undertake projects largely on their own. For example, in studying the extent to which Florida ports were able to implement a set of security requirements imposed by the State, we found that some ports were able to draw on more financial resources than others, based on such factors as size, economic climate, and funding base.<sup>17</sup> While such information would be valuable in crafting Federal assistance, it currently is largely unavailable. Relatively little is known about the extent of State, local, and private-sector funding resources across the country.

The Federal Government has a variety of funding tools potentially available for use such as grants, direct loans, loan guarantees, tax expenditures, and user fees. Through cost sharing and other arrangements, the Federal Government can use these approaches to help ensure that Federal funds supplement—and not supplant—funds from other stakeholders. For example, an effective use of funding tools, with appropriate non-Federal matches and incentives, can be valuable in implementing a national strategy to support Federal port investments, without putting the government in the position of choosing winners or losers.

Federal approaches can take other forms besides those that relate specifically to making funding available. These following approaches allow increased output without making major capital investments:

- Demand management. Demand management is designed to reduce travel at the most congested times and on the most congested routes. One demand management strategy involves requiring users to pay more to use congested parts of the system during such periods, with the idea that the charge will provide an incentive for some users to shift their use to a less congested time or to less congested routes or transportation modes. On inland waterways, for example, congestion pricing for locks—that is, charging a toll during congested periods to reflect the additional cost of delay that a vessel imposes on other vessels—might be a way to space out demand on the system. Many economists generally believe that such surcharges or tolls enhance economic efficiency by making operators take into account the external costs they impose on others in deciding when, where, and how to travel.
- Technology improvements. Instead of making extensive modifications to infrastructure such as locks and dams, it may be possible to apply Federal investments to technology that makes the existing system more efficient. For example, technological improvements may be able to help barges on the inland waterways navigate locks in inclement weather, thereby reducing delays on the inland waterway system.
- Maintenance and rehabilitation. Enhancing capacity of existing infrastructure through increased maintenance and rehabilitation is an important supplement to, and sometimes a substitute for, building new infrastructure. Maintenance and rehabilitation can improve the speed and reliability of passenger and freight travel, thereby optimizing capital investments.

Management and operation improvements. Better management and operation of existing infrastructure may allow the existing transportation system to accommodate additional travel without having to add new infrastructure. For example, the U.S. Army Corps of Engineers is investigating the possibility of automating the operation of locks and dams on the inland waterways to reduce congestion at bottlenecks.

*Examining Outcomes to Determine the Effectiveness of Investments*

Regardless of the tools selected, results should be evaluated and lessons learned should be incorporated into the decisionmaking process. Evaluating the effectiveness of existing or proposed Federal investment programs could provide decisionmakers with valuable information for determining whether intended benefits have been achieved and whether goals, responsibilities, and approaches should be modified.

<sup>17</sup>U.S. General Accounting Office, Port Security: Nation Faces Formidable Challenges in Making New Initiatives Successful, GAO-02-993T (Washington, DC: Aug. 5, 2002).

Such evaluations are also useful for better ensuring accountability and providing incentives for achieving results.

Leading organizations that we have studied have stressed the importance of developing performance measures and linking investment decisions and their expected outcomes to overall strategic goals and objectives.<sup>18</sup> Hypothetically, for example, one goal for the marine transportation system might be to increase throughput (that is, the volume of cargo) that can be transported through a particular lock and dam system on the nation's inland waterways. A performance measure to gauge the results of an investment for this goal might be the increased use (such as number of barges passing through per hour) that results from this investment and the economic benefits associated with that increase.

In summary, Mr. Chairmen, the projected increases in freight tonnage will likely place pressures on the nation's surface transportation systems. Maintaining these systems is critical to sustaining America's economic growth. Therefore, there is a need to view various transportation modes from an integrated standpoint, particularly for the purposes of developing and implementing a Federal investment strategy and alternative funding approaches. In such an effort, the framework of goals, roles, tools, and evaluation can be particularly helpful—not only for marine transportation funding, but for other modes as well.

Mr. Chairmen, this concludes my testimony. I will be happy to respond to any questions you or other members may have.

---

#### APPENDIX I: SCOPE AND METHODOLOGY

To determine the amount of Federal expenditures to support the commercial marine,<sup>19</sup> aviation, and highway transportation systems and the amount of collections from Federal assessments on the users of these systems for fiscal years 1999, 2000, and 2001, we reviewed prior GAO reports and other relevant documents, and interviewed officials from the Office of Management and Budget and various industry representatives. On the basis of this determination, we contacted 15 Federal agencies and asked them to provide information on the expenditures<sup>20</sup> and collections<sup>21</sup> that were specific to the transportation systems, relying on each agency to identify expenditures and collections related to activities that support the transportation systems. In addition, we also received data from the U.S. Customs Service on the amount of duty collected on commodities imported by the transportation modes. The U.S. Customs Service provided estimates, developed by the U.S. Census Bureau, on the percent of collections that were attributable to water, sea, and land transportation modes. We applied these percentages to the total customs duties collected for fiscal years 1999, 2000, and 2001 provided by the U.S. Customs Service to compute the amount of total customs duties collected by the marine, aviation, and highway transportation systems each year.

We performed limited reasonableness tests on the data by comparing the data with the actual trust fund outlays contained in the budget of the U.S. Government for fiscal years 2001, 2002, and 2003. Although we had each agency validate the data provided, we did not verify agency expenditures and collections.

To identify initial considerations that could help the Congress in addressing whether to change the scope or nature of Federal investments in the marine transportation system, we conducted a review of prior GAO reports and other relevant studies to identify managerial best practices in establishing strategic plans and Federal investment approaches. We also interviewed U.S. Army Corps of Engineers and Department of Transportation officials to obtain information on the current state of the commercial marine transportation system, the ability of the system to keep pace with growing demand, and activities that are under way to assess the condition and capacity of the infrastructure. Our work was carried out from January 2002 to September 2002 in accordance with generally accepted government auditing standards.

---

<sup>18</sup>U.S. General Accounting Office, Executive Guide: Leading Practices in Capital Decision-Making, GAO/AIMD-99-32 (Washington, DC.: Dec. 1998).

<sup>19</sup>Noncommercial activities, to include Coast Guard missions such as search and rescue and drug and migrant interdiction, as well as recreational activities, were excluded from our review as our focus was on the commercial marine transportation system.

<sup>20</sup>For the purposes of this report, expenditures are outlays to pay Federal obligations identified by the agency for each fiscal year to support these systems, but may include payments for obligations incurred in previous fiscal years.

<sup>21</sup>Assessment collections are fees and taxes paid by users of a system that were identified by the agencies and may include revenues credited to Federal funds, offsetting collections, and offsetting revenue.

APPENDIX II: EXPENDITURES FOR THE MARINE, AVIATION, AND HIGHWAY  
TRANSPORTATION SYSTEMS BY SOURCE OF FUNDS (FISCAL YEARS 1999–2001)

Federal agencies spent an average of \$3.9 billion annually on the marine transportation system, \$10 billion annually on the aviation system, and \$25 billion annually on the highway system. Whereas the primary source of funding for the marine transportation system is general tax revenues, the vast majority of Federal funding invested in both the aviation and highway systems came from assessments on users of the systems. During the 3-year period, general revenues were the funding source for 80 percent of the expenditures for the marine transportation system. In contrast, assessments on system users were the funding source for 88 percent of the amount spent on the aviation system and nearly 100 percent of the amount spent on the highway system.

APPENDIX III: DISTRIBUTION OF AMOUNTS COLLECTED FROM USERS OF THE  
TRANSPORTATION SYSTEMS (FISCAL YEARS 1999–2001)

Federal agencies collected an average of \$1 billion annually from users of the marine transportation system, \$11.1 billion annually from users of the aviation system, and \$33.7 billion annually from users of the highway system. For all three transportation systems, most of the collections were deposited into trust fund accounts. During the 3-year period, 85 percent of the amounts collected from marine transportation system users, 94 percent of the amounts collected from aviation system users, and nearly 100 percent of the amounts collected from highway system users were deposited into trust fund accounts.

#### APPENDIX IV: AMOUNT COLLECTED FROM CUSTOMS DUTIES ON COMMODITIES TRANSPORTED ON THE TRANSPORTATION SYSTEMS (FISCAL YEARS 1999–2001)

Unlike the fees and taxes on users that are earmarked to support the transportation systems, customs duties are not an assessment on the system; rather, duties are assessed on imported goods transported by the systems. The majority of customs duties collected are deposited in the U.S. Treasury's general fund for the general support of Federal activities.<sup>22</sup> On average, the Customs Service reported \$19.8 billion collected annually for commodities imported by the transportation modes, with nearly 80 percent collected from the marine system.

Table 3: Amount of Customs Duties Collected for Commodities Transported on the Marine, Aviation, and Highway Transportation Systems, Fiscal Years 1999 through 2001  
dollars in millions

| Transportation System               | 1999     |         | 2000     |         | 2001     | Percent | Average Amount |
|-------------------------------------|----------|---------|----------|---------|----------|---------|----------------|
|                                     | Amount   | Percent | Amount   | Percent | Amount   |         |                |
| Marine .....                        | \$14,310 | 75      | \$15,624 | 76      | \$15,637 | 79      | \$15,190       |

#### RESPONSES BY JAYETTA HECKER TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question.* In your statement, you emphasize the importance of a more system-wide approach to Federal transportation programs—and in particular, focus on promoting intermodal approaches to meeting the rapidly growing requirements for freight infrastructure. You also proposed use of a framework to assist in refining Federal transportation policies focusing on national goals, defining roles of the many public and private stakeholders, selecting appropriate government tools to best leverage Federal resources, and evaluating performance of programs and policies. Can you discuss how this framework might assist the Congress in defining and developing a coherent national freight policy—and challenges and options that should be considered during the forthcoming reauthorization of the Transportation Equity Act for the 21st Century (TEA–21)?

<sup>22</sup>Under Section 612 of Title 7, about 30 percent of the gross receipts from customs duties are designated for agricultural and food programs. In addition, pursuant to 16 U.S.C. 3912, all duties on guns and ammunitions go to the Migratory Bird Conservation Fund and pursuant to 26 U.S.C. 9504, duties on fishing tackle and yachts and pleasure craft go to the Sports Fish Restoration account of the Aquatic Resources Trust Fund. Also, tariffs from wood and certain wood products are transferred to the Reforestation Trust Fund up to a total of \$30 million (16 U.S.C. 1606(a)).

Response. Moving toward a coherent national freight policy requires solutions that cut across modes and better prepare the Nation for the ever-expanding growth of international trade. Responding to that challenge requires evaluating the performance of existing legislation and programs in promoting an efficient intermodal freight transportation industry, establishing the promotion of an efficient intermodal freight industry as a national goal, defining the Federal role relative to other stakeholders, and developing funding tools and other approaches that maximize the return on the Federal investment. An elaboration of each component of this framework follows:

*Evaluation of Performance of Existing Legislative Framework and Programs in Promoting an Efficient Intermodal Freight Transportation Industry*

Evaluating the results of Federal investment programs and incorporating lessons learned into the decisionmaking process could provide decisionmakers with valuable information for determining whether intended benefits have been achieved and whether goals, responsibilities, and approaches should be modified. Such evaluations are also useful for better ensuring accountability and providing incentives for achieving results. For example, one goal for the marine transportation system might be to increase throughput (the volume of cargo) that can be transported through a particular lock and dam system on the nation's inland waterways. A performance measure to gauge the results of an investment for this goal might be the increased capacity that results from this investment and the economic benefits associated with that increase. Assessing progress in achieving this goal is, therefore, dependent on carrying out analyses of accurate and complete data.

*Establishing Promotion of an Efficient Intermodal Freight Industry as a National Goal to Guide Federal Participation*

There appears to be substantial consensus that promoting an efficient intermodal freight industry should be a central national goal for reauthorization of the core transportation legislation. The challenge is how to make such language more integral to the future structure and performance of transportation programs. One shift would be to consider articulation of a national goal related to freight/intermodal transportation in performance terms—and to structure revised or new programs around specific performance goals.

Clearly, in setting national goals and defining outcomes, the explicit focus would be on a system-wide, rather than mode-specific approach to transportation planning and funding and could include a focus on outcomes that users—both freight and passengers, both intercity and local—desire from the transportation system.<sup>1</sup> The key for achieving the goals, regardless of how detailed, is to align the goal with the roles of the various stakeholders and the funding approaches selected. For example, a performance oriented funding system could be developed in which the Federal Government would first define certain national interests of the transportation system—such as identifying freight corridors of importance to the national economy—then set national performance standards for those systems that States and localities must meet. Federal funds would be distributed to those entities that are addressing national interests and established standards. Any Federal funds remaining after meeting the performance standards could then be used for whatever transportation purpose the State or locality deems most appropriate to achieve State or local mobility goals.

Another feature of performance goals could include a focus on congestion, which is increasingly affecting travel times and the reliability of transportation systems. In the aggregate, congestion results in thousands of hours of delay every day, which can translate into costs such as lost productivity and increased fuel consumption. In addition, a decrease in travel reliability imposes costs on the traveler in terms of raising the cost of moving goods resulting in higher prices for consumers. While there is some evidence that freight transportation costs related to managing business operations have decreased as a percentage of gross national product (indicating that producers and manufacturers adjust to transportation supply by switching modes or altering delivery schedules to avoid delays and resulting cost increases), these adaptations by businesses represent economic inefficiencies that can be very costly. Increasing congestion can cause businesses to avoid a substantial number of trips that might result in a corresponding loss of the benefits of those trips.

National goals for the transportation system could also recognize that the concept of capacity is broader than just the physical characteristics of the transportation network (e.g., the number of lane-miles of road or locks on a waterway). The capac-

<sup>1</sup>U.S. General Accounting Office, *Surface and Maritime Transportation: Developing Strategies for Enhancing Mobility: A National Challenge*, GAO-02-775, (Washington, DC: Aug. 2002).

ity of transportation systems is also determined by how well they are managed and operated. Evidence has mounted that congestion on highways was in part due to poor management of traffic flows on the connectors between highways and poor management in clearing roads that are blocked due to accidents, inclement weather, or construction. For example, in the 75 metropolitan areas studied by the Texas Transportation Institute, 54 percent of annual vehicle delays in 2000 were due to incidents such as breakdowns or crashes. In addition, the Oak Ridge National Laboratory reported that, nationwide, significant delays are caused by work zones on highways; poorly timed traffic signals; and snow, ice, and fog.<sup>2</sup>

Another dimension of sound and efficient transportation systems that could be defined in national goals is the recognition of full life-cycle costs and benefits of various transportation programs, and building that concept into system-wide transportation planning and funding. Cost-benefit frameworks that transportation agencies currently use to evaluate various transportation projects could be more comprehensive in considering a wider array of social and economic costs and benefits, recognizing transportation systems' links to each other and to other social and financial systems. A model worthy of exploration is the Federal Transit Administration New Starts Program, where projects compete nationally, and are all scored not only for their projected transportation benefits but also for their effectiveness in assuring provisions are made to cover the long term operational costs of the system.

#### *Defining the Federal Role Relative to Other Stakeholders*

A central challenge of developing and refining national transportation policies and programs, particularly relative to freight transportation, is the intersection of public and private interests. A specific role issue surrounding development and refinement of a national freight transportation policy is the Federal vs. the State and local role in selecting and prioritizing freight projects. The structure of the core highway and transit programs since passage of the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) is to delegate decisionmaking and project prioritization to States and metropolitan planning organizations (MPOs). Because control of transportation investment decisions has been delegated to State and local governments, freight projects funded through programs such as the Congestion Mitigation and Air Quality Program (CMAQ), the National Highway System (NHS), and the Surface Transportation Program (STP) have to be identified as priorities within the State and MPO planning processes. In contrast, Federal discretionary grant programs such as the National Corridor Planning and Development and Coordinated Border Infrastructure programs (Borders and Corridors programs) provides funds over and above the annual State highway apportionment. Therefore, to address the role issues, congressional action could be guided by assessment of the relative strengths and weaknesses of programs that require freight projects to be identified as priorities within the State and MPO-led planning processes (CMAQ, NHS, and STP) relative to the experience with programs funded with resources over and above the regular formula allocations to the States (Borders and Corridors programs).

The diverse proposals put forth by various freight interests range from expanding eligibility and funding of any or all of these existing programs to numerous proposals for new freight set-aside programs. Thus, a central decision point for the Congress in defining a national freight policy is determination of the extent to which incentives can be refined sufficiently to enable local transportation planning to reflect national interests and priorities for intermodal freight needs or whether a directly federally administered program holds greater promise to efficiently meet the critical needs of this key segment of the transportation industry.

#### *Developing Funding Tools and Other Approaches That Maximize the Return on the Federal Investment*

Our recent mobility report on strategies for enhancing mobility identified the need for using a full range of tools to achieve desired mobility outcomes, providing more financing options, and developing additional revenue sources.<sup>3</sup> While new construction may hold some promise to ease congestion in certain bottlenecks, it is not always a viable solution due to cost, land, regulatory, or administrative constraints. Thus, balanced attention and priority needs to be given to using noncapital alternatives to meet capital investment needs. In December 1998, GAO reported that leading private sector and public organizations consider just such alternatives in

<sup>2</sup>S.M. Chin, O. Franzede, D.L. Greene, H.L. Hwang, and R. Gibson, *Temporary Losses of Capacity Study and Impacts on Performance*, Report No. ORNL/TM-2002/3 (Oak Ridge, TN: Oak Ridge National Laboratory, May 2002).

<sup>3</sup>U.S. General Accounting Office, *Surface and Maritime Transportation: Developing Strategies for Enhancing Mobility: A National Challenge*, GAO-02-775, (Washington, DC: Aug. 2002).

their capital decisionmaking process.<sup>4</sup> These alternatives can include (1) improving the management and operation of the existing system by increasing corrective and preventative maintenance and rehabilitation and (2) managing or reducing travel demand through pricing incentives. For example, capacity can be enhanced by performing needed maintenance on existing transportation systems to improve the speed and reliability of passenger as well as freight travel. In addition, investing in Intelligent Transportation Systems—technologies that enhance the safety, efficiency, and effectiveness of the transportation network—can serve as another way of increasing capacity and mobility without making major capital investments.<sup>5</sup> Finally, instituting tolls or fees during peak travel times may lead people to schedule recreational trips or move freight during less congested times or by alternate routes.

Regarding financing, the current system of financing surface and maritime transportation projects limits options for addressing mobility challenges. Separate funding for each mode at the Federal, State, and local level can make it difficult to consider possible efficient and effective ways for enhancing mobility. Providing more flexibility in funding across modes could help address this limitation. Transportation experts have also expressed concern that “earmarking” or designation by the Congress of Federal funds for particular transportation projects bypasses traditional planning processes used to identify the highest priority projects, thus potentially limiting transportation agencies’ options for addressing the most severe mobility challenges. Bypassing transportation planning processes can also result in logical connections or interconnections between projects being overlooked.

The public sector could expand support for alternative financing mechanisms to access new sources of capital and stimulate additional investment in surface and maritime transportation infrastructure. These mechanisms include both newly emerging and existing financing techniques such as providing credit assistance to State and local governments for capital projects and using tax policy to provide incentives to the private sector for investing in surface and maritime transportation infrastructure. However, these mechanisms currently provide only a small portion of the total funding that is needed for capital investment and are not, by themselves, a major strategy for addressing mobility challenges. Furthermore some of these mechanisms, such as Grant Anticipation Revenue Vehicles, could create difficulties for State and local agencies to address future transportation problems, because agencies would be reliant on future Federal revenues to repay the bonds.<sup>6</sup>

Finally, a key issue is how Federal revenues are raised and what level of funding is targeted. New or increased taxes or other fees imposed on the freight sector, while never an attractive option, could also help fund mobility improvements. For example, one way to raise revenue for funding mobility improvements would be to increase taxes on heavy trucks that move freight. According to FHWA, heavy trucks (weighing over 55,000 pounds) cause a disproportionate amount of damage to the nation’s highways and have not paid a corresponding share for the cost of pavement damage they cause.

Better aligning sources of revenues or user fees with actual use and damage, including contributions to congestion and pollution, hold promise to not only provide a source of revenue, but to promote more efficient use of congested infrastructure. Congestion is in part due to inefficient pricing of the infrastructure because users—whether they are drivers on a highway or barge operators moving through a lock—do not pay the full costs they impose on the system and on other users for their use of the system. If travelers and freight carriers had to pay a higher cost for using transportation systems during peak periods to reflect the full costs they impose, they would have an incentive to avoid or reschedule some trips and to load vehicles more fully, resulting in less congestion.

RESPONSES OF JAYETTA HECKER TO ADDITIONAL QUESTIONS FROM SENATOR REID  
AND SENATOR JEFFORDS

*Question 1.* Freight transportation is expected to double in the next 20 years. This increase in freight traffic will occur at the same time that congestion on our roads is already at levels many of us consider unacceptable. Clearly, capacity issues have to be at the top of our list as we begin to reauthorize our surface transportation programs. However, in addition to building new physical capacity, we will need to seek ways to squeeze more out of our existing transportation infrastructure through intelligent transportation systems, better operations, and perhaps a more efficient mix of transportation choices. Please give your thoughts on what we can do when we reauthorize Transportation Equity Act for the 21st Century (TEA-21) to get the most efficient use out of our transportation infrastructure.

Response. Our recent work on surface and maritime transportation mobility provides insight on several strategies that offer promise for enhancing the efficiency of the transportation infrastructure and addressing mobility challenges, especially growing congestion.<sup>7</sup> We developed these strategies based upon expert opinion drawn from two panels of surface and maritime transportation experts that we convened in April 2002. These strategies include:

*Strategy 1:* Encourage the development of transportation planning and funding systems that focus on the entire surface and maritime transportation system rather than on specific modes or types of travel to achieve desired mobility outcomes. Some examples of alternative planning and funding systems include the following:

- Performance-oriented funding system. The Federal Government would define certain national interests of the transportation system, set national performance standards for those systems, and distribute Federal funds to entities that address national interests and meet the performance standards.
- Federal financial reward-based system. Federal support would reward those States or localities that apply Federal money to gain efficiencies in their transportation systems, or tie transportation projects to land use and other local policies to achieve community and environmental goals, as well as mobility goals.
- System with different Federal matching criteria for different types of expenditures that might reflect Federal priorities. For example, if infrastructure preservation became a higher national priority than building new capacity, matching requirements could be changed to a 50 percent Federal share for building new physical capacity and an 80 percent Federal share for preservation.
- System in which State and local governments pay for a larger share of transportation projects, which might provide them with incentives to invest in more cost-effective projects. Reducing the Federal match for projects in all modes may give States and localities more fiscal responsibility for projects they are planning. If cost savings resulted, these entities might have more funds available to address other mobility challenges. Making Federal matching requirements equal for all modes may avoid creating incentives to pursue projects in one mode that might be less effective than projects in other modes.

*Strategy 2:* Use a full range of techniques to achieve desired mobility outcomes. The techniques that offer promise for achieving more efficient use of the transportation infrastructure are as follows:

- Increase infrastructure maintenance and rehabilitation. An emphasis on enhancing capacity from existing infrastructure through increased corrective and preventive maintenance and rehabilitation is an important supplement to, and sometimes a substitute for, building new infrastructure. Maintaining and rehabilitating transportation systems can improve the speed and reliability of passenger and freight travel, thereby optimizing capital investments.
- Improve management and operations. Better management and operation of existing surface and maritime transportation infrastructure is another technique for enhancing mobility because it may allow the existing transportation system to accommodate additional travel without having to add new infrastructure. For example, the Texas Transportation Institute reported that coordinating traffic signal timing with changing traffic conditions could improve flow on congested roadways. Shifting the focus of transportation planning from building capital facilities to an "operations mindset" may require a cultural shift in many transportation institutions, particularly in the public sector, so that the organizational structure, hier-

<sup>7</sup>See U.S. General Accounting Office, *Surface and Maritime Transportation: Developing Strategies for Enhancing Mobility: A National Challenge*, GAO-02-775 (Washington, DC: Aug. 30, 2002) and U.S. General Accounting Office, *Surface and Maritime Transportation: Challenges and Strategies for Enhancing Mobility*, GAO-02-1132T (Washington, DC: Sept. 30, 2002).

archy, and rewards and incentives are all focused on improving transportation management and operations.<sup>8</sup>

- Increase investment in technology. Increasing public sector investment in Intelligent Transportation System (ITS) technologies that are designed to enhance the safety, efficiency, and effectiveness of the transportation network, can serve as a way of increasing capacity and mobility without making major capital investments. ITS includes technologies that improve traffic flow by adjusting signals, facilitating traffic flow at toll plazas, alerting emergency management services to the locations of crashes, increasing the efficiency of transit fare payment systems, and other actions. Other technological improvements include increasing information available to users of the transportation system to help people avoid congested areas and to improve customer satisfaction with the system.

- Use demand management techniques. Another approach to reducing congestion without making major capital investments is to use demand management techniques to reduce the number of vehicles traveling at the most congested times and on the most congested routes. One type of demand management for travel on public roads is to make greater use of pricing incentives. In particular, some economists have proposed using congestion pricing that involves charging surcharges or tolls to drivers who choose to travel during peak periods when their use of the roads increases congestion. These surcharges might help reduce congestion by providing incentives for travelers to share rides, use transit, travel at less congested (generally off-peak) times and on less congested routes, or make other adjustments. The surcharges may also lead businesses to move freight during less congested times or by alternate routes. At the same time, congestion pricing generates more revenues that can be targeted to alleviating congestion in those specific corridors. In addition to pricing incentives, other demand management techniques that encourage ride-sharing through carpools and vanpools may also be useful in reducing congestion. We note, however, that demand management techniques on roads, particularly those involving pricing, often provoke strong political opposition and raise equity issues that arise from the potentially regressive nature of these charges (i.e., the surcharges constitute a larger portion of the earnings of lower income households and therefore impose a greater financial burden on them).

*Strategy 3:* Provide more options for financing mobility improvements and consider additional sources of revenue. There are three potential elements to this strategy, as follows:

- Increase funding flexibility. The current system of financing surface and maritime transportation projects limits options for addressing mobility challenges. For example, separate funding for each mode at the Federal, State, and local level can make it difficult to consider possible efficient and effective ways for enhancing mobility. Providing more flexibility in funding across modes could help address this limitation.

- Expand support for alternative financing mechanisms. The public sector could also expand its financial support for alternative financing mechanisms to access new sources of capital and stimulate additional investment in surface and maritime transportation infrastructure. These mechanisms include both newly emerging and existing financing techniques such as providing credit assistance to State and local governments for capital projects and using tax policy to provide incentives to the private sector for investing in surface and maritime transportation infrastructure.<sup>9</sup> These mechanisms currently provide a small portion of the total funding that is needed for capital investment and some of them could create future funding difficulties for State and local agencies because they involve greater borrowing from the private sector.

- Consider new revenue sources. A possible future shortage of revenues may limit efforts to address mobility challenges, according to many of the panelists that we consulted. For example, some panelists said that because of the increasing use of alternative fuels, revenues from the gas tax are expected to decrease, possibly limiting funds available to finance future transportation projects. One method of raising revenue is for counties and other regional authorities to impose sales taxes for funding transportation projects. A number of counties have already passed such taxes and more are being considered nationwide. However, several panelists expressed concerns that this method might not be the best option for addressing mobility challenges because (1) moving away from transportation user charges to sales taxes that are not directly tied to the use of transportation systems weakens the

<sup>8</sup>Joseph M. Sussman, "Transitions in the World of Transportation: A Systems View," *Transportation Quarterly* 56 (2002): 21–22.

<sup>9</sup>See U.S. General Accounting Office, *Transportation Infrastructure: Alternative Financing Mechanisms for Surface Transportation*, GAO1–02–1126T (Washington, DC: Sept. 25, 2002).

ties between transportation planning and finance and (2) counties and other taxing authorities may be able to bypass traditional State and metropolitan planning processes because sales taxes provide them with their own funding sources for transportation.

New or increased taxes or other fees imposed on the freight sector could also help fund mobility improvements, for example, by increasing taxes on freight trucking. The Joint Committee on Taxation estimated that raising the ceiling on the tax paid by heavy vehicles to \$1,900 could generate about \$100 million per year.<sup>10</sup> Another revenue raising method would be to dedicate more of the revenues from taxes on alternative fuels, such as gasohol, to the Highway Trust Fund rather than to Treasury's general fund, as currently happens. However, this would decrease the amount of funds available for other Federal programs. Finally, pricing strategies, mentioned earlier in this statement as a technique to reduce congestion, are also possible additional sources of revenue for transportation purposes.

*Question 2.* We clearly have significant freight transportation needs across our Nation. How do we determine what our freight priorities should be? Do we have sufficient information to determine which freight corridors, border crossings, ports, intermodal facilities, and connectors should be our top funding priorities? Where is our freight infrastructure least efficient and where is the growth expected to occur?

*Response.* GAO has not performed work in this area. Therefore, we are unable to directly address your questions concerning the nation's freight priorities. We believe, however, that the Federal programs established in core transportation legislation should be evaluated to determine the extent to which these programs are enhancing freight transportation. As such, we are currently working with your staffs to undertake such work.

It would be prudent to evaluate the results of Federal programs to determine if programs are enhancing freight transportation. There appears to be substantial consensus that the reliability and effectiveness of the nation's freight transportation system is being constrained because of increasing demand and capacity limitations. Projected increases in the volume of freight being transported over the nation's transportation infrastructure and changes in the freight industry, such as just-in-time delivery and e-commerce, are placing new demands on the transportation system by requiring more freight to be shipped more frequently over the system. Furthermore, capacity and mobility limitations of the existing infrastructure—such as the need for deeper harbor channels to accommodate bigger ships, terminal capacity/expansion limitations, congestion on intermodal connectors, and aging and limited low-capacity locks on our nation's rivers—could potentially pose threats to our ability to move goods efficiently. While system stakeholders have maintained that demand and capacity limitations have not received the attention necessary to meet projected needs, these issues have not been evaluated on a system-wide basis.

Although the Intermodal Surface Transportation Efficiency Act (ISTEA) and TEA-21 allowed transportation planners to consider freight transportation requirements when developing transportation plans and making investment decisions, freight carriers and users have questioned whether the mandate set forth in core transportation legislation has been successful. Because control of transportation investment decisions has been delegated to State and local governments, freight projects funded through most of the programs have to be identified as priorities within the State and metropolitan planning organization (MPO) planning processes. States and MPOs, however, must weigh the need for freight transportation projects against priorities for other transportation projects. Furthermore, freight systems are global in scope whereas the perspective of State and local planners is limited to the area over which they have jurisdiction.

In our recent report on maritime finance,<sup>11</sup> we provide a framework for national infrastructure investment. The first component of this framework calls for evaluating results and incorporating lessons learned into the decisionmaking process. We are currently working with your staffs to evaluate many of these freight transportation issues.

*Question 3.* The Borders and Corridors programs have not worked very well. One improvement we should consider is to revise this program to encourage public-private partnerships through a greater emphasis on innovative finance and other creative incentives. How else can we improve the Borders and Corridors programs to target the highest priority freight corridors and intermodal facilities?

<sup>10</sup>See U.S. General Accounting Office, *Highway Financing: Factors Affecting Highway Trust Fund Revenues*, GAO-02-667T (Washington, DC: May 9, 2002).

<sup>11</sup>U.S. General Accounting Office, *Marine Transportation: Federal Financing and a Framework for Infrastructure Investments*, GAO-02-1033, (Washington, DC: Sept. 9, 2002).

Response. In your question, you raised concern that the Borders and Corridors programs have not worked well and inquired about approaches (other than innovative finance and incentives) that might improve the programs. Absent an evaluation of the programs, we are not able to take a position on whether the programs have been successful in advancing freight projects. We can, however, provide information on noncapital alternatives to meet capital investment needs based on our recent work on surface and maritime transportation mobility.<sup>12</sup>

According to a report issued by the Federal Highway Administration (FHWA),<sup>13</sup> since States and MPOs must balance competing priorities for scarce transportation funding, the project prioritization process established in ISTEA and TEA-21 may serve to detract focus from freight projects within the State and MPO decision-making process. A common complaint of freight carriers and users of the system is that freight issues cannot compete with other politically popular projects, such as passenger projects. The Borders and Corridors programs, established in TEA-21, addressed this difficulty by providing funds over and above the annual State highway apportionment.

The FHWA report also notes that although the programs have been a good source of funding for freight projects, the programs have purportedly been oversubscribed and much of the program funds have been earmarked for non-freight projects. The apparent demand for funds under these programs suggests that there is a need for such programs. As previously noted, we are not able to take a position on whether the programs have been successful. We can, however, provide strategies that could be considered when developing the legislative reauthorization package.

In our recent mobility report on strategies for enhancing mobility, we identified the need for using a full range of tools to achieve desired program outcomes. While new construction may hold some promise to ease congestion in certain bottlenecks, it is not always a viable solution due to cost, land, regulatory, or administrative constraints. Therefore, noncapital alternatives to meet capital investment needs should also be considered. These alternatives can include improving the management and operation of the existing system through corrective and preventative maintenance and rehabilitation and/or managing or reducing travel demand through pricing incentives. Another alternative we proposed in our mobility report involves instituting tolls or fees during peak travel times which may lead people to schedule recreational trips or move freight during less congested times or be alternate routes.

Question 4: One way to squeeze more capacity out of existing infrastructure is through more rapid deployment of Intelligent Transportation Systems and an increased focus on the operations and management of regional transportation systems. How much potential do Intelligent Transportation System initiatives have for improving the efficiency of freight operations and what can we do to promote the development of a freight-friendly ITS infrastructure?

Response. We have not done any recent work to evaluate Intelligent Transportation Systems (ITS) initiatives or to identify strategies for promoting "freight-friendly" ITS infrastructure. As noted in our response to question 1, however, our recent work on strategies for addressing mobility provides information about Intelligent Transportation Systems (ITS). The Department of Transportation's ITS program applies proven and emerging technologies-drawn from computer hardware and software systems, telecommunications, navigation, and other systems-to surface transportation. In fiscal year 2001, nearly 50 percent of FHWA's \$387.2 million research and technology budget was allocated to intelligent transportation systems.<sup>14</sup> A number of intelligent transportation systems offer promise for improving the efficiency of freight transportation. For example, highway-rail intersection systems are being developed to coordinate traffic signal operations and train movement and notify drivers of approaching trains using in-vehicle warning systems. Also, commercial vehicle intelligent transportation systems are being developed that will apply technologies to improve the safety and productivity of commercial vehicles and drivers, reduce commercial vehicles' operations costs, and facilitate regulatory processes for the trucking industry and government agencies.

Question 5: What can we do to promote better regional freight planning and how do we ensure that planning agencies take a comprehensive, intermodal approach to infrastructure planning and development? In particular, when it comes to freight, how do we bring the private sector into the public planning process?

<sup>12</sup>U.S. General Accounting Office, *Surface and Maritime Transportation: Developing Strategies for Enhancing Mobility: A National Challenge*, GAO-02-775, (Washington, DC: Aug. 30, 2002).

<sup>13</sup>Federal Highway Administration, *Freight Financing Options for National Freight Productivity*, (Washington, DC: Apr. 2001).

<sup>14</sup>U.S. General Accounting Office, *Highway Research: Systematic Selection and Evaluation Processes Needed for Research Program*, GAO-02-573 (Washington, DC: May 24, 2002).

Response. GAO has not reviewed the freight planning process. We are therefore unable to proffer suggestions on how the process can be improved. At this time, we are planning to undertake work that would allow us to more fully address this question.

We can provide the following observations based on our recent work on surface and maritime transportation mobility and expert panels we convened to discuss major transportation issues:

- Planning with a regional focus. Experts participating in a conference we sponsored on June 14, 2001 to discuss major transportation issues raised concerns about integrating freight needs into transportation planning and investment decisions.<sup>15</sup> Conference speakers supported more planning with a regional focus-with participation by Federal, State, and local entities-to make better use of Federal transportation assistance.

- Modal limitations. Experts participating in a conference we sponsored on January 26, 1999 noted that freight stakeholders must become full partners in making transportation policy so that surface transportation investments are linked to freight needs.<sup>16</sup> Facilitating freight users' and suppliers' involvement in transportation policy will enhance the nation's ability to move freight seamlessly across different transportation systems. In addition, manufacturers and freight companies regard the Department of Transportation's "stovepipe" organization as a major obstacle to working with the Federal Government. They find it difficult to discuss intermodal projects or emerging issues with a single DOT agency that is responsible only for highway or maritime issues.

- Knowledge/expertise. The January 26, 1999 conference participants also noted that the public sector must better understand the needs and problems of moving freight nationally and regionally. State transportation departments and MPOs, however, may not have sufficient expertise, or in some cases, authority to effectively identify and implement mobility improvements across modes or types of travel.<sup>17</sup>

- Research. The January 26, 1999 participants noted that Federal policymakers should renew their commitment to funding nationally important research. While TEA-21 substantially increased States' research funding, it considerably reduced funds for Federal research. State research programs focus on short-term practical problems whereas Federal research focuses on long-term and high-risk research, intermodal problems, and transportation policies.

- Best practices. In our recently issued mobility report, experts offered the Alameda Corridor as an example of successful cooperation and coordination of freight needs. The Alameda Corridor is designed to improve cargo movement from California's ports of Los Angeles and Long Beach to the rest of the country. Its planning, financing, and building required cooperation among private railroads, the local port authorities, the cities of Los Angeles and Long Beach, community groups along the corridor, the State of California, and the Federal Government.

*Question 6 (from Senator Jeffords).* I have a hypothesis that if more was done to provide strategic investment in rail infrastructure, we could reduce congestion on our highways and improve the quality air we breathe. For instance, in Chicago, it is my understanding that a majority of the truck traffic in the metro area is a result of cargo being off loaded from one rail line and being shipped to another part of town to be loaded on another train to continue its journey. If funding were made available for improving rail-to-rail connections in the Chicago area, what kind of effect would consolidating rail yards and rail lines in the Chicago area have on truck traffic on the highway system?

Response. GAO has not conducted work on rail-to-rail connections in the Chicago area and therefore, we are unable to comment on the effect consolidating rail yards and lines in the Chicago area would have on truck traffic.

---

STATEMENT OF KATIE DUSENBERRY, CHAIRMAN, ARIZONA DEPARTMENT OF  
TRANSPORTATION BOARD

Good morning Mr. Chairman and members of the committee. Thank you for the opportunity to present to you today the views of the Arizona Department of Trans-

<sup>15</sup>U.S. General Accounting Office, *Physical Infrastructure: Crosscutting Issues Planning Conference Report*, GAO-02-139, (Washington, DC: Oct. 1, 2001).

portation Board regarding the Hoover Dam Bypass Project and the impact on commercial trucking.

For the record, my name is Katie Dusenberry, and I am the chairman of the Arizona Department of Transportation Board. The Board is responsible for a variety of transportation activities prescribed by Arizona statute.

#### *Introduction*

Over the past 10 years, there has been a significant growth in freight due to improvements in manufacturing processes and new technologies. This growth, while important for economic vitality, stresses our trade gateways and corridors. U.S. DOT has estimated that freight traffic will double over the next 20 years making the condition of these trade corridors even more critical. Our economic growth and ability to maintain a competitive edge in international markets depends on the condition and capacity of these trade corridors to accommodate the ever increasing freight traffic.

#### *History*

U.S. Highway 93 is part of the major transportation network in the western United States and is the primary, direct north-south connecting highway linking two major metropolitan cities, Phoenix, Arizona and Las Vegas, Nevada, in two of the fastest growing States in the United States. U.S. 93 is one of the highway segments that makes up the route from Mexico City, Mexico to Edmonton, Canada known as the CANAMEX Corridor. This corridor was formally designated as a high-priority trade corridor by the National Highway System Designation Act of 1995. The Corridor runs from Mexico City to I-19 in Nogales to Tucson, I-10 from Tucson to Phoenix, US 93 in the vicinity of Phoenix to the Nevada Border, US 93 from Arizona to Las Vegas and I-15 from Las Vegas through Montana to Edmonton, Canada.

The CANAMEX Corridor represents an opportunity for economic development that facilitates trade and encourages economic growth throughout the region. The interest in developing this Corridor is to facilitate transportation distribution, commerce and tourism. A preliminary study of the potential positive economic impact if the CANAMEX Corridor is fully developed suggests over a 30 year period:

- Economic development (value added) of \$1.2 billion;
- Economic efficiencies of \$509 million;
- Approximately 1,900 new permanent jobs.

These figures reflect completion of a number of projects within the Corridor including the Hoover Dam Bypass project.

Prior to the terrorist attacks on 9/11/01, the direct route for all traffic, including commercial trucks, to reach either Arizona or Nevada was a road across the top of Hoover Dam consisting of two lanes of traffic, one in each direction. The approach from Arizona to the Hoover Dam consists of approximately 1.2 miles of roadway and from Nevada, 2.2 miles of roadway. On the approach to Hoover Dam from both Arizona and Nevada, steep grades, hairpin turns, and inadequate sight distance are encountered by freight and passenger traffic reducing speeds to between 8 to 18 MPH. Commercial trucks are often too large to pass each other on the extreme hairpin curves and must come to a complete stop. On both the Arizona and Nevada approaches, the grades are greater than 6 percent. The existing 6.3 miles north and south of the Dam requires an average of 16.5 minutes to cross due to the nature of the road and the traffic on the Dam itself. To remedy the inadequacy of this route, the Federal Highway Administration (FHWA) in cooperation with the States of Arizona and Nevada and other affected Federal and State agencies has taken a leadership role in developing plans to construct a new bridge to cross the Colorado River in the vicinity of Hoover Dam. This bridge is entirely on Federal property and therefore should be largely a Federal financial responsibility.

Since 9/11/01, the road across the Hoover Dam has been closed to commercial trucking and over 2,100 trucks per day are now detoured to other highways. Commercial truck traffic must now route through Laughlin, an additional 23 miles or I-40 an additional 70 miles, adding dozens of travel miles to each trip. This creates a negative financial impact of \$30 million per year, based on only the additional mileage, which is ultimately passed on to the consumer. The detours currently being used by commercial trucks are not designed to handle this traffic volume and weight. The Hoover Dam crossing is the only major highway in the Nation with ongoing restrictions as a result of the terrorist attack.

### *Purpose of Project*

The purpose of the project, a joint effort among Arizona, Nevada and the Federal Government is to significantly reduce traffic on the road atop the Hoover Dam and will accomplish the following objectives:

- Remove a major bottleneck to interstate and international commerce and travel by reducing traffic congestion and accidents in this segment of the major commercial route.
- Separate tourist and commercial traffic to reduce congestion.
- Improve efficiency and reduce cost to the shippers of freight by reducing travel time.
- Replace an inadequate federally owned highway river crossing, first constructed over 60 years ago, with a new bridge that meets current roadway design criteria and improves both vehicle and truck capacity on U.S. 93 in the area of the Dam.
- Minimize the potential for pedestrian—vehicle accidents on the Dam crest and on the Nevada and Arizona approaches.
- Protect the Hoover Dam, visitors, employees, equipment, and power generation capabilities and Colorado River waters while enhancing the visitors' experience at Hoover Dam.

The FHWA recommended the Sugarloaf alignment as the best location to construct the bridge. This location is approximately 1,500 feet downstream from Hoover Dam. This site requires constructing 2.2 miles of highway approach in Nevada and approximately 1.2 miles of highway approach in Arizona and a 2,000-foot long bridge.

### *Travel Times*

The current travel time across the top of the Hoover Dam averages 16.5 minutes up to 60 minutes during peak hours. The proposed bypass bridge and approaches would reduce the travel time to only 6 minutes.

When accidents occur on and near the Dam, significant traffic backups of over ten to 15 miles result. Since there are no alternative routes to which traffic can shift, this results in delays ranging from two to 5 hours for motorists. There have been incidents of up to 18 hours delay.

### *Accident Statistics*

The number of tourists traveling to the Lake Mead Recreational Area and Hoover Dam was 1.03 million in 1997 and was projected to increase to 1.6 million in 1999. Since 1964 more than 500 accidents have occurred in the 3.4 mile stretch of highway on or near the Hoover Dam. Commercial trucks were involved in 96 of these accidents. Forty-three accidents between 1985 and 1991 involved one or more personal injuries, including two fatalities. In each accident, the cause was partially attributable to sharp curves, narrow highway widths, insufficient shoulder widths, poor sight distance and slow travel speeds. Especially in regards to freight traffic, the previous configuration of putting trucks across the Hoover Dam with two-lane traffic, steep approaches, sharp curves at the entrances and heavy pedestrian traffic, the Hoover Dam was a serious accident location.

One mile of the Hoover Dam road reflects a much higher accident rate than the three-mile adjoining segments. The half-mile segments of US 93 approaching the Dam have an accident rate of 3.97 per million vehicle miles traveled. That rate is over three times the Nevada average of 1.15 per million vehicle miles traveled for rural principal arterial routes.

Traffic on the road across the Hoover Dam was 5,500 vehicles per day in 1993 and currently is 11,500 vehicles per day. 18 percent to 20 percent was truck traffic prior to 9/11/01. Future traffic is projected to be 21,000 in 2017 and 26,000 in 2027. As the average annual daily traffic across the Dam continues to increase, the number of accidents is increasing accordingly as congestion on the Dam also increases.

### *Security*

Since Hoover Dam holds the waters of Lake Mead, the largest water reservoir in the Nation, the U.S. Department of Interior has identified the Hoover Dam Bypass Project as its No. 1 national security priority. The massive Dam provides vital flood control for more than a quarter million people living in the Colorado River region and generates four billion kilowatt-hours of energy for 1.3 million people in the tri-State regions of California, Arizona and Nevada.

### *Project Status*

- Hoover Dam Bypass Project received its record of decision for project approval in April 2001. The Environmental Impact Statement has been finalized.

- This project is the No. 1 priority of the States of Arizona and Nevada. Only an additional \$108 million is needed to ensure full funding for this project.
- The design is over 95 percent complete for the Arizona approach. Nevada's approach is 60 percent complete. The bridge design is 30 percent complete.

Funding

|  | Current       |
|--|---------------|
| Nevada & Arizona State funds .....       | \$40,000,000  |
| Federal Funds previously committed ..... | \$86,000,000  |
| Additional Federal Funding needed .....  | \$108,000,000 |
| Total Project Budget .....               | \$234,000,000 |

We are requesting \$108 million to complete the Hoover Dam Bypass Project. Because there are no complex interchanges and only one small area of roadway on either side of the bridge to construct, we are confident that the bridge as designed will be completed within the entire project budget of \$234 million dollars. The bridge's design ensures that it will accommodate anticipated traffic volumes including increased freight that will be generated due to the north-south trade from Mexico to Canada well into the future.

*GARVEE Bonds / Innovative Financing*

Because of the great need to construct the Hoover Dam Bypass, Grant Anticipation Revenue Vehicles (GARVEEs) are being considered as a mechanism to provide immediate funds to complete the construction of the Hoover Dam Bypass through the issuing of bonds. Even though bond financing incurs interest and other debt-related costs, delaying the project would create greater costs such as inflation, lost driver time, freight delays, and wasted fuel. Both Arizona and Nevada are interested in pursuing this as an option to allow construction to begin immediately, while allowing Federal funding to occur over time. This allows for completion of the Hoover Dam Bypass by mid 2007 and thereby, providing a safe and efficient route for commercial trucking.

*Conclusion*

Mr. Chairman and members of the committee, we urge you to consider providing an additional \$108 million dollars to fully fund the Hoover Dam Bypass. The bypass project is vital to the efficient movement of commercial freight and will substantially reduce the additional miles and travel times that commercial trucks are currently experiencing. This project is also a critical part of the development of the CANAMEX Corridor which runs from Mexico to Canada and will provide economic growth and safer transportation by increasing commercial freight, commerce and tourism.

STATEMENT OF MICHAEL W. WICKHAM, CHAIRMAN AND CEO, ROADWAY CORPORATION, FOR THE AMERICAN TRUCKING ASSOCIATIONS, INC.

Chairmen Reid and Breaux, Senators Inhofe and Smith, members of the subcommittees, thank you for the opportunity to express the trucking industry's perspectives regarding freight transportation. I am Michael Wickham, Chairman of the Board and Chief Executive Officer of Roadway Corporation. Roadway is headquartered in Akron, OH. The company was founded in 1930, and today we are one of the Nation's leading providers of less-than-truckload (LTL) freight transportation services. Roadway provides seamless service between all 50 States, Canada, Mexico, and Puerto Rico, with international freight services for 140 countries. We have subsidiaries in Canada and Mexico, and we operate 379 terminals throughout North America. Roadway employs more than 26,000 people. Roadway's Mexican and Canadian operations connect our neighbors with 96 percent of the U.S. population through seamless cross-border operations and services. In addition, Roadway ships over three billion pounds of truckload freight annually. Through Roadway Air, our company provides time-definite air freight delivery services.

I am appearing before the subcommittees today on behalf of the American Trucking Associations, Inc. (ATA) and Roadway Corporation. ATA is the national trade association of the trucking industry. We are a federation of affiliated State trucking associations, conferences, and other organizations that together include more than 37,000 motor-carrier members, representing every type and class of motor carrier in the country. We represent an industry that employs nearly ten million people, providing one out of every 14 civilian jobs. While we are a highly diverse industry,

we all agree that a good highway system is crucial to our Nation's economy, to the safety of all drivers, and to our bottom line. This includes the more than 3 million truck drivers who travel over 400 billion miles per year to deliver to Americans 86 percent of their transported food, clothing, finished products, raw materials, and other items.<sup>1</sup>

American industrial and commercial enterprises are able to compete more effectively in the global marketplace due to the benefits of safe and efficient trucking. Truck transportation is the most flexible mode for freight shipment, providing door-to-door service to every city, manufacturing plant, warehouse, retail store and home in the country. For many people and businesses located in towns and cities across the United States, trucking services are the only available means to ship goods. Trucks are the only providers of goods to 75 percent of American communities. Five percent of the Nation's GDP is created by truck transportation. Actions that affect the trucking industry's ability to move its annual 8.9 billion tons of freight have significant consequences for the ability of every American to do their job well and to enjoy a high quality of life.

#### BUILDING ON SUCCESS: MAKING OUR NATION'S HIGHWAYS SAFER FOR ALL MOTORISTS

Having spent my entire career in the trucking industry, I am most proud of the fact that we continue to improve our safety record, year after year, mile after mile. Safety must be paramount in our consideration of future reauthorization programs and policies. ATA takes safety concerns very seriously. Our industry has strongly promoted many safety improvements that have made trucking safer today than it has ever been in the past. Between 1985 and 2000, the fatal accident rate involving trucks has fallen 44 percent. Furthermore, research by the AAA Foundation, and a study done by the University of Michigan at the request of the USDOT, found that in about three-quarters of accidents involving a passenger vehicle and a truck, the actions of the truck driver were not a factor leading to the accident.<sup>2</sup>In fact, today's truck driver is the safest driver—passenger or commercial—in our Nation's recorded history.

Even though the trucking industry is taking proactive steps to improve our safety record, ATA is very concerned about America's overall highway safety experience. Each year, more than 40,000 people lose their lives as a result of a traffic accident. This is an unacceptable loss of life and an economic tragedy. As Secretary of Transportation Norman Mineta announced earlier this year, the economic impact of motor vehicle crashes is over \$230 billion per year. This represents an annual economic loss of \$820 for every American. Investing additional resources in projects and programs that improve highway safety produces more than human benefits; it has positive economic consequences as well. However, we should also spend our money wisely, directing precious resources toward those activities that will produce the greatest safety benefit, based on sound scientific evaluation of the causes of crashes and appropriate remedies.

It is clear that truck safety has improved over the last 20 years. An interesting question, however, is "What has caused the improvement?" This is a tough question to answer for both industry and government officials. It's fairly clear that some programs that have been implemented in the last 10 to 20 years have contributed to the overall positive picture. The industry-supported Federal-State truck safety inspection grant program (known as the Motor Carrier Safety Assistance Program or MCSAP) has had an impact by improving trucks' condition; the Commercial Driver's License (CDL) program has contributed by raising the bar for driver entry into the industry; and the implementation of voluntary drug testing by the industry and a mandatory Federal drug and alcohol testing program have also contributed in a positive way. It is very likely that the increase in seat belt use by truck drivers and other motorists have also had a positive impact. Many other industry and government initiatives are likely to have had some benefit as well. The point here, however, is that we still need to have a better understanding of what has worked and why. Additionally, we still do not understand thoroughly how and why truck crashes occur.

Section 224 of the Motor Carrier Safety Improvement Act of 1999 (MCSIA, P.L. 106-159) required the Secretary of Transportation to conduct a comprehensive study to determine the causes of, and contributing factors to, crashes involving large trucks and buses. The primary purpose of this study requirement was to have a

<sup>1</sup>87.3 percent by revenue. American Trucking Associations, *U.S. Freight Transportation Forecast to 2013*, 2002.

<sup>2</sup>"Driver-Related Factors in Crashes Between Large Trucks and Passenger Vehicles," Federal Highway Administration, April 1999; "Identifying Unsafe Driver Actions that Lead to Fatal Car-Truck Crashes," AAA Foundation, April 2002.

comprehensive analysis and report that would yield information to help FMCSA and the States identify activities and safety measures that would likely lead to significant reductions in the frequency, severity and rate per mile traveled of crashes involving large trucks and buses. ATA fully supported this study concept during the truck safety debate in 1999 that resulted in the passage of MCSIA.

FMCSA initiated this study in 2000 with the assistance of the National Highway Traffic Safety Administration (NHTSA), and the State agencies involved in commercial vehicle safety efforts. The study will not be complete until the end of 2003 at the earliest. However, a FMCSA official recently confirmed that preliminary information suggests that driver actions—both passenger and commercial—appear to be a more significant factor in accident causation than previously thought, and that enforcement resources may have to be redirected to reflect these findings.<sup>3</sup>

Other studies and data confirm these preliminary findings.<sup>4</sup> Congress and the U.S. DOT have traditionally taken different approaches to improving traffic safety versus truck safety. NHTSA's traffic safety programs have included education and outreach, traffic enforcement programs aimed at changing driver behavior, and crash data analysis. FMCSA's truck safety programs, on the other hand, have focused on increasing the number of regulatory requirements on drivers and carriers, enforced through on-road safety inspections and facility compliance audits. Since so much of truck safety is rooted in overall traffic safety, Congress should seriously consider much more of a traffic safety approach to improving truck safety.

Earlier this year, ATA's President and CEO, William Canary, challenged our State and Federal partners to seriously address one of the most pervasive and dangerous violations of the law that drivers encounter every day—speeding. FMCSA reports that speeding (exceeding the speed limit or driving too fast for conditions) was a contributing factor in 22 percent of fatal crashes involving a truck in 2000. Since the majority of fatal truck crashes are multi-vehicle crashes involving one or more passenger vehicles, this 22 percent figure includes speeding on the part of the truck driver, or speeding on the part of the other driver, or speeding by both parties. Also, according to a recent FMCSA study, driving at an unsafe speed was the second most frequent unsafe driving act committed by passenger vehicles in the vicinity of large trucks. Following too closely was the most frequently cited unsafe driving act by motorists.

Additionally, NHTSA reports that speeding was a contributing factor in 29 percent of all fatal crashes in 2000. This means that more than 12,000 people lost their lives in 2000 in part due to speed-related crashes. This is simply unacceptable. The time has come to combat excessive speeding. There are four words that every motorist and every commercial vehicle driver needs to remember when they buckle up and take the wheel of their vehicle: *Safe Speeds Save Lives!*

The Section 402 Highway Safety Grant Program administered by the NHTSA supports many outreach and enforcement programs, including the priority programs to encourage the proper use of occupant protection devices and reduce drug and alcohol impaired driving. While these programs clearly deserve a high priority for NHTSA, ATA is concerned that strong, visible speed enforcement may not be getting the focus, attention and funding it deserves by NHTSA.

Additionally, the Motor Carrier Safety Assistance Program (MCSAP) administered by FMCSA focuses on priority truck and bus safety initiatives that, for the most part, do not address speeding truck and bus drivers, or other motorists. The MCSAP program, a generally successful truck and bus safety inspection program, is simply not putting enough emphasis on traffic enforcement activities. Strong speed enforcement aimed at commercial vehicle drivers, as well as other motorists with which commercial drivers share the road, needs to take on a much greater role in the MCSAP program. In fact, there is currently an artificial constraint that keeps the amount of speed enforcement activity in the MCSAP program small. FMCSA's regulations require that all speed enforcement stops (as well as all other types of traffic enforcement stops) of trucks include an appropriate North American Standard Inspection of the truck or the driver, or both, for the activity to be eligible for MCSAP funding. This inspection requirement, found at 49 C.F.R. 350.111, is unnecessary and unwarranted. Additionally, since speeding and other unsafe driving behaviors of non-commercial drivers play an even greater role in truck-involved crashes than do the actions of the commercial driver, the MCSAP program must include traffic enforcement efforts aimed at unsafe motorist behavior.

<sup>3</sup>"FMCSA Crash Data Analyst Says Study May Alter Inspections," *Transport Topics*, Aug. 26, 2002, p. 2.

<sup>4</sup>"Driver-Related Factors in Crashes Between Large Trucks and Passenger Vehicles," Federal Highway Administration, April 1999; "Identifying Unsafe Driver Actions that Lead to Fatal Car-Truck Crashes," AAA Foundation, April 2002.

ATA recommends that Congress authorize additional funding for the Section 402 Highway Safety Grant Program administered by NHTSA, and the MCSAP truck safety grant program administered by FMCSA, specifically for increased traffic and speed enforcement efforts in the upcoming highway reauthorization. ATA further recommends that Congress make it clear in legislative language that MCSAP funding may be used for State speed enforcement efforts aimed at both commercial and non-commercial drivers, and that speed enforcement activities aimed at commercial drivers do not have to be linked to a North American Standard Inspection. Additional funding, additional emphasis, and greater Federal leadership is needed on this issue to reduce the speed of all drivers on our highways and to save lives.

ATA is also a firm believer in the life-saving benefits of seat belts. ATA recommends that Congress continue to support and fully fund the occupant protection programs of NHTSA, including the ongoing 'Click It or Ticket' grant program.

#### IMPROVING THE SAFETY AND EFFICIENCY OF INTERMODAL EQUIPMENT

Mr. Chairman, while we try to cooperate with our intermodal partners in many areas, and will do so during this reauthorization cycle, there is one area on which we disagree, and I am afraid that the footdragging by Federal agencies and by many in the rail and ocean carrier industries to work with us to resolve the "roadability" issue is having serious safety and economic impacts. Since the advent of containerized shipping in the 1970's, a serious safety loophole has crept into the Federal Motor Carrier Safety Regulations (F.M.C.S.R.s).

As containerized intermodal freight has evolved over the decades, the Federal safety regulations have not kept pace. As a result, 750,000 intermodal chassis are operating in a safety loophole. These frame-like trailers are used exclusively to haul intermodal containers, and are interchanged between steamship lines, railroads, and motor carriers. The chassis are also classified as commercial motor vehicles by the USDOT. However, they evade USDOT safety oversight.

The F.M.C.S.R.s fundamentally assume that motor carriers have daily management control over all commercial motor vehicles they take onto public roadways. Based on that assumption, the regulations read, "Every motor carrier shall systematically inspect, repair, and maintain . . . all motor vehicles subject to its control."<sup>5</sup>

USDOT's interpretation of *systematic maintenance* is, ". . . a regular or scheduled program to keep vehicles in a safe operating condition."<sup>6</sup> It explains that the agency does not specify maintenance intervals, leaving that decision to motor carriers, based on fleet and vehicle considerations. So how does USDOT know if a motor carrier is failing to "keep vehicles in a safe operating condition?" When roadside safety inspections, typically conducted by State police, drive a motor carrier's SAFESTAT (violation) numbers above a certain threshold, the agency and State police send an envoy to the motor carrier's place of business to audit the maintenance and employee training records, inspect the carrier's equipment, etc.

While railroads and foreign-owned steamship lines (collectively called "providers") own or lease the intermodal chassis,<sup>7</sup> and control its daily disposition, they claim not to be motor carriers, thus not technically responsible for the condition of their equipment under Federal safety regulations. However, they do affix the annual inspection sticker on their equipment, which constitutes an act of certification that the equipment was inspected in detail at least once a year. Providers conduct the annual inspection pursuant to the F.M.C.S.R.s, but many do not conduct systematic maintenance on the same equipment, which is likewise mandated by the F.M.C.S.R.s. In fact, providers are generally unaware of the existence of the Federal systematic maintenance requirement. This explains the poor condition of intermodal chassis and points to USDOT's failure to close their own regulatory loophole to hold the controlling party accountable for the safety compliance of their own chassis.

SAFESTAT is the USDOT's computer analysis of their data base containing motor-carriers' accumulated violations. They use it to judge how safely a motor carrier maintains the commercial vehicles under its control. By contrast, it is impossible to assess providers' adequacy in performing systematic maintenance because USDOT resists including them in the SAFESTAT program. Ironically, USDOT says the reason it has not moved forward to close the intermodal equipment safety loophole is because they do not have the data to indicate a problem with the providers' chassis!

<sup>5</sup>49 CFR Part 396.3. Inspection, repair, and maintenance

<sup>6</sup>*Regulatory Guidance to the Federal Motor Carrier Safety Regulations*, at 49 CFR 396.3; emphasis added.

<sup>7</sup>While this is the general practice, some ports have different arrangements.

A new study<sup>8</sup> conducted jointly by the Federal Motor Carrier Safety Administration and the University of Maryland at College Park provides support to ATA's position on the Roadability issue. This study looked at 11 sectors of the trucking industry, one of which was intermodal operations. Researchers used nine safety performance measurements and other data managed by the USDOT to analyze the safety performance of each sector. One significant finding is that intermodal trucking operations were found to be average or better-than-average in six of the nine measurements. However, in the two measurements relating to vehicle condition, and the one relating to accidents, the intermodal sector ranked poorly. Specifically, among the 11 sectors, intermodal operations ranked last for vehicle safety condition, second-to-last (tenth) for accumulating vehicle out-of-service violations, and ninth for reportable accidents. Thus, the latest research findings from FMCSA confirm what intermodal trucking executives have been saying for years ( that the equipment controlled by steamship lines and railroads, and subsequently provided to motor carriers for brief periods of time, are not maintained by those controlling parties as required by the Federal Motor Carrier Safety Regulations.

In summarizing the roadability issue, providers claim they are not motor carriers, thus they are not responsible for maintenance of their chassis. Providers say the motor carriers are responsible. The motor carriers point out that they do not control the providers' equipment; they neither own it, lease it, control its maintenance treatment, conduct annual or periodic inspections on it, nor do they control its daily disposition. The regulations reasonably require truckers to maintain only the equipment they actually control. In the meantime, USDOT has acknowledged that it has jurisdiction over the issue, but has failed to place safety responsibility. That places the 750,000 chassis squarely in a safety loophole, which the USDOT has yet to close.

Enforcement needs to be redirected from the motor carriers, who are powerless to include interchanged intermodal equipment in their periodic maintenance programs, and placed on the parties who decide every day whether to repair a chassis, or hand it off to a motor carrier without the benefit of this USDOT-mandated maintenance benefit. Therefore, ATA is recommending that Congress pass legislation which forces the USDOT to equitably enforce laws designed to ensure the safe condition of all regulated equipment, including intermodal chassis.

#### THE NATIONAL HIGHWAY SYSTEM: THE BACKBONE OF AMERICA'S FREIGHT TRANSPORTATION SYSTEM

Trucks move 67 percent of freight tonnage, 86 percent measured by value.<sup>9</sup> This is freight that moves by truck alone; it does not touch another mode. Truck freight is a vital component of America's economy. Trucks are the only providers of goods to 75 percent of American communities. For every \$20 spent on freight transportation, \$17 will accrue to trucks.<sup>10</sup> This pre-eminence is likely to grow. According to the Federal Highway Administration (FHWA) the demand for freight transportation services will increase by 87 percent by 2020.<sup>11</sup> The trucking industry will be asked to transport nearly 2.7 billion more tons of freight in 2014 than we carry today.<sup>12</sup> This increase of 2.7 billion tons alone is more than 500 million tons greater than the total volume of freight that the railroads will carry in 2014 (See Appendix A). To accommodate this higher demand level, the number of trucks will increase over the next 12 years by 31 percent, adding 1.9 million more trucks to the road, over 157,000 trucks each year. The largest increase, 58 percent, will be among smaller trucks, which tend to operate mostly in urban areas and are not subject to competition from other modes. Overall, truck vehicle miles traveled (VMT) will increase by 36 percent, or 60 billion miles, by 2013.<sup>13</sup> Thus, more trucks will be traveling more miles on a highway system that will see very little capacity expansion over the next dozen years.

This is not a sustainable trend, and it should not be allowed to continue. While the growth in truck demand is inevitable, limiting highway capacity growth is not.

<sup>8</sup>Motor-Carrier Industry Profile Study Evaluating Safety Performance by Motor Carrier Industry Segment: by Thomas P. Keane of the Federal Motor Carrier Safety Administration (USDOT); Dr. Thomas Corsi of the University of Maryland, College Park, and Kristine N. Braaten of Econometrics, inc, April 1, 2002. This study was published in the *Proceedings of the International Truck and Bus Safety Research and Policy Symposium* on April 3-5, 2002 in Knoxville, TN, an event hosted by the Center for Transportation Research at the University of Tennessee.

<sup>10</sup>Ibid.

<sup>11</sup>Federal Highway Administration, *National Freight Trends/Issues, System Flows, and Policy Implications*, 2000.

<sup>12</sup>Based on unpublished data from ATA's Economics and Statistics Group.

<sup>13</sup>American Trucking Associations, *U.S. Freight Transportation Forecast to 2013*, 2001.

Congress has the ability to ensure that the growth in highway capacity matches the growth in vehicle travel.

The intermodal movement of freight can play an important role and should be encouraged. Roadway relies heavily on the railroads for a large portion of our long-distance movements. Last year, one-quarter of my company's delivery miles were on a train. This saved Roadway nearly 24,000,000 gallons in fuel use. However, we believe that we have reached the limit of our railroad utilization potential.

The ability of rail intermodal transportation to slow the growth of truck traffic is limited by market forces beyond the control of Congress, the States and, to some extent, the modes themselves. Today, just 1.2 percent of freight moves in a rail intermodal shipment.<sup>14</sup> Despite anticipated growth in this sector that will exceed trucking growth, by 2014 rail intermodal shipments will capture just 1.5 percent of the freight market, while trucking's market share, as measured by tonnage, will expand to 69 percent.<sup>15</sup>

It is not constructive to assume that the business logistics trends of the past half-century which have made trucks the dominant mover of freight will somehow reverse themselves, and that our Nation's reliance on trucks will subside. Congress should focus its attention and resources where they are needed most and will pay the greatest dividends for our country—on improving the efficiency of the highway system and the productivity of the trucking industry. Although the past two reauthorization acts developed and promoted by these subcommittees have been instrumental in revitalizing Federal surface transportation policy, there is still a distance to go, with some longstanding obstacles and some new challenges to face.

One of these challenges is basic highway infrastructure. At a time when many stakeholders, including those appearing at this hearing, have legitimate concerns about the future of intermodal connectivity, alternative transportation, and transportation enhancements, there often is a loss of focus on the original purpose of Federal involvement in surface transportation: namely, to help the States build and maintain a national system of highways. As the subcommittees consider their reauthorization proposals, it is imperative to review whether this goal is still being met. According to the Department of Transportation's 1999 Conditions and Performance report, even with the high levels of funding authorized by the Transportation Equity Act for the 21st Century (TEA-21), there is still a shortfall in Federal funding of over \$25 billion each year just to maintain current conditions on our highways and bridges. While it is inconceivable under current economic conditions to consider completely eliminating the shortfall during this upcoming reauthorization cycle, serious thought must be given to reducing the shortfall.

As America's economy becomes even more dependent on trucks, so too will the economy be affected by the impacts of congestion on the trucking industry's ability to meet shippers' needs. While manufacturers and distributors demand ever more speed and reliability from the trucking industry, our ability to meet those demands are being challenged by growing highway congestion.

For businesses whose livelihoods depend on road transportation, these costs are particularly heavy. No industry is as negatively affected by congestion as trucking. It used to be possible for truckers to schedule their deliveries through congested urban areas at off-peak times. However, increasingly, such times do not exist. Current congestion levels are now compelling revisions to the language of congestion itself. It is no longer proper to discuss the "rush hour," when it lasts for 3 hours, twice a day. On the Interstate System, for example, more than half of peak-hour travel on urban Interstates occurs under congested conditions.<sup>16</sup> Under such circumstances, it is becoming almost nonsensical to employ terms such as "peak" and "non-peak." In years past, it was possible to schedule deliveries outside of the rush hour window; increasingly, that is no longer possible.

Our highway capacity was perhaps adequate for our Nation's economic and social functioning a generation ago, but today it is increasingly stressed. Over the past 30 years, the nation's population has risen by 32 percent, truck registrations have risen by 45 percent, truck vehicle-miles traveled (VMT) has risen by 145 percent, but road mileage has only increased by 6 percent.<sup>17</sup> This has led to unprecedented levels of congestion across the country.

Through new innovations such as just-in-time delivery, the trucking industry has played a vital role in improving U.S. productivity. This would have been difficult, if not impossible, to achieve without an efficient network of good roads that connect

<sup>14</sup>Ibid.

<sup>15</sup>Based on unpublished data from ATA's Economics and Statistics Group.

<sup>17</sup>Federal Highway Administration, *Highway Statistics*, 1999.

markets, centers of industry, and multi-modal transportation facilities. These productivity improvements let U.S. industry sell more goods and services at lower prices, both at home and abroad. As a result, more people can be employed at higher wages. Since salary increases are firmly tied to the increase in the amount of goods and services each worker produces, living standards are improved. In addition, these real wage increases result in elevated tax revenues. However, if congestion cannot be effectively managed, it will be difficult for industries to meet these foreign and domestic challenges. The resulting productivity losses will take a severe human toll as stiff competition from abroad wipes out existing jobs and reduces the ability of our economy to create new jobs for a rapidly expanding population.

The National Highway System (NHS), which carries 75 percent of the Nation's truck traffic, is the backbone of the trucking industry. Yet it is also critical to the efficient movement of rail, waterborne and air freight. No matter how efficient these other modes become on an individual basis, their speed and reliability will ultimately be limited by the efficiency of the trucks that they rely on for part of their intermodal movements.

Unfortunately, the performance of the NHS has deteriorated to the point where nearly half of urban Interstate miles are congested during peak periods. Forty percent of travel on urban NHS routes takes place under such congested conditions that even a minor incident can cause severe traffic flow disruptions and extensive queuing.<sup>18</sup> Average annual investment requirements just to maintain conditions on NHS highways and bridges were \$26.8 billion in 1997.<sup>19</sup> The actual capital outlay was \$22.5 billion, a \$4.3 billion, or 19.1 percent shortfall. This was despite the fact that the 160,000-mile NHS carries 40 percent of all traffic and 75 percent of truck traffic.<sup>20</sup> Continued funding shortfalls will only harm road and bridge conditions, further exacerbating congestion levels. We urge Congress to reevaluate the current distribution of Federal highway funds during the next reauthorization period and consider whether a greater emphasis should be placed on the NHS.

We are also extremely concerned about the condition of the Nation's bridges. According to a recent study by The Road Information Program (TRIP), approximately one in four of the country's major, heavily traveled bridges is deficient and in need of repair or replacement.<sup>21</sup> However, some States have conditions that are much worse than the national average indicates. Thirty-four percent of bridges that are 20 feet or longer in Louisiana are either structurally deficient or functionally obsolete. Oklahoma has the highest percentage of deficient bridges in the country. Approximately one-third of the State's bridges 20 feet or longer are in need of immediate repair or replacement because of deterioration or because they no longer meet current design standards. However, the worst news is reserved for Oregon, where more than 350 bridges will have to be replaced in the near future and several major truck routes, including sections of the State's Interstate Highway System, have been load-posted. Additional Federal funds must be dedicated to the Bridge Program to prevent this type of situation from permeating throughout the country.

Perhaps nowhere are the effects of many years of neglect and under-funding of the NHS more pronounced than with the situation facing NHS intermodal connectors. In its report to Congress,<sup>22</sup> the U.S. Department of Transportation found that connectors to ports were found to have twice the percentage of mileage with pavement deficiencies when compared to non-Interstate NHS routes. Furthermore, DOT found significant physical and geometric deficiencies that made it difficult for trucks to move safely and efficiently between the NHS and intermodal terminals. DOT identified 616 intermodal freight terminals in the United States. This includes 253 truck-and-port terminals, 203 truck-and-rail terminals, and 99 truck-and-air terminals.

It is useful to understand just how important these intermodal intersections are to the U.S. economy. Any product that is produced in the United States must access the global marketplace in the most cost-efficient manner possible. The producer or manufacturer is the party that decides how to receive or ship freight. They make their decisions based on many factors, including just-in-time delivery factors, reliability of delivery times, security, freight value-to-weight ratios, and cost. Shippers also avail themselves of the inherent virtues of each mode of freight carriage. The

<sup>19</sup>Ibid.

<sup>20</sup>Ibid.

<sup>21</sup>"Showing Their Age: The Nation's Bridges at 40." The Road Information Program, May 2002.

<sup>22</sup>*NHS Intermodal Freight Connectors, A Report to Congress*; Prepared by the U.S. Department of Transportation, July 2000.

only way they can take advantage of these efficiencies and values is if the interfacing mechanisms that join the different freight modes is adequate for the transfer. Many times, this is not the case.

Improving intermodal connections also benefits communities, surrounding ports, railheads, and other Intermodal transfer facilities. In many situations, improving connectors will separate commercial vehicles from surface traffic that passes through congested neighborhoods. Often, these neighborhoods are clean-air non-attainment areas, and improved intermodal connectors would likely produce more efficient trucking operations, which will in turn result in fewer emissions.

ATA encourages Congress to set aside funding for improvement of intermodal connectors and to make innovative financing options more available for addressing connector deficiencies. This should include lowering the threshold for TIFIA funding eligibility. We further urge Congress to make changes to the State and metropolitan planning processes to ensure that projects which benefit freight on a regional and national scale receive greater consideration. Project selection should be determined by the U.S. DOT in cooperation with the freight community, State DOTs and other stakeholders.

It is important to keep in mind, however, that as critical as improving intermodal connections is, if the overall highway system is allowed to deteriorate, investing in connectors will be for naught. The 2,000 miles of connector roads will only be as efficient as the 160,000 miles of NHS highways that bind intermodal terminals and other points of loading and offloading together.

Congress should also consider more creative ways of financing highway improvements and adding highway capacity. New innovative techniques would allow States to leverage existing funds. In addition, we support the spending down of the current cash balance in the Highway Trust Fund (HTF) to fiscally responsible levels; crediting the Highway Account with gasohol tax revenues that currently go into the General Fund; ending the gasohol subsidy or crediting the HTF from the General Fund for the cost of the subsidy; crediting interest on HTF balances; and eliminating fuel tax evasion.

Some have suggested that fuel taxes should be increased to pay for growing demand. For nearly 50 years, the trucking industry has supported the concept of a user-supported system. However, the relationship between those who provide financial support for the system and those who determine how the money is spent must be a two-way street. Over our objections, Congress has continuously expanded highway program eligibility to include projects that provide few or no benefits to highway users (e.g. bicycle paths, light rail). Therefore, we cannot and will not invest additional moneys in a highway program whose value to our industry is slowly diminishing. Furthermore, any discussion about trucks paying additional fees to meet their full cost responsibility must be preceded by an acknowledgment that our industry has been prohibited by the Federal Government from operating our safest, most pavement-friendly vehicles, and that such prohibition is an obstacle to the industry's ability to meet our full cost responsibility.

ATA applauds the efforts of Senators Ernest Hollings and John McCain to eliminate the TEA 21 toll pilot program. ATA is opposed to any attempts to toll existing non-toll highways. However, we would not oppose toll financing that delivered an economic benefit to the trucking industry and did not restrict our use of existing roads. For example, we believe that Congress should consider supporting the construction of truck-only highways. While we will evaluate each project on its merit, any congressional proposal should include all of the following constraints:

- The project should add capacity;
- Use of the lanes should be voluntary;
- If the highway is tolled, trucks should receive a rebate on Federal and State fuel taxes paid for using the facility;
- The facility should allow for the use of more productive trucks; and
- The facility should have a safe design.

#### IMPROVING FREIGHT PRODUCTIVITY

An effective approach to saving lives, relieving congestion and improving air quality is to reduce the number of trucks on American roads. Given a fixed amount of freight for America's trucks to move, the only way to reduce the number of trucks is to improve the productivity of the trucks themselves, and of their drivers. This is analogous to carpooling—it increases capacity without increasing the road lane-miles. To improve truck productivity, Federal size and weight regulations must be reformed.

Federal law currently limits States' ability to control size and weight on their own highways. The limits imposed are lower than those mandated by other nations' gov-

ernments, including our northern and southern neighbors, who are major trade partners and business competitors. This creates an economic disadvantage for American businesses and it causes additional costs and administrative problems when it comes to moving international freight, including intermodal containers.

There has been no legislative relief to these laws in 20 years, despite considerable improvements in truck safety and better driver training. Decades of experience and volumes of research indicate that more productive vehicles can be safely operated without a detrimental effect on safety or the condition of highways and bridges.<sup>23</sup>

At the request of Congress, the Transportation Research Board (TRB) recently issued a new report on the impacts of Federal truck size and weight regulations.<sup>24</sup> Among the report's conclusions was that the largely static and inflexible system of Federal regulation that currently exists ". . . discourages private and public-sector innovation aimed at improving highway efficiency and reducing the costs of truck traffic . . ." including costs related to accidents involving trucks.<sup>25</sup>

In a nutshell, the TRB report concludes that States should be given greater authority, with strong Federal oversight, to make decisions with regard to the size and weight limits of trucks on highways under their jurisdiction. This reflects ATA's own policy. TRB further recommends that Federal regulatory oversight of weight limits should not be extended to the NHS, as H.R. 3132, the Safe Highways and Infrastructure Preservation Act (SHIPA) seeks to do.<sup>26</sup>

There is no doubt that continuing or further restricting current Federal size and weight limits will cost lives. While it would not make sense from a safety or economic standpoint to allow larger or heavier trucks to operate on every highway or in every State, Congress cannot continue to ignore the growing body of evidence that supports the fact that opportunities to prevent accidents through size and weight reform are available. Those States that identify these opportunities should be allowed to take advantage of them.

Allowing the expanded operation of more productive trucks would have two safety benefits. First, carriers would need fewer trucks to haul a given amount of freight, reducing accident exposure. Second, studies have consistently found that certain trucks with greater carrying capacity have a much better safety record than trucks that are in common use today. A study sponsored by the Federal Highway Administration found that the accident rate for longer combination vehicles (LCVs) is half that of other trucks.<sup>27</sup>

A recent Canadian study found that LCVs have an accident rate that is five times lower than the rate for tractor-semitrailers.<sup>28</sup> This study also found that during the 10-year period after LCVs were authorized to operate on a large scale in Alberta Province, the number of registered trucks dropped by 19 percent, even though the economy grew and non-truck vehicle registrations grew by 23 percent. The report concluded that increased truck productivity due to expanded LCV use was the most likely reason for this reduction in truck registrations.

In Nevada last year, just .02 percent of vehicles involved in an accident were triples.<sup>29</sup> Of the more than 36,000 accidents in Montana, including 1,326 accidents involving trucks, just one accident involved a triple. The year before, there were two triples accidents in Montana, in 1999 there was one, and in 1998 there were none.<sup>30</sup> In Colorado, of the 4,226 accidents involving trucks in 2000, just nine involved triples; none of the triples accidents involved a fatality.<sup>31</sup>

This data reflects Roadway Corporation's experience with triple-trailer trucks. Since 1990, Roadway triples have been involved in exactly one fatal accident. That is one fatal accident in over 155 million miles of travel. Last year, there were just five accidents involving Roadway triples, one accident every 2.5 million miles. By comparison, on average, all vehicles nationwide are involved in an accident every 430,000 miles.<sup>32</sup> Triples are by far the safest trucks in our fleet and among the safest vehicles on the highway.

<sup>23</sup>See for example Transportation Research Board, *Truck Weight Limits—Issues and Options, 1990, and New Trucks for Greater Productivity and Less Road Wear*, 1990.

<sup>29</sup>Nevada Department of Transportation.

<sup>30</sup>Montana Department of Transportation.

<sup>31</sup>Colorado State Patrol.

<sup>32</sup>"Traffic Safety Facts 2000," National Highway Traffic Safety Administration.

Furthermore, Congress and the States can avoid large investments in pavement maintenance and rehabilitation, as well as capacity expansion, by allowing States to make common-sense changes to their size and weight regulations. Gross weight can increase exponentially and not cause additional pavement damage so long as axle-weight is controlled. This is why, for example, a turnpike double that weighs 126,000 pounds causes half the damage of an 80,000 pound tractor-semitrailer on a ton-mile basis. In addition, if trucks are able to ship the same amount of freight in fewer trucks, the need for capacity expansion could be avoided, fuel use and emissions could be lowered, and costs to American manufacturers and consumers could come down.

The Federal restrictions on States that limit their ability to determine what types of trucks are allowed to operate on State-owned—and controlled highways have no basis in science or logic and can no longer be justified. Our opponents on this issue continually attempt to represent the industry's ultimate goal as unfettered access to the highway system by more productive trucks. Such a position would be completely illogical, and it thoroughly misrepresents the industry's position. It would be foolish for the trucking industry to disregard the infrastructure and safety impacts of putting trucks on highways that they were not meant to handle or in traffic conditions that are unsuitable. Ultimately, the trucking industry itself would pay the price in terms of higher user fees, weight-posted bridges, higher insurance premiums and tighter government regulation. We are not asking Congress to increase truck sizes and weights. We are simply asking Congress to give States the ability to determine the safest and most cost-effective regulatory regime for their own highway systems.

#### IMPROVING THE FREIGHT PLANNING PROCESS

ATA believes that the current planning process does not effectively address the movement of freight. The Federal Government has effectively devolved its responsibility for ensuring a safe and efficient highway system to State and local governments. While this has allowed planning agencies to address the unique demands of local transportation needs, and to respond more effectively to citizens' concerns, it has also resulted in a parochial system of transportation planning and programming that essentially ignores freight needs. MPOs, for example, may ignore a deficient connector road that links a seaport or rail-head to the Interstate Highway System because the project's benefits are not believed to be as beneficial as other local projects. However, most of the benefits of the project may accrue beyond the geographic scope of the State or local planning agencies' analyses.

We do not blame these agencies for failing to include these far-reaching benefits in their analyses; they simply do not have the resources or expertise necessary to do so. The Federal Government is the only governmental entity with the expertise, resources and standing to identify freight projects of national significance. We urge Congress to give FHWA the necessary tools and direction that allow the agency to ensure that crucial freight bottlenecks are dealt with quickly and effectively.

#### FREIGHT STAKEHOLDERS: WORKING TOGETHER TO ENSURE FUTURE ECONOMIC COMPETITIVENESS

ATA has joined with representatives of our modal freight partners and our customers in promoting a joint agenda designed to facilitate the efficient movement of freight. A joint statement is attached at Appendix B. The joint statement may be the most extensive united effort by the freight transportation community ever at the Federal level, and this points to both the growing interdependence of freight modes and the seriousness with which we regard Congress' decisions in the next reauthorization bill. In brief, the freight community is requesting additional investment in freight projects, including intermodal connectors, and in border crossings and corridors with significant freight traffic; the creation of a national freight industry advisory group to assist in the freight planning process; additional money for freight research and professional development; creation of new or expanded innovative financing options for funding freight projects; and more emphasis on funding freight projects that reduce congestion and improve air quality under the Congestion Mitigation and Air Quality Improvement (CMAQ) program.

We have also joined with our freight partners to secure additional funding for the Borders and Corridors programs that were created in TEA 21. The Coalition for America's Gateways and Trade Corridors, of which ATA is a founding member, is calling for a significant increase in funding for these crucial programs. We are concerned about the significant earmarking that has undermined the effectiveness of these programs. However, we believe that the original intent of the programs—to ensure that the infrastructure necessary to accommodate current and future freight

needs, due in part to massive trade expansion—is still valid. We strongly urge Congress to extend the Borders and Corridors programs during TEA-21 reauthorization, and to make the programmatic and financial changes that are necessary to ensure the future mobility of America's freight transportation system. In addition, we urge Congress to refrain from expanding the eligibility of the program beyond its current parameters.

#### IMPROVING THE EFFICIENCY OF NAFTA-RELATED FREIGHT

Trade volumes between the United States and its two North American Free Trade Agreement (NAFTA) partners have reached record levels: For 2000, U.S.-Mexico trade reached \$248 billion, while U.S.-Canada trade amounted to \$408 billion. The growth in NAFTA trade is especially impressive if one considers that in 1993, the year before NAFTA was implemented, U.S.-Mexico trade stood at just \$81 billion, while trade with Canada was valued at \$211 billion. The movement of imports and exports across our international land borders depends on an efficient and effective transportation system.

Unfortunately, the development of physical and human resources at U.S. international land borders has not kept pace with the growth in NAFTA trade. Congestion at U.S. ports of entry is the norm, and considering the heightened security that will continue into the foreseeable future due to the September 11 attacks, these problems have been compounded. This creates inefficiencies in the movement of cargo among the North American trading partners, straining the present-day capacity of human resources and facilities at U.S. land borders. Because trucks haul more than 80 percent of the U.S.-Mexico freight bill and more than 70 percent of the U.S.-Canada freight bill, they are critical to the success of NAFTA and its attendant economic benefits. Delays result in additional freight transportation costs, and threaten to diminish NAFTA's promise.

Data from a Federal Highway Administration (FHWA) analysis of the seven busiest border crossings (which account for 60 percent of truck crossings) reveal that congestion at these ports of entry cost the industry about 2.6 million hours in delay time per year, at a financial cost of at least \$88 million.<sup>33</sup> In addition, trucks waste about 2.6 million gallons of fuel annually, with a resulting environmental impact of 23,000 tons of carbon dioxide and more than 300 tons of nitrous oxides. Congress should ensure that adequate resources are dedicated to the development of infrastructure and human resources along the U.S. borders with Canada and Mexico in order to meet the challenges associated with rapidly increasing trade growth among the three countries.

Some examples of where Federal resources could be applied include:

- Funding for the construction of truck inspection facilities, and for hiring truck inspectors, both at the Federal and State level, to inspect trucks entering the United States from Mexico.
- Construction of ports of entry solely for commercial traffic on the U.S. northern and southern borders.
- Planning and development of quality access roads between ports of entry and the National Highway System.

In addition, ATA has actively supported the funding and development of the Automated Commercial Environment (ACE) and the International Trade Data System (ITDS) to make cross-border movements of cargo, vehicles and drivers more efficient and secure.

We ask the subcommittees to look at technologies under development that can facilitate enforcement efforts while at the same time expedite the movement of freight across our borders. One such system being designed presently by U.S. Customs, with input from the trade community, is the Automated Commercial Environment, or "ACE."

In 1993, along with legislation implementing the NAFTA, Congress passed the Customs Modernization Act, or "Mod Act," establishing a new operating environment for U.S. Customs and the international trade community. Concepts such as "informed compliance," "shared responsibility," and "reasonable care" imposed greater obligations on U.S. Customs to provide improved information concerning the responsibilities and rights of the trade community. At the same time, the legislation mandated U.S. Customs to develop a new automated customs processing system to replace the antiquated and overburdened Automated Customs System (ACS). Nearly 10 years after the passage of the Mod Act, ACE is still in its nascent stage, but it is finally under significant development, and its full deployment is expected with-

<sup>33</sup>"Commercial Vehicle Travel Time and Delay at U.S. Border Crossings," Federal Highway Administration, Office of Freight Management and Operations, June 2002.

in the next three to 4 years. The present head of U.S. Customs, Commissioner Robert Bonner, has recognized the importance of developing such a system to give Customs greater tools to improve its information collection and improve the efficiency with which it processes millions of transactions every year.

Mr. Chairman, it is important that Congress continue to provide adequate funding for the full development and implementation of the ACE system. In order to defend our Nation from potential future terrorist attacks, and at the same time process the legitimate commercial goods so important to our Nation's economy, we must provide our border enforcement agencies the necessary tools and resources to fulfill their duties and responsibilities. It is also critical that no new user fees be imposed for the future development of ACE, especially if the current Merchandise Processing Fee (MPF), which raises about \$900 million each year and is slated to end in 2003, is earmarked for some other budgetary purpose. If the MPF is supposed to be for Customs commercial processing, then this fee should be used for nothing but for improving Customs commercial operations.

Mr. Chairman, ATA supports the implementation of NAFTA's trucking provisions in order to improve the efficiency with which cross-border operations take place between the U.S. and Mexico. ATA is also a strong advocate for ensuring that all carriers operating in the U.S.—Canadian, Mexican or U.S. carriers—meet all U.S. safety and environmental standards, as well as all financial operational responsibilities.

Furthermore, implementing NAFTA's trucking provisions would enhance the security of cross-border trucking operations by simplifying the movement of trailers across our common borders. In a report to Congress issued in 1997 by the White House on U.S.-Mexico anti-drug cooperation, the U.S. Customs Service wrote:

The high congestion of truck traffic entering the United States is, in part, a result of restrictions imposed by both the United States and Mexico on crossborder motor carrier operation . . . over 50 percent of commercial trucks enter the United States empty, contributing to border congestion and increasing the inspection burden for border agencies.

NAFTA's trucking provisions allow for carriers throughout North America to improve their ability to make cross-border trucking more efficient, effective, safer, and more secure.

It is also important that we work with our counterparts in Canada and Mexico to improve harmonization of border operations and infrastructure development to establish technology and mechanisms to facilitate and expedite the gathering, sharing, and exchange of information and data to clear cargo and people crossing our land borders efficiently and securely. We must continue to find solutions that improve the processing of the legitimate flows of people and cargo, while simultaneously improving our security through stronger relationships between the trade community and law enforcement agencies at our borders.

#### ENSURING THE SECURE AND EFFICIENT MOVEMENT OF FREIGHT

In our efforts to protect the country from the terrorist threat, strategic planning for this new type of war must take into account three critical principles with respect to the trucking industry.

First, the timely communication of threat related information is the single most important short-term objective that must be met. In order for trucking companies to properly deploy our security resources and instruct our drivers on the proper steps needed to protect themselves, the public and our customers' goods, we need detailed communications so that we can understand and appreciate the threat, evaluate our company's exposure and act in time to avoid becoming victims of terrorism.

Second, our professional drivers, dispatchers, managers and supervisors are the most critical elements in protecting trucks from becoming the objects of, or the mechanism for, terrorist attacks. Drivers have control of our equipment 90 percent of the time, and therefore they are the most vulnerable to terrorism. We have an obligation to train our 3.2 million professional drivers to recognize terrorist operational acts, report these acts to the proper authorities, and react appropriately. The trucking industry needs Federal help to complete this effort in no more than 3 years.

Third, productivity is the lynchpin of America's global economic competitiveness. In our efforts to conduct our war on terrorism, we must give equal attention to the preservation of our abilities as transportation enterprises to creatively and efficiently move the goods and instruments of commerce where needed, when needed. Any new regulatory framework must adhere to the core principal of "the green light is on" for trucks unless there is a substantial, direct and immediate threat that would justify slowing or restricting commercial flows.

Thank you for the opportunity to offer our thoughts regarding the upcoming reauthorization of the Federal surface transportation legislation. We look forward to working with the subcommittees to improve the safety and mobility of our Nation's freight transportation system.

---

## APPENDIX B

### FREIGHT STAKEHOLDERS TEA-21 REAUTHORIZATION AGENDA

1. Protect the integrity of the Highway Trust Fund. Reauthorize the firewalls provided for in TEA-21 to ensure that the funds collected are used for their dedicated purpose and not for deficit reduction.

2. Dedicate funds for NHS highway connectors to intermodal freight facilities. The NHS Intermodal Freight Connectors report that was sent to Congress documents the fact that these road segments are in worse condition and receive less funding than other NHS routes. Targeted investment in these "last mile" segments would reap significant economic benefits compared to the associated costs.

3. Form a national freight industry advisory group pursuant to the Federal Advisory Committee Act to provide industry input to USDOT. The advisory group should be funded and staffed, and it should consist of freight transportation providers from all modes as well as shippers and State and local planning organizations. Despite the best efforts of the agency to function as "One DOT," there is still not enough of a focused voice for freight. An Advisory Group would meet the need for regular and professional interaction between USDOT and the diverse freight industry, and could help identify critical freight bottlenecks in the national freight transportation system.

4. Create a Freight Cooperative Research Program. Increasingly, industry issues are public issues that would benefit from a dedicated, funded research effort led by an industry-based steering/oversight group, such as the one described above, to ensure useful research results to benefit the freight transportation system as a whole. One option would be to dedicate a portion of the States SP&R dollars to freight issues. Freight data issues would fall under this program as well.

5. Expand freight planning expertise at the State and local levels. Given the importance of freight mobility to the national economy, States and MPO's should be provided additional funds for expert staff positions dedicated to freight issues (commensurate to the volumes of freight moving in and through their areas).

6. Develop ways to increase available funds without new user fees and taxes by creating a toolbox of innovative financing options specifically aimed at freight capacity improvements and enhancements. Options could include (1) lowering of the threshold for TIFIA funding eligibility (2) development of tax incentives, and (3) expansion of the State infrastructure banks (SIBs).

7. Significantly increase funds for an expanded corridor/border and gateway program. This would build on the highly popular but under-funded "Corridors and Borders Program" (Sections 1118 and 1119), but adds the important concept of gateways. The funding should be freight specific, and there should be a qualification threshold (based on volumes) so that dollars get directed at high volume corridors/borders/gateways rather than wish-list projects.

8. Streamline environmental permitting for freight projects. Multiple and often duplicative Federal laws and regulations delay environmental review of transportation projects. Language in TEA-21 directing Federal agencies to streamline the review process for highway projects has not been effective and other measures to simplify the review process for all freight projects should be considered.

9. Increase funding and promote use of the Congestion Mitigation and Air Quality Improvement Program for freight projects that reduce congestion and improve air quality. CMAQ was designed to fund projects that will help reduce transportation-related emissions. Although CMAQ has supported some freight projects, it has been used primarily to address passenger needs. CMAQ funding should be dedicated to projects that can be shown to reduce congestion or improve air quality. Total fund-

ing for CMAQ should be increased and the use of CMAQ funds for freight projects should be clarified and strongly encouraged.

RESPONSES BY MICHAEL W. WICKHAM TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question 1.* In your testimony you state that the value of the highway program to your industry is diminishing because of "expanded highway program eligibility to include projects that provide few benefits to highway users." I find that statement astonishing. Do you really believe that highway programs that encourage nontraditional solutions to traffic congestion like HOV lanes, intelligent transportation systems, and transit are of no benefit to highway users? Every person who commutes on transit, takes the train, or shares a ride with a friend, means one less car clogging our roads. No one benefits from transit use more than those of us who drive on our roads every day. Are you saying that because States have the flexibility to spend highway funds on non-construction programs that you do not believe the highway program has value to your industry?

Response. ATA believes strongly in a Federal highway program that is funded by highway users for the benefit of highway users. Highway maintenance and capacity expansion are critical components of a highway program that promotes a safe and efficient surface transportation system. However, as your question suggests, we must also look beyond these traditional methods and seek out more innovative ways of improving the condition and performance of our highways.

You mentioned Intelligent Transportation Systems (ITS), for example. ATA supports eligibility of ITS under the highway program. ITS can be an effective means of communicating system problems, which allows traffic agencies to respond more quickly and gives motorists the information they need to avoid these problems. States, in partnership with the trucking industry, use ITS to more effectively target their truck inspections, improving the efficiency of responsible carriers and enhancing highway safety. In addition, under certain circumstances, HOV lanes can be an effective tool for relieving congestion and improving air quality, and ATA does not oppose their eligibility under the highway program.

However, an increasingly larger share of Federal highway revenues is being used for projects whose effectiveness at curbing congestion and saving lives is questionable. For example, while transit can effectively relieve congestion in some areas, in most of the cities where rail transit systems have recently been established, it will not be an effective strategy for addressing the growing traffic that plagues our urban areas. It is important to recognize that transit demand is very concentrated. One-half of the national ridership is in New York and Chicago and 76 percent is in seven metropolitan areas. In urban areas, transit accounts for just 2-3 percent of all trips. Even if transit ridership were to double in the next 10 years—an ambitious goal since ridership actually declined over the previous decade—because highway use would also rise, transit's share of trips would only grow to 3-3.5 percent. Transit is largely beneficial for commutes to and from work. However, commutes now make up less than 20 percent of all trips, and less than one out of three trips during rush hours are trips between home and work.

According to a study by the Texas Transportation Institute, areas that were more active in adding roadway capacity to respond to increased travel were able to slow the increase of regional traffic congestion. However, not all highway projects need add more traffic lanes or new highways to achieve substantial improvements. According to one study, improving conditions at the 167 worst traffic bottlenecks around the country would reduce travel times by an average of 38 minutes per day, result in 287,000 fewer accidents, including 1,150 fewer fatalities, reduce carbon monoxide emissions by 45 percent, smog-forming emissions by 44 percent and carbon dioxide emissions by 71 percent at those sites. Unfortunately, a lack of resources, in part because of the diversion of highway funds to non-highway projects that are less effective, is preventing States from making these crucial investments.

We have concerns with other eligible activities, such as those under the CMAQ and enhancements programs. While some would argue that these programs divert relatively few resources from the highway program, the impact of this diversion is actually quite large. For example, we find it difficult to understand how it is in the national interest to invest more than twice as much Federal money on bicycle paths than on truck safety programs.

ATA does not oppose using highway user fee revenues for nontraditional programs. We oppose the use of this money on programs that have been shown to be ineffective at reducing congestion and improving highway safety. We believe that in the face of limited resources, the Federal Government should make strategic investments that deliver the most cost-effective results.

*Question 2.* In your testimony, you argue for reduced Federal restrictions on truck size and weight. You make many safety claims that are refuted by a recent U.S. Department of Transportation study on truck size and weight, which estimated that multi-trailer trucks have an 11 percent higher fatality crash rate than single trailer trucks. While I differ with your conclusions on safety, I will not dwell on that issue here. However, I will ask you to address the conclusion of the Department of Transportation study that allowing bigger trucks on our roads would result in bridge capital costs of over \$50 billion and well over \$200 billion in additional costs due to delay from bridge construction and repairs.

Response. It should first be noted that the U.S. DOT's Comprehensive Truck Size and Weight Study to which you refer was roundly criticized by the academic community, State departments of transportation, the trucking industry, and others. In fact, AASHTO passed a resolution (attached) calling on the Department to delay release of the report until its many deficiencies could be addressed; unfortunately, the uncorrected report was released anyway. Therefore, we would caution Congress against using the Study as a basis for making policy decisions.

Specifically, to the multi-trailer truck accident rate that appeared in the Study. Some have used this analysis to argue that longer combination vehicles (LCVs) are less safe than single-trailer trucks. In fact, because about 80 percent of the vehicle miles traveled by multi-trailer trucks are by non-LCVs, the statistic cannot be applied to this class of vehicle. Nonetheless, we cannot allow DOT's study to stand unchallenged. Almost all previous evaluations of the multi-trailer trucks that make up the bulk of vehicles that comprise DOT's research found that these vehicles were either as safe or safer than single trailer trucks. The most comprehensive evaluation of the safety of twin trailer trucks to date is a 1986 study by the Transportation Research Board (TRB Special Report. 211). That study concluded that, "overall, twins clearly appear to be about as safe a method of hauling freight as the tractor-semitrailers they replace."

DOT did, in fact, contract with an independent consultant to complete a study on the safety experience of LCVs versus other, more common, trucks (Accident Rates for Longer Combination Vehicles. FHWA, October 1996). This study found that LCVs, including triples and heavy doubles, had an accident rate which was half that of the trucks they would replace. The study also concluded that truck configuration, not highway environment or driver factors, was the reason for this finding.

This statistic is reflected by other research. For example, Alberta Province found that LCVs had the lowest accident rate of all vehicles on their highways, including passenger vehicles. In fact, single-trailer trucks had an accident rate five times higher than LCVs. States have also found that LCVs are extremely safe. In Nevada, for example, triples were involved in just .02 percent of all accidents in 2000; none were fatal.

LCVs have been in operation for more than 50 years. Today, they operate on rural roads in the west, eastern turnpikes and in large urban areas, in nearly half the States. No State has ever rescinded their operating authority, for the simple reason that LCVs contribute to a much safer and a much more efficient highway system.

Regarding the bridge costs cited in the DOT study. Of all the criticisms leveled against the study, those regarding bridge costs were probably the most severe. DOT

assumes that any bridge not rated to carry the loads modeled by the study would automatically be replaced. This simply does not happen in the real world. In practice, States would choose to either replace or strengthen the affected bridges, or to load-post them.

As part of its research, the panel that conducted the most recent TRB truck size and weight study (TRB Special Report 267) obtained from DOT a list of highway structures in California identified by the bridge analysis method used in the study as requiring replacement if a specified type of larger truck were to come into use. Four were selected for analysis. Each of the four structures exceeds the threshold overstress criterion applied in the DOT study under the assumed loading by just a few percent, and therefore the DOT study would assume that all four bridges would have to be replaced given the heavier loads. The four structures were examined by engineers of the State DOT, who reported to the committee that, following its normal practices, the State would not replace, strengthen, or restrict the use of any of the four structures if heavier tractor-semitrailers within the range analyzed in the DOT 2000 study came into use.

This is not to say that increasing the weight of trucks will not produce additional bridge costs, or that some interchanges may not have to be rebuilt to accommodate longer trucks. However, these are one-time investments whose costs pale in comparison with the tremendous savings associated with less pavement damage, less pollution, fewer accidents and greater economic productivity if size and weight laws were reformed.

*Question 3.* You argue that allowing longer combination vehicles will reduce the number of trucks on our roads. Isn't the real impact likely to be a shift of freight from rails to our already overburdened road infrastructure?

Response. While evaluations of increases in truck productivity all predict some shift of freight from rail to truck, the magnitude of this shift is generally considered to be very low. A 1990 TRB study (TRB Special Report 225) found that under various scenarios where truck productivity increased, rail diversion would range from 2.2 to 6.6 percent, and all scenarios resulted in overall truck VMT reductions. Furthermore, it is very likely that the shift of freight from existing trucks to other, more productive trucks, will result in a net reduction in both the number of trucks on the road and truck miles, even when rail diversion is factored in. For example, the previously referenced Alberta study found that over the 11-year period following the introduction of higher weight trucks to the province, the number of registered trucks dropped by 19 percent, even though non-truck registrations grew by 23 percent and the economy expanded.

The fact is that trucks and trains compete for very little business. Even with a productivity increase that makes truck transportation more attractive to rail shippers, the fact that freight railroads enjoy very large profit margins on most routes means that the railroads simply have to lower their rates slightly to keep this business. Herein lies the real reason for rail opposition to trucking productivity gains. This competition is a positive factor for shippers, who will realize lower shipping costs, and consumers, who will see lower retail prices. The most likely market for truck-rail competition is in the rail intermodal segment. Rail carload shipments are simply too price-sensitive for trucks to compete effectively in this market segment. Even if trucks were somehow able to draw 100 percent of all rail intermodal business, however, this would increase annual truck volumes by less than one-fifth of 1 percent nationwide (Freight Transportation Forecast . . . To 2013, DRI-WEFA, 2001).

According to the FHWA, truck volumes will nearly double by 2020 and trucks' market share will expand from 71 percent in 1998 to 75 percent in 2020. This growth is inevitable, but a doubling of the number of trucks needed to accommodate this growth is not inevitable. Increasing trucking productivity through sensible size and weight reform will slow the growth of trucks and reduce their societal impacts.

---

RESPONSE BY MICHAEL W. WICKHAM TO ADDITIONAL QUESTION FROM SENATOR  
JEFFORDS

*Question 1.* Mr. Hamberger of the Association of American Railroads notes that railroads are three or more times more fuel efficient as trucks. He points out that the EPA estimates that for every ton-mile, a typical locomotive emits roughly three times fewer nitrogen oxides and particulate matter than the typical truck. He also points out that "rail competitive trucks, which are the heaviest, highest mileage operators among all trucks, do not come close to fully paying for the damage they cause to our highway system."

Response. As noted above, the potential for shifting freight from truck to rail, or vice versa, is extremely limited, and significant growth in truck traffic is inevitable. Therefore, any comparison of modal impacts becomes an academic exercise. Nonetheless, we are pleased to have the opportunity to respond to Mr. Hamberger's statements.

According to new data produced under contract to the FHWA, in 2000, trucks' ton-miles were double that of rail. Therefore, if Mr. Hamberger's statement that trucks produce three times more emissions per ton-mile than railroads is correct, then trucks would have to emit six times more total NOx and PM than railroads. In fact, according to the EPA, trucks' total emissions of NOx and PM were just 2.7 times greater than the total emissions for rail. Therefore, on a ton-mile basis, trucks produce only about 1.35 times as much NOx and PM as locomotives.

However, this does not tell the whole story. When measuring emissions on a ton-mile basis, what is left out is the fact that the commodities hauled by trucks are comprised of a far greater proportion of high-volume, low-weight freight than the commodities hauled by railroads, which haul mostly low-volume, heavier freight. Therefore, expressing trucks' volumes in terms of weight instead of area understates the amount of freight trucks are actually carrying, resulting in a disproportionately high amount of freight being assigned to railroads. This produces an emissions level which favors railroads.

Furthermore, rail moves are almost always more circuitous than truck moves. Therefore, if one considers the environmental impact of shifting freight from truck to rail, the impact of this longer route must be considered. If there is an increase in distance of greater than 35 percent, then the environmental benefits of shifting the freight to rail are wiped out by this factor alone.

Also to be considered is the fact that if there is to be a truck to rail shift, this will likely occur as an intermodal movement. Therefore, the environmental impacts of the truck deliveries on both ends of the rail movement must be considered. These are not inconsequential impacts. The average truck drayage move is roughly 90 to 120 miles long, typically with a significant urban component. The trucks involved are generally older—and therefore more polluting—than the typical trucks involved in long-distance movements.

The issue of whether railroads pollute less than trucks is not that simple, and it should not be automatically assumed that a rail move produces less pollution than a truck move. In fact, FHWA has rejected States' requests for using CMAQ money on freight rail projects because they found that shifting freight from truck to rail would actually have a negative environmental impact.

One other point should be made. Trucks contribute approximately \$35 billion in Federal and State highway user fees each year, which are used, in part, to offset the societal costs of the pollution that they produce. The railroads, on the other hand, pay just \$170 million in user fees, and these revenues are not tied to societal costs produced by the railroad industry. There is little doubt that these revenues do not approach the health costs associated with pollution emitted by locomotives.

This brings us to the second part of the question, which refers to trucking industry cost allocation. It is interesting that Mr. Hamberger attacks trucks for paying too little for their infrastructure and societal costs when his own industry fails to pay a single penny to compensate for the safety, environmental and congestion societal impacts of rail operations. (NOTE: While the question refers only to infrastructure costs, other societal impacts are now included in cost allocation studies. In addition, while the railroads do pay a tax on diesel, unlike highway user fees, there is no tie between these fees and the costs imposed by the railroads which are borne by the public.)

While the FHWA Cost Allocation Study found that certain trucks do not pay their cost equity, there are several factors that contributed to this conclusion and that must be examined. First, there were several problems with the study which produced erroneous results. This is not to deny that there are trucks in operation which do not pay their fair share. However, it should also be noted that the study found that certain classes of trucks paid more than their fair share. It would be virtually impossible to achieve a perfect balance. While such an effort should be made, it must be recognized that results will always change depending on the assumptions and data used, which are constantly evolving. Therefore, there will always be some vehicles that will be found to not pay their allocated share of the costs.

Mr. Hamberger complains that "rail competitive trucks" do not pay for the damage they do to highways without defining what a rail competitive truck is. Since the railroads and the "safety groups" they associate themselves with regularly criticize triple-trailer trucks, we assume that these are among the class to which Mr. Hamberger refers. However, it is widely recognized that the markets served by triples are generally not rail-competitive.

When looking at the factors which result in a determination that a truck is not paying its cost equity, an objective analysis must lead one to the conclusion that this finding was made because of Federal restrictions on truck size and weight, not despite the restrictions. As the recent TRB study (TRB 267) found, significant opportunities exist for States to reduce their infrastructure and societal costs if they are given flexibility to reform their size and weight limits. It is the Federal regulatory system that prevents carriers from putting trucks on the road that are more infrastructure-friendly and safer. For example, many States allow the operation of heavier trucks on non-Interstate highways, but are prevented from granting these trucks access to the Interstates by Federal law. If they were to use the Interstates rather than lower-order roads, the infrastructure, safety, congestion and environmental costs resulting from these trucks' operation would be lower, and thus the trucks would come closer to achieving cost equity.

There are two ways to address the cost inequities of certain trucks. Congress and/or the States can increase the taxes imposed on these trucks, thus lowering the competitiveness of critical U.S. industries and increasing consumer prices. Alternatively, Congress can give the States the opportunity to improve their size and weight regulations, thus potentially changing the current vehicle fleet to one that is safer, less polluting, more productive and that produces lower infrastructure costs. The former choice benefits the railroads at the expense of the rest of the Nation. The latter would result in slightly lower railroad profitability, but the overall benefits to the Nation could be very significant.

---

STATEMENT OF EDWARD R. HAMBERGER, PRESIDENT AND CHIEF EXECUTIVE OFFICER,  
ASSOCIATION OF AMERICAN RAILROADS

On behalf of the members of the Association of American Railroads (AAR), thank you for this opportunity to discuss key issues relating to our nation's freight transportation capabilities as a result of the remarkable growth of international trade.

Since Colonial times, the growth and vitality of our economy has been closely tied to the development of trade. The railroads' role in the settlement and development of the United States is well known, and yet the efficiency of our ports, international border crossings, and inland transportation systems is just as critical today. We must take steps to insure that our freight transportation system will be able to handle what is certain to be a huge increase in international trade volume in the years ahead. Today, I will focus on ways that our nation can combine the advantages of various transportation modes to reduce costs, save energy, better protect the environment, and increase transportation efficiency—thereby enhancing our productivity and international competitiveness.

INTERNATIONAL TRADE

International trade is becoming the lifeblood of both the world and U.S. economy, and has been a major driving force behind world economic growth over the past decade. From 1990 to 2000, global GDP increased at an average annual rate of 2.0 percent, but the volume of world merchandise trade increased during the same period at an average annual rate of 7 percent—more than three times as much. In the case of the United States, which is the world's single largest exporting and importing nation by a significant margin, GDP over the same period increased at an annual average rate of 3.2 percent, while the volume of merchandise exports increased at an average annual rate of 6.5 percent and imports increased at an annual rate of 8.5 percent.<sup>1</sup>

The importance of international trade relative to U.S. economic output has also risen dramatically. In 1975, U.S. exports plus imports was equal to less than 16 percent of GDP, but by 2000 that figure had risen to more than 26 percent.<sup>2</sup> Manufacturers and agricultural producers in the United States depend upon foreign trade to reach markets for their products, and consumers have enjoyed both a richer variety of products and lower prices as a result of trade opportunities. According to the Office of the U.S. Trade Representative, U.S. exports alone support more than 12 million American jobs, including one in five jobs in the manufacturing sector.<sup>3</sup>

In 2001, the value of U.S. international merchandise trade was \$1.9 trillion. According to figures from the Maritime Administration, United States ports handled

<sup>2</sup>Economic Report of the President, February 2002, p. 253.

<sup>3</sup>Office of U.S. Trade Representative, Benefits of Trade: Information on the Globalization Debate, September 19, 2001 available at [www.ustr.gov/new/benefits.html](http://www.ustr.gov/new/benefits.html).

over 1.1 billion tons of foreign trade in 2001. The liner sector, consisting mostly of containerized shipments, accounted for 68 percent of the value of this trade.<sup>4</sup> More than 20 million loaded containers were imported or exported through our nation's ports in 2001, with the ports of Los Angeles and Long Beach ranked number 1 and 2, respectively—each handling over 3.3 million loaded containers. Additional intermodal traffic flows across our borders with Canada and Mexico. Our ports and border crossings also handle significant volumes of bulk commodities, including grain, coal, non-metallic minerals, forest products, and petroleum products. Railroads serve U.S. ports on the Atlantic, Pacific, and Gulf coasts and the Great Lakes, and provide through service to and from Canada and Mexico at more than 30 border crossings. Railroads handled approximately 5.2 million international containers in 2000, which represented about one-half of their total intermodal traffic.<sup>5</sup>

U.S. trade with Canada (long our largest trading partner) and Mexico (now our No. 2 trade partner) has grown rapidly following the lowering of trade barriers under the North American Free Trade Agreement of 1993. Together, Canada and Mexico account for approximately one-third of U.S. foreign merchandise trade.<sup>6</sup> The value of this North American trade had increased by 85 percent from 1994 to 2000, before declining slightly in 2001 largely following the September 11 terrorist attack. The freight railroads of Canada, Mexico, and the United States, which form a seamless, integrated network that provides the world's most efficient, lowest-cost rail service, have achieved major increases in their trans-border traffic—up 22 percent by value between Canada and the United States and up 72 percent between Mexico and the United States just from 1997 to 2000.<sup>7</sup>

Our seaports, airports, and land border crossings—the gateways that connect us to the rest of the world through commerce—are clearly critical to the economic well being of our Nation. Moreover, more efficient modern container ships carrying 6,000 or more TEUs<sup>8</sup> are increasingly being used, up from the 4,500-TEU standard that has been dominant up to now. These larger ships will place increasing demands on port and landside facilities.

Existing congestion at these facilities must not be permitted to worsen. Moreover, as the Federal Highway Administration documented in a recent study,<sup>9</sup> funding for intermodal connectors—public roads averaging less than two miles in length that lead to/from major intermodal terminals—has not been adequate under the Transportation Equity Act for the 21st Century (TEA-21) and these critical components of the freight transportation system suffer many deficiencies. According to the FHWA, “States and MPOs often see freight as a low priority when compared with the pressing needs of passenger travel. NHS connectors are “orphans” in the traditional State and MPO planning processes.” We must make the investments needed to improve our ability to handle international traffic efficiently, while limiting impacts on surrounding communities in terms of congestion, noise, and air pollution.

#### GROWING IMPORTANCE OF RAIL INTERMODAL SERVICE

U.S. freight railroads move just about everything—from lumber to vegetables, from coal to orange juice, from grain to automobiles, from chemicals to scrap iron—and connect businesses with each other across the country and with markets overseas. America's freight railroads carry more than 40 percent of the nation's intercity freight (measured in ton-miles); about 70 percent of vehicles from domestic manufacturers; 67 percent of the nation's coal to coal-fired power plants (coal generates more than half the nation's electricity); and massive amounts of grain, chemicals, forest products, ores, and other commodities. They also contribute billions of dollars to the economy through wages, purchases, and taxes.

Intermodal rail freight transport—the movement of cargo in trailers or containers by rail in combination with at least one other mode of transportation—has been the fastest growing major segment of traffic for the U.S. freight railroad industry over the past decade. Indeed, while volumes of non-intermodal rail traffic for 2002 to date are below those of last year for the same period as a result of the weak economy, U.S. rail intermodal traffic through August 2002 is 5.1 percent above the 2001

<sup>4</sup> See “U.S. Foreign Waterborne Transportation Statistics,” U.S. Maritime Administration press release, March 28, 2002, available at [www.marad.dot.gov/statistics/usfwts/PR2001/PRDEC2001.htm](http://www.marad.dot.gov/statistics/usfwts/PR2001/PRDEC2001.htm).

level, including increases of between 7.4 percent and 9.4 percent each month from April through August. U.S. intermodal traffic has grown from 3.1 million trailers and containers in 1980 to nearly 9.0 million in 2001. It now accounts for approximately 20 percent of revenue for Class I carriers and is vying for the No. 1 ranking among all rail commodities. Approximately half of U.S. intermodal traffic is either U.S. exports and imports, and intermodal traffic moves throughout the North American rail network.

There are several reasons why intermodal transport has become such a vital part of the U.S. freight transportation mix:

*1. Convenience and lower cost*

Intermodal combines the door-to-door convenience of trucks with the long-haul efficiency and cost-effectiveness of rail. As a result, railroads, trucking companies, international steamship lines, intermodal marketing companies, and others engage in productive partnerships to combine the best characteristics of all modes.

*2. Fuel efficiency*

Railroads are the mode of choice in terms of fuel efficiency. According to studies sponsored by the U.S. Department of Transportation (U.S. DOT) and others, railroads are three or more times as fuel efficient as trucks. Fuel efficiency means reduced emissions and reduced dependence on foreign oil.

*3. Improved air quality*

The Environmental Protection Agency estimates that for every ton-mile, a typical locomotive emits roughly three times fewer nitrogen oxides and particulates than a typical truck. Other studies suggest that locomotives have a much greater environmental advantage relative to trucks, depending upon the pollutant measured.

*4. Reduced traffic congestion*

An intermodal train can take approximately 280 trucks from the highways. Since a single combination truck requires the same highway capacity as approximately four automobiles, a single intermodal train can mean the equivalent of more than 1,100 fewer cars on the highway. According to the Texas Transportation Institute's (TTI) 2002 Urban Mobility Study, the aggregate cost of highway traffic congestion in just the 75 urban areas the institute studied is \$67.4 billion, representing the cost of 3.6 billion hours of extra travel time and 5.7 billion gallons of fuel wasted while sitting in traffic. Since 1982, according to TTI, the cost of congestion has risen by approximately 400 percent in inflation-adjusted terms. Rail intermodal service is a highly effective way to reduce the staggering costs of highway congestion and the associated pressure to build costly new highways.

*5. Innovative technology, specialized equipment, and tailored services*

Doublestack trains—with specialized rail cars that can accommodate one container atop another—are now in widespread use. RoadRailers look like conventional trailers, but come equipped with both rubber tires and detachable steel wheels so they can ride directly on the rails or on a highway. By using specialized equipment, railroads are targeting midand short-distance hauls, in addition to traditional long-haul markets. Rail service offerings include the use of flat cars in dedicated trains operating on a fixed schedule that are specially designed to quickly load, unload and carry standard, non-reinforced highway trailers without damage to the goods or the trailers themselves.

The market for intermodal freight is extremely competitive, and U.S. freight railroads must continue to make major investments so that they can further enhance their cost efficiency and meet customer service requirements that are continually becoming more stringent.

Railroads are incredibly capital intensive, and each year freight railroads must invest heavily to maintain and improve their infrastructure and equipment, that, together, comprise a national system that is the envy of the world. In 2000, Class I railroads directed 17.8 percent of their revenue to capital expenditures; the comparable figure for the U.S. manufacturing sector as a whole was just 3.7 percent. Indeed, since 1980 when the Staggers Rail Act partially deregulated the rail industry, major U.S. railroads have spent more than \$290 billion for this purpose—an average of more than \$13 billion per year over this extended period. Much of this spending is either directly attributable to intermodal service (e.g., the construction or expansion of intermodal hubs, raising underpass clearances to allow for doublestack trains) or indirectly related to intermodal traffic (e.g., capacity expansion and enhanced signaling systems to allow faster, more frequent trains of all types throughout the rail network).

In addition to making necessary infrastructure improvements, railroads have responded to customer needs by instituting a series of operational improvements and service initiatives. Some of these initiatives involve the improved use of information technology. For example, most major railroads now offer comprehensive Internet-based car ordering, car tracing, pricing, and billing capabilities. Railroads have also increasingly entered into productive partnerships with other carriers. These alliances expand the focus for a particular railroad beyond the interchange point, encompassing the total movement and providing customers with seamless service—giving rail customers more value for their transportation dollar.

Since the Staggers Act, freight railroads have improved earnings, but as a group they still do not come close to earning their cost of capital. In 2001, the rail industry's cost of capital (as determined by the Surface Transportation Board (STB), an independent regulatory agency within the U.S. DOT) was 10.2 percent, compared with a return on investment (ROI) of 6.9 percent, as determined by the STB. Rail profitability is consistently in the bottom quartile of all industries.

This cannot continue forever, and this fact explains why—notwithstanding the tremendous gains railroads have made in intermodal and other service offerings in recent years, and the massive investments they have made—the future strength and vitality of our nation's rail system requires that earnings be aligned with investment needs.

Especially over the past couple of years, freight railroads have become increasingly constrained in how much capital they can devote to infrastructure. Rail stockholders and outside capital providers are becoming ever more focused on the railroad financial performance, and now increasingly insist that railroads demonstrate a compelling case for further investments. This financial discipline is necessary and appropriate in a market economy, but it discourages railroad investments that would yield significant public benefits (e.g., congestion mitigation, emissions relief, enhanced mobility, enhanced safety, economic efficiency), but only limited direct railroad benefits. As profit-driven private entities, freight railroads simply cannot afford to make investments, including investments in intermodal projects and facilities, that yield primarily public benefits.

Unless this issue is addressed head on, it will worsen in the years ahead as pressure on our nation's freight rail network intensifies. The U.S. DOT expects freight traffic to nearly double in the next 20 years. Rail customers will continue to demand improved service levels. With highway congestion consuming a growing share of our nation's economic output, and with the need to reduce emissions, conserve fuel, and promote safety on the rise, the need for railroads to provide relief will increase.

#### *Surface Transportation Reauthorization*

TEA-21 expanded the reliance on an intermodal approach to transportation planning that was the focus of the landmark Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA). Today, we are seeing the benefits that can be gained by taking this comprehensive approach.

As planning for the reauthorization of TEA-21 proceeds apace, the AAR is pleased to be an active participant in the Freight Stakeholders Coalition, an organization comprised of diverse freight interests that work cooperatively to promote policies benefiting freight transportation. Besides the AAR, members of the Freight Stakeholders Coalition include the American Association of Port Authorities, the American Trucking Associations, the Coalition for America's Gateways and Trade Corridors, the Intermodal Association of North America, the National Association of Manufacturers, the National Industrial Transportation League, the U.S. Chamber of Commerce, and the World Shipping Council.

The Freight Stakeholders Coalition has unified behind a nine-point agenda designed to promote sound, effective transportation solutions. The agenda includes:

##### *1. Protect the integrity of the Highway Trust Fund*

Reauthorization of the firewalls provided for in TEA-21 would ensure that the funds collected in the HTF would be used for dedicated transportation purposes and not for deficit reduction or general government operations.

##### *2. Dedicate funds for National Highway System (NHS) highway connectors to intermodal freight facilities*

NHS intermodal freight connectors provide for a broad array of intermodal transport services and options. The FHWA has identified 517 NHS freight terminals (253 ocean and river ports, 203 truck/rail terminals, and 61 pipeline/truck terminals). These 517 freight terminals, augmented by 99 major freight airports, connect to the mainline NHS via more than 1,200 miles of NHS connectors. Typically, connectors are located in older, industrialized and mixed land use areas that are subject to physical constraints and environmental considerations.

TEA-21 directed the FHWA to review the condition of connectors and potential investments to improve their condition. In a June 2000 report to Congress, FHWA found that the connectors have significantly poorer physical and operational characteristics, and are underfunded when compared with all NHS mileage. Such conditions on these “last mile” segments can slow freight movement, damage goods in transit, and decrease efficiency and safety. U.S. DOT estimates show that the cost of improving connectors to an adequate level of service over the 2002–2020 time-frame is \$3.5 to \$4.0 billion.

*3. Establish a national freight industry advisory group to provide input to the U.S. DOT*

The advisory group should be funded and staffed, and should consist of freight transportation providers from all modes as well as shippers and State and local planning organizations. There is not a sufficiently focused Federal voice for freight; an advisory group would meet the need for regular and professional interaction between the department and the diverse freight industry, and could help identify critical freight bottlenecks in the national freight transportation system.

*4. Create and fund a Freight Cooperative Research Program*

More accurate and timely data on freight movements would allow State and local governments to plan transportation infrastructure improvements that more closely match actual transportation needs. To this end, a dedicated, funded research effort led by an industry-based steering/oversight group would allow for the collection and dissemination of more timely, complete, and detailed commodity flow and other types of freight data and better planning tools for freight planning professionals and others.

*5. Expand freight planning expertise at the State and local levels*

Unfortunately, transportation planning typically focuses almost exclusively on highway and transit projects, with scant attention paid to freight (including freight rail). To address this deficiency, planning organizations should be strongly encouraged to consider freight transportation needs, including railroad projects and intermodal projects, more fully in their planning. Given the importance of freight mobility to the national economy, States and metropolitan planning organization (MPOs) should be provided additional funds for expert staff positions dedicated to freight issues, commensurate to the volumes of freight moving in and through their areas.

*6. Develop ways to increase available funds without new user fees and taxes by creating a toolbox of innovative financing options specifically aimed at freight capacity improvements and enhancements*

New capital investment in critical freight transportation infrastructure leads to major public benefits including higher productivity, enhanced global competitiveness, and a higher standard of living for our Nation. With freight traffic now forecast to double within the next 20 years, the United States must expand its limited transportation infrastructure dollars by leveraging additional public and private sources of funding. This will require innovative approaches to maximize transportation-related investments.

Two financing options in which freight railroads are most interested are discussed below.

The first option calls for tax incentives and tax exempt financing to companies that make investments in intermodal freight infrastructure. This option would provide targeted income tax benefits (investment tax credits, expensing in lieu of capitalization, accelerated depreciation, and/or tax-exempt financing) to companies for investments made in qualifying assets to improve the efficiency or increase the capacity of the national intermodal freight transportation system. Qualifying assets would include track and roadbed located on intermodal corridors, intermodal transfer facilities, freight handling machinery and equipment at intermodal transfer facilities, and intermodal information infrastructure. Under this option, the tax benefits would accrue to any company that made such investments, not just railroads. Such a program would recognize the huge societal benefits derived from an expansion of intermodal transportation solutions.

The second option calls for allowing the funding of rail infrastructure through the issuance of tax-exempt indebtedness. Under this option, holders of “Qualified Railroad Indebtedness (QRI)” would qualify for an income tax exclusion for interest earned on the QRI. QRI would be any type of indebtedness, regardless of the form, issued to fund the acquisition, construction, improvement, maintenance, or repair of “Qualified Railroad Property” (QRP). QRP, in turn, would be any expenditure for the acquisition or maintenance of depreciable property, such as track, bridges, tunnels, grading, wharves and docks, terminal facilities, signals, computer systems, and

public improvements either used or to be used in the railroad's trade or business. The tax benefits would flow directly to the holders of the indebtedness in the form of income tax exclusion for interest earned, and indirectly to railroads in the form of lower capital costs.

*7. Significantly increase funds for an expanded corridor/border and gateway program*

This proposal would build on the highly popular but underfunded "Corridors and Borders Program," but adds the important concept of gateways. The funding should be freight specific, and there should be a qualification threshold (based on volumes) so that dollars get directed at high volume corridors/borders/gateways rather than wish-list projects. The AAR is a member of the Coalition for America's Gateways and Trade Corridors, which is leading the effort among freight interests to expand funding for this important program.

*8. Streamline environmental permitting for freight projects*

Multiple and often duplicative Federal laws and regulations delay environmental review of transportation projects. Language in TEA-21 directing Federal agencies to streamline the review process for highway projects has not been effective. Consequently, other measures to simplify the review process for all freight projects should be considered.

*9. Increase funding and promote the use of the Congestion Mitigation and Air Quality Improvement Program (CMAQ) for freight projects that reduce congestion and improve air quality*

CMAQ was designed to fund projects that will help reduce transportation-related emissions. Although CMAQ has supported some freight projects, it has been used primarily to address passenger needs. CMAQ funding should be dedicated to projects that can be shown to reduce congestion or improve air quality. Total funding for CMAQ should be increased and the use of CMAQ funds for freight projects should be clarified and strongly encouraged.

In addition to the Freight Stakeholder Coalition proposals outlined above, the railroad industry proposes additional measures which we believe will enhance the ability of our nation's transportation providers to function effectively. Like the proposals from the Freight Stakeholder Coalition, the rail proposals expand further the emphasis on intermodalism that was fundamental to the original TEA-21 legislation. The rail proposals include the following:

*1. Increase funding for the Section 130 grade crossing program and clarify that funds can be spent on maintenance activities*

The most critical safety problems faced by railroads are collisions at highway-rail grade crossings and incidents involving trespassers on railroad rights-of-way. Both of these problems generally arise from factors that are largely outside of railroad control. In 2001, these two categories accounted for 96 percent of rail-related fatalities.

Due largely to railroads' and others' efforts to close grade crossings and to educate the public about the dangers of grade crossings, in conjunction with the Section 130 Federal grade crossing program, the number of collisions, injuries, and fatalities at highway-rail grade crossings has fallen steadily over the years. From 1980 to 2001, the number of grade crossing collisions was reduced 70 percent, injuries declined by 70 percent, and fatalities were down 49 percent. Despite these impressive declines, far too many grade crossing accidents occur each year.

The Section 130 Program provides Federal funds to States and local governments to eliminate or reduce hazards at highway-rail grade crossings on public highways. Current funding, under a set-aside to the Surface Transportation Program of TEA-21, is approximately \$155 million per year. The vast majority of Section 130 funds have been spent on the installation of new active warning devices such as lights and gates, upgrading existing devices, and replacing or improving grade crossing surfaces.

The high cost of current active warning devices—approximately \$150,000, on average, per installation—has limited the number of crossings at which they have been installed. Research into improved low-cost grade crossing warning systems is underway, but increased Federal funding for highway-rail crossing hazard abatement would permit additional crossings to be protected immediately.

The Section 130 program is an important element of the HTF. Grade crossing warning devices are highway traffic control devices, there to protect the motoring public, not trains.

Increasing Section 130 funding and clarifying that such funds can be spent on grade crossing maintenance projects would allow additional crossings to be protected and further enhance highway safety.

*2. Expand the Railroad Rehabilitation and Improvement Financing (RRIF) Program and remove restrictive program requirements*

The Railroad Rehabilitation and Improvement Financing (RRIF) program provides low-interest loans and loan guarantees (not direct Federal grants) to help finance railroad capital investments. As authorized by TEA-21, RRIF authorizes up to \$3.5 billion in direct loans and loan guarantees, of which at least \$1 billion is reserved for small railroad projects. It is administered by the Federal Railroad Administration. Due largely to an exceedingly long delay in the release of implementing regulations and overly restrictive regulatory requirements (especially lender of last resort and collateral requirements), to date very few RRIF loans have been approved.

Railroads seek a major expansion of the RRIF program, and an easing of regulatory barriers to its use, in order to help railroads of all sizes—both freight and passenger—to continue to provide safe and efficient transportation service. Pending legislation (S. 1530—“RAIL-21”, H.R. 2950—“RIDE-21”, and S. 1991 “The National Defense Rail Act”) would increase to \$35 billion the amount of loans and loan guarantees available through the RRIF program. These proposals would also countermand unnecessary existing regulatory barriers pertaining to lender of last resort provisions and collateral requirements.

OPPOSITION TO TRUCK SIZE AND WEIGHT INCREASES

Notwithstanding the broad agreement detailed above among the freight railroads and other transportation modes on many issues relating to our national transportation needs and capabilities, there are some limited areas of disagreement among the modes. One such area concerns truck sizes and weights. Recently, proposals to allow larger and heavier trucks on our nation’s highways have been offered. The rail industry strongly opposes these efforts.

Under current Federal law, trucks operating on the 46,000-mile U.S. Interstate Highway System can have a gross vehicle weight of no more than 80,000 pounds, and the use of longer combination vehicles (LCV—a tractor and two or more trailers or semi-trailers longer than 28 feet each) is limited to 14 Western States that allowed such trucks before 1991. These limits were frozen by Congress in the 1991 ISTEA legislation, largely in response to concerns about the safety of longer and heavier trucks. Since then, various interests have proposed that the weight limit be increased (for example, to 97,000 pounds) and that the use of LCVs be permitted on all or parts of the U.S. interstate highway network. Since 1991, all attempts to thaw the Federal freeze have been rejected by Congress.

Increased truck size and weight (TS&W) limits would, according to the U.S. Department of Transportation, have a disastrous effect on freight railroads. Railroad revenues would decline by \$2.9 billion to as much as \$6.7 billion per year. Contribution to railroad fixed and common costs would fall by \$2.1 billion to \$3.1 billion per year. As the contribution to fixed costs declined, less funding would be available for current and future investments, and so fewer such investments would be made. The reduction in investment would directly translate into reduced capacity, lower efficiency, degradation of service, a reduced ability to handle freight, and, eventually, further disinvestment. Remaining shippers on the rail network would face higher rates, reduced service, or both. Social costs associated with diversion of rail traffic to truck—more highway accidents, pollution, greenhouse gases, congestion, energy consumption, noise—would rise, and the cycle would continue in a vicious circle. This outcome is certainly not in the best interest of our Nation.

A primary basis for the rail industry’s opposition to larger and heavier trucks is the unfair dichotomy between costs paid and costs incurred among the modes. Rail-competitive trucks, which are the heaviest, highest mileage operators among all trucks, do not come close to fully paying for the damage they cause to the highway system. The U.S. DOT’s recent comprehensive Highway Cost Allocation Study concluded that combination trucks weighing 80,000 to 100,000 pounds pay an estimated 50 percent of their cost responsibility, and trucks weighing over 100,000 pounds would pay only 40 percent of their cost responsibility. Rail-competitive trucks already underpay by billions of dollars per year, representing an enormous competitive hurdle that railroads must overcome. Liberalizing TS&W limits would only exacerbate the existing inequity.

A committee of the Transportation Research Board (TRB), an arm of the National Research Council, which in turn is part of the National Academy of Sciences, recently released a report on the truck size and weight issue. The report was Special Report 267: Regulation of Weights, Lengths and Widths of Commercial Motor Vehi-

cles. The report recommends an immediate thaw in the TS&W freeze via the introduction of 90,000-pound single trailer trucks and a 50 percent increase in the weight of double trailer combination vehicles (while also boosting the size of the vehicles). These dramatic changes would be followed by further TS&W increases and the authorization of LCVs through “pilot programs” overseen by a proposed new government agency. The TRB report calls for much of the regulatory authority associated with TS&W to be transferred from the Federal Government to the States.

The TRB report has many shortcomings that undermine its usefulness in the debate over TS&W, as detailed in Dr. Gerard McCullough’s August 2002 evaluation of the report, undertaken for the AAR and included here as Attachment 1. As Professor McCullough<sup>10</sup> explains, the TRB report starts with the faulty premise that there is widespread “dissatisfaction” with existing TS&W limits, when, in fact, existing limits represent an equilibrium wherein the needs of truckers and truck shippers are balanced against the safety concerns of motorists and the national goal of maintaining a healthy overall freight transportation system. Professor McCullough notes that the TRB report contains no new quantitative analysis. For example, the report is critical of the way previous studies calculated bridge damage costs due to changes in TS&W, but does not provide an estimate of what it views as the correct costs. Instead, the report says that the correct analysis has not been done yet. In other words, the TRB report admits it does not know what the effect would be of a TS&W thaw on bridge costs, but it nevertheless recommends a thaw.

Professor McCullough stresses that an efficient freight market is one in which the users absorb the full marginal costs that they impose. Unfortunately, the TRB offers no specific proposal by which the substantial current truck underpayment for the pavement damage they inflict would be ameliorated. These underpayments would sharply increase as gross vehicle weight increased, making existing inequities even worse. Finally, as the TRB report admits, serious questions exist regarding the safety implications of increasing TS&W limits. Yet the TRB calls for addressing this issue by instituting a “pilot program” that would essentially force unknowing and likely unwilling highway users to participate in an experiment to determine the safety implications of changes in TS&W.

As noted above, increasing the size of trucks without insuring full cost recovery would greatly exacerbate the problems caused by large trucks. It is interesting to note that under a recent proposal by the Reason Foundation, a Los Angeles “free market” think tank, truck-only tollways would be built on highway median strips. Under Reason’s proposal, LCVs and heavier trucks would be allowed on the truck tollways, but the roads would be completely user-financed. Railroads are pleased that the Reason proposal explicitly endorses what the railroads have long maintained—that heavy trucks should pay their own way.<sup>11</sup> Every year that goes by means that motorists pay billions of dollars in subsidies, while heavy trucks continue to avoid their cost responsibility.

#### COMMUTER AND INTERCITY PASSENGER ACCESS

Another important issue that could significantly affect the freight railroads’ ability to provide the quality of service that today’s freight shippers require to remain competitive in the global marketplace is the increasing demand for both intercity and commuter rail service.

Rail passenger service can play an important role in alleviating highway and airport congestion, decreasing dependence on foreign oil, reducing pollution, and en-

<sup>10</sup>Dr. McCullough is Associate Professor of Applied Economics, University of Minnesota, St. Paul, MN, and Senior Consultant, Charles River Associates, Boston, MA. He is former Director of the Center for Transportation Studies at Minnesota and former Deputy Director of the Center for Transportation Studies at the Massachusetts Institute of Technology (MIT). He has been a consultant on transportation to the World Bank and the Federal Highway Administration (FHWA) and various private organizations. He was a Special Assistant at the U.S. Department of Transportation from 1977–1980. His Ph.D. is from MIT.

<sup>11</sup>While a detailed analysis of the Reason proposal is beyond the scope of this testimony, it should be noted that while railroads support the requirement that trucks fully repay the cost of the damage they cause to the highway system, care should be taken to insure that all costs—such as right-of-way acquisition, property taxes, truck staging areas, etc.—be fully recovered. For example, the publicly owned median should not just be given to the private sector motor carrier industry without their having to pay for it. Railroads repaid the Federal Government several times over for the value of the land grants they received from the Federal Government. A 1943 study by the Board of Investigation and Research concluded that the value of compensation provided by railroads to the Federal Government has “fully counter-balanced these aids which were conferred many years ago.” A 1977 study by the U.S. Department of Transportation concluded that “. . . the Federal Government has been a net beneficiary of its railway aid programs,” having been more than fully reimbursed for its land, with interest.

hancing mobility and safety. Freight railroads have demonstrated their willingness to work cooperatively with Congress, Amtrak, commuter railroads, the States, and local jurisdictions to insure that the public's transportation needs can be met in the most efficient possible manner. Currently, freight railroads host commuter operations in cities around the Nation, operate commuter trains under contract to local authorities in several cities, and own 97 percent of the mileage over which Amtrak operates. Moreover, at least 29 cities are proposing to establish new or expanded commuter rail operations, and the U.S. Department of Transportation has designated 11 corridors for the introduction of high speed passenger rail systems across the country.

Freight railroads once provided all of our nation's rail passenger service, but large and growing deficits following World War II led them to exit the business. Existing rail passenger service is supported primarily by the public through Federal, State, or local government programs. While passenger railroading is important to our country, it pales in comparison to the importance of freight railroading. Our privately owned freight railroad system is a vital and strategic national asset—moving more freight, more efficiently, and at lower rates than anywhere else in the world, according to Lou Thompson, the World Bank's Railways Advisor. The safe, efficient, and cost-effective transportation service that freight railroads provide is critical to the domestic efficiency and global competitiveness of our Nation.

Therefore, we must find the most effective way to provide the passenger services that America needs, but without burdening the freight rail system—operationally, financially, or in any other way. Congress should resist calls to legislate mandated passenger access to freight-owned track, as proposed in H.R. 2654 in the current Congress. Access by passenger railroads to facilities owned by private freight railroads must be negotiated on a case-by-case basis by the parties, without government interference.

Freight railroads have developed a series of principles regarding the future of intercity passenger rail service. Our principles call for future rail passenger public policy to acknowledge the extreme capital intensity of railroading and to ensure that railroads' investment needs can be met. Policies which add to freight railroads' already enormous investment burden, such as further saddling them with the support of passenger rail infrastructure needs, or which reduce their ability to provide the quality of service needed by their freight customers, must be avoided. To do otherwise would undercut our nation's freight rail capabilities and be counterproductive in addressing our country's congestion, environmental, safety, and economic concerns.

#### SECURITY OF OUR NATION'S RAIL NETWORK

Finally, I would like to touch on the issue of security. This issue is relevant to this hearing because of the tension between the free flow of commerce and the assurance that our transportation systems are adequately protected from terrorist threats. Congress should strike a proper balance between protecting our country's transportation assets and its citizens, and providing for the free flow of goods and promoting our international competitiveness.

Following the terrorist attacks on September 11, 2001, railroads took numerous proactive steps to increase the security of our nation's rail network. Railroads immediately began developing a comprehensive Terrorism Risk Analysis and Security Management Plan. The industry formed a security task force composed of railroad representatives with expertise in areas such as operations, legal issues, railroad police activities, hazardous materials transportation, and information technology. Outside consultants with expertise in intelligence and counter-terrorism were retained to provide advice on best practices.

The task force created five Critical Action Teams addressing hazardous materials, operations security, infrastructure, information technology and communications, and military liaison. The task force undertook a comprehensive risk analysis which identified critical assets, vulnerabilities, and threats, and assessed the overall risk to people, national security, and the nation's economy. The task force then identified more than 50 countermeasures. The Terrorism Risk Analysis and Security Management Plan, which is now in effect, utilizes all this information and establishes four different alert levels, with implementation of specific countermeasures dependent on the alert level in effect.

The plan also provides for the establishment of a Railway Alert Network (RAN), a 24-hours-a-day, 7-days-a-week communications center operated by the AAR. Through the RAN, railroads share information with the intelligence community. In addition, the RAN provides a means for instituting appropriate alert levels and beginning to take the appropriate countermeasures.

The AAR also operates the Surface Transportation Information Sharing and Analysis Center (ST-ISAC). Presidential Decision Directive 63 called for the creation of private sector ISACs to protect the nation's critical infrastructure from attack. The ST-ISAC, formed at the request of the U.S. DOT, collects, analyzes, and distributes security information from worldwide resources to protect vital information technology systems from attack. The ST-ISAC also operates 24-hours-a-day, 7-days-a-week.

#### CONCLUSION

Our nation's global economic supremacy is derived in large part from a transportation system that is second-to-none. Freight railroads are an indispensable element of that system. Going forward, we must ensure that our freight transportation capabilities will meet the increasing demands placed upon it. We are confident that the rail industry can play a major role in meeting this challenge. However, our nation's ability to provide transportation alternatives that promote mobility, economic efficiency, and environmental responsibility depends critically on the further development of the intermodal approach initiated by ISTEA and TEA-21 in which the full capabilities of each mode can be fully realized. No less important to freight railroads is the rejection of public policies that would unnecessarily and unfairly restrict their capability to deliver their maximum value to the U.S. economy.

[August 2002]

#### EVALUATION OF TRANSPORTATION RESEARCH BOARD SPECIAL REPORT 267: REGULATION OF WEIGHTS, LENGTHS AND WIDTHS OF COMMERCIAL MOTOR VEHICLES

(By Gerard J. McCullough, Ph.D.)

Dr. McCullough is Associate Professor of Applied Economics, University of Minnesota, St. Paul, MN, and Senior Consultant, Charles River Associates, Boston, MA. He is former Director of the Center for Transportation Studies at Minnesota and former Deputy Director of the Center for Transportation Studies at the Massachusetts Institute of Technology (MIT). He has been a consultant on transportation to the World Bank and the Federal Highway Administration (FHWA) and various private organizations. He was a Special Assistant at the U.S. Department of Transportation from 1977-1980. His Ph.D. is from MIT.

#### EXECUTIVE SUMMARY

The purpose of this memorandum is to provide an evaluation of the Transportation Research Board's (TRB) Special Report 267: Regulation of Weights, Lengths and Widths of Commercial Motor Vehicles (hereafter, "the Report"), which was released on May 16, 2002. The Report was produced by the TRB Committee for the Study of the Regulation of Weights, Lengths and Widths of Commercial Motor Vehicles ("the committee").

The Report contains a series of conclusions and recommendations regarding TS&W regulation in the United States. It concludes that "opportunities exist for improving the efficiency of the highway system through reform of Federal truck size and weight regulations" (p. ES-1) and finds that "changes in truck size and weight regulations . . . offer the greatest potential to improve the functioning of the [highway] system" (p. ES-2). The Report recognizes that "it is essential to examine the safety consequences of size and weight regulation" (p. ES-3), but cautions "it is not possible to predict the outcomes of regulatory changes with high confidence" (p. ES-3).

To facilitate the liberalization of TS&W limits, the Report recommends a revised regulatory regime that would involve Federal supervision of State-set limits with evaluation provided by an independent Commercial Traffic Effects Institute (CTEI). The committee calls for pilot studies to evaluate the consequences of changes in TS&W regulations, and recommends that States be allowed to issue permits for the operation of longer and heavier trucks once the CTEI is established and able to monitor and evaluate their performance.

The Report adopts a too-narrow analytical perspective that significantly limits its usefulness in establishing national transportation policy. The report starts with the questionable assumption that there is widespread dissatisfaction with existing Federal truck size and weight regulations, when, in fact, the current system represents a balancing of the needs of truckers and truck shippers against the needs of motor-

ists and the national goal of maintaining a healthy overall freight transportation system. In addition, it also fails to recognize:

- The need for an analysis of total freight supply and demand, including the role of shipper logistics costs.
- That changes in TS&W limits affect the capacity of the highway freight network and this in turn affects the performance of railroad and other freight networks (and their shippers).
- That the goal of TS&W regulation—after safety—should be to improve the overall efficiency of the national freight market, not just to reduce direct trucking costs.
- That an efficient freight market is one in which the users absorb the full marginal costs that they impose.

There is no analytical basis, either in the Report or in earlier TS&W studies evaluated by the committee, for many of the Report's most important conclusions and recommendations. For example, the committee's recommendations for immediate changes in TS&W (subject to the creation of a CTEI) are not consistent with its own finding that the effects of such changes are uncertain. Nor is there any legal or economic analysis of why an independent CTEI would be more effective, or more appropriate, than the Federal DOT in determining the need for, and evaluating the performance of, TS&W regulations. There is also no analysis from an experimental design perspective of how the committee's pilot studies would demonstrate the effects of changes in TS&W limits, or an explanation of the potentially serious ethical issues a pilot program might entail.

Perhaps most importantly, the Report does not evaluate the effects of changes in TS&W limits on the overall freight transportation market. Unfortunately, this decision causes it to omit certain points which are essential to a thorough evaluation of TS&W regulations. These include:

- Significant diversion of freight tonnage off the rail and barge networks and onto the highway network.
- Significant increases in the social cost—accidents, pollution, greenhouse gases, congestion, energy consumption, and noise—of moving this freight.
- Potential increases in the rates paid by freight shippers who remain on the rail network.
- Potential disinvestment by railroads, reduced intermodal and other service offerings by railroads, and secondary diversion of more freight onto the highway system.

The Report has some strengths. It recognizes the uncertainty that exists regarding the benefits and full costs of changes in TS&W limits; the need to better understand nuisance-related and stress-related costs from mixed auto and truck traffic, and the potential benefit of separating auto and truck; the potential role of cost-based user fees in managing infrastructure and mitigating negative effects of trucks; and the importance of regulatory institutions and enforcement mechanisms.

Overall, because of its shortcomings, the Report provides extremely limited usefulness to policymakers interested in evaluating TS&W regulations. Previous studies relating to TS&W issues, produced by the U.S. Department of Transportation and other TRB committees, do a more satisfactory job of including all pertinent factors in their analyses.

#### I. BACKGROUND

The current U.S. truck fleet comprises about 8 million vehicles, about a fourth of which are combination trucks. Most combination trucks are large, with about 70 percent having registered maximum gross vehicle weights (GVW) over 75,000 pounds. The number of trucks on the road is small by comparison to private passenger vehicles, but because on average trucks are driven more frequently, their share of vehicle miles traveled (VMT) is disproportionate to their numbers. However, combination trucks still make up only about 5 percent of total VMT, as shown in Table 1.

Table 1. Total Vehicles and Vehicle Miles Traveled by Vehicle Class (2000)

|                          |             | Total VMT<br>(millions) | Percent of<br>Total Vehicles | Percent of<br>Total VMT |
|--------------------------|-------------|-------------------------|------------------------------|-------------------------|
| Autos .....              | 137,967,488 | 1,612,393               | 61.1 percent                 | 58.6 percent            |
| Pickups/Vans .....       | 79,084,979  | 924,018                 | 35.0 percent                 | 33.6 percent            |
| Buses .....              | 746,125     | 7,601                   | 0.3 percent                  | 0.3 percent             |
| Single Unit Trucks ..... | 5,926,030   | 70,583                  | 2.6 percent                  | 2.6 percent             |
| Combination Trucks ..... | 2,096,619   | 135,208                 | 0.9 percent                  | 4.9 percent             |

Table 1. Total Vehicles and Vehicle Miles Traveled by Vehicle Class (2000)—Continued

|             |             | Total VMT<br>(millions) | Percent of<br>Total Vehicles | Percent of<br>Total VMT |
|-------------|-------------|-------------------------|------------------------------|-------------------------|
| Total ..... | 225,821,241 | 2,749,803               | 100.0                        | 100.0                   |

Note: Autos category includes motorcycles.

Despite their relatively small numbers, trucks have an important and significant impact on the U.S. highway system. Trucks are disproportionately involved in fatal traffic accidents<sup>1</sup> and are a major factor in urban traffic congestion and noise pollution.<sup>2</sup> Trucks also produce significant emissions and because of their weight, produce much greater wear on pavement than do private passenger vehicles.<sup>3</sup>

Since the creation of the Interstate Highway System, trucking has become an increasingly important component of the U.S. freight market. Trucks now carry about 29 percent of total intercity freight volume in terms of ton-miles in the United States versus the 41 percent carried by railroads. In terms of revenue, trucking is even more significant—intercity trucking now represents 81 percent of all intercity expenditures for freight transportation in the United States, as shown in Table 2

Table 2. Freight Transportation Outlays by Type of Transport—2000

| Mode                  | Millions of dollars | Percent of total |
|-----------------------|---------------------|------------------|
| Rail .....            | 36,454              | 9.0 percent      |
| Truck-intercity ..... | 328,632             | 80.7 percent     |

#### Existing TS&W Regulation

The dimensions and weights of commercial vehicles are regulated at both the Federal and State levels. Federal laws regulate both maximum permissible gross vehicle weights and maximum axle weights, and the width, length, and number of trailers. A summary of current Federal TS&W regulations is provided in Table 3.

All States have laws governing the weights and dimensions of trucks. All but seven States apply some modification of the Federal regulations on a limited basis through permits, exemptions, and “grandfather rights.”<sup>5</sup> Altogether, regulations in the 50 States and the District of Columbia represent over 40 different combinations of single axle, tandem axle, bridge formula, gross vehicle weight, and interstate/non-interstate specifications.<sup>4</sup>

Table 3. Summary of Current Federal Truck Size and Weight Regulations

| Criteria     | Applicability                                | Limit                              |
|--------------|--|------------------------------------|
| Weight ..... | Single Axle limit on Interstate System ..... | Interstate System .... 20,000 lbs. |

<sup>1</sup>According to the Federal Motor Carrier Safety Administration, large trucks are involved in 9 percent of fatal accidents and 78 percent of the victims in truck-related fatal accidents are occupants of the other vehicles. See Large Truck Crash Profile: The 1998 National Picture, Tables 1 and 4.

<sup>2</sup>The Federal Highway Administration has found that a combination truck imposes the congestion costs equivalent to 2.5 to 15 automobiles, depending upon the highway's grade and speed, the weight-to-power ratio of the truck, and the vehicle length, and that the most common semi-trailer trucks impose more than 30 times as much noise pollution costs as autos. See Federal Highway Administration, 1997 Federal Highway Cost Allocation Study Final Report, August 1997, Table V-26.

<sup>3</sup>Pavement wear increases exponentially with vehicle weight, such that 80,000-pound trucks on urban interstates impose marginal pavement costs per mile that are more than 400 times greater than automobiles. See Federal Highway Administration, 1997 Federal Highway Cost Allocation Study Final Report, August 1997, Table ES-6.

<sup>4</sup>A complete inventory of current State size and weight limits, as well as a thorough discussion of the nature, extent, and present status of grandfather rights is provided in U.S. Department of Transportation, Comprehensive Truck Size and Weight Study, Volume II Issues and Background, 2000, pp II-8—II-24.

Table 3. Summary of Current Federal Truck Size and Weight Regulations—Continued

|            | Criteria   | Applicability          | Limit                  |
|------------|--|------------------------|------------------------|
|            | Tandem Axle limit on Interstate System .....                                 | Interstate System .... | 34,000 lbs.            |
|            | Total gross vehicle weight .....   | Interstate System .... | 80,000 lbs.            |
|            | Gross weight on any group of two or more consecutive axles (bridge formula). | Interstate System .... | $500(LN/(N-1)+12N+36)$ |
| Size ..... | Vehicle width .....  | National Network ....  | 102 inches             |
|            | Semi-trailer length .....  | National Network ....  | 48 feet (minimum)      |
|            | Twin trailer length .....  | National Network ....  | 28 feet (minimum)      |

Notes: National Network refers to a network of roads designated by the Secretary of Transportation pursuant to the Surface Transportation Assistance Act of 1982. It includes virtually all Interstates and some other highways and totals more than 200,000 miles. For Bridge Formula  $W$  = overall gross weight on any group of two or more consecutive axles to the nearest 500 lbs.,  $LN$  = distance in feet between the extreme of any two or more consecutive axles, and  $N$  = number of axles in the group.

Source: U.S. DOT, Comprehensive Truck Size and Weight Study, Volume I Summary Report, p. 3.

Federal TS&W regulation has its origin in the creation of the Interstate Highway System in 1956. The passage of the regulations was motivated by the significant role of the Federal Government in funding 90percent of the construction of the system. The Federal weight limits were originally set at 73,280 pounds, 18,000 pounds, and 32,000 pounds for gross vehicle weight, single axle weight, and tandem axle weight, respectively, but were increased to those shown in Table 3 in 1975.

In 1982, the Federal role in TS&W regulation was increased through the passage of the Surface Transportation Assistance Act (STAA), which required States to adopt Federal weight limits on Interstate highways and allow single 48-foot trailers and twin 28-foot trailers on a "National Network" designated by the Secretary of Transportation in consultation with the States. This network consists of virtually the entire Interstate system plus another 156,000 miles of highways.

The Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) prohibited the States from expanding either the number of routes on which Longer Combination Vehicles (LCVs) could be operated or the maximum weights and dimensions allowed for these vehicles.<sup>5</sup> This regulation has come to be known as the "LCV freeze" and in 1998 it was extended by the Transportation Equity Act for the 21st Century.

The study of TS&W issues by the Federal Government predates its involvement in funding of the highway system. The first major study was completed in 1941 by the Interstate Commerce Commission.<sup>6</sup> A major impetus for these studies has been the claim that higher size and weight limits increase the efficiency of the freight markets. The main findings of previous TS&W studies, especially those that are relevant to conclusions and recommendations in TRB Special Report 267, are reviewed in Appendix A1.

## II. OVERVIEW OF TRB SPECIAL REPORT 267

The Transportation Equity Act for the 21st Century (TEA-21) contained a provision specifically requiring the Secretary of Transportation to request that TRB conduct a TS&W study. The charge given in the act is quite general in scope, specifying only: ". . . a study regarding the weights, lengths, and widths of commercial motor vehicles operating on Federal-aid highways . . ." and that the study provide policy recommendations.<sup>7</sup>

The law requires TRB to consult with the U.S. Department of Transportation, States, the motor carrier industry, freight shippers, highway safety groups, air quality and natural resource management groups, and commercial motor vehicle driver representatives. It requires TRB to consult with "other appropriate entities," although it does not specify what these entities might be. It also requires TRB to consider and evaluate the impact of its recommendations on the economy, the environment, safety, and service to communities.

The Committee for the Study of the Regulation of Weights, Lengths and Widths of Commercial Motor Vehicles was formed in 1998, and its original purpose was to review certain aspects of the U.S. DOT's TS&W study. As it happens, TRB had already begun planning for a TS&W study before TEA-21, and so the committee was

<sup>5</sup>Longer combination vehicles (LCVs) refers to multi-trailer combinations longer than the standard twin 28-foot trailer combination vehicle (the so-called STAA double). The LCVs include seven-axle "Rocky Mountain" doubles, eight-axle "B-Train" doubles, nine-axle "turnpike doubles", and seven-axle tripletrailer combinations.

<sup>6</sup>Interstate Commerce Commission, Federal Regulation of the Sizes and Weight of Motor Vehicles; Letter from the chairman, Interstate Commerce Commission, 77th Congress, 1st Session, House Document No. 354, August 14, 1941.

<sup>7</sup>P.L. 105-178, Section 1213, Subsection (i).

reassigned to this task when the law was passed. The committee consisted of 13 members representing State transportation officials, professional researchers, and academics, overwhelmingly in the field of civil engineering, with a small representation from economics. A summary list of the members and their respective affiliations is provided in Appendix A2.

As part of the process of conducting the study, the committee solicited comments from outside parties on the issue of changes to TS&W regulations. Of the 46 organizations receiving letters, 25 provided comments in response. The full list of organizations contacted is shown in Appendix A3.

The committee's request for comments included the following three specific questions:

1. What revisions to Federal law and regulations regarding commercial vehicle weights, lengths, and widths should the committee consider?
2. What factors should it take into account in evaluating possible revisions?
3. Should the committee recommend revisions to Federal law and regulations?

Responses to the three questions were quite varied. In response to Question 2, four respondents explicitly stated that the committee should not consider the issue of modal competitiveness or the diversion of freight from the railroads in evaluating possible TS&W revisions. Three of these were trucking industry interests.<sup>8</sup> The other was the National Industrial Transportation League.

The basic conclusion in Special Report 267 is that increased TS&W limits have the "greatest potential" to improve highway freight efficiency, but that their full effects (including safety effects) are uncertain and that there is a "substantial probability" that there will be safety ramifications. To facilitate the liberalization of TS&W limits, the Report proposes a revised regulatory regime that would involve Federal supervision of State-set limits with evaluation provided by an independent Commercial Traffic Effects Institute (CTEI). The Report suggests that the States should not be able to begin liberalizing the regulations until the CTEI is established and is able to conduct careful assessments. A full list of the Report's conclusions and recommendations is in Table 4.

Table 4. Conclusions and Recommendations of TRB Special Report 267

| Conclusions  | Recommendations   |
|--|---|
| 1. Opportunities exist for improving the efficiency of the highway system through reform of Federal truck size and weight regulations. Such reform may entail allowing larger trucks to operate.   | 1. Create a Commercial Traffic Effects Institute  |
| 2. Appropriate objectives for Federal truck size and weight regulations are to facilitate safe and efficient freight transportation and interstate commerce, to establish highway design parameters, and to manage consumption of public infrastructure assets.    | 2. Evaluate the consequences of changes in truck size and weight regulations through pilot studies  |
| 3. Changes in truck size and weight regulations made in coordination with complimentary changes in the management of the highway system offer the greatest potential to improve the functioning system.  | 3. Allow certain immediate changes in Federal regulations   |
| 4. The methods used in past studies have not produced satisfactory estimates of the effect of changes in truck weights on bridge costs.  | 4. Allow certain Longer Combination Vehicles (LCVs)   |
| 5. It is not possible to predict the outcomes of regulatory changes with high confidence.  | 5. Routes and roads to which Federal standards should apply   |
| 6. It is essential to examine the safety consequences of size and weight regulation. Research and monitoring needed to understand the relationship of truck characteristics and truck regulations to safety and other highway costs are not being conducted today. | 6. Conduct research on enforcement, environment and safety effects, bridge costs, freight markets, driver stress, and dedicated truck infrastructure. |
| 7. Although violations of size and weight regulations may be an expensive problem, monitoring of compliance with the regulations is too unsystematic to allow the costs involved to be estimated.  |   |

## III. EVALUATION OF TRB SPECIAL REPORT 267 GENERAL OBSERVATIONS

The most detailed analysis in the Report (pp. 2-17 to 2-29) focuses on new probabilistic techniques for assessing bridge costs. The actual analysis of freight market efficiencies—the *raison d’être* for the Report—is limited to a few bullet-points on pages 2-12 and 2-13. There is some discussion on pages 2-36 to 2-39 of the relationship between freight markets and land use—a topic some would regard as very important—but the Report elects not to weigh these effects: “Predicting and evaluating the effect of changes in size and weight regulation on land use would be extremely difficult” (p.2-39).

The Report does recognize the uncertainty that exists regarding TS&W issues. The Executive Summary cautions: “Throughout its work, the committee found that a lack of information about the costs and benefits of truck transportation and the impacts of the size and weight regulations hindered its effort to provide useful policy advice” (p. ES-1). In a more detailed summary of these uncertainties (p. 2-11), the Report concludes that pavement impacts and traffic impacts are well enough understood to facilitate regulatory change, but that there is inadequate knowledge of safety effects, bridge costs, changes in the volume of truck traffic, motorist stress and discomfort, and administrative feasibility. Not all would accept the claim that the infrastructure and traffic effects are well known.<sup>9</sup>

The Report also acknowledges the potential importance of motorist comfort and distress to TS&W. The Report does not devote an extensive amount of time to discussing the issue, but it does acknowledge that research should be conducted to determine whether these effects are “real costs that should be considered in evaluations of highway regulations” (p. 5-18).<sup>10</sup> The Report also mentions the potential benefits to be gained from separating truck and auto traffic by constructing separate highway and bridge facilities for trucks. Road Work, the 1989 Brookings Institution study of the U.S. highway system by Small, Winston, and Evans developed this idea that there may be “diseconomies of scope” that result from combining cars and trucks on the same system.<sup>11</sup> The Report acknowledges that separate truck facilities could help to accommodate the growth in freight demand, though it does not discuss the financing of these facilities.<sup>12</sup>

Finally, the TRB Report recognizes the potential role that cost-based user fees could play in managing the utilization of highways and bridges and mitigating the negative effects of trucks. Though the Report’s discussion is mostly limited to cases where the imposition of fees would facilitate the implementation of higher TS&W limits (p. 3-28), the general endorsement of highway pricing is a policy advance. This is coupled with the important recognition that the design of regulatory institutions and enforcement mechanisms as well as standards are important elements of the regulatory process.

A major shortcoming of the Report is that it fails to provide any real analysis of supply and demand in the freight market, even though the explicit aim of the Report is to increase the efficiency of this market. The economic theory upon which the Report is based is uncomplicated: “The regulations have important economic consequences because trucking accounts for four-fifths of expenditures on freight transportation in the United States, and trucking costs are influenced by truck size and weight.”

The DOT Comprehensive Truck Size and Weight Study does not necessarily contradict this theory, but it does provide a more thorough picture of the freight market to provide a basis for careful policy decisions. For example, the U.S. DOT study points out in Chapter IV that overall logistics costs—not truck or rail rates—are the

<sup>9</sup>The committee appears to be less than certain about its knowledge of traffic effects. It recognizes (pp. 236) that the methods used to estimate congestion and pollution costs involve “oversimplified treatment on the complex interactions between trucks and other vehicles in the traffic stream. Changing the traffic volume, dimensions, and acceleration abilities of trucks will change how motorists drive around them, affecting other vehicles’ patterns of acceleration and braking.” The committee also acknowledges (pp. 233 to 2-34) that the predicted effects on traffic flow depend critically on freight diversion forecasts, (which the Report discounts).

<sup>10</sup>The Report makes the methodological suggestion that the only way to evaluate the economic value of driver stress is to observe changes in traveler behavior where automobile drivers chose different routes to avoid big trucks. To see the limitations of this method, consider a case with which the committee members might be familiar—the installation of Traveler Information Systems on public transportation systems. The economic value of these systems, which let travelers know in real time when the next bus or train is arriving, is not measured solely by the number of travelers who divert from highway to transit. The valuation should include some measure of the usefulness of information provided existing users.

<sup>11</sup>Small, K., Winston, W., and Evans, C., *Road Work: A New Highway Pricing & Investment Policy*, Washington DC: The Brookings Institution, p. 102.

<sup>12</sup>The Report also acknowledges here that “other modes” (p.5-18) will be part of the solution.

factors that determine freight market decisions. It notes that savings in inventory carrying costs are about equally important as reductions in (truck and rail) transportation costs in increasing the efficiency of freight markets. The U.S. DOT study also spends a considerable amount of time analyzing the impact of TS&W regulations on the freight railroad industry (Volume III, Chapters II, III, IV, XI). These impacts are important because they have direct bearing on the overall efficiency of the freight market.

The notion of freight market efficiency developed in Special Report 267 is too narrow to be useful in a discussion of national transportation policy. The sole focus of the Report is on the movement by truck from Point A to Point B at the lowest direct expense to some motor carriers and shippers. An efficient national freight market is an intermodal system of air, water, highway, rail and shipper activities which take full advantage of linked networks of transport assets. Moreover, (as the TRB itself recognized in Special Report 246<sup>13</sup>) an efficient freight market is one in which the users absorb the full marginal costs that they impose.

Using this metric, Special Report 246 found rail operations to be two-to-five times more efficient than truck operations on a corridor-by-corridor basis. This suggests that higher TS&W limits, which would divert freight from the rail network onto the highway network, would increase social costs and decrease efficiency. One could argue that the reduction in private costs to truckers and truck shippers could partially offset this effect, but a national policy report should make that argument explicitly.

#### POINT-BY-POINT EVALUATION OF REPORT CONCLUSIONS AND RECOMMENDATIONS

This section provides a point-by-point evaluation of the TRB Report's conclusions and recommendations. A serious shortcoming of the Report is its failure to establish an analytical basis for the recommendations which it makes. There is no analytical justification, for example, either in earlier TS&W studies or the Report itself, for its novel regulatory proposal—Federal “supervision” of State TS&W permitting with oversight provided by an independent Commercial Traffic Effects Institute (CTEI). Nor is there an analysis from an experimental design perspective of how the Report's pilot studies would demonstrate the effects of changes in TS&W. Other recommendations for immediate change that the Report makes appear to be inconsistent with its own finding that the effects of increased TS&W limits are uncertain. The Report does suggest that States should not be able to begin liberalizing the regulations until the CTEI is established and is able to conduct careful assessments.

##### A. *Conclusions of the TRB Report*

Conclusion 1: Opportunities exist for improving the efficiency of the highway system through reform of Federal TS&W regulations. Such reform may entail allowing larger trucks to operate.

The proper focus of TS&W policy should not be solely on lowering the private costs of trucking firms and/or some freight shippers, but on minimizing the public costs (infrastructure, safety, pollution, energy consumption, congestion) of truck transportation and ensuring the overall efficiency of the national freight market. An efficient market is one in which the users absorb the full marginal costs that they impose.

It is wrong for the Report to conclude—without a more careful analysis—that there is a direct relationship between increases in TS&W limits and increases in freight market efficiency. The data for such analyses were available to the committee in TRB Special Report 246, in a 1998 DOT-sponsored study by David J. Forkenbrock of the University

of Iowa entitled *External Costs of Truck and Rail Freight Transportation*, in the DOT's 2000 Comprehensive Truck Size and Weight Study, and in the 2000 Addendum to the 1997 Federal Highway Cost Allocation Study.

According to the 2000 Addendum to the 1997 Federal Highway Cost Allocation Study, heavy trucks in the 75,000–80,000 pound range cover only 80 percent of the infrastructure costs they impose, and heavy trucks in the 80,000–100,000 pound range cover 50 percent.<sup>14</sup> The full marginal social cost of bigger trucks—much of it not recovered—is on the order of \$0.20 to \$0.70 per mile.<sup>15</sup>

<sup>13</sup> TRB Special Report 246, *Paying Our Way: Estimating Marginal Social Costs of Freight Transportation*, 1996, Table ES-1, p. 8.

<sup>14</sup> Federal Highway Administration, 2000 Addendum to the 1997 Federal Highway Cost Allocation Study Final Report, Table 7.

<sup>15</sup> *Ibid.*, Table 13.

Table 5 summarizes the relevant results of the TRB's own Special Report 246, comparing the efficiency of two representative freight movements by rail and by 5-axle tractor semitrailer:

- Case 1 compares the full costs of a grain movement from Walnut Grove, MN to Winona, MN, a distance of about 200 miles. Case 1A summarizes the full costs of a direct truck move using local roads. Case 1B analyzes the truck costs by Interstate. Case 1C is a combined truck/rail movement.

- Case 3 compares the full costs of a container movement from Los Angeles, CA to Chicago, IL, a distance of about 2,000 miles. Case 3A is a truck movement by Interstate. Case 3B involves truck and container railcar.

In both corridors, the rail movements are more energy-efficient and labor-efficient and impose lower social costs. The modes are competitive largely because of public subsidies to trucking and the high valuation that shippers place on the flexibility and speed of the truck mode.

Table 5. Efficiency Comparisons: Truck versus Rail (\$)

|  | Case 1A       | Case 1B       | Case 1C      | Case 3A       | Case 3B       |
|--|---------------|---------------|--------------|---------------|---------------|
| Marginal External Cost                       |               |               |              |               |               |
| Congestion .....                             | 8.94          | 6.25          | 0.00         | 295.81        | 0.75          |
| Accidents .....                              | 46.04         | 26.11         | 9.19         | 89.43         | 77.72         |
| Air Pollution .....                          | 6.54          | 6.75          | 1.43         | 63.65         | 34.83         |
| Energy Security .....                        | 3.10          | 3.63          | 0.39         | 16.64         | 5.36          |

| Marginal cost of public infrastructure ..... | 38.63         | 61.02         | 0.00         | 141.47        | 1.81          |
| <b>Total .....</b>                           | <b>105.57</b> | <b>103.77</b> | <b>11.78</b> | <b>627.67</b> | <b>133.12</b> |
| Less: User fees (\$/truckload) .....         | 51.16         | 59.90         | 0.65         | 285.14        | 10.50         |
| Equals: Net subsidy (\$/truckload) .....     | 54.41         | 43.87         | 11.13        | 342.53        | 122.62        |
| Carrier's average cost (\$/truckload) .....  | 454.16        | 442.73        | 124.87       | 2469.06       | 1049.44       |

Source: TRB Special Report 246, Tables 4-2, 4-3, and 4-4.

The implication is that the liberalization of TS&W might improve the efficiency of the highway system, but in so doing it would also add external costs (negative impacts on other transportation modes, and increased costs to some transport users) that would not be recovered. Thus, total freight transport efficiency would be harmed.

Conclusion 2: Appropriate objectives for Federal TS&W regulations are to facilitate safe and efficient freight transportation and interstate commerce, to establish highway design parameters, and to manage consumption of public infrastructure assets.

The Report recognizes here that the goal of TS&W regulation is not to improve the efficiency of the "highway system," but to balance the public costs of truck travel against the efficiency of the freight transportation market. However, the committee does not follow its own admonition, because the focus throughout the Report is overwhelmingly on lowering the private costs of trucking.

A more balanced statement of goals is in the DOT's National Freight Transportation Policy Statement (January 1997), which guided the Comprehensive Truck Size and Weight Study. These goals include:

- Ensure a safe transportation system;
- Promote economic growth by removing unwise or unnecessary regulation and through the efficient pricing of publicly financed transportation infrastructure;
- Protect the environment and conserve energy;
- Provide funding and a planning framework that establishes priorities for allocation of Federal resources to cost-effective infrastructure investments that support broad National goals;
- Promote effective and equitable joint utilization of transportation infrastructure for freight and passenger service.

Notice the emphasis on safety, transportation infrastructure (not just highways), environment, and effective and fair use of all of the nation's transportation assets. It is worth noting, also, that when the DOT conducted its Comprehensive Truck Size and Weight Study, direction was provided by a Policy Oversight Group which included officials from FHWA, the Federal Railroad Administration, and the Maritime Administration. In addition, a Multimodal Advisory Group was established to provide technical assistance.

It is surprising that a national panel of transportation experts would view this broad set of goals and multimodal working structure as a "shortcoming" (p. 2-1),

and yet that is the conclusion of the TRB Special Report 267. The Report claims that a fundamental problem with the 2000 study and earlier studies is that “analyses have not started with clear definitions of the objective of regulation” (p. 2–1) which should be “asking how the size and weight regulations can be used as a part of a strategy for increasing the benefits of the highway system” (p. 2–3). What the Report means by “increasing the benefits” is liberalizing the TS&W limits.

Conclusion 3: Changes in TS&W regulations made in coordination with complementary changes in the management of the highway system offer the greatest potential to improve the functioning of the system.

The Report provides no analytic basis for its conclusion that changes in TS&W have “the greatest potential” to improve the functioning of the freight market or the efficiency of the highway system. There is no analysis of the role of logistics costs, for example, or of the impact of deregulation, computerization, containerization, and advanced communications on freight productivity. Nor is there a complete analysis of the role that prices could play in making highways more efficient.

The Report’s failure to consider logistics contrasts with the U.S. DOT’s Comprehensive Truck Size and Weight Study, which recognizes that the freight market properly understood is a \$600 billion activity (p. IV–12). The DOT study estimates that business logistics costs declined by about \$65 billion during the 1980’s, but that a large portion of that savings (\$30 billion) was attributable to reductions in inventory carrying costs. The other \$35 billion of savings was attributed to reductions in transportation costs for all modes including truck, rail, water, pipeline and air.

With respect to the highway system, Special Report 246 concludes that the best way to guarantee improvement for all users of the system would be to charge the right prices. Quoting the earlier committee:

It is desirable that shippers and carriers pay the full social cost of their freight operations—that is, that the special taxes and fees paid by the shipper or carrier for each shipment of freight be enough to offset the cost to the government of the shipment and the external costs that the shipment imposes on others. If the shipper and carrier do pay the full cost of each freight shipment, then they will be more likely to use transportation services responsibly and efficiently.<sup>16</sup>

TRB Special Report 267 also recognizes the potential role that cost-based user fees could play in managing the utilization of the highway system, but the focus is on applying these fees to larger-permit trucks in order to “facilitate” the implementation of higher TS&W limits (p. 3–28). There are technical problems with such a fee scheme that are discussed below under Recommendation 3. The more general problem is that the pricing described in this Report would do little to reduce the truck-related stresses that motorists feel, the safety risks they face, or the cross-subsidies they pay for infrastructure.

Conclusion 4: The methods used in past studies have not produced satisfactory estimates of the effect of changes in truck weights on bridge costs.

In its Comprehensive Truck Size and Weight Study, the U.S. DOT estimates that nationwide legalization of six-axle 97,000-pound single trucks would reduce shipper costs by 5.1 percent, but increase bridge costs by 33.1 percent. Similarly, nationwide operation of LCVs would decrease shipper costs by 11.4 percent, but increase bridge costs by 34.4 percent. Large expenditures for bridges—\$53 billion in capital costs and \$266 billion in user delay costs—would offset the efficiency gain to truckers and truck shippers.

The reason for this large estimate is that heavier singles and LCVs would overstress bridges beyond their design limits and force them to be replaced. The DOT recognizes that it probably overestimates bridge costs since “some bridges could be strengthened and replacement of bridges on highways with low volumes of the damaging vehicles would not have to be improved at all.”<sup>17</sup>

The TRB Report puts considerable emphasis on the fact that a risk-based analysis would reduce the projected cost of bridge replacement.

Very high estimates of bridge costs from liberalized regulations are inconsistent with the experience of jurisdictions—in particular Michigan and Ontario—that have opened their roads to use by trucks much heavier than the Federal weight limits without experiencing costs of the magnitude estimated. Most important, the DOT estimates ignore the great potential for lower-cost methods of maintaining bridge safety that the States are increasingly capable of applying because of the widespread adoption of bridge management systems (p. 2–29).

<sup>16</sup>TRB Special Report 246, *Paying Our Way: Estimating Marginal Social Costs of Freight Transportation*, 1996, p. 1.

<sup>17</sup>U.S. Department of Transportation, *Comprehensive Truck Size and Weight Study*, Volume I Summary Report, 2000, p. ES–20.

The Report recognizes that a proper, risk-based analysis has not yet been conducted. It does not fully acknowledge the difficulties that might be involved in such an analysis or the possibilities for upward revision of the DOT estimates. The Report is skeptical of the DOT's ability to predict regulatory outcomes in markets governed by supply and demand (see Conclusion 5 below), but confident of its ability to predict the behavior of State highway agencies and the legislative committees that fund these agencies.

Also, as the Report notes on p. 2–19, the U.S. DOT study omits fatigue costs attributed to larger vehicles markets which State engineers feel are underestimated. And, as the Report notes on p. 2–21, there are alternative rating systems for judging how much a bridge can be loaded and the choice of the higher rating system would revise the DOT estimate upward. The methods used in the past may not have produced satisfactory estimates, but they have not necessarily produced exaggerated estimates, as the Report claims.

Conclusion 5: It is not possible to predict the outcomes of regulatory changes with high confidence.

It is true that there is uncertainty involved in the prediction of regulatory outcomes. However, economists have made considerable progress in the empirical analysis of various network industries, and these results have been used extensively to improve the regulatory framework and the functioning of the economy. An example which a TRB panel should have been aware of is railroad deregulation in 1980. The regulatory changes accompanying rail deregulation were supported by extensive economic studies before the fact, and have been validated by subsequent analyses. One might point to similar work in most other network industries—airlines, electricity, telecom, gas, water, etc.<sup>18</sup>

It is one thing to conclude, as the Report does (p. 2–6), that a 1986 TRB committee was not able to predict the exact length (53 ft) of the trailers that the trucking industry would adopt in response to a change in statutory language, or (p. 2–6) that a 1970's Canadian study did not anticipate the variety of specialized trucks that would evolve as a result of new provincial weight limits. It is another thing to decide—as the committee apparently does—that it could disregard the work in the Comprehensive Truck Size and Weight Study aimed at forecasting the effects of TS&W changes on the intercity freight markets.

Those effects can be quite striking. The illustrative TS&W scenarios analyzed in the DOT study show that bigger trucks would divert between 4.0 percent and 19.6 percent of annual rail traffic (measured in car-miles) onto the highway system (Table ES–12). This means between 1.02 billion car-miles and 5.0 billion car-miles would be converted into highway trailer-miles each year. It also means a projected loss of railroad contribution to fixed costs ranging from 38.2 percent to 55.8 percent. This is money that would no longer be available to the railroads to cover the fixed costs of their operations and sustain investment.

The problem that the DOT report recognizes is that railroad fixed costs are high, so the losses would have to be recovered (to some extent) in the form of higher prices to remaining rail shippers. In other words, a reduction in costs to some highway shippers must lead to an increase in rates for some rail shippers. In response to trucks cutting rates, railroads in many cases would have to lower their rates to stay competitive or else lose the traffic. Losing traffic means that remaining shippers must bear the burden of providing fixed costs, and so on, and you get a vicious circle. The TRB committee, with a mandate to consider overall economic efficiency, should have recognized this.

Conclusion 6: It is essential to examine the safety consequences of TS&W regulation.

In its Comprehensive Truck Size and Weight Study, the U.S. DOT concludes that safety must be the primary goal of TS&W policy along with “the considerable public concern about mixing larger trucks with passenger cars on our highways.”<sup>19</sup>

Collisions between medium to heavy trucks and other, smaller vehicles (principally passenger cars and light trucks and minivans) can be particularly lethal to the occupants of the smaller vehicles, principally because of the difference in weight (mass) between the two vehicles, and for head-on collisions, the high vehicle closing speeds typically involved. In total, collisions with medium to heavy trucks account

<sup>18</sup>Economists involved in these reforms are aware of the mistakes that have been made and of the limitations of such analyses, but no one has concluded that the analysis efforts are irrelevant. For a critical overview of these developments see Michael A. Crew and Paul R. Kleindorfer, “Regulatory Economics: Twenty years of Progress?” pp. 5–22, in a special issue of the *Journal of Regulatory Economics*, 21(1), January 2002.

<sup>19</sup> US Department of Transportation, *Comprehensive Truck Size and Weight Study*, p. V–1.

for 22 percent of all passenger car and light truck/van occupant fatalities sustained in collisions with other motor vehicles. (p. V-2)

The DOT study acknowledges that it is difficult to use statistical inference to establish a relationship between TS&W limits and highway safety. Longer combination vehicles account for less than 2 percent of annual truck VMT, while 5-axle single trailers comprise 65.4 percent. It is difficult to develop robust estimates for vehicles larger than the typical vehicle in use. Also, the crash rates for larger vehicles now operating in highly controlled situations may not be transferable to other operating situations. The DOT's approach, therefore, is to focus on the systematic components of truck safety, comparing physical differences in vehicles and equipment, driver performance, and operating environment in standard versus larger trucks.

The TRB Report recognizes the lack of conclusive information about the relationship between truck size and weight and truck safety. It also recognizes that this kind of information is critically important in formulating potential changes to TS&W regulation. The approach that the Report proposes is different from the DOT's and raises serious questions. According to the Report, pilot studies would solve the information problem by facilitating "direct observation of the primary impact of interest" (p. 5-9) which would be frequency and severity of accidents. This amounts to the use of unknowing or unwilling human subjects (motorists) in large-scale (or lengthy) safety experiments.

The most successful past studies of the relative accident rates of trucks of differing dimensions have used data obtained from truck operators that include records of large numbers of trips made by different kinds of trucks operating between the same origins and destinations . . . In pilot studies involving a small number of vehicles, it would not be possible within a reasonable time span to measure small differences in relative accident risks. (pp. 5-9, 5-20)

The pilot studies are endorsed despite the DOT's findings that combination trucks are more susceptible to rollover than conventional trucks and induce greater driver fatigue, as well as repeated substantiation that the public is strongly opposed to longer, heavier trucks and, therefore, would likely not wish to be party to a "pilot study" to examine the safety effects of TS&W changes.<sup>20</sup>

Conclusion 7: Monitoring of compliance with TS&W regulations is too unsystematic to allow the costs (of violations) to be estimated.

This is an important observation, and the report rightly points out the need to better quantify the nature and extent of violations in order to inform the process of TS&W regulation. The Report identifies a number of techniques as being promising for improving enforcement, especially more widespread use of automated, information technology based systems.

#### *B. TRB Report Recommendations*

##### *Recommendation 1: Establish an independent Commercial Traffic Effects Institute to monitor and evaluate TS&W changes*

The Report stresses that the design of regulatory institutions and enforcement mechanisms, as well as performance standards, are important elements of the TS&W regulatory process. This is an important contribution, but the Report offers no legal, economic or administrative analysis of why a Commercial Traffic Effects Institute (CTEI) would provide more effective regulation than the DOT—especially in an area where there are significant public concerns.

The primary justification for CTEI is that "under present practices Federal size and weight policy has been deadlocked for more than a decade, in spite of general dissatisfaction with the regulation" (p. 5-5). In fact, it is debatable that there is widespread dissatisfaction with the existing TS&W regulations, at least as far as it concerns liberalization, among the general driving public. The Report recognizes that the DOT's recent analysis of TS&W issues was "comprehensive" (p. 5-6), and that the DOT has the authority to regulate truck safety (p. 3-4), but it concludes that the way to end the "deadlock" is to establish a separate agency (p. 5-6).

The CTEI would be an "independent public organization," financed from the Highway Trust Fund, and governed by a congressionally appointed board of Federal, State and industry representatives. The CTEI's professional staff of engineers, statisticians and economists would work on pilot studies and other research funded by government or the private sector. Here is how it might work, according to the Report:

For example, a group of carriers in one industry segment or one region might have a particular interest in having research or a pilot study conducted on a vehicle or operating practice they believed would be of value to them. In such a cir-

<sup>20</sup>Ibid., p. I-22 and V-11.

cumstance, the carriers should be expected to contribute a major portion of the costs of the evaluations. Legislation would be needed to provide the proper legal form for such contributions. (p. 3–5)

The Report predicts that under such arrangements the Institute “would come to be seen by industry, State governments, and others as a means to implement ideas about more efficient highway management and truck regulation” (p. 3–4). This seems accurate, but it is not clear that the public interest would be protected.

*Recommendation 2: Evaluate the Consequences of Changes in TS&W Regulations Through Pilot Studies*

While the concept of pilot studies is, in principle, not inappropriate for research of this nature, the specific proposal put forth in the TRB report is problematic at best. As described by the Report, the pilot program would expose ordinary travelers to bigger/heavier experimental trucks in traffic if the CTET determined, based on all available information, that the pilot could be conducted without harm to safety (p. 5–10).

One might consider pharmaceuticals as a model for the evaluation of innovations with the potential to both produce public harm and benefit, but what is proposed here is not really analogous to pharmaceutical regulation. In that industry, it takes about 13 years to develop one new drug, and the process is characterized by systematic, sequential incremental testing of the product for 7–8 years before it is tried on any humans. When human testing begins, extensive tests are initially conducted on healthy human volunteers just to ensure the product does no harm. Critical to the process is extensive monitoring in a controlled environment. Moreover, safety is always first—before a new drug is even tested for efficacy it is tested to ensure that it does no harm to human beings. Clearly, any public policy innovation that could potentially harm the public needs should be examined in a similar risk-averse, safety-based framework.

Nor is it clear that the pilot studies recommended by the committee would establish the “consequences” of TS&W changes. The DOT study recognizes how difficult it is to use statistical inference to establish a relationship between TS&W limits and highway safety. One reason is that the current use of such vehicles is highly controlled so that the results would not generalize to different operating conditions. The same caveat would apply to pilot studies.

Another troublesome aspect of this recommendation is that it gives individual States responsibilities for making decisions that affect the overall efficiency of the national freight network. Increases in TS&W limits lower the per-ton operating costs of long-haul trucks and this has an immediate effect on rail traffic—about one-third of which (on a ton-mile basis) is competitive with long-haul trucks. Because the rail and highway networks are interrelated—and because the rail network has high fixed costs—all shippers are affected.

The Report fails to recognize that there is a difference between the optimal management of highway pavement and bridge structures and optimal regulation of a complex national freight network. It may make sense for the United States to further “devolve” responsibility for the management of pavement and bridge assets to State highway agencies (or regional agencies, or regulated private firms), but it is wrong to confuse the management of infrastructure with the regulation of national freight operations.

*Recommendation 3: Authorize the States to participate in a federally supervised permit program allowing for a) six-axle tractor semi-trailers with maximum weight of 90,000 pounds, and b) double-trailer configurations with each trailer up to 33 feet long*

The committee has been careful in its recommendations regarding changes to existing TS&W limits. The maximum gross vehicle weight of 90,000 pounds for six axle semitrailers, for example, is just below the threshold estimated to cause negative bridge impacts, according to the DOT study.<sup>21</sup> Because axle weights are not increased, such a limit would (according to the DOT study) not necessarily cause increased pavement damage. However, the current bridge formula would allow 33-foot double-trailer configurations with weights up to 120,000 pounds on a nine-axle vehicle, 115,000 pounds on eight axles, or 110,000 pounds on only seven axles. A seven-axle vehicle at 110,000 pounds may not be as damaging to bridges as a 120,000-lb. nine-axle vehicle of the same length, but it certainly does more pavement damage. Notwithstanding the issue of infrastructure impacts, questions still exist regarding the safety implications of increasing TS&W limits, even in this limited fash-

<sup>21</sup>The 90,000-pound GVW six-axle semitrailer is examined as part of “North American Trade scenario.” See U.S. DOT, op. cit., Volume III, Table VI-1.

ion. The TRB report describes the lack of statistically reliable evidence both concerning the relationship between truck weight and accident involvement, and regarding the relationship between truck weight and the probability that an accident will result in a fatality (pp. 2-44 to 2-45).

In addition, the Report recognizes that nuisance-related and stress-related costs from mixed auto and truck traffic should be considered in the evaluation of any TS&W policy. In focus groups conducted as part of the U.S. DOT study, a vast majority of automobile drivers said they opposed changes in TS&W regulations.<sup>22</sup> Truck drivers in the survey groups also questioned the need for change. Truck sizes and weights are a serious issue for the public, and this must be an important consideration in any public policy decision.

The Report recommends that “fees related to costs be adopted to accompany the proposed new size and weight limits” (p. 3-27), but it does not appear that these would cover the marginal costs of pilot programs. The Report does not explicitly endorse the pricing of all truck traffic (which would be logical) but only the pricing of experimental permit trucks to cover their “added costs”. The report recognizes (p. 3-28) that the “added costs might be proportional to the volume of permit traffic up to some traffic level but increase at an accelerating rate at higher volumes.” As truck traffic increases, in other words, the marginal cost of the permit trucks would be increasing. But this implies that increases in conventional truck traffic would also increase the marginal cost of permit trucks, and vice versa. Under the plan that the report describes, increase in marginal costs of existing trucks would not be covered.

*Recommendation 4: Allow the States to conduct pilot studies involving any longer combination vehicles as long as the pilot study is judged safe by the CTEI*

In addition to proposing the allowance of the 33-foot doubles described in Recommendation 3, this recommendation suggests that States be allowed to conduct pilot studies with any configuration of LCVs, so long as they are judged safe by CTEI.

The open-ended nature of this aspect of this recommendation raises two important questions:

1. What types of LCVs are likely to be proposed for pilot studies?
2. How broad would the scope of these pilots be?

With regard to the first question, the DOT study indicates that the economics of the industry are such that if longer combination vehicles were allowed to operate nationwide, they would become the dominant configuration, eventually constituting the majority of US truck VMT.<sup>23</sup> In this context, the second question becomes critical.

Here the DOT study concludes that “(e)ven if Federal law did not require States to allow larger or heavier vehicles, some States fear that if neighboring States allow LCVs, they will face irresistible pressure to also allow LCVs to keep their businesses competitive.”<sup>24</sup> This raises the possibility that, even within the carefully designed pilot studies advocated by the committee, larger LCVs could eventually dominate the intercity freight market.

A majority of automobile drivers oppose these vehicles. LCVs are less stable than conventional tractor-trailers, and the effects they would have on congestion and pollution are uncertain. LCVs would have a significant effect on the overall viability of railroad operations across their service offerings as described in the discussion under Conclusion 5.

*Recommendation 5: Do not extend Federal TS&W regulations to the non-Interstate portion of the National Highway System*

The committee reports a recommendation that there is no justification for extending Federal weight regulation to the non-Interstate portion of the National Highway System. There is no discussion of this issue in the body of the Report and the committee’s congressional mandate is to analyze the regulations “on Federal-aid highways to which Federal regulations apply on the date of enactment of this Act.”<sup>25</sup> The recommendation appears to be aimed at HR3132, the “Safe Highway and Infrastructure Preservation Act”, which would extend the current Federal TS&W limits beyond the 44,000 miles Interstate system to the entire National Highway System of nearly 157,000 miles.

<sup>22</sup> U.S. DOT, Volume II, pp. V-17-V-18.

<sup>23</sup> U.S. DOT, Comprehensive Truck Size and Weight Study, Volume III Scenario Analysis, 2000, pp. IV 32-IV-33.

<sup>24</sup> U.S. DOT, op. cit., Volume I Summary Report, p. 40.

<sup>25</sup> PL 105-178, Section 1213.

The recommendation is not inconsistent with the idea proposed in the Report that there should be a “redefinition” of Federal and State TS&W regulatory responsibilities. The Report describes that redefinition as follows:

The Federal Government would have diminished involvement in defining numerical dimensional limits on the Interstates and other Federal-aid highways, since the States would have more discretion with respect to limits on these roads. However, the Federal Government would take on greater responsibility for ensuring that State rules governing the use of vehicles on Federal-aid highways were contributing to meeting national objectives. (p. 3–21)

The Institute (Recommendation 1) would play a key role here, providing “monitoring, oversight and research” (p. 3–21), and the Federal Government would focus on performance standards: “States could propose solutions to problems, and the Federal Government would have to assess whether the proposals met qualitative objectives” (p. 322).

The Report does not identify these qualitative objectives. It also does not recognize that changes in TS&W limits change the capacity of the highway freight network, and this affects the overall efficiency of the national freight network. Because the rail and highway networks are interrelated, all shippers (and all motorists) are affected. State agencies may well provide optimal management of highway and bridge assets but this does not mean that they can optimally regulate the performance of the national freight network.

*Recommendation 6: Specific TS&W topics requiring research include enforcement effectiveness, air quality effects, truck characteristics and crash involvement, risk-based bridge costs, freight market behavior, driver stress, and truck-only facilities*

The report makes a good case that there are several key areas in which more information would improve TS&W policy.

The recommendation for more freight transportation market research should consider not only the relationship between truck costs and truck traffic, but should examine the broader context of total logistics costs and shipper preferences across modes. Advanced and well-accepted market research techniques now exist that would, within a carefully designed program of research, allow the estimation of models that quantify shippers’ relative valuation of the most important freight service characteristics. These models could then be used to forecast the likely impacts of service changes across the freight industry. This work could build on the DOT (2000) study.

The proposed research into the nuisance costs of mixed auto and truck traffic is also an important recommendation, particularly given that the report rightly points out that these costs may be independent of actual accident rates. But the conclusion that such costs should only be considered in policymaking if they lead to observable changes in driver behavior is wrong. The stress or anxiety associated with driving with large trucks may impose costs on drivers that are real, but for a variety of reasons do not cause changes in behavior. Research into the adoption of advanced information technology in the public

transit sector, for example, has demonstrated that travelers may value useful information for its ability to reduce stress and uncertainty, but may not necessarily change their travel patterns as a result of having access to it. Modern market research techniques could similarly be used to estimate and clarify drivers’ valuations concerning the stress associated with truck traffic.

#### APPENDIX A1. PREVIOUS TS&W STUDIES

##### *DOT (1981) An Investigation of Truck Size and Weight Limits*

This study was conducted in response to a congressional directive that the U.S. DOT examine the appropriateness of uniform TS&W standards throughout the United States. It examined the range of benefits and costs to the U.S. economy and society, as well as to specific groups, that would result from alternative changes in TS&W regulations. Five categories of changes were considered, including grandfather clause elimination, barrier elimination, uniformity, rollback to pre-1974 limits, and increases in limits.

The study found that transport cost savings from increased truck productivity could exceed the increase in highway and bridge maintenance costs and increased accident costs that would accompany the introduction of higher TS&W limits. At the same time, however, it found that additional infrastructure investments would be required to accommodate such increases, and that it was uncertain as to whether or not funding would be available for these investments. If these investments were not made, the study found that the negative impacts of TS&W changes could be

much greater. The study estimated that diversion from rail would be small under the specific scenarios examined, but did not attempt to estimate the resulting effect on the railroad industry.

*TRB (1986) Special Report 211: Twin Trailer Trucks*

The purpose of this study was to examine the potential impact of new rules adopted in the 1982 STAA, with a particular focus on safety. It found that twins were probably less safe than semis, but that little change in accidents should be expected because it was assumed that truck VMT would decline overall. On the other hand, it concluded that twins were expected to produce 90 percent more wear on asphalt pavement and 20 percent more wear on concrete pavement than the semis they would replace. This study did not independently estimate the diversion of freight traffic from rail to trucks using twin trailers, but traffic forecasts used in the study assumed that any such diversion would be very small. This assumption was based on the prediction that LTL carriers would be the primary users of twins, and that rail was not a good substitute for LTL truck service.

*TRB (1990) Special Report 227: New Trucks for Greater Productivity and Less Road Wear: An Evaluation of the Turner Proposal*

The purpose of this study was to evaluate a proposal to reduce road wear and increase truck productivity. Known as the Turner Proposal, the concept was to increase allowable truck lengths and gross vehicle weights but at the same time decrease allowable axle weights. The study evaluated the impact of "Turner Trucks" in terms of productivity, safety, traffic, bridges and pavement. It examined both nationwide and less-than-nationwide adoption scenarios.

For nationwide adoption, it found that that savings to carriers or shippers switching to Turner trucks would average 12 percent of linehaul operating costs, and the aggregate cost savings would be 1.4 percent of total truck freight shipping. Approximately 4 percent of rail ton-miles would be diverted, causing rail to lose 5 percent of its gross revenue. Some of the designs proposed were predicted to have negative safety or traffic effects, but the study predicted that total truck VMT would decrease. The study found that bridge costs would be increased markedly, but that pavement wear would be reduced, such that under nationwide adoption the net effect would be a savings in total infrastructure costs. Under less than nationwide adoption, however, the study found that bridge costs could exceed reductions in pavement costs. Overall, the study found that the Turner proposal would produce benefits and recommended that States consider its adoption under certain circumstances.

*DOT (1997) Federal Highway Cost Allocation Study*

As part of its role in administering the Federal-aid highway system, the Federal Highway Administration has from time to time undertaken analyses aimed at estimating the costs imposed on the various parts of the system by different classes of vehicles. The total costs of building and maintaining the system are generally known, but the purpose of these studies is to allocate the costs among users. Known as Highway Cost Allocation Studies (HCAS), these analyses are major efforts requiring significant data collection and analysis, and have therefore been relatively infrequent. The most recent was conducted in 1997, the first HCAS since 1982.

The 1997 HCAS provides the most up-to-date estimates available of the relative costs imposed on the system by cars and trucks. A specific objective of the study was to determine how changes in the Federal highway program and the user fees that support it have affected the equity of the user fee structure. The study also estimated the responsibility of different vehicle classes for the external costs associated with highway use, an important addition not included in the 1982 report. In addition to estimating marginal pavement and bridge costs imposed by each class of vehicle, therefore, the study estimated per mile congestion and noise costs. An addendum to the report published in 2000 provided estimates of per mile air pollution costs by vehicle class. The study found that combination trucks with registered weights over 75,000 pounds (about 70 percent of all combination trucks as shown in Table A-1) are not paying their fair share of highway costs. Trucks with registered weights of over 80,000 pounds are on average paying only 50 percent or less of the infrastructure costs they impose.<sup>26</sup>

The study was closely coordinated with the Comprehensive Truck Size and Weight Study then being conducted by the U.S. DOT, in order to provide a con-

<sup>26</sup>Federal Highway Administration, 1997 Federal Highway Cost Allocation Study Summary Report, Table 7.

sistent set of assumptions and methods for estimating the differential impacts on the highway system by vehicle class. The DOT study is described below.

*DOT (2000) Comprehensive Truck Size and Weight Study*

This study was intended to be a comprehensive examination of the issues related to TS&W regulations and the potential impacts of changing them. The aim of the study was not to promote a specific policy objective, which is noted in the TRB Report.<sup>27</sup> Rather the aim of the study was “. . . to develop an information base and set of analytical tools upon which to evaluate alternative TS&W options.”<sup>28</sup> The study is comprehensive in many respects. For example, it attempts to make “. . . a significant improvement in the analysis of diversion from other modes by explicitly considering inventory and other logistics costs that shippers evaluate in making real-world transportation decisions.”<sup>29</sup> The study recognizes the role of TRB in evaluating changes to TS&W regulations, with the assumption being that the TRB committee charged with examining TS&W issues would internalize the results of the DOT study.<sup>30</sup>

#### RESPONSES OF EDWARD R. HAMBERGER TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question.* Some of the figures we have seen indicate that much of the growth in freight will be carried on trucks. However, as you mention in your statement, one way to reduce wear and tear and congestion on our roads is to move more people and freight by rail. Since our road infrastructure will be hard pressed to accommodate the expected increase in truck traffic, how can we make rail more competitive and ensure the most efficient division between freight carried by trucks and freight on our rails? Keep in mind that we also will need to move more people by rail in the future, not just freight.

*Response.* If freight railroads are to continue to provide safe and efficient transportation service that enhances our nation's economic health and global competitiveness, and if they are to play a meaningful future role in relieving congestion, reducing emissions and energy consumption, and improving safety, a number of steps should be taken that remove public policy obstacles and focus public policy choices on rail infrastructure.

First, there should be a more pronounced reliance on public-private financing partnerships for railroad infrastructure improvement projects, especially for projects that provide significant public benefits or meet public needs, such as congestion mitigation, emissions relief, enhanced mobility, and enhanced safety. As outlined in my September 9th testimony, the TEA-21 reauthorization process should include modifications to several transportation infrastructure programs and Federal tax policies to allow freight railroads and other transportation providers to meet vital public transportation needs more efficiently and effectively.

Second, Congress and rail regulators should resist calls to reregulate the rail industry. While it is beyond the scope here to explain in detail why railroad reregulation is such a counterproductive notion, the essential point is that regulatory restrictions that impede railroads' ability to generate sufficient returns would severely compromise their ability both to generate investment funds internally and to attract the outside capital needed to sustain—much less increase—their operations over the long term. Ultimately, if railroads are reregulated, the only realistic alternative to wholesale disinvestment of our nation's rail network would be for the government to step in and subsidize railroads on a massive scale.

Third, a number of Federal laws and regulations that inhibit railroads by treating them less favorably than other modes should be addressed.

For example, under existing truck size and weight limits, rail-competitive trucks cover far less than the costs of the damage they cause to our highways. The shortfall is made up through billions of dollars in subsidies from other highway users to truckers. Equity demands that truckers bear this expense themselves. To make matters worse, various interests have proposed that the existing truck weight limit be increased (for example, to 97,000 pounds) and the use of longer combination vehicles be expanded. Attempts to expand existing truck size and weight limits should be resisted because such expansion would exacerbate existing inequities while severely harming the rail industry. A recent U.S. DOT study found that, depending on the scenario, increased truck sizes and weights would result in a decline in rail revenue of between \$2.9 billion and \$6.7 billion, a decline in the contribution to railroad fixed costs of between \$2.1 billion and \$3.1 billion, and a decline in railroad

return on equity of 32 to 46 percent. Such declines would decimate the rail industry's ability to invest in its infrastructure, add significantly to highway wear and tear, increase highway congestion, and diminish highway safety.

Another example of a modal inequity concerns Federal research and development. The "21st Century Truck Initiative" is a public-private research partnership involving many of the nation's largest heavy-duty engine and truck companies and several Federal agencies designed to lead to prototype engines that double existing fuel economy for long-haul trucks and significantly reduce truck emissions. Currently, there is no similar program for locomotives. To correct this inequity, Congress should establish a public-private partnership involving Federal agencies, railroads, and rail suppliers designed to increase the fuel efficiency of, and reduce emissions from, locomotives.

Taxes constitute a third area in which modal inequities hinder railroads. Public policy should ensure that tax laws do not distort market forces by giving one mode a distinct competitive advantage over other modes. Thus, existing tax laws which disadvantage railroads relative to trucks and other modes should be modified.

For example, the 4.3 cents per gallon "deficit reduction" fuel tax paid by railroads but not paid by trucks should be repealed. Likewise, railroad disadvantages created by existing capital recovery provisions should be addressed. Currently, for income tax purposes railroads must capitalize and depreciate, over a period of years, the costs incurred in building their infrastructure. In addition, railroads must capitalize many of the costs of repairing and maintaining their infrastructure. In contrast, the fuel taxes paid by trucking companies (used for both new capital expenditures and highway repair and maintenance) are expenses which can be deducted immediately. This disparity in treatment of infrastructure spending for income tax purposes results in a 9 percentage point penalty for railroads on their capitalized infrastructure investments. It is a significant issue for freight railroads because railroads are enormously capital intensive: in 2000, railroad capital spending was equal to 17.8 percent of revenue, compared with 3.7 percent for U.S. manufacturing as a whole. Railroads also pay hundreds of millions of dollars per year in property taxes on their right-of-way, an expense their trucking competitors do not pay.

Finally, as your question reminds us, freight railroads also face significant and increasing demands for use of their infrastructure for passenger operations. Freight railroads agree that passenger rail can, under the right circumstances, play a role in alleviating highway and airport congestion, decreasing dependence on foreign oil, reducing pollution, and enhancing mobility and safety. However, the importance of passenger railroading to our country pales in comparison to the importance of freight railroading. Therefore, we must find the most effective way to provide the passenger services that America needs, but without burdening the freight rail system—operationally, financially, or in any other way. The goals of reducing pollution and highway congestion can be realized only if we ensure that passenger trains don't interfere with freight service.

To this end, Congress should resist calls to legislate mandated passenger access to freight-owned track. Access by passenger railroads to facilities owned by private freight railroads must be negotiated on a case-by-case basis by the parties, without government interference. For their part, freight railroads will continue to work cooperatively to help passenger railroading succeed where it is practicable, but it is not the responsibility of our nation's privately owned freight railroads to subsidize passenger service. Once policymakers agree on the nature and scope of passenger railroading in this country, they must be willing to commit public funds on a long-term basis commensurate with that determination. To do otherwise would undercut our nation's freight rail capabilities and be counterproductive in addressing our country's congestion, environmental, safety, and economic concerns.

---

RESPONSE OF EDWARD R. HAMBERGER TO ADDITIONAL QUESTION FROM SENATOR  
JEFFORDS

*Question.* Mr. Hamberger, I appreciate your detailed and thorough recommendations regarding TEA21 reauthorization. Would you please expand upon the legislative changes—as opposed to the regulatory changes—you are seeking to the Railroad Rehabilitation and Improvement Financing Program?

*Response.* AAR is seeking legislative changes to the Railroad Rehabilitation and Improvement Financing (RRIF) program that would ensure that the applicant for a loan or loan guarantee would not have to (1) provide collateral; or (2) demonstrate that it has sought other financial assistance under the program (i.e., lender of last resort provision). S. 1530, the "Railroad Advancement and Infrastructure Law of the 21st Century," or RAIL-21, and a related House measure both include these impor-

tant legislative changes. S. 1530, which has ten Senate cosponsors, is pending in the Senate Committee on Commerce, Science, and Transportation.

---

STATEMENT OF RICK LARABEE, DIRECTOR OF PORT COMMERCE, PORT AUTHORITY OF  
NEW YORK AND NEW JERSEY

Chairman Reid and Chairman Breaux, thank you for the invitation to appear before this panel on the matter of intermodal transportation and port access. I am pleased that you chose to conduct a joint hearing of your two committees. After all, the subject is intermodal transportation. Your collective effort demonstrates that it is important to consider how separate modes of transportation operate as a part of a total system. Congress showed great wisdom in acknowledging the role of intermodalism in modern transportation and commerce with the enactment of ISTEA and then TEA-21. Federal policy and support should continue to evolve to foster the productivity and efficiencies that can be achieved through addressing national transportation needs as a system of connecting and complimentary modes.

As a region that has major port facilities and the nation's largest consumer market we especially feel the impact of the economic globalization on a major gateway and its infrastructure. My hope is that this hearing will heighten your interest in the subject, further your understanding of how the efficient movement of intermodal cargo is a matter of national interest, and convince you that improvements in Federal policy and the level of assistance are warranted.

For the record, the Port Authority of New York & New Jersey is a bistate public authority created in 1921 by our States with the consent of Congress. The Port Authority's mission on behalf of the States is to identify and meet the critical transportation infrastructure needs of the bistate region and provide access to the rest of the Nation and to the world. The Port Authority's jurisdiction includes the region's major aviation and marine terminal facilities as well as the PATH commuter transit system, ferry and bus terminals, the interstate tunnels and bridges and other facilities. And appropriate to the subject of this hearing, intermodal transportation was born at Port Newark and, soon after, the first U.S. container port was developed on Newark Bay.

Our operations and projects help move people on air, land and water to the workplace, home and distant places. The region is the most densely populated in the United States and the largest international gateway on the Atlantic. As such, people and freight heavily populate the highways, rail systems and marine terminals as foreign commerce and domestic markets are served in just-in-time fashion. And while you have asked me to focus my remarks on port access I should observe that our region and gateway is as modally diverse as can be, making access and mobility issues that much more complex. Within a one mile radius of our busiest marine terminals is one of the nation's largest air cargo facilities, the northeast corridor rail line serving passengers and freight, interstate highways, and other roads and rail lines in addition to the warehouses, rail yards and businesses that support national and regional commerce. Similar multi-modal views can be seen elsewhere in the bistate area.

Our airports are responsible for roughly 22 percent of all US international cargo, which, combined with domestic cargo, totaled nearly 2.95 million tons in 2000 at a value of \$150 billion. The seaport serves 35 percent of the U.S. population and 200 nations. The terminals in New York and New Jersey handled over 3 million container units (as measured in Twenty-foot Equivalent Units) last year and \$80 billion of general, bulk and breakbulk cargo moved through the port in 2001. At one container terminal alone over 5,000 trucks go through the gates every day. Our on-dock rail terminal handled 200,000 containers per year and is near capacity. And lest you think that our port is the exclusive gateway for our region's consumers and manufacturers, another 750,000 TEUs arrive in our region via rail from the West Coast. Meanwhile, traveling annually over our bridges and through our tunnels are approximately 250 million vehicles while 2.5 million buses use our two terminals in New York City.

Those statistics attest to the vitality of the trade and economic activity that is at work every day. But it also hints at a major challenge we and other regions face.

That challenge is to make sure that American gateways and freight corridors have the capacity to keep up with the growth in trade and the larger economy. To be clear, this is not a case of build it and they will come. It is a matter of . . . build it because the cargo is coming. In fact it is already here resulting in ever-greater congestion 7 days a week. And whether you are talking about commuter routes, air cargo or port access finding new capacity is a present day issue that will only wors-

en unless actions are taken on a Federal, State and local level to improve efficiencies and expand capacity.

To help you better understand the challenge we face, I would like to paint a present-day intermodal picture for you:

- The New York/New Jersey metropolitan region is a severe nonattainment area for ozone (NOx and VOCs).
- Approximately 87 percent of ocean borne cargo leaves or arrives at the Port of New York-New Jersey in a truck. Almost all of the remainder travel on rail.
- At a growth rate of 4 percent a year, estimates show trade in all types of cargo doubling in our port in little over 10 years. Nationally, trade will double by 2020.
- Demand for consumer goods is driving continued growth in intermodal trade, which is expected to rise at rates exceeding 4 percent annually. In the past recent years actual growth in general cargo at the port has averaged 6 percent. Container traffic is expected to quadruple by 2020.
- Five thousand commercial cargo ships called in the port in 2001.
- While regional population totals are expected to advance slowly at about 0.3 percent per year to 2020, even this modest growth rate will result in an absolute increase of nearly one million people to the population base creating a greater demand for consumer goods and placing further strains on an aging transportation infrastructure.
- Commercial and retail development initiatives along with growing public demand for access to limited waterfront areas are increasing traffic and land pressure on marine terminals, rail yards, and air cargo operations.
- Distribution facilities are migrating to more affordable locations on the region's periphery and in other States further straining our roadway systems and degrading our air quality as trucks must travel greater distances to deliver commodities to consumers in our urban center.
- Our region's highways are at or near capacity. Shortfalls in the rail freight line and yard capacity necessary to accommodate commodity flows are increasing. Competition for capacity on the road and rail systems between commuters and goods movement is fierce.
- Trucks move 90 percent of the region's freight (and 87 percent of the port's intermodal cargo), though they represent about 10 percent of the vehicles on the region's highways and about 7 percent at the Port Authority tunnel and bridge crossings. Freight trains comprise an even smaller proportion of the region's railroad activity, often confined to limited operating times in deference to extensive commuter rail schedules.
- The eight active intermodal rail yards that serve the entire region handle more than 1,000,000 lifts per year and are close to capacity.
- In addition to being among the busiest in the Nation, our airports contend with freight access problems, especially J.F.K. International where trucks and passenger vehicles vie for space on the main access route.

Addressing these challenges will require investing in infrastructure and adjusting policies to foster logistically and environmentally smart solutions for the long term. Partnerships are coming together locally and regionally to support projects and we need a strong Federal partner to accelerate these activities. Such partnerships have proven to be successful, exemplified best by the Alameda Corridor project undertaken by our West Coast friends. The public and private sectors, including Federal and State governments, joined in planning and building the Alameda Corridor. And Federal support was crucial to the project being financially feasible.

It is heartening that the U.S. Department of Transportation-the Federal Highway Administration, Maritime Administration and the Secretary's intermodal staff, in particular-and the freight community have devoted recent years to studying freight and intermodal transportation issues. FHWA maps vividly illustrate what the future holds for our country as international and domestic freight volumes grow at the gateways, borders and along trade corridors. The Maritime Administration's survey of port access problems and recent report of its findings is important work as was the discovery that port access and other intermodal linkages are among the lowest federally funded transportation projects.

The Port Authority, in coordination with the States of New York and New Jersey, is in the process of developing specific recommendations for future legislation. Therefore I will devote the remainder of this statement to some general observations for your consideration. These are in no particular order.

First, we and other ports greatly appreciate the attention that your committees are giving to the maritime transportation system (MTS). For a country that from its earliest days has depended upon maritime transportation to build and sustain a Nation the MTS is the least visible and federally supported transportation system

in the country. That is why we are grateful that that the Bush Administration continued the MTS initiative. Consideration is now being given to identifying MTS infrastructure requirements and it is our hope that the Federal Government will act affirmatively on that information.

Second, congestion and other bottlenecks to efficient transportation can be found throughout the country, but it is especially severe in major gateways and metropolitan areas that are essential elements of the nation's economic infrastructure and security. As such, those areas, including the New York-New Jersey region, deserve special attention. An older and densely developed area like ours, with roadways, ramps and bridges designed for early 20th century conditions have a special challenge to upgrade facilities to standardized lane widths and weight limits that can accommodate the larger and heavier containerized freight movements.

Third, the significant growth in freight movement that is projected for this country will have to be accommodated efficiently or the Nation will suffer the consequences. However, in the Northeast and other heavily traveled areas building new capacity to meet the needs of commerce should not mean that trucking will alone have to bear the brunt of that growth. Clearly trucking will be an essential part of the transport strategy in the decades to come, carrying more and more freight. But in our region trucking and the highways on which they depend are not expected to have the capacity to handle a growing population and the anticipated doubling and tripling of domestic and international cargo. Can many more lanes be added to the region's interstates or to major corridors like I-95, even in the Washington area? And can that be done while maintaining Federal and State clean air objectives? It is evident to us that if we are to avoid debilitating congestion at the port and on the region's highways adjustments will be needed in the modal sharing of intermodal cargo. That leads me to my fourth point.

Even as Congress continues to support the enhancement of highway capacity in the United States your committees should consider how to foster the development of other modes to accommodate increasing demand. Rail certainly is one part of the answer. We are building three new intermodal rail yards at our marine terminals in order to dramatically expand our capacity to move containers on rail. In addition, the Port Authority is working with the railroads and public agencies to identify specific regional rail projects that will improve line and terminal capacity.

Another answer can be found off our shores. We are undertaking a program to encourage intermodal cargo to move by water where possible. That is made possible in part by the costs of congestion, which have made traditionally long distance modes more competitive over shorter hauls. There is tremendous underutilized capacity on the water. And while moving containers on barges can satisfy the market in the Northeast I think that Congress can look into the future and see how fast vessel technology can bring new capacity to intermodal transportation along major corridors. It is not the solution but if examined for its associated capital, energy and environmental costs it can be part of the solution with Federal support.

Fifth, innovations approved by Congress in TEA-21, such as the Congestion Mitigation Air Quality (CMAQ) and National Corridor Planning and Development programs, were very worthwhile policy steps to take. CMAQ helps regions such as ours make sound transportation choices that are consistent with clean air objectives. The corridor program recognized that special conditions in need of special attention exist at the borders and elsewhere. Those innovations were worthwhile directions to take and they could be improved and expanded even further, especially to add to the capacity of major gateways and corridors.

Sixth, while this hearing is concerned with the movement of freight, it is important to note how attention to freight can achieve improvements for passengers. I think especially of projects intended to divert freight from heavily traveled automobile routes to dedicated freight corridors, whether on land or water. Area transportation agencies have intermodal corridor projects in varying stages. Some were authorized for study in TEA-21, such as the New Jersey intermodal corridor and the cross-harbor rail freight tunnel projects. Port Authority staff have undertaken a comprehensive look at how intermodal freight improvements, primarily linkages between existing roads and rail lines, can be strategically planned and implemented to stitch together freight corridors. Already underway is a Port Authority project to link the Howland Hook Marine Terminal on Staten Island to the Chemical Coast Line in New Jersey. That, combined with the improvements that we have made with the State and City at Howland Hook, will bring intermodal rail access to a fast growing area of the port. It is a significant step in improving direct rail service to New York City. Another project, referred to earlier, is the Port Authority's Port Inland Distribution Network (PIDN), which is in the early stages of implementation. PIDN is intended to mitigate against growing congestion at the marine terminals and on the highways by transshipping via railroads and barges those inbound con-

tainers destined for Northeastern locations. The strong level of interest that Northeastern State departments of transportation are showing in PIDN is an indicator of how transportation planners are eager to find alternatives to congested corridors like I-95. An equally strong level of interest on the part of the Federal Government could help such initiatives demonstrate how water transportation can manage part of the freight growth. Flexibility in Federal programs can be a way to support such initiatives.

Lastly, the use of intelligent technology has proven very worthwhile in our region for managing the flow of our busy highways and crossings. Continuing and enhanced Federal support in this area would be welcome including expanding the integrated use of technology to expedite, track and more efficiently manage freight movements in congested metropolitan areas. It could also provide a double benefit of added security for cargo shipments.

Senators, the Port Authority of New York and New Jersey and other agencies of the region know we must dramatically strengthen intermodal service options. My department's twenty-year goal is to reduce port reliance on trucking from 87 percent of modal market share to 57 percent by strongly growing water borne and rail market shares. Our capital plan reflects this with its support for dock and near dock rail extensions, port terminal highway improvements and PIDN developments. To do so we need to improve connections to local intermodal service facilities at or near the port with connector highway improvements as contemplated by the NJDOT International Intermodal Corridor Program and its portway element. New York City and New York State are taking a similar tact with plans for rail access, car float and intermodal rail improvements in the City and Long Island.

In closing I should note that a lot of good work is being done by organizations represented at this hearing and others who are not here. The American Association of Port Authorities, the American Trucking Association, the Association of American Railroads, and the Coalition for America's Gateways and Corridors have joined with others in the freight community to develop a common platform to address freight mobility in future Federal policy. The Coastwise Coalition has worked to identify the potential for the maritime sector to accommodate some of the future demand for freight transportation. I think your committees can benefit greatly by the thoughtful attention that has been given to these issues by my counterparts in government and the private sector. Federal freight transportation policy is still in its adolescent stage, which means there is great opportunity for improvement to meet the challenges I have described.

Thank you again for inviting the Port Authority to participate in this hearing. I welcome any questions you may have.

---

RESPONSES BY RICK LARRABEE TO ADDITIONAL WRITTEN QUESTIONS FROM SENATOR REID

*Question 1.* Mr. Larrabee, you argue in your testimony that at the same time Congress continues to support the enhancement of highway capacity, we should consider how to foster the development of other modes to accommodate increasing demand. What specific steps do you recommend Congress take to lighten the load on our highways and ensure that other modes share more equally in moving freight through our nation?

Response. The points below will suggest ways that Federal programs can enhance the ability of waterborne systems to serve as an alternative to highway use recognizing that water transportation is the nation's least used mode. One of the reasons why water (and rail) modes do not handle larger volumes of domestic freight is that Federal policy has done such a good job in developing and expanding our interstate road system—understandably so—but it has not paid enough attention to the contributions that non-highway modes can make. The highway focus has worked well over the years but costly capacity constraints, resulting from the strong and continuing growth in commercial truck vehicle miles traveled (VMT), have become a glaring issue. Other modes should be examined for their potential to relieve truck volume related pressures. Federal policy has not been focused on the overall benefits to the highway program that could result from greater Federal support to alternative modal development such as less highway congestion, less wear and tear on the infrastructure, less pressure to add new highway capacity, as well as the general quality of life improvements (i.e.—safety, security, and environmental). ISTEA, through the creation of the Congestion Mitigation Air Quality (CMAQ) program, allowed funding of intermodal freight programs that advanced its “clean air” policy purpose. CMAQ funding for non-highway projects, such as the locally successful Red Hook, Brooklyn to Port Newark Barge, has demonstrated that waterborne services

can help reduce truck VMT in congested areas and mitigate negative environmental impacts. By encouraging additional programs that support multi-modal systems development, the committee can broaden the means available to simultaneously create freight system efficiency and provide highway congestion relief.

Here in the Northeast, Interstate 95 is not just a vital highway route to North—South travel between some of the nation's largest urban areas; it is the spine of a multimodal transportation corridor. Air, rail and waterborne systems join this essential highway element to create a network for personal and commercial mobility. Just as Northeast rail corridor operations provide relief and alternatives to highway and aviation systems, waterborne improvements can bring increased mobility and shipper choice in the freight realm. Congress should not wait for congestion to build to the point where gridlock finally occurs and forces a change to other modes—only then discovering that the alternative modes are not fully prepared to respond. Federal policy should begin now to support a transition toward modal equilibrium that our economy and society will require in the not so distant future. That equilibrium will certainly have trucking as its most essential element, but the increased cargo burden that growth will bring should be shared by the others.

Following are proposals that I recommend:

#### *Harbor Maintenance Tax Application Reform*

Obstacles to the expansion of domestic barge and short sea operations should be removed. One such obstacle is a provision within the Harbor Maintenance Tax (HMT) that creates an economic penalty on inherently domestic freight movements. If a container of imported cargo enters the US at the Port of New York and New Jersey, for example, it is assessed a fee for the maintenance of Federal channels. If that same cargo is off-loaded to a barge and now moves between two US ports (i.e.—Port Newark—Elizabeth and the Port of Boston), the HMT requires that the fee be paid again by the shipper after the goods are discharged in Boston.

#### *Recommendation:*

Eliminate the provision in the HMT that allows for double collection of the tax on domestic moves—especially the transshipped cargo. This change will provide a modest but important cost reduction that will make the waterborne alternative more attractive as a service choice. It would also eliminate an unfair “double hit” tax policy that puts the ad valorem tax on the same cargo twice. Based on fiscal year 1999 figures (the latest we have), the tax on all domestic cargo accounts (bulk and non-bulk) raised less than \$50 million of the over \$500 million that was collected that year. And the portion paid by containerized general cargo likely is a small fraction of the total domestic collection. Voiding the tax application on that cargo seems to be a cost-effective way to encourage consideration of the waterborne mode.

#### *Freight Congestion Relief Grants And Corridor Improvement Funding Targeted To Non-Highway Modes*

The startup costs associated with new services are a barrier to the introduction of waterborne alternatives to the truck-only movement of freight. The carriers who could provide such services need to be given the opportunity to demonstrate their effectiveness if we are ever to create congestion relief in critical multi-modal freight corridors. There are major but not insurmountable challenges to the initiation of domestic movements of containerized freight by water. Water carriers (like railroads) have to absorb additional costs of transferring containers at points where transfers to local truck pick up and delivery take place. Economies of scale advantages can only be realized by these intermodal services once they have operated long enough to build a market presence which attracts substantial volumes of general freight. Historically, shippers and ocean carriers have been slow to change their domestic transfer service patterns even when there is good reason to do so. Without some type of external funding assistance to give alternative modes, especially domestic water service operators, a chance to prove themselves, little progress can be made in shifting freight movements.

The Port Authority is developing a barge and rail Port Inland Distribution Network (PIDN) as an alternative to truck-only container distribution in an eight-State market area 75 miles or more distant from Port of New York and New Jersey facilities. Our analysis shows that most of the potential routes can be operationally self-sustaining within 5 or 10 years and that there are substantial public benefits from reduced congestion, air quality improvements and increased economic development opportunities at feeder port locations from such a system. Moreover, the cost of operational support on a per route basis over this time is generally modest (i.e.—less than ten million dollars). PIDN barge service between the Port of New York

and New Jersey and the Port of Albany may begin as early as this December. Some Federal funds, notably CMAQ moneys, will be utilized to help give the barge service its start. Unfortunately, CMAQ grants for waterborne programs compete with other worthwhile CMAQ programs and this puts a practical limit on dollars available. Moreover, CMAQ has a narrow focus on air quality improvements in non-attainment areas and only allows for 2 years of operational support. It does not fully recognize the impact modal alternatives can have on general highway system congestion relief, safety, security or public investment cost effectiveness in multi-modal corridor service and development.

A major barrier to new modal development, even where it enjoys strong local and State support, is the fact that intermodal service development requires multi-State support. Oftentimes, the benefits cross State lines while the major development costs are centered at the service hub and regional port. Thus benefits can reach well beyond these few locations but the sharing of the costs does not. Federal assistance supporting the delivery of broadly distributed benefits would seem ideal to overcome developmental barriers created by MPO boundaries and State lines. The Federal aid would, however, require expeditious Federal approval, based on State and local support, rather than the bottom's up MPO-through-the-State process that makes CMAQ and many other Federal programs difficult to apply even where it may be the intent of Congress to do so.

*Recommendation:*

New programs, more focused on congestion relief and other public benefits that would occur from the introduction of new intermodal or multi-modal services in congested corridors, are needed. One way to meet this need would be to set criteria to measure the contribution that the waterborne alternatives can make to multi-modal freight corridor congestion relief. If those criteria were satisfied, highway funds could be made available to introduce and sustain regional efforts to establish new systems. To deal with startup challenges, multi-year operational and capital assistance should be included. A greater Federal role to facilitate the application and funding review process for multi-State/multi-MPO applications is essential. An expanded CMAQ program is one way to support such projects in their initial years. A better approach is to create a freight specific CMAQ-like congestion relief program, open to alternative intermodal systems that can demonstrate highway congestion relief.

*Question 2.* We hear a lot of positive feedback about the Alameda Corridor project and how Federal funds were able to leverage private sector, State and local funds for a project that benefited the port, the trucking companies, and the railroads. How useful is the Alameda Corridor model and can it be replicated elsewhere with some Federal assistance?

*Response.* The Alameda Corridor project is an ideal model for strategically planning, coordinating, and funding the development of multi-jurisdictional corridors which optimize the movement of freight between and among key maritime, highway, rail and aviation gateways.

The Port Authority of New York & New Jersey has already begun to expand upon the Alameda "model" in our development of a multi-State "Northeast Intermodal Transportation Corridor" (NITC) program. While still in its infancy, the basic tenet of NITC is that it will, with Federal assistance, encourage States from Maine to Maryland to approach the planning and development of their respective freight infrastructure programs in a coordinated, systematic manner consistent with TEA-21's "National Corridor Planning and Development Program" requirements for the development of corridors of national significance.

Corridor programs such as Alameda offer the potential for: 1) removing cargo from the general passenger traffic flows thereby simultaneously reducing the cost to move those goods and enhancing public safety; 2) rationalizing container distribution; 3) improving air quality; 4) enhancing security; 5) fostering the utilization of "brownfields" for warehousing and goods distribution activity; and 6) stimulating local economies. Given the potential benefits, it is clear that Federal policy needs to do more to promote logistically and environmentally sound long-term solutions to the movement of the nations freight.

---

STATEMENT OF MICHAEL P. HUERTA, SENIOR VICE PRESIDENT AND MANAGING DIRECTOR, ACS STATE & LOCAL SOLUTIONS, ON BEHALF OF THE COALITION FOR AMERICA'S GATEWAYS AND TRADE CORRIDORS

#### *The Coalition*

The Coalition for America's Gateways and Trade Corridors is an intermodal organization comprised of more than 22 groups. The Coalition's sole interest is to encourage adequate Federal investment in our nation's intermodal freight infrastructure and technology to ensure safe, efficient and cost effective goods movement.

#### *Borders and Corridors Programs Overview*

Recognizing the unprecedented demands international trade is placing on our nation's transportation infrastructure, and bringing a clearer focus on needed freight transportation and intermodal connector projects, Congress established the National Corridor Planning and Development Program (NCPD) and the Coordinated Border Infrastructure Program (CBI) often referred to as the Borders and Corridors Program. Section 1118 and 1119 of the Transportation Equity Act for the 21st Century (TEA-21) provided \$140 million annually through a discretionary grant program administered by the Federal Highway Administration's (FHWA) Office of Freight Management & Operations to fund planning, development, construction and operation of projects that serve border regions near Mexico and Canada and high priority corridors throughout the United States.

The Coalition believes that current Borders and Corridors Programs have fallen short of the intended goals when these programs were established for two reasons.

First, the programs included in the TEA-21 Conference Report were funded at levels far less than necessary to meet freight transportation and intermodal connector needs. As witness to that, since the beginning of the programs, funding requests from States and Metropolitan Planning Organizations (MPOs) have exceeded available funds by a ratio of 15:1.

Second, programs were extensively earmarked in the annual appropriations process. In fact, in the transportation appropriations bill for fiscal year 1902 these programs were earmarked for specific projects at more than twice the authorized funding level, causing the FHWA to decline taking grant applications for that year. As a result, funds have not always been allocated to projects with the greatest national significance to the movement of freight.

#### *Reauthorization*

With respect to the reauthorization of TEA-21, the Coalition strongly recommends the programs be continued, but bolstered to ensure the original goals are met. With respect to modification, the Coalition respectfully commends several recommendations to the committee for consideration.

- To meet the high level of demand, funding for the Borders and Corridors Program must be increased to not less than \$ 2 billion annually.
- The distribution of funds should be freight specific, and there should be a qualification threshold based on freight volumes and freight-related congestion to ensure limited dollars reach high-volume corridors/borders/gateways.
- Under current law, only States or MPOs are eligible to apply for funding under the Borders and Corridors Programs. It is recommended that the designation of entities eligible to apply for Program funding be expanded to include other public and quasi-public organizations.
- The programs should be redefined to address the needs of all trade gateways, not only land borders, and gateway connected trade corridors. Many gateways that handle high volumes of freight are not eligible for funding because they may not be "borders." For example, while Illinois is not a "border State," one-third of the nation's freight passes through Chicago and it is the largest intermodal hub in the Nation. Similarly, inland ports are also important gateways that enable the efficient movement of goods throughout the country.
- The designated "high priority" corridors eligible for funding under the Corridors Program need to be reexamined to ensure freight intensive areas can apply for funding. Currently, there are many important projects in need of funding that do not fall in one of the 43 priority corridors designated under TEA-21. Highest priority should be given to corridors that move goods to and from trade gateways.

#### *Overall Needs*

International trade is the key to America's economic future. Imports and exports, which fuel our economy, are doubling every 10 years. At the same time, freight traffic within the United States' borders will increase 100 percent by 2020. In 1970, for-

ign trade was 10.8 percent of U.S. gross domestic product (GDP). By 2000, it grew to more than 26 percent of the GDP.

This growth trend is expected to continue in all modes of transportation. In the next 20 years, foreign trade moving through American ports is expected to increase by 187 percent, while containerized cargo will experience an explosive 350 percent increase. In response to the overwhelming growth in trade, truck traffic will increase by 200 billion vehicle miles and rail freight shipments are projected to grow by 1 billion tons.

Rapidly accelerating trade combined with domestic growth have created a \$10 trillion U.S. commodity flow that produced millions of new job opportunities and a higher standard of living for Americans.

These benefits will only last as long as we keep the freight moving.

While so far freight carriers have done a good job keeping goods moving, in coming years, better, smarter and more truck, rail and intermodal gateway infrastructure will be needed to keep the traffic from stalling in gridlock. Even today, congestion and heavy volume often impede access to major freight terminals. Near dock rail capacity requires significant expansion and capital investment.

Unfortunately, too small a portion of TEA-21 is devoted to freight-related intermodal projects. Meanwhile, intermodal connectors currently have up to twice as many engineering deficiencies and pavement deteriorations as National Highway System non-Interstate routes. While the current port and trade corridor system is pressed to accommodate the current traffic levels, demands on it are expected to double by 2020.

The large burden placed on our freight transportation system has only been exacerbated by increased security concerns since September 11. Intermodal freight infrastructure is critical to national defense. Thirty-eight thousand miles of the interconnected civilian rail system—vital for carrying heavy, oversized equipment and weapons systems—links some 170 strategic defense installations to seaports for military deployment.

Ports and their connectors have always been the point of embarkation for defense materiel, and this role is even more important as our global strategy emphasizes flexible response. Highway connectors play a vital role in the rapid mobilization of personnel and materiel toward points of deployment.

#### *Value of Investment / Cost of Neglect*

Investing in transportation yields economic paybacks for all corners of the country. Every dollar invested in the highway system yields \$5.70 in economic benefits to the Nation. U.S. freight railroads contribute over \$14 billion a year to the economy in wages and benefits to about 200,000 employees and billions in purchases from supplies. And, U.S. ports generate 13 million jobs, contribute \$743 billion to the GDP and supply \$200 billion in Federal, State and local taxes.

Ignoring these problems will cost our Nation in numerous ways. Growing freight congestion puts our economic growth in peril by creating costly delays for manufacturing, putting a drag on job creation and undermining our ability to compete in the increasingly important global market. Highway congestion alone costs the U.S. economy \$78 billion annually, while also contributing to air pollution and other environmental concerns. In addition, delays at canal locks nationwide totally some 550,000 hours annually, representing an estimated \$385 million in increased operating cost borne by shippers, carriers and, ultimately, consumers.

As you are all probably aware, the Alameda Corridor recently opened in Southern California. We believe this public-private project exemplifies the type needed throughout the country. While at first glance this may seem to be only a rail project, it will also facilitate more efficient truck, ship and rail movement. The benefits from moving freight in and out of our nation's busiest ports faster will not only be felt in Southern California, but will stretch across the rest of the country. The goods that move through the ports of Long Beach and Los Angeles represent \$97.3 billion in U.S. trade, support 2,121,500 jobs nationwide and deliver \$4.51 billion in State and local taxes throughout the country.

There are many other projects, similar to the Alameda Corridor that still need funding. Here are a few of examples drawn from our members:

- The Port of Pittsburgh will need up to \$30 million for rail, road and port improvements.
- To facilitate goods movement San Bernardino County, California needs \$383.3 million and Riverside County, California needs \$926.7 million.
- For infrastructure improvements Washington State needs \$183.8 million.
- The Gateways Cities Council of Governments in California alone needs \$4 billion for improvements for goods movement and freight related congestion.

These are just a few examples of tremendous need for intermodal infrastructure improvements.

*Recommendation Detail*

In response to these problems, the Coalition for America's Gateways and Trade Corridors is asking Congress to:

*1. Increase Funding for Freight Mobility*

Funding needs for freight mobility are large, and will be met in a variety of ways. It is estimated that some 25 percent of the general highway expenditures go to the benefit of freight movement. Special programs to encourage public-private partnerships will be a key element as well. Given the need for major, targeted investments that meet national needs, but are built by regional, State and local entities, there needs to be a targeted program to encourage and support these projects.

A minimum of \$2 billion per year for the Borders and Corridors Programs is required immediately to support designated programs for freight technology and infrastructure, such as intermodal connectors. This amount could productively be doubled as projects move out of design and into construction in the next reauthorization period.

Since the beginning of the program, funding requests from States and MPOs have exceeded available funds by a ratio of 15:1. Much of this funding has gone to the planning, design and engineering of future projects. There is clearly large unmet demand for funding and a growing backlog of projects that are "ready to go." The U.S. Department of Transportation projects that the volume of freight movements in the U.S. will double over the next 20 years. As a result, demands for infrastructure project funding will increase ever further.

*2. Utilize Creative Funding Approaches*

To provide the level of funding required, Congress should actively explore a variety of funding approaches including the possibility of utilizing general funds. Available funds under the current Borders and Corridors Programs should be increased to support freight-related intermodal projects, especially projects that aim to reduce greenhouse gases.

Attention should also be focused on restructuring and expanding Federal loan and loan guarantee mechanisms to provide grants and long-term credit for intermodal and intermodal connector projects. The program should create incentives for State and local actions taken in support of freight movement projects that are designated under a national program.

*3. Establish Freight Mobility as a Central Element in National Transportation Policy and a Key Factor in State and Local Planning*

Establishing and maintaining freight mobility as a high national priority must be articulated and reinforced in a variety of ways. Through public pronouncements and policy documents both Congress and the Administration need continually to underscore the importance of freight transportation and the urgency of increasing the capacity and efficiency of our national system.

The Coalition is a member of the Freight Stakeholders Coalition and supports the principles outlined in testimony presented by that organization, which not only call for greater funding but also better freight data and planning.

Freight mobility needs to be given higher priority as an element in State and local transportation planning. Strong relationships exist between the Departments of Transportation and Defense, but these relationships need updating to align them with today's priorities.

Congress should create a National Council on Freight Mobility (including community mitigation) with strong representation from both shippers and carriers, as well as affected communities and other stakeholders, to advise the Secretary of Transportation.

The Council would provide advice and counsel on:

- Overall freight infrastructure expansion strategy
- Developing trends and technology in freight movement
- Determining public interest in freight infrastructure projects

RESPONSES OF MICHAEL HUERTA TO ADDITIONAL QUESTIONS FROM SENATOR REID

*Question 1.* Mr. Larrabee argues in his testimony that at the same time Congress continues to support the enhancement of highway capacity, we should consider how to foster the development of other modes to accommodate increasing demand. What specific steps do you recommend Congress take to lighten the load on our highways

and ensure that other modes share more equally in moving freight through our nation?

Response. The Coalition believes competition in the marketplace is the best way to decide questions regarding the distribution of freight among modes to be decided. However, much can be done to improve the overall efficiency of our nation's transportation system.

For example, the Coalition believes too small a portion of TEA-21 is devoted to freight-related intermodal projects. Intermodal connectors currently have up to twice the engineering deficiencies and pavement deterioration than National Highway System non-Interstates routes. Also, while the current gateway and trade corridor system is pressed to accommodate the current traffic levels, demands on them are expected to double by 2020. Seamless transfer of goods between the modes will help meet that demand.

The large burden placed on our freight transportation system has only been exacerbated by increased security concerns since September 11. Intermodal freight infrastructure is critical to national defense. Thirty-eight thousand-miles of the interconnected civilian rail system—vital for carrying heavy, oversized equipment and weapons systems—links some 170 strategic defense installations to seaports for military deployment.

Ports and their connectors have always been the point of embarkation for defense materiel, and this role is even more important as our global strategy emphasizes flexible response. Connectors play a vital role in the rapid mobilization of personnel and materiel toward points of deployment.

Accordingly, The Coalition recommends that a larger portion of Federal transportation efforts target intermodal connectors and other infrastructure that improve our nations ability to move goods to and from our international gateways.

*Question 2.* We hear a lot of positive feedback about the Alameda Corridor project and how Federal funds were able to leverage private sector, State and local funds for a project that benefited the port, the trucking companies, and the railroads. How useful is the Alameda Corridor model and can it be replicated elsewhere with some Federal assistance?

Response. The Alameda Corridor is a great example of how focused Federal funds can leverage the involvement of other governments and the private sector in transportation improvement projects.

We believe this public-private project exemplifies the type needed throughout the country. While at first glance this may seem to be only a rail project, it will also facilitate more efficient truck, ship and rail movement. The benefits from moving freight in and out of our nation's busiest ports faster will not only be felt in Southern California, but will stretch across the rest of the country. The goods that move through the ports of Long Beach and Los Angeles represent \$97.3 billion in U.S. trade, support 2,121,500 jobs nationwide and deliver \$4.51 billion in State and local taxes throughout the country.

There are many other projects, similar to the Alameda Corridor that still need funding. Here are a few of examples drawn from our members:

- The Port of Pittsburgh will need up to \$30 million for rail, road and port improvements.
- The Alameda Corridor East, San Gabriel Valley, and OnTrac Corridors in California need \$2.5 billion for infrastructure improvements.
- To facilitate goods movement San Bernardino County needs \$383.3 million and Riverside County needs \$926.7 million.
- For infrastructure improvements Washington State needs \$183.8 million.
- The Gateways Cities Council of Governments alone needs \$4 billion for improvements for goods movement and freight related congestion.

In each of these projects, Federal funds will galvanize together the assets of local governments with private sector transportation providers in a manner similar to that which occurred with the Alameda Corridor project. I should note, however, that the Federal assistance the Alameda Corridor project received was primarily in the form of a loan. While this worked for that specific project, it will not work in every case and Congress should look at both grant and loan funds to facilitate projects such as those described above.

*Question 3.* Many people believe that the Borders and Corridors Programs has not been able to successfully address many key freight issues. One improvement I believe we should consider is to revise this program to encourage public-private partnerships through a greater emphasis on innovative finance and other creative incentives. How else can we improve the Borders and Corridors Programs to target the highest priority freight corridors and intermodal facilities?

Response. One significant step that can be taken is to establish freight mobility as a central element in national transportation policy and a key factor in State and local planning.

Establishing and maintaining freight mobility as a high national priority must be articulated and reinforced in a variety of ways. Through public pronouncements and policy documents both Congress and the Administration need continually to underscore the importance of freight transportation and the urgency of increasing the capacity and efficiency of our national system.

The Coalition is a member of the Freight Stakeholder Coalition and supports the principles outlined in testimony presented by that organization which not only calls for greater funding but also better freight data and planning.

Freight mobility needs to be given higher priority as an element in State and local transportation planning. Strong relationships exist between the Departments of Transportation and Defense, but these relationships need updating to align them with today's priorities.

To advise the Secretary of Transportation, Congress should create a National Council on Freight Mobility (including community mitigation) with strong representation from both shippers and carriers, as well as affected communities and other stakeholders.

The Council would provide advice and counsel on:

- Overall freight infrastructure expansion strategy;
- Developing trends and technology in freight movement;
- Determining public interest in freight infrastructure projects;

With respect to the Borders and Corridors program funds:

- The distribution of funds should be freight specific, and there should be a qualification threshold based on freight volumes and freight-related congestion to ensure limited dollars reach high-volume corridors/borders/gateways.

- Entity eligibility should be clarified and broadened to other public and quasi-public organization, such as multi-jurisdictional authorities.

- The programs should be redefined to address the needs of all trade gateways, not only land borders, and gateway connected trade corridors. Many gateways that handle high volumes of freight are not eligible for funding because they may not be "borders." For example, while Illinois is not a "border State," one-third of the nation's freight passes through Chicago and it is the largest intermodal hub in the Nation. Similarly, inland ports are also important gateways that enable the efficient movement of goods throughout the country.

- The designated "high priority" corridors eligible for funding under the Corridors Program need to be reexamined to ensure freight intensive areas can apply for funding. Currently, there are many important projects in need of funding that do not fall in one of the 43 priority corridors designated under TEA-21. Highest priority should be given to corridors that move goods to and from trade gateways.

---

RESPONSES OF MICHAEL HUERTA TO ADDITIONAL QUESTION FROM SENATOR  
JEFFORDS

*Question 1.* Mr. Huerta, you recommend that a minimum of \$2 billion per year be provided for the Borders and Corridors Programs, and that the \$2 billion should be doubled in future years. You also recommend that the Congress expand Federal loan and loan guarantee mechanisms for such projects. Would you please expand upon how this \$4 billion in annual funding could be used to meet your estimated demand for funding.

Response. The Coalition's recommendation is that funding for the Borders and Corridors Program must be increased to not less than \$ 2 billion annually. With respect to how funds can be most productively used the Coalition offers the following recommendations:

- The distribution of funds should be freight specific, and there should be a qualification threshold based on freight volumes and freight-related congestion to ensure limited dollars reach high-volume corridors/borders/gateways.

- Entity eligibility should be clarified and broadened to other public and quasi-public organization, such as multi-jurisdictional authorities.

- The programs should be redefined to address the needs of all trade gateways, not only land borders, and gateway connected trade corridors. Many gateways that handle high volumes of freight are not eligible for funding because they may not be "borders." For example, while Illinois is not a "border State," one-third of the nation's freight passes through Chicago and it is the largest intermodal hub in the Na-

tion. Similarly, inland ports are also important gateways that enable the efficient movement of goods throughout the country.

- The designated “high priority” corridors eligible for funding under the Corridors Program need to be reexamined to ensure freight intensive areas can apply for funding. Currently, there are many important projects in need of funding that do not fall in one of the 43 priority corridors designated under TEA-21. Highest priority should be given to corridors that move goods to and from trade gateways.

---

STATEMENT OF JOHN D. CARUTHERS, JR., CHAIRMAN, I-69 MID-CONTINENT HIGHWAY COALITION

Messrs. Chairmen and members of the subcommittees, it is a pleasure to come before you today to discuss the importance of the completion of Interstate I-69 to the efficient movement of the nation’s freight.

When completed, I-69 will span the nation’s heartland, connecting Canada and Mexico through the States of Michigan, Illinois, Indiana, Kentucky, Tennessee, Mississippi, Arkansas, Louisiana and Texas. Designated as congressional High Priority Corridors 18 and 20 in the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) and as Interstate Route I-69 in the Transportation Equity Act for the 21st Century (TEA-21), the I-69 Corridor traverses over 150 counties and hundreds of municipalities, directly serving over 25 million people. The I-69 Mid-Continent Highway Coalition is comprised of cities, counties, States, business, labor and civic organizations all along the I-69 Corridor. It reflects the economic diversity of this vast region, including the agriculture, mining, timber, energy, transportation, chemical, electronic and industrial sectors-current and future users of the I-69 Corridor.

Two sections of the Corridor 18 system—Interstate 69 from Port Huron, Michigan at the Canadian border to Indianapolis, Indiana and Interstate 94 from Port Huron southwest to the Ambassador Bridge in Detroit and west to Chicago, Illinois—are existing-open-to-traffic Interstates. The rest of Corridor 18, as well as Corridor 20, is under development. From Indianapolis south I-69 connects Evansville, Indiana, Memphis, Tennessee, Mississippi, Arkansas, Shreveport/Bossier City, Louisiana and Houston, Texas to the Lower Rio Grande Valley at the Mexican border. Corridor 20 extends along US 59 from Laredo, Texas at the Mexican border through Houston to Texarkana, Texas. A portion of Corridor 20 overlaps Corridor 18. Together, Corridors 18 and 20 comprise I-69.

The I-69 Corridor 18 and 20 system spans over 2600 miles. About 2000 miles from Indianapolis to the Mexican border remain to be completed. Completion of I-69 will not require an entirely new facility from Indianapolis to the Mexican border. In some areas it will link existing Interstates or highways at Interstate standards. In other areas it will require upgrading and linking existing non-Interstate highways and, in others, new construction.

Work is underway along the entire I-69 corridor. Feasibility studies have been completed and have shown that both Corridors 18 and 20 have positive cost benefit ratios returning \$1.57 and \$1.68 respectively for every dollar invested. Location and environmental studies are in progress and some sections are in design, preliminary engineering and construction. The entire corridor will be ready to go to construction and, in fact, much of it can be completed in the upcoming TEA-21 reauthorization, if funds are available.

While I-69 traverses nine States, it is important to the Nation as a whole; for efficient movement of freight, for trade, intermodal connectivity and economic development. Trade has shifted, particularly after the passage of the North American Free Trade Agreement (NAFTA), from east-west to north-south. Canada and Mexico are now the United States’ major trading partners. U.S. Mexican trade has more than doubled since the passage of NAFTA in 1993. U.S. imports from Mexico were up 175 percent from 1993 to 1999. U.S. exports to Mexico rose 109 percent over the same period and trade with Canada increased 73 percent. In 2001, 80 percent of U.S. trade with Mexico and 67 percent of U.S. trade with Canada went by truck. The I-69 Corridor accounts for over 63 percent of the nation’s truckborne trade with Canada and Mexico. It has the nation’s busiest border crossings on both the Canadian and Mexican borders. The Michigan border points of Detroit and Port Huron account for 48 percent of the nation’s truckborne trade with Canada and the Texas border between Laredo and the Lower Rio Grande Valley accounts for over 49 percent of the nation’s truckborne trade with Mexico.

Examining the impact of NAFTA trade on just the I-69 States represented at this joint subcommittee hearing, in my own State of Louisiana truckborne exports and imports to Canada and Mexico grew 47 percent from 1995 to 2000, from \$856 million to \$1.26 billion. The largest increase in freight traffic has been in truckborne

exports to Mexico which have tripled since 1995. Truckborne exports from Mississippi to Mexico have grown 105 percent since 1995 and truckborne imports have grown 74 percent. Total truckborne trade between Mississippi and Canada and Mexico increased from \$984 million to \$1.415 billion, or 44 percent between 1995 and 2002. Truckborne trade between Illinois and Canada rose 49 percent from \$10.76 billion to \$16 billion. Truckborne trade between Illinois and Mexico rose 138 percent from \$1.9 billion to \$4.6 billion. The value of truckborne trade between Texas and Mexico and Canada has increased from \$35.6 billion to \$72.2 billion since 1995, 103 percent over 5 years. The largest increase has been in truckborne exports from Texas to Mexico. Michigan and Texas are our nation's two largest trading partners with other countries in North America, accounting for \$175 billion in value carried by all modes of surface transportation in 2000. Texas' North American trade is the equivalent of the combined North American trade activity of California, Pennsylvania and North Carolina.

Looking at freight flows nationwide, not just with Canada and Mexico, approximately half of the total freight shipped in the United States in 1997—over five billion tons—passed through, originated or terminated in the I-69 Corridor States. Freight is entering and leaving the I-69 Corridor by truck, rail, air and water. Seventeen of the nation's top 25 seaports are directly connected to I-69 and 13 inland waterway ports serve I-69 cities. Fifteen of the nation's top 25 air cargo airports are readily accessible to I-69. There are 96 rail terminals within 150 miles of the Interstate 69 Corridor. Every major eastern and western rail carrier and both Canadian carriers have terminal operations on the I-69 Corridor. There are truck rail intermodal facilities in every major city along the I-69 Corridor.

The I-69 Port of Houston leads the Nation in foreign waterborne tonnage. The Port of Houston handled 128.8 million tons of foreign cargo volume in 2000, 23 percent more than the foreign freight traffic handled at any other port in the United States. The foreign trade cargo volume handled at the Port of Houston in 2000 was the equivalent of the foreign cargo volume at the Ports of Long Beach, Los Angeles, Portland and Seattle combined. It was also the equivalent of the 2000 foreign cargo volume at the Ports of New York/New Jersey, Hampton Roads, Charleston, and Miami combined. With the exception of the Port of South Louisiana, which is also directly accessible to I-69, the Port of Houston handled more total trade tonnage (imports and exports) in 2000 than any other port in the United States. The Port of Houston has 150 trucking lines and two railroads operating intermodal service.

While the Port of Louisiana is ranked third in the world in total tonnage, with 194 million metric tons of cargo volume, and the Port of Houston is ranked eighth in the world in tonnage with 144 million metric tons, container traffic is also growing. Container traffic in Gulf of Mexico ports served by I-69 is growing faster than the national average or than traffic at Atlantic or Pacific ports. Between 1990 and 2000 Gulf port container traffic increased by 105 percent as compared to the national average of 99 percent. Container traffic in the Port of Houston grew 113 percent.

The I-69 freight corridor also serves the nation's inland waterways. The I-69 Port of Memphis is the second largest inland port in the country. The location of a foreign trade zone, it generates \$1.5 billion in economic activity annually. The Port handled 18.3 million tons of domestic trade cargo volume in 2000. More than 275 trucking lines operate regular intermodal services in the Port of Memphis. In the city of Memphis, one of the top ten distribution centers in the United States, all modes of transportation converge and link to I-69. Federal Express operates its main hub in Memphis. The company's delivery of nine million packages a day includes a high percentage of intermodal movements between truck and air. Every major eastern and western rail carrier has a terminal in this I-69 gateway.

Trade entering I-69 from all modes of transportation is growing faster than in the rest of the Nation. The trade tonnage moving through the U.S.' top 50 entry points—including land, sea and air—grew 8.3 percent from 1990 to 1999. Trade tonnage moving through I-69 points of entry grew 18.3 percent, or more than twice as fast as the national average.

A Federal Highway Administration (FHWA) study, "Freight Analysis Framework" 2000, suggests that the recent growth in freight traffic will continue through the year 2020. The study estimates that total domestic freight traffic will increase by approximately 87 percent over the next 20 years and that international trade will increase over 107 percent. The vast majority of the new growth will be in the trucking industry with trucks expected to handle 68 percent of the increased tonnage, 82 percent of the increased value and 62 percent of the increased ton-miles. The FHWA Freight Analysis shows that the majority of the expected growth in truck shipments will continue to be in the central, eastern and southern United States, with a domi-

nant movement in the southwest to northeast direction—a movement ideally suited for the I-69 Corridor.

Yet the I-69 Corridor has not been completed and there is no direct Interstate level highway from Indianapolis to the Mexican border. Completion of I-69 will significantly enhance safety and efficiency along this key international trade route. I-69 will reduce travel time, fuel consumption and costs over the existing circuitous route. It is an essential intermodal link for trade and commodity flow. Completion of the Corridor 18 portion of I-69 alone is also projected to save 3100 lives, avoid 158,000 injuries and 409,000 property damage accidents.

In addition to its national and international trade benefits, I-69 will stimulate economic growth. I-69 traverses some of the nation's most impoverished regions. There are over 9.1 million people living below the poverty level in the I-69 Corridor States. In six of the Corridor States the population in poverty exceeds the U.S. average. There are 13 empowerment zones, enhanced enterprise communities and enterprise communities along the Corridor, including two rural empowerment zones—Mid-Delta and Lower Rio Grande Valley. Construction of I-69 will provide economic growth. The Corridor 18 Feasibility Study estimated that, in the Houston to Indianapolis segment alone, I-69 will create 27,000 jobs, add \$11 billion in wages and produce \$19 billion in value added through 2025.

When the Interstate system was initially designed in the 1940's and 50's, it was laid out generally east to west, reflecting the demographics, trade patterns and defense needs of the time. Trade has shifted, particularly after the passage of the North American Free Trade Agreement (NAFTA), from east-west to north-south. However, when the Interstate was declared completed in 1995, some of the newer north-south sections like I-69 were left dangling and unfinished. The promise of the National Corridor Planning and Development and Coordinated Border Infrastructure programs in TEA-21, of which the I-69 Mid-Continent Highway Coalition was a major proponent, was the recognition that within the 160,000 mile National Highway System there were some remaining, unfinished corridors of significance to the Nation as a whole, serving national objectives of trade and economic growth, that still needed to be completed and merited a separate program with dedicated funding to do so. Unfortunately, the program was only funded at \$140 million a year nationwide and many of the projects that qualified or were earmarked for funding were of local, not national interest. Despite insufficient funding diluted among projects that are not nationally significant, the I-69 Corridor made significant progress. Since the inception of TEA-21, I-69 has received over \$245 million from the National Corridor Planning and Development and the Coordinated Border Infrastructure programs and directly from the Highway Trust Fund. Funds have also been provided for specific segments in ISTEA, TEA-21 and appropriations. States have also invested substantial amounts of their own funds.

The Corridor has moved ahead so significantly that all of I-69 can go to construction in the period of TEA-21 reauthorization and much of it can be completed—if dedicated funds are available to do so. The last estimated cost of completing the unfinished portion of I-69 was \$8.3 billion, with the Federal share at \$6.6 billion.

Having built the Interstate system, which served us well for the latter half of the twentieth century, we cannot rest on our laurels. We must invest our resources in those unfinished corridors that serve today's and tomorrow's 20 first century trade flows such as I-69. There are a number of mechanisms to accomplish this; limiting the Corridors and Borders program to major trade corridors and increasing its funding, dedicating program funds to complete unfinished Interstate links or funding freight corridors. Any of these programmatic options would work—whether alone or in combination. The point is that we must recognize the need for and build the infrastructure to serve our nation's freight flows. The traffic is there. The intermodal connections—rail, water, and air—are there. The trade is surging at Houston, Detroit and Laredo. The maquiladoras in the Lower Rio Grande Valley of Texas are manufacturing automobile parts, electronics, computers, batteries and plastic, glass and rubber components and transporting them by truck for final assembly in manufacturing facilities in Michigan, Indiana, Illinois and Ohio. Corn from Indiana is being trucked to the Lower Rio Grande Valley to be used as corn syrup in soft drinks, fruit juices and candy produced in maquiladoras and shipped worldwide. Cotton is going by truck from Mississippi to be made into clothing apparel in South Texas. Foreign exports from the Port of Houston are going by truck to Chicago and Indianapolis. Yet the Interstate level facility to transport these products safely, efficiently and economically—I-69 remains unfinished.

*Interstate 69—High Priority Corridors 18 and 20*

- Designated as congressional High Priority Corridors 18 and 20 in the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) and as Interstate

Route I-69 in the Transportation Equity Act for the 21st Century (TEA-21), the I-69 Corridor traverses over 150 counties and hundreds of municipalities, directly serving over 25 million people. When completed, I-69 will span the nation's heartland, connecting Canada and Mexico through the States of Michigan, Illinois, Indiana, Kentucky, Tennessee, Mississippi, Arkansas, Louisiana and Texas.

- Two sections of the Corridor 18 system—Interstate 69 from Port Huron, Michigan at the Canadian border to Indianapolis, Indiana and Interstate 94 from Port Huron southwest to the Ambassador Bridge in Detroit and west to Chicago, Illinois—are existing-open-to-traffic Interstates. The rest of Corridor 18, as well as Corridor 20, is under development. From Indianapolis south I-69 connects Evansville, Indiana, Memphis, Tennessee, Mississippi, Arkansas, Shreveport/Bossier City, Louisiana and Houston, Texas to the Lower Rio Grande Valley at the Mexican border. Corridor 20 extends along US 59 from Laredo, Texas at the Mexican border through Houston to Texarkana, Texas. A portion of Corridor 20 overlaps Corridor 18. Together, Corridors 18 and 20 comprise I-69.

- When the Interstate system was initially designed, it was laid out generally east to west, reflecting the demographics, trade patterns and defense needs of the time. Trade has shifted, particularly after the passage of the North American Free Trade Agreement (NAFTA), from east-west to north-south. U.S. Mexican trade has more than doubled since the passage of NAFTA in 1993. U.S. imports from Mexico were up 175 percent from 1993 to 1999. U.S. exports to Mexico rose 109 percent over the same period and trade with Canada increased 73 percent. The I-69 Corridor accounts for over 63 percent of the nation's trade with Canada and Mexico. It has the nation's busiest border crossings on both the Canadian and Mexican borders, accounting for 48 percent of the nation's trade with Canada and over 49 percent of the nation's trade with Mexico.

- Yet there is no direct Interstate level highway from Indianapolis to the Mexican border. Completion of I-69 will significantly enhance safety and efficiency along this key international trade route. Completion of the Corridor 18 portion of I-69 alone is projected to save 3100 lives, avoid 158,000 injuries and 409,000 property damage accidents. I-69 will reduce travel time, fuel consumption and costs over the existing circuitous route. It is an essential intermodal link for trade and commodity flow. Seventeen of the nation's top 25 seaports are directly connected to I-69 and 15 of the nation's top 25 air cargo airports are readily accessible to I-69.

- In addition to its national and international trade benefits, I-69 will stimulate economic growth. I-69 traverses some of the nation's most impoverished regions. There are over 9.1 million people living below the poverty level in the I-69 Corridor States. In six of the Corridor States the population in poverty exceeds the U.S. average. There are 13 empowerment zones, enhanced enterprise communities and enterprise communities along the Corridor, including two rural empowerment zones—Mid-Delta and Lower Rio Grande Valley. Construction of I-69 will provide economic growth. The Corridor 18 Feasibility Study estimated that, in the Houston to Indianapolis segment alone, I-69 will create 27,000 jobs, add \$11 billion in wages and produce \$19 billion in value added through 2025.

- The I-69 Corridor 18 and 20 system spans over 2600 miles. About 2000 miles from Indianapolis to the Mexican border remain to be completed. The last estimated cost of completing the unfinished portion of I-69 was \$8.3 billion, with the Federal share at \$6.6 billion. Completion of I-69 will not require an entirely new facility from Indianapolis to the Mexican border. In some areas it will link existing Interstates or highways at Interstate standards. In other areas it will require upgrading and linking existing non-Interstate highways and in others new construction.

- ISTEPA provided \$4.05 million for Corridor 18 Feasibility and Special Issues Studies, the identification of Sections of Independent Utility (SIUs) and Special Environmental Studies. The State of Texas paid for the Corridor 20 Feasibility Study and other location studies out of State only funds. Since the inception of TEA-21, Corridors 18 and 20 have received over \$245 million from the National Corridor Planning and Development and the Coordinated Border Infrastructure programs and directly from the Highway Trust Fund. Funds also have been provided for specific segments in appropriations, ISTEPA and TEA-21 and States have invested their own funds.

- Work is underway along the entire I-69 corridor. Feasibility studies have shown that both Corridors 18 and 20 have positive cost benefit ratios returning \$1.57 and \$1.68 respectively for every dollar invested. Location and environmental studies are in progress and some sections are in design, preliminary engineering and construction. The entire corridor will be ready to go to construction and, in fact, much of it can be completed in the upcoming TEA-21 reauthorization, if funds are available.

- The Corridors and Borders program is only authorized at \$140 million per year and there has been over \$2 billion in demand for funding each year. While I-69 is truly a national/international Corridor, there are many projects that have received funding under the Corridor program that only serve one State or region.

- Completion of I-69 will require funding dedicated to I-69 and other corridors that are truly international in scope and service. I-69 is the nation's preeminent national/international Corridor. It is one of the nation's few unfinished Interstates that remained when the Interstate program was terminated in 1995. It is also one of a handful of high priority corridors that are designated as future Interstates under Section 1105(e)(5)(A) of ISTEA.

- The I-69 Mid-Continent Highway Coalition has been the primary advocate for I-69 before Congress and the executive branch. The Coalition spearheaded the creation of the National Corridor Planning and Development and Coordinated Border Infrastructure programs in the Transportation Equity Act for the 21st Century and has consistently advocated funding for I-69 in annual appropriations and at the Department of Transportation. The Coalition is a dues paying organization of cities, counties, states, business, labor and civic organizations all along the I-69 Corridor. Supporters include over 45 Chambers of Commerce representing over 13,050 businesses. The I-69 Mid-Continent Highway Coalition reflects the economic diversity of this vast region, including the agriculture, mining, timber, energy, transportation, chemical, electronic and industrial sectors-current and future users of the I-69 Corridor.

---

STATEMENT OF JIM FISKE, CHAIRMAN, MAGTUBE, INC., GOLETA, CA

I am Jim Fiske, Founder and Chairman of Magtube, Inc. of Goleta, California. We are a venture funded-company developing a new freight transportation system that promises faster service, higher security, far better energy efficiency, cleaner operation, and lower cost than any existing mode. Thank-you for giving me this opportunity to present information that I think could have a significant impact on the transportation planning that is so crucial to the economic future of this country.

As I'm sure the committee is aware, the American transportation industry is vast, encompassing nearly 11 percent of the GNP. According to the Bureau of Transportation Statistics, one out of every 10 U.S. jobs is directly or indirectly related to transportation. Some industry experts say the figure is closer to one out of five when all inventory, logistics, and related corporate functions are included. This industry, and the American population, is now facing severe problems, not the least of which is increasing congestion. For example, according to the Southern California Association of Governments (SCAG) the average speed for a 24-hour weekday period on the greater Los Angeles highway and arterial system is about 38 miles per hour. During the morning peak period in some of the heaviest corridors the average travel speed is less than 20 miles per hour. And Los Angeles is far from alone. In general, demand for transport rises faster than population or average incomes. Roughly 20 percent of U.S. urban areas are experiencing extreme congestion, and the percentage is growing.

The capacity of our highways is clearly being strained to the limit, and yet the Department of Transportation projects that highway demand will only grow. Between the years 2000 and 2025 the number of passenger vehicles is forecast to grow from 219 to 262 million, while intercity ton-miles of freight carried by truck grows by 88 percent. City, State, and Federal agencies have earmarked huge sums of money to deal with this growth. The SCAG Regional Transportation Plan alone includes \$15 billion for highway and arterial improvement projects including mixed-flow lanes, interchanges, truck climbing lanes, truck lanes and grade crossings. But even if this plan is completed SCAG projects that Southern California congestion delays could increase more than 100 percent by 2025. Some statistics project that a freeway trip taking 1 hour under normal conditions today will take 3 hours and 10 minutes in 2020.

What are we to do? Government and industry experts are straining to provide improvements but most industry analysts seem to believe that increasing congestion, safety concerns, and environmental damage is inevitable—"an inescapable part of modern urban life worldwide". I am here to tell you that nothing could be further from the truth. The "Electro-Mechanical Revolution" is far from over.

The immensity of the transportation industry aggravates its problems and makes them difficult to deal with, but it also creates a huge potential market for cost effective solutions.

I think there is a common misconception that the passenger transport business is much larger than the freight business, and as a result far more attention has

been focused on improving the infrastructure and technology required to move people than that required to move freight. If this continues, we run the risk of missing a major opportunity. In reality, the freight component of the industry is both larger than the passenger component and far easier to improve. Furthermore, by improving the freight component we will greatly reduce the strain on the passenger component of the industry. But railroad, truck and air transport are all mature technologies with fundamental barriers to improvement. Significant improvement in speed, cost, and quality of service requires a totally new approach that circumvents existing problems.

One possibility frequently overlooked is the pipeline. More than 1.4 million miles of gas and petroleum transmission and distribution pipeline are in service in America. The technology is highly developed, well understood, and extremely cost effective. Transporting a ton of oil by pipeline is nearly 5 times cheaper than shipping a ton of freight by rail, 50 times cheaper than truck, and 170 times cheaper than air. Pipelines are also the safest transport mode and the least disruptive to the environment. But pipelines have two major limitations that prevent their application to general freight—their transport speed is very low (oil travels at roughly 4 miles per hour), and they only carry fluids.

Another possibility is Maglev, or magnetic levitation, which uses magnetic forces to provide both lift and propulsion. Studies sponsored by U.S. Government agencies in the early 1990's compiled a long list of potentially beneficial attributes, including high speed, faster trips, low energy consumption, low operating costs, high reliability, low wear and maintenance, petroleum independence, low pollution, excellent system control, high capacity, safety, convenience, modest land requirements, and low noise. But they also revealed that capital costs exceeding \$35 million per mile for maglev systems would result in a very low return on investment, making them commercially infeasible. Since the 1970's Germany and Japan have invested billions of dollars in maglev development. Neither has constructed an operational system. Only the Chinese government, which has purchased the German Transrapid design for a short installation in Shanghai, has been willing to foot the bill for an operational system. Barring a major cost breakthrough, maglev systems will never be constructed by private business alone.

We have found that cost breakthrough.

Engineers constantly improve operational equipment, so it's no surprise that their first impulse after discovering maglev technology was to apply it to an existing transport mode, namely railroad. Over time maglev became synonymous with trains. "Maglev Train" has become a single concept. This is a huge oversight. Trains are the wrong metaphor. Maglev is a powerful technology crippled by its association with the wrong application. Using maglev simply to improve a train is rather like using jet engines to propel a barge.

If maglev technology is applied to pipelines, however, particularly freight pipelines, the result is revolutionary. This combination allows smaller vehicle size, narrower rights-of-way, lower complexity, reduced initial investment, lower energy costs, higher acceleration, higher speed, shorter headway, and higher system capacity. These capabilities reinforce each other to create a new synergy. Costs plummet, performance skyrockets, and the available market increases. Unlike maglev passenger trains, a system of maglev freight pipelines has the potential for a high return on investment.

Magtube is creating just such a system. We have discovered a new maglev technique, for which we have patents pending, with fundamental advantages over previous designs. We are implementing it now. At this moment our first full-size maglev vehicle is floating over its track just outside Santa Barbara, California. Our goal is to create a new transportation paradigm, an arrangement of maglev pipelines or "Magtubes" we call the Magnetic Levitation Freight Transportation Network, or more simply, the Mag Net. This network will provide a level of speed, safety, security, efficiency, and cost-effectiveness not currently possible for mail, priority packages, perishables, and freight of all types. Transit times will be measured in minutes or hours instead of days. Think of it as an "Internet for Freight." The Mag Net will streamline vital transportation corridors to reduce congestion, transit times, and costs while improving reliability. Construction costs will be a fraction of conventional Maglev, high speed rail, or highway expansion. Shipping costs will be lower than air freight, truck or railroad. The potential for high return on investment will permit private ownership, decreasing highway damage and congestion at no direct cost to the Federal Government. The same design can be used around the globe, providing even greater benefits for countries with poorly developed transport.

We are currently planning the construction of pipelines a bit over six feet in diameter with a projected cost in the vicinity of \$5 million per mile. Our vehicles are sized to handle standard freight pallets for easy interchange with other modes. They

will have the capability to move a one-ton payload at up to 500 miles per hour or more through an evacuated tube while providing an energy efficiency equivalent to more than 1000 miles per gallon of gasoline. Magtubes will have very high capacity when fully utilized—10,000 tons per hour or more should be readily achievable for a single pipe. This compares to a capacity of 7000 to 18000 tons per lane per hour for heavy trucks on an uncongested highway. Truck lanes planned for the Los Angeles area are projected to cost over \$50 million per lane mile.

The Mag Net's extreme energy efficiency provides a potential energy savings exceeding 8 billion gallons of diesel fuel per year in the U.S. alone, with a 72 million metric ton decrease in CO<sub>2</sub> emissions. The carbon monoxide, nitrogen oxides, particulates, sulfur dioxide, volatile organic compounds and noise normally emitted by truck and air freight carriers would likewise be eliminated. With our vehicles traveling through underground tubes, totally isolated from passenger traffic, they will provide a level of safety never before seen in a transportation system.

The Mag Net will also provide an unprecedented level of security.

America's current freight system is barely able to handle the immense traffic flow required for free trade, even with minimal security. But the events of 9/11 have created a frightening dilemma—while cursory inspection of imports is no longer acceptable, thorough screening seems impossible without bringing trade to a halt. Government and industry are struggling to find ways to efficiently move freight across borders while ensuring detection of explosives, chemical weapons, biotoxins, nuclear materials and other contraband. At present officials search only 2 percent of the 11 million freight containers arriving here each year. The solutions that have been proposed, such as they are, provide stop-gap measures at best. They will require huge expenditures and attempt to maximize security primarily by focusing it on a small fraction of shipments. Most trade goods will continue to cross borders without inspection, as they do now, or will encounter severe delays—or both.

Magtube vehicles, on the other hand, will travel silently out of sight, protected by a vacuum, a steel tube, and several feet of earth. Untouchable. With computer control their precise location will always be known to Magtube and our security partners—and no one else. Small, standardized shipping containers will provide compatibility with other shipping modes and easy access for inspection or machine scanning. Automated searches for contraband will be fast and cheap with minimal delays. Nuclear, biologic, and/or chemical sensors can be installed in each vehicle for enhanced detection capability. Freight can be inspected either at its source or at a facility far from any border, then sent to a border crossing with complete assurance that it will remain under constant supervision until it reaches its destination. Whether their cargo is tissue paper or spent nuclear fuel rods, our vehicles will bypass highways, railroads, border inspection stations, and all other sources of congestion or concern. If one link of the Mag Net is shut down its normal traffic will simply be rerouted through other links.

We are currently in the final stages of constructing a laboratory demonstration of a full-scale vehicle and track. In 2003 we plan to begin construction of a second-generation vehicle and a high-speed test track. At the same time we're exploring options for commercial pilot projects—actual revenue-producing freight transport installations—with organizations such as SCAG, other transportation groups in California, New York and Michigan, and the Department of Transportation. Our goal is to be ready to begin the construction of pilot projects in the 2004–2005 timeframe. The most attractive sites for these installations will be those areas with the worst problems, such as clean air non-attainment areas, border bottlenecks, and severely congested cities.

We do not expect or want the Mag Net to be publicly funded. We are in business to design, build, and operate the Mag Net for profit. But there are several things the Federal Government could do to accelerate system startup and expansion. (1) Congress could make freight maglev installations explicitly eligible for DOT's Transportation Infrastructure Finance and Innovation Act (TIFIA) to provide Federal credit assistance such as direct loans, loan guarantees and lines of credit. Additionally with much of the focus of next year's TEA–21 reauthorization on the Congestion Mitigation and Air Quality (CMAQ) program, we would respectfully that it be clarified that technologies such as ours, be eligible, where appropriate and necessary, for CMAQ funding for those areas of the country in air quality non-attainment and maintenance areas. (2) Congress could help provide access to or assistance in acquiring rights-of-way for such installations adjacent to Federal aid highways. (3) Congress could make freight maglev part of any proposed freight component in the next highway authorization. (4) Congress could provide assistance with Federal agencies in identifying pilot projects and planning border crossing installations to improve freight flow and security. (5) Congress could assist us in our discussions with mul-

tiple Federal agencies and with our cross-border trading partners, Canada and Mexico.

Major breakthroughs in transportation technology are exceedingly rare—the railroad, the automobile, the airplane—but they have far-reaching consequences. In 1942 German submarines sank most of our oil tankers along the Gulf and East Coasts. In response we built the government-financed War Emergency Pipeline, the first large-diameter long-distance oil pipeline, and soon discovered it had immense economic and operational advantages. In that case it took a World War to overcome inertia and jumpstart a better method of transportation. We are now facing another crisis, a battle against increasing congestion, major threats to security, stagnating travel, slower goods movement, and increasingly severe environmental impact. We can win this war—without constraining the free movement of goods and people. Indeed, we now have a clear path to a level of mobility previously considered science fiction. The “Network Economy” need not be limited to the exchange of information. If we build the Mag Net and move freight transport below ground everybody wins—shippers, carriers, the government, and the public. This committee and the Congress can help us do it.

Again, my thanks to the committee for allowing me to present this testimony. My associates and I are available at your convenience should you care to discuss the information I have presented, or any issue dealing with freight transportation and security.

#### Energy Efficiency Comparison

| Mode                    | Speed (mph) | BTU/ ton-mile | Ton-miles/Gal. (diesel equiv. *) |
|-------------------------|-------------|---------------|----------------------------------|
| Railroad .....          | 65          | 368           | 377                              |
| Long-haul truck .....   | 65          | 1151          | 120                              |
| Truck (avg) .....       | 65          | 2793          | 150                              |
| 747-400F .....          | 500         | 10,800        | 12.5                             |
| Air Freight (avg) ..... | 500         | 20,000        | 7                                |
| Mag Tube (est.) .....   | 200         | 48            | 2890                             |
| Mag Tube (est.) .....   | 300         | 49            | 2831                             |
| Mag Tube (est.) .....   | 400         | 60            | 2312                             |
| Mag Tube (est.) .....   | 500         | 81            | 1712                             |

#### STATEMENT OF THE LOS ANGELES COUNTY ECONOMIC DEVELOPMENT CORPORATION (LAEDC)

Mr. Chairman and members of the subcommittees, the Los Angeles County Economic Development Corporation (LAEDC), a private nonprofit, 501(c)3, is pleased to present this overview of goods movement in Southern California. We appreciate the opportunity to offer this statement as part of legislative hearing record being developed by the U.S. Senate in preparation for the reauthorization of TEA-21. We greatly appreciate the interest and focus of the respective full committees in the issues surrounding TEA-21. In addition, we are very appreciative of the leadership demonstrated by Senator Barbara Boxer and Senator Diane Feinstein and the great economic and environmental benefits TEA-21 has brought to California’s transportation system.

This statement is based from four public policy and transportation studies: the Southern California Freight Management Case Study (enclosed); the Alameda Corridor East Train Study (enclosed); the 60-Mile Circle (available at [www.laedc.org](http://www.laedc.org) the week of September 16th); and the forthcoming On-Trac Corridor Trade Impact Study, 2002. Together these studies, coordinated by the LAEDC, paint a remarkable picture of a region with a rapidly growing population, burgeoning international and domestic trade, and a looming trade transportation capacity crisis that has both local and national implications. Southern California is America’s gateway to the Pacific Rim, and our nation’s international trade is growing rapidly. Yet, Southern California’s infrastructure is inadequate to handle this rising tide of trade, and the region will need Federal assistance and creative solutions to finance the required improvements.

Today we would like to briefly introduce you to the region, describe its key population and trade trends, and summarize the region’s infrastructure capacity shortfalls.

### *Regional Overview*

Southern California, the five-county region comprised of Los Angeles, Orange, Riverside, San Bernardino and Ventura Counties, operates on a scale normally associated with States and even countries. At 17 million people and growing, more people live in Southern California than in all of Florida, currently the fourth most populous State in the union. Despite its reputation for making movies and little else, Southern California employs more than a million people in manufacturing. Powered by core strengths in aircraft, biomedical technology, business services, food, furniture, metal fabrication, motion pictures and television production, textiles and apparel and tourism, the region produces over \$600 billion in goods and services annually. This places the region's gross domestic product tenth in the world among countries, just behind Canada and Brazil and ahead of Mexico, Spain, India, South Korea and Australia. Home to almost 200 different nationalities and cultures, Southern California is one of the most diverse places on earth. The region is one of the top tourist destinations in the country, and thanks to its combination of wealth, size and reputation for trend setting, comprises one of the world's most important consumer markets.

### *Regional Trends and Resulting Capacity Shortages*

Population and trade growth are the two key trends affecting the region. The five-county Southern California region will add more than 5 million people between 2000 and 2020. This is roughly equivalent to the combined populations of the Cities of Los Angeles and San Diego, or twice the population of Chicago. Much of the growth will be internally generated: In addition to having the largest population base among the 50 States, California also has one of the highest rates of natural increase (births minus deaths as a share of total population). Internal population growth will be supplemented by immigration. California has the highest rate of net international migration of any State, helping make Los Angeles a modern Ellis Island.

Two shocking implications of this growth: First, at current rates of automobile ownership, five million more people will add about 2.7 million private vehicles to the region's already congested freeways. Second, just to maintain the status quo, population growth of more than five million people will require adding twice the infrastructure and services that exist in present-day Chicago. For every school in Chicago, Southern California will need to build two.

In terms of trade, Southern California has emerged as a leading global trade and transshipment center because of its massive internal market, heavy investment in world-class trade infrastructure, and its new role as the distribution center for U.S.-Pacific Rim trade. The massive internal market draws trade both for final consumption and for inputs in valued-added products ranging from shirts that are labeled and placed on hangers to parts that are used in manufacturing. These two factors help to pull in still more trade, and drive up the percentage of international cargo that makes its first stop in Southern California. With so much cargo destined here in the first place, it makes sense for shippers to use the region as a distribution center for the rest of the United States. This role is confirmed by data from the Los Angeles Customs District, which recorded almost one-quarter trillion (\$230 billion) dollars in trade for year 2000.

The \$230 billion in trade is an underestimate since it is merchandise trade only, therefore excluding some of the region's core strengths such as motion pictures, tourism, and financial services. The number is also low because it is based on port of entry only, thereby excluding the region's NAFTA trade with Canada and Mexico, which travels primarily by truck and rail and thus is counted in border areas such as San Diego, Laredo and Detroit. Even still, the value of merchandise trade at the L.A. Customs District is expected to almost triple to \$661 billion, 2000-2020. We'd like to quickly describe the growth trends and capacity issues for the region's ports, railroads, freeways and airports.

Ports—The Ports of Los Angeles and Long Beach are the busiest in the Nation, together handling one-third of all container traffic in the United States and an astonishing 65 percent of all container traffic on the West Coast. With a combined container throughput of 9.5 million Twenty-Foot Equivalent Units (TEU) in 2000, they were the third busiest container facility in the world, behind only Singapore and Hong Kong.

The long-term trend in container traffic at the ports has seen steady growth, though the pace has slowed in recent months. As recently as 1998, the Alameda Corridor Transportation Authority (ACTA) conservatively forecast year 2000 container traffic of 5.6 million TEUs (twenty-foot equivalent units). The actual total was 9.5 million TEUs; no one, including the ports, anticipated that container traffic would grow so fast.

Container traffic on the Alameda Corridor East (see geographic map in Rail Corridors section) is now expected to almost double by 2010, and then double again to 32 million TEUs by 2025. For perspective, consider that a single large ship typically carries 6,000 TEUs. That is enough containers, placed end to end, to build a wall of boxes more than 20 miles long. The forecast growth may seem incredible, but if anything, it is probably conservative. Indeed, for the past 10 years, traffic levels have consistently surpassed previous estimates.

Rail Corridors—Driven by the rising tide of trade flowing through the ports, easterly bound rail traffic is expected to rise dramatically over the next twenty-five years. The newly constructed Alameda Corridor—a 20-mile, high-speed, completely grade-separated train route connecting international trade via the ports and the rail yards just east of downtown Los Angeles—will handle some of the international increases. Yet the Alameda Corridor is only the first link of a massive regional mainline rail corridor network. Domestic and international trade at the two rail yards east of downtown is the starting points of the Alameda Corridor East. This eastbound corridor carries about three times the cargo of the recently completed Alameda Corridor because the intermodal rail yards receive more international goods by truck from the ports and even more domestic or locally produced goods for movement to the rest of the United States. The short answer is that Alameda Corridor East carries about 23 percent of the United States waterborne international trade and is the only corridor in Southern California that carries both domestic and international goods through the region to and from the rest of the United States.

#### *Alameda Corridor East*

##### *(Union Pacific and Burlington Northern Santa Fe Mainlines)*

As seen in the above graphic, the two rail corridors connect the downtown rail yards with the transcontinental rail network: the Alameda Corridor East (San Gabriel Valley Corridor), via the Union Pacific (UP) tracks through the San Gabriel Valley into San Bernardino and Riverside Counties, and the Alameda Corridor East (OnTrac Corridor), which follows the Burlington Northern Santa Fe (BNSF) mainline through densely populated northern Orange County into Riverside and San Bernardino Counties. Freight and commuter trains also share the tracks of both corridors, further complicating efficient mobility. The OnTrac Corridor, going through the city of Placentia, carries 50 percent of all eastbound rail cargo and is the only rail artery used by the United Parcel Service to move cargo to Midwest and East Coast destinations. OnTrac Corridor train traffic will rise 210 percent, 2000–2025, while the San Gabriel Valley Corridors train traffic will increase 236 percent over the same period. Rail traffic on these routes, at more than one train every 10 minutes, will easily surpass current capacity, barring major improvements, in the next 3–5 years. Intermodal lift capacity in the region—the facilities that transfer containers between trucks and trains—is greatly constrained. Demand for intermodal lifts is expected to exceed capacity within the next 5 years. Simply put, in just a few years, a shortage of intermodal capacity and additional passenger trains will mean more trucks on the already congested freeways. At the same time, additional freight trains will translate into more cars on the freeway. Without additional capacity it is a no-win situation for local commuters, the other 49 States, and the U.S. Treasury. Local commuters will be impacted because they will reach unbearable congestion. The other forty-nine will see job growth slow because Southern California consumers will see more difficulty receiving goods through eastbound rail corridors, and the U.S. Treasury because the customs revenues collected on imported international goods—an unbelievable 1 percent of all U.S. Treasury revenues comes from customs duties—will likely slow or decrease due to inefficient freight mobility in Southern California. Currently about half of those customs revenues are collected on goods going through Southern California's transportation systems.

Freeway System—On the freeways, the number of vehicle miles traveled in Southern California has been rising faster than population growth. “Rush hour” has become an oxymoron in Los Angeles. The peak travel period has crept up to 6 hours per day, during which the average travel speed drops to 35 miles per hour. The Texas Transportation Institute annually surveys road congestion in metropolitan areas across the U.S., and Los Angeles has had the worst congestion every year since 1982. The latest survey reveals 85 percent of all lane miles are congested, with almost half classified as “extremely congested.” As a result, on a per capita basis, the region wastes more hours (56) annually stuck in traffic than anywhere else in the country.

Some freeways handle up to 40,000 trucks daily, and with heavy truck traffic expected to rise 65 percent, 1995–2020, they may soon handle up to 80,000 truck trips daily. Owing to their size and operating characteristics, trucks use a much greater share of freeway capacity than their numbers might suggest. Already, heavy trucks

use 45 to 60 percent of capacity on certain freeways, most notably the I-710. Since trucks move 81 percent of all tonnage originating in Southern California (according to the 1997 Commodity Flow Survey), increasing freight flows will mean more trucks on the freeways.

Airports—Southern California's economy is increasingly dependent on airports. Many of the region's leading industries—from tourism to manufacturing to biotechnology—depend on air travel and air cargo. Even businesses that don't rely on air cargo directly benefit from the enhanced business connections and opportunities made possible by direct flights to and from our key overseas trading partners. The region's exports increasingly travel by plane. In 1995, 54 percent of regionally produced exports (by value) were shipped by air, and the percentage is higher today. Indeed, LAX handles more exports by dollar value each year than the Ports of Los Angeles and Long Beach combined.

LAX is already extremely busy. In 2000, LAX was the third busiest passenger airport in the world, after Atlanta (ATL) and Chicago (ORD). Similarly, LAX was the third busiest cargo airport in the world behind only FedEx-hub Memphis (MEM) and Hong Kong (HKG). Although air demand dipped following the September 11, 2001 tragedy, the impact on long-term air travel trends is expected to be slight. Air traffic demand has been skyrocketing, outpacing population growth. Estimates from the Southern California Association of Governments (SCAG) suggest air passenger demand will almost double from 82 million annual passengers (MAP) in 1998 to 157 MAP in 2020. Air cargo volume is expected to triple from 2.8 million annual tons in 1999 to 8.9 million tons in 2020. Preliminary, post-9/11 revisions suggest these levels will be reached two to 3 years later than previously estimated, with passenger growth delayed more than cargo. Overall, the region faces a capacity crisis; particularly now that it seems certain that an airport will not be built at El Toro in Orange County.

Congestion is a problem across all modes of transportation. The region will struggle to accommodate future freight operations; 10–15 year lead times for financing and constructing upgrades to infrastructure are almost guaranteed; current intermodal facilities at local ports and rail yards will reach capacity within 5 years; and without major investments, the rail lines east of downtown Los Angeles will be so congested the rail network will effectively cease to function. These problems will be exacerbated by congestion on the roads. Air cargo facilities, for example, rely on trucks to feed shipments to the airport and deliver airfreight to its final destination, yet traffic is terribly congested in the vicinity of LAX. Congestion threatens both domestic and international trade moving through the region, and the quality of life for people who live there.

#### *National Implications*

Southern California's trade transportation infrastructure should be of great concern to the rest of the United States because the region's global gateways and trade corridors act as conduits for two-way domestic and international surface trade between Pacific Rim nations and every region of the United States. Let's take a quick look at the OnTrac Corridor Trade Impact Study (2002) for two-way domestic and international surface trade during the year 2000 between California and regions of the United States.

The international trade figure for each region represents the two-way trade between other regions of the United States and overseas customers and suppliers that travel via the UP and BNSF train routes that comprise the Alameda Corridor East. The domestic trade numbers represent commerce between California and other States. Roughly half of the domestic trade between California and other States will originate or be consumed in Southern California (based on Southern California's share of the State's GDP). International trade diversion to other ports of entry is cost prohibitive since half of all international goods would still need to be delivered to Southern California. This means that over 20 percent of all U.S. waterborne trade is consumed locally in Southern California, or 45 percent of all customs revenue that is generated in the United States goes through Southern California, or .5 percent of all the revenues of the United States Treasury is collected via customs duties on products imported through Southern California each year.

The Northwest States (WA, OR, MT, ID and WY) received and sent international trade via the Alameda Corridor East in 2000 valued at \$2.2 billion dollars. Domestic trade between the Northwest and California for the same year was \$60.4 billion. For the Great Plains States (ND, SD, NE, KS, MN, IA and MO), the comparable figures were \$8.6 billion and \$42.4 billion. The numbers for the Great Lakes States (IL, WI, MI, IN, KY, OH and WV) were \$25.0 billion and \$69.4 billion. For the Atlantic Seaboard (CT, DE, ME, MD, MA, NH, NJ, NY, PA, RI, VT and VA), the figures were \$34.4 billion in international and \$74.6 billion in domestic trade. In the Southeast

(AR, AL, GA, FL, LA, NC, SC, TN and MS), the numbers were \$16.0 billion international and \$71.7 billion domestic. For Texas and Oklahoma, the numbers were \$12.1 billion international and \$54.2 billion domestic. And finally, for the Southwest States (CA, NV, AZ, UT, CO and NM), international trade moving through the Alameda Corridor East rail routes was valued at \$98.0 billion and domestic trade with California was worth \$80.3 billion. The Southwest was the only region where the international trade was larger than the domestic only because California's international trade is included, but California's domestic trade with itself (worth \$1.3 trillion in 2000) is not included in the \$80 billion regional total.

All these billions of dollars in domestic and international trade represent the value in two-way trade to other regions of the country and highlight the importance of efficient movement of goods through Southern California for the entire country. The domestic surface trade between California and the other States, worth tens of billions of dollars annually, dwarfs the enormous international trade flows. California consumers represent one of the largest markets for goods produced by other U.S. States. Thus, investing national funds in efficient transportation networks in California is actually in other States' interest. For example, Montana sells Californians about \$1.5 billion of domestic products each year and receives about \$10 million of international trade through Southern California ports and corridors. Iowa, on the other hand, sells Californians about \$5 billion worth of products each year and only buys about \$300 million of Californian products in return. So, a lot of jobs depend on Southern California's appetite for products and all the Federal money spent on trade transportation infrastructure in Southern California will ensure that the goods produced in other States continue to reach their California customers in a timely way; may reduce warehousing cost through logistics strategies like "just-in-time" delivery; and will speed goods to and from overseas to destinations throughout the United States.

*Reauthorization of TEA-21 and Freight Policy*

During the deliberations by your respective subcommittees regarding the reauthorization of TEA-21, we urge that you give strong consideration to the following proposals for Federal action to enhance the efficient movement of goods and freight on the nation's transportation system:

1) Freight movement should be considered a major policy focus and high priority in the TEA-3 legislation;

2) A dedicated category of Federal funding should be established to support freight related transportation infrastructure. Particular support should be given to trade corridor improvements, similar to the Alameda Corridor East extension program in Southern California, and other similar global gateways throughout the country. In addition, support should be given to the implementation of intermodal connectors, including connectors designed to improve ground access at international airports;

3) Increased funding flexibility should be extended to existing TEA-21 funding categories, including CMAQ, providing access to freight related infrastructure, including rail grade-crossing and lowering improvements;

4) Consideration should be given to new and innovative funding sources, including direct user-based fees, similar to the financing arrangement used for the Alameda Corridor project. Another concept we urge you to review is the earmarking of the incremental growth in custom revenues going through the nation's corridors and global gateways. These added funds should be targeted to support unfunded infrastructure improvements in communities that are directly related to the growth of two-way domestic and international trade;

5) New policies and provisions, including changes in Federal tax policy to encourage public private transportation partnerships, including an enhanced role for Class I railroads serving the nation's most severely congested corridors; and

6) Establish an Office of Freight Policy and Implementation in the Office of the Secretary of Transportation. One option would be to expand the current responsibilities of the Office of Intermodalism, and place the management responsibility with the Under Secretary of Transportation.

Mr. Chairman, thank you for the opportunity to submit this statement for the legislative record associated with the reauthorization of TEA-21.

STATEMENT OF HON. JAMES P. MCGOVERN, U.S. REPRESENTATIVE FROM THE  
COMMONWEALTH OF MASSACHUSETTS

Mr. Chairman, thank you for the opportunity to testify before the subcommittee today. I commend you and the members for holding this TEA-21 reauthorization hearing on truck safety. It is, as we all know, a critically important issue.

Mr. Chairman, I appear before the sub-committee this afternoon because I believe strongly that any serious and substantive discussion regarding truck safety begins and ends with the subject of truck size and weight. That is because truck safety is largely a function of truck size and weight. We know this, not only from recent studies and reports, but from our shared common experience as well.

Too many of us, too often, have been unsettled while driving alongside or behind huge triple trailer trucks and other longer combination vehicles known as LCVs. These trucks can be more than 100 feet in length and can sway three to four feet into adjacent lanes of traffic, even on a windless day. In some instances, a truck veering sharply can cause a "crack the whip" effect, where the wheels on one side of the rear trailer are actually lifted off the ground. These life-threatening occurrences are altogether too frequent to be dismissed as dramatized anecdotal evidence. In fact, the research suggests the danger posed by such trucks is very real.

The US Department of Transportation's 2000 Comprehensive Truck Size and Weight Study confirmed that multi-trailer trucks are especially dangerous. According to the DOT study, if the current restrictions on LCVs were removed, they would likely have a fatal crash rate of at least 11 percent higher than single trailer trucks.

An earlier report prepared for the Association of American Railroads suggested that LCVs are actually 66 percent more likely to be involved in a fatal crash. Similar studies have found that heavier trucks take more time and distance to stop and merge into traffic, thereby increasing the likelihood of crashes. Not surprisingly, these same studies have found that increasing truck weight increases the risk of rollover crashes and enhances the risk that collisions between trucks and cars will be fatal for the occupants of the car.

Now, I recognize and appreciate that the Transportation Research Board's (TRB) recent report on truck size and weight finds much of the research I have just cited as inconclusive. And while I congratulate the TRB for their contribution to this policy discussion, I must tell you that I am more than a little troubled by their recommendation that we should instead experiment with bigger trucks on America's roads and bridges. I can assure you my constituents do not care to be guinea pigs in that experiment.

Mr. Chairman, just as our common experience informs our opinion on this issue, so must common sense dictate the solution. I am pleased to be joined by nearly 75 of my colleagues in bi-partisan support of H.R. 3132, the Safe Highways and Infrastructure Preservation Act. This IS common sense legislation that will maintain the reasonable limits that currently exist on truck size and weight on our Interstate System and extend those same limits to the National Highway System. It does not roll back truck size and weight, but rather closes loopholes in the current law that have resulted in a proliferation of overweight trucks. Ultimately, this legislation will both save lives AND protect the nation's multi-billion dollar investment in our highway infrastructure.

Mr. Chairman, the fiscal considerations attendant to this issue must also not be minimized. According to the Federal Highway Administration's 1999 Status Report on the Nation's Surface Transportation System, it will take \$1.13 trillion over the next 20 years simply to maintain our roads and bridges. But, as we are all keenly aware, there is a backlog on road and bridge maintenance. Nearly 30 percent of our nation's bridges—and 50 percent of the bridges in my home state of Massachusetts—are structurally deficient or functionally obsolete. Now, we also know that as truck weight increases, the amount of pavement damage increases exponentially. In fact, according to the DOT's 2000 Comprehensive Truck Size and Weight Study I referenced earlier, bigger trucks would add more than \$300 billion in costs to our transportation spending.

Mr. Chairman, as Congress prepares to consider the reauthorization of its major transportation spending bill, I am hopeful that the Safe Highways and Infrastructure Preservation Act will be adopted in some form or fashion.

The legislation makes sense, the timing is right and above all else, the American public must be protected from the danger of still bigger trucks.

Thank you very much.

## REAUTHORIZATION OF TEA-21

---

THURSDAY, SEPTEMBER 19, 2002

U.S. SENATE,  
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,  
*Washington, DC.*

The committee met, pursuant to notice, at 9:35 a.m. in room 406, Senate Dirksen Building, Hon. James Jeffords [chairman of the committee] presiding.

### **PROJECT DELIVERY AND ENVIRONMENTAL STEWARDSHIP**

Present: Senators Jeffords, Baucus, Bond, Carper, Corzine, Crapo, Voinovich, Warner and Wyden.

### **OPENING STATEMENT OF HON. JAMES M. JEFFORDS, U.S. SENATOR FROM THE STATE OF VERMONT**

Senator JEFFORDS. The hearing will come to order.

Late yesterday, President Bush issued an Executive Order on environmental stewardship in transportation, the exact topic of this hearing. I read the order. I am willing to give the Administration the benefit of the doubt on this enhanced Federal coordination. The value of the value of the order depends on how it is carried, so I am willing to reserve judgment.

I will be asking a number of questions about this order, and I expect that other Senators will be doing the same. I want to point out to the reporters in the audience that the Executive Order is only a portion of the real story today. The men and women testifying today will be discussing successes that are already being made in improving transportation projects, while protecting and enhancing the environment.

The real focus of today's hearing is about understanding the multitude of factors that can affect the development and construction of a major transportation project. Transportation projects not only provide mobility, they bring about benefits for families, communities and the environment. GAO will tell us that there can be up to 200 steps in four broad categories of completing a major transportation project. But it is more complicated than that. Charlie Hales, representing Portland, views this process as, quote, "governing with the consent of the governed." He also says that Portland's experience is that the best way to deliver quality projects is to go through the planning process right the first time, and only once. This approach is sometimes referred to as the environmental stewardship. The goal of environmental stewardship should be to identify and meaningfully address project conflicts at the beginning of the planning process, not at the eleventh hour through litigation.

The keys to better up-front planning include earlier involvement by the stakeholders, more resources to facilitate that involvement, and a better information base. Project stewardship will assure that we get the most out of every dollar spent. Let us not forget that these major projects are not just about building infrastructure, but also involve protecting and enhancing the natural and human environment. Thus, this hearing today is about how to get it right the first time, which can save billions and even more lives.

I want to be sure that our discussion today is placed in the proper context. For instance, I was surprised to learn that only 3 percent of federally funded transportation projects even require an environmental impact statement. These very few major projects can take between nine and 19 years to complete, but most projects require far less time. It is also important to remember that when delay does occur, it can be caused by events throughout the delivery process, by right-of-way challenges, utility relocation problems, remitting, weather delays, and construction change orders. As we look to improve the timeliness of the project delivery, we will also see deficiencies in each stage. I am concerned as well about quality, cost-effectiveness, and honesty in project delivery. That is why I have asked the DOT Inspector General to testify today about the importance of these aspects of good project stewardship, keeping graft and corruption away from those huge construction contracts. But I know that most of our attention has been focused on environmental process. I agree with the very recent FHWA report that says that we must get beyond environmental process bottlenecks and focus on practical solutions through integrated concurrent planning and public input. In 1999, as a part of the last reauthorization, Congress directed the Secretary of USDOT to develop a coordinated environmental review process in conjunction with other Federal resource agencies. Today, representatives of the USDOT and the USEPA will report on their progress in meeting that mandate.

Perhaps most notably today, we will hear from practitioners from around the country reporting on their efforts to improve both the efficiency and effectiveness of the planning and environmental process. I am pleased to welcome Emily Wadhams, the Historic Preservation Officer from my home State of Vermont, who has helped pioneer cooperative efforts with our transportation agency.

I am also happy to welcome Carol Murray from my neighboring State and the home of the Ranking Member, Bob Smith. Carol is a Transportation Commissioner in New Hampshire and has led an innovative effort in the State to expand Interstate 93.

We are also joined today by witnesses from Florida, Portland, Oregon, and from a representative of the Nation's consulting engineers.

Throughout our reauthorization process, we will have asked our witnesses about lessons learned over the past 10 years, and about changing conditions that confront us in the future. We have then asked the key question, How should we refine our program based on these lessons learned and those changing conditions? Today's hearing will continue this approach.

Let me now introduce our witnesses. Emil Frankel is the Assistant Secretary for Transportation Policy at the U.S. Department of

Transportation. Thank you for joining us today. I am pleased to have you with us. We also have John Peter Suarez, the Assistant Administrator of Enforcement and Compliance Assurance of the U.S. Environmental Protection Agency. Also from USDOT is Kenneth Mead, Inspector General of the U.S. Department of Transportation. Ken advises the Secretary of Transportation and the Congress on the best practices and deficiencies found, and recommends ways to strengthen the management of DOT's programs and operations. Thank you for being here today, Ken. Also Kate Siggerud is here today with us. Kate is the Acting Director of the Physical Infrastructure Issues for GAO. For the past several years, Kate has directed GAO's reviews of Federal aid highway program issues, which includes the interaction between transportation and the environment. New Hampshire Department of Transportation Commissioner Carol Murray—thank you again for being with us today. [The document referred to follows:]

THE WHITE HOUSE

*September 18, 2002*

EXECUTIVE ORDER—ENVIRONMENTAL STEWARDSHIP AND TRANSPORTATION  
INFRASTRUCTURE PROJECT REVIEWS

By the authority vested in me as President by the Constitution and the laws of the United States of America, and to enhance environmental stewardship and streamline the environmental review and development of transportation infrastructure projects, it is hereby ordered as follows:

Section 1. Policy. The development and implementation of transportation infrastructure projects in an efficient and environmentally sound manner is essential to the well-being of the American people and a strong American economy. Executive departments and agencies (agencies) shall take appropriate actions, to the extent consistent with applicable law and available resources, to promote environmental stewardship in the Nation's transportation system and expedite environmental reviews of high-priority transportation infrastructure projects.

Sec. 2. Actions. (a) For transportation infrastructure projects, agencies shall, in support of the Department of Transportation, formulate and implement administrative, policy, and procedural mechanisms that enable each agency required by law to conduct environmental reviews (reviews) with respect to such projects to ensure completion of such reviews in a timely and environmentally responsible manner.

(b) In furtherance of the policy set forth in section 1 of this order, the Secretary of Transportation, in coordination with agencies as appropriate, shall advance environmental stewardship through cooperative actions with project sponsors to promote protection and enhancement of the natural and human environment in the planning, development, operation, and maintenance of transportation facilities and services.

(c) The Secretary of Transportation shall designate for the purposes of this order a list of high-priority transportation infrastructure projects that should receive expedited agency reviews and shall amend such list from time to time as the Secretary deems appropriate. For projects on the Secretary's list, agencies shall to the maximum extent practicable expedite their reviews for relevant permits or other approvals, and take related actions as necessary, consistent with available resources and applicable laws, including those relating to safety, public health, and environmental protection.

Sec. 3. Interagency Task Force. (a) Establishment. There is established, within the Department of Transportation for administrative purposes, the interagency "Transportation Infrastructure Streamlining Task Force" (Task Force) to: (i) monitor and assist agencies in their efforts to expedite a review of transportation infrastructure projects and issue permits or similar actions, as necessary; (ii) review projects, at least quarterly, on the list of priority projects pursuant to section 2(c) of this order; and (iii) identify and promote policies that can effectively streamline the process more required to provide approvals for transportation infrastructure projects, in compliance with applicable law, while maintaining safety, public health, and environmental protection.

(b) Membership and Operation. The Task Force shall promote interagency cooperation and the establishment of appropriate mechanisms to coordinate Federal, State, tribal, and local agency consultation, review, approval, and permitting of transportation infrastructure projects. The Task Force shall consist exclusively of the following officers of the United States: the Secretary of Agriculture, Secretary of Commerce, Secretary of Transportation (who shall chair the Task Force), Secretary of the Interior, Secretary of Defense, Administrator of the Environmental Protection Agency, Chairman of the Advisory Council on Historic Preservation, and Chairman of the Council on Environmental Quality. A member of the Task Force may designate, to perform the Task Force functions of the member, any person who is part of the member's department, agency, or office and who is either an officer of the United States appointed by the President with the advice and consent of the Senate or a member of the Senior Executive Service. The Task Force shall report to the President through the Chairman of the Council on Environmental Quality.

Sec. 4. Report. At least once each year, the Task Force shall submit to the President a report that: (a) Describes the results of the coordinated and expedited reviews on a project-by-project basis, and identifies those procedures and actions that proved to be most useful and appropriate in coordinating and expediting the review of the projects.

(b) Identifies substantive and procedural requirements of Federal, State, tribal, and local laws, regulations, and Executive Orders that are inconsistent with, duplicative of, or are structured so as to restrict their efficient implementation with other applicable requirements.

(c) Makes recommendations regarding those additional actions that could be taken to: (i) address the coordination and expediting of reviews of transportation infrastructure projects by simplifying and harmonizing applicable substantive and procedural requirements; and (ii) elevate and resolve controversies among Federal, State, tribal, and local agencies related to the review or impacts of transportation infrastructure projects in a timely manner.

(d) Provides any other recommendations that would, in the judgment of the Task Force, advance the policy set forth in section 1 of this order. Sec. 5. Preservation of Authority. Nothing in this order shall be construed to impair or otherwise affect the functions of the Director of the Office of Management and Budget relating to budget, administrative, and legislative proposals.

Sec. 6. Judicial Review. This order is intended only to improve the internal management of the Federal Government and is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or equity by a party against the United States, its departments, agencies, instrumentalities or entities, its officers or employees, or any other person.

GEORGE W. BUSH,

*The White House, September 18, 2002.*

I now turn to Kit Bond. Do you have a statement?

**OPENING STATEMENT OF HON. CHRISTOPHER S. BOND,  
U.S. SENATOR FROM THE STATE OF MISSOURI**

Senator Bond. Thank you, Mr. Chairman.

I was hoping I would get to say something. We have some views on this. This hearing is very important to examine the progress made on environmental streamlining under TEA-21. As the Department of Transportation itself says, environmentally responsible transportation improvements, delivered on time and within budget, is a simple vision that all too often evades the USDOT and its partners. Every one of us in this room knows the importance and role that transportation plays in our everyday lives, especially in our economy. Our economic stability and progress is tied directly to transportation. As my dear friend and colleague from Virginia, Senator Warner, often said, this is a one-world market. Our country's transportation infrastructure makes it so.

My home State of Missouri has always been a leader in this area. In 1808, the King's Highway from St. Louis to southwest Missouri became the first legally designated road west of the Mississippi. In 1929, Missouri was the first State to protect and earmark funds for

highway purposes. The first stretch of Interstate on which work actually began anywhere in the country was Interstate 70 in St. Charles, Missouri.

Missouri is at the geographic center of the U.S., and serves as a confluence not only of our Nation's highway systems, but also for our Nation's two greatest waterways, the Mississippi and the Missouri. With the second largest third rail hubs and the second largest inland port in the United States, Missouri products travel to all 50 States and all reaches of the globe. So we care a lot about transportation.

We also care a great deal about the environment. I have fought long and hard as Governor and now in the Senate to increase the amount of money we spend in Missouri and across the Nation on cleaning up waste water and making water safe to drink. I hope next year we will come to a consensus on further air pollution reductions from electric power utilities.

We cannot give away our environmental gains achieved over the last 30 years to transportation projects needlessly hurting the environment. I share the historic trust belief that environmental reviews are an essential element in transportation development. I also agree with the American Association of State Highway Transportation Officials that, quote, "Environmental stewardship begins not with new laws and regulations, but with a commitment by transportation agencies themselves to make environmental protection and environmental enhancement an integral part of their mission," close quotes.

But with that commitment, how far can we get under the current laws and regulations? According to FHWA, it typically takes nine to 19 years to plan, gain approval and construct a new major federally funded highway project that has significant environmental impact. Frankly, that is far too long. Now, some would say that the environmental portion is a minority of that time period. That just hides the fact that the average length of time to process environmental documents for major projects is still over 5 years. Some may be proud that the average is now 5 years and 2 months instead of 5 years and 10 months, but that does not cut the mustard. Five years is just too long.

Part of the problem is groups who use well-meaning environmental reviews for nothing but delay. Testifying before this committee, the Executive Director of the Surface Transportation Policy Project admitted that, quote, "In the struggle between the proponents and opponents of a controversial project, the best an opponent can hope to do is to delay things until the proponents change their minds or tire of the fight. That is the only option they have, so they use it," close quotes.

Sometimes these advocates of delays are actually aided by governments themselves. Attempts by DOT in the last Administration failed to implement the intent of Congress in TEA-21. Their regulatory proposals were riddled with new requirements that could easily mushroom into new major causes of delay, cost-overruns and litigation. They also left many existing problems unaddressed, resulting in missed opportunities to achieve needed reforms.

Many States are trying to implement innovative new programs to streamline environmental and historic preservation reviews. I

was particularly impressed by the example of Vermont, the home State of our chairman. We will hear testimony today that Vermont delegated sign-off authority under Section 106 of the National Historic Preservation Act to the State agency of transportation itself. Maybe we should consider going national with the Vermont model. Do you think we could delegate sign-off for environmental reviews to the Department of Transportation? Somehow, I believe there may be some objections.

But all kidding aside, we still have a long way to go in realizing our vision of environmentally responsible transportation improvements delivered on time and within budget. Memorandums of understanding, either well-meaning, but toothless tools, calling for agencies to do nothing more than play nicely, are insufficient. I commend President Bush for his leadership in issuing the Executive Order already mentioned by the chairman, on environmental streamlining. Putting the weight and authority of the President behind the need to deliver environmentally sensitive transportation projects on time, on budget and in compliance, is a great step.

We know, however, that Administrations come and go. The next Administration may not share the same commitment to our Nation's transportation infrastructure. So I think we need to institutionalize improvements and we should consider doing so in legislation.

We need to take a serious look at some of the proposals which might strengthen the overall NEPA decisionmaking process and eliminate inefficiencies in this system. Some of the suggestions I have heard to date include putting a final end to the major investment study requirement and recognizing the innovations occurring at State and local levels; two, possibly designating USDOT or State DOTs as lead agencies in these NEPA processes for surface transportation projects; or three, establishing default deadlines for agency and public comments, with allowances for alternative deadlines or extensions; and four, the possibility of providing clear guidance on how to define a project's purpose and needs statement in a NEPA document. These are extremely important issues for the environment, for transportation, and for our economy and for our future. I look forward to working with my colleagues on all of these issues.

I thank the chairman.

Senator JEFFORDS. Thank you.

Senator Wyden?

**OPENING STATEMENT OF HON. RON WYDEN, U.S. SENATOR  
FROM THE STATE OF OREGON**

Senator WYDEN. Thank you, Mr. Chairman.

I would like to take just a minute and talk about the history of how this came into being, because maybe it will be helpful to us as we try to finally turn this around and get this done.

The last time ISTEA came up, Senator Bob Graham and Senator Chafee and I met for many, many months with transportation officials, with environmentalists, with developers, and we said look, here is the problem. When it comes to major transportation projects, those projects in effect go on two tracks. Over here is the development side; over here is the environmental side. And what

has happened, as Senator Bond correctly lays out, is you go all the way down the line and you are basically pretty much done on the development side, and then somebody comes in with a NEPA objections or something at the very end, slam the brakes on, and then everything falls apart.

So what we proposed in the last ISTEIA legislation is that instead of going down those two separate tracks, just ignoring one or the other, the two tracks were supposed to work together. The idea was that every step of the way, the two tracks would be linked and there would be constant communication from transportation, the development community and the environmental community. Conceptually, it sounds fairly straightforward. It sounded straightforward then. It still sounds straightforward today. Unfortunately, what we have seen, and Senator Bond again is right. Vermont is a very good model. Portland, Oregon is a very good model where we have had years of exactly this kind of communication under the leadership of our former Commissioner Charlie Hales and others. Somehow, it cannot be writ large here in Washington, DC.

I am prepared to say, and I think I can speak for Senator Graham on this, that if this does not get done right now, we are going to come back and legislate it again in the next version of ISTEIA. I am prepared, as long as I've got any breath in this body, to stay at it administratively to try to get it right. If it doesn't get done right, then we will have to look at it once again legislatively. But I would just hope that we would say that the fundamental premise, instead of having these two separate tracks that never get linked, and the only time they communicate is when there is a blow-up at the end, which causes the delays that Senator Bond is correct to describe, that we change that process and that we essentially say that every step of the way there has got to be the kind of communication that prevents these kinds of delays.

So Mr. Chairman, I am only going to be able to stay a little bit because we have got a markup in the Commerce Committee. But I know a lot of colleagues care a lot about this. There is a lot of history and this should not be bureaucratic water torture. People in this country want the proverbial win-win. They want transportation projects. They want them done in line with sensible environmental rules. What we have gotten as a result of this process is in effect a lose-lose. We do not get the transportation projects, nor do we get the important environmental work that needs to be done. I guess if we have to legislate a Vermont or Portland, Oregon model, we can look at doing that the next time around, but I hope it will not come to that, and this can finally get done right administratively.

I thank you for the time this morning.

Senator JEFFORDS. I thank the Senator from Oregon.  
Senator Crapo?

**OPENING STATEMENT OF HON. MICHAEL D. CRAPO,  
U.S. SENATOR FROM THE STATE OF IDAHO**

Senator Crapo. Thank you, Mr. Chairman.

I do have an opening statement, but I would defer to Senator Baucus if he wanted to go first. Senator, would you prefer to go first?

Senator Baucus. Well, Senator, that is fine. You are here. go ahead.

Senator Crapo. OK. Thank you.

The reason I made that offer is because Senator Baucus and I have a common interest in this issue as well, and we are working together on some legislation that we intend to introduce I believe in the next few weeks that will deal with this issue that we are talking about. It is going to focus on reducing delays in the highway projects and the transit projects under the NEPA Act.

The basic approach that we are talking about is going to be one of, as the Senator from Oregon has indicated, ensuring prompt and effective coordination among the Federal agencies on this two-track approach, with reasonable deadlines and completion of reviews, and with authority for the States to assume some of the responsibilities of the Department of Transportation in certain circumstances, which would facilitate a lot of the kinds of successes that I believe other Senators here have been talking about.

I will not make my opening statement lengthy because frankly Senator Bond and Senator Wyden and the chairman in their statements have already well laid-out the case for why I believe and Senator Baucus and I are working together, that we need to have legislative solutions. In fact, some of the ideas that have already been tossed out may need to be added in as we work together to address this.

My goal is to advance a common sense approach that will both strengthen our transportation system and make sure that we support our environmental laws and achieve their objectives. I doubt there is a member in this chamber who has not heard concerns about the transportation projects, and I doubt there is a member in this chamber who does not believe that we can do much better than we are now doing in terms of accomplishing both effective transportation systems and meeting the needs of our environmental protection. The delays that we see add to the cost of the projects, deny the public the benefit of the projects, and frankly I do not think add anything to our ability to improve and strengthen our achievement of environmental objectives.

I am concerned that the situation has reached the point where frustration over unwarranted delays in the development of needed transportation projects are going to undermine public support for environmental review requirements. We must move forward and not allow that unhealthy situation to develop.

I look forward to learning from our witnesses today how they would approach these issues. I am very open-minded about how we need to deal with it, but I am convinced that we need to take action now; that we simply cannot see the kinds of delays that we have faced continue.

Reauthorization of TEA-21 will be our opportunity to act, and I would like to see us specifically legislate as we deal with this streamlining issue. We can eliminate unnecessary delays. We have got to be firm and we have got to be focused, and we have got to demand that the delays end.

Thank you, Mr. Chairman.

Senator JEFFORDS. Thank you.

Senator Baucus?

**OPENING STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR  
FROM THE STATE OF MONTANA**

Senator BAUCUS. Thank you, Mr. Chairman. I was privileged to be one of the authors of TEA-21. I helped write sections 1308 and 1309. These are the sections, as you know, that direct the Secretary of Transportation to find ways to expedite the project approval process and get construction underway faster. I remember working with Senators Warner, Graham, Wyden and the late John Chafee, former chairman of this committee, and the member of the House to come to a compromise on the environmental streamlining provisions included in TEA-21.

At the time, I had heard from many Departments of Transportation, particularly mine in the State of Montana, about how cumbersome a process it is to come to completion on a highway project. Everyone who worked on TEA-21, both the House and the Senate, wanted to include a direction to USDOT to streamline the planning and project development processes for the States. So we did. We were very clear. The environment and the environmental reviews should not get short shrift, but we needed to find a way to make it easier to get a project done, eliminate unnecessary delays, move faster, and with as little paperwork as possible.

I cannot overemphasize that the planning and environmental provisions of TEA-21 need to be implemented in a way that will streamline and expedite, not complicate the process of delivering transportation projects. These projects that we are trying to expedite provide good-paying jobs for every State. Contracts must be let in a timely manner.

That is why Congress directed the USDOT to include certain elements in the regulations on environmental streamlining. We included concept to be incorporated, like concurrent environmental reviews by agencies and reasonable deadlines for the agency to follow when completing the reviews. Certainly, we did not legislate an easy task for USDOT. Trying to coordinate so many separate agencies is, as is often said around, like trying to herd cats. The whole concept of environmental streamlining is to make the permit and approval process work more smoothly and effectively, while still ensuring protection of the environment—one of the more difficult challenges of TEA-21.

So we waited for the rules. We waited to hear from DOT, patiently. And we waited. After 2 years after the passage of TEA-21, we finally got them. I have to tell you, Mr. Chairman, I was very disappointed when those rules came out in May of 2000. They hit very far from the mark, and in fact they made things worse. There were a greater complication than were they an assistance to States. They made the jobs much, much more difficult. They were supposed to answer questions, but those proposed rules raised even more questions because they were vague where they needed to be precise.

These proposed rules would make it much harder, if not impossible, to come to a decision. It would have been even more difficult for States to deliver their programs. Contracts would not get let and jobs would be lost.

So the DOT solicited comments, which I understand were overwhelmingly negative, and went back to the drawing board, and we

never heard from them again. Even when a new President took over, a new Administration, no new rules. We are exactly where we were in 1998. As for sections 1308 and 1309, nothing has been done to implement them. It is just as cumbersome today to bring a highway project to completion.

This committee has held three hearings on this subject of environmental streamlining since the passage of TEA-21 in 1998. This is the fourth. I understand that late yesterday, the President signed an Executive Order calling for a handful of projects to be supervised by the heads of USDOT and CEQ. The highest levels would personally make sure that there were timely environmental reviews. That would have been a good start in 1998, but I must say it is a bit late. We are on the verge of reauthorization of TEA-21. This time, I would like us to take specific legislative action. I would like to see us specifically legislative environmental streamlining—no waiting for regulations or more Executive Orders. Congress needs to be clear about what they need to see and put it into law.

To that end, along with Senators Crapo and others, I plan to introduce a proposal on environmental streamlining. It will be part of a series of bills that we are introducing on highway reauthorization. This bill will address three issues. First, the USDOT needs to be the lead agency on at least two requirements—purpose and need for a project, and scope of alternatives; not just one of the agencies, but the lead agency. This will make sure that any stalemates, at least more sure that any stalemates are resolved more quickly.

Second, we should allow States to take over the role of USDOT if they can meet certain requirements and if they choose to take on that role. This will help eliminate another step of bureaucracy. And last, we must ensure that resource agencies act in a timely manner. When it comes time for an agency like Fish and Wildlife to assess the extent of damage, if any, to a wetlands, or the Army Corps of Engineers to issue a permit, these agencies should not be able to take years to make those decisions. We need to legislate specific time limits, and I mean legislate. I have great deference for those who say let the administrators come up with administrative decision, but frankly my patience has run out. I don't think we can wait any longer. We have to legislate time limits, because otherwise, my fear is the agencies will come up with something that is as complicated as the last effort. They will no get the job done.

In my view, these three matters are not meant to be a comprehensive streamlining, but I believe they will be a big help and a good start, and the bill we will introduce will be a solid beginning to Congress setting some specific guidelines for expediting the planning and the environmental review process.

Once again, I want to reiterate, I want to make sure that environmental laws and policies are obeyed to the letter, but there has got to be a faster, easier way to do the work that needs to be done on our surface transportation system, while continuing to protect the environment.

Thank you, Mr. Chairman.

[The prepared statement of Senator Baucus follows:]

## STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR FROM THE STATE OF MONTANA

Thank you Mr. Chairman. I appreciate your interest in this issue and look forward to working under your leadership as we try to resolve these problems. I was privileged to be one of the authors of TEA-21. I helped write sections 1308 and 1309. These are the sections that direct the Secretary of Transportation to find ways to expedite the project approval process and get construction underway faster.

I remember working with Senators Warner, Graham, Wyden and Chafee and with the House members to come to a compromise on the environmental streamlining provisions included in TEA-21. At the time, I had heard from my Department of Transportation and from others about how cumbersome a process it is to come to completion on a highway project. Everyone who worked on TEA 21 both the House and Senate, wanted to include a direction to the USDOT to streamline the planning and project development processes for the States.

We were very clear—The environment and the environmental reviews should NOT get short shrift! But, we needed to find a way to make it easier to get a project done, eliminate unnecessary delays, move faster and with as little paperwork as possible.

I cannot over-emphasize that the planning and environmental provisions of TEA-21 need to be implemented in a way that will streamline and expedite, not complicate, the process of delivering transportation projects. These projects that we're trying to expedite provide good paying jobs for the folks in Montana and for every State. Contracts must be let in a timely manner. That is why Congress directed the USDOT to include certain elements in their regulations on environmental streamlining.

We included concepts to be incorporated—like concurrent environmental reviews by agencies and reasonable deadlines for the agencies to follow when completing their reviews. Certainly we did not legislate an easy task to the USDOT. Trying to coordinate so many separate agencies is like trying to herd cats.

The whole concept of environmental streamlining—that is, to make the permit and approval process work more smoothly and effectively, while still ensuring protection of the environment—is one of the more-difficult challenges of TEA-21.

So I waited for the rules to come out. And waited. And 2 years after the passage of TEA-21 I finally got them. I have to tell you Mr. Chairman. I'm very disappointed when those rules came out in May of 2000. I believe those regulations hit very far from the mark. Those regulations were supposed to help the State DOTs get their jobs done better and more efficiently not make their jobs harder. They were supposed to answer questions-but what is contained in those documents raises even more questions than before because they were vague where they needed to be precise.

Those proposed rules would make it even harder, if not impossible to come to a decision. It would have been even more difficult for States to deliver their programs. Contracts wouldn't get let and jobs would be lost. So the DOT solicited comments—which I understand were overwhelmingly negative—and went back to the drawing board and we never heard from them again. Even when a new President took over. New administration. No new rules. And today we have nothing. We're exactly where we were in 1998. As for sections 1308 and 1309. Nothing has been done to implement them. Its just as cumbersome today to bring a highway project to completion.

This committee has held three hearings on the subject of environmental streamlining since the passage of TEA-21 in 1998. This is the fourth. I understand that late yesterday the President signed an Executive Order calling for a handful of projects to be supervised by the heads of USDOT and CEQ. The highest levels would personally make sure that there were timely environmental reviews.

That would have been a good start in 1998. But, its too little too late. We are on the verge of reauthorization of TEA-21. This time, I would like to see us specifically legislate environmental streamlining. No waiting for regulations or more executive orders. Congress needs to be clear about what they want to see and put it into law.

To that end, along with Senator Crapo and others, I plan to introduce a proposal on environmental streamlining. It will be part of a series of bills that we are introducing on highway reauthorization.

This bill will address three issues. First, the US DOT needs to be the lead agency on at least two requirements—"Purpose and Need" for a project and "Scope of Alternatives." This will make sure that any stalemates are resolved quickly. Second, we should allow States to take over the role of the USDOT if they can meet certain requirements and if they choose to take on that role. This will eliminate another step of bureaucracy. Last, we must ensure that resource agencies act in a timely manner. When it comes time for an agency like Fish and Wildlife to assess the ex-

tent of damage (if any) to a wetlands or the Army Corps Engineers to issue a permit, these agencies shouldn't be able to take years to make these decisions.

We need to legislate specific time limits for them to follow. No answer at all is not acceptable. It is unacceptable for agencies to sit on their decision for years. We can't make them issue the permit and we don't want to, but we can make them make a decision in a timely manner.

The rest of the world works on deadlines. They can too. These three things will help to expedite the planning and NEPA processes.

These three things are not meant to be comprehensive streamlining, but I believe that they will be a big help and a great start. The bill we will introduce will be a solid beginning to Congress setting some specific guidelines for expediting the planning and environmental review processes.

Once again, I want to reiterate that I want to make sure that environmental laws and policies are obeyed to the letter. But, there's got to be a faster, easier way to do the work that needs to be done on our surface transportation system, while continuing to protect the environment. I believe our bill will be a means to those ends.

Thank you Mr. Chairman.

Senator JEFFORDS. Senator Voinovich?

**OPENING STATEMENT OF HON. GEORGE V. VOINOVICH,  
U.S. SENATOR FROM THE STATE OF OHIO**

Senator Voinovich. Thank you, Mr. Chairman for conducting this hearing on project delivery and environmental stewardship.

I think I have a unique perspective on this issue, as a former Governor and Mayor. In particular as Governor, I first witnessed the frustration of many State agencies because they were required to complete a myriad of federally required tasks on every project they initiated. My experience with the process led me to hold two hearings on project delivery and streamlining when I was chairman of the Subcommittee on Transportation and Infrastructure.

Now, I am concerned that the amount of time it takes to develop and complete large construction projects has gotten even worse, and my colleagues have mentioned that. Ten years ago, one Ohio group produced a chart entitled, "So you want to build a highway." It showed that—they called it the 8-year hitch that was required to develop a road project, and that is before construction even begins. On average, major transportation projects now take 13 years or more to get through the planning process, environmental reviews, designed, right-of-way acquisition. On those major projects, development of environmental impact takes on an average more than 5 years to complete, although we have seen some things around the country where they have been able to streamline it by just coming together in a task force.

Environmental review is a good policy, but there are more efficient ways to get it done. As chairman of the National Governors Association, I was involved in negotiating TEA-21 and lobbying for a streamlined project delivery process. Congress recognized the States' frustration and enacted an environmental streamlining provision, and Senator Baucus you made reference to it, 1308, 1309.

After arriving in the Senate in 1999, I called two subcommittee hearings on implementation on environmental streamlining as contained in TEA-21. We stressed the importance of implementing it. A year after those hearings and nearly 2 years after the passage of TEA-21, the Department of Transportation finally published its proposed regulations for implementation. As you know, every group in the country that had anything to do with it said, rather than complying with the intent of 1308 and 1309, it did just the opposite

and it made the process even more complicated than what it was before. Other groups such as the Association of Metropolitan Planning, American Society of Civil Engineers, the American Road and Transportation Association—all requested that the rules be substantially rewritten.

At that time, I joined Senator Smith to introduce a bill, in the year 2000, that would have required the Administration to revise and re-propose the rules, and Senator Baucus and Senator Crapo, I am very interested in your legislation. Frankly, I think that—and I am not going to read the rest of the statement—but I think that the time has come when we have to act. I am pleased that the Administration has an Executive Order, and they get it, but the fact is, if we really want to get something done on this, we ought to sit down with the Administration, these people here that are here at the table, figure out what it takes in order to get this job done. We have enough models out there. My goodness, we have had benchmark models all over the country about what it takes in order to get the job done. They have done it consistent with good environmental issues, and figure out what it is that we need to do, and get the law passed. I would hope, Mr. Chairman, that we do not wait for the reauthorization of TEA-21. Why don't we get this issue out of the way now, and not go back and revisit it and have it part of the overall TEA-21 legislation? Get it off the table. We are going to have enough other stuff to talk about on TEA-21, that we are going to be debating about. Let's get this one off the table and get on with it, because we have waited too long.

Thank you.

[The prepared statement of Senator Voinovich follows:]

STATEMENT OF HON. GEORGE V. VOINOVICH, U.S. SENATOR FROM THE STATE OF OHIO

Thank you, Mr. Chairman, for conducting this hearing on project delivery and environmental stewardship. I have a unique perspective on this important issue due to my background as a former Governor and mayor. In particular, as Governor, I witnessed first-hand the frustration of many State agencies because they were required to complete a myriad of federally required tasks on every project they initiated.

My experience with this process led me to hold two hearings on project delivery and streamlining when I was chairman of the Subcommittee on Transportation and Infrastructure. Now, as the current ranking member of the Clean Air Subcommittee, which has jurisdiction over NEPA, I am concerned that the amount of time it takes to develop and complete large construction projects has gotten even worse. Ten years ago, one Ohio group produced a chart entitled "So You Want to Build a Highway?" that showed an "eight-year hitch" required to develop a road project—and that's before construction even begins.

On average, major transportation projects now take 13 years or more to get through the planning process, environmental reviews, design, and right-of-way acquisition. On those major projects, development of an Environmental Impact Statement (EIS) takes, on average, more than 5 years to complete. Surely, there is room for improvement.

Environmental review is good public policy, and I know there are more efficient ways to ensure adequate and timely delivery of construction projects and still carefully assess environmental concerns.

As chairman of the National Governors Association, I was involved in negotiating TEA-21 and lobbying for a streamlined project delivery process. Congress recognized the States' frustration and enacted an environmental streamlining provision in TEA-21.

After arriving in the Senate in 1999, I called two subcommittee hearings on implementation of environmental streamlining as contained in Section 1309 of TEA-21. At those hearings, I stressed the importance of implementing Section 1309 in

a way that will streamline and expedite, not complicate the process of delivering transportation projects.

A year after these hearings and nearly 2 years after the passage of TEA-21, the Department of Transportation finally published its proposed regulations for the implementation of Section 1309 in May 2000. Many of us were disappointed with the length of time it took to develop these rules and with their content.

Unfortunately, the proposed rules were inconsistent with congressional intent and would have done little, if anything, to streamline and expedite the States' ability to meet their transportation needs. In fact, the American Association of State and Highway Transportation Officials, representing our customers—the State departments of transportation—and said that the proposal was “completely at odds” with congressional intent.

Other groups, such as the Association of Metropolitan Planning Organizations, American Society of Civil Engineers, and the American Road and Transportation Builders Association all requested that the proposed rules be substantially rewritten. They were really a great disappointment. That is why I joined Senator Smith to introduce a bill in October 2000 that would have required the administration to revise and re-propose the rules.

Mr. Chairman, we are about to enter the last year of TEA-21, and we still do not have rules to implement the environmental streamlining provision of the law. I regret that we may have wasted an opportunity to realize the benefits of an expedited environmental review process that we envisioned 5 years ago.

Meeting our nation's transportation needs is too important for us to wait until the next highway authorization bill before we get serious about streamlining. That is why we should do whatever is humanly possible to implement the environmental streamlining provision of TEA-21. Otherwise, I believe we will end up waiting several more years before we can see any substantial progress in reducing unnecessary delays on transportation projects.

In 1999, the Federal Highway Administration signed a Memorandum of Understanding with six other Federal agencies and established a pilot program on environmental streamlining. I am eager to hear from the Department of Transportation as to whether the MOU or the pilot program has had an impact on reducing project delays. Most importantly, I would like to know why the Department has not issued a new rule on environmental streamlining and whether it intends to do so before TEA-21 expires next year.

However, last night the President did announce an Executive Order on Environmental Stewardship and Transportation Infrastructure Project Reviews. Although it's not a new rule, I appreciate the Administration's recognition of the continued importance of environmental streamlining to improving our nation's transportation system. I look forward to hearing from today's witnesses about this Executive Order and how effective it may be in improving project delivery.

Again, thank you, Mr. Chairman, for holding this hearing. I join you in welcoming each of the witnesses who have come to testify. I look forward to their testimony and to their answers to any questions that may follow.

Senator JEFFORDS. Now, I turn to our witnesses. Our first witness is the Honorable Emil Frankel, Assistant Secretary for Transportation Policy, U.S. Department of Transportation, Washington, DC. Please proceed.

**STATEMENT OF HON. EMIL FRANKEL, ASSISTANT SECRETARY FOR TRANSPORTATION POLICY, U.S. DEPARTMENT OF TRANSPORTATION**

Mr. Frankel. Mr. Chairman, members of the committee, thank you for the opportunity to discuss the issues of transportation project delivery and environmental stewardship, and thank you for your opening statements.

Ensuring that important transportation projects are completed as quickly as possible, while protecting the environment, is one of the top priorities for all of us at the Department of Transportation, as I know it is to members of this committee, as reflected in the opening remarks. Many factors impact the timing of a project's completion, from planning to environmental review to construction. Issues confronted on one project will often vary substantially from those

in another seemingly similar project. Unfortunately, the nature and complexity of the issues mean that blanket solutions have proved very elusive.

That is not to say that progress cannot be made. The Federal Government's role in creating project delays is frequently minor, although occasionally it is not. In light of these circumstances, President Bush yesterday issued an Executive Order to enhance environmental stewardship and improve transportation infrastructure project reviews. Concurrent with the President's Executive Order, the Secretary of Transportation has withdrawn draft rules proposed by the Department of Transportation in May, 2000 that deal with planning and environmental streamlining for transportation projects.

The Executive Order is responsive, we believe, to the purposes of section 1309 of the Transportation Equity Act for the 21st Century. It lends the weight of the White House to bring together Federal agencies to coordinate and accelerate reviews of important transportation projects. The order does not bypass or alter in any way NEPA or any other environmental statute. President Bush has instructed his cabinet to form a review team chaired by Secretary Mineta to coordinate the environmental review of specific high-impact transportation projects. In addition, by working closely with Governors and transportation leaders, we hope to identify effective procedures for routinely expediting consideration of environmentally sound transportation projects nationwide.

The Secretary will develop a list of specific streamlining projects to tackle immediately. We will seek project nominations from Governors, from local authorities, such as airport directors and MPOs and other transportation agencies. Working with State and Federal agencies, we expect to help cut through red tape and promote effective strategies for taking time out of the decisionmaking process. While we will start with a few projects, the intent is that this is a rolling list. That is, projects are dealt with that other projects will be substituted for. So it is not just a few projects. The Department will be contacting affected stakeholders soon to develop criteria for selecting projects into established deadlines for project nominations.

In its simplest terms, environmental stewardship and streamlining consists of cooperatively establishing realistic project development timeframes among the transportation and environmental agencies, and then working together to adhere to those timeframes. Because major transportation projects are affected by dozens of Federal, State and local environmental requirements, administered by a multitude of agencies, improved interagency cooperation is critical to the success of environmental streamlining.

Long before the issuance of this Executive Order, the Department has targeted the intersection of transportation and environment as an area of importance. The Executive Order follows other administrative actions taken by the Department and the resource agencies, I might say, to enhance coordinated project review. In February, as noted, the Department of Transportation submitted a report to Congress that summarized many of the steps the Federal Highway Administration had taken to enhance environmental streamlining. That was in compliance with a request and a report.

From 1999 to 2001, the median time for completing environmental review for the small number of projects requiring EIS decreased by 1 year. This year, the Federal Highway Administration has set internal goals to continue to decrease the review time for all projects requiring rigorous environmental analysis. This would be accomplished through negotiated project timeframes with each State Department of Transportation and Federal Highway Administration division office, in consultation with review agencies.

All 50 States have adopted initiatives for streamlining that clarify, amend or reinvent the project development process. Twenty-four States have focused their process redesign efforts on integrating planning and NEPA activities. Using TEA-21 authority, 34 States have agreed to provide personnel to State and Federal environmental agencies for the purposes of expediting reviews. Twenty-nine States have adopted agreements to merge the NEPA process in the Clean Water Act permitting process administered by the Corps of Engineers. And Federal Highway Administration is working with the Corps to modernize merger agreements already in place and foster new ones.

Aside from the environmental issues, as this hearing emphasizes, other problems can delay the completion of a project. Many of the procedures relating to construction bidding and procurement that influence the initiation and development of projects are a function of State, not Federal, law. Nonetheless, Federal law should be permissive, should promote innovation at the State level, and we are examining, as I know you are, a relevant statutory framework in the context of the reauthorization proposal which we will be making to the Congress early next year.

I am pleased that the Inspector General of the Department is here, and we welcome his comments and have had conversations with him about the issue of oversight, which the chairman has emphasized in his opening remarks. You cannot have a complete conversation about project delivery without talking about DOT's oversight role. And although TEA-21 directed extensive delegation of approval authorities to the States, for most Federal aid projects the Federal Highway Administration's oversight role and FTAs on larger projects was enhanced. TEA-21 requires that projects with an estimated cost of \$1 billion or more submit an annual finance plan. In reauthorization, we will be looking for ways to further enhance the management of projects.

In conclusion, Mr. Chairman, the upcoming reauthorization bill will be the next step in a long process that began with TEA-21 and ISTEA before it. By further fostering the efficient and effective coordination and collaboration of numerous Federal Departments and agencies to enhance environmental reviews, TEA-21 and the just-issued Executive Order should provide an excellent framework from which to take that step. It is not, I emphasize, the Executive Order is certainly not the end of the road. It is just another step in a process of enhancing this review process.

We will continue to examine other administrative actions and legislative proposals, as I know the committee will, to further enhance this process, while being respectful of the environmental stewardship.

Mr. Chairman, I request that my written statement be included in the record of this hearing. Thank you again for the opportunity to testify before you today, and I look forward to responding to any questions.

Senator JEFFORDS. Your statement will be included in the record. Mr. Suarez?

**STATEMENT OF HON. JOHN PETER SUAREZ, ASSISTANT ADMINISTRATOR, OFFICE OF ENFORCEMENT, COMPLIANCE, AND ASSURANCE, U.S. ENVIRONMENTAL PROTECTION AGENCY**

Mr. Suarez. Thank you, Mr. Chairman. Members of the committee, good morning.

As you know, I am the Assistant Administrator for the Office of Enforcement and Compliance Assurance at the EPA. I want to thank you for inviting me to appear before you today to discuss project delivery and environmental stewardship under TEA-21. I am pleased to be here, and I look forward to a productive relationship with this committee, and I thank you. It is my first time up, and I am enjoying my appearance.

Senator JEFFORDS. I look forward to working with you.

Mr. Suarez. Thank you, Mr. Chairman.

As you consider reauthorization of TEA-21 legislation, I understand the committee is particularly interested in EPA's contribution to the environmental streamlining called for in section 1309. As you know, the Office of Enforcement and Compliance Assurance is responsible for EPA's NEPA program, and my remarks today will focus on how EPA has attempted to incorporate the provisions of section 1309 into our NEPA program.

EPA embraces the streamlining provisions of section 1309. We are committed to working with our Federal and State partners to better serve the American people with faster, yet environmentally sound transportation decisions. We are bringing our special expertise to bear earlier in the transportation decisionmaking process to improve the quality of analysis and to ensure that the environment is protected, and also to speed project approvals.

Quality and expedient analysis are being accomplished through strategic staffing. An example of this includes the hiring of a manager with Federal Highway Administration experience for EPA's regional NEPA office in California. In several key States, we are able to provide more timely and sustained assistance on State priority projects thanks to the additional personnel funded by section 1309. We are working closer than ever with Federal highway and State DOTs entering into formal agreements which ensure early involvement and technical assistance for future individual projects. Early involvement reduces delays at the later stages of project review resulting from interagency agreements. FHWA statistics, as Mr. Frankel has just mentioned, show that 1 year has been shaved off the median time to process environmental documents for major projects since the passage of TEA-21.

For example, Interstate Highway 69, a proposed 1,600-mile cross-America highway from Mexico to our border with Canada is a good example of how EPA is using its efforts to expedite a specific national priority project. Three EPA regions are coordinating

with the FHWA and seven State DOTs to identify and resolve environmental issues at the earliest possible stage. The EPA regions are also providing technical assistance to the State DOTs with geographic mapping of sensitive resources to improve and streamline the environmental impact analyses. In fact, Arkansas estimates that in one recent case, use of the geographic information system analysis, or GIS, and early coordination cut in half the time needed to complete the NEPA process.

Within a year of TEA-21's enactment, EPA had expanded the model process developed with the mid-Atlantic States, FHWA, and our other Federal and State partners to streamline the environmental review of transportation projects. The mid-Atlantic transportation and environmental process, also known as the MATE process, resulted in a formal agreement that commits all parties to a timely, cost-effective and environmentally sound transportation project development plan. In addition to the MATE process in the mid-Atlantic, other EPA regional offices have signed a variety of streamlining agreements tailored to the needs of individual States. For example, last year EPA and the California DOT signed an agreement for the review of California's priority transportation projects. In Oregon, EPA and the State have formally agreed to implement a specific process for resource agency involvement in streamlining. Also, after the Washington State legislature passed its Environmental Permit Streamlining Act last year, EPA became an active partner in developing and implementing streamlining processes in that State. Additionally, EPA is serving as a cooperating agency with the Kansas DOT on the U.S. Highway 59 project and on the I-70 second-tier studies in Missouri. EPA and the Minnesota DOT are working under an MOU to streamline the approval process for the 169 Trunk Highway.

Our strong relationship with the States is exemplified by our participation in streamlining discussions at many of the American Association of State Highway and Transportation Officials Planning and Environmental Committee meetings. This first-hand discussion by my staff with AASHTO members is a direct result of Congress' emphasis on streamlining. EPA is also participating in the development of AASHTO's Center for Environmental Excellence. This Center holds great potential for sharing expertise across agency and State boundaries on a quick-turnaround basis.

An encouraging sign that EPA has noticed since the passage of TEA-21 is a growing endorsement of environmental stewardship by the State DOTs. Half of our State DOT partners are formally supporting AASHTO's Environmental Stewardship Demonstration Program. New York State, for example, has found that by mulching land adjacent to highways, the State saves mowing costs by preventing stream damage from runoff. The more we can build environmental considerations into all aspects of transportation planning and delivery, the better we will serve the American public by providing environmentally sound transportation solutions.

EPA, as you know, participates in FHWA's Streamlining Committee. We continue to encourage our regional offices, where most NEPA reviews are done, to work with their States to obtain funding for positions and technical support, which in turn is resulting in expedited attention to State priority transportation projects.

EPA is also working with FHWA in its effort to develop training for Federal agencies and State DOTs on Alternative Dispute Resolution. This training, expected to start next spring, will ensure that disagreements during the project review process can be identified and swiftly resolved.

In conclusion, I would like to endorse the critical role that NEPA plays in coordinating environmental requirements. NEPA has served the American public well for 30 years by providing full disclosure of the impacts of major Federal actions, and requiring examination of alternative ways to achieve a project's purpose. EPA is committed to streamlining as the way to make NEPA even more effective through a more efficient and timely process.

I thank you for the opportunity to testify. I look forward to working with you and continuing to promote streamlining and stewardship, and I will be happy to answer any questions.

Senator JEFFORDS. Thank you.

Mr. Mead?

**STATEMENT OF HON. KENNETH M. MEAD, INSPECTOR  
GENERAL, U.S. DEPARTMENT OF TRANSPORTATION**

Mr. Mead. Thank you, Mr. Chairman.

Much of the discussion thus far has focused on responsible environmental streamlining. I very much appreciate the invite today because I like to focus on the broader subject of project delivery, and a series of specific steps that the Congress can take in the coming reauthorization to strengthen management and oversight, facilitate delivery of projects to taxpayers, approximately on budget, on schedule, and free from fraud and waste.

My testimony is based on audit reports we have done on about 18 major highway and transit projects across the Nation, as well as significant criminal investigations that we have undertaken with the Department of Justice. Whether transportation dollars are lost to cost overruns, schedule slippage or even outright fraud, the result is that fewer resources remain for transportation projects. The dollars are going to be tighter this time around, as you know, but the demand for infrastructure investment is going to be at least as great as it was last time.

Mr. Chairman, the combined Federal, State and local investment during the 6 years of TEA-21 is likely to exceed \$500 billion. That is more than \$225 million at a burn rate per day. A lot of money goes to large projects. These so-called "megaprojects" are projects of national significance. To give you a frame of reference, there are 35 active or planned highway projects that will cost about \$71 billion. The Department has requested funding for 34 new-start transit projects that are valued at about \$21 billion. Increasing the efficiency with which that \$500 billion I mentioned is spent by just 1 percent would free up an additional \$5 billion, which is enough to pay for four of the Nation's active largest highway projects.

The projects have become more complex in the last couple of decades. I don't have any panacea for all of the problems, and there is no cookie cutter approach from what we see in our work. But project managers nowadays are consistently faced with such factors as having to maintain traffic flow and commerce, while building in dense urban areas and meeting the environmental and historic

preservation requirements—considerations that two or three decades ago, when we launched the Interstate, really were not quite that pronounced.

The financing of projects has changed. It has become a much more difficult proposition involving complex financing techniques like structured bonding, innovative financing, and private equity investments.

From what we see, the Federal Highway Administration has taken some steps to strengthen the stewardship and oversight, and adapt to today's environment, but it still has a very heavy emphasis on engineering issues and detailed contract change-order level reviews and approvals. Historically, the Federal Highway Administration has given much less attention to identifying systemic problems with project management or other major project drivers of today, like project financing, controlling project level costs, schedule performance, and maintaining accountability over funds. Because they have not implemented a higher level focus on oversight, it sometimes has missed the larger issues.

For example, on Boston's Central Artery project, the Federal Highway Administration approved literally thousands of design changes to the project and contract amendments—about 16,000, I think—but missed a \$1.4 billion cost overrun. Likewise, when Congress asked the Federal Highway Administration to identify projects costing \$10 million or more, that had increased by 25 percent, the information system that we have at the Department is not sophisticated enough to respond to that question.

In this reauthorization, we think that Congress ought to consider delegating to the States more of the detailed contract-level approval actions and refocusing FHWA's oversight. Specifically, projects that are running around \$1 billion or more are of national significance, and FHWA ought to stay on top of them to ensure they are kept on time and budget. But for the overall highway program, FHWA ought to institute an oversight program that is aimed at ensuring those major project drivers are working well.

That is going to require a change in the staff at Federal Highway Administration that is more in keeping with the complexities of the modern-day transportation project. FHWA's staff is and has been predominantly engineers—very few people with project management skills, transportation project management skills or that understand the financing of today's modern transportation project.

We think they also ought to give some consideration to using the Federal Transit Administration's approach of contracting out oversight. That has worked reasonably well. It is not perfect, but it helped the Federal Transit Administration get off the General Accounting Office's high-risk list. I think it could help while FHWA develops a multidisciplinary staff.

Project finance plans—I think this is great that Congress enacted that in TEA-21. I think it only makes sense that when you are spending millions of taxpayer dollars that we ought to have a finance plan about how we are going to pay for it. Right now, that requirement applies to \$1 billion and up. I would reduce it probably to \$500 million or perhaps even lower. I am not sure that the Federal Government needs to get in the business of approving

ones, though, that are under \$1 billion, but I think there should be one.

Cost estimating—there are no standards for cost estimating projects that are under \$1 billion. I think there ought to be a standard so the 50 States are singing off the same sheet of music.

Information—you need information to manage these projects. We think it is pretty basic that the Federal Highway Administration ought to know how much a project is going to cost and roughly when it is going to be completed. When there are major cost overruns and delays, we ought to be able to tell you. Right now, we cannot. Fraud prevention—This is an important subject because I think that it would be unfair to characterize the TEA-21 program as being riddled with abuse like fraud. Nothing on the scale of the 1950's and 1960's and in the Interstate era. We are not seeing problems like that. But I do need to tell you that given the large increase in funding in TEA-21, our indicators for fraud are on the upswing. This is a major area of emphasis by the Department and by the States. Secretary Mineta and Administrators Peters and Dorn both appeared at the National Fraud Conference earlier this year to emphasize the importance of this. To give you an idea of the numbers, from 1999 to 2001, indictments moved from 12 to 39; convictions from 12 to 26; monetary recoveries, \$15.8 million to \$43.2 million. That is just for my office alone. Right now, we have about 106 pending investigations across the United States in 37 States.

One thing I would recommend that the Congress consider in reauthorization is when we go in and prosecute a case and we get a judgment, and there is a fine involved, the current practice is to send that money back to the U.S. Treasury. I can give you a whole series of examples where what prompted the case was that the State was damaged. For example, in the State of Louisiana, giant culverts—they were buried in the soil in the State of Louisiana, but they did not have the laminant that you need around these culverts in the acidic soils of that State. So you had these culverts buried all over the State, and the government was being defrauded. The State of Louisiana suffered. Now, they are going to have to dig them up and replace them. We got a \$30 million judgment on that.

I think that some of the money in cases like that ought to go back to the States that have been damaged. It could help in the fraud prevention efforts and it can also help restore the State—kind of make the State whole. But to do what we did in the State of Louisiana, it is a torturous process. You have got to go to the highest levels of the Justice Department. You have got to make special procedures. I think we ought to be doing that as a matter of course.

Thank you, Mr. Chairman. I know I ran a bit over, but thank you.

Senator JEFFORDS. Thank you. Excellent testimony.

Ms. Siggerud?

**STATEMENT OF KATE SIGGERUD, ACTING DIRECTOR OF  
PHYSICAL INFRASTRUCTURE ISSUES, GENERAL ACCOUNT-  
ING OFFICE**

Ms. Siggerud. Thank you.

Mr. Chairman and members of the committee, thank you for the opportunity to appear before you today. In this series of hearings on TEA-21 reauthorization, you have heard about the importance of mobility to the Nation's economy. Delivering Federal aid highway projects in a timely manner is a key contribution to improving mobility.

My testimony today will cover three topics: first, the time it takes to deliver a federally financed highway project; second, the types of events that can affect delivery time; and third, Federal and State initiatives designed to improve delivery time for highway projects. My testimony is based today on ongoing work for Chairman Jeffords. We plan to conduct additional research and issue a final report in spring of 2003.

Regarding my first point, in FHWA's best judgment, it typically requires from nine to 19 years to build a major highway project. In developing this estimate, FHWA focused on new roads that had significant environmental impacts. This estimate is based on FHWA's best judgment, rather than an analysis of actual projects, because FHWA and State DOTs do not track how long it takes to build federally financed roads. Projects take this long in part because they are large and complex, involving up to 200 key steps. However, only about 3 percent of highway projects are major projects. Most are narrower in scope, for example, resurfacing an existing road, which would presumably take less time. According to the experts with which we spoke, these kinds of highway projects can range from three to 20 years depending on their complexity.

To make sense of this nine to 19 year timeframe, we broke it down into four phases. Planning, the first phase, typically takes four to 5 years. Activities include developing a multi-year plan that lists approved projects; consulting with the public on the plan; and review and approval of the plan by the Federal Highway Administration. Preliminary design and environmental review, the second phase, takes one to 5 years. Activities include an initial project design and environmental review of project alternatives. About 3 percent of projects require an environmental impact statement, the most extensive type of review. As a result, these are likely to take longer than other reviews. Most projects—91 percent—are categorically excluded from needing an environmental impact statement, while 6 percent require an environmental assessment instead.

The third phase, final design and right-of-way acquisition, takes two to 3 years. Activities include acquiring title to the property needed for the project and locating and making plans to move the utilities. In construction, the final phase, this takes two to 6 years. During this phase, States let a construction contract subject to FHWA approval, of course, and then build the project.

Turning now to events that can affect duration of highway projects, larger and more complex projects take longer in part because they are large and complex. They involve Federal and State requirements, more Federal stakeholders, and attract more public interest. However, we conducted a limited review of six new road projects in California, Florida and Texas. These varied in their complexity. We found that the projects took from seven to over 15 years to complete, excluding the planning phase for which the data were not available at the State level. Several of these projects expe-

rienced events that affected the duration of the project. For example, during the preliminary design phase, one project needed to be altered to accommodate clearances for large trucks. Another project was altered in response to wetlands that had been previously undiscovered. During the final design phase, several projects ran into difficulty obtaining clear title to the right-of-way and other encountered delays while relocating the utilities. Finally, during construction, several States encountered weather delays and problems with the contractor performance.

Turning now to Federal and State initiatives, we identified several initiatives that looked promising in terms of reducing project duration. Most of these efforts have focused on the environmental review phase. Since DOT has already testified today on its environmental streamlining process, I am going to concentrate my remarks on State efforts.

Thirty-four States are using interagency funding agreements to hire staff at Federal and State resource agencies to help expedite project reviews. Forty-one States have delegated enforcement of historic preservation requirements to their DOTs. In Vermont, for example, this is believed to expedite project approval by weeks or months. States also had initiatives for the other phases of a project. For example, several States that we talked with are identifying utility locations earlier in order to save time in the final design and construction. Several others, including Florida, have made successful use of incentives in contracts to improve their contractors' performance.

Mr. Chairman, this concludes my short statement. I would be pleased to answer any questions.

Senator JEFFORDS. Thank you. Thank you all for very excellent statements.

Now, I will go back to Mr. Frankel.

Mr. Frankel. Thank you, Mr. Chairman.

Senator JEFFORDS. I would like to ask you a few questions about the President's Executive Order. How does this Executive Order differ from the environmental streamlining memorandum of understanding signed in 1999?

Mr. Frankel. Mr. Chairman, I think that as I mention in my remarks, I think this has to be viewed in context, in a continuum—obviously, Congress' own action and the enactment of TEA-21 and section 1309; the administrative actions which I have cited and of which you are aware, were in the report; memoranda of understanding that have been drafted with other resource agencies. I think the most important thing is that the Executive Order puts the weight of the President, of the White House, behind this process. With all due respect, the environmental streamlining provisions of TEA-21 were directed primarily, if you will, at the Secretary of Transportation at the Department of Transportation. This needs to be obviously a cooperative effort involving the resource agencies, so the Department of Transportation is not in the position of regulating, of administering the various laws relating to environmental protection and environmental quality.

I think the key thing with this is that the President himself has basically said to all the relevant agencies, under the leadership to be sure of the Secretary of Transportation, but to the resource

agencies that on a project-by-project basis, we must work together, not in any way to shortchange the substantive outcomes. I want to emphasize this. This does not speak to the substantive outcomes, but rather to assure an expedited, timely and appropriate review. In that sense, it reinforces, continues the efforts undertaken, as you mention, with the memorandum of understanding.

Senator JEFFORDS. The Executive Order calls for the Secretary of Transportation to develop a list of high priority transportation infrastructure projects for expedited agency review. What process will be used to select these projects, and will there be safeguards in the selection process to ensure that projects have come from the transportation planning process, and have realistic funding for their completion?

Mr. Frankel. Let me say about the process, Mr. Chairman, that this really is proceeding on the track, as I indicated, that we want advice from Congress, from stakeholders, from the States as to what our process should be in terms of defining the standards for the nominations, if I can use that word. It will proceed under the same time. We are going to go, and as a matter of fact, the Secretary has already written to Governors and to other stakeholders, but particularly to the Governors asking them to nominate projects for this. Quite candidly, we have some ideas within the Department, but that is not even a beginning point. This really must come from States and local officials and from various transportation agencies.

At the same time, on a parallel track, if you will, we want advice about what process we should use within the Department so that the Secretary can reduce that number, whatever it may be, of possible nominees to key projects—ten, fifteen. As I emphasized in my remarks, this is going to be a rolling list. This is not a list that we will do our ten or fifteen, and then the Executive Order goes away—quite the contrary. But we want help and advice about what the process, what the standards ought to be, as we are soliciting and in fact sifting through the possible nominees. We want to make sure that these are projects that are genuinely affected, where the issue genuinely is one of, for whatever reason, not timely consideration by the resource agencies of the applications and of the environmental process.

Senator JEFFORDS. Following up on that question, what does the Administration envision as an expedited review for these projects?

Mr. Frankel. Again, Mr. Chairman, I do not think there is a blanket answer, as I said in my remarks. Here, frankly, I draw on my own experience, not over the last year, as an official of the U.S. Department of Transportation, but as you know, I served as a Commissioner of a State Department of Transportation. There are no silver bullets for this. This is a tedious, time-consuming, project-by-project basis. I share with many members of the committee that there need to be deadlines. There need, where we can, to be concurrent reviews. But I think that really needs to be negotiated, worked out, if you will, on a project-by-project basis because some projects are a lot more complicated. Projects raise different issues. They involve different resource agencies. There are many other factors involved.

I think the question of expediting really, as I said, depends on the specific characteristics of the project, and negotiating, working out the deadlines, and then ensuring that the resource agencies meet those deadlines that they have agreed to. I have had experience, as I know others have, in terms of working projects in that way. I think that expedited is in a sense of making sure the resources are available for the environmental review to go forward; that commitments are made and that those commitments are honored; and that we get decisions—we get decisions, not dictating whether they are up and down decisions, but that there is a final decisionmaking process in the case of each of these major projects.

Senator JEFFORDS.port of the Transportation Infrastructure Streamlining Task Force will be issued at least once a year. When would the first issuance of this report be made, and will the report be issued to Congress as well as the President?

Mr. Frankel. Actually, let me say, Mr. Chairman, I am glad you mentioned that. I didn't have a chance, really, to speak to that. That part of the Executive Order I think is one of the most important parts. As you have said, it talks about a report, but what is in that report would describe the results of these coordinated, expedited reviews, and identify procedures. Someone here earlier made reference to the fact of best cases and learning from examples. You have cited something in Vermont. I think States should learn from each other. We will learn from this process. We will share those experiences with others. These will be contained in the report. We will address procedures that can be undertaken and implemented, which will continue to improve the process.

I must tell you candidly, I am going to have to get back to the committee on the question of exactly when the first report would be made. I am sure that it is something that would be shared and available. This is intended to be a transparent process. I think the transparency of it and the accountability of it is one of the things that is most important. That is really something else that is implicit, if not explicit, in this Executive Order—instructions to DOT and the resource agencies, that we be transparent and not use delays in order to frustrate the achievement of important and good transportation infrastructure projects.

Senator JEFFORDS. The Inspector General recommends changes to thresholds required for projects to have a finance plan from the current \$1 billion to \$500 million. What were your thoughts on this recommendation? What additional workloads will this create?

Mr. Frankel. Let me say, we obviously have spoken to the Inspector General as we and you well know from conversations we have had that we have been involved in the preparation of the Administration's reauthorization bill now for several months. We expect to address this. We are aware of the Inspector General's recommendations. We are considering recommendations. I think you can appreciate the fact that I cannot indicate to you the specifics of those recommendations in regard to oversight, and the specific suggestion made by the Inspector General at this point because we have not completed our own internal processes of what is going to be in our recommendations to the Congress. But this is something that we are taking very seriously and we are looking at the range

of options, including that one which the Inspector General has mentioned.

Senator JEFFORDS. In your testimony, you explain that environmental streamlining and stewardship is a term for a new way of doing business that brings together the timely deliver of transportation projects with the protection and enhancement of the environment. In essence, it is the rejection of the false choice so often presented between adding transportation capacity and protecting the environment. Can you give the committee an example of these false choices?

Mr. Frankel. Well, I am not sure whether you are seeking a specific project. If so, I think that is something—a specific project or projects—that I would like to supply subsequently to the committee. But I think in general, the use of delay, and again someone mentioned this in the opening remarks maybe several times, the use of delay as a device to defeat a project I think is not appropriate. I think that is an example, if you will, maybe false choice is not exactly the right term, but bad public policy.

We need, and indeed the environmental laws, NEPA and the various permitting and regulatory laws, are written in a way so that we balance investments with environmental protection and quality of life. I think we just have to ensure that substantive decisions are made. That, in and of itself, is the way these laws and public policies are supposed to work.

Senator JEFFORDS. Senator Voinovich?

Senator Voinovich. Thank you, Mr. Chairman.

I have a couple of areas I am interested in. Mr. Mead and Ms. Siggerud, you had an opportunity to review these agencies. I have been spending a lot of time in another committee on the human capital crisis that we have—the crisis in competence; the issue of having the people with the right skills and the right knowledge at the right places and at the right time.

What is your observation about the capacity of the Department of Transportation in terms of fulfilling their role, in terms of personnel and the people they need to get the job done?

Mr. Mead. I think there needs to be a major change. Specifically in our testimony, I mentioned that today's project requires many things in addition to just the engineering discipline, just like the profession of auditing needs more than just people with the discipline of accountancy today. The Federal Highway Administration, for example, I think they need to develop some skills in the financial management area. When you are talking about multi-billion dollar projects; when you are going to be inviting the public to invest in projects and spend their money in a project, it is important that the prospectus make the appropriate disclosures, particularly if the Federal Government is supposed to sign-off on a finance plan, as they are required by law to do.

At the Department of Transportation, they would have to make a concerted effort to develop a more multi-disciplined workforce in the Federal Highway Administration. I think they are examining that. That cannot be done overnight. That is why I would suggest that as an interim measure, at least, and on a selected basis you contract out some of those reviews so you can secure that talent in that fashion.

Ms. Siggerud. Senator Voinovich, we report to the new Congress every 2 years in what we call our performance and accountability series on each cabinet-level department. We will be including in that report this year a very similar message to what Ken just outlined. There is a human capital crisis in the Department of Transportation and within the highway community in general. We will point out that the engineering profession, while it has been very important in developing the highways in this country, has not necessarily set up the use of technology, the kind of public outreach and environmental analysis that is needed, as well as the financial management issues that Ken mentioned.

We will be pointing out that this is an issue both for the Federal Highway Administration and also at State and local transportation agencies as well, and there is a need to look at that issue.

Senator Voinovich. I had asked the Department of Transportation, and I am going to write to your people over there, I want to see in the next couple of months your plan to re-shape the workforce of the Department of Transportation. I know that the Administration has asked agencies to do it. Mr. Chairman, I think we should insist upon finding out from them where their problems are, what they are going to do to re-shape, what they are going to do to bring on the people that can get the job done.

This issue was ignored by Congress and it has been ignored by Administrations. Until we deal with this personnel problem, a lot of the problems that we are talking about here are not going to get taken care of.

The second area that I am concerned about is that we are talking about changing rules, changing regulations. We are going to be hearing later on from some people out in Oregon and others, where things have really worked out quite well. I am really interested in getting back—we are going to be working on this legislation—but getting back on just what changes really need to be made. You have got projects where you have been able to get the job done. My experience as a manager is if you get the right people with the right interpersonal skills at the table, you can get the job done.

Now, the issue is, what rules are standing in the way? If you have got these people that have got this right attitude toward things and have moved projects along, to ask them, what are the regs that if they were changed would have helped expedite the process even more? OK. I want to know, what are those. No. 2, are there laws that are in place that have stood in the way, or stand in the way of our moving forward? Gee, if we could have got this, we could have gotten that. Boy, things would have been even smoother.

Last but not least, the issue of role models. What are the role models? I would like an around the country—particularly projects that deal with some really sensitive environmental concerns. I am sure that some of the people here today are interested about the environment. Are we going to sacrifice the environment on the altar of expediting highway projects? I would like to know where we have had some very sensitive projects and where they have moved along in a smooth fashion, so that we have the best information we can have when we are putting together legislation to deal in this particular area.

Is there anything, Mr. Frankel, on your mind of a model that you could share with us?

Mr. Frankel. Well, Senator, your comments are very thoughtful and we will obviously try to be as responsive as we can to the variety of personnel workforce issues, as well as the rules and best cases. I think that is something we are trying to do, as I have indicated. I think the Executive Order advances, moves the ball forward, does not get us by any means to the end of the road. Because again, if you will forgive me for drawing on my experience when I worked at the State level, and something you certainly know far more about than I, but nonetheless it is people and it is tedious, tough work of getting people of good will.

EPA, for example, has regulatory responsibilities. They have a law or laws to enforce, if you will. We need to identify what the issues are, but ultimately it is people of good will around a table on a continuing basis, tables over a long period of time, working out the details, trying to assure that these appropriate interests—advancing the economy, infrastructure investment, and environmental protection are all balanced in an appropriate way. They can be. That is my own experience. A couple of times there are some projects where it is just very difficult to achieve, but generally people, if they are there, and this Executive Order I think is basically saying not just to the technical staff, but saying to the Administrator of EPA, to the Secretary of Agriculture, the Secretary of the Interior, and the Secretary of Transportation—you have got to weigh-in on these projects. You have to apply the best cases. What have we learned here and what can we apply there?

I might say that, and I think you would be the first to acknowledge, I am quite familiar obviously from my own background of some of the things done in Vermont, for example; less aware, perhaps, about Ohio and Oregon. But I also know that the circumstances are different. There are different environmental laws which are applicable in Oregon from Connecticut, and there may be, while there are things we can learn in Oregon and apply elsewhere, there are also things which are unique project-by-project. This is tedious, tough work, and you know that from your experience as a Governor, as the leader of a State. There really is no cookie cutter. There is no, as I said, silver bullet here to come up with an answer which is going to be the answer for all projects.

We can, and I think you are quite right—are there particular legislative statutory issues or regulatory issues which stand in the way of those sorts of negotiations and dispute resolution and so forth, and we should dismantle those. I know this committee and the Congress will address those in reauthorization. We hope to be helpful in that process. We will have some statutory recommendations to make, consistent with your question. But again, I want to emphasize that we have to learn and apply ourselves on a case-by-case basis.

Senator Voinovich. I would just like to make one last comment, and that is this. Mr. Chairman, I would like to see us expedite this issue and get it over with before we get into the whole rest of the reauthorization of TEA-21. This has been around here for too long and it is too important to just say, well, we are going to wait around, because we will add another 3 years.

The last thing, my advice to you would be, if the President is going to do an Executive Order and pick out the projects, what I would do is I would get the people involved in those projects from the States to sit down with the people from Vermont and Oregon and have a seminar for them for a couple of days; have them come in and talk to these people about what they did locally to get the job done. Because I don't care what you do with the heads of all these Federal agencies, it happens on the—you know, where the rubber meets the road, with the people that are involved. If they can get together and hear from other people and say, hey, this is the way we got the job done, I think you are going to get much farther ahead than if you try to do this from the top down.

Thank you.

Mr. Frankel. Senator, I think that is a very good suggestion. A lot of that has been going on, but we need to do more of that, and thank you for the suggestion.

Mr. Mead. I think you are onto something, too, about the best practices in these projects. This transcends just the environmental issue—I-15 in Utah, brought in on time; I-40, which was the bridge collapse that was recently done—that was done on time; Alameda Corridor in California; and I think even the Central Artery in Boston today stands as some testament to the wisdom of Congress in establishing the finance plan. Some people may find that is a strange comment for the Inspector General from the DOT to make, but I think it is true.

Senator JEFFORDS. Thank you.

Senator Corzine?

Senator CORZINE. Thank you, Mr. Chairman. I appreciate you holding these hearings. They are very informative and one that impacts all of us in our local communities.

I have a statement that I would like to submit for the record, if that is OK.

Senator JEFFORDS.

[The prepared statement of Senator Corzine follows:]

Senator CORZINE. I am curious why when only 3 percent of all the federally funded projects are being held up, according to this GAO study and testimony, by environmental issues, why we are not doing some of the things that Senator Voinovich is talking about. It seems to me that a lot of these major projects, there are issues that are far more impacting on the length of time it takes. Isn't that making the case of working on best practices in the planning area, and best practices in the design area, and dealing with, I think you used the word "concurrent" efforts with regard to all of these various phases of development with regard to projects. Why are we singling out environmental stewardship—if you would speak to that; any of you, but certainly Mr. Frankel, since the Department of Transportation is working on it. Can you give me some understanding of why that is the focus of expediting this process, streamlining this process, relative to, at least from this testimony, a four to 5 year planning process for a major project.

Mr. Frankel. Senator, first of all as I indicated in my remarks, there are other issues. By no means is the environmental review and permitting process the only factor that impacts the timing of a project. I suppose our comments in the Executive Order were ad-

dressed to environmental streamlining and stewardship because that was the subject of section 1309, and it was an important action, in my mind, for the President and the Administration to take as not fulfilling, but moving forward, being responsive to the mandate of that section of TEA-21.

As I indicated in my remarks, we hoped—we want to make sure, I think it is very important that Federal law not in any way inhibit States from innovating. The issue of bidding, procurement, which also is a very—the contracting process itself, which is a very important factor in project initiation, is primarily, as you well know, an issue of State law, but we need to make sure that Federal law does not inhibit States from taking innovations. Again, the application of best cases—that is going on within the Department. I think we need to advance that.

I might say, incidentally, the 3 percent figure—actually the 3 percent figure is of transportation projects which are subject to EIS's. It is not even 3 percent are subject to delays, because a lot of those projects move forward. There is a certain time requirement, but nonetheless are not unnecessarily or inappropriately delayed, but it is a factor. We single it out here. The Executive Order does really because we thought it was, and it is important that we be responsive to the mandate that the Congress established, and the leadership of many members of this committee, and contained in section 1309 of TEA-21.

Senator CORZINE. Well, I would just make the comment that I identify with the kinds of managerial issues, if you will, that I think Senator Voinovich is talking about, being accountability issues, being at least as significant in the delaying process by most analysis that I have seen, as opposed to singling out environmental issues, which seem to be the whipping boy of why this is a slower process than people expect in the political realm. I question whether that is where we ought to be directing our efforts, or whether we ought to be directing our efforts toward the managerial and accountability issues that bring delivery. It certainly has a lot of impact with regard to how State and Federal authorities work with each other. So much of this is done at the State level, so looking at best practices that are being accomplished in the State, I encourage and I think the chairman is working in that area.

Thank you.

Senator JEFFORDS. Senator Warner?

Senator Warner. Thank you, Mr. Chairman, and colleagues. I am pleased to join in this very important hearing. I am just going to make a few personal observations, Mr. Chairman.

Senator JEFFORDS. Go right ahead.

Senator Warner. I would start off by saying with all due respect to my long-time friend and chairman, I am going to part with you and associate myself with Mr. Baucus and others this morning who spoke with regard to the need for legislation. Roughly 16-plus years I have been on this committee. It has been a great pleasure and an honor to serve on it. I went through the 1991 ISTEA, in which we made a reference to this subject—I noted, just a reference. And then in 1996, 1997, I was privileged to be chairman of the subcommittee, and in that bill, we put in provisions in that bill. But here we are today still looking at the same subject, and with all

due respect to a very distinguished President, I feel it is time that the matter has to be codified, and we will be working with those colleagues to do so.

I just wish to inform the chair of that.

Senator JEFFORDS. I appreciate that.

Senator Warner. And to show you the intensity of my feeling on this subject, I am up for reelection. Now, that is not any great moment to anybody sitting in this room, but on the referendum in two major geographic areas of my State, in Northern Virginia and Tidewater, is a very simple authorization to raise taxes on the citizens—got that?—raise taxes for transportation needs. Most skilled politicians, which I am not, would learn how to duck and run from that.

[Laughter.]

Senator Warner. But I feel I have an obligation to tell my constituents, since I am going to vote on one of those ballots for that referendum item, I am going to vote for it. Now, not too many, particularly who pride themselves as conservative Republicans, vote to raise taxes, and particularly in the year in which you are seeking reelection to the Senate. But that is the intensity with which I feel on this issue of transportation, my constituents are just plain weary of waiting year after year after year after year to see that these programs materialize, combining most often State and Federal funds. So the time has arrived to codify this and I will work to do so. Whether I will be here next year remains to be seen, but I will cast that vote.

I thank the chair.

Senator JEFFORDS. I think there is no one that can do so with less fear of retribution than you, Senator.

[Laughter.]

Senator Warner. Well spoken.

[Laughter.]

Senator JEFFORDS. I want to thank the panel. We will now move on to our next panel.

I want to welcome our second panel. This is an important hearing and I really look forward to this panel and your participation. I will introduce each of the witnesses and ask for their statement. The first witness is the Honorable Carol Murray, Commissioner in the New Hampshire Department of Transportation, from Concord, New Hampshire.

Ms. Murray, please proceed.

**STATEMENT OF HON. CAROL MURRAY, COMMISSIONER, NEW HAMPSHIRE DEPARTMENT OF TRANSPORTATION.**

Ms. Murray. Good morning, and thank you very much, Mr. Chairman. As wonderful as Washington is, I think you and I would rather be back in our respective States.

Mr. Chairman, members of the committee, I do appreciate very much the opportunity to be here today, having said I would rather be in New Hampshire. I thank you very much to be here to talk about environmental streamlining.

The subject of environmental streamlining is a very important and unfortunately very complex and difficult topic, one that has no silver bullet solution that I can identify and isolate. I can readily

identify the reason that I and my counterparts nationally consider this so significant. The public has asked the transportation agencies to provide this Nation with the mobility critical for our quality of life and our economic vitality. The same public also wants the environment preserved and protected. The only way to accomplish these twin goals is for transportation and environmental agencies to work cooperatively.

The public looks to these agencies to implement the policy direction provided by elected officials with an open, trusting, balanced and communicative spirit. But I am not convinced that the public's vision or that of their elected officials is being implemented very well by the agencies involved. The concept of environmental streamlining was not conceived to put environmental preservation and enhancement as secondary or a minor interest in the development of transportation projects, but rather to encourage early discussion, involvement and decisionmaking by the agencies with environmental and transportation duties. If the public agencies could work to provide the best balanced project in a timely way, then the public's voice will have been heard.

Over the last two reauthorization bills, Congress set a new direction for transportation. Transportation agencies moved into a new era. With some resistance, we realized that mobility for the future was not just highways. Choices in modes of transportation and connection between modes are now a focus. Congress also said that to develop the best projects for this country, the participation of local communities, regional planning agencies and the public must be encouraged and their voice heeded. The evolution in how State DOTs work came hard to those of us used to doing the designs by the book, and approaching the public with our well-designed, but off-the-shelf, standard highway solutions.

What we in the transportation business have found is Congress was right in the direction they gave us. After a decade of increasingly successful implementation, we are believers. We are cutting ribbons and celebrating projects that have been developed with more thoughtful consideration of transportation user needs, local communities' visions for their future, and in balance with the natural and cultural environment. I do believe that over the last two decades, the transportation community has changed and become better. While I would like to say that we have got it perfect, that would certainly not be true. We need to continue to listen, to learn, and I think we are going to do that with an acceptance that was not there before ISTEA and what we have learned since.

What is frustrating is the reluctance of the environmental community to recognize this change. It is disheartening that this environmental community has not championed and joined in early involvement and commitment to transportation project planning. We have found reluctance in engaging and working toward a mobility solution that balances the various public needs in a fiscally responsible way.

You have all heard about the Interstate 93 widening project in New Hampshire, and Senator Smith's work to bring streamlining to reality. As we agree, policy level representation from the public regulatory agencies met as decision points were approached. Early agreement was reached to operate in an open, trustful and profes-

sional manner. This group has met numerous times over the past 2 years, and the culmination of this work is the draft environmental impact statement which is being published as we speak.

Then, on September 9, I received a letter from the EPA that discounts the work accomplished in the streamlining process. Primary reasons given were that only regulatory agencies were involved, not private environmental groups, and the 18 communities that may experience secondary growth, even though they are directly not on the Interstate. This letter came despite over four dozen public meetings that have been held as this project develops, with all these meetings publicly noticed well in advance and individual notices sent to those specific environmental groups.

The project impacts an estimated 70 acres of wetland over 19 miles of widening of an existing Interstate highway. Our proposed mitigation includes 650 acres of land purchased and wetland creation, at an estimated cost of \$15 million, plus a \$3 million technical assistance program for local communities to assist in developing local land-use regulations that reflect their future vision for their community. The proposed mitigation package was severely criticized in the letter from EPA because, and this is a quote, "While of importance to the towns, it does not have high ecological value." The EPA letter further states, and again I quote, "Current State and Federal wetland regulations and typical zoning rules have generally not been effective."

While the debate about local, State and Federal roles in land-use transportation and secondary impacts is a really engaging debate, I believe that is a public policy decision that Congress, State legislatures, municipalities and the public should decide, not governmental employees, particularly those far removed from the project area. The EPA submits that a mitigation package of approximately 2,300 acres at a cost of upwards of \$50 million is needed. The reason cited is secondary impacts that may occur due to the project, not the direct impacts, which they even agree are a relatively minor consequence.

Additionally, to their way of thinking, the highway widening should include concurrent construction of transit options beyond what we have already planned—enhanced bus service and potential rail being provided for in the project.

All of these proposed environmental mitigation elements are, I think, good things. But the fundamental question is whether or not it is the responsibility of this transportation project to pay for all of them. In fact, because New Hampshire has done a very good job in providing a high quality of life in all arenas, including environmental protection, mobility and economic vitality, people will come to New Hampshire with or without that Interstate being widened.

Why do we need environmental streamlining? Because all agency implementers of elected officials' laws need to work together effectively and in a fiscally responsible way to respond to the public's needs in a balanced manner.

The transportation agencies after ISTEA and TEA-21 learned we have not got the answers. The designers and builders of our Interstate system achieved a wonder, but in hindsight, it might and probably should have been done differently. So Congress passed ISTEA and TEA-21, and now in 2002, it seems that the transpor-

tation projects, in the environmental view, are seen as a financial resource to implement conservation projects. Early involvement in all transportation project planning is needed, but additionally mutual respect for professional responsibilities, fiscal reality, and overall an understanding that we need to make honest decisions that respects the public's will as envisioned by our elected leaders.

The EPA letter that I mentioned states that mitigation costs should be up to 20 percent of the total project cost. In a time when we are all struggling to fund the public's transportation mobility needs, a decision by a government employee to direct funding to non-transportation purpose seems to me inappropriate.

What do we need to meet the public's goal of providing mobility for quality of life and economic vitality, while protecting and preserving the environment? This is best achieved if the principles envisioned by Congress for environmental streamlining are implemented. Above all, we need a process that includes early involvement that is consistent, truth-based, cooperative, a process that is streamlined, effective, balanced, and then we will get to good transportation project delivery which unfortunately is not what we are seeing today.

Hopefully, the next reauthorization or sooner will produce a streamlined process that follows the direction of Congress and meets the public expectations.

Thank you very much, Mr. Chairman and members of the committee for your time. I would be happy to answer any questions.

Senator JEFFORDS. Thank you, Ms. Murray.  
Mr. Morefield?

**STATEMENT OF KENNETH MOREFIELD, ASSISTANT SECRETARY FOR PLANNING AND ENGINEERING, FLORIDA DEPARTMENT OF TRANSPORTATION**

Mr. Morefield. Mr. Chairman, members of the committee, it is my pleasure to appear before the committee today to present view of the Florida Department of Transportation concerning project delivery and environmental stewardship.

Section 1309 of TEA-21 has provided the impetus for State and Federal agencies to look for ways to improve the delivery of transportation projects, while protecting our environment. The Federal Highway Administration, along with the Federal Transit Administration, have worked with us and many other Federal, State and local agencies to develop a new process we call the Efficient Transportation Decision Making process, or ETDM for short. I am pleased to report that we are virtually finished developing the new process. We expect to begin full statewide implementation by July of next year.

The development of this new process began in February of 2000, when over 20 Federal, State and local agencies met and pledged their support of an effort to examine how transportation decisions are made in Florida, and to develop an improved process. The multi-agency working group was then formed and met several times during the year. Nine task work groups worked on issues related to implementation of the process.

In December 2001, Federal, State and local agencies gathered at an executive summit and signed a memorandum of understanding

endorsing the ETDM process and pledging their continued support for full development and implementation of the process. We believe our ETDM process is fully responsive to the direction of section 1309 and the National Environmental Policy Act. We have been pleased to brief your committee, staff and others on our process, but we do not promote it as one that would fit every State. In fact, Florida's environmental laws, our own mix of State and local agencies, and other differences led us to an early conclusion that the best way to address improved project delivery and efficient decisionmaking was with our own efforts, and not through a one-size-fits-all approach. Section 1309 of TEA-21 calls for change. Florida's ETDM process accomplishes all the objectives in section 1309.

The State of Florida is fortunate to have a very rich data base of information about our resources. We have collected that information at the University of Florida GeoPlan Center in Gainesville. This high technology digital data base tool allows direct access to project planning information over the Internet. It provides the foundation for our ETDM process and is called the Environmental Screening Tool. This tool enables us to perform two screenings which document agency and community input much earlier in our transportation planning process. We call these screening events the Planning Screen and the Programming Screen. Modification of project plans in response to these early screening events will enable us to avoid or reduce costly changes late in the process. These screening events will provide information that will allow agencies to be engaged in the thoughtful exchange necessary to properly balance land use, environmental protection and mobility needs.

The primary purpose for the Planning Screen is to provide decisionmakers with better information to stage transportation improvements in the Cost Feasible Long Range Transportation Plan. The Programming Screen provides an opportunity to identify project issues and the need for technical studies prior to the project advancing into our work program. The NEPA process begins at the Programming Screen with a class of action determination that leads to environmental documentation and construction permits. A fundamental premise of our process is that it builds upon earlier analyses, rather than reopening all issues at every step of the process.

The screening events will be performed by Federal, State and local agencies working together as an Environmental Technical Advisory Team. We will have one team in each of our seven geographic districts. Each team will be responsible for agency reviews and feedback as projects are developed. Community outreach coordinators within FDOT will seek input from affected communities and post the input received so that agencies are aware of community concerns.

Project planning information is entered into the environmental screening tool by metropolitan planning organizations or by the Department for rural areas. Standardized analysis will then be performed on these planned projects, and the results are then made available to agencies through the Internet. All agencies will perform their reviews on a coordinated time schedule, and enter the agency's official comments about the impact on the resources protected by their agency. The agency will be able to suggest changes

to project concepts through the feedback portion of the data base system.

At the same time, opinions of the affected community are also posted in the feedback portion of the system. The results are visible to the agencies, nongovernmental organizations, and the public. Everyone will have access to the same information.

In summary, Florida is about to implement a new way of doing business. We believe the Efficient Transportation Decision Making process meets the objectives of this committee as set forth in TEA-21. We are convinced that this new process will provide for earlier and concurrent agency reviews, resulting in a reduction in the time required to plan projects and achieve earlier permit approval.

Thank you for the opportunity to share Florida's approach on environmental stewardship, and I would be pleased to answer any questions.

Senator JEFFORDS. Thank you for your statement.

Ms. Wadhams, I welcome you here, and commend you for all the wonderful work you have done in Vermont. It is a pleasure to have you here.

**STATEMENT OF EMILY WADHAMS, STATE HISTORIC PRESERVATION OFFICER, VERMONT DEPARTMENT OF HOUSING AND COMMUNITY AFFAIRS**

Ms. Wadhams. Thank you, Senator Jeffords. Good morning, Mr. Chairman, members of the committee.

Thank you for the opportunity to provide testimony today on how Vermont has expedited our historic preservation reviews of transportation projects. For the record, my name is Emily Wadhams and I am the State Historic Preservation Officer in Vermont.

It is an honor to be here, and I especially want to thank you, Senator Jeffords, for the invitation. We in Vermont have long looked to you as a leader in historic preservation. History is important to Vermonters, as you know, and you have worked hard to help Vermont citizens preserve our State as a special place. You have recognized the importance of landmarks like covered bridges and barns, with national legislation that helps preserve these icons for all Americans, and you have championed our small towns and village centers with your leadership on Postal Service policy that helps keep post offices active as vital community centers, so we thank you.

Senator JEFFORDS. Thank you.

Ms. Wadhams. In Vermont, my office has worked very hard with State and Federal transportation officials to develop a programmatic agreement. We accomplished this in the year 2000. This agreement created a simplified review process under section 106 of the National Historic Preservation Act. As you know, section 106 requires Federal agencies to assess the impact of their funding on historic and archaeological resources. Before we had this agreement, the agency of transportation would submit projects to my staff for review. Resolving impact issues often meant the time consuming exchange of memos, telephone calls, and meetings. Like other States, we found that transportation safety and efficiency goals often collided with historic preservation goals, pitting our Department against our Agency of Transportation in battles over the

preservation of cultural resources. Mistrust among the parties to the process was common, often resulting in a blame game of who was at fault for delaying projects.

I believe that we did not have much to lose by changing the way we did business around environmental reviews. Now, under the terms of our new programmatic agreement, the State Historic Preservation Officer has delegated the review and sign-off authority to qualified historic preservation professionals within the Vermont Agency of Transportation for all State and Federal projects. After almost 2 years of experience with the agreement, I can report that the success of this approach has far exceeded our expectations. The first annual evaluation by the signatories of the agreement last December proclaimed it a resounding success. Thirty other States recently requested copies of our agreement so that they can consider it for their jurisdictions.

Vermont is the only State so far to have developed such a comprehensive, and some might say radical solution. One could argue that the State Historic Preservation Office has given away control over projects, but I would contend that we have gained time to do other important preservation work. We have gained a constituency within our agency of transportation that we never had before. I also think that historic resources are being better protected.

In the 1990's, several things happened that set the stage for allowing us to take this step. First, my office and AOT worked together to address historic metal truss bridges, one of the most adversarial issues that we have had to deal with. We both committed time and money to develop a survey, to produce a consensus bridge plan that prescribes treatments for over 100 bridges in our State. In Arlington, Vermont, for example, an obsolete metal truss bridge next to a fishing access on the famed Batten Kill trout stream is now a fishing platform accessible for people with disabilities. This is one of many useful and historic bridges that would have been demolished without this bridge program.

Another collaborative effort occurred about the same time, a project sanctioned by the passage of ISTEA in 1991, the development of the new Vermont Design Standards. The standards allow for more creativity and flexibility in designing transportation projects and increased community input early in the planning process. One of the first beneficiaries of the Standards was the town of Underhill, where citizens fought for and won a so-called "footprint" replacement bridge—a bridge that matched the dimensions of the old bridge, as well as the small scale of the community. So with ISTEA and TEA-21 encouraging departments of transportation to look beyond the pavement; and with the new relationship we had developed in creating the bridge program and the design standards, there was an increased level of trust between my office and the Agency of Transportation. This trust allowed us to take the leap of faith needed to write the comprehensive programmatic agreement.

A critical step was working together with them on the manual of procedures that we were going to follow. We negotiated the list of activities that are exempt from any kind of review. We found a way for the SHPO to be kept informed and to intercede if nec-

essary, and we defined an annual reporting and amendment process.

The key to our success was really our Agency of Transportation's willingness to take its responsibility toward historic preservation seriously. Now, resource stewardship is more naturally integrated into the Agency's thinking in the very earliest stages of planning projects, not as an afterthought or a burden. In the past when preservation issues came up, as you have heard before, it was often late in the process, making it very difficult and expensive to make changes.

The programmatic agreement has reduced delays in the review process dramatically. It has increased and improved the quality of public involvement and public education. It has increased inter-agency cooperation on non-regulatory projects in ways that benefit Vermonters. For example, our AOT now sponsors our annual state-wide historic preservation conference, and our Vermont archaeology month. And AOT has now begun on their own initiative to develop projects like a railroad depot initiative to rehab the State-owned railroad stations. This probably would not have happened without this new consideration of historic resource protection in their day-to-day activities.

There has been much discussion recently about problems with section 4(f) of the Department of Transportation Act, and I felt I needed to put in a word in about this. Section 4(f) prohibits the use of historic sites on public lands unless there is no prudent and feasible alternative. It is viewed by some as being rigid and cumbersome, and sometimes results in solutions that do not make sense, especially with smaller projects. In Vermont, 4(f) has not been an issue because AOT's historic preservation staff flags adverse affects early on in the planning process and addresses them at this stage. Almost everyone who works with 4(f) agrees that improvements to the process could and should be made, but changing the statute is, in my opinion, unnecessary and would weaken the protection in the law.

The success of the Vermont example to expedite reviews under 106 can be applied to improving the 4(f) process. As we learned, willing partners, committed to making the process work, can come up with good solutions. We have demonstrated that with a collaborative approach, everyone wins. Projects get built faster. Resources get protected, and the public is better served.

Thank you.

Senator JEFFORDS. Thank you, Ms. Wadhams, for an excellent statement. We really appreciate the work you are doing. Vermont probably has the most difficult time because the whole State is historic.

Ms. Wadhams. Exactly, exactly.

[Laughter.]

Senator JEFFORDS. Our next witness is Vice President of Highways Programs for Parsons Brinckerhoff, Hal Kassoff of Washington, DC. Please proceed.

**STATEMENT OF HAL KASSOFF, VICE PRESIDENT OF HIGHWAY PROGRAMS FOR PARSONS BRINCKERHOFF, WASHINGTON, D.C.**

Mr. Kassoff. Mr. Chairman, members of the committee, good morning. My name is Hal Kassoff. I am Vice President with the consulting engineering firm of Parsons Brinckerhoff. This morning I am representing the 5,800 member firms of the American Council of Engineering Companies, where I chair the Transportation Subcommittee on Environmental Streamlining. I am also co-chair of the Planning and Environmental Working Group for the American Road and Transportation Builders Association's Reauthorization Task Force.

Let me just add as an aside, it is a pleasure to sit between two success stories—one that you have just heard and one that you are about to hear. If these successes were typical of what was happening across the land, much of my testimony would not be necessary.

Expediting project delivery is one of the premier issues for members of the transportation community. And those who are experienced in delivering surface transportation projects will agree that the most difficult and time-consuming challenge involves coping with what has too often become an overly arduous and time-consuming environmental review process.

Recently, those who oppose streamlining this process have begun to argue that environmental factors are not the significant cause of project delay; that funding constraints and mismanagement are the real problems. Mr. Chairman, I am afraid these arguments are a distortion of the reality that I have known for the last 23 years working with the project development process across this country in both the public and private sectors.

In his testimony before this committee on April 29, 1999, Mr. Roy Kienitz, the then-Executive Director of the Surface Transportation Policy Project, said, and I quote, "In the struggle between the proponents and opponents of a controversial project, the best that an opponent can hope for is to delay things until the proponents change their minds or tire of the fight. It is the only option they have, and so they use it."

Mr. Kienitz went on to say, and I quote, "There is no good reason for Federal approval to take years if there are no major disagreements over the project being proposed. These delays are the most needless of all and are the easiest ones to attack," end of quote. Mr. Chairman, this refreshing observation by Mr. Kienitz underscores the fact that the process needs to be fixed. A recent study by FHWA found that in the 1970's, the average time for completion of environmental impact statements was 2.2 years, and this time period doubled to 4.4 years in the 1980's, moved further to an average of 5 years in the 1990's. Also, the average time grew by nearly two additional years when either section 404 wetland permit issues or section 4(f) issues were involved.

Now, we have heard about the 3 percent EIS's. Let's look at the 97 percent environmental assessments and categorical exclusions. Another recent study under the National Cooperative Highway Research Program reported on a survey of well over 30 States who described their experiences with delays in satisfying environmental

requirements for smaller, simpler projects. According to this report, 63 percent of all DOTs responding to the survey experienced environmental processing delays with preparation of these categorical exclusions, CEs, and 81 percent reported similar delays involving environmental assessments, or EAs. These delays triple average environmental review times from about 8 months to just under 2 years for the CEs and more than double these time periods, from under 1.5 years to about 3.5 years for the EAs.

Now, some Departments of Transportation have actually extended their schedules to reflect these extremely long durations. Unfortunately, this can then give the misimpression that the environmental process is not causing needless delay, because the schedules have been lengthened. Other DOTs will simply not allocate funds to projects until environmental requirements have been cleared, in order to avoid tying up and then delaying the use of critically important financial resources.

In an ironic twist, environmental activists can then claim that such projects are being delayed not by environmental requirements, but by funding constraints, when in fact the opposite is often the case.

Mr. Chairman, ten national environmental organizations recently joined in releasing a one-page document, and there are copies in this room, entitled *Expediting Project Delivery Without Sacrificing Environmental Protection*. While exception could be taken with a number of specific points in the paper, the overall title is right on the mark. In fact, we are not aware of anyone in the transportation community who would argue that environmental protection should be sacrificed in order to expedite the project deliver process. You heard this from Carol Murray. We have gotten the message. This issue is no about weakening environmental protection. The issue is about implementing an improved process that expedites project delivery without sacrificing environmental protection.

We believe that section 1309 needs a legislative booster shot in the form of a carefully balanced approach that reflects three basic components—the first, clarify expectations of both transportation and environmental agencies; second, transform specific processes; and third, hold both transportation and environmental agencies accountable for achieving positive results.

Mr. Chairman, time does not permit us to talk about the entire list of specific measures which we are urging this committee to support through legislation. They are spelled out in our written statement, which is submitted for the record. I am about to close. They cover a variety of areas, including some you have heard—streamlining, planning rules, as well as environment, 4(f) reform, delegation of authority.

Mr. Chairman, in closing, the need for fixing the environmental review and approval process is unfortunately very real. The problem has been building for decades. Solutions are needed now, or urgently needed projects will continue to be bogged down. The results will be lives lost, a weakened economy, less time with our families, fuel wasted, expensive and undependable delivery of freight, and increased air pollution. On behalf of the transportation community, we urge the committee to support legislation that will address the problem in a meaningful and effective way.

Thank you.

Senator JEFFORDS. Thank you very much.

Mr. Hales is the Transit Planning Principal, HDR, Inc., of Portland, Oregon. Out to Oregon we go.

**STATEMENT OF CHARLES HALES, TRANSIT PLANNING  
PRINCIPAL, HDR, INC.**

Mr. Hales. Thank you, Mr. Chairman. It is an honor to be here.

I am Charlie Hales and I am with HDR in Portland. When I was first contacted about testifying here at the committee, I was a little apprehensive because I knew you would hear from a variety of experts, as you have this morning, including my colleague, Mr. Kassoff. I am not one of those experts in terms of the laws and the regulations and their specifics, but I am a practitioner because I served for 10 years on the Portland City Council as an elected Commissioner in charge of transportation and planning. I think my story and our community's story is, I hope, helpful to your committee as an example.

I want to frame that story, really, in two paradoxes. First, I have during my entire political career enjoyed strong support from environmental organizations and that alliance continues today. And yet in all three of my campaigns for public office, most of my financial support came from real estate developers. The other paradox is that our city and our State is loaded with environmentalists. We have lots of trees and lots of tree huggers. And our city is awash in neighborhood associations. We have 100 of them, and in some people's minds to make that even more bizarre, we actually fund them to provide them staff support. If there was ever a recipe for paralysis, we should be it. And yet Portland boomed in the 1990's, and I was involved in the construction of over \$2 billion worth of infrastructure, including highway widening projects. We have grown and grown well. Money magazine calls us the most livable city in America.

So how is this possible? How is it possible that we have grown this way, and during that process, by the way, in almost no case, in almost no case, have major transportation projects been held up by appeals or multiple trips through the NEPA process, and a similar story is true for private development. Almost all projects are approved at the permit counter.

I believe the answer to that question and the resolution of those paradoxes is that in our State, smart growth is not just a turn of phrase. It is a way of life. In applying that philosophy to these projects, we have really found three principles that are consistent all the way across the board. First, public works projects are placemakers. This is true whether the project is a highway or a transit line or a park or a community center. When you build a public works project, a freeway interchange, a light rail line, you exert a massive influence on the character and the destiny of the place. Suburban sprawl results from the compartmentalized, rather than integrated approach to this question. Designing projects which support the place is the only prudent investment strategy for public funds. The alternative strategy, and one which is far too common, is building public works projects and then letting the place develop spontaneously.

Second, land use planning must lead project engineering. We believe the purpose and need section of NEPA is just applied common sense. We need to honestly consider all the alternatives and their side-effects, and that failure to do this is expensive. We think that transportation investments that serve a well thought-out plan pay dividends. My company summarizes this integrated approach in three words: community, mobility and environment. It is sound public policy to respect all three.

The third principle: bring all stakeholders and all points of view to the table. As I mentioned, I build a lot of infrastructure. For those projects to succeed, all who have a stake in them must be appropriately involved early on. An open, inclusive process considering all the issues involved in a major project is legally, pragmatically and politically required.

Portland believes that the best way to, quote, “streamline NEPA,” end quote, is to go through the planning process right and the first time. A sustained commitment to comprehensive land use planning integrates these requirements and addresses the concerns of Federal, State and local agencies and communities in our plans and projects. We get to “yes” in that environment, even in a city with an endangered species swimming through our downtown.

We have taken this coordination and public involvement and alternative analysis instructions from you seriously and put it into our practices. We do not believe because of that incorporation of this philosophy into our approach that environmental review needs to hold up projects, or add significantly to their costs. That is important in my State. If Oregonians are green, they are also tight. We do not like to spend money and are almost as serious about that as Vermonters, I suspect.

[Laughter.]

Mr. Hales. We think that done right and expeditiously, environmental review reduces interagency conflict. The Oregon DOT, like most State DOTs, is still primarily a road and highway organization, but our ODOT staff has incorporated this planning-based approach into their work. They, in return, expect counties and municipalities to work cooperatively with them.

I do not think it is possible to mandate cooperation or consensus or trust. So trying to push projects forward by arbitrary time limits or curtailing public or judicial review or limiting consideration of alternatives or determinations of the project’s purpose and need—I do not think those are going to work. I think in a complex environment like the design and permitting of major public works projects, cooperation, consensus and trust are necessities. Our experience is that if local citizens participate in the planning process and have a clear buy-in and responsibility for commitment, there are few lawsuits and few appeals and few challenges. The plan is the community’s plan.

I should also emphasize, because Portland gets bandied about as this example, maybe too much, that one does not need to adopt Portland’s approach. You do not have to clone Portland in the rest of the country in order for this approach to be effective. Portland is not a charming abnormality, but we get projects built by embracing smart growth. There are lots of ways to do that, and that is

the message that I hope other communities will heed in making these laws work.

To sum up, I believe that a community which first engages in real, comprehensive and sustained land use planning and which makes infrastructure decisions subordinate to and consistent with that plan, and conducts a genuine and genuinely open process of alternatives analysis, not only gets through environmental review with a minimum of difficulty, the people in that community own the results of that process and they get to live in a better place.

Thank you, Mr. Chairman.

Senator JEFFORDS. Thank you. I have enjoyed working with Oregon for over 30 years now, I think, since we did away with billboards and beverage container laws and all those kind of things. So it is pleasure to have you here to testify.

Now, I turn to questions. Trust, Ms. Wadhams—Emily—trust seems to be the key in your successful interactions with the Vermont Agency of Transportation. What would you say are things that other States can do to build trust between the State Transportation Agency and the State Historic Preservation Office?

Ms. Wadhams. That is a good question. I think you could do it the way we did, by having specific projects that we worked on, like our bridge project and our Vermont Design Standards Project, that were a collaborative effort. So people from the Agency of Transportation and the Division for Historic Preservation got to work together on projects with common goals. That was one thing that got us to the point where we had enough trust.

But I think another really critical part of it was the leadership at both the Agency of Transportation and at the Division for Historic Preservation. As a matter of fact, in the early 1990's, Jeff Squires, who now is on your staff here, worked for the Agency of Transportation as a planner, and then was the Deputy Secretary. That was the same time that ISTEA was coming in, and there was a cultural shift that began to happen at the Agency of Transportation. A lot of it I give Jeff credit for. Instead of having an engineer-based approach to create roads for "happy cars," as we like to call them, it was really an approach that looked at people in communities and what they wanted. The leadership at the Agency of Transportation insisted that it happen. Plus, the Federal regulation—ISTEA and the enhancements program—really helped.

On my side, I found there was great mistrust on the part of my staff about "letting the fox guard the hen house."—(we cannot give up authority to review these projects to AOT. They are building the roads; they are going to be the ones that are tearing down the historic resources.) My sense was, it is the Federal agencies' responsibility delegated to the States, to comply with section 106 and to review and evaluate historic resources. It is by law their responsibility. They have trained professionals on staff who have the same skills that we have. Give them the opportunity to prove that they will do a good job. If it does not work, we can stop. We can terminate the agreement.

I really had to pull my own staff into this reluctantly, and I think they have also been surprised by how well it has worked. It is the leadership saying, we can do this, we can cooperate, much as you have in Oregon.

I think a third thing that you could do at the Federal level that might help us, (and I have to put in a plug here for more resources for historic preservation offices—I am the historic preservation officer—is the Historic Preservation Fund. Federal funds (over approximately 60 percent of our office expenses) have been level-funded at best over the last 30 years. As a matter of fact, while our mandated responsibilities have increased, we have seen our dollars decrease in real-dollar value. What we would like to be able to do, is what Florida has done a very up-to-date data base and Internet-based survey. We in Vermont do not have that and a lot of States are in the same position that we are. If we could create the infrastructure for good decisionmaking, do good surveys, update the ones that we have, get good data bases, do good public education—do that part of our job, then we can make better decisions. We can give the information to the Agency of Transportation. They do not have to go out and do a survey every time they have a project. I think that would give the State Historic Preservation Offices the confidence that they were doing their job; they had the resources to provide information. Bring us into the 21st century with our technology, because many States are not there.

So that is another thing that I think the Federal Government could do, either by earmarking transportation dollars for historic preservation offices, since we do work so closely together, to make sure we provide the transportation offices with the tools they need to do their work.

Senator JEFFORDS. Mr. Morefield, do you have a comment to make on Ms. Wadhams' statement?

Mr. Morefield. Overall on the historical process, I think in Florida we would love to work together, and I think we are moving toward that way on that particular activity through what we are doing with our streamlining process. I think some of the issues that we see is the 106 process being historic, and then having to go back through again the same type of a process because of the 4(f) requirements of the USDOT.

So I think there are some efficiencies if we can do it one time would be good. As she related to our data base, I think that that particular issue is going to be key to our process. Is it going to work? We have got a program. We have got the Internet-based system. We are going to have timeframes for agencies to put into their portion of the file, their comments. I think it is going to behoove the Department of Transportation to make sure this process is going to work, that we listen. We read those comments. We actually meet with those folks when they have valid comments, and that we actually make some changes in the process.

It is not going to work if we just gather comments and then, like the old highway and bridge companies or agencies of the past, we are the Department of Transportation, we need to take into account those, work with those that have comments, and make sure that we do in fact change the projects so that when we get to the NEPA process, we have identified those issues that need to go through the formal process. Once we do that, hopefully the NEPA process, instead of taking 5 years will take something less because we have narrowed it down to those few critical issues.

So it behooves the Department of Transportation, who has got the overall responsibility, to make sure that we do something with these comments now that we are going to have them, on a timely basis.

Senator JEFFORDS. I am afraid we are going to have to end in about 15–20 minutes, so I am going to ask one question and have your comments on the panel.

Section 1309 of TEA–21 was Congress' attempt to focus public policy toward improved transportation decisions, while still protecting and enhancing the environment. It directed the Department of Transportation to work with the Federal resource agencies to improve the environmental decisionmaking process. As practitioners from the State and local governments and the private sector, what programs and policies developed by DOT have been most successful, and where can further improvements be made?

Anybody want to start? Mr. Hales, go right ahead.

Mr. Hales. One of the programs that I think is working particularly well because it does recognize—I know talking about land use here in the Senate and in the Congress is problematical, having a lot of people running and screaming from the room saying it is a local issue, but the FTA has recognized that unless a transit project really carries out a local land use plan, it is unlikely to exceed its ridership estimates. Unlike a highway project, obviously a transit project is better and better if more people are using it.

So in their new-starts criteria, which guide their selection of those projects for funding, they have incorporated in those criteria a land use criteria, as well as ones about ridership and cost-per-mile and so on. I think that merits-based approach, that naturally involves other agencies because the FTA, after all, is not in the land use planning business; tends to bring the other parties to the table and tends to assure that the projects that get funded are the ones that really do multi-objective, do accomplish multiple objectives, rather than simply the transportation objective. So I would commend those new-starts criteria as an example of how an agency can put those provisions into practice.

Senator JEFFORDS. Mr. Kassoff?

Mr. Kassoff. I think ironically the area I would say has been most successful is one which the environmental community cites as an area that would be in the greatest jeopardy if streamlining were implemented, and that is the area of public involvement. Through ISTEA, which transformed the philosophical basis, the philosophical approach to transportation planning, and TEA–21, which kept that philosophy intact, you have public involvement in the long-range planning process that produces area-wide plans and statewide plans. You have public involvement in the programming process that produces what is called the STPs and TIPs, which are the capital improvement programs. And then at the project level, when a project proceeds forward you have public involvement again.

What transportation agencies are learning is that it can't even end at the planning and environmental stage, right down through construction, particularly when you are impacting people with construction, that public involvement process actually helps the agency get its job done.

So I think the public involvement process, while not perfect and there is always room for improvement, has been one of the great successes in this country.

Senator JEFFORDS. Ms. Wadhams?

Ms. Wadhams. I would say the enhancements program in TEA-21 (originally ISTEA). I mentioned this earlier, I think because it did really effect a cultural shift in agencies of transportation, and allowed them to incorporate the idea of enhancements, not just pavement, bridges, new highways, but ideas of community, how you are affecting community, and building highways not for happy cars, as I said, but for people and communities. I think the enhancements program has been very, very successful and I would encourage that it be maintained and increased even.

Senator JEFFORDS. Mr. Morefield.

Mr. Morefield. One of the things that, not just in the environmental area, but overall the FHWA, speaking specifically about them, is that their delegation for more responsibilities down to the division level in the States—they have done that. That has been working out great. We have been getting answers and a lot more decisions made on a lot quicker basis, whether it be design issues, environmental issues or whatever. So I think the delegation of some of the decisions that heretofore had been in Washington level or even at the regional level, giving it to the State FHWA division has worked out extremely well.

Senator JEFFORDS. Ms. Murray?

Ms. Murray. There are actually a couple of things that I would like to cite of things that USDOT has done that have been tremendous. You heard about the TE projects. They are fabulous. I absolutely agree. Some of that is reflective of their approach these days to be more flexible in allowing the State DOTs to determine how money is spent. It no longer has to fit in very rigid rules. That increases our ability to respond to the public, to respond to the environment, to respond to the communities.

Quite frankly, I think it is something that Federal Highway, and certainly USDOT should be complimented for because States have said all along, give us the money, let us make the decision, we will do what is right for the States. I think that has happened.

One program we did not talk about at all is the TCSP program. We have four TCSP projects that we are doing in New Hampshire, and if you want to talk about the ultimate public involvement at the community level, that is those four projects. One of them began 3 years ago in the capital city of Concord. It is not a State DOT project. It is the city's in partnership with us and in partnership with USDOT. The first step was community-wide envisioning. Believe it or not, we turned out over 10,000 people in the course of a summer to come in and talk about, this is what Concord looks like today; what do you want it to look like in the year 2020? They were energized. They were enthusiastic. And New Hampshire has a long tradition of building things on the back of volunteers. Once again, we did it and we got their input.

We are now moving to phase two, where we have said, OK, you have defined the vision, you have said what you want your neighborhoods and your villages within the city to look like. Let's start moving forward and putting things on the ground. Again, the flexi-

bility that Federal Highway and USDOT and in fact Congress in creating this program gave to the States I think is a wonderful opportunity to bring in those local land use discussions. But before I leave that project, I do want to say very quickly that as we set up the board of directors, for lack of a better word, that will be overseeing phase two, we reached out to the environmental community—public, private, State and Federal—and we had a Federal agency that has declined to participate because they do not—the meetings are at night, and they are too far away from home, and they will reserve their comments until phase two is complete and we move to phase three. That is so damaging to the over 10,000 people that have been involved.

The final thing that I would have to say with USDOT is I think along with the State, they got it when you told us, Congress told us to get out there, be more involved, be more inclusive. The flexibility that they now allow the States to make their decision on how their funds are spent and how they interact with the public and the communities is reflective of that. So there are successes.

Senator JEFFORDS. Thank you.

Senator Voinovich?

Senator Voinovich. Thank you, Mr. Chairman.

This is a really important hearing today, and I really have enjoyed getting the different perspectives of those of you here at the table.

My first questions is, would you like us to move on with this before we wait until the end of next year and deal with the reauthorization of TEA, fresh TEA or whatever we are going to call it?

[Laughter.]

Senator Voinovich. Just yes or no. Is there unanimity about moving forward with this and not waiting until the end of next year?

Ms. Murray. If I might, Mr. Chairman, I am going to answer from my perspective, and certainly I can only offer my opinion. I think certainly from my perspective, there is a need to get on with this. We have talked about it, we have talked about it. We are frustrating the public. Quite frankly, on the Interstate 93 project, we have a crash rate that is totally unacceptable. It is not unusual on a daily basis to have an eight to 12 car crash, with injuries, with bodily injuries. The air is affected. Everything in those folks' quality of life was affected, but above all safety. We need to get on with it.

Senator Voinovich. You are just saying, get on with it. All right. Anybody who does not think we should get on with it? Anybody? Ms. Wadhams?

Ms. Wadhams. I feel it is working in Vermont, the way we have approached our historic preservation reviews. I am hesitant about, if you mean get on with it, looking at enacting legislation to open up section 4(f) of the Department of Transportation Act of 1966, because I really do feel that we have proven that you do not need legislative action to address that issue. So my only caution is there are some things I think with good faith effort and good leadership on the part of the people in the agencies of transportation, Federal highways, AASHTO, to really try to come up with good guidance or a regulatory solution, rather than a legislative solution in that case. I think it is hard to mandate change.

I think it is important to—I like the idea of looking at different best case examples and working on those, and finding ways to encourage other States to do what you have heard about today. When I went to a conference in Kentucky a few months ago on transportation and historic preservation, I was swamped with people that were very interested in what we were doing and how to do it and how did you make it work. And people have asked if I could come to their State, or send them information and talk about what it was we did. I am not sure legislation is always the answer to affect streamlining. I think there may be other ways, and I would be very hesitant to open up 4(f) to a legislative change.

Senator Voinovich. Go ahead. Yes, Mr. Kassoff?

Mr. Kassoff. I would like to comment on that, because first, we think it is essential to move on. There are many other issues in reauthorization, particularly funding issues, that could overwhelm this particular issue if we wait.

Senator Voinovich. We ought to spend our time figuring out where to get the money, and the rest of it gets in the . . .

Mr. Kassoff. And just a different perspective on 4(f)—I had the occasion yesterday to be in a meeting with one of Ms. Wadhams' colleagues who is a State historic preservation officer, who offered a different perspective and one that I share, that often historic preservation goals are blocked as a result of 4(f) because the 4(f) tag is so onerous that State agencies would avoid an impact that a private owner could create on that same property without any difficulty, and there would be no mitigation. If 4(f) is looked at in the context of 106, you see sheer duplication and a lot of non-common sense solutions. So I am afraid I have a different perspective on the 4(f) issue.

Senator Voinovich. The thing is that what I would be interested in is the categorizing of these things. No. 1 is, those of you who have had good experiences, getting back to the question I asked the first panel, have there been any regulations, laws that have impeded your ability to achieve what you have wanted to achieve by just sitting at a table and having good interpersonal skills and having consensus and getting everybody at the table? That is one thing. The second thing then becomes, what are the techniques that you have used—Ms. Wadhams—to bring people—now, you have put your historic preservation people over in the Department of Transportation—no?

Ms. Wadhams. No, they have their own historic preservation staff in the . . .

Senator Voinovich. OK, but they have, and they are competent people. In effect, you have kind of given your proxy there because you have the confidence that those people will do a good job and they are there, and that helps out.

I think one of the things that a lot of people do not understand is it takes a lot of time to do these things, doesn't it? I know it took us—we have a transportation track, transportation resource allocation. It took us almost 4 years to put the standards together. Now, the President is looking around for priority projects. All he has to do is come to Ohio. We have got them. We know exactly what they are and we have objective standards in order to determine them, rather than arbitrary, so that the next Governor comes in and says,

"I am going to build that highway." That took a lot of work, of getting everybody involved to agree on what the standards should be.

So the issue then becomes, what are the best practices that you have put in place, Mr. Hales and Ms. Wadhams, and others, that facilitate that? And then the issue then is, is it the Federal Government's responsibility to have seminars, like Ms. Wadhams you went to one in Tennessee about historical preservation, to do that, to get that message out there. In other words, Mr. Chairman, we have to concentrate on the stuff that really impedes the process from going forward, but after that, it looks to me like the magic here in so many areas is how do people get together and do the job. And then the next issue, and I am going to ask you to comment on some of these, is like the National—I am past chairman of the National Governors Association, and one of the things that we created when I was chairman was our best practices. They wanted to call it the Department of Innovations, and I said I am not interested in innovations, because many people announce innovations, and 5 years later nothing has happened. I want to know what has worked. Would it be the National Governors Association or the AASHTO? Somebody has got to get out there in this area, and it may not be the Federal Government, that is going to pull people together. There is enough synergy among various groups here that maybe they could take on that challenge. I think that might do more to move things ahead than the new regs and the laws.

I will stop. Would you comment on what I have just mentioned?

Mr. Hales. I will take a stab at that first, Senator Voinovich.

To your first question, are there laws or Federal law that has really gotten in our way in the 10 years that I have been involved in projects in Portland. The short answer to that question is no, at least in terms of environmental review. Actually, the only Federal requirement that I can think of that really cramped our style on a project was that we built a new street car line in downtown Portland, primarily as a development tool for a new district that we have created there. It is a great real estate success story, as well as a transportation success. That project would not have passed muster through the conventional FTA process because the neighborhood that it was about to serve did not exist yet, so you could not do a ridership estimate, and we wanted to buy vehicles from the Czech Republic, and therefore could not meet the U.S. content requirements for manufacturing. So we built that project with local money. So maybe that is the result the Federal Government would prefer, but if we want to fund those kinds of projects, some kind of small start or—I hate to use that overused word again—innovative projects provision in the next TEA bill I think could encourage those kinds of fairly quickly developed, inexpensive and very effective projects.

To your idea about best practices and some kind of collaborative effort, perhaps through the organizations involved, I think it is a very good idea. I think although I was involved in the National League of Cities and in fact was the President of my State League of Cities, I have not found the conventional structure of the associations, as good as they are, to be a good source of that kind of information exchange because they tend to be too insular—this professional association, that government association. I think some

kind of collaborative effort among them would really be a good idea and I hope we can do that.

Senator Voinovich. Maybe I can do that because I am the only person in the history of the United States who was President of the National League of Cities and chairman of the National Governors Association, so maybe we can get them together and bang their heads and see if we can't get them to work together on this.

Mr. Hales. I suspect they will return your phone calls, Senator. [Laughter.]

Mr. Morefield. If I might, Senator, on the best practices, I think with the Florida Department of Transportation, we try and do that across the board. We try to benchmark other agencies, whether it is a highway agency or a sister agency in-state or out of state, whether it is a financial issue or engineering issue. I think in this case, certainly I have heard enough here today that I have got enough ideas to go back to have our historic officer contact Vermont and talk about certain things. But also in benchmarking, I think you do also have to look at the processes. If you do not continually look at the processes to improve the processes, I think you get a lot of that out when you benchmark. That means you go back and take a look at your processes. I think NEPA is a process; the 4(f) is a process, and the 106 is a process. So I am not saying you need to go out and change it, but I think it does behoove anyone when you are talking about best practices to take a look at the processes you are best practicing, and there may be some legislative changes and/or rule changes, because primarily the only concerns that I have noted over the years—obviously, I do not agree with every, with all due respect, law that Congress or our State legislature passed—but most of the problems that we have is in the agencies that do the implementing rules. What they put into it is not in the law—that gives us a lot of problems.

Senator Voinovich. Efficient transportation decisionmaking process—have you done any projects yet underneath that?

Mr. Morefield. We have got some pilot projects and everyone is going in the system, as I said. As of the middle of next year, we will have to go through this process. As we update the TIPs, we will be doing that.

Senator Voinovich. One other point, if you would continue to comment on it—I was very disturbed that you have indicated that you got everybody together, Ms. Murray, and that the Federal agencies were not willing to sit at the table. Mr. Chairman, that may be a problem because if we are going to gain consensus and get things, it seems to me that if the community is willing to get together at the table, that any Federal agencies that are involved ought to have representation there so that they have input in the beginning of the process. You thought you worked out something good, and they came back and said, no, we do not like this; it didn't do the thing; spend \$50 million, it didn't do the thing. It seems to me that if they had been there initially at the time that you started the discussion, that probably would not have occurred—either that or you got it out on the table earlier and then you would have started talking about it, or they would have seen that there were some other things that were there that maybe would have satisfied the wetland problem. Would you comment on that?

Ms. Murray. Yes, Senator, that is a very good observation that you have made. We have monthly meetings with the resource agencies on the State and Federal level—monthly meetings where all of our projects as they develop are discussed. In addition to that, we invite all of the resource agencies to come out as we update our 10-year plan, which we do every 2 years as other States do. We have found that the response from the environmental agencies, whether they be regulatory or private, is minimal to those attempts. We set aside a fair amount of our planning money every year to do what we call corridor studies. As a matter of fact, we have one going on with Vermont and Maine, because we share a lot of things. We have been out in numerous public settings talking about the potential of what is the future of Route 2. The environmental communities have not come to those meetings.

So we are out in the public. We are talking about engaging with them on land use discussions, on what their vision is for the future. We put all this effort into it, and we have been at that one for about 2.5 years. Now, if the resource agencies in turn come back and say, no, we do not agree with that, then I think we have severely let the public down, because they thought they were hearing from one voice.

The other issue that I have seen, unfortunately, is positions that are taken early in a project development by a resource agency, a regulator, do not last to the next phase. That is, again, you talk about a way to waste time, if you get past a certain point, work on a project for 5 years, and then you hear, you did not get the purpose and need right, and you have to go back and start over—that frustration is huge. I do think that you highlighted a real weakness. If we are going to get out there, we are trying to improve how we are doing business. We need the others to engage, make decisions, stick to those decisions, and don't revisit those decisions.

Senator JEFFORDS. Thank you all. It has been very helpful testimony, and this is an extremely important area as we move into the future to make sure we can expedite, as well as do things better.

So thank you, and the hearing is adjourned.

[Whereupon, at 12:12 p.m., the committee was adjourned, to reconvene at the call of the chair.]

[Additional statements submitted for the record follow:]

STATEMENT OF HON. JON S. CORZINE, U.S. SENATOR FROM THE STATE OF NEW JERSEY

Thank you, Mr. Chairman, for holding these continuing hearings on the reauthorization of the Transportation Equity Act for the 21st Century—TEA-21—and I'd like to join you in welcoming our witnesses.

Mr. Chairman, the issue of expediting the completion of federally funded highway construction and mass transit projects is an important one. I am extremely concerned that this can often be an expensive and time-consuming process that discourages the completion of valuable road and rail projects. As someone who represents the most densely populated State in the Nation, I can state to the need we have for quick help for the traffic problems that we face.

I want to see things go faster. I know that the witnesses appearing before the committee today all want to see things go faster. But we need to make sure that we do not turn our backs on the strides we have made in protecting the environment over the past 30 years—on the land, in the air and in the water.

Congress enacted streamlining provisions in TEA-21. We need to consider the effects of these provisions within the reauthorization process. But we also need to consider the progress that is being made on the State level because it is usually State Departments of Transportation that are responsible for the completion of environ-

mental documents. I was heartened, for example, to see in a report from the Department of Transportation that all 50 States have adopted or initiated agreements for streamlining environmental review. I look forward to hearing from the witnesses today as to what has been accomplished and what can still be done.

Mr. Chairman, in conclusion we need to focus on an inclusive process that considers the views of all stakeholders and brings them all together in an expedited process that does not sacrifice environmental protection. I look forward to working with the committee to see such an approach happen.

STATEMENT OF HON. BOB SMITH, U.S. SENATOR FROM THE STATE OF NEW  
HAMPSHIRE

Thank you, Mr. Chairman, and welcome to our witnesses.

Progress on implementing the TEA-21 Environmental Streamlining provisions, Section 1309, has been a challenge. TEA-21 was authorized over 4 years ago, and implementing regulations have not yet been issued.

On their own initiative, with support from DOT, a number of States have developed improved project delivery and environmental management systems, demonstrating that Section 1309 is not only a laudable goal but a practical reality.

I believe we all recognize that delays in the delivery of highway projects can cause severe economic impact, increased congestion and accidents, and higher construction costs.

In addition to the States and DOT, other Federal agencies, especially those under EPW jurisdiction (Corps, EPA, Fish and Wildlife Service) must do better to make streamlining a priority.

So I am very pleased that President Bush issued this executive order which I believe will make huge strides in implementing the fundamental elements of section 1309, including:

- Integrated review of environmental regulations or concurrent reviews;
- Full and early participation by all relevant agencies;
- Coordinated time schedules; and,
- Dispute resolution procedures.

Mr. Chairman, I ask unanimous consent to include a copy of Executive Order titled "Environmental Stewardship and Transportation Infrastructure Project Reviews," dated September 18, in the record of this hearing.

I would also like to acknowledge today some important work being undertaken by the Western Governor's Association, and led by Governors Leavitt of Utah and Kitzhaber of Oregon, to reform the NEPA process.

This effort is called "Enlibra" and being undertaken in a growing number of States. At the heart of "Enlibra" is a set of principles that I believe could help guide our effort to streamline highway project delivery and improve environmental stewardship.

These principles provide a common-sense approach to making progress on streamlining and improving our protection of the environment.

They emphasize the need to reward results (project construction and environmental stewardship), and not red-tape process and procedures.

They recognize the need to promote collaboration, not polarization; and the need to support national standards yet allow flexibility for local solutions.

They also promote basic conservative principles of sound science and economics.

I ask unanimous consent to include a copy of the Enlibra principles in the record of this hearing.

Lastly, I'd like to make a few remarks about New Hampshire's I-93 highway widening.

The widening of I-93 is the State's highway priority project. It experiences daily rush-hour congestion and there are serious safety concerns.

In 2000, Congress designated I-93 a National Environmental Streamlining Pilot Project.

I'd like to applaud Carol Murray and the other members of the I-93 Board of Directors, which was created to develop a streamlined and environmental sound project.

Your efforts have led to greater trust, reduced delays, and provided for a rapid dispute resolution process.

It is unfortunate, however, that U.S. EPA cannot join the other agencies in either a consensus or negotiated package of wetlands mitigation and continues to demand that DOT purchase over \$50 million (dollars) worth of land for conservation.

I do not want to see transportation projects used as a back door to fund Federal conservation programs.

This certainly appears unreasonable, and I hope today's hearing will provide us guidance for how we may resolve this, and other streamlining issues.

ENLIBRA PRINCIPLES

- National Standards, Neighborhood Solutions—Assign Responsibilities at the Right Level

NEPA is basically sound—the Act does not need to be changed. Local areas, however, need flexibility, with accountability, to address local environmental, economic and social conditions.

- Collaboration, Not Polarization—Use Collaborative Processes to Break Down Barriers and Find Solutions

Increase public involvement early in the transportation planning and NEPA process, and close legal loopholes used for disruptive and special interest lawsuits. Collaborative approaches produce longer-term solutions and save money.

- Reward Results, Not Programs—Move to a Performance-Based System
- Eliminate unnecessary paperwork and procedures, while rewarding better accountability, environmental protection and faster transportation project delivery.

- Science For Facts, Process for Priorities—Separate Subjective Choices from Objective Data Gathering

Use sound science, engineering and economics to assess the impact of transportation projects on the environment and economy. Increase State and local use of GIS to provide better location information on environmental and historical resources.

- Markets Before Mandates—Pursue Economic Incentives Whenever Appropriate
- Market incentives can encourage more cost-effective and sustainable solutions to the environmental impacts of transportation projects

- Change A Heart, Change A Nation—Environmental Understanding is Crucial
- Ultimately, environmental protection depends on the transportation choices people make every day. Government has a role in educating people about the impact their transportation choices have on the environment.

- Recognition of Benefits and Costs—Make Sure All Decisions Affecting Infrastructure, Development and Environment are Fully Informed

Decisions should be guided by an assessment of the true environmental and transportation costs and benefits. These assessments, with equal consideration of non-qualitative factors, can illustrate the advantages of different options.

- Solutions Transcend Political Boundaries—Use Appropriate Geographic Boundaries for Environmental Problems

Focusing on the natural boundaries, or watershed, of the transportation project can help insure that the full range of scientific, economic, and political factors and interests are taken into consideration.

---

STATEMENT OF HON. EMIL H. FRANKEL, ASSISTANT SECRETARY FOR TRANSPORTATION POLICY, U.S. DEPARTMENT OF TRANSPORTATION

Mr. Chairman and members of the committee, thank you for this opportunity to discuss the issues of transportation project delivery and environmental stewardship.

Ensuring that important transportation projects are completed as quickly as possible is one of the top priorities for all of us at the Department of Transportation, as I know it is for members of this committee. Transportation system users too are becoming more and more frustrated with a process they perceive to be overly laborious and cumbersome. Growing congestion is fueling this frustration. This Department has already made great strides in the area of streamlining the project development process while protecting the environment, and the reauthorization of the Transportation Equity Act for the 21st Century (TEA-21) presents an excellent opportunity to review and refine those efforts.

There are a multitude of factors that impact the timing of project delivery, from the planning process to construction techniques to environmental issues. Issues confronted in one project will often vary substantially from the issues confronted in another seemingly similar project. Many problems are local in nature and thus demand local solutions. The Federal Government's role in creating project delays is frequently minor, although occasionally it is not. Unfortunately, the nature and complexity of the issues mean that blanket solutions have proved very elusive. That is not to say that progress cannot be made. In fact, this Department's expansive efforts have brought positive change. Progress has always required great efforts, and the area of transportation project delivery is no different.

While this testimony will focus heavily on the environmental aspect of project delivery, it is important to note that advancements have been made in streamlining

other aspects transportation project development. A few of those advancements are discussed later in the testimony.

#### *Environmental Streamlining*

Secretary Mineta noted to this committee back in January that one of the goals of the Department's reauthorization proposal will be to increase the efficiency of our infrastructure while retaining environmental protections that enhance our quality of life. Transportation agencies realize today, more than ever, that environmental stewardship is a critical part of how we do business.

Public expectations and demands for transportation solutions today, not 10 years from now, are understandable, given the magnitude and pervasiveness of America's transportation problems. Equally understandable is the public's desire for environmentally sensitive ways of doing business. Sometimes these two societal goals work in conflict. Environmental streamlining and stewardship is the term used for a new way of doing business that brings together the timely delivery of transportation projects with the protection and enhancement of the environment. In essence, it is a rejection of the false choice so often presented between adding transportation capacity and protecting our environment.

In its simplest terms, environmental streamlining consists of cooperatively establishing realistic project development timeframes among the transportation and environmental agencies, and then working together cooperatively to adhere to those timeframes. Because major transportation projects are affected by dozens of Federal, State, and local environmental requirements administered by a multitude of agencies, improved interagency cooperation is critical to the success of environmental streamlining.

The Department has worked extremely hard to solidify relevant interagency partnerships through a series of actions that include pilot efforts, process reinvention, alternative dispute resolution, and a focus on performance evaluation. We can and will do more.

#### *TEA-21*

TEA-21 has also been crucial in encouraging meaningful streamlining and stewardship. The objectives of TEA-21's streamlining section 1309 were to: expedite transportation project delivery; integrate review and permitting processes to identify key decision points and potential conflicts as early as possible; encourage full and early participation by all relevant agencies that must review a highway construction or transit project or issue a permit, license or opinion relating to the project; coordinate time schedules for agencies to act on project decisions; establish dispute resolution procedures to address unresolved project issues; and to improve decisionmaking under the NEPA.

Consistent with the mandate of Section 1309, the Department has taken a series of administrative actions to enhance environmental streamlining. The fiscal year 2002 Department of Transportation Appropriations Conference Report, of November 30, 2001, directed FHWA to report on agency streamlining efforts by January 2, 2002. In January, we submitted a report to Congress that summarized many of the steps the FHWA has taken to enhance environmental streamlining:

From 1999 to 2001, the median time for completing environmental review for projects requiring an Environmental Impact Statement decreased by 1 year (from five and a half years to four and a half years). This reflects respectable progress for projects that are most complex, challenging and have significant impacts. These constitute less than 3 percent of all federally funded surface transportation projects.

This year, FHWA has set internal goals to continue to decrease the review time for all projects requiring rigorous environmental analysis. This would be accomplished through negotiated project timeframes with each State DOT and FHWA division office and consultation with review agencies. FHWA has put an Environmental Data tracking system in place to track review times on an ongoing basis. FHWA expects to have a solid data base within the first year.

Fifty States have adopted initiatives for streamlining that clarify, amend, or reinvent the project development process. At least 24 States have focused their process redesign efforts on integrating planning and National Environment Policy Act (NEPA) activities.

A number of these initiatives have evolved into major process reinventions that FHWA has supported with streamlining funds as well as technical assistance. Not only are environmental concerns integrated into the long range planning process, the processes themselves and the agency reviews and comments are conducted electronically. This cuts review time and makes the web-based process transparent and accessible to the public.

Using TEA-21 authority, 34 States have agreed to provide personnel to State and Federal environmental agencies for the purposes of expediting reviews. The Department is very encouraged by the efforts. FHWA has now finalized guidance for using these arrangements, as well as documented the lessons learned for viewing by all States. The guidance includes a template that other States can easily adapt and modify for their use.

Twenty-nine States have adopted agreements to merge the FHWA NEPA process and the Clean Water Act permitting process administered by the USACOE. This eliminates what can be a duplicative process. FHWA is working with the Corps to modernize merger agreements already in place and update agency policy directives and clarifications that will help foster new NEPA merger agreements.

Forty-one States have created some level of delegated authority for historic resources that allows many projects to be processed quickly. This also frees up Federal and State resources to focus on complex issues. Vermont's efforts in this area are to be commended, and their approach sets the standard nationwide.

FHWA's streamlining website, [www.fhwa.dot.gov/environment/strmlng/index.htm](http://www.fhwa.dot.gov/environment/strmlng/index.htm), has proven to be a key medium for communication on these topics. It includes an inventory of best practices and a catalogue of State efforts and national activities. A new "Success Story" is featured each month, and feedback from our stakeholders has been very positive. Links to other key sites (e.g., AASHTO Center for Environmental Excellence) will make the website more interactive and provide access to very useful resources.

Successful environmental streamlining requires fostering good working relationships across a number of organizational lines. These relationships allow for the development and establishment of reasonable and realistic schedules for advancing major projects. It is important for the Department to facilitate agreement by Federal agencies on timeframes for conducting reviews and granting approvals. Working together in partnerships, combining a full range of Federal, State, and local officials and interest groups, will lead to reasonable ways to meet the Nation's transportation needs, while being good stewards of the environment. A wonderful example has been Senator Smith's efforts to initiate a successful partnering model in NH that has fostered the examination and exploration of improved and more efficient approaches to mitigation while adhering to deadlines.

Pursuant to a national memorandum of understanding signed among Federal agencies, DOT and other agencies have worked to further progress on a coordinated environmental process to expedite Federal highway and transit projects. The agencies have developed interagency action plans. We are on track for the successful implementation of our 2002 priority items adopted by the Federal Interagency groups. Our activities in this regard include:

1. Securing commitments from Federal agencies to develop national templates for regional general permits, NEPA/404 mergers, National Historic Preservation Act of 1966 Section 106 delegations/testing of alternative procedures, Section 4(f) programmatic agreements, and Endangered Species Act programmatic agreements;
2. Encouraging and supporting watershed-based approaches to environmental stewardship implementation/oversight through a best practices scan, and innovative mitigation pilots.
3. Supporting research priorities that emphasize flexible mitigation for habitat connectivity.
4. Maximizing staff resources using cross training, interagency workshops, development and shared uses of data bases such as GIS maps of environmental resources, tribal interests and transportation facilities;
5. Defining specific FHWA performance measures for streamlining and stewardship. We have invited other Federal agencies to work with us to develop measures that demonstrate how they have aided the implementation of successful project delivery.
6. Continuing to add to our baseline studies on national timeframes for environmental reviews. A supplemental study on major projects completed from 1990-95 is underway. This will validate our historical baseline data and help us to better isolate which variables may add time to the process. We are also expecting an initial assessment of streamlining implementation progress from both environmental and transportation frontline professionals some time this fall. This Gallup Organization managed research project will help define expectations and definitions of success and measures of quality.

In addition, we are implementing actions to streamline the environmental review of airport projects. Secretary Mineta's May 2001 report to Congress on the Environmental Review of Airport Improvement Projects concluded that reducing environmental delays should be addressed in areas of resource, process, product, and interagency coordination. FAA is implementing administrative initiatives outlined in the

report. These include establishing expert teams to expedite environmental reviews for critical airport capacity projects, allocating more resources to environmental reviews, maximizing the use of consultant resources, expanding the list of projects with minimal impacts that don't need detailed environmental review, issuing guidance to streamline reviews, better interagency coordination and cooperation, and a guide to best practices.

#### *Environmental Stewardship*

When the first President Bush set a national "no-net loss" wetlands policy to stop a decades-long history of cumulative losses, FHWA set a target of 1.5 acres replaced for every acre adversely affected by highway projects. Our recent performance figures show that we are exceeding that target by a substantial margin, providing over two acres of replacement wetland for every acre taken. To our knowledge, no other public or private entity is setting goals as ambitious as ours or is tracking their wetlands performance as we are.

To date, we have invested over \$11 billion dollars to improve air quality in areas that do not, or did not, meet Federal air quality standards under the Congestion Mitigation and Air Quality Improvement Program, or CMAQ. These funds have furthered air quality improvement in a number of very important ways. They have helped to accelerate use of cleaner technologies by retrofitting, or replacing, heavily polluting trucks and buses. They have helped to further Intelligent Transportation Systems on the road and for transit, making our transportation system work better, smarter and cleaner. And they have helped to put in place alternatives to driving alone. No single source of funding has made a greater investment in clean air than CMAQ.

Looking at the human environment, more money has been spent on historic preservation from transportation funds than any other source. Historic preservation often leads to private investment far beyond the transportation investment. For example, the city of Meridian, Mississippi strategically used the \$7 million rehabilitation of the Meridian, Mississippi Union Station for reuse as a multi-modal transportation center to leverage over \$10 million in private investment in the depot district.

As we look ahead, we see a number of possible environmental stewardship opportunities to pursue in collaboration with transportation and environmental colleagues. We are providing funds and staff assistance to the new American Association of State Highway Transportation Officials (AASHTO) Center for Environmental Excellence. Working in partnership with the Federal Highway Administration (FHWA) and with involvement from other Federal agencies, the Center will promote the use of environmental management systems by transportation agencies, as a systematic way of institutionalizing environmental stewardship.

We have provided Texas with funds to support their streamlining efforts to develop a Geographic Information Systems (GIS) based mapping and environmental management system that is helping State and Federal agencies to devise the best protection, conservation and mitigation strategies for the entire 1,000-mile section of the I-69 North American Free Trade Agreement corridor project within Texas. The Environmental Protection Agency (EPA) and the United States Army Corps of Engineers (USACE) are consolidating their reviews and comments so that Texas will have just one set of comments from each agency. This action is greatly facilitated by the coordination, training and development of those management efforts we are funding.

We have asked FHWA division offices to help establish at least 30 exemplary ecosystem initiatives around the country during the next 5 years. When we say "exemplary," we are looking for initiatives that raise the bar, that push the boundaries. Such initiatives will result in project delivery efficiencies through mitigation and conservation measures that are defined for regions or corridors and for which credits are applied to types of projects, or within specific transportation corridors.

Endangered species habitat conservation plans fall in this category and so do large-scale studies of migration patterns by large mammals and ways to minimize conflicts between the migration of people on the highways and the migration of animals near and across highways. FHWA is working with Alaska to advance habitat connectivity and GIS data base mapping efforts that will significantly address human and wildlife mortality along critical habitat corridors for major freight, transportation and railroad corridors and effectively plan for future transportation improvements.

FHWA and Federal Lands Highway offices are working with States to develop integrated approaches to transportation and environmental planning and project development at the system level and supporting "context sensitive solutions" at the project level. Many States have embraced or are advancing these approaches. We will continue to facilitate the success of such endeavors.

Context-sensitive solutions are an effort to get all of the players to work together in an integrated fashion to ensure that transportation decisions are fully respectful of the community and the natural environment. In Montana, on US 93, the State Department of Transportation, Indian tribes, and local communities were able to come together with a context sensitive approach. Currently 26 States have some type of context sensitive design activities underway.

#### *Project Construction Innovations*

As I discussed above, aside from environmental issues, other problems can delay the completion of a project. Construction of a typical highway project generally takes from one to more than 5 years depending on the complexity, size and controversy of the project. Unforeseen and often uncontrollable circumstances impede construction efficiency. There are, however, some fairly recent and significant advancements that have been made in the ways projects are constructed.

#### *Design/Build*

The most significant of these advancements is the design/build construction technique. TEA-21 expanded and clarified the circumstances under which design/build projects may be advanced. At least 30 States have adopted the technique. Under the design/build concept, the contracting agency identifies the end result parameters and establishes the design criteria minimums. The prospective bidders then develop proposals that optimize their construction capabilities. Allowing the project design to be tailored to a contractor's advantage provides flexibility to compensate for cost increases in one area through efficiencies in another. This concept allows the contractor to optimize his work force, equipment and scheduling.

However, along with the increased flexibility, the contractor must also assume greater responsibility and risk. Because both design and construction are performed under the same contract, delays related to design error claims are eliminated, and the potential for other types of claims are greatly reduced. Recently, design/build projects have been authorized to include right-of-way (ROW) acquisition in addition to design and construction, creating a "turnkey" project for the State. Prior to this authorization, necessary ROW for design/build projects was typically provided by the State or local transportation agency. To include ROW acquisition services as part of the design/build approach, it must be allowed by State procedures for procurement of such services. From a State highway agency's perspective, the potential time savings can be substantial.

With generous cooperation from the States of South Carolina and Virginia, and the Transportation Corridor Agency, Orange County, California, the FHWA's Office of Real Estate Services reviewed several design/build projects. We interviewed officials from the State and FHWA Division offices, along with key individuals from the prime contractor's team, to determine "best practices" and the extent of any problems associated with these projects. As a result, the Department is now working with State and local transportation officials on the most effective means and times to implement a design/build approach.

#### *Cost-Plus-Time Bidding*

Another innovative construction approach is called cost-plus-time bidding, also referred to as the A+B method. This is a procedure that selects the low bidder based on a monetary combination of the contract bid items (A) and the time (B) needed to complete the critical portion of the project. This procedure is intended to provide a contractual incentive for the contractor to minimize delivery time for high priority and congested roadways by offering incentives for early completion and assessing disincentives for late completion.

#### *Lane Rental*

Lane rental is the practice of charging the contractor a fee for occupying lanes or shoulders during construction. Charges are based on hourly or daily rates and can vary with time of day, amount of traffic, and other measures of user costs. Similar to cost-plus-time bidding, lane rental provides strong contractual incentives for early completion.

#### *Major Project Oversight*

One cannot have a complete conversation about transportation project delivery without talking about the Department's oversight role. Although TEA-21 directed extensive delegation of approval authorities to the States for most Federal-aid projects, FHWA's oversight role on larger projects was enhanced. Section 1305(b) requires that projects with an estimated total cost of \$1 billion or more submit an annual Finance Plan, based on detailed estimates of the cost to complete the project and on reasonable assumptions of future cost increases.

Projects subject to this requirement have been labeled “major” or “mega” projects. However, FHWA includes in the major project category those projects designated “major” projects by senior management due to their complexity or a high level of interest by the public, Congress, or the Administration. Finance plans may be required for such projects even though their estimated total cost is less than \$1 billion.

Over the past 10 years, the number of projects greater than \$1 billion has grown and, at present, we have identified 14 active major projects across the country, including six that are at the stage of requiring an initial Finance Plan.

FHWA now has the benefit of “lessons learned” from some of the early major projects—construction of the Boston Central Artery/Tunnel (CA/T) project, reconstruction of I-15 in Salt Lake City, and the management of the Alameda Corridor—and we are putting these lessons to work. We have seen that the primary cost drivers of major projects, from the Plans, Specifications, and Estimates stage to completion of construction, are: (1) inflation, since many of these projects take years to complete; (2) phasing of the projects to use available funds; and (3) regional and national economic trends, since these projects are such large economic investments and typically stretch the available technology and industry abilities. We know that the most common factor leading to cost increases and delays for all major projects, especially in 2001–2002, has been the annual adjustment of project schedules to fit actual revenues available. Currently, as a result of the national economic situation and revenue shortfalls, States are readjusting their statewide programs, in some cases stalling major projects.

While cost overruns and schedule delays on major projects occasionally occur, we have seen notable successes as well. The Alameda Corridor project in Los Angeles, California, was a huge success in being completed on schedule and within budget. Also, the I-15 reconstruction project in Salt Lake City, Utah, was completed ahead of schedule, well before the opening of the 2002 Winter Olympic Games. Although the CA/T has been the subject of many controversies, it has resulted in important engineering and technological advances. Engineering innovations included new solutions for tunnel ventilation systems that have also been used to reduce the costs on the Cumberland Gap Tunnel project. When complete, the CA/T will link air, sea, rail, bus, and subway facilities, to facilitate local and regional economic growth, while providing environmental benefits, reducing traffic congestion, and improving traffic safety.

Our approach to improving management of major projects has been to continue to strengthen our oversight of all programs, while issuing certain specific requirements for major projects within the framework of existing laws and taking into account that each major project is unique in its complexity, sponsoring agencies, and contracting plans. This approach is consistent with the overall delivery of the FHWA program as a federally assisted, State-administered program.

#### *FHWA Stewardship and Oversight Policy*

Implementation of the restated FHWA Stewardship and Oversight Policy (issued June 2001) underpins all of our major project oversight actions. A key element in implementing the policy is to emphasize that all federally funded projects are subject to Federal oversight, even where State agencies have title 23 project approval authorities. FHWA has also committed to conducting risk assessments with States to identify strengths, areas needing improvement, and then prioritizing oversight activities accordingly. FHWA will trust, but verify. We must have confidence in the quality of a State’s products and processes, or we must work with the State to achieve appropriate improvement.

The Plan for Oversight and Management of Major Transportation Projects (issued October 5, 2001), provides that improved management of major projects will rely on the sound implementation of the restated FHWA Stewardship and Oversight Policy, FHWA technical assistance and technology deployment, dissemination of best practices information, industry and agency partnership activities, and specific initiatives for major projects in response to recommendations of the DOT Task Force on the Oversight of Large Infrastructure Projects (Report issued December 2000). The Division offices have lead responsibility for the delivery of FHWA programs and are assisted in oversight of major projects by the Major Project Team within FHWA Headquarters. The Divisions are building on a foundation already in place that consists of existing FHWA/State Stewardship agreements, the documented State project development and financial procedures, and the FHWA Financial Plan Guidance (issued May 2000). In addition, once a project is identified as a “major project” based on Division Office information, the Major Project Team begins tracking the project and increases FHWA Headquarters involvement following the environmental clearance of the selected alternative. Each major project will be reviewed at this stage

for unique features, or unique relationships between the project sponsors, that require additional documentation to clarify responsibilities and ensure that sound planning and management is implemented.

In response to the TEA-21 major project finance plan requirement, FHWA issued Financial Plan Guidance and, since then, the Division Offices and Headquarters have applied this guidance in the review of finance plans on seven projects. Key major project finance plan requirements include: project cost estimates must be prepared in “year of expenditure” dollars; agency accountability must be increased for the proposed financing in the plan; and significant changes to the project scope in the annual finance plan must be accurately disclosed. FHWA requires annual updates to the plans and obtains independent verification of the financial data provided by the States in these plans.

#### *Conclusion*

The upcoming reauthorization of the Federal-aid highway program gives us an opportunity to refine the appropriate Federal role in overseeing infrastructure projects, particularly the high-cost projects. As the Secretary has directed, we will focus on the management and performance of the system as a whole, while ensuring appropriate oversight for both project management and program performance.

We will look for ways to encourage well-managed State programs, without adding additional layers of Federal requirements. Our oversight procedures must harmonize with our efforts to streamline project approvals and expedite project delivery.

The bottom line is: improve oversight and accountability for the expenditure of public funds, without negatively impacting the ability of States and local governments to deliver their programs. Together with Congress, we will define what our role should be and how we carry out our responsibilities.

Mr. Chairman and members of the committee, thank you again for the opportunity to testify before you today. I look forward to responding to any questions you may have.

---

#### STATEMENT OF JOHN PETER SUAREZ, ASSISTANT ADMINISTRATOR FOR ENFORCEMENT AND COMPLIANCE ASSURANCE, U.S. ENVIRONMENTAL PROTECTION AGENCY

Mr. Chairman and members of the committee, I am J.P. Suarez, Assistant Administrator for OECA. Thank you for inviting me to appear before you today to discuss project delivery and environmental stewardship under the Transportation Equity Act for the 21st Century (TEA-21). I understand the committee is particularly interested in EPA's contribution to the environmental streamlining called for in Section 1309 of TEA-21.

I am pleased to be here today as this is the first time I have testified before you since my confirmation. I look forward to a productive relationship with this committee and to working with you as you consider reauthorization of the TEA-21 legislation. As you know, I am responsible for EPA's National Environmental Policy Act (NEPA) program. In addition to OECA, other EPA programs have an interest in various TEA-21 provisions, such as those related to congestion management and air quality. My remarks today will focus on how EPA has incorporated the provisions of Section 1309 into the NEPA program.

EPA embraces the streamlining provisions of Section 1309. We are committed to working with our Federal and State partners to better serve the American people with faster yet environmentally sound, transportation decisions. We are bringing our special expertise to bear earlier in the transportation decisionmaking process to improve the quality of analysis, protect the environment, and speed project approvals. We have put new staff in key positions: we hired a manager with Federal Highway Administration (FHWA) experience for EPA's regional NEPA office in California; and, in Texas, another State with a large number of highway projects, the regional office placed an EPA NEPA employee in the Texas Department of Transportation (DOT) office. In several key States, we are able to provide more timely and sustained assistance on State priority projects thanks to the additional personnel funded by State DOTs that Section 1309 allows. While it is too early in the process to measure time savings for many of these efforts, we are confident that we will be able to quantitatively demonstrate the value of these investments in the near future.

Interstate Highway 69, a proposed 1600-mile across-America highway—from Mexico to our border with Canada—is a good example of EPA's current effort to expedite a specific national priority project. Three EPA regions are coordinating with the FHWA and seven State DOTs to identify and resolve environmental issues at the

earliest possible stage. On February 22, 2002, the EPA Regions sent one set of coordinated and consistent pre-Environmental Impact Statement (EIS) technical comments to the many highway offices and Federal agencies working on project design. The EPA regions are also providing technical assistance to the State DOTs with geographic mapping of sensitive resources to improve and streamline the environmental impact analyses. In fact, Arkansas estimates that in one recent case use of GIS and early coordination cut in half the time needed to complete the NEPA process.

While EPA has devoted considerable energy to implementing Section 1309, we realize there needs to be more progress before we have a truly streamlined transportation review process. Both we and our State partners recognize that it takes an up-front investment to produce a pay-off. Initially, having all the stakeholders at the table well ahead of the Draft EIS takes more time on the planning end. However, indications are that well-planned projects do move faster once the environmental documentation is completed. FHWA's statistics show that 1 year has been shaved off the median time to process environmental documents for major projects since passage of TEA-21. And, we are encouraged that newer tools such as geographic information system analysis are starting to have a marked impact on the speed of the environmental analysis.

As we work more closely than ever with FHWA and with the State DOTs, formal agreements are being cooperatively negotiated that set the stage for future early involvement and technical assistance on individual projects. Within a year of TEA-21's enactment, EPA had expanded the model process developed with the mid-Atlantic States, FHWA and our other Federal and State partners to streamline the environmental review of transportation projects. The Mid-Atlantic Transportation and Environment Process, also known as the MATE Process, resulted in a formal agreement that commits all parties to a timely, cost-effective, and environmentally sound transportation project development process. This agreement is supported by specific project development and agreement steps and specified input and concurrence points to avoid future gridlock. The mid-Atlantic States are funding four EPA positions through streamlining agreements between EPA and the individual States.

In addition to the MATE process in the Mid-Atlantic, other EPA regional offices have signed a variety of streamlining agreements tailored to the needs of individual States. For example, last year EPA and the California DOT (CALTRANS) signed an MOU for the review of California's priority transportation projects. TEA-21 substantially increased the number of transportation projects in California, and through this agreement CALTRANS ensures increased EPA early involvement in project planning and development. Early involvement reduces delays at the later stages of project review resulting from interagency disagreements. It also ensures that critical resource issues are identified and analyzed, which can reduce the time lost to third-party litigation on the adequacy of the NEPA documentation. This MOU followed a July 2000 agreement (the Mare Island Accord) which has resulted in improvements such as joint training of EPA and CALTRANS staff. Joint training has long-term benefits by ensuring that the staff in both agencies have a shared understanding of each agency's requirements and the analytical processes that are needed to ensure a review that will meet all statutory and regulatory requirements.

Another outgrowth of the Mare Island Accord is a pilot project to which CALTRANS, EPA, FHWA and the Merced County Association of Governments have committed staff and funding. The Merced Partnership for Integrated Planning will update the STET regional transportation plan taking into account environmental requirements; this project is supported with a geographic information system analysis and is intended to become the model for regional transportation planning California-wide.

In Oregon, EPA and the State have formally agreed to prescribe and implement a specific process for resource agency involvement and streamlining. And, after the Washington State Legislature passed its Environmental Permit Streamlining Act last year, EPA became an active partner in developing and implementing streamlined processes in that State. Additionally, EPA is serving as a cooperating agency with the Kansas DOT on the U.S. 59 project and on the I-70 Second Tier studies in Missouri. EPA and the Minnesota DOT are working under an MOU to streamline the approval process for the 169 Trunk Highway.

Our stronger relationship with the States is exemplified by our participation in streamlining discussions at many of the American Association of State Highway and Transportation Officials (AASHTO) Planning and Environment Committee meetings. We greatly appreciate the State association's invitation to meet and their willingness to discuss our experiences with streamlining. EPA certainly benefits from hearing directly from State DOTs about their successes and frustrations in dealing with us! This level of direct discussion with AASHTO members has come about

since the passage of TEA-21, and we believe results from Congress' emphasis on streamlining. EPA also is participating in the development of AASHTO's Center for Environmental Excellence. This Center holds great potential for sharing expertise across agency and State boundaries on a quick-turn-around basis, another result of the improved collaboration streamlining has engendered.

One very encouraging sign EPA has noted since the passage of TEA-21 four years ago is the growing endorsement of environmental stewardship by the State DOTs. Half of our State DOT partners are formally supporting AASHTO's Environmental Stewardship Demonstration Program. This program has tremendous potential from an environmental, transportation and financial perspective. New York State, for example, has found that by mulching land adjacent to highways, the State saves mowing costs while preventing stream damage from runoff. The more we can build environmental considerations into all aspects of transportation planning and delivery, the better we will serve the American public by providing environmentally sound transportation solutions.

At the national level, EPA has taken a number of steps to promote streamlining since the passage of Section 1309. A National MOU on Environmental Streamlining set the stage for a number of specific initiatives, including EPA's early involvement in the planning and scoping of projects and EPA's active participation in streamlining pilots. EPA participates in FHWA's streamlining committee, and is working with FHWA to develop guidance and training on streamlining. We have helped train Federal resource agencies on drafting streamlining MOUs with State DOTs to strengthen relationships in the field and improve project management. We continue to encourage our regional offices, where most NEPA reviews are done, to work with their States to obtain funding for positions and technical support. These resources are providing intensive expedited attention to State priority transportation projects.

EPA is also working with FHWA in its effort to develop training for Federal agencies and State DOTs on Alternative Dispute Resolution. This training, expected to start next Spring, will ensure that disagreements during the project review process can be identified and swiftly resolved.

In conclusion, I would like to endorse the critical role NEPA plays in coordinating environmental requirements. NEPA has served the American public well for 30 years by providing full disclosure of the impacts of major Federal actions and requiring an examination of alternative ways to achieve a project's purpose. EPA is committed to streamlining as the way to make NEPA even more effective through a more efficient and timely process.

Thank you for the opportunity to testify today. I would like to work with you as you continue to promote environmental stewardship and streamlining. These efforts are good for the environment and the economy, and they allow EPA to focus our resources where we can achieve the best results.

I look forward to responding to any questions you may have.

---

RESPONSES OF JOHN PETER SUAREZ TO ADDITIONAL QUESTIONS FROM SENATOR  
CARPER

*Question 1.* Can you discuss the relationship that EPA has with the States and the use of Section 1309 funds to provide additional personnel for environmental review of State priority projects?

Response. EPA generally has a good working relationship with the State DOTs. State reaction has varied widely to EPA suggestions to use TEA-21's Section 1309 authority to fund dedicated positions to streamline the environmental review process. Currently, 6 States fund a total of 8 EPA positions, and one State provides funding for EPA technical assistance. Several States are considering increasing the number of Federal positions or providing one for the first time. Some States do not believe that EPA's review creates significant timing issues, and many rely on the concurrence points laid out in the NEPA/Clean Water Act Section 404 merger process to define issues earlier in the process and achieve shorter review timeframes. EPA believes that the more complex or controversial projects benefit from State investment in additional EPA personnel focused on their priority projects, especially in those States with a heavy transportation workload where EPA's resources are spread across a number of projects, and we will continue to pursue these arrangements.

*Question 2.* Can you discuss the President's Executive Order regarding NEPA and transportation project delivery? How do you think this Order will affect your agency's ability to fulfill its mission?

Response. The Executive Order on Environmental Stewardship and Transportation Infrastructure Project Reviews was signed by the President on September 18,

2002. It sets up a Federal Task Force, including EPA, to expedite the review of selected transportation projects. EPA looks forward to working with our fellow departments and agencies to focus attention on projects of national priority which we hope can serve as models of streamlining for other projects. While the Executive Order will require EPA to focus additional resources on the priority projects in the short term, we expect that the lessons learned from these projects will produce longer term savings as we apply these lessons to streamlining future transportation projects.

---

RESPONSES OF JOHN PETER SUAREZ TO ADDITIONAL QUESTIONS FROM SENATOR VOINOVICH

*Question 1.* What is the process to establish formal agreements between the EPA, the Federal Highway Administration, and State DOTs?

Response. There are formal agreements for streamlining that do not involve transfer of funds as well as those which do. There is no set process for either, but EPA helped the Federal Highway Administration develop guidance for our respective staffs and the State DOTs on establishing formal streamlining agreements. The guidance is on FHWA's website at:

The guidance explains requirements for use of TEA-21's Section 1309 funding authority and suggests how to structure a formal agreement to produce the desired results. A State wishing to use Federal-aid funds to pay for another agency's costs submits a request to FHWA and should have a formal agreement in place with that agency once funds are approved. FHWA's website also has examples of agreements between Federal agencies and State DOTs, and my office maintains a file of current EPA agreements to assist EPA's regions as they develop new ones with States.

Many formal agreements do not involve a transfer of funds and only require the signatures of the agencies involved. In addition to one-on-one agreements with States, such as EPA's wetlands banking agreement with PA and our transportation stewardship agreement with OR, EPA is a signatory to a multi-State agreement, the Mid-Atlantic Transportation and Environmental Streamlining Process (known as MATE). MATE was developed with PA, MD, DE and WV DOTs as well as State and other Federal resource agencies. The MATE agreement applies to the entire project planning and development process and provides for integrated permitting and environmental review processes. MATE was the result of an extensive mapping of the various decision points needed to complete the environmental review of a project and determining when each agency needs to concur to streamline decision-making.

*Question 2.* In your testimony, you claimed that some of the benefits of an agreement between the California DOT and the EPA were due to joint training of the Federal and State agency staff. Is this a new innovation? Is it being applied in other agreements? Are there other examples of innovations that you could share with the committee that have streamlined the transportation review process?

Response. While not a new innovation, EPA and its State partners are increasingly recognizing the value of joint training of our staffs. Interagency training helps establish a common knowledge base and provides opportunities for networking and building relationships. Some EPA NEPA training includes staff of other Federal agencies, as well as the State DOTs, providing even greater cross-fertilization.

An important innovation in streamlining is the NEPA/Clean Water Act Section 404 merger process used by EPA, State DOTs and our Federal partners to coordinate early on transportation projects and avoid duplication and reconsideration of issues as a project progresses. This is the key streamlining tool used by many States and EPA where there is no specific streamlining or funding agreement in place. In EPA's Region 5 (upper mid-West), for example, agencies benefit from the concurrence process set up under the merger agreement and several State DOTs use this process routinely to work more efficiently with EPA on their transportation projects. (EPA's Region 5 office notes, though, that staffing and/or travel assistance from the DOTs would allow for more up-front involvement and opportunities for early resolution of issues.)

*Question 3.* As one of the steps at the national level to promote streamlining, you stated that the EPA is encouraging its regional offices, which mainly do the NEPA reviews, to work with their States to obtain funding for positions and technical support. How big of an issue is State funding in causing transportation review delays? How have States been responding to requests from EPA regional offices for additional funding?

Response. State funding or lack thereof can be a big issue in streamlining the review of transportation projects. In those States which have a large number of

projects underway, or one or more complex or highly controversial projects, having State funding support is critical for EPA to provide early and sustained involvement on State priority projects. EPA has approximately 15 FTE nation-wide devoted to NEPA reviews of highway projects, plus 8 positions funded under Section 1309. In any given year, EPA receives about 100 draft and final EISs for transportation projects and reviews a number of Environmental Assessments. In heavy workload States not providing assistance, EPA finds it difficult to be involved prior to receiving the draft EIS. With little or no EPA involvement prior to the draft EIS, projects may be delayed if EPA's review uncovers issues that could have been resolved during the scoping process for the project. If EPA is involved while projects are being planned, we can bring our expertise to bear and work with DOTs to choose transportation routes and options that minimize environmental impacts and mitigation costs while providing needed transportation solutions.

As noted under Senator Carper Question #1, State DOT response has varied widely to EPA suggestions for additional funding. Those States which (1) have the heaviest workload, (2) have invested in streamlining at the State level and (3) which perceive EPA's review to create timing delays are the most open to funding EPA positions or technical assistance. As other States see the benefits the States providing funding are achieving, it is likely that more will do so. In addition to the 8 positions and one State's funding of EPA technical assistance, several other States are considering increasing the number of funded positions or providing one for the first time. In the meantime, EPA will continue to promote streamlining and look for ways to achieve greater efficiencies with our current resources. Reauthorization of Highway and Transit Programs:

---

STATEMENT OF HON. KENNETH M. MEAD INSPECTOR GENERAL, U.S. DEPARTMENT OF TRANSPORTATION

Mr. Chairman and members of the committee: We appreciate the opportunity to participate in the committee's preparation for reauthorization. I commend the committee for examining project delivery and environmental streamlining issues. Although meeting environmental requirements can take a significant amount of time, delays can occur throughout any project's planning, design, and construction phases for any number of reasons. We know of no panacea that will prevent all problems. However, our work has shown that effective management and oversight can help prevent avoidable problems, and mitigate the cost increases and schedule delays when problems do occur.

Today, I want to discuss a series of steps that can be taken in the reauthorization to improve management and oversight, and facilitate the delivery of projects to taxpayers approximately on budget, on schedule, and free from fraud. These steps are (1) refocusing Federal Highway Administration's (FHWA's) oversight to ensure State programs operate effectively and projects of national significance are well managed, (2) promoting the use of proven project management tools, and (3) strengthening efforts to prevent fraud, waste, and abuse. Of course, whether moneys are lost to cost overruns, schedule slippage, or fraud, the result is the same—fewer resources remain for transportation projects.

The Transportation Equity Act for the 21st Century (TEA-21) provided record levels of transportation funding for highways and transit, with the investment almost doubling, from \$23 billion in fiscal year (FY) 1997 to nearly \$39 billion this fiscal year. The combined Federal, State and local investment in highways and transit during the 6-year period of TEA-21 will exceed \$500 billion—an average expenditure of more than \$225 million a day.

Although the recent economic downturn has reduced Federal and State transportation funding streams, the demand for investments in transportation infrastructure remains great. For example, the 14 active FHWA large projects are estimated to cost more than \$39 billion. FHWA also has identified another 21 large projects on the drawing board that are expected to cost over \$32 billion, and 22 large corridor projects that will cost over \$44 billion. For fiscal year 2003, the Federal Transit Administration (FTA) is requesting funding for 34 new starts projects valued at a total cost of \$21.2 billion.

Managing the construction of large projects, especially in densely populated urban areas, has become much more difficult over the last several decades. Specifically, project managers are faced with such factors as having to maintain traffic flow and commerce during construction; meet environmental and historic preservation requirements; and incorporate intermodal capabilities. Financing large projects has also become a much more difficult proposition because it can often involve complex

financial techniques, such as structured bonding, innovative financing mechanisms, and private equity investments.

These issues affect not only billion dollar projects, but often those in the hundreds of millions of dollars as well. Changing conditions have materially affected project delivery and have wide-ranging implications for the approaches and staffing of FHWA, FTA, the States, and grantees. However, improving project management and delivery can provide significant benefits. For example, increasing the efficiency with which \$500 billion is spent by only 1 percent provides an additional \$5 billion—an amount equal to 4 of the 14 active FHWA large projects.

The States have generally developed the capability to meet their responsibilities, and we have reviewed a number of large projects that stand as examples of good project management—projects such as Utah’s I-15, New Jersey’s Hudson Bergen Light Rail project, and the Alameda Corridor in California. In contrast, we have reviewed projects in which management and oversight were ineffective, leading to significant cost increases, financing problems, schedule delays, and technical or construction difficulties. These projects include the Central Artery, the Woodrow Wilson Bridge, the Springfield Interchange in Virginia, Puerto Rico’s Tren Urbano, the Los Angeles Metro Red Line, and the Seattle Central Link. In each of those cases, project management has agreed to take action to correct the deficiencies we reported. We are in the process of conducting follow-up work on several of the projects.

Our testimony today is based on audit reports we have issued on 18 large highway and transit projects, our ongoing work, as well as significant criminal investigations we carried out with the Justice Department.

Overall, we see several opportunities to improve project delivery in the reauthorization by:

- Refocusing FHWA’s oversight to ensure State programs operate effectively and projects of national significance are well managed.
- Recognizing that the interstate system was largely completed, and that States and localities know better what is needed for their citizens, Congress delegated responsibility for project selection and execution to the States during the 1980’s and 1990’s. The States have improved their capability to manage their transportation programs, including engineering expertise. However, FHWA has historically continued to focus most heavily on oversight of engineering and contract issues, rather than on oversight of management and financial issues. To a large extent, FHWA defers to the States for both the implementation and oversight of federally funded transportation programs. Although FHWA has taken several steps to improve its stewardship it has not completed the transition from its traditional role of reviewing and approving contract level actions, to a new higher-level role of conducting reviews to ensure the effectiveness of the States’ processes in areas that are major project drivers, such as financing, controlling project-level costs, schedule performance, transportation planning, and maintaining accountability over funds.

Because FHWA remains focused on detailed engineering activities, rather than developing a more multi-disciplinary staff and higher level approach to oversight, it has sometimes missed larger management issues. For example, FHWA approved thousands of design changes on the Central Artery, but was caught unaware when the project’s cost increased by \$1.4 billion.

Among the actions that would promote more timely and efficient project delivery are:

- Clarifying FHWA’s role to ensure it is focused on the programs and processes in which States use Federal highway funding, rather than on detailed, contract level reviews and approvals. On projects costing more than \$1 billion, FHWA must have clear direction to monitor and ensure these projects of national significance are kept on time and on budget.
- Delegating detailed contract and project actions to the States and refocusing FHWA on independently monitoring State management processes, rather than approving detailed contract level actions. For example, FHWA still performs many detailed contract administration actions, such as approving contract change orders and the location and wording of highway signs.
- Requiring FHWA to report on the skills and competencies it needs to implement a process and program oriented oversight program. Reflecting its historical focus on engineering issues, the current FHWA staff mix is dominated by engineers (see Chart). Engineering skills will remain important, but on today’s projects a more multidisciplinary staff will be needed. This is not to suggest FHWA needs more staff. A strategy for achieving a more multidisciplinary approach to oversight activities within current staffing levels could include a mix of actions such as hiring staff with private sector project management skills, that is, financing, program analysis,

and cost estimating; streamlining and delegating project-level approvals to the States so staff time can be refocused on overseeing higher-level management and financial issues.

- On a selected basis, allowing FHWA to emulate FTA's approach to overseeing large, significant, projects through project management oversight contractors (PMOCs) and financial management oversight contractors (FMOCs). This approach helped FTA become one of only a few agencies to get off the General Accounting Office's "High Risk List." The use of PMOCs and FMOCs needs further fine tuning, which we are working with FTA on, but overall it is a sound approach to project oversight.

- Promoting the use of proven project management tools. In reviewing large projects, we have identified a number of tools that can help managers keep projects approximately on time and on budget. These tools include reliable costs estimates, project finance plans, achievable State transportation program plans, and integrated master schedules. When managers look to attract investors to participate in financing large infrastructure projects, reliable information is essential to make appropriate disclosures. Finally, information is critical for policymakers as they decide which projects would be the best use of resources to address transportation problems and promote economic development.

We have found several troubled highway and transit projects and programs in which these tools were not used, or were not used effectively. For example, several large projects were not using the full capability of their schedule tools, and thus, did not have the information needed to deal with the inevitable schedule conflicts that arise in complex projects employing multiple contractors.

Actions that could promote more timely and efficient project delivery include:

- Expanding the use of project finance plans to include other projects that can strain a State's capability. Finance plans provide senior program and oversight officials with the comprehensive information needed to make appropriate financial decisions regarding the projects. Our work has shown that requiring finance plans for projects costing more than \$1 billion in TEA-21 was a very wise decision on the part of Congress.

On the other hand, projects costing less than \$1 billion can also burden a State's management resources. The threshold for requiring plans could be reduced to \$500 million. In States that have smaller highway programs, projects costing less than \$500 million may be difficult to undertake. An alternate threshold could be to require finance plans for projects costing more than half a State's apportionment. We also suggest, however, that there be some limits on finance plan requirements, such as exempting projects with minimal Federal participation or any project less than \$100 million regardless of the percentage of State apportionment. FHWA should continue to approve the plans for each project costing more than \$1 billion, and should review States' processes for preparing finance plans on other projects.

- Requiring FHWA to establish baseline cost estimating standards for all projects exceeding \$100 million or 50 percent of a State's annual apportionment, and to ensure that cost growth on large projects is monitored and controlled. Presently, FHWA has established no detailed standards for preparing cost estimates on projects under \$1 billion.

- Requiring large projects to use integrated resource loaded schedule tools and earned value project measurement techniques. Given the complexity typical of large projects, problems with one contractor can have a domino effect that delays the overall project delivery. Integrated, resource loaded schedules can help to identify schedule conflicts and prevent or mitigate delays, thereby reducing cost increases.

- Requiring FHWA to develop and implement systems to provide timely information on the performance of State programs and large projects. FHWA's information system tracks only costs by individual project segment and each entry overwrites previous data. Consequently, to develop nationwide reports, such as identifying the status of large projects, FHWA must request data from each State and combine the data manually. Having timely, consistent information would enable FHWA to better analyze trends, such as might be found by comparing program-wide statistics on State planning, project delays, or cost increases beyond initial estimates on large-dollar highway projects.

- Improving efforts to prevent fraud, waste, and abuse. Congress, the Federal Government, and State governments are all concerned with preventing fraud and abuse in transportation projects. Secretary Mineta has also recognized that DOT needs to develop better mechanisms to prevent and detect fraud, waste, and abuse. As he has said on numerous occasions "My credo on waste, fraud and abuse is simple: If the project calls for concrete and it's a 10-sack job, we at [the Department of Transportation] DOT are going to be sure we don't end up with a 7-sack job."

Our work does not suggest abuse on a scale such as was experienced in the 1950's and 1960's. Nonetheless, in the last 3 years, since the increases in funding in TEA-21, we have seen significant increases in our fraud case work and judicial actions involving highways and transit. Overall, from 1999 to 2001, indictments based on our highway and transit fraud investigations increased from 12 to 39; convictions increased from 12 to 26; and monetary recoveries increased from \$15.8 million to \$43.2 million (see chart). Those include some of the biggest cases in the history of the highway program. At present, we have 106 pending investigations of contract and grant fraud involving highway and transit projects in 37 States.

The types of fraud we are commonly seeing today include activities such as bid rigging, bribery and kickbacks, false claims, product substitution, and disadvantaged business enterprises (DBEs). For example:

- This month (September), two construction companies pleaded guilty to separate charges of making false statements to the Government in their bids on separate Federal highway construction projects in North Carolina. The companies had shared their bid prices with an unnamed competitor after certifying that they would not disclose bid prices to any other bidder or competitor before the sealed bid opening. The two contractors subsequently were awarded contracts for about \$1.6 million and \$3 million. Sentencing is pending, but each company faces a maximum corporate fine of \$500,000 that may be increased to twice the gain derived from the crime or twice the loss suffered by the victims of the crime, if either amount is greater than the statutory minimum.

- One of the most significant highway fraud cases occurred in Illinois. The scheme, which ran from the mid-1980's until 1996, involved both fraud and bribery. The owners of two companies and several of their employees altered equipment in their production plant to overstate the amount of materials (like asphalt) delivered to various highway projects. To conceal their activities, they bribed the State engineer by building the engineer's summer home. As a result, FHWA permanently debarred six companies and individuals from participating in federally funded road construction projects. In addition, the participants had to pay about \$15 million in fines and restitution and faced sentences ranging from 3 years probation to 21 months in jail.

- Two minority business enterprises (MBEs) admitted they acted as fronts for contractors on public projects. This was one of the largest MBE frauds in U.S. history, involving approximately 60 fraudulent MBE subcontracts with a total value of over \$40 million. Approximately 46 subcontracts totaling \$26 million were on contracts let by Department of Transportation grantees, including projects to repave area highways and rehabilitate transit stations.

The States are the first line of defense in preventing such fraud, and we have been working closely with a number of State Inspectors General and State auditors on our fraud investigations. The Office of Inspector General, FHWA, and FTA have implemented many initiatives to protect major investments in infrastructure programs. For example, we co-sponsored two National Fraud Conferences on Highway Construction and Related Programs with the American Association of State Highway & Transportation Officials (AASHTO), American Public Transportation Association (APTA) Internal Audit Committee, FHWA and FTA, and the Missouri and Georgia Departments of Transportation. Secretary Mineta personally addressed the conference we held this past May to emphasize the importance of fraud prevention. We have also increased the number of special agents working fulltime on fraud investigations involving highway and transit infrastructure programs. Finally, we provided fraud awareness briefings to over 10,500 Federal, State, and local officials, law enforcement agencies, and industry organizations.

Preventing losses to fraud will make additional resources available for improving project delivery. Some States and even large transit authorities have established Offices of Inspector General or Offices of Audit to detect and prevent fraud and abuse. In our work, we have heard from several State officials that the pressure to fund "concrete and steel" projects sometimes makes it difficult to provide resources for oversight and fraud prevention. During the reauthorization, Congress should consider ways to help States fortify their oversight and fraud prevention efforts with dedicated funding, separate from funds used for constructing transportation projects.

A possible source of funding may be to allow States to retain monetary recoveries resulting from Federal transportation infrastructure enforcement actions. Normally, fines and recoveries from such judgments are returned to the Federal Treasury. Since the States programs are damaged by the fraud that leads to the enforcement action, sharing in the recoveries would help them restore their programs and provide support for further fraud deterrence efforts.

An example of this occurred in a civil settlement with Contech Construction Products, Inc., and Ispat-Inland, Inc., which was a case involving product substitution in the State of Louisiana. The companies substituted sub-standard polymer-coated steel culvert pipe used in highway and road construction projects from 1992 through 1997. Under the settlement agreement, the United States and the State of Louisiana shared in a \$30 million recovery.

That concludes my prepared remarks. I would be glad to answer any questions you may have.

---

RESPONSES OF KENNETH MEAD TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question 1.* In your written testimony, you cite three examples (Utah's I-15, New Jersey's Hudson Bergen Light Rail Project, and the Alameda Corridor in California) of good project management. Could you provide the committee with your insights into why these projects were well managed? Are there themes of good management practices that are common among these projects?

Response. These projects are examples of good management in that they were completed substantially on time, on budget, and with no known major instances of fraud or corruption. Our reviews found no significant problems or deviations from good management practice, although we did make suggestions to improve project controls in several instances. We did note some common characteristics which, we believe, contributed to their overall success.

First, all three projects prepared finance plans or analyses that contained financial data similar to finance plans. In two cases, the projects provided this detailed information about costs, funding sources, cash-flows, schedules even though they were not required to do so. We have identified finance plans as a key management tool that helps projects stay on track.

We also found that reliable and even conservatively developed cost estimates was a common management practice in these projects. The cost estimates consistently included reasonable estimates for all anticipated cost elements, and reflected appropriate contingency reserve to account for risks.

These projects also applied disciplined management practices, including controls over costs and schedules and detailed tracking and reporting of progress compared to plans. The I-15 project created an internal audit function that reviewed controls to ensure they operated effectively. The Alameda Corridor Project even hired an internal auditor who reported directly to the agency director, rather than to a division manager.

Each of the projects also used, in one form or another, a "design-build" contracting approach. Under design-build, one contractor is selected to both design and construct the project. This is in contrast to the more traditional approach of hiring one contractor to design the project, and then soliciting bids from other contractors to build the project as designed ("design-bid-build"). One of the benefits of design-build contracting is that, by using only one contractor, the conflicts and delays that result from disagreements between multiple contractors can be reduced. Design build is not a panacea because we have identified other design build projects that have encountered problems. However, it appears that, properly managed, the design build concept has significant potential.

*Question 2.* Given the constraints of making major personnel changes over a short time, what actions can the Federal Highway Administration take to improve the quality of oversight that FHWA provides? What long-term skill sets need to be in place at FHWA and how can we get those in place?

Response. DOT has begun the process of improve the quality of FHWA's oversight. In June 2001 FHWA issued its Stewardship and Oversight Policy and, in October 2001, an action plan for implementing that policy. The policy calls for FHWA Division Offices to conduct risk assessments of State programs and to periodically review State management processes to ensure they are effective. The most important short-term action for FHWA is to implement its new policy effectively.

Another near term action that would improve the quality of FHWA's oversight would be to begin to improve the agency's management information systems. Reliable data to support in-depth analyses of program performance is essential to improving oversight. However, over the years, we have found that FHWA lacks the data needed to understand the reasons for project delays and cost increases on highway projects. For example, FHWA's information system cannot track changes in project costs or the reasons for cost increases. For example, FHWA was unable to answer Congress when it requested that FHWA identify projects of \$10 million or more that had cost increases of 25 percent or more.

Turning to the skill sets, engineering skills will remain important, but FHWA needs to strengthen its capability in other important areas such as financial planning and budgeting, controlling project-level costs, program analysis, transportation planning, and maintaining accountability over funds. For example, complex financing approaches such as equity financing and grant anticipation notes require sophisticated finance skills. To determine the needed skills will require FHWA to re-examine the activities it should be performing and to analyze the types of skills and number of people needed to perform the required functions. Once required skill levels are identified, FHWA should develop a staffing plan to effectively meet the needs of the agency.

A strategy to obtain the necessary skills should include a mix of actions such as hiring staff with private sector project management skills such as financing, program analysis, and cost estimating; streamlining and delegating project-level approvals to the States so staff time can be refocused on overseeing higher-level management and financial issues; and perhaps adapting FTA's approach of hiring contractors to provide needed expertise.

*Question 3.* What are your thoughts on the mission of the FRA? What improvements need to be made to FRA if Congress was to make a major thrust of its reauthorization effort the revitalization of rail freight and passenger rail?

Response. FRA's stated mission is to promote "safe, environmentally sound, successful railroad transportation to meet current and future needs of all customers." Because economic and competitive issues, including entry and exit from markets and infrastructure investments have, in the past, been the province of the Interstate Commerce Commission and the Surface Transportation Board, FRA's focus has tended to be on railroad transportation safety and research.

Any approach to improving rail freight and passenger services would need to include significant investments to expand existing rail infrastructure. If Congress were to assign FRA responsibility for directing major Federal involvement in railroad infrastructure investment, FRA would need to develop the capability to provide effective stewardship and oversight of those investments. FRA is not currently a grant-making institution in the mold of the Federal Transit Administration or the Federal Highway Administration. As a result, if infrastructure investments were made through grants, FRA's capacity for and expertise in analyzing, approving, and overseeing grants would need to be strengthened. Furthermore, the best practices we have noted in other surface grant-making programs, such as requirements for finance plans and continuous project management and financial oversight, should be essential elements of any new FRA programs.

## **HIGHWAY INFRASTRUCTURE**

### **Preliminary Information on the Timely Completion of Highway Construction Projects**

Statement of Katherine Siggerud  
Acting Director, Physical Infrastructure Issues

---

GAO-02-1067T

---

Mr. Chairman and Members of the Committee:

We appreciate the opportunity to testify today on the timely completion of highway projects that receive federal financial assistance from the Federal Highway Administration (FHWA) under the Transportation Equity Act for the 21st Century (TEA-21). My testimony today will discuss (1) the time involved in planning, gaining approval for, and constructing federally financed highway projects; (2) events that arise that affect completion time; and (3) federal and state initiatives to improve the completion times of highway projects.

The United States is the most mobile nation on the planet. Constructing, improving, and repairing roads and bridges is fundamental to meeting the nation's mobility needs to facilitate commerce, national defense, and pleasure use and to promote economic growth. Therefore, it is important that highway projects using federal financial support are completed in as timely a manner as possible. My statement presents preliminary results of our ongoing work for this committee on the construction of new roads. My statement is based on our review of federal laws and regulations governing the construction of federally funded highway projects; studies and other analyses of the time it takes to complete new federally financed roads; and discussions with various federal agency officials who have responsibilities relating to the construction of federally financed roads, transportation engineering organizations, transportation professional associations, and state transportation officials in seven states. We also reviewed the time it took to complete six new highway construction projects in California, Florida, and Texas.

Federal and state governments do not maintain information centrally (or, in some cases, at all) on the time it takes to complete highway projects; and there is no accepted measuring stick with which to gauge whether project performance is timely. Our discussion of the typical amount of time it takes to complete major construction projects that involve building new roads is based on a best estimate prepared by FHWA. According to FHWA, it based its estimate on the professional judgment of its staff and several state departments of transportation. We also discussed typical times to complete major new highway construction projects with several professional associations and state departments of transportation. In those instances where they had anecdotal information, their estimates fell within the FHWA time frames. (See app. I for additional details, including how we picked the six projects to review.) We are continuing to examine this issue and expect to report to you on the final results of our work in Spring 2003, to aid in your consideration of the reauthorization of TEA-21.

In summary:

- According to FHWA, and based on its professional judgment, it typically takes from 9 to 19 years to plan, gain approval for, and construct a new, major federally funded highway project that has significant environmental impacts. However, these projects constitute only about 3 percent of all federally funded projects, according to FHWA. These highway projects are often carried out in four phases. (See table 1.)

**Table 1: Typical Time Necessary to Complete a Federally Financed Major New Construction Highway Project**

| Phase                                       | Time to complete, in years |
|---|----------------------------|
| Planning                                    | 4-6                        |
| Preliminary design and environmental review | 1-5                        |
| Final design and right-of-way acquisition   | 2-3                        |
| Construction                                | 2-6                        |
| <b>Total</b>                                | <b>9-19</b>                |

Note: The durations of the phases are approximate. The preliminary design/environmental review steps and the final design/right-of-way acquisition steps often overlap.

Source: FHWA.

The time required varies with the size of the project, its complexity, and the public interest in the project. Some projects may take as few as 3 years or as many as 20 years or more to complete. The six new highway construction projects that we reviewed ranged from a \$1.7 million project in Florida to upgrade an existing dirt road to a two-lane paved road, which took 8 years to complete, to a \$50 million project to build a six-lane, 15 mile divided highway in Texas, which took over 15 years to complete (excluding the planning phase, for which information was not available). Constructing a new, major roadway typically takes this long to complete because there can be as many as 200 major steps involved throughout a project's life, with approvals or input required from a number of federal, state, and other stakeholders.

- Not surprisingly, officials in federal and state agencies and other knowledgeable organizations indicate that delivering larger, more complex or controversial projects may take longer to complete than is typical for most highway projects. In addition to needing more time because of their size and complexity, they often take longer to complete because they must comply with more federal and state requirements and because of the public interest that they may generate. A survey of 33 state departments of transportation conducted by the American Association of State Highway

---

and Transportation Officials agree that larger projects take longer to complete.<sup>3</sup> However, both our work and the association's survey are based on anecdotal information and officials' memories, as no federal or state baseline information exists on how long highway projects take. While there are many reasons for new highway construction projects to take a long time to complete, most studies on the topic focused on the timely resolution of environmental issues to improve project completion times, rather than examining all aspects of highway projects. The officials we contacted generally stated that environmental reviews resulted in better project decisions, but reaching those decisions was difficult and time consuming, complicated by such factors as incomplete permit applications, limited resources at environmental agencies, and environmental opposition to projects.

- Federal and state agencies have undertaken several initiatives to improve completion times for highway construction projects. Most of these initiatives address opportunities for reducing the time required to obtain environmental approvals. For example, FHWA is working with federal agencies that conduct environmental and historic preservation reviews to promote uniform practices and to clarify and update guidance. At the state level, according to FHWA, 34 states are using interagency funding agreements to hire additional staff at state and federal environmental agencies to facilitate environmental reviews and approval. With respect to nonenvironmental issues, North Carolina and Texas, for example, are identifying utilities that need to be moved earlier in the design phase than was previously done. This is intended to reduce delays during the construction phase. Texas and Florida are providing monetary incentives to contractors to finish construction more quickly.

---

## Background

In fiscal year 2001, FHWA obligated over \$20 billion to the states for roadway projects.<sup>4</sup> Generally, states are required to use their own funds to pay up to 20 percent of the project costs. Federally funded highway projects vary in size, from new lane striping to resurfacing an existing road

---

<sup>3</sup>TransTech Management, Inc., *Environmental Streamlining: A Report on Delays Associated with the Categorical Exclusion and Environmental Assessment Processes* (Washington, D.C., Oct. 2006).

<sup>4</sup>Most of the funding for roadway projects comes from the Highway Trust Fund. The Highway Trust Fund is derived from highway user taxes such as excise taxes on motor fuels, tires, and the sale of trucks and trailers, and from taxes on the use of heavy vehicles.

---

to building a new road or interchange. Most federally funded highway projects are minor rehabilitation or reconstruction projects rather than major new road construction projects. Of the approximately 27,000 miles of roadway projects funded in 2006 (latest data available), about 26,000 miles (96 percent) involved either the addition of capacity, preservation, or improvements (such as widening lanes, resurfacing, and rehabilitation of roadways). Only about 1,100 miles of new road construction projects were underway.

Although federal, state, and local governments all have a role in the construction of federally financed highway projects, the state department of transportation is typically the focal point for these activities. It is responsible for setting the transportation goals for the state. To do so, it works with the state's transportation organizations and local governments and metropolitan planning organizations.<sup>3</sup> State departments of transportation are responsible for planning safe and efficient transportation between cities and towns in the state. They are also responsible for designing most projects, acquiring property for highway projects, and awarding contracts for highway construction. Local governments also carry out many transportation planning functions, such as scheduling improvements and maintenance for local streets and roads. Citizens and community action organizations also generally have the opportunity to provide their views and have them considered.

At the federal level, FHWA is the primary agency involved in transportation project decisionmaking. FHWA oversees the transportation planning and project activities of state departments of transportation and metropolitan planning organizations by approving state transportation plans, certifying that states have met requirements involving environmental protection, and approving acquisition of property for certain state highway projects. FHWA also provides advice and training on transportation topics ranging from pavement technology to efficient operations of highway systems, and it provides funding to the states for transportation planning and projects. Because any transportation project using federal funding must be examined for potential effects on the environment before federal decisions are made, FHWA also works with other federal agencies and state, local, and tribal governments; public and private organizations; and the public to understand a project's potential

---

<sup>3</sup>Among other things, metropolitan planning organizations propose short- and long-term solutions to transportation and transportation-related concerns.

---

impact on the environment and historic properties.<sup>9</sup> Other federal agencies with environmental and historic preservation responsibilities that often are affected by federally funded highway projects include

- the Environmental Protection Agency (air and water quality; wetlands preservation);
- the Fish and Wildlife Service (endangered species) and the Bureau of Land Management (may own lands on which a highway is to be constructed) within the Department of the Interior;
- National Marine Fisheries Service (for example, effects on fish and spawning grounds) within the Department of Commerce;
- the Army Corps of Engineers (effects on wetlands);
- the Coast Guard (bridge and navigation responsibilities); and
- the Advisory Council on Historic Preservation (protecting historic sites).

Concerned about how long the completion of highway projects takes, Congress included provisions in TEA-21 to streamline environmental review. These provisions require FHWA to identify and work with federal agencies that have environmental and historic preservation jurisdiction over highway and transit projects to cooperatively establish realistic project development time frames among the transportation and environmental agencies and to work with these agencies to adhere to those time frames. Because transportation projects are also affected by state and local environmental requirements, TEA-21 allows individual states to participate in these streamlining initiatives, as long as all affected

---

<sup>9</sup>Environmental review is governed by the National Environmental Policy Act of 1969, which established a national environmental policy requiring that any project using federal funding or approval, including transportation projects, examine the effects of the proposal and alternative choices on the environment and historic properties before a federal decision is made.

For federally funded highway projects that FHWA determines will have a significant impact on the environment, FHWA must prepare a statement that describes the project, characterizes the surrounding environment, analyzes the environmental effects of all reasonable construction alternatives, and indicates plans for complying with applicable environmental laws and mitigating environmental damage. Other federal agencies with responsibilities for these laws, such as the Environmental Protection Agency, Army Corps of Engineers, and Fish and Wildlife Service, often cooperate in the preparation of these statements. If it is clearly known that a highway project will not individually or cumulatively have significant environmental impacts, FHWA issues a statement indicating this. However, if it is not initially clear whether significant impacts would occur, FHWA must conduct additional analysis. If significant impacts are then identified, FHWA must prepare a statement for significant impacts as described above. Otherwise, FHWA issues a statement that it found no significant impacts.

---

states' agencies participate. Finally, FHWA can approve state requests to use their federal-aid highway and mass transit funds to provide additional federal environmental personnel to help expedite environmental reviews.

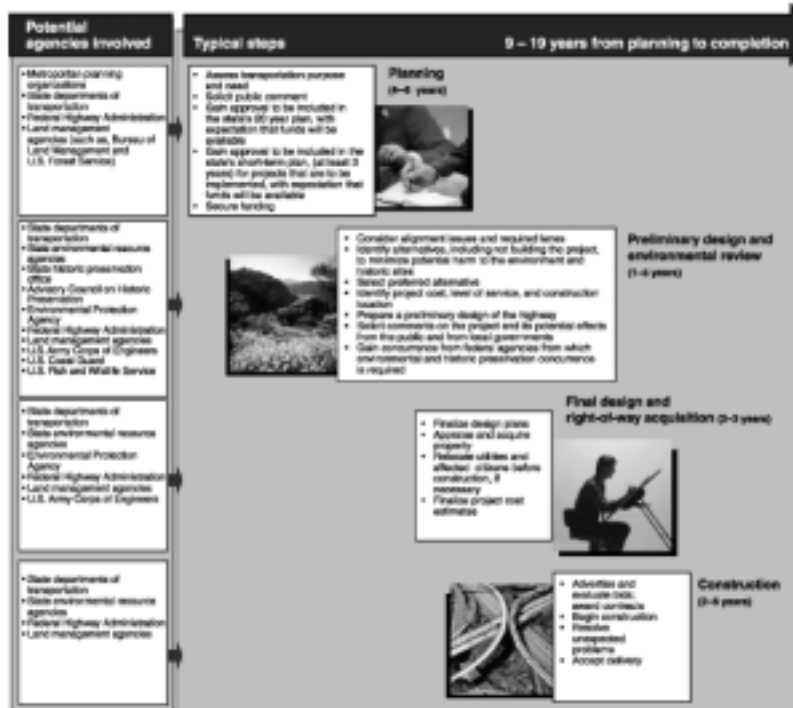

---

### Time to Complete Highway Projects

According to FHWA, and based on its professional judgment, planning, gaining approval for, and constructing a federally funded major highway project that involves new construction and has a significant environmental impact typically takes from 9 to 19 years. However, these projects constitute about 3 percent of all federally funded projects, according to FHWA. Some projects may take as few as 3 years or as many as 30 years or more to complete. The six new construction projects that we reviewed did not all meet FHWA's criteria yet fell within the time range FHWA estimates that it takes to complete more complex projects. These six projects ranged from 8 years to upgrade an existing dirt road in Florida to a two-lane paved road to over 15 years to build a six-lane, 15-mile divided highway in Texas (excluding the planning phases on both projects, for which information was not available).

Completing a new, major highway construction project takes a number of years because of the many tasks, requirements, approvals, and stakeholders involved. As many as 200 major steps can be involved in developing a transportation project from the identification of project need to the start of construction, depending on the project type and complexity. (See fig. 1.) Smaller projects (such as new lane striping) as well as larger projects (such as constructing a new highway) must go through many steps that require multiple stakeholder reviews and approvals. Because most federally funded highway construction projects are minor rehabilitation or reconstruction projects rather than major new road construction projects, these projects generally will not require extensive planning studies and will not have significant environmental impacts. As a result, according to FHWA, most federally funded highway construction projects advance from planning to construction within 1 year but may take up to 4–6 years, depending on the individual project's characteristics.

Figure 1: Typical Amount of Time Involved in Planning, Approving, and Building a Major New Highway Project

Note: The duration of the phases are approximate. The preliminary design/environmental review steps and the final design/right-of-way acquisition steps often overlap.

Source: FHWA.

---

According to FHWA, the planning phase for a major new construction project typically takes from 4 to 5 years. In this phase, most projects must first be identified in long-range (for example, covering a 20 year period) and short-range (for example, covering a 3 to 5 year period) state transportation plans.<sup>5</sup> Planners look at transportation alternatives and work with the public to select the alternatives that make the most sense for their areas and that are consistent with federal requirements, such as helping to adhere to air quality standards for the area. Short-range plans may have some citizen involvement and must be approved by state and local transportation officials as well as FHWA. States and metropolitan areas must demonstrate that funding is available for the projects included in the short-range plans. Finally, the length of the planning phase for a project will depend on whether the project is located in an urbanized area that does not meet federal air quality standards.<sup>6</sup>

The preliminary design and environmental review phase typically takes from 1 to 5 years depending on the complexity of the design and possible environmental impacts that must be considered, according to FHWA. During preliminary design, states identify the preliminary engineering issues, proposed alignment of the roadway, cost, and project details, such as turn-lane identification. The proposed project and alternatives to it are examined for any impacts on the natural environment (such as on endangered species) and public health and welfare (such as on safety and historic preservation). These environmental reviews require state and FHWA officials to address and comply with as many as 60 federal laws, as well as applicable state laws. More complex projects require more time for the completion of preliminary designs and environmental reviews. Transportation and environmental officials told us that reaching a decision on how to address projects with significant environmental impacts has taken several years. A 2001 FHWA study on the amount of time required for environmental reviews of projects with significant environmental impacts found that the average amount of time taken to complete these

---

<sup>5</sup>TEA-21 requires a Statewide Transportation Improvement Program or a metropolitan area's Transportation Improvement Program that contains individual transportation projects. FHWA requires the development of these improvement programs on at least a 2-year cycle.

<sup>6</sup>The Environmental Protection Agency sets maximum safe amounts of pollution that a region or state can have in the air. How much pollution is allowed from cars, trucks, and buses to the air will vary depending on the area's climate, wind, and other pollution sources and factors.

---

reviews in 1998 was about 5 1/2 years.<sup>7</sup> In comparison, these officials told us that projects in which the environmental impact was initially unclear and later determined to be insignificant took less time. These officials also told us that completing environmental reviews for projects that FHWA had determined as having no significant environmental impact from the start of the review process, including those categories of projects statutorily excluded from environmental review (for example, landscaping or installation of road signs), took only a matter of months. The previously cited anecdotal survey of 33 state departments of transportation conducted by the American Association of State Highway and Transportation Officials in 2000 found that reviews involving projects for which the environmental impact was determined to be insignificant or the initial environmental impact was unclear took an average of nearly 2 years and about 3 1/2 years, respectively. FHWA has found that 91 percent of federally funded roadway projects have no significant environmental impact and, in another 6 percent of the projects, the initial impact was unclear.

Final design and acquiring the right of way for a major new highway construction project typically takes from 2 to 3 years, according to FHWA. During this phase, state departments of transportation must develop detailed engineering plans consistent with environmental documents and updated environmental studies, and must finalize cost estimates. If a significant amount of time has passed since the preliminary design work was performed, right-of-way maps and other information may need to be updated. Acquiring property for the project includes determining any restrictions to state ownership of the property; determining the identities of property owners; making offers to property owners based on appraised price; negotiating a purchase price; and sometimes invoking eminent domain.<sup>8</sup> This phase may take a significant amount of time, especially if residents must be relocated. Utilities must also be located, marked, and surveyed, which can be complicated if there are many underground utilities that require professional engineers, geologists, and licensed land surveyors for determining the exact location of utilities.

---

<sup>7</sup>Federal Highway Administration, *Evaluating the Performance of Environmental Streamlining: Development of a NEPA Reviewer for Assessing Construction Performance* (Washington, D.C.: Jan. 2001).

<sup>8</sup>Eminent domain is the right of a government to take private property for public use in exchange for just compensation by virtue of the sovereign power over all lands within its jurisdiction.

---

According to FHWA, the construction phase typically takes from 2 to 4 years. To begin construction, the state department of transportation must request and evaluate bids on the project and award a contract. Projects that receive federal-aid highway funds require FHWA concurrence on the award. During construction, the contractor and the state must resolve any unexpected problems that may arise, such as removal of hazardous waste discovered at the construction site. Once satisfied that construction has been carried out as agreed to with the contractor, the state must approve the final completion of construction.<sup>7</sup>

---

### Many Events May Affect Project Completion Time

Not surprisingly, officials in federal and state agencies and other knowledgeable organizations indicate that larger, more complex or controversial projects take longer to complete than is usual for most highway projects. This is because large, complex projects are subject to more requirements, involve more federal stakeholders, and attract more public interest. For example, in the previously cited survey of 33 state departments of transportation, projects that involve many federal agencies took longer to complete than projects requiring only state-level review. The survey reported that state-only reviews typically occur for simpler, less complicated projects, which involve fewer stakeholders. However, both the information we collected and the state survey are anecdotal and based on interviewees' memories, because states do not maintain centralized information on project completion times. State officials told us that an effort to capture those data systematically would require resources that the state departments of transportation could use more productively to complete projects.

Although the six medium-sized and large highway projects in California, Florida, and Texas that we reviewed did not meet all of FHWA's criteria for a major project, they still took from nearly 7 years to over 15 years to complete, excluding the planning phase for which data were not available. (See table 2.) The time required to complete these six projects fell within the typical time FHWA has estimated that it takes to complete more complex projects. Only two of the six projects, both in California, were required to complete the preparation of an environmental impact statement.

---

<sup>7</sup>In some cases, FHWA approves the final completion of construction.

**Table 2: Duration of Six Medium-sized and Large New Construction Highway Projects in California, Florida, and Texas**

| Project                       | Total cost | Project duration |   |   |                    |                    |
|-------------------------------|------------|------------------|---|---|--------------------|--------------------|
|                               |            | Planning         | Preliminary design and environmental review | Final design and right-of-way acquisition | Construction       | Total <sup>a</sup> |
| <b>Medium-sized project</b>   |            |                  |   |   |                    |                    |
| State Route 168 (California)  | \$29.9     | N/A              | 3 years, 8 months                           | 3 years, 4 months                         | 2 years, 3 months  | 9 years, 4 months  |
| Fort Green/Dns Road (Florida) | 5.7        | N/A              | 2 years, 7 months                           | 4 years, 6 months                         | 1 year, 6 months   | 8 years, 3 months  |
| State Highway 140 (Texas)     | 95.7       | N/A              | 4 years, 4 months                           | 4 years, 5 months                         | 2 years, 10 months | 9 years, 8 months  |
| <b>Large project</b>          |            |                  |   |   |                    |                    |
| State Route 199 (California)  | 42.9       | N/A              | 4 years                                     | 6 years, 0 months                         | 3 years, 6 months  | 14 years, 3 months |
| State Road 115 (Florida)      | 2.2        | N/A              | 1 year, 7 months                            | 1 year, 2 months                          | 2 years, 6 months  | 6 years, 7 months  |
| U.S. Highway 290 (Texas)      | 50.1       | N/A              | 9 years, 8 months                           | 10 years                                  | 3 years, 1 month   | 15 years, 3 months |

N/A - not available

<sup>a</sup>Total time may not equal the sum of each phase. In some instances total time is less than the sum of each phase because phases overlap, most notably with the two projects in Texas. In addition, the State Route 115 project in Florida was a spin-off of an existing project. As a result, there is a 15-month gap between the end of the preliminary design and environmental review phase and the start of the final design and right-of-way acquisition phase for this spin-off project.

Source: GAO analysis of state documentation and discussions with state department of transportation officials.

Another way of assessing project timeliness is to compare how long it takes to complete a project with how long state transportation officials expected completion to take. For the six projects we reviewed, state officials established milestones for each phase of the project (excluding the planning phase, for which state officials could not provide information) but not always for the project overall.<sup>16</sup> We attempted to compare the time it took to complete each phase against the time expected for the projects that we reviewed. For the two California projects, the project phases were generally completed within a year of established time frames. However, aspects of the two projects in Texas took substantially longer to complete than planned. For example, the

<sup>16</sup>Florida officials could not provide information on planned completion times for the phases of the two projects we reviewed. Therefore, we could not determine if project phases were completed within planned time frames.

preliminary design and environmental review phase for the U.S. 290 project took 6 years and 7 months longer to complete than planned. In addition, the right-of-way acquisition for this project took 4 years and 7 months longer to complete than planned. For the Texas State Highway 146 project, the preliminary design and environmental review phase took 2 years and 8 months longer to complete than planned, and the right-of-way acquisition took 2 years longer to complete than planned. State officials were able to provide a qualitative recollection or in some cases documentation of events that affected their ability to complete highway projects on time. (See table 3.) For example, three of the six projects encountered problems in both the final design and right-of-way acquisition phase and in the construction phase.

Table 3: Events Affecting Selected Projects

| Project                       | Planning          | Preliminary design and environmental review  | Final design and right-of-way acquisition   | Construction   |
|-------------------------------|-------------------|--|---|--|
| State Route 198 (California)  | Funding shortages | No events cited  | Following earthquakes, project shelved in favor of seismic retrofit work around the state   | Weather delays; contract change orders; contractor performance issues  |
| State Route 199 (California)  | Not available*    | No events cited  | No events cited   | No events cited  |
| Fort Green/Dns Road (Florida) | Not available*    | No events cited  | Contractor had to devote time and resources to other ongoing projects; redesigns on account of drainage problems; property owners resisted right-of-way acquisition                         | Quality issues with paving material used; poor contractor performance; weather delays                              |
| State Road 116 (Florida)      | No events cited   | No events cited  | No events cited   | Weather delays; vibration damage complaints from adjacent homeowners necessitated change in construction equipment |
| State Highway 146 (Texas)     | No events cited   | Design changes to accommodate large truck vertical clearance necessitated changes to schematics and environmental documents      | Lengthy process to hire design consultant; parcels of land had numerous title problems; one property owner died during negotiations leading to probate issues; underfilled natural gas line | No events cited  |
| U.S. Highway 290 (Texas)      | No events cited   | Various access design changes to accommodate historic property; wetlands previously undiscovered at the site had to be addressed | Property owners refused state's purchase offer necessitating condemnation; utility adjustments  | Slope stability problems required an extensive redesign effort   |

\*State officials could not provide this information.

Source: GAO review of project documentation and discussion with state department of transportation officials.

---

Most studies we identified on timely completion of highway projects have examined the timely resolution of environmental issues for improving project completion times. For example, the previously cited 2001 FHWA study indicated that some larger, more complex projects tend to take longer than is typical in the preliminary design and environmental review phase. In an attempt to establish a baseline for evaluating project completion times, FHWA analyzed the time required for 37 projects with significant environmental impacts to complete the environmental review process. (As noted above, projects of this class are usually major projects rather than small, less complex ones.) This analysis indicated that the average amount of time taken to complete these reviews was 5 years and 7 months—exceeding the 5 years that a “typical” major highway project was expected to take for the entire preliminary design and environmental review phase. According to FHWA, these types of projects constitute only about 3 percent of all federally funded highway projects. Most federally funded projects are minor rehabilitation or reconstruction projects that do not have significant environmental impacts.

The survey of 33 state departments of transportation conducted in 2000 for the American Association of State Highway and Transportation Officials indicated that state departments of transportation may underestimate the time that completing an environmental review would require. The survey indicated that the environmental reviews for 31 to 48 percent of projects with no significant environmental impacts, and for 43 to 64 percent of projects with potential environmental impacts, took longer to complete than expected. According to the survey results, these projects took three times longer than planned to complete federal environmental review requirements related to public lands and historic resources, historic resources and cultural resources, and wetlands.

Federal and state transportation officials and transportation engineering organizations identified the timely resolution of environmental issues as providing the greatest opportunity for reducing the time it takes to complete highway projects. These officials generally stated that environmental reviews resulted in better project decisions, but that reaching the decisions was difficult and time consuming. For example, officials with the Army Corps of Engineers in Texas told us that the permit applications that it receives are sometimes incomplete or inaccurate, resulting in added time to process environmental permits related to waterways. In addition, officials with the Fish and Wildlife Service and the California Department of Transportation identified staffing shortfalls and workloads at the Fish and Wildlife Service as contributing to increased

---

time to perform environmental consultations. Finally, officials with the Environmental Protection Agency stated that public opposition to major transportation projects can result in greater scrutiny of environmental analyses or the proposed mitigation of environmental impacts, and therefore increases the length of the environmental review phase.

---

### Initiatives to Improve the Timely Completion of Highway Projects

Federal and state agencies have undertaken several initiatives to improve completion times for highway construction projects. Most of these initiatives address environmental review; however, some states have undertaken initiatives to improve completion times in other aspects of a project, such as construction. Generally, the impact of these initiatives is unclear because of the brevity of time they have been in place.

At the federal level, FHWA environmental streamlining efforts have included working with federal agencies involved in environmental and historic preservation reviews to conduct agency-specific training workshops in 2001 and 2002. FHWA has conducted these workshops for field staff to promote uniform practices and to clarify and update guidance. In addition, FHWA has started tracking the time to complete environmental reviews of federally funded highway projects this year. A recent FHWA report indicated that since the enactment of the TEA-21 environmental streamlining provisions in 1998, the average review time for projects with significant environmental impacts has decreased from 70 months to 62 months.<sup>10</sup> FHWA officials told us that the improved review times could be a result of such things as reinvented processes, programmatic agreements, and accelerated review times. FHWA has also developed guidance for states on how to use federal-aid highway funds to reimburse federal agencies that meet agreed-upon targets for environmental reviews. FHWA has catalogued environmental streamlining best practices and publicized them on its Web site.

State departments of transportation are using interagency funding agreements to hire additional staff at state and federal environmental agencies to facilitate environmental review and approval.<sup>11</sup> According to FHWA, 34 states are using these agreements. A 2001 survey by the

---

<sup>10</sup>Federal Highway Administration, *Highway and Transit Environmental Streamlining Progress Summary* (Washington, D.C.: Feb. 2002).

<sup>11</sup>Under these agreements, state departments of transportation are providing funding or positions to agencies that are involved in environmental and historic preservation reviews.

---

American Association of State Highway and Transportation Officials indicated that the people in these positions made permit reviews more efficient and consistent, improved communication between agencies, and fostered greater trust and understanding, thus facilitating project approvals and making the process less controversial.<sup>6</sup>

Forty-one states have some level of delegated authority for historic resources that allows them to process many projects quickly, according to FHWA. For example, the Vermont Agency of Transportation has an agreement with the state historic preservation office that allows the transportation department rather than the state historic preservation office to enforce historic preservation requirements. According to Vermont transportation agency officials, this agreement has resulted in, among other things, expedited permit acquisition, enhanced public participation, effective internal and inter-agency communication, and the best possible treatment of historic properties. These officials estimate that this agreement has shaved weeks from routine projects and will shave months from more complex ones.

Outside of the environmental review process, states such as Florida, North Carolina, and Texas are identifying utilities in certain urban areas earlier in the design phase, in order to avoid delays during construction. Texas and Florida have also developed strategies to accelerate construction for some projects by increasing contractor incentives for early completion, and Florida has documented savings in time and cost from this approach.

---

Mr. Chairman, this concludes my prepared statement. I would be pleased to answer any questions that you or Members of the Committee may have.

## Appendix I: Scope and Methodology

---

To perform our work, we reviewed laws and regulations governing the construction of federally financed highway projects. We discussed these requirements, the time required to complete projects, and initiatives to reduce this time with officials from FHWA, the Advisory Council on Historic Preservation, the Environmental Protection Agency, the Army Corps of Engineers, the Coast Guard, the Fish and Wildlife Service, the American Association of State Highway and Transportation Officials, the American Road and Transportation Builders Association, the American Society of Civil Engineers, private transportation engineering firms, and others. We also interviewed officials from California, Florida, North Carolina, Texas, Vermont, Washington, and Wisconsin departments of transportation about highway project completion times and initiatives to improve the timely completion of these projects. We chose these states either because they spent the most federal-aid highway funds or because officials we interviewed identified these states as making efforts to reduce project time. We also reviewed federal and private studies on highway project completion.

We reviewed the time it took to complete six new highway construction projects in California, Florida, and Texas. We selected three of the four states that spent the most National Highway System and Surface Transportation Program Funds in fiscal year 2000 (latest data available). These represent the primary sources of federal funds for new road construction. In each state, we selected two new construction projects that were completed between June 30, 1999, and June 30, 2002. In each state we selected the largest project (in terms of federal funds received) and a medium-sized project. In selecting these projects, we had no knowledge of the project itself or of how long it took to complete. We did not independently verify the information in the FHWA information system that contained these data. For the six projects, we obtained documentation and interviewed state department of transportation officials to determine how the projects were planned, approved, and carried out.

We conducted our work from May 2002 through September 2002 in accordance with generally accepted government auditing standards.

### RESPONSE FROM KATHERINE SIGGERUD TO ADDITIONAL QUESTIONS FROM SENATOR CARPER

*Question:* In your testimony, you note wide diversity in the time needed to complete environmental review depending on the scope of the project. You also note a general agreement that the environmental review process improves project decisions, though it can be time-consuming. Are there broad measures that Congress can apply to improve the process, or will gains be driven by allowing more flexibility and innovation at the State level, within the context of strong Federal oversight and financial partnership?

Response. The General Accounting Office will be issuing a report to Senator Jeffords in March, 2003. In this report, we will outline promising approaches to improve the process of highway delivery and reduce the time required to complete highway projects. Our report will focus on the environmental review process, as well as other phases of highway projects, including planning, design and construction.

Once we have finished our analysis, I will be able to provide a more detailed response to your question.

---

STATEMENT OF CAROL ANN MURRAY, COMMISSIONER, NEW HAMPSHIRE DEPARTMENT OF TRANSPORTATION

Mr. Chairman, members of the Senate Environment and Public Works Committee and certainly, Senator Smith, good morning.

Thank you for the opportunity to be here today to talk about environmental streamlining. For the record I am Carol Murray, actually, let me correct that, for my Mom that I lost a month ago, I am Carol Ann Murray, the Commissioner of the New Hampshire Department of Transportation. The subject of environmental streamlining is a very important, difficult topic. One that has no silver bullet solution that I can identify and isolate.

I can readily identify the reason that I and my counterparts nationally consider this so significant. The public has asked the transportation agencies to provide this nation with the mobility critical for our quality of life and economic vitality. The same public also wants the environment preserved and protected. The only way to accomplish these twin goals is for transportation and environmental agencies to work cooperatively. This public looks to all these agencies to implement the policy direction provided by elected officials with an open, trusting, balanced, communicative spirit.

I am not convinced that the public's vision, or that of their elected officials, is being implemented very well by the various public agencies involved. The concept of environmental streamlining was not conceived to put environmental preservation and enhancement as a secondary or minor interest in the development of public transportation projects, but rather to encourage early discussion, involvement and decisionmaking by the agencies with environmental and transportation duties. If the public agencies could work to provide the best-balanced projects in a timely way, then the public's voice is being heard.

Over the last two reauthorization bills, Congress set a new direction for transportation. Transportation agencies moved into a new era. With some resistance, we realized that mobility for the future was not just highways: choices in modes of transportation and connections between modes are now a focus. Congress also said that to develop the best projects for this country, the participation of the local communities, regional planning agencies and the public must be encouraged and their voice heeded.

This evolution in how State transportation departments work came hard to those of us used to doing designs by the book and approaching the public with our well designed, but off the shelf, standard highway solutions.

What we in the transportation business have found is that Congress was right in the policy direction they gave us. After a decade of increasingly successful implementation we are believers. We are cutting ribbons and celebrating projects that have been developed with more thoughtful consideration of the transportation users' needs and the local communities' vision for their future, and in balance with the natural and cultural environment they are built in.

I do believe that over the last two decades the transportation community has changed and become better. While I would like to say that we have got it all perfect, that would certainly not be true. We need to continue to listen, learn and, I think, we are ready to do that with an acceptance that was not there before ISTEA and the lessons learned since.

What is a frustrating is the reluctance of the environmental community to recognize this change. It is disheartening that the community has not championed and joined our early involvement and commitment to transportation project planning. We have found reluctance to engage in working toward a mobility solution that balances the various public needs in a fiscally responsible way.

You have all heard about the Interstate 93 widening project in New Hampshire and Senator Smith's work to bring streamlining to a reality with this project. As agreed, policy level staff from all the public regulatory agencies met as decision points were approached. Early agreement was reached to operate in an open, trustful and professional manner.

The group has met a number of times over the past 2 years. The culmination of this work is the draft environmental statement to be published this week. Then on September 9, I received a letter from the EPA that discounts the work accomplished in the streamlining process. Primary reasons given were that only the regulatory agencies were involved, and not the private environmental groups and the 18 communities that may experience secondary growth pressure even though they are not

directly on the Interstate. This letter came despite the four dozen public meetings held as this project has developed; with all meetings publicly notice well in advance, with individual notices to the specific environmental groups.

This project impacts an estimated 70 acres of wetland over 19 miles of widening of an existing Interstate highway. Proposed mitigation for this project includes 650 acres of land purchase and wetland creation at a cost estimated to be \$15.0 million, plus a \$3.0 million technical assistance program for local communities to assist in developing local land use regulations that reflect their future vision for their communities.

The proposed mitigation package was severely criticized in the letter from EPA because, and this is a quote, "while of importance to the towns, it does not have high ecological value". The EPA letter also says that (again I quote) "current State and Federal wetland regulations and typical zoning rules have generally not been effective . . ."

While the debate about local, State and Federal roles in land use, transportation, and secondary impacts is an engaging debate, I believe that is a public policy decision that Congress, State Legislatures, municipalities and the public should decide, not government employees, particularly those far removed from the project area.

The EPA submits that a mitigation package of approximately 2300 acres at a cost of upwards of \$50 million is needed. The reason cited is secondary impacts that may occur due to the project; not the direct impacts which they agree are of relatively minor consequence. Additionally, to their way of thinking, the highway widening should include the concurrent construction of transit options beyond the enhanced bus service already planned to be implemented and rail potential currently provided for in the project.

All these proposed environmental mitigation elements are, I think, good things. The question is whether or not it is the responsibility of this project to pay for all of them? And, in fact, because New Hampshire has done a very good job in providing a high quality of life in all arenas including environmental protection, mobility and economic prosperity, people will come here even without Interstate 93 being widened.

Why environmental streamlining? Because all agency implementers of elected officials' laws need to work together to effectively and in a fiscally responsible way to respond to public needs in a balanced way.

The transportation agencies, after ISTEA and TEA-21, learned that we don't know all the answers. The designers and builders of our Interstate highway system achieved a wonder, but in hindsight it might have been done differently. So Congress passed ISTEA and TEA-21. And now in 2002 it seems that the transportation projects in the environmental view are seen as a financial resource to implement conservation projects.

Early involvement in transportation project planning by all involved is needed. But, additionally, mutual respect for professional responsibilities, fiscal reality and, overall, an understanding that we need to make honest decisions that respects the public's will as envisioned by our elected leaders.

The EPA letter that I mentioned earlier States that mitigation costs should be up to 20 percent of the total project cost. In a time when we are all struggling to fund the public's transportation needs, a decision by a government employee to direct funding to a nontransportation purpose is inappropriate.

What do we need to meet the public's goal of providing mobility for quality of life and economic vitality while protecting and preserving the environment? This is best achieved if the principals envisioned by Congress for streamlining are implemented.

Above all, we need a process that includes early involvement that is consistent, trust based and cooperative; a process that is streamlined, effective, balanced, public transportation delivery which unfortunately is not what we are experiencing today.

Hopefully the next reauthorization will produce a streamlined process that follows the direction of Congress and meets the public's expectations.

I am happy to answer any questions, and again I thank you for this opportunity.

---

STATEMENT OF KEN MOREFIELD, ASSISTANT SECRETARY FOR TRANSPORTATION  
POLICY, FLORIDA DEPARTMENT OF TRANSPORTATION

Mr. Chairman, it is my pleasure to appear before the committee today to present the views of the Florida Department of Transportation (FDOT) concerning the reauthorization of the Transportation Equity Act for the 21st Century (TEA-21). This committee is to be commended for the extensive hearings that have been held in preparation for legislative action next year.

Florida's natural resources and pristine environment are what make us unique among the States. We are indeed fortunate to be home to the Nation's oldest city, St. Augustine, the Nation's largest restoration project in history, America's Everglades, and some of the most endangered large terrestrial and marine mammals in the world. It is the policy of the Florida Department of Transportation to help preserve and enhance Florida's natural, physical, cultural and social environment as we develop, implement and maintain transportation facilities and services.

My testimony today will address "Project Delivery and Environmental Stewardship". Section 1309 of TEA-21 has provided the impetus for State and Federal agencies to look for ways to improve the delivery of transportation projects while protecting our environment. The Federal Highway Administration along with the Federal Transit Administration have worked with us and many other Federal, State, and local agencies to develop a new process we call the "Efficient Transportation Decision Making Process" or "ETDM". I am pleased to report that we are virtually finished developing the new process. Training on the new process is scheduled to begin in January 2003 with completion by the end of June. We expect to begin full state-wide implementation by July 2003.

This new process has not been developed by the Florida Department of Transportation working in isolation. It began on February 3, 2000 when over 20 Federal, State, and local agencies met and pledged their support of an effort to examine how transportation decisions are made in Florida and to develop an improved process. A multi-agency working group including representatives of Metropolitan Planning Organizations was then formed and met several times during the year. Later, nine Task Work Groups worked on specific issues related to implementation of the new process.

In December 2001, Federal, State, and local agencies gathered at an "Executive Summit" and signed a Memorandum of Understanding endorsing the ETDM process and pledging their continued support for the full development and implementation of the process in Florida. I am equally proud of the assistance we received from one of our environmental organizations, 1000 Friends of Florida, as they hosted five meetings around the State to explain the process to non-governmental organizations.

We believe our ETDM process is fully responsive to the direction of Section 1309 and the National Environmental Policy Act. We have been pleased to brief your committee staff and others on our process, but we do not promote it as one that will fit every State. In fact, Florida's environmental laws, our own mix of State and local agencies, and other differences led us to an early conclusion that the best way to address improved project delivery and efficient decisionmaking was within our own efforts, and not through a "one-size-fits-all" approach.

Section 1309 of TEA-21 called for change. Key changes requested by Congress included:

- Early and continuous agency and public involvement
- Integrated environmental review and permitting processes
- Early approvals in the planning process
- Coordinated time schedules for agency involvement
- Effective dispute resolution mechanisms

Florida's ETDM process accomplishes all these objectives and more. The State of Florida is fortunate to have a very rich data base of information about our resources. We have collected that information at the University of Florida GeoPlan Center in Gainesville, Florida. This high technology digital data base tool allows agencies and the public to access project planning information over the Internet. It provides the foundation for our ETDM process and is called the "Environmental Screening Tool".

This tool enables us to perform two "screening events" which document agency and community inputs much earlier in our transportation planning process. We call these screening events the "Planning Screen" and the "Programming Screen". Modification of project plans in response to these early screening events will enable us to avoid or reduce costly changes late in the process. These screening events will provide information that will allow agencies to be engaged in the thoughtful exchange necessary to properly balance land use, environmental protection and mobility needs.

The primary purpose for the "Planning Screen" is to provide decisionmakers with better information to stage transportation improvements in the Cost Feasible Long Range Transportation Plan. The "Programming Screen" provides an opportunity to identify project issues and the need for technical studies prior to the project advancing into our Work Program. The NEPA process begins at the "Programming Screen" with a class of action determination that leads to environmental documentation and

construction permits. A fundamental premise of our process is that it builds upon earlier analyses rather than reopening all issues at every step of the process.

The screening events will be performed by Federal, State, and local agencies working together as an Environmental Technical Advisory Team. We will have one team in each of our seven geographic Districts. Each team will be responsible for agency review and feedback as projects are developed. Community Outreach Coordinators within FDOT will seek input from the affected community and post the input received so that agencies are aware of community concerns.

Project planning information is entered into the Environmental Screening Tool by Metropolitan Planning Organizations (or by FDOT for our rural areas). Standardized analyses will then be performed on these planned projects and the results are then made available to agencies through the Internet. All agencies will perform their reviews on a coordinated time schedule and enter the agencies' official comments about the impact on the resources protected by their agency. The agency will be able to suggest changes to project concepts through the feedback portion of the data base system. At the same time, the opinions of the affected community are also posted in the feedback portion of the system. The results are visible to the agencies, non-governmental organizations and the public. Everyone will have access to the same information.

In summary, Florida is about to implement a new way of doing business. We believe the Efficient Transportation Decision Making Process meets all the objectives this committee set forth in TEA-21. We are convinced that this new process will provide for earlier and concurrent agency reviews resulting in a reduction in the time required to plan projects and achieve earlier permit approval. Further benefits include improved public participation in the transportation planning process, a reduction in the cost of planning and building projects, and, most importantly, improved decisions.

Thank you for the opportunity to share Florida's efforts on project delivery and environmental stewardship. I will be pleased to address any questions you may have.

---

#### RESPONSES OF KEN MOREFIELD TO ADDITIONAL QUESTIONS FROM SENATOR JEFFORDS

*Question 1.* The proposed Efficient Transportation Decision Making Process seems to be an innovative approach to making better decisions. FDOT has invested a large amount of time and resources to bring this program to this stage. Since this process is a departure for how business is being done, how is FDOT dealing with the institutional and cultural changes that will have to happen within FDOT and within the Federal, State, and local agencies involved in ETDM?

Response. The following are past and present actions to bring about change within FDOT and other participating agencies:

- FDOT began our first meeting with Federal, State, and local agency heads stating that we were willing to change our old way of doing business and partner with these agencies in developing a new more efficient transportation process. Our challenge to these leaders was to be willing to change the way their agencies operate to improve the process for transportation projects.
- A Memorandum of Agreement was signed by all participating agency heads to support, develop, and implement this new process. Also, there has been consistent and continuous communication with these agencies.
- The Manager of our Central Environmental Management Office is meeting with the management of each of our District Office to discuss what will be required of their offices and their Metropolitan Planning Organization (MPO) counterparts.
- An ETDM Manual is being developed to provide operating procedures for FDOT and other agencies involved in this process in order to change how we will do business in the future.
- Extensive training of the Manual and this process will be completed within a 6-month period of time in order to begin implementation of this process within all of the agencies. Each of the seven geographic FDOT District Offices will host training to include the agencies, MPOs, and their own District personnel who will serve on the Environmental Technical Advisory Team. This will allow each agency to see the roles of others and how collective involvement of all members will improve decisions efficiently.
- Agency Operating Agreements are being developed that will describe how each agency's operational processes will be practiced to accommodate this new process. Also, separate agreements are being developed to provide funding assistance to agencies for additional personnel and equipment needs where applicable so that agencies can be effective in partnering with FDOT.

- Electronic technology will bring about better coordination with agencies creating consistency as agencies change their operations to complement this new process.

## FLORIDA'S ETDM PROCESS PROGRESS REPORT 2

### EXECUTIVE SUMMARY

The Florida Department of Transportation (FDOT), working in conjunction with the Federal Highway Administration and other federal, state, and local agencies, is developing a refined and improved methodology for effecting improved transportation decisions. Initially called "streamlining" in response to Section 1309 of the Transportation Equity Act for the 21st Century (TEA 21), the FDOT process refines how the State of Florida will accomplish transportation planning and project development within its current statutes and regulations. This report is the second progress report describing the state of development of the new process-The Efficient Transportation Decision-Making Process (The ETDM Process). This report includes the process refinements and changes noted below.

#### Significant Updates from Progress Report No. 1

- Agencies endorse MOU to implement the ETDM Process.
- ETAT and ETDM Coordinator roles and responsibilities defined.
- Planning and Project Development steps further defined.
- Process for community outreach and involvement defined.
- Environmental Screening Tool further developed.
- Dispute resolution process defined.
- Agency Operating Agreements being developed.
- Implementation strategy and schedule in place.

The ETDM Process creates linkages between land use, transportation, and environmental resource planning initiatives through early, interactive agency and community involvement, which is expected to improve decisions and greatly reduce the time, effort, and cost to affect transportation decisions. Efficiency is gained by two screening events and an efficient permitting process built into the current transportation planning and project development process. The screening events are the "Planning" and "Programming" Screens.

An Environmental Technical Advisory Team (ETAT) performs these screenings. The ETAT consists of planning, consultation, and resource protection agencies. Each agency will appoint their ETAT representative with responsibility to coordinate transportation reviews within their respective agency. They will then provide agency responses to the transportation planning entity (FDOT and the Metropolitan Planning Organization (MPO)). This response will be advisory during the early phases of transportation planning. The ETAT member's role transitions as a project proceeds from planning to project development. The ETAT member's role then shifts to coordination within the agency to issue an opinion or permit the project.

Screening is conducted by the agency ETAT representatives appointed for each FDOT District. Agency Operating Agreements (AOAs) are being created between FDOT, FHWA and each agency to address the specific details about ETDM implementation. The AOAs will also document agreed dispute resolution methods.

The following describes ETAT screening input at two stages in the planning and project development phases of a project.

**Planning Screen:** This screen allows agencies to comment on the impact of projects very early in the planning process. This will enable planners to adjust project concepts to avoid or minimize adverse impacts and to consider mitigation alternatives and improve estimation of project costs. Secondary and cumulative effects will be evaluated on a project and system-wide basis in connection with the Planning Screen. The interrelationship between land use, ecosystem management, and mobility plans could then be considered in integrated agency planning.

**Programming Screen:** This screen occurs before projects enter the FDOT Work Program and initiates the National Environmental Policy Act (NEPA) process for projects that have not been categorically excluded. ETAT input provides "agency scoping" requirements to satisfy NEPA and other pertinent laws, etc., that are addressed during the NEPA process. ("NEPA" is used throughout this report to collectively refer to all applicable laws.)

**Permit Coordination:** ETAT members coordinate with FDOT's project managers during project development and coordinate within their agency to issue construction permits simultaneously with the federal NEPA Record of Decision.

An electronic database system will provide the vehicle for information exchange to and from ETAT members regarding project plans, impacts, and agency recommendations or requirements. The database system will be housed at the University of Florida GeoPlan Center. All project and resource data will reside in the GeoPlan Center's Florida Geographic Data Library (FGDL). The platform will be the current version of ESRI Geographic Information System (GIS) software. All GIS analyses will be performed within the FGDL system so agency ETAT members will only need an Internet connection to view and comment on GIS results.

The database system will house responses from ETAT members as well as inputs documented from the public. That input will be summarized in virtually automated reports produced from the GIS database system. These reports will capture the essential detail that must be addressed as a consequence of ETAT and community input during planning and project development.

The ETAT concept was developed to create linkages and communication with agencies responsible for protecting resources. Protection of the affected community, however, is accomplished by coordination of transportation plans through a Community Outreach Network. This network is the responsibility of the FDOT District Community Impacts Assessment (CIA) Coordinator.

During a Summit held in December 2001, federal and state agency heads signed a Memorandum of Understand-

ing supporting the continued development and implementation of the ETDM Process.

Agency participants, FDOT, the Federal Highway Administration (FHWA), and the Federal Transit Administration (FTA) believe that Florida's ETDM Process is a better way to plan and implement transportation projects. Agency involvement will occur earlier in planning and will largely be evaluated through efficient electronic information exchange. Secondary and cumulative impact analysis and evaluation will occur early in planning on a system-wide basis. Environmental evaluations will be focused on key issues and proceed years earlier than in today's practice. Agency interaction and internal coordination by their ETAT members will lead to earlier permits and avoidance of late project changes.

The ETDM Process has been in development since early 2000 and has involved significant effort by agency participants. The development work is ongoing, and the new process is expected to be available for use in the summer 2002. The ETDM Process will be tested with a "Mock ETAT" during the spring 2002. Based on this experience, the process will be refined and then documented as an FDOT procedure that will complement the current Project Development and Environment (PDE) Manual as well as MPO and statewide planning procedures.

## CONTEXT FOR ETDM PROCESS

Planners, engineers, environmental scientists, and government officials have raised concern about the level of effort, time, and cost associated with the environmental review and approval process for transportation projects. Stories abound about long delays in implementing projects, the difficulty of one agency's change affecting another's decision, and the high cost associated with rework when an agency denial for a permit requires restarting the environmental review process.

The environmental provisions in Section 1309 of the Transportation Equity Act for the 21st Century (TEA-21) reflect Congress' concern about delays, unnecessary duplication of effort, and added costs often associated with the current process for reviewing and approving transportation projects. Called "Environmental Streamlining," this legislation challenged FHWA and FTA to implement an improved, more efficient transportation planning and environmental review process.

The objective of Environmental Streamlining is to improve interagency coordination, more effectively address environmental concerns, and reduce costly delays in the environmental review process. In addition to the need for predictable, expeditious timeframes within which resource agencies conduct their roles in the process, there is also a need for increased, meaningful activity from the federal resource agencies. The advantage of more intensive federal resource agency involvement is that agencies' input is more useful in project decision making the earlier it occurs in the process. The timeliness and quality of the projects are improved, and environmental issues can more easily be resolved.

**TEA-21 Streamlining Objectives**

- Establish an integrated review and permitting process;
- Integrate environmental review and approvals early in the transportation planning process;
- Encourage full and early participation by agencies;
- Establish coordinated time schedules for agency action; and
- Establish dispute-resolution mechanisms.

In the fall of 1999, Florida was selected as a pilot state for developing and implementing a streamlined planning and project development process. Florida was considered an ideal pilot state due to its strong state environmental laws that must be meshed with federal laws and processes. In response, FDOT, working with FHWV, FTA, and other federal, state, and local agencies committed to evaluating Florida's current transportation planning and project development and environmental processes and identifying ways to make these processes more efficient.

**THE PROBLEM**

In Florida's current transportation planning process, mobility needs are identified by MPOs and FDOT in response to the development thresholds allowed under approved Local Government Comprehensive Plans. During the comprehensive planning process, minimal consideration is given to the potential direct, secondary, and cumulative impacts of transportation or land use decisions on the community's social and natural resources.

MPOs and FDOT identify transportation improvement priorities for inclusion in a Long Range Transportation Plan (LRTP) with little input from environmental resource agencies. The majority of agency input does not occur until later in the project development process, sometimes

decades after it has been decided that a transportation facility is needed and significant funds expended. Substantial environmental impacts that could influence the priority of a project are not considered. Often, the purpose and need for the project has not been adequately defined.

The priority projects then enter the FDOT Work Program and remain there for five years before any substantial planning and environmental analyses are conducted. By the time a project enters the project development phase, it has gained so much public momentum that a decision not to build the project due to substantial environmental or social impacts is almost never made. Instead, mitigation strategies are identified. In summary, land use, transportation, and ecosystem preservation decisions are not truly balanced to support a community vision. The following figure shows some of the problems with Florida's current planning and project development processes.

**METHODOLOGY - THE PROCESS TO DEVELOP THE PROCESS**

**Opening Summit on Environmental Streamlining**

On February 3, 2000, leaders from 23 federal, state, and local transportation and resource protection agencies participated in a summit meeting on environmental streamlining. The purpose of the summit was to initiate a

statewide coordinated effort to improve Florida's planning and project development processes. The agency leaders committed their support and assigned responsibility to key staff who then worked with FDOT to form a shared vision for Florida's transportation decision making process:

*"It is our vision to improve transportation decision making in a way that protects our natural and human environmental resources. It is our goal that we, as environmental resource and transportation agencies, establish a systematic approach that integrates land use, social, economic, environmental, and transportation considerations. This approach will include the active participation of federal, state, and local agencies, and the public. It will lead to decisions that provide the highest quality of life and an optimal level of mobility for the public we serve."*

Following the summit meeting, a working group consisting of over 50 representatives from over 28 agencies worked together with FDOT and FHWA in a series of multi-agency meetings to accomplish their shared vision.

### Multi-Agency Meetings

The working group team participated in eight multi-agency workshops between February 2000 and November 2000 to examine the current planning process and develop a more efficient process while still protecting Florida's environment. This collaborative approach to redefine the existing planning and project development processes was characterized by "out of the box" thinking by the team. Initially, these workshops were informational. Planning participants became informed of the Department's Work Program and Project Development & Environmental (PD&E) processes. Project Development and resource agency participants were similarly informed about the planning processes performed by MPOs and by FDOT. Together, the agencies identified problems with the current processes, and the team identified the follow-

ing characteristics of a streamlined environmental review process:

- Earlier agency involvement in the planning process,
- Complete and accurate information for improved decision making,
- Improved access to information,
- Better and continuous communication among agencies and with the public,
- More efficient and concurrent project reviews, and
- Complete and timely permit applications.

During the subsequent team workshops, the working group developed a conceptual process that included the above characteristics. The team named the new process the "Efficient Transportation Decision Making Process" (ETDM Process).

The workshop participants then focused on developing and refining the ETDM Process. A key issue was how the ETDM Process could produce construction permits earlier in project development. Since implementation issues were focused on planning and permitting, two expanded focus groups were formed.

### Focus Groups

Two focus groups were formed to further develop and refine the planning and permitting phases of the new process. The Planning Focus Group consisted of the planners from the working group plus an expanded roster of representatives from various federal, state, and local planning agencies. The Permitting Focus Group consisted of an expanded group of project development professionals and agency representatives involved in the FHWA, NEPA, and permitting processes. The focus groups conducted workshops in December 2000 and January 2001 and provided recommendations to improve the conceptual ETDM Process.

### Task Work Groups

Recommendations resulting from the Planning and Permitting focus group meetings identified several issues requiring further work to define how the new process will be implemented. To address these issues, nine task work groups were created consisting of experienced specialists and practitioners who were charged with developing the specific details about how the ETDM Process works. The task work groups and objectives are listed below:

By the fall of 2001, the task work groups developed findings and recommendations to further refine the specifics of the ETDM Process, and to define the content of Agency Operating Agreements and an ETDM Procedures Manual. The following sections present the status of the ETDM Process as well as the path to statewide implementation.

| <i>Task Work Group</i>                                | <i>Objective</i>   |
|---|--|
| Environmental Permits                                 | <ol style="list-style-type: none"> <li>1. Develop a process to obtain construction permits simultaneously with the NEPA record of decision (ROD).</li> <li>2. Achieve concurrent and simplified notices where feasible.</li> <li>3. Develop criteria for categorically excluding certain projects from permitting.</li> </ol>  |
| Two-Year State Transportation Improvement Plan (STIP) | <ol style="list-style-type: none"> <li>1. Evaluate the feasibility of implementing a two-year STIP and a two-year Transportation Improvement Program (TIP) development cycle.</li> <li>2. Determine the steps required to implement this 2-year planning cycle with FDOT.</li> </ol>   |
| Programming NEPA Projects                             | <ol style="list-style-type: none"> <li>1. Develop a method for proceeding with environmental studies earlier in the FDOE, Five-Year Work Program.</li> </ol>   |
| NEPA Decision Making Process                          | <ol style="list-style-type: none"> <li>1. Determine how project development will be accomplished in the ETDM Process.</li> <li>2. Determine the method for achieving agency consultation during project development.</li> </ol>  |
| Planning Document Evaluation                          | <ol style="list-style-type: none"> <li>1. Develop recommendations for key documents that should be a part of the ETDM Process and create a linkage to project development.</li> <li>2. Describe the timing during the planning process, the content, and the audience for the documents.</li> </ol>  |
| Secondary and Cumulative Impacts                      | <ol style="list-style-type: none"> <li>1. Create a framework in the ETDM Process for conducting secondary and cumulative impact assessments that incorporates needed data from land use, transportation, and resource protection plans.</li> </ol>   |
| Bridge Program  | <ol style="list-style-type: none"> <li>1. Investigate and document how the FDOT bridge program enters the Five-Year Work Program.</li> <li>2. Recommend a method for interfacing the bridge program with the ETDM Process.</li> </ol>  |
| Cultural Resources                                    | <ol style="list-style-type: none"> <li>1. Investigate and document how to complete archaeological and historical assessments for transportation projects more efficiently and earlier in the project development process.</li> <li>2. Ensure how appropriate identification, avoidance, minimization, and mitigation of Native American issues are considered and documented.</li> </ol> |
| Community Impact Assessment (CIA)                     | <ol style="list-style-type: none"> <li>1. Document how CIA and Public Involvement are accomplished in the ETDM Process.</li> </ol>   |

## THE EFFICIENT TRANSPORTATION DECISION MAKING PROCESS

Florida's ETDM Process redefines how the State will accomplish transportation planning and project development within its current statutes and regulations. The ETDM Process will bring agency and community interaction forward into the early stages of transportation planning. Efficiency is gained in the new process by two agency screening events built into the current transportation planning process. The screening events are the Planning Screen and the Programming Screen, which are conducted years earlier in the overall process than at present. This early agency involvement coupled with continuous community impact assessment and involvement is expected to improve the quality of decisions made during planning and reduce challenges during NEPA and permitting. This interaction will continue throughout the life of a project to ensure that mobility needs are balanced with land use decisions and ecosystem management and preservation. In this new process, resource avoidance and minimization options and strategies are identified earlier, and cost impacts for these strategies can be considered in establishing transportation plan priorities. Agency interaction during project development will allow permitting to be concurrent with the end of the federal NEPA process.

### Key features of the ETDM Process include:

- Early agency and community involvement;
- Continuous public representation;
- Early identification of avoidance and mitigation strategies;
- Integrated planning between agencies;
- Reduced duplication of effort;
- Linkages between land use, transportation, and environment;
- Earlier assessment of secondary and cumulative impacts;
- Access to comprehensive data in standardized formats;
- Earlier project approvals;
- Fewer projects subject to detailed reviews;
- Reviews focused on the key issues;
- Timely dispute resolution;
- Permit issuance linked to NEPA reviews; and
- Maximized use of technology for coordination.

### Early Involvement - The Key to Success

#### Environmental Technical Advisory Team (ETAT)

Agency interaction will occur throughout the life of a project - from concept to concrete - to ensure that transportation decisions are balanced with social, land use, and ecosystem preservation decisions. This will be accomplished through an Environmental Technical Advisory Team (ETAT). An ETAT, consisting of planning, consultation, and resource protection agencies, will be established with each agency appointing a representative with responsibility to coordinate and perform all agency actions to satisfy the agency statutory responsibility with respect to the planning and implementation of transportation projects. This responsibility will require diverse and excellent skills, especially the ability to function effectively within the agency and to coordinate with other agencies on the ETAT.

One ETAT will be established for each of the seven geographic FDOT Districts. The ETAT will consist of representatives from agencies with statutory responsibility for approval and consultation on mobility projects and other transportation and governmental agencies. Agency heads will be responsible for appointing their ETAT members, who will be the point of interaction with that agency on transportation decision-making. One or more ETAT representatives may be appointed depending on agency requirements and geographic considerations.

#### *Potential ETAT Representatives*

- Federal Highway Administration
- Federal Transit Administration
- Federal Rail Administration
- National Marine Fisheries Service
- National Park Service
- Natural Resources Conservation Service
- U.S. Army Corps of Engineers
- U.S. Coast Guard
- U.S. Environmental Protection Agency
- U.S. Fish and Wildlife Service
- U.S. Forest Service
- Florida Department of Agriculture and Consumer Services
- Florida Department of Community Affairs
- Florida Department of Environmental Protection
- Florida Department of State
- Florida Department of Transportation
- Florida Fish and Wildlife Conservation Commission
- MPOs within FDOT District (one representative per MPO)
- Local Resource Agencies
- Regional Planning Councils
- Water Management Districts
- Native American Tribal Governments
- Local Planning Agencies

The ETAT representative will have delegated agency authority and responsibility to coordinate internally and represent agency positions. The role of the ETAT changes from advisory during planning to coordinator during project development, which includes permitting. During planning, the ETAT will advise the MPO in urban areas and the FDOT in non-MPO areas of potential project impacts to the natural and human environment, consistent with their agency's regulatory and planning program. Recommendations on how to avoid, minimize, or mitigate these impacts will be provided. The ETAT will also evaluate and provide comments on secondary and cumulative effects of a transportation improvement project for the resource that their agency is responsible for protecting. The ETAT's role is advisory during planning. Final decision making for establishing project priorities will lie within the transportation planning agency.

As a project advances into the project development and design phases, the ETAT will continue to provide project input and technical assistance to the project sponsor (e.g., FDOT, local government, transit authority) to satisfy agency permit requirements. This will include identifying, defining, and participating in technical studies needed for permitting decisions. ETAT members will be responsible for coordinating within their agencies to accomplish construction permitting concurrent with the completion of the federal NEPA process.

The ETAT is the mechanism for engaging agencies in the ETDM Process. It is equally important in this process to engage the affected community by providing timely information and effective methods for the public to participate. This will be accomplished in the ETDM Process through a Community Outreach Network.

#### **Community Outreach Network**

Each FDOT District Secretary has appointed a Community Impacts Assessment (CIA) Coordinator, who is the

conduct for the flow of information between transportation planners and the affected community. This person will be responsible for coordination with the District ETDM Coordinator to ensure the public's interests are known and represented. It is expected that the CIA Coordinator will compile Community Outreach Networks with the help of MPOs and local governments to engage the public in the transportation planning process.

The Community Outreach Network represents the public in non-MPO areas and complements the MPO Citizens Advisory Committee in urbanized areas. This is done by outreach to neighborhoods and other organized community groups. Representatives from social agencies may also participate through the Local Social Advisory Committee. The overall purpose of this network is to provide an avenue for two-way flow of information regarding transportation plans and effects on the community.

#### ETDM Coordinator

The District ETDM Coordinators will be responsible for the full implementation of Florida's ETDM Process, overall interagency and public involvement coordination, and for ensuring compliance with ADAs. This will include performing the following key coordination activities:

- Coordinates input of project planning data for the ETDM Process;
- Ensures timely ETAT reviews;
- Ensures timely information flow with the CIA Coordinator, the Community Outreach Network, and the Local Social Advisory Committee;
- Ensures that transportation projects and technical studies are developed in full compliance with NEPA and all environmental permit requirements;
- Prepares or delegates preparation of summary reports of ETAT and Community Outreach Network responses;
- Conducts ETDM training and provides technical assistance to ETAT members; and
- Coordinates permitting process with all agencies.

Agency interaction during planning and project development will be accomplished largely through an interactive Geographic Information System (GIS), which will allow ETAT members to conduct environmental screenings on projects and transmit agency comments from their desktop computers. This will be accomplished by the Environmental Screening Tool.

#### Environmental Screening Tool

The Environmental Screening Tool is an Internet-accessible GIS application that creates linkages between ETAT members and The Florida Geographic Data Library (FGDL) housed at the GeoPlan Center at the University of Florida. The GeoPlan Center at the University of Florida will be responsible for managing and maintaining the environmental resource data within the FGDL. The Center has staff and faculty who are experts in using GIS for environmental management and transportation planning applications.

The Environmental Screening Tool application provides tools to input and update information about transportation projects, perform standardized GIS analyses, gather and report comments by the ETAT members, and provide read-only information to the public. The following diagram schematically displays the concept for the ETDM Internet-accessible GIS database system:

### Data Entry

The GIS data input consists of environmental resource information and project planning information. Environmental resource information is provided by resource protection agencies which input their data to the FGDL. The environmental resource data is updated via the FGDL according to operating agreements with each agency. The ETAT member reviews the information in the FGDL to verify the most current information is available.

Project planning information is provided by MPOs and by FDOT in non-MPO areas. The Environmental Screening Tool provides three mechanisms for entering transportation project planning information into the ETDM database:

- **Interactive Data Entry Forms** - Forms enable MPOs and FDOT to draw project segments on an aerial photograph and enter information describing the project via on-line forms. These tools are intended to assist MPOs and FDOT to enter information that is not available electronically.
- **Extraction Tool for State Highways** - Allows FDOT staff to input planned improvements to roadways that are stored in the FDOT digital base map. The Tool allows planners to point at the beginning and end points along the roadway. Data entry forms are pre-populated with information extracted from the database so users can update and add to the information. When complete, the project information is loaded into the ETDM database.
- **GIS File Transfer** - Intended for MPOs or FDOT planners who have project plans in GIS format already and need to transfer their data to the ETDM database. This input tool allows the existing GIS data to be readily translated and transferred to the ETDM database. This minimizes redundant data entry.

### Standardized Analyses

As the projects are loaded into the ETDM database, standardized GIS analyses are automatically performed to

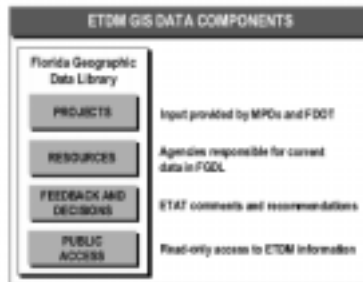

identify potential impacts to environmental resources. These analyses have been prescribed by the resource agencies performing the ETAT review on each specific resource issue. The analyses compare the location of proposed projects with the locations of environmental resources and provide quantitative results for consideration by the ETAT. The results are displayed in the ETAT Review module along with issue-specific maps displaying the project and environmental resources. Data layers, types of analyses, and graphic or tabular outputs were also prescribed by the agencies responsible for each issue through a series of workshops conducted in the fall 2001.

ETAT members access the information by Internet connection to the Department's ETDM website. "Point and click" simplicity is a feature of this system that allows agency ETAT members access to the ETDM database and GIS analysis results without the cost of high-end computer facilities, costly software, and the specialized skills of a GIS analyst.

#### Internet Access to the FGDL

- Incorporates point-and-click simplicity for access to results,
- Avoids costly computer expense for agencies, and
- Achieves consistency of formats and reviews.

The Environmental Screening Tool includes interactive mapping tools, forms for adding comments during the Planning and Programming Screen phases of the ETDM process, and summary reports of ETAT comments. These reports are also available through a public access website, which enables the public to view and query the information. Four data components compose the Environmental Screening Tool and are diagrammed and described below.

#### Project Description Data

The Project Description data will describe the candidate transportation projects for which the MPO and the FDOT require project impact evaluations. The MPO in urban areas and the FDOT in non-MPO areas will be responsible for developing the following information to describe each candidate project and uploading this data into the Project Description data of the Environmental Screening Tool:

- Project identification number,
- Project name (e.g., roadway, transit facility),
- Logical project termini (from/to),
- Brief description of initial project concept, and
- Initial purpose and need statement.

The project termini, description, and purpose and need statement may evolve over time - through the planning and project development phases of the project - as the ETAT and District or MPO planners gain knowledge about project issues. Initially, the purpose and need statement should include the following information for each candidate project:

- Travel demand (traffic or ridership projections, volume/capacity ratio),
- Modal options,
- Agency-expressed needs (e.g., emergency evacuation, freight mobility), and
- Community-expressed needs.

#### Environmental Resource Data

The Environmental Resource data of the screening tool will include the data layers required by the ETAT members to perform environmental impact analyses on each mobility project. Each agency on the ETAT will be responsible for sending their updated data layers (including the location of priority resource protection areas) required for project analyses to the GeoPlan Center. These will include prioritized resource protection areas and species recovery plans for each resource agency. The Center will be responsible for ensuring that the latest available data layers are in a standard format and are accessible by all ETAT members.

#### Feedback and Decision Data

The Feedback and Decision data will contain the results of the ETAT project impact evaluations performed during the Planning and Programming Screens. This will include the following information about each candidate mobility project:

- Comments from each ETAT member about the purpose and need statement,
- Degree of impact of a proposed transportation project to the resource each ETAT member is responsible for protecting and/or managing;
- Comments and recommendations from each ETAT member about project impacts;
- Project scoping recommendations, including required technical studies; and
- Carry forward summary of community issues, concerns, and commitments made throughout the public involvement process.

#### Public Access

The public will be provided read-only access to key project information allowing the general public and non-government organizations to view project data. The project information available to the public and non-government organizations will include the project description, sum-

marized GIS analysis graphics, summarized results of the ETAT project impact analyses, previously submitted public comments, and other information to assist formulation of comments on the project.

The public and non-government organizations will not have the ability to submit comments using the Environmental Screening Tool. Comments can be submitted to the project sponsor in writing or verbally at a public workshop, hearing, or other locally identified method to receive public input. The District CIA Coordinator will be responsible for engaging and documenting input from the affected community through Community Outreach Networks.

During the planning phase of a project, the MPO in urban areas and the FDOT in non-MPO areas will be responsible for entering public comments received through their public involvement efforts into the Public Access data component. During the project development phase, the project sponsor (FDOT, Local Government, and Transit Agency) will be responsible for loading public comments into the database.

## MOBILITY PLANNING

The intent of the ETDM Process is that the long-range planning process in non-MPO rural areas mirrors the planning process in the MPO urban areas of the state. This will provide for consistency among planning documents developed during the planning process with standardized formats and reporting procedures throughout the State. The planning phase of the ETDM Process is conceptually shown in the following figure.

### Long Range Transportation Plan Development

#### Urban Area Planning

MPOs, which represent larger urban areas, are required to update long range transportation plans at a maximum of every three years in air quality non-attainment and maintenance areas and every five years in air quality attainment areas. The primary purpose of the long range transportation plan is to guide the development of transportation systems to serve the travel demands of existing development and new growth, as envisioned by and balanced with goals of other Local Government Comprehensive Plans, over a minimum 20-year period.

#### Rural Area Planning

In non-MPO areas, FDOT in consultation with local governments, has the responsibility of planning for future transportation systems. The Florida Intra-state Highway System (FIHS) Plan is developed by the FDOT to identify the mobility needs on the major regional state roads throughout Florida. At the local level, the Transportation Elements of the Local Government Comprehensive Plans identify the mobility needs within each county and municipality.

In the ETDM Process, the MPOs in urban areas and the FDOT in non-MPO areas will be responsible for identifying the mobility needs required to support projected growth and development in the region. The description and location of these candidate mobility projects will be electronically uploaded by the project sponsor into the Project Description Data component of the Environmental Screening Tool for review by the ETAT. The ETAT will conduct project impact analyses for each candidate project.

### ETAT Planning Screen

This project impact analysis, called the Planning Screen, allows for early identification of environmental issues that could influence the priority, alignment, and/or future features of candidate projects. This system-level analysis also identifies resource protection areas that could influence future land use and transportation decisions in the comprehensive planning process. The results of the Planning Screen analysis will be documented in a Planning Summary Report which will be posted in the Feedback and Decision Data component of the ETDM database.

The Planning Screen is conducted on a maximum three-year cycle in MPO air quality non-attainment and maintenance areas and on a maximum five-year cycle in all other areas, consistent with the federal requirements for updating MPO long range transportation plans and Local Government Comprehensive Plans. The primary purpose of this screen is to assist the MPOs in urban areas and the FDOT in non-MPO areas to prioritize transportation projects by providing resource agency input that identifies issues that could influence transportation planning decisions.

In the Planning Screen, GeoPlan electronically uploads project description data received from the MPO and FDOT into the web-based Environmental Screening Tool and performs the standardized automated GIS analyses of the data for ETAT review.

The ETAT is electronically notified to conduct an assessment of the potential direct, secondary, and cumulative impacts that each candidate mobility project will have on the social or natural resource that their agency is responsible for protecting and/or managing. The ETAT will have 45 days to conduct their project impact evaluations and electronically submit their input to the ETDM database.

#### Potential Project Impacts

##### Social Resources

- Land Use
- Community Cohesion
- Community Impact Assessment
- Economic Resources
- Safety
- Mobility
- Civil Rights
- Relocations
- Noise
- Air Quality

##### Natural Environmental Resources

- Wetlands
- Wildlife and Habitat
- Water Quality and Quantity
- Aquatic Preserves
- Outstanding Florida Waters
- Sole Source Aquifers
- Wild and Scenic Rivers
- Floodplains
- Coastal Zone Consistency
- Coastal Barrier Islands
- Contaminated Sites

##### Cultural Resources

- Section 4(f) Lands
- Historic Sites/Districts
- Archaeological Sites
- Recreation Areas

##### Secondary and Cumulative Impacts

The Community Outreach Network will also be notified to perform their assessment of potential community impacts. Their evaluations will be submitted to the MPO in urban areas and the FDOT in non-urban areas for posting to the ETDM database.

The District ETDM Coordinator will verify that all input has been received from the ETAT and the Community Outreach Network. The Environmental Screening Tool will automatically date and time stamp all ETAT and public involvement comments for future reference.

## Secondary and Cumulative Impacts

*Secondary impacts are the indirect effects of a proposed action that occur later in time and are reasonably certain to occur. Cumulative effects are the impacts on the environment which result from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions.*

In the ETDM Process, secondary and cumulative impacts of land use and transportation decisions will be evaluated at the system level during the comprehensive plan development process as shown below. Understanding the secondary and cumulative impacts of proposed actions early in the planning process is expected to lead to improved balance between transportation, land use, and environmental resource management decisions. This analysis will be performed by ETAT during the Planning Screen.

The FDOT ETDM Coordinator will review the ETAT comments on potential secondary and cumulative impacts, summarize these results, and develop recommendations for addressing the stated impacts. The cumulative impacts will be based on a review of potential direct and secondary impacts related to both the baseline quality of environmental and community resources and the level of change that a future land use plan or planned transportation improvements could facilitate. This summary statement will be posted in the ETDM database. The

summary of ETAT comments on secondary and cumulative impacts will comprise a portion of the Planning Summary Report.

### Analysis of Public Involvement Feedback

The MPO in urban areas and the FDOT in non-MPO areas will be responsible for compiling and analyzing all system-wide and project-specific public comments received from the Community Outreach Network. The comments will be summarized and entered into a standard report format. The report will be electronically submitted to the District ETDM Coordinator for posting in the ETDM database. Community input will be a portion of the Planning Summary Report.

### Planning Summary Report

A Planning Summary Report will summarize key recommendations and conclusions for the direct, secondary, and cumulative impacts identified by the ETAT and the Community Outreach Network in the Planning Screen. The District ETDM Coordinator will be responsible for preparation of the summary report and posting it in the ETDM database. Standardized and automated report output forms will provide an efficient and accurate method of documentation. The Planning Summary Report will be available electronically to resource agencies and to the public.

#### Planning Summary Report Contents

- Project description,
- Purpose and need statement,
- Agency comments,
- GIS mapping,
- Secondary and cumulative impacts evaluations,
- Public involvement comments, and
- Preliminary project concept based on agency and public input.

The report will contain agency and community information needed by the MPOs and the FDOT to prioritize transportation improvement projects in the LRTP, Florida Intrastate Highway System (FIHS) Plan, and the FDOT Work Program. The report will also be provided to the planners responsible for developing Local Government Comprehensive Plans. It will contain identified issues and recommendations regarding potential secondary and cumulative impacts to assist comprehensive planners in more effectively balancing land use decisions with ecosystem protection, community mobility needs, and the human environment.

## PROJECT DEVELOPMENT

### Programming Transportation Priorities

Limited funding at the federal, state, and local levels necessitates that transportation improvements be prioritized to best serve the mobility needs of our citizens. In urban areas, MPOs are primarily responsible for priori-

tizing transportation improvement projects. The MPOs identify these priorities through project evaluation criteria used in the LRTP development process, public involvement, and interagency coordination and with guidance from their advisory committees. The FDOT and local governments establish bridge replacement and FIHS project priorities in the non-MPO areas for annual approval by the FDOT Executive Board. These project priorities, along with the MPO and local government priorities, are used to guide the development of the FDOT Work Program. Before priority projects will be eligible for inclusion in the FDOT Work Program, a Programming Screen will be performed by ETAT.

### Programming Screen

In the Programming Screen, ETAT representatives will review the Environmental Screening Tool information for priority projects and assist FDOT in scoping technical studies necessary to satisfy NEPA and obtain project permits during the project development phase. ETAT comments will be entered directly into the Feedback and Decision Data portion of the ETDM database.

### Advance Notification

The NEPA process begins at the Programming Screen with the development of the Advance Notification (AN). The FDOT District EITDM Coordinator will be responsible for assembling the AN package of information in preparation for the Programming Screen. This process is the method used by FDOT to inform federal, state, and local agencies of a proposed action and to give notice of the Department's intent to apply for federal aid on a project.

The AN package consists of a transmittal letter, application for federal assistance (when applicable), department project fact sheet, and location map. Part of the AN package will be produced as a "standard report" from a query generated from the EITDM database. The AN package will be available electronically to the ETAT and distributed to other appropriate federal agencies, central units of State government, local agencies, and American Indian tribes, as appropriate.

### Class of Action Determination

Compliance with NEPA requires that the type of required environmental documentation be agreed upon in consultation with FHWA/FTA. This agreement is called the "Class of Action Determination" and will be made by the FHWA/FTA ETAT member in consultation with the FDOT EITDM Coordinator. Their decision will determine whether a project can be categorically excluded from NEPA or whether the project requires further environmental analyses and documentation to achieve required permits. This decision by FHWA and FTA is based on the issues and comments provided by the ETAT in the Planning Screen.

Activities classified as Categorical Exclusions will advance to the design phase and will be programmed by FDOT. Interagency agreements between federal, state,

and local agencies will define categorically excluded activities using FHWA/FTA regulations as the basis.

### Project Scoping

The primary purpose of the Programming Screen is for the ETAT to conduct "project scoping." Project scoping entails the identification of environmental and social issues that require further study during project development and the methodology for analyzing those issues. The Programming Screen also provides the opportunity for ETAT members to elect "no further involvement" if the project has limited or no impacts on the resource that their agency is responsible for managing or protecting.

After notification by the FDOT EITDM Coordinator that the Environmental Screening Tool has been loaded with new projects entering the work program, each ETAT member will conduct the following activities during the Programming Screen:

- **Acceptance of the Purpose and Need Statement:** The ETAT member may provide comments to clarify the purpose and need statement.
- **Update Environmental Impact Reviews:** Environmental analyses conducted during the Planning Screen may need to be updated if new data or project issues warrant further evaluation. The ETAT member may also elect "no further involvement" if participation is not statutorily required.
- **Identification of Required Technical Studies:** The ETAT will participate in project scoping to identify and define studies that should be conducted during project development to satisfy NEPA and permits requirements.

The ETAT will electronically submit analysis results to FDOT for use in programming the technical studies and subsequent project phases into the FDOT Five-Year Work Program. The FDOT EITDM Coordinator may elect to conduct one or more face-to-face meetings with any or all ETAT members to discuss specific project issues, including secondary and cumulative impacts, during project scoping.

**ETDM Dispute Resolution Process**

**ETDM PROCESS COMMITMENT**  
*Significant unresolved disputes must proceed through Dispute Resolution prior to programming.*

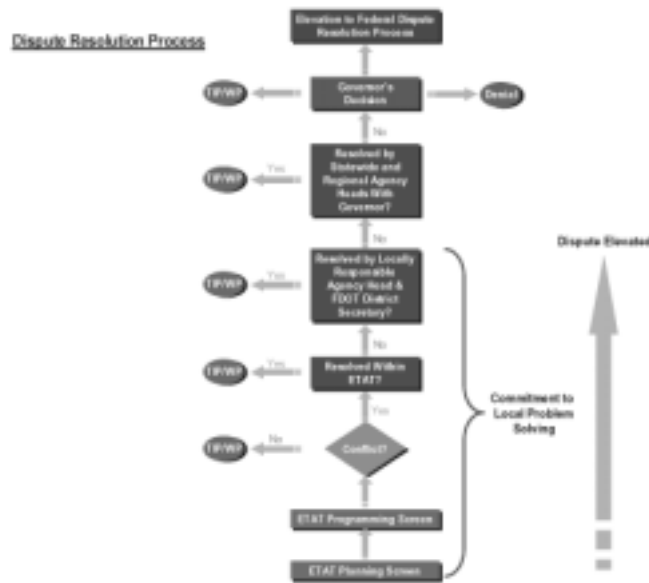

Identification of potential disputes will begin with the Planning Screen. Responses by ETAT will document the potential for a dispute relative to a candidate project's affect on a resource. When this occurs, the ETAT representatives and the District ETDM Coordinator are encouraged to consult and resolve the dispute, during the planning process, before the approval of the relevant LRTP or FHIS Plan.

Ongoing unresolved issues that require Dispute Resolution in the ETDM Process will be flagged by ETAT during the Programming Screen. Agency Operating Agreements (AOAs) and addenda will contain criteria that identify the basis and methodology for flagging a dispute.

The Memorandum of Understanding signed in December 2001 by state and federal agencies requires that project disputes be resolved before projects are eligible for programming by FDOT.

The ETDM Dispute Resolution Process is shown in the diagram below. This process focuses on resolution of disputes locally prior to elevation within agencies or to the Governor.

For each dispute in the ETDM Process, the ETDM Coordinator will first attempt to resolve the conflict or issue

at the agency staff level. The ETDM Coordinator will have the authority to make agency commitments, such as requiring specific technical studies to evaluate project alternatives or mitigation options during the project development phase. If the conflict cannot be resolved by the ETDM Coordinator, then the dispute will elevate to an Informal Dispute Resolution Process within the ETAT.

The Informal Dispute Resolution Process involves a sub-team of the ETAT including those agencies with identified concerns for a transportation project. The ETAT subteam may undertake the following actions to address identified conflicts and issues: 1) resolve the issue or conflict through consultation and commemorate the resolution; 2) complete a feasibility or technical study for ETAT review; 3) advance project into the FDOT Work Program with identified issues to be addressed during project development.

Significant disputes which cannot be resolved locally within ETAT will enter Formal Dispute Resolution which involves elevation within agencies.

#### Programming Summary Report

A Programming Summary Report will be prepared for each project as a transition document to the project development phase. The following key components will make up this report:

##### *Programming Summary Report Contents*

- Project description and logical termini,
- Purpose and need statement,
- Class of action determination,
- Agency comments,
- Affected community comments,
- Preliminary project concept,
- Required technical studies to achieve NEMA compliance and project permit,
- Reasonable alternatives for further study,
- Dismissed alternatives with reasons, and
- Dispute resolution issues.

The community input and ETAT analysis, commentary, and documentation contained in the Environmental Screening Tool will provide the base information required for the Programming Summary Report. Standardized and automated report output forms will provide an efficient and accurate method of documentation.

The ETDM Coordinator will be responsible for the preparation and posting of all Programming Summary Reports in the ETDM database. These reports will be electronically available to all ETAT representatives and the FDOT design engineers. The reports will be the transition document which transmits agency and community planning input for FDOT use in subsequent project development and design phases.

## ETDM AGREEMENTS

### Memorandum of Understanding

On December 14, 2001, federal and state agencies involved with the transportation planning decisions in Florida signed a Memorandum of Understanding agreeing to support the continued development and implementation of the ETDM Process in Florida. The agencies endorsed the process concept and agreed to support, establish, and implement the ETDM Process within their respective agencies to the extent feasible within existing legal authority, staffing, and budget.

### Agency Operating Agreements (AOAs)

Agency Operating Agreements (AOAs) are currently in review or under development and are anticipated to be executed within the next six months. It is the intent of these AOAs to implement the EITDM Process for all transportation projects in Florida that require coordination, consultation, and compliance approval from transportation and environmental resource and regulatory agencies. Topics addressed in the AOAs include the project information and agency reviews necessary to complete the

Planning and Programming Screens. The AOAs also document the resource analyses and technical reports necessary to obtain NEPA approval and project permits during the Project Development Phase. Mutually agreeable changes to operating procedures will be developed within agencies to document procedures supporting Florida's EITDM Process.

### The Path Forward

Final preparations are underway through the spring 2002 to allow FDOT to begin using the EITDM Process in July 2002. It is planned that a "staged implementation" will proceed at that time with EITDM Coordinators within each FDOT District rolling out the new process to MPOs and District planners as warranted by their readiness and status of their planning cycle. MPOs initiating the needs assessment phase of their long range transportation plan update, for example, would be a priority to begin using the new process. Full statewide implementation is anticipated by July 2003.

The preparations include the following:

- Completing development of the Environmental Screening List;
- Completing the EITDM Procedures Guide which will be used by District planners, MPOs, and resource agencies;
- Developing training materials for agencies and consultants; and
- Testing the effectiveness of the new process with a "Mock EITDM."

Each of these implementation issues is described further in the following paragraphs.

### Environmental Screening Tool

Activities planned through the spring 2002 include programming the final elements of the Environmental Screening Tool and finalizing preparation of the User's Guide as well as preparation of on-line documentation. This User's Guide will be included in the Procedure Guide. The GIS team will then train and work with the "Mock ETAI" during system testing and will make final refinements to the system and User's Guide prior to implementation.

### ETDM Procedure Guide

Volume I of FDOT's Project Development and Environment Manual (the two-volume PD&E Manual) will be supplemented and eventually replaced by the ETDM Procedure Guide that will describe the steps and actions needed to accomplish efficient transportation decision-making within this new process. The Procedure Guide will detail, for example, the activities needed to accomplish the "Planning Screen," "Programming Screen," and the activities and timeline during "Project Development" that will lead to issuance of construction permits and the federal Record of Decision.

This Procedure Guide will draw from the results of task work groups that considered the specific actions needed to implement the ETDM Process.

The Procedure Guide will include a User's Guide for the Environmental Screening Tool as well as procedures for engaging input from the affected community.

### Training

Training on the intent of the new process and procedures to be used will be required within FDOT, resource agencies, and MPOs. Some of the work to be performed within FDOT or by MPOs may be performed under Gen-

eral Consulting Contracts or other contract arrangements with consulting firms. Those consulting firms will also require training in the process.

Training materials and a training syllabus will be developed to support this preparatory activity. All training for Department, agency, and MPO personnel plus consultants will proceed shortly following the start of the Department's 2002/2003 fiscal year. ETDM Coordinators in each District will sequence the training depending on their perspective of the Department's needs and the degree of readiness for the entity involved. For example, an MPO that is not currently performing an LRTP update may be a lower training priority than an MPO which is starting its LRTP update.

It is planned that bulk training sessions will be held initially to introduce the process and describe the procedures to be used. Hands-on training will then be available as people engaged in the process begin using the Environmental Screening Tool and Procedure Guide. The goal of this training effort is to minimize the potential frustration that can occur as new procedures are implemented.

### Testing the ETDM Process

Initially it was planned to conduct a series of "pilot applications" to test the Environmental Screening Tool and to allow more time for the FDOT Districts to adjust to a "new way of doing business." During meetings with the Districts in the latter portion of 2001, however, the FDOT Central Environmental Management Office met enthusiasm for proceeding with implementation. As a consequence, it was decided to accelerate preparations and to begin using the new process during the summer of 2002. The concept of pilot applications has subsequently been replaced by "Mock ETAI" testing to reduce the testing time required.

Late in the spring of 2002, the ETDM Procedure Guide and Environmental Screening Tool will be tested by a "Mock ETAT." The FDOT and "Mock ETAT" will meet with the ETDM project team members for a two-day orientation period during which participants will be instructed in the use of the Environmental Screening Tool and Procedure Manual. This will be an abbreviated version of the ETDM training which will be provided to other participants since the "Mock ETAT" members will be knowledgeable of the background and intent that produced the ETDM Process.

"Mock ETAT" members will then perform the Planning Screen and Programming Screen involved with an MPO LRTP update and for selected project priorities within the LRTP. ETDM project team members will be available to the "Mock ETAT" through this test to provide hands-on help with the system and to collect feedback on suggested improvements.

The Procedure Manual will be modified to incorporate input from the "Mock ETAT" prior to implementation within Districts beginning in July 2002.

Examples from Environmental Screening Tool

STATEMENT OF EMILY WADHAMS, VERMONT STATE HISTORIC PRESERVATION OFFICER

Mr. Chairman and members of the committee, thank you for inviting me to provide testimony today on the approach Vermont has taken to expedite historic preservation reviews of transportation projects. My name is Emily Wadhams. I am the Vermont State Historic Preservation Officer. I am also on the Board of Directors of the National Conference of State Historic Preservation Officers and am an Advisor to the National Trust for Historic Preservation. Although I am not speaking on behalf of these national organizations, I have been working closely with them on the issues I'll be addressing this morning.

I appreciate the opportunity to testify today and especially want to thank Senator Jeffords for the invitation. We in Vermont have long looked to Senator Jeffords as a leader in historic preservation. History is important to Vermonters, and Senator Jeffords has done a lot to help the citizens of Vermont preserve our State as a special place. He has recognized and supported the importance of landmarks like covered bridges and barns with national legislation that helps preserve these icons for all Americans. And he has championed our small towns and villages with his leadership on postal service policy that keeps post offices active as vital community centers.

In Vermont, my office collaborated with State and Federal transportation officials to improve the way we review the impacts of transportation projects on historic and archeological resources. In brief, we developed an agreement known officially as a Programmatic Agreement, or PA, that creates an alternative review process for transportation projects under Section 106 of the National Historic Preservation Act. Although Section 106 regulations encourage programmatic agreements, Vermont is the only State to have developed such a comprehensive document. Under the agreement, the State Historic Preservation Officer has delegated the review and sign-off authority to qualified historic preservation professionals within the Vermont Agency of Transportation for all State and Federal transportation undertakings. After almost 2 years of experience with the PA, I can report that the success of this approach has far exceeded our expectations.

#### *Background*

Section 106 of the National Historic Preservation Act requires Federal agencies to consider the effects of their undertakings on historic and archeological resources. In Vermont, as in other States, transportation safety and efficiency goals have often collided with historic preservation goals, sometimes delaying projects, and pitting State DOT's against State Historic Preservation Offices (SHPOs) in battles over the preservation of cultural resources. Mistrust among the parties to the process was common, and it often turned into a 'blame game' of whose fault it was that projects were being delayed. In the end both sides lost—project schedules lengthened, costs increased, and cultural resources were destroyed. Vermont, like most States, was mired in the problem. We were hearing from communities that they were not being heard and that changes were being made in the name of improving roads that were ruining the character of their towns.

Vermonters believe that it is possible to change things for the better, that if you bring together the right people and talk about a problem, you can fix it. In the mid 1990's, Vermont started talking about how to solve the Section 106 review problem for transportation projects. Many of the most pressing—and adversarial—projects involved historic metal truss bridge replacements, and so we focused first on a survey of these bridges—which ones were most important, which ones were good candidates for preservation, which ones had to be removed, and was it feasible to reuse some elsewhere? The Vermont Agency of Transportation and the Vermont State Historic Preservation Office both committed time and money to answer the questions and produced a consensus bridge plan, formalized into a programmatic agreement for bridges. Although many bridges have been saved in place and continue to serve vehicular traffic, AOT developed a Historic Bridge Program to relocate and restore important bridges. In Hinesburg, Vermont, a small pony truss has been reused to cross a stream on a heavily used community pedestrian and bike path. In Arlington, a bypassed metal truss bridge next to a fishing access on the famed Battenkill trout stream became a fishing platform accessible for people with disabilities.

Another collaborative effort also occurred at the same time. This was the development of the Vermont Design Standards (1996) and a new community review process designed to create more flexibility and creativity in designing transportation projects and to increase community input early in the planning process. One of the first beneficiaries of the new Standards was the town of Underhill where citizens fought for and won a "footprint" replacement bridge, a bridge that matched the dimensions of the old bridge as well as the small scale of the community. The success of these efforts led to broader discussions about how to streamline all Section 106 reviews and better protect cultural resources in transportation planning.

These projects changed our relationship with the Agency of Transportation. We began working on the premise that we shared the same two goals—to improve the review process to allow AOT to do its job, and to be good stewards of the State's historic resources. The trust that evolved led to the creation of a general Programmatic Agreement, or PA, that emerged in 2000. The PA delegates Section 106 sign-off authority to the Agency of Transportation itself, for its own projects, a radical concept. The PA relies on qualified historic preservation professionals within AOT to ensure appropriate consideration of historic and archeological resources in

transportation project planning. AOT now files a final comment with the SHPO, and there is a specified timeframe for the SHPO to ask questions or disagree. AOT and SHPO staff worked together to create the PA Manual that clarified or developed procedures and other guidance to define how resources should be evaluated and treated in the Section 106 process. That effort allowed us to discuss, debate, and agree on exactly how the Section 106 process would work under the PA, which set the overall tone of the process, but did not provide details. The first annual evaluation of the PA process proclaimed it a resounding success. Thirty other States have requested copies so that they may consider it for their jurisdictions.

*What has changed—Increased stewardship*

Preservationists have long thought that consideration of historic and archeological resources early in project planning could eliminate many potential adverse effects on those resources in transportation projects. The PA promotes early consideration by sanctioning AOT historic preservation staff to actively and authoritatively participate in that early planning to avoid adverse effects. Formerly, when preservation issues came up late in the project planning process, it was often difficult and expensive to redesign to avoid adverse effects, and resources were lost.

*Reduces project and process delays*

The PA has reduced delays in the review process dramatically. AOT estimates that review of routine projects has been shortened by weeks, and complex projects, by months or more. The PA exempts from review a long list of activities with little potential to affect historic and archeological resources. The time-consuming exchange of memos, telephone calls and frequent meetings have been eliminated between the SHPO and AOT staff.

*Increases amount and range of public involvement*

The PA Manual prescribes opportunities for broad public involvement and comment on the issues covered by Section 106, piggybacked on the Agency's existing public process. The Manual requires that the Agency reach out to certain interested constituencies and inform them about their opportunity to comment, thereby enhancing the public's ability to understand and comment on affected historic and archeological resources. The PA also stresses public education about historic and archeological resources, both as projects occur and as mitigation.

*Enhances interagency coordination*

The PA also called for interagency cooperation on other innovative non-regulatory projects, and several are currently underway which will benefit Vermonters: AOT now co-sponsors our annual State-wide historic preservation conference and Vermont Archeology Month; it is working with us to develop a data base of historic resources, refine a GIS-based predictive model for archeological sites; and is considering helping us update our long-neglected State survey of historic sites. And I'll throw in a plug for more capacity for State historic preservation offices here. The appropriation to Department of Interior's Historic Preservation Fund, which provides Federal funding to State historic preservation offices to do all the things we are mandated to do under Federal law,—survey work, regulatory reviews, historic tax credit reviews, provide technical assistance, and so on—has seen only minor increases in the last 30 years. In Vermont, we have not been able to invest in the infrastructure—good data base, historic sites surveys and GIS mapping—to allow information about historic resources to be integrated into State, local and Federal planning processes. Any way that the Historic Preservation Fund can be increased or enhancement dollars earmarked to assist us with this process would greatly improve our ability to be better stewards of these resources while improving the historic preservation offices' regulatory review process.

*Increases Agency's stewardship role*

The key to success of the Vermont Programmatic Agreement has been a willingness on AOT's part to take its mandated responsibility toward historic preservation seriously. In the past, it was too easy for AOT to say the State historic preservation office was "making them" do something. With the new process, historic preservation concerns are more naturally integrated into the agency's thinking in the earliest stages of project development, not as an afterthought or a burden. In addition, the Agency of Transportation has now begun to develop projects, like a new railroad depot initiative to rehabilitate the State-owned railroad depots that probably wouldn't have happened without this new integration of historic resource protection into their day-to-day activities.

*Role of Enhancements Programs*

Without the enactment of ISTEA and TEA-21—the enhancement programs that began in 1991, I’m not sure we would be where we are today. Congress made a clear statement with the enhancements program that built upon on the 1966 National Historic Preservation Act. It said that ‘yes’ in 1966 we were serious about making sure that federally funded highway projects and other Federal undertakings couldn’t ignore the impacts of interstate highways and other transportation projects on our nation’s historic resources. Now, with the enhancements program, Congress has also made a commitment to those “activities that enhance community benefits of transportation investments”. Enhancements are engines of change and natural partnership builders. They enhance the natural and built environments through which roads pass. Vermont’s Agency of Transportation’s major responsibility is to repair and build roads and bridges for safe and efficient travel. But it also takes its environmental responsibilities seriously. AASHTO honored the Vermont enhancements program as one of the four best in America in a 2000 competition.

We have come a long way toward recognizing the importance of stewardship. We still need better policies to address important issues like limiting truck length and weight on the National Highway System roads, changing Federal funding policy to encourage, not discourage retention of historic bridges, and provide funding that will allow for the retention of unpaved scenic roads, for example. Also badly needed are changes to the enhancements program that remove serious impediments in applying for scenic easement acquisitions. Vermont is making a major effort to gain scenic or conservation easements at interstate exits to help communities address growth and traffic concerns. The current program, which will not allow for an appraisal or negotiated purchase price until after the enhancements grant has been awarded, make this almost impossible.

In Vermont our “new and improved” approach to regulatory reviews is working. I believe it works because we have a citizenry that values the resources we strive to protect, we have legislators in Washington who recognize the importance of protecting these resources for future generations of Vermonters, we have a Governor who has worked hard to protect our downtowns, village centers and scenic landscapes, we have supportive leadership within our Agency of Transportation, and we have a Federal Highway Administration staff that has been a strong partner in these efforts. Our mutual goal has been to address issues of safety and efficiency in a modern transportation system in a way that enhances and does not compromise the special characteristics of the State we love.

*Section 4(f)*

I strongly believe that the approach we’re taken in Vermont to improve the regulatory process can also work with the protections established in Section 4(f) of the Department of Transportation Act. 4(f) prohibits the use of historic sites and public lands unless there is no prudent and feasible alternative. It is viewed by some as being rigid and cumbersome and sometimes results in solutions that don’t make sense especially with smaller projects. In Vermont, 4(f) is rarely a problem, because AOT’s historic preservation staff flags adverse effects very early on in the planning process and can work to either avoid the adverse effect or go through the required alternatives analysis early on. I think almost everyone who works with 4(f) agrees that improvements to the process could be made. But changing the statute would be drastic and unnecessary and open the door to weakening the protections created by the law. The success of the Vermont example to expedite reviews under Section 106 can be applied to improving the 4(f) process. As we learned with our project, willing partners committed to making the process work effectively, can devise a regulatory or procedural solution to address the problem. In Vermont, I believe we have shown that with a collaborative approach, everyone wins—projects get built, resources get protected and the public is better served.

Thank you.

## ATTACHMENTS

1.) Manual of Standards and Guidelines, in accordance with the Programmatic Agreement among the VAOT, FHWA, ACHP, VSHPO regarding the Implementation of the Federal-Aid Highway Program in Vermont (12/28/0). Manual includes the Programmatic Agreement as Appendix A.

2.) Better Historic Preservation Reviews for Road Projects, National Trust for Historic Preservation, 2002

## RESPONSES OF EMILY WADHAMS TO ADDITIONAL QUESTION FROM SENATOR JEFFORDS

*Question 1.* Transportation agencies and associations are recommending that Congress make changes to Section 4(f). They contend that Section 106 can in many cases take the place of 4(f). In your testimony, you mentioned that this was not a good idea. Why would transportation agencies seek such changes? Please expand upon your concerns over this proposed change.

Response. Section 4(f) has always provided a greater level of protection than Section 106 because it prohibits damage or destruction of historic resources unless there is no prudent and feasible alternative. Section 106 provides a process for considering alternatives to damage or destruction, but not a mandate to avoid them. Large-scale transportation projects have the potential to damage or destroy significant numbers of historic and archeological resources. The extra protection provided by 4(f) beyond Section 106 (which applies generally to all Federal agencies) highlighted a specific public concern for potential environmental impacts of such transportation projects. The presence of 4(f) has flagged consideration of historic resources as a priority for State transportation agencies across the country, and has resulted in early planning for their preservation in transportation projects where possible. In some cases, where Section 106 has failed to protect resources where it was feasible to do so, 4(f) has done the job. From what I have heard from transportation agencies and organizations around the country, there is legitimate concern that there is sometimes redundancy between 4(f) and Section 106, especially on minor projects. That redundancy can contribute to project delays. However, I believe that there is an easier and faster way to address that problem than changing the law and then spending many months on developing implementing regulations and training. Section 4(f) protection for historic resources is too important to lose. But we can streamline the process to avoid unnecessary duplication and delays through administrative action, specifically through Programmatic Agreements (PA's).

State or regional multi-State Programmatic Agreements (PA's) could allow Section 106 reviews to satisfy 4(f) requirements for minor takes and other projects where there is concurrence on an appropriate outcome. States could tailor PA's to reflect their resource base, typical kinds of undertakings, and staff capacity and procedures. The Exempt List feature of a PA could include types of projects unlikely to affect historic resources because of their size and nature, and/or categories of Section 106 determinations, like "No Historic Properties Affected", that all parties agreed on. Likewise, the Standard Mitigation Measures feature of a PA could provide a menu for mitigating adverse effects in meaningful ways, without the added time and expense of developing separate mitigation on each individual project with an adverse effect. Vermont operates under a similar PA for Section 106 review of transportation undertakings (described in my September 19th testimony), and we have found it to be very successful at both streamlining reviews and protecting resources.

I have heard complaints about a one-size-fits-all approach to 4(f) alternatives analyses that results in unnecessary extra work on smaller projects. We believe that either in a PA or in administrative guidance from FHWA, it would be possible to relate the depth of an alternatives analysis to the scale of a project and its potential effect. Common sense could prevail.

The goal of streamlining historic resource reviews for transportation projects could be achieved quickly and effectively through a PA approach. Many Federal and State agencies have experience in creative problem-solving through PA's, and the Vermont Division for Historic Preservation would be happy to contribute to such an effort. Please let us know if we can help.

- (B) ACT 250 Criteria

## **1 APPLICABILITY AND SCOPE**

### **Laws, Regulations, Guidelines**

- Programmatic Agreement Among the Federal Highway Administration, the Vermont Agency of Transportation, the Advisory Council on Historic Preservation, and the Vermont State Historic Preservation Officer Regarding Implementation of the Federal-Aid Highway Program in Vermont (AOT PA)

### **Key Definitions**

### **Implementation**

In 1997, the Vermont Agency of Transportation (VAOT), the Vermont Division for Historic Preservation (VDHP), and the Federal Highway Administration (FHWA) began discussing how we could improve the Section 106 process for transportation projects in Vermont. Could we make the process easier, faster, more effective, less redundant, while maintaining an appropriate level of protection for historic and archeological resources? The results were something of a revolution, and are embodied in the Programmatic Agreement (PA) signed on April 5, 2000. It is the first agreement of its kind in the country, and may become a model for other states to follow.

The basic premise of the PA is that VAOT will conduct reviews of its own projects, using qualified historic preservation and archeological professionals on VAOT staff, without further review or input by VDHP and the Vermont State Historic Preservation Officer (SHPO) except in rare instances. It is expected that the PA will enhance early project planning to avoid or minimize impact to historic and archeological resources, will result in more timely and predictable reviews, and will enhance public support for projects. The Manual is a guide to implementing the PA. It interprets and provides more detail on the provisions of the PA. Like the PA, it is the result of a lengthy collaborative effort among VAOT, VDHP and FHWA.

The Manual sets out the qualifications for the VAOT review staff, procedures for project reviews, provisions for soliciting and responding to public comment, standards for evaluating and documenting projects, an annual reporting process, and guidance on using standard mitigation measures and addressing emergency situations and unanticipated discoveries. The Manual is meant to provide guidance for professional evaluation and documentation by historic preservation and archeological professionals employed as staff or consultants for VAOT. The PA and the Manual rely on the sound professional judgement of the VAOT historic preservation and archeological professionals. The guidance in the Manual cannot substitute for professional knowledge and experience.

### **Documentation**

## 2(A) EMPLOYMENT OF QUALIFIED PERSONNEL

### Laws, Regulations, Guidelines

- 36 CFR 61, Appendix A (Professional Qualifications and Standards)
- VT Personnel Dept., Job Specifications
- April, 2000 Federal-Aid Highway Program Programmatic Agreement

### Key Definitions

- **Archaeology Officer:** Qualified professional staff responsible for implementing the provisions of the Programmatic Agreement.
- **Historic Preservation Officer:** Qualified professional staff responsible for implementing the provisions of the Programmatic Agreement.

### Implementation

- **Archaeology and Historic Preservation Officers** will be experienced professionals in their fields. At a minimum, Officers will have Master's degrees in their respective fields, five years of professional experience, and an understanding of and experience applying the NR criteria and the Secretary's Standards. A Ph.D. may substitute for experience on a six months per semester basis. Consult the Dept. of Personnel job descriptions for full statement of qualifications.
- **Hiring procedure:** Standard hiring procedure assisted by SHPO. SHPO will be consulted by providing written comments for each candidate selected for an interview.
- **Absence of Officers:** In the case of prolonged absence of an officer, VAOT will appoint an acting officer meeting position qualifications.

### Documentation

**2(B) MANUAL OF ANCILLARY STANDARDS AND GUIDELINES****Laws, Regulations, Guidelines**

- Programmatic Agreement Among the Federal Highway Administration, the Vermont Agency of Transportation, the Advisory Council on Historic Preservation, and the Vermont State Historic Preservation Officer Regarding Implementation of the Federal-Aid Highway Program in Vermont (AOT PA)

**Key Definitions****Implementation**

The AOT PA was signed on April 5, 2000, but it stipulated that the PA would not take effect until an accompanying Manual was completed and accepted by the parties. Work began immediately to create a Manual to implement the provisions of the PA. Under the direction of SHPO Emily Wadhams and VAOT Director of Technical Services John Perkins, the parties established a steering committee to guide development of the Manual. The committee was composed of AOT staff - Scott Newman, Scott Gurley, Duncan Wilkie, Jen Russell, and John Narowski, SHPO staff - Nancy Boone, Giovanna Peebles, Scott Dillon, and Sue Jamele, and FHWA staff - Rob Sikora. MaryAnn Nabor, then of the Advisory Council and currently the FHPO at FHWA, also provided input as questions arose.

Principal authors of the Manual were Scott Newman and Nancy Boone. Generally, they drafted sections of the Manual, corresponding to the sections of the PA, and reviewed them in detail with the steering committee. Some sections of the Manual that dealt primarily with archeological resources were drafted by Jen Russell and Giovanna Peebles. The steering committee spent many hours discussing and reviewing draft sections of the document, and the authors revised the sections in response to committee comments and concerns, and reviewed them again with the committee. This work occurred between April and December 2000. The Manual was completed at the end of December 2000, and accepted by the parties in December, 2000.

**Documentation**

## **2(C) COORDINATION OF PROJECT REVIEW AMONG VAOT DIVISIONS**

### **Laws, Regulations, Guidelines**

- National Historic Preservation Act , 36 CFR 800
- VAOT Structures Project Development Process Manual
- VAOT Structures Project Development Process Flowchart
- VAOT Local Transportation Facilities Guidebook
- VAOT Programmatic Agreement for Paving and Minor Highway Projects
- VAOT 10/1/99 Paving PA Review – Revised Review Process
- Exempt Activities listed in 4/5/00 VAOT PA Appendix
- VAOT Programmatic Agreement for Projects Involving Historic Bridges
- VAOT Draft Criteria for Evaluation of Concrete Bridges and Guidelines for Project Review
- VAOT Surveys of RR lines and structures.
- VAOT Environmental Permit Process for Town Transportation Projects
- VAOT Environmental Permit Requirements for Federal-Aid Town Highway and Bridge Projects

### **Key Definitions**

### **Implementation**

Federally assisted transportation activities administered by the VAOT and constituting undertakings under 36 CFR 800 fall under separate divisions of the agency. Some have established coordination procedures for Section 106 review, and some are handled in a less formal way at this time. All coordination efforts are periodically reviewed and updated, and revised procedures will be added to the Manual at the time of its annual review.

The VAOT Environmental Specialists (one for each of four regions) obtain and provide lists of programmed projects from all Divisions to the VAOT Officers. Provision of lists remains the responsibility for project managers in each Division. Individual requests for Section 106 review come directly from project managers. Based on the VAOT project schedule and Agency requirements, Officers prioritize and conduct project reviews and are responsible for final approval for all projects. The specialists ensure all environmental reviews required for the NEPA process, including Section 106 are completed and forward the NEPA document to FHWA. Project data is entered into the VAOT environmental database where the permitting progress of all projects can be tracked.

The following is a brief description of undertakings by Division, and a summary of VAOT Section 106 coordination protocols as of 12/2000.

### **Office of the Secretary**

- **Special Projects Division**  
Projects are few in number but very large, time consuming projects with the capacity for extensive impacts to historic properties. Examples include the Bennington Bypass and Chittenden County Circumferential Highway projects. Projects may be in planning and construction for decades, and Act 250 will normally apply. Projects are normally handled by consultants; special situations will call for input from Officers and may be controversial. Officers will ensure early and ongoing coordination with the project managers which is essential to keeping these projects on track and avoiding unanticipated Section 106 concerns. Officers will review projects, direct changes as needed, and proceed with final approval.

### **Technical Services Division**

- **Right-Of-Way**  
Projects typically include the sale, lease, or exchange of VAOT -owned surplus lands. These transfers are reviewed for the possible application of easements on historic properties within the parcels as appropriate. Information regarding these projects is forwarded to environmental specialists for distribution to the Officers for review and final approval.
- **Utilities**  
Projects include the installation or modification of utilities infrastructure where this work is the primary or sole component of the project: aerial and buried power lines, fiberoptics, water lines etc. Information regarding these projects is forwarded to environmental specialists for distribution to the Officers for review and final approval.

### **Maintenance Division**

- **Aviation**  
Projects include airport infrastructure improvements including runway expansions and work to facilities – some of which may be historic buildings or structures. Archaeological properties may be impacted. It is the responsibility of Aviation project managers to provide information on all proposed projects to the VAOT Environmental Section showing area of potential affect, existing buildings and structures and proposed scope of work including all ground disturbances. The Officers will offer guidance on proceeding with required historic preservation review, likely including an initial request for project maps, plans, and identification of the resources. Once required information is in hand, Officers will review projects, direct changes as needed, and proceed with final approval. Site visits are generally recommended.

- **Maintenance Districts**

Includes maintenance and upgrading of existing transportation infrastructure and confined to the right-of-way – including guardrail, signage, sight distance projects, bridges and culverts, ditches, bridge washing, water repellent, emergency repairs, and minor bridge repairs. Projects can come in individually, or listed in groups such as “betterment projects,” “fast squad” projects, or statewide programs. It is the responsibility of District Administrators to provide information on all proposed projects to the VAOT Environmental Section showing area of potential effect, existing buildings and structures and proposed scope of work including all ground disturbances. The Officers will offer guidance on proceeding with required historic preservation review, likely including an initial request for project maps, plans, and identification of the resources. Once required information is in hand, Officers will review projects direct changes as needed, and proceed with final approval. Site visits are generally recommended.

#### **Project Development Division**

In general, Section 106, Act 250, and VT 22 VSA reviews follow process described in the [Project Development Process Manual](#) (pp. 28), and Dec 22, 1997 [Project Development Process Flowchart](#). Program-specific procedures are stipulated for the following sections of the Project Development Division:

- **Construction**

Archaeology and Historic Preservation Officers schedule annual meetings with each of four construction area engineers to review construction issues. Meetings with project Resident Engineers are requested on an as-needed basis. Pre-construction meetings are mandated in the special provision sections of contracts as required by the Archaeology Officer or Historic Preservation Officer. These meetings are held to ensure that conditions of the Section 106 formal comment letters and other permits are implemented.

- **Local Transportation Facilities**

Wide array of locally administered projects including transportation enhancements, building rehabilitation, bike/ped facilities, scenic easements, etc. The [Local Transportation Facilities Guidebook](#) provides thorough and specific guidance for LTF, local officials, and their consultants on the steps required for Section 106 compliance. Refer to sections 3-26 to 3-46 for environmental review process. It is the responsibility of the VAOT LTF project managers to provide the environmental section with lists of projects and scope of work descriptions, to ensure that qualified professionals are conducting resource ID and effect determinations as required, and to ensure that all review steps undertaken by their local officials and their consultants are carried out in accordance with the guidebook. Once required information is in hand, Officers will review consultants reports, direct changes as needed, and proceed with final approval.

- **Pavement Management**

Most paving projects (95%) are reviewed under 2/1/96 Programmatic Agreement for Paving and Minor Highway Projects by consultants on retainer with VAOT Engineering subcontractors. Consultants undertake complete

review of projects under PA per [10/1/99 Paving PA Review – Revised Review Process](#), attach archaeology clearance from VAOT Archaeology Officer, and forward to VAOT Historic Preservation Officer for review and final approval. Consultants should consult [Exempt Activities](#) listed in 4/5/00 PA Appendix, which supercedes the Paving PA where the former is inconsistent with the latter.

- **Roadway and Traffic Design**

Projects can be lengthy and complex. Officers will ensure early and ongoing coordination with Roadway project managers on design questions where significant impacts are possible to historic properties. It is the responsibility of Roadway project managers to provide information on all proposed projects to the VAOT Environmental Section showing area of potential affect, existing buildings and structures and proposed scope of work including all ground disturbances. [Programmatic Agreement for Paving and Minor Highway Projects](#) may apply. See Project Development Process and Flowchart. Once required information is in hand, Officers will review projects, direct changes as needed, and proceed with final approval.

- **Structures**

Projects are frequently complex with potential for significant impact to historic properties. [Programmatic Agreement for Projects Involving Historic Bridges](#) may apply. See also [Draft Criteria for Evaluation and Guidelines for Project Review](#). Requires early and ongoing coordination with Structures project managers on design questions where impacts are possible to historic properties. It is the responsibility of Structures Division project managers to provide information on all proposed projects to the VAOT Environmental Section showing area of potential affect, existing buildings and structures and proposed scope of work including all ground disturbances. Once required information is in hand, Officers will review projects, direct changes as needed, and proceed with final approval. See [Project Development Process and Flowchart](#).

### **Rail Division**

Projects may impact historic RR buildings (including 11 VAOT-owned depots), bridges, culverts and lines - most of which qualify as historic districts. Rail project managers advise environmental section of projects with historic resources present. Early and ongoing coordination is necessary to provide for Section 106 review. It is the responsibility of Rail Division project managers to provide information on all proposed projects to the VAOT Environmental Section showing area of potential affect, existing buildings and structures and proposed scope of work including all ground disturbances. Emphasis is given to the protection and preservation of historic RR depots as required by 22 VSA 14. The [Programmatic Agreement for Paving and Minor Highway Projects](#) and Exempt Activities listed in 4/5/00 PA Appendix may apply to minor RR related projects. Once required information is in hand, Officers will review projects, direct changes as needed, and proceed with final approval. Consult VAOT [surveys of RR lines and structures](#).

**Documentation**

Permitting progress and related comments are entered into project files and the environmental database. Separate lists are maintained for projects not entered in database (e.g. enhancement projects, district maintenance projects).

Examples of recommended education and outreach projects:

- VAOT web site and Consultant Web Sites
- Temporary exhibits
- Traveling exhibits
- Permanent exhibits
- Lecture series
- Non-technical booklets
- Vermont Life Magazine article or news bulletin
- Videos
- Press releases
- Community archaeology projects using adult and youth volunteers (Field Schools, Summer Camps)
- Education curricula
- TV programs
- Lecture – slide show
- CD Rom
- Interactive virtual tours
- Digital publications
- Interpretive signage
- Site tours
- Site brochures
- Innovative programs see [Section 2(I)]

## 2(D) EDUCATION

### Laws, Regulations, Guidelines

- Guidelines for Archaeological Studies (1989)

### Key Definitions

- *CLG Commission* : Certified Local Government Historic Preservation Commissions certified through the National Park Service's Certified Local Government Program.

### Implementation

- VAOT will provide a significant public education and interpretation component in its undertakings whenever appropriate.
- The goal of the public education effort is to provide information about newly identified resources, their historic context, and/or other similar resources in order to foster understanding of the significance of resources affected by an VAOT project.
- Education and outreach should be directed toward property owners, the town (both local government and community groups), educators, students and the general public, as appropriate.
- VAOT will require its consultants to submit site information as appropriate to the VAOT web site as well as consultant web sites.
- To the greatest extent possible, education outreach projects and programs should be conducted in consultation with the local community and other interested parties both during planning and implementation.
- Education and outreach activities will be coordinated with Native Americans as appropriate.
- The VT SHPO Guidelines for Archaeological Studies (1989), state that "all archaeological studies carried out in Vermont should interpret project results for the public benefit and present those findings to the public." The expected level of education and outreach differs for each study phase and is dependent on project size and results. The Guidelines offer some examples of education and outreach projects but archaeological consultants are encouraged to adopt new and innovative methods as well. The following incorporates recent advances in technology to offer as tools for public education and outreach within the general policy of the 1989 Guidelines.

**Additional Guidance for Archeological Public Education Projects:**

- Exceptional sites may require education and outreach after the Phase I study.
- Historic archaeological sites may be suited to different types of education and outreach efforts than prehistoric sites.
- Education and outreach activities will be coordinated with Native Americans as appropriate.

**Education Specific to the Landowner:**

- Site information will be provided to the landowner. Written information should include the Non-Technical Summary, Site Survey Form, and a site map if available.
- Additional site information will be provided to the landowner as it becomes available (including, for example, site reports, non-technical publications, etc.)
- A public meeting for site landowners and other interested persons may be appropriate depending on the results of the study.

**Education Specific to the Town:**

- To the greatest extent possible, local governments and CLG Commissions (where they exist), should be made aware of the archaeological study; project location, anticipated schedule, site tour information, etc.
- At the conclusion of the archaeological study, site information will be provided to the Town. Information may include the Non-Technical Summary, site map, GPS coordinates and report.
- A presentation to the Selectboard, Planning Commission, CLG Commission, and /or Regional Planning Commission may be appropriate depending on the results of the archaeological study.

**Documentation**

- Products will be distributed to appropriate publics.

**2(E) TRAINING****Laws, Regulations, Guidelines****Key Definitions****Implementation**

- This section sets out training targets for each reporting period. The accomplishment of each training task is encouraged but, given possible changes in staff availability, workload, and timing, they are not mandatory under this agreement. The first period begins 1/1/01 and ends 6/30/01. The second begins 7/1/01 and ends 12/31/01. Reporting periods follow the calendar year thereafter.
- An evaluation of completed training activities and revisions to training targets will be undertaken as part of each annual review. Accomplishments will include development of training materials where the workshop will not yet have taken place.
- Depending on the subject, workshops, seminars and other training activities can be collaborative efforts between VAOT and VDHP and other groups including Native Americans as appropriate.

Training targets for the period 1/1/01 – 6/30/01, and 7/1/01 – 12/31/01:

- Orientation to PA and Manual Section 106 provisions for executive staff.
- Public participation in the Section 106 review process: for VAOT project managers and consultants.
- Best Practices: innovative approaches for Section 106 compliance as highlighted in current and completed VAOT projects, other State DOT's.
- Archaeological Priorities.
- Section 106 training for VAOT District Staff.
- Ongoing compliance workshops for VAOT Project Managers.
- Professional development and training for Officers, including GIS.
- Ongoing training for construction districts and area engineers.

**Documentation**

Accomplishments will be evaluated and discussed in the annual VAOT report to VDHP. See Annual Report requirements in Section 3A.

**2(F) ANNUAL EVALUATION****Laws, Regulations, Guidelines****Key Definitions****Implementation**

- The Officers shall produce an Annual Report in January and provide copies to the SHPO and FHWA.
- An Annual Evaluation meeting is due by March 1 of each year, and includes the parties to the PA – VAOT, FHWA and SHPO. AOT and SHPO shall convene the meeting at a mutually agreed upon date and time.
- The SHPO needs to schedule a review of the Report by the Vermont Advisory Council on Historic Preservation prior to the Annual Evaluation meeting.
- Refer to the Annual Report Outline in 3(A) for a summary of what should be included in the Report. The reporting period for the Annual Report is the calendar year. The Report summarizes undertakings and findings in a table format, and includes a narrative description of accomplishments, concerns, and recommendations regarding possible changes to the Manual or the PA.
- After the Annual Evaluation meeting, the SHPO shall provide a written response to the Annual Report within 30 days of the Annual Evaluation meeting. The SHPO may conclude that the terms of the PA and Manual are being met, or that performance under the agreement is less than satisfactory.
- If the SHPO concludes that performance is less than satisfactory, the Officers should consult with the SHPO and FHWA to improve performance, and meet within six months to evaluate improvements.

**Documentation**

- The Annual Report should follow the Annual Report Outline in section 3(A) of the Manual.

**2(G) TRANSITION****Laws, Regulations, Guidelines****Key Definitions****Implementation**

- This section acknowledges that transition procedures are required for the following potential situations:
- Projects have been partially reviewed under Section 106 at the time of the implementation of this agreement.  
TRANSITION: VAOT Officers will complete the reviews under the terms of the PA.
- Existing MOA's signed by all parties require SHPO to review documents or monitor compliance with stipulations.  
TRANSITION: VAOT Officers will assume the role of SHPO to carry out tasks specified under existing MOA's.
- Re-considerations of SHPO NR/SR eligibility determinations - rarely made, but can occur under certain conditions.  
TRANSITION: VAOT Officers will request concurrence from SHPO.
- Changed circumstances require modifications to projects previously permitted under Section 106.  
TRANSITION: VAOT Officers will document changed circumstances, new project design, and proceed with new Section 106 review of new design unless changes have no potential to affect historic properties.

**Documentation**

Documentation for determinations and supporting materials will be generated and copied to other parties per normal PA review procedure.

**2(H) DELEGATION**

**Laws, Regulations, Guidelines**

**Key Definitions**

**Implementation**

- Archaeology and Historic Preservation Officers are responsible for all findings regarding (i) determination that an undertaking exists; (ii) the potential area of an undertaking's effect; (iii) the eligibility of archaeological or historic properties to the National Register of Historic Places within the projects area of effect; (iv) determinations of effect; (v) interpretation of the Secretary of the Interior's Standards for Historic Preservation Projects; (vi) conformance with Vermont Guidelines for Archeological Studies of 1989; or (vii) applicability of the Manual of Ancillary Standards and Guidelines adopted pursuant to this PA, shall rest with VAOT's Archaeology Officer or Historic Preservation Officer.
- These responsibilities may not be delegated.

**Documentation**

**2(I) INNOVATIVE PROGRAMS**

**Laws, Regulations, Guidelines**

**Key Definitions**

**Implementation**

Ongoing:

- Analysis and synthesis of past data accumulated through VAOT/FHWA projects and distribute such information.
- Development of GIS-based Statewide or Watershed-wide Predictive Models.
- Improved data management and access (ex: development of electronic database).
- Development of historic contexts and preservation priorities.
- Consultation with Native American groups on mutually important issues and programs.
- Sponsor special education and outreach programs (ex: VT Archaeology Week).
- Develop GIS based historic building and structure surveys.

Future Consideration:

- Conduct statewide thematic, corridor, or other surveys of historic properties.
- Preparation and implementation of relevant preservation or management plans.
- Encourage creative mitigation when and where appropriate.
- Develop new policies that enhance permanent resource protection (for example, purchase important sites adjacent to ROW, accelerate purchase of important sites after Phase I or II if land purchase is eventually anticipated, purchase easements, etc.).
- Develop and encourage permanent site protection strategies.
- Develop streamlined approach to "property easement" project review.

|   |
|---|
| <p>Creative mitigation includes</p> <ul style="list-style-type: none"> <li>• Contribute to local preservation effort</li> <li>• Prepare preservation plan or ordinance</li> <li>• Establish fund for future preservation activities</li> <li>• Restore or preserve a resource similar to one adversely affected</li> <li>• Develop off-site mitigation</li> </ul> |
|---|

**Documentation**

- The type of documentation required will depend on the chosen program implemented.

**3(A) TYPES OF DOCUMENTATION**

The following forms are included in this section:

1. Historic Buildings and Structures Identification and Evaluation Form
2. Vermont Archeological Inventory Site Review Form (digital template)
3. Exempt Activity Review Form.
4. No Historic Properties Affected Review Form
5. No Adverse Effect Letter Format
6. Adverse Effect – Standard Mitigation Letter Format
7. Memorandum of Agreement Form
8. Annual Report Outline

VERMONT ARCHEOLOGICAL INVENTORY  
 SITE SURVEY FORM DATA DICTIONARY (rev. 2/01)  
 FINAL DRAFT

Vermont Division for Historic Preservation  
 National Life Building, Drawer 20 ~~SEMI-~~  
 Montpelier, Vermont 05602-0601

**DRAFT INSTRUCTIONS FOR TEMPLATE DEVELOPMENT and DATA DICTIONARY:**

**General:**

1. left click on any field brings up pick list (use blank box and arrow)
2. Right click on any field brings up data dictionary and HELP info
3. Use "undefined," "unknown," and "not applicable" in any pick list where appropriate (this also accommodates existing, incomplete site survey forms)

\*\* = pick list

1. Site No. [must be formatted w/oaps: VT-COUNTY ABBREV - ] \_\_\_\_\_

2. A. Site Name [common name of site, sometimes property name, landowner name, nickname used by survey crew, etc.]

2. B. Other site number \*\*

[suggested pick list:

USFS

Field #

Other

Not Applicable]

3. Town \*\* [pick list available from VAOT]

4. County \*\* [auto loaded, based on town name]

5. Site Type \*\* [for pick list, look at 93 list]

6. Reported by \*\*

[Suggested pick list:

DHP staff

CAP

UMF

NIRCS

USFS

LCMM

Other [ mandatory field: prompt to fill in text]

[ how to deal w/ other VT consultants?? Collectors? ]

7. Reporter's Address

8. Date Found [4 digit year field] / / 9. Date Submitted [4 digit year field] / / [auto-generated by date emailed out]

10. Discovered by (if different than reporter) and address \*\*

[suggested pick list:

not applicable

other

[with prompt to fill in address text]

11. Primary Project Sponsor \*\*

\*\* DHP  
VAOT  
NRCS  
USFS  
Other fed agency  
State agency  
Private developer  
Multiple  
Utility  
Non-profit  
Individual or Academic Researcher  
Not applicable  
[ Should there be Collector field??]

12. Project Name (text field) \_\_\_\_\_

13. Study Phase \*\*

\*\* archeological sensitivity assessment (aka field inspection)  
Phase 1  
Phase 2  
Phase 3  
Not applicable

14. Map Location Data \*\*

\*\* Vt. State Plane NAD 83 Coord. \_\_\_\_\_

UTM \_\_\_\_\_

[must pick one; then appropriate field below opens  
add drop down list; if site has gone to Phase II or III studies, provide shape file]

15. If Orthophoto:

VCS NAD 83 Coord. E [ 6 spaces] \_\_\_\_\_ N [ 6 spaces] \_\_\_\_\_

[can be blank if UTM filled out  
for QA/QC purposes, put in validation check for min and max coordinate values for the Town]

16. UTM/Zone \*\* 18

19

[can be blank]

17. If UTM:

Easting [ 7 spaces] \_\_\_\_\_ Northing [ 7 spaces] \_\_\_\_\_

[can be blank if VCS NAD 83 filled out  
for QA/QC purposes, put in validation check for min and max coordinate values for the Town]

18. USGS Format \*\*

\*\* 7.5

15

7.5 x 15

19. USGS Quad \*\* [ pick list available from VAOT] \_\_\_\_\_

20. Permanent Datum Coordinates ( open field) \_\_\_\_\_

21. Directions to Site (text) \_\_\_\_\_

22. Landowner type \*\*

\*\* private  
town  
state/ANR

state/VAOT  
 state/other  
 USFS  
 US Fish & Wildlife  
 other federal  
 The Nature Conservancy  
 Other

23. Landowner Name/Address **[text field]**

24. Site Located By \*\*  
 \*\* CRM professional  
 researcher  
 informant  
 collector  
 DHP staff  
 other  
 [ do we need this field?? Seems duplicative . See #6 ]

25. How Located \*\*  
 \*\* surface  
 subsurface testing  
 underwater  
 archival  
 other

26. Prehistoric Context \*\* [can pick more than 1]  
 \*\* Paleoindian  
 Early Archaic  
 Middle Archaic  
 Late Archaic  
 Terminal Archaic  
 Early Woodland  
 Middle Woodland  
 Late Woodland  
 Contact  
 Undetermined prehistoric

27. Historic Context \*\* [can pick more than 1]  
 \*\* Contact  
 Exploration  
 Conflict  
 Early Settlement  
 Industry and Commerce  
 Agriculture  
 War and Peace  
 Tourism  
 Transportation  
 Culture and Government  
 Housing and Community

Exempt Activities

Comment

VAOT Project

GIS / State Plane Coordinates

Street Address  
Town County

Applicable Exempt Activities

*Example*  
**ROADWAY**  
1. Rehabilitation of existing pavement and/or application of new pavement on existing travel lanes and existing paved shoulders with shoulder banking.

**CULVERTS AND IMPROVING**  
1. Reestablishment of existing ditches to original width.

**UTILITIES**  
2. Replacement and relocation of existing utility poles between edge of sidewalk and road.

I have reviewed the attached plans dated \_\_\_\_\_ for this project and have determined that the project involves only those activities listed above and will not have any other effects on historic and archeological resources. Completion of this form in accordance with the VAOT PA evidences that FHWA has satisfied its Section 106 responsibilities for this undertaking.

\_\_\_\_\_  
Date

**Further explanation and justification for determination of No Historic Properties Affected**

Use this space to explain why the building, structure or potential archeological site present in the APE is not an Historic Property or why it will not be affected by the project. Include enough information to justify the conclusion. For instance, summarize the negative results of a field investigation of a potential archeological site, or explain how buildings greater than 50 years old have lost integrity to the extent that they are no longer eligible for the National Register. Be specific, so that a reader can reach the same conclusion from the information provided. Generalize about a group of resources, if that is appropriate. The use of photographs for buildings is encouraged, but not required. Provide attachments as appropriate.

**MEMORANDUM**

To: Rob Sikora, FHWA

Date:

Subject: **NO ADVERSE EFFECT**

Project Name:

Project Number:

Location:

Distribution: State Historic Preservation Office  
Project Files, Environmental Section  
VTTrans Project Manager

The Vermont Agency of Transportation has reviewed this undertaking according to the standards and procedures detailed in the 4/5/99 Programmatic Agreement to implement the Federal-Aid Highway Program in Vermont and, the PA Manual of Standards and Guidelines. Project review consists of identifying the project's potential impacts to historic buildings, structures, historic districts, historic landscapes, and settings, and to known or potential archeological resources. The following details the VAOT Officers findings supporting our effect determination for this project of No Adverse Effect. Completion of this document evidences that FHWA has satisfied its obligations under Section 106 for this undertaking.

Project Description: *Describe project: type, specific location(s), purpose and need, scope of work, specific effects to historic properties. Attach map(s) as required.*

Above-Ground Historic Properties: *Define Area of Potential Effect (APE) and attach map if required. List surveyed historic properties in APE with Survey # references. List unsurveyed historic properties in APE with building Identification and Evaluation forms, and VAI forms. Note boundaries of existing, new, or amended historic districts and attach district map. Specify properties that are affected and nature of effect.*

Archaeological Resources: *List all known and discovered archaeologically sensitive sites and properties in the APE. Provide VAI references, maps, GIS data, and consultants reports to support findings as required. Specify properties that are affected and nature of effect..*

Public Participation: *Provide information and/or documentation regarding public input for this project. Specify the nature and frequency of consultation and who was consulted. Describe significant changes to design that have been the result of public involvement.*

Analysis: *Discuss the application of the the Secretary's Standards to project to support finding of No Adverse Effect. Be specific about nature of all effects: direct, indirect, reasonably foreseeable, and cumulative to all known and potential historic and archaeological properties..*

Stipulations: *Specify all conditions on implementation of project that support the finding of No Adverse Effect. scope of work, responsible parties, timing, performance criteria, and monitoring. Specify all stipulations to be included in the special provisions section of the construction contract.*

Attachments: *Attach supporting documents required to support finding of No Adverse Effect: maps, photographs, plans, building Identification and Evaluation forms, VAI forms, correspondence etc. List attachments in this section.*

**MEMORANDUM**

To: Rob Sikora, FHWA

Date:

Subject: **ADVERSE EFFECT - STANDARD MITIGATION APPLICABLE**

Project Name:

Project Number:

Location:

Distribution: State Historic Preservation Office  
Project Files, Environmental Section  
VTTrans Project Manager

The Vermont Agency of Transportation has reviewed this undertaking according to the standards and procedures detailed in the 4/5/99 Programmatic Agreement to implement the Federal-Aid Highway Program in Vermont and, the PA Manual of Standards and Guidelines. Project review consists of identifying the project's potential impacts to historic buildings, structures, historic districts, historic landscapes, and settings, and to known or potential archeological resources. The following details the VAOT Officers findings supporting our effect determination for this project of Adverse Effect - STANDARD MITIGATION APPLICABLE. Completion of this document evidences that FHWA has satisfied its obligations under Section 106 for this undertaking.

Project Description: Describe project: type, specific location(s), purpose and need, scope of work, specific effects to historic properties. Attach map(s) as required. Specify anticipated adverse effect.

Above-Ground Historic Properties: Define Area of Potential Effect (APE) and attach map if required. List surveyed historic properties in APE with Survey # references. List unsurveyed historic properties in APE with building Identification and Evaluation forms, and VAI forms.

*Note boundaries of existing, new, or amended historic districts and attach district map. Specify properties that are adversely affected and nature of effect.*

Archaeological Resources: *List all known and discovered archaeologically sensitive sites and properties in the APE. Provide VAI references, maps, GIS data, and consultants reports to support findings as required. Specify properties that are adversely affected and nature of effect.*

Public Participation: *Provide information and/or documentation regarding public input for this project. Specify the nature and frequency of consultation and who was consulted. Describe significant changes to design that have been the result of public involvement.*

Analysis: *Discuss the application of the the Secretary's Standards to project to support finding of Adverse Effect. Be specific about nature of all effects: direct, indirect, reasonably foreseeable, and cumulative to all known and potential historic and archaeological properties. Provide evidence that no reasonable and feasible alternatives exist that would avoid the adverse effect.*

Standard Mitigation Application: *Quote verbatim and list the standard mitigation measures to be applied to mitigate the adverse effects. Provide specifics about the application of the measures and how they achieve adequate mitigation.*

Stipulations: *Specify all implementation details of standard mitigation measures: scope of work, responsible parties, timing, performance criteria, and monitoring. Specify all stipulation to be included in the special provisions section of the construction contract.*

Attachments: *Attach supporting documents required to support finding of Adverse Effect – Standard Mitigation Applicable: maps, photographs, plans, building Identification and Evaluation forms, VAI forms, correspondence etc. List attachments in this section.*

MEMORANDUM OF AGREEMENT

AMONG THE FEDERAL HIGHWAY ADMINISTRATION (FHWA),  
THE AGENCY OF TRANSPORTATION (VTTRANS),  
AND THE STATE HISTORIC PRESERVATION OFFICER (SHPO)

REGARDING *name of undertaking / project #*

WHEREAS, the FHWA proposes to what is proposed in regard to the undertaking to implement name of undertaking, and

WHEREAS, the FHWA has established the name of undertaking's area of potential effects, as defined at 36 CFR 800.16(d), to be specify area of potential effects, and

WHEREAS, the FHWA has established that name of undertaking will have adverse effects on specify historic property/properties, including citations of reports, etc. giving locations and descriptions and

WHEREAS, the FHWA has determined that the Standard Mitigation Measures as defined in the VTrans Manual of Standards and Guidelines are not appropriate to mitigate the adverse effects; and

WHEREAS, the FHWA has consulted with the State Historic Preservation Officer in accordance with Section 106 of the National Historic Preservation Act, 16 U.S.C. 470 (NHPA) and its implementing regulations (36 CFR Part 800) to resolve the adverse effects of name of undertaking on historic properties; and

(Optional) WHEREAS, the FHWA and the SHPO have invited specify others invited to consult to participate in consultation and to concur in this MOA; and

(Optional – other WHEREAS clauses as needed to explain pertinent circumstances)

NOW, THEREFORE, the FHWA and the SHPO agree that, upon the FHWA's decision to proceed with name of undertaking, the FHWA shall ensure the following stipulations are implemented to in order to take into account the effects of name of undertaking on historic properties.

Stipulations

On behalf of the FHWA, the VAOT shall ensure that the following stipulations are implemented:

(Insert stipulations)

(refer to workbook Section 106: An Advanced Seminar by Thomas F. King for guidelines on the development and writing of MOA stipulations)

(MOA must contain sunset provision )

(MOA must contain provision for archaeological discoveries as written and included with this section of the Manual)

Execution of this MOA by the FHWA and the SHPO, its subsequent acceptance by the Council, and implementation of its terms evidence that the FHWA has afforded the Council an opportunity to comment on name of undertaking and its effects on historic properties, and that the FHWA has taken into account the effects of name of undertaking on historic properties.

\_\_\_\_\_ Date: \_\_\_\_\_

(Other invited concurring parties)

*(Minimum Stipulations for Projects That May Involve  
Significant Ground Disturbance)*

Stipulations: Archaeological Properties: FHWA will ensure archaeological study is conducted in a manner consistent with the Secretary of the Interior's Standards. The completed survey will be sufficient to determine the nature and extent of resources, evaluate their National Register significance, and determine appropriate treatment measures. If the survey results in the identification of properties eligible for the National Register, effects on these properties' values will be assessed to determine the importance of preservation in place versus data recovery. If preservation in place is necessary, a change in design or location will be recommended, if feasible and prudent. If the properties are solely valuable for the information they contain, a data recovery plan will be developed and implemented.

**STIPULATIONS**

**A: Archaeological Resources:**

1. All archaeological studies will be completed in accordance with the Secretary of the Interior's Standards and guidelines for Archaeology (48 FR 44734-37), Vermont State Historic Preservation Officer's (SHPO) Guidelines for Archaeological Studies (1989).
2. All archaeological studies must be completed prior to the initiation of any ground disturbing activities or any other construction activity related to the project.

**B: Discovery:**

1. The project will stop immediately if previously unidentified archaeological sites, including human remains and/or cultural items, are discovered during project construction.
2. Burials are considered archaeological sites under state & federal laws.
3. The Construction Company or Resident Engineer will immediately notify the VAOT Archaeology Officer who will notify the SHPO.
4. No further construction will proceed in the site area until it has been reviewed and documented according to 36 CFR 800.11.
5. The VAOT Archaeology Officer will conduct a field inspection of the site to determine its potential National Register eligibility and the project's potential effects.
6. The VAOT Archaeologist or the Archaeology Officer may hire an Archaeological Consultant if additional information is necessary to determine site boundaries and NR eligibility.
7. If the site is determined NR eligible, the preferred treatment is to avoid it and protect it in place.
8. Site significance and treatment options should be discussed with the appropriate interested public parties and documented.

9. If site avoidance is not possible, then data recovery of the site must be completed in accordance with 36 CFR 800 and the Guidelines for Archaeological Studies.

**C: Treatment of Human Remains:**

1. If human remains and/or associated cultural items are discovered during construction, that portion of the project will stop immediately. The remains will be respectfully covered and the project resident engineer will immediately contact the VAOT Archaeology Officer who will notify the SHPO.
2. The VAOT Archaeology Officer will also contact the Town Sheriff, Town Clerk, Chief Medical Examiner, and State Police as well as Native Americans, when appropriate, and shall follow the requirements of state law.
3. If the human remains are identified as Native American, then a treatment and reburial plan will be developed in full consultation with the appropriate Native American group(s) as identified above.
4. Human remains and cultural items should not be disturbed or removed from their original location if at all possible. [refer to Advisory Council for Historic Preservation Policy Statements: Native American Concerns (1993)]
5. Avoidance and preservation in place is the preferred option for treating human remains.
6. All determinations will be made or approved by the Archaeology Officer.
7. If human remains are identified, a written treatment plan will be developed in consultation with the VAOT Archaeology Officer, SHPO and with public parties such as Native Americans, local government and others as appropriate.
8. Recovery when necessary, should be done carefully, respectfully and completely in accordance with the proper archaeological methods (as outlined in 36 CFR 800 and the Guidelines for Archaeological Studies, 1989) [also refer to Advisory Council for Historic Preservation Policy Statements: Native American Concerns (1988, 1993)].
9. Refer to Programmatic Agreement Manual of Standards and Guidelines, Section 4 (J) for additional guidance.

12/00

**Annual Report Outline for 2(F)****Table summary**

- project name /numbers
- town
- identification findings (# of properties added to inventories, determined NR eligible, etc.)
- determination of effect
- resource results in adverse effects ( Standard Mitigation Measures, archeo phase 3 studies, moved buildings, demolitions, etc.)

summary statistics from each category

**Narrative (2-4 pages, combined archeology and buildings)**

- observations on statistics in table (e.g. explanation of anomalies, year to year comparisons)
- accomplishments

  - innovative programs
  - summary of important archeo logical discoveries
- problems/concerns
- recommendations for changes to process, PA, Manual, etc.
- summary of staff and consultant training held
- summary of staff and consultant training needed
- views of AOT on the effectiveness of the PA

**Performance Statement**

*-a statement that the Officers believe that VAOT satisfactorily met the terms of the PA and Manual during the review period*

- signature lines for the Historic Preservation Officer and the Archeology Officer

**Enclosures**

- any VAI or VHSS forms or other documentation not previously submitted during the year

### 3(B) GIS Systems

#### Laws, Regulations, Guidelines

- Guidelines for Archaeological Studies (1989)

#### Key Definitions

- *GIS*: Geographic Information Systems.
- *ArcView*: a user friendly software for storing, manipulating, and retrieving GIS information.
- *VAI*: Vermont Archeological Inventory, maintained by the SHPO to document the state's recorded archeological sites.
- *VCGI*: Vermont Center for Geographic Information .

#### Implementation

- The SHPO is developing a survey plan for architectural resources that will include a strong GIS component, and when it is completed, pertinent information from the plan will be included here. Planning for a GIS system for archeological resources is further advanced, and is outlined below.
- Convert all archaeological site information into electronic data files (both site data and geographic information) so VAOT can use this information in planning and reviewing projects for archaeological resources.
- Collaborate with SHPO to plan and implement the archeological data conversion project from paper to electronic systems.
- Conduct "Feasibility Study for Developing an Archaeology Predictive Model for the State of Vermont" (completed 9/97).
- Hold Statewide Workshop on Developing a Vermont Archaeological Predictive Model (held 2/99).
- Develop appropriate VAI site form template for use by consultants and as basis for electronic data base (final draft nearing completion).
- Contract with VCGI to supply technical knowledge for development of a number of RFP tasks (development of electronic site form, ArcView data files for all known sites, and development of predictive modeling), assist in selection of GIS consultant, and review consultant deliverables and QA/QC on all electronic data .
- Collect all available electronic files on archaeological sites in Vermont (sources: NRCS, GMNF, UVM-CAP, UMF), and convert to standard ArcView file format. Identify the number of professionally recorded sites which do not have electronic site locations. Determine the exact number of professionally recorded sites to be used in the predictive modeling.
- Develop procedures and timeframe for entering other paper data onto database and GIS maps. Identify cost and how and who can accomplish.
- Design database and mapping format and protocols for use by VAOT/SHPO and consultants.
- Consult with likely users after development of system proto-type.
- Identify respective responsibilities of VAOT and SHPO in operations and maintenance of archeology data base and GIS mapping.

#### Documentation

### 3(C) ARCHAEOLOGY PLANNING AND RESEARCH

#### **Legal, Regulations, Guidelines**

- 36 CFR 79 [Operation of Federally Owned and Administered Archaeological Collections]
- 36 CFR 800 [Recommended Approach for Consultation on Recovery of Significant Information from Archaeological Sites]
- National Historic Preservation Act [Section 30 (a)(2)(A)(i)]
- Archaeological Resources Subsection Act [Section 7]
- Vermont Historic Preservation Act (22 V.S.A. 54), sections 722R, 504, 507
- *Guidelines for Archaeological Studies (1997)*
- Advisory Council on Historic Preservation Policy Statement: Native American Consultation (1995)
- Native American Graves Protection and Repatriation Act (PL. 101-601) and its regulations (43 CFR, Part 101)

#### **Key Definitions**

- *Archaeological collections* include artifacts, soils and feature samples, floral and faunal data, records, reports, photographs and other sets of data recovered from an archaeological site and determined to require collection care.

#### **Implementation**

- 1) Conduct a Feasibility Study in consultation with the Division for creating a Vermont Archaeology Research Center, for permanently caring for 450+ years of archaeological collections, and for maintaining and enhancing their interpretive and educational values.
- 2) Develop a schedule for implementing the feasibility study in collaboration with the Division, identify project partners and additional sources of funding, consult with Native Americans and other partners in project planning and implementation.
- 3) Immediately implement short-term recommendations affecting statewide consultants, for example:
  - Establish interim collections care facility
  - implement appropriate collection care basic structure
  - implement data collecting and retention guidelines as provided by project consultant
  - provide information on the archaeology research center project, collection care policies and guidelines, and other related topics on the VAAOC web site
  - Establish and implement a process for securing legal agreements with landowners, for making loans to other institutions, etc.
  - Identify staffing and additional resources needed to implement feasibility study, both short-term and long-term

- 4) Establish working group to continue work on Native American repatriation (NAGPRA) issues and other issues important to AOT.

#### **Documentation**

- Feasibility Report.
- AOT archeological collections data managed on database with public access component
- Legal agreement documents including:
  - permanent loan, gift, or donation agreements from landowner
  - partner commitments for Vermont Archeology Research Center
- other

#### **4(A) DETERMINATION OF UNDERTAKING AND ASSESSMENT OF AREA OF POTENTIAL EFFECT**

##### **Laws, Regulations, Guidelines**

- 36 CFR 800.3 (Initiation of Section 106 Process)

##### **Key Definitions**

- *Undertaking* means a project, activity, or program funded in whole or in part under the direct or indirect jurisdiction of a Federal agency, including those carried out by or on behalf of a Federal agency; those carried out with Federal financial assistance; those requiring a Federal permit, license, or approval; and those subject to state or local regulation administered pursuant to a delegation or approval by a Federal agency [36 CFR 800.16(y)].
- *Area of Potential Effect (APE)* means the geographic area or areas within which an undertaking may directly or indirectly cause changes in the character or use of historic properties, if any such properties exist. The area of potential effect is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking [800.16(d)].

##### **Implementation**

- FHWA delegates to VAOT Archaeology and Historic Officers the responsibility to: 1, determine whether proposed action is an undertaking; 2, determine and document the area of potential effects (APE) and; 3, determine whether historic properties may be affected.
- The APE is the area in which historic properties may be affected by direct and/or indirect effects, and effects that may be cumulative or reasonable foreseeable (refer to Manual section 4(G) for criteria for, and examples of, adverse effects.)
- The APE may be significantly larger than the project construction area, to possibly include viewsheds, traffic corridors, historic downtowns and rural historic districts.
- The APE may be discontinuous.
- Federal undertakings that may affect historic properties include leasing properties, property easements, land transfers, and right-of-way purchases.

##### **Documentation**

- APE will be documented in a brief written description, map, and/or GIS database.

## 4(B) IDENTIFYING HISTORIC PROPERTIES

### Laws, Regulations, Guidelines

- 36 CFR 800.4 (Identification of Historic Properties)  
[www.achp.gov/usersguide](http://www.achp.gov/usersguide)
  - 36 CFR 63 (Determinations of Eligibility for Inclusion in the National Register of Historic Places)
  - National Register Bulletins (selected relevant Bulletins)
    - How to Apply the National Register Criteria for Evaluation
    - How to Complete the National Register Registration Form
    - Defining Boundaries for National Register Properties
    - Guidelines for Evaluating and Documenting Rural Historic Landscapes
    - Guidelines for Evaluating and Documenting Historic Aviation Properties
    - Guidelines for Evaluating and Registering Historic Archaeological Sites and Districts
    - Guidelines for Evaluating and Documenting Traditional Cultural Properties (TCP)
    - Guidelines for Evaluating and Nominating Properties that Have Achieved Significance Within the Past Fifty Years
    - Guidelines for Evaluating and Registering Cemeteries and Burial Places
    - Nominating Historic Vessels and Shipwrecks to the National Register
    - How to Evaluate and Nominate Designed Historic Landscapes
    - Guidelines for Evaluating and Documenting Properties Associated with Significant Persons

[www.cr.nps.gov/nr](http://www.cr.nps.gov/nr)
  - The Vermont Historic Preservation Plan – Historic Contexts
  - Multiple Property Documentation Forms (MPDF's ) for National Register Listings
    - Metal Truss, Masonry, and Concrete Bridges in Vermont
    - Agricultural Resources of Vermont
    - Historic Resources of the Mad River Valley
    - Educational Resources of Vermont
    - Historic Government Buildings of Vermont
    - DRAFT Hydroelectric Generating Facilities in Vermont
    - DRAFT Maritime Resources of Vermont
    - DRAFT Chittenden County Circumferential Highway (Prehistoric Resources)
    - UVMCAP, Report No. 197, May 1988.
- Vermont Historic Sites and Structures Survey Manual
- Secretary's Standards and Guidelines for Identification

Guidelines for Archeological Studies (1989)

### Key Definitions

*Historic Property* means any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization (TCP) and that met the National Register criteria. The term *eligible for inclusion in the National Register* includes both properties formally

determined as such in accordance with regulations of the Secretary of the Interior and all other properties that meet the National Register criteria. [36 CFR 800.16 (f)]

### **Implementation**

- The Division for Historic Preservation's Resource Room contains information on over 30,000 historic and archaeological properties, filed by town. However, the inventory is far from complete.
- Check files and other data sources of existing information on historic and archaeological properties including, at minimum, the National Register of Historic Places, Vermont Historic Sites and Structures Survey, Vermont Archeological Inventory, index of National Register Preliminary Reviews, index of Vermont Archeological Studies/Reports, and standard historic maps.
- Archeological studies must meet the SHPO's Guidelines for Archeological Studies (1989).
- If undertaking a survey of a previously unidentified historic district, AOT should consult with the SHPO in developing the scope of work, commensurate with the scale of the project.
- If undertaking a survey that identifies additional properties in or adjacent to an existing district, consultation with the SHPO is not necessary.
- AOT should verify previously identified resources in the field to determine if they remain or have changed.
- If the undertaking is an exempt activity, no identification or documentation of historic properties is required. However, an Exempt Activity form is required. See 3(A).
- Seek information from individuals and organizations likely to have knowledge about historic properties in the APE, if such information is not readily available in published sources or existing inventories.

### **Documentation**

Resources not previously identified shall be documented in a standard format for inclusion in the Vermont Historic Sites and Structures Survey or the Vermont Archeological Inventory, and for inclusion in a database system accessible to AOT and SHPO. See section 3(A) of the Manual. Supplemental information on existing State Register or National Register properties shall be provided to the Division for Historic Preservation in a standard format that is easy to integrate into existing State Register and National Register files. See section 3(A) of the Manual.

#### 4(C) PUBLIC PARTICIPATION AND NOTIFICATION

##### Laws, Regulations, Guidelines

- 36 CFR 800.2c(4),(6) (Consulting Parties)
- 36 CFR 800.2d(1) (The Public)
- 36 CFR 800.2d(2) (Providing Notice and Information)
- 36 CFR 800.2d(3) (Use of Agency Procedures)
- Advisory Council on Historic Preservation Policy Statements: Native American Concerns (1993)
- "Protecting Historic Properties: A Citizen's Guide to Section 106 Review" available at [www.achp.gov](http://www.achp.gov)

##### Key Definitions

- *Consultation* means the process of seeking, discussing, and considering the views of other participants, and, where feasible, seeking agreement with them regarding matters arising in the Section 106 process [36 CFR 800.16(f)].
- *CP* means consulting party
- *Cons* means VAOT Consultant
- *Pr Mgr* means VAOT Project Manager
- *Env Sp* means Environmental Specialist
- *VT AC* means VT Advisory Council for Historic Preservation
- *SHPO* means Vermont Historic Preservation Officer
- *FHWA* means Federal Highway Administration

##### Implementation

- For most projects, and consistent with 36 CFR 800.2d(3), public notification and consultation will be achieved through the standard VAOT Project Development Process, as follows:

All Meetings: Invite representatives from local government, Regional Planning Commission, CLG, Historical Society, and groups with an interest in historic properties in the APE; warn meeting to public. Make public input brochure available to participants.

Both the VDHP Involving the Public Brochure and VAOT Public Input Guidebook should be consulted in determining public input requirements.

Public Concerns Meeting: Provide overview of Section 106 provisions and opportunities for public involvement; inform meeting attendees of the presence and nature of known historic and archaeological properties in the APE and seek input concerning other historic and archaeological resources in the APE.

Alternatives Meeting: Show historic and archaeological resources plotted on project alternative plans; inform meeting attendees about the potential effect on these resources for each alternative presented; seek input from public concerning these potential effects, and discuss avoidance or mitigation options as appropriate; consider the views of and seek agreement with the public, if feasible, concerning impacts to historic properties.

- Native American consultation: consultation with Native Americans should be initiated early in the project development process and in discovery situations where appropriate. Where the Archaeology Officer determines, based on scope and location of project, that there is potential for effect to Native American cultural property, he/she will consult with the Abenaki Self Help Association and the Governor's Advisory Council on Native American Affairs.
- For projects with the potential for significant adverse effect, or projects which may impact a large number of properties, additional public meetings may be required at the discretion of the VAOT Archaeology and Historic Preservation Officers, to discuss and seek resolution of Section 106 issues.

**Documentation**

The degree and nature of Public involvement for a project will be documented in the Section 106 Formal Comment Letter by written description.

#### 4(D) EVALUATING HISTORIC AND ARCHEOLOGICAL SIGNIFICANCE

##### Laws, Regulations, Guidelines

- 36 CFR 800.4 (Identification of Historic Properties) [www.nachp.gov/nachpguide](http://www.nachp.gov/nachpguide)
- 36 CFR 63 (Determinations of Eligibility for Inclusion in the National Register of Historic Places)
- National Register Bulletins (selected relevant Bulletins)
  - How to Apply the National Register Criteria for Evaluation
  - How to Complete the National Register Registration Form
  - Defining Boundaries for National Register Properties
  - Guidelines for Evaluating and Documenting Rural Historic Landscapes
  - Guidelines for Evaluating and Documenting Historic Aviation Properties
  - Guidelines for Evaluating and Registering Archeological Sites and Districts
  - Guidelines for Evaluating and Documenting Traditional Cultural Properties
  - Guidelines for Evaluating and Nominating Properties that Have Achieved Significance Within the Past Fifty Years
  - Guidelines for Evaluating and Registering Cemeteries and Burial Places
  - Nominating Historic Vessels and Shipwrecks to the National Register
  - How to Evaluate and Nominate Designed Historic Landscapes
  - Guidelines for Evaluating and Documenting Properties Associated with Significant Persons
  - [www.cr.nps.gov/nr](http://www.cr.nps.gov/nr)
- The Vermont Historic Preservation Plan – Historic Contexts
- Multiple Property Documentation Forms for National Register Listings
  - Metal Truss, Masonry, and Concrete Bridges in Vermont
  - Agricultural Resources of Vermont
  - Historic Resources of the Mad River Valley
  - Educational Resources of Vermont
  - Historic Government Buildings of Vermont
  - Hydroelectric Generating Facilities in Vermont (in process)
  - Maritime Resources of Vermont (in process)
  - DRAFT Chittenden County Circumferential Highway (Prehistoric Resources)
  - UVM-CAP, Report No. 197, May 1988.
- SHPO's *Guidelines for Archeological Studies* (1982).

##### Key Definitions

*Historic Property* means any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that met the National Register criteria. The term *eligible for inclusion in the National Register* includes both properties formally determined as such in accordance with regulations of the Secretary of the Interior and all other properties that meet the National Register criteria. [36 CFR 800.16 (f)]

The *Hydroelectric Generating Facilities MPDF* Provides a context for evaluating hydro facilities for the National Register. Some facilities, noted in the MPDF file, have already been determined eligible for the Register.

The *Metal Truss, Masonry, and Concrete Bridges MPDF* Contains the history of bridge-building in Vermont and gives Registration Requirements for truss, and masonry and concrete arch bridges. Many individual bridges have been nominated to the National Register using the MPDF.

**Implementation**

- Seek information from individuals and organizations likely to have knowledge of historic properties in the APE, if such information is not readily available in published sources or existing inventories. See 4(C).
- The level of information that needs to be developed is a level sufficient to evaluate National Register eligibility. It is not necessary to fully develop information under all National Register criteria, if one criteria is met. However, it is necessary to develop information under criterion D, in addition to A, B, and/or C if an archeological component of a property may be impacted by the project.
- Archeological studies must meet the SHPO's Guidelines for Archeological Studies (1982).
- Connecticut River bridges included in the 1985 Vermont Historic Bridge Survey have been determined by the Vermont SHPO to be eligible for the National Register of Historic Places.
- Concrete 'slab and girder' or 'beam and slab' bridges shall be evaluated according to criteria established by the SHPO and AOT.
- Where relevant MPDF's exist, evaluations shall use the Registration Requirements in the MPDF.

**Documentation**

- Resources not previously identified shall be documented in a standard format for inclusion in the Vermont Historic Sites and Structures Survey or the Vermont Archeological Inventory, and for inclusion in a database system accessible to AOT and SHPO. See Section 3 of the Manual.
- Supplemental information on existing State Register or National Register properties shall be provided to the Division for Historic Preservation in a standard format that integrates easily into existing State and National Register files. See Section 3 of the Manual.
- AOT shall distribute additional reports, as appropriate, to the local library and/or historical society, UVM, special interest repositories, local colleges or other schools, etc.

**4(E) FINDING OF NO HISTORIC PROPERTIES AFFECTED****Laws, Regulations, Guidelines**

- 36 CFR 800.4(d)1 (No Historic Properties Affected – Requirements for Finding)
- 36 CFR 800.11(d) (No Historic Properties Affected – Documentation Requirements)

**Key Definitions**

- *Effect* means alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the National Register.

**Implementation**

- Finding of No Historic Properties Affected appropriate only when:
  1. There are no Historic Properties in the project Area of Potential Effect (APE), or
  2. The project will have no effect, positive or negative, on historic properties located within the APE.
- Finding of No Historic Properties Affected inappropriate when:
  1. A historic property is positively or negatively affected by direct, indirect, cumulative, reasonably foreseeable effects (see 4G for explanations and examples of effects), or
  2. When significant data is recovered from an NR-eligible archaeological site.

For projects that require an Act 250 permit or are funded exclusively with state funds, follow Appendix B of the PA, "Review of VAOT Undertakings under Vermont State Law."

**Documentation**

- Findings of No Historic Properties Affected will be documented on the corresponding form in section 3(A).
- Provide enough information to justify the conclusion. Be specific, so that a reader can reach the same conclusion from the information provided. See additional guidance on the No Historic Properties Affected form in section 3A.
- Attach relevant documents: Archaeological Resource Assessment (ARA), Field Inspection, Phase I Study, or photographs, if appropriate.
- If demolition of a building over 50 years old is proposed in the project, attach a photo of the building.

**4(F) FINDING OF NO ADVERSE EFFECT**

**Laws, Regulations, Guidelines**

- 36 CFR 800.5 (Assessment of Adverse Effects)
- Programmatic Agreement Among the Federal Highway Administration, the Advisory Council on Historic Preservation, the Vermont Agency of Transportation, the Vermont Historic Preservation Officer, and the Vermont Agency of Commerce and Community Development Regarding Implementation of a Program for Projects involving Historic Bridges (Bridge PA)

**Key Definitions**

- *Effect* means alteration to the characteristics of a historic property qualifying it for inclusion in the or eligibility for the National Register [36 CFR 800.16(1)].
- *Criteria of Adverse Effect* An adverse effect is found when an undertaking may alter, directly or indirectly, the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, setting, design, materials, workmanship, feeling, or association [36 CFR 800.5a(1)].

**Implementation**

- Finding of No Adverse Effect appropriate only when:
  - 5) There are Historic Properties in the project Area of Potential Effect (APE), and;
  - 6) The project will not adversely effect the historic properties (see 4(G) for explanations and examples of adverse effects.)
- Finding of No Adverse Effect inappropriate when:
  - 1) There are no historic properties located in the APE or;
  - 2) A historic property is adversely affected by direct, indirect, cumulative, reasonably foreseeable effects (see 4(G) for explanations and examples of effects.) or;
  - 3) When data is recovered from a archaeological site
- Projects involving metal truss bridges are addressed in the Bridge Programmatic Agreement (PA) and the Bridge Plan incorporated within it. Refer to section 9 of the PA. Bridges assigned to categories A, B, and C in the Bridge Plan are "No Adverse Effects." Bridges assigned to categories D, E, and F are "Adverse Effects."

For projects that require an Act 250 permit or are funded exclusively with state funds, follow Appendix B of the PA, "Review of VAOT Undertakings under Vermont State Law."

**Documentation**

- Findings of No Adverse Effect shall be documented in a written report.
- The degree and nature of Public involvement for a project will be documented in the Section 106 Formal Comment Letter by written description.
- Refer to Section 3(A) for letter format.

**Examples of  
Adverse Effects**

1. Physical destruction of or damage to all or part of a property;
2. Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation, and provision of handicapped access, that is not consistent with the Secretary's Standards for the Treatment of Historic properties (36 CFR part 68) and applicable guidelines;
3. Removal of a property from its historic location;
4. Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;
5. Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features;
6. Neglect of a property which causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian Tribe or Native Hawaiian organization; and
7. Transfer, lease, or sale of a property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long term preservation of the property's historic significance. [36 CFR 800.5a(2)]

**4(G) FINDING OF ADVERSE EFFECT**

**Laws, Regulations, Guidelines**

- 36 CFR 800.5 (Assessment of Adverse Effects)
- 36 CFR 800.6 (Resolution of Adverse Effects)
- Recommended Approach for Consultation on Recovery of Significant Information From Archeological Sites

**Key Definitions**

- *Criteria of Adverse Effect* An Adverse effect is found when an undertaking may alter, directly or indirectly, the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. [36 CFR 800.5a(1)].

**Implementation**

- Examples of direct effects include destruction in part or in whole of an archaeological site or above-ground historic property.
- Examples of indirect effects may include those on a historic downtown due to bypass construction or other traffic rerouting; visual and audible effects on historic properties from new construction, road widening or traffic rerouting and; changes to settings of historic properties.
- Examples of cumulative adverse effects may include successive upgrades around historic village centers resulting in pressure to upgrade roads within the village; and successive curb cuts on a bypass resulting in sprawl and; successive development projects in rural areas whose sum total constitutes an adverse effect on archaeological properties;
- Examples of reasonably foreseeable adverse effects may include closing a historic bridge to traffic without a rehabilitation and maintenance plan.
- Data recovery of an archaeological site is considered an adverse effect.
- Projects involving metal truss bridges are addressed in the Bridge Programmatic Agreement (PA) and the bridge plan incorporated within it. Refer to Section 9 of the PA. Bridges assigned to categories A, B, and C in the Bridge Plan are "No Adverse Effects." Bridges assigned to categories D, E, and F are "Adverse Effects."

**FOR PROJECTS THAT REQUIRE AN ACT 250  
PERMIT OR ARE FUNDED EXCLUSIVELY WITH  
STATE FUNDS, FOLLOW APPENDIX B OF THE  
PA, "REVIEW OF VAOT UNDERTAKINGS  
UNDER VERMONT STATE LAW."**

**Documentation**

Findings of Adverse Effect [4(G)(1)-standard mitigation, 4(G)(2) - memorandum of agreement, 4(G)(3) - national historic landmark] will be documented per the corresponding format.

- Refer to Section 3(A) for documentation requirements.

**4(G)(1) STANDARD MITIGATION MEASURES APPLICABLE**

**Laws, Regulations, Guidelines**

**Key Definitions**

**Implementation**

- When appropriate, the VAOT Officers may select one or more Standard Mitigation Measures from the list below to mitigate or compensate for an adverse effect on historic and/or archeological resources.
- The list includes measures that directly address affected resources, measures that address similar resources, and off-site mitigation measures.
- Standard Mitigation Measures should only be considered when there is compelling reason(s) to accept the adverse effect on the resource. All possible efforts to avoid the adverse effect should be made prior to consideration of Standard Mitigation Measures.
- AOT must seek the views of previously identified interested parties on proposed Standard Mitigation Measures and include them in project documentation.

**Documentation**

- The Measures shall be incorporated verbatim into VAOT's formal written finding of adverse effect, and supplemented with additional specific details where appropriate. See Section 3 of the Manual.
- VAOT shall inform the SHPO when the Measures have been completed.

**1. Photographic Documentation.** The VAOT shall ensure that the Historic property is recorded prior to its demolition, alteration or relocation in accordance with Historic American Buildings Survey (HABS) or Historic American Engineering Record (HAER) standards, for nationally significant properties, or, for other properties, the Photographic Documentation Standards for Historic Structures adopted by the SHPO. The VAOT shall retain one copy, provide one to DHP, and one or more to appropriate local depositories. Copies of original plans for engineering structures should be part of the documentation package, if possible.

**2. Marketing and Sale.** The VAOT shall develop a marketing plan and ensure that a property is advertised for sale in newspapers of general local circulation for a minimum of 30 days (???) prior to the demolition or relocation of historic properties. The VAOT Officers shall review all purchase offers and may consult with the SHPO. If VAOT selects a successful purchaser, VAOT may include preservation covenants in the transfer deed, upon recommendation of the VAOT Officers. If no successful purchaser is identified, VAOT may either convey the property without covenants or proceed with the demolition or relocation after the historic properties have been recorded pursuant to standards listed in 1. Above.

Should be considered only after rehabilitation and continued use have been proven infeasible. Rehab costs equal to new construction are generally considered reasonable and feasible. For nationally significant properties, consult NPS for documentation requirements.

A good faith effort and effective public outreach are expected.

A good faith effort and effective public outreach are expected.

Appropriate when a covenant or easement would be too onerous or incompatible with the scale of the effect.

Good media coverage should be part of the plan. Opportunities for public participation are encouraged where appropriate. VAOT may consult with SHPO and/or request that SHPO partner with VAOT on public education projects. Projects could include community archeology programs, educational curricula, TV or video programs, etc.

**3. Relocation.** In relocating the building, every effort shall be made to Reestablish it's historic orientation, immediate setting, and general environment in the new location, in accordance with 36 CFR 60. The VAOT Historic Preservation Officer shall evaluate the continued eligibility of the moved building for the National Register of Historic Places, and provide a written evaluation to the SHPO. If the building is located within an existing National Register historic district, VAOT shall prepare an amendment to the existing nomination form to reflect the relocation.

**4. Future Work on Buildings.** Future work on the exterior and/or Interior of the building shall meet the Secretary of the Interior's Standards for Rehabilitation.

**5. Lectures/Tours.** The VAOT shall ensure that a qualified Professional organize public lectures and tours of ongoing projects and excavations. Involvement of local school groups is encouraged. See Section 2D for more options.

**6. Public Education.** VAOT shall develop a public education program or project that enhances public understanding and appreciation of the resources on site or resources similar in location or type to the resources adversely affected by the project, and provide an outline of the program or project to the SHPO. VAOT shall report the results to the SHPO. See Section 2D for more options.

Wide distribution to interested audiences is expected.

**7. Popular Publications.** The VAOT, through the use of consultants as appropriate, shall produce and distribute a popular version of a technical report and/or, a booklet, pamphlet, or brochure that illustrates the work on a property, archeological resources recovered from a site, the site's history, or its historic context. See Section 2D for more options.

**8. Web Site.** The VAOT shall post material on its web site, with links to related sites, or, as appropriate, develop a new non-VAOT web site or enhance an existing one, to aid public understanding of the resources on site or resources similar in location or type to the resources adversely affected by the project. See Section 2D for more options.

Uniform regional or statewide graphics are encouraged.

**9. Interpretive Signage.** The VAOT, through the use of research, Design and fabrication consultants as appropriate, shall produce one or more signs to describe the work on a property, archeological resources recovered from a site, the site's history, or its historic context. VAOT and/or local interested parties shall plan the sign(s) and address maintenance and long-term care of permanent sign(s). See Section 2D for more options.

**10. Exhibits.** The VAOT, in conjunction with appropriate Consultants, shall develop and install a professional quality exhibit that describes the work on a property, archeological resources recovered from a site, the site's history, or its historic context. Local installations or exhibits that travel to local schools are encouraged. See Section 2D for more options.

The measure should stipulate the properties to be surveyed, or reference another document that specifies them.

**11. Survey.** The VAOT shall ensure that a qualified professional Undertake a survey of \_\_\_\_\_ to meet the standards for the Vermont Historic Sites and Structures Survey and/or the Vermont Archeological Inventory.

The measure should stipulate the properties to be nominated.

**12. National Register.** The VAOT shall ensure that a qualified Professional prepare a National Register of Historic Places nomination form(s) for the following resource(s): \_\_\_\_\_

**13. Development of Historic Context.** The VAOT shall ensure that a Qualified professional research and prepare a written historic context statement for the class of resources affected by the project. The format of the context statement shall be determined in conjunction with the SHPO.

Appropriate when there is a likelihood that the features would be appropriately reused elsewhere.

**14. Salvage of Architectural or Engineering Features.** VAOT shall identify appropriate parties to receive salvaged architectural or engineering features. VAOT shall ensure that the features are salvaged prior to demolition activities and properly stored and curated. When feasible, salvaged architectural features shall be reused in other preservation projects.

**15. Data Recovery of archeological information.** The VAOT Archeology Officer shall develop an Archeological Data Recovery Plan that meets the

Council's Treatment of Archeological Properties, the SHPO's Guidelines for Conducting Archeological Studies, and the "Recommended Approach for Consultation on Recovery of Significant Information From Archeological Sites" (Federal Register, May 18, 1999, Appendix B). Data Recovery projects shall include a significant public education and interpretation component. Materials recovered shall be curated and stored in accordance with 36 CFR 79. The VAOT Archeology Officer shall provide a draft Archeological Data Recovery Plan, including a detailed draft scope of work, to the SHPO prior to finalizing the Data Recovery Plan and offer the SHPO an opportunity to comment on it within 30 days.

May be particularly appropriate for replication of an ornamental bridge railing where it is a very important feature of the bridge, has severely deteriorated, and provides a gateway feature or otherwise enhances community identity in an historic district. It is not appropriate if repair of the original feature is feasible.

**16. Replication of Bridge Feature.** The new feature shall match the old in design, appearance, materials, craftsmanship, etc. as closely as possible.

The overlook may focus on natural and/or historic resources, including historic bridges and building ruins.

**17. Development of a Scenic Overlook.** VAOT shall incorporate into the project design a place for the public to see and appreciate the scenic view at the site. Provision of the overlook should not create an adverse effect.

Existing historic landscape features that contribute to a property's significance and setting should be retained, e.g. large front yard trees, tree lines, stone walls, etc. Replacement trees should be as large as feasible.

**18. Landscaping.** VAOT shall incorporate a landscape plan in the project design that enhances historic features, and/or replaces removed or missing specimen trees and other plantings, tree canopies, roadway features such as stone walls, or other historic or traditional landscape features. The VAOT Officers shall review and approve final landscape plans.

Creative modern designs are encouraged where appropriate.

**19. Design of a New Bridge.** VAOT shall design a new bridge that is compatible with the surrounding historic and natural environment in design, massing, scale, width, materials, color, etc. The design shall be recognizable as contemporary, and while it may reference the design of the previous bridge, it shall avoid creating an inappropriate false historic appearance.

#### 4(G)(2) FINDING OF ADVERSE EFFECT – MEMORANDUM OF AGREEMENT

##### Laws, Regulations, Guidelines

- 36 CFR 800.6 (Resolution of Adverse Effects)
- 36 CFR 800.11(f) (Memorandum of Agreement - Documentation requirements)

##### Key Definitions

*Memorandum of Agreement (MOA)* means the document that records the terms and conditions agreed upon to resolve the adverse effects of an undertaking on historic properties [36 CFR 800.16(0)].

##### Implementation

- Use of MOA is appropriate only when Officers have determined that standard mitigation (4G1) is inappropriate for mitigating adverse effect of undertaking on historic properties.
- "Process MOA's" may under certain rare circumstances be drafted and executed to expedite acquisition of the NEPA document. This may be appropriate where there are extensive archaeological requirements, complex and time-consuming design elements which will not adversely affect historic properties, or for phased review of complex projects. In these cases, both the Archaeology and Historic Preservation Officers shall sign the MOA assuming the signatory role of the SHPO.

##### Documentation

- Memorandums of Agreement will be prepared, and supporting documentation attached in accord with the format prescribed in Section 3A.
- Refer to workbook Section 106: An Advanced Seminar by Thomas F. King for guidelines on the development and writing of MOA stipulations.

MOA must contain sunset provision and provision for discoveries.

#### 4(G)(3) FINDING OF ADVERSE EFFECT - SPECIAL REQUIREMENTS FOR PROTECTING NATIONAL HISTORIC LANDMARKS

##### Laws, Regulations, Guidelines

- 36 CFR 800.10 (Special Requirements for Protecting National Historic Landmarks)

##### Key Definitions

- *National Historic Landmark (NHL)* means a property that the Secretary of the Interior has designated a National Historic Landmark [36 CFR 800.16(p)].

##### Implementation

- Regulations governing the resolution of adverse effects to NHLs (36 CFR 800.10) mandate participation by the Federal Advisory Council and Secretary of the Interior.
- VAOT officers will contact the Regional Office of the National Park Service, which participates on behalf of the Secretary of the Interior, in every instance of adverse effect to an NHL, and coordinate procedures for project review with the Council.

##### Documentation

- Findings of Adverse Effect to an NHL will be documented in accordance with 36 CFR 800.10(d).

##### **NATIONAL HISTORIC LANDMARKS**

###### **Addison County**

Robert Frost Farm, Ripton  
Emma Willard House, Middlebury  
Mount Independence, Orwell  
Rokeby, Ferrisburgh

###### **Caledonia County**

St. Johnsbury Athenaeum, St. Johnsbury

###### **Chittenden County**

Ticonderoga, Shelburne  
Round Church, Richmond

###### **Orange County**

Justin Smith Morrill Homestead, Stratford

###### **Washington County**

Socialist Labor Party Hall, Barn  
Vermont Statehouse, Montpelier

###### **Windham County**

Naulakha, Dumfrieson  
Rockingham Meeting House, Rockingham

###### **Windsor County**

Calvin Coolidge Homestead District, Plymouth  
Robbins and Lawrence Armory & Machine Shop, Springfield  
George Perkins Marsh Boyhood Home, Woodstock  
StellaLine Observatory, Springfield

#### 4(H) EMERGENCY SITUATIONS

##### Laws, Regulations, Guidelines

- 36 CFR 800.12 (Emergency Situations)

##### Key Definitions

The PA recognizes two classes or categories of emergency situations:

- Immediate rescue and salvage operations conducted to preserve life or property such as necessitated by natural disaster or other catastrophic event;
- Operations that are responding to a disaster or emergency that pose immediate threats to life or property that are
- declared by the President or Governor, or
- declared by the Secretary of Transportation in consultation with the VAOT Archaeology or Historic Preservation Officers, or if unavailable, the SHPO
- and for which corrective measures are initiated within 30 days after the disaster or emergency has been formally declared

##### Implementation

- For emergencies that involve immediate rescue and salvage operations conducted to preserve life or property such as necessitated by natural disaster or other catastrophic event, no Section 106 review is required. This exemption is intended to be very narrowly interpreted i.e. to apply only to events like tornadoes, catastrophic floods, and other acts of God.
- For emergencies declared by the President, Governor, or Secretary of Transportation, Officers will:
- Request and obtain a written declaration of the emergency from the authorizing office;
- Follow standard Section 106 process with shortened periods for comment as required;
- Consult with interested parties before corrective measures are undertaken depending on the nature of the emergency and the timeframe available for corrective actions;
- Recommend, as appropriate, post - emergency mitigation for unavoidable adverse effects to historic resources caused directly or indirectly by the emergency or corrective actions.

##### Documentation

- All facets of the undertakings (Declarations, APE, resource ID, Determination of Effect, Avoidance, Minimization and Mitigation Measures) will be documented in accordance with Section 106, but with modified timeframes to account for urgent corrective measures as appropriate. If necessary, documentation may occur after the undertaking as in the case of natural disasters.

|---|---|

**Unauthorized Removal of Human Remains:** a person who, not being authorized by law, intentionally excavates, disinters, removes or carries away a human body or the remains thereof, interred or entombed in this state, or intentionally excavates, disinters, removes or carries away an object interred or entombed with a human body in this state, or knowingly aids in such excavation, disinterment, removal or carrying away, or is accessory thereto, shall be imprisoned not more than 15 years or fined not more than \$10,000.00 or both [Title 13 VSA Section 3761].

**Other Key Definitions Related to Native American Grave Sites**

**Cultural Items:** human remains and (A) "associated funerary objects" and (B) "unassociated funerary objects" which shall mean objects that, as a part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later..." [see NAGPRA Section 2(3A and 3B) for full definitions]  
**Sacred Objects:** "specific ceremonial objects which are needed by traditional Native American religious leaders for the practice of traditional Native American religions by their present day adherents" [NAGPRA Section 2(3C)].  
**Cultural Patrimony:** "an object having ongoing historical, traditional, or cultural importance central to the Native American group or culture itself, rather than property owned by an individual native American..." [see NAGPRA Section 2(3D) for full definition]

**4(J) TREATMENT OF HUMAN REMAINS**

**\*Note:** This section applies to *any* human remains which are discovered at *any* time either during Section 106 review studies before construction or accidental discovery during construction.

**\*If human remains are discovered, the project will stop immediately.**

**Laws, Regulations, Guidelines**

- Council Memorandum on Archaeological Burial Sites
- Native American Grave Protection and Repatriation Act, 1989 (NAGPRA)
- Native American Burial Site Preservation act of 1989
- Title 13 Vermont Statutes Annotated Sections 3761(Unauthorized Removal of Human Remains)
- Title 13 VSA Section 3764 (Cemeteries and Monuments – Grave markers and historical tablets)
- Title 18 VSA Section 5212 (Permit to Remove Dead Bodies)
- Advisory Council for Historic Preservation Policy Statements: Native American Concerns (1988)

**Key Definitions**

- **Burial Site:** "any natural or prepared physical location, whether originally below, on, or above the surface of the earth, into which as a part of the death rite or ceremony of a culture, individual human remains are deposited." [NAGPRA Section 2(1)]
- **Native American:** "of, or relating to, a tribe, people, or culture that is indigenous to the United States." [NAGPRA Section 2(9)].
- See sidebar for additional key definitions

**Implementation**

- Avoidance and preservation in place is the preferred option for treating human remains.
- The Transportation Archaeology Officer or Archaeological Consultant will evaluate the potential for burial sites or associated cultural items within the project area. If the project area is considered sensitive for Native American burials, then the appropriate Native American group(s) will be contacted. Native American groups may also notify VAOT of burial site potential concerns.
- Examples of these appropriate groups are identified as the Abenaki Self-Help Organization and the Governor's Advisory Council on Native American Affairs.

- If human remains and/or associated cultural items are discovered, the project will stop and the Archaeological Consultant will immediately contact the Archaeology Officer who will notify the SHPO.
- If human remains and/or associated cultural items are discovered during construction, the resident engineer will contact the VAOT Archaeology Officer.
- The VAOT Archaeology Officer will also contact the Town Sheriff, Town Clerk , Chief Medical Examiner and State Police as well as Native Americans when appropriate.
- If the human remains are identified as Native American, then a treatment and reburial plan will be developed in full consultation with the appropriate Native American group(s) as identified above.
- Human remains and cultural items should not be disturbed or removed from their original location if at all possible. [refer to Advisory Council Policy Statement, 1988]
- All determinations will be made or approved by the Archaeology Officer.

#### **Documentation**

- If human remains are identified, a written treatment plan will be developed in consultation with the VAOT Archaeology Officer, SHPO and with public parties such as Native Americans, local government and others as appropriate.
- Recovery when necessary, should be done carefully, respectfully and completely in accordance with the proper archaeological methods (as outlined in 36 CFR 800 and the Guidelines for Archaeological Studies, 1989) [refer to Advisory Council Policy Statement, 1988].

## 5. SUPPLEMENTARY REVIEW

### Laws, Regulations, Guidelines

### Key Definitions

### Implementation (copied from PA)

- This Programmatic Agreement is intended to provide for complete, thorough, and streamlined review of VAOT transportation projects. It is agreed that the formal supplementary review process described below is intended for use in circumstances of significant disagreement only. For the purposes of informal consultation, the SHPO may at his or her discretion, consult via telephone, memo, or in a meeting with the VAOT's historic and archaeological preservation staff.
- If, for any undertaking, formal written comment or formal written objection, so titled, is made within 30 days by FHWA, VAOT, SHPO, the Council, or any consulting party, to any findings made by either the Archaeology Officer or Historic Preservation Officer regarding: (i) determination that an undertaking exists; (ii) the potential area of an undertaking's effect; (iii) the eligibility of archaeological or historic properties to the State or National Register of Historic Places within the project area of effect; (iv) determinations of effect; (v) interpretation of the Secretary of the Interior's Standards for Historic Preservation Projects; (vi) conformance with Vermont Guidelines for Archeological Studies of 1989, and any successors to those guidelines; (vii) applicability of the Manual of Ancillary Standards and Guidelines adopted pursuant to this PA; (viii) the appropriateness of the Standard Mitigation Measures, the Archaeology Officer or Historic Preservation Officer shall consult, as appropriate, with SHPO, ACHP, FHWA, or VAOT. If, after consultation, agreement on Federal undertakings cannot be reached regarding any such findings, any party may request the project be reviewed pursuant to the procedures identified in 36 CFR Part 800 et seq. In such event, the terms of this agreement shall be superseded by the provisions contained in 36 CFR Part 800 et seq for that single undertaking only.

**Documentation**

- Formal written objections shall clearly state which determination is being objected to, and specifically why the objection is being made.
- Officers will retain formal objection documents in project files and forward copies of same as received to SHPO.

\*\*\*\*\*

WHEREAS, the Federal Highway Administration (FHWA) proposes to administer its Transportation Program in Vermont authorized by 23 U.S.C. 101 et seq. through the Vermont Agency of Transportation (VAOT) (23 U.S.C. 315); and

WHEREAS, FHWA: (1) has determined that undertakings may have an effect upon properties included in or eligible for inclusion in the National Register of Historic Places; (2) has consulted with the Advisory Council on Historic Preservation (Council) and the Vermont State Historic Preservation Officer (SHPO) pursuant to Section 800.13 of the regulations (36 CFR 800) implementing Section 106 of the National Historic Preservation Act (NHPA) (16 U.S.C. 470f); (3) wishes to insure that VAOT will conduct its programs in a manner consistent with 36 CFR 800; and (4) intends to integrate its historic and archaeological preservation planning and management decisions with other policy and program requirements to the maximum extent possible consistent with Sec 110 of the NHPA; and

WHEREAS, 36 CFR Part 800 encourages Federal Agencies to efficiently fulfill their obligations under Section 106 of the National Historic Preservation Act through the development and implementation of cooperative programmatic agreements.

WHEREAS, VAOT has participated in the consultation and has been invited to execute this Programmatic Agreement (PA); and

WHEREAS, FHWA and VAOT are committed to the design of transportation systems that: (1) achieve a safe and efficient function appropriately placed within the Vermont context; (2) avoid, minimize and mitigate adverse effects on historical and cultural resources; (3) recognize that investment in these historic, archaeological, and cultural resources is critical to Vermont's continued growth and prosperity; and (4) respond to the needs of Vermont communities,

WHEREAS, FHWA, the Council, SHPO, and VAOT aspire to engage in meaningful, long term planning for the protection of historic and archaeological properties and, toward that end, desire to: (1) develop a comprehensive and efficient process for all Section 106 undertakings; (2) simplify procedural requirements to the maximum extent possible; (3) eliminate unnecessary paperwork; (4) reduce the role of SHPO to the minimum extent required; (5) devote a larger percentage of time and energies identifying transportation-related concerns threatening historic and archaeological properties; and (6) create innovative programs to address those problems.

WHEREAS it is desirable to integrate and streamline project reviews under parallel state historic preservation and environmental laws.

NOW THEREFORE, FHWA, the Council, VAOT and SHPO hereby agree that the review of FHWA undertakings shall be administered according to the following stipulations in order to satisfy FHWA's Section 106 responsibilities and to integrate, to the maximum extent feasible, the manner in which FHWA meets its historic and archaeological preservation responsibilities with its other responsibilities under Federal and State statutory or regulatory authorities and policies.

#### STIPULATIONS

FHWA will ensure that the following measures are carried out:

**1. Applicability and Scope.** This PA sets forth the process by which FHWA, with the assistance of VAOT, will meet its responsibilities under Section 106 of the NHPA and the regulations set forth in 36 CFR Part 800 as amended adopted to implement that act. For purposes of this PA, the definitions for terms appearing in 36 CFR 800.16 (a) through (y) inclusive shall be employed whenever applicable.

(A) Applicability. This PA shall apply to all FHWA undertakings administered under its Federal-aid Highway Program in Vermont. Those undertakings partially reviewed under any existing programmatic agreements or memorandums of agreement will be superseded by this agreement to the extent that the terms of the former are inconsistent with the latter. A list of those programmatic agreements is attached hereto as Appendix D. See Appendix B for programmatic review of State-funded transportation projects.

(B) Scope. The objective of this PA is to render more efficient the methods by which FHWA and VAOT review individual undertakings that may affect historic properties and to establish the process by which FHWA, the Council, the SHPO, and interested persons will be involved in any such review.

2. **General Requirements.** In compliance with its responsibilities under NHPA and as a condition of its award of any assistance under the Federal-aid Highway Program to VAOT, FHWA shall require that VAOT carry out the requirements of 36 CFR 800 inclusive, all applicable Council standards and guidelines, or the requirements set forth in this PA, for all FHWA undertakings. FHWA will insure that VAOT observes the following requirements.

(A) Employment of Qualified Personnel. For the purpose of implementing this agreement, VAOT shall continue to employ qualified professional staff and consultants who meet the requirements of 36 CFR Part 61, Appendix A. At a minimum, the professional staff shall consist of two permanent, full time, classified service positions: (1) an archaeologist; and (2) an architectural historian or historic preservation professional. The individuals holding these positions shall have the titles: (1) VAOT Archaeology Officer; and (2) VAOT Historic Preservation Officer. These two individuals will report directly to the Environmental Services Engineer. Where the VAOT Archaeology Officer and/or the VAOT Historic Preservation Officer determine that a project may be controversial, the officers may at their discretion consult their Division Director and/or the Secretary of Transportation, and/or, refer a project for review under 36 CFR 800. SHPO shall be consulted in the selection of individuals to fill these two positions. In the event of a prolonged absence of the archaeology officer or the historic preservation officer, VAOT will, in consultation with SHPO, appoint acting officers that meet the requirements of 36 CFR Part 61, Appendix A.

(B) Manual of Ancillary Standards and Guidelines. In addition to the Secretary of the Interior's Standards for Historic Preservation Projects (36 CFR Part 68), and the Vermont SHPO Guidelines for Archeological Studies, as revised, VAOT, FHWA, and SHPO shall prepare a document titled Manual of Ancillary Standards and Guidelines to implement this PA, to provide guidance for the drafting of any findings or other documents produced by the VAOT Archaeology Officer or Historic Preservation Officer, and to prescribe measures to mitigate any adverse effects caused to historic resources. This document shall, by reference, be incorporated into this PA and will serve as a manual for the Section 106 review by VAOT of all FHWA undertakings in Vermont. The Manual of Ancillary Standards and Guidelines will be prepared by September 30, 2000, or within six months of the date of execution of this agreement, whichever is later. An Outline of Topics for the Manual of Ancillary Standards and Guidelines is attached hereto as Appendix A.

(C) Coordination of Project Review Among VAOT Divisions. VAOT will prepare a detailed written procedure for Section 106 review of FHWA undertakings among its various divisions, and this procedure will be included in the Manual of Ancillary Standards and Guidelines.

(D) Education. FHWA and VAOT, in collaboration with SHPO, will provide a significant public education and interpretation component in its undertakings whenever appropriate.

(E) Training. FHWA and VAOT will collaborate with SHPO in ensuring periodic training for VAOT personnel and their consultants to assure compliance with Section 106 responsibilities. Creative initiatives are encouraged.

(F) Annual Evaluation. VAOT, FHWA, and SHPO shall meet six months after the date this agreement takes effect to evaluate the agreement, suggest revisions to its provisions or to the Manual of Ancillary Standards and Guidelines, and to evaluate the quality of the resource identification and protection activities carried out under the agreement. After the initial period, evaluations shall take place annually, by March 1. Prior to the annual evaluation, VAOT shall submit a report to FHWA and SHPO. This report shall include, but is not limited to, summaries in table form identifying all undertakings and specifying project names, towns, and all findings pursuant to 36 CFR 800. The report shall also contain a narrative description of accomplishments, concerns, and recommendations regarding any changes to this PA or to the Manual of Ancillary Standards and Guidelines.

The SHPO shall provide a copy of the VAOT annual report to the Vermont Advisory Council on Historic Preservation and shall schedule a meeting with the Council to discuss the report prior to the annual review meeting. The SHPO shall provide a written response to the report, after considering the comments of FHWA, the Vermont Advisory Council, and other interest groups and, if appropriate, concur that the terms of the PA and Manual are being met satisfactorily. If the SHPO concludes that performance under the agreement is less than satisfactory, the parties shall consult to improve performance, and meet again within six months to evaluate improvements.

(G) Transition. This PA will become effective upon the date of its execution by all parties and, acceptance of the Manual of Ancillary Standards and Guidelines by AOT, FHWA, and the SHPO. If issues arise regarding FHWA undertakings partially reviewed prior to the date this PA becomes effective, the Archaeology Officer or Historic Preservation Officer shall consult with SHPO, ACHP, FHWA, or VAOT as appropriate. If, after consultation, agreement cannot be reached regarding any such prior review, any party may request project review pursuant to the procedures identified in 36 CFR Part 800 et seq. In such event, the terms of this agreement shall be superseded by the provisions contained in 36 CFR Part 800 et seq for that single undertaking.

(H) Delegation. Responsibility for any findings regarding (i) determination that an undertaking exists; (ii) the potential area of an undertaking's effect; (iii) the eligibility of archaeological or historic properties to the National Register of Historic Places within the project's area of effect; (iv) determinations of effect; (v) interpretation of the Secretary of the Interior's Standards for Historic Preservation Projects; (vi) conformance with Vermont Guidelines for Archeological Studies of 1989, and any successors to those guidelines; or (vii) applicability of the Manual of Ancillary Standards and Guidelines adopted pursuant to this PA, shall rest with VAOT's Archaeology Officer or Historic Preservation Officer. These responsibilities may not be delegated to project sponsors.

(f) Innovative Programs Envisioned. To facilitate historic and archaeological preservation planning and actions, VAOT will establish and promote progressive programs and activities of mutual interest to, and in consultation with, FHWA, SHPO, ACHP, or other consulting parties. In its annual reports, VAOT will identify special needs that should be addressed through such programs and activities and will prepare a plan and cost estimate to address those needs. Examples of programs envisioned may include: (i) analysis and synthesis of past data accumulated through VAOT/FHWA projects; (ii) statewide thematic or other surveys of historic properties; (iii) statewide predictive models; (iv) improved data management and access; (v) development of historic contexts and preservation priorities; (vi) identification and survey of properties considered eligible for the National Register of Historic Places; (vii) consultation with Native American groups and (viii) preparation and implementation of relevant preservation or management plans; project information internet site.

**3. Documentation.** Documentation assembled by the VAOT Archaeology Officer, the VAOT Historic Preservation Officer, their staff, or their consultants, to support any Section 106 findings shall be consistent with 36 CFR 800.11. Copies of supporting documentation shall be forwarded as generated to SHPO to be made available for public inspection and use. Scoping reports, corridor studies, EA's and EIS's, and alternative alignment studies shall be included in the documentation. FHWA shall insure that VAOT prepare a plan to address the following requirements, and this plan will be included in the Manual of Ancillary Standards and Guidelines.

**A. Types of Documentation.** The documentation required to support findings of effect and eligibility to the National Register will be incorporated into a database system as described in the Manual of Ancillary Standards and Guidelines. A list of all FHWA undertakings reviewed each year under this agreement will be included in a report that will be submitted as part of the annual review described in Section 2(F) herein. VAOT shall provide to SHPO copies of all identification, evaluation, treatment and data recovery reports, survey forms, digital survey information, and other relevant resource information as they are generated.

**B. GIS Systems.** Procedures for incorporating pertinent documentation into GIS systems will be developed as part of the Manual of Ancillary Standards and Guidelines, and FHWA and VAOT will coordinate with SHPO to accomplish this objective. These procedures shall include the development of an historic and archeological resource recovery database and statewide predictive model. SHPO, FHWA, and VAOT will share technology and information by providing mutual access to site data, historic contexts, and any other information pertaining to cultural resource sensitivity analysis and/or site prediction modeling .

**C. Archaeology Planning and Research.** FHWA and VAOT shall provide for archaeological planning and research that includes, but is not limited to, appropriate care, access, and interpretation of data collections recovered from the above undertakings. FHWA and VAOT, in consultation with SHPO, will partner with other organizations who maintain or are responsible for Vermont collections to assess needs, identify alternative solutions, and implement the most appropriate collections care, research, and interpretation program for Vermont. Any archaeological research center shall meet the standards set forth by the US Department of the

Interior in 36 CFR 79. Archaeological research priorities and a public education and outreach plan will be included in the Manual of Ancillary Standards and Guidelines.

**4. Requirements for Project Review by FHWA and VAOT.** For all FHWA undertakings reviewed pursuant to this PA, FHWA and VAOT shall observe the following requirements:

**A. Determination of Undertaking and Assessment of Area of Potential Effect.** On behalf of the FHWA, the VAOT Archaeology Officer and Historic Preservation Officer shall follow the procedures in 36 CFR 800.3 and 800.4 to (i) determine whether proposed projects, activities, or programs constitute an undertaking; and (ii) establish the undertaking's area of potential effects.

**B. Identifying Historic Properties.** Pursuant to 36 CFR 800.4, the VAOT Archaeology Officer and Historic Preservation Officer shall identify historic and archaeological properties that may be affected by the undertaking and gather sufficient information to evaluate the eligibility of these properties for the National Register of Historic Places. Information shall be obtained through cultural resource surveys or other appropriate investigations. Identification of historic and archaeological properties shall follow the Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation (48 FR 44716), applicable SHPO guidelines, and agency programs to meet the requirements of Section 110(a)(2) of NHPA.

**C. Public Participation and Notification** The VAOT Archaeology Officer and Historic Preservation Officer shall, through opportunities afforded by the VAOT project development process, seek and consider the views of the public in a manner that reflects the nature and complexity of the undertaking and its effects on historic properties, the likely interest of the public in the effects on historic properties, confidentiality concerns of private individuals and businesses, and the relationship of the Federal involvement to the undertaking. VAOT will use existing procedures to solicit public participation early in the project planning process and consistent with 36 CFR Part 800.3.

**D. Evaluating Historic and Archaeological Significance.** For any undertaking that may affect properties that have not been previously evaluated for eligibility to the National Register of Historic Places, the VAOT Archaeology Officer and Historic Preservation Officer shall apply the National Register Criteria (36 CFR 60.4), and shall make an appropriate finding regarding eligibility pursuant to 36 CFR 800.4(c). VAOT shall notify FHWA and any interested person that this finding has been made and shall provide copies to SHPO of adequate documentation to support that finding for inspection by the public.

Prior to any finding of eligibility or non-eligibility, VAOT may consult with SHPO regarding application of the criteria contained in 36 CFR 60.4. Copies of these findings with supporting documentation shall be forwarded as they are generated to SHPO for their records.

**E. Finding of No Historic Properties Affected.** If VAOT finds that either there are no historic properties present or there are historic properties present but the undertaking will have no effect on them as defined in 36 CFR Part 800.16(i), the VAOT Archaeology Officer and

Historic Preservation Officer shall make a formal finding of No Historic Properties Affected. Prior to any such finding, VAOT may consult with SHPO regarding application of the criteria. VAOT shall notify FHWA and any interested person that this finding of No Historic Properties Affected has been made and shall forward copies of adequate documentation as set forth in 36 CFR Part 800.11(d) to support that finding to SHPO for inspection by the public. No further review under Section 106 is required for a finding of No Historic Properties Affected unless supplementary review pursuant to Section 5 herein, is requested.

F. Finding of No Adverse Effect. For any undertaking that includes, within the area of potential effects, listed or eligible properties that will not be adversely affected by the undertaking, as defined by the Criteria of Adverse Effect set forth in 36 CFR 800.5(a), the VAOT Archaeology Officer and Historic Preservation Officer shall make a formal finding of no adverse effect and specify those conditions, if any, that shall be imposed to secure that finding. FHWA and VAOT shall ensure that specified conditions are met. VAOT shall notify FHWA and any interested person that this finding of no adverse effect has been made and shall forward copies of adequate documentation to support that finding to SHPO for inspection by the public. No further review under Section 106 is required for a finding of no adverse effect unless supplementary review pursuant to Section 5, herein, is requested.

Prior to any finding of no adverse effect, VAOT may consult with SHPO regarding application of the criteria. Copies of these findings of no adverse effect with supporting documentation shall be forwarded to SHPO as available for their records.

G. Findings of Adverse Effect. For any undertaking that includes, within the area of potential effects, listed or eligible properties that will or may be adversely affected by the undertaking, as defined by the Criteria of Adverse Effect set forth in 36 CFR 800.5(a), the VAOT Archaeology Officer and Historic Preservation Officer shall make a formal finding of adverse effect. When a finding of adverse effect has been made, VAOT shall, at a minimum, evaluate in consultation with consulting parties alternatives to the project that would avoid any adverse effect and document them in the project files. If no such alternatives exist, VAOT shall undertake all possible steps to minimize or mitigate the adverse effect, taking into account the requirements of the Secretary of the Interior's Standards for Historic Preservation Projects; the Vermont Guidelines for Archeological Studies of 1989 and its subsequent revisions, together with the Manual of Ancillary Standards and Guidelines adopted pursuant to this PA.

(1) Adverse Effect - Standard Mitigation Measures Applicable. Prior to any finding of adverse effect, VAOT may consult with SHPO regarding application of the criteria and appropriateness of utilizing the Standard Mitigation Measures set forth in the Manual of Ancillary Standards and Guidelines. If VAOT makes a determination regarding applicability of the Standard Mitigation Measures, those measures shall be incorporated into a formal written finding of adverse effect. VAOT shall notify FHWA, SHPO, consulting parties and interested members of the public that this finding of adverse effect has been made and shall forward copies of adequate documentation to support that finding to SHPO for inspection by the public. No further review under Section 106 is required for a finding of adverse effect unless supplementary review pursuant to Section 5, herein, is requested.

(2) Adverse Effect - Memorandum of Agreement (MOA) If VAOT determines that the Standard Mitigation Measures are not applicable, VAOT will consult with SHPO, FHWA, and consulting parties on the special provisions adopted to avoid, minimize, or mitigate the adverse effect, and draft an MOA to reflect the agreement. This MOA, together with copies of the documentation necessary to support the finding of adverse effect, will be forwarded to SHPO and FHWA wherein they will, within 30 days, either sign the agreement or initiate consultation with the Council. Copies of the MOA and findings of adverse effect with supporting documentation shall be forwarded to the Council, and SHPO as generated for their records and inspection by the public.

(3) Adverse Effect - Special Requirements for Protecting National Historic Landmarks  
If VAOT determines that an undertaking may adversely affect a National Historic Landmark, VAOT shall request the SHPO, the Council and the Secretary of the Interior to participate in consultation to resolve any adverse effects, as outlined in 36 CFR 800.10.

H. Emergency Situations. This document prescribes review processes for two classes of emergency situations. The first class exists when (1) the undertakings are operations that are responding to a disaster or emergency declared by the President or governor, or that are responding to immediate threats to life or property, or (2) that are responding to immediate threats to life or property that are declared emergencies by the Secretary of Transportation in consultation with the VAOT Historic Preservation and Archaeology Officers or, if unavailable, the SHPO and (3) corrective measures are initiated within 30 days after the disaster or emergency has been formally declared. Reviews in these emergency situations shall utilize the review process described in Section 4, but with a shortened timeframe for participation by the SHPO, consulting parties, and the general public as time permits. Written notification of the emergency action being considered shall be provided to the SHPO, the legislative body of the Municipality and the Municipal Planning Commission. The notice shall be clearly and prominently marked as an emergency notification, and shall include a brief description of the significance of the resources involved, the nature and anticipated effect of the emergency action on the resource(s), and the anticipated timeframe available for comment. Notification may be similarly provided to the general public in a box ad in a newspaper of general circulation in the area. VAOT is encouraged to also communicate with consulting parties by telephone.

The second class of emergencies as defined by immediate rescue and salvage operations conducted to preserve life or property such as necessitated by natural disaster or other catastrophic event, are exempt from the provisions of Section 106 and this Programmatic Agreement.

I. Discovery. If previously unidentified archaeological or historic sites are discovered after VAOT has completed its review under this programmatic agreement, that portion of the project will stop immediately. The resident engineer will immediately contact the SHPO. No further construction will proceed until the requirements of 36 CFR 800.13 have been satisfied. FHWA and VAOT will consult with SHPO to record, document and evaluate National Register eligibility of the site and the project's effect on the site, and to design a plan for avoiding or mitigating adverse effects on a potentially eligible site.

J. Treatment of Human Remains. In accordance with state laws that protect unmarked burials, if previously unidentified Native American remains are discovered during construction, that

portion of the project will stop immediately. The remains will be respectfully covered over and the project engineer will immediately consult with FHWA, VAOT's archaeologist, and SHPO. A treatment and reburial plan will be developed by FHWA, VAOT, and SHPO in consultation with appropriate Native Americans. FHWA and VAOT will ensure that the treatment and reburial plan is fully implemented. Avoidance and preservation in place is the preferred option for treating human remains.

**5. Supplementary Review** This Programmatic Agreement is intended to provide for complete, thorough, and streamlined review of VAOT transportation projects. It is agreed that the formal supplementary review process described below is intended for use in circumstances of significant disagreement only. For the purposes of informal consultation, the SHPO may at his or her discretion, consult via telephone, memo, or in a meeting with the VAOT's historic and archaeological preservation staff.

If, for any undertaking, formal written comment or formal written objection, so titled, is made within 30 days by FHWA, VAOT, SHPO, the Council, or any consulting party, to any findings made by either the Archaeology Officer or Historic Preservation Officer regarding: (i) determination that an undertaking exists; (ii) the potential area of an undertaking's effect; (iii) the eligibility of archaeological or historic properties to the State or National Register of Historic Places within the project area of effect; (iv) determinations of effect; (v) interpretation of the Secretary of the Interior's Standards for Historic Preservation Projects; (vi) conformance with Vermont Guidelines for Archeological Studies of 1989, and any successors to those guidelines; (vii) applicability of the Manual of Ancillary Standards and Guidelines adopted pursuant to this PA; (viii) the appropriateness of the Standard Mitigation Measures, the Archaeology Officer or Historic Preservation Officer shall consult, as appropriate, with SHPO, ACHP, FHWA, or VAOT. If, after consultation, agreement on Federal undertakings cannot be reached regarding any such findings, any party may request the project be reviewed pursuant to the procedures identified in 36 CFR Part 800 et seq. In such event, the terms of this agreement shall be superseded by the provisions contained in 36 CFR Part 800 et seq for that single undertaking only.

**6. Dispute Resolution.** Should any party to this agreement object within 30 days to any actions proposed pursuant to this agreement not covered by Section 5 (Supplementary Review), FHWA, VAOT, SHPO, and the objecting party shall consult to resolve the objection. If the objection cannot be resolved, FHWA and VAOT shall request comment from the Council pursuant to 36 CFR 800.6(b). Any Council comment provided in response to such a request will be taken into account by FHWA and VAOT in accordance with 36 CFR 800.6(c)(2) with reference only to the subject of the dispute. The responsibility of VAOT, FHWA, and SHPO to carry out all actions under this agreement, other than those that are the subject of the dispute, will remain unchanged.

**7. Amendment.** Any party to this agreement may request that it be amended, whereupon the parties will consult in accordance with 36 CFR 800.14 to consider such amendment. The responsibility of VAOT, FHWA, and SHPO to carry out all actions under this agreement, other than those subject to the amendment, will remain unchanged.

**8. Right to Terminate.** Any party to this PA may terminate it by providing thirty (30) days written notice to the other parties, provided that the parties will consult during the period before termination to seek agreement on amendments or other action that would avoid termination. In the event of termination, the FHWA shall comply with 36 CFR 800 with regard to the individual undertakings covered by this PA.

**9. Duration.** This Programmatic Agreement will be in effect for three years from the date of execution, with renewal upon agreement by all parties.

\*\*\*\*\*

Execution and implementation of this PA evidences that the FHWA has satisfied its Section 106 responsibilities for all individual undertakings of the Federal-aid Highway Program in Vermont.

## APPENDIX B

## Review of VAOT Undertakings under Vermont State Law

I. INTRODUCTION TO STATE REVIEW PROCEDURES. In addition to Section 106 review of VAOT projects, state law requires that state undertakings be reviewed under 22 V.S.A. 14, the Vermont Historic Preservation Act, and in some cases, under 10 V.S.A. 151, Act 250, the State's land use permit law. VAOT undertakings that comply with the review requirements of Section 106 or Act 250 shall be considered to be in compliance with the requirements of 22 V.S.A.14. Compliance with 22 V.S.A.14, however, generally does not satisfy the review requirements of Section 106 or Act 250.

A. 22 V.S.A. 14. In those circumstances where there is no federal or Act 250 involvement in an AOT undertaking, the Vermont Advisory Council on Historic Preservation (VACHP) delegates to the VAOT and VAOT's qualified historic and archaeological preservation professionals the responsibility to identify potentially significant resources, to evaluate project impacts, and to develop mitigation measures that avoid or minimize adverse impacts, as outlined in the Division's rules for State undertakings. For undertakings that do not result in an adverse effect, AOT shall provide a copy of the determinations to the VACHP. For undertakings that may have an impact on a listed or eligible State or National Register resource, VAOT shall consult with the VACHP as outlined in the rules.

B. 10 V.S.A. 151, Act 250. VAOT shall identify the applicability of Act 250 to VAOT projects early in the planning process. For undertakings that require an Act 250 permit, the VACHP delegates to the VAOT and VAOT's qualified historic and archaeological preservation professionals the responsibility to identify potentially significant resources, and the Vermont Division for Historic Preservation delegates the responsibility to evaluate project impacts and to develop mitigation measures that avoid, minimize, or mitigate impacts, as outlined in the Division's rules for state undertakings.

(1) Finding of No Effect. For any undertaking that does not include a listed or eligible State or National Register resource within the area of potential effects, or alternatively includes listed or eligible properties that will not be affected by the undertaking, the VAOT Archaeology Officer and Historic Preservation Officer shall make a formal finding of no effect. VAOT shall forward copies of this finding to the District Environmental Commission and the SHPO and these comments shall serve as the SHPO's comments on the project for Criterion 8 and other applicable criteria. No further review by AOT under Act 250 is required.

(2) Finding of No Adverse Effect. For any undertaking that includes, within the area of potential effects, a listed or eligible State or National Register resource that will not be adversely affected by the undertaking as defined in the Division's rules, the VAOT Archaeology Officer and Historic Preservation Officer shall make a formal finding of no adverse effect and specify those conditions, if any, that shall be imposed to secure that finding. VAOT shall forward copies of this finding to the District Environmental Commission and the SHPO and these comments shall serve as the SHPO's comments on the project for Criterion 8 and other applicable criteria. No further review by AOT under Act 250 is required.

(3) Finding of Adverse Effect. Prior to any finding of adverse effect, VAOT may consult with SHPO regarding application of the criteria of adverse effect in the Division's rules. For undertakings that may have an adverse effect on a listed or eligible State or National Register resource, VAOT shall consult with the SHPO, and prepare for the SHPO's concurrence a recommendation for mitigation measures that would avoid an undue adverse effect. The recommendation, with the SHPO's concurrence, shall be submitted to the District Commission and shall serve as the Division's comments on the project for Criterion 8 and other applicable criteria. If the SHPO does not concur, either in the assessment of undue adverse effect or in proposed mitigation measures, the SHPO may issue his or her own comments to the District Commission.

2. PUBLIC NOTIFICATION. VAOT shall also be responsible for notifying towns or municipalities when a property is being evaluated for the SR/NR as required by Title 22, Vermont Statutes Annotated, Section 723(11) and related policies. Such notification shall be incorporated into existing VAOT procedures as appropriate. VAOT and SHPO will coordinate any requested public hearings requested pursuant to that act.

**APPENDIX C****Exempt Activities****ROADWAY**

1. Rehabilitation of existing pavement and/or application of new pavement on existing travel lanes and existing paved shoulders with shoulder backing
2. Sub-base improvement limited to the depth of the existing sub-base, for drainage purposes.
3. Routine pavement maintenance such as crack filling.
4. Routine sign maintenance, such as in-kind replacement of damaged or down signs, and in-kind replacement of signs, guardrails, lights, signals, curbs, sidewalks, shoulder backing, and pavement markings at their existing locations. For projects not located in historic districts, minor modifications in size, locations, content, and material composition of these features are permitted and do not require review.
5. Interstate projects involving: (1) installation of guardrails to replace existing guardrails; (2) installation of new guardrails on existing shoulders; and (3) maintenance projects, including construction of cross-overs, on previously disturbed median strips.
6. Converting existing drop inlets to traversable designs.
7. Safety end treatments (standard flares) for guardrails.
8. Installation of new guardrail on existing shoulders outside historic districts.
9. Installation of rumble strips on existing pavement.

**CULVERTS AND DITCHING**

1. In-kind replacement of 48" or smaller culverts not fifty years old, provided replacement is confined to existing locations. In-kind replacement shall mean construction of a new facility substantially the same in materials and size.
2. In-kind replacement of 49" or larger culverts not fifty years old, provided replacement is confined to existing locations, no temporary bridge or culvert is required, and no approach work is undertaken. In-kind replacement shall mean construction of a new facility substantially the same in materials and size and in footprint.
3. Reestablishment of existing ditches to original width.

**BRIDGES**

1. Washing, cleaning, and regular maintenance.
2. In-kind repairs to abutments where no excavation is proposed.
3. For bridges that are not fifty years old, rehabilitation of existing pavement and/or application of new pavement on bridge decks, replacement of membranes, and replacement of expansion joints, and replacement/repair of railings where bridge is located outside a historic district.

**AIRPORTS**

1. Repaving of existing runways.
2. Repairing existing less than 50 year old safety components including beacons on airport property as long as no new access is required.
3. In kind replacement or repair of existing beacons less than 50 years old not on airport property as long as no new access is required.
4. General maintenance of existing airport facilities.

#### RAILROADS

1. Installation of new RR signals and replacement/repair of existing less than 50 year old RR safety components.
2. Resurfacing on railroad crossings.
3. In-kind replacement of existing bolt connected RR tracks and wood ties.

#### ENHANCEMENTS

1. Installation of Bike Racks.
2. Maintenance and minor improvements to existing Park and Rides, except lighting, where no excavation will take place.
3. Modification to concrete sidewalks and curb ramps to satisfy the Americans with Disabilities Act.

#### UTILITIES

1. Replacing/repairing existing underground utilities in kind and within existing footprint.
2. Replacement and relocation of existing utility poles between edge of sidewalk and road.

#### PROCEDURAL

1. Minor changes to previously permitted projects where those changes fall under the exempt activity category as described in this appendix.

**APPENDIX D**

**Existing Statewide Programmatic Agreements**

1. Paving and Minor Highway Project Programmatic Agreement, executed February 1, 1996

Programmatic Agreement among the Federal Highway Administration, the Vermont Agency of Transportation, the Vermont State Historic Preservation Officer, and the Advisory Council on Historic Preservation regarding Paving and Minor Highway Projects.

2. Historic Bridge Programmatic Agreement, executed July 7, 1998

Programmatic Agreement among the Federal Highway Administration, the Advisory Council on Historic Preservation, the Vermont Agency of Transportation, the Vermont Agency of Natural Resources, and the Vermont Agency of Commerce and Community Development regarding implementation of a program involving historic bridges.

12/00

---

STATEMENT OF HAL KASSOFF, VICE PRESIDENT, PARSONS BRINCKERHOFF, ON BEHALF  
OF THE AMERICAN COUNCIL OF ENGINEERING COMPANIES

Good morning. My name is Hal Kassoff. I am Vice President with the consulting engineering firm of Parsons Brinckerhoff. I am representing the 5,800 member firms of the American Council of Engineering Companies, where I chair the Transportation Committee's Subcommittee on Environmental Streamlining. I am also co-chair of the Planning and Environmental Working Group for the American Road and Transportation Builders Association's TEA-2 Reauthorization Task Force.

Expediting project delivery is one of the premier issues for members of the transportation community. And those who are experienced in delivering surface transportation projects will agree that the most difficult and time consuming challenge involves coping with what has become an overly arduous and time consuming environmental review process.

Recently, those who oppose streamlining the transportation project environmental review and approval process have begun to argue that the process is not a significant cause of project delay—that funding constraints and mismanagement are the real problems. These arguments are a distortion of the reality that I have known for 18 years as planning director and then Administrator for the Maryland State Highway Administration, and for the past 5 years working on a national basis with Parsons Brinckerhoff. Environmental groups have, on occasion, candidly acknowledged that using the current process to delay projects that they oppose is key to meeting their objectives.

In his testimony before this committee on April 29, 1999, Mr. Roy Kienitz, the then Executive Director of the Surface Transportation Policy Project said:

“In the struggle between the proponents and opponents of a controversial project, the best an opponent can hope for is to delay things until the proponents change their minds or tire of the fight. It is the only option they have, and so they use it.”

Mr. Kienitz went on to offer:

“We think of the projects that navigate the Federal approval process as falling into two natural categories: first, those on which a consensus has been reached locally, and second, those where strong disagreement still exists . . . We believe that Federal process reforms can be most effective in addressing the treatment of projects in the first category. There is no good reason for Federal approval to take years if there are no major disagreements over the project being proposed. These delays are the most needless of all, and are the easiest ones to attack.”

Mr. Chairman, this is a refreshing observation by Mr. Kienitz that underscores the fact that the process needs to be fixed.

A recent study by FHWA has confirmed that the time required to process environmental documents for large projects has more than doubled over the past 20 to 30 years. According to this report, in the 1970's the average time for completion of environmental impact statements was 2.2 years. This time period doubled to 4.4 years in the 1980's and grew further to an average of 5.0 years in the 1990's. Also of interest is that the average time grew by nearly 2 years when section 404 wetland permit issues come into play and the same occurred when section 4(f) historic preservation or parkland avoidance issues are involved.

And another recent study under the National Cooperative Highway Research Program (NCHRP) reported on a survey of more than 30 States who described their experiences with delays in satisfying environmental requirements for small, simple projects as well. According to this report, 63 percent of all DOTs responding to the survey reported experiencing environmental processing delays with preparation of categorical exclusions (CEs), and 81 percent reported similar delays involving environmental assessments (EAs). These delays triple average environmental review times from about 8 months to just under 2 years for CEs, and more than double these time periods from under 1.5 years to about 3.5 years for EAs.

Some DOTs have extended their schedules to reflect these extremely long durations—which can then give the misimpression that the environmental process is not taking an inordinately lengthy period of time. Other DOTs will simply not allocate funds to projects until environmental requirements have been met in order to avoid tying up and then delaying the utilization of critically important financial resources. In an ironic twist of reality, environmental activists can then claim that such projects are being delayed not by environmental requirements but by funding constraints, when in fact the opposite is often the case.

Mr. Chairman and members of the committee, needless delay to transportation projects caused by environmental processing is widespread, and the opportunity is at hand to take positive action. Section 1309 of TEA-21 attempted to address the problem by calling upon the U.S. DOT and environmental resource agencies to cooperatively implement streamlined procedures, including concurrent processing, adherence to deadlines and dispute resolution. The goal was to expedite project delivery by eliminating unnecessary delays and requiring timely resolution of conflicts without diminishing environmental protections.

The last point—“without diminishing environmental protections”—is critically important. Ten national environmental organizations recently joined in releasing a one-page document titled “Expediting Project Delivery Without Sacrificing Environmental Protection.” And while exception could be taken with a number of specific

points in the paper, the overall title is on the mark. In fact, we are not aware of anyone in the transportation community who would argue that environmental protection should be sacrificed in order to expedite the project delivery process. This issue is not about weakening environmental protection. The issue is about implementing an improved process that expedites project delivery without sacrificing environmental protection.

There are some environmental groups who are interested in continuing a process that facilitates delay, or can be manipulated or challenged to cause delay, of project decisions with which they disagree. Those of us involved in delivering transportation project decisions are interested in a process that allows full public participation and ensures that only environmentally sound projects that meet the public and business demand for safe and efficient travel move forward. We also want a process, however, that is fair, certain, and comes to closure in what most people would consider a reasonable amount of time.

We believe that Section 1309 needs a legislative “booster shot” in the form of a carefully balanced approach that reflects three basic components:

- (1) clarify expectations of both transportation and environmental agencies,
- (2) transform specific processes, and
- (3) hold both transportation and environmental agencies accountable for achieving positive results.

*(1) Clarify Expectations*

Congress should clearly define its expectations for expediting project delivery by articulating in clear and unmistakable language a balanced array of basic policy principles. Such clearly defined expectations will be of great value in guiding the actions of participants in the process. Attached to this testimony is a draft of 20 such principles—10 that would apply to transportation agencies and 10 to environmental resource agencies. Taking just a few as examples, transportation agencies would be expected to advance projects that reflect environmental sensitivity as a priority. This will help lend substance and meaning to the philosophy of environmental stewardship which AASHTO and FHWA have been articulating and practicing. At the same time, environmental agencies would be expected to recognize the economic, safety/health and mobility needs for transportation projects, and offer constructive and problem solving ideas that respect their basic purpose. Environmental staffs would work with transportation agencies in a search for win/win outcomes.

To fully appreciate how far the transportation community has come with respect to environmental stewardship, I commend to you the definition and goals as presented by AASHTO in its Transportation Environmental Stewardship Program, which is also attached. One of the key points that AASHTO makes is that environmental stewardship is a voluntary commitment to go beyond the minimums required by law. It can only succeed if States embrace the concept in their own unique ways. It cannot be standardized, nor can it be embodied in a new set of requirements, without defeating the whole purpose of inducing a culture change that encourages going beyond bare minimums.

*(2) Transform Processes*

Mr. Chairman, transformations of certain processes are essential if significant improvements in expediting project delivery are to be achieved. Legislation is needed to ensure that these changes occur. They include the following:

- **US DOT Lead Agency Responsibilities:** The US DOT must play a stronger lead agency role in advancing process improvements and in advocating responsible transportation projects. This can be achieved legislatively by clarifying DOT responsibilities in defining the purpose and need for transportation projects, in determining the legitimate range of transportation alternatives to be considered, in approving transportation related technical methodologies, in establishing and enforcing reasonable project schedules, including review and comment periods, and in orchestrating the involvement of appropriate agencies.
- **Streamlined Planning and Environmental Regulations:** The US DOT should be directed to transform its planning and environmental regulatory approach from an overly complex and prescriptive framework to a more concise, flexible, performance-based combination of rulemaking and guidance that focuses on outcomes. Opportunities to integrate planning and environmental requirements should be offered, but not prescribed, and should be predicated on the notion that guidance derived from duly certified and valid long range transportation planning processes bearing upon such issues as transportation corridor purpose and need, mode selection, and range of alternatives will be acknowledged and have standing in subsequent environmental stages. Duplicative corridor studies that have no standing under NEPA should clearly be eliminated as a requirement.

- Section 4(f) Reform : Legislation is needed in addition to administrative actions that US DOT might advance to address Section 4(f) problems that have become a major source of delay. The needed reforms include:
  - Section 4(f) Finding of No Significant Impact (FONSI) designation to streamline those actions where impacts to 4(f) resources are determined to be insignificant
  - Integration of 4(f) alternatives as part of the NEPA process
  - Review of “feasibility” and “prudence” in a manner that permits weighing the balance and proportionality of diverse impacts
  - Satisfactory completion of the Section 106 Historic Preservation process for historic properties should suffice for 4(f)
  - Exclude 4(f) applicability to private properties unless they are National Historic Landmarks or fall under some form of legal protective covenant
  - Exclude the consideration of Interstate highways themselves as being historic and falling under Section 4(f) and 106 requirements
    - Decision/dispute Resolution Process: US DOT should be expected to implement a simplified, responsive and effective decision and dispute resolution process to be invoked at the request of a Governor and led by the Secretary or his designee.
    - Time Limits to Legal Challenges: A reasonable time limit should apply to the filing of legal actions that challenge the environmental process (90 days seems reasonable).
    - Delegation of Authority: US DOT and Federal environmental resource agencies should be required to implement programs to delegate authority to willing and able State counterpart agencies for EA/FONSI and Categorical Exclusion projects, using a post-audit quality assurance process to ensure adherence to Federal requirements. Environmental agencies should conserve their limited resources to focus attention upon the relatively small number of projects that involve significant environmental issues. Various models exist for implementing the delegation process, such as Section 404 wetland permitting in New Jersey and Michigan, and Section 106 historic preservation procedures in Vermont. These have been described in a recently completed AASHTO requested study funded under the NCHRP.

(3) *Hold Agencies Accountable*

- Annual Report: Congress should require annual reports on the progress that is being made to achieve a streamlined environmental review and approval process that does not weaken environmental protections. The report should include discussion of process changes and results. Results should be measured in two ways.
- Milestone Durations: Similar to the recent report by FHWA on the time required to process EIS's over the past 3 decades, a monitoring and reporting framework should be established to determine trends for time required in achieving key milestones, classified by type of project and type of environmental document
- Interagency Cooperation: Building upon a prototype process being developed by the Gallup Organization under contract to FHWA, a peer review “report card” should be implemented to gauge the degree to which congressionally endorsed expectations are, in fact, being fulfilled by individual transportation and environmental agencies. If done well, this approach can foster working relationships in which environmental stewardship as well as environmental streamlining will flourish.
  - Project Reports: Reports on a project basis should be filed by US DOT with Congress when certain milestone criteria have not been achieved (by a wide margin) and also in connection with designated transportation projects of national significance.

Mr. Chairman, the need for fixing the environmental review and approval process is real. The problem has been building for decades. Solutions are needed now, or urgently needed projects will continue to be bogged down. The result will be lives lost, a weakened economy, less time with our families, fuel wasted, expensive and undependable delivery of freight, and increased air pollution.

On behalf of the transportation community we would urge the committee to support legislation that will address the problem in a meaningful and effective way. We believe that the objective articulated by the environmental community to “expedite project delivery without sacrificing environmental protection” is both laudable and achievable—but it will require a 3-pronged legislative approach that clarifies expectations, transforms processes, and holds agencies accountable to achieve success.

Thank you for the opportunity to testify.

## ATTACHMENTS

*Expectations of Transportation Agencies in Expediting Project Delivery*

- Advance reasonable projects that reflect environmental sensitivity
- Ensure that the purpose and need are well established and compelling
- Consider alternatives that reflect environmental concerns
- Treat environmental concerns on a par with transportation issues
- Foster an open and interactive project development process
- Encourage early involvement by environmental resource agencies
- Keep unavoidable environmental impacts to a bare minimum
- Develop context sensitive solutions with environmental agency as well as public involvement
- Provide effective mitigation and reasonable enhancements to temper unavoidable impacts
- Adhere rigorously to environmental commitments and monitor effectiveness

*Expectations of Environmental Agencies in Expediting Project Delivery*

- Uphold and implement environmental laws and regulations
- Recognize the need for environmentally sensitive transportation projects
- Participate early and effectively in transportation project development
- Demonstrate a spirit of cooperation
- Offer constructive and problem-solving ideas that address purpose and need
- Reflect a sense of urgency about meeting schedules
- Implement concurrent processing and a performance approach to permitting
- Apply clear and consistent interpretations of legal and regulatory requirements
- Consider common sense, balance and proportionality consistent with legal and regulatory requirements
- Avoid unnecessary duplication by sharing responsibilities with capable and willing State counterparts

*Environmental Stewardship Is: (AASHTO)*

- Improving environmental conditions and quality of life when possible, not just complying with regulations
- Careful management of environmental resources and values through partnerships among public and private entities.
- Attitude, ethics, and behavior by individuals.
- Wise choices based on understanding consequences to natural, human-made, and social environment.
- Fulfilling responsibilities as trustees of the environment for succeeding generation, moving toward a cost-effective and environmentally sustainable future.
- Integrating environmental values with partners within all transportation work as a "core business value".

*Environmental Stewardship Works Toward: (AASHTO)*

- Agency-wide commitment to environmental excellence
- Improved public and regulatory attitudes
- Improved transportation programs and services
- Achieving TEA-21 streamlining goals
- Developing an environmental stewardship ethic
- Overcoming barriers

---

STATEMENT OF CHARLES HALES, TRANSIT PLANNING PRINCIPAL, HDR, PORTLAND,  
OREGON

Mr. Chairman, members of the Committee on Environment and Public Works. My name is Charles Hales. I am the Transit Planning Principal with the engineering firm of HDR in Portland, Oregon. HDR is a member of the American Council of Engineering Companies, and supports their efforts to improve project delivery. I am pleased to testify today as a former elected official and as a principal of HDR. In both of those capacities, I have worked collaboratively with a broad coalition of environmental and smart growth organizations. Some of them have endorsed my testimony here today and have supplied supporting materials for the points I will make here; those include: The Surface Transportation Policy Project, Environmental Defense, The Sierra Club, The National Coalition to Defend NEPA, Defenders of Wildlife and the Natural Resources Defense Council.

Thank you for this opportunity to advise you on your work on Federal policy affecting transportation project delivery. In both my public service as Portland's Transportation Commissioner and in my role now in the private sector, building

public works—particularly transportation projects—has been and is the focus of my work.

Twelve years ago, I was working in the development and construction industry. In 1991, I made the decision to run and was elected to the office of Portland City Commissioner. I did so because I believed that Portland was about to experience a major wave of growth and change, and I wanted to help steer our course through the perils and opportunities that growth brings. As it turned out, I was correct in that prediction; Portland boomed in the 1990's, and I was involved in the construction of over \$2 billion worth of infrastructure. I'm happy to report that we have grown well. Money Magazine and others share my opinion when they call us America's Most Livable City.

My experience might prove instructive as you consider issues involved with the reauthorization of the Transportation Equity Act for the 21st Century (TEA-21), and ideas for "streamlining" the planning process required under this law or the National Environmental Policy Act (NEPA). What we have found is a set of principles that have been validated in project after project:

(1) Public works projects are "place-makers." This is true whether the project is a highway, a transit line, a park, a community center, or a police station. To pretend otherwise is . . . well, to pretend. When we build a freeway interchange or light rail line, we exert a massive influence on the character and destiny of the land around the project. A lot of unlovely places have been created and a lot of infrastructure money wasted by ignoring this principle. Suburban sprawl results from the compartmentalized, rather than the integrated approach to land use and development planning in one realm, while the provision of public works happens in another. In an era when infrastructure dollars are limited (actually, is there ever a time when this isn't true?) and quality of life is the most important driver of local economic development, designing projects which support the "place" is the only prudent investment strategy for public funds. The alternative strategy, and one, which is far too common, is building public works projects, and letting the "place" spontaneously develop around them. Sprawl, congestion and other unintended consequences are the predictable result.

(2) Land use planning must lead project engineering. The "purpose and need" stage of NEPA is applied common sense. Before we build a project, we need to ask what our goals are and how a proposed "improvement" will advance those goals. We need to honestly consider all the alternatives. We need to examine the consequences and side effects of the proposed improvement. If we don't we will not leverage the benefit of the infrastructure investment as we should, and we will likely create problems that will be worse and more expensive to solve than the one that we just "solved." The classic example of this phenomenon is the much-repeated fallacy of the past 50 years: expanding highways to alleviate traffic congestion. We don't need to be subtle about this issue anymore: building highway capacity without integrating transportation planning and project design with regional and local land use planning is counterproductive.

Lewis Mumford warned us more than 50 years ago when he said, "Americans will soon have every facility for moving around the city, and no reason whatsoever to go there." Transportation investments which serve a well-thought-out land use plan pay dividends; those which take an engineering-only approach cause terrible side-effects or at least, don't perform very well or very long. My company summarizes the integrated approach in three words: community, mobility and environment. It is sound public policy to respect all three.

(3) Bring all stakeholders and points of view to the table. As I mentioned, I've built a lot of infrastructure and now, as a principal with HDR, I look forward to being involved with building a lot more. For those projects to succeed, all who have a stake in them must inform their concept and design. The "good old days", in which a Robert Moses in New York or in my State, a Glenn Jackson could locate and authorize a project by fiat, are gone. The public, with good cause, won't stand for it. Similarly, Federal, State, regional and local agencies have their responsibilities under law, and they are bound to carry them out.

An open, inclusive process of considering all the issues involved in a major infrastructure investment is legally, pragmatically, and politically required.

The good news I have to report, Mr. Chairman, is that these principles are not simply lofty ideals. They are standard practice in my community, and as a result Portland is widely considered to be one of America's most livable cities.

My community's experience shows that the best way to "streamline NEPA" is to go through the planning process right the first time and only once. We have made a sustained commitment to comprehensive land use and transportation planning. We work collaboratively to integrate the requirements and address the concerns of Federal and State regulatory agencies in our plans and projects. We then ask those

agencies to sign off early on purpose and need. We base our project priorities on the plans. We are thrifty in our expenditure of public moneys. We build transportation projects on time and on budget. And our transit projects in particular outperform their projections.

Our experience allays some concerns about environmental review:

(1) It is not my experience that environmental groups and NIMBY's (not-in-my-back yard neighborhood groups) will exploit environmental review and tie needed projects up for years. If there is any place in America where this should be true, it is Portland, Oregon. Our State is loaded with environmentalists (remember the book "Ecotopia"?), and our city is populated with neighborhood activists. In fact, Portland actually goes so far as to provide funding and staff support for neighborhood associations and gives them a free land use appeal right for discretionary land use decisions. Some might expect this to be a recipe for paralysis.

Yet the contrary is true. In the 10 years I served as a Portland City Commissioner and as Portland's representative to the MPO for our region, we built dozens of major highway, transit, sewer, and water projects, and other major facilities. In almost no case . . . allow me to repeat that . . . in almost no case have projects been held up by appeals, litigation or multiple trips through the NEPA process or through State or local review. I'm proud of that track record; I believe that I made good decisions. I must admit, though, that I was not infallible. Some appeals are meritorious; they are part of the checks and balances system, and their scrutiny accomplishes a legitimate purpose of these laws: avoiding bad projects, or reshaping them to be good ones.

Similarly, in 10 years of rapid growth and dramatic change in the built landscape of my city, only citizen blocked a handful of private development projects in Portland or neighborhood appeals. This paradox is explained by the fact that we have taken the coordination, public involvement and alternatives analysis goals of NEPA and TEA-21 to heart. We plan, we work for consensus, and we follow our plans. We are a case study that demonstrates that good administrative practice gets good treatment under the Federal requirements. We demonstrate that even in a city with Endangered Species swimming through its downtown, Federal and State agencies can reach agreement and construction of public works and private development can continue apace.

(2) Environmental review does not need to hold up projects or add significantly to their costs. If my community's citizens are "green," they are also "tight." Oregonians are frugal, and expect frugality in public expenditure. In my experience, this expectation is more likely to be met with a truly good faith effort to follow these planning and alternatives analysis requirements. To borrow a popular phrase, planning is expensive and time-consuming, but not compared to the alternative.

(3) These laws and regulations don't foster internecine warfare among public agencies; done right, environmental review reduces interagency conflict. The Oregon DOT, like most State DOTs, is still primarily a road and highway organization. The ODOT staff has, however, incorporated this planning-based approach in their work. They, in return, expect counties and municipalities to work collaboratively with them; for example, we are transitioning some former State highways located in urban areas into locally managed streets. These projects don't require environmental review, but the cooperative working relationships forged in environmental review makes these other "win-win" agreements possible.

Environmental review requirements, well integrated and well administered, help assure that good projects are advanced with public support, avoiding adverse impacts and mitigating unavoidable impacts. This translates into public acceptance and smoother permitting. Indeed, efforts to expedite project delivery are likely to fail and work against sound decisionmaking if they set arbitrary time limits, curtail public and judicial review, limit consideration of alternatives and determinations of project purpose and need, or allow use of project segmentation and analysis models insensitive to induced traffic and other indirect impacts. Such approaches are likely to spur increased conflict and reduced public support for transportation funding and programs.

It's not possible to mandate cooperation, consensus and trust. Trying to push projects forward by the means I just listed will fail because in a complex environment like the design and permitting of a major public works project, cooperation, consensus and trust are necessities, not niceties. Likewise, it's not possible to measure a transportation project's success on transportation or engineering terms alone, so evaluation measures, if the committee pursues them, should evaluate a project's affect on a community's goals and plans. Land use results—i.e. the places where Americans live their lives—are not a "secondary effect."

When I was first contacted about testifying before your committee, I was reluctant to accept the invitation. I knew that the subject was streamlining the approval process for transportation projects, and that the committee would, necessarily, confer with experts on the specific language of Federal law and the regulations, both current and draft, which have been promulgated to implement these laws. My reticence was based on my understanding that I am not one of those experts and, more powerfully, that I have spent 10 years governing a growing city and building major infrastructure projects without having to think much about NEPA or the planning requirements of TEA-21.

That, ultimately, is my message and why I am here after all: if you take the commonsense planning, coordination and public involvement requirements of these Federal policies seriously, they don't get in your way. If you are committed to the spirit of these laws, the particulars are relatively unimportant. And as a local or State official, your time is much better spent in genuine consensus-building and integrated planning than in complaining about the regulations or defending against citizen suits. Our experience is that if citizens participate in the planning process and have a clear buy-in and responsibility for commitment, there are few suits. The plan is the community's plan. I should also emphasize that one does not need to adopt Portland's approach, or anyone else's; a community is free to plan its own future, not imitate anyone else's approach in order to get these beneficial results.

I'm not simply saying that if one plans, coordinates and communicates, the Federal regulatory requirements are not so bad. The results can be better than that. A community which first, engages in real, comprehensive, and sustained land use planning, and which makes infrastructure decisions consistent with that plan, and conducts a genuine and genuinely open process of alternative analysis not only gets through the environmental review process with a minimum of difficulty; the people of this community own the results of the planning process and get to live in a better place.

That is the opportunity that environmental review offers to States and localities. I hope that this committee, in its work on the next transportation bill, encourages us all to get serious about taking it.

Thank you. I would be pleased to answer any questions.

ATTACHMENTS:

- Attachment 1, "Expediting Project Delivery Without Sacrificing Environmental Protection," summarizes broadly supported principles for accomplishing improved project delivery and better environmental stewardship through better administration of the planning and project review process. These principles are fully consistent with the approach we have followed to achieve success in Portland.
- Attachment 2, "Questions and Answers About Environmental Streamlining," provides important background on the debate over streamlining vs. stewardship and transportation project delivery, including information about sources of project delay identified by AASHTO and FHWA studies.
- Attachment 3, "The Most Environmental Impact: Forests, Highways and Army Corps of Engineers," shows the share of agencies issuing Environmental Impact Studies (EISs) by year and the trends in number of EISs filed each year. These charts show that transportation still accounts for a large share of projects that are so environmentally significant as to trigger a full EIS, but that the number of EISs filed is actually declining slightly overall.
- Attachment 4, "Environmental Streamlining: Better Decisions from Integrated Transportation Plans/Reviews? Or Steam-rolling for Destructive New and Bigger Highways and Airports?," summarizes key talking points developed by Environmental Defense to explicate the current public policy issues in this area and offering ideas for what streamlining should and should not seek to accomplish if it is to protect the environment and expedite project delivery. These are principles that are highly consistent with our experience in Portland and I commend them to your attention.
- Attachment 5, "Comments by Environmental Defense on Proposed Metropolitan Planning and NEPA Streamlining Rules," provides important background on the statutory requirements for regional planning in TEA-21 and how these relate to NEPA requirements, Title VI of the Civil Rights Act, and other elements of the Federal highway law that require consideration of the adverse effects of air pollution prior to the approval of plans and specifications for a highway, as well as measures to eliminate or minimize the adverse effects of air pollution. The approaches advocated in these comments are consistent with Portland's efforts to integrate transportation, growth management, and air quality efforts.

- Attachment 6, “Letter to Transportation Secretary Rodney Slater from Rep. John Lewis and four other Members of Congress, December 2000”, calls for U.S. DOT to adopt a national mobility goal to measure the performance of metropolitan transportation system and ensure equal access to employment opportunities and public facilities through regional transportation plans and timely progress toward this goal through transportation improvement programs. Adoption of this goal would be consistent with making our communities better places to live, with greater transportation choices, with a transportation system that delivers effective performance for all citizens, fostering a sense of place and a sense of region built on access to opportunities.

STATEMENT OF DEFENDERS OF WILDLIFE, NATIONAL WILDLIFE FEDERATION AND THE HUMANE SOCIETY OF THE UNITED STATES, WASHINGTON, DC.

Our organizations submit the following testimony to the public record on behalf of our millions of members and supporters, who support strong environmental protections as well as sustainable transportation solutions.

There is no question that America’s transportation infrastructure is imperative to our mobility, productivity and success. However, it has also had significant impacts on ecosystems of the U.S. Four million miles of roadways in the U.S. cover an area approximately the size of the State of South Carolina, and impacts beyond the road surface extend to as much as 20 percent of the total land area. Unfortunately, roads have not always been planned wisely, leaving a destructive B and permanent B footprint on landscapes and wildlife habitat. That is why it is imperative that transportation decisions are made after careful consideration of not only the immediate need and purpose, but also the long term and cumulative effects. In addition, transportation decisions cannot be made in a vacuum, but only after consultation with all stakeholders and interested parties.

Our primary concern with environmental streamlining, as some have proposed it, is simple and transparent: the potential for weakening environmental considerations required by the National Environmental Policy Act (NEPA). NEPA is the foundation for environmental protection in this country, and is largely credited for the level of environmental quality we enjoy today. When the 91st Congress enacted NEPA, the intent was clearly to declare environmental protection a national priority B not to delay projects, or pit agency against agency. The NEPA review process was intended to ensure that the actions of Federal agencies reflect the nation’s dedication to environmental quality. It was not intended to be an assembly line of meaningless paperwork in pursuit of a mindless rubber-stamp approval. However, when agencies perceive the process as a nuisance, it not only contributes to the added costs and delays, it is an aberration of congressional design and a miscarriage of the trust and responsibility endowed upon these agencies by the American people.

Rather than advocating solutions that would shortchange critically needed environmental reviews required by NEPA, we believe that administrative actions that have been adopted in response to streamlining provisions in TEA-21 are fundamentally working. Some State streamlining activities, including early involvement of natural resource agencies in highway planning, coordination with existing natural resource planning efforts and enhanced application of mitigation approaches, can further reduce project completion time and do so without the need for additional legislation.

*TEA-21’s Streamlining is Working*

Past streamlining debates resulted in the inclusion of an environmental streamlining provision in the Transportation Equity Act for the 21st Century (TEA-21). This provision, Section 1309, mandates that the Department of Transportation (DOT) work to reduce delays in project delivery while maintaining environmental protection: AThe Secretary shall develop and implement a coordinated environmental review process for highway and mass transit projects.<sup>1</sup>

Since then, great strides have been made in expediting the environmental review process. A report to Congress by the Federal Highway Administration (FHWA) in February 2002 examined States’ efforts in carrying out Section 1309. The report found significant progress across the country, in particular that Athrough trial and error, innovation, testing, and early lessons learned, much of the transportation community has adopted a new way of thinking to get beyond the usual environ-

<sup>1</sup>Transportation Equity Act for the 21st Century, Pub. L. No. 105-178, 191309.

mental process bottlenecks.<sup>2</sup> Among other findings were that every State has adopted or initiated a process for streamlining that clarifies, amends, or re-invents the project development process. Nearly half of the States (24) have focused their efforts on integrating planning and NEPA activities. Forty-one States have some level of delegated authority for historic resources permitting.

Streamlining, as set out in TEA-21, is working. Improved project delivery is already being realized, simply by improving the process. One measure of that achievement, cited by FHWA, is that the length of time spent processing environmental documents has declined by 8 months between 1999 to 2001.

#### *Environmental Reviews Are Not Causing Most Project Delays*

There is no doubt that some transportation projects stretch far beyond their projected timeframe for delivery. However, there is little evidence to suggest that environmental regulations are the cause of most project delays. Three new studies, from the American Association of State Highway and Transportation Officials (AASHTO) and FHWA, quantify the impact that the NEPA process has had on transportation projects. The results of these studies call into question the complaints that environmental regulations are the source of delays, and provide further evidence that efforts to reduce review time are successfully under way.

Federal Highway Administration published two reports on transportation project delay in late 2000. The first study examined 89 projects requiring an environmental impact statement (EIS) that have yet to complete the review process after five or more years. Contrary to popular belief, the most common reason for delay was lack of funding or low priority (32 percent), local controversy (16 percent), or the inherent complexity of the project (13 percent). These issues, as well as changing or expanding the scope of the project (8 percent) far outweigh environmental review as causes of project delay.<sup>3</sup>

The second study, conducted by the Louis Berger Group, set out to establish a baseline of the length of time required to comply with the NEPA process. The study found that the average (mean) time required to complete the NEPA process was about 3.6 years. The median time was only 3 years which in this case is a better indicator because of outliers in the sample. It is important to note that the time required to complete the NEPA process is not necessarily additive to the project planning and design process, and may be coincident with other phases of the project.<sup>4</sup>

A third study, commissioned by AASHTO and conducted by the consulting firm TransTech Management, looked specifically at the causes of delay for projects receiving a Categorical Exclusion or requiring an Environmental Assessment. According to AASHTO's survey of 32 State DOTs, the vast majority of transportation projects require only a Categorical Exclusion (CE). In fact, the AASHTO study found that fully 92 percent of environmental documents processed by State DOTs are CEs. Environmental assessments (EA) make up 7 percent, with Environmental Impact Statements (EIS) rounding out the sample at less than 2 percent.<sup>5</sup>

#### *Consideration of Natural Resources Can Expedite Projects*

We fully support efforts to reduce costly delays in transportation projects to the extent that they do not compromise environmental safeguards. We emphasize several measures which can expedite project delivery while enhancing natural resource conservation. Each of these measures is authorized in TEA-21, and many States are already taking advantage of the benefits.

##### *1. Early, continued, substantive and supported involvement by regulatory agencies*

Many projects are delayed because they are planned and designed before consultation with regulatory agencies. If regulatory agencies are involved from the beginning, they can steer DOTs clear of problems early. We support the facilitation of agency representation at the early stages of project design. Early agency consultations can identify decision points and potential conflicts before considerable time and resources have been committed to a particular plan of action which may later be discovered to be unacceptable or inconsistent with existing standards.

<sup>2</sup>Federal Highway Admin., Highway and Transit Environmental Streamlining Progress Summary (Feb. 2002).

<sup>3</sup>FHWA. Reasons for EIS Project Delays. September 2000.

<sup>4</sup>The Louis Berger Group, Federal Highway Admin., Evaluating the Performance of Environmental Streamlining: Development of a NEPA Baseline for Measuring Continuous Performance (2000).

<sup>5</sup>American Ass'n of State Highway and Transp. Officials, Environmental Process Streamlining: A Report on Delays Associated with States' Categorical Exclusion and Environmental Assessment Processes (Oct. 2000).

NEPA reviews are but one of many responsibilities of Federal land and resource management agencies. Delays are often the result of inadequate funding and understaffed field offices. When agencies are fiscally restrained, their ability to respond to applicants' requests is likewise restrained. TEA-21 significantly increased transportation funding, resulting in an increase in transportation projects requiring environmental review. TEA-21 did not, however, increase funding to the agencies charged with reviewing and permitting these projects. The experience of the U.S. Fish and Wildlife Service (USFWS) provides an excellent example. Between 1998 and 2000, USFWS experienced a 77 percent increase in transportation project workload. However, since 1994 the USFWS budget and personnel levels for transportation technical assistance have increased only 1 percent.

Section 1309 allows transportation funds to be used to reimburse permitting agencies for staff hours and expenses, so that these agencies can dedicate staff time to reviewing proposed road projects early on and in a timely manner. Such reimbursement is an efficient investment that prevents delays in project delivery and increases natural resource conservation. To date, several States have taken full advantage of the reimbursement provision and are reaping the streamlining benefits of early, continued and supported involvement.

### *2. Incorporate conservation into transportation planning*

Substantial progress can be made in reducing project delays by coordinating conservation planning and transportation planning. Several States, including Florida and Massachusetts, have undertaken comprehensive wildlife conservation plans which identify the most important habitats for sustaining the full complement of species in the State into the future. Under the State Wildlife Grants program in the FY2002 Interior Appropriations Act, States are now receiving Federal funding that can be used to develop these State plans. State natural resource agencies are awarded formula-based grants with the requirement that it complete a comprehensive wildlife conservation plan by 2005. Transportation plans and projects will have reduced impacts on wildlife and proceed more smoothly if they take these conservation plans into account by avoiding impacts to ecologically important lands and directing mitigation funds to the preservation of those lands.

Florida's Efficient Transportation Decision-Making (ETDM) process is an example of coordination of conservation plans with transportation plans. ETDM was developed as a streamlining program, in which transportation plans, very early on in the process, are evaluated in terms of their environmental impacts, including impacts to the State's strategic habitat conservation areas. The ETDM system also enables more rapid permitting by moving the permitting to earlier stages of the process.

### *3. Advance programmatic mitigation or conservation banking*

Better coordination of conservation plans and transportation plans can allow transportation agencies to avoid and minimize impacts to biodiversity. These conservation plans can also inform mitigation efforts, when impacts to remaining natural areas cannot be avoided. Current mitigation practice, however, is not only time-consuming and expensive for action agencies; it may not always provide the best return for resource agencies. Most mitigation is done on an onsite, project-by-project basis, which often misses important indirect and cumulative impacts. On-site mitigation is often necessary, but project-by-project mitigation can result in isolated patches of protected land that are not ecologically viable and are more vulnerable to continued development.

We support innovative efforts by State DOTs to conduct advance programmatic mitigation and conservation banking for endangered species. In these efforts, State DOTs acquire or "bank" large blocks of conservation lands, from which they can extract conservation credits for those projects deemed to have negative environmental impacts. Mitigation funds are used most effectively when directed toward the acquisition of lands identified as ecologically important in State or eco-regional conservation plans. We support wider use of conservation mitigation and banking as part of expediting project delivery, with appropriate regulations and guidance, and with assurances proper sequencing would not be compromised. We believe that this approach will save DOTs considerable time and expense, while implementing State and ecoregional conservation goals.

In closing, we reiterate that implementation of TEA-21 has largely resulted in faster project delivery and meaningful streamlining that still preserves environmental standards. Our points of emphasis above (early involvement, coordination with conservation planning, and advance mitigation) are all authorized and supported in TEA-21. Major legislative changes in streamlining are not needed. Finally, we urge the committee to embrace the reformative ideals of Section 1309

without losing sight of the original intent of NEPA: to protect and preserve our natural heritage.

---

STATEMENT OF THE AMERICAN SOCIETY OF CIVIL ENGINEERS

The American Society of Civil Engineers (ASCE) wishes to express its views on the environmental streamlining provisions in section 1309 of the Transportation Equity Act for the 21st Century (TEA-21) and to recommend some simple adjustments to section 1309 to improve the functioning of the streamlining process, as well as the larger issue of project delivery related to surface transportation projects.

ASCE was founded in 1852 and is the country's oldest national civil engineering organization. It represents more than 125,000 civil engineers in private practice, government, industry, and academia who are dedicated to the advancement of the science and profession of civil engineering. ASCE is a non-profit educational and professional society organized under Part 1.501(c)(3) of the Internal Revenue Service rules.

As you know, Congress enacted section 1309 in 1998 to remove the procedural bottlenecks in the environmental review process for Federal-aid highway projects, many of which take years to complete. The Act directed the Federal Highway Administration (FHWA) to issue new regulations to implement the streamlining program. The FHWA proposed regulations under section 1309 in May 2000. The regulations have not been made final as of this writing.

ASCE opposed the FHWA's streamlining regulations at the time that they were proposed. We believed then—and continue to believe—that the proposed regulations were faulty because they failed, at a minimum, to establish firm deadlines for the completion of the Federal portion of the transportation streamlining process and they appeared to clear the way for pilot projects in contravention of the intent of Congress.

Because the FHWA has estimated that the environmental review process still averages approximately 5 years to complete, ASCE recommends that the committee provide more detailed guidance to the FHWA on the implementation of section 1309. Specifically, we urge the committee to add binding deadlines to the environmental review process.

Additionally, ASCE considers section 1309 to be flawed because it does not require agencies other than the FHWA to comply with the Act's streamlining requirements. This failure should be remedied in the reauthorization of TEA-21.

ASCE advocates two important steps that government can take immediately that would profoundly enhance our ability to preserve and improve our infrastructure. First, revamp and simplify the regulatory regime affecting infrastructure planning and implementation to be less prescriptive and confining and more performance based and flexible. Second, reform the rules to be more concise, outcome oriented, plainly written, common sense oriented and, supplemented by best practice models that encourage continuous improvement. Specifically, ASCE supports concurrent reviews, and the designation of a lead agency to manage the process.

Few will disagree that it takes too long to deliver major projects. Recent studies by FHWA have documented that the environmental process alone takes twice as long as it used to, due in large part to expanded environmental requirements. While major efforts are focused on speeding up that process, it is clear that there are other factors contributing to the extended timeframe required to navigate from early planning to completion, a timeframe often measured in decades.

With structural, safety and service issues spurring the need for renewing, replacing and expanding an aging infrastructure, the nation's long-term economic vitality and quality of life will be affected by whether project planning, financing, and delivery systems can keep up the necessary pace.

It is clear that processes considered adequate over the past 50 years are inadequate to meet the needs of the next half-century. And compounding the problem during a period of generally expanding financial resources has been a depletion of human resources as measured by numbers and experience within organizations responsible for deployment.

The answer lies in reinventing processes for planning, financing, and delivery of infrastructure, and doing so in a way that retains and builds upon vitally important and successful principles and practices. For example, improving the environmental review process cannot be at the expense of protecting and enhancing environmental quality. And streamlining project delivery cannot be at the price of weakening market forces or reducing competition.

*Procurement of A/E Services*

ASCE believes that the selection of professional engineers as prime consultants and subconsultants should result from competition based on the qualifications best suited to complete the work successfully. Cost of engineering services, while important and meriting careful negotiations and performance accountability, should be secondary to professional qualifications.

Accordingly, ASCE supports qualifications-based selection (QBS) procedures such as those specified by the Brooks Architect-Engineers Act of 1972, 40 U.S.C. 541 et seq., and the American Bar Association's Model Procurement Code for State and Local Governments for the engagement of engineering services. This process has withstood the test of time.

Traditionally, Federal Government procurement procedures properly have emphasized awarding contracts to the lowest bidder, or using price as a dominant factor. For many goods that the government purchases — paper, office equipment, desks, even construction services — this process serves the government and the taxpayer well. Specifications can be written, products can be inspected and tested, and safeguards can be built in to assure saving money.

Sometimes, however, agencies mistakenly assume professional architecture, engineering, surveying and mapping services fall into this category. Unfortunately, the assumption ignores the increase in costs to administer the preparation of detailed scopes of work and bid specifications, to evaluate numerous bids, and to remedy serious consequences of unprofessional A/E related services.

Quality, therefore, should always be the primary focus in the competition for architectural, engineering and surveying and mapping procurement. Only after high-quality performance is ensured should the focus turn to the contract price. That is exactly what QBS provides. The Brooks A/E Act ensures that specialized skills and technologies are evaluated properly and are not overlooked. At the same time, the Act also ensures that small businesses are able to compete on an even basis with large A/E design firms. In this manner, the government benefits from direct control of both the quality of the services and the project's development.

The Brooks A/E Act applies to the acquisition of all architectural and engineering services, including services of an architectural or an engineering nature that are logically and justifiably to be performed by architects or engineers. The language of the Brooks Act governs the broadest range of A/E design services, i.e., any that are performed by architects or engineers and those that may be. Nothing in the Act limits or restricts the application of QBS procedures to some architectural or engineering services while exempting others.

The use of negotiated procedures directs the focus of procurement activity where it should be, on the quality of the professional A/E services specifically suited to a given contract.

All competitors must submit their qualifications to the procuring agency; the agency assesses the relative expertise of the competing firms; and the most qualified firm is selected for the particular procurement. Such procedures produce a more cost effective design, map and related professional service than can be achieved under price bidding procedures.

The qualifications-based selection law was codified to protect the interest of taxpayers. It is Federal law because over the life of a project, engineering-related services account for less than one-half of 1 percent of total costs. Yet these important services play a major role in determining the other 99.5 percent of the project's "life cycle costs," such as construction, operation, and maintenance.

This process has been so successful at the Federal level that it is recommended by the American Bar Association in its model procurement code for State and local government. Forty-two States have enacted their own qualifications-based selection laws for architecture, engineering, surveying and mapping services based on the Federal model. Others use it as a standard procedure. Today, no State has a specific law requiring bidding of these services.

For design build procurement, ASCE strongly supports the use of the two-phase competitive source-selection process required by the Federal Acquisition Reform Act of 1996, 41 U.S.C. 253m, for design-build contracts awarded by government agencies. The design-build team must be selected using the modified QBS criteria specified by the Act.

*Expedited Project Delivery*

If we are to meet the needs of a future where infrastructure investments and improvements are increasingly large and complex, where requirements are more diverse, where time is of the essence, then it is essential to continue to improve and expand creative and innovative approaches that provide the broadest array of necessary tools. It is essential that future legislation and policies be supportive of this

goal. Alternative delivery systems such as fast-tracking, design/build, CM/GC and program management have taken root, again where large-scale projects and programs exceeded the capability or effectiveness of established processes.

Thank you for considering our views. If ASCE can be of any assistance to the committee in the debate over section 1309 or other aspects of the reauthorization of TEA-21, please do not hesitate to contact Brian Pallasch, Director of Government Relations, in our Washington Office at (202) 789-2200 or by e-mail at <pallasch#asce.org>.

**Statement of**  
**The American Society of Civil Engineers**  
**on**  
**Project Delivery and Environmental Stewardship**  
**Before the**  
**Senate Committee on Environment and Public Works**  
**September 19, 2002**

The American Society of Civil Engineers (ASCE) wishes to express its views on the environmental streamlining provisions in section 1309 of the Transportation Equity Act for the 21<sup>st</sup> Century (TEA-21) and to recommend some simple adjustments to section 1309 to improve the functioning of the streamlining process, as well as the larger issue of project delivery related to surface transportation projects.

ASCE was founded in 1852 and is the country's oldest national civil engineering organization. It represents more than 125,000 civil engineers in private practice, government, industry, and academia who are dedicated to the advancement of the science and profession of civil engineering. ASCE is a non-profit educational and professional society organized under Part 1.501(c)(3) of the Internal Revenue Service rules.

As you know, Congress enacted section 1309 in 1998 to remove the procedural bottlenecks in the environmental review process for federal-aid highway projects, many of which take years to complete. The Act directed the Federal Highway Administration (FHWA) to issue new regulations to implement the streamlining program. The FHWA proposed regulations under section 1309 in May 2000. The regulations have not been made final as of this writing.

ASCE opposed the FHWA's streamlining regulations at the time that they were proposed. We believed then – and continue to believe – that the proposed regulations were faulty because they failed, at a minimum, to establish firm deadlines for the completion of the federal portion of the transportation streamlining process and they appeared to clear the way for pilot projects in contravention of the intent of Congress.

Because the FHWA has estimated that the environmental review process still averages approximately five years to complete, ASCE recommends that the Committee provide more detailed guidance to the FHWA on the implementation of section 1309. Specifically, we urge the Committee to add binding deadlines to the environmental review process.

ASCE—September 19, 2002—page 2

Additionally, ASCE considers section 1309 to be flawed because it does not require agencies other than the FHWA to comply with the Act's streamlining requirements. This failure should be remedied in the reauthorization of TEA-21.

ASCE advocates two important steps that government can take immediately that would profoundly enhance our ability to preserve and improve our infrastructure. First, revamp and simplify the regulatory regime affecting infrastructure planning and implementation to be less prescriptive and confining and more performance based and flexible. Second, reform the rules to be more concise, outcome oriented, plainly written, common sense oriented and, supplemented by best practice models that encourage continuous improvement. Specifically, ASCE supports concurrent reviews, and the designation of a lead agency to manage the process.

Few will disagree that it takes too long to deliver major projects. Recent studies by FHWA have documented that the environmental process alone takes twice as long as it used to, due in large part to expanded environmental requirements. While major efforts are focused on speeding up that process, it is clear that there are other factors contributing to the extended time frame required to navigate from early planning to completion, a time frame often measured in decades.

With structural, safety and service issues spurring the need for renewing, replacing and expanding an aging infrastructure, the nation's long-term economic vitality and quality of life will be affected by whether project planning, financing, and delivery systems can keep up the necessary pace.

It is clear that processes considered adequate over the past 50 years are inadequate to meet the needs of the next half-century. And compounding the problem during a period of generally expanding financial resources has been a depletion of human resources as measured by numbers and experience within organizations responsible for deployment.

The answer lies in reinventing processes for planning, financing, and delivery of infrastructure, and doing so in a way that retains and builds upon vitally important and successful principles and practices. For example, improving the environmental review process cannot be at the expense of protecting and enhancing environmental quality. And streamlining project delivery cannot be at the price of weakening market forces or reducing competition.

#### **Procurement of A/E Services**

ASCE believes that the selection of professional engineers as prime consultants and subconsultants should result from competition based on the qualifications best suited to complete the work successfully. Cost of engineering services, while important

ASCE—September 19, 2002—page 3

and meriting careful negotiations and performance accountability, should be secondary to professional qualifications.

Accordingly, ASCE supports qualifications-based selection (QBS) procedures such as those specified by the Brooks Architect-Engineers Act of 1972, 40 U.S.C. 541 et seq., and the American Bar Association's Model Procurement Code for State and Local Governments for the engagement of engineering services. This process has withstood the test of time.

Traditionally, federal government procurement procedures properly have emphasized awarding contracts to the lowest bidder, or using price as a dominant factor. For many goods that the government purchases—paper, office equipment, desks, even construction services—this process serves the government and the taxpayer well. Specifications can be written, products can be inspected and tested, and safeguards can be built in to assure saving money.

Sometimes, however, agencies mistakenly assume professional architecture, engineering, surveying and mapping services fall into this category. Unfortunately, the assumption ignores the increase in costs to administer the preparation of detailed scopes of work and bid specifications, to evaluate numerous bids, and to remedy serious consequences of unprofessional A/E related services.

Quality, therefore, should always be the primary focus in the competition for architectural, engineering and surveying and mapping procurement. Only after high-quality performance is ensured should the focus turn to the contract price. That is exactly what QBS provides. The Brooks A/E Act ensures that specialized skills and technologies are evaluated properly and are not overlooked. At the same time, the Act also ensures that small businesses are able to compete on an even basis with large A/E design firms. In this manner, the government benefits from direct control of both the quality of the services and the project's development.

The Brooks A/E Act applies to the acquisition of all architectural and engineering services, including services of an architectural or an engineering nature that are logically and justifiably to be performed by architects or engineers. The language of the Brooks Act governs the broadest range of A/E design services, i.e., any that are performed by architects or engineers and those that may be. Nothing in the Act limits or restricts the application of QBS procedures to some architectural or engineering services while exempting others.

The use of negotiated procedures directs the focus of procurement activity where it should be, on the quality of the professional A/E services specifically suited to a given contract.

ASCE—September 19, 2002—page 4

All competitors must submit their qualifications to the procuring agency; the agency assesses the relative expertise of the competing firms; and the most qualified firm is selected for the particular procurement. Such procedures produce a more cost effective design, map and related professional service than can be achieved under price bidding procedures.

The qualifications-based selection law was codified to protect the interest of taxpayers. It is federal law because over the life of a project, engineering-related services account for less than one-half of one percent of total costs. Yet these important services play a major role in determining the other 99.5 percent of the project's "life cycle costs," such as construction, operation, and maintenance.

This process has been so successful at the federal level that it is recommended by the American Bar Association in its model procurement code for state and local government. Forty-two states have enacted their own qualifications-based selection laws for architecture, engineering, surveying and mapping services based on the federal model. Others use it as a standard procedure. Today, no state has a specific law requiring bidding of these services.

For design build procurement, ASCE strongly supports the use of the two-phase competitive source-selection process required by the Federal Acquisition Reform Act of 1996, 41 U.S.C. 253m, for design-build contracts awarded by government agencies. The design-build team must be selected using the modified QBS criteria specified by the Act.

#### **Expedited Project Delivery**

If we are to meet the needs of a future where infrastructure investments and improvements are increasingly large and complex, where requirements are more diverse, where time is of the essence, then it is essential to continue to improve and expand creative and innovative approaches that provide the broadest array of necessary tools. It is essential that future legislation and policies be supportive of this goal. Alternative delivery systems such as fast-tracking, design/build, CM/GC and program management have taken root, again where large-scale projects and programs exceeded the capability or effectiveness of established processes.

Thank you for considering our views. If ASCE can be of any assistance to the Committee in the debate over section 1309 or other aspects of the reauthorization of TEA-21, please do not hesitate to contact Brian Pallasch, Director of Government Relations, in our Washington Office at (202) 789-2200 or by e-mail at [bpallasch@asce.org](mailto:bpallasch@asce.org).

## REAUTHORIZATION OF TEA-21

---

WEDNESDAY, SEPTEMBER 25, 2002

U.S. SENATE,  
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,  
COMMITTEE ON FINANCE,  
*Washington, DC.*

The hearing was convened, pursuant to notice, at 9:36 a.m., Hon. Max Baucus (chairman of the Committee on Finance) and Hon. James M. Jeffords (chairman of the Committee on Environment and Public Works) presiding.

### **INNOVATIVE FINANCING: BEYOND THE HIGHWAY TRUST FUND**

Present for the Committee on Environment and Public Works: Senators Jeffords, Reid, Inhofe and Crapo.

Present for the Committee on Finance: Senator Baucus.

### **OPENING STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR FROM THE STATE OF MONTANA**

Senator BAUCUS. The joint hearing of the Finance Committee and the Environment and Public Works Committee will come to hearing.

This is a unique and quite possibly historic occasion because the Environment and Public Works Committee and the Finance Committee are holding a joint hearing in the Finance Committee hearing room, chaired by the chairman of the Environment and Public Works Committee. I am sure that all historians will note this. It surely will be recorded as a major moment in history.

Senator JEFFORDS. If you hear a rumbling up there, let me know.

Senator BAUCUS. But at the very least, I welcome everyone. I will make an opening statement, then turn the hearing over to Chairman Jeffords, who will chair the joint hearing.

First, as a member of this committee and also Environment and Public Works Committee, I have spent a lot of time working on highway issues and financing highway programs because highways are just so important to the State of Montana.

This joint hearing, clearly, is one that recognizes the joint interests between the two committees: providing the funds to the Finance Committee for a highway program—the trust fund; and second, the authorization of programs by Environment and Public Works Committee, deciding which projects will be built and maintained over the life of the authorization law.

I was also privileged to be a co-author of TEA-21, with Senators Warner, Chafee, Byrd, and Graham. There are many others, also, who helped to make it a successful bill.

It was a time, frankly, where we all worked very well together. I expect the same camaraderie and relationship to prevail among the principal members of the Environment and Public Works Committee again this year.

I am especially pleased that Senator Grassley, the Ranking Member of the Finance Committee, has also shown such a great interest in these issues. He, too, will play a very important role during TEA-21 reauthorization.

The Finance Committee recently held a hearing that explained how the Highway Trust Fund is structured to provide funding for our highway system. We heard testimony that was quite interesting. The testimony focused on the projections for trust fund income over the next 10 years.

As successful as the trust fund has been, unfortunately our transportation needs far outweigh the resources. In fact, I remember the Department of Transportation mentioning—this has been the case over many years—how the needs of our country in developing our highway program provide only about half of the funds that are available about 50 percent. My guess is, that figure is not going to get any better in the future.

Today's hearing is intended to discover how we can get additional financing beyond the trust fund for our highway program. We are looking at additional means to finance the ordinary way—that is, the gasoline tax and fuel taxes that the users pay to the trust fund—in order to meet our Nation's needs.

In recent years, there has been increased recognition of the greater importance of our highways to our country. As we prepare to reauthorize the highway program next year, the big question for Congress will be how to increase the level of investment for the benefit of us all.

Earlier this year, Senator Crapo and I introduced bipartisan legislation with 12 co-sponsors, S. 2678, the MEGA-TRUST Act, for Maximum Economic Growth for America through the Highway Trust Fund.

This bill laid out some ways to increase investment in the highway program without raising taxes. That legislation would allow the trust fund to be properly credited with taxes either paid or foregone with respect to gasohol consumption.

We would also reinstate the principal that the highway and mass transit accounts of the Highway Trust Fund should be credited with the interest on their respective balances.

As we all know now, the general fund does not go back to the respective balances of those two programs. I think that change is very important.

But we must also continue to work out additional ways to enable a stronger level of highway investment. Next week, I will introduce the MEGA-INNOVATE, Maximum Economic Growth for America through Innovative Financing. I do not know where in the world we got that name.

Under this legislation, the Secretary of the Treasury would sell bonds, with the proceeds being placed in the highway account of

the Highway Trust Fund. The Treasury would be responsible for the principal and the interest. The bond proceeds would enable the basic highway program to grow. It would help the citizens of every State.

The administration of this initiative would be simple. No new structure is required. It is a new idea that does not raise taxes, but would advance our national interest in a strong highway program.

As this is a new idea for highways, the bill introduces this concept at a very modest level, in the range of \$3 billion annually in bond sales.

However, when combined with the provisions of the Trust Act and the continuation of current resources of revenue, this legislation should enable the highway program to achieve an obligation level of approximately \$41 to \$42 billion by fiscal 2009.

Many other elected officials and organizations have shown interest in both of these acts, and I would like to enter their statements into the record.

Senator JEFFORDS. Without objection.

[The prepared statement of Senator Grassley follows:]

STATEMENT OF HON. CHARLES GRASSLEY, U.S. SENATOR FROM THE STATE OF IOWA

I would like to thank Chairmen Baucus and Jeffords for scheduling this joint hearing between the Senate Finance Committee and the Senate Environment and Public Works Committee. We are here to examine issues of highway finance in anticipation, of the reauthorization of TEA-21. As Senator Baucus indicated, both committees have an interest in providing adequate funding for our nation's transportation system whether it be through the traditional fuel tax regime or through other tax-based financing mechanisms. As I noted in our first hearing on the highway trust fund reauthorization in May, transportation issues are very important to Iowa. Accordingly, I look forward to working with Senators Baucus, Jeffords, and Smith in reauthorizing TEA-21 during the next Congress.

On May 9, the Finance Committee held its first hearing to begin evaluating the future health of the Highway Trust Fund. In that hearing, we focused largely on the flow of taxes into the trust fund and the continued ability of the highway trust fund to support transportation needs under reauthorized TEA-21.

We also began talking about the impact that alternative vehicles and alternative fuel sources will have on the trust fund in the years ahead. Finally, we began to consider how we would maintain the existing levels of trust revenue for transportation demands without raising taxes.

Today, we will not focus on trust fund revenue. Instead, we will shift our attention to various financing mechanisms that will supplement transportation needs beyond the dedicated revenues in the trust fund.

Historically, issuing State and local bonds (which are exempt from Federal taxation) was the principal way States raised capital for transportation needs in excess of those currently available with highway trust fund resources. While this works well in some States, some including Iowa have decided against using bonds to finance infrastructure projects while others are constitutionally prohibited from doing so.

During the reauthorization of TEA-21, a concerted effort was made to begin using Federal resources to encourage private investment in transportation projects. During the reauthorization, the drafters also attempted to expand and make more flexible the resources available to State transportation departments. A number of pilot programs were established to achieve those goals including (i) TIFIA Funding (named for the Transportation Infrastructure Finance and Innovation Act), (ii) SIBs (State Infrastructure Banks), (iii) GARVEES (Grant Anticipation Revenue Vehicles), and GANS (Transit Grant Anticipation Notes). Because many of these programs rely on State borrowing, they are not viable solutions for all States. In other circumstances, the programs may not have worked as intended.

Iowa, for example, is in the process of closing out its State infrastructure bank. Without the ability to use State and local bonds to increase SIB funding, it was difficult for Iowa to effectively use the concept. In addition, several shortline and regional railroads in my State have tried to use the railroad infrastructure fund ad-

ministered by the Federal railroad administration. The application process is extremely cumbersome and prevents many railroads from even considering the option. Those who have applied have had difficulty coming up with the required credit risk premium to access funds. The role of the State DOT in these projects has been limited to moral support—a problem that should clearly be fixed.

Evaluating the successes and failures of previously authorized programs is an important first step in the reauthorization process. I look forward to hearing from the witnesses today on how we may improve and further refine existing programs. We should particularly examine programs that involve public-private partnerships such as TIFIA. Many of the witnesses have commented on the operation of these programs in their testimony, and at least one of our witnesses has suggested program modifications. These types of comments are highly instructive, and I look forward to hearing additional witness views on these issues.

As we move into reauthorization, I know we will want to maintain the important goals of stretching available resources and inducing private investment into the transportation sector. This hearing should help us evaluate alternative financing mechanisms for achieving those goals. Specifically, I look forward to learning more about the bond proposals offered by the American Association of Highway and Transportation Officials (AASHTO) and Senator Baucus. Because these ideas are new to the transportation sector, we will want to consider carefully the details of those proposals. With respect to each new proposal, I would like to further consider whether additional funds should be raised for State apportionment (program finance) or, for the benefit of specific projects (project-finance). In addition, I would like to further consider whether leveraged funds should be retired using tax-arbitraged escrow funds, repayments from the general fund, or project-specific revenue sources.

In closing, I would like to reiterate that I look forward to working with my colleagues on the reauthorization of TEA-21. I am anxious to hear from the witnesses on how to most effectively finance the important needs of our highway transportation system. Thank you, Mr. Chairmen.

Senator BAUCUS. Concerning other statements for the record, the first, is from the Departments of Transportation from the following five States: Montana, Idaho, Wyoming, North Dakota, and South Dakota, endorsing both the MEGA-TRUST and my forthcoming bond proposal. Second, a statement from the American Highway Users Alliance, also indicating support for both measures.

I very much appreciate the support of these groups, as well as the support of others, for these two important initiatives. A well-funded highway program is certainly essential to the economic future of each of our States. I look forward to working with my colleagues on these measures, and on other ways to help our citizens benefit from increased levels of highway investment.

I also look forward to hearing additional proposals on alternative means to finance the Nation's surface transportation program. The more we can get the private sector involved and the more we can leverage funds, the better we will be able to meet our transportation needs.

[Additional statements submitted for the record appear at the end of the hearing record.]

Senator BAUCUS. I would now like to turn the hearing over to my good friend, Jim Jeffords from Vermont, who will chair the joint hearing.

**OPENING STATEMENT OF HON. JAMES M. JEFFORDS,  
U.S. SENATOR FROM THE STATE OF VERMONT**

Senator JEFFORDS. Thank you, Senator Baucus. I appreciate the opportunity to sit in your seat here. We work very closely together on both committees, and you are doing an excellent job on the Finance Committee. It is appreciated, your hard work that brings us here today.

I am pleased this morning to join in this hearing on a very, very important subject. Today, we will focus on money, a key to the future of America's transportation system.

By some accounts, the annual level of investment needed to just maintain our transportation system is nearly \$110 billion per year. Our current national program falls well short of that figure.

Over the last 50 years in our successful campaign to develop the Eisenhower Interstate Highway system, we have used Federal grants to States in a pay-as-you-go program to build our national system. Today, that system is essentially complete.

We are in a post-interstate era. Our Federal aid programs now focus, appropriately, on maintaining, operating, and enhancing the highway asset that we have built. But this Federal/State partnership is now being overwhelmed by just its asset management responsibility. Unless we adapt, I foresee a continuing deterioration of our transportation system.

We are a Nation with unlimited potential and boundless possibility. That spirit has propelled a range of achievement unparalleled anywhere else in this world. Our renewal of America's transportation program must reflect this national heritage in meeting the needs of the next generation.

It should be as bold as President Eisenhower's vision was in its time. Our vision should not be hobbled by artificial constraints or narrow thinking which would permit other nations to gain competitive advantages over us. To fully compete in the world markets and to offer all American families and businesses the full range of products in international commerce, we need strategic investment in key new facilities, while reinvesting in those already built.

We have explored options to increase revenues to the highway fund in previous hearings. I will consider all options for growing the trust fund. But today we will look beyond the Highway Trust Fund, beyond the grant and aid programs, and beyond the Federal/State partnership.

We will hear today from two distinguished panels on a topic that has been referred to in the last 10 years as innovative financing. We will look at the role of revenue streams, private capital, special-purpose entities, and intermodal facilities in meeting the needs of the next generation. But this is not innovative, radical, or even new. In fact, what we will explore today is really the pre-interstate approach to financing roads and bridges. It is the standard way that our free enterprise system creates our means of production through private capital and return on investment.

I am pleased that Councilwoman Hahn from Los Angeles is here to discuss a pioneering effort in modern transportation finance, the Alameda Corridor. This prototype project is intermodal in its nature, provides both freight and passenger benefits, draws on new revenues to retire debt, and is sponsored by a special-purpose district.

In my home State of Vermont, we have utilized a finance program called a State Infrastructure Bank, or a SIB. A SIB is a revolving fund mechanism for financing a wide variety of highway and transit projects through loans and credit enhancement. Vermont has taken hundreds of fuel delivery trucks off our roads by financing bulk storage facilities in key rail yards.

Other States have used this mechanism, and others, to provide early project financing. In the State of South Carolina, a variety of finance techniques, coupled with public/private partnerships, has resulted in the construction of 27 years' worth of projects in a 7-year timeframe.

On a smaller scale, the State of Delaware has joined with the Norfolk Southern Railroad to renovate historic Shellpot Bridge, with the railroad retiring the project's cost over time through fees on its rail cars.

What we will discuss today is a complement to our traditional programs, not a replacement. Private capital represents a realistic means to expand our buying capacity. The key is revenue streams.

When a project is supported by dedicated revenues, whether it is tied directly to the use of the facility as in the case of Alameda or Shellpot Bridge, or simply earmarked from more general sources such as property rentals or operating revenues, then the project can retire debt.

The freight community particularly will benefit from expanded use of financing. Today's freight interests are frustrated by their inability to compete when projects are ranked at the State and NPO level.

Through its capacity to generate revenue, the freight sector can essentially create its own program. This will also reduce demand on the traditional Federal aid grant program.

Let me close by suggesting a vision for transportation finance. In the future, every responsible fund manager, both here and globally, will have a fraction of his or her portfolio invested in U.S. transportation infrastructure. They will do so with confidence in the investment and the bold Nation it supports. Over the next few hours, I will listen for ways to make this vision a reality. Thank you.

Now we turn to the hearing, the best parts of it. I would turn, also, to the Senator from Nevada for any statement.

**STATEMENT OF HON. HARRY REID, U.S. SENATOR FROM THE STATE NEVADA**

Senator REID. I thank you and Chairman Baucus. I commend both of you for holding this joint hearing. It is so important. I am thankful also, of course, that Ranking Members Smith and Grassley have agreed to do this.

We are authorizing TEA-21 the legislation to address our Nation's infrastructure needs is a big job, an important job, and one that will take the cooperation of more than one committee.

Early this month, the Subcommittee on Transportation, Infrastructure, and Nuclear Safety conducted a joint hearing on freight issues with Senator Breaux's Commerce Subcommittee. We need more cooperation between committees involved in reauthorizing TEA-21.

We have to work together to ensure that our significant diverse transportation needs are addressed. Our highways, transit system, and railways are too important to our economic well-being and quality of life to ignore.

I look forward to working with the Finance Committee and other committees to see if we can adequately address our transportation needs. We are nearing the completion of the Environment and Pub-

lic Works Committee's year-long series of 14 hearings and symposia addressing the critical issues related to reauthorization. It is appropriate that our final two scheduled hearings focus on funding issues.

As we have been told today, we will review opportunities for innovative financing. On Monday, the Transportation Subcommittee will examine the state of the infrastructure and the funding necessary to maintain and improve our Nation's highway system.

The State of Nevada has been a leader in the field of innovative financing and has aggressively sought to leverage private investment through existing Federal financing programs.

For example, the project that should have taken place 100 years ago, the Reno Transportation Rail Access Corridor, RTRAC, is seeking to use \$70 million in loans under TIFIA to leverage \$200 million in State, local, and private funding to build a below-grade rail transportation corridor. This project will increase safety and reduce traffic congestion by eliminating 10 at-grade rail crossings. That is important, of course.

The Las Vegas monorail project is seeking a \$120 million TIFIA loan to bridge the gap between Federal, State, local, and private financing to build Phase II of what will eventually be an 18-mile regional rail transit system.

Finally, the State is expediting the critical Hoover Dam Bypass—and we are working with the State of Arizona on this—by using a bonding mechanism similar to the GARVEE bonds to allow construction to proceed before Federal funding is completed.

Each of these vital highway transit rail projects were made possible by innovative financing opportunities provided by the Federal Government. In the future, we hope to creatively use new, innovative financing tools to bridge the gap between public and private investment to build a high-speed magnetic levitation train between Southern California and Las Vegas.

There is no question that innovative financing must be a critical component of next year's transportation bill. We should encourage new public/private partnerships and focus on where Federal resources can creatively be used to leverage State, local, and private investment for critical highway transit and rail projects.

Let me say publicly what I have said privately. I think it is tremendous that the chairman of the Finance Committee, the all-power Finance Committee as we know here, and the former chairman of this committee is working so closely with us.

I think that we are going to benefit so greatly in the year to come from Senator Baucus' experience as chairman of this committee, and his experience as chairman of the Finance Committee, to help come up with some of these innovative ways to finance these projects. We need this very, very badly.

I applaud and commend the chairman of the Environment and Public Works committee, Senator Jeffords, for his agreeing to do these kinds of joint hearings. This is something we do not do here very often. We were so protective of our turf here. I think we should Senator Baucus for all we can because of his experience.

[Laughter.]

I think that we need to understand that we, as the Transportation and Infrastructure Committee, cannot do it alone. We need

to do things differently than we have done in the past. I think this is great to have this hearing. I think this is an indication of what is to come next year, and coming up with a highway bill. It is going to be different than any highway bill we have ever done before.

I want to apologize to the committee. Senator Inouye is not here today, and I have got to help him on a committee beginning at 10 o'clock.

Senator JEFFORDS. Well, thank you very much for your excellent statement.

Senator BAUCUS. If I might, Mr. Chairman, also thank Senator Reid for his very strong endorsement of the joint hearing. I think that we get better legislation here with more joint hearings, as a general rule. The legislation is good as it is, but I think joint hearings are very, very helpful. I compliment the Senator for making that observation.

Senator JEFFORDS. There is no subject that a joint hearing is more appropriate for than this one right now.

Senator Crapo?

**STATEMENT OF HON. MICHAEL D. CRAPO, U.S. SENATOR  
FROM THE STATE OF IDAHO**

Senator CRAPO. Thank you very much. I would like to thank both of our joint chairmen today and associate myself with the remarks of Senator Reid about the importance of the fact that we are working together and having these joint hearings.

As we work together to put together the next highway bill, it is going to be critical that we do a good job, and a prompt job. But, even more importantly, we have got to work together to make sure that we build the kind of support for the good bill that we will need to build. I appreciate the efforts of both of our joint chairmen for holding this hearing. Clearly, innovative financing and the funding aspects of this are going to be critical.

In terms of talking about working together, I want to especially thank Senator Baucus. He and I, both coming from neighboring States out in the Northwest, have similar concerns with regard to our States' issues with regard to transportation.

We have found an opportunity to work together across party lines to put together some innovative approaches of our own to try to address the question of how to increase the pot of funding for our highway needs in this country. With the two approaches that we have come together on, we have done it without raising taxes, and I think that that is a very important first step: the MEGA-TRUST Act, which Senator Baucus already mentioned, and then the MEGA-INNOVATE Act that will be introduced soon.

We have two ideas on the table that are very important. As has been indicated by Senator Baucus and Senator Jeffords today, I look forward to hearing from people around the country who have had a lot of experience with this and who have a lot of ideas about how we can accomplish it, to giving us more ideas and more proposals for how we can address the needs for funding our next highway bill.

So, again, to both of our chairmen, I thank you for this opportunity. I look forward to the information we are going to receive today, and working with you as we put together the next bill.

Senator JEFFORDS. Thank you. A very helpful statement. Senator Inhofe?

**STATEMENT OF HON. JAMES M. INHOFE, U.S. SENATOR FROM THE STATE OF OKLAHOMA**

Senator INHOFE. Thank you, Mr. Chairman.

As we work together in drafting the reauthorization of TEA-21, it is safe to say that all members here recognize that this is a time of extraordinary challenge and opportunity for the transportation sector.

The world of surface transportation is changing. It is now our job to work together to ensure adequate funding for investment in the Nation's transportation system and preserve State and local government flexibility to allow the broadest application of funds for transportation solutions.

TEA-21 dramatically altered the transportation funding mechanisms, provided greater equity among States in the Federal funding, and record levels of transportation investment. For most Federal aid projects, the law requires that 20 percent of the costs be derived from a non-Federal source.

In order to maximize the use of all available resources, States now have a range of options for matching the Federal share of highway projects. By providing flexibility in a form that the non-Federal match might take, Federal dollars can be leveraged more effectively.

What we have been taking advantage of in Oklahoma is the toll credit match. We apply certain toll revenues/expenditures to build and improve our public highway facilities as a credit toward the non-Federal matching share of particular projects.

However, transportation officials at all levels of government still face a significant challenge when considering the ways to pay for improvements to transportation infrastructure. It is apparent that traditional funding sources are insufficient to meet the increasing complex needs.

I remember when I was mayor of Tulsa, we worked diligently trying to focus on the public/private partnerships. I recognize that the implementation process is a complex undertaking with a wide range of organizational and financial options. But it is important for public agencies to evaluate all of their alternatives.

Despite the record levels of investment, funding is not keeping pace with the demands for improvement and to maintain the vitality of the Nation's transportation system.

I am in a unique position to appreciate this because I spent 8 years in the House of Representatives on the Transportation Committee and I was really into it.

When I came to the Senate, I was more on some of the problems we were having in the EPA and clean air problems. Until I became chairman of the Subcommittee on Transportation and Infrastructure, I was more involved with those issues.

In that 4-year period, the congestion and other severe problems that we are facing are brought home to me in such a way that I see that we are going to have to try something new and different.

That is what we did with TEA-21; that is what we are going to continue to do. I am looking forward to working with you. I ask

unanimous consent that my entire statement be made a part of the record at this point.

Senator JEFFORDS. It certainly will.

[The prepared statement of Senator Inhofe follows:]

STATEMENT OF HON. JAMES M. INHOFE, U.S. SENATOR FROM THE STATE OF OKLAHOMA

Thank you Mr. Chairman. As we work on the drafting of this reauthorization, I think it is safe to say that all the members here recognize that this is a time of extraordinary challenge and opportunity in the transportation sector. The world of surface transportation is changing. It is now our job to work together to ensure adequate funding for investment in the nation's transportation system and preserve State and local government flexibility to allow the broadest application of funds to transportation solutions.

TEA-21 dramatically altered transportation funding mechanisms. It provided greater equity among States in Federal funding and record levels of transportation investment.

For most Federal-aid projects, the law requires that 20 percent of the costs be derived from a non-Federal source. In order to maximize the use of all available resources, States now have a range of options for matching the Federal share of highway projects. By providing flexibility in the form that the non-Federal match might take, Federal dollars can be leveraged more effectively.

What we have been taking advantage of in Oklahoma is the toll credit match. We apply certain toll revenue expenditures to build and improve our public highway facilities as a credit toward the non-Federal matching share on particular projects.

However, transportation officials at all levels of government still face a significant challenge when considering ways to pay for improvements to transportation infrastructure. It is apparent that traditional funding sources are insufficient to meet the increasingly complex needs. I remember when I was Mayor of Tulsa, we worked diligently trying to focus on public private partnerships. I recognize that the implementation process is a complex undertaking with the wide range of organizational and financing options but its important for public agencies to evaluate all their alternatives.

Despite the record levels of investment, funding is not keeping pace with demands for improvements to maintain the vitality of the nation's transportation system.

Some transportation projects are so large that their costs exceed available current grant funding or would consume so much of these current funding sources that they would delay many other planned projects.

ARTBA proposed a number of options for enhancing the Highway Account revenues. Some included indexing the motor fuels excise taxes for inflation, crediting the Highway Account with gasohol tax revenues that currently go into the General Fund, and expanding innovative financing programs. I might also mention that since the enactment of TEA-21, interest accrued on any obligation held by the fund does not get credited to the Highway Trust Fund, the interest earned goes to the General Fund. This is obviously something that we need to rethink during reauthorization. These are all revenue enhancements that would increase the fund substantially.

With the Energy bill pending in Conference, the Trust Fund will recoup an additional 2.5 cents per gallon of ethanol currently being deposited into the general revenue. The Senator from Montana has been very aggressive at trying to make the Trust Fund whole with respect to the current 5.3 cent per gallon ethanol subsidy. Although he and I do not agree on how to best address this issue, we are in agreement that the Highway Trust Fund should not pay to subsidize any fuel source. Our surface transportation infrastructure needs are such that we cannot afford to forego any revenue source.

Certainly one of the key factors in the economic engine that drives our economy is a safe, efficient transportation system. If our economic recovery is going to continue to expand, we cannot ignore the immediate and critical infrastructure needs of highways, bridges, and State/local roadway systems.

Finally, I would encourage our witnesses to address the current issues with funding dilemmas and how the use of innovative finance can generate real economic returns by expediting project construction.

Thank you Mr. Chairman. I look forward to today's hearing and want to welcome all of our witnesses.

Senator INHOFE. I also want to say, Mr. Chairman, that at the same time in the next room we have the Senate Armed Services

Committee that is meeting, so we have required attendance at both places and I will be going back and forth.

Senator JEFFORDS. Thank you very much.

Now we turn to the important part of the hearing, and that is listening to our witnesses.

Our first witness is David Seltzer, Distinguished Practitioner at the National Center for Innovations in Public Finance, University of Southern California, Los Angeles. Please proceed.

**STATEMENT OF DAVID SELTZER, PRINCIPAL, MERCATOR ADVISORS, PHILADELPHIA, PA, ON BEHALF OF THE UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES, NATIONAL CENTER FOR INNOVATIONS IN PUBLIC FINANCE**

Mr. SELTZER. Thank you very much, Mr. Chairman and members. I am affiliated with the National Center at USC. It is a professional education and research center in the field of infrastructure finance. As part of the record, I have furnished this copy of a report that USC published last year concerning public/private partnerships in California. I feel compelled to tell you, this will be covered on the final exam.

[Laughter.]

Senator JEFFORDS. It will be made a part of the record. Thank you.

Mr. SELTZER. I, too, would like to commend you for holding this joint hearing on innovative finance. Because the Nation's transportation needs require a wide array of tools, it is very valuable that both the tax writing and authorizing committees are jointly deliberating this important issue.

This morning you will be hearing from a distinguished panel of individuals from the Federal, State, local, and private sectors on various innovative finance tools, including New Mexico's GARVEE bonds, the Alameda Corridor, TIFIA credit instruments, private activity bonds, and tax credit bonds.

What I would like to do, briefly, is provide a table-setter, giving you a framework for evaluating these and other innovative finance tools. This may help your committees determine which tools would be most effective in filling the funding gap and, in essence, provide a context for considering innovative finance.

To my mind, the central problem in Federal transportation policy is that, on the one hand, transportation projects are lumpy investments. They are capital-intensive, long-lived, and very heterogeneous.

On the other hand, Federal budgetary policy is very short-term oriented. It is cash-based and it is focused on costs rather than benefits. This treatment is really reflected in Federal budgetary scoring, where current outlays are treated the same way as long-term capital investments in transportation infrastructure. That mismatch between the period of when costs and benefits are recognized can distort project investment decisions.

Where innovative finance comes in, is that it can help redress some of that imbalance, in my view. Innovative finance tools are generally less intrusive than direct Federal grants. They, as you pointed out, Mr. Chairman, allow market forces to work by draw-

ing on private capital, and can better match the periods of the costs and the benefits.

Your two committees have at their disposal, really, three approaches that may be used to advance infrastructure projects: regulatory incentives, Tax Code incentives, and credit incentives.

Regulatory incentives are best demonstrated perhaps by New Mexico. You will be hearing in the next panel about not just innovative financing using GARVEE bonds, but also innovative procurement using design build procurement and innovative asset management, employing long-term warranties. Those three regulatory reforms were put together to advance an important project.

The second incentive, the Tax Code, includes things like tax-oriented leasing of capital assets, private activity bonds, and tax credit bonds. These tax measures have the benefit of using the pay-go scoring methodology, where the tax expenditures are recognized on an annual basis, not all up front. That approach represents something more akin to a commercial practice of amortizing costs.

The third of the three general approaches, Mr. Chairman, is credit incentives, as evidenced by Federal loan and loan guarantee programs like TIFIA and the Railroad Rehabilitation and Improvement Financing Program.

For Federal credit instruments, the budget scoring uses a present value concept, again akin to commercial practices where the time value of money is taken into account.

Now, for any of these various innovative finance tools to be successful, they must satisfy three groups of stakeholders simultaneously. First is the project sponsor, the public or private entity that is developing, advancing, and managing the capital investment.

The second of the three stakeholders is the investor. You have to provide a competitive, risk-adjusted rate of return that an investor can compare to options to invest capital elsewhere.

The third of the three stakeholders is, of course, Federal policymakers who have to look at both policy objectives and budgetary costs.

Senator Jeffords, you indicated an interest in identifying new products for portfolio managers. One interesting example would be a way to attract pension funds into infrastructure finance.

Public, corporate, and union funds represent some \$3.6 trillion of investment assets, yet today there are virtually no U.S. transportation projects in their portfolios.

The principal reason for that is that the primary financing vehicle of tax-exempt bonds does not appeal to tax-exempt entities such as pension funds. However, something like tax credit bonds, which you will be hearing about later, where the principal could be sold to, say, a pension fund and the tax credits decoupled and sold to other investors, might address some of your objectives.

In summary, different innovative finance tools are suited to different products and projects. I have submitted also as part of the record a methodology for looking at how one can systematically compare tools such as GARVEE bonds, tax credit bonds, private activity bonds, and TIFIA instruments in considering reauthorization.

So, thank you very much for your time. I appreciate it.

Senator JEFFORDS. Thank you for a very helpful statement.

Our next witness is Phyllis Scheinberg, Deputy Assistant Secretary for Budget and Programs at the U.S. Department of Transportation, right here in Washington, DC.

Ms. Scheinberg, please proceed.

**STATEMENT OF PHYLLIS SCHEINBERG, DEPUTY ASSISTANT SECRETARY FOR BUDGET AND PROGRAMS, U.S. DEPARTMENT OF TRANSPORTATION**

Ms. SCHEINBERG. Thank you, Chairman Jeffords. I want to send my appreciation to Chairman Baucus and members of the committees.

Thank you for holding this hearing today and inviting me to testify on Federal innovative finance initiatives for surface transportation projects.

These financing techniques, in combination with our traditional grant programs, have become important resources for meeting the transportation challenges facing our Nation.

Last January, Secretary Mineta indicated to you his desire to “expand and improve innovative finance programs in order to encourage greater private sector investment in the transportation system.”

He stated that innovative financing will be one of the Department’s core principles in working with Congress, State, local officials, tribal governments, and stakeholders to shape the surface transportation reauthorization legislation. Secretary Mineta remains steadfast in his support for these programs, so we want to tell you that we are here to work with you.

But, first, let us talk about, what is innovative finance? We at the Department apply the term to a collection of financial management techniques and debt finance tools that supplement and expand the flexibility of the Federal Government’s transportation grant programs.

We see the primary objectives of innovative finance as leveraging Federal resources, improving utilization of existing funds, accelerating construction timetables, and attracting non-Federal investment in major projects.

There are three major innovative finance programs that I would like to talk about today: the Transportation Infrastructure Finance and Innovation Program, or TIFIA, Grant Anticipation Revenue Vehicles, or GARVEE bonds, and State Infrastructure Banks, or SIBs.

First, the TIFIA credit program. Through the leadership of the Senate, and this committee in particular, TIFIA was established to provide a direct role for the Department of Transportation to assist nationally or regionally significant transportation projects through direct loans, loan guarantees, and stand-by lines of credit.

TIFIA allows the Federal Government to supplement, but not supplant, existing capital finance markets for large transportation infrastructure projects. We seek to take prudent risks in order to leverage Federal resources through attracting private and other non-Federal capital projects.

We have selected 11 projects, representing \$15.7 billion in transportation investment, to receive TIFIA credit assistance. The TIFIA

commitments themselves total \$3.7 billion in credit assistance, with a budgetary impact of only a little bit more than \$200 million. Highway, transit, passenger rail, and multimodal projects have all sought, and received, TIFIA credit assistance.

We are pleased with the results that we are seeing. The overall leveraging effect of the Federal assistance for the TIFIA projects has been 5 to 1. Private co-investment has totaled \$3.1 billion, or about 20 percent of the total project costs.

We believe that a limited number of large surface transportation projects each year will continue to need the types of credit instruments offered under TIFIA. Project sponsors and DOT staff are still exploring how best to utilize this credit assistance, and we welcome congressional guidance and dialog during this evolutionary program period.

A second financing tool used by States has been the issuance of Grant Anticipation Revenue Vehicles, or GARVEEs. These bonds enable States to pay debt service and other bond-related expenses with future Federal-aid highway apportionments.

A GARVEE generates up-front capital for major highway projects and enables a State to accelerate project construction, and spread the cost of a facility over its useful life. With projects in place sooner, costs are lower and safety and economic benefits are realized earlier. In total, six States have issued 14 GARVEE bonds totaling more than \$2.5 billion to be repaid using a portion of their future Federal-aid highway funds.

A third significant project finance tool is the State Infrastructure Bank, or SIB, which is a revolving fund administered by a State. Federally capitalized SIBs were first authorized under the provisions of the National Highway System Designation Act of 1995. SIBs provide various forms of credit assistance. As loans are repaid, a SIB's capital is replenished and can be used to support new projects.

As of June 2002, SIBs had entered into almost 300 loan agreements, for a total of \$4 billion of loans. This level of activity indicates that the SIB program is ready to move beyond its pilot phase to become a permanent program.

Looking ahead, the use of TIFIA, GARVEEs and SIBs are moving from innovative to mainstream. This reflects significant success, but it does not indicate that the needs of project finance have been completely met.

Secretary Mineta has issued a clear challenge to those of us in the Department in our development of a reauthorization proposal for TEA-21, asking us to expand innovative finance programs to encourage private sector investment.

We are considering options for further leveraging Federal resources for surface transportation. Among these options are enhancing the use of innovative finance in intermodal freight projects and adapting the financing techniques used in other public work sectors. The challenge is to build on our successes to date, but not set unrealistic expectations for the future.

We look forward to working with our partners in the State DOTs, metropolitan planning organizations, and private industry to apply innovative funding strategies that extend the financial means of our individual stakeholders.

Senator Jeffords, we look forward to working with you and the Congress to craft the next surface transportation legislation.

Thank you for the opportunity to testify today. I will be happy to answer any questions.

Senator JEFFORDS. Well, thank you very much for your excellent testimony. I extend my good thoughts to your Secretary. We have been friends for over 20 years, and I now have the opportunity to work closely with him on this. I am looking forward to it.

Ms. SCHEINBERG. Thank you.

Senator JEFFORDS. Next, we have JayEtta Hecker, Director of Physical Infrastructure Issues at the GAO. Please proceed.

**STATEMENT OF JAYETTA HECKER, DIRECTOR OF PHYSICAL INFRASTRUCTURE ISSUES, GENERAL ACCOUNTING OFFICE, WASHINGTON, DC**

Ms. HECKER. Thank you, Mr. Chairman. I am very pleased to be here, and appreciate the historic occasion of the two committees working together. As you and others have said, there could be no topic that more justifies that kind of collaboration.

First, the use and performance of innovative financing mechanisms; second, the cost involved in alternative approaches; and finally, selected issues for reauthorization.

I will skip over the use of the existing programs. I think Phyllis clearly described 6 States with GARVEEs, 32 States with SIBs, and 9 States with having agreements in TIFIA.

What I will do, is summarize the key advantages and limitations that have been identified in some of the studies and some of our own interviews with different States.

There is no doubt that one of the most significant advantages of these new financing and grant management tools is that they accelerate project construction. That is unequivocally a real result for many of these projects.

It is also very clear that they increase the tools in the State, local, or regional toolbox. They are financing multi-billion dollar long-term investments and you need tools that do that wisely and well.

The third advantage, is they have the potential to leverage Federal investment. Some of our work on the costs will discuss what we mean by leveraging and what we are really measuring with some of the different approaches.

The limitations on the use of these tools are real. The biggest one, of course, is States' willingness and authority. You have a lot of States that are very cautious about debt financing and financing projects in a manner other than on a pay-as-you-go basis.

There is also a skill issue. At a hearing last week, we talked about the skill capability in the DOTs. This is a brand-new kind of skill, financing and bond market specialists. It is very different than highway engineering.

Also, it is mostly affected by legislators at the State level or the local level and their willingness to look at these different tools.

There are also limitations in Federal and State law. The application of TIFIA is limited to projects costing over \$100 million. Only 5 States are allowed to use TEA-21 funds to capitalize their SIBs.

Then there are State laws that restrict public/private partnerships and, of course, there are Federal tax policies on private activity bonds. So, there are a whole range of factors that are really behind some of the limitations in the extensive application of these new tools.

Our real contribution today is, in part, to examine options for financing \$10 billion through four different approaches. Basically, we compare the Federal grants, similar to the current highway program, with an 80/20 match; a TIFIA-like Federal loan; State tax credit bonds that are basically similar to the AASHTO proposal. Of course, the credit is from Federal taxes. State-issued tax-exempt bonds are again, exempt from Federal taxes.

I have two charts that I present. One, is about the short-versus the long-term costs of the different tools, and they vary quite dramatically. The other chart compares the State versus Federal costs, as well as other parties.

Depending on how the programs are structured and who ends up paying can vary considerably not only across the alternatives, but even within them. Then the risks vary.

Looking at the tax credit bond, for example, the total cost of that, in present value terms, is nearly \$13 billion compared to \$10 billion that it would cost in direct appropriations in the grant program. The tax credit bond also varies quite a bit in its distribution of costs between the Federal Government and State and other parties.

The tax credit bonds, because of the costs of borrowing and are paying investors, cost \$12.7 billion, but most of that is borne by the Federal Government in a tax credit bond. Compare that with the TIFIA direct loan, where most of the costs, with the 33 percent limitation, are borne by the State and other parties.

The broad overview here is that there is, in fact, only modest success in leveraging private investment. We are getting debt financing, new debt to the table, which is significant and has benefits.

But these approaches have limits in how much they are really bringing private equity capital and real investors to the table who are absorbing a substantial amount of the risk.

That goes back to some of the limitations that I cited earlier. There are limited projects that really can generate their own revenue. That is in part a reflection of how we finance highways and that users tend to view highways as free. There are conflicts with the Federal tax-exempt finance rules and the cap on the private activity bonds, and the State laws.

So, you have got some restrictions inherent in the current system that are limiting how much private investment in highways and other intermodal facilities you can bring to the table.

These financing tools are a critical part of reauthorization. They decide on whether current users or future users pay, they decide on the extent to which we continue to rely on user financing or switch toward the use of general revenues, and they have very different results in the use of State and Federal funds.

We have ongoing work for your committee and are looking forward to being able to provide more detail on this. I think, as you and others have said, some of the real opportunities are to provide

new structures or to get broader applicability of these to projects of national concern, intermodal needs, and to focus on the effect on promoting the efficiency in the transportation sector.

That concludes my statement, Mr. Chairman.

Senator JEFFORDS. Thank you very much.

I think I will ask you the first question. While many States have embraced transportation financing techniques, several States seem resistant to these tools.

What precludes some States from the use of innovative financing?

Ms. HECKER. There is a concern among many States about moving further from pay-as-you-go to debt financing, as well as State DOTs unfamiliar with these approaches.

There are also a range of State laws that could apply, restrictions on public/private partnerships that are written into State laws. There are State laws that prohibit committing their future apportionment to debt repayment and thus prohibit the use of GARVEEs.

We've talked with several of the States who are applying these tools and are very excited about it. So it seems once folks get involved, they are pretty enthusiastic.

Senator JEFFORDS. I want to bring sort of a current situation and ask you what difference makes now, when we have had this huge downturn in the economy and the threats to various means of financing. How does that impact what may or may not be a better way to borrow, or what kind of financing instruments you have put on the rockets?

Ms. HECKER. Well, certainly there is more interest in looking for alternative sources with the revenue conditions and budget pressures at both the Federal and State level. So, the impetus of the economic downturn actually increases interest in these tools.

The ultimate financing question, though, is really not the tool itself. It is how the debt is going to be paid for. That is really what we are looking at, and we encourage the committee to keep very transparent.

If you look at the TIFIA loans where you get over 70 percent at the private and State level, most of it is different State taxes that get dedicated. In only a few instances do you really have private equity. So, there is borrowing going on and new taxes being raised.

As the instruments are broadened and extended, the issue is the extent to which costs are borne by current versus future users, and the extent to which costs are borne by general taxpayers versus users.

Senator JEFFORDS. Thank you.

Mr. Seltzer, in your testimony you state that "capital is notoriously unsentimental, and finance techniques used for transportation projects must compete for investor demand against other investment products in the marketplace."

What conditions need to be in place to make transportation projects more attractive when competing for private investment?

Mr. SELTZER. Well, Senator, you yourself in your statement indicated that the first ingredient or prerequisite is identifying the revenue stream. It has to be stable and reliable enough to attract investors. If it is debt financing, typically there is a watershed invest-

ment-grade rating category that indicates it is not a speculative type of investment.

Some of the innovative finance tools that your committee will be considering could help advance debt financing through providing various forms of credit enhancements such as the TIFIA program that Ms. Scheinberg mentioned.

Senator JEFFORDS. Ms. Scheinberg, currently the threshold for projects to be eligible for TIFIA programs is \$100 million. How would lowering the threshold for projects to \$50 million affect the program?

Ms. SCHEINBERG. Senator Jeffords, we are not sure. We have no experience with anyone coming in and saying they could not meet the \$100 million threshold. So, we cannot tell you that that is a barrier to this program.

The program, as you probably know, is new to the users and there is a fair amount of learning that goes on regarding how to engage in the TIFIA program. So its original purpose was for large projects that could not find funding in the traditional categories of funding that the Federal Government provides—large, intermodal, complicated, lumpy projects, as David said.

I think we still have not tapped out those projects. We are still working with folks. We have six letters of interest that have come in that are seriously looking at asking for a TIFIA loan.

We have not seen people who have come in and said, we wish it was a lower threshold, so I cannot really tell you what the difference would make. We have a lower threshold for ITS projects of \$30 million and we have not seen any takers on that. That does not seem to have made a difference.

Senator JEFFORDS. Our next generation effort will place greater emphasis on intermodal projects and on project financing. I am concerned that U.S. DOT is not adequately staffed or structured to accommodate this shift in focus.

Do you share my concern? I imagine you will say yes.

Ms. SCHEINBERG. Well, first I would say, yes, we are also very focused on intermodal in general, and freight in particular, which we believe needs much more attention than it has received in the past.

As far as our staffing, we are looking at this. I can tell you that it is a topic of discussion in the Department, organizationally, financially, and with resource attention.

We are looking at this issue of freight very seriously, both how to help the freight sector and how to deal with it internally in DOT.

Senator JEFFORDS. Well, I want to thank you, all three of you, for very helpful testimony. I assure you, we will be taking advantage of your expertise as time goes by to assist us as we move forward to try and improve the ability to finance these projects.

Thank you very much.

Mr. SELTZER. Thank you, Mr. Chairman.

Ms. SCHEINBERG. Thank you.

Ms. HECKER. Thank you, Mr. Chairman.

Senator JEFFORDS. I want to let everyone know that we are going to have votes starting, two votes, in the next few minutes. So we will postpone the testimony on the next panel. You can relax and

await my return. Since it takes about 20 minutes for the first vote and I have to wait for the second vote, it will probably be about 25 minutes before we resume.

So if anybody wants to take a break, take a break.

[Whereupon, at 10:29 a.m. the hearing was recessed.]

[At 11:16 a.m. the hearing was reconvened.]

Senator JEFFORDS. The hearing will come to order. I am sorry for the delay, but we are in the process of saving the Nation, so it took a little bit longer than we anticipated.

[Laughter.]

Welcome, panel No. 2. Our first witness is the Honorable Janice Hahn, Councilwoman for the city of Los Angeles, California, on behalf of the Alameda Corridor Transportation Authority. We have been waiting anxiously for your testimony because of all the exciting work that you have been involved in. Please proceed.

**STATEMENT OF HON. JANICE HAHN, COUNCILWOMAN, CITY OF LOS ANGELES, LOS ANGELES, CA, ON BEHALF OF THE ALAMEDA CORRIDOR TRANSPORTATION AUTHORITY; ACCOMPANIED BY DEAN MARTIN, ALAMEDA CORRIDOR'S CHIEF FINANCIAL OFFICER, AND JOSEPH BURTON, GENERAL COUNSEL.**

Ms. HAHN. Thank you, Mr. Chairman. Good morning. Thank you for this opportunity to be here today. Besides being a city councilwoman in Los Angeles, I serve as the chairwoman of the Governing Board of the Alameda Corridor Transportation Authority.

So, on behalf of the city of Los Angeles, the mayor, Jim Hahn, my brother, the city of Long Beach, Mayor Beverly O'Neill, and the Corridor Authority's Governing Board and our CEO Jim Hankla, I am honored to be here today.

Accompanying me today are Dean Martin, the Corridor Authority's chief financial officer, and Joseph Burton, our general counsel.

The Alameda Corridor Transportation Authority, or ACTA, is a joint powers authority created by the Cities of Long Beach and Los Angeles in 1989 to oversee the financing, design, and construction of the Alameda Corridor.

The project was monumentally complex, running through eight different government jurisdictions in urban Los Angeles County, requiring multiple detailed partnerships between public and private entities, and presenting extensive engineering challenges.

One of the key partnerships that has been vital over the years has been with the U.S. Congress. We greatly appreciated the strong support you and your colleagues provided to ACTA in developing the innovative loan from the Department of Transportation.

Indeed, the Federal Government, by its \$400 million Department of Transportation loan, became the first financial partner in this magnificently successful project. We are particularly thankful for the strong leadership demonstrated by many of you in Congress, including our two distinguished Senators, Dianne Feinstein and Barbara Boxer, along with Congressman Steve Horn and Congresswoman Juanita Millender-McDonald. Without their vision and support, it is unlikely the Alameda Corridor would be in operation today, strengthening the Nation's global economic competitiveness.

The \$2.4 billion Alameda Corridor, one of the Nation's public works projects, opened on time and on budget on April 15th of this year.

A container train from the ports of Los Angeles and Long Beach to the transcontinental rail yards near downtown Los Angeles used to take more than 2 hours and wreak havoc to L.A. traffic at dozens of crossings. It now takes about 45 minutes, avoiding traffic conflicts.

As cargo volumes increase, this enhanced speed and efficiency is critical. More than 100 trains per day are expected on the Alameda Corridor by the year 2020.

We have demonstrated that governments can work together, and they can work with the private sector, putting aside competition for the benefit of greater economic and societal good.

We have proven that communities do not have to sacrifice quality of life to benefit from international trade and port and economic activity. The volume of containers doubled in the 1990's, and last year reached more than \$10 million 20-foot containers. Last year, our ports handled more than \$200 billion in cargo, or about one-quarter to one-third of the Nation's waterborne commerce.

ACTA consolidated four branch lines serving the ports into a 20-mile freight rail expressway that is completely grade separated, including a 10-mile long 30-foot trench that runs through older, economically disadvantaged industrial neighborhoods south of downtown Los Angeles.

The linchpin of ACTA's funding plan was designation of the Alameda Corridor as a high-priority corridor in the 1995 National Highway System's Designation Act. That designation cleared the way for Congress to appropriate \$59 million needed to back the \$400 million loan to the project from the U.S. Department of Transportation.

That was the leverage, if you will, for the biggest piece of our financing package, more than \$1.1 billion in proceeds from revenue bonds sold by ACTA. The bond and the Federal loan are being retired by corridor use fees and paid by the railroads.

The funding breaks down roughly like this: 46 percent from ACTA revenue bonds, 16 percent from the U.S. DOT loan, 16 percent from the ports, 16 percent from California's State and local grants, much of it administered by the L.A. County Metropolitan Transportation Authority, and 6 percent from other sources.

There are many reasons why our project stayed on schedule, but at the top of the list are permit-facilitating agreements with corridor cities, relocating agreements with utility companies, and our decision to use a design-build contract with the Mid-Corridor Trench.

Among the direct community benefits, the Alameda Corridor is projected to reduce emissions from idling trucks and automobiles by 54 percent, slash delays at railroad crossings by 90 percent, and cut noise pollution by 90 percent.

Disadvantaged firms have earned contracts worth more than \$285 million, meeting our goal of 22 percent DBE participation. The goal of our Alameda Corridor job training and development program was to provide job training and placement services to 1,000 residents of the corridor communities.

We exceeded that goal. Almost 1,300 residents received construction industry-specific job training, and of those, 600 were placed in construction trade union apprenticeships. The Alameda Corridor Conservation Corps provided the life skill training to 447 young people from that community.

In the future, ACTA and the California DOT are working at an innovative, cooperative agreement to develop plans for a truck expressway that would provide a "life-line" link between Terminal Island at the ports and the Pacific Coast Highway at Alameda Street.

The Alameda Corridor truck expressway is intended to speed the flow of containers into the Southern California marketplace. This project could be ready for approval as early as March, 2003.

At ACTA, we believe that by restructuring our Federal loan we can undertake this critical truck expressway project without any additional Federal financial support. But we need this committee—

Senator JEFFORDS. Would you repeat that, please?

[Laughter.]

Ms. HAHN. I am glad you asked for that. Hold my time, Mr. Chairman. At ACTA, we believe that by restructuring our Federal loan we can undertake this critical truck expressway project without any additional Federal financial support, but we need this committee to help us get Congress to give the approval to DOT to allow us to do this.

Let me just give you a few recommendations for your committee as you are looking at reauthorization of TEA-21. We think the planning and funding of intermodal projects of national significance directly benefiting international trade should be sponsored at the highest levels within the Office of the Secretary of Transportation.

There should be a national policy establishing the linkage between the promotion of free trade and the support for critical intermodal infrastructure, moving goods to every corner of the United States. Public-private partnerships do, in fact, work and should be promoted and encouraged by Federal transportation legislation.

We think a specific funding category is needed to support intermodal infrastructure projects and trade connector projects. Consideration should be given to new and innovative funding strategies for the maritime intermodal systems, infrastructure improvements enhancing good movements.

The Corridor benefited from the DOT being willing to undertake some risks and provide loan terms that were not available on a commercial basis. The Federal participation gave private investors confidence in the project and made our bond financing possible.

Most important in my mind is this. The success of the Alameda Corridor has shown that Federal investment in trade-related infrastructure can benefit the economy without sacrificing the quality of life issues.

Thank you for inviting me. I am happy to answer any questions.

Senator JEFFORDS. Thank you very much.

The Honorable Peter Rahn. Please proceed.

**STATEMENT OF HON. PETER RAHN, SECRETARY, NEW MEXICO  
DEPARTMENT OF TRANSPORTATION, SANTA FE, NM**

Mr. RAHN. Good morning, Mr. Chairman. I am Pete Rahn. I am the Secretary of the New Mexico State Highway and Transportation Department and I am very pleased to be here today to testify before this very unique joint hearing.

It seems so important that the two committees work smoothly together in the reauthorization of the National Highway Funding bill, which is absolutely critical to the States and their transportation systems.

Mr. Chairman, I am here to not only urge, but plead, that Congress not only allow, but actually encourage, innovative public-private partnerships. Public-private partnerships draw on the experiences and expertise of both sides to perfect just tremendous success in projects like New Mexico 44, which is now called U.S. 550.

New Mexico traditionally has been a pay-as-you-go State, which meant we paid as we went downhill and lost more and more of our system.

New Mexico 44 is, I believe, a national example of a successful project that brought together the Federal Government, State government, and private concerns to open up a corridor into northwest New Mexico that is providing economic opportunity and greatly improved safety for those people traveling on that roadway.

New Mexico 44 stretches 141 miles from just north of Albuquerque into northwest New Mexico. Northwest New Mexico did not have a four-lane highway for the entire corridor of the State.

This corridor has opened up economic opportunity in the region of Farmington and Bloomfield in which they are now experiencing growth at twice the rate of the average of the State of New Mexico.

The project itself brought together innovative financing, innovative procurement, innovative contracting, and innovative construction. I need to give credit to the Federal Highway Administration as a very critical partner in developing this project.

The project itself was a 118-mile corridor that utilized innovative financing in the form of GARVEE bonds. I understand it is not very flattering to Jane Garvey that our particular bonds were named "naked" GARVEE bonds because they did not have the guarantee of the State government, but only the revenue stream of future Federal programs to back up the issuance of those bonds. The bonds were issued for 15 years. We also utilized the soft match provisions of TEA-21.

Our procurement was unique in that we were able to utilize, not design-build, but the traditional low-bid process in a very unique way in which we secured a developer, and the developer designed the project, provided the designs back to the department, we utilized low bid, selected the contractor, presented the contractor back to the developer which managed the construction of it, and then warranted the project for 20 years. Twenty years, to our belief, is the longest period of time that a highway has ever been warranted in the United States.

From concept to contract, the project took us 15 months. From contract to construction of a 118-mile long four-lane road was 28 months. Using traditional methods, we estimate it would have taken us 27 years to have built that roadway utilizing the tradi-

tional 3-and 5-mile increments that most DOTs undertake in constructing long corridors.

The warranty is a \$114 million guarantee for performance of the roadway for 20 years. It is a no-fault guarantee that we estimate will save the State \$89 million over the life of the warrantee.

Coke Industries, which was the developer, has \$50 million of their own assets at risk within the warranty and have produced a roadway from their design and management of the contractors that is smoother and will last longer than any road built in New Mexico today.

Utilizing the leveraging of Federal revenue streams at very competitive interest rates, our overall bonding program, of which the GARVEE bonds are only once piece, has an average interest rate of 4.47 percent, when the Federal Highway Administration estimates inflation in the construction industry at 4.5 percent. So the value of a road in place today is greater than the value of a road in place tomorrow.

I will close by just saying that I believe it is very important that Congress, as it is looking at reauthorization, not only allow the DOTs the flexibility to use Federal revenues in the ways best suited for their particular States, but the importance of a stable revenue stream that the States can depend upon is critical to our ability to leverage those dollars through using innovative financing, whether it is bonding or any of the other ways.

The last point I would make, Mr. Chairman, is just simply that if Congress wants to encourage private investment in our transportation system, I believe there is going to have to be a mechanism for the private sector to invest on par with government tax-free bonds in order for that investment to occur.

Thank you, Mr. Chairman.

Senator JEFFORDS. Thank you. Excellent presentation.

Our next witness is John Horsley, executive director of the American Association of State Highway and Transportation Officials right here in Washington, DC. Please proceed.

**STATEMENT OF JOHN HORSLEY, EXECUTIVE DIRECTOR,  
AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS, WASHINGTON, DC**

Mr. HORSLEY. Thank you, Mr. Chairman.

First, we want to commend you and Senator Baucus for convening this joint hearing, and commend you, Senator Reid, and your colleagues in the Senate for fully restoring highway funding for fiscal year 2003 to the \$31.8 billion level that Governors, States, and many others have been pushing for. It is vital that you succeed, and we want to commend you and the Senate for your leadership.

We also hope you will convey our thanks to Senator Baucus for his leadership in moving the 2.5 cents of gasohol revenues that now go to the general fund over to the Highway Trust Fund, and some of the other work that he is doing, including pushing for use of the interest in the Highway Trust Fund in order to put that into our cash-flow and be able to put it to work.

So, I want to thank you both for holding this hearing today. I heard a lot of good things so far, and look forward to Jeff's testimony.

Pete is one of my bosses, so I will try to represent you well, Pete.

Mr. Chairman, we believe that the central issue on reauthorization will be how to grow the program. Huge safety, preservation and capacity needs exist in every region of the country.

To fund them, AASHTO believes Congress must find a way to increase highway funding from \$34 billion in fiscal year 2004 to at least \$41 billion in 2009, and annual transit funding over the next 6 years from \$7.5 billion to \$10 billion.

The challenge, is how to fashion a funding solution that can achieve these goals and garner the bipartisan support needed for enactment next year.

AASHTO has explored a menu of options for generating additional program revenues, including tapping Highway Trust Fund reserves, gasohol transfers, indexing, and raising fuel taxes. While the program could grow somewhat without raising taxes, it would fall short of meeting national needs.

We also directed our staff to explore the feasibility of leveraging new revenues through a federally chartered transportation finance corporation which could achieve AASHTO's goals for highway and transit funding in coordination with all of the other proposals, such as those proposed by Chairman Baucus.

They have developed a creative proposal which appears feasible and has been well received. Let me describe it for you in brief.

Under this concept, Congress would be asked to charter a non-profit transportation finance corporation, authorized to issue \$60 billion in tax credit bonds over 6 years. We describe this as program finance rather than project finance.

Thirty-four billion dollars would go to highways and be apportioned to States through Federal highways, and \$8.5 billion, 20 percent, would be apportioned to transit agencies; \$17 billion of the bond proceeds would be invested in government securities which, over 25 years, would generate a return sufficient to pay off the bond principal.

The Department of Treasury would be reimbursed for the annual cost of the tax credits from the Highway Trust Fund. There would be no impact on the Federal deficit. The TFC would leverage approximately \$18 billion in new revenues into an increase of nearly \$43 billion in program funding.

When we tested this concept with seven Wall Street investment banks and two rating agencies, this is what we heard. No. 1, tax credit bonds are marketable. Capital markets can absorb the amount of bonds being discussed.

Second, bond marketability and liquidity are enhanced by a central issuer, and there is a broad potential investor base, especially if the tax credits could be decoupled from the bond principal.

Our analysis shows that AASHTO's funding targets through fiscal year 2009 could be achieved through the Transportation Finance Corporation without indexing or raising taxes. Over the longer term, however, the program for the following 4 years would slip slightly before it resumed positive growth again in fiscal year 2013.

When the TFC is combined with indexing, not only does the program continue with healthy growth from fiscal year 2010 on, even higher funding levels in the \$41 billion for highways and the \$10 billion for transit would be possible.

We believe this idea has potential, and stand ready to work with Congress to find a way to grow the program using this technique, or other techniques.

In addition to this concept for program financing, we also believe reauthorization needs to make improvements in several project financing tools such as extending State Infrastructure Bank to all 50 States, lowering the threshold for TIFIA loans from \$100 million down to \$50 million, and working with you to change the terms of the RRIF program.

I will be glad to submit the balance of my testimony for the record.

Senator JEFFORDS. Thank you. Excellent testimony.

Our last witness is Jeff Carey, Managing Director of Merrill Lynch & Co., New York, NY.

**STATEMENT OF JEFF CAREY, MANAGING DIRECTOR, MERRILL LYNCH & CO., INC., NEW YORK, NY**

Mr. CAREY. Mr. Chairman, ladies and gentlemen, I am a managing director in public finance at Merrill Lynch. I have had the privilege to work with U.S. DOT, Federal Highway officials, as well as our clients, State transportation officials, and other project sponsors during the last decade on the development and implementation of innovative finance mechanisms.

Thank you for inviting me to provide a wrap-up commentary from a capital markets perspective at today's joint hearings and for encouraging private sector participation during your on-ramp to reauthorization.

Public finance industry professionals are pleased to have played a role in creating a strong market reception for the new transportation funding tools and expanded flexibility for public-private partnerships.

We commend these panel participants, the leadership from DOT and Federal Highway, other State transportation officials, and private sponsors for the dramatic evolution from Federal aid funding to the wide array of financing vehicles and programs introduced and utilized over the last 8 years.

To briefly reflect on the prior testimony, ISTEA, post-ISTEA initiatives, and TEA-21 implementation have produced many market-related accomplishments, dramatically increased bondholder investment in transportation projects and State programs; new and/or specially dedicated revenue sources, particularly for the purpose of paying off debt obligations; broad market acceptance in the use of Federal aid funding for debt instrument financing; more coordination with other funding partners beyond just the States, and lower financing costs and increased project flexibility and feasibility through Federal credit enhancement.

Addressing characteristics sought by capital markets and private sector project sponsors provides efficient market access and innovative transportation finance opportunities.

Coining an earlier term, the “unsentimental characteristics” sought by capital markets participants include: sound, understandable credits; evidence of government support at the Federal and State level; strong debt service payment coverage; predictability in Federal programs and a consistency with an evolution of new funding instruments, something that the MEGA-Fund and Trust Acts would enhance; market rate investment returns for bonds, development costs, and equity investment; reasonable and reliable timing in terms of the receipt of grants and revenues; acronyms that capture Federal programs’ spirit and promote investor familiarity; and volume market profile, and liquidity.

For example, the track record and predictability of Federal aid highway programs enabled GARVEE bonds to be structured without the double-barreled credit of other State credit-backed stops, as described earlier in New Mexico. It was the strong issuance history of municipal bond banks in States like Vermont that served as the model for the development of State Infrastructure Banks or SIBs in the mid-1990’s.

Mr. Chairman, I agree that SIBs such as Vermont’s can provide an extremely flexible and responsive financing tool. How various innovative financing components have been used by public agencies and received by the markets provides a strong road map for reauthorization.

When SIBs were created as part of the 1995 Act, the pilot program for 10 State transportation revolving funds became very popular in 1996, in part because supplemental Federal funding was available for seed capitalization.

Thirty-two States have active SIBs and have made different levels of highway or other project assistance primarily through loans, despite widespread under-capitalization and the curtailment of the program in TEA-21.

Limited capitalization has resulted from the inability to use Federal aid funds outside of five States and the application of Federal requirements and rules to all moneys deposited in the SIB revolving fund, regardless of whether the source was a State, a public contribution, or repaid loan proceeds. In addition, only two States have leveraged their SIBs with bonds.

As a flexible, State-directed tool, SIBs have a greater potential to provide loans and credit enhancement that can be realized through further modifications as part of Reauthorization.

Reauthorization should provide incentives for public-private market-based partnerships that finance, develop, operate, and maintain highways, mass transit facilities, high-speed rail and freight rail, and intermodal facilities. This could be accomplished by permitting the targeted use of a new class of private activity bonds, or by modifying certain restrictions in the Internal Revenue Code on tax-exempt bond financing of transportation modes. We commend the Senate and this committee’s earlier consideration of HICSA, HIPA, and, most recently, the Multimodal Transportation Financing Act.

Mr. Chairman, my office is across the street from the World Trade Center site. As workers in downtown Manhattan, we greatly appreciated your passage of Federal legislation creating a Liberty Zone for the redevelopment of lower Manhattan and for the cre-

ation of a new type of tax-exempt private activity bonds, Liberty Bonds, for the rebuilding and economic revitalization of New York City. Transportation infrastructure financing deserves a bond mechanism similar to Liberty Bonds under Reauthorization to attract more private investment, as well as to increase the use of new construction techniques, cost controls, performance guarantees, and technologies, as also described by the New Mexico Secretary.

Past “innovative finance” should become mainstream transportation finance under TEA-21 Reauthorization, and the Federal Government should provide additional, new financing tools and initiatives, at least on a pilot basis.

The market’s perception of the integrity of the Federal Highway Trust Fund would be greatly enhanced by the MEGA-TRUST Act and the MEGA-INNOVATE Act, providing tax-credit bond proceeds to augment gas tax revenues.

The success of innovative finance places a higher level of responsibility on the Federal reauthorization process to maintain the characteristics that attract strong capital markets and private sector participation.

We want to meet your vision, Mr. Chairman, and your challenge to structure and sell U.S. transportation credits to investor portfolios in U.S. municipal markets and in other appropriate markets.

Thank you.

Senator JEFFORDS. Well, thank you. Excellent testimony, all of you. I am very appreciative, as I think we are going to make some good progress this year.

The first question is for Janice Hahn. Design-build was utilized on the Mid-Corridor Trench portion of the Alameda Corridor. How important was this approach to project the development in your efforts to finance and build the Alameda Corridor?

Ms. HAHN. Well, I think design-build was really one of the reasons that this project came in on time and on budget. It was so important, that actually we had to get an ordinance passed by the City Council of Los Angeles, because previously that was not allowed under the normal building of projects and the RFP proposals. So we estimate that that concept saved the project 18 months in terms of streamlining the majority of that project.

Senator JEFFORDS. Thank you.

I note that the Alameda project was sponsored by ACTA, a special-purpose entity. Does this institutional arrangement provide any advantages?

Ms. HAHN. Well, certainly the whole structure and the cooperative agreements that we came to, joining together two cities, Los Angeles and Long Beach, both rival ports and competing railroads, and then with the public entity of ACTA, provided really a very unique partnership and agreement. I must say, as chairwoman of this Governing Board of ACTA, it is a very small, focused governing board. I think that really is the reason this is so successful.

Senator JEFFORDS. David Seltzer, in an answer to my earlier question, said that one of the keys to attracting private investors is a reliable revenue stream. Janice, can you tell us more about your project’s revenue stream?

Ms. HAHN. Well, that really was another huge piece of success, is we locked in a great revenue stream, which was the containers

themselves. The containers have been there. They are there now, and more are coming every year.

As a matter of fact, as I mentioned, we have 10 million containers using the Corridor on an annual basis. The charge is about \$15 per 20-foot container, so you can see that that is an incredible revenue stream that we have locked in for a very long time.

Senator JEFFORDS. Peter, as a member of the AASHTO Board of Directors, what are your thoughts on that organization's funding proposal?

Mr. RAHN. Mr. Chairman, I support their proposal because I believe it is a way for us to get more money into infrastructure today. I hope that that was one of the things that was made clear by my testimony, was the belief that transportation infrastructure is more valuable in place today than it is tomorrow.

The proposal from AASHTO is a vehicle by which this country can invest in more infrastructure, thereby supporting our economic activity, as well as quality of life and safety of its citizens. I believe it is a very innovative approach. I believe it is workable, and I am hopeful that Congress will approve it.

Senator JEFFORDS. John, in your testimony you state that "finance tools are useful, but only fill a niche in program and project funding."

What changes are needed in reauthorization to allow for more financing of transportation projects?

Mr. HORSLEY. Mr. Chairman, there is need for change at both levels. At the Federal legislative level, we think the authority to extend State Infrastructure Banks to all 50 States, for example, should be included in your bill. There is, I think, a great interest in the success of the five States that are currently authorized.

We would seek your authority to extend it to all 50 States, but with the understanding that all Title 23 requirements come with the extension of that authority, including Davis-Bacon, for example. We are willing to continue to advance the program in partnership with a broad base of interests, including labor, that wants the Davis-Bacon provision to apply to future funding cycles.

Many of our smaller States have told us that the \$100 million restriction in TIFIA is too tight, and they have smaller projects that would benefit from either the additional loan security or other finance enhancements of TIFIA. So, we'd like to have you take a look at dropping that threshold.

The terms and conditions of RRIF includes restrictions that Treasury has put on that are too tight, and we think, if you could take a look at flexing the terms of finance for railroad finance, that would be helpful.

Now, let me tell you, at the State level we have a long way to go. For example, New Mexico represented by Pete here, California and Florida. But we have some very sophisticated States that have long track records of innovative finance and are using those tools well.

We have 17 States that we understand are statutorily barred from using debt finance. So when it comes to enhancing project finance, we have some change that also needs to take place at the State level so they can put to work GARVEEs and some of the

other excellent techniques that you have approved over the last 6 years.

Senator JEFFORDS. A major piece of your testimony centers on the creation of a Transportation Finance Corporation. Under your proposal, the TFC would issue tax credit bonds. We have heard testimony from GAO that these instruments are the most costly long-term to the Federal Government. Why does AASHTO consider this to be the most appropriate bonding mechanism for the Federal aid program?

Mr. HORSLEY. Well, Mr. Chairman, we are looking for the art of the possible. When we tried to put together a vehicle that, as Pete was describing, could leverage revenues that are currently available to achieve the funding targets that we are seeking for fiscal years 2004 to 2009, we looked at several options.

We looked at whether municipal bonds issued at the State level would work, and concluded they would not because so many States have obstacles, either statutory or constitutional, to the issuance of debt and the utilization of GARVEEs in some of the current techniques, so we figured that that would not extend universal help to all 50 States.

We looked at the utilization of municipal bonds at the Federal level and figured that would compete directly with Treasury's, so that was not as good a vehicle. We then looked at the appeal of the tax credit bonds. It was currently pending in RAIL-21 as a vehicle for funding high-speed rail and had been used previously to fund schools through so-called QSABs.

But our conclusion was that the TFC was the most efficient, most viable method that would also score well under Federal scoring rules and just in practical terms, would get us, with current revenues or revenues enhanced with indexing, to the funding targets that States feel are essential, which is over \$40 billion for highways and over \$10 billion for transit.

Senator JEFFORDS. Does it make sense to issue bonds to support the mainline work of State DOTs, namely system preservation? Would it not be more appropriate to reserve debt financing for capital improvements, and particularly for those projects with associated revenue streams?

Mr. HORSLEY. Mr. Chairman, the Transportation Finance Corporation funding, that we are talking about, we classify as program finance, which would then be available to States to use for all of those purposes.

But we are looking for a near-term practical solution that gives you a measure you can pass with bipartisan support to boost funding for the next cycle to the funding levels we are after.

When it comes to the use of the issuance of municipal bond debt at the State level, I think each State has to make a judgment whether they issue long-term debt, for long-term purposes, such as schools, water and sewer plants, and most hospitals.

Almost every other area of public infrastructure is financed through debt. We think that transportation has been slower than those other entities to come to the table and use debt finance for long-term infrastructure. But we think the time has come.

As you have from both of these panels, the market is there and the transportation agencies are there and are utilizing debt finance

on an increasing basis. But the one differentiation I wanted to make was between the program finance, which would flow out to States for utilization as if it were cash over the next 6 years, and then Pete could leverage it as he saw fit through further leverage through GARVEEs and other means, as opposed to project finance, which we also support.

Senator JEFFORDS. Mr. Carey, as I mentioned in my opening remarks, I have a vision that investment in U.S. transportation infrastructure would become a component of every fund manager's portfolio. Based on your experience, what measures should Congress consider to expand private sector investment to assist in making transportation a solid investment choice?

Mr. CAREY. I think it is a focus on the previously stated "unsentimental characteristics" in terms of maintaining predictability and Federal program consistency in the introduction of new instruments. Also, to provide an opportunity for market rate investment returns on transportation project finance.

Also, as has been described in some of the proposals today, an opportunity to look at new taxable instruments, as well as variations on existing tax-exempt instruments, to broaden the existing capital markets participation in transportation finance.

I have to stress, however, that the municipal markets in the United States are unique in the world. These markets are incredibly deep, conservative, and provide guidance for Federal credit assistance and other initiatives on the part of the Federal Government under TIFIA.

Also, these markets provide a lot of examples that have been adopted for transportation "innovative finance" over the last 8 years. They are incredibly easy for States and local governments to access, which is not the case in the taxable markets or in foreign government markets.

Senator JEFFORDS. Well, thank you very much, all of you. I find that you have done such a wonderful job, I am not even going to ask you the final question I had because you have already answered it with all of your testimony. So, you have a grade A+ for your participation today.

[Laughter.]

I would like you to know that.

But we will also reserve the right to continue to hound you until such time as we come through with a perfect solution. Thank you very much. That goes for both panels. This has been a very excellent hearing. I look forward to working with you as we continue forward to give our people the best advantages we can to make this the best transportation bill that ever occurred. Thank you very much.

[Whereupon, at 11:58 a.m. the hearing was concluded.]

[Additional statements submitted for the record follow:]

STATEMENT OF SENATOR JON S. CORZINE, U.S. SENATOR FROM THE STATE OF NEW JERSEY

Thank you, Chairman Jeffords and Chairman Baucus, for holding this joint hearing on the success we have had on expanding the reach of the highway trust fund through innovative financing and how we can continue that success in the reauthorization of TEA-21. I look forward to hearing from our witnesses.

Chairman Jeffords and Baucus, it is clear that we need to consider alternative means to finance our important highway and mass transit projects. AASHTO estimates that the annual level of investment needed to maintain current conditions and performance of our highway systems is \$92 billion. For mass transit, the amount is \$19 billion. We are falling far short of this under the authorized amounts of TEA-21. To get even close, we need to look at all sources of funding, including financing.

Congress enacted financing provisions in TEA-21. Under the "Transportation Infrastructure Finance and Innovation Act" (TIFEA), the Department of Transportation may provide secured loans, lines of credit and loan guarantees to public and private sponsors of eligible surface transportation projects. \$530 million was authorized for this program.

Chairman Jeffords and Baucus, we need to look at what good has been done under TIFEA, what needs to be changed, and what can be done in addition to TIFEA. I look forward to working with you both to explore ways to do this.

---

STATEMENT OF DAVID SELTZER, DISTINGUISHED PRACTITIONER, THE NATIONAL CENTER FOR INNOVATIONS IN PUBLIC FINANCE, UNIVERSITY OF SOUTHERN CALIFORNIA

A FEDERAL POLICY COMPARATOR FOR PUTTING "INNOVATIVE FINANCE" IN CONTEXT

Good morning, ladies and gentlemen. My name is David Seltzer, and I am a principal at Mercator Advisors, LLC, a consulting firm that advises public, private and nonprofit organizations on infrastructure financing issues. I also am affiliated with The University of Southern California's National Center for Innovations in Public Finance. The National Center, established 2 years ago, undertakes research and helps provide mid-career professional training in the field of infrastructure finance, including the growing use of public-private partnerships for project delivery. I would like to submit for the record a copy of a report USC published last year on California's 10-year experience with Innovations in Public Finance, which may prove informative to your committees.

Previously, I had the privilege of serving as Capital Markets Advisor for 3 years at the U.S. Department of Transportation during TEA-21's authorization, and before I that spent over 20 years assembling bond issues for transportation and other public agencies as an investment banker. So having worked in the public and private sectors, I have clearly violated both ends of the timeless dictum of "neither a borrower nor a lender be."

You will be hearing testimony this morning from a distinguished array of Federal, State, local and private sector experts in connection with new financing initiatives for reauthorization. Since many of the new ideas draw upon tax incentives as well as other Federal policy tools, I commend you on making this is a joint hearing of both the tax writing and surface transportation authorizing committees.

I found when in Federal service that the wide array of financial tools, techniques and even terminology can be bewildering. If I may, I'd like to put on my academic hat for a couple of minutes and try to present an analytic framework that may be helpful in comparing so-called "Innovative Finance" options.

The term "innovative finance" in Federal transportation parlance encompasses not only new financing techniques such as State Infrastructure Banks and TIFIA credit support, but also new approaches in the areas of project delivery, asset management, and service operations. In many cases, the techniques involve some form of public and private sector partnering. Private participation is seen as offering the potential to transfer risks, achieve production or operating efficiencies, and attract additional capital.

In order to systematically analyze the cost-and policy-effectiveness of an innovative finance proposal, I believe it would be useful to employ a "Federal Policy Comparator." A comparator is a scientific instrument used for measuring the features of different objects. In much the same way, it should be possible to compare various innovative finance proposals within an analytic framework to determine which proposals would be most effective.

The Federal Policy Comparator would seek answers to three central questions:

1. *Which Federal Policy Incentives are most suitable to attaining the proposal's objectives?*

2. *Does the proposal achieve balance among Sponsors, Investors and Policymakers?*

And

3. *What is the Budgetary Treatment of the proposal?*

1. Which Federal Policy Incentives are Most Suitable? Aside from conventional grants, the Federal Government has available to it three major types of incentives it can use to stimulate capital investment:

- Regulatory Incentives make existing programs and tools more flexible, in order to expand project resources or accelerate project delivery. (GARVEE Bonds are one such example, in that they broadened allowable uses for grants to include paying debt service on bond issues that fund eligible projects. Other regulatory reforms include design-build contracting, in-kind match and environmental streamlining.)

- Tax Incentives involve modifying the Internal Revenue Code to attract investors into transportation projects. (Examples include private activity bonds, tax credit bonds, and tax-oriented leasing.)

- Credit Incentives provide Federal assistance in the form of Federal loans or loan guarantees to reduce the cost of financing and fill capital gaps. (Examples include Federal credit instruments provided through TIFIA and the Railroad Rehabilitation and Improvement Financing (RRIF) program.)

Generally, there is a tradeoff between the budgetary cost of the incentive and its degree of effectiveness in making the desired capital investment feasible. For instance, many regulatory reforms have little or no budgetary cost, but they also generally provide only very incremental assistance in advancing projects. Tax measures typically are a “helpful but not sufficient” pre-condition for investment; the project must be on the margin of viability to benefit from them. Credit assistance can fill funding gaps and attract co-investment, but its uncertain cost depends on risk factors and interest rate subsidies. For instance, a complex and capital-intensive initiative such as Maglev may confer significant mobility, environmental and technology benefits. However, it also may well require deeper tax and/or credit subsidies in order to bring projects to fruition than that afforded by an incentive such as private activity bond eligibility.

2. Does the Proposal Achieve Balance Among Sponsors, Investors and Policymakers? To be successful, each innovative financing initiative should be designed to meet the requirements of three distinct groups of stakeholders. First, the proposal must be attractive to project sponsors—the public or private entity responsible for delivering the project. Attractiveness to the project sponsor can be measured in terms of its cost-effectiveness, flexibility, and ease of implementation. Second, the proposal must make sense to investors—offering them a competitive risk-adjusted rate of return. Capital is notoriously unsentimental, and the innovative finance tool must compete for investor demand against other investment products in the marketplace. And finally, the concept must make sense to Federal policymakers. This entails not only achieving public policy objectives but also being affordable in terms of budgetary cost. These three groups—project sponsors, investors and policymakers—can be thought of as the legs of a three-legged stool. If any one leg of the stool has shortcomings, the proposal will wobble, and probably not be supportable.

For example, dating back to the 1993 Federal Infrastructure Investment Commission, there has been a wide-stated interest in trying to voluntarily attract pension fund capital into the infrastructure sector. Public, union and corporate plans represent over \$3.6 trillion of assets, yet they have virtually no U.S. transportation projects in their portfolios. Why? Because the dominant financing vehicle to date has been tax-exempt municipal bonds. While the tax-exempt market will continue to be an absolutely critical component of infrastructure financing, pension funds, as tax-exempt entities, place no value on the tax-exemption. Pension funds gladly would purchase infrastructure debt if it were offered at higher taxable yields, but that has limited appeal for the project sponsors who can access the municipal market. Consequently, the three-legged stool is uneven. (I note that various proposals have been introduced recently to create a “win-win” security that is both cost-effective for borrowers and competitively priced for pension fund lenders—while at the same time satisfying Federal policy drivers.)

3. Finally, what is the Budgetary Treatment of the proposal? Efficient markets rely upon transparent pricing signals to function properly. However, oftentimes when Federal proposals are being developed, the key pricing information—budget scoring—is at best translucent, if not completely opaque. It seems it is the mysterious scoring of a proposal, and not its policy effectiveness, that too frequently drives the ultimate policy decision—perhaps a case of the “tail wagging the dog.” Better information on budgetary costs earlier on in the process would benefit the development and evaluation of alternative policy options.

Unlike corporate and State and local entities, the Federal Government makes no budgetary distinction between current period operating outlays and long-term capital investments. Nor does it distinguish between full faith and credit general obligations and limited special revenue pledges. From the perspective of infrastructure

advocates, this is both inequitable and inefficient: Inequitable in that costs are not shared by future beneficiaries, and inefficient in that there is a bias toward considering those proposals that have the lowest front-end costs, rather than looking at cost-effectiveness over the long-term.

Some Federal innovative finance concepts attempt to overcome this problem by drawing upon either credit reform budgetary rules (a rare case where Federal accounting is on an accrual basis and conforms to best commercial practices) or by utilizing the tax code (where the PAYGO rules recognize tax expenditures on an annual basis).

While some may consider these tools to be unnecessarily complicated attempts to circumnavigate cash-based accounting, I believe they offer the benefit of rationalizing the budgetary treatment of capital spending and facilitating sound decisionmaking on Federal infrastructure policy.

In conclusion, I submit that by using this three-part Federal Policy Comparator as an analytic framework, policymakers can more systematically compare the budgetary cost with the policy effectiveness of proposals. It would allow comparisons of initiatives as varied as private activity bonds for intermodal facilities, shadow tolling for highways, national or regional loan revolving funds for freight rail, tax credit bonds for high-speed rail, and reinsurance for long-term vendor warranties. By way of illustration, I am including as an attachment a pro-forma Federal Policy Comparator analysis of four current or proposed Federal innovative finance tools for surface transportation—GARVEE Bonds, TIFIA Instruments, Private Activity Bonds and Tax Credit Bonds.

Thank you very much for your time. I would be happy to answer any questions you might have.

## ***Using a Federal Policy Comparator to put "Innovative Finance" in Context***

Joint Committee Hearing on Innovative Finance

Senate Committee on Environment and Public Works  
Senate Committee on Finance

September 25, 2002

*David Seltzer, Distinguished Practitioner  
National Center for Innovations in Public Finance  
University of Southern California*

*Four Features of "Innovative Finance" Tools*

USC / National Center for Innovations in Public Finance

*Balancing the Interests of Three Key Stakeholder Perspectives when Designing Innovative Finance Tools*

USC / National Center for Innovations in Public Finance

### *Project Sponsor Drivers*

- What is the effective financing cost (IRR)?
- How high is the annual payment factor?
- Is there a direct or contingent financial liability to the sponsor's balance sheet?
- What is the book and legal accounting treatment (e.g. approval requirements, debt ceilings)?
- How difficult is it to implement?

USC / National Center for Innovations in Public Finance

### *Investor Decision Drivers*

- Is the risk-adjusted rate of return competitive?
- Is there a secondary market (liquidity)?
- Are there other investment risks (tax compliance, call risk, etc.)?
- Will it help diversify portfolio exposure?
- Are there any other strategic reasons for investing?

USC / National Center for Innovations in Public Finance

### *Federal Policy Drivers*

- † What is the budgetary cost?
- † Is the finance tool cost-effective (how much leveraging)?
- † What is the overall economic return (benefit/cost ratio)?
- † Does it support federal policy objectives (e.g. access, mobility, safety through better management, private participation, project acceleration)?

USC / National Center for Innovations in Public Finance

### *1. New Sources of Debt Repayment: GARVEE Bonds (23 U.S.C. 122)*

- † State issues tax-exempt bonds to fund federal share (e.g. 80%) of Federal-aid eligible project costs.
- † Principal and interest are repayable from future years' anticipated FHWA apportionments.
- † Bonds may stand alone or be backed by the state.
- † State must meet match on a present-value basis.

USC / National Center for Innovations in Public Finance

### Flow Chart of GARVEE Bonds

USC / National Center for Innovations in Public Finance

### Project Sponsor Pros and Cons of GARVEE Bonds

#### Advantages

- + Accelerates non-revenue projects (avoided costs and accelerated benefits).
- + Avoids having one large "pay-as-you-go" project displace numerous small ones.
- + Promotes efficient resource allocation by matching term of payments with life of asset.
- + Protects the state's general credit rating (if stand-alone).

#### Disadvantages

- + Reduces out-year capacity / flexibility by consuming future years' grants.
- + If stand-alone, may entail slightly higher interest cost than G.O. or State Highway Fund backed debt.
- + State may need to obtain legislative authority or voter approval.
- + State must demonstrate that acceleration benefits outweigh financing costs.

USC / National Center for Innovations in Public Finance

## *Investor Pros and Cons of GARVEE Bonds*

### Advantages

### Disadvantages

- |   |   |
|---|---|
| <ul style="list-style-type: none"> <li>+ Mid-investment grade ratings reflect adequate security.</li> <li>+ Growing number of states issuing GARVEEs builds political constituency for continuing the Federal-aid program.</li> <li>+ Direct assignment of grants to trustee reduces risk.</li> </ul> | <ul style="list-style-type: none"> <li>+ No assurance that the Federal-aid program will be reauthorized over the life of the bonds (no federal guarantee of payment).</li> <li>+ Bonds may be non-recourse to the issuer (no state back-stop or security interest in the facility being financed).</li> </ul> |
|---|---|

USC / National Center for Innovations in Public Finance

## *Federal Policy Pros and Cons of GARVEE Bonds*

### Advantages

### Disadvantages

- |  |   |
|--|---|
| <ul style="list-style-type: none"> <li>+ Simple "program" with little additional federal administration.</li> <li>+ As a regulatory / eligibility initiative, avoids explicit budget scoring.</li> <li>+ Consistent with efficient / equitable pay-as-you-use funding strategy that accelerates project benefits.</li> </ul> | <ul style="list-style-type: none"> <li>+ Some policymakers see tax-exempt bonds as an inefficient subsidy, since the federal revenue loss exceeds the interest savings benefit to the borrower/issuer.</li> <li>+ GARVEE projects are still funded mostly (e.g. 80%) by the federal government (limited leveraging with non-federal funds).</li> <li>+ Use of GARVEEs slightly increases the Federal-aid program spend-out rate.</li> </ul> |
|--|---|

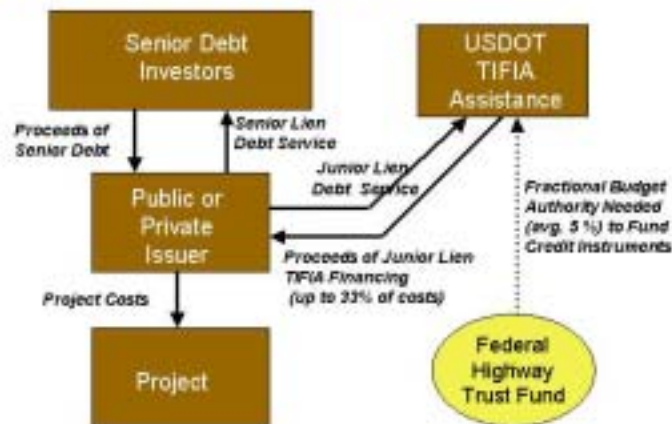

USC / National Center for Innovations in Public Finance

## 2. New Sources of Investment Capital: TIFIA Instruments (23 U.S.C. 181-189)

- + Direct federal credit assistance in the form of loans, loan guarantees and lines of credit.
- + Designed to provide supplemental and subordinate capital for large project financings.
- + Twin-test volume cap of the lesser of \$10.6 billion in credit authority or \$530 million in budget authority.
- + Limited to 33% of eligible project costs.
- + Project must cost \$100 million (or 50% of state's apportionments).
- + Project's senior debt must be investment grade ("BBB-" or higher).

USC / National Center for Innovations in Public Finance

### Flow Chart of TIFIA Assistance

USC / National Center for Innovations in Public Finance

## *Project Sponsor Pros and Cons of TIFIA*

### Advantages

### Disadvantages

- |  |   |
|--|---|
| <ul style="list-style-type: none"> <li>+ Source of "patient capital" for large projects.</li> <li>+ Flexible payment structures, including deferrals and prepayments.</li> <li>+ TIFIA lending rate (U.S. Treasuries) is competitive with tax-exempt borrowing rates for weaker (low-rated) credits.</li> <li>+ Reduced transaction fees and no credit facility fees.</li> </ul> | <ul style="list-style-type: none"> <li>+ Limited to 33% of project costs.</li> <li>+ Direct loans may not be attractive for stronger (high-rated) projects with access to the tax-exempt market.</li> <li>+ TIFIA makes the entire project subject to federal rules, including NEPA.</li> </ul> |
|--|---|

USC / National Center for Innovations in Public Finance

## *Investor Pros and Cons of TIFIA*

### Advantages

### Disadvantages

- |   |   |
|---|---|
| <ul style="list-style-type: none"> <li>+ Direct loan strengthens senior bondholders' security by shifting up to 33% of borrowings to a junior position.</li> <li>+ Loan guarantee secures bondholders with pledge of the U.S. government.</li> <li>+ Line of credit provides supplemental capital to mitigate revenue "ramp-up" risk.</li> <li>+ Co-investment by federal government indicates public sector commitment to and due diligence on the project.</li> </ul> | <ul style="list-style-type: none"> <li>+ For weaker (low-rated) projects, the "springing lien" may erode the functional subordination of TIFIA assistance.</li> <li>+ Co-investment by the federal government does not imply any U.S. backing of the non-TIFIA debt (TIFIA assistance mitigates but does not eliminate project financing risks).</li> </ul> |
|---|---|

USC / National Center for Innovations in Public Finance

## *Federal Policy Pros and Cons of TIFIA*

### Advantages

### Disadvantages

- |   |  |
|---|--|
| <ul style="list-style-type: none"> <li>+ Substantial leverage both internally (fractional risk-scoring) and externally (federal share 33% or less).</li> <li>+ Costs only 5 cents per dollar lent, on average.</li> <li>+ Substantial co-investment by private sector helps ensure fiscal discipline.</li> <li>+ Investment grade requirement for senior debt limits federal exposure.</li> <li>+ Facilitates large project financings with significant public benefits.</li> </ul> | <ul style="list-style-type: none"> <li>+ Federal government generally is opposed to taking a subordinate lien position.</li> <li>+ TIFIA assistance for non-project financings may displace rather than induce capital markets participation.</li> <li>+ "Procrustes' Bed" syndrome: credit applicants are either too risky or too well off, meaning program assistance is either inadvisable or unnecessary!</li> </ul> |
|---|--|

USC / National Center for Innovations in Public Finance

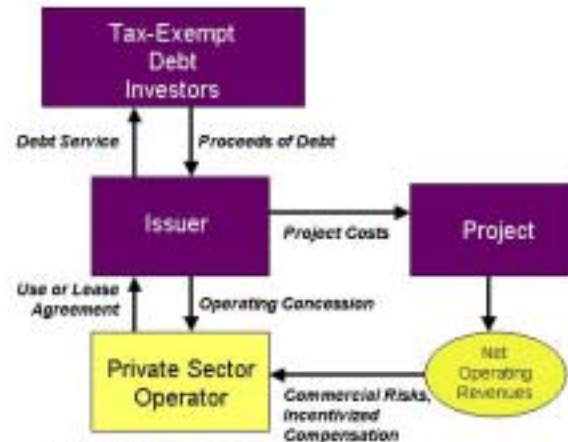

## *3. New Methods of Project Delivery: Private Activity Bonds*

- + Proposed tax code change (S. 870 – The Multimodal Transportation Financing Act, or "Multitrans").
- + Authorizes certain highway, transit, rail and intermodal projects with ongoing private participation to issue tax-exempt private activity bonds (exempt from volume caps).
- + Allows for-profit companies to share in commercial risks and rewards of projects through long-term management contracts.
- + Permits 2 advance refundings for revenue bond-financed projects (vs. one or none under current law).

USC / National Center for Innovations in Public Finance

### Flow Chart of Private Activity Bonds

USC / National Center for Innovations in Public Finance

### Project Sponsor Pros and Cons of Private Activity Bonds

#### Advantages

- + Tax-exempt debt is cheaper (20-25% interest savings in p.v. terms).
- + Broader universe of investors in the tax-exempt market who understand infrastructure projects.
- + Familiar funding mechanism to most state and local governments.
- + Private participation in development and/or operation aligns motives and reduces costs and risks.

#### Disadvantages

- + Must adhere to IRS requirements concerning investment yields, permitted uses, etc.
- + May not be a deep enough subsidy in and of itself to advance larger, more complex projects.

USC / National Center for Innovations in Public Finance

## *Investor Pros and Cons of Private Activity Bonds*

### Advantages

- + Slightly higher yield (approx. 0.10%) due to the Alternative Minimum Tax.
- + Reassuring participation of the government in the project approval process through issuer conduit, franchise award, etc.
- + Alignment of interests between private developer / operator and investors.
- + Potential co-investment by vendors and other project participants.

### Disadvantages

- + Bonds likely to be non-recourse to the issuer (no "deep pocket").
- + Perception of riskier tax status than for governmental purpose bonds.

USC / National Center for Innovations in Public Finance

## *Federal Policy Pros and Cons of Private Activity Bonds*

### Advantages

- + Encourages private investment (and associated benefits / efficiencies) in public infrastructure with little administrative cost.
- + Levels the playing field by providing the same tax incentives for all modes of transportation.
- + Budget scoring *should* be minimal, since much of the financing activity should be a substitution for governmental purpose bonds.

### Disadvantages

- + Some policymakers see tax-exempt bonds as an inefficient subsidy, since the federal revenue loss exceeds the interest savings benefit to the borrower/issuer.
- + Despite the likely "substitution effect," significant tax expenditures are scored against such proposals (up to \$18m per \$100m of bonds over 10 years).

USC / National Center for Innovations in Public Finance

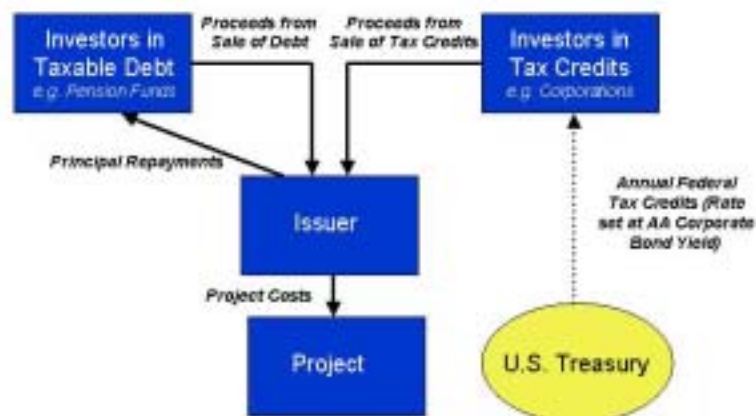

#### 4. New Types of Financial Return: Tax Credit Bonds

- ✦ Proposed tax code change (S. 250 – The High-Speed Rail Investment Act of 2001) to provide annual federal tax credits to bond purchasers.
- ✦ Investors would receive annual tax credits in lieu of cash interest payments from the issuer.
- ✦ Tax credit would be set at mid investment grade corporate bond yield (e.g. 6.50%) and would be taxable.

USC / National Center for Innovations in Public Finance

#### Flow Chart of Tax Credit Bonds

(assuming interest is split from principal)

USC / National Center for Innovations in Public Finance

## *Project Sponsor Pros and Cons of Tax Credit Bonds*

### Advantages

### Disadvantages

- |  |  |
|--|--|
| <ul style="list-style-type: none"> <li>+ 0% effective cost of borrowing represents approximate 50% total savings in p.v. terms.</li> <li>+ Potential for accessing new category of institutional investors for infrastructure projects – Pension Funds.</li> <li>+ Doesn't compete with issuer's traditional investor base.</li> </ul> | <ul style="list-style-type: none"> <li>+ Limited investor familiarity may hinder marketability of bonds.</li> <li>+ Program volume is controlled by Congress, rather than issuers (as with tax-exempt bonds).</li> </ul> |
|--|--|

USC / National Center for Innovations in Public Finance

## *Investor Pros and Cons of Tax Credit Bonds*

### Advantages

### Disadvantages

- |  |   |
|--|---|
| <ul style="list-style-type: none"> <li>+ Should be of reasonably high credit quality, since there is no risk of payment default on the "interest" portion (the tax credit).</li> <li>+ If principal de-coupled from tax credits, opportunity for pension funds to diversify into the infrastructure sector.</li> </ul> | <ul style="list-style-type: none"> <li>+ Non-cash nature of the interest component limits marketability.</li> <li>+ New instrument with limited volume lacks an active secondary market, if investor needs to sell due to change in its tax position.</li> <li>+ May face tax risk, if issuer fails to meet federal requirements of the program.</li> </ul> |
|--|---|

USC / National Center for Innovations in Public Finance

## Federal Policy Pros and Cons of Tax Credit Bonds

### Advantages

### Disadvantages

- + Little administrative cost compared to grant and credit programs.
  - + Some policymakers believe tax credit bonds are a more efficient subsidy than tax-exempt bonds – borrower gets 100% of tax benefit.
  - + May reduce muni bond tax expenditures, to the extent it substitutes for issuance of tax-exempt bonds.
  - + New form of public-private partnership, new source of capital for public infrastructure.
- + Compared to tax-exempt bonds, much deeper subsidy (50% vs. 10% debt service savings to borrower) with higher tax expenditures.
  - + Tax expenditures scored at up to \$46m per \$100m of bonds over 10 years.

USC / National Center for Innovations in Public Finance

APPENDIX B: FINDINGS & RECOMMENDATIONS: A ROUNDTABLE DISCUSSION OF CALIFORNIA'S EXPERIENCE WITH INNOVATIONS IN PUBLIC FINANCE, THE NATIONAL CENTER FOR INNOVATIONS IN PUBLIC FINANCE, UNIVERSITY OF SOUTHERN CALIFORNIA, APRIL, 2001.

[December 13, 2000]

FINDINGS AND RECOMMENDATIONS, REPORT PREPARED BY THE UNIVERSITY OF SOUTHERN CALIFORNIA, NATIONAL CENTER FOR INNOVATIONS IN PUBLIC FINANCE

A ROUNDTABLE DISCUSSION OF CALIFORNIA'S EXPERIENCE WITH INNOVATIONS IN PUBLIC FINANCE: FINDINGS, RECOMMENDATIONS AND PROCEEDINGS: IMPLICATIONS FOR FINANCING OUR NATION'S INFRASTRUCTURE

(Edited by Daniel V. Flanagan, Jr.; Director, David Seltzer, Distinguished Practitioner, USC; Sarah Layton, President, Advancing Infrastructure, LLC)

---

UNIVERSITY OF SOUTHERN CALIFORNIA,  
NATIONAL CENTER FOR INNOVATIONS IN PUBLIC FINANCE,  
*Los Angeles, CA April 2, 2001.*

DEAR FRIENDS: On December 13, 2000, the University of Southern California hosted a Roundtable policy discussion at USC's Sacramento Center entitled "California's Experience with Innovations in Public Finance." The program was sponsored by a grant received from the United States Department of Transportation. The National Center for Innovations in Public Finance, located within USC's School of Policy, Planning & Development, served as the host coordinator.

As the Director of the National Center, it is my pleasure to enclose a summary of Findings, Recommendations and Proceedings elicited from the participants at the Roundtable. Approximately 75 experts, drawn from governmental, academic and business organizations within California and throughout the country, were in attendance.

The National Center for Innovations in Public Finance is dedicated to exploring how new development and financing techniques involving public-private partnerships could contribute to addressing the nation's infrastructure challenges at the national, State and local levels. We believe that many of the ideas and recommendations generated at the Roundtable could serve as important references in future public policy decisions.

For those interested in a more complete record of proceedings, a videotape of the conference as well as a summary of each speaker's remarks may be obtained through the National Center. We would welcome any comments you might have on the Roundtable. I would like to thank the entire faculty and staff at the USC Sacramento Center for their support of this valuable effort.

Sincerely,

DANIEL V. FLANAGAN, JR., *Director*  
*National Center for Innovations in Public Finance*

UNIVERSITY OF SOUTHERN CALIFORNIA

The USC School of Policy, Planning, and Development (SPPD) builds on the strengths of two premier professional schools to address the dynamic intersects of the public, private and nonprofit sectors. Launched on July 1, 1998, the new School combined the former nationally ranked schools of Public Administration and Urban Planning and Development and offers degrees in five core areas—public policy, planning, public administration, health administration and real estate development.

The School's primary mission is to cultivate leaders—the ethical men and women who will design and build our communities, reshape our governmental structures and processes and rethink the relationship between government, citizens and business. We accomplish this in three important ways: teaching that prepares students to lead, shape and manage in the evolving new 21st century world order; research that takes advantage of and contributes to Southern California, the State, the Nation and the world; and action that yields insights and offers solutions to pressing societal problems.

The USC Sacramento Center, located at 1800 I Street, Sacramento, offers Master programs in Public Administration, Health Administration, and Planning and Development. The Center also offers leadership training programs. For more information about the Center and additional programs, please visit [www.usc.edu/sacto](http://www.usc.edu/sacto).

The National Center for Innovations in Public Finance was established in 1999 to promote research and instruction in the field of infrastructure finance. Housed within USC's School of Policy, Planning and Development, the National Center draws upon USC academic faculty and distinguished practitioners from the public and private sectors to teach courses, conduct research projects and provide advice on key public policy issues. The Founder and Executive Director of the National Center is Daniel V. Flanagan, Jr. who has been centrally involved in framing national policy in the areas of deregulation of utilities and in transportation finance.

This report was prepared as part of a project sponsored by the University of Southern California with funding from the Federal Highway Administration, under the terms of a cooperative agreement. The views expressed herein are those of the conference speakers, participants and authors of this report and do not necessarily represent the views of the University of Southern California or the Federal Highway Administration.

#### INTRODUCTION

Ten years have passed since the first toll road franchises were awarded by the California Department of Transportation in December 1990, under Assembly Bill No. 680 (A.B. 680). To date, only one of the four projects selected through that process—the SR 91 Express toll lanes—actually has been built and is operational. Yet this landmark legislation and other initiatives across the State for highways, seaports, transit, intercity rail, and airports have made California the nation's leading incubator for using public-private partnerships to develop, finance and manage transportation facilities and services.

The California experiment with public-private partnerships has seen a number of new approaches used to deliver and manage transportation projects. In the highway sector, in addition to the SR 91 project, three major new toll roads have combined design-build development teams, a project-finance approach, and Federal credit assistance: a second AB 680 franchise—the SR 125 toll road south of San Diego, which is scheduled to come to market during 2001—as well as two new toll roads developed in the mid-1990's by the Orange County Transportation Corridor Agencies.

In the transit sector, major new capital investments such as the BART Airport Extension and the recently awarded Los Angeles-Pasadena light rail line have drawn upon novel design-build procurement techniques. The Alameda Corridor freight rail project represents a unique joint venture between two major rail carriers, the Ports of Long Beach and Los Angeles, and numerous other local, State and Federal stakeholders. Several new private sector initiatives are being pursued across the State in the aviation sector.

Outside of California, one sees unmistakable evidence both in other States and at the Federal level of greater willingness to experiment with innovative public-private approaches to address infrastructure investment needs. Taken together, these developments indicate that the evolution—if not the revolution—is well underway in how large infrastructure investments are being developed and financed.

With a decade's experience in California, it is timely to look back and candidly assess the strengths and weaknesses of using public-private partnerships for major transportation projects.

Among the questions that need to be explored are:

- What kinds of projects are most suitable for public-private partnerships?
- Are public policy objectives adequately being served through these public-private approaches?
- Have there been demonstrable advantages in terms of expedited project completion, greater cost-effectiveness, or reduced public sector risk?
- What are the appropriate roles for the public and private sectors at various stages of each project's development?
- Does the current development process properly balance social objectives such as environmental considerations and fair labor practices with capital investment needs?
- Which institutional models and capital structures appear to work best in terms of both economic efficiency and social equity?

The lessons learned from California's experience—as well as that of other States and from recent Federal activities—could provide valuable insights into what new policies to consider for the upcoming State of California budget considerations and for the Federal reauthorization of the TEA-21 transportation bill in 2003.

*The State Economy*

California's economy—really a series of major regional sub-economies—has changed dramatically in recent years. The State domestic product is now of similar magnitude to the gross national products of major Western European trading partners such as Italy, the United Kingdom, and France. Moreover, California has been the epicenter of the e-economy. And yet, as profound as the emergence of e-commerce has been, the “new” economy is very much dependent on the infrastructure of the “old”; businesses are increasingly reliant upon timely delivery of goods and services. At the same time, the mobility of e-business, which allows employers to locate their places of employment “virtually” anywhere, makes good transportation links critical if the State is to remain an attractive venue for these high value enterprises. The State's population is expected to grow by another 10 million residents by 2020, placing further burdens on aging transport infrastructure systems to move people and goods safely, quickly and cost-effectively.

*Past State Investment Policy*

Investment in transportation infrastructure within the State has not kept pace with either the growth of population or the increase in travel demand. California's per capita investment in transport has declined by two-thirds in real terms since the 1960's. Forty years ago, transportation spending represented 23 percent of the State budget; today, it comprises about 6 percent. One of the major reasons for underinvestment has been the fiscal constraints of the tax limitation measures enacted in the 1960's and 1970's. The current electricity crisis has also added a new uncertainty as to budgeting for transportation.

Presently, there is no exclusive dedicated State funding source for transportation, so it has had to compete with other governmental and social service programs for annual funding through the political process. Because of the lengthy lead-time required to develop major infrastructure projects, such investments are dependent upon stable and reliable long-term funding commitments. And, as with the electricity sector, new capital formation has been curtailed because of increased concerns about environmental issues. As a result, transportation services have deteriorated dramatically. For example, the time lost by the average motorist due to freeway delays has doubled over the last decade. Prospects for the future are problematic: Many of the county local option sales taxes adopted in the 1980's for transportation funding expire over the next several years, yet their extension by voters is uncertain.

*Recent Initiatives*

The State has taken several positive steps in recent months to address these concerns. The Governor's Commission on Building for the 21st Century will soon publish the results of its 18month survey of California's infrastructure investment needs. The final report is expected to cite that California today has over \$100 billion in unmet transportation investment needs.

Even prior to the completion of the Commission's report, the State had started leveraging its available funding through mechanisms such as the California Infrastructure and Economic Development Bank and Grant Anticipation Revenue Vehicles (GARVEEs). The Bank is a new \$475 million State loan revolving fund designed to make loans to small and mid-sized transportation and other infrastructure projects. GARVEE Bonds, which were authorized by the State legislature last year, are a form of non-tax backed borrowing in anticipation of future year's grant assistance from the Federal Department of Transportation. Another important advance is the enactment of bill A.B. 1473, under which the State would begin preparing annual Five-year Capital Facilities Plans to better integrate capital planning and financial policy decisions.

Yet these measures by themselves will not be sufficient to overcome past years' underinvestment. Simply stated, more resources must be identified, collected and committed. And the State needs to consider how best to leverage these finite resources most effectively. California's recent electricity crisis has underscored the importance of a comprehensive State strategy that responds to market signals as conveyed through the pricing mechanism, to ensure a proper balance between supply and demand. Public-private partnerships (PPP's) can play a key role in helping solve the problem—especially for the larger, more complicated projects.

*Issues to be Addressed*

Conferees identified the following issues currently confronting State policymakers:

- There is a clear need for better planning of capital investments—specifically, more closely relating State transportation spending policy to State land use and housing policy. The State should integrate its planning and funding strategies for water systems, drainage, waste management and public buildings with its transportation investment decisions.

- The current allocation formula under S.B. 45 distributes 75 percent of State transportation funding to the metropolitan planning organizations and retains 25 percent to be administered at the State level. This regional emphasis, while valuable in vesting investment decision authority with metropolitan organizations, makes it difficult to address statewide transportation issues on a comprehensive and systematic basis. For example, it is difficult to coordinate actions for inter-regional investments such as intercity high-speed rail or regional airport systems to relieve congestion at heavily used facilities.

As zoning is a local matter, the MPO's cannot control land use policy decisions at the municipal level. Fractionalized zoning policy at the local level often leads to a disconnect between infrastructure planning efforts and actual development activities.

- The plan of finance for new capital projects should explicitly identify not only how to finance upfront acquisition costs but also how to pay yearly operating and maintenance costs over the projects' useful lives. The financial interdependence between asset acquisition and asset maintenance must be firmly established at the outset. The initial capital investment decision should be based upon Life-Cycle Costing, taking into account the best value for money over the long-term economic life of the asset.

- To the extent tax sources fall short, the State should explore user fees, since they send a clear market signal about consumer demand for goods and services. To the extent there are "free" transportation alternatives (such as a freeway with tolled express lanes), the user charge allows individuals to make an economic decision as to whether the timesavings and convenience of the tolled facility are worth the cost. User charges also free up limited grant funds for those projects that are important for reasons of social equity or public policy, but are not financially self-sustaining. By freeing up capacity on non-tolled facilities, user charges actually may benefit those who are not in a position to pay. Ideally, these charges would reflect the user's actual consumption of transportation services, such as fees based on weight-distance or vehicle miles traveled. The challenge in establishing user charges is discerning the benefits that accrue to society as a whole from the benefits accruing to the individual user or some narrower group of beneficiaries.

- In addition to direct user charges, indirect user charges such as supplemental gas taxes, capacity charges on Alternative Fuel Vehicles, and the extension of expiring local option sales taxes also deserve consideration. Once the underlying funding sources are in place, policymakers can select which tactical financing techniques would be most effective.

#### POLICY DRIVER II: DEFINING ROLES AND RESPONSIBILITIES IN A PUBLIC-PRIVATE PARTNERSHIP (PPP)

For the overwhelming majority of transportation projects and services, traditional governmental ownership, operation and financing will continue to be the most appropriate approach. However for some types of projects—especially those that are large or complex—a joint venture between the public and private sectors may prove advantageous. The non-profit sector may also play a significant role in the institutional structure.

##### *Reasons to Consider PPP's*

State and local governments around the country are turning to joint ventures with private sector organizations to meet their capital needs. They are doing so for a variety of reasons, including:

- **Production Efficiency.** Oftentimes, private firms can build projects faster (if not cheaper), using design-build and other innovative procurement techniques.

- **Operating Efficiency.** Complex projects may be managed more efficiently, due to greater expertise with innovation and technology, the presence of commercial competition, and the incentive of performance-based compensation.

- **Risk Transfer.** Private firms may be willing to assume certain risks from the governmental project sponsor as concerns construction, performance, or demand for the facility. However, the private sector should not be viewed as the ultimate repository for all project risks—only for those exposures which are of a business (as opposed to regulatory or political) nature.

- Access to New Sources of Capital. Private firms may be able to help identify new sources of project revenues that can be monetized. In addition, the private sector partners may be willing to invest directly in projects or draw upon other funding sources not typically employed in conventional municipal financing of projects.
- Simplified Project Management. Out-sourcing responsibilities to third party providers should reduce the governmental unit's need for staffing up during construction and allow the organization to maintain its institutional focus on current operations.

Features that make a Project a Good PPP Candidate The following project characteristics lend themselves to a PPP:

- Size and/or complexity issues, which neither the public nor the private sector could resolve adequately on their own.
- Widely acknowledged need for the project (public acceptance).
- Equilibrium and trust among the various public and private stakeholders in the project. Central to achieving this goal is obtaining financial commitments from both public and private participants, to align their interests (i.e., ensure that both public and private participants are "sitting on the same side of the table").
- A governmental sponsor with the policy and legal infrastructure to see the process through.
- Clear demarcation of responsibilities of different parties for securing public approvals, environmental clearances, etc.
- A dependable and bankable revenue stream.
- The "tummy test"—an intangible sense that the project "feels right," being structured as a PPP.

#### *Key Issues Confronting PPP's*

While joint ventures can confer substantial benefits, several sensitive public policy issues need to be addressed early on in the project development process:

- Labor Policy. At least for larger capital projects in California, the issue in construction is not labor wage levels, (Davis-Bacon) but labor availability. There is a dearth of qualified workers to build and manage complex projects. Concerns about displacement of governmental workers in PPP's generally can be resolved.
- Unsolicited Proposals. The A.B. 680 program of 1990 has seen one of the four projects built and become operational (SR91 in Orange County). The second project (SR 125 near San Diego) is expected to be financed in spring of 2001. A third (Santa Ana Freeway) is still in the planning stages, and the fourth has been tabled. Each of these projects was identified and advanced by private development teams, not by metropolitan planning organizations (MPO's) or the State. Yet private sector identification and sponsorship of projects is not a problem per se. What is imperative, however, is that the projects be placed on State transportation plans and supported by the host governmental jurisdiction.
- Procurement Rules. In California (as in most States), prevailing law generally does not permit design-build procurement. For the handful of major projects done thus far in California using design-build, either special legislation was required or special legal authority was available. A.B. 680, for example, expressly authorized design-build for its four pilot highway projects. Two measures enacted by the legislature last year, A.B. 958 and A.B. 2296, allow design-build to be used by transit agencies and certain counties for larger projects.

Another approach is to establish a Joint Powers Authority, which can draw upon the inherent powers of one of its sponsoring local governmental units to use design-build, as was the case with the Alameda Corridor freight rail project.

At the Federal level, although TEA-21 has liberalized the procurement rules for federally assisted projects, contractors under the National Environmental Protection Act still are prohibited from having an interest in the ultimate development of a project. This rule generally prevents construction firms that assist projects in their environmental review process from continuing to be involved in design and construction. It results in a loss of continuity and discourages entrepreneurial efforts in the critical developmental phase of potential projects.

- Environmental Risk. Environmental permitting and governmental approvals are inherently political processes. Although private developers can play a valuable role in synthesizing the project design with the environmental review process, they are ill equipped to absorb what fundamentally are non-business risks. Moreover, in contrast to other environmental statutes such as the Clean Air and Clean Water Acts, there is no statute of limitations governing challenges to transportation projects under the National Environmental Protection Act. Unlike a decade ago, developers are now unwilling to assume the financial risk of public approvals in these early stages (as in SR 125).

- **Exit Strategy.** Most of policymakers' efforts thus far on PPP have been focused on developing projects and negotiating entrance strategies for private sector participation. Yet a fundamental requirement for attracting investment capital is liquidity. Insufficient attention has been given to the investor's exit strategy during the life of a franchise, including valuation of the asset or concession. Although there were a number of political issues surrounding the proposed sale of the SR91 franchise, at least part of the controversy was attributable to insufficient local input into evaluating the concession operator's desired exit strategy.

#### POLICY DRIVER III: SELECTING TOOLS TO GUIDE CAPITAL INVESTMENT

##### *Benefits of Design-Build Procurement*

As demonstrated by the two Transportation Corridor Agency toll roads built thus far (total investment of \$3 billion) design-build (vs. traditional design-bid-build) can provide substantial benefits for larger projects:

- Simplified Project Management for the governmental project sponsors;
- Better Cost controls (reduced exposure to cost overruns);
- Faster Completion (a recent university study surveying major capital projects determined on average that design-build leads to 33 percent faster construction completion); and
- Base price of hard costs may be comparable or even slightly higher, but savings on soft costs and the other benefits described above often justify it.

##### *Linkage between Investment and Ongoing Asset Management*

The relationship between the initial project investment decision and periodic capital maintenance and renewal must be strengthened to preserve the value of the investment over time. On toll roads with a net revenue pledge, the rate covenant covers both capital recovery and operations and maintenance requirements.

For non-tolled facilities, this full-cost recovery can be achieved through synthetic mechanisms. For example, long-term performance warranties from the constructor can require that assets be maintained at a specified service level in exchange for an up-front or ongoing warranty fee.

Another approach, used in the United Kingdom and elsewhere overseas, involves shadow tolling. Under shadow tolls, an operator is paid a per vehicle fee by the governmental sponsor based on throughput, to build and maintain an asset at a defined level.

GASB Statement 34, going into effect for governmental units July 1, 2001, mandates more complete disclosure of governmental infrastructure assets, including recognition of depreciation expense if asset quality deteriorates. Warranties or shadow tolls would link capital investment with capital renewal, and help ensure that infrastructure assets are adequately maintained—both for accounting and transportation purposes.

##### *Special Purpose Entities*

California popularized the concept of creating new Special Purpose Public Agencies (like the Orange County Transportation Corridor Agencies, Alameda Corridor Transportation Authority, and LA-Pasadena Rail Construction Authority) to carry out infrastructure development on a project-finance basis. An alternative approach involves the formation of a special purpose not-for-profit corporation under Internal Revenue Service revenue procedure 63–20. For example, two recently opened several hundred million-dollar toll roads, the Pocahontas Parkway in Virginia and the Southern Connector in South Carolina, utilized 63–20 corporations to develop and finance the facilities. Having a singular mission, these entities bring a special focus to completing the projects.

#### POLICY DRIVER IV: COMPARING DIFFERENT TRANSACTION TEMPLATES

##### *Institutional Models*

There are a variety of organizational forms that can be used to advance infrastructure projects. They can be viewed as stretching along a continuum, ranging at one end as conventional public projects to the other end as fully commercialized facilities. The accompanying diagram illustrates four distinct positions along the spectrum from purely public to purely private. Projects can be categorized in terms of whether public or private parties share in the risks and rewards of development, operation and ownership.

INCREASINGLY PUBLIC—INCREASINGLY PRIVATE

The financing component is a discrete element but also may be classified as being either public or private. Financing is considered to be public if either:

- a. the capital funding source for the loan or investment is public tax dollars (e.g. a governmental infrastructure bank, revolving fund or public pension fund capitalized with public funds); or
- b. if the loan repayment source is derived from or guaranteed by public tax dollars (sales taxes, State Highway Fund moneys, Federal-aid supported, etc.).

On this basis, a loan funded by a State infrastructure bank, even if the borrower is a corporate entity, would be deemed “public financing.” Likewise, a privately funded loan for a transit project developed and operated by a private consortium but payable from or guaranteed by the State transportation fund, would be considered public financing. On the other hand, a taxable or tax-exempt revenue bond sold into the capital markets and backed by user charges would be deemed “private,” even though the obligations were issued by a public conduit (e.g. Transportation Corridor Agencies, Alameda Corridor). The ultimate determinant is whether public capital is at-risk, either in terms of the initial funding or the ultimate repayment of the obligation.

Matrix of Public-Private Transaction Templates

|                       | Governmental Model | Turnkey Development Model      | Warranty/Concession Model | Profit-Sharing Model                       |
|-----------------------|--------------------|--------------------------------|---------------------------|--|
| Examples of Projects. | LACMTA; Caltrans.  | TCA; ACTA; BART Airport; Extn. | Hudson-Bergen; NM44.      | Las Vegas Monorail; SR 91, Dulles Greenway |
| Development           | Public .....       | Private .....                  | Private .....             | Private                                    |
| Operation ...         | Public .....       | Public .....                   | Private .....             | Private                                    |
| Ownership ...         | Public .....       | Public .....                   | Public .....              | Private                                    |
| Financing ...         | Public .....       | Public or Private              | Public or Private         | Private                                    |

Models on the left of the table are increasingly public and models on the right are increasingly private.

The four principal financing templates are:

*Governmental Model*

Starting on the left side of the chart would be governmentally developed, owned and operated projects, using public tax dollars. Examples include Caltrans highway projects or other normal public works spending, either pay-as-you-go or debt financed, with the governmental unit responsible for funding operating and maintenance costs. The vast majority of transportation projects are developed in this fashion.

*Turnkey Development Model*

Of greater “private” character are turnkey financings, where the projects are developed under a guaranteed maximum price and guaranteed completion date by a private design-build team and then turned over to the governmental sponsor. Because of construction risk transfer, there are financial rewards and penalties to the constructors based upon performance. In some cases, the facilities are financed principally with project-generated revenues (project-financing) such as the San Joaquin Hills and Foothill-Eastern Toll Road projects developed by the Transportation Corridor Agencies in Orange County. In other cases, such as the BART airport extension, the projects are funded conventionally with public grants and local tax dollars.

*Warranty/Concession Model*

Farther along the spectrum to the right would be projects that are publicly owned, but use private parties not only for development but also for operation/maintenance of the facility. Generally, the compensation is based on a flat fee or a cost-plus basis, rather than a profit-sharing formula based upon the net revenues or patronage volume. The new Hudson-Bergen light rail line in New Jersey falls into this category. Under current tax law, the term and compensation for private management contracts associated with facilities financed with tax-exempt debt is severely constrained, diluting any incentives for superior performance.

Another way to get ongoing private participation without running afoul of the IRS management contract rules is through long-term performance warranties on the physical condition of the infrastructure assets themselves. For example, the New Mexico Corridor 44 road-widening project has entered into a long-term warranty with a private firm for the pavement and bridge structures extending up to 20

years. In both the Hudson-Bergen and the New Mexico 44 projects, the pledged repayment source for debt service is public moneys, not project revenues.

*Profit-Sharing Model*

Finally, at the far right end are fully commercial projects, involving private development, operation, and even ownership of the facility. Financing sources are largely or entirely project-based revenue streams, rather than public or tax-backed sources. Compensation to the operator is based upon utilization of the facility and/or net income, resulting in performance-based rewards. Major examples of this are the SR91 Express Lanes in Orange County, the Dulles Greenway in Virginia, and the Las Vegas monorail, currently under construction.

No single model or structure can be said to be “the best”; rather, the most suitable model will depend on facts and circumstances surrounding each particular project. Among the factors that will determine which approach is most appropriate are:

- political support for an alternative project delivery method;
- need for project cost and completion date certainty (which is particularly applicable to project financings);
- State law considerations (especially procurement regulations);
- Federal tax code implications (as concerns eligible financing instruments);
- commercial potential of the project, as reflected in capital markets acceptance; and
- degree of risk transfer to the private sector.

As noted above, projects need not be self-liquidating to benefit from a PPP approach. Concession arrangements for subsidized services such as public transport have proven successful overseas because incentivized performance for private operators can produce better service, lower public subsidy, and greater cost transparency. For instance, Melbourne, Australia achieved these enhancements in out-sourcing operations of its commuter rail network.

Nor is a commercial or “privatized” approach incompatible with a cooperative working arrangement with organized labor. In fact, both the management team and the union work force can benefit from entering into a project labor agreement at the outset of the project that squarely addresses prevailing wages, non-disruption of work schedule, and other features that will facilitate the timely, on-budget completion of a high-quality project.

Historically, most transportation projects have been funded either through governmental grants (public equity) or tax-supported municipal bonds (public debt), since these have represented the lowest cost sources of capital. However, there are alternative sources of private sector equity and debt capital that may be drawn upon for infrastructure projects with steady cash-flows linked to economic growth. Low tax bracket institutional investors such as life insurance companies and non-taxable pension funds would benefit from being able to diversify into a new economic sector that presently is absent from their portfolios. Because the major financial vehicle for infrastructure has been tax-exempt bonds, it has not been appropriate for pension funds as tax-exempt entities to purchase such paper when higher-yielding corporate bonds of equal quality are available.

However, several recent developments have lowered the relative funding cost of taxable debt and equity:

- The Federal budget surplus has reduced the supply of Treasury bonds, lowering the benchmark against which taxable paper is priced, relative to municipal bonds.
- Pension funds and insurance companies have gained greater familiarity with project financings, through investing in debt and equity in overseas infrastructure projects and domestic power generation facilities. They are now willing to accept longer term debt obligations with minimal amortization in the early years, cushioning the cash-flow impact on project revenues.
- New Federal programs such as TIFIA (the Transportation Infrastructure Finance and Innovation Act of 1998) provide debt capital on terms which in some cases are even more favorable than those in the municipal bond market. Other proposed legislation such as tax credit bonds would allow de-coupling of the principal from the interest portion, creating a stand-alone taxable debt instrument suitable for retirement funds.
- Finally, even though infrastructure projects are highly capital intensive, cost savings on the operating side from private participation may partially offset the higher capital costs of taxable rate financing.

Taxable Investment Funds. Together, these factors are combining to reduce the disparity in funding cost between the taxable and tax-exempt markets. As a result, project sponsors may now find that it is cost-effective to seek out pension funds and

other taxable market investors to invest equity and debt capital in project financings. As corporate, union and public retirement systems represent \$5 trillion in investment assets, even allocating a small portion of their portfolios to invest in U.S. transportation infrastructure could have significant ramifications. They could invest either directly or through pooled investment accounts similar to mutual funds.

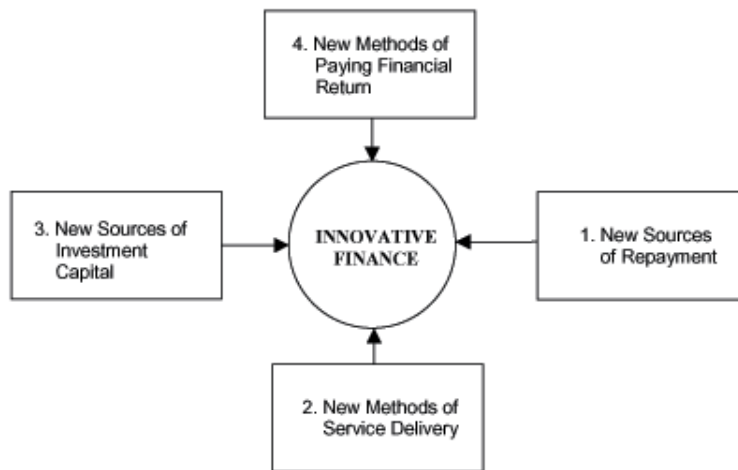

*"Innovative Finance" Techniques*

Innovative approaches that involve PPP's to develop, operate or own transportation assets will lend themselves toward using innovative financing techniques. "Innovative Finance," while not a panacea, can help address these capital investment needs once the underlying payment source for the project has been identified.

Innovative Finance can be defined as the use of external financing approaches that draw upon at least one of the four following elements:

1. New Sources of Repayment that haven't previously been used to secure external financing.
2. New Methods of Service Delivery that offer development, production or operational efficiencies.
3. New Sources of Investment Capital that broaden the funding alternatives for transportation projects beyond conventional tools.
4. New Methods of Paying Financial Return to investors, that either reduce effective financing cost for the project sponsor or shift risks (such as interest rate and financial risk) to third party investors, or do both.

*Diagram of Elements Comprising Innovative Finance*

Participants at the Roundtable suggested a number of innovative finance ideas relating to repayment streams, service delivery, funding sources, and investment return:

NEW SOURCES OF REPAYMENT

*State & Local Taxes*

- Extension of Local Option Sales Tax
- New Tax on Alternative Fuel Vehicles
- Inflation adjusted Gas Tax
- Other User-related fees (e.g. weight-distance)
- Non-user related Taxes (internet/mail order sales tax, property transfer tax, etc.)
- A defined percentage of State General Fund Revenues

*Other*

- Shared revenue from fiber optics, etc. along State rights-of-way

- Tobacco Funds
- State version of GARVEE Bonds (using counties' share of State Gas tax allocation)
- State-aid Intercept mechanism to credit enhance local bonds
- Development Risk Insurance

*New Methods of Service Delivery*

- Broaden application of innovative procurement techniques such as design-build.
- Modify transit requirement 13(c) [consent required of DOL and local unions to proposed project labor agreements] to make it easier for transit agencies to outsource existing operations/capital improvements via tendering routes to concessionaires.
- Liberalize the management contract rules or seek tax code change (private activity bonds for highways) to allow performance-based compensation to private operators of toll facilities financed with tax-exempt debt.
- Permit outsourcing of highway maintenance activities or enter into long-term warranties to guarantee defined service standard levels of State highways under GASB Statement 34.
- Change statute of limitations under NEPA for challenges, so that it is consistent with other environmental statutes (e.g. within 60 days from the Record of Decision).

*New Sources of Investment Capital*

- Public (State and local) Pension Funds and Taft-Hartley (union) Pension Funds, investing either directly or through pooled accounts.
- Leveraged Leasing (domestic and cross-border tax-oriented equity).
- Extend TIFIA beyond 2003.
- Reduce threshold project size below \$100 million for TIFIA assistance, to make it consistent with the lower thresholds in TEA-21 for using design-build (e.g. \$50 million).

*New Methods of Paying Financial Return*

- Tax Credit bonds (interest paid by U.S. Treasury in the form of a tax credit to the investor).
- Shadow Tolls (per vehicle compensation to private concessionaire).
- Variable Rate bonds for State transportation borrowings to hedge interest rates.

*Government Policy Tools*

Historically, the public sector has used direct governmental spending to expand transportation capital investment. However, where innovative finance and public-private ventures are involved, it may be possible to generate additional investment through less costly means. To encourage the foregoing innovative finance techniques, the government sector may use these policy tools:

1. Regulatory Incentives-streamlining procedures, removing program restrictions, etc.;
2. Tax Incentives-using the tax code to encourage the free flow of capital into certain desired investment and operational activities; and
3. Credit Incentives-using fractional credit assistance (direct loans or loan guarantees) to leverage a larger multiple of private financing.

Each of the suggestions under the four innovative financing tools may be addressed through regulatory, tax, or credit policy initiatives.

CONCLUSION: ENCOURAGING CONTINUED INNOVATION

The following policy recommendations emerged from the Roundtable discussion:—  
Process Streamlining. Process reform was recommended in three areas:

- State procurement practices should be simplified for public-private partnerships;
- Regional financing protocols with Federal agencies need to be supported; and
- Environmental review processes should be consolidated with public agency responsibility.

*Environmental Risk.* Project-based financings must have time-certainty and cost-discipline to attract private debt and equity capital. Because securing environmental and public permitting approvals is fundamentally a governmental rather than a commercial process, the private sector is not equipped to assume the financial re-

sponsibility for obtaining the environmental record of decision. The time period for challenges to projects' environmental impact statements under NEPA should be made consistent with other environmental statutes.

*Co-Investment by Public & Private Sector.* User fees can be both an effective and equitable way of generating project-funding streams. However, in most cases, project-generated revenues alone will not be sufficient to fully finance the projects. Some level of public investment will be required, and it needn't take the form of contributed capital. For instance, the Alameda Corridor has four distinct layers of debt investment—first tier capital markets, second tier TIFIA loan, third tier capital markets, and fourth tier port loans—as well as lesser amounts of Federal, State and local grant funding. In addition to reducing the burden on project revenues to cash-flow the private investment, public co-investment is useful in that it gives all parties a financial stake in the commercial success of the enterprise.

*Subsidy Level.* Even where an external operating subsidy is required (e.g. public transit or freeway maintenance), the public sector doesn't have to provide that service. As has been demonstrated overseas, there may be substantial reductions in public subsidy required and/or enhancement of service levels through selective outsourcing of operations to private parties.

*Special Purpose Agencies.* Major capital projects can benefit by establishing a special purpose entity to undertake development and operations, whose sole responsibility is the project. The organization, which could be a legislatively established new authority, a joint powers authority formed by several jurisdictions, or a private non-profit corporation formed by the principal public and private stakeholders, helps bring a singular institutional focus to completing the project on-time and within budget.

*Design-Build.* Larger or more complex projects often can accelerate completion and reduce construction and performance risk through design-build procurement. Yet State law may make it difficult to proceed on any other basis than design-bid-build, with its attendant delays and lack of accountability. Also, State and Federal law should allow a contractor to participate in both the environmental analysis of a project and its subsequent construction, to gain the benefit of their continued involvement from project inception to project completion.

*Linking Investment & Maintenance.* Reliable funding of ongoing project operations and maintenance costs must be identified at the outset, to ensure the best capital investment decision is made. Among the institutional arrangements that can foster this Life-Cycle Costing perspective are long-term franchise agreements (for toll facilities) or shadow toll agreements (for free facilities); or long-term warranties stipulating that specific asset quality levels be maintained over the life of the project.

*Role of Innovative Finance.* Once a project's revenue stream has been identified, innovative finance techniques can assist in capitalizing the value of the future project revenues to fund the investment today. Federal, State and local policymakers can use regulatory, tax and credit incentives to encourage the use of new financial instruments. The financial tools themselves may draw upon one or more of the following mechanisms: new repayment streams, new procurement methods, new sources of investment capital, and new methods of a paying financial return. Given that many of these financing approaches already are in use in the private sector, a more apt name for "innovative finance" might be "project-based finance."

*Continuing Education.* Presently, there is very little offered in the way of organized educational programs on the use of PPP's for infrastructure development. The dearth of relevant training extends both to entry-level candidates for public or private positions (Masters programs) and to mid-career corporate and governmental practitioners. An ongoing university-sponsored program on new project development and financing techniques could prove highly useful in further developing both public and private sector management skills in this growing and dynamic discipline.

Table 1: Key Drivers on Innovative Finance Proposals for Project Sponsors, Investors and Federal Policymakers

PERSPECTIVE KEY QUESTIONS PROJECT SPONSOR/BORROWER

- What is the effective financing cost (IRR)?
- How high is the Annual Payment Factor?
- Is the transaction reported as a direct or contingent liability on the Sponsor's balance sheet?
- What legal steps (State legislation, etc.) must be taken to utilize it?
- How difficult is it for Management to implement it?

*Investor*

- Is the risk-adjusted rate of return competitive?
- Is there a secondary market for the product (liquidity)?
- Are there other investment risks (tax compliance, call risk, etc.)?
- Will it help diversify the investor's portfolio exposure?
- Are there any other strategic reasons for investing aside from its return?

*Federal Policymaker*

- What is the proposal's budgetary cost?
- Is the finance tool cost-effective (how much leveraging of Federal resources)?
- What is the overall economic return (benefit/cost ratio)?
- How well does it achieve multiple Federal policy objectives?
- Improve Access
- Enhance Mobility
- Shift Risks away from the Government
- Attract Non-Federal Resources / Private Participation
- Accelerate Projects

---

 RESPONSE OF DAVID SELTZER TO ADDITIONAL QUESTION FROM SENATOR BAUCUS

*Question.* Many of us are concerned about the continued viability of the Highway Trust Fund. That is, with increased fuel economy and incentives for alternative fuels, can the Trust Fund continue to meet our ever-increasing highway needs? In fact, in the MEGA-TRUST Act, I create a commission to look at the Trust Fund and its continued sustainability. When we talk about innovative financing for highways are we talking about a way to supplement the Highway Trust Fund or replacing the Trust Fund with this "new way of doing business?"

*Response.* Perhaps the most accurate answer is "a new way of doing certain types of business."

The vast majority of highway projects are not capable of generating their own revenue streams, and will continue to be reliant upon grant funding from Federal and State sources. That is why the findings of the National Surface Transportation Infrastructure Financing Commission proposed in S. 2678 will be so vital to policymakers in identifying ways to sustain the Highway Trust Fund in coming years.

However, the term "Innovative Finance" really encompasses a number of different initiatives that can help promote investment in the Nation's surface transportation system.

First, it references grant management techniques that give States greater flexibility in using existing Highway Trust Fund resources. GARVEE Bonds are a good example of this; the total resources committed to highways are not increased, but projects can be greatly accelerated, through monetizing future streams of Federal receivables. Another example is State Infrastructure Banks and section 129 loans, where States may use Federal-aid apportionments to fund loans and provide other types of financial assistance.

Second, Innovative Finance connotes innovative procurement methods, such as design-build contracting, which can expedite projects, transfer risks to private parties, and/or save the project sponsor money. The pilot provisions for design-build contracting in TEA-21 provide an excellent vehicle for evaluating such alternative approaches. Further refinements, especially as concerns streamlining Federal approvals, would be beneficial.

Third, the term includes innovative asset management techniques that provide superior value-for-money over the long-term. Initiatives that encourage States to make project investment decisions with regard to the life cycle costing over the economic life of the project should be encouraged. For example, long-term warranties such as those New Mexico has used on its Corridor 44 project, or other long-term performance-based private management contracts, help ensure that the initial capital investment is maintained adequately to optimize its value.

Finally, Innovative Finance includes new financial instruments that either lower the cost of capital obtained from existing sources, identify new sources of capital, or do both. For instance, Federal credit programs such as TIFIA establish the Federal Government as a new source of debt capital on favorable terms for certain types of projects. This can make it easier for projects with their own revenue streams, such as toll roads, to access the capital markets for the balance of their needs. To the extent a project sponsor can more readily borrow against non-Federal revenue streams, the number of claimants on a State's apportionments is reduced.

Other new financial instruments, based on tax code incentives, can reduce the required cash outlays from traditional funding sources by providing a return to inves-

tors in the form of a non-cash tax benefit. Techniques such as tax credit bonds or tax-oriented leasing serve to attract debt and equity capital from private sources, again freeing up traditional revenue sources for other projects.

In summary, the combination of grants management, procurement, asset maintenance and financing techniques comprising “Innovative Finance” should be viewed as an important element of any national transportation policy. But it will never replace the need for a long-term strategy for augmenting Highway Trust Fund resources that are used to fund grants required by most surface transportation investments. Ultimately, the political process will determine the types and amounts of resources directed to the HTF, based on the desired level of investment activity and the perceived role of the Federal Government relative to State, local and other funding partners.

---

STATEMENT OF PHYLLIS F. SCHEINBERG, DEPUTY ASSISTANT SECRETARY FOR BUDGET AND PROGRAMS UNITED STATES DEPARTMENT OF TRANSPORTATION

Chairman Jeffords, Chairman Baucus, Ranking Members Smith and Grassley, and members of the committees: Thank you for holding this hearing today and inviting me to testify on Federal innovative finance initiatives for surface transportation projects. These financing techniques, in combination with our traditional grant programs, have become important resources for meeting the transportation challenges facing our Nation. Secretary Mineta, in his testimony last January before the Environment and Public Works Committee, indicated his desire to increase their application.

The Secretary stated that “Expanding and improving innovative financing programs in order to encourage greater private sector investment in the transportation system . . .” will be one of the Department of Transportation’s core principles in working with Congress, State and local officials, tribal governments and stakeholders to shape the surface transportation reauthorization legislation. He remains steadfast in his support for these programs.

*Defining “Innovative Finance”*

Perhaps the first issue to address today is “What is innovative finance?” We increasingly hear the term used in the context of transportation projects, but what does it really mean? We at the Department apply the term to a collection of management techniques and debt finance tools available to supplement and expand the flexibility of the Federal Government’s transportation grant programs. We see the primary objectives of innovative finance as leveraging Federal resources, improving utilization of existing funds, accelerating construction timetables, and attracting non-Federal investment in major projects. The quantifiable successes of such innovative finance are beginning to mount.

The July 2002 report entitled “Performance Review of U.S. DOT Innovative Finance Initiatives” states that Federal investments of \$8.6 billion have helped to finance projects worth a total of \$29 billion, a ratio of \$3.40 invested for each Federal dollar. Of this \$29 billion, more than 27 percent, or \$8 billion, consists of debt that will be repaid from new revenue sources. Sponsors report that more than 50 projects were accelerated from 6 months to 24 years as a result of innovative financing compared to transportation grants. The total economic impacts of \$91 billion nationwide represent benefits that have accrued more rapidly than ever possible using a pay-as-you-go method.

While these achievements demonstrate the value of innovative finance techniques and tools, they also deserve a realistic assessment in the context of the grant system, financed by the Highway Trust Fund, that provides the foundation of Federal financial assistance for surface transportation projects.

The first assessment in realism is to examine the “innovative” nature of the financial tools. Improving the flexibility of fund administration and creating opportunities to borrow and lend Federal money have been vitally important initiatives, and we can thank numerous role models outside the transportation sector for developing these tools long ago. The “new” or “innovative” feature of these tools, then, derives from their application to the Federal transportation program. Further, these financing techniques have now become better known and accepted by many State and local transportation partners. Because the demand for transportation investment throughout the country consistently exceeds the supply of resources, those regions facing the greatest challenges to mobility have readily embraced—and in many cases paved the way for—the opportunities provided by innovative finance.

The second assessment concerns the potential for innovative finance to ease demands on the current grant funding distributed each year to States and local agen-

cies. That doesn't seem likely. The focus of innovative finance (and perhaps a more appropriate term to designate these tools) is project finance. The techniques supplement existing programs on an as-needed, project-by-project basis. Transportation officials must evaluate each project individually to determine the best financing approach. The grant programs remain the bulk of Federal transportation assistance, supplemented by the extra muscle and flexibility of innovative finance.

The diagram below depicts a pyramid that illustrates the range of surface transportation projects and the innovative tools available for financing them. The base represents the majority of projects: those that rely on grant-based funding, but may benefit from measures that enhance flexibility and resources. Various Federal funds management techniques, such as advance construction, tapered match, and grant-supported debt through Grant Anticipation Revenue Vehicles, or GARVEEs, can help move these projects to construction more quickly. The mid-section represents those projects that can be partially financed with project-related revenues, but may also require some form of public credit assistance. State Infrastructure Banks (SIBs) can assist State, regional, and local projects through low-interest loans, loan guarantees, and other credit enhancements. State loans of Federal grant funds known as Section 129 loans represent another credit assistance technique. The Transportation Infrastructure Finance and Innovation Act (TIFIA) program provides credit assistance to a small number of large-scale projects of regional or national significance that might otherwise be delayed or not constructed at all because of risk, complexity, or cost. The peak of the pyramid reflects the very small number of projects able to secure private capital financing without any governmental assistance.

#### FEDERAL PROJECT FINANCE TOOLS FOR SURFACE TRANSPORTATION

#### *The TIFIA Credit Program*

Let me begin with the program that, through the leadership of the Senate during enactment of the Transportation Equity Act for the 21st Century (TEA-21), provides a direct role for the Federal Government to assist large transportation projects. In June 2002, the Department delivered its Report to Congress on the Transportation Infrastructure Finance and Innovation Act of 1998 (TIFIA), which authorizes the Department of Transportation (DOT) to provide three forms of credit assistance—secured (direct) loans, loan guarantees and standby lines of credit—to surface transportation projects of national or regional significance.

The public policy underlying the TIFIA credit program asserts that the Federal Government can perform a constructive role in supplementing, but not supplanting, existing capital finance markets for large transportation infrastructure projects. As identified by Congress in TEA-21, “. . . a Federal credit program for projects of national significance can complement existing funding resources by filling market gaps, thereby leveraging substantial private co-investment.” Because the TIFIA pro-

gram offers credit assistance, rather than grant funding, its potential users are infrastructure projects capable of generating their own revenue streams through user charges or other dedicated funding sources.

Identifying a constructive role for Federal credit assistance begins with the acknowledgement that, compared to private investors, the Federal Government's naturally long-term investment horizon means that it can more readily absorb the relatively short-term risks of project financings. Absent typical capital market investor concerns regarding timing of payments and financial liquidity, the Federal Government can become the "patient investor" whose long-term view of asset returns enables the project's non-Federal financial partners to meet their investment goals, allowing the project's sponsors to complete a favorable financing package.

The TIFIA program's pragmatic challenge is to balance the objective of advancing transportation projects with the equally important need to lend prudently and protect the Federal interest. The DOT must apply rigorous credit standards as it fashions assistance to improve the financial prospects of participating projects. The Federal objective is not to minimize its exposure but to optimize its exposure—that is, to take prudent risks in order to leverage Federal resources through attracting private and other non-Federal capital to projects.

The TIFIA program assistance is meant to support expensive, complex and significant transportation investments. In general, a project's eligible costs must be reasonably anticipated to total at least \$100 million. Credit assistance is available to highway, transit, passenger rail and multi-modal projects. Other types of eligible projects include intercity passenger rail or bus projects, publicly owned intermodal facilities on or adjacent to the National Highway System, projects that provide ground access to airports or seaports, and surface transportation projects principally involving the installation of Intelligent Transportation Systems (ITS), for which the cost threshold is \$30 million. The TIFIA credit assistance is limited to 33 percent of eligible project costs.

Congress has authorized the DOT to provide up to \$10.6 billion of TIFIA credit assistance through the TEA-21 authorization period of 1998–2003. From the Highway Trust Fund, Congress authorized \$530 million, subject to the annual obligation limitation on Federal-aid appropriations, to pay the subsidy cost of TIFIA credit assistance and related administrative costs. The subsidy cost calculations establish the capital reserves which the DOT must set aside in advance to cover the expected long-term cost to the Government of providing credit assistance, pursuant to the Federal Credit Reform Act of 1990 (FCRA).

To date, the DOT has selected 11 projects, representing \$15.7 billion in transportation investment, to receive TIFIA credit assistance. The TIFIA commitments total \$3.7 billion in credit assistance at a subsidy cost of about \$202 million. The DOT has received 38 letters of interest and 15 applications from project sponsors. All major categories of eligible projects—highway, transit, passenger rail and multi-modal—have sought and received credit assistance. The TIFIA credit assistance ranges in size for each project, from \$73.5 million to \$800 million, mostly in the form of direct Federal loans from the DOT to the project sponsors. These projects are summarized in the table below.

TIFIA Commitments as of September 2002

| Project                     | Project Type         | Project Cost          | Instrument Type      | Credit Amount |
|-----------------------------|----------------------|-----------------------|----------------------|---------------|
| Miami Intermodal Center.    | Intermodal .....     | \$1,349 million ..... | Direct Loan .....    | \$269 million |
|                             |                      |                       | Direct Loan .....    | \$163 million |
| SR 125 Toll Road .....      | Hwy/Bridge .....     | \$450 million .....   | Direct Loan .....    | \$94 million  |
|                             |                      |                       | Line of Credit ..... | \$33 million  |
| Farley Penn Station .....   | Passenger Rail ..... | \$800 million .....   | Direct Loan .....    | \$140 million |
|                             |                      |                       | Line of Credit ..... | \$20 million  |
| Washington Metro CIP ..     | Transit .....        | \$2,324 million ..... | Guarantee .....      | \$600 million |
| Tren Urbano (PR) .....      | Transit .....        | \$1,676 million ..... | Direct Loan .....    | \$300 million |
| Tacoma Narrows Bridge       | Hwy/Bridge .....     | \$835 million .....   | Direct Loan .....    | \$240 million |
|                             |                      |                       | Line of Credit ..... | \$30 million  |
| Cooper River Bridge .....   | Hwy/Bridge .....     | \$668 million .....   | Direct Loan .....    | \$215 million |
| Staten Island Ferries ..... | Transit .....        | \$482 million .....   | Direct Loan .....    | \$159 million |
| Central Texas Turnpike      | Hwy/Bridge .....     | \$3,580 million ..... | Direct Loan .....    | \$917 million |
| Reno Rail Corridor .....    | Intermodal .....     | \$242 million .....   | Direct Loan .....    | \$51 million  |
|                             |                      |                       | Direct Loan .....    | \$5 million   |
|                             |                      |                       | Direct Loan .....    | \$18 million  |
| SF-Oakland Bay Bridge       | Hwy/Bridge .....     | \$3,305 million ..... | Direct Loan .....    | \$450 million |

## TIFIA Commitments as of September 2002—Continued

| Project     | Project Type | Project Cost           | Instrument Type | Credit Amount   |
|-------------|--------------|------------------------|-----------------|-----------------|
| Total ..... |              | \$15,711 million ..... |                 | \$3,704 million |

Already limited by statute to 33 percent of total project costs, actual TIFIA assistance has averaged 23 percent of project costs. Including grant assistance, total Federal investment in TIFIA projects amounts to 43 percent of total costs. Investments from other government and private sources comprise the remaining 57 percent.

Because credit assistance requires a small fraction of the contract authority needed to provide a similar amount of grant assistance, TIFIA promotes a cost-effective use of Federal resources to encourage co-investment in transportation infrastructure. Federal grant funds that otherwise might be required to support these large projects can then be redirected toward smaller but critical infrastructure investments.

An explicit goal of the TIFIA program is to induce private investment in transportation infrastructure. Private co-investment in the TIFIA project selections totals about \$3.1 billion, comprised of more than \$3 billion in debt (including State and local debt held by private investors) and nearly \$100 million in equity. This co-investment totals approximately 20 percent of the nearly \$15.7 billion in total costs.

The DOT believes that a limited number of large surface transportation projects each year will continue to need the types of credit instruments offered under TIFIA. Project sponsors and DOT staff are still exploring how best to utilize this credit assistance, and we welcome congressional guidance and dialog during this evolutionary program period.

As stated in the Conference Report accompanying TEA-21 and TIFIA, “[a]n objective of the program is to help the financial markets develop the capability ultimately to supplant the role of the Federal Government in helping finance the costs of large projects of national significance.” The current form of TIFIA administration—within a Federal agency subject to regular budget oversight—enables policymakers to monitor program performance as staff, sponsors and the financial markets gain experience. As current TIFIA projects move into their construction, operation and repayment phases, and as additional projects obtain TIFIA assistance, policymakers will acquire better information with which to determine whether TIFIA should remain within the DOT, “spin off” into a Government corporation or Government sponsored enterprise, or phaseout entirely and rely on the capital markets to meet the program’s objectives.

The Department also administers a credit assistance program specifically for the railroad industry: the Railroad Rehabilitation and Improvement Financing Program (RRIF). Also authorized in TEA-21, the RRIF program provides direct loans and loan guarantees to railroads and other public and private ventures in partnership with railroads. The aggregate unpaid principal amount under the program cannot exceed \$3.5 billion, and the subsidy cost is covered by a “credit risk premium” paid by or on behalf of the borrower from a non-Federal source. To date, the Federal Railroad Administration (FRA) has approved four RRIF loans for a total of more than \$200 million, and six more applications are currently being evaluated.

#### *GARVEE Bonds*

Another financing tool among States has been the issuance of Grant Anticipation Revenue Vehicles (GARVEEs): bonds that enable States to pay debt service and other bond-related expenses with future Federal-aid highway apportionments. States are finding GARVEEs to be an attractive financing mechanism to bridge funding gaps and accelerate construction of major corridor projects. The GARVEE generates up-front capital for major highway projects at tax-exempt rates and enables a State to construct a project earlier than using traditional pay-as-you-go grant resources. With projects in place sooner, costs are lower due to inflation savings and the public realizes safety and economic benefits. Paying via future Federal highway reimbursements spreads the cost of the facility over its useful life, rather than just the construction period. GARVEEs expand access to capital markets, supplementing general obligation or revenue bonds.

A GARVEE is a debt-financing instrument authorized to receive Federal reimbursement of debt service and related financing costs. In general, projects funded with the proceeds of a GARVEE debt instrument are subject to the same requirements as other Federal-aid projects with the exception of the reimbursement process. Instead of reimbursements as construction costs are incurred, the reimbursement of GARVEE projects occurs when debt service is due.

Candidates for GARVEE financing are typically large projects, or a program of projects, where the costs of delay outweigh the costs of financing and other borrowing approaches may not be available. In total, six States have issued 14 GARVEE Bonds, totaling more than \$2.5 billion, to be repaid using a portion of their future Federal-aid highway funds. The table below summarizes this activity.

GARVEE Transactions as of July 2002

| State      | Date of Issue | Face Amount of Issue | Projects Financed   |
|------------|---------------|----------------------|---|
| Ohio       | May-98        | \$70 million         | Various projects including:<br>Spring-Sandusky and<br>Maumee river improvements |
|            | Aug-99        | \$20 million         |   |
|            | Sep-01        | \$100 million        |   |
| New Mexico | Sep-98        | \$100 million        | New Mexico SR 44  |
|            | Feb-01        | \$19 million         |   |
| Arkansas   | Mar-00        | \$175 million        | Interstate Highways   |
|            | Jul-01        | \$185 million        |   |
|            | Jul-02        | \$215 million        |   |
| Colorado   | May-00        | \$537 million        | Any project financed wholly or<br>in part by Federal funds                      |
|            | Apr-01        | \$506 million        |   |
|            | Jun-02        | \$208 million        |   |
| Arizona    | Jun-00        | \$39 million         | Maricopa freeway projects   |
|            | May-01        | \$143 million        |   |
| Alabama    | Apr-02        | \$200 million        | County Bridge Program   |
| Total      |               | \$2,517 million.     |   |

#### State Infrastructure Banks

Another significant project finance tool is the State Infrastructure Bank (SIB), a revolving transportation investment fund administered by a State. A SIB functions as a revolving fund that, much like a bank, can offer loans and other credit products to public and private sponsors of Title 23 highway construction projects or Title 49 transit capital projects. Federally capitalized SIBs were first authorized under the provisions of the National Highway System Designation Act of 1995. The initial infusion of Federal and State matching funds was critical to the startup of a SIB, but States have the opportunity to contribute additional State or local funds to enhance capitalization. SIB assistance may include loans (at or below market rates), loan guarantees, standby lines of credit, letters of credit, certificates of participation, debt service reserve funds, bond insurance, and other forms of non-grant assistance. As loans are repaid, a SIB's capital is replenished and can be used to support a new cycle of projects. And, as has been accomplished in Minnesota and South Carolina, SIBs can also be structured to issue bonds against their capitalization, increasing the amount of funds available for loans.

SIBs complement traditional funding techniques and serve as a useful tool to stretch both Federal and State dollars. The primary benefits of SIBs to transportation investment include:

- Flexible project financing, such as low interest loans and credit assistance that can be tailored to the individual projects;
- Accelerated completion of projects;
- Incentive for increased State and/or local investment;
- Enhanced opportunities for private investment by lowering the financial risk and creating a stronger market condition; and
- Recycling of funds to provide financing for future transportation projects.

The pilot program was originally available to only 10 States, and was later expanded to include 38 States and Puerto Rico. TEA-21 established a new pilot program for the States of California, Florida, Missouri, and Rhode Island. Texas was later authorized to participate in the TEA-21 program. To date, however, only Florida and Missouri have elected to revise their agreements in accordance with TEA-21.

The authorizing Federal legislation allows States to customize the structure and focus of their SIB programs to meet specific requirements. While a SIB can offer many types of financing assistance, loans have been the most popular tool. As of June 2002, 32 States had entered into 294 loan agreements totaling more than \$4 billion. This activity has been largely concentrated within six States. The largest SIB, the South Carolina Transportation Infrastructure Bank, has approved financing and begun development of almost \$2.4 billion in projects, helping to condense into 7 years a transportation program that would have taken 27 years under a pay-

as-you-go approach. The Florida SIB had executed 32 loan agreements through the end of fiscal year 2001, at a value of \$465 million. The Florida SIB has been augmented with a State appropriation of \$150 million, and both Ohio and Arizona have also contributed additional State funds to their SIBs. The table below demonstrates the concentration of activity in the six largest SIBs.

State Infrastructure Banks Transactions as of June 2002

| State                | Number of Agreements | Loan Agreement Amount |
|----------------------|----------------------|-----------------------|
| South Carolina ..... | 6                    | \$2,382 million       |
| Florida .....        | 32                   | \$465 million         |
| Arizona .....        | 37                   | \$424 million         |
| Texas .....          | 37                   | \$252 million         |
| Ohio .....           | 39                   | \$141 million         |
| Missouri .....       | 11                   | \$73 million          |
| Subtotal .....       | 162                  | \$3,738 million       |
| Other States .....   | 132                  | \$318 million         |
| Total .....          | 294                  | \$4,056 million       |

#### *Looking Ahead*

Although States and local partners have not adopted them evenly, the tools of TIFIA, GARVEEs and SIBs have clearly moved from the innovative to the mainstream. This reflects significant success, but it doesn't indicate that the needs of project finance have been completely met. Secretary Mineta has issued a clear challenge to the Department in our development of a reauthorization proposal for TEA-21, asking us to expand innovative finance programs to encourage private sector investment and examine other means to augment existing revenue streams. As part of our internal reauthorization deliberations, we are considering options for further leveraging Federal resources for surface transportation. Enhancing the use of innovative finance in intermodal projects and examining the financing techniques used in other major public infrastructure investments are among the areas we are looking at. The challenge is to build on our successes to date, but not set unrealistic expectations for the future.

A particular focus is on the issue of private investment, an at-risk contribution to a project with the expectation of repayment from project revenues—and a return on investment—over time. Unlike much of the world, the provision of roads and transit systems in the U.S. is almost completely a public sector responsibility. As has been often pointed out, our system of tax-exempt financing means that the public cost of capital is significantly less expensive than for a private entity. Many public works sectors in the U.S. permit private firms to gain access to tax-exempt capital for the construction of public infrastructure. Legislation has been introduced previously to confer this opportunity to a limited number of highway projects. Before the Department would consider any proposed amendment to the Internal Revenue Code, it would first consult with the Department of the Treasury.

One transportation sector with a high degree of private participation, which deserves a higher profile among public transportation planners and policymakers, concerns the movement of freight. Supporting the efficiency of commercial freight transportation continues to be a cornerstone of the Department's vision for America's transportation system. ISTEA and TEA-21 legislation gave us many tools to bring this vision to reality, and our experience has given us new ideas for programs that will get us even closer to our goal of a seamless transportation network. Greater investments in transportation infrastructure and wider use of information technology will certainly be required to achieve this goal.

The activity of SIBs in many States indicates that this program is ready to move beyond its pilot phase to become a permanent feature of the innovative finance landscape.

The Department looks forward to working with our partners in State DOTs, metropolitan planning organizations, and private industry to apply innovative funding strategies that extend the financial means of our individual stakeholders. And we look forward to working with the Congress to craft the next surface transportation legislation. Working together, the Administration, the Congress, States and localities and the private sector can preserve, enhance, and establish surface transportation programs that will result in increased mobility, safety and prosperity for all Americans.

Thank you for the opportunity to testify before you today. I would be happy to answer any questions you may have.

---

RESPONSES OF PHYLLIS SCHEINBERG TO ADDITIONAL QUESTIONS FROM SENATOR  
JEFFORDS

*Question 1.* State Infrastructure Banks (SIBs) are currently limited to only a few States. What is the track record of SIBs? Are they performing as anticipated? Are SIBs a viable option that should be available to all States? Do you have suggestions which this committee should consider to improve the effectiveness of SIBs?

Response. Thirty-nine States, including the Commonwealth of Puerto Rico, were authorized by the Department of Transportation to establish a SIB under the National Highway System Designation Act of 1995 (NHS Act). In addition, the Transportation Equity Act for the 21st Century (TEA-21) established a SIB pilot program that was limited to only a few States that already had authorized SIBs under the NHS Act. Specifically, five States (Florida, Missouri, California, Rhode Island, and Texas) were authorized to use TEA-21 funds to capitalize their SIBs. However, only Florida and Missouri have modified their SIB agreements to comply with the TEA-21 requirements and are currently eligible to use TEA-21 funds for SIB capitalization. To date, States have transferred \$456 million of Federal funds apportioned in FYs 1996 and 1997 into SIBs and \$52.1 million of TEA-21 funds have been transferred to SIBs.

We believe that SIBs have been a viable tool for States that have established them. Of the 39 authorized SIBs, 32 remain active even though only two (Florida and Missouri) are using the additional TEA-21 funds for capitalization. As of June 2002, these States have entered into 294 SIB loan agreements for a total of \$4 billion dollars for surface transportation projects. Some benefits of SIBs assistance are flexible project financing, accelerated completion of projects, recycling of funds, increased State and/or local investment, and enhanced private investment and economic development opportunities.

There is an important distinction between the SIB provisions in the NHS Act and TEA-21. For SIBs operating under the provisions of the NHS Act, all "first generation" SIB assisted projects are subject to Federal requirements. Federal requirements, however, do not apply to SIB projects funded with "second and subsequent generation" SIB funds—i.e., funds derived from repayment proceeds of the first generation projects. All SIB projects assisted with TEA-21 funds are subject to Federal requirements regardless of whether they are first generation projects or financed from repayment proceeds of previously assisted projects. Most States seem to prefer the NHS Act provision that does not expand the application of Federal requirements.

*Question 2.* In my statement I mentioned that the State of South Carolina is undertaking what would be 27 years worth of projects using traditional Federal-aid funding in a span of 7 years. They are able to accomplish this through various transportation financing mechanisms. What challenges does a State face if they use this approach to "jump start" project construction? Are programs like those helping or harming the State's future ability to invest in infrastructure?

Response. One significant challenge involves a State's ability to manage a sudden increase in the number of projects. Another challenge relates to the availability of contractors to perform the work. South Carolina has addressed the first challenge by supplementing its own staff with consultants. In addition, the State has not, to date, reported problems with the availability of contractors.

Accelerating the start of transportation infrastructure projects can result in the twin benefits of (1) cost savings from reduced cost escalation due to inflation and increases in right-of-way costs and (2) earlier returns on economic and safety benefits provided by the new facility.

At this point, we are not aware of instances in which the use of financing mechanisms to "jump start" projects has jeopardized a State's future ability to invest in infrastructure. For example, States that have issued GARVEE bonds thus far have judiciously imposed coverage tests and dollar limits that they believe are appropriate and marketable. GARVEE bonds are State-issued bonds whose repayment source is future Federal-aid highway apportionments.

*Question 3.* AASHTO is proposing a Transportation Finance Corporation (TFC) be created in the next reauthorization to increase the size of the Federal program. The TFC would be involved in various financing mechanisms such as bonding. Has DOT investigated or researched similar ideas? What are your thoughts on the viability of such an approach?

Response. DOT is currently formulating its highway reauthorization policies, but has not finalized its proposals. DOT has considered a variety of alternative financing approaches and has solicited input from all relevant stakeholders.

*Question 4.* In your statement you mention that DOT is pursuing more avenues for transportation financing. We are very interested in this matter including looking at Federal loan guarantees, bonding, tax incentives to purchasing bonds, and a range of other options. One concept I heard was “adapting the financing techniques using other public works sectors”. Could you give us examples of other public works techniques? How applicable would they be to transportation investment? What other innovative financing approaches should we work with you on? Are there other models which have worked well in other areas which could be helpful here—for example, the Farm Credit System sells securities to raise funds to make loans. What existing financing ideas regarding other Departments, Government Sponsored Enterprises, Federal or State agencies, or private entities should we at least consider in terms of the reauthorization?

Response. One mechanism that is currently available for certain major public infrastructure projects—but not highways—is private activity bonds. Private activity bonds are tax-exempt financings issued for certain privately developed and operated public infrastructure. Examples of projects that are currently eligible for private activity bonds are airport facilities; docks and wharves; water, wastewater and solid waste disposal facilities; mass commuting facilities; and high speed intercity rail facilities. Whether private activity bonds would be a useful tool for highway financing could be worth investigation.

---

STATEMENT OF JAYETTA Z. HECKER DIRECTOR, PHYSICAL INFRASTRUCTURE ISSUES,  
GENERAL ACCOUNTING OFFICE

Mr. Chairman and members of the committees: We are pleased to be here today to discuss alternative financing for surface transportation infrastructure projects. As Congress considers reauthorizing the Transportation Equity Act for the 21st Century (TEA-21) in 2003, it does so in the face of a continuing need for the Nation to invest in its surface transportation infrastructure and at a time when both the Federal and State governments are experiencing severe financial constraints.<sup>1</sup> Many observers are concerned that a significant gap exists between the availability of funds and immediate needs. In the longer term, questions have been raised about the financial capacity of the Highway Trust Fund to sustain current and future levels of highway and transit spending. This is of particular concern since Congress has by law established a direct link between Highway Trust Fund revenues and surface transportation spending levels.

In recent years, as transportation needs have grown, Congress provided States—in the National Highway System Designation Act of 1995 (NHS) and TEA-21—additional means to make highway investments through alternative financing mechanisms. These alternative mechanisms included State Infrastructure Banks (SIBs)—revolving funds to make or guarantee loans to approved projects; Grant Anticipation Revenue Vehicles (GARVEEs)—which are State issued bonds or notes repayable with future Federal-aid; and credit assistance under the Transportation Infrastructure Finance and Innovation Act (TIFIA)—including loans, loan guarantees, and lines of credit. All are part of the Federal Highway Administration’s (FHWA’s) Innovative Finance Program. As the time draws nearer to reauthorizing TEA-21, information is needed about the performance of these tools and the potential for these and other proposed tools to help meet the nation’s surface transportation infrastructure investment needs.

At the request of your committees, we are examining a range of surface transportation financing issues, including FHWA’s Innovative Finance Program and proposed alternative financing approaches. My testimony today is based on the preliminary results of our work and discusses (1) the use and performance of existing innovative financing tools and the factors limiting their use, and (2) the prospective costs of current and newly proposed alternative financing techniques for meeting surface transportation infrastructure investment needs. I will also discuss issues concerning the potential costs and benefits of expanding alternative financing mechanisms to meet our nation’s surface transportation needs. My testimony is based on our review of applicable laws, FHWA’s evaluation studies and other reports concerning its Innovative Financing Program, and interviews with FHWA officials, transportation officials in eight States, and bond rating companies. It is also based on a cost comparison we conducted of four current and newly proposed financing techniques.

<sup>1</sup>Performance Budgeting: Opportunities and Challenges. (GAO-02-1106T, Sept.19, 2002).

In summary:

- A number of States are using existing alternative financing tools such as State Infrastructure Banks, GARVEE bonds, and TIFIA loans. These tools can provide States with additional options to accelerate projects and leverage Federal assistance—they can also provide greater flexibility and more funding techniques. However, a number of factors can limit the use of these tools, including some States' preference not to use the tools, restrictions in State law on using them, and restrictions in Federal law on the number of States and types of projects that can use them.
- Federal funding of surface transportation investments includes Federal-aid highway program grant funding appropriated by Congress out of the Highway Trust Fund, loans and loan guarantees, and bonds that are issued by States and that are exempt from Federal taxation. In addition, the use of tax credit bonds—where investors receive a tax credit against their Federal income taxes instead of interest payments from the bond issuers—have been proposed for helping to finance surface transportation investments. Because each of these financing mechanisms is structured differently, we determined that the total cost of providing \$10 billion in infrastructure investment using each of these existing or proposed mechanisms ranges from \$10 billion to over \$13 billion (in present value terms). The mechanisms that involve greater borrowing from the private sector, such as tax-exempt bonds and tax credit bonds, require the least amount of public outlays up front. However, those same mechanisms have the highest long-term costs to the public sector participants in the investments because the latter must compensate the private investors for the risks that they assume. With respect to the Federal Government's contribution, tax credit bonds are the most costly mechanism, while TIFIA loans and tax exempt bonds are the least costly.
- Expanding the use of alternative financing mechanisms has the potential to stimulate additional investment and private participation. But expanding investment in our nation's highways and transit systems raises basic questions of who pays, how much, and when. How alternative financing mechanisms are structured determines how much of the needs are met through Federal funding and how much are met by the States and others. The structure of these mechanisms also determines how much of the cost of meeting our current needs are met by current users and taxpayers versus future users and taxpayers.

#### *Background*

The Federal-aid highway program is financed through motor fuel taxes and other levies on highway users. Federal aid for highways is provided largely on a cash basis from the Highway Trust Fund. States have financed roads primarily through a combination of State revenues and Federal aid. Typically, States raise their share of the funds by taxing motor fuels and charging user fees. In addition, debt financing—issuing bonds to pay for highway development and construction—represents about 10 percent of total State funding for highways, although some States make greater use of borrowing than others.

Federal-aid highway funding to States is typically in the form of grants. These grants are distributed from the Highway Trust Fund and apportioned to States based on a series of funding formulas. Funding is subject to grant-matching rules—for most federally funded highway projects, an 80-percent Federal and 20-percent State funding ratio. States are subject to pay-as-you-go rules where they obligate all of the funds needed for a project up front and are reimbursed for project costs as they are incurred.

In the mid-1990's, FHWA and the States tested and evaluated a variety of innovative financing techniques and strategies.<sup>2</sup> Many financing innovations were approved for use through administrative action or legislative changes under NHS and TEA-21. Three of the techniques approved were SIBs, GARVEEs, and TIFIA loans.<sup>3</sup> SIBs are State revolving loan funds that make loans or loan guarantees to approved projects; the loans are subsequently repaid, and recycled back into the revolving fund for additional loans. GARVEEs are any State issued bond or note repayable with future Federal-aid highway funds. Through the issuance of GARVEE bonds, projects are able to meet the need for up-front capital as well as use future Federal

<sup>2</sup>FHWA uses the term "innovative finance" to refer to any funding measure other than grants to States appropriated from the Highway Trust Fund. Most of the innovative measures entail debt financing. The term is used to contrast that approach with traditional methods of funding highway projects.

<sup>3</sup>FHWA's test and evaluation research initiative (TE-045) evaluated a number of other innovations, including flexible match, toll credits, advance construction, partial conversion of advance construction, and tapered match. Many of these techniques were subsequently approved for use.

highway dollars for debt service. TIFIA allows FHWA to provide credit assistance, up to 33 percent of eligible project costs, to sponsors of major transportation projects. Credit assistance can take the form of a loan, loan guarantee, or line of credit. See appendix II for additional information about these financing techniques.

According to FHWA, the goals of its Innovative Finance Program are to accelerate projects by reducing inefficient and unnecessary constraints on States' management of Federal highway funds; expand investment by removing barriers to private investment; encourage the introduction of new revenue streams, particularly for the purpose of retiring debt obligations; and reduce financing and related costs, thus freeing up the savings for investments into the transportation system itself. When Congress established the TIFIA program in TEA-21, it set out goals for the program to offer sponsors of large transportation projects a new tool to leverage limited Federal resources, stimulate additional investment in our nation's infrastructure, and encourage greater private sector participation in meeting our transportation needs.

*Alternative Financing Mechanisms Offer States Options, But Factors Limit Their Use*

Over the last 8 years, many States have used one or more of the FHWA-sponsored alternative financing tools to fund their highway and transit infrastructure projects. As of June 2002:

- 32 States (including the Commonwealth of Puerto Rico) have established SIBs and have entered into 294 loan agreements with a dollar value of about \$4.06 billion;
- 9 States (including the District of Columbia and Commonwealth of Puerto Rico) have entered into TIFIA credit assistance agreements for 11 projects, representing \$15.4 billion in transportation investment; and
- 6 States have issued GARVEE bonds with face amounts totaling \$2.3 billion.

These mechanisms have given States additional options to accelerate the construction of projects and leverage Federal assistance. It has also provided them with greater flexibility and more funding techniques.

*Accelerate Project Construction*

States' use of innovative financing techniques has resulted in projects being constructed more quickly than they would be under traditional pay-as-you-go financing. This is because techniques such as SIBs can provide loans to fill a funding gap, which allows the project to move ahead. For example, using a \$25 million SIB loan for land acquisition in the initial phase of the Miami Intermodal Center, Florida accelerated the project by 2 years, according to FHWA. Similarly, South Carolina used an array of innovative finance tools when it undertook its "27 in 7 program"—a plan to accomplish infrastructure investment projects that were expected to take 27 years and reduce that to just 7 years. Officials in the States that we contacted that were using FHWA innovative finance tools noted that project acceleration was one of the main reasons for using them.

*Leverage Federal Investments*

Innovative finance—in particular the TIFIA program—can leverage Federal funds by attracting additional non-Federal investments in infrastructure projects. For example, the TIFIA program funds a lower share of eligible project costs than traditional Federal-aid programs, thus requiring a larger investment by other, non-Federal funding sources. It also attracts private creditors by assuming a lower priority on revenues pledged to repay debt. Bond rating companies told us they view TIFIA as "quasi-equity" because the Federal loan is subordinate to all other debt in terms of repayments and offers debt service grace periods, low interest costs, and flexible repayment terms.

It is often difficult to measure precisely the leveraging effect of the Federal investment. As a recent FHWA evaluation report noted, just comparing the cost of the Federal subsidy with the size of the overall investment can overstate the Federal influence—the key issue being whether the projects assisted were sufficiently credit-worthy even without Federal assistance and the Federal impact was to primarily lower the cost of the capital for the project sponsor.

However, TIFIA's features, taken together, can enhance senior project debt ratings and thus make the project more attractive to investors. For example, the \$3.2 billion Central Texas Turnpike project—a toll road to serve the Austin-San Antonio corridor—received a \$917 million TIFIA loan and will use future toll revenues to repay debt on the project, including revenue bonds issued by the Texas Transportation Commission and the TIFIA loan. According to public finance analysts from two ratings firms, the project leaders were able to offset potential concerns about the uncertain toll road revenue stream by bringing the TIFIA loan to the project's financing.

*Provide Greater Flexibility And Additional Financing Techniques*

FHWA's innovative finance techniques provide States with greater flexibility when deciding how to put together project financing. By having access to various alternatives, States can finance large transportation projects that they may not have been able to build with pay-as-you-go financing. For example, faced with the challenge of Interstate highway needs of over \$1.0 billion, the State of Arkansas determined that GARVEE bonds would make up for the lack of available funding. In June 1999, Arkansas voters approved the issuance of \$575 million in GARVEE bonds to help finance this reconstruction on an accelerated schedule. The State will use future Federal funds, together with the required State matching funds and the proceeds from a diesel fuel tax increase, to retire the bonds. The GARVEE bonds allow Arkansas to rebuild approximately 380 miles, or 60 percent of its total Interstate miles, within 5 years.

*Factors Can Limit the Use Finance Tools*

Although FHWA's innovative financing tools have provided States with of additional options for meeting their needs, a number of factors can limit the use of these tools.

- State DOTs are not always willing to use Federal innovative financing tools, nor do they always see advantages to using them. For example, officials in two States indicated that they had a philosophy against committing their Federal aid funding to debt service. Moreover, not all States see advantages to using FHWA innovative financing tools. For example, one official indicated that his State did not have a need to accelerate projects because the State has only a few relatively small urban areas and thus does not face the congestion problems that would warrant using innovative financing tools more often. Officials in another State noted that because their DOT has the authority to issue tax-exempt bonds as long as the State has a revenue stream to repay the debt, they could obtain financing on their own and at lower cost.

- Not all State DOTs have the authority to use certain financing mechanisms, and others have limitations on the extent to which they can issue debt. For example, California requires voter approval in order to use its allocations from the Highway Trust Fund to pay for debt servicing costs. In Texas, the State constitution prohibits using highway funds to pay the State's debt service. Other States limit the amount of debt that can be incurred. For example, Montana has a debt ceiling of \$150 million and is now paying off bonds issued in the late 1970's and early 1980's and plans to issue a GARVEE bond in the next few years.

- Some financing tools have limitations set in law. For example, five States are currently authorized to use TEA-21 Federal-aid funding to capitalize their SIBs. Although other States have created SIBs and use them, they could not use their TEA-21 Federal-aid funding to capitalize them. Similarly, TIFIA credit assistance can be used only for certain projects. TIFIA's requirement that, in general, projects cost at least \$100 million restricts its use to large projects.

*Costs and Risks of Alternative Financing Mechanisms Vary*

We assessed the costs that Federal, State and local governments (or special purpose entities they create) would incur to finance \$10 billion in infrastructure investment using four current and newly proposed financing mechanisms for meeting infrastructure investment needs.<sup>4</sup> To date, most Federal funding for highways and transit projects has come through the Federal-aid highway grants—appropriated by Congress from the Highway Trust Fund. Through the TIFIA program, the Federal Government also provides subsidized loans for State highway and transit projects. In addition, the Federal Government also subsidizes State and local bond financing of highways by exempting the interest paid on those bonds from Federal income tax. Another type of tax preference—tax credit bonds—has been used, to a very limited extent, to finance certain school investments. Investors in tax credit bonds receive a tax credit against their Federal income taxes instead of interest payments from

<sup>4</sup>In deriving our comparisons we use current rules and practices relating to State matching expenditures. Specifically, when computing the costs associated with grants we assume that States pay for 20 percent of the investment expenditures; we assume a similar matching rate would be applied if a tax credit bond program were introduced. Our tax-exempt bond example represents independent investments by the State or local governments (or special purpose entities) with no Federal support other than the tax subsidy. In the case of the direct loan program, we assume that the \$10 billion of expenditures is financed by approximately the same combination of Federal loans, Federal grants, State, local or special purpose entity bonds, State appropriations, and private investment as the average project currently financed by TIFIA loans. (See app. I for further details of our methodology). However, it is important to note that the current rules and practices could be revised so that any desired cost sharing between the Federal and State governments could be achieved through any of the mechanisms.

the bond issuer.<sup>5</sup> Proposals have been made to extend the use of this relatively new financing mechanism to other public investments, including transportation projects.

The use of these four mechanisms to finance \$10 billion in infrastructure investment result in differences in (1) total costs—and how much of the cost is incurred within the short term 5-year period and how much of it is postponed to the future; (2) sharing costs—or the extent to which States must spend their own money, or obtain private investment, in order to receive the Federal subsidy; and (3) risks—which level of government bears the risk associated with an investment (or compensates others for taking the risk). As a result of these differences, for any given amount of highway investment, combined and Federal Government budget costs will vary, depending on which financing mechanism is used.

#### *Total Costs—And Short-and Long-Term Costs—Differ*

Total costs—and how much of the cost is incurred within the short term 5-year period and how much of it is postponed to the future—differ under each of the four mechanisms. As figure 1 shows, grant funds are the lowest-cost method to finance a given amount of investment expenditure, \$10 billion.<sup>6</sup> The reason for this result is that it is the only alternative that does not involve borrowing from the private sector through the issuance of bonds. Bonds are more expensive than grants because the governments have to compensate private investors for the risks that they assume (in addition to paying them back the present value of the bond principal). However, because the grants alternative does not involve borrowing, all of the public spending on the project must be made up front. The TIFIA direct loan, tax credit bond, and tax-exempt loan alternatives involve increased amounts of borrowing from the private sector and, therefore, increased overall costs.

Grants entail the highest short term costs as these costs, in our example, are all incurred on a pay-as-you-go basis. The tax-exempt bond alternative, which involves the most borrowing and has the highest combined costs, also requires the least amount of public money up front.<sup>7</sup>

Figure 1: Present Value Costs of Financing \$10 Billion of Spending on Transportation, Using Alternative Approaches

Source: GAO analysis.

#### *Alternatives Result in Different Shares of the Cost*

There are significant differences across the four alternatives in the cost sharing between Federal and State governments. (See fig. 2). Federal costs would be highest under the tax credit bond alternative, under which the Federal Government pays the equivalent of 30 years of interest on the bonds. Grants are the next most costly alternative for the Federal Government. Federal costs for the tax-exempt bond and

<sup>5</sup>The only tax credit bonds currently in existence are Qualified Zone Academy bonds. State or local governments may issue these bonds to finance improvements in public schools in disadvantaged areas. The issuance limit for these bonds is set at \$400 million for 2002 and is allocated to the States on the basis of their portion of the population below the poverty level.

<sup>6</sup>We present our results in present value terms so that the value of dollars spent in the future are adjusted to make them comparable to dollars spent today.

<sup>7</sup>The results presented in figure 1 were computed using current interest rates, which are relatively low by historical standards. At higher interest rates, the combined costs of the alternatives that involve bond financing would be higher, while the costs of grants would remain the same. If we had used bonds with 20-year terms, instead of 30-year terms, in our examples, the costs of the three alternatives that involve bond financing would be lower, but they all would still be greater than the costs of grants.

TIFIA loan alternatives are significantly lower than for tax credit bonds and grants.<sup>8</sup>

Figure 2: Present Value of Federal, State, and Other Costs of Financing \$10 Billion of Spending on Transportation, Using Alternative Approaches

Source: GAO analysis.

In some past and current proposals for using tax credit bonds to finance transportation investments, the issuers of the bonds would be allowed to place the proceeds from the sales of some bonds into a “sinking fund” and, thereby, earn investment income that could be used to redeem bond principal. This added feature would reduce (or eliminate) the costs of the bond financing to the issuers, but this would come at a significant additional cost to the Federal Government. For example, in our example where States issue \$8 billion of tax credit bonds to finance highway projects, if the States were allowed to issue an additional \$ 2.4 billion of bonds to start a sinking fund, they would be able to earn enough investment income to pay back all of the bonds without raising any of their own money. However, this added benefit for the States could increase costs to the Federal Government by about 30 percent—an additional \$2.7 billion (in present value), raising the total Federal cost to \$11.7 billion.

#### *The Federal Role in Bearing Investment Risk Varies*

In some cases private investors participate in highway projects, either by purchasing “nonrecourse” State bonds that will be repaid out of project revenues (such as tolls) or by making equity investments in exchange for a share of future toll revenues.<sup>9</sup> By making these investments the investors are taking the risk that project revenues will be sufficient to pay back their principal, plus an adequate return on their investment. In the case where the nonrecourse bond is a tax-exempt bond, the State must pay an interest rate that provides an adequate after-tax rate of return, including compensation for the risk assumed by the investors. By exempting this interest payment from income tax, the Federal Government is effectively sharing the cost of compensating investors for risk. Nevertheless, the State still bears some of the risk-related cost and, therefore has an incentive to either select investment projects that have lower risks, or select riskier projects only if the expected benefits from those projects are large enough to warrant taking on the additional risk.

In the case of a tax credit bond where project revenues would be the only source of financing to redeem the bonds and the Federal Government would be committed to paying whatever rate of credit investors would demand to purchase bonds at par value, the Federal Government would bear all of the cost of compensating the investors for risk.<sup>10</sup> States would no longer have a financial incentive to balance higher

<sup>8</sup>Using different assumptions could produce different results. For example, Congress could reduce the Federal cost differences across the four alternatives by establishing higher State matching requirements for those programs. In the case of tax credit bonds, setting the rate of credit to substitute for only a fraction of the interest that bond investors would demand would require States to pay the difference.

<sup>9</sup>A nonrecourse bond is not backed by the full faith and credit of the State or local government issuer. Purchasers of such bonds do not have recourse to the issuer’s taxing authority for bond repayment.

<sup>10</sup>In the case of Qualified Zone Academy Bonds the statute calls for the credit rate to be set so that the bonds sell at par. Selling at par means that the issuer can sell a bond with a face value of \$1,000 to an investor for \$1,000. If, alternatively, the credit rate were set at an average interest rate, bonds for riskier projects would have to be sold below par (e.g., a bond with a

Continued

project risks with higher expected project benefits. Alternatively, the credit rate could be set equal to the interest rate that would be required to sell the average State bonds (issued within the same timeframe) at par value. In that case, States would bear the additional cost of selling bonds for projects with above-average risks.

In the case of a TIFIA loan for a project that has private sector participation, the Federal loan does not compensate the private investors for their risk; instead, the Federal Government assumes some of the risk and, thereby, lowers the risk to the private investors and lowers the amount that States have to pay to compensate for that risk.

In summary, Mr. Chairman, alternative financing mechanisms have accelerated the pace of some surface transportation infrastructure improvement projects and provided States additional tools and flexibility to meet their needs—goals of FHWA's Innovative Finance Program. FHWA and the States have made progress to attain the goal Congress set for the TIFIA program—to stimulate additional investment and encourage greater private sector participation—but measuring success involves measuring the leverage effect of the Federal investment, which is often difficult. Our work raises a number of issues concerning the potential costs and benefits of expanding alternative financing mechanisms to meet our nation's surface transportation needs. Congress likely will weigh these potential costs and benefits as it considers reauthorizing TEA-21.

Expanding the use of alternative financing mechanisms has the potential to stimulate additional investment and private participation. But expanding investment in our nation's highways and transit systems raises basic questions of who pays, how much, and when. How alternative financing mechanisms are structured determines how much of the needs are met through Federal funding and how much are met by the States and others. The structure of these mechanisms also determines how much of the cost of meeting our current needs are met by current users and taxpayers versus future users and taxpayers.

While alternative finance mechanisms can leverage Federal investments, they are, in the final analysis, different forms of debt financing. This debt ultimately must be repaid, with interest, either by highway users—through tolls, fuel taxes, or licensing and vehicle fees—or by the general population through increases in general fund taxes or reductions in other government services. Proposals for tax credit bonds would shift the costs of highway investments away from the traditional user-financed sources, unless revenues from the Highway Trust Fund are specifically earmarked to pay for these tax credits.

Mr. Chairman this concludes my prepared statement. I would be pleased to answer any questions you or other members of the committees have.

---

#### APPENDIX I: METHODOLOGY FOR ESTIMATING THE COSTS OF TRANSPORTATION FINANCING ALTERNATIVES

We estimated the costs that the Federal, State or local governments (or special purpose entities they create) would incur if they financed \$10 billion in infrastructure investment using each of four alternative financing mechanisms: grants, tax credit bonds, tax-exempt bonds, and direct Federal loans. The following subsections explain our cost computations for each alternative. We converted all of our results into present value terms, so that the value of the dollars spent in the future are adjusted to make them comparable to dollars spent today.<sup>1</sup> This adjustment is particularly important when comparing the costs of bond repayment that occur 30 years from now with the costs of grants that occur immediately.

##### *The Cost of Grants*

We estimated the cost to the Federal and State governments of traditional grants with a State match. We assume the State was responsible for 20 percent of the investment expenditures. We then found the percentage of Federal grants such that the Federal grant plus the State match totaled \$10 billion. This form of matching resulted in the State being responsible for \$2 billion of the spending and the Federal Government being responsible for \$8 billion.

---

\$1,000 face value might sell for only \$950), meaning that the issuer receives less money to spend for a given amount of bonds issued. Conversely, bonds sold for less risky projects could be sold above par, so that issuers receive more funds than the face value of the bonds issued.

<sup>1</sup>For example, current interest rates on long-term bonds indicate that, to the government and investors, the present value of a dollar to be spent 30 years from now is less than 25 cents.

#### *The Cost of Tax Credit Bonds*

We estimated the cost to the Federal and State governments of issuing \$8 billion in tax credit bonds with a State match of \$2 billion. The cost to the Federal Government equals the amount of tax credits that would be paid out over a given loan term.<sup>2</sup> We estimated the amount of credit payment in a given year by multiplying the amount of outstanding bonds in a given year by the credit rate. We assumed that the credit rate would be approximately equal to the interest rates on municipal bonds of comparable maturity, grossed up by the marginal tax rate of bond purchasers.<sup>3</sup> For the results presented in figures 1 and 2 we assumed that the bonds would have a 30-year term and would have a credit rating between Aaa and Baa. The cost to the issuing States would consist of the repayment of bond principal in future years, plus the upfront cost of \$2 billion in State appropriations for the matching contribution.

#### *The Cost of Tax-Exempt Bonds*

The cost of tax-exempt bonds to the State or local government (or special purpose entity) issuers would consist of the interest payments on the bonds and the repayment of bond principal. The cost to the Federal Government would equal the taxes forgone on the income that bond purchasers would have earned from the investments they would have made if the tax-exempt bonds were not available for purchase. For the results presented in figures 1 and 2 we made the same assumptions regarding the terms and credit rating of the bonds as we did for the tax credit bond alternative. We computed the cost of interest payments by the State by multiplying the amount of outstanding bonds by the current interest rate for municipal bonds with the same term and credit rating. We assumed that the pretax rate of return that bond purchasers would have earned on alternative investments would have been equal to the municipal bond rate divided by one minus the investors' average marginal tax rate. Consequently, the Federal revenue loss was equal to that pretax rate of return, multiplied by the amount of tax-exempt bonds outstanding each year (in this example), and then multiplied by the investors' average marginal tax rate.

#### *Direct Federal Loans*

In order to have our direct loan example reflect the financing packages typical of current TIFIA projects, we used data from FHWA's June 2002 Report to Congress<sup>4</sup> to determine what shares of total project expenditures were financed by TIFIA direct loans, Federal grants, bonds issued by State or local governments or by special purpose entities, private investment, and other sources. We assumed that the \$10 billion of expenditures in our example was financed by these various sources in roughly the same proportions as they are used, on average, in current TIFIA projects. We estimated the Federal and nonFederal costs of the grants and bond financing components in the same manner as we did for the grants and tax-exempt bond examples above. To compute the Federal cost of the direct loan component, we multiplied the dollar amount of the direct loan in our example by the average amount of Federal subsidy per dollar of TIFIA loans, as reported in the TIFIA report. In the results presented in figure 1, this portion of the Federal cost amounted to \$130 million. The nonFederal costs of the loan component consist of the loan repayments and interest payments to the Federal Government. We assumed that the term of the loan was 30 years and that the interest rate was set equal to the Federal cost of funds, which is TIFIA's policy. The private investment (other than through bonds), which accounted for less than 1 percent of the spending, and the "other" sources, which accounted for about 3 percent of the spending, were treated as money spend immediately on the project.

#### *Sensitivity Analysis*

A number of factors—including general interest rate levels, the terms of the bonds or loans, the individual risks of the projects being financed—affect the relative costs of the various alternatives. For this reason, we examined multiple scenarios for each alternative. In particular, current interest rates are relatively low by historical standards. In our alternative scenarios we used higher interest rates, typical of those in the early 1990's. At higher interest rates, the combined costs of the alternatives that involve bond financing would be higher, while the costs of grants would

<sup>2</sup>Although the credits that investors earn on tax credit bonds are taxable, we assume that any tax the Federal Government would gain from this source would be offset by the tax that investors would have paid on income from the investments they would have made if the tax credit bonds were not available for purchase.

<sup>3</sup>For the tax credit and tax-exempt bond computations we based our rates on municipal bond interest rates reported in the August 22, 2002 issue of the Bond Buyer.

<sup>4</sup>U.S. Department of Transportation, TIFIA Report to Congress, June 2002.

remain the same. If we had used bonds with 20-year terms, instead of 30-year terms in the examples, the costs of the three alternatives that involve bond financing would be lower, but they would still be greater than the costs of grants.

APPENDIX II: STATES' USE OF INNOVATIVE FINANCING TOOLS

*State Infrastructure Banks*

One of the earliest techniques tested to fund transportation infrastructure was revolving loan funds. Prior to 1995, Federal law did not permit States to allocate Federal highway funds to capitalize revolving loan funds. However, in the early 1990's, transportation officials began to explore the possibility of adding revolving loan fund capitalization to the list of eligible uses for certain Federal transportation funds. Under such a proposal, Federal funding is used to "capitalize" or provide seed money for the revolving fund. Then money from the revolving fund would be loaned out to projects, repaid, and recycled back into the revolving fund, and subsequently reinvested in the transportation system through additional loans. In 1995, the federally capitalized transportation revolving loan fund concept took shape as the State Infrastructure Bank (SIB) pilot program, authorized under Section 350 of the NHS Act. This pilot program was originally available only to a maximum of 10 States, but then was expanded under the 1997 U.S. DOT Appropriations Act, which appropriated \$150 million in Federal general funds for SIB capitalization. TEA-21 established a new SIB pilot program, but limited participation to four States—California, Florida, Missouri, and Rhode Island. Texas subsequently obtained authorization under TEA-21. These States may enter into cooperative agreements with the U.S. DOT to capitalize their banks with Federal-aid funds authorized in TEA-21 for fiscal years 1998 through 2003. Of the States currently authorized, only Florida and Missouri have capitalized their SIBs with TEA-21 funds.

Table 1: State's use of SIBs

| State                | Number of agreements | Loan agreement amount (\$ 000) | Disbursements to date (\$ 000) |
|----------------------|----------------------|--------------------------------|--------------------------------|
| Alabama.             |                      |                                |                                |
| Alaska .....         | 1                    | \$2,737                        | \$2,737                        |
| Arizona .....        | 37                   | \$424,287                      | \$216,104                      |
| Arkansas .....       | 1                    | \$31                           | \$31                           |
| California.          |                      |                                |                                |
| Colorado .....       | 2                    | \$400                          | \$400                          |
| Connecticut.         |                      |                                |                                |
| Delaware .....       | 1                    | \$6,000                        | \$6,000                        |
| D.C..                |                      |                                |                                |
| Florida .....        | 32                   | \$465,000                      | \$98,600                       |
| Georgia.             |                      |                                |                                |
| Hawaii.              |                      |                                |                                |

*Transportation Infrastructure Finance and Innovation Act (TIFIA) credit assistance*

As part of TEA-21, Congress authorized the Transportation Infrastructure Finance and Innovation Act of 1998 (TIFIA) to provide credit assistance, in the form of direct loans, loan guarantees, and standby lines of credit to projects of national significance. The TIFIA legislation authorized \$10.6 billion in credit assistance and \$530 million in subsidy cost to cover the expected long-term cost to the government for providing credit assistance. TIFIA credit assistance is available to highway, transit, passenger rail and multi-modal project, as well as projects involving installation of intelligent transportation systems (ITS).

The TIFIA statute sets forth a number of prerequisites for participation in the TIFIA program. The project costs must be reasonably expected to total at least \$100 million, or alternatively, at least 50 percent of the State's annual apportionment of Federal-aid highway funds, whichever is less. For projects involving ITS, eligible project costs must be expected to total at least \$30 million. Projects must be listed on the State's transportation improvement program, have a dedicated revenue source for repayment, and must receive an investment grade rating for their senior debt. Finally, TIFIA assistance cannot exceed 33 percent of the project costs and the final maturity date of any TIFIA credit assistance cannot exceed 35 years after the project's substantial completion date.

Table 2: State's use of TIFIA credit assistance

| State            | Project name                           | Project description  | Project cost (\$ millions) | Instrument type                   | Credit amount (\$ millions)              | Primary revenue pledge |
